23.3.5 ACL Policing – Jericho Platform Switches

Section 23.1.4 describes ACL policing.

Implementing ACL policing consists of configuring the following:

- policy-map settings
- class-name
- committed information rate (CIR) the data speed committed to any given circuit regardless of the number of users
- burst size the maximum burst size in bytes the network commits to moving under normal conditions

The default unit for the metering rate CIR is bits per second; the default unit for the burst size is bytes.

The policer is applied to the class inside the policy map. Policy maps can contain one or more policy map classes, each with different match criteria and policer.

Default behavior and available policing actions are as follows:

- Policy map can be applied on multiple interfaces. Interfaces on the same chip will share the policer. (Applicable for Arad and Jericho only.)
- If there is no policer configured within a class, all traffic is transmitted without any policing.
- If there are any actions configured, the configured actions are applied:
  - Conform-action (green): transmit (default)
  - Violate-action (red): drop (default)
Example

These commands configure ACL policing in single-rate, two-color mode.

```
switch(config)#class-map type qos match-any class1
switch(config-cmap-class1)#match ip access-group acl1
switch(config-cmap-class1)#exit
switch(config)#policy-map type qos policy1
switch(config-policy1)#class class1
switch(config-policy1-class1)#police cir 512000 bc 96000
switch(config-policy1-class1)#exit
switch(config-policy1)#exit
switch(config)#show policy-map
Service-policy policy1

Class-map: class1 (match-any)
Match: ip access-group name acl1
Police cir 512000 bps bc 96000 bytes

Class-map: class-default (match-any)
```

Example

Displaying ACL Policing Information

Example

This command shows the interface specific police counters.

```
switch(config)#show policy-map interface Ethernet 1 input counters
Service-policy input: policy1
Hardware programming status: Successful

Class-map: class1 (match-any) Match: ip access-group name acl1
Police cir 512000 bps bc 96000 bytes Conformed 4351 packets, 1857386 bytes
Conformed 2536 packets, 3384260 bytes

Class-map: class-default (match-any) matched packets: 0
```

Example

This command configures ACL policing.

```
switch(config)#show policy-map [type qos] p1 input counters
Service-policy input: p1 Class-map: c1 (match-any)
Match: ip access-group name a1
Police cir 512000 bps bc 96000 bytes Interface: Ethernet1
Conformed 4351 packets, 1857386 bytes
Exceeded 2536 packets, 3384260 bytes
Interface: Ethernet2
Conformed 2351 packets, 957386 bytes
Exceeded 1536 packets, 1384260 bytes
Class-map: class-default (match-any) Matched packets: 3229
```

switch(config)#
Example

This command configures ACL policing.

```bash
switch(config)#show policy-map interface Ethernet 1 input [type qos]
Interface: Ethernet 1 Service-policy input: policy1
Hardware programming status: Successful Class-map: class1 (match-any)
  Match: ip access-group name acl1
  Police cir 512000 bps bc 9000 bytes
Class-map: class2 (match-any)
  Match: ip access-group name acl2 set dscp 2
Class-map: class3 (match-any) Match: ip access-group name acl3
  Police cir 1280000 bps bc 9000 bytes
Class-map: class-default (match-any)

switch(config)#
```
23.4 QoS Configuration: FM6000 Platform Switches
Implementing QoS on an FM6000 platform switch consists of configuring port trust settings, default port settings, default traffic classes, conversion maps, and transmit queues.

- Section 23.4.1: CoS and DSCP Port Settings – FM6000 Platform Switches
- Section 23.4.2: Traffic Class Derivations – FM6000 Platform Switches
- Section 23.4.3: CoS and DSCP Rewrite – FM6000 Platform Switches
- Section 23.4.4: Transmit Queues and Port Shaping – FM6000 Platform Switches

23.4.1 CoS and DSCP Port Settings – FM6000 Platform Switches
Section 23.1.1.2 describes port trust and default port CoS and DSCP values.

Configuring Port Trust Settings
The `qos trust` command configures the QoS port trust mode for the configuration mode interface. Trust enabled ports use packet CoS or DSCP values to classify traffic. The port-trust default for switched ports is `cos`. The port-trust default for routed ports is `dscp`.

- `qos trust cos` specifies `cos` as the port's port-trust mode.
- `qos trust dscp` specifies `dscp` as the port's port-trust mode.
- `no qos trust` specifies `untrusted` as the port's port-trust mode.

The `show qos interfaces trust` command displays the trust mode of specified interfaces.

Example
- These commands configure and display the following trust modes:
  - Ethernet 15: dscp
  - Ethernet 16: untrusted
  - Ethernet 17: cos
  - Ethernet 18: default as a switched port
• Ethernet 19: default as a routed port

switch(config)#interface ethernet 15
switch(config-if-Et15)#qos trust dscp
switch(config-if-Et15)#interface ethernet 16
switch(config-if-Et16)#no qos trust
switch(config-if-Et16)#interface ethernet 17
switch(config-if-Et17)#qos trust cos
switch(config-if-Et17)#interface ethernet 18
switch(config-if-Et18)#switchport
default qos trust
switch(config-if-Et18)#interface ethernet 19
switch(config-if-Et19)#default qos trust
switch(config-if-Et19)#show qos interface ethernet 15 - 19 trust
Port Operational Configured
--------------- ----------- ------------
Ethernet15 DSCP DSCP
Ethernet16 UNTRUSTED UNTRUSTED
Ethernet17 COS COS
Ethernet18 COS DEFAULT
Ethernet19 DSCP DEFAULT

Configuring Default Port Settings

Default CoS and DSCP settings are assigned to individual port channel and Ethernet interfaces. These configuration mode interface commands specify the port’s default CoS and DSCP values.

• `qos cos` configures a port’s default CoS value.
• `qos dscp` configures a port’s default DSCP value.

Example

• These commands configure default CoS (4) and DSCP (44) settings on Ethernet interface 19.

switch(config)#interface ethernet 19
switch(config-if-Et19)#qos cos 4
switch(config-if-Et19)#qos dscp 44
switch(config-if-Et19)#show active
interface Ethernet19
  qos cos 4
  qos dscp 44
switch(config-if-Et19)#show qos interfaces ethernet 19
Ethernet19:
  Trust Mode: COS
  Default COS: 4
  Default DSCP: 44

<--------OUTPUT OMITTED FROM EXAMPLE-------->

23.4.2 Traffic Class Derivations – FM6000 Platform Switches

Section 23.1.1.4 describes traffic classes.
Traffic Class Derivation Source

Table 23-11 displays the source for deriving a data stream’s traffic class.

<table>
<thead>
<tr>
<th>Traffic Class Derivation Source: FM6000 Platform Switches</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Table 23-11 Traffic Class Derivation Source: FM6000 Platform Switches</strong></td>

<tr>
<td><strong>Untrusted</strong></td>
</tr>
<tr>
<td>---------------</td>
</tr>
<tr>
<td>Untagged Non-IP</td>
</tr>
<tr>
<td>Untagged IP</td>
</tr>
<tr>
<td>Tagged IP</td>
</tr>
</tbody>
</table>

Section 23.4.1 describes the default CoS and DSCP settings for each port.

Mapping CoS to Traffic Class

The `qos map cos` command assigns a traffic class to a list of CoS settings. Multiple commands create a complete CoS to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet’s CoS field or the port upon which it is received.

Example

- This command assigns the traffic class of 5 to the classes of service 1, 3, 5, and 7.

```
switch(config)# qos map cos 1 3 5 7 to traffic-class 5
switch(config)# show qos maps
    Number of Traffic Classes supported: 8
    Number of Transmit Queues supported: 8
    <<<OUTPUT OMITTED FROM EXAMPLE>>>-
    Cos-tc map:
      cos:  0  1  2  3  4  5  6  7
      tc:   1  5  2  5  4  5  6  5
    <<<OUTPUT OMITTED FROM EXAMPLE>>>-
```

Table 23-12 displays the default CoS to Traffic Class map on FM6000 platform switches.

<table>
<thead>
<tr>
<th>Traffic Class Derivation Source: FM6000 Platform Switches</th>

</tr>
<tr>
<td><strong>Inbound CoS</strong></td>
</tr>
<tr>
<td>-----------------</td>
</tr>
<tr>
<td>Untagged</td>
</tr>
</tbody>
</table>

Mapping DSCP to Traffic Class

The `qos map dscp` command assigns a traffic class to a set of DSCP values. Multiple commands create a complete DSCP to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet’s DSCP field or the chip upon which it is received.
Chapter 23: Quality of Service

Example

- This command assigns the traffic class of three to the DSCP values of 12, 13, 25, and 37.

  switch(config)# qos map dscp 12 13 25 37 to traffic-class 3
  switch(config)# show qos map
  Number of Traffic Classes supported: 8

  <--------OUTPUT OMITTED FROM EXAMPLE-------->

  Dscp-tc map:
  d1 :  d2 0 1 2 3 4 5 6 7 8 9
  -------------------------------------
  0 :  1 1 1 1 1 1 1 1 0 0
  1 :  0 0 3 3 0 0 2 2 2 2
  2 :  2 2 2 2 3 3 3 3 3 3
  3 :  3 3 4 4 4 4 3 4 4 4
  4 :  5 5 5 5 5 5 5 6 6 6
  5 :  6 6 6 6 6 6 7 7 7 7
  6 :  7 7 7 7

  <--------OUTPUT OMITTED FROM EXAMPLE-------->

<td>7</td>
</tr>
</tbody>
</table>

23.4.3 CoS and DSCP Rewrite – FM6000 Platform Switches

Section 23.1.1.3 describes the CoS and DSCP rewrite functions.

Traffic Class to CoS Rewrite Map

The CoS rewrite value is configurable and based on a data stream’s traffic class, as specified by the traffic class-CoS rewrite map. The `qos map traffic-class to cos` command assigns a CoS rewrite value to a list of traffic classes. Multiple commands create the complete traffic class–CoS rewrite map.

Example

- This command assigns the CoS rewrite value of two to traffic classes 1, 3, and 5.

  switch(config)# qos map traffic-class 1 3 5 to cos 2
  switch(config)# show qos map
  Number of Traffic Classes supported: 8

  <--------OUTPUT OMITTED FROM EXAMPLE-------->

  Tc - tx-queue map:
  tc:  0 1 2 3 4 5 6 7
  ----------------------------------------
  tx-queue:  0 1 2 3 4 5 6 7

  <--------OUTPUT OMITTED FROM EXAMPLE-------->

switch(config)#
Table 23-14 displays the default traffic class–CoS rewrite map on FM6000 platform switches.

### Table 23-14 Default Traffic Class to CoS Rewrite Map: FM6000 Platform Switches

<table>
<thead>
<tr>
<th>Traffic Class</th>

<td>7</td>
</tr>
</tbody>
</table>

**Traffic Class to DSCP Rewrite Map**

The DSCP rewrite value is configurable and based on a data stream's traffic class, as specified by the traffic class-DSCP rewrite map. The `qos map traffic-class to dscp` command assigns a DSCP rewrite value to a list of traffic classes. Multiple commands create the complete traffic class-DSCP rewrite map.

**Example**

- This command assigns the DSCP rewrite value of 37 to traffic classes 2, 4, and 6.

```bash
switch(config)# qos map traffic-class 2 4 6 to dscp 37
switch(config)# show qos map
```

```
Number of Traffic Classes supported: 8

Tc-dscp map:
tc: 0 1 2 3 4 5 6 7
-----------------------------------
dscp: 8 0 37 24 40 37 48 56
```

*Output omitted from example*

**Table 23-15 displays the default traffic class–DSCP rewrite map on FM6000 platform switches.**

### Table 23-15 Default Traffic Class to DSCP Rewrite Map: FM6000 Platform Switches

<table>
<thead>
<tr>
<th>Traffic Class</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSCP Rewrite Value</td>
<td>8</td>
<td>0</td>
<td>16</td>
<td>24</td>
<td>32</td>
<td>40</td>
<td>48</td>
<td>56</td>
</tr>
</tbody>
</table>

### 23.4.4 Transmit Queues and Port Shaping – FM6000 Platform Switches

Section 23.1.2 describes transmit queues and port shaping.

A data stream’s traffic class determines the transmit queue it uses. The switch defines a single traffic class-transmit queue map for all Ethernet and port channel interfaces and is used for unicast and multicast traffic. The `show qos maps` command displays the traffic class to transmit queue map.

**Table 23-16 displays the default traffic class to transmit queue map on FM6000 platform switches.**

### Table 23-16 Default Traffic Class to Transmit Queue Map: FM6000 Platform Switches

<table>
<thead>
<tr>
<th>Traffic Class</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transmit Queue</td>
<td>0</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>
<td>5</td>
<td>6</td>
<td>7</td>
</tr>
</tbody>
</table>

**Mapping Traffic Classes to a Transmit Queue**

The `qos map traffic-class to tx-queue` command assigns traffic classes to a transmit queue. Multiple commands create the complete map.
Example

- These commands assign traffic classes of 1, 3, and 5 to transmit queue 1, traffic classes 2, 4, and 6 to transmit queue 2, and traffic class 0 to transmit queue 0, then display the resultant map.

```bash
switch(config)# qos map traffic-class 1 3 5 to tx-queue 1
switch(config)# qos map traffic-class 2 4 6 to tx-queue 2
switch(config)# qos map traffic-class 0 to tx-queue 0
```

```bash
switch(config)# show qos maps
Number of Traffic Classes supported: 8
Number of Transmit Queues supported: 8
```

```bash
<-------OUTPUT OMITTED FROM EXAMPLE------->
```

```bash
Tc - tx-queue map:
tc:        0  1  2  3  4  5  6  7
---------------------------------
tx-queue:  0  1  2  1  2  1  2  7
```

```bash
switch(config)#
```

Entering TX-Queue Configuration Mode

Transmit queues are configurable on Ethernet ports and port channels. Queue parameters are configured in tx-queue configuration command mode, which is entered from interface ethernet configuration mode. The `tx-queue (FM6000)` command places the switch in tx-queue configuration mode. The `show qos interfaces` displays the transmit queue configuration for a specified port.

Example

- This command enters tx-queue configuration mode for transmit queue 3 of Ethernet interface 5.

```bash
switch(config)# interface ethernet 5
switch(config-if-Et5)# tx-queue 3
```

```
```

Configuring the Shape Rate – Port and Transmit Queues

A port’s shape rate specifies its maximum outbound traffic bandwidth. A transmit queue’s shape rate specifies the queue’s maximum outbound bandwidth. Shape rate commands specify data rates in kbps.

**Important!** Enabling port shaping on an FM6000 interface disables queue shaping internally. Disabling port shaping restores queue shaping as specified in `running-config`.

- To configure a port’s shape rate, enter `shape rate (Interface – FM6000)` from the port’s interface configuration mode.
- To configure a transmit queue’s shape rate, enter `shape rate (Tx-queue – FM6000)` from the queue’s tx-queue configuration mode.

Example

- These commands configure a shape rate of 5 Gbs on Ethernet port 3, then configure the shape rate for the following transmit queues:

  - transmit queues 0, 1, and 2: 500 Mbps
- transmit queues 3, 4, and 5: 400 Mbps

```
switch(config)#interface ethernet 3
switch(config-if-Et3)#shape rate 5000000
switch(config-if-Et3)#tx-queue 0
switch(config-if-Et3-txq-0)#shape rate 500000
switch(config-if-Et3-txq-0)#tx-queue 1
switch(config-if-Et3-txq-1)#shape rate 500000
switch(config-if-Et3-txq-1)#tx-queue 3
switch(config-if-Et3-txq-3)#shape rate 400000
switch(config-if-Et3-txq-3)#tx-queue 4
switch(config-if-Et3-txq-4)#shape rate 400000
switch(config-if-Et3-txq-4)#tx-queue 5
switch(config-if-Et3-txq-5)#shape rate 400000
switch(config-if-Et3-txq-5)#exit
switch(config-if-Et3)#show qos interface ethernet 3
```

```
Ethernet3:

</tr>
</tbody>
</table>
```

Configuring Queue Priority

Queue priority rank is denoted by the queue number; transmit queues with higher numbers have higher priority. The `priority` command configures a transmit queue’s priority type:

- **priority strict** configures the queue as a strict priority queue.
- **no priority** configures the queue as a round robin queue.

A queue’s configuration as **round robin** also applies to all lower priority queues regardless of other configuration statements.

The `bandwidth percent` command configures a round robin queue’s bandwidth share. The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the cumulative configured bandwidth is greater than 100%, each port’s operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

**Example**

- These commands configure transmit queue 3 (on Ethernet interface 19) as a round robin queue, then allocates 10%, 20%, 30%, and 40% bandwidth to queues 0 through 3.
The **no priority** statement for queue 3 also configures queues 0, 1, and 2 as round robin queues. Removing this statement reverts the other queues to **strict priority** type unless **running-config** contains a **no priority** statement for one of these queues.

```
switch(config)#interface ethernet 19
switch(config-if-Et19)#tx-queue 3
switch(config-if-Et19-txq-3)#no priority
switch(config-if-Et19-txq-3)#bandwidth percent 40
switch(config-if-Et19-txq-3)#tx-queue 2
switch(config-if-Et19-txq-2)#bandwidth percent 30
switch(config-if-Et19-txq-2)#tx-queue 1
switch(config-if-Et19-txq-1)#bandwidth percent 20
switch(config-if-Et19-txq-1)#tx-queue 0
switch(config-if-Et19-txq-0)#bandwidth percent 10
switch(config-if-Et19-txq-0)#show qos interface ethernet 19

23.5 QoS Configuration: Petra Platform Switches

Implementing QoS on a Petra platform switch consists of configuring port trust settings, default port settings, default traffic classes, conversion maps, and transmit queues.

- Section 23.5.1: CoS and DSCP Port Settings – Petra Platform Switches
- Section 23.5.2: Traffic Class Derivations – Petra Platform Switches
- Section 23.5.3: CoS Rewrite – Petra Platform Switches
- Section 23.5.4: Transmit Queues and Port Shaping – Petra Platform Switches

23.5.1 CoS and DSCP Port Settings – Petra Platform Switches

Section 23.1.1.2 describes port trust and default port CoS and DSCP values.

Configuring Port Trust Settings

The `qos trust` command configures the QoS port trust mode for the configuration mode interface. Trust enabled ports use packet CoS or DSCP values to classify traffic. The port-trust default for switched ports is `cos`. The port-trust default for routed ports is `dscp`.

- `qos trust cos` specifies `cos` as the port's port-trust mode.
- `qos trust dscp` specifies `dscp` as the port’s port-trust mode.
- `no qos trust` specifies `untrusted` as the port’s port-trust mode.

The `show qos interfaces trust` command displays the trust mode of specified interfaces.

Example

- These commands configure and display the following trust modes:
  - Ethernet 3/25: dscp
  - Ethernet 3/26: untrusted
  - Ethernet 3/27: cos
  - Ethernet 3/28: default as a switched port
• Ethernet 3/29: default as a routed port

```
switch(config)#interface ethernet 3/25
switch(config-if-Et3/25)#qos trust dscp
switch(config-if-Et3/25)#interface ethernet 3/26
switch(config-if-Et3/26)#no qos trust
switch(config-if-Et3/26)#interface ethernet 3/27
switch(config-if-Et3/27)#qos trust cos
switch(config-if-Et3/27)#interface ethernet 3/28
switch(config-if-Et3/28)#switchport
switch(config-if-Et3/28)#default qos trust
switch(config-if-Et3/28)#interface ethernet 3/29
switch(config-if-Et3/29)#no switchport
switch(config-if-Et3/29)#default qos trust
switch(config-if-Et3/29)#show qos interface ethernet 3/25 - 3/29 trust
```

<table>
<thead>
<tr>
<th>Port</th>

<td>DSCP</td>
</tr>
</tbody>
</table>

```
switch(config-if-Et3/29)#
```

### Configuring Default Port Settings

Port channel and Ethernet interfaces are not assigned default CoS or DSCP settings.

#### 23.5.2 Traffic Class Derivations – Petra Platform Switches

Section 23.1.1.4 describes traffic classes.

### Traffic Class Derivation Source

Table 23-17 displays the source for deriving a data stream’s default traffic class.

**Table 23-17 Traffic Class Derivation Source: Petra Platform Switches**

<table>
<thead>
<tr>
<th>Untagged Non-IP</th>

<td></td>
</tr>
<tr>
<td>Default TC (chip)</td>
<td>CoS (packet)</td>
<td>DSCP (packet)</td>
<td></td>
</tr>
</tbody>
</table>

### Configuring Default Traffic Class

Petra platform switches assign a default traffic class to the set of Ethernet interfaces controlled by individual PetraA chips. Default traffic class values are configurable for each PetraA chip, not individual interfaces.

The **platform petraA traffic-class** command specifies the default traffic class used by all ports controlled by a specified chip. The **show platform petraA traffic-class** command displays traffic class assignments.
Example

- This command configures the default traffic class to five for the ports 32-39 on linecard 3 (7500 Series).
  
  ```
  switch(config)#platform petraA petra3/4 traffic-class 5
  switch(config)#show platform petraA module 3 traffic-class
  Petra3/0 traffic-class: 1
  Petra3/1 traffic-class: 1
  Petra3/2 traffic-class: 1
  Petra3/3 traffic-class: 1
  Petra3/4 traffic-class: 5
  Petra3/5 traffic-class: 1
  switch(config)#
  ```

- This command configures the default traffic class to three for all ports on linecard 6 (7500 Series).
  
  ```
  switch(config)#platform petraA module 6 traffic-class 6
  switch(config)#show platform petraA module 6 traffic-class
  Petra6/0 traffic-class: 6
  Petra6/1 traffic-class: 6
  Petra6/2 traffic-class: 6
  Petra6/3 traffic-class: 6
  Petra6/4 traffic-class: 6
  Petra6/5 traffic-class: 6
  switch(config)#
  ```

Mapping CoS to Traffic Class

The `qos map cos` command assigns a traffic class to a list of CoS settings. Multiple commands create a complete CoS–traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet’s CoS field or the port upon which it is received.

Example

- This command assigns the traffic class of 4 to the classes of service 1, 3, 5, and 7.
  
  ```
  switch(config)#qos map cos 1 3 5 7 to traffic-class 4
  switch(config)#show qos maps
  Number of Traffic Classes supported: 8
  <--------OUTPUT OMITTED FROM EXAMPLE-------->
  Cos-tc map:
  cos:  0  1  2  3  4  5  6  7
  --------------------------
  tc:   1  4  2  4  4  4  6  4
  <--------OUTPUT OMITTED FROM EXAMPLE-------->
  switch(config)#
  ```

Table 23-18 displays the default CoS to traffic class map on Petra platform switches.

### Table 23-18 Default CoS to Traffic Class Map: Petra Platform Switches

</tbody>
</table>

Mapping DSCP to Traffic Class

The `qos map dscp` command assigns a traffic class to a set of DSCP values. Multiple commands create a complete DSCP to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet’s DSCP field or the chip upon which it is received.
Example

- This command assigns the traffic class of three to the DSCP values of 12, 13, 25, and 37.

```
switch(config)# qos map dscp 12 13 14 25 48 to traffic-class 3
```

```
switch(config)# show qos maps
  Number of Traffic Classes supported: 8

<--------OUTPUT OMITTED FROM EXAMPLE-------->
```

Dscp-tc map:

d1 :  d2 0 1 2 3 4 5 6 7 8 9
--------------------------------------

<td>3</td>
<td>4</td>
<td>5</td>
<td>6</td>
<td>7</td>
</tr>
</tbody>
</table>

23.5.3 CoS Rewrite – Petra Platform Switches

Section 23.1.1.3 describes the CoS rewrite function.

Traffic Class to CoS Rewrite Map

The CoS rewrite value is configurable and based on a data stream’s traffic class, as specified by the traffic class-CoS rewrite map. The `qos map traffic-class to cos` command assigns a CoS rewrite value to a list of traffic classes. Multiple commands create the complete traffic class-CoS rewrite map.

Example

- This command assigns the CoS of two to traffic classes 1, 3, and 5.

```
switch(config)# qos map traffic-class 1 3 5 to cos 2
```

```
switch(config)# show qos map
  Number of Traffic Classes supported: 8

<--------OUTPUT OMITTED FROM EXAMPLE-------->
```

Tc-cos map:

tc:  0 1 2 3 4 5 6 7
------------------------------
cos: 1 2 2 2 4 2 6 7
<--------OUTPUT OMITTED FROM EXAMPLE-------->
```

switch(config)"
Table 23-20 displays the default Traffic Class to CoS rewrite value map on Petra platform switches.

<table>
<thead>
<tr>
<th>Traffic Class</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
</tr>
</thead>
<tbody>
<tr>
<td>CoS Rewrite Value</td>
<td>1</td>
<td>0</td>
<td>2</td>
<td>3</td>
<td>4</td>
<td>5</td>
<td>6</td>
<td>7</td>
</tr>
</tbody>
</table>

**Traffic Class to DSCP Rewrite Map**

DSCP rewrite is always disabled on Petra platform switches.

23.5.4 Transmit Queues and Port Shaping – Petra Platform Switches

Section 23.1.2 describes transmit queues and port shaping.

Petra platform switches provide four physical queues for each egress port: Unicast High, Unicast Low, Multicast High, and Multicast Low. Data is scheduled for the high or low queue based on its priority as defined by its transmit queue assignment (unicast traffic) or traffic class (multicast traffic), as shown in Table 23-21. A Petra transmit queue is a data structure that defines scheduling of unicast traffic among physical egress queues.

Table 23-21 Traffic Distribution to Egress Port Queues

<table>
<thead>
<tr>
<th>Unicast Traffic</th>
<th>High Priority Queue</th>
<th>Low Priority Queue</th>
</tr>
</thead>
<tbody>
<tr>
<td>Multicast Traffic</td>
<td>Transmit Queues 5 – 7</td>
<td>Transmit Queues 0 – 4</td>
</tr>
<tr>
<td>Traffic Classes 5 – 7</td>
<td>Traffic Classes 0 – 4</td>
<td></td>
</tr>
</tbody>
</table>

Multicast queue capacity that is available after multicast traffic is serviced is used for unicast traffic of a corresponding priority. Similarly, unicast queue capacity that is available after unicast traffic is serviced is used for overflow multicast traffic. Under conditions of unicast and multicast congestion, egress traffic is evenly split between unicast and multicast traffic.

Section 23.5.4.1 describes unicast transmit queues and shaping. Section 23.5.4.2 describes multicast priority and traffic classes.

23.5.4.1 Unicast Transmit Queues and Port Shaping

A data stream’s traffic class determines the transmit queue it uses. The switch defines a single traffic class–transmit queue map for unicast traffic on all Ethernet interfaces. The `show qos maps` command displays the traffic class–transmit queue map. The `show qos maps` command displays the default traffic class to transmit queue map on Petra platform switches.

Table 23-22 Default Traffic Class to Transmit Queue Map: Petra Platform Switches

<table>
<thead>
<tr>
<th>Traffic Class</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transmit Queue</td>
<td>0</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>
<td>5</td>
<td>6</td>
<td>7</td>
</tr>
</tbody>
</table>

Transmit queue parameters are configured in tx-queue configuration command mode.

**Mapping Traffic Classes to a Transmit Queue**

The `qos map traffic-class to tx-queue` command assigns traffic classes to a transmit queue. Multiple commands complete the traffic class–transmit queue map. Traffic class 7 and transmit queue 7 are always mapped to each other. This association is not editable.
Example

- These commands assign traffic classes of 1, 3, and 5 to transmit queue 1, traffic classes 2, 4, and 6 to transmit queue 2, and traffic class 0 to transmit queue 0, then display the resultant map.

  switch(config)#qos map traffic-class 1 3 5 to tx-queue 1
  switch(config)#qos map traffic-class 2 4 6 to tx-queue 2
  switch(config)#qos map traffic-class 0 to tx-queue 0
  switch(config)#show qos maps
  Number of Traffic Classes supported: 8
  Number of Transmit Queues supported: 8

  Tc - tx-queue map:
  tc:        0  1  2  3  4  5  6  7
  ---------------------------------
  tx-queue:  0  1  2  1  2  1  2  7

  switch(config)#

Entering Tx-Queue Configuration Mode

The tx-queue (Petra) command places the switch in tx-queue configuration mode to configure a transmit queue on the configuration mode interface. Tx-queue 7 is not configurable. The show qos interfaces displays the transmit queue configuration for a specified port.

Example

- This command enters tx-queue configuration mode for transmit queue 3 of Ethernet interface 3/28

  switch(config)#interface ethernet 3/28
  switch(config-if-Et3/28)#tx-queue 3
  switch(config-if-Et3/28-txq-3)#

Configuring the Shape Rate – Port and Transmit Queues

A port’s shape rate specifies its maximum outbound traffic bandwidth. A transmit queue’s shape rate specifies the queue’s maximum outbound bandwidth. Shape rate commands specify data rates in kbps.

- To configure a port’s shape rate, enter shape rate (Interface – Petra) from the port’s interface configuration mode.

  switch(config)#interface ethernet 3/28
  switch(config-if-Et3/28)#shape rate

- To configure a transmit queue’s shape rate, enter shape rate (Tx-queue – Petra) from the queue’s tx-queue configuration mode.

Example

- These commands configure a shape rate of 5 Gbs on Ethernet port 3, then configure the shape rate for the following transmit queues:
  - transmit queues 0, 1, and 2: 500 Mbps
- transmit queues 3, 4, and 5: 400 Mbps

```
switch(config)#interface ethernet 3/28
switch(config-if-Et3/28)#shape rate 5000000
switch(config-if-Et3/28)#tx-queue 0
switch(config-if-Et3/28-txq-0)#shape rate 500000
switch(config-if-Et3/28-txq-0)#tx-queue 1
switch(config-if-Et3/28-txq-1)#shape rate 500000
switch(config-if-Et3/28-txq-1)#tx-queue 2
switch(config-if-Et3/28-txq-2)#shape rate 500000
switch(config-if-Et3/28-txq-2)#tx-queue 3
switch(config-if-Et3/28-txq-3)#shape rate 400000
switch(config-if-Et3/28-txq-3)#tx-queue 4
switch(config-if-Et3/28-txq-4)#shape rate 400000
switch(config-if-Et3/28-txq-4)#tx-queue 5
switch(config-if-Et3/28-txq-5)#shape rate 400000
switch(config-if-Et3/28-txq-5)#show qos interface ethernet 3/28
```

Ethernet3/28:

```

</tbody>
</table>

```
switch(config-if-Et3/28-txq-5)#
```

Configuring Queue Priority

The `priority` command configures a transmit queue’s priority type:

- The `priority strict` command configures the queue as a strict priority queue.
- The `no priority` command configures the queue as a round robin queue.

A queue’s configuration as `round robin` also applies to all lower priority queues regardless of other configuration statements.

The `bandwidth percent` command configures a round robin queue’s bandwidth share. The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the cumulative configured bandwidth is greater than 100%, each port’s operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

Example

- These commands configure transmit queue 3 (on Ethernet interface 3/28) as a round robin queue, then allocates 10%, 20%, 30%, and 40% bandwidth to queues 0 through 3.
The `no priority` statement for queue 3 also configures queues 0, 1, and 2 as round robin queues. Removing this statement reverts the other queues to `strict priority` type unless `running-config` contains a `no priority` statement for one of these queues.

```
switch(config-if-Et3/28)#tx-queue 3
switch(config-if-Et3/28-txq-3)#no priority
switch(config-if-Et3/28-txq-3)#bandwidth percent 40
switch(config-if-Et3/28-txq-3)#tx-queue 2
switch(config-if-Et3/28-txq-2)#bandwidth percent 30
switch(config-if-Et3/28-txq-2)#tx-queue 1
switch(config-if-Et3/28-txq-1)#bandwidth percent 20
switch(config-if-Et3/28-txq-1)#tx-queue 0
switch(config-if-Et3/28-txq-0)#bandwidth percent 10
switch(config-if-Et3/28-txq-0)#show qos interface ethernet 3/28
```

```

Multicast Egress Scheduling

Multiclass traffic is not affected by traffic class assignment or port shaping statements. Multicast traffic is assigned to port egress queues based on traffic class and uses strict priority to schedule egress between the high and low queues.
23.6 QoS Configuration: Trident Platform Switches

Implementing QoS on a Trident platform switch consists of configuring port trust settings, default port settings, default traffic classes, conversion maps, and transmit queues.

- Section 23.6.1: CoS and DSCP Port Settings – Trident Platform Switches
- Section 23.6.2: Traffic Class Derivations – Trident Platform Switches
- Section 23.6.3: CoS and DSCP Rewrite – Trident Platform Switches
- Section 23.6.4: Transmit Queues and Port Shaping – Trident Platform Switches
- Section 23.6.5: ECN Configuration – Trident Platform Switches

23.6.1 CoS and DSCP Port Settings – Trident Platform Switches

**Configuring Port Trust Settings**

The `qos trust` command configures the QoS port trust mode for the configuration mode interface. Trust-enabled ports use packet CoS or DSCP values to classify traffic. The port-trust default for switched ports is **CoS**. The port-trust default for routed ports is **DSCP**.

- `qos trust cos` specifies **CoS** as the port’s trust mode.
- `qos trust dscp` specifies **DSCP** as the port’s trust mode.
- `no qos trust` specifies **untrusted** as the port’s trust mode.

The `show qos interfaces trust` command displays the trust mode of specified interfaces.

**Example**

- These commands configure and display the following trust modes:
  - Ethernet 15: dscp
  - Ethernet 16: untrusted
  - Ethernet 17: cos
  - Ethernet 18: default as a switched port
QoS Configuration: Trident Platform Switches  Chapter 23: Quality of Service

- Ethernet 19: default as a routed port

```
switch(config)#interface ethernet 15
switch(config-if-Et15)#qos trust dscp
switch(config-if-Et15)#interface ethernet 16
switch(config-if-Et16)#no qos trust
switch(config-if-Et16)#interface ethernet 17
switch(config-if-Et17)#qos trust cos
switch(config-if-Et17)#interface ethernet 18
switch(config-if-Et18)#switchport
switch(config-if-Et18)#default qos trust
switch(config-if-Et18)#interface ethernet 19
switch(config-if-Et19)#no switchport
switch(config-if-Et19)#default qos trust
switch(config-if-Et19)#show qos interface ethernet 15 - 19 trust
```

<table>

```
switch(config-if-Et19)#
```

### Configuring Default Port Settings

Default CoS and DSCP settings are assigned to individual port channel and Ethernet interfaces. These configuration mode interface commands specify the port's default CoS and DSCP values.

- `qos cos` configures a port's default CoS value.
- `qos dscp` configures a port's default DSCP value.

### Example

- These commands configure default CoS (4) and DSCP (44) values on Ethernet interface 7.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#qos cos 4
switch(config-if-Et7)#qos dscp 44
switch(config-if-Et7)#show active
interface Ethernet7
  qos cos 4
  qos dscp 44
switch(config-if-Et7)#show qos interfaces ethernet 7
Ethernet7:
  Trust Mode: COS
  Default COS: 4
  Default DSCP: 44
```

```
<--------OUTPUT OMITTED FROM EXAMPLE-------->
```

```
switch(config-if-Et7)#
```

### 23.6.2 Traffic Class Derivations – Trident Platform Switches

Section 23.1.1.4 describes traffic classes.
Traffic Class Derivation Source

Table 23-23 displays the source for deriving a data stream’s traffic class.

Table 23-23  Traffic Class Derivation Source: Trident Platform Switches

<table>
<thead>
<tr>

<td>Default CoS (port)</td>
<td>CoS (packet)</td>
<td>DSCP (packet)</td>
</tr>
</tbody>
</table>

Section 23.6.1 describes the default CoS and DSCP settings for each port.

Mapping CoS to Traffic Class

The `qos map cos` command assigns a traffic class to a list of CoS settings. Multiple commands create a complete CoS to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet’s CoS field or the port upon which it is received.

Example

- This command assigns the traffic class of 5 to the classes of service 1, 3, 5, and 7.

  switch(config)# qos map cos 1 3 5 7 to traffic-class 5
  switch(config)# show qos maps
  Number of Traffic Classes supported: 8
  <-------OUTPUT OMITTED FROM EXAMPLE--------->

  Cos-tc map:
  cos: 0 1 2 3 4 5 6 7
  ------------------------
  tc:  1 5 2 5 4 5 6 5

  <-------OUTPUT OMITTED FROM EXAMPLE--------->

  switch(config)#

Table 23-24 displays the default CoS–traffic class map on Trident platform switches.

Table 23-24  Default CoS to Traffic Class Map: Trident Platform Switches

Mapping DSCP to Traffic Class

The `qos map dscp` command assigns a traffic class to a set of DSCP values. Multiple commands create a complete DSCP to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet’s DSCP field or the chip upon which it is received.
Example

- This command assigns the traffic class of 0 to DSCP values of 12, 24, 41, and 44-47.

```plaintext
switch(config)# qos map dscp 12 24 41 44 45 46 47 to traffic-class 0
switch(config)# show qos maps
Number of Traffic Classes supported: 8

<--------OUTPUT OMITTED FROM EXAMPLE-------->
```

Table 23-25 displays the default DSCP–traffic class map on Trident platform switches.

23.6.3 CoS and DSCP Rewrite – Trident Platform Switches

Section 23.1.1.3 describes the CoS and DSCP rewrite functions.

Traffic Class to CoS Rewrite Map

The CoS rewrite value is configurable and based on a data stream’s traffic class, as specified by the traffic class-CoS rewrite map. The `qos map traffic-class to cos` command assigns a CoS rewrite value to a list of traffic classes. Multiple commands create the complete traffic class–CoS rewrite map.

Example

- This command assigns the CoS of two to traffic classes 1, 3, and 5.

```plaintext
switch(config)# qos map traffic-class 1 3 5 to cos 2
switch(config)# show qos map
Number of Traffic Classes supported: 8

Tc-cos map:
  tc:  0  1  2  3  4  5  6  7
-----------------------------
cos:  1  2  2  2  4  2  6  7

<--------OUTPUT OMITTED FROM EXAMPLE-------->
```
Table 23-26 displays the default Traffic Class to CoS rewrite value map on Trident platform switches.

### Traffic Class to DSCP Rewrite Map

The DSCP rewrite value is configurable and based on a data stream’s traffic class, as specified by the traffic class-DSCP rewrite map. The `qos map traffic-class to dscp` command assigns a DSCP rewrite value to a list of traffic classes. Multiple commands create the complete traffic class-DSCP rewrite map.

### Example

- This command assigns the DSCP value of 29 to traffic classes 2, 4, and 6.

  ```bash
  switch(config)# qos map traffic-class 2 4 6 to dscp 29
  switch(config)# show qos map
  Number of Traffic Classes supported: 8
  <--------OUTPUT OMITTED FROM EXAMPLE-------->
  Tc-dscp map:
  tc:    0 1 2 3 4 5 6 7
  -----------------------------
  dscp:  8 0 29 24 29 40 29 56
  <--------OUTPUT OMITTED FROM EXAMPLE-------->
  ```

23.6.4 Transmit Queues and Port Shaping – Trident Platform Switches

Section 23.1.2 describes transmit queues and port shaping.

Trident platform switches define 12 transmit queues: eight unicast (UC0 – UC7) and four multicast (MC0 – MC03). The traffic class–transmit queue maps are configured globally and apply to all Ethernet interfaces. The `show qos maps` command displays the traffic class–transmit queue maps.

Table 23-28 displays the default traffic class–transmit queue maps.

### Table 23-28 Default Traffic Class to Transmit Queue Map: Trident Platform Switches

<table>
<thead>
<tr>
<th>Traffic Class</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unicast Transmit Queue</td>
<td>0</td>

<td>3</td>
</tr>
</tbody>
</table>

### Mapping Traffic Classes to a Transmit Queue

These commands assign traffic classes to a transmit queue:

- `qos map traffic-class to uc-tx-queue` associates a unicast queue to a traffic class set.
- `qos map traffic-class to mc-tx-queue` associates a multicast queue to a traffic class set.

Multiple commands create the complete maps.
Example

These commands assign the following on Ethernet interface 7:

- traffic classes 1, 3, and 5 to unicast queue 1
- traffic classes 2, 4, and 6 to unicast queue 5
- traffic classes 1, 2, and 3 to multicast queue 1
- traffic classes 4, 5, and 6 to multicast queue 3
- traffic class 0 to unicast queue 0 and multicast queue 0

```
switch(config)#default interface ethernet 7
switch(config)#qos map traffic-class 1 3 5 to uc-tx-queue 1
switch(config)#qos map traffic-class 2 4 6 to uc-tx-queue 5
switch(config)#qos map traffic-class 1 2 3 to mc-tx-queue 1
switch(config)#qos map traffic-class 4 5 6 to mc-tx-queue 3
switch(config)#qos map traffic-class 0 to uc-tx-queue 0
switch(config)#qos map traffic-class 0 to mc-tx-queue 0
switch(config)#show qos maps
Number of Traffic Classes supported: 8
Number of Transmit Queues supported: 12

<--------OUTPUT OMITTED FROM EXAMPLE-------->

Tc - uc-tx-queue map:
  tc:   0  1  2  3  4  5  6  7
  uc-tx-queue: 0  1  5  1  5  1  5  7

Tc - mc-tx-queue map:
  tc:   0  1  2  3  4  5  6  7
  mc-tx-queue: 0  1  1  1  3  3  3  3
```

Entering a Transmit Queue Configuration Mode

Transmit queues are configurable on individual Ethernet ports. Parameters for individual transmit queues are configured in one of two transmit queue configuration modes. Transmit queue modes are accessed from an interface-ethernet configuration mode.

- **uc-tx-queue** places the switch in uc-tx-queue mode to configure a unicast transmit queue.
- **mc-tx-queue** places the switch in mc-tx-queue mode to configure a multicast transmit queue.

The `show qos interfaces` displays the transmit queue configuration for a specified port. Examples

Example

- This command enters the mode that configures unicast transmit queue 3 of Ethernet interface 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#uc-tx-queue 3
```

- This command enters the mode to configure multicast transmit queue 3 of Ethernet interface 5.

```
switch(config-if-Et5)#mc-tx-queue 2
```
Chapter 23: Quality of Service

QoS Configuration: Trident Platform Switches

Configuring the Shape Rate – Port and Transmit Queues

A port’s shape rate specifies the port’s maximum outbound traffic bandwidth. A shape rate can also be configured for all transmit queues on each port. All shape rate commands use kbps to specify data rates.

- To configure a port’s shape rate, enter `shape rate (Interface – Trident)` from the port’s interface configuration mode.
- To configure a transmit queue’s shape rate, enter `shape rate (Tx-queues – Trident)` from the queue’s tx-queue configuration mode.

Example

- These commands configure a shape rate of 5 Gbs on Ethernet port 7, then configure the shape rate for the following transmit queues:
  - unicast transmit queues 0 and 1: 500 Mbps
  - unicast transmit queues 3 and 4: 400 Mbps
  - multicast transmit queues 0 and 2: 300 Mbps

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#shape rate 5000000
switch(config-if-Et7)#uc-tx-queue 0
switch(config-if-Et7-uc-txq-0)#shape rate 500000
switch(config-if-Et7-uc-txq-0)#uc-tx-queue 1
switch(config-if-Et7-uc-txq-1)#shape rate 500000
switch(config-if-Et7-uc-txq-1)#uc-tx-queue 3
switch(config-if-Et7-uc-txq-3)#shape rate 400000
switch(config-if-Et7-uc-txq-3)#uc-tx-queue 5
switch(config-if-Et7-uc-txq-5)#shape rate 400000
switch(config-if-Et7-uc-txq-5)#mc-tx-queue 0
switch(config-if-Et7-mc-txq-0)#shape rate 300000
switch(config-if-Et7-mc-txq-0)#mc-tx-queue 2
switch(config-if-Et7-mc-txq-2)#shape rate 300000
switch(config-if-Et7-mc-txq-2)#exit
switch(config-if-Et7)#show qos interface ethernet 7
```

switch(config-if-Et7)#
```
Configuring Queue Priority

Trident platform switch queues are categorized into two priority groups. Priority group 1 queues have priority over priority 0 queues. The following lists display the priority group queues in order from higher priority to lower priority.

- Priority Group 1: UC7, UC6, MC3
- Priority Group 0: UC5, UC4, MC2, UC3, UC2, MC1, UC1, UC0, MC0

The `priority (Trident)` command configures a transmit queue's priority type:

- The `priority strict` command configures the queue as a strict priority queue.
- The `no priority` command configures the queue as a round robin queue.

A queue’s configuration as `round robin` also applies to all lower priority queues regardless of other configuration statements.

The `bandwidth percent (Trident)` command configures a round robin queue’s bandwidth share. The cumulative operational bandwidth of all round robin queues is always 100%. If the cumulative configured bandwidth is greater than 100%, each port’s operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

Priority Group 1 queues (UC7, UC6, MC3) are not configurable as round robin queues. The `bandwidth percent` command is not available for these queues.

Example

- These commands configure unicast transmit queue 3 as a round robin queue, then allocates 5%, 15%, 25%, 35%, 8%, and 12% bandwidth to unicast transmit queues 0 through 3 and multicast transmit queues 0 and 1, respectively.
The `no priority` statement for queue 3 also configures priority for all lower priority queues. Removing the statement reverts the other queues to `strict priority` type unless `running-config` contains a `no priority` statement for one of these queues.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#uc-tx-queue 3
switch(config-if-Et7-uc-txq-3)#no priority
switch(config-if-Et7-uc-txq-3)#bandwidth percent 5
switch(config-if-Et7-uc-txq-3)#uc-tx-queue 2
switch(config-if-Et7-uc-txq-2)#bandwidth percent 15
switch(config-if-Et7-uc-txq-2)#uc-tx-queue 1
switch(config-if-Et7-uc-txq-1)#bandwidth percent 25
switch(config-if-Et7-uc-txq-1)#uc-tx-queue 0
switch(config-if-Et7-uc-txq-0)#bandwidth percent 35
switch(config-if-Et7-uc-txq-0)#mc-tx-queue 1
switch(config-if-Et7-mc-txq-1)#bandwidth percent 12
switch(config-if-Et7-mc-txq-1)#mc-tx-queue 0
switch(config-if-Et7-mc-txq-0)#bandwidth percent 8

### 23.6.5 ECN Configuration – Trident Platform Switches

Section 23.1.3 describes Explicit Congestion Notification (ECN).

ECN is independently configurable on all egress queues of each Ethernet interface. ECN settings for Port-Channels are applied on each of the channel's member Ethernet interfaces. ECN is also globally configurable to mark packets from the shared pool used for dynamically allocating memory to the queues. Multicast packets contribute to the globally shared pool and can contribute to global level congestion that result in ECN marking of unicast packets queued after the multicast packets.

Average queue length is tracked for transmit queues and the global pool independently. When either entity reaches its maximum threshold, all subsequent packets are marked.

Although the switch does not limit the number of queues that can be configured for ECN, hardware table limitations restrict the number of queues (including the global shared pool) that can simultaneously implement ECN.

The `qos random-detect ecn global-buffer (Trident)` command enables ECN marking for globally shared packet memory and specifies minimum and maximum queue threshold sizes.

#### Example

* This command enables ECN marking of unicast packets from the global data pool and sets the minimum and maximum thresholds at 20 and 500 segments.

```
switch(config)#qos random-detect ecn global-buffer minimum-threshold 20 segments
maximum-threshold 500 segments
switch(config)#
```
This command disables ECN marking of unicast packets from the global data pool:

```
switch(config)#no qos random-detect ecn global-buffer
switch(config)#
```

The `random-detect ecn` (Trident) command enables ECN marking for the configuration mode unicast transmit queue and specifies threshold queue sizes.

**Example**

- These commands enable ECN marking of unicast packets from transmit queue 4 of Ethernet interface 15, setting thresholds at 10 and 100 segments.

```
switch(config)#interface ethernet 15
switch(config-if-Et15)#uc-tx-queue 4
switch(config-if-Et15-uc-txq-4)#random-detect ecn minimum-threshold 10 segments
maximum-threshold 100 segments
switch(config-if-Et15-uc-txq-4)#show active
interface Ethernet15
     uc-tx-queue 4
          random-detect ecn minimum-threshold 10 segments maximum-threshold 100 segments
switch(config-if-Et15-uc-txq-4)#exit
switch(config-if-Et15)#
```

- This command disables ECN marking of unicast packets from transmit queue 4 of Ethernet interface 15.

```
switch(config-if-Et15-uc-txq-4)#no random-detect ecn
switch(config-if-Et15-uc-txq-4)#show active
interface Ethernet15
switch(config-if-Et15-uc-txq-4)#exit
switch(config-if-Et15)#
```
23.7 QoS Configuration: Trident-II and Helix Platform Switches

Implementing QoS on a Trident platform switch consists of configuring port trust settings, default port settings, default traffic classes, conversion maps, and transmit queues.

- Section 23.7.1: CoS and DSCP Port Settings – Trident-II and Helix Platform Switches
- Section 23.7.2: Traffic Class Derivations – Trident-II and Helix Platform Switches
- Section 23.7.3: CoS and DSCP Rewrite – Trident-II and Helix Platform Switches
- Section 23.7.4: Transmit Queues and Port Shaping – Trident-II and Helix Platform Switches

23.7.1 CoS and DSCP Port Settings – Trident-II and Helix Platform Switches

Configuring Port Trust Settings

The `qos trust` command configures the QoS port trust mode for the configuration mode interface. Trust enabled ports use packet CoS or DSCP values to classify traffic. The port-trust default for switched ports is `cos`. The port-trust default for routed ports is `dscp`.

- `qos trust cos` specifies `cos` as the port’s port-trust mode.
- `qos trust dscp` specifies `dscp` as the port’s port-trust mode.
- `no qos trust` specifies `untrusted` as the port’s port-trust mode.

The `show qos interfaces trust` command displays the trust mode of specified interfaces.

Example

- These commands configure and display the following trust modes:
  - Ethernet 7/1: dscp
  - Ethernet 7/2: untrusted
  - Ethernet 7/3: cos
  - Ethernet 7/4: default as a switched port
  - Ethernet 8/1: default as a routed port

```
switch(config)#interface ethernet 7/
switch(config-if-Et7/1)#qos trust dscp
switch(config-if-Et7/1)#interface ethernet 7/2
switch(config-if-Et7/2)#no qos trust
switch(config-if-Et7/2)#interface ethernet 7/3
switch(config-if-Et7/3)#qos trust cos
switch(config-if-Et7/3)#interface ethernet 7/4
switch(config-if-Et7/4)#switchport
switch(config-if-Et7/4)#default qos trust
switch(config-if-Et7/4)#interface ethernet 8/1
switch(config-if-Et8/1)#no switchport
switch(config-if-Et8/1)#default qos trust
switch(config-if-Et8/1)#show qos interface ethernet 7/1 - 8/1 trust

Chapter 23: Quality of Service

QoS Configuration: Trident-II and Helix Platform Switches

Configuring Default Port Settings

Default CoS and DSCP settings are assigned to individual port channel and Ethernet interfaces. These configuration mode interface commands specify the port’s default CoS and DSCP values.

- **qos cos** configures a port’s default CoS value.
- **qos dscp** configures a port’s default DSCP value.

Example

These commands configure default CoS (4) and DSCP (44) values on Ethernet interface 7/3.

```
switch(config)#interface ethernet 7/3
switch(config-if-Et7/3)#qos cos 4
switch(config-if-Et7/3)#qos dscp 44
switch(config-if-Et7/3)#show active
interface Ethernet7/3
  qos cos 4
  qos dscp 44
switch(config-if-Et7/3)#show qos interfaces ethernet 7/3
Ethernet7/3:
  Trust Mode: COS
  Default COS: 4
  Default DSCP: 44
```

23.7.2 Traffic Class Derivations – Trident-II and Helix Platform Switches

Section 23.1.1.4 describes traffic classes.

Note

Qos traffic policy is supported on Trident-II platform switches.

Traffic Class Derivation Source

Table 23-29 displays the source for deriving a data stream’s traffic class.

<table>

</table>

Section 23.7.1 describes the default CoS and DSCP settings for each port.

Mapping CoS to Traffic Class

The **qos map cos** command assigns a traffic class to a list of CoS settings. Multiple commands create a complete CoS to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet’s CoS field or the port upon which it is received.
Example

- This command assigns the traffic class of 5 to the classes of service 1, 3, 5, and 7.

```
switch(config)# qos map cos 1 3 5 7 to traffic-class 5
switch(config)# show qos maps
  Number of Traffic Classes supported: 8
      <-------OUTPUT OMITTED FROM EXAMPLE------->

  Cos-tc map:
  cos:  0 1 2 3 4 5 6 7
  ---------------
  tc:   1 5 2 5 4 5 6 5
  <-------OUTPUT OMITTED FROM EXAMPLE------->
```

Table 23-30 displays the default CoS–traffic class map on Trident-II platform switches.

Table 23-30 Default CoS to Traffic Class Map: Trident-II Platform Switches

<table>
<thead>
<tr>
<th>Inbound CoS</th>
<th>Traffic Class</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 1 2 3 4 5 6 7</td>
<td>1 0 2 3 4 5 6 7</td>
</tr>
</tbody>
</table>

Mapping DSCP to Traffic Class

The `qos map dscp` command assigns a traffic class to a set of DSCP values. Multiple commands create a complete DSCP to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet’s DSCP field or the chip upon which it is received.

Example

- This command assigns the traffic class of 0 to DSCP values of 12, 24, 41, and 44-47.

```
switch(config)# qos map dscp 12 24 41 44 45 46 47 to traffic-class 0
switch(config)# show qos maps
  Number of Traffic Classes supported: 8
      <-------OUTPUT OMITTED FROM EXAMPLE------->

  Dscp-tc map:
  d1 : d2 0 1 2 3 4 5 6 7 8 9
  -----------------------------
  0 :  1 1 1 1 1 1 1 0 0 0
  1 :  0 0 0 0 0 0 2 2 2 2
  2 :  2 2 2 2 0 3 3 3 3 3
  3 :  3 3 4 4 4 4 4 4 4 4
  4 :  5 0 5 5 0 0 0 0 6 6
  5 :  6 6 6 6 6 6 7 7 7 7
  6 :  7 7 7 7
  <-------OUTPUT OMITTED FROM EXAMPLE------->
```

Table 23-31 displays the default DSCP–traffic class map on Trident-II platform switches.

23.7.3 CoS and DSCP Rewrite – Trident-II and Helix Platform Switches

Section 23.1.1.3 describes the CoS and DSCP rewrite functions.

**Traffic Class to CoS Rewrite Map**

The CoS rewrite value is configurable and based on a data stream’s traffic class, as specified by the traffic class-CoS rewrite map. The `qos map traffic-class to cos` command assigns a CoS rewrite value to a list of traffic classes. Multiple commands create the complete traffic class–CoS rewrite map.

**Example**
- This command assigns the CoS of two to traffic classes 1, 3, and 5.

    ```
    switch(config)# qos map traffic-class 1 3 5 to cos 2
    switch(config)# show qos map
    Number of Traffic Classes supported: 8
    <--------OUTPUT OMITTED FROM EXAMPLE-------->
    
    Tc-cos map:
    tc:   0  1  2  3  4  5  6  7
    ----------------------------------------
    cos:  1  2  2  2  4  2  6  7
    <--------OUTPUT OMITTED FROM EXAMPLE-------->
    ```

Table 23-32 displays the default Traffic Class to CoS rewrite value map on Trident-II platform switches.

### Table 23-32 Default Traffic Class to CoS Rewrite Value Map: Trident-II Platform Switches

**Traffic Class to DSCP Rewrite Map**

The DSCP rewrite value is configurable and based on a data stream’s traffic class, as specified by the traffic class-DSCP rewrite map. The `qos map traffic-class to dscp` command assigns a DSCP rewrite value to a list of traffic classes. Multiple commands create the complete traffic class-DSCP rewrite map.

**Example**
- This command assigns the DSCP value of 29 to traffic classes 2, 4, and 6.

    ```
    switch(config)# qos map traffic-class 2 4 6 to dscp 29
    switch(config)# show qos map
    Number of Traffic Classes supported: 8
    <--------OUTPUT OMITTED FROM EXAMPLE-------->
    
    Tc-dscp map:
    tc:   0  1  2  3  4  5  6  7
    ----------------------------------------
    dscp:  8  0 29 24 29 40 29 56
    <--------OUTPUT OMITTED FROM EXAMPLE-------->
    ```

</tbody>
</table>

23.7.4 Transmit Queues and Port Shaping – Trident-II and Helix Platform Switches

Section 23.1.2 describes transmit queues and port shaping.

A data stream’s traffic class determines the transmit queue it uses. The switch defines a single traffic class-transmit queue map for all Ethernet interfaces and is used for unicast and multicast traffic. The traffic class to transmit queue maps are configured globally and apply to all Ethernet and port channel interfaces. The `show qos maps` command displays the traffic class to transmit queue map.

Trident-II platform switches have eight unicast (UC0 – UC7) and eight multicast (MC0 – MC7) queues. Each UCx-MCx queue set is combined into a single queue group (L1.x), which is exposed to the CLI through this command.

Table 23-34 displays the default traffic class to transmit queue maps.

<table>
<thead>
<tr>
<th>Traffic Class</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transmit Queue Group</td>
<td>0</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>
<td>5</td>
<td>6</td>
<td>7</td>
</tr>
</tbody>
</table>

Mapping Traffic Classes to a Transmit Queue

The `qos map traffic-class to tx-queue` command assigns traffic classes to a transmit queue. Multiple commands create the complete map.

**Example**

- These commands assign traffic classes of 1, 3, and 5 to transmit queue 1, traffic classes 2, 4, and 6 to transmit queue 2, and traffic class 0 to transmit queue 0, then display the resultant map.

```
switch(config)#qos map traffic-class 1 3 5 to tx-queue 1
switch(config)#qos map traffic-class 2 4 6 to tx-queue 2
switch(config)#qos map traffic-class 0 to tx-queue 0
```

```
switch(config)#show qos maps
Number of Traffic Classes supported: 8
Number of Transmit Queues supported: 8
<--------OUTPUT OMITTED FROM EXAMPLE-------->

Tc - tx-queue map:
tc:       0  1  2  3  4  5  6  7
----------
tx-queue: 0  1  2  1  2  1  2  7
```

Entering a Transmit Queue Configuration Mode

Transmit queues are configurable on Ethernet ports and port channels. Queue parameters are configured in tx-queue configuration command mode, which is entered from the appropriate interface configuration mode. The `tx-queue (Trident-II)` command places the switch in tx-queue configuration mode. The `show qos interfaces` displays the transmit queue configuration for a specified port.
Chapter 23: Quality of Service
QoS Configuration: Trident-II and Helix Platform Switches

Example

- This command enters tx-queue configuration mode for transmit queue 3 of Ethernet interface 5.

  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#tx-queue 3
  switch(config-if-Et5-txq-3)#
  ```

Configuring the Shape Rate – Port and Transmit Queues

A port’s shape rate specifies the port’s maximum outbound traffic bandwidth. A shape rate can also be configured for all transmit queues on each port. All shape rate commands use kbps to specify data rates.

- To configure a port’s shape rate, enter `shape rate (Interface – Trident-II)` from the port’s interface configuration mode.

- To configure a transmit queue’s shape rate, enter `shape rate (Tx-queue – Trident-II)` from the queue’s tx-queue configuration mode.

Example

- These commands configure a shape rate of 5 Gbs on Ethernet port 3, then configure the shape rate for the following transmit queues:
  - transmit queues 0, 1, and 2: 500 Mbps
  - transmit queues 3, 4, and 5: 400 Mbps

  ```
  switch(config)#interface ethernet 17/3
  switch(config-if-Et17/3)#shape rate 5000000
  switch(config-if-Et17/3)#tx-queue 0
  switch(config-if-Et17/3-txq-0)#shape rate 500000
  switch(config-if-Et17/3-txq-0)#tx-queue 1
  switch(config-if-Et17/3-txq-1)#shape rate 500000
  switch(config-if-Et17/3-txq-1)#tx-queue 3
  switch(config-if-Et17/3-txq-3)#shape rate 400000
  switch(config-if-Et17/3-txq-3)#tx-queue 4
  switch(config-if-Et17/3-txq-4)#shape rate 400000
  switch(config-if-Et17/3-txq-4)#tx-queue 5
  switch(config-if-Et17/3-txq-5)#shape rate 400000
  switch(config-if-Et17/3-txq-5)#exit
  switch(config-if-Et17/3)#show qos interface ethernet 17/3

  Ethernet17/3:
  <--------OUTPUT OMITTED FROM EXAMPLE-------->
  Tx Queue  Bandwidth Guaranteed (units)  Shape Rate (units)  Priority
  -----------------------------------------------
  7      - / -    ( - )     - / -    ( - )      SP / SP
  6      - / -    ( - )     - / -    ( - )      SP / SP
  5      - / -    ( - )   400 / 400  ( Mbps )   SP / SP

  1      - / -    ( - )   500 / 500  ( Mbps )   SP / SP
  0      - / -    ( - )   500 / 500  ( Mbps )   SP / SP
  <--------OUTPUT OMITTED FROM EXAMPLE-------->
  ```

  switch(config-if-Et17/3)#
Configuring Queue Priority

Queue priority rank is denoted by the queue number; transmit queues with higher numbers have higher priority. Trident-II supports strict priority queues; round robin queues are not supported.

The **bandwidth guaranteed (Trident-II)** command configures specifies the minimum bandwidth for outbound traffic on the transmit queue.

**Example**

- These commands configure a minimum egress bandwidth of 1 Mbps for transmit queue 4 of Ethernet interface 17/3.

```
switch(config-if-Et17/3)#tx-queue 4
switch(config-if-Et17/3-txq-4)#show qos interface ethernet 17/3
```

23.8 Quality of Service Configuration Commands

QoS Data Field and Traffic Class Configuration Commands
- qos cos
- qos dscp
- qos trust
- qos map cos
- qos map dscp
- qos map traffic-class to cos
- qos map traffic-class to dscp
- qos map traffic-class to tx-queue
- qos map traffic-class to uc-tx-queue
- qos map traffic-class to mc-tx-queue
- platform petraA traffic-class
- qos rewrite cos
- qos rewrite dscp

QoS Data Field and Traffic Class Display Commands
- show qos interfaces
- show qos maps
- show qos interfaces trust
- show platform petraA traffic-class

ECN Configuration Commands
- qos random-detect ecn global-buffer (Helix)
- qos random-detect ecn global-buffer (Trident)
- random-detect ecn (Arad/Jericho)
- random-detect ecn (Helix)
- random-detect ecn (Trident)
- show qos interfaces random-detect ecn
- show qos random-detect ecn

Transmit Queue and Port Shaping Commands – Arad and Jericho Platforms
- tx-queue (Arad/Jericho)
- bandwidth percent (Arad/Jericho)
- priority (Arad/Jericho)
- shape rate (Tx-queue – Arad/Jericho)
- shape rate (Interface – Arad/Jericho)

Transmit Queue and Port Shaping Commands – FM6000 Platform
- tx-queue (FM6000)
- bandwidth percent (FM6000)
- priority (FM6000)
- shape rate (Tx-queue – FM6000)
- shape rate (Interface – FM6000)

Transmit Queue and Port Shaping Commands – Helix Platform
- tx-queue (Helix)
- bandwidth guaranteed (Helix)
- shape rate (Tx-queue – Helix)
- shape rate (Interface – Helix)
Transmit Queue and Port Shaping Commands – Petra Platform
- `tx-queue` (Petra)
- `bandwidth percent` (Petra)
- `priority` (Petra)
- `shape rate (Tx-queue – Petra)`
- `shape rate (Interface – Petra)`

Transmit Queue and Port Shaping Commands – Trident Platform
- `uc-tx-queue`
- `mc-tx-queue`
- `bandwidth percent` (Trident)
- `priority` (Trident)
- `shape rate (Tx-queues – Trident)`
- `shape rate (Interface – Trident)`

Transmit Queue and Port Shaping Commands – Trident-II Platform
- `tx-queue` (Trident-II)
- `bandwidth guaranteed` (Trident-II)
- `shape rate (Tx-queue – Trident-II)`
- `shape rate (Interface – Trident-II)`
**bandwidth guaranteed (Helix)**

The `bandwidth guaranteed` command specifies the minimum bandwidth for outbound traffic on the transmit queue. By default, no bandwidth is guaranteed to any transmit queue.

The `no bandwidth guaranteed` and `default bandwidth guaranteed` commands remove the minimum bandwidth guarantee on the transmit queue by deleting the corresponding `bandwidth guaranteed` command from `running-config`.

**Command Mode**

Tx-Queue Configuration

**Command Syntax**

```
bandwidth guaranteed rate DATA_MIN
no bandwidth guaranteed
default bandwidth guaranteed
```

**Parameters**

- **DATA_MIN** minimum bandwidth. Value range varies with data unit:
  - `<8 to 40000000>` 8 to 40,000,000 kbytes per second.
  - `<8 to 40000000>-kbps` 8 to 40,000,000 kbytes per second.
  - `<8 to 60000000>-pps` 1 to 60,000,000 packets per second.

**Related Commands**

- `tx-queue (Helix)` places the switch in tx-queue configuration mode.

**Example**

- These commands configure a minimum egress bandwidth of 1 Mbps for transmit queue 4 of Ethernet interface 17/3.

```
switch(config)#interface ethernet 17
switch(config-if-Et17)#tx-queue 4
switch(config-if-Et17-txq-4)#bandwidth guaranteed 1000 kbps
```

**Port shaping rate: disabled**

switch(config-if-Et17/3-txq-4)#
```
bandwidth percent (Arad/Jericho)

The bandwidth percent command configures the bandwidth share of the transmit queue when configured for round robin priority. Bandwidth is allocated to all queues based on the cumulative configured bandwidth of all the port’s round robin queues.

The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the cumulative configured bandwidth is greater than 100%, each port’s operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

The no bandwidth percent and default bandwidth percent commands restore the default bandwidth share of the transmit queue by removing the corresponding bandwidth percent command from running-config.

Command Mode
Tx-Queue Configuration

Command Syntax
bandwidth percent proportion
no bandwidth percent
default bandwidth percent

Parameters
• proportion Bandwidth percentage assigned to queues. Values range from 1 to 100.

Related Commands
• tx-queue (Arad/Jericho) places the switch in tx-queue configuration mode.

Example
• These commands configure queues 0 through 3 (Ethernet interface 3/5/1) as round robin, then allocate bandwidth for three queues at 30% and one queue at 10%.

switch(config)#interface ethernet 3/5/1
switch(config-if-Et3/5/1)#tx-queue 3
switch(config-if-Et3/5/1-txq-3)#no priority
switch(config-if-Et3/5/1-txq-3)#bandwidth percent 10
switch(config-if-Et3/5/1-txq-3)#tx-queue 2
switch(config-if-Et3/5/1-txq-2)#bandwidth percent 30
switch(config-if-Et3/5/1-txq-2)#tx-queue 1
switch(config-if-Et3/5/1-txq-2)#bandwidth percent 30
switch(config-if-Et3/5/1-txq-2)#tx-queue 0
switch(config-if-Et3/5/1-txq-0)#bandwidth percent 30
switch(config-if-Et3/5/1-txq-0)#show qos interfaces ethernet 3/5/1

**bandwidth percent (FM6000)**

The *bandwidth percent* command configures the bandwidth share of the transmit queue when configured for round robin priority. Bandwidth is allocated to all queues based on the cumulative configured bandwidth of all the port’s round robin queues.

The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the cumulative configured bandwidth is greater than 100%, each port’s operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

The *no bandwidth percent* and *default bandwidth percent* commands restore the default bandwidth share of the transmit queue by removing the corresponding *bandwidth percent* command *running-config*.

**Command Mode**

Tx-Queue Configuration

**Command Syntax**

```
bandwidth percent proportion
no bandwidth percent
default bandwidth percent
```

**Parameters**

- *proportion*  Configured bandwidth percentage. Value ranges from 1 to 100. Default value is 0.

**Related Commands**

- *tx-queue (FM6000)* places the switch in tx-queue configuration mode.

**Example**

- These commands configure queues 0 through 3 (Ethernet interface 19) as round robin, then allocate bandwidth for three queues at 30% and one queue at 10%.

```
switch(config)#interface ethernet 19
switch(config-if-Et19)#tx-queue 3
switch(config-if-Et19-txq-3)#no priority
switch(config-if-Et19-txq-3)#bandwidth percent 10

bandwidth percent (Petra)

The `bandwidth percent` command configures the bandwidth share of the transmit queue when configured for round robin priority. Bandwidth is allocated to all queues based on the cumulative configured bandwidth of all the port’s round robin queues.

The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the cumulative configured bandwidth is greater than 100%, each port’s operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

The `no bandwidth percent` and `default bandwidth percent` commands restore the default bandwidth share of the transmit queue by removing the corresponding `bandwidth percent` command running-config.

Command Mode
- Tx-Queue Configuration

Command Syntax
- `bandwidth percent proportion`
- `no bandwidth percent`
- `default bandwidth percent`

Parameters
- `proportion` Bandwidth percentage assigned to queues. Values range from 1 to 100.

Related Commands
- `tx-queue (Petra)` places the switch in tx-queue configuration mode.

Example
- These commands configure queues 0 through 3 (Ethernet interface 3/28) as round robin, then allocate bandwidth for three queues at 30% and one queue at 10%.

```
switch(config)#interface ethernet 3/28
switch(config-if-Et3/28)#tx-queue 3
switch(config-if-Et3/28-txq-3)#no priority
switch(config-if-Et3/28-txq-3)#bandwidth percent 10

bandwidth percent (Trident)

The **bandwidth percent** command configures the bandwidth share of the transmit queue when configured for round robin priority. Bandwidth is allocated to all queues based on the cumulative configured bandwidth of all the port’s round robin queues.

The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the cumulative configured bandwidth is greater than 100%, each port’s operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

The **no bandwidth percent** and **default bandwidth percent** commands restore the default bandwidth share of the transmit queue by removing the corresponding **bandwidth percent** command from the running-config.

**Command Mode**
- Mc-Tx-Queue configuration
- Uc-Tx-Queue configuration

**Command Syntax**

```
bandwidth percent proportion
no bandwidth percent
default bandwidth percent
```

**Parameters**
- **proportion** Bandwidth percentage assigned to queues. Values range from 1 to 100.

**Related Commands**
- **mc-tx-queue** places the switch in mc-tx-queue configuration mode.
- **uc-tx-queue** places the switch in uc-tx-queue configuration mode.
Example

- These commands configure unicast transmit queue 3 (and all other queues of lower priority) as round robin, then allocate bandwidth for unicast transmit queues 1, 2, and 3 at 30% and multicast transmit queue 1 at 10%.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#uc-tx-queue 3
switch(config-if-Et7-uc-txq-3)#no priority
switch(config-if-Et7-uc-txq-3)#bandwidth percent 30

```
switch(config-if-Et7-uc-txq-3)#
**mc-tx-queue**

The `mc-tx-queue` command places the switch in mc-tx-queue configuration mode to configure a multicast transmit queue on the configuration mode interface. Mc-tx-queue configuration mode is not a group change mode; `running-config` is changed immediately after commands are executed. The `exit` command does not affect the configuration.

Trident switches have four multicast queues (MC0 – MC03) and eight unicast queues (UC0 – UC7), categorized into two priority groups. All queues are exposed through the CLI and are user configurable.

- Priority Group 1: UC7, UC6, MC3
- Priority Group 0: UC5, UC4, MC2, UC3, UC2, MC1, UC1, UC0, MC0

The `exit` command returns the switch to the configuration mode for the base Ethernet or port channel interface.

The `no mc-tx-queue` and `default mc-tx-queue` commands remove the configuration for the specified transmit queue by deleting the all corresponding `mc-tx-queue` mode commands from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

**Command Syntax**

```
mc-tx-queue queue_level
```

**Parameters**

- `queue_level` The multicast transmit queue number. Values range from 0 to 3.

**Commands Available in tx-queue Configuration Mode**

- `bandwidth percent (Trident)`
- `priority (Trident)`
- `shape rate (Tx-queues – Trident)`

**Related Commands**

- `uc-tx-queue`: Configures unicast transmit queues on Trident platform switches.

**Example**

- This command enters mc-tx-queue configuration mode for multicast transmit queue 3 of Ethernet interface 5.

  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#mc-tx-queue 3
  switch(config-if-Et5-mc-txq-3)#
  ```
platform petraA traffic-class

The platform petraA traffic-class command configures the default traffic class used by all ports on a specified chip. The default traffic class is implemented by Petra platform switches to replace qos cos and qos dscp commands. Traffic class values range from 0 to 7. The default traffic class is one.

When platform ? returns Petra:
- CoS trusted ports: inbound untagged packets are assigned to the default traffic class. Tagged packets are assigned to the traffic class that corresponds to the contents of its CoS field.
- DSCP trusted ports: inbound non-IP packets are assigned to the default traffic class. IP packets are assigned to the traffic class that corresponds to the contents of its DSCP field.
- Untrusted ports: all inbound packets are assigned to the default traffic class.

The no platform petraA traffic-class and default platform petraA traffic-class commands restore the default traffic class of one for all ports on the specified chips by deleting the corresponding platform petraA traffic-class command from running-config.

Command Mode
Global Configuration

Command Syntax
platform petraA [CHIP_NAME] traffic-class tc_value
no platform petraA [CHIP_NAME] traffic-class
default platform petraA [CHIP_NAME] traffic-class

Parameters
- CHIP_NAME trust mode assigned to the specified ports. Port designation options include:
  - <no parameter> all ports on the switch.
  - module cardX all ports on specified linecard (7500 Series).
  - petra cardX /chipY all ports on PetraA chip chipY on linecard cardX (7500 Series).
  - petra-chipZ all ports on PetraA chip chipZ (7048 Series)

7500 Series
Switches can contain up to eight linecards. cardX varies from 3 to 10.
Each linecard contains six PetraA chips. Each chip controls eight ports. chipY varies from 0 to 5:
- 0 controls ports 1 through 8
- 1 controls ports 9 through 16
- 2 controls ports 17 through 24
- 3 controls ports 25 through 32
- 4 controls ports 33 through 40
- 5 controls ports 41 through 48

7048 Series
Each switch contains two PetraA chips. chipZ varies from 0 to 1:
- 0 controls ports 1 through 32
- 1 controls ports 33 through 52

- tc_value Traffic class value. Values range from 0 to 7. Default value is 1.
Related Commands

- `show platform petraA traffic-class` displays the traffic class assignment on all specified Petra chips.

Example

- This command configures the default traffic class to six for ports 25-32 on linecard 5.

```
switch(config)#platform petraA petra5/3 traffic-class 6
switch(config)#
```
**priority (Arad/Jericho)**

The `priority` command specifies the priority of the transmit queue. The switch supports two queue priorities:

- **strict priority**: contents are removed from the queue - subject to maximum bandwidth limits, before data from lower priority queues. The default setting on all queues is strict priority.
- **round robin priority**: contents are removed proportionately from all round robin queues - subject to maximum bandwidth limits assigned to the strict priority queues.

Tx-queue 7 is set to strict priority and is not configurable.

When a queue is configured as a round robin queue, all lower priority queues also function as round robin queues. A queue's numerical label denotes its priority: higher labels denote higher priority. Tx-queue 6 has higher priority than Tx-queue 5, and Tx-queue 0 has the lowest priority.

The `priority strict` and `default priority` commands configure a transmit queue to function as a strict priority queue unless a higher priority queue is configured as a round robin queue.

The `no priority` command configures a transmit queue as a round robin queue. All lower priority queues also function as round robin queues regardless of their configuration.

**Command Mode**

`Tx-Queue Configuration`

**Command Syntax**

```
priority strict
no priority
default priority
```

**Related Commands**

- `tx-queue (Arad/Jericho)` places the switch in tx-queue configuration mode.

**Example**

- These commands perform the following on Ethernet interface 3/4/1:
  - Displays the default state of all transmit queues.
  - Configures transmit queue 3 as a round robin queue.
• Displays the effect of the no priority command on all transmit queues on the interface.

switch(config)#interface ethernet 3/4/1

Tx-Queue Configuration

Command Syntax

- priority strict
- no priority
- default priority

Related Commands

- tx-queue (FM6000) places the switch in tx-queue configuration mode.

Example

- These commands perform the following on Ethernet interface 2:
  - Displays the default state of all transmit queues.
  - Configures transmit queue 3 as a round robin queue.
  - Displays the effect of the no priority command on all transmit queues on the interface.
switch(config)#interface ethernet 19
switch(config-if-Et19)#show qos interface ethernet 19

**priority (Petra)**

The `priority` command specifies the priority of the transmit queue. The switch supports two queue priorities:

- **strict priority**: contents are removed from the queue - subject to maximum bandwidth limits, before data from lower priority queues. The default setting on all queues is strict priority.
- **round robin priority**: contents are removed proportionately from all round robin queues - subject to maximum bandwidth limits assigned to the strict priority queues.

Tx-queue 7 is set to strict priority and is not configurable.

When a queue is configured as a round robin queue, all lower priority queues also function as round robin queues. A queue’s numerical label denotes its priority: higher labels denote higher priority. Tx-queue 6 has higher priority than Tx-queue 5, and Tx-queue 0 has the lowest priority.

The `priority strict` and `default priority` commands configure a transmit queue to function as a strict priority queue unless a higher priority queue is configured as a round robin queue.

The `no priority` command configures a transmit queue as a round robin queue. All lower priority queues also function as round robin queues regardless of their configuration.

**Command Mode**

Tx-Queue Configuration

**Command Syntax**

```
priority strict
no priority
default priority
```

**Related Commands**

- `tx-queue (Petra)` places the switch in tx-queue configuration mode.

**Example**

- These commands perform the following on Ethernet interface 3/28:
  - Displays the default state of all transmit queues.
  - Configures transmit queue 3 as a round robin queue.
Displays the effect of the no priority command on all transmit queues on the interface.

```
switch(config)#interface ethernet 3/28
switch(config-if-Et3/28)#show qos interface ethernet 3/28
Ethernet3/28:
  Trust Mode: COS
  <--------OUTPUT OMITTED FROM EXAMPLE-------->
  Tx-Queue  Bandwidth  Shape Rate  Priority
  (percent)  (Kbps)                
  -----------------------------------------------
   7   N/A        disabled  strict
   6   N/A        disabled  strict
   5   N/A        disabled  strict
   4   N/A        disabled  strict
   3   N/A        disabled  strict
   2   N/A        disabled  strict
   1   N/A        disabled  strict
   0   N/A        disabled  strict

switch(config-if-Et3/28)#tx-queue 3
switch(config-if-Et3/28-txq-3)#no priority
switch(config-if-Et3/28-txq-3)#show qos interface ethernet 3/28
Ethernet3/28:
  Trust Mode: COS
  <--------OUTPUT OMITTED FROM EXAMPLE-------->
  Tx-Queue  Bandwidth  Shape Rate  Priority
  (percent)  (Kbps)                
  -----------------------------------------------
   7   N/A        disabled  strict
   6   N/A        disabled  strict
   5   N/A        disabled  strict
   4   N/A        disabled  strict
   3   25         disabled  round-robin
   2   25         disabled  round-robin
   1   25         disabled  round-robin
   0   25         disabled  round-robin

switch(config-if-Et3/28-txq-3)#
```
priority (Trident)

The `priority` command specifies the priority of the transmit queue. The switch supports two queue priorities:

- **strict priority**: contents are removed from the queue - subject to maximum bandwidth limits, before data from lower priority queues. The default setting on all other queues is strict priority.
- **round robin priority**: contents are removed proportionately from all round robin queues - subject to maximum bandwidth limits assigned to the strict priority queues.

Trident switches have eight unicast queues (UC0 – UC7) and four multicast queues (MC0 – MC03), categorized into two priority groups. Priority group 1 queues have priority over priority 0 queues. The following lists display the priority group queues in order from higher priority to lower priority.

- Priority Group 1: UC7, UC6, MC3
- Priority Group 0: UC5, UC4, MC2, UC3, UC2, MC1, UC1, UC0, MC0

Priority group 1 queues are strict priority queues and are not configurable as round robin. Priority 0 queues are strict priority by default and are configurable as round robin. When a queue is configured as a round robin queue, all lower priority queues automatically function as round robin queues.

The `priority strict` and `default priority` commands configure a transmit queue to function as a strict priority queue unless a higher priority queue is configured as a round robin queue.

The `no priority` command configures a transmit queue as a round robin queue. All lower priority queues also function as round robin queues regardless of their configuration.

**Command Mode**

```
Mc-Tx-Queue configuration
Uc-Tx-Queue configuration
```

**Command Syntax**

```
priority strict
no priority
default priority
```

**Related Commands**

- `mc-tx-queue` places the switch in mc-tx-queue configuration mode.
- `uc-tx-queue`: places the switch in uc-tx-queue configuration mode.

**Example**

- These commands perform the following on Ethernet interface 7:
  - Displays the default state of all transmit queues.
  - Configures transmit queue 3 as a round robin queue.
  - Displays the effect of the `no priority` command on all transmit queues on the interface.
switch(config)#interface ethernet 7
switch(config-if-Et7)#show qos interface ethernet 7

switch(config-if-Et7-uc-txq-3)#
qos cos

The qos cos command specifies the default class of service (CoS) value of the configuration mode interface. CoS values range from 0 to 7. Default value is 0.

Arad, Jericho, fm6000, trident, and Trident-II platform switches:
• CoS trusted ports: the default CoS value determines the traffic class for inbound untagged packets. Tagged packets are assigned to the traffic class that corresponds to the contents of its CoS field.
• Untrusted ports: the default CoS value determines the traffic class for all inbound packets.

Petra platform switches:
• CoS trusted ports: inbound untagged packets are assigned to the default traffic class, as configured by platform petraA traffic-class. Tagged packets are assigned to the traffic class that corresponds to the contents of its CoS field.
• Untrusted ports: all inbound packets are assigned to the default traffic class.

The no qos cos and default qos cos commands restore the port’s default CoS value to zero by deleting the corresponding qos cos command from running-config.

Command Mode
Interface-Ethernet Configuration
Interface-Port-Channel Configuration

Command Syntax
```
qos cos cos_value
no qos cos
default qos cos
```

Parameters
• cos_value CoS value assigned to port. Value ranges from 0 to 7. Default value is 0.

Example
• This command configures the default CoS of four on Ethernet interface 8.
  ```
  switch(config-if-Et8)#qos cos 4
  switch(config-if-Et8)#
  ```
qos dscp

The qos dscp command specifies the default Differentiated Services Code Point (DSCP) value of the configuration mode interface. The default DSCP determines the traffic class for non-IP packets that are inbound on DSCP trusted ports. DSCP trusted ports determine the traffic class for inbound packets as follows:

- **Arad, Jericho, fm6000, trident, and Trident-II** platform switches:
  - non-IP packets: default DSCP value specified by qos dscp determines the traffic class.
  - IP packets: assigned to the traffic class corresponding to its DSCP field contents.
- **Petra** platform switches:
  - non-IP packets: assigned to default traffic class configured by platform petraA traffic-class.
  - IP packets: assigned to the traffic class corresponding to its DSCP field contents.

The no qos dscp and default qos dscp commands restore the port’s default DSCP value to zero by deleting the corresponding qos dscp command from running-config.

### Command Mode

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

### Command Syntax

- `qos dscp dscp_value`
- `no qos dscp`
- `default qos dscp`

### Parameters

- **dscp_value**  
  DSCP value assigned to the port. Value ranges from 0 to 63. Default value is 0.

### Example

- This command sets the default DSCP of 44 on Ethernet 7 interface.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#qos dscp 44
switch(config-if-Et7)
```
qos trust

The **qos trust** command configures the quality of service port trust mode for the configuration mode interface. Trust-enabled ports classify traffic by examining the traffic’s CoS or DSCP value. Port trust mode default setting is **cos** for switched interfaces and **dscp** for routed interfaces.

The **default qos trust** command restores the default trust mode on the configuration mode interface by removing the corresponding **qos trust** or **no qos trust** statement from **running-config**.

The **no qos trust** command performs the following:

- **no qos trust** places the port in **untrusted** mode.
- **no qos trust cos** removes the corresponding **qos trust cos** statement.
- **no qos trust dscp** removes the corresponding **qos trust dscp** statement.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

**Command Syntax**

```
qos trust MODE
no qos trust [MODE]
default qos trust
```

**Parameters**

- **MODE** trust mode assigned to the port. Options include:
  - **cos** enables cos trust mode.
  - **dscp** enables dscp trust mode.

- **no qos trust** enables untrusted mode on the port.

**Examples**

- This command configures trust mode of dscp for Ethernet interface 5.

  ```
  switch(config)#interface Ethernet 7
  switch(config-if-Et7)#qos trust dscp
  switch(config-if-Et7)#show active
  interface Ethernet7
  qos trust dscp
  switch(config-if-Et7)#
  ```

- This command configures trust mode of untrusted for Port Channel interface 23.

  ```
  switch(config)#interface port-channel 23
  switch(config-if-Po23)#no qos trust
  switch(config-if-Po23)#show active
  interface Port-Channel23
  no qos trust
  switch(config-if-Po23)#
  ```
qos map cos

The `qos map cos` command associates a traffic class to a list of class of service (CoS) settings. Multiple commands create a complete CoS to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet’s CoS field or the port upon which it is received.

The `no qos map cos` and `default qos map cos` commands restore the specified CoS values to their default traffic class setting by deleting the corresponding `qos map cos` statements from `running-config`.

Command Mode

- Global Configuration

Command Syntax

```plaintext
qos map cos cos_value_1 [cos_value_2 ... cos_value_n] to traffic-class tc_value
no qos map cos cos_value_1 [cos_value_2 ... cos_value_n]
default qos map cos cos_value_1 [cos_value_2 ... cos_value_n]
```

Parameters

- `cos_value_x` Class of service (CoS) value. Value ranges from 0 to 7.
- `tc_value` Traffic class value. Value range varies by platform.

Default CoS to traffic class map varies by platform (Table 23-35).

Default Inbound CoS to Traffic Class Map

Table 23-35 displays the default CoS to traffic class map for each platform.

<table>

Related Commands

- `qos cos` specifies the default CoS
- `platform petraA traffic-class` specifies the default traffic class

Example

- This command assigns the traffic class of 5 to the classes of service 1, 3, 5, and 7.

  ```plaintext
  switch(config)#qos map cos 1 3 5 7 to traffic-class 5
  switch(config)#
  ```
qos map dscp

The `qos map dscp` command associates a traffic class to a set of Differentiated Services Code Point (DSCP) values. Multiple commands create a complete DSCP to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet’s DSCP field or the chip upon which it is received.

The `no qos map dscp` and `default qos map dscp` commands restore the specified DSCP values to their default traffic class settings by deleting corresponding `qos map dscp` statements from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
qos map dscp dscpv_1 [dscpv_2 ... dscpv_n] to traffic-class tc_value
no qos map dscp dscpv_1 [dscpv_2 ... dscpv_n]
default qos map dscp dscpv_1 [dscpv_2 ... dscpv_n]
```

**Parameters**

- `dscpv_x` Differentiated services code point (DSCP) value. Value ranges from 0 to 63.
- `tc_value` Traffic class value. Value range varies by platform.

Default map varies by platform (Table 23-36).

**Default Inbound DSCP to Traffic Class Map**

Table 23-36 displays the default DSCP to traffic class map for each platform.

<table>
<thead>
<tr>
<th>Inbound DSCP</th>
<th>0-7</th>
<th>8-15</th>
<th>16-23</th>

</tr>
</tbody>
</table>

**Example**

- This command assigns the traffic class of three to the DSCP values of 12, 13, 25, and 37.
  ```
  switch(config)#qos map dscp 12 13 25 37 to traffic-class 3
  switch(config)#
  ```
qos map traffic-class to cos

The `qos map traffic-class to cos` command associates a class of service (CoS) to a list of traffic classes. Multiple commands create a complete traffic class to CoS map. The switch uses this map in CoS rewrite operations to fill the CoS field in outbound packets. This map is applicable to DSCP trusted ports and untrusted ports. CoS rewrite is disabled on CoS trusted ports. The `show qos maps` command displays the CoS to traffic class map.

The `no qos traffic-class to cos` and `default qos traffic-class to cos` commands restore the specified traffic class values to their default CoS settings by removing the corresponding `qos map traffic-class to cos` command from `running-config`.

Command Mode

Global Configuration

Command Syntax

```
qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to cos cos_value
no qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to cos
default qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to cos
```

Parameters

- `tc_num_x` Traffic class value. Value range varies by switch platform.
- `cos_value` Class of service (CoS) value. Value ranges from 0 to 7.

Default Inbound Traffic Class to CoS Map

Table 23-37 displays the default traffic class to CoS map for each platform.

</tbody>
</table>

Example

- This command assigns the CoS of two to traffic classes 1, 3, and 5.

```
switch(config)#qos map traffic-class 1 3 5 to cos 2
switch(config)#
```
**qos map traffic-class to dscp**

The `qos map traffic-class to dscp` command associates a Differentiated Services Code Point (DSCP) value to a list of traffic classes. Multiple commands create a complete traffic class to DSCP map. The switch uses this map in DSCP rewrite operations to fill the DSCP field in outbound packets. This map is applicable to CoS trusted ports and untrusted ports but disabled by default on these ports. DSCP rewrite is disabled on DSCP trusted ports. The `show qos maps` command displays the traffic class to DSCP map.

The `no qos traffic-class to dscp` and `default qos traffic-class to dscp` commands restore the specified traffic class values to their default DSCP settings by removing the corresponding `qos map traffic-class to dscp` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to dscp dscp_value
no qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to dscp
default qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to dscp
```

**Parameters**

- `tc_num_x` Traffic class value. Value range varies by switch platform.
- `dscp_value` Differentiated services code point (DSCP) value. Value ranges from 0 to 63.

**Default Inbound Traffic Class to DSCP Map**

<td>8</td>
<td>0</td>
<td>16</td>
<td>24</td>
<td>32</td>
<td>40</td>
<td>48</td>
<td>56</td>
</tr>
</tbody>
</table>

**Example**

- This command assigns the DSCP value of 17 to traffic classes 1, 2, and 4.
  ```
  switch(config)#qos map traffic-class 1 2 4 to dscp 17
  ```
  ```
  switch(config)#
  ```
**qos map traffic-class to mc-tx-queue**

The **qos map traffic-class to mc-tx-queue** command associates a multicast transmit queue to a list of traffic classes. Multiple commands create a complete traffic class to mc-tx-queue map. The switch uses this map to route outbound packets to transmit queues, which in turn schedules their transmission from the switch. The **show qos maps** command displays the traffic class to multicast transmit queue map.

The **no qos traffic-class to mc-tx-queue** and **default qos traffic-class to mc-tx-queue** commands restore the default traffic class to multicast transmit queue map for the specified traffic class values by removing the corresponding **qos map traffic-class to mc-tx-queue** command from **running-config**.

**Command Mode**
Global Configuration

**Command Syntax**

```
qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to mc-tx-queue mtq_value
no qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to mc-tx-queue
default qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to mc-tx-queue
```

**Parameters**
- `tc_num_x` Traffic class value. Value ranges from 0 to 7.
- `mtq_value` Multicast transmit queue number. Value ranges from 0 to 3.

**Default Inbound Traffic Class to Multicast Transmit Queue Map**

Table 23-39 displays the default traffic class to multicast transmit queue map for Trident platform switches.

<table>
<thead>
<tr>
<th>Traffic Class</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
</tr>

<td>0</td>
<td>0</td>
<td>1</td>
<td>1</td>
<td>2</td>
<td>2</td>
<td>3</td>
<td>3</td>
</tr>
</tbody>
</table>

**Related Commands**
- **qos map traffic-class to uc-tx-queue** (Trident) associates traffic classes to a multicast transmit queue.
- **qos map traffic-class to tx-queue** (all other platforms) associates traffic classes to a transmit queue.

**Example**
- This command maps traffic classes 0, 4, and 5 to mc-tx-queue 2.

```
switch(config)#qos map traffic-class 0 4 5 to mc-tx-queue 2
switch(config)#
```
qos map traffic-class to tx-queue

The `qos map traffic-class to tx-queue` command associates a transmit queue (tx-queue) to a list of traffic classes. Multiple commands create a complete traffic to tx-queue map. The switch uses this map to route outbound packets to transmit queues, which in turn schedules their transmission from the switch. The `show qos maps` command displays the transmit queue to traffic class map.

The `no qos traffic-class to tx-queue` and `default qos traffic-class to tx-queue` commands restore the specified traffic class values to their default transmit queue settings by removing the corresponding `qos map traffic-class to tx-queue` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to tx-queue txq_value
no qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to tx-queue
default qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to tx-queue
```

**Parameters**

- `tc_num_x` Traffic class value. Value range varies by platform.
- `txq_value` Transmit queue value. Value range varies by platform.

**Restrictions**

FM6000: When priority flow control (PFC) is enabled, traffic classes are mapped to their corresponding transmit queues, regardless of existing `qos map traffic-class to tx-queue` statements.

Arad, Jericho, and Petra: Traffic class 7 always maps to transmit queue 7. This association is not editable.

**Default Inbound Traffic Class to Transmit Queue Map**

Table 23-40 displays the transmit queue to traffic class map.

**Related Commands**

- `qos map traffic-class to mc-tx-queue` (Trident) associates traffic classes to a unicast transmit queue.
- `qos map traffic-class to uc-tx-queue` (Trident) associates traffic classes to a multicast transmit queue.

**Example**

- This command maps traffic classes 0, 4, and 5 to tx-queue 4.
```
switch(config)#qos map traffic-class 0 4 5 to tx-queue 4
switch(config)#
```
qos map traffic-class to uc-tx-queue

The `qos map traffic-class to uc-tx-queue` command associates a unicast transmit queue to a list of traffic classes. Multiple commands create a complete traffic class to unicast transmit queue map. The switch uses this map to route outbound packets to transmit queues, which in turn schedules their transmission from the switch. The `show qos maps` command displays the traffic class to unicast transmit queue map.

The `no qos traffic-class to uc-tx-queue` and `default qos traffic-class to uc-tx-queue` commands restore the default traffic class to unicast transmit queue map for the specified traffic class values by removing the corresponding `qos map traffic-class to uc-tx-queue` command from `running-config`.

Command Mode
Global Configuration

Command Syntax
```
qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to uc-tx-queue utq_value
no qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to uc-tx-queue
default qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to uc-tx-queue
```

Parameters
- `tc_num_x` Traffic class value. Value ranges from 0 to 7.
- `utq_value` Unicast transmit queue number. Value ranges from 0 to 7.

Default Inbound Traffic Class to Unicast Transmit Queue Map
`Table 23-41` displays the default traffic class to Unicast transmit queue map for Trident platform switches.

```
<table>
<thead>
<tr>
<th>Traffic Class</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>

</tr>
</tbody>
</table>
```

Related Commands
- `qos map traffic-class to mc-tx-queue` (Trident) associates traffic classes to a unicast transmit queue.
- `qos map traffic-class to tx-queue` (all other platforms) associates traffic classes to a transmit queue.

Example
- This command maps traffic classes 0, 4, and 5 to unicast transmit queue 4.
```
switch(config)# qos map traffic-class 0 4 5 to uc-tx-queue 4
switch(config)#
```
qos random-detect ecn global-buffer (Helix)

The **qos random-detect ecn global-buffer** command enables ECN marking for globally shared packet memory and specifies minimum and maximum queue threshold sizes. Hosts can advertise their ECN capabilities in the ToS DiffServ field’s two least significant bits:

- 00 Non ECN Capable transport.
- 10 ECN Capable transport.
- 01 ECN Capable transport.
- 11 Congestion encountered.

Congestion is determined by comparing average queue size with queue thresholds. Average queue size is calculated through a formula based on the previous average and current queue size. Packets are marked based on this average size and the specified thresholds:

- Average queue size below minimum threshold: Packets are queued normally.
- Average queue size above maximum threshold: Packets are marked **congestion encountered**.
- Average queue size between minimum and maximum thresholds. Packets are queued or marked **congestion encountered**. The proportion of marked packets varies linearly with average queue size:
  - 0% are marked when average queue size is less than or equal to minimum threshold.
  - 100% are marked when average queue size is greater than or equal to maximum threshold.

When transmitted packets are marked **Non ECN Capable**, congestion packets are dropped, not marked.

The **no qos random-detect ecn global-buffer** and **default qos random-detect ecn global-buffer** commands disables ECN marking for the shared buffer by removing the **qos random-detect ecn global-buffer** command from **running-config**.

**Command Mode**
Global Configuration

**Command Syntax**
```
qos random-detect ecn global-buffer minimum-threshold MIN maximum-threshold MAX
no qos random-detect ecn global-buffer
default qos random-detect ecn global-buffer
```

**Guidelines**
Packet memory is divided into 46080 208-byte cells, whose allocation is managed by the memory management unit (MMU). The MMU tracks the cells that each entity uses and determines the number of cells that can be allocated to an entity.

**Related Commands**
- **random-detect ecn (Helix)** enables ECN marking for a unicast transmit queue.

**Parameters**
```
MIN and MAX parameters must use the same data unit.
```

- **MIN** Minimum threshold. Options include:
  - `<1 to 19456>` segments 208-byte segments units
  - `<1 to 4>` mbytes Megabyte units
  - `<1 to 4046>` kbytes Kilobyte units

- **MAX** Maximum threshold. Options include:
  - `<1 to 19456>` segments 208-byte segments units
  - `<1 to 4>` mbytes Megabyte units
  - `<1 to 4046>` kbytes Kilobyte units
• <1 to 4046848> bytes  Byte units
• MAX  Maximum threshold. Options include:
  • <1 to 46080> segments  208-byte segments units
  • <1 to 4> mbytes  Megabyte units
  • <1 to 4046> kbytes  Kilobyte units
  • <1 to 4046848> bytes  Byte units

Examples
• This command enables ECN marking of unicast packets from the global data pool and sets the minimum and maximum thresholds at 20 and 500 segments.
  switch(config)#qos random-detect ecn global-buffer minimum-threshold 20 segments
  maximum-threshold 500 segments
  switch(config)#
• This command disables ECN marking of unicast packets from the global data pool
  switch(config)#no qos random-detect ecn global-buffer
  switch(config)#
qos random-detect ecn global-buffer (Trident)

The `qos random-detect ecn global-buffer` command enables ECN marking for globally shared packet memory and specifies minimum and maximum queue threshold sizes. Hosts can advertise their ECN capabilities in the ToS DiffServ field’s two least significant bits:

- 00 Non ECN Capable transport.
- 10 ECN Capable transport.
- 01 ECN Capable transport.
- 11 Congestion encountered.

Congestion is determined by comparing average queue size with queue thresholds. Average queue size is calculated through a formula based on the previous average and current queue size. Packets are marked based on this average size and the specified thresholds:

- Average queue size below minimum threshold: Packets are queued normally.
- Average queue size above maximum threshold: Packets are marked `congestion encountered`.
- Average queue size between minimum and maximum thresholds. Packets are queued or marked `congestion encountered`. The proportion of marked packets varies linearly with average queue size:
  - 0% are marked when average queue size is less than or equal to minimum threshold.
  - 100% are marked when average queue size is greater than or equal to maximum threshold.

When transmitted packets are marked `Non ECN Capable`, congestion packets are dropped, not marked.

The `no qos random-detect ecn global-buffer` and `default qos random-detect ecn global-buffer` commands disables ECN marking for the shared buffer by removing the `qos random-detect ecn global-buffer` command from `running-config`.

Command Mode
Global Configuration

Command Syntax
```
qos random-detect ecn global-buffer minimum-threshold MIN maximum-threshold MAX
no qos random-detect ecn global-buffer
default qos random-detect ecn global-buffer
```

Guidelines
Packet memory is divided into 46080 208-byte cells, whose allocation is managed by the memory management unit (MMU). The MMU tracks the cells that each entity uses and determines the number of cells that can be allocated to an entity.

Related Commands
- `random-detect ecn (Trident)` enables ECN marking for a unicast transmit queue.

Parameters
- `MIN` and `MAX` parameters must use the same data unit.
- `MIN` Minimum threshold. Options include:
  - `<1 to 46080>` segments 208-byte segments units
  - `<1 to 9>` mbytes Megabyte units
  - `<1 to 9584>` kbytes Kilobyte units
Quality of Service Configuration Commands

Chapter 23: Quality of Service

- `<1 to 9584640> bytes` Byte units
- **MAX** Maximum threshold. Options include:
  - `<1 to 46080> segments` 208-byte segments units
  - `<1 to 9> mbytes` Megabyte units
  - `<1 to 9584> kbytes` Kilobyte units
  - `<1 to 9584640> bytes` Byte units

Examples

- This command enables ECN marking of unicast packets from the global data pool and sets the minimum and maximum thresholds at 20 and 500 segments.
  
  `switch(config)# qos random-detect ecn global-buffer minimum-threshold 20 segments maximum-threshold 500 segments
switch(config)#`

- This command disables ECN marking of unicast packets from the global data pool
  
  `switch(config)# no qos random-detect ecn global-buffer
switch(config)#`
qos rewrite cos

The `qos rewrite cos` command enables the rewriting of the CoS field for outbound tagged packets that were received on DSCP trusted ports and untrusted ports. CoS rewrite is always disabled on CoS trusted ports. The CoS value that is written into the packet is based on the data stream’s traffic class. CoS rewriting is active by default.

The `no qos rewrite cos` command disables CoS rewriting on the switch. The default `qos rewrite cos` command restores the default setting of enabling CoS rewriting by removing the `no qos rewrite cos` command from `running-config`.

**Command Mode**
- Global Configuration

**Command Syntax**
- `qos rewrite cos`
- `no qos rewrite cos`
- `default qos rewrite cos`

**Related Commands**
- `qos map traffic-class to cos` configures the traffic class to CoS rewrite map.

**Example**
- This command enables CoS rewrite.

```
switch(config)#qos rewrite cos
switch(config)#
```
**qos rewrite dscp**

The `qos rewrite dscp` command enables the rewriting of the DSCP field for outbound tagged packets that were received on CoS trusted ports and untrusted ports. DSCP rewrite is always disabled on DSCP trusted ports. The DSCP value that is written into the packet is based on the data stream’s traffic class. DSCP rewriting is disabled by default.

The `no qos rewrite dscp` and `default qos rewrite dscp` commands disable DSCP rewriting on the switch by removing the `no qos rewrite dscp` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
qos rewrite dscp
no qos rewrite dscp
default qos rewrite dscp
```

**Related Commands**

- `qos map traffic-class to dscp` configures the traffic class to DSCP rewrite map.

**Example**

- This command enables DSCP rewrite.
  ```
  switch(config)#qos rewrite dscp
  switch(config)#
  ```
random-detect ecn (Arad/Jericho)

The random-detect ecn command enables ECN marking for the configuration mode unicast transmit queue and specifies threshold queue sizes. Hosts can advertise their ECN capabilities in the ToS DiffServ field’s two least significant bits:

- 00  Non ECN Capable transport.
- 10  ECN Capable transport.
- 01  ECN Capable transport.
- 11  Congestion encountered.

Congestion is determined by comparing average queue size with queue thresholds. Average queue size is calculated through a formula based on the previous average and current queue size. Packets are marked based on this average size and the specified thresholds:

- Average queue size below minimum threshold: Packets are queued normally.
- Average queue size above maximum threshold: Packets are marked *congestion encountered*.
- Average queue size between minimum and maximum thresholds. Packets are queued or marked *congestion encountered*. The proportion of marked packets varies linearly with average queue size:
  - 0% are marked when average queue size is less than or equal to minimum threshold.
  - 100% are marked when average queue size is greater than or equal to maximum threshold.

When transmitted packets are marked *Non ECN Capable*, congestion packets are dropped, not marked.

The `no random-detect ecn` and `default qos random-detect ecn` commands disables ECN marking for the shared buffer by removing the `qos random-detect ecn` command from *running-config*.

**Command Mode**

 Tx-Queue configuration

**Command Syntax**

```
random-detect ecn minimum-threshold \texttt{MIN} maximum-threshold \texttt{MAX}
```

```
no random-detect ecn
default random-detect ecn
```

**Parameters**

`\texttt{MIN}` and `\texttt{MAX}` parameters must use the same data unit.

- `\texttt{MIN}` Minimum threshold. Options include:
  - `<\texttt{1 to 256}> mbytes` Megabyte units
  - `<\texttt{1 to 256000}> kbytes` Kilobyte units
  - `<\texttt{1 to 256000000}> bytes` Byte units

- `\texttt{MAX}` Maximum threshold. Options include:
  - `<\texttt{1 to 256}> mbytes` Megabyte units
  - `<\texttt{1 to 256000}> kbytes` Kilobyte units
  - `<\texttt{1 to 256000000}> bytes` Byte units

**Related Commands**

- `tx-queue (Arad/Jericho)` places the switch in tx-queue configuration mode.
Examples

- These commands enable ECN marking of unicast packets from unicast transmit queue 4 of Ethernet interface 3/5/1, setting thresholds at 128 kbytes and 1280 kbytes.

```
switch(config)#interface ethernet 3/5/1
switch(config-if-Et3/5/1)#tx-queue 4
switch(config-if-Et3/5/1-txq-4)#random-detect ecn minimum-threshold 128 kbytes maximum-threshold 1280 kbyte
switch(config-if-Et3/5/1-txq-4)#show active
interface Ethernet3/5/1
  tx-queue 4
    random-detect ecn minimum-threshold 128 kbytes maximum-threshold 1280 kbytes
switch(config-if-Et3/5/1-txq-4)#
```
random-detect ecn (Helix)

The random-detect ecn command enables ECN marking for the configuration mode unicast transmit queue and specifies threshold queue sizes. Hosts can advertise their ECN capabilities in the ToS DiffServ field’s two least significant bits:

- 00 Non ECN Capable transport.
- 10 ECN Capable transport.
- 01 ECN Capable transport.
- 11 Congestion encountered.

Congestion is determined by comparing average queue size with queue thresholds. Average queue size is calculated through a formula based on the previous average and current queue size. Packets are marked based on this average size and the specified thresholds:

- Average queue size below minimum threshold: Packets are queued normally.
- Average queue size above maximum threshold: Packets are marked congestion encountered.
- Average queue size between minimum and maximum thresholds. Packets are queued or marked congestion encountered. The proportion of marked packets varies linearly with average queue size:
  - 0% are marked when average queue size is less than or equal to minimum threshold.
  - 100% are marked when average queue size is greater than or equal to maximum threshold.

When transmitted packets are marked Non ECN Capable, congestion packets are dropped, not marked.

Average queue length is tracked for transmit queues and the global pool independently. When either entity reaches its maximum threshold, all subsequent packets are marked.

The no random-detect ecn and default random-detect ecn commands disable ECN marking on the configuration mode queue, deleting the corresponding random-detect ecn command from running-config.

Command Mode
TxC-Queue configuration

Command Syntax
random-detect ecn minimum-threshold MIN maximum-threshold MAX
no random-detect ecn
default random-detect ecn

Related Commands
- tx-queue (Helix) places the switch in tx-queue configuration mode.
- qos random-detect ecn global-buffer (Helix) enables ECN marking for globally shared packet memory.

Parameters
MIN and MAX parameters must use the same data unit.

- **MIN** Minimum threshold. Options include:
  - <1 to 46080> segments 208-byte segments units
  - <1 to 9> mbytes Megabyte units
  - <1 to 9584> kbytes Kilobyte units
• <1 to 9584640> bytes Byte units

• MAX Maximum threshold. Options include:
  • <1 to 46080> segments 208-byte segments units
  • <1 to 9> mbytes Megabyte units
  • <1 to 9584> kbytes Kilobyte units
  • <1 to 9584640> bytes Byte units

Examples
• These commands enable ECN marking of unicast packets from transmit queue 4 of Ethernet interface 15, setting thresholds at 10 and 100 segments.

  switch(config)#interface ethernet 15
  switch(config-if-Et15)#uc-tx-queue 4
  switch(config-if-Et15-txq-4)#random-detect ecn minimum-threshold 10 segments
  maximum-threshold 100 segments
  switch(config-if-Et15-txq-4)#show active
  interface Ethernet15
  tx-queue 4
  random-detect ecn minimum-threshold 10 segments maximum-threshold 100 segments
  switch(config-if-Et15-txq-4)#exit
  switch(config-if-Et15)

• This command disables ECN marking of unicast packets from transmit queue 4 of Ethernet interface 15.

  switch(config-if-Et15-txq-4)#no random-detect ecn
  switch(config-if-Et15-txq-4)#show active
  interface Ethernet15
  switch(config-if-Et15-txq-4)#exit
  switch(config-if-Et15)#
random-detect ecn (Trident)

The **random-detect ecn** command enables ECN marking for the configuration mode unicast transmit queue and specifies threshold queue sizes. Hosts can advertise their ECN capabilities in the ToS DiffServ field’s two least significant bits:

- 00  Non ECN Capable transport.
- 10  ECN Capable transport.
- 01  ECN Capable transport.
- 11  Congestion encountered.

Congestion is determined by comparing average queue size with queue thresholds. Average queue size is calculated through a formula based on the previous average and current queue size. Packets are marked based on this average size and the specified thresholds:

- Average queue size below minimum threshold: Packets are queued normally.
- Average queue size above maximum threshold: Packets are marked *congestion encountered*.
- Average queue size between minimum and maximum thresholds. Packets are queued or marked *congestion encountered*. The proportion of marked packets varies linearly with average queue size:
  - 0% are marked when average queue size is less than or equal to minimum threshold.
  - 100% are marked when average queue size is greater than or equal to maximum threshold.

When transmitted packets are marked *Non ECN Capable*, congestion packets are dropped, not marked.

Average queue length is tracked for transmit queues and the global pool independently. When either entity reaches its maximum threshold, all subsequent packets are marked.

The **no random-detect ecn** and **default random-detect ecn** commands disable ECN marking on the configuration mode queue, deleting the corresponding **random-detect ecn** command from *running-config*.

**Command Mode**

Uc-Tx-Queue configuration

**Command Syntax**

```
random-detect ecn minimum-threshold MIN maximum-threshold MAX
no random-detect ecn
default random-detect ecn
```

**Related Commands**

- **uc-tx-queue** places the switch in uc-tx-queue configuration mode.
- **qos random-detect ecn global-buffer (Trident)** enables ECN marking for globally shared packet memory.

**Parameters**

*MIN* and *MAX* parameters must use the same data unit.

- **MIN**  Minimum threshold. Options include:
  - <1 to 46080> segments  208-byte segments units
  - <1 to 9> mbytes  Megabyte units
  - <1 to 9584> kbytes  Kilobyte units
•  <1 to 9584640> bytes  Byte units

•  MAX  Maximum threshold. Options include:
  •  <1 to 46080> segments  208-byte segments units
  •  <1 to 9> mbytes  Megabyte units
  •  <1 to 9584> kbytes  Kilobyte units
  •  <1 to 9584640> bytes  Byte units

**Examples**

•  These commands enable ECN marking of unicast packets from unicast transmit queue 4 of Ethernet interface 15, setting thresholds at 10 and 100 segments.

  switch(config)#interface ethernet 15
  switch(config-if-Et15)#uc-tx-queue 4
  switch(config-if-Et15-uc-txq-4)#random-detect ecn minimum-threshold 10 segments maximum-threshold 100 segments
  switch(config-if-Et15-uc-txq-4)#show active
    interface Ethernet15
      uc-tx-queue 4

  switch(config-if-Et15-uc-txq-4)#exit
  switch(config-if-Et15)#

•  This command disables ECN marking of unicast packets from unicast transmit queue 4 of Ethernet interface 15.

  switch(config-if-Et15-uc-txq-4)#no random-detect ecn
  switch(config-if-Et15-uc-txq-4)#show active
    interface Ethernet15
  switch(config-if-Et15-uc-txq-4)#exit
  switch(config-if-Et15)#
shape rate (Interface – Arad/Jericho)

The `shape rate` command specifies the maximum bandwidth for outbound traffic on the configuration mode interface, also known as queue shaping. The shape rate for individual transmit queues is configured by the `shape rate (Tx-queue – Arad/Jericho)` command. By default, outbound transmission rate is not bounded by a shape rate.

The `no shape rate` and `default shape rate` commands remove the shape rate bandwidth limit on the configuration mode interface by deleting the corresponding `shape rate` command from `running-config`.

Command Mode
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

Command Syntax
```
shape rate byte_limit [kbps]
no shape rate
default shape rate
```

Parameters
- `byte_limit` : shape rate applied to interface (Kbps). Value ranges from 162 to 100000000.

Example
- This command configures a port shape rate of 5 Gbps on Ethernet interface 3/5/1.

```
switch(config)#interface ethernet 3/5/1
switch(config-if-Et3/5/1)#shape rate 5000000
switch(config-if-Et3/5/1)#show qos interfaces ethernet 3/5/1
```

```
Ethernet3/5/1:
<--------OUTPUT OMITTED FROM EXAMPLE-------->
Port shaping rate: 5000012 / 5000000 kbps

<--------OUTPUT OMITTED FROM EXAMPLE-------->
```

```
switch(config-if-Et3/5/1)#
```
shape rate (Interface – FM6000)

The shape rate command specifies the maximum bandwidth for outbound traffic on the configuration mode interface, also known as queue shaping. The shape rate for individual transmit queues is configured by the shape rate (Tx-queue – FM6000) command. By default, outbound transmission rate is not bounded by a shape rate.

The no shape rate and default shape rate commands remove the shape rate bandwidth limit on the configuration mode interface by deleting the corresponding shape rate command from running-config.

Command Mode

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

Command Syntax

```
shape rate byte_limit [kbps]
no shape rate
default shape rate
```

Parameters

- `byte_limit` shape rate applied to interface (Kbps). Value ranges from 7000 to 10000000.

Guidelines

Enabling port shaping on an FM6000 interface disables queue shaping internally. Disabling port shaping restores queue shaping as specified in running-config.

Example

- This command configures a port shape rate of 5 Gbps on Ethernet interface 5.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# shape rate 5000000
switch(config-if-Et5)#
```
shape rate (Interface – Helix)

The `shape rate` command specifies the maximum bandwidth for outbound traffic on the configuration mode interface, also known as queue shaping. The shape rate for individual transmit queues is configured by the `shape rate (Tx-queue – Helix)` command. By default, outbound transmission rate is not bounded by a shape rate.

The `no shape rate` and `default shape rate` commands remove the shape rate bandwidth limit on the configuration mode interface by deleting the corresponding `shape rate` command from `running-config`.

Command Mode

Interface-Ethernet Configuration
Interface-Port-Channel Configuration

Command Syntax

- `shape rate DATA_LIMIT`
- `no shape rate`
- `default shape rate`

Parameters

- **DATA_LIMIT**  shape rate applied to interface. Value range varies with data unit:
  - `<8 to 40000000>`  8 to 40,000,000 kbytes per second.
  - `<8 to 40000000kbps>`  8 to 40,000,000 kbytes per second.
  - `<8 to 60000000pps>`  8 to 60,000,000 packets per second.

Guidelines

Shaping rates of at least 8 kbps are supported. At shaping rates smaller than 1 Mbps, granularity and rounding errors may skew the actual shaping rate by 20% from the specified rate.

Example

- This command configures a port shape rate of 5 Gbps on Ethernet interface 17.

```
switch(config)#interface ethernet 17
switch(config-if-Et17)#shape rate 5000000 kbps
switch(config-if-Et17)#show qos interface ethernet 17/3
Ethernet17:
   Trust Mode: COS
   Default COS: 0
   Default DSCP: 0

   Port shaping rate: 5000000 / 5000000 kbps

   Tx Queue Bandwidth Guaranteed (units) Shape Rate Guaranteed (units) Priority
   ----------- ------------------ ------------------ ------------------ --------
   7        - / -   ( - )      - / -   ( - )    SP / SP
   6        - / -   ( - )      - / -   ( - )    SP / SP
```

```
switch(config-if-Et17)#
```
**shape rate (Interface – Petra)**

The **shape rate** command specifies the maximum bandwidth for outbound traffic on the configuration mode interface, also known as queue shaping. The shape rate for individual transmit queues is configured by the **shape rate (Tx-queue – Petra)** command. By default, outbound transmission rate is not bounded by a shape rate.

The **no shape rate** and **default shape rate** commands remove the shape rate bandwidth limit on the configuration mode interface by deleting the corresponding **shape rate** command from **running-config**.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

**Command Syntax**

```
shape rate data_limit [kbps]
no shape rate
default shape rate
```

**Parameters**

- **data_limit** shape rate applied to interface (Kbps). Value ranges from 100 to 1000000.

**Guidelines**

The following port shaping rates are supported:

- 1G ports: above 100 kbps.
- 10G ports: above 7900 kbps.

Commands that specify a smaller shape rate disable port shaping on the interface.

**Example**

- This command configures a port shape rate of 5 Gbps on Ethernet interface 3/3.

```
switch(config)#interface ethernet 3/3
switch(config-if-Et3/3)#shape rate 5000000
switch(config-if-Et3/3)#show active
interface Ethernet3/3
  shape rate 5000000
switch(config-if-Et3/3)#
```
shape rate (Interface – Trident)

The **shape rate** command specifies the maximum bandwidth for outbound traffic on the configuration mode interface, also known as queue shaping. The shape rate for individual transmit queues is configured by the **shape rate (Tx-queues – Trident)** command. By default, outbound transmission rate is not bounded by a shape rate.

The **no shape rate** and **default shape rate** commands remove the shape rate bandwidth limit on the configuration mode interface by deleting the corresponding **shape rate** command from **running-config**.

Command Mode
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

Command Syntax
```
shape rate DATA_LIMIT
no shape rate
default shape rate
```

Parameters
- **DATA_LIMIT** shape rate applied to interface. Value range varies with data unit:
  - `<8 to 40000000>` 8 to 40,000,000 kbytes per second.
  - `<8 to 40000000>kbps` 8 to 40,000,000 kbytes per second.
  - `<8 to 60000000>pps` 8 to 60,000,000 packets per second.

Guidelines
Shaping rates of at least 8 kbps are supported. At shaping rates smaller than 1 Mbps, granularity and rounding errors may skew the actual shaping rate by 20% from the specified rate.

Example
- This command configures a port shape rate of 5 Gbps on Ethernet interface 5.
```
switch(config)#interface ethernet 5
switch(config-if-Et5)#shape rate 5000000
```
shape rate (Interface – Trident-II)

The `shape rate` command specifies the maximum bandwidth for outbound traffic on the configuration mode interface, also known as queue shaping. The shape rate for individual transmit queues is configured by the `shape rate (Tx-queue – Trident-II)` command. By default, outbound transmission rate is not bounded by a shape rate.

The `no shape rate` and `default shape rate` commands remove the shape rate bandwidth limit on the configuration mode interface by deleting the corresponding `shape rate` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

**Command Syntax**

```markdown
shape rate DATA_LIMIT
no shape rate
default shape rate
```

**Parameters**
- `DATA_LIMIT` shape rate applied to interface. Value range varies with data unit:
  - `<8 to 40000000>` 8 to 40,000,000 kbytes per second.
  - `<8 to 40000000-kbps` 8 to 40,000,000 kbytes per second.
  - `<8 to 60000000-pps` 8 to 60,000,000 packets per second.

**Guidelines**
Shaping rates of at least 8 kbps are supported. At shaping rates smaller than 1 Mbps, granularity and rounding errors may skew the actual shaping rate by 20% from the specified rate.

**Example**
- This command configures a port shape rate of 5 Gbps on Ethernet interface 17/3.

```bash
switch(config)#interface ethernet 17/3
switch(config-if-Et17/3)#shape rate 5000000 kbps
```

```

switch(config-if-Et17/3-txq-3)#
shape rate (Tx-queue – Petra)

The shape rate command specifies the maximum bandwidth for outbound traffic on the configuration mode transmit queue, also known as queue shaping. The shape rate for interfaces is configured by the shape rate (Interface – Petra) command. By default, the configured outbound transmission rate is not bounded by a transmit queue shape rate.

Queue shaping applies only to unicast traffic. Shaping rates of at least 162 Kbps are supported. The no shape rate and default shape rate commands remove the shape rate bandwidth limit on the configuration mode queue by deleting the corresponding shape rate command from running-config.

Command Mode

Tx-Queue Configuration

Command Syntax

- `shape rate DATA_LIMIT`
- `no shape rate`
- `default shape rate`

Parameters

- **DATA_LIMIT**  
  shape rate applied to the queue. Value range varies with data unit:
  - `<8 to 40000000>` 8 to 40,000,000 kbytes per second.
  - `<8 to 40000000>`kbps 8 to 40,000,000 kbytes per second.
  - `<8 to 60000000>`pps 8 to 60,000,000 packets per second.

Shaping rates greater than 460 kbps are supported. At lower shaping rates (less than 10 Mbps), granularity and rounding errors may skew the actual shaping rate by 20% from the specified rate.

Related Commands

- tx-queue (Petra) places the switch in tx-queue configuration mode
- shape rate (Interface – Petra) configures the shape rate for a configuration mode interface.
Example

- These commands configure a shape rate of 1 Gbps (1,000,000 Kbps) on transmit queues 3 and 4 of Ethernet interface 3/28.

```plaintext
switch(config)#interface ethernet 3/28
switch(config-if-Et3/28)#tx-queue 4
switch(config-if-Et3/28-txq-4)#shape rate 1000000
switch(config-if-Et3/28-txq-4)#tx-queue 3
switch(config-if-Et3/28-txq-3)#shape rate 1000000
switch(config-if-Et3/28-txq-3)#show qos interface ethernet 3/28

switch(config-if-Et3/28-txq-3)#
```
The `shape rate` command specifies the maximum bandwidth for outbound traffic on the configuration mode transmit queue, also known as queue shaping. The shape rate for interfaces is configured by the `shape rate (Interface – Trident)` command. By default, the configured outbound transmission rate is not bounded by a transmit queue shape rate.

The `no shape rate` and `default shape rate` commands remove the shape rate limit from the configuration mode transmit queue by deleting the corresponding `shape rate` command from `running-config`.

**Command Mode**
- Mc-Tx-Queue configuration
- Uc-Tx-Queue configuration

**Command Syntax**
```
shape rate DATA_LIMIT
no shape rate
default shape rate
```

**Parameters**
- `DATA_LIMIT` shape rate applied to the queue. Value range varies with data unit:
  - `<8 to 40000000>` 8 to 40,000,000 kbytes per second.
  - `<8 to 40000000>kbps` 8 to 40,000,000 kbytes per second.
  - `<8 to 60000000>pps` 8 to 60,000,000 packets per second.

**Related Commands**
- `mc-tx-queue` places the switch in mc-tx-queue configuration mode.
- `uc-tx-queue` places the switch in uc-tx-queue configuration mode.
- `shape rate (Interface – Trident)` configures the shape rate for a configuration mode interface.

**Guidelines**
Shaping rates of at least 8 kbps are supported. At shaping rates smaller than 1 Mbps, granularity and rounding errors may skew the actual shaping rate by 20% from the specified rate.

When two queues source traffic from the same traffic class and the higher priority queue is shaped, that queue consumes all internal buffers, starving the lower priority queue even if bandwidth is available.
Example

- These commands configure a shape rate of 1 Gbps (1,000,000 Kbps) on unicast transmit queues 3 and multicast transmit 4 of Ethernet interface 7.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#uc-tx-queue 3
switch(config-if-Et7-uc-txq-3)#shape rate 1000000
switch(config-if-Et7-uc-txq-3)#mc-tx-queue 2
switch(config-if-Et7-mc-txq-2)#shape rate 1000000
switch(config-if-Et7-mc-txq-2)#show qos interface ethernet 7
```

```
switch(config-if-Et17/3-txq-3)#
```
show platform petraA traffic-class

The **show platform petraA traffic-class** command displays the traffic class assignment on all specified Petra chips. Each chip controls eight Ethernet interfaces. The default traffic class of an interface is specified by the traffic class assigned to the chip that controls the interface.

Traffic class assignments are configured with the **platform petraA traffic-class** command.

Valid command options include:

- **show platform petraA traffic-class** traffic class of all chips on all linecard.
- **show platform petraA CHIP_NAME traffic-class** traffic class of specified chip.
- **show platform petraA MODULE_NAME traffic-class** traffic class of all chips on specified linecard.

**Command Mode**
EXEC

**Command Syntax**
```
show platform petraA traffic-class
show platform petraA CHIP_NAME traffic-class
show platform petraA MODULE_NAME traffic-class
```

**Parameters**

- **CHIP_NAME** Name of Petra chip on linecard that control Ethernet ports. Options include:
  - petracardX/chipY all ports on PetraA chip chipY on linecard cardX (7500 Series).
  - petra-chipZ all ports on PetraA chip chipZ (7048 Series)

**7500 Series**

Switches can contain up to eight linecards. cardX varies from 3 to 10.

Each linecard contains six PetraA chips. Each chip controls eight ports. chipY varies from 0 to 5:

- 0 controls ports 1 through 8
- 1 controls ports 9 through 16
- 2 controls ports 17 through 24
- 3 controls ports 25 through 32
- 4 controls ports 33 through 40
- 5 controls ports 41 through 48

**7048 Series**

Each switch contains two PetraA chips. chipZ varies from 0 to 1:

- 0 controls ports 1 through 32
- 1 controls ports 33 through 52

- **MODULE_NAME** Name and number of linecard (7500 Series). Options include:
  - module linecard mod_num. Linecard number (3 to 10).
  - module mod_num Linecard number (3 to 10).

**Related Commands**

- **platform petraA traffic-class** configures the default traffic class used by all ports on a specified chip
Example

- This command displays the traffic class of all chips on linecard 3.

```bash
switch#show platform petraA module linecard 3 traffic-class
Petra3/0 traffic-class: 1
Petra3/1 traffic-class: 1
Petra3/2 traffic-class: 1
Petra3/3 traffic-class: 1
Petra3/4 traffic-class: 5
Petra3/5 traffic-class: 1
switch#
```
show qos interfaces

The **show qos interfaces** command displays the QoS, DSCP, and transmit queue configuration on a specified interface. Information provided by this command includes the ports trust setting, the default CoS value, and the DSCP value.

**Command Mode**

EXEC

**Command Syntax**

```
show qos interfaces INTERFACE_NAME
```

**Parameters**

- **INTERFACE_NAME** Interface For which command returns data. Options include:
  - <no parameter> returns data for all interfaces.
  - **ethernet e_num** Ethernet interface specified by `e_num`.
  - **port-channel p_num** Port-Channel Interface specified by `p_num`.

**Examples**

- This command lists the QoS configuration for Ethernet interface 4.

  ```
switch>show qos interfaces ethernet 4
  Ethernet4:
  Trust Mode: COS
  Default COS: 0
  Default DSCP: 0
  Port shaping rate: 5000000Kbps
  
  Tx-Queue | Bandwidth | ShapeRate | Priority
  ------- | --------- | --------- | -----
  0      | 50        | disabled  | round-robin
  1      | 50        | disabled  | round-robin
  2      | N/A       | disabled  | strict
  3      | N/A       | 1000000   | strict
  4      | N/A       | 1000000   | strict
  5      | N/A       | 1500000   | strict
  6      | N/A       | 2000000   | strict
  
switch>
```
show qos interfaces random-detect ecn

The `show qos interfaces random-detect ecn` command displays the Explicit Congestion Notification (ECN) configuration for each transmit queue on the specified interfaces.

**Command Mode**

EXEC

**Command Syntax**

```
show qos interfaces [INTERFACE_NAME] random-detect ecn
```

**Parameters**

- `INTERFACE_NAME` Interface for which command returns data. Options include:
  - `<no parameter>` returns data for all interfaces.
  - `ethernet e_range` Ethernet interfaces specified by `e_range`.
  - `port-channel p_range` Port-Channel Interfaces specified by `p_range`.

**Examples**

- This command configures ECN parameters for transmit queues 0 through 3 on Ethernet interface 3/5/1, then displays that configuration.

```plaintext
switch(config)#interface ethernet 3/5/1
switch(config-if-Et3/5/1)#tx-queue 0
switch(config-if-Et3/5/1-txq-0)#random-detect ecn minimum-threshold 2560 kbytes maximum-threshold 256000 kbytes
switch(config-if-Et3/5/1-txq-0)#tx-queue 1
switch(config-if-Et3/5/1-txq-1)#random-detect ecn minimum-threshold 25600 kbytes maximum-threshold 128000 kbytes
switch(config-if-Et3/5/1-txq-1)#tx-queue 2
switch(config-if-Et3/5/1-txq-2)#random-detect ecn minimum-threshold 25600 bytes maximum-threshold 128000 bytes
switch(config-if-Et3/5/1-txq-2)#tx-queue 3
switch(config-if-Et3/5/1-txq-3)#random-detect ecn minimum-threshold 25 mbytes maximum-threshold 128 mbytes
switch(config-if-Et3/5/1-txq-3)#show qos interfaces ethernet 3/5/1 random-detect ecn
Ethernet3/5/1:
```

```

```
switch(config-if-Et3/5/1-txq-3)#
```
show qos maps

The `show qos maps` command lists the number of traffic classes that the switch supports and displays the CoS-Traffic Class, DSCP-Traffic Class, Traffic Class-CoS, and Traffic Class-Transmit Queue maps.

**Command Mode**

EXEC

**Command Syntax**

`show qos maps`

**Examples**

- This command displays the QoS maps that are configured on the switch.

```
switch>show qos maps
Number of Traffic Classes supported: 8
Number of Transmit Queues supported: 8
Cos Rewrite: Disabled
Dscp Rewrite: Disabled

Cos-tc map:
  cos: 0 1 2 3 4 5 6 7

  tx-queue: 0 1 2 3 4 5 6 7

switch>
```
show qos random-detect ecn

The `show qos random-detect ecn` command displays the global Explicit Congestion Notification (ECN) configuration.

**Command Mode**

EXEC

**Command Syntax**

`show qos random-detect ecn`

**Examples**

- These commands configure global ECN parameters, then displays that configuration.

```
switch(config)#qos random-detect ecn global-buffer minimum-threshold 2 mbytes maximum-threshold 5 mbytes
switch(config)#show qos random-detect ecn
 Minimum Threshold: 2
 Maximum Threshold: 5
 Threshold Unit: mbytes
```

`switch(config)#`
show qos interfaces trust

The **show qos interfaces trust** command displays the configured and operational QoS trust mode of all specified interfaces.

**Command Mode**

EXEC

**Command Syntax**

```text
show qos interfaces [INTERFACE_NAME] trust
```

**Parameters**

- **INTERFACE_NAME** Interface for which command returns data. Options include:
  - `<no parameter>` returns data for all interfaces.
  - `ethernet e_range` Ethernet interfaces specified by `e_range`.
  - `port-channel p_range` Port-Channel Interfaces specified by `p_range`.

**Examples**

- These commands configure a variety of QoS trust settings on a set of interfaces, then displays the QoS trust mode on these interfaces.

  ```text
  switch(config)#interface ethernet 1/1
  switch(config-if-Et1/1)#qos trust cos
  switch(config-if-Et1/1)#interface ethernet 1/2
  switch(config-if-Et1/2)#qos trust dscp
  switch(config-if-Et1/2)#interface ethernet 1/3

  Ethernet2/2                    COS                   DEFAULT
  Ethernet2/3                    COS                   DEFAULT
  Ethernet2/4                    COS                   DEFAULT
  ```

  ```text
  switch(config-if-Et2/1)#
  ```
tx-queue (Arad/Jericho)

The tx-queue command places the switch in Tx-queue configuration mode to configure a transmit queue on the configuration mode interface. Tx-queue configuration mode is not a group change mode; running-config is changed immediately after commands are executed. The exit command does not affect the configuration.

Arad and Jericho platform switches have eight queues, 0 through 7, and all queues are exposed through the CLI. However, queue 7 is not user-configurable. Queue 7 is always mapped to traffic class 7, which is reserved for control traffic.

The exit command returns the switch to the configuration mode for the base Ethernet or port channel interface.

The no tx-queue and default tx-queue commands remove the configuration for the specified transmit queue by deleting all corresponding tx-queue mode statements from running-config.

Command Mode

Interface-Ethernet Configuration
Interface-Port-Channel Configuration

Command Syntax

```
  tx-queue queue_level
```

Parameters

- `queue_level` the transmit queue. Values range from 0 to 6.

Commands Available in tx-queue Configuration Mode

- bandwidth percent (Arad/Jericho)
- priority (Arad/Jericho)
- shape rate (Tx-queue – Arad/Jericho)

Guidelines

Arad and Jericho platform switch queues handle unicast traffic. Queues for multicast traffic are not supported.

Example

- This command enters Tx-queue configuration mode for transmit queue 4 of Ethernet interface 3/3/3.

  ```
  switch(config)#interface ethernet 3/3/3
  switch(config-if-Et3/3/3)#tx-queue 4
  switch(config-if-Et3/3/3-txq-4)#
  ```
tx-queue (FM6000)

The tx-queue command places the switch in Tx-queue configuration mode to configure a transmit queue on the configuration mode interface. Tx-queue configuration mode is not a group change mode; running-config is changed immediately after commands are executed. The exit command does not affect the configuration.

FM6000 platform switches have eight queues, 0 through 7. All queues are exposed through the CLI and are user configurable.

The exit command returns the switch to the configuration mode for the base Ethernet or port channel interface.

The no tx-queue and default tx-queue commands remove the configuration for the specified transmit queue by deleting the all corresponding tx-queue mode commands from running-config.

Command Mode

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

Command Syntax

```
  tx-queue queue_level
```

Parameters

- `queue_level` the transmit queue. Values range from 0 to 7.

Commands Available in tx-queue Configuration Mode

- bandwidth percent (FM6000)
- priority (FM6000)
- shape rate (Tx-queue – FM6000)

Guidelines

FM6000 platform switch queues handle unicast and multicast traffic.

Example

- This command enters Tx-queue configuration mode for transmit queue 3 of Ethernet interface 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#tx-queue 3
switch(config-if-Et5-txq-3)#
```
tx-queue (Helix)

The tx-queue command places the switch in Tx-queue configuration mode to configure a transmit queue on the configuration mode interface. Tx-queue configuration mode is not a group change mode; running-config is changed immediately after commands are executed. The exit command does not affect the configuration.

Helix platform switches have eight unicast (UC0 – UC7) and eight multicast (MC0 – MC7) queues. Each UCx-MCx queue set is combined into a single queue group (L1.x), which is exposed to the CLI through this command.

The exit command returns the switch to the configuration mode for the base Ethernet or port channel interface.

The no tx-queue and default tx-queue commands remove the configuration for the specified transmit queue by deleting the all corresponding tx-queue mode commands from running-config.

Command Mode

Interface-Ethernet Configuration
Interface-Port-Channel Configuration

Command Syntax

```
rx-queue queue_level
```

Parameters

- **queue_level**  transmit queue group number. Values range from 0 to 7.

Commands Available in tx-queue Configuration Mode

- bandwidth guaranteed (Helix)
- shape rate (Tx-queue – Helix)

Guidelines

Helix platform switch queues handle unicast and multicast traffic.

Example

- This command enters Tx-queue configuration mode for transmit queue 4 of Ethernet interface 17/3.

  ```
  switch(config)#interface ethernet 17/3
  switch(config-if-Et17/3)#tx-queue 4
  switch(config-if-Et17/3-txq-4)#
  ```
tx-queue (Petra)

The `tx-queue` command places the switch in Tx-queue configuration mode to configure a transmit queue on the configuration mode interface. Tx-queue configuration mode is not a group change mode; `running-config` is changed immediately after commands are executed. The `exit` command does not affect the configuration.

Petra platform switches have eight queues, 0 through 7, and all queues are exposed through the CLI. However, queue 7 is not user-configurable. Queue 7 is always mapped to traffic class 7, which is reserved for control traffic.

The `exit` command returns the switch to the configuration mode for the base Ethernet or port channel interface.

The `no tx-queue` and `default tx-queue` commands remove the configuration for the specified transmit queue by deleting the all corresponding `tx-queue` mode commands from `running-config`.

### Command Mode

| Interface-Ethernet Configuration |
| Interface-Port-Channel Configuration |

### Command Syntax

```
    tx-queue queue_level
```

### Parameters

- `queue_level` the transmit queue. Values range from 0 to 6.

### Commands Available in tx-queue Configuration Mode

- `bandwidth percent (Petra)`
- `priority (Petra)`
- `shape rate (Tx-queue – Petra)`

### Guidelines

Petra platform switch queues handle unicast traffic. Queues for multicast traffic are not supported.

### Example

- This command enters Tx-queue configuration mode for transmit queue 3 of Ethernet interface 3/3.

```bash
switch(config)#interface ethernet 3/3
switch(config-if-Et3/3)#tx-queue 3
switch(config-if-Et3/3-txq-3)#
```
**tx-queue (Trident-II)**

The **tx-queue** command places the switch in Tx-queue configuration mode to configure a transmit queue on the configuration mode interface. Tx-queue configuration mode is not a group change mode; **running-config** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

Trident-II platform switches have eight unicast (UC0 – UC7) and eight multicast (MC0 – MC7) queues. Each UCx-MCx queue set is combined into a single queue group (L1.x), which is exposed to the CLI through this command.

The **exit** command returns the switch to the configuration mode for the base Ethernet or port channel interface.

The **no tx-queue** and **default tx-queue** commands remove the configuration for the specified transmit queue by deleting the all corresponding **tx-queue** mode commands from **running-config**.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

**Command Syntax**

```
  tx-queue  queue_level
```

**Parameters**

- **queue_level** transmit queue group number. Values range from 0 to 7.

**Commands Available in tx-queue Configuration Mode**

- **bandwidth guaranteed (Trident-II)**
- **shape rate (Tx-queue – Trident-II)**

**Guidelines**

Trident-II platform switch queues handle unicast and multicast traffic.

**Example**

- This command enters Tx-queue configuration mode for transmit queue 4 of Ethernet interface 17/3.

```
switch(config)#interface ethernet 17/3
switch(config-if-Et17/3)#tx-queue 4
switch(config-if-Et17/3-txq-4)#
```
uc-tx-queue

The **uc-tx-queue** command places the switch in uc-tx-queue configuration mode to configure a unicast transmit queue on the configuration mode interface. Uc-tx-queue configuration mode is not a group change mode; **running-config** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

Trident switches have eight unicast queues (UC0 – UC7) and four multicast queues (MC0 – MC03), categorized into two priority groups. All queues are exposed through the CLI and are user-configurable.

- Priority Group 1: UC7, UC6, MC3
- Priority Group 0: UC5, UC4, MC2, UC3, UC2, MC1, UC1, UC0, MC0

The **exit** command returns the switch to the configuration mode for the base Ethernet or port channel interface.

The **no uc-tx-queue** and **default uc-tx-queue** commands remove the configuration for the specified transmit queue by deleting the all corresponding **uc-tx-queue** mode commands from **running-config**.

### Command Mode

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

### Command Syntax

**uc-tx-queue queue_level**

### Parameters

- **queue_level** The multicast transmit queue number. Values range from 0 to 7.

### Commands Available in uc-tx-queue Configuration Mode

- **bandwidth percent** (Trident)
- **priority** (Trident)
- **shape rate** (Tx-queues – Trident)

### Related Commands

- **mc-tx-queue**: Configures multicast transmit queues on Trident platform switches.

### Example

- This command enters mc-tx-queue configuration mode for multicast transmit queue 3 of Ethernet interface 5.

  ```bash
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#uc-tx-queue 4
  switch(config-if-Et5-mc-txq-4)#
  ```
Chapter 24

IPv4

Arista switches support Internet Protocol version 4 (IPv4) and Internet Protocol version 6 (IPv6) for routing packets across network boundaries. This chapter describes Arista’s implementation of IPv4 and includes these sections:

- Section 24.1: IPv4 Addressing
- Section 24.2: IPv4 Routing
- Section 24.3: IPv4 Multicast Counters
- Section 24.4: Route Management
- Section 24.5: IPv4 Route Scale
- Section 24.6: IP Source Guard
- Section 24.7: DHCP Relay Across VRF
- Section 24.8: IP NAT
- Section 24.9: IPv4 Command Descriptions

24.1 IPv4 Addressing

Each IPv4 network device is assigned a 32-bit IP address that identifies its network location. These sections describe IPv4 address formats, data structures, configuration tasks, and display options:

- Section 24.1.1: IPv4 Address Formats
- Section 24.1.2: IPv4 Address Configuration
- Section 24.1.3: Address Resolution Protocol (ARP)
- Section 24.2.4: Viewing IPv4 Routes and Network Components

24.1.1 IPv4 Address Formats

IPv4 addresses are composed of 32 bits, expressed in dotted decimal notation by four decimal numbers, each ranging from 0 to 255. A subnet is identified by an IP address and an address space defined by a routing prefix. The switch supports the following subnet formats:

- **IP address and subnet mask**: The subnet mask is a 32-bit number (dotted decimal notation) that specifies the subnet address space. The subnet address space is calculated by performing an AND operation between the IP address and subnet mask.

- **IP address and wildcard mask**: The wildcard mask is a 32-bit number (dotted decimal notation) that specifies the subnet address space. Wildcard masks differ from subnet masks in that the bits are inverted. Some commands use wildcard masks instead of subnet masks.
• **CIDR notation:** CIDR notation specifies the scope of the subnet space by using a decimal number to identify the number of leading ones in the routing prefix. When referring to wildcard notation, CIDR notation specifies the number of leading zeros in the routing prefix.

**Example**

• These subnets (subnet mask and CIDR notation) are calculated identically:

  10.24.154.13 255.255.255.0  
  10.24.154.13/24  

The defined space includes all addresses between **10.24.154.0** and **10.24.154.255**.

• These subnets (wildcard mask and CIDR notation) are calculated identically:

  124.17.3.142 0.0.0.15  
  124.17.3.142/28  

The defined space includes all addresses between **124.17.3.128** and **124.17.3.143**.

### 24.1.2 IPv4 Address Configuration

**Assigning an IPv4 Address to an Interface**

The `ip address` command specifies the IPv4 address of an interface and the mask for the subnet to which the interface is connected.

**Example**

• These commands configure an IPv4 address with subnet mask for VLAN 200:

  ```
  switch(config)#interface vlan 200
  switch(config-if-Vl200)#ip address 10.0.0.1/24
  switch(config-if-Vl200)#
  ```

### 24.1.3 Address Resolution Protocol (ARP)

Address Resolution Protocol (ARP) is a protocol that maps IP addresses to MAC addresses that local network devices recognize. The ARP cache is a table that stores the correlated addresses of the devices for which the router facilitates data transmissions.

After receiving a packet, routers use ARP to find the MAC address of the device assigned to the packet’s destination IP address. If the ARP cache contains both addresses, the router sends the packet to the specified port. If the ARP cache does not contain the addresses, ARP broadcasts a request packet to all devices in the subnet. The device at the requested IP address responds and provides its MAC address. ARP updates the ARP cache with a dynamic entry and forwards the packet to the responding device. Static ARP entries can also be added to the cache through the CLI.

Proxy ARP is an ARP variant. A network device (proxy) responds to ARP requests for network addresses on a different network with its MAC address. Traffic to the destination is directed to the proxy device which then routes the traffic toward the ultimate destination.

**Configuring ARP**

The switch uses ARP cache entries to correlate 32-bit IP addresses to 48-bit hardware addresses. The `arp timeout` command specifies the duration of dynamic address entries in the Address Resolution Protocol (ARP) cache for addresses learned through the layer 3 interface. The default duration is 14400 seconds (four hours).

Static ARP entries never time out and must be removed from the table manually.
Example

- This command specifies an ARP cache duration of 7200 seconds (two hours) for dynamic addresses added to the ARP cache that were learned through VLAN 200.

  switch(config)#interface vlan 200
  switch(config-if-Vl200)#arp timeout 7200
  interface Vlan200
  arp timeout 7200
  switch(config-if-Vl200)#

The `arp` command adds a static entry to an Address Resolution Protocol (ARP) cache.

Example

- This command adds a static entry to the ARP cache in the default VRF.

  switch(config)#arp 172.22.30.52 0025.900e.c63c arpa
  switch(config)#

Displaying ARP Entries

The `show ip arp` command displays ARP cache entries that map an IP address to a corresponding MAC address. The table displays addresses by their host names when the command includes the `resolve` argument.

Example

- This command displays ARP cache entries that map MAC addresses to IPv4 addresses.

  switch>show ip arp

switch>
24.1.3.1 ARP Inspection

Address Resolution Protocol (ARP) inspection command `ip arp inspection vlan` activates a security feature that protects the network from ARP spoofing. ARP requests and responses on untrusted interfaces are intercepted on specified VLANs, and intercepted packets are verified to have valid IP-MAC address bindings. All invalid ARP packets are dropped. On trusted interfaces, all incoming ARP packets are processed and forwarded without verification.

Enabling and Disabling ARP Inspection

By default, ARP inspection is disabled on all VLANs.

Examples

- This command enables ARP inspection on VLANs 1 through 150.
  ```
  switch(config)#ip arp inspection vlan 1 - 150
  switch(config)#
  ```

- This command disables ARP inspection on VLANs 1 through 150.
  ```
  switch(config)#no ip arp inspection vlan 1 - 150
  switch(config)#
  ```

- This command sets the ARP inspection default to VLANs 1 through 150.
  ```
  switch(config)#default ip arp inspection vlan 1 - 150
  switch(config)#
  ```

- These commands enable ARP inspection on multiple VLANs 1 through 150 and 200 through 250.
  ```
  switch(config)#ip arp inspection vlan 1-150,200-250
  switch(config)#
  ```

Syslog for Invalid ARP Packets Dropped

When an invalid ARP packet is dropped, the following syslog message appears. The log severity level can be set higher if required.

```
%SECURITY-4-ARP_PACKET_DROPPED: Dropped ARP packet on interface Ethernet28/1 Vlan 2121 because invalid mac and ip binding. Received: 00:0a:00:bc:00:de/1.1.1.1.
```

Displaying ARP Inspection States

The command `show ip arp inspection vlan` displays the configuration and operation state of ARP inspection. For a VLAN range specified by `show ip arp inspection vlan` only VLANs with ARP inspection enabled will be displayed. If no VLAN is specified, all VLANs with ARP inspection enabled are displayed. The operation state turns to `Active` when hardware is ready to trap ARP packets for inspection.
Example

- This command displays the configuration and operation state of ARP inspection for VLANs 1 through 150.

  ```
  switch(config)#show ip arp inspection vlan 1 - 150
  VLAN 1
  -----------
  Configuration : Enabled
  Operation State : Active
  VLAN 2
  -----------
  Configuration : Enabled
  Operation State : Active
  {...}
  VLAN 150
  -----------
  Configuration : Enabled
  Operation State : Active
  ```

  switch(config)#

Displaying ARP Inspection Statistics

The command `show ip arp inspection statistics` displays the statistics of inspected ARP packets. For a VLAN specified by `show ip arp inspection vlan` only VLANs with ARP inspection enabled will be displayed. If no VLAN is specified, all VLANs with ARP inspection enabled are displayed.

The command `clear ip arp inspection statistics` clears ARP inspection.

Examples

- This command displays ARP inspection statistics for VLAN 1.

  ```
  switch(config)#show ip arp inspection statistics vlan 2
  Vlan : 2
  -----------
  ARP Req Forwarded = 20
  ARP Res Forwarded = 20
  ARP Req Dropped = 1
  ARP Res Dropped = 1

  Last invalid ARP:
  Time: 10:20:30 ( 5 minutes ago )
  Reason: Bad IP/Mac match
  Received on: Ethernet 3/1
  Packet:
  Source MAC: 00:01:00:01:00:01
  Dest MAC: 00:02:00:02:00:02
  ARP Type: Request
  ARP Sender MAC: 00:01:00:01:00:01
  ARP Sender IP: 1.1.1
  ```

  switch(config)#
This command displays ARP inspection statistics for Ethernet interface 3/1.

```
switch(config)#show ip arp inspection statistics ethernet interface 3/1
Interface : 3/1
---------
ARP Req Forwarded = 10
ARP Res Forwarded = 10
ARP Req Dropped = 1
ARP Res Dropped = 1

Last invalid ARP:
  Time: 10:20:30 ( 5 minutes ago )
  Reason: Bad IP/Mac match
  Received on: VLAN 10
  Packet:
    Source MAC: 00:01:00:01:00:01
    Dest MAC: 00:02:00:02:00:02
    ARP Type: Request
    ARP Sender MAC: 00:01:00:01:00:01
    ARP Sender IP: 1.1.1.1

switch(config) #
```

This command clears ARP inspection statistics.

```
switch(config)#clear ip arp inspection statistics
switch(config) #
```

**Configure Trust Interface**

By default, all interfaces are untrusted. The command `ip arp inspection trust` configures the trust state of an interface.

**Examples**

- This command configures the trust state of an interface.
  ```
switch(config)#ip arp inspection trust
switch(config) #
  ```

- This command configures the trust state of an interface to untrusted.
  ```
switch(config)#no ip arp inspection trust
switch(config) #
  ```

- This command configures the trust state of an interface to its default (untrusted).
  ```
switch(config)#default ip arp inspection trust
switch(config) #
  ```

**Configure Rate Limit**

When ARP inspection is enabled, ARP packets are trapped to the CPU. Two actions can be taken when the incoming ARP rate exceeds expectation. For notification purpose, the command `ip arp inspection logging` will enable logging of the incoming ARP packets. To prevent a denial-of-service attack, the command `ip arp inspection limit` will error-disable interfaces.
Examples

- This command enables logging of incoming ARP packets when its rate exceeds the configured value, and sets the rate to 2048 (which is the upper limit for the number of invalid ARP packets allowed per second), and sets the burst consecutive interval over which the interface is monitored for a high ARP rate to 15 seconds.

```
switch(config)#ip arp inspection logging rate 2048 burst interval 15
```

- This command configures the rate limit of incoming ARP packets to errdisable the interface when the incoming ARP rate exceeds the configured value, sets the rate to 512 (which is the upper limit for the number of invalid ARP packets allowed per second), and sets the burst consecutive interval over which the interface is monitored for a high ARP rate to 11 seconds.

```
switch(config)#ip arp inspection limit rate 512 burst interval 11
```

- This command displays verification of the interface specific configuration.

```
switch(config)#interface Ethernet 3 / 1
switch(config)#ip arp inspection limit rate 20 burst interval 5
switch(config)#interface Ethernet 3 / 3
switch(config)#ip arp inspection trust
switch(config)#show ip arp inspection interfaces

<table>

<td>None</td>
<td>N/A</td>
<td></td>
</tr>
</tbody>
</table>
```

Configure Errdisable Caused by ARP Inspection

If the incoming ARP packet rate on an interface exceeds the configured rate limit in burst interval, the interface will be errdisabled (by default). If errdisabled, the interface will stay in this state until you intervene with the command `errdisable detect cause arp-inspection` (e.g., after you perform a `shutdown` or `no shutdown` of the interface) or it automatically recovers after a certain time period. The command `errdisable recovery cause arp-inspection` will enable auto recovery. The command `errdisable recovery interval` will enable sharing the auto recovery interval among all errdisable interfaces. (See the chapter “Data Transfer” for information on all `errdisable` commands.

Examples

- This command enables errdisable caused by an ARP inspection violation.

```
switch(config)#errdisable detect cause arp-inspection
```

- This command disables errdisable caused by an ARP inspection violation.

```
switch(config)#no errdisable detect cause arp-inspection
```

- This command enables auto recovery.

```
switch(config)#errdisable recovery cause arp-inspection
```

- This command disables auto recovery.

```
switch(config)#no errdisable recovery cause arp-inspection
```

---

1329
- This command enables sharing the auto recovery interval of 10 seconds among all errdisable interfaces.

```
switch(config)#errdisable recovery interval 10
```

- This command disables sharing the auto recovery interval of 10 seconds among all errdisable interfaces.

```
switch(config)#no errdisable recovery interval 10
```

- This command displays the reason for a port entering the errdisable state.

```
switch(config)#show interfaces status errdisabled
```

## Configure Static IP MAC Binding

The ARP inspection command **ip source binding** allows users to add static IP-MAC binding. If enabled, ARP inspection verifies incoming ARP packets based on the configured IP-MAC bindings. The static IP-MAC binding entry can only be configured on Layer 2 ports. By default, there is no binding entry on the system.

### Examples

- This command configures static IP-MAC binding for IP address 127.0.0.1, MAC address 0001.0001.0001, VLAN 1, and Ethernet interface slot 4 and port 1.

```
switch(config)#ip source binding 127.0.0.1 0001.0001.0001 vlan 1 interface ethernet 4/1
```

- This command configures static IP-MAC binding for IP address 127.0.0.1, MAC address 0001.0001.0001, VLAN 1, and port-channel interface 20.

```
switch(config)#ip source binding 127.0.0.1 0001.0001.0001 vlan 1 interface port-channel 20
```

- This command displays the configured IP-MAC binding entries. Note that the Lease column is mainly used for displaying dynamic DHCP snooping binding entries. For static binding entries, lease time is shown as infinite.

```
switch(config)#show ip source binding 127.0.0.1 0001.0001.0001 static vlan 1 interface port-channel 20
```

24.2 IPv4 Routing

Internet Protocol version 4 (IPv4) is a communications protocol used for relaying network packets across a set of connected networks using the Internet Protocol suite. Routing transmits network layer data packets over connected independent subnets. Each subnet is assigned an IP address range and each device on the subnet is assigned an IP address from that range. The connected subnets have IP address ranges that do not overlap.

A router is a network device that connects multiple subnets. Routers forward inbound packets to the subnet whose address range includes the packets' destination address. IPv4 and IPv6 are internet layer protocols that define packet-switched internetworking, including source-to-destination datagram transmission across multiple networks.

These sections describe IPv4 routing and route creation options:

- Section 24.2.1: Enabling IPv4 Routing
- Section 24.2.2: Static and Default IPv4 Routes
- Section 24.2.3: Dynamic IPv4 Routes
- Section 24.2.4: Viewing IPv4 Routes and Network Components

24.2.1 Enabling IPv4 Routing

When IPv4 routing is enabled, the switch attempts to deliver inbound packets to destination IPv4 addresses by forwarding them to interfaces or next hop addresses specified by the forwarding table.

The `ip routing` command enables IPv4 routing.

**Example**

- This command enables IP routing:

```
switch(config)# ip routing
switch(config)#
```

24.2.2 Static and Default IPv4 Routes

Static routes are entered through the CLI and are typically used when dynamic protocols are unable to establish routes to a specified destination prefix. Static routes are also useful when dynamic routing protocols are not available or appropriate. Creating a static route associates a destination IP address with a local interface. The routing table refers to these routes as *connected* routes that are available for redistribution into routing domains defined by dynamic routing protocols.

The `ip route` command creates a static route. The destination is a network segment; the nexthop is either an IP address or a routable interface port. When multiple routes exist to a destination prefix, the route with the lowest administrative distance takes precedence.

By default, the administrative distance assigned to static routes is 1. Assigning a higher administrative distance to a static route configures it to be overridden by dynamic routing data. For example, a static route with a distance value of 200 is overridden by OSPF intra-area routes, which have a default distance of 110.

A route tag is a 32-bit number that is attached to a route. Route maps use tags to filter routes. Static routes have a default tag value of 0.

**Example**

- This command creates a static route:

```
switch(config)# ip route 172.17.252.0/24 vlan 500
switch(config)#
```
Creating Default IPv4 Routes

The default route denotes the packet forwarding rule that takes effect when no other route is configured for a specified IPv4 address. All packets with destinations that are not established in the routing table are sent to the destination specified by the default route.

The IPv4 destination prefix is 0.0.0.0/0 and the next-hop is the default gateway.

Example

- This command creates a default route and establishes 192.14.0.4 as the default gateway address:
  ```
  switch(config)#ip route 0.0.0.0/0 192.14.0.4
  switch(config)#
  ```

24.2.3 Dynamic IPv4 Routes

Dynamic routes are established by dynamic routing protocols. These protocols also maintain the routing table and modify routes to adjust for topology or traffic changes. Routing protocols assist the switch in communicating with other devices to exchange network information, maintaining routing tables, and establishing data paths.

The switch supports these dynamic IPv4 routing protocols:

- Open Shortest Path First – Version 2
- Border Gateway Protocol (BGP)
- Routing Information Protocol
- IS-IS

24.2.4 Viewing IPv4 Routes and Network Components

Displaying the FIB and Routing Table

The `show ip route` command displays routing table entries that are in the forwarding information base (FIB), including static routes, routes to directly connected networks, and dynamically learned routes. Multiple equal-cost paths to the same prefix are displayed contiguously as a block, with the destination prefix displayed only on the first line.

The `show running-config` command displays configured commands not in the FIB. The `show ip route summary` command displays the number of routes, categorized by source, in the routing table.
Examples

- This command displays IP routes learned through BGP.

  ```
  switch>show ip route bgp
  Codes: C - connected, S - static, K - kernel,
  O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
  E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
  N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
  R - RIP, A - Aggregate
  B E    170.44.48.0/23 [20/0] via 170.44.254.78
  B E    170.44.50.0/23 [20/0] via 170.44.254.78
  B E    170.44.52.0/23 [20/0] via 170.44.254.78
  B E    170.44.54.0/23 [20/0] via 170.44.254.78
  B E    170.44.254.112/30 [20/0] via 170.44.254.78
  B I    170.53.0.34/32 [1/0] via 170.44.254.78
  via 170.44.254.13
  via 170.44.254.20
  via 170.44.254.67
  via 170.44.254.35
  via 170.44.254.98
  ```

- This command displays a summary of routing table contents.

  ```
  switch>show ip route summary
  Route Source         Number Of Routes
  ---------------------
  connected                   15
  static                       0
  ospf                        74
    Intra-area: 32 Inter-area:33 External-1:0 External-2:9
    NSSA External-1:0 NSSA External-2:0
  bgp                          7
    External: 6 Internal: 1
  internal                    45
  attached                    18
  aggregate                   0
  ```

Displaying the IP Route Age

The `show ip route age` command displays the current state of the routing table and specifies the last time the route was updated.

Example

- This command displays the amount of time since the last update to ip route 172.17.0.0/20.

  ```
  switch>show ip route 172.17.0.0/20 age
  Codes: C - connected, S - static, K - kernel,
  O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
  E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
  N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
  R - RIP, I - ISIS, A - Aggregate
  B E    172.17.0.0/20 via 172.25.0.1, age 3d01h
  ```
Displaying Gateways
A gateway is a router that provides access to another network. The gateway of last resort, also known as the default route, is the route that a packet uses when the route to its destination address is unknown. The IPv4 default route is 0.0.0.0/0.

The `show ip route gateway` command displays IP addresses of all gateways (next hops) used by active routes.

Example
- This command displays next hops used by active routes.

  ```
  switch>show ip route gateway
  The following gateways are in use:
  172.25.0.1 Vlan101
  172.17.253.2 Vlan2000
  172.17.254.2 Vlan2201
  172.17.254.11 Vlan2302
  172.17.254.13 Vlan2302
  172.17.254.17 Vlan2303
  172.17.254.20 Vlan2303
  172.17.254.66 Vlan2418
  172.17.254.67 Vlan2418
  172.17.254.68 Vlan2768
  172.17.254.29 Vlan3020
  switch>
  ```

Displaying Host Routes
The `show ip route host` command displays all host routes in the host forwarding table. Host routes are those whose destination prefix is the entire address (mask = 255.255.255.255 or prefix = /32). Each displayed host route is labeled with its purpose:

- **F** static routes from the FIB.
- **R** routes defined because the IP address is an interface address.
- **B** broadcast address.
- **A** routes to any neighboring host for which the switch has an ARP entry.
Example

- This command displays all host routes in the host forwarding table.

```plaintext
switch# show ip route host
R - receive B - broadcast F - FIB, A - attached

F  127.0.0.1 to cpu
B  172.17.252.0 to cpu
A  172.17.253.2 on Vlan2000
R  172.17.253.3 to cpu
A  172.17.253.10 on Vlan2000
R  172.17.254.1 to cpu
A  172.17.254.2 on Vlan2901
B  172.17.254.3 to cpu
B  172.17.254.8 to cpu
A  172.17.254.11 on Vlan2902
R  172.17.254.12 to cpu

F  172.26.0.28 via 172.17.254.20 on Vlan3003
   via 172.17.254.67 on Vlan3008
   via 172.17.254.98 on Vlan3492
via 172.17.254.86 on Vlan3884
   via 172.17.253.2 on Vlan3000
F  172.26.0.29 via 172.25.0.1 on Vlan101
F  172.26.0.30 via 172.17.254.29 on Vlan3910
F  172.26.0.31 via 172.17.254.33 on Vlan3911
F  172.26.0.32 via 172.17.254.105 on Vlan3912
switch#
```
24.3 IPv4 Multicast Counters

IPv4 multicast counters allow association of IPv4 multicast routes with a packet or byte counter.

This chapter contains the following sections.

- Section 24.3.1: Multicast Counters Hardware Overview
- Section 24.3.2: Multicast Counters iBGP and eBGP Configuration
- Section 24.3.3: Multicast Counters CLI

24.3.1 Multicast Counters Hardware Overview

This section describes a hardware overview for multicast counters, and contains the following sections.

- Section 24.3.1.1: Platform Independent Requirements for Counters
- Section 24.3.1.2: Policer Counter Overview
- Section 24.3.1.3: BGP Functions Supported for Arista Switches
- Section 24.3.1.4: Additional Requirements

24.3.1.1 Platform Independent Requirements for Counters

The following platform independent requirements include:

- Enable/Disable counters
- Clear counters
- Show counters
- Configure counter mode for byte (default) or frame mode

24.3.1.2 Policer Counter Overview

The switch hardware has two policer banks, each with 4k entries and each entry has one 32 bit entry1, and one 32 bit entry2, which can be used as either packet counter or byte counter.

In the pipeline, each bank can have one policer index coming from upstream blocks, which means different features cannot update multiple policer entries in the same bank simultaneously. Therefore, different features cannot share entries in the same bank.

In switch hardware routing, each FFU/BST entry points to a corresponding RAM. A policer index is saved in the action ram, so when installing a multicast route into hardware, platform code will get a policer index and saved in the action field. If a policer index is unavailable, a counter is not added to the action field.

Switch hardware can have multiple features competing for the policer banks. It is desirable to have a platform command to reserve policer banks dedicated for a certain feature.

The following command reserves one or two policer banks to be used only by the named feature:

```
[no] platform fm6000 [nat | acl | qos | multicast] policer banks <1|2>
```

Available bank(s) are reserved for the feature. Otherwise the command takes effect at the next reboot or FocalPointV2 agent restart. This reservation guarantees the configured number of bank(s) for this feature. However, the feature can still possibly obtain the other policer bank if it needs more, and the other bank is available.

If a feature has a pending reservation request which is not fulfilled because of availability, and some other feature frees a bank, the bank will be allocated to the pending feature.
24.3.1.3 BGP Functions Supported for Arista Switches

Arista switches support these BGP functions:
- A single BGP instance
- Simultaneous internal (IBGP) and external (EBGP) peering
- Multiprotocol BGP
- BGP Confederations

24.3.1.4 Additional Requirements

On switch hardware, the following additional requirements include:
- Reservation of policer banks
- Notification of policer bank availability when a policer entry is freed by other features

24.3.2 Multicast Counters iBGP and eBGP Configuration

This section describes the commands required to configure an iBGP and an eBGP topology, and contains the following sections.
- Section 24.3.2.1: Policer Usage

24.3.2.1 Policer Usage

There are two types of counters – those created by wildcard creation and by specific creation. When a specific counter is required and the hardware runs out of policer entries, a wildcard counter is forced to give up its policer entry.

If the user configures a specific counter and the starter group (SG) already has a wildcard-created counter for it, then this counter is upgraded to a specific one, with no change in hardware policer index. If the user configures both a wildcard counter and specific counter for this SG, and subsequently deletes the specific counter, the counter for this SG is downgraded to a wildcard, with no change in hardware policer index. However, if another specific counter is pending for a hardware policer index, then this policer entry will be assigned to that counter due to its higher precedence.

Even if a counter is configured by the user, in order to conserve the use of hardware resources, we should not allocate a policer entry until a real route \((G, S)\) is programmed into the frame filtering and forwarding unit (FFU).

24.3.3 Multicast Counters CLI

IPv4 multicast counters are configured by enabling wildcard counters and changing bytes and packets mode, through the process of “specific creation” and “wildcard creation.”

**Command Mode**

**EXEC**

**Command Syntax**

```
ip multicast count [bytes | packets]
```

- Enables wildcard counters. Also used to change bytes / packets mode.

```
ip multicast count <G> <S>
```

- This is only takes affect when `ip multicast count` is enabled. If \(<G, S>\) is specified, a counter will be created for this route only. We call creation of counters in this way “specific creation.”

```
clear ip multicast count <G> <S>
```
This is only takes affect when \texttt{ip multicast count} is enabled. If \texttt{<G, S>} is specified, a counter will be cleared for this route only.

\texttt{show ip mfib \textless G\textgreater count}

- Total \texttt{count} is the sum of counts from all sources in that group. The count value can be \texttt{N/A} if an \texttt{mroute} does not have an associated counter. If the count value for any source in a \texttt{<G>} is \texttt{N/A}, then the total counts for \texttt{<G>} will be shown as \texttt{N/A}. However, the count values for other sources are still shown.

\texttt{no ip multicast count}

- No IP multicast count. Deletes all multicast counters, including explicit G S routes.

\texttt{no ip multicast count \textless G\textgreater \textless S\textgreater}

- Removes the config. Does not delete the counter because the wildcard is still active. If no \texttt{<G, S>} is specified, all multicast routes will have counters unless hardware runs out of resource. We call creation of counters in this way “wildcard creation.”

\textbf{Parameters}

- \texttt{bytes | packets}: specifies the bytes / packets mode.

\subsection{IPv4 Multicast Counter CLI Steps}

IPv4 multicast counters are configured by performing the following platform independent CLI steps:

\textbf{Step 1} Execute the global configuration command:

- \texttt{no | default ip multicast count bytes | packets}
  
  Enables wildcard counters. Also used to change bytes / packets mode. When hardware runs of resources, specific creation has priority to preempt counters from wildcard creation. The \texttt{bytes | packets} optional keyword enables the counter to be in either bytes mode or packets mode. This mode applies to all counters. When the counter mode changes, all counter values will be reset to zero.

- \texttt{no | default ip multicast count \textless G\textgreater \textless S\textgreater}
  
  This is only takes affect when \texttt{ip multicast count} is enabled. Either \texttt{<G, S>} or \texttt{bytes | packets} optional keyword is used. They can not be used concurrently.

  No \texttt{default Commands}: (default is same as \texttt{no})

- \texttt{no ip multicast count}
  
  - Deletes all multicast counters, including explicit \texttt{<G> <S>} routes

- \texttt{no ip multicast count \textless G\textgreater \textless S\textgreater}
  
  - Removes the config. Does not delete the counter because the wildcard is still active.

- If no \texttt{<G, S>} is specified, all multicast routes will have counters unless the hardware runs out of resources. The creation of counters is referred to as “wildcard creation.”

- If \texttt{<G, S>} is specified, only \texttt{<G, S>} will get a counter (and no other route). The creation of counters is referred to as “specific creation.” By default, all mcast routes will have counters allocated. This \texttt{<G, S>} configuration is applicable when the hardware runs out of resources. Specific \texttt{<G, S>} creation has priority to preempt counters from wildcard creation.

The \texttt{byte | frame} optional keyword enables the counter to be in either byte mode or frame mode. This mode applies to all counters. When the counter mode changes, all counter values will be reset to zero.
Either \(<G, S>\) or byte | frame optional keywords are used and cannot be used together. All counters are byte | frame. The byte | frame mode is global, and not applicable on a \(<G, S>\) basis.

**Step 2** Execute clear command:
- `clear ip multicast count <G> <S>`

**Step 3** Execute show command:
- `show ip mfib <G> count`

This command currently exists but does not show anything.

This show command is intended to display the following (example):

```
waltartr15(config)#sho ip mfib c
Activity poll time: 60 seconds
225.1.1.1 100.0.0.2
Byte: 123
Vlan100 (iif)
Vlan200
Activity 0:00:47 ago
```

Total counts is the sum of counts from all sources in that group.

The count value can be N/A if a mroute does not have an associated counter.

If the count value for any source in a \(<G>\) is N/A, then the total counts for \(<G>\) will be shown as N/A. However, the count values for other sources are still shown.
24.4 Route Management

When routing is enabled, the switch discovers the best route to a packet’s destination address by exchanging routing information with other devices. IP routing is disabled by default.

The following sections describes routing features that the switch supports:

- Section 24.4.1: Route Redistribution
- Section 24.4.2: Equal Cost Multipath Routing (ECMP) and Load Sharing
- Section 24.4.3: Unicast Reverse Path Forwarding (uRPF)
- Section 24.4.4: Routing Tables / Virtual Routing and Forwarding (VRF)

24.4.1 Route Redistribution

Route redistribution is the advertisement, into a dynamic routing protocol’s routing domain, of connected (static) routes or routes established by other routing protocols. By default, the switch advertises only routes in a routing domain that are established by the protocol that defined the domain.

Route redistribution commands specify the scope of the redistribution action. By default, all routes from a specified protocol (or all static routes) are advertised into the routing domain. Commands can also filter routes by applying a route map, which defines the subset of routes to be advertised.

24.4.2 Equal Cost Multipath Routing (ECMP) and Load Sharing

Equal cost multi-path (ECMP) is a routing strategy where traffic is forwarded over multiple paths that have equal routing metric values.

Configuring ECMP (IPv4)

All ECMP paths are assigned the same tag value; commands that change the tag value of a path also change the tag value of all paths in the ECMP route.

In a network topology using ECMP routing, hash polarization may result when all switches perform identical hash calculations. Hash polarization leads to uneven load distribution among the data paths. Hash polarization is avoided when switches use different hash seeds to perform hash calculations.

The `ip load-sharing` command provides the hash seed to an algorithm that the switch uses to distribute data streams among multiple equal-cost routes to a specified subnet.

Example

- This command sets the IPv4 load sharing hash seed to 20:

  ```
  switch(config)#ip load-sharing fm6000 20
  switch(config)#
  ```

Multicast Traffic Over ECMP

The switch attempts to spread outbound unicast and multicast traffic to all ECMP route paths equally. To disable the sending of multicast traffic over ECMP, use the `ip multicast multipath none` command.

Resilient ECMP (IPv4)

The default method of adding or removing next hop entries, as required by the active hashing algorithm, leads to inefficient management of the ECMP table, which can result in rerouting of packets to different next hops that breaks TCP packet flows. Resilient ECMP configures a fixed number of next hop entries in the hardware ECMP table for a specified IP address prefix.
The `ip hardware fib ecmp resilience` command specifies the maximum number of next hop addresses that the hardware ECMP table can contain for a specified IP prefix and a redundancy factor that facilitates the duplication of nexthop addresses in the table. The fixed table space for the address is the maximum number of next hops multiplied by the redundancy factor. When the table contains the maximum number of nexthop addresses, the redundancy factor specifies the number of times each address is listed in the table. When the table contains fewer than the maximum number of nexthop addresses, the table space entries are filled by additional duplication of the nexthop addresses.

Resilient ECMP is also available for IPv6 IP addresses.

**Example**

- This command configures a hardware ECMP table space of 24 entries for the IP address 10.14.2.2/24. A maximum of six nexthop addresses can be specified for the IP address. When the table contains six nexthop addresses, each appears in the table four times. When the table contains fewer than six nexthop addresses, each is duplicated until the 24 table entries are filled.

  ```
  switch(config)#ip hardware fib ecmp resilience 10.14.2.2/24 capacity 6 redundancy 4
  switch(config)#
  ```

**24.4.3 Unicast Reverse Path Forwarding (uRPF)**

Unicast Reverse Path Forwarding (uRPF) verifies the accessibility of source IP addresses in packets that the switch forwards. The switch drops a packet when uRPF determines that the routing table does not contain an entry with a valid path to that packet’s source IP address.

IPv4 and IPv6 uRPF operate independently. uRPF is VRF aware; commands that do not specify a VRF utilize the default instance. Multicast routing is not affected by uRPF.

uRPF defines two operational modes: strict mode and loose mode.

- **Strict mode:** uRPF also verifies that a packet is received on the interface that its routing table entry specifies for its return packet.
- **Loose mode:** uRPF validation does not consider the inbound packet’s ingress interface.

**24.4.3.1 uRPF Operation**

uRPF is configurable on interfaces. For packets arriving on a uRPF-enabled interfaces, the source IP address is verified by examining the source and destination addresses of unicast routing table entries.

uRPF requires a reconfigured routing table to support IP address verification. When uRPF is enabled for the first time, unicast routing is briefly disabled to facilitate the routing table reconfiguration. Multicast routing is not affected by the initial uRPF enabling.

A packet fails uRPF verification if the table does not contain an entry whose source or destination address matches the packet’s source IP address. In strict mode, the uRPF also fails when the matching entry’s outbound interface does not match the packet’s ingress interface.

uRPF verification is not available for the following packets:

- **DHCP (Source is 0.0.0.0 – Destination is 255.255.255.255)**
- **IPv6 link local (FE80::/10)**
- **Multicast packets**
ECMP uRPF

When verifying ECMP routes, strict mode checks all possible paths to determine that a packet is received on the correct interface. Strict mode is supported for ECMP groups with a maximum of eight routing table entries. The switch reverts to loose mode for ECMP groups that exceed eight entries.

Default Routes

uRPF strict mode provides an allow-default option that accepts default routes. On interfaces that enable allow-default and a default route is defined, uRPF strict mode validates a packet even when the routing table does not contain an entry that matches the packet’s source IP address. When allow-default is not enabled, uRPF does not consider the default route when verifying an inbound packet.

Null Routes

NULL0 routes drop traffic destined to a specified prefix. When uRPF is enabled, traffic originating from a null route prefixes is dropped in strict and loose modes.

24.4.3.2 uRPF Configuration

Unicast Reverse Path Forwarding (uRPF) is enabled for IPv4 packets ingressing the configuration mode interface through the ip verify command.

Note

uRPF cannot be enabled on interfaces with ECMP member FECs.

Example

- This command enables uRPF loose mode on VLAN interface 17.
  
  switch(config)#interface vlan 17
  switch(config-if-Vl17)#ip verify unicast source reachable-via any
  switch(config-if-Vl17)#show active
  interface Vlan17
  ip verify unicast source reachable-via any
  switch(config-if-Vl17)#

- This command enables uRPF strict mode on VLAN interface 18.
  
  switch(config)#interface vlan 18
  switch(config-if-Vl18)#ip verify unicast source reachable-via rx
  switch(config-if-Vl18)#show active
  interface Vlan18
  ip verify unicast source reachable-via rx
  switch(config-if-Vl18)#

24.4.4 Routing Tables / Virtual Routing and Forwarding (VRF)

An IP routing table is a data table that lists the routes to network destinations and metrics (distances) associated with those routes. A routing table is also known as a routing information base (RIB).

Virtual Routing and Forwarding (VRF) allows traffic separation by maintaining multiple routing tables. Arista switches support multiple VRF instances: one global or default VRF called “default” and multiple user-defined VRFs; the number of user-defined VRFs supported varies by platform. VRFs can be used as management or data plane VRFs.

- Management VRFs have routing disabled. They are typically used for management-related traffic.
- Dataplane VRFs have routing enabled. They support routing protocols and packet forwarding (hardware and software).
Dataplane VRFs are supported by Trident, FM6000, and Arad platform switches.

VRFs support unicast IPv4 traffic; multicast and IPv6 traffic is not supported on L3 interfaces configured into a VRF. Loopback, SVI, and routed ports may be added to VRFs. Management ports may be added without any hardware forwarding.

To allow overlap in the sets of IP addresses used by different VRF instances, a route distinguisher (RD) is prepended to each address. RDs are defined in RFC 4364.

### 24.4.4.1 Default VRF

The default VRF on Arista switches is called “default.” It is created automatically and cannot be renamed or configured. Some configuration options accept “default” as a VRF input.

### 24.4.4.2 User-Defined VRFs

A user-defined VRF is created with the `vrf definition` command. After its creation, a VRF is activated by assigning it a route distinguisher with the `rd (VRF configuration mode)` command.

**Example**

- These commands create a VRF named “purple,” place the switch in VRF configuration mode for that VRF, and specify a route distinguisher for the VRF identifying the administrator as AS 530 and assigning 12 as its local number.

  ```
  switch(config)#vrf definition purple
  switch(config-vrf-purple)#rd 530:12
  switch(config-vrf-purple)#
  ```

To add interfaces to a user-defined VRF, enter configuration mode for the interface and use the `vrf forwarding` command. Loopback, SVI, and routed ports can be added to a VRF.

**Example**

- These commands add VLAN 20 to the VRF named “purple.”

  ```
  switch(config)#interface VLAN 20
  switch(config-if-Vl20)#vrf forwarding purple
  switch(config-if-Vl20)#
  ```

The `show vrf` command shows information about user-defined VRFs on the switch.

**Example**

- This command displays information for the VRF named “purple”.

  ```
  switch>show vrf purple
  Vrf     RD               Protocols   State         Interfaces
  -------- ----------------- ----------- -------- -----------------------
  purple  64496:237         ipv4       no routing    Vlan42, Vlan43
  ```

**24.4.4.3 Context-Active VRF**

The context-active VRF specifies the default VRF that VRF-context aware commands use when displaying or refreshing routing table data.

VRF-context aware commands include:

- `clear arp-cache`
- `copy`
The `routing-context vrf` command specifies the context-active VRF.

**Example**

- This command specifies *magenta* as the context-active VRF.

  ```
  switch# routing-context vrf magenta
  switch# show routing-context vrf
  Current VRF routing-context is magenta
  ```

The `show routing-context vrf` command displays the context-active VRF.

**Example**

- This command displays the context-active VRF.

  ```
  switch> show routing-context vrf
  Current VRF routing-context is magenta
  switch>
  ```
24.5 **IPv4 Route Scale**

IPv4 routes are optimized to achieve route scale when route distribution has a large number of routes of one or two parameters, with each parameter consisting of prefix lengths 12, 16, 20, 24, 28, and 32. If two separate prefix lengths are configured (in any order), one of them must be the prefix length of 32.

The following sections describes IPv4 route scale configuration, show commands, and syslog messages:

- **Section 24.5.1: Configuring IPv4 Route Scale**
- **Section 24.5.2: Show Commands**
- **Section 24.5.3: Syslog**

24.5.1 **Configuring IPv4 Route Scale**

IPv4 route scale is enabled by the `ip hardware fib optimize` command for the configuration mode interface. The platform layer 3 agent is restarted to ensure IPv4 routes are optimized with the `agent SandL3Unicast terminate` command for the configuration mode interface.

**Example**

- This configuration command allows configuring prefix lengths 12 and 32.

```
switch(config)#ip hardware fib optimize exact-match prefix-length 12 32
! Please restart layer 3 forwarding agent to ensure IPv4 routes are optimized
```

One of the two prefixes in this command is a prefix-length of 32, which is required in the instance where there are two prefixes. For this command to take effect, the platform layer 3 agent must be restarted.

This configuration command restarts the platform layer 3 agent to ensure IPv4 routes are optimized.

```
switch(config)#agent SandL3Unicast terminate
SandL3Unicast was terminated
```

Restarting the platform layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.

**Example**

- This configuration command allows configuring prefix lengths 32 and 16.

```
switch(config)#ip hardware fib optimize exact-match prefix-length 32 16
! Please restart layer 3 forwarding agent to ensure IPv4 routes are optimized
```

One of the two prefixes in this command is a prefix-length of 32, which is required in the instance where there are two prefixes. For this command to take effect, the platform layer 3 agent must be restarted.

This configuration command restarts the platform layer 3 agent to ensure IPv4 routes are optimized.

```
switch(config)#agent SandL3Unicast terminate
SandL3Unicast was terminated
```

Restarting the platform layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.
Example

- This configuration command allows configuring prefix length 24.

  ```
  switch(config)#ip hardware fib optimize exact-match prefix-length 24
  ! Please restart layer 3 forwarding agent to ensure IPv4 routes are optimized
  ```

  In this instance, there is only one prefix-length, so a prefix-length of 32 is not required. For this command to take effect, the platform layer 3 agent must be restarted.

  This configuration command restarts the platform layer 3 agent to ensure IPv4 routes are optimized.

  ```
  switch(config)#agent SandL3Unicast terminate
  SandL3Unicast was terminated
  ```

  Restarting the platform layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.

Example

- This configuration command allows configuring prefix length 32.

  ```
  switch(config)#ip hardware fib optimize exact-match prefix-length 32
  ! Please restart layer 3 forwarding agent to ensure IPv4 routes are optimized
  ```

  For this command to take effect, the platform layer 3 agent must be restarted.

  This configuration command restarts the platform layer 3 agent to ensure IPv4 routes are optimized.

  ```
  switch(config)#agent SandL3Unicast terminate
  SandL3Unicast was terminated
  ```

  Restarting the platform layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.

Example

- This configuration command disables configuring prefix lengths 12 and 32.

  ```
  switch(config)#no ip hardware fib optimize exact-match prefix-length 12 32
  ! Please restart layer 3 forwarding agent to ensure IPv4 routes are not optimized
  ```

  One of the two prefixes in this command is a prefix-length of 32, which is required in the instance where there are two prefixes. For this command to take effect, the platform layer 3 agent must be restarted.

  This configuration command restarts the platform layer 3 agent to ensure IPv4 routes are not optimized.

  ```
  switch(config)#agent SandL3Unicast terminate
  SandL3Unicast was terminated
  ```

  Restarting the platform layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.

Example

- This configuration command attempts to configure prefix length 20 and 28 which triggers an error exception. One of the two prefixes in this command must be a prefix-length of 32, which is required in the instance where there are two prefixes.

  ```
  switch(config)#ip hardware fib optimize exact-match prefix-length 20 28
  % One of the prefix lengths must be 32
  ```
24.5.2 Show Commands

The IPv4 route scale summary is displayed by the show platform arad ip route summary command for the configuration mode interface. Resources for all IPv4 route scale routes are displayed by the show platform arad ip route command for the configuration mode interface.

Example

This command shows hardware resource usage of IPv4 routes.

```
switch(config)#show platform arad ip route summary
Total number of VRFs: 1
Total number of routes: 25
Total number of route-paths: 21
Total number of lem-routes: 4
```

Example

This command shows resources for all IPv4 routes in hardware. Routes that use the additional hardware resources will appear with an asterisk.

```
switch(config)#show platform arad ip route
Tunnel Type: M(mpls), G(gre)
* - Routes in LEM

24.5.3 Syslog

When the number of routes exceed additional hardware resources, the `ROUTINGLEMRESOURCEFULL` syslog message is displayed.
24.6 IP Source Guard

IP Source Guard (IPSG) prevents IP spoofing attacks. It filters inbound IP packets based on their source MAC and IP addresses. IPSG is supported in hardware. IPSG enabled on a Layer 2 port verifies IP packets received on this port. Packets are permitted if each packet source MAC and IP addresses match any of the user-configured IP-MAC binding entries on the receiving VLAN and port. Packets with no match are dropped immediately.

24.6.1 Configuring IPSG

IPSG is applicable only to Layer 2 ports, and is enabled by the `ip verify source` command for the configuration mode interface. When configured on Layer 3 ports, IPSG does not take effect until this interface is converted to Layer 2.

IPSG is supported on Layer 2 Port-Channels, not member ports. The IPSG configuration on port channels supersedes the configuration on the physical member ports. Hence, source IP MAC binding entries should be configured on port channels using the `ip source binding` command. When configured on a port channel member port, IPSG does not take effect until this port is deleted from the port channel configuration.

Example

- These configuration commands exclude VLAN IDs 1 through 3 from IPSG filtering. When enabled on a trunk port, IPSG filters the inbound IP packets on all allowed VLANs. IP packets received on VLANs 4 through 10 on Ethernet 36 will be filtered by IPSG, while those received on VLANs 1 through 3 are permitted.

```plaintext
switch(config)#no ip verify source vlan 1-3
switch(config)#interface ethernet 36
switch(config-if-Et36)#switchport mode trunk
switch(config-if-Et36)#switchport trunk allowed vlan 1-10
switch(config-if-Et36)#ip verify source
switch(config-if-Et36)#
```

This configuration command configures source IP-MAC binding entries to IP address 10.1.1.1, MAC address 0000.aaaa.1111, VLAN ID 4094, and Ethernet interface 36.

```plaintext
switch(config)#ip source binding 10.1.1.1 0000.aaaa.1111 vlan 4094 interface ethernet 36
switch(config)#
```

24.6.2 Show Commands

The IPSG configuration and operational states and IP-MAC binding entries are displayed by the `show ip verify source` command for the configuration mode interface.

Example

This command verifies the IPSG configuration and operational states.

```plaintext
switch(config)#show ip verify source
Interface       Operational State
--------------- ------------------------
Ethernet1       IP source guard enabled
Ethernet2       IP source guard disabled
```
Example

This command displays all VLANs configured in `no ip verify source vlan`. Hardware programming errors, e.g., VLAN classification failed, are indicated in the operational state. If an error occurs, this VLAN will be considered as enabled for IPSG. Traffic on this VLAN will still be filtered by IPSG.

```
switch(config)# show ip verify source vlan
IPSG disabled on VLANS: 1-2
VLAN Operational State
----------------- ------------------------
1 IP source guard disabled
2 Error: vlan classification failed
```

Example

This command displays all source IP-MAC binding entries configured for IPSG. A source binding entry is considered active if it is programmed in hardware. IP traffic matching any active binding entry will be permitted. If a source binding entry is configured on an interface or a VLAN whose operational state is IPSG disabled, this entry will not be installed in the hardware, in which case an “IP source guard disabled” state will be shown. If a port channel has no member port configured, binding entries configured for this port channel will not be installed in hardware, and a “Port-Channel down” state will be shown.

```
switch(config)# show ip verify source detail
Interface       IP Address    MAC Address      VLAN   State
--------------- ------------- ---------------- ------ ------------------------
Ethernet1       10.1.1.1      0000.aaaa.1111   5      active
Ethernet1       10.1.1.5      0000.aaaa.5555   1      IP source guard disabled
Port-Channel1   20.1.1.1      0000.bbbb.1111   4      Port-Channel down
```
24.7 DHCP Relay Across VRF

The EOS DHCP relay agent supports forwarding of DHCP requests to DHCP servers located in a different VRF to the DHCP client interface VRF. In order to enable VRF support for the DHCP relay agent, Option 82 (DHCP Relay Agent Information Option) must first be enabled. The DHCP relay agent uses Option 82 to pass client specific information to the DHCP server.

These sections describe DHCP Relay across VRF features:

- **Section 24.7.1: Global Configuration**
- **Section 24.7.2: Show Commands**

The DHCP relay agent inserts Option 82 information into the DHCP forwarded request, which requires the DHCP server belongs to a network on an interface, and that interface belongs to a different VRF than the DHCP client interface. Option 82 information includes the following:

- **VPN identifier**: The VRF name for the ingress interface of the DHCP request, inserted as sub-option 151.

  ![Figure 24-1: VPN Identifier](image)

- **Link selection**: The subnet address of the interface that receives the DHCP request, inserted as sub-option 5. When the DHCP smart relay is enabled, the link selection is filled with the subnet of the active address. The relay agent will set the Gateway IP address (gIPaddr) to its own IP address so that DHCP messages can be routed over the network to the DHCP server.

  ![Figure 24-2: Link Selection](image)

- **Server identifier override**: The primary IP address of the interface that receives the DHCP request, inserted as sub-option 11. When the DHCP smart relay is enabled, the server identifier is filled with the active address (one of the primary or secondary addresses chosen by smart relay mechanism).

  ![Figure 24-3: Link Selection](image)

- **VSS control suboption as suboption 152**: The DHCP server will strip out this suboption when sending the response to the relay, indicating that the DHCP server used VPN information to allocate IP address.

  ![Figure 24-4: VSS Control Suboption](image)

**Note**

The DHCP server must be capable of handling VPN identifier information in option 82.

Direct communication between DHCP client and server may not be possible as they are in separate VRFs. The Server identifier override and Link Selection sub-options set the relay agent to act as the DHCP server, and enable all DHCP communication to flow through the relay agent.

The relay agent adds all the appropriate sub-options, and forwards all (including renew and release) request packets to the DHCP server. When the DHCP server response messages are received by the relay, Option 82 information is removed and the response is forwarded to the DHCP client in the client VRF.
24.7.1 Global Configuration

The DHCP relay agent information option is inserted in DHCP messages relayed to the DHCP server. The existing command below will turn on the attachment of VRF related tags in the relay agent information option. Determination of whether to add the tags is made if the client or server is on a default VRF.

If both the DHCP Client interface and Server interface are on the same VRF (default or non-default), then no VRF related DHCP Relay Agent information option is inserted.

**Example**

This command configures the DHCP relay to add option 82 information.

```plaintext
switch(config)#ip dhcp relay information option
```

**Example**

This command configures VRFs.

```plaintext
switch(config)#vrf definition mtxxg-vrf
switch(config)#rd 5546:5546
switch(config)#vrf definition qchyh-vrf
switch(config)#rd 218:218
```

**Example**

This command configures the interface connected to the DHCP client.

```plaintext
switch(config)#interface Ethernet9
switch(config)#switchport access vlan 2
switch(config)#no switchport
```

**Example**

This command configures the DHCP client interface in VRF mtxxg-vrf.

```plaintext
switch(config)#vrf forwarding mtxxg-vrf
switch(config)#ip address 10.10.0.1/16
```

**Example**

This command configures the DHCP server in the default VRF configuration.

```plaintext
switch(config)#ip helper-address 10.40.2.3 vrf default
```

If there is a DHCP server in the default VRF configured with keyword `default`, IP addresses in a different VRF will have overlapping addresses.

**Example**

This command configures the DHCP server in non-default VRF configuration that is configured with the VRF name:

```plaintext
switch(config)#ip helper-address 10.40.2.3 vrf qchyh-vrf
```
24.7.2 Show Commands

Example

This command displays the VRF specifier for the server:

```
  rtr1#show ip dhcp relay
  DHCP Relay is active
  DHCP Relay Option 82 is enabled
  DHCP Smart Relay is disabled
  Interface: Ethernet9
  Option 82 Circuit ID: Ethernet9
  DHCP servers: 10.40.2.3
  10.40.2.3:vrf=qchyh-vrf
```

This command displays the VRF specifier for the server.

```
  rtr1#show ip helper-address
  DHCP Relay is active
  DHCP Relay Option 82 is enabled
  DHCP Smart Relay is disabled
  Interface: Ethernet9
  Option 82 Circuit ID: Ethernet9
  DHCP servers: 10.40.2.3
  10.40.2.3:vrf=qchyh-vrf
```
Network address translation (NAT) is a router process that modifies address information of IP packets in transit. NAT is typically used to correlate address spaces between a local network and a remote, often public, network. Static NAT defines a one-to-one map between local and remote IP addresses. Static maps are configured manually through CLI commands. An interface can support multiple NAT commands, but each command must specify a unique local IP address-port location.

NAT is configured on routers that have interfaces connecting to the local networks and interfaces connecting to a remote network.

NAT is available only on FM6000 platform switches (the 7150 series).

Inside and Outside Addresses
In NAT configurations, IP addresses are placed into one of two categories: inside or outside. Inside refers to IP addresses used within the organizational network. Outside refers to addresses on an external network outside the organizational network.

Static IP NAT
Static NAT configurations create a one-to-one mapping and translate a particular address to another address. This type of configuration creates a permanent entry in the NAT table as long as the configuration is present, and it enables both inside and outside hosts to initiate a connection.

Static NAT options include source NAT, destination NAT, and twice NAT.

- **Source NAT** modifies the source address in the IP header of a packet exiting the interface, and can optionally change the source port referenced in the TCP/UDP headers.
- **Destination NAT** modifies the destination address in the IP header of a packet entering the interface, and can optionally change the destination port referenced in the TCP/UDP headers.
- **Twice NAT** modifies both the source and destination address of packets entering and exiting the interface, and can optionally change the L4 port information in the TCP/UDP headers. Twice NAT is generally used when inside network addresses overlap or otherwise conflict with outside network addresses. When a packet exits the interface, local source and destination addresses are translated to global source and destination addresses. When a packet enters the interface, global source and destination addresses are translated to local source and destination addresses.

Configuring Static NAT

**Configuring Source NAT**
Network address translation of a source address (source NAT) is enabled by the `ip nat source static` command for the configuration mode interface. Applying source NAT to interfaces that connect to local hosts shields the IP address of the host when sending IP packets to remote destinations.

This command installs hardware translation entries for forward and reverse unicast traffic. When the rule specifies a multicast group, the command does not install the reverse path in hardware. The command may include an access control list to filter packets for translation.

**Note**
The switch uses a common NAT table for the entire switch, not a per interface one. For example, if a customer has the same inside local address translated to different inside global addresses depending on which interface it exits. It might be translated to exit interface B’s inside global address even though it exits through interface A. A way to avoid this is to use an access list that differentiates based on the destination IP address.
Example

- These commands configure VLAN 201 to translate source address 10.24.1.10 to 168.32.14.15.

  switch(config)#interface vlan 201
  switch(config-if-Vl201)#ip nat source static 10.24.1.10 168.32.14.15
  switch(config-if-Vl201)#

The `ip nat source static` command may include an ACL to limit packet translation. Only packets whose source IP address matches the ACL are cleared. ACLs configured for source NAT must specify a source IP address of `any`. Source port or protocol matching is not permitted. The destination may be an IP subnet. Commands referencing nonexistent ACLs are accepted by the CLI but not installed in hardware until the ACL is created. Modifying a referenced ACL causes the corresponding hardware entries to be replaced by entries that match the new command.

Example

- These commands configure VLAN 101 to translate the source address 10.24.1.10 to 168.32.14.15 for all packets with IP destination addresses in the 168.10.1.0/32 subnet.

  switch(config)#ip access-list ACL1
  switch(config-acl-ACL1)#permit ip 168.10.1.0/24 any
  switch(config-acl-ACL1)#exit
  switch(config)#interface vlan 101
  switch(config-if-Vl101)#ip nat source static 168.32.14.15 access-list ACL1 10.24.1.10
  switch(config-if-Vl101)#

Configuring Destination NAT

Network address translation of a destination address (destination NAT) is enabled by the `ip nat destination static` command for the configuration mode interface. Applying destination NAT to interfaces that connect to remote hosts shields the IP address of the recipient host when receiving IP packets from remote destinations.

This command installs hardware translation entries for forward and reverse unicast traffic. When the rule specifies a multicast group, the command does not install the reverse path in hardware. The command may include an access control list to filter packets for translation.
Example

- These commands configure VLAN 201 to translate destination address 168.32.14.15 to 10.24.1.10.

  switch(config)#interface vlan 201
  switch(config-if-Vl201)#ip nat destination static 168.32.14.15 10.24.1.10
  switch(config-if-Vl201)#

The **ip nat destination static** command may include an ACL to limit packet translation. Only packets whose source IP address matches the ACL are cleared. ACLs configured for destination NAT must specify a destination IP address of **any**. Destination port or protocol matching is not permitted. The source may be an IP subnet. Commands referencing nonexistent ACLs are accepted by the CLI but not installed in hardware until the ACL is created. Modifying a referenced ACL causes the corresponding hardware entries to be replaced by entries that match the new command.

Example

- These commands configure VLAN 201 to translate the source address 10.24.1.10 to 168.32.14.15 for all packets with IP destination addresses in the 168.10.1.0/32 subnet.

  switch(config)#ip access-list ACL2
  switch(config-acl-ACL2)#permit ip 168.10.1.0/32 any
  switch(config-acl-ACL2)#exit
  switch(config)#interface vlan 201
  switch(config-if-Vl201)#ip nat destination static 10.24.1.10 access-list ACL2 168.32.14.15
  switch(config-if-Vl201)#

Configuring Twice NAT

Network address translation of both source and destination addresses on the same interface (twice NAT) is enabled by creating one source NAT rule and one destination NAT rule on the same interface and associating them through a NAT group using the **ip nat source static** and **ip nat destination static** commands.

The **ip nat source static** command translates the actual local source address to a source address which can be used outside the local network to reference the source. The **ip nat destination static** command translates an internally used destination address to the actual IP address that is the destination of the packet.
The source and destination NAT rules must reference the same NAT group, and both should either specify only IP addresses or specify both IP addresses and L4 port information. If L4 port information is configured in one rule but not in the other, an error message will be displayed.

Each NAT rule installs hardware translation entries for forward and reverse unicast traffic. When the rule specifies a multicast group, the command does not install the reverse path in hardware. Twice NAT does not support the use of access control lists to filter packets for translation.

Example

These commands configure Ethernet interface 2 to translate the local source address 10.24.1.10 to the global source address 168.32.14.15, and to translate the local destination address 10.68.104.3 to the global destination address 168.25.10.7 for all packets moving through the interface. The use of NAT group 3 is arbitrary, but must be the same in both rules.

```
switch(config)#interface ethernet 2
switch(config-if-Et2)#ip nat source static 10.24.1.10 168.32.14.15 group 3
switch(config-if-Et2)#ip nat destination static 10.68.104.3 168.25.10.7 group 3
```

24.8.1.2 Static NAT Configuration Considerations

Egress VLAN filter for static NAT

When a static source NAT is configured on an interface, the source IP translation happens only for those packets that is going 'out' of this interface. If a packet is egressing on an interface which does not have NAT configured, then the source IP is not translated.

When there are two interfaces on which static SNAT is configured then the translation specified for one interface can be applied to a packet going out on the other interface.

Example

In this example, the packets with source IP 20.1.1.1 going out of E1 will still have the source IP translated to 172.1.1.1 even though the rule is configured in E2 and not on E1.

```
switch(config)#interface ethernet 1
switch(config-if-Et1)# ip nat source static 10.1.1.1 171.1.1.1
switch(config)#interface ethernet 2
switch(config-if-Et2)#ip nat source static 20.1.1.1 172.1.1.1

To prevent this, use an ACL to filter the traffic that needs NAT on the interfaces.

switch(config)#ip access-list acl1
switch(config-acl-acl1)#permit ip any 171.1.1.0/24
switch(config)#ip access-list acl2
switch(config-acl-acl2)#permit ip any 172.1.1.0/24

switch(config)#interface ethernet 1
switch(config-if-Et1)# ip nat source static 10.1.1.1 access-list acl1 171.1.1.1
switch(config)#interface ethernet 2
switch(config-if-Et2)#ip nat source static 20.1.1.1 access-list acl2 172.1.1.1
```

ACL filtering is not supported when using twice NAT.

24.8.2 Dynamic NAT

Dynamic NAT can be used when fewer addresses are accessible than the number of hosts to be translated. A NAT table entry is created when the host starts a connection and establishes a one-to-one mapping between addresses. The mapping can vary and is dependent upon the registered addresses in the pool at the time of the communication. Dynamic NAT sessions are only allowed to be initiated only from inside networks. NAT should be configured on a Layer 3 interface, either a routed port or
Switch Virtual Interface (SVI). If the host doesn't communicate for a specific period, dynamic NAT entries are removed from the translation table. The address will then returned to the pool for use by another host.

Figure 24-6: Dynamic NAT Scenario

- **Many-to-Many NAT**
  
  Maps local addresses to a global address that is selected from a pool of global addresses. After pool is configured, the first available address from the pool is picked dynamically on receiving the first packet.

- **Many-to-One NAT (PAT)**
  
  PAT is a form of dynamic NAT where multiple local addresses are mapped to a single global address (many-to-one) using different source ports. This method is also called NAT Overloading, NAPT (Network and Port address translation), and Masquerade. The global address can be the IP address configured on the outside interface.

  Hardware entries that translate packets are created when the CLI command is processed. Entries for forward and reverse traffic are created for unicast traffic. The hardware entry for reverse traffic is not created for multicast traffic.

  Commands may include ACLs to filter packets that are cleared. Source NAT use ACLs to filter packets based on destination IP address. Destination NAT use ACLs to filter packets based on source IP address. Upon using NAT, inside usually refers to a private network while outside usually refers to a public network.

  A switch with NAT configured translates forwarded traffic between inside and outside interfaces, and the flow that matches the criteria specified for translation.

  The same IP address can't be used for the NAT static configuration and in the pool for dynamic NAT configurations. Public IP addresses must be unique. The global addresses used in static translations aren't excluded with dynamic pools containing the same global addresses.

  Hardware entries that translate packets are created when the CLI command is processed. Entries for forward and reverse traffic are created for unicast traffic. The hardware entry for reverse traffic is not created for multicast traffic.
Commands may include ACLs to filter packets that are cleared. Source NAT use ACLs to filter packets based on destination IP address. Destination NAT use ACLs to filter packets based on source IP address. When using NAT, inside usually refers to a private network while outside usually refers to a public network.

A switch with NAT configured translates forwarded traffic between inside and outside interfaces, and the flow that matches the criteria specified for translation.

Important! The same IP address can't be used for the NAT static configuration and in the pool for dynamic NAT configurations. Public IP addresses must be unique. The global addresses used in static translations aren't excluded with dynamic pools containing the same global addresses.

### 24.8.2.1 Configuring Dynamic NAT

**Prerequisites**
- Configure an ACL to specify IP addresses allowed to be translated.
- Determine if you should use an IP address as the translated source address.
- Decide on a public IP address pool for address translation.

**Configure the Address Pool**

The addresses used for translation are configured by issuing the `ip nat pool` command in global configuration mode.

**Example**
- This command configures the pool of addresses using start address, and end address.

```
switch(config)#ip nat pool p1 10.15.15.15 10.15.15.25
switch(config)#
```

**Set the IP Address**

The `ip address` command configures VLAN 201 with an IP address.

**Example**
- This command configures an IPv4 address for VLAN 201.

```
switch(config)#interface vlan 201
switch(config-if-Vl201)#ip address 10.0.0.1/24
switch(config-if-Vl201)#
```

- This command configures the dynamic NAT source address and sets the NAT overload for pool P2.

```
switch(config-if-Vl201)#ip nat source dynamic access-list ACL2 pool p2 overload
```

**Define the NAT Source Address for Translation**

The `ip nat source dynamic` command specifies a dynamic translation from the source IP address to the pool and to overload the pool address (or addresses).

**Example**
- This command configures the dynamic NAT source address and sets the pool P2 NAT overload.

```
switch(config)#interface ethernet 3/1
switch(config-if-Et3/1)#ip nat source dynamic access-list ACL2 pool p2 overload
switch(config-if-Et3/1)#
```

1359
Specify the Timeout Values

The `ip nat translation tcp-timeout` or `ip nat translation udp-timeout` commands alter the translation timeout period for NAT translation table entries.

Example

- This command globally sets the timeout for TCP to 600 seconds.
  ```
  switch(config)# ip nat translation tcp-timeout 600
  switch(config)#
  ```
- This command globally sets the timeout for UDP to 800 seconds.
  ```
  switch(config)# ip nat translation udp-timeout 800
  switch(config)#
  ```

24.8.2.2 Verify the NAT Configuration

Display the Address Pools

The `show ip nat pool` command displays the configuration of the address pool.

Example

- This command displays all the address pools configured on the switch.
  ```
  switch#show ip nat pool
  Pool       StartIp       EndIp       Prefix
  p1         10.15.15.15   10.15.15.25  24
  p2         10.10.15.15   10.15.15.25  22
  p3         10.12.15.15   10.12.15.25  12
  switch#
  ```

24.8.2.3 Clearing IP NAT Translations

Use the `clear ip nat translation` command to remove all or the specified NAT table entries.

Example

- This command clears all dynamic entries from the NAT translation table
  ```
  switch#clear ip nat translation
  switch#
  ```

24.8.2.4 Dynamic NAT Configuration Considerations

Configuring Dynamic NAT Using Pools in a L2 Adjacent Network

When many-to-one dynamic NAT is configured using a NAT pool, and the next hop router for the NAT device is on the same network (L2 adjacent), then you must configure the IP addresses in the NAT pool as a secondary address on the interface.
Example

- The IP addresses in the NAT pool are configured as the secondary address on the interface.

```
switch(config)#ip nat pool p1 10.1.1.1 10.1.1.4 prefix-length 24
switch(config)#interface ethernet 1
switch(config-if-Et1)#ip nat source dynamic access-list a1 pool p1
switch(config-if-Et1)#ip address 10.1.1.1/24 secondary
switch(config-if-Et1)#ip address 10.1.1.2/24 secondary
switch(config-if-Et1)#ip address 10.1.1.3/24 secondary
switch(config-if-Et1)#ip address 10.1.1.4/24 secondary
```

Configuring Dynamic NAT Using Pool in a L3 Network

If the next hop of the NAT device is on a different subnet, then you should configure a static Null route for the IP addresses in the NAT pool. Redistribute the static route using BGP/OSPF.

Example

- Outside Interface

```
switch(config)#interface port-channel 319
switch(config-if-Po319)#ip nat source dynamic access-list dynamic-nat-m2m pool natpl-dynamic-nat-m2m
switch(config)#ip access-list dynamic-nat-m2m
switch(config-acl-dynamic-nat-m2m)#10 permit ip 192.168.93.0/24 any
switch(config)#ip nat pool natpl-dynamic-nat-m2m prefix-length 24
switch(config-natpool-p1)#range 11.3.3.2 11.3.3.10
```

- Static Null Route for Virtual IP

```
switch(config)#ip route 11.0.0.0/8 Null0
switch(config)#router ospf 1
switch(config-router-ospf)#redistribute static
```

Configuring Dynamic NAT Using Overload with ECMP Routes

Dynamic many-to-one NAT using overload (PAT) should not be configured on interfaces that form an ECMP group. When one interface in the group goes down, the return packet for connections that are already established will continue to go to the IP address of the interface that went down and will not be forwarded to the inside host. For this type of scenario, use Dynamic Nat with pool configurations.
24.9 IPv4 Command Descriptions

IP Routing and Address Commands
- agent SandL3Unicast terminate
- clear ip arp inspection statistics
- ip address
- ip arp inspection limit
- ip arp inspection logging
- ip arp inspection trust
- ip arp inspection vlan
- ip hardware fib ecmp resilience
- ip hardware fib optimize
- ip icmp redirect
- ip load-sharing
- ip route
- ip routing
- ip source binding
- ip verify
- ip verify source
- show ip
- show ip arp inspection vlan
- show ip arp inspection statistics
- show ip interface
- show ip interface brief
- show ip route
- show ip route age
- show ip route gateway
- show ip route host
- show ip route summary
- show ip route tag
- show ip verify source
- show platform arad ip route
- show platform arad ip route summary

IPv4 DHCP Relay
- clear ip dhcp relay counters
- ip dhcp relay always-on
- ip dhcp relay information option (Global)
- ip dhcp relay information option circuit-id
- ip dhcp smart-relay
- ip dhcp smart-relay global
- ip helper-address
- show ip dhcp relay
- show ip dhcp relay counters
- show ip helper-address

IPv4 DHCP Snooping
- clear ip dhcp snooping counters
- ip dhcp snooping
- ip dhcp snooping information option
IPv4 Command Descriptions

IPv4 Multicast Counters

IPv4 NAT

ARP Table

VRF Commands

Trident Forwarding Table Commands
agent SandL3Unicast terminate

The agent SandL3Unicast terminate command restarts the platform layer 3 agent to ensure IPv4 routes are optimized.

**Command Mode**
- Global Configuration

**Command Syntax**
- `agent SandL3Unicast terminate`

**Related Commands**
- `ip hardware fib optimize` enables IPv4 route scale.
- `show platform arad ip route` shows resources for all IPv4 routes in hardware. Routes that use the additional hardware resources will appear with an asterisk.
- `show platform arad ip route summary` shows hardware resource usage of IPv4 routes.

**Example**
- This configuration command restarts the platform layer 3 agent to ensure IPv4 routes are optimized.
  
  switch(config)#agent SandL3Unicast terminate
  SandL3Unicast was terminated

  Restarting the platform layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.
arp

The **arp** command adds a static entry to an Address Resolution Protocol (ARP) cache. The switch uses ARP cache entries to correlate 32-bit IP addresses to 48-bit hardware addresses.

The **no arp** and **default arp** commands remove the ARP cache entry with the specified IP address. When multiple VRFs contain ARP cache entries for identical IP addresses, each entry can only be removed individually.

**Command Mode**

Global Configuration

**Command Syntax**

```
arp [VRF_INSTANCE] ipv4_addr mac_addr arpa
no arp [VRF_INSTANCE] ipv4_addr
default arp [VRF_INSTANCE] ipv4_addr
```

**Parameters**

- **VRF_INSTANCE** specifies the VRF instance being modified.
  - <no parameter> changes are made to the default VRF.
  - `vrf vrf_name` changes are made to the specified user-defined VRF.
- **ipv4_addr** IPv4 address of ARP entry.
- **mac_addr** local data-link (hardware) address (48-bit dotted hex notation – H.H.H).

**Examples**

- This command adds a static entry to the ARP cache in the default VRF.
  ```
  switch(config)#arp 172.22.30.52 0025.900e.c63c arpa
  switch(config)#
  ```

- This command adds the same static entry to the ARP cache in the VRF named "purple."
  ```
  switch(config)#arp vrf purple 172.22.30.52 0025.900e.c63c arpa
  switch(config)#
  ```
arp cache persistent

The **arp cache persistent** command restores the dynamic entries in the Address Resolution Protocol (ARP) cache after reboot.

The **no arp cache persistent** and **default arp cache persistent** commands remove the ARP cache persistent configuration from the *running-config*.

**Command Mode**

Global Configuration

**Command Syntax**

- `arp cache persistent`
- `no arp cache persistent`
- `default arp cache persistent`

**Example**

- This command restores the ARP cache after reboot.

  ```
  switch(config)#arp cache persistent
  switch(config)#
  ```
arp timeout

The `arp timeout` command specifies the duration of dynamic address entries in the Address Resolution Protocol (ARP) cache for addresses learned through the configuration mode interface. The default duration is 14400 seconds (four hours).

The `arp timeout` and `default arp timeout` commands restores the default ARP timeout for addresses learned on the configuration mode interface by deleting the corresponding `arp timeout` command from `running-config`.

Command Mode
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

Command Syntax
- `arp timeout` `arp_time`
- `no arp timeout`
- `default arp timeout`

Parameters
- `arp_time` ARP timeout period (seconds). Values range from 60 to 65535. Default value is 14400.

Examples
- This command specifies an ARP cache duration of 7200 seconds (two hours) for dynamic addresses added to the ARP cache that were learned through VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#arp timeout 7200
switch(config-if-Vl200)#show active
interface Vlan200
  arp timeout 7200
switch(config-if-Vl200)#
```
clear arp-cache

The clear arp-cache command refreshes dynamic entries in the Address Resolution Protocol (ARP) cache. Refreshing the ARP cache updates current ARP table entries and removes expired ARP entries not yet deleted by an internal, timer-driven process.

The command, without arguments, refreshes ARP cache entries for all enabled interfaces. With arguments, the command refreshes cache entries for the specified interface. Executing clear arp-cache for all interfaces can result in extremely high CPU usage while the tables are resolving.

Command Mode

Privileged EXEC

Command Syntax

clear arp-cache [VRF_INSTANCE] [INTERFACE_NAME]

Parameters

- **VRF_INSTANCE** specifies the VRF instance for which arp data is refreshed.
  - <no parameter> specifies the context-active VRF.
  - vrf vrf_name specifies name of VRF instance. System default VRF is specified by default.
- **INTERFACE_NAME** interface upon which ARP cache entries are refreshed. Options include:
  - <no parameter> All ARP cache entries.
  - interface ethernet e_num ARP cache entries of specified Ethernet interface.
  - interface loopback l_num ARP cache entries of specified loopback interface.
  - interface management m_num ARP cache entries of specified management interface.
  - interface port-channel p_num ARP cache entries of specified port-channel Interface.
  - interface vlan v_num ARP cache entries of specified VLAN interface.
  - interface vxlan vx_num VXLAN interface specified by vx_num.

Related Commands

- routing-context vrf specifies the context-active VRF.

Example

- These commands display the ARP cache before and after ARP cache entries are refreshed.

```plaintext
switch#show arp
Address     Age (min)  Hardware Addr   Interface
172.22.30.1 0 001c.730b.1d15 Management1
172.22.30.118 0 001c.7301.6015 Management1

switch#clear arp-cache

switch#show arp
Address     Age (min)  Hardware Addr   Interface
172.22.30.1 0 001c.730b.1d15 Management1

switch#
```
**clear ip arp**

The `clear ip arp` command removes the specified dynamic ARP entry for the specified IP address from the Address Resolution Protocol (ARP) table.

**Command Mode**

Privileged EXEC

**Command Syntax**

```
clear ip arp [VRF_INSTANCE] ipv4_addr
```

**Parameters**

- **VRF_INSTANCE** specifies the VRF instance for which arp data is removed.
  - `<no parameter>` specifies the context-active VRF.
  - `vrf vrf_name` specifies name of VRF instance. System default VRF is specified by `default`.
- **ipv4_addr** IPv4 address of dynamic ARP entry.

**Related Commands**

- `routing-context vrf` specifies the context-active VRF.

**Example**

- These commands display the ARP table before and after the removal of dynamic ARP entry for IP address 172.22.30.52.

  ```
switch# show arp
  Address         Age (min)  Hardware Addr   Interface
  172.22.30.1     0          001c.730b.1d15  Management1
  172.22.30.52    0          0025.900e.c468  Management1
  172.22.30.53    0          0025.900e.c63c  Management1
  172.22.30.133   0          001c.7304.3906  Management1
  switch# clear ip arp 172.22.30.52
  switch# show arp
  Address         Age (min)  Hardware Addr   Interface
  172.22.30.1     0          001c.730b.1d15  Management1
  172.22.30.53    0          0025.900e.c63c  Management1
  172.22.30.133   0          001c.7304.3906  Management1
  switch#
  ```
clear ip arp inspection statistics

The `clear ip arp inspection statistics` command clears ARP inspection statistics.

**Command Mode**

EXEC

**Command Syntax**

```
clear ip arp inspection statistics
```

**Related Commands**

- `ip arp inspection limit`
- `ip arp inspection logging`
- `ip arp inspection trust`
- `ip arp inspection vlan`
- `show ip arp inspection vlan`
- `show ip arp inspection statistics`

**Examples**

- This command clears ARP inspection statistics.
  
  ```
  switch(config)# clear ip arp inspection statistics
  switch(config)#
  ```
clear ip dhcp relay counters

The `clear ip dhcp relay counters` command resets the DHCP relay counters. The configuration mode determines which counters are reset:

- Interface configuration: command clears the counter for the configuration mode interface.

**Command Mode**
Privileged EXEC

**Command Syntax**
```
clear ip dhcp relay counters [INTERFACE_NAME]
```

**Parameters**
- `INTERFACE_NAME` entity for which counters are cleared. Options include:
  - `<no parameter>` clears counters for the switch and for all interfaces.
  - `interface ethernet e_num` clears counters for the specified Ethernet interface.
  - `interface loopback l_num` clears counters for the specified loopback interface.
  - `interface port-channel p_num` clears counters for the specified port-channel Interface.
  - `interface vlan v_num` clears counters for the specified VLAN interface.

**Examples**
- These commands clear the DHCP relay counters for VLAN 1045 and shows the counters before and after the `clear` command.

```bash
switch# show ip dhcp relay counters

clear ip dhcp snooping counters

The `clear ip dhcp snooping counters` command resets the DHCP snooping packet counters.

**Command Mode**

Privileged EXEC

**Command Syntax**

```
clear ip dhcp snooping counters [COUNTER_TYPE]
```

**Parameters**

- `COUNTER_TYPE` The type of counter that the command resets. Options include:
  - `<no parameter>` counters for each VLAN.
  - `debug` aggregate counters and drop cause counters.

**Example**

- This command clears the DHCP snooping counters for each VLAN.
  ```
  switch#clear ip dhcp snooping counters
  switch#show ip dhcp snooping counters
  ```
  ```
  | Dhcp Request Pkts | Dhcp Reply Pkts |
  Vlan | Rcvd Fwdd Drop | Rcvd Fwdd Drop | Last Cleared |

  switch#
clear ip nat translation

The clear ip nat translation command clears all or the specified NAT table entries.

**Command Mode**
Privileged EXEC

**Command Syntax**
clear ip nat translation [HOST_ADDR [DEST_ADDR]] [INTF] [PROT_TYPE]

**Parameters**
- **HOST_ADDR** Host address to be modified. Options include:
  - <no parameter> All packets with specified destination address are cleared.
  - address local_ipv4 IPv4 address.
  - address local_ipv4 local_port IPv4 address and port (port value ranges from 1 to 65535).
- **DEST_ADDR** Destination address of translated packet. Destination address can be entered only when the HOST_ADDR is specified. Options include:
  - <no parameter> All packets with specified destination address are cleared.
  - global_ipv4 IPv4 address.
  - global_ipv4 global_port IPv4 address and port (port value ranges from 1 to 65535).
- **INTF** Route source. Options include:
  - <no parameter> All packets with specified destination address are cleared.
  - interface ethernet e_num Ethernet interface specified by e_num.
  - interface loopback l_num Loopback interface specified by l_num.
  - interface management m_num Management interface specified by m_num.
  - interface port-channel p_num Port-channel interface specified by p_num.
  - interface vlan v_num VLAN interface specified by v_num.
- **PROT_TYPE** Filters packets based on protocol type. Options include:
  - <no parameter> All packets with specified destination address are cleared.
  - tcp TCP packets with specified destination address are cleared.
  - udp UDP packets with specified destination address are cleared.

**Example**
- This command clears all dynamic entries from the NAT translation table
  ```switch#clear ip nat translation
  switch#```
- This command clears a specific NAT IP address 172.22.30.52.
  ```switch#clear ip nat translation address 172.22.30.52
  switch#```
- This command clears the inside entry that maps the private address 10.10.10.3 to Internet address 172.22.30.52.
  ```switch#clear ip nat translation address 172.22.30.52 10.10.10.3
  switch#```
description (VRF)

The description command adds a text string to the configuration mode VRF. The string has no functional impact on the VRF.

The no description and default description commands remove the text string from the configuration mode VRF by deleting the corresponding description command from running-config.

Command Mode
VRF Configuration

Command Syntax

```
description label_text
no description
default description
```

Parameters
- `label_text` character string assigned to the VRF configuration.

Related Commands
- vrf definition places the switch in VRF configuration mode.

Examples
- These commands add description text to the magenta VRF.

```
switch(config)#vrf definition magenta
switch(config-vrf-magenta)#description This is the first vrf
switch(config-vrf-magenta)#show active
vrf definition magenta
  description This is the first vrf
switch(config-vrf-magenta)#
```
**ip address**

The *ip address* command configures the IPv4 address and connected subnet on the configuration mode interface. Each interface can have one primary address and multiple secondary addresses.

The *no ip address* and *default ip address* commands remove the IPv4 address assignment from the configuration mode interface. Entering the command without specifying an address removes the primary and all secondary addresses from the interface. The primary address cannot be deleted until all secondary addresses are removed from the interface.

Removing all IPv4 address assignments from an interface disables IPv4 processing on that port.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ip address ipv4_subnet [PRIORITY]
no ip address [ipv4_subnet] [PRIORITY]
default ip address [ipv4_subnet] [PRIORITY]
```

**Parameters**
- *ipv4_subnet* IPv4 and subnet address (CIDR or address-mask notation). *Running-config* stores value in CIDR notation.
- *PRIORITY* interface priority. Options include:
  - <no parameter> the address is the primary IPv4 address for the interface.
  - *secondary* the address is the secondary IPv4 address for the interface.

**Guidelines**
The *ip address* command is supported on routable interfaces.

**Example**
- This command configures an IPv4 address for VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ip address 10.0.0.1/24
switch(config-if-Vl200)#
```
**ip arp inspection limit**

The `ip arp inspection limit` command err-disables the interface if the incoming ARP rate exceeds the configured value rate limit the incoming ARP packets on an interface.

**Command Mode**

EXEC

**Command Syntax**

```
[no | default] ip arp inspection limit [RATE <pps>] [BURST_INTERVAL <sec> | none]
```

**Parameters**

- **RATE** specifies the ARP inspection limit rate in packets per second.
  - `<pps>` ARP inspection limit rate packets per second.
- **BURST_INTERVAL** specifies the ARP inspection limit burst interval.
  - `<sec>` burst interval second.

**Related Commands**

- `ip arp inspection limit`
- `ip arp inspection trust`
- `ip arp inspection vlan`
- `show ip arp inspection vlan`

**Examples**

- This command configures the rate limit of incoming ARP packets to errdisable the interface when the incoming ARP rate exceeds the configured value, sets the rate to 512 (which is the upper limit for the number of invalid ARP packets allowed per second), and sets the burst consecutive interval over which the interface is monitored for a high ARP rate to 11 seconds.

  ```
switch(config)#ip arp inspection limit rate 512 burst interval 11
  switch(config)#
  ```

- This command displays verification of the interface specific configuration.

  ```
switch(config)#interface Ethernet 3 / 1
switch(config)#ip arp inspection limit rate 20 burst interval 5
switch(config)#interface Ethernet 3 / 3
switch(config)#ip arp inspection trust
switch(config)#show ip arp inspection interfaces

<table>
<thead>
<tr>
<th>Interface</th>
<th>Trust State</th>
<th>Rate (pps)</th>
<th>Burst Interval</th>
</tr>
</thead>
<tbody>
<tr>
<td>Et3/1</td>
<td>Untrusted</td>
<td>20</td>
<td>5</td>
</tr>
<tr>
<td>Et3/3</td>
<td>Trusted</td>
<td>None</td>
<td>N/A</td>
</tr>
</tbody>
</table>

switch(config)#
  ```
ip arp inspection logging

The `ip arp inspection logging` command enables logging of incoming ARP packets on the interface if the rate exceeds the configured value.

**Command Mode**

EXEC

**Command Syntax**

```
[no | default] ip arp inspection logging [RATE <pps>] [BURST_INTERVAL <sec> | none]
```

**Parameters**

- `RATE` specifies the ARP inspection limit rate in packets per second.
  - `<pps>` ARP inspection limit rate packets per second.
- `BURST_INTERVAL` specifies the ARP inspection limit burst interval.
  - `<sec>` burst interval second.

**Related Commands**

- `ip arp inspection limit`
- `ip arp inspection trust`
- `ip arp inspection vlan`
- `show ip arp inspection vlan`

**Example**

- This command enables logging of incoming ARP packets when the incoming ARP rate exceeds the configured value on the interface, sets the rate to 2048 (which is the upper limit for the number of invalid ARP packets allowed per second), and sets the burst consecutive interval over which the interface is monitored for a high ARP rate to 15 seconds.

```
switch(config)#ip arp inspection logging rate 2048 burst interval 15
switch(config)#
```
The `ip arp inspection trust` command configures the trust state of an interface. By default, all interfaces are untrusted.

**Command Mode**

EXEC

**Command Syntax**

```
[no | default] ip arp inspection trust
```

**Related Commands**

- `ip arp inspection limit`
- `ip arp inspection logging`
- `ip arp inspection vlan`
- `show ip arp inspection vlan`

**Examples**

- This command configures the trust state of an interface.
  ```
  switch(config)#ip arp inspection trust
  switch(config)#
  ```

- This command configures the trust state of an interface to untrusted.
  ```
  switch(config)#no ip arp inspection trust
  switch(config)#
  ```

- This command configures the trust state of an interface to its default (untrusted).
  ```
  switch(config)#default ip arp inspection trust
  switch(config)#
  ```
ip arp inspection vlan

The `ip arp inspection vlan` command enables ARP inspection. ARP requests and responses on untrusted interfaces are intercepted on specified VLANs, and intercepted packets are verified to have valid IP-MAC address bindings. All invalid ARP packets are dropped. On trusted interfaces, all incoming ARP packets are processed and forwarded without verification. By default, ARP inspection is disabled on all VLANs.

Command Mode

EXEC

Command Syntax

```
ip arp inspection vlan [LIST]
```

Parameters

- `LIST` specifies the VLAN interface number.

Related Commands

- `ip arp inspection limit`
- `ip arp inspection trust`
- `show ip arp inspection vlan`

Examples

- This command enables ARP inspection on VLANs 1 through 150.
  ```
  switch(config)#ip arp inspection vlan 1 - 150
  switch(config)#
  ```
- This command disables ARP inspection on VLANs 1 through 150.
  ```
  switch(config)#no ip arp inspection vlan 1 - 150
  switch(config)#
  ```
- This command sets the ARP inspection default to VLANs 1 through 150.
  ```
  switch(config)#default ip arp inspection vlan 1 - 150
  switch(config)#
  ```
- These commands enable ARP inspection on multiple VLANs 1 through 150 and 200 through 250.
  ```
  switch(config)#ip arp inspection vlan 1-150,200-250
  switch(config)#
  ```
ip dhcp relay always-on

The `ip dhcp relay always-on` command enables the switch DHCP relay agent on the switch regardless of the DHCP relay agent status on any interface. By default, the DHCP relay agent is enabled only if at least one routable interface is configured with an `ip helper-address` statement.

The `no ip dhcp relay always-on` and `default ip dhcp relay always-on` commands remove the `ip dhcp relay always-on` command from `running-config`.

Command Mode

Global Configuration

Command Syntax

```
pip dhcp relay always-on
no ip dhcp relay always-on
default ip dhcp relay always-on
```

Related Commands

These commands implement DHCP relay agent.

- `ip helper-address`
- `ip dhcp relay information option (Global)`
- `ip dhcp relay information option circuit-id`

Example

- This command enables the DHCP relay agent.

```
switch(config)#ip dhcp relay always-on
switch(config)#
```
ip dhcp relay information option (Global)

The **ip dhcp relay information option** command configures the switch to attach tags to DHCP requests before forwarding them to the DHCP servers designated by **ip helper-address** commands. The **ip dhcp relay information option circuit-id** command specifies the tag contents for packets forwarded by the interface that it configures.

The **no ip dhcp relay information option** and **default ip dhcp relay information option** commands restore the switch’s default setting of not attaching tags to DHCP requests by removing the **ip dhcp relay information option** command from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip dhcp relay information option
no ip dhcp relay information option
default ip dhcp relay information option
```

**Related Commands**

These commands implement DHCP relay agent.

- **ip helper-address**
- **ip dhcp relay always-on**
- **ip dhcp relay information option circuit-id**

**Example**

- This command enables the attachment of tags to DHCP requests that are forwarded to DHCP server addresses.

  ```
switch(config)#ip dhcp relay information option
switch(config)#
```
**ip dhcp relay information option circuit-id**

The `ip dhcp relay information option circuit-id` command specifies the content of tags that the switch attaches to DHCP requests before they are forwarded from the configuration mode interface to DHCP server addresses specified by `ip helper-address` commands. Tags are attached to outbound DHCP requests only if the information option is enabled on the switch (`ip dhcp relay information option circuit-id`). The default value for each interface is the name and number of the interface.

The `no ip dhcp relay information option circuit-id` and `default ip dhcp relay information option circuit-id` commands restore the default content setting for the configuration mode interface by removing the corresponding command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
```
ip dhcp relay information option circuit-id id_label
no ip dhcp relay information option circuit-id
default ip dhcp relay information option circuit-id
```

**Parameters**
- `id_label` Tag content. Format is alphanumeric characters (maximum 15 characters).

**Related Commands**
- `ip helper-address`
- `ip dhcp relay always-on`
- `ip dhcp relay information option (Global)`

**Example**
- This command configures `x-1234` as the tag content for packets send from VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ip dhcp relay information option circuit-id x-1234
switch(config-if-Vl200)#
```
ip dhcp smart-relay

The **ip dhcp smart-relay** command configures the DHCP smart relay status on the configuration mode interface. DHCP smart relay supports forwarding DHCP requests with a client’s secondary IP addresses in the gateway address field. Enabling DHCP smart relay on an interface requires that DHCP relay is also enabled on that interface.

By default, an interface assumes the global DHCP smart relay setting as configured by the **ip dhcp smart-relay global** command. The **ip dhcp smart-relay** command, when configured, takes precedence over the global smart relay setting.

The **no ip dhcp smart-relay** command disables DHCP smart relay on the configuration mode interface. The **default ip dhcp smart-relay** command restores the interface’s to the default DHCP smart relay setting, as configured by the **ip dhcp smart-relay global** command, by removing the corresponding **ip dhcp smart-relay** or **no ip dhcp smart-relay** statement from **running-config**.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
```
ip dhcp smart-relay
no ip dhcp smart-relay
default ip dhcp smart-relay
```

**Examples**
- This command enables DHCP smart relay on VLAN interface 100.
  ```
  switch(config)#interface vlan 100
  switch(config-if-Vl100)#ip helper-address 10.4.4.4
  switch(config-if-Vl100)#ip dhcp smart-relay
  switch(config-if-Vl100)#show ip dhcp relay
  DHCP Relay is active
  DHCP Relay Option 82 is disabled
  DHCP Smart Relay is enabled
  Interface: Vlan100
    DHCP Smart Relay is enabled
    DHCP servers: 10.4.4.4
  switch(config-if-Vl100)#
  ```
- This command disables DHCP smart relay on VLAN interface 100.
  ```
  switch(config-if-Vl100)#no ip dhcp smart-relay
  switch(config-if-Vl100)#show active
  interface Vlan100
    no ip dhcp smart-relay
    ip helper-address 10.4.4.4
  switch(config-if-Vl100)#show ip dhcp relay
  DHCP Relay is active
  DHCP Relay Option 82 is disabled
  DHCP Smart Relay is enabled
  Interface: Vlan100
    DHCP Smart Relay is disabled
    DHCP servers: 10.4.4.4
  switch(config-if-Vl100)#
  ```
• This command enables DHCP smart relay globally, configures VLAN interface 100 to use the
global setting, then displays the DHCP relay status

switch(config)#ip dhcp smart-relay global
switch(config)#interface vlan 100
switch(config-if-Vl100)#ip helper-address 10.4.4.4
switch(config-if-Vl100)#default ip dhcp relay
switch(config-if-Vl100)#show ip dhcp relay

DHCP Relay is active
DHCP Relay Option 82 is disabled
DHCP Smart Relay is enabled
Interface: Vlan100
  Option 82 Circuit ID: 333
  DHCP Smart Relay is enabled
  DHCP servers: 10.4.4.4

switch(config-if-Vl100)#
ip dhcp smart-relay global

The **ip dhcp smart-relay global** command configures the global DHCP smart relay setting. DHCP smart relay supports forwarding DHCP requests with a client’s secondary IP addresses in the gateway address field. The default global DHCP smart relay setting is disabled.

The global DHCP smart relay setting is applied to all interfaces for which an **ip dhcp smart-relay** statement is not configured. Enabling DHCP smart relay on an interface requires that DHCP relay is also enabled on that interface.

The **no ip dhcp smart-relay global** and **default ip dhcp smart-relay global** commands restore the global DHCP smart relay default setting of disabled by removing the **ip dhcp smart-relay global** command from **running-config**.

**Command Mode**
Global Configuration

**Command Syntax**
- ip dhcp smart-relay global
- no ip dhcp smart-relay global
- default ip dhcp smart-relay global

**Related Commands**
- **ip helper-address** enables the DHCP relay agent on a configuration mode interface.
- **ip dhcp smart-relay** enables the DHCP smart relay agent on a configuration mode interface.

**Example**
- This command configures the global DHCP smart relay setting to **enabled**.

```plaintext
switch(config)#ip dhcp smart-relay global
switch(config)#
```
ip dhcp snooping

The **ip dhcp snooping** command enables DHCP snooping globally on the switch. DHCP snooping is a set of layer 2 processes that can be configured on LAN switches and used with DHCP servers to control network access to clients with specific IP/MAC addresses. The switch supports Option-82 insertion, which is a DHCP snooping process that allows relay agents to provide remote-ID and circuit-ID information to DHCP reply and request packets. DHCP servers use this information to determine the originating port of DHCP requests and associate a corresponding IP address to that port. DHCP servers use port information to track host location and IP address usage by authorized physical ports.

DHCP snooping uses the information option (Option-82) to include the switch MAC address (router-ID) along with the physical interface name and VLAN number (circuit-ID) in DHCP packets. After adding the information to the packet, the DHCP relay agent forwards the packet to the DHCP server as specified by the DHCP protocol.

DHCP snooping on a specified VLAN requires all of these conditions to be met:

- DHCP snooping is globally enabled.
- Insertion of option-82 information in DHCP packets is enabled.
- DHCP snooping is enabled on the specified VLAN.
- DHCP relay is enabled on the corresponding VLAN interface.

The **no ip dhcp snooping** and **default ip dhcp snooping** commands disables global DHCP snooping by removing the **ip dhcp snooping** command from **running-config**.

**Command Mode**

- **Global Configuration**

**Command Syntax**

- `ip dhcp snooping`
- `no ip dhcp snooping`
- `default ip dhcp snooping`

**Related Commands**

- **ip dhcp snooping information option** enables insertion of option-82 snooping data.
- **ip helper-address** enables the DHCP relay agent on a configuration mode interface.

**Example**

- This command globally enables snooping on the switch, displaying DHCP snooping status prior and after invoking the command.

```bash
switch(config)#show ip dhcp snooping
DHCP Snooping is disabled
switch(config)#ip dhcp snooping
switch(config)#show ip dhcp snooping
DHCP Snooping is enabled
DHCP Snooping is not operational
DHCP Snooping is configured on following VLANs:
  None
DHCP Snooping is operational on following VLANs:
  None
Insertion of Option-82 is disabled
switch(config)#
```
**ip dhcp snooping information option**

The **ip dhcp snooping information option** command enables the insertion of option-82 DHCP snooping information in DHCP packets on VLANs where DHCP snooping is enabled. DHCP snooping is a layer 2 switch process that allows relay agents to provide remote-ID and circuit-ID information to DHCP reply and request packets. DHCP servers use this information to determine the originating port of DHCP requests and associate a corresponding IP address to that port.

DHCP snooping uses information option (Option-82) to include the switch MAC address (router-ID) along with the physical interface name and VLAN number (circuit-ID) in DHCP packets. After adding the information to the packet, the DHCP relay agent forwards the packet to the DHCP server through DHCP protocol processes.

DHCP snooping on a specified VLAN requires all of these conditions to be met:

- DHCP snooping is globally enabled.
- Insertion of option-82 information in DHCP packets is enabled.
- DHCP snooping is enabled on the specified VLAN.
- DHCP relay is enabled on the corresponding VLAN interface.

When global DHCP snooping is not enabled, the **ip dhcp snooping information option** command persists in **running-config** without any operational effect.

The **no ip dhcp snooping information option** and **default ip dhcp snooping information option** commands disable the insertion of option-82 DHCP snooping information in DHCP packets by removing the **ip dhcp snooping information option** statement from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip dhcp snooping information option
no ip dhcp snooping information option
default ip dhcp snooping information option
```

**Related Commands**

- **ip dhcp snooping** globally enables DHCP snooping.
- **ip helper-address** enables the DHCP relay agent on a configuration mode interface.

**Example**

- These commands enable DHCP snooping on DHCP packets from ports on snooping-enabled VLANs. DHCP snooping was previously enabled on the switch.

  ```
  switch(config)#ip dhcp snooping information option
  switch(config)#show ip dhcp snooping
  DHCP Snooping is enabled
  DHCP Snooping is operational
  DHCP Snooping is configured on following VLANs:
  100
  DHCP Snooping is operational on following VLANs:
  100
  Insertion of Option-82 is enabled
  Circuit-id format: Interface name:Vlan ID
  Remote-id: 00:1c:73:1f:b4:38 (Switch MAC)
  switch(config)#
  ```
ip dhcp snooping vlan

The `ip dhcp snooping vlan` command enables DHCP snooping on specified VLANs. DHCP snooping is a layer 2 process that allows relay agents to provide remote-ID and circuit-ID information in DHCP packets. DHCP servers use this data to determine the originating port of DHCP requests and associate a corresponding IP address to that port. DHCP snooping is configured on a global and VLAN basis.

VLAN snooping on a specified VLAN requires each of these conditions:

- DHCP snooping is globally enabled.
- Insertion of option-82 information in DHCP packets is enabled.
- DHCP snooping is enabled on the specified VLAN.
- DHCP relay is enabled on the corresponding VLAN interface.

When global DHCP snooping is not enabled, the `ip dhcp snooping vlan` command persists in `running-config` without any operational affect.

The `no ip dhcp snooping information option` and `default ip dhcp snooping information option` commands disable DHCP snooping operability by removing the `ip dhcp snooping information option` statement from `running-config`.

**Command Mode**
- Global Configuration

**Command Syntax**

```
ip dhcp snooping vlan v_range
no ip dhcp snooping vlan v_range
default ip dhcp snooping vlan v_range
```

**Parameters**

- `v_range`  VLANs upon which snooping is enabled. Formats include a number, a number range, or a comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.

**Related Commands**

- `ip dhcp snooping` globally enables DHCP snooping.
- `ip dhcp snooping information option` enables insertion of option-82 snooping data.
- `ip helper-address` enables the DHCP relay agent on a configuration mode interface.
Example

- These commands enable DHCP snooping globally, DHCP on VLAN interface 100, and DHCP snooping on VLAN 100.

```plaintext
switch(config)#ip dhcp snooping
switch(config)#ip dhcp snooping information option
switch(config)#ip dhcp snooping vlan 100
switch(config)#interface vlan 100
switch(config-if-Vl100)#ip helper-address 10.4.4.4
switch(config-if-Vl100)#show ip dhcp snooping
DHCP Snooping is enabled
DHCP Snooping is operational
DHCP Snooping is configured on following VLANs:
  100
DHCP Snooping is operational on following VLANs:
  100
Insertion of Option-82 is enabled
  Circuit-id format: Interface name:Vlan ID
  Remote-id: 00:1c:73:1f:b4:38 (Switch MAC)
switch(config)#
```
ip hardware fib ecmp resilience

The `ip hardware fib ecmp resilience` command configures a fixed number of next hop entries in the hardware ECMP table for the specified IP address prefix. In addition to specifying the maximum number of next hop addresses that the table can contain for the prefix, the command includes a redundancy factor that allows duplication of each next hop address. The fixed table space for the address is the maximum number of next hops multiplied by the redundancy factor.

The default method of adding or removing next hop entries when required by the active hashing algorithm leads to inefficient management of the ECMP table, which can result in the rerouting of packets to different next hops that breaks TCP packet flows. Implementing fixed table entries for a specified IP address allows data flows that are hashed to a valid next hop number to remain intact. Additionally, traffic is evenly distributed over a new set of next hops.

The `no ip hardware fib ecmp resilience` and `default ip hardware fib ecmp resilience` commands restore the default hardware ECMP table management by removing the `ip hardware fib ecmp resilience` command from `running-config`.

**Command Mode**
- Global Configuration

**Command Syntax**

- `ip hardware fib ecmp resilience net_addr capacity nhop_max redundancy duplicates`
- `no ip hardware fib ecmp resilience net_addr`
- `default ip hardware fib ecmp resilience net_addr`

**Parameters**

- **net_addr** IP address prefix managed by command. (CIDR or address-mask).
- **nhop_max** Maximum number of nexthop addresses for specified IP address prefix. Value range varies by platform:
  - Helix: `<2 to 64>`
  - Trident: `<2 to 32>`
  - Trident II: `<2 to 64>`
- **duplicates** Specifies the redundancy factor. Value ranges from 1 to 128.

**Example**

- This command configures a hardware ECMP table space of 24 entries for the IP address 10.14.2.2/24. A maximum of six nexthop addresses can be specified for the IP address. When the table contains six nexthop addresses, each appears in the table four times. When the table contains fewer than six nexthop addresses, each is duplicated until the 24 table entries are filled.

  ```
  switch(config)#ip hardware fib ecmp resilience 10.14.2.2/24 capacity 6 redundancy 4
  switch(config)#
  ```
ip hardware fib optimize

The `ip hardware fib optimize` command enables IPv4 route scale. The platform layer 3 agent is restarted to ensure IPv4 routes are optimized with the `agent SandL3Unicast terminate` command for the configuration mode interface.

Command Mode
Global Configuration

Command Syntax
```
ip hardware fib optimize exact-match prefix-length <prefix-length>
<optional: prefix-length>
no ip hardware fib optimize exact-match prefix-length <prefix-length>
<optional: prefix-length>
```

Parameters
- `prefix-length` The length of the prefix equal to 12, 16, 20, 24, 28, or 32. One additional prefix-length limited to the prefix-length of 32 is optional.

Related Commands
- `agent SandL3Unicast terminate` enables restarting the layer 3 agent to ensure IPv4 routes are optimized.
- `show platform arad ip route` shows resources for all IPv4 routes in hardware. Routes that use the additional hardware resources will appear with an asterisk.
- `show platform arad ip route summary` shows hardware resource usage of IPv4 routes.

Examples
- This configuration command allows configuring prefix lengths 12 and 32.
  ```
  switch(config)#ip hardware fib optimize exact-match prefix-length 12 32
  ! Please restart layer 3 forwarding agent to ensure IPv4 routes are optimized
  ```
  One of the two prefixes in this command is a prefix-length of 32, which is required in the instance where there are two prefixes. For this command to take effect, the platform layer 3 agent must be restarted.

  This configuration command restarts the platform layer 3 agent to ensure IPv4 routes are optimized.
  ```
  switch(config)#agent SandL3Unicast terminate
  SandL3Unicast was terminated
  ```

- This configuration command allows configuring prefix lengths 32 and 16.
  ```
  switch(config)#ip hardware fib optimize exact-match prefix-length 32 16
  ! Please restart layer 3 forwarding agent to ensure IPv4 routes are optimized
  ```
  One of the two prefixes in this command is a prefix-length of 32, which is required in the instance where there are two prefixes. For this command to take effect, the platform layer 3 agent must be restarted.

  This configuration command restarts the platform layer 3 agent to ensure IPv4 routes are optimized.
  ```
  switch(config)#agent SandL3Unicast terminate
  SandL3Unicast was terminated
  ```
Restarting the platform layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.

- This configuration command allows configuring prefix length 24.
  
  \[
  \text{switch(config)} \# \text{ip hardware fib optimize exact-match prefix-length 24} \\
  ! \text{Please restart layer 3 forwarding agent to ensure IPv4 routes are optimized}
  \]

  In this instance, there is only one prefix-length, so a prefix-length of 32 is not required. For this command to take effect, the platform layer 3 agent must be restarted.

  This configuration command restarts the platform layer 3 agent to ensure IPv4 routes are optimized.

  \[
  \text{switch(config)} \# \text{agent SandL3Unicast terminate} \\
  \text{SandL3Unicast was terminated}
  \]

  Restarting the platform layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.

- This configuration command allows configuring prefix length 32.
  
  \[
  \text{switch(config)} \# \text{ip hardware fib optimize exact-match prefix-length 32} \\
  ! \text{Please restart layer 3 forwarding agent to ensure IPv4 routes are optimized}
  \]

  For this command to take effect, the platform layer 3 agent must be restarted.

  This configuration command restarts the platform layer 3 agent to ensure IPv4 routes are optimized.

  \[
  \text{switch(config)} \# \text{agent SandL3Unicast terminate} \\
  \text{SandL3Unicast was terminated}
  \]

  Restarting the platform layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.

**Example**

- This configuration command disables configuring prefix lengths 12 and 32.
  
  \[
  \text{switch(config)} \# \text{no ip hardware fib optimize exact-match prefix-length 12 32} \\
  ! \text{Please restart layer 3 forwarding agent to ensure IPv4 routes are not optimized}
  \]

  One of the two prefixes in this command is a prefix-length of 32, which is required in the instance where there are two prefixes. For this command to take effect, the platform layer 3 agent must be restarted.
ip helper-address

The `ip helper-address` command enables the DHCP relay agent on the configuration mode interface and specifies a forwarding address for DHCP requests. An interface that is configured with multiple helper-addresses forwards DHCP requests to all specified addresses.

The `no ip helper-address` and `default ip helper-address` commands remove the corresponding `ip helper-address` command from `running-config`. Commands that do not specify an IP helper-address removes all helper-addresses from the interface.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `ip helper-address ipv4_addr`
- `no ip helper-address [ipv4_addr]`
- `default ip helper-address [ipv4_addr]`

**Parameters**
- `ipv4_addr` DHCP server address accessed by interface.

**Related Commands**
- `ip dhcp relay always-on`
- `ip dhcp relay information option (Global)`
- `ip dhcp relay information option circuit-id`

**Example**
- This command enables DHCP relay on VLAN interface 200 and configure the switch to forward DHCP requests received on this interface to the server at 10.10.41.15.

```bash
switch(config)#interface vlan 200
switch(config-if-Vl200)#ip helper-address 10.10.41.15
switch(config-if-Vl200)#show active
interface Vlan200
  ip helper-address 10.10.41.15
switch(config-if-Vl200)#
```
ip icmp redirect

The **ip icmp redirect** command enables the transmission of ICMP redirect messages. Routers send ICMP redirect messages to notify data link hosts of the availability of a better route for a specific destination.

The **no ip icmp redirect** command disables the switch from sending ICMP redirect messages.

**Command Mode**
Global Configuration

**Command Syntax**
- `ip icmp redirect`
- `no ip icmp redirect`
- `default ip icmp redirect`

**Example**
- This command disables the redirect messages.
  ```
  switch(config)#no ip icmp redirect
  switch(config)#show running-config
  !
  no ip icmp redirect
  ip routing
  !
  ```
**ip load-sharing**

The **ip load-sharing** command provides the hash seed to an algorithm that the switch uses to distribute data streams among multiple equal-cost routes to an individual IPv4 subnet.

In a network topology using Equal-Cost Multipath routing, all switches performing identical hash calculations may result in hash polarization, leading to uneven load distribution among the data paths. Hash polarization is avoided when switches use different hash seeds to perform different hash calculations.

The **no ip load-sharing** and **default ip load-sharing** commands return the hash seed to the default value of zero by removing the **ip load-sharing** command from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip load-sharing HARDWARE seed
no ip load-sharing HARDWARE
default ip load-sharing HARDWARE
```

**Parameters**

- **HARDWARE**  The ASIC switching device. The available option depend on the switch platform. Verify available options with the CLI ? command.
  - `arad`
  - `fm6000`
  - `petraA`
  - `trident`
- **seed**  The hash seed. Value range varies by switch platform. The default value on all platforms is 0:
  - when `HARDWARE=arad`  `seed` ranges from 0 to 2.
  - when `HARDWARE=fm6000`  `seed` ranges from 0 to 39.
  - when `HARDWARE=petraA`  `seed` ranges from 0 to 2.
  - when `HARDWARE=trident`  `seed` ranges from 0 to 5.

**Example**

- This command sets the IPv4 load sharing hash seed to one on FM6000 platform switches.

  ```
  switch(config)#ip load-sharing fm6000 1
  switch(config)#
  ```
ip local-proxy-arp

The `ip local-proxy-arp` command enables local proxy ARP (Address Resolution Protocol) on the configuration mode interface. When local proxy ARP is enabled, ARP requests received on the configuration mode interface will return an IP address even when the request comes from within the same subnet.

The `no ip local-proxy-arp` and `default ip local-proxy-arp` commands disable local proxy ARP on the configuration mode interface by removing the corresponding `ip local-proxy-arp` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `ip local-proxy-arp`
- `no ip local-proxy-arp`
- `default ip local-proxy-arp`

**Example**
- These commands enable local proxy ARP on VLAN interface 140.
  
  ```
  switch(config)#interface vlan 140
  switch(config-if-Vl140)#ip local-proxy-arp
  switch(config-if-Vl140)#show active
  interface Vlan140
  ip local-proxy-arp
  switch(config-if-Vl140)#
  ```
ip nat destination static

The *ip nat destination static* command enables NAT of a specified destination address for the configuration mode interface. This command installs hardware translation entries for forward and reverse unicast traffic. When the rule specifies a multicast group, the command does not install the reverse path in hardware. The command may include an access control list to filter packets for translation.

When configuring twice NAT, an arbitrary NAT group number is used to associate the source NAT and destination NAT rules. This number must be the same in both rules.

The *no ip nat destination static* and *default ip nat destination static* commands disables NAT translation of the specified destination address by removing the corresponding *ip nat destination static* command from *running_config*.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ip nat destination static ORIGINAL [FILTER] TRANSLATED [PROT_TYPE] [group group_number]
no ip nat destination static ORIGINAL [FILTER] TRANSLATED [PROT_TYPE] [group group_number]
default ip nat destination static ORIGINAL [FILTER] TRANSLATED [PROT_TYPE] [group group_number]
```

**Parameters**

- **ORIGINAL** Destination address to be modified. Options include:
  - `local_ipv4` IPv4 address.
  - `local_ipv4 local_port` IPv4 address and port (port value ranges from 1 to 65535).
- **FILTER** Access control list that filters packets. Options include:
  - `<no parameter>` All packets with specified destination address are cleared.
  - `access-list list_name` List that specifies the packets that are cleared. Not supported when configuring twice NAT.
- **TRANSLATED** Destination address of translated packet. Options include:
  - `global_ipv4` IPv4 address.
  - `global_ipv4 global_port` IPv4 address and port (port value ranges from 1 to 65535). When configuring twice NAT, source and destination NAT rules must either both specify a port translation or both not specify a port translation.
- **PROT_TYPE** Filters packets based on protocol type. Options include:
  - `<no parameter>` All packets with specified destination address are cleared.
  - `protocol tcp` TCP packets with specified destination address are cleared.
  - `protocol udp` UDP packets with specified destination address are cleared.
- **group group_number** Used only when configuring twice NAT, the NAT group number associates a source NAT rule with a destination NAT rule on the same interface. The group number (values range from 1 to 255) is arbitrary, but must be the same in both rules.
Example

- These commands configure VLAN 201 to translate destination address 168.32.14.15 to 10.24.1.10.

  ```
  switch(config)#interface vlan 201
  switch(config-if-Vl201)#ip nat destination static 10.24.1.10 168.32.14.15
  switch(config-if-Vl201)#
  ```

- These commands configure VLAN 201 to translate the source address 10.24.1.10 to 168.32.14.15 for all packets with IP destination addresses in the 168.10.1.1/32 subnet.

  ```
  switch(config)#ip access-list ACL2
  switch(config-acl-ACL2)#permit ip 168.10.1.1/32 any
  switch(config-acl-ACL2)#exit
  switch(config)#interface vlan 201
  switch(config-if-Vl201)#ip nat destination static 10.24.1.10 access-list ACL2 168.32.14.15
  switch(config-if-Vl201)#
  ```

- These commands configure Ethernet interface 2 to translate the local source address 10.24.1.10 to the global source address 168.32.14.15, and to translate the local destination address 10.68.104.3 to the global destination address 168.25.10.7 for all packets moving through the interface. The use of NAT group 3 is arbitrary, but must be the same in both rules.

  ```
  switch(config)#interface ethernet 2
  switch(config-if-Et2)#ip nat source static 10.24.1.10 168.32.14.15 group 3
  switch(config-if-Et2)#ip nat destination static 10.68.104.3 168.25.10.7 group 3
  ```
**ip nat pool**

The *ip nat pool* command identifies a pool of addresses using start address, end address, and either netmask or prefix length. If its starting IP address and ending IP address are the same, there is only one address in the address pool.

The no *ip nat pool* removes the *ip nat pool* command from *running_config*.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip nat pool pool_name [ADDRESS_SPAN] SUBNET_SIZE
no ip nat pool pool_name
default ip nat pool pool_name
```

**Parameters**

- *pool_name* name of the IP address pool.
- *ADDRESS_SPAN* Options include:
  - *start_addr* The first IP address in the address pool (IPv4 addresses in dotted decimal notation).
  - *end_addr* The last IP address in the address pool. (IPv4 addresses in dotted decimal notation).
- *SUBNET_SIZE* this functions as a sanity check to ensure it is not a network or broadcast network. Options include:
  - *netmask ipv4_addr* The netmask of the address pool’s network (dotted decimal notation).
  - *prefix-length <0 to 32>* The number of bits of the netmask (of the address pool’s network) that are ones (how many bits of the address indicate network).

**Examples**

- This command configures the pool of addresses using start address, end address, and prefix length of 24.
  ```
  switch(config)#ip nat pool pool 10.15.15.15 10.15.15.25 prefix-length 24
  switch(config)
  ```
- This command removes the pool of addresses.
  ```
  switch(config)# no ip nat pool pool 10.15.15.15 10.15.15.25 prefix-length 24
  switch(config)
  ```
ip nat source dynamic

The **ip nat source dynamic** command enables NAT of a specified source address for packets sent and received on the configuration mode interface. This command installs hardware translation entries for forward and reverse traffic. When the rule specifies a multicast group, the command does not install the reverse path in hardware. The command may include an access control list to filter packets for translation.

The **no ip nat source dynamic** and **default ip nat source dynamic** commands disables NAT translation of the specified destination address by removing the corresponding **ip nat source dynamic** command from running_config.

**Note**

Ethernet and Port-channel interfaces should be configured as routed ports.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```plaintext
ip nat source dynamic access-list acl_name POOL_TYPE
no ip nat source dynamic access-list acl_name
default ip nat source dynamic access-list acl_name
```

**Parameters**

- **acl_name**  Access control list that controls the internal network addresses eligible for NAT.
- **POOL_TYPE**  Options include:
  - **overload**  Translates multiple local addresses to a single global address. When overloading is enabled, conversations using the same IP address are distinguished by their TCP or UDP port number.
  - **pool pool_name**  The name of the IP address pool. The pool is defined using the **ip nat pool** command.

  The pool option is required even if the pool has just one address. NAT uses that one address for all of the translations.
  - **pool_fullcone**  Enables full cone NAT where all requests from the same internal IP address and port are mapped to the same external IP address and port.

**Example**

- This command configures the dynamic NAT source address and sets the NAT overload for pool P2.
  ```plaintext
  switch(config)#interface ethernet 3/1
  switch(config-if-Et3/1)#ip nat source dynamic access-list ACL2 pool p2
  switch#
  ```

- This command disables the NAT source translation on interface Ethernet 3/1.
  ```plaintext
  switch(config)#interface ethernet 3/1
  switch(config-if-Et3/1)# no ip nat source dynamic access-list ACL2
  switch(config-if-Et3/1)#
  ```
**ip nat source static**

The **ip nat source static** command enables NAT of a specified source address for the configuration mode interface. This command installs hardware translation entries for forward and reverse unicast traffic. When the rule specifies a multicast group, the command does not install the reverse path in hardware. The command may include an access control list to filter packets for translation.

When configuring twice NAT, an arbitrary NAT group number is used to associate the source NAT and destination NAT rules. This number must be the same in both rules.

The **no ip nat source static** and **default ip nat source static** commands disables NAT translation of the specified source address by removing the corresponding ip nat source command from running_config.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ip nat source static ORIGINAL [FILTER] TRANSLATED [PROT_TYPE] [group group_number]
no ip nat source static ORIGINAL [FILTER] TRANSLATED [PROT_TYPE] [group group_number]
default ip nat source static ORIGINAL [FILTER] TRANSLATED [PROT_TYPE] [group group_number]
```

**Parameters**

- **ORIGINAL**  
  Source address to be modified. Options include:
  - `original_ipv4`  IPv4 address.
  - `original_ipv4 original_port`  IPv4 address and port (port value ranges from 1 to 65535).
- **FILTER**  
  Access control list that filters packets. Options include:
  - `<no parameter>`  All packets with specified source address are cleared.
  - `access-list list_name`  List that specifies the packets that are cleared. Not supported when configuring twice NAT.
- **TRANSLATED**  
  Source address of translated packet. Options include:
  - `translated_ipv4`  IPv4 address.
  - `translated_ipv4 translated_port`  IPv4 address and port (port value ranges from 1 to 65535). When configuring twice NAT, source and destination NAT rules must either both specify a port translation or both not specify a port translation.
- **PROT_TYPE**  
  Filters packets based on protocol type. Options include:
  - `<no parameter>`  All packets with specified source address are cleared.
  - `protocol tcp`  TCP packets with specified source address are cleared.
  - `protocol udp`  UDP packets with specified source address are cleared.
  - `group group_number`  Used only when configuring twice NAT, the NAT group number associates a source NAT rule with a destination NAT rule on the same interface. The group number (values range from 1 to 255) is arbitrary, but must be the same in both rules.

**Restrictions**

- If **ORIGINAL** includes a port, **TRANSLATED** must also include a port.
- If **ORIGINAL** does not include a port, **TRANSLATED** cannot include a port.
Example

- These commands configure VLAN 101 to translate source address 10.24.1.10 to 168.32.14.15.
  
  switch(config)#interface vlan 101
  switch(config-if-Vl101)#ip nat source static 10.24.1.10 168.32.14.15
  switch(config-if-Vl101)#

- These commands configure VLAN 100 to translate the source address 10.24.1.10 to 168.32.14.15 for all packets with IP destination addresses in the 168.10.1.1/32 subnet.
  
  switch(config)#ip access-list ACL1
  switch(config-acl-ACL1)#permit ip any 168.10.1.1/32
  switch(config-acl-ACL1)#exit
  switch(config)#interface vlan 101
  switch(config-if-Vl101)#ip nat source static 10.24.1.10 access-list ACL1 168.32.141.15
  switch(config-if-Vl101)#

- These commands configure Ethernet interface 2 to translate the local source address 10.24.1.10 to the global source address 168.32.14.15, and to translate the local destination address 10.68.104.3 to the global destination address 168.25.10.7 for all packets moving through the interface. The use of NAT group 3 is arbitrary, but must be the same in both rules.
  
  switch(config)#interface ethernet 2
  switch(config-if-Et2)#ip nat source static 10.24.1.10 168.32.14.15 group 3
  switch(config-if-Et2)#ip nat destination static 10.68.104.3 168.25.10.7 group 3
**ip nat translation low-mark**

The `ip nat translation low-mark` command configures the minimum threshold that triggers the resumption of programming new NAT translation connections.

The `ip nat translation max-entries` command specifies the maximum number of NAT translation connections that can be stored. When this limit is reached, new connections are dropped instead of being programmed in hardware or software. At this point no new connections will be programmed until the number of stored entries drop below the configured low-mark, expressed as a percentage of the max-entries value. The default low mark value is 90%.

The `no ip nat translation low-mark` and `default ip nat translation low-mark` commands restores the default low-mark value by removing the `ip nat translation low-mark` command from `running_config`.

**Command Mode**
- Global Configuration

**Command Syntax**
```
ip nat translation low-mark threshold
no ip nat translation low-mark
default ip nat translation low-mark
```

**Parameters**
- `threshold`  Percentage of maximum connection entries. Value ranges from 1 to 99. Default is 90.

**Examples**
- This command globally sets the translation low mark of 93%.
```
switch(config)#ip nat translation low-mark 93
switch(config)#
```
**ip nat translation max-entries**

The `ip nat translation max-entries` command specifies the maximum number of NAT translation connections. After this threshold is reached, new connections are dropped until the number of programmed connections is reduced below the level specified by the `ip nat translation low-mark` command.

The `no ip nat translation max-entries` and `default ip nat translation max-entries` commands remove the maximum connection limit and reset the parameter value to zero by removing the `ip nat translation max-entries` command from `running_config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip nat translation max-entries connections
no ip nat translation max-entries
default ip nat translation max-entries
```

**Parameters**

- `connections` The maximum number of NAT translation connections. Value ranges from 0 to 4294967295. Default value is 0, which removes the connection limit.

**Examples**

- This command limits the number of NAT translation connections the switch can store to 3000.

```
switch(config)#ip nat translation max-entries 3000
switch(config)#
```
ip nat translation tcp-timeout

The **ip nat translation tcp-timeout** command specifies the translation timeout period for translation table entries. The timeout period specifies the interval during which the switch will attempt to reuse an existing TCP translation for devices specified by table entries.

The **no ip nat translation tcp-timeout** and **default ip nat translation tcp-timeout** commands reset the timeout to its default by removing the corresponding **ip nat translation tcp-timeout** command from **running_config**.

**Command Mode**
Global Configuration

**Command Syntax**

```
ip nat translation tcp-timeout period
no ip nat translation tcp-timeout
default ip nat translation tcp-timeout
```

**Parameters**
- **period**  Time-out period in seconds for port translations. Value ranges from 0 to 4294967295. Default value is 86400 (24 hours).

**Examples**
- This command sets the TCP timeout for translations to 600 seconds.
  ```
  switch(config)# ip nat translation tcp-timeout 600
  switch(config)#
  ```
- This command removes the TCP translation timeout.
  ```
  switch(config)# no ip nat translation tcp-timeout
  switch(config)#
  ```
**ip nat translation udp-timeout**

The `ip nat translation udp-timeout` command specifies the translation timeout period for translation table entries. The timeout period specifies the interval the switch attempts to establish a UDP connection with devices specified by table entries.

The `no ip nat translation udp-timeout` and `default ip nat translation udp-timeout` commands disables NAT translation of the specified destination address by removing the corresponding `ip nat translation udp-timeout` command from `running_config`.

**Command Mode**
- Global Configuration

**Command Syntax**

```
ip nat translation udp-timeout period
no ip nat translation udp-timeout
default ip nat translation udp-timeout
```

**Parameters**

- `period` Value ranges from 0 to 4294967295. Default value is 300 (5 minutes).

**Examples**

- This command globally sets the timeout for UDP to 800 seconds.
  
  ```
  switch(config)# ip nat translation udp-timeout 800
  switch(config)#
  ```

- This command removes the timeout for UDP.

  ```
  switch(config)# no ip nat translation udp-timeout
  switch(config)#
  ```
**ip proxy-arp**

The **ip proxy-arp** command enables proxy ARP on the configuration mode interface. Proxy ARP is disabled by default.

The **no ip proxy-arp** and **default ip proxy-arp** commands disable proxy ARP on the configuration mode interface by removing the corresponding **ip proxy-arp** command from **running-config**.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- ip proxy-arp
- no ip proxy-arp
- default ip proxy-arp

**Examples**
- This command enables proxy ARP on Ethernet interface 4.
  ```
  switch(config)#interface ethernet 4
  switch(config-if-Et4)#ip proxy-arp
  switch(config-if-Et4)#
  ```
**ip route**

The `ip route` command creates a static route. The destination is a network segment; the nexthop address is either an IPv4 address or a routable port. When multiple routes exist to a destination prefix, the route with the lowest administrative distance takes precedence.

By default, the administrative distance assigned to static routes is 1. Assigning a higher administrative distance to a static route configures it to be overridden by dynamic routing data. For example, a static route with an administrative distance value of 200 is overridden by OSPF intra-area routes, which have a default administrative distance of 110.

Tags are used by route maps to filter routes. The default tag value on static routes is 0.

Multiple routes with the same destination and the same administrative distance comprise an Equal Cost Multi-Path (ECMP) route. The switch attempts to spread outbound traffic equally through all ECMP route paths. All paths comprising an ECMP are assigned identical tag values; commands that change the tag value of a path change the tag value of all paths in the ECMP.

The `no ip route` and `default ip route` commands delete the specified static route by removing the corresponding `ip route` command from `running-config`. Commands that do not list a nexthop address remove all `ip route` statements with the specified destination from `running-config`. If an `ip route` statement exists for the same IP address in multiple VRFs, each must be removed separately. All static routes in a user-defined VRF are deleted when the VRF is deleted.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip route [VRF_INSTANCE] dest_net NEXTHOP [DISTANCE] [TAG_OPTION] [RT_NAME]
no ip route [VRF_INSTANCE] dest_net [NEXTHOP] [DISTANCE]
default ip route [VRF_INSTANCE] dest_net [NEXTHOP] [DISTANCE]
```

**Parameters**

- **VRF_INSTANCE**  Specifies the VRF instance being modified.
  - `<no parameter>`  Changes are made to the default VRF.
  - `vrf vrf_name`  Changes are made to the specified VRF.
- **dest_net**  Destination IPv4 subnet (CIDR or address-mask notation).
- **NEXTHOP**  Location or access method of next hop device. Options include:
  - `ipv4_addr`  An IPv4 address.
  - `null0`  Null0 interface.
  - `ethernet e_num`  Ethernet interface specified by `e_num`.
  - `loopback l_num`  Loopback interface specified by `l_num`.
  - `management m_num`  Management interface specified by `m_num`.
  - `port-channel p_num`  Port-channel interface specified by `p_num`.
  - `vlan v_num`  VLAN interface specified by `v_num`.
  - `vxlan vx_num`  VXLAN interface specified by `vx_num`.
- **DISTANCE**  Administrative distance assigned to route. Options include:
  - `<no parameter>`  Route assigned default administrative distance of one.
  - `<1-255>`  The administrative distance assigned to route.
- **TAG_OPTION**  static route tag. Options include:
- <no parameter> Assigns default static route tag of 0.
- tag \texttt{t\_value} Static route tag value. \texttt{t\_value} ranges from 0 to 4294967295.
- \texttt{RT\_NAME} Associates descriptive text to the route. Options include:
  - <no parameter> No text is associated with the route.
  - name \texttt{descriptive\_text} The specified text is assigned to the route.

Related Commands
- \texttt{ip route nexthop-group} command creates a static route that specifies a Nexthop Group to determine the Nexthop address.

Example
- This command creates a static route in the default VRF.
  
  \begin{verbatim}
  switch(config)#ip route 172.17.252.0/24 vlan 2000
  switch(config)#
  \end{verbatim}
**ip routing**

The *ip routing* command enables IPv4 routing. When IPv4 routing is enabled, the switch attempts to deliver inbound packets to destination IPv4 addresses by forwarding them to interfaces or next hop addresses specified by the forwarding table.

The *no ip routing* and *default ip routing* commands disable IPv4 routing by removing the *ip routing* command from *running-config*. When IPv4 routing is disabled, the switch attempts to deliver inbound packets to their destination MAC addresses. When this address matches the switch's MAC address, the packet is delivered to the CPU. IP packets with IPv4 destinations that differ from the switch's address are typically discarded. The *delete-static-routes* option removes static entries from the routing table.

IPv4 routing is disabled by default.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip routing [VRF_INSTANCE]
noc ip routing [DELETE_ROUTES] [VRF_INSTANCE]
default ip routing [DELETE_ROUTES] [VRF_INSTANCE]
```

**Parameters**

- **DELETE_ROUTES** Resolves routing table static entries when routing is disabled.
  - *<no parameter>* Routing table retains static entries.
  - *delete-static-routes* Static entries are removed from the routing table.
- **VRF_INSTANCE** specifies the VRF instance being modified.
  - *<no parameter>* changes are made to the default VRF.
  - *vrf vrf_name* changes are made to the specified user-defined VRF.

**Example**

- This command enables IPv4 routing.

  ```
  switch(config)#ip routing
  switch(config)#
  ```
**ip source binding**

IP source guard (IPSG) is supported on Layer 2 Port-Channels, not member ports. The IPSG configuration on port channels supersedes the configuration on the physical member ports. Hence, source IP MAC binding entries should be configured on port channels. When configured on a port channel member port, IPSG does not take effect until this port is deleted from the port channel configuration.

**Note**

IP source bindings are also used by static ARP inspection.

The **no ip source binding** and **default ip source binding** commands exclude parameters from IPSG filtering, and set the default for **ip source binding**.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

```
ip source binding [IP_ADDRESS] [MAC_ADDRESS] vlan [VLAN_RANGE] interface [INTERFACE]
no ip source binding [IP_ADDRESS] [MAC_ADDRESS] vlan [VLAN_RANGE] interface [INTERFACE]
default ip source binding [IP_ADDRESS] [MAC_ADDRESS] vlan [VLAN_RANGE] interface [INTERFACE]
```

**Parameters**

- **IP_ADDRESS** Specifies the IP ADDRESS.
- **MAC_ADDRESS** Specifies the MAC ADDRESS.
- **VLAN_RANGE** Specifies the VLAN ID range.
- **INTERFACE** Specifies the Ethernet interface.

**Related Commands**

- **ip verify source**
- **show ip verify source**

**Example**

- This command configures source IP-MAC binding entries to IP address 10.1.1.1, MAC address 0000.aaaa.1111, VLAN ID 4094, and Ethernet interface 36.

```plaintext
switch(config)#ip source binding 10.1.1.1 0000.aaaa.1111 vlan 4094 interface ethernet 36
switch(config)#
```
ip verify

The `ip verify` command configures Unicast Reverse Path Forwarding (uRPF) for inbound IPv4 packets on the configuration mode interface. uRPF verifies the accessibility of source IP addresses in packets that the switch forwards.

uRPF defines two operational modes: strict mode and loose mode.

- **Strict mode**: uRPF verifies that a packet is received on the interface that its routing table entry specifies for its return packet.
- **Loose mode**: uRPF validation does not consider the inbound packet’s ingress interface only that there is a valid return path.

The `no ip verify` and `default ip verify` commands disable uRPF on the configuration mode interface by deleting the corresponding `ip verify` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ip verify unicast source reachable-via RPF_MODE
no ip verify unicast
default ip verify unicast
```

**Parameters**

- **RPF_MODE** Specifies the uRPF mode. Options include:
  - `any` Loose mode.
  - `rx` Strict mode.
  - `rx allow-default` Strict mode. All inbound packets are forwarded if a default route is defined.

**Guidelines**

The first IPv4 uRPF implementation briefly disrupts IPv4 unicast routing. Subsequent `ip verify` commands on any interface do not disrupt IPv4 routing.

**Example**

- This command enables uRPF loose mode on VLAN interface 17.

  ```
  switch(config)#interface vlan 17
  switch(config-if-Vl17)#ip verify unicast source reachable-via any
  switch(config-if-Vl17)#show active
  interface Vlan17
       ip verify unicast source reachable-via any
  switch(config-if-Vl17)#
  ```

- This command enables uRPF strict mode on VLAN interface 18.

  ```
  switch(config)#interface vlan 18
  switch(config-if-Vl18)#ip verify unicast source reachable-via rx
  switch(config-if-Vl18)#show active
  interface Vlan18
       ip verify unicast source reachable-via rx
  switch(config-if-Vl18)#
  ```
ip verify source

The **ip verify source** command configures IP source guard (IPSG) applicable only to Layer 2 ports. When configured on Layer 3 ports, IPSG does not take effect until this interface is converted to Layer 2.

IPSG is supported on Layer 2 Port-Channels, not member ports. The IPSG configuration on port channels supersedes the configuration on the physical member ports. Hence, source IP MAC binding entries should be configured on port channels. When configured on a port channel member port, IPSG does not take effect until this port is deleted from the port channel configuration.

The **no ip verify source** and **default ip verify source** commands exclude VLAN IDs from IPSG filtering, and set the default for **ip verify source**.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

```
ip verify source vlan [VLAN_RANGE]
no ip verify source [VLAN_RANGE]
default ip verify source
```

**Parameters**

- **VLAN_RANGE**  Specifies the VLAN ID range.

**Related Commands**

- ip source binding
- show ip verify source

**Example**

- This command excludes VLAN IDs 1 through 3 from IPSG filtering. When enabled on a trunk port, IPSG filters the inbound IP packets on all allowed VLANs. IP packets received on VLANs 4 through 10 on Ethernet 36 will be filtered by IPSG, while those received on VLANs 1 through 3 are permitted.

```
switch(config)#no ip verify source vlan 1-3
switch(config)#interface ethernet 36
switch(config-if-Et36)#switchport mode trunk
switch(config-if-Et36)#switchport trunk allowed vlan 1-10
switch(config-if-Et36)#ip verify source
switch(config-if-Et36)#
```
platform trident forwarding-table partition

The **platform trident forwarding-table partition** command provides a shared table memory for L2, L3 and algorithmic LPM entries that can be partitioned in different ways.

Instead of having fixed-size tables for L2 MAC entry tables, L3 IP forwarding tables, and Longest Prefix Match (LPM) routes, the tables can be unified into a single shareable forwarding table.

**Important!** Changing the Unified Forwarding Table mode causes the forwarding agent to restart, briefly disrupting traffic forwarding on all ports.

The **no platform trident forwarding-table partition** and **default platform trident forwarding-table partition** commands remove the **platform trident forwarding-table partition** command from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

```
platform trident forwarding-table partition SIZE
no platform trident forwarding-table partition
default platform trident forwarding-table partition
```

**Parameters**

- **SIZE** Size of partition. Options include:
  - 0 288k L2 entries, 16k host entries, 16k LPM entries
  - 1 224k L2 entries, 80k host entries, 16k LPM entries
  - 2 160k L2 entries, 144k host entries, 16k LPM entries
  - 3 96k L2 entries, 208k host entries, 16k LPM entries

Default value is **2** (160k L2 entries, 144k host entries, 16k LPM entries).

**Example**

- This command sets the single shareable forwarding table to option 2 that supports 160k L2 entries, 144k host entries, and 16k LPM entries.

```
switch(config)# platform trident forwarding-table partition 2
```

- This command sets the single shareable forwarding table to option 3 that supports 96k L2 entries, 208k host entries, and 16k LPM entries. Since the switch was previously configured to option 2, you'll see a warning notice before the changes are implemented.

```
# switch(config)# platform trident forwarding-table partition 3
Warning: StrataAgent will restart immediately
```
**platform trident routing-table partition**

The **platform trident routing-table partition** command manages the partition sizes for the hardware LPM table that stores IPv6 routes of varying sizes.

An IPv6 route of length /64 (or shorter) requires half the hardware resources of an IPv6 route that is longer than /64. The switch installs routes of varying lengths in different table partitions. This command specifies the size of these partitions to optimize table usage.

---

**Important!** Changing the routing table partition mode causes the forwarding agent to restart, briefly disrupting traffic forwarding on all ports.

The **no platform trident routing-table partition** and **default platform trident routing-table partition** commands restore the default partitions sizes by removing the **platform trident routing-table partition** command from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

```plaintext
platform trident routing-table partition SIZE
no platform trident routing-table partition
default platform trident routing-table partition
```

**Parameters**

- **SIZE** Size of partition. Options include:
  - 1 16k IPv4 entries, 6k IPv6 (/64 and smaller) entries, 1k IPv6 (any prefix length)
  - 2 16k IPv4 entries, 4k IPv6 (/64 and smaller) entries, 2k IPv6 (any prefix length)
  - 3 16k IPv4 entries, 2k IPv6 (/64 and smaller) entries, 3k IPv6 (any prefix length)

Default value is 2 (16k IPv4 entries, 4k IPv6 (/64 and smaller) entries, 2k IPv6 (any prefix length).

**Restrictions**

Partition allocation cannot be changed from the default setting when uRPF is enabled for IPv6 traffic.

**Example**

- This command sets the shareable routing table to option 1 that supports 6K prefixes equal to or shorter than /64 and 1K prefixes longer than /64.

  ```plaintext
  switch(config)#platform trident routing-table partition 1
  switch(config)
  ```
rd (VRF configuration mode)

The rd command adds a route distinguisher (RD) to the configuration mode VRF. RDs internally identify routes belonging to a VRF to distinguish overlapping or duplicate IP address ranges. This allows the creation of distinct routes to the same IP address for different VPNs. The RD is a 64-bit number made up of an AS number or IPv4 address followed by a user-selected ID number.

Once an RD has been assigned to a VRF it cannot be changed. If the RD must be changed, remove the VRF using the no default form of the vrf definition command, then create it again.

Command Mode
VRF Configuration

Command Syntax
   rd admin_ID:local_assignment

Parameters
- **admin_ID**  An AS number or globally assigned IPv4 address identifying the entity assigning the RD. This should be an IANA-assigned identifying number.
- **local_assignment**  A locally assigned number distinguishing the VRF. Values range from 0-65535 if the admin_ID is an IPv4 address, or from 0-4,294,967,295 if the admin_ID is an AS number. If the admin_ID is an AS number, the local_assignment can also be entered in the form of an IPv4 address.

Example
- These commands identify the administrator of the VRF called “purple” as AS 530 and assign 12 as its local number.

```
switch(config)#vrf definition purple
switch(config-vrf-purple)#rd 530:12
```

**routing-context vrf**

The `routing-context vrf` command specifies the context-active VRF. The context-active VRF determines the default VRF that VRF-context aware commands use when displaying routing table data.

**Command Mode**
Privileged EXEC

**Command Syntax**

```
routing-context vrf [VRF_ID]
```

**Parameters**

- **VRF_ID** Name of VRF assigned as the current VRF scope. Options include:
  - `vrf_name` Name of user-defined VRF.
  - `default` System-default VRF.

**Guidelines**
VRF-context aware commands include:

- `clear arp-cache`
- `show ip`
- `show ip arp`
- `show ip route`
- `show ip route gateway`
- `show ip route host`
- `copy`
- `install source`
- `ping`
- `tcpdump`
- `telnet`
- `traceroute`

**Related Commands**
- `show routing-context vrf` displays the context-active VRF.

**Example**

- These commands specify `magenta` as the context-active VRF, then display the context-active VRF.

```
switch# routing-context vrf magenta
switch# show routing-context vrf
Current VRF routing-context is magenta
```

```
switch#
```
show arp

The show arp command displays all ARP tables. This command differs from the show ip arp command in that it shows MAC bindings for all protocols, whereas show ip arp only displays MAC address – IP address bindings. Addresses are displayed as their host name by including the resolve argument.

Command Mode

EXEC

Command Syntax

show arp [VRF_INST] [FORMAT] [HOST_ADD] [HOST_NAME] [INTF] [MAC_ADDR] [DATA]

Parameters

The VRF_INST and FORMAT parameters are always listed first and second. The DATA parameter is always listed last. All other parameters can be placed in any order.

- **VRF_INST** specifies the VRF instance for which data is displayed.
  - <no parameter> context-active VRF.
  - vrf vrf_name specifies name of VRF instance. System default VRF is specified by default.

- **FORMAT** Display format of host address. Options include:
  - <no parameter> entries associate hardware address with an IPv4 address.
  - resolve entry associate hardware address with a host name (if it exists).

- **HOST_ADD** IPv4 address by which routing table entries are filtered. Options include:
  - <no parameter> routing table entries are not filtered by host address.
  - ipv4_addr table entries matching specified IPv4 address.

- ** HOST_NAME** Host name by which routing table entries are filtered. Options include:
  - <no parameter> routing table entries are not filtered by host name.
  - host hostname entries matching hostname (text).

- **INTF** interfaces for which command displays status.
  - <no parameter> Routing table entries are not filtered by interface.
  - interface ethernet e_num Routed Ethernet interface specified by e_num.
  - interface loopback l_num Routed loopback interface specified by l_num.
  - interface management m_num Routed management interface specified by m_num.
  - interface port-channel p_num Routed port channel Interface specified by p_num.
  - interface vlan v_num VLAN interface specified by v_num.
  - interface vxlan vx_num VXLAN interface specified by vx_num.

- **MAC_ADDR** MAC address by which routing table entries are filtered. Options include:
  - <no parameter> Routing table entries are not filtered by interface MAC address.
  - mac_address mac_address entries matching mac_address (dotted hex notation – H.H.H).

- **DATA** Detail of information provided by command. Options include:
  - <no parameter> Routing table entries.
  - summary Summary of ARP table entries.
  - summary total Number of ARP table entries.
Related Commands

- `routing-context vrf` specifies the context-active VRF.

Example

- This command displays the ARP table.

  switch> `show arp`
  Address       Age (min)  Hardware Addr   Interface
  172.22.30.1    0          001c.730b.1d15  Management1
  172.22.30.133  0          001c.7304.3906  Management1
  switch>
show ip

The show ip command displays IPv4 routing, IPv6 routing, IPv4 multicast routing, and VRRP status on the switch.

**Command Mode**

EXEC

**Command Syntax**

`show ip`

**Example**

- This command displays IPv4 routing status.

  `switch>show ip`

  IP Routing : Enabled
  IP Multicast Routing : Disabled
  VRRP: Configured on 0 interfaces

  IPv6 Unicast Routing : Enabled
  IPv6 ECMP Route support : False
  IPv6 ECMP Route nexthop index: 5
  IPv6 ECMP Route num prefix bits for nexthop index: 10

  `switch>`
show ip arp

The `show ip arp` command displays ARP cache entries that map an IPv4 address to a corresponding MAC address. The table displays addresses by their host names when the command includes the `resolve` argument.

**Command Mode**
EXEC

**Command Syntax**
```
show ip arp [VRF_INST] [FORMAT] [HOST_ADD] [HOST_NAME] [INTF] [MAC_ADDR] [DATA]
```

**Parameters**
The `VRF_INST` and `FORMAT` parameters are always listed first and second. The `DATA` parameter is always listed last. All other parameters can be placed in any order.

- **VRF_INST** specifies the VRF instance for which data is displayed.
  - `<no parameter>` context-active VRF.
  - `vrf vrf_name` specifies name of VRF instance. System default VRF is specified by `default`.
- **FORMAT** Display format of host address. Options include:
  - `<no parameter>` entries associate hardware address with an IPv4 address.
  - `resolve` entry associate hardware address with a host name (if it exists).
- **HOST_ADDR** IPv4 address by which routing table entries are filtered. Options include:
  - `<no parameter>` routing table entries are not filtered by host address.
  - `ipv4_addr` table entries matching specified IPv4 address.
- **HOST_NAME** Host name by which routing table entries are filtered. Options include:
  - `<no parameter>` routing table entries are not filtered by host name.
  - `host hostname` entries matching `hostname` (text).
- **INTERFACE_NAME** interfaces for which command displays status.
  - `<no parameter>` Routing table entries are not filtered by interface.
  - `interface ethernet e_num` Routed Ethernet interface specified by `e_num`.
  - `interface loopback l_num` Routed loopback interface specified by `l_num`.
  - `interface management m_num` Routed management interface specified by `m_num`.
  - `interface port-channel p_num` Routed port channel Interface specified by `p_num`.
  - `interface vlan v_num` VLAN interface specified by `v_num`.
  - `interface vxlan vx_num` VXLAN interface specified by `vx_num`.
- **MAC_ADDR** MAC address by which routing table entries are filtered. Options include:
  - `<no parameter>` Routing table entries are not filtered by interface MAC address.
  - `mac_address mac_address` entries matching `mac_address` (dotted hex notation – H.H.H).
- **DATA** Detail of information provided by command. Options include:
  - `<no parameter>` Routing table entries.
  - `summary` Summary of ARP table entries.
  - `summary total` Number of ARP table entries.

**Related Commands**
- `routing-context vrf` specifies the context-active VRF.
Examples

- This command displays ARP cache entries that map MAC addresses to IPv4 addresses.

```
switch> show ip arp
Address       Age (min)   Hardware Addr   Interface
172.25.0.2     0           004c.6211.021e  Vlan101, Port-Channel2
172.22.0.1     0           004c.6214.3699  Vlan1000, Port-Channel1
172.22.0.2     0           004c.6219.a0f3   Vlan1000, Port-Channel1
172.22.0.3     0           0045.4942.a32c   Vlan1000, Ethernet33
172.22.0.5     0           f012.3118.c09d   Vlan1000, Port-Channel1
172.22.0.6     0           00e1.d11a.a1eb   Vlan1000, Ethernet5
172.22.0.7     0           004f.e320.cd23   Vlan1000, Ethernet6
172.22.0.8     0           0032.48da.f9d9   Vlan1000, Ethernet37
172.22.0.9     0           0018.910a.1fc5   Vlan1000, Ethernet29
172.22.0.11    0           0056.cbe9.8510   Vlan1000, Ethernet26
```

- This command displays ARP cache entries that map MAC addresses to IPv4 addresses. Host names assigned to IP addresses are displayed in place of the address.

```
switch> show ip arp resolve
Address       Age (min)   Hardware Addr   Interface
green-vl101.new 0           004c.6211.021e  Vlan101, Port-Channel2
172.22.0.1     0           004c.6214.3699  Vlan1000, Port-Channel1
orange-vl1000.n 0           004c.6219.a0f3   Vlan1000, Port-Channel1

```
show ip arp inspection vlan

The `show ip arp inspection vlan` command displays the configuration and operation state of ARP inspection. For a VLAN range specified, only VLANs with ARP inspection enabled will be displayed. If no VLAN is specified, all VLANs with ARP inspection enabled are displayed. The operation state turns to Active when hardware is ready to trap ARP packets for inspection.

**Command Mode**

EXEC

**Command Syntax**

```
show ip arp inspection vlan [LIST]
```

**Parameters**

- `LIST` specifies the VLAN interface number.

**Related Commands**

- `ip arp inspection limit`
- `ip arp inspection trust`
- `show ip arp inspection statistics`

**Example**

- This command displays the configuration and operation state of ARP inspection for VLANs 1 through 150.

```
switch(config)#show ip arp inspection vlan 1 - 150
VLAN 1
----------
Configuration : Enabled
Operation State : Active
VLAN 2
----------
Configuration : Enabled
Operation State : Active
{...}
VLAN 150
----------
Configuration : Enabled
Operation State : Active

switch(config)#
```
show ip arp inspection statistics

The `show ip arp inspection statistics` command displays the statistics of inspected ARP packets. For a VLAN specified, only VLANs with ARP inspection enabled will be displayed. If no VLAN is specified, all VLANs with ARP inspection enabled are displayed.

**Command Mode**

EXEC

**Command Syntax**

```
show ip arp inspection statistics [vlan [VID] | [INTERFACE] interface <intf_slot/intf_port>]
```

**Parameters**

- **VID** specifies the VLAN interface ID.
- **INTERFACE** specifies the interface (e.g., Ethernet).
  - `<intf_slot>` interface slot.
  - `<intf_port>` interface port.
- **INTF** specifies the VLAN interface slot and port.

**Related Commands**

- `ip arp inspection limit`
- `ip arp inspection trust`
- `show ip arp inspection vlan`

**Examples**

- This command display statistics of inspected ARP packets for VLAN 10.

  ```
  switch(config)#show ip arp inspection statistics vlan 10
  Vlan : 10
  ------------
  ARP
  Req Forwarded = 20
  ARP Res Forwarded = 20
  ARP Req Dropped = 1
  ARP Res Dropped = 1
  Last invalid ARP:
  Time: 10:20:30 ( 5 minutes ago )
  Reason: Bad IP/Mac match
  Received on: Ethernet 3/1
  Packet:
    Source MAC: 00:01:00:01:00:01
    Dest MAC: 00:02:00:02:00:02
    ARP Type: Request
    ARP Sender MAC: 00:01:00:01:00:01
    ARP Sender IP: 1.1.1
  ```

  switch(config)#
This command displays ARP inspection statistics for Ethernet interface 3/1.

```
switch(config)#show ip arp inspection statistics ethernet interface 3/1
Interface : 3/1
----------
ARP Req Forwarded = 10
ARP Res Forwarded = 10
ARP Req Dropped = 1
ARP Res Dropped = 1

Last invalid ARP:
Time: 10:20:30 ( 5 minutes ago )
Reason: Bad IP/Mac match
Received on: VLAN 10
Packet:
  Source MAC: 00:01:00:01:00:01
  Dest MAC: 00:02:00:02:00:02
  ARP Type: Request
  ARP Sender MAC: 00:01:00:01:00:01
  ARP Sender IP: 1.1.1
switch(config)#
```
show ip dhcp relay

The `show ip dhcp relay` command displays the DHCP relay agent configuration status on the switch.

**Command Mode**

EXEC

**Command Syntax**

`show ip dhcp relay`

**Example**

- This command displays the DHCP relay agent configuration status.

```
switch>show ip dhcp relay
DHCP Relay is active
DHCP Relay Option 82 is disabled
DHCP Smart Relay is enabled
Interface: Vlan100
  DHCP Smart Relay is disabled
  DHCP servers: 10.4.4.4
switch>
```
**show ip dhcp relay counters**

The `show ip dhcp relay counters` command displays the number of DHCP packets received, forwarded, or dropped on the switch and on all interfaces enabled as DHCP relay agents.

**Command Mode**

EXEC

**Command Syntax**

`show ip dhcp relay counters`

**Example**

- This command displays the IP DHCP relay counter table.

```
switch>show ip dhcp relay counters

<table>
<thead>
<tr>
<th>Dhcp Packets</th>
<th>Rcvd</th>
<th>Fwdd</th>
<th>Drop</th>
<th>Last Cleared</th>

</tr>
</tbody>
</table>

switch>
```
show ip dhcp snooping

The show ip dhcp snooping command displays the DHCP snooping configuration.

Command Mode

   EXEC

Command Syntax

   show ip dhcp snooping

Related Commands

   •  ip dhcp snooping globally enables DHCP snooping.
   •  ip dhcp snooping vlan enables DHCP snooping on specified VLANs.
   •  ip dhcp snooping information option enables insertion of option-82 snooping data.
   •  ip helper-address enables the DHCP relay agent on a configuration mode interface.

Example

   •  This command displays the switch's DHCP snooping configuration.

     switch>show ip dhcp snooping
     DHCP Snooping is enabled
     DHCP Snooping is operational
     DHCP Snooping is configured on following VLANs:
     100
     DHCP Snooping is operational on following VLANs:
     100
     Insertion of Option-82 is enabled
     Circuit-id format: Interface name:Vlan ID
     Remote-id: 00:1c:73:1f:b4:38 (Switch MAC)
     switch>
show ip dhcp snooping counters

The **show ip dhcp snooping counters** command displays counters that track the quantity of DHCP request and reply packets that the switch receives. Data is either presented for each VLAN or aggregated for all VLANs with counters for packets dropped.

**Command Mode**
EXEC

**Command Syntax**

```
show ip dhcp snooping counters [COUNTER_TYPE]
```

**Parameters**

- **COUNTER_TYPE** The type of counter that the command resets. Formats include:
  - `<no parameter>` command displays counters for each VLAN.
  - **debug** command displays aggregate counters and drop cause counters.

**Example**

- This command displays the number of DHCP packets sent and received on each VLAN.
  ```
  switch>show ip dhcp snooping counters
  | Dhcp Request Pkts | Dhcp Reply Pkts |
  Vlan | Rcvd Fwdd Drop | Rcvd Fwdd Drop | Last Cleared
  -----|-------------|-------------|-------------
  100  |   0     0 |     0     0 | 0:35:39 ago
  switch>
  ```

- This command displays the number of DHCP packets sent on the switch.
  ```
  switch>show ip dhcp snooping counters debug
  Counter                        Snooping to Relay Relay to Snooping
  ----------------------------- ------------------- -------------------
  Received                      0                   0
  Forwarded                     0                   0
  Dropped - Invalid VlanId      0                   0
  Dropped - Parse error         0                   0
  Dropped - Invalid Dhcp Optype 0                   0
  Dropped - Invalid Info Option 0                   0
  Dropped - Snooping disabled   0                   0
  Last Cleared: 3:37:18 ago
  switch>
  ```
**show ip dhcp snooping hardware**

The *show ip dhcp snooping hardware* command displays internal hardware DHCP snooping status on the switch.

**Command Mode**

EXEC

**Command Syntax**

`show ip dhcp snooping hardware`

**Example**

- This command DHCP snooping hardware status.

```
switch>show ip dhcp snooping hardware
DHCP Snooping is enabled
DHCP Snooping is enabled on following VLANs:
  None
  Vlans enabled per Slice
  Slice:  FixedSystem
  None

switch>
```
show ip helper-address

The **show ip helper-address** command displays the status of DHCP relay agent parameters on the switch and each interface where at least one feature parameter is listed. The command provides status on the following parameters:

- Global: DHCP relay agent Always-on mode, DHCP relay agent Information option
- Interface: DHCP server (list of addresses), Circuit ID contents

**Command Mode**

EXEC

**Command Syntax**

`show ip helper-address`

**Example**

- This command displays the DHCP Agent Relay parameter status.

```bash
switch>show ip helper-address
DHCP Relay Agent Information Option Enabled
DHCP Relay Agent Always-On Mode Enabled
Interface: Vlan200
  Circuit ID: V-200
  DHCP servers: 10.3.31.14
switch>
```
show ip interface

The **show ip interface** command displays the status of specified interfaces that are configured as routed ports. The command provides the following information:

- Interface description
- Internet address
- Broadcast address
- Address configuration method
- Proxy-ARP status
- MTU size

**Command Mode**
EXEC

**Command Syntax**

```
show ip interface [INTERFACE_NAME] [VRF_INST]
```

**Parameters**

- **INTERFACE_NAME** interfaces for which command displays status.
  - `<no parameter>` all routed interfaces.
  - `ipv4_addr` Neighbor IPv4 address.
  - `ethernet e_range` Routed Ethernet interfaces specified by `e_range`.
  - `loopback l_range` Routed loopback interfaces specified by `l_range`.
  - `management m_range` Routed management interfaces specified by `m_range`.
  - `port-channel p_range` Routed port channel Interfaces specified by `p_range`.
  - `vlan v_range` VLAN interfaces specified by `v_range`.
  - `vxlan vx_range` VXLAN interfaces specified by `vx_range`.
- **VRF_INST** specifies the VRF instance for which data is displayed.
  - `<no parameter>` context-active VRF.
  - `vrf vrf_name` specifies name of VRF instance. System default VRF is specified by `default`.

**Example**

- This command displays IP status of configured VLAN interfaces numbered between 900 and 910.

```bash
switch>show ip interface vlan 900-910
! Some interfaces do not exist
Vlan901 is up, line protocol is up (connected)
  Description: ar.pqt.mlag.peer
  Internet address is 170.23.254.1/30
  Broadcast address is 255.255.255.255
  Address determined by manual configuration
  Proxy-ARP is disabled
  MTU 9212 bytes
Vlan903 is up, line protocol is up (connected)
  Description: ar.pqt.rn.170.23.254.16/29
  Internet address is 170.23.254.19/29
  Broadcast address is 255.255.255.255
  Address determined by manual configuration
  Proxy-ARP is disabled
  MTU 9212 bytes
```
**show ip interface brief**

Use the `show ip interface brief` command output to display the status summary of the specified interfaces that are configured as routed ports. The command provides the following information for each specified interface:

- IP address
- Operational status
- Line protocol status
- MTU size

**Command Mode**

EXEC

**Command Syntax**

```
show ip interface [INTERFACE_NAME] [VRF_INST] brief
```

**Parameters**

- **INTERFACE_NAME**
  - interfaces for which command displays status.
  - `<no parameter>` all routed interfaces.
  - `ipv4_addr` Neighbor IPv4 address.
  - `ethernet e_range` Routed Ethernet interfaces specified by `e_range`.
  - `loopback l_range` Routed loopback interfaces specified by `l_range`.
  - `management m_range` Routed management interfaces specified by `m_range`.
  - `port-channel p_range` Routed port channel Interfaces specified by `p_range`.
  - `vlan v_range` VLAN interfaces specified by `v_range`.
  - `vxlan vx_range` VXLAN interface range specified by `vx_range`.
- **VRF_INST**
  - specifies the VRF instance for which data is displayed.
  - `<no parameter>` context-active VRF.
  - `vrf vrf_name` specifies name of VRF instance. System default VRF is specified by `default`.

**Example**

- This command displays the summary status of VLAN interfaces 900-910

```bash
switch>show ip interface vlan 900-910 brief
! Some interfaces do not exist
Interface        IP Address     Status   Protocol  MTU
Vlan901          170.33.254.1/30 up       up       9212
Vlan902          170.33.254.14/29  up       up       9212
Vlan905          170.33.254.17/29  up       up       1500
Vlan907          170.33.254.67/29  up       up       9212
Vlan910          170.33.254.30/30  up       up       9212
```
show ip nat access-list interface

The `show ip nat acl interface` command displays the access control lists (ACLs) that are configured as source NAT or destination NAT filters. The display indicates ACL rules that do not comply with these NAT requirements:

- Source IP address is `any`.
- Destination IP address may use any mask size.
- Source port matching is not allowed.
- Protocol matching is not allowed.

**Command Mode**

EXEC

**Command Syntax**

```
show ip nat access-list [INTF] [LISTS]
```

**Parameters**

- **INTF** Filters NAT statements by interface. Options include:
  - <no parameter> includes all statements on all interfaces.
  - `interface ethernet e_num` Statements on specified Ethernet interface.
  - `interface loopback l_num` Statements on specified Loopback interface.
  - `interface management m_num` Statements on specified Management interface.
  - `interface port-channel p_num` Statements on specified Port-Channel Interface.
  - `interface vlan v_num` Statements on specified VLAN interface.
  - `interface vxlan vx_num` Statements on specified VXLAN interface.
- **LISTS** ACLs displayed by command. Options include:
  - <no parameter> all ACLs.
  - `acl_name` Specifies individual ACL.

**Example**

- These commands display the NAT command usage of the ACL1 and ACL2 access control lists.
  ```
  switch>show ip nat acl ACL1
  acl ACL1
  (0.0.0.0/0, 168.10.1.1/32)
  Interfaces using this ACL for Nat:
  Vlan100
  
  switch>show ip nat acl ACL2
  acl ACL2
  (168.10.1.1/32, 0.0.0.0/0)
  Interfaces using this ACL for Nat:
  Vlan201
  switch>
  ```
show ip nat pool

The **show ip nat pool** command displays the configuration of the address pool.

**Command Mode**

EXEC

**Command Syntax**

```
show ip nat pool
```

**Parameters**

- **pool_name**  The name of the pool.
- **POOL_SET**  Options include:
  - `<no parameter>`  all configured port channels.
  - **pool_name**  The name of the pool.

**Example**

- This command displays all the address pools configured on the switch.
  ```
  switch#show ip nat pool
  Pool     StartIp        EndIp         Prefix
  p1       10.15.15.15    10.15.15.25   24
  p2       10.10.15.15    10.10.15.25   22
  p3       10.12.15.15    10.12.15.25   12
  switch#
  ```

- These commands display specific information for the address pools configured on the switch.
  ```
  switch#show ip nat pool p1
  Pool     StartIp        EndIp         Prefix
  p1       4.1.1.1         4.1.1.2       24
  1.1.1.1   1.1.1.2       24
  3.1.1.1   3.1.1.2       24
  switch#
  ```
  ```
  switch#show ip nat pool p2
  Pool     StartIp        EndIp         Prefix
  p2       10.1.1.1        10.1.1.2      16
  switch#
  ```
show ip nat translations

The `show ip nat translations` command displays configured NAT statements in the switch hardware.

Command Mode
EXEC

Command Syntax

```
show ip nat translations [INTF] [ADDR] [TYPE] [DIR] [H_STATE] [K_STATE] [V_STATE]
```

Command position of `INTF`, `ADDR`, `TYPE`, and `DIR` parameters are interchangeable.

Parameters

- **INTF** Filters NAT statements by interface. Options include:
  - `<no parameter>` includes all statement on all interfaces.
  - `interface ethernet e_num` Statements on specified Ethernet interface.
  - `interface loopback l_num` Statements on specified Loopback interface.
  - `interface management m_num` Statements on specified Management interface.
  - `interface port-channel p_num` Statements on specified Port-Channel Interface.
  - `interface vlan v_num` Statements on specified VLAN interface.

- **ADDR** Filters NAT statements by status. Options include:
  - `<no parameter>` includes all NAT statements, including those not installed in hardware.
  - `address ipv4_addr` includes only NAT statements installed in hardware.

- **TYPE** Filters NAT statements by status. Options include:
  - `<no parameter>` includes all NAT statements, including those not installed in hardware.
  - `static` includes only NAT statements installed in hardware.
  - `dynamic` includes only NAT statements installed in hardware.

- **DIR** Filters NAT statements by status. Options include:
  - `<no parameter>` includes all NAT statements, including those not installed in hardware.
  - `source` includes only NAT statements installed in hardware.
  - `destination` includes only NAT statements installed in hardware.

- **H_STATE** Filters NAT statements by status. Options include:
  - `<no parameter>` includes all NAT statements, including those not installed in hardware.
  - `hardware` includes only NAT statements installed in hardware.

- **K_STATE** Filters NAT statements by status. Options include:
  - `<no parameter>` includes all NAT statements, including those not installed in hardware.
  - `kernel` includes only NAT statements installed in hardware.

- **V_STATE** Specifies information that the command returns. Options include:
  - `<no parameter>` displays table of NAT translations.
  - `detail` displays table of NAT translations.
### Example

- This command displays all configured NAT translations.

```text
switch# show ip nat translations
Source IP   Destination IP        Translated IP        TGT Type Intf
---------------------------------------------------------------------
192.152.1.10:20342   172.22.22.40:80       172.17.254.161:22222  SRC STAT Vl3945
switch#
```
show ip route

The show ip route command displays routing table entries that are in the Forwarding Information Base (FIB), including static routes, routes to directly connected networks, and dynamically learned routes. Multiple equal-cost paths to the same prefix are displayed contiguously as a block, with the destination prefix displayed only on the first line.

The show running-config command displays configured commands not in the FIB.

Command Mode
EXEC

Command Syntax

```
show ip route [VRF_INSTANCE] [ADDRESS] [ROUTE_TYPE] [INFO_LEVEL] [PREFIX]
```

Parameters

The VRF_INSTANCE and ADDRESS parameters are always listed first and second, respectively. All other parameters can be placed in any order.

- **VRF_INSTANCE** specifies the VRF instance for which data is displayed.
  - <no parameter> context-active VRF.
  - vrf vrf_name specifies name of VRF instance. System default VRF is specified by default.

- **ADDRESS** filters routes by IPv4 address or subnet.
  - <no parameter> all routing table entries.
  - ipv4_addr routing table entries matching specified address.
  - ipv4_subnet routing table entries matching specified subnet (CIDR or address-mask).

- **ROUTE_TYPE** filters routes by specified protocol or origin. Options include:
  - <no parameter> all routing table entries.
  - aggregate entries for BGP aggregate routes.
  - bgp entries added through BGP protocol.
  - connected entries for routes to networks directly connected to the switch.
  - isis entries added through ISIS protocol.
  - kernel entries appearing in Linux kernel but not added by EOS software.
  - ospf entries added through OSPF protocol.
  - rip entries added through RIP protocol.
  - static entries added through CLI commands.

- **INFO_LEVEL** filters entries by next hop connection. Options include:
  - <no parameter> filters routes whose next hops are directly connected.
  - detail displays all routes.

- **PREFIX** filters routes by prefix.
  - <no parameter> specific route entry that matches the ADDRESS parameter.
  - longer-prefixes all subnet route entries in range specified by ADDRESS parameter.

Related Commands

- **routing-context vrf** specifies the context-active VRF.
Example

- This command displays IPv4 routes learned through BGP.

```plaintext
switch>show ip route bgp
Codes:  C - connected,  S - static,  K - kernel,
        O - OSPF,  IA - OSPF inter area,  E1 - OSPF external type 1,
        E2 - OSPF external type 2,  N1 - OSPF NSSA external type 1,

```
**show ip route age**

The `show ip route age` command displays the current state of the routing table and specifies the last time the route was updated.

**Command Mode**

EXEC

**Command Syntax**

```
show ip route ADDRESS age
```

**Parameters**

- `ADDRESS` Filters routes by IPv4 address or subnet.
  - `ipv4_addr` routing table entries matching specified address.
  - `ipv4_subnet` routing table entries matching specified subnet (CIDR or address-mask).

**Example**

- This command shows the amount of time since the last update to ip route 172.17.0.0/20.

```
switch>show ip route 172.17.0.0/20 age
Codes: C - connected, S - static, K - kernel,
O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,

N2 - OSPF NSSA external type 2, B I - iBGP, B E - eBGP,
R - RIP, I - ISIS, A - Aggregate

B E 172.17.0.0/20 via 172.25.0.1, age 3d01h
```

switch>
The `show ip route gateway` command displays IP addresses of all gateways (next hops) used by active routes.

**Command Mode**

EXEC

**Command Syntax**

```
show ip route [VRF_INSTANCE] gateway
```

**Parameters**

- `VRF_INSTANCE` specifies the VRF instance for which data is displayed.
  - `<no parameter>` context-active VRF.
  - `vrf vrf_name` specifies name of VRF instance. System default VRF is specified by `default`.

**Related Commands**

- `routing-context vrf` specifies the context-active VRF.

**Example**

```
switch>show ip route gateway
The following gateways are in use:
  172.25.0.1 Vlan101
  172.17.253.2 Vlan3000
  172.17.254.2 Vlan3901
  172.17.254.11 Vlan3902
  172.17.254.13 Vlan3902
  172.17.254.17 Vlan3903
  172.17.254.20 Vlan3903
  172.17.254.66 Vlan3908
  172.17.254.67 Vlan3908
  172.17.254.68 Vlan3908
  172.17.254.29 Vlan3910
  172.17.254.33 Vlan3911
  172.17.254.35 Vlan3911
  172.17.254.105 Vlan3912
  172.17.254.86 Vlan3984
  172.17.254.98 Vlan3992
  172.17.254.99 Vlan3992
switch>
```
show ip route host

The **show ip route host** command displays all host routes in the host forwarding table. Host routes are those whose destination prefix is the entire address (mask = 255.255.255.255 or prefix = /32). Each entry includes a code of the route’s purpose:

- **F** static routes from the FIB.
- **R** routes defined because the IP address is an interface address.
- **B** broadcast address.
- **A** routes to any neighboring host for which the switch has an ARP entry.

**Command Mode**

EXEC

**Command Syntax**

```
show ip route [VRF_INSTANCE] host
```

**Parameters**

- **VRF_INSTANCE** specifies the VRF instance for which data is displayed.
  - `<no parameter>` context-active VRF.
  - `vrf vrf_name` specifies name of VRF instance. System default VRF is specified by `default`.

**Related Commands**

- `routing-context vrf` specifies the context-active VRF.

**Example**

- This command displays all host routes in the host forwarding table.

  switch>show ip route host
  R - receive  B - broadcast  F - FIB,  A - attached

  F  127.0.0.1 to cpu
  B  172.17.252.0 to cpu
  A  172.17.253.2 on Vlan2000
  R  172.17.253.3 to cpu
  A  172.17.253.10 on Vlan2000
  B  172.17.253.255 to cpu
  B  172.17.254.0 to cpu
  R  172.17.254.1 to cpu
  B  172.17.254.3 to cpu
  B  172.17.254.8 to cpu
  A  172.17.254.11 on Vlan2902
  R  172.17.254.12 to cpu

  F  172.26.0.28 via 172.17.254.20 on Vlan3003
      via 172.17.254.67 on Vlan3008
      via 172.17.254.98 on Vlan3492
      via 172.17.254.2 on Vlan3601
      via 172.17.254.13 on Vlan3602
  via 172.17.253.2 on Vlan3000
  F  172.26.0.29 via 172.25.0.1 on Vlan101
  F  172.26.0.30 via 172.17.254.29 on Vlan3910
  F  172.26.0.32 via 172.17.254.105 on Vlan3912

  switch>
**show ip route summary**

The `show ip route summary` command displays the number of routes, categorized by destination prefix, in the routing table.

**Command Mode**

EXEC

**Command Syntax**

```
show ip route [VRF_INSTANCE] summary
```

**Parameters**

- `VRF_INSTANCE` specifies the VRF instance for which data is displayed.
  - `<no parameter>` context-active VRF.
  - `vrf vrf_name` specifies name of VRF instance. System default VRF is specified by `default`.

**Example**

- This command displays a summary of the routing table contents.

```
switch>show ip route summary
Route Source          Number Of Routes
---------------------------------------------
connected             15
static                0
ospf                  74
    Intra-area: 32 Inter-area:33 External-1:0 External-2:9
    NSSA External-1:0 NSSA External-2:0
bgp                   7
    External: 6 Internal: 1
internal              45
attached              18
aggregate             0
switch>
```
show ip route tag

The `show ip route tag` command displays the route tag assigned to the specified IPv4 address or subnet. Route tags are added to static routes for use by route maps.

**Command Mode**

EXEC

**Command Syntax**

```
show ip route [VRF_INSTANCE] ADDRESS tag
```

**Parameters**

- **VRF_INSTANCE** specifies the VRF instance for which data is displayed.
  - `<no parameter>` context-active VRF.
  - `vrf vrf_name` specifies name of VRF instance. System default VRF is specified by `default`.
- **ADDRESS** displays routes of specified IPv4 address or subnet.
  - `ipv4_addr` routing table entries matching specified IPv4 address.
  - `ipv4_subnet` routing table entries matching specified IPv4 subnet (CIDR or address-mask).

**Example**

- This command displays the route tag for the specified subnet.

  ```
  switch>show ip route 172.17.50.0/23 tag
  Codes: C - connected, S - static, K - kernel,
  O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
  E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
  N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
  R - RIP, A - Aggregate
  
  O E2 172.17.50.0/23 tag 0
  
  switch>
  ```
**show ip verify source**

The **show ip verify source** command displays the IP source guard (IPSG) configuration, operational states, and IP-MAC binding entries for the configuration mode interface.

**Command Mode**

EXEC

**Command Syntax**

```
show ip verify source [VLAN | DETAIL]
```

**Parameters**

- **VLAN** displays all VLANs configured in `no ip verify source vlan`.
- **DETAIL** displays all source IP-MAC binding entries configured for IPSG.

**Related Commands**

- `ip source binding`
- `ip verify source`

**Example**

This command verifies the IPSG configuration and operational states.

```
switch(config)#show ip verify source
Interface       Operational State
--------------- ------------------------
Ethernet1       IP source guard enabled
Ethernet2       IP source guard disabled
```

**Example**

This command displays all VLANs configured in `no ip verify source vlan`. Hardware programming errors, e.g., VLAN classification failed, are indicated in the operational state. If an error occurs, this VLAN will be considered as enabled for IPSG. Traffic on this VLAN will still be filtered by IPSG.

```
switch(config)#show ip verify source vlan
IPSG disabled on VLANS: 1-2
VLAN     Operational State
--------- ------------------------
1         IP source guard disabled
2         Error: vlan classification failed
```

**Example**

This command displays all source IP-MAC binding entries configured for IPSG. A source binding entry is considered active if it is programmed in hardware. IP traffic matching any active binding entry will be permitted. If a source binding entry is configured on an interface or a VLAN whose operational state is IPSG disabled, this entry will not be installed in the hardware, in which case an “IP source guard disabled” state will be shown. If a port channel has no member port configured, binding entries configured for this port channel will not be installed in hardware, and a “Port-Channel down” state will be shown.

```
switch(config)#show ip verify source detail
Interface       IP Address    MAC Address      VLAN   State
--------------- ------------- ---------------- ------ ------------------------
Ethernet1       10.1.1.1      0000.aaaa.1111   5      active
Ethernet1       10.1.1.5      0000.aaaa.5555   1      IP source guard disabled
Port-Channel1   20.1.1.1      0000.bbbb.1111   4      Port-Channel down
```
show platform arad ip route

The `show platform arad ip route` command shows resources for all IPv4 routes in hardware. Routes that use the additional hardware resources will appear with an asterisk.

**Command Mode**

EXEC

**Command Syntax**

`show platform arad ip route`

**Related Commands**

- `agent SandL3Unicast terminate` enables restarting the layer 3 agent to ensure IPv4 routes are optimized.
- `ip hardware fib optimize` enables IPv4 route scale.
- `show platform arad ip route summary` shows hardware resource usage of IPv4 routes.
### Examples

- This command shows resources for all IPv4 routes in hardware. Routes that use the additional hardware resources will appear with an asterisk.

```
switch(config)#show platform arad ip route
Tunnel Type: M(mpls), G(gre)
* - Routes in LEM
```

`switch(config)#`
show platform arad ip route summary

The `show platform arad ip route summary` command shows hardware resource usage of IPv4 routes.

**Command Mode**

EXEC

**Command Syntax**

`show platform arad ip route summary`

**Related Commands**

- `agent SandL3Unicast terminate` enables restarting the layer 3 agent to ensure IPv4 routes are optimized.
- `ip hardware fib optimize` enables IPv4 route scale.
- `show platform arad ip route` shows resources for all IPv4 routes in hardware. Routes that use the additional hardware resources will appear with an asterisk.

**Example**

- This command shows hardware resource usage of IPv4 routes.

```
switch(config)#show platform arad ip route summary
Total number of VRFs: 1
Total number of routes: 25
Total number of route-paths: 21
Total number of lem-routes: 4

switch(config)#
```
show platform trident forwarding-table partition

The `show platform trident forwarding-table partition` command displays the size of the L2 MAC entry tables, L3 IP forwarding tables, and Longest Prefix Match (LPM) routes.

**Command Mode**
Privileged EXEC

**Command Syntax**

```
show platform trident forwarding-table partition
```

**Example**

- This command shows the Trident forwarding table information.

```
switch(config)#show platform trident forwarding-table partition
L2 Table Size: 96k
L3 Host Table Size: 208k
LPM Table Size: 16k
switch(config)#
```
show routing-context vrf

The show routing-context vrf command displays the context-active VRF. The context-active VRF determines the default VRF that VRF-context aware commands use when displaying routing table data from a specified VRF.

Command Mode
EXEC

Command Syntax
    show routing-context vrf

Related Commands
    • routing-context vrf specifies the context-active VRF.

Example
    • This command displays the context-active VRF.

        switch>show routing-context vrf
        Current VRF routing-context is PURPLE
        switch>

**show vrf**

The `show vrf` command displays the VRF name, RD, supported protocols, state and included interfaces for the specified VRF or for all VRFs on the switch.

**Command Mode**

EXEC

**Command Syntax**

```
show vrf [VRF_INSTANCE]
```

**Parameters**

- `VRF_INSTANCE` specifies the VRF instance to display.
- `<no parameter>` information is displayed for all VRFs.
- `vrf vrf_name` information is displayed for the specified user-defined VRF.

**Example**

- This command displays information for the VRF named “purple.”

```
switch> show vrf purple
Vrf          RD              Protocols       State         Interfaces
------------ --------------- --------------- ---------------- --------------
purple       64496:237       ipv4            no routing     Vlan42, Vlan43

switch>
```
vrf definition

The vrf definition command places the switch in VRF configuration mode for the specified VRF. If the named VRF does not exist, this command creates it. The number of user-defined VRFs supported varies by platform.

To add an interface to the VRF once it is created, use the vrf forwarding command.

The no vrf definition and default vrf definition commands delete the specified VRF instance by removing the corresponding vrf definition command from running-config. This also removes all IP addresses associated with interfaces that belong to the deleted VRF.

The exit command returns the switch to global configuration mode.

Command Mode
Global Configuration

Command Syntax
   vrf definition vrf_name
   no vrf definition vrf_name
   default vrf definition vrf_name

Parameters
- vrf_name Name of VRF being created, deleted or configured. The names “main” and “default” are reserved.

Commands Available in VRF Configuration Mode
- rd (VRF configuration mode)

Example
- This command creates a VRF named “purple” and places the switch in VRF configuration mode for that VRF.

  switch(config)#vrf definition purple
  switch(config-vrf-purple)#
vrf forwarding

The **vrf forwarding** command adds the configuration mode interface to the specified VRF. You must create the VRF first, using the **vrf definition** command.

The **no vrf forwarding** and **default vrf forwarding** commands remove the configuration mode interface from the specified VRF by deleting the corresponding **vrf forwarding** command from **running-config**.

All forms of the **vrf forwarding** command remove all IP addresses associated with the configuration mode interface.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
vrf forwarding vrf_name
no vrf forwarding [vrf_name]
default vrf forwarding [vrf_name]
```

**Parameters**

- **vrf_name** name of configured VRF.

**Examples**

- These commands add the configuration mode interface (VLAN 20) to the VRF named “purple”.
  
  ```
  switch(config)#interface vlan 20
  switch(config-if-Vl20)#vrf forwarding purple
  switch(config-if-Vl20)#
  ```

- These commands remove the configuration mode interface from VRF “purple”.
  
  ```
  switch(config)#interface vlan 20
  switch(config-if-Vl20)#no vrf forwarding purple
  switch(config-if-Vl20)#
  ```
IPv6

Arista switches support Internet Protocol version 4 (IPv4) and Internet Protocol version 6 (IPv6) for routing packets across network boundaries. This chapter describes Arista’s implementation of IPv6 and includes these sections:

- Section 25.1: Introduction
- Section 25.2: IPv6 Description
- Section 25.3: Configuring IPv6
- Section 25.4: IPv6 Command Descriptions

25.1 Introduction

Routing transmits network layer data packets over connected independent subnets. Each subnet is assigned an IP address range and each device on the subnet is assigned an IP address from that range.

Connected subnets have IP address ranges that do not overlap. A router is a network device connecting multiple subnets. Routers forward inbound packets to the subnet whose address range includes the packets’ destination address.

IPv4 and IPv6 are internet layer protocols that define packet-switched inter-networking, including source-to-destination datagram transmission across multiple networks. The switch supports IP Version 4 (IPv4) and IP Version 6 (IPv6).

25.2 IPv6 Description

Internet Protocol Version 6 is a communications protocol used for relaying network packets across a set of connected networks using the Internet Protocol suite. Each network device is assigned a 128 bit IP address that identifies its network location.

IPv6 specifies a packet format that minimizes router processing of packet headers. Since the IPv4 and IPv6 packet headers differ significantly, the protocols are not interoperable. Many transport and application-layer protocols require little or no change to operate over IPv6.

25.2.1 IPv6 Address Format

IPv6 addresses have 128 bits, represented by eight 16-bit hexadecimal numbers separated by colons. IPv6 addresses are abbreviated as follows:

- Leading zeroes in each 16-bit number may be omitted.
- One set of consecutive 16-bit numbers that equal zero may be replaced by a double colon.

Example

- The following three IPv6 hexadecimal number representations refer to the same address:
  
  \[ \text{d28e:0000:0000:0000:0234:812f:61ed:4419} \]
  
  \[ \text{d28e:0:0:0:234:812f:61ed:4419} \]
  
  \[ \text{d28e::234:812f:61ed:4419} \]

IPv6 addresses typically denote a 64-bit network prefix and a 64-bit host address.

Unicast and Anycast Addressing

Unicast addressing defines a one-to-one association between the destination address and a network endpoint. Each destination address uniquely identifies a single receiver endpoint. Anycast addressing defines a one-to-one-of-many association: packets to a single member of a group of potential receivers identified by the same destination address.

Unicast and anycast addresses are typically composed as follows:

- a 64-bit network prefix that identifies the network segment.
- a 64-bit interface identifier that is based on interface MAC address.

The format of a network address identifies the scope of the address

- Global address: valid in all networks and connect with other addresses with global scope anywhere or to addresses with link-local scope on the directly attached network.
- Link-local address: scope extends only to the link to which the interface is directly connected. Link-local addresses are not routable off the link.

Link-local addresses are created by the switch and are not configurable. Figure 25-1 depicts the switch’s link local address derivation method.

Multicast Addressing

Multicast addressing defines a one-to-many association: packets are simultaneously routed from a single sender to multiple endpoints in a single transmission. The network replicates packets as required by network links that contain a recipient endpoint. One multicast address is assigned to an interface for each multicast group to which the interface belongs.
A solicited-node multicast address is an IPv6 multicast address whose scope extends only to the link to which the interface is directly connected. All IPv6 hosts have at least one such address per interface. Solicited-node multicast addresses are used by the Neighbor Discovery Protocol to obtain layer 2 link-layer addresses of other nodes.

### 25.2.2 Neighbor Discovery Protocol

The Neighbor Discovery Protocol (RFC 4861) operates with IPv6 to facilitate the following tasks for nodes within a specified prefix space:

- autoconfiguring a node's IPv6 address
- sensing other nodes on the link
- discovering the link-local addresses of other nodes on the link
- detecting duplicate addresses
- discovering available routers
- discovering DNS servers
- discovering the link's address prefix
- maintaining path reachability data to other active neighbor nodes

The Neighbor Discovery Protocol protocol defines five different ICMPv6 packet types:

- Router Solicitation
- Router Advertisement
- Neighbor Solicitation
- Neighbor Advertisement
- Redirect
25.3 Configuring IPv6

These sections describe IPv6 configuration tasks:

- Section 25.3.1: Configuring IPv6 on the Switch
- Section 25.3.2: Configuring IPv6 on an Interface
- Section 25.3.3: Viewing IPv6 Network Components
- Section 25.3.4: DHCP Relay Agent for IPv6

25.3.1 Configuring IPv6 on the Switch

25.3.1.1 Enabling IPv6 Unicast Routing on the Switch

The `ipv6 unicast-routing` command enables the forwarding of IPv6 unicast packets. When routing is enabled, the switch attempts to deliver inbound packets to destination addresses by forwarding them to interfaces or next hop addresses specified by the IPv6 routing table.

Example

- This command enables IPv6 unicast-routing.

  switch(config)#ipv6 unicast-routing
  switch(config)#

25.3.1.2 Configuring Default and Static IPv6 Routes

The `ipv6 route` command creates an IPv6 static route. The destination is a IPv6 prefix; the source is an IPv6 address or a routable interface port. When multiple routes exist to a destination prefix, the route with the lowest administrative distance takes precedence.

By default, the administrative distance assigned to static routes is 1. Assigning a higher administrative distance to a static route configures it to be overridden by dynamic routing data. For example, a static route with a distance value of 200 is overridden by OSPF intra-area routes, which have a default distance of 110.

Example

- This command creates an IPv6 static route.

  switch(config)#ipv6 route 10:23:31:00:01:32:93/24 vlan 300
  switch(config)#

The default route denotes the packet forwarding rule that takes effect when no other route is configured for a specified IPv6 address. All packets with destinations that are not established in the routing table are sent to the destination specified by the default route.

The IPv6 default route source is ::/0. The default route destination is referred to as the default gateway.

Example

- This command creates a default route and establishes fd7a:629f:52a4:fe61::2 as the default gateway address.

  switch(config)#ipv6 route ::/0 fd7a:629f:52a4:fe61::2
  switch(config)#
25.3.1.3 IPv6 ECMP

Multiple routes that are configured to the same destination with the same administrative distance comprise an Equal Cost Multi-Path (ECMP) route. The switch attempts to spread outbound traffic across all ECMP route paths equally. All ECMP paths are assigned the same tag value; commands that change the tag value of any ECMP path change the tag value of all paths in the ECMP.

Resilient ECMP is available for IPv6 routes. Section 24.4.2 describes resilient ECMP. The `ipv6 hardware fib ecmp resilience` command implements IPv6 resilient ECMP.

Example

- This command implements IPv6 resilient ECMP by configuring a hardware ECMP table space of 15 entries for IPv6 address 2001:db8:0::/64. A maximum of five nexthop addresses can be specified for the address. When the table contains five addresses, each appears in the table three times. When the table contains fewer than five addresses, each is duplicated until the 15 table entries are filled.

```
switch(config)#ipv6 hardware fib ecmp resilience 2001:db8:0::/64 capacity 5 redundancy 3
```

25.3.2 Configuring IPv6 on an Interface

25.3.2.1 Enabling IPv6 on an Interface

The `ipv6 enable` command enables IPv6 on the configuration mode interface if it does not have a configured IPv6 address. It also configures the interface with an IPv6 address.

The `no ipv6 enable` command disables IPv6 on a configuration mode interface not configured with an IPv6 address. Interfaces configured with an IPv6 address are not disabled by this command.

Example

- This command enables IPv6 on VLAN interface 200.

```
switch(config)#interface vlan 200
switch(config-vl200)#ipv6 enable
```

25.3.2.2 Assigning an IPv6 Address to an Interface

The `ipv6 address` command enables IPv6 on the configuration mode interface, assigns a global IPv6 address to the interface, and defines the prefix length. This command is supported on routable interfaces. Multiple global IPv6 addresses can be assigned to an interface.

Example

- These commands configure an IPv6 address with subnet mask for VLAN 200:

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 address 10:23:31:00:01:32:93/24
```

25.3.2.3 IPv6 Neighbor Discovery

The IPv6 Neighbor Discovery protocol defines a method for nodes to perform the following network maintenance tasks:

- determine layer 2 addresses for neighbors known to reside on attached links
- detect changed layer 2 addresses
- purge invalid values from the neighbor cache table
- (hosts) find neighboring routers to forward packets
- track neighbor reachability status

IPv6 Neighbor Discovery is defined by RFC 2461. IPv6 Stateless Address Autoconfiguration is described by RFC 2462.

The following sections describe Neighbor Discovery configuration tasks.

### Reachable Time

The `ipv6 nd reachable-time` command specifies the time period that the switch includes in the reachable time field of Router Advertisements (RAs) sent from the configuration mode interface. The reachable time defines the period that a remote IPv6 node is considered reachable after a reachability confirmation event.

**Example**

- These commands configure the entry of 25000 (25 seconds) in the reachable time field of RAs sent from VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd reachable-time 25000
switch(config-if-Vl200)#show active
interface Vlan200
   ipv6 address fd7a:4321::/64
   ipv6 nd reachable-time 25000
switch(config-if-Vl200)#
```

### Router Advertisement Interval

The `ipv6 nd ra interval` command configures the interval between IPv6 RA transmissions from the configuration mode interface.

**Example**

- These commands configure a RA transmission interval of 60 seconds on VLAN interface 200, then displays the interface status.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd ra interval 60
switch(config-if-Vl200)#show active
interface Vlan200
   ipv6 nd ra interval 60
switch(config-if-Vl200)#
```

### Router Lifetime

The `ipv6 nd ra lifetime` command specifies the value that the switch places in the `router lifetime` field of IPv6 RAs sent from the configuration mode interface.

If the value is set to 0, IPv6 peers connected to the specified interface will remove the switch from their lists of default routers. Values greater than 0 indicate the time in seconds that peers should keep the router on their default router lists without receiving further RAs from the switch. Unless the value is 0, the router lifetime value should be equal to or greater than the interval between unsolicited RAs sent on the interface.
Example

- This command configures the switch to enter 2700 in the router lifetime field of RAs transmitted from VLAN 200.

```plaintext
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd ra lifetime 2700
switch(config-if-Vl200)#show active
interface Vlan200
  ipv6 nd ra lifetime 2700
switch(config-if-Vl200)#
```

Router Advertisement Prefix

The `ipv6 nd prefix` command configures neighbor discovery router advertisement prefix inclusion for RAs sent from the configuration mode interface.

By default, all prefixes configured as IPv6 addresses are advertised in the interface’s RAs. The `ipv6 nd prefix` command with the `no-advertise` option prevents advertising of the specified prefix without affecting the advertising of other prefixes specified as IPv6 addresses. When an interface configuration includes at least one `ipv6 nd prefix` command that enables prefix advertising, RAs advertise only prefixes specified through `ipv6 nd prefix` commands.

Commands enabling prefix advertising also specify the advertised valid and preferred lifetime periods. Default periods are 2,592,000 (valid) and 604,800 (preferred) seconds.

Example

- These commands enable neighbor discovery advertising for IPv6 address 3012:D678::/64, specifying a valid lifetime of 1,296,000 seconds and the default preferred lifetime.

```plaintext
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd prefix 3012:D678::/64 1296000
switch(config-if-Vl200)#
```

Router Advertisement Suppression

The `ipv6 nd ra suppress` command suppress IPv6 RA transmissions on the configuration mode interface. By default, only unsolicited RAs that are transmitted periodically are suppressed. The `all` option configures the switch to suppress all RAs, including those responding to a router solicitation.

Example

- This command suppresses all RAs on VLAN interface 200.

```plaintext
switch(config)#interface vlan 200
switch(config-vl200)#ipv6 nd ra suppress all
switch(config-vl200)#
```

Router Advertisement MTU Suppression

The `ipv6 nd ra mtu suppress` command suppresses the router advertisement MTU option on the configuration mode interface. The MTU option causes an identical MTU value to be advertised by all nodes on a link. By default, the router advertisement MTU option is not suppressed.

Example

- This command suppresses the MTU option on VLAN interface 200.

```plaintext
switch(config)#interface vlan 200
switch(config-vl200)#ipv6 nd ra mtu suppress
switch(config-vl200)#
```

1461
Router Advertisement Flag Configuration

The following commands sets the specified configuration flag in IPv6 RAs transmitted from the configuration mode interface:

- The **ipv6 nd managed-config-flag** command sets the *managed address configuration* flag. This bit instructs hosts to use stateful address autoconfiguration.
- The **ipv6 nd other-config-flag** command sets the *other stateful configuration* flag. This bit indicates availability of autoconfiguration information, other than addresses. Hosts should use stateful autoconfiguration when available. The setting of this flag has no effect if the *managed address configuration* flag is set.
- These commands configure the switch to set the *managed address configuration* flag in advertisements sent from VLAN interface 200.

```bash
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd managed-config-flag
```

- These commands configure the switch to set the *other stateful configuration* flag in advertisements sent from VLAN interface 200.

```bash
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd other-config-flag
```

### 25.3.2.4 IPv6 Router Preference

The IPv6 Router Preference protocol supports an extension to RA messages for communicating default router preferences and more specific routes from routers to hosts. This provides assistance to hosts when selecting a router. RFC 4191 describes the IPv6 Router Preference Protocol.

The **ipv6 nd router-preference** command specifies the value that the switch enters in the Default Router Preference (DRP) field of RAs that it sends from the configuration mode interface. The default field entry value is *medium*.

**Example**

- This command configures the switch as a medium preference router on RAs sent from VLAN 200.

```bash
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd router-preference medium
```

### 25.3.2.5 uRPF Configuration

Unicast Reverse Path Forwarding (uRPF) verifies the accessibility of source IP addresses in packets that the switch forwards. Section 24.4.3 describe uRPF. uRPF is enabled for IPv6 packets ingressing the configuration mode interface through the **ipv6 verify** command.

uRPF defines two operational modes: strict mode and loose mode.

- **Strict mode**: uRPF verifies that a packet is received on the interface that its routing table entry specifies for its return packet.
- **Loose mode**: uRPF validation does not consider the inbound packet’s ingress interface only that there is a valid return path.
Example

- This command enables uRPF strict mode on VLAN interface 100. If a default route is configured on the interface, all inbound packets will pass the uRPF check as valid.

  switch(config)#interface vlan 100
  switch(config-if-Vl100)#ipv6 verify unicast source reachable-via rx allow-default
  switch(config-if-Vl100)#show active
  interface Vlan100
    ipv6 verify unicast source reachable-via rx allow-default
  switch(config-if-Vl100)#

25.3.3 Viewing IPv6 Network Components

Displaying the FIB and Routing Table

The `show ipv6 route` command displays routing table entries that are in the Forwarding Information Base (FIB), including static routes, routes to directly connected networks, and dynamically learned routes. Multiple equal cost paths to the same prefix are displayed contiguously as a block, with the destination prefix displayed only on the first line.

Example

- This command displays a route table entry for a specific IPv6 route.

  switch>show ipv6 route fd7a:3418:52a4:fe18::/64
  IPv6 Routing Table - 77 entries
  Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP, R - RIP, A - Aggregate

  O  fd7a:3418:52a4:fe18::/64 [10/20]
     via f180::21c:73ff:fe00:1319, Vlan3601
     via f180::21c:73ff:fe00:1319, Vlan3602
     via f180::21c:73ff:fe00:1319, Vlan3608
     via f180::21c:73ff:fe0f:6a80, Vlan3610
     via f180::21c:73ff:fe00:1319, Vlan3611

  switch>

Displaying the Route Age

The `show ipv6 route age` command displays the IPv6 route age to the specified IPv6 address or prefix.

Example

- This command displays the route age for the specified prefix.

  switch>show ipv6 route 2001::3:0/11 age
  IPv6 Routing Table - 74 entries
  Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP, R - RIP, A - Aggregate

  C 2001::3:0/11 age 00:02:34
  switch>

Displaying Host Routes

The `show ipv6 route host` command displays all host routes in the IPv6 host forwarding table. Host routes are those whose destination prefix is the entire address (prefix = /128). Each displayed host route is labeled with its purpose:
Configuring IPv6

Chapter 25: IPv6

- **F** static routes from the FIB.
- **R** routes defined because the IP address is an interface address.
- **A** routes to any neighboring host for which the switch has an ARP entry.

**Example**

- This command displays all IPv6 host routes in the host forwarding table.

```
switch# show ipv6 route host
R - receive  F - FIB,  A - attached
F  ::1 to cpu
A  fe80::10c11:1900:400::1 on Vlan102
R  fe80::10c11:1900:400::2 to cpu
F  fee7:48a2:0c11:1a00::2 via fe80::21c:73ff:fe0b:a80e on Vlan3902
R  fee7:48a2:0c11:1a00::17 to cpu
F  fee7:48a2:0c11:1a00::20 via fe80::21c:73ff:fe0b:33e on Vlan3913
F  fee7:48a2:0c11:1a00::22 via fe80::21c:73ff:fe01:5fe1 on Vlan3908
via fe80::21c:73ff:fe01:5fe1 on Vlan3902
```

**Displaying Route Summaries**

The `show ipv6 route summary` command displays the current number of routes of the IPv6 routing table in summary format.

**Example**

- This command displays the route source and the corresponding number of routes in the IPv6 routing table.

```
switch> show ipv6 route summary
Route Source Number Of Routes
-------------- ----------------
connected      2
static         0
ospf           5
bgp            7
isis           0
internal       1
attached       0
aggregate      2
Total Routes   17
switch>
```

### 25.3.4 DHCP Relay Agent for IPv6

#### 25.3.4.1 Configuring IPv6 DHCP Relay

**Configuring the IPv6 DHCP Relay Agent (Global)**

The `ipv6 dhcp relay always-on` command enables the switch DHCP relay agent globally regardless of the DHCP relay agent status on any interface. The DHCP relay agent is enabled by default if at least one routable interface is configured with an `ipv6 dhcp relay destination` statement.
Example

- This command enables the DHCP relay agent.

```
switch(config)#ipv6 dhcp relay always-on
switch(config)#
```

Configuring DHCP for IPv6 relay agent

The `ipv6 dhcp relay destination` command enables the DHCPv6 relay agent function and specifies the client message destination address on an interface.

Example

- This command enables the DHCPv6 relay agent function and sets the client message destination address to `2001:0db8:0:1::1` on Ethernet interface 4.

```
switch(config)interface ethernet 4
switch(config-if-Et4)#ipv6 dhcp relay destination 2001:0db8:0:1::1
```

Clearing IPv6 DHCP Relay Counters

The `clear ipv6 dhcp relay counters` command resets the DHCP relay counters. The configuration mode determines which counters are reset:

- Global configuration: command clears the counters for the switch and for all interfaces.
- Interface configuration: command clears the counter for the configuration mode interface.

Example

- These commands clear all DHCP relay counters on the switch.

```
switch(config-if-Et4)#exit
switch(config)#clear ipv6 dhcp relay counters
switch(config)#
```

- These commands clear the DHCP relay counters for Ethernet interface 4.

```
switch(config)#interface ethernet 4
switch(config-if-Et4)#clear ipv6 dhcp relay counters
switch(config)#
```

25.3.4.2 Viewing IPv6 DHCP Relay Information

IPv6 DHCP Status

The `show ipv6 helper-address` command displays the status of DHCP relay agent parameters on the switch and each interface where at least one feature parameter is listed. The command displays the status for both global and interface configurations.

Example

- This command displays the DHCP Agent Relay parameter status.

```
switch>show ipv6 helper-address
DHCP Relay Agent Information Option Enabled
DHCP Relay Agent Always-On Mode Enabled
Interface: Ethernet4
   Circuit ID: V-200
      DHCP servers: 2001:db8:0:1::1
switch>
```
IPv6 DHCP Relay Counters

The `show ipv6 dhcp relay counters` command displays the number of DHCP packets received, forwarded, or dropped on the switch and on all interfaces enabled as DHCP relay agents.

**Example**

- This command displays the IP DHCP relay counter table.

  switch> `show ipv6 dhcp relay counters`

  ```plaintext
<table>
<thead>
<tr>
<th>Dhcp Packets</th>
<th>Rcvd Fwdd Drop</th>
<th>Last Cleared</th>
</tr>
</thead>
</table>
  All Req | 376 376 0 | 4 days, 19:55:12 ago |
  All Resp | 277 277 0 | |
  Ethernet4 | 207 148 0 | 4 days, 19:54:24 ago |
  switch>
  ```
25.4 IPv6 Command Descriptions

Global Configuration Commands
- ipv6 dhcp relay always-on
- ipv6 hardware fib aggregate-address
- ipv6 hardware fib ecmp resilience
- ipv6 hardware fib nexthop-index
- ipv6 neighbor
- ipv6 neighbor cache persistent
- ipv6 route
- ipv6 unicast-routing

Interface Configuration Commands
- ipv6 address
- ipv6 dhcp relay destination
- ipv6 enable
- ipv6 helper-address
- ipv6 nd managed-config-flag
- ipv6 nd ns-interval
- ipv6 nd other-config-flag
- ipv6 nd prefix
- ipv6 nd ra dns-server
- ipv6 nd ra dns-servers lifetime
- ipv6 nd ra dns-suffix
- ipv6 nd ra dns-suffixes lifetime
- ipv6 nd ra hop-limit
- ipv6 nd ra interval
- ipv6 nd ra lifetime
- ipv6 nd ra mtu suppress
- ipv6 nd ra suppress
- ipv6 nd reachable-time
- ipv6 nd router-preference
- ipv6 verify

Privileged EXEC Commands
- clear ipv6 dhcp relay counters
- clear ipv6 neighbors

EXEC Commands
- show ipv6 dhcp relay counters
- show ipv6 hardware fib aggregate-address
- show ipv6 helper-address
- show ipv6 interface
- show ipv6 nd ra internal state
- show ipv6 neighbors
- show ipv6 route
- show ipv6 route age
- show ipv6 route host
- show ipv6 route interface
- show ipv6 route summary
- show ipv6 route tag
clear ipv6 dhcp relay counters

The `clear ipv6 dhcp relay counters` command resets the DHCP relay counters. When no port is specified, the command clears the counters for the switch and for all interfaces. Otherwise, the command clears the counter for the specified interface.

**Command Mode**

Privileged EXEC

**Command Syntax**

`clear ipv6 dhcp relay counters [PORT]`

**Parameters**

- **PORT** Interface through which neighbor is accessed. Options include:
  - `<no parameter>` all dynamic entries are removed.
  - `interface ethernet e_num` Ethernet interface specified by `e_num`.
  - `interface loopback l_num` Loopback interface specified by `l_num`.
  - `interface port-channel p_num` Port-channel interface specified by `p_num`.
  - `interface vlan v_num` VLAN interface specified by `v_num`. 
Examples

- These commands clear the DHCP relay counters for Ethernet interface 4 and shows the counters before and after the `clear` command.

  switch(config)#show ipv6 dhcp relay counters

<table>
<thead>
<tr>
<th>Dhcp Packets</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
</tr>
<tr>
<td>-----------</td>
</tr>
<tr>
<td>All Req</td>
</tr>
<tr>
<td>All Resp</td>
</tr>
<tr>
<td>Ethernet4</td>
</tr>
</tbody>
</table>

  switch(config)#interface ethernet 4
  switch(config-if-Et4)#clear ipv6 dhcp relay counters

<table>
<thead>
<tr>
<th>Dhcp Packets</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
</tr>
<tr>
<td>-----------</td>
</tr>
<tr>
<td>All Req</td>
</tr>
<tr>
<td>All Resp</td>
</tr>
<tr>
<td>Ethernet4</td>
</tr>
</tbody>
</table>

  These commands clear all DHCP relay counters on the switch.
  switch(config-if-Et4)#exit
  switch(config)#clear ipv6 dhcp relay counters
  switch(config)#show ipv6 dhcp relay counters

<table>
<thead>
<tr>
<th>Dhcp Packets</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
</tr>
<tr>
<td>-----------</td>
</tr>
<tr>
<td>All Req</td>
</tr>
<tr>
<td>All Resp</td>
</tr>
<tr>
<td>Ethernet4</td>
</tr>
</tbody>
</table>

  switch(config)#
clear ipv6 neighbors

The clear ipv6 neighbors command removes the specified dynamic IPv6 neighbor discovery cache entries. Commands that do not specify an IPv6 address remove all dynamic entries for the listed interface. Commands that do not specify an interface remove all dynamic entries.

Command Mode
Privileged EXEC

Command Syntax

clear ipv6 neighbors [PORT] [DYNAMIC_IPV6]

Parameters

- **PORT** Interface through which neighbor is accessed. Options include:
  - `<no parameter>` all dynamic entries are removed.
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-channel interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
  - `vxlan vx_num` VXLAN interface specified by `vx_num`.

- **DYNAMIC_IPV6** Address of entry removed by the command. Options include:
  - `<no parameter>` all dynamic entries for specified interface are removed.
  - `ipv6_addr` IPv6 address of entry.

Example

- This command removes all dynamic neighbor entries for VLAN interface 200.

  switch#clear ipv6 neighbors vlan 200
  switch#
**ipv6 address**

The `ipv6 address` command assigns a global IPv6 address to the IPv6 interface, and defines the prefix length. This command is supported on routable interfaces. Multiple global IPv6 addresses can be assigned to an interface.

The `no ipv6 address` and `default ipv6 address` commands remove the IPv6 address assignment from the configuration mode interface by deleting the corresponding `ipv6 address` command from `running-config`. If the command does not include an address, all address assignments are removed from the interface. IPv6 remains enabled on the interface after the removal of all IPv6 addresses only if an `ipv6 enable` command is configured on the interface.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ipv6 address ipv6_prefix
no ipv6 address [ipv6_prefix]
default ipv6 address [ipv6_prefix]
```

**Parameters**

- `ipv6_prefix`  address assigned to the interface (CIDR notation).

**Guidelines**

This command is supported on routable interfaces.

**Example**

- These commands configure an IPv6 address and prefix length for VLAN 200:

  ```
  switch(config)#interface vlan 200
  switch(config-if-Vl200)#ipv6 address 10:23:31:00:01:32:93/64
  switch(config-if-Vl200)#
  ```
ipv6 dhcp relay always-on

The `ipv6 dhcp relay always-on` command enables the switch DHCP relay agent on the switch regardless of the DHCP relay agent status on any interface. By default, the DHCP relay agent is enabled only if at least one routable interface is configured with an `ipv6 dhcp relay destination` statement.

The `no ipv6 dhcp relay always-on` and `default ipv6 dhcp relay always-on` commands remove the `ipv6 dhcp relay always-on` command from `running-config`.

Command Mode

Global Configuration

Command Syntax

```
ipv6 dhcp relay always-on
no ipv6 dhcp relay always-on
default ipv6 dhcp relay always-on
```

Example

- This command enables the DHCP relay agent.
  ```
  switch(config)#ipv6 dhcp relay always-on
  switch(config)#
  ```
ipv6 dhcp relay destination

The `ipv6 dhcp relay destination` command enables the DHCPv6 relay agent and sets the destination address on the configuration mode interface.

The no `ipv6 dhcp relay destination` and default `ipv6 dhcp relay destination` commands remove the corresponding `ipv6 dhcp relay destination` command from `running-config`. When the commands do not list an IPv6 address, all `ipv6 dhcp relay destination` commands are removed from `running-config`.

Command Mode
- Interface-Ethernet Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

Command Syntax
- `ipv6 dhcp relay destination ipv6_addr`
- `no ipv6 dhcp relay destination [ipv6_addr]`
- `default ipv6 dhcp relay destination [ipv6_addr]`

Parameters
- `ipv6_addr` DCHP Server’s IPv6 address.

Example
- This command enables the DHCPv6 relay agent and sets the destination address to 2001:0db8:0:1::1 on Ethernet interface 4.

```console
switch(config)#interface ethernet 4
switch(config-if-Et4)#ipv6 dhcp relay destination 2001:0db8:0:1::1
switch(config-if-Et4)#show active
interface Ethernet4
ipv6 dhcp relay destination 2001:0db8:0:1::1
switch(config-if-Et4)#
```
**ipv6 enable**

The `ipv6 enable` command enables IPv6 on the configuration mode interface. Assigning an IPv6 address to an interface also enables IPv6 on the interface.

The `no ipv6 enable` and `default ipv6 enable` command remove the corresponding `ipv6 enable` command from `running-config`. This action disables IPv6 on interfaces that are not configured with an IPv6 address.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ipv6 enable
no ipv6 enable
default ipv6 enable
```

**Example**

- This command enables IPv6 on VLAN interface 200.

```
switch(config)#interface vlan 200
switch(config-vl200)#ipv6 enable
switch(config-vl200)#
```
ipv6 hardware fib aggregate-address

The `ipv6 hardware fib aggregate-address` command specifies the routing table repository of specified IPv6 route.

By default, routes that are created statically through the CLI or dynamically through routing protocols are initially stored in software routing tables, then entered in the hardware routing table by the routing agent. This command prevents the entry of the specified route into the hardware routing table. Specified routes that are in the hardware routing table are removed by this command. Specific routes that are encompassed within the specified route prefix are affected by this command.

The `no ipv6 hardware fib aggregate-address` and `default ipv6 hardware fib aggregate-address` commands remove the restriction from the hardware routing table for the specified routes by removing the corresponding `ipv6 hardware fib aggregate-address` command from `running-config`.

Command Mode
Global Configuration

Command Syntax
```
ipv6 hardware fib aggregate-address ipv6_prefix summary-only software-forward
no ipv6 hardware fib aggregate-address ipv6_prefix
default ipv6 hardware fib aggregate-address ipv6_prefix
```

Parameters
- `ipv6_prefix` IPv6 prefix that is restricted from the hardware routing table (CIDR notation).

Example
- These commands configure a hardware routing restriction for an IPv6 prefix, then displays that restriction.
```
switch(config)#ipv6 hardware fib aggregate-address fd77:4890:5313:ffed::/64 summary-only software-forward
switch(config)#show ipv6 hardware fib aggregate-address
Codes: S - Software Forwarded
S  fd77:4890:5313:ffed::/64

switch(config)#
```
ipv6 hardware fib ecmp resilience

The ip hardware fib ecmp resilience command configures a fixed number of next hop entries in the hardware ECMP table for the specified IPv6 address prefix. In addition to specifying the maximum number of next hop addresses that the table can contain for the prefix, the command introduces a redundancy factor that allows duplication of each next hop address. The fixed table space for the address is the maximum number of next hops multiplied by the redundancy factor.

The default method of adding or removing next hop entries when required by the active hashing algorithm leads to inefficient management of the ECMP table, which can result in the rerouting of packets to different next hops that breaks TCP packet flows. Implementing fixed table entries for a specified IP address allows data flows that are hashed to a valid next hop number to remain intact. Additionally, traffic is evenly distributed over a new set of next hops.

The no ip hardware fib ecmp resilience and default ip hardware fib ecmp resilience commands restore the default hardware ECMP table management by removing the ip hardware fib ecmp resilience command from running-config.

Command Mode
Global Configuration

Command Syntax
ipv6 hardware fib ecmp resilience net_prfx capacity nhop_max redundancy duplicates
no ipv6 hardware fib ecmp resilience net_addr
default ipv6 hardware fib ecmp resilience net_addr

Parameters
- net_prfx IPv6 address prefix managed by command.
- nhop_max Specifies maximum number of nexthop entries for specified IP address prefix. Value range varies by platform:
  - Helix: <2 to 64>
  - Trident: <2 to 32>
  - Trident II: <2 to 64>
- duplicates Specifies the redundancy factor. Value ranges from 1 to 128.

Example
- This command configures a hardware ECMP table space of 15 entries for the IPv6 address 2001:db8:0::/64. A maximum of five nexthop addresses can be specified for the address. When the table contains five nexthop addresses, each appears in the table three times. When the table contains fewer than five nexthop addresses, each is duplicated until the 15 table entries are filled.
  switch(config)#ipv6 hardware fib ecmp resilience 2001:db8:0::/64 capacity 5 redundancy 3
ipv6 hardware fib nexthop-index

The `ipv6 hardware fib nexthop-index` command deterministically selects the next hop used for ECMP routes. By default, routes that are created statically through the CLI or dynamically through routing protocols are initially stored in software routing tables, then entered in the hardware routing table by the routing agent. This command specifies the method of creating an index-offset number that points to the next hop from the list of the route’s ECMP next hops.

The index-offset is calculated by adding the next hop index to a prefix offset.

- Next hop index: specified in the command.
- Prefix offset: the least significant bits of the route’s prefix.

The command specifies the number of bits that comprise the prefix offset. The prefix offset is set to the prefix when the command specifies a prefix size larger than the prefix. If the command specifies an prefix size of zero, the prefix-offset is also zero and the index-offset is set to the next hop index.

When the index-offset is greater than the number of next hops in the table, the position of the next hop is the remainder of the division of the index-offset by the number of next hop entries.

The `no ipv6 hardware fib nexthop-index` and `default ipv6 hardware fib nexthop-index` commands remove the specified nexthop used for ECMP routes by removing the `ipv6 hardware fib nexthop-index` command from `running-config`.

**Command Mode**
- Global Configuration

**Command Syntax**

```
ipv6 hardware fib nexthop nexthop_index [PREFIX]
no ipv6 hardware fib nexthop
default ipv6 hardware fib nexthop
```

**Parameters**
- `nexthop_index` specifies the next hop index. Value ranges from 0 to 32.
- `PREFIX` Number of bits of the route’s prefix to use as the prefix-offset. Value ranges from 0 to 64.
  - `<no parameter>` The prefix offset is set to zero.
  - `prefix-bits <0 to 64>` Specifies the number bits to use as the prefix-offset.

**Example**
- This command specifies the next hop from the list of ECMP next hops for the route.
  ```
  switch(config)#ipv6 hardware fib nexthop-index 5 prefix-bits 10
  switch>show ip
  IP Routing : Enabled
  IP Multicast Routing : Disabled
  VRRP: Configured on 0 interfaces

  IPv6 Unicast Routing : Enabled
  IPv6 ECMP Route support : False
  IPv6 ECMP Route nexthop index: 5
  IPv6 ECMP Route num prefix bits for nexthop index: 10
  switch>
  ```
ipv6 helper-address

The `ipv6 helper-address` command enables the DHCP relay agent on the configuration mode interface and specifies a forwarding address for DHCP requests. An interface that is configured with multiple helper-addresses forwards DHCP requests to all specified addresses.

The `no ipv6 helper-address` and `default ipv6 helper-address` commands remove the corresponding `ipv6 helper-address` command from `running-config`. Commands that do not specify an IP helper-address removes all helper-addresses from the interface.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration

**Command Syntax**
- `ipv6 helper-address ipv6_addr`
- `no ipv6 helper-address [ipv6_addr]`
- `default ipv6 helper-address [ipv6_addr]`

**Parameters**
- `ipv6_addr` DHCP server address accessed by interface.

**Example**
- This command enables the DHCP relay agent on VLAN interface 200 and configures the switch to forward DHCP requests received on this interface to the server at 2001:0db8:0:1::1.

```bash
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 helper-address 2001:0db8:0:1::1
switch(config-if-Vl200)#show active
interface Vlan200
  ipv6 helper-address 2001:0db8:0:1::1
switch(config-if-Vl200)#
```
**ipv6 nd managed-config-flag**

The `ipv6 nd managed-config-flag` command causes the *managed address configuration* flag to be set in IPv6 RA packets transmitted from the configuration mode interface.

The `no ipv6 nd managed-config-flag` and `default ipv6 nd managed-config-flag` commands restore the default setting where the *managed address configuration* flag is not set in IPv6 RA packets transmitted by the interface by removing the corresponding `ipv6 nd managed-config-flag` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ipv6 nd managed-config-flag
no ipv6 nd managed-config-flag
default ipv6 nd managed-config-flag
```

**Example**

- These commands cause the *managed address configuration* flag to be set in IPv6 RA packets sent from VLAN interface 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd managed-config-flag
switch(config-if-Vl200)#
```
**ipv6 nd ns-interval**

The `ipv6 nd ns-interval` command configures the interval between IPv6 neighbor solicitation (NS) transmissions from the configuration mode interface.

The `no ipv6 nd ns-interval` and `default ipv6 nd ns-interval` commands return the IPv6 NS transmission interval for the configuration mode interface to the default value of 1000 milliseconds by removing the corresponding `ipv6 nd ns-interval` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ipv6 nd ns-interval period
no ipv6 nd ns-interval
default ipv6 nd ns-interval
```

**Parameters**

- `period` interval in milliseconds between successive IPv6 neighbor solicitation transmissions. Values range from 1000 to 4294967295. The default period is 1000 milliseconds.

**Example**

- This command configures a neighbor solicitation transmission interval of 30 seconds on VLAN interface 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd ns-interval 30000
switch(config-if-Vl200)#
```
ipv6 nd other-config-flag

The `ipv6 nd other-config-flag` command configures the configuration mode interface to send IPv6 RAs with the `other stateful configuration` flag set.

The `no ipv6 nd other-config-flag` and `default ipv6 nd other-config-flag` commands restore the default setting by removing the corresponding `ipv6 nd other-config-flag` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `ipv6 nd other-config-flag`
- `no ipv6 nd other-config-flag`
- `default ipv6 nd other-config-flag`

**Example**
- These commands configure the switch to set the other stateful configuration flag in advertisements sent from VLAN interface 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd other-config-flag
switch(config-if-Vl200)#
```
ipv6 nd prefix

The `ipv6 nd prefix` command configures neighbor discovery Router Advertisements (RAs) prefix inclusion for RAs sent from the configuration mode interface.

By default, all prefixes configured as IPv6 addresses (`ipv6 address`) are advertised in the interface’s RAs. The `ipv6 nd prefix` command with the `no-advertise` option prevents advertising of the specified prefix without affecting the advertising of other prefixes specified as IPv6 addresses. When an interface configuration includes at least one `ipv6 nd prefix` command that enables prefix advertising, RAs advertise only prefixes specified through `ipv6 nd prefix` commands.

Commands enabling prefix advertising also specify the advertised valid and preferred lifetime periods. Default periods are 2,592,000 (valid) and 604,800 (preferred) seconds.

The `no ipv6 nd prefix` and `default ipv6 nd prefix` commands remove the corresponding `ipv6 nd prefix` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```markdown
ipv6 nd prefix ipv6_prefix LIFETIME [FLAGS]
ipv6 nd prefix ipv6_prefix no-advertise
no ipv6 nd prefix ipv6_prefix
default ipv6 nd prefix ipv6_prefix
```

**Parameters**

- `ipv6_prefix` IPv6 prefix (CIDR notation).
- `no-advertise` Prevents advertising of the specified prefix.
- `LIFETIME` Period that the specified IPv6 prefix is advertised (seconds). Options include
  - `valid preferred` Two values that set the `valid` and `preferred` lifetime periods.
  - `valid` One value that sets the `valid` lifetime. The `preferred` lifetime is set to the default value.
  - `<no parameter>` The `valid` and `preferred` lifetime periods are set to their default values.

  Options for `valid`: `<0 to 4294967295>` and `infinite`. Default value is 2592000
  Options for `preferred`: `<0 to 4294967295>` and `infinite`. Default value is 604800
  The maximum value (`4294967295`) and `infinite` are equivalent settings.

- `FLAGS` `on-link` and `autonomous address-configuration` flag values in RAs.
  - `<no parameter>` both flags are set.
  - `no-autoconfig` `autonomous address-configuration` flag is reset.
  - `no-onlink` `on-link` flag is reset.
  - `no-autoconfig no-onlink` both flags are reset.
  - `no-onlink no-autoconfig` both flags are reset.
Example

- These commands enable neighbor discovery advertising for IPv6 address 3012:D678::/64, on VLAN interface 200, specifying a valid lifetime of 1,296,000 seconds and the default preferred lifetime.

    switch(config)#interface vlan 200
    switch(config-if-Vl200)#ipv6 nd prefix 3012:D678::/64 1296000
**ipv6 nd ra dns-server**

The `ipv6 nd ra dns-server` command configures the IPv6 address of a preferred Recursive DNS Server (RDNSS) for the command mode interface to include in its neighbor-discovery Router Advertisements (RAs). Including RDNSS information in RAs provides DNS server configuration for connected IPv6 hosts without requiring DHCPv6.

Multiple servers can be configured on the interface by using the command repeatedly. A lifetime value for the RDNSS can optionally be specified with this command, and overrides any default value configured for the interface using the `ipv6 nd ra dns-servers lifetime` command.

The `no ipv6 nd ra dns-server` and `default ipv6 nd ra dns-server` commands remove the corresponding `ipv6 nd ra dns-server` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ipv6 nd ra dns-server ipv6_addr SERVER_LIFE
no ipv6 nd ra dns-server ipv6_addr
default ipv6 nd ra dns-server ipv6_addr
```

**Parameters**

- `ipv6_addr` RDNSS address to be included in RAs from the command mode interface.
- `SERVER_LIFE` maximum lifetime value for the specified RDNSS entry. This value overrides any default lifetime value. Value should be between the RA interval configured on the interface and two times that interval. Options include:
  - `<no parameter>` lifetime period is the default lifetime period configured on the interface. If no lifetime period is configured on the interface, the default value is 1.5 times the maximum RA interval set by the `ipv6 nd ra interval` command.
  - `lifetime 0` the configured RDNSS is not to be used.
  - `lifetime <1 to 4294967295>` specifies the lifetime period for this RDNSS in seconds.

**Example**

- This command configures the RDNSS at 2001:0db8:0:1::1 as a preferred RDNSS for VLAN interface 200 to include in its neighbor-discovery route advertisements, and sets its lifetime value to 300 seconds.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd ra dns-server 2001:0db8:0:1::1 lifetime 300
switch(config-if-Vl200)#
```
**ipv6 nd ra dns-servers lifetime**

The **ipv6 nd ra dns-servers lifetime** command sets the default value that the configuration mode interface uses for the lifetime of any Recursive DNS Server (RDNSS) configured on the interface. A lifetime value set for an individual RDNSS overrides this value. The lifetime value is the maximum amount of time after a route advertisement packet is sent that the RDNSS referenced in the packet may be used for name resolution.

The **no ipv6 nd ra dns-servers lifetime** and **default ipv6 nd ra dns-servers lifetime** commands remove the default lifetime value from the interface by removing the corresponding **ipv6 nd ra dns-servers lifetime** command from **running-config**. When there is no default RDNSS lifetime value configured on the interface, an RDNSS without a custom lifetime value will default to 1.5 times the RA interval configured on the interface. A lifetime of zero seconds means that the RDNSS must not be used for name resolution.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
```
ipv6 nd ra dns-servers lifetime period
no ipv6 nd ra dns-servers lifetime
default ipv6 nd ra dns-servers lifetime
```

**Parameters**
- **period** the RDNSS lifetime value for the configuration mode interface. Options include:
  - `<0>` any RDNSS configured on the command mode interface without a custom lifetime value must not be used.
  - `<1 to 4294967295>` maximum RDNSS lifetime value for the configuration mode interface. This value is overridden by any lifetime value set with the **ipv6 nd ra dns-server** command. Should be between the router advertisement interval configured on the interface and two times that interval.

**Example**
- This command sets the default RDNSS maximum lifetime value for VLAN 200 to 350 seconds.
  ```
  switch(config)#interface vlan 200
  switch(config-if-Vl200)#ipv6 nd ra dns-servers lifetime 350
  switch(config-if-Vl200)#
  ```
ipv6 nd ra dns-suffix

The `ipv6 nd ra dns-suffix` command creates a DNS Search List (DNSSL) for the command mode interface to include in its neighbor-discovery Router Advertisements as defined in RFC 6106. The DNSSL contains the domain names of DNS suffixes for IPv6 hosts to append to short, unqualified domain names for DNS queries.

Multiple DNS domain names can be added to the DNSSL by using the command repeatedly. A lifetime value for the DNSSL can optionally be specified with this command, and overrides any default value configured for the interface using the `ipv6 nd ra dns-suffixes lifetime` command.

The `no ipv6 nd ra dns-suffix` and `default ipv6 nd ra dns-suffix` commands remove the corresponding `ipv6 nd ra dns-suffix` command from running-config.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ipv6 nd ra dns-suffix domain SUFFIX_LIFE
no ipv6 nd ra dns-suffix ipv6_addr
default ipv6 nd ra dns-suffix ipv6_addr
```

**Parameters**

- `domain` domain suffix for IPv6 hosts to append to short, unqualified domain names for DNS queries. Suffix must contain only alphanumeric characters, “.” and “-” and must begin and end with an alphanumeric character.
- `SUFFIX_LIFE` maximum lifetime value for the specified domain suffix. This value overrides any default lifetime value. Value should be between the RA interval configured on the interface and two times that interval. Options include:
  - `<no parameter>` lifetime period is the default lifetime period configured on the interface. If no lifetime period is configured on the interface, the default value is 1.5 times the maximum RA interval set by the ipv6 nd ra interval command.
  - `lifetime 0` the configured domain suffix is not to be used.
  - `lifetime <1 to 4294967295>` specifies the lifetime period for this domain suffix in seconds.

**Example**

- These commands create a DNSSL for VLAN interface 200 to include in its neighbor-discovery route advertisements, and set its lifetime value to 300 seconds.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd ra dns-suffix test.com lifetime 300
switch(config-if-Vl200)#
```
ipv6 nd ra dns-suffixes lifetime

The `ipv6 nd ra dns-suffixes lifetime` command sets the default value that the configuration mode interface uses for the lifetime of any DNS Search List (DNSSL) configured on the interface. A lifetime value set for an individual DNSSL overrides this value. The lifetime value is the maximum amount of time after a route advertisement packet is sent that the DNSSL included in the packet may be used for name resolution.

The `no ipv6 nd ra dns-suffixes lifetime` and `default ipv6 nd ra dns-suffixes lifetime` commands remove the default lifetime value from the interface by removing the corresponding `ipv6 nd ra dns-suffixes lifetime` command from *running-config*. When there is no default DNSSL lifetime value configured on the interface, a DNSSL without a custom lifetime value will default to 1.5 times the RA interval configured on the interface. A lifetime of zero seconds means that the DNSSL must not be used for name resolution.

Command Mode

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

Command Syntax

```plaintext
ipv6 nd ra dns-suffixes lifetime period
no ipv6 nd ra dns-suffixes lifetime
default ipv6 nd ra dns-suffixes lifetime
```

Parameters

- `period` the DNSSL lifetime value for the configuration mode interface. Options include:
  - `<0>` any DNSSL configured on the command mode interface without a custom lifetime value must not be used.
  - `<1 to 4294967295>` maximum DNSSL lifetime value for the configuration mode interface. This value is overridden by any lifetime value set with the `ipv6 nd ra dns-suffix` command. Should be between the RA interval configured on the interface and two times that interval.

Example

- This command sets the default DNSSL maximum lifetime value for VLAN 200 to 350 seconds.
  ```plaintext
  switch(config)# interface vlan 200
  switch(config-if-Vl200)# ipv6 nd ra dns-suffixes lifetime 350
  switch(config-if-Vl200)#
  ```
**ipv6 nd ra hop-limit**

The `ipv6 nd ra hop-limit` command sets a suggested hop-limit value to be included in Router Advertisement (RA) packets. The hop-limit value is to be used by attached hosts in outgoing packets.

The `no ipv6 nd ra hop-limit` and `default ipv6 nd ra hop-limit` commands remove the corresponding `ipv6 nd ra hop-limit` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
```
ipv6 nd ra hop-limit quantity
no ipv6 nd ra hop-limit lifetime
default ipv6 nd ra hop-limit lifetime
```

**Parameters**
- `quantity` the hop-limit value to be included in RA packets sent by the configuration mode interface. Options include:
  - `<0>` indicates that outgoing packets from attached hosts are to be immediately discarded.
  - `<1` to `255>` number of hops. The default value is 64.

**Example**
- These commands include a hop-limit value of 100 in RA packets sent by VLAN 200.
```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd ra hop-limit
switch(config-if-Vl200)#
```
ipv6 nd ra interval

The **ipv6 nd ra interval** command configures the interval between IPv6 Router Advertisement transmissions from the configuration mode interface.

The **no ipv6 nd ra interval** and **default ipv6 nd ra interval** commands return the IPv6 RA transmission interval for the configuration mode interface to the default value of 200 seconds by removing the corresponding **ipv6 nd ra interval** command from **running-config**.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```plaintext
ipv6 nd ra interval [SCALE] ra_period [minimum_period]
no ipv6 nd ra interval
default ipv6 nd ra interval
```

**Parameters**

- **SCALE** timescale in which command parameter values are expressed.
  - <no parameter> seconds
  - msec milliseconds
- **ra_period** maximum interval between successive IPv6 RA transmissions. The default period is 200 seconds.
  - <4 - 1800> valid range when scale is set to default value (seconds).
  - <500 - 1800000> valid range when scale is set to msec.
- **minimum_period** minimum interval between successive IPv6 RA transmissions. Must be smaller than ra_period. By default, a minimum period is not defined.
  - <no parameter> Command does not specify a minimum period.
  - <3 - 1799> valid range when scale is set to default value (seconds).
  - <375 - 1799999> valid range when scale is set to msec.

**Example**

- These commands configure a RA transmission interval of 60 seconds on VLAN interface 200, then displays the interface status.

```plaintext
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd ra interval 60
switch(config-if-Vl200)#show active
interface Vlan200
  ipv6 nd ra interval 60
switch(config-if-Vl200)#
```
**ipv6 nd ra lifetime**

The `ipv6 nd ra lifetime` command specifies the value that the switch places in the *router lifetime* field of IPv6 Router Advertisements sent from the configuration mode interface.

If the value is set to 0, IPv6 peers connected to the specified interface will remove the switch from their lists of default routers. Values greater than 0 indicate the time in seconds that peers should keep the router on their default router lists without receiving further RAs from the switch. Unless the value is 0, the router lifetime value should be equal to or greater than the interval between unsolicited RAs sent on the interface.

The `no ipv6 nd ra lifetime` and `default ipv6 nd ra lifetime` commands return the IPv6 RA lifetime data entry filed for the configuration mode interface to the default value of 1800 seconds by removing the corresponding `ipv6 nd ra lifetime` command from *running-config*.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ipv6 nd ra lifetime ra_lifetime  
no ipv6 nd ra lifetime  
default ipv6 nd ra lifetime
```

**Parameters**

- `ra_lifetime` router lifetime period (seconds). Default value is 1800. Options include
  - `<0>` Router should not be considered as a default router
  - `<1 - 65535>` Lifetime period advertised in RAs. Should be greater than or equal to the interval between IPv6 RA transmissions from the configuration mode interface as set by the `ipv6 nd ra interval` command.

**Example**

- This command configures the switch to enter 2700 in the router lifetime field of RAs transmitted from VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd ra lifetime 2700
```

```
switch(config-if-Vl200)#show active  
interface V1an20  
   ipv6 nd ra lifetime 2700  
```

```
switch(config-if-Vl200)#
```
**ipv6 nd ra mtu suppress**

The `ipv6 nd ra mtu suppress` command suppresses the Router Advertisement (RA) MTU option on the configuration mode interface. The MTU option causes an identical MTU value to be advertised by all nodes on a link. By default, the RA MTU option is not suppressed.

The `no ipv6 nd ra mtu suppress` and `default ipv6 nd ra mtu suppress` commands restores the MTU option setting to enabled by for the configuration mode interface by removing the corresponding `ipv6 nd ra mtu suppress` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

- `ipv6 nd ra mtu suppress`
- `no ipv6 nd ra mtu suppress`
- `default ipv6 nd ra mtu suppress`

**Example**

- This command suppresses the MTU option on VLAN interface 200.

```
switch(config)#interface vlan 200
switch(config-vl200)#ipv6 nd ra mtu suppress
switch(config-vl200)#
```
**ipv6 nd ra suppress**

The **ipv6 nd ra suppress** command suppress IPv6 Router Advertisement (RA) transmissions on the configuration mode interface. By default, only unsolicited RAs that are transmitted periodically are suppressed. The **all** option configures the switch to suppress all RAs, including those responding to a router solicitation.

The **no ipv6 nd ra suppress** and **default ipv6 nd ra suppress** commands restore the transmission of RAs on the configuration mode interface by deleting the corresponding **ipv6 nd ra suppress** command from **running-config**.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ipv6 nd ra suppress [SCOPE]
no ipv6 nd ra suppress
default ipv6 nd ra suppress
```

**Parameters**

- **SCOPE** specifies the RAs that are suppressed.
  - `<no parameter>` Periodic unsolicited RAs are suppressed.
  - **all** All RAs are suppressed.

**Example**

- This command suppresses all RAs on VLAN interface 200.

```
switch(config)#interface vlan 200
switch(config-vl200)#ipv6 nd ra suppress all
switch(config-vl200)#
```
**ipv6 nd reachable-time**

The **ipv6 nd reachable-time** command specifies the time period that the switch includes in the reachable time field of RAs sent from the configuration mode interface. The reachable time defines the period that a remote IPv6 node is considered reachable after a reachability confirmation event.

RAs that advertise zero seconds indicate that the router does not specify a reachable time. The default advertisement value is 0 seconds. The switch reachability default period is 30 seconds.

The **no ipv6 nd reachable-time** and **default ipv6 nd reachable-time** commands restore the entry of the default value (0) in RAs sent from the configuration mode interface by deleting the corresponding **ipv6 nd reachable-time** command from **running-config**.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
```
ipv6 nd reachable-time period
no ipv6 nd reachable-time
default ipv6 nd reachable-time
```

**Parameters**
- **period** Reachable time value (milliseconds). Value ranges from 0 to 4294967295. Default is 0.

**Example**
- These commands configure the entry of 25000 (25 seconds) in the reachable time field of RAs sent from VLAN 200.

```bash
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd reachable-time 25000
interface Vlan200
  ipv6 address fd7a:4321::1/64
  ipv6 nd reachable-time 25000
switch(config-if-Vl200)#
```
**ipv6 nd router-preference**

The `ipv6 nd router-preference` command specifies the value that the switch enters in the Default Router Preference (DRP) field of Router Advertisements (RAs) that it sends from the configuration mode interface. The default field entry value is `medium`.

The `no ipv6 nd router-preference` and `default ipv6 nd router-preference` commands restore the switch to enter the default DRP field value of `medium` in RAs sent from the configuration mode interface by deleting the corresponding `ipv6 nd router-preference` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
```
ipv6 nd router-preference RANK
no ipv6 nd router-preference
default ipv6 nd router-preference
```

**Parameters**
- `RANK`  
  
  Router preference value. Options include:
  - `high`
  - `low`
  - `medium`

**Example**
- This command configures the switch as a medium preference router on RAs sent from VLAN 200.
  ```
  switch(config)#interface vlan 200
  switch(config-if-Vl200)#ipv6 nd router-preference medium
  switch(config-if-Vl200)#
  ```
ipv6 neighbor

The `ipv6 neighbor` command creates an IPv6 neighbor discovery cache static entry. The command converts pre-existing dynamic cache entries for the specified address to static entries.

The `no ipv6 neighbor` and `default ipv6 neighbor` commands remove the specified static entry from the IPv6 neighbor discovery cache and delete the corresponding `ipv6 neighbor` command from `running-config`. These commands do not affect any dynamic entries in the cache.

**Command Mode**
Global Configuration

**Command Syntax**
```
ipv6 neighbor ipv6_addr PORT mac_addr
no ipv6 neighbor ipv6_address PORT
default ipv6 neighbor ipv6_addr PORT
```

**Parameters**
- `ipv6_addr` Neighbor’s IPv6 address.
- `PORT` Interface through which the neighbor is accessed. Options include:
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-channel interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
  - `vxlan vx_num` VXLAN interface specified by `vx_num`.
- `mac_addr` Neighbor’s data-link (hardware) address. (48-bit dotted hex notation – H.H.H).

**Example**
- This command will add a static entry to the neighbor discovery cache for the neighbor located at 3100:4219::3EF2 with hardware address 0100.4EA1.B100 and accessible through VLAN 200.

```
switch(config)#ipv6 neighbor 3100:4219::3EF2 vlan 200 0100.4EA1.B100
switch(config)#
```
**ipv6 neighbor cache persistent**

The `ipv6 neighbor cache persistent` command restores the IPv6 neighbor cache after reboot. The `no ipv6 neighbor cache persistent` and `default ipv6 neighbor cache persistent` commands remove the ARP cache persistent configuration from the `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ipv6 neighbor cache persistent
no ipv6 neighbor cache persistent
default ipv6 neighbor cache persistent
```

**Example**

- This command restores the ipv6 neighbor cache after reboot.

```
switch(config)# ipv6 neighbor cache persistent
switch(config)#
```
ipv6 route

The ipv6 route command creates an IPv6 static route. The destination is a IPv6 prefix; the source is an IPv6 address or a routable interface port. When multiple routes exist to a destination prefix, the route with the lowest administrative distance takes precedence.

By default, the administrative distance assigned to static routes is 1. Assigning a higher administrative distance to a static route configures it to be overridden by dynamic routing data. For example, a static route with a distance value of 200 is overridden by OSPF intra-area routes, which have a default distance of 110.

The command provides these methods of designating the nexthop location:

- null0: Traffic to the specified destination is dropped.
- IPv6 gateway: Switch identifies egress interface by recursively resolving the next-hop.
- Egress interface: Switch assumes destination subnet is directly connected to interface; when routing to any subnet address, the switch sends an ARP request to find the MAC address for the first packet.
- Combination Egress interface and IPv6 gateway: Switch does not assume subnet is directly connected to interface; the only ARP traffic is for the nexthop address for the first packet on the subnet. Combination routes are not recursively resolved.

Multiple routes that are configured to the same destination with the same administrative distance comprise an Equal Cost Multi-Path (ECMP) route. The switch attempts to spread outbound traffic across all ECMP route paths equally. All ECMP paths are assigned the same tag value; commands that change the tag value of any ECMP path change the tag value of all paths in the ECMP.

The no ipv6 route and default ipv6 route commands delete static routes by removing the corresponding ipv6 route statements from running-config. Commands not including a source delete all statements to the destination. Only statements with parameters that match specified command arguments are deleted. Parameters that are not in the command line are not evaluated.

**Command Mode**

Global Configuration

**Command Syntax**

```
ipv6 route dest_prefix NEXTHOP [DISTANCE] [TAG_OPT] [RT_NAME]
no ipv6 route dest_prefix [nexthop_addr] [DISTANCE]
default ipv6 route dest_prefix [nexthop_addr] [DISTANCE]
```

**Parameters**

- `dest_prefix` destination IPv6 prefix (CIDR notation).
- `NEXTHOP` Access method of next hop device. Options include:
  - `null0` Null0 interface – route is dropped.
  - `nexthop_addr` IPv6 address of nexthop device.
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-channel interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
  - `vxlan vx_num` VXLAN interface specified by `vx_num`.
  - `ethernet e_num nexthop_addr` Combination route (Ethernet interface and gateway).
IPv6 Command Descriptions

Chapter 25: IPv6

- **loopback** \textit{\texttt{l\_num \ nexthop\_addr}} Combination route (loopback interface and gateway).
- **management** \textit{\texttt{m\_num \ nexthop\_addr}} Combination route (management interface and gateway).
- **port-channel** \textit{\texttt{p\_num \ nexthop\_addr}} Combination route (port channel interface and gateway).
- **vlan** \textit{\texttt{v\_num \ nexthop\_addr}} Combination route (VLAN interface and gateway).
- **vxlan** \textit{\texttt{vx\_num \ nexthop\_addr}} Combination route (VXLAN interface and gateway).

- **DISTANCE** administrative distance assigned to route. Options include:
  - \texttt{<no parameter> route assigned default administrative distance of one.}
  - \texttt{<1 \ to \ 255> The administrative distance assigned to route.}

- **TAG_OPT** static route tag. Options include:
  - \texttt{<no parameter> assigns default static route tag of 0.}
  - \texttt{tag \texttt{<0 \ to \ 4294967295> Static route tag value.}}

- **RT_NAME** Associates descriptive text to the route. Options include:
  - \texttt{<no parameter> No text is associated with the route.}
  - \texttt{name \ descriptive\_text The specified text is assigned to the route.}

**Example**

- This command creates an IPv6 static route.

  \texttt{switch(config)#ipv6 route 10:23:31:00:01:32:93/24 \ vlan \ 300}
**ipv6 unicast-routing**

The `ipv6 unicast-routing` command enables the forwarding of IPv6 unicast packets. When routing is enabled, the switch attempts to deliver inbound packets to destination addresses by forwarding them to interfaces or next hop addresses specified by the IPv6 routing table.

The `no ipv6 unicast-routing` and default `ip ipv6 unicast-routing` commands disable IPv6 unicast routing by removing the `ipv6 unicast-routing` command from `running-config`. Dynamic routes added by routing protocols are removed from the routing table. Static routes are preserved by default; the `delete-static-routes` option removes static entries from the routing table.

IPv6 unicast routing is disabled by default.

**Command Mode**
Global Configuration

**Command Syntax**

```
ipv6 unicast-routing
no ipv6 unicast-routing [DELETE_ROUTES]
default ipv6 unicast-routing [DELETE_ROUTES]
```

**Parameters**
- `DELETE_ROUTES` Resolves routing table static entries when routing is disabled.
- `<no parameter>` Routing table retains static entries.
- `delete-static-routes` Static entries are removed from the routing table.

**Example**
- This command enables IPv6 unicast-routing.
  ```
  switch(config)#ipv6 unicast-routing
  switch(config)#
  ```
ipv6 verify

The `ipv6 verify` command configures Unicast Reverse Path Forwarding (uRPF) for inbound IPv6 packets on the configuration mode interface. uRPF verifies the accessibility of source IP addresses in packets that the switch forwards.

uRPF defines two operational modes: strict mode and loose mode.

- **Strict mode**: uRPF also verifies that a packet is received on the interface that its routing table entry specifies for its return packet.
- **Loose mode**: uRPF validation does not consider the inbound packet’s ingress interface.

The `no ipv6 verify` and `default ipv6 verify` commands disable uRPF on the configuration mode interface by deleting the corresponding `ipv6 verify` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```plaintext
ipv6 verify unicast source reachable-via RPF_MODE
no ipv6 verify unicast
default ipv6 verify unicast
```

**Parameters**

- **RPF_MODE**  
  Specifies the uRPF mode. Options include:
  - **any**  Loose mode.
  - **rx**   Strict mode
  - **rx allow-default**  Strict mode. All inbound packets are forwarded if a default route is defined.

**Guidelines**

The first IPv6 uRPF implementation briefly disables IPv6 unicast routing. Subsequent `ip verify` commands on any interface do not disable IPv6 routing.

**Example**

- This command enables uRPF strict mode on VLAN interface 100. When a default route is configured on the interface, all inbound packets are checked as valid.

```plaintext
switch(config)#interface vlan 100
switch(config-if-Vl100)#ipv6 verify unicast source reachable-via rx
allow-default
switch(config-if-Vl100)#show active
interface Vlan100
  ipv6 verify unicast source reachable-via rx allow-default
switch(config-if-Vl100)#
```
show ipv6 dhcp relay counters

The `show ipv6 dhcp relay counters` command displays the number of DHCP packets received, forwarded, or dropped on the switch and on all interfaces enabled as DHCP relay agents.

**Command Mode**

EXEC

**Command Syntax**

`show ipv6 dhcp relay counters`

**Example**

- This command displays the IP DHCP relay counter table.

```
switch>show ipv6 dhcp relay counters

<table>
<thead>
<tr>
<th>DhcP Packets</th>
<th>Rcvd Fwdd Drop</th>
<th>Last Cleared</th>
</tr>
</thead>
<tbody>
<tr>
<td>All Req</td>
<td>376 376</td>
<td>4 days, 19:55:12 ago</td>
</tr>
<tr>
<td>All Resp</td>
<td>277 277</td>
<td></td>
</tr>
<tr>
<td>Ethernet4</td>
<td>207 148</td>
<td>4 days, 19:54:24 ago</td>
</tr>
</tbody>
</table>
```

switch>
show ipv6 hardware fib aggregate-address

The `show ipv6 hardware fib aggregate-address` command displays the IPv6 prefixes that are restricted from entry into the hardware routing table. The `ipv6 hardware fib aggregate-address` command configures IPv6 prefix restrictions.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 address fib aggregate-address [ADDRESS] [RESTRICTION]
```

**Parameters**

- **ROUTE_FILTER** filters by IPv6 address. Options include:
  - `<no parameter>` Displays all routes.
  - `ipv6_addr` Command displays only specified address.
  - `ipv6_prefix` Command displays addresses filtered by specified prefix (CIDR notation).
- **RESTRICTION** filters by route restriction.
  - `<no parameter>` displays routes restricted from the hardware routing table.
  - `software-forward` displays routes restricted from the hardware routing table.

**Example**

```
This command displays the routes that are restricted from the hardware routing table.

switch>show ipv6 hardware fib aggregate-address
Codes: S - Software Forwarded
S fd77:4890:5313:aaed::/64
S fd77:4890:5313:ffed::/64

switch>
```
show ipv6 helper-address

The **show ipv6 helper-address** command displays the status of DHCP relay agent parameters on the switch and each interface where at least one feature parameter is listed. The command provides status on the following parameters:

- Global: DHCP relay agent Always-on mode, DHCP relay agent Information option
- Interface: DHCP server (list of addresses), Circuit ID contents.

**Command Mode**

`EXEC`

**Command Syntax**

`show ipv6 helper-address`

**Example**

- This command displays the DHCP Agent Relay parameter status.
  
  ```
  switch>show ipv6 helper-address
  DHCP Relay Agent Information Option Enabled
  DHCP Relay Agent Always-On Mode Enabled
  Interface: Ethernet4
  Circuit ID: V-200
  DHCP servers: 2001:db8:0:1::1
  switch>
  ```
show ipv6 interface

The `ipv6 interface` command displays the status of specified routed interfaces that are configured for IPv6.

**Command Mode**

**EXEC**

**Command Syntax**

```
show ipv6 interface [INTERFACE_NAME] [INFO_LEVEL]
```

**Parameters**

- **INTERFACE_NAME**  
  - `<no parameter>` all routed interfaces.
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-Channel Interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
  - `vxlan vx_num` VXLAN interface specified by `vx_num`.

- **INFO_LEVEL**  
  - `<no parameter>` command displays data block for each specified interface.
  - `brief` command displays table that summarizes IPv6 interface data.

**Example**

- This command displays the status of VLAN 903.

```
switch>show ipv6 interface vlan 903
Vlan903 is up, line protocol is up (connected)
IPv6 is enabled, link-local is fe80::21c:73ff:fe01:21e/64
Global unicast address(es):
  fd7a:629f:52a4:fe10::3, subnet is fd7a:629f:52a4:fe10::/64
Joined group address(es):
  ff02::1
  ff02::1:ff01:21e
  ff02::1:ff00:3
  ff01::2
switch>
```
show ipv6 nd ra internal state

The `ipv6 nd ra internal state` command displays the state of the IPv6 Router Advertisement (RA) daemon for the specified routable interface.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 nd ra internal state [INTERFACE_NAME]
```

**Parameters**

- `INTERFACE_NAME` interfaces for which command displays status.
  - `<no parameter>` all routed interfaces.
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-Channel Interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
  - `vxlan vx_num` VXLAN interface specified by `vx_num`.

**Example**

- This command displays the IPv6 RA daemon for VLAN interface 1243.

```
switch> show ipv6 nd ra internal state vlan 1243
 INTERFACE: Vlan3908
  ifindex : 0x00000021
  mtu : 9212
  numIpv6Addr : 2

  numRsRspSent : 0
  numRsDroppedInvalidHopLimit : 0
  numPktDroppedUnexpectedType : 0
  initialized : 1

switch>
```
**show ipv6 neighbors**

The `show ipv6 neighbors` command displays the IPv6 neighbor discovery cache. The command provides filters to restrict the list to a specified IPv6 address or routable interface.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 neighbors [PORT] [SOURCE] [INFO_LEVEL]
```

**Parameters**

- **PORT** Filters by interface through which neighbor is accessed. Options include:
  - `<no parameter>` all routed interfaces.
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-channel interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
  - `vxlan vx_num` VXLAN interface specified by `vx_num`.

- **SOURCE** Filters by neighbor IPv6 address. Options include:
  - `<no parameter>` all IPv6 neighbors.
  - `ipv6_addr` IPv6 address of individual neighbor.

- **INFO_LEVEL** amount of information that is displayed. Options include:
  - `<no parameter>` command displays the discovery cache for the specified interfaces.
  - `summary` command displays summary information only.

**Example**

- This command displays the IPv6 neighbor discovery cache for IPv6 address `fe80::21c:73ff:fe01:5fe1`.

```
switch>show ipv6 neighbors fe80::21c:73ff:fe01:5fe1

```
show ipv6 route

The `show ipv6 route` command displays IPv6 routing table entries that are in the Forwarding Information Base (FIB), including static routes, routes to directly connected networks, and dynamically learned routes. Multiple equal cost paths to the same prefix are displayed contiguously as a block, with the destination prefix displayed only on the first line.

The `show running-config` command displays all configured routes.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 route [ADDRESS] [ROUTE_TYPE] [INFO_LEVEL]
```

**Parameters**

Address, when present, is always listed first. All other parameters can be placed in any order.

- **ADDRESS** filters routes by IPv6 address or prefix.
  - `<no parameter>` all routing table entries.
  - `ipv6_address` routing table entries matching specified IPv6 address.
  - `ipv6_prefix` routing table entries matching specified IPv6 prefix (CIDR notation).
- **ROUTE_TYPE** filters routes by specified protocol or origin.
  - `<no parameter>` all routing table entries.
  - `aggregate` entries for BGP aggregate routes.
  - `bgp` entries added through BGP protocol.
  - `connected` entries for routes to networks directly connected to the switch.
  - `kernel` entries appearing in Linux kernel but not added by EOS software.
  - `isis` entries added through IS-IS protocol.
  - `ospf` entries added through OSPF protocol.
  - `static` entries added through CLI commands.
- **INFO_LEVEL** Filters entries by next hop connection.
  - `<no parameter>` filters routes whose next hops are directly connected.
  - `detail` displays all routes.

**Example**

- This command displays a route table entry for a specific IPv6 route.

  ```
  switch>show ipv6 route fd7a:3418:52a4:fe18::/64
  IPv6 Routing Table - 77 entries
  Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP, R - RIP, A - Aggregate
  O  fd7a:3418:52a4:fe18::/64 [10/20]
  via fe80::21c:73ff:fe00:1319, Vlan3601
  via fe80::21c:73ff:fe00:1319, Vlan3602
  via fe80::21c:73ff:fe00:1319, Vlan3610
  via fe80::21c:73ff:fe00:1319, Vlan3611
  switch>
  ```
show ipv6 route age

The `show ipv6 route age` command displays the IPv6 route age to the specified IPv6 address or prefix.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 route ADDRESS age
```

**Parameters**

- **ADDRESS** filters routes by IPv6 address or prefix.

**Example**

- This command displays the route age for the specified prefix.

  ```
  switch>show ipv6 route 2001::3:0/11 age
  IPv6 Routing Table - 74 entries
  Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP, R - RIP, A - Aggregate

  C 2001::3:0/11 age 00:02:34
  switch>
  ```
show ipv6 route host

The `show ipv6 route host` command displays all host routes in the IPv6 host forwarding table. Host routes are those whose destination prefix is the entire address (prefix = /128). Each displayed host route is labeled with its purpose:

- **F** static routes from the FIB.
- **R** routes defined because the IP address is an interface address.
- **A** routes to any neighboring host for which the switch has an ARP entry.

**Command Mode**

EXEC

**Command Syntax**

`show ipv6 route host`

**Example**

- This command displays all IPv6 host routes in the host forwarding table.

```
switch>show ipv6 route host
R - receive F - FIB, A - attached

F ::1 to cpu
A fee7:48a2:0c11:1900:400::1 on Vlan102
R fee7:48a2:0c11:1900:400::2 to cpu
F fee7:48a2:0c11:1a00::b via fe80::21c:73ff:fe0b:a80e on Vlan3902
R fee7:48a2:0c11:1a00::17 to cpu
F fee7:48a2:0c11:1a00::20 via fe80::21c:73ff:fe0b:33e on Vlan3913
F fee7:48a2:0c11:1a00::22 via fe80::21c:73ff:fe01:5fe1 on Vlan3908
                              via fe80::21c:73ff:fe01:5fe1 on Vlan3902

switch>
```
show ipv6 route interface

The `show ipv6 route interface` command displays routing table entries on a specified routed port.

**Command Mode**
EXEC

**Command Syntax**
```
show ipv6 route [ADDRESS] interface PORT_NAME [INFO_LEVEL]
```

**Parameters**

- **ADDRESS**, when present, is always listed first. All other parameters can be placed in any order.
  - **ADDRESS** filters routes by IPv6 address or prefix.
    - `<no parameter>` all routing table entries.
    - `ipv6_address` routing table entries matching specified IPv6 address.
    - `ipv6_prefix` routing table entries matching specified IPv6 prefix (CIDR notation).
  - **PORT_NAME** interfaces for which command displays status.
    - `ethernet e_num` Ethernet interface specified by `e_num`.
    - `loopback l_num` Loopback interface specified by `l_num`.
    - `management m_num` Management interface specified by `m_num`.
    - `port-channel p_num` Port-Channel Interface specified by `p_num`.
    - `vlan v_num` VLAN interface specified by `v_num`.
    - `vxlan vx_num` VXLAN interface specified by `vx_num`.
  - **INFO_LEVEL** filters entries by next hop connection.
    - `<no parameter>` filters routes whose next hops are directly connected.
    - `detail` displays all routes.

**Example**

- This command displays the IPv6 routes in VLAN interface 661.

```
switch>show ipv6 route interface ethernet 8
IPv6 Routing Table - 77 entries
Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP, R - RIP, A - Aggregate

O fd7a:629f:63af:1232::/64 [150/11]
   via fe80::823c:73ff:fe00:3640, Ethernet8
O fd7a:629f:63af:4118::/64 [150/11]
   via fe80::823c:73ff:fe00:3640, Ethernet8
O fd7a:629f:63af:4119::/64 [150/11]
   via fe80::823c:73ff:fe00:3640, Ethernet8
O fd7a:629f:63af:411a::/64 [150/11]
   via fe80::823c:73ff:fe00:3640, Ethernet8
O fd7a:629f:63af:411b::/64 [150/11]
   via fe80::823c:73ff:fe00:3640, Ethernet8
O fd7a:629f:63af:411c::/64 [150/11]
   via fe80::823c:73ff:fe00:3640, Ethernet8
O fd7a:629f:63af:411d::/64 [150/11]
   via fe80::823c:73ff:fe00:3640, Ethernet8
O fd7a:629f:63af:411e::/64 [150/11]
   via fe80::823c:73ff:fe00:3640, Ethernet8

   via ::, Ethernet12
O fd7a:629f:63af:fe8c::/64 [10/20]
   via fe80::21c:73ff:fe00:3640, Ethernet8
C fe80:0:40::/64 [0/1]
   via ::, Ethernet8
```
**show ipv6 route summary**

The `show ipv6 route summary` command displays the information about the IPv6 routing table.

**Command Mode**
- EXEC

**Command Syntax**
- `show ipv6 route summary`

**Example**
- This command displays the route source and the corresponding number of routes in the IPv6 routing table.

```
switch>show ipv6 route summary
Route Source    Number Of Routes
------------------ ----------------
connected        2
static           0
ospf             5
bgp              7
isis             0
internal         1
attached         0
aggregate        2

Total Routes     17
switch>
```
**show ipv6 route tag**

The `show ipv6 route tag` command displays the route tag assigned to the specified IPv6 address or prefix. Route tags are added to static routes for use by route maps.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 route ADDRESS tag
```

**Parameters**

- `ADDRESS` filters routes by IPv6 address or prefix.
  - `ipv6_address` routing table entries matching specified address (A:B:C:D:E:F:G:H)

**Example**

- This command displays the route tag for the specified prefix.

```bash
switch>show ipv6 route fd7b:789f:5314:fe08::/64 tag
IPv6 Routing Table - 74 entries
Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP, R - RIP, A - Aggregate

C   fd7b:789f:5314:fe08::/64 tag 0
```

`switch>}`
# Traffic Management

This chapter describes Arista’s Traffic Management, including configuration instructions and command descriptions. Topics covered by this chapter include:

- Section 26.1: Traffic Management Conceptual Overview
- Section 26.2: Traffic Management Configuration – Arad Platform Switches
- Section 26.3: Traffic Management Configuration – FM6000 Platform Switches
- Section 26.4: Traffic Management Configuration – Petra Platform Switches
- Section 26.5: Traffic Management Configuration – Trident Platform Switches
- Section 26.6: Traffic Management Configuration – Trident-II Platform Switches
- Section 26.7: Traffic Management Configuration Commands

## 26.1 Traffic Management Conceptual Overview

Traffic is managed through policy maps that apply data shaping methods to specific data streams. A policy map is a data structure that identifies specific data streams and then defines shaping parameters that modify packets within the streams. The switch defines three types of policies:

- **Section 26.1.1: Control Plane Policies**: Control plane policy maps are applied to the control plane.
- **Section 26.1.2: QoS Policies**: QoS policy maps are applied to Ethernet and port channel interfaces.
- **Section 26.1.3: PBR Policies**: PBR policy maps are applied to Ethernet interfaces, port channel interfaces and switch virtual interfaces (SVIs).

A policy map consists of classes. Each class contains an eponymous class map and traffic resolution commands.

- A class map is a data structure that defines a data stream by specifying characteristics of data packets that comprise that stream. Each class map is typed as either QoS, control plane, or PBR, and is available only to identically typed policy maps.
- Traffic resolution commands specify data handling methods for traffic that matches a class map. Traffic resolution options vary by policy map type.

Data packets that enter an entity to which a policy map is assigned are managed with traffic resolution commands of the first class that matches the packets.
26.1.1 Control Plane Policies

The switch defines one control plane policy map named copp-system-policy. The copp-system-policy policy map is always applied to the control plane and cannot be removed from the switch. Other control plane policy maps cannot be added. Copp-system-policy consists of preconfigured classes, each containing a static class map and traffic resolution commands. Preconfigured classes cannot be removed from copp-system-policy.

Static class maps are provided by the switch and cannot be modified or deleted. The naming convention of static class maps is copp-system-name, where name differentiates the class maps. Static class maps have pre-defined internal conditions, are not based on ACLs, and are only listed in running-config as components of copp-system-policy. The sequence of static class maps in the policy map is not significant. Traffic resolution commands define minimum (bandwidth) and maximum (shape) transmission rates for data streams matching the corresponding class map.

Copp-system-policy can be modified through the following steps:

- Add classes consisting of an eponymous dynamic class map and traffic resolution commands.
  Dynamic class maps are user created, can be edited or deleted, filter traffic with a single IPv4 ACL, and are listed in running-config.
- Change traffic resolution commands for a preconfigured class.

These sections describe control plane traffic policy configuration procedures:

- Section 26.2.1: Configuring Control Plane Traffic Policies – Arad Platform Switches
- Section 26.3.1: Configuring Control Plane Traffic Policies – FM6000 Platform Switches
- Section 26.4.1: Configuring Control Plane Traffic Policies – Petra Platform Switches
- Section 26.5.1: Configuring Control Plane Traffic Policies – Trident Platform Switches

26.1.2 QoS Policies

QoS policy maps are user defined. The switch does not provide preconfigured QoS policy maps and in the default configuration, policy maps are not applied to any Ethernet or port channel interface. Policy maps and class maps are created and applied to interfaces through configuration commands.

A QoS policy map is composed of one or more classes. Each class contains an eponymous dynamic class map and traffic resolution commands. Dynamic class maps are user created, can be edited or deleted, filter traffic with a single IPv4 ACL, and are listed in running-config.

QoS traffic resolution commands perform one of the following:

- Set the layer 2 CoS field
- Set the DSCP value in the ToS byte
- Specify a traffic class queue

The last class in all QoS policy maps is class-default, which is composed as follows:

- The class-default class map matches all traffic except IPv4 or IPv6 traffic and is not editable.
- By default, class-default class contains no traffic resolution commands. Traffic resolution commands can be added through configuration commands.

Data packets that enter an interface to which a policy map is assigned are managed with traffic resolution commands that correspond to the first class that matches the packet.

These sections describe QoS traffic policy configuration procedures:

- Section 26.2.2: Configuring QoS Traffic Policies – Arad Platform Switches
26.1.3 PBR Policies

Policy-Based Routing (PBR) allows the operator to specify the next hop for selected incoming packets on an L3 interface, overriding the routing table. Incoming packets are filtered through a policy map referencing one or more ACLs, and matching packets are routed to the next hop specified.

A PBR policy map is composed of one or more classes and can include next-hop information for each class. It can also include single-line raw match statements, which have the appearance and function of a single line from an ACL. Each class contains an eponymous class map. Class maps are user-created, can be edited or deleted, filter traffic using IPv4 ACLs, and are listed in `running-config`.

These sections describe PBR policy configuration procedures:

- Section 26.2.3: Configuring PBR Policies – Arad Platform Switches
- Section 26.3.3: Configuring PBR Policies – FM6000 Platform Switches
- Section 26.4.3: Configuring PBR Policies – Petra Platform Switches
- Section 26.5.3: Configuring PBR Policies – Trident Platform Switches
26.2 Traffic Management Configuration – Arad Platform Switches

Traffic policies are implemented by policy maps, which are applied to the control plane, or to L3 interfaces for Policy-Based Routing (PBR). Policy maps contain classes, which are composed of class maps and traffic resolution commands.

Section 26.1 describes traffic policies.

26.2.1 Configuring Control Plane Traffic Policies – Arad Platform Switches

Default control plane traffic policies are implemented automatically without user intervention. These policies are modified by associating traffic resolution commands with static classes that comprise the control plane policy map.

Static Class Maps

Control plane traffic policies utilize static class maps, which are provided by the switch, are not editable, and cannot be deleted.

Editing the Policy Map

The only control plane policy map is `copp-system-policy`, which cannot be deleted. In its default form, `copp-system-policy` consists of the classes listed in Table 26-1. Although the underlying class map of each class cannot be edited, the traffic resolution commands can be adjusted. The default classes cannot be removed from the policy map and their sequence within the policy map is not editable.

<table>
<thead>
<tr>
<th>Class Name</th>
<th>shape (pps)</th>
<th>bandwidth (pps)</th>
</tr>
</thead>
<tbody>
<tr>
<td>copp-system-bgp</td>
<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-bpdu</td>
<td>2500</td>
<td>1250</td>
</tr>
<tr>
<td>copp-system-default</td>
<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-ipbroadcast</td>
<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-ipmc</td>
<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-ipmcmiss</td>
<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-ipunicast</td>
<td>NO LIMIT</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-l2broadcast</td>
<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-l2unicast</td>
<td>NO LIMIT</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-l3destmiss</td>
<td>2500</td>
<td>250</td>

<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-lldp</td>
<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-mlag</td>
<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-multicastsnoop</td>
<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-OspfIsis</td>
<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-sflow</td>
<td>2500</td>
<td>250</td>
</tr>
</tbody>
</table>
Policy maps are modified in policy-map configuration mode. The policy-map type control-plane command enters policy-map configuration mode.

Example
- This command enters policy-map configuration mode for editing copp-system-policy.
  ```
  switch(config)#policy-map type control-plane copp-system-policy
  switch(config-pmap-copp-system-policy)#
  ```

The class (policy-map (control-plane) – Arad) command enters policy-map-class configuration mode, where traffic resolution commands are modified for the configuration mode class.

Example
- This command enters policy-map-class configuration mode for the copp-system-lacp static class.
  ```
  switch(config-pmap-copp-system-policy)#class copp-system-lacp
  switch(config-pmap-c-copp-system-policy-copp-system-lacp)#
  ```

Two traffic resolution commands determine bandwidth parameters for class traffic:

- **bandwidth (policy-map-class (control-plane) – Arad)** specifies the minimum bandwidth.
- **shape (policy-map-class (control-plane) – Arad)** specifies the maximum bandwidth.

Example
- These commands configure a bandwidth range of 2000 to 4000 packets per seconds (pps) for traffic filtered by the copp-system-lacp class map:
  ```
  switch(config-pmap-c-copp-system-policy-copp-system-lacp)#bandwidth kbps 2000
  switch(config-pmap-c-copp-system-policy-copp-system-lacp)#shape kbps 4000
  switch(config-pmap-c-copp-system-policy-copp-system-lacp)#
  ```

Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the exit command or discarded with the abort command. The show active command displays the saved version of policy map. The show pending command displays the modified policy map.

Example
- These commands exit policy-map-class configuration mode, display the pending policy-map, then exit policy-map configuration mode, which saves the altered policy map to running-config.
  ```
  switch(config-pmap-c-copp-system-policy-copp-system-lacp)#exit
  switch(config-pmap-c-copp-system-policy)#show pending
  policy-map type control-plane copp-system-policy
  class copp-system-bpdu
  class copp-system-lldp
  class copp-system-lacp
  shape kbps 4000
  bandwidth kbps 2000
  class copp-system-l3ttl1
  class copp-system-l3slowpath
  ```

<--------OUTPUT OMITTED FROM EXAMPLE-------->

switch(config-pmap-c-copp-system-policy)#exit
switch(config)#
Applying Policy Maps to the Control Plane

The **copp-system-policy** policy map is always applied to the control plane. No commands are available to add or remove this assignment.

Displaying Policy Maps

The `show policy-map interface type qos` command displays the configured values of the policy map’s classes and the number of packets filtered and dropped as a result of the class maps.

Example

- These commands exit policy-map-class configuration mode, display the pending policy-map, then exit policy-map configuration mode, which saves the altered policy map to `running-config`.

  ```
  switch(config)# show policy-map interface control-plane copp-system-policy
  Service-policy input: copp-system-policy
  Hardware programming status: InProgress
  
  Class-map: copp-system-mlag (match-any)
  shape : 10000001 kbps
  bandwidth : 10000001 kbps
  Out Packets : 0
  Drop Packets : 0

  Class-map: copp-system-bpdu (match-any)
  shape : 2604 kbps
  bandwidth : 1302 kbps
  Out Packets : 0
  Drop Packets : 0

  Class-map: copp-system-lacp (match-any)
  shape : 4230 kbps
  bandwidth : 2115 kbps
  Out Packets : 0
  Drop Packets : 0
  
  <---OUTPUT OMITTED FROM EXAMPLE----->
  
  switch(config)#
  
  switch(config-pmap-c-copp-system-policy-copp-system-lacp)# exit
  ```

26.2.2 Configuring QoS Traffic Policies – Arad Platform Switches

QoS traffic policies are not supported on Arad platform switches.

26.2.3 Configuring PBR Policies – Arad Platform Switches

Policy Based Routing (PBR) is implemented by creating class maps and policy maps, then applying the policy maps to Ethernet interfaces, port channel interfaces or switch virtual interfaces (SVIs).

Creating PBR Class Maps

PBR policies utilize class maps that are created and modified in class-map configuration mode. The **class-map type pbr** command enters class-map configuration mode.
Example

- This command enters class-map configuration mode to create a PBR class map named CMAP1.

```bash
switch(config)#class-map type pbr match-any CMAP1
switch(config-cmap-PBR-CMAP1)#
```

A class map contains one or more access control lists (ACLs). The `match (policy-map (pbr))` command assigns an ACL to the class map. Subsequent `match` commands add additional ACLs to the class map. Class maps filter traffic only on ACL permit rules. Deny ACL rules are disregarded; if a class map includes ACLs with deny rules, the configuration reverts to its previous state.

Example

- This command adds the ACL named ACL1 to the class map.

```bash
switch(config-cmap-PBR-CMAP1)#match ip access-group ACL1
switch(config-cmap-PBR-CMAP1)#
```

Class-map configuration mode is a group-change mode. Changes made in a group-change mode are saved by exiting the mode. The `show active` command displays the saved version of class map.

- The `show active` command indicates that the configuration mode class map is not stored in `running-config`.

```bash
switch(config-cmap-PBR-CMAP1)#show active
switch(config-cmap-PBR-CMAP1)#
```

The `exit` command returns the switch to global configuration mode and saves pending class map changes. The `abort` command returns the switch to global configuration mode and discards pending changes.

Example

- This command exits class-map configuration mode and stores pending changes to `running-config`.

```bash
switch(config-cmap-PBR-CMAP1)#exit
switch(config)#show class-map type pbr CMAP1
class-map type pbr match-any CMAP1
  10 match ip access-group ACL1
switch(config)#
```

Creating PBR Policy Maps

Policy maps are created and modified in policy-map configuration mode. The `policy-map type pbr` command enters policy-map configuration mode.

Example

- This command enters policy-map configuration mode for creating a PBR policy map named PMAP1.

```bash
switch(config)#policy-map type pbr PMAP1
switch(config-pmap-PMAP1)#
```

Policy map are edited by adding or removing classes. A class automatically contains its eponymous class map; next-hop commands are added or edited in policy-map-class configuration mode. The `class (policy-map (pbr))` command adds a class to the configuration mode policy map and places the switch in policy-map-class configuration mode, where next-hop commands are added to the class.
Example

- This command adds the CMAP1 class to the policy map and places the switch in policy-map-class configuration mode.

```bash
switch(config-pmap-PMAP1)#class CMAP1
switch(config-pmap-c-PMAP1-CMAP1)#
```

The `set nexthop (policy-map-class – pbr)` command configures the next hop for data that passes the class map.

- This command configures the policy map to set the next hop to 10.12.0.5 on packets filtered by the class map.

```bash
switch(config-pmap-c-PMAP1-CMAP1)#set nexthop 10.12.0.5
switch(config-pmap-c-PMAP1-CMAP1)#
```

The `set nexthop-group (policy-map-class(pbr) – Arad)` command configures a nexthop group as the next hop for data that passes the class map.

- These commands configure the policy map PMAP1 to set the next hop to a nexthop group named GROUP1 for traffic defined by class map CMAP1.

```bash
switch(config)#policy-map type pbr PMAP1
switch(config-pmap-PMAP1)#class CMAP1
switch(config-pmap-c-PMAP1-CMAP1)#set nexthop-group GROUP1
switch(config-pmap-c-PMAP1-CMAP1)#
```

Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the `exit` command or discarded with the `abort` command. The `show active` command displays the currently saved map version.

Example

- These commands exit policy-map-class configuration mode, then exit policy-map configuration mode to save the altered policy map to `running-config`.

```bash
switch(config-pmap-c-PMAP1-CMAP1)#exit
switch(config-pmap-PMAP1)#exit
switch(config)#
```

Applying a PBR Policy Map to an Interface

The `service-policy type pbr (Interface mode)` command applies the specified PBR policy map to the configuration mode interface. Only one PBR service policy is supported per interface.

- These commands apply the PMAP1 PBR policy map to Ethernet interface 8.

```bash
switch(config)#interface ethernet 8
switch(config-if-Et8)#service-policy type pbr input PMAP1
switch(config-if-Et8)#
```

Hardware Decapsulation

When hardware decapsulation takes place, PBR policy maps on Arad platform switches match on outer packet headers (i.e., they match based on the attributes of the packet before it is decapsulated).
26.3 Traffic Management Configuration – FM6000 Platform Switches

Traffic policies are implemented by policy maps, which are applied to the control plane or an interface. Policy maps contain classes, which are composed of class maps and traffic resolution commands. Section 26.1 describes traffic policies.

FM6000 platform switches support the following traffic policies:

- Control plane policies manage control plane traffic.
- QoS traffic policies manage traffic on Ethernet and port channel interfaces.

These sections describe the construction and application of policy maps on FM6000 platform switches:

- Section 26.3.1: Configuring Control Plane Traffic Policies – FM6000 Platform Switches
- Section 26.3.2: Configuring QoS Traffic Policies – FM6000 Platform Switches
- Section 26.3.3: Configuring PBR Policies – FM6000 Platform Switches

26.3.1 Configuring Control Plane Traffic Policies – FM6000 Platform Switches

Default control plane traffic policies are implemented automatically without user intervention. These policies are modified by associating traffic resolution commands with static classes that comprise the control plane policy map.

Static Class Maps

Control plane traffic policies utilize static class maps, which are provided by the switch, are not editable, and cannot be deleted.

Editing the Policy Map

The only control plane policy map is `copp-system-policy`, which cannot be deleted. In its default form, `copp-system-policy` consists of the classes listed in Table 26-2. Although the underlying class map of each class cannot be edited, the traffic resolution commands can be adjusted. The default classes cannot be removed from the policy map and their sequence within the policy map is not editable.

Table 26-2 copp-system-policy default classes: FM6000 Platform Switches

<table>
<thead>
<tr>
<th>Class Name</th>
<th>shape (pps)</th>
<th>bandwidth (pps)</th>
</tr>
</thead>
<tbody>
<tr>
<td>copp-system-arp</td>
<td>10000</td>
<td>1000</td>
</tr>
<tr>
<td>copp-system-default</td>
<td>8000</td>
<td>1000</td>
</tr>
<tr>
<td>copp-system-ipmcrsvd</td>
<td>10000</td>
<td>1000</td>
</tr>
<tr>
<td>copp-system-ipmcmiss</td>
<td>10000</td>
<td>1000</td>
</tr>
<tr>
<td>copp-system-igmp</td>
<td>10000</td>
<td>1000</td>
</tr>
<tr>
<td>copp-system-l2rsvd</td>
<td>10000</td>
<td>10000</td>
</tr>
<tr>
<td>copp-system-l3slowpath</td>
<td>10000</td>
<td>1000</td>
</tr>
<tr>
<td>copp-system-pim-tp</td>
<td>10000</td>
<td>1000</td>
</tr>
<tr>
<td>copp-system-ospf-isis</td>
<td>10000</td>
<td>1000</td>
</tr>
<tr>
<td>copp-system-selfip</td>
<td>5000</td>
<td>5000</td>
</tr>
<tr>
<td>copp-system-selfip-tc6to7</td>
<td>5000</td>
<td>5000</td>
</tr>
<tr>
<td>copp-system-sflow</td>
<td>25000</td>
<td>1000</td>
</tr>
</tbody>
</table>
Policy maps are modified in policy-map configuration mode. The `policy-map type control-plane` command enters policy-map configuration mode.

**Example**
- This command enters policy-map configuration mode for editing `copp-system-policy`.

```
switch(config)#policy-map type control-plane copp-system-policy
switch(config-pmap-copp-system-policy)#
```

The `class (policy-map (control-plane) – FM6000)` command enters policy-map-class configuration mode, where traffic resolution commands are modified for the configuration mode class.

**Example**
- This command enters policy-map-class configuration mode for the copp-system-arp static class.

```
switch(config-pmap-c copp-system-policy)#class copp-system-arp
switch(config-pmap-c-copp-system-policy-copp-system-arp)#
```

Two traffic resolution commands determine bandwidth parameters for class traffic:
- `bandwidth (policy-map-class (control-plane) – FM6000)` specifies the minimum bandwidth.
- `shape (policy-map-class (control-plane) – FM6000)` specifies the maximum bandwidth.

**Example**
- These commands configure a bandwidth range of 2000 to 4000 packets per seconds (pps) for traffic filtered by the copp-system-arp class map:

```
switch(config-pmap-c-copp-system-policy-copp-system-arp)#bandwidth pps 2000
switch(config-pmap-c-copp-system-policy-copp-system-arp)#shape pps 4000
switch(config-pmap-c-copp-system-policy-copp-system-arp)#
```

Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the `exit` command or discarded with the `abort` command. The `show active` command displays the saved version of policy map. The `show pending` command displays the modified policy map.
Example

- These commands exit policy-map-class configuration mode, display the pending policy-map, then exit policy-map configuration mode, which saves the altered policy map to `running-config`.

```bash
switch(config-pmap-c-copp-system-policy-CP-CMAP_1)#exit
switch(config-pmap-copp-system-policy)#show pending
policy-map type control-plane copp-system-policy
  class CP-CMAP_1
    shape pps 4000
    bandwidth pps 2000
  class copp-system-bpdu
  class copp-system-lldp
  class copp-system-lacp
  class copp-system-arp
  class copp-system-arpresolver
  class copp-system-default

<--------OUTPUT OMITTED FROM EXAMPLE-------->
  class copp-system-arpresolver
  class copp-system-default

switch(config-pmap-copp-system-policy)#exit
switch(config)#
```

Applying Policy Maps to the Control Plane

The `copp-system-policy` policy map is always applied to the control plane. No commands are available to add or remove this assignment.

26.3.2 Configuring QoS Traffic Policies – FM6000 Platform Switches

QoS traffic policies are implemented by creating class maps and policy maps, then applying the policy maps to Ethernet and port channel interfaces.

Creating Class Maps

QoS traffic policies utilize dynamic class maps that are created and modified in class-map configuration mode. The `class-map type qos` command enters class-map configuration mode.

Example

- This command enters class-map configuration mode to create QoS class map named Q-CMap_1.

```bash
switch(config)#class-map type qos match-any Q-CMap_1
switch(config-cmap-Q-CMap_1)#
```

A class map contains one IPv4 access control list (ACL). The `match (class-map (qos) – FM6000)` command assigns an ACL to the class map. Subsequent `match` commands replace the existing `match` command. Class maps filter traffic only on ACL permit rules. Deny ACL rules are disregarded.

Example

- This command adds the IPv4 ACL named ACL_1 to the class map.

```bash
switch(config-cmap-Q-CMap_1)#match ip access-group ACL_1
switch(config-cmap-Q-CMap_1)#
```
Class-map configuration mode is a group-change mode. Changes made in a group-change mode are saved by exiting the mode. The `show active` command displays the saved version of class map. The `show pending` command displays the unsaved class map.

**Example**
- The `show active` command indicates that the configuration mode class map is not stored in `running-config`. The `show pending` command displays the class map to be stored upon exiting class-map configuration mode.

```plaintext
switch(config-cmap-Q-CMap_1)#show active
switch(config-cmap-Q-CMap_1)#show pending
class-map type qos match-any Q-CMap_1
  match ip access-group ACL_1

switch(config-cmap-Q-CMap_1)#
```

The `exit` command returns the switch to global configuration mode and saves pending class map changes. The `abort` command returns the switch to global configuration mode and discards pending changes.

**Example**
- This command exits class-map configuration mode and stores pending changes to `running-config`.

```plaintext
switch(config-cmap-CP-CMAP_1)#exit
switch(config)#show class-map type control-plane CP-CMAP_1
  Class-map: CP-CMAP_1 (match-any)
    Match: ip access-group name ACLv4_1

switch(config)#
```

**Creating Policy Maps**

Policy maps are created and modified in policy-map configuration mode. The `policy-map type qos` command enters policy-map configuration mode.

**Example**
- This command places the switch in policy-map configuration mode and creates a QoS policy map named Q-PMAP_1.

```plaintext
switch(config)#policy-map type qos Q-PMAP_1
switch(config-pmap-Q-PMAP_1)#
```

Policy map are edited by adding or removing classes. A class automatically contains its eponymous class map; traffic resolution commands are added or edited in policy-map-class configuration mode. The `class (policy-map (qos) – FM6000)` command adds a class to the configuration mode policy map and places the switch in policy-map-class configuration mode, where traffic resolution commands are added to the class.

**Example**
- This command adds the Q-CMap_1 class to the Q-PMAP_1 policy map and places the switch in policy-map-class configuration mode.

```plaintext
switch(config-pmap-Q-PMAP_1)#class Q-CMap_1
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#
```

`set (policy-map-class (qos) – FM6000)` commands configure traffic resolution methods for data that passes the class map:
- `set cos` sets the layer 2 CoS field.
• **set dscp** sets the DSCP value in the ToS byte.
• **set traffic class** specifies a traffic class queue.

**Example**

These commands configure the policy map to set the CoS field to 7 on packets filtered by the class map, then assigns those packets to traffic class 4.

```
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#set cos 7
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#set traffic-class 4
```

Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the **exit** command or discarded with the **abort** command. The **show active** and **show pending** commands display the saved and modified policy map versions, respectively.

**Example**

These commands exit policy-map-class configuration mode, display the pending policy-map, then exit policy-map configuration mode to save the altered policy map to **running-config**.

```
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#exit
switch(config-pmap-Q-PMAP_1)#show pending
policy-map type qos Q-PMAP_1
  class Q-CMap_1
    set cos 7
    set traffic-class 4
  class class-default

switch(config-pmap-Q-PMAP_1)#exit
switch(config)#
```

The last class in all QoS policy maps is **class-default**. The **class-default** class map matches all traffic except IPv4 or IPv6 traffic and provides no traffic resolution commands. The **class-default** class map is not editable; traffic resolution commands can be added to the **class-default** class.

To modify traffic resolution commands for the **class-default** class, enter policy-map-class configuration mode for the class, then enter the desired **set** commands.
Example

- These commands enter policy-map-class configuration mode for `class-default`, configures the stream to enter traffic class 2, and saves the altered policy map to `running-config`.

```
switch(config)#policy-map type qos Q-PMap_1
switch(config-pmap-Q-PMap_1)#class class-default
switch(config-pmap-c-Q-PMap_1-class-default)#set traffic-class 2
switch(config-pmap-c-Q-PMap_1-class-default)#exit
switch(config-pmap-Q-PMap_1)#exit
switch(config)#show policy-map type qos Q-PMap_1
Service-policy Q-PMap_1

Class-map: Q-CMap_1 (match-any)
  Match: ipv6 access-group name ACLv6_1
           set cos 7
           set traffic-class 4

Class-map: class-default (match-any)
           set traffic-class 2
```

Applying Policy Maps to an Interface

The `service-policy type qos (Interface mode)` command applies a specified policy map to the configuration mode interface.

- These commands apply PMAP-1 policy map to Ethernet interface 8.

```
switch(config)#interface ethernet 8
switch(config-if-Et8)#show active
switch(config-if-Et8)#service-policy input PMAP-1
switch(config-if-Et8)#show active
interface Ethernet8
           service-policy type qos input PMAP-1
switch(config-if-Et8)#
```

26.3.3 Configuring PBR Policies – FM6000 Platform Switches

Policy Based Routing (PBR) is implemented by creating class maps and policy maps, then applying the policy maps to Ethernet interfaces, port channel interfaces or switch virtual interfaces (SVIs).

Creating PBR Class Maps

PBR policies utilize class maps that are created and modified in class-map configuration mode. The `class-map type pbr` command enters class-map configuration mode.

Example

- This command enters class-map configuration mode to create a PBR class map named CMAP1.

```
switch(config)#class-map type pbr match-any CMAP1
switch(config-cmap-PBR-CMAP1)#
```

A class map contains one or more IPv4 access control lists (ACLs). The `match (policy-map (pbr))` command assigns an ACL to the class map. Subsequent `match` commands add additional ACLs to the class map. Class maps filter traffic only on ACL permit rules. Deny ACL rules are disregarded; if a class map includes ACLs with deny rules, the configuration reverts to its previous state.

On FM6000 platform switches, counters are not supported, so a `statistics per-entry (ACL configuration modes)` command in an ACL is ignored.
Example

- This command adds the IPv4 ACL named ACL1 to the class map.

```yaml
switch(config-cmap-PBR-CMAP1)#match ip access-group ACL1
```

Class-map configuration mode is a group-change mode. Changes made in a group-change mode are saved by exiting the mode. The `show active` command displays the saved version of class map.

- The `show active` command indicates that the configuration mode class map is not stored in `running-config`.

```yaml
switch(config-cmap-PBR-CMAP1)#show active
```

The `exit` command returns the switch to global configuration mode and saves pending class map changes. The `abort` command returns the switch to global configuration mode and discards pending changes.

Example

- This command exits class-map configuration mode and stores pending changes to `running-config`.

```yaml
switch(config-cmap-PBR-CMAP1)#exit
switch(config)#show class-map type pbr CMAP1
class-map type pbr match-any CMAP1
   10 match ip access-group ACL1
switch(config)#
```

Creating PBR Policy Maps

Policy maps are created and modified in policy-map configuration mode. The `policy-map type pbr` command enters policy-map configuration mode.

Example

- This command enters policy-map configuration mode for creating a PBR policy map named PMAP1.

```yaml
switch(config)#policy-map type pbr PMAP1
switch(config-pmap-PMAP1)#
```

Policy map are edited by adding or removing classes. A class automatically contains its eponymous class map; next-hop commands are added or edited in policy-map-class configuration mode. The `class (policy-map (pbr))` command adds a class to the configuration mode policy map and places the switch in policy-map-class configuration mode, where next-hop commands are added to the class.

Example

- This command adds the CMAP1 class to the policy map and places the switch in policy-map-class configuration mode.

```yaml
switch(config-pmap-PMAP1)#class CMAP1
switch(config-pmap-c-PMAP1-CMAP1)#
```

The `set nexthop (policy-map-class – pbr)` command configures the next hop for data that passes the class map.

- This command configures the policy map to set the next hop to 10.12.0.5 on packets filtered by the class map.

```yaml
switch(config-pmap-c-PMAP1-CMAP1)#set nexthop 10.12.0.5
switch(config-pmap-c-PMAP1-CMAP1)#
```
Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the `exit` command or discarded with the `abort` command. The `show active` command displays the currently saved map version.

**Example**

- These commands exit policy-map-class configuration mode, then exit policy-map configuration mode to save the altered policy map to `running-config`.
  ```
  switch(config-pmap-c-PMAP1-CMAP1)#exit
  switch(config-pmap-PMAP1)#exit
  switch(config)#
  ```

**Applying a PBR Policy Map to an Interface**

The `service-policy type pbr (Interface mode)` command applies the specified PBR policy map to the configuration mode interface. Only one PBR service policy is supported per interface.

- These commands apply the PMAP1 PBR policy map to Ethernet interface 8.
  ```
  switch(config)#interface ethernet 8
  switch(config-if-Et8)#service-policy type pbr input PMAP1
  switch(config-if-Et8)#
  ```

**Hardware Decapsulation**

When hardware decapsulation takes place, PBR policy maps on FM6000 platform switches match on outer packet headers (i.e., they match based on the attributes of the packet before it is decapsulated).
26.4 Traffic Management Configuration – Petra Platform Switches

Traffic policies are implemented by policy maps, which are applied to the control plane. Policy maps contain classes, which are composed of class maps and traffic resolution commands. QoS traffic policies are not supported on 7500 Series switches.

Section 26.1 describes traffic policies.

26.4.1 Configuring Control Plane Traffic Policies – Petra Platform Switches

Default control plane traffic policies are implemented automatically without user intervention. These policies are modified by associating traffic resolution commands with static classes that comprise the control plane policy map.

Static Class Maps

Control plane traffic policies utilize static class maps, which are provided by the switch, are not editable, and cannot be deleted.

Editing the Policy Map

The only control plane policy map is `copp-system-policy`, which cannot be deleted. In its default form, `copp-system-policy` consists of the classes listed in Table 26-3. Although the underlying class map of each class cannot be edited, the traffic resolution commands can be adjusted. The default classes cannot be removed from the policy map and their sequence within the policy map is not editable.

Table 26-3 copp-system-policy default classes: Petra Platform Switches

<table>
<thead>
<tr>
<th>Class Name</th>
<th>shape (pps)</th>
<th>bandwidth (pps)</th>
</tr>
</thead>
<tbody>
<tr>
<td>copp-system-bpdu</td>
<td>2500</td>
<td>1250</td>
</tr>
<tr>
<td>copp-system-default</td>
<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-igmp</td>
<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-ipbroadcast</td>
<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-ipmc</td>
<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-ipmcmiss</td>
<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-ipmcrsvd</td>
<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-ipunicast</td>
<td>NO LIMIT</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-I3destmiss</td>
<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-I3slowpath</td>
<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-I3ttl0</td>
<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-I3ttl1</td>
<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-lacp</td>
<td>2500</td>
<td>1250</td>
</tr>
<tr>
<td>copp-system-lldp</td>
<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-unicast-arp</td>
<td>2500</td>
<td>250</td>
</tr>
</tbody>
</table>

Policy maps are modified in policy-map configuration mode. The `policy-map type control-plane` command enters policy-map configuration mode.
Example

- This command enters policy-map configuration mode for editing `copp-system-policy`.

  ```
  switch(config)#policy-map type control-plane copp-system-policy
  switch(config-pmap-copp-system-policy)#
  ```

  The `class (policy-map (control-plane) – Petra)` command enters policy-map-class configuration mode, where traffic resolution commands are modified for the configuration mode class.

Example

- This command enters policy-map-class configuration mode for the copp-system-lldp static class.

  ```
  switch(config-pmap-copp-system-policy)#class copp-system-lldp
  switch(config-pmap-c-copp-system-policy-copp-system-lldp)#
  ```

  Two traffic resolution commands determine bandwidth parameters for class traffic:

  - `bandwidth (policy-map-class (control-plane) – Petra)` specifies the minimum bandwidth.
  - `shape (policy-map-class (control-plane) – Petra)` specifies the maximum bandwidth.

Example

- These commands configure a bandwidth range of 2000 to 4000 packets per seconds (pps) for traffic filtered by the copp-system-arp class map:

  ```
  switch(config-pmap-c-copp-system-policy-copp-system-lldp)#bandwidth kbps 2000
  switch(config-pmap-c-copp-system-policy-copp-system-lldp)#shape kbps 4000
  ```

  Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the `exit` command or discarded with the `abort` command. The `show active` command displays the saved version of policy map. The `show pending` command displays the configured policy map.

  Petra platform switches do not support all discrete rate values. When a `bandwidth` or `shape` command specifies a value that is not supported, the switch converts the rate to the next highest discrete value that it supports. The `show policy-map interface type qos` command displays the converted rate and not the user configured rate.

Example

- These commands exit policy-map-class configuration mode, display the pending policy-map, then exit policy-map configuration mode, which saves the altered policy map to `running-config`.

  ```
  switch(config-pmap-c-copp-system-policy-copp-system-lldp)#exit
  switch(config-pmap-copp-system-policy)#show pending

  policy-map type control-plane copp-system-policy
  class copp-system-bpdu
  class copp-system-lldp
    shape kbps 4000
    bandwidth kbps 2000

  class copp-system-lacp
  ```

  Changes are saved with the `exit` command or discarded with the `abort` command. The `show active` command displays the saved version of policy map. The `show pending` command displays the modified policy map.
Displaying Policy Maps

The `show policy-map interface type qos` command displays the traffic resolution rates of the policy map’s classes and the number of packets filtered and dropped as a result of the class maps. The shape and bandwidth rates may differ from configured values, because the switch does not support all discrete rate values.

Example

- These commands exit policy-map-class configuration mode, display the pending policy-map, then exit policy-map configuration mode, which saves the altered policy map to `running-config`.

  ```
  switch(config)#show policy-map interface control-plane copp-system-policy
  Service-policy input: copp-system-policy
  Hardware programming status: InProgress

  Class-map: copp-system-mlag (match-any)
    shape : 10000001 kbps
    bandwidth : 10000001 kbps
    Out Packets : 0
    Drop Packets : 0
  
  Class-map: copp-system-lacp (match-any)
    shape : 2604 kbps
    bandwidth : 1302 kbps
    Out Packets : 0
    Drop Packets : 0
  
  ---OUTPUT OMITTED FROM EXAMPLE-------
  ```

Applying Policy Maps to the Control Plane

The `copp-system-policy` policy map is always applied to the control plane. No commands are available to add or remove this assignment.

26.4.2 Configuring QoS Traffic Policies – Petra Platform Switches

QoS traffic policies are not supported on Petra platform switches.

26.4.3 Configuring PBR Policies – Petra Platform Switches

PBR policies are not supported on Petra platform switches.
26.5 Traffic Management Configuration – Trident Platform Switches

Traffic policies are implemented by policy maps, which are applied to the control plane or an interface. Policy maps contain classes, which are composed of class maps and traffic resolution commands. Section 26.1 describes traffic policies.

Trident platform switches support the following traffic policies:

- Control plane policies manage control plane traffic.
- QoS traffic policies manage traffic on Ethernet and port channel interfaces.

These sections describe the construction and application of policy maps:

- Section 26.5.1: Configuring Control Plane Traffic Policies – Trident Platform Switches
- Section 26.5.2: Configuring QoS Traffic Policies – Trident Platform Switches

26.5.1 Configuring Control Plane Traffic Policies – Trident Platform Switches

Default control plane traffic policies are implemented automatically without user intervention. These policies are modified by creating class maps and editing the policy map to include the new class maps.

Creating Class Maps

Control plane traffic policies utilize static and dynamic class maps. Static class maps are provided by the switch, are not editable, and cannot be deleted. Dynamic class maps are created and modified in class-map configuration mode. The `class-map type control-plane` command enters class-map configuration mode.

Example

- This command enters class-map configuration mode for creating or editing a control plane dynamic class map named CP-CMAP_1.

  ```
  switch(config)#class-map type control-plane match-any CP-CMAP_1
  switch(config-cmap-CP-CMAP_1)#
  ```

Class maps contain one IPv4 or IPv6 access control list (ACL). The `match (class-map (control-plane) – Trident)` command assigns an ACL to the class map. Subsequent `match` commands replace the existing `match` command. Class maps filter traffic only on ACL permit rules. Deny ACL rules are disregarded.

Example

- This command assigns the IPv4 ACL named ACLv4_1 to the class map.

  ```
  switch(config-cmap-CP-CMAP_1)#match ip access-group ACLv4_1
  switch(config-cmap-CP-CMAP_1)#
  ```

Class-map configuration mode is a group-change mode. Changes are saved by exiting the mode. The `show active` command displays the saved version of class map. The `show pending` command displays the unsaved class map.
Example

- The `show active` command indicates that the configuration mode class map is not stored in `running-config`. The `show pending` command displays the class map to be stored upon exiting class-map configuration mode.

```plaintext
switch(config-cmap-CP-CMAP_1)#show active
switch(config-cmap-CP-CMAP_1)#show pending
class-map type control-plane match-any CP-CMAP_1
    match ip access-group ACLv4_1

switch(config-cmap-CP-CMAP_1)#
```

The `exit` command returns the switch to global configuration mode and saves pending class map changes. The `abort` command returns the switch to global configuration mode and discards pending class map changes.

Example

- This command exits class-map configuration mode and stores pending changes to `running-config`.

```plaintext
switch(config-cmap-CP-CMAP_1)#exit
switch(config)#show class-map type control-plane CP-CMAP_1
    Class-map: CP-CMAP_1 (match-any)
        Match: ip access-group name ACLv4_1

switch(config)#
```

Editing the Policy Map

The only control plane policy map is `copp-system-policy`, which cannot be deleted. In its default form, `copp-system-policy` consists of the classes listed in Table 26-4. Although the underlying class map of each class cannot be edited, the traffic resolution commands can be adjusted. The default classes cannot be removed from the policy map and their sequence within the policy map is not editable.

Table 26-4  copp-system-policy default classes: Trident Platform Switches

<table>
<thead>
<tr>
<th>Class Name</th>
<th>shape (pps)</th>
<th>bandwidth (pps)</th>
</tr>
</thead>
<tbody>
<tr>
<td>copp-system-bpdu</td>
<td>5000</td>
<td>5000</td>
</tr>
<tr>
<td>copp-system-lacp</td>
<td>5000</td>
<td>5000</td>
</tr>
<tr>
<td>copp-system-selfip-tc6to7</td>
<td>5000</td>
<td>5000</td>
</tr>
<tr>
<td>copp-system-selfip</td>
<td>5000</td>

<td>10000</td>
<td>1000</td>
</tr>
<tr>
<td>copp-system-arpresolver</td>
<td>10000</td>
<td>1000</td>
</tr>
<tr>
<td>copp-system-l3destmiss</td>
<td>10000</td>
<td>1000</td>
</tr>
<tr>
<td>copp-system-l3slowpath</td>
<td>10000</td>
<td>1000</td>
</tr>
<tr>
<td>copp-system-l3ttl1</td>
<td>10000</td>
<td>1000</td>
</tr>
</tbody>
</table>
Policy maps are modified in policy-map configuration mode. The `policy-map type control-plane` command enters policy-map configuration mode.

**Example**

- This command enters policy-map configuration mode for editing `copp-system-policy`.

  ```
  switch(config)#policy-map type control-plane copp-system-policy
  switch(config-pmap-copp-system-policy)#
  ```

Dynamic classes are inserted in front of the static classes. Classes automatically contain their eponymous class map; traffic resolution commands are created or edited in policy-map-class configuration mode. The `class (policy-map (control-plane) – Trident and Trident-II)` command adds a class to the policy map and places the switch in policy-map-class configuration mode, where traffic resolution commands are added to the class.

**Example**

- This command adds the CP-CMAP_1 class to the copp-system-policy policy map and places the switch in policy-map-class configuration mode.

  ```
  switch(config-pmap-copp-system-policy)#class CP-CMAP_1
  switch(config-pmap-c-copp-system-policy-CP-CMAP_1)#
  ```

Two traffic resolution commands determine bandwidth parameters for class traffic:

- `bandwidth (policy-map-class (control-plane) – Trident)` specifies the minimum bandwidth.
- `shape (policy-map-class (control-plane) – Trident)` specifies the maximum bandwidth.

**Example**

- These commands configure a bandwidth range of 2000 to 4000 packets per seconds (pps) for traffic filtered by the CP-CMAP_1 class map:

  ```
  switch(config-pmap-c-copp-system-policy-CP-CMAP_1)#bandwidth pps 2000
  switch(config-pmap-c-copp-system-policy-CP-CMAP_1)#shape pps 4000
  switch(config-pmap-c-copp-system-policy-CP-CMAP_1)#
  ```

Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the `exit` command or discarded with the `abort` command. The `show active` command displays the saved version of policy map. The `show pending` command displays the modified policy map.

---

**Table 26-4  copp-system-policy default classes: Trident Platform Switches**

<table>
<thead>
<tr>
<th>Class Name</th>
<th>shape (pps)</th>
<th>bandwidth (pps)</th>
</tr>
</thead>
<tbody>
<tr>
<td>copp-system-default</td>
<td>8000</td>
<td>1000</td>
</tr>
<tr>
<td>copp-system-acllog</td>
<td>10000</td>
<td>1000</td>
</tr>
<tr>
<td>copp-system-sflow</td>
<td>25000</td>
<td>0</td>
</tr>
</tbody>
</table>
Example

- These commands exit policy-map-class configuration mode, display the pending policy-map, then exit policy-map configuration mode, which saves the altered policy map to `running-config`.

```
switch(config-pmap-c-copp-system-policy-CP-CMAP_1)#exit
switch(config-pmap-copp-system-policy)#show pending
policy-map type control-plane copp-system-policy
  class CP-CMAP_1
    shape pps 4000
    bandwidth pps 2000
  class copp-system-bpdu
  class copp-system-lldp
  class copp-system-lacp
  class copp-system-arp

  class copp-system-arpresolver
  class copp-system-default

switch(config-pmap-copp-system-policy)#exit
switch(config)#
```

To modify traffic resolution commands for a static class, enter policy-map-class configuration mode for the class, then enter the desired `bandwidth` and `shape` commands.

Example

- These commands enter policy-map-class configuration mode for copp-system-bpdu class, change the bandwidth range for the class, then save the altered policy map to `running-config`.

```
switch(config)#policy-map type control-plane copp-system-policy
switch(config-pmap-copp-system-policy)#class copp-system-bpdu
switch(config-pmap-c Copp-system-policy-copp-system-bpdu)#shape pps 200
switch(config-pmap-c Copp-system-policy-copp-system-bpdu)#bandwidth pps 100
switch(config-pmap-c Copp-system-policy-copp-system-bpdu)#exit
switch(config-pmap-c Copp-system-policy)#show pending
policy-map type control-plane copp-system-policy
  class CP-CMAP_1
    shape pps 4000
    bandwidth pps 2000
  class copp-system-bpdu
    shape pps 200
    bandwidth pps 100
  class copp-system-lldp

<--------OUTPUT OMITTED FROM EXAMPLE--------->

switch(config-pmap-copp-system-policy)#exit
switch(config)#
```
Applying Policy Maps to the Control Plane
The `copp-system-policy` policy map is always applied to the control plane. No commands are available to add or remove this assignment.

26.5.2 Configuring QoS Traffic Policies – Trident Platform Switches
QoS traffic policies are implemented by creating class maps and policy maps, then applying the policy maps to Ethernet and port channel interfaces.

Creating Class Maps
QoS traffic policies utilize dynamic class maps that are created and modified in class-map configuration mode. The `class-map type qos` command enters class-map configuration mode.

Example
- This command enters class-map configuration mode to create QoS class map named Q-CMap_1.
  ```
  switch(config)#class-map type qos match-any Q-CMap_1
  switch(config-cmap-Q-CMap_1)#
  ```
  A class map contains one IPv4 or IPv6 access control list (ACL). The `match (class-map (qos) – Trident)` command assigns an ACL to the class map. Subsequent `match` commands replace the existing `match` command. Class maps filter traffic only on ACL permit rules. Deny ACL rules are disregarded.

Example
- This command adds the IPv6 ACL named ACLv6_1 to the class map.
  ```
  switch(config-cmap-Q-CMap_1)#match ipv6 access-group ACLv6_1
  switch(config-cmap-Q-CMap_1)#
  ```
  Class-map configuration mode is a group-change mode. Changes made in a group-change mode are saved by exiting the mode. The `show active` command displays the saved version of class map. The `show pending` command displays the unsaved class map.

Example
- The `show active` command indicates that the configuration mode class map is not stored in `running-config`. The `show pending` command displays the class map to be stored upon exiting class-map configuration mode.
  ```
  switch(config-cmap-Q-CMap_1)#show active
  switch(config-cmap-Q-CMap_1)#show pending
  class-map type qos match-any Q-CMap_1
  match ipv6 access-group ACLv6_1
  ```
  The `exit` command returns the switch to global configuration mode and saves pending class map changes. The `abort` command returns the switch to global configuration mode and discards pending class map changes.
Example
- This command exits class-map configuration mode and stores pending changes to running-config.

```plaintext
switch(config-cmap-CP-CMAP_1)#exit
switch(config)#show class-map type control-plane CP-CMAP_1
Class-map: CP-CMAP_1 (match-any)
  Match: ip access-group name ACLv4_1
switch(config)#
```

Creating Policy Maps
Policy maps are created and modified in policy-map configuration mode. The `policy-map type qos` command enters policy-map configuration mode.

Example
- This command enters policy-map configuration mode for creating a QoS policy map named Q-PMAP_1.

```plaintext
switch(config)#policy-map type qos Q-PMAP_1
switch(config-pmap-Q-PMAP_1)#
```

Policy maps are edited by adding or removing classes. A class automatically contains its eponymous class map; traffic resolution commands are added or edited in policy-map-class configuration mode. The `class (policy-map (qos) – Trident)` command adds a class to the configuration mode policy map and places the switch in policy-map-class configuration mode, where traffic resolution commands are added to the class.

Example
- This command adds the Q-CMap_1 class to the Q-PMAP_1 policy map and places the switch in policy-map-class configuration mode.

```plaintext
switch(config-pmap-Q-PMAP_1)#class Q-CMap_1
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#
```

The `set (policy-map-class (qos) – Trident)` command configures traffic resolution methods for data that passes the class map:
- `set cos` sets the layer 2 CoS field.
- `set dscp` sets the DSCP value in the ToS byte.
- `set traffic class` specifies a traffic class queue.

Example
- These commands configure the policy map to set the CoS field to 7 on packets filtered by the class map, then assigns those packets to traffic class 4.

```plaintext
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#set cos 7
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#set traffic-class 4
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#
```

Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the `exit` command or discarded with the `abort` command. The `show active` and `show pending` commands display the saved and modified policy map versions, respectively.
Example

- These commands exit policy-map-class configuration mode, display the pending policy-map, then exit policy-map configuration mode to save the altered policy map to running-config.

```bash
switch(config-pmap-c-Q-PMap_1-Q-CMap_1)#exit
switch(config-pmap-Q-PMap_1)#show pending
policy-map type qos Q-PMap_1
  class Q-CMap_1
    set cos 7
    set traffic-class 4

class class-default

switch(config-pmap-Q-PMap_1)#exit
switch(config)#
```

The last class in all QoS policy maps is class-default. The class-default class map matches all traffic except IPv4 or IPv6 traffic and provides no traffic resolution commands. The class-default class map is not editable; traffic resolution commands can be added to the class-default class.

To modify traffic resolution commands for the class-default class, enter policy-map-class configuration mode for the class, then enter the desired set commands.

Example

- These commands enter policy-map-class configuration mode for class-default, configures the stream to enter traffic class 2, and saves the altered policy map to running-config.

```bash
switch(config)#policy-map type qos Q-PMap_1
switch(config-pmap-Q-PMap_1)#class class-default
switch(config-pmap-c-Q-PMap_1-class-default)#set traffic-class 2
switch(config-pmap-c-Q-PMap_1-class-default)#exit
switch(config-pmap-Q-PMap_1)#exit
switch(config)#show policy-map type qos Q-PMap_1
Service-policy Q-PMap_1

Class-map: Q-CMap_1 (match-any)
  Match: ipv6 access-group name ACLv6_1
    set cos 7
    set traffic-class 4

Class-map: class-default (match-any)
  set traffic-class 2

switch(config)#
```

Applying Policy Maps to an Interface

The service-policy type qos (Interface mode) command applies a specified policy map to the configuration mode interface.
Example
- These commands apply PMAP-1 policy map to Ethernet interface 8.

```
switch(config)#interface ethernet 8
switch(config-if-Et8)#show active
switch(config-if-Et8)#service-policy input PMAP-1
switch(config-if-Et8)#show active
interface Ethernet8
    service-policy type qos input PMAP-1
switch(config-if-Et8)#
```

26.5.3 Configuring PBR Policies – Trident Platform Switches

Policy Based Routing (PBR) is implemented by creating class maps and policy maps, then applying the policy maps to Ethernet interfaces, port channel interfaces or switch virtual interfaces (SVIs).

Creating PBR Class Maps

PBR policies utilize class maps that are created and modified in class-map configuration mode. The `class-map type pbr` command enters class-map configuration mode.

Example
- This command enters class-map configuration mode to create a PBR class map named CMAP1.

```
switch(config)#class-map type pbr match-any CMAP1
switch(config-cmap-PBR-CMAP1)#
```

A class map contains one or more access control lists (ACLs). The `match (policy-map (pbr))` command assigns an ACL to the class map. Subsequent `match` commands add additional ACLs to the class map. Class maps filter traffic only on ACL permit rules. Deny ACL rules are disregarded; if a class map includes ACLs with deny rules, the configuration reverts to its previous state.

Example
- This command adds the ACL named ACL1 to the class map.

```
switch(config-cmap-PBR-CMAP1)#match ip access-group ACL1
switch(config-cmap-PBR-CMAP1)#
```

Class-map configuration mode is a group-change mode. Changes made in a group-change mode are saved by exiting the mode. The `show active` command displays the saved version of class map.

- The `show active` command indicates that the configuration mode class map is not stored in `running-config`.

```
switch(config-cmap-PBR-CMAP1)#show active
switch(config-cmap-PBR-CMAP1)#
```

The `exit` command returns the switch to global configuration mode and saves pending class map changes. The `abort` command returns the switch to global configuration mode and discards pending changes.

Example
- This command exits class-map configuration mode and stores pending changes to `running-config`.

```
switch(config-cmap-PBR-CMAP1)#exit
switch(config)#show class-map type pbr CMAP1
class-map type pbr match-any CMAP1
    10 match ip access-group ACL1
switch(config)#
```
Creating PBR Policy Maps

Policy maps are created and modified in policy-map configuration mode. The `policy-map type pbr` command enters policy-map configuration mode.

Example
- This command enters policy-map configuration mode for creating a PBR policy map named PMAP1.
  ```
  switch(config)#policy-map type pbr PMAP1
  switch(config-pmap-PMAP1)#
  ```

Policy map are edited by adding or removing classes. A class automatically contains its eponymous class map; next-hop commands are added or edited in policy-map-class configuration mode. The `class (policy-map (pbr))` command adds a class to the configuration mode policy map and places the switch in policy-map-class configuration mode, where next-hop commands are added to the class.

Example
- This command adds the CMAP1 class to the policy map and places the switch in policy-map-class configuration mode.
  ```
  switch(config-pmap-PMAP1)#class CMAP1
  switch(config-pmap-c-PMAP1-CMAP1)#
  ```

The `set nexthop (policy-map-class – pbr)` command configures the next hop for data that passes the class map.

- This command configures the policy map to set the next hop to 10.12.0.5 on packets filtered by the class map.
  ```
  switch(config-pmap-c-PMAP1-CMAP1)#set nexthop 10.12.0.5
  switch(config-pmap-c-PMAP1-CMAP1)#
  ```

Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the `exit` command or discarded with the `abort` command. The `show active` command displays the currently saved map version.

Example
- These commands exit policy-map-class configuration mode, then exit policy-map configuration mode to save the altered policy map to `running-config`.
  ```
  switch(config-pmap-c-PMAP1-CMAP1)#exit
  switch(config-pmap-PMAP1)#exit
  switch(config)#
  ```

Applying a PBR Policy Map to an Interface

The `service-policy type pbr (Interface mode)` command applies the specified PBR policy map to the configuration mode interface. Only one PBR service policy is supported per interface.

- These commands apply the PMAP1 PBR policy map to Ethernet interface 8.
  ```
  switch(config)#interface ethernet 8
  switch(config-if-Et8)#service-policy type pbr input PMAP1
  switch(config-if-Et8)#
  ```

Hardware Decapsulation

When hardware decapsulation takes place, PBR policy maps on Trident platform switches match on inner packet headers (i.e., they match based on the attributes of the decapsulated packet).
26.6 Traffic Management Configuration – Trident-II Platform Switches

Traffic policies are implemented by policy maps, which are applied to the control plane or an interface. Policy maps contain classes, which are composed of class maps and traffic resolution commands. Section 26.1 describes traffic policies.

Trident platform switches support the following traffic policies:

- Control plane policies manage control plane traffic.
- QoS traffic policies manage traffic on Ethernet and port channel interfaces.

These sections describe the construction and application of policy maps:

- Section 26.6.1: Configuring Control Plane Traffic Policies – Trident-II Platform Switches
- Section 26.6.2: Configuring QoS Traffic Policies – Trident-II Platform Switches

26.6.1 Configuring Control Plane Traffic Policies – Trident-II Platform Switches

Default control plane traffic policies are implemented automatically without user intervention. These policies are modified by associating traffic resolution commands with static classes that comprise the control plane policy map.

Static Class Maps

Control plane traffic policies utilize static class maps, which are provided by the switch, are not editable, and cannot be deleted.

Editing the Policy Map

The only control plane policy map is `copp-system-policy`, which cannot be deleted. In its default form, `copp-system-policy` consists of the classes listed in Table 26-5. Although the underlying class map of each class cannot be edited, the traffic resolution commands can be adjusted. The default classes cannot be removed from the policy map and their sequence within the policy map is not editable.

Table 26-5 copp-system-policy default classes: Trident-II Platform Switches

<table>
<thead>
<tr>
<th>Class Name</th>
<th>shape (pps)</th>
<th>bandwidth (pps)</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>copp-system-l3ttl1</td>
<td>1000</td>
<td>10000</td>
</tr>
</tbody>
</table>
Policy maps are modified in policy-map configuration mode. The `policy-map type control-plane` command enters policy-map configuration mode.

Example
- This command enters policy-map configuration mode for editing `copp-system-policy`.
  ```
  switch(config)#policy-map type control-plane copp-system-policy
  switch(config-pmap-copp-system-policy)#
  ```

The `class (policy-map (control-plane) – Trident-II)` command enters policy-map-class configuration mode, where traffic resolution commands are modified for the configuration mode class.

Example
- This command enters policy-map-class configuration mode for the copp-system-lacp static class.
  ```
  switch(config-pmap-c copp-system-policy)#class copp-system-lacp
  switch(config-pmap-c-copp-system-policy-copp-system-lacp)#
  ```

Two traffic resolution commands determine bandwidth parameters for class traffic:
- `bandwidth (policy-map-class (control-plane) – Trident-II)` specifies the minimum bandwidth.
- `shape (policy-map-class (control-plane) – Trident-II)` specifies the maximum bandwidth.

Example
- These commands configure a bandwidth range of 2000 to 4000 packets per seconds (pps) for traffic filtered by the copp-system-lacp class map:
  ```
  switch(config-pmap-c-copp-system-policy-c copp-system-lacp)#bandwidth kbps 2000
  switch(config-pmap-c-copp-system-policy-c copp-system-lacp)#shape kbps 4000
  ```

Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the `exit` command or discarded with the `abort` command. The `show active` command displays the saved version of policy map. The `show pending` command displays the modified policy map.
Example

- These commands exit policy-map-class configuration mode, display the pending policy-map, then exit policy-map configuration mode, which saves the altered policy map to *running-config*.

```
switch(config-pmap-c-copp-system-policy-copp-system-lacp)#exit
switch(config-pmap-copp-system-policy)#show pending
policy-map type control-plane copp-system-policy
class copp-system-bpdu

class copp-system-lldp

class copp-system-lacp
    shape pps 4000
    bandwidth pps 2000

class copp-system-arp
```

Applying Policy Maps to the Control Plane

The *copp-system-policy* policy map is always applied to the control plane. No commands are available to add or remove this assignment.

26.6.2 Configuring QoS Traffic Policies – Trident-II Platform Switches

QoS traffic policies are not supported on Trident-II platform switches.

26.6.3 Configuring PBR Policies – Trident-II Platform Switches

PBR Policies are not supported on Trident-II platform switches.
26.7 Traffic Management Configuration Commands

Traffic Policy (Control Plane) Configuration Commands

- class-map type control-plane
- policy-map type control-plane

- bandwidth (policy-map-class (control-plane) – Arad)
- class (policy-map (control-plane) – Arad)
- shape (policy-map-class (control-plane) – Arad)

- bandwidth (policy-map-class (control-plane) – FM6000)
- class (policy-map (control-plane) – FM6000)
- shape (policy-map-class (control-plane) – FM6000)

- bandwidth (policy-map-class (control-plane) – Helix)
- class (policy-map (control-plane) – Helix)
- match (class-map (control-plane) – Helix)
- shape (policy-map-class (control-plane) – Helix)

- bandwidth (policy-map-class (control-plane) – Petra)
- class (policy-map (control-plane) – Petra)
- shape (policy-map-class (control-plane) – Petra)

- bandwidth (policy-map-class (control-plane) – Trident)
- class (policy-map (control-plane) – Trident and Trident-II)
- match (class-map (control-plane) – Trident)
- shape (policy-map-class (control-plane) – Trident)

- bandwidth (policy-map-class (control-plane) – Trident-II)
- class (policy-map (control-plane) – Trident-II)
- match (class-map (control-plane) – Trident-II)
- shape (policy-map-class (control-plane) – Trident-II)

Traffic Policy (QoS) Configuration Commands

- class-map type qos
- policy-map type qos
- service-policy type qos (Interface mode)

- class (policy-map (qos) – FM6000)
- match (class-map (qos) – FM6000)
- set (policy-map-class (qos) – FM6000)

- class (policy-map (qos) – Helix)
- match (class-map (qos) – Helix)
• set (policy-map-class (qos) – Helix)

• class (policy-map (qos) – Trident)
  • match (class-map (qos) – Trident)
  • set (policy-map-class (qos) – Trident)

• class (policy-map (qos) – Trident II)
  • match (class-map (qos) – Trident II)
  • set (policy-map-class (qos) – Trident II)

Traffic Policy Display and Utility Commands
• clear policy-map counters
• show class-map type control-plane
• show class-map type qos
• show policy-map type control-plane
• show policy-map type qos
• show policy-map type qos counters
• show policy-map interface control-plane
• show policy-map interface type qos
• show policy-map interface type qos counters

Policy Based Routing Configuration Commands
• class (policy-map (pbr))
• class-map type pbr
• match (class-map (pbr))
• match (policy-map (pbr))
• policy-map type pbr
• resequence (class-map (pbr))
• resequence (policy-map (pbr))
• service-policy type pbr (Interface mode)
• set nexthop (policy-map-class – pbr)

Policy Based Routing Display and Utility Commands
• show class-map type pbr
• show policy-map type pbr
bandwidth (policy-map-class (control-plane) – Arad)

The bandwidth command specifies the minimum bandwidth for traffic filtered by the configuration mode policy map class.

The no bandwidth and default bandwidth commands remove the minimum bandwidth guarantee for the configuration mode class by deleting the corresponding bandwidth command from running-config.

**Command Mode**
Policy-map-class (control plane) configuration accessed through class (policy-map (control-plane) – Arad)

**Command Syntax**

```
bandwidth kbps kbits
no bandwidth
default bandwidth
```

**Parameters**
- **kbits** Minimum data rate (kbits per second). Value ranges from 1 to 1000000.

**Related Commands**
- **class (policy-map (control-plane) – Arad)** places the switch in policy-map-class (control plane) configuration mode.
- **shape (policy-map-class (control-plane) – Arad)** specifies the maximum bandwidth for traffic defined by the associated class map in its configuration mode policy map class.

**Static Classes Default Bandwidth**

Arad platform switches define these default bandwidths for control plane static classes:

- copp-system-bgp250•copp-system-l3lmoverflow250
- copp-system-bpdru1250•copp-system-l3slowpath250
- copp-system-default250•copp-system-l3ttl1250
- copp-system-ipbroadcast250•copp-system-lacp1250
- copp-system-ipmc250•copp-system-linklocal250
- copp-system-ipmcmiss250•copp-system-ldp250
- copp-system-ipunicast250•copp-system-mlag250
- copp-system-l2broadcast250•copp-system-multicastsnoop250
- copp-system-l2unicast250•copp-system-ospfisis250
- copp-system-l3destmiss250•copp-system-sflow250
Example

- These commands configure the minimum bandwidth of 500 kbps for data traffic specified by the class map copp-system-lldp of the default control-plane policy map.

```plaintext
switch(config)#policy-map type control-plane copp-system-policy
switch(config-pmap-copp-system-policy)#class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#bandwidth kbps 500
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#exit
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#exit
switch(config)#show policy-map interface control-plane copp-system-policy
Service-policy input: copp-system-policy
  Hardware programming status: InProgress
  <-------OUTPUT OMITTED FROM EXAMPLE-------->

Class-map: copp-system-lldp (match-any)
  shape : 2500 kbps
  bandwidth : 500 kbps
  Out Packets : 0
  Drop Packets : 0

  <-------OUTPUT OMITTED FROM EXAMPLE-------->

switch(config)#
```
bandwidth (policy-map-class (control-plane) – FM6000)

The `bandwidth` command specifies the minimum bandwidth for traffic filtered by the configuration mode policy map class.

The `no bandwidth` and `default bandwidth` commands remove the minimum bandwidth guarantee for the configuration mode class by deleting the corresponding `bandwidth` command from `running-config`.

**Command Mode**

Policy-map-class (control plane) configuration accessed through `class (policy-map (control-plane) – FM6000)`

**Command Syntax**

```
bandwidth pps packets
no bandwidth
default bandwidth
```

**Parameters**

- `packets` Minimum data rate (packets per second). Value ranges from 1 to 100000.

**Related Commands**

- `class (policy-map (control-plane) – FM6000)` places the switch in policy-map-class (control plane) configuration mode.
- `shape (policy-map-class (control-plane) – FM6000)` specifies the maximum bandwidth for traffic defined by the associated class map in its configuration mode policy map class.

**Static Classes Default Bandwidth**

FM6000 platform switches define these default bandwidths for control plane static classes:

- copp-system-arp1000
- copp-system-l3slowpath1000
- copp-system-default1000
- copp-system-pim-iptp1000
- copp-system-ipmcrsvd1000
- copp-system-ospf-isis1000
- copp-system-ipmcmss1000
- copp-system-selfip5000
- copp-system-igmp1000
- copp-system-selfip-tc6to75000
- copp-system-l2rsvd1000
- copp-system-sflow1000

**Example**

- These commands configure the minimum bandwidth of 1000 packets per second for data traffic specified by the class map PMAP-1 in the policy map named copp-system-policy.

```
switch(config)#policy-map type control-plane copp-system-policy
switch(config-pmap-copp-system-policy)#class PMAP-1
switch(config-pmap-c-copp-system-policy-PMAP-1)#bandwidth pps 1000
switch(config-pmap-c-copp-system-policy-PMAP-1)#
```
bandwidth (policy-map-class (control-plane) – Helix)

The bandwidth command specifies the minimum bandwidth for traffic filtered by the configuration mode policy map class.

The no bandwidth and default bandwidth commands remove the minimum bandwidth guarantee for the configuration mode class by deleting the corresponding bandwidth command from running-config.

Command Mode
Policy-map-class (control plane) configuration
accessed through class (policy-map (control-plane) – Helix)

Command Syntax

bandwidth pps packets
no bandwidth
default bandwidth

Parameters
- packets Minimum data rate (packets per second). Value ranges from 1 to 100000.

Related Commands
- class (policy-map (control-plane) – Helix) places the switch in policy-map-class (control plane) configuration mode.
- shape (policy-map-class (control-plane) – Helix) specifies the maximum bandwidth for traffic defined by the associated class map in its configuration mode policy map class.

Static Classes Default Bandwidth
Helix platform switches define these default bandwidths for control plane static classes:

- copp-system-acclolog1000
copp-system-l3ttl11000
- copp-system-arp1000
copp-system-l3ttl1000
- copp-system-arpsolver1000
copp-system-lldp1000
- copp-system-bfd5000
copp-system-mlag5000
- copp-system-bgp5000
copp-system-ospfisis5000
- copp-system-bpdu5000
copp-system-selfip5000
- copp-system-default1000
copp-system-selfip-tc6to75000
- copp-system-glean1000
copp-system-sflow0
- copp-system-igmp1000
copp-system-tc3to51000
- copp-system-ipmcmisss1000
copp-system-tc6to71000
- copp-system-ipmcrsvd1000
copp-system-urm1000
- copp-system-l3destmiss1000
copp-system-vrrp1000
- copp-system-l3slowpath1000
Example

- These commands configure the minimum bandwidth of 500 packets per second for data traffic specified by the class map copp-system-lldp.

```bash
switch(config)#policy-map type control-plane copp-system-policy
switch(config-pmap-copp-system-policy)#class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#bandwidth pps 500
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#exit
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#exit
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#exit
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#exit
switch(config)#show policy-map interface control-plan copp-system-policy
Service-policy input: copp-system-policy
  Number of units programmed: 4  
  Hardware programming status: Successful
  <--------OUTPUT OMITTED FROM EXAMPLE-------->
  Class-map: copp-system-lldp (match-any)
    shape : 10000 pps
    bandwidth : 500 pps
    Out Packets : 304996
    Drop Packets : 0
  <--------OUTPUT OMITTED FROM EXAMPLE-------->
switch(config)#
```
**bandwidth (policy-map-class (control-plane) – Petra)**

The `bandwidth` command specifies the minimum bandwidth for traffic filtered by the configuration mode policy map class.

The `no bandwidth` and `default bandwidth` commands remove the minimum bandwidth guarantee for the configuration mode class by deleting the corresponding `bandwidth` command from `running-config`.

**Command Mode**

- Policy-map-class (control plane) configuration
- accessed through `class (policy-map (control-plane) – Petra)`

**Command Syntax**

```
bandwidth kbps kbits
no bandwidth
default bandwidth
```

**Parameters**

- `kbits` Minimum data rate (kbits per second). Value ranges from 1 to 1000000.

**Related Commands**

- `class (policy-map (control-plane) – Petra)` places the switch in policy-map-class (control plane) configuration mode.
- `shape (policy-map-class (control-plane) – Petra)` specifies the maximum bandwidth for traffic defined by the associated class map in its configuration mode policy map class.

**Static Classes Default Bandwidth**

Petra platform switches define these default bandwidths for control plane static classes:

- `copp-system-bpdu1250`
- `copp-system-l3destmiss250`
- `copp-system-default250`
- `copp-system-l3slowpath250`
- `copp-system-igmp250`
- `copp-system-l3ttl0250`
- `copp-system-ipbroadcast250`
- `copp-system-l3ttl1250`
- `copp-system-ipmc250`
- `copp-system-lacp1250`
- `copp-system-ipmcmis250`
- `copp-system-lldp250`
- `copp-system-ipmcrsvd250`
- `copp-system-unicast-arp250`
- `copp-system-ipunicast250`

**Guidelines**

Petra does not support all discrete rate values. When a specified discrete value is not supported, the switch converts the rate to the next highest discrete value that it supports. The `show` commands displays the converted rate and not the user configured rate.
Example

- These commands configure the minimum bandwidth of 500 kbps for data traffic specified by the class map copp-system-lldp of the default control-plane policy map. Because the switch does not support the discrete value of 500 kbps, it converts the bandwidth up to 651 kbps.

```
switch(config)#policy-map type control-plane copp-system-policy
switch(config-pmap-copp-system-policy)#class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#bandwidth kbps 500
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#exit
switch(config-pmap-copp-system-policy)#exit
switch(config)#show policy-map interface control-plane copp-system-policy
Service-policy input: copp-system-policy
 Hardware programming status: InProgress
 <--------OUTPUT OMITTED FROM EXAMPLE--------->

Class-map: copp-system-lldp (match-any)
  shape : 2766 kbps
  bandwidth : 651 kbps
 Out Packets : 0
 Drop Packets : 0

 <--------OUTPUT OMITTED FROM EXAMPLE--------->
```

switch(config)#
**bandwidth (policy-map-class (control-plane) – Trident)**

The `bandwidth` command specifies the minimum bandwidth for traffic filtered by the configuration mode policy map class.

The `no bandwidth` and `default bandwidth` commands remove the minimum bandwidth guarantee for the configuration mode class by deleting the corresponding `bandwidth` command from `running-config`.

**Command Mode**

Policy-map-class (control plane) configuration
accessed through `class (policy-map (control-plane) – Trident and Trident-II)`

**Command Syntax**

```
bandwidth pps packets
no bandwidth
default bandwidth
```

**Parameters**

- `packets` Minimum data rate (packets per second). Value ranges from 1 to 100000.

**Related Commands**

- `class (policy-map (control-plane) – Trident and Trident-II)` places the switch in policy-map-class (control plane) configuration mode.
- `shape (policy-map-class (control-plane) – Trident)` specifies the maximum bandwidth for traffic defined by the associated class map in its configuration mode policy map class.

**Static Classes Default Bandwidth**

Trident platform switches define these default bandwidths for control plane static classes:

- copp-system-arp1000
copp-system-lldp1000
- copp-system-arpresolver1000•copp-system-l3destmiss1000
- copp-system-bpdu5000•copp-system-l3slowpath1000
- copp-system-default1000•copp-system-l3ttl11000
- copp-system-glean1000•copp-system-selfip5000
- copp-system-igmp1000•copp-system-selfip-tc6to75000
- copp-system-ipmcmiss1000•copp-system-sflow0
- copp-system-ipmcrsvd1000•copp-system-tc6to71000
- copp-system-lacp5000•copp-system-tc3to51000

**Example**

- These commands configure the minimum bandwidth of 1000 packets per second for data traffic specified by the class map PMAP-1 in the policy map named copp-system-policy.

```
switch(config)#policy-map type control-plane copp-system-policy
switch(config-pmap-copp-system-policy)#class PMAP-1
switch(config-pmap-c-copp-system-policy-PMAP-1)#bandwidth pps 1000
switch(config-pmap-c-copp-system-policy-PMAP-1)#
```
bandwidth (policy-map-class (control-plane) – Trident-II)

The bandwidth command specifies the minimum bandwidth for traffic filtered by the configuration mode policy map class.

The no bandwidth and default bandwidth commands remove the minimum bandwidth guarantee for the configuration mode class by deleting the corresponding bandwidth command from running-config.

Command Mode
Policy-map-class (control plane) configuration
accessed through class (policy-map (control-plane) – Trident-II)

Command Syntax

```text
bandwidth pps packets
no bandwidth
default bandwidth
```

Parameters

- **packets** Minimum data rate (packets per second). Value ranges from 1 to 100000.

Related Commands

- class (policy-map (control-plane) – Trident-II) places the switch in policy-map-class (control plane) configuration mode.
- shape (policy-map-class (control-plane) – Trident-II) specifies the maximum bandwidth for traffic defined by the associated class map in its configuration mode policy map class.

Static Classes Default Bandwidth

Trident-II platform switches define these default bandwidths for control plane static classes:

- copp-system-aclog1000
- copp-system-arp1000
- copp-system-arpsresolver1000
- copp-system-bfd5000
- copp-system-bgp5000
- copp-system-bpdu5000
- copp-system-defualt1000
- copp-system-glean1000
- copp-system-igmp1000
- copp-system-ipmcmess1000
- copp-system-ipmcrsvd1000
- copp-system-l3destmiss1000
- copp-system-l3slowpath1000
- copp-system-l3tl11000
- copp-system-lacp5000
- copp-system-ldp1000
- copp-system-mlag5000
- copp-system-selfip5000
- copp-system-selfip-tc6to75000
- copp-system-sflow0
- copp-system-tc3to51000
- copp-system-tc6to71000
- copp-system-urm1000
- copp-system-urml1000

Example

- These commands configure the minimum bandwidth of 500 packets per second for data traffic specified by the class map copp-system-lldp.

```
switch(config)#policy-map type control-plane copp-system-policy
switch(config-pmap-copp-system-policy)#class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#bandwidth pps 500
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#exit
switch(config-pmap-c copp-system-policy)#exit
switch(config)#show policy-map interface control-plan copp-system-policy
Service-policy input: copp-system-policy
  Number of units programmed: 4
 Hardware programming status: Successful
  <--------OUTPUT OMITTED FROM EXAMPLE-------->
  Class-map: copp-system-lldp (match-any)
    shape : 10000 pps
    bandwidth : 500 pps
    Out Packets : 304996
    Drop Packets : 0
  <--------OUTPUT OMITTED FROM EXAMPLE-------->

switch(config)#
```
class (policy-map (control-plane) – Arad)

The `class` command places the switch in policy-map-class (control plane) configuration mode, which is a group change mode for changing bandwidth and shape parameters associated with a specified class. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. The control plane policy map contains 20 static classes. Each class contains an eponymous class map and may contain `bandwidth` and `shape` commands.

- The class map identifies a data stream.
- **Bandwidth** command defines the stream’s minimum transmission rate through the control plane.
- **Shape** command defines the stream’s maximum transmission rate through the control plane.

Static class maps identify a data stream by definition. Each data packet is managed by commands of the first class whose map matches the packet’s content. Dynamic classes are not supported for control plane policing on Arad platform switches.

Each class corresponds to a transmission queue. Queue scheduling is round-robin until `bandwidth` rate for a queue is exceeded. Scheduling becomes strict-priority with CPU queue number determining priority until the `shape` rate is reached. Packets are dropped after the shape rate is exceeded.

The `exit` command returns the switch to policy-map configuration mode. Saving policy-map-class changes also require an exit from policy-map mode, which saves pending policy-map-class and policy-map changes to `running-config` and returns the switch to global configuration mode. The `abort` command discards pending changes, returning the switch to global configuration mode.

The `no class` and `default class` commands remove policy-map-class commands for the specified class assignment from the policy map.

**Command Mode**

Policy-Map (control plane) configuration accessed through `policy-map type control-plane` command

**Command Syntax**

```
class class_name
no class class_name
default class class_name
```

**Parameters**

- `class_name` name of the class.

**Static Classes**

Arad platform switches provide the following static control plane classes:

- `copp-system-bgp`
- `copp-system-l2broadcast`
- `copp-system-linklocal`
- `copp-system-bpdu`
- `copp-system-l2unicast`
- `copp-system-lldp`
- `copp-system-default`
- `copp-system-l3destmiss`
- `copp-system-mlag`
- `copp-system-ipbroadcast`
- `copp-system-l3lpmoveflow`
- `copp-system-multicastsnoop`
- `copp-system-ipmcast`
- `copp-system-l3slowpath`
- `copp-system-OspfIsis`
- `copp-system-ipmcmmiss`
- `copp-system-l3ttl1`
- `copp-system-sflow`
- `copp-system-ipunicast`
- `copp-system-lacp`

**Commands Available in Policy-map-class (control plane) Configuration Mode**

- `bandwidth (policy-map-class (control-plane) – Arad)`
- `shape (policy-map-class (control-plane) – Arad)`
• **exit** saves pending class map changes, then returns the switch to global configuration mode.
• **abort** discards pending class map changes, then returns the switch to global configuration mode.

**Related Commands**
• **policy-map type control-plane** places switch in policy-map (control plane) configuration mode.

**Example**
• These commands enters policy-map-class configuration mode to modify the shape, bandwidth parameters associated with the static class named **copp-system-lldp**.

```
switch(config)#policy-map type control-plane copp-system-policy
switch(config-pmap-copp-system-policy)#class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#
```
class (policy-map (control-plane) – FM6000)

The class command places the switch in policy-map-class (control plane) configuration mode, which is a group change mode for changing bandwidth and shape parameters associated with a specified class. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. The control plane policy map contains 12 static classes. Each class contains an eponymous class map and may contain bandwidth and shape commands.

- The class map identifies a data stream.
- Bandwidth command defines the stream's minimum transmission rate through the control plane.
- Shape command defines the stream's maximum transmission rate through the control plane.

Static class maps identify a data stream by definition. Each data packet is managed by commands of the first class whose map matches the packet's content. Dynamic classes are not supported for control plane policing on FM6000 platform switches.

Each class corresponds to a transmission queue. Queue scheduling is round-robin until bandwidth rate for a queue is exceeded. Scheduling becomes strict-priority with CPU queue number determining priority until the shape rate is reached. Packets are dropped after the shape rate is exceeded.

The exit command returns the switch to policy-map configuration mode. Saving policy-map-class changes also require an exit from policy-map mode, which saves pending policy-map-class and policy-map changes to running-config and returns the switch to global configuration mode. The abort command discards pending changes, returning the switch to global configuration mode.

The no class and default class commands remove policy-map-class commands for the specified class assignment from the policy map. The class is removed from the policy map if it is a dynamic class.

Command Mode

Policy-Map (control plane) configuration
accessed through policy-map type control-plane command

Command Syntax

```plaintext
class class_name
no class class_name
default class class_name
```

Parameters

- `class_name` name of the class.

Static Classes

FM6000 platform switches provide the following static control plane classes:

- copp-system-arp
- copp-system-igmp
- copp-system-PimPtp
- copp-system-default
- copp-system-l2svd
- copp-system-selfip
- copp-system-ipmcmiss
- copp-system-l3slowpath
- copp-system-selfip-tc6to7
- copp-system-ipmcrsvd
- copp-system-OspfIsis
- copp-system-sflow

Commands Available in Policy-map-class (control plane) Configuration Mode

- `bandwidth (policy-map-class (control-plane) – FM6000)`
- `shape (policy-map-class (control-plane) – FM6000)`
- `exit` saves pending class map changes, then returns the switch to global configuration mode.
- `abort` discards pending class map changes, then returns the switch to global configuration mode.
Related Commands

- `policy-map type control-plane` places switch in policy-map (control plane) configuration mode.

Example

- These commands enters policy-map-class configuration mode to modify the shape, bandwidth parameters associated with the static class named `copp-system-arp`.

```
switch(config)#policy-map type control-plane copp-system-policy
switch(config-pmap-copp-system-policy)#class copp-system-arp
switch(config-pmap-c-copp-system-policy-copp-system-arp)#
```
The **class** command places the switch in policy-map-class (control plane) configuration mode, which is a group change mode for changing bandwidth and shape parameters associated with a specified class. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. The control plane policy map contains 23 static classes. Each class contains an eponymous class map and may contain **bandwidth** and **shape** commands.

- The class map identifies a data stream.
- **Bandwidth** command defines the stream’s minimum transmission rate through the control plane.
- **Shape** command defines the stream’s maximum transmission rate through the control plane.

Static class maps identify a data stream by definition. Each data packet is managed by commands of the first class whose map matches the packet’s content. Dynamic classes are not supported for control plane policing on Helix platform switches.

Each class corresponds to a transmission queue. Queue scheduling is strict-priority; CPU queue number determines priority until the **shape** rate is reached. Packets are dropped after the shape rate is exceeded.

The **exit** command returns the switch to policy-map configuration mode. Saving policy-map-class changes also require an exit from policy-map mode, which saves pending policy-map-class and policy-map changes to **running-config** and returns the switch to global configuration mode. The **abort** command discards pending changes, returning the switch to global configuration mode.

The **no class** and **default class** commands remove policy-map-class commands for the specified class assignment from the policy map.

Chapter 26: Traffic Management

Traffic Management Configuration Commands

Commands Available in Policy-map-class (control plane) Configuration Mode
- `bandwidth (policy-map-class (control-plane) – Helix)`
- `shape (policy-map-class (control-plane) – Helix)`
- `exit` saves pending class map changes, then returns the switch to global configuration mode.
- `abort` discards pending class map changes, then returns the switch to global configuration mode.

Related Commands
- `policy-map type control-plane` places switch in policy-map (control plane) configuration mode.

Example
- These commands enters policy-map-class configuration mode to modify the shape, bandwidth parameters associated with the static class named `copp-system-arp`.

```
switch(config)#policy-map
switch(config)#policy-map type control-plane copp-system-policy
switch(config-pmap-copp-system-policy)#class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#
```
class (policy-map (control-plane) – Petra)

The `class` command places the switch in policy-map-class (control plane) configuration mode, which is a group change mode for changing bandwidth and shape parameters associated with a specified class. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. The control plane policy map contains 15 static classes. Each class contains an eponymous class map and may contain `bandwidth` and `shape` commands.

- The class map identifies a data stream.
- **Bandwidth** command defines the stream’s minimum transmission rate through the control plane.
- **Shape** command defines the stream’s maximum transmission rate through the control plane.

Static class maps identify a data stream by definition. Each data packet is managed by commands of the first class whose map matches the packet’s content. Dynamic classes are not supported for control plane policing on Petra platform switches.

Each class corresponds to a transmission queue. Queue scheduling is round-robin until **bandwidth** rate for a queue is exceeded. Scheduling becomes strict-priority with CPU queue number determining priority until the **shape** rate is reached. Packets are dropped after the shape rate is exceeded.

The `exit` command returns the switch to policy-map configuration mode. Saving policy-map-class changes also require an exit from policy-map mode, which saves pending policy-map-class and policy-map changes to `running-config` and returns the switch to global configuration mode. The `abort` command discards pending changes, returning the switch to global configuration mode.

The `no class` and `default class` commands remove policy-map-class commands for the specified class assignment from the policy map.

**Command Mode**

Policy-Map (control plane) configuration
accessed through `policy-map type control-plane` command

**Command Syntax**

```plaintext
class class_name
no class class_name
default class class_name
```

**Parameters**

- `class_name` name of the class.

**Static Classes**

Petra platform switches provide the following static control plane classes:

- copp-system-bpdu
- copp-system-ipmcmiiss
- copp-system-l3ttl0
- copp-system-default
- copp-system-ipmcrsvd
- copp-system-l3ttl1
- copp-system-igmp
- copp-system-ipunicast
- copp-system-lacp
- copp-system-ipbroadcast
- copp-system-l3destmiss
- copp-system-ldlp
- copp-system-ipmci
- copp-system-l3slowpath
- copp-system-unicast-arp

**Commands Available in Policy-map-class (control plane) Configuration Mode**

- `bandwidth (policy-map-class (control-plane) – Petra)`
- `shape (policy-map-class (control-plane) – Petra)`
- `exit` saves pending class map changes, then returns the switch to global configuration mode.
- `abort` discards pending class map changes, then returns the switch to global configuration mode.
Related Commands

- `policy-map type control-plane` places switch in policy-map (control plane) configuration mode.

Example

- These commands enters policy-map-class configuration mode to modify the shape, bandwidth parameters associated with the static class named `copp-system-lldp`.

```plaintext
switch(config)#policy-map
switch(config)#policy-map type control-plane copp-system-policy
switch(config-pmap-copp-system-policy)#class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#
```
class (policy-map (control-plane) – Trident and Trident-II)

The `class` command places the switch in policy-map-class (control plane) configuration mode, which is a group change mode for changing bandwidth and shape parameters associated with a specified class. The command adds the specified class to the policy map if it was not previously included. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. The control plane policy map contains 18 static classes and up to 30 dynamic classes. Dynamic classes contain an eponymous class map. All classes may contain `bandwidth` and `shape` commands.

- The class map identifies a data stream.
- **Bandwidth** command defines the stream’s minimum transmission rate through the control plane.
- **Shape** command defines the stream’s maximum transmission rate through the control plane.

Dynamic class maps identify a data stream with an ACL assigned by `match (class-map (control-plane) – Trident)`. Static class maps identify a data stream by definition. Each data packet is managed by commands of the first class whose map matches the packet’s content.

Static classes are provided with the switch and cannot be removed from the policy map or modified by the `class` command. Dynamic classes are user defined and added to the policy map by this command. Dynamic classes are always placed in front of the static classes. Bandwidth and shape parameters are editable for all classes.

Each class corresponds to a transmission queue. Queue scheduling is round-robin until `bandwidth` rate for a queue is exceeded. Scheduling becomes strict-priority with CPU queue number determining priority until the `shape` rate is reached. Packets are dropped after the shape rate is exceeded.

The `exit` command returns the switch to policy-map configuration mode. Saving policy-map-class changes also require an exit from policy-map mode, which saves pending policy-map-class and policy-map changes to `running-config` and returns the switch to global configuration mode. The `abort` command discards pending changes, returning the switch to global configuration mode.

The `no class` and `default class` commands remove policy-map-class commands for the specified class assignment from the policy map. The class is removed from the policy map if it is a dynamic class.

**Command Mode**

Policy-Map (control plane) configuration
accessed through `policy-map type control-plane` command

**Command Syntax**

```markdown
class class_name [PLACEMENT]
no class class_name [PLACEMENT]
default class class_name [PLACEMENT]
```

**Parameters**

- `class_name` name of the class.
- **PLACEMENT** Specifies the class’s map placement. Configurable only for dynamic classes.
  - `<no parameter>` New classes are placed between the dynamic and static classes. Previously defined classes retain their current policy map placement.
  - `insert-before dynamic_class` Class is inserted in front of the specified dynamic class.

**Static Classes**

Trident switches provide the following static control plane classes:

- `copp-system-acllog`
- `copp-system-ipmcmiss`
- `copp-system-lldp`
• copp-system-arp
• copp-system-ipmcrsvd
• copp-system-selfip
• copp-system-arpsolver
• copp-system-l3destmiss
• copp-system-selfip-tc6to7
• copp-system-bpdu
• copp-system-l3slowpath
• copp-system-sflow
• copp-system-glean
• copp-system-l3ttl1
• copp-system-tc3to5
• copp-system-igmp
• copp-system-lacp
• copp-system-tc6to7

**Commands Available in Policy-map-class (control plane) Configuration Mode**

- **bandwidth (policy-map-class (control-plane) – Trident)**
- **shape (policy-map-class (control-plane) – Trident)**
- **exit** saves pending class map changes, then returns the switch to global configuration mode.
- **abort** discards pending class map changes, then returns the switch to global configuration mode.

**Related Commands**

- **class-map type control-plane** places switch in class-map (control-plane) configuration mode.
- **policy-map type control-plane** places switch in policy-map (control plane) configuration mode.

**Example**

- These commands add CM-1 class to the copp-system-policy policy map.

  switch(config)#policy-map type control-plane copp-system-policy
  switch(config-pmap-copp-system-policy)#class CM-1
  switch(config-pmap-c-copp-system-policy-CM-1)#
**class (policy-map (control-plane) – Trident-II)**

The `class` command places the switch in policy-map-class (control plane) configuration mode, which is a group change mode for changing bandwidth and shape parameters associated with a specified class. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. The control plane policy map contains 23 static classes. Each class contains an eponymous class map and may contain `bandwidth` and `shape` commands.

- The class map identifies a data stream.
- **Bandwidth** command defines the stream’s minimum transmission rate through the control plane.
- **Shape** command defines the stream’s maximum transmission rate through the control plane.

Static class maps identify a data stream by definition. Each data packet is managed by commands of the first class whose map matches the packet's content. Dynamic classes are not supported for control plane policing on Trident-II platform switches.

Each class corresponds to a transmission queue. Queue scheduling is strict-priority; CPU queue number determines priority until the `shape` rate is reached. Packets are dropped after the shape rate is exceeded.

The `exit` command returns the switch to policy-map configuration mode. Saving policy-map-class changes also require an exit from policy-map mode, which saves pending policy-map-class and policy-map changes to `running-config` and returns the switch to global configuration mode. The `abort` command discards pending changes, returning the switch to global configuration mode.

The `no class` and `default class` commands remove policy-map-class commands for the specified class assignment from the policy map.

**Command Mode**

Policy-Map (control plane) configuration

accessed through `policy-map type control-plane` command

**Command Syntax**

```text
class class_name
no class class_name
default class class_name
```

**Parameters**

- `class_name` name of the class.

**Static Classes**

Trident-II platform switches provide the following static control plane classes:

- copp-system-aclog
- copp-system-igmp
- copp-system-mlag
- copp-system-arp
- copp-system-ipmcrsvd
- copp-system-selfip
- copp-system-arpresolver
- copp-system-ipmcrsvd
- copp-system-selfip-tc6to7
- copp-system-bfd
- copp-system-l3destmiss
- copp-system-sflow
- copp-system-bgp
- copp-system-l3slowpath
- copp-system-tc3to5
- copp-system-bpdu
- copp-system-l3ttl1
- copp-system-tc6to7
- copp-system-default
- copp-system-lacp
- copp-system-urm
- copp-system-glean
- copp-system-ldlp

**Commands Available in Policy-map-class (control plane) Configuration Mode**

- `bandwidth (policy-map-class (control-plane) – Trident-II)`
• **shape (policy-map-class (control-plane) – Trident-II)**
• **exit** saves pending class map changes, then returns the switch to global configuration mode.
• **abort** discards pending class map changes, then returns the switch to global configuration mode.

**Related Commands**
• **policy-map type control-plane** places switch in policy-map (control plane) configuration mode.

**Example**
• These commands enters policy-map-class configuration mode to modify the shape, bandwidth parameters associated with the static class named **copp-system-arp**.

```plaintext
switch(config)#policy-map
switch(config)#policy-map type control-plane copp-system-policy
switch(config-pmap-copp-system-policy)#class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#
```
class (policy-map (pbr))

The class (policy-map (pbr)) command places the switch in policy-map-class (pbr) configuration mode, which is a group change mode that modifies the specified class of the configuration mode Policy-Based Routing (PBR) policy map. The command adds the class to the policy map if it was not previously included in the policy map. All changes in a group change mode edit session are pending until the mode is exited, and can be canceled by using the abort command.

A PBR policy map is an ordered list of classes. Each class contains an eponymous class map and can contain set commands to specify next hop. Classes without set commands translate to no action being performed on that class of packets.

- The class map identifies a data stream through ACLs. Class maps are configured in class-map (pbr) configuration mode.
- Set commands can be used to specify the next hop for a given class. Set commands are configured in policy-map-class (pbr) configuration mode.

PBR policy maps can also contain one or more raw match statements which filter incoming traffic without using ACLs. Data packets are managed by commands of the first class or raw match statement matching the packet's contents.

The exit command returns the switch to policy-map (pbr) configuration mode. However, saving policy-map-class changes also requires an exit from policy-map (pbr) configuration mode. This saves all pending policy map and policy-map-class changes to running-config and returns the switch to global configuration mode. The abort command discards pending changes, returning the switch to global configuration mode.

The no class and default class commands remove the class assignment from the configuration mode policy map by deleting the corresponding class configuration from running-config.

Command Mode

Policy-Map (pbr) Configuration
accessed through policy-map type pbr

Command Syntax

[sequence_number] class class_name
no [sequence_number] class class_name
default [sequence_number] class class_name
no sequence_number
default sequence_number

Parameters

- sequence_number  Sequence number (1 to 4294967295) assigned to the rule. If no number is entered, the number is derived by adding 10 to the number of the policy map’s last numbered line. To increase the distance between existing entries, use the resequence command.
- class_name  name of the class.

Commands Available in Policy-map-class (pbr) Configuration Mode

- set nexthop (policy-map-class – pbr) sets next hop for the class.
- exit saves pending class changes and returns switch to policy-map (pbr) configuration mode.
- abort discards pending class changes and returns switch to policy-map (pbr) configuration mode.

Related Commands

- class-map type pbr places switch in class-map (pbr) configuration mode.
- policy-map type pbr places switch in policy-map (pbr) configuration mode
Examples

- These commands add the `CMAP1` class map to the `PMAP1` policy map, then place the switch in policy-map-class configuration mode where the next hops can be assigned to the class. Changes will not take effect until both modes are exited.

```
switch(config)#policy-map type pbr PMAP1
switch(config-pmap-PMAP1)#class CMAP1
switch(config-pmap-c-PMAP1-CMAP1)#
```
class (policy-map (qos) – FM6000)

The class command places the switch in policy-map-class (qos) configuration mode, which is a group change mode that modifies the specified class of the configuration mode policy map. The command adds the class to the policy map if it was not previously included in the policy map. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. Each class contains an eponymous class map and at least one set command:

- The class map identifies a data stream through an ACL. Class maps are configured in class-map (qos) configuration mode.
- Set commands either modify a packet’s content (CoS or DSCP fields) or assigns it to a traffic class queue. Set commands are configured in policy-map-class (qos) configuration mode.

Data packets are managed by commands of the first class whose map matches the packet’s content.

The exit command returns the switch to policy-map configuration mode. However, saving policy-map-class changes also require an exit from policy-map mode. This saves all pending policy map and policy-map-class changes to running-config and returns the switch to global configuration mode. The abort command discards pending changes, returning the switch to global configuration mode.

The no class and default class commands remove the class assignment from the configuration mode policy map by deleting the corresponding class configuration from running-config.

Command Mode
Policy-Map (qos) Configuration
accessed through policy-map type qos

Command Syntax
class class_name [PLACEMENT]
no class class_name [PLACEMENT]
default class class_name [PLACEMENT]

Parameters
- class_name name of the class.
- PLACEMENT Specifies the map placement within the list of class maps.
  - <no parameter> Class is placed at the top of the list.
  - insert-before existing_class Class is inserted in front of the specified class.

Commands Available in Policy-map-class (qos) Configuration Mode
- set (policy-map-class (qos) – FM6000)
- exit saves pending class changes and returns switch to policy-map (qos) configuration mode.
- abort discards pending class changes and returns switch to policy-map (qos) configuration mode.

Related Commands
- class-map type qos places switch in class-map (qos) configuration mode.
- policy-map type qos places switch in policy-map (qos) configuration mode
Example

- These commands add the `CMAP_1` class map to the `PMAP_1` policy map, then places the switch in policy-map-class configuration mode.

```bash
switch(config)#policy-map type qos PMAP-1
switch(config-pmap-PMAP-1)#class CMAP-1
switch(config-pmap-c-PMAP-1-CMAP-1)#
```
class (policy-map (qos) – Helix)

The class command places the switch in policy-map-class (qos) configuration mode, which is a group change mode that modifies the specified class of the configuration mode policy map. The command adds the class to the policy map if it was not previously included in the policy map. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. Each class contains an eponymous class map and at least one set command:

- The class map identifies a data stream through an ACL. Class maps are configured in class-map (qos) configuration mode.
- Set commands either modify a packet’s content (CoS or DSCP fields) or assigns it to a traffic class queue. Set commands are configured in policy-map-class (qos) configuration mode.

Data packets are managed by commands of the first class whose map matches the packet’s content.

The exit command returns the switch to policy-map configuration mode. However, saving policy-map-class changes also require an exit from policy-map mode. This saves all pending policy map and policy-map-class changes to running-config and returns the switch to global configuration mode. The abort command discards pending changes, returning the switch to global configuration mode.

The no class and default class commands remove the class assignment from the configuration mode policy map by deleting the corresponding class configuration from running-config.

Command Mode
Policy-Map (qos) Configuration
accessed through policy-map type qos command

Command Syntax
    class class_name [PLACEMENT]
no class class_name [PLACEMENT]
    default class class_name [PLACEMENT]

Parameters
- class_name name of the class.
- PLACEMENT Specifies the map placement within the list of class maps.
  - <no parameter> Class is placed at the top of the list.
  - insert-before existing_class Class is inserted in front of the specified class.

Commands Available in Policy-map-class (qos) Configuration Mode
- set (policy-map-class (qos) – Helix)
- exit saves pending class changes and returns switch to policy-map (qos) configuration mode.
- abort discards pending class changes and returns switch to policy-map (qos) configuration mode.

Related Commands
- class-map type qos places switch in class-map (qos) configuration mode.
- policy-map type qos places switch in policy-map (qos) configuration mode
Example

- These commands add the `CMAP_1` class map to the `PMAP_1` policy map, then places the switch in policy-map-class configuration mode.

  ```
  switch(config)#policy-map type qos PMAP-1
  switch(config-pmap-PMAP-1)#class CMAP-1
  switch(config-pmap-c-PMAP-1-CMAP-1)#
  ```
class (policy-map (qos) – Trident)

The **class** command places the switch in policy-map-class (qos) configuration mode, which is a group change mode that modifies the specified class of the configuration mode policy map. The command adds the class to the policy map if it was not previously included in the policy map. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. Each class contains an eponymous class map and at least one set command:

- The class map identifies a data stream through an ACL. Class maps are configured in class-map (qos) configuration mode.
- **Set** commands either modify a packet’s content (CoS or DSCP fields) or assigns it to a traffic class queue. **Set** commands are configured in policy-map-class (qos) configuration mode.

  Data packets are managed by commands of the first class whose map matches the packet’s content.

The **exit** command returns the switch to policy-map configuration mode. However, saving policy-map-class changes also require an exit from policy-map mode. This saves all pending policy map and policy-map-class changes to **running-config** and returns the switch to global configuration mode. The **abort** command discards pending changes, returning the switch to global configuration mode.

The **no class** and **default class** commands remove the class assignment from the configuration mode policy map by deleting the corresponding **class** configuration from **running-config**.

**Command Mode**

Policy-Map (qos) Configuration
accessed through **policy-map type qos** command

**Command Syntax**

```
class class_name [PLACEMENT]
no class class_name [PLACEMENT]
default class class_name [PLACEMENT]
```

**Parameters**

- **class_name**  name of the class.
- **PLACEMENT**  Specifies the map placement within the list of class maps.
  
  - <no parameter>  Class is placed at the top of the list.
  
  - **insert-before existing_class**  Class is inserted in front of the specified class.

**Commands Available in Policy-map-class (qos) Configuration Mode**

- **set (policy-map-class (qos) – Trident)**
- **exit** saves pending class changes and returns switch to policy-map (qos) configuration mode.
- **abort** discards pending class changes and returns switch to policy-map (qos) configuration mode.

**Related Commands**

- **class-map type qos** places switch in class-map (qos) configuration mode.
- **policy-map type qos** places switch in policy-map (qos) configuration mode
Example

- These commands add the **CMAP_1** class map to the **PMAP_1** policy map, then places the switch in policy-map-class configuration mode.

  ```
  switch(config)#policy-map type qos PMAP-1
  switch(config-pmap-PMAP-1)#class CMAP-1
  switch(config-pmap-c-PMAP-1-CMAP-1)#
  ```
class (policy-map (qos) – Trident II)

The `class` command places the switch in policy-map-class (qos) configuration mode, which is a group change mode that modifies the specified class of the configuration mode policy map. The command adds the class to the policy map if it was not previously included in the policy map. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. Each class contains an eponymous class map and at least one set command:

- The class map identifies a data stream through an ACL. Class maps are configured in class-map (qos) configuration mode.
- `Set` commands either modify a packet’s content (CoS or DSCP fields) or assigns it to a traffic class queue. Set commands are configured in policy-map-class (qos) configuration mode.

  Data packets are managed by commands of the first class whose map matches the packet’s content.

The `exit` command returns the switch to policy-map configuration mode. However, saving policy-map-class changes also require an exit from policy-map mode. This saves all pending policy map and policy-map-class changes to `running-config` and returns the switch to global configuration mode. The `abort` command discards pending changes, returning the switch to global configuration mode.

The `no class` and `default class` commands remove the class assignment from the configuration mode policy map by deleting the corresponding class configuration from `running-config`.

Command Mode

Policy-Map (qos) Configuration
accessed through `policy-map type qos` command

Command Syntax

```
class class_name [PLACEMENT]
no class class_name [PLACEMENT]
default class class_name [PLACEMENT]
```

Parameters

- `class_name` name of the class.
- `PLACEMENT` Specifies the map placement within the list of class maps.
  - `<no parameter>` Class is placed at the top of the list.
  - `insert-before existing_class` Class is inserted in front of the specified class.

Commands Available in Policy-map-class (qos) Configuration Mode

- `set (policy-map-class (qos) – Trident II)
- `exit` saves pending class changes and returns switch to policy-map (qos) configuration mode.
- `abort` discards pending class changes and returns switch to policy-map (qos) configuration mode.

Related Commands

- `class-map type qos` places switch in class-map (qos) configuration mode.
- `policy-map type qos` places switch in policy-map (qos) configuration mode
Example

- These commands add the `CMAP_1` class map to the `PMAP_1` policy map, then places the switch in policy-map-class configuration mode.

  ```
  switch(config)#policy-map type qos PMAP-1
  switch(config-pmap-PMAP-1)#class CMAP-1
  switch(config-pmap-c-PMAP-1-CMAP-1)#
  ```
**class-map type control-plane**

The `class-map type control-plane` command places the switch in Class-Map (control plane) configuration mode, which is a group change mode that modifies a control-plane dynamic class map. A dynamic class map is a data structure that uses access control lists (ACLs) to define a data stream by specifying characteristics of data packets that comprise that stream. Control-plane policy maps use class maps to specify which control plane traffic is controlled by policy map criteria.

The `exit` command saves pending class map changes to `running-config` and returns the switch to global configuration mode. Class map changes are also saved by entering a different configuration mode. The `abort` command discards pending changes and returns the switch to global configuration mode.

The `no class-map type control-plane` and `default class-map type control-plane` commands delete the specified class map by removing the corresponding `class-map type control-plane` command and its associated configuration.

**Command Mode**

Global Configuration

**Command Syntax**

```
class-map type control-plane match-any class_name
no class-map type control-plane [match-any] class_name
default class-map type control-plane [match-any] class_name
```

**Parameters**

- `class_name` Name of class map.

**Commands Available in Class-Map (Control Plane) Configuration Mode**

- `match (class-map (control-plane) – Trident)`

**Related Commands**

- `policy-map type control-plane`
- `class (policy-map (control-plane) – Trident and Trident-II)`
- `class-map type qos`

**Example**

- This command creates the control plane class map named CP-MAP-1 and places the switch in class-map configuration mode.

  ```
  switch(config)#class-map type control-plane match-any CP-CMAP-1
  switch(config-cmap-CP-CMAP-1)#
  ```
class-map type pbr

The class-map type pbr command places the switch in class-map (pbr) configuration mode for the specified class map, and creates the class map if one does not already exist. Class-map (pbr) configuration mode is a group change mode that modifies a class map for policy-based routing (PBR). PBR class maps contain one or more match statements which filter incoming traffic using ACLs. PBRs can then use these class maps to set next-hop IP addresses for the traffic that matches them. (Classes without set commands translate to no action being performed on that class of packets.)

The exit command saves pending class map changes to running-config, then returns the switch to global configuration mode. Class map changes are also saved by directly entering a different configuration mode. The abort command discards pending changes and returns the switch to global configuration mode.

The no class-map type pbr and default class-map type pbr commands delete the specified class map by removing the corresponding class-map type pbr command and its associated configuration.

Command Mode

  Global Configuration

Command Syntax

  class-map type pbr match-any map_name
  no class-map type pbr match-any map_name
  default class-map type pbr match-any map_name

Parameters

  • map_name  Name of class map.

Commands Available in Class-Map (PBR) configuration mode

  • match (class-map (pbr))
  • resequence (class-map (pbr))

Related Commands

  • policy-map type pbr
  • class (policy-map (pbr))

Example

  • This command creates the PBR class map named MAP1 and places the switch in class-map (pbr) configuration mode where match criteria can be configured for the class.

    switch(config)# class-map type pbr match-any MAP1
    switch(config-cmap-MAP1)#
class-map type qos

The **class-map type qos** command places the switch in Class-Map (qos) configuration mode, which is a group change mode that modifies a QoS dynamic class map. A dynamic class map is a data structure that uses access control lists (ACLs) to define a data stream by specifying characteristics of data packets that comprise that stream. QoS policy maps use class maps to specify the traffic (to which the policy map is assigned) that is transformed by policy map criteria.

The **exit** command saves pending class map changes to **running-config**, then returns the switch to global configuration mode. Class map changes are also saved by entering a different configuration mode. The **abort** command discards pending changes and returns the switch to global configuration mode.

The **no class-map type qos** and **default class-map type qos** commands delete the specified class map by removing the corresponding **class-map type qos** command and its associated configuration. The **class-map** and **class-map type qos** commands are equivalent.

**Command Mode**

Global Configuration

**Command Syntax**

```
class-map [type qos] match-any class_name
no class-map [type qos] [match-any] class_name
default class-map [type qos] [match-any] class_name
```

**Parameters**

- **class_name** Name of class map.

**Commands Available in Class-Map (QoS) Configuration Mode**

- **match (class-map (qos) – FM6000)**
- **match (class-map (qos) – Trident)**

**Related Commands**

- **policy-map type qos**
- **class (policy-map (qos) – FM6000)**
- **class (policy-map (qos) – Trident)**

**Example**

- This command creates the QoS class map named MAP-1 and places the switch in class-map configuration mode.

```
switch(config)#class-map type qos match-any MAP-1
switch(config-cmap-MAP-1)#
```
clear policy-map counters

The clear policy-map command resets the specified policy map counters to zero. Policy map counters record the quantity of packets that are filtered by the ACLs that comprise a specified policy map.

Command Mode
Privileged EXEC

Command Syntax
clear policy-map INTERFACE_NAME counters MAP_NAME

Parameters
  • INTERFACE_NAME Interface for which command clears table counters. Options include:
    • interface control-plane Control plane.
  • MAP_NAME Policy map for which command clears counters. Options include:
    • copp-system-policy Name of only policy map supported for the control plane.
match (class-map (control-plane) – Helix)

The `match` command assigns an ACL to the configuration mode class map. A class map can contain only one ACL. Class maps only use permit rules to filter data; deny rules are ignored. The command accepts IPv4 and IPv4 standard ACLs.

A class map is assigned to a policy map by the `class (policy-map (control-plane) – Helix)` command.

Class map (control plane) configuration mode is a group change mode. Match statements are not saved to `running-config` until the edit session is completed by exiting the mode.

The `no match` and `default match` commands remove the `match` statement from the configuration mode class map by deleting the corresponding command from `running-config`.

Command Mode

Class-Map (control plane) configuration accessed through `class-map type control-plane` command

Command Syntax

```
match ip access-group list_name
no match ip access-group list_name
default match ip access-group list_name
```

Parameters

- `list_name` name of ACL assigned to class map.

Related Commands

- `class-map type control-plane` places the switch in Class-Map configuration mode.
- `exit` saves pending class map changes, then returns the switch to global configuration mode.
- `abort` discards pending class map changes, then returns the switch to global configuration mode.
- `class (policy-map (control-plane) – Helix)` assigns a class map to a policy map.

Guidelines

Static class maps cannot be modified by this command.

Match statements are saved to `running-config` only upon exiting Class-Map (control plane) configuration mode.

Example

- These commands add the IP ACL `list_1` to the `map_1` class map, then saves the command by exiting class-map mode.

```
switch(config)#class-map type control-plane map_1
switch(config-cmap-map_1)#match ip access-group list_1
switch(config-cmap-map_1)#exit
switch(config)#
```
match (class-map (control-plane) – Trident)

The **match** command assigns an ACL to the configuration mode class map. A class map can contain only one ACL. Class maps only use permit rules to filter data; deny rules are ignored. The command accepts IPv4, IPv6, IPv4 standard, and IPv6 standard ACLs.

A class map is assigned to a policy map by the **class (policy-map (control-plane) – Trident and Trident-II)** command.

Class map (control plane) configuration mode is a group change mode. **Match** statements are not saved to **running-config** until the edit session is completed by exiting the mode.

The **no match** and **default match** commands remove the **match** statement from the configuration mode class map by deleting the corresponding command from **running-config**.

**Command Mode**  
Class-Map (control plane) configuration accessed through **class-map type control-plane** command

**Command Syntax**

```
match IP_VERSION access-group list_name  
no match IP_VERSION access-group list_name  
default match IP_VERSION access-group list_name
```

**Parameters**

- **IP_VERSION**   IP version of the specified ACL. Options include:
  - **ip**   IPv4.
  - **ipv6**   IPv6.
- **list_name**   name of ACL assigned to class map.

**Related Commands**

- **class-map type control-plane** places the switch in Class-Map configuration mode.
- **exit** saves pending class map changes, then returns the switch to global configuration mode.
- **abort** discards pending class map changes, then returns the switch to global configuration mode.
- **class (policy-map (control-plane) – Trident and Trident-II)** assigns a class map to a policy map.

**Guidelines**

Static class maps cannot be modified by this command.

**Match** statements are saved to **running-config** only upon exiting Class-Map (control plane) configuration mode.

**Example**

- These commands add the IPv4 ACL names **list_1** to the **map_1** class map, then saves the command by exiting class-map mode.
  ```
  switch(config)#class-map type control-plane map_1  
  switch(config-cmap-map_1)#match ip access-group list_1  
  switch(config-cmap-map_1)#exit  
  switch(config)#
  ```
match (class-map (control-plane) – Trident-II)

The `match` command assigns an ACL to the configuration mode class map. A class map can contain only one ACL. Class maps only use permit rules to filter data; deny rules are ignored. The command accepts IPv4 and IPv4 standard ACLs.

A class map is assigned to a policy map by the `class (policy-map (control-plane) – Trident-II)` command.

Class map (control plane) configuration mode is a group change mode. `Match` statements are not saved to `running-config` until the edit session is completed by exiting the mode.

The `no match` and `default match` commands remove the `match` statement from the configuration mode class map by deleting the corresponding command from `running-config`.

Command Mode
- Class-Map (control plane) configuration
  - accessed through `class-map type control-plane` command

Command Syntax
- `match ip access-group list_name`
- `no match ip access-group list_name`
- `default match ip access-group list_name`

Parameters
- `list_name` name of ACL assigned to class map.

Related Commands
- `class-map type control-plane` places the switch in Class-Map configuration mode.
- `exit` saves pending class map changes, then returns the switch to global configuration mode.
- `abort` discards pending class map changes, then returns the switch to global configuration mode.
- `class (policy-map (control-plane) – Trident-II)` assigns a class map to a policy map.

Guidelines
Static class maps cannot be modified by this command.

`Match` statements are saved to `running-config` only upon exiting Class-Map (control plane) configuration mode.

Example
- These commands add the IP ACL `list_1` to the `map_1` class map, then saves the command by exiting class-map mode.

```bash
switch(config)#class-map type control-plane map_1
switch(config-cmap-map_1)#match ip access-group list_1
switch(config-cmap-map_1)#exit
switch(config)#
```
match (class-map (pbr))

The `match` command assigns ACLs to the configuration mode Policy-Based Routing (PBR) class map. The command accepts IPv4, IPv4 standard, IPv6 and IPv6 standard ACLs.

Class map (pbr) configuration mode is a group change mode. `Match` statements are not saved to `running-config` until the edit session is completed by exiting the mode.

The `no match` and `default match` commands remove the `match` statement from the configuration mode class map by deleting the corresponding command from `running-config`.

Important! PBR ACLs use only permit rules to filter data; if there are deny rules in an ACL used by PBR, the configuration will be reverted.

Command Mode

Class-map (pbr) configuration accessed through `class-map type pbr` command

Command Syntax

```
[sequence_number] match {ip|ipv6} access-group list_name
no [sequence_number] match {ip|ipv6} access-group list_name
default [sequence_number] match {ip|ipv6} access-group list_name
no sequence_number
default sequence_number
```

Parameters

- `sequence_number`  Sequence number (1 to 4294967295) assigned to the rule. If no number is entered, the number is derived by adding 10 to the number of the class map's last numbered line. To increase the distance between existing entries, use the `resequence` command.

- `list_name`  name of ACL assigned to class map.

Related Commands

- `class-map type pbr` places the switch in class-map configuration mode.
- `exit` saves pending class map changes, then returns the switch to global configuration mode.
- `abort` discards pending class map changes, then returns the switch to global configuration mode.
- `class (policy-map (pbr))` assigns a class map to a policy map.

Example

- These commands add the IPv4 ACL named `list1` to the `map1` class map, then save the change by exiting class-map mode.

  ```
  switch(config)#class-map type pbr map1
  switch(config-cmap-map1)#match ip access-group list1
  switch(config-cmap-map1)#exit
  switch(config)#
  ```
match (class-map (qos) – FM6000)

The match command assigns an ACL to the configuration mode class map. A class map can contain only one ACL. Class maps only use permit rules to filter data; deny rules are ignored. The command accepts IPv4 and IPv4 standard ACLs.

Class map (qos) configuration mode is a group change mode. Match statements are not saved to running-config until the edit session is completed by exiting the mode.

The no match and default match commands remove the match statement from the configuration mode class map by deleting the corresponding command from running-config.

Command Mode

Class-map (qos) configuration accessed through class-map type qos command

Command Syntax

```
match IP_VERSION access-group list_name
no match IP_VERSION access-group list_name
default match IP_VERSION access-group list_name
```

Parameters

- **IP_VERSION** IP version of the specified ACL. Options include:
  - ip IPv4.
- **list_name** name of ACL assigned to class map.

Related Commands

- **class-map type qos** places the switch in Class-Map configuration mode.
- **exit** saves pending class map changes, then returns the switch to global configuration mode.
- **abort** discards pending class map changes, then returns the switch to global configuration mode.
- **class (policy-map (qos) – FM6000)** assigns a class map to a policy map.

Example

- These commands add the IPv4 ACL named list_1 to the map_1 class map, then saves the command by exiting class-map mode.

```
switch(config)#class-map type qos map_1
switch(config-cmap-map_1)#match ip access-group list_1
switch(config-cmap-map_1)#exit
switch(config)#
```
match (class-map (qos) – Helix)

The `match` command assigns an ACL to the configuration mode class map. A class map can contain only one ACL. Class maps only use permit rules to filter data; deny rules are ignored. The command accepts IPv4, IPv4 standard, IPv6, and IPv6 standard ACLs.

Class map (qos) configuration mode is a group change mode. Match statements are not saved to `running-config` until the edit session is completed by exiting the mode.

The `no match` and `default match` commands remove the `match` statement from the configuration mode class map by deleting the corresponding command from `running-config`.

Command Mode

Class-Map (qos) configuration
accessed through `class-map type qos` command

Command Syntax

```
match IPC_VERSION access-group list_name
no match IPC_VERSION access-group list_name
default match IPC_VERSION access-group list_name
```

Parameters

- `IP_VERSION` IP version of the specified ACL. Options include:
  - `ip` IPv4.
  - `ipv6` IPv6.
- `list_name` name of ACL assigned to class map.

Related Commands

- `class-map type qos` places the switch in Class-Map configuration mode.
- `exit` saves pending class map changes, then returns the switch to global configuration mode.
- `abort` discards pending class map changes, then returns the switch to global configuration mode.
- `class (policy-map (qos) – Helix)` assigns a class map to a policy map.

Example

- These commands add the IPv4 ACL named `list_1` to the `map_1` class map, then saves the command by exiting class-map mode.

```
switch(config)#class-map type qos map_1
switch(config-cmap-map_1)#match ip access-group list_1
switch(config-cmap-map_1)#exit
switch(config)#
```
match (class-map (qos) – Trident)

The `match` command assigns an ACL to the configuration mode class map. A class map can contain only one ACL. Class maps only use permit rules to filter data; deny rules are ignored. The command accepts IPv4, IPv4 standard, IPv6, and IPv6 standard ACLs.

Class map (qos) configuration mode is a group change mode. **Match** statements are not saved to `running-config` until the edit session is completed by exiting the mode.

The no match and default match commands remove the match statement from the configuration mode class map by deleting the corresponding command from `running-config`.

**Command Mode**

Class-Map (qos) configuration accessed through `class-map type qos` command

**Command Syntax**

```
match IP_VERSION access-group list_name
no match IP_VERSION access-group list_name
default match IP_VERSION access-group list_name
```

**Parameters**

- **IP_VERSION** IP version of the specified ACL. Options include:
  - ip IPv4.
  - ipv6 IPv6.
- **list_name** name of ACL assigned to class map.

**Related Commands**

- **class-map type qos** places the switch in Class-Map configuration mode.
- **exit** saves pending class map changes, then returns the switch to global configuration mode.
- **abort** discards pending class map changes, then returns the switch to global configuration mode.
- **class (policy-map (qos) – Trident)** assigns a class map to a policy map.

**Example**

- These commands add the IPv4 ACL named list_1 to the map_1 class map, then saves the command by exiting class-map mode.

```
switch(config)#class-map type qos map_1
switch(config-cmap-map_1)#match ip access-group list_1
switch(config-cmap-map_1)#exit
switch(config)#
```
match (class-map (qos) – Trident II)

The match command assigns an ACL to the configuration mode class map. A class map can contain only one ACL. Class maps only use permit rules to filter data; deny rules are ignored. The command accepts IPv4, IPv4 standard, IPv6, and IPv6 standard ACLs.

Class map (qos) configuration mode is a group change mode. Match statements are not saved to running-config until the edit session is completed by exiting the mode.

The no match and default match commands remove the match statement from the configuration mode class map by deleting the corresponding command from running-config.

Command Mode

Class-Map (qos) configuration
accessed through class-map type qos command

Command Syntax

match IP_VERSION access-group list_name
no match IP_VERSION access-group list_name
default match IP_VERSION access-group list_name

Parameters

- **IP_VERSION** IP version of the specified ACL. Options include:
  - ip  IPv4.
  - ipv6  IPv6.
- **list_name** name of ACL assigned to class map.

Related Commands

- **class-map type qos** places the switch in Class-Map configuration mode.
- **exit** saves pending class map changes, then returns the switch to global configuration mode.
- **abort** discards pending class map changes, then returns the switch to global configuration mode.
- **class (policy-map (qos) – Trident)** assigns a class map to a policy map.

Example

- These commands add the IPv4 ACL named list_1 to the map_1 class map, then saves the command by exiting class-map mode.

```
switch(config)#class-map type qos map_1
switch(config-cmap-map_1)#match ip access-group list_1
switch(config-cmap-map_1)#exit
switch(config)#
```
match (policy-map (pbr))

The `match` command creates a policy map clause entry that specifies one filtering condition. When a packet matches the filtering criteria, its next hop is set as specified. When a packet’s properties do not equal the statement parameters, the packet is evaluated against the next clause or class map in the policy map, as determined by sequence number. If all clauses fail to set a next hop for the packet, the packet is routed according to the FIB.

The `no match` and `default match` commands remove the `match` statement from the configuration mode policy map by deleting the corresponding command from `running-config`.

Command Mode

Policy-Map (pbr) Configuration

accessed through `policy-map type pbr` command

Command Syntax

```
[sequence_number] match ip SOURCE_ADDR DEST_ADDR [set nexthop [recursive] NH-addr_1 [NH-addr_2] ... [NH-addr_n]]

no match ip SOURCE_ADDR DEST_ADDR [set nexthop [recursive] NH-addr_1 [NH-addr_2] ... [NH-addr_n]]

no SEQ_NUM

default match match ip SOURCE_ADDR DEST_ADDR [set nexthop [recursive] NH-addr_1 [[NH-addr_2] ... [NH-addr_n]]

default SEQ_NUM
```

Parameters

- `sequence_number` Sequence number assigned to the rule. If no number is entered, the number is derived by adding 10 to the number of the policy map’s last numbered line. To increase the distance between existing entries, use the `resequence` command.
- `SOURCE_ADDR` and `DEST_ADDR` source and destination address filters. Options include:
  - `network_addr` subnet address (CIDR or address-mask).
  - `any` packets from or to all addresses are matched.
  - `host ip_addr` IP address (dotted decimal notation).
    Source and destination subnet addresses support discontiguous masks.
  - `recursive` enables recursive next hop resolution.
  - `NH_addr` IP address of next hop. If multiple addresses are entered, they are treated as an ECMP group.

Related Commands

- `policy-map type pbr` enters policy-map (PBR) configuration mode.

Example

- These commands create a match rule in policy map “PMAP1” which sets the next hop to 192.168.3.5 for packets received from 172.16.0.0/12 regardless of their destination, then exit the mode to save the changes.

```
switch(config)#policy-map type pbr PMAP1
switch(config-pmap-PMAP1)#match ip 172.16.0.0/12 any set nexthop 192.163.3.5
switch(config-pmap-PMAP1)#exit
switch(config)#
```
policy-map type control-plane

The policy-map type control-plane command places the switch in Policy-Map (control plane) configuration mode, which is a group change mode that modifies a control-plane policy map. A policy map is a data structure that consists of class maps that identify a specific data stream and specify bandwidth and shaping parameters that controls its transmission. Control plane policy maps are applied to the control plane to manage traffic.

The copp-system-policy policy map is supplied with the switch and is always applied to the control plane. Copp-system-policy is the only valid control plane policy map.

The exit command saves pending policy map changes to running-config and returns the switch to global configuration mode. Policy map changes are also saved by entering a different configuration mode. The abort command discards pending changes, returning the switch to global configuration mode.

The no policy-map type control-plane and default policy-map type control-plane commands delete the specified policy map by removing the corresponding policy-map type control-plane command and its associated configuration.

Command Mode
Global Configuration

Command Syntax
policy-map type control-plane copp-system-policy
no policy-map type control-plane copp-system-policy
default policy-map type control-plane copp-system-policy
copp-system-policy is supplied with the switch and is the only valid control plane policy map.

Commands Available in Policy-Map Configuration Mode
- class (policy-map (control-plane) – FM6000)
- class (policy-map (control-plane) – Trident and Trident-II)

Related Commands
- class-map type control-plane enters control-plane class-map configuration mode for modifying a control-plane dynamic class map.

Only Helix and Trident platform switches support dynamic classes for control plane policing.

Example
- This command places the switch in policy-map configuration mode to edit the copp-system-policy policy map.

switch(config)#policy-map type control-plane copp-system-policy
switch(config-pmap-copp-system-policy)#
policy-map type pbr

The `policy-map type pbr` command places the switch in policy-map (pbr) configuration mode, which is a group change mode that modifies a Policy-Based Routing (PBR) policy map. The command also creates the specified policy map if it does not already exist. A PBR policy map is a data structure that consists of class maps that identify specific packets and the next hops for those packets. Policy maps are applied to Ethernet or port channel interfaces to manage traffic.

The `exit` command saves pending policy map changes to `running-config` and returns the switch to global configuration mode. Policy map changes are also saved by entering a different configuration mode. The `abort` command discards pending changes, returning the switch to global configuration mode.

The `no policy-map type pbr` and `default policy-map type pbr` commands delete the specified policy map by removing the corresponding `policy-map type pbr` command and its associated configuration.

**Command Mode**

Global Configuration

**Command Syntax**

```
policy-map type pbr map_name
no policy-map type pbr map_name
default policy-map type pbr map_name
```

**Parameters**

- `map_name` Name of policy map.

**Commands Available in Policy-Map configuration mode**

- `class (policy-map (pbr))`
- `match (policy-map (pbr))`

**Related Commands**

- `class-map type pbr`
- `service-policy type pbr (Interface mode)`

**Example**

- This command creates the PBR policy map named PMAP1 and places the switch in policy-map configuration mode.

  ```
switch(config)#policy-map type pbr PMAP1
switch(config-pmap-PMAP1)#
```
policy-map type qos

The `policy-map type qos` command places the switch in Policy-Map (qos) configuration mode, which is a group change mode that modifies a QoS policy map. A policy map is a data structure that consists of class maps that identify a specific data stream and shaping parameters that controls its transmission. Policy maps are applied to Ethernet or port channel interfaces to manage traffic.

The `exit` command saves pending policy map changes to `running-config` and returns the switch to global configuration mode. Policy map changes are also saved by entering a different configuration mode. The `abort` command discards pending changes, returning the switch to global configuration mode.

The `no policy-map type qos` and `default policy-map type qos` commands delete the specified policy map by removing the corresponding `policy-map type qos` command and its associated configuration. The `policy-map` and `policy-map type qos` commands are equivalent.

Command Mode
Global Configuration

Command Syntax

```
policy-map [type qos] map_name
no policy-map [type qos] map_name
default policy-map [type qos] map_name
```

`policy-map map_name` and `policy-map type qos map_name` are identical commands.

Parameters
- `map_name` Name of policy map.

Commands Available in Policy-Map Configuration Mode
- `class (policy-map (qos) – FM6000)`
- `class (policy-map (qos) – Trident)`

Related Commands
- `class-map type qos`
- `service-policy type qos (Interface mode)`

Example
- This command creates the QoS policy map named PMAP-1 and places the switch in policy-map configuration mode.
  ```
  switch(config)#policy-map PMAP-1
  switch(config-pmap-PMAP-1)#
  ```
**resequence (class-map (pbr))**

The `resequence` command assigns sequence numbers to rules in the configuration mode class map. Command parameters specify the number of the first rule and the numeric interval between consecutive rules. Once changed, rule numbers persist unless changed again using the `resequence` command, but the interval used for numbering new rules reverts to 10 on exiting class-map (pbr) configuration mode.

Maximum rule sequence number is 4294967295.

**Command Mode**

Class-Map (PBR) Configuration
accessed through `class-map type pbr` command

**Command Syntax**

```
resequence [start_num [inc_num]]
```

**Parameters**

- `start_num` sequence number assigned to the first rule. Default is 10.
- `inc_num` numeric interval between consecutive rules. Default is 10.

**Example**

- The `resequence` command renumbers the rules in CMAP1, starting the first command at number 100 and incrementing subsequent lines by 20.

```
switch(config)#class-map type pbr match-any CMAP1
switch(config-cmap-CMAP1)#show active
class-map type pbr match-any CMAP1
  10 match ip access-group group1
  20 match ip access-group group2
  30 match ip access-group group3
switch(config-cmap-CMAP1)#resequence 100 20
switch(config-cmap-CMAP1)#exit
switch(config)#class-map type pbr match-any CMAP1
switch(config-cmap-CMAP1)#show active
class-map type pbr match-any CMAP1
  100 match ip access-group group1
  120 match ip access-group group2
  140 match ip access-group group3
```
resequence (policy-map (pbr))

The resequence command assigns sequence numbers to rules in the configuration mode policy map. Command parameters specify the number of the first rule and the numeric interval between consecutive rules. Once changed, rule numbers persist unless changed again using the resequence command, but the interval used for numbering new rules reverts to 10 on exiting policy-map (pbr) configuration mode.

Maximum rule sequence number is 4294967295.

Command Mode
Policy-Map (PBR) Configuration accessed through policy-map type pbr command

Command Syntax
resequence [start_num [inc_num]]

Parameters
- **start_num** sequence number assigned to the first rule. Default is 10.
- **inc_num** numeric interval between consecutive rules. Default is 10.

Example
- The resequence command renumbers the rules in PMAP1, starting the first command at number 100 and incrementing subsequent lines by 20.

```plaintext
switch(config)#policy-map type pbr PMAP1
switch(config-pmap-PMAP1)#show active
policy-map type pbr PMAP1
  10 class CMAP1
    set nexthop 172.16.1.1
  20 class CMAP2
    set nexthop 172.16.2.2
  30 class CMAP3
    set nexthop 172.16.3.3
switch(config-pmap-PMAP1)#resequence 100 20
switch(config-pmap-PMAP1)#exit
switch(config)#policy-map type pbr PMAP1
switch(config-pmap-PMAP1)#show active
class-map type pbr PMAP1
  100 class CMAP1
    set nexthop 172.16.1.1
  120 class CMAP2
    set nexthop 172.16.2.2
  140 class CMAP3
    set nexthop 172.16.3.3
switch(config-pmap-PMAP1)#
```
service-policy type pbr (Interface mode)

The service-policy pbr command applies the specified Policy-Based Routing (PBR) policy map to the configuration mode interface. A PBR policy map is a data structure that consists of class maps that identify specific packets and the next hops for those packets. Policy maps are applied to Ethernet or port channel interfaces to manage traffic. Only one service policy is supported per interface.

The no service-policy pbr and default service-policy pbr commands remove the service policy assignment from the configuration mode interface by deleting the corresponding service-policy pbr command from running-config.

**Command Mode**

Interface-Ethernet Configuration  
Interface-Port-Channel Configuration  
Interface-VLAN Configuration

**Command Syntax**

```
service-policy type pbr TRAFFIC_DIRECTION map_name
no service-policy pbr TRAFFIC_DIRECTION map_name
default service-policy pbr TRAFFIC_DIRECTION map_name
```

**Parameters**

- **TRAFFIC_DIRECTION** IP address or peer group name. Values include:
  - `input` Policy map applies to inbound packet streams.
  - `map_name` Name of policy map.

**Guidelines**

A policy map that is attached to a port channel interface takes precedence for member interfaces of the port channel over their individual Ethernet interface configuration. Members that are removed from a port channel revert to the policy map implementation specified by its Ethernet interface configuration.

**Related Commands**

- `policy-map type pbr`

**Example**

- This command applies the PBR policy map “PMAP1” to Ethernet interface 8.

  ```
switch#config
switch(config)#interface ethernet 8
switch(config-if-Et8)#service-policy type pbr input PMAP1
switch(config-if-Et8)#
```
service-policy type qos (Interface mode)

The service-policy command applies a specified policy map to the configuration mode interface. A policy map is a data structure that identifies data traffic through class maps, then specifies actions to classify the traffic (by setting the traffic class), mark the traffic (by setting the cos and dscp values), and police the traffic (by setting the police rate) through data packet field modifications.

The no service-policy and default service-policy commands remove the service policy assignment from the configuration mode interface by deleting the corresponding service-policy command from running-config.

Command Mode
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

Command Syntax
- service-policy [type qos] TRAFFIC_DIRECTION map_name
- no service-policy [type qos] TRAFFIC_DIRECTION map_name
- default service-policy [type qos] TRAFFIC_DIRECTION map_name

Parameters
- type qos Parameter has no functional effect.
- TRAFFIC_DIRECTION Direction of data stream to which command applies. Options include:
  - input Policy map applies to inbound packet streams.
- map_name Name of policy map.

Guidelines

A policy map that is attached to a port channel interface takes precedence for member interfaces of the port channel over their individual Ethernet interface configuration. Members that are removed from a port channel revert to the policy map implementation specified by its Ethernet interface configuration.

DCS-7500E and DCS-7280E limitations:
- A maximum of 31 QoS service policies per chip may be applied on L3 interfaces.
- Applying different QoS service policies to an SVI and its member interfaces causes unpredictable behavior.
- When an SVI on which QoS service policies are applied experiences partial failure due to limited hardware resources, a forwarding agent restart will cause unpredictable behavior.
- Policy-map programming may fail when QoS service policies are applied on two SVIs if an event causes a member interface to switch membership from one to the other. To change the VLAN membership of an interface in this case, remove the interface from one VLAN before adding it to the other.
- Outgoing COS rewrite is not supported.
- QoS policy-map counters are not supported.

DCS-7010, DCS-7050, DCS-7050X, DCS-7250X, and DCS-7300X limitations:
- When the same policy map is applied to multiple SVIs, TCAM resources are not shared.
- A policy map applied to an SVI will result in TCAM allocation on all chips whether SVI members are present or not.
- Applying different QoS service policies to an SVI and its member interfaces causes unpredictable behavior.
Related Commands

- policy-map type qos

Example

- This command applies the PMAP-1 policy map to Ethernet interface 8.

  switch(config)
  switch(config)#interface ethernet 8
  switch(config-if-Et8)#show active
  switch(config-if-Et8)#service-policy input PMAP-1
  switch(config-if-Et8)#show active
  interface Ethernet8
    service-policy type qos input PMAP-1
  switch(config-if-Et8)#
set (policy-map-class (qos) – FM6000)

The set command specifies traffic resolution methods for traffic defined by its associated class map in its configuration mode policy map class. Three set statements are available for each class:

- **cos** Sets the layer 2 class of service field.
- **dscp** Sets the differentiated services code point value in the type of service (ToS) byte.
- **traffic-class** Sets the traffic class queue for data packets.

Each type of set command can be assigned to a class, allowing for the simultaneous modification of both (cos, dscp) fields and assignment to a traffic class.

The no set and default set commands remove the specified data action from the class map by deleting the associated set command from running-config.

**Command Mode**

Policy-map-class (qos) configuration accessed through class (policy-map (qos) – FM6000) command

**Command Syntax**

- `set QOS_TYPE value`
- `no set QOS_TYPE`
- `default set QOS_TYPE`

**Parameters**

- **QOS_TYPE** Specifies the data stream resolution method. Valid options include:
  - **cos** Layer 2 class of service field of outbound packet is modified.
  - **dscp** Differentiated services code point value in the ToS byte is modified.
  - **traffic-class** Data stream is assigned to a traffic class queue.
- **value** Specifies the data field value or traffic class queue. Valid data range depends on QOS_TYPE.
  - **QOS_TYPE is cos** Value ranges from 0 to 7.
  - **QOS_TYPE is dscp** Value ranges from 0 to 63.
  - **QOS_TYPE is traffic-class** Value ranges from 0 to 7.

**Related Commands**

- `policy-map type qos`
- `class (policy-map (qos) – FM6000)`

**Example**

- These commands configure the policy map to set the CoS field to 7 to data traffic specified by the class map CMAP-1, then assigns that data to traffic class queue 4.

```
switch(config)#policy-map type qos PMAP-1
switch(config-pmap-PMAP-1)#class CMAP-1
switch(config-pmap-c-PMAP-1-CMAP-1)#set cos 7
switch(config-pmap-c-PMAP-1-CMAP-1)#set traffic-class 4
```
set (policy-map-class (qos) – Helix)

The set command specifies traffic resolution methods for traffic defined by its associated class map in its configuration mode policy map class. Three set statements are available for each class:

- **cos**  Sets the layer 2 class of service field.
- **dscp**  Sets the differentiated services code point value in the type of service (ToS) byte.
- **traffic-class**  Sets the traffic class queue for data packets.

Each type of set command can be assigned to a class, allowing for the simultaneous modification of both (cos, dscp) fields and assignment to a traffic class.

The **no set** and **default set** commands remove the specified data action from the class map by deleting the associated set command from **running-config**.

**Command Mode**

Policy-map-class (qos) configuration accessed through **class (policy-map (qos) – Helix)** command

**Command Syntax**

```
set QOS_TYPE value
no set QOS_TYPE
default set QOS_TYPE
```

**Parameters**

- **QOS_TYPE**  Specifies the data stream resolution method. Valid options include:
  - **cos**  Layer 2 class of service field of outbound packet is modified.
  - **dscp**  Differentiated services code point value in the ToS byte is modified.
  - **traffic-class**  Data stream is assigned to a traffic class queue.
- **value**  Specifies the data field value or traffic class queue. Valid data range depends on QOS type.
  - **QOS_TYPE is cos**  Value ranges from 0 to 7.
  - **QOS_TYPE is dscp**  Value ranges from 0 to 63.
  - **QOS_TYPE is traffic-class**  Value ranges from 0 to 7.

**Related Commands**

- **policy-map type qos**
- **class (policy-map (qos) – Helix)**

**Example**

- These commands configure the policy map to set the CoS field to 7 to data traffic specified by the class map CMAP-1, then assigns that data to traffic class queue 4.

```
switch(config)#policy-map type qos PMAP-1
switch(config-pmap-PMAP-1)#class CMAP-1
switch(config-pmap-c-PMAP-1-CMAP-1)#set cos 7
switch(config-pmap-c-PMAP-1-CMAP-1)#set traffic-class 4
switch(config-pmap-c-PMAP-1-CMAP-1)#
```
set (policy-map-class (qos) – Trident)

The set command specifies traffic resolution methods for traffic defined by its associated class map in its configuration mode policy map class. Three set statements are available for each class:

- **cos**  Sets the layer 2 class of service field.
- **dscp**  Sets the differentiated services code point value in the type of service (ToS) byte.
- **traffic-class**  Sets the traffic class queue for data packets.

Each type of set command can be assigned to a class, allowing for the simultaneous modification of both (cos, dscp) fields and assignment to a traffic class.

The no set and default set commands remove the specified data action from the class map by deleting the associated set command from running-config.

**Command Mode**

Policy-map-class (qos) configuration accessed through class (policy-map (qos) – Trident) command

**Command Syntax**

```
set QOS_TYPE value
no set QOS_TYPE
default set QOS_TYPE
```

**Parameters**

- **QOS_TYPE**  Specifies the data stream resolution method. Valid options include:
  - **cos**  Layer 2 class of service field of outbound packet is modified.
  - **dscp**  Differentiated services code point value in the ToS byte is modified.
  - **traffic-class**  Data stream is assigned to a traffic class queue.
  - **value**  Specifies the data field value or traffic class queue. Valid data range depends on QOS type.
    - **QOS_TYPE is cos**  Value ranges from 0 to 7.
    - **QOS_TYPE is dscp**  Value ranges from 0 to 63.
    - **QOS_TYPE is traffic-class**  Value ranges from 0 to 7.

**Related Commands**

- policy-map type qos
- class (policy-map (qos) – Trident)

**Example**

These commands configure the policy map to set the CoS field to 7 to data traffic specified by the class map CMAP-1, then assigns that data to traffic class queue 4.

```
switch(config)#policy-map type qos PMAP-1
switch(config-pmap-PMAP-1)#class CMAP-1
switch(config-pmap-c-PMAP-1-CMAP-1)#set cos 7
switch(config-pmap-c-PMAP-1-CMAP-1)#set traffic-class 4
switch(config-pmap-c-PMAP-1-CMAP-1)#
```
set (policy-map-class (qos) – Trident II)

The set command specifies traffic resolution methods for traffic defined by its associated class map in its configuration mode policy map class. Three set statements are available for each class:

- **cos**  Sets the layer 2 class of service field.
- **dscp**  Sets the differentiated services code point value in the type of service (ToS) byte.
- **traffic-class**  Sets the traffic class queue for data packets.

Each type of set command can be assigned to a class, allowing for the simultaneous modification of both (cos, dscp) fields and assignment to a traffic class.

The no set and default set commands remove the specified data action from the class map by deleting the associated set command from running-config.

**Command Mode**

Policy-map-class (qos) configuration accessed through class (policy-map (qos) – Trident) command

**Command Syntax**

```
set QOS_TYPE value
no set QOS_TYPE
default set QOS_TYPE
```

**Parameters**

- **QOS_TYPE**  Specifies the data stream resolution method. Valid options include:
  - **cos**  Layer 2 class of service field of outbound packet is modified.
  - **dscp**  Differentiated services code point value in the ToS byte is modified.
  - **traffic-class**  Data stream is assigned to a traffic class queue.
- **value**  Specifies the data field value or traffic class queue. Valid data range depends on QOS type.
  - **QOS_TYPE is cos**  Value ranges from 0 to 7.
  - **QOS_TYPE is dscp**  Value ranges from 0 to 63.
  - **QOS_TYPE is traffic-class**  Value ranges from 0 to 7.

**Related Commands**

- **policy-map type qos**
- **class (policy-map (qos) – Trident)**

**Example**

These commands configure the policy map to set the CoS field to 7 to data traffic specified by the class map CMAP-1, then assigns that data to traffic class queue 4.

```
switch(config)#policy-map type qos PMAP-1
switch(config-pmap-PMAP-1)#class CMAP-1
switch(config-pmap-c-PMAP-1-CMAP-1)#set cos 7
switch(config-pmap-c-PMAP-1-CMAP-1)#set traffic-class 4
switch(config-pmap-c-PMAP-1-CMAP-1)#
```
set nexthop (policy-map-class – pbr)

The `set nexthop` command specifies the next hop for traffic defined by its associated class map in its configuration mode policy map class.

The `no set nexthop` and `default set nexthop` commands remove the specified action from the class map by deleting the associated `set nexthop` command from `running-config`.

Command Mode

Policy-map-class (pbr) configuration
accessed through `class (policy-map (pbr))` command

Command Syntax

```
set nexthop [recursive] NH-addr_1 [NH-addr_2] ... [NH-addr_n]
no set nexthop [recursive]
default set nexthop [recursive]
```

Parameters

- **recursive** enables recursive next hop resolution.
- **NH_addr** IP address of next hop. If multiple addresses are entered, they are treated as an ECMP group.

Related Commands

- `policy-map type pbr`
- `class (policy-map (pbr))`

Example

- These commands configure the policy map PMAP1 to set the next hop to 192.168.5.3 for traffic defined by class map CMAP1.

```
switch(config)#policy-map type pbr PMAP1
switch(config-pmap-PMAP1)#class CMAP1
switch(config-pmap-c-PMAP1-CMAP1)#set nexthop 192.168.5.3
switch(config-pmap-c-PMAP1-CMAP1)#
```
set nexthop-group (policy-map-class(pbr) – Arad)

The `set nexthop-group` command specifies a nexthop group as the next hop for traffic defined by its associated class map in its configuration mode policy map class.

The `no set nexthop-group` and `default set nexthop-group` commands remove the specified action from the class map by deleting the associated `set nexthop-group` command from `running-config`.

Command Mode

Policy-map-class (pbr) configuration
accessed through `class (policy-map (pbr))` command

Command Syntax

```
set nexthop-group group_name
no set nexthop-group
default set nexthop-group
```

Parameters

- `group_name` name of ECMP group to use as next hop.

Related Commands

- `policy-map type pbr`
- `class (policy-map (pbr))`

Example

- These commands configure the policy map PMAP1 to set the next hop to a nexthop group named GROUP1 for traffic defined by class map CMAP1.

```
switch(config)#policy-map type pbr PMAP1
switch(config-pmap-PMAP1)#class CMAP1
switch(config-pmap-c-PMAP1-CMAP1)#set nexthop-group GROUP1
switch(config-pmap-c-PMAP1-CMAP1)#
```
shape (policy-map-class (control-plane) – Arad)

The `shape` command specifies the maximum bandwidth for traffic filtered by the configuration mode policy map class.

The `no shape` and `default shape` commands remove the maximum bandwidth restriction for the configuration mode class by deleting the corresponding `bandwidth` command from `running-config`.

**Command Mode**

Policy-map-class (control plane) configuration accessed through `class (policy-map (control-plane) – Arad)`

**Command Syntax**

```
shape kbps kbits
no shape
default shape
```

**Parameters**

- `kbits` Maximum data rate (kbps per second). Value ranges from 1 to 10000000.

**Related Commands**

- `class (policy-map (control-plane) – Arad)` places the switch in policy-map-class (control plane) configuration mode.
- `bandwidth (policy-map-class (control-plane) – Arad)` specifies the minimum bandwidth for traffic defined by its associated class map in its configuration mode policy map class.

**Static Classes Default Shape**

Arad platform switches define these default shapes for static classes:

- `copp-system-bgp2500`
- `copp-system-l3pmoverflow2500`
- `copp-system-bpdu2500`
- `copp-system-l3slowpath2500`
- `copp-system-default2500`
- `copp-system-l3ttl12500`
- `copp-system-ipbroadcast2500`
- `copp-system-lacp2500`
- `copp-system-ipmc2500`
- `copp-system-linklocal2500`
- `copp-system-ipmcmmiss2500`
- `copp-system-ldp2500`
- `copp-system-ipunicastNO LIMIT`
- `copp-system-mlag2500`
- `copp-system-l2broadcast2500`
- `copp-system-multicastsnoop2500`
- `copp-system-l2unicastNO LIMIT`
- `copp-system-OspfIsis2500`
- `copp-system-l3destmiss2500`
- `copp-system-sflow2500`
Example

- These commands configure the maximum bandwidth of 2000 kbps for data traffic specified by the class map copp-system-lldp of the default control-plane policy map.

  switch(config)#policy-map type control-plane copp-system-policy
  switch(config-pmap-copp-system-policy)#class copp-system-lldp
  switch(config-pmap-c-copp-system-policy-copp-system-lldp)#shape kbps 2000
  switch(config-pmap-c-copp-system-policy-copp-system-lldp)#exit
  switch(config-pmap-copp-system-policy)#exit
  switch(config)#show policy-map interface control-plane copp-system-policy
  Service-policy input: copp-system-policy
  Class-map: copp-system-lldp (match-any)
    shape : 200 kbps
    bandwidth : 250 kbps
    Out Packets : 0
    Drop Packets : 0

  <-------OUTPUT OMITTED FROM EXAMPLE--------->
shape (policy-map-class (control-plane) – FM6000)

The **shape** command specifies the maximum bandwidth for traffic filtered by the configuration mode policy map class.

The **no shape** and **default shape** commands remove the maximum bandwidth restriction for the configuration mode class by deleting the corresponding **bandwidth** command from **running-config**.

**Command Mode**

Policy-map-class (control plane) configuration
accessed through **class (policy-map (control-plane) – FM6000)**

**Command Syntax**

```
shape pps packets
no shape
default shape
```

**Parameters**

- **packets** Minimum data rate (packets per second). Value ranges from 1 to 100000.

**Related Commands**

- **class (policy-map (control-plane) – FM6000)** places the switch in policy-map-class (control plane) configuration mode.
- **bandwidth (policy-map-class (control-plane) – FM6000)** specifies the minimum bandwidth for traffic defined by its associated class map in its configuration mode policy map class.

**Static Classes Default Shape**

FM6000 platform switches define these default shapes for static classes:

- copp-system-arp10000
- copp-system-l3slowpath10000
- copp-system-default8000
- copp-system-pim-tp10000
- copp-system-ipmcrsvd10000
- copp-system-ospf-isis10000
- copp-system-ipmcmiss10000
- copp-system-selfip5000
- copp-system-igmp10000
- copp-system-selfip-tc6to7500
- copp-system-l2rsvd10000
- copp-system-sflow25000

**Example**

- These commands configure the maximum bandwidth of 5000 packets per second for data traffic specified by the class map PMAP-1 in the policy map named copp-system-policy.

```
switch(config)#policy-map type control-plane copp-system-policy
switch(config-pmap-c copp-system-policy)#class PMAP-1
switch(config-pmap-c-copp-system-policy-PMAP-1)#shape pps 5000
switch(config-pmap-c-copp-system-policy-PMAP-1)#
```
**shape (policy-map-class (control-plane) – Helix)**

The `shape` command specifies the maximum bandwidth for traffic filtered by the configuration mode policy map class.

The `no shape` and `default shape` commands remove the maximum bandwidth restriction for the configuration mode class by deleting the corresponding `bandwidth` command from `running-config`.

**Command Mode**

Policy-map-class (control plane) configuration
accessed through `class (policy-map (control-plane) – Helix)`

**Command Syntax**

```
shape pps packets
no shape
default shape
```

**Parameters**

- `packets` Minimum data rate (packets per second). Value ranges from 1 to 100000.

**Static Classes Default Shape**

Trident platform switches define these default shapes for static classes:

- `copp-system-nclog10000`
- `copp-system-l3ttl110000`
- `copp-system-arp10000`
- `copp-system-lacp5000`
- `copp-system-arpsolver10000`
- `copp-system-lldp10000`
- `copp-system-bfd10000`
- `copp-system-mlag5000`
- `copp-system-bgp5000`
- `copp-system-ospfls10000`
- `copp-system-bpdu5000`
- `copp-system-selfip5000`
- `copp-system-default8000`
- `copp-system-selfip-tc6to75000`
- `copp-system-glean10000`
- `copp-system-sflow25024`
- `copp-system-igmp10000`
- `copp-system-tc3to510000`
- `copp-system-ipmcmisss10000`
- `copp-system-tc6to710000`
- `copp-system-ipmcrsvd10000`
- `copp-system-urm10000`
- `copp-system-l3destmiss10000`
- `copp-system-vrrp5000`
- `copp-system-l3slowpath10000`

**Related Commands**

- `class (policy-map (control-plane) – Helix)` places the switch in policy-map-class (control plane) configuration mode.
- `bandwidth (policy-map-class (control-plane) – Helix)` specifies the minimum bandwidth for traffic defined by its associated class map in its configuration mode policy map class.
Example

- These commands configure the maximum bandwidth of 5000 packets per second for data traffic specified by the copp-system-lldp of the default control-plane policy map

  ```
  switch(config)#policy-map type control-plan copp-system-policy
  switch(config-pmap-copp-system-policy)#class copp-system-lldp
  switch(config-pmap-c-copp-system-policy-copp-system-lldp)#shape pps 5000
  switch(config-pmap-c-copp-system-policy-copp-system-lldp)#exit
  switch(config-pmap-copp-system-policy)#exit
  switch(config)#show policy-map interface control-plane copp-system-policy
  Service-policy input: copp-system-policy
    Class-map: copp-system-lldp (match-any)
      shape : 5000 pps
      bandwidth : 500 pps
      Out Packets : 305961
      Drop Packets : 0
    <----------OUTPUT OMITTED FROM EXAMPLE---------->
  ```

  ```
  switch(config)#
  ```
shape (policy-map-class (control-plane) – Petra)

The `shape` command specifies the maximum bandwidth for traffic filtered by the configuration mode policy map class.

The `no shape` and `default shape` commands remove the maximum bandwidth restriction for the configuration mode class by deleting the corresponding `bandwidth` command from `running-config`.

**Command Mode**

Policy-map-class (control plane) configuration accessed through `class (policy-map (control-plane) – Petra)`

**Command Syntax**

```
shape kbps kbits
no shape
default shape
```

**Parameters**

- `kbits` Maximum data rate (kbps per second). Value ranges from 1 to 10000000.

**Related Commands**

- `class (policy-map (control-plane) – Petra)` places the switch in policy-map-class (control plane) configuration mode.
- `bandwidth (policy-map-class (control-plane) – Petra)` specifies the minimum bandwidth for traffic defined by its associated class map in its configuration mode policy map class.

**Static Classes Default Shape**

Petra platform switches define these default shapes for static classes:

- copp-system-bpdu2500
copp-system-l3destmiss2500
- copp-system-default2500
copp-system-l3slowpath2500
- copp-system-igmp2500
copp-system-l3ttl02500
- copp-system-ipbroadcast2500
copp-system-l3ttl12500
- copp-system-ipmc2500
copp-system-lacp2500
- copp-system-ipmcmis2500
copp-system-lldp2500
- copp-system-ipmcrsvd2500
copp-system-unicast-arp2500
- copp-system-ipunicastNo Limit

**Guidelines**

Petra does not support all discrete rate values. When a specified discrete value is not supported, the switch converts the rate to the next highest discrete value that it supports. The `show` commands displays the converted rate and not the user configured rate.
Example

- These commands configure the maximum bandwidth of 2000 kbps for data traffic specified by the class map copp-system-lldp of the default control-plane policy map. Because the switch does not support the discrete value of 2000 kbps, it converts the bandwidth up to 2115 kbps.

```
switch(config)#policy-map type control-plane copp-system-policy
switch(config-pmap-copp-system-policy)#class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#shape kbps 2000
switch(config-pmap-c-c copp-system-policy-copp-system-lldp)#exit
switch(config-pmap-copp-system-policy)#exit

switch(config)#show policy-map interface control-plane copp-system-policy
Service-policy input: copp-system-policy

Class-map: copp-system-lldp (match-any)
  shape : 2115 kbps
  bandwidth : 325 kbps
  Out Packets : 0
  Drop Packets : 0

<--------OUTPUT OMITTED FROM EXAMPLE--------->
```

switch(config)#
The `shape` command specifies the maximum bandwidth for traffic filtered by the configuration mode policy map class.

The `no shape` and `default shape` commands remove the maximum bandwidth restriction for the configuration mode class by deleting the corresponding `bandwidth` command from `running-config`.

### Command Mode

Policy-map-class (control plane) configuration accessed through `class (policy-map (control-plane) – Trident and Trident-II)`

### Command Syntax

```
shape pps packets
no shape
default shape
```

### Parameters

- **packets** Minimum data rate (packets per second). Value ranges from 1 to 100000.

### Static Classes Default Shape

Trident platform switches define these default shapes for static classes:

- copp-system-arp10000
- copp-system-lldp10000
- copp-system-arpsolver10000
- copp-system-l3destmiss10000
- copp-system-bpdu5000
- copp-system-l3slowpath10000
- copp-system-default8000
- copp-system-l3ttl110000
- copp-system-glean10000
- copp-system-selfip5000
- copp-system-igmp10000
- copp-system-selfip-tc6to75000
- copp-system-ipmcmiss10000
- copp-system-sflow25000
- copp-system-ipmcrsvd10000
- copp-system-tc3to510000
- copp-system-lacp5000
- copp-system-tc6to710000

### Related Commands

- `class (policy-map (control-plane) – Trident and Trident-II)` places the switch in policy-map-class (control plane) configuration mode.
- `bandwidth (policy-map-class (control-plane) – Trident)` specifies the minimum bandwidth for traffic defined by its associated class map in its configuration mode policy map class.

### Example

These commands configure the maximum bandwidth of 5000 packets per second for data traffic specified by the class map PMAP-1 in the policy map named copp-system-policy.

```
switch(config)#policy-map type control-plane copp-system-policy
switch(config-pmap-copp-system-policy)#class PMAP-1
switch(config-pmap-c-copp-system-policy-PMAP-1)#shape pps 5000
switch(config-pmap-c-copp-system-policy-PMAP-1)#
```
shape (policy-map-class (control-plane) – Trident-II)

The `shape` command specifies the maximum bandwidth for traffic filtered by the configuration mode policy map class.

The `no shape` and `default shape` commands remove the maximum bandwidth restriction for the configuration mode class by deleting the corresponding `bandwidth` command from `running-config`.

Command Mode

- Policy-map-class (control plane) configuration accessed through `class (policy-map (control-plane) – Trident-II)`

Command Syntax

```
shape pps packets
no shape
default shape
```

Parameters

- `packets` Minimum data rate (packets per second). Value ranges from 1 to 100000.

Static Classes Default Shape

Trident-II platform switches define these default shapes for static classes:

- copp-system-ac1log10000
- copp-system-l3slowpath10000
- copp-system-arp10000
- copp-system-l3ttl110000
- copp-system-arpresolver10000
- copp-system-lacp5000
- copp-system-bfd10000
- copp-system-lldp10000
- copp-system-bgp5000
- copp-system-mlag5000
- copp-system-bpdu5000
- copp-system-selfip5000
- copp-system-default8000
- copp-system-selfip-tc6to75000
- copp-system-glean10000
- copp-system-sflow25024
- copp-system-igmp10000
- copp-system-tc3to510000
- copp-system-ipmcmisss10000
- copp-system-urm10000
- copp-system-l3destmiss10000

Related Commands

- `class (policy-map (control-plane) – Trident-II)` places the switch in policy-map-class (control plane) configuration mode.
- `bandwidth (policy-map-class (control-plane) – Trident-II)` specifies the minimum bandwidth for traffic defined by its associated class map in its configuration mode policy map class.
Example

- These commands configure the maximum bandwidth of 5000 packets per second for data traffic specified by the copp-system-lldp of the default control-plane policy map

```
switch(config)#policy-map type control-plan copp-system-policy
switch(config-pmap-copp-system-policy)#class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#shape pps 5000
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#exit
switch(config-pmap-copp-system-policy)#exit
switch(config)#show policy-map interface control-plane copp-system-policy
Service-policy input: copp-system-policy
    <--------OUTPUT OMITTED FROM EXAMPLE-------->
Class-map: copp-system-lldp (match-any)
    shape : 5000 pps
    bandwidth : 500 pps
    Out Packets : 305961
    Drop Packets : 0
    <--------OUTPUT OMITTED FROM EXAMPLE-------->
switch(config)#
```
show class-map type control-plane

The `show class-map` command displays contents of available control-plane class maps. Control-plane class maps can be added to the copp-system-policy policy map. Control-plane class maps can be static class maps defined by the system or dynamic maps created in class-map-configuration mode.

Dynamic class maps are composed of statements that match IPv4 access control lists. Static class maps are defined by the switch and cannot be altered.

**Command Mode**

EXEC

**Command Syntax**

```
show class-map type control-plane [MAP_NAME]
```

**Parameters**

- **MAP_NAME** Name of class map displayed by the command. Options include:
  - `<no parameter>` Command displays all control plane class maps.
  - `name_text` Command displays specified control-plane class maps.

**Related Commands**

- `show class-map type qos` displays control plane class maps.

**Example**

- This command displays all control plane class maps.
- This command displays the available control plane class maps.

```
switch>show class-map type control-plane
Class-map: CM-CP1 (match-any)
  Match: ip access-group name LIST-CP1
Class-map: copp-system-aclog (match-any)
Class-map: copp-system-arp (match-any)
Class-map: copp-system-arpresolver (match-any)
Class-map: copp-system-bpdu (match-any)
Class-map: copp-system-glean (match-any)
Class-map: copp-system-igmp (match-any)
Class-map: copp-system-ipmcmiss (match-any)
Class-map: copp-system-ipmcrsvd (match-any)
Class-map: copp-system-l3destmiss (match.any)
Class-map: copp-system-l3slowpath (match-any)
Class-map: copp-system-l3ttll (match-any)
Class-map: copp-system-lacp (match-any)
Class-map: copp-system-lldp (match-any)
Class-map: copp-system-selfip (match-any)
Class-map: copp-system-selfip-tc6to7 (match-any)
Class-map: copp-system-sflow (match-any)
Class-map: copp-system-tc3to5 (match-any)
Class-map: copp-system-tc6to7 (match-any)
switch>
```
**show class-map type pbr**

The `show class-map` command displays contents of all available Policy-Based Routing (PBR) class maps, or of a specified PBR class map. PBR class maps are used by PBR policy maps. PBR class maps are dynamic maps that are created in class-map-configuration mode. Dynamic class maps are composed of statements that match IPv4 or IPv6 access control lists.

**Command Mode**

EXEC

**Command Syntax**

```
show class-map type pbr [map_name]
```

**Parameters**

- `map_name` Name of class map displayed by the command. If no parameter is entered, command show all available PBR class maps.

**Related Commands**

- `show policy-map type pbr` displays PBR policy maps.

**Example**

- This command displays the contents of the PBR class map CMAP1.
  
  ```
  switch>show class-map type pbr CMAP1
  Class-map: CMAP1 (match-any)
  Match: 10 ip access-group PBRgroup1
  Match: 20 ip access-group PBRgroup2
  Match: 30 ip access-group PBRgroup3
  switch>
  ```
show class-map type qos

The show class-map command displays contents of all available QoS class maps. QoS class maps are used by QoS policy maps. QoS class maps are dynamic maps that are created in class-map-configuration mode. Dynamic class maps are composed of statements that match IPv4 or IPv6 access control lists.

**Command Mode**

EXEC

**Command Syntax**

```
show class-map [type qos] [MAP_NAME]
```

**Parameters**

- **MAP_NAME**   Name of class map displayed by the command.
  - <no parameter>   Command displays all QoS class maps.
  - name_text   Command displays specified QoS class maps.

**Related Commands**

- **show class-map type control-plane** displays control plane class maps.

**Example**

- This command displays the available QoS class maps.

```
switch>show class-map type qos
Class-map: CM-Q1 (match-any)
  Match: ipv6 access-group name LIST-1
Class-map: CM-Q2 (match-any)
  Match: ip access-group name LIST-2
switch>
```
show policy-map type control-plane

The `show policy-map control-plane` command displays contents of control plane policy maps. Control-plane policy maps are applied to the control plane; copp-system-policy is the only supported policy map.

Command options filter the output to display contents of all policy maps, contents of a specified policy map, or contents of a single class map within a specified policy map.

**Command Mode**
EXEC

**Command Syntax**
```
show policy-map type control-plane copp-system-policy [MAP_NAME]
```

**Parameters**
- **MAP_NAME** Name of class map displayed by the command.
- `<no parameter>` Command displays all class maps in specified policy map.
- **class_name** Command displays specified class map.

**Example**
- This command displays the contents of the copp-system-bpdu class map in the copp-system-policy policy maps.
```
switch>show policy-map type control-plane copp-system-policy class copp-system-bpdu
Class-map: copp-system-bpdu (match-any)
  shape : 5000 pps
  bandwidth : 5000 pps

switch>
```
show policy-map type pbr

The `show policy-map pbr` command displays contents of Policy-Based Routing (PBR) policy maps. PBR policy maps are applied to Ethernet interfaces, port channel interfaces or switch virtual interfaces (SVIs).

Command options filter the output to either display contents of all policy maps, contents of a specified policy map, or summary contents of all or a specified policy map.

**Command Mode**

EXEC

**Command Syntax**

```
show policy-map type pbr [PMAP_NAME] [DATA_LEVEL]
```

**Parameters**

- **PMAP_NAME** Name of policy map displayed by the command.
  - `<no parameter>` Command displays all policy maps.
  - `policy_map` Command displays specified policy map.
- **DATA_LEVEL** Type of information the command displays. Values include:
  - `<no parameter>` Command displays all class maps in specified policy map.
  - `summary` Command displays summary data for the specified policy map.

**Example**

- This command displays the contents of all PBR policy maps in `running-config`.
  ```
  switch#show policy-map type pbr
  Service policy PMAP1
  Configured on:
  Applied on:
  10: Class-map: CMAP1 (match-any)
      Match: 10 ip access-group PBRgroup1
      Match: 20 ip access-group PBRgroup2
      Match: 30 ip access-group PBRgroup3
      Configured actions: set nexthop 172.16.10.12
  20: Class-map: CMAP2 (match-any)
      Match: 10 ip access-group PBRgroup4
      Match: 20 ip access-group PBRgroup5
      Configured actions: set nexthop 192.168.15.15
  switch#
  ```
show policy-map type qos

The show policy-map qos command displays contents of QoS policy maps. QoS policy maps are applied to Ethernet or port channel interfaces.

Command options filter the output to either display contents of all policy maps, contents of a specified policy map, or contents of a single class map within a specified policy map.

Command Mode

EXEC

Command Syntax

`show policy-map [type qos] [P_MAP_NAME [C_MAP_NAME]]`

Parameters

- **P_MAP_NAME** Name of policy map displayed by the command.
  - <no parameter> Command displays all policy maps.
  - `policy_map` Command displays specified policy map.
- **C_MAP_NAME** Name of class map displayed by the command. This option is available only when the command includes a policy map name.
  - <no parameter> Command displays all class maps in specified policy map.
  - `class_name` Command displays specified class map.

Example

- This command displays the contents of all QoS policy maps in `running-config`.
  
  ```
  switch#show policy-map type qos
  Service-policy input: PMAP-1
  Hardware programming status: Successful

  Class-map: xeter (match-any)
  Match: ip access-group name LIST-1
  set cos 6

  Class-map: class-default (match-any)

  Service-policy PMAP-2

  Class-map: class-default (match-any)

  switch#
  ```
**show policy-map type qos counters**

The `show policy-map counters` command displays the quantity of packets that are filtered by the ACLs that comprise a specified QoS policy map.

**Command Mode**

EXEC

**Command Syntax**

```
show policy-map [type qos] pmap_name [TRAFFIC] counters [INFO_LEVEL]
```

**Parameters**

- `pmap_name` Name of policy map displayed by the command.
- `TRAFFIC` Filters policy maps by the traffic they manage. Options include:
  - `<no parameter>` Policy maps that manage interface’s ingress traffic (same as `input` option).
  - `input` Policy maps that manage interface’s ingress traffic.
- `INFO_LEVEL` amount of information that is displayed. Options include:
  - `<no parameter>` displays summarized information about the policy map.
  - `detail` displays detailed policy map information.
**show policy-map interface control-plane**

The `show policy-map interface control-plane` command displays contents of the control-plane policy map. Control-plane policy maps are applied to the control plane. `copp-system-policy` is the only supported policy map.

**Command Mode**

EXEC

**Command Syntax**

```
show policy-map interface control-plane copp-system-policy
```

**Example**

- This command displays the contents and throughput of the policy map applied to the control plane.

```
switch>show policy-map interface control-plane copp-system-policy
Service-policy input: copp-system-policy
   Number of units programmed: 1
   Hardware programming status: Successful

   Class-map: copp-system-bpdu (match-any)
      shape : 5000 pps
      bandwidth : 5000 pps
      Out Packets : 2
      Drop Packets : 0

   Class-map: copp-system-lacp (match-any)
      shape : 5000 pps
      bandwidth : 5000 pps
      Out Packets : 0
      Drop Packets : 0

<--------OUTPUT OMITTED FROM EXAMPLE-------->

switch>
```
show policy-map interface type qos

The `show policy-map interface` command displays contents of the policy maps applied to specified interfaces or to the control plane.

**Command Mode**

EXEC

**Command Syntax**

```
show policy-map interface INTERFACE_NAME [type qos] [TRAFFIC]
```

**Parameters**

- **INTERFACE_NAME** Filters policy map list by interfaces. Options include:
  - **ethernet e_range** Ethernet ports for which command displays policy maps.
  - **port-channel p_range** Port channels for which command displays policy maps.
- **TRAFFIC** Filters policy maps by the traffic they manage. Options include:
  - **<no parameter>** Policy maps that manage interface’s ingress traffic (same as input option).
  - **input** Policy maps that manage interface’s ingress traffic.

**Example**

- This command displays the policy maps applied to Ethernet interfaces 7 and 8.

  ```
  switch#show policy-map interface ethernet 7-8
  Service-policy input: PMAP-1
  Hardware programming status: Successful
  
  Class-map: cmap-1 (match-any)
  Match: ip access-group name LIST-2
  set cos 6
  
  Class-map: class-default (match-any)
  
  Service-policy input: PMAP-2
  Hardware programming status: Successful
  
  Class-map: cmap-2 (match-any)
  Match: ip access-group name LIST-2
  set dscp 10
  
  Class-map: class-default (match-any)
  ```
  
  switch#
show policy-map interface type qos counters

The `show policy-map interface` command displays the quantity of packets that are filtered by ACLs applied to a interface.

**Command Mode**

EXEC

**Command Syntax**

```
show policy-map [INTERFACE_NAME] [type qos] [TRAFFIC] counters
```

**Parameters**

- `INTERFACE_NAME` Filters policy map list by interfaces. Options include:
  - `<no parameter>` Displays data for all configured interfaces.
  - `interface ethernet e_range` Ethernet ports for which command displays policy maps.
  - `interface port-channel p_range` Port channels for which command displays policy maps.

- `TRAFFIC` Filters policy maps by the traffic they manage. Options include:
  - `<no parameter>` Policy maps that manage interface’s ingress traffic (same as `input` option).
  - `input` Policy maps that manage interface’s ingress traffic.

**Example**

- This command displays the policy maps applied to Ethernet interfaces 7 and 8.

```
switch#show policy-map interface ethernet 7-8
Service-policy input: PMAP-1
  Hardware programming status: Successful

  Class-map: cmap-1 (match-any)
    Match: ip access-group name LIST-2
      set cos 6

  Class-map: class-default (match-any)

Service-policy input: PMAP-2
  Hardware programming status: Successful

  Class-map: cmap-2 (match-any)
    Match: ip access-group name LIST-2
      set dscp 10

  Class-map: class-default (match-any)

switch#
```
Open Shortest Path First (OSPF) is a link-state routing protocol that operates within a single autonomous system. OSPF version 2 is defined by RFC 2328.

This chapter contains the following sections.

- Section 27.1: OSPFv2 Introduction
- Section 27.2: OSPFv2 Conceptual Overview
- Section 27.3: Configuring OSPFv2
- Section 27.4: OSPFv2 Examples
- Section 27.5: OSPFv2 Commands

### 27.1 OSPFv2 Introduction

#### 27.1.1 Supported Features

Arista switches support the following OSPFv2 functions:

- A single OSPFv2 instance
- Intra- and inter-area routing
- Type 1 and 2 external routing
- Broadcast and P2P interfaces
- Stub areas
- Not so stubby areas (NSSA) (RFC 3101)
- MD5 Authentication
- Redistribution of static, IP, and BGP routes into OSPFv2 with route map filtering
- Opaque LSAs (RFC 2370)

#### 27.1.2 Features Not Supported

The following OSPFv2 functions are not supported in the current version:

- NBMA, demand circuit, and P2MP interfaces
- Graceful restart (RFC 3623)
- OSPFv2 MIB support
27.2 OSPFv2 Conceptual Overview

27.2.1 Storing Link States

OSPFv2 is a dynamic, link-state routing protocol, where links represent interfaces or routable paths. Dynamic routing protocols calculate the most efficient path between locations based on bandwidth and device status.

A link state advertisement (LSA) is an OSPFv2 packet that communicates a router's topology to other routers. The link state database (LSDB) stores an area’s topology database and is composed of LSAs received from other routers. Routers update the LSDB by storing LSA’s from other routers.

27.2.2 Topology

An autonomous system (AS) is the IP domain within which a dynamic protocol controls the routing of traffic. In OSPFv2, an AS is composed of areas, which define the LSDB computation boundaries. All routers in an area store identical LSDBs. Routers in different areas exchange updates without storing the entire database, reducing information maintenance on large, dynamic networks.

An AS shares internal routing information from its areas and external routing information from other processes to inform routers outside the AS about routes the network can access. Routers that advertise routes on other ASs commit to carry data to the IP space on the route.

OSPFv2 defines these routers:

- Internal router (IR) – a router whose interfaces are contained in a single area. All IRs in an area maintain identical LSDBs.
- Area border router (ABR) – a router that has interfaces in multiple areas. ABRs maintain one LSDB for each connected area.
- Autonomous system boundary router (ASBR) – a gateway router connecting the OSPFv2 domain to external routes, including static routes and routes from other autonomous systems.

Figure 27-1 displays the OSPFv2 router types.

Figure 27-1: OSPFv2 Router Types
Chapter 27: Open Shortest Path First – Version 2

OSPFv2 areas are assigned a number between 0 and 4,294,967,295 \( (2^{32} - 1) \). Area numbers are often expressed in dotted decimal notation, similar to IP addresses.

Each AS has a backbone area, designated as area 0, that connects to all other areas. The backbone receives routing information from all areas, then distributes it to the other areas as required.

OSPFv2 area types include:

- Normal area – accepts intra-area, inter-area, and external routes. The backbone is a normal area.
- Stub area – does not receive router advertisements external to the AS. Stub area routing is based on a default route.
- Not-so-stubby-area (NSSA) – may import external routes from an ASBR, does not receive external routes from the backbone, and does not propagate external routes to other areas.

### 27.2.3 Link Updates

Routers periodically send hello packets to advertise status and establish neighbors. A router’s hello packet includes IP addresses of other routers from which it received a hello packet within the time specified by the router dead interval. Routers become neighbors when they detect each other in their hello packets if they:

- share a common network segment.
- are in the same area.
- have the same hello interval, dead interval, and authentication parameters.

Neighbors form adjacencies to exchange LSDB information. A neighbor group uses hello packets to elect a Designated Router (DR) and Backup Designated Router (BDR). The DR and BDR become adjacent to all other neighbors, including each other. Only adjacent neighbors share database information.

Figure 27-2 illustrates OSPFv2 neighbors.

**Figure 27-2: OSPFv2 Neighbors**

If Routers A, B, and C have the same Hello interval, Dead interval, and authentication parameters, then:

- Area 1 – Router A and Router B are neighbors.
- Area 0 – Router A, Router B, and Router C are neighbors.
- Area 2 – Router C has no neighbors.
The DR is the central contact for database exchanges. Switches send database information to their DR, which relays the information to the other neighbors. All routers in an area maintain identical LSDBs. Switches also send database information to their BDR, which stores this data without distributing it. If the DR fails, the BDR distributes LSDB information to its neighbors.

OSPFv2 routers distribute LSAs by sending them on all of their active interfaces. The router will generate an LSA for a network defined and active on a passive interface but will not transmit this LSA on the passive interface as no adjacencies are formed.

When a router’s LSDB is changed by an LSA, it sends the changes to the DR and BDR for distribution to the other neighbors. Routing information is updated only when the topology changes.

Routers use Dijkstra’s algorithm to calculate the shortest path to all known destinations, based on cumulative route cost. The cost of an interface indicates the transmission overhead and is usually inversely proportional to its bandwidth.
27.3 Configuring OSPFv2

These sections describe basic OSPFv2 configuration steps:

- Section 27.3.1: Configuring the OSPFv2 Instance
- Section 27.3.2: Configuring OSPFv2 Areas
- Section 27.3.3: Configuring Interfaces for OSPFv2
- Section 27.3.4: Enabling OSPFv2
- Section 27.3.5: Displaying OSPFv2 Status

27.3.1 Configuring the OSPFv2 Instance

27.3.1.1 Entering OSPFv2 Configuration Mode

The `router ospf` command places the switch in router-ospf configuration mode and creates an OSPFv2 instance if one was not previously created. The switch only supports one OSPFv2 instance and all OSPFv2 configuration commands apply to this instance.

When an OSPFv2 instance is already configured, the command must specify its process ID. Any attempt to define additional instances will fail and generate errors.

The process ID is local to the router and is used to identify the running OSPFv2 process. Neighbor OSPFv2 routers can have different process ID's.

**Example**

- This command places the switch in router-ospf configuration mode and, if not previously created, creates an OSPFv2 instance with a process ID of 100.

  ```
  switch(config)#router ospf 100
  switch(config-router-ospf)#
  ```

27.3.1.2 Defining the Router ID

The router ID is a 32-bit number assigned to a router running OSPFv2. This number uniquely labels the router within an Autonomous System. Status commands identify the switch through the router ID.

The switch sets the router ID to the first available alternative in the following list:

1. The `router-id` command.
2. The loopback IP address, if a loopback interface is active on the switch.
3. The highest IP address on the router.

**Important!** When configuring VXLAN on an MLAG, always manually configure the OSPFv2 router ID to prevent the switch from using the common VTEP IP address as the router ID.

The `router-id (OSPFv2)` command configures the router ID for an OSPFv2 instance.

**Example**

- This command assigns 10.1.1.1 as the OSPFv2 router ID.

  ```
  switch(config-router-ospf)#router-id 10.1.1.1
  switch(config-router-ospf)#
  ```

27.3.1.3 Global OSPFv2 Parameters

These router-ospf configuration mode commands define OSPFv2 behavior.
LSA Overload

The `max-lsa (OSPFv2)` command specifies the maximum number of LSAs allowed in an LSDB database and configures the switch behavior when the limit is approached or exceeded. An LSA overload condition triggers these actions:

- Warning: The switch logs OSPF MAXLSAWARNING if the LSDB contains a specified percentage of the LSA maximum.
- Temporary shutdown: When the LSDB exceeds the LSA maximum, OSPFv2 is disabled and does not accept or acknowledge new LSAs. The switch re-starts OSPFv2 after a specified period.
- Permanent shutdown: The switch permanently disables OSPFv2 after performing a specified number of temporary shutdowns. This state usually indicates the need to resolve a network condition that consistently generates excessive LSA packets.

OSPFv2 is re-enabled with a `router ospf` command.

The LSDB size restriction is removed by setting the LSA limit to zero.

Example

- This command configures the OSPFv2 maximum LSA count to 20,000 and triggers these actions:
  - The switch logs an OSPF MAXLSAWARNING if the LSDB has 8,000 LSAs (40% of 20,000).
  - The switch temporarily disables OSPFv2 for 10 minutes if the LSDB contains 20,000 LSAs.
  - The switch permanently disables OSPFv2 after four temporary OSPFv2 shutdowns.
  - The shutdown counter resets if the LSDB contains less than 20,000 LSAs for 20 minutes.

  ```
  switch(config-router-ospf)#max-lsa 20000 40 ignore-time 10 ignore-count 4 reset-time 20
  switch(config-router-ospf)#
  ```

Logging Adjacency Changes

The `log-adjacency-changes (OSPFv2)` command configures the switch to log OSPFv2 link-state changes and transitions of OSPFv2 neighbors into the up or down state.

Examples

- This command configures the switch to log transitions of OSPFv2 neighbors into the up or down state.

  ```
  switch(config-router-ospf)#log-adjacency-changes
  switch(config-router-ospf)#
  ```

- This command configures the switch to log all OSPFv2 link-state changes.

  ```
  switch(config-router-ospf)#log-adjacency-changes detail
  switch(config-router-ospf)#
  ```

OSPF RFC Compatibility

RFC 2328 and RFC 1583 specify different methods for calculating summary route metrics. The `compatible (OSPFv2)` command allows the selective disabbling of compatibility with RFC 2328.

Example

- This command sets the OSPF compatibility list with RFC 1583.

  ```
  switch(config)#router ospf 6
  switch(config-router-ospf)#compatible rfc1583
  switch(config-router-ospf)#
  ```
Intra-Area Distance

The `distance ospf (OSPFv2)` command configures the administrative distance for routes contained in a single OSPFv2 area. Administrative distances compare dynamic routes configured by different protocols. The default administrative distance for intra-area routes is 110.

Example

- This command configures an administrative distance of 95 for OSPFv2 intra-area routes.
  
  ```
  switch(config-router-ospf)#distance ospf intra-area 95
  switch(config-router-ospf)#
  ```

Passive Interfaces

The `passive-interface <interface> (OSPFv2)` command prevents the transmission of hello packets on the specified interface. Passive interfaces drop all adjacencies and do not form new adjacencies. Passive interfaces send LSAs but do not receive them. The router does not send or process OSPFv2 packets received on passive interfaces. The router advertises the passive interface in the router LSA.

The `no passive-interface` command re-enables OSPFv2 processing on the specified interface.

Examples

- This command configures VLAN 2 as a passive interface.
  
  ```
  switch(config-router-ospf)#passive-interface vlan 2
  switch(config-router-ospf)#
  ```

- This command configures VLAN 2 as an active interface.
  
  ```
  switch(config-router-ospf)#no passive-interface vlan 2
  switch(config-router-ospf)#
  ```

Redistributing Connected Routes

Redistributing connected routes causes the OSPFv2 instance to advertise all connected routes on the switch as external OSPFv2 routes. Connected routes are routes that are established when IPv6 is enabled on an interface.

Example

- The `redistribute (OSPFv2) connected` command converts connected routes to OSPFv2 external routes.
  
  ```
  switch(config-router-ospf)#redistribute connected
  switch(config-router-ospf)#
  ```

Redistributing Static Routes

Redistributing static routes causes the OSPFv2 instance to advertise all static routes on the switch as external OSPFv2 routes. The switch does not support redistributing individual static routes.

Example

- The `redistribute (OSPFv2) static` static command converts the static routes to OSPFv2 external routes.
  
  ```
  switch(config-router-ospf)#redistribute static
  switch(config-router-ospf)#
  ```

- The `no redistribute (OSPFv2)` command stops the advertising of the static routes as OSPFv2 external routes.
  
  ```
  switch(config-router-ospf)#no redistribute static
  switch(config-router-ospf)#
  ```
Filtering Routes with Distribute Lists

An OSPF distribute list uses a route map or prefix list to filter specific routes from incoming OSPF LSAs; this filtering occurs after SPF calculation. The filtered routes are not installed on the switch, but are still included in LSAs sent by the switch. An OSPF router instance can have one distribute list configured.

If a prefix list is used, destination prefixes that do not match the prefix list will not be installed. If a route map is used, routes may be filtered based on address, next hop, or metric. OSPF external routes may also be filtered by metric type or tag.

The **distribute-list in** command specifies the filter to be used and applies it to the OSPF instance.

**Example**

- These commands configure a prefix-list named “dist_list1” in OSPF instance 5 to filter certain routes from incoming OSPF LSAs.

  ```
  switch(config)#router ospf 5
  switch(config-router-ospf)#distribute-list prefix-list dist_list1 in
  ```

27.3.2 Configuring OSPFv2 Areas

OSPFv2 areas are configured through area commands. The switch must be in router-ospf configuration mode, as described in Section 27.3.1.1: Entering OSPFv2 Configuration Mode, to run area commands.

Areas are assigned a 32-bit number that is expressed in decimal or dotted-decimal notation. When an OSPFv2 instance configuration contains multiple areas, the switch only configures areas associated with its interfaces.

27.3.2.1 Configuring the Area Type

The **area (OSPFv2)** command specifies the area type. The switch supports three area types:

- Normal area: Area that accepts intra-area, inter-area, and external routes. The backbone area (area 0) is a normal area.
- Stub area: Area where external routes are not advertised. External routes are reached through a default summary route (0.0.0.0). Networks with no external routes do not require stub areas.
- NSSA (Not So Stubby Area): ASBRs advertise external LSAs directly connected to the area. External routes from other areas are not advertised and are reached through a default summary route.

The default area type is normal.

**Examples**

- This command configures area 45 as a stub area.

  ```
  switch(config-router-ospf)#area 45 stub
  ```

- This command configures area 10.92.148.17 as an NSSA.

  ```
  switch(config-router-ospf)#area 10.92.148.17 NSSA
  ```
27.3.2.2 Blocking All Summary Routes from Flooding the NSSA

The `area nssa no-summary (OSPFv2)` command configures the router to not import type-3 summary LSAs into the not-so-stubby area (NSSA) and injects a default summary route (0.0.0.0/0) into the NSSA to reach the inter-area prefixes.

Example
- This command directs the device not to import type-3 summary LSAs into the NSSA area and injects a default summary route (0.0.0.0/0) into the NSSA area.
  ```
  switch(config)# router ospf 6
  switch(config-router-ospf)# area 1.1.1.1 nssa no-summary
  switch(config-router-ospf)#
  ```

27.3.2.3 Assigning Network Segments to the Area

Assigning Routes to an Area

The `network area (OSPFv2)` command assigns the specified network segment to an OSPFv2 area. The network can be entered in CIDR notation or by an address and wildcard mask.

The switch zeroes the host portion of the specified network address e.g. 1.2.3.4/24 converts to 1.2.3.0/24 and 1.2.3.4/16 converts to 1.2.0.0/16

Example
- Each of these equivalent commands assign the network segment 10.1.10.0/24 to area 0.
  ```
  switch(config-router-ospf)# network 10.1.10.0 0.0.0.255 area 0
  switch(config-router-ospf)#
  
  switch(config-router-ospf)# network 10.1.10.0/24 area 0
  switch(config-router-ospf)#
  ```
  In each case, `running-config` stores the command in CIDR (prefix) notation.

Summarizing Routes

By default, ABRs create a summary LSA for each route in an area and advertise them to adjacent routers. The `area range (OSPFv2)` command aggregates routing information, allowing the ABR to advertise multiple routes with one LSA. The `area range` command can be used to suppress route advertisements.

Examples
- Two `network area` commands assign subnets to an area. The `area range` command summarizes the addresses, which the ABR advertises in a single LSA.
  ```
  switch(config-router-ospf)# network 10.1.25.80 0.0.0.240 area 5
  switch(config-router-ospf)# network 10.1.25.112 0.0.0.240 area 5
  switch(config-router-ospf)# area 5 range 10.1.25.64 0.0.0.192
  switch(config-router-ospf)#
  ```
- The `network area` command assigns a subnet to an area, followed by an `area range` command that suppresses the advertisement of that subnet.
  ```
  switch(config-router-ospf)# network 10.12.31.0 0.0.0.255 area 5
  switch(config-router-ospf)# area 5 range 10.12.31.0 0.0.0.255 not-advertise
  switch(config-router-ospf)#
  ```
27.3.2.4 Configuring Area Parameters

These router-ospf configuration mode commands define OSPFv2 behavior in a specified area.

Default Summary Route Cost

The `area default-cost (OSPFv2)` command specifies the cost of the default summary route that ABRs send into a stub area or NSSA. Summary routes, also called inter-area routes, originate in areas different than their destination.

Example

- This command configures a cost of 15 for the default summary route in area 23.

```
switch(config-router-ospf)#area 23 default-cost 15
```

Filtering Type 3 LSAs

The `area filter (OSPFv2)` command prevents an area from receiving Type 3 (Summary) LSAs from a specified subnet. Type 3 LSAs are sent by ABRs and contain information about one of its connected areas.

Example

- This command prevents the switch from entering Type 3 LSAs originating from the 10.1.1.2/24 subnet into its area 2 LSDB.

```
switch(config-router-ospf)#area 2 filter 10.1.1.2/24
```

27.3.3 Configuring Interfaces for OSPFv2

OSPFv2 interface configuration commands specify transmission parameters for routed ports and SVIs that handle OSPFv2 packets.

27.3.3.1 Configuring Authentication

OSPFv2 authenticates packets through passwords configured on VLAN interfaces. Interfaces connecting to the same area can authenticate packets if they have the same key. By default, OSPFv2 does not authenticate packets.

OSPFv2 supports simple password and message digest authentication:

- Simple password authentication: A password is assigned to an area. Interfaces connected to the area can authenticate packets if they have the same key. By default, OSPFv2 does not authenticate packets.
- Message digest authentication: Each interface is configured with a key (password) and key-id pair. When transmitting a packet, the interface generates a string, using the MD5 algorithm, based on the OSPFv2 packet, key, and key ID, then appends that string to the packet.

Message digest authentication supports uninterrupted transmissions during key changes by allowing each interface to have two keys with different key IDs. When a new key is configured on an interface, the router transmits OSPFv2 packets for both keys. Once the router detects that all neighbors are using the new key, it stops sending the old one.

Implementing authentication on an interface is a two step process:

1. Enabling authentication.
2. Configuring a key (password).
To configure simple authentication on a VLAN interface:

**Step 1** Enable simple authentication with the `ip ospf authentication` command.

```
switch(config-if-vl12)#ip ospf authentication
```

**Step 2** Configure the password with the `ip ospf authentication-key` command.

```
switch(config-if-vl12)#ip ospf authentication-key 0 code123
```

*Running-config* stores the password as an encrypted string, using a proprietary algorithm.

To configure Message-Digest authentication on a VLAN interface:

**Step 1** Enable Message-Digest authentication with the `ip ospf authentication message-digest` command.

```
switch(config-if-vl12)#ip ospf authentication message-digest
```

**Step 2** Configure the key ID and password with the `ip ospf message-digest-key` command.

```
switch(config-if-vl12)#ip ospf message-digest-key 23 md5 0 code123
```

*Running-config* stores the password as an encrypted string, using a proprietary algorithm. The key ID (23) is between keywords `message-digest-key` and `md5`.

### 27.3.3.2 Configuring Intervals

Interval configuration commands determine OSPFv2 packet transmission characteristics for the specified VLAN interface and are entered in interface-vlan configuration mode.

#### Hello Interval

The hello interval specifies the period between consecutive hello packet transmissions from an interface. Each OSPFv2 neighbor should specify the same hello interval, which should not be longer than any neighbor’s dead interval.

The `ip ospf hello-interval` command configures the hello interval for the configuration mode interface. The default is 10 seconds.

**Example**

- This command configures a hello interval of 30 seconds for VLAN 2.
  
  ```
  switch(config-if-Vl2)#ip ospf hello-interval 30
  switch(config-if-Vl2)#
  ```

#### Dead Interval

The dead interval specifies the period that an interface waits for an OSPFv2 packet from a neighbor before it disables the adjacency under the assumption that the neighbor is down. The dead interval should be configured identically on all OSPFv2 neighbors and be longer than the hello interval of any neighbor.

The `ip ospf dead-interval` command configures the dead interval for the configuration mode interface. The default is 40 seconds.

**Example**

- This command configures a dead interval of 120 seconds for VLAN 4.
  
  ```
  switch(config-if-Vl4)#ip ospf dead-interval 120
  switch(config-if-Vl4)#
  ```
Retransmit Interval

Routers that send OSPFv2 advertisements to an adjacent router expect to receive an acknowledgment from that neighbor. Routers that do not receive an acknowledgment will retransmit the advertisement. The retransmit interval specifies the period between retransmissions.

The `ip ospf retransmit-interval` command configures the LSA retransmission interval for the configuration mode interface. The default retransmit interval is 5 seconds.

**Example**

- This command configures a retransmit interval of 15 seconds for VLAN 3.

  ```
  switch(config-if-Vl3)#ip ospf retransmit-interval 15
  switch(config-if-Vl3)#
  ```

Transmission Delay

The transmission delay is an estimate of the time that an interface requires to transmit a link-state update packet. OSPFv2 adds this delay to the age of outbound packets to more accurately reflect the age of the LSA when received by a neighbor. The default transmission delay is one second.

The `ip ospf transmit-delay` command configures the transmission delay for the configuration mode interface.

**Example**

- This command configures a transmission delay of 5 seconds for VLAN 6.

  ```
  switch(config-if-Vl6)#ip ospf transmit-delay 5
  switch(config-if-Vl6)#
  ```

27.3.3.3 Configuring Interface Parameters

Interface Cost

The OSPFv2 interface cost (or metric) reflects the overhead of sending packets across the interface. The cost is typically inversely proportional to the bandwidth of the interface. The default cost is 10.

The `ip ospf cost` command configures the OSPFv2 cost for the configuration mode interface.

**Example**

- This command configures a cost of 15 for VLAN 2.

  ```
  switch(config-if-Vl2)#ip ospf cost 15
  switch(config-if-Vl2)#
  ```

Router Priority

Router priority determines preference during designated router (DR) and backup designated router (BDR) elections. Routers with higher priority numbers have preference over other routers. Routers with a priority of zero cannot be elected as a DR or BDR.

The `ip ospf priority` command configures router priority for the configuration mode interface. The default priority is 1.

**Examples**

- This command configures a router priority of 15 for VLAN 8.

  ```
  switch(config-if-Vl8)#ip ospf priority 15
  switch(config-if-Vl8)#
  ```
27.3.4 Enabling OSPFv2

27.3.4.1 IPv4 Routing

OSPFv2 requires that IPv4 routing is enabled on the switch. When IP routing is not enabled, entering OSPFv2 configuration mode generates a message.

Example

- This message is displayed if, when entering router-ospf configuration mode, IP routing is not enabled.

  switch(config)#router ospf 100
  ! IP routing not enabled
  switch(config-router-ospf)#

- This command enables IP routing on the switch.

  switch(config)#ip routing
  switch(config)#

27.3.4.2 Disabling OSPFv2

The switch can disable OSPFv2 operations without disrupting the OSPFv2 configuration.

- **shutdown (OSPFv2)** disables all OSPFv2 activity.
- **ip ospf shutdown** disables OSPFv2 activity on a VLAN interface.

The **no shutdown** and **no ip ospf shutdown** commands resume OSPFv2 activity.

Examples

- This command disables OSPFv2 activity on the switch.

  switch(config-router-ospf)#shutdown
  switch(config-router-ospf)#

- This command resumes OSPFv2 activity on the switch.

  switch(config-router-ospf)#no shutdown
  switch(config-router-ospf)#

- This command disables OSPFv2 activity on VLAN 5.

  switch(config-if-Vl5)#ip ospf shutdown
  switch(config-if-Vl5)#

27.3.5 Displaying OSPFv2 Status

This section describes OSPFv2 show commands that display OSPFv2 status. General switch methods that provide OSPFv2 information include pinging routes, viewing route status (**show ip route** command), and viewing the configuration (**show running-config** command).

27.3.5.1 OSPFv2 Summary

The **show ip ospf** command displays general OSPFv2 configuration information and operational statistics.
Example

- This command displays general OSPFv2 information.

```
switch#show ip ospf
Routing Process "ospf 1" with ID 10.168.103.1
    Supports opaque LSA
    Maximum number of LSA allowed 12000
    Threshold for warning message 75%
    Ignore-time 5 minutes, reset-time 5 minutes
    Ignore-count allowed 5, current 0
    It is an area border router
    Hold time between two consecutive SPF's 5000 msecs
    SPF algorithm last executed 00:00:09 ago
    Minimum LSA interval 5 secs
    Minimum LSA arrival 1000 msecs
    Number of external LSA 0. Checksum Sum 0x000000
    Number of opaque AS LSA 0. Checksum Sum 0x000000
    Number of LSA 27.
    Number of areas in this router is 3. 3 normal 0 stub 0 nssa
    Area BACKBONE(0.0.0.0)
        Number of interfaces in this area is 2
        It is a normal area
        Area has no authentication
        SPF algorithm executed 153 times
        Number of LSA 8. Checksum Sum 0x03e13a
        Number of opaque link LSA 0. Checksum Sum 0x000000
    Area 0.0.0.2
        Number of interfaces in this area is 1
        It is a normal area
        Area has no authentication
        SPF algorithm executed 153 times
        Number of LSA 11. Checksum Sum 0x054e57
        Number of opaque link LSA 0. Checksum Sum 0x000000
    Area 0.0.0.3
        Number of interfaces in this area is 1
        It is a normal area
        Area has no authentication
        SPF algorithm executed 5 times
        Number of LSA 6. Checksum Sum 0x02a401
        Number of opaque link LSA 0. Checksum Sum 0x000000
```

The output lists configuration parameters and operational statistics and status for the OSPFv2 instance, followed by a brief description of the areas located on the switch.

27.3.5.2 Viewing OSPFv2 on the Interfaces

The `show ip ospf interface` command displays OSPFv2 information for switch interfaces configured for OSPFv2. Different command options allow the display of either all interfaces or a specified interface. The command can also be configured to display complete information or a brief summary.
Example

- This command displays complete OSPFv2 information for VLAN 1.

  ```
  switch# show ip ospf interface vlan 1
  Vlan1 is up, line protocol is up (connected)
  Internet Address 10.168.0.1/24, Area 0.0.0.0
  Process ID 1, Router ID 10.168.103.1, Network Type BROADCAST, Cost: 10
  Transmit Delay is 1 sec, State BDR, Priority 1
  Designated Router is 10.168.104.2
  Backup Designated router is 10.168.103.1
  Timer intervals configured, Hello 10, Dead 40, Retransmit 5
  Neighbor Count is 1
  MTU is 1500
  switch#
  
  The display indicates the switch is an ABR by displaying a neighbor count, the Designated Router, and Backup Designated Router.
  ```

- This command displays a summary of interface information for the switch.

  ```
  switch# show ip ospf interface brief
  Interface    PID   Area            IP Address         Cost  State    Nbrs
  Loopback0    1     0.0.0.0         10.168.103.1/24   10    DR       0
  Vlan1        1     0.0.0.0         10.168.0.1/24     10    BDR      1
  Vlan2        1     0.0.0.2         10.168.2.1/24     10    BDR      1
  Vlan3        1     0.0.0.3         10.168.3.1/24     10    DR       0
  switch#
  
  Configuration information includes the Process ID (PID), area, IP address, and cost. OSPFv2 operational information includes the Designated Router status and number of neighbors.
  ```

27.3.5.3 Viewing the OSPFv2 Database

The `show ip ospf database <link state list>` command displays the LSAs in the LSDB for the specified area. If no area is listed, the command displays the contents of the database for each area on the switch. The database command provides options to display subsets of the LSDB database, a summary of database contents, and the link states that comprise the database.
Examples

- This command displays LSDB contents for area 2.
  ```
  switch# show ip ospf 1 2 database
  ```

```

27.3.5.4 Viewing OSPFv2 Neighbors

The `show ip ospf neighbor` command displays information about the routers that are neighbors to the switch. Command options allow the display of summary or detailed information about the neighbors for all areas and interfaces on the switch. The command also allows the display of neighbors for individual interfaces or areas. The `adjacency-changes` option displays the interface’s adjacency changes.

**Example**

• This command displays the switch’s neighbors.

```
switch#show ip ospf neighbor
```

<table>
<thead>
<tr>
<th>Neighbor ID</th>
<th>Pri</th>
<th>State</th>
<th>Dead Time</th>
<th>Address</th>
<th>Interface</th>
</tr>
</thead>
<tbody>
<tr>
<td>10.168.104.2</td>
<td>1</td>
<td>FULL/DR</td>
<td>00:00:35</td>
<td>10.168.0.2</td>
<td>Vlan1</td>
</tr>
<tr>
<td>10.168.104.2</td>
<td>8</td>
<td>FULL/BDR</td>
<td>00:00:31</td>
<td>10.168.2.2</td>
<td>Vlan2</td>
</tr>
</tbody>
</table>
```

```
• This command displays details about the neighbors to VLAN 2.

```
switch#show ip ospf neighbor vlan 2 detail
Neighbor 10.168.104.2, interface address 10.168.2.2
In the area 0.0.0.2 via interface Vlan2
Neighbor priority is 8, State is FULL, 13 state changes
Adjacency was established 000:01:25:48 ago
DR is 10.168.2.1 BDR is 10.168.2.2
Options is E
Dead timer due in 00:00:34
```

• This command displays the adjacency changes to VLAN 2.

```
switch#show ip ospf neighbor vlan 2 adjacency-changes
[08-04 09:58:58] 10.168.104.2, interface Vlan2 adjacency established
[08-04 09:59:34] 10.168.104.2, interface Vlan2 adjacency dropped: interface went down
[08-04 09:59:42] 10.168.104.2, interface Vlan2 adjacency established
[08-04 10:01:40] 10.168.104.2, interface Vlan2 adjacency dropped: nbr did not list our router ID
[08-04 10:01:46] 10.168.104.2, interface Vlan2 adjacency established
```

The `show ip ospf neighbor state` command displays the state information for OSPF neighbors on a per-interface basis.

**Examples**

• This command displays OSPF information for neighboring routers that are fully adjacent.

```
switch>show ip ospf neighbor state full
Neighbor ID VRF Pri State       Dead Time  Address         Interface
Test1     default 1 FULL/BDR    00:00:35  10.17.254.105  Vlan3912
Test2     default 1 FULL/BDR    00:00:36  10.17.254.29   Vlan3910
Test3     default 1 FULL/DR     00:00:35  10.25.0.1      Vlan101
Test4     default 1 FULL/DROTHER 00:00:36  10.17.254.67   Vlan3908
Test5     default 1 FULL/DROTHER 00:00:36  10.17.254.68   Vlan3908
Test6     default 1 FULL/BDR    00:00:32  10.17.254.66   Vlan3908
Test7     default 1 FULL/DROTHER 00:00:34  10.17.36.4     Vlan3036
Test8     default 1 FULL/BDR    00:00:35  10.17.36.3     Vlan3036
Test9     default 1 FULL/DROTHER 00:00:31  10.17.254.13   Vlan3902
Test10    default 1 FULL/BDR    00:00:37  10.17.254.11   Vlan3902
Test11    default 1 FULL/DROTHER 00:00:33  10.17.254.163  Vlan3925
Test12    default 1 FULL/DR     00:00:37  10.17.254.161  Vlan3925
Test13    default 1 FULL/DROTHER 00:00:31  10.17.254.154  Vlan3923
Test14    default 1 FULL/BDR    00:00:39  10.17.254.156  Vlan3923
Test15    default 1 FULL/DROTHER 00:00:33  10.17.254.35   Vlan3911
Test16    default 1 FULL/DR     00:00:34  10.17.254.33   Vlan3911
Test17    default 1 FULL/DR     00:00:36  10.17.254.138  Ethernet12
Test18    default 1 FULL/DR     00:00:37  10.17.254.2     Vlan3901
```

The `show ip ospf neighbor summary` command displays a single line of summary information for each OSPFv2 neighbor.
Example

- This command displays the summary information for the OSPFv2 neighbors.

```
switch>show ip ospf neighbor summary
OSPF Router with (Process ID 1) (VRF default)
0 neighbors are in state DOWN
0 neighbors are in state GRACEFUL RESTART
2 neighbors are in state INIT
0 neighbors are in state LOADING
0 neighbors are in state ATTEMPT
18 neighbors are in state FULL
0 neighbors are in state EXCHANGE
0 neighbors are in state 2 WAYS
0 neighbors are in state EXCH START
switch>
```

27.3.5.5 Viewing OSPFv2 Routes

The `show ip routes` command provides an OSPFv2 option.

**Examples**

- This command displays all of a switch’s routes.

```
switch#show ip route
Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP

Gateway of last resort:
S  0.0.0.0/0 [1/0] via 10.255.255.1

C  10.255.255.0/24 is directly connected, Management1
C  10.168.0.0/24 is directly connected, Vlan1
C  10.168.2.0/24 is directly connected, Vlan2
O  10.168.3.0/24 [110/20] via 10.168.0.1
O  10.168.103.0/24 [110/20] via 10.168.0.1
C  10.168.104.0/24 is directly connected, Loopback0
switch#
```

- This command displays the switch’s OSPFv2 routes.

```
switch#show ip route ospf
Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP

O  10.168.3.0/24 [110/20] via 10.168.0.1
O  10.168.103.0/24 [110/20] via 10.168.0.1
switch#
```

Use the **ping** command to determine the accessibility of a route.
Example

- This command pings an OSPFv2 route.

```bash
switch#ping 10.168.0.1
PING 10.168.0.1 (10.168.0.1) 72(100) bytes of data.
80 bytes from 10.168.0.1: icmp_seq=1 ttl=64 time=0.148 ms
80 bytes from 10.168.0.1: icmp_seq=2 ttl=64 time=0.132 ms
80 bytes from 10.168.0.1: icmp_seq=3 ttl=64 time=0.136 ms
80 bytes from 10.168.0.1: icmp_seq=4 ttl=64 time=0.137 ms
80 bytes from 10.168.0.1: icmp_seq=5 ttl=64 time=0.136 ms

--- 10.168.0.1 ping statistics ---
5 packets transmitted, 5 received, 0% packet loss, time 7999ms
rtt min/avg/max/mdev = 0.132/0.137/0.148/0.015 ms
switch#
```

27.3.5.6 Viewing OSPFv2 SPF Logs

The `show ip ospf spf-log` command displays when and how long the switch took to run a full SPF calculation for OSPF.

Examples

- This command displays the SPF information for OSPF.

```bash
switch>show ip ospf spf-log
OSPF Process 172.26.0.22
When                Duration(msec)
13:01:34              1.482
13:01:29              1.547
13:01:24              1.893
13:00:50              1.459
13:00:45              1.473
13:00:40              2.603
11:00:49              1.561
11:00:45              1.463
11:00:35              1.467
11:00:30              1.434
11:00:25              1.456
11:00:20              1.472
11:00:15              1.582
15:01:49              1.575
15:01:44              1.470
15:01:40              1.679
15:01:35              1.601
15:00:57              1.454
15:00:52              1.446
15:00:47              1.603
switch>
```
27.4 OSPFv2 Examples

This section describes the commands required to configure three OSPFv2 topologies.

27.4.1 OSPFv2 Example 1

The AS in example 1 contains two areas that are connected through two routers. The backbone area also contains an internal router that connects two subnets.

27.4.1.1 Example 1 Diagram

Figure 27-3 displays the Example 1 topology. Two ABRs connect area 0 and area 1 – Router A and Router B. Router C is an internal router that connects two subnets in area 0.

Figure 27-3: OSPFv2 Example 1

Area 1 Configuration

Area 1 contains one subnet that is accessed by Router A and Router B.

- Router A: The subnet 10.10.1.0/24 is accessed through VLAN 1.
- Router B: The subnet 10.10.1.0/24 is accessed through VLAN 1.
- Each router uses simple authentication, with password abcdefgh.
- Designated Router (DR): Router A.
- Backup Designated Router (BDR): Router B.
- Each router defines an interface cost of 10.
- Router priority is not specified for either router on area 1.

Area 0 ABR Configuration

Area 0 contains one subnet that is accessed by ABRs Router A and Router B.

- Router A: The subnet 10.10.2.0/24 is accessed through VLAN 2.
- Router B: The subnet 10.10.2.0/24 is accessed through VLAN 2.
- Designated Router (DR): Router B.
Backup Designated Router (BDR): Router A.
Each router uses simple authentication, with password iklmnop.
Each router defines an interface cost of 20.
Each router defines a retransmit-interval of 10.
Each router defines a transmit-delay of 2.
Router priority is specified such that Router B will be elected as the Designated Router.

Area 0 IR Configuration
Area 0 contains one internal router that connects two subnets.
Router C: The subnet 10.10.2.0/24 is accessed through VLAN 2.
Router C: The subnet 10.10.3.0/24 is accessed through VLAN 3.
The subnet 10.10.2.0/24 link is configured as follows:
  • Interface cost of 20.
  • Retransmit-interval of 10.
  • Transmit-delay of 2.
The subnet 10.10.3.0/24 link is configured as follows:
  • Interface cost of 20.
  • Dead interval of 80 seconds.

27.4.1.2 Example 1 Code
This code configures the OSPFv2 instances on the three switches.

Step 1 Configure the interface addresses.

a Router A interfaces:
switch-A(config)#interface vlan 1
switch-A(config-if-vl1)#ip address 10.10.1.1/24
switch-A(config-if-vl1)#interface vlan 2
switch-A(config-if-vl2)#ip address 10.10.2.1/24

b Router B interfaces:
switch-B(config)#interface vlan 1
switch-B(config-if-vl1)#ip address 10.10.1.2/24
switch-B(config-if-vl1)#interface vlan 2
switch-B(config-if-vl2)#ip address 10.10.2.2/24

c Router C interfaces:
switch-C(config)#interface vlan 2
switch-C(config-if-vl2)#ip address 10.10.2.3/24
switch-C(config-if-vl2)#interface vlan 3
switch-C(config-if-vl3)#ip address 10.10.3.3/24
Step 2  Configure the interface OSPFv2 parameters.

a  Router A interfaces:
switch-A(config-if-vl2)#interface vlan 1
switch-A(config-if-vl1)#ip ospf authentication-key abedefgh
switch-A(config-if-vl1)#ip ospf cost 10
switch-A(config-if-vl1)#ip ospf priority 6
switch-A(config-if-vl1)#interface vlan 2
switch-A(config-if-vl2)#ip ospf authentication-key ijklnmop
switch-A(config-if-vl2)#ip ospf cost 20
switch-A(config-if-vl2)#ip ospf retransmit-interval 10
switch-A(config-if-vl2)#ip ospf transmit-delay 2
switch-A(config-if-vl2)#ip ospf priority 4

b  Router B interfaces:
switch-B(config-if-vl2)#interface vlan 1
switch-B(config-if-vl1)#ip ospf authentication-key abedefgh
switch-B(config-if-vl1)#ip ospf cost 10
switch-B(config-if-vl1)#ip ospf priority 4
switch-B(config-if-vl1)#interface vlan 2
switch-B(config-if-vl2)#ip ospf authentication-key ijklnmop
switch-B(config-if-vl2)#ip ospf cost 20
switch-B(config-if-vl2)#ip ospf retransmit-interval 10
switch-B(config-if-vl2)#ip ospf transmit-delay 2
switch-B(config-if-vl2)#ip ospf priority 6

c  Router C interfaces:
switch-C(config-if-vl3)#interface vlan 2
switch-C(config-if-vl2)#ip ospf cost 20
switch-C(config-if-vl2)#ip ospf retransmit-interval 10
switch-C(config-if-vl2)#ip ospf transmit-delay 2
switch-C(config-if-vl2)#interface vlan 3
switch-C(config-if-vl3)#ip ospf cost 20
switch-C(config-if-vl3)#ip ospf dead-interval 80

Step 3  Attach the network segments to the areas.

a  Router A interfaces:
switch-A(config-if-vl2)#router ospf 1
switch-A(config-router-ospf)#router-id 169.10.0.1
switch-A(config-router-ospf)#network 10.10.1.0/24 area 1
switch-A(config-router-ospf)#network 10.10.2.0/24 area 0

b  Router B interfaces:
switch-B(config-if-vl2)#router ospf 1
switch-B(config-router-ospf)#router-id 169.10.0.2
switch-B(config-router-ospf)#network 10.10.1.0/24 area 1
switch-B(config-router-ospf)#network 10.10.2.0/24 area 0

c  Router C interfaces:
switch-C(config-if-vl3)#router ospf 1
switch-C(config-router-ospf)#router-id 169.10.0.3
switch-C(config-router-ospf)#network 10.10.2.0/24 area 0
switch-C(config-router-ospf)#network 10.10.3.0/24 area 0

27.4.2  OSPFv2 Example 2

The AS in example 2 contains three areas. Area 0 connects to the other areas through different routers. The backbone area contains an internal router that connects two subnets. Area 0 is normal; the other areas are stub areas.
### 27.4.2.1 Example 2 Diagram

Figure 27-4 displays the Example 2 topology. One ABR (Router B) connects area 0 and area 10.42.110.0; another ABR (router C) connects area 0 and area 36.56.0.0. Router A is an internal router that connects two subnets in area 0.

#### Figure 27-4: OSPFv2 Example 2

---

**Area 10.42.110.0 Configuration**

Area 10.42.110.0 contains one subnet that is accessed by Router B.
- Router B: The subnet 10.42.110.0 is accessed through VLAN 15.
- Router B uses simple authentication, with password abcdefgh.
- Each router defines a interface cost of 10.

**Area 10.56.0.0 Configuration**

Area 10.56.0.0 contains one subnet that is accessed by Router C.
- Router C: The subnet 10.56.0.0 is accessed through VLAN 21.
- Router C uses simple authentication, with password ijklnmop.
- Each router defines a interface cost of 20.

**Area 0 ABR Configuration**

Area 0 contains two subnets. ABR Router B connects one subnet to area 10.42.110.0. ABR Router C connects the other subnet to area 10.56.0.0.
- Router B: The subnet 10.119.254.0/24 is accessed through VLAN 16.
- Router C: The subnet 10.119.251.0/24 is accessed through VLAN 20.
Chapter 27: Open Shortest Path First – Version 2

**Designated Router (DR):** Router B.
**Backup Designated Router (BDR):** Router C.
Each ABR uses simple authentication, with password ijklmnop
Each router defines an interface cost of 20.
Each router defines a retransmit-interval of 10.
Each router defines a transmit-delay of 2.

**Area 0 IR Configuration**

Area 0 contains two subnets connected by an internal router.
- Router A: The subnet 10.119.254.0/24 is accessed through VLAN 16.
- Router A: The subnet 10.119.251.0/24 is accessed through VLAN 20.
- The subnet 10.42.110.0 is configured as follows:
  - Interface cost of 10.
- The subnet 10.56.0.0/24 is configured as follows:
  - Interface cost of 20.
  - Retransmit-interval of 10.
  - Transmit-delay of 2.

**27.4.2.2 Example 2 Code**

**Step 1** Configure the interface addresses.

**a** Router A interfaces:

```
switch-A(config)#interface vlan 16
switch-A(config-if-vl16)#ip address 10.119.254.2/24
```

```
switch-A(config-if-vl16)#interface vlan 20
switch-A(config-if-vl20)#ip address 10.119.251.1/24
```

**b** Router B interfaces:

```
switch-B(config)#interface vlan 15
switch-B(config-if-vl15)#ip address 10.42.110.1/24
```

```
switch-B(config-if-vl15)#interface vlan 16
switch-B(config-if-vl16)#ip address 10.119.254.1/24
```

**c** Router C interfaces:

```
switch-C(config)#interface vlan 20
switch-C(config-if-vl20)#ip address 10.119.251.2/24
```

```
switch-C(config-if-vl20)#interface vlan 21
switch-C(config-if-vl21)#ip address 10.56.0.1/24
```

**Step 2** Configure the interface OSPFv2 parameters.

**a** Router A interfaces:

```
switch-A(config-if-vl20)#interface vlan 16
switch-A(config-if-vl16)#ip ospf cost 10
switch-A(config-if-vl16)#interface vlan 20
switch-A(config-if-vl20)#ip ospf cost 20
switch-A(config-if-vl20)#ip ospf retransmit-interval 10
switch-A(config-if-vl20)#ip ospf transmit-delay 2
```
b Router B interfaces:

```
switch-B(config-if-vl16)#interface vlan 15
switch-B(config-if-vl15)#ip ospf authentication-key abcdefgh
switch-B(config-if-vl15)#ip ospf cost 10
switch-B(config-if-vl16)#interface vlan 16
switch-B(config-if-vl16)#ip ospf authentication-key ijklnmop
switch-B(config-if-vl16)#ip ospf cost 20
switch-B(config-if-vl16)#ip ospf retransmit-interval 10
switch-B(config-if-vl16)#ip ospf transmit-delay 2
switch-B(config-if-vl16)#ip ospf priority 6
```

c Router C interfaces:

```
switch-C(config-if-vl21)#interface vlan 20
switch-C(config-if-vl20)#ip ospf authentication-key ijklnmop
switch-C(config-if-vl20)#ip ospf cost 20
switch-C(config-if-vl20)#ip ospf retransmit-interval 10
switch-C(config-if-vl20)#ip ospf transmit-delay 2
switch-C(config-if-vl20)#ip ospf priority 4
switch-C(config-if-vl21)#interface vlan 21
switch-C(config-if-vl21)#ip ospf authentication-key ijklnmop
switch-C(config-if-vl21)#ip ospf cost 20
switch-C(config-if-vl21)#ip ospf dead-interval 80
```

Step 3 Attach the network segments to the areas.

a Router A interfaces:

```
switch-A(config-if-vl20)#router ospf 1
switch-A(config-router-ospf)#router-id 10.24.1.1
switch-A(config-router-ospf)#network 10.119.254.0/24 area 0
switch-A(config-router-ospf)#network 10.119.251.0/24 area 0
switch-A(config-router-ospf)#area 0 range 10.119.251.0 0.0.7.255
```

b Router B interfaces:

```
switch-B(config-if-vl16)#router ospf 1
switch-B(config-router-ospf)#router-id 10.24.1.2
switch-B(config-router-ospf)#area 10.42.110.0 stub
switch-B(config-router-ospf)#network 10.42.110.0/24 area 10.42.110.0
switch-B(config-router-ospf)#network 10.119.254.0/24 area 0
```

c Router C interfaces:

```
switch-C(config-if-vl21)#router ospf 1
switch-C(config-router-ospf)#router-id 10.24.1.3
switch-C(config-router-ospf)#area 10.56.0.0 stub 0
switch-C(config-router-ospf)#network 10.119.251.0/24 area 0
switch-C(config-router-ospf)#network 10.56.0.0/24 area 36.56.0.0
```

27.4.3 OSPFv2 Example 3

The AS in example 3 contains two areas that connect through one ABR.

- Area 0: Backbone area contains two internal routers that connect three subnets, one ASBR, and one ABR that connects to Area 1.
- Area 1: NSSA contains one internal router, one ASBR, and one ABR that connects to the backbone.
27.4.3.1 Example 3 Diagram

Figure 27-5 displays the Example 3 topology. One ABR connects area 0 and area 1. Router C is an ABR that connects the areas. Router A is an internal router that connects two subnets in area 1. Router D and Router E are internal routers that connect subnets in area 0. Router B and Router F are ASBRs that connect static routes outside the AS to area 1 and area 0, respectively.

**Figure 27-5: OSPFv2 Example 3**

**Area 0 ABR Configuration**

ABR Router C connects one area 0 subnet to an area 1 subnet.
- Router C: The subnet 10.10.2.0/24 is accessed through VLAN 11.
- Authentication is not configured on the interfaces.
- All interface OSPFv2 parameters are set to their default values.

**Area 0 IR Configuration**

Area 0 contains two internal routers, each of which connects two of the three subnets in the area.
- Router D: The subnet 10.10.2.0/24 is accessed through VLAN 11.
- Router D: The subnet 10.10.3.0/24 is accessed through VLAN 12.
- Router E: The subnet 10.10.3.0/24 is accessed through VLAN 12.
- Router E: The subnet 10.10.4.0/24 is accessed through VLAN 13.
- All interface OSPFv2 parameters are set to their default values.

**Area 0 ASBR Configuration**

ASBR Router F connects one area 0 subnet to an external subnet.
• Router F: The subnet 10.10.4.0/24 is accessed through VLAN 13.
• Router F: The subnet 12.15.(146,300),(787,308)(155,300),(797,308).0/24 is accessed through VLAN 14.
• All interface OSPFv2 parameters are set to their default values.

Area 1 ABR Configuration

ABR Router C connects one area 0 subnet to area 1.
• Router C: The subnet 10.10.1.0/24 is accessed through VLAN 10.
• Authentication is not configured on the interface.
• All interface OSPFv2 parameters are set to their default values.

Area 1 IR Configuration

Area 1 contains one internal router that connects two subnets in the area.
• Router A: The subnet 10.10.1.0/24 is accessed through VLAN 10.
• Router A: The subnet 10.10.5.0/24 is accessed through VLAN 9.
• All interface OSPFv2 parameters are set to their default values.

Area 1 ASBR Configuration

ASBR Router B connects one area 1 subnet to an external subnet.
• Router B: The subnet 10.10.1.0/24 is accessed through VLAN 10.
• Router B: The subnet 16.29.1.0/24 is accessed through VLAN 15.
• All interface OSPFv2 parameters are set to their default values.

27.4.3.2 Example 3 Code

Step 1 Configure the interfaces.

a Router A interfaces:
  switch-A(config)#interface vlan 10
  switch-A(config-if-vl10)#ip address 10.10.1.1/24
  switch-A(config-if-vl10)#interface vlan 9
  switch-A(config-if-vl11)#ip address 10.10.5.1/24

b Router B interfaces:
  switch-B(config)#interface vlan 10
  switch-B(config-if-vl10)#ip address 10.10.1.2/24
  switch-B(config-if-vl10)#interface vlan 15
  switch-B(config-if-vl18)#ip address 16.29.1.1/24

c Router C interfaces:
  switch-C(config)#interface vlan 10
  switch-C(config-if-vl10)#ip address 10.10.1.3/24
  switch-C(config-if-vl10)#interface vlan 11
  switch-C(config-if-vl11)#ip address 10.10.2.2/24

d Router D interfaces:
  switch-D(config)#interface vlan 11
  switch-D(config-if-vl11)#ip address 10.10.2.1/24
  switch-D(config)#interface vlan 12
  switch-D(config-if-vl12)#ip address 10.10.3.1/24
e  Router E interfaces:
   switch-E(config)#interface vlan 12
   switch-E(config-if-vl12)#ip address 10.10.3.2/24
   switch-E(config)#interface vlan 13
   switch-E(config-if-vl13)#ip address 10.10.4.1/24
f  Router F interfaces:
   switch-F(config)#interface vlan 13
   switch-F(config-if-vl13)#ip address 10.10.4.2/24
   switch-F(config)#interface vlan 14
   switch-F(config-if-vl14)#ip address 12.15.1.1/24

Step 2  Attach the network segments to the areas.
   a  Router A interfaces:
      switch-A(config-if-vl10)#router ospf 1
      switch-A(config-router-ospf)#router-id 170.21.0.1
      switch-A(config-router-ospf)#area 1 NSSA
      switch-A(config-router-ospf)#network 10.10.1.0/24 area 1
   b  Router B interfaces:
      switch-B(config-if-vl10)#router ospf 1
      switch-B(config-router-ospf)#router-id 170.21.0.2
      switch-B(config-router-ospf)#area 1 NSSA
      switch-B(config-router-ospf)#network 10.10.1.0/24 area 1
   c  Router C interfaces:
      switch-C(config-if-vl11)#router ospf 1
      switch-C(config-router-ospf)#router-id 170.21.0.3
      switch-C(config-router-ospf)#area 1 NSSA
      switch-C(config-router-ospf)#network 10.10.1.0/24 area 1
      switch-C(config-router-ospf)#network 10.10.2.0/24 area 0
   d  Router D interfaces:
      switch-D(config-if-vl12)#router ospf 1
      switch-D(config-router-ospf)#router-id 170.21.0.4
      switch-D(config-router-ospf)#network 10.10.2.0/24 area 0
      switch-D(config-router-ospf)#network 10.10.3.0/24 area 0
   e  Router E interfaces:
      switch-E(config-if-vl13)#router ospf 1
      switch-E(config-router-ospf)#router-id 170.21.0.5
      switch-E(config-router-ospf)#network 10.10.3.0/24 area 0
      switch-E(config-router-ospf)#network 10.10.4.0/24 area 0
   f  Router F interfaces:
      switch-F(config-if-vl14)#router ospf 1
      switch-F(config-router-ospf)#router-id 170.21.0.6
      switch-F(config-router-ospf)#network 10.10.4.0/24 area 0
      switch-F(config-router-ospf)#redistribute static
27.5 **OSPFv2 Commands**

**Global Configuration Mode**
- `ip ospf name-lookup`
- `router ospf`

**Interface Configuration Mode**
- `ip ospf authentication`
- `ip ospf authentication-key`
- `ip ospf cost`
- `ip ospf dead-interval`
- `ip ospf hello-interval`
- `ip ospf message-digest-key`
- `ip ospf network point-to-point`
- `ip ospf priority`
- `ip ospf retransmit-interval`
- `ip ospf shutdown`
- `ip ospf transmit-delay`

**Router-OSPFv2 Configuration Mode**
- `adjacency exchange-start threshold (OSPFv2)`
- `area default-cost (OSPFv2)`
- `area filter (OSPFv2)`
- `area nssa (OSPFv2)`
- `area nssa default-information-originate (OSPFv2)`
- `area nssa no-summary (OSPFv2)`
- `area nssa translate type7 always (OSPFv2)`
- `area range (OSPFv2)`
- `area stub (OSPFv2)`
- `auto-cost reference-bandwidth (OSPFv2)`
- `compatible (OSPFv2)`
- `default-information originate (OSPFv2)`
- `distance ospf (OSPFv2)`
- `log-adjacency-changes (OSPFv2)`
- `max-lsa (OSPFv2)`
- `max-metric router-lsa (OSPFv2)`
- `maximum-paths (OSPFv2)`
- `network area (OSPFv2)`
- `no area (OSPFv2)`
- `passive-interface default (OSPFv2)`
- `passive-interface <interface> (OSPFv2)`
- `point-to-point routes (OSPFv2)`
- `redistribute (OSPFv2)`
- `router-id (OSPFv2)`
- `shutdown (OSPFv2)`
- `timers lsq arrival (OSPFv2)`
- `timers throttle lsq all (OSPFv2)`
- `timers throttle spf (OSPFv2)`

**Display and Clear Commands**
- `clear ip ospf neighbor`
• show ip ospf
• show ip ospf border-routers
• show ip ospf database database-summary
• show ip ospf database <link state list>
• show ip ospf database <link-state details>
• show ip ospf interface
• show ip ospf interface brief
• show ip ospf lsdb-log
• show ip ospf neighbor
• show ip ospf neighbor adjacency-changes
• show ip ospf neighbor state
• show ip ospf neighbor summary
• show ip ospf request-list
• show ip ospf retransmission-list
• show ip ospf spf-log
adjacency exchange-start threshold (OSPFv2)

The adjacency exchange-start threshold command sets the exchange-start options for an OSPF instance.

The no adjacency exchange-start threshold and default adjacency exchange-start threshold command resets the default by removing the corresponding adjacency exchange-start threshold command from running-config.

Command Mode
Router-OSPF Configuration

Command Syntax

adjacency exchange-start threshold peers
no adjacency exchange-start threshold
default adjacency exchange-start threshold

Parameters
- peers  Value ranges from 1 4294967295. Default value is 10.

Example
- This command sets the adjacency exchange start threshold to 20045623.
  switch(config)#ipv6 router ospf 6
  switch(config-router-ospf)#adjacency exchange-start threshold 20045623
  switch(config-router-ospf)#
area default-cost (OSPFv2)

The **area default-cost** command specifies the cost for the default summary routes sent into a specified area. The default-cost is set to 10.

The **no area default-cost** and **default area default-cost** command resets the default-cost value of the specified area to 10 by removing the corresponding **area default-cost** command from **running-config**. The **no area (OSPFv2)** command removes all area commands for the specified area from **running-config**, including the **area default-cost** command.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```
area area_id default-cost def_cost
no area area_id default-cost
default area area_id default-cost
```

**Parameters**

- `area_id` area number. `<0 to 4294967295>` or `<0.0.0.0 to 255.255.255.255>`
  - **running-config** stores value in dotted decimal notation.
- `def_cost` Value ranges from 1 to 65535. Default value is 10.

**Example**

- This command configures a cost of 15 for default summary routes that an ABR sends into area 23.

  switch(config)#router ospf 6
  switch(config-router-ospf)#area 23 default-cost 15
  switch(config-router-ospf)#
area filter (OSPFv2)

The **area filter** command prevents an area from receiving Type 3 Summary LSAs from a specified subnet.

The **no area filter** and **default area filter** commands remove the specified **area filter** command from **running-config**. The **no area** command (see **no area (OSPFv2)**) removes all area commands for the specified area from **running-config**, including **area filter** commands.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```plaintext
area area_id filter net_addr
no area area_id filter net_addr
default area area_id filter net_addr
```

**Parameters**

- **area_id** area number. `<0` to `4294967295>` or `<0.0.0.0` to `255.255.255.255>`
  - **running-config** stores value in dotted decimal notation.
- **net_addr** network IP address. Entry formats include address-prefix (CIDR) and address-mask.
  - **running-config** stores value in CIDR notation.

**Example**

- This command prevents the switch from entering Type 3 LSAs originating from the 10.1.1.0/24 subnet into its area 2 LSDB.

```plaintext
switch(config)#router ospf 6
switch(config-router-ospf)#area 2 filter 10.1.1.0/24
switch(config-router-ospf)#
```
area nssa (OSPFv2)

The `area nssa` command configures an OSPFv2 area as a not-so-stubby area (NSSA). All routers in an AS must specify the same area type for identically numbered areas.

NSSA ASBRs advertise external LSAs that are part of the area, but do not advertise external LSAs from other areas.

Areas are `normal` by default; area type configuration is required only for stub NSSA areas. Area 0 is always a normal area and cannot be configured through this command.

The `no area nssa` command configures the specified area as a normal area by removing the specified `area nssa` command from `running-config`.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```
area area_id nssa [TYPE]
noln area area_id nssa [TYPE]
default area area_id nssa [TYPE]
```

All parameters except `area_id` can be placed in any order.

**Parameters**

- `area_id`
  - Valid formats: integer `<1` to `<4294967295>` or dotted decimal `<0.0.0.1>` to `<255.255.255.255>`
  - Area 0 (or `0.0.0.0`) is not configurable; it is always `normal`.
  - `running-config` stores value in dotted decimal notation.

- `TYPE` area type. Values include:
  - `<no parameter>`
  - `nssa-only`

**Example**

- This command configures area 3 as a NSSA area.
  ```
  switch(config-router-ospf)#area 3 nssa nssa-only
  switch(config-router-ospf)#
  ```
area nssa default-information-originate (OSPFv2)

The `default area nssa default-information-originate` command sets default route origination for the NSSA, allowing the redistribute policy to advertise a default route if one is present. The resulting OSPF behavior depends on the presence of an installed static default route and on whether static routes are redistributed in OSPF (using the `redistribute (OSPFv2)` command). The `no area nssa default-information-originate` command disables advertisement of the default route for the NSSA regardless of the redistribute policy. See Table 27-1 for details.

Areas are `normal` by default; area type configuration is required only for stub and NSSA areas. Area 0 is always a normal area and cannot be configured through this command.

Default route origination is configured differently for different area types and supports three area types:

- Normal areas: advertisement of the default route is configured for all normal areas using the `default-information originate (OSPFv2)` command.
- Stub areas: the default route is automatically advertised in stub areas and cannot be configured.
- Not So Stubby Areas (NSSAs): advertisement of the default route is configured per area using the `area nssa default-information-originate (OSPFv2)` or `area nssa no-summary (OSPFv2)` command.

Table 27-1 Advertisement of Default Route

Command Mode

Router-OSPF Configuration

Command Syntax

```
area area_id nssa default-information-originate [VALUE][TYPE][EXCL]
no area area_id nssa default-information-originate
default area area_id nssa default-information-originate
```

All parameters except `area_id` can be placed in any order.

Parameters

- `area_id`
  - Valid formats: integer `<1 to 4294967295>` or dotted decimal `<0.0.0.1 to 255.255.255.255>`
  - Area 0 (or 0.0.0.0) is not configurable; it is always `normal`.
  - `running-config` stores value in dotted decimal notation.
• **VALUE**  Values include:
  • <no parameter>  Default value of 1.
  • **metric**  \(<1\text{-}65535>\)

• **TYPE**  Values include:
  • <no parameter>
  • **metric-type**  \(<1\text{-}2>\)

• **EXCL**  Values include:
  • <no parameter>.
  • **nssa-only**

**Example**

• This command configures area 3 as an NSSA and generates a type 7 default LSA within the NSSA.

```
switch(config-router-ospf)#area 3 nssa default-information-originate nssa-only
switch(config-router-ospf)#
```
area nssa no-summary (OSPFv2)

The **area nssa no-summary** command configures the switch to stop importing type-3 summary LSAs into the not-so-stubby area and sets the default summary route into the NSSA in order to reach the inter-area prefixes.

The **no area nssa no-summary** and **default area nssa no-summary** commands allow type-3 summary LSAs into the NSSA area.

The **no area nssa** and **default area nssa** commands configure the specified area as a normal area.

**Command Mode**
Router-OSPF Configuration

**Command Syntax**
- `area area_id nssa no-summary`
- `no area area_id nssa no-summary`
- `default area area_id nssa no-summary`

**Parameters**
- `area_id`  area number.
  - Valid formats: integer `<1 to 4294967295>` or dotted decimal `<0.0.0.1 to 255.255.255.255>`
  - Area 0 (or 0.0.0.0) is not configurable; it is always **normal**.
  - **running-config** stores value in dotted decimal notation.

**Example**
- This command directs the device not to import type-3 summary LSAs into the NSSA area.
  ```
  switch(config)# router ospf 6
  switch(config-router-ospf)# area 1.1.1.1 nssa no-summary
  switch(config-router-ospf)#
  ```
- This command directs the device to import type-3 summary LSAs into the NSSA area.
  ```
  switch(config)# router ospf 6
  switch(config-router-ospf)# no area 1.1.1.1 nssa no-summary
  switch(config-router-ospf)#
  ```
area nssa translate type7 always (OSPFv2)

The `area nssa translate type7 always` command configures the switch to always translate Type-7 link-state advertisement (LSAs) to Type-5 LSAs.

The `no area nssa translate type7 always` and `no area nssa translate type7 always` commands allow LSAs to be translated dynamically by removing the `no area nssa translate type7 always` command from `running-config`.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```
area area_id nssa translate type7 always
no area_id nssa translate type7 always
default area_id nssa translate type7 always
```

**Parameters**

- `area_id` area number.
  - Valid formats: integer `<1 to 4294967295>` or dotted decimal `<0.0.0.1 to 255.255.255.255>`
  - Area 0 (or 0.0.0.0) is not configurable; it is always `normal`.
  - `running-config` stores value in dotted decimal notation.

**Example**

- This command configures the switch to always translate Type-7 link-state advertisement (LSAs) to Type-5 LSAs.

  ```
  switch(config-router-ospf)#area 3 nssa translate type7 always
  switch(config-router-ospf)#
  ```
area range (OSPFv2)

The **area range** command configures OSPF area border routers (ABRs) to consolidate or summarize routes, to set the cost setting routes, and to suppress summary route advertisements.

The **no area** command removes all area commands for the specified area from running-config.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```
area area_id range net_addr [ADVERTISE_SETTING] [COST_SETTING]
no area area_id range net_addr [ADVERTISE_SETTING] [COST_SETTING]
default area area_id range net_addr [ADVERTISE_SETTING] [COST_SETTING]
```

**Parameters**

- **area_id** area number. \(<0 \text{ to } 4294967295> \text{ or } 0.0.0.0 \text{ to } 255.255.255.255>\)
  - \(<\text{no parameter}>\)

- **net_addr**

- **ADVERTISE_SETTING** Values include
  - \(<\text{no parameter}>\)
  - advertise
  - not-advertise

- **COST_SETTING** Values include
  - \(<\text{no parameter}>\)
  - cost range_cost Value ranges from 1 to 65535.

**Examples**

- The **network area** commands assign two subnets to an area. The **area range** command summarizes the addresses, which the ABR advertises in a single LSA.

  switch(config)#router ospf 6
  switch(config-router-ospf)#network 10.1.25.80 0.0.0.240 area 5
  switch(config-router-ospf)#network 10.1.25.112 0.0.0.240 area 5
  switch(config-router-ospf)#area 5 range 10.1.25.64 0.0.0.192
  switch(config-router-ospf)#

- The **network area** command assigns a subnet to an area, followed by an **area range** command that suppresses the advertisement of that subnet.

  switch(config-router-ospf)#network 10.12.31.0/24 area 5
  switch(config-router-ospf)#area 5 range 10.12.31.0/24 not-advertise
  switch(config-router-ospf)#
area stub (OSPFv2)

The `area stub` command sets the area type of an OSPF area to `stub`. All devices in an AS must specify the same area type for identically numbered areas.

The `no area stub` command remove the specified stub area from the OSPFv2 instance by deleting all `area stub` commands from `running-config` for the specified area.

The `no area stub` command configure the specified area as a normal area.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```
area area_id stub [summarize]
no area area_id stub [summarize]
default area area_id stub [summarize]
```

**Parameters**

- `area_id` area number.
  - Valid formats: integer `<1` to `<4294967295>` or dotted decimal `<0.0.0.1` to `<255.255.255.255>`
  - Area 0 (or `0.0.0.0`) is not configurable; it is always `normal`.
  - `running-config` stores value in dotted decimal notation.
- `SUMMARIZE` area type. Values include:
  - `<no parameter>`
  - `no-summary`

**Examples**

- These commands configure area 45 as a stub area.
  
  ```
  switch(config)#router ospf 3
  switch(config-router-ospf)#area 45 stub
  switch(config-router-ospf)#
  ```

- This command configures area `10.92.148.17` as a stub area.
  
  ```
  switch(config-router-ospf)#area 10.92.148.17 stub
  switch(config-router-ospf)#
  ```
auto-cost reference-bandwidth (OSPFv2)

The auto-cost reference-bandwidth command is a factor in the formula that calculates the default OSPFv2 cost for Ethernet interfaces.

\[
\text{OSPFv2-cost} = \frac{(\text{auto-cost value} \times 1 \text{ Mbps})}{\text{interface bandwidth}}
\]

The switch uses a minimum OSPFv2-cost of one. The switch rounds down all non-integer results.

On a 10G Ethernet interface:
- if auto-cost = 100, then OSPFv2-cost = 100 Mbps / 10 Gbps = 0.01, and the default cost is set to 1.
- if auto-cost = 59000, then OSPFv2-cost = 59000 Mbps / 10 Gbps = 5.9, and the default cost is set to 5.

The no auto-cost reference-bandwidth and default auto-cost reference-bandwidth command removes the auto-cost reference-bandwidth command from running-config. When this parameter is not set, the default cost for Ethernet interfaces is the default ip ospf cost value of 10.

Command Mode
Router-OSPF Configuration

Command Syntax
auto-cost reference-bandwidth rate
no auto-cost reference-bandwidth
default auto-cost reference-bandwidth

Parameters
- **rate** Values range from 1 to 4294967. Default is 100.

Example
To configure a default cost of 20 on 10G Ethernet interfaces:

**Step 1** calculate the required auto-cost value:

\[
\text{auto-cost} = \frac{\text{OSPFv2-cost} \times \text{interface bandwidth}}{1 \text{ Mbps}} = \frac{(20 \times 10000 \text{ Mbps})}{1 \text{ Mbps}} = 200000
\]

**Step 2** Configure this value as the auto-cost reference-bandwidth.

```
switch(config)#router ospf 6
switch(config-router-ospf)#auto-cost reference-bandwidth 200000
switch(config-router-ospf)#
```
clear ip ospf neighbor

The clear ip ospf command clears the neighbors statistics per interface.

Command Mode
Privileged EXEC

Command Syntax

```
clear ip ospf [PROCESS_ID] neighbor[LOCATION] [VRF_INSTANCE]
```

Parameters
- **PROCESS_ID** OSPFv2 process ID. Values include:
  - <no parameter>
  - <1 to 65535>
- **LOCATION** IP address or interface peer group name. Values include:
  - * clears all OSPF IPv4 neighbors.
  - ipv4_addr
  - ethernet e_num
  - loopback l_num
  - port-channel p_num
  - vlan v_num
- **VRF_INSTANCE** specifies the VRF instance.
  - <no parameter>
  - vrf vrf_name

Examples

- This command resets all OSPF neighbor statistics.
  ```
  switch#clear ip ospf neighbor *
  switch#
  ```
- This command resets the OSPF neighbor statistics for the specified Ethernet 3 interface.
  ```
  switch#clear ip ospf neighbor ethernet 3
  switch##
  ```
compatible (OSPFv2)

The compatible command allows the selective disabling of compatibility with RFC 2328.

The no compatible and default compatible commands reverts OSPF to RFC 2328 compatible and removes the compatible statement from running-config.

Command Mode
   Router-OSPF Configuration

Command Syntax
   compatible rfc1583
   no compatible rfc1583
   default compatible rfc1583

Example
   • This command sets the OSPF compatibility list with RFC 1583.
     switch(config)#router ospf 6
     switch(config-router-ospf)#compatible rfc1583
     switch(config-router-ospf)#
   • This command disables RFC 1583 compatibility.
     switch(config)#router ospf 6
     switch(config-router-ospf)# no compatible rfc1583
     switch(config-router-ospf)#
default-information originate (OSPFv2)

The **default-information originate** command enables default route origination for normal areas. The user user may configure the metric value and metric type used in LSAs. The **always** option will cause the ASBR to create and advertise a default route whether or not one is configured.

The **no default-information originate** command prevents the advertisement of the default route. The **default default-information originate** command enables default route origination with default values (metric type 2, metric=1).

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```
default-information originate [FORCE][VALUE][TYPE][MAP]
no default-information originate
default default-information originate
```

All parameters can be placed in any order.

**Parameters**

- **FORCE** advertisement forcing option. Values include:
  - <no parameter>
  - always
- **VALUE** Values include:
  - <no parameter>
  - metric <1-65535>
- **TYPE** Values include:
  - <no parameter>
  - metric-type <1-2>
- **MAP** sets attributes in the LSA based on a route map. Values include:
  - <no parameter>
  - route-map map_name.

**Examples**

- These commands will always advertise the OSPFv2 default route regardless of whether the switch has a default route configured.
  ```
  switch(config)#router ospf 1
  switch((config-router-ospf)#default-information originate always
  switch(config-router-ospf)#show active
  router ospf 1
  default-information originate always
  ```
- These commands advertise a default route with a metric of 100 and an external metric type of 1 if a default route is configured.
  ```
  switch(config)#router ospf 1
  switch((config-router-ospf)#default-information originate metric 100 metric-type 1
  ```
distance ospf (OSPFv2)

The distance ospf intra-area command specifies the administrative distance for routes in a single OSPFv2 area. The default administrative distance for intra-area, inter-area and external routes is 110.

The no distance ospf intra-area and default distance ospf intra-area commands remove the distance ospf intra-area command from running-config, returning the OSPFv2 administrative distance settings to the default value of 110.

Command Mode

Router-OSPF Configuration

Command Syntax

```
distance ospf AREA_TYPE distance
no distance ospf AREA_TYPE
default distance ospf AREA_TYPE
```

Parameters

- **AREA_TYPE** specifies routes for which administrative distance is to be set. Values include:
  - external
  - inter-area
  - intra-area

- **distance** Values range from 1 to 255. Default value is 110 for all types.

Example

- This command configures a distance of 85 for all OSPFv2 intra-area routes on the switch.

  ```
switch(config)#router ospf 6
switch(config-router-ospf)#distance ospf intra-area 85
switch(config-router-ospf)#
  ```
**distribute-list in**

A distribute list uses a route map or prefix list to filter specific routes from incoming OSPF LSAs. Filtering occurs after SPF calculation. The filtered routes are not installed on the switch, but are still included in LSAs sent by the switch. The `distribute-list in` command creates a distribute list in the configuration mode OSPF instance.

If a prefix list is used, destination prefixes that do not match the prefix list will not be installed. If a route map is used, routes may be filtered based on address, next hop, or metric. OSPF external routes may also be filtered by metric type or tag.

The `no distribute-list in` and `default distribute-list in` commands remove the `distribute-list in` command from `running-config`.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```
distribute-list {prefix-list|route-map} list_name in
no distribute-list {prefix-list|route-map}
default distribute-list {prefix-list|route-map}
```

**Parameters**

- `prefix-list` specifies a prefix-list as the filter.
- `route-map` specifies a route-map as the filter.
- `list_name` the name of the prefix-list or route-map used to filter routes from incoming LSAs.

**Example**

- These commands configure a prefix list named “dist_list1” in OSPF instance 5 to filter certain routes from incoming OSPF LSAs.

  switch(config)#router ospf 5
  switch(config-router-ospf)#distribute-list prefix-list dist_list1 in
  switch(config-router-ospf)#
ip ospf authentication

The `ip ospf authentication` command enables OSPFv2 authentication for the configuration mode interface.

The `no ip ospf authentication` and `default ip ospf authentication` commands disable OSPFv2 authentication on the configuration mode interface by removing the corresponding `ip ospf` authentication command from `running-config`.

Command Mode

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

Command Syntax

```
ip ospf authentication [METHOD]
no ip ospf authentication
default ip ospf authentication
```

Parameters

- `METHOD` OSPFv2 authentication method. Options include:
  - <no parameter>
  - `message-digest`

Examples

- This command enables simple authentication on VLAN 12.
  
  ```
  switch(config)#interface vlan 12
  switch(config-if-vl12)#ip ospf authentication
  switch(config-if-vl12)#
  ```

- This command enables message-digest authentication on VLAN 12.
  
  ```
  switch(config-if-vl12)#ip ospf authentication message-digest
  switch(config-if-vl12)#
  ```
ip ospf authentication-key

The ip ospf authentication-key command configures the OSPFv2 authentication password for the configuration mode interface.

The no ip ospf authentication-key and default ip ospf authentication-key commands removes the OSPFv2 authentication password from the configuration mode interface by removing the corresponding ip ospf authentication-key command from running-config.

Command Mode

  Interface-Ethernet Configuration
  Interface-Port-Channel Configuration
  Interface-VLAN Configuration

Command Syntax

  ip ospf authentication-key [ENCRYPT_TYPE] key_text
  no ip ospf authentication-key
  default ip ospf authentication-key

Parameters

  • ENCRYPT_TYPE encryption level of the key_text parameter. Values include:
    • <no parameter> the key_text is in clear text.
    • 0 key_text is in clear text. Equivalent to <no parameter>.
    • 7 key_text is MD5 encrypted.
  • key_text the authentication-key password.

Example

  • This command specifies a password in clear text.

    switch(config)#interface vlan 12
    switch(config-if-Vl12)#ip ospf authentication-key 0 code123
    switch(config-if-Vl12)#show active
      interface Vlan12
        ip ospf authentication-key 7 baY1lFzVbCx4yHqlIhmMdw==
    switch(config-if-Vl12)#

    Running-config stores the password as an encrypted string.
**ip ospf cost**

The `ip ospf cost` command configures the OSPFv2 cost for the configuration mode interface. The default cost depends on the interface type:

- Ethernet: determined by the `auto-cost reference-bandwidth (OSPFv2)` command.
- Port channel: 10.
- VLAN: 10.

The `no ip ospf cost` and `default ip ospf cost` commands restore the default OSPFv2 cost for the configuration mode interface by removing the corresponding `ip ospf cost` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ip ospf cost interface_cost
no ip ospf cost
default ip ospf cost
```

**Parameters**

- `interface_cost` Value ranges from 1 to 65535; default is 10.

**Examples**

- This command configures a cost of 15 for VLAN 2.
  
  ```
  switch(config)#interface vlan 2
  switch(config-if-Vl2)#ip ospf cost 15
  ```

  ```
  switch(config-if-Vl2)#
  ```
ip ospf dead-interval

The `ip ospf dead-interval` command configures the dead interval for the configuration mode interface.

The `no ip ospf dead-interval` and `default ip ospf dead-interval` commands restore the default dead interval of 40 seconds on the configuration mode interface by removing the corresponding `ip ospf dead-interval` command from `running-config`.

Command Mode
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

Command Syntax
```
ip ospf dead-interval time
no ip ospf dead-interval
default ip ospf dead-interval
```

Parameters
- `time` Value ranges from 1 to 8192; default is 40.

Example
- This command configures a dead interval of 120 seconds for VLAN 4.
  ```
  switch(config)#interface vlan 4
  switch(config-if-Vl4)#ip ospf dead-interval 120
  switch(config-if-Vl4)#
  ```
**ip ospf hello-interval**

The `ip ospf hello-interval` command configures the OSPFv2 hello interval for the configuration mode interface.

The same hello interval should be specified for Each OSPFv2 neighbor, and should not be longer than any neighbor's dead interval.

The `no ip ospf hello-interval` and `default ip ospf hello-interval` commands restore the default hello interval of 10 seconds on the configuration mode interface by removing the `ip ospf hello-interval` command from `running-config`.

**Command Mode**

   Interface-Ethernet Configuration
   Interface-Port-Channel Configuration
   Interface-VLAN Configuration

**Command Syntax**

```
ip ospf hello-interval time
no ip ospf hello-interval
default ip ospf hello-interval
```

**Parameters**

- `time` hello interval (seconds). Values range from 1 to 8192; default is 10.

**Example**

- This command configures a hello interval of 30 seconds for VLAN 2.

    ```
    switch(config)#interface vlan 2
    switch(config-if-Vl2)#ip ospf hello-interval 30
    switch(config-if-Vl2)#
    ```
ip ospf message-digest-key

The `ip ospf message-digest-key` command configures a message digest authentication key for the configuration mode interface.

The `no ip ospf message-digest-key` and `default ip ospf message-digest-key` commands remove the message digest authentication key for the specified key ID on the configuration mode interface by deleting the corresponding `ip ospf message-digest-key` command from `running-config`.

Command Mode

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

Command Syntax

```
ip ospf message-digest-key key_id md5 ENCRYPT_TYPE key_text
no ip ospf message-digest-key key_id
default ip ospf message-digest-key key_id
```

Parameters

- `key_id` key ID number. Value ranges from 1 to 255.
- `ENCRYPT_TYPE` encryption level of the `key_text` parameters. Values include:
  - `<no parameter>`
  - `0` `key_text`
  - `7` `key_text`
- `key_text` message key (password).

Example

- This command configures `code123` as the MD5 key with a corresponding key ID of 23.

```
switch(config)#interface vlan 12
switch(config-if-vl12)#ip ospf message-digest-key 23 md5 0 code123
switch(config-if-vl12)#
```

`Running-config` stores the password as an encrypted string.
**ip ospf name-lookup**

The `ip ospf name-lookup` command causes the switch to display DNS names in place of numeric OSPFv2 router IDs in all OSPFv2 show commands, including:

- `show ip ospf`
- `show ip ospf border-routers`
- `show ip ospf database <link state list>`
- `show ip ospf database database-summary`
- `show ip ospf database <link-state details>`
- `show ip ospf interface`
- `show ip ospf neighbor`
- `show ip ospf request-list`
- `show ip ospf retransmission-list`.

The `no ip ospf name-lookup` and `default ip ospf name-lookup` commands remove the `ip ospf name-lookup` command from `running-config`, restoring the default behavior of displaying OSPFv2 router IDs by their numeric value.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip ospf name-lookup
no ip ospf name-lookup
default ip ospf name-lookup
```

**Example**

- This command programs the switch to display OSPFv2 router IDs by the corresponding DNS name in subsequent show commands.

```
switch(config)#ip ospf lookup
switch(config)#
```
ip ospf network point-to-point

The `ip ospf network point-to-point` command sets the configuration mode interface as a point-to-point link. By default, interfaces are configured as broadcast links.

The `no ip ospf network` and `default ip ospf network` commands set the configuration mode interface as a broadcast link by removing the corresponding `ip ospf network` command from `running-config`.

Command Mode

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

Command Syntax

- `ip ospf network point-to-point`
- `no ip ospf network`
- `default ip ospf network`

Examples

- These commands configure Ethernet interface 10 as a point-to-point link.
  
  ```
  switch(config)#interface ethernet 10
  switch(config-if-Etl0)#ip ospf network point-to-point
  switch(config-if-Etl0)#
  ```

- This command restores Ethernet interface 10 as a broadcast link.
  
  ```
  switch(config-if-Etl0)#no ip ospf network
  switch(config-if-Etl0)#
  ```
ip ospf priority

The **ip ospf priority** command configures OSPFv2 router priority for the configuration mode interface.

The **no ip ospf priority** and **default ip ospf priority** commands restore the default priority (1) on the configuration mode interface by removing the corresponding **ip ospf priority** command from **running-config**.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ip ospf priority priority_level
no ip ospf priority
default ip ospf priority
```

**Parameters**

- **priority_level** priority level. Value ranges from 0 to 255. Default value is 1.

**Examples**

- This command configures a router priority of 15 for VLAN 8.
  ```
  switch(config)#interface vlan 8
  switch(config-if-Vl8)#ip ospf priority 15
  switch(config-if-Vl8)#
  ```

- This command restores the router priority of 1 for VLAN 7.
  ```
  switch(config)#interface vlan 7
  switch(config-if-Vl7)#no ip ospf priority
  switch(config-if-Vl7)#
  ```
ip ospf retransmit-interval

The `ip ospf retransmit-interval` command configures the link state advertisement retransmission interval for the interface.

The `no ip ospf retransmit-interval` and `default ip ospf retransmit-interval` commands restore the default retransmission interval of 5 seconds on the configuration mode interface by removing the corresponding `ip ospf retransmit-interval` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `ip ospf retransmit-interval period`
- `no ip ospf retransmit-interval`
- `default ip ospf retransmit-interval`

**Parameters**
- `period` retransmission interval (seconds). Value ranges from 1 to 8192; default is 5.

**Example**
- This command configures a retransmission interval of 15 seconds for VLAN 3.

```
switch(config)#interface vlan 3
switch(config-if-Vl3)#ip ospf retransmit-interval 15
switch(config-if-Vl3)#
```
**ip ospf shutdown**

The `ip ospf shutdown` command disables OSPFv2 on the configuration mode interface without disrupting the OSPFv2 configuration. When OSPFv2 is enabled on the switch, the it is also enabled by default on all interfaces.

The OSPFv2 instance is disabled on the entire switch with the `shutdown (OSPFv2)` command.

The `no ip ospf shutdown` and `default ip ospf shutdown` commands enable OSPFv2 on the configuration mode interface by removing the corresponding `ip ospf shutdown` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `ip ospf shutdown`
- `no ip ospf shutdown`
- `default ip ospf shutdown`

**Examples**
- This command shuts down OSPFv2 activity on VLAN 5.
  ```
  switch(config)#interface vlan 5
  switch(config-if-Vl5)#ip ospf shutdown
  switch(config-if-Vl5)#
  ```
- This command resumes OSPFv2 activity on VLAN 5.
  ```
  switch(config-if-Vl5)#no ip ospf shutdown
  switch(config-if-Vl5)#
  ```
ip ospf transmit-delay

The `ip ospf transmit-delay` command configures the transmission delay for OSPFv2 packets over the configuration mode interface.

The `no ip ospf transmit-delay` and `default ip ospf transmit-delay` commands restore the default transmission delay (one second) on the configuration mode interface by removing the corresponding `ip ospf transmit-delay` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

- `ip ospf transmit-delay trans`
- `no ip ospf transmit-delay`
- `default ip ospf transmit-delay`

**Parameters**
- `trans` LSA transmission delay (seconds). Value ranges from 1 to 8192; default is 1.

**Example**
- This command configures a transmission delay of 5 seconds for VLAN 6.
  
  ```
  switch(config)#interface vlan 6
  switch(config-if-Vl6)#ip ospf transmit-delay 5
  switch(config-if-Vl6)#
  ```
log-adjacency-changes (OSPFv2)

The log-adjacency-changes command enables syslog messages to be sent when it detects OSPFv2 link state changes or when it detects that a neighbor has gone up or down. Log message sending is enabled by default.

The default log-adjacency-changes command restores the default state by removing the log-adjacency-changes statement from running-config.

The default option (sending a message only when a neighbor goes up or down) is active when running-config does not contain any form of the command. Entering the command in any form replaces the previous command state in running-config.

The no log-adjacency-changes disables link state change syslog reporting.

The default log-adjacency-changes command restores the default state by removing the log-adjacency-changes detail or no log-adjacency-changes statement from running-config.

Command Mode

Router-OSPF Configuration

Command Syntax

    log-adjacency-changes
    log-adjacency-changes detail
    no log-adjacency-changes
    default log-adjacency-changes

Examples

- This command configures the switch to send a syslog message when a neighbor goes up or down.
  
  ```
  switch(config)#router ospf 6
  switch(config-router-ospf)#log-adjacency-changes
  switch(config-router-ospf)#
  ```

  After entering the command, show active does not display a log-adjacency-changes statement.

  ```
  switch(config-router-ospf)#show active
  router ospf 1
  switch(config-router-ospf)#
  ```

- This command configures the switch to send a syslog message when it detects any link state change.

  ```
  switch(config-router-ospf)#log-adjacency-changes detail
  switch(config-router-ospf)#
  ```

  After entering the command, show active displays a log-adjacency-changes detail command.

  ```
  switch(config-router-ospf)#show active
  router ospf 1
  - log-adjacency-changes detail
  switch(config-router-ospf)#
  ```
**max-lsa (OSPFv2)**

The `max-lsa` command specifies the number of LSAs allowed in the LSDB. Setting the limit to zero removes the LSDB restriction and disables LSA overload actions. Actions triggered by LSDB overload conditions include:

- Warning
- Temporary shutdown
- Permanent shutdown

The `no max-lsa` and `default max-lsa` commands restore all LSA overload parameters to their default settings by placing the `max-lsa 12000` statement in `running-config`.

**Command Mode**
- Router-OSPF Configuration

**Command Syntax**

```
max-lsa lsa_num [WARNING] [IGNORE_TIME] [IGNORE_COUNT] [RESET]
no max-lsa
default max-lsa
```

**Parameters**

- `lsa_num` maximum number of LSAs. Value ranges from 0 to 100,000.
  - 0 disables overload protection
  - 1 to 100000 Default value is 12,000.
- `WARNING` warning threshold, as a percentage of the maximum number of LSAs (% of `lsa_num`).
  - <no parameter> Default of 75%.
  - `percent` Ranges from 25 to 99.
- `IGNORE_TIME` temporary shutdown period (minutes). Options include:
  - <no parameter> Default value of 5 minutes.
  - `ignore-time period` Value ranges from 1 to 60.
- `IGNORE_COUNT` number of temporary shutdowns required to trigger a permanent shutdown.
  - <no parameter> Default value of 5.
  - `ignore-count episodes` Ranges from 1 to 20.
- `RESET` period of not exceeding LSA limit required to reset temporary shutdown counter to zero.
  - <no parameter> Default value of 5 minutes
  - `reset-time r_period` Ranges from 1 to 60.

**Example**

- This command defines an LSA limit of 8,000 and other parameters.

```
switch(config-router-ospf)#max-lsa 8000 40 ignore-time 6 ignore-count 3 reset-time 20
```
max-metric router-lsa (OSPFv2)

The **max-metric router-lsa** command configures OSPF to include the maximum value in LSA metric fields to keep other network devices from using the switch as a preferred intermediate SPF hop.

The **no max-metric router-lsa** and **default max-metric router-lsa** commands disable the advertisement of a maximum metric.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```
max-metric router-lsa [EXTERNAL] [STUB] [STARTUP] [SUMMARY]
no max-metric router-lsa [EXTERNAL] [STUB] [STARTUP] [SUMMARY]
default max-metric router-lsa [EXTERNAL] [STUB] [STARTUP] [SUMMARY]
```

All parameters can be placed in any order.

**Parameters**

- **EXTERNAL** advertised metric value. Values include:
  - `<no parameter>` Default value of 1.
  - `external-lsa`
  - `external-lsa <1 to 16777215>` Default value is `0xFF0000`.

- **STUB** advertised metric type. Values include:
  - `<no parameter>` Default value of 2.
  - `include-stub`

- **STARTUP** limit scope of LSAs. Values include:
  - `<no parameter>`
  - `on-startup`
  - `on-startup wait-for-bgp`
  - `on-startup <5 to 86400>`
  - `wait-for-bgp` or an `on-start` time value is not included in no and default commands.

- **SUMMARY** advertised metric value. Values include:
  - `<no parameter>`
  - `summary-lsa`
  - `summary-lsa <1 to 16777215>`

**Example**

- This command configures OSPF to to include the maximum value in LSA metric fields until BGP has converged:

  ```
  switch(config-router-ospf)##max-metric router-lsa on-startup wait-for-bgp
  switch(config-router-ospf)##
  ```
maximum-paths (OSPFv2)

The `maximum-paths` command controls the number of parallel routes that OSPFv2 supports. The default maximum is 16 paths.

The `no maximum-paths` and `default maximum-paths` commands restore the maximum number of parallel routes that OSPFv2 supports on the switch to the default value of 16 by placing the `maximum-paths 16` statement in `running-config`.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```
maximum-paths paths
no maximum-paths
default maximum-paths
```

**Parameters**

- `paths` maximum number of parallel routes.
  
  Value ranges from 1 to the number of interfaces available per ECMP group, which is platform dependent.
  
  - Arad: Value ranges from 1 to 128. Default value is 128.
  - FM6000: Value ranges from 1 to 32. Default value is 32.
  - PetraA: Value ranges from 1 to 16. Default value is 16.
  - Trident: Value ranges from 1 to 32. Default value is 32.
  - Trident-II: Value ranges from 1 to 128. Default value is 128.

**Example**

- This command configures the maximum number of OSPFv2 parallel paths to 12.

```
switch(config)#router ospf 6
switch(config-router-ospf)#maximum-paths 12
switch(config-router-ospf)#
```
network area (OSPFv2)

The **network area** command assigns the specified IPv4 subnet to an OSPFv2 area. The **no network area** and **default network area** commands delete the specified network area assignment by removing the corresponding **network area** command from **running-config**.

**Command Mode**
Router-OSPF Configuration

**Command Syntax**

```
network ipv4_subnet area area_id
no network ipv4_subnet area area_id
default network ipv4_subnet area area_id
```

**Parameters**

- **ipv4_subnet** IPv4 subnet. Entry formats include address-prefix (CIDR) or address-wildcard mask.  
  **running-config** stores value in CIDR notation.
- **area_id** area number. `<0 to 4294967295>` or `<0.0.0.0 to 255.255.255.255>`  
  **Running-config** stores value in dotted decimal notation.

**Example**

- These equivalent commands each assign the subnet 10.1.0.0/24 to area 0.

```bash
switch(config-router-ospf)#network 10.1.0.0 0.0.0.255 area 0
switch(config-router-ospf)#
```

```bash
switch(config-router-ospf)#network 10.1.0.0/24 area 0
switch(config-router-ospf)#
```
no area (OSPFv2)

The no area <type> command removes the corresponding area <type> command from running-config:

- no/default area nssa translate type7 always commands remove the translate type7 always parameter without changing the area type.
- no/default area nssa, no/default area stub, and no/default area stub no-summary commands restore the area’s type to normal.
- no/default area default-information-originate command removes all area commands for the specified area from running-config.
- no/default area command removes all area commands for the specified area from running-config.
- no/default area command removes all area commands for the specified area from running-config.

Command Mode
Router-OSPF Configuration

Command Syntax

```
no area area_id [TYPE]
default area area_id [TYPE]
```

Parameters

- **area_id** area number.
  - Valid formats: integer <1 to 4294967295> or dotted decimal <0.0.0.1 to 255.255.255.255>
  - Area 0 (or 0.0.0.0) is not configurable; it is always normal.
  - Running-config stores value in dotted decimal notation.
- **TYPE** area type. Values include:
  - nssa
  - nssa translate type7 always
  - stub
  - stub no-summary

Examples

- These commands remove area 1 from the running configuration.
  ```
  switch(config)#router ospf 6
  switch(config-router-ospf)# no area 1
  switch(config-router-ospf)#
  ```
- These commands remove area 10.92.148.17 as an NSSA.
  ```
  switch(config-router-ospf)#no area 10.92.148.17 nssa
  switch(config-router-ospf)#
  ```
passive-interface default (OSPFv2)

The `passive-interface default` command configures all interfaces as OSPFv2 passive by default. The switch advertises the passive interface as part of the router LSA.

The `passive-interface <interface> (OSPFv2)` configures the OSPFv2 active-passive status for a specific interface:

- When `passive-interface default` is not set, all interfaces are OSPFv2 active by default and passive interfaces are denoted by `passive-interface <interface>` statements in `running-config`.
- When `passive-interface default` is set, all interfaces are OSPFv2 passive by default and active interfaces are denoted by `no passive-interface <interface>` statements in `running-config`.

The `no passive-interface` and `default passive-interface` commands configures all interfaces as OSPFv2 active by default by removing the `passive-interface default` statement from `running-config`.

Command Mode

- Router-OSPF Configuration

Command Syntax

```
passive-interface default
no passive-interface default
default passive-interface default
```

Examples

- This command configures the default interface setting as OSPFv2 passive. This command also removes all `passive-interface <interface>` statements from `running-config`.

```
switch(config)#router ospf 6
switch(config-router-ospf)#passive-interface default
switch(config-router-ospf)#
```

- This command configures the default interface setting as OSPFv2 active. This command also removes all `no passive-interface <interface>` statements from `running-config`.

```
switch(config-router-ospf)#no passive-interface default
switch(config-router-ospf)#
```
passive-interface <interface> (OSPFv2)

The `passive-interface` command disables OSPFv2 on an interface range. The switch advertises the passive interface as part of the LSA.

The default OSPFv2 interface activity is configured by the `passive-interface default (OSPFv2)` command:

- When `passive-interface default` is not set, all interfaces are OSPFv2 active by default and passive interfaces are denoted by `passive-interface <interface>` statements in `running-config`.
- When `passive-interface default` is set, all interfaces are OSPFv2 passive by default and active interfaces are denoted by `no passive-interface <interface>` statements in `running-config`.

The `no passive-interface` command enables OSPFv2 on the specified interface range. The `default passive-interface` command sets the interface to the default interface activity setting by removing the corresponding `passive-interface` or `no passive-interface` statement from `running-config`.

**Command Mode**
Router-OSPF Configuration

**Command Syntax**
```
passive-interface INTERFACE_NAME
no passive-interface INTERFACE_NAME
default passive-interface INTERFACE_NAME
```

**Parameters**
- `INTERFACE_NAME` interface to be configured. Options include:
  - `ethernet e_range`
  - `port-channel p_range`
  - `vlan v_range`
  - `vxlan vx_range`

**Examples**
- These commands configure Ethernet interfaces 2 through 5 as passive interfaces.
  ```
  switch(config)#router ospf 6
  switch(config-router-ospf)#passive-interface ethernet 2-5
  switch(config-router-ospf)#
  ```
- This command configures VLAN interfaces 50-54, 61, 68, and 102-120 as passive interfaces.
  ```
  switch(config-router-ospf)#passive-interface vlan 50-54,61,68,102-120
  switch(config-router-ospf)#
  ```
- This command configures VLAN 2 as an active interface.
  ```
  switch(config-router-ospf)#no passive-interface vlan 2
  switch(config-router-ospf)#
  ```
point-to-point routes (OSPFv2)

The point-to-point routes command enables the switch to maintain a local routing information base (RIB) to store information it learns from its neighbors.

The `point-to-point routes` and `default point-to-point routes` commands program the switch to include point-to-point links in its RIB by removing the `no point-to-point routes` command from `running-config`.

**Command Mode**
- Router-OSPF Configuration

**Command Syntax**

```
point-to-point routes
no point-to-point routes
default point-to-point routes
```

**Examples**

- This command configures the switch to optimize the local RIB by not including point-to-point routes.

  ```
  switch(config)#router ospf 6
  switch(config-router-ospf)#no point-to-point routes
  switch(config-router-ospf)#
  ```

- This command configures the switch to include point-to-point routes.

  ```
  switch(config-router-ospf)#point-to-point routes
  switch(config-router-ospf)#
  ```
redistribute (OSPFv2)

The `redistribute` command enables the advertising of all specified routes on the switch into the OSPFv2 domain as external routes.

The `no redistribute` and `default redistribute` commands remove the corresponding `redistribute` command from `running-config`, disabling route redistribution for the specified route type.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```
redistribute ROUTE_TYPE [ROUTE_MAP]
no redistribute ROUTE_TYPE
default redistribute ROUTE_TYPE
```

**Parameters**

- **ROUTE_TYPE**  
  source from which routes are redistributed. Options include:
  - `connected`  
  - `BGP`  
  - `RIP`  
  - `static`  

- **ROUTE_MAP**  
  route map that determines the routes that are redistributed. Options include:
  - `<no parameter>`  
  - `route-map map_name`

**Examples**

- The `redistribute static` command starts the advertising of static routes as OSPFv2 external routes.
  ```
  switch(config)#router ospf 6
  switch(config-router-ospf)#redistribute static
  switch(config-router-ospf)#
  ```

- The `no redistribute bgp` command stops the advertising of BGP routes as OSPFv2 external routes.
  ```
  switch(config-router-ospf)#no redistribute bgp
  switch(config-router-ospf)#
  ```
router-id (OSPFv2)

The `router-id` command assigns a router ID for an OSPFv2 instance. This number uniquely identifies the router within an Autonomous System. Status commands use the router ID to identify the switch.

The switch sets the router ID to the first available alternative in the following list:

1. The `router-id` command.
2. The loopback IP address, if a loopback interface is configured on the switch.
3. The highest IP address present on the router.

**Important!** When configuring VXLAN on an MLAG, always manually configure the OSPFv2 router ID to prevent the switch from using the common VTEP IP address as the router ID.

The `no router-id` and `default router-id` commands remove the router ID command from `running-config`; the switch uses the loopback or highest address as the router ID.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```
router-id  identifier
no router-id [identifier]
default router-id [identifier]
```

**Parameters**

- `identifier` Value ranges from 0.0.0.0 to 255.255.255.255.

**Example**

- This command assigns 10.5.4.2 as the router ID for the OSPFv2 instance.
  
  ```
  switch(config)#router ospf 6
  switch(config-router-ospf)#router-id 10.5.4.2
  switch(config-router-ospf)#
  ```
router ospf

The `router ospf` command places the switch in router-ospf configuration mode. The switch will create a process ID for the new instance if one does not already exist. The `exit` command returns the switch to global configuration mode.

The `show ip ospf` command displays the process ID of the OSPFv2 instances configured on the switch.

The `no router ospf` and `default router ospf` commands delete the specified OSPFv2 instance.

Router-ospf configuration mode is not a group change mode; `running-config` is changed immediately upon entering commands. Exiting router-ospf configuration mode does not affect `running-config`. The `exit` command returns the switch to global configuration mode.

Refer to Router-OSPFv2 Configuration Mode (page 1654) for a list of commands available in router-ospf configuration mode.

Command Mode

Global Configuration

Command Syntax

```
router ospf process_id [VRF_INSTANCE]
no router ospf process_id [VRF_INSTANCE]
default router ospf process_id [VRF_INSTANCE]
```

Parameters

- `process_id` OSPFv2 process ID. Values range from 1 to 65535.
- `VRF_INSTANCE`
  - `<no parameter>`
  - `vrf vrf_name`

Examples

- This command creates an OSPFv2 instance with process ID 145 in the main VRF.
  
  ```
  switch(config)#router ospf 145
  switch(config-router-ospf)#
  ```

- This command deletes the specified OSPFv2 instance.
  
  ```
  switch(config)#no router ospf 145
  switch(config)#
  ```
show ip ospf

The `show ip ospf` command displays OSPFv2 routing information

**Command Mode**
EXEC

**Command Syntax**
```
show ip ospf [PROCESS_ID] [VRF_INSTANCE]
```

**Parameters**
- `PROCESS_ID` OSPFv2 process ID. Values include:
  - `<no parameter>`
  - `<1 to 65535>`
- `VRF_INSTANCE` specifies the VRF instance.
  - `<no parameter>`
  - `vrf vrf_name`
Example

- This command displays configuration parameters, operational statistics, status of the OSPFv2 instance, and a brief description of the areas on the switch.

```
switch>show ip ospf
Routing Process "ospf 1" with ID 10.168.103.1 VRF default
Supports opaque LSA
Maximum number of LSA allowed 12000
  Threshold for warning message 75%
  Ignore-time 5 minutes, reset-time 5 minutes
  Ignore-count allowed 5, current 0
  It is an area border router
  Hold time between two consecutive SPF's 5000 msecs
  SPF algorithm last executed 00:00:09 ago
  Minimum LSA interval 5 secs
  Minimum LSA arrival 1000 msecs
  Number of external LSA 0. Checksum Sum 0x000000
  Number of opaque AS LSA 0. Checksum Sum 0x000000
  Number of LSA 27.
  Number of areas in this router is 3. 3 normal 0 stub 0 nssa
  Area BACKBONE(0.0.0.0)
    Number of interfaces in this area is 2
    It is a normal area
    Area has no authentication
    SPF algorithm executed 153 times
    Number of LSA 8. Checksum Sum 0x03e13a

  Area 0.0.0.2
    Number of interfaces in this area is 1
    It is a normal area
    Area has no authentication
    SPF algorithm executed 153 times
    Number of LSA 11. Checksum Sum 0x054e57
    Number of opaque link LSA 0. Checksum Sum 0x000000
  Area 0.0.0.3
    Number of interfaces in this area is 1
    It is a normal area
    Area has no authentication
    SPF algorithm executed 5 times
    Number of LSA 6. Checksum Sum 0x02a401
    Number of opaque link LSA 0. Checksum Sum 0x000000
```
**show ip ospf border-routers**

The `show ip ospf border-routers` command displays the internal OSPFv2 routing table entries to area border routers (ABRs) and autonomous system boundary routers (ASBRs) for each of the OSPFv2 areas.

**Command Mode**

EXEC

**Command Syntax**

```
show ip ospf border-routers [VRF_INSTANCE]
```

**Parameters**

- **VRF_INSTANCE** specifies the VRF instance.
- <no parameter>
- `vrf vrf_name`

**Example**

- This command displays the ABRs and ASBRs

```
switch>show ip ospf border-routers
OSPF Process 10.17.0.42, VRF default

Router ID       Area       Type
10.17.0.1       0.0.0.0    ASBR
switch>
```
show ip ospf database database-summary

The `show ip ospf database database-summary` command displays the number of link state advertisements in the OSPFv2 database.

**Command Mode**

EXEC

**Command Syntax**

```
show ip ospf [AREA] database database-summary [VRF_INSTANCE]
```

**Parameters**

- `VRF_INSTANCE` specifies the VRF instance.
- `<no parameter>`
- `vrf vrf_name`

- `AREA` areas for which command displays data. Specifying an individual area requires entering the process ID where the area is located. Options include:
  - `<no parameter>`
  - `process_id`
  - `process_id area_id`
  - `process_id` input range: <1 to 65535>
  - `area_id` input range: <0 to 4294967295> or <0.0.0.0 to 255.255.255.255>

**Example**

- This command displays the LSDB content summary for area 0.
  ```
  switch>show ip ospf 1 0 database database-summary
  LSA Type    Count
  Router      18
  Network     21
  Summary Net 59
  Summary ASBR 4
  Type-7 Ext 0
  Opaque Area 0
  Type-5 Ext 4238
  Opaque AS 0
  Total 4340
  ```
  ```switch>```
show ip ospf database <link state list>

The `show ip ospf database <link state list>` command displays the OSPFv2 link state advertisements that originate on a specified switch.

**Command Mode**
EXEC

**Command Syntax**
```
show ip ospf [AREA] database [ROUTER] [VRF_INSTANCE]
```

**Parameters**
- **AREA** areas for which command displays data. Specifying an individual area requires entering the process ID where the area is located. Options include:
  - <no parameter>
  - process_id
  - process_id area_id
  - process_id value ranges from 1 to 65535.
  - area_id is entered in decimal or dotted decimal notation.

- **ROUTER** router or switch for which the command provides data. Options include:
  - <no parameter>
  - adv-router [a.b.c.d]
  - self originate

- **VRF INSTANCE** specifies the VRF instance.
  - <no parameter>
  - vrf vrf_name

**Example**
- This command displays OSPFv2 LSAs that originate at the router with a router ID of 10.26.0.31.
```
switch>show ip ospf database adv-router 10.26.0.31
```

```
OSPF Router with ID(10.26.0.23) (Process ID 1) (VRF default)

10.26.0.31     10.26.0.31     918         0x80002b4a   0x1315   3

<-------OUTPUT OMITTED FROM EXAMPLE-------->

Type 11 Opaque LSDB

```
switch>
```

```
```
show ip ospf database <link-state details>

The `show ip ospf database <link-state details>` command displays details of the specified link state advertisements.

**Command Mode**

EXEC

**Command Syntax**

```
show ip ospf [AREA] database LINKSTATE_TYPE linkstate_id [ROUTER] [VRF_INSTANCE]
```

**Parameters**

- **AREA**  areas for which command displays data. Specifying an individual area requires entering the process ID where the area is located. Options include:
  - <no parameter>
  - process_id
  - process_id area_id
  - process_id input range: <1 to 65535>
  - area_id input range: <0 to 4294967295> or <0.0.0.0 to 255.255.255.255>

- **LINKSTATE_TYPE**  link state types. Parameter options include:
  - detail Displays all link states.
  - router
  - network
  - summary
  - asbr-summary
  - external
  - nssa-external
  - opaque-link
  - opaque-area
  - opaque-as

- **linkstate_id**  Network segment described by the LSA (dotted decimal notation). Value depends on the LSA type.

- **ROUTER**  router or switch for which the command provides data. Options include:
  - <no parameter>
  - adv-router [a.b.c.d]
  - self-originate

- **VRF_INSTANCE** parameter has no effect; this command displays information about the specified process and area regardless of VRF.
  - <no parameter>
  - vrf vrf_name
Examples

- This command displays the router link states contained in the area 2 LSDB.

```
switch>show ip ospf 1 2 database router

switch>
```
**show ip ospf interface**

The `show ip ospf interface` command displays interface information that is related to OSPFv2.

**Command Mode**

EXEC

**Command Syntax**

```
show ip ospf [PROCESS_ID] interface [INTERFACE_NAME] [VRF_INSTANCE]
```

**Parameters**

- `PROCESS_ID`  OSPFv2 process ID. Values include:
  - `<no parameter>`
  - `1 to 65535`
- `INTERFACE_NAME`  Interface type and number. Values include
  - `<no parameter>`
  - `ethernet e_num`
  - `loopback l_num`
  - `port-channel p_num`
  - `vlan v_num`
- `VRF_INSTANCE`  specifies the VRF instance.
  - `<no parameter>`
  - `vrf vrf_name`

**Related Command**

`show ip ospf interface brief`

**Example**

- This command displays complete OSPFv2 information for VLAN 1.

```
switch>show ip ospf interface vlan 1
Vlan1 is up, line protocol is up (connected)
 Internet Address 10.168.0.1/24, VRF default, Area 0.0.0.0
 Process ID 1, Router ID 10.168.103.1, Network Type BROADCAST, Cost: 10
 Transmit Delay is 1 sec, State BDR, Priority 1
 Designated Router is 10.168.104.2
 Backup Designated router is 10.168.103.1
 Timer intervals configured, Hello 10, Dead 40, Retransmit 5
 Neighbor Count is 1

switch>
```
show ip ospf interface brief

The show ip ospf interface brief command displays a summary of OSPFv2 information.

Command Mode
EXEC

Command Syntax
show ip ospf [PROCESS_ID] interface brief [VRF_INSTANCE]

Parameters
- **PROCESS_ID** OSPFv2 process ID. Values include:
  - <no parameter>
  - <1 to 65535>
- **VRF_INSTANCE** specifies the VRF instance.
  - <no parameter>
  - vrf vrf_name

Related Commands
show ip ospf interface

Example
This command displays a summary of interface information for the switch.

```
switch>show ip ospf interface brief
Interface    PID   Area            IP Address         Cost  State    Nbrs
Loopback0    1     0.0.0.0         10.168.103.1/24   10    DR       0
Vlan1        1     0.0.0.0         10.168.0.1/24     10    BDR      1
Vlan2        1     0.0.0.2         10.168.2.1/24     10    BDR      1
Vlan3        1     0.0.0.3         10.168.3.1/24     10    DR       0
switch>
```
**show ip ospf lsa-log**

The `show ip ospf lsa-log` command displays log entries when LSA update messages are sent or received for OSPF.

**Command Mode**

EXEC

**Command Syntax**

```
show ip ospf [PROCESS_ID] ospf-log
```

**Parameters**

- **PROCESS_ID**  
  OSPFv2 process ID. Values include:
  - `<no parameter>`
  - `<1 to 65535>`

**Examples**

- This command displays log entries when LSA update messages are sent or received for OSPF.

```
switch>show ip ospf lsa-log
OSPF Process 3.3.3.3, LSA Throttling Log:
[04:21:09] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 2000 msecs
[04:21:08] type 1: 3.3.3.3/32 [3.3.3.3], event 2, backoff restarted, new hold value 900 msecs
[04:21:00] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 3000 msecs
[04:21:00] type 1: 3.3.3.3/32 [3.3.3.3], event 4, maxwait value changed, new hold value 3000 msecs
/* Here the maxwait value was changed to 3000 from earlier 32000, this is not part of the log */
[04:20:42] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 32000 msecs
[04:20:10] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 32000 msecs
[04:19:54] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 16000 msecs
[04:19:46] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 8000 msecs
[04:19:42] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 4000 msecs
[04:19:40] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 2000 msecs
[04:19:39] type 1: 3.3.3.3/32 [3.3.3.3], event 2, backoff restarted, new hold value 900 msecs
[04:19:22] type 1: 4.4.4.4/32 [4.4.4.4], event 3, discarded, was early by 995 msecs
[04:19:22] type 1: 3.3.3.3/32 [3.3.3.3], event 0, backoff started, new hold value 1000 msecs
switch>
```
show ip ospf neighbor

The `show ip ospf neighbor` command displays OSPFv2 neighbor information for specified interfaces.

**Command Mode**

EXEC

**Command Syntax**

```
show ip ospf \[PROCESS_ID\] neighbor
\[INTERFACE_NAME\] \[NEIGHBOR\] \[DATA\] \[VRF_INSTANCE\]
```

**Parameters**

- **PROCESS_ID**  OSPFv2 process ID. Values include:
  - <no parameter>
  - <1 to 65535>
- **INTERFACE_NAME**  Interface type and number. Values include:
  - <no parameter>
  - ethernet e_num
  - loopback l_num
  - port-channel p_num
  - vlan v_num
- **NEIGHBOR**  OSPFv2 neighbor. Options include:
  - <no parameter>
  - ipv4_addr
- **DATA**  Type of information the command displays. Values include:
  - <no parameter>
  - detail
- **VRF_INSTANCE**  specifies the VRF instance.
  - <no parameter>
  - vrf vrf_name

**Examples**

- This command displays the switch’s neighbors.
  ```
  switch>show ip ospf neighbor
  Neighbor ID    VRF     Pri  State        Dead Time   Address        Interface
  10.168.104.2   default  1   FULL/DR      00:00:35    10.168.0.2     Vlan1
  10.168.104.2   default  8   FULL/BDR     00:00:31    10.168.2.2     Vlan2
  switch>
  ```

- This command displays details about the neighbors to VLAN 2.
  ```
  switch>show ip ospf neighbor vlan 2 detail
  Neighbor 10.168.104.2, VRF default, interface address 10.168.2.2
  In the area 0.0.0.2 via interface Vlan2
  Neighbor priority is 8, State is FULL, 13 state changes
  Adjacency was established 000:01:25:48 ago
  DR is 10.168.2.1 BDR is 10.168.2.2
  Options is E
  Dead timer due in 00:00:34
  switch>
  ```
**show ip ospf neighbor adjacency-changes**

The `show ip ospf neighbor adjacency-changes` command displays the OSPFv2 neighbor adjacency change log for specified interfaces.

**Command Mode**

EXEC

**Command Syntax**

`show ip ospf neighbor [INTERFACE_NAME] [NEIGHBOR] adjacency-changes [VRF_INSTANCE]`

**Parameters**

- `INTERFACE_NAME` Interface type and number. Values include:
  - <no parameter>
  - ethernet `e_num`
  - loopback `l_num`
  - port-channel `p_num`
  - vlan `v_num`
- `NEIGHBOR` OSPFv2 neighbor. Options include:
  - <no parameter>
  - ipv4_addr
  - host_name
- `VRF_INSTANCE` specifies the VRF instance.
  - <no parameter>
  - vrf `vrf_name`

**Examples**

- This command displays the adjacency changes to VLAN 2.
  
  `switch>show ip ospf neighbor vlan 2 adjacency-changes`
  
  
  
  `[08-04 09:58:58] 10.168.104.2, interface Vlan2 adjacency established`
  
  `[08-04 09:59:34] 10.168.104.2, interface Vlan2 adjacency dropped: interface went down`
  
  `[08-04 09:59:42] 10.168.104.2, interface Vlan2 adjacency established`
  
  `[08-04 10:01:40] 10.168.104.2, interface Vlan2 adjacency dropped: nbr did not list our router ID`
  
  `[08-04 10:01:46] 10.168.104.2, interface Vlan2 adjacency established`
  
  `switch>箅`
show ip ospf neighbor state

The `show ip ospf neighbor state` command displays the state information on OSPF neighbors on a per-interface basis.

**Command Mode**

EXEC

**Command Syntax**

```
show ip ospf neighbor state  STATE_NAME [VRF_INSTANCE]
```

**Parameters**

- **STATE_NAME** Output filtered by the devices OSPF state. Options include valid OSPF states:
  - 2-ways
  - attempt
  - down
  - exch-start
  - exchange
  - full
  - graceful-restart
  - init
  - loading
- **VRF_INSTANCE** specifies the VRF instance.
  - <no parameter> displays information from all VRFs, or from context-active VRF if set.
  - vrf vrf_name displays information from the specified VRF.

**Examples**

- This command displays OSPF information for neighboring routers that are fully adjacent.

  ```
  switch>show ip ospf neighbor state full
  Neighbor ID VRF Pri State     Dead Time Address Interface
  Test1     default  1 FULL/BDR 00:00:35  10.17.254.105 Vlan3912
  Test2     default  1 FULL/BDR 00:00:36  10.17.254.29  Vlan3910
  Test3     default  1 FULL/DR  00:00:35  10.25.0.1      Vlan101
  Test4     default  1 FULL/DROTHER 00:00:36  10.17.254.67 Vlan3908
  Test5     default  1 FULL/DROTHER 00:00:36  10.17.254.68 Vlan3908
  Test6     default  1 FULL/BDR  00:00:32  10.17.254.66 Vlan3908
  Test7     default  1 FULL/DROTHER 00:00:34  10.17.36.4   Vlan3036
  Test8     default  1 FULL/DR  00:00:35  10.17.36.3   Vlan3036
  Test9     default  1 FULL/DROTHER 00:00:31  10.17.254.13 Vlan3902
  Test10    default  1 FULL/BDR  00:00:37  10.17.254.11 Vlan3902
  Test11    default  1 FULL/BDR  00:00:33  10.17.254.163 Vlan3925
  Test12    default  1 FULL/DR  00:00:37  10.17.254.161 Vlan3925
  Test13    default  1 FULL/DROTHER 00:00:31  10.17.254.154 Vlan3923
  Test14    default  1 FULL/BDR  00:00:39  10.17.254.156 Vlan3923
  Test15    default  1 FULL/DROTHER 00:00:33  10.17.254.35 Vlan3911
  Test16    default  1 FULL/DR  00:00:34  10.17.254.33 Vlan3911
  Test17    default  1 FULL/DR  00:00:36  10.17.254.138 Ethernet12
  Test18    default  1 FULL/DR  00:00:37  10.17.254.2   Vlan3901
  ```

  switch>
show ip ospf neighbor summary

The `show ip ospf neighbor summary` command displays a single line of summary information for each OSPFv2 neighbor.

**Command Mode**

EXEC

**Command Syntax**

```
show ip ospf [PROCESS_ID] neighbor summary [VRF_INSTANCE]
```

**Parameters**

- **PROCESS_ID** OSPFv2 process ID. Values include:
  - <no parameter>
  - <1 to 65535>
- **VRF_INSTANCE** specifies the VRF instance.
  - <no parameter>
  - `vrf vrf_name`

**Examples**

- This command displays the summary information for the OSPFv2 neighbors.

```
switch>show ip ospf neighbor summary
OSPF Router with (Process ID 1) (VRF default)
  0 neighbors are in state DOWN
  0 neighbors are in state GRACEFUL RESTART
  2 neighbors are in state INIT
  0 neighbors are in state LOADING
  0 neighbors are in state ATTEMPT
  18 neighbors are in state FULL
  0 neighbors are in state EXCHANGE
  0 neighbors are in state 2 WAYS
  0 neighbors are in state EXCH START
switch>
```
**show ip ospf request-list**

The `show ip ospf request-list` command displays a list of all OSPFv2 link state advertisements (LSAs) requested by a router.

**Command Mode**
- EXEC

**Command Syntax**

```
show ip ospf request-list [VRF_INSTANCE]
```

**Parameters**
- `VRF_INSTANCE` specifies the VRF instance.
  - `<no parameter>`
  - `vrf vrf_name`

**Example**
- This command displays an LSA request list.

```
switch>show ip ospf request-list
Neighbor 10.168.104.2 vrf default interface: 10.168.0.2 address vlan1
  Type LS ID ADV RTR Seq No Age Checksum
Neighbor 10.168.104.2 vrf default interface: 10.168.2.2 address vlan2
  Type LS ID ADV RTR Seq No Age Checksum
switch>
```
show ip ospf retransmission-list

The **show ip ospf retransmission-list** command displays a list of all OSPFv2 link state advertisements (LSAs) waiting to be re-sent.

**Command Mode**

EXEC

**Command Syntax**

```
show ip ospf retransmission-list [VRF_INSTANCE]
```

**Parameters**

- **VRF_INSTANCE** specifies the VRF instance.
- `<no parameter>`
- `vrf vrf_name`

**Example**

- This command displays an empty retransmission list.

```
switch>show ip ospf retransmission-list
Neighbor 10.168.104.2 vrf default interface vlan1 address 10.168.0.2
LSA retransmission not currently scheduled. Queue length is 0

Type   Link ID   ADV Router   Age   Seq#  Checksum
Neighbor 10.168.104.2 vrf default interface vlan2 address 10.168.2.2
LSA retransmission not currently scheduled. Queue length is 0

Type   Link ID   ADV Router   Age   Seq#  Checksum
switch>
```
show ip ospf spf-log

The `show ip ospf spf-log` command displays when and how long the switch took to run a full SPF calculation for OSPF.

Command Mode

EXEC

Command Syntax

`show ip ospf [PROCESS_ID] ospf-log`

Parameters

- `PROCESS_ID` OSPFv2 process ID. Values include:
  - `<no parameter>`
  - `<1 to 65535>`

Examples

- This command displays the SPF information for OSPF.

  switch> `show ip ospf spf-log`
  OSPF Process 172.26.0.22
  When   Duration(msec)
  13:01:34   1.482
  13:01:29   1.547
  13:01:24   1.893
  13:00:50   1.459
  13:00:45   1.473
  13:00:40   2.603
  11:01:49   1.561
  11:01:40   1.463
  11:01:35   1.467
  11:01:30   1.434
  11:00:54   1.456
  11:00:49   1.472
  11:00:44   1.582
  15:01:49   1.575
  15:01:44   1.470
  15:01:39   1.679
  15:01:34   1.601
  15:00:57   1.454
  15:00:52   1.446
  15:00:47   1.603

  switch>
**shutdown (OSPFv2)**

The `shutdown` command disables OSPFv2 on the switch. OSPFv2 is disabled on individual interfaces with the `shutdown (OSPFv2)` command.

The `no shutdown` and `default shutdown` commands enable the OSPFv2 instance by removing the `shutdown` statement from the OSPF block in `running-config`.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```
shutdown
no shutdown
default shutdown
```

**Examples**

- This command disables OSPFv2 activity on the switch.
  
  ```
  switch(config)#router ospf 6
  switch(config-router-ospf)#shutdown
  switch(config-router-ospf)#
  ```

- This command resumes OSPFv2 activity on the switch.
  
  ```
  switch(config-router-ospf)#no shutdown
  switch(config-router-ospf)#
  ```
timers lsa arrival (OSPFv2)

The **timers lsa arrival** command sets the minimum interval for acceptance of identical link-state advertisements (LSAs) from OSPFv2 neighbors.

The **no timers lsa arrival** and **default timers lsa arrival** commands restore the minimum interval to the default of one second by removing the **timers lsa arrival** command from **running-config**.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```
    timers lsa arrival lsa_time
    no timers lsa arrival
    default timers lsa arrival
```

**Parameters**

- **lsa_time** minimum time (in milliseconds) after which the switch will accept an identical LSA from OSPFv2 neighbors. Default is 1000 (1 second).

**Example**

- This command sets the minimum LSA arrival interval to ten milliseconds.

  ```
  switch(config)#router ospf 6
  switch(config-router-ospf)#timers lsa arrival 10
  switch(config-router-ospf)#
  ```
timers throttle lsa all (OSPFv2)

The **timers throttle lsa all** command sets the rate-limiting values for OSPF link-state advertisement generation.

The **no timers throttle lsa all** and **default timers throttle lsa all** commands restore the defaults by removing the **timers throttle lsa all** command from **running-config**.

**Command Mode**
- Router-OSPF Configuration

**Command Syntax**

```
timers throttle lsa all initial_delay min_hold max_wait
no timers throttle lsa all
default timers throttle lsa all
```

**Parameters**

- **initial_delay**  Value ranges from 0 to 600000 (ms). Default is 1000.
- **min_hold**  Value ranges from 0 to 600000 (ms). Default is 5000.
- **max_wait**  Value ranges from 0 to 600000 (ms). Default is 5000.

**Example**

- This command sets the rate-limiting values for OSPF link-state advertisements to 10 milliseconds.

```
switch(config)#router ospf 6
switch(config-router-ospf)#timers throttle lsa all 10
switch(config-router-ospf)#
```
timers throttle spf (OSPFv2)

The purpose of SPF throttling is to delay shortest path first (SPF) calculations when network topology is changing rapidly. The `timers throttle spf` command controls the intervals at which the switch will perform SPF calculations. The command sets three values:

- **Initial delay**: how long the switch waits to perform an SPF calculation after a topology change in a network that has been stable throughout the hold interval. Because a topology change often causes several link state updates to be sent, the initial delay is configured to allow the network to settle before the switch performs an SPF calculation. If an additional topology change occurs during the initial interval, the SPF calculation still takes place after the expiration of the initial delay period and no other change is made to the throttle timers.

- **Hold interval**: this is an additional wait timer which scales to slow SPF calculations during periods of network instability. If a network change occurs during the hold period, an SPF calculation is scheduled to occur at the expiration of the hold interval. Subsequent hold intervals are doubled if further topology changes occur during a hold interval until either the hold interval reaches its configured maximum or no topology change occurs during the interval. If the next topology change occurs after the expiration of the hold interval, the hold interval is reset to its configured value and the SPF calculation is scheduled to take place after the initial delay.

- **Maximum interval**: the maximum time the switch will wait after a topology change before performing an SPF calculation.

The `no timers throttle spf` and `default timers throttle spf` commands restore the default OSPFv2 SPF calculation intervals by removing the `timers throttle spf` command from `running-config`.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```
    timers throttle spf initial_delay hold_interval max_interval
    no timers spf
    default timers spf
```

**Parameters**

- **initial_delay**  Initial delay between a topology change and SPF calculation. Value ranges from 0 to 65535000 (ms). Default is 0 (ms).

- **hold_interval**  Additional wait time after SPF calculation to allow the network to settle. If a topology change occurs during the hold interval, another SPF calculation is scheduled to occur after the hold interval expires. The next hold interval is doubled if topology changes occur during the hold interval. If doubling exceeds the maximum value, the maximum value is used instead. Value ranges from 0 to 65535000 (ms). Default is 5000 (ms).

- **max_interval**  Maximum hold interval before the switch will perform an SPF calculation. Value ranges from 0 to 65535000 (ms). Default is 5000 (ms).

**Example**

- These commands set the SPF timers on the switch.
  
  ```
  switch(config)#router ospf 6
  switch(config-router-ospf)#timers spf 5 100 20000
  switch(config-router-ospf)#
  ```
Open Shortest Path First (OSPF) is a link-state routing protocol that operates within a single autonomous system. OSPF version 3 is defined by RFC 5340.

This chapter contains the following sections.

- Section 28.1: OSPFv3 Introduction
- Section 28.2: OSPFv3 Conceptual Overview
- Section 28.3: Configuring OSPFv3
- Section 28.4: OSPFv3 Examples
- Section 28.5: OSPFv3 Commands

28.1 OSPFv3 Introduction

OSPFv3 is based on OSPF version 2 and includes enhancements that utilize IPv6 features. However, OSPFv3 is configured and operates independently of any implementation of OSPFv2 on the switch. OSPFv2 features that OSPFv3 implements include:

- Packet types
- Neighbor discovery and adjacency formation mechanisms
- LSA aging and flooding
- SPF calculations
- DR election procedure
- Multiple area support
- Router-ID (32 bits)
The following list describes the OSPFv3 differences and enhancements from OSPFv2:

- IPv6 128-bit addresses
- Use of link-local addresses
- OSPFv3 runs over links instead of subnets

Arista switches support the following OSPFv3 functions:

- A single OSPFv3 instance for each VRF
- Intra- and inter-area routing
- Type 1 and 2 external routing
- Broadcast and P2P interfaces
- Stub areas
- Redistribution of static and connected routes into OSPFv3

## 28.2 OSPFv3 Conceptual Overview

### 28.2.1 Storing Link States

OSPFv3 is a dynamic, link-state routing protocol, where links represent routable paths. Dynamic routing protocols calculate the most efficient path between locations based on bandwidth and device status.

A link state advertisement (LSA) is an OSPFv3 packet that communicates a router's topology to other routers. The link state database (LSDB) stores an area's topology database and is composed of LSAs received from other routers. Routers update the LSDB by storing LSAs from other routers.

### 28.2.2 Topology

An autonomous system (AS) is the IP domain within which a dynamic protocol controls the routing of traffic. In OSPFv3, an AS is composed of areas, which define the LSDB computation boundaries. All routers in an area store identical LSDBs. Routers in different areas exchange updates without storing the entire database, reducing information maintenance on large, dynamic networks.

An AS shares internal routing information from its areas and external routing information from other processes to inform routers outside the AS about routes the network can access. Routers that advertise routes on other ASs commit to carry data to the IP space on the route.

OSPFv3 defines these routers:

- Internal router (IR) – a router whose interfaces are contained in a single area. All IRs in an area maintain identical LSDBs.
- Area border router (ABR) – a router that has interfaces in multiple areas. ABRs maintain one LSDB for each connected area.
- Autonomous system boundary router (ASBR) – a gateway router connecting the OSPFv3 domain to external routes, including static routes and routes from other autonomous systems.

*Figure 28-1* displays the OSPFv3 router types.

OSPFv3 areas are assigned a number between 0 and 4,294,967,295. Area numbers are often expressed in dotted decimal notation, similar to IP addresses.

Each AS has a backbone area, designated as area 0, that connects to all other areas. The backbone receives routing information from all areas, then distributes it to the other areas as required.

OSPFv3 area types include:
Normal area – accepts intra-area, inter-area, and external routes. The backbone is a normal area.

Stub area – does not receive router advertisements external to the AS. Stub area routing is based on a default route.

### 28.2.3 Link Updates

Routers periodically send hello packets to advertise status and establish neighbors. A router’s hello packet includes IP addresses of other routers from which it received a hello packet within the time specified by the router dead interval. Routers become neighbors when they detect each other in their hello packets if they:

- share a common network segment.
- are in the same area.
- have the same hello interval, dead interval, and authentication parameters.

Neighbors form adjacencies to exchange LSDB information. A neighbor group uses hello packets to elect a Designated Router (DR) and Backup Designated Router (BDR). The DR and BDR become adjacent to all other neighbors, including each other. Only adjacent neighbors share database information.

*Figure 28-2* illustrates OSPFv3 neighbors.

The DR is the central contact for database exchanges. Switches send database information to their DR, which relays the information to the other neighbors. All routers in an area maintain identical LSDBs. Switches also send database information to their BDR, which stores this data without distributing it. If the DR fails, the BDR distributes LSDB information to its neighbors.

OSPFv3 routers distribute LSAs by sending them on all of their active interfaces. The router does not send hello packets from passive interfaces preventing adjacencies. The router does not process any OSPFv2 packets received on a passive interface.

When a router’s LSDB is changed by an LSA, it sends the changes to the BDR and DR for distribution to the other neighbors. Routing information is updated only when the topology changes.
Routing devices use Dijkstra’s algorithm to calculate the shortest path to all known destinations, based on cumulative route cost. The cost of an interface indicates the transmission overhead and is usually inversely proportional to its bandwidth.
28.3 Configuring OSPFv3

These sections describe basic OSPFv3 configuration steps:

- Section 28.3.1: Configuring an OSPFv3 Instance
- Section 28.3.2: Configuring OSPFv3 Areas
- Section 28.3.3: Configuring Interfaces for OSPFv3
- Section 28.3.4: Enabling OSPFv3
- Section 28.3.5: Displaying OSPFv3 Status

28.3.1 Configuring an OSPFv3 Instance

28.3.1.1 Entering OSPFv3 Configuration Mode

OSPFv3 configuration commands apply to the specified OSPFv3 instance. To perform OSPFv3 configuration commands, the switch must be in router-OSPFv3 configuration mode. The `ipv6 router ospf` command places the switch in router-OSPFv3 configuration mode, creating an OSPFv3 instance if OSPFv3 was not previously instantiated on the switch. If no VRF is specified, the OSPFv3 instance is in the default VRF. To instantiate or configure OSPFv3 on a non-default VRF, specify that VRF when using the `ipv6 router ospf` command.

The process ID identifies the OSPFv3 instance and is local to the router. Neighbor OSPFv3 routers can have different process IDs. OSPFv3 instances configured in different VRFs on the switch must have different process IDs.

The switch supports one OSPFv3 instance for each VRF. When an OSPFv3 instance already exists, the `ipv6 router ospf` command must specify its process ID (and VRF, if it is not configured in the default VRF). Attempts to define additional instances in the same VRF will generate errors. The `show ipv6 ospf` command displays information about OSPFv3 instances, including their process IDs.

Example

- This command places the switch in router-OSPFv3 configuration mode for the default VRF. If OSPFv3 was not previously instantiated in the default VRF, the command creates an OSPFv3 instance in the default VRF with a process ID of 9.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#show active
ipv6 router ospf 9
switch(config-router-ospf3)#
```

28.3.1.2 Defining the Router ID

The router ID is a 32-bit number assigned to a router running OSPFv3. This number uniquely labels the router within an Autonomous System. Status commands identify the switch through the router ID. When configuring OSPFv3 instances in multiple VRFs, each should have a different router ID.

The switch sets the router ID to the first available alternative in the following list:

1. The `router-id` command.
2. The loopback IPv6 address, if a loopback interface is active on the switch.
3. The highest IPv6 address on the router.

**Important!** When configuring VXLAN on an MLAG, always manually configure the OSPFv3 router ID to prevent the switch from using the common VTEP IP address as the router ID.
The `router-id (OSPFv3)` command configures the router ID for an OSPFv3 instance.

**Example**

- This command assigns 15.1.1.1 as the OSPFv3 router ID.
  ```
  switch(config-router-ospf3)#router-id 15.21.4.9
  switch(config-router-ospf3)#show active
  ipv6 router ospf 9
  router-id 15.21.4.9
  switch(config-router-ospf3)#
  ```

28.3.1.3 Global OSPFv3 Parameters

These router-OSPFv3 configuration mode commands define OSPFv3 behavior for the OSPFv3 instance under which they are used.

**Logging Adjacency Changes**

The `log-adjacency-changes (OSPFv3)` command configures the switch to log OSPFv3 link-state changes and transitions of OSPFv3 neighbors into the up or down state.

**Examples**

- This command configures the switch to log transitions of OSPFv3 neighbors into the up or down state.
  ```
  switch(config-router-ospf3)#log-adjacency-changes
  switch(config-router-ospf3)#
  ```

- This command configures the switch to log all OSPFv3 link-state changes.
  ```
  switch(config-router-ospf3)#log-adjacency-changes detail
  switch(config-router-ospf3)#
  ```

**Intra-Area Distance**

The `distance ospf intra-area (OSPFv3)` command configures the administrative distance for routes contained in a single OSPFv3 area. Administrative distances compare dynamic routes configured by different protocols. The default administrative distance for intra-area routes is 10.

**Example**

- This command configures an administrative distance of 90 for OSPFv3 intra-area routes.
  ```
  switch(config-router-ospf3)#distance ospf intra-area 90
  switch(config-router-ospf3)#show active
  ipv6 router ospf 9
  distance ospf intra-area 90
  switch(config-router-ospf3)#
  ```

**Passive Interfaces**

The `passive-interface (OSPFv3)` command prevents the transmission of hello packets on the specified interface. Passive interfaces drop all adjacencies and do not form new adjacencies. Although passive interfaces do not send or receive LSAs, other interfaces may generate LSAs for the network segment. The router does not send OSPFv3 packets from a passive interface or process OSPFv3 packets received on a passive interface. The router advertises the passive interface in the router LSA.

The `no passive-interface` command re-enables OSPFv3 processing on the specified interface.
Examples

- This command configures VLAN 200 as a passive interface.
  
  ```
  switch(config-router-ospf3)#passive-interface vlan 200
  switch(config-router-ospf3)#show active
  ipv6 router ospf 9
  passive-interface Vlan200
  switch(config-router-ospf3)#
  ```

- This command configures VLAN 200 as an active interface.
  
  ```
  switch(config-router-ospf3)#no passive-interface vlan 200
  switch(config-router-ospf3)#show active
  ipv6 router ospf 9
  switch(config-router-ospf3)#
  ```

Redistributing Connected Routes

Redistributing connected routes causes the OSPFv3 instance to advertise all connected routes on the switch as external OSPFv3 routes. Connected routes are routes that are established when IPv6 is enabled on an interface.

Example

- The `redistribute (OSPFv3) connected` command converts connected routes to OSPFv3 external routes.
  
  ```
  switch(config-router-ospf3)#redistribute connected
  switch(config-router-ospf3)#show active
  ipv6 router ospf 9
  redistribute connected
  switch(config-router-ospf3)#
  ```

Redistributing Static Routes

Redistributing static routes causes the OSPFv3 instance to advertise all static routes on the switch as external OSPFv3 routes. The switch does not support redistributing individual static routes.

Example

- The `redistribute (OSPFv3) static` command converts static routes to OSPFv3 external routes.
  
  ```
  switch(config-router-ospf3)#redistribute static
  switch(config-router-ospf3)#show active
  ipv6 router ospf 9
  redistribute static
  switch(config-router-ospf3)#
  ```

28.3.2 Configuring OSPFv3 Areas

OSPFv3 areas are configured through area commands. The switch must be in router-OSPFv3 configuration mode, as described in Section 28.3.1.1: Entering OSPFv3 Configuration Mode, to run area commands.

Areas are assigned a 32-bit number that is expressed in decimal or dotted-decimal notation. When an OSPFv3 instance configuration contains multiple areas, the switch only configures areas associated with its interfaces.

28.3.2.1 Configuring the Area Type

The `no area (OSPFv3)` command specifies the area type. The switch supports three area types:
• Normal area: Area that accepts intra-area, inter-area, and external routes. The backbone area (area 0) is a normal area.

• Stub area: Area where external routes are not advertised. External routes are reached through a default summary route (0.0.0.0) inserted into stub areas. Networks with no external routes do not require stub areas.

The default area type is normal.

Example

• These commands configures area 200 as a NSSA area and 300 as a stub area.

  switch(config)#ipv6 router ospf 9
  switch(config-router-ospf3)#area 200 nssa
  switch(config-router-ospf3)#area 300 stub
  switch(config-router-ospf3)#show active
  ipv6 router ospf 9
  area 0.0.0.200
  area 0.0.1.44 stub
  switch(config-router-ospf3)#

28.3.2.2 Configuring Area Parameters

These router-OSPFv3 configuration mode commands define OSPFv3 behavior in a specified area.

Default Summary Route Cost

The area default-cost (OSPFv3) command specifies the cost of the default summary route that ABRs send into a stub area or NSSA. Summary routes, also called inter-area routes, originate in areas different than their destination. When the area default-cost command is not configured for an area, the default-cost of that area is set to 10.

Example

• This command configures a cost of 25 for the default summary route in area 0.0.1.194 (450).

  switch(config-router-ospf3)#area 450 default-cost 25
  switch(config-router-ospf3)#show active
  ipv6 router ospf 9
  area 0.0.1.194 default-cost 25
  switch(config-router-ospf3)#

Area Stub

The area stub (OSPFv3) command configures the area type of an OSPFv3 area. All routers in an AS must specify the same area type for identically numbered areas.

Stub areas are areas in which external routes are not advertised. To reach these external routes, the stub area uses a default summary route (0.0.0.0). Networks without external routes do not require stub areas.

Areas are normal by default; area type configuration is required only for stub NSSA areas. Area 0 is always a normal area and cannot be configured through this command.

Examples

• This command configures area 45 as a stub area.

  switch(config)#ipv6 router ospf 3
  switch(config-router-ospf3)#area 45 stub
  switch(config-router-ospf3)#
- This command configures area 10.92.148.17 as a stub area.
  switch(config-router-ospf3)#area 10.92.148.17 stub
  switch(config-router-ospf3)#

**Area Range**

The **area range (OSPFv3)** command is used by OSPFv3 area border routers (ABRs) to consolidate or summarize routes, to configure a cost setting for those routes, and to suppress summary route advertisements.

By default, an ABR creates a summary LSA for each route in an area and advertises that LSA to adjacent areas. The **area range (OSPFv3)** command aggregates routing information on area boundaries, allowing the ABR to use one summary LSA to advertise multiple routes.

**Examples**

- The **area range** command consolidates and summarizes routes at an area boundary 1.
  
  switch(config)#router ipv6 ospf 1
  switch(config-router-ospf3)#area 1 range 2001:0DB8:0:1::/64
  switch(config-router-ospf3)#

- The **area range** command changes the address range status to DoNotAdvertise. Neither one of the individual intra-area routes falling under range or the ranged prefix is advertised as summary LSA.
  switch(config)#ipv6 router ospf 1
  switch(config-router-ospf3)# area 1 range 2001:0DB8:0:1::/64 not-advertise
  switch(config-router-ospf3)#

### 28.3.3 Configuring Interfaces for OSPFv3

OSPFv3 interface configuration commands enable OSPFv3 on an interface, assign the interface to an area, and specify transmission parameters for routed ports and SVIs that handle OSPFv3 packets.

#### 28.3.3.1 Assigning an Interface to an Area

The **ipv6 ospf area** command enables OSPFv3 on the configuration mode interface and associates the specified area to the interface. Each routed interface can be associated with one OSPFv3 area; subsequent **ipv6 ospf area** commands that designate a different area on an interface replace any existing command for the interface.

**Example**

- These commands enable OSPFv3 instance 9 on VLAN interface 200 and associate area 0 to the interface.
  switch(config)#interface vlan 200
  switch(config-if-Vl200)#ipv6 ospf 9 area 0
  switch(config-if-Vl200)#show active
  interface Vlan200
  ipv6 ospf 9 area 0.0.0.0
  switch(config-if-Vl200)#

#### 28.3.3.2 Configuring Intervals

Interval configuration commands determine OSPFv3 packet transmission characteristics for a specified VLAN interface. Interval configuration commands are entered in vlan-interface configuration mode.
Hello Interval

The hello interval specifies the period between consecutive hello packet transmissions from an interface. Each OSPFv3 neighbor should specify the same hello interval, which should not be longer than any neighbor’s dead interval.

The `ipv6 ospf hello-interval` command configures the hello interval for the configuration mode interface. The default is 10 seconds.

**Example**

- These commands configure a hello interval of 45 seconds for VLAN 200.

  ```
  switch(config)#interface vlan 200
  switch(config-if-Vl200)#ipv6 ospf hello-interval 45
  switch(config-if-Vl200)#show active
  interface Vlan200
    ipv6 ospf hello-interval 45
  switch(config-if-Vl200)#
  ```

Dead Interval

The dead interval specifies the period that an interface waits for an OSPFv3 packet from a neighbor before it disables the adjacency under the assumption that the neighbor is down. The dead interval should be configured identically on all OSPFv3 neighbors and be longer than the hello interval of any neighbor.

The `ipv6 ospf dead-interval` command configures the dead interval for the configuration mode interface. The default is 40 seconds.

**Example**

- This command configures a dead interval of 75 seconds for VLAN 200.

  ```
  switch(config)#interface vlan 200
  switch(config-if-Vl200)#ipv6 ospf dead-interval 75
  switch(config-if-Vl200)#show active
  interface Vlan200
    ipv6 ospf dead-interval 75
  switch(config-if-Vl200)#
  ```

Retransmission Interval

Routers that send OSPFv3 advertisements to an adjacent router expect to receive an acknowledgment from that neighbor. Routers that do not receive an acknowledgment will retransmit the advertisement. The retransmission interval specifies the period between retransmissions.

The `ipv6 ospf retransmit-interval` command configures the LSA retransmission interval for the configuration mode interface. The default retransmission interval is 5 seconds.

**Example**

- This command configures a retransmission interval of 25 seconds for VLAN 200.

  ```
  switch(config)#interface vlan 200
  switch(config-if-Vl200)#ipv6 ospf retransmit-interval 25
  switch(config-if-Vl200)#show active
  interface Vlan200
    ipv6 ospf retransmit-interval 25
  switch(config-if-Vl200)#
  ```
Transmission Delay

The transmission delay is an estimate of the time that an interface requires to transmit a link-state update packet. OSPFv3 adds this delay to the age of outbound packets to more accurately reflect the age of the LSA when received by a neighbor.

The `ipv6 ospf transmit-delay` command configures the transmission delay for the configuration mode interface. The default transmission delay is one second.

**Example**

- This command configures a transmission delay of 10 seconds for VLAN 200.

```plaintext
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 ospf transmit-delay 10
switch(config-if-Vl200)#show active
interface Vlan200
  ipv6 ospf transmit-delay 10
switch(config-if-Vl200)#
```

28.3.3.3 Configuring Interface Parameters

Interface Cost

The OSPFv3 interface cost reflects the overhead of sending packets across the interface. The cost is typically assigned to be inversely proportional to the bandwidth of the interface. The `ipv6 ospf cost` command configures the OSPFv3 cost for the configuration mode interface. The default cost is 10.

**Example**

- This command configures a cost of 50 for VLAN 200.

```plaintext
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 ospf cost 50
switch(config-if-Vl200)#show active
interface Vlan200
  ipv6 ospf cost 50
switch(config-if-Vl200)#
```

Router Priority

Router priority determines preference during designated router (DR) and backup designated router (BDR) elections. Routers with higher priority numbers have preference over other routers. Routers with a priority of zero cannot be elected as a DR or BDR.

The `ipv6 ospf priority` command configures router priority for the configuration mode interface. The default priority is 1.

**Example**

- This command configures a router priority of 128 for VLAN 200.

```plaintext
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 ospf priority 128
switch(config-if-Vl200)#show active
interface Vlan200
  ipv6 ospf priority 128
switch(config-if-Vl200)#
```
28.3.4 Enabling OSPFv3

28.3.4.1 IP Routing

OSPFv3 requires that IPv6 unicast routing is enabled on the switch. When IP routing is not enabled, entering OSPFv3 configuration mode generates a message.

Examples

- This message is displayed if, when entering router-OSPFv3 configuration mode, IPv6 unicast routing is not enabled.
  
  ``switch(config)#ipv6 router ospf 9
  ! IPv6 routing not enabled
  switch(config-router-ospf3)#``

- This command enables IP routing on the switch.
  
  ``switch(config)#ipv6 unicast-routing``

28.3.4.2 Disabling OSPFv3

The `shutdown` (OSPFv3) disables OSPFv3 operations on the switch without disrupting the OSPFv3 configuration. To disable OSPFv3 on an interface, remove the `ipv6 ospf area` statement for the corresponding interface.

The `no shutdown` command resumes OSPFv3 activity.

Examples

- This command disables OSPFv3 activity on the switch.
  
  ``switch(config)#ipv6 router ospf 9
  switch(config-router-ospf3)#shutdown
  switch(config-router-ospf3)#show active
  ipv6 router ospf 9
  shutdown
  switch(config-router-ospf3)#``

- This command resumes OSPFv3 activity on the switch.
  
  ``switch(config-router-ospf3)#no shutdown
  switch(config-router-ospf3)#show active
  ipv6 router ospf 9
  switch(config-router-ospf3)#``

28.3.5 Displaying OSPFv3 Status

This section describes OSPFv3 `show` commands that display OSPFv3 status. General switch methods that provide OSPFv3 information include pinging routes, viewing route status (`show ip route` command), and viewing the configuration (`show running-config` command).

28.3.5.1 OSPFv3 Summary

The `show ipv6 ospf` command displays general OSPFv3 configuration information, operational statistics and status for the OSPFv3 instance, followed by a brief description of the areas configured on the switch.
Example

- This command displays OSPFv3 routing process information.

  switch>**show ipv6 ospf**
  Routing Process "ospfv3 1" with ID 10.37.0.23 and Instance 0
  It is an autonomous system boundary router and is an area border router
  Hold time between two SPF's is 5
  Minimum LSA interval 5. Minimum LSA arrival 1
  It has 13 fully adjacent neighbors
  Number of areas in this router is 2. 2 normal, 0 stub, 0 nssa
  Graceful restart is enabled
  Grace period is 40
  Strict helper is enabled
  SPF algorithm last executed 00:02:59 ago
  Area 0.0.0.0
  Number of interface in this area is 8
  It is a normal area
  Area 0.0.0.2
  Number of interface in this area is 1
  It is a normal area

28.3.5.2 Viewing OSPFv3 on the Interfaces

The **show ipv6 ospf interface** command displays OSPFv3 information for switch interfaces configured for OSPFv3. Different command options allow the display of either all interfaces or a specified interface. The command can also be configured to display complete information or a brief summary.

Example

- This command displays OSPFv3 information for interfaces where OSPFv3 is enabled.

  switch>**show ipv6 ospf interface**
  Ethernet17 is up
  Interface Address fe80::48c:73ff:fe00:1319%Ethernet12, Area 0.0.0.0
  Network Type Broadcast, Cost 10
  Transmit Delay is 1 sec, State Backup DR, Priority 1
  Designated Router is 10.37.0.37
  Backup Designated Router is 10.37.0.23
  Timer intervals configured, Hello 10, Dead 40, Retransmit 5
  Neighbor Count is 1
  Vlan31 is up
  Interface Address fe80::48c:73ff:fe00:1319%Vlan31, Area 0.0.0.0
  Network Type Broadcast, Cost 10
  Transmit Delay is 1 sec, State Backup DR, Priority 1
  Designated Router is 10.37.0.22
  Backup Designated Router is 10.37.0.23
  Timer intervals configured, Hello 10, Dead 40, Retransmit 5
  Neighbor Count is 1
  Vlan32 is up
  Interface Address fe80::48c:73ff:fe00:1319%Vlan32, Area 0.0.0.0
  Network Type Broadcast, Cost 10
  Transmit Delay is 1 sec, State DR Other, Priority 1
  Designated Router is 10.37.0.11
  Backup Designated Router is 10.37.0.22
  Timer intervals configured, Hello 10, Dead 40, Retransmit 5
  Neighbor Count is 2
  switch#
28.3.5.3 Viewing the OSPFv3 Database

The `show ipv6 ospf database <link state list>` command displays the LSAs in the LSDB for the specified area. If no area is listed, the command displays the contents of the database for each area on the switch. The database command provides options to display subsets of the LSDB database, a summary of database contents, and the link states that comprise the database.

Example

- This command displays the OSPFv3 database of link state advertisements (LSAs).

  ```
  switch#show ipv6 ospf database
  Routing Process "ospf 9":

  AS Scope LSDB
  Type     Link ID       ADV Router  Age       Seq#   Checksum
  AEX      0.0.0.5      10.37.0.37   15 0x80000005   0x00be82
  AEX      0.0.0.9      10.37.0.22  1747 0x8000002b   0x00df56
  AEX      0.0.0.3      10.37.0.46  599 0x8000002d   0x00651d

  Area 0.0.0.0 LSDB
  Type     Link ID       ADV Router  Age       Seq#   Checksum
  RTR      0.0.0.0      10.37.0.32  234 0x80000031   0x00585a
  NTW      0.0.0.26     10.37.0.32  271 0x80000005   0x005609
  NAP      0.0.0.26     10.37.0.32  274 0x80000005   0x00964c

  Interface vlan3911 LSDB
  Type     Link ID       ADV Router  Age       Seq#   Checksum
  LNK      0.0.0.38     10.37.0.22  267 0x80000005   0x00a45a
  LNK      0.0.0.23     10.37.0.23  270 0x80000002c  0x005b7e

  Interface vlan3902 LSDB
  Type     Link ID       ADV Router  Age       Seq#   Checksum
  LNK      0.0.0.17     10.37.0.11  1535 0x8000002b  0x007120
  LNK      0.0.0.37     10.37.0.22  7 0x80000002b   0x00ce23
  LNK      0.0.0.22     10.37.0.23  250 0x8000002d   0x00c350
  
  switch#
  ```

28.3.5.4 Viewing OSPFv3 Neighbors

The `show ipv6 ospf neighbor` command displays information about the routers that are neighbors to the switch. Command options allow the display of summary or detailed information about the neighbors to all areas and interfaces on the switch. The command also allows for the display of neighbors to individual interfaces or areas. The `adjacency-changes` option displays the interface’s adjacency changes.
Example

- This command displays the switch’s neighbors.

```
switch# show ipv6 ospf neighbor
Routing Process "ospf 9":
Neighbor 10.37.0.37 priority is 1, state is Full
  In area 0.0.0.0 interface et12
  DR is 10.37.0.37 BDR is 10.37.0.23
  Options is 0
  Dead timer is due in 37 seconds
Neighbor 10.37.0.22 priority is 1, state is Full
  In area 0.0.0.0 interface vlan3911
  DR is 10.37.0.22 BDR is 10.37.0.23
  Options is 0
  Dead timer is due in 31 seconds
Neighbor 10.37.0.22 priority is 1, state is Full
  In area 0.0.0.0 interface vlan3902
  DR is 10.37.0.11 BDR is 10.37.0.22
  Options is 0
  Dead timer is due in 31 seconds
Neighbor 10.37.0.22 priority is 1, state is Full
  In area 0.0.0.0 interface vlan3908
  DR is 10.37.0.22 BDR is 10.37.0.21
  Options is 0
  Dead timer is due in 39 seconds
```

switch#

28.3.5.5 Viewing OSPFv3 Routes

The `show ipv6 routes` command provides an OSPFv3 option.

Example

- This command displays the switch’s OSPFv3 routes.

```
switch# show ipv6 route ospf
IPv6 Routing Table - 43 entries
Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP, R - RIP, A - Aggregate
O  fd7a:3279:81a4:1112::/64 [150/11]
  via fe80::21c:41ff:fe00:d120, Ethernet12
O  fd7a:3279:81a4:1114::/64 [150/11]
  via fe80::21c:41ff:fe00:d120, Ethernet12
O  fd7a:3279:81a4:1124::/64 [10/20]
  via fe80::21c:41ff:fe01:5fe1, Vlan3901
  via fe80::21c:41ff:fe01:5fe1, Vlan3902
  via fe80::21c:41ff:fe01:5fe1, Vlan3908
O  fd7a:3279:81a4:1a00::25/128 [150/11]
  via fe80::21c:41ff:fe00:d120, Ethernet12
O  fd7a:3279:81a4:1a00::28/128 [150/11]
  via fd7a:3279:81a4:fe40::5, Vlan3908
```
28.4 OSPFv3 Examples

This section describes the commands required to configure three OSPFv3 topologies.

28.4.1 OSPFv3 Example 1

The AS in Example 1 contains two areas that are connected through two routers. The backbone area also contains an internal router that connects two links.

28.4.1.1 Example 1 Diagram

Figure 28-3 displays the Example 1 topology. Two ABRs connect area 0 and area 1 – Router A and Router B. Router C is an internal router that connects two links in area 0. Area 0 is normal; area 1 is stub.

Figure 28-3: OSPFv3 Example 1

Area 1 Configuration

Area 1 contains links to ABRs Router A and Router B.
- Router A is accessed through VLAN 301.
- Router B is accessed through VLAN 401.
- Designated Router (DR): Router A.
- Backup Designated Router (BDR): Router B.
- Each router defines an interface cost of 10.
- Router priority is not specified for either router on area 1.

Area 0 ABR Configuration

Area 0 contains links to ABRs Router A and Router B.
- Router A is accessed through VLAN 302.
- Router B is accessed through VLAN 402.
- Designated Router (DR): Router B.
- Backup Designated Router (BDR): Router A.
Each router defines an interface cost of 20.
Each router defines a retransmit-interval of 10.
Each router defines a transmit-delay of 2.
Router priority is specified such that Router B will be elected as the Designated Router.

Area 0 IR Configuration
Area 0 contains two links to an internal router.
- Router C is accessed through VLAN 501 and VLAN 502.
- VLAN 501 is configured as follows:
  - Interface cost of 20.
  - Retransmit-interval of 10.
  - Transmit-delay of 2.
- VLAN 502 is configured as follows:
  - Interface cost of 20.
  - Dead interval of 80 seconds.

28.4.1.2 Example 1 Code
This code configures the OSPFv3 instances on the three switches.

Step 1  Configure the areas and router IDs.

a  Router A OSPFv3 instance configuration:

switch-A(config)#ipv6 router ospf 100
switch-A(config-router-ospfv3)#area 1 stub
switch-A(config-router-ospfv3)#router-id 10.17.0.1

b  Router B OSPFv3 instance configuration:

switch-B(config)#ipv6 router ospf 100
switch-B(config-router-ospfv3)#area 1 stub
switch-B(config-router-ospfv3)#router-id 10.17.0.2

c  Router C OSPFv3 instance configuration: interfaces:

switch-C(config)#ipv6 router ospf 100
switch-C(config-router-ospfv3)#router-id 10.17.0.3

Step 2  Configure the interface OSPFv3 area and transmission parameters.

a  Router A interfaces:

switch-A(config)#interface vlan 301
switch-A(config-if-Vl301)#ipv6 ospf 100 area 1
switch-A(config-if-Vl301)#ipv6 ospf cost 10
switch-A(config-if-Vl301)#ipv6 ospf priority 6
switch-A(config-if-Vl301)#exit
switch-A(config)#interface vlan 302
switch-A(config-if-Vl302)#ipv6 ospf 100 area 0
switch-A(config-if-Vl302)#ipv6 ospf cost 20
switch-A(config-if-Vl302)#ipv6 ospf retransmit-interval 10
switch-A(config-if-Vl302)#ipv6 ospf transmit-delay 2
switch-A(config-if-Vl302)#ipv6 ospf priority 4
b  Router B interfaces:
switch-B(config)#interface vlan 401
switch-B(config-if-Vl401)#ipv6 ospf 100 area 1
switch-B(config-if-Vl401)#ipv6 ospf cost 10
switch-B(config-if-Vl401)#ipv6 ospf priority 4
switch-B(config-if-Vl401)#exit
switch-B(config)#interface vlan 402
switch-B(config-if-Vl402)#ipv6 ospf 100 area 0
switch-B(config-if-Vl402)#ipv6 ospf cost 20
switch-B(config-if-Vl402)#ipv6 ospf retransmit-interval 10
switch-B(config-if-Vl402)#ipv6 ospf transmit-delay 2
switch-B(config-if-Vl402)#ipv6 ospf priority 6
c  Router C interfaces:
switch-C(config)#interface vlan 501
switch-C(config-if-Vl501)#ipv6 ospf 100 area 0
switch-C(config-if-Vl501)#ipv6 ospf cost 20
switch-C(config-if-Vl501)#ipv6 ospf retransmit-interval 10
switch-C(config-if-Vl501)#ipv6 ospf transmit-delay 2
switch-C(config-if-Vl501)#exit
switch-C(config)#interface vlan 502
switch-C(config-if-Vl502)#ipv6 ospf 100 area 0
switch-C(config-if-Vl502)#ipv6 ospf cost 20
switch-C(config-if-Vl502)#ipv6 ospf dead-interval 80

28.4.2  OSPFv3 Example 2
The AS in Example 2 contains three areas. Area 0 connects to the other areas through different routers and contains an internal router connecting two links. Area 0 is normal; the other areas are stub areas.

28.4.2.1  Example 2 Diagram
Figure 28-4 displays the Example 2 topology. One ABR (Router B) connects area 0 and area 1; another ABR (router C) connects area 0 and area 2. Router A is an internal router that connects two links in area 0.

Area 1 Configuration
Area 1 contains one link that is accessed by Router B.
•  Router B is accessed through VLAN 601.
•  The router defines a interface cost of 10.

Area 2 Configuration
Area 2 contains one link that is accessed by Router C.
•  Router C is accessed through VLAN 802.
•  The router defines a interface cost of 20.

Area 0 ABR Configuration
One ABR Router B link connects area 1 to area 0. One ABR Router C link connects area 0 to area 2.
•  Router B is accessed through VLAN 602.
•  Router C is accessed through VLAN 801.
•  Designated Router (DR): Router B.
•  Backup Designated Router (BDR): Router C.
Each router defines an interface cost of 20.
Each router defines a retransmit-interval of 10.
Each router defines a transmit-delay of 2.

Area 0 IR Configuration
Area 0 contains links connected by an internal router.
- Router A is accessed through VLAN 701 and 702.
- The VLAN 701 link is configured as follows:
  - Interface cost of 10.
- The VLAN 702 link is configured as follows:
  - Interface cost of 20.
  - Retransmit-interval of 10.
  - Transmit-delay of 2.

28.4.2.2 Example 2 Code

Step 1 Configure the areas and router IDs.
  a. Router A OSPFv3 instance configuration:
     switch-A(config)#ipv6 router ospf 200
     switch-A(config-router-ospfv3)#router-id 10.24.1.10
b Router B OSPFv3 instance configuration:

```
switch-B(config)#ipv6 router ospf 200
switch-B(config-router-ospfv3)#area 1 stub
switch-B(config-router-ospfv3)#router-id 10.24.2.10
```

c Router C OSPFv3 instance configuration:

```
switch-C(config)#ipv6 router ospf 200
switch-C(config-router-ospfv3)#area 1 stub
switch-C(config-router-ospfv3)#router-id 10.25.2.12
```

Step 2 Configure the interface OSPFv3 area and transmission parameters.

a Router A interfaces:

```
switch-A(config)#interface vlan 701
switch-A(config-if-Vl701)#ipv6 ospf 200 area 0
switch-A(config-if-Vl701)#ipv6 ospf cost 10
switch-A(config-if-Vl701)#exit
switch-A(config)#interface vlan 702
switch-A(config-if-Vl702)#ipv6 ospf 200 area 0
switch-A(config-if-Vl702)#ipv6 ospf cost 20
switch-A(config-if-Vl702)#ipv6 ospf retransmit-interval 10
switch-A(config-if-Vl702)#ipv6 ospf transmit-delay 2
```

b Router B interfaces:

```
switch-B(config)#interface vlan 601
switch-B(config-if-Vl601)#ipv6 ospf 200 area 1
switch-B(config-if-Vl601)#ipv6 ospf cost 10
switch-B(config-if-Vl601)#exit
switch-B(config)#interface vlan 602
switch-B(config-if-Vl602)#ipv6 ospf 200 area 0
switch-B(config-if-Vl602)#ipv6 ospf cost 20
switch-B(config-if-Vl602)#ipv6 ospf retransmit-interval 10
switch-B(config-if-Vl602)#ipv6 ospf transmit-delay 2
```

c Router C interfaces:

```
switch-C(config)#interface vlan 801
switch-C(config-if-Vl801)#ipv6 ospf 200 area 0
switch-C(config-if-Vl801)#ipv6 ospf cost 20
switch-C(config-if-Vl801)#ipv6 ospf retransmit-interval 10
switch-C(config-if-Vl801)#ipv6 ospf transmit-delay 2
switch-C(config-if-Vl801)#exit
switch-C(config)#interface vlan 802
switch-C(config-if-Vl802)#ipv6 ospf 200 area 2
switch-C(config-if-Vl802)#ipv6 ospf cost 20
switch-C(config-if-Vl802)#ipv6 ospf dead-interval 80
```

28.4.3 OSPFv3 Example 3

The AS in Example 3 contains two areas that connect through one ABR. Each area also contains an ASBR that connects static routes to the AS.

28.4.3.1 Example 3 Diagram

Figure 28-5 displays the Example 3 topology. One ABR connects area 0 and area 1. Router C is an ABR that connects the areas. Router A is an internal router that connects two links in area 1. Router D and Router E are internal routers that connect links in area 0. Router B and Router F are ASBRs that connect static routes outside the AS to area 1 and area 0, respectively.
Area 0 ABR Configuration
ABR Router C connects one area 0 link to an area 1 link.
- Router C is accessed through VLAN 1302.
- All interface OSPFv3 parameters are set to their default values.

Area 0 IR Configuration
Area 0 contains two internal routers, each of which connects two of the three links in the area.
- Router D is accessed through VLAN 1401 and VLAN 1402.
- Router E is accessed through VLAN 1501 and VLAN 1502.
- All interface OSPFv3 parameters are set to their default values.

Area 0 ASBR Configuration
ASBR Router F connects one area 0 link to an external link.
- Router F is accessed through VLAN 1601.
- Router F connects to the external AS through VLAN 1602.
- All interface OSPFv3 parameters are set to their default values.

Area 1 ABR Configuration
ABR Router C connects one area 0 link to an area 1 link.
- Router C is accessed by area 1 through VLAN 1301.
• Router C is accessed by area 0 through VLAN 1302.
• All interface OSPFv3 parameters are set to their default values.

Area 1 IR Configuration
Area 1 contains one internal router that connects two links in the area.
• Router A is accessed through VLAN 1101 and VLAN 1102.
• All interface OSPFv3 parameters are set to their default values.

Area 1 ASBR Configuration
ASBR Router B connects one area 1 link to an external link.
• Router B is access through VLAN 1201.
• Router B connects to the external AS through VLAN 1202.
• All interface OSPFv3 parameters are set to their default values.

28.4.3.2 Example 3 Code
Step 1  Configure the areas and router IDs.

a  Router A OSPFv3 instance configuration:
switch-A(config)#ipv6 router ospf 300
switch-A(config-router-ospfv3)#router-id 10.12.15.10
switch-A(config-router-ospfv3)#area 1 stub

b  Router B OSPFv3 instance configuration:
switch-B(config)#ipv6 router ospf 300
switch-B(config-router-ospfv3)#router-id 10.12.15.12
switch-B(config-router-ospfv3)#area 1 stub

c  Router OSPFv3 instance configuration:
switch-C(config)#ipv6 router ospf 300
switch-C(config-router-ospfv3)#router-id 10.12.15.13
switch-C(config-router-ospfv3)#area 1 stub

d  Router D OSPFv3 instance configuration:
switch-D(config)#ipv6 router ospf 300
switch-D(config-router-ospfv3)#router-id 10.12.15.14

e  Router E OSPFv3 instance configuration:
switch-E(config)#ipv6 router ospf 300
switch-E(config-router-ospfv3)#router-id 10.12.15.15

f  Router F OSPFv3 instance configuration:
switch-F(config)#ipv6 router ospf 300
switch-F(config-router-ospfv3)#router-id 10.12.15.31

Step 2  Configure the interfaces.

a  Router A interfaces:
switch-A(config)#interface vlan 1101
switch-A(config-if-Vl1101)#ipv6 ospf 300 area 1
switch-A(config-if-Vl1101)#exit
switch-A(config)#interface vlan 1102
switch-A(config-if-Vl1102)#ipv6 ospf 300 area 1
b  Router B interfaces:
   
   switch-B(config)#interface vlan 1201
   switch-B(config-if-Vl1201)#ipv6 ospf 300 area 1
   switch-B(config-if-Vl1201)#exit

c  Router C interfaces:
   
   switch-C(config)#interface vlan 1301
   switch-C(config-if-Vl1301)#ipv6 ospf 300 area 1
   switch-C(config-if-Vl1301)#exit
   switch-C(config)#interface vlan 1302
   switch-C(config-if-Vl1302)#ipv6 ospf 300 area 0

d  Router D interfaces:
   
   switch-D(config)#interface vlan 1401
   switch-D(config-if-Vl1401)#ipv6 ospf 300 area 0
   switch-D(config-if-Vl1401)#exit
   switch-D(config)#interface vlan 1402
   switch-D(config-if-Vl1402)#ipv6 ospf 300 area 0

e  Router E interfaces:
   
   switch-E(config)#interface vlan 1501
   switch-E(config-if-Vl1501)#ipv6 ospf 300 area 0
   switch-E(config-if-Vl1501)#exit
   switch-E(config)#interface vlan 1502
   switch-E(config-if-Vl1502)#ipv6 ospf 300 area 0

f  Router F interfaces:
   
   switch-F(config)#interface vlan 1601
   switch-F(config-if-Vl1601)#ipv6 ospf 300 area 0
   switch-F(config-if-Vl1601)#exit
28.5 OSPFv3 Commands

Global Configuration Mode
- `ipv6 router ospf`
- `clear ipv6 ospf force-spf`

Interface Configuration Mode
- `ipv6 ospf area`
- `ipv6 ospf cost`
- `ipv6 ospf dead-interval`
- `ipv6 ospf hello-interval`
- `ipv6 ospf network`
- `ipv6 ospf priority`
- `ipv6 ospf retransmit-interval`
- `ipv6 ospf transmit-delay`

Router-OSPFv3 Configuration Mode
- `adjacency exchange-start threshold (OSPFv3)`
- `area default-cost (OSPFv3)`
- `area nssa (OSPFv3)`
- `area nssa default-information originate (OSPFv3)`
- `area nssa translate type7 always (OSPFv3)`
- `area range (OSPFv3)`
- `area stub (OSPFv3)`
- `default-information originate (OSPFv3)`
- `default-metric (OSPFv3)`
- `distance ospf intra-area (OSPFv3)`
- `log-adjacency-changes (OSPFv3)`
- `max-metric router-lsa (OSPFv3)`
- `maximum-paths (OSPFv3)`
- `no area (OSPFv3)`
- `passive-interface (OSPFv3)`
- `redistribute (OSPFv3)`
- `router-id (OSPFv3)`
- `shutdown (OSPFv3)`

Display Commands
- `show ipv6 ospf`
- `show ipv6 ospf border-routers`
- `show ipv6 ospf database`
- `show ipv6 ospf database <link-state details>`
- `show ipv6 ospf database <link state list>`
- `show ipv6 ospf database link`
- `show ipv6 ospf database link if-name`
- `show ipv6 ospf database link if-type`
- `show ipv6 ospf interface`
- `show ipv6 ospf lsa-log`
- `show ipv6 ospf neighbor`
- `show ipv6 ospf neighbor state`
- `show ipv6 ospf neighbor summary`
- `show ipv6 ospf spf-log`
adjacency exchange-start threshold (OSPFv3)

The adjacency exchange-start threshold command sets the exchange-start options for an OSPF instance.

The no adjacency exchange-start threshold and default adjacency exchange-start threshold command resets the default by removing the corresponding adjacency exchange-start threshold command from running-config.

Command Mode
Router-OSPFv3 Configuration

Command Syntax

adjacency exchange-start threshold peers
no adjacency exchange-start threshold
default adjacency exchange-start threshold

Parameters

- peers Value ranges from 1 4294967295. Default value is 10.

Example

- This command sets the adjacency exchange start threshold to 156923.

`switch(config)#ipv6 router ospf 3
switch(config-router-ospf3)#adjacency exchange-start threshold 156923
switch(config-router-ospf3)#`
area default-cost (OSPFv3)

The `area default-cost` command sets the cost for the default summary routes sent into an area. When the `area default-cost` command is not configured for an area, the default-cost of that area is set to 10.

The `no area default-cost` and `default area default-cost` command resets the default-cost value of the specified area to 10 by removing the corresponding `area default-cost` command from `running-config`. The `no area (OSPFv3)` command removes all area commands for the specified area from `running-config`, including the `area default-cost` command.

Command Mode

Router-OSPFv3 Configuration

Command Syntax

```
area area_id default-cost def_cost
no area area_id default-cost
default area area_id default-cost
```

Parameters

- **area_id**  area number. <0 to 4294967295> or <0.0.0.0 to 255.255.255.255>
  
  `Running-config` stores value in dotted decimal notation.
- **def_cost**  Values range from 1 to 65535.

Example

- These commands configure a cost of 15 for default summary routes that an ABR sends into area 100.

  `switch(config)#ipv6 router ospf 9
  switch(config-router-ospf3)#area 100 default 15
  switch(config-router-ospf3)#show active
  ipv6 router ospf 9
    area 0.0.0.100 default-cost 15
  switch(config-router-ospf3)#`
**area nssa (OSPFv3)**

The **area nssa** command configures an OSPFv3 area as a not-so-stubby area (NSSA). All routers in an AS must specify the same area type for identically numbered areas.

NSSA ASBRs advertise external LSAs that are part of the area, but do not advertise external LSAs from other areas.

Areas are **normal** by default; area type configuration is required only for stub NSSA areas. Area 0 is always a normal area and cannot be configured through this command.

The **no area nssa** command configures the specified area as a normal area by removing the specified **area nssa** command from **running-config**.

**Command Mode**

Router-OSPFv3 Configuration

**Command Syntax**

```
area area_id nssa [TYPE]
no area area_id nssa [TYPE]
```

**Parameters**

- **area_id**
  - Valid formats: integer <1 to 4294967295> or dotted decimal <0.0.0.1 to 255.255.255.255>
  - Area 0 (or 0.0.0.0) is not configurable; it is always **normal**.
  - **Running-config** stores value in dotted decimal notation.

- **TYPE**
  - Values include:
    - <no parameter>
    - nssa-only

**Example**

- This command configures area 3 as a NSSA area.
  ```
  switch(config)#ipv6 router ospf 1
  switch(config-router-ospf3)#area 3 nssa nssa-only
  switch(config-router-ospf3)#
  ```
area nssa default-information-originate (OSPFv3)

The area nssa default-information-originate command sets an area as an NSSA and the generation of a type 7 default LSAs is created if a default route exists in the routing table.

The switch supports three area types:

Areas are normal by default; area type configuration is required only for stub NSSA areas. Area 0 is always a normal area and cannot be configured through this command.

The no area and default area commands remove the specified area from the OSPFv3 instance by deleting all area commands from running-config for the specified area, including the area default-cost (OSPFv3) command.

The no area stub and default area stub commands configure the specified area as a normal area.

Command Mode
Router-OSPFv3 Configuration

Command Syntax

area area_id nssa default-information-originate [VALUE] [TYPE] [EXCL]
no area area_id nssa default-information-originate [VALUE] [TYPE] [EXCL]
default area area_id nssa default-information-originate [VALUE] [TYPE] [EXCL]

All parameters except area_id can be placed in any order.

Parameters

- area_id
  - Valid formats: integer <1 to 4294967295> or dotted decimal <0.0.0.1 to 255.255.255.255>
  - Area 0 (or 0.0.0.0) is not configurable; it is always normal.
  - Running-config stores value in dotted decimal notation.
- VALUE Values include:
  - <no parameter>
  - metric <1-65535>
- TYPE Values include:
  - <no parameter>
  - metric-type <1-2>
- EXCL Values include:
  - <no parameter>
  - nssa-only

Example

- These commands sets area 1 as NSSA only and generates a type 7 default LSA if a default route exists in the routing table.
  switch(config-router-ospf3)#area 3 nssa default-information-originate nssa-only
  switch(config-router-ospf3)#
- These commands generates a type 7 default route.
  switch(config-router-ospf3)#area 3 nssa default-information-originate
  switch(config-router-ospf3)#
area nssa translate type7 always (OSPFv3)

The `area nssa translate type7 always` command configures the switch to always translate Type-7 link-state advertisement (LSAs) to Type-5 LSAs.

The `no area nssa translate type7 always` commands allow LSAs to be translated dynamically by removing the `no area nssa translate type7 always` command from `running-config`.

**Command Mode**

Router-OSPFv3 Configuration

**Command Syntax**

```
area area_id nssa translate type7 always
no area_id nssa translate type7 always
default area_id nssa translate type7 always
```

**Parameters**

- `area_id`
  - Valid formats: integer `<1` to `4294967295>` or dotted decimal `<0.0.0.1` to `255.255.255.255>`
  - Area 0 (or `0.0.0.0`) is not configurable; it is always `normal`.
  - `Running-config` stores value in dotted decimal notation.

**Example**

- These commands configure the switch to always translate Type-7 link-state advertisement (LSAs) to Type-5 LSAs.

```
switch(config)#ipv6 router ospf 3
switch(config-router-ospf3)#area 3 nssa translate type7 always
switch(config-router-ospf3)#
```
area range (OSPFv3)

The area range command is used by OSPFv3 area border routers to summarize routes.

The no area range and default area range commands remove the area-range by deleting the corresponding area range command from running-config.

Command Mode
Router-OSPFv3 Configuration

Command Syntax
area area_id range net_addr [ADVERTISE_SETTING] [COST_SETTING]
no area area_id range net_addr [ADVERTISE_SETTING] [COST_SETTING]
default area area_id range net_addr [ADVERTISE_SETTING] [COST_SETTING]

Parameters
- area_id <0 to 4294967295> or <0.0.0.0 to 255.255.255.255>
- net_addr
- ADVERTISE_SETTING specifies the LSA advertising activity. Values include
  - <no parameter>
  - advertise
  - not-advertise
- COST_SETTING Values include
  - <no parameter>
  - cost range_cost Value ranges from 1 to 65535.

Examples
- The area range command summarizes routes at an area boundary 1.
  switch(config)#router ipv6 ospf 1
  switch(config-router-ospf3)#area 1 range 2001:0DB8:0:1::/64
  switch(config-router-ospf3)#
- The area range command modifies the address range status to do not advertise.
  switch(config)#ipv6 router ospf 1
  switch(config-ospf6-router)# area 1 range 2001:0DB8:0:1::/64 not-advertise
  switch(config-ospf6-router)#
area stub (OSPFv3)

The area stub command configures the area type of an OSPFv3 area.
Areas are normal by default.

The no area stub command configures the specified area as a normal area.

Command Mode
Router-OSPFv3 Configuration

Command Syntax

```plaintext
area area_id stub
no area area_id stub
default area area_id stub
```

Parameters

- `area_id`
  - Valid formats: integer <1 to 4294967295> or dotted decimal <0.0.0.1 to 255.255.255.255>
  - Area 0 (or 0.0.0.0) is not configurable; it is always normal.
  - Running-config stores value in dotted decimal notation.

Examples

- This command configures area 45 as a stub area.
  ```plaintext
  switch(config)#ipv6 router ospf 3
  switch(config-router-ospf3)#area 45 stub
  switch(config-router-ospf3)#
  ```

- This command configures area 10.92.148.17 as a stub area.
  ```plaintext
  switch(config-router-ospf3)#area 10.92.148.17 stub
  switch(config-router-ospf3)#
  ```
clear ipv6 ospf force-spf

The `clear ipv6 ospf force-spf` command starts the SPF algorithm without clearing the OSPF database.

**Command Mode**

Privileged EXEC

**Command Syntax**

```
clear ipv6 ospf force-spf [VRF_INSTANCE]
```

**Parameters**

- **VRF_INSTANCE** Values include:
  - `<no parameter>` Action is performed in the default VRF.
  - `vrf vrf_name` Action is performed in the specified VRF.

**Example**

- This command restarts the SPF algorithm in the default VRF without first clearing the OSPFv3 database.

```
switch(config)#clear ipv6 ospf force-spf
switch(config)#
```
default-information originate (OSPFv3)

The `default-information originate` command generates a default external route into an OSPF domain.

The `no default-information originate` and `default default-information originate` command removes the configuration from the `running-config`.

Command Mode
Router-OSPFv3 Configuration

Command Syntax

```
default-information originate [DURATION] [VALUE] [TYPE] [MAP]
no default-information originate
default default-information originate
```

All parameters can be placed in any order.

Parameters
- **DURATION** Values include:
  - <no parameter>
  - always
- **VALUE** Values include:
  - <no parameter>
  - metric <1-65535>
- **TYPE** Values include:
  - <no parameter>
  - metric-type <1-2>
- **MAP** Values include:
  - <no parameter>
  - route-map map_name

Examples
- These commands will advertise the OSPFv3 default route regardless of whether the switch has a default route configured.
  ```
  switch(config)#ipv6 router ospf 1
  switch(config-router-ospf3)#default-information originate always
  switch(config-router-ospf3)#show active
  ipv6 router ospf 1
     default-information originate always
  ```
- These commands configures OSPF area 1 as metric of 100 for the default route with an external metric type of Type 1.
  ```
  switch(config)#ipv6 router ospf 1
  switch(config-router-ospf3)#default-information originate metric 100 metric-type 1
  switch(config-router-ospf3)#show active
  ipv6 router ospf 1
     default-information originate metric 100 metric-type 1
  ```
**default-metric (OSPFv3)**

The `default-metric` command sets default metric value for routes redistributed into the OSPFv3 domain.

The `no default-metric` and `default default-metric` commands restores the default metric to its default value of 10 by removing the `default-metric` command from `running-config`.

**Command Mode**

Router-OSPFv3 Configuration

**Command Syntax**

```
  default-metric  def_metric
  no default-metric
  default default-metric
```

**Parameters**

- `def_metric` Values range from 1 to 65535. Default value is 10.

**Example**

- These commands configure a default metric of 30 for routes redistributed into OSPFv3.

  ```
  switch(config)#ipv6 router ospf 9
  switch(config-router-ospf3)#default-metric 30
  switch(config-router-ospf3)#show active
  ipv6 router ospf 9
    default-metric 30
  switch(config-router-ospf3)#
  ```
distance ospf intra-area (OSPFv3)

The `distance ospf intra-area` command sets the administrative distance for routes in a single OSPFv3 area. The default is 110.

The `no distance ospf intra-area` and `default distance ospf intra-area` commands remove the `distance ospf intra-area` command from `running-config`, returning the OSPFv3 intra-area distance setting to the default value of 110.

**Command Mode**

Router-OSPFv3 Configuration

**Command Syntax**

```
distance ospf intra-area distance
no distance ospf intra-area
default distance ospf intra-area
```

**Parameters**

- `distance` Values range from 1 to 255. Default is 110.

**Example**

- This command configures a distance of 90 for all OSPFv3 intra-area routes on the switch.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#distance ospf intra-area 90
switch(config-router-ospf3)#show active
ipv6 router ospf 9
  distance ospf intra-area 90
switch(config-router-ospf3)#
```
ipv6 ospf area

The `ipv6 ospf area` command enables OSPFv3 on the interface and associates the area to the interface.

OSPFv3 areas are configured in by `no area (OSPFv3)` commands in router-OSPFv3 configuration mode.

The `no ipv6 ospf area` and `default ipv6 ospf area` commands disable OSPFv3 on the configuration mode interface by removing the corresponding `ipv6 ospf area` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
```
ipv6 ospf process_id area area_id
no ipv6 ospf process_id [area area_id]
default ipv6 ospf process_id [area area_id]
```

**Parameters**
- `process_id` Values range from 1 to 65535.
- `area_id`
  - Valid formats: integer `<0 to 4294967295>` or dotted decimal `<0.0.0.0 to 255.255.255.255>`
  - `Running-config` stores value in dotted decimal notation.

**Example**
- These commands enable OSPFv3 on VLAN interface 200 and associates area 0 to the interface.
```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 ospf 9 area 0
switch(config-if-Vl200)#show active
interface Vlan200
  ipv6 ospf 9 area 0.0.0.0
switch(config-if-Vl200)#
```
ipv6 ospf cost

The `ipv6 ospf cost` command sets the OSPFv3 cost for the interface. The default OSPFv3 cost is 10.

The `no ipv6 ospf cost` and `default ipv6 ospf cost` commands restore the default cost of 10 for the configuration mode interface by removing the corresponding `ipv6 ospf cost` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ipv6 ospf cost interface_cost
no ipv6 ospf cost
default ipv6 ospf cost
```

**Parameters**
- `interface_cost` Value ranges from 1 to 65535; default is 10.

**Example**

- This command configures a cost of 50 for VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 ospf cost 50
switch(config-if-Vl200)#show active
interface Vlan200
  ipv6 ospf cost 50
switch(config-if-Vl200)#
```
**ipv6 ospf dead-interval**

The *ipv6 ospf dead-interval* command sets the OSPFv3 dead interval.

The *no ipv6 ospf dead-interval* and *default ipv6 ospf dead-interval* commands restore the default dead interval of 40 seconds on the configuration mode interface by removing the corresponding *ipv6 ospf dead-interval* command from *running-config*.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
```
ipv6 ospf dead-interval time
no ipv6 ospf dead-interval
default ipv6 ospf dead-interval
```

**Parameters**
- *time*  Value ranges from 1 to 65535; default is 40.

**Example**
- This command configures a dead interval of 75 seconds for VLAN 200.
```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 ospf dead-interval 75
switch(config-if-Vl200)#show active
interface Vlan200
  ipv6 ospf dead-interval 75
switch(config-if-Vl200)#
```
**ipv6 ospf hello-interval**

The `ipv6 ospf hello-interval` command sets the OSPFv3 hello interval. The hello interval is the period between the transmission of consecutive hello packets.

Each OSPFv3 neighbor should be the same hello interval and should not be longer than any neighbor’s dead interval.

The `no ipv6 ospf hello-interval` and `default ipv6 ospf hello-interval` commands restore the default hello interval of 10 seconds on the configuration mode interface by removing the `ipv6 ospf hello-interval` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ipv6 ospf hello-interval time
no ipv6 ospf hello-interval
default ipv6 ospf hello-interval
```

**Parameters**
- `time`  Values range from 1 to 65535; default is 10.

**Example**
- These commands configure a hello interval of 45 seconds for VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 ospf hello-interval 45
switch(config-if-Vl200)#show active
interface Vlan200
  ipv6 ospf hello-interval 45
switch(config-if-Vl200)#
```
**ipv6 ospf network**

The `ipv6 ospf network` command sets the configuration mode interface as a point-to-point link. By default, interfaces are set as broadcast links.

The `no ipv6 ospf network` and `default ipv6 ospf network` commands set the configuration mode interface as a broadcast link by removing the corresponding `ipv6 ospf network` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ipv6 ospf network point-to-point
no ipv6 ospf network
default ipv6 ospf network
```

**Examples**

- These commands configure VLAN interface 200 as a point-to-point link.
  
  ```
  switch(config)#interface vlan 200
  switch(config-if-Vl200)#ipv6 ospf network point-to-point
  switch(config-if-Vl200)#show active
  interface Vlan200
     ipv6 ospf network point-to-point
  switch(config-if-Vl200)#
  ```

- This command restores Ethernet interface 10 as a broadcast link.
  
  ```
  switch(config)#interface vlan 200
  switch(config-if-Vl200)#no ipv6 ospf network
  switch(config-if-Vl200)#show active
  interface Vlan200
  ```
**ipv6 ospf priority**

The `ipv6 ospf priority` command configures the OSPFv3 router priority.

The `no ipv6 ospf priority` and `default ipv6 ospf priority` commands restore the default priority (1) on the interface by removing the corresponding `ipv6 ospf priority` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ipv6 ospf priority priority_level
no ipv6 ospf priority
default ipv6 ospf priority
```

**Parameters**

- `priority_level` Settings range from 0 to 255.

**Example**

- This command configures a router priority of 128 for VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 ospf priority 128
switch(config-if-Vl200)#show active
interface Vlan200
    ipv6 ospf priority 128
switch(config-if-Vl200)#
```
**ipv6 ospf retransmit-interval**

The `ipv6 ospf retransmit-interval` command configures the link state advertisement retransmission interval.

The `no ipv6 ospf retransmit-interval` and `default ipv6 ospf retransmit-interval` commands restore the default retransmission interval of 5 seconds on the configuration mode interface by removing the corresponding `ipv6 ospf retransmit-interval` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `ipv6 ospf retransmit-interval period`
- `no ipv6 ospf retransmit-interval`
- `default ipv6 ospf retransmit-interval`

**Parameters**
- `period` Value ranges from 1 to 65535; default is 5.

**Example**
- This command configures a retransmission interval of 25 seconds for VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 ospf retransmit-interval 25
switch(config-if-Vl200)#show active
interface Vlan200
  ipv6 ospf retransmit-interval 25
switch(config-if-Vl200)#
```
**ipv6 ospf transmit-delay**

The `ipv6 ospf transmit-delay` command configures the transmission delay for OSPFv3 packets.

The `no ipv6 ospf transmit-delay` and `default ipv6 ospf transmit-delay` commands restore the default transmission delay of one second on the configuration mode interface by removing the corresponding `ipv6 ospf transmit-delay` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ipv6 ospf transmit-delay trans
no ipv6 ospf transmit-delay
default ipv6 ospf transmit-delay
```

**Parameters**

- `trans` Value ranges from 1 to 65535; default is 1.

**Example**

- This command configures a transmission delay of 10 seconds for VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 ospf transmit-delay 10
switch(config-if-Vl200)#show active
interface Vlan200
  ipv6 ospf transmit-delay 10
switch(config-if-Vl200)#
```
ipv6 router ospf

The ipv6 router ospf command places the switch in router-OSPFv3 configuration mode and creates an OSPFv3 instance if one does not already exist. Note that each OSPFv3 instance on the switch must have a unique process ID. A router ID for the new instance will be created if one does not already exist.

The show ipv6 ospf command displays the router ID of each OSPFv3 instance configured on the switch.

The no ipv6 router ospf and default ipv6 router ospf command deletes the OSPFv3 instance.

Refer to the Router-OSPFv3 Configuration Mode command for a list of commands available in router-OSPFv3 configuration mode.

Command Mode
Global Configuration

Command Syntax
ipv6 router ospf process_id [VRF_INSTANCE]
no ipv6 router ospf process_id [VRF_INSTANCE]
default ipv6 router ospf process_id [VRF_INSTANCE]

Parameters
- process_id Values range from 1 to 65535.
- VRF_INSTANCE Values include:
  - <no parameter> OSPF instance is in the default VRF.
  - vrf vrf_name OSPF instance is the specified VRF.

Examples
- This command creates an OSPFv3 instance in the default VRF with process ID 9.
  switch(config)#ipv6 router ospf 9
  switch(config-router-ospf3)#show active
  ipv6 router ospf 9
  switch(config-router-ospf3)#
- This command deletes the OSPFv3 instance.
  switch(config)#no ipv6 router ospf 9
  switch(config)#
log-adjacency-changes (OSPFv3)

The `log-adjacency-changes` command enables syslog messages to be sent when it detects OSPFv3 link state changes or when it detects that a neighbor has gone up or down. Log message sending is enabled by default.

The `default log-adjacency-changes` command restores the default state by removing the `log-adjacency-changes` statement from `running-config`.

The default option (sending a message only when a neighbor goes up or down) is active when `running-config` does not contain any form of the command. Entering the command in any form replaces the previous command state in `running-config`.

The `no log-adjacency-changes` command disables link state change syslog reporting.

The `default log-adjacency-changes detail` or `no log-adjacency-changes` statement from `running-config`.

**Command Mode**

Router-OSPFv3 Configuration

**Command Syntax**

```
log-adjacency-changes [INFO_LEVEL]
no log-adjacency-changes
default log-adjacency-changes
```

**Parameters**

- **INFO_LEVEL**

  Options include

  - *<no parameter>* Sends messages when a neighbor goes up or down.
  - *detail* Sends messages for all neighbor state changes.

**Example**

- This command configures the switch to send a syslog message when a neighbor state changes.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#log-adjacency-changes
switch(config-router-ospf3)#show active
ipv6 router ospf 9
  log-adjacency-changes
switch(config-router-ospf3)#
```
max-metric router-lsa (OSPFv3)

The max-metric router-lsa command configures OSPF to include the maximum value in LSA metric fields to keep other network devices from using the switch as a preferred intermediate SPF hop.

The no max-metric router-lsa and default max-metric router-lsa commands disable the advertisement of a maximum metric.

Command Mode
Router-OSPFv3 Configuration

Command Syntax

```
max-metric router-lsa [EXTERNAL] [STUB] [STARTUP] [SUMMARY]
no max-metric router-lsa [EXTERNAL] [STUB] [STARTUP] [SUMMARY]
default max-metric router-lsa [EXTERNAL] [STUB] [STARTUP] [SUMMARY]
```

All parameters can be placed in any order.

Parameters

- **EXTERNAL** Values include:
  - <no parameter> Default value of 1.
  - external-lsa
  - external-lsa <1 to 16777215> The default value is 0xFF0000.

- **STUB** Values include:
  - <no parameter> Default value of 2.
  - include-stub

- **STARTUP** Values include:
  - <no parameter>
  - on-startup
  - on-startup wait-for-bgp
  - on-startup <5 to 86400>
    
    `wait-for-bgp` or an `on-start` time value is not included in `no` and `default` commands.

- **SUMMARY** Values include:
  - <no parameter> Metric is set to the default value of 1.
  - summary-lsa
  - summary-lsa <1 to 16777215>

Example

- This command configures OSPFv3 to include the maximum value in LSA metric fields until BGP has converged:
  
  ```
  switch(config-router-ospf3)#max-metric router-lsa on-startup wait-for-bgp
  switch(config-router-ospf3)#
  ```
maximum-paths (OSPFv3)

The `maximum-paths` command sets the maximum number of parallel routes that OSPFv3 supports on the switch.

The `no maximum-paths` command restores the maximum number of parallel routes that OSPFv3 supports on the switch to the default value of 16 by removing the maximum-paths command from `running-config`.

**Command Mode**

Router-OSPFv3 Configuration

**Command Syntax**

```
maximum-paths paths
no maximum-paths
default maximum-paths
```

**Parameters**

- `paths` Value range is platform dependent:
  - Arad: Value ranges from 1 to 128. Default value is 128.
  - FM6000: Value ranges from 1 to 32. Default value is 32.
  - PetraA: Value ranges from 1 to 16. Default value is 16.
  - Trident: Value ranges from 1 to 32. Default value is 32.
  - Trident-II: Value ranges from 1 to 128. Default value is 128.

**Example**

- This command configures the maximum number of OSPFv3 parallel paths to 12.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#maximum-paths 12
switch(config-router-ospf3)#
```
no area (OSPFv3)

The no area command removes all area configuration commands for the specified OSPFv3 area. Commands removed by the no area command include:

- area
- nssa
- range
- stub

Area settings can be removed individually; refer to the command description page of the desired command for details.

Command Mode
Router-OSPFv3 Configuration

Command Syntax
no area area_id [TYPE]
default area area_id [TYPE]

Parameters

- area_id area number.
  - Valid formats: integer <1 to 4294967295> or dotted decimal <0.0.0.1 to 255.255.255.255>
  - Area 0 (or 0.0.0.0) is not configurable; it is always normal.
  - Running-config stores value in dotted decimal notation.
- TYPE area type. Values include:
  - nssa
  - nssa translate type7 always
  - stub
  - stub no-summary

Example

- These commands remove the area 1 stub configuration.
  switch(config)#ipv6 router ospf 9
  switch(config-router-ospf3)# no area 1 stub
  switch(config-router-ospf3)#
passive-interface (OSPFv3)

The **passive-interface** command disables OSPF on an interface range. All interfaces are active by default.

The **no passive-interface** and **default passive-interface** commands enable OSPFv3 on the specified interface range by removing the corresponding **passive-interface** statements from **running-config**.

**Command Mode**

Router-OSPFv3 Configuration

**Command Syntax**

```
passive-interface INTERFACE_NAME
no passive-interface INTERFACE_NAME
default passive-interface INTERFACE_NAME
```

**Parameters**

- **INTERFACE_NAME**
  - Options include:
    - ethernet *e_range*
    - loopback *l_range*
    - management *m_range*
    - port-channel *p_range*
    - vlan *v_range*
    - vxlan *vx_range*
    - default

Valid *e_range*, *l_range*, *m_range*, *p_range*, *v_range*, and *vx_range* formats include number, range, or comma-delimited list of numbers and ranges.

**Example**

- This command configures VLAN interfaces 101 through 103 as passive interfaces.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#passive-interface vlan 101-103
switch(config-router-ospf3)#show active
ipv6 router ospf 9
    passive-interface Vlan101
    passive-interface Vlan102
    passive-interface Vlan103
switch(config-router-ospf3)#
```
redistribute (OSPFv3)

The `redistribute` command enables the advertising of all specified routes into the OSPFv3 domain as external routes.

The `no redistribute` and `default redistribute` commands remove the corresponding `redistribute` command from `running-config`, disabling route redistribution for the specified route type.

** Command Mode  
Router-OSPFv3 Configuration

** Command Syntax  
```
redistribute ROUTE_TYPE [ROUTE_MAP]  
no redistribute ROUTE_TYPE  
default redistribute ROUTE_TYPE
```

** Parameters  
- `ROUTE_TYPE` Options include:  
  - BGP  
  - connected  
  - static

- `ROUTE_MAP` Options include:  
  - route-map `map_name`

** Example  
- The `redistribute static` command starts the advertising of static routes as OSPFv3 external routes.

```bash
switch(config)#ipv6 router ospf 9  
switch(config-router-ospf3)#redistribute static  
switch(config-router-ospf3)#show active  
ipv6 router ospf 9  
  redistribute connected  
  redistribute static  
switch(config-router-ospf3)#
```
router-id (OSPFv3)

The `router-id` command assigns the router ID for an OSPFv3 instance. The switch sets the router ID to the first available alternative in the following list:

1. The `router-id` command
2. The loopback IP address
3. The highest IP address present on the device

Important! When configuring VXLAN on an MLAG, always manually configure the OSPFv3 router ID to prevent the switch from using the common VTEP IP address as the router ID.

The `no router-id` and `default router-id` commands remove the router ID command from `running-config`.

Command Mode

Router-OSPFv3 Configuration

Command Syntax

```
routing-id identifier
no router-id
default router-id
```

Parameters

- `identifier` Value ranges from 0.0.0.0 to 255.255.255.255 (dotted decimal notation).

Example

- This command assigns 10.10.1.4 as the router ID for the OSPFv3 instance.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#router-id 10.10.1.4
switch(config-router-ospf3)#show active
ipv6 router ospf 9
   router-id 15.10.1.4
switch(config-router-ospf3)#
```
show ipv6 ospf

The `show ipv6 ospf` command displays information about OSPFv3 routing.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 ospf [VRF_INSTANCE]
```

**Parameters**

- **VRF_INSTANCE** Values include:
  - `<no parameter>` Displays information for all VRFs.
  - `vrf vrf_name` Displays information for the specified VRF.

**Example**

- This command displays OSPFv3 routing information for all VRFs.

  switch>show ipv6 ospf
  Routing Process "ospfv3 1" with ID 10.37.0.23 and Instance 0 VRF default
  It is an autonomous system boundary router and is an area border router
  Minimum LSA arrival interval 1000 msecs
  Initial LSA throttle delay 1000 msecs
  Minimum hold time for LSA throttle 5000 msecs
  Maximum wait time for LSA throttle 5000 msecs
  It has 13 fully adjacent neighbors
  Number of areas in this router is 2. 2 normal, 0 stub, 0 nssa
  Initial SPF schedule delay 0 msecs
  Minimum hold time between two consecutive SPFs 5000 msecs
  Current hold time between two consecutive SPFs 5000 msecs
  Maximum wait time between two consecutive SPFs 5000 msecs
  SPF algorithm last executed 00:00:14 ago
  No scheduled SPF
  Adjacency exchange-start threshold is 20
  Maximum number of next-hops supported in ECMP is 128
  Area 0.0.0.0
  Number of interface in this area is 1
  It is a normal area
  Area 0.0.0.2
  Number of interface in this area is 1
  It is a normal area

  switch>
show ipv6 ospf border-routers

The `show ipv6 ospf border-routers` command displays the OSPF routing table entries.

**Command Mode**
EXEC

**Command Syntax**
```
show ipv6 ospf border-routers [VRF_INSTANCE]
```

**Parameters**
- **VRF_INSTANCE** Values include:
  - <no parameter> Displays information for all VRFs.
  - `vrf vrf_name` Displays information for the specified VRF.

**Example**
- This command displays the ABRs and ASBRs configured in the switch in all VRFs.

```
switch>show ipv6 ospf border-routers
Routing Process "ospf 9", VRF default
 Router 10.37.0.32 area 0.0.0.0 ASBR
 Router 10.37.0.18 area 0.0.0.0 ASBR
 Router 10.37.0.22 area 0.0.0.0 ASBR ABR
 Router 10.37.0.31 area 0.0.0.0 ASBR ABR
 Router 10.37.0.58 area 0.0.0.0 ASBR
 Router 10.37.0.37 area 0.0.0.0 ASBR
 Router 10.37.0.22 area 0.0.0.2 ASBR ABR
 Router 10.37.0.31 area 0.0.0.2 ASBR ABR
switch>
```
**show ipv6 ospf database**

The **show ipv6 ospf database** command displays data from the OSPF database. The switch can return link state data for a single VRF or for all VRFs on the switch.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 ospf database [VRF_INSTANCE]
```

**Parameters**

- **VRF_INSTANCE**  Values include:
  - <no parameter> Displays information for all VRFs.
  - `vrf vrf_name` Displays information for the specified VRF.

**Example**

- This command displays OSPF database information for VRF blue.

```
switch>show ipv6 ospf database vrf blue
Codes: AEX - AS External, GRC - Grace,
IAP - Inter Area Prefix, IAR - Inter Area Router,
LNK - Link, NAP - Intra Area Prefix,
NSA - Not So Stubby Area, NTW - Network,
RTR - Router
Routing Process "ospf 9", VRF blue
AS Scope LSDB
switch>
```
show ipv6 ospf database<link-state details>

The `show ipv6 ospf database <link-state details>` command displays detailed information about the specified link state advertisements. The switch can return link state data about a single area or for all areas on the switch.

**Command Mode**
EXEC

**Command Syntax**

```
show ipv6 ospf database [FILTER] LINK_TYPE [LINKSTATE_ID] [ROUTER] [DATA_LEVEL]
```

**Parameters**

- **FILTER** filters the output of the command by specifying areas. Options include:
  - area `<A.B.C.D>`
  - area backbone
- **LINK_TYPE** Parameter options include:
  - router
  - network
  - inter-area-prefix
  - inter-area-router
  - intra-area-prefix
  - nssa
- **LINKSTATE_ID** Options include:
  - <no parameter>
  - `<A.B.C.D>`
- **ROUTER** Options include:
  - <no parameter>
  - adv-router `[a.b.c.d]`
  - self-originate
- **DATA_LEVEL** Options include:
  - <no parameter>
  - detail
Example

- This command displays the OSPF database summary.

```bash
switch>show ipv6 ospf database detail
```

switch>
show ipv6 ospf database <link state list>

The `show ipv6 ospf database <link state list>` command displays the OSPF link state advertisements that originate on a switch.

**Command Mode**
EXEC

**Command Syntax**

```
show ipv6 ospf database [FILTER] [LINKSTATE_ID] [ROUTER] [DATA_LEVEL]
```

**Parameters**
- **FILTER** filters the output of the command by specifying areas. Options include:
  - <no parameter>
  - area <A.B.C.D>
  - area backbone
  - as
  - as external
- **LINKSTATE_ID** Options include:
  - <no parameter>
  - <A.B.C.D>
- **ROUTER** Options include:
  - <no parameter>
  - adv-router [a.b.c.d]
  - self-originate
- **DATA_LEVEL** Options include:
  - <no parameter>
  - detail
Example

- This command displays the OSPFV3 database of link state advertisements.

```bash
switch> show ipv6 ospf database 10.26.0.23
```

Codes: AEX - AS External, GRC - Grace,
IAP - Inter Area Prefix, IAR - Inter Area Router,
LNK - Link, NAP - Intra Area Prefix,

switch>
show ipv6 ospf database link

The `show ipv6 ospf database link` command displays details of the specified link state advertisements. The switch can return link state data about a single area or for all areas on the switch.

Command Mode

EXEC

Command Syntax

```
show ipv6 ospf database link [LINKSTATE_ID] [ROUTER] [DATA_LEVEL]
```

Parameters

- **LINKSTATE_ID** Options include:
  - <no parameter>
  - <A.B.C.D>
- **ROUTER** Options include:
  - <no parameter>
  - `adv-router [a.b.c.d]`
  - `self-originate`
- **DATA_LEVEL** Options include:
  - <no parameter>
  - `detail`

Example

- This command displays information about the Open Shortest Path First (OSPF).

  ```
  switch> show ipv6 ospf database link
  Codes: AEX - AS External, GRC - Grace,
         IAP - Inter Area Prefix, IAR - Inter Area Router,
         LNK - Link, NAP - Intra Area Prefix,
         NSA - Not So Stubby Area, NTW - Network,
         RTR - Router
  Routing Process "ospf 9":

  switch>
  ```
show ipv6 ospf database link if-name

The `show ipv6 ospf database link` command displays link state advertisement details. The switch can return link state data about a single area or for all areas on the switch.

Command Mode
EXEC

Command Syntax
`show ipv6 ospf database link if-name [INTF_ID] [LS_ID] [ROUTER] [DATA_LEVEL]`

Parameters
- **INTF_ID** Options include:
  - `ethernet e_range` Ethernet interface list.
  - `loopback l_range` Loopback interface list.
  - `management m_range` Management interface list.
  - `port-channel p_range` Channel group interface list.
  - `vlan v_range` VLAN interface list.
  - `vxlan vx_range` VXLAN interface list.
  Valid range formats include number, range, or comma-delimited list of numbers and ranges.
- **LS_ID** Options include:
  - `<no parameter>`
  - `<A.B.C.D>`
- **ROUTER** Options include:
  - `<no parameter>`
  - `adv-router [a.b.c.d]`
  - `self-originate`
- **DATA_LEVEL** Options include:
  - `<no parameter>`
  - `detail`

Example
- This command displays information for Ethernet 4/1 link state advertisements.

```
switch>show ipv6 ospf database link if-name ethernet 4/1
Codes: AEX = AS External, GRC = Grace,
       IAP = Inter Area Prefix, IAR = Inter Area Router,
       LNK = Link, NAP = Intra Area Prefix,
       NSA = Not So Stubby Area, NTW = Network,
       RTR = Router
Routing Process "ospf 1":
```

switch>
show ipv6 ospf database link if-type

The `show ipv6 ospf database link` command displays information of the link state advertisements. The switch can return link state data about a single area or for all areas on the switch.

Command Mode

`EXEC`

Command Syntax

```
show ipv6 ospf database link if-type [INTF_TYPE] [LS_ID] [ROUTER] [DATA_LEVEL]
```

Parameters

- **INTF_TYPE**
  - broadcast
  - nbma
  - p2mp
  - p2p
- **LS_ID** Options include:
  - <no parameter>
  - <A.B.C.D>
- **ROUTER** Options include:
  - <no parameter>
  - adv-router [a.b.c.d]
  - self-originate
- **DATA_LEVEL** Options include:
  - <no parameter>
  - detail
Example

- This command displays LSA information for the interfaces configured for broadcast transmissions.

```
switch>show ipv6 ospf database link if-type broadcast
Codes:  AEX - AS External, GRC - Grace,
        IAP - Inter Area Prefix, IAR - Inter Area Router,
        LNK - Link, NAP - Intra Area Prefix,
        NSA - Not So Stubby Area, NTW - Network,
        RTR - Router

switch>
```
show ipv6 ospf lsa-log

The `show ipv6 ospf lsa-log` command displays log entries when LSA update messages are sent or received for OSPFv3.

**Command Mode**
EXEC

**Command Syntax**
```
show ipv6 ospf [PROCESS_ID] lsa-log [VRF_INSTANCE]
```

**Parameters**
- **PROCESS_ID** OSPFv3 process ID. Values include:
  - `<no parameter>` Displays information for all process IDs.
  - `<1 to 65535>` Displays information for the specified process ID.
- **VRF_INSTANCE** Values include:
  - `<no parameter>` Displays information for all VRFs.
  - `vrf vrf_name` Displays information for the specified VRF.

**Examples**
- This command displays log entries when LSA update messages are sent or received for OSPFv3.

```
switch>show ipv6 ospf lsa-log
OSPF3 Process 3.3.3.3, VRF default, LSA Throttling Log:
[04:21:09] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 2000 msecs
[04:21:08] type 1: 3.3.3.3/32 [3.3.3.3], event 2, backoff restarted, new hold value 900 msecs

switch>
```
The `show ipv6 ospf neighbor state` command displays the state information on OSPF neighbors on a per-interface basis.

**Command Mode**
EXEC

**Command Syntax**
```
show ipv6 ospf neighbor state 
```

**Parameters**
- `STATE_NAME` Values include:
  - 2-ways
  - attempt
  - down
  - exch-start
  - exchange
  - full
  - restart
  - init
  - loading

- `VRF_INSTANCE` Values include:
  - `<no parameter>` Displays information for all VRFs.
  - `vrf vrf_name` Displays information for the specified VRF.

**Examples**
- This command displays OSPF information for neighboring devices that are adjacent.

```
switch>show ipv6 ospf neighbor state full
Routing Process "ospf 3":
switch>
```
show ipv6 ospf neighbor summary

The `show ipv6 ospf neighbor summary` command displays a single line of state information for each OSPFv3 neighbor.

**Command Mode**

EXEC

**Command Syntax**

`show ipv6 ospf neighbor summary [VRF_INSTANCE]`

**Parameters**

- **VRF_INSTANCE** Values include:
  - `<no parameter>` Displays information for all VRFs.
  - `vrf vrf_name` Displays information for the specified VRF.

**Examples**

- This command shows the summary information for the OSPFv3 neighbors.

```
switch>show ipv6 ospf neighbor summary
Routing Process "ospf 1":
  3 neighbors are in state Down
  3 neighbors are in state Full
  5 neighbors are in state Init
  0 neighbors are in state Loading
  0 neighbors are in state Attempt
  3 neighbors are in state Restarting
  0 neighbors are in state Exchange
  3 neighbors are in state 2 Ways
  0 neighbors are in state Exch Start
switch>
```
show ipv6 ospf spf-log

The **show ipv6 ospf spf-log** command displays when and how long the switch took to run a full SPF calculation for OSPFv3.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 ospf [PROCESS_ID] spf-log [VRF_INSTANCE]
```

**Parameters**

- **PROCESS_ID**  
  OSPFv3 process ID. Values include:
  - `<no parameter>`  Displays information for all process IDs.
  - `<1 to 65535>`  Displays information for the specified process ID.

- **VRF_INSTANCE**  
  Values include:
  - `<no parameter>`  Displays information for all VRFs.
  - `vrf vrf_name`  Displays information for the specified VRF.

**Examples**

- This command displays the SPF information for OSPFv3 in all VRFs.
  
  ```
  switch>show ipv6 ospf spf-log
  OSPF3 Process 172.26.0.22, VRF default
  TIME EVENT REASON

  04:53:33.081 Scheduled after 0 ms Router LSA generation
  04:53:33.081 SPF ran for 0.3 ms
  04:53:33.081 Scheduled after 0 ms ECMP max nexthop cfg change
  switch>
  ```
shutdown (OSPFv3)

The `shutdown` command disables OSPFv3 on the switch. OSPFv3 is disabled by default on individual interfaces and enabled through `ipv6 ospf area` commands. The `no shutdown` and `default shutdown` commands enable the OSPFv3 instance by removing the `shutdown` statement from the OSPFv3 block in `running-config`.

**Command Mode**

Router-OSPFv3 Configuration

**Command Syntax**

```
shutdown
no shutdown
default shutdown
```

**Example**

- These commands disable OSPFv3 activity on the switch.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#shutdown
switch(config-router-ospf3)#show active
ipv6 router ospf 9
  shutdown
switch(config-router-ospf3)#
```
Border Gateway Protocol (BGP)

Border Gateway Protocol (BGP) is an exterior gateway protocol (EGP) that exchanges routing information among neighboring routers in different Autonomous Systems (AS). BGP version 4 is defined by RFC 4271.

Multiprotocol BGP (BGP4+) can carry routes from multiple address families (AFI) and sub-address families (SAFI) simultaneously over a single BGP peering. Multiprotocol BGP is defined by RFC 4760.

This chapter contains the following sections.

- Section 29.1: BGP Conceptual Overview
- Section 29.2: Configuring BGP
- Section 29.3: BGP Examples
- Section 29.4: BGP Commands

Arista switches support these BGP functions:

- A single BGP instance
- Simultaneous internal (IBGP) and external (EBGP) peering
- Multiprotocol BGP
- BGP Confederations
29.1 BGP Conceptual Overview

BGP is an exterior gateway protocol (EGP) that exchanges routing information among neighboring routers in different autonomous systems through TCP sessions.

BGP neighbors (peers) communicate through a TCP session on port 179. They are established by manual configuration commands (static peers) or by creating a peer group listen range and accepting incoming peering requests in that range (dynamic peers). Internal BGP (IBGP) peers operate within a single autonomous system (AS). External BGP (EBGP) peers operate between autonomous systems. Border routers are on AS boundaries and exchange information with other autonomous systems; the primary function of border routers is distributing routes. Internal routers do not distribute route updates that they receive.

BGP defines a state machine for establishing connections. BGP routers maintain a state variable for each peer-to-peer session to track connection status. The state machine consists of these states:

- **Idle**: The router initializes BGP resources, refuses inbound BGP connection attempts, initiates a TCP connection to the peer, then transitions to the **Connect** state.
- **Connect**: The router waits for the TCP connection to complete, then sends an OPEN message to the peer and transitions to the **OpenSent** state if successful. If unsuccessful, it sets the **ConnectRetry** timer and transitions to the **Active** state upon expiry.
- **Active**: The router sets the **ConnectRetry** timer to zero and returns to the **Connect** state.
- **OpenSent**: The router waits for an OPEN message from the peer. After receiving a valid message, it transitions to the **OpenConfirm** state.
- **OpenConfirm**: The router waits for a keepalive message from its peer. If the message is received prior to a timeout expiry, the router transitions to the **Established** state. If the timeout expires or an error condition exists, the router transitions to the **Idle** state.
- **Established**: Peers exchange UPDATE messages about routes they advertise. If an UPDATE message contains an error, the router sends a NOTIFICATION message and transitions to the **Idle** state.

During established BGP sessions, routers exchange UPDATE messages about the destinations to which they offer connectivity. The route description includes the destination prefix, prefix length, autonomous systems in the path, the next hop, and information that affects the acceptance policy of the receiving router. UPDATE messages also list destinations to which the router no longer offers connectivity.

BGP detects and eliminates routing loops while making routing policy decisions by using the network topology as defined by AS paths and path attributes.

**Multiprotocol BGP**

Multiprotocol BGP facilitates the advertisement of network routes and switch capabilities to neighbors from multiple address families over a single BGP peering. The switch supports IPv4 unicast and IPv6 unicast address families.

Neighbors negotiate to select an address family when establishing a connection. The peer session is based on this address family, which identifies the following:

- The set of network layer protocols to which the address carried in the Next Hop field must belong,
- The encoding format of the next hop address.
- The semantics of Network Layer Reachability Information (NLRI).
BGP Confederations

BGP confederations divide an autonomous system (AS) into subsystems (sub-ASs), each identified by a unique sub-AS number, while still appearing externally as a single AS.

QoS Control of Neighbor Discovery and ARP Packets

To help prevent BGP sessions from being affected by dropped neighbor discovery and ARP packets, some Arista switches assign those packets to a higher priority output queue when they are being software forwarded. This helps minimize hardware drops from competition with data plane packets traffic congestion.

The switch platforms which use this feature are:

- DCS-7500E
- DCS-7250X
- DCS-7300X
- DCS-7010X
- DCS-7050X
29.2 Configuring BGP

These sections describe basic BGP configuration steps:

- Section 29.2.1: Configuring BGP Instances
- Section 29.2.2: Configuring BGP Neighbors
- Section 29.2.3: Configuring Routes
- Section 29.2.4: Configuring Address Families
- Section 29.2.5: BGP Confederations
- Section 29.2.6: BGP Operational Commands

29.2.1 Configuring BGP Instances

29.2.1.1 Creating an Instance and Entering BGP Configuration Mode

The switch supports one BGP instance, which is associated with a specified autonomous system (AS). To other BGP peers, the AS number uniquely identifies the network to which the switch belongs. Arista switches support four-byte AS numbers as described in RFC 4893. Four-byte AS number capability is communicated to BGP peers in OPEN messages. When communicating with a BGP peer which does not support four-byte AS numbers, the switch will replace AS numbers greater than 65535 with the well-known two-byte AS number 23456 (also called AS_TRANS), and encode the actual four-byte AS numbers using the AS4_PATH attribute.

The switch must be in router-BGP configuration mode to run BGP configuration commands. The `router bgp` command places the switch in router-BGP configuration mode and creates a BGP instance if one was not previously created. BGP configuration commands apply globally to the BGP instance.

**Example**

- This command places the switch in router-BGP configuration mode. It also creates a BGP instance in AS 50 if an instance was not previously created.
  
  ```
  switch(config)#router bgp 50
  switch(config-router-bgp)#
  ```

When a BGP instance exists, the `router bgp` command must include its autonomous system. Any attempt to create a second instance results in an error message.

**Example**

- This command attempts to open a BGP instance with a different AS number from that of the existing instance. The switch displays an error and stays in global configuration mode.
  
  ```
  switch(config)#router bgp 100
  % BGP is already running with AS number 50
  switch(config)#
  ```

29.2.1.2 Entering BGP VRF Configuration Mode

IPv6 VRF support in EOS allows application of a BGP configuration to a single VRF instance, overriding global commands. To apply VRF-specific BGP configuration, use the `vrf` command to enter BGP VRF configuration mode. IPv6 BGP VRF configuration is performed in the VRF submode of the router-bgp configuration mode.
Examples

- This command places the switch in BGP VRF configuration mode for VRF “purple.” Commands issued in this mode will override global BGP configuration for the specified VRF instance.

  switch(config-router-bgp)#vrf purple

- This command activates IPv6 address-family support for the IPv6 neighbor fd7a:2433:8c01::1 in the red VRF.

  switch(config)#router bgp 1
  switch(config-router-bgp)#vrf red
  switch(config-router-bgp-vrf-red)#router-id 1.1.1.1
  switch(config-router-bgp-vrf-red)#neighbor fd7a:2433:8c01::1 remote-as 16
  switch(config-router-bgp-vrf-red)#address-family ipv6
  switch(config-router-bgp-vrf-red-af)#neighbor fd7a:2433:8c01::1 activate

29.2.2 Configuring BGP Neighbors

29.2.2.1 Establishing BGP Neighbors

BGP neighbors, or peers, are established by configuration commands that initiate a TCP connection. BGP supports two types of neighbors:

- Internal neighbors are in the same autonomous system.
- External neighbors are in different autonomous systems.

BGP neighbors can be either static or dynamic:

- Static neighbors are established by manually configuring the connection.
- Dynamic neighbors are established by creating a listen range and accepting incoming connections from neighbors in that address range.

Static neighbors may belong to a static peer group, allowing them to be configured as a group. Configuration applied to an individual member of a static peer group overrides the group configuration for that peer. Dynamic neighbors must belong to a dynamic peer group, and can only be configured as a group.

Static BGP Neighbors

The **neighbor remote-as** command connects the switch with a peer, establishing a static neighbor. Once established, a static neighbor may be added to an existing peer group. Any configuration applied to the peer group then is inherited by the neighbor, unless a conflicting configuration has been entered for that peer. Settings applied to a member of the peer group override group settings.

Example

- These commands establish an internal BGP connection with the peer at 10.1.1.14.

  switch(config)#router bgp 50
  switch(config-router-bgp)#neighbor 10.1.1.14 remote-as 50
  switch(config-router-bgp)#

- These commands establish an external BGP connection with the peer at 192.0.2.5.

  switch(config)#router bgp 50
  switch(config-router-bgp)#neighbor 192.0.2.5 remote-as 100
  switch(config-router-bgp)#
Dynamic BGP Neighbors

The `bgp listen range` command specifies a range of IPv4 addresses from which the switch will accept incoming dynamic BGP peering requests, and creates the named dynamic peer group to which those peers belong. Dynamic BGP neighbors are peers which have not been manually established, but are accepted into a dynamic peer group when the switch receives a peering request from them.

Dynamic peers cannot be configured individually, but inherit any configuration that is applied to the peer group to which they belong. Peering relationships with dynamic peers are terminated if the peer group is deleted.

Example

- These commands create a peer group called “brazil” which accepts dynamic peering requests from the 192.0.2.0/24 subnet.

```plaintext
switch(config)#router bgp 50
switch(config-router-bgp)#bgp listen range 192.0.2.0/24 peer-group brazil remote-as 50
switch(config-router-bgp)#
```

Displaying Neighbor Connections

The `show ip bgp summary` and `show ip bgp neighbors` commands display neighbor connection status.

Example

- This command indicates the connection state with the peer at 192.0.2.5 is `Established`. The peer is an external neighbor because it is in AS 100 and the local server is in AS 50.

```plaintext
switch>show ip bgp summary
  BGP router identifier 192.168.104.2, local AS number 50
  192.0.2.5  4  100  Established
switch>
```

Static BGP Peer Groups

A static BGP peer group is a collection of BGP neighbors which can be configured as a group. Once a static peer group is created, the group name can be used as a parameter in neighbor configuration commands, and the configuration will be applied to all members of the group. Neighbors added to the group will inherit any settings already created for the group. Static peer group members may also be configured individually, and the settings of an individual neighbor in the peer group override group settings for that neighbor.

When the `default` form of a BGP configuration command is entered for a member of a static peer group, the peer inherits that configuration from the peer group.

A static peer group is created with the `neighbor peer-group (create)` command, or by using the `bgp listen range` command to accept dynamic peering requests. Once a static peer group has been created, static neighbors can be manually added to the group by using the `neighbor peer-group (neighbor assignment)` command. The `no neighbor peer-group (neighbor assignment)` command removes a neighbor from a static peer group.

The `no neighbor peer-group (create)` command will delete a static peer group. When a peer group is deleted, the members of that group revert to their individual configurations, or to the system default for any attributes that have not been specifically configured for that peer.
Examples

- These commands create a peer group named “akron.”
  
  `switch(config)#router bgp 50
  switch(config-router-bgp)#neighbor akron peer-group
  switch(config-router-bgp)#`

- This command adds the neighbors at 1.1.1.1 and 2.2.2.2 to peer group akron.
  
  `switch(config-router-bgp)#neighbor 1.1.1.1 peer-group akron
  switch(config-router-bgp)#neighbor 2.2.2.2 peer-group akron
  switch(config-router-bgp)#`

- These commands configure the members of peer group akron, but cause the neighbor at 1.1.1.1 to use the system default value for out-delay.
  
  `switch(config-router-bgp)#neighbor akron remote-as 109
  switch(config-router-bgp)#neighbor akron out-delay 101
  switch(config-router-bgp)#neighbor akron maximum-routes 12000
  switch(config-router-bgp)#no neighbor 1.1.1.1 out-delay
  switch(config-router-bgp)#`

Dynamic BGP Peer Groups

A dynamic BGP peer group is a collection of BGP neighbors in a specified address range which have made peering requests to the switch. Members of a dynamic peer group cannot be configured individually but must be configured as a group. Once a dynamic peer group is created, the group name can be used as a parameter in neighbor configuration commands, and the configuration will be applied to all members of the group. Neighbors joining the group will also inherit any settings already created for the group.

A dynamic peer group is created with the `bgp listen range` command, which identifies a range of IPv4 addresses from which the switch will accept incoming dynamic BGP peering requests, and names the dynamic peer group to which those peers will belong. To delete a dynamic peer group, use the `no` or `default` form of the `bgp listen range` command. All peering relationships with group members are terminated when the dynamic peer group is deleted.

Example

- These commands create a dynamic peer group called “brazil” in AS 5 which accepts peering requests from the 192.0.2.0/24 subnet.
  
  `switch(config)#router bgp 1
  switch(config-router-bgp)#bgp listen range 192.0.2.0/24 peer-group brazil`  

29.2.2.2 Maintaining Neighbor Connections

BGP neighbors maintain connections by exchanging keepalive, UPDATE, and NOTIFICATION messages. Neighbors that do not receive a message from a peer within a specified period (`hold time`) close the BGP session with that peer. Hold time is typically three times the period between scheduled keepalive messages. The default keepalive period is 60 seconds; default hold time is 180 seconds.

The `timers bgp` command configures the hold time and keepalive period. A peer retains its BGP connections indefinitely when its hold time is zero.

Example

- This command sets the keepalive period to 15 seconds and the hold time to 45 seconds.
  
  `switch(config-router-bgp)#timers bgp 15 45
  switch(config-router-bgp)#`
The `show ip bgp neighbors` command displays the hold time.

**Example**

- This command indicates the BGP hold time is 45 seconds.

```
switch>show ip bgp neighbors 10.100.100.2
BGP neighbor is 10.100.100.2, remote AS 100
BGP version is 4, remote router ID 192.168.104.2
Negotiated version is 4
TTL is 0
holdtime is 45
restart-time is 0
Restarting: no
Current state is Established
Updates received: 1
Updates sent: 4
Total messages received: 372
Total messages sent: 383
Last state was OpenConfirm
Last event was RecvKeepAlive
Last error code was 0
Last error subcode was 0
Local TCP address is 10.100.100.1
Local AS is 100
Local router ID is 192.168.103.1
```

```
switch>
```

29.2.2.3 Neighbor – Route Configuration

**Maximum Routes**

The `neighbor maximum-routes` command determines the number of BGP routes the switch accepts from a specified neighbor. The switch disables peering with the neighbor when this number is exceeded.

**Example**

- This command configures the switch to accept 15,000 routes from the peer at 192.168.18.24.

```
switch(config-router-bgp)#neighbor 192.168.18.24 maximum-routes 15000
```

**Route Reflection**

Participating BGP routers within an AS communicate EBGP-learned routes to all of their peers; they do not re-advertise IBGP-learned routes within the AS to prevent routing loops. Although a fully meshed network topology ensures that all AS members share routing information, this topology can result in high volumes of IBGP messages when scaled. Alternatively, one or more routers are configured as route reflectors in larger networks.

A route reflector re-advertises routes learned through IBGP to a group of BGP neighbors within the AS, replacing the function of a fully meshed topology. The `neighbor route-reflector-client` command configures the switch to act as a route reflector and configures the specified neighbor as a client. The `bgp client-to-client reflection` command enables client-to-client reflection.

When using route reflectors, an AS is divided into clusters. A cluster contains at least one route reflector and a group of clients to which they re-advertise route information. A cluster may contain multiple route reflectors to provide redundancy protection. Each reflector has a cluster ID. When the
When a cluster has a single route reflector, the cluster ID is its router ID. When a cluster has multiple route reflectors, a 4-byte cluster ID is assigned to all route reflectors in the cluster, allowing them to recognize updates from other cluster reflectors. The `bgp cluster-id` command configures the cluster ID in a cluster with multiple route reflectors.

**Example**

- These commands configure the switch as a route reflector and the neighbor at 172.72.14.5 as one of its clients, and set the cluster ID to 172.22.30.101.

  ```
  switch(config-router-bgp)#neighbor 172.72.14.5 route-reflector-client
  switch(config-router-bgp)#bgp cluster-id 172.22.30.101
  switch(config-router-bgp)#
  ```

Usually the clients of a route reflector are not interconnected, and any routes learned by a client are mirrored to other clients and re-advertised within the AS by the route reflector. If the clients of a route reflector are fully meshed, routes received from a client do not need to be mirrored to other clients. In this case, client-to-client reflection should be disabled (no bgp client-to-client reflection).

**Route Preference**

The primary function of external peers is to distribute routes they learn from their peers. Internal peers receive route updates without distributing them. External peers receive route updates, then distribute them to internal and external peers.

Local preference is a metric that IBGP sessions use to select an external route. Preferred routes have the highest local preference value. UPDATE packets include this metric in the LOCAL_PREF field.

The `neighbor export-localpref` command specifies the LOCAL_PREF that the switch sends to an internal peer. The command overrides previously assigned preferences and has no effect on external peers.

**Example**

- This command configures the switch to enter 200 in the LOCAL_PREF field of UPDATE packets it sends to the peer at 10.1.1.45.

  ```
  switch(config-router-bgp)#neighbor 10.1.1.45 export-localpref 200
  switch(config-router-bgp)#
  ```

The `neighbor import-localpref` command assigns a local preference to routes received through UPDATE packets from an external peer. This command has no effect when the neighbor is an internal peer.

**Example**

- This command configures the switch to assign the local preference of 50 for routes advertised from the peer at 172.16.5.2.

  ```
  switch(config-router-bgp)#neighbor 172.16.5.2 import-localpref 50
  switch(config-router-bgp)#
  ```

The `show ip bgp` command displays the LOCAL_PREF value for all listed routes.
Example

- This command indicates the route to network 10.10.20.0/24 has a local preference of 400.

```
switch#show ip bgp
Route status codes: s - suppressed, * - valid, > - active

   Network        Next Hop     R Metric  LocPref Path
   * > 10.10.20.0/24  10.10.10.1   u 0       400     (100) IGP (Id 4) Rt-ID: 19.16.1.1
```

Graceful Restart

Graceful BGP restart allows a BGP speaker with separate control plane and data plane processing to continue forwarding traffic during a BGP restart. Its neighbors (receiving speakers) may retain routing information from the restarting speaker while a BGP session with it is being re-established, reducing route flapping.

Arista switches can act as helpers (receiving speakers) for graceful BGP restart with neighbors that advertise graceful restart capability.

Graceful restart helper mode is enabled by default, but can be turned off globally with the `no graceful-restart-helper` command. Per-peer configuration takes precedence over the global configuration.

Example

- This command disables graceful restart helper mode for all BGP peers.

```
switch(config-router-bgp)#no graceful-restart-helper
switch(config-router-bgp)#
```

- This command disables graceful restart helper mode for the neighbor at 192.168.32.5 regardless of global configuration.

```
switch(config-router-bgp)#no neighbor 192.168.32.5 graceful-restart-helper
switch(config-router-bgp)#
```

Peers with graceful restart capability advertise a restart time value as an estimate of the time it will take them to restart a BGP session. When a BGP session with a restarting speaker goes down, the switch (receiving speaker) marks routes from that peer as stale and starts the restart timer. If the session with the peer is not re-established before the restart time runs out, the switch deletes the stale routes from that peer. If the session is re-established within that time, the stale path timer is started. If the stale paths are not updated by the restarting speaker before the stale path time runs out, they are deleted. The maximum time these stale paths will be retained after the BGP session is re-established is 300 seconds by default, but can be configured using the `graceful-restart stalepath-time` command.

Example

- This command configures BGP to discard stale paths from a restarting peer 500 seconds after the BGP session with that peer is re-established.

```
switch(config-router-bgp)#graceful-restart stalepath-time 500
switch(config-router-bgp)#
```

29.2.2.4 Filtering Routes

**Route Maps**

Route maps are used in BGP to directly filter IPv4 unicast routes. The `neighbor route-map (BGP)` command applies a route map to inbound or outbound BGP routes. To display the route maps associated with a specific BGP neighbor, use the `show ip bgp neighbors` command.
AS Path Access Lists

An AS path access list is a named list of permit and deny statements which use regular expressions to filter BGP routes based on their AS path attribute. AS path access lists are created using the `ip as-path access-list` command, and are applied using a route map `match` clause with the name of the access list as a parameter.

**Example**

- These commands create an AS path access list identifying routes which pass through AS 3, create a route map which references the access list, assign the routes it filters to community 300, and apply the route map to the neighbor at 192.68.14.5 to assign a community value of 300 to inbound routes received from that neighbor.

**Step 1**  Create the AS path access list.

```
switch(config)#ip as-path access-list as_list3 permit _3_
```

**Step 2**  Create a route map that matches the AS path access list and sets the community value.

```
switch(config)#route-map MAP_3 permit
switch(config-route-map-MAP_3)#match as-path as_list3
switch(config-route-map-MAP_3)#set community 300
switch(config-route-map-MAP_3)#exit
```

**Step 3**  Apply the route map to the neighbor.

```
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 192.68.14.5 route-map MAP_3 in
```

BGP Communities

A BGP community is a group of subnet address prefixes that share a common identifying attribute. Communities simplify routing policies by consolidating IP network spaces into logical entities that BGP speakers can address to accept, prefer, and distribute routing information.

The BGP community attribute is a 32 bit value formatted as follows:

- an integer between 0 and 4294967040.
- AA:NN, where AA specifies an Autonomous System number (0-4294967295) and NN specifies a community number (0-65535) within the AS.

These four community attribute values, and the associated BGP speaker actions, are predefined:

- **no-export**: speaker does not advertise the routes beyond the BGP domain.
- **no-advertise**: speaker does not advertise the routes to any BGP peers.
- **local-as**: speaker does not advertise route to any external peers.
- **internet**: speaker advertises the route to the Internet community. By default, this includes all prefixes.

Community values are assigned to a set of subnet prefixes through route map `set` commands. Route map `match` commands subsequently use community values to filter routes. The switch uses the following `ip community-list` commands to filter community routes into a BGP domain:

- `ip community-list standard`
- `ip community-list expanded`
- `ip extcommunity-list standard`
- **ip extcommunity-list expanded**
  Standard community lists refer to route maps by name or number. Expanded community lists reference route maps through regular expressions.

**Example**
- These commands assign two network subnets to a prefix list, assign a community number to the prefix list members, then utilize that community in an **ip community-list** command to permit the routes into the BGP domain.

**Step 1** Compose the IP prefix list.
  ```
  switch(config)#ip prefix-list PL_1 permit 10.1.2.5/24
  switch(config)#ip prefix-list PL_1 permit 10.2.5.1/28
  ```

**Step 2** Create a route map that matches the IP prefix list and sets the community value.
  ```
  switch(config)#route-map MAP_1 permit
  switch(config-route-map-MAP_1)#match ip address prefix-list PL_1
  switch(config-route-map-MAP_1)#set community 500
  switch(config-route-map-MAP_1)#exit
  ```

**Step 3** Create a community list that references the community.
  ```
  switch(config)#ip community-list standard CL_1 permit 500
  ```

BGP extended communities identify routes for VRFs. Extended community clauses utilize route target (rt) and site of origin options (soo):
- **route targets** identify sites that may receive appropriately tagged routes.
- **site of origin** identifies the site where the router learned the route.

### 29.2.3 Configuring Routes

#### 29.2.3.1 Advertising Routes

A BGP neighbor advertises routes it can reach through UPDATE packets. The **network (BGP)** command specifies a prefix that the switch advertises as a route originating from its AS.

The configuration clears the host portion of addresses entered in **network** commands. For example, 192.0.2.4/24 is stored as 192.0.2.0/24.

**Example**
- This command configures the switch to advertise the 10.5.8.0/24 network.
  ```
  switch(config-router-bgp)#network 10.5.8.0/24
  ```

By default, BGP will advertise only those routes that are active in the switch’s RIB. This can contribute to dropped traffic. If a preferred route is available through another protocol (like OSPF), the BGP route will become inactive and not be advertised; if the preferred route is lost, there is no available route to the affected peers. Advertising inactive BGP routes minimizes traffic loss by providing alternative routes.

The **bgp advertise-inactive** command causes BGP to advertise inactive routes to BGP neighbors. Inactive route advertisement is configured globally, but the global setting can be overridden on a per-VRF basis.
Examples

- This command configures the switch to advertise routes learned through BGP even if they are not active on the switch.
  
  switch(config-router-bgp)#bgp advertise-inactive
  switch(config-router-bgp)#

- This command overrides inactive route advertisement for VRF “purple.”
  
  switch(config-router-bgp)#vrf purple
  switch(config-router-bgp-vrf-purple)#no bgp advertise-inactive
  switch(config-router-bgp-vrf-purple)#

29.2.3.2 BGP Route Aggregation

Aggregation combines the characteristics of multiple routes into a single route for advertisement by the BGP speaker. Aggregation can reduce the amount of information that a BGP speaker is required to store and transmit when advertising routes to other BGP speakers. Aggregation options affect the attributes associated with the aggregated route, the advertisement of the contributor routes that comprise the aggregate, and which contributor routes are included.

Aggregate routes are created with the `aggregate-address` command, which takes an IP subnet as an argument; any routes configured on the switch that lie within that subnet then become contributors to the aggregate. Note that on Arista switches the BGP aggregate route will become active if there are any available contributor routes on the switch, regardless of the originating protocol. This includes routes configured statically.

BGP speakers display aggregate routes that they create as null routes (with one exception: if all the contributors to the aggregate have the same BGP path attributes, then the BGP aggregate copies those attributes and is no longer a null route). Aggregate routes are advertised into the BGP autonomous system and redistributed automatically, and their redistribution cannot be disabled. BGP neighbors display inbound aggregate routes as normal BGP routes. Null routes are displayed with the `show ip route` command; normal BGP routes (and null aggregate routes) are displayed with the `show ip bgp` and `show ip route` commands.

Aggregation Options

The `aggregate-address` command provides the following aggregate route options:

- **AS_PATH attribute inclusion:** the `as-set` option controls the aggregate route’s AS_PATH and ATOMIC_AGGREGATE attribute contents. AS_PATH identifies the autonomous systems through which UPDATE message routing information passes. ATOMIC_AGGREGATE indicates that the route is an aggregate or summary of more specific routes.

  When the command includes `as-set`, the aggregate route’s AS_SET attribute contains the AS numbers of contributor routes. This can help BGP neighbors to prevent loops by rejecting aggregate routes that include their AS number in the AS_SET.

  When the command does not include `as-set`, the aggregate route’s ATOMIC_AGGREGATE attribute is set and the AS_PATH attribute does not include AS numbers of contributing routes.

- **Attribute assignment:** The `attribute-map` option assigns attributes contained in set commands in a specified route map’s lowest sequence with any set command to the aggregated route, overriding the automatic determination of the aggregate route’s attributes by the switch.

- **Route suppression:** The `summary-only` option suppresses the advertisement of the contributor routes that comprise the aggregate.

- **Contributor filtering:** The `match-map` option uses a route map to filter out contributor routes that would otherwise be included in the aggregate.
Example

- These commands create an aggregate route (10.16.48.0/20) from four contributor routes (10.16.48.0/23, 10.16.50.0/23, 10.16.52.0/23, and 10.16.54.0/23). The aggregate route includes the AS_PATH information from the contributor routes.

```
switch(config)#router bgp 1
switch(config-router-bgp)#aggregate-address 10.16.48.0/20 as-set
switch(config-router-bgp)#exit
switch(config)#
```

- These commands create an aggregate route and use a route map to add a local-preference attribute to the route.

```
switch(config)#route-map map1 permit 10
switch(config-route-map-map1)#set local-preference 40
switch(config)#exit
switch(config-router-bgp)#aggregate-address 10.16.48.0/20 attribute-map map1
switch(config-router-bgp)#exit
switch(config)#
```

- These commands create an aggregate route and use a route map to allow only those contributors which match a specified prefix list to be included in the aggregate route.

```
switch(config)#route-map matchmap permit 10
switch(config-route-map-matchmap)#match ip address prefix-list agglist
switch(config-route-map-matchmap)#exit
switch(config-router-bgp)#aggregate-address 1.1.0.0/16 match-map matchmap
```

29.2.4 Configuring Address Families

The switch determines the network prefixes that peering sessions advertise and the BGP neighbor addresses that receive advertisements through address family activity configuration.

An address family is a data structure that defines route advertising status to BGP neighbor addresses. Each BGP neighbor address is assigned an activity level for each address family on the switch. The switch sends capability and network prefix advertisements to neighbor addresses that are active within specified address families:

- IPv4 address family: switch advertises IPv4 capability and network commands with IPv4 prefixes to neighbor addresses configured as IPv4 address family active.
- IPv6 address family: switch advertises IPv6 capability and network commands with IPv6 prefixes to neighbor addresses configured as IPv6 address family active.

Note

The switch does not support IPv6 neighbor addresses as IPv4 address family active.

29.2.4.1 Neighbor Address Family Configuration

Address family activity levels for neighbor addresses is configured through bgp default and neighbor activate commands.

- The bgp default command specifies the default activity level of BGP neighbor addresses for a specified address family.
- The neighbor activate command specifies deviations from default address family activity level for a specified BGP neighbor address.
Default neighbor activation
The `bgp default` command configures the default address family activity level of all configured BGP neighbor addresses. The switch advertises the following to `address family active` addresses:

- IPv4 address family active: IPv4 capability and all network advertisements with IPv4 prefixes.
- IPv6 address family active: IPv6 capability and all network advertisements with IPv6 prefixes.

These commands configure default address family activity levels for configured BGP neighbor addresses:

- `bgp default ipv4-unicast` all BGP neighbor addresses are IPv4 address family active.
- `no bgp default ipv4-unicast` no BGP neighbor addresses are IPv4 address family active.
- `bgp default ipv6-unicast` all BGP neighbor addresses are IPv6 address family active.
- `no bgp default ipv6-unicast` no BGP neighbor addresses are IPv6 address family active.

The default activity level of the default address family varies by address family:

- IPv4 address family all BGP addresses are IPv4 address family active.
- IPv6 address family no BGP addresses are IPv6 address family active.

Activating Individual Neighbor Addresses
The `address-family` command places the switch in address family mode to configure the address family activity level of individual BGP neighbor addresses. The switch supports these address families:

- ipv4-unicast
- ipv6-unicast

`Running-config` displays address family commands in sub-blocks of the BGP configuration. The `neighbor activate` command is available in each address family configuration mode and defines the configuration mode address family activity level of a specified configured BGP neighbor address. Addresses are assigned one of the following states by the activate command:

- `neighbor activate` configures the address as active in the configuration mode address family.
- `no neighbor activate` configures the address as not active in the configuration mode address family.

The switch sends the following announcements to addresses that are active in an address family:

- IPv4 address family: IPv4 capability and all network routes with IPv4 prefixes.
- IPv6 address family: IPv6 capability and all network routes with IPv6 prefixes.

The `neighbor route-map (BGP)` command applies a route map to inbound or outbound BGP routes. In address-family mode, the route map is applied to routes corresponding to the configuration mode address family. When a route map is applied to outbound routes, the switch advertises only routes matching at least one section of the route map. One outbound and one inbound route map can be applied to a neighbor for each address family. Applying a route map to a route replaces the previous corresponding route map assignment.

Network Route Advertising in Address Families
The `network (BGP)` command specifies a network for advertisement through UPDATE packets to BGP peers. The command is available in Router-BGP and Router-BGP-Address-Family configuration modes; the mode in which the command is issued does not affect the command’s execution.

- Commands with an IPv4 address are advertised to peers that are IPv4 address family-active.
- Commands with an IPv6 address are advertised to peers that are IPv6 address family-active.
Examples

- These commands instantiate BGP, configure three neighbors, and configure 2 network routes.

  The default activity level for IPv4 and IPv6 address families is set to the default; all neighbor
  addresses are IPv4 address family active and IPv6 address family not active. IPv4 capability and
  network routes with IPv4 prefixes are advertised to all neighbor IPv4 addresses.

  ```
  switch(config)#router bgp 9
  switch(config-router-bgp)#neighbor 172.21.14.8 remote-as 15
  switch(config-router-bgp)#neighbor 172.23.18.6 remote-as 16
  switch(config-router-bgp)#neighbor 2001:0DB8:8c01::1 remote-as 16
  switch(config-router-bgp)#network 172.18.23.9/24
  switch(config-router-bgp)#network 2001:0DB8:de29::/64
  switch(config-router-bgp)#
  ```

- These commands instantiate BGP on the switch, set IPv4 default activity level (**not active**), set
  IPv6 default activity level (**active**), and configure three neighbor addresses and two network route
  prefixes.

  IPv6 capability and network routes with IPv6 prefixes are advertised to all neighbor addresses.

  ```
  switch(config)#router bgp 10
  switch(config-router-bgp)#bgp default ipv6-unicast
  switch(config-router-bgp)#no bgp default ipv4-unicast
  switch(config-router-bgp)#neighbor 172.21.14.8 remote-as 15
  switch(config-router-bgp)#neighbor 172.23.18.6 remote-as 16
  switch(config-router-bgp)#neighbor 2001:0DB8:8c01::1 remote-as 16
  switch(config-router-bgp)#network 172.18.23.9/24
  switch(config-router-bgp)#network 2001:0DB8:de29::/64
  switch(config-router-bgp)#
  ```

- These commands configure three neighbors, two network routes, and the default activity level for
  each address family (**not active**), and specify neighbor addresses for each address family that is
  active.

  ```
  switch(config)#router bgp 11
  switch(config-router-bgp)#neighbor 172.21.14.8 remote-as 15
  switch(config-router-bgp)#neighbor 172.23.18.6 remote-as 16
  switch(config-router-bgp)#neighbor 2001:0DB8:8c01::1 remote-as 16
  switch(config-router-bgp)#network 172.18.23.9/24
  switch(config-router-bgp)#network 2001:0DB8:de29::/64
  switch(config-router-bgp)#no bgp default ipv4-unicast
  switch(config-router-bgp)#no bgp default ipv6-unicast
  switch(config-router-bgp)#address-family ipv4
  switch(config-router-bgp-af)#neighbor 172.21.14.8 activate
  switch(config-router-bgp-af)#neighbor 172.23.18.6 activate
  switch(config-router-bgp-af)#exit
  switch(config-router-bgp)#address-family ipv6
  switch(config-router-bgp-af)#neighbor 2001:0DB8:8c01::1 activate
  switch(config-router-bgp-af)#exit
  switch(config-router-bgp)#
  ```

29.2.5 BGP Confederations

BGP confederations allow you to break an autonomous system (AS) into multiple sub-ASs, and then
to group the sub-ASs as a confederation.

The sub-ASs exchange IBGP routing information (next-hop, local-preference and MED), but
communicate via EBGP.
To configure a BGP confederation, perform these configuration tasks on each BGP device within the confederation:

- Configure the local AS number. The local AS number indicates membership in a sub-AS. All BGP devices with the same local AS number are members of the same sub-AS. BGP devices use the local AS number when communicating with other BGP4 devices in the confederation.
- Configure the confederation ID. The confederation ID is the AS number by which BGP devices outside the confederation recognize the confederation. A BGP device outside the confederation is not aware of, and does not care that BGP devices are in multiple sub-ASs. A BGP device uses the confederation ID to communicate with devices outside the confederation. The confederation ID must differ from the sub-AS numbers.
- Configure the list of the sub-AS numbers that are members of the confederation. Devices in a sub-AS exchange information via IBGP, while devices in different sub-ASs use EBGP.

**Example**

- The `router bgp` command enables BGP and configures the router in sub-autonomous system 100. The `bgp confederation identifier` command specifies confederation 65050 belongs to autonomous system 100.

  The neighbors from other autonomous systems within the confederation are treated as special EBGP peers when using the `bgp confederation peers` command.

  ```
  switch(config)#router bgp 100
  switch(config-router-bgp)#bgp confederation identifier 65050
  switch(config-router-bgp)#bgp confederation peers 65060
  ```
29.2.6 BGP Operational Commands

29.2.6.1 Shutdown

The shutdown (BGP) command disables BGP operations without disrupting the BGP configuration. The no router bgp command disables BGP and removes the BGP configuration.

The no shutdown command resumes BGP activity.

Example

- This command disables BGP activity on the switch.
  ```
  switch(config-router-bgp)#shutdown
  switch(config-router-bgp)#
  ```

- This command resumes BGP activity on the switch.
  ```
  switch(config-router-bgp)#no shutdown
  switch(config-router-bgp)#
  ```

29.2.6.2 Clearing the Routing Table and Resetting BGP Sessions

Changes to a route map do not take effect until the BGP process is forced to recognize the changes. The clear ip bgp command clears all BGP learned routes from the routing table, reads routes from designated peers, and sends routes required by those peers. Routes that are read or sent are processed through any modified route map or AS-path access list.

The clear ip bgp * command clears the BGP sessions with all BGP peers. To reset the session with a specific peer, enter the peer’s IP address in place of the asterisk.

Example

- This command removes all BGP learned routes from the routing table.
  ```
  switch#clear ip bgp
  switch#
  ```
Chapter 29: Border Gateway Protocol (BGP)

29.3 BGP Examples
This section describes the commands required to configure an IBGP and an EBGP topology.

29.3.1 Example 1
Example 1 features an internal BGP link that connects peers in AS 100.

29.3.1.1 Diagram
Figure 29-2 displays BGP Example 1. The BGP link establishes IBGP neighbors in AS 100. Each switch advertises two subnets. In UPDATE packets sent by Switch A, the LOCAL_PREF field is 150. In UPDATE packets sent by Switch B, the LOCAL_PREF field is 75.

29.3.1.2 Code
This code configures the Example 1 BGP instance on both switches.

**Step 1** Configure the neighbor addresses.

a Specify the neighbor to Switch A.

```
switchA(config)#router bgp 100
switchA(config-router-bgp)#neighbor 10.100.100.2 remote-as 100
```

b Specify the neighbor to Switch B.

```
switchB(config)#router bgp 100
switchB(config-router-bgp)#neighbor 10.100.100.1 remote-as 100
```

**Step 2** Configure the routes to be advertised.

a Advertise Switch A’s routes.

```
switchA(config-router-bgp)#network 10.10.1.0/24
switchA(config-router-bgp)#network 10.10.2.0/24
```

b Advertise Switch B’s routes.

```
switchB(config-router-bgp)#network 10.10.3.0/24
switchB(config-router-bgp)#network 10.10.4.0/24
```
Step 3 Configure the LOCAL_PREF.

```
switchA(config-router-bgp)#neighbor 10.100.100.2 export-localpref 150
switchB(config-router-bgp)#neighbor 10.100.100.1 export-localpref 75
```

Step 4 Modify the hold time and keepalive interval.

```
switchA(config-router-bgp)#timer bgp 30 90
switchB(config-router-bgp)#timer bgp 30 90
```

29.3.2 Example 2

Example 2 creates an external BGP link that connects routers in AS 100 and AS 200.

29.3.2.1 Diagram

Figure 29-3 displays BGP Example 2. The BGP link connects a switch in AS 100 to a switch in AS 200. Each switch advertises two subnets.

Switch A assigns a local preference of 150 to networks advertised by Switch B. Switch B assigns a local preference of 75 to networks advertised by Switch A.

**Figure 29-3: BGP Example 2**

29.3.2.2 Code

This code configures the Example 2 BGP instance on both switches.

Step 1 Configure the neighbor addresses.

a Specify the neighbor to Switch A.

```
switchA(config)#router bgp 100
switchA(config-router-bgp)#neighbor 10.100.100.2 remote-as 200
```

b Specify the neighbor to Switch B.

```
switchB(config)#router bgp 200
switchB(config-router-bgp)#neighbor 10.100.100.1 remote-as 100
```
Step 2  Configure the routes to be advertised.
   a  Advertise Switch A’s routes.
      switchA(config-router-bgp)#network 10.10.1.0/24
      switchA(config-router-bgp)#network 10.10.2.0/24
   b  Advertise Switch B’s routes.
      switchB(config-router-bgp)#network 10.10.3.0/24
      switchB(config-router-bgp)#network 10.10.4.0/24

Step 3  Assign local preference values to routes received from their respective peers.
      switchA(config-router-bgp)#neighbor 10.100.100.2 import-localpref 150
      switchB(config-router-bgp)#neighbor 10.100.100.2 import-localpref 75

Step 4  Modify the hold timer and keepalive interval.
      switchA(config-router-bgp)#timer bgp 30 90
      switchB(config-router-bgp)#timer bgp 30 90
29.4 BGP Commands

Global Configuration Commands

- router bgp
- ip as-path access-list
- ip as-path regex-mode
- ip community-list expanded
- ip community-list standard
- ip extcommunity-list expanded
- ip extcommunity-list standard

Router-BGP Configuration Mode (Includes Address-Family Mode)

- address-family
- aggregate-address
- bgp advertise-inactive
- bgp client-to-client reflection
- bgp cluster-id
- bgp confederation identifier
- bgp confederation peers
- bgp default
- bgp enforce-first-as
- bgp listen limit
- bgp listen range
- bgp log-neighbor-changes
- bgp redistribute-internal (BGP)
- distance bgp
- graceful-restart stalepath-time
- graceful-restart-helper
- maximum paths (BGP)
- no neighbor
- neighbor activate
- neighbor allowas-in
- neighbor default-originate
- neighbor description
- neighbor ebgp-multihop
- neighbor enforce-first-as
- neighbor export-localpref
- neighbor graceful-restart-helper
- neighbor import-localpref
- neighbor local-as
- neighbor local-v6-addr
- neighbor maximum-routes
- neighbor next-hop-peer
- neighbor next-hop-self
- neighbor out-delay
- neighbor password
- neighbor peer-group (create)
- neighbor peer-group (neighbor assignment)
- neighbor remote-as
- neighbor remove-private-as
• neighbor route-map (BGP)
• neighbor route-reflector-client
• neighbor send-community
• neighbor shutdown
• neighbor soft-reconfiguration
• neighbor timers
• neighbor transport connection-mode
• neighbor update-source
• neighbor weight
• network (BGP)
• redistribute (BGP)
• router-id (BGP)
• shutdown (BGP)
• timers bgp
• vrf

Clear Commands – Privileged EXEC Mode
• clear ip bgp
• clear ip bgp neighbor *
• clear ipv6 bgp
• clear ipv6 bgp neighbor *

Display Commands – EXEC Mode
• show bgp instance
• show ip as-path access-list
• show ip bgp
• show ip bgp community
• show ip bgp neighbors
• show ip bgp neighbors (route type)
• show ip bgp neighbors (route-type) community
• show ip bgp neighbors regexp
• show ip bgp paths
• show ip bgp peer-group
• show ip bgp regexp
• show ip bgp summary
• show ip community-list
• show ip extcommunity-list
• show ipv6 bgp
• show ipv6 bgp community
• show ipv6 bgp neighbors
• show ipv6 bgp neighbors (route type)
• show ipv6 bgp neighbors (route type) community
• show ipv6 bgp neighbors regexp
• show ipv6 bgp regexp
• show ipv6 bgp summary
address-family

The `address-family` command places the switch in address-family configuration mode to configure the address family setting of addresses configured as BGP neighbors. Address-family configuration mode is not a group change mode; `running-config` is changed immediately after commands are executed. The `exit` command does not affect the configuration.

The switch supports these address families:

- ipv4-unicast
- ipv6-unicast

`Running-config` displays address family commands in sub-blocks of the BGP configuration. The following commands are available in address family configuration mode:

- `neighbor activate` configures the address as active in the configuration mode address family.
- `no neighbor activate` configures the address as not active in the configuration mode address family.
- `neighbor default-originate` advertises a default route to the specified BGP neighbor.
- `neighbor route-map (BGP)` applies a route map to the specified BGP route.
- `network (BGP)` specifies a network for advertisement through UPDATE packets to BGP peers.

The `no address-family` and `default address-family` commands delete the specified address-family from `running-config` by removing all commands previously configured in the corresponding address-family mode.

The `exit` command returns the switch to router-BGP configuration mode.

Command Mode

Router-BGP Configuration

Command Syntax

```
bgp ADDRESS_TYPE
no bgp ADDRESS_TYPE
default bgp ADDRESS_TYPE
```

Parameters

- `ADDRESS_FAMILY` Address family affected by subsequent commands. Options include:
  - `ipv4` IPv4 unicast
  - `ipv6` IPv6 unicast

Example

- These commands enter address family mode for IPv6-unicast, insert a command, then exit the mode:
  ```
  switch(config)#router bgp 1
  switch(config-router-bgp)#address-family ipv6
  switch(config-router-bgp-af)#neighbor 172.10.1.1 activate
  switch(config-router-bgp-af)#exit
  switch(config-router-bgp)#
  ```
aggregate-address

The `aggregate-address` command creates an aggregate route in the Border Gateway Protocol (BGP) database. Aggregate routes combine the characteristics of multiple routes into a single route that the switch advertises. Aggregation can reduce the amount of information that a BGP speaker is required to store and transmit when advertising routes to other BGP speakers. Aggregate routes are advertised only after they are redistributed.

The advertised address of the aggregate is entered as an IP subnet; any routes configured on the switch that lie within that subnet then become contributors to the aggregate. Note that on Arista switches the BGP aggregate route will become active if there are any available contributor routes on the switch, regardless of the originating protocol. This includes routes configured statically.

**Important!** Aggregate routes are redistributed automatically, and their redistribution cannot be disabled.

Command options affect the attributes associated with the aggregated route, the advertisement of the contributor routes that comprise the aggregate, and which contributor routes are included.

Command options affect the following aggregate routing attributes:

- **AS_PATH attribute inclusion**: the `as-set` option controls the aggregate route’s AS_PATH and ATOMIC_AGGREGATE attribute contents. AS_PATH identifies the autonomous systems through which UPDATE message routing information passes. ATOMIC_AGGREGATE indicates that the route is an aggregate or summary of more specific routes.

  When the command includes `as-set`, the aggregate route’s AS_SET attribute contains the AS numbers of contributor routes. This can help BGP neighbors to prevent loops by rejecting aggregate routes that include their AS number in the AS_SET.

  When the command does not include `as-set`, the aggregate route’s ATOMIC_AGGREGATE attribute is set and the AS_PATH attribute does not include AS numbers of contributing routes.

- **Attribute assignment**: The `attribute-map` option assigns attributes contained in set commands in a specified route map’s lowest sequence with any set command to the aggregated route, overriding the automatic determination of the aggregate route’s attributes by the switch.

- **Route suppression**: The `summary-only` option suppresses the advertisement of the contributor routes that comprise the aggregate.

- **Contributor filtering**: The `match-map` option uses a route map to filter out contributor routes that would otherwise be included in the aggregate.

The `no aggregate-address` and `default aggregate-address` commands remove the corresponding `aggregate-address` command from `running-config`.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
aggregate-address AGGREGATE_NET [AS_SET] [SUMMARY] [ATTRIBUTE_MAP] [MATCH_MAP]
no aggregate-address AGGREGATE_NET
default aggregate-address AGGREGATE_NET
```

**Parameters**

- **`AGGREGATE_NET`** aggregate route IP address. Options include:
  - `netv4_addr` IPv4 subnet address (CIDR or address-mask notation).
  - `netv6_addr` IPv6 subnet address (CIDR notation).
• **AS_SET** controls AS_PATH attribute values associated with aggregate route. Options include:
  • <no parameter> ATOMIC_AGGREGATE attribute is set. Route contains no AS_PATH data.
  • as-set route includes AS_PATH information from contributor routes as AS_SET attributes.

• **SUMMARY** controls advertisement of contributor routes. Options include:
  • <no parameter> contributor and aggregate routes are advertised.
  • summary-only contributor routes are not advertised.

• **ATTRIBUTE_MAP** controls attribute assignments to the aggregate route. Options include:
  • <no parameter> attribute values are not assigned to route.
  • attribute-map map_name assigns attribute values in set commands of the map’s permit clauses. Deny clauses and match commands in permit clauses are ignored.

• **MATCH_MAP** filters contributors to the aggregate route. Options include:
  • <no parameter> no contributors are filtered.
  • match-map map_name filters contributor routes using the named match-map.

**Examples**

• These commands create an aggregate route (10.16.48.0/20) from the contributor routes 10.16.48.0/23, 10.16.50.0/23,10.16.52.0/23, and 10.16.54.0/23. The aggregate route includes the AS_PATH information from the contributor routes.

```plaintext
switch(config)#router bgp 1
switch(config-router-bgp)#aggregate-address 10.16.48.0/20 as-set
switch(config-router-bgp)#exit
switch(config)#
```

• These commands create an aggregate route and use a route map to add a local-preference attribute to the route.

```plaintext
switch(config)#route-map map1 permit 10
switch(config-route-map-map1)#set community 45
switch(config-route-map-map1)#exit
switch(config)#router bgp 1
switch(config-router-bgp)#aggregate-address 10.16.48.0/20 attribute-map map1
switch(config-router-bgp)#exit
switch(config)#
```

• These commands create an aggregate route and use a route map to allow only those contributors which match a specified prefix list to be included in the aggregate route.

```plaintext
switch(config)#route-map matchmap permit 10
switch(config-route-map-matchmap)#match ip address prefix-list agglist
switch(config-route-map-matchmap)#exit
switch(config)#router bgp 1
switch(config-router-bgp)#aggregate-address 1.1.0.0/16 match-map matchmap
```

bgp advertise-inactive

By default, BGP will advertise only those routes that are active in the switch’s RIB. This can contribute to dropped traffic. If a preferred route is available through another protocol (like OSPF), the BGP route will become inactive and not be advertised; if the preferred route is lost, there is no available route to the affected peers. Advertising inactive BGP routes minimizes traffic loss by providing alternative routes.

The `bgp advertise-inactive` command configures BGP to advertise inactive routes to BGP neighbors. Inactive route advertisement is configured globally, but the global setting can be overridden on a per-VRF basis.

The `no bgp advertise-inactive` and `default bgp advertise-inactive` commands restore the default BGP behavior (advertising only active routes) by removing the corresponding `bgp advertise-inactive` command from `running-config`.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
bgp advertise-inactive
no bgp advertise-inactive
default bgp advertise-inactive
```

**Example**

- These commands configure BGP to advertise inactive routes.

```
switch(config)#router bgp 64500
switch(config-router-bgp)#bgp advertise-inactive
switch(config-router-bgp)#
```
**bgp client-to-client reflection**

By default, routes received from a route reflector client and selected as best routes are propagated to all BGP peers, including other route reflector clients. If the clients are fully meshed, however, routes received from a client do not need to be mirrored to other clients. In this case, client-to-client reflection should be disabled.

The **no bgp client-to-client reflection** command disables client-to-client reflection.

The **bgp client-to-client reflection** and **default bgp client-to-client reflection** commands restore the default behavior by removing the **no bgp client-to-client reflection** command from **running-config**.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
bgp client-to-client reflection
no bgp client-to-client reflection
default bgp client-to-client reflection
```

**Example**

- This command disables client-to-client reflection on the switch.

```
switch(config)#router bgp 1
switch(config-router-bgp)#no bgp client-to-client reflection
switch(config-router-bgp)#
```
**bgp cluster-id**

When using route reflectors, an AS is divided into clusters. A cluster consists of one or more route reflectors and a group of clients to which they re-advertise route information, and for redundancy a single cluster may contain multiple route reflectors. Each route reflector has a cluster ID. If the cluster has only one route reflector the cluster ID is its router ID, but if a cluster has multiple route reflectors a 4-byte cluster ID must be assigned to all route reflectors in the cluster. All must be configured with the same cluster ID to allow them to identify updates from the cluster’s other route reflectors.

The `bgp cluster-id` command configures the cluster ID in a cluster with multiple route reflectors.

The `no bgp cluster-id` and `default bgp cluster-id` commands remove the cluster ID by removing the corresponding `bgp cluster-id` command from `running-config`. Do not remove the cluster ID if there are multiple route reflectors in the cluster.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
bgp cluster-id ID_NUM
no bgp cluster-id
default bgp cluster-id
```

**Parameters**

- `ID_NUM`  
  cluster ID shared by all route reflectors in the cluster (32-bit dotted-decimal notation).
  Options include:
  - `0.0.0.1` to `255.255.255.255`  
    valid cluster ID number.
  - `0.0.0.0`  
    removes the cluster-ID from the switch. Equivalent to `no bgp cluster-id` command.

**Example**

- This command sets the cluster ID for the switch to 172.22.30.101.
  ```
  switch(config)#router bgp 1
  switch(config-router-bgp)#bgp cluster-id 172.22.30.101
  switch(config-router-bgp)#
  ```
**bgp confederation identifier**

The *bgp confederation identifier* command configures the confederation identifier. Confederation can reduce the number of IBGP connections in a large AS domain. The AS domain is divided into several smaller sub-ASs, and each sub-AS remains fully connected. Devices in a sub-AS exchange information via IBGP, while devices in different sub-ASs use EBGP.

The *no bgp confederation identifier* and *default bgp confederation identifier* commands remove the *bgp confederation identifier* command from *running-config*.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
bgp confederation identifier as_number
no bgp confederation identifier
default bgp confederation identifier
```

**Parameters**

- **as_number** the ID of BGP AS confederation. Value ranges from 1 to 4294967295.

**Example**

- This command sets the BGP confederation identifier to 9.

```
switch(config)#router bgp 1
switch(config-router-bgp)#bgp confederation identifier 9
switch(config-router-bgp)#
```
**bgp confederation peers**

The `bgp confederation peers` command configures a confederation consisting of sub-ASs.

Before this command is executed, the confederation ID should be configured by the `bgp confederation identifier` command. Otherwise this configuration is invalid. The configured ASs in this command are inside the confederation and each AS uses a fully meshed network. The confederation appears as a single AS to the devices outside it.

The `no bgp confederation peers` and `default bgp confederation peers` commands delete the specified sub-AS from the confederation by removing the corresponding `bgp confederation peers` command from `running-config`.

**Command Mode**
Router-BGP Configuration

**Command Syntax**
```
bgp confederation peers as_range
no bgp confederation peers as_range
default bgp confederation peers as_range
```

**Parameters**
- **as_range** the Sub-AS number.
  
  *as_range* formats include number (from 1 to 4294967295), number range, or comma-delimited list of numbers and ranges.

**Example**
- This command configures the confederation that contains AS 1000 and 1002.

```
switch(config)#router bgp 1
switch(config-router-bgp)#bgp confederation peers 1000 1002
switch(config-router-bgp)#
```
bogp default

The `bogp default` command configures the default address family activation level of all addresses configured as BGP neighbors. The switch sends the following announcements to addresses active in an address family:

- IPv4 address family: IPv4 capability and all network advertisements with IPv4 prefixes.
- IPv6 address family: IPv6 capability and all network advertisements with IPv6 prefixes.

The following commands configure default address family activation levels for addresses configured as BGP neighbors:

- `bogp default ipv4-unicast` all addresses are IPv4 address family active.
- `no bogp default ipv4-unicast` all addresses are not IPv4 address family active.
- `bogp default ipv6-unicast` all addresses are IPv6 address family active
- `no bogp default ipv6-unicast` all addresses are not IPv6 address family active.

The activation state of an individual BGP neighbor address is configured by the `neighbor activate` commands. The `neighbor activate` command overrides the address’s default activation state for the address family configuration mode in which the command is issued:

- `neighbor activate`: the specified address is active.
- `no neighbor activate`: the specified address is not active.

The `default-default address family` activation state defines address family activation level of all addresses configured as BGP neighbors when `running-config` does not contain any `bogp default` commands. The default state of the BGP default activation level varies by address family:

- IPv4 address family all BGP addresses are IPv4 address family active.
- IPv6 address family all BGP addresses are not IPv6 address family active.

The `default bogp default` command restores the default-default activation setting for BGP neighbor addresses in the specified address family:

- `default bogp ipv4-unicast` is equivalent to `bogp ipv4-unicast`
- `default bogp ipv6-unicast` is equivalent to `no bogp ipv6-unicast`

Command Mode

Router-BGP Configuration

Command Syntax

```
bgp default ADDRESS_FAMILY
no bgp default ADDRESS_FAMILY
default bogp default ADDRESS_FAMILY
```

Parameters

- `ADDRESS_FAMILY` BGP address family. Options include:
  - `ipv4-unicast` IPv4-unicast peering sessions.
  - `ipv6-unicast` IPv6-unicast peering sessions.

Limitations

The switch supports the advertisement of networks with IPv6 prefixes to IPv4 transport neighbors. The switch does not support the advertisement of networks with IPv4 prefixes to IPv6 transport neighbors.
Example

- These commands configure the switch to configure all BGP neighbor addresses as IPv4 address family active and IPv6 address family active.

  switch(config)#router bgp 1
  switch(config-router-bgp)#bgp default ipv4-unicast
  switch(config-router-bgp)#bgp default ipv6-unicast
  switch(config-router-bgp)#show active
  router bgp 65533
      bgp log-neighbor-changes
      distance bgp 20 200 200
      neighbor 172.23.254.2 remote-as 65533
      neighbor 172.41.254.78 remote-as 65534
      neighbor 2001:0DB8:52a4:fe01::2 remote-as 65533
      neighbor 2001:0DB8:52a4:fe4c::1 out-delay 10
  switch(config-router-bgp)#

  The show active command does not display the `bgp default ipv4-unicast` command because it is the default setting for IPv4 peering sessions.
**bgp enforce-first-as**

The `bgp enforce-first-as` command causes a forced comparison of the first autonomous system (AS) in the AS path of eBGP routes received from BGP neighbors to the configured remote external peer autonomous system number (ASN). Updates from eBGP peers that do not include an ASN as first AS path (in the AS_PATH attribute) are discarded.

This behavior is enabled by default upon BGP configuration, and disabled globally by the `no` form of this command. To configure enforce-first-as for an individual neighbor or peer group, use the `neighbor enforce-first-as` command.

**Command Mode**
- Router-BGP Configuration

**Command Syntax**
- `bgp enforce-first-as`
- `default bgp enforce-first-as`
- `no bgp enforce-first-as`

**Example**
- This command configures BGP to enforce the first AS globally.

```bash
switch(config-router-bgp)#bgp enforce-first-as
switch(config-router-bgp)#
```
**bgp listen limit**

The `bgp listen limit` command limits the number of dynamic BGP peers allowed on the switch.

The `no bgp listen limit` and `default bgp listen limit` commands restore the default limit of dynamic BGP peers by removing the `bgp listen limit` command from `running-config`.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
bgp listen limit maximum
no bgp listen limit
default bgp listen limit
```

**Parameters**

- `maximum` the maximum number of dynamic BGP peers to be allowed on the switch. Values range from 1 to 1000; default value is 100.

**Example**

- This command sets the maximum number of dynamic BGP peers allowed on the switch to 200.

```
switch(config)#router bgp 1
switch(config-router-bgp)#bgp listen limit 200
switch(config-router-bgp)#
```
**bgp listen range**

The **bgp listen range** command identifies a range of IPv4 and IPv6 addresses from which the switch will accept incoming dynamic BGP peering requests, and creates the named dynamic peer group to which those peers will belong. To create a static peer group, use the **neighbor peer-group (create)** command.

Neighbors in a dynamic peer group are configured as a group and cannot be configured individually. Once a dynamic peer group is created with this command, the following **neighbor** commands can use the peer group name as a parameter:

- neighbor ebgp-multihop
- neighbor import-localpref
- neighbor maximum-routes
- neighbor route-map (BGP)
- neighbor timers
- neighbor update-source

The **no bgp listen range** and **default bgp listen range** commands remove the dynamic peer group by deleting the corresponding command from **running-config**. To remove a static peer group, use the **no neighbor** command. All peering relationships with group members are terminated when the dynamic peer group is deleted.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
bgp listen range NET_ADDRESS peer-group group_name remote-as as_number
no bgp listen range NET_ADDRESS peer-group group_name
default bgp listen range NET_ADDRESS peer-group group_name
```

**Parameters**

- **NET_ADDRESS** IPv4 address range. Entry options include:
  - **IPv4 subnet** IPv4 subnet (CIDR notation).
  - **IPv4_address mask subnet** IPv4 subnet (dotted decimal notation).
  - **IPv6_prefix** IPv6 subnet (dotted decimal notation).
- **group_name** name of the peer group.
- **as_number** the autonomous system to which the peer group belongs.

**Example**

- These commands create a dynamic peer group called “brazil” in AS 5 which accepts peering requests from the 192.168.6.0/24 subnet.
  ```
  switch(config)#router bgp 1
  switch(config-router-bgp)#bgp listen range 192.168.6.0/24 peer-group brazil remote-as 5
  switch(config-router-bgp)#
  ```
**bgp log-neighbor-changes**

The `bgp log-neighbor-changes` command configures the switch to generate a log message when a BGP peer enters or exits the Established state. This is the default behavior.

The `no bgp log-neighbor-changes` command disables the generation of these log messages. The `default bgp log-neighbor-changes` command enables the generation of these log messages.

**Command Mode**

- **Router-BGP Configuration**

**Command Syntax**

- `bgp log-neighbor-changes`
- `no bgp log-neighbor-changes`
- `default bgp log-neighbor-changes`

**Example**

- These commands configure the switch to generate a message when a BGP peer enters or exits the `established` state.

```
switch(config)#router bgp 1
switch(config-router-bgp)#bgp log-neighbor-changes
switch(config-router-bgp)#
```
**bgp redistribute-internal (BGP)**

The `bgp redistribute-internal` command enables the redistribution of iBGP routes into an interior gateway protocol (IGP).

The `no bgp redistribute-internal` and `default bgp redistribute-internal` commands disable route redistribution from the specified domain by removing the corresponding `bgp redistribute-internal` command from *running-config*.

**Command Mode**
- Router-BGP Configuration
- Router-BGP Configuration-Address-Family

**Command Syntax**
- `bgp redistribute internal`
- `no bgp redistribute internal`
- `default bgp redistribute internal`

**Example**
- This command redistributes internal BGP routes.
  ```
  switch(config)#router bgp 9
  switch(config-router-bgp)#bgp redistribute-internal
  switch(config-router-bgp)#
  ```
clear ip bgp

The clear ip bgp command removes learned BGP routes from the routing table, reads all routes from designated peers, and sends routes to those peers as required.

- using hard reset terminates current BGP sessions and recreates the local routing information base.
- using soft reset maintains current BGP sessions and reconfigures the local routing information base using stored routes.

Routes that are read or sent are processed through modified route maps or AS-path access lists. The command can also clear the switch’s BGP sessions with its peers.

After a route map is modified, the changes do not take effect until the BGP process is forced to recognize the changes. Use the clear ip bgp command after changing any of these BGP attributes:

- access lists
- weights
- distribution lists
- timers
- administrative distance
- route maps

Command Mode
Privileged EXEC

Command Syntax
```
clear ip bgp [ACTION] [RESET_TYPE] [DATA_FLOW] [VRF_INSTANCE]
```

Parameters
- **ACTION** the entity upon which the clearing action is taken. Options include:
  - <no parameter> clears the routing table, then reads in routes from designated peers.
  - * clears all BGP IPv4 sessions with the switch’s peers.
  - ipv4_addr resets the IPv4 session with the peer at the specified IPv4 address.
  - ipv6_addr resets the IPv4 session with the peer at the specified IPv6 address.
- **RESET_TYPE** reconfiguration type. Options include:
  - <no parameter> hard reset.
  - soft soft reset.
- **DATA_FLOW** restricts hard reset to inbound or outbound routes. Soft reset is bidirectional.
  - <no parameter> inbound and outbound routes are reset.
  - in inbound routes are reset.
  - out outbound routes are reset.
- **VRF_INSTANCE** specifies VRF instances.
  - <no parameter> clears routing table for context-active VRF.
  - vrf vrf_name clears routing table for the specified VRF.
  - vrf all clears routing table for all VRFs.
  - vrf default clears routing table for default VRF.
Examples

- This command removes all BGP learned routes from the routing table:
  ```
  switch# clear ip bgp
  switch#
  ```

- This command clears all of the switch’s BGP IPv4 peering sessions:
  ```
  switch# clear ip bgp *
  switch#
  ```
clear ip bgp neighbor *

The clear ip bgp neighbor * command clears BGP neighbors belonging to the IPv4 transport address family. To clear BGP neighbors in the IPv6 transport address family, use the clear ipv6 bgp neighbor * command.

Command Mode
Privileged EXEC

Command Syntax
   clear ip bgp neighbor * [VRF_INSTANCE]

Parameters
- VRF_INSTANCE specifies VRF instance for which IPv4 transport address family BGP neighbors will be cleared. Options include:
  - <no parameter> clears IPv4 BGP neighbors in the context-active VRF.
  - vrf vrf_name clears IPv4 BGP neighbors in the specified VRF.
  - vrf all clears IPv4 BGP neighbors in the all VRFs.
  - vrf default clears IPv4 BGP neighbors in the default VRF.

Examples
- This command clears all IPv4 BGP neighbors in the context-active VRF.
  switch#clear ip bgp neighbor *
  switch#
- This command clears all IPv4 BGP neighbors in VRF “purple.”
  switch#clear ip bgp neighbor * vrf purple
  switch#
clear ipv6 bgp

The clear ipv6 bgp command removes learned BGP routes from the routing table, reads all routes from designated peers, and sends routes to those peers as required.

- using hard reset terminates current BGP sessions and recreates the local routing information base.
- using soft reset maintains current BGP sessions and reconfigures the local routing information base using stored routes.

Routes that are read or sent are processed through modified route maps or AS-path access lists. The command can also clear the switch’s BGP sessions with its peers.

After a route map is modified, the changes do not take effect until the BGP process is forced to recognize the changes. Use the clear ipv6 bgp command after changing any of these BGP attributes:

- access lists
- weights
- distribution lists
- timers
- administrative distance
- route maps

Command Mode
Privileged EXEC

Command Syntax

clear ipv6 bgp [ACTION] [RESET_TYPE] [DATA_FLOW] [VRF_INSTANCE]

Parameters

- **ACTION** the entity upon which the clearing action is taken. Options include:
  - <no parameter> clears the routing table, then reads in routes from designated peers.
  - * clears all BGP IPv6 sessions with the switch’s peers.
  - ipv4_addr resets IPv6 session with peer at specified IPv4 address.
  - ipv6_addr resets IPv6 session with peer at specified IPv6 address.

- **RESET_TYPE** reconfiguration type. Options include:
  - <no parameter> hard reset.
  - soft soft reset.

- **DATA_FLOW** restricts reset to inbound or outbound routes.
  - <no parameter> inbound and outbound routes are reset.
  - in inbound routes are reset.
  - out outbound routes are reset.

- **VRF_INSTANCE** specifies VRF instances.
  - <no parameter> clears routing table for context-active VRF.
  - vrf vrf_name clears routing table for the specified VRF.
  - vrf all clears routing table for all VRFs.
  - vrf default clears routing table for default VRF.
Examples

- This command removes all BGP IPv6 learned routes from the routing table:
  ```
  switch# clear ipv6 bgp
  switch#
  ```

- This command clears all of the switch's BGP IPv6 peering sessions:
  ```
  switch# clear ip bgp *
  switch#
  ```
clear ipv6 bgp neighbor *

The `clear ipv6 bgp neighbor *` command clears BGP neighbors belonging to the IPv6 transport address family. To clear BGP neighbors in the IPv4 transport address family, use the `clear ip bgp neighbor *` command.

**Command Mode**
Privileged EXEC

**Command Syntax**
`clear ipv6 bgp neighbor * [VRF_INSTANCE]`

**Parameters**
- `VRF_INSTANCE` specifies VRF instance for which IPv6 transport address family BGP neighbors will be cleared. Options include:
  - `<no parameter>` clears IPv6 BGP neighbors in the context-active VRF.
  - `vrf vrf_name` clears IPv6 BGP neighbors in the specified VRF.
  - `vrf all` clears IPv6 BGP neighbors in the all VRFs.
  - `vrf default` clears IPv6 BGP neighbors in the default VRF.

**Examples**
- This command clears all IPv6 BGP neighbors in the context-active VRF.
  ```
  switch#clear ipv6 bgp neighbor *
  switch#
  ```
- This command clears all IPv6 BGP neighbors in VRF “purple.”
  ```
  switch#clear ipv6 bgp neighbor * vrf purple
  switch#
  ```
distance bgp

The `distance bgp` command assigns an administrative distance to routes that the switch learns through BGP. Routers use administrative distances to select a route when two protocols provide routing information to the same destination. Distance values range from 1 to 255; lower distance values correspond to higher reliability. BGP routing tables do not include routes with a distance of 255.

The distance command assigns distance values to external, internal, and local BGP routes:

- **external**: Best path routes learned from a neighbor external to the autonomous system. Default distance is 200.
- **internal**: Internal routes are routes learned from a BGP entity within the same autonomous system. Default distance is 200.
- **local**: Local routes are networks listed with a network router configuration command for that router or for networks that are redistributed from another process. Default distance is 200.

The `no distance bgp` and `default distance bgp` commands restore the default administrative distances by removing the `distance bgp` command from `running-config`.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
distance bgp external_dist [INTERNAL_LOCAL]
no distance bgp
default distance bgp
```

**Parameters**

- **external_dist** distance assigned to external routes. Values range from 1 to 255.
- **INTERNAL_LOCAL** distance assigned to internal and local routes. Values for both routes range from 1 to 255. Options include:
  - `<no parameter>` `external_dist` value is assigned to internal and local routes.
  - `internal_dist` `local_dist` values assigned to internal `(internal_dist)` and local `(local_dist)` routes.

**Example**

- This command assigns an administrative distance of 150 to external routes, 200 to internal, and 150 to local routes.
  
  ```
  switch(config)#router bgp 1
  switch(config-router-bgp)#distance bgp 150 200 150
  switch(config-router-bgp)#
  ```
**graceful-restart stalepath-time**

The `graceful-restart stalepath-time` command specifies the maximum time that stale routes from a restarting BGP neighbor will be retained after a BGP session is re-established with that peer.

The `no graceful-restart stalepath-time` and `default graceful-restart stalepath-time` commands restore the default value of 300 seconds by deleting the `graceful-restart stalepath-time` statement from `running-config`.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
graceful-restart stalepath-time interval
no graceful-restart stalepath-time
default graceful-restart stalepath-time
```

**Parameters**

- `interval` Maximum period (in seconds) that stale routes from a restarting BGP neighbor will be retained after the BGP session is re-established. Value ranges from 1 to 3600 (60 minutes). Default is 300.

**Example**

- These commands configure the stale path retention interval to 15 minutes.

  ```
switch(config)#router bgp 1
switch(config-router-bgp)#graceful-restart stalepath-time 900
switch(config-router-bgp)#
```
graceful-restart-helper

The graceful-restart helper command enables BGP graceful restart helper mode on the switch for all BGP neighbors. When graceful restart helper mode is enabled, the switch will retain routes from neighbors which are capable of graceful restart while those neighbors are restarting BGP. Graceful restart is enabled by default. To configure graceful restart helper mode for a specific neighbor or peer group, use the neighbor graceful-restart-helper command. Individual neighbor configuration takes precedence over the global configuration.

The no graceful-restart helper command disables graceful restart helper mode on the switch. The default graceful-restart helper command enables graceful restart helper mode by removing the corresponding no graceful-restart helper command from running-config.

Command Mode
   Router-BGP Configuration

Command Syntax
   graceful-restart helper
   no graceful-restart helper
   default graceful-restart helper

Example
   • These commands disable graceful restart helper mode on the switch.
     switch(config)#router bgp 1
     switch(config-router-bgp)#no graceful-restart-helper
     switch(config-router-bgp)#
ip as-path access-list

The **ip as-path access-list** command creates an access list to filter BGP route updates. If access list **list_name** does not exist, this command creates it. If it already exists, this command appends statements to the list.

The **no ip as-path access-list** and **default ip as-path access-list** commands delete the named access list.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip as-path access-list list_name FILTER_TYPE regex ORIGIN
no ip as-path access-list list_name
default ip as-path access-list list_name
```

**Parameters**

- **list_name** the name of the AS path access list.
- **FILTER_TYPE** access resolution of the specified AS path. Options include:
  - **permit** access is permitted.
  - **deny** access is denied.
- **regex** a regular expression describing the AS path being filtered. Regular expressions are pattern matching strings that are composed of text characters and operators.
- **ORIGIN** the origin of the path information. Values include:
  - <no parameter> sets the origin to **any**.
  - **any** any BGP origin.
  - **egp** EGP origin.
  - **igp** IGP origin.
  - **incomplete** incomplete origin.

**Example**

- These commands create an AS path access list named "list1" which allows all BGP routes except those originating in AS 3.

  ```
switch(config)#ip as-path access-list list1 deny _3$
switch(config)#ip as-path access-list list1 permit .*
switch(config)#
```
ip as-path regex-mode

The `ip as-path regex-mode` command specifies how the switch will evaluate regular expressions describing AS paths in ACLs. When the regex mode is set to `asn`, AS numbers in the ACL are interpreted as AS numbers; only complete AS number matches in the AS path return a match. When it is set to `string`, AS numbers in the ACL are interpreted as strings; both complete AS number matches and longer AS numbers that include the target string return a match. The default mode is `asn`.

For example, `asn` mode will return “false” and `string` mode will return “true” when searching for “10” in an AS path of “100 200”.

The `no ip as-path regex-mode` and `default ip as-path regex-mode` commands restore the regex mode to `asn` by removing the `ip as-path regex-mode` command from `running-config`.

Command Mode

- Global Configuration

Command Syntax

- `ip as-path regex-mode MODE_SETTING`
- `no ip as-path regex-mode`
- `default ip as-path regex-mode`

Parameters

- **MODE_SETTING** Specifies how regular expressions describing AS paths in AS path ACLs will be evaluated. Options include:
  - `asn` AS numbers in the ACL are interpreted as AS numbers; only complete AS number matches in the AS path return a match.
  - `string` AS numbers in the ACL are interpreted as strings; both complete AS number matches and longer AS numbers that include the target string return a match.

Example

- This command sets the regex mode to `string`.

```
switch(config)#ip as-path regex-mode string
switch(config)#
```
ip community-list expanded

The **ip community-list expanded** command creates and configures a BGP access list based on BGP communities. A BGP community access list filters route maps that are configured as BGP communities. The command uses regular expressions to name the communities specified by the list.

The **no ip community-list expanded** and **default ip community-list expanded** commands delete the specified community list by removing the corresponding **ip community-list expanded** command from **running-config**.

**Command Mode**

- Global Configuration

**Command Syntax**

- `ip community-list expanded listname FILTER_TYPE R_EXP`
- `no ip community-list expanded listname`
- `default community-list expanded listname`

**Parameters**

- **listname**  name of the community list. Valid input is text.
- **FILTER_TYPE**  access resolution of the specified community. Options include:
  - **permit**  access is permitted.
  - **deny**  access is denied.
- **R_EXP**  list of communities, formatted as a regular expression. Regular expressions are pattern matching strings that are composed of text characters and operators.

**Example**

- This command creates a BGP community list that permits routes from networks 20-24 and 30-34 in autonomous system 10.

  ```
  switch(config)#ip community-list expanded list_2 permit 10:[2-3][0-4]_
  switch(config)#
  ```
**ip community-list standard**

The `ip community-list standard` command creates and configures a BGP access list based on BGP communities. A BGP community list filters route maps that are configured as BGP communities.

The `no ip community-list standard` and `default ip community-list standard` commands delete the specified community list by removing the corresponding `ip community-list standard` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip community-list standard listname FILTER_TYPE COMM_1 [COMM_2...COMM_n]
neg ip community-list standard listname
default ip community-list standard listname
```

**Parameters**

- `listname` name of the community list. Valid input is text.
- `FILTER_TYPE` access resolution of the specified community. Options include:
  - `permit` access is permitted.
  - `deny` access is denied.
- `COMM_x` community number or name, as specified in the route map that sets the community list number.
  - `aa:nn` AS and network number, separated by colon. Each value ranges from 1 to 4294967295.
  - `number` community number. Values range from 1 to 4294967040.
  - `internet` advertises route to Internet community.
  - `local-as` advertises route only to local peers.
  - `no-advertise` does not advertise route to any peer.
  - `no-export` advertises route only within BGP AS boundary.

**Example**

- This command creates a BGP community list (named list_9) that denies members of route maps configured as AS-network number 100:250.

  ```
  switch(config)#ip community-list standard list_9 deny 100:250
  switch(config)#
  ```
ip extcommunity-list expanded

The **ip extcommunity-list expanded** command creates an extended community list to filter VRF routes. The command uses regular expressions to name the communities specified by the list.

- **route targets** identify sites that may receive appropriately tagged routes.
- **site of origin** identifies the site where the router learned the route.

The **no ip extcommunity-list expanded** and **default ip extcommunity-list expanded** commands delete the specified extended community list by removing the corresponding **ip community-list expanded** statement from **running-config**.

**Command Mode**
- Global Configuration

**Command Syntax**

```
ip extcommunity-list expanded listname FILTER_TYPE R_EXP
no ip extcommunity-list expanded listname
default ip extcommunity-list expanded listname
```

**Parameters**

- **listname** name of the extended community list. Valid input is text.
- **FILTER_TYPE** access resolution of the specified extended community list. Options include:
  - **permit** access is permitted.
  - **deny** access is denied.
- **R_EXP** list of communities, formatted as a regular expression. Regular expressions are pattern matching strings that are composed of text characters and operators.
  - Expressions beginning **RT:** match the **route target** extended community attribute option.
  - Expressions beginning **SoO:** match the **site of origin** extended community attribute option.

**Example**

- This command creates a BGP extended community list that denies routes from route target networks 20-24 and 30-34 in autonomous system 10.

```
switch(config)#ip extcommunity-list expanded list_1 deny RT:10:[2-3][0-4]_
switch(config)#
```
ip extcommunity-list standard

The `ip extcommunity-list standard` command creates an extended community list to filter VRF routes.

- **Route Target (rt)** identify sites that may receive appropriately tagged routes.
- **Site of Origin (soo)** identifies sites where the switch learned the route.

The `no ip extcommunity-list standard` and `default ip extcommunity-list standard` commands delete the specified extended community list by removing the corresponding `ip extcommunity-list standard` statement from `running-config`.

**Command Mode**
- Global Configuration

**Command Syntax**

```
ip extcommunity-list standard listname FILTER_TYPE COMM_1 [COMM_2...COMM_n]
no ip extcommunity-list standard listname
default ip extcommunity-list standard listname
```

**Parameters**
- `listname` name of the extended community list. Valid input is text.
- `FILTER_TYPE` access resolution of the specified extended community list. Options include:
  - `permit` access is permitted.
  - `deny` access is denied.
- `COMM_x` extended community attribute. Options include:
  - `rt aa:nn` route target, as specified by autonomous system:network number
  - `rt ip_addr:nn` route target, as specified by ip address:network number
  - `soo aa:nn` site of origin, as specified by autonomous system:network number
  - `soo ip_addr:nn` site of origin, as specified by ip address:network number

**Example**
- This command creates a BGP extended community list that denies routes from route target 100:250.

  ```
  switch(config)#ip extcommunity-list standard list_9 deny rt 100:250
  switch(config)#
  ```
maximum paths (BGP)

The **maximum-paths** command controls the maximum number of parallel eBGP routes that the switch supports. The default maximum is one route. The command provides an ECMP (equal cost multiple paths) parameter that controls the number of equal-cost paths that the switch stores in the routing table for each route.

The **no maximum-paths** and **default maximum-paths** commands restore the default values of the maximum number of parallel routes and the maximum number of ECMP paths by removing the corresponding command from **running-config**.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
maximum-paths paths [ecmp ecmp_paths]
no maximum-paths
default maximum-paths
```

**Parameters**

- **paths** maximum number of parallel routes. Default value is 1.
- **ecmp_paths** maximum number of ECMP paths for each route. Default is maximum value.

Value for each parameter ranges from 1 to the number of interfaces available per ECMP group, which is platform dependent.

- Arad: Value ranges from 1 to 128. Default value is 128.
- FM6000: Value ranges from 1 to 32. Default value is 32.
- PetraA: Value ranges from 1 to 16. Default value is 16.
- Trident: Value ranges from 1 to 32. Default value is 32.
- Trident-II: Value ranges from 1 to 128. Default value is 128.

**Examples**

- This command configures the maximum number of BGP parallel paths to 12. The ECMP value for each route is 16 (PetraA platforms) or 32 (Trident platform).
  ```
  switch(config)#router bgp 1
  switch(config-router-bgp)#maximum-paths 12
  ! Warning: maximum-paths will take effect after BGP restart.
  switch(config-router-bgp)#
  ```

- This command configures the maximum number of BGP parallel paths to 2. The ECMP value for each route is 4.
  ```
  switch(config)#router bgp 1
  switch(config-router-bgp)#maximum-paths 2 ecmp 4
  ! Warning: maximum-paths will take effect after BGP restart.
  switch(config-router-bgp)#
  ```
neighbor activate

The **neighbor activate** command defines the configuration mode address family activation state of a specified address that is configured as a BGP neighbor. The switch sends the following announcements to addresses active in an address family:

- IPv4 address family: IPv4 capability and all network advertisements with IPv4 prefixes.
- IPv6 address family: IPv6 capability and all network advertisements with IPv6 prefixes.

The **bgp default** command configures the default address family activation state of addresses configured as BGP neighbors. The **neighbor activate** and **no neighbor activate** commands override the neighbor’s default activation state within the configuration mode address family.

- **neighbor activate**: the specified address is active in the address family.
- **no neighbor activate**: the specified address is not active in the address family.

The **default neighbor activate** command removes the corresponding **neighbor activate** or **no neighbor activate** command from **running-config**, restoring the default address family activation state for the specified neighbor address.

**Command Mode**

Router-BGP Configuration-Address-Family Configuration

**Command Syntax**

```
neighbor NEIGHBOR_ID activate
no neighbor NEIGHBOR_ID activate
default neighbor NEIGHBOR_ID activate
```

**Parameters**

- **NEIGHBOR_ID** IP address or peer group name. Values include:
  - **ipv4_addr** neighbor’s IPv4 address.
  - **ipv6_addr** neighbor’s IPv6 address.
  - **group_name** peer group name.

**Limitations**

The switch supports the advertisement of networks with IPv6 prefixes to IPv4 transport neighbors. The switch does not support the advertisement of networks with IPv4 prefixes to IPv6 transport neighbors.

**Example**

- The two neighbor activation commands activate the advertising of specified neighbors during IPv4 peering sessions. The **show active** command displays the result of the previous commands.

```
switch(config)#router bgp 1
switch(config-router-bgp)#no address-family ipv4
switch(config-router-bgp-af)#neighbor 172.41.18.15 activate
switch(config-router-bgp-af)#neighbor 172.49.22.6 activate
switch(config-router-bgp-af)#no neighbor 172.15.21.18 activate
switch(config-router-bgp-af)#show active
address-family ipv4
  no neighbor 172.15.21.18 activate
  neighbor 172.49.22.6 activate
  neighbor 172.41.18.15 activate
switch(config-router-bgp-af)#exit
switch(config-router-bgp)#
```
neighbor allowas-in

The `neighbor allowas-in` command configures the switch to permit the advertisement of prefixes containing duplicate autonomous switch numbers (ASNs). This command programs the switch to ignore its ASN in the AS path of routes and allow them into the routing domain. This function is disabled by default.

The `no neighbor allowas-in` command applies the system default configuration.

The `default neighbor allowas-in` command applies the system default configuration for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

The `no neighbor` command removes all configuration commands for the neighbor at the specified address.

Command Mode

Router-BGP Configuration

Command Syntax

```
neighbor  NEIGHBOR_ID  allowas-in  [asn_quantity]
no  neighbor  NEIGHBOR_ID  allowas-in
default  neighbor  NEIGHBOR_ID  allowas-in
```

Parameters

- **NEIGHBOR_ID**  IP address or peer group name. Values include:
  - `ipv4_addr`  neighbor’s IPv4 address.
  - `ipv6_addr`  neighbor’s IPv6 address.
  - `group_name`  peer group name.
- **asn_quantity**  Number of switches (ASN) allowed in path. Values range from 1 to 10. Default is 3.

Example

- This command activates the allowas-in function for the neighbor at 192.168.1.30.

```
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 192.168.1.30  allowas-in
switch(config-router-bgp)#
```
neighbor default-originate

The `neighbor default-originate` command advertises a default route to a BGP neighbor or peer group. This default route overrides the default route advertised by any other means to the specified neighbor or peer group. However, the update generated by `neighbor default-originate` is not processed by neighbor route-map out policies.

If a route map is specified in this command, its set clauses are used to modify attributes of the exported default route, but its match clauses are not used to conditionally advertise the route. The default route is always advertised to the specified neighbor.

The `no neighbor default-originate` command applies the system default configuration.

The `default neighbor default-originate` command applies the system default configuration for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

The `no neighbor` command removes all configuration commands for the neighbor at the specified address.

**Command Mode**
- Router-BGP Configuration
- Router-BGP Configuration-Address-Family

**Command Syntax**

```
neighbor NEIGHBOR_ID default-originate [MAP]
no neighbor NEIGHBOR_ID default-originate
default neighbor NEIGHBOR_ID default-originate
```

**Parameters**

- `NEIGHBOR_ID` IP address or peer group name. Values include:
  - `ipv4_addr` neighbor’s IPv4 address.
  - `ipv6_addr` neighbor’s IPv6 address.
  - `group_name` peer group name.
- `MAP` specifies route map that modifies attributes of the exported default route. Options include:
  - `<no parameter>` attributes are not modified by a route map.
  - `route-map map_name` attributes set by specified route map are assigned to the exported default route.

**Example**

- These commands advertise a default route to the BGP neighbor at 192.168.14.5.

```
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor 192.168.14.5 default-originate
switch(config-router-bgp)#
```
neighbor description

The **neighbor description** command associates descriptive text with the specified peer or peer group.

The **no neighbor description** command removes the text association from the specified peer or peer group.

The **default neighbor description** command removes the text association from the specified peer for individual neighbors, and applies the peer group’s description to neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address or for the specified peer group.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor NEIGHBOR_ID description description_string
no neighbor NEIGHBOR_ID description
default neighbor NEIGHBOR_ID description
```

**Parameters**

- **NEIGHBOR_ID**  IP address or peer group name. Options include:
  - *ipv4_addr* neighbor’s IPv4 address.
  - *ipv6_addr* neighbor’s IPv6 address.
  - *group_name* peer group name.
- **description_string** text string to be associated with the neighbor or peer group.

**Example**

- This command associates the string PEER_1 with the peer located at 192.168.1.30.

  switch(config)#router bgp 1
  switch(config-router-bgp)#neighbor 192.168.1.30 description PEER_1
  switch(config-router-bgp)#
**neighbor ebgp-multihop**

The `neighbor ebgp-multihop` command programs the switch to accept and attempt BGP connections to the external peers residing on networks not directly connected to the switch. The command does not establish the multihop if the only route to the peer is the default route (0.0.0.0).

The `no neighbor ebgp-multihop` command applies the system default configuration.

The `default neighbor ebgp-multihop` command applies the system default configuration for individual neighbors, and applies the peer group’s setting for neighbors that are members of a peer group.

The `no neighbor` command removes all configuration commands for the neighbor at the specified address.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor NEIGHBOR_ID ebgp-multihop [hop_number]
no neighbor NEIGHBOR_ID ebgp-multihop
default neighbor NEIGHBOR_ID ebgp-multihop
```

**Parameters**

- **NEIGHBOR_ID**  IP address or peer group name. Values include:
  - `ipv4_addr`  neighbor’s IPv4 address.
  - `ipv6_addr`  neighbor’s IPv6 address.
  - `group_name`  peer group name.

- **hop_number**  time-to-live (hops). Values range from 1 to 255. Default value is 255.

**Example**

- This command programs the switch to accept and attempt BGP connections to the external peer located at 192.168.1.30, setting the hop limit to 32.

```
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 192.168.1.30 ebgp-multihop 32
switch(config-router-bgp)#
```
neighbor enforce-first-as

The `neighbor enforce-first-as` command causes a forced comparison of the first autonomous system (AS) in the AS path of eBGP routes received from a specified BGP peer or peer group to the configured remote external peer autonomous system number (ASN). Updates from the specified eBGP peers that do not include an ASN as first AS path (in the AS_PATH attribute) are discarded.

This behavior is enabled globally by default upon BGP configuration, and disabled for the specified neighbor or peer group by the `no` form of the command. To configure enforce-first-as globally, use the `bgp enforce-first-as` command.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor NEIGHBOR_ID enforce-first-as
default neighbor NEIGHBOR_ID enforce-first-as
no neighbor NEIGHBOR_ID enforce-first-as
```

**Parameters**

- `NEIGHBOR_ID`  IP address or peer group name. Values include:
  - `ipv4_addr`  neighbor’s IPv4 address.
  - `ipv6_addr`  neighbor’s IPv6 address.
  - `group_name`  peer group name.

**Example**

- This command disables BGP enforce-first-as for the neighbors in peer group “region-3”.

```
switch(config-router-bgp)#no neighbor region-3 enforce-first-as
switch(config-router-bgp)#
```
neighbor export-localpref

The neighbor export-localpref command determines the LOCAL_PREF value that is sent in BGP UPDATE packets to the specified peer or peer group. This command has no effect on external peers.

The no neighbor export-localpref command resets the LOCAL_PREF value to the system default of 100 in packets sent to the specified peer or peer group.

The default neighbor export-localpref command resets the LOCAL_PREF value to the system default of 100 for individual neighbors, and applies the peer group’s setting for neighbors that are members of a peer group.

The no neighbor command removes all configuration commands for the neighbor at the specified address or the specified peer group.

Command Mode
   Router-BGP Configuration

Command Syntax
   neighbor NEIGHBOR_ID export-localpref preference
   no neighbor NEIGHBOR_ID export-localpref
   default neighbor NEIGHBOR_ID export-localpref

Parameters
   • **NEIGHBOR_ID**   IP address or peer group name. Values include:
     •    ipv4_addr    neighbor’s IPv4 address.
     •    ipv6_addr    neighbor’s IPv6 address.
     •    group_name    peer group name.
   • **preference**   preference value. Values range from 0 to 4294967295.

Example
   • This command configures the switch to fill the LOCAL_PREF field with 200 in UPDATE packets that it sends to the peer located at 10.1.1.45.
     switch(config)#router bgp 1
     switch(config-router-bgp)#neighbor 10.1.1.45 export-localpref 200
     switch(config-router-bgp)#
neighbor graceful-restart-helper

The `neighbor graceful-restart helper` command enables BGP graceful restart helper mode for the specified BGP neighbor or peer group. When graceful restart helper mode is enabled, the switch will retain routes from neighbors which are capable of graceful restart while those neighbors are restarting BGP. Graceful restart is enabled by default for all BGP neighbors. To configure graceful restart helper mode for all BGP neighbors, use the `graceful-restart-helper` command. Individual neighbor configuration takes precedence over the global configuration.

The `no neighbor graceful-restart helper` command disables graceful restart helper mode for the specified BGP neighbor or peer group. The `default neighbor graceful-restart helper` command enables graceful restart helper mode for the specified BGP neighbor or peer group by removing the corresponding `no neighbor graceful-restart helper` command from `running-config`.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor NEIGHBOR_ID graceful-restart helper
no neighbor NEIGHBOR_ID graceful-restart helper
default neighbor NEIGHBOR_ID graceful-restart helper
```

**Parameters**

- **NEIGHBOR_ID** IP address or peer group name. Values include:
  - `ipv4_addr` neighbor’s IPv4 address.
  - `ipv6_addr` neighbor’s IPv6 address.
  - `group_name` peer group name.

**Example**

- These commands disable graceful restart helper mode for the neighbor at 192.168.12.1.

```
switch(config)#router bgp 1
switch(config-router-bgp)#no neighbor 192.168.12.1 graceful-restart-helper
switch(config-router-bgp)#
```
neighbor import-localpref

The `neighbor import-localpref` command determines the local preference assigned to routes received from the specified external peer or peer group. This command has no effect on routes received from internal peers.

The `no neighbor import-localpref` command resets the local preference to the default of 100 for routes received from the specified peer or peer group.

The `default neighbor import-localpref` command resets the local preference to the default of 100 for individual neighbors, and applies the peer group’s setting for neighbors that are members of a peer group.

The `no neighbor` command removes all configuration commands for the neighbor at the specified address.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor NEIGHBOR_ID import-localpref preference
no neighbor NEIGHBOR_ID import-localpref
default neighbor NEIGHBOR_ID import-localpref
```

**Parameters**

- **NEIGHBOR_ID** IP address or peer group name. Values include:
  - `ipv4_addr` neighbor’s IPv4 address.
  - `ipv6_addr` neighbor’s IPv6 address.
  - `group_name` peer group name.
- **preference** preference value. Values range from 0 to 4294967295.

**Example**

- This command configures the switch to assign a local preference of 50 to routes received from the peer located at 192.168.1.30.

```
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 192.168.1.30 import-localpref 50
```

```
neighbor local-as

The `neighbor local-as` command enables AS_PATH attribute modification for received eBGP routes, allowing the switch to appear as a member of a different AS to external peers. Arista switches do not prepend the local AS number to routes received from the eBGP neighbor; currently, we implement the command only as `neighbor local-as no-prepend replace-as`.

The no `neighbor local-as` command disables AS_PATH modification for the specified peer or peer group. The default `neighbor local-as` command disables AS_PATH modification for individual neighbors, and applies the peer group's setting for neighbors that are members of a peer group.

Command Mode
Router-BGP Configuration

Command Syntax
```
neighbor NEIGHBOR_ID local-as as_id no-prepend replace-as
no neighbor NEIGHBOR_ID local-as
default neighbor NEIGHBOR_ID local-as
```

Parameters
- **NEIGHBOR_ID**: IP address or peer group name. Values include:
  - `ipv4_addr`: neighbor's IPv4 address.
  - `ipv6_addr`: neighbor's IPv6 address.
  - `group_name`: peer group name.
- **as_id**: AS number that is sent in outbound routing updates in place of the actual AS of the switch. Values range from 1 to 4294967295.
  This parameter cannot be set to the switch’s AS number or to any AS number in the peer’s network.

Example
- For the neighbor at 10.13.64.1, these commands remove AS 300 from outbound routing updates and replace it with AS 600, then display the result.

```
switch(config)#router bgp 300
switch(config-router-bgp)# neighbor 10.13.64.1 local-as 600 no-prepend replace-as
switch(config-router-bgp)#show ip bgp neighbor 10.13.64.1 advertised-routes
```

Network Next Hop Metric LocPref Weight Path
* > 192.168.117.0/24 1.1.1.1 - - 600 245 i
neighbor local-v6-addr

The `neighbor local-v6-addr` command specifies the next-hop value that the switch sends as the IPv6 NLRI value to neighbors with whom IPv4 transport peering is established.

In IPv6 peering sessions, the switch sends the global IPv6 address of the interface that is used to transmit BGP updates.

The `no neighbor local-v6-addr` command applies the system default configuration.

The `default neighbor local-v6-addr` command applies the system default configuration for individual neighbors, and applies the peer group's setting for neighbors that are members of a peer group.

**Command Mode**
Router-BGP Configuration

**Command Syntax**

```plaintext
neighbor NEIGHBOR_ID local-v6-addr ipv6_local
no neighbor NEIGHBOR_ID local-v6-addr
default neighbor NEIGHBOR_ID local-v6-addr
```

**Parameters**
- **NEIGHBOR_ID** IP address or peer group name. Values include:
  - `ipv4_addr` neighbor's IPv4 address.
  - `group_name` peer group name.

**Example**
- For the neighbor at 10.7.5.11, these commands specify an IPv6 NLRI value that is sent during IPv4 transport peering sessions.

```plaintext
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 10.7.5.11 local-v6-addr 2001:0DB8:c2a4::2
switch(config-router-bgp)#show active
gerouter bgp 1
  bgp log-neighbor-changes
  bgp default ipv6-unicast
  neighbor 172.15.21.18 local-v6-addr 2001:0DB8:c2a4:1761::2
switch(config-router-bgp)#
```
neighbor maximum-routes

The `neighbor maximum-routes` command determines the number of BGP routes the switch accepts from a specified neighbor and defines an action when the limit is exceeded. The default value is 12,000. To remove the maximum routes limit, select a limit of zero.

When the number of routes received from a peer exceeds the limit, the switch generates an error message. This command can also configure the switch to disable peering with the neighbor. In this case, the neighbor state is reset only through a `clear ip bgp` command.

The `no neighbor maximum-routes` command applies the system default maximum-routes value of 12,000 for the specified peer.

The `default neighbor maximum-routes` command applies the system default value for individual neighbors, and applies the peer group’s setting for neighbors that are members of a peer group.

The `no neighbor` command removes all configuration commands for the neighbor at the specified address.

**Command Mode**
Router-BGP Configuration

**Command Syntax**
```
neighbor NEIGHBOR_ID maximum-routes quantity [ACTION]
no neighbor NEIGHBOR_ID maximum-routes
default neighbor NEIGHBOR_ID maximum-routes
```

**Parameters**
- `NEIGHBOR_ID` IP address or peer group name. Values include:
  - `ipv4_addr` neighbor’s IPv4 address.
  - `ipv6_addr` neighbor’s IPv6 address.
  - `group_name` peer group name.
- `quantity` maximum number of routes. Values include:
  - 0 the switch does not define a route limit.
  - 1 to 4294967294 maximum number of routes.
- `ACTION` switch action when the route limit is exceeded. Values include:
  - `<no parameter>` peering is disabled and an error message is generated.
  - `warning-only` peering is not disabled, but an error message is generated.

**Example**
- This command configures the switch to accept 15000 routes for the neighbor at 10.3.16.210. If the neighbor exceeds 15000 routes, the switch disables peering with the neighbor.

```
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 110.3.16.210 maximum-routes 15000
switch(config-router-bgp)#
```
neighbor next-hop-peer

The **neighbor next-hop-peer** command configures the switch to list the peer address as the next hop in routes that it receives from the specified peer BGP-speaking neighbor or members of the specified peer group. This command overrides the next hop for all routes received from this neighbor or peer group.

The **no neighbor next-hop-peer** command applies the system default (no next-hop override) for the specified peer.

The **default neighbor next-hop-peer** command applies the system default for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address or the specified peer group.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor NEIGHBOR_ID next-hop-peer
no neighbor NEIGHBOR_ID next-hop-peer
default neighbor NEIGHBOR_ID next-hop-peer
```

**Parameters**

- **NEIGHBOR_ID**  
  IP address or peer group name. Values include:
  - ipv4_addr  neighbor’s IPv4 address.
  - ipv6_addr  neighbor’s IPv6 address.
  - group_name  peer group name.

**Example**

- This command configures the peer address of 10.3.2.24 as the next hop for routes advertised to the switch from the peer BGP neighbor.

```
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor 10.3.2.24 next-hop-peer
switch(config-router-bgp)#
```
neighbor next-hop-self

The **neighbor next-hop-self** command configures the switch to list its address as the next hop in routes that it advertises to the specified BGP-speaking neighbor or neighbors in the specified peer group. This is used in networks where BGP neighbors do not directly access all other neighbors on the same subnet.

The **no neighbor next-hop-self** command applies the system default (no next-hop override) for the specified peer.

The **default neighbor next-hop-self** command applies the system default for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address or for the specified peer group.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor NEIGHBOR_ID next-hop-self
no neighbor NEIGHBOR_ID next-hop-self
default neighbor NEIGHBOR_ID next-hop-self
```

**Parameters**

- **NEIGHBOR_ID** IP address or peer group name. Values include:
  - *ipv4_addr* neighbor’s IPv4 address.
  - *ipv6_addr* neighbor’s IPv6 address.
  - *group_name* peer group name.

**Example**

- This command configures the switch as the next hop for the peer at 10.4.1.30.

```
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 10.4.1.30 next-hop-self
switch(config-router-bgp)#
```
neighbor out-delay

The **neighbor out-delay** command sets the period of time that a route update for the specified neighbor must be in the routing table before the switch exports it to BGP. The out delay interval is used for bundling routing updates.

The **no neighbor out-delay** command applies the system default (out-delay value of zero) for the specified peer.

The **default neighbor out-delay** command applies the system default for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the specified neighbor.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor NEIGHBOR_ID out-delay delay_time
no neighbor NEIGHBOR_ID out-delay
default neighbor NEIGHBOR_ID out-delay
```

**Parameters**

- **NEIGHBOR_ID**   IP address or peer group name. Values include:
  - `ipv4_addr`   neighbor’s IPv4 address.
  - `ipv6_addr`   neighbor’s IPv6 address.
  - `group_name`   peer group name.
- **delay_time**   the out delay period (seconds). Values range from 0 to 600. Default value is 0.

**Example**

- This command sets the out delay period to 5 seconds for the connection with the peer at 10.24.15.9.

  ```
  switch(config)#router bgp 1
  switch(config-router-bgp)#neighbor 10.24.15.9 out-delay 5
  switch(config-router-bgp)#
  ```
neighbor password

The `neighbor password` command enables authentication on a TCP connection with a BGP peer. The plain-text version of the password is a string, up to 8 bytes in length. Peers must use the same password to ensure proper communication.

*Running-config* displays the encrypted version of the password. The encryption scheme is not strong by cryptographic standards; encrypted passwords should be treated in the same manner as plain-text passwords.

The `no neighbor password` command applies the system default for the specified peer, removing the neighbor password from the configuration and disabling authentication with the specified peer.

The `default neighbor password` command applies the system default for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

The `no neighbor password` and `default neighbor password` commands remove the neighbor password from the configuration, disabling authentication with the specified peer.

The `no neighbor` command removes all configuration commands for the neighbor at the specified address.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor NEIGHBOR_ID password [ENCRYPT_LEVEL] key_text
no neighbor NEIGHBOR_ID password
default neighbor NEIGHBOR_ID password
```

**Parameters**

- `NEIGHBOR_ID` IP address or peer group name. Values include:
  - `ipv4_addr` neighbor’s IPv4 address.
  - `ipv6_addr` neighbor’s IPv6 address.
  - `group_name` peer group name.

- `ENCRYPT_LEVEL` the encryption level of the `key_text` parameter. Values include:
  - `<no parameter>` indicates the `key_text` is in clear text.
  - `0` indicates `key_text` is in clear text. Equivalent to the `<no parameter>` case.
  - `7` indicates `key_text` is md5 encrypted.

- `key_text` the password.

**Example**

- This command specifies a password in clear text.

```
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 10.25.25.13 password 0 code123
switch(config-router-bgp)#
```

*Running-config* stores the password as an encrypted string.
neighbor peer-group (create)

Peer groups allow the user to apply settings to a group of BGP neighbors simultaneously. Once a peer group is created, the group name can be used as a parameter in neighbor configuration commands, and the configuration will be applied to all members of the group. Settings applied to an individual neighbor in the peer group override group settings.

The **neighbor peer-group (create)** command is used to create static BGP peer groups. Static peer groups are peer groups whose members are added manually. To assign BGP neighbors to a static peer group, use the **neighbor peer-group (neighbor assignment)** command. To create a dynamic peer group, use the **bgp listen range** command.

The **no neighbor peer-group (create)** and **default neighbor peer-group (create)** commands remove the specified static peer group from **running-config**. When a static peer group is deleted, the neighbors that were members of that peer group lose any configuration that was inherited from the peer group. The **no bgp listen range** command removes a dynamic peer group.

The **no neighbor** command removes all configuration commands for the specified neighbor.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor group_name peer-group
no neighbor group_name peer-group
default neighbor group_name peer-group
```

**Parameters**

- `group_name` peer group name.

**Examples**

- These commands create a BGP peer group called bgpgroup1, assign several neighbors to the group, apply a route map and adjust the configuration for one group member.

```
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor bgpgroup1 peer-group
switch(config-router-bgp)#neighbor 10.1.1.1 peer-group bgpgroup1
switch(config-router-bgp)#neighbor 10.2.2.2 peer-group bgpgroup1
switch(config-router-bgp)#neighbor 10.3.3.3 peer-group bgpgroup1
switch(config-router-bgp)#neighbor bgpgroup1 route-map corporate in
switch(config-router-bgp)#neighbor 10.3.3.3 maximum-routes 5000
switch(config-router-bgp)#show active
router bgp 9
bgp log-neighbor-changes
neighbor bgpgroup1 peer-group
neighbor bgpgroup1 route-map corporate in
neighbor bgpgroup1 maximum-routes 12000
neighbor 10.1.1.1 peer-group bgpgroup1
neighbor 10.2.2.2 peer-group bgpgroup1
neighbor 10.3.3.3 peer-group bgpgroup1
neighbor 10.3.3.3 maximum-routes 5000
switch(config-router-bgp)#
```
This command removes peer group “bgpgroup1” from running-config. The group members remain, but all settings that group members inherited from the peer group are removed.

```bash
switch(config-router-bgp)#no neighbor bgpgroup1 peer-group
switch(config-router-bgp)#show active
router bgp 9
bgp log-neighbor-changes
 neighbor 10.1.1.1 maximum-routes 12000
 neighbor 10.2.2.2 maximum-routes 12000
 neighbor 10.3.3.3 maximum-routes 5000
switch(config-router-bgp)#
```
neighbor peer-group (neighbor assignment)

Peer groups allow the user to apply settings to a group of BGP neighbors simultaneously. Once a peer group is created, the group name can be used as a parameter in neighbor configuration commands, and the configuration will be applied to all members of the group. Settings applied to an individual neighbor in the peer group override group settings.

The `neighbor peer-group (neighbor assignment)` command is used to assign BGP neighbors to an existing static peer group. To create a static peer group, use the `neighbor peer-group (create)` command. A neighbor can only belong to one peer group, so issuing this command for a neighbor that is already a member of another group will remove it from that group.

The `no neighbor peer-group` and `default neighbor peer-group` commands remove the specified neighbor from all peer groups. When a neighbor is removed from a peer group, the neighbor retains the configuration inherited from the peer group.

The `no neighbor` command removes all configuration commands for the specified neighbor.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor NEIGHBOR_ADDR peer-group group_name
no neighbor NEIGHBOR_ADDR peer-group
default neighbor NEIGHBOR_ADDR peer-group
```

**Parameters**

- **NEIGHBOR_ADDR** Address of a neighbor being added to peer group. Values include:
  - `ipv4_addr` neighbor's IPv4 address.
  - `ipv6_addr` neighbor's IPv6 address.
- **group_name** peer group name.

**Examples**

- These commands create a BGP peer group called bgpgroup1, assign several neighbors to the group, and apply a route map.

  ```
  switch(config)#router bgp 9
  switch(config-router-bgp)#neighbor bgpgroup1 peer-group
  switch(config-router-bgp)#neighbor 10.1.1.1 peer-group bgpgroup1
  switch(config-router-bgp)#neighbor 10.1.1.1 peer-group bgpgroup1
  switch(config-router-bgp)#neighbor 10.2.2.2 peer-group bgpgroup1
  switch(config-router-bgp)#neighbor 10.3.3.3 peer-group bgpgroup1
  switch(config-router-bgp)#neighbor bgpgroup1 route-map corporate in
  ```

- This command removes the neighbor at 1.1.1.1 from the peer group. All settings that neighbor 10.1.1.1 inherited from the peer group are maintained.

  ```
  switch(config-router-bgp)#no neighbor 10.1.1.1 peer-group
  ```
neighbor remote-as

The `neighbor remote-as` command configures the expected AS number for a neighbor (peer). This configuration is required to establish a neighbor connection. Internal neighbors have the same AS number; external neighbors have different AS numbers.

The `no neighbor remote-as` command applies the system default for the specified peer or peer group.

The `default neighbor remote-as` command applies the system default for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

The `no neighbor` command removes all configuration commands for the neighbor at the specified address.

**Command Mode**
- Router-BGP Configuration

**Command Syntax**
```
neighbor NEIGHBOR_ID remote-as as_id
no neighbor NEIGHBOR_ID remote-as
default neighbor NEIGHBOR_ID remote-as
```

**Parameters**
- `NEIGHBOR_ID` IP address or peer group name. Values include:
  - `ipv4_addr` neighbor's IPv4 address.
  - `ipv6_addr` neighbor's IPv6 address.
  - `group_name` peer group name.
- `as_id` Autonomous system (AS) of the peer. Values range from 1 to 4294967295.

**Example**
- This command establishes a BGP connection with the router at 10.4.3.10 in AS 300.
```
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor 10.4.3.10 remote-as 300
switch(config-router-bgp)#
```
neighbor remove-private-as

The `neighbor remove-private-as` command removes private autonomous system numbers from outbound routing updates for external BGP (eBGP) neighbors. When the autonomous system path includes both private and public autonomous system numbers, the `REMOVAL` parameter specifies how the private autonomous system number is removed.

The `no neighbor remove-private-as` command applies the system default (preserves private AS numbers) for the specified peer.

The `default neighbor remove-private-as` command applies the system default for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

The `no neighbor` command removes all configuration commands for the neighbor at the specified address.

**Command Mode**
Router-BGP Configuration

**Command Syntax**

```plaintext
neighbor NEIGHBOR_ID remove-private-as [REMOVAL]
no neighbor NEIGHBOR_ID remove-private-as
default neighbor NEIGHBOR_ID remove-private-as
```

**Parameters**

- **NEIGHBOR_ID** IP address or peer group name. Values include:
  - `ipv4_addr` neighbor’s IPv4 address.
  - `ipv6_addr` neighbor’s IPv6 address.
  - `group_name` peer group name.

- **REMOVAL** Specifies removal of private autonomous AS number when path includes both private and public numbers. Values include:
  - `<no parameter>` private AS numbers is not removed.
  - `all` removes all private AS numbers from AS path in outbound updates.
  - `all replace-as` all private AS numbers in AS path are replaced with router’s local AS number.

**Example**

- These commands program the switch to remove private AS numbers from outbound routing updates for the eBGP neighbor at 10.5.2.11.
  ```plaintext
  switch(config)#router bgp 9
  switch(config-router-bgp)#neighbor 10.5.2.11 remove-private-as
  switch(config-router-bgp)#
  ```

- This command replaces all private AS numbers in the AS path with the switch’s local AS number.
  ```plaintext
  switch(config)#router bgp 9
  switch(config-router-bgp)#neighbor 10.5.2.11 remove-private-as all replace-as
  switch(config-router-bgp)#
  ```
neighbor route-map (BGP)

The `neighbor route-map` command applies a route map to inbound or outbound BGP routes. When a route map is applied to outbound routes, the switch will advertise only routes matching at least one section of the route map. Only one outbound route map and one inbound route map can be applied to a given neighbor. A new route map applied to a neighbor will replace the previous route map.

The command is available in Router-BGP and Router-BGP-Address-Family configuration modes. The mode in which the command is executed determines the scope of the command:

- In Router-BGP mode, the route map is applied to specified neighbor in all peering sessions where it is advertised.
- In Router-BGP-Address-Family mode, the route map is applied to the neighbors only in peering sessions corresponding to the configuration mode address family.

The `no neighbor route-map` command discontinues the application of the specified route map for the specified neighbor and direction. Removing a route map from one direction does not remove it from the other if it has been applied to both.

The `default neighbor route-map` command applies the system default (no route map) for individual neighbors, and applies the peer group’s setting for neighbors that are members of a peer group.

Command Mode

- Router-BGP Configuration
- Router-BGP Configuration-Address-Family

Command Syntax

```
neighbor NEIGHBOR_ID route-map map_name DIRECTION
no neighbor NEIGHBOR_ID route-map map_name DIRECTION
default neighbor NEIGHBOR_ID route-map map_name DIRECTION
```

Parameters

- `NEIGHBOR_ID` IP address or peer group name. Values include:
  - `ipv4_addr` neighbor’s IPv4 address.
  - `ipv6_addr` neighbor’s IPv6 address.
  - `group_name` peer group name.
- `map_name` name of a route map.
- `DIRECTION` routes to which the route map is applied. Options include:
  - `in` route map is applied to inbound routes.
  - `out` route map is applied to outbound routes.

Example

- This command applies a route map named `inner-map` to a BGP inbound route from 10.5.2.11
  ```
  switch(config)#router bgp 9
  switch(config-router-bgp)#neighbor 10.5.2.11 route-map inner-map in
  ```
neighbor route-reflector-client

Participating BGP routers within an AS communicate EBGP-learned routes to all of their peers, but to prevent routing loops they must not re-advertise IBGP-learned routes within the AS. To ensure that all members of the AS share the same routing information, a fully meshed network topology (in which each member router of the AS is connected to every other member) can be used, but this topology can result in high volumes of IBGP messages when it is scaled. Instead, in larger networks one or more routers can be configured as route reflectors.

A route reflector is configured to re-advertise routes learned through IBGP to a group of BGP neighbors within the AS (its clients), eliminating the need for a fully meshed topology.

The `neighbor route-reflector-client` command configures the switch to act as a route reflector and configures the specified neighbor as one of its clients. Additional clients are specified by re-issuing the command.

The `no neighbor route-reflector-client` and `default neighbor route-reflector-client` commands disable route reflection by deleting the `neighbor route-reflector-client` command from `running-config`.

Command Mode

Router-BGP Configuration

Command Syntax

```plaintext
neighbor NEIGHBOR_ID route-reflector-client
no neighbor NEIGHBOR_ID route-reflector-client
default neighbor NEIGHBOR_ID route-reflector-client
```

Parameters

- **NEIGHBOR_ID** IP address of neighbor. Values include:
  - `ipv4_addr` neighbor’s IPv4 address.
  - `ipv6_addr` neighbor’s IPv6 address.
  - `group_name` peer group name.

Related Commands

- `bgp client-to-client reflection`

Example

- This command configures the switch as a route reflector and the neighbor at 10.5.2.1 as one of its clients.

```plaintext
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor 10.5.2.11 route-reflector-client
switch(config-router-bgp)#
```
neighbor send-community

The **neighbor send-community** command configures the switch to send community attributes to the specified BGP neighbor.

The **no neighbor send-community** command applies the system default (not sending community attributes) for the specified peer.

The **default neighbor send-community** command applies the system default for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

**Command Mode**
* Router-BGP Configuration

**Command Syntax**
```
neighbor NEIGHBOR_ID send-community
no neighbor NEIGHBOR_ID send-community
default neighbor NEIGHBOR_ID send-community
```

**Parameters**
- **NEIGHBOR_ID** IP address or peer group name. Values include:
  - *ipv4_addr* neighbor’s IPv4 address.
  - *ipv6_addr* neighbor’s IPv6 address.
  - *group_name* peer group name.

**Example**
- This command configures the switch to send community attributes to the neighbor at address 10.5.2.23.
  ```
  switch(config)# router bgp 9
  switch(config-router-bgp)# neighbor 10.5.2.23 send-community
  switch(config-router-bgp)#
  ```
neighbor shutdown

The `neighbor shutdown` command disables the specified neighbor. Disabling a neighbor also terminates all of its active sessions and removes associated routing information.

The `no neighbor shutdown` command enables the specified peer.

The default neighbor shutdown command enables individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor NEIGHBOR_ID shutdown
no neighbor NEIGHBOR_ID shutdown
default neighbor NEIGHBOR_ID shutdown
```

**Parameters**

- `NEIGHBOR_ID` IP address or peer group name. Values include:
  - `ipv4_addr` neighbor’s IPv4 address.
  - `ipv6_addr` neighbor’s IPv6 address.
  - `group_name` peer group name.

**Example**

- This command disables the neighbor at 10.5.2.23.

```
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor 10.5.2.23 shutdown
switch(config-router-bgp)#
```
neighbor soft-reconfiguration

By default, inbound BGP routes that are filtered out by the import policy are still stored on the switch. Because all routes are retained, this allows policies to be changed without resetting BGP sessions. It also allows the switch to display all advertised routes when the `show ip bgp neighbor advertised-routes` command is issued.

The `no neighbor soft-reconfiguration` command configures the switch to discard information about routes received from the specified neighbor or group that fail the import policy.

The `neighbor soft-reconfiguration` command restores the system default behavior (retaining routes from the specified neighbor or group regardless of import policy).

The default neighbor soft-reconfiguration command applies the system default (retaining all routes) for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

Command Mode
  Router-BGP Configuration

Command Syntax
  neighbor NEIGHBOR_ID soft-configuration inbound [SCOPE]
  no neighbor NEIGHBOR_ID soft-configuration inbound
  default neighbor NEIGHBOR_ID soft-configuration inbound

Parameters
  • **NEIGHBOR_ID**  IP address or peer group name. Values include:
    •  `ipv4_addr`  neighbor’s IPv4 address.
    •  `ipv6_addr`  neighbor’s IPv6 address.
    •  `group_name`  peer group name.
  • **SCOPE**  determines how routes including the switch’s AS number are handled. Values include:
    •  `<no parameter>`  routes including the switch’s AS number are discarded.
    •  `all`  routes including the switch’s AS number are retained.

Example
  • This command configures the switch to discard information about routes from the neighbor at 10.5.2.23 which are filtered out by the switch’s import policies.

```
switch(config)#router bgp 9
switch(config-router-bgp)#no neighbor 10.5.2.23 soft-reconfiguration inbound
switch(config-router-bgp)#
```
neighbor timers

The `neighbor timers` command configures the BGP keepalive and hold times for a specified peer connection. The `timers bgp` command configures the times on all peer connections for which an individual command is not specified.

- Keepalive time is the period between the transmission of consecutive keepalive messages.
- Hold time is the period the switch waits for a KEEPALIVE or UPDATE message before it disables peering.

The hold time must be at least 3 seconds and should be three times longer than the keepalive setting.

The `no neighbor timers` command applies the system default for the specified peer or group (the timers specified by the `timers bgp` command).

The default neighbor timers command applies the system default for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

The `no neighbor` command removes all configuration commands for the neighbor at the specified address.

Command Mode
- Router-BGP Configuration

Command Syntax

```
neighbor NEIGHBOR_ID timers keep_alive hold_time
no neighbor NEIGHBOR_ID timers
default neighbor NEIGHBOR_ID timers
```

Parameters
- `NEIGHBOR_ID` IP address or peer group name. Values include:
  - `ipv4_addr` neighbor’s IPv4 address.
  - `ipv6_addr` neighbor’s IPv6 address.
  - `group_name` peer group name.
- `keep_alive` keepalive period, in seconds. Values include
  - 0 keepalive messages are not sent
  - 1 to 3600 keepalive time (seconds).
- `hold_time` hold time. Values include
  - 0 peering is not disabled by timeout expiry; keepalive packets are not sent.
  - 3 to 7200 hold time (seconds).

Example
- This command sets the keepalive time to 30 seconds and the hold time to 90 seconds for the connection with the peer at 10.24.15.9.
  ```
  switch(config)#router bgp 9
  switch(config-router-bgp)#neighbor 10.24.15.9 timers 30 90
  ```
neighbor transport connection-mode

The `neighbor transport connection-mode` command sets the TCP connection for the specified BGP neighbor or peer group to passive mode. When the peer’s transport connection mode is set to passive, it accepts TCP connections for BGP but does not initiate them.

The `no neighbor transport connection-mode` command sets the specified BGP neighbor or peer group to active connection mode. BGP peers in active mode can both accept and initiate TCP connections for BGP. This is the default behavior.

The `default neighbor transport connection-mode` command restores the default connection mode. The default mode is “active” for individual BGP peers, or the mode inherited from the peer group for peer group members.

**Command Mode**
- Router-BGP Configuration

**Command Syntax**
```
neighbor NEIGHBOR_ID transport connection-mode passive
no neighbor NEIGHBOR_ID transport connection-mode
default neighbor NEIGHBOR_ID transport connection-mode
```

**Parameters**
- `NEIGHBOR_ID` IP address or peer group name. Values include:
  - `ipv4_addr` neighbor’s IPv4 address.
  - `ipv6_addr` neighbor’s IPv6 address.
  - `group_name` peer group name.

**Example**
- These commands configure the neighbor at IP address 10.2.2.14 to not initiate TCP connections for BGP peering.

```
switch(config)#router bgp 300
switch(config-router-bgp)#neighbor 10.2.2.14 transport connection-mode passive
switch(config-router-bgp)#
```
**neighbor update-source**

The `neighbor update-source` command specifies the interface that BGP sessions use for TCP connections. By default, BGP sessions use the neighbor’s closest interface (also known as the best local address).

The `no neighbor update-source` command applies the system default (using best local address for TCP connections) for the specified peer or group.

The default neighbor update-source command applies the system default for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

The `no neighbor` command removes all configuration commands for the neighbor at the specified address.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor NEIGHBOR_ID update-source INTERFACE
no neighbor NEIGHBOR_ID update-source
default neighbor NEIGHBOR_ID update-source
```

**Parameters**

- **NEIGHBOR_ID**  IP address or peer group name. Values include:
  - `ipv4_addr` neighbor’s IPv4 address.
  - `ipv6_addr` neighbor’s IPv6 address.
  - `group_name` peer group name.
- **INTERFACE** Interface type and number. Options include:
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` loopback interface specified by `l_num`.
  - `management m_num` management interface specified by `m_num`.
  - `port-channel p_num` port channel interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.

**Example**

- This command configures the switch to use Ethernet interface 10 for TCP connections for the neighbor at 10.2.2.14.

  ```
  switch(config)#router bgp 9
  switch(config-router-bgp)#neighbor 10.2.2.14 update-source ethernet 10
  switch(config-router-bgp)#
  ```
neighbor weight

The **neighbor weight** command assigns a weight attribute value to paths from the specified neighbor. Weight is the first parameter that the BGP best-path selection algorithm considers. When multiple paths to a destination prefix exist, the best-path selection algorithm prefers the path with the highest weight. Other attributes are used only when all paths to the prefix have the same weight.

Weight values range from 0 to 65535 and are not propagated to other switches through route updates. The default weight for paths that the router originates is 32768; the default weight for routes received through BGP is 0.

A path’s BGP weight is also configurable through route maps. Weight values set through route map commands have precedence over neighbor weight command values.

The **no neighbor weight** command applies the system default (32768 for router-originated paths, 0 for routes received through BGP) for the specified peer or group.

The **default neighbor weight** command applies the system default for individual neighbors, and applies the peer group’s setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```plaintext
neighbor NEIGHBOR_ID weight weight_value
no neighbor NEIGHBOR_ID weight
default neighbor NEIGHBOR_ID weight
```

**Parameters**

- **NEIGHBOR_ID** IP address or peer group name. Values include:
  - `ipv4_addr` neighbor’s IPv4 address.
  - `ipv6_addr` neighbor’s IPv6 address.
  - `group_name` peer group name.
- **weight_value** weight value. Values range from 1 to 65535.

**Example**

- This command specifies a weight of 4000 for all paths from the neighbor at 10.1.2.5

```plaintext
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor 10.1.2.5 weight 4000
switch(config-router-bgp)#
```
network (BGP)

The network command specifies a network for advertisement through UPDATE packets to BGP peers. The configuration zeros the host portion of the specified network address; for example, 192.0.2.4/24 is stored as 192.0.2.0/24. A route map option is available for assigning attributes to the network.

The command is available in Router-BGP and Router-BGP-Address-Family configuration modes. The mode in which the command is issued does not affect the command. The scope of the command depends on the specified network address:

- Commands with an IPv4 address are advertised to peers activated in the IPv4 address family.
- Commands with an IPv6 address are advertised to peers activated in the IPv6 address family.

The no network and default network commands remove the network from the routing table, preventing its advertisement.

Command Mode
- Router-BGP Configuration
- Router-BGP Configuration-Address-Family

Command Syntax

```
network NET_ADDRESS [ROUTE_MAP]
no network NET_ADDRESS
default network NET_ADDRESS
```

Parameters

- **NET_ADDRESS** IP address range. Entry options include:
  - ipv4_subnet IPv4 subnet (CIDR notation).
  - ipv4_addr mask subnet IPv4 subnet (address-mask notation).
  - ipv6_prefix neighbor’s IPv6 prefix (CIDR notation).
- **ROUTE_MAP** specifies route map that assigns attribute values to the network. Options include:
  - <no parameter> attributes are not assigned through a route map.
  - route-map map_name attributes listed by specified route map are assigned to the network.

Example

- This command enables BGP advertising for the network located at 10.1.2.5. The configuration stores the network as 10.1.2.5.
  ```
  switch(config)#router bgp 9
  switch(config-router-bgp)#network 10.1.2.5
  switch(config-router-bgp)#
  ```
no neighbor

The no neighbor command removes all neighbor configuration commands for the specified neighbor. Commands removed by the no neighbor command include:

- **neighbor description**
- **neighbor ebgp-multihop**
- **neighbor export-localpref**
- **neighbor import-localpref**
- **neighbor local-as**
- **neighbor maximum-routes**
- **neighbor next-hop-peer**
- **neighbor next-hop-self**
- **neighbor out-delay**
- **neighbor password**
- **neighbor peer-group (create)**
- **neighbor peer-group (neighbor assignment)**
- **neighbor remote-as**
- **neighbor remove-private-as**
- **neighbor route-map (BGP)**
- **neighbor route-reflector-client**
- **neighbor send-community**
- **neighbor timers**
- **neighbor update-source**

Neighbor settings can be removed individually; refer to the command description page of the desired command for details. Neighbor settings for a peer group must be removed individually.

**Command Mode**
Router-BGP Configuration

**Command Syntax**
```
no neighbor NEIGHBOR_ID
default neighbor NEIGHBOR_ID
```

**Parameters**
- **NEIGHBOR_ID** IP address. Options include:
  - **ipv4_addr** neighbor’s IPv4 address.
  - **ipv6_addr** neighbor’s IPv6 address.

**Example**
- This command removes all neighbor configuration commands for the neighbor at 10.1.1.1.
  ```
  switch(config)#router bgp 9
  switch(config-router-bgp)#no neighbor 10.1.1.1
  switch(config-router-bgp)#
  ```
redistribute (BGP)

The `redistribute` command enables the redistribution of specified routes to the BGP domain.

The `no redistribute` and `default redistribute` commands disable route redistribution from the specified domain by removing the corresponding `redistribute` command from `running-config`.

Important! Aggregate routes are redistributed automatically, and their redistribution cannot be disabled.

Command Mode
Router-BGP Configuration

Command Syntax
```
redistribute ROUTE_TYPE [ROUTE_MAP]
no redistribute ROUTE_TYPE
default redistribute ROUTE_TYPE
```

Parameters
- **ROUTE_TYPE** source from which routes are redistributed. Options include:
  - `connected` routes that are established when IP is enabled on an interface.
  - `match nssa-external` all OSPF NSSA external routes.
  - `match nssa-external 1` type 1 OSPF NSSA external routes.
  - `match nssa-external 2` type 2 OSPF NSSA external routes.
  - `ospf` routes from an OSPF domain.
  - `ospf match external` routes external to the AS, but imported from OSPF.
  - `ospf match internal` OSPF routes that are internal to the AS.
  - `ospf match nssa-external` all OSPF NSSA external routes.
  - `ospf match nssa-external 1` type 1 OSPF NSSA external routes.
  - `ospf match nssa-external 2` type 2 OSPF NSSA external routes.
  - `ospf3` routes from an OSPFv3 domain.
  - `ospf3 match external` routes external to the AS, but imported from OSPFv3.
  - `ospf3 match internal` OSPFv3 routes that are internal to the AS.
  - `rip` routes from a RIP domain.
  - `static` IP static routes.
- **ROUTE_MAP** route map that determines the routes that are redistributed. Options include:
  - `<no parameter>` all routes are redistributed.
  - `route-map map_name` only routes in the specified route map are redistributed.

Example
- This command redistributes OSPF routes into the BGP domain.

```
switch(config)#router bgp 9
switch(config-router-bgp)#redistribute OSPF
switch(config-router-bgp)#
```
**router-id (BGP)**

The `router-id` command sets the local router BGP router ID.

When no ID has been specified, the local router ID is set to the following:

- The loopback IP address when a single loopback interface is configured.
- The loopback with the highest IP address when multiple loopback interfaces are configured.
- The highest IP address on a physical interface when no loopback interfaces are configured.

**Important!** The router-id must be specified if the switch has no IPv4 addresses configured.

The `no router-id` and `default router-id` commands remove the `router-id` command from `running-config`.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
router-id id_num
no router-id [id_num]
default router-id [id_num]
```

**Parameters**

- `id_num` router ID number (32-bit dotted decimal notation).

**Example**

- This command configures the fixed router ID address of 10.10.4.11

  ```
  switch(config)#router bgp 9
  switch(config-router-bgp)#router-id 10.10.4.11
  switch(config-router-bgp)#
  ```
router bgp

The `router bgp` command places the switch in router-BGP configuration mode. If BGP was not previously instantiated, this command creates a BGP instance with the specified AS number. Router-BGP configuration mode is not a group change mode; `running-config` is changed immediately after commands are executed. The `exit` command does not affect the configuration.

When a BGP instance exists, the command must include the AS number of the existing BGP instance. Running this command with a different AS number generates an error message.

The `no router bgp` and `default router bgp` commands delete the BGP instance.

Refer to `Router-BGP Configuration Mode (Includes Address-Family Mode)` (page 1810) for a list of commands available in router-BGP configuration mode.

The `exit` command returns the switch to global configuration mode.

**Command Mode**

Global Configuration

**Command Syntax**

```
router bgp as_id
no router bgp
default router bgp
```

**Parameters**

- `as_id` Autonomous system (AS) number. Values range from 1 to 4294967295.

**Examples**

- This command creates a BGP instance with AS number 64500.
  
  ```
  switch(config)#router bgp 64500
  switch(config-router-bgp)#
  ```

- This command attempts to open a BGP instance with a different AS number from that of the existing instance. The switch displays an error and stays in global configuration mode.
  
  ```
  switch(config)#router bgp 64501
  % BGP is already running with AS number 64500
  switch(config)#
  ```

- This command exits BGP configuration mode.
  
  ```
  switch(config-router-bgp)#exit
  switch(config)#
  ```

- This command deletes the BGP instance.
  
  ```
  switch(config)#no router bgp
  switch(config)#
  ```
show bgp instance

The show bgp instance command displays summary Border Gateway Protocol (BGP) information about the BGP instance in the specified VRF or in all VRFs.

Command Mode

EXEC

Command Syntax

    show ip bgp instance [VRF_INSTANCE]

Parameters

- **VRF_INSTANCE** specifies VRF instances.
  - <no parameter> displays BGP information for the context-active VRF.
  - `vrf vrf_name` displays BGP information for the specified VRF.
  - `vrf all` displays BGP information for all VRFs.
  - `vrf default` displays BGP information for the default VRF.

Examples

- This command displays information about the BGP instance in the context-active VRF.

  switch>show bgp instance
  BGP instance information for VRF purple
  BGP Local AS:  64497, Router ID: 1.2.3.5
  Total peers:              5
  Configured peers:         3
    UnConfigured peers:   2
    Disabled peers:       0
    Established peers:   3
  Graceful restart helper mode enabled
  End of rib timer timeout: 00:05:00
  BGP Convergence timer is inactive
  BGP Convergence information:
    BGP has converged:   no
    Outstanding EORs:    0,     Outstanding Keepalives: 0
    Convergence timeout: 00:10:00
  switch>

- This command displays information about the BGP instance in the default VRF.

  switch>show bgp instance vrf default
  BGP instance information for VRF default
  BGP Local AS:  64503, Router ID: 1.2.3.5
  Total peers:              1
  Configured peers:         1
    UnConfigured peers:   0
    Disabled peers:       0
    Established peers:   0
  Graceful restart helper mode enabled
  End of rib timer timeout: 00:05:00
  BGP Convergence timer is inactive
  BGP Convergence information:
    BGP has converged:   no
    Outstanding EORs:    0,     Outstanding Keepalives: 0
    Convergence timeout: 00:10:00
  switch>
show ip as-path access-list

The show ip as-path access-list command displays BGP filters on the switch. Specifying an access list displays the statements from that access list. Entering the command without parameters displays the statements from all access lists on the switch.

Command Mode

EXEC

Command Syntax

    show ip as-path access-list [list_name]

Parameters

- **list_name**  the name of an AS path access list.

Example

- This command displays the contents of the AS path access list named “list1.”

  switch>**show ip as-path access-list list1**
  ip as-path access-list list1 deny _3$
  ip as-path access-list list1 permit .*
  switch>
show ip bgp

The `show ip bgp` command displays Border Gateway Protocol (BGP) IPv4 routing table entries. The output format depends on the command parameters:

- Data block format displays comprehensive information for each specified BGP routing table entry.
- Tabular format displays routing table entries in a tabular format for the specified IPv4 addresses.

**Command Mode**

EXEC

**Command Syntax**

```
show ip bgp [FILTER] [VRF_INSTANCE]
```

**Parameters**

- **FILTER** routing table entries that the command displays. Values include:
  - `<no parameter>` displays all routing table entries. Tabular format.
  - `detail` displays all routing table entries. Data block format.
  - `ipv4_addr` IPv4 host address. Data block format.
  - `ipv4_subnet` IPv4 subnet address. (CIDR notation). Data block format.
  - `ipv4_subnet detail` IPv4 subnet address. (CIDR notation). Data block format.
  - `ipv4_subnet longer-prefixes` IPv4 subnet address. (CIDR notation). Tabular format.
  - `ipv4_subnet longer-prefixes detail` IPv4 subnet address. (CIDR notation). Data block format.

- **VRF_INSTANCE** specifies VRF instances.
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Examples**

- This command displays the BGP routing table in the 10.17.48.0/23 network.

  switch> `show ip bgp 10.17.48.0/23`
  BGP routing table entry for 10.17.48.0/23
  Paths: 2 available
  (65533) 65534
  10.17.254.78 from 10.17.254.78 (10.26.0.34)
    Origin IGP, metric 0, localpref 100, valid, external, best
    Community: 0:10
  (65533) 65534
  10.17.254.82 from 10.17.254.2 (10.26.0.23)
    Origin IGP, metric 0, localpref 100, valid, internal
    Router-ID: 10.26.0.23
  switch>
This command displays the BGP routing table.

switch>show ip bgp
Route status codes: s - suppressed, * - valid, > - active, e - ECMP

switch>
show ip bgp community

The `show ip bgp community` command displays Border Gateway Protocol (BGP) routing table entries, filtered by community.

**Command Mode**

EXEC

**Command Syntax**

```
show ip bgp community [COMM_1 ... COMM_n][MATCH_TYPE][DATA_OPTION][VRF_INSTANCE]
```

**Parameters**

- **COMM_x**  community number or name, as specified in the route map that sets the community list number.
  - *aa:nn* AS and network number, separated by colon. Each value ranges from 1 to 4294967295.
  - *comm_num* community number. Values range from 1 to 4294967040.
  - *internet* advertises route to Internet community.
  - *local-as* advertises route only to local peers.
  - *no-advertise* does not advertise the route to any peer.
  - *no-export* advertises route only within BGP AS boundary.
- **MATCH_TYPE** Routes are filtered based on their communities.
  - *<no parameter>* routes must match at least one community in the list
  - *exact* route must match all communities and include no other communities.
- **DATA_OPTION** Type of information the command displays. Values include:
  - *<no parameter>* Displays table of the routing entry line items.
  - *detail* Displays data block for each routing table entry.
- **VRF_INSTANCE** specifies VRF instances.
  - *<no parameter>* displays routing table for context-active VRF.
  - *vrf vrf_name* displays routing table for the specified VRF.
  - *vrf all* displays routing table for all VRFs.
  - *vrf default* displays routing table for default VRF.

**Example**

- This command displays the BGP routing table entries for a specified community.

  ```
  switch>show ip bgp community 65533:100 exact detail
  BGP routing table entry for 10.17.254.0/30
  Paths: 1 available
  Local
  - from - (10.26.0.23)
    Origin IGP, metric 1, localpref 0, valid, local, best
  Community: 65533:100
  switch>
  ```
**show ip bgp neighbors**

The `show ip bgp neighbors` command displays Border Gateway Protocol (BGP) and TCP session data for a specified IPv4 BGP neighbor, or for all IPv4 BGP neighbors if an address is not included.

**Command Mode**

EXEC

**Command Syntax**

```
show ip bgp neighbors [NEIGHBOR_ADDR][VRF_INSTANCE]
```

**Parameters**

- **NEIGHBOR_ADDR** location of the neighbors. Options include:
  - `<no parameter>` command displays information for all IPv4 BGP neighbors.
  - `ipv4_addr` command displays information for specified neighbor.
- **VRF_INSTANCE** specifies VRF instances.
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Related Command**

- `show ip bgp neighbors (route type)`
- `show ip bgp neighbors (route-type) community`
Example

- This command displays information for the neighbor at 10.0.2.6

```
switch>show ip bgp neighbors 10.0.2.6
BGP neighbor is 10.0.2.6, remote AS 64496, external link
BGP version 4, remote router ID 10.0.2.10
Negotiated BGP version 4
Last read 00:00:10, last write 00:00:58
Hold time is 180, keepalive interval is 60 seconds
BGP state is Established, up for 9d02h
Number of transitions to established: 1
Last state was OpenConfirm
Last event was RecvKeepAlive
Last error code was 0, last error subcode was 0
Neighbor Capabilities:
  Multiprotocol IPv4 Unicast: advertised and received and negotiated
  Route Refresh: advertised and received and negotiated
Message statistics:
  InQ depth is 0
  OutQ depth is 0
  Sent  Rcvd
  Opens:  1  1
  Notifications:  0  0
  Updates:  1  269
  Keepalives:  13087  13023
  Route-Refresh:  0  0
  Total messages:  13089  13293
Prefix statistics:
  Total prefixes received 57
Inbound route map is prod-to-alpha
Outbound route map is alpha-to-prod
Local AS is 64511, local router ID 10.0.2.23
TTL is 0
Local TCP address is 10.0.2.5, local port is 59274
Remote TCP address is 10.0.2.6, remote port is 179
switch>
```
show ip bgp neighbors (route type)

The `show ip bgp neighbors (route type)` command displays information for next hop routes to a specified IPv4 neighbor. The `show ip bgp neighbors (route-type) community` command displays the same information for routes filtered by communities.

The output format depends on the selected `FILTER` parameter:

- Data block format displays comprehensive information for each specified route.
- Tabular format displays routing table entries in tabular format for the specified IP addresses.

Commands that do not include a route type revert to the `show ip bgp neighbors` command.

Command Mode

EXEC

Command Syntax

```
show ip bgp neighbors neighbor_addr HOPDIRECT [FILTER] [VRF_INSTANCE]
show ip bgp neighbors neighbor_addr [ROUTE_TYPE] HOPDIRECT
show ip bgp neighbors neighbor_addr [ROUTE_TYPE] HOPDIRECT detail
```

Related Command

- `show ip bgp neighbors`
- `show ip bgp neighbors (route-type) community`

Parameters

- `neighbor_addr` location of the neighbor.
- `ROUTE_TYPE` filters route on route type. Options include:
  - `ipv4 unicast` displays IPv4 unicast routes.
  - `ipv6 unicast` displays IPv6 unicast routes.
- `HOPDIRECT` filters route on the basis of direction from neighbor. Options include:
  - `advertised-routes` displays routes advertised to the specified neighbor.
  - `received-routes` displays routes received from the specified neighbor (accepted and rejected).
  - `routes` displays routes received and accepted from specified neighbor.
- `FILTER` routing table entries that the command displays. Values include:
  - `<no parameter>` displays all routing table entries. Tabular format.
  - `detail` displays all routing table entries. Data block format.
  - `ipv4_addr` host IPv4 address. Data block format.
  - `ipv4_subnet` subnet address. (CIDR notation). Data block format.
  - `ipv4_subnet longer-prefixes` subnet address. (CIDR notation). Tabular format.
- `VRF_INSTANCE` specifies VRF instances.
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.
Example

- This command displays information for routes advertised to the neighbor at 10.17.254.78

```
switch> show ip bgp neighbors 10.17.254.78 advertised-routes
```

Route status codes: s - suppressed, * - valid, > - active, e - ECMP

switch>
show ip bgp neighbors (route-type) community

The `show ip bgp neighbors (route type) community` command displays information for next hop routes to a specified neighbor. Routes are filtered by community.

The `show ip bgp neighbors (route type)` command displays the same information for routes filtered by IP addresses and subnets.

**Command Mode**

EXEC

**Command Syntax**

```
show ip bgp neighbors addr RTE community CM_1 [CM_2 .. CM_n] [MATCH] [INFO] [VRF_INST]
```

**Related Command**

- `show ip bgp neighbors`
- `show ip bgp neighbors (route type)`

**Parameters**

- `addr` Neighbor location (IPv4 address). Dotted decimal notation.
- `RTE` type of route that the command displays. Options include:
  - `advertised-routes` displays routes advertised to the specified neighbor.
  - `received-routes` displays routes received from the specified neighbor (accepted and rejected).
  - `routes` displays routes received and accepted from specified neighbor.
- `CM_x` community number or name, as specified in the route map that sets the community list number. The command must list at least one of the following community identifiers:
  - `aa:nn` AS and network number, separated by colon. Each value ranges from 1 to 4294967295.
  - `comm_num` community number. Values range from 1 to 4294967040.
  - `internet` advertises route to Internet community.
  - `local-as` advertises route only to local peers.
  - `no-advertise` does not advertise route to any peer.
  - `no-export` advertises route only within BGP AS boundary.
- `MATCH` Routes are filtered based on their communities.
  - `<no parameter>` routes must match at least one community in the list
  - `exact` route must match all communities and include no other communities.
- `INFO` Type of information the command displays. Values include:
  - `<no parameter>` Displays table of routing entry line items.
  - `detail` Displays data block for each routing table entry.
- `VRF_INST` specifies VRF instances.
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.
show ip bgp neighbors regexp

The show ip bgp neighbors regexp command displays information for next hop routes to a specified IPv4 neighbor that match the AS path attributes specified in the given regular expression.

Command Mode
EXEC

Command Syntax
  show ip bgp neighbors addr RTE regexp as_paths [VRF_INST]

Related Command
  • show ip bgp neighbors
  • show ip bgp neighbors (route type)

Parameters
  • addr Neighbor location (IPv4 address). Dotted decimal notation.
  • RTE type of route that the command displays. Options include:
    • advertised-routes displays routes advertised to the specified neighbor.
    • received-routes displays routes received from the specified neighbor (accepted and rejected).
    • routes displays routes received and accepted from specified neighbor.
  • as_paths list of AS paths, formatted as a regular expression. Regular expressions are pattern matching strings that are composed of text characters and operators.
  • VRF_INST specifies VRF instances.
    • <no parameter> displays routing table for context-active VRF.
    • vrf vrf_name displays routing table for the specified VRF.
    • vrf all displays routing table for all VRFs.
    • vrf default displays routing table for default VRF.

Examples
  • This command displays information for routes advertised to the neighbor at 10.14.4.4 which include AS number 64502 in their AS paths.
    switch>show ip bgp neighbors 10.14.4.4 advertised-routes regexp _64502_
    BGP routing table information for VRF default
    Router identifier 10.24.78.191, local AS number 64498
    Route status codes: s - suppressed, * - valid, > - active, E - ECMP head, e - ECMP S - Stale
    Origin codes: i - IGP, e - EGP, ? - incomplete
    AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop

    | Network       | Next Hop   | Metric | LocPref | Weight | Path          |
    |---------------|------------|--------|---------|--------|---------------|
    | * > 10.99.31.0/24 | 10.88.202.1 | 333    | 100     | -      | (64502 64503) 99 i |
    | * > 10.99.41.0/24 | 10.88.202.1 | 333    | 100     | -      | (64502 64503) 99 i |
    | * > 10.99.99.0/24 | 10.88.202.1 | 333    | 100     | -      | (64502 64504) 99 i |
show ip bgp paths

The **show ip bgp paths** command displays all BGP paths in the database.

**Command Mode**

EXEC

**Command Syntax**

```
show ip bgp paths [VRF_INSTANCE]
```

**Parameters**

- **VRF_INSTANCE** specifies VRF instances.
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Display Values**

- **Refcount**: Number of routes using a listed path.
- **Metric**: The path’s Multi Exit Discriminator (MED).
- **Path**: The route’s AS path and its origin code.

The MED (the path’s external metric) provides information to external neighbors about the preferred path into an AS that has multiple entry points. Lower MED values are preferred.

**Example**

- This command displays the BGP paths in the switch’s database.

```
switch>show ip bgp paths
Refcount Metric     Path
6        0          IGP (Id 1)
2        0          Incomplete (Id 2)
2        0          (100) IGP (Id 5)
switch>
```
show ip bgp peer-group

The `show ip bgp peer-group` command displays the BGP version, address family and group members for all BGP peer groups defined on the switch.

Command Mode

EXEC

Command Syntax

    show ip bgp peer-group [GROUP][VRF_INSTANCE]

Parameters

- **GROUP** peer group for which command displays information. Options include:
  - `<no parameter>` command displays information for all peer groups.
  - `group_name` name of peer group for which command displays information.
- **VRF_INSTANCE** specifies VRF instances.
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

Example

- This command displays BGP peer group information for all peer groups on the switch.

  ```plaintext
  switch> show ip bgp peer-group
  BGP peer-group local
  BGP version 4
  Address family: IPv4 Unicast
  Peer-group members:
  10.254.17.7
  10.254.17.8
  BGP peer-group external
  BGP version 4
  Address family: IPv4 Unicast
  Peer-group members:
  10.5.20.21
  10.5.20.25
  10.5.20.31
  ```
**show ip bgp regexp**

The `show ip bgp regexp` command displays Border Gateway Protocol (BGP) IPv4 routing table entries that match the AS path attributes specified in the given regular expression.

**Command Mode**

EXEC

**Command Syntax**

```
show ip bgp regexp as_paths [VRF_INSTANCE]
```

**Parameters**

- **as_paths** list of AS paths, formatted as a regular expression. Regular expressions are pattern matching strings that are composed of text characters and operators.
- **VRF_INSTANCE** specifies the VRF instance of the BGP routing table to be displayed.
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Examples**

- This command displays information about the BGP IPv4 routes in the context-active VRF that pass through AS 64511.

```
switch# show ip bgp regexp _64511_
BGP routing table information for VRF default
Router identifier 10.254.81.1, local AS number 64496
Route status codes: s - suppressed, * - valid, > - active, E - ECMP head, e - ECMP
S - Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop

</table>
```
**show ip bgp summary**

The `show ip bgp summary` command displays BGP path, prefix, and attribute information for all BGP neighbors.

**Command Mode**

EXEC

**Command Syntax**

```
show ip bgp summary [VRF_INSTANCE]
```

**Parameters**

- `VRF_INSTANCE` specifies VRF instances.
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Display Values**

**Header Row**

- **BGP router identifier**: The router identifier – loopback address or highest IP address.
- **Local AS Number**: AS number assigned to switch

**Neighbor Table Columns**

- **(First) Neighbor**: Neighbor's IP address.
- **(Second) V**: BGP version number.
- **(Third) AS**: Neighbor's AS number.
- **(Fourth) MsgRcvd**: Messages received from the neighbor.
- **(Fifth) MsgSent**: Messages sent to neighbor.
- **(Sixth) InQ**: Messages queued from neighbor.
- **(Seventh) OutQ**: Messages queued to send neighbor.
- **(Eighth) Up/Down**: Period the BGP session has been Established, or its current status.
- **(Ninth) State**: State of the BGP session and the number of routes received from a neighbor.

After the maximum number of routes are received, the ninth field displays `PfxRcd`, and the connection becomes Idle. Maximum number of routes is set using the `maximum paths (BGP)` command.

**Example**

- This command displays the status of the switch’s BGP connections.

```
switch>show ip bgp summary
BGP router identifier 10.26.0.22, local AS number 65533
Neighbor   V   AS   MsgRcvd   MsgSent   InQ OutQ   Up/Down      State PfxRcd
10.17.254.78 4  65534    187       191    0    0 02:49:40 7
10.17.254.2   4  65533    184       191    0    0 02:59:41 7
switch>
```
show ip community-list

The **show ip community-list** command displays the BGP community lists configured on the switch.

**Command Mode**

EXEC

**Command Syntax**

```
show ip community-list [COMMUNITY_LIST]
```

**Parameters**

- **COMMUNITY_LIST** community list for which command displays information.
- <no parameter> command displays information for all community lists.
- **listname** name of the community list (text string).

**Example**

- This command displays the BGP paths in the switch’s database.

```
switch>show ip community-list hs-comm-list
ip community-list standard hs-comm-list permit 0:10
switch>
```
show ip extcommunity-list

The **show ip extcommunity-list** command displays the BGP extended community lists configured on the switch.

**Command Mode**
- EXEC

**Command Syntax**

```
show ip extcommunity-list [COMMUNITY_LIST]
```

**Parameters**
- **COMMUNITY_LIST** extended community list for which command displays information.
- `<no parameter>` command displays information for all extended community lists.
- **listname** name of the extended community list (text string).

**Example**
- This command displays the extended extcommunity lists on the switch.

```
switch>show ip extcommunity-list
ip extcommunity-list standard hs-extcomm-list permit rt 3050:20
ip extcommunity-list standard hs-extcomm-list permit soo 172.17.52.2:30
ip extcommunity-list standard hs-extcomm-list permit rt 3050:70000
switch>
```
show ipv6 bgp

The `show ipv6 bgp` command displays IPv6 Border Gateway Protocol (BGP) routing table entries. The output format depends on the command parameters:

The output format depends on the command parameters:
- Data block format displays comprehensive information for each specified BGP routing table entry.
- Tabular format displays routing table entries in tabular format for the specified IP addresses.

Output produced by the `longer-prefixes` option includes the specified route and all more specific routes.

**Command Mode**
EXEC

**Command Syntax**
```
show ipv6 bgp [FILTER] [VRF_INSTANCE]
```

**Parameters**
- `FILTER` routing table entries that the command displays. Values include:
  - `<no parameter>` displays all routing table entries. Tabular format.
  - `detail` displays all routing table entries. Data block format.
  - `ipv6_addr` IPv6 host address. Data block format.
  - `ipv6_prefix` IPv6 prefix address. (CIDR notation). Data block format.
  - `ipv6_prefix detail` IPv6 prefix address. (CIDR notation). Data block format.
  - `ipv6_prefix longer-prefixes` IPv6 prefix address. (CIDR notation). Tabular format.
  - `ipv6_prefix longer-prefixes detail` IPv6 prefix address. (CIDR notation). Data block format.
- `VRF_INSTANCE` specifies VRF instances.
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Examples**
- This command displays the routing data blocks for a specified IPv6 prefix.
  
  ```
  switch>show ipv6 bgp 2001:0DB8:5804:1134::/64 longer-prefixes
  Route status codes: s - suppressed, * - valid, > - active, e - ECMP

switch>
```
show ipv6 bgp community

The `show ipv6 bgp community` command displays IPv6 Border Gateway Protocol (BGP) routing table entries, filtered by community.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 bgp community [COMM_1 ... COMM_n][MATCH_TYPE][INFO][VRF_INSTANCE]
```

**Parameters**

- **COMM_x** community number or name, as specified in the route map that sets the community list number.
  - **aa:nn** AS and network number, separated by colon. Each value ranges from 1 to 4294967295.
  - **comm_num** community number. Values range from 1 to 4294967040.
- **internet** advertises route to Internet community.
- **local-as** advertises route only to local peers.
- **no-advertise** does not advertise route to any peer.
- **no-export** advertises route only within BGP AS boundary.
- **MATCH_TYPE** Routes are filtered based on their communities.
  - <no parameter> routes must match at least one community in the list
  - **exact** route must match all communities and include no other communities.
- **INFO** Type of information the command displays. Values include:
  - <no parameter> Displays table of the routing entry line items.
  - **detail** Displays data block for each routing table entry.
- **VRF_INSTANCE** specifies VRF instances.
  - <no parameter> displays routing table for context-active VRF.
  - **vrf vrf_name** displays routing table for the specified VRF.
  - **vrf all** displays routing table for all VRFs.
  - **vrf default** displays routing table for default VRF.
**show ipv6 bgp neighbors**

The `show ipv6 bgp neighbors` command displays IPv6 Border Gateway Protocol (BGP) and TCP session data for a specified neighbor. Command displays data for all neighbors if an address is not included.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 bgp neighbor [NEIGHBOR_ADDR][VRF_INSTANCE]
```

**Parameters**

- **NEIGHBOR_ADDR** location of the neighbors. Options include:
  - `<no parameter>` command displays information for all neighbors.
  - `ipv6_addr` command displays information for specified neighbor.
- **VRF_INSTANCE** specifies VRF instances.
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.
Example

- This command displays information for the neighbor at 2001:0DB8:52a4:fe01::2

```
switch#show ipv6 bgp neighbors 2001:0DB8:52a4:fe01::2
BGP neighbor is 2001:0DB8:52a4:fe01::2, remote AS 65536
Description: v6-bgp-to-magensium
BGP version is 4, remote router ID 172.26.0.23
Negotiated version is 4
TTL is 0
holdtime is 180
restart-time is 0
Restarting: no
Current state is Established
Updates received: 256
Updates sent: 4787
Total messages received: 11097
Total messages sent: 15250
Last state was OpenConfirm
Last event was RecvKeepAlive
Last error code was 0
Last error subcode was 0
Established time: 652492 seconds
Number of transitions to established: 1
Local TCP address is 2001:0DB8:52a4:fe01::1
Local AS is 65533
Local router ID is 172.26.0.22
```

show ipv6 bgp neighbors (route type)

The `show ipv6 bgp neighbors (route type)` command displays information for next hop routes to a specified IPv6 BGP neighbor. The `show ipv6 bgp neighbors (route type) community` command displays the same information for routes filtered by communities. Commands that do not include a route type revert to the `show ipv6 bgp neighbors` command.

The output format depends on the selected `FILTER` parameter:
- Data block format displays comprehensive information for each specified route.
- Tabular format displays routing table entries in tabular format for the specified IP addresses.

Output produced by the `longer-prefixes` option includes the specified route and all more specific routes.

Command Mode
EXEC

Command Syntax
show ipv6 bgp neighbors neighbor_addr ROUTE_TYPE [FILTER] [VRF_INSTANCE]

Parameters
- `neighbor_addr` location of the neighbor.
- `ROUTE_TYPE` type of route that the command displays. Options include:
  - `advertised-routes` displays routes advertised to the specified neighbor.
  - `received-routes` displays routes received from the specified neighbor (accepted and rejected).
  - `routes` displays routes received and accepted from specified neighbor.
- `FILTER` routing table entries that the command displays. Options include:
  - `<no parameter>` displays all routing table entries. Tabular format.
  - `detail` displays all routing table entries. Data block format.
  - `ipv6_addr` IPv6 host address. Data block format.
  - `ipv6_prefix` IPv6 prefix address (CIDR notation). Data block format.
  - `ipv6_prefix longer-prefixes` IPv6 prefix address. (CIDR notation). Tabular format.
- `VRF_INSTANCE` specifies VRF instances.
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.
Example

- This command displays information for routes advertised to the neighbor at 2001:0DB8:52a4:1::/64

```bash
switch>show ipv6 bgp neighbors 2001:0DB8:52a4:fe01::2 routes 2001:0DB8:52a4::/48 longer-prefixes
Route status codes: s - suppressed, * - valid, > - active, e - ECMP

</tbody>
</table>
```

switch>
show ipv6 bgp neighbors (route type) community

The `show ipv6 bgp neighbors (route type) community` command displays information for next hop routes to a specified IPv6 BGP neighbor. Routes are filtered by community.

The `show ipv6 bgp neighbors (route type)` command displays the same information for routes filtered by IP addresses and prefixes.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 bgp neighbors adr RTE community CM_1
[CM_2..CM_n] [MATCH] [INFO] [VRF_INST]
```

**Parameters**

- `adr` Neighbor location (IPv6 address). Dotted decimal notation.
- `RTE` type of route that the command displays. Options include:
  - `advertised-routes` displays routes advertised to the specified neighbor.
  - `received-routes` displays routes received from the specified neighbor (accepted and rejected).
  - `routes` displays routes received and accepted from specified neighbor.
- `CM_x` community number or name, as specified in the route map that sets the community list number. The command must list at least one of the following community identifiers:
  - `aa:nn` AS and network number, separated by colon. Each value ranges from 1 to 4294967295.
  - `comm_num` community number. Values range from 1 to 4294967040.
  - `internet` advertises route to Internet community.
  - `local-as` advertises route only to local peers.
  - `no-advertise` does not advertise route to any peer.
  - `no-export` advertises route only within BGP AS boundary.
- `MATCH` Routes are filtered based on their communities.
  - `<no parameter>` routes must match at least one community in the list
  - `exact` route must match all communities and include no other communities.
- `INFO` Type of information the command displays. Values include:
  - `<no parameter>` Displays table of the routing entry line items.
  - `detail` Displays data block for each routing table entry.
- `VRF_INST` specifies VRF instances.
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.
Example

- This command displays the BGP routes in the 2001:0DB8:523c:fe4c::1 network that are assigned the community of 65533:100.

```
switch>show ipv6 bgp neighbors 2001:0DB8:523c:fe4c::1 advertised-routes community 65533:100
Route status codes: s - suppressed, * - valid, > - active, e - ECMP

</tr>
</tbody>
</table>
```

switch>
show ipv6 bgp neighbors regexp

The `show ipv6 bgp neighbors regexp` command displays information for next hop routes to a specified IPv6 neighbor that match the AS path attributes specified in the given regular expression.

Command Mode
EXEC

Command Syntax
```
show ipv6 bgp neighbors addr RTE regexp as_paths [VRF_INST]
```

Related Command
- `show ip bgp neighbors`
- `show ip bgp neighbors (route type)`

Parameters
- `addr` Neighbor location (IPv6 address).
- `RTE` type of route that the command displays. Options include:
  - `advertised-routes` displays routes advertised to the specified neighbor.
  - `received-routes` displays routes received from the specified neighbor (accepted and rejected).
  - `routes` displays routes received and accepted from specified neighbor.
- `as_paths` list of AS paths, formatted as a regular expression. Regular expressions are pattern matching strings that are composed of text characters and operators.
- `VRF_INST` specifies VRF instances.
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

Examples
- This command displays information for routes advertised to the neighbor at 2001:0DB8:254:177::15 which include AS number 64502 in their AS paths.

```bash
switch>show ipv6 bgp neighbors 2001:0DB8:254:177::15 received-routes
BGP routing table information for VRF default
Router identifier 10.254.83.8, local AS number 64496
Route status codes: s - suppressed, * - valid, > - active, E - ECMP head, e - ECMP S - Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

show ipv6 bgp regexp

The `show ipv6 bgp regexp` command displays Border Gateway Protocol (BGP) IPv6 routing table entries that match the AS path attributes specified in the given regular expression.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 bgp regexp as_paths [VRF_INSTANCE]
```

**Parameters**

- `as_paths` list of AS paths, formatted as a regular expression. Regular expressions are pattern matching strings that are composed of text characters and operators.
- `VRF_INSTANCE` specifies the VRF instance of the BGP routing table to be displayed.
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Examples**

- This command displays information about the BGP IPv6 routes in the context-active VRF that pass through AS 64511.

```
switch>show ipv6 bgp regexp _64511_
BGP routing table information for VRF default
Router identifier 22.0.0.3, local AS number 64496
Route status codes: s - suppressed, * - valid, > - active, E - ECMP head, e - ECMP S - Stale

</tbody>
</table>
show ipv6 bgp summary

The `show ipv6 bgp summary` command displays BGP path, prefix, and attribute information for all BGP IPv6 neighbors.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 bgp summary [VRF_INSTANCE]
```

**Parameters**

- **VRF_INSTANCE** specifies VRF instances.
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Display Values**

**Header Row**

- **BGP router identifier**: The router identifier: loopback address or highest IP address.
- **Local AS Number**: AS number assigned to switch

**Neighbor Table Columns**

- **(First) Neighbor**: Neighbor's IP address.
- **(Second) V**: BGP version number.
- **(Third) AS**: Neighbor's AS number.
- **(Fourth) MsgRcvd**: Messages received from the neighbor.
- **(Fifth) MsgSent**: Messages sent to neighbor.
- **(Sixth) InQ**: Messages queued from neighbor.
- **(Seventh) OutQ**: Messages queued to send neighbor.
- **(Eighth) Up/Down**: Period the BGP session has been Established, or its current status.
- **(Ninth) State**: State of the BGP session and the number of routes received from a neighbor.

After the maximum number of routes are received, the ninth field displays `PfxRcd`, and the connection becomes Idle. Maximum number of routes is set using the `maximum paths (BGP)` command.

**Example**

- This command displays the status of the switch’s BGP connections.

  ```
  switch>show ipv6 bgp summary
  BGP router identifier 10.26.0.22, local AS number 65533
  Neighbor        V  AS     MsgRcvd   MsgSent  InQ OutQ  Up/Down State  PfxRcd
  2001:0DB8:52a4:fe4c::1 4  65534      6030      6029    0    0    2d13h Estab  8
  2001:0DB8:52a4:fe01::2 4  65533      6212      6294    0    0    3d08h Estab  818
  switch>
  ```
shutdown (BGP)

The `shutdown` command disables BGP on the switch without modifying the BGP configuration. The `no shutdown` and `default shutdown` commands enable the BGP instance by removing the `shutdown` command from `running-config`.

**Command Mode**
- Router-BGP Configuration

**Command Syntax**
- `shutdown`
- `no shutdown`
- `default shutdown`

**Examples**
- This command disables BGP on the switch.
  ```
  switch(config)#router bgp 9
  switch(config-router-bgp)#shutdown
  switch(config-router-bgp)#
  ```
- This command enables BGP on the switch.
  ```
  switch(config)#router bgp 9
  switch(config-router-bgp)#no shutdown
  switch(config-router-bgp)#
  ```
timers bgp

The `timers bgp` command configures the BGP keepalive and hold times. Timer settings apply to each peer connection. The `neighbor timers` command configures the times on a specified peer connection.

- Keepalive time: period between the transmission of consecutive keepalive messages.
- Hold time: period the switch waits for a keepalive or UPDATE message before it disables peering.

The hold time must be at least 3 seconds and should be three times longer than the keepalive setting.

The `no timers bgp` and `default timers bgp` commands return the time settings to their default values by removing the `timers bgp` command from `running-config`.

- keepalive: 60 seconds
- hold time: 180 seconds

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```plaintext
timers bgp keep_alive hold_time
no timers bgp
default timers bgp
```

**Parameters**

- `keep_alive` keepalive period, in seconds. Values include
  - 0 keepalive messages are not sent
  - 1 to 3600 keepalive time (seconds).
- `hold_time` hold time. Values include
  - 0 peering is not disabled by timeout expiry; keepalive packets are not sent.
  - 3 to 7200 hold time (seconds).

**Example**

- This command sets the keepalive time to 30 seconds and the hold time to 90 seconds.
  ```plaintext
  switch(config)#router bgp 9
  switch(config-router-bgp)#timers bgp 30 90
  switch(config-router-bgp)#
  ```
The `vrf` command places the switch in BGP VRF configuration mode for the specified VRF. Commands issued in this mode will override global BGP configuration for the specified VRF.

**Command Mode**
- Router-BGP Configuration

**Command Syntax**

```
vrf vrf_instance
```

**Parameters**
- `vrf_instance` VRF to be configured.

**Example**
- These commands place the switch in BGP VRF configuration mode for VRF “purple.”

```
switch(config)#router bgp 9
switch(config-router-bgp)#vrf purple
switch(config-router-bgp-vrf-purple)#
```
Routing Information Protocol

This chapter contains the following sections.

- Section 30.1: RIP Conceptual Overview
- Section 30.2: Running RIP on the Switch
- Section 30.3: Configuring RIP on Multiple VRFs
- Section 30.4: RIP Commands

30.1 RIP Conceptual Overview

Routing Information Protocol (RIP) is a routing protocol typically used as an interior gateway protocol (IGP). RIP uses hop counts only to determine the shortest path to a destination. To avoid loops, RIP limits its paths to a maximum of 15 hops, making it an ineffective protocol for large networks. RIP Version 2 supports Classless Inter-Domain Routing (CIDR) and uses IP multicasting at address 224.0.0.9 to share the routing table with adjacent routers.

RIP sends updates whenever there is a change in the network topology and periodic updates when there are no changes. Receiving switches update their routing table whenever the update includes topology changes. Because RIP transmits the entire routing table every 30 seconds, RIP updates can generate heavy traffic loads in large or complicated networks.

Each switch also sends a list of distance-vectors to each of its neighbors periodically. The distance-vector is the metric RIP uses to express the cost of a route, and it describes the number of hops required to reach a destination. Each hop is typically assigned a hop count value of 1, and the router adds 1 to the metric when it receives a routing update and adds the network to its routing table.

To remove dead routes from its routing table, RIP marks a route for deletion if the router does not receive an advertisement for it within the expiration interval, then removes it from the routing table after the deletion interval.
30.2 Running RIP on the Switch

30.2.1 Accessing RIP Configuration Mode and Enabling RIP

30.2.1.1 RIP Configuration Mode

The `router rip` command places the switch in router-RIP configuration mode to configure the Routing Information Protocol (RIP) routing.

**Example**

- This command places the switch in router-rip configuration mode.
  
  
  ```
  switch(config)#router rip
  switch(config-router-rip)#
  ```

Using the `router rip` command puts the switch in router-RIP configuration mode, but does not enable RIP on the switch.

30.2.1.2 Enabling RIP

Routing Information Protocol (RIP) is disabled on the switch by default. The `no shutdown (RIP)` command in router-RIP configuration mode will enable RIP.

**Example**

- This command enables RIP on the switch.
  
  ```
  switch(config-router-rip)#no shutdown
  switch(config-router-rip)#
  ```

Issuing this command enables RIP, but to send and receive RIP route updates and to route packets via RIP you must also specify interfaces on which RIP will run by using the `network (RIP)` command.

30.2.1.3 Disabling RIP

You can disable RIP in two ways. The `shutdown (RIP)` command disables RIP on the switch but maintains all user-entered router-RIP configuration statements in the `running-config`. The `no router rip` command disables RIP and removes all user-entered router-RIP configuration statements from the `running-config`.

**Examples**

- This command disables RIP on the switch and removes all user-entered router-RIP configuration.
  
  ```
  switch(config)#no router rip
  switch(config)#
  ```

- This command disables RIP on the switch, but preserves all user-entered router-RIP configuration.
  
  ```
  switch(config-router-rip)#shutdown
  switch(config-router-rip)#
  ```

30.2.2 Configuring RIP

Issuing the `no shutdown (RIP)` command in router-RIP configuration mode enables RIP, but to run RIP on an interface you must specify a RIP network by using the `network (RIP)` command.

You can also configure the redistribution of routes learned from other protocols, set the default metric and administrative distance for redistributed routes, configure the timing of various RIP events, and configure specific interfaces to send RIP update packets by broadcast instead of multicast.
30.2.2.1 Specifying RIP Networks

The **network (RIP)** command identifies networks on which RIP will run and also specifies which routes RIP will accept into its routing table. You can issue the **network (RIP)** command multiple times to build up a list of RIP networks. No RIP networks are configured by default, so in order to route packets and send and receive RIP updates you must specify one or more RIP networks.

To disable RIP on a specific network, use the **no network (RIP)** command.

**Examples**

- This command enables RIP on 10.168.1.1/24
  ```
  switch(config-router-rip)#network 10.168.1.1/24
  switch(config-router-rip)#
  ```

- This command disables RIP on 10.168.1.1/24
  ```
  switch(config-router-rip)#no network 10.168.1.1/24
  switch(config-router-rip)#
  ```

30.2.2.2 Redistributing Routes Learned from Other Protocols into RIP

To enable route import from a specified protocol into RIP, use the **redistribute (RIP)** command. Additionally, you can apply a route map to the incoming routes to filter which routes are added to the RIP routing table. All connected routes are redistributed into RIP by default.

**Example**

- This command redistributes all routes learned from OSPF into RIP.
  ```
  switch(config-router-rip)#redistribute OSPF
  switch(config-router-rip)#
  ```

30.2.2.3 Configuring RIP Timers

When RIP is running on the switch, it sends unsolicited route updates and deletes expired routes at regular intervals. To configure the timing of those events, use the **timers basic (RIP)** command. The command takes three parameters: the update interval, the route expiration time, and the route deletion time.

The update interval is the amount of time in seconds that the switch waits between sending unsolicited RIP route updates to its neighbors. The route expiration time is how long the switch waits before marking an unadvertised route for deletion (the counter resets whenever an advertisement for the route is received). And the route deletion time is how long the switch waits between marking a route for deletion and removing it from the routing table. During the deletion interval, the switch continues to forward packets on the route.

**Example**

- This command sets the update interval to 60 seconds, expiration time to 90 seconds, and deletion time to 150 seconds.
  ```
  switch(config-router-rip)#timers basic 60 90 150
  switch(config-router-rip)#
  ```

30.2.2.4 Configuring an Interface to Transmit Broadcast RIP Updates

By default, the switch uses RIP version 2 and multicasts RIP update packets from all participating interfaces. To reconfigure a specific interface to send updates as broadcast packets, use the **ip rip v2-broadcast** command in the configuration mode for the interface.
Example

- The following commands configure RIP version 2 broadcasting on interface Ethernet 5.
  
  switch(config)#interface ethernet5
  switch(config-if-Et5)#ip rip v2-broadcast
  switch(config-if-Et5)#exit
  switch(config)#

30.2.3 Displaying RIP Information

30.2.3.1 Displaying RIP Routes

To see a listing of the RIP routes in the switch’s routing table, use the `show ip rip database` command. (You can also display similar information using the RIP option in the `show ip route` command)

Examples

- This command displays all active rip routes.
  
  switch>show ip rip database
  10.168.11.0/24 directly connected, Et4
  10.168.13.0/24
  [1] via 10.168.14.2, 00:00:25, Et4
  [2] via 10.168.15.2, 00:00:20, Et1
  10.168.13.0/24
  [1] via 10.168.14.2, 00:00:25, Et3

- This command submits a query for RIP route information for a network.
  
  switch>show ip rip database 10.168.13.0/16
  10.168.13.0/24
  [1] via 10.168.14.2, 00:00:25, Et4
  [2] via 10.168.15.2, 00:00:20, Et1

30.2.3.2 Displaying RIP Route Gateways

To see information about the switch’s RIP route gateways, use the `show ip rip neighbors` command. The output displays the IPv4 address, the last heard time of the gateway, and characteristic flags applying to the gateway.

Example

- This command displays information about all the gateways of RIP routes.
  
  switch>show ip rip neighbors
  Gateway       Last-Heard       Bad-Packets   Bad-Routes Flags
  10.2.12.33    00:00:15          SRC, TRSTED, ACCEPTED, RJCTED, Q_RJCTED, AUTHFAIL
30.3 Configuring RIP on Multiple VRFs

VRF support for Routing Information Protocol (RIP) allows instances of RIP on multiple non-default VRFs on the same router. By default, all interfaces belong to the default VRF until VRF forwarding is executed.

The `vrf definition` and `vrf forwarding` commands configure a non-default VRF, enable routing in it, and configure the network command under the configuration router RIP for the prefix to which the interface belongs.

The `router rip` command places the switch in router-RIP configuration mode to configure an RIP routing instance in the non-default VRF.

Examples

- This command configures a non-default VRF and enables unicast routing in it.

```
switch(config)#vrf definition test
switch(config-vrf-test)#rd 1:1
switch(config-vrf-test)#exit
switch(config)#ip routing vrf test
```

- This command configures a RIP instance in the non-default VRF.

```
switch(config)#router rip vrf test
switch(config-router-rip-router-rip-vrf-test)#no shutdown
switch(config-router-rip)#exit
```

- This command configures an interface as part of a non-default VRF, by configuring the network command under the configuration router RIP for the prefix to which the interface belongs.

```
switch(config)#interface Ethernet 3 / 1
switch(config-if-Et3/1)#no switchport
switch(config-if-Et3/1)#ip address 1.0.0.1/24
switch(config-if-Et3/1)#vrf forwarding test
switch(config-if-Et3/1)#network 1.0.0.1
switch(config-if-Et3/1)#exit
switch(config)#
```
30.4 RIP Commands

Global Configuration Commands
- `router rip`
- `router rip vrf`

Interface Configuration Commands
- `ip rip v2-broadcast`

Router-RIP Configuration Mode
- `default-metric`
- `distance (RIP)`
- `distribute-list (RIP)`
- `network (RIP)`
- `redistribute (RIP)`
- `shutdown (RIP)`
- `timers basic (RIP)`

VRF Configuration Mode
- `vrf definition`
- `vrf forwarding`

Display Commands – EXEC Mode
- `show ip rip database`
- `show ip rip neighbors`
default-metric

The default-metric command specifies the metric value assigned to RIP routes learned from other protocols. All routes imported into RIP receive the default metric unless a matching route-map exists for the route. The route metric of 0 is assigned to redistributed connected and static routes. Default-metric values range from 0 to 16 with a default value of 1.

The no default-metric and default default-metric commands remove the default-metric command from running-config and returns the default-metric value to its default value of 1.

Command Mode
Router-RIP Configuration

Command Syntax
default-metric metric_value
no default-metric
default default-metric

Parameters
• metric_value default metric value assigned. Values range from 0 to 16; default is 1.

Example
• This command sets the default metric value to five.
  switch(config)#router rip
  switch(config-router-rip)#default-metric 5
  switch(config-router-rip)#
distance (RIP)

The `distance` command assigns an administrative distance to routes that the switch learns through RIP. Routers use administrative distances to select a route when two protocols provide routing information to the same destination. Distance values range from 1 to 255; lower distance values correspond to higher reliability. The default RIP distance value is 120.

The `no distance` and `default distance` commands restore the administrative distance default value of 120 by removing the `distance` command from `running-config`.

**Command Mode**
Router-RIP Configuration

**Command Syntax**
```
distance distance_value
no distance
default distance
```

**Parameters**
- `distance_value` distance assigned to RIP routes. Values range from 1 to 255.

**Examples**
- These commands assign an administrative distance of 75 to RIP routes.
```
switch(config)#router rip
switch(config-router-rip)#distance 75
switch(config-router-rip)#
```
distribute-list (RIP)

The distribute-list command allows users to filter out routes that are received or sent out. The distribute-list command influences which routes the router installs into its routing table and advertises to its neighbors.

**Configuration Notes:**
- Only one inbound distribute-list is allowed per interface.
- Only one outbound distribute-list is allowed per interface.
- Only one globally-defined inbound distribute-list is allowed.
- Only one globally-defined outbound distribute-list is allowed.
- Not all match clauses in a route-map are supported using RIP routes filtering. These match clauses for distribute-lists are supported:
  - match ip address access-list
  - match ip address prefix-list
- The distribute-list command does not enforce the specified route-map to contain only supported match clauses.
- Permit or deny can be specified in both prefix/access list and route-map configurations. The following rules apply when filtering routes:
  - Routes permitted by the prefix/access lists are treated as matched.
  - Matched routes are filtered based on the permit or deny option configured for the route-map clause.
  - Unmatched routes are further evaluated by the next route-map clause.
  - If a route does not match any clause in a route-map, it is denied.
  - If the route-map given in the distribute-list command is not configured, then all routes are permitted.
  - When multiple inbound (or outbound) distribute-lists are configured, only the most specific one is applied.

The no distribute-list and default distribute-list commands remove the corresponding distribute-list command from running-config.

**Command Mode**
Router-RIP Configuration

**Command Syntax**
```
distribute-list DIRECTION MAP [INTF]
no distribute-list DIRECTION MAP [INTF]
default distribute-list DIRECTION MAP [INTF]
```

**Parameters**
- **DIRECTION** direction specifies if distribute-list is applied on inbound or outbound traffic. Valid options include:
  - **in** specifies inbound as the direction the distribute-list is applied.
  - **out** specifies outbound as the direction the distribute-list is applied.
- **MAP** specifies route map that assigns attribute values to the network. Options include:
  - <no parameter> attributes are not assigned through a route map.
  - route-map map_name attributes listed by specified route map are assigned to the network.
• **INTF** interface to be configured. Options include:
  • ethernet *e_num* Ethernet interface.
  • loopback *l_num* Loopback interface.
  • port-channel *p_num* Port channel interface.
  • vlan *v_num* VLAN interface.

**Example**

- The following commands demonstrate that an access-list or prefix-list can be used within a route-map for use in a distribute-list.

  ```
  switch(config)#ip prefix-list 8to24 seq 5 permit 0.0.0.0/0 ge 8 le 24
  switch(config)#route-map myRouteMap permit 10
  switch(config-route-map-myRouteMap)#match ip address prefix-list 8to24
  switch(config-route-map-myRouteMap)#exit
  switch(config)#router rip
  switch(config-router-rip)#distribute-list in route-map myRouteMap
  ```

- These commands suppress routes advertised on a particular interface.

  ```
  switch(config)#ip prefix-list 2 seq 10 deny 30.1.1.0/24
  switch(config)#route-map myRmOut permit 10
  switch(config-route-map-myRmOut)#match ip address prefix-list 2
  switch(config-route-map-myRmOut)#exit
  switch(config)#router rip
  switch(config-router-rip)#distribute-list out route-map myRmOut
  ```
**ip rip v2-broadcast**

The `ip rip v2-broadcast` command specifies the transmission of Routing Information Protocol (RIP) Version 2 update packets from the configuration mode interface as broadcast to 255.255.255.255.

The `no rip v2-broadcast` and `default rip v2-broadcast commands` specify the transmission of update packets as multicast to 224.0.0.9 if the configuration mode interface is multicast capable. Updates are broadcast if the interface is not multicast capable.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `ip rip v2-broadcast`
- `no ip rip v2-broadcast`
- `default ip rip v2-broadcast`

**Example**
- The following example configures version 2 broadcasting on interface Ethernet 5.
  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#ip rip v2-broadcast
  switch(config-if-Et5)#exit
  switch(config)#
  ```
network (RIP)

The network command specifies which network the switch runs Routing Information Protocol (RIP), and also specifies which routes will be accepted into the RIP routing table. Multiple network commands can be issued to create a network list on which RIP runs.

The switch enables RIP on all interfaces in the specified network.

The no network and default network commands disable RIP on the specified network by removing the corresponding network command from running-config.

Command Mode
Router-RIP Configuration

Command Syntax

```
network NETWORK_ADDRESS
no network NETWORK_ADDRESS
default network NETWORK_ADDRESS
```

Parameters

- **NETWORK_ADDRESS** network IP address. Entry formats include the following:
  - *ipv4_subnet* IPv4 subnet (CIDR notation).
  - *ipv4_addr mask* wildcard_mask IP address and wildcard-mask.

Examples

- This command enables RIP on 10.168.1.1/24
  ```
switch(config)#router rip
switch(config-router-rip)#network 10.168.1.1/24
switch(config-router-rip)#
  ```
- This command also enables RIP on 10.168.1.1/24
  ```
switch(config-router-rip)#network 10.168.1.1 mask 0.0.0.255
switch(config-router-rip)#
  ```
redistribute (RIP)

The `redistribute` command enables the importing of routes from a specified routing domain to RIP.

- **connected** by default, RIP redistributes all connected routes that are established when IP is enabled on an interface. The route-map parameter facilitates the exclusion of connected routes from redistribution by specifying a route map that denies the excluded routes.

- **BGP, OSPF, and IP static routes** by default, routes are not redistributed. The redistribution command without the route-map parameter facilitates the redistribution of all routes from the specified source.

The `no redistribute` and `default redistribute` commands reset the default route redistribution setting by removing the `redistribute` statement from `running-config`.

**Command Mode**
Router-RIP Configuration

**Command Syntax**

```
redistribute connected ROUTE_MAP
redistribute ROUTE_TYPE [ROUTE_MAP]
no redistribute connected ROUTE_MAP
no redistribute ROUTE_TYPE
default redistribute connected ROUTE_MAP
default redistribute ROUTE_TYPE
```

**Parameters**

- **ROUTE_TYPE** source from which routes are redistributed. Options include:
  - **BGP** routes from a BGP domain.
  - **OSPF** routes from an OSPF domain.
  - **OSPF match external** Routes external to RIP, but imported from OSPF.
  - **OSPF match internal** OSPF routes that are internal to the AS.
  - **static** IP static routes.

- **ROUTE_MAP** route map that determines the routes that are redistributed. Options include:
  - `<no parameter>` all routes are redistributed.
  - `route-map map_name` only routes in the specified route map are redistributed.

**Example**

- These commands redistribute OSPF routes into RIP.

  ```
  switch(config)#router rip
  switch(config-router-rip)#redistribute OSPF
  switch(config-router-rip)#
  ```
**router rip**

The `router rip` command places the switch in router-rip configuration mode to configure the Routing Information Protocol (RIP) routing process. Router-rip configuration mode is not a group change mode; `running-config` is changed immediately upon command entry. The `exit` command does not affect `running-config`.

The `no router rip` and `default router rip` commands disable RIP and remove all user-entered `router-rip` configuration statements from `running-config`. To disable RIP without removing configuration statements, use the `shutdown (RIP)` command.

The `exit` command returns the switch to global configuration mode.

**Command Mode**

Global Configuration

**Command Syntax**

- `router rip`
- `no router rip`
- `default router rip`

**Commands Available in router-rip Configuration Mode**

- `default-metric`
- `distance (RIP)`
- `network (RIP)`
- `redistribute (RIP)`
- `shutdown (RIP)`
- `timers basic (RIP)`

**Example**

- This command places the switch in router-rip configuration mode.

```
switch(config)#router rip
switch(config-router-rip)#
```
router rip vrf

The `router rip` command places the switch in router-RIP configuration mode to configure an RIP routing instance in the non-default VRF.

The `no router rip vrf` and `default router rip vrf` commands disable an RIP routing instance in the non-default VRF, and remove all user-entered `router-rip` configuration statements from `running-config`. To disable RIP without removing configuration statements, use the `shutdown (RIP)` command.

The `exit` command returns the switch to global configuration mode.

**Command Mode**

Global Configuration

**Command Syntax**

```
router rip vrf [RIP_INSTANCE]
no router rip vrf [RIP_INSTANCE]
default router rip vrf [RIP_INSTANCE]
```

**Parameters**

- `RIP_INSTANCE` configure a RIP VRF instance in the non-default VRF:

**Example**

- This command configures a RIP instance in the non-default VRF.

  switch(config)#router rip vrf test
  switch(config-router-rip-router-rip-vrf-test)#no shutdown
  switch(config-router-rip)#exit
  switch(config)#

- This command disables a RIP instance in the non-default VRF.

  switch(config)#no router rip vrf test
  switch(config)#
**show ip rip database**

The `show ip rip database` command displays information about routes in the Routing Information Base. The default command displays active routes and learned routes not used in deference to higher priority routes from other protocols.

This command has the following forms:

- default (no arguments): information about all RIP routes.
- IPv4 address and mask: information about the referenced addresses
- `active`: information about routes not superceded by routes from other protocols.

**Command Mode**

EXEC

**Command Syntax**

`show ip rip database [FILTER]`

**Parameters**

- `FILTER` routing table entries that the command displays. Values include:
  - `<no parameter>` displays all routing table entries
  - `active` displays all active routing table entries.
  - `net_addr` subnet address (CIDR or address-mask). Command displays entries in this subnet.

**Examples**

- This command displays all active rip routes.
  ```
  switch>show ip rip database active
  10.168.11.0/24 directly connected, Et4
  10.168.13.0/24
  [1] via 10.168.14.2, 00:00:25, Et4
  [2] via 10.168.15.2, 00:00:20, Et1
  10.168.13.0/24
  [1] via 10.168.14.2, 00:00:25, Et3
  ```

- This command submits a query for RIP route information for a network.
  ```
  switch>show ip rip database 10.168.13.0/16
  10.168.13.0/24
  [1] via 10.168.14.2, 00:00:25, Et4
  [2] via 10.168.15.2, 00:00:20, Et1
  ```

- This command returns information for all RIP routes.
  ```
  switch>show ip rip database
  10.1.0.0/255.255.255.0
  [1] via 10.8.31.15, 00:00:21, Et2, holddown
  10.2.0.0/255.255.255.0
  [1] via 10.8.31.15, 00:00:21, Et2, holddown
  10.3.0.0/255.255.255.0
  [1] via 10.8.31.15, 00:00:21, Et2, inactive
  10.212.0.0/255.255.255.0
  [1] via 10.8.31.15, 00:00:21, Et2, active
  10.214.0.0/255.255.255.0
  [1] via 10.8.12.17, 00:00:30, Et4, active
  ```
show ip rip neighbors

The `show ip rip neighbors` command displays information about all RIP route gateways. The output displays the IPv4 address, the last heard time of the gateway, and characteristic flags applying to the gateway.

**Command Mode**

EXEC

**Command Syntax**

`show ip rip neighbors`

**Example**

- The `show ip rip neighbors` query displays information about all the gateways of RIP routes.

```
switch>show ip rip neighbors
Gateway     Last-Heard      Bad-Packets    Bad-Routes    Flags
10.2.12.33  00:00:15                                      SRC, TRSTED, ACCEPTED, RJCTED, Q_RJCTED, AUTHFAIL
```
**shutdown (RIP)**

The `shutdown` command disables RIP on the switch without modifying the RIP configuration. RIP is disabled by default.

The `no shutdown` command enables RIP. The `default shutdown` command disables RIP.

**Command Mode**

- **Router-RIP Configuration**

**Command Syntax**

- `shutdown`
- `no shutdown`
- `default shutdown`

**Examples**

- This command disables RIP on the switch.
  
  ```
  switch(config)#router rip
  switch(config-router-rip)#shutdown
  switch(config-router-rip)#
  ```

- This command enables RIP on the switch.
  
  ```
  switch(config-router-rip)#no shutdown
  switch(config-router-rip)#
  ```
timers basic (RIP)

The timers basic command configures the update interval, the expiration time, and the deletion time for routes received and sent through RIP. The command requires value declaration of all values.

- The update time is the interval between unsolicited route responses.
- The expiration time is initialized when a route is established and any time an update is received for the route.
- The deletion time is initialized when the expiration time elapses and the route is invalid. It is retained in the routing table until deletion time expiry.

The no timers basic and default timers basic commands return the timer values to their default values by removing the timers-basic command from running-config.

**Command Mode**
Router-RIP Configuration

**Command Syntax**
```plaintext
timers basic  update_time  expire_time  deletion_time
no timers basic
default timers basic
```

**Parameters**
- **update_time**    Default is 30 seconds
- **expire_time**    Default is 180 seconds.
- **deletion_time**  Default is 120 seconds.

Parameter values are in seconds and range from **5 to 2147483647**.

**Example**
- This command sets the update (60 seconds), expiration (90 seconds), and deletion (150 seconds) times.
  ```plaintext
  switch(config)#router rip
  switch(config-router-rip)#timers basic  60  90  150
  switch(config-router-rip)#
  ```
**vrf definition**

The `vrf definition` command configure a non-default VRF, enable routing in it, and configure the network command under the configuration router RIP for the prefix to which the interface belongs.

The `no vrf definition` and `default vrf definition` commands disable a non-default VRF.

The `exit` command returns the switch to global configuration mode.

**Command Mode**

Global Configuration

**Command Syntax**

- `vrf definition [RIP_INSTANCE]`
- `no vrf definition [RIP_INSTANCE]`
- `default vrf definition [RIP_INSTANCE]`

**Parameters**

- **RIP_INSTANCE** configure the definition of a RIP VRF instance in the non-default VRF:

**Examples**

- This command configures a non-default VRF and enables unicast routing in it.
  ```
  switch(config)#vrf definition test
  switch(config-vrf-test)#rd 1:1
  switch(config-vrf-test)#exit
  switch(config)#ip routing vrf test
  switch(config)#
  ```

- This command disables a non-default VRF.
  ```
  switch(config)#no vrf definition test
  switch(config)#
  ```
vrf forwarding

The *vrf forwarding* command configures a non-default VRF, enables routing in it, and configures the network command under the configuration router RIP for the prefix to which the interface belongs. By default, all interfaces belong to the default VRF until VRF forwarding is executed.

The *exit* command returns the switch to global configuration mode.

**Command Mode**

- Global Configuration

**Command Syntax**

```
vrf forwarding [RIP_INSTANCE]
```

**Parameters**

- `RIP_INSTANCE` configure forwarding of a RIP VRF instance in the non-default VRF.

**Example**

- This command configures an interface as part of a non-default VRF, by configuring the network command under the configuration router RIP for the prefix to which the interface belongs.

```
switch(config)#interface Ethernet 3 / 1
switch(config-if-Et3/1)#no switchport
switch(config-if-Et3/1)#ip address 1.0.0.1/24
switch(config-if-Et3/1)#vrf forwarding test
switch(config-if-Et3/1)#network 1.0.0.1
switch(config-if-Et3/1)#exit
switch(config)#
```
IS-IS

Intermediate System-to-Intermediate System (IS-IS) intra-domain routing information exchange protocol is designed by the International Organization for Standardization to support connectionless networking. This protocol is a dynamic routing protocol.

This chapter contains the following sections.

• Section 31.1: IS-IS Introduction
• Section 31.2: IS-IS
• Section 31.3: IS-IS Command Descriptions

31.1 IS-IS Introduction

IS-IS is a link state protocol, which uses the shortest path first (SPF) algorithm. IS-IS and the OSPF protocol are similar in many aspects. As an interior gateway protocol (IGP), IS-IS runs inside an AS. To enable IS-IS, you must instantiate an IS-IS routing instance and assign it to an interface.

31.2 IS-IS

These sections describe IS-IS configuration tasks:

• Section 31.2.1: Enabling IS-IS
• Section 31.2.2: IS-IS Optional Global Parameters
• Section 31.2.3: IS-IS Interface Optional Parameters
• Section 31.2.4: Disabling IS-IS
• Section 31.2.5: Verifying IS-IS
31.2.1 Enabling IS-IS

For the normal operation of the IS-IS protocol, the \texttt{router isis} command must be used to enable the IS-IS instance. Then the \texttt{net} command is used to set a Network Entity Title (NET) for the device. Next you must configure at least one \texttt{address-family}. Lastly, the \texttt{isis enable} command is used to enable IS-IS on the desired interface. The IS-IS protocol is enabled upon the completion of these configurations.

To enable IS-IS, the following tasks must be performed in the global configuration mode.

- Section 31.2.1.1: Enable IS-IS Globally and Specify an IS-IS Instance
- Section 31.2.1.2: Configure the Network Entity Title (NET)
- Section 31.2.1.4: Enable IS-IS on a Specified Interface
- Section 31.2.1.3: Set the Address Family Configuration

31.2.1.1 Enable IS-IS Globally and Specify an IS-IS Instance

The switch supports only one IS-IS routing instance. The routing instance uniquely identifies the switch to other devices. IS-IS configuration commands apply globally to the IS-IS instance.

The switch must be in router IS-IS configuration mode to run IS-IS configuration commands. The \texttt{router isis} command places the switch in router IS-IS configuration mode.

Example

- These commands place the switch in router IS-IS configuration mode. It also creates an IS-IS routing instance named Osiris.

  \begin{verbatim}
  switch(config)#router isis Osiris
  switch(config-router-isis)#
  \end{verbatim}

31.2.1.2 Configure the Network Entity Title (NET)

After creating an IS-IS routing instance, you should also configure the Network Entity Title (NET) with the \texttt{net} command. The NET defines the current IS-IS area address and the system ID of the device.

Example

- These commands define the current IS-IS area address and the system ID of the device.

  \begin{verbatim}
  switch(config)#router isis Osiris
  switch(config-router-isis)# net 49.0001.1010.1040.1030.00
  \end{verbatim}

31.2.1.3 Set the Address Family Configuration

The \texttt{address-family} command allows you to enable the address families that IS-IS will route and also enter a configuration sub-mode to configure settings that are distinct to that address family. Currently Arista does not support per address family options. The address families supported are IPv4 unicast and IPv6 unicast.

Example

- These commands enable and enter the address family mode for IPv4 unicast.

  \begin{verbatim}
  switch(config)#router isis Osiris
  switch(config-router-isis)#address-family ipv4 unicast
  switch(config-router-isis-af)#
  \end{verbatim}
31.2.1.4 Enable IS-IS on a Specified Interface

After enabling IS-IS, you need to specify on which interface IS-IS will be run with the `isis enable` command.

**Example**

- These commands enable IS-IS on the specified interface Ethernet 4.

  ```
  switch(config-router-isis)#interface ethernet 4
  switch(config-if-Eth4)#isis enable 4
  ```

31.2.2 IS-IS Optional Global Parameters

After globally enabling IS-IS, the following global parameters can be configured.

- **Section 31.2.2.1: Set the Router Type**
- **Section 31.2.2.2: Configure IS-IS to Redistribute Routes of Other Protocols**
- **Section 31.2.2.3: Set the Overload Bit**
- **Section 31.2.2.4: Configure IS-IS full MD5**
- **Section 31.2.2.6: Enable Logging for Peer Changes**
- **Section 31.2.2.7: Set the IS-IS hostname**

31.2.2.1 Set the Router Type

The `is-type` command sets the routing level for an IS-IS instance.

**Example**

- These commands specify level-2 for the IS-IS instance.

  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#is-type level-2
  ```

31.2.2.2 Configure IS-IS to Redistribute Routes of Other Protocols

To redistribute static and/or connected routes into IS-IS, use the `redistribute (IS-IS)` command.

**Example**

- These commands redistribute connected routes into the IS-IS domain.

  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#redistribute connected
  ```

31.2.2.3 Set the Overload Bit

The `set-overload-bit` command used without the on-startup option, informs other devices not to use the local router to forward transit traffic. When used with the on-startup option, the overload bit is set for the interval specified after startup.

In scenarios when Border Gateway Protocol (BGP) routes are resolved using Interior Gateway Protocol (IGP), if the transit router reboots and becomes available again, IGP will consider the transit router for an optimal path again. After rebooting, it will black hole traffic until the transit router learns the external destination reachability information via BGP.
Examples

- These commands configure the switch and sets the overload bit to 120 seconds after startup.
  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#set-overload-bit on-startup 120
  switch(config-router-isis)#
  ```

- These commands configure the overload bit until BGP converges. If BGP fails to converge within the set timeout default period, then the overload bit gets cleared.
  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#set-overload-bit on-startup wait-for-bgp
  switch(config-router-isis)#set-overload-bit on-startup wait-for-bgp timeout 750
  switch(config-router-isis)#
  ```

31.2.2.4 Configure IS-IS full MD5

To configure authentication for the IS-IS instance causing LSPs, CSNPs and PSNPs to be authenticated, use the `authentication mode` and `authentication key` commands. To configure authentication on the interface, causing IS-IS Hellos to be authenticated, use the `isis authentication mode` and `isis authentication key` commands.

Two forms of authentication are supported by the IS-IS routing protocol: Clear text authentication and MD5 authentication. The difference between the two forms of authentication is in the level of security provided. In the case of clear text authentication, the password is specified as text in the authentication TLV, making it possible for an attacker to break authentication by sniffing and capturing IS-IS PDUs on the network.

HMAC MD5 authentication provides much stronger authentication by computing the message digest (on the IS-IS PDU contents) using the secret key to produce a hashed message authentication code (HMAC). Different modes of authentication can be specified on the interface, which authenticates IIH PDUs (IS-IS hello PDUs), and globally in the router IS-IS mode, in which the LSPs, CSNPs and PSNPs are authenticated. Area wide and domain wide authentication can be specified for L1 and L2 routers respectively.

Example

- These commands configure authentication for the IS-IS instance causing LSPs, CSNPs and PSNPs to be authenticated.
  ```
  switch(config)#router isis 1
  switch(config-router-isis)#authentication mode md5
  switch(config-router-isis)#authentication key secret
  switch(config-router-isis)#
  ```

- These commands configure authentication on the interface causing IS-IS Hellos to be authenticated.
  ```
  switch(config)#interface Ethernet 3/6
  switch(config-if-Et3/6)#isis authentication mode text
  switch(config-if-Et3/6)#isis authentication key 7 cAm28+9a/xPi04o7hjd8Jw==
  switch(config-if-Et3/6)#
  ```

31.2.2.5 Set the SPF Interval

The `spf-interval` command configures the shortest path first (SPF) timer. IS-IS runs SPF calculations following a change in the network topology or the link state database. The SPF timer defines the minimum interval between two successive IS-IS SPF calculations.
31.2.2.6 Enable Logging for Peer Changes

The **log-adjacency-changes (IS-IS)** command configures the switch to send syslog messages when it detects IS-IS neighbor adjacency state changes.

**Example**

- These commands configure the switch to send a syslog message when a neighbor goes up or down.

```
switch(config)#router isis Osiris
switch(config-router-isis)#log-adjacency-changes
```

31.2.2.7 Set the IS-IS hostname

The **is-hostname** command configures the use of a human readable string to represent the symbolic name of an IS-IS router, and map the IS-IS system IDs and IS-IS hostnames. It also changes the output of IS-IS show commands, to show the IS-IS hostname in place of system IDs if the corresponding IS-IS hostname is known. However, syslogs still use IS-IS system IDs and not the IS-IS hostname.

By default if there’s a hostname configured on the switch, it is used as the IS-IS hostname. It is also possible to unconfigure an assigned hostname for IS-IS using the **no is-hostname** command. When the IS-IS hostname is removed, the switch goes back to using the switch’s hostname as the IS-IS hostname.

**Examples**

- These commands configure the IS-IS hostname to the symbolic name foobar for the IS-IS router.

```
switch(config)#router isis inst1
switch(config-router-isis)#is-hostname ishost1
```

- These commands unconfigure the IS-IS hostname of the symbolic name foobar for the IS-IS router.

```
switch(config)#router isis inst1
switch(config-router-isis)#no is-hostname ishost1
```

31.2.2.8 Configuring IS-IS Multi-Topology

The **multi-topology** command configures IS-IS Multi-Topology (MT) support (disabled by default), enabling an IS-IS router to compute a separate topology for IPv4 and IPv6 links in the network. With MT configured, not all the links in a network need to support both IPv4 and IPv6. Some can support IPv4 or IPv6 individually. The IPv4 SPF will install IPv4 routes using the IPv4 topology, and similarly the IPv6 SPF will install IPv6 routes using the IPv6 topology. Without MT support, all links in an IS-IS network need to support the same set of address families.

When MT is enabled, and each link has a separate IPv4 metric and IPv6 metric.

The **isis ipv6 metric** command configures the IPv6 metric.
The **isis network** command configures the IPv4 or IPv6 address family individually on an interface with both IPv4 and IPv6 addresses.

The address families that are enabled on an interface are based on the global address families enabled in router IS-IS configuration mode, and the addresses configured on the interface. To enable a particular address family on an interface, it needs to have an address configured in that address family. In the case where both IPv4 and IPv6 address families are enabled in router IS-IS configuration mode, then if an interface has IPv4 and IPv6 addresses, both IPv4 and IPv6 address families are enabled on that interface. In the case of an interface with only an IPv4 address family, the IPv4 address family is enabled on that interface. Where an interface only has an IPv6 address family, the IPv6 address family is enabled on that interface. Finally, where only the IPv6 address family is enabled in router IS-IS config mode and MT is enabled, then the IPv6 address family is enabled on all interfaces which have an IPv6 address configured.

**Examples**

- These commands configure MT for the IS-IS router.

  ```
  switch(config)#router isis 1
  switch(config-router-isis)#address-family ipv6 unicast
  switch(config-router-isis-af)#multi-topology
  ```

- These commands unconfigure MT for the IS-IS router.

  ```
  switch(config)#router isis 1
  switch(config-router-isis)#address-family ipv6 unicast
  switch(config-router-isis-af)#no multi-topology
  ```

- These commands configure the IPv6 metric.

  ```
  switch(config)#interface Ethernet 5/6
  switch(config-if-Et5/6)#isis ipv6 metric 30
  ```

- These commands configure the IPv4 address family on an interface with both IPv4 and IPv6 addresses.

  ```
  switch(config)#interface Ethernet1
  switch(config-if-Et1)#isis multi-topology address-family ipv4 unicast
  ```

- These commands configure the IPv6 address family on an interface with both IPv4 and IPv6 addresses.

  ```
  switch(config)#interface Ethernet1
  switch(config-if-Et1)#isis multi-topology address-family ipv6 unicast
  ```

- These commands configure both the IPv4 and IPv6 address families on an interface.

  ```
  switch(config)#interface Ethernet1
  switch(config-if-Et1)#no isis multi-topology address-family unicast
  ```

**31.2.3 IS-IS Interface Optional Parameters**

After globally enabling IS-IS, the following parameters can be configured on individual interfaces.

- **Section 31.2.3.1: Set the Hello Packet Interval**
- **Section 31.2.3.2: Configure the Hello Multiplier for the Interface**
- **Section 31.2.3.3: Configure the IS-IS Metric**
- **Section 31.2.3.4: Set the LSP Interval**
31.2.3.1 Set the Hello Packet Interval

The `isis hello-interval` command periodically sends hello packets to maintain adjacency through the transmitting/receiving of the hello packets. The hello packet interval can be modified.

**Example**

- These commands configure a hello interval of 60 seconds for Ethernet 4.

```
switch(config)#interface ethernet 4
switch(config-if-Et4)#isis hello-interval 60
```

31.2.3.2 Configure the Hello Multiplier for the Interface

The switch maintains the adjacency by sending/receiving hello packets. When receiving no hello packets from the peer within a time interval, the local switch considers the neighbors invalid.

The `isis hello-multiplier` command calculates the hold time announced in hello packets by multiplying this number with the configured `isis hello-interval`.

**Example**

- These commands configure a hello multiplier of 45 for Ethernet 4.

```
switch(config)#interface ethernet 4
switch(config-if-Et4)#isis hello-interval 60
switch(config-if-Et4)#isis hello-multiplier 45
```

31.2.3.3 Configure the IS-IS Metric

The `isis metric` command sets cost for sending information over a specific interface. At present only wide metrics are supported.

**Example**

- These commands configure a metric cost of 30 for sending information over Ethernet 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#isis metric 30
```

31.2.3.4 Set the LSP Interval

The `isis lsp-interval` command configures the minimum interval between successive LSP transmissions on an interface.

**Example**

- This command sets the LSP interval on interface Ethernet 5 to 600 milliseconds.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#isis lsp-interval 600
```
31.2.3.5 Set the IS-IS Priority

The `isis priority` command determines which device will be the Designated Intermediate System (DIS). The device with the highest priority will become the DIS.

**Example**
- These commands configure a device priority of 60 on interface Ethernet 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#isis priority 60
switch(config-if-Et5)#
```

31.2.3.6 Configure an Interface as Passive

The `isis passive` and `passive-interface (IS-IS)` commands configure IS-IS interfaces as passive to interfaces where adjacencies are wanted. The interface does not send or receive IS-IS packets on an interface configured as passive.

**Examples**
- These commands configure Ethernet interface 10 as a passive interface. The switch neither sends IS-IS packets received on passive interfaces.

```
switch(config)#interface ethernet 10
switch(config-if-Et10)#isis passive
switch(config-if-Et10)#
```

- These commands configure Ethernet interface 10 as a passive interface in the router IS-IS mode.

```
switch(config)#router isis Osiris
switch(config-router-isis)#passive-interface interface ethernet 10
switch(config-router-isis)#
```

31.2.3.7 Configure BFD support for IS-IS for IPv4

The `bfd all-interfaces` and `isis bfd` commands configure Bidirectional Forwarding Detection (BFD), a low overhead protocol designed to provide rapid detection of failures at any protocol layer in the path between adjacent forwarding engines over any media. BFD is supported for IS-IS IPv4 routes.

**Examples**
- These commands enable BFD for all the interfaces on which IS-IS is enabled. By default BFD is disabled on all the interfaces.

```
switch(config)#router isis 1
switch(config-router-isis)#address-family ipv4
switch(config-router-af)#bfd all-interfaces
switch(config-router-af)#
```

- These commands enable BFD on IS-IS interfaces.

```
switch(config)#interface Ethernet 5/6
switch(config-if-Et5/6)#isis bfd
switch(config-if-Et5/6)#
```

31.2.4 Disabling IS-IS

An IS-IS instance can be shut down globally, or the IS-IS protocol can be disabled on individual interfaces.

The `shutdown (IS-IS)` command shuts down an IS-IS instance globally.
Example

- These commands disable IS-IS globally without modifying the IS-IS configuration.
  
  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#shutdown
  switch(config-router-isis)#
  ```

  The **no isis enable** command disables IS-IS on an interface.

Example

- These commands disable IS-IS on interface Ethernet 4.
  
  ```
  switch(config-router-isis)#interface ethernet 4
  switch(config-if-Eth4)#no isis enable
  ```

31.2.5 Verifying IS-IS

The following tasks verify the IS-IS peer and connection configuration:

- [Section 31.2.5.1: Verify the Link State Database](#)
- [Section 31.2.5.2: Verify the Interface Information for the IS-IS Instance](#)
- [Section 31.2.5.3: Verify the IS-IS Neighbor Information](#)
- [Section 31.2.5.4: Verify IS-IS Instance Information](#)

31.2.5.1 Verify the Link State Database

To display the link state database of IS-IS, use the **show isis database** command.

Example

- This command displays the IS-IS link state database.
  
  ```
  switch>show isis database
  ```

  **ISIS Instance: Osiris**

  **ISIS Level 2 Link State Database**

  switch>

31.2.5.2 Verify the Interface Information for the IS-IS Instance

To display interface information related to the IS-IS instance, use the **show isis interface** command.
Example

- This command displays IS-IS interface information.

```bash
switch>show isis interface

ISIS Instance: Osiris
Interface Vlan20:
  Index: 59 SNPA: 0:1c:73:c:5:7f
  MTU: 1497 Type: broadcast
  Level 2:
    Metric: 10, Number of adjacencies: 2
    LAN-ID: 1212.1212.1212, Priority: 64
    DIS: 1212.1212.1212, DIS Priority: 64
Interface Ethernet30:
  Index: 36 SNPA: 0:1c:73:c:5:7f
  MTU: 1497 Type: broadcast
  Level 2:
    Metric: 10, Number of adjacencies: 1
    LAN-ID: 3030.3030.3030, Priority: 64
    DIS: 3030.3030.3030, DIS Priority: 64
```

31.2.5.3 Verify the IS-IS Neighbor Information

To display general information for IS-IS neighbors that the device sees, use `show isis neighbors`.

Example

- This command displays information for IS-IS neighbors that the device sees.

```bash
switch>show isis neighbor

Inst Id   System Id            Type Interface       SNPA              State Hold time
10        2222.2222.2222       L2   Vlan20          2:1:0:c:0:0       UP    30
10        1212.1212.1212       L2   Vlan20          2:1:0:d:0:0       UP    9
10        3030.3030.3030       L2   Ethernet30      2:1:0:b:0:0       UP    9
```

31.2.5.4 Verify IS-IS Instance Information

To display the system ID, Type, Interface, IP address, State and Hold information for IS-IS instances, use the `show isis summary` command.

Example

- This command displays general information about IS-IS instances.

```bash
switch>show isis summary

ISIS Instance: Osiris
  System ID: 1010.1040.1030, administratively enabled, attached
  Internal Preference: Level 1: 115, Level 2: 115
  External Preference: Level 1: 115, Level 2: 115
  IS-Type: Level 2, Number active interfaces: 1
  Routes IPv4 only
  Last Level 2 SPF run 2:32 minutes ago
  Area Addresses:
    10.0001
    level 2: number dis interfaces: 1, LSDB size: 1
```

switch>
31.3 IS-IS Command Descriptions

Global Configuration Commands

- `router isis`

Interface Configuration Commands

- `authentication mode`
- `authentication key`
- `isis authentication mode`
- `isis authentication key`
- `isis enable`
- `isis bfd`
- `isis hello-interval`
- `isis hello-multiplier`
- `isis ipv6 metric`
- `isis lsp-interval`
- `isis metric`
- `isis multi-topology`
- `isis network`
- `isis passive`
- `isis priority`

Router IS-IS Configuration Mode (Includes Address-Family Mode)

- `address-family`
- `is-hostname`
- `bfd all/interfaces`
- `is-type`
- `log-adjacency-changes (IS-IS)`
- `multi-topology`
- `net`
- `passive-interface (IS-IS)`
- `redistribute (IS-IS)`
- `set-overload-bit`
- `shutdown (IS-IS)`
- `spf-interval`

- `show isis database`
- `show isis hostname`
- `show isis interface`
- `show isis neighbors`
- `show isis summary`
- `show isis topology`
address-family

The **address-family** command places the switch in address-family configuration mode.

Address-family configuration mode is not a group change mode; **running-config** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

The switch supports these address families:

- ipv4-unicast
- ipv6-unicast

The **no address-family** and **default address-family** commands delete the specified address-family from **running-config** by removing all commands previously configured in the corresponding address-family mode.

The **exit** command returns the switch to router IS-IS configuration mode.

**Command Mode**

Router-IS-IS Configuration

**Command Syntax**

```
isis ADDRESS_FAMILY [TRANSMISSION]
no isis ADDRESS_FAMILY
default isis ADDRESS_FAMILY
```

**Parameters**

- **ADDRESS_FAMILY**  Options include:
  - **ipv4**  IPv4 unicast
  - **ipv6**  IPv6 unicast
- **MODE**  Options include:
  - <no parameter>  Defaults to unicast.
  - **unicast**  All IPv4 or IPv6 addresses are active.

**Example**

- These commands enter the address family mode for IPv4 unicast.

  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#address-family ipv4 unicast
  switch(config-router-isis-af)#
  ```

- To exit from the IPv4 IS-IS unicast address family configuration mode, enter the following command.

  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#address-family ipv4 unicast
  switch(config-router-isis-af)#exit
  switch(config-router-isis)#
  ```
**bfd all-interfaces**

The `bfd all-interfaces` command places the switch in address-family configuration mode.

The `bfd all-interfaces` and `isis bfd` commands configure Bidirectional Forwarding Detection (BFD), a low overhead protocol designed to provide rapid detection of failures at any protocol layer in the path between adjacent forwarding engines over any media. BFD is supported for IS-IS IPv4 routes.

**Command Mode**
- Router-Address-Family Configuration

**Command Syntax**
- `bfd all-interfaces`

**Example**
- These commands enable BFD for all the interfaces on which IS-IS is enabled. By default BFD is disabled on all the interfaces.
  switch(config)#router isis 1
  switch(config-router-isis)#address-family ipv4
  switch(config-router-af)#bfd all-interfaces
  switch(config-router-af)#
**authentication mode**

The **authentication mode** command configures authentication for the IS-IS instance causing LSPs, CSNPs and PSNPs to be authenticated.

The **no authentication mode** and **default authentication mode** commands disables authentication for the IS-IS instance.

**Command Mode**

ISIS-Router Configuration

**Command Syntax**

```
authentication mode <md5 | text> [LAYER_VALUE]
no authentication mode <md5 | text> [LAYER_VALUE]
default authentication mode <md5 | text> [LAYER_VALUE]
```

**Parameters**

- **LAYER.VALUE** layer value; options include:
  - level-1
  - level-2

**Examples**

- These commands configure authentication for the IS-IS instance causing LSPs, CSNPs and PSNPs to be authenticated.

```
switch(config)#router isis 1
switch(config-router-isis)#authentication mode md5
switch(config-router-isis)#
```
authentication key

The **authentication key** command configures the authentication key for the IS-IS instance causing LSPs, CSNPs and PSNPs to be authenticated.

The **no authentication key** and **default authentication key** commands disables the authentication key for the IS-IS instance.

**Command Mode**
ISIS-Router Configuration

**Command Syntax**

```
authentication key [0 | 7] [LAYER_VALUE]
no authentication key [0 | 7] [LAYER_VALUE]
default authentication key [0 | 7] [LAYER_VALUE]
```

**Parameters**

- **LAYER_VALUE** layer value; options include:
  - level-1
  - level-2

**Examples**

- These commands configure authentication for the IS-IS instance causing LSPs, CSNPs and PSNPs to be authenticated.
  
  ```
  switch(config)#router isis 1
  switch(config-router-isis)#authentication key secret
  switch(config-router-isis)#
  ```
isis authentication mode

The **isis authentication mode** command configures authentication on the interface causing IS-IS Hellos to be authenticated.

The **no isis authentication mode** and **default isis authentication mode** commands disables authentication for the IS-IS instance.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

```
isis authentication mode <md5 | text> [LAYER_VALUE]
no isis authentication mode <md5 | text> [LAYER_VALUE]
default isis authentication mode <md5 | text> [LAYER_VALUE]
```

**Parameters**

- **LAYER_VALUE**  layer value; options include:
  - level-1
  - level-2

**Examples**

- These commands configure authentication on the interface causing IS-IS Hellos to be authenticated.

  ```
  switch(config)#interface Ethernet 3/6
  switch(config-if-Et3/6)#isis authentication mode text
  switch(config-if-Et3/6)#isis authentication key 7 cAm28+9a/xPi04o7hjd8Jw==
  switch(config-if-Et3/6)#
  ```
**isis authentication key**

The **isis authentication key** command configures the authentication key on the interface causing IS-IS Hellos to be authenticated.

The **no isis authentication mode** and **default isis authentication mode** commands disables the authentication key for the IS-IS instance.

**Command Mode**
- Interface-Ethernet Configuration

**Command Syntax**

```plaintext
isis authentication key [0 | 7] [LAYER_VALUE]
no isis authentication key [0 | 7] [LAYER_VALUE]
default isis authentication key [0 | 7] [LAYER_VALUE]
```

**Parameters**
- **LAYER_VALUE** layer value; options include:
  - level-1
  - level-2

**Examples**
- These commands configure authentication on the interface causing IS-IS Hellos to be authenticated.

```
switch(config)#interface Ethernet 3/6
switch(config-if-Et3/6)#isis authentication mode text
switch(config-if-Et3/6)#isis authentication key 7 cAm28+9a/xPi04o7hjd8Jw==
switch(config-if-Et3/6)#
```
**isis enable**

The `isis enable` command activates the corresponding IS-IS routing instance on the configuration mode interface. By default, the IS-IS routing instance is not enabled on an interface.

The `no isis enable` and `default isis enable` commands disable IS-IS on the configuration mode interface by removing the corresponding `isis enable` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```plaintext
isis enable instance_id
no isis enable
default isis enable
```

**Parameters**

- `instance_id` IS-IS instance name.

**Examples**

- These commands enable the IS-IS protocol on the interface Ethernet 4.
  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)# net 49.0001.1010.1040.1030.00
  switch(config-router-isis)#interface ethernet 4
  switch(config-if-Eth4)#isis enable Osiris
  ```

- These commands disable the IS-IS protocol on the interface Ethernet 4.
  ```
  switch(config)#interface ethernet 4
  switch(config-if-Eth4)# no isis enable
  ```
isis bfd

The isis bfd command activates the corresponding IS-IS routing instance on the configuration mode interface. By default, the IS-IS routing instance is not enabled on an interface.

The no isis enable and default isis enable commands disable IS-IS on the configuration mode interface by removing the corresponding isis enable command from running-config.

Command Mode

Interface-Ethernet Configuration

Command Syntax

isis bfd
no isis bfd
default isis bfd

Examples

- These commands enable BFD on IS-IS interfaces.
  switch(config)#interface Ethernet 5/6
  switch(config-if-Et5/6)#isis bfd
  switch(config-if-Et5/6)#
**isis hello-interval**

The **isis hello-interval** command sends Hello packets from applicable interfaces to maintain the adjacency through the transmitting and receiving of Hello packets. The Hello packet interval can be modified.

The no **isis hello-interval** and default **isis hello-interval** commands restore the default hello interval of 10 seconds on the configuration mode interface by removing the **isis hello-interval** command from **running-config**.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
```
isis hello-interval time
no isis hello-interval
default isis hello-interval
```

**Parameters**
- **time**  Values range from 1 to 300; default is 10.

**Examples**
- These commands configure a hello interval of 45 seconds for VLAN 200.
  ```
  switch(config)#interface vlan 200
  switch(config-if-Vl200)#isis hello-interval 45
  switch(config-if-Vl200)#
  ```
- These commands remove the configured hello interval of 45 seconds from VLAN 200.
  ```
  switch(config)#interface vlan 200
  switch(config-if-Vl200)#no isis hello-interval
  switch(config-if-Vl200)#
  ```
- These commands configure a hello interval of 60 seconds for Ethernet 5.
  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#isis hello-interval 60
  switch(config-if-Et5)#
  ```
- These commands remove the configured hello interval of 60 seconds from Ethernet 5.
  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#no isis hello-interval
  switch(config-if-Et5)#
  ```
**isis hello-multiplier**

The **isis hello-multiplier** command specifies the number of IS-IS hello packets missed by a neighbor before the adjacency is considered down.

The **no isis hello-multiplier** and **default isis hello-multiplier** commands restore the default hello interval of 3 on the configuration mode interface by removing the **isis hello-multiplier** command from **running-config**.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
isis hello-multiplier factor
no isis hello-multiplier
default isis hello-multiplier
```

**Parameters**

- **factor**  Values range from 3 to 100; default is 3

**Examples**

- These commands configure a hello multiplier of 4 for VLAN 200.
  ```
  switch(config)#interface vlan 200
  switch(config-if-Vl200)#isis hello-multiplier 4
  switch(config-if-Vl200)#
  ```

- These commands remove the configured hello multiplier of 4 from VLAN 200.
  ```
  switch(config)#interface vlan 200
  switch(config-if-Vl200)# no isis hello-multiplier
  switch(config-if-Vl200)#
  ```

- These commands configure a hello multiplier of 45 for Ethernet 5.
  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#isis hello-multiplier 45
  switch(config-if-Et5)#
  ```

- These commands remove the configured hello multiplier of 45 from Ethernet 5.
  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#no isis hello-multiplier
  switch(config-if-Et5)#
  ```
**isis ipv6 metric**

The `isis ipv6 metric` command configures the IPv6 metric.

The no `isis ipv6 metric` and default `isis ipv6 metric` commands restore the default metric of 10 on the configuration mode interface.

**Command Mode**
- Interface-Ethernet Configuration

**Command Syntax**
```
isis ipv6 metric metric_value
no isis ipv6 metric
default isis ipv6 metric
```

**Parameters**
- `metric_value` Values range from 1 to 16777214; default is 10.

**Examples**
- These commands configure the IPv6 metric.
  ```
  switch(config)#interface Ethernet 5/6
  switch(config-if-Et5/6)#isis ipv6 metric 30
  switch(config-if-Et5/6)#
  ```
**isis lsp-interval**

The `isis lsp-interval` command sets the interval at which IS-IS sends link-state information on the interface.

The `no isis lsp-interval` and `default isis lsp-interval` commands restores the default setting of 33 ms. by removing the `isis lsp-interval` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```plaintext
isis lsp-interval period
no isis lsp-interval
default isis lsp-interval
```

**Parameters**

- `period` Value ranges from 1 through 3000. Default interval is 33 ms.

**Examples**

- This command sets the LSP interval on interface Ethernet 5 to 600 milliseconds.
  ```plaintext
  switch(config)#interface ethernet 5
  switch(config-if-Et5)# isis lsp-interval 600
  switch(config-if-Et5)#
  ```

- This command removes the LSP interval on interface Ethernet 5.
  ```plaintext
  switch(config)#interface ethernet 5
  switch(config-if-Et5)# no isis lsp-interval
  switch(config-if-Et5)#
  ```
isis metric

The isis metric command sets cost for sending information over an interface.

The no isis metric and default isis metric commands restores the default metric to its default value of 10 by removing the isis metric command from running-config.

Command Mode
   Interface-Ethernet Configuration
   Interface-Loopback Configuration
   Interface-Port-channel Configuration
   Interface-VLAN Configuration

Command Syntax
   isis metric metric_cost
   no isis metric
   default isis metric

Parameters
   • metric_cost   Values range from 1 to 1677214. Default value is 10.

Examples
   • These commands configure a metric cost of 30 for sending information over Ethernet 5.
     switch(config)#router isis Osiris
     switch(config-router-isis)#interface ethernet 5
     switch(config-if-Et5)#isis metric 30
     switch(config-if-Et5)#
   • These commands remove the configured metric cost of 30 from Ethernet 5.
     switch(config)#router isis Osiris
     switch(config-router-isis)#interface ethernet 5
     switch(config-if-Et5)#no isis metric
     switch(config-if-Et5)#
isis multi-topology

The `isis multi-topology` command configures the IPv4 or IPv6 address family individually on an interface with both IPv4 and IPv6 addresses.

The `no isis multi-topology` and `default isis multi-topology` commands restores the default interface to both IPv4 and IPv6 address families.

**Command Mode**
Interface-Ethernet Configuration

**Command Syntax**

- `isis multi-topology address-family ipv4 unicast`
- `no isis multi-topology address-family ipv4 unicast`
- `default isis multi-topology address-family ipv4 unicast`

**Examples**

- These commands configure the IPv4 address family on an interface with both IPv4 and IPv6 addresses.

  ```
  switch(config)#interface Ethernet 5/6
  switch(config-if-Et5/6)#isis multi-topology address-family ipv4 unicast
  switch(config-if-Et5/6)#
  ```

- These commands configure the IPv6 address family on an interface with both IPv4 and IPv6 addresses.

  ```
  switch(config)#interface Ethernet 5/6
  switch(config-if-Et5/6)#isis multi-topology address-family ipv6 unicast
  switch(config-if-Et5/6)#
  ```

- These commands configure both the IPv4 and IPv6 address families on an interface.

  ```
  switch(config)#interface Ethernet 5/6
  switch(config-if-Et5/6)#no isis multi-topology address-family unicast
  switch(config-if-Et5/6)#
  ```
isis network

The `ip isis network` command sets the configuration mode interface as a point-to-point link. By default, interfaces are configured as broadcast links.

The `no ip isis network` and `default ip isis network` commands set the configuration mode interface as a broadcast link by removing the corresponding `ip isis network` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `ip isis network point-to-point`
- `no ip isis network`
- `default ip isis network`

**Examples**
- These commands configure Ethernet interface 10 as a point-to-point link.
  ```
  switch(config)#interface ethernet 10
  switch(config-if-Et10)# isis network point-to-point
  switch(config-if-Et10)#
  ```
- This command restores Ethernet interface 10 as a broadcast link.
  ```
  switch(config-if-Et10)#no isis network
  switch(config-if-Et10)#
  ```
**isis passive**

The `isis passive` command disables IS-IS on an interface configured as passive. The switch won’t send or process IS-IS packets received on passive interfaces. The switch will continue to advertise the IP address in the LSP.

The `no passive` command enables IS-IS on the interface. The `default passive` command sets the interface to the default interface activity setting by removing the corresponding `passive` or `no passive` statement from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

- `isis passive`
- `no isis passive`
- `default isis passive`

**Examples**

- These commands configure Ethernet interface 10 as a passive interface.
  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#interface ethernet 10
  switch(config-if-Et10)# isis passive
  switch(config-if-Et10)#
  ```

- This command restores Ethernet interface 10 as a broadcast link.
  ```
  switch(config-if-Et10)#no isis passive
  switch(config-if-Et10)#
  ```
**isis priority**

The `isis priority` command sets IS-IS priority for the interface.

The default priority is 64. The network device with the highest priority will be elected as the designated intermediate router to send link-state advertisements for that network.

The `no isis priority` and `default isis priority` commands restore the default priority (64) on the configuration mode interface.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
isis priority priority_level
no isis priority
default isis priority
```

**Parameters**

- `priority_level` Value ranges from 0 to 127. Default value is 64.

**Examples**

- These commands configure a IS-IS priority of 60 on interface Ethernet 5.
  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#interface ethernet 5
  switch(config-if-Et5)#priority 60
  switch(config-if-Et5)#
  ```

- These commands restores the default IS-IS priority of 64 from interface Ethernet 5.
  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#interface ethernet 5
  switch(config-if-Et5)# no priority
  switch(config-if-Et5)#
  ```

- These commands configure the switch with a priority of 64 for VLAN 7.
  ```
  switch(config)#interface vlan 7
  switch(config-if-Vl7)#isis priority 64
  switch(config-if-Vl7)#
  ```

- These command restores the default IS-IS priority of 64 for VLAN 7.
  ```
  switch(config)#interface vlan 7
  switch(config-if-Vl7)#no isis priority
  switch(config-if-Vl7)#
  ```
is-hostname

The `is-hostname` command configures the use of a human readable string to represent the symbolic name of an IS-IS router, and maps the IS-IS system IDs and IS-IS hostnames. It also changes the output of IS-IS show commands, to show the IS-IS hostname in place of system IDs if the corresponding IS-IS hostname is known. However, syslogs still use IS-IS system IDs and not the IS-IS hostname.

By default if there’s a hostname configured on the switch, it is used as the IS-IS hostname. It is also possible to unconfigure an assigned hostname for IS-IS using the `no is-hostname` command. When the IS-IS hostname is removed, the switch goes back to using the switch’s hostname as the IS-IS hostname.

**Command Mode**

Router-IS-IS Configuration

**Command Syntax**

```
is-hostname
no is-hostname
```

**Example**

- These commands configure the IS-IS hostname to the symbolic name `ishost1` for the IS-IS router.
  
  ```
  switch(config)#router isis inst1
  switch(config-router-isis)#is-hostname ishost1
  switch(config-router-isis)#
  ```

- These commands unconfigure the IS-IS hostname of the symbolic name `ishost1` for the IS-IS router.
  
  ```
  switch(config)#router isis inst1
  switch(config-router-isis)#no is-hostname ishost1
  switch(config-router-isis)#
  ```
**is-type**

The `is-type` command configures the routing level for an IS-IS instance.

An IS-IS router can be configured as Level-1-2 which can form adjacencies and exchange routing information with both Level-1 and Level-2 routers. A Level-1-2 router can be configured to transfer routing information from Level-1 to Level-2 areas and vice versa (via route leaking). By default, all routes from Level-1 area are always leaked into Level-2 network.

**Command Mode**

Router-IS-IS Configuration

**Command Syntax**

```
is-type LAYER_VALUE
```

**Parameters**

- `LAYER_VALUE` layer value options include:
  - `level-1`
  - `level-1-2`
  - `level-2`

**Example**

- These commands configure Level 1-2 routing on interface Ethernet 5.

  switch(config)#router isis Osiris
  switch(config-router-isis)#is-type level-1-2
  switch(config-router-isis)#

- These commands configure Level 2 routing on interface Ethernet 5.

  switch(config)#router isis Osiris
  switch(config-router-isis)#is-type level-2
  switch(config-router-isis)#
log-adjacency-changes (IS-IS)

The `log-adjacency-changes` command sets the switch to send syslog messages when it detects link state changes or when it detects that a neighbor state has changed.

The default option is active when `running-config` does not contain any form of the command. Entering the command in any form replaces the previous command state in `running-config`.

**Command Mode**

Router-IS-IS Configuration

**Command Syntax**

- `log-adjacency-changes`
- `no log-adjacency-changes`
- `default log-adjacency-changes`

**Examples**

- These commands configure the switch to send a syslog message when a neighbor state changes.
  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#log-adjacency-changes
  switch(config-router-isis)#
  ```

- These commands configure not to log the peer changes.
  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#no log-adjacency-changes
  switch(config-router-isis)#
  ```
multi-topology

The multi-topology command configures IS-IS Multi-Topology (MT) support (disabled by default), enabling an IS-IS router to compute a separate topology for IPv4 and IPv6 links in the network. With MT configured, not all the links in a network need to support both IPv4 and IPv6. Some can support IPv4 or IPv6 individually. The IPv4 SPF will install IPv4 routes using the IPv4 topology, and similarly the IPv6 SPF will install IPv6 routes using the IPv6 topology. Without MT support, all links in an IS-IS network need to support the same set of address families. When MT is enabled, and each link has a separate IPv4 metric and IPv6 metric.

The no multi-topology and default multi-topology commands restores the default interface to both IPv4 and IPv6 address families.

Command Mode
Interface-Ethernet Configuration

Command Syntax
- multi-topology
- no multi-topology
- default multi-topology

Examples
- These commands configure MT for the IS-IS router.
  switch(config)#router isis 1
  switch(config-router-isis)#address-family ipv6 unicast
  switch(config-router-isis-af)#multi-topology
  switch(config-router-isis-af)#

- These commands unconfigure MT for the IS-IS router.
  switch(config)#router isis 1
  switch(config-router-isis)#address-family ipv6 unicast
  switch(config-router-isis-af)#no multi-topology
  switch(config-router-isis-af)#
The `net` command configures the name of Network Entity Title of the IS-IS instance. By default, no NET is defined.

The `no net` and `default net` commands removes the NET from `running-config`.

**Command Mode**
- **Router-IS-IS Configuration**

**Command Syntax**
- `net mask_hex`
- `no net`
- `default net`

**Parameters**
- `mask_hex` mask value. Format is hh.hhhh.hhhh.hhhh.hhhh.hhhh.hhhh.hhhh.hhhh.hhhh.00.

**Examples**
- These commands specify the NET as 49.0001.1010.1040.1030.00, in which the system ID is 1010.1040.1030, area ID is 49.0001.
  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)# net 49.0001.1010.1040.1030.00
  switch(config-router-isis)#
  ```
- These commands remove NET 49.0001.1010.1040.1030.00 from `running-config`.
  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)# no net 49.0001.1010.1040.1030.00
  switch(config-router-isis)#
  ```
passive-interface (IS-IS)

The **passive-interface** command disables IS-IS on a passive interface. The switch will continue to advertise the IP address in the LSP.

The **no passive** command enables IS-IS on the interface. The **default passive** command sets the interface to the default interface activity setting by removing the corresponding **passive** or **no passive** statement from **running-config**.

**Command Mode**

Router-IS-IS Configuration

**Command Syntax**

```
passive-interface INTERFACE_NAME
no passive-interface INTERFACE_NAME
default passive-interface INTERFACE_NAME
```

**Parameters**

- **INTERFACE_NAME**
  
  Options include:

  - **ethernet e_range** Ethernet interface list.
  - **loopback l_range** Loopback interface list.
  - **port-channel p_range** Channel group interface list.
  - **vlan v_range** VLAN interface list.

  Valid **e_range**, **l_range**, **p_range**, and **v_range** formats include number, range, or comma-delimited list of numbers and ranges.

**Examples**

- These commands configure Ethernet interface 10 as a passive interface.
  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)# passive-interface interface ethernet 10
  ```

- This command restores Ethernet interface 10 as an active interface.
  ```
  switch(config-if-Etl0)#no isis passive
  switch(config-if-Etl0)#
  ```
redistribute (IS-IS)

The redistribute command redistributes IS-IS connected or static routes. To disable the redistribution, use the no redistribute command.

The no redistribute and default redistribute commands disable route redistribution from the specified domain by removing the corresponding redistribute statement from running-config.

Command Mode
Router-IS-IS Configuration

Command Syntax
redistribute ROUTE_TYPE
no redistribute ROUTE_TYPE
default redistribute ROUTE_TYPE

Parameters
- ROUTE_TYPE Options include:
  - connected
  - static

Examples
- These commands redistribute connected routes into the IS-IS domain.
  switch(config)#router isis Osiris
  switch(config-router-isis)#redistribute connected
  switch(config-router-isis)#
- These commands redistribute static routes into the IS-IS domain.
  switch(config)#router isis Osiris
  switch(config-router-isis)#redistribute static
  switch(config-router-isis)#
- These commands remove the redistributed connected routes from running-config.
  switch(config)#router isis Osiris
  switch(config-router-isis)#no redistribute connected
  switch(config-router-isis)#
- These commands remove the redistributed static routes from running-config.
  switch(config)#router isis Osiris
  switch(config-router-isis)#no redistribute static
  switch(config-router-isis)#
**router isis**

The `router isis` command places the switch in router ISIS configuration mode.

Router ISIS configuration mode is not a group change mode; `running-config` is changed immediately after commands are executed. The `exit` command does not affect the configuration.

The `no router isis` command deletes the IS-IS instance.

The `exit` command returns the switch to global configuration mode.

**Command Mode**

Global Configuration

**Command Syntax**

```
router isis instance_name [VRF_INSTANCE]
no router isis instance_name
default router isis instance_name
```

**Parameters**

- `instance_name` routing instance.
- `VRF_INSTANCE`
  - <no parameter>
  - `vrf vrf_name`

**Examples**

- These commands places the switch in router IS-IS mode and creates an IS-IS routing instance named Osiris.
  
  switch(config)#router isis Osiris  
  switch(config-router-isis)#

- This command attempts to open an instance with a different routing instance name from that of the existing instance. The switch displays an error and stays in global configuration mode.

  switch(config)#router isis Osiris  
  % More than 1 ISIS instance is not supported  
  switch(config)#

- This command deletes the IS-IS instance.

  switch(config)#no router isis Osiris  
  switch(config)#
set-overload-bit

The `set-overload-bit` command used without the on-startup option will inform other devices not to use this switch in SPF computation. When used with the on-startup parameter, the overload bit is set for the interval after startup.

The `no set-overload-bit` and `default set-overload-bit` commands removes the corresponding `set-overload-bit` command from `running-config`.

**Command Mode**

Router-IS-IS Configuration

**Command Syntax**

```
set-overload-bit TIMING
no set-overload-bit
default set-overload-bit
```

**Parameters**

- **TIMING** Options include:
  - `<no parameter>`
  - `on-startup <1 to 3600>`

**Example**

- These commands configure the switch to sets the overload bit to 120 seconds after startup.
  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#set-overload-bit on-startup 120
  switch(config-router-isis)#
  ```

- These commands remove the configured overload bit of 120 seconds from the `running-config`.
  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#no set-overload-bit on-startup
  switch(config-router-isis)#
  ```
show isis database

The `show isis database` command displays the link state database of IS-IS. The default command displays active routes and learned routes.

**Command Mode**

EXEC

**Command Syntax**

```plaintext
show isis database [INSTANCES] [INFO_LEVEL]
show isis database [INFO_LEVEL] VRF_INSTANCE
```

**Parameters**

- **INSTANCES**  Options include:
  - <no parameter>
  - `instance_name`

- **INFO_LEVEL** Options include:
  - <no parameter>
  - `detail`

- **VRF_INSTANCE** specifies the VRF instance.
  - <no parameter>
  - `vrf vrf_name`

**Display Values**

- ISIS Instance
- LSPID
- Seq Num
- Cksum
- Life
- IS

**Examples**

- This command displays general information about the link state database of IS-IS.

```
switch>show isis database

ISIS Instance: Osiris
ISIS Level 2 Link State Database
LSPID        Seq Num  Cksum  Life  IS Flags
1212.1212.1212.00-00  4    714   1064  L2 <>

switch>
**show isis hostname**

The `show isis hostname` command displays mapping between the System ID and IS-IS hostname.

**Command Mode**

EXEC

**Command Syntax**

```plaintext
show isis hostname
```

**Examples**

- This command mapping between the System ID and IS-IS hostnames host1 and host2.

```
switch>show isis hostname
ISIS Instance: 1 VRF: default
Level  System ID Hostname
L1  1111.1111.1001 host1
L1  1111.1111.1002 host2
```
show isis interface

The show isis interface command displays interface information for the IS-IS instance.

Command Mode
EXEC

Command Syntax
show isis interface [INSTANCES] [INTERFACE_NAME] [INFO_LEVEL]
show isis interface [INTERFACE_NAME] [INFO_LEVEL] VRF_INSTANCE

Parameters
• INSTANCES Options include:
  • <no parameter>
  • instance_name
• INTERFACE_NAME Values include
  • <no parameter> all interfaces.
  • ethernet e_num Ethernet interface specified by e_num.
  • loopback l_num Loopback interface specified by l_num.
  • management m_num Management interface specified by m_num.
  • port-channel p_num Port channel interface specified by p_num.
  • vlan v_num VLAN interface specified by v_num.
  • vxlan vx_num VXLAN interface specified by vx_num.
• INFO_LEVEL Options include:
  • <no parameter>
  • detail
• VRF_INSTANCE specifies the VRF instance.
  • <no parameter>
  • vrf vrf_name

Display Values
• ISIS Instance
• System ID
• Index
• MTU
• Metric
• LAN-ID
• DIS
• Type
• Interface
• SNPA
• State
• Hold time
Examples

- This command displays general IS-IS information for instance Osiris.

Switch>show isis interface

switch(config)#
show isis summary

The **show isis summary** command displays information for IS-IS instances.

**Command Mode**

EXEC

**Command Syntax**

```
show isis [INSTANCES] summary
show isis summary VRF_INSTANCE
```

**Parameters**

- **INSTANCES** Options include:
  - <no parameter>
  - instance_name
  - VRF_INSTANCE specifies the VRF instance.
    - <no parameter>
    - vrf vrf_name

**Display Values**

- System ID
- Internal Preference
- External Preference
- IS-Type
- Area Addresses
- level 2

**Example**

- This command displays general information about IS-IS instances.

```
switch>show isis summary
ISIS Instance: Osiris
    System ID: 1010.1040.1030, administratively enabled, attached
    Internal Preference: Level 1: 115, Level 2: 115
    External Preference: Level 1: 115, Level 2: 115
    IS-Type: Level 2, Number active interfaces: 1
    Routes IPv4 only
    Last Level 2 SPF run 2:32 minutes ago
    Area Addresses:
        10.0001
    level 2: number dis interfaces: 1, LSDB size: 1
switch>
```
show isis topology

The `show isis topology` command displays a list of all connected devices in all areas.

**Command Mode**

EXEC

**Command Syntax**

```
show isis topology
show isis INSTANCES topology
show isis topology VRF_INSTANCE
```

**Parameters**

- `INSTANCES` Options include:
  - `<no parameter>`
  - `instance_name`
- `VRF_INSTANCE` specifies the VRF instance.
  - `<no parameter>`
  - `vrf vrf_name`

**Display Values**

- System Id
- Metric
- Next-Hop
- Interface
- SNPA

**Examples**

- This command displays forwarding state for ports mapped to all VLANs.
  
  switch>show isis topology
  
  ISIS Instance: Osiris VRF: default

<td>00e0.22b5.5843</td>
</tr>
</tbody>
</table>

  switch>
shutdown (IS-IS)

The **shutdown** command disables IS-IS on the switch without modifying the IS-IS configuration.

The **no shutdown** and **default shutdown** commands enable the IS-IS instance by removing the **shutdown** command from **running-config**.

**Command Mode**

Router-IS-IS Configuration

**Command Syntax**

```
shutdown
no shutdown
default shutdown
```

**Examples**

- These commands disable IS-IS on the switch.
  
  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#shutdown
  switch(config-router-isis)#
  ```

- This command enables IS-IS on the switch.
  
  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#no shutdown
  switch(config-router-isis)#
  ```
**spf-interval**

The `spf-interval` command sets the shortest path first (SPF) timer. The SPF timer defines the interval between IS-IS path calculations. The default is two seconds.

The `no spf-interval` and `default spf-interval` commands restore the default maximum IS-IS path calculation interval to two seconds by removing the `spf-interval` command from `running-config`.

**Command Mode**

Router-IS-IS Configuration

**Command Syntax**

```
spf-interval period
no spf-interval
default spf-interval
```

**Parameters**

- **period**  Value ranges from 1 through 300. Default interval is 2 seconds.

**Examples**

- These commands configures the SPF interval to 50 seconds.

  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#spf-interval 50
  switch(config-router-isis)#
  ```

- These commands remove the SPF interval.

  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#no spf-interval
  switch(config-router-isis)#
  ```
Multiprotocol Label Switching (MPLS)

Tunneling protocols encapsulate packets of a different protocol as the payload of a larger frame for delivery within networks utilizing the encapsulating protocol. Tunneling facilitates the delivery of payload over an incompatible delivery network and creates a secure path through an untrusted network. Protocols that this chapter describes include MPLS, Decap Groups, and Nexthop Groups.

Sections in this chapter include:

- Section 32.1: MPLS
- Section 32.2: Decap Groups
- Section 32.3: Nexthop Groups
- Section 32.4: MPLS Command Descriptions

32.1 MPLS

These sections describe the Arista MPLS implementation:

- Section 32.1.1: MPLS Description
- Section 32.1.2: MPLS Configuration

32.1.1 MPLS Description

32.1.1.1 MPLS Overview

Multiprotocol Label Switching (MPLS) is a networking process that replaces complete network addresses with short path labels for directing data packets to network nodes. The labels identify virtual links (paths) between distant nodes rather than endpoints. MPLS is scalable and protocol-independent. Data packets are assigned labels, which are used to determine packet forwarding destinations without examining the packet.

Arista switches utilize MPLS to improve efficiency and control from servers through data centers and to the WAN. The MPLS implementation supports static MPLS tunneling that is manually configured on each switch or established over a network by an SDN controller. The configuration is specified by a set of rules that filter packets based on matching criteria. Each rule applies MPLS-related actions to packets that match the rule's criteria. Each rule includes a metric that the switch uses to select an action when multiple rules match a packet.
32.1.2 MPLS Implementation

MPLS static rule parameters contain the following:

- A 20-bit value that is compared to the top header label of each MPLS packet. Other rule parameters may be applied to packets whose top label match this value.
- A nexthop location that specifies the packet’s next destination (IPv4 or IPv6) and the interface through which the switch forwards the packet.
- An MPLS label stack management action that is performed on filtered packets:
  - pop-payload: removes the top label from stack; this terminates an LSP (label-switched path).
  - swap-label: replaces top label with a specified new label; this passes a packet along an LSP.
- A rule metric that the switch uses to select a rule when multiple rules match an MPLS packet.

Packets that do not match any MPLS rules are dropped.

32.1.2 MPLS Configuration

MPLS routing is enabled through the `mpls ip` command.

- This command enables MPLS routing.

```
switch(config)#mpls ip
switch(config)#show running-config
```

**Example**

```
mpls ip
!
```

```
end
switch(config)#
```

MPLS rules are created by the `mpls static` command. MPLS static rules identify a set of MPLS packets by a common top label and defines the method of handling these packets.

**Examples**

- These commands create an MPLS rule that matches packets with a top label value of 3400 and causes the removal of the top label from the header stack. The nexthop destination of the IPv4 payload is IP address 10.14.4.4 through Ethernet interface 3/3/3. This rule has a metric value of 100.

```
switch(config)#mpls static top-label 3400 ethernet 3/3/3 10.14.4.4 pop payload-type ipv4
switch(config)#show running-config

!
```

```
mpls static top-label 3400 Ethernet3/3/3 10.14.4.4 pop payload-type ipv4
!
```

```
end
switch(config)#
```
• These commands create a backup rule that forwards the packet through Ethernet interface 4/3. This rule’s metric value of 150 assigns it backup status prior to the first rule.

```
switch(config)#mpls static top-label 3400 ethernet 4/3 10.14.4.4 pop payload-type ipv4 metric 150
switch(config)#show running-config

!  mpls static top-label 3400 Ethernet4/3 10.14.4.4 pop payload-type ipv4 metric 150
mpls static top-label 3400 Ethernet3/3/3 10.14.4.4 pop payload-type ipv4
!

end
switch(config)#
```

• These commands create an MPLS rule that forwards the packet to the nexthop address through any interface.

```
switch(config)#mpls static top-label 4400 10.15.46.45 pop payload-type ipv4
switch(config)#show running-config

!  mpls static top-label 3400 Ethernet4/3 10.14.4.4 pop payload-type ipv4 metric 150
mpls static top-label 3400 Ethernet3/3/3 10.14.4.4 pop payload-type ipv4
mpls static top-label 4400 10.15.46.45 pop payload-type ipv4
!

end
switch(config)#
```

The switch’s MPLS static rule configuration for specified routes and rules is displayed by `show mpls route`.

**Example**

• This command displays the MPLS rule configuration.

```
switch>show mpls config route
In-Label Out-Label Metric Payload  NextHop
3400    pop    100  ipv4    10.14.4.4,Et3/3/3
3400    pop    150  ipv4    10.14.4.4,Et4/3
switch>
```

Statistics about the configuration and implementation of MPLS rules are displayed by the `show mpls route summary` command.

**Example**

• This command displays a summary of MPLS rule implementation.

```
switch>show mpls route summary
Number of Labels: 1 (1 unprogrammed)
Number of adjacencies in hardware: 0
Number of backup adjacencies: 2
switch>
```
32.1.2.1 Egress IPv4/IPv6 over MPLS ACLs

IPv4/IPv6 over MPLS packets are now eligible for ACLs at the egress stage by default, applicable only to IPv4/IPv6 over MPLS packets that are MPLS label popped (i.e. if the label is at the bottom of stack). The user can override this behavior if required, thereby disabling egress ACLs for certain MPLS labels by configuration. No special configuration is required to enable egress ACLs on IPv4/IPv6 over MPLS packets.

Example

- This command disables egress ACLs for MPLS top-label 12000 on the egress interface 120.1.1.1 nexthop address.
  
  switch(config)#no mpls static top-label 12000 120.1.1.1 pop payload-type ipv6
  switch(config)#

- This command enables egress ACLs for MPLS top-label 12000 on the egress interface 120.1.1.1 nexthop address.
  
  switch(config)#mpls static top-label 12000 120.1.1.1 pop payload-type ipv6
  switch(config)#

32.2 Decap Groups

These sections describe the Decap groups:

- Section 32.2.1: Decap Groups Description
- Section 32.2.2: Decap Groups Configuration

32.2.1 Decap Groups Description

The decap group is a data structure that receives encapsulated packets and extracts the payload. The switch then processes or forwards the extracted payload as required. Although packets cannot be transmitted through decap groups, nexthop groups can be used to create a packet's reverse path. Decap groups support payload extraction of packets received from GRE and IP-in-IP tunnels.

Decap groups have these limitations:

- Tunnels are terminated using destination IP address; source IP address has no influence.
- Packets matching a decap group are processed through their ingress interface and VLAN
- Ingress ACL filter each decap group packet's outer header.
- Packet counters are not available.
- VRF is not supported.

Decap groups are defined by their tunnel type and decap IP address:

- **Tunnel type** specifies the tunnel protocol that the switch uses to extract payload.
- **Decap IP address** specifies the IP address where the switch receives decap group packets.

Decap groups support Generic Routing Encapsulation (GRE) tunnels.

Decap groups support Generic Routing Encapsulation (GRE) and IP-in-IP tunnels.

32.2.2 Decap Groups Configuration

Decap groups are configured in decap-group configuration mode. Decap-group configuration mode is not a group change mode; **running-config** is changed immediately upon entering commands. Exiting decap-group configuration mode does not affect **running-config**. The exit command returns the switch to global configuration mode.
Chapter 32: Multiprotocol Label Switching (MPLS)  Nexthop Groups

- The static CLI entry for the incoming label is specified by the `mpls static` command.
- The tunnel type is specified by the `tunnel type (Decap Group)` command.
- The Decap IP address is specified by the `tunnel decap-ip (Decap Group)` command.

Decap groups do not define a default destination address or tunnel type and is not functional until both parameters are configured. A decap group can contain only one `tunnel decap-ip` statement; a subsequent command replaces the previously configured statements.

**Example**

- This command defines a static CLI entry for the incoming-label.
  
  ```
  switch(config)# mpls static top-label 3400 ethernet 3/3/3 10.14.4.4 pop payload-type ipv4
  ```

- This command creates a decap group named DC-1 and configures the group to terminate packets from GRE tunnel packets with the destination IP address of 10.14.3.2
  
  ```
  switch(config)#ip decap-group DC-1
  switch(config-dg-DC-1)#tunnel type gre
  switch(config-dg-DC-1)#tunnel decap-ip 10.14.3.2
  ```

32.3  Nexthop Groups

32.3.1  Nexthop Group Description

Each routing table entry provides the next hop address to its specified destination. A nexthop address is the address of the next device on the path to the entry’s specified destination.

A nexthop group is a data structure that defines a list of nexthop addresses and a tunnel type for packets routed to the specified address. When an IP route statement specifies a nexthop group as the nexthop address, the switch configures a static route with a nexthop group member as the nexthop address and encapsulates packets forwarded to that address as required by the group’s tunnel type.

The nexthop group size is a configurable parameter that specifies the number of entries that the group contains. Group entries that are not explicitly configured are filled with drop routes. The switch uses ECMP hashing to select the address within the nexthop group when forwarding packets. When a packet’s hash selects a drop route, the packet is dropped.

Nexthop groups are supported on Trident platform switches and subject to the following restrictions:

- Each switch can support 512 IPv4 or IPv6 Tunnels
- Nexthop groups can contain 256 nexthops.
- The switch supports 1024 nexthop groups.
- Multiple routes can share a tunnel.
- Tunnels do not support IP multicast packets.

Nexthop groups support IP-in-IP tunnels. The entry IP address family within a particular nexthop group cannot be mixed, i.e. either they are all IPv4 or they are all IPv6 entries.
32.3.2 Nexthop Group Configuration

Nexthop groups are configured and modified in nexthop-group configuration mode. After a group is created, it is associated to a static route through an `ip route nexthop-group` statement.

These tasks are required to configure a nexthop group and apply it to a static route.

- Creating and Editing Nexthop Groups
- Configuring a Group’s Encapsulation Parameters
- Configuring the Group’s Size
- Creating Nexthop Group Entries
- Displaying Nexthop Groups
- Applying a Nexthop Group to a Static Route

Creating and Editing Nexthop Groups

Nexthop groups are created by a `nexthop-group` command that specifies a group that isn’t already configured. The switch enters nexthop-group configuration mode for the new group. Nexthop-group mode is also accessible for modifying existing groups. When in nexthop-group configuration mode, the `show active` command displays the group’s configuration.

Example

- This command creates a nexthop group named NH-1.

```
switch(config)#nexthop-group NH-1
switch(config-nexthop-group-NH-1)#
```

- These commands enter nexthop-group configuration mode for the group named NH3, then displays the previously configured group parameters.

```
switch(config)#nexthop-group NH3
switch(config-nexthop-group-NH3)#show active
nexthop-group NH3
  size 4
  ttl 10
  entry 0 tunnel-destination 10.14.21.3
  entry 1 tunnel-destination 10.14.21.5
  entry 2 tunnel-destination 10.14.22.5
  entry 3 tunnel-destination 10.14.22.6
switch(config-nexthop-group-NH3)#
```

Configuring a Group’s Encapsulation Parameters

Packets in static routes that are associated with the nexthop group are encapsulated to support the group’s tunnel type. Nexthop groups support IP-in-IP tunnels. The group also defines the source IP address and TTL field contents that are included in the packet encapsulation.

Example

- This command configures the TTL setting to 32 for nexthop group NH-1 encapsulation packets.

```
switch(config)#nexthop-group NH-1
switch(config-nexthop-group-NH-1)#ttl 32
switch(config-nexthop-group-NH-1)#show active
nexthop-group NH-1
  size 128
  ttl 32
switch(config-nexthop-group-NH-1)#
```
Chapter 32: Multiprotocol Label Switching (MPLS)

Nexthop Groups

The address is inserted in the encapsulation source IP fields is specified by **tunnel-source (Nexthop Group)**.

**Example**

- These commands create loopback interface 100, assign an IP address to the interface, then specifies that address as the tunnel source for packets designated by nexthop-group NH-1.

```
switch(config)#interface loopback 100
switch(config-if-Lo100)#ip address 10.1.1.1/32
switch(config-if-Lo100)#exit
switch(config)#nexthop-group NH-1
switch(config-nexthop-group-NH-1)#tunnel-source intf loopback 100
switch(config-nexthop-group-NH-1)#show active
nexthop-group NH-1
  size 256
  ttl 32
  tunnel-source intf Loopback100
```

**Configuring IP-in-IP Encapsulation**

Through IP-in-IP encapsulation, IP packets matching a static Nexthop-Group route are encapsulated within an IP-in-IP tunnel and forwarded.

**Example**

- This command configures a static Nexthop-Group route and an IP-in-IP Nexthop-Group for IP-in-IP encapsulation.

```
switch(config)#ip route 124.0.0.1/32 nexthop-group abc
switch(config)#nexthop-group abc type ip-in-ip
switch(config-nexthop-group-abc)#size 512
switch(config-nexthop-group-abc)#tunnel-source 1.1.1.1
switch(config-nexthop-group-abc)#entry 0 tunnel-destination 1.1.1.2
table 1 tunnel-destination 10.1.1.1
switch(config-nexthop-group-abc)#entry 1 tunnel-destination 10.1.1.1
switch(config-nexthop-group-abc)#ttl 64
```

**Configuring the Group’s Size**

The group’s size specifies the number of entries in the group. A group can contain up to 256 entries, which is the default size. The group’s size is specified by **size (Nexthop Group)**.

**Example**

- This command configures the nexthop group NH-1 to contain 128 entries.

```
switch(config)#nexthop-group NH-1
switch(config-nexthop-group-NH-1)#size 128
switch(config-nexthop-group-NH-1)#show active
nexthop-group NH-1
  size 128
  ttl 64
```
Creating Nexthop Group Entries

Each entry specifies a nexthop address that is used to forward packets. A nexthop group contains one entry statement for each nexthop address. The group's size specifies the number of entry statements the group may contain. Each entry statement is assigned an index number to distinguish it from other entries within the group; entry index numbers range from zero to the group size minus one.

Nexthop group entries are configured by **entry (Nexthop Group)**.

**Example**

- These commands set the nexthop group size at four entries, then create three entries. Packets that are hashed to the fourth entry are dropped.

```
switch(config)#nexthop-group NH-1
switch(config-nexthop-group-NH-1)#size 4
switch(config-nexthop-group-NH-1)#entry 0 tunnel-destination 10.13.4.4
switch(config-nexthop-group-NH-1)#entry 1 tunnel-destination 10.15.4.22
switch(config-nexthop-group-NH-1)#entry 2 tunnel-destination 10.15.5.37
```

- These commands configure a nexthop group with three IPv6 nexthop entries.

```
switch(config)#nexthop-group nhg-v6-mpls type ip
switch(config-nhg-v6-mpls)#size 3
switch(config-nhg-v6-mpls)#entry 0 nexthop 2002::6401:1
switch(config-nhg-v6-mpls)#entry 1 nexthop 2002::6404:1
switch(config-nhg-v6-mpls)#entry 2 nexthop 2002::6404:2
```

- These commands configure an IPv4 route to point to the nexthop group nhg-v6-mplsp. (Both IPv4 routes and IPv6 routes can point to this nexthop group.)

```
switch#ip route 100.5.0.0/16 Nexthop-Group nhg-v6-mplsp
switch#
```

Displaying Nexthop Groups

The **show nexthop-group** command displays a group’s configured parameters.

**Example**

- This command displays the properties of the nexthop group named NH-1.

```
switch>show nexthop-group NH-1
Name   Id   type   size   ttl  sourceIp
NH-1   4    ipInIp 256   64   0.0.0.0
switch>
```

Applying a Nexthop Group to a Static Route

The **ip route nexthop-group** associates a nexthop group with a specified destination address and configures the encapsulation method for packets tunneled to that address.
Example

- This command creates a static route in the default VRF, using the nexthop group of NH-1 to determine the next hop address.

  switch(config)#ip route 10.17.252.0/24 nexthop-group NH-1
  switch(config)#

The `show ip route` command displays the routing table for a specified VRF. Routes that utilize a nexthop group entry are noted with a route type code of NG.

Example

- This command displays a routing table that contains a static route with its nexthop specified by a nexthop group.

  switch>show ip route
  Codes:  C - connected,  S - static,  K - kernel,
          O - OSPF,  IA - OSPF inter area,  E1 - OSPF external type 1,
          E2 - OSPF external type 2,  N1 - OSPF NSSA external type 1,
          N2 - OSPF NSSA external type 2,  B I - iBGP,  B E - eBGP,
          R - RIP,  I - ISIS,  A B - BGP Aggregate,  A O - OSPF Summary,
          NG - Nexthop Group Static Route

  Gateway of last resort is not set

  switch>
32.4 MPLS Command Descriptions

MPLS Commands
- mpls ip
- mpls static
- show mpls route
- show mpls route summary

Decap Group Commands
- ip decap-group
- tunnel decap-ip (Decap Group)
- tunnel type (Decap Group)

Nexthop Group Commands
- entry (Nexthop Group)
- ip route nexthop-group
- nexthop-group
- show nexthop-group
- size (Nexthop Group)
- ttl (Nexthop Group)
- tunnel-source (Nexthop Group)
entry (Nexthop Group)

The entry command defines a nexthop entry in the configuration mode nexthop group. Each nexthop entry specifies a nexthop IP address for static routes to which the nexthop group is assigned. The group size (size (Nexthop Group)) specifies the quantity of entries a group contains. Each entry is created by an individual command. Entries within a group are distinguished by an index number.

The no entry and default entry commands delete the specified nexthop group entry, as referenced by index number, by removing the corresponding entry statement from running-config.

Command Mode
Nexthop-group Configuration

Command Syntax

entry index tunnel-destination ipv4_address
no entry index
default entry index

Parameters
- index Entry index. Values range from 0 to group-size – 1.
- ipv4_address Nexthop IPv4 address.
- group-size is the group’s entry capacity, as specified by the size (Nexthop Group) command.

Example
- These commands sets the nexthop group size at 4 entries, then creates three nexthop entries. Packets that are hashed to the fourth entry are dropped.

switch(config)#nexthop-group NH-1
switch(config-nexthop-group-NH-1)#size 4
switch(config-nexthop-group-NH-1)#entry 0 tunnel-destination 10.13.4.4
switch(config-nexthop-group-NH-1)#entry 1 tunnel-destination 10.15.4.22
switch(config-nexthop-group-NH-1)#entry 2 tunnel-destination 10.15.5.37
switch(config-nexthop-group-NH-1)#show active
nexthop-group NH-1
  size 4
  ttl 64
  entry 0 tunnel-destination 10.13.4.4
  entry 1 tunnel-destination 10.15.4.22
  entry 2 tunnel-destination 10.15.5.37
switch(config-nexthop-group-NH-1)#
The `ip decap-group` command places the switch in decap-group configuration mode, through which decap groups are created or modified. A decap group is a data structure that defines a method of extracting the payload from an encapsulated packet that the switch receives on a specified IP address.

Decap groups do not specify a default IP address group or tunnel type. These parameters must be explicitly configured before a decap group can function.

Decap-group configuration mode is not a group change mode; `running-config` is changed immediately upon entering commands. Exiting decap-group configuration mode does not affect `running-config`. The `exit` command returns the switch to global configuration mode.

The `no ip decap-group` and `default ip decap-group` commands delete previously configured commands in the specified `decap-group` mode.

### Command Mode

- **Global Configuration**

### Command Syntax

```plaintext
ip decap-group group_name
no ip decap-group group_name
default ip decap-group group_name
```

### Parameters

- `group_name` Decap group name.

### Commands Available in Decap-group Configuration Mode

- `tunnel decap-ip (Decap Group)` specifies the IP address of packets handled by the decap group.
- `tunnel type (Decap Group)` specifies the tunnel protocol for extracting payload.

### Examples

- This command creates a decap group named DC-1.
  ```plaintext
  switch(config)#ip decap-group DC-1
  switch(config-dg-DC-1)#
  ```

- This command exits decap-group mode for the DC-1 decap group.
  ```plaintext
  switch(config-dg-DC-1)#exit
  switch(config)#
  ```

- This command delete the decap group named DC-1.
  ```plaintext
  switch(config)#no ip decap-group DC-1
  switch(config)#
  ```
ip route nexthop-group

The `ip route nexthop-group` command creates a static route. The destination is a network segment. The nexthop address is one of the IP addresses that comprise the specified nexthop group. Packets forwarded as a result of this command are encapsulated as specified by the tunnel-type parameter of the specified nexthop group.

When multiple routes exist to a destination prefix, the route with the lowest administrative distance takes precedence. When a route created through this command has the same administrative distance as another static route (ECMP), the route that was created earliest has preference; `running-config` stores static routes in the order that they are created.

By default, the administrative distance assigned to static routes is 1. Assigning a higher administrative distance to a static route configures it to be overridden by dynamic routing data. For example, a static route with a distance value of 200 is overridden by OSPF intra-area routes, which have a default distance of 110.

The `no ip route nexthop-group` and `default ip route nexthop-group` commands delete the specified route by removing the corresponding `ip route nexthop-group` command from `running-config`. `ip route nexthop-group` statements for an IP address in multiple VRFs must be removed separately.

A `no ip route` or `default ip route` command without a nexthop parameter deletes all corresponding `ip route nexthop-group` statements. Deleting a user-defined VRF also deletes its static routes.

Command Mode
Global Configuration

Command Syntax
```
ip route [VRF_INST] dest_net nexthop-group nhgp_name [dist] [TAG_OPTION] [RT_NAME]
no ip route [VRF_INST] dest_net [nexthop-group nhgroup_name] [distance]
default ip route [VRF_INST] dest_net [nexthop-group nhgroup_name] [distance]
```

Parameters
- **VRF_INST** Specifies the VRF instance being modified.
  - `<no parameter>` Changes are made to the default VRF.
  - `vrf vrf_name` Changes are made to the specified VRF.
- **dest_net** Destination IPv4 subnet (CIDR or address-mask notation).
- **nhgp_name** Name of nexthop group.
- **dist** Administrative distance assigned to route. Options include:
  - `<no parameter>` Route assigned default administrative distance of one.
  - `<1-255>` The administrative distance assigned to route.
- **TAG_OPTION** static route tag. Options include:
  - `<no parameter>` Assigns default static route tag of 0.
  - `tag t_value` Static route tag value. `t_value` ranges from 0 to 4294967295.
- **RT_NAME** Associates descriptive text to the route. Options include:
  - `<no parameter>` No text is associated with the route.
  - `name descriptive_text` The specified text is assigned to the route.

Related Commands
- `ip route` creates a static route that specifies the nexthop address without using nexthop groups.
Example

- This command creates a static route in the default VRF, using the nexthop group of NH-1 to determine the next hop address.

  `switch(config)#ip route 10.17.252.0/24 nexthop-group NH-1`
  `switch(config)#`
mpls ip

The `mpls ip` command enables MPLS routing. Multiprotocol Label Switching (MPLS) is a networking process that avoids complex lookups in a routing table by replacing complete network addresses with short path labels for directing data packets to network nodes. MPLS data paths are serviced through a tunnel encapsulation data structure that adds four-byte label headers to packets.

The `no mpls ip` and `default mpls ip` commands disable MPLS routing by removing the `mpls ip` command from `running-config`. When MPLS routing is disabled, routed MPLS packets are dropped and all MPLS routes and adjacencies are removed. MPLS routing is disabled by default.

**Command Mode**

Global Configuration

**Command Syntax**

```plaintext
mpls ip
no mpls ip
default mpls ip
```

**Example**

- This command enables MPLS routing. Previous commands enabled IP routing and configured MPLS static routes.

  ```plaintext
  switch(config)#mpls ip
  switch(config)#show running-config
  ! Command: show running-config
  
  ! ip routing
  !
  mpls ip
  !
  mpls static top-label 3400 10.14.4.4 pop payload-type ipv4
  mpls static top-label 4400 10.15.46.45 pop payload-type ipv4
  !
  !
  end
  switch(config)#
  ```

- This command disables MPLS routing.

  ```plaintext
  switch(config)#no mpls ip
  switch(config)#show running-config
  ! Command: show running-config
  
  ! ip routing
  !
  mpls static top-label 3400 10.14.4.4 pop payload-type ipv4
  mpls static top-label 4400 10.15.46.45 pop payload-type ipv4
  !
  !
  end
  switch(config)#
  ```
**mpls static**

The `mpls static` command creates an MPLS rule that specifies the method of handling of inbound MPLS traffic. Multiprotocol Label Switching (MPLS) is a networking process that replaces complete network addresses with short path labels for directing data packets to network nodes.

Static rules specify these parameters:

- **MPLS filter**: The top-label parameter specifies the 20-bit value that the MPLS packet’s top header label must match to be handled by the rule.
- **Nexthop location**: Specifies the destination nexthop address (IPv4 or IPv6) and the interface through which the switch forwards the packet.
- **MPLS action**: Specifies the MPLS label stack management action performed on the packet:
  - `pop-payload`: removes the top label from stack; this terminates an LSP (label-switched path).
  - `swap-label`: replaces top label with a specified new label; this passes a packet along an LSP.
- **Rule priority**: Specifies the rule to be used when an MPLS packet matches multiple rules.

The `no mpls static` and `default mpls static` commands delete the specified MPLS rule from `running-config`.

- Commands that include only a top label tag remove all MPLS rules with the matching top label.
- Commands with no `PRIORITY` parameter remove all matching routes of every metric value.

**Command Mode**

Global Configuration

**Command Syntax**

```
mpls static top-label top_tag [DEST_INTF] NEXTHOP_ADDR ACTION [PRIORITY]
no mpls static top-label top_tag
no mpls static top-label top_tag [DEST_INTF] NEXTHOP_ADDR ACTION [PRIORITY]
default mpls static top-label top_tag
default mpls static top-label top_tag [DEST_INTF] NEXTHOP_ADDR ACTION [PRIORITY]
```

**Parameters**

- `top_tag` Top header’s label field contents. Value ranges from 0 to 1048575 (20 bits).
- **DEST_INTF** Specifies interface through which `NEXTHOP_ADDR` is accessed. Options include:
  - `<no parameter>` Any interface.
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-channel interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
  - `vxlan vx_num` VXLAN interface specified by `vx_num`.
- **NEXTHOP_ADDR** Nexthop address for MPLS for filtered MPLS packets. Options include:
  - `ipv4_addr` IPv4 address.
  - `ipv6_addr` IPv6 address.
- **ACTION** MPLS header stack management action performed on packet. Options include:
  - `pop payload-type ipv4` Removes top layer from stack. Payload is handled as IPv4 packet.
  - `pop payload-type ipv6` Removes top layer from stack. Payload is handled as IPv6 packet.
- `swap-label <0 to 1048575>`  Replaces header label with specified label value (20 bits).
- `PRIORITY`  Specifies rule priority when multiple rules match a packet. Options include:
  - `<no parameter>`  Assigns a metric value of 100 to the rule.
  - `metric <1 to 255>`  Lower values denote higher priority. Value ranges from 1 to 255.

**Parameters**
The `mpls static` command does not support push label actions.

**Example**
- These commands create an MPLS rule that matches packets with a top label value of 3400 and causes the removal of the top label from the header stack. The nexthop destination of the IPv4 payload is IP address 10.14.4.4 through Ethernet interface 3/3/3. This rule has a metric value of 100.

  ```
  switch(config)#mpls static top-label 3400 ethernet 3/3/3 10.14.4.4 pop payload-type ipv4
  switch(config)#show running-config
  
  !
  mpls static top-label 3400 Ethernet3/3/3 10.14.4.4 pop payload-type ipv4
  !
  
  end
  switch(config)#
  ```

- These commands create a backup rule that forwards the packet through Ethernet interface 4/3. This rule's metric value of 150 assigns it backup status prior to the first rule.

  ```
  switch(config)#mpls static top-label 3400 ethernet 4/3 10.14.4.4 pop payload-type ipv4 metric 150
  switch(config)#show running-config
  
  !
  mpls static top-label 3400 Ethernet4/3 10.14.4.4 pop payload-type ipv4 metric 150
  mpls static top-label 3400 Ethernet3/3/3 10.14.4.4 pop payload-type ipv4
  !
  
  <--------OUTPUT OMITTED FROM EXAMPLE-------->
  
  end
  switch(config)#
  ```

- These commands create an MPLS rule that forwards the packet to the nexthop address through any interface.

  ```
  switch(config)#mpls static top-label 4400 10.15.46.45 pop payload-type ipv4
  switch(config)#show running-config
  
  !
  mpls static top-label 4400 10.15.46.45 pop payload-type ipv4 metric 150
  mpls static top-label 3400 Ethernet4/3 10.14.4.4 pop payload-type ipv4 metric 150
  mpls static top-label 3400 Ethernet3/3/3 10.14.4.4 pop payload-type ipv4
  mpls static top-label 4400 10.15.46.45 pop payload-type ipv4
  !
  
  <--------OUTPUT OMITTED FROM EXAMPLE--------->
  
  end
  switch(config)#
  ```
nexthop-group

The `nexthop-group` command places the switch in nexthop-group configuration mode, through which nexthop groups are created or modified. The command also specifies the tunnel protocol for extracting payload from encapsulated packets that arrive through an IP address upon which the group is applied.

A nexthop group is a data structure that defines a list of nexthop addresses and the encapsulation process for packets routed to the specified address. The command either accesses an existing nexthop group configuration or creates a new group if it specifies a non-existent group. Supported tunnel protocols include IP ECMP and IP-in-IP.

Nexthop-group configuration mode is not a group change mode; `running-config` is changed immediately upon entering commands. Exiting nexthop-group configuration mode does not affect `running-config`. The `exit` command returns the switch to global configuration mode.

The `no nexthop-group` and `default nexthop-group` commands delete previously configured commands in the specified `nexthop-group` mode. When the command does not specify a group, it removes all nexthop-groups. When the command specifies a tunnel type without naming a group, it removes all nexthop-groups of the specified type.

**Command Mode**
Global Configuration

**Command Syntax**

```
nexthop-group  group_name  type  TUNNEL_TYPE
no  nexthop-group  [group_name]  [type  TUNNEL_TYPE]
default  nexthop-group  [group_name]  [type  TUNNEL_TYPE]
```

**Parameters**
- `group_name`  Nexthop group name.
- `TUNNEL_TYPE`  Tunnel protocol of the nexthop-group. Options include:
  - `ip`  ECMP nexthop.
  - `ip-in-ip`  IP in IP tunnel.

**Commands Available in Nexthop-group Configuration Mode**
- `entry` (Nexthop Group)
- `size` (Nexthop Group)
- `ttl` (Nexthop Group)
- `tunnel-source` (Nexthop Group)

**Restrictions**
Tunnel type availability varies by switch platform.

**Examples**
- This command creates a nexthop group named NH-1 that specifies ECMP nexthops.
  ```
  switch(config)#nexthop-group  NH-1  type  ip
  switch(config-nexthop-group-NH-1)#
  ```
- This command exits nexthop-group mode for the NH-1 nexthop group.
  ```
  switch(config-nexthop-group-NH-1)#exit
  switch(config)#
  ```
**show mpls route**

The **show mpls config route** command displays the switch’s MPLS static rule configuration for the specified routes and rules.

**Command Mode**

EXEC

**Command Syntax**

```
show mpls [INFO_LEVEL] route [header_label]
```

**Parameters**

- **INFO_LEVEL**  
  Specifies the filters that are used to select the routes to display. Options include:
  - `<no parameter>` displays routes published by the forwarding agent.
  - `config` displays all configured routes.
  - `lfib` displays routes stored to the Label Forwarding Information Base (LFIB)
- **header_label**  
  Filters routes by MPLS top header label. Options include:
  - `<no parameter>` Displays routes for all header values.
  - `<0 to 1048575>` Specifies header for which command displays information.

**Example**

- This command displays the MPLS rule configuration.
  
  ```
  switch>show mpls config route
  In-Label  Out-Label  Metric  Payload  NextHop
  3400      pop        100     ipv4     10.14.4.4,Et3/3/3
  3400      pop        150     ipv4     10.14.4.4,Et4/3
  switch>
  ```
show mpls route summary

The `show mpls route summary` command displays statistics about the configuration and implementation of MPLS rules.

**Command Mode**

- EXEC

**Command Syntax**

```
show mpls route summary
```

**Example**

- This command displays a summary of MPLS rule implementation.

```
switch>show mpls route summary
Number of Labels: 1 (1 unprogrammed)
Number of adjacencies in hardware: 0
Number of backup adjacencies: 2
switch>
```
show nexthop-group

The `show nexthop-group` command displays properties of the specified nexthop group.

**Command Mode**

EXEC

**Command Syntax**

```
show nhgroup_name [VRF_INST]
```

**Parameters**

- `nhgroup_name` Name of the group displayed by command.
- `VRF_INST` specifies the VRF instance for which data is displayed.
  - `<no parameter>` context-active VRF.
  - `vrf vrf_name` specifies name of VRF instance. System default VRF is specified by `default`.

**Related Commands**

- `nexthop-group` places the switch in nexthop-group configuration mode to create a new group or modify an existing group.

**Example**

- This command displays the properties of the nexthop group named NH-1.

  ```
  switch>show nexthop-group NH-1
  Name    Id  type    size  ttl  sourceIp
  NH-1    4   ipInIp  256   64   0.0.0.0
  switch>
  ```
size (Nexthop Group)

The size command configures the quantity of nexthop entries in the configuration mode nexthop group. Each entry specifies a nexthop IP address for static routes to which the group is assigned. Entries are configured with the entry (Nexthop Group) command. The default size is 256 entries.

The no size and default size commands restore the size of the configuration mode nexthop group to its default of 256 by removing the corresponding size command from running-config.

Command Mode

  Nexthop-group Configuration

Command Syntax

  size entry_size
  no size entry_size
  default size entry_size

Parameters

  •  entry_size  Group size (entries). Value ranges from 1 to 255. Default value is 256.

Example

  •  This command configures the nexthop group NH-1 to contain 128 entries.

    switch(config)#next-hop-group NH-1
    switch(config-next-hop-group-NH-1)#size 128
    switch(config-next-hop-group-NH-1)#show active
        nexthop-group NH-1
        size 128
        ttl 64
    switch(config-next-hop-group-NH-1)#
ttl (Nexthop Group)

The `ttl` command specifies the number entered into the TTL (time to live) encapsulation field of packets that are transmitted to the address designated by the configuration mode nexthop group. The default TTL value is 64.

The `no ttl` and `default ttl` commands restore the default TTL value written into TTL fields for the configuration mode nexthop group by deleting the corresponding `ttl` command from `running-config`.

Command Mode

Nexthop-group Configuration

Command Syntax

```
ttl hop_expiry
no ttl hop_expiry
default ttl hop_expiry
```

Parameters

- `hop_expiry` Period that the packet remains valid (seconds or hops) Value ranges from 1 to 64.

Restrictions

This command is available only to Nexthop groups for tunnels of type `IP-in-IP`, `GRE`, `MPLS`, and `MPLS over GRE`.

Related Commands

- `nexthop-group` places the switch in Nexthop-group configuration mode.

Example

- This command configures the ttl setting to 32 for nexthop group NH-1 packets.

  ```
  switch(config)#nexthop-group NH-1
  switch(config-nexthop-group-NH-1)#ttl 32
  switch(config-nexthop-group-NH-1)#show active
  nexthop-group NH-1
  size 128
  ttl 32
  switch(config-nexthop-group-NH-1)#
  ```

- This command restores the default ttl setting for nexthop group NH-1 packets.

  ```
  switch(config-nexthop-group-NH-1)#no ttl
  switch(config-nexthop-group-NH-1)#show active
  nexthop-group NH-1
  size 128
  ttl 64
  switch(config-nexthop-group-NH-1)#
  ```
tunnel decap-ip (Decap Group)

The tunnel decap-ip command specifies the IP address of packets that are handled by the configuration mode decap group. A decap group is a data structure that defines a method of extracting the payload from an encapsulated packet that the switch receives on a specified IP address.

Decap groups do not define a default decap-ip address. A decap group is not functional until an IP address is specified. Decap groups can contain only one tunnel decap-ip statement; subsequent commands replace any previously configured statements.

Command Mode
Decap-Group Configuration

Command Syntax
```
tunnel decap-ip ipv4_address
```

Parameters
- `ipv4_addr` An IPv4 address.

Related Commands
- `ip decap-group` places the switch in decap-group configuration mode.
- `tunnel type (Decap Group)` specifies the tunnel protocol for extracting payload.

Guidelines
A decap group does not specify a default IP address group or tunnel type. These parameters must be explicitly configured before a decap group can function.

Example
- These commands configure 10.14.3.2 as the decap-IP address for the DC-1 decap group.
  ```
  switch(config)#ip decap-group DC-1
  switch(config-dg-DC-1)#tunnel decap-ip 10.14.3.2
  switch(config-dg-DC-1)#show active
  ip decap-group DC-1
  tunnel decap-ip 10.14.3.2
  switch(config-dg-DC-1)#
  ```
tunnel-source (Nexthop Group)

The **tunnel-source** command specifies the address that is entered into the source IP address encapsulation field of packets that are transmitted as designated by the configuration mode nexthop group. The command may directly specify an IP address or specify an interface from which an IP address is derived. The default source address IP address is 0.0.0.0.

The **no tunnel-source** and **default tunnel-source** commands remove the source IP address setting from the configuration mode nexthop group by deleting the **tunnel-source** command from *running-config*.

**Command Mode**

Nexthop-group Configuration

**Command Syntax**

```
tunnel-source **SOURCE**
no tunnel-source **SOURCE**
default tunnel-source **SOURCE**
```

**Parameters**

- **SOURCE**  
  IP address or derivation interface. Options include:
  - *ipv4_addr*  
    An IPv4 address.
  - *intf ethernet e_num*  
    Ethernet interface specified by *e_num*.
  - *intf loopback l_num*  
    Loopback interface specified by *l_num*.
  - *intf management m_num*  
    Management interface specified by *m_num*.
  - *intf port-channel p_num*  
    Port-channel interface specified by *p_num*.
  - *intf vlan v_num*  
    VLAN interface specified by *v_num*.

**Restrictions**

This command is available only to Nexthop groups for tunnels of type *ip-in-ip*.

**Related Commands**

- **nexthop-group** places the switch in Nexthop-group configuration mode.

**Example**

- These commands create loopback interface 100, assign an IP address to the interface, then specifies that address as the tunnel source for packets designated by nexthop-group NH-1.

  ```
  switch(config)#interface loopback 100
  switch(config-if-Lo100)#ip address 10.1.1.1/32
  switch(config-if-Lo100)#exit
  switch(config)#nexthop-group NH-1
  switch(config-nexthop-group-NH-1)#tunnel-source intf loopback 100
  switch(config-nexthop-group-NH-1)#show active
  nexthop-group NH-1
  size 256
  ttl 64
  tunnel-source intf Loopback100
  switch(config-nexthop-group-NH-1)#show nexthop-group NH-1
  Name  Id  type  size  ttl  sourceIp
  NH-1  2  ipInIp  256  64  10.1.1.1
  switch(config-nexthop-group-NH-1)#
  ```
**tunnel type (Decap Group)**

The **tunnel type** command specifies the tunnel protocol for extracting payload from encapsulated packets that arrive on the IP address specified for the configuration mode decap group. Supported tunnel protocols include GRE (General Routing Encapsulation) and IP-in-IP.

Decap groups do not define a default tunnel type. A decap group is not functional until an IP address is specified. Decap groups can contain only one tunnel decap-ip statement; subsequent commands replace any previously configured statements.

**Command Mode**
- Decap-group Configuration

**Command Syntax**

```
tunnel type gre
```

**Related Commands**
- `ip decap-group` places the switch in decap-group configuration mode.
- `tunnel decap-ip (Decap Group)` specifies the IP address of packets handled by the decap group.

**Guidelines**

A decap group does not specify a default IP address group or tunnel type. These parameters must be explicitly configured before a decap group can function.

**Example**

- This command configures decap group DC-1 to terminate packets from GRE tunnel packets.

  ```
  switch(config)#ip decap-group DC-1
  switch(config-dg-DC-1)#tunnel type gre
  switch(config-dg-DC-1)#show active
  ip decap-group DC-1
  tunnel type gre
  switch(config-dg-DC-1)#
  ```
Bidirectional Forwarding Detection

This chapter describes bidirectional forwarding detection (BFD) and how it is configured in relation to various protocols. Sections in this chapter include:

- Section 33.1: Introduction
- Section 33.2: BFD Configuration
- Section 33.3: BFD Command Descriptions

33.1 Introduction

In networks without data link signaling, connection failures are usually detected by the hello mechanisms of routing protocols. Detection can take over a second, and reducing detection time by increasing the rate at which hello packets are exchanged can create an excessive burden on the participating CPUs.

BFD is a low-overhead, protocol-independent mechanism which adjacent systems can use instead for faster detection of faults in the path between them. BFD is strictly a failure-detection mechanism, and does not discover neighbors or reroute traffic.

BFD is a simple mechanism which detects the liveness of a connection between adjacent systems, allowing it to quickly detect failure of any element in the connection. It does not operate independently, but only as an adjunct to routing protocols. The routing protocols are responsible for neighbor detection, and create BFD sessions with neighbors by requesting failure monitoring from BFD.

Once a BFD session is established with a neighbor, BFD exchanges control packets to verify connectivity and informs the requesting protocol of failure if a specified number of successive packets are not received. The requesting protocol is then responsible for responding to the loss of connectivity.

Routing protocols using BFD for failure detection continue to operate normally when BFD is enabled, including the exchange of hello packets.

The basic behavior of BFD is defined in RFC 5880.

33.1.1 BFD Modes

BFD functions in asynchronous or demand mode, and also offers an echo function. EOS supports asynchronous mode and the echo function.
33.1.1.1 Asynchronous Mode
In asynchronous mode, BFD control packets are exchanged by neighboring systems at regular intervals. If a specified number of sequential packets are not received, BFD declares the session to be down.

33.1.1.2 Demand Mode
In demand mode, once the BFD session is established, the participating systems can request that BFD packets not be sent, then request an exchange of packets only when needed to verify connectivity. EOS does not support demand mode.

33.1.2 Echo Function
When the echo function is in use, echo packets are looped back through the hardware forwarding path of the neighbor system without involving the CPU. Failure is detected by an interruption in the stream of echoed packets. The minimum reception rate for BFD control packets from the neighbor is also changed automatically when the echo function is operational, because liveness detection is supplied by the echo packets.

While BFD control messages are transmitted to port 3786, BFD echo messages use UDP port 3785 for both source and destination.

33.1.3 BFD on Port Channels
On port channels, the BFD per-link feature can be used to add resiliency to the port channel’s BFD sessions. When BFD per-link is enabled, BFD considers the port channel “up” as long as any link in the port channel is functioning properly.

**Important!** BFD per-link and BFD echo are mutually exclusive on a port channel. If both are configured, BFD per-link takes precedence.
33.2 BFD Configuration

To use BFD as the failure detection mechanism for a routing protocol, it must be enabled for each participating protocol.

These sections describe BFD configuration tasks:

- Section 33.2.1: Configuring BFD on an Interface
- Section 33.2.2: Configuring BFD on a Port Channel
- Section 33.2.3: Configuring the Echo Function
- Section 33.2.4: Configuring BFD for PIM
- Section 33.2.5: Configuring BFD for BGP
- Section 33.2.6: Configuring BFD for VRRP
- Section 33.2.7: Configuring BFD for OSPF
- Section 33.2.8: Displaying BFD Neighbor Information

33.2.1 Configuring BFD on an Interface

The transmission rate for BFD control packets, the minimum rate at which control packets are expected from the peer, and the multiplier (the number of packets that must be missed in succession before BFD declares the session to be down) can all be configured per interface. The values configured apply to all BFD sessions that pass through the interface.

The default values for these parameters are:

- **transmission rate** 300 milliseconds
- **minimum receive rate** 300 milliseconds
- **multiplier** 3

To configure different values for these parameters on an interface, use the `bfd interval` command.

For BFD to function as a failure detection mechanism, it must be enabled for each participating protocol.

**Example**

These commands set the transmit and receive intervals to 200 milliseconds and the multiplier to 2 for all BFD sessions passing through Ethernet interface 3/20.

```
switch(config)#interface ethernet 3/20
switch(config-if-Et3/20)#bfd interval 200 min_rx 200 multiplier 2
switch(config-if-Et3/20)#
```

33.2.2 Configuring BFD on a Port Channel

Basic BFD parameters are configured on a port channel as described in Configuring BFD on an Interface above.

Additionally, BFD can be configured in per-link mode on a port channel so that the port channel will be considered up as long as any link in the channel is up.

To enable BFD per-link on a port channel, use the `bfd per-link` command.

**Important!** BFD per-link and BFD echo are mutually exclusive on a port channel. If both are configured, BFD per-link takes precedence.
### 33.2.3 Configuring the Echo Function

The echo function is disabled by default, and is enabled on an interface using the `bfd echo` command. When the BFD echo function is enabled, a “slow-timer” value replaces the minimum receive interval value in BFD packets sent from the switch. The default value is 2000 milliseconds. To configure a different value for the slow-timer, use the `bfd slow-timer` command.

**Important!** BFD per-link and BFD echo are mutually exclusive on a port channel. If both are configured, BFD per-link takes precedence.

**Examples**

- These commands enable the BFD echo function on Ethernet interface 5. If a slow-timer value has been configured on the switch, the minimum receive rate expected from the BFD neighbor will be reset to that value; otherwise, the minimum receive rate will be set to 2000 milliseconds.

  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#bfd echo
  switch(config-if-Et5)#
  ```

- This command configures BFD to expect control packets from the peer every 10000 milliseconds when the BFD echo function is enabled.

  ```
  switch(config)#bfd slow-timer 10000
  switch(config)#
  ```

### 33.2.4 Configuring BFD for PIM

The `ip pim bfd` command enables or disables bidirectional forwarding detection (BFD) globally for all protocol independent multicast (PIM) neighbors.

To enable or disable PIM BFD on a specific interface, use the `ip pim bfd-instance` command. The interface-level configuration supersedes the global setting.

**Example**

- This command enables PIM BFD globally on the switch, enabling it on all interfaces where it is not explicitly disabled.

  ```
  switch(config)#ip pim bfd
  switch(config)#
  ```

- These commands configure VLAN interface 200 to use BFD for PIM connection failure detection regardless of the global PIM BFD configuration.

  ```
  switch(config)#interface vlan 200
  switch(config-if-VL200)#ip pim bfd-instance
  switch(config-if-VL200)#
  ```
33.2.5 Configuring BFD for BGP

To enable or disable bidirectional forwarding detection (BFD) for border gateway protocol (BGP) connections with a BGP neighbor or peer group, use the `neighbor fall-over bfd` command.

**Example**

- These commands enable BFD failure detection for BGP connections with the neighbor at 10.13.64.1.

```bash
switch(config)# router bgp 300
switch(config-router-bgp)# neighbor 10.13.64.1 fall-over bfd
```

33.2.6 Configuring BFD for VRRP

To enable or disable bidirectional forwarding detection (BFD) for virtual router redundancy protocol (VRRP), use the `vrrp bfd ip` command.

When enabled, BFD provides failure detection for a 2-router VRRP system. When the master is configured with the physical IP address of the backup router, and the backup is configured with the address of the master, a BFD session is established between them. If the BFD session goes down, the backup router immediately assumes the master role.

VRRP master advertisement packets are still sent even when the BFD session is established to accommodate VRRP systems involving more than two routers.

**Example**

- These commands enable BFD on Ethernet interface 3/20 for VRRP ID 15 with a connection to a router at IP address 192.168.2.1.

```bash
switch(config)# interface ethernet 3/20
switch(config-if-Et3/20)# vrrp 15 bfd ip 192.168.2.1
```

33.2.7 Configuring BFD for OSPF

To enable or disable BFD globally for all OSPF neighbors, use the `bfd all-interfaces` command in OSPF configuration mode.

To enable or disable BFD for OSPF on a specific interface, use the `ip ospf bfd` command. The interface-level configuration supercedes the global setting.

**Example**

- These commands enable BFD in OSPF instance 100 for all OSPF neighbors on BFD-enabled interfaces except those connected to interfaces on which OSPF BFD has been explicitly disabled.

```bash
switch(config)# router ospf 100
switch(config-router-ospf)# bfd all-interfaces
```

- This command enables OSPF BFD on Ethernet interface 3/21.

```bash
switch(config)# interface ethernet 3/21
switch(config-if-Et3/21)# ip ospf bfd
```
33.2.8 Displaying BFD Neighbor Information

Use the `show bfd neighbors` command to display information about bidirectional forwarding detection (BFD) neighbors.

**Example**

- This command displays general information about BFD neighbors.

```
switch>show bfd neighbors
DstAddr       MyDisc  YoDisc  If            LUp     LDown  Ldiag           Stat
10.168.1.56   16      13      et52_1(81)    17151450 0      No Diagnostic    Up
10.168.1.58   17      14      et52_2(65)    17151883 0      No Diagnostic    Up
10.168.1.24   18      15      et51_1(73)    17152175 0      No Diagnostic    Up
```

- This command displays detailed information about BFD neighbors.

```
switch>show bfd neighbors detail
Peer Addr 10.168.1.56, Intf Ethernet52/1, State Up
VRF default, LAddr 10.168.1.57, LD/RD 16/13
Last Up 17151450
Last Down 0
Last Diag: No Diagnostic
TxInt: 300, RxInt: 300, Multiplier: 3
Received RxInt: 300, Received Multiplier: 3
Rx Count: 433987, Tx Count: 433829
Detect Time: 900
Registered protocols: bgp

Peer Addr 10.168.1.58, Intf Ethernet52/2, State Up

```
33.3 BFD Command Descriptions

BFD Configuration Commands
- `bfd interval`
- `bfd echo`
- `bfd slow-timer`

BFD Display Commands
- `show bfd neighbors`

PIM-BFD Configuration Commands
- `ip pim bfd`
- `ip pim bfd-instance`

BGP-BFD Configuration Commands
- `neighbor fall-over bfd`

VRRP-BFD Configuration Commands
- `vrrp bfd ip`

OSPF-BFD Configuration Commands
- `bfd all-interfaces`
- `ip ospf bfd`
The `bfd all-interfaces` command globally configures OSPF to use bidirectional forwarding detection (BFD). When this command is issued, BFD sessions will be established with all OSPF neighbors connected to BFD-enabled interfaces unless OSPF BFD has been disabled on a participating interface using the `ip ospf bfd` command. BFD is globally disabled in OSPF by default.

For OSPF BFD to function on an interface, BFD must also be enabled and configured on that interface using the `bfd interval` command.

The `no bfd all-interfaces` and `default bfd all-interfaces` commands disable OSPF BFD on all interfaces except those where it has been explicitly enabled using the `ip ospf bfd` command.

**Command Mode**
Router-OSPF Configuration

**Command Syntax**
```
bfd all-interfaces
no bfd all-interfaces
default bfd all-interfaces
```

**Examples**
These commands enable BFD for OSPF instance 100 on all interfaces except those on which OSPF BFD has been explicitly disabled.
```
switch(config)#router ospf 100
switch(config-router-ospf)#bfd all-interfaces
switch(config-router-ospf)#
```
bfd echo

The `bfd echo` command enables the BFD echo function on the configuration mode interface. The `no bfd echo` and `default bfd echo` commands disable the BFD echo function by removing the corresponding `bfd echo` command from `running-config`.

Command Mode
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

Command Syntax
```
bfd echo
no bfd echo
default bfd echo
```

Example
- These commands enable the BFD echo function on Ethernet interface 5. If a slow-timer value has been configured on the switch, the minimum receive rate expected from the BFD neighbor will be reset to that value; otherwise, the minimum receive rate will be set to 2000 milliseconds.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#bfd echo
switch(config-if-Et5)#
```
**bfd interval**

The **bfd interval** command configures the BFD control packet transmission rate, minimum control packet receive rate, and the number of missed packets that will signal that the session is down. These parameters can be configured globally for the switch or for the configuration mode interface. If a parameter is configured both globally and on the interface, the value configured on the interface takes precedence.

---

**Important!** For a BFD session to be established, BFD must be enabled for any routing protocol using BFD for failure detection.

---

The **no bfd interval** and **default bfd interval** commands return the BFD parameters on the configuration mode interface to default values by removing the corresponding **bfd interval** command from **running-config**.

---

**Command Mode**
- Global Configuration
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
```
bfd interval transmit_rate min_rx receive_minimum multiplier factor
no bfd interval
default bfd interval
```

**Parameters**
- **transmit_rate** rate in milliseconds at which control packets will be sent. Values range from 50 to 60000; the default value is 300.
- **receive_minimum** rate in milliseconds at which control packets will be expected. Values range from 50 to 60000.
- **factor** number of consecutive missed BFD control packets after which BFD will declare the session as down. Values range from 3 to 50.

**Examples**
- These commands configure BFD on Ethernet interface 5 to expect packets from the peer every 200 milliseconds and declare the session down after failing to receive 5 consecutive packets. This configuration overrides any values configured globally.
  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#bfd interval 200 min_rx 200 multiplier 5
  switch(config-if-Et5)#
  ```
**bfd per-link**

The **bfd per-link** command enables the BFD per-link function on the port channel being configured. When BFD per-link is enabled, BFD sub-sessions are run on each link of the port channel; BFD considers the port-channel to be “up” as long as any one of the links is live.

**Important!** BFD per-link and BFD echo are mutually exclusive. If both are enabled on a port channel, BFD per-link takes precedence and BFD echo will be disabled.

The **no bfd per-link** and **default bfd per-link** commands disable the BFD per-link function by removing the corresponding **bfd per-link** command from **running-config**.

**Command Mode**

- Interface-Port-channel Configuration

**Command Syntax**

```
bfd per-link
no bfd per-link
default bfd per-link
```

**Example**

- These commands enable the BFD per-link function on port channel 5. If the BFD echo function has been configured on the port channel, the per-link function will disable BFD echo.

  ```
switch(config)#interface port-channel 5
switch(config-if-Po5)#bfd per-link
switch(config-if-Po5)#
```
**bfd slow-timer**

The **bfd slow-timer** command configures the minimum reception rate for BFD control packets which will be used if the BFD echo function is enabled. The default value is 2000 milliseconds.

---

**Important!** For a BFD session to be established, BFD must be enabled for any routing protocol using BFD for failure detection.

---

The **no bfd slow-timer** and **default bfd slow-timer** commands return the BFD slow-timer to the default value of 2000 milliseconds by removing the corresponding **bfd interval** command from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

```
bfd slow-timer receive_minimum
no bfd slow-timer
default bfd slow-timer
```  

**Parameters**

- **receive_minimum**  rate in milliseconds at which control packets will be expected when the BFD echo function is enabled. Values range from 2000 to 60000; default value is 2000.

**Examples**

- This command configures BFD to expect control packets from the peer every 10000 milliseconds when the BFD echo function is enabled.

  ```
  switch(config)#bfd slow-timer 10000
  switch(config)#
  ```
**ip ospf bfd**

The `ip ospf bfd` command enables bidirectional forwarding detection (BFD) for the open shortest path first protocol (OSPF) on the configuration mode interface regardless of the global settings for the OSPF instance. All OSPF neighbors associated with the interface become BFD peers, and OSPF uses BFD for failure detection.

For OSPF BFD to function on an interface, BFD must also be enabled and configured on that interface using the `bfd interval` command.

The `no ip ospf bfd` command disables OSPF BFD on the interface and terminates all BFD sessions with the interface’s OSPF peers. The `default ip ospf bfd` command causes the interface to follow global OSPF BFD settings configured by the `bfd all-interfaces` command.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ip ospf bfd
no ip ospf bfd
default ip ospf bfd
```

**Example**

- These commands enable BFD on Ethernet interface 3/20.
  
  ```
  switch(config)#interface ethernet 3/20
  switch(config-if-Et3/20)#ip ospf bfd
  switch(config-if-Et3/20)#
  ```

- These commands cause Ethernet interface 3/20 to follow the global OSPF BFD configuration.
  
  ```
  switch(config)#interface ethernet 3/20
  switch(config-if-Et3/20)#default ip ospf bfd
  switch(config-if-Et3/20)#
  ```
**ip pim bfd**

The **ip pim bfd** command enables bidirectional forwarding detection (BFD) globally for use as a failure detection mechanism for protocol independent multicast (PIM) on the switch. To override the global configuration for a specific interface, use the **ip pim bfd-instance** command. All PIM interfaces will use the global setting if they are not individually configured.

When PIM BFD is enabled, a BFD session is created for each PIM neighbor and used to detect a loss of connectivity with the neighbor. PIM hello packets are still exchanged with PIM neighbors when BFD is enabled.

The **no ip pim bfd** and **default ip pim bfd** commands disable PIM BFD globally by deleting the **ip pim bfd** statement from **running-config**. When this is done, only interfaces with PIM BFD explicitly enabled will use PIM BFD.

**Command Mode**

Global Configuration

**Command Syntax**

- ip pim bfd
- no ip pim bfd
- default ip pim bfd

**Example**

- This command enables PIM BFD globally on the switch, enabling it on all interfaces where it is not explicitly disabled.

```
switch(config)#ip pim bfd
switch(config)#
```
**ip pim bfd-instance**

The `ip pim bfd-instance` command enables bidirectional forwarding detection (BFD) on the configuration mode interface as a failure detection mechanism for protocol-independent multicast (PIM). To enable PIM BFD globally on the switch, use the `ip pim bfd` command. Interface-level settings override the global setting.

When PIM BFD is enabled, a BFD session is created for each PIM neighbor and used to detect a loss of connectivity with the neighbor. PIM hello packets are still exchanged with PIM neighbors when BFD is enabled.

The `no ip pim bfd-instance` disables PIM BFD on the configuration mode interface regardless of global settings. The `default ip pim bfd-instance` command causes the configuration mode interface to follow the global setting for PIM BFD by removing the corresponding `ip pim bfd-instance` statement from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `ip pim bfd-instance`
- `no ip pim bfd-instance`
- `default ip pim bfd-instance`

**Example**
- These commands configure VLAN interface 200 to use BFD for PIM connection failure detection regardless of the global PIM BFD configuration.

```plaintext
switch(config)#interface vlan 200
switch(config-if-VL200)#ip pim bfd-instance
switch(config-if-VL200)#
```
neighbor fall-over bfd

The `neighbor fall-over bfd` command enables bidirectional forwarding detection (BFD) for use as a failure detection mechanism for border gateway protocol (BGP) connections to the specified BGP neighbor or peer group.

Once a BFD session is established with a BGP neighbor, if the BFD session goes down the status of the BGP session is changed to “down” as well.

The `no neighbor fall-over bfd` and `default neighbor fall-over bfd` commands disable BFD for BGP connections to the specified neighbor or peer group by removing the corresponding `neighbor fall-over bfd` command from `running-config`.

**Command Mode**
Router-BGP Configuration

**Command Syntax**
```
neighbor NEIGHBOR_ID fall-over bfd
no neighbor NEIGHBOR_ID fall-over bfd
default neighbor NEIGHBOR_ID fall-over bfd
```

**Parameters**
- `NEIGHBOR_ID` IP address or peer group name. Values include:
  - `ipv4_addr` neighbor’s IPv4 address.
  - `ipv6_addr` neighbor’s IPv6 address.
  - `group_name` peer group name.

**Example**
- These commands enable BFD failure detection for BGP connections with the neighbor at 10.13.64.1.
  ```
  switch(config)#router bgp 300
  switch(config-router-bgp)#neighbor 10.13.64.1 fall-over bfd
  switch(config-router-bgp)#
  ```
show bfd neighbors

The `show bfd neighbors` command displays information about the neighbors with which the switch currently has a bidirectional forwarding detection (BFD) session.

**Command Mode**

EXEC

**Command Syntax**

`show bfd neighbors [INFO_LEVEL]`

**Parameters**

- `INFO_LEVEL` amount of information that is displayed. Options include:
  - `<no parameter>` command displays data block for each specified interface.
  - `detail` command displays table that summarizes interface data.

**Display Values**

- `DstAddr` IP address of the BFD neighbor.
- `MyDisc` Local discriminator value of the BFD session.
- `YoDisc` Neighbor’s discriminator value for the BFD session.
- `If` Interface to which the neighbor is connected.
- `LUp` Last up.
- `LDown` Last down.
- `Ldiag` Diagnostic for the last change in session state.
- `State` State of the BFD session.
- `TxInt` Transmit interval of the local interface.
- `RxInt` Minimum receive interval set on the local interface.
- `Multiplier` Local multiplier (number of packets that must be missed to declare session down).
- `Received RxInt` Minimum receive interval set on the neighbor interface.
- `Received Multiplier` Neighbor’s multiplier (number of packets that must be missed to declare session down).
- `Rx Count` BFD control packets transmitted.
- `Tx Count` BFD control packets received.
- `Detect Time` Total time in milliseconds it takes for BFD to detect connection failure.
- `Registered Protocols` Protocols using BFD with this neighbor.
Examples

- This command displays general information about BFD neighbors.

```
switch> show bfd neighbors
DstAddr       MyDisc  YoDisc  If            LUp     LDown   Ldiag             S
Diagnostic      Up
10.168.1.56   16      13      et52_1(81)    17151450 0       No Diagnostic      Up
10.168.1.58   17      14      et52_2(65)    17151883 0       No Diagnostic      Up
10.168.1.24   18      15      et51_1(73)    17152175 0       No Diagnostic      Up
10.168.254.6  19      12      vlan4094(26)  17152336 0       No Diagnostic      Up
10.168.1.26   20      16      et51_2(57)    17152523 0       No Diagnostic      Up
10.168.1.40   21      12      et50_1(77)    17152966 0       No Diagnostic      Up
10.168.1.42   22      13      et50_2(61)    17153488 0       No Diagnostic      Up
10.168.1.8    27      55      et49_1(69)    26710447 0       No Diagnostic      Up
10.168.1.10   28      56      et49_2(53)    26710847 0       No Diagnostic      Up
```

- This command displays detailed information about BFD neighbors.

```
switch> show bfd neighbors detail
Peer Addr 10.168.1.56, Intf Ethernet52/1, State Up

Registered protocols: bgp
```

switch>
vrrp bfd ip

The **vrrp bfd ip** command enables and configures bidirectional forwarding detection (BFD) for virtual router redundancy protocol (VRRP) on the configuration mode interface.

When enabled, BFD provides failure detection for a 2-router VRRP system. When the master is configured with the physical IP address of the backup router, and the backup is configured with the address of the master, a BFD session is established between them. If the BFD session goes down, the backup router immediately assumes the master role.

VRRP master advertisement packets are still sent even when the BFD session is established to accommodate VRRP systems involving more than two routers.

The **no vrrp bfd ip** and **default vrrp bfd ip** commands disable BFD for VRRP on the configuration mode interface by removing the corresponding **vrrp bfd ip** statement from **running-config**. The **no vrrp** command also removes the **vrrp bfd ip** command for the specified virtual router.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

- `vrrp group bfd ip ipv4_address`
- `no vrrp group bfd ip`
- `default vrrp group bfd ip`

**Parameters**
- **group** virtual router identifier (VRID). Values range from 1 to 255.
- **ipv4_address** IPv4 address of the other VRRP router. On the master router, enter the physical IP address of the backup; on the backup, enter the physical IP address of the master.

**Example**
- These commands enable BFD on Ethernet interface 3/20 for VRRP ID 15 with a connection to a router at IP address 192.168.2.1.

```plaintext
switch(config)#interface ethernet 3/20
switch(config-if-Et3/20)#vrrp 15 bfd ip 192.168.2.1
switch(config-if-Et3/20)#
```
Chapter 34

Multicast Architecture

IP multicast is the transmission of data packets to multiple hosts through a common IP address. Arista switches support multicast transmissions through IGMP, IGMP Snooping, and PIM-SM. These sections describe the Arista multicast architecture.

- Section 34.1: Introduction is a chapter overview and lists the features supported by Arista switches.
- Section 34.2: Multicast Architecture Description describes multicast data structures.
- Section 34.3: Multicast Configuration describes multicast implementation configuration tasks.
- Section 34.4: Multicast Commands contains multicast command descriptions.

34.1 Introduction

Arista switches provide layer 2 multicast filtering and layer 3 routing features for applications requiring IP multicast services. The switches support over a thousand separate routed multicast sessions at wire speed without compromising other Layer 2/3 switching features. Arista switches support IGMP, IGMP snooping, PIM-SM, and MSDP to simplify and scale data center multicast deployments.

Supported Features

Feature support varies by platform; please consult the release notes for multicast support information by platform.

Multicast and unicast use the same routing table. Unicast routes use TCAM resources, which may also impact the maximum number of multicast routes.

Features Not Supported

These multicast functions are not supported by Arista switches include (*,*,G) forwarding or boundary routers, Multicast MIBs, and Router applications joining multicast groups.
34.2 Multicast Architecture Description

IP multicast is data transmission to a subset of all hosts through a single multicast group address. Multicast packets are delivered using best-effort reliability, similar to unicast packets. Senders use the multicast address as the destination address. Any host, regardless of group membership, can send to a group. However, only group members receive messages sent to a group address.

IP multicast addresses range from 224.0.0.0 to 239.255.255.255. Multicast routing protocol control traffic reserves the address range 224.0.0.0 to 224.0.0.255. The address 224.0.0.0 is never assigned to any group.

Multicast group membership is dynamic; a group’s activity level and membership can vary over time. A host can also simultaneously belong to multiple multicast groups.

Figure 34-1 depicts the components that comprise the multicast architecture. This section describes multicast components depicted in the figure.

34.2.1 Multicast Control Plane

The Multicast Control Plane builds and maintains multicast distribution trees. It communicates changes in the multicast routing table to the MFIB for multicast forwarding.

- Protocol Independent Multicast (PIM) builds and maintains multicast routing trees using reverse path forwarding (RPF) on a unicast routing table.
- Internet Group Management Protocol (IGMP) identifies multicast group members on subnets directly connected to the switch. Hosts manage multicast group membership with IGMP messages.
- The switch maintains an mroute (multicast routing) table when running PIM to provide forwarding tables used to deliver multicast packets.

The mroute table stores the states of inbound and outbound interfaces for each source-group pair \((S,G)\). The switch discards and forwards packets on the basis of this state information. Each table entry, referred to as an mroute, corresponds to a unique \((S,G)\) and contains:

- the multicast group address
- the multicast source address (or * for all sources)
• the inbound interface
• a list of outbound interfaces

34.2.2 Multicast Forwarding Plane

The Multicast Forwarding Plane consists of the Multicast Forwarding Information Base (MFIB), a forwarding engine that is independent of multicast routing protocols.

MFIB formats PIM and IGMP multicast routes for protocol-independent hardware packet forwarding and adds them to the hardware multicast expansion table (MET) and the hardware FIB.

MFIB uses a core forwarding engine for interrupt-level (fast switching) and process-level (process switching) forwarding. MFIB fast-switches inbound multicast packets that match an MFIB forwarding entry and process-switches packets requiring a forwarding entry if a matching entry does not exist.

34.2.3 Multicast Routing Information Base (MRIB)

The MRIB is the channel between Multicast Control Plane clients and the Multicast Forwarding Plane. The show ip mroute displays MRIB entries as (*, G), (S, G), and (*, G/m) multicast entries.

MRIB entries are based on source, group, and group masks. The entries are associated with a list of interfaces whose forwarding state is described with flags. MRIB communication is based on the state change of entry and interface flags. Flags are significant to MRIB clients and not interpreted by MRIB.

34.2.4 Hardware Dependent Forwarding and Fast Dropping

In IP multicast protocols, each (S,G) and (*,G) route corresponds to an inbound reverse path forwarding (RPF) interface. Packets arriving on non-RPF interfaces may require PIM processing, as performed by the CPU subsystem software.

By default, hardware sends all packets arriving on non-RPF interfaces to the CPU subsystem software. However, the CPU can be overwhelmed by non-RPF packets that do not require software processing. The CPU subsystem software prevents CPU overload by creating a fast-drop entry in hardware for inbound non-RPF packets not requiring PIM processing. Packets matching a fast-drop entry are bridged in the ingress VLAN but not sent to the software, avoiding CPU subsystem software overload. Fast-drop entry usage is critical in topologies with persistent RPF failures.

Protocol events, such as links going down or unicast routing table changes, can change the set of packets that can be fast dropped. Packets that were correctly fast dropped before a topology change may require forwarding to the CPU subsystem software after the change. The CPU subsystem software handles fast-drop entries that respond to protocol events so that PIM can process all necessary non-RPF packets.
34.3 Multicast Configuration

This section describes the following configuration tasks:

- **Section 34.3.1: Multicast Configuration**
- **Section 34.3.2: Configuring MFIB**
- **Section 34.3.3: Configuring Static IP Mroute**
- **Section 34.3.4: Displaying and Clearing the mroute Table**

34.3.1 Multicast Configuration

Enabling Multicast Routing

Enabling IP multicast routing allows the switch to forward multicast packets. The `ip multicast-routing` command enables multicast routing. When multicast routing is enabled, `running-config` contains an `ip multicast-routing` statement.

**Example**

- This command enables multicast routing on the switch.

  ```
  switch(config)#ip multicast-routing
  switch(config)#
  ```

Multicast Boundary Configuration

The multicast boundary specifies subnets where source traffic entering an interface is filtered to prevent the creation of mroute states on the interface. The interface is not included in the outgoing interface list (OIL). Multicast PIM, IGMP and other multicast data cannot cross the boundary, facilitating the use of a multicast group address in multiple administrative domains.

The `ip multicast boundary` command configures the multicast boundary. The multicast boundary can be specified through multiple IPv4 subnets or one standard IPv4 ACL.

**Examples**

- This command configures the multicast address of 229.43.23.0/24 as a multicast boundary where source traffic is restricted from VLAN interface 300.

  ```
  switch(config)#interface vlan 300
  switch(config-if-vl300)#ip multicast boundary 229.43.23.0/24
  switch(config-if-vl300)#
  ```

- These commands create a standard ACL, then implements the ACL in an `ip multicast boundary` command to configure two boundary subnets (225.123.0.0/16 and 239.120.10.0/24).

  ```
  switch(config)#ip access-list standard mbac1
  switch(config-std-acl-mbac1)#10 deny 225.123.0.0/16
  switch(config-std-acl-mbac1)#20 deny 239.120.10.0/24
  switch(config-std-acl-mbac1)#exit
  switch(config)#interface vlan 200
  switch(config-if-Vl200)#ip multicast boundary mbac1
  switch(config-if-Vl200)#exit
  switch(config)#
  ```

34.3.2 Configuring MFIB

MFIB formats PIM and IGMP multicast routes for protocol-independent hardware packet forwarding and adds them to the hardware multicast expansion table (MET) and the hardware FIB.
MFIB Polling Interval

The switch records activity levels for multicast routes in the MFIB after polling the corresponding hardware activity bits. The `ip mfib activity polling-interval` command specifies the frequency that the switch polls the hardware activity bits for the multicast routes.

Example

- This command sets the MFIB activity polling period at 15 seconds.

```
switch(config)#ip mfib activity polling-interval 15
switch(config)#
```

MFIB Fastdrops

In IP multicast protocols, every (S,G) or (*,G) route is associated with an inbound RPF (reverse path forwarding) interface. Packets arriving on an interface not associated with the route may need CPU-dependent PIM processing, so packets received by non-RPF interfaces are sent to the CPU by default, causing heavy CPU processing loads.

Multicast routing protocols often do not require non-RPF packets; these packets do not require software processing. The CPU therefore updates the hardware MFIB with a fast-drop entry when it receives a non-RPF interface packet that PIM does not require. Additional packets that match the fast-drop entry are not sent to the system software.

Fastdrop is enabled on all interfaces by default. The `no ip mfib fastdrop` command disables MFIB fast drops for the configuration mode interface.

Example

- This command disables MFIB fast drops for the VLAN interface 120.

```
switch(config)#interface vlan 120
switch(config-if-Vl120)#no ip mfib fastdrop
switch(config-if-Vl120)#
```

The `ip mfib max-fastdrops` command limits the number of fast drop routes that the switch’s MFIB table can contain. The default fast drop route limit is 1024.

Example

- This command sets the maximum number of fast drop routes at 2000.

```
switch(config)#ip mfib max-fastdrops 2000
switch(config)#
```

The `clear ip mfib fastdrop` command, in global configuration mode, removes all MFIB fast drop entries on all interfaces.

Example

- This command removes all fast-drop entries from the MFIB table.

```
switch#clear ip mfib fastdrop
switch#
```

The `show ip mfib` command displays information about the routes and interfaces in the IPv4 MFIB

- `show ip mfib` displays MFIB information for hardware-forwarded routes.
- `show ip mfib software` displays MFIB information for software-forwarded routes.
Example

- This command displays MFIB information for hardware-forwarded routes.

```plaintext
switch>show ip mfib
Activity poll time: 60 seconds

  Cpu
    Activity 0:03:37 ago
switch>
```

### 34.3.3 Configuring Static IP Mroute

The static IP multicast route (or static mroute) interface overrides the interface that is ordinarily selected from the marching route in the unicast routing table, providing a means for breaking dependence on multicast topology for unicast topology. The command `ip mroute` specifies a candidate for the multicast reverse path forwarding (RPF) interface of any (S,G) multicast route, where the source falls within the given source or mask.

### 34.3.3.1 Selecting RPF interface

Static mroutes are stored in a separate routing table, the Multicast Routing Information Base (MRIB). The RPF interface is selected for a source as follows:

- A route to the source is selected from the unicast Rib (based on the existing unicast Rib lookup algorithm).
- A route to the source is selected from the mrib.
- If only one of the above lookups yields a route, that route is used to select the RPF interface.
- If both of the above lookups yield a route, the admin distances of the two routes is compared. The route with the lower admin distance is used to select the RPF interface.
- Comparing the static mroute and the unicast route, the static mroute is the winner even though both have the same distance.
- Comparing routes from the two Ribs is not driven by specificity. The route with the lower cost is selected even if less specific.
- A connected route in the unicast Rib will always win.
- Static mroutes, by default, have an admin distance of one (1).
- For a static mroute to be considered for selection, the specified interface must be up and the Pim must be enabled on it.

### 34.3.3.2 Selecting Static Mroutes

The longest match is selected when a source matches multiple static mroutes in the mrib. The order in which static mroutes were configured is not a factor.
Example

- This command selects the longest match when a source matches multiple static mroutes in the mrib.

```
switch(config-as)#ip mroute 10.0.0.0/16 Ethernet 4
switch(config-as)#ip mroute 11.10.1.0/24 Ethernet 5
switch(config-as)#ip mroute 11.10.1.2/32 Ethernet 6
switch(config-as)#
```

Example

- This command includes an administrative distance of 255 on Ethernet 5 with a static mroute.

```
switch(config-as)#ip mroute 10.0.0.0/16 Ethernet 4
switch(config-as)#ip mroute 11.10.1.0/24 Ethernet 5 255
switch(config-as)#ip mroute 11.10.1.2/32 Ethernet 6
switch(config-as)#
```

34.3.4 Displaying and Clearing the mroute Table

The mroute table stores the states of inbound and outbound interfaces for each source-group pair (S,G). The switch discards and forwards packets on the basis of this state information. Each table entry, referred to as an mroute, corresponds to a unique (S,G) and contains:

- the multicast group address
- the multicast source address (or * for all sources)
- the inbound interface
- a list of outbound interfaces

Clearing mroute Entries

The `clear ip mroute` command removes route entries from the mroute table:

- `clear ip mroute *` all entries from the mroute table.
- `clear ip mroute gp_ipv4` all entries for the specified multicast group.
- `clear ip mroute gp_ipv4 src_ipv4` all entries for the specified source sending to a specified group.

Examples

- This command removes all route entries from the mroute table.

```
switch#clear ip mroute *
switch#
```

- This command removes entries for source 228.3.10.1 sending to multicast group 224.2.205.42.

```
switch#clear ip mroute 224.2.205.42 228.3.10.1
switch#
```

Displaying the mroute Table

The `show ip mroute count` command displays IP multicast routing table statistics.
Example

- This command displays IP multicast routing table statistics.

  switch>show ip mroute count
  IP Multicast Statistics
  1 groups and 1 sources
  Multicast routes: 1 (*,G), 1 (S,G)
  Average of 1.00 sources per group
  Maximum of 1 sources per group:
    228.24.12.1
  switch>

  The `show ip mroute` command displays information from the IP multicast routing table.

  - `show ip mroute` displays information for all routes in the table.
  - `show ip mroute gp_addr` displays information for the specified multicast group.

Example

- This command displays the IP multicast routing table for the multicast group 225.1.1.11

  switch>show ip mroute 225.1.1.1
  PIM Sparse Mode Multicast Routing Table
  Flags: E - Entry forwarding on the RPT, J - Joining to the SPT
  R - RPT bit is set, S - SPT bit is set
  W - Wildcard entry, X - External component interest
  I - SG Include Join alert rcvd, P - Ex-Prune alert rcvd
  H - Joining SPT due to policy, D - Joining SPT due to protocol
  Z - Entry marked for deletion
  A - Learned via Anycast RP Router
  225.1.1.1
    172.28.1.100, 5d04h, flags: S
    Incoming interface: Vlan281
    Outgoing interface list:
      Port-Channel1999
  switch>
34.4 **Multicast Commands**

**Multicast Configuration Commands (Global)**
- `ip mfib activity polling-interval`
- `ip mfib cache-entries unresolved max`
- `ip mfib max-fastdrops`
- `ip mfib packet-buffers unresolved max`
- `ip mroute`
- `ip multicast multipath none`
- `ip multicast-routing`

**Multicast Configuration Commands (Interface)**
- `ip mfib fastdrop`
- `ip multicast boundary`

**Multicast Clear Commands**
- `clear ip mfib fastdrop`
- `clear ip mroute`

**Multicast Display Commands**
- `show ip mfib`
- `show ip mfib software`
- `show ip mroute`
- `show ip mroute count`
clear ip mfib fastdrop

The `clear ip mfib fastdrop` command removes all fast-drop entries from the MFIB table.

**Command Mode**
Privileged EXEC

**Command Syntax**

```
clear ip mfib fastdrop
```

**Example**

- This command removes all fast-drop entries from the MFIB table.

```
switch#clear ip mfib fastdrop
switch#
```
clear ip mroute

The `clear ip mroute` command removes route entries from the mroute table, as follows:

- `clear ip mroute *` all entries from the mroute table.
- `clear ip mroute gp_ipv4` all entries for the specified multicast group.
- `clear ip mroute gp_ipv4 src_ipv4` all entries for the specified source sending to a specified group.

Command Mode
Privileged EXEC

Command Syntax
`clear ip mroute ENTRY_LIST`

Parameters
- `ENTRY_LIST` entries that the command removes from the mroute table. Options include:
  - `*` all route entries are removed from the table
  - `gp_ipv4` all entries for multicast group `gp_ipv4` (dotted decimal notation).
  - `gp_ipv4 src_ipv4` all entries for source (`src_ipv4`) sending to group (`gp_ipv4`).

Examples
- This command removes all route entries from the mroute table.
  `switch#clear ip mroute *`
  `switch#`
- This command removes entries for the source 228.3.10.1 sending to multicast group 224.2.205.42.
  `switch#clear ip mroute 224.2.205.42 228.3.10.1`
  `switch#`
ip mfib activity polling-interval

The switch records activity levels for multicast routes in the mfib after polling the corresponding hardware activity bits. The `ip mfib activity polling-interval` command specifies the frequency that the switch polls the hardware activity bits for the multicast routes.

The `no ip mfib activity polling-interval` and `default ip mfib activity polling-interval` commands restore the default interval of 60 seconds by removing the `ip mfib activity polling-interval` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip mfib activity polling-interval period
no ip mfib activity polling-interval
default ip mfib activity polling-interval
```

**Parameters**

- `period` interval (seconds) between polls. Values range from 1 to 60. Default is 60.

**Example**

- This command sets the MFIB activity polling period at 15 seconds.

```
switch(config)#ip mfib activity polling-interval 15
switch(config)#
```
**ip mfib cache-entries unresolved max**

The `ip mfib cache-entries unresolved max` command specifies the buffer size for storing multicast packets whose routes are not cached and that have not been otherwise dropped. The default buffer size is 4000 packets.

The `ip mfib packet-buffers unresolved max` command configures the number of packets for an individual (S,G) entry that the switch can process before its route is entered into cache. Packets that exceed this limit for an individual route are dropped. The `ip mfib cache-entries unresolved max` is the cumulative limit for all routes; packets that exceed this limit are dropped even if they do not exceed the limit for their routes.

The `no ip mfib cache-entries unresolved max` and `default ip mfib cache-entries unresolved max` commands restore the default unresolved cache-entries buffer size of 4000 packets by removing the `ip mfib cache-entries unresolved max` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip mfib cache-entries unresolved max quantity_entries
no ip mfib cache-entries unresolved max
default ip mfib cache-entries unresolved max
```

**Parameters**

- `quantity_entries` maximum buffer size (packets). Value ranges from 10 to 10000000. Default is 4000.

**Example**

- This command sets the maximum mfib unresolved cache-entry buffer size at 6000 packets.
  
  ```
  switch(config)#ip mfib cache-entries unresolved max 6000
  switch(config)#
  ```
**ip mfib fastdrop**

In IP multicast protocols, every (S,G) or (*,G) route is associated with an inbound RPF (reverse path forwarding) interface. Packets arriving on an interface not associated with the route may need CPU-dependent PIM processing, so packets received by non-RPF interfaces are sent to the CPU by default, causing heavy CPU processing loads.

Multicast routing protocols often do not require non-RPF packets; these packets do not require software processing. The CPU therefore updates the hardware MFIB with a fast-drop entry when it receives a non-RPF interface packet that PIM does not require. Additional packets that match the fast-drop entry are not sent to the system software.

Fastdrop is enabled on all interfaces by default. The `no ip mfib fastdrop` command disables MFIB fast drops for the configuration mode interface.

The `ip mfib fastdrop` and `default ip mfib fastdrop` commands enable MFIB fast drops for the configuration mode interface by removing the corresponding `no ip mfib fastdrop` command from `running-config`.

The `clear ip mfib fastdrop` command, in global configuration mode, removes all MFIB fast drop entries on all interfaces.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `ip mfib fastdrop`
- `no ip mfib fastdrop`
- `default ip mfib fastdrop`

**Examples**
- This command enables MFIB fast drops for the VLAN interface 120.

  ```
  switch(config)#interface vlan 120
  switch(config-if-Vl120)#ip mfib fastdrop
  switch(config-if-Vl120)#
  ```
The **ip mfib max-fastdrops** command limits the number of fast drop routes that the switch’s MFIB table can contain.

The **no ip mfib max-fastdrops** and **default ip mfib max-fastdrops** commands restore the default fast drop route limit of 1024 by removing the **ip mfib max-fastdrops** command from **running-config**.

### Command Mode
- **Global Configuration**

### Command Syntax
- `ip mfib max-fastdrops`  
- `no ip mfib max-fastdrops`  
- `default ip mfib max-fastdrops`

### Parameters
- **quantity** number of fast-drop routes. Value ranges from 0 to 1000000 (one million). Default is 1024.

### Example
- This command sets the maximum number of fast drop routes at 2000.

```bash
switch(config)#ip mfib max-fastdrops 2000
switch(config)#
```
The `ip mfib packet-buffers unresolved max` command specifies the number of (S,G) multicast packets for an individual route that the switch can process before the (S,G) entry is entered into cache. Packets that are received in excess of this limit before the route is programmed into the cache are dropped. By default, the switch processes 3 unresolved packets for an individual route.

The `ip mfib cache-entries unresolved max` command specifies the buffer size for storing multicast packets whose routes are not cached and that have not been otherwise dropped. This command is the cumulative limit for all routes; packets that exceed this limit are dropped even if they do not exceed the limit for their routes.

The `no ip mfib packet-buffers unresolved max` and `default ip mfib packet-buffers unresolved max` commands restore the number of unresolved packets that the switch processes to the default value of 3 packets by removing the `ip mfib packet-buffers unresolved max` command from `running-config`.

**Command Mode**
- Global Configuration

**Command Syntax**
- `ip mfib packet-buffers unresolved max quantity_packets`
- `no ip mfib packet-buffers unresolved max`
- `default ip mfib packet-buffers unresolved max`

**Parameters**
- `quantity_packets` packets per unresolved route that the switch processes. Value ranges from 3 to 10000000. Default is 3.

**Example**
- This command programs the switch to process three multicast packets from any route regardless of its entry’s presence in the multicast routing cache.
  
  ```bash
  switch(config)#ip mfib packet-buffers unresolved max 30
  switch(config)#
  ```
The `ip multicast boundary` command specifies subnets where source traffic entering the configuration mode interface is dropped, preventing the creation of mroute states on the interface. The interface is not included in the outgoing interface list (OIL). The multicast boundary can be specified through multiple IPv4 subnets or one standard IPv4 ACL.

Multicast PIM, IGMP and other multicast data cannot cross the boundary, facilitating the use of a multicast group address in multiple administrative domains.

The `no ip multicast boundary` and `default ip multicast boundary` commands delete the specified subnet restriction by removing the corresponding `ip multicast boundary` command from `running-config`. When these commands do not specify a subnet address, all `ip multicast boundary` statements for the configuration mode interface are removed.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
```
ip multicast boundary SUB_NET [TCAM]
nop ip multicast boundary [SUB_NET]
default ip multicast boundary [SUB_NET]
```

**Parameters**
- **SUB_NET** the subnet address configured as the multicast boundary. Options include:
  - `net_addr` multicast subnet address (CIDR or address mask).
  - `acl_name` standard access control list (ACL) that specifies the multicast group addresses.
- **TCAM** specifies address inclusion in the routing table. Options include:
  - `<no parameter>` boundaries ((S,G) entries) are added to routing table.
  - `out` boundaries are not added to routing table.

**Guidelines**
When `out` is selected, the first inbound data packet corresponding to the `SUB_NET` may be sent to the CPU. In response, the packet is dropped and the boundary prefix is added to the hardware table. In this scenario, the mroute entry is added only when data traffic is received.

**Restrictions**
Only one command that specifies an ACL can be assigned to an interface. Commands that specify an ACL and a subnet cannot be simultaneously assigned to an interface.

**Examples**
- This command configures the multicast address of 229.43.23.0/24 as a multicast boundary where source traffic is restricted from VLAN interface 300.
```
switch(config)#interface vlan 300
switch(config-if-vl300)#ip multicast boundary 229.43.23.0/24
switch(config-if-vl300)#
```
These commands create a standard ACL, then implements ACL in an ip multicast boundary command to configure two boundary subnets (225.123.0.0/16 and 239.120.10.0/24).

```
switch(config)#ip access-list standard mbac1
switch(config-std-acl-mbac1)#10 deny 225.123.0.0/16
switch(config-std-acl-mbac1)#20 deny 239.120.10.0/24
switch(config-std-acl-mbac1)#exit
switch(config)#interface vlan 200
switch(config-if-Vl200)#ip multicast boundary mbac1
switch(config-if-Vl200)#exit
switch(config)#
```
ip mroute

The `ip mroute` command specifies a candidate for the multicast reverse path forwarding (RPF) interface of any (S,G) multicast route, where the source falls within the given source or mask. Static mroutes are stored in a separate routing table, the Multicast Routing Information Base (MRIB).

**Command Mode**
Global Configuration

**Command Syntax**
```
ip mroute [source-prefix|source-address <mask>]
[rpf-interface|rpf-neighbor]
[admin distance]
no ip mroute [source-prefix|source-address <mask>]
[rpf-interface|rpf-neighbor]
default ip mroute [source-prefix|source-address <mask>]
[rpf-interface|rpf-neighbor]
```

**Parameters**
- `source-prefix` specifies the source prefix.
- `source-address` specifies the source address.
- `mask` specifies the address mask.
- `rpf-interface` specifies the multicast RPF interface.
- `rpf-neighbor` specifies the multicast RPF neighbor.

**Examples**
- This command selects the longest match when a source matches multiple static mroutes in the MRIB.
  
  switch(config-as)#ip mroute 10.0.0.0/16 Ethernet 4
  switch(config-as)#ip mroute 11.10.1.0/24 Ethernet 5
  switch(config-as)#ip mroute 11.10.1.2/32 Ethernet 6
  switch(config-as)#

- This command includes an administrative distance of 255 on Ethernet 5 with static mroute.
  
  switch(config-as)#ip mroute 10.0.0.0/16 Ethernet 4
  switch(config-as)#ip mroute 11.10.1.0/24 Ethernet 5 255
  switch(config-as)#ip mroute 11.10.1.2/32 Ethernet 6
  switch(config-as)#
The `ip multicast multipath none` command routes multicast ECMP traffic to the neighbor with the highest IPv4 address. By default, multicast traffic is load balanced by distributing packets over all ECMP links.

The `no ip multicast multipath none` and `default ip multicast multipath none` commands restore the default behavior of randomly distributing multicast traffic over all ECMP links by removing the `ip multicast multipath none` command from `running-config`.

**Command Mode**
- Global Configuration

**Command Syntax**
- `ip multicast multipath none`
- `no ip multicast multipath none`
- `default ip multicast multipath none`

**Example**
- This command configures the switch to route multicast traffic through the ECMP link to the neighbor with the highest IP address.

```
switch(config)#ip multicast multipath none
switch(config)#
```
ip multicast-routing

The ip multicast-routing command allows the switch to forward multicast packets. Multicast routing is disabled by default.

The no ip multicast-routing and default ip multicast-routing commands disables multicast routing removing the ip multicast-routing command from running-config.

Command Mode
   Global Configuration

Command Syntax
   ip multicast-routing
   no ip multicast-routing
   default ip multicast-routing

Example
   • This command enables multicast routing on the switch.
     switch(config)#ip multicast-routing
     switch(config)#
show ip mfib

The show ip mfib command displays information about the interfaces and the hardware-forwarded routes included in the IPv4 Multicast Forwarding Information Base (MFIB). Use the show ip mfib software command for software-forwarded routes.

Parameter options are available to filter output by group address or group and source addresses.

Command Mode
EXEC

Command Syntax
show ip mfib [ROUTE]

Parameters
- **ROUTE** routes displayed, filtered by multicast group and source IP addresses:
  - <no parameter> all multicast messages of the specified group are fast-switched.
  - **group_addr** multicast group IPv4 address.
  - **group_addr source address** two IPv4 addresses: multicast group and source addresses.

Example
- This command displays MFIB information for hardware-forwarded routes.

```
switch>show ip mfib
Activity poll time: 60 seconds
239.255.255.250 172.17.26.25
  Vlan26 (iif)  Vlan2028  Cpu
    Activity 0:02:11 ago
239.255.255.250 172.17.26.156
  Vlan26 (iif)  Vlan2028  Cpu
    Activity 0:02:11 ago
239.255.255.250 172.17.26.190
  Vlan26 (iif)  Vlan2028  Cpu
    Activity 0:02:11 ago
239.255.255.250 172.17.26.209
  Vlan26 (iif)  Vlan2028  Cpu
    Activity 0:02:11 ago
239.255.255.250 172.17.26.223
  Vlan26 (iif)  Vlan2028  Cpu
    Activity 0:02:11 ago

switch>
```
show ip mfib software

The show ip mfib software command displays information about the interfaces and the software-forwarded routes included in the IPv4 Multicast Forwarding Information Base (MFIB). Use the show ip mfib command for hardware-forwarded routes.

Parameter options are available to filter output by group address or group and source address.

Command Mode
EXEC

Command Syntax
show ip mfib software [INFO_LEVEL][ROUTE]

Parameters
- **INFO_LEVEL** specifies the type of information displayed. Options include
  - <no parameter> Output displays packet reception counters.
  - detail Output displays packet reception counters and packet queued/dropped counters.
- **ROUTE** routes displayed, filtered by multicast group and source IP addresses:
  - <no parameter> all multicast messages of the specified group are fast-switched.
  - group_addr multicast group IPv4 address.
  - group_addr source address two IPv4 addresses: multicast group and source addresses.

Example
- This command displays MFIB information for software-forwarded routes.
  
  switch>show ip mfib software
  239.255.255.250 172.17.41.150
  Vlan3040 (iif)
  Packets Received: 18
  Bytes Received : 9147
  RPF Failures    : 0
  239.255.255.250 172.17.41.120
  Vlan3040 (iif)
  Packets Received: 6
  Bytes Received : 966
  RPF Failures    : 0

  switch>
- This command displays MFIB information for software-forwarded routes.
  
  switch>show ip mfib software detail
  239.255.255.250 172.17.41.150
  Vlan3040 (iif)
  Packets Received: 18
  Bytes Received : 9147
  RPF Failures    : 0
  Packets Queued/Dropped : 0 / 0
  239.255.255.250 172.17.41.120
  Vlan3040 (iif)
  Packets Received: 6
  Bytes Received : 966
  RPF Failures    : 0
  Packets Queued/Dropped : 0 / 0

  switch>
show ip mroute

The `show ip mroute` command displays information from the IP multicast routing table.

- `show ip mroute` displays information for all routes in the table.
- `show ip mroute gp_addr` displays information for the specified multicast group.

**Command Mode**

EXEC

**Command Syntax**

```
show ip mroute
show ip mroute gp_addr
```

**Parameters**

- `gp_addr` group IP address (dotted decimal notation).

**Example**

- This command displays the IP multicast routing table for the multicast group 225.1.1.11

```
switch>show ip mroute 225.1.1.1
PIM Sparse Mode Multicast Routing Table
Flags: E - Entry forwarding on the RPT, J - Joining to the SPT
R - RPT bit is set, S - SPT bit is set
W - Wildcard entry, X - External component interest
I - SG Include Join alert rcvd, P - Ex-Prune alert rcvd
H - Joining SPT due to policy, D - Joining SPT due to protocol
Z - Entry marked for deletion
A - Learned via Anycast RP Router

225.1.1.1
172.28.1.100, 5d04h, flags: S
Incoming interface: Vlan281
Outgoing interface list:
- Port-Channel1999

switch>
```
show ip mroute count

The show ip mroute count command displays IP multicast routing table statistics.
The show ip mroute command displays information from the IP multicast routing table.

Command Mode
EXEC

Command Syntax
show ip mroute count

Example
• This command displays IP multicast routing table statistics.

switch>show ip mroute count
IP Multicast Statistics
1 groups and 1 sources
Multicast routes: 1 (*,G), 1 (S,G)
Average of 1.00 sources per group
Maximum of 1 sources per group:
    228.24.12.1
switch>
Chapter 35

IGMP and IGMP Snooping

IP multicast is the transmission of data packets to multiple hosts through a common IP address. Networks use Internet Group Management Protocol (IGMP) to control the flow of layer 3 multicast traffic. Hosts request and maintain multicast group membership through IGMP messages. IGMP snooping is a layer 2 optimization for the layer 3 IGMP protocol that extracts lists of hosts receiving multicast group traffic by monitoring IGMP network packets.

These sections describe the Arista IGMP and IGMP snooping implementation.

- Section 35.1: Introduction lists supported IGMP and IGMP snooping features.
- Section 35.2: IGMP Protocols describes IGMP and IGMP snooping.
- Section 35.3: Configuring IGMP describes IGMP configuration tasks.
- Section 35.4: Configuring IGMP Snooping describes IGMP snooping configuration tasks.
- Section 35.5: IGMP Host Proxy describes IGMP host proxy configuration tasks.
- Section 35.6: IGMP and IGMP Snooping Commands lists IGMP and IGMP snooping commands.

35.1 Introduction

35.1.1 Supported Features

For a list of the IGMP features that each Arista switch platform supports, referred to the supported features table here: https://www.arista.com/en/support/product-documentation/supported-features.
35.2 IGMP Protocols

35.2.1 IGMP

Networks use Internet Group Management Protocol (IGMP) to control the flow of layer 3 multicast traffic. Hosts request and maintain multicast group membership through IGMP messages. Multicast routers use IGMP to maintain a membership list of active multicast groups for each attached network.

- IGMP version 1 is defined in RFC 1112. Hosts can join multicast groups without a method to leave a group. Routers use a timeout-based process to determine when hosts lose interest in a group.
- IGMP version 2 is defined in RFC 2236. Version 2 adds leave messages that hosts use to terminate group membership.
- IGMP version 3 is defined in RFC 4604. Version 3 allows hosts to specify IP addresses within a group from where they receive traffic. Traffic from all other group addresses is blocked from the host.

With respect to each of its attached networks, a multicast router is either a querier or non-querier. Each physical network contains only one querier. A network with more than one multicast router designates the router with the lowest IP address as its querier.

Queriers solicit group membership information by periodically sending General Query messages. Queriers also receive unsolicited messages from hosts joining or leaving a multicast group. When a querier receives a message from a host, it updates its membership list for the group referenced in the message and the network where the message originated.

Queriers forward multicasts from remote sources only to networks as specified by its membership list. If a querier does not receive a report from a network host for a specific group, it removes the corresponding entry from the table and discontinues forwarding multicasts for that group on the network. Queriers also send group-specific queries after receiving a leave request from a host to determine if the network still contains active multicast group members. If it does not receive a membership report during the period defined by the last member query response interval, the querier removes the group-network entry from the membership list.

When a host receives a General Query, it responds with Membership Report messages for each of its multicast groups within the interval specified by the Max Response Time field in the query. IGMP suppresses multiple messages from different hosts on a network for the same group. Hosts send unsolicited Membership reports to join a multicast group and send leave messages to exit a group.

35.2.2 IGMP Snooping

IGMP snooping is a layer 2 switch process that extracts lists of hosts receiving multicast group traffic by monitoring IGMP network packets. The switch uses these lists to avoid flooding hosts with extraneous multicast traffic by sending group packets only to group members. Besides preventing local hosts from receiving traffic for groups they did not join, snooping prunes multicast traffic from links that do not contain IGMP clients.

When snooping is enabled, a switch examines IGMP packets sent between hosts connected to network switches and multicast routers (mrouters). When a switch finds an IGMP report from a multicast group recipient, it adds the recipient’s port to the group multicast list. When the switch receives an IGMP leave, it removes the recipient’s port from the list. Groups are removed upon the group timer expiry. When the switch finds an IGMP query packet or PIM hello packet from a multicast router, it adds the router’s port to the port list for all multicast groups.
Snooping Querier

Snooping requires an IGMP querier in the network to create multicast group tables. An IGMP snooping querier performs the multicast router (mrouter) role when the network does not have a router. When the snooping querier is enabled on a VLAN, the switch periodically broadcasts IGMP queries and listens for IGMP Reports that indicate host group memberships.

Networks that contain multiple snooping queriers elect one as the querier, based on IP address. When IGMP snooping querier is enabled on a VLAN, the switch performs as a querier only when it is elected or it is the only snooping querier on the network.

L2 Report Flooding

L2 report flooding is an IGMP snooping feature that forwards membership report messages to specified ports. Relying on a single switch to maintain and send report messages can degrade performance. L2 report flooding addresses this by facilitating report message forwarding through any network port. This allows switches to bypass the querier when forwarding multicast traffic to its interested ports.
35.3 Configuring IGMP

This section describes the following configuration tasks:

- Section 35.3.1: Enabling IGMP
- Section 35.3.2: Configuring IGMP Settings

35.3.1 Enabling IGMP

Enabling PIM also enables IGMP on that interface. When the switch fills the multicast routing table, it only adds interfaces when the interface receives join messages from downstream devices or when the interface is directly connected to a member of the IGMP group.

By default, PIM and IGMP are disabled on an interface. The command enables PIM and IGMP on the configuration mode interface.

**Example**

- This command enables PIM and IGMP on VLAN interface 8.

```
switch(config)#interface vlan 8
switch(config-if-Vl8)#ip pim sparse-mode
```

35.3.2 Configuring IGMP Settings

An interface that runs IGMP uses default protocol settings unless otherwise configured. The switch provides commands that alter startup query, last member query, and normal query settings.

**IGMP Version**

The switch supports IGMP versions 1 through 3. The `ip igmp version` command configures the IGMP version on the configuration mode interface. Version 3 is the default IGMP version.

**Example**

- This command configures IGMP version 3 on VLAN interface 4

```
switch(config)#interface vlan 4
switch(config-if-Vl4)#ip igmp version 3
```

**Startup Query**

Membership queries are sent at an increased frequency immediately after an interface starts up to quickly establish the group state. Query count and query interval commands adjust the period between membership queries for a specified number of messages.

The `ip igmp startup-query-interval` command specifies the interval between membership queries that an interface sends immediately after it starts up. The `ip igmp startup-query-count` command specifies the number of queries that the switches sends from the interface at the startup interval rate.

**Example**

- These commands define a startup interval of 15 seconds for the first 10 membership queries sent from VLAN interface 12.

```
switch(config)#interface vlan 12
switch(config-if-Vl12)#ip igmp startup-query-interval 150
switch(config-if-Vl12)#ip igmp startup-query-count 10
```
Chapter 35: IGMP and IGMP Snooping

Configuring IGMP

Membership Queries
The router with the lowest IP address on a subnet sends membership queries as the IGMP querier. When a membership query is received from a source with a lower IP address, the router resets its query response timer. Upon timer expiry, the router begins sending membership queries. If the router subsequently receives a membership query originating from a lower IP address, it stops sending membership queries and resets the query response timer.

The `ip igmp query-interval` command configures the frequency at which the active interface, as an IGMP querier, sends membership query messages.

The `ip igmp query-max-response-time` command configures the time that a host has to respond to a membership query.

Example
- These commands define a membership query interval of 75 seconds and a query response timer reset value of 45 seconds for queries sent from VLAN interface 15.

```
switch(config)#interface vlan 15
switch(config-if-Vl15)#ip igmp query-interval 75
switch(config-if-Vl15)#ip igmp query-max-response-time 450
```

Last Member Query
When the querier receives an IGMP leave message, it verifies the group has no remaining hosts by sending a set of group-specific queries at a specified interval. If the querier does not receive a response to the queries, it removes the group state and discontinues multicast transmissions.

The `ip igmp last-member-query-count` (LMQC) command specifies the number of query messages the router sends in response to a group-specific or group-source-specific leave message.

The `ip igmp last-member-query-interval` command configures the transmission interval for sending group-specific or group-source-specific query messages to the active interface.

Example
- These commands program the switch to send 3 query messages, one every 25 seconds, when VLAN interface 15 receives an IGMP leave message.

```
switch(config)#interface vlan 15
switch(config-if-Vl15)#ip igmp last-member-query-interval 250
switch(config-if-Vl15)#ip igmp last-member-query-count 3
```

Static Groups
The `ip igmp static-group` command configures the configuration mode interface as a static member of the multicast group at the specified address. The router forwards multicast group packets through the interface without otherwise appearing or acting as a group member. No interface is a static member of a multicast group by default.

Note
To become a static member of a multicast group, the switch must be the PIM designated router (DR) for the network. If it is not, you can use the `ip pim dr-priority` command to make it the DR by configuring its PIM DR value to be the highest on the network.
Example

- These commands configure VLAN interface 15 as the PIM designated router, then configure it as a static member of the multicast group at address 231.1.1.15 for multicast data packets that originate at 10.1.1.1.

  switch(config)#interface vlan 15
  switch(config-if-Vl15)#ip pim dr-priority 5000
  switch(config-if-Vl15)#ip igmp static-group 231.1.1.45 10.1.1.1
  switch(config-if-Vl15)#
35.4 Configuring IGMP Snooping

This section describes the following configuration tasks:

- Section 35.4.1: Enabling Snooping
- Section 35.4.2: Configuring Snooping Parameters
- Section 35.4.3: Snooping Querier
- Section 35.4.4: IGMP Snooping L2 Report Flooding
- Section 35.4.5: IGMP Snooping Filters

35.4.1 Enabling Snooping

The switch provides two control settings for snooping IGMP packets:

- Global settings control the availability of IGMP snooping on the switch. Snooping is globally enabled by default.
- Per-VLAN settings control IGMP on individual VLANs. If snooping is enabled on the VLAN, it follows the global snooping state.

The `ip igmp snooping` command controls the global snooping setting. The `ip igmp snooping vlan` command configures snooping on individual VLANs.

Examples

- This command globally enables snooping on the switch.
  
  switch(config)#ip igmp snooping
  switch(config)#

- This command disables snooping on VLANs 2 through 4.
  
  switch(config)#no ip igmp snooping vlan 2-4
  switch(config)#

35.4.2 Configuring Snooping Parameters

Specifying a Static Multicast Router Connection

The `ip igmp snooping vlan mrouter` command statically configures a port that connects to a multicast router to join all multicast groups. The port to the router must be in the specified VLAN range.

Snooping may not always be able to locate the IGMP querier. This command is for IGMP queriers that are known to connect through the network to a port on the switch.

Example

- This command configures the static connection to a multicast router through Ethernet port 3.
  
  switch(config)#ip igmp snooping vlan 2 mrouter interface ethernet 3
  switch(config)#

Adding a Port to a Multicast Group

The `ip igmp snooping vlan static` command adds an a port to a multicast group. The IP address must be an unreserved IPv4 multicast address. The interface to the port must be in the specified VLAN range.
Example

- This command configures the static connection to a multicast group at 237.2.1.4 through Ethernet port 3.

```
switch(config)#ip igmp snooping vlan 7 static 237.2.1.4 interface ethernet 3
switch(config)#
```

Robustness Variable

The robustness variable specifies the number of unacknowledged snooping queries that a switch sends before removing the recipient from the group list.

The `ip igmp snooping robustness-variable` command configures the robustness variable for all snooping packets sent from the switch. The default value is 2.

Example

- This command sets the robustness-variable value to 3.

```
switch(config)#ip igmp snooping robustness-variable 3
switch(config)#
```

Configuring Interface Startup Initial Query Times

The `ip igmp snooping interface-restart-query` command configures the interface startup initial query times in milliseconds. If nothing is configured, a default value of 2000 milliseconds is used. Issuing the command replaces any values already configured. Multiple values may be input in a single command; this makes the mechanism more resilient in the case of dropped packets.

Examples

- This command configures interfaces to send IGMP queries at 1000, 2000, and 4000 milliseconds (i.e., 1 second, 2 seconds, and 4 seconds) after an interface restart or spanning tree change.

```
switch(config)#ip igmp snooping interface-restart-query 1000 2000 4000
switch(config)#
```

Example

- This command configures interfaces to send a single IGMP query 5000 milliseconds (i.e., 5 seconds) after an interface restart or spanning tree change.

```
switch(config)#ip igmp snooping interface-restart-query 5000
switch(config)#
```

35.4.3 Snooping Querier

The IGMP snooping querier supports snooping by sending layer 2 membership queries to hosts attached to the switch. Note that if IGMP snooping is enabled, QoS will not apply to IGMP packets.

35.4.3.1 Enabling the Snooping Querier

Enabling the snooping querier on an interface requires the explicit configuration of a global querier address or a local querier address for the interface. See Section 35.4.3.2.

The switch provides two control settings for controlling the snooping querier:

- The global setting controls the querier on VLANs for which there is no snooping querier command.
- VLAN querier settings take precedence over the global querier setting.

The `ip igmp snooping querier` command controls the global querier setting. When enabled globally, the querier is controlled on individual VLANs through the `ip igmp snooping vlan querier` command.
The `ip igmp snooping vlan querier` command controls the querier for the specified VLANs. VLANs follow the global querier setting unless overridden by one of these commands:

- `ip igmp snooping vlan querier` enables the querier on specified VLANs.
- `no ip igmp snooping vlan querier` disables the querier on specified VLANs.

**Example**

- These commands globally enables the snooping querier on the switch, explicitly disables snooping on VLANs 1-4, and explicitly enables snooping on VLANs 5-8.

  ```
  switch(config)#ip igmp snooping querier
  switch(config)#no ip igmp snooping vlan 1-4 querier
  switch(config)#ip igmp snooping vlan 5-8 querier
  switch(config)#
  ```

- This command removes the querier setting for VLANs 3-6:

  ```
  switch(config)#default ip igmp snooping vlan 3-6 querier
  switch(config)#
  ```

**Globally Set the Snooping Querier Version**

The `ip igmp snooping querier version` command configures the IGMP snooping querier version. Version 3 is the default IGMP snooping version.

**Example**

- This command globally configures IGMP snooping querier version 2.

  ```
  switch(config)#ip igmp snooping querier version 2
  switch(config)#
  ```

The `ip igmp snooping vlan querier version` command configures IGMP globally on the VLAN. Version 3 is the default IGMP snooping version.

**Example**

- This command configures IGMP snooping vlan querier version VLAN 5.

  ```
  switch(config)#ip igmp snooping vlan 5 querier version 2
  switch(config)#
  ```

### 35.4.3.2 Configuring Snooping Querier Parameters

**Querier Address**

The switch provides two IP addresses for setting the querier source:

- The global address is used by VLANs for which there is no querier address command.
- VLAN querier address settings take precedence over the global querier address.

The snooping querier address specifies the source IP address for IGMP snooping query packets that the switch transmits. The source address is also used to elect a snooping querier when the subnet contains multiple snooping queriers.

The default global querier address is not defined. When the configuration includes a snooping querier, a querier address must be defined globally or for each interface that enables a querier.

The `ip igmp snooping querier address` command sets the global querier source IP address for the switch. VLANs use the global address unless overwritten with the `ip igmp snooping vlan querier address` command. The default global address is not defined.
The **ip igmp snooping vlan querier address** command sets the source IP address for query packets transmitted from the specified VLAN. This command overrides the **ip igmp snooping querier address** for the specified VLAN.

**Examples**
- This command sets the source IP address for query packets that the switch transmits to 10.1.1.41.
  ```
  switch(config)#ip igmp snooping querier address 10.1.1.41
  switch(config)#
  ```
- This command sets the source IP address for query packets that VLAN 2 transmits to 10.14.1.1.
  ```
  switch(config)#ip igmp snooping vlan 2 querier address 10.14.1.1
  switch(config)#
  ```

**Membership Query Interval**
The query interval is the period (seconds), between IGMP Membership Query message transmissions. The interval ranges from 5 to 3600 seconds. The **ip igmp snooping querier query-interval** command specifies the global query interval for packets the switch sends as a snooper querier. The default global setting is 125 seconds.

The **ip igmp snooping vlan querier query-interval** command specifies the query interval for packets sent from the snooping querier to the specified VLAN, overriding the global setting. VLANs that do not specify a query interval use the global setting.

**Examples**
- This command sets a query interval of 150 seconds for queries transmitted from VLANs for which a query interval is not configured.
  ```
  switch(config)#ip igmp snooping querier query-interval 150
  switch(config)#
  ```
- This command sets the query interval of 240 seconds for queries transmitted from VLAN 2.
  ```
  switch(config)#ip igmp snooping vlan 2 querier query-interval 240
  switch(config)#
  ```

**Membership Query Response Interval**
The Max Response Time field, in Membership Query messages, specifies the longest time a host can wait before responding with a Membership Report message. In all other messages, the sender sets the field to zero and the receiver ignores it. The switch provides two values for setting this field:
- The global value is used by VLANs for which there is no Max Response Time command.
- VLAN values take precedence over the global value for the specified VLAN.

The **ip igmp snooping querier max-response-time** command specifies the global Max Response Time value used in snooping query packets transmitted from the switch. Values range from 1 to 25 seconds with a default of 10 seconds. VLANs use the global setting unless overwritten with the **ip igmp snooping vlan querier max-response-time** command.

The **ip igmp snooping vlan querier max-response-time** command configures the Max Response Time field contents for packets transmitted from the specified VLAN, overriding the global setting.
Examples

- This command sets the maximum response time of 15 seconds for queries transmitted from VLANs for which a maximum response time is not configured.
  
  ```
  switch(config)#ip igmp snooping querier max-response-time 15
  switch(config)#
  ```

- This command sets a maximum response time of 5 seconds for queries that VLAN 2 transmits.
  
  ```
  switch(config)#ip igmp snooping vlan 2 querier max-response-time 5
  switch(config)#
  ```

Last Member Query

When the querier receives an IGMP leave message, it verifies the group has no remaining hosts by sending a set of group-specific queries at a specified interval. If the querier does not receive a response to the queries, it removes the group state and discontinues multicast transmissions.

The switch provides two values for setting this field:

- The global value is used by VLANs for which there is no last-member-query-interval defined.
- VLAN values take precedence over the global value for the specified VLAN.

The `ip igmp snooping querier last-member-query-interval` command specifies the global last-member-query-interval used in snooping query packets transmitted from the switch. This value is used for VLANs that do not have a value specified. Values range from 1 to 25 seconds with a global default of one second.

The `ip igmp snooping vlan querier last-member-query-interval` command configures the last-member-query-interval field contents for packets transmitted from the specified VLAN, overriding the global setting.

Example

- This command sets the global snooping querier last-member-query-interval to five seconds and the VLAN 10 last-member-query-interval to 12 seconds.
  
  ```
  switch(config)#ip igmp snooping querier last-member-query-interval 5
  switch(config)#ip igmp snooping vlan 10 querier last-member-query-interval 12
  switch(config)#
  ```

Interface Restart Query Spoofing

When the port status (link status or spanning tree status) changes, an IGMP general query is spoofed based on the information of the last known IGMP querier. This facilitates faster network convergence time.

By default, interfaces wait 2000 milliseconds before sending the spoofed IGMP query. To configure the delay before the spoofed query is sent, use the `ip igmp snooping interface-restart-query` command. This setting is applied to all ports.

Example

- This command configures the switch to send general IGMP queries at 100 milliseconds, 200 milliseconds, and 300 milliseconds after interface restart or spanning tree status change.
  
  ```
  switch(config)# ip igmp snooping interface-restart-query 100 200 300
  ```
35.4.4 IGMP Snooping L2 Report Flooding

L2 report flooding is an IGMP snooping feature that forwards membership report messages to specified ports. Report flooding is disabled by default and must be enabled globally before it can be enabled on individual interfaces.

The list of ports that can forward membership report messages must be explicitly configured. Commands are available to define lists of ports that are valid for all VLANs and port lists that are valid for specified VLAN ranges. Ports can forward membership reports only if they are configured to handle VLAN traffic, regardless of any report flooding configuration settings.

Enabling L2 Report Flooding

These commands enable L2 report flooding:

- `ip igmp snooping report-flooding` enables report flooding globally.
- `ip igmp snooping vlan report-flooding` enables report flooding on a specified VLAN range.

Example

These commands enable L2 report flooding globally, and on VLANs 201-205.

```
switch(config)#ip igmp snooping report-flooding
switch(config)#ip igmp snooping vlan 201-205 report-flooding
switch(config)#
```

Configuring Forwarding Ports

These commands specify the ports that forward membership report messages:

- `ip igmp snooping report-flooding switch-port` configures ports globally.
- `ip igmp snooping vlan report-flooding switch-port` configures ports for a specified VLAN range.

Example

These commands enable Ethernet ports 5-9 to forward reports on all VLANs and ports 12-15 on VLANs 201-205.

```
switch(config)#ip igmp snooping report-flooding switch-port ethernet 5-9
switch(config)#ip igmp snooping vlan 201-205 report-flooding switch-port ethernet 12-15
switch(config)#
```

35.4.5 IGMP Snooping Filters

IGMP Snooping filters assign IGMP profiles to Ethernet and port channel interfaces to control the multicast groups that the interfaces can join. An IGMP profile specifies a filter type and a list of address ranges. The address ranges comprise the multicast groups covered by the profile. The filter type determines an interface’s accessibility to the multicast groups:

- Permit filters define the multicast groups the interface can join.
- Deny filters define the multicast groups the interface cannot join.

Profiles are created in IGMP-profile configuration mode, then applied to an interface in interface configuration mode.

The `ip igmp profile` command places the switch in IGMP profile configuration mode. The `permit / deny` and `range` commands specify the profile’s filter type and address range. A profile may contain multiple range statements to define a discontiguous address range.
Example

- These commands create an IGMP profile named list_1 by entering IGMP-profile configuration mode, configure the profile to permit multicast groups 231.22.24.0 through 231.22.24.127, and return the switch to global configuration mode.

```
switch(config)#ip igmp profile list_1
switch(config-igmp-profile-list_1)#permit
switch(config-igmp-profile-list_1)#range 231.22.24.0 231.22.24.127
switch(config-igmp-profile-list_1)#exit
switch(config)#
```

The `ip igmp snooping filter` command applies an IGMP profile to the configuration mode interface.

Example

- These commands apply the `list_1` snooping profile to Ethernet interface 7.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#ip igmp snooping filter list_1
switch(config-if-Et7)#
```

35.4.5.1 Verifying IGMP Snooping

Show commands are available to display various configurations and IGMP snooping status. IGMP snooping that are viewable include:

- `show ip igmp snooping`
- `show ip igmp snooping counters`
- `show ip igmp snooping querier`
- `show ip igmp snooping querier counters`
- `show ip igmp snooping querier membership`

IGMP Snooping Status

The `show ip igmp snooping` command displays the switch’s IGMP snooping configuration.

Example

- This command displays the switch’s IGMP snooping configuration.

```
switch>show ip igmp snooping
   Global IGMP Snooping configuration:
   -------------------------------------------
   IGMP snooping                  : Enabled
   Robustness variable            : 2

   Vlan 1 :
   -------
   IGMP snooping                  : Enabled
   Multicast router learning mode : pim-dvmrp

   Vlan 20 :
   -------
   IGMP snooping                  : Enabled
   Multicast router learning mode : pim-dvmrp

   Vlan 2028 :

   switch>
```
IGMP Snooping Counters

The `show ip igmp snooping counters` command displays the number of IGMP messages sent and received through each switch port. The display table sorts the messages by type.

**Example**

- This command displays the number of messages received on each port.

```
switch>show ip igmp snooping counters
```

IGMP Snooping Querier

The `show ip igmp snooping querier` command displays snooping querier configuration and status information. Command provides options to only include specific VLANs.

**Example**

- This command displays the querier IP address, version, and port servicing each VLAN.

```
switch>show ip igmp snooping querier
```

<table>
<thead>
<tr>
<th>Vlan</th>
<th>IP Address</th>
<th>Version</th>
<th>Port</th>
</tr>

switch>
IGMP Snooping Querier Counters

The `show ip igmp snooping querier counters` command displays the counters from the querier, as learned through Internet Group Management Protocol (IGMP).

Example

- This command displays the counters from the querier.

```bash
switch>show ip igmp snooping querier counters
-----------------------------------------------------------------------
Vlan: 1    IP Addr: 100.0.0.1       Op State: Querier     Version: v3
v1 General Queries Sent         :0
v1 Queries Received             :0
v1 Reports Received             :0
v2 General Queries Sent         :1
v2 Queries Received             :0
v2 Reports Received             :25
v2 Leaves Received              :0
v3 General Queries Sent         :655
v3 GSQ Queries Sent             :0
v3 GSSQ Queries Sent            :8
v3 Queries Received             :654
v3 Reports Received             :2385
Error Packets                   :0
Other Packets                   :0
switch>
```

IGMP Snooping Querier Membership

The `show ip igmp snooping querier membership` command displays the membership from the querier, as learned through Internet Group Management Protocol (IGMP).

Example

- This command displays the membership from the querier fro VLAN 1.

```bash
switch>show ip igmp snooping querier membership
-------------------------------------------------------------------------
Vlan: 1    Elected: 100.0.0.1       QQI: 125  QRV: 2  QRI: 10  GMI: 260
Groups           Mode  Ver  Num of Sources
-------------------------------------------------------------------------
10.0.0.2        EX    v3   0 []
10.0.0.3        IN    v3   2 [ 3.3.3.3, 3.3.3.4 ]
10.0.0.4        EX    v3   0 []
10.0.0.13       EX    v3   0 []
10.0.0.22       EX    v3   0 []
10.0.0.1        IN    v3   3 [ 5.6.7.9, 5.6.7.8, ... ]
switch>
```
35.5 IGMP Host Proxy

IGMP Host-Proxy programs the switch as an IGMP host proxy. An IGMP host proxy exchanges IGMP reports (joins/leaves) between networks whose connection does not support PIM along network boundaries.

35.5.1 IGMP Host Proxy Description

Figure 35-1 displays a typical IGMP host-proxy implementation. The customer network connects to the sender network through the edge switch’s Ethernet 1 interface, which is configured as an IGMP host proxy. PIM is enabled within the sender and customer networks but not on the connection between the networks.

The IGMP proxy agent sends unsolicited IGMP joins when a (S,G) or (*,G) entry arrives in the Mroute Table. Subsequently, IGMP reports are sent when queries or group-specific queries arrive on the host proxy interface. When the customer network is void of active listeners, the connection eventually expires and the senders stop transmitting to the network.

Interfaces configured as IGMP host proxies support IGMP Versions 1, 2 and 3. Version 3 is assumed by default. The version of the unsolicited reports is specified through `ip igmp version`. Reports that are triggered by IGMP queries are sent in the same version as the received query.

IGMP host proxy requires the following:
- PIM MBR must be enabled on the interface.
- IP IGMP and IP multicast must be enabled.
- The switch must be an RP or in each host’s RP path.
- Fast drop entries are required when there are no interested listeners for the group.

IGMP host proxy is configurable to filter for specific multicast groups and sources.

35.5.2 IGMP Host Proxy Configuration

The IGMP host proxy service is configured on an interface by the interface configuration mode `ip igmp host-proxy` command.

When the host-proxy command does not specify a group address, the host proxy sends reports for all (S,G) and (*,G) entries. Specifying group addresses restricts the host proxy to sending reports only for specified groups and/or source, even no (*, G) entry in the mroute status table for that group. Multiple `ip igmp host-proxy` statements are required to specify multiple groups. The interval between IGMP reports is configured by `ip igmp host-proxy report-interval`. 

Figure 35-1: IP IGMP Host Proxy Implementation
The **no igmp host-proxy** version of the command disables the forwarding of IGMP reports. Supplying groups with **no** version removes relevant groups from the report. i.e. a report would be sent for applicable groups without sources.

When the configuration mode interface is set to IGMP version 3, the command can include or exclude source addresses. These commands are ignored when the interface runs any other IGMP version.

**IGMP host proxy** can also be enabled for the addresses defined by an ACL. If one or more groups are configured in addition to ACLs, the groups are processed first. If the ACL has a “deny all” rule for a group, then this filter takes precedence over configurations with include/exclude keywords or permit/deny rules for that group. If a group is configured with no filters and a host-proxy is configured with an ACL with rules having filters for the group, or configured with groups and source filters, then the filters are applied to the group.

**Examples**

- This command enables IGMP host proxy on Ethernet interface 17 for all multicast group addresses.

```bash
switch(config)#interface ethernet 17
switch(config-if-Et17)#ip igmp host-proxy
switch(config-if-Et17)#show active
interface Ethernet17
  ip igmp host-proxy
switch(config-if-Et17)#
```

- This command enables IGMP host proxy on Ethernet interface 18 for the multicast group at 231.10.10.1. The list of source addresses is not restricted.

```bash
switch(config)#interface ethernet 18
switch(config-if-Et18)#ip igmp host-proxy 231.10.10.1
switch(config-if-Et18)#show active
interface Ethernet18
  ip igmp host-proxy 231.10.10.1
switch(config-if-Et18)#
```

- This command enables IGMP host proxy on Ethernet interface 17 for the multicast group at 231.10.10.2. The list of source addresses only excludes 10.4.4.1 and 10.4.5.2.

```bash
switch(config)#interface ethernet 19
switch(config-if-Et19)#ip igmp host-proxy 231.10.10.2 exclude 10.4.4.1
switch(config-if-Et19)#ip igmp host-proxy 231.10.10.2 exclude 10.4.5.2
switch(config-if-Et19)#show active
interface Ethernet19
  ip igmp host-proxy 231.10.10.2 exclude 10.4.5.2
  ip igmp host-proxy 231.10.10.2 exclude 10.4.4.1
switch(config-if-Et19)#
```

- This command enables IGMP host proxy on Ethernet interface 16 for the multicast group at 231.10.10.3. The list of source address for this group only includes 10.5.5.1 and 10.5.5.2.

```bash
switch(config)#interface ethernet 16
switch(config-if-Et16)#ip igmp host-proxy 231.10.10.3 include 10.5.5.1
switch(config-if-Et16)#ip igmp host-proxy 231.10.10.3 include 10.5.5.2
switch(config-if-Et16)#show active
interface Ethernet16
  ip igmp host-proxy 231.10.10.3 include 10.5.5.2
  ip igmp host-proxy 231.10.10.3 include 10.5.5.1
  ip igmp host-proxy 231.10.10.3
switch(config-if-Et16)#
```
These commands configures a IGMP host proxy interval of five seconds on port channel 100.

```
switch(config)#interface port-channel 100
switch(config-if-Po100)#ip igmp host-proxy report-interval 5
switch(config-if-Po100)#show active
  interface Port-Channel100
    ip igmp host-proxy
    ip igmp host-proxy report-interval 5
switch(config-if-Po100)#
```

This command enables IGMP host proxy on Ethernet interface 17 for the group address(es) specified in ACL “acl1”

```
switch(config-if-Et17)#ip igmp host-proxy access-list acl1
switch(config-if-Et17)#show active
  interface Ethernet17
    ip igmp host-proxy
    ip igmp host-proxy access-list acl2
switch(config-if-Et17)#
```
35.6 IGMP and IGMP Snooping Commands

IGMP Configuration Commands (Interface Configuration Mode)

- ip igmp last-member-query-count
- ip igmp last-member-query-interval
- ip igmp query-interval
- ip igmp query-max-response-time
- ip igmp router-alert
- ip igmp startup-query-count
- ip igmp startup-query-interval
- ip igmp static-group
- ip igmp static-group acl
- ip igmp static-group range
- ip igmp version

IGMP Clear Commands

- clear ip igmp group
- clear ip igmp statistics

IGMP Display Commands

- show ip igmp groups
- show ip igmp groups count
- show ip igmp interface
- show ip igmp static-groups
- show ip igmp static-groups acl
- show ip igmp static-groups group
- show ip igmp statistics

IGMP Snooping Configuration Commands (Global Configuration Mode)

- ip igmp profile
- ip igmp snooping
- ip igmp snooping querier
- ip igmp snooping querier address
- ip igmp snooping querier last-member-query-count
- ip igmp snooping querier last-member-query-interval
- ip igmp snooping querier max-response-time
- ip igmp snooping querier query-interval
- ip igmp snooping querier startup-query-count
- ip igmp snooping querier startup-query-interval
- ip igmp snooping querier version
- ip igmp snooping report-flooding
- ip igmp snooping report-flooding switch-port
- ip igmp snooping restart query-interval
- ip igmp snooping robustness-variable
- ip igmp snooping vlan
- ip igmp snooping vlan immediate-leave
- ip igmp snooping vlan max-groups
- ip igmp snooping vlan mrouter
- ip igmp snooping vlan querier
- ip igmp snooping vlan querier address
- ip igmp snooping vlan querier last-member-query-count
• ip igmp snooping vlan querier last-member-query-interval
• ip igmp snooping vlan querier max-response-time
• ip igmp snooping vlan querier query-interval
• ip igmp snooping vlan querier startup-query-count
• ip igmp snooping vlan querier startup-query-interval
• ip igmp snooping vlan querier version
• ip igmp snooping vlan report-flooding
• ip igmp snooping vlan report-flooding switch-port
• ip igmp snooping vlan static

IGMP Configuration Commands (Interface Configuration Mode)
• ip igmp snooping filter

IGMP Snooping Clear Commands
• clear ip igmp snooping counters

IGMP Snooping Display Commands
• show ip igmp profile
• show ip igmp snooping
• show ip igmp snooping counters
• show ip igmp snooping counters ethdev-pams
• show ip igmp snooping groups
• show ip igmp snooping groups count
• show ip igmp snooping mrouter
• show ip igmp snooping querier
• show ip igmp snooping querier counters
• show ip igmp snooping querier membership
• show ip igmp snooping report-flooding

IGMP Profile Configuration Mode Commands
• permit / deny
• range

IGMP Host Proxy Commands
• ip igmp host-proxy
• ip igmp host-proxy report-interval
• show ip igmp host-proxy config-sanity
• show ip igmp host-proxy interface
clear ip igmp group

The `clear ip igmp group` command deletes IGMP cache entries as follows:

- `clear ip igmp group all` all entries from the IGMP cache.
- `clear ip igmp group gp_addr` all entries for a specified multicast group.
- `clear ip igmp group interface int_id` all entries that include a specified interface.
- `clear ip igmp group gp_addr interface int_id` all entries for a specified interface in a specified group.

Command Mode
Privileged EXEC

Command Syntax
```
clear ip igmp group [gp_addr] [interface INT_ID]
```

Parameters
- `gp_addr` multicast group IP address (dotted decimal notation).
- `INT_ID` interface name. Options include:
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-channel interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
  - `vxlan vx_num` VXLAN interface specified by `vx_num`.

Examples
- This command deletes all IGMP cache entries for the multicast group 231.23.23.14.
  ```
  switch#clear ip igmp group 231.23.23.14
  switch#
  ```
- This command deletes IGMP cache entries for Ethernet interface 16 in multicast group 226.45.10.45.
  ```
  switch#clear ip igmp group 226.45.10.45 interface ethernet 16
  switch#
  ```
clear ip igmp snooping counters

The clear ip igmp snooping counters command resets the snooping message counters for the specified interface. The snooping counters for all interfaces are reset if the command does not include an interface name.

The show ip igmp snooping counters command displays the counter contents. See the show ip igmp snooping counters command description for a list of available snooping counters.

Command Mode
Privileged EXEC

Command Syntax

clear ip igmp snooping counters [INT_NAME]

Parameters

- **INT_NAME** interface name. Formats include:
  - ethernet e_num Ethernet interface specified by e_num.
  - port-channel p_num Port-channel interface specified by p_num.
  - switch virtual interface to an L2 querier.

Example

- This command clears the snooping counters for messages received on Ethernet interface 15.

  switch(config)#clear ip igmp snooping counters ethernet 15
  switch(config)#
clear ip igmp statistics

The `clear ip igmp statistics` command resets IGMP transmission statistic counters for the specified interface.

**Command Mode**
Privileged EXEC

**Command Syntax**
```
clear ip igmp statistics [INTF_ID]
```

**Parameters**
- `INTF_ID` interface name. Options include:
  - `<no parameter>` all interfaces.
  - `interface ethernet e_num` Ethernet interface specified by `e_num`.
  - `interface loopback l_num` Loopback interface specified by `l_num`.
  - `interface management m_num` Management interface specified by `m_num`.
  - `interface port-channel p_num` Port-channel interface specified by `p_num`.
  - `interface vlan v_num` VLAN interface specified by `v_num`.
  - `interface xlan vx_num` VXLAN interface specified by `vx_num`.

**Examples**
- This command resets IGMP transmission statistic counters on Ethernet 1 interface.
  ```
  switch#clear ip igmp statistics interface ethernet 1
  switch#
  ```
ip igmp host-proxy

The **ip igmp host-proxy** command enables the IGMP host proxy service on the configuration mode interface. The IGMP host proxy performs IGMP joins and leaves between networks that are directly connected by an exchange that does not support PIM on the network boundary.

The IGMP host proxy sends unsolicited IGMP join reports when a (S,G) or (*,G) entry arrives in the Mroute table. Reports are subsequently sent upon the arrival of queries on the interface. The interval between IGMP reports is configured through **ip igmp host-proxy report-interval**.

When the host-proxy command does not specify a group address, the host proxy sends reports for all (S,G) and (*,G) entries. Specifying group addresses restricts the host proxy to sending reports only for specified groups. Multiple **ip igmp host-proxy** statements are required to specify multiple groups.

An ACL can also be used in place of a group address in a separate **ip igmp host-proxy** statement. If both an ACL and one or more group addresses are configured, the groups are processed before the ACL.

When the configuration mode interface is set to IGMP version 3, the command can include or exclude source addresses. These commands are ignored when the interface runs any other IGMP version.

The **no ip igmp host-proxy** and **default ip igmp host-proxy** commands remove the corresponding command from **running-config**. When these commands do not include a group address, all ip igmp host-proxy statements are deleted. When inclusion or exclusion parameters are not included, all statements with the specified group address are deleted.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
```
ip igmp host-proxy [GROUP_ADDRESS [SOURCE_ADDRESS]]][[access-list acl]
no ip igmp host-proxy [GROUP_ADDRESS [SOURCE_ADDRESS]]
default ip igmp host-proxy [GROUP_ADDRESS [SOURCE_ADDRESS]]
```

**Parameters**
- **GROUP_ADDRESS** IPv4 address of group address for which host proxy sends reports.
  - <no parameter> all multicast groups.
  - *ipv4_address* IP address of multicast group (dotted decimal notation).
- **SOURCE_ADDRESS** IP address of a host that originates multicast data packets.
  - <no parameter> Proxy sends report for all source addresses.
  - **exclude ipv4_address** Proxy sends reports for all sources except those specified.
  - **include ipv4_address** Proxy send reports for only specified addresses.
    - Commands that list at least one parameter must specify a group address. Parameters may be listed in any order.
    - When a command specifies include and exclude parameters, the exclude parameter is ignored.
- **access-list acl** specifies an access control list (ACL). If an ACL and one or more groups are configured together, the groups are processed before the ACL.
Guidelines

Multiple statements for a group address may be configured. The effect of entering a command depends on previously entered commands. The following describes command combination:

- **ip igmp host-proxy**: IGMP host proxy is enabled for all multicast groups and their source addresses. When enabled for all group addresses, the source address list cannot be restricted.

- **ip igmp host-proxy group_ipv4**: IGMP host proxy is enabled for a specified multicast group. The list of source addresses for this group is not restricted. Enabling host proxy for another group address requires another `ip igmp host-proxy` command.

- **ip igmp host-proxy group_ipv4 exclude source_ipv4**: IGMP host proxy is enabled for the specified multicast group. Sources for this group include all addresses not in an exclude statement. Multiple source addresses for the group are excluded by multiple statements.

- **ip igmp host-proxy group_ipv4 include source_ipv4**: IGMP host proxy is enabled for the specified group address for only the specified source address. Additional statements are required to include other source addresses for the group. The presence of one include parameter invalidates all exclude statements for the specified multicast group.

- **ip igmp host-proxy access-list acl**: IGMP host proxy is enabled for the addresses defined by the specified ACL. If one or more groups are configured in addition to ACLs, the groups are processed first. If the ACL has a “deny all” rule for a group, then this filter takes precedence over configurations with include/exclude keywords or permit/deny rules for that group. If a group is configured with no filters and a host-proxy is configured with an ACL with rules having filters for the group, or configured with groups and source filters, then the filters are applied to the group.

Example

- This command enables IGMP host proxy on Ethernet interface 17 for all multicast group addresses.
  
  `switch(config)#interface ethernet 17
  switch(config-if-Et17)#ip igmp host-proxy
  switch(config-if-Et17)#show active
  interface Ethernet17
  ip igmp host-proxy
  switch(config-if-Et17)#`

- This command enables IGMP host proxy on Ethernet interface 17 for the multicast group at 231.10.10.1. The list of source addresses is not restricted.
  
  `switch(config-if-Et17)#ip igmp host-proxy 231.10.10.1
  switch(config-if-Et17)#show active
  interface Ethernet17
  ip igmp host-proxy 231.10.10.1
  switch(config-if-Et17)#`

- This command enables IGMP host proxy on Ethernet interface 17 for the multicast group at 231.10.10.2. The list of source addresses only excludes 10.4.4.1 and 10.4.5.2.
  
  `switch(config-if-Et17)#ip igmp host-proxy 231.10.10.2 exclude 10.4.4.1
  switch(config-if-Et17)#ip igmp host-proxy 231.10.10.2 exclude 10.4.5.2
  switch(config-if-Et17)#show active
  interface Ethernet17
  ip igmp host-proxy 231.10.10.2 exclude 10.4.5.2
  ip igmp host-proxy 231.10.10.2 exclude 10.4.4.1
  ip igmp host-proxy 231.10.10.1
  switch(config-if-Et17)#`
- This command enables IGMP host proxy on Ethernet interface 17 for the multicast group at 231.10.10.3. The list of source address for this group only includes 10.5.5.1 and 10.5.5.2

```
switch(config-if-Et17)#ip igmp host-proxy 231.10.10.3 include 10.5.5.1
switch(config-if-Et17)#ip igmp host-proxy 231.10.10.3 include 10.5.5.2
switch(config-if-Et17)#show active
  interface Ethernet17
    ip igmp host-proxy 231.10.10.3 include 10.5.5.2
    ip igmp host-proxy 231.10.10.3 include 10.5.5.1
    ip igmp host-proxy 231.10.10.3
    ip igmp host-proxy 231.10.10.2 exclude 10.4.5.2
    ip igmp host-proxy 231.10.10.2 exclude 10.4.4.1
    ip igmp host-proxy 231.10.10.1
```

- This command enables IGMP host proxy on Ethernet interface 17 for the group address(es) specified in ACL "acl1"

```
switch(config-if-Et17)#ip igmp host-proxy access-list acl1
switch(config-if-Et17)#show active
  interface Ethernet17
    ip igmp host-proxy
    ip igmp host-proxy access-list acl2
switch(config-if-Et17)#
```
ip igmp host-proxy report-interval

The `ip igmp host-proxy report-interval` command configures the period between unsolicited join reports that the switch sends as an IGMP host proxy from the configuration mode interface to a sender network after a (S,G) or (*,G) entry arrives in the Mroute table. When the interface receives a query in response, this interval is set to the `ip igmp last-member-query-interval`. This command also enables the host proxy on the configuration mode interface if it was not previously enabled.

The `no ip igmp host-proxy report-interval` and `default ip igmp host-proxy report-interval` commands reset the query interval to the default value of one second by removing the corresponding `ip igmp host-proxy report-interval` command from `running-config`. The `no ip igmp host-proxy` and `default ip igmp host-proxy` commands also remove the corresponding `report-interval` command.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ip igmp host-proxy report-interval period
no ip igmp host-proxy report-interval
default ip igmp host-proxy report-interval
```

**Parameters**
- `period` transmission interval (seconds) between consecutive reports.
  
Value range: 1 (one second) to 31744 (8 hours, 49 minutes, 4 seconds). Default is 1 (one second).

**Example**
- These commands configures a IGMP host proxy interval of five seconds on port channel 100.

```
switch(config)#interface port-channel 100
switch(config-if-Po100)#ip igmp host-proxy report-interval 5
switch(config-if-Po100)#show active
interface Port-Channel100
  ip igmp host-proxy
  ip igmp host-proxy report-interval 5
switch(config-if-Po100)#
```
**ip igmp last-member-query-count**

The `ip igmp last-member-query-count` command specifies the number of query messages the switch sends in response to a group-specific or group-source-specific leave message.

After receiving a message from a host leaving a group, the switch sends query messages at intervals specified by `ip igmp last-member-query-interval`. If the switch does not receive a response to the queries after sending the number of messages specified by this parameter, it stops forwarding messages to the host.

Setting the last member query count (LMQC) to 1 causes the loss of a single packet to stop traffic forwarding. While the switch can start forwarding traffic again after receiving a response to the next general query, the host may not receive that query for a period defined by `ip igmp query-interval`.

The `no ip igmp last-member-query-count` and `default ip igmp last-member-query-count` commands reset the LMQC to the default value by removing the corresponding `ip igmp last-member-query-count` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ip igmp last-member-query-count number
no ip igmp last-member-query-count
default ip igmp last-member-query-count
```

**Parameters**

- `number` query message quantity. Values range from 1 to 3. Default is 2.

**Example**

- This command configures the last-member-query-count to 3 on VLAN interface 4.

```
switch(config)#interface vlan 4
switch(config-if-Vl4)#ip igmp last-member-query-count 3
switch(config-if-Vl4)#
```
**ip igmp last-member-query-interval**

The `ip igmp last-member-query-interval` command configures the switch's transmission interval for sending group-specific or group-source-specific query messages from the configuration mode interface.

When a switch receives a message from a host that is leaving a group it sends query messages at intervals set by this command. The `ip igmp startup-query-count` specifies the number of messages that are sent before the switch stops forwarding packets to the host.

If the switch does not receive a response after this period, it stops forwarding traffic to the host on behalf of the group, source, or channel.

The `no ip igmp last-member-query-interval` and `default ip igmp last-member-query-interval` commands reset the query interval to the default value of one second by removing the `ip igmp last-member-query-interval` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
```
ip igmp last-member-query-interval period
no ip igmp last-member-query-interval
default ip igmp last-member-query-interval
```

**Parameters**
- `period` transmission interval (deciseconds) between consecutive group-specific query messages.
  
  Value range: 10 (one second) to 317440 (8 hours, 49 minutes, 4 seconds). Default is 10 (one second).

**Example**
- This command configures the last member query interval of 6 seconds for VLAN interface 4.
  ```
  switch(config)#interface vlan 4
  switch(config-if-Vl4)#ip igmp last-member-query-interval 60
  switch(config-if-Vl4)#
  ```
ip igmp profile

The **ip igmp profile** command places the switch in IGMP-profile configuration mode to configure an IGMP profile. IGMP profiles control the multicast groups that an interface can join.

Profiles consist of the filter type and an address range:

- Filter types specify accessibility to the listed address range:
  - Permit filters define the multicast groups the interface can join.
  - Deny filters define the multicast groups the interface cannot join.

Profiles are deny filters by default.

- Address ranges specify a list of addresses and ranges:
  - In permit filters, permitted groups are specified by the address range.
  - In deny filters, all groups are permitted except those specified by the address range.

Implementing IGMP filtering affects IGMP report forwarding as follows:

- IGMPv2: Report is forwarded to mrouters for permitted groups and dropped for disallowed groups.
- IGMPv3: There may be multiple group records in a report.
  - No groups are allowed: The report is dropped.
  - All groups are allowed: The report is forwarded to mrouter ports as normal.
  - Some groups are allowed: A revised report is forwarded to mrouter ports.

  The revised report includes records for the allowed group addresses with the same source MAC and IP addresses.

The **no ip igmp profile** and **default ip igmp profile** commands delete the specified IGMP profile from **running-config**.

IGMP-profile configuration mode is not a group change mode; **running-config** is changed immediately upon entering commands. Exiting IGMP-profile configuration mode does not affect the configuration. The **exit** command returns the switch to global configuration mode.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip igmp profile profile_name
no ip igmp profile profile_name
default ip igmp profile profile_name
```

**Parameters**

- **profile_name** name of the IGMP profile.

**Commands Available in igmp-profile Configuration Mode**

- **permit / deny**
- **range**

**Related Commands**

- **ip igmp snooping filter** applies an IGMP snooping filter to a configuration mode interface.
Example

- These commands enter IGMP-profile configuration mode and configure the profile as a permit list.

  ```
  switch(config)#ip igmp profile list_1
  switch(config-igmp-profile-list_1)#permit
  switch(config-igmp-profile-list_1)#
  ```
**ip igmp query-interval**

The `ip igmp query-interval` command configures the frequency at which the configuration mode interface, as an IGMP querier, sends host-query messages.

An IGMP querier sends host-query messages to discover the multicast groups that have members on networks attached to the interface. The switch implements a default query interval of 125 seconds.

The `no ip igmp query-interval` and `default ip igmp query-interval` commands reset the IGMP query interval to the default value of 125 seconds by removing the `ip igmp query-interval` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `ip igmp query-interval period`
- `no ip igmp query-interval`
- `default ip igmp query-interval`

**Parameters**
- `period` interval (seconds) between IGMP query messages. Values range from 1 to 3175 (52 minutes, 55 seconds). Default is 125.

**Example**
- This command configures the query-interval of 2 minutes, 30 seconds for VLAN interface 4.
  ```
  switch(config)#interface vlan 4
  switch(config-if-Vl4)#ip igmp query-interval 150
  switch(config-if-Vl4)#
  ```
**ip igmp query-max-response-time**

The `ip igmp query-max-response-time` command configures the `query-max-response-time` variable for the configuration mode interface. This variable is used to set the Max Response Time field in outbound Membership Query messages. Max Response Time specifies the maximum period a recipient can wait before responding with a Membership Report.

The router with the lowest IP address on a subnet sends membership queries as the IGMP querier. When a membership query is received from a source with a lower IP address, the router resets its query response timer. Upon timer expiry, the router begins sending membership queries. If the router subsequently receives a membership query originating from a lower IP address, it stops sending membership queries and resets the query response timer.

The `no ip igmp query-max-response-time` and `default ip igmp query-max-response-time` commands restore the default query-max-response-time of 10 seconds for the configuration mode interface by removing the corresponding `ip igmp query max-response-time` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ip igmp query-max-response-time period
no ip igmp query-max-response-time
default ip igmp query-max-response-time
```

**Parameters**
- `period` maximum response time (deciseconds). Values range from 1 to 31744 (52 minutes, 54 seconds). Default is 100 (ten seconds).

**Example**
- This command configures the query-max-response-time of 18 seconds for VLAN interface 4.
  ```
  switch(config)#interface vlan 4
  switch(config-if-Vl4)#ip igmp query-max-response-time 180
  switch(config-if-Vl4)#
  ```
**ip igmp router-alert**

The `ip igmp router-alert` command configures the switch disposition of inbound IGMP packets to the configuration mode interface based on the presence of the router-alert option in the IP header. By default, the port accepts all IGMP packets that arrive on the local subnet and rejects all other packets that arrive without the router-alert option.

The command provides three IGMP packet disposition options:

- **mandatory**: packets are accepted only when router-alert is present.
- **optional**: packets are accepted regardless of router-alert presence.
- **optional connected**: packets are accepted from the same subnet; other packets require router-alert.

The `no ip igmp router-alert` and `default ip igmp router-alert` commands reset the default setting of `optional connected` on the configuration mode interface by removing the corresponding `ip igmp router-alert` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

- `ip igmp router-alert DISPOSITION`
- `no ip igmp router-alert`
- `default ip igmp router-alert`

**Parameters**

- **DISPOSITION**  IGMP packet disposition method. Options include:
  - **mandatory**  Rejects packets if router-alert is not present.
  - **optional**  Accepts packets regardless of router-alert presence.
  - **optional connected**  Accepts packets from same subnet. Other packets require router-alert.

**Example**

- This command configures the switch to accept IGMP packets on Ethernet interface 8 only if the IP header contains router alert.

```
switch(config)#interface ethernet 8
switch(config-if-Et8)#ip igmp router-alert mandatory
switch(config-if-Et8)#show active
interface Ethernet8
  load-interval 60
  ip igmp router-alert mandatory
switch(config-if-Et8)#
```
**ip igmp snooping**

The **ip igmp snooping** command enables snooping globally. By default, global snooping is enabled. When global snooping is enabled, **ip igmp snooping vlan** enables or disables snooping on individual VLANs. When global snooping is disabled, snooping cannot be enabled on individual VLANs.

QoS cannot be used for IGMP packets when IGMP snooping is enabled.

The **no ip igmp snooping** command disables global snooping. The **default ip igmp snooping** command restores the global snooping default setting of enabled by removing the **ip igmp snooping** command from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

- `ip igmp snooping`
- `no ip igmp snooping`
- `default ip igmp snooping`

**Example**

- This command globally enables snooping on the switch.

```bash
switch(config)#ip igmp snooping
switch(config)#
```
**ip igmp snooping filter**

The **ip igmp snooping filter** command applies the specified IGMP snooping profile to the configuration mode interface. An IGMP snooping profile specifies the multicast groups that an interface may join. Profiles consist of the filter type and an address range:

- **Filter type**: Specifies accessibility to the listed address range:
  - Permit filters define the multicast groups the interface can join.
  - Deny filters define the multicast groups the interface cannot join.

- **Address range**: Specifies a list of addresses and ranges.
  - In permit filters, the permitted groups are specified by the address range.
  - In deny filters, all groups are permitted except those specified by the address range.

An interface without a snooping profile assignment may join any multicast group.

Snooping profiles are configured in IGMP-profile configuration mode (**ip igmp profile**).

The **no ip igmp snooping filter** and **default ip igmp snooping filter** commands restore the default setting of allowing an interface to join any multicast group by deleting the corresponding **ip igmp snooping filter** command from **running-config**.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

**Command Syntax**

```
ip igmp snooping filter profile_name
no ip igmp snooping filter [profile_name]
default ip igmp snooping filter [profile_name]
```

**Parameters**
- **profile_name**  name of profile assigned to interface.

**Example**
- This command applies the **list_1** snooping profile to Ethernet interface 7.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#ip igmp snooping filter list_1
switch(config-if-Et7)#
```
**ip igmp snooping interface-restart-query**

The `ip igmp snooping interface-restart-query` command configures the interface startup initial query time used for IGMP query spoofing. When an interface restarts or there is a change to the spanning tree, the interface will send general IGMP queries after this interval. The query is based on the information of the last known IGMP querier, and serves to facilitate faster network convergence times.

Multiple values can be configured with a single command; issuing the command again replaces any previously configured value(s).

The **no ip igmp snooping interface-restart-query** and **default ip igmp snooping interface-restart-query** commands restore the default setting of 2000 milliseconds by deleting the corresponding `ip igmp snooping interface-restart-query` command from `running-config`.

**Command Mode**

General Configuration

**Command Syntax**

```
ip igmp snooping interface-restart-query query_time
no ip igmp snooping interface-restart-query
default ip igmp snooping interface-restart-query
```

**Parameters**

- `query_time` interval (in milliseconds) after an interface restart or spanning tree change at which the interface will send general IGMP queries. Values range from 100 to 50000 milliseconds; default is 2000.

**Example**

- This command configures interfaces to send IGMP queries at 100, 200, and 300 milliseconds after an interface restart or spanning tree change.

```
switch(config)#ip igmp snooping interface-restart-query 100 200 300
switch(config)#
```
ip igmp snooping querier

The `ip igmp snooping querier` command enables the snooping querier globally, which controls the querier for VLANs that are not configured with a snooping querier command. The `ip igmp snooping vlan querier` command controls the querier on individual VLANs.

The IGMP snooping querier supports snooping by sending layer 2 membership queries to hosts attached to the switch. The snooping querier is functional on VLANs where hosts receive IP multicast traffic without access to a network IP multicast router. A snooping querier avoids flooding multicast packets in the VLAN by querying for hosts and routers.

The IGMP snooping querier is functional on VLANs that meet these criteria:

- Snooping is enabled.
- The corresponding SVI (VLAN interface) is active.
- The VLAN's querier IP address or the global querier IP address is configured.

The `no ip igmp snooping querier` and `default ip igmp snooping querier` commands disable the snooping querier globally by removing the `ip igmp snooping querier` statement from `running-config`. The snooping querier is globally disabled by default.

**Command Mode**

Global Configuration

**Command Syntax**

- `ip igmp snooping querier`
- `no ip igmp snooping querier`
- `default ip igmp snooping querier`

**Guidelines**

- Enabling a querier after it was disabled is equivalent to establishing a new querier.
- Changing the querier's IP address is equivalent to establishing a new querier.

**Example**

- This command globally enables the snooping querier on the switch.

```
switch(config)#ip igmp snooping querier
switch(config)#
```
ip igmp snooping querier address

The `ip igmp snooping querier address` command sets the global querier source IP address, which specifies the source address for packets transmitted from VLANs for which a querier address (`ip igmp snooping vlan querier address`) is not configured. To use a snooping querier, an address must be explicitly configured globally or for the VLAN.

The switch does not define a default global querier address.

The `no ip igmp snooping querier address` and `default ip igmp snooping querier address` commands remove the global querier address command from `running-config`.

**Command Mode**
- Global Configuration

**Command Syntax**
```
ip igmp snooping querier address ipv4_address
no ip igmp snooping querier address
default ip igmp snooping querier address
```

**Parameters**
- `ipv4_address` source IPv4 address.

**Example**
- This command sets the source IP address to 10.1.1.41 for query packets transmitted from the switch.
```
switch(config)#ip igmp snooping querier address 10.1.1.41
switch(config)#
```
**ip igmp snooping querier last-member-query-count**

The `ip igmp snooping querier last-member-query-count` command configures the global *IGMP snooping querier last member query count* (LMQC) value. LMQC specifies the number of query messages the switch sends in response to group-specific or group-source-specific leave messages it receives from a host; the transmission frequency is specified by *IGMP snooping querier last member query interval*. The switch stops forwarding messages to the host if it does not receive a response to these query messages.

Setting LMQC to 1 causes the loss of one packet to stop traffic forwarding. While the switch can start forwarding traffic again after receiving a response to the next general query, the host may not receive that query for a period defined by `ip igmp snooping querier query-interval`.

VLANs use the global value when they are not assigned a value (`ip igmp snooping vlan querier last-member-query-count`). VLAN commands take precedence over the global value. The default global value is specified by the robustness variable (`ip igmp snooping robustness-variable`).

The `no igmp snooping querier last-member-query-count` and `default igmp snooping querier last-member-query-count` commands reset the LMQC to the default value by removing the corresponding `ip igmp snooping querier last-member-query-count` command from running-config.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip igmp snooping querier last-member-query-count number
no ip igmp snooping querier last-member-query-count
default ip igmp snooping querier last-member-query-count
```

**Parameters**

- `number` query message quantity. Value ranges from 1 to 3. Default is set by robustness-variable.

**Example**

- This command configures the global last-member-query-count to 3.

```
switch(config)#ip igmp snooping querier last-member-query-count 3
switch(config)#show ip igmp snooping querier status

Global IGMP Querier status

-----------------------------------------------

```

switch(config)#
ip igmp snooping querier last-member-query-interval

The `ip igmp snooping querier last-member-query-interval` command sets the global IGMP snooping last member query interval. The default interval is one second.

A multicast host sends an IGMP leave report when it leaves a group. To determine if the host was the last group member, the leave message recipient sends an IGMP query. The last-member-query-interval determines when the group record is deleted if no subsequent reports are received.

VLANs not assigned a `last member query interval` value (`ip igmp snooping vlan querier last-member-query-interval`) use the global value. VLAN commands take precedence over the global value.

The `no ip igmp snooping querier last-member-query-interval` and `default ip igmp snooping querier last-member-query-interval` commands reset the `last-member-query-interval` value the default interval of one second by removing the `ip igmp snooping querier last-member-query-interval` statement from `running-config`.

**Command Mode**
- Global Configuration

**Command Syntax**
```
ip igmp snooping querier last-member-query-interval period
no ip igmp snooping querier last-member-query-interval
default ip igmp snooping querier last-member-query-interval
```

**Parameters**
- `period` last member query interval (seconds). Value ranges from 1 to 25. Default is one second.

**Related Commands**
- `ip igmp snooping vlan querier last-member-query-interval` assign a last member query interval value to the specified VLANs.

**Example**
- This command sets the IGMP snooping querier last-member-query-interval to five seconds.
```
switch(config)#ip igmp snooping querier last-member-query-interval 5
switch(config)#
```
ip igmp snooping querier max-response-time

The **ip igmp snooping querier max-response-time** command specifies the global **max-response-time** value. The switch uses **max-response-time** to set the Max Response Time field in outbound Membership Query messages. Max Response Time specifies the maximum period a recipient can wait before responding with a Membership Report.

VLANs not assigned a **max-response-time** value (**ip igmp snooping vlan querier max-response-time**) use the global value. VLAN commands take precedence over the global value.

Values range from 1 to 25 seconds. The default global value is 10 seconds.

The **no ip igmp snooping querier max-response-time** and **default ip igmp snooping querier max-response-time** commands restore the global **max-response-time** default value by removing the **ip igmp snooping querier max-response-time** statement from **running-config**.

**Command Mode**
Global Configuration

**Command Syntax**

```
ip igmp snooping querier max-response-time resp_sec
no ip igmp snooping querier max-response-time
default ip igmp snooping querier max-response-time
```

**Parameters**
- **resp_sec**  **max-response-time** value (seconds). Values range from 1 to 25. Default (global) is 10.

**Example**
- This command sets the global max-response-time to 15 seconds.
```
switch(config)#ip igmp snooping querier max-response-time 15
switch(config)#
```
The `ip igmp snooping querier query-interval` command sets the global query interval. This command also sets the query-interval of IGMP Snooping when using IGMP version 2. Values range from 5 to 3600 seconds. The default global value is 125 seconds. The query interval is the period between IGMP Membership Query messages sent from the querier. The global value specifies the query interval for VLANs with no query-interval command.

VLANs not assigned a `query interval` value (`ip igmp snooping vlan querier query-interval`) use the global value. VLAN commands take precedence over the global value.

The `no ip igmp snooping querier query-interval` and `default ip igmp snooping querier query-interval` commands reset the global query-interval value to 125 seconds by removing the `ip igmp snooping querier query-interval` statement from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip igmp snooping querier query-interval query_sec
no ip igmp snooping querier query-interval
default ip igmp snooping querier query-interval
```

**Parameters**

- `query_sec` query interval (seconds). Values range from 5 to 3600. Default (global) is 125.

**Example**

- This command sets the global query interval to 150 seconds.

```
switch(config)#ip igmp snooping querier query-interval 150
switch(config)#
```
The `ip igmp snooping querier startup-query-count` command configures the global `startup query count` value. The `startup query count` specifies the number of query messages that the querier sends on a VLAN during the `startup query interval` (`ip igmp snooping querier startup-query-interval`).

When snooping is enabled, the group state is more quickly established by sending query messages at a higher frequency. The `startup-query-interval` and `startup-query-count` parameters define the startup period by defining the number of queries to be sent and transmission frequency for these messages.

VLANs use the global `startup query count` value when they are not assigned a value (`ip igmp snooping vlan querier startup-query-count`). VLAN commands take precedence over the global value. The default global value is specified by the robustness variable (`ip igmp snooping robustness-variable`).

The `no ip igmp snooping querier startup-query-count` and `default ip igmp snooping querier startup-query-count` commands restore the default `startup-query-count` value by removing the corresponding `ip igmp snooping querier startup-query-count` command from `running-config`.

**Command Mode**
- Global Configuration

**Command Syntax**
- `ip igmp snooping querier startup-query-count [number]
- `no ip igmp snooping querier startup-query-count
- `default ip igmp snooping querier startup-query-count

**Parameters**
- `number` global startup query count. Value ranges from 1 to 3.

**Example**
- These commands configure the global startup query count value of 2, then displays the status of the snooping querier.

```
switch(config)#ip igmp snooping querier startup-query-count 2
switch(config)#show ip igmp snooping querier status
Global IGMP Querier status
-------------------------------------------------------
admin state                      : Disabled
source IP address                : 0.0.0.0
query-interval (sec)             : 125.0
max-response-time (sec)          : 10.0
querier timeout (sec)            : 255.0
last-member-query-interval (sec) : 1.0
last-member-query-count          : 2 (robustness)
startup-query-interval (sec)     : 31.25 (query-interval/4)
startup-query-count              : 2

Vlan Admin    IP              Query    Response Querier Operational Ver
State                    Interval Time     Timeout State

101  Disabled 0.0.0.0         125.0    10.0     255.0   Non-Querier v2
```

switch(config)#
**ip igmp snooping querier startup-query-interval**

The `ip igmp snooping querier startup-query-interval` command configures the global startup query interval value. The **startup query interval** specifies the period between query messages that the querier sends upon startup.

When snooping is enabled, the group state is more quickly established by sending query messages at a higher frequency. The **startup-query-interval** and **startup-query-count** parameters define the startup period by defining the number of queries to be sent and transmission frequency for these messages.

VLANs use the global **startup query interval** value when they are not assigned a value (**ip igmp snooping vlan querier startup-query-interval**). VLAN commands take precedence over the global value. The default global value equals the query interval divided by four (**ip igmp snooping querier query-interval**).

The **no ip igmp snooping querier startup-query-interval** and **default ip igmp snooping querier startup-query-interval** commands restore the default method of specifying the startup query interval by removing the corresponding **ip igmp snooping querier startup-query-interval** command from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip igmp snooping querier startup-query-interval period
no ip igmp snooping querier startup-query-interval
default ip igmp snooping querier startup-query-interval
```

**Parameters**

- **period**  startup query interval (seconds). Value ranges from 1 to 3600 (1 hour).

**Example**

- This command configures the startup query count of one minute for VLAN interface 4.

```
switch(config)#ip igmp snooping querier startup-query-interval 40
switch(config)#show ip igmp snooping querier status
Global IGMP Querier status
-------------------------------------------------------
admin state                      : Enabled
source IP address                : 0.0.0.0
query-interval (sec)             : 125.0
max-response-time (sec)          : 10.0
querier timeout (sec)            : 255.0
last-member-query-interval (sec) : 1.0
last-member-query-count          : 2 (robustness)
startup-query-interval (sec)     : 40.0
startup-query-count              : 2

Vlan Admin    IP              Query    Response Querier Operational Ver
State                    Interval Time     Timeout State

1   Enabled  0.0.0.0         125.0    10.0     255.0   Non-Querier v3
100  Enabled  0.0.0.0         125.0    10.0     255.0   Non-Querier v3
101  Enabled  0.0.0.0         125.0    10.0     255.0   Non-Querier v3
```

switch(config)
The `ip igmp snooping querier version` command configures the Internet Group Management Protocol (IGMP) snooping querier version on the configuration mode interfaces. Version 3 is the default IGMP version.

IGMP is enabled by the `ip pim sparse-mode` command. The `ip igmp snooping querier version` command does not affect the IGMP enabled status.

The `no ip igmp snooping querier version` and `default ip igmp snooping querier version` commands restore the configuration mode to IGMP version 3 by removing the `ip igmp snooping querier version` statement from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**
```
ip igmp snooping querier version version_number
no ip igmp snooping querier version
default ip igmp snooping querier version
```

**Parameters**
- `version_number` IGMP version number. Value ranges from 1 to 3. Default value is 3.

**Example**
- This command configures IGMP snooping querier version 2.
```
switch(config)#ip igmp snooping querier version 2
switch(config)#
```
- This command restores the IGMP snooping querier to version 3.
```
switch(config)# no ip igmp snooping querier version
switch(config)#
```
ip igmp snooping report-flooding

The `ip igmp snooping report-flooding` command globally enables L2 report flooding on the switch. When report flooding is globally enabled, the `ip igmp snooping vlan report-flooding` configures a VLAN range to forward membership report messages to specified ports. When report flooding is not globally enabled, L2 report flooding cannot be enabled on individual VLANs.

L2 report flooding is an IGMP snooping feature that forwards membership report messages to specified ports. Relying on a single switch to maintain and send report messages can result in performance issues. L2 report flooding addresses this by facilitating report message transmissions through any network port. This allows switches to bypass the querier when forwarding multicast traffic to its interested ports.

The `no ip igmp snooping report-flooding` and `default ip igmp snooping report-flooding` commands disable global L2 report flooding by removing `ip igmp report flooding` from `running-config`. L2 report flooding is disabled by default.

Command Mode
- Global Configuration

Command Syntax
```
ip igmp snooping report-flooding
no ip igmp snooping report-flooding
default ip igmp snooping report-flooding
```

Related Commands
- `ip igmp snooping vlan report-flooding` enables L2 report flooding on a specified VLAN range.

Example
- This command globally enables the snooping L2 report-flooding.
```
switch(config)#ip igmp snooping report-flooding
switch(config)#
```
**ip igmp snooping report-flooding switch-port**

The `ip igmp snooping report-flooding switch-port` command specifies Ethernet ports or port channels that can forward IGMP membership report messages for all VLANs where L2 report flooding is enabled. Ports that are connected to multicast routers or queriers continue to forward traffic as previously specified and are not affected by L2 report flooding commands.

L2 report flooding is an IGMP snooping feature that forwards membership report messages to specified ports. The `ip igmp snooping vlan report-flooding switch-port` command configures a list of forwarding ports for a specified VLAN range.

The `no ip igmp snooping report-flooding switch-port` and `default ip igmp snooping report-flooding switch-port` commands remove the specified ports from the global report flooding port list by deleting the corresponding `ip igmp snooping report-flooding switch-port` command from `running-config`.

**Command Mode**
- Global Configuration

**Command Syntax**
- `ip igmp snooping report-flooding switch-port INTERFACE`
- `no ip igmp snooping report-flooding switch-port INTERFACE`
- `default ip igmp snooping report-flooding switch-port INTERFACE`

**Parameters**
- `INTERFACE` Membership report message forwarding is enabled on these ports:
  - `ethernet e_range` where `e_range` is the number, range, or list of ethernet ports
  - `port-channel p_range` where `p_range` is the number, range, or list of channel ports

**Related Commands**
- `ip igmp snooping report-flooding` globally enables L2 report flooding.
- `ip igmp snooping vlan report-flooding switch-port` specifies a port list for a VLAN range.

**Example**
- This command configures Ethernet ports 7-9 for report message forwarding for any VLAN where L2 report flooding is enabled.

  ```
  switch(config)#ip igmp snooping report-flooding switch-port ethernet 7-9
  switch(config)#
  ```
ip igmp snooping restart query-interval

The `ip igmp snooping restart query-interval` command sets the query interval for all VLANs during an IGMP snooping restart. By default, the query interval during an IGMP snooping restart is a VLAN's configured query interval divided by five. This accelerates the transmission of robustness queries to establish the IGMP snooping state more quickly. However, some large scale configurations may not be able to process all of the queries at this query interval rate. The restart query interval, when configured, is valid for all VLANs.

The `no ip igmp snooping restart query-interval` and `default ip igmp snooping restart query-interval` commands removes the global restart query interval by deleting the `ip igmp snooping restart query-interval` statement from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**

```
ip igmp snooping restart query-interval query_sec
no ip igmp snooping restart query-interval
default ip igmp snooping restart query-interval
```

**Parameters**
- `query_sec` query interval (seconds). Values range from 2 to 400. Default (global) is 125.

**Example**
- This command sets the global query interval to 35 seconds.
  ```
  switch(config)#ip igmp snooping restart query-interval 35
  switch(config)#
  ```
ip igmp snooping robustness-variable

The `ip igmp snooping robustness-variable` command configures the robustness variable for snooping packets sent from any VLAN. Values range from 1 to 3 with a default of 2.

The robustness variable specifies the number of unacknowledged snooping queries that a switch sends before removing the recipient from the group list.

The `no ip igmp snooping robustness-variable` and `default ip igmp snooping robustness-variable` commands reset the robustness variable to 2 by removing the `ip igmp snooping robustness-variable` command from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**
```
ip igmp snooping robustness-variable robust_value
no ip igmp snooping robustness-variable
default ip igmp snooping robustness-variable
```

**Parameters**
- `robust_value` robustness variable. Values range from 1 to 3. Default is 2.

**Example**
- This command sets the robustness-variable value to 3.
```
switch(config)#ip igmp snooping robustness-variable 3
switch(config)#
```
ip igmp snooping vlan

The `ip igmp snooping vlan` command enables snooping on the specified VLANs if snooping is globally enabled. IGMP snooping is globally enabled by default. The `ip igmp snooping` command enables snooping globally.

Note that if IGMP snooping is enabled, QoS will not apply to IGMP packets.

The `no ip igmp snooping vlan` command disables snooping on the specified VLANs.

The `default ip igmp snooping vlan` command returns the snooping setting for the specified VLANs to enabled by removing the corresponding `ip igmp snooping vlan` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip igmp snooping vlan v_range
no ip igmp snooping vlan v_range
default ip igmp snooping vlan v_range
```

**Parameters**

- `v_range` VLANs upon which snooping is enabled. Formats include a number, a number range, or a comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.

**Example**

- This command disables snooping on VLANs 2 through 4.
  
  ```
  switch(config)#no ip igmp snooping vlan 2-4
  switch(config)#
  ```
**ip igmp snooping vlan immediate-leave**

The `ip igmp snooping vlan immediate-leave` command enables fast-leave processing on specified VLANs. When fast-leave processing is enabled, the removal of a VLAN interface's multicast group entry from the IGMP table is not preceded by an IGMP group-specific query to the interface. The switch removes an interface from the forwarding table when it detects an IGMP leave message on the interface. IGMP fast-leave processing is enabled on all VLANs by default.

The `no ip igmp snooping vlan immediate-leave` command disables fast-leave processing on the specified VLANs. The `default ip igmp snooping vlan immediate-leave` command restores fast-leave processing on the specified VLANs by removing the corresponding `no ip igmp snooping vlan immediate-leave` statement from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip igmp snooping vlan v_range immediate-leave
no ip igmp snooping vlan v_range immediate-leave
default ip igmp snooping vlan v_range immediate-leave
```

**Parameters**

- `v_range` VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.

**Example**

- This command enables IGMP fast-leave processing on VLAN 10.

  ```
  switch(config)#ip igmp snooping vlan 10 immediate-leave
  switch(config)#
  ```
ip igmp snooping vlan max-groups

The `ip igmp snooping vlan max-groups` command configures the quantity of multicast groups that the specified VLAN's forwarding table can contain. After the limit is reached, attempts to join new groups are ignored. There is no default limit.

The `no ip igmp snooping vlan max-groups` and `default ip igmp snooping vlan max-groups` removes the maximum group limit by deleting the `ip igmp snooping vlan max-groups` statement from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**

```
ip igmp snooping vlan v_range max-groups quantity
no ip igmp snooping vlan v_range max-groups
default ip igmp snooping vlan v_range max-groups
```

**Parameters**
- `v_range` VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- `quantity` maximum number of groups that can access the VLAN. Value ranges from 0 to 65534.

**Examples**
- This command limits the number of multicast groups that hosts on VLAN 6 can simultaneously access to 25.
  ```
  switch(config)#ip igmp snooping vlan 6 max-groups 25
  switch(config)#
  ```
- This command allows each VLAN between 8 and 15 to receive multicast packets from 30 groups.
  ```
  switch(config)#ip igmp snooping vlan 8-15 max-groups 30
  switch(config)#
  ```
- This command removes the maximum group restriction from all VLAN interfaces between 1 and 50.
  ```
  switch(config)#no ip igmp snooping vlan 1-50 max-groups
  switch(config)#
  ```
ip igmp snooping vlan mrouter

The `ip igmp snooping vlan mrouter` command adds a multicast router as a static port to the specified VLANs. The router port must be in the specified VLAN range.

Snooping may not always be able to locate the IGMP querier. This command should specify IGMP queriers that are known to connect to the network through a port on the switch.

The `no ip igmp snooping vlan mrouter` and `default ip igmp snooping vlan mrouter` commands remove the specified static port configuration by deleting the corresponding `ip igmp snooping vlan mrouter` command from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**
```
ip igmp snooping vlan v_range mrouter interface STATIC_INT
no ip igmp snooping vlan v_range mrouter interface STATIC_INT
default ip igmp snooping vlan v_range mrouter interface STATIC_INT
```

**Parameters**
- `v_range` VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- `STATIC_INT` interface the command configures as a static port. Selection options include:
  - `ethernet e_range` where `e_range` is the number, range, or list of ethernet ports
  - `port-channel p_range` where `p_range` is the number, range, or list of channel ports

The `STATIC_INT` interface must route traffic through a VLAN specified within `v_range`.

**Example**
- This command configures the static connection to a multicast router through Ethernet port 3.
  ```
  switch(config)#ip igmp snooping vlan 2 mrouter interface ethernet 3
  switch(config)#
  ```
Chapter 35: IGMP and IGMP Snooping

IGMP and IGMP Snooping Commands

ip igmp snooping vlan querier

The `ip igmp snooping vlan querier` command controls the querier for the specified VLANs. VLANs follow the global querier setting unless overridden by one of these commands:

- `ip igmp snooping vlan querier` enables the querier on specified VLANs.
- `no ip igmp snooping vlan querier` disables the querier on specified VLANs.

VLAN querier commands take precedence over the global querier setting. The `ip igmp snooping querier` controls the querier for VLANs with no snooping querier command.

The IGMP snooping querier supports snooping by sending layer 2 membership queries to hosts attached to the switch. The snooping querier is functional on VLANs where hosts receive IP multicast traffic without access to a network IP multicast router. A snooping querier avoids flooding multicast packets in the VLAN by querying for hosts and routers.

The IGMP snooping querier is functional on VLANs that meet these criteria:

- Snooping is enabled.
- The corresponding SVI (VLAN interface) is active.
- The VLAN’s querier IP address or the global querier IP address is configured.

The `default ip igmp snooping vlan querier` command restores the usage of the global setting for the specified VLAN by removing the corresponding `ip igmp snooping vlan querier` or `no ip igmp snooping vlan querier` command from `running-config`.

Command Mode
Global Configuration

Command Syntax

```
ip igmp snooping vlan v_range querier
no ip igmp snooping vlan v_range querier
default ip igmp snooping vlan v_range querier
```

Parameters

- `v_range` VLAN IDs. Formats include a number, a number range, or a comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.

Examples

- These commands globally enable the snooping querier on the switch, explicitly disable snooping on VLANs 1-3, and explicitly enable snooping on VLANs 4-6.

```
switch(config)#ip igmp snooping querier
switch(config)#no ip igmp snooping vlan 1-3 querier
switch(config)#ip igmp snooping vlan 4-6 querier
```

After running these commands, the running-config file contains these lines, which indicate that the snooping querier is enabled on VLANs 4-6.

```
switch(config)#show running-config

<--------OUTPUT OMITTED FROM EXAMPLE-------->

no ip igmp snooping vlan 1 querier
no ip igmp snooping vlan 2 querier
no ip igmp snooping vlan 3 querier
ip igmp snooping vlan 4 querier
ip igmp snooping vlan 5 querier
ip igmp snooping vlan 6 querier
ip igmp snooping querier

<--------OUTPUT OMITTED FROM EXAMPLE-------->
```
• This command removes the querier setting for VLANs 2-5:

```text
switch(config)#default ip igmp snooping vlan 2-5 querier
```

When executed after the previous commands, the snooping querier is disabled explicitly on VLANs 1-2, enabled implicitly on VLANs 3-6, and enabled explicitly on VLANs 7-8, as shown by `running-config`:

```
<-------OUTPUT OMITTED FROM EXAMPLE--------->
no ip igmp snooping vlan 1 querier
ip igmp snooping vlan 6 querier
ip igmp snooping querier
<-------OUTPUT OMITTED FROM EXAMPLE--------->
```

• This command sets the global snooping querier to disabled by removing the global querier setting from `running-config`:

```text
switch(config)#no ip igmp snooping querier
```

When executed after the previous commands, the snooping querier is disabled explicitly on VLANs 1-2, disabled implicitly on VLANs 3-6 and enabled explicitly on VLANs 7-8, as shown by `running-config`:

```
<-------OUTPUT OMITTED FROM EXAMPLE--------->
no ip igmp snooping vlan 1 querier
ip igmp snooping vlan 6 querier
<-------OUTPUT OMITTED FROM EXAMPLE--------->
```
**ip igmp snooping vlan querier address**

The `ip igmp snooping vlan querier address` command sets the source address for query packets sent from specified VLANs. VLANs not assigned an address use the global address ([ip igmp snooping querier address](#)). VLAN querier address commands take precedence over the global address. To use a snooping querier, an address must be explicitly configured globally or for the querier's VLAN.

The `no ip igmp vlan snooping querier address` and `default ip igmp snooping vlan querier address` commands reset the specified VLAN to use the global address by removing the corresponding `ip igmp snooping vlan querier address` command from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**

```
ip igmp snooping vlan v_range querier address ipv4_address
no ip igmp snooping vlan v_range querier address
default ip igmp snooping vlan v_range querier address
```

**Parameters**

- `v_range` VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- `ipv4_address` source IPv4 address.

**Example**

- This command sets the source IPv4 address of 10.14.1.1 for query packets transmitted from VLAN 2.

```
switch(config)#ip igmp snooping vlan 2 querier address 10.14.1.1
switch(config)#
```
ip igmp snooping vlan querier last-member-query-count

The `ip igmp snooping vlan querier last-member-query-count` command specifies an IGMP snooping querier last member query count (LMQC) value for the specified VLANs. LMQC specifies the number of query messages the switch sends in response to group-specific or group-source-specific leave messages it receives from a host; the transmission frequency is specified by `IGMP snooping querier last member query interval`. The switch stops forwarding messages to the host if it does not receive a response to these query messages.

VLANs not assigned an LMQC value use the global value (`ip igmp snooping querier last-member-query-count`). VLAN commands take precedence over the global command.

Setting the last member query count (LMQC) to 1 causes the loss of a single packet to stop traffic forwarding. While the switch can start forwarding traffic again after receiving a response to the next general query, the host may not receive that query for a period defined by `ip igmp snooping querier query-intervall`.

The `no igmp snooping vlan querier last-member-query-count` and `default igmp snooping vlan querier last-member-query-count` commands reset the specified VLAN to use the global LMQC by removing the corresponding `ip igmp snooping vlan querier last-member-query-count` command from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**
```
ip igmp snooping vlan v_range querier last-member-query-count number
no ip igmp snooping vlan v_range querier last-member-query-count
default ip igmp snooping vlan v_range querier last-member-query-count
```

**Parameters**
- `v_range` VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- `number` query message quantity. Value ranges from 1 to 3.

**Example**
- This command configures the last-member-query-count to 1 on VLAN interface 3.
  ```
  switch(config)#ip igmp snooping vlan 3 querier last-member-query-count 1
  switch(config)#
  ```
The `ip igmp snooping vlan querier last-member-query-interval` command configures
`last-member-query-interval` for packets sent from the specified VLANs. VLANs not assigned a value
use the global setting (`ip igmp snooping querier last-member-query-interval`). VLAN commands
take precedence over the global value. The global default is one second.

A multicast host sends an IGMP leave report when it leaves a group. To determine if the host was the
last group member, the leave message recipient sends an IGMP query. The
`last-member-query-interval` determines when the group record is deleted if no subsequent reports are
received.

The `no ip igmp snooping vlan querier last-member-query-interval` and `default ip igmp snooping
vlan querier last-member-query-interval` commands reset the specified VLAN to use the global
`last-member-query-interval` by removing the corresponding `ip igmp snooping vlan querier
last-member-query-interval` command from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**

```
  ip igmp snooping vlan v_range querier last-member-query-interval period
  no ip igmp snooping vlan v_range querier last-member-query-interval
  default ip igmp snooping vlan v_range querier last-member-query-interval
```

**Parameters**

- `v_range` VLAN IDs. Formats include a number, number range, or comma-delimited list of
  numbers and ranges. Numbers range from 1 to 4094.
- `period` last member query interval (seconds). Value ranges from 1 to 25.

**Example**

- This command sets the last-member-query-interval for VLAN 10 to 12 seconds.
  ```
  switch(config)#ip igmp snooping vlan 10 querier last-member-query-interval 12
  switch(config)#
  ```
**ip igmp snooping vlan querier max-response-time**

The `ip igmp snooping vlan querier max-response-time` command configures `max-response-time` for packets sent from the specified VLANs. VLANs not assigned a value use the global setting (`ip igmp snooping querier max-response-time`). VLAN commands take precedence over the global value. The global default is 10 seconds.

Switches use `max-response-time` to set the Max Response Time field in outbound Membership Query messages. Max Response Time specifies the maximum period a recipient can wait before responding with a Membership Report.

The `no ip igmp snooping vlan querier max-response-time` and `default ip igmp snooping vlan querier max-response-time` commands reset the specified VLAN to use the global `max-response-time` by removing the corresponding `ip igmp snooping vlan querier max-response-time` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip igmp snooping vlan v_range querier max-response-time resp_sec
no ip igmp snooping vlan v_range querier max-response-time
default ip igmp snooping vlan v_range querier max-response-time
```

**Parameters**

- `v_range` VLAN ID. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- `resp_sec` `max-response-time` value (seconds). Values range from 1 to 25.

**Example**

- This command sets the max-response-time for VLAN 2 to 5 seconds.

```
switch(config)#ip igmp snooping vlan 2 querier max-response-time 5
switch(config)#
```
**ip igmp snooping vlan querier query-interval**

The `ip igmp snooping vlan querier query-interval` command sets the query interval for the specified VLAN. VLANs not assigned a value use the global value (`ip igmp snooping querier query-interval`). VLAN commands have precedence over the global value. The query interval is the period between IGMP Membership Query messages sent from the querier.

The `no ip igmp snooping vlan querier query-interval` and `default ip igmp snooping vlan querier query-interval` commands reset the specified VLAN to use the global value by removing the corresponding `ip igmp snooping vlan querier query-interval` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip igmp snooping vlan v_range querier query-interval query_sec
no ip igmp snooping vlan v_range querier query-interval
default ip igmp snooping vlan v_range querier query-interval
```

**Parameters**

- `v_range` VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- `query_sec` query interval (seconds). Values range from 5 to 3600. Default (global) is 125.

**Example**

- This command sets the query interval for VLAN 10 to 240 seconds.

  ```
  switch(config)#ip igmp snooping vlan 10 querier query-interval 240
  switch(config)#
  ```
**ip igmp snooping vlan querier startup-query-count**

The `ip igmp snooping vlan querier startup-query-count` command specifies the startup query count value for the specified VLANs. The **startup query count** specifies the number of query messages that the querier sends on a VLAN during the **startup query interval** (`ip igmp snooping vlan querier startup-query-interval`).

When an interface starts running IGMP, it can establish the group state more quickly by sending query messages at a higher frequency. The **startup-query-interval** and **startup-query-count** parameters define the startup period and the query message transmission frequency during that period.

VLANs not assigned a **startup query count** value use the global value (`ip igmp snooping querier startup-query-count`). VLAN commands take precedence over the global command.

The `no ip igmp snooping vlan querier startup-query-count` and `default ip igmp snooping vlan querier startup-query-count` commands restore the default condition of using the global **startup query count** value by removing the corresponding `ip igmp snooping vlan querier startup-query-count` command from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip igmp snooping vlan v_range querier startup-query-count number
no ip igmp snooping vlan v_range querier startup-query-count
default ip igmp snooping vlan v_range querier startup-query-count
```

**Parameters**

- **v_range** VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- **number** startup query count. Value ranges from 1 to 3.

**Example**

- This command configures the startup query count of 3 for VLAN 100.

  switch(config)#ip igmp snooping vlan 100 querier startup-query-count 3
  switch(config)#
ip igmp snooping vlan querier startup-query-interval

The `ip igmp snooping vlan querier startup-query-interval` command specifies the *startup query interval* value for the specified VLANs. The *startup query interval* specifies the period between query messages that the querier sends upon startup.

When snooping is enabled, the group state is more quickly established by sending query messages at a higher frequency. The *startup-query-interval* and *startup-query-count* parameters define the startup period by defining the number of queries to be sent and transmission frequency for these messages.

VLANs not assigned a *startup query interval* value use the global value (`ip igmp snooping querier startup-query-count`). VLAN commands take precedence over the global command.

The `no ip igmp snooping vlan querier startup-query-interval` and `default ip igmp snooping vlan querier startup-query-interval` commands restore the default condition of using the global *startup query interval* value by removing the corresponding `ip igmp snooping vlan querier startup-query-interval` command from `running-config`.

**Command Mode**
- Global Configuration

**Command Syntax**
```
ip igmp snooping vlan v_range querier startup-query-interval period
no ip igmp snooping vlan v_range querier startup-query-interval
default ip igmp snooping vlan v_range querier startup-query-interval
```

**Parameters**
- `v_range` VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- `period` startup query interval (seconds). Value ranges from 1 to 3600 (1 hour). Default is 31.

**Example**
- This command configures the startup query count of one minute for VLAN interface 100.
```
switch(config)#ip igmp snooping vlan 100 querier startup-query-interval 60
switch(config)#
```
**ip igmp snooping vlan querier version**

The *ip igmp snooping vlan querier version* command configures the Internet Group Management Protocol (IGMP) snooping querier function on the VLAN. Version 3 is the default IGMP snooping version.

IGMP is enabled by the *ip pim sparse-mode* command. The *ip igmp snooping vlan querier version* command does not affect the IGMP enabled status.

The *no ip igmp snooping vlan querier version* and *default ip igmp snooping vlan querier version* commands restore the configuration mode interface to IGMP snooping VLAN querier version 3 by removing the *ip igmp snooping vlan querier version* statement from *running-config*.

**Command Mode**
Global Configuration

**Command Syntax**

```
ip igmp snooping vlan v_range querier version version_number
no ip igmp snooping vlan v_range querier version
default ip igmp snooping vlan v_range querier version
```

**Parameters**

- *v_range* VLAN ID. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- *version_number* IGMP version number. Value ranges from 1 to 3. Default value is 3.

**Example**

- The example sets the querier version to 2 on vlan 5.
  ```
  switch(config)#ip igmp snooping vlan 5 querier version 2
  switch(config)#
  ```

- This command restores IGMP snooping querier version 3 to VLAN 5.
  ```
  switch(config)# no ip igmp snooping vlan 5 querier version
  switch(config)#
  ```
**ip igmp snooping vlan report-flooding**

The `ip igmp snooping vlan immediate-leave` command enables L2 report flooding on the specified VLANs if report flooding is globally enabled. When L2 report flooding is not globally enabled, this command has no effect. The `ip igmp snooping report-flooding` command globally enables L2 report flooding.

L2 report flooding is an IGMP snooping feature that forwards membership report messages to specified ports. Relying on a single switch to maintain and send report messages can degrade performance. L2 report flooding addresses this by facilitating report message forwarding through any network port. This allows switches to bypass the querier when forwarding multicast traffic to its interested ports.

Two commands specify the ports that forward reports:

- `ip igmp snooping vlan report-flooding switch-port` for a VLAN range.
- `ip igmp snooping report-flooding switch-port` for all VLANs where report flooding is enabled.

The `no ip igmp snooping vlan immediate-leave` and `default ip igmp snooping vlan immediate-leave` commands disable L2 report flooding for the specified VLAN by removing the corresponding `ip igmp snooping vlan immediate-leave` statement from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip igmp snooping vlan v_range report-flooding
no ip igmp snooping vlan v_range report-flooding
default ip igmp snooping vlan v_range report-flooding
```

**Parameters**

- `v_range` VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.

**Related Commands**

- `ip igmp snooping report-flooding` globally enables L2 report flooding.

**Example**

- These commands enable L2 report flooding globally and on VLANs 201 through 205.

```
switch(config)#ip igmp snooping report-flooding
switch(config)#ip igmp snooping vlan 201-205 report-flooding
switch(config)#
```
The `ip igmp snooping vlan report-flooding switch-port` command configures Ethernet ports or port channels to forward IGMP membership report messages for a specified VLAN range where L2 report flooding is enabled. Ports that are connected to multicast routers or queriers continue to forward traffic as previously specified and are not affected by L2 report flooding commands.

L2 report flooding is an IGMP snooping feature that forwards membership report messages to specified ports. The `ip igmp snooping report-flooding switch-port` command configures a list of forwarding ports for all VLANs where L2 report flooding is enabled.

The `no ip igmp snooping vlan report-flooding switch-port` and `default ip igmp snooping vlan report-flooding switch-port` commands remove the listed ports from the specified report flooding port list by deleting the corresponding `ip igmp snooping vlan report-flooding switch-port` statements from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip igmp snooping vlan v_range report-flooding switch-port INTERFACE
no ip igmp snooping vlan v_range report-flooding switch-port INTERFACE
default ip igmp snooping vlan v_range report-flooding switch-port INTERFACE
```

**Parameters**

- `v_range` VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- `INTERFACE` Membership report message forwarding is enabled on these ports:
  - `ethernet e_range` where `e_range` is the number, range, or list of ethernet ports
  - `port-channel p_range` where `p_range` is the number, range, or list of channel ports

**Related Commands**

- `ip igmp snooping report-flooding` globally enables L2 report flooding.
- `ip igmp snooping vlan report-flooding switch-port` specifies a port list for a VLAN range.
- `ip igmp snooping report-flooding switch-port` specifies a port list for all VLANs.

**Example**

- These commands globally enable L2 report flooding, enable flooding on VLANs 201 through 205, and specify Ethernet ports 8-10 as the report flooding port list for VLANs 201-205.

  ```
  switch(config)#ip igmp snooping report-flooding
  switch(config)#ip igmp snooping vlan 201-205 report-flooding
  switch(config)#ip igmp snooping vlan 201-205 report-flooding switch-port ethernet 8-10
  switch(config)#
  ```
**ip igmp snooping vlan static**

The *ip igmp snooping static* command adds ports as static members to a multicast group. The ports must be in the specified VLAN range.

The *no ip igmp snooping static* and *default ip igmp snooping static* commands remove the specified ports from the multicast group by deleting the corresponding ip igmp snooping static statements from *running-config*.

**Command Mode**
Global Configuration

**Command Syntax**

```
ip igmp snooping vlan v_num static ipv4_addr interface STATIC_INT
no ip igmp snooping vlan v_num static ipv4_addr interface STATIC_INT
default ip igmp snooping vlan v_num static ipv4_addr interface STATIC_INT
```

**Parameters**

- **v_num** VLAN number. Value ranges from 1 to 4094.
- **ipv4_addr** multicast group IPv4 address.
- **STATIC_INT** interface the command configures as the static group member. Options include:
  - *ethernet e_range*, where *e_range* is the number, range, or list of Ethernet ports
  - *port-channel p_range*, where *p_range* is the number, range, or list of channel ports

**Example**

- This command configures the static connection to a multicast group at 237.2.1.4 through Ethernet port 3.

```
switch(config)#ip igmp snooping vlan 7 static 237.2.1.4 interface ethernet 3
```

```
switch(config)#
```
**ip igmp startup-query-count**

The `ip igmp startup-query-count` command specifies the number of query messages that an interface sends during the startup interval defined by `ip igmp startup-query-interval`.

When an interface starts running IGMP, it can establish the group state more quickly by sending query messages at a higher frequency. The `startup-query-interval` and `startup-query-count` parameters define the startup period and the query message transmission frequency during that period.

The `no ip igmp startup-query-count` and `default ip igmp startup-query-count` commands restore the default `startup-query-count` value of 2 for the configuration mode interface by removing the corresponding `ip igmp startup-query-count` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `ip igmp startup-query-count number`
- `no ip igmp startup-query-count`
- `default ip igmp startup-query-count`

**Parameters**
- `number` quantity of queries. Values range from 1 to 65535. Default is 2.

**Example**
- This command configures the startup query count of 10 for VLAN interface 4.
  
  ```
  switch(config)#interface vlan 4
  switch(config-if-Vl4)#ip igmp startup-query-count 10
  switch(config-if-Vl4)#
  ```
**ip igmp startup-query-interval**

The `ip igmp startup-query-interval` command specifies the configuration mode interface’s IGMP startup period, during which query messages are sent at an accelerated rate.

When an interface starts running IGMP, it can establish the group state quicker by sending query messages at a higher frequency. The `startup-query-interval` and `startup-query-count` parameters define the startup period and the query message transmission frequency during that period.

The `no ip igmp startup-query-interval` and `default ip igmp startup-query-interval` commands restore the configuration mode interface’s default IGMP `startup-query-interval` of 31 seconds by removing the corresponding `ip igmp startup-query-interval` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```plaintext
ip igmp startup-query-interval period
no ip igmp startup-query-interval
default ip igmp startup-query-interval
```

**Parameters**
- `period` startup query interval, in deciseconds. Value ranges from 10 (one second) to 317440 (8 hours, 49 minutes, 4 seconds). Default is 31 seconds.

**Example**
- This command configures the startup query count of one minute for VLAN interface 4.
  ```plaintext
  switch(config)#interface vlan 4
  switch(config-if-Vl4)#ip igmp startup-query-interval 600
  switch(config-if-Vl4)#
  ```
**ip igmp static-group**

The *ip igmp static-group* command configures the configuration mode interface as a static member of a specified multicast group. This allows the router to forward multicast group packets through the interface without otherwise appearing or acting as a group member. By default, static group memberships are not configured on any interfaces.

If the command includes a source address, only multicast group messages received from the specified host address are fast-switched. Otherwise, all multicast messages of the specified group are fast-switched.

**Note**

To become a static member of a multicast group, the switch must be the PIM designated router (DR) for the network. If it is not, you can use the *ip pim dr-priority* command to make it the DR by configuring its PIM DR value to be the highest on the network.

The *no ip igmp static-group* and *default ip igmp static-group* commands remove the configuration mode interface’s group membership by removing the corresponding *ip igmp static-group* command from *running-config*.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
*ip igmp static-group  group_address [SOURCE_ADDRESS]*
*no ip igmp static-group  group_address [SOURCE_ADDRESS]*
*default ip igmp static-group  group_address [SOURCE_ADDRESS]*
```

**Parameters**

- `group_address` IPv4 address of multicast group for which the interface fast-switches packets.
- `SOURCE_ADDRESS` IP address of host that originates multicast data packets.
  - `<no parameter>` all multicast messages of the specified group are fast-switched.
  - `ipv4_address` source IP address (dotted decimal notation).

**Related Commands**

- *ip igmp static-group acl* configures the configuration mode interface as a static member of the multicast groups specified by an IP access control list (ACL).
- *ip igmp static-group range* configures the configuration mode interface as a static member of multicast groups specified by an address range.

One *ip igmp static-group range* command is equivalent to multiple *ip igmp static-group* commands.

**Example**

- These commands configure VLAN interface 15 as the PIM designated router, then configure it as a static member of the multicast group at address 231.1.1.15 for multicast data packets that originate at 10.1.1.1.

```
switch(config)#interface vlan 15
switch(config-if-Vl15)#ip pim dr-priority 5000
switch(config-if-Vl15)#ip igmp static-group 231.1.1.45 10.1.1.1
switch(config-if-Vl15)#
```
ip igmp static-group acl

The `ip igmp static-group acl` command configures the configuration mode interface as a static member of the multicast groups specified by an IP access control list (ACL). This command is a variant of the `ip igmp static-group` command that uses ACL rules to specify a set of source-multicast group address pairs instead of specifying a single pair. Multiple static-group ACLs can be assigned to an interface. Static groups can be assigned manually and through ACLs simultaneously.

Access control lists that this command references must contain rules of the following format.

- `permit <protocol><source><destination>`, where
  - `<protocol>` has no effect on the static group.
  - `<source>` address of host originating multicast data packets. Must be a host address.
  - `<destination>` multicast group IP address or subnet. Must be a valid multicast address.

An ACL can contain multiple rules. An ACL can be applied to an interface only when all of its rules comply to the specified restrictions. The `show ip igmp static-groups acl` displays the source-multicast group pairs that the specified list configures and lists issues with illegal rules.

The `no ip igmp static-group acl` and `default ip igmp static-group acl` commands remove the specified static group ACL command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `ip igmp static-group acl list_name`
- `no ip igmp static-group acl list_name`
- `default ip igmp static-group acl list_name`

**Parameters**
- `list_name` ACL that specifies multicast group addresses for which interface fast-switches packets.

**Example**
- This command configures VLAN interface 4 as a static member of the multicast group specified by the ACL named `LIST_1`.
  ```
  switch(config)#interface vlan 4
  switch(config-if-Vl4)#ip igmp static-group acl LIST_1
  switch(config-if-Vl4)#
  ```
**ip igmp static-group range**

The **ip igmp static-group range** command configures the configuration mode interface as a static member of multicast groups specified by an address range. This allows the router to forward multicast group packets through the interface without otherwise appearing or acting as a group member. By default, no static group memberships are configured on interfaces.

This command is a variant of the **ip igmp static-group** command that allows the assignment of a subnet range of source addresses or a subnet range of multicast groups. A single **ip igmp static-group range** command is the equivalent of multiple **ip igmp static-group** commands, each of which can only assign a single multigroup-source pair to an interface. Running-config converts the range command to the equivalent list of **ip igmp static-group** commands.

If the command includes a source address range, only multicast group messages received from the range are fast-switched. Otherwise, all multicast messages of the specified group are fast-switched.

The **no ip igmp static-group range** and **default ip igmp static-group range** commands remove the specified range of static group statements from running-config. The **no ip igmp static-group** and **default ip igmp static-group** commands can remove an individual static-group command that was initially added to running-config by an **ip igmp static-group range** command.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
```
ip igmp static-group range GROUP_ADDR [SOURCE_ADDR]
no ip igmp static-group range GROUP_ADDR [SOURCE_ADDR]
default ip igmp static-group range GROUP_ADDR [SOURCE_ADDR]
```

**Parameters**
- **GROUP_ADDR** address of multicast group for which the interface fast-switches packets.
  - gp_ipv4_addr multicast group IPv4 address.
  - gp_ipv4_subnet IPv4 subnet address of multicast groups (CIDR or address-mask).
- **SOURCE_ADDR** IP address of a host range that originates multicast data packets.
  - <no parameter> all multicast messages of the specified range are fast-switched.
  - source sr_ipv4_address source IPv4 address (dotted decimal notation).
  - source sr_ipv4_subnet IPv4 subnet address of source hosts (CIDR or address-mask).

**Warning** A command cannot specify a subnet address for both multicast group and source.

**Examples**
- This command configures VLAN interface 4 as a static member of the multicast group range 241.1.4.1/24 for data packets that originate at 10.1.1.1.

```
switch(config)#interface vlan 4
switch(config-if-Vl4)#ip igmp static-group range 239.1.4.1/24 source 10.1.1.1
switch(config-if-Vl4)#
```
This command attempts to configure VLAN interface 4 as a static member of the multicast group range 241.1.4.1/24 for data packets that originate at the 10.1.1.1/29 subnet. Because the range and source cannot both be subnets, this command generates an error message.

```
switch(config-if-Vl4)#ip igmp static-group range 239.1.1.1/29 source 16.1.1.1/29
% Error: cannot specify source range with group range
switch(config-if-Vl4)#
```
**ip igmp version**

The `ip igmp version` command configures the Internet Group Management Protocol (IGMP) version on the configuration mode interface. Version 3 is the default IGMP version.

IGMP is enabled by the `ip pim sparse-mode` command. The `ip igmp version` command does not affect the IGMP enabled status.

The `no ip igmp version` and `default ip igmp version` commands restore the configuration mode interface to IGMP version 3 by removing the `ip igmp version` statement from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ip igmp version version_number
no ip igmp version
default ip igmp version
```

**Parameters**

- `version_number`  IGMP version number. Value ranges from 1 to 3.

**Example**

- This command configures IGMP version 3 on VLAN interface 4.
  ```
  switch(config)#interface vlan 4
  switch(config-if-Vl4)#ip igmp version 3
  switch(config-if-Vl4)#
  ```
permit / deny

The **permit** command configures the configuration mode IGMP profile as a permit list. Applying a permit list to an interface restricts that interface from joining any multicast group not included in the list.

IGMP profiles are deny lists by default. When applied to an interface, a deny list allows the interface to join any multicast group that is not included in the list.

The **deny** command restores the IGMP list to its default type by removing the corresponding **permit** statement from `running-config`.

The **range** command adds and removes address ranges from the configuration mode profile.

**Command Mode**
- IGMP-profile Configuration

**Command Syntax**
- `permit`
- `deny`

**Related Commands**
- `ip igmp profile` places the switch in IGMP-profile configuration mode.

**Example**
- These commands enter IGMP profile configuration mode and configure the profile as a permit list.

```
switch(config)#ip igmp profile list_1
switch(config-igmp-profile-list_1)#permit
switch(config-igmp-profile-list_1)#
```
range

The **range** command specifies an address range for the configuration mode IGMP profile. A permit range specifies the groups that an interface is permitted to join. A deny range specifies the groups that an interface is not permitted to join. The **permit / deny** command specifies the range type.

A profile may contain multiple range statements to define a discontiguous address range.

The **no range** and **default range** commands remove the specified address range from a previous specified list.

**Command Mode**

IGMP-profile Configuration

**Command Syntax**

```
range init_address [UPPER_RANGE]
no range init_address [UPPER_RANGE]
default range init_address [UPPER_RANGE]
```

**Parameters**

- **init_address**  
  IP address of lower boundary of the address range (dotted decimal notation).

- **UPPER_RANGE**  
  sets the upper boundary of the address range. Options include
  - <no parameter> upper boundary is equal to lower boundary: range consists of one address.
  - **range_address**  
    IP address of upper boundary.

All addresses must be multicast addresses (10.0.0.0 to 239.255.255.255).

**Related Commands**

- **ip igmp profile** places the switch in IGMP-profile configuration mode.

**Example**

These commands enter IGMP profile configuration mode, configure the profile as a permit list, and define the permit address list of 232.1.1.0 to 232.1.1.255 and 233.1.1.10.

```
switch(config)#ip igmp profile list_1
switch(config-igmp-profile-list_1)#permit
switch(config-igmp-profile-list_1)#permit 232.1.1.0 232.1.1.255
switch(config-igmp-profile-list_1)#permit 233.1.1.10
switch(config-igmp-profile-list_1)#
```
show ip igmp groups

The **show ip igmp groups** command displays multicast groups that have receivers directly connected to the switch, as learned through Internet Group Management Protocol (IGMP).

- **show ip igmp groups** all multicast groups.
- **show ip igmp groups group_addr** listed multicast group.
- **show ip igmp groups interface int_name** all multicast groups on specified interfaces
- **show ip igmp groups group_addr interface int_name** listed multicast group on specified interface.

**Command Mode**
EXEC

**Command Syntax**
```
show ip igmp groups GROUP_LIST [DATA]
```

**Parameters**
- **GROUP_LIST** list of groups for which the command displays information. Options include:
  - **<no parameter>** all multicast groups.
  - **group_addr** single multicast group address (dotted decimal notation).
  - **interface ethernet e_num** all multicast groups on specified Ethernet interface.
  - **interface loopback l_num** all multicast groups on specified Loopback interface.
  - **interface management m_num** all multicast groups on specified Management interface.
  - **interface port-channel p_num** all multicast groups on specified Port-Channel Interface.
  - **interface vlan v_num** all multicast groups on specified VLAN interface.
  - **interface vxlan vx_num** all multicast groups on specified VXLAN interface.
- **DATA** specifies the type of information displayed. Options include:
  - **<no parameter>** provides uptime, expiration, and address of reporter.
  - **detail** also include group mode and group source list.

**Example**
- This command displays multicast groups with receivers directly connected to the switch.

```
switch>show ip igmp groups
NOTE: static-group information not shown below. Use the 'show ip igmp static-groups' command.
IGMP Connected Group Membership
Group Address    Interface                Uptime    Expires   Last Reporter
10.12.1.1       Vlan162                  11d01h    00:02:57  172.17.2.110
10.12.1.2       Vlan162                  11d01h    00:02:57  172.17.2.110
10.12.1.3       Vlan162                  11d01h    00:02:57  172.17.2.110

switch>
```
**show ip igmp groups count**

The `show ip igmp groups count` command displays the number of multicast groups that are joined across the specified interfaces.

**Command Mode**

EXEC

**Command Syntax**

```
show ip igmp groups [GROUP_LIST] count
```

**Parameters**

- `INTERF` Specifies the interface for which the command displays information. Options include:
  - `<no parameter>` all IGMP interfaces.
  - `interface ethernet e_num` Ethernet interface.
  - `interface loopback l_num` Loopback interface.
  - `interface management m_num` Management interface.
  - `interface port-channel p_num` Port-Channel Interface.
  - `interface vlan v_num` VLAN interface.
  - `interface vxlan vx_num` VXLAN interface.

**Example**

- This command displays the number of multicast groups joined across all interfaces.
  ```
  switch>show ip igmp groups count
  Number of total groups joined across all IGMP interfaces: 5
  switch>
  ```

- This command displays the number of multicast groups joined on Ethernet 3/4 interface.
  ```
  switch>show ip igmp groups interface ethernet 3/4 count
  Number of groups joined on Ethernet3/4: 2
  switch>
  ```
show ip igmp host-proxy config-sanity

The `show ip igmp host-proxy config-sanity` command displays diagnostic information about an IGMP host proxy configuration.

**Command Mode**

EXEC

**Command Syntax**

```
show ip igmp host-proxy config-sanity
```

**Example**

- This command displays IGMP host proxy configuration diagnostic information.

  ```
  switch>show ip igmp host-proxy config-sanity
  DISCLAIMER:
  Below are only hints of potential IGMP Host-Proxy misconfiguration.
  They do not necessary imply that there is a real problem.
  ```

  No IGMP Host-Proxy misconfiguration hints found

  switch>
show ip igmp host-proxy interface

The **show ip igmp host-proxy interface** command displays IGMP host proxy configuration information. Command filters allow the list to provide data for a specified interface.

**Command Mode**

**EXEC**

**Command Syntax**

```
show ip igmp host-proxy interface GROUP_LIST [DATA]
```

**Parameters**

- **GROUP_LIST** Filters data to include only a specified list of groups for which the command displays information:
  - `<no parameter>` reports host proxy configuration status on all interfaces.
  - `ethernet e_num` reports status on specified Ethernet interface.
  - `port-channel p_num` reports status on specified Port-Channel Interface.
  - `vlan v_num` reports status on specified VLAN interface.
- **DATA** specifies the type of information displayed. Options include
  - `<no parameter>` indicates interfaces where host proxy is configured.
  - `detail` data includes multicast group and source addresses.

**Example**

- This command displays host proxy information for all switch interfaces.
  ```
  switch(config-if-Po100)#show active
  interface Port-Channel100
    ip igmp host-proxy 234.4.4.4 exclude 0.0.0.0
    ip igmp host-proxy 234.10.4.4 include 10.14.3.3
    ip igmp host-proxy 234.10.4.4 include 10.14.3.2
    ip igmp host-proxy 234.10.4.4
    ip igmp host-proxy report-interval 4
  switch(config-if-Po100)#show ip igmp host-proxy interface
  ----------------------------------------------------------------------
  Interface: Port-Channel100
  IGMP Host-Proxy configured.
  ----------------------------------------------------------------------
  switch(config-if-Po100)#
  ```

- This command displays host proxy information for all switch interfaces, including multicast groups and source interfaces for which the interface is proxying.
  ```
  switch>show ip igmp host-proxy interface detail
  ----------------------------------------------------------------------
  Interface: Port-Channel100
  IGMP Host-Proxy configured.
  ----------------------------------------------------------------------

  Group: 234.4.4.4
  Exclude source list: 0.0.0.0

  Group: 234.10.4.4
  Include source list: 10.14.3.3  10.14.3.2
  ----------------------------------------------------------------------
  switch>
  ```
show ip igmp interface

The **show ip igmp interface** command displays multicast information about the specified interface.

**Command Mode**
EXEC

**Command Syntax**
```
show ip igmp interface [INT_NAME]
```

**Parameters**
- `INT_NAME` Interface type and number. Values include
  - `<no parameter>` Displays information for all interfaces.
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-Channel Interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
  - `vxlan vx_num` VXLAN interface specified by `vx_num`.

**Example**
- This command displays multicast related information about VLAN 26.
  ```
  switch>show ip igmp interface vlan 26
  Vlan26 is up
  Interface address: 172.17.26.1/23
  IGMP on this interface: enabled
  Multicast routing on this interface: enabled
  Multicast TTL threshold: 1
  Current IGMP router version: 2
  IGMP query interval: 125 seconds
  IGMP max query response time: 100 deciseconds
  Last member query response interval: 10 deciseconds
  Last member query response count: 2
  IGMP querier: 172.17.26.1
  Robustness: 2
  Require router alert: enabled
  Startup query interval: 312 deciseconds
  Startup query count: 2
  General query timer expiry: 00:00:22
  Multicast groups joined:
    239.255.255.250
  
  switch>
  ```
**show ip igmp profile**

The `show ip igmp profile` command displays the contents of the specified IGMP profile. IGMP snooping filters use an IGMP profile to control the multicast groups that an interface can join.

**Command Mode**

EXEC

**Command Syntax**

```
show ip igmp snooping [PROFILES]
```

**Parameters**

- **PROFILES** IGMP profiles for which command displays contents. Options include:
  - `<no parameter>` displays all IGMP profiles.
  - `profile_name` displays specified profile.

**Example**

- This command displays the IGMP profiles configured on the switch.
  
  ```
  switch>show ip igmp profile
  IGMP Profile list_1
  permit
  range 229.1.24.0 229.1.25.255
  IGMP Profile list_2
  range 234.1.1.0 234.1.255.255
  switch>
  ```
**show ip igmp snooping**

The **show ip igmp snooping** command displays the switch’s IGMP snooping configuration.

**Command Mode**

EXEC

**Command Syntax**

```
show ip igmp snooping [VLAN_ID]
```

**Parameters**

- **VLAN_ID** specifies VLANs for which command displays information. Options include:
  - `<no parameter>` displays information for all VLANs.
  - `vlan v_num` displays information for specified VLAN.

**Example**

- This command displays the switch’s IGMP snooping configuration.

```
switch>show ip igmp snooping
  Global IGMP Snooping configuration:
  ________________________________

switch>
```
show ip igmp snooping counters

The show ip igmp snooping counters command displays the number of IGMP messages sent and received through each switch port. The display table sorts the messages by type.

**Command Mode**

EXEC

**Command Syntax**

```
show ip igmp snooping counters [DATA_TYPE][DATA_LEVEL]
```

**Parameters**

- **DATA_TYPE** Information displayed by the command. Options include:
  - <no parameter> displays transmission counters.
  - errors displays error counters.
- **DATA_LEVEL** specifies the type of information displayed. Options include:
  - <no parameter> number of packets on physical ports.
  - detail number of packets on physical ports.

**Example**

This command displays the number of messages received on each port.

```
switch>show ip igmp snooping counters
```

**show ip igmp snooping counters ethdev-pams**

The `show ip igmp snooping counters` command displays the number of dropped IGMP packets messages sent and received through each switch port at the kernel level. The display table sorts the messages by type.

**Command Mode**

EXEC

**Command Syntax**

`show ip igmp snooping counters ethdev-pams`

**Example**

- This command displays the number of messages dropped at the kernel level.

```
switch>show ip igmp snooping counters ethdev-pams

switch>
```
The `show ip igmp snooping groups` command displays IGMP snooping statistics. Available information includes the physical ports that send and receive information, the time when multicast data was originally and most recently heard on the ports, and the version number of the IGMP messages. Command provides options that restrict the output to specific VLANs, ports, and groups.

**Command Mode**

EXEC

**Command Syntax**

```
show ip igmp snooping groups [VLAN_ID][PORT_INT][GROUPS][DATA]
```

**Parameters**

- **VLAN_ID** specifies VLAN for which command displays information. Options include:
  - `<no parameter>` displays information for all VLANs.
  - `vlan v_num` displays information for VLAN v_num (1 to 4094).
- **PORT_INT** specifies physical ports for which command displays information. Options include:
  - `<no parameter>` displays information for all physical ports.
  - `interface ethernet e_range`, where `e_range` is the number, range, or list of Ethernet ports.
  - `interface port-channel p_range`, where `p_range` is the number, range, or list of channel ports.
- **GROUPS** specifies the multicast groups. Options include:
  - `<no parameter>` all multicast groups on all specified ports.
  - `mgroup_address` multicast group specified by IPv4 address (dotted decimal notation).
  - `dynamic` multicast groups learned through IGMP.
  - `user` multicast groups manually added.
- **DATA** specifies the type of information displayed. Options include:
  - `<no parameter>` VLAN number and port-list for each group.
  - `detail` port-specific information for each group, including transmission times and expiration.

**Example**

This command displays the port lists for all multicast groups.

```
switch>show ip igmp snooping groups
Vlan  Group            Type     Version             Port-List
-------------------------------------------------------------------------------
-      
1     239.255.255.250  -        -                   Po1, Po2
26    239.255.255.250  -        -                   Cpu, Et3, Et4, Et10, Et23, Et27
switch>
```
This command displays detailed port information of all multicast groups.

```
switch>show ip igmp snooping groups detail

```
show ip igmp snooping groups count

The `show ip igmp snooping groups count` command displays the number of multicast groups on the switch. Command provides options to only include specific VLANs and ports.

**Command Mode**

EXEC

**Command Syntax**

```
show ip igmp snooping groups [VLAN_ID][PORT_INT] count [DATA]
```

**Parameters**

- `VLAN_ID` specifies VLAN for which command displays information. Options include:
  - `<no parameter>` all VLANs.
  - `vlan v_num` specified VLAN.
- `PORT_INT` specifies physical ports for which command displays information. Options include:
  - `<no parameter>` all physical ports.
  - `interface ethernet e_range` specified Ethernet ports.
  - `interface port-channel p_range` specified port channels.

Valid `e_range` and `p_range` formats include number, number range, or comma-delimited list of numbers and ranges.

- `DATA` specifies the type of information displayed. Options include:
  - `<no parameter>` number of multicast group on specified VLAN and ports.
  - `detail` number of multicast group on specified VLAN and ports.

**Example**

- This command displays the number of multicast groups on the switch.

  ```
  switch>show ip igmp snooping groups count
  Total number of multicast groups: 2
  switch>
  ```
**show ip igmp snooping mrouter**

The `show ip igmp snooping mrouter` command displays the status of dynamic and static multicast router ports. Command provides options to include only specific VLANs.

**Command Mode**

EXEC

**Command Syntax**

```
show ip igmp snooping mrouter [VLAN_ID] [DATA]
```

**Parameters**

- **VLAN_ID** specifies VLAN for which command displays information. Options include:
  - `<no parameter>` all VLANs.
  - `vlan v_num` specified VLAN.
- **DATA** specifies the type of information displayed. Options include:
  - `<no parameter>` displays VLAN number and port-list for each group.
  - `detail` displays port-specific data for each group; includes transmission times and expiration.

**Examples**

- This command displays port information of each multicast router on all VLANs.
  ```
  switch>show ip igmp snooping mrouter
  Vlan    Interface-ports
  ------------------------------------------------------------
  1       Po1(dynamic)
  20      Po1(dynamic)
  26      Cpu(dynamic)
  2028    Cpu(dynamic), Po1(dynamic)
  switch>
  ```

- This command displays multicast router information for each port.
  ```
  switch>show ip igmp snooping mrouter detail
  Vlan  Intf  Address        FirstHeard LastHeard  Expires  Type
  ---------------------------------------------------------------------------
  1    Po1   172.17.0.37     31549:12   0:12       1:33       pim
  20   Po1   172.17.20.1      7066:51    0:19       1:26       pim
  26   Cpu   172.17.26.1      31549:16   0:28       1:17       pim
  2028  Po1   172.17.255.29    31549:10   0:18       1:27       pim
  2028  Cpu   172.17.255.30    31549:14   0:28       1:17       pim
  switch>
  ```
**show ip igmp snooping querier**

The `show ip igmp snooping querier` command displays snooping querier configuration and status information. Command provides options to only include specific VLANs.

**Command Mode**

EXEC

**Command Syntax**

```
show ip igmp snooping querier [STATUS][VLAN_ID][DATA]
```

**Parameters**

- **STATUS** specifies the type of information displayed. Options include:
  - `<no parameter>` querier IP address, port, and IGMP version.
  - `status` querier configuration parameters.
- **VLAN_ID** specifies VLANs for which command displays information. Options include:
  - `<no parameter>` all VLANs.
  - `vlan v_num` specified VLAN.
- **DATA** specifies the type of information displayed. Options include:
  - `<no parameter>` displays VLAN number and port-list for each group.
  - `detail` displays port-specific data for each group; includes transmission times and expiration.

**Example**

- This command displays the querier IP address, version, and port servicing each VLAN.

```
switch>show ip igmp snooping querier
Vlan  IP Address       Version  Port
----------------------------------------
 1     172.17.0.37      v2       Po1
 20    172.17.20.1      v2       Po1
 26    172.17.26.1      v2       Cpu
 2028  172.17.255.29    v2       Po1
switch>
```

- This command displays the querier configuration parameters for each VLAN.

```
switch>show ip igmp snooping querier status
Global IGMP Querier status
------------------------------------

```
show ip igmp snooping querier counters

The `show ip igmp snooping querier counters` command displays the counters from the querier, as learned through Internet Group Management Protocol (IGMP).

**Command Mode**
- EXEC

**Command Syntax**
```
show ip igmp querier counters [VLAN_ID]
```

**Parameters**
- `VLAN_ID` specifies VLANs for which command displays information. Options include:
  - `<no parameter>` displays information for all VLANs.
  - `vlan v_num` displays information for specified VLAN.

**Example**
- This command displays the counters from the querier.
  ```
switch>show ip igmp snooping querier counters

Vlan: 1    IP Addr: 100.0.0.1       Op State: Querier     Version: v3
  v1 General Queries Sent      :0

  Other Packets                :0

switch>
```
**show ip igmp snooping querier membership**

The `show ip igmp snooping querier membership` command displays the membership from the querier, as learned through Internet Group Management Protocol (IGMP).

**Command Mode**

EXEC

**Command Syntax**

```
show ip igmp querier membership [VLAN_ID [GROUP_LIST]]
```

**Parameters**

- **VLAN_ID** specifies VLANs for which command displays information. Options include:
  - `<no parameter>` displays information for all VLANs.
  - `vlan v_num` displays information for specified VLAN.
- **GROUP_LIST** list of groups for which the command displays information. Options include:
  - `<no parameter>` all multicast groups within specified VLAN.
  - `group ipv4_addr` single multicast group address (dotted decimal notation).

**Example**

- This command displays the membership from the querier for VLAN 1.

```plaintext
switch> show ip igmp snooping querier membership
-------------------------------------------------------------------------
Vlan: 1    Elected: 10.0.0.1       QQI: 125  QRV: 2  QRI: 10  GMI: 260

switch>
```
show ip igmp snooping report-flooding

The `show ip igmp snooping report-flooding` command displays IGMP snooping L2 report flooding configuration and status information. Command provides options to only include specific VLANs.

**Command Mode**

EXEC

**Command Syntax**

```plaintext
show ip igmp snooping report-flooding [VLAN_ID][DATA]
```

**Parameters**

- `VLAN_ID` specifies VLANs for which command displays information. Options include:
  - `<no parameter>` all VLANs.
  - `vlan v_num` specified VLAN.
- `DATA` specifies the type of information displayed. Options include:
  - `<no parameter>` displays VLAN number and port-list for each group.
  - `detail` displays port-specific data for each group; includes transmission times and expiration.
show ip igmp static-groups

The **show ip igmp static-groups** command displays information about all configured IGMP multicast static groups. IGMP multicast static groups are assigned with the **ip igmp static-group** command.

**Command Mode**
EXEC

**Command Syntax**
```
show ip igmp static-groups [INFO_LEVEL] [interface INT_NAME]
```

**Parameters**
- **INFO_LEVEL** specifies the type of information displayed. Options include
  - `<no parameter>` VLAN number and port-list for each group.
  - `detail` port-specific information for each group, including transmission times and expiration.
- **INT_NAME** Interface type and number. Values include
  - `<no parameter>` static groups on all interfaces.
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-Channel Interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
  - `vxlan vx_num` VXLAN interface specified by `vx_num`.

**Related Commands**
- **show ip igmp static-groups acl**
- **show ip igmp static-groups group**

**Examples**
- This command displays information about all multicast static groups.
  ```
switch>show ip igmp static-groups
  Interface Vlan281:
  Manually configured groups:
  Interface Port-Channel999:
  Manually configured groups:
  switch>
  ```
- This command displays information about the multicast static groups on VLAN interface 21.
  ```
switch>show ip igmp static-groups interface vlan 21
  Interface Vlan281:
  Manually configured groups:
  switch>
  ```
**show ip igmp static-groups acl**

The `show ip igmp static-groups acl` command displays information about the IGMP multicast static groups that are configured by the specified access control list (ACL). The command also displays problems with an ACL that prevent its assignment to an interface.

**Command Mode**

**EXEC**

**Command Syntax**

`show ip igmp static-groups acl`

**Example**

The following `show ip igmp static-group acl` command example references these ACLs:

```
ip access-list 1
  10 permit igmp host 10.1.1.1 10.1.1.0/29
  20 permit igmp host 10.1.1.2 10.1.1.0/29
!
ip access-list 2
  10 permit igmp 10.1.1.0/29 host 10.1.1.1
!
ip access-list 3
  10 deny igmp host 10.1.1.1 255.1.1.0/29
!
ip access-list 4
  10 permit igmp host 10.1.1.1 10.1.1.0/29
  20 permit igmp 10.1.1.0/29 host 10.1.1.1
```

- This command displays static group configuration data about the various ACLs.

```
switch>show ip igmp static-group acl 1
acl 1
  ( 10.1.1.1, 10.1.1.0/29 )
  ( 10.1.1.2, 10.1.1.0/29 )
Interfaces using this ACL for static groups:
  Ethernet12
switch>show ip igmp static-group acl 2
acl 2
  Seq no 30: source address must be a single host or *, not a range
Interfaces using this ACL for static groups:
  Ethernet8
switch>show ip igmp static-group acl 3
acl 4
  Seq no 10: action must be 'permit'
Interfaces using this ACL for static groups:
  none
switch>show ip igmp static-group acl 4
acl 5
  ( 10.1.1.1, 10.1.1.0/29 )
  Seq no 20: source address must be a single host or *, not a range
Interfaces using this ACL for static groups:
  none
switch>
```
show ip igmp static-groups group

The `show ip igmp static-groups group` command displays information about all specified IGMP multicast static groups. IGMP multicast static groups are assigned with the `ip igmp static-group` command.

**Command Mode**
EXEC

**Command Syntax**
```
show ip igmp static-groups group [GROUP_LIST]
```

**Parameters**
- `GROUP LIST` Groups for which command displays information
  - `<no parameter>` all multicast groups.
  - `group_address` single multicast group address (dotted decimal notation).

**Related Commands**
- `show ip igmp static-groups`
show ip igmp statistics

The show ip igmp statistics command displays IGMP transmission statistics for the specified interface.

Command Mode
EXEC

Command Syntax

```plaintext
show ip igmp statistics [INTERFACE_ID]
```

Parameters

- **INTERFACE_ID**  Specifies interface for which command returns data. Options include:
  - <no parameter>    all interfaces.
  - `interface ethernet e_num`  Ethernet interface specified by `e_num`.
  - `interface loopback l_num`  Loopback interface specified by `l_num`.
  - `interface management m_num`  Management interface specified by `m_num`.
  - `interface port-channel p_num`  Port-Channel Interface specified by `p_num`.
  - `interface vlan v_num`  VLAN interface specified by `v_num`.
  - `interface vxlan vx_num`  VXLAN interface specified by `vx_num`.

Example

- This command displays IGMP transmission statistics for ethernet 1 interface.

```plaintext
switch>show ip igmp statistics interface ethernet 1
IGMP counters for Ethernet1:
  V1 queries sent: 0
  V2 queries sent: 0
  V3 queries sent: 3
  Total general queries sent: 3

```
Protocol Independent Multicast

Protocol Independent Multicast (PIM) distributes multicast data using routes gathered by other protocols. PIM Sparse Mode (PIM-SM), defined in RFC 4601, is a multicast routing protocol designed for networks where multicast group recipients are sparsely distributed, including wide-area and inter-domain networks. These sections describe the Arista PIM implementation:

- **Section 36.1: Introduction** provides an overview of PIM.
- **Section 36.2: Configuring PIM** describes configuration tasks that implement PIM.
- **Section 36.3: Multicast Example** provides a multicast implementation scenario.
- **Section 36.4: PIM Commands** contains PIM command descriptions.

### 36.1 Introduction

Protocol Independent Multicast (PIM) distributes multicast data using routes gathered by other protocols. PIM Sparse Mode (PIM-SM), defined in RFC 4601, is a multicast routing protocol designed for networks where multicast group recipients are sparsely distributed, including wide-area and inter-domain networks.

PIM builds and maintains multicast routing trees using reverse path forwarding (RPF) on a unicast routing table. PIM can use routing tables consisting of OSPF, BGP, RIP, and static routes. All sources send traffic to the multicast group through shared trees that have a common root node called the Rendezvous Point (RP). Each host (senders and receivers) is associated with a Designated Router (DR) that acts for all directly connected hosts in PIM-SM transactions.

### 36.1.1 Protocol Overview

PIM uses an MRIB that is populated from the unicast table. The MRIB provides the next-hop router along a multicast-capable path to each destination subnet. This determines the next-hop neighbor for sending PIM Join or Prune messages.

PIM establishes multicast routes through three phases:

- Establishing the RP Tree
- Eliminating Encapsulation
- Establishing the Shortest Path Tree (SPT)
Establishing the RP Tree (Phase 1)
The RP tree is a distribution network that all sources share to deliver multicast data. The root of the RP tree is the Rendezvous Point.

The process starts when a receiver requests multicast data from a group \((G)\). The receiver's DR sends a PIM \((*,G)\) Join message toward the multicast group's RP. As the message travels towards the RP, it instantiates the multicast \((*,G)\) state in each router on the path. After many receivers join the group, the Join messages converge on the RP to form the RP tree.

The DR resends Join messages periodically, while it has a receiver in the group, to prevent state timeout expiry in the routers along the path. When all receivers on a DR’s subnet leave a group, the DR sends a \((*,G)\) Prune message towards the RP to remove the state from the routers.

A multicast sender transmits multicast data to the RP through its DR. The DR encapsulates the multicast packets and sends them as unicast packets. The RP extracts the native multicast packet and sends it to the RP tree towards the group members.

Eliminating Multicast Encapsulation (Phase 2)
Data encapsulation, while initially required before the multicast path is established, is inefficient because it requires the transmission of data that is extraneous to multicast. Phase 2 establishes states in the routers that support the transmission of native multicast packets.

When the RP receives an encapsulated packet from source \(S\) on group \(G\), it sends a source-specific \((S,G)\) Join message towards the source. As the message travels towards \(S\), it instantiates the \((S,G)\) state on each router in the path. This state is used only to forward packets for group \(G\) from source \(S\). Data packets on the \((S,G)\) path are also routed into the RP tree when they encounter an \((*,G)\) router.

When the RP starts receiving native packets from the sources, it sends a Register-Stop message to the source's DR, halting packet encapsulation. At this time, traffic flows natively from the source along a source-specific tree to the RP, then along the shared RP tree to the receivers.

Establishing the Shortest Path Tree (Phase 3)
The third phase establishes the shortest path from the multicast source to all receivers.

When a multicast packet arrives at the receiver, its router (typically the DR) sends a Join message towards the source to instantiate the \((S,G)\) state in all routers along its path. The message eventually reaches either the source’s subnet or a router that already has an \((S,G)\) state. This causes data to flow from the source to the receiver following the \((S,G)\) path. At this time, the receiver is receiving data from the Shortest Path Tree (SPT) and the RP Tree (RPT).

The DR (or upstream router) eliminates the data transmission along the RPT by sending a Prune message \((S,G,rpt)\) towards the RP. The message travels hop-by-hop, instantiating the state on each router in the path, continues until it reaches the RP or a router that needs traffic from \(S\) for other receivers.

36.1.2 Rendezvous Points (RP)
An RP is a router that is configured as the root of a non-source-specific distribution tree for a multicast group. Join messages for receivers to a group are sent towards the RP. Data from senders is sent to the RP, allowing receivers to discover sender identity and begin receiving group traffic. Paths through RP routers are temporary; when traffic volume reaches a sufficient level, the receiver joins a source-specific tree and the path through the RP is dropped.

The switch supports two methods of mapping RPs to multicast groups:
- Static: RPs are statically configured through a CLI statement.
• Dynamic: RPs are dynamically selected by a bootstrap router from a set of candidate RPs.

While dynamic RP mappings have priority over static maps by default, a static RP can be configured to override dynamic mappings.

Section 36.2.2 describes the configuration of rendezvous points.
36.2 Configuring PIM

The following sections describe the configuration of static RPs, dynamic RPs, and anycast-RPs. RP implementation is defined through the following RFCs:

- RFC 5059: Bootstrap Router (BSR) for Protocol Independent Multicast (PIM).

This section describes the following configuration tasks:

- Section 36.2.1: Enabling PIM
- Section 36.2.2: Rendezvous Points (RPs)
- Section 36.2.3: Hello Messages
- Section 36.2.4: Designated Router Election
- Section 36.2.5: Join-Prune Messages

36.2.1 Enabling PIM

By default, PIM is disabled on an interface. The `ip pim sparse-mode` command enables PIM on the configuration mode interface.

Example

- This command enables PIM and IGMP on VLAN interface 8.

  ```
  switch(config-if-Vl8)#ip pim sparse-mode
  switch(config-if-Vl8)#
  ```

36.2.2 Rendezvous Points (RPs)

Networks that run PIM sparse mode require a rendezvous point (RP). The switch supports dynamic RPs, static RPs, and anycast-RP.

**Configuring Static RPs**

The `ip pim rp-address` command configures a static RP, providing an option to override dynamic RPs.

Examples

- This command creates a static RP at 10.17.255.83 that maps to all multicast groups (224/4) and override dynamic RPs.

  ```
  switch(config)#ip pim rp-address 10.17.255.83 override
  switch(config)#
  ```

- This command creates a static RP at 10.21.18.23 that maps to the multicast groups at 238.1.12.0/24.

  ```
  switch(config)#ip pim rp-address 10.21.18.23 238.1.12.0/24
  switch(config)#
  ```

**Configuring Dynamic RPs**

Dynamic RP selection is implemented through a bootstrap router (BSR), which is a PIM router within the PIM domain that selects RPs from a list of candidates. A subset of PIM routers within the domain are configured as candidate bootstrap routers (C-BSRs). Through the exchange of bootstrap messages (BSMs), the C-BSRs elect the BSR, which then uses BSMs to inform all domain routers of its status.
The BSR holdtime defines the timeout period that an elected BSR remains valid after the receipt of a BSM and is also used in dynamic RP configuration. Holdtime is designated by the BSR router and communicated to other routers through BSMs.

Another subset of domain PIM routers are configured as candidate RPs (C-RPs). The BSR creates a set of qualifying RPs from the list of C-RPs, then distributes the group-to RP mapping set to all domain routers through BSMs. Each PIM router, after receiving this set, uses a standard algorithm defined in RFC 6226 to select one RP per multicast group.

The `ip pim bsr-candidate` command configures the switch as a candidate BSR router (C-BSR). Command parameters specify the switch’s BSR address, the interval between BSM transmissions, and the switch’s BSR priority rating. Priority ratings range from 0 to 255 with a default of 128. Higher numbers denote higher priority during BSR elections.

**Example**

- These commands configure the switch as a BSR candidate, using the IP address assigned to VLAN interface 24 as its BSR address. The BSM transmission interval is set to 30 seconds and the priority is set to 192.

  switch(config)#ip pim bsr-candidate vlan 24 priority 192 interval 30
  switch(config)#

The `ip pim bsr-holdtime` command specifies the value the switch inserts in the **holdtime** field of bootstrap messages (BSMs) that it sends. This value becomes the holdtime for the PIM domain if the switch is elected as the BSR.

**Example**

- This command specifies 75 seconds as the value that the switch inserts into BSM holdtime fields.

  switch(config)#ip pim bsr-holdtime 75
  switch(config)#

The `ip pim rp-candidate` command configures the switch as a candidate rendezvous point (C-RP). The BSR selects a multicast group’s dynamic RP set from the list of C-RPs. Command parameters specify the switch’s RP address, C-RP advertisement interval, and priority rating. The priority rating is used by the BSR when selecting RPs. The C-RP advertisement interval specifies the period between successive C-RP advertisement message transmissions to the BSR.

**Running-config** may contain multiple `ip pim rp-candidate` statements to support multiple multicast groups:

- All commands must specify the same interface. Issuing a command with an interface that differs from existing commands removes all existing commands from **running-config**.

- **Running-config** stores the **interval** setting in a separate statement that applies to all **rp-candidate** statements. Commands that specify an interval that differs from the previously configured value place the new value in **running-config**. This new value applies to all **rp-candidate** statements.

**Example**

- This command configures a switch as a candidate RP for the multicast group 235.1.1.0/24, with a priority of 48 and a RP advertisement interval of 45 seconds.

  switch(config)#ip pim rp-candidate vlan 24 235.1.1.0/24 priority 48 interval 45
  switch(config)#

By default, the switch transmits bootstrap router messages (BSMs) over all PIM-SM enabled interfaces. The `ip pim bsr-border` command prevents the switch from transmitting BSMs over the configuration mode interface.
Example

- This command enables `ip pim bsr-border` in VLAN 10.

```
switch(config)#interface vlan 10
switch(config-if-Vl10)#ip pim bsr-border
```

Anycast-RP

PIM Anycast-RP defines a single RP address that is on multiple devices. An anycast-RP set consists of the routers configured with the same anycast-RP address. Anycast-RP provides redundancy protection and load balancing. The anycast-RP set supports all multicast groups.

The `ip pim anycast-rp` command configures the switch as a member of an anycast-RP set and establishes a communication link with another member of the set.

Example

- These commands configure a switch (IP address 10.1.1.14) into an anycast-RP set with an RP address of 10.17.255.2. The anycast-RP set contains three other routers, located at 10.1.2.14, 10.1.3.14, and 10.1.4.14. It sets the number of unacknowledged register messages it sends to each router at 15.

```
switch(config)#ip pim anycast-rp 10.17.255.2 10.1.1.14 register-count 15
```

36.2.3 Hello Messages

Multicast routers send PIM router query (Hello) messages to determine the designated router (DR) for each subnet. The DR then sends registration messages to the RP.

The `ip pim query-interval` command specifies the transmission interval between PIM hello messages originating from the specified VLAN interface.

Example

- This command configures 45 second intervals between hello messages originating from VLAN interface 4.

```
switch(config-if-Vl4)#ip pim query-interval 45
```

36.2.4 Designated Router Election

PIM uses these criteria for electing designated routers (DR):

- If one router does not advertise a dr-priority value, the router with the highest IP address becomes the Designated Router.
- If all routers advertise a dr-priority value, the router with the highest dr-priority value becomes the Designated Router.

The `ip pim dr-priority` command sets the DR priority value that the switch advertises. If running-config does not contain a `ip pim dr-priority` statement, the switch does not advertise a dr-priority value.
Examples

- This command configures the dr-priority value of 15 on VLAN interface 4.
  
  ```
  switch(config-if-Vl4)#ip pim dr-priority 15
  switch(config-if-Vl4)#
  ```

- This command removes the **ip-pim dr-priority** statement (VLAN interface 4) from **running-config**.
  
  ```
  switch(config-if-Vl4)#no ip pim dr-priority
  switch(config-if-Vl4)#
  ```

36.2.5 Join-Prune Messages

Join/prune messages are sent by the PIM designated router (DR) toward the rendezvous point (RP). These messages inform other PIM routers about clients that want to become receivers (Join) or stop being receivers (Prune) for the groups.

The **ip pim join-prune-interval** command specifies the period between join/prune messages that the switch originates from the specified VLAN interface and sends to the upstream RPF neighbor.

**Example**

- This command configures 75 second intervals between join/prune messages originating from VLAN interface 4.
  
  ```
  switch(config-if-Vl4)#ip pim join-prune-interval 75
  switch(config-if-Vl4)#
  ```
36.3 Multicast Example

This section provides an example network that implements multicast and includes the required commands.

36.3.1 Diagram

Figure 36-1 displays the multicast network example. The network contains four routers. Multicast routing is enabled on two switches. One switch has its IGMP Snooping Querier enabled.

Figure 36-1: Multicast Example

The example multicast network implements these multicast parameters:

**Rendezvous Point Address**: 10.25.10.15

**Switch Clara**
- IGMP Snooping : disabled
- Subnet Summary:
  - 10.40.10.0/24: VLAN 11
  - 10.15.10.0/24: VLAN 12
  - 10.15.11.0/24: VLAN 13
  - 10.15.12.0/24: VLAN 14
  - 10.5.1.0/20: VLAN 10

**Switch Mateo**
- IGMP Snooping : disabled
- Subnet Summary:
  - 10.20.13.0/24: VLAN 18
  - 10.20.10.0/24: VLAN 15
  - 10.20.11.0/24: VLAN 16
Chapter 36: Protocol Independent Multicast

Multicast Example

- 10.20.12.0/24: VLAN 17
- 10.15.10.0/24: VLAN 12
- 10.15.11.0/24: VLAN 13
- 10.15.12.0/24: VLAN 14
- 10.25.10.12/30: VLAN 19
- 10.5.1.0/20: VLAN 10

Switch Allie
- IGMP Snooping: enabled
- Multicast Routing: enabled
- Querier: enabled
- Rendezvous Point Address: 10.25.10.15
- MFIB activity polling interval: 5 second
- Subnet Summary:
  - 10.30.13.0/24: VLAN 23
  - 10.30.10.0/24: VLAN 20 – PIM-SM enabled
  - 10.30.11.0/24: VLAN 21 – PIM-SM enabled
  - 10.30.12.0/24: VLAN 22
  - 10.25.10.12/30: VLAN 19
  - 10.35.10.0/30: VLAN 24 – PIM-SM enabled
  - 10.5.1.0/20: VLAN 10 – PIM-SM enabled

Switch Francis
- IGMP Snooping: enabled
- Multicast Routing: enabled
- Subnet Summary:
  - 10.40.10.0/24: VLAN 25 – PIM-SM enabled
  - 10.35.10.0/30: VLAN 24 – PIM-SM enabled
  - 10.5.1.0/20: VLAN 10
36.3.2 Example

This example configures multicasting.

**Step 1** Configure the interface addresses

**a** Router Clara interfaces

```plaintext
Clara(config)#interface vlan 11
Clara(config-if-vl11)#ip address 10.40.10.1/24
Clara(config-if-vl11)#interface vlan 12
Clara(config-if-vl12)#ip address 10.15.10.42/24
Clara(config-if-vl12)#interface vlan 13
Clara(config-if-vl13)#ip address 10.15.11.21/24
Clara(config-if-vl13)#interface vlan 14
Clara(config-if-vl14)#ip address 10.15.12.50/24
Clara(config-if-vl14)#interface vlan 10
Clara(config-if-vl10)#ip address 10.5.1.33/20
Clara(config-if-vl10)#router ospf 1
Clara(config-router-ospf)#redistribute static
```

**b** Router Mateo interfaces

```plaintext
Mateo(config)#interface vlan 18
Mateo(config-if-vl18)#ip address 10.20.13.1/24
Mateo(config-if-vl18)#interface vlan 15
Mateo(config-if-vl15)#ip address 10.20.10.1/24
Mateo(config-if-vl15)#interface vlan 16
Mateo(config-if-vl16)#ip address 10.20.11.1/24
Mateo(config-if-vl16)#interface vlan 17
Mateo(config-if-vl17)#ip address 10.20.12.16/24
Mateo(config-if-vl17)#interface vlan 12
Mateo(config-if-vl12)#ip address 10.15.10.41/24
Mateo(config-if-vl12)#interface vlan 13
Mateo(config-if-vl13)#ip address 10.15.11.17/24
Mateo(config-if-vl13)#interface vlan 14
Mateo(config-if-vl14)#ip address 10.15.12.49/24
Mateo(config-if-vl14)#interface vlan 19
Mateo(config-if-vl19)#ip address 10.25.10.13/30
Mateo(config-if-vl19)#interface vlan 10
Mateo(config-if-vl10)#ip address 10.5.1.1/20
Mateo(config-if-vl10)#router ospf 1
Mateo(config-router-ospf)#redistribute static
```

**c** Router Allie interfaces

```plaintext
Allie(config)#interface vlan 23
Allie(config-if-vl23)#ip address 10.30.13.34/24
Allie(config-if-vl23)#interface vlan 20
Allie(config-if-vl20)#ip address 10.30.10.1/24
Allie(config-if-vl20)#interface vlan 21
Allie(config-if-vl21)#ip address 10.30.11.25/24
Allie(config-if-vl21)#interface vlan 22
Allie(config-if-vl22)#ip address 10.30.12.254/24
Allie(config-if-vl22)#interface vlan 19
Allie(config-if-vl19)#ip address 10.25.10.14/30
Allie(config-if-vl19)#interface vlan 24
Allie(config-if-vl24)#ip address 10.35.10.29/30
Allie(config-if-vl24)#interface vlan 10
Allie(config-if-vl10)#ip address 10.5.1.1/20
Allie(config-if-vl10)#router ospf 1
Allie(config-router-ospf)#redistribute static
```
d  Router Francis interfaces
   Francis(config)#interface vlan 25
   Francis(config-if-vl25)#ip address 10.40.10.1/24
   Francis(config-if-vl25)#interface vlan 24
   Francis(config-if-vl24)#ip address 10.35.10.30/24
   Francis(config-if-vl24)#interface vlan 10
   Francis(config-if-vl10)#ip address 10.5.1.35/24
   Francis(config-if-vl10)#router ospf 1
   Francis(config-router-ospf)#redistribute static

Step 2  Configure the interface multicast parameters
a  Router Allie interfaces
   Allie(config-router-ospf)#interface vlan 20
   Allie(config-if-vl20)#ip pim sparse-mode
   Allie(config-if-vl20)#interface vlan 21
   Allie(config-if-vl21)#ip pim sparse-mode
   Allie(config-if-vl21)#interface vlan 24
   Allie(config-if-vl24)#ip pim sparse-mode
   Allie(config-if-vl24)#interface vlan 10
   Allie(config-if-vl10)#ip pim sparse-mode

b  Router Francis interfaces
   Francis(config-router-ospf)#interface vlan 25
   Francis(config-if-vl25)#ip pim sparse-mode
   Francis(config-if-vl25)#interface vlan 24
   Francis(config-if-vl24)#ip pim sparse-mode

Step 3  Configure the router multicast parameters
a  Router Clara parameters
   Clara(config-router-ospf)#exit
   Clara(config)#no ip igmp snooping

b  Router Mateo interfaces
   Mateo(config-router-ospf)#exit
   Mateo(config)#no ip igmp snooping

c  Router Allie interfaces
   Allie(config-if-vl10)#exit
   Allie(config)#ip multicast-routing
   Allie(config)#ip mfib activity polling-interval 5
   Allie(config)#ip pim rp-address 10.25.10.15

d  Router Francis interfaces
   Francis(config-if-vl24)#exit
   Francis(config)#ip multicast-routing
   Francis(config)#ip pim rp-address 10.25.10.15
36.4 PIM Commands

PIM Configuration Commands (Global)
- `ip pim anycast-rp`
- `ip pim bsr-candidate`
- `ip pim bsr-holdtime`
- `ip pim log-neighbor-changes`
- `ip pim register-source`
- `ip pim rp-address`
- `ip pim rp-candidate`
- `ip pim sparse-mode sg-expiry-timer`
- `ip pim spt-threshold`
- `ip pim spt-threshold group-list`
- `ip pim ssm range`

PIM Configuration Commands (Interface)
- `ip pim border-router`
- `ip pim bsr-border`
- `ip pim dr-priority`
- `ip pim join-prune-interval`
- `ip pim neighbor-filter`
- `ip pim query-interval`
- `ip pim sparse-mode`

PIM Display Commands
- `show ip pim bsr`
- `show ip pim config-sanity`
- `show ip pim interface`
- `show ip pim neighbor`
- `show ip pim protocol counters`
- `show ip pim register-source`
- `show ip pim rp`
- `show ip pim rp-candidate`
- `show ip pim rp-hash`
- `show ip pim upstream joins`
ip pim anycast-rp

The `ip pim anycast-rp` command configures the switch as a member of an anycast-RP set and establishes a communication link with another member of the set.

The `no ip pim anycast-rp` and `default ip pim anycast-rp` commands remove the corresponding `ip pim anycast-rp` commands from `running-config`. When the `no` and `default` commands do not include a peer address, all commands for the specified rp address are removed.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip pim anycast-rp rp_addr peer_addr [REGISTER]
nip pim anycast-rp rp_addr [peer_addr]
default ip pim anycast-rp rp_addr [peer_addr]
```

**Parameters**

- `rp_addr`  Rendezvous point IP address (dotted decimal notation).
- `peer_addr` IP address of an anycast-RP set member (dotted decimal notation).
- `REGISTER` Number of unacknowledged register messages the switch sends to the peer router.
  - `<No parameter>` register count is set to default value of 10.
  - `register-count r_num` where `r_num` is an integer that ranges from 1 to 4294967295.
  - `register-count infinity`

**Example**

- These commands configure a switch (IP address 10.1.1.14) into an anycast-RP set with an RP address of 10.17.255.2. The anycast-RP set contains three other routers, located at 10.1.2.14, 10.1.3.14, and 10.1.4.14. It sets the number of unacknowledged register messages it sends to each router at 15.

  ```
  switch(config)#ip pim anycast-rp 10.17.255.2 10.1.1.14 register-count 15
  switch(config)#ip pim anycast-rp 10.17.255.2 10.1.2.14 register-count 15
  switch(config)#ip pim anycast-rp 10.17.255.2 10.1.3.14 register-count 15
  switch(config)#ip pim anycast-rp 10.17.255.2 10.1.4.14 register-count 15
  ```
ip pim border-router

The **ip pim border-router** command configures the configuration mode interface as a PIM multicast border router (MBR). A PIM MBR interface allows multicast traffic from sources that are outside of the PIM domain.

This command does not control the transmission or reception of PIM protocol packets by the interface. Sources learned through an MBR interface are treated as local sources (directly connected to the switch). The border-bit is set in all PIM register messages sent for these sources.

**Important!** Configuration as an MBR and configuration in PIM sparse mode must be mutually exclusive. Ensure that PIM sparse mode is not configured by issuing the **no ip pim sparse-mode** command on the interface before issuing this command.

The **no ip pim border-router** and **default ip pim border-router** commands removes the PIM MBR configuration for the configuration mode interface by removing the corresponding **ip pim border-router** statement from **running-config**.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
```
  ip pim border-router
  no ip pim border-router
  default ip pim border-router
```

**Example**
- These commands configure VLAN interface 200 as a PIM MBR, then display its status.

```
switch(config)#interface vlan 200
switch(config-if-VL200)#ip address 10.44.2.1/24
switch(config-if-VL200)#no ip pim sparse-mode
switch(config-if-VL200)#ip pim border-router
switch(config-if-VL200)#show active
interface Vlan200
  ip address 10.44.2.1/24
  ip pim border-router
switch(config-if-VL200)#exit
switch(config)#show ip pim interface
Address  Interface Mode Neighbor   Hello DR  DR  Count  Intvl Pri
Address  PktsQed  PktsDropped
10.44.2.1 Vlan200  mbr  0 30 1  10.44.2.1 0 0
switch(config)#
```
ip pim bsr-border

The `ip pim bsr-border` command prevents the switch from sending bootstrap router messages (BSMs) over the configuration mode interface. By default, BSMs are transmitted over all PIM-SM enabled interfaces.

The `no ip pim bsr-border` and `default ip pim bsr-border` commands restore the transmission of BSMs over the configuration mode interface by removing the corresponding `ip pim bsr-border` statement from `running-config`.

Command Mode
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

Command Syntax
- `ip pim bsr-border`
- `no ip pim bsr-border`
- `default ip pim bsr-border`

Example
- This command prevents the switch from sending BSMs from VLAN interface 10.

```
switch(config)#interface vlan 10
switch(config-if-Vl10)#ip pim bsr-border
switch(config-if-Vl10)#
```
**ip pim bsr-candidate**

The `ip pim bsr-candidate` command configures the switch as a candidate BSR router (C-BSR). A BSR is a PIM router within the PIM domain through which dynamic RP selection is implemented. The BSR selects RPs from a list of candidate RPs and exchange bootstrap messages (BSM) with all routers in the domain. The BSR is elected from one of the C-BSRs through an exchange of BSMS.

A subset of PIM routers within the domain are configured as candidate bootstrap routers (C-BSRs). Through the exchange of bootstrap messages (BSMs), the C-BSRs elect the BSR, which then uses BSMS to inform all domain routers of its status.

Command parameters specify the switch’s BSR address, the interval between BSM transmissions, the length of the hash mask, and the priority assigned to the switch when electing a BSR.

Entering an `ip pim bsr-candidate` command replaces any previously configured `bsr-candidate` command. If the new command does not specify a priority, hash mask length, or interval, the previously configured values persist in `running-config`.

The `no ip pim bsr-candidate` and `default ip pim bsr-candidate` commands remove the corresponding `ip pim bsr-candidate` commands from `running-config`. The `no` and `default` commands restore the priority, hash mask length, and interval parameters to their default values.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip pim bsr-candidate INTERFACE [HASHMASK_LENGTH] [INTERVAL_PERIOD] [PRIORITY_NUM]
no ip pim bsr-candidate [priority] [interval]
default ip pim bsr-candidate [priority] [interval]
```

**Parameters**

- **INTERFACE**  
  Switch uses IP address of specified interface as its BSR address. Options include:
  - `ethernet e_num`  Ethernet interface specified by `e_num`.
  - `loopback l_num`  Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-Channel Interface specified by `p_num`.
  - `vlan v_num`  VLAN interface specified by `v_num`.

- **HASHMASK_LENGTH**  
  Length (in bits) of the hash mask.
  - `<no parameter>`  hash mask remains unchanged from previous setting.
  - `hashmask <0 - 32>`  hash mask length (in bits). Default value is 30.

- **INTERVAL_PERIOD**  
  Period between the transmission of BSMS (seconds). Default value is 60.
  - `<no parameter>`  interval remains unchanged from previous setting.
  - `interval <10 - 536870906>`  transmission interval in seconds.

- **PRIORITY_NUM**  
  BSR election priority rating. Larger numbers denote higher priority. Default value is 64.
  - `<no parameter>`  priority remains unchanged from previous setting.
  - `priority <0 - 255>`  priority rating.
Example

- This command configures the switch as a BSR candidate, using the IP address assigned to VLAN interface 24 as its BSR address. The BSM transmission interval is set to 30 seconds and the priority is set to 192.

```
switch(config)#ip pim bsr-candidate vlan 24 priority 192 interval 30
switch(config)#
```
ip pim bsr-holdtime

The `ip pim bsr-holdtime` command specifies the value the switch inserts in the `holdtime` parameter field in bootstrap messages (BSM) that it sends. The BSR holdtime defines the timeout period that an elected BSR remains valid after the receipt of a BSM and is also used in dynamic RP configuration. BSR holdtime is designated by the BSR router and communicated to other routers through BSMs.

The `no ip pim bsr-holdtime` and `default ip pim bsr-holdtime` commands restore the default holdtime parameter field insertion value of 130 seconds by removing the `ip pim dr-priority` statement from `running-config`.

Command Mode
Global Configuration

Command Syntax

```
ip pim bsr-holdtime period
no ip pim bsr-holdtime
default ip pim bsr-holdtime
```

Parameters
- `period` BSR holdtime (seconds). Value ranges from 12 to 1073741823 (1.073 billion). Default is 130.

Example
- This command specifies 75 seconds as the value that the switch inserts into BSM holdtime fields.
  ```
  switch(config)#ip pim bsr-holdtime 75
  switch(config)#
  ```
**ip pim dr-priority**

PIM uses these criteria for electing designated routers (DR):

- If one router does not advertise a dr-priority value, the router with the highest IP address becomes the Designated Router.
- If all routers advertise a dr-priority value, the router with the highest dr-priority value becomes the Designated Router.

The `ip pim dr-priority` command sets the dr-priority value that the configuration mode interface advertises. By default, the interface does not advertise a dr-priority value.

The `no ip pim dr-priority` and `default ip pim dr-priority` commands force the use of IP addresses to elect the designated router by removing the corresponding `ip pim dr-priority` statement from `running-config`.

**Command Mode**

Interface-Ethernet Configuration  
Interface-Port-Channel Configuration  
Interface-VLAN Configuration

**Command Syntax**

```
ip pim dr-priority level
no ip pim dr-priority [level]
default ip pim dr-priority [level]
```

**Parameters**

- `level` DR selection priority rating. Value ranges from 0 to 4294967295.

**Examples**

- This command configures the dr-priority value of 15 on VLAN interface 4.

  ```
  switch(config)#interface vlan 4  
  switch(config-if-Vl4)#ip pim dr-priority 15  
  switch(config-if-Vl4)#
  ```

- This command removes the `ip-pim dr-priority` statement from `running-config`.

  ```
  switch(config-if-Vl4)#no ip pim dr-priority  
  switch(config-if-Vl4)#
  ```
**ip pim join-prune-interval**

The *ip pim join-prune-interval* command specifies the period between join/prune messages that the configuration mode interface originates and sends to the upstream RPF neighbor.

The *no ip pim join-prune-interval* and *default ip pim join-prune-interval* commands restore the default join/prune interval of 60 seconds for the configuration mode interface by removing the corresponding *ip pim join-prune-interval* command from *running-config*.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ip pim join-prune-interval period
no ip pim join-prune-interval [period]
default ip pim join-prune-interval [period]
```

**Parameters**

- *period* join/prune interval (seconds). Value ranges from 1 to 18724. Default is 60.

**Example**

```
switch(config)#interface vlan 4
switch(config-if-Vl4)#ip pim join-prune-interval 75
switch(config-if-Vl4)#
```
**ip pim log-neighbor-changes**

The `ip pim log-neighbor-changes` command configures the switch to generate a log message when a neighbor entry is added or removed from the PIM Neighbor table. This function is enabled by default.

The `no ip pim log-neighbor-changes` command disables log message generation based on changes to the PIM Neighbor table; this command is stored in the `running-config`. The `ip pim log-neighbor-changes` and `default ip pim log-neighbor-changes` commands restore the default setting of generating log messages by deleting the `no ip pim log-neighbor-changes` statement from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip pim log-neighbor-changes
no ip pim log-neighbor-changes
default ip pim log-neighbor-changes
```

**Examples**

- This command configures the switch to stop generating log messages based on PIM Neighbor table changes.
  ```
switch(config)#no ip pim log-neighbor-changes
switch(config)#
```

- This command configures the switch to generate log messages when a neighbor entry is added or removed from the PIM Neighbor table.
  ```
switch(config)#ip pim log-neighbor-changes
switch(config)#
```
**ip pim neighbor-filter**

The **ip pim neighbor-filter** command configures the configuration mode interface to filter PIM control packets on the basis of neighbor addresses listed in a specified standard access list.

The **no ip pim neighbor-filter** and **default ip pim neighbor-filter** commands disable the configuration mode interface from filtering PIM control packets by removing the corresponding **ip pim neighbor-filter** command from **running-config**.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ip pim neighbor-filter access_list
no ip pim neighbor-filter
default ip pim neighbor-filter
```

**Parameters**

- **access_list** name of the standard IP access list.

**Example**

- This command configures the IP access list named filter_1 to filter neighbor PIM control messages for VLAN 4.

```
switch(config)#ip access-list standard filter_1
switch(config-std-acl-filter_1)#permit 10.13.24.9/24
switch(config-std-acl-filter_1)#exit
switch(config)#interface vlan 4
switch(config-if-Vl4)#ip pim neighbor-filter filter_1
switch(config-if-Vl4)#
```
**ip pim query-interval**

The `ip pim query-interval` command specifies the transmission interval between PIM hello messages originating from the configuration mode interface.

The `no ip pim query-interval` and `default ip pim query-interval` commands restore the default query interval of 30 seconds for the configuration mode interface by removing the corresponding `ip pim query-interval` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ip pim query-interval period
no ip pim query-interval [period]
default ip pim query-interval [period]
```

**Parameters**

- `period`  query interval (seconds). Value ranges from 1 to 1000000 (1 million). Default is 30.

**Example**

- This command configures 45 second intervals between hello messages originating from VLAN interface 4.

```
switch(config)#interface vlan 4
switch(config-if-Vl4)#ip pim query-interval 45
switch(config-if-Vl4)#
```
**ip pim register-source**

The `ip pim register-source` command programs the switch to fill the source field in all outbound PIM SM register packets with the IP address of a specified interface or the incoming interface of the group specified by the message. By default, the source field is filled with the IP address from the interface associated with the best route to the RP.

The `no ip pim register-source` and `default ip pim register-source` commands restore the default method of filling the register packet source field by removing the `ip pim register-source` statement from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip pim register-source INT_NAME
no ip pim register-source
default ip pim register-source
```

**Parameters**

- **INT_NAME** Interface type and number. Values include:
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port channel interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.

**Example**

- This command programs the switch to fill the source field of outbound PIM SM register packets with the IP address of loopback interface 2.

  ```
  switch(config)#ip pim register-source loopback 2
  switch(config)#
  ```
**ip pim rp-address**

The **ip pim rp-address** command configures the address of a Protocol Independent Multicast (PIM) static rendezvous point (RP) for a specified multicast subnet. If the command does not specify a subnet, the static RP maps to all multicast groups (224/4). Dynamic RPs override static RPs unless the static RP is given priority by using the **override** option of this command.

Multicast groups use RPs to connect sources and receivers. A PIM domain requires that all routers have consistently configured RP addresses.

The switch uses multiple **ip pim rp-address** commands to configure multiple RPs or to assign multiple subnets to an RP. When the address of a multicast group falls within multicast subnets configured by multiple **ip pim rp-address** commands, the group’s RP address is selected by comparing the commands’ multicast subnet size.

- Different size subnets: group uses command with the largest subnet.
- Same size subnets: group uses command as determined by hash algorithm.

The **no ip pim rp-address** and **default ip pim rp-address** commands remove the corresponding **ip pim rp-address** command from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip pim rp-address rp_addr [MULTICAST_SUBNET] [HASHMASK_LENGTH] [BSR_OVERRIDE] [PRIORITY_NUM]
no ip pim rp-address rp_addr [MULTICAST_SUBNET]
default ip pim rp-address rp_addr [MULTICAST_SUBNET]
```

**Parameters**

- **rp_addr**  Rendezvous point IP address (dotted decimal notation).
- **MULTICAST_SUBNET**  Multicast IP address space (CIDR or address-mask).
  - <no parameter>  Default multicast group IP address of 224/4.
  - **gp_addr**  Multicast group IP address (CIDR or address-mask).
  - **access-list acl_name**  Standard access control list that specifies the multicast group address.
  - **acl_name**  Standard access control list that specifies the multicast group address.
- **HASHMASK_LENGTH**  Length (in bits) of the hash mask.
  - <no parameter>  hash mask remains unchanged from previous setting.
  - **hashmask <0 - 32>**  hash mask length (in bits). Default value is 30.
- **BSR_OVERRIDE**  Configures priority relative to dynamic RPs selected by BSR.
  - <no parameter>  Dynamic RPs have priority over specified RP.
  - **override**  RP has priority over dynamic RPs.
- **PRIORITY_NUM**  BSR election priority rating. Larger numbers denote higher priority. Default value is 64.
  - <no parameter>  priority remains unchanged from previous setting.
  - **priority <0 - 255>**  priority rating.
Example

- This command configures 10.17.255.2 as a static RP for all multicast groups.

  switch(config)#ip pim rp-address 10.17.255.2
  switch(config)#
ip pim rp-candidate

The `ip pim rp-candidate` command configures the switch as a candidate rendezvous point (C-RP). The BSR selects a multicast group’s dynamic RP set from the list of C-RPs in the PIM domain. The command specifies the interface (used to derive the RP address), C-RP advertisement interval, and priority rating. The BSR selects the RP set by comparing C-RP priority ratings. The C-RP advertisement interval specifies the period between successive C-RP advertisement message transmissions to the BSR.

`Running-config` supports multiple multicast groups through multiple `ip pim rp-candidate` statements:

- All commands must specify the same interface. Issuing a command with an interface that differs from existing commands removes all existing commands from `running-config`.
- `Running-config` stores the `interval` setting in a separate statement that applies to all `rp-candidate` statements. When a command specifies an interval that differs from the previously configured value, the new value replaces the old value and applies to all configured `rp-candidate` statements. The default `interval` value is 60 seconds.

The `no ip pim rp-candidate` and `default ip pim rp-candidate` commands remove `ip pim rp-candidate` for the specified group. When these commands do not specify a multicast group, all `rp-candidate` statements are removed from `running-config`.

The `no ip pim rp-candidate interval` and `default ip pim rp-candidate interval` commands restore the interval setting to the default value of 60 seconds. The `no ip pim rp-candidate priority` and `default ip pim rp-candidate priority` commands restore the priority setting to the default value of 0.

Command Mode

Global Configuration

Command Syntax

The `INTERFACE` parameter is always listed first. All other parameters can be placed in any order.

```
  ip pim rp-candidate INTERFACE [GROUP_ADDR] [PRIORITY_NUM] [INTERVAL_PERIOD]
  no ip pim rp-candidate [INTERFACE] [GROUP_ADDR]
  no ip pim rp-candidate [INTERFACE] interval
  no ip pim rp-candidate [INTERFACE] priority
  default ip pim rp-candidate [INTERFACE] [GROUP_ADDR]
  default ip pim rp-candidate [INTERFACE] interval
  default ip pim rp-candidate [INTERFACE] priority
```

Parameters

- `INTERFACE` Switch uses IP address of specified interface as its C-RP address. Options include:
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-Channel Interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
  - `vxlan vx_num` VXLAN interface specified by `vx_num`.
- `GROUP_ADDR` address of multicast group for which candidate is configured. Options include:
  - `<no parameter>` default multicast group (224.0.0.0/4).
  - `net_addr` multicast IPv4 subnet address (CIDR or address mask).
  - `access-list acl_name` standard access control list that specifies the multicast group address.
- **PRIORITY NUM** RP selection priority rating. Smaller numbers denote higher priority.
  - <no parameter> priority rating is set to the default value of 0.
  - **priority** <0 - 255> priority rating.
- **INTERVAL NUM** Period between consecutive RP-advertisement message transmissions (seconds). Value also applies to previously configured rp-candidate statements.
  - <no parameter> interval remains unchanged from previous setting.
  - **interval** <10 - 16383> transmission interval.

**Example**
- This command configures a switch as a candidate RP for the multicast group 235.1.1.0/24 with a priority of 48 and a RP advertisement interval of 45 seconds. The switch advertises the IP address assigned to VLAN 24 as its RP address.

```bash
switch(config)# ip pim rp-candidate vlan 24 235.1.1.0/24 priority 48 interval 45
switch(config)#
```
ip pim sparse-mode

The `ip pim sparse-mode` command enables PIM and IGMP (router mode) on the configuration mode interface.

**Important!** PIM sparse mode and multicast border router (MBR) must be mutually exclusive on an interface. If the interface is configured as an MBR, do not enable PIM sparse mode on the interface.

The `no ip pim sparse-mode`, `no ip pim`, `default ip pim sparse-mode`, and `default ip pim` commands restore the default PIM and IGMP (router mode) settings of `disabled` on the configuration mode interface by removing the `ip pim sparse-mode` statement from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `ip pim sparse-mode`
- `no ip pim`
- `no ip pim sparse-mode`
- `default ip pim`
- `default ip pim sparse-mode`

**Example**
- This command enables PIM sparse mode on VLAN 4 interface.
  
  ```
  switch(config)#interface vlan 4
  switch(config-if-Vl4)#ip pim sparse-mode
  switch(config-if-Vl4)#
  ```
**ip pim sparse-mode sg-expiry-timer**

The `ip pim sparse-mode sg-expiry-timer` command configures the (S, G) expiry timer interval for PIM-SM (S, G) multicast routes. The command does not apply to (*, G) mroutes.

The `no ip pim sparse-mode sg-expiry-timer` and `default ip pim sparse-mode sg-expiry-timer` commands restore the default setting of 210 seconds by removing the `ip pim sparse-mode sg-expiry-timer` statement from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip pim sparse-mode sg-expiry-timer period
no ip pim sparse-mode sg-expiry-timer
default ip pim sparse-mode sg-expiry-timer
```

**Parameters**

- `period` expiry timer interval (seconds). Value ranges from 120 (two minutes) to 65535 (18 hours, 12 minutes, 15 seconds). Default is 210 (three minutes, 30 seconds).

**Example**

- This command configures 2 minutes 30 seconds as the (S,G) expiry timer interval.

```
switch(config)#ip pim sparse-mode sg-expiry-timer 150
switch(config)#
```
The `ip pim spt-threshold` command determines when the switch joins the shortest path source tree (SPT) for all IPv4 multicast groups. Setting the SPT-threshold is valid for switches configured as PIM leaf routers.

- When `running-config` does not list this command, the switch joins the SPT immediately after receiving the first PIM packet from a new source. The switch joins the SPT by sending a PIM join message toward the source.
- When `running-config` lists this command with a value of infinity, the switch never joins the SPT.

The `ip pim spt-threshold group-list` command configures the spt-threshold action for IPv4 multicast groups that match a specified access control list (ACL).

The `no ip pim spt-threshold` and `default ip pim spt-threshold` commands restore the default value of 0 by removing the `ip pim spt-threshold infinity` command from running-config.

### Command Mode
Global Configuration

### Command Syntax
```
ip pim spt-threshold JOIN
no ip pim spt-threshold
default ip pim spt-threshold
```

### Parameters
- **JOIN** specifies switch’s use of the short path tree (SPT). Options include:
  - 0 The switch immediately joins the SPT. This is the default value.
  - `infinity` The switch never joins the SPT.

### Examples
- This command configures the switch to never join the SPT.
  ```
  switch(config)#ip pim spt-threshold infinity
  switch(config)#
  ```
- These equivalent commands restore the default value by removing the `ip pim spt-threshold` statement from running-config.
  ```
  switch(config)#ip pim spt-threshold 0
  switch(config)#
  ```
  ```
  switch(config)#no ip pim spt-threshold
  switch(config)#
  ```
The `ip pim spt-threshold group-list` command configures the spt-threshold action for IPv4 multicast groups that match a specified access control list (ACL).

- When `running-config` does not list this command, the switch joins the shortest path tree (SPT) immediately after receiving the first PIM packet from a new source. The switch joins the SPT by sending PIM join message toward the source.
- When `running-config` lists this command with a value of infinity, the switch never joins the SPT.

The action for all groups that are not specified by an ACL is configured with the global `ip pim spt-threshold` command.

The `no ip pim spt-threshold` and `default ip pim spt-threshold` commands remove the corresponding `ip pim spt-threshold group-list` command from `running-config`. All groups specified by ACLs removed by this command revert to using the global `ip pim spt-threshold` command unless covered by another configured group-list command.

**Command Mode**

Global Configuration

**Command Syntax**

```plaintext
ip pim spt-threshold JOIN group-list acl_name
no ip pim spt-threshold JOIN group-list acl_name
default ip pim spt-threshold JOIN group-list acl_name
```

**Parameters**

- `JOIN` specifies switch’s use of the short path tree (SPT) for specified groups. Options include:
  - `0` The switch immediately joins the SPT. This is the default value.
  - `infinity` The switch never joins the SPT.
  - `acl_name` name of access control list.

**Examples**

- This command configures the switch to never join the SPT except for multicast groups matched by the ACL group-1.

  ```plaintext
  switch(config)#ip pim spt-threshold infinity
  switch(config)#ip pim spt-threshold 0 group-list group-1
  switch(config)#
  ```
ip pim ssm range

The `ip pim ssm range` command defines the source specific multicast (SSM) range of IP multicast addresses.

SSM is a multicast packet delivery method where only packets originating from a specific source address requested by a receiver are routed to that receiver. SSM explicitly excludes the use of (*,G) join for applicable multicast groups. Source-specific multicast differs from any-source multicast (ASM), where a receiver expresses interest in traffic to a multicast address, then receives traffic from all multicast sources sending to that address.

The `no ip pim ssm range` and `default ip pim ssm range` commands remove the SSM IP multicast address range by deleting the `ip pim ssm range` statement from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip pim ssm range [ACCESS_RANGE]
no ip pim ssm range
default ip pim ssm range
```

**Parameters**

- `ACCESS_RANGE` specifies the SSM IP multicast address range. Options include:
  - `acl_name` sets the SSM range to address set specified by the standard ACL.
  - `standard` sets the SSM range to 232/8.

**Examples**

- This command configures the SSM address range to 232/8.
  ```
  switch(config)#ip pim ssm range standard
  switch(config)#
  ```

- These commands configure the SSM address range to those permitted by the LIST_1 standard ACL. The ACL permits the subnet address range 233.0.0.0/24.
  ```
  switch(config)#ip access-list standard LIST_1
  switch(config-std-acl-LIST_1)#permit 233.0.0.0/24
  switch(config-std-acl-LIST_1)#exit
  switch(config)#ip pim ssm range LIST_1
  switch(config)#
  ```
show ip pim bsr

The `show ip pim bsr` command displays the switch’s bootstrap router (BSR) information.

**Command Mode**

EXEC

**Command Syntax**

```
show ip pim bsr [GROUP_FILTER]
```

**Parameters**

- `GROUP_FILTER` specifies groups for which command displays information.
  - `<no parameter>` Displays data for all groups.
  - `net_addr` Displays message for specified group address. (CIDR or address mask).

**Example**

- This command configures the switch’s BSR information.

```sql
switch>show ip pim bsr
PIMv2 Bootstrap information
This system is the Bootstrap Router (BSR)
  BSR address: 10.1.1.1
  Uptime: 00:14:42, BSR Priority: 0, Hash mask length: 30
  Next bootstrap message in 00:00:05
```
show ip pim config-sanity

The **show ip pim config-sanity** command displays diagnostic information about the switch's PIM configuration.

**Command Mode**

EXEC

**Command Syntax**

```
show ip pim config-sanity
```

**Example**

- This command displays PIM configuration diagnostic information.

```
switch>show ip pim config-sanity
DISCLAIMER: Below are only hints of potential PIM misconfiguration. They do not necessary imply that there is a real problem.

The interfaces with PIM which are down: V14

switch>
```
show ip pim interface

The `show ip pim interface` command displays information about interfaces configured for PIM.

**Command Mode**

EXEC

**Command Syntax**

```
show ip pim interface [INT_NAME] [INFO_LEVEL]
```

**Parameters**

- **INT_NAME** Interface type and number. Values include
  - `<no parameter>` displays information for all interfaces.
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `port-channel p_num` Port-Channel Interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
  - `vxlan vx_num` VXLAN interface specified by `vx_num`.
- **INFO_LEVEL** specifies level of information detail provided by the command.
  - `<no parameter>` table of basic configuration information.
  - `detail` list of complete configuration information.

**Examples**

- This command displays information about all interfaces on which PIM is enabled.

```
switch>show ip pim interface
Address   Interface     Mode   Neighbor   Hello DR  DR Address   PktsQed PktsDropped
          Count    Intvl  Pri

  PIM State-Refresh Interval: unknown seconds
  PIM Graft Retry Interval: unknown seconds
  PIM domain border: disabled
switch>
```
**show ip pim neighbor**

The `show ip pim neighbor` command displays information about Protocol Independent Multicast (PIM) neighbors discovered by hello messages.

**Command Mode**

EXEC

**Command Syntax**

```
show ip pim neighbor [INT_NAME] [BFD_DATA]
```

**Parameters**

- **INT_NAME** Interface type and number. Values include
  - `<no parameter>` displays information for all interfaces.
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-Channel Interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
  - `vxlan vx_num` VXLAN interface specified by `vx_num`.
- **BFD_DATA** Specifies inclusion of BFD data.
  - `<no parameter>` BFD data is not displayed.
  - `bfd` BFD data is displayed.

**Example**

- This command displays information about neighbor PIM routers.
  ```
  switch>show ip pim neighbor
  PIM Neighbor Table
  Neighbor Address   Interface       Uptime     Expires    Mode
  10.17.255.2        Vlan2028        21d22h     00:01:31   sparse
  ```

- This command displays information about neighbor PIM routers and the status of BFD.
  ```
  switch>show ip pim neighbor bfd
  PIM Neighbor Table
  Flags: U - BFD is enabled and is UP
  I - BFD is enabled and is INIT
  D - BFD is enabled and is DOWN
  N - Not running BFD

  Neighbor Address   Interface       Uptime     Expires    Mode     Flags
  10.17.255.2        Vlan2028        21d22h     00:01:31   sparse U
  ```
show ip pim protocol counters

The `show ip pim protocol` command displays statistics about Protocol Independent Multicast (PIM) control messages sent and received by the switch.

**Command Mode**

EXEC

**Command Syntax**

```
show ip pim protocol counters [INT_NAME]
```

**Parameters**

- **INT_NAME**  Interface type and number. Values include
  - `<no parameter>`  displays information for all interfaces.
  - `ethernet e_num`  Ethernet interface specified by `e_num`.
  - `loopback l_num`  Loopback interface specified by `l_num`.
  - `management m_num`  Management interface specified by `m_num`.
  - `port-channel p_num`  Port-Channel Interface specified by `p_num`.
  - `vlan v_num`  VLAN interface specified by `v_num`.
  - `vxlan vx_num`  VXLAN interface specified by `vx_num`.

**Example**

- This command displays statistics about inbound and outbound PIM control messages.

```
switch>show ip pim protocol counters
PIM Control Counters

switch>
```
**show ip pim register-source**

The *show ip pim register-source* command displays the name of the interface from where the switch derives the IP address that it uses to fill the source field in all outbound PIM SM register packets. The *ip pim register-source* command specifies this interface.

By default, the source field is filled with the IP address from the interface associated with the best route to the RP. The *show ip pim register-source* command does not return a value when the source field is filled with the default value.

**Command Mode**

EXEC

**Command Syntax**

```
show ip pim register-source
```

**Example**

- This command displays the register-source interface.

```
switch>show ip pim register-source
Ethernet22
switch>
```
show ip pim rp

The `show ip pim rp` command displays the status and multicast group of each cached rendezvous point (RP).

**Command Mode**

EXEC

**Command Syntax**

`show ip pim rp`

**Example**

- This command displays the cached RPs.

  switch>show ip pim rp
  show ip pim rp
  The PIM RP Set
  Group: 224.0.0.0/4
  RP: 10.1.2.3
  Uptime: 00:05:12, Expires: never, Priority: 1 Override: 1
**show ip pim rp-candidate**

The `show ip pim rp-candidate` command displays the rendezvous point (RP) that is used for a specified multicast group.

**Command Mode**

EXEC

**Command Syntax**

`show ip pim rp-candidate`

**Example**

- This command displays the switch’s candidate-RP information.

```
switch>show ip pim rp-candidate
Candidate RP information
  Candidate RP Address: 10.0.12.2
  CRP Holdtime: 150 seconds
  Group 224.2.0.0/16 Priority 2
```
**show ip pim rp-hash**

The `show ip pim rp-hash` displays the group to RP-hash mapping for the specified group and the list of qualifying candidate RPs.

**Command Mode**

EXEC

**Command Syntax**

`show ip pim rp-hash ipv4_addr [INFO_LEVEL]`

**Parameters**

- `ipv4_addr` multicast group IPv4 address.
- `INFO_LEVEL` specifies level of information detail provided by the command.
  - `<no parameter>` RP-hash map and list of candidate RPs.
  - `detail` includes data about the selected RP.

**Example**

- This command displays the RP that the switch uses for multicast group 224.1.0.0.
  
  switch> `show ip pim rp-hash 224.1.0.0`
  
  RP 10.1.2.3
show ip pim upstream joins

The `show ip pim upstream joins` command displays the join messages that the switch is scheduled to send.

**Command Mode**
EXEC

**Command Syntax**
```
show ip pim upstream joins [JOIN_ADDRESSES] [NEIGHBOR_FILTER]
```

**Parameters**
- **JOIN_ADDRESSES**  Filters messages by source and group addresses.
  - `<no parameter>`  displays all join messages.
  - `source_addr`  displays all join messages for specified source group IPv4 address.
  - `group_addr`  displays all join messages for specified multicast IPv4 address.
  - `source_addr group_addr`  displays join message with specified source and group addresses.
  - `group_addr source_addr`  displays join message with specified group and source addresses.
    - `group_addr`  must be a valid multicast IPv4 address.
- **NEIGHBOR_FILTER**  specifies neighbors for which command provides data.
  - `<no parameter>`  Displays messages for all neighbors.
  - `neighbor neighbor_addr`  Displays message for specified neighbor address.

**Example**
- This command displays the list of join messages the switch is scheduled to send. The example only displays the first two messages.

```
switch>show ip pim upstream joins

------------- show ip pim upstream joins -------------
Neighbor address: 10.1.1.1
Via interface: 10.1.1.2
Next message in 1 seconds
Group: 10.10.10.3
  Joins:
    10.25.1.1/32 SPT
  Prunes:
    No prunes included
Neighbor address: 10.1.1.6
Via interface: 10.1.1.5
Next message in 1 seconds
Group: 10.14.1.69
  Joins:
    10.105.14.3/32 SPT
  Prunes:
    No prunes included
switch>
```
Multicast Source Discovery Protocol (MSDP) describes a topology that connects multiple IPv4 Protocol Independent Multicast Sparse-Mode (PIM-SM) domains. Each PIM-SM domain uses its independent Rendezvous Point (RP) without depending on RPs in other domains.

These sections describe the Arista MSDP implementation.

- **Section 37.1: MSDP Introduction** is an overview and lists features supported by Arista switches.
- **Section 37.2: MSDP Description** describes the MSDP protocol.
- **Section 37.3: MSDP Configuration** describes configuration tasks that implement MSDP.
- **Section 37.4: MSDP Commands** contains MSDP command descriptions.

### 37.1 MSDP Introduction

Arista switches support these MSDP features:

- Basic MSDP speaker functions.
- MSDP peer configuration: description, connect-source interface, keepalive time, and hold time.
- ACL filtering of inbound and outbound Source-Active (SA) messages.
- Mesh groups.
- Display of peer status.
- Display of filtered SA messages received from MSDP peers.

These MSDP features are not supported:

- MSDP is not supported with Anycast-RP (RFC4610).
- IP packet encapsulation.
37.2 MSDP Description

The Multicast Source Discovery Protocol (MSDP) defines a topology connecting Protocol Independent Multicast sparse mode (PIM-SM) domains. MSDP provides interdomain access to multicast sources in all domains by enabling all rendezvous points (RPs) to discover multicast sources outside of their domains. RPs also use MSDP to announce sources that are sending to a multicast group.

37.2.1 MSDP Speakers

An MSDP speaker is a router in a PIM-SM domain that has MSDP peering sessions with MSDP peers in other domains. An MSDP peering session is a TCP connection through which peers exchange MSDP control information. An MSDP peer is a router that is connected to the speaker though a peering session.

PIM uses MSDP to register a local source with remote domain RPs through Source Active (SA) messages, which originate at the local domain’s RP. Receivers in remote PIM-SM domains depend only on RPs in their domains to learn of multicast data sources in other domains. Multicast data is subsequently delivered from a source to receivers in different domains through a PIM-SM source tree. Section 37.3.1: MSDP Speaker Configuration describes the process of configuring MSDP speakers.

37.2.2 Network Configuration

The TCP connections between RPs are defined either through an underlying unicast routing table or by configuring a default MSDP peer. A typical MSDP configuration utilizes a BGP specified routing table. SA messages are MSDP control messages that peers exchange during peering sessions.

37.2.2.1 Source Active Messages

A Source Active (SA) message is a message that an RP creates and sends to MSDP peers when it learns of a new multicast source through a PIM register message. RPs that intend to originate or receive SA messages must establish MSDP peering with other RPs, either directly or through intermediate MSDP peers. An RP that is not a DR on a shared network should only originate SAs in response to register messages it receives from the DR. It does not originate SA’s for directly connected sources in its domain.

SA messages contain the following fields:

- Source address of the data source.
- Group address that receives data sent by the source.
- IP address of the RP.

The SA Cache is the repository of SA messages received by the MSDP speaker. The switch always stores received SA messages. Section 37.3.4: Managing the SA Cache describes procedures that limit the size of the SA cache and options for displaying the cache.

37.2.2.2 Reverse Path Forwarding

Reverse path forwarding (RPF) is a multicast packet transport technique that ensures loop-free packet forwarding by using a router’s unicast routing table. Traffic forwarding is based on source addresses instead of destination addresses. RPF is implemented as defined in RFC 3618.

Packet forwarding is based on the packet’s unicast reverse path. An RPF router prevents network loops by only forwarding a packet when it enters through the interface holding its source routing entry.
When a multicast packet enters a router's interface, the router checks the reverse path of the packet by examining the list of networks that are reachable through the input interface. If the list contains a matching routing entry for the multicast packet's source IP address, the packet is forwarded to all other interfaces that are participants in the multicast group. Otherwise, the packet is dropped.

RPF requires that the unicast routing table is correct and converged. It also assumes that the use of symmetric forward and reverse paths between router and sender. RPF fails on uni-directional links. Section 37.3.3.1: Displaying RPF Peers describes commands that display RPF peers.

37.2.2.3  Default MSDP Peers

The default peer is the MSDP peer from which the MSDP speaker accepts SA messages. If there is only one MSDP peer, all of its SA messages will be accepted. When multiple default peers are configured the switch uses the first default peer to appear in `running-config`. Default MSDP peers invalidate the use of RPF over unicast routing tables.

Each default peer may be associated with a prefix list. The prefix list specifies the RPs from where the speaker accepts SA messages. When `running-config` contains multiple default peers with prefix lists, an SA is accepted from the first default peer in `running-config` whose prefix list contains the RP in the SA. The speaker accepts all remaining SAs from the first default peer that is not associated with a prefix list.

Section 37.3.3.2: Configuring the Default Peer describes commands that configure default peers.

37.2.3  MSDP Exchange Processes

37.2.3.1  Control Information Exchange

An RP originates an SA message when a source registers with the RP to send data to a multicast group. RPs periodically originate SA messages while its registered sources send data to maintain messages in SA caches of its MSDP peers. RPs that have no registered sources periodically send keepalive messages to maintain TCP connections with its peers.

MSDP defines the following timers that specify the transmission frequency of control messages:

- **SA Advertisement Time**: Duration of SA Advertisement intervals. An RP sends periodic SA messages to reference each registered source once per interval. SA advertisement time is 60 seconds.
- **Keepalive Time**: Period between the transmission of consecutive keepalive messages. Default keepalive time is 60 seconds. Minimum keepalive time is one second.
- **Hold Timer**: Period an MSDP speaker maintains a peer TCP connection after receiving an SA or keepalive message from the peer. Default time is 75 seconds. Minimum hold time is three seconds.

37.2.3.2  MSDP Data Exchange

This sequence describes the exchange of multicast data across PIM domains through MSDP:

**Step 1**  When a source's first data packet is registered by the first hop router, the RP extracts the data from the packet and forwards it down the shared tree in the PIM domain.

**Step 2**  The RP informs MSDP peers of the new source by sending a Source-Active (SA) message that identifies the source, the recipient group, and the RP's address or originator ID.

**Step 3**  Upon receiving the SA message, an MSDP peer which is the RP for a multicast tree that includes members interested in the data multicast sends a PIM join message (S,G) toward the data source.
**Step 4** The PIM designated router (DR) sends subsequent data encapsulated in PIM register messages directly to the remote domain’s RP when the source becomes active.

**Step 5** If the source times out, this process repeats when the source goes active again.
Chapter 37: Multicast Source Discovery Protocol

37.3 MSDP Configuration

These sections describe the configuration of the switch as an MSDP speaker and the establishment of MSDP peering sessions.

- Section 37.3.1: MSDP Speaker Configuration
- Section 37.3.2: Establishing MSDP Peers
- Section 37.3.3: MSDP Network Configuration
- Section 37.3.4: Managing the SA Cache

MSDP requires that TCP port 639 (MSDP) is open on the control plane. The default control-plane ACL includes a permit rule that allows TCP packets access through the MSDP port.

37.3.1 MSDP Speaker Configuration

The switch is configured as an MSDP speaker when MSDP is enabled. MSDP is enabled by configuring an MSDP peer. Section 37.3.2.1 describes the process of configuring an MSDP peer.

Source-Address (SA) messages that an MSDP speaker originates contain the speaker’s rendezvous point (RP) address, as configured through PIM statements and processes. MSDP provides a method of assigning an originator ID address, which the speaker uses in place of its RP address when advertising SA messages. The `ip msdp originator-id` command configures the switch to set the RP address to the specified interface’s IP address in SA messages that it originates as an MSDP speaker.

Only RPs originate SA messages and only for its registered sources. RPs do not originate periodic SA messages for sources in other PIM domains. MSDP speakers that are not RPs do not originate periodic SA messages. Intermediate MSDP speakers forward SA messages received from other domains. Intermediate speakers are not required to be RPs.

Example

- This command configures the switch to use the IP address assigned to loopback interface 100 as the RP address in SA messages that it originates.
  
  ```
  switch(config)#ip msdp originator-id loopback 100
  switch(config)#
  ```

37.3.2 Establishing MSDP Peers

These sections describe MSDP Peer configuration tasks.

- Section 37.3.2.1: Configuring an MSDP Peer
- Section 37.3.2.2: Mesh Groups
- Section 37.3.2.3: Filtering SA Messages
- Section 37.3.2.4: Keepalive, Hold Time, and Reset Time Configuration
- Section 37.3.2.5: Displaying Peer Information

37.3.2.1 Configuring an MSDP Peer

The switch attempts to establish MSDP peering sessions through IP addresses configured as MSDP peers. The `ip msdp peer` command configures a specified address as an MSDP peer and enables the switch as an MSDP speaker if no other peers are configured. The peering session with the device at the specified network is established over a TCP connection. The command can specify an interface through which the switch establishes the TCP session. When the command does not specify an interface, the connection is established through an interface determined by existing routing algorithms.
To display MSDP peer information, enter `show ip msdp peer`.

**Example**

- These commands assign an IP address to loopback interface 100, then configure 10.4.4.12 as an MSDP peer and establishes the TCP peer session through the loopback.

  switch(config)#interface loopback 100
  switch(config-if-Lo100)#ip address 10.6.8.6/24
  switch(config-if-Lo100)#exit
  switch(config)#ip msdp peer 10.4.4.12 connect-source loopback 100
  switch(config)#show ip msdp peer

  MSDP Peer 10.4.4.12
  Connection status:
  State: Connect
  Connection Source: Loopback100 (10.6.8.6)

  switch(config)#

To associate descriptive text with the specified MSDP peer, enter `ip msdp description`.

**Example**

- These commands associate the string NORTH with the MSDP peer located at 10.4.4.12.

  switch(config)#ip msdp description 10.4.4.12 NORTH
  switch(config)#show ip msdp peer

  MSDP Peer 10.4.4.12
  Description: NORTH
  Connection status:
  State: Connect
  Connection Source: Loopback100 (10.6.8.6)

  switch(config)#

To close the peering session with the specified MSDP peer, enter `ip msdp shutdown`. This terminates the TCP connection between the switch and the peer. The peer remains configured and the peer session can be resumed by removing the `ip msdp shutdown` command from `running-config`.

**Examples**

- This command closes the peering session with the MSDP peer at 10.4.4.12.

  switch(config)#ip msdp shutdown 10.4.4.12
  switch(config)#show ip msdp peer

  MSDP Peer 10.4.4.12
  Description: NORTH
  Connection status:
  State: Disabled
  Connection Source: Loopback100 (10.6.8.6)

  switch(config)#
This command reopens the peering session with the peer at 10.4.4.12.

```
switch(config)# no ip msdp shutdown 10.4.4.12
switch(config)# show ip msdp peer
MSDP Peer 10.4.4.12
Description: NORTH
Connection status:
    State: Connect
    Connection Source: Loopback100 ( 10.6.8.6 )
```

37.3.2.2 Mesh Groups

Each node in a fully meshed network is directly connected to every other node in the network. Each peer in a fully meshed MSDP speaker network can be configured as a member of a mesh group. SA messages received from a mesh group peer are not forwarded to other members of the mesh group.

To configure the specified MSDP peer connection as an MSDP mesh group member, enter `ip msdp mesh-group`. An MSDP peer can be assigned to multiple mesh groups. Multiple peer connections can be assigned to the same mesh group.

To display the mesh group membership of configured MSDP peers, enter `show ip msdp mesh-group`.

**Example**

- These commands configure the MSDP peer connection to 10.1.1.14 as a member of the AREA-1 mesh group, then displays members of mesh groups to which configured MSDP peers belong.

```
switch(config)# ip msdp mesh-group AREA-1 10.1.1.14
switch(config)# show ip msdp mesh-group
Mesh Group: AREA-1
    Mesh Group: 10.1.1.14
    Mesh Group: tier_01
        10.24.18.13
    Mesh Group: tier_02
        10.26.101.18
```

37.3.2.3 Filtering SA Messages

The switch can filter Source-Active (SA) messages that it sends and receives with access control lists (ACLs). The commands accept standard and extended ACLs. The address field in standard ACLs filter an SA message on its group address.

The `ip msdp sa-filter in` command assigns an ACL to filter inbound SA messages from a specified MSDP peer connection. The switch only accepts SA messages from the peer that pass the ACL. The switch accepts all SA messages from peers that are not assigned an input ACL. A peer can be assigned only one input filter ACL. Subsequent `ip msdp sa-filter in` commands for a peer replace the existing command.

The `ip msdp sa-filter out` command assigns an ACL as a filter for outbound SA messages to a specified MSDP peer connection. The switch only sends SA messages to the peer that pass the ACL. The switch sends all specified SA messages to peers not assigned an output filter ACL. A peer can be assigned only one output ACL. Subsequent `ip msdp sa-filter out` commands for a peer replace the existing command.
Example

- These commands assign the IP ACLs named LIST-IN as the inbound SA message filter and LIST-OUT as the outbound SA message filter for the MSDP peer connection to 10.4.4.12.

switch(config)#ip msdp sa-filter in 10.4.4.12 list LIST-IN
switch(config)#ip msdp sa-filter out 10.4.4.12 list LIST-OUT

37.3.2.4 Keepalive, Hold Time, and Reset Time Configuration

To configure the MSDP keepalive and hold time intervals for a specified MSDP peer connection, enter `ip msdp keepalive`.

- Keepalive time interval is the period between the transmission of consecutive keepalive messages. The default keepalive time interval is 60 seconds.
- Hold time interval is the period the switch waits for a KEEPALIVE or UPDATE message before it disables peering. The default hold time interval is 75 seconds.

The hold time interval must be longer than or equal to the keepalive time interval.

Example

- This command sets the keepalive time to 45 seconds and the hold time to 80 seconds for the MSDP peer connection to 10.4.4.12.

switch(config)#ip msdp keepalive 10.4.4.12 45 80

To specify the period that the switch waits after an MSDP peering session is reset before attempting to reestablish the session, enter `ip msdp timer`. The default period is 30 seconds.

Example

- This command configures the switch to wait 45 seconds after an MSDP peering session is reset before attempting to reestablish the session.

switch(config)#ip msdp timer 45

37.3.2.5 Displaying Peer Information

To display the MSDP peers, enter `show ip msdp summary`. The command also displays the operational status of each peer and the number of messages from the peers in the SA cache.
Example

- This command displays the configured peers, the status of the peers, and the number of SA messages received from those peers.

  ```
  switch>show ip msdp summary
  MSDP Peer Status Summary
  Peer Address      State   SA Count
  192.168.3.18      Up      0
  192.168.3.16      Up      0
  192.168.3.37      Listen  0
  192.168.3.46      Up      0
  192.168.3.47      Up      0
  switch>
  ```

37.3.3 MSDP Network Configuration

37.3.3.1 Displaying RPF Peers

The switch uses the unicast routing table to define TCP connections between RPs by selecting the next hop peer toward the originating RP of an SA message as the reverse path forwarding (RPF) peer. The switch forwards SA messages that it receives from the RPF peer to all other MSDP peers. The switch rejects SA messages that it receives from non-RPF peers.

To display MSDP information for the peer from which the switch accepts SA messages for a specified rendezvous point (RP), enter `show ip msdp rpf-peer`.

Example

- This command displays MSDP information for the peer from which the switch accepts SA messages for the RP at 10.5.29.4.

  ```
  switch>show ip msdp rpf-peer 10.5.29.4
  Rpf Peer is 10.5.29.4 for RP 10.5.29.4
  switch>
  ```

37.3.3.2 Configuring the Default Peer

The default peer is the MSDP peer from which the MSDP speaker is configured to accept all SA messages. A default peer may be associated with a prefix list. The prefix list specifies the RPs from where the speaker accepts SA messages.

The switch can designate multiple default peers:

- Switch defines one peer: A default peer statement is not required; the switch accepts SA traffic from the configured peer.
- Switch defines one default peer (no prefix list): The switch accepts all SA messages from only the default peer.
- Switch defines multiple default peers (no prefix lists): The switch accepts all SA messages from only the first default peer listed in `running-config`. Other listed default peers take effect only if the peer named in the first default-peer statement is not accessible.
- First default-peer statement includes a prefix list: The switch accepts all SA messages from the default peer whose originating RP is covered in the prefix list. The disposition of SA messages originating from other RPs is determined by subsequent `ip msdp default-peer` statements.

To configure the specified MSDP peer connection as a default peer on the switch, enter `ip msdp default-peer`. The default peer address must be a previously configured MSDP peer (`ip msdp peer`).

```
Example

- These commands configure an MSDP peer.
  
  switch(config)#ip msdp peer 10.5.2.2
  switch(config)#ip msdp default-peer 10.5.2.2
  switch(config)#

37.3.4 Managing the SA Cache

The switch stores Source Active (SA) messages after forwarding the information. This allows new group members to learn about the source before the next SA message is received. The caching action is not configurable and cannot be disabled. The `ip msdp cache-sa-state` command is included to maintain compatibility with other devices. The command has no effect on switch operations.

SA messages have an expiration period of 90 seconds and remain in the SA cache until they expire. A peer’s SA limit defines the number of SA messages the switch stores from the peer. The switch does not store SA messages from a peer whose SA limit is reached until its cached messages start expiring.

37.3.4.1 Limiting SA Cache Contents

To configure the maximum number of SA messages from a specified MSDP peer that the switch stores in the SA cache, enter `ip msdp sa-limit`. The default limit of SA messages that the switch can store from a specified peer is 40000.

Example

- This command sets the SA limit of 500 for the MSDP peer at 10.1.1.5.
  
  switch(config)#ip msdp sa-limit 10.1.1.5 500
  switch(config)#

  The maximum number of SA messages that the switch can store in the SA cache for a specified multicast group address is configured by the `ip msdp group-limit` command. The default limit of SA messages that the switch can store from a specified group is 40000.

Example

- This command sets the maximum number of 1000 SAs for multicast group 225.13.15.8/29
  
  switch(config)#ip msdp group-limit 1000 source 225.13.15.8/29
  switch(config)#

  The maximum number of rejected SA messages that the switch can store in the SA cache is configured by the `ip msdp rejected-limit` command. The default limit of rejected SA messages that the switch can store is 40000.

Example

- This command sets 5000 as the maximum number of rejected SAs that the SA cache can contain.
  
  switch(config)#ip msdp rejected-limit 5000
  switch(config)#

  Contents of the SA message cache are removed by the `clear ip msdp sa-cache` command. The command provides options for removing all cache contents or only contents of a specific multicast group.
Example

- This command deletes all SA message cache contents.

  ```plaintext
  switch# clear ip msdp sa-cache
  switch#
  ```

37.3.4.2 Displaying SA Cache Contents

SA message cache contents are displayed by the `show ip msdp sa-cache` command. Filter options provided by the command for displaying partial cache contents include:

- multicast group address: multicast group
- source address and group address

The command can also display unexpired SAs rejected by ACL filters or cache limit exceeded conditions.

Example

- This command displays the contents of the SA message cache.

  ```plaintext
  switch# show ip msdp sa-cache
  MSDP Source Active Cache
  (10.61.71.29, 234.1.4.2), RP 10.5.29.4, heard from 10.5.29.4
  (10.51.71.23, 234.1.4.1), RP 10.5.29.4, heard from 10.5.29.4
  (10.53.71.27, 234.1.4.2), RP 10.3.25.4, heard from 10.3.25.4
  (10.10.101.24, 234.1.4.1), RP 10.2.44.4, heard from 10.2.44.4
  (10.10.151.22, 234.1.4.1), RP 10.1.12.4, heard from 10.1.12.4
  switch>
  ```

Information about specified MSDP peers, including SAs accepted from the peer is displayed by the `show ip msdp peer` command.

Example

- This command displays data for the peer at 10.2.42.4, including SAs accepted from the peer.

  ```plaintext
  switch# show ip msdp peer 10.2.42.4 accepted-sas
  MSDP Peer 10.2.42.4
  Connection status:
  State: Up
  Connection Source: Loopback4 ( 10.2.43.4 )
  SA Filtering:
  Input Filter: allow-multicast-for-msdp
  Output Filter: allow-multicast-for-msdp
  SAs accepted:
  (10.62.79.30, 234.1.4.2), RP 10.2.42.4
  (10.61.79.29, 234.1.4.1), RP 10.2.42.4
  (10.62.79.30, 234.1.4.1), RP 10.2.42.4
  switch>
  ```

The SA cache for the local PIM domain is displayed by the `show ip msdp pim sa-cache` command.
Example

- This command displays the SA cache for the local PIM domain.

```bash
switch>show ip msdp pim sa-cache
MSDP Source Active Messages for local Pim RP
(10.51.71.23, 234.1.4.1), RP 10.2.43.4
(10.20.91.26, 234.1.4.1), RP 10.2.43.4
(10.20.91.26, 234.1.4.2), RP 10.2.43.4
(10.20.91.24, 234.1.4.1), RP 10.2.43.4
```

37.3.4.3 Verifying Consistency Between the SA Cache and the Routing Table

To check the consistency between the multicast routing table and the MSDP Source-Address (SA) caches, enter `show ip msdp sanity`. When the command detects inconsistencies, it displays the cache entries that are not in the table.

Example

- This command displays a sanity check that detects inconsistencies between the SA cache and the multicast routing table.

```bash
switch>show ip msdp sanity
PIM SA cache entries not in the MRT
Msdp-learnt MRT entries not in the SA cache
SA cache entries not in the MRT
(192.168.3.8, 224.1.154.1)
(192.168.3.35, 224.1.167.1)
(192.168.3.16, 224.1.226.1)
(192.168.3.12, 224.1.182.1)
(192.168.3.33, 224.1.150.1)
May-Notify-MSDP entries not in the PIM SA cache
(need not be an error condition)
4.1), RP 10.2.42.4
```

```bash
switch>
```
37.4 MSDP Commands

MSDP Configuration Commands (Global)
- ip msdp cache-sa-state
- ip msdp default-peer
- ip msdp description
- ip msdp group-limit
- ip msdp keepalive
- ip msdp mesh-group
- ip msdp originator-id
- ip msdp peer
- ip msdp rejected-limit
- ip msdp sa-filter in
- ip msdp sa-filter out
- ip msdp sa-limit
- ip msdp shutdown
- ip msdp timer

MSDP SA Cache Commands
- clear ip msdp sa-cache

MSDP Display Commands
- show ip msdp mesh-group
- show ip msdp peer
- show ip msdp pim sa-cache
- show ip msdp rpf-peer
- show ip msdp sa-cache
- show ip msdp sanity
- show ip msdp summary
clear ip msdp sa-cache

The `clear ip msdp sa-cache` command removes contents of the Source-Active (SA) message cache. The command provides these filter options for removing partial cache contents:

- contents of a multicast group by specifying its group address
- all cache contents

**Command Mode**

Privileged EXEC

**Command Syntax**

```
clear ip msdp sa-cache [ADDRESS_FILTER]
```

**Parameters**

- `ADDRESS_FILTER` IPv4 address used to select table entries for removal.
- `<no parameter>` All SA messages
- `grp_addr` Multicast group address (IPv4 address).

  `grp_addr` must be a valid multicast address.

**Example**

- This command deletes all SA message cache contents.

  ```
  switch# clear ip msdp sa-cache
  switch#
  ```
ip msdp cache-sa-state

The switch stores Source Active (SA) messages after forwarding the information it contains to the next MSDP peer. This allows new group members to learn about the source before the next SA message is received. The caching action is not configurable and cannot be disabled.

The ip msdp cache-sa-state command is included to maintain compatibility with other devices. The command has no effect on switch operations.

Command Mode
- Global Configuration

Command Syntax
- ip msdp cache-sa-state
The \texttt{ip msdp default-peer} command configures the specified MSDP peer connection as a default peer on the switch. The default peer configuration defines the peers from which the switch accepts Source-Active (SA) messages. When the command includes a \texttt{prefix list} parameter, the specified peer is the default peer for only SA messages originating from rendezvous points (RPs) covered by prefix list entries. The default peer address must be a previously configured MSDP peer (\texttt{ip msdp peer}).

Default peers provide an alternative to reverse packet forwarding (RPF) typically used by MSDP to specify the peers from which a switch accepts SA messages. However, RPF requires a unicast routing table that is correct and converged. RPF also assumes symmetric forward and reverse paths between router and sender. RPF fails on uni-directional links. Default MSDP peers invalidate the use of RPF over unicast routing tables.

The switch can designate multiple default peers:

- Switch defines one peer: A default peer statement is not required; the switch accepts SA traffic from the configured peer.
- Switch defines one default peer (no prefix list): The switch accepts all SA messages from only the default peer.
- Switch defines multiple default peers (no prefix lists): The switch accepts all SA messages from only the first default peer listed in \texttt{running-config}. Other listed default peers are used only when peers listed before them in \texttt{running-config} are not accessible.
- First default-peer statement includes a prefix list: The switch accepts all SA messages from the default peer whose originating RP is covered in the prefix list. The disposition of SA messages originating from other RPs is determined by subsequent \texttt{ip msdp default-peer} statements.

The \texttt{no ip msdp default-peer} and \texttt{default ip default-peer} commands remove the corresponding \texttt{ip msdp default-peer} command from \texttt{running-config}.

**Command Mode**

Global Configuration

**Command Syntax**

\begin{verbatim}
ip msdp default-peer peer_id [PREFIX]
no ip msdp default-peer peer_id
default ip msdp default-peer peer_id
\end{verbatim}

**Parameters**

- \texttt{peer_id} MSDP peer (IPv4 address).
- \texttt{PREFIX} List of RPs from the SA messages originate for which the default peer is valid.
  - <no parameter> default peer is valid for SAs from all originating RPs.
  - \texttt{prefix-list list_name} name of the prefix list that defines affected originating RP prefixes.

**Example**

- These commands configure two MSDP peers.

  \begin{verbatim}
  switch(config)#ip msdp peer 10.5.2.2
  switch(config)#ip msdp peer 10.6.2.2
  switch(config)#ip msdp default-peer 10.5.2.2
  switch(config)#
  \end{verbatim}
ip msdp description

The **ip msdp description** command associates descriptive text with the specified MSDP peer.

The **no ip msdp description** and **default ip msdp description** commands remove the text association from the specified peer.

**Command Mode**
Global Configuration

**Command Syntax**

```
ip msdp peer_id description description_string
no ip msdp peer_id description
default ip msdp peer_id description
```

**Parameters**

- `peer_id` MSDP peer (IPv4 address).
- `description_string` text string that is associated with neighbor.

**Example**

- These commands associate the string NORTH with the MSDP peer located at 10.4.4.12.

  ```
switch(config)#ip msdp description 10.4.4.12 NORTH
switch(config)#show ip msdp peer
  MSDP Peer 10.4.4.12
  Description: NORTH
  Connection status:
    State: Connect
    Connection Source: Loopback100 ( 10.6.8.6 )
  
switch(config)#
  ```
**ip msdp group-limit**

The `ip msdp group-limit` command specifies the maximum number of Source-Active (SA) messages that the switch allows in the SA cache for a specified multicast group address.

SA messages have an expiration period of 90 seconds and remain in the SA cache until they expire. The switch does not accept SA messages for a group whose cache limit is reached until its cached messages start expiring.

The `no ip msdp group-limit` and `default ip msdp group-limit` command removes the maximum group limit for the specified prefix by removing the corresponding `ip msdp group-limit` statement from `running-config`.

**Command Mode**
- Global Configuration

**Command Syntax**

```
ip msdp group-limit quantity source src_subnet
no ip msdp group-limit quantity source src_subnet
default ip msdp group-limit quantity source src_subnet
```

**Parameters**
- `quantity` maximum number of groups that can access the interface. Value ranges from 1 to 40000.
- `src_subnet` Source IPv4 subnet (CIDR or address-mask notation).

**Example**

- This command sets the maximum number of 1000 SAs for multicast group 10.13.15.8/29.

```
switch(config)#ip msdp group-limit 1000 source 10.13.15.8/29
switch(config)#
```
ip msdp keepalive

The `ip msdp keepalive` command configures the MSDP keepalive and hold time intervals for a specified MSDP peer connection.

- Keepalive time interval is the period between the transmission of consecutive keepalive messages. The default keepalive time interval is 60 seconds.
- Hold time interval is the period the switch waits for a KEEPALIVE or UPDATE message before it disables peering. The default hold time interval is 75 seconds.

The `no ip msdp keepalive` and `default ip msdp keepalive` commands restore the default keepalive and hold time intervals for the specified MSDP peer connection by removing the corresponding `ip msdp keepalive` command from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**
```
  ip msdp keepalive peer_id keep_alive hold_time
  no ip msdp keepalive peer_id
  default ip msdp keepalive peer_id
```

**Parameters**
- `peer_id` MSDP peer address (IPv4 address).
- `keep_alive` keepalive period (seconds). Value ranges from 1 to 65535. Default value is 60.
- `hold_time` hold time (seconds). Value ranges from 1 to 65535. Default value is 75.

**Restrictions**
The hold time interval must be longer than or equal to the keepalive time interval.

**Example**
- This command sets the keepalive time to 45 seconds and the hold time to 80 seconds for the connection with the MSDP peer at 10.4.4.12.

```
switch(config)#ip msdp keepalive 10.4.4.12 45 80
switch(config)#
```
**ip msdp mesh-group**

The `ip msdp mesh-group` command configures the specified MSDP peer connection as an MSDP mesh group member. A peer can be assigned to multiple mesh groups. Multiple MSDP peers can be assigned to a common mesh group.

An MSDP mesh group is a network of MSDP speakers where each speaker directly connects to every other speaker. The switch does not forward Source-Active (SA) messages that it receives from a mesh group peer to other peers of the same group.

The `no ip msdp mesh-group` and `default ip msdp mesh-group` commands delete the specified peer connection from a mesh group by removing the corresponding `ip msdp mesh-group` command from running-config. Commands that do not include a specific MSDP peer delete all configured connections from the specified mesh group.

**Command Mode**

Global Configuration

**Command Syntax**

- `ip msdp mesh-group group_name peer_id`
- `no ip msdp mesh-group group_name [peer_id]`
- `default ip msdp mesh-group group_name [peer_id]`

**Parameters**

- `group_name` name of mesh group.
- `peer_id` MSDP peer address (IPv4 address).

**Related Commands**

- `show ip msdp mesh-group` displays mesh group membership of MSDP peers.

**Example**

- These commands configure the MSDP peer connection to 10.1.1.14 a member of AREA-1 mesh group, then displays members of mesh groups to which configured MSDP peers belong.

```plaintext
switch(config)#ip msdp mesh-group AREA-1 10.1.1.14
switch(config)#show ip msdp mesh-group
Mesh Group: AREA-1
           10.1.1.14
switch(config)#
```
**ip msdp originator-id**

The `ip msdp originator-id` command configures an originator ID to replace the rendezvous point (RP) address in source-address (SA) messages that it originates as an MSDP speaker.

SA messages that an MSDP speaker originates contain the speaker’s rendezvous point (RP) address, as configured through PIM statements and processes. An originator ID is an alternative IPv4 address that a speaker uses in place of its RP address when advertising SA messages. This command configures the switch to use the specified interface’s IP address as the RP address in SA messages that it originates.

The `no ip msdp originator-id` and `default ip msdp originator-id` commands configure the switch to use its RP address in SA messages that it sends by removing the `ip msdp originator-id` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

- `ip msdp originator-id INTERFACE`
- `no ip msdp originator-id INTERFACE`
- `default ip msdp originator-id INTERFACE`

**Parameters**

- `INTERFACE` Specifies the interface from which the IP address is derived. Options include:
  - `ethernet e_num` Ethernet interface.
  - `loopback l_num` Loopback interface.
  - `management m_num` Management interface.
  - `port-channel p_num` Port-Channel Interface.
  - `vlan v_num` VLAN interface.
  - `vxlan vx_num` VXLAN interface.

**Example**

- This command configures the switch to use the IP address assigned to loopback 100 as the RP address in SA messages that it originates.

```
switch(config)#ip msdp originator-id loopback 100
switch(config)#
```
ip msdp peer

The **ip msdp peer** command configures the specified address as an MSDP peer and enables MSDP on the switch if it was not previously enabled. The peering session with the device at the specified network is established over a TCP connection.

The command can specify an interface through which the TCP connection is established. When the command does not specify an interface, the connection is established through an interface determined by existing routing algorithms.

The **no ip msdp peer** and **default ip msdp peer** commands remove the specified MSDP peer configuration by deleting the corresponding **ip msdp peer** command from **running-config**. MSDP is disabled when the last **ip msdp peer** command is removed.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip msdp peer peer_id [CONNECTION]
no ip msdp peer peer_id
default ip msdp peer peer_id
```

**Parameters**

- **peer_id** MSDP peer address (IPv4 address).
- **CONNECTION** interface through which TCP session connects. Options include:
  - <no parameter> determined through previously configured protocol.
  - **connect-source ethernet e_num** Ethernet interface.
  - **connect-source loopback l_num** Loopback interface.
  - **connect-source management m_num** Management interface.
  - **connect-source port-channel p_num** Port-Channel Interface.
  - **connect-source vlan v_num** VLAN interface.
  - **connect-source vxlan vx_num** VXLAN interface.

**Example**

- These commands assign an IP address to loopback interface 100, then configure 10.4.4.12 as an MSDP peer and establishes the TCP peer session through the loopback.

  ```
  switch(config)#interface loopback 100
  switch(config-if-Lo100)#ip address 10.6.8.6/24
  switch(config-if-Lo100)#exit
  switch(config)#ip msdp peer 10.4.4.12 connect-source loopback 100
  switch(config)#show ip msdp peer
  MSDP Peer 10.4.4.12
  Connection status:
  State: Connect
  Connection Source: Loopback100 (10.6.8.6)
  ```

  ```
  switch(config)#
  ```
**ip msdp rejected-limit**

The **ip msdp rejected-limit** command specifies the maximum number of rejected Source-Active messages that the switch allows in the SA cache.

SA messages have an expiration period of 90 seconds. They remain in the SA cache during this time. The default limit of rejected SA messages that the switch can store is 40000.

The **no ip msdp rejected-limit** and **default ip msdp rejected-limit** commands restore the rejected SA limit of 40000 by removing the **ip msdp rejected-limit** statement from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip msdp rejected-limit quantity  
no ip msdp rejected-limit  
default ip msdp rejected-limit  
```

**Parameters**

- **quantity**  maximum rejected SA messages the SA cache can store. Value ranges from 0 to 40000.

**Example**

- This command sets 5000 as the maximum number of rejected SAs that the SA cache can contain.

```
switch(config)#ip msdp rejected-limit 5000  
switch(config)#  
```
ip msdp sa-filter in

The `ip msdp sa-filter in` command assigns an IP access control list (ACL) as a filter for inbound Source-Active (SA) messages from the specified MSDP peer connection. The switch only accepts SA messages from the specified peer that are accepted by the assigned ACL. The switch accepts all SA messages from the peer when an ACL is not assigned as an inbound filter.

Only one ACL can be assigned as an inbound filter to an MSDP peer. Any subsequent `ip msdp sa-filter in` commands for the peer replace the existing command.

The `no ip msdp sa-filter in` and `default ip msdp sa-filter in` commands remove the ACL assignment as an inbound filter by removing the corresponding `ip msdp sa-filter in` command from `running-config`.

**Command Mode**
- Global Configuration

**Command Syntax**

```
ip msdp sa-filter in peer_id list list_name
no ip msdp sa-filter in peer_id
default ip msdp sa-filter in peer_id
```

**Parameters**
- `peer_id` MSDP peer address (IPv4 address).
- `list_name` name of ACL that filters SA messages.

**Related Commands**
- `ip msdp sa-filter out` assigns an IP ACL to filter outbound SA messages to a specified MSDP peer.

**Guidelines**

The command accepts standard and extended ACLs. The address field in a standard ACLs filters an SA message on its group address.

**Example**

- These commands create an IP ACL named LIST-IN as the inbound SA message filter for the MSDP peer connection to 10.4.4.12. The ACL permits SAs from the multicast group 239.14.4.2/28.

```
switch(config)#ip access-list LIST-IN
switch(config-acl-LIST-IN)#permit ip any 239.14.4.2/28
switch(config-acl-LIST-IN)#exit
switch(config)#ip msdp sa-filter in 10.4.4.12 list LIST-IN
switch(config)#show ip msdp peer
MSDP Peer 10.4.4.12
Connection status: State: Listen
            Connection Source: Loopback100 ( 10.6.8.6 )
SA Filtering: Input Filter: LIST-IN
```

switch(config)#
ip msdp sa-filter out

The **ip msdp sa-filter out** command assigns an IP access control list (ACL) as a filter for outbound Source-Active (SA) messages to the specified MSDP peer connection. The switch only sends SA messages to the specified peer that are accepted by the assigned ACL. The switch sends all SA messages to the peer when an ACL is not assigned as an output filter to the peer.

Only one ACL can be assigned as an outbound filter to an MSDP peer. Any subsequent **ip msdp sa-filter out** commands for the peer replace the existing command.

The **no ip msdp sa-filter out** and **default ip msdp sa-filter out** commands remove the ACL assignment as an outbound filter by removing the corresponding **ip msdp sa-filter out** command from running-config.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip msdp sa-filter out peer_id list list_name
no ip msdp sa-filter out peer_id
default ip msdp sa-filter out peer_id
```

**Parameters**

- **peer_id** MSDP peer address (IPv4 address).
- **list_name** name of ACL that filters SA messages.

**Related Commands**

- **ip msdp sa-filter in** assigns an IP ACL to filter inbound SA messages from a specified MSDP peer.

**Guidelines**

The command accepts standard and extended ACLs. The address field in a standard ACLs filters an SA message on its group address.

**Example**

- These commands assign the IP ACL named LIST-OUT as the outbound SA message filter for the MSDP peer connection to 10.4.4.12.

```
switch(config)#ip access-list LIST-OUT
switch(config-acl-LIST-OUT)#permit ip any 239.14.4.2/28
switch(config-acl-LIST-OUT)#exit
switch(config)#ip msdp sa-filter out 10.4.4.12 list LIST-OUT
switch(config)#show ip msdp peer
MSDP Peer 10.4.4.12
Connection status:
   State: Listen
   Connection Source: Loopback100 (10.6.8.6)
SA Filtering:
Output Filter: LIST-OUT

switch(config)#
```
ip msdp sa-limit

The **ip msdp sa-limit** command specifies the maximum number of Source-Active messages from a specified MSDP peer that the switch allows in the SA cache. SA messages have an expiration period of 90 seconds, during which time they remain in the SA cache. The switch does not accept SA messages from a peer after the peer’s SA limit is reached. By default, the limit to the number of SA messages that the switch can store from a specified peer is 40000, by default.

The **no ip msdp sa-limit** and **default ip msdp sa-limit** commands restore the SA limit of 40000 for the specified MSDP peer by removing the corresponding **ip msdp sa-limit** statement from **running-config**.

**Command Mode**
Global Configuration

**Command Syntax**

```
ip msdp sa-limit peer_id quantity
no ip msdp sa-limit peer_id
default ip msdp sa-limit peer_id
```

**Parameters**

- **peer_id** MSDP peer (IPv4 address).
- **quantity** maximum number of SA messages that the switch can store. Value ranges from 0 to 40000.

**Example**

- This command sets the SA limit of 500 for the MSDP peer at 10.1.1.5

```
switch(config)#ip msdp sa-limit 10.1.1.5 500
```

```
switch(config)#
```
ip msdp shutdown

The `ip msdp shutdown` command closes the peering session with the specified MSDP peer by terminating the TCP connection between the switch and the peer. The connection is not resumed until the shutdown command is removed from `running-config`.

The `no ip msdp shutdown` and `default ip msdp shutdown` commands establish an MSDP peering session with the specified peer by removing the corresponding `ip msdp shutdown` command from `running-config`.

**Command Mode**

- Global Configuration

**Command Syntax**

- `ip msdp peer_id shutdown`
- `no ip msdp peer_id shutdown`
- `default ip msdp peer_id shutdown`

**Parameters**

- `peer_id` MSDP peer (IPv4 address).

**Examples**

- This command closes the peering session with the MSDP peer at 10.4.4.12.

  ```
  switch(config)#ip msdp shutdown 10.4.4.12
  switch(config)#show ip msdp peer
  MSDP Peer 10.4.4.12
  Description: NORTH
  Connection status:
  State: Disabled
  Connection Source: Loopback100 ( 10.6.8.6 )
  ```

- This command reopens the peering session with the peer at 10.4.4.12.

  ```
  switch(config)#no ip msdp shutdown 10.4.4.12
  switch(config)#show ip msdp peer
  MSDP Peer 10.4.4.12
  Description: NORTH
  Connection status:
  State: Connect
  Connection Source: Loopback100 ( 10.6.8.6 )
  ```
ip msdp timer

The `ip msdp timer` command specifies the period that the switch waits after an MSDP peering session is reset before trying to reestablish the session. The default period is 30 seconds.

The `no ip msdp timer` and `default ip msdp timer` commands reset the timer interval to the default period of 30 seconds by removing the `ip msdp timer` command from `running-config`.

Command Mode
Global Configuration

Command Syntax

```
ip msdp timer connect_retry
no ip msdp timer connect_retry
default ip msdp timer connect_retry
```

Parameters

- `connect_retry`  Reconnect period (seconds). Value ranges from 1 to 65535. Default is 30.

Example

- This command configures the switch to wait 45 seconds after an MSDP peering session is reset before attempting to reestablish the session.

```
switch(config)#ip msdp timer 45
switch(config)#
```
show ip msdp mesh-group

The `show ip msdp mesh-group` command displays the mesh group membership of MSDP peers that are configured on the switch. An MSDP mesh group is a network of MSDP speakers where each speaker is directly connected to every other speaker. The switch does not forward Source-Active (SA) messages that it receives from a mesh group peer to other peers of the same group.

**Command Mode**

EXEC

**Command Syntax**

`show ip msdp mesh-group`

**Related Commands**

- `ip msdp mesh-group` configures the MSDP peer connection as an MSDP mesh group member.

**Example**

- This command displays the mesh group membership of configured MSDP peers.

```bash
switch>show ip msdp mesh-group
Mesh Group: tier_01
    10.24.18.13
Mesh Group: tier_02
    10.26.101.18
switch(config)#
```
**show ip msdp peer**

The `show ip msdp peer` command displays information about specified MSDP peers. The command includes an optional parameter for displaying SAs accepted from the peer.

**Command Mode**

EXEC

**Command Syntax**

```
show ip msdp peer [PEER_ADDR] [SA_ACCEPT]
```

**Parameters**

- **PEER_ADDR** Peers for which command displays information.
  - `<no parameter>` All peers configured on the switch.
  - `ipv4_addr` Address of specified MSDP peer.

- **SA_ACCEPT** Command displays SAs accepted from the specified peers.
  - `<no parameter>` Accepted SAs are not displayed.
  - `accepted-sas` Accepted SAs are displayed.

**Example**

- This command displays MSDP information concerning the peer located at 10.2.42.4, including SAs that the switch accepted from this peer.

```
switch>show ip msdp peer 10.2.42.4 accepted-sas
MSDP Peer 10.2.42.4
Connection status:
  State: Up
  Connection Source: Loopback4 ( 10.2.43.4 )
SA Filtering:
Input Filter: allow-multicast-for-msdp
Output Filter: allow-multicast-for-msdp
SAs accepted:
  (10.62.79.30, 234.1.4.2), RP 10.2.42.4
  (10.61.79.29, 234.1.4.1), RP 10.2.42.4
  (10.62.79.30, 234.1.4.1), RP 10.2.42.4
switch>
```
show ip msdp pim sa-cache

The `show ip msdp pim sa-cache` command displays the SA cache for the local PIM domain configured on the switch. An SA cache is a table of Source-Active messages that are generated or accepted by the PIM domain.

**Command Mode**

EXEC

**Command Syntax**

`show ip msdp pim sa-cache`

**Example**

- This command displays the SA cache for the local PIM domain.

```
switch>show ip msdp pim sa-cache
MSDP Source Active Messages for local Pim RP
(10.51.71.23, 234.1.4.1), RP 10.2.43.4
(10.20.91.26, 234.1.4.1), RP 10.2.43.4
(10.51.71.23, 234.1.4.2), RP 10.2.43.4
(10.20.91.21, 234.1.4.1), RP 10.2.43.4
(10.51.79.23, 234.1.4.1), RP 10.2.43.4
(10.20.91.24, 234.1.4.2), RP 10.2.43.4
(10.51.79.23, 234.1.4.2), RP 10.2.43.4
(10.20.91.21, 234.1.4.2), RP 10.2.43.4
(10.20.91.26, 234.1.4.2), RP 10.2.43.4
(10.20.91.24, 234.1.4.1), RP 10.2.43.4
switch>
```
**show ip msdp rpf-peer**

The *show ip msdp rpf-peer* command displays MSDP information for the peer from which the switch accepts SA messages for a specified rendezvous point (RP).

The switch examines the BGP routing table to determine the next hop peer toward the originating RP of an SA message. This next hop peer is the reverse path forwarding (RPF) peer. Because the switch receives SA messages from the RPF peer, it forwards the message to all other MSDP peers. The switch rejects identical SA messages that it receives from a non-RPF peer.

**Command Mode**

EXEC

**Command Syntax**

```
show ip msdp peer rp_addr
```

**Parameters**

- `rp_addr`  PIM RP IPv4 address.

**Example**

- This command displays MSDP information for the peer from which the switch accepts SA messages for the RP at 10.5.29.4.

```
switch> show ip msdp rpf-peer 10.5.29.4
Rpf Peer is 10.5.29.4 for RP 10.5.29.4
switch>
```
show ip msdp sa-cache

The `show ip msdp sa-cache` command displays contents of the Source-Active (SA) message cache. The command provides these filter options for displaying partial cache contents:

- multicast group address: multicast group
- source address and group address

The command can also display unexpired SAs that were rejected by ACL filters or cache limit exceeded conditions.

**Command Mode**

EXEC

**Command Syntax**

```
show ip msdp sa-cache [ADDRESS_FILTER] [CONTENTS]
```

**Parameters**

- **ADDRESS_FILTER** IPv4 address used to filter SA messages.
  - `<no parameter>` All SA messages.
  - `grp_addr` Multicast group address (IPv4 address).
  - `src_addr grp_addr` Source and multicast group addresses (two IPv4 addresses).
    - `grp_addr` must be a valid multicast address.
- **CONTENTS** type of SAs that the command displays.
  - `<no parameter>` Displays contents of SA Cache.
  - `rejected` Displays rejected SAs in addition to the SA cache contents.

**Example**

- This command displays the contents of the SA message cache.

```
switch>show ip msdp sa-cache
MSDP Source Active Cache

switch>
```
show ip msdp sanity

The **show ip msdp sanity** command performs a consistency check between the multicast routing table and the MSDP Source-Address (SA) caches. When the command detects inconsistencies, it displays the cache entries that are not in the table.

**Command Mode**

EXEC

**Command Syntax**

`show ip msdp sanity`

**Example**

- This command displays a sanity check that detects no inconsistencies between the SA cache and the multicast routing table.

  switch>**show ip msdp sanity**
  PIM SA cache entries not in the MRT
  Msdp-learnt MRT entries not in the SA cache
  SA cache entries not in the MRT
  May-Notify-MSDP entries not in the PIM SA cache
  (need not be an error condition)
  switch>

- This command displays inconsistencies between the SA cache and the multicast routing table.

  switch>**show ip msdp sanity**
  PIM SA cache entries not in the MRT
  Msdp-learnt MRT entries not in the SA cache
  SA cache entries not in the MRT

show ip msdp summary

The `show ip msdp summary` command displays a list of peer addresses, the operational status of the peer, and the number of Source-Active messages in the SA cache from that peer.

**Command Mode**

EXEC

**Command Syntax**

`show ip msdp summary`

**Example**

- This command displays the configured peers, the status of the peers, and the number of SA message received from those peers.

```
switch>show ip msdp summary
MSDP Peer Status Summary
Peer Address   State  SA Count
192.168.3.18   Up     0
192.168.3.16   Up     0
192.168.3.37   Listen 0
192.168.3.46   Up     0
192.168.3.47   Up     0
switch>
```
Audio Video Bridging (AVB)

Arista switches support Audio Video Bridging (AVB) and the associated protocols. This chapter describes AVB concepts and the implementation of associated protocols.

Sections in this chapter include:

- Section 38.1: AVB Overview
- Section 38.2: AVB Protocols
- Section 38.3: AVB Configuration
- Section 38.4: AVB Command Descriptions

38.1 AVB Overview

Audio Video Bridging (AVB) is a protocol set that provides precision time synchronization, admission control, queuing reservation, and guaranteed bandwidth of professional grade quality audio and video across an IP network.

Supported AVB protocols include:

- Generalized Precision Time Protocol (gPTP)
- Multiple Stream Reservation Protocol (MSRP)
- Multiple VLAN Registration Protocol (MVRP)

These AVB features are supported on Arista 7280, 7150 Series, and 7500E Series switches:

- gPTP with hardware time stamping
- gPTP Grandmaster function
- MSRP protocol on Ethernet interfaces: stream admission control and propagation
- Control plane protection for PTP and MSRP control frames
- MVRP
- Traffic classes 2 and 3 for AVB traffic
- Traffic shaping on egress ports
These AVB features are not available on Arista switches:

- MSRP protocol on LAGs
- MSRP co-ordination with gPTP; streams are allowed even when gPTP is not in sync
- MMRP
- Signaling message support in gPTP
- Running peer delay mechanism on STP blocked ports
- Grandmaster-specific state machines (gPTP)

### 38.2 AVB Protocols

This section describes supported AVB protocols:

- Section 38.2.1: gPTP
- Section 38.2.2: MVRP
- Section 38.2.3: MSRP
- Section 38.2.4: MRP

#### 38.2.1 gPTP

Generalized Precision Time Protocol (gPTP) is a network time synchronization standard for bridged Local Area Networks based on the IEEE 1588v2 Precision Time Protocol and supports the AVB protocol standards. Time synchronization in a gPTP domain is conducted the same way as in a PTP 1588 domain. A grandmaster is selected through the best grand master clock algorithm and distributes timing synchronization information to all directly attached peers. This information is propagated across the network to provide a common time reference to all Audio and Video end stations.

#### 38.2.2 MVRP

Multiple VLAN Registration Protocol (MVRP) is an application of Multiple Registration Protocol used by AVB endpoints to dynamically register and unregister VLANs on an interface.

When an interface wishes to join a VLAN advertised by an MSRP talker (to receive a stream), MVRP sends a Join message. On receiving the Join message, the interface is added to the VLAN. If the VLAN does not already exist, MVRP dynamically creates the VLAN and propagates it through the network.

MVRP events post Syslog messages, with the severity level of INFO for each message.

- **MVRP_VLAN_JOIN**
  
  MVRP VLAN Join received/transmitted on an interface.

- **MVRP_VLAN_LV**
  
  MVRP VLAN Leave received/transmitted on an interface.

- **MVRP_ERROR**
  
  MVRP Join was discarded due to an error.
38.2.3 MSRP

Multiple Stream Registration Protocol (MSRP) is a signaling protocol that allows end stations (nodes) to reserve network resources and ensure QoS for communicating with other end stations.

MSRP nodes are specified as talkers or listeners:

- Talker nodes transmit multimedia streams to other nodes in the AVB network.
- Listener nodes receive multimedia streams from the AVB talker nodes.

MSRP is implemented by the switch on individual interfaces. MSRP is active when it is enabled on at least one interface, and stopped when it is disabled on all interfaces. MSRP uses Multiple Registration Protocol (MRP) to facilitate attribute registrations and distribution across connected end points in a LAN environment.

MSRP events post Syslog messages, with the severity level of INFO for each message.

- **MSRP_SR_CLASS_TRANSITION**
  MSRP SR Class state transition occurred on an interface.

- **MSRP_TALKER_ADV_JOIN**
  Talker Advertise Join message for a stream was transmitted/received on an interface.

- **MSRP_TALKER_FAIL_JOIN**
  Talker Failed Join message for a stream was transmitted/received on an interface.

- **MSRP_LISTENER_JOIN**
  Listener Join message for a stream was transmitted/received on an interface.

- **MSRP_DOMAIN_JOIN**
  Domain Join message was transmitted/received on an interface.

- **MSRP_TALKER_ADV_LV**
  Talker Advertise Leave message for a stream was transmitted/received on an interface.

- **MSRP_TALKER_FAIL_LV**
  Talker Failed Leave message for a stream was transmitted/received on an interface.

- **MSRP_LISTENER_LV**
  Listener Leave message for a stream was transmitted/received on an interface.

- **MSRP_DOMAIN_LV**
  Domain Leave message was transmitted/received on an interface.

- **MSRP_BW_ALLOC_SUCCESS**
  MSRP Bandwidth was allocated for a listener on an interface.

- **MSRP_BW_ALLOC_FAIL**
  MSRP Bandwidth could not be allocated for a listener on an interface.

- **MSRP_BW_DEALLOC**
  MSRP Bandwidth was de-allocated for a listener on an interface.

- **MSRP_ERROR**
  MSRP Join was discarded because of an error.
38.2.4 MRP

Multiple Registration Protocol (MRP) protocol includes MSRP and MVRP, and allows participants in an MRP application to register attributes with participants in a Bridged Local Area Network (BLAN).
38.3 AVB Configuration

This section describes the AVB configuration:

- Section 38.3.1: Enabling gPTP
- Section 38.3.2: Enabling MSRP
- Section 38.3.3: Displaying MSRP Configuration and Status
- Section 38.3.4: Enabling MVRP
- Section 38.3.5: Displaying MVRP Configuration and Status

38.3.1 Enabling gPTP

Configure gPTP on the switch through the ptp mode command. PTP is enabled on individual interfaces with the ptp enable command.

Example

- These commands configure gPTP on the switch and enable PTP on Ethernet interfaces 41-45.

```
switch(config)#ptp mode gptp
switch(config)#interface ethernet 41-45
switch(config-if-Et41-45)#ptp enable
switch(config)#show running-config

<-------OUTPUT OMITTED FROM EXAMPLE-------->

! ptp mode gptp
!

<-------OUTPUT OMITTED FROM EXAMPLE-------->

end
switch(config-if-Et41-45)#show active
interface Ethernet41
  speed forced 10000full
  msrp
  ptp enable
interface Ethernet42
  speed forced 10000full
  msrp
  ptp enable
interface Ethernet43
  speed forced 10000full
  msrp
  ptp enable
interface Ethernet44
  speed forced 10000full
  ptp enable
interface Ethernet45
  ptp enable
switch(config-if-Et41-45)#
```

38.3.2 Enabling MSRP

MSRP is enabled on an interface with the msrp command.
Example

- These commands enable MSRP on Ethernet interfaces 41-43.

```
switch(config)#interface ethernet 41-43
switch(config-if-Et41-43)#msrp
switch(config-if-Et41-43)#show active
interface Ethernet41
    speed forced 10000full
    msrp
interface Ethernet42
    speed forced 10000full
    msrp
interface Ethernet43
    speed forced 10000full
    msrp
switch(config-if-Et41-43)#
```

38.3.3 Displaying MSRP Configuration and Status

MSRP configuration information and status is displayed with the `show msrp` command.

Example

- This command displays the MSRP status for Ethernet interfaces 41-43.

```
switch(config)#show msrp interfaces ethernet 41-43

MSRP Global Status : Enabled
Max Frame Size : 1522
Max Fan-In Ports : No limit

switch(config)#
```

Stream data is available for the talker and listener. The `show msrp interfaces` command displays the status and configuration information for each stream.
Examples

- This command displays data for listener station streams on Ethernet interfaces 1 and 2.

  ```
  switch(config)# show msrp interfaces ethernet 1-2
  MSRP Global Status : Enabled
  Max Frame Size : 1522
  Max Fan-In Ports : No limit
  
  Delta

  0000.0000.0000.038f  Adv      Rx     7
  
  switch(config)#
  ```

38.3.4 Enabling MVRP

MVRP is disabled by default. To enable MVRP on an interface, use the `mvrp` command. MVRP is enabled globally if it is enabled on at least one interface.
Example

- These commands enable MVRP on Ethernet interface 34.
  
  ```
  switch(config)#interface ethernet 34
  switch(config-if-Et34)#mvrp
  switch(config-if-Et34)#
  ```

38.3.5 Displaying MVRP Configuration and Status

MVRP configuration information and status are displayed with the `show mvrp` command.

Example

- This command displays the MVRP status for Ethernet interfaces 30 through 40.
  
  ```
  switch(config)#show mvrp interfaces Ethernet 30-40
  MVRP Global Status : Enabled
  
  Port      Admin State   Registered Vlans      Declared Vlans
  --------  ------------  --------------------  --------------------
  Et30      Disabled
  Et31      Disabled
  Et32      Disabled
  Et33      Disabled
  Et34      Active
  Et35      Disabled
  Et36      Disabled
  Et37      Disabled
  Et38      Disabled
  Et39      Disabled
  Et40      Disabled
  ```

  ```
  switch(config)#
  ```
38.4 AVB Command Descriptions

MSRP Commands
- msrp
- msrp streams load-file
- show msrp
- show msrp interfaces
- show msrp streams

MRP Commands
- mrp leave-all-timer
- mrp leave-timer

MVRP Commands
- mvrp
- show mvrp
**msrp**

MSRP enables Multiple Stream Registration Protocol (MSRP), which is a signaling protocol that provides nodes with the ability to reserve network resources to ensure Quality of Service (QoS) between talker and listener endpoints. The Stream Reservation Protocol (SRP) utilizes MSRP to reserve bandwidth for data streams, and configure a complete path between endpoints.

The `msrp` command enables MSRP on the configuration mode interface. If MSRP was not previously enabled on any interface, the MSRP agent is launched by this command.

The `no msrp` and `default msrp` commands disable MSRP on the configuration mode interface, and removes the corresponding `msrp` command from `running-config`. The command stops the MSRP agent when MSRP is no longer enabled on any interface.

**Command Mode**
- Interface-Ethernet Configuration

**Command Syntax**
```
msrp
no msrp
default msrp
```

**Example**
- These commands enable MSRP on Ethernet interface 3/3/3. Because it was not previously enabled on any other interface, the command launches the MSRP agent.

```
switch(config)#interface ethernet 3/3/3
switch(config-if-Et3/3/3)#msrp
Launching MSRP Agent
switch(config-if-Et3/3/3)#show active
  interface Ethernet3/3/3
    msrp
switch(config-if-Et3/3/3)#
```

- These commands disable the MSRP agent on Ethernet interface 3/3/3. Because it is not enabled on any other interface, the command stops the MSRP agent.

```
switch(config-if-Et3/3/3)#no msrp
Stopping MSRP agent
switch(config-if-Et3/3/3)#show active
  interface Ethernet3/3/3
switch(config-if-Et3/3/3)#msrp
```
mrp leave-all-timer

The `mrp leave-all-timer` command specifies the mrp leave all timer interval for the configuration mode interface.

When starting MRP, a participant starts its LeaveAll timer. Upon timer expiry, it sends a LeaveAll message and restarts its timer. When other participants receive the message, they register their attributes and restart their leave-all timers.

The default leave-all timer interval is a randomly selected value from 10 to 15 seconds. Under normal conditions, this value should not be adjusted.

The `no mrp leave-all-timer` and `default mrp leave-all-timer` commands restore the default leave-all timer interval on the configuration mode interface by removing the corresponding `mrp leave-all-timer` command from `running-config`.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

```
  mrp leave-all-timer period
  no mrp leave-all-timer
  default mrp leave-all-timer
```

**Parameters**

- `period` leave all timer interval (seconds). Values range from 10 to 60. Default value is a randomly selected value from 10 to 15.

**Example**

- This command sets the MRP leave-all timer interval on Ethernet interface 17 to twelve seconds.

```
  switch(config)#interface ethernet 17
  switch(config-if-Et17)#mrp leave-all-timer 12
  switch(config-if-Et17)#
```
**mrp leave-timer**

The leave-timer controls the deregistration of attributes. If an MRP participant needs other participants to unregister their attributes, it sends a Leave message. When receiving a Leave message, the Leave-timer starts and unregisters the attributes if it doesn’t receive Join messages for the attributes before the Leave-timer expires.

The **mrp leave-timer** command specifies the mrp leave-timer interval for the configuration mode interface. The default leave-timer interval is 0.6 seconds. Under normal operation conditions, this value should not be adjusted.

The **no mrp leave-timer** and **default mrp leave-timer** commands restore the default leave-timer interval of 0.6 seconds on the configuration mode interface by removing the corresponding **mrp leave-timer** command from **running-config**.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

```
   mrp leave-timer period
   no mrp leave-timer
   default mrp leave-timer
```

**Parameters**

- **period** leave all timer (seconds). Values range from 0.6 to 30.

**Example**

- This command sets the MRP leave timer interval on Ethernet interface 17 to 0.8 seconds.

```
switch(config)#interface ethernet 17
switch(config-if-Et17)#mrp leave-timer 0.8
switch(config-if-Et17)#
```
**msrp streams load-file**

The load-file for MSRP streams provides a file that contains an alias that can be substituted in the name (stream-id) of a string.

The `msrp streams load-file` command allows users to include a line in the file (example: `0102.0304.0506 XYZW4` or `0102.0304 XYZW5`) that causes the bytes to be replaced with the accompanying string in `show msrp streams` commands.

The `no msrp streams load-file` and `default msrp streams load-file` commands remove the alias assignment by removing the corresponding `msrp streams load-file` command from `running-config`.

**Command Mode**
- Global Configuration

**Command Syntax**

```
msrp streams load-file [FILE TYPE]
no msrp streams load-file
default msrp streams load-file
```

**Parameters**
- `FILE TYPE` The options include:
  - `certificate`: device name, directory, or file name
  - `extension`: device name, directory, or file name
  - `file`: device name, directory, or file name
  - `flash`: device name, directory, or file name
  - `ftp`: device name, directory, or file name
  - `http`: device name, directory, or file name
  - `https`: device name, directory, or file name
  - `scp`: device name, directory, or file name
  - `sftp`: device name, directory, or file name
  - `sslkey`: device name, directory, or file name
  - `system`: device name, directory, or file name
  - `terminal`: device name, directory, or file name
  - `tftp`: device name, directory, or file name
  - `usb1`: device name, directory, or file name

**Example**
- This command indicates that the file named `file1` contains the alias names that is used in MSRP stream names.

```
switch(config)#msrp streams load-file file1
switch(config)#
```
**mvrp**

MVRP dynamically registers and unregisters VLANs on an interface. When an interface wishes to join a VLAN advertised by an MSRP talker (to receive a stream), MVRP sends a Join message. On receipt of the Join message, the interface is added to the VLAN. If the VLAN does not already exist, MVRP dynamically creates the VLAN and propagates it through the network.

The `mvrp` command enables Multiple VLAN Registration Protocol (MVRP) on the configuration mode interface. If MVRP was not previously enabled on any interface, MVRP is also enabled globally by this command.

The `no mvrp` and `default mvrp` commands disable MVRP on the configuration mode interface by removing the corresponding `mvrp` command from `running-config`. These commands also disable MVRP globally when MVRP is no longer enabled on any interface.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

```
mvrp
no mvrp
default mvrp
```

**Example**

- These commands enable MVRP on Ethernet interface 34. If MVRP was not previously enabled on any other interface, these commands also enable MVRP globally.

```
switch(config)#interface ethernet 34
switch(config-if-Et34)#mvrp
switch(config-if-Et34)#
```
show msrp

The `show msrp` command displays MSRP operational information for the specified interfaces.

**Command Mode**

EXEC

**Command Syntax**

`show msrp [INTERFACE_NAME]`

**Parameters**

- `INTERFACE_NAME` Interface type and number. Values include
  - `<no parameter>` all Ethernet interfaces.
  - `interfaces ethernet e_range` Ethernet interface list.

Valid `e_range` formats include number, range, or comma-delimited list of numbers and ranges.

**Example**

- This command displays the MSRP status for Ethernet interfaces 41 through 43.

```
switch(config)#show msrp interfaces ethernet 41-43

MSRP Global Status : Enabled
Max Frame Size : 1522
Max Fan-In Ports : No limit

switch(config)#
show msrp interfaces

The show msrp interfaces command displays station stream information for the specified station type, interfaces and streams.

Command Mode
EXEC

Command Syntax
show msrp interfaces [INTERFACE_NAME] STATION_TYPE_NAME [STREAMS]

Parameters
- **INTERFACE_NAME** Interface type and number. Values include:
  - <no parameter> all Ethernet interfaces.
  - ethernet e_range Ethernet interface list.
- **STATION_TYPE** Endpoint type. Values include:
  - talker Command displays data for talker station streams.
  - listeners Command displays data for listener station streams.
  - streams Command displays data for talker and listener station streams.
- **STREAMS** Streams for which command displays information. Options include:
  - <no parameter> all streams.
  - stream-id hex_string specifies the stream command for which command displays information.

Valid e_range formats include number, range, or comma-delimited list of numbers and ranges.
Valid hex_string formats include <H>, <H.H>, <H.H.H>, or <H.H.H.H>, where H is a four-digit hex number that ranges from 0 to FFFF.

Example
- This command displays data for listener station streams on Ethernet interfaces 1 and 2.
  switch(config)#show msrp interfaces ethernet 1-2 listeners

switch(config)#
**show msrp streams**

The `show msrp streams` command displays configuration and status information on the specified MSRP streams.

**Command Mode**

EXEC

**Command Syntax**

```
show msrp streams [STREAM_NAME] [INFO_LEVEL]
```

**Parameters**

- **STREAMS** Streams for which command displays information. Options include:
  - `<no parameter>` all streams.
  - `stream-id hex_string` specifies the stream command for which command displays information.

Valid `hex_string` formats include `<H>, <H.H>, <H.H.H>, or <H.H.H.H>`, where H is a four-digit hex number that ranges from 0 to FFFF.

- **INFO_LEVEL** type of information that the command displays. Options include:
  - `<no parameter>` command displays stream identification information.
  - `detail` command displays identification and transmission characteristics.
  - `propagation` command displays ingress and egress port information.

**Examples**

- This command displays stream identification information.

  ```
  switch(config)#show msrp interfaces streams

```

```
switch(config)#
```
show mvrp

The `show mvrp` command displays MVRP operational information for the specified interfaces.

**Command Mode**
EXEC

**Command Syntax**

```
show mvrp INTERFACE_NAME
```

**Parameters**

- `INTERFACE_NAME` Interface type and number. Values include
  - `<no parameter>` all Ethernet interfaces.
  - `interfaces ethernet e_range` Ethernet interface list.

Valid `e_range` formats include number, range, or comma-delimited list of numbers and ranges.

**Example**

- This command displays the MVRP status for Ethernet interfaces 30 through 40.

```
switch(config)# show mvrp interfaces Ethernet 30-40

MVRP Global Status : Enabled

`switch(config) #`
This chapter describes the Arista switch SNMP agent and contains these sections:

- Section 39.1: SNMP Introduction
- Section 39.2: SNMP Conceptual Overview
- Section 39.3: Configuring SNMP
- Section 39.4: SNMP Commands

### 39.1 SNMP Introduction

Arista Networks switches support many standard SNMP MIBs, making it easier to integrate these platforms into existing network management infrastructures. With only a few configurations, many public domain and commercially available network management tools can quickly manage Arista switches out of the box. Support of SNMP V2 groups and views and V3 security allow network managers to tune switch monitoring to match the administration policy of the IT organization.

### 39.2 SNMP Conceptual Overview

Simple Network Management Protocol (SNMP) is a protocol that provides a standardized framework and a common language to monitor and manage network devices.

#### 39.2.1 SNMP Structure

The SNMP framework has three parts:

- **SNMP manager**: The SNMP manager controls and monitors network host activities and is typically part of a Network Management System (NMS).
- **SNMP agent**: The SNMP agent is the managed device component that manages and reports device information to the manager.
- **Management Information Base (MIB)**: The MIB stores network management information.

The agent and MIB reside on the switch. Enabling the SNMP agent requires the definition of the manager-agent relationship. The agent contains MIB variables whose values the manager can request or change. The agent gathers data from the MIB and responds to requests for information. For a list of supported MIBs, please refer to the release notes for a specific EOS version.

This chapter discusses enabling the SNMP agent on an Arista switch and controlling notification transmissions from the agent. Information on using SNMP management systems is available in the appropriate documentation for the corresponding NMS application.
39.2.2 SNMP Notifications

SNMP notifications are messages, sent by the agent, informing of an event or a network condition. A *trap* is an unsolicited notification. An *inform* (or inform request) is a trap that includes a request for a confirmation that the message is received. Events that a notification can indicate include improper user authentication, restart, and connection losses.

For a list of supported traps, please refer to the release notes for a specific EOS version.

39.2.3 SNMP Versions

Arista switches support the following SNMP versions:

- **SNMPv1**: The Simple Network Management Protocol, defined in RFC 1157. Security is based on community strings.
- **SNMPv2c**: Community-string based Administrative Framework for SNMPv2, defined in RFC 1901, RFC 1905, and RFC 1906. Security is based on SNMPv1.
- **SNMPv3**: Version 3, as defined in RFCs 2273 to 2275.

39.3 Configuring SNMP

This section describes the steps that configure the switch SNMP agent to communicate with an SNMP manager, including the following:

- **Enabling and Disabling SNMP**
- **Configuring Community Access Control**
- **Configuring SNMP Parameters**
- **Configuring the Agent to Send Notifications**
- **Extending the SNMP Agent Through Run Time Scripts**

39.3.1 Enabling and Disabling SNMP

SNMP is enabled globally by issuing any `snmp-server community` or `snmp-server user` command. The `no snmp-server` command disables SNMP agent operation by removing all non-default `snmp-server` commands from `running-config`.

39.3.2 Enabling SNMP in a VRF

By default, SNMP is enabled only in the **default** VRF. The switch can only send SNMP traps and informs if the host that has been configured to receive them is accessible through an interface in a VRF in which SNMP has been enabled.

To enable or disable SNMP in a VRF, use the `snmp-server vrf` command.

39.3.3 Configuring Community Access Control

SNMP community strings serve as passwords that permit an SNMP manager to access the agent on the switch. A Network Management System (NMS) can access the switch only if its community string matches at least one of the switch’s community strings.

The `snmp-server community` command configures the community string.
Example

- This command adds the community string `ab_1` to provide read-only access to the switch agent.

```
switch(config)#snmp-server community ab_1 ro
switch(config)#
```

Community statements can reference views to limit MIB objects that are available to a manager. A view is a community string object that specifies a subset of MIB objects. The `snmp-server view` command configures the community string.

Example

- These commands create a view that includes all objects in the `system` group except for those in `system.2`.

```
switch(config)#snmp-server view sys-view system include
switch(config)#snmp-server view sys-view system.2 exclude
switch(config)#
```

- This command adds the community string `lab_1` to provide read-only access to the switch agent for the previously defined view.

```
switch(config)#snmp-server community lab_1 sys-view
switch(config)#
```

39.3.4 Configuring SNMP Parameters

This section describes these SNMP parameter configuration tasks:

- Configuring the Engine ID
- Configuring the Group
- Configuring the User
- Configuring the Host
- Enabling Link Trap Generation
- Configuring the Chassis-id String
- Configuring the Contact String
- Configuring the Location String

Configuring the Engine ID

The `snmp-server engineID remote` command configures the the name of a Simple Network Management Protocol (SNMP) engine located on a remote device. Use the `snmp-server engineID local` command for the local engine.

A remote agent’s engine ID must be configured before remote users for that agent are configured. User authentication and privacy digests are derived from the engine ID and user passwords. The configuration command fails if the remote engine ID is not configured first.

**Important!** When the remote engine ID is changed, all user passwords associated with the engine must be reconfigured.

Example

- This command configures DC945798CAB4 as the name of the remote SNMP engine located at 12.23.104.25, UDP port 162.

```
switch(config)#snmp-server engineID remote 10.23.104.25 udp-port DC945798CA
switch(config)#
```
Configuring the Group

An SNMP group grants specific levels of SNMP access to group users. The `snmp-server group` command configures a new SNMP group.

Example

- This command configures `normal_one` as an SNMPv3 group (authentication and encryption) that provides access to the `all-items` read view.

  ```
  switch(config)#snmp-server group normal_one v3 priv read all-items
  switch(config)#
  ```

Configuring the User

Members of SNMP groups are called “users.” The `snmp-server user` command allows a new user to be added an SNMP group and configures that user’s parameters. Remote users are configured by specifying the IP address or port number that accesses the user’s SNMP agent.

Example

- This command configures the local SNMPv3 user `tech-1` as a member of the SNMP group `tech-sup`.

  ```
  switch(config)#snmp-server user tech-1 tech-sup v3
  switch(config)#
  ```

- This command configures the remote SNMPv3 user `tech-2` as a member of the SNMP group `tech-sup`. The remote user is on the agent located at 13.1.1.4.

  ```
  switch(config)#snmp-server user tech-2 tech-sup remote 13.1.1.4 v3
  switch(config)#
  ```

Configuring the Host

The `snmp-server host` command configures an SNMP host (to which SNMP traps will be sent). The `snmp-server host` command sets the community string if it was not previously configured.

Example

- This command adds a v2c inform notification recipient at 12.15.2.3 using the community string `comm-1`.

  ```
  switch(config)#snmp-server host 12.15.2.3 informs version 2c comm-1
  switch(config)#
  ```

Enabling Link Trap Generation

The `snmp trap link-status` command enables SNMP link trap generation on the configuration mode interface. SNMP link trap generation is enabled by default. If SNMP link trap generation was previously disabled, this command removes the corresponding `no snmp link-status` statement from the configuration. The `show snmp trap` command displays the SNMP link trap generation information.

Example

- This command disables SNMP link trap generation on the Ethernet 5 interface.

  ```
  switch(config-if-Et5)#no snmp trap link-status
  switch(config-if-Et5)#
  ```
Specifying the Source Interface

The `snmp-server source-interface` command specifies the interface from where an SNMP trap originates. The `show snmp source-interface` command displays the interface of the IP address for SNMP traps.

**Example**

- This command configures the Ethernet 1 interface as the source of SNMP traps and informs.

  ```
  switch(config)#snmp-server source-interface ethernet 1
  switch(config)#
  ```

Configuring the Chassis-id String

The chassis ID string is typically set to the serial number of the switch. The SNMP manager uses this string to associate all data retrieved from the switch with a unique identifying label. Under normal operating conditions, editing the chassis ID string contents is unnecessary.

The `snmp-server chassis-id` command configures the chassis ID string. The default chassis ID string is the serial number of the switch. The `show snmp` command displays the chassis ID.

**Example**

- This command configures `xyz-1234` as the chassis-ID string, then displays the result.

  ```
  switch(config)#snmp-server chassis-id xyz-1234
  switch(config)#show snmp
  Chassis: xyz-1234  <-- chassis ID
  8 SNMP packets input
  0 Bad SNMP version errors
  0 Unknown community name
  0 Illegal operation for community name supplied
  0 Encoding errors
  8 Number of requested variables
  0 Number of altered variables
  4 Get-request PDUs
  4 Get-next PDUs
  0 Set-request PDUs
  21 SNMP packets output
  0 Too big errors
  0 No such name errors
  0 Bad value errors
  0 General errors
  8 Response PDUs
  0 Trap PDUs
  SNMP logging: enabled
  Logging to taccon.162
  SNMP agent enabled
  ```

Configuring the Contact String

The SNMP contact string is information text that typically displays the name of a person or organization associated with the SNMP agent.

The `snmp-server contact` command configures the system contact string. The contact string is displayed by the `show snmp` and `show snmp contact` commands.
Example

- These commands configure *Bonnie H at 3-1470* as the contact string.
  
  ```
  switch(config)#snmp-server contact Bonnie H at 3-1470
  switch(config)#
  ```

Configuring the Location String

The location string typically provides information about the physical location of the SNMP agent. The `snmp-server location` command configures the system location string. By default, the system location string is not set.

Example

- These commands configure *lab-25* as the location string.

  ```
  switch(config)#snmp-server location lab_25
  switch(config)#show snmp location
  Location: lab_25
  switch(config)#
  ```

39.3.5 Configuring the Agent to Send Notifications

The following steps are mandatory when setting up the SNMP agent to send notifications:

**Step 1** Configure the remote engine ID.

**Step 2** Configure the group.

**Step 3** Configure the user.

**Step 4** Configure the host.

**Step 5** Enable link trap generation on the interfaces.

Section 39.3.4 describes each of these tasks.

39.3.6 Extending the SNMP Agent Through Run Time Scripts

The switch supports the execution of user supplied scripts to service portions of the OID space.

Scripts run under one of two operational modes:

- Normal: scripts run over an indefinite period to process subsequent objects after the initial request. Maintaining an executing script avoids startup and connection delay each time an object requires processing.
- One-shot mode: scripts process a single object, then terminates execution.

Normal extension scripts are conceptually multithreaded: one thread collects data and the other thread is ready to communicate with snmpd. One-shot scripts process a single object, running once and exiting. Startup and data collection overhead is required for each request. In both modes, the SNMP server is blocked from serving other requests when waiting for script responses.

The `snmp-server extension` command configures the execution of user supplied scripts to service portions of the OID space.

Example

- This command specifies the file *example.sh*, located in flash as the script file that services the specified OID space in normal mode.

  ```
  switch(config)#snmp-server extension .1.3.6.1.4.1.8072.2 flash:example.sh
  switch(config)#
  ```
39.3.6.1 Normal Script Behavior

The first time the SNMP server requires a script result, it launches it with no arguments. The server communicates with the script through stdin/stdout. Before each request, the script is the string `PING

on stdin. The expected response is printing `PONG

to stdout.

**GET and GETNEXT Requests**

For GET and GETNEXT requests, the script is passed two lines on stdin, the command (get or getnext) and the requested OID. The expected response from the script is the printing of three lines to stdout: , the TYPE, the OID for the result varbind, and the VALUE itself.

**Table 39-1** lists legal TYPE values and resulting VALUE encodings. If the command does not return an appropriate varbind, it should print print "NONE\n" to stdout and continue running; this results in an SNMP `noSuchName` error or a `noSuchInstance` exception.

**Table 39-1 Extension Script Type and Encoding**

<table>
<thead>
<tr>

</tr>
<tr>
<td>opaque</td>
<td>Opaque</td>
<td>hexadecimal string</td>
</tr>
<tr>
<td>string</td>
<td>OctetString</td>
<td>ascii string</td>
</tr>
</tbody>
</table>

**SET**

For SET requests, script is passed three lines on stdin: the command (set), and the requested OID, and the type and value, both on the same line. If the assignment is successful, the expected script response is to print `DONE\n` to stdout. Indicated errors by writing one of the error strings described in **Table 39-2** In each case, the command should continue running.

<table>
<thead>
<tr>
<th>Error string</th>

<td>wrong-value</td>
</tr>
</tbody>
</table>

**Table 39-2 Set Request Error Strings**

39.3.6.2 One Shot Script Behavior

The command should exit after it finishes processing a single object.
GET and GETNEXT

For each GET or GETNEXT request, the script is invoked once for each OID in the space that it serves. It receives two arguments: -g for GET or -n for GETNEXT, and the requested OID.

The expected script response is the response varbind as three separate lines printed to stdout: the result OID, the type, and the value.

If the command does not return an appropriate varbind, then the script should exit without producing any output. This results in an SNMP noSuchName error, or a noSuchInstance exception.

Possible reasons that a command would not return an appropriate varbind includes:

- The specified OID didn’t correspond to a valid instance for a GET request.
- There were no following instances for a GET request.

SET

A SET request results in the command being called with the arguments: -s, OID, TYPE and VALUE, where TYPE is a listed token Table 39-1, indicating the type of the value passed as the third parameter.

When the assignment is successful, the script exits without producing any output. Errors are indicated by writing just the error name (Table 39-2); the agent generates the appropriate error response.
39.4 **SNMP Commands**

**Global Configuration Commands**
- `no snmp-server`
- `snmp-server chassis-id`
- `snmp-server community`
- `snmp-server contact`
- `snmp-server enable traps`
- `snmp-server engineID local`
- `snmp-server engineID remote`
- `snmp-server extension`
- `snmp-server group`
- `snmp-server host`
- `snmp-server location`
- `snmp-server source-interface`
- `snmp-server user`
- `snmp-server view`
- `snmp-server vrf`

**Interface Configuration Commands**
- `snmp trap link-status`

**Display Commands**
- `show snmp`
- `show snmp chassis`
- `show snmp community`
- `show snmp contact`
- `show snmp engineID`
- `show snmp group`
- `show snmp host`
- `show snmp location`
- `show snmp mib`
- `show snmp source-interface`
- `show snmp trap`
- `show snmp user`
- `show snmp view`
no snmp-server

The no snmp-server and default snmp-server commands disable Simple Network Management Protocol (SNMP) agent operation by removing all snmp-server commands from running-config.

SNMP is enabled with any snmp-server community or snmp-server user command.

**Command Mode**

Global Configuration

**Command Syntax**

- no snmp-server
- default snmp-server

**Example**

- This command disables SNMP agent operation on the switch.

```
switch(config)#no snmp-server
switch(config)#
```
show snmp

The `show snmp` command displays SNMP information including the SNMP counter status and the chassis ID string.

### Example

**EXEC**

**Command Syntax**

```
show snmp
```

**Example**

- This command displays SNMP counter status, the chassis ID, the previously configured location string, logging status and destination, and the VRFs in which the SNMP agent is operating.

```
switch>show snmp
Chassis: JFL08320162
Location: 5470ga.dc
2329135 SNMP packets input
  0 Bad SNMP version errors
  0 Unknown community name
  0 Illegal operation for community name supplied
  0 Encoding errors
  38132599 Number of requested variables
  0 Number of altered variables
  563934 Get-request PDUs
  148236 Get-next PDUs
  0 Set-request PDUs
2329437 SNMP packets output
  0 Too big errors
  0 No such name errors
  0 Bad value errors
  0 General errors
  2329135 Response PDUs
  0 Trap PDUs
SNMP logging: enabled
    Logging to 172.22.22.20.162
SNMP agent configured in VRFs: default
SNMP agent enabled in default VRF
switch>
```
show snmp chassis

The `show snmp chassis` command displays the Simple Network Management Protocol (SNMP) server serial number or the chassis ID string configured by the `snmp-server chassis-id` command.

**Example**

**EXEC**

**Command Syntax**

`show snmp chassis`

**Example**

- This command displays the chassis ID string.

```
switch> show snmp chassis
Chassis: JFL08320162
switch>
```
**show snmp community**

The `show snmp community` command displays the Simple Network Management Protocol (SNMP) community access strings configured by the `snmp-server community` command.

**Example**

EXEC

**Command Syntax**

```
show snmp community
```

**Example**

- This command displays the list of community access strings configured on the switch.

```
switch>show snmp community

Community name: public
switch>
```
show snmp contact

The show snmp contact command displays the Simple Network Management Protocol (SNMP) system contact string configured by the snmp-server contact command. The command has no effect if a contact string was not previously configured.

Example

EXEC

Command Syntax

show snmp contact

Example

- This command displays the contact string contents.

switch>show snmp contact
Contact: John Smith
switch>
show snmp engineID

The `show snmp engineID` command displays the local SNMP engine information configured on the switch.

Example

EXEC

Command Syntax

    show snmp engineID

Example

- This command displays the ID of the local SNMP engine.

    switch>show snmp engineid
    Local SNMP EngineID: f5717f001c730436d700
    switch>
**show snmp group**

The `show snmp group` command shows the names of configured SNMP groups along with the security model, and view status of each group.

**Example**

```
EXEC

Command Syntax

`show snmp group [GROUP_LIST]`
```

**Parameters**

- `GROUP_LIST` the name of the group.
- `<no parameter>` displays information about all groups.
- `group_name` the name of the group.

**Field Descriptions**

- `groupname` name of the SNMP group.
- `security model` security model used by the group: `v1`, `v2c`, or `v3`.
- `readview` string identifying the group’s read view. Refer to `show snmp view`.
- `writeview` string identifying the group’s write view.
- `notifyview` string identifying the group’s notify view.

**Example**

```
This command displays the groups configured on the switch.

switch>show snmp group

groupname : normal                          security model:v3 priv
readview  : all                             writeview: <no writeview specified>
notifyview: <no notifyview specified>

switch>
```
**show snmp host**

The `show snmp host` command displays information for Simple Network Management Protocol notification. Details include IP address and port number of the Network Management System, notification type, and SNMP version.

**Example**

```
EXEC
```

**Command Syntax**

```
show snmp host
```

**Field Descriptions**

- **Notification host** IP address of the host.
- **udp-port** port number.
- **type** notification type.
- **user** access type of the user.
- **security model** SNMP version used.
- **traps** details of the notification.

**Example**

- This command displays the hosts configured on the switch.

```
switch>show snmp host
Notification host: 172.22.22.20    udp-port: 162   type: trap
user: public                       security model: v2c

switch>
```
**show snmp location**

The **show snmp location** command displays the Simple Network Management Protocol (SNMP) system location string. The **snmp-server location** command configures system location details. The command has no effect if a location string was not previously configured.

**Example**

EXEC

**Command Syntax**

```
show snmp location
```

**Example**

- This command displays the location string contents.

```
switch>show snmp location
Location: santa clara
switch>
```
show snmp mib

The `show snmp mib` command displays values associated with specified MIB object identifiers (OIDs) that are registered on the switch.

Example

EXEC

Command Syntax

```
show snmp mib OBJECTS
```

Parameters

- **OBJECTS** object identifiers for which the command returns data. Options include:
  - `get oid_1 [oid_2 ... oid_x]` values associated with each listed OID.
  - `get-next oid_1 [oid_2 ... oid_x]` values associated with subsequent OIDs relative to listed OIDs.
  - `table oid` table associated with specified OID.
  - `translate oid` object name associated with specified OID.
  - `walk oid` objects below the specified subtree.

Example

- This command uses the get option to retrieve information about the sysORID.1 OID.
  ```
  switch#show snmp mib get sysORID.1
  SNMPv2-MIB::sysORID[1] = OID: TCP-MIB::tcpMIB
  ```

- This command uses the get-next option to retrieve information about the OID that is after sysORID.8.
  ```
  switch#show snmp mib get-next sysORID.8
  SNMPv2-MIB::sysORDescr[1] = STRING: The MIB module for managing TCP implementations
  ```
**show snmp source-interface**

The `show snmp source-interface` command displays the interface whose IP address is the source address for SNMP traps.

**Example**

```
EXEC
```

**Command Syntax**

```
show snmp source-interface
```

**Example**

- This command displays the source interface for the SNMP notifications.

  ```
  switch>show snmp source-interface
  SNMP source interface: Ethernet1
  switch>
  ```
show snmp trap

The `show snmp trap` command displays the SNMP trap generation information.

**Example**

**EXEC**

**Command Syntax**

`show snmp trap`

**Example**

- This command displays the SNMP traps configured on the switch.

```
switch>show snmp trap

switch>
```
**show snmp user**

The `show snmp user` command shows information about Simple Network Management Protocol (SNMP) users. Information that the command displays about each user includes their SNMP version, the engine ID of the host where they reside, and security information.

**Example**

`EXEC`

**Command Syntax**

```
show snmp user [USER_LIST]
```

**Parameters**

- `USER_LIST` the name of the group.
  - `<no parameter>` displays information about all users.
  - `user_name` specifies name of displayed user.

**Example**

- This command displays information about the users configured on the switch.

```
switch>show snmp user

User name: test

Security model: v3
Engine ID: f5717f001c73010e0900
Authentication protocol: SHA
Privacy protocol: AES-128
Group name: normal
switch>
```
**show snmp view**

The `show snmp view` command displays the information of a Simple Network Management Protocol (SNMP) configuration and the associated MIB. SNMP views are configured with the `snmp-server view` command.

**Example**

```plaintext
EXEC
```

**Command Syntax**

```
show snmp view [VIEW_LIST]
```

**Parameters**

- **VIEW_LIST**  the name of the view.
  
  - <no parameter>  displays information about all views.
  
  - **view_name**  the name of the view.

**Field Descriptions**

- **First column**  view name.
- **Second column**  name of the MIB object or family.
- **Third column**  inclusion level of the specified family within the view.

**Example**

```
These commands configure an SNMP view, then displays that view.
```

```plaintext
switch(config)#snmp-server view sys-view system include
switch(config)#snmp-server view sys-view system.2 exclude
switch(config)#show snmp view
sys-view system - included
sys-view system.2 - excluded
```
**snmp-server chassis-id**

The `snmp-server chassis-id` command configures the chassis ID string. The default chassis ID string is the serial number of the switch. The `show snmp` command displays the chassis ID.

The `no snmp-server chassis-id` and `default snmp-server chassis-id` commands restore the default chassis ID string by removing the `snmp-server chassis-id` command from the configuration.

**Command Mode**
Global Configuration

**Command Syntax**

```
snmp-server chassis-id  id_text
no snmp-server chassis-id
default snmp-server chassis-id
```

**Parameters**
- `id_text` chassis ID string

**Example**
- These commands configure `xyz-1234` as the chassis-id string, then display the result.

```
switch(config)#snmp-server chassis-id xyz-1234
switch(config)#show snmp
Chassis:  xyz-1234  
8 SNMP packets input
  0 Bad SNMP version errors
  0 Unknown community name
  0 Illegal operation for community name supplied
  0 Encoding errors
  8 Number of requested variables
  0 Number of altered variables
  4 Get-request PDUs
  4 Get-next PDUs
  0 Set-request PDUs
21 SNMP packets output
  0 Too big errors
  0 No such name errors
  0 Bad value errors
  0 General errors
  8 Response PDUs
  0 Trap PDUs
SNMP logging: enabled
  Logging to taccon.162
SNMP agent enabled
switch(config)#
```
The `snmp-server community` command configures the community string. SNMP community strings serve as passwords that permit an SNMP manager to access the agent on the switch. The Network Management System (NMS) must define a community string that matches at least one of the switch community strings to access the switch.

The `no snmp-server community` and `default snmp-server community` commands remove the community access string from the configuration.

**Command Mode**
- Global Configuration

**Command Syntax**
```
snmp-server community string_text [MIB_VIEW] [ACCESS] [ACL_NAMES]
no snmp-server community string_text
default snmp-server community string_text
```

**Parameters**
- `string_text`: community access string.
- `MIB_VIEW`: community access availability. Options include:
  - `<no parameter>`: community string allows access to all objects.
  - `view view_name`: community string allows access only to objects in the `view_name` view.
- `ACCESS`: community access availability. Options include:
  - `<no parameter>`: read-only access (default setting).
  - `ro`: read-only access.
  - `rw`: read-write access.
- `ACL_NAMES`: community access availability. Options include:
  - `<no parameter>`: community string allows access to all objects.
  - `list_v4`: IPv4 ACL list.
  - `ipv6 list_v6`: IPv6 ACL list.
  - `ipv6 list_v6 list_v4`: IPv4 and IPv6 ACL list.

**Example**
- This command adds the community string lab_1 to provide read-only access to the switch agent.
```
switch(config)#snmp-server community lab_1 ro
switch(config)#
```
**snmp-server contact**

The `snmp-server contact` command configures the system contact string. The contact is displayed by the `show snmp` and `show snmp contact` commands.

The `no snmp-server contact` and `default snmp-server contact` commands remove the `snmp-server contact` command from the configuration.

**Command Mode**
- Global Configuration

**Command Syntax**
- `snmp-server contact contact_string`
- `no snmp-server contact`
- `default snmp-server contact`

**Parameters**
- `contact_string` system contact string.

**Example**
- These commands configure *Bonnie H* as the contact string, then display the result.

```
switch(config)#snmp-server contact Bonnie H
switch(config)#show snmp
Chassis: xyz-1234
Contact: Bonnie H.
8 SNMP packets input
  0 Bad SNMP version errors
  0 Unknown community name
  0 Illegal operation for community name supplied
  0 Encoding errors
  8 Number of requested variables
  0 Number of altered variables
  4 Get-request PDUs
  4 Get-next PDUs
  0 Set-request PDUs
24 SNMP packets output
  0 Too big errors
  0 No such name errors
  0 Bad value errors
  0 General errors
  8 Response PDUs
  0 Trap PDUs
SNMP logging: enabled
  Logging to taccon.162
SNMP agent enabled
switch(config)#
```
snmp-server enable traps

The `snmp-server enable traps` command enables both Simple Network Management Protocol (SNMP) traps and SNMP inform requests; use the `snmp-server host` command to specify which will receive SNMP notifications. Sending notifications requires at least one `snmp-server host` command.

The `snmp-server enable traps` and `no snmp-server enable traps` commands, without a MIB parameter, specify the default notification trap generation setting for all MIBs. These commands, when specifying a MIB, control notification generation for the specified MIB. The `default snmp-server enable traps` command resets notification generation to the default setting for the specified MIB.

**Command Mode**
Global Configuration

**Command Syntax**

```
  snmp-server enable traps [trap_type]
  no snmp-server enable traps [trap_type]
  default snmp-server enable traps [trap_type]
```

**Parameters**

- `trap_type` controls the generation of informs or traps for the specified MIB:
  - `<no parameter>` controls notifications for MIBs not covered by specific commands.
  - `entity` controls entity-MIB modification notifications.
  - `lldp` controls LLDP notifications.
  - `msdpBackwardTransition` controls msdpBackwardTransition notifications.
  - `msdpEstablished` controls msdpEstablished notifications.
  - `snmp` controls SNMP-v2 notifications.
  - `switchover` controls switchover notifications.
  - `snmpConfigManEvent` controls snmpConfigManEvent notifications.
  - `test` controls test traps.

**Examples**

- These commands enables notification generation for all MIBs except spanning tree.

  ```
  switch(config)#snmp-server enable traps
  switch(config)#no snmp-server enable traps spanning-tree
  switch(config)#
  ```

- This command enables spanning-tree MIB notification generation, regardless of the default setting.

  ```
  switch(config)#snmp-server enable traps spanning-tree
  switch(config)#
  ```

- This command resets the spanning-tree MIB notification generation to follow the default setting.

  ```
  switch(config)#default snmp-server enable traps spanning-tree
  switch(config)#
  ```

- This command enables switchover MIB notification generation, regardless of the default setting.

  ```
  switch(config)#snmp-server enable traps switchover
  switch(config)#
  ```

- This command resets the switchover MIB notification generation to follow the default setting.

  ```
  switch(config)# default snmp-server enable traps switchover
  switch(config)#
  ```
The `snmp-server engineID local` command configures the name for the local Simple Network Management Protocol (SNMP) engine. The default SNMP engineID is generated by the switch and is used when an engineID is not configured with this command. The `show snmp engineID` command displays the default or configured engine ID.

SNMPv3 authenticates users through security digests (MD5 or SHA) that are based on user passwords and the local engine ID. Passwords entered on the CLI are similarly converted, then compared to the user's security digest to authenticate the user.

**Important!** Changing the local engineID value invalidates SNMPv3 security digests, requiring the reconfiguration of all user passwords.

The `no snmp-server engineID` and `default snmp-server engineID` commands restore the default engineID by removing the `snmp-server engineID` command from the configuration.

**Command Mode**
- Global Configuration

**Command Syntax**
- `snmp-server engineID local engine_hex`
- `no snmp-server engineID local`
- `default snmp-server engineID`

**Parameters**
- `engine_hex` the switch's name for the local SNMP engine (hex string).
  - The string must consist of at least ten characters with a maximum of 64 characters.

**Example**
- This command configures DC945798CAB4 as the name of the local SNMP engine.
  ```
  switch(config)#snmp-server engineID local DC945798CAB4
  switch(config)#
  ```
snmp-server engineID remote

The `snmp-server engineID remote` command configures the name of a Simple Network Management Protocol (SNMP) engine located on a remote device. The switch generates a default engineID; use the `show snmp engineID` command to view the configured or default engineID.

An SNMPv3 inform requires a remote engine ID to compute the security digest that authenticates and encrypts data transmitted to remote users. SNMPv3 authenticates users with MD5 or SHA through the engine ID and user passwords. CLI passwords are similarly authenticated.

---

**Important!** Changing the engineID value invalidates SNMPv3 security digests, requiring the reconfiguration of all user passwords.

The `no snmp-server engineID remote` and `default snmp-server engineID remote` commands remove the `snmp-server engineID remote` command from the configuration.

**Command Mode**
Global Configuration

**Command Syntax**

```
snmp-server engineID remote engine_addr [PORT] engine_hex
no snmp-server engineID remote engine_addr [PORT]
default snmp-server engineID remote engine_addr [PORT]
```

**Parameters**
- `engine_addr` location of remote engine (IP address or host name).
- `PORT` udp port location of the remote engine. Options include:
  - `<No parameter>` port number 161 (default).
  - `udp-port port_num` port number. Ranges from 0 to 65535.
- `engine_hex` the switch’s name for the remote SNMP engine (hex string).
  The string must have at least ten characters and can contain a maximum of 64 characters.

**Example**
- This command configures DC945798CA as the engineID of the remote SNMP engine located at 10.23.10.25, UDP port 162.

```
switch(config)#snmp-server engineID remote 10.23.10.25 udp-port 162 DC945798CA
switch(config)#
```
**snmp-server extension**

The **snmp-server extension** command configures the execution of user supplied scripts to service portions of the OID space.

The **no snmp-server extension** and **default snmp-server extension** commands deletes the **snmp-server extension** command from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

```
    snmp-server extension OID_space FILE_PATH [DURATION]
```

**Parameters**

- **OID_space**  OID branch serviced by the script, in numerical format.
- **FILE_PATH**  path and name of the script file. Options include:
  - file:  file is located in the switch file directory.
  - flash:  file is located in flash memory.
- **DURATION**  the execution scope of the script.
  - <no parameter>  script runs after initial request to process subsequent requests.
  - one-shot  script processes a single object (runs once), then terminates.

**Examples**

- This command specifies the file **example.sh**, located in flash, as the script file that services the listed OID space.

```
switch(config)#snmp-server extension .1.3.6.1.4.1.8072.2 flash:example.sh
```
snmp-server group

The **snmp-server group** command configures a new Simple Network Management Protocol (SNMP) group or modifies an existing group. An SNMP group is a data structure that user statements reference to map SNMP users to SNMP contexts and views, providing a common access policy to the specified users.

An SNMP context is a collection of management information items accessible by an SNMP entity. Each item may exist in multiple contexts. Each SNMP entity can access multiple contexts. A context is identified by the EngineID of the hosting device and a context name.

The **no snmp-server group** and **default snmp-server group** commands delete the specified group by removing the corresponding **snmp-server group** command from the configuration.

**Command Mode**

Global Configuration

**Command Syntax**

```
snmp-server group group_name VERSION [CNTX] [READ] [WRITE] [NOTIFY]
no snmp-server group group_name VERSION
default snmp-server group group_name VERSION
```

**Parameters**

- `group_name` the name of the group.
- `VERSION` the security model utilized by the group.
  - v1 SNMPv1. Uses a community string match for authentication.
  - v2c SNMPv2c. Uses a community string match for authentication.
  - v3 no auth SNMPv3. Uses a username match for authentication.
  - v3 auth SNMPv3. HMAC-MD5 or HMAC-SHA authentication.
  - v3 priv SNMPv3. HMAC-MD5 or HMAC-SHA authentication. AES or DES encryption.
- `CNTX` associates the SNMP group to an SNMP context.
  - `<no parameter>` command does not associate group with an SNMP context.
  - `context context_name` associates group with context specified by `context_name`.
- `READ` specifies read view for SNMP group.
  - `<no parameter>` command does not specify read view.
  - `read read_name` read view specified by `read_name` (string – maximum 64 characters).
- `WRITE` specifies write view for SNMP group.
  - `<no parameter>` command does not specify write view.
  - `write write_name` write view specified by `write_name` (string – maximum 64 characters).
- `NOTIFY` specifies notify view for SNMP group.
  - `<no parameter>` command does not specify notify view.
  - `notify notify_name` notify view specified by `notify_name` (string – maximum 64 characters).

**Example**

- This command configures normal_one as SNMP version 3 group (authentication and encryption) that provides access to the `all-items` read view.

  ```
  switch(config)#snmp-server group normal_one v3 priv read all-items
  switch(config)#
  ```
**snmp-server host**

The `snmp-server host` command configures an SNMP host (to which SNMP traps will be sent) and sets the community string if it was not previously configured. The host is denoted by host location and community string. The command also specifies the type of SNMP notifications that are sent: a **trap** is an unsolicited notification; an **inform** is a trap that includes a request for a confirmation that the message is received.

The configuration can contain multiple statements to the same host location with different community strings. For instance, a configuration can simultaneously contain all of the following:

- `snmp-server host host-1 version 2c comm-1`
- `snmp-server host host-1 informs version 2c comm-2`
- `snmp-server host host-1 version 2c comm-3 udp-port 666`
- `snmp-server host host-1 version 3 auth comm-3`

The **no snmp-server host** and **default snmp-server host** commands remove the specified host by deleting the corresponding `snmp-server host` statement from the configuration. When removing a statement, the host (address and port) and community string must be specified.

**Command Mode**

Global Configuration

**Command Syntax**

```
 snmp-server host host_id [VRF_INST] [MESSAGE] [VERSION] comm_str [PORT]
 no snmp-server host host_id [VRF_INST] [MESSAGE] [VERSION] comm_str [PORT]
 default snmp-server host host_id [VRF_INST] [MESSAGE] [VERSION] comm_str [PORT]
```

**Parameters**

- **host_id**  hostname or IP address of the SNMP host.
- **VRF_INST**  specifies the VRF instance being modified.
  - `<no parameter>`  changes are made to the default VRF.
  - `vrf vrf_name`  changes are made to the specified user-defined VRF.
- **MESSAGE**  message type that is sent to the host.
  - `<no parameter>`  sends SNMP traps to host (default).
  - `informs`  sends SNMP informs to host.
  - `traps`  sends SNMP traps to host.
- **VERSION**  SNMP version. Options include:
  - `<no parameter>`  SNMPv2c (default).
  - `version 1`  SNMPv1; option not available with informs.
  - `version 2c`  SNMPv2c.
  - `version 3 noauth`  SNMPv3; enables user-name match authentication.
  - `version 3 auth`  SNMPv3; enables MD5 and SHA packet authentication.
  - `version 3 priv`  SNMPv3. HMAC-MD5 or HMAC-SHA authentication. AES or DES encryption.
- **comm_str**  community string to be sent with the notification as a password.

Arista recommends setting this string separately before issuing the `snmp-server host` command. To set the community string separately, use the `snmp-server community` command.

- **PORT**  port number of the host.
- `<no parameter>` socket number set to 162 (default)
- `udp-port p-name` socket number specified by `p-name`

**Guidelines**

The switch can only send SNMP traps and informs if the host that has been configured to receive them is accessible through an interface in a VRF in which SNMP has been enabled. SNMP is enabled by default only in the `default` VRF. Enable or disable SNMP in a VRF with the `snmp-server vrf` command.

**Example**

- This command adds a version 2c inform notification recipient.

```bash
switch(config)#snmp-server host 10.15.2.3 informs version 2c comm-1
switch(config)#
```
The `snmp-server location` command configures the system location string. By default, no system location string is set.

The `no snmp-server location` and `default snmp-server location` commands delete the location string by removing the `snmp-server location` command from the configuration.

**Command Mode**
- Global Configuration

**Command Syntax**

```
    snmp-server location node_locate
    no snmp-server location
    default snmp-server location
```

**Parameters**
- `node_locate` system location information (string).

**Example**
- These commands configure `lab-east` as the location string.

```
switch(config)#snmp-server location lab_east
```
snmp-server source-interface

The `snmp-server source-interface` command specifies the interface where SNMP originates informs and traps.

The `no snmp-server source-interface` and `default snmp-server source-interface` commands remove the inform or trap source assignment by removing the `snmp-server source-interface` command from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**

```
snmp-server source-interface INTERFACE
no snmp-server source-interface
default snmp-server source-interface
```

**Parameters**

- `INTERFACE` Interface type and number. Values include:
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-Channel Interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.

**Example**

- This command configures the Ethernet 1 interface as the source of SNMP traps and informs.
  ```
  switch(config)#snmp-server source-interface ethernet 1
  ```
**snmp-server user**

The `snmp-server user` command adds a user to a Simple Network Management Protocol (SNMP) group or modifies an existing user’s parameters.

To configure a user, the IP address or port number of the device where the user’s remote SNMP agent resides must be specified. A user's authentication come from the engine ID and the user's password. Remote user configuration commands fail if the remote engine ID is not configured first.

The `no snmp-server user` and `default snmp-server user` commands remove the user from an SNMP group by removing the user command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
snmp-server user user_name group_name [AGENT] VERSION [ENGINE] [SECURITY]
no snmp-server user user_name group_name [AGENT] VERSION
default snmp-server user user_name group_name [AGENT] VERSION
```

**Parameters**

- `user_name` name of user.
- `group_name` name of group to which user is being added.
- `AGENT` Options include:
  - `<no parameter>` local SNMP agent.
  - `remote addr [udp-port p_num]` remote SNMP agent location.
    
    `addr` denotes the IP address; `p_num` denotes the udp port socket. (default port is 162).
  - `version` SNMP version; options include:
    - `v1` SNMPv1.
    - `v2c` SNMPv2c.
    - `v3` SNMPv3.
  - `ENGINE` engine ID used to localize passwords. Available only if `VERSION` is `v3`.
    - `<no parameter>` Passwords localized by SNMP copy specified by `agent`.
    - `localized engineID` octet string of engineID.
  - `SECURITY` Specifies authentication and encryption levels. Available only if `VERSION` is `v3`.
    - `<no parameter>` no authentication or encryption.
    - `auth a_meth a_pass [priv e_meth e_pass]` authentication parameters.
      - `a-meth` authentication method: options are `md5` (HMAC-MD5-96) and `sha` (HMAC-SHA-96).
      - `a-pass` authentication string for users receiving packets.
      - `e-meth` encryption method: Options are `aes` (AES-128) and `des` (CBC-DES).
      - `e-pass` encryption string for the users sending packets.

**Example**

- This command configures the remote SNMP user `tech-1` to the `tech-sup` SNMP group.

```
switch(config)#snmp-server user tech-1 tech-sup remote 10.1.1.2 v3
```
**snmp-server view**

The `snmp-server view` command defines a view.

An SNMP view defines a subset of objects from an MIB. Every SNMP access group specifies views, each associated with read or write access rights, to allow or limit the group's access to MIB objects.

The `no snmp-server view` command deletes a view entry by removing the corresponding `snmp-server view` command from the `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
snmp-server view view_name family_name INCLUSION
no snmp-server view view_name [family_name]
```

**Parameters**

- **view_name**  Label for the view record that the command updates. Other commands reference the view with this label.
- **family_name** name of the MIB object or family.

MIB objects and MIB subtrees can be identified by name or by the numbers representing the position of the object or subtree in the MIB hierarchy.

- **INCLUSION** inclusion level of the specified family within the view. Options include:
  - **include**  view includes the specified subtree.
  - **exclude**  view excludes the specified subtree.

**Example**

- These commands create a view named `sys-view` that includes all objects in the `system` subtree except for those in `system.2`.

  ```
  switch(config)#snmp-server view sys-view system include
  switch(config)#snmp-server view sys-view system.2 exclude
  ```
**snmp-server vrf**

The `snmp-server vrf` command enables SNMP in the specified VRF. By default, SNMP is enabled only in `default` VRF.

- **User-defined VRFs**: The `no snmp-server vrf` command disables SNMP in the specified VRF by removing the corresponding `snmp-server vrf` command from the `running-config`.
- **Default VRF**: The `no snmp-server vrf` command disables SNMP in the VRF by adding a `no snmp-server vrf default` statement to `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**

```
  snmp-server vrf vrf_name
  no snmp-server vrf vrf_name
  default snmp-server vrf vrf_name
```

**Parameters**

- **vrf_name**  The VRF in which SNMP is enabled. The keyword `default` specifies the default VRF.

**Guidelines**

The switch can only send SNMP traps and informs if the host that has been configured to receive them is accessible through an interface in a VRF in which SNMP has been enabled. SNMP is enabled by default only in the `default` VRF. Enable or disable SNMP in a VRF with the `snmp-server vrf` command.

**Example**

- These commands disable SNMP in the default VRF, then enable it in the user-defined VRFs named “magenta” and “columbia.”

```
switch(config)#no snmp-server vrf default
switch(config)#snmp-server vrf magenta
switch(config)#snmp-server vrf columbia
switch(config)#
```
**snmp trap link-status**

The `snmp trap link-status` command enables Simple Network Management Protocol (SNMP) link-status trap generation on the configuration mode interface. The generation of link-status traps is enabled by default. If SNMP link-trap generation was previously disabled, this command removes the corresponding `no snmp link-status` statement from the configuration to re-enable link-trap generation.

The `no snmp trap link-status` command disables SNMP link trap generation on the configuration mode interface.

The `snmp trap link-status` and `default snmp trap link-status` commands restore the default behavior by removing the `no snmp trap link-status` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration
- Interface-VXLAN Configuration

**Command Syntax**

`snmp trap link-status`

`no snmp trap link-status`

`default snmp trap link-status`

**Guidelines**

The switch can only send SNMP traps and informs if the host that has been configured to receive them is accessible through an interface in a VRF in which SNMP has been enabled. SNMP is enabled by default only in the `default` VRF. Enable or disable SNMP in a VRF with the `snmp-server vrf` command.

**Example**

- This command disables SNMP link trap generation on the Ethernet 5 interface.

```bash
switch(config-if-Et5)#no snmp trap link-status
switch(config-if-Et5)#
```
Arista Networks’ Latency Analyzer (LANZ) is a family of EOS features that provide enhanced visibility into network dynamics, particularly in areas related to the delay packets experience through the network. The LANZ feature is available on the FM6000, Petra, Arad, Trident II, and Tomahawk switch platforms.

This chapter describes the purpose, behavior, and configuration of LANZ features. Topics covered by this chapter include:

- Section 40.1: Introduction to LANZ
- Section 40.2: LANZ Overview
- Section 40.3: Configuring LANZ
- Section 40.4: LANZ Commands

### 40.1 Introduction to LANZ

LANZ tracks interface congestion and queuing latency with real-time reporting. With LANZ application layer event export, external applications can predict impending congestion and latency. This enables the application layer to make traffic routing decisions with visibility into the network layer.

With LANZ, network operations teams and administrators have near real-time visibility into the network, enabling early detection of microbursts. LANZ continually monitors congestion, allowing for rapid detection of congestion and sending of application layer messages.

### 40.2 LANZ Overview

LANZ monitors output queue lengths to provide congestion information for individual interfaces. This allows for more detailed analysis of congestion events, and allows identification of potential latency problems before they arise. On some platforms, LANZ also monitors global buffer usage.

Output queues for each port are monitored, and information about queue congestion events can be accessed in the form of syslog messages, reports, or streaming.

### 40.2.1 LANZ Monitoring Mechanism

LANZ provides congestion data by continuously monitoring each port’s output queue lengths. When the length of an output queue exceeds the upper threshold for that port, LANZ generates an over-threshold event. LANZ continues to report an over-threshold state every 800 microseconds until all queue lengths for that port pass below the lower threshold.
40.2.2 LANZ Logging

Over-threshold events generated by LANZ can be logged as syslog messages. Log messages are generated for events on all ports, at a maximum rate of one message per second per interface. The interval between messages can be configured globally.

Log messages indicate the time of the event, the interface affected, the threshold set for that interface, and the actual number of entries in the port’s queue.

40.2.3 LANZ Reporting

Detailed LANZ data can be viewed through the CLI or exported as a CSV-formatted report.

A circular FIFO event buffer is dynamically shared by all interfaces. When an interface begins generating LANZ over-threshold events it can fill all available buffer space. However, each interface is guaranteed sufficient resources for a minimum of 500 entries.

40.2.4 LANZ Streaming

On some platforms, external client applications can also receive congestion event information as a data stream. The switch can stream LANZ data to up to 100 clients via TCP through port 50001. Streamed data is in Google protocol buffer format, and includes both over-threshold events and LANZ configuration information.

40.2.5 Platforms

The LANZ feature is available on the FM6000, Petra, Arad, Trident II, and Tomahawk switch platforms. To determine the switch platform from the CLI, enter `show platform ?` at the prompt.

Settings and capabilities differ slightly between the platforms:

- The Petra and Arad chips measure threshold values in bytes; FM6000, Trident II, and Tomahawk chips measure threshold values in segments.
- FM6000, Trident II, and Tomahawk chips allow configuration of both upper and lower threshold values.
- FM6000, Trident II, and Tomahawk chips support LANZ data streaming.
- Only FM6000 chips support global buffer monitoring.
- While the FM6000, Trident II, and Tomahawk chips monitor congestion events for all queues, the Petra and Arad chips only monitor the most congested queues.
40.3 Configuring LANZ

LANZ is disabled by default and must be enabled to function. Upper and lower queue-length thresholds can be defined for individual interfaces.

These sections describe the basic LANZ configuration steps:

- Section 40.3.1: Enabling and Disabling LANZ
- Section 40.3.2: Setting LANZ Congestion Thresholds
- Section 40.3.3: Setting LANZ Traffic Sampling
- Section 40.3.4: Logging LANZ Congestion Events
- Section 40.3.5: Viewing LANZ Data
- Section 40.3.6: Streaming LANZ Data

40.3.1 Enabling and Disabling LANZ

For the switch to collect and display latency information, LANZ must be enabled. The queue-monitor length (global configuration mode) command enables LANZ with the current settings, or with the default settings if none have been configured. LANZ is disabled by default.

When LANZ is enabled, the switch monitors queue lengths on all ports and queue length data is available in the following forms:

- syslog data (see queue-monitor length log)
- CLI display or CSV-format output (see show queue-monitor length)
- data stream (see queue-monitor streaming)

To disable LANZ globally, enter the no queue-monitor length command in global configuration mode. Disabling LANZ globally also discards LANZ log data, but retains settings. To disable LANZ on an individual interface, enter the no queue-monitor length command in interface ethernet configuration mode.

Examples

- This command enables LANZ on the switch.
  
  switch(config)#queue-monitor length

- This command disables LANZ on the switch.
  
  switch(config)#no queue-monitor length

- These commands disable LANZ on Ethernet interface 7.
  
  switch(config)#interface ethernet 7
  switch(config-if-Et7)#no queue-monitor length

40.3.2 Setting LANZ Congestion Thresholds

When LANZ is enabled on the switch, it generates over-threshold events when queue lengths on any monitored interface exceed the upper threshold value and continues generating them until all the queue lengths on that interface drop back below the lower threshold.

40.3.2.1 Congestion Thresholds on FM6000, Trident II, and Tomahawk Switches

Queue lengths are measured in 480-byte segments on FM6000 switches and in 208-byte segments on Trident II and Tomahawk switches. The default threshold values are 512 segments and 256 segments. To change the threshold values for a specific interface, use the queue-monitor length thresholds (FM6000, Trident II, and Tomahawk) command.
FM6000 switches can also monitor global buffer usage. Global buffers are measured in 160-byte segments; the default threshold values are 10940 segments and 4376 segments. To enable global buffer monitoring, use the `queue-monitor length global-buffer` command. To change the threshold values for global buffer usage monitoring on the switch, use the `queue-monitor length global-buffer thresholds` command.

**Examples**

- These commands set the upper and lower queue-length thresholds on Ethernet interface 5 to 300 segments and 200 segments.
  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#queue-monitor length thresholds 300 200
  switch(config-if-Et5)#
  ```

- These commands enable global buffer monitoring on the switch and set the upper and lower thresholds to 9000 segments and 4000 segments.
  ```
  switch(config)#queue-monitor length global-buffer
  switch(config)#queue-monitor length global-buffer thresholds 9000 4000
  switch(config)#
  ```

### 40.3.2.2 Congestion Thresholds on Petra and Arad Switches

Queue lengths are measured in bytes. The top threshold value can be between 2 and 52428800 bytes (the default value is 52428800 bytes). To change the upper threshold value for a specific interface, use the `queue-monitor length threshold (Arad and Petra)` command.

**Example**

- These commands set the upper queue-length threshold on Ethernet interface 5 to 2614400 bytes.
  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#queue-monitor length thresholds 2614400
  switch(config-if-Et5)#
  ```

### 40.3.3 Setting LANZ Traffic Sampling

Traffic experiencing congestion can be configured to automatically send congested traffic to either the CPU or an Ethernet egress interface destination, once a queue threshold is crossed, by enabling LANZ mirroring through the command `queue-monitor length mirror`. The CPU or an egress interface mirror destination is then configured through the command `queue-monitor length mirror destination`. LANZ traffic sampling includes exporting congested traffic to a packet capture device or another tool for analysis, or directly to the switch CPU for inspection through the command `tcpdump queue-monitor`.

**Example**

- This command enables LANZ traffic sampling.
  ```
  switch(config)#queue-monitor length mirror
  switch(config)#
  ```

- This command disables LANZ traffic sampling.
  ```
  switch(config)#no queue-monitor length mirror
  switch(config)#
  ```
Examples

- This command configures LANZ traffic sampling for a CPU interface mirror destination.
  
  ```
  switch(config)#queue-monitor length mirror destination cpu
  switch(config)#
  ```

- This command configures LANZ traffic sampling for an Ethernet interface mirror destination for ports 1 through 5.
  
  ```
  switch(config)#queue-monitor length mirror destination Ethernet 1-5
  switch(config)#
  ```

- This command configures LANZ traffic sampling for an Ethernet interface mirror destination for ports 6, 10, and 12 through 14.
  
  ```
  switch(config)#queue-monitor length mirror destination Ethernet 6,10,12-14
  switch(config)#
  ```

Example

- This command inspects traffic on the switch.
  
  ```
  switch(config)#tcpdump queue-monitor
  tcpdump: WARNING: lanz: no IPv4 address assigned
  tcpdump: verbose output suppressed, use -v or -vv for full protocol decode
  listening on lanz, link-type EN10MB (Ethernet), capture size 65535 bytes
  ...
  0 packets captured
  0 packets received by filter
  0 packets dropped by kernel
  switch(config)#
  ```

40.3.4 Logging LANZ Congestion Events

To generate syslog messages when queue lengths on an interface exceed its upper threshold, enable logging with the `queue-monitor length log` command. When logging is enabled, a log message is generated each time one or more queues on an interface exceed the upper threshold value for that interface (see `queue-monitor length threshold (Arad and Petra)` or `queue-monitor length thresholds (FM6000, Trident II, and Tomahawk)`). Once an interface is over threshold, additional messages are generated at a maximum rate of one per `interval` as long as the queue length remains above the lower threshold for that interface. No syslog message is generated when queue length drops back under threshold.

Queue length information is not included in log messages, but can be accessed by displaying LANZ data or exporting reports.

On FM6000 platforms, log messages can also be created whenever global buffer usage exceeds its upper threshold value (see `queue-monitor length global-buffer thresholds`). To enable global buffer monitoring, use the `queue-monitor length global-buffer` command. To log over-threshold events for the global buffer, use the `queue-monitor length global-buffer log` command.

Examples

- This command enables queue-length over-threshold logging with a minimum interval of 10 seconds between messages for a given interface.
  
  ```
  switch(config)#queue-monitor length log 10
  ```

- This command disables queue-length over-threshold logging on the switch.
  
  ```
  switch(config)#queue-monitor length log 0
  ```
Creating LANZ 

Chapter 40: Latency Analyzer (LANZ)

- This is an example of a queue-length log message.
  Oct 27 12:48:22 switch QUEUE_MONITOR-6-LENGTH_OVER_THRESHOLD: Interface Ethernet6 queue length is over threshold of 512, current length is 1024.

- This command enables global buffer over-threshold logging on the switch with a minimum interval of 60 seconds between messages.
  switch(config)#queue-monitor length global-buffer log 60

40.3.5 Viewing LANZ Data

LANZ status, and the data stored in the LANZ data buffer, can be viewed using the CLI. Output varies by switch platform, and can be limited to a specified number of records.

40.3.5.1 Viewing LANZ Data on Petra and Arad Platform Switches

When LANZ is enabled on a Petra or Arad platform switch, the show queue-monitor length command displays a report of recent over-threshold events for a range of interfaces or for all interfaces. By default, the command displays data for all interfaces, limited to the last 1000 records, with the most recent events listed first. To view a subset of the LANZ data, limited to a specified number of records, use the show queue-monitor length limit command.

Example

- This command displays the last 100 records for Ethernet interfaces 6 through 8.
  switch#show queue-monitor length ethernet 6-8 limit 100
  Report generated at 2010-01-01 12:56:13

  Time                        Interface   Queue length (segments, 1 to 512 bytes)
  --------------------------- ------------ -------------------------------
  0:00:07.43393 ago           Et6         1049
  0:00:39.22856 ago           Et7         2039
  1 day, 4:33:23.12345 ago    Et6         1077

To view the current LANZ configuration for the switch and for each interface, use the show queue-monitor length status command.

Example

- This command displays LANZ configuration and status information.
  switch(config)#show queue-monitor length status
  Per-Interface Queue Length Monitoring
  -------------------------------------
  Queue length monitoring is enabled
  Maximum queue length in bytes : 52428800
  Port threshold in bytes:
  Port      High threshold
  Et3/1      5242880
  Et3/2      5242880
  Et3/3      5242880
  Et3/4      5242880
  Et3/5      5242880

  <-------OUTPUT OMITTED FROM EXAMPLE-------->
40.3.5.2 Viewing LANZ Data on FM6000, Trident II, and Tomahawk Platform Switches

When LANZ is enabled on an FM6000, Trident II, or Tomahawk platform switch, the `show queue-monitor length` command displays a report of recent over-threshold events for a range of interfaces or for all interfaces. By default, the command displays data for all interfaces, limited to the last 1000 records, with the most recent events listed first. To view a subset of the LANZ data, limited to a specified number of records, use the `show queue-monitor length limit` command.

**Example**

- This command displays the last 100 records for Ethernet interfaces 6 through 8.

  ```
  switch# show queue-monitor length ethernet 6-8 limit 100
  Report generated at 2010-01-01 12:56:13
  Time                        Interface   Queue length (segments, 1 to 512 bytes)
  0:00:07.43393 ago           Et6         1049
  0:00:39.22856 ago           Et7         2039
  1 day, 4:33:23.12345 ago    Et6         1077
  ```

To view the current LANZ configuration for the switch and for each interface, use the `show queue-monitor length status` command.

**Example**

- This command displays LANZ configuration and status information.

  ```
  switch(config)# show queue-monitor length status
  queue-monitor length enabled
  Global Buffer Monitoring
  ------------------------
  Global buffer monitoring is enabled
  Segment size in bytes :   160
  Total buffers in segments : 36864
  High threshold : 10940
  Low threshold :  4376
  Per-Interface Queue Length Monitoring
  --------------------------
  Queue length monitoring is enabled
  Segment size in bytes :   480
  Maximum queue length in segments : 3647
  Port thresholds in segments:
  Port     High threshold  Low threshold
  Et1                 512            256
  Et2                 512            256
  Et3                 512            256
  Et4                 512            256
  Et5                 512            256
  ```

To view all available LANZ records, use the `show queue-monitor length all` command.
Example

- This command displays all available LANZ records.

```bash
switch>show queue-monitor length all
```

E-End, U-Update, S-Start, TC-Traffic Class
GH-High, GU-Update, GL-Low
Segment size for E, U and S congestion records is 480 bytes
Segment size for GL, GU and GH congestion records is 160 bytes

switch>

On the FM6000, Trident II, and Tomahawk platforms, information is also available for the number of dropped packets (see `show queue-monitor length drops`) and transmission latency (see `show queue-monitor length tx-latency`); global buffer usage can also be viewed on FM6000 platforms (see `show queue-monitor length global-buffer`).

40.3.6 Streaming LANZ Data

To support analysis of latency conditions, the switch can be configured to stream LANZ congestion and configuration data. The switch streams LANZ data via TCP in Google protocol buffer format through port 50001 and through the management interface.

You must create a client application to receive the streaming data. By default, the switch will accept up to 10 client connections for streaming LANZ data. This limit can be configured up to a maximum of 100. Maximum connections can be configured when LANZ is disabled.

40.3.6.1 Enabling and Disabling LANZ Data Streaming

LANZ data streaming is disabled by default. To enable streaming, issue the `no shutdown (queue-monitor-streaming configuration)` command in queue-monitor streaming configuration mode. To disable streaming, use the `shutdown (queue-monitor-streaming configuration)` command.

When streaming is disabled, a message is sent to any connected clients and the connections are closed.
To ensure client access to LANZ data, add a rule to any relevant ACL permitting traffic destined for the LANZ port (50001) before initiating a client connection for streaming from a remote host. A static rule (sequence number 130) in the default control plane ACL permits LANZ traffic, but a similar rule must be added to any user-created ACL.

**Examples**

- These commands enable the streaming of LANZ data from the switch.
  
  ```
  switch(config)#queue-monitor streaming
  switch(config-qm-streaming)#no shutdown
  switch(config-qm-streaming)#
  ```

- These commands disable LANZ data streaming.
  
  ```
  switch(config)#queue-monitor streaming
  switch(config-qm-streaming)#shutdown
  switch(config-qm-streaming)#
  ```

### 40.3.6.2 Configuring Maximum Connections

By default, the switch will accept a maximum of 10 client connections for LANZ data streaming. This maximum can be configured using the `max-connections` command. If a client connects to the switch after the limit has been reached, an error message is sent and the connection is closed.

**Example**

- This command sets the maximum number of client connections for LANZ data streaming to 50.
  
  ```
  switch(config-qm-streaming)#max-connections 50
  ```

### 40.3.6.3 LANZ Streaming Messages

When streaming is enabled, LANZ sends a message whenever a congestion event or a configuration event occurs. The messages are streamed in Google protocol buffer format.

**Configuration Messages**

A configuration message is sent whenever a change is made to the LANZ configuration settings on the switch. The switch also sends a configuration message when a new client connection is established.

The configuration message includes the following information:

- **timestamp** time of change in configuration in tens of microseconds (UTC).
- **lanzVersion** LANZ feature version.
- **numOfPorts** number of ports in the switch.
- **segmentSize** segment size.
- **maxQueueSize** maximum queue size in segments.
- **qLenInterval** frequency of updates.
- **intfName** name of the port.
- **switchId** ID of the chip on a multi-chip system.
- **portId** ID of the port.
- **internalPort** “true” if it is an internal port.
- **highThreshold** higher threshold value.
- **lowThreshold** lower threshold value.
Congestion Messages

A congestion message is sent whenever LANZ generates an over-threshold event.

The congestion message includes the following information:

- **timestamp**  time of congestion in micro-seconds (UTC).
- **intfName** name of the port.
- **switchId** ID of the chip on a multi-chip system.
- **portId** ID of the port.
- **queueSize** queue size in segments at time of congestion.

40.3.6.4 Creating the LANZ Client

For a client device to receive streaming data from the LANZ server, it must be running a client application designed to receive LANZ data. Client programs must be based on the Google protocol buffer schema file describing the structure of the congestion and configuration messages which LANZ streams.

**Google Protocol Buffers**

Google protocol buffers provide an efficient mechanism for serializing LANZ data for streaming. A protocol buffer package is needed in order to run a LANZ client.

The latest version of the Google protocol buffer source code is available at this address: [http://code.google.com/p/protobuf/downloads/list](http://code.google.com/p/protobuf/downloads/list)
LANZ Message Schema

LANZ client applications must be designed based on the LANZ protocol buffer schema, which defines the format and contents of the streamed messages. The schema file is shown below, and is also available on the Arista FTP site at this address: https://www.arista.com/support/download/Extensions/Lanz.proto

```
package LanzProtobuf;

message ConfigRecord {
  required uint64 timestamp = 1; // Time of change in configuration in micro-seconds (UTC)
  required uint32 lanzVersion = 2; // LANZ feature version
  required uint32 numOfPorts = 3; // Num of ports in the switch
  required uint32 segmentSize = 4; // Segement size
  required uint32 maxQueueSize = 5; // Maximum queue size in segments
  optional uint32 qLenInterval = 10; // Frequency of update
  message PortConfigRecord {
    required string intfName = 1; // Name of the port
    required uint32 switchId = 2; // Id of the chip on a multi-chip system
    required uint32 portId = 3; // Id of the port
    required bool internalPort = 4; // 'True' if it's an internal port
    required uint32 highThreshold = 5; // Higher threshold
    required uint32 lowThreshold = 6; // Lower threshold
  }
  repeated PortConfigRecord portConfigRecord = 6; // Lanz config details of each port
}

message CongestionRecord {
  required uint64 timestamp = 1; // Time of congestion in micro-seconds (UTC)
  required string intfName = 2; // Name of the port
  required uint32 switchId = 3; // Id of the chip on a multi-chip system
  required uint32 portId = 4; // Id of the port
  required uint32 queueSize = 5; // Queue size in segments at time of congestion
}

message ErrorRecord {
  required uint64 timestamp = 1; // Time of event in micro-seconds (UTC)
  required string errorMessage = 2; // Text message
}

message LanzRecord {
  optional ConfigRecord configRecord = 1;
  optional CongestionRecord congestionRecord = 2;
  optional ErrorRecord errorRecord = 3;
}
```

Implementation Procedure

The following steps create and install a functional client to receive streamed LANZ data. This procedure assumes a functional Python programming environment.

**Step 1** Download the example client from the Arista FTP server at this address: https://www.arista.com/support/download/Extensions/lanz_client.py

**Step 2** Decompress the GPB archive to a directory.

**Step 3** Run the GPB C++ compilation and install. With default flags using GCC on "nix platforms, this will produce a binary called "protoc" in your /usr/local/bin directory.

**Step 4** From the archive root, cd to python, and run the following commands:
```bash
python setup.py build
```
```python
python setup.py test
```

**Step 5**  Next, use the protoc compiler to convert the Lanz.proto file into a Python program called Lanz_pb2.py, used by the client. The command to do so is:

```bash
protoc --python_out=. Lanz.proto
```

The `--python_out=.` flag drops the compiled Python program in the directory where you ran the command.

**Step 6**  Run `lanz_client.py -h` to activate the LANZ client.
40.4 LANZ Commands

LANZ Commands: Global Configuration
- clear queue-monitor length statistics
- queue-monitor length (global configuration mode)
- queue-monitor length global-buffer
- queue-monitor length global-buffer log
- queue-monitor length global-buffer thresholds
- queue-monitor length log
- queue-monitor length mirror
- queue-monitor length mirror destination
- queue-monitor streaming
- tcpdump queue-monitor

LANZ Commands: Interface Ethernet Configuration Mode
- queue-monitor length threshold (Arad and Petra)
- queue-monitor length thresholds (FM6000, Trident II, and Tomahawk)

LANZ Commands: Queue-Monitor Streaming Configuration Mode
- max-connections
- shutdown (queue-monitor-streaming configuration)

LANZ Display Commands
- show queue-monitor length
- show queue-monitor length all
- show queue-monitor length cpu
- show queue-monitor length csv
- show queue-monitor length drops
- show queue-monitor length ethernet
- show queue-monitor length global-buffer
- show queue-monitor length limit
- show queue-monitor length drops
- show queue-monitor length statistics
- show queue-monitor length status
- show queue-monitor length tx-latency
clear queue-monitor length statistics

The clear queue-monitor length statistics command resets the occurrences of all over-threshold events on the switch including global buffer information (if supported).

Command Mode
Privileged EXEC

Command Syntax

```
clear queue-monitor length statistics
```

Example
- This command resets all over-threshold events and global buffer information on an FM6000 switch.
  
  ```
  switch#clear queue-monitor length statistics
  switch#
  ```
max-connections

The **max-connections** command sets the maximum number of client connections the switch accepts for streaming LANZ data. The default maximum is 10 connections. To stream LANZ data, you must use the **queue-monitor streaming** command to enable LANZ data streaming.

**Command Mode**
Queue-Monitor-Streaming Configuration

**Command Syntax**

```
max-connections connections
```

**Parameters**
- **connections**  maximum number of simultaneous LANZ streaming client connections the switch will accept. Values range from 1 through 100.

**Related Commands**
- **queue-monitor streaming** places the switch in queue-monitor-streaming configuration mode.

**Examples**
- This command sets the maximum number of client connections the switch accepts for LANZ data streaming to 50.

```
switch(config-qm-streaming)#max-connections 50
switch(config-qm-streaming)#
```
queue-monitor length (global configuration mode)

The **queue-monitor length (global configuration mode)** command enables LANZ with the current settings, or with the default settings if LANZ has not yet been configured. LANZ is disabled by default.

When LANZ is enabled, the switch monitors queue lengths on all ports and generates over-threshold events when an output queue becomes congested. Over-threshold event data is available in the following forms:

- syslog data (see **queue-monitor length log**)
- CLI display or CSV-format output (see **show queue-monitor length**)
- data stream (see **queue-monitor streaming**)

The **no queue-monitor length** and **default queue-monitor length** commands entered in global configuration mode disable LANZ and discard LANZ log data, but retain settings. LANZ settings include:

- logging settings (see **queue-monitor length log**)
- queue length thresholds (see **queue-monitor length threshold (Arad and Petra)** or **queue-monitor length thresholds (FM6000, Trident II, and Tomahawk)**)
- data streaming settings (see **queue-monitor streaming**)

**Command Mode**

Global Configuration

**Command Syntax**

```
queue-monitor length
no queue-monitor length
default queue-monitor length
```

**Examples**

- This command enables LANZ on the switch.
  ```
  switch(config)#queue-monitor length
  switch(config)#
  ```
- This command disables LANZ on the switch.
  ```
  switch(config)#no queue-monitor length
  switch(config)#
  ```
queue-monitor length threshold (Arad and Petra)

The queue-monitor length threshold command sets the queue length threshold to define “congested” on the command-mode interface for purposes of LANZ reporting. If LANZ is enabled (see queue-monitor length (global configuration mode)), an over-threshold event is generated when one or more queues on the interface exceed the upper threshold, and over-threshold events continue to be generated until all queue lengths on the interface drop below the lower threshold. (To log these events, use the queue-monitor length log command.)

Entering the no queue-monitor length command in interface configuration mode disables LANZ on the interface. Entering either the queue-monitor length threshold command or the default queue-monitor length threshold command enables LANZ on the interface by removing the no queue-monitor length command from the configuration.

The no queue-monitor length threshold and default queue-monitor length threshold commands erase custom queue length threshold settings for the interface.

Command Mode
- Interface-Ethernet Configuration

Command Syntax

```
queue-monitor length threshold upper_limit
no queue-monitor length
default queue-monitor length
```

Parameters

- `upper_limit` is the queue length in bytes that triggers an over-threshold event. Values range from 2 to 52428800 bytes. Default setting is 52428800.

Guidelines

Queue length is measured in bytes. Only the upper threshold is configurable, and it is set at a default value of 52428800 bytes.

Examples

- These commands set the upper queue-length threshold on Ethernet interface 3/30 to 40000000 bytes.

```
switch(config)#interface ethernet 3/30
switch(config-if-Et3/30)#queue-monitor length threshold 40000000
switch(config-if-Et3/30)#
```

- These commands reset the upper queue-length threshold on Ethernet interface 3/30 to its default value of 52428800 bytes.

```
switch(config)#interface ethernet 3/30
switch(config-if-Et3/30)#default queue-monitor length threshold
switch(config-if-Et3/30)#
```
queue-monitor length thresholds (FM6000, Trident II, and Tomahawk)

The **queue-monitor length thresholds** command sets queue length thresholds to define "congested" on the command-mode interface for purposes of LANZ reporting. If LANZ is enabled (see **queue-monitor length (global configuration mode)**), an over-threshold event is generated when one or more queues on the interface exceed the upper threshold, and over-threshold events continue to be generated until all queue lengths on the interface drop below the lower threshold. (To log these events, use the **queue-monitor length log** command.)

Entering the **no queue-monitor length** command in interface configuration mode disables LANZ on the interface. Entering either the **queue-monitor length** command or the **default queue-monitor length** command in interface configuration mode enables LANZ on the interface by removing the **no queue-monitor length** command from the configuration.

The **no queue-monitor length thresholds** and **default queue-monitor length thresholds** commands in interface configuration mode both erase custom queue length threshold settings for the interface.

**Command Mode**
- Interface-Ethernet Configuration

**Command Syntax**

```
queue-monitor length thresholds upper_limit lower_limit
no queue-monitor length
default queue-monitor length
```

**Parameters**

- **upper_limit** queue length in segments that triggers an over-threshold event. Must be higher than **lower_limit**. The minimum value is 2. The maximum is the largest number of segments which can be queued before packets are dropped, and varies based on factors including flow control state and private buffer settings. Default setting is 512.

- **lower_limit** lower queue length threshold in segments. When logging is enabled, an over-threshold interface continues generating over-threshold events until all its queues drop back below this length. Must be lower than **upper_limit**. Values range from 1 to 4806. Default setting is 256.

**Guidelines**

Queue lengths are measured in 480-byte segments on FM6000 switches and in 208-byte segments on Trident II and Tomahawk switches. Default upper threshold is 512 segments and lower threshold is 256 segments. Both upper and lower thresholds are configurable.

**Examples**

- These commands set the upper and lower queue-length thresholds on Ethernet interface 5 to 300 segments and 200 segments.
  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#queue-monitor length thresholds 300 200
  switch(config-if-Et5)#
  ```

- These commands reset the upper and lower queue-length thresholds on Ethernet interface 5 to their default values.
  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#default queue-monitor length thresholds
  switch(config-if-Et5)#
  ```
• These commands disable LANZ on Ethernet interface 5.
  
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#no queue-monitor length
  switch(config-if-Et5)#
queue-monitor length global-buffer

The `queue-monitor length global-buffer` command includes global buffer usage in LANZ reporting. When global buffer reporting is enabled, over-threshold events are generated when global buffer usage exceeds the upper threshold. To set the threshold value, use the `queue-monitor length global-buffer thresholds` command. Usage data may be viewed using the `show queue-monitor length global-buffer` command. To view status and threshold information, use the `show queue-monitor length status` command.

Global buffer usage is measured in segments of 160 bytes.

The `no queue-monitor length global-buffer` and `default queue-monitor length global-buffer` commands disable global buffer usage reporting by removing the corresponding `queue-monitor length global-buffer` command from running-config.

**Command Mode**

Global Configuration

**Command Syntax**

```
queue-monitor length global-buffer
no queue-monitor length global-buffer
default queue-monitor length global-buffer
```

**Guidelines**

This command is available on FM6000 platform switches.

**Examples**

- This command enables global buffer monitoring on the switch.
  ```
  switch(config)#queue-monitor length global-buffer
  switch(config)#
  ```

- This command disables global buffer monitoring on the switch.
  ```
  switch(config)#no queue-monitor length global-buffer
  switch(config)#
  ```
queue-monitor length global-buffer log

The `queue-monitor length global-buffer log` command enables logging of global buffer over-threshold events. When logging is enabled, a log message is generated each time the contents of the global buffer exceed the upper threshold value set for the switch (see `queue-monitor length global-buffer thresholds`). Once the global buffer is over the threshold, additional messages are generated at a maximum rate of one per `interval` as long as the buffer value remains above the lower threshold for the switch.

Global buffer logging is disabled by default.

Log messages do not include buffer usage or congestion information. To view this information, use the `show queue-monitor length global-buffer` command.

The `no queue-monitor length global-buffer log` and `default queue-monitor length global-buffer log` commands disable global buffer logging by removing the corresponding `queue-monitor length global-buffer log` command from `running-config`. The `queue-monitor length global-buffer log` command with an interval value of 0 also disables global buffer logging.

**Command Mode**

Global Configuration

**Command Syntax**

```
queue-monitor length global-buffer log interval
no queue-monitor length global-buffer log
default queue-monitor length global-buffer log
```

**Parameters**

- `interval` minimum interval in seconds between logged messages.
  - 0 global buffer logging is disabled on the switch (the default setting).
  - 1 to 65535 minimum logging interval (in seconds).

**Guidelines**

This command is available on FM6000 platform switches.

**Examples**

- This command enables global buffer logging with a minimum interval of 10 seconds between messages.
  
  `switch(config)#queue-monitor length global-buffer log 10`

- This command disables global buffer logging on the switch.
  
  `switch(config)#no queue-monitor length global-buffer log`
queue-monitor length global-buffer thresholds

The queue-monitor length global-buffer thresholds command sets global buffer thresholds for the switch. An over-threshold event is generated when usage of the global buffer exceeds the upper threshold, and over-threshold events continue to be generated until usage drops below the lower threshold. (To log these events, use the queue-monitor length global-buffer log command.)

The no queue-monitor length global-buffer and default queue-monitor length global-buffer commands disable global buffer reporting.

The no queue-monitor length global-buffer thresholds and default queue-monitor length global-buffer thresholds commands erase custom global buffer threshold settings.

Command Mode
Global Configuration

Command Syntax

queue-monitor length global-buffer thresholds max_segments min_segments
no queue-monitor length global-buffer log
default queue-monitor length global-buffer log

Parameters
• max_segments upper threshold in 160-byte segments. Value ranges from 2 to 36864. Default is 10940.
• min_segments lower threshold in 160-byte segments. Value ranges from 1 to 36864. Default is 4376.

Examples
• This command sets the upper and lower global buffer thresholds to 9000 segments and 3000 segments.
  switch(config)#queue-monitor length global-buffer thresholds 9000 3000
  switch(config)#
• This command resets the upper and lower global buffer thresholds to their default values.
  switch(config)#no queue-monitor length global-buffer thresholds 9000 3000
  switch(config)#
queue-monitor length log

The **queue-monitor length log** command enables logging of queue-length over-threshold events when LANZ is enabled on the switch (see **queue-monitor length (global configuration mode)**). When logging is enabled, a log message is generated each time one or more queues on an interface exceed the upper threshold value for that interface (see **queue-monitor length threshold (Arad and Petra)**). Once an interface is over threshold, additional messages are generated at a maximum rate of one per *interval* as long as the queue length remains above the lower threshold for that interface. No syslog message is generated when queue length drops back under threshold.

Logging is disabled by default.

Log messages do not include queue length information. To view queue length information, use the **show queue-monitor length** command.

The **queue-monitor length log** command with an interval value of 0 disables event logging.

**Command Mode**

Global Configuration

**Command Syntax**

```
queue-monitor length log interval
```

**Parameters**

- *interval*  
  - minimum interval in seconds between logged messages from a single interface.
  - 0  queue-length logging is disabled on the switch (the default setting).
  - 1 to 65535  minimum logging interval (in seconds).

**Examples**

- This command enables over-threshold logging with a minimum interval of 10 seconds between messages for a given interface.
  ```
  switch(config)#queue-monitor length log 10
  ```

- This command disables queue-length over-threshold logging on the switch.
  ```
  switch(config)#queue-monitor length log 0
  ```

- This is an example of a queue-length log message.
  ```
  Oct 27 12:48:22 switch QUEUE_MONITOR-6-LENGTH_OVER_THRESHOLD: Interface Ethernet6 queue length is over threshold of 512, current length is 1024.
  ```
queue-monitor length mirror

The `queue-monitor length mirror` command enables LANZ mirroring. As a result, traffic experiencing congestion can be configured to automatically send congested traffic to either the CPU or an Ethernet egress interface destination, once a queue threshold is crossed (see `queue-monitor length mirror destination`).

**Command Mode**
Global Configuration

**Command Syntax**

```
queue-monitor length mirror
```

**Example**

- This command enables LANZ traffic sampling.
  ```
  switch(config)#queue-monitor length mirror
  switch(config)#
  ```

- This command disables LANZ traffic sampling.
  ```
  switch(config)#no queue-monitor length mirror
  switch(config)#
  ```
queue-monitor length mirror destination

The `queue-monitor length mirror destination` command results in automatically sending traffic experiencing congestion to either the CPU or an Ethernet egress interface destination, once a queue threshold is crossed. Before using this command, first enable LANZ mirroring through the command `queue-monitor length mirror`.

**Command Mode**
Global Configuration

**Command Syntax**
```
queue-monitor length mirror destination cpu | Ethernet <ports 1-24>
```

**Parameters**
- `ports` any combination of Ethernet ports 1 through 24.

**Examples**
- This command configures LANZ traffic sampling for a CPU interface mirror destination.
  ```
  switch(config)#queue-monitor length mirror destination cpu
  switch(config)#
  ```
- This command configures LANZ traffic sampling for an Ethernet interface mirror destination for ports 3, 11, and 15 through 20.
  ```
  switch(config)#queue-monitor length mirror destination Ethernet 3,11,15-20
  switch(config)#
  ```
queue-monitor streaming

The **queue-monitor streaming** command places the switch in queue-monitor-streaming configuration mode. Queue-monitor-streaming configuration mode is not a group change mode; **running-config** is changed immediately upon command entry. The exit command does not affect **running-config**.

To enable LANZ data streaming on the switch, use the **no shutdown (queue-monitor-streaming configuration)** command.

The **exit** command returns the switch to global configuration mode.

**Command Mode**

Global Configuration

**Command Syntax**

```
queue-monitor streaming
```

**Commands Available in queue-monitor streaming Configuration Mode**

- **max-connections**
- **shutdown (queue-monitor-streaming configuration)**

**Example**

- This command places the switch in queue-monitor streaming configuration mode.

```
switch(config)#queue-monitor streaming
switch(config-qm-streaming)#
```
show queue-monitor length

The `show queue-monitor length` command displays a report of recent over-threshold events for all interfaces, limited to the last 1000 records, with the newest events listed first.

LANZ must be enabled to use this command (see `queue-monitor length (global configuration mode)`). If LANZ is disabled, the command displays “queue-monitor is disabled.”

To limit the output to a specified number of seconds and/or records, use the `show queue-monitor length limit` command.

**Command Mode**
EXEC

**Command Syntax**
`show queue-monitor length`

**Example**
- This command displays the last 1000 LANZ records on a Petra or Arad platform switch.

```
switch>show queue-monitor length

show queue-monitor length csv

The `show queue-monitor length csv` command displays LANZ records in comma-separated value (CSV) format with the oldest samples displayed first.

LANZ must be enabled to use this command (see `queue-monitor length` (global configuration mode)). If LANZ is disabled, the command displays “queue-monitor is disabled.”

**Command Mode**

EXEC

**Command Syntax**

`show queue-monitor length csv`

**Example**

- This command displays LANZ records in CSV format.

```
switch>show queue-monitor length csv

show queue-monitor length drops

The `show queue-monitor length drops` command displays a report of cumulative transmission drop totals for a range of interfaces or for all interfaces. Output can be limited to a specified number of seconds or records. The most recent events are listed first. By default, the command displays data for all interfaces, limited to the last 1000 records. Newest events are listed first.

LANZ must be enabled to use this command (see `queue-monitor length (global configuration mode)`). If LANZ is disabled, the command displays “queue-monitor is disabled.”

Command Mode

EXEC

Command Syntax

```
show queue-monitor length [INTERFACES] [FACTOR] drops
```

Parameters

- **INTERFACES** interface type and number for report. Values include:
  - `<no parameter>` displays information for all interfaces.
  - `ethernet e-range` e-range formats include a number, number range, or comma-delimited list of numbers and ranges

- **FACTOR** limiting parameter for report. Values include:
  - `<no parameter>` displays the last 1000 records.
  - `limit number samples` displays the last `number` records.
  - `limit number seconds` displays all records generated during the last `number` seconds.

Value of `number` ranges from 1 to 1000000.

Guidelines

This command is available on FM6000, Trident II, and Tomahawk platform switches.

Example

- This command displays the last 10 records of transmission drop data on a Trident II or Tomahawk switch.

```
switch> show queue-monitor length limit 10 samples drops
```

show queue-monitor length ethernet

The `show queue-monitor length ethernet` command displays a report of recent over-threshold events for a range of interfaces, with the newest events listed first.

LANZ must be enabled to use this command (see `queue-monitor length (global configuration mode)`). If LANZ is disabled, the command displays “queue-monitor is disabled.”

Command Mode
EXEC

Command Syntax
`show queue-monitor length ethernet e-range`

Parameters
`e-range` the range of interfaces to be included in the report; formats include a number, number range, or comma-delimited list of numbers and ranges

Examples
- This command displays the last 1000 records for Ethernet interfaces 6 through 8 on a Petra or Arad platform switch.

  switch> `show queue-monitor length ethernet 6-8`
  Report generated at 2010-01-01 12:56:13

switch>
```
show queue-monitor length global-buffer

The `show queue-monitor length global-buffer` command displays a report of recent high usage, low usage and update events for the global buffer. Newest events are listed first.

LANZ must be enabled to use this command (see `queue-monitor length (global configuration mode)`). If LANZ is disabled, the command displays “queue-monitor is disabled.”

**Command Mode**

EXEC

**Command Syntax**

    show queue-monitor length global-buffer

**Guidelines**

This command is available on FM6000 platform switches.

**Example**

- This command displays the global buffer event records for the switch.

```
switch>show queue-monitor length global buffer

**show queue-monitor length limit**

The `show queue-monitor length limit` command displays a report of recent over-threshold events for a range of interfaces or for all interfaces, limited by a specified number of records.

LANZ must be enabled to use this command (see `queue-monitor length (global configuration mode)`). If LANZ is disabled, the command displays “queue-monitor is disabled.”

**Command Mode**

EXEC

**Command Syntax**

```
show queue-monitor length limit [INTERFACES] number
```

**Parameters**

- **INTERFACES** interface type and number for report. Values include:
  - `<no parameter>` displays information for all interfaces.
  - `ethernet e-range` e-range formats include a number, number range, or comma-delimited list of numbers and ranges
  - `number` number of records to display. Values range from 1 to 1000000.

**Example**

- This command displays the last 100 records for Ethernet interfaces 6 through 8.

```
switch>#show queue-monitor length ethernet 6-8 limit 100 samples

<-------OUTPUT OMITTED FROM EXAMPLE--------->
**LANZ Commands Chapter 40: Latency Analyzer (LANZ)**

**show queue-monitor length tx-latency**

The **show queue-monitor length tx-latency** command displays the latency data of recent LANZ events for a range of interfaces or for all interfaces. Output can be limited to a specified number of seconds or records. The most recent events are listed first. By default, the command displays data for all interfaces, limited to the last 1000 records. Newest events are listed first.

LANZ must be enabled to use this command (see **queue-monitor length (global configuration mode)**). If LANZ is disabled, the command displays “queue-monitor is disabled.”

**Command Mode**

EXEC

**Command Syntax**

`show queue-monitor length [INTERFACES] [FACTOR] tx-latency`

**Parameters**

- **INTERFACES**  interface type and number for report. Values include:
  - `<no parameter>`  displays information for all interfaces.
  - `ethernet e-range`  e-range formats include a number, number range, or comma-delimited list of numbers and ranges

- **FACTOR**  limiting parameter for report. Values include:
  - `<no parameter>`  displays the last 1000 records.
  - `limit number samples`  displays the last `number` records.
  - `limit number seconds`  displays all records generated during the last `number` seconds.

Value of `number` ranges from 1 to 1000000.

**Guidelines**

This command is available on FM6000, Trident II, and Tomahawk platform switches.

**Example**

- This command displays transmission latency data for the last 1000 LANZ events on the switch.

```plaintext
switch>show queue-monitor length tx-latency

switch>
```
shutdown (queue-monitor-streaming configuration)

The `shutdown` command disables the streaming of LANZ data to external clients. The `no shutdown` command enables LANZ data streaming. Streaming is disabled by default.

**Command Mode**
Queue-Monitor-Streaming Configuration

**Command Syntax**

- `shutdown`
- `no shutdown`

**Example**

- These commands enable the streaming of LANZ data on the switch.

```
switch(config)#queue-monitor streaming
switch(config-qm-streaming)#no shutdown
switch(config-qm-streaming)#
```
tcpdump queue-monitor

The `tcpdump queue-monitor` command exports congested traffic to a packet capture device or another tool for analysis, or directly to the switch CPU for inspection.

**Command Mode**

Global Configuration

**Command Syntax**

```
tcpdump queue-monitor
```

```
tcpdump queue-monitor <file | filecount | filter | lookup-names | max-file-size |
              | packet-count | size | verbose>
```

**Parameters**

- `file` output file.
  - certificate: certificate file.
  - flash: flash file.
  - sslkey: sslkey file.
  - usb1: usb1 file.
- `filecount` specify the number of output files: 1 to 100.
- `filter` set the filtering expression to select which packets will be dumped.
- `lookup-names` enable reverse DNS lookups.
- `max-file-size` specify the maximum file size by entering 1 to 100 million bytes.
- `packet-count` specify 1 to 10000 packets to capture.
- `size` specify the maximum number of bytes to dump per packet with a size of 1 to 65536 bytes.
- `verbose` enable verbose mode.

**Example**

- This command inspects traffic on the switch.
```
switch(config)#tcpdump queue-monitor
```

```
tcpdump: WARNING: lanz: no IPv4 address assigned
tcpdump: WARNING: no IPv4 address assigned
tcpdump: verbose output suppressed, use -v or -vv for full protocol decode
listening on lanz, link-type EN10MB (Ethernet), capture size 65535 bytes
...
0 packets captured
0 packets received by filter
0 packets dropped by kernel
switch(config)#
```
Chapter 41

VM Tracer

This chapter describes VM Tracer configuration and usage and contains these sections:

- Section 41.1: VM Tracer Introduction
- Section 41.2: VM Tracer Description
- Section 41.3: VM Tracer Configuration Procedures
- Section 41.4: VM Tracer Configuration Commands

41.1 VM Tracer Introduction

VM Tracer is a switch feature that determines the network configuration and requirements of connected VMware hypervisors. The switch uses VMware's SOAP XML API to discover VMware host server components, including:

- instantiated VMs with their network configuration (VLANs and distributed/virtual Switches).
- server hardware IPMI data which can be shown to the network manager.

VM Tracer also supports adaptive auto-segmentation, which automatically provisions and prunes VLANs from server-switched ports as VMs are instantiated and moved within the data center.
41.2 VM Tracer Description

Cloud operating systems manage large virtualized computing infrastructures, including software and hardware. Cloud operating systems consist of virtual machines and hypervisors:

- A virtual machine (VM) is a software implementation of a computer that operates as running on dedicated physical hardware. Multiple VMs share physical machine resources from a single physical device. Each VM is controlled by its operating system.
- A hypervisor, also called a virtual Machine Manager (VMM), is software that manages multiple operating systems running concurrently on a physical device.

VM Tracer tracks activity of VMs that are controlled by hypervisors connected to the switch’s Ethernet or LAG ports. VM Tracer supports vSphere versions 4.0 – 5.5. vSphere features include distributed virtual switches (DVS) and VM movement among VMware servers (VMotion).

vSphere components include:
- ESX and ESXi: hypervisors that run on VMware host server hardware.
- vCenter: centralized tool that manages multiple servers running VMware hypervisors.
- vShield: suite of security applications that support vCenter server integration.
- vShield Manager (VSM): centralized tool that manages vShield access.

Monitoring VLAN based configurations requires vCenter access. Monitoring VXLAN based configurations requires access to vCenter and vShield Manager. The following sections describe topologies that monitor these networks:

- Section 41.2.1: Monitoring VLAN Based Configurations
- Section 41.2.2: Monitoring VXLAN Based Configurations

41.2.1 Monitoring VLAN Based Configurations

vCenter manages ESX hosts and VMs through a central database. VM Tracer identifies interfaces connected to a specified ESX host and sends discovery packets (CDP or LLDP) on interfaces where VM Tracer is enabled. The ESX host updates the vCenter when it receives a discovery packet. VM Tracer reads this data from the vCenter through a SOAP XML API to associate the ESX host to the connected switch ports. Figure 41-1 displays the network topology of this configuration.
VM Tracer connects to a maximum of four vCenters through a SOAP (Simple Object Access Protocol) API to discover VMs in the data centers that the vCenters manage. VM Tracer maintains a list of VMs in the data center and gathers network related information about each VM, including the number of Vnics (virtual network interface card), the MAC address of each Vnic, the switch to which it connects, and the host on which it resides. VM Tracer also identifies the host NICs connected to the switch through the bridge MAC address and the interface port name. VM Tracer then searches for VMs on this host and connected to the vswitch or dvswitch whose uplink is mapped to the connected NIC.

For each connected interface, VM Tracer creates a VM Table that lists its active VMs, sorted by Vnic MAC address. Each VM entry includes its name, Vnic name, VLAN, switch name, datacenter name, and portgroup. An entry is deleted when the corresponding VM is removed, moved to a different host, or its Vnic is no longer part of the vswitch or dvswitch. An entry is added when a VM is created or moved to a host connected to the interface. VM Tracer monitors vCenter for VM management updates. If an interface goes down, all VM entries for that interface are removed from the VM Table.

### 41.2.2 Monitoring VXLAN Based Configurations

Monitoring VXLAN based configurations require access to the vShield Manager (VSM), in addition to the configuration described in Section 41.2.1. Each VM Tracer session can communicate with one VSM through a REST interface over XML and gathers VXLAN information by polling it on a 30 second polling cycle. VXLAN data that the switch receives from the VSM includes:

- VNI range.
- VXLAN segment.
- Multicast address range.
- network scope.

The network scope specifies the virtual address space the VXLAN segments span and is defined by the server group (cluster) collections within the segments, which in turn contain a collection of distributed virtual switches (DVS) from ESX hosts within the clusters.

VM Tracer uses this information to build a network model. Communications with VSM requires a single polling thread that detects network connectivity and constantly updates the local data model.

*Figure 41-2* displays the network topology of this configuration.

*Figure 41-2: VM Tracer Topology – Monitoring VXLAN Based Configurations*
41.3 VM Tracer Configuration Procedures

The following sections describe the session configuration process, configuring the VSM connection for VXLAN based configurations, and the procedure for enabling VM Tracer on individual interfaces. The switch defines vmtracer configuration mode and VMtracer mode:

- vmtracer configuration mode is a command mode for configuring VM Tracer monitoring sessions.
- VMtracer mode is defines an interface state where discovery packets are sent to attached vSwitches.

41.3.1 Configuring vCenter Monitoring Sessions

A VM Tracer session connects the switch to a vCenter server for downloading data about VMs and vSwitches managed by ESX hosts connected to the switch’s ports. The switch supports four VM Tracer sessions.

The switch is placed in vmtracer configuration mode to edit session parameters, including the vCenter location and dynamic VLAN usage. Changes take effect by exiting vmtracer mode.

The `vmtracer session` command places the switch in vmtracer configuration mode for a specified session. The command either creates a new session or loads an existing session for editing.

- This command enters vmtracer configuration mode for the system_1 session.

```
switch(config)#vmtracer session system_1
switch(vmtracer-system_1)#
```

In vmtracer configuration mode, the `url (vmtracer mode)`, `username (vmtracer mode)`, and `password (vmtracer mode)` commands specify the location and the account information that authenticates the switch. The url parameter must reference a fully formed secure url.

- These commands specify the IANA url along with the username and password that allow the switch to access the location.

```
switch(vmtracer-system_1)#url https://example.com
switch(vmtracer-system_1)#username a-switch_01
switch(vmtracer-system_1)#password abcde
switch(vmtracer-system_1)#
```

Default session settings allow auto-segmentation, or the dynamic allocation and pruning of VLANs when a VM managed by the ESX host connected to the switch is created, deleted, or moved to a different host. The `autovlan disable` command prevents auto-segmentation, regardless of VM activity. The `allow-vlan` command specifies the VLANs that may be added when a VM is added or moved. By default, all VLANs are allowed.

- This command disables auto-segmentation.

```
switch(vmtracer-system_1)#autovlan disable
switch(vmtracer-system_1)#
```

- These commands enable auto-segmentation and limit the list of allowed VLANs to VLAN 1-2000.

```
switch(vmtracer-system_1)#no autovlan disable
switch(vmtracer-system_1)#allow-vlan 1-2000
switch(vmtracer-system_1)#
```

The `exit` command returns the switch to Global configuration mode and enables the VM Tracer session. Vmtracer configuration mode can be re-entered for this session to edit session parameters.

- This command exits vmtracer configuration mode.

```
switch(vmtracer-system_1)#exit
switch(config)#
```
The `no vmtracer session` command disables the session and removes it from `running-config`.

- This command disables and deletes the system_1 VM Tracer session.

```
switch(config)#no vmtracer session system_1
switch(config)
```

### 41.3.2 Configuring vShield Monitoring Sessions

To monitor VXLAN based VMware configurations, the switch must communicate with a vShield Manager (VSM). Vmtracer-vxlan configuration mode specifies the location and user account data that allows the switch to access a VSM within the configuration mode vmtracer session.

The switch is placed in vmtracer configuration mode to edit session parameters, including the vCenter location and dynamic VLAN usage. Changes take effect by exiting vmtracer mode.

The `vxlan (vmtracer mode)` command is executed from vmtracer mode for a specified session and places the switch in vmtracer-vxlan configuration mode for that session. Each VM Tracer session can be associated with one vShield instance.

- These commands create the vShield instance for the VMTracer session named vnet-1.

```
switch(config)#vmtracer session vnet-1
switch(config-vmtracer-vnet-1)#vxlan
```

In vmtracer-vxlan configuration mode, the `url (vmtracer-vxlan mode)`, `username (vmtracer-vxlan mode)`, and `password (vmtracer-vxlan mode)` commands specify the vShield server’s location and the account information that authenticates the switch to the vShield server. The `url` parameter must reference a fully formed secure url, such as `https://vshieldserver.company1.org/sdk`.

- These commands specify the vShield’s url along with the username and password that allow the switch to access the vShield server.

```
switch(config-vmtracer-vnet-1-vxlan)#url https://vshieldserver.company1.org/sdk
switch(config-vmtracer-vnet-1-vxlan)#username a-shield_01
switch(config-vmtracer-vnet-1-vxlan)#password home
```

### 41.3.3 Enabling vmtracer Mode

VMTracer mode is an interface setting that enables interfaces to send discovery packets to the connected vSwitch. The `vmtracer` command enables VMTracer mode on the configuration mode interface.

- These commands enable VMTracer mode on the Ethernet 3 interface.

```
switch(config)#interface Ethernet3
switch(config-if-Et3)#vmtracer vmware-esx
```

The `no vmtracer` command disables vmtracer mode on the configuration mode interface.

- This command disables vmtracer mode on the Ethernet 3 interface.

```
switch(config-if-Et3)#no vmtracer vmware-esx
```

### 41.3.4 Displaying VM Tracer Data

#### 41.3.4.1 Displaying Session Status

The `show vmtracer session` command displays information about the specified session.
Without the `detail` parameter, the command displays connection parameters and status for the vCenter associated to the specified session.

- This command displays connection parameters for the vCenter associated with the system_1 session.
  
  ```
  switch#show vmtracer session system_1
  vCenter URL https://vmware-vcenter1/sdk
  username arista
  password arista
  Session Status Disconnected
  ```

With the `detail` parameter, the command displays connection status and data concerning messages the vCenter previously received from ESX hosts connected to the switch.

- This command displays connection parameters and message details for the vCenter associated with the system_1 session.
  
  ```
  switch#show vmtracer session system_1 detail
  vCenter URL https://vmware-vcenter1/sdk
  username arista
  sessionState Connected
  lastStateChange 19 days, 23:03:59 ago
  lastMsgSent CheckForUpdatesMsg
  timeOfLastMsg 19 days, 23:14:09 ago
  responseTimeForLastMsg 0.0
  numSuccessfulMsg 43183
  lastSuccessfulMsgCheckForUpdatesMsg
  lastSuccessfulMsgTime 19 days, 23:14:19 ago
  numFailedMsg 1076
  lastFailedMsgCheckForUpdatesMsg
  lastFailedMsgTime 19 days, 23:14:09 ago
  lastErrorCode Error -1 fault: SOAP-ENV:Client [no subcode]
    "End of file or no input: Operation interrupted or timed out after 600s send or 600s receive delay"
  Detail: [no detail]
  CheckForUpdates:
  ```

### 41.3.4.2 Displaying VM Interfaces

The `show vmtracer interface` command displays the VM interfaces (Vnics) that are active on switch interfaces where vmtracer mode is enabled. For each Vnic, the command displays the name of the attached VM, the adapter name, its VLAN, the VM power state, and the presence status of its MAC address in the switch’s MAC table.
• This command displays the Vnics connected to all VM Tracer-enabled interfaces.

```
switch#show vmtracer interface
```

```
Ethernet8 : example.com
    VM Name VM Adapter VLAN Status
    esx3.aristanetworks.com vmk0 0 Up/Down
    vspheremanagement Network adapter 1 0 Up/Down

Ethernet15 : example.com
    VM Name VM Adapter VLAN Status
    Openview Network adapter 1 123 Up/Down
    VmTracerVm Network adapter 1 123 Down/Down

Ethernet23 : example.com
    VM Name VM Adapter VLAN Status

Ethernet24 : example.com
    VM Name VM Adapter VLAN Status
```

41.3.4.3 Displaying VMs

The `show vmtracer vm` command displays VM interfaces (Vnics) accessible to the VM Tracer-enabled interfaces. For each active listed VM, the command displays its name, adapter, and the connected hypervisor.

• This command displays the VMs connected to all VM Tracer-enabled interfaces.

```
switch#show vmtracer vm
```

```
VM Name VM Adapter Interface VLAN
    Openview Network adapter 1 Et15 123
    vspheremanagement Network adapter 1 Et8 0
    VmTracerVm Network adapter 1 Et15 123
    example.com vmk0 Et8 0
```

• This command displays connection data for the VMs connected to all VM Tracer-enabled interfaces.

```
switch#show vmtracer vm detail
```

```
VM Name Openview
    intf : Et15
    vnic : Network adapter 1
    mac : 00:0c:29:ae:7e:90
    portgroup : dvPortGroup
    vlan : 123
    switch : vds
    host : example.com
```
41.4 VM Tracer Configuration Commands

Global Configuration Commands
- `vmtracer session`

Interface Configuration (Ethernet and Port Channel) Commands
- `vmtracer`

VMTracer Configuration Commands
- `allowed-vlan`
- `autovlan disable`
- `password (vmtracer mode)`
- `url (vmtracer mode)`
- `username (vmtracer mode)`
- `vxlan (vmtracer mode)`

VMTracer-VXLAN Configuration Commands
- `password (vmtracer-vxlan mode)`
- `url (vmtracer-vxlan mode)`
- `username (vmtracer-vxlan mode)`

VM Tracer Display Commands
- `show vmtracer all`
- `show vmtracer interface`
- `show vmtracer session`
- `show vmtracer session vcenter`
- `show vmtracer session vsm`
- `show vmtracer vm`
- `show vmtracer vm detail`
- `show vmtracer vnic counters`
- `show vmtracer vxlan segment`
- `show vmtracer vxlan vm`
allowed-vlan

The **allowed-vlan** command specifies the VLANs that may be added when a VM is added or moved from the hypervisor connected to the session specified by the `vmtracer` mode. By default, all VLANs are allowed.

**Command Mode**

Vmtracer Configuration

**Command Syntax**

```plaintext
allowed-vlan VLAN_LIST
no allowed-vlan vlan
default allowed-vlan vlan
```

**Parameters**

- **VLAN_LIST** The VLAN list or the edit actions to the current VLAN list. Valid `v_range` formats include number, or number range.
  - **v_range** The list consists of the `v_range` VLANs.
  - **add v_range** The `v_range` VLANs are added to the current VLAN list.
  - **all** The list consists of all VLANs (1-4094).
  - **except v_range** The list consists of all VLANs except for those specified by `v_range`.
  - **none** The list of VLANs is empty.
  - **remove v_range** The `v_range` VLANs are removed from the current VLAN list.

**Related Commands**

- **vmtracer session** places the switch in vmtracer configuration mode.

**Examples**

- This command sets the list of allowed VLANs to 1 through 2000.
  
  ```plaintext
  switch(vmtracer-system_1)#allow-vlan 1-2000
  switch(vmtracer-system_1)#
  ```

- This command adds VLANs to 2501 through 3000.
  
  ```plaintext
  switch(vmtracer-system_1)#allow-vlan add 2051-3000
  switch(vmtracer-system_1)#
  ```
**autovlan disable**

Default VM Tracer session settings enable auto provisioning, which allows the dynamic assignment and pruning of VLANs when a VM attached to the ESX connected to the switch is created, deleted, or moved to a different ESX host. The autovlan setting controls auto provisioning.

The *autovlan disable* command disables auto provisioning, which prevents the creation or deletion of VLANs regardless of VM activity. The *allowed-vlan* command specifies the VLANs that may be added when a VM is added or moved. By default, all VLANs are allowed.

The *no autovlan disable* command enables the creation and deletion of VLANs caused by VM activity. This is the default setting.

**Command Mode**

Vmtracer Configuration

**Command Syntax**

```
autovlan disable
no autovlan disable
default autovlan disable
```

**Related Commands**

- `vmtracer session` places the switch in vmtracer configuration mode.

**Example**

- This command disables dynamic VLAN creation or pruning within the configuration mode VM Tracer session.

  ```
  switch{vmtracer-system_1}#autovlan disable
  switch{vmtracer-system_1}#
  ```
password (vmtracer mode)

The `password` command specifies the token that authorizes the username to the vCenter associated with the VM Tracer mode session.

**Command Mode**

Vmtracer Configuration

**Command Syntax**

```
password [ENCRYPTION] [password]
```

**Parameters**

- `ENCRYPTION` encryption level of the password.
  - `<no parameter>` `password` is a clear-text string.
  - `0` the `password` is a clear-text string. Equivalent to `<no parameter>`.
  - `7` the `password` is an encrypted string.
- `password` text that authenticates the username.
  - `password` is a clear-text string if `ENCRYPTION` specifies clear text.
  - `password` is an encrypted string if `ENCRYPTION` specifies an encrypted string.

**Related Commands**

- `vmtracer session` places the switch in vmtracer configuration mode.

**Example**

- This command configures `abode` as the clear-text string that authorizes the username `a-switch_01` located at `example.com`.

  ```
  switch(vmtracer-system_1)#url https://example.com
  switch(vmtracer-system_1)#username a-switch_01
  switch(vmtracer-system_1)#password abcde
  switch(vmtracer-system_1)#
  ```
password (vmtracer-vxlan mode)

The `password` command specifies the token that authorizes the username on the vShield Manager (VSM) server located at the URL configured for the configuration mode VM Tracer. The switch uses this account to access VSM information.

The `password` statement is replaced in `running-config` for the configuration mode interface by a subsequent `password` command. The statement is removed by deleting the VSM instance through a `no vxlan (vmtracer mode)` command in vmtracer configuration mode.

**Command Mode**
Vmtracer-vxlan Configuration

**Command Syntax**
```
password [ENCRYPTION] password
```

**Parameters**
- `ENCRYPTION` encryption level of the password.
  - `<no parameter>` `password` is a clear-text string.
  - `0` the `password` is a clear-text string. Equivalent to `<no parameter>`.
  - `7` the `password` is an encrypted string.
- `password` text that authorizes the username.
  - `password` is a clear-text string if `ENCRYPTION` specifies clear text.
  - `password` is an encrypted string if `ENCRYPTION` specifies an encrypted string.

**Related Commands**
- `vxlan (vmtracer mode)` places the switch in vmtracer-vxlan configuration mode.

**Example**
- This command configures `5678` as the clear-text string that authorizes the username `admin` to the VSM located at `https://example.com`.

```bash
switch(config)#vmtracer session vnet-1
switch(config-vmtracer-vnet-1)#vxlan
switch(config-vmtracer-vnet-1-vxlan)#url https://example.com
switch(config-vmtracer-vnet-1-vxlan)#username admin
switch(config-vmtracer-vnet-1-vxlan)#password 5678
switch(config-vmtracer-vnet-1-vxlan)#exit
vmtracer session vnet-1
  allowed-vlan 1-4094
vxlan
    url https://example.com
    username admin
    password 7 s2Xq4GSBlYU=
switch(config-vmtracer-vnet-1)#
```
show vmtracer all

The `show vmtracer all` command displays VM Tracer data for all switches with the vSphere scope.

**Command Mode**

`EXEC`

**Command Syntax**

`show vmtracer all`

**Example**

- This command displays data for both switches in the vSphere scope.

```
switch> show vmtracer all

Switch : a109(10.10.30.109)
Ethernet49 : 10.102.28.3/10G
  VM Name  VM Adapter  VLAN  Status  State
  ABCD     Network adapter 2 native Up/--  --

Switch : a164(10.10.30.172.22.30.164)
Ethernet49 : 10.102.28.3/10G Storage Network/dvUplink1
  VM Name  VM Adapter  VLAN  Status  State
  WXYZ    Network adapter 2 native Up/--  --

switch>
```
show vmtracer interface

The show vmtracer interface command displays the VM interfaces (Vnics) that are active on the VM Tracer enabled interface. For each Vnic, the command displays the name of the attached VM, the adapter name, its VLAN, the VM power state, and the presence status of its MAC address in the switch’s MAC table.

Command Mode

EXEC

Command Syntax

show vmtracer interface [INT_NAME] [INFO_LEVEL]

Parameters

- **INT_NAME** the interfaces to be configured. Values include:
  - <no parameter> command returns information for all interfaces.
  - ethernet e_range Ethernet interface range.
  - port-channel p_range Port Channel interface range.

- **INFO_LEVEL** specifies information that the command returns.
  - <no parameter> connection parameters and status for VM associated to specified sessions.
  - detail connection status and data concerning messages the VM.
  - host name of the connected host.

Examples

- This command displays the Vnics connected to all VM Tracer enabled interfaces.

```
switch>show vmtracer interface
```

```
Ethernet8 : example.com  
  VM Name                     VM Adapter          VLAN          Status  
  esx3.aristannetworks.com   vmk0                0             Up/Down  
  vspheremanager             Network adapter 1   0             Up/Down  

Ethernet15 : example.com  
  VM Name                     VM Adapter          VLAN          Status  
  Openview                    Network adapter 1   123           Up/Down  
  VmTracerVm                  Network adapter 1   123           Down/Down  

Ethernet23 : example.com  
  VM Name                     VM Adapter          VLAN          Status  
```

- This command displays the Vnics connected to the Ethernet 8 interface.

```
switch>show vmtracer interface Ethernet8
```

```
Ethernet8 : example.com  
  VM Name                     VM Adapter          VLAN          Status  
  example.com                vmk0                0             Up/Down  
  vspheremanager             Network adapter 1   0             Up/Down  
```

2350
show vmtracer session

The **show vmtracer session** command displays vCenter and vShield connection information for a specified VM Tracer session.

**Command Mode**

EXEC

**Command Syntax**

```
show vmtracer session [SESSION_LIST]
```

**Parameters**

- **SESSION_LIST** VM Tracer sessions for which the command returns information.
  - <no parameter> all configured VM Tracer sessions.
  - **session_name** name of one VM Tracer session.

**Examples**

- This command displays connection parameters associated to the abcde session.

  ```
  switch>show vmtracer session abcde
  
  Session abcde
  vCenter URL       https://example.com
  username                        Administrator
  autovlan                        enabled
  allowed-vlans     1-4094
  sessionState      Connected
  VShield URL       https://vmware-vshield5.1.xyz.abcde.com
  username                    admin
  sessionState      Connected
  
  switch>
  ```
**show vmtracer session vcenter**

The *show vmtracer session vcenter* command displays vCenter information for a specified VM Tracer session.

**Command Mode**

**EXEC**

**Command Syntax**

```
show vmtracer session session_name vcenter [INFO_LEVEL]
```

**Parameters**

- **session_name**  VM Tracer sessions for which the command returns information.
- **INFO_LEVEL** specifies information that the command returns.
  - *<no parameter>* displays connection and status information for the specified vCenter.
  - *detail* displays connection, status, and history information for the specified vCenter.

**Examples**

- This command displays connection parameters for the vCenter associated to the abcde session.

  ```
  switch>show vmtracer session abcde vcenter
  Session abcde
  vCenter URL       https://vmware-vcenter5.1/sdk
  username                        Administrator
  autovlan                        enabled
  allowed-vlans     1-4094
  sessionState      Connected
  switch>
  ```

- This command displays connection parameters and history details from the vCenter associated to the abcde session.

  ```
  switch>show vmtracer session abcde vcenter detail
  Session                        abcde
  vCenter URL                    https://vmware-vcenter5.1/sdk
  username                       Administrator
  autovlan                       enabled
  allowed-vlans                  1-4094
  SessionState                   Connected
  lastStateChange                2:46:50 ago
  lastMsgSent                    Query network hint message
  timeOfLastMsg                  0:00:20 ago
  responseTimeForLastMsg         0.000102301000479
  numSuccessfulMsg               998
  lastSuccessfulMsg              Query network hint message
  lastSuccessfulMsgTime          0:00:20 ago
  numFailedMsg                   0
  lastFailedMsg                  --
  lastFailedMsgTime              never
  lastErrorCode                  --
  switch>
  ```
show vmtracer session vsm

The `show vmtracer session vsm` command displays vShield Manager information for a specified VM Tracer session.

**Command Mode**
EXEC

**Command Syntax**
```
show vmtracer session session_name vsm [INFO_LEVEL]
```

**Parameters**
- `session_name` VM Tracer sessions for which the command returns information.
- `INFO_LEVEL` specifies information that the command returns.
  - `<no parameter>` connection and status information for the specified vShield Manager.
  - `detail` connection, status, and history information for the specified vShield Manager.

**Examples**
- This command displays connection parameters for the vShield Manager associated to the abcde session.
  ```
  switch>show vmtracer session abcde vsm
  Session abcde
  VShield URL       https://example.com
  username                    admin
  sessionState      Connected
  switch>
  ```
- This command displays connection parameters and history details from the vShield Manager associated to the abcde session.
  ```
  switch>show vmtracer session abcde vsm detail
  Session abcde
  VShield URL       https://vmware-vshield5.1/
  username                    admin
  sessionState      Connected
  LaststateChange     19 days, 23:14:19 ago
  LastMsgSent          /api/2.0/vdn/scopes
  timeOfLastMsg       1 days, 13:22:09 ago
  responseTimeForLastMsg 0.3 sec
  numSuccessfulMsg     3649
  lastSuccessfulMsgTime 0:00:00 ago
  numFailedMsg         1
  lastFailedMsg          /api/2.0/vdn/config/segments
  lastFailedMsgTime     10 days, 1:15:29 ago
  lastErrorCode        CURLE_COULDN'T_RESOLVE_HOST - Couldn't resolve host
  The given remote host was not resolved.
  switch>
  ```
show vmtracer vm

The `show vmtracer vm` command displays VMs interfaces (Vnics) that are accessible to VM Tracer enabled interfaces. For each active VM, the command displays the name of the VM, its adapter, and the hypervisor to which it connects.

**Command Mode**

EXEC

**Command Syntax**

```
show vmtracer [INT_NAME] vm [VM_LIST]
```

**Parameters**

- `INT_NAME` the interfaces name Values include:
  - `<no parameter>` command returns information for all interfaces.
  - `interface ethernet e_range` Ethernet interface range.
  - `interface port-channel p_range` Port Channel interface range.
    Valid `e_range` and `p_range` formats include a number, number range, or comma-delimited list of numbers and ranges.
- `VM_LIST` The virtual machines for which the command displays information. Options include:
  - `<no parameter>` command returns information for all present VMs.
  - `vm_name` command returns information only for specified VM.

**Related Commands**

- `show vmtracer vm detail` displays connection information for one or more specified VMs.

**Examples**

- This command displays the VMs connected to all VM Tracer enabled interfaces.

```
switch>show vmtracer vm
VM Name             Esx Host                  Interface VLAN   Status
vCenter1            172.22.28.8               Po45      native Down/Down
vCenter2            172.22.28.8               Po45      native Up/Up
vCenter3            172.22.28.8               Po45      11     Down/Down
vCenter4            172.22.28.8               Po45      native Down/Down

switch>
```
show vmtracer vm detail

The `show vmtracer vm detail` command displays connection data for VMs interfaces (Vnics) that are accessible to VM Tracer enabled interfaces.

**Command Mode**
EXEC

**Command Syntax**
```
show vmtracer vm [VM_LIST] detail
```

**Parameters**
- **VM_LIST** The virtual machines for which the command displays information. Options include:
  - `<no parameter>` command returns information for all present VMs.
  - `vm_name` command returns information only for specified VM.

**Examples**
- This command displays connection data for the VMs connected to all VM Tracer enabled interfaces.
```
switch#show vmtracer vm vmcenter1
VM Name  vCenter1 Server App
   Interface   :     Po45
   vNIC        :     Network adapter 1
   MAC         :     00:31:22:8e:b8:41
   Portgroup   :     VM Network
   VLAN        :     native
   Switch      :     Switch2
   Status      :     Down/Down
   Host        :     10.22.18.28
   Data Center :     vcenter-5
switch>
```
- This command displays connection data for the VMs connected to all VM Tracer enabled interfaces.
```
switch#show vmtracer vm detail
VM Name  vCenter1 Server App
   Interface   :     Po45
   vNIC        :     Network adapter 1
   MAC         :     00:31:22:8e:b8:41
   Portgroup   :     VM Network
   VLAN        :     native
   Switch      :     Switch2
   Status      :     Down/Down
   Host        :     10.22.18.28
   Data Center :     vcenter-5

VM Name  vCenter2 Server App

   vNIC        :     vmk0
   MAC         :     00:33:23:3c:e1:4e
   Portgroup   :     Management Network
   VLAN        :     native
switch>
```
**show vmtrancer vnic counters**

The **show vmtrancer interface vnic counters** command displays input and output packet counts for VM interfaces (Vnics) that are active on the specified interface or VM.

**Command Mode**

EXEC

**Command Syntax**

```
show vmtrancer [ENTITY] vnic counters
```

**Parameters**

- **ENTITY** the virtual machine or interface over which statistics are gathered and displayed.
  - <no parameter> command returns information for all active VMs.
  - **interface ethernet e_range** Ethernet interface range.
  - **interface port-channel p_range** Port Channel interface range.
  - **vm vm_name** command returns information for specified VM.

Valid **e_range** and **p_range** formats include a number, number range, or comma-delimited list of numbers and ranges.

**Examples**

- This command displays the Vnics connected to Ethernet interface 24.

```
switch>show vmtrancer interface ethernet 24 vnic counters
Physical Intf: Ethernet24
Host: 10.17.28.8/site1/dvUplink1
VM Name   vNic               Input Pkt/Byte/%               Output Pkt/Byte/%
vCenter1  Network adapter 2  2550/ 187175/ 0.6              6/ 360/ 0.0
vCenter2  Network adapter 2  418615/30678024/99.4        1904439/1145654973/100.0
Summary                           421165/30865199/100.0 1904445/1904445/
switch>
```
show vmtracer vxlan segment

The `show vmtracer vxlan segment` command displays information about the VXLAN segments that are managed by the connected vShield Manager.

**Command Mode**

EXEC

**Command Syntax**

```
show vmtracer segment ENTITY
```

**Parameters**

- `ENTITY` specifies the information that the command displays. Options include:
  - `<no parameter>` displays information for VXLAN segments.
  - `pool` displays resource pools available to segments.
  - `pool pool_name` displays connection information about the specified pool.
  - `range` displays the VNI range of the managed segments.

**Examples**

- This command displays the VXLAN segments managed by the VSM.

  ```
  switch> show vmtracer vxlan segment
  Name                  VNI     Multicast IP     Network Scope
  -------------------------------------------------------------
  Eng Wire              5002    237.0.0.1        abcde
  HR Wire               5000    237.0.0.2        abcde
  switch>
  ```

- This command displays the resource pools available to the VXLANs.

  ```
  switch> show vmtracer vxlan segment pool
  Name                  Description                     Segments
  ------------------------------------------------------------------------
  abcde                 Spans Cluster 1 and Cluster 2   Eng Wire, HR Wire
  switch>
  ```

- This command displays connection and packet information for the abcde pool.

  ```
  switch> show vmtracer vxlan segment pool abcde
  Name:               abcde
  Description:        Spans Cluster 1 and Cluster 2
  Segments:           Eng Wire, HR Wire
  Vxlan Segment       Cluster   Host                      VTEP IP          DVS     VLAN   MTU
  Eng Wire            Cluster2  test2.example.com         10.168.200.1/24 dvs-test2 200   1600
  Eng Wire            Cluster1  test2.example.com         10.168.100.1/24 dvs-test1 100   1600
  HR Wire             Cluster1  test2.example.com         10.168.100.1/24 dvs-test1 100   1600
  HR Wire             Cluster2  test2.example.com         10.168.200.1/24 dvs-test2 200   1600
  switch>
  ```
- This command displays the VNI range of the VXLAN segments.

```bash
switch> show vmtracer vxlan segment range
```

switch>
show vmtracer vxlan vm

The `show vmtracer interface vnic counters` command displays the VXLAN segments, their VTEP IP numbers, and their VM endpoints that are managed by the connected vShield Manager.

**Command Mode**

EXEC

**Command Syntax**

`show vmtracer vxlan vm`

**Examples**

- This command displays the VM endpoints of the VXLAN segments managed by the VSM.

```
switch>show vmtracer vxlan vm

Vxlan Segment     VTEP IP          VLAN  VMs
Eng Wire           192.168.200.1/24 200   Eng VM3, Eng VM2
Eng Wire           192.168.100.1/24 100   Eng VM1
HR Wire            192.168.100.1/24 100   HR VM2, HR VM1
HR Wire            192.168.200.1/24 200   --
switch>
```
url (vmtracer mode)

The `url` command specifies the vCenter server location that is monitored by the session being edited by the current vmtracer mode. The command must reference a fully formed secure url.

**Command Mode**

Vmtracer Configuration

**Command Syntax**

```
url url_name
```

**Parameters**

- `url_name` location of the vCenter server. Valid formats include IP address (dotted decimal notation) and fully qualified domain name.

**Related Commands**

- `vmtracer session` places the switch in vmtracer configuration mode.

**Example**

- This command specifies the location of the vCenter monitored by the system_1 VM Tracer session.

```
switch(vmtracer-system_1)#url https://example.com
switch(vmtracer-system_1)#
```
url (vmtracer-vxlan mode)

The `url` command specifies the vShield Manager (VSM) server location that is monitored for VXLAN information by the configuration mode VM Tracer session. The command must reference a fully formed secure `url`.

The `url` statement is replaced in `running-config` for the configuration mode session by a subsequent `url` command. The statement is removed by deleting the VSM instance through a `no vxlan (vmtracer mode)` command in vmtracer configuration mode.

**Command Mode**

Vmtracer-vxlan Configuration

**Command Syntax**

```
url url_name
```

**Parameters**

- `url_name` location of the VSM server. Valid formats include IP address (dotted decimal notation) and fully qualified domain name.

**Related Commands**

- `vxlan (vmtracer mode)` places the switch in vmtracer-vxlan configuration mode.

**Example**

- This command configures the location of the VSM monitored by the vnet-1 VM Tracer session.

```
switch(config)#vmtracer session vnet-1
switch(config-vmtracer-vnet-1)#vxlan
switch(config-vmtracer-vnet-1-vxlan)#url https://example.com
switch(config-vmtracer-vnet-1-vxlan)#exit
switch(config-vmtracer-vnet-1)#show active
vmtracer session vnet-1
  allowed-vlan 1-4094
  vxlan
    url https://example.com
switch(config-vmtracer-vnet-1)#
```
username (vmtracer mode)

The `username` command identifies the switch’s account name on the vCenter server. The switch uses this user name to access vCenter information.

**Command Mode**

Vmtracer Configuration

**Command Syntax**

```
username name_string
```

**Parameters**

- `name_string`: vCenter account user name. Parameter must match the user name configured on the vCenter.

**Related Commands**

- `vmtracer session` places the switch in vmtracer configuration mode.

**Example**

- This command configures the user name for the vCenter associated with the system_1 session. The session uses this user name to log into the vCenter server.

```
switch(vmtracer-system_1)#username a-switch_01
switch(vmtracer-system_1)#
```
username (vmtracer-vxlan mode)

The `username` command identifies the switch’s account name on the vShield Manager (VSM) server located at the URL configured for the configuration mode VM Tracer. The switch uses this user name to access VSM information.

The `username` statement is replaced in `running-config` for the configuration mode interface by a subsequent `username` command. The statement is removed by deleting the VSM instance through a `no vxlan (vmtracer mode)` command in `vmtracer configuration mode`.

**Command Mode**

Vmtracer-vxlan Configuration

**Command Syntax**

```
username name_string
```

**Parameters**

- `name_string` VSM account user name. Parameter must match a user name configured on the VSM.

**Related Commands**

- `vxlan (vmtracer mode)` places the switch in `vmtracer-vxlan configuration mode`.

**Example**

- This command configures the user name of admin for the VSM located at the URL specified by the URL command.

```
switch(config)#vmtracer session vnet-1
switch(config-vmtracer-vnet-1)#vxlan
switch(config-vmtracer-vnet-1-vxlan)#url https://example.com
switch(config-vmtracer-vnet-1-vxlan)#username admin
switch(config-vmtracer-vnet-1-vxlan)#exit
switch(config-vmtracer-vnet-1)#show active
   vmtracer session vnet-1
       allowed-vlan 1-4094
       vxlan
           url https://example.com
           username admin
switch(config-vmtracer-vnet-1)#
```
vmtracer

The `vmtracer` command enables vmtracer mode on the configuration mode interface. Interfaces with vmtracer mode enabled send discovery packets to the connected vSwitch.

The `no vmtracer` and `default vmtracer` commands disable vmtracer mode on the configuration mode interface by removing the corresponding `vmtracer` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-channel Configuration

**Command Syntax**

```
vmtracer HOST_TYPE
no vmtracer HOST_TYPE
default vmtracer HOST_TYPE
```

**Parameters**

- `HOST_TYPE` the type of hypervisor that controls the vSwitch to which the interface connects.
  - `vmware-esx` ESX or ESXI hypervisor (VMware).

**Examples**

- These commands enable vmtracer mode on the Ethernet 3 interface.
  ```
  switch(config)#interface Ethernet 3
  switch(config-if-Et3)#vmtracer vmware-esx
  switch(config-if-Et3)#
  ```

- This command disables vmtracer mode on the Ethernet 3 interface.
  ```
  switch(config-if-Et3)#no vmtracer vmware-esx
  switch(config-if-Et3)#
  ```
vmtracer session

The vmtracer session command places the switch in vmtracer mode for the specified session. The command creates a new session or loads an existing session for editing.

A VM Tracer session connects the switch to a vCenter server at a specified location, then downloads data about VMs and vSwitches managed by ESX hosts connected to switch ports. The switch supports a maximum of four VM Tracer sessions.

VM Tracer session parameters are configured in vmtracer mode. Parameters configured in vmtracer mode include the vCenter location and dynamic VLAN usage.

The no vmtracer session and default vmtracer session commands disable the session and remove its configuration from running-config.

Command Mode
Global Configuration

Command Syntax

vmtracer session name
no vmtracer session name
default vmtracer session name

Parameters

- name The label assigned to the VM Tracer session.

Commands Available in vmtracer Configuration Mode

- allowed-vlan
- autovlan disable
- password (vmtracer mode)
- url (vmtracer mode)
- username (vmtracer mode)
- vxlan (vmtracer mode)

Examples

- This command enters vmtracer mode for the system_1 session.
  
  switch(config)#vmtracer session system_1
  switch(vmtracer-system_1)#

- This command disables the system_1 VM Tracer session. The system_1 session and all of its parameters are removed from running-config.
  
  switch(config)#no vmtracer session system_1
  switch(config)#
**vxlan (vmtracer mode)**

The `vxlan` command places the switch in vmtracer-vxlan configuration mode. To monitor VXLAN based VMware configurations, the switch must communicate with a vShield Manager (VSM). Vmtracer-vxlan configuration mode specifies the location and user account data that allows the switch to access a VSM within the configuration mode vmtracer session. Each VM Tracer session can be associated with one vShield instance.

The `no vxlan` and `default interface vxlan` commands delete the vShield instance from the configuration mode vmtracer session by removing all vmtracer-vxlan mode commands from `running-config`.

**Command Mode**

Vmtracer Configuration

**Command Syntax**

```
vxlan
no vxlan
default vxlan
```

**Related Commands**

- `vmtracer session` places the switch in vmtracer configuration mode.

**Commands Available in vmtracer-vxlan Configuration Mode**

- `password (vmtracer mode)`
- `url (vmtracer mode)`
- `username (vmtracer mode)`

**Example**

- These commands create the vShield instance for the VMTracer session named vnet-1.

  ```
  switch(config)#vmtracer session vnet-1
  switch(config-vmtracer-vnet-1)#vxlan
  switch(config-vmtracer-vnet-1-vxlan)#
  ```
Path Tracer

Path Tracer is a network tool that continuously analyzes the network for packet loss and network changes. This chapter describes path tracer concepts and configuration processes.

Sections in this chapter include:

- Section 42.1: Path Tracer Description
- Section 42.2: Path Tracer Configuration
- Section 42.3: Path Tracer Command Descriptions

### 42.1 Path Tracer Description

#### 42.1.1 Path Tracer Synopsis

Path Tracer is a network tool that continuously analyzes the network for packet loss by sending small test packets (probes) with ranging TTL values to various network destinations. Probes are trapped upon their expiration and recorded by switches and routers along the data path. Aggregated data from multiple probes provide information concerning packet drop frequency along each data path.

Within networks that utilize ECMP and LAG multipaths, a packet’s destination is among a criteria set that determines its path and the network devices it encounters. At each multipath decision point, a packet’s movement is based on a hash of its header field contents and its ingress layer-2 interface. Factors in a packet’s successful delivery include its path and ultimate destination.

Path Tracer implements a distributed version of traceroute, where probe performance measurements are based on sequence number gaps at trapping devices.

Path Tracer provides the following:

- Background monitoring for problem detection.
- Coverage of all first-hop ECMP or LAG members to the probed destination.
- Randomized source port and IP address, providing entropy in the rest of the network links.
- Records recipient L2 interface on trapping device to detect drops affecting a single LAG member.
- Unidirectional path verification without relying on response packets.
- Hardware forwarding verification.

#### 42.1.2 Path Tracer Devices

Path tracer devices are switches and routers along a data path that forwards and processes and path tracer packets (probes). The following terms refer to these devices in terms of their path tracer function.

- **Beacon**: Device that sends or receives probes. A beacon can be a switch, router, or host.
• An **egress beacon** is a device that sends probes.
• An **ingress beacon** is a device that receives probes and records statistics.
• **Path**: The set of devices that probes traverse through the network.
• **Load balancing group**: The set of physical interfaces a packet can egress, based on its IP destination.

### 42.1.3 Path Tracer Data Structures

Data structures refer to packet formats and stream contents that Path Tracer uses. The following terms describe Path Tracer data structures:

- **Probe**: Text packets transmitted by path tracer beacons and processed by other path tracer devices. Probes are TCP or UDP packets with special payload information that receiving devices use to track network performance.
- **Stream header**: The basic path tracer packet construct. A stream header consists of:
  • Source IP Address
  • Destination IP Address
  • Source Port
  • IP Type
  • Egress Source MAC Address
  • Egress Dest MAC Address
  • Egress VLAN Tag
  • Originating device’s egress L3-Interface
  • Originating device’s egress L2-Interface

The first four fields determine the packet’s hash. The originating device’s egress L2-interface determines the link used by the first packet. The ingress L2-interface at the second hop can be used for hashing. The originating device’s L3-interface determines the packets’ first-hop direction.

- **Egress header**: Data set used to compute a beacon’s set of egress streams. Contains information common to all streams that egress a specific L2-interface. The egress header does not include stream parameters that are not directly tied to an interface, (source IP, source port, IP type).

The egress header includes:
  • Egress Source MAC Address
  • Egress Dest MAC Address
  • Egress VLAN Tag
  • Destination IP Address
  • Original Egress L3-Interface
  • Original Egress L2-Interface

- **Egress stream**: The data set that consists of the stream header and TTL. The egress stream specifies the probe packet’s direction (stream header) and network depth (TTL). Probes flow from one or more egress streams at the origin beacon.

- **Ingress stream**: The data set consisting of the stream header, original TTL, and ingress L2-interface, as recorded from arriving probe packets. During stable network periods, a stream’s ingress L2-interface remains constant.

- **Destination L4 Port**: Destination TCP or UDP port identifies inbound probe packets. The port must be identical on all beacons through a probe’s path. The default destination L4 port 49152.
• **Sequence number**: A 64-bit number that is written into each probe packet to specify its sequence within the stream.

• **Epoch**: Time-based identifier of a probe session. It is refreshed when the sequence number resets.

• **Robustness**: A factor in the calculation of the period that stream data remains in the ingress stream table. The robustness value is 30.

### 42.1.4 Path Tracer Probe Format

Probe header type (TCP or UDP) and data written in a probe header is determined by the egress stream except for the destination port number. The probe body repeats the TTL from the egress stream, since it is decremented when the packet egresses. The body contains the epoch and sequence numbers.

Probe packets are formatted as follows:

```
0                   1                   2                   3
0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
| Type = 0x01  |  Version=0x01 |           Checksum             |
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
|                     Epoch Time (seconds)                      |
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
|                     Epoch Time (microseconds)                  |
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
|                    Sequence Number (64-bit)                    |
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
|                    Sequence Number (64-bit)                    |
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
|                      Origin Interface IP                       |

+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
|                  Probing Interval in ms                         |
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
```

### 42.1.5 Path Tracer Processes

These sections describe the behavior of switches and routers within their roles as path tracer ingress and egress beacons.

#### 42.1.5.1 Ingress Beacon Behavior

Ingress beacons are network devices that receive and process probes. Ingress beacons trap only probes with an expired TTL (hop limit) or a destination IP that matches the ingress interface.

Each ingress beacon maintains an Ingress Stream Table, which contains the following information for each ingress stream:

- The ingress stream data set.
Ingress beacons distinguish probes from other packets by their L4 destination port. Upon identifying a packet that should be trapped, an ingress beacon suspends normal processing of the packet without generating normal responses. The ingress stream data set is generated from the packet header and body. The epoch is compared to the data stream’s recorded epoch number. Matching epoch numbers indicate a common probing session sent to each probe. The probe’s sequence number is compared to the sequence number in the most recently received packet in the ingress stream. The following are recorded:

- The probe is recorded as **received**.
- Sequence number gaps are recorded as **losses**.
- A sequence number that is smaller than the previously received probe is recorded as **misordered** if the epochs are identical.
- When epochs differ, the probe is received without recording a loss or misorder.

Ingress Beacons store information locally about received probes. They do not send response packets to the egress beacon.

### 42.1.5.2 Egress Beacon Behavior

Egress beacons are devices that generate probes. Each egress beacon maintains a path tracer monitor configuration and an egress stream table.

Egress beacon configuration includes the following:

- The source IP addresses or source interfaces whose IP addresses are used as the probe source.
- The L4 source ports to used as the probe source.
- The IP TTL (hop limit) and a corresponding probe transmission rate.
- The destination IP addresses.

The Egress Stream Table contains the following:

- Egress stream data set.
- Epoch and sequence numbers.
- Probe transmission interval and rate (packets per interval).

The egress beacon uses configuration and forwarding information to generate a set of egress streams based on configuration parameters, valid egress physical interfaces, and specified destinations. An egress stream is added for each of the following:

- Each interface or address that is configured as the egress stream source IP address.
- Each port number that is configured as the egress stream source port.
- Each value that is configured as the Egress Stream TTL.
- Each protocol for which the egress stream source IP protocol type is configured.
- Each member of the load balancing group for the specified destination.

Load balancing group members include the set of Ethernet interfaces from where the destination IP address can egress. This set is computed using local forwarding and bridging tables (a switch’s FIB and MAC tables or a server’s kernel routing tables) and includes:

- Destination IP Address (configured destination).
- Egress Interface IP (each member of ECMP next hops for this destination)
- Egress L2- Interface (each member of any L2 LAGs that act as next hops for this destination).
The egress stream set is computed periodically and is frequently out of date when routing information changes rapidly. When an egress stream is added to the egress stream table, an epoch number is generated based on the current system time and the sequence number is reset to 1. Each egress stream generates probe packets at a specified rate with incrementing sequence numbers. When the sequence number space is exhausted, the epoch number is reset to the current time and the sequence number restarts at 1. Egress beacons can transmit probes in batches if the interval is too short. Each probe must be transmitted from the egress L2- interface specified in the egress stream data set. Beacons do not route packets using their kernel or other routing mechanisms.
### 42.2 Path Tracer Configuration

These sections describe Path Tracer configuration tasks:

- Section 42.2.1: Enabling Path Tracer
- Section 42.2.2: Path Tracer Beacon Configuration
- Section 42.2.3: Displaying Path Tracer Results

#### 42.2.1 Enabling Path Tracer

Path Tracer parameters are configured in monitor-reachability configuration mode. Monitor-reachability configuration mode is not a group change mode; *running-config is immediately changed when commands are entered*. The `monitor reachability` command places the switch in monitor-reachability configuration mode.

Path Tracer is disabled by default and enabled globally on the switch. The `no shutdown (Monitor Reachability)` command enables Path Tracer on the switch.

**Example**

- These commands enter monitor-reachability configuration mode and enables Path Tracer.

```
switch(config)#monitor reachability
switch(config-mon-reach)#no shutdown
switch(config-mon-reach)#show active
monitor reachability
    no shutdown
switch(config-mon-reach)#
```

- This command disables Path Tracer.

```
switch(config-mon-reach)#shutdown
switch(config-mon-reach)#show active
switch(config-mon-reach)#
```

- This command exits monitor reachability mode.

```
switch(config-mon-reach)#exit
switch(config)#
```

The `destination port (Monitor Reachability)` command specifies the TCP or UDP port for Path Tracer probes that the switch sends and receives. A probe's destination port must remain consistent throughout its path and not used by any other application.

**Example**

- This command sets the Path Tracer destination port to 55666.

```
switch(config)#monitor reachability
switch(config-mon-reach)#destination port 55666
switch(config-mon-reach)#show active
monitor reachability
    destination port 55666
switch(config-mon-reach)#
```

#### 42.2.2 Path Tracer Beacon Configuration

This section describes tasks that configure ingress beacon and egress beacon parameters.
Ingress Beacon Configuration

Enabling Path Tracer also enables the switch as an ingress beacon. Ingress beacon commands limit the quantity of streams that the switch can process and control content removal from the ingress stream table.

Limiting the number of ingress probe streams can diminish the total CPU resources and memory used by Path Tracer when there is a misconfiguration or the switch is receiving more probes than expected. By default, 50,000 streams is the switch maximum. The `probe receiver max-streams` command configures the quantity of ingress probe streams that the switch can simultaneously process.

Example

- This command configures the switch to process a maximum of 10000 ingress streams.

```
switch(config)#monitor reachability
switch(config-mon-reach)#probe receiver max-streams 10000
switch(config-mon-reach)#show active
monitor reachability
    probe receiver max-streams 10000
switch(config-mon-reach)#
```

By default, data streams remain in the ingress stream period for the period obtained by multiplying the robustness value by the stream’s TTL. The `preserve streams` command prevents the removal of stream data from the Ingress Stream Table on the basis of the robustness-TTL expiration period.

Example

- This command prevents the removal of data from the ingress stream table on the basis of robustness-TTL timeout expiry.

```
switch(config)#monitor reachability
switch(config-mon-reach)#preserve-streams
switch(config-mon-reach)#show active
monitor reachability
    preserve-streams
switch(config-mon-reach)#
```

Egress Beacon and Probe Transmitter Configuration

Egress beacon functions are enabled and configured from probe-xmit configuration, which is a child mode of monitor reachability mode. Probe-xmit mode configures a specified probe transmitter and can be entered multiple times with different transmitter names to create multiple probe transmitters.

Probe-xmit mode is not a group change mode; `running-config is immediately changed when commands are entered`. The `probe transmitter` command places the switch in probe-xmit configuration mode for a specified transmitter. The `exit` command returns the switch to monitor-reachability configuration mode.

Probe transmitters are disabled by default and enabled individually from probe-xmit mode. The `no shutdown` (Monitor Reachability Probe Transmitter) command enables Path Tracer on the switch. Even when enabled, a probe transmitter cannot start functioning until a mandatory set of parameters are configured for the transmitter.
Example

- These commands globally enable Path Tracer, then enables the PROBE-1 probe transmitter.

```
switch(config)#monitor reachability
switch(config-mon-reach)#no shutdown
switch(config-mon-reach)#probe transmitter PROBE-1
switch(config-mr-trans-PROBE-1)#no shutdown
switch(config-mr-trans-PROBE-1)#show active
```

Probe transmission characteristics for probe packets are configured through `hops (Monitor Reachability Probe Transmitter)` commands. Each `hops` command specifies the following:

- The probe’s range, in terms of hops as implemented through IP TTL. When a probe’s hop limit expires or it reaches the destination IP address, the destination device processes the packet.
- The transmission rate of packets per specified interval. Packet transmissions are uniformly distributed over the specified interval.

A probe transmitter may contain multiple hop commands to facilitate probing at different distances from the switch. Each hop statement in a probe transmitter must specify different hop numbers.

Example

- These commands configure two sets of probe packets: one set transmits probes with a maximum range of 40 hops and the other set transmits probes with a maximum range of 50 hops.

```
switch(config)#monitor reachability
switch(config-mon-reach)#probe transmitter PROBE-X
switch(config-mr-trans-PROBE-X)#hops 40 rate 25 probes every 10 seconds uniform
switch(config-mr-trans-PROBE-X)#hops 50 rate 15 probes every 20 seconds uniform
switch(config-mr-trans-PROBE-X)#show active
```

The probe destination is configured through `destination ip (Monitor Reachability Probe Transmitter)`. The `destination ip` command specifies either a single IP address or a set of IP addresses with a common host number and varying subnets.

A probe packet is processed when its TTL (hop limit) expires or it reaches the destination IP address. Each probe transmitter must list at least one destination address and may list multiple addresses through additional `destination ip` commands. The CLI does not accept commands that include an address that was previously specified.
Example

- This command configures the destination IP address as 10.4.3.3.
  ```
  switch(config-mon-reach)#probe transmitter PROBE-X
  switch(config-mr-trans-PROBE-X)#destination ip 10.4.3.3
  switch(config-mr-trans-PROBE-X)#show active
  monitor reachability
    probe transmitter PROBE-X
    destination ip 10.4.3.3
  switch(config-mr-trans-PROBE-X)#
  ```

- This command configures the destination address as 10.10.5.5, 10.10.6.5, 10.10.7.5, and 10.10.8.5.
  ```
  switch(config-mr-trans-PROBE-X)#destination ip 10.10.5.5/24 subnets 4
  switch(config-mr-trans-PROBE-X)#show active
  monitor reachability
    probe transmitter PROBE-X
    destination ip 10.10.5.5/24 subnets 4
  switch(config-mr-trans-PROBE-X)#
  ```

The IP protocol through which probe packets are sent is configured through `ip protocol (Monitor Reachability Probe Transmitter)` commands. UDP is the default protocol.

Example

- These commands configure the PROBE-X probe transmitter to send TCP probe packets.
  ```
  switch(config)#monitor reachability
  switch(config-mon-reach)#probe transmitter PROBE-X
  switch(config-mr-trans-PROBE-X)#ip protocol tcp
  switch(config-mr-trans-PROBE-X)#show active
  monitor reachability
    probe transmitter PROBE-X
    hops 40 rate 25 probes every 20 seconds uniform
    hops 50 rate 15 probes every 20 seconds uniform
    ip protocol tcp
    destination ip 10.4.3.3
    destination ip 10.10.5.5/24 subnets 4
  switch(config-mr-trans-PROBE-X)#
  ```

The contents of source IP address and source port fields of probe packets are derived from `source interface (Monitor Reachability Probe Transmitter)` and `source port (Monitor Reachability Probe Transmitter)` commands. The probe transmitter enters one of these source IP addresses and ports in the source fields. Entering multiple addresses and ports in source fields assure the distribution of packets among the available ECMPs.
Example

- These commands configure the probe transmitter to use the IP address 10.25.25.3 as the source interface it probe packets by assigning that address to loopback interface 0, then configuring the loopback interface as the probe transmitter’s source interface.

  switch(config)#interface loopback 0
  switch(config-if-Lo0)#ip address 10.25.25.3/28
  switch(config-if-Lo0)#exit
  switch(config)#monitor reachability
  switch(config-mon-reach)#probe transmitter PROBE-X
  switch(config-mr-trans-PROBE-X)#source interface loopback 0
  switch(config-mr-trans-PROBE-X)#show active

- This command configures port transmitters to use 1000, 1010, and 1020 as source ports in its packets.

  switch(config)#monitor reachability
  switch(config-mon-reach)#probe transmitter PROBE-X
  switch(config-mr-trans-PROBE-X)#source port sequential start 1000 stride 10 count 3
  switch(config-mr-trans-PROBE-X)#show active

42.2.3 Displaying Path Tracer Results

An ingress beacon captures a probe whose TTL expires or has reached its IP destination. Probes are categorized based on their stream headers; the ingress physical interface is also recorded. Two consecutive probes with the same epoch number and a sequence number gap indicates packet loss that corresponds to the missing sequence numbers. When consecutive probes arrive with the same epoch number and the later packets has the lower sequence number, the switch records a misordering.

Path Tracer information and status is displayed through the `show monitor reachability` command.
Example

- This command displays Path Tracer configuration information.

```bash
switch#show monitor reachability
Reachability Monitor Configuration
===================================
Reachability Monitor : Enabled
Ignore checksum      : False
Preserve streams    : True
Allow destination reuse : False
Maximum ingress streams : 50000
Destination L4 port : 49152
Checkpoint interval (s) : 60.0

Probe Transmitters:
Transmitter one : Enabled
```

Probes transmitter configuration and status is displayed through the `show monitor reachability probe-transmitter` command.

Example

- This command displays configuration data for the configured probe transmitters.

```bash
switch#show monitor reachability probe-transmitter
Probe Transmitter one
===================================
Status: Enabled
IP Protocol: UDP
Probing hop 1 uniformly at rate 1 probes every 1 seconds
Probing hop 2 uniformly at rate 1 probes every 1 seconds
Source Interfaces: Loopback0
Source L4 Ports: 1053, 1181, 2044, 2069, 2738, 2965, 3833, 4505, 4660, 5035,
                 5303, 5713, 5769, 7115, 7244, 8477, 9991, 11516, 13831,
                 14217, 15763, 18541, 19727, 20623, 22674, 22855, 23085,
                 23287, 23641, 24566, 24620, 25462, 25804, 27591, 28266,
                 29970, 32479, 32846, 33172, 33661, 33793, 34803, 35837,
                 39500, 40219, 41086, 41427, 42139, 42355, 42948, 44237,
                 44314, 44552, 44803, 46036, 46555, 47853, 47878, 48376,
                 48386, 50322, 50325, 50420, 50581, 51602, 51942, 52886,
                 54378, 54711, 54907, 56087, 57569, 57825, 57902, 59942,
                 61370, 62817, 63070, 63715, 65340

Destination IPs: 10.0.3.1
```

Contents of the egress streams table is displayed through the `show monitor reachability egress-streams` command.
Example

- This command displays Path Tracer packets that the switch transmitted.

```
switch#show monitor reachability egress-streams
Report generated at 2013-11-01 17:27:54
```

switch#
42.3 Path Tracer Command Descriptions

Global Configuration Commands
- monitor reachability

Clear Commands
- clear monitor reachability probe-statistics

Display Commands
- show monitor reachability
- show monitor reachability egress-streams
- show monitor reachability ingress-streams
- show monitor reachability interface-ttl-statistics
- show monitor reachability probe-statistics
- show monitor reachability probe-transmitter

Monitor Reachability Configuration Mode Commands
- destination port (Monitor Reachability)
- preserve streams
- probe receiver max-streams
- probe transmitter
- shutdown (Monitor Reachability)

Monitor Reachability Probe Transmitter Configuration Mode Commands
- destination ip (Monitor Reachability Probe Transmitter)
- hops (Monitor Reachability Probe Transmitter)
- ip protocol (Monitor Reachability Probe Transmitter)
- shutdown (Monitor Reachability Probe Transmitter)
- source interface (Monitor Reachability Probe Transmitter)
- source port (Monitor Reachability Probe Transmitter)
clear monitor reachability probe-statistics

The `clear monitor reachability probe-statistics` command removes all entries from the probe statistics table and resets the ingress stream table.

**Command Mode**

Privileged EXEC

**Command Syntax**

`clear monitor reachability probe-statistics`

**Example**

- This command clears the probe statistics and ingress stream tables.

```bash
switch# clear monitor reachability probe-statistics
switch#
```
destination ip (Monitor Reachability Probe Transmitter)

The destination ip command specifies the destination of packets sent by the configuration mode probe transmitter. The command specifies either a single IP address or a set of IP addresses with a common host number and varying subnets.

A probe packet is processed when its TTL (hop limit) expires or it reaches the destination IP address. Each probe transmitter must list at least one destination address and may list multiple addresses through additional commands. A command that includes an address that was previously specified is not accepted.

The no destination ip and default destination ip commands remove the specified destination IP address from the configuration probe transmitter by removing the corresponding destination IP command from running-config.

Command Mode
Mon-reach-xmit Configuration

Command Syntax

```
destination ip DESTINATION_ADDR
no destination ip DESTINATION_ADDR
default destination ip DESTINATION_ADDR
```

Parameters

- **DESTINATION_ADDR** Probe transmitter destination IP addresses. Options include:
  - `ipv4_addr` Individual IP address.
  - `ipv4_prefix subnets <1 to 65535>` IPv4 address followed by number of subnets.

Related Commands

- `probe transmitter` places the switch in monitor-reachability-xmit configuration mode.

Examples

- This command configures the destination IP address as 10.4.3.3.
  ```
  switch(config-mon-reach)#probe transmitter PROBE-X
  switch(config-mr-trans-PROBE-X)#destination ip 10.4.3.3
  switch(config-mr-trans-PROBE-X)#show active
  monitor reachability
  probe transmitter PROBE-X
  destination ip 10.4.3.3
  switch(config-mr-trans-PROBE-X)#
  ```

- This command configures the destination address as 10.10.5.5, 10.10.6.5, 10.10.7.5, and 10.10.8.5.
  ```
  switch(config-mr-trans-PROBE-X)#destination ip 10.10.5.5/24 subnets 4
  switch(config-mr-trans-PROBE-X)#show active
  monitor reachability
  probe transmitter PROBE-X
  destination ip 10.4.3.3
  destination ip 10.10.5.5/24 subnets 4
  switch(config-mr-trans-PROBE-X)#
  ```
destination port (Monitor Reachability)

The destination port command specifies the destination L4 (TCP or UDP) port for Path Tracer probes that the switch sends and receives. The default path tracer port is 49152. A probe’s destination port must remain consistent throughout its path and not used by any other application.

The no destination port and default destination port commands restore the default destination L4 port to 49152 by removing the destination port command from running-config.

Command Mode
Mon-reach Configuration

Command Syntax
  destination port port_id
  no destination port
  default destination port

Parameters
  • port_id  UDP or TCP port number. Value ranges from 0 to 65535.

Related Commands
  • monitor reachability places the switch in monitor-reachability configuration mode.

Example
  • This command sets the Path Tracer destination port to 55666.

switch(config)#monitor reachability
switch(config-mon-reach)#destination port 55666
switch(config-mon-reach)#show active
  monitor reachability
    destination port 55666
switch(config-mon-reach)#

  • This command resets the path tracer destination port to the default value of 49152.

switch(config-mon-reach)#no destination port
switch(config-mon-reach)#show active
switch(config-mon-reach)#
hops (Monitor Reachability Probe Transmitter)

The **hops** command configures probe transmission characteristics for the configuration mode probe transmitter by specifying the network distance (measured in hops) and packet rate. The command configures the following egress stream packet transmission parameters:

- The distance is measured in hops as implemented through IP TTL. When a probe’s hop limit expires or it reaches the destination IP address, the device that received the packet processes it.
- The packet rate defines the number of packets sent per specified interval. Packet transmissions are uniformly distributed over the specified interval.

A probe transmitter may contain multiple hop commands to facilitate reachability probing at different distances from the switch. Multiple hop statements within a probe transmitter cannot specify the same number of hops.

The **no hops** and **default hops** commands remove the probe transmission characteristics configuration by removing the corresponding **hops** command from *running-config*.

**Command Mode**

Mon-reach-xmit Configuration

**Command Syntax**

```
 hops distance_hops rate rate probes_quantity probes every INTERVAL uniform
 no hops distance_hops
 default hops distance_hops
```

**Parameters**

- **distance_hops** specifies the probe’s hop limit (TTL). Value ranges from 1 to 255.
- **probes_quantity** quantity of packets sent per transmission period. Value ranges from 1 to 65535.
- **INTERVAL** transmission period. Options specify a programmable number of seconds or minutes. Quantity value for each time unit ranges from 1 to 65535.
  - **quantity seconds** Interval length, as measured in seconds.
  - **quantity minutes** Interval length, as measured in minutes.

**Related Commands**

- **probe transmitter** places the switch in monitor-reachability-xmit configuration mode.

**Examples**

- These commands configure two set of probe packets: one set transmits probes with a maximum range of 40 hops and the other set transmits probes with a maximum range of 50 hops.

```
switch(config)#monitor reachability
switch(config-mon-reach)#probe transmitter PROBE-X
switch(config-mr-trans-PROBE-X)#hops 40 rate 25 probes every 10 seconds uniform
switch(config-mr-trans-PROBE-X)#hops 50 rate 15 probes every 20 seconds uniform
switch(config-mr-trans-PROBE-X)#show active
monitor reachability
probe transmitter PROBE-X
  hops 40 rate 25 probes every 20 seconds uniform
  hops 50 rate 15 probes every 20 seconds uniform
destination ip 10.4.3.3
destination ip 10.10.5.5/24 subnets 4
switch(config-mr-trans-PROBE-X)#
```
**ip protocol (Monitor Reachability Probe Transmitter)**

The `ip protocol` command specifies the IP protocol that the switch uses to send probe packet through the configuration mode probe transmitter. The default protocol is UDP.

The `no ip protocol` and `default ip protocol` commands restore the default protocol for the configuration mode probe transmitter by removing the corresponding `ip protocol` statement from `running_config`.

**Command Mode**

Mon-reach-xmit Configuration

**Command Syntax**

```
ip protocol PROT_TYPE
no ip protocol
default ip protocol
```

**Parameters**

- `PROT_TYPE` Specifies the IP protocol. Options include:
  - `tcp` TCP packets.
  - `udp` UDP packets.

**Related Commands**

- `probe transmitter` places the switch in monitor-reachability-xmit configuration mode.

**Example**

- These commands configure the PROBE-X probe transmitter to send TCP probe packets.

```
switch(config)#monitor reachability
switch(config-mon-reach)#probe transmitter PROBE-X
switch(config-mr-trans-PROBE-X)#ip protocol tcp
switch(config-mr-trans-PROBE-X)#show active
monitor reachability
  probe transmitter PROBE-X
    hops 40 rate 25 probes every 20 seconds uniform
    hops 50 rate 15 probes every 20 seconds uniform
    ip protocol tcp
    destination ip 10.4.3.3
    destination ip 10.10.5.5/24 subnets 4
switch(config-mr-trans-PROBE-X)#
```
monitor reachability

The `monitor reachability` command places the switch in monitor-reachability configuration mode, which is used to specify Path Tracer configuration parameters. Path Tracer is a network monitor and analysis tool that continuously and actively probes the network for packet loss.

Monitor-reachability configuration mode is not a group change mode; `running-config` is changed immediately upon entering commands. Exiting monitor-reachability configuration mode does not affect `running-config`. The `exit` command returns the switch to global configuration mode.

The `no monitor reachability` and `default monitor reachability` commands remove previously configured `monitor reachability` commands from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**

```
monitor reachability
no monitor reachability
default monitor reachability
```

**Commands Available in Monitor-reachability Configuration Mode**

- destination port (Monitor Reachability)
- preserve streams
- probe transmitter
- probe receiver max-streams
- shutdown (Monitor Reachability)

**Examples**

- These commands place the switch in monitor-reachability configuration mode and globally enable Path Tracer.
  ```
  switch(config)#monitor reachability
  switch(config-mon-reach)#no shutdown
  switch(config-mon-reach)#show active
  monitor reachability
  no shutdown
  switch(config-mon-reach)#
  ```

- This command exits monitor reachability mode.
  ```
  switch(config-mon-reach)#exit
  switch(config)#
  ```

- This command deletes all previously configured monitor-reachability commands.
  ```
  switch(config)#no monitor reachability
  switch(config)#monitor reachability
  switch(config-mon-reach)#show active
  switch(config-mon-reach)#
**preserve streams**

The **preserve streams** command prevents the expiration of streams from the Ingress Stream Table. By default, data streams remain in the ingress stream period for the period obtained by multiplying the robustness value by the stream’s TTL.

The **no preserve streams** and **default preserve streams** commands restore the default behavior of removing streams from the ingress stream table upon robustness-TTL timeout expiry by removing the **preserve streams** command from **running-config**.

**Command Mode**

Mon-reach Configuration

**Command Syntax**

```
preserve streams
no preserve streams
default preserve streams
```

**Related Commands**

- **monitor reachability** places the switch in monitor-reachability configuration mode.

**Example**

- This command prevents the expiration of streams from the Ingress Stream Table.

```plaintext
switch(config)#monitor reachability
switch(config-mon-reach)#preserve-streams
switch(config-mon-reach)#show active
  monitor reachability
    preserve-streams
switch(config-mon-reach)#
```
probe receiver max-streams

The `probe receiver max-streams` command configures the quantity of ingress probe streams that the switch can simultaneously process. Limiting the number of ingress probe streams can diminish the total CPU resources and memory used by Path Tracer when there is a misconfiguration or the switch is receiving more probes than expected. The default maximum is 50,000 streams.

The `no probe receiver max-streams` and `default probe receiver max-streams` commands restore the max-hops setting to its default value of 50000 by removing the `probe receiver max-streams` command from `running-config`.

**Command Mode**
Mon-reach Configuration

**Command Syntax**

```
probe receiver max-streams data_streams
no probe receiver max-streams
default probe receiver max-streams
```

**Parameters**

- `data_streams` Maximum quantity of ingress probe streams. Value ranges from 0 to 50000. Default is 50000.

**Related Commands**

- `monitor reachability` places the switch in monitor-reachability configuration mode.

**Example**

- This command configures a ingress maximum of 10000 probe streams.

```bash
switch(config)#monitor reachability
switch(config-mon-reach)#probe receiver max-streams 10000
switch(config-mon-reach)#show active
  monitor reachability
    probe receiver max-streams 10000
switch(config-mon-reach)#
```
probe transmitter

The **probe transmitter** command is a monitor reachability command that places the switch in probe-xmit mode for configuring and enabling a Path Tracer probe transmitter. The command either accesses an existing probe transmitter configuration or creates a new instance if it specifies a new transmitter.

Probe-xmit configuration mode is not a group change mode; **running-config** is changed immediately upon entering commands. Exiting probe-xmit mode does not affect **running-config**. The **exit** command returns the switch to monitor-reachability configuration mode.

The **no probe transmitter** and **default probe transmitter** commands delete the specified probe transmitter and its configuration statements.

**Command Mode**
- Mon-reach Configuration

**Command Syntax**

```
probe transmitter transmitter_name
no probe transmitter transmitter_name
default probe transmitter transmitter_name
```

**Parameters**
- **transmitter_name**  Probe transmitter name.

**Related Commands**
- **monitor reachability** places the switch in monitor-reachability configuration mode.

**Commands Available in Monitor-reachability- Configuration Mode**
- **destination ip** (Monitor Reachability Probe Transmitter)
- **hops** (Monitor Reachability Probe Transmitter)
- **ip protocol** (Monitor Reachability Probe Transmitter)
- **shutdown** (Monitor Reachability Probe Transmitter)
- **source port** (Monitor Reachability Probe Transmitter)

**Examples**
- These commands create a Path Tracer probe transmitter named PROBE-1.
  ```
  switch(config)#monitor reachability
  switch(config-mon-reach)#probe transmitter PROBE-1
  switch(config-mr-trans-PROBE-1)#show active
  monitor reachability
   probe transmitter PROBE-1
  switch(config-mr-trans-PROBE-1)#
  ```
- These commands exit probe-xmit configuration and monitor reachability configuration modes.
  ```
  switch(config-mr-trans-PROBE-1)#exit
  switch(config-mon-reach)#exit
  switch(config)#
  ```
- These commands delete the PROBE-1 probe transmitter.
  ```
  switch(config)#monitor reachability
  switch(config-mon-reach)#no probe transmitter PROBE-1
  switch(config-mon-reach)#
  ```
show monitor reachability

The `show monitor reachability` command displays path tracer configuration information.

**Command Mode**
Privileged EXEC

**Command Syntax**
```
show monitor reachability
```

**Example**
- This command displays Path Tracer configuration information.

```
switch#show monitor reachability
Reachability Monitor Configuration
===================================
Reachability Monitor           : Enabled
Ignore checksum                : False
Preserve streams               : True
Allow destination reuse        : False
Maximum ingress streams        : 50000
Destination L4 port            : 49152
Checkpoint interval (s)        : 60.0

Probe Transmitters:
Transmitter one                : Enabled
switch#
```
show monitor reachability egress-streams

The `show monitor reachability egress-streams` command displays contents of the egress streams table.

**Command Mode**

Privileged EXEC

**Command Syntax**

```
show monitor reachability egress-streams DATA_TYPE OUTPUT
```

**Parameters**

- **DATA_TYPE** specifies information about the egress beacon.
  - `<no parameter>` displays beacon’s interface and IP information.
  - `layer2` displays beacon’s interface, IP, and MAC address information.
- **OUTPUT** Specifies format of output data.
  - `<no parameter>` beacon data is summarized, followed by list of packets.
  - `verbose` each entry displays packet and beacon information. Items listed in tabular format.
  - `verbose csv` Same information as verbose, formatted into csv table.
## Example

- This command displays Path Tracer packets that the switch transmitted.

```
switch# show monitor reachability egress-streams
```

**show monitor reachability probe-transmitter**

The **show monitor reachability probe-transmitter** command displays configured parameters for the specified probe transmitter.

**Command Mode**  
Privileged EXEC

**Command Syntax**  
```
show monitor reachability probe-transmitter XMITTER_LIST
```

**Parameters**

- `XMITTER_LIST`  
  Source interface for the mirroring session.
- `<no parameter>`  
  Displays all configured probe transmitters.
- `xmitter_1`  
  Name of probe transmitter that is displayed.
- `xmitter_1 xmitter_2 ... xmitter_N`  
  List of probe transmitters that the command displays.

**Example**

- This command displays configuration data for the configured probe transmitters.

```
switch#show monitor reachability probe-transmitter
Probe Transmitter one    
===================================
Status: Enabled
IP Protocol: UDP
Probing hop 1 uniformly at rate 1 probes every 1 seconds
Probing hop 2 uniformly at rate 1 probes every 1 seconds
Source Interfaces: Loopback0
Source L4 Ports: 1053, 1181, 2044, 2069, 2738, 2965, 3833, 4505, 4660, 5035, 5303, 5713, 5769, 7115, 7244, 8477, 9991, 11516, 13831, 14217, 15763, 18541, 19727, 20623, 22674, 22855, 23287, 23641, 24566, 24620, 25462, 25804, 27591, 28266, 29970, 32479, 32846, 33172, 33661, 33793, 34803, 35837, 39500, 40219, 41086, 41427, 42139, 42355, 42948, 44237, 44314, 44552, 44803, 46036, 46555, 47853, 47878, 48376, 48886, 50322, 50325, 50420, 50581, 51602, 51942, 52886, 54378, 54711, 54907, 56087, 57569, 57825, 57902, 59942, 61370, 62817, 63070, 63715, 65340
Destination IPs: 10.0.3.1
```

```
switch#
```
shutdown (Monitor Reachability)

The `shutdown` command globally disables the Path Tracer on the switch. Globally disabling path tracer disables all probe transmitters on the switch. When path tracer is globally enabled, probe transmitters are individually enabled through `shutdown (Monitor Reachability Probe Transmitter)` commands.

By default, path tracer is disabled. After entering monitor-reachability configuration mode, a `no shutdown` command is required to enable path tracer. When path tracer is globally disabled, all path tracer probe transmitter are disabled.

The `shutdown` and `default shutdown` commands disable path tracer by removing the `no shutdown` command from `running-config`.

**Command Mode**

Mon-reach Configuration

**Command Syntax**

```
shutdown
no shutdown
default shutdown
```

**Related Commands**

- `monitor reachability` places the switch in monitor-reachability configuration mode.

**Examples**

- These commands globally enable path tracer.
  ```
  switch(config)#monitor reachability
  switch(config-mon-reach)#no shutdown
  switch(config-mon-reach)#show active
  monitor reachability
  no shutdown
  switch(config-mon-reach)#
  ```

- This command globally disables path tracer.
  ```
  switch(config-mon-reach)#shutdown
  switch(config-mon-reach)#show active
  switch(config-mon-reach)#
  ```
shutdown (Monitor Reachability Probe Transmitter)

The **shutdown** command disables the configuration mode probe transmitter. A probe transmitter is a routine that defines the parameters of an egress stream and, when enabled, facilitates the transmission of the probes that comprise the stream.

When Path Tracer is globally disabled (**shutdown (Monitor Reachability)**, all probe transmitters are disabled. When Path Tracer is globally enabled, probe transmitters are individually enabled through **shutdown (Monitor Reachability Probe Transmitter)** commands.

By default, probe transmitters are disabled. After entering probe-xmit configuration mode, a **no shutdown** command is required to enable the probe transmitter.

The **shutdown** and **default shutdown** commands disable the configuration mode probe transmitter by removing the corresponding **no shutdown** command from **running-config**.

**Command Mode**

- Mon-reach-xmit Configuration

**Command Syntax**

- shutdown
- no shutdown
- default shutdown

**Related Commands**
- **probe transmitter** places the switch in monitor-reachability-xmit configuration mode.

**Examples**

- These commands globally enable the Path Tracer, then enables the PROBE-1 probe transmitter.

```plaintext
switch(config)#monitor reachability
switch(config-mon-reach)#no shutdown
switch(config-mon-reach)#probe transmitter PROBE-1
switch(config-mon-reach)#no shutdown
switch(config-mon-reach)#show active
monitor reachability
  no shutdown
  probe transmitter PROBE-1
  no shutdown
switch(config-mon-reach)#
```

```plaintext
switch(config-mr-trans-PROBE-1)#
```
source interface (Monitor Reachability Probe Transmitter)

The `source interface` command specifies the interface from where the configuration mode probe transmitter's source IP addresses are derived. The probe transmitter enters one of these source IP addresses in the source IP address field of packets that it sends. Multiple source interface statements may be configured for a probe transmitter. Using multiple source addresses can assure the distribution of packets among the available ECMPs paths.

The `no source interface` and `default source interface` commands remove the specified source interface assignments from the configuration mode transmitter by removing the corresponding `source interface` command from `running-config`.

Command Mode
Mon-reach-xmit Configuration

Command Syntax

```
source interface INT_NAME
no source interface INT_NAME
default source interface INT_NAME
```

Parameters

- `INT_NAME` Interface type and number. Options include:
  - `ethernet e_range` Ethernet interface range specified by `e_range`.
  - `loopback l_range` Loopback interface specified by `l_range`.
  - `management m_range` Management interface range specified by `m_range`.
  - `port-channel p_range` Port-Channel Interface range specified by `p_range`.
  - `vlan v_range` VLAN interface range specified by `v_range`.

Valid parameter formats include number, number range, or comma-delimited list of numbers and ranges.

Example

- These commands configure the probe transmitter to use the IP address 10.25.25.3 as the source interface by assigning that address to loopback interface 0, then configuring the loopback interface as the probe transmitter's source interface.

```
switch(config)#interface loopback 0
switch(config-if-Lo0)#ip address 10.25.25.3/28
switch(config-if-Lo0)#exit
switch(config)#monitor reachability
switch(config-mon-reach)#probe transmitter PROBE-X
switch(config-mr-trans-PROBE-X)#source interface loopback 0
switch(config-mr-trans-PROBE-X)#show active
monitor reachability
  probe transmitter PROBE-X
    source interface Loopback0
    destination ip 10.4.3.3
    destination ip 10.10.5.5/24 subnets 4
switch(config-mr-trans-PROBE-X)#
```
source port (Monitor Reachability Probe Transmitter)

The **source port** command specifies the configuration mode probe transmitter’s source port values. The probe transmitter enters one of these source port values in the source port field of packets that it sends. Although only one source port statement can be configured for a probe transmitter, a statement may specify multiple explicitly or randomly selected ports. Using multiple source ports can assure the distribution of packets among the available ECMPs paths. The default setting is one randomly selected port.

The **no source port** and **default source port** commands restore the default setting of one random source port numbers by removing the corresponding **source port** command from **running-config**.

**Command Mode**

Mon-reach-xmit Configuration

**Command Syntax**

```
source port [PORT_ROSTER]
no source port
default source port
```

**Parameters**

- **PORT_ROSTER** set of source port numbers. Options include:
  - <no parameter> one random port. Same as **random count 1**.
  - **list port_1 [port_2 ... port_n]** a list of port number. Values of port_x range from 0 to 65535.
  - **random count port_quantity** a set of randomly selected port numbers. The set size is specified by **port_quantity**. Value of **port_quantity** ranges from 1 to 65535.
  - **sequential start port_1 stride port_interval count port_quantity** A set of explicitly defined port values. The set size is specified by **port_quantity**. The first port is specified by **port_1**. Successive port numbers are derived by adding **port_interval** to the port numbers, starting with **port_1**.

**Related Commands**

- **probe transmitter** places the switch in monitor-reachability-xmit configuration mode.
Example

- This command configures the port transmitters to use 1000, 1010, and 1020 as source ports in its packets.

```bash
switch(config)#monitor reachability
switch(config-mon-reach)#probe transmitter PROBE-X
switch(config-mr-trans-PROBE-X)#source port sequential start 1000 stride 10 count 3

MapReduce Tracer

This chapter describes Arista’s implementation of MapReduce Tracer, including configuration instructions and command descriptions. Topics covered by this chapter include:

- Section 43.1: MapReduce Tracer Introduction
- Section 43.2: MapReduce Tracer Configuration
- Section 43.3: Displaying MapReduce Tracer Results
- Section 43.4: MapReduce Tracer Command Descriptions

43.1 MapReduce Tracer Introduction

MapReduce Tracer is a network tool that monitors Hadoop nodes that are directly connected to Arista switches. MapReduce Tracer requires the following:

- Hadoop clusters are deployed with a L3 design.
- The top of rack switch is the default gateway to all attached TaskTracker nodes.
- JobTracker RPC ports do not require authentication.
- Nodes cannot simultaneously belong to multiple Hadoop clusters.
- All TaskTrackers within a cluster are accessed through a common HTTP access port.
- The switch’s DNS or static host configuration facilitates TaskTracker name resolution.

Map Reduce Tracer supports these Hadoop releases:

- Apache 0.20.205
- Apache 1.2.1
- Cloudera 3u6
- Cloudera 4.1.3
- Cloudera 4.3.0
- HortonWorks 1.3
- Cloudera 4.5.0

These sections briefly describe Hadoop, Hadoop data structures, and MapReduce Tracer.
43.1.1 Hadoop Description

Apache Hadoop is an open-source, Java-based software framework that supports large dataset storage and processing in a distributed computational environment. Hadoop is licensed under Apache License 2.0 and developed through a global community.

Hadoop facilitates application execution on systems composed of thousands of nodes utilizing petabytes of data. Its distributed file system facilitates rapid data transfer among nodes and supports continued operations when individual nodes fail or become inaccessible.

Hadoop Distributed File System (HDFS) is a distributed file-system that stores data on the commodity machines to provide high aggregate bandwidth across the cluster.

43.1.2 Hadoop Cluster Structure

A cluster is a group of servers that function as a single system to provide high availability through load balancing and parallel processing. A Hadoop cluster is a type of computational cluster designed for storing and analyzing large amounts of unstructured data in a distributed computing environment.

Typical Hadoop clusters include one master and multiple worker nodes. The master node consists of a TaskTracker, JobTracker, NameNode and DataNode. Worker nodes include a TaskTracker and DataNode.

43.1.3 Map Reduce

MapReduce is an algorithm that Hadoop implements to process large datasets by distributing parallel tasks to nodes within a cluster. The MapReduce program includes a Map procedure that filters data and a Reduce procedure that processes the data.

MapReduce manages task and data distribution to cluster nodes such that tasks are executed in parallel, and data transfers between cluster components support redundancy and fault tolerance.

The MapReduce engine consists of one JobTracker and multiple TaskTrackers – all nodes within the Hadoop cluster. The JobTracker receives MapReduce jobs from a client application and manages the completion of these jobs by submitting tasks to available TaskTracker nodes. If a TaskTracker fails to perform the assigned task, the JobTracker reschedules that part of the job to another node.

43.1.4 MapReduce Tracer Function

MapReduce Tracer is a feature that tracks and interacts with Hadoop nodes directly connected to Arista switches in a cluster. It communicates with a JobTracker to obtain a list of all nodes in a cluster and then queries JobTracker and TaskTrackers on these nodes for information regarding the jobs they are running and progress of those jobs. This creates a map of TaskTrackers with kinds of jobs they are running. Commands are available to display this data in tables through the CLI and EAPI.

MapReduce Tracer monitors only nodes that connect directly to the switch in L3 networks. Directly connected nodes use the top-of-rack switch as their default gateway and the switch learns ARP entries for these nodes. The list of nodes provided by JobTracker is filtered by tracking ARP entries to remove nodes that are not directly accessible.

MapReduce Tracer creates a database of nodes from the filtered list. After the database is created, the switch queries the JobTracker and TaskTrackers to obtain the following:

- The number of monitored Hadoop nodes.
- The list of monitored nodes, including their IP addresses.
- Jobs that the TaskTrackers are running.
- JobTracker and TaskTracker statistics.
MapReduce Tracer can simultaneously monitor multiple clusters. This means the directly connected TaskTracker nodes can belong to different clusters. A maximum of 5 clusters are supported per switch.

43.2 MapReduce Tracer Configuration

MapReduce Tracer configuration commands are structured into two configuration levels:

- Monitor-hadoop configuration mode is a child of global configuration mode and controls global MapReduce Tracer settings.
- Monitor-hadoop-cluster configuration mode is a child of Monitor-hadoop configuration mode and defines polling configurations that monitor individual Hadoop clusters.

These sections describe MapReduce Tracer configuration processes:

- Section 43.2.1: MapReduce Tracer Global Configuration
- Section 43.2.2: Hadoop Cluster Access Configuration

MapReduce Tracer functions after it is enabled globally. Each polling configuration can be individually enabled after the feature is enabled globally.

43.2.1 MapReduce Tracer Global Configuration

MapReduce Tracer global parameters are configured in Monitor-hadoop configuration mode. Tasks performed from this mode include specifying connection parameters to Hadoop clusters and globally enabling MapReduce Tracer.

Entering Monitor-Hadoop Configuration Mode

Monitor-hadoop configuration mode is entered by `monitor hadoop`. Monitor-hadoop configuration mode is not a group change mode; statements are stored in the `running-config` when they are entered through the CLI. The `exit` command returns the switch to global configuration mode.

Examples

- These commands place the switch in monitor-hadoop configuration mode.
  
  ```
  switch(config)#monitor hadoop
  switch(config-monitor-hadoop)#
  ```

- This command exits monitor-hadoop mode.
  
  ```
  switch(config-monitor-hadoop)#exit
  switch(config)#
  ```

- This command deletes all previously configured monitor-hadoop configuration mode commands.
  
  ```
  switch(config)#no monitor hadoop
  switch(config)#
  ```

Globally Enabling MapReduce Tracer

MapReduce Tracer is globally enabled by `no shutdown (Monitor-Hadoop)`. MapReduce Tracer is globally disabled by default.
Example

- These commands globally enable MapReduce Tracer.

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#no shutdown
switch(config-monitor-hadoop)#show active
monitor hadoop
    no shutdown
switch(config-monitor-hadoop)#
```

Creating a Cluster Monitor

A cluster monitor is created by entering monitor-hadoop-cluster mode with `cluster (Monitor Hadoop)`. Each monitor is labeled with a cluster ID and probes one Hadoop cluster. When the command specifies a monitor with a previously defined cluster ID, subsequent commands edit that monitor's parameters. A monitor with a new cluster ID is created by a command that specifies a nonexistent cluster ID.

Example

- These commands enter monitor-hadoop-cluster mode to edit a cluster monitor. The monitor's cluster-id is CL2.

```
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#show active
monitor hadoop
    cluster CL2
switch(config-monitor-hadoop-CL2)#
```

43.2.2 Hadoop Cluster Access Configuration

Cluster monitors are configured in monitor-hadoop-cluster configuration mode. Each monitor corresponds to a hadoop cluster through these configurable parameters:

- JobTracker access parameters (address, port number, and username)
- TaskTracker access port
- Polling interval
- Cluster description
- Enabled setting

The minimum explicit configuration includes JobTracker address and username; default values are defined for all other parameters. By default, cluster monitors are disabled.

The `cluster (Monitor Hadoop)` command places the switch in monitor-hadoop-cluster mode for the specified monitor, where a cluster's connection parameters are specified. Monitor-hadoop-cluster mode is not a group change mode.

A cluster monitor is enabled by `no shutdown (Monitor Hadoop Cluster)` when MapReduce Tracer is globally enabled.

43.2.2.1 JobTracker Configuration

A cluster's JobTracker is located on the master node and schedules work to the cluster’s TaskTracker nodes. The `jobtracker (Monitor Hadoop Cluster)` command specifies connection parameters to the monitored cluster.

JobTracker parameters include its node location (IPv4 address or hostname), RPC port, and username. The default RPC port is 8021. Location and username parameters do not have default values and must be explicitly configured.
Example

- For the CL2 monitor, these commands configure connection parameters to a JobTracker node at `10.4.4.4` with the username `account1`. The default RPC port (8021) is implicitly specified.

switch(config)#monitor hadoop
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#jobtracker host 10.4.4.4 username account1
switch(config-monitor-hadoop-CL2)#show active
  monitor hadoop
    cluster CL2
      jobtracker host 10.4.4.4 user account1
switch(config-monitor-hadoop-CL2)#

43.2.2.2 TaskTracker Configuration

The `tasktracker (Monitor Hadoop Cluster)` command specifies the HTTP port that access TaskTrackers of the Hadoop cluster probed by the configuration mode monitor. The switch compiles a list of the cluster’s TaskTracker addresses by periodically polling the cluster’s JobTracker.

The default TaskTracker HTTP port is 50060.

Examples

- For the CL2 monitor, these commands configure a TaskTracker access port of 51000.

  switch(config)#monitor hadoop
  switch(config-monitor-hadoop)#cluster CL2
  switch(config-monitor-hadoop-CL2)#tasktracker http-port 51000
  switch(config-monitor-hadoop-CL2)#show active
    monitor hadoop
      cluster CL2
        tasktracker http-port 51000
  switch(config-monitor-hadoop-CL2)#

- These commands restore the default TaskTracker HTTP access port address of 50060.

  switch(config-monitor-hadoop-CL2)#no tasktracker http-port
  switch(config-monitor-hadoop-CL2)#show active
    monitor hadoop
      cluster CL2
        tasktracker http-port 50060
        interval 10
        shutdown
  switch(config-monitor-hadoop-CL2)#

43.2.2.3 Polling Interval Configuration

When the monitor configuration is complete, the switch polls the cluster’s JobTracker to maintain the list of active TaskTracker nodes associated with the monitored cluster and compile Hadoop job statistics. The `interval (Monitor Hadoop Cluster)` command specifies the interval between polls to the JobTracker of the monitored cluster. The default interval is 10 seconds.
Example

- This command sets the JobTracker polling interval to 25 seconds for the cluster monitored by the CL2 MapReduce Tracer configuration.

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#interval 25
switch(config-monitor-hadoop-CL2)#show active
monitor hadoop
    cluster CL2
    interval 25
switch(config-monitor-hadoop-CL2)#
```

### 43.2.3 MapReduce Tracer Example

The commands in this section create monitors that probe two Hadoop clusters, enables each monitor individually, then enables MapReduce Tracer globally. Monitor parameters for the clusters include:

- **Cluster ID: CL_1**
  - JobTracker: IP address 10.15.2.2; RPC port 8021; username xyz1
  - TaskTracker: HTTP address 54000
  - JobTracker polling interval: 10 seconds (default)

- **Cluster ID: CL_2**
  - JobTracker: IP address 10.21.5.2; RPC port 9521; username qrst4
  - TaskTracker: HTTP address 50060 (default)
  - JobTracker polling interval: 5 seconds

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#cluster CL_1

switch(config-monitor-hadoop-CL_1)#jobtracker host 10.15.2.2 username xyz1
switch(config-monitor-hadoop-CL_1)#tasktracker http-port 54000
switch(config-monitor-hadoop-CL_1)#no shutdown
switch(config-monitor-hadoop-CL_1)#exit

switch(config-monitor-hadoop)#cluster CL_2
switch(config-monitor-hadoop-CL_2)#jobtracker host 10.21.5.2 rpc-port 9521 username qrst4
switch(config-monitor-hadoop-CL_2)#interval 5
switch(config-monitor-hadoop-CL_2)#no shutdown
switch(config-monitor-hadoop-CL_2)#exit

switch(config-monitor-hadoop)#no shutdown
switch(config-monitor-hadoop)#show active
monitor hadoop
    no shutdown
    cluster CL_1
        jobtracker host 10.15.2.2 user xyz1
tasktracker http-port 54000
    no shutdown

    !
    cluster CL_2
        jobtracker host 10.21.5.2 rpc-port 9521 user qrst4
    interval 5
```

2408
no shutdown

switch(config-monitor-hadoop)#show active all
monitor hadoop
  no shutdown
cluster CL_1
  jobtracker host 10.15.2.2 rpc-port 8021 user xyz1
tasktracker http-port 54000
  interval 10
  no shutdown
!
cluster CL_2
  jobtracker host 10.21.5.2 rpc-port 9521 user qrst4
tasktracker http-port 50060
  interval 5
  no shutdown
switch(config-monitor-hadoop)#exit
switch(config)#
43.3 Displaying MapReduce Tracer Results

MapReduce Tracer display commands provide information about the configuration and activity on the monitored clusters.

43.3.1 MapReduce Tracer Status

MapReduce Tracer status is accessed through `show monitor hadoop status`. Status information includes the enabled status and the number of monitored clusters, TaskTrackers, and locally running jobs.

Example
- This command displays MapReduce Tracer status for all connected clusters and TaskTrackers.

```
switch> show monitor hadoop status
Last updated: 2013-10-06 18:14:23
Mapreduce Tracer status:
  Admin status                  : Enabled
  Operational status            : Enabled
  Number of clusters configured : 3
  Number of local TaskTrackers  : 4
  Number of jobs running locally: 4
```

43.3.2 Cluster Configuration and Connections

The following cluster configuration and connection information is available through these commands:

- Configuration and connection data for all monitored clusters – `show monitor hadoop cluster all`.
- Configuration and connection data for a specified cluster – `show monitor hadoop cluster status`.
- Connection and activity information for TaskTrackers in a specified cluster, on a specified node, or accessed through a specified interface – `show monitor hadoop tasktracker status`.

Example
- This command displays configuration and connection data for the `Cluster0` cluster.

```
switch> show monitor hadoop cluster Cluster0 status
Last updated: 2013-10-06 18:14:23
Cluster status for cluster: Cluster0
  Admin status                  : Enabled
  JobTracker host               : host0
  JobTracker RPC port           : 9000
  JobTracker user               : user0
  JobTracker polling interval   : 100 seconds
  TaskTracker HTTP port         : 88000
  Operational status            : Enabled
  Active TaskTrackers           : 31
  Blacklisted TaskTrackers      : 1
  Decommissioned TaskTrackers   : 1
  Tracker expiry interval       : 20.0
  Map slots (used/total)        : 10/100
  Reduce slots (used/total)     : 11/110
  JobTracker heap size          : 1.04GB (max: 2.08GB)
```

switch>
43.3.3 Job Lists

The following commands display rosters of currently running job or jobs that previously ran:

- Jobs running on all monitored Hadoop clusters – `show monitor hadoop`.
- Jobs running on a specified cluster and byte counter data – `show monitor hadoop cluster counters`.
- Jobs that previously ran on a specified cluster – `show monitor hadoop cluster history`.
  - Includes jobs that ran since the monitor was enabled, the switch was reloaded, or the job history was cleared (`clear monitor hadoop job-history`).
- Jobs running on a specified cluster – `show monitor hadoop cluster jobs`.
- Jobs that ran on all configured clusters is accessed through `show monitor hadoop history`.
  - Includes jobs that ran since the monitor was enabled, the switch was reloaded, or the job history was cleared (`clear monitor hadoop job-history`).
- Jobs running on a specified TaskTracker and byte counter data – `show monitor hadoop tasktracker counters`.

Examples

- This command displays the jobs that are running on all monitored clusters.
  ```
  switch>show monitor hadoop
  Last updated: 2013-10-06 18:14:23
  Currently running jobs: 4
<table>

### 43.3.4 Job Data

The following commands display information about jobs that are running or previously ran on monitored clusters. Available data include job identifiers, JobTracker ID, start time, stop time, data consumption, and progress statistics.

- **Data consumption, start and stop times, and JobTracker ID for a specific job** – `show monitor hadoop cluster history jobs`.
- **Data consumption, start and stop times, priority, JobTracker ID, and progress statistics for a specified job** – `show monitor hadoop cluster jobs <job number>`.
- **HDFS (Hadoop Distributed File System) data consumption and and shuffle byte counters for a specified job** – `show monitor hadoop cluster jobs counter`.
- **Data through and start time for jobs running on all monitored clusters** – `show monitor hadoop counters`.
- **Progress statistics and start times are available for jobs running on specified TaskTracker** – `show monitor hadoop tasktracker jobs`.
- **Job progress and byte counts of jobs running on a specified Hadoop cluster** – `show monitor hadoop tasktracker running-tasks`.
- **Progress statistics, HDFS data consumption, start time, and progress information for the specified task of a running job** – `show monitor hadoop tasktracker running-tasks cluster job task`.
- **Data consumption and start times for jobs running on a specified TaskTracker** – `show monitor hadoop tasktracker counters`.

### Examples

- **This command displays information about job 1 that ran on cluster Cluster0.**

```
switch>show monitor hadoop cluster Cluster0 history job 1
Job history data for job: HistoryJob1
  Cluster : Cluster0
  Job Id   : 1
  JT Id    : 201310110013
  User     : HistoryUser1
  Job start time : 2013-10-06 17:57:43
  Job end time  : 2013-10-08 00:31:03
Per Interface job counters:
  Interface      TaskTracker      Bytes In      Bytes Out
  --------------------------------------------------------------
  Ethernet7       TaskTracker2   26.08GB       13.04GB

switch>
```
Chapter 43: MapReduce Tracer Displaying MapReduce Tracer Results

- This command displays information about job 1 that is running on cluster Cluster0.

  switch>show monitor hadoop cluster Cluster0 jobs 1
  Last updated: 2013-10-06 18:14:23
  Information for job: ReallyAVeryLongNameForAJob1 running on cluster: Cluster0
  Cluster : Cluster0
  Id       : 1
  Name     : ReallyAVeryLongNameForAJob1
  User     : JobUser1
  Priority : veryHigh
  Running state : running
  Number of map tasks : 2
  Number of reduce tasks : 0
  Start time : 2013-10-06 17:56:03
  Bytes In  : 37.36GB
  Bytes Out : 76.29MB
  Map Progress : 12.34%
  Reduce Progress : 13.45%
  Cleanup Progress : 14.56%
  Setup Progress : 15.67%

  switch>

- This command displays data for jobs running on TaskTracker1.

  switch>show monitor hadoop tasktracker host TaskTracker1 jobs
  Last updated: 2013-10-06 18:14:23
  Running job for TaskTracker: TaskTracker1
  JobId  Job Name         Cluster   Maps(#/%)    Reduces(#/%)    Start Time
  ------ ----------------- --------- ---------- -------------- -------------------
  1      ReallyAVeryLon\  Cluster0  2/12.34%     0/13.45%      2013-10-06 17:56:03
gNameForAJob1
  2      ShortName2       Cluster0  2/24.68%     0/26.90%      2013-10-06 17:37:43

  switch>

43.3.5 TaskTracker Lists

These commands display lists of TaskTrackers that are active on monitored clusters:

- TaskTrackers on a specified cluster – show monitor hadoop cluster tasktracker.
- TaskTrackers on all monitored clusters – show monitor hadoop tasktracker all.

Example

- This command displays the TaskTrackers on the Cluster0 cluster.

  switch>show monitor hadoop cluster Cluster0 tasktracker
  Last updated: 2013-10-06 18:14:23
  Total 2 TaskTrackers on cluster Cluster0:
  Node           IP Address    Interface    Maps    Reduces
  ----------------- ------------- --------- ------ -------
  TaskTracker1     10.100.0.1   Ethernet7  4       0
  TaskTracker2     10.100.0.2   Port-Channel7 4       0

  switch>

43.3.6 TaskTracker Connection and Activity

The following TaskTracker connection and activity data is available through these commands:
• Connection and activity information for TaskTrackers on a specified cluster or accessed through a specified interface – `show monitor hadoop tasktracker status`.
• Data consumption for TaskTrackers connected to monitored clusters – `show monitor hadoop tasktracker all counters`.

**Example**

• This command displays connection and activity data for TaskTracker on the `TaskTracker1` node.

```bash
switch> show monitor hadoop tasktracker host TaskTracker1 status
Last updated: 2013-10-06 18:14:23
TaskTracker : TaskTracker1
IP Address   : 10.100.0.1
Interface    : Ethernet7
State        : active
Running jobs : 2
Running tasks: 4
Map Tasks    : 4
Reduce Tasks : 0
Total bytes read : 2.08GB
Total bytes written : 4.24MB
```

### 43.3.7 Data Bursts

The `show monitor hadoop traffic burst` command displays the largest data bursts for jobs running on a specified cluster or accessed through a specified node or interface. A data burst is the data consumed during a polling interval.

**Example**

• This command displays traffic burst data for all running jobs that are accessible through port channel interface 7.

```bash
switch> show monitor hadoop traffic burst interface Port-Channel 7
Last updated: 2013-10-06 18:14:23
Bursts on Interface: 'Port-Channel7' in cluster: Cluster0
Top 2 input bursts:
  JobId Job Name                Burst        Time
    1   ShortName               3.07GB      2013-10-06 17:57:43
    2   ReallyAVeryLon\gNameForAJob  6.15GB      2013-10-06 17:41:03

Top 2 output bursts:
  JobId Job Name                Burst        Time
    1   ShortName               4.10GB      2013-10-06 17:55:13
    2   ReallyAVeryLon\gNameForAJob  8.20GB      2013-10-06 17:36:03
```
43.4 MapReduce Tracer Command Descriptions

Global Configuration Commands
- monitor hadoop

Clear Hadoop Monitor Commands
- clear monitor hadoop burst-counters
- clear monitor hadoop job-history

Display Commands
- show monitor hadoop
- show monitor hadoop cluster all
- show monitor hadoop cluster counters
- show monitor hadoop cluster history
- show monitor hadoop cluster history jobs
- show monitor hadoop cluster jobs
- show monitor hadoop cluster jobs <job number>
- show monitor hadoop cluster jobs counter
- show monitor hadoop cluster status
- show monitor hadoop cluster tasktracker
- show monitor hadoop counters
- show monitor hadoop history
- show monitor hadoop status
- show monitor hadoop tasktracker all
- show monitor hadoop tasktracker all counters
- show monitor hadoop tasktracker counters
- show monitor hadoop tasktracker jobs
- show monitor hadoop tasktracker running-tasks
- show monitor hadoop tasktracker running-tasks cluster job task
- show monitor hadoop tasktracker status
- show monitor hadoop traffic burst

Hadoop Commands
- cluster (Monitor Hadoop)
- shutdown (Monitor-Hadoop)

Hadoop-Cluster Commands
- description (Monitor Hadoop Cluster)
- interval (Monitor Hadoop Cluster)
- jobtracker (Monitor Hadoop Cluster)
- shutdown (Monitor Hadoop Cluster)
- tasktracker (Monitor Hadoop Cluster)
clear monitor hadoop burst-counters

The `clear monitor hadoop burst-counters` command resets MapReduce Tracer burst counters for all jobs running on specified clusters.

**Command Mode**

Privileged EXEC

**Command Syntax**

```
clear monitor hadoop burst-counters [CLUSTERS]
```

**Parameters**

- `CLUSTERS` Hadoop clusters for which command displays data. Options include:
  - `<no parameter>` all clusters.
  - `cluster c_name` Cluster name.

**Example**

- This command clears the burst counters for all jobs running on CL2 cluster.

```
switch#clear monitor hadoop burst-counters cluster CL2
Cleared burst counters
switch#
```
clear monitor hadoop job-history

The `clear monitor hadoop job-history` command resets the job history database for all specified clusters.

**Command Mode**
- Privileged EXEC

**Command Syntax**

```
clear monitor hadoop job-history [CLUSTERS]
```

**Parameters**
- `CLUSTERS` Hadoop clusters for which command displays data. Options include:
  - `<no parameter>` all clusters.
  - `cluster c_name` Cluster name.

**Example**
- This command clears the job history on the CL2 cluster.

```
switch# clear monitor hadoop job-history cluster CL2
Cleared job history
switch#
```
cluster (Monitor Hadoop)

The `cluster` command is a monitor-hadoop command that places the switch in monitor-hadoop-cluster mode for configuring and enabling a MapReduce Tracer monitor for a Hadoop cluster. The command either accesses an existing monitor configuration or creates a monitor.

Monitor-hadoop-cluster configuration mode is not a group change mode; `running-config` is changed immediately upon entering commands. Exiting monitor-hadoop-cluster mode does not affect `running-config`. The `exit` command returns the switch to monitor-hadoop configuration mode.

The configuration mode monitor is enabled by `no shutdown (Monitor Hadoop Cluster)`. Enabling a monitor also requires that MapReduce Tracer is globally enabled (`no shutdown (Monitor-Hadoop)`).

The `no cluster` and `default cluster` commands remove the specified Hadoop cluster configuration from `running-config`.

**Command Mode**
Monitor-hadoop Configuration

**Command Syntax**
```
cluster cluster_name
no cluster cluster_name
default cluster cluster_name
```

**Parameters**
- `cluster_name` Hadoop cluster name.

**Related Commands**
- `monitor hadoop` places the switch in monitor-hadoop configuration mode.

**Commands Available in Monitor-hadoop-cluster Configuration Mode**
- `description (Monitor Hadoop Cluster)`
- `interval (Monitor Hadoop Cluster)`
- `jobtracker (Monitor Hadoop Cluster)`
- `shutdown (Monitor Hadoop Cluster)`
- `tasktracker (Monitor Hadoop Cluster)`

**Examples**
- These commands create the CL2 monitor and enters monitor-hadoop-cluster mode for the monitor.
  ```
  switch(config)#monitor hadoop
  switch(config-monitor-hadoop)#cluster CL2
  switch(config-monitor-hadoop-CL2)#show active
  monitor hadoop
  cluster CL2
  switch(config-monitor-hadoop-CL2)#
  ```
- These commands exit monitor-hadoop-cluster mode.
  ```
  switch(config-monitor-hadoop-CL2)#exit
  switch(config-monitor-hadoop)#show active
  monitor hadoop
  cluster CL2
  switch(config-monitor-hadoop)#
  ```
These commands remove the CL2 monitor.

```
switch(config-monitor-hadoop)# no cluster CL2
switch(config-monitor-hadoop)# show active
switch(config-monitor-hadoop)#
```
description (Monitor Hadoop Cluster)

The `description` command adds a text string to the configuration mode MapReduce Tracer cluster monitor. The string has no functional impact on the monitor.

The `no description` and `default description` commands remove the text string from the configuration mode monitor by removing the corresponding `description` command from `running-config`.

Command Mode

Monitor-hadoop-cluster Configuration

Command Syntax

```
description label_text
no description
default description
```

Parameters

- `label_text` character string assigned to the monitor configuration.

Related Commands

- `cluster (Monitor Hadoop)` places the switch in monitor-hadoop-cluster configuration mode.

Examples

These commands add description text to the CL2 monitor.

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#description First Cluster
monitor hadoop
    cluster CL2
        description First Cluster
        jobtracker host 10.3.3.3 user JANE
switch(config-monitor-hadoop-CL2)#
```
interval (Monitor Hadoop Cluster)

The `interval` command specifies the polling interval between queries to the Hadoop cluster JobTracker specified by configuration mode statements. The switch polls a cluster’s JobTracker to update its list of active TaskTracker nodes and the statistics of jobs running in the cluster. This command controls the frequency of these polls. The default interval is 10 seconds.

The `no interval` and `default interval` commands restore the default interval of 10 seconds by removing the `interval` command from `running-config`.

**Command Mode**

Monitor-hadoop-cluster Configuration

**Command Syntax**

```
interval period
no interval
default interval
```

**Parameters**

- `period` interval (seconds) between JobTracker polls. Value ranges from 1 to 600. Default is 10.

**Related Commands**

- `cluster (Monitor Hadoop)` places the switch in monitor-hadoop-cluster configuration mode.

**Example**

- This command sets the JobTracker polling interval to 25 seconds for the CL2 cluster configuration.

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#interval 25
switch(config-monitor-hadoop-CL2)#show active
monitor hadoop
  cluster CL2
    interval 25
switch(config-monitor-hadoop-CL2)#
```
jobtracker (Monitor Hadoop Cluster)

The **jobtracker** command specifies JobTracker access parameters for the cluster monitored by configuration mode monitor statements. A cluster's JobTracker is located on the master node and schedules work to the cluster's TaskTracker nodes.

Parameters required to communicate with a JobTracker include its node location (IPv4 address or hostname), RPC port, and username. The default RPC port is 8021. Location and username parameters do not have default values and must be explicitly configured. A JobTracker command that specifies a partial parameter list modifies the existing corresponding **jobtracker** statement in **running-config**.

The **no jobtracker** and **default jobtracker** commands perform the following:

- removes the **jobtracker** statement from **running config** when it lists all command parameters.
- modifies the existing **jobtracker** statement when it lists a subset of command parameters.

**Command Mode**
Monitor-hadoop-cluster Configuration

**Command Syntax**

```
jobtracker [LOCATION] [PORT] [USER]
no jobtracker [LOCATION] [PORT] [USER]
default jobtracker [LOCATION] [PORT] [USER]
```

All parameters can be placed in any order.

**Parameters**

- **LOCATION** Address or hostname of JobTracker node. Options include:
  - <no parameter> location remains undefined or unchanged from a previous configuration.
  - **host ipv4_addr** IPv4 address of master (JobTracker) node.
  - **host hostname** Hostname of master (JobTracker) node.

- **PORT** JobTracker RPC port number. Default value is 8021. Options include:
  - <No parameter> Port number remains unchanged from previous configuration.
  - **rdp-port port_num** Port number of master (JobTracker) node. Value ranges from 1 to 65535.

- **USER** Username that accesses JobTracker node. Options include:
  - <No parameter> username remains undefined or unchanged from previous configuration.
  - **username name_string** JobTracker username.

**Related Commands**

- **cluster (Monitor Hadoop)** places the switch in monitor-hadoop-cluster configuration mode.
Example

- For the CL2 cluster configuration, these commands establish a connection to the JobTracker node at 10.4.4.4 with the username `account1`. The default RPC port (8021) is implicitly specified.

```bash
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#jobtracker host 10.4.4.4 username account1
switch(config-monitor-hadoop-CL2)#show active
   monitor hadoop
       cluster CL2
           jobtracker host 10.4.4.4 user account1
switch(config-monitor-hadoop-CL2)#
```

- These commands modify the JobTracker configuration to specify an RPC port of 9000.

```bash
switch(config-monitor-hadoop-CL2)#jobtracker rpc-port 9000
switch(config-monitor-hadoop-CL2)#show active
   monitor hadoop
       cluster CL2
           jobtracker host 10.4.4.4 rpc-port 9000 user account1
switch(config-monitor-hadoop-CL2)#
```
**monitor hadoop**

The `monitor hadoop` command places the switch in monitor-hadoop configuration mode for configuring MapReduce Tracer monitors. A MapReduce Tracer monitor interacts with Hadoop cluster nodes that are directly attached to the switch. Tasks that the switch can perform through this interaction include:

- compile a list of nodes in the cluster
- compile a list of jobs the nodes are running
- download progress of the running jobs

Monitor-hadoop configuration mode is not a group change mode; `running-config` is changed immediately upon entering commands. Exiting monitor-hadoop configuration mode does not affect `running-config`. The `exit` command returns the switch to global configuration mode. MapReduce Tracer is enabled in monitor-hadoop mode through the `no shutdown (Monitor-Hadoop)` command.

The `no monitor hadoop` and `default monitor hadoop` commands delete previously configured `monitor hadoop mode` configuration commands.

**Command Mode**

Global Configuration

**Command Syntax**

```
monitor hadoop
no monitor hadoop
default monitor hadoop
```

**Commands Available in Monitor-hadoop Configuration Mode**

- `cluster (Monitor Hadoop)`
- `shutdown (Monitor-Hadoop)`

**Examples**

- These commands place the switch in monitor-hadoop configuration mode.
  ```
  switch(config)#monitor hadoop
  switch(config-monitor-hadoop)#
  ```

- This command exits monitor-hadoop mode.
  ```
  switch(config-monitor-hadoop)#exit
  switch(config)#
  ```

- This command deletes all previously configured monitor-hadoop configuration mode commands.
  ```
  switch(config)#no monitor hadoop
  switch(config)#
  ```
show monitor hadoop

The **show monitor hadoop** command displays a list of jobs that are running on all monitored Hadoop clusters.

**Command Mode**

EXEC

**Command Syntax**

```
show monitor hadoop
```

**Example**

- This command displays the jobs that are running on all monitored clusters.

```bash
switch>show monitor hadoop
Last updated: 2013-10-06 18:14:23
Currently running jobs: 4

JobId | Job Name      | Cluster  | Maps(#/%) | Reduces(#/%) | Start Time
----- | ------------- | -------- | --------- | ------------ | ----------
1     | ReallyAVeryLon\ gNameForAJob1 | Cluster0 | 2/12.34% | 0/13.45% | 2013-10-06 17:56:03

switch>
```
show monitor hadoop cluster all

The `show monitor hadoop cluster all` command displays configuration and connection information for all monitored Hadoop clusters.

**Command Mode**

EXEC

**Command Syntax**

`show monitor hadoop cluster all`

**Example**

- This command displays configuration and connection data for all connected Hadoop clusters.

```
switch>show monitor hadoop cluster all
Total number of clusters configured: 3

```
show monitor hadoop cluster counters

The **show monitor hadoop cluster counters** command displays a list of jobs running on the specified Hadoop cluster and data consumption associated with these jobs.

**Command Mode**

EXEC

**Command Syntax**

`show monitor hadoop cluster c_name counters`

**Parameters**

- **c_name**  Cluster name.

**Examples**

- This command displays jobs running on cluster **Cluster0**.

```
switch>show monitor hadoop cluster Cluster0 counters
Last updated: 2013-10-06 18:14:23
Counters for currently running jobs on cluster: Cluster0
<table>

```

switch>
**show monitor hadoop cluster history**

The **show monitor hadoop cluster history** command displays all jobs that ran on the specified cluster. The list includes all jobs that ran since the switch was reloaded, the job history was cleared (**clear monitor hadoop job-history**), or MapReduce Tracer was enabled.

**Command Mode**

EXEC

**Command Syntax**

```
show monitor hadoop cluster c_name history
```

**Parameters**

- `c_name`  Cluster name.

**Examples**

- This command displays the jobs that were ran on the cluster named **Cluster0**.

```
switch>show monitor hadoop cluster Cluster0 history
Jobs history on cluster: Cluster0
JobId    Job Name           Start Time     End Time       Bytes In   Bytes Out

```

switch>
show monitor hadoop cluster history jobs

The show monitor hadoop cluster history jobs command displays data about the specified job. Hadoop jobs are identified by job number and the cluster that ran the job.

Data that the command returns include job identifiers, JobTracker ID, start and stop times, and data consumption.

Command Mode

EXEC

Command Syntax

show monitor hadoop cluster c_name history jobs job_number

Parameters

- **c_name**  Cluster name.
- **job_number**  Job number. Value ranges from 0 to 2147483647.

Examples

- This command displays information about job 1 that ran on cluster Cluster0.

```
switch>show monitor hadoop cluster Cluster0 history job 1
Job history data for job: HistoryJob1
  Cluster : Cluster0
  Job Id  : 1
  JT Id   : 201310110013
  User    : HistoryUser1
  Job start time : 2013-10-06 17:57:43
  Job end time  : 2013-10-08 00:31:03
Per Interface job counters:
  Interface      TaskTracker     Bytes In     Bytes Out
  -------------- -------------- ---------- ----------
  Ethernet7      TaskTracker2  26.08GB     13.04GB

switch>
```
show monitor hadoop cluster jobs

The `show monitor hadoop cluster jobs` command displays a list of jobs that are running on the specified cluster.

**Command Mode**

EXEC

**Command Syntax**

```
show monitor hadoop cluster c_name jobs
```

**Parameters**

- `c_name` Cluster name.

**Examples**

- This command displays the list of jobs running on cluster *Cluster0*.

```
switch>show monitor hadoop cluster Cluster0 jobs
Last updated: 2013-10-06 18:14:23
Currently running jobs on cluster: Cluster0

<table>

</tr>
</tbody>
</table>

switch>
```
show monitor hadoop cluster jobs <job number>

The `show monitor hadoop cluster jobs <job number>` command displays information about the specified job. Hadoop jobs are identified by job ID and the cluster that is running the job.

Data that the command returns include time of update, job identifiers, start times, data consumption, and completion progress.

**Command Mode**

EXEC

**Command Syntax**

```
show monitor hadoop cluster c_name jobs job_number
```

**Parameters**

- `c_name`  Cluster name.
- `job_number`  Job number. Value ranges from 0 to 2147483647.

**Examples**

- This command displays information about job 1 that is running on cluster `Cluster0`.

  switch>show monitor hadoop cluster Cluster0 jobs 1

switch>
```
show monitor hadoop history

The **show monitor hadoop history** command displays jobs that ran on clusters for which MapReduce Tracer is configured. The list includes all jobs that ran since the switch was reloaded, MapReduce Tracer was enabled, or the job history was cleared (**clear monitor hadoop job-history**).

**Command Mode**

**EXEC**

**Command Syntax**

show monitor hadoop history

**Example**

- This command displays data that jobs that previously ran on connected Hadoop clusters.

```
switch>show monitor hadoop history
Job history for all clusters:

JobId | Job Name              | Cluster   | Start Time | End Time | Bytes In  | Bytes Out  
------|-----------------------|-----------|------------|----------|-----------|------------
   2   | AReallyBigHistoricalJobName | Cluster0  | 2013-10-06 | 2013-10-09 | 26.08GB   | 13.04GB    
442  | AReallyBigHistoricalJobName | Cluster1  | 2013-10-06 | 2013-10-09 | 26.08GB   | 13.04GB    
442  | AReallyBigHistoricalJobName | Cluster1  | 2013-10-06 | 2013-10-09 | 26.08GB   | 13.04GB    
   2   | AReallyBigHistoricalJobName | Cluster0  | 2013-10-06 | 2013-10-09 | 26.08GB   | 13.04GB    
441  | HistoryJob1             | Cluster1  | 2013-10-06 | 2013-10-08 | 26.08GB   | 13.04GB    
   1   | HistoryJob1             | Cluster0  | 2013-10-06 | 2013-10-08 | 26.08GB   | 13.04GB    

switch>
```
**show monitor hadoop status**

The *show monitor hadoop status* command displays system status for MapReduce Tracer.

**Command Mode**

EXEC

**Command Syntax**

`show monitor hadoop status`

**Example**

* This command displays MapReduce Tracer status for all connected clusters and TaskTrackers.

```
switch>show monitor hadoop status
Last updated: 2013-10-06 18:14:23
Mapreduce Tracer status:
  Admin status : Enabled
  Operational status : Enabled
  Number of clusters configured : 3
  Number of local TaskTrackers : 4
  Number of jobs running locally : 4

switch>
```
show monitor hadoop tasktracker all

The `show monitor hadoop tasktracker all` command displays a list of TaskTrackers that are on all monitored Hadoop clusters.

**Command Mode**

EXEC

**Command Syntax**

```
show monitor hadoop tasktracker all
```

**Examples**

- This command displays the TaskTrackers of all monitored clusters that are connected to the switch.

```
switch>show monitor hadoop tasktracker all
Last updated: 2013-10-06 18:14:23
All local TaskTrackers:

<table>
<thead>
<tr>
<th>Node</th>
<th>Cluster</th>
<th>IP Address</th>
<th>Interface</th>
<th>Maps</th>
<th>Reduces</th>
</tr>
</thead>
<tbody>
<tr>
<td>TaskTracker1</td>
<td>Cluster0</td>
<td>10.100.0.1</td>
<td>Ethernet7</td>
<td>4</td>
<td>0</td>
</tr>

<td>0</td>
</tr>
</tbody>
</table>
```

switch>
show monitor hadoop tasktracker all counters

The `show monitor hadoop tasktracker all counters` command displays byte counters for the TaskTrackers of all monitored Hadoop clusters.

**Command Mode**

EXEC

**Command Syntax**

`show monitor hadoop tasktracker all counters`

**Examples**

- This command displays byte counter data for the TaskTrackers servicing all MapReduce Tracer Hadoop clusters.

```
switch>show monitor hadoop tasktracker all counters
Last updated: 2013-10-06 18:14:23
Counters for all TaskTrackers:

<table>
<thead>
<tr>
<th>Node</th>
<th>IP Address</th>
<th>Interface</th>
<th>Bytes Read</th>
<th>Bytes Written</th>
</tr>
</thead>
<tbody>
<tr>
<td>TaskTracker1</td>
<td>10.100.0.1</td>
<td>Ethernet7</td>
<td>2.08GB</td>
<td>4.24MB</td>
</tr>

<td>Port-Channel8</td>
<td>8.30GB</td>
<td>16.95MB</td>
</tr>
</tbody>
</table>

switch>
```
show monitor hadoop tasktracker counters

The `show monitor hadoop tasktracker counters` command displays a list of jobs running on the specified TaskTracker and output from byte counters associated with these jobs.

**Command Mode**

EXEC

**Command Syntax**

```
show monitor hadoop tasktracker NODES counters
```

**Parameters**

- **NODES** TaskTracker node access point. Options include:
  - `host hostname` Node name.
  - `interface ethernet e_range` Ethernet interfaces through which node connects.
  - `interface port-channel p_range` Port channel interfaces through which node connects.

**Examples**

- This command displays the jobs running on the TaskTracker on the `TaskTracker1` node.

```
switch> show monitor hadoop tasktracker host TaskTracker1 counters

show monitor hadoop tasktracker jobs

The show monitor hadoop tasktracker jobs command displays data about the jobs that are running on TaskTrackers located on the specified node or accessed through the listed interfaces.

Including a cluster parameter filters results to include data only from the cluster polled by the specified monitor.

Command Mode
EXEC

Command Syntax
  show monitor hadoop tasktracker NODES jobs [CLUSTERS]

Parameters
- **NODES**  TaskTracker node access point. Options include:
  - host hostname  Node name.
  - interface ethernet e_range  Ethernet interfaces through which node connects.
  - interface port-channel p_range  Port channel interfaces through which node connects.
- **CLUSTERS**  Hadoop cluster for which command displays data. Options include:
  - <no parameter>  TaskTracker on specified NODE can be in any cluster.
  - cluster c_name  TaskCluster on specified NODE must be in named cluster.

Examples
- This command displays data for jobs running on TaskTracker1.
  
  switch>show monitor hadoop tasktracker host TaskTracker1 jobs

show monitor hadoop tasktracker running-tasks

The **show monitor hadoop tasktracker running-tasks** command displays progress and byte counts of tasks executed by TaskTrackers located on the specified node or accessed through the listed interfaces.

Including a cluster-ID parameter filters results to include data only from the specified cluster.

**Command Mode**

EXEC

**Command Syntax**

```
show monitor hadoop tasktracker NODES running-tasks [CLUSTERS] [JOBS]
```

**Parameters**

- **NODES** TaskTracker node access point. Options include:
  - `host hostname` Node name.
  - `interface ethernet e_range` Ethernet interfaces through which node connects.
  - `interface port-channel p_range` Port channel interfaces through which node connects.

- **CLUSTERS** Hadoop cluster for which command displays data. Options include:
  - `<no parameter>` TaskTracker on specified NODE can be in any cluster.
  - `cluster c_name` TaskCluster on specified NODE must be in named cluster.

- **JOBS** Job list. Options include:
  - `<no parameter>` all jobs.
  - `job <0 to 2147483647>` Specifies number of single job.

**Examples**

- This command displays data for tasks running on TaskTracker named **TaskTracker1**.

switch>
show monitor hadoop tasktracker running-tasks cluster job task

The show monitor hadoop tasktracker running-tasks cluster job task command displays detailed data for the specified task.

Command Mode
EXEC

Command Syntax
show monitor hadoop tasktracker NODE running-tasks cluster name job jnum task tnum

Parameters
• **NODE**  TaskTracker node access point. Options include:
  • host hostname  Node name.
  • interface ethernet e_range  Ethernet interfaces through which node connects.
  • interface port-channel p_range  Port channel interfaces through which node connects.
• name  Cluster name.
• jnum  Job number. Value ranges from 0 to 2147483647
• tnum  Task number. Value ranges from 0 to 2147483647

Examples
• This command displays data for task 1 of job 1 on TaskTracker1 of Cluster0.

  ```
  switch>show monitor hadoop tasktracker host TaskTracker1 running-tasks cluster Cluster0 job 1 task 1
  Last updated: 2013-10-06 18:14:23
  Task details for one task as given below:
  TaskTracker name : TaskTracker1
  Interface : 'Ethernet7'
  Cluster : Cluster0
  Job Id : 1
  Task Id : 1
  Attempt Id : 0
  Task type : Map
  Status : running
  State : running
  Start time : 2013-10-06 17:57:43
  Progress : 50.00%
  HDFS bytes read : 1.05MB
  HDFS bytes written : 1.07MB
  Reduce shuffle bytes : 1.48MB
  ```

  switch>

• This command displays data for task 1 of job 1 on the Cluster0 TaskTracker that is accessible through Ethernet interface 7.

    switch>
show monitor hadoop tasktracker status

The `show monitor hadoop tasktracker status` command displays connection and activity information for the TaskTracker on the specified clusters or accessed through the specified interface. The following command formats display the listed TaskTracker information:

- `show monitor hadoop cluster c_name tasktracker status`: TaskTrackers on specified cluster.
- `show monitor hadoop tasktracker node status`: TaskTrackers on specified nodes or interfaces.
- `show monitor hadoop tasktracker all status`: all connected TaskTrackers.

Command Mode
EXEC

Command Syntax

```
show monitor hadoop cluster c_name tasktracker status
show monitor hadoop tasktracker NODES status
show monitor hadoop tasktracker all status
```

Parameters

- `c_name` Cluster name.
- `NODES` TaskTracker node access point. Options include:
  - `host hostname` Node name.
  - `interface ethernet e_range` Ethernet interfaces through which node connects.
  - `interface port-channel p_range` Port channel interfaces through which node connects.

Examples

- This command displays connection and activity information for all TaskTrackers connected through Ethernet interfaces 7 and 8.

```
switch>show monitor hadoop tasktracker interface Ethernet7,8 status

switch>
```
show monitor hadoop traffic burst

The `show monitor hadoop traffic burst` command displays the largest data bursts for specified Hadoop cluster jobs. A data burst is the data consumed during a polling interval. The command displays input and output burst:

- Input bursts include bytes written to the host.
- Output bursts include bytes written by the host.

**Command Mode**

EXEC

**Command Syntax**

```
show monitor hadoop [CLUSTERS] traffic burst [NODE]
```

**Parameters**

- **CLUSTERS** Hadoop clusters for which command displays data. Options include:
  - `<no parameter>` all clusters.
  - `cluster c_name` Cluster name.
- **NODES** TaskTracker node access point. Options include:
  - `host hostname` Node name.
  - `interface ethernet e_range` Ethernet interfaces through which node connects.
  - `interface port-channel p_range` Port channel interfaces through which node connects.
Examples

- This command displays traffic burst data for all running jobs.

```bash
switch>show monitor hadoop traffic burst

```
shutdown (Monitor-Hadoop)

The `shutdown` command globally disables MapReduce Tracer on the switch. Enabling MapReduce Tracer for an individual cluster requires the feature to be globally enabled through this command and enabled for the individual cluster through the `shutdown (Monitor Hadoop Cluster)` command. By default, MapReduce Tracer is globally disabled.

The `no shutdown` command globally enables MapReduce Tracer. The `shutdown` and `default shutdown` commands globally disable MapReduce Tracer by removing the corresponding `no shutdown` command from `running-config`.

**Command Mode**

Monitor-hadoop Configuration

**Command Syntax**

```
shutdown
no shutdown
default shutdown
```

**Related Commands**

- `monitor hadoop` places the switch in monitor-hadoop configuration mode.

**Example**

- These commands globally enable MapReduce Tracer.
  ```
  switch(config)#monitor hadoop
  switch(config-monitor-hadoop)#no shutdown
  switch(config-monitor-hadoop)#show active
  monitor hadoop
  no shutdown
  switch(config-monitor-hadoop)#
  ```
- This command globally disables MapReduce Tracer.
  ```
  switch(config-monitor-hadoop)#shutdown
  switch(config-monitor-hadoop)#show active
  switch(config-monitor-hadoop)#
  ```
shutdown (Monitor Hadoop Cluster)

The `shutdown` command disables MapReduce Tracer for the configuration mode cluster. Globally disabling MapReduce Tracer (`shutdown (Monitor-Hadoop)`) also disables the function on the individual cluster. Enabling MapReduce Tracer for the cluster requires the function to be enabled globally and for the individual cluster.

The `no shutdown` command configures the MapReduce Tracer setting as `enabled` for the configuration mode cluster. The `shutdown` and `default shutdown` commands disable MapReduce Tracer for the cluster by removing the corresponding `no shutdown` command from `running-config`.

**Command Mode**
- Monitor-hadoop-cluster Configuration

**Command Syntax**

```
shutdown
no shutdown
default shutdown
```

**Related Commands**
- `cluster (Monitor Hadoop)` places the switch in monitor-hadoop-cluster configuration mode.

**Example**
- These commands globally enable MapReduce Tracer, then enables it for the CL2 cluster.

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#no shutdown
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#no shutdown
switch(config-monitor-hadoop-CL2)#show active
monitor hadoop
  cluster CL2
    no shutdown
switch(config-monitor-hadoop-CL2)#exit
switch(config-monitor-hadoop)#show active
monitor hadoop
  no shutdown
  cluster CL2
    no shutdown
switch(config-monitor-hadoop)#
```

- These commands disable MapReduce Tracer for the CL2 cluster. MapReduce Tracer remains globally enabled.

```
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#shutdown
switch(config-monitor-hadoop-CL2)#show active
monitor hadoop
  cluster CL2
switch(config-monitor-hadoop-CL2)#exit
switch(config-monitor-hadoop)#show active
monitor hadoop
  no shutdown
  cluster CL2
switch(config-monitor-hadoop)#
```
tasktracker (Monitor Hadoop Cluster)

The tasktracker command specifies the HTTP port for accessing TaskTrackers of the Hadoop cluster monitored through configuration mode statements. The switch compiles a list of the cluster’s TaskTracker addresses by periodically polling the cluster’s JobTracker (jobtracker (Monitor Hadoop Cluster)). The default TaskTracker HTTP port is 50060.

The no tasktracker and default tasktracker commands restore the configuration mode TaskTracker HTTP port to 50060 by removing the corresponding tasktracker command from running-config.

Command Mode
Monitor-hadoop-cluster Configuration

Command Syntax

```
tasktracker http-port port_number
no tasktracker http-port
default tasktracker http-port
```

Parameters

- **port_num** TaskTracker HTTP port number. Value ranges from 1 to 65535. Default value is 50060.

Related Commands

- **cluster (Monitor Hadoop)** places the switch in monitor-hadoop-cluster configuration mode.

Example

- These commands specify a TaskTracker HTTP port address of 51000.

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#tasktracker http-port 51000
switch(config-monitor-hadoop-CL2)#show active
monitor hadoop
    cluster CL2
        tasktracker http-port 51000
    switch(config-monitor-hadoop-CL2)#
```

- These commands restore the default TaskTracker HTTP port address of 50060.

```
switch(config-monitor-hadoop-CL2)#no tasktracker http-port
switch(config-monitor-hadoop-CL2)#show active
monitor hadoop
    cluster CL2
    switch(config-monitor-hadoop-CL2)#show active all
monitor hadoop
    cluster CL2
        jobtracker rpc-port 8021
        tasktracker http-port 50060
        interval 10
        shutdown
    switch(config-monitor-hadoop-CL2)#
```
This chapter describes Arista’s implementation of sFlow, including configuration instructions and command descriptions. Topics covered by this chapter include:

- Section 44.1: sFlow Conceptual Overview
- Section 44.2: sFlow Configuration Procedures
- Section 44.3: sFlow Configuration Commands

### 44.1 sFlow Conceptual Overview

#### 44.1.1 sFlow Technology

sFlow is a multi-vendor sampling technology that continuously monitors application level traffic flow at wire speed simultaneously on all interfaces. sFlow provides gigabit speed quantitative traffic measurements without impacting network performance.

sFlow has the following network traffic monitoring characteristics:

- sFlow provides a network view of active route usage that measures network traffic.
- sFlow is scalable to 10 Gb/s without impacting switch performance or the network load.
- sFlow is implemented on a wide range of devices, without requiring additional memory and CPU.
- sFlow is an industry standard.

An sFlow configuration consists of:

- sFlow agents, embedded on network equipment, that monitors traffic and generates data.
- sFlow collectors that receive and analyze sFlow data.

Arista switches include an sFlow agent that monitors ingress data through all Ethernet interfaces.

#### 44.1.1 sFlow Agents

The sFlow agent is a software process that runs as part of the network management software within an Arista switch. It combines interface counters and flow samples into sFlow datagrams that are sent to an sFlow collector. Packets typically include flow samples and state information of the forwarding/routing table entries associated with each sample.

The sFlow Agent performs minimal processing when packaging data into datagrams. Immediate data forwarding minimizes agent memory and CPU requirements.
44.1.1.2 sFlow Collector

An sFlow collector is a server that runs software that analyzes and reports network traffic. Collectors receive flow samples and counter samples respectively as sFlow datagrams from sFlow agents. Arista switches reference a collector’s IP address and UDP port as a configurable setting through a CLI command. Arista switches do not include sFlow collector software.

44.1.1.3 sFlow Data

The sFlow Agent uses two forms of sampling: statistical packet-based sampling of switched flows and time-based sampling of network interface statistics.

- **Switched flow sampling**: A sample is taken by either copying the packet’s header or extracting feature data from the packet.
- **Interface statistics sampling**: Counter sampling extracts statistics by periodically polling each data source on the device.

sFlow implements flow sampling and counter sampling as part of an integrated system. An sFlow datagram incorporates both sample types.

44.1.2 Arista sFlow Implementation

Arista switches provide a single sFlow agent instance that samples ingress traffic from all Ethernet and port channel interfaces. The switch provides two levels of settings for enabling sFlow:

- a global setting that enables packet sampling on the entire switch.
- interface settings that control sampling on individual interfaces when sFlow is globally enabled.

sFlow default settings include:

- **global**: sFlow is globally disabled.
- **Ethernet and port channel interfaces**: sFlow is enabled on all interfaces when it is globally enabled.

The switch performs sFlow polling when sFlow is globally enabled. The CLI provides commands that globally disable sampling while counter polling remains enabled. Sample enabling is not controllable on individual interfaces.

The switch sends sFlow datagrams to the collector located at an IP address specified by a global configuration command. If the collector destination is not configured, the switch samples data without transmitting the resulting datagrams.

Although the CLI enforces the configured sampling rate limit, it may drop samples if it cannot handle the number of samples it receives over a specified period. Under normal operation, the maximum packet sample rate is one per 16384 packets. The CLI allows for higher sampling rates by using the `dangerous` keyword.

The following lists describe sFlow's sampling behavior relative to different packet types:

- **Packets that are sampled**:
  - CPU
  - IP Options and MTU violations
  - Flooded packets
  - Multicast packets
- **Packets that are not sampled**:
  - LACP frames
• LLDP frames
• STP BPDUs
• IGMP packets
• PAUSE frames
• PIM hello packets
• CRC error frames
• Packets dropped by ACLs or due to VLAN violations

44.1.3 Petra Platform sFlow Implementation

sFlow implementation on Petra platform switches differ from sFlow implementation on other platforms as follows:

• Petra platform ports configured for mirroring cannot support sFlow. Ports configured for both sFlow and mirroring ignore sFlow and continue mirroring operations; sFlow configuration commands remain in place and take effect when mirroring is disabled on the port.

• sFlow sampling rate may be affected by congestion of the switch on Petra which can be mitigated by changing the buffer configuration.

On Petra platforms, ingress buffers are divided into three categories: unicast, multicast and mini-multicast. Ingress packets on interfaces configured for sFlow sampling or ingress mirroring use mini-multicast buffers. If mini-multicast buffers are exhausted, the packets use unicast buffers but are not candidates for sFlow sampling or ingress mirroring.

By default on Petra platforms, EOS allocates 8K mini-multicast buffers and 180K unicast buffers. Up to 64K of the unicast buffers can be reconfigured as mini-multicast buffers, dividing the total buffer pool into 64K mini-multicast buffers and 124K unicast buffers. When implementing sFlow, it is recommended that more buffer space be allocated to mini-multicast buffers using the `platform petraA buffers mini-multicast` command to ensure proper sFlow sampling.

Example

• The following command allocates 64K buffer space to mini-multicast buffers:

  switch(config)#platform petraA buffers mini-multicast 65536
  ! Command will cause interfaces to flap (links will go down/up).
  Proceed with command? [confirm]y
  switch(config)#

  The default setting is 8192 (8K). Executing this command disrupts traffic on all switch ports.
44.2 sFlow Configuration Procedures

Implementing sFlow on an Arista switch consists of configuring the following agent parameters:

1. Collector location address.
2. Agent source address.
3. Polling interval.
4. Sampling rate.

(Optionally, sFlow can be configured to include output interface and traffic class information in samples using the `sflow sample` command.)

After configuring the sFlow agent, sampling is initiated by globally enabling sFlow on the switch.

Configuring the collector location

The `sflow destination` command specifies the IP address and UDP port of an sFlow collector. The switch supports multiple collectors.

Example

- This command configures the switch to send sFlow data to collectors at 10.42.15.12, port 6100 and 10.52.12.2 port 6343 (the default sFlow port).

  switch(config)#sflow destination 10.42.15.12 6100
  switch(config)#sflow destination 10.52.12.2
  switch(config)#

Configuring the agent source address

The `sflow source` command specifies the source address that the switch places in all sFlow datagrams that it sends to the collector. This address is normally set to an IP address configured on the switch.

Example

- This command configures 10.2.9.21 as the sFlow source address.

  switch(config)#sflow source 10.2.9.21
  switch(config)#

The `sflow source-interface` command can be alternatively used to specify the interface from which an IP address is derived that the switch places in all sFlow datagrams that it sends to the collector. This address is normally set to an IP address configured on the switch.

Example

- This command configures VLAN interface 25 as the sFlow source interface. The switch enters the IP address for VLAN 25 in the source field of sFlow datagrams.

  switch(config)#sflow source-interface vlan 25
  switch(config)#

`running-config` cannot simultaneously contain `sflow source` and `sflow source-interface` commands.

Configuring the polling interval

The `sflow polling-interval` command specifies the interval for sending counter data to the sFlow collector. The default interval is two seconds.
Example

- This command configures the switch to send sFlow data every ten seconds.
  
  ```
  switch(config)#sflow polling-interval 10
  switch(config)#
  ```

Configuring the sampling rate and sample contents

The `sflow sample` command sets the packet sampling rate. Packets are sampled at random intervals to avoid inaccurate sampling of periodic events. A rate of 16384 corresponds to an average sample of one per 16,384 packets. The default rate is 1048576.

Example

- This command configures the sFlow sampling rate as 65536 (one per 65,536 packets).
  
  ```
  switch(config)#sflow sample 65536
  switch(config)#
  ```

The `sflow sample` command can also optionally configure sample packets to include information about the traffic class of the sample. Traffic class is communicated by rewriting the DSCP field in the sample packet.

By default, samples include information about the output interface. To remove this information, use the `[no] sflow sample output interface` command.

- These commands configure sFlow to include traffic class information in samples but to exclude output interface data.
  
  ```
  switch(config)#no sflow sample output interface
  switch(config)#sflow sample rewrite dscp
  switch(config)#
  ```

Enabling sFlow

The `sflow run` command globally enables sFlow on the switch. The `sflow enable` command controls sFlow operation on Ethernet and port channel interfaces when sFlow is globally enabled. The `sflow enable` command has no effect when sFlow is globally disabled.

Example

- These commands enable sFlow on the switch, then disables sFlow on Ethernet interface 10.
  
  ```
  switch(config)#sflow run
  switch(config)#interface ethernet 10
  switch(config-if-Et10)#no sflow enable
  switch(config)#
  ```
44.3 sFlow Configuration Commands

This section contains descriptions of sFlow commands.

Global Configuration Commands
- platform petraA buffers mini-multicast
- sflow destination
- sflow polling-interval
- sflow run
- sflow sample
- sflow source
- sflow source-interface

Interface Configuration Commands
- sflow enable

Privileged EXEC Command
- clear sflow counters

sFlow Display Commands
- show sflow
- show sflow interfaces
clear sflow counters

The clear sflow counters command resets the global sFlow statistics, which includes the number of samples and sample pool. The hardware trigger count is not reset.

The show sflow command displays global sFlow statistics.

Command Mode
Privileged EXEC

Command Syntax

  clear sflow counters

Example

  This command resets the sFlow counters.

    switch#clear sflow counters
    switch#
**platform petraA buffers mini-multicast**

The **platform petraA buffers mini-multicast** command configures the buffer space allocated to mini-multicast use on the Petra chip.

Mini-multicast buffers are used on the Petra platform switches for ingress mirroring and sFlow. On Petra platforms, ingress buffers are divided into three categories: unicast, multicast and mini-multicast. Ingress packets on interfaces configured for sflow sampling or ingress mirroring use mini-multicast buffers. If mini-multicast buffers are exhausted, the packets use unicast buffers but are not candidates for sflow sampling or ingress mirroring.

By default on Petra platforms, EOS allocates 8K mini-multicast buffers and 180K unicast buffers. Up to 64K of the unicast buffers can be reconfigured as mini-multicast buffers, dividing the total buffer pool into 64K mini-multicast buffers and 124K unicast buffers. When implementing sFlow, it is recommended that more buffer space be allocated to mini-multicast buffers to ensure proper sFlow sampling.

---

**Note**

Executing this command will cause all links on the switch to flap.

---

**Command Mode**

Global Configuration

**Command Syntax**

```
platform petraA buffers mini-multicast num_buf RUNTIME
no platform petraA buffers mini-multicast RUNTIME
default platform petraA buffers mini-multicast RUNTIME
```

**Parameters**

- **num_buf** number of buffers to allocate to mini-multicast use. Value ranges from 8192 (the default) to 65536.
- **RUNTIME** allows execution of the command without confirmation. Options include:
  - `<no parameter>` CLI prints a warning and asks for confirmation before execution.
  - `now` command is executed immediately.

**Example**

- The following command allocates 64K of buffer space to mini-multicast buffers.

  ```
  switch(config)#platform petraA buffers mini-multicast 65536
  ! Command will cause interfaces to flap (links will go down/up).
  Proceed with command? [confirm]y
  switch(config)#
  ```
sflow destination

The **sflow destination** command specifies an sFlow collector IP address and UDP port. The switch supports sFlow collector addresses through multiple sFlow destination commands in *running-config*.

The **no sflow destination** and **default sflow destination** commands remove the specified sFlow collector IP address by deleting the corresponding *sflow destination* command from *running-config*.

**Command Mode**
- Global Configuration

**Command Syntax**

```
sflow destination dest_addr [UDP_PORT]
no sflow destination dest_addr [UDP_PORT]
default sflow destination dest_addr [UDP_PORT]
```

**Parameters**
- `dest_addr` sflow collector's IP address.
- `UDP_PORT` sFlow collector's data reception port. Options include:
  - `<No parameter>` port number 6343 (default).
  - `port_num` port number. Value ranges from 0 to 65535.

**Example**
- This command configures the switch to send sFlow data to the collector located at 10.42.15.12; the collector receives the data through UDP port 6100.
  ```
  switch(config)#sflow destination 10.42.15.12 6100
  switch(config)#
  ```
**sflow enable**

The `sflow enable` command enables sFlow on the configuration mode interface when sFlow is globally enabled. By default, sFlow is enabled on all interfaces when sFlow is globally enabled (`sflow run`). The `sflow enable` command is required only when `running-config` contains a `no sflow enable` statement for the specified interface.

The `no sflow enable` command disables sFlow on the configuration mode interface. When sFlow is globally disabled, this command persists in `running-config` but has no effect on switch operation.

The `default sflow enable` command removes the corresponding `no sflow enable` command from `running-config`, enabling sFlow capability on the interface.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

**Command Syntax**
```
sflow enable
no sflow enable
default sflow enable
```

**Examples**
- These commands enable sFlow on the switch and disable sFlow on Ethernet interface 12.
  ```
  switch(config)#sflow run
  switch(config)#interface ethernet 12
  switch(config-if-Et12)#no sflow enable
  switch(config-if-Et12)#
  ```
- This command removes the `no sflow enable` command for Ethernet interface 12 from `running-config`, enabling sFlow on the interface whenever sFlow is globally enabled.
  ```
  switch(config-if-Et12)#sflow enable
  switch(config-if-Et12)#
  ```
sflow polling-interval

The sflow polling-interval command specifies the counter’s polling interval. The switch uses this interval to schedule a port’s counter data transmissions to the sFlow collector.

The default interval is two seconds.

The no sflow polling-interval and default sflow polling-interval commands revert the polling interval to the default of two seconds by removing the sflow polling-interval command from running-config.

Command Mode
Global Configuration

Command Syntax

sflow polling-interval interval_period
no sflow polling-interval
default sflow polling-interval

Parameters
• interval_period polling interval (seconds). Value ranges from 0 to 3600 (60 minutes). Default is 2.

Example
• This command configures the switch to send sFlow counter data every ten seconds.

  switch(config)#sflow polling-interval 10
  switch(config)#
sflow run

The `sflow run` command globally enables sFlow on the switch. The default sFlow global setting is *disabled*. sFlow cannot be enabled on individual interfaces when it is globally disabled.

The `sflow enable` interface configuration command controls sFlow operation on individual Ethernet and port channel interfaces when sFlow is globally enabled. When sFlow is enabled globally, sFlow is also enabled on all interfaces by default.

The `no sflow run` and `default sflow run` commands globally disable sFlow on the switch.

**Command Mode**
Global Configuration

**Command Syntax**

```
sflow run
no sflow run
default sflow run
```

**Examples**

- This command enables sFlow on the switch.

  ```
  switch(config)#sflow run
  switch(config)#
  ```

- This command globally disables sFlow.

  ```
  switch(config)#no sflow run
  switch(config)#
  ```
sflow sample

The **sflow sample** command sets the packet sampling rate. Packets are sampled at random intervals to avoid inaccurate sampling of periodic events; the packet sampling rate defines the average number of ingress packets that pass through an interface for every packet that is sampled. A rate of 16384 corresponds to an average sample of one per 16,384 packets. The switch may drop samples if it cannot handle the configured sample rate. Under normal operation, the maximum packet sample rate is one per 16384 packets. Higher sampling rates can be specified with the *dangerous* option.

By default, samples include information about the output interface. To remove this information, use the [no] **sflow sample output interface** command.

The **sflow sample** command can also optionally configure sample packets to include information about the traffic class of the sample. Traffic class is communicated by rewriting the DSCP field in the sample packet.

The **no sflow sample** and **default sflow sample** commands reset the packet sampling rate to the default of 1,048,576 and remove output interface and traffic class information from samples by removing the **sflow sample** command from the configuration.

**Command Mode**

Global Configuration

**Command Syntax**

```plaintext
sflow sample SAMPLE_RATE [rewrite dscp]
no sflow sample
default sflow sample
```

**Parameters**

- **SAMPLE_RATE** size of the packet sample from which one packet is selected. Default sample size is 1048576 packets. Options include:
  - **recommended_rate** Integer between 16384 to 16777215.
  - **dangerous any_rate** permits overriding the recommended range of sampling rates. The *any_rate* value range varies by platform:
    - **fm6000** 1 to 65535
    - **trident** 1 to 16777216
    - **petra** 1 and 7895 to 16777216
  - **rewrite dscp** configures sFlow to rewrite the DSCP field of sample packets to indicate the traffic class of the original packet.

**Examples**

- This command configures the sFlow sampling rate as 65536 (one per 65,536 packets).
  ```plaintext
  switch(config)#sflow sample 65536
  switch(config)#
  ```
- This command configures the sFlow sampling rate as 256 (one per 256 packets).
  ```plaintext
  switch(config)#sflow sample dangerous 256
  switch(config)#
  ```
- This command configures sFlow to include traffic class information in samples.
  ```plaintext
  switch(config)#sflow sample rewrite dscp
  switch(config)#
  ```
[no] sflow sample output interface

By default, sFlow samples include information about the output interface of the sampled packet. The no sflow sample output interface command prevents sFlow from including that information.

Command Mode
   Global Configuration

Command Syntax
   no sflow sample output interface

Examples
   • This command configures sFlow to not include output interface information in samples.
     switch(config)#no sflow sample output interface
     switch(config)#
sflow source

The `sflow source` command specifies the address that is listed as the source in all sFlow datagrams that the switch sends to the collector. The source address is normally set to an IP address configured on the switch. This command cannot be used if `running-config` contains an `sflow source-interface` command.

The `no sflow source` and `default sflow source` commands remove the `sflow source` command from `running-config`.

**Command Mode**
- Global Configuration

**Command Syntax**

```
sflow source source_addr
no sflow source
default sflow source
```

**Parameters**

- `source_addr` source IP address (dotted decimal notation).

**Example**

- This command configures 10.2.9.21 as the sFlow source address.

```
switch(config)#sflow source 10.2.9.21
switch(config)#
```
sflow source-interface

The `sflow source-interface` command specifies the interface from which the sFlow source IP address is derived. The switch enters the interface’s IP address as the source in sFlow datagrams that it sends to the collector. This command cannot be used if `running-config` contains an `sflow source` command.

The `no sflow source-interface` and `default sflow source-interface` commands remove the `sflow source-interface` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
sflow source-interface INT_NAME
no sflow source-interface
default sflow source-interface
```

**Parameters**

- `INT_NAME` Interface type and number. Options include:
  - `interface ethernet e_num` Ethernet interface specified by `e_num`.
  - `interface loopback l_num` Loopback interface specified by `l_num`.
  - `interface management m_num` Management interface specified by `m_num`.
  - `interface port-channel p_num` Port-Channel Interface specified by `p_num`.
  - `interface vlan v_num` VLAN interface specified by `v_num`.

**Example**

- This command configures the sFlow source address as the IP address assigned to the loopback 0 interface.

  ```
  switch(config)#sflow source-interface loopback 0
  switch(config)#
  ```
show sflow

The `show sflow` command displays configured sFlow parameters, operational status, and statistics. The `show sflow interfaces` command displays the interfaces where sFlow is enabled.

**Command Mode**

EXEC

**Command Syntax**

```
show sflow [INFO_LEVEL]
```

**Parameters**

- `INFO_LEVEL` Specifies the information that the command displays: Options include:
  - `<no parameter>` displays base information
  - `detail` displays base information plus hardware sampling status and number of discarded samples.

**Examples**

- This command displays the base sFlow information.

```
switch#show sflow
Warning: displaying counters that may be stale

  ```
45.1 \textbf{OpenFlow Introduction}
Arista EOS supports OpenFlow 1.0 controlled by OpenFlow controllers for filtering and redirecting traffic.

45.2 \textbf{OpenFlow Description}
OpenFlow is a programmable network protocol that manages and directs traffic among Ethernet switches, routers, and wireless access points over the network in support of Software-Defined Networking (SDN) applications. OpenFlow can be used for traffic flow management in metro, WAN, and data center networks, and also security management in enterprise and campus data center applications, and other applications with the appropriate use of OpenFlow controllers.
45.2.1 OpenFlow Controller

The Arista device supports an active controller connection for which the Arista device will initiate (seek) the TCP connection to a given OpenFlow Controller address.

Figure 45-1: Reactive and proactive modes

The controller can be any standard OpenFlow controller.

Switch consists of three parts:

- A flow table, to tell the switch how to process the flow.
- A channel that connects the switch to a remote controller, allowing commands and packets to be sent between a controller and the switch.
- The OpenFlow Protocol, which provides a way for a controller to communicate with a switch.

An OpenFlow-enabled device supports an OpenFlow Client (control plane software), which communicates with an OpenFlow Controller using the OpenFlow protocol. The OpenFlow Controller runs on a server or a server cluster. OpenFlow-enabled devices support the abstraction of a flow table, which is manipulated by the OpenFlow Controller. A flow is a collection of packets where some selected header fields match particular values for those fields. The flow table is sorted by flow priority, which is defined by the controller.

**Flow table**

Forwarding decisions for incoming packets are decided by a simple lookup on its flow-table entries. Packets that don’t match any flow entry are dropped by default. Every flow entry in the flow-table contains:

- Header fields to match against packets: Each entry contains a specific value, or ANY, which matches any value.

<table>
<thead>
<tr>
<th>Ingress Port</th>
<th>Ether Source</th>
<th>Ether Type</th>
<th>VLAN Id</th>
<th>IP Proto</th>
<th>Src Dst</th>
<th>Dst Port</th>
</tr>
</thead>
</table>

- Counters to update for matching packet: These counters are used for statistics purposes, in order to keep track of the number of packets and bytes for each flow and the time that has elapsed since the flow initiation.
- Actions to apply to matching packets: The action specifies the way in which the packets of a flow will be processed. An action can be one of the following: 1) forward the packet to a given port or ports, after optionally rewriting some header fields, 2) drop the packet 3) forward the packet to the controller.
Channel

The channel is the interface that connects each OpenFlow switch to a controller. Through this interface
the controller exchanges messages with the switches in order to configure and manage them.

45.2.2 OpenFlow Modes

Bind modes

The switch can be configured to divide traffic entering the switch in either of two ways:

- By interface, so that only packets arriving on certain interfaces are processed by OpenFlow
  (interface bind mode, the default).
- By VLAN, so that only packets associated with certain VLAN IDs are processed by OpenFlow
  (VLAN bind mode).

Other packets are forwarded normally according to the MAC address table, filtered by ACLs, mirrored
to other ports.

Note

The hybrid mode of operation is experimental.

The switch can also be configured to apply a limited set of OpenFlow actions to any packets, regardless
of ingress interface or VLAN, as well as forward the packets normally (monitor bind mode).

Interface bind mode

When the switch is configured in interface bind mode, the ingress interface of a packet is processed
according to entries in the OpenFlow table.

Only interfaces bound to OpenFlow are mapped to OpenFlow ports and exposed to the controller via
features reply and port status messages. Output actions in flow table entries and in packet out
messages can refer only to mapped ports. Use the `show openflow ports` command to see which
interfaces the switch maps to OpenFlow ports and exposes to the controller.

- In OpenFlow configuration mode, use the `bind mode (OpenFlow)` command to select interface
  bind mode.
- In the OpenFlow configuration mode, use the bind interface command to bind one or more
  interfaces to OpenFlow.

When an interface is bound to OpenFlow, certain switch functions are disabled on the interface,
including spanning tree protocol (STP). The OpenFlow controller and application must ensure that flow
table entries do not allow traffic to loop in the network.

Only Ethernet and Port-Channel interfaces can be bound to OpenFlow. If an Ethernet interface is
configured as a member of a LAG, attempting to bind the interface to OpenFlow has no effect. However,
the Port-Channel interface of which it is a member may itself be bound to OpenFlow.

VLAN bind mode

When a packet arrives at a switch interface, the switch assigns it a VLAN for internal processing, based
on the switchport configuration of the ingress interface and on the packet's VLAN tag (if any). If the
switch is configured in VLAN bind mode, the internal VLAN determines whether the packet is
processed according to entries in the OpenFlow table and whether the packet is matched by a given
entry in the OpenFlow table. After the switch has processed the packet, the switchport configuration of
each potential egress interface controls whether the packet is transmitted tagged with the internal
VLAN ID, transmitted untagged, or filtered.
Several configuration commands affect whether packets received on a given interface are processed by OpenFlow, and whether packets directed to an interface via an OpenFlow output action are transmitted or filtered:

Use the VLAN configuration mode command to create the VLANs to be accepted by the switch and processed by OpenFlow.

In the interface configuration mode, use switchport commands to configure the interface as either an access port or a trunk port. For an access port, set the VLAN to an OpenFlow VLAN; for a trunk port, configure which OpenFlow VLANs are allowed.

In OpenFlow configuration mode, use the bind mode (OpenFlow) command to select VLAN bind mode, and use the bind vlan (OpenFlow) command to bind one or more VLANs to OpenFlow.

**Untagged packet processing in VLAN bind mode**

The OpenFlow protocol also allows a flow table entry to explicitly match untagged packets, or to strip the VLAN tag from matched packets. Since the switch actually assigns a VLAN internally to packets received without a tag, the OpenFlow function on the switch must be configured with a single "native" VLAN ID in order to make sense of such flow entries. When an OpenFlow native VLAN is configured:

- A flow table entry defined to match untagged packets actually matches packets whose internal VLAN is the OpenFlow native VLAN.
- A flow table entry with a strip VLAN tag action actually sets the packet’s internal VLAN to the OpenFlow native VLAN.
- Packets sent to the controller via a packet-in message are sent untagged if they are assigned to the native VLAN, and tagged otherwise.
- Untagged packets received from the controller via a packet-out message are assigned to the native VLAN.

In contrast, when no OpenFlow native VLAN is configured:

- Flow table entries defined to match untagged packets or with a strip VLAN tag action are rejected.
- All packets sent to the controller via a packet-in message are sent tagged.
- Untagged packets received from the controller via a packet-out message are dropped.

There is no explicit command to configure the OpenFlow native VLAN. To configure a VLAN as the OpenFlow native VLAN:

- Use the VLAN configuration mode command.
- Every interface handling of OpenFlow traffic, in interface configuration mode, uses switchport commands to configure the interface as either an access port or a trunk port. For an access port, set the access VLAN to N; for a trunk port, either set the native VLAN to N or configure the interface to drop untagged frames.
- In OpenFlow configuration mode, use the bind vlan (OpenFlow) command to assign VLAN N to OpenFlow.

Configuring two interfaces as access ports with different OpenFlow-bound VLANs, or as trunk ports with different native OpenFlow-bound VLANs, violates these constraints and causes the OpenFlow function to behave as no OpenFlow native VLAN is configured.

Use the show openflow command to see whether an OpenFlow native VLAN has been configured.
Spanning Tree Protocol in VLAN bind mode

STP can operate on OpenFlow-bound VLANs. The switch default STP configuration is one multiple spanning tree (MST) instance containing all VLANs, including OpenFlow-bound VLANs. When STP is configured on OpenFlow-bound VLANs, packets received from or sent to blocked ports are dropped, regardless of the rules defined in the OpenFlow flow table.

For some applications, you may want to disable STP on OpenFlow-bound VLANs. Before doing so, be sure that the OpenFlow controller and application is configured properly to manage multiple redundant paths through the network without allowing traffic to loop.

To ensure proper operation of STP on the switch and to support OpenFlow applications that interoperate with STP, OpenFlow forwards inbound STP packets both to the spanning tree agent on the switch and to the OpenFlow controller as packet-in messages. This behavior overrides any flow table entries that might otherwise match STP packets, and is not configurable.

Monitor bind mode

Unlike interface and VLAN bind modes, monitor bind mode is tailored for specific applications. The switch both forwards traffic normally and selectively mirrors packets under OpenFlow control.

When the switch is configured in monitor bind mode, all traffic entering the switch is forwarded normally, regardless of ingress interface or internal VLAN. All Ethernet and Port-Channel interfaces are mapped to OpenFlow ports and exposed to the controller (except LAG members and mirror destination ports).

In this mode, the entire switch is bound to OpenFlow, and OpenFlow processing is applied to packets in addition to the normal forwarding behavior.

Currently the only actions that can be performed on packets in monitor bind mode are:

- Output normally
- Copy to mirror destination port

In monitor bind mode, the default action taken on packets that are not matched by any flow table entry is output normally. The switch rejects flow entries not conforming to these restrictions.

Routing Between the OpenFlow and Non-OpenFlow Domain

The switch can be configured to perform standard IP routing of traffic processed by OpenFlow. From the controller's point of view, the switch appears to have a virtual port 40000 (OpenFlowRouter) in addition to the physical ports.

Packets sent out the OpenFlowRouter port can undergo standard IP routing into a different IP subnet. After routing, those packets can either exit the switch or be processed by OpenFlow again.

45.2.2.1 Port mapping

For switches that support QSFP+ modules, a 40G interface can be configured as four 10G ports. These Ethernet interfaces are mapped to OpenFlow ports according to the formula port = M * 200 + N for EthernetM/N. For example, interface Ethernet1/1 is mapped to OpenFlow port 201; Ethernet1/2 to OpenFlow port 202, Ethernet16/1 to OpenFlow port 3201, Ethernet16/2 to OpenFlow port 3202, and so on.

When IP routing is configured, the OpenFlow Router interface is mapped to OpenFlow port 40000. Port-Channel (LAG) interfaces are mapped to OpenFlow ports according to the formula port = 40000 + N for Port-ChannelN. For example, interface Port-Channel23 is mapped to OpenFlow port 40023.
The OpenFlow virtual ports all and flood refer to all Ethernet interfaces on the switch, but normal VLAN egress policies apply: a packet tagged with a given OpenFlow-bound VLAN (or untagged, if a native OpenFlow VLAN is configured) will egress a given interface only if the interface is configured to handle traffic for that VLAN. If an interface is not configured to handle traffic for any OpenFlow-bound VLAN, then no packets sent to all or flood will egress on that interface.

45.2.2.2 Queue mapping

All multicast transmit queues that are configured to be mapped from a QoS traffic class are mapped to OpenFlow. OpenFlow-mapped queues can be used by the enqueue action in flow table entries and are included in queue stats reply messages. By default, all the multicast queues 0 to 3 are mapped.

Use the `show qos maps` command to view the current mapping of traffic class to multicast transmit queue, and use the `qos map traffic-class to mc-tx-queue` configuration command to modify it. If no traffic class is mapped to a given multicast transmit queue, the queue will not be mapped to OpenFlow and will be unavailable for use by the enqueue action.

45.2.2.3 Table size

The switch supports one flow table. OpenFlow packet processing is performed in hardware; software forwarding (via the switch CPU) is not supported.

The switch advertises the table size for the l2-match profile. This should be taken as an approximation, as other switch features such as ACLs can consume hardware resources shared with OpenFlow. If the controller attempts to add a flow entry but there are insufficient resources to implement it in hardware, the switch returns an error message.

45.2.2.4 Match fields

A flow table entry can specify an exact value or wildcard for any of the following fields:

- L2 source and destination addresses
- VLAN ID (and untagged packets, if the native OpenFlow VLAN is configured)
- VLAN priority
- L2 frame type
- IPv4 source and destination addresses with subnet masking
- IPv4 TOS/DSCP field
- IPv4 protocol
- TCP/UDP source and destination port numbers

Matching the IPv4 source or destination address within an ARP message is not supported, nor is matching the ARP opcode.

45.2.2.5 Actions

In VLAN and interface bind modes, the following flow entry actions are supported:

- Copy packet on ingress to a mirror destination port (vendor-specific extension)
- Set L2 source and destination addresses
- Set VLAN ID
- Strip VLAN tag (if the native OpenFlow VLAN is configured)
- Set VLAN priority
- Set IPv4 TOS/DSCP
• Output or enqueue to physical port (see Section 45.2.3 for restrictions on multiple output actions)
• Output or enqueue to all or flood (see Section 45.2.3)
• Output to controller (buffering not supported; entire packet contents are always sent)
• Drop (no action)
• Copy packet on egress to a mirror destination port (vendor-specific extension)

In monitor bind mode, only the following actions are supported:
• Copy packet on ingress to a mirror destination port (vendor-specific extension)
• Output per normal forwarding (this action is required in every flow entry)
• Copy packet on egress to a mirror destination port (vendor-specific extension)

45.2.3 OpenFlow Limitations

Consider the following when using OpenFlow:

• OpenFlow is supported on both the 7050 and 7050X series of switches.
• OpenFlow Hybrid mode is not supported.
• Output to an ingress port is silently dropped. Flow table entries with an output to ingress port action are accepted by the switch, but matching packets are not actually forwarded via the ingress port. (But for packet-out, the output to ingress port action is supported.)
• Output/enqueue actions must follow modify actions. The switch will return an error if a modify action follows an output/enqueue action.
• Each action can be performed at most once. The switch will return an error if the same action appears more than once. Output and enqueue actions may appear at most once per port.
• Support output to only one queue. The switch will return an error if multiple enqueue actions appear with different queue ids, or if both enqueue and output actions appear.
• Packet is sent at most once per port even if there are overlapping output or enqueue actions. For example, the switch will accept a rule with actions output to all ports and output to a specific port 12, but will transmit the packet on port 12 only once even though it is contained in both actions.
• Flow entry priority is always respected, even for exact-match flow entries. The switch does not force exact-match flow entries to be processed at the highest priority.
• For packet-out messages, only output actions are supported (to a physical port, or to all, flood, or ingress port). The switch will return an error if a packet-out message is received with any other action.
• The switch-to-controller connection is plain TCP. The switch does not support encrypted TLS connections to the controller.
• Matching source and destination IP and operation code in ARP packets is not supported. Flow entries with matching the ARP Ethernet type are accepted by the switch, but the source and destination IP and protocol (opcode) match field values are ignored (i.e. the fields are wildcarded).
• A flow_mod message with modify or modify_strict command does not modify the cookie value of existing flow entries. If the modify is treated as an add, however, the new entry will be assigned the specified cookie value.
• Matching all 802.3 packets without SNAP headers is not supported. The switch does not treat a dl_type value of 0x5ff as special.
• The port_mod message is not supported. It is not possible to modify the behavior of physical ports via the port_mod message. In particular, the no_flood port_config bit cannot be used to exclude ports from the flood virtual output port set.
• Changing the list of controllers causes the current controller connection to be dropped. When the OpenFlow feature is enabled and the list of controllers is changed in any fashion (e.g. by adding or deleting a controller), the current controller connection will be dropped.

• When adding a large number of flow table entries, add higher-priority entries before lower-priority entries. Due to hardware limitations, the switch will take much longer to add a new flow entry if the table already contains many entries with lower priority.
45.3 OpenFlow Configuration

By default, the OpenFlow feature is disabled on Arista devices. You must first enable the OpenFlow feature on the device. These sections describe OpenFlow configuration tasks:

- Section 45.3.1: Configuration Procedures
- Section 45.3.2: Enabling Basic OpenFlow
- Section 45.3.3: Optional OpenFlow Commands
- Section 45.3.4: Displaying OpenFlow Configurations

45.3.1 Configuration Procedures

Use the OpenFlow configuration mode commands to configure the following basic parameters:

- `openflow`: places the switch in OpenFlow configuration mode.
- `controller (OpenFlow)`: set the controller IP address and port
- `bind interface (OpenFlow)`: bind interfaces to OpenFlow
- `shutdown (OpenFlow)`: enable or disable OpenFlow

45.3.2 Enabling Basic OpenFlow

Configure the management interface. Assign an IP address to the interface and set the default gateway IP address, allowing the OpenFlow function on the switch to establish a TCP connection with the OpenFlow controller.

The following commands turn on OpenFlow pointing to a controller, ready to receive flow setup messages to be programmed in hardware for all traffic.

- The `openflow` command places the switch in OpenFlow configuration mode.
  
  ```
  switch(config)#openflow
  switch(config-OpenFlow)#
  ```

- The `controller (OpenFlow)` command points to the primary OpenFlow controller. Others can be configured as a standby list.
  
  ```
  switch(config)#OpenFlow
  switch(config-OpenFlow)#controller tcp:15.16.15.16:6633
  switch(config-OpenFlow)#
  ```

- The `bind vlan (OpenFlow)` command dictates what VLAN or interfaces are tied to OpenFlow. Since hybrid mode is not supported, Arista recommends binding all VLANs or all interfaces to OpenFlow.
  
  ```
  switch(config)#openflow
  switch(config-openflow)#controller tcp:1.2.3.4:6633
  switch(config-openflow)#bind mode vlan
  switch(config-openflow)#bind vlan 1
  ```

- The `shutdown (OpenFlow)` command determines if the configuration takes effect or not. The following command enables OpenFlow on the switch.
  
  ```
  switch(config-OpenFlow)#no shutdown
  switch(config-OpenFlow)#
  ```
45.3.3 Optional OpenFlow Commands

**Keepalive**

The `keepalive (OpenFlow)` command allows you to set the interval for switch to controller keepalives (default of 10 seconds scales best for large scale multi-node OpenFlow switch networks). After three consecutive reply (from the controller) misses, the switch will try to connect to the second configured controller, if configured.

```
switch(config-OpenFlow)#keepalive
switch(config-OpenFlow)#
```

**Profile**

The `profile (OpenFlow)` command determines the type of flows. To double flow table size (in case all flows are L2 only), setting a profile of l2-match is best suited. Default is full-match (includes L3/4 field match).

```
switch(config-OpenFlow)#profile l2-match
switch(config-OpenFlow)#
```

**Default-action**

The `default-action (OpenFlow)` command tells the Arista OpenFlow agent the action that needs to be taken for packets (drop or send-to-controller) that don't match any existing flows programmed locally on the hardware.

```
switch(config-OpenFlow)#default-action drop
switch(config-OpenFlow)#
```

45.3.4 Displaying OpenFlow Configurations

Show commands display the state of OpenFlow running on the Arista switch.

- The `show openflow` command displays the configuration state of the OpenFlow feature and the flows that are actively installed in the hardware of the Arista switch.

```
switch(config)# show openflow
OpenFlow configuration: Enabled
DPID: 0x0000001c73111a92
Description: sw3-Arista
Controllers:
configured: tcp:172.22.28.228:6633
connected: tcp:172.22.28.228:6633
connection count: 3
keepalive period: 10 sec
Flow table state: Enabled
Flow table profile: full-match
Bind mode: VLAN
VLANs: 1-2
native VLAN: 1
IP routing state: Disabled
Shell command execution: Disabled
Total matched: 7977645 packets
```
• The **show openflow flows** command show the default flow that is installed when OpenFlow is enabled.

```plaintext
switch(config)# show OpenFlow flows
Flow flow00000000000000000005:
  priority: 100
  cookie: 45035996453121666 (0xa000000ab1ae82)
  match:
    ingress interface: Ethernet3
    Ethernet type: IPv4
    source IPv4 address: 10.0.0.0/255.255.255.0
  actions:
    output interfaces: Ethernet11
  matched: 0 packets, 0 bytes
Flow __default__:
  priority: -1
  cookie: 0 (0x0)
  match:
  actions:
    output to controller
  matched: 5519922 packets, 433188045 bytes
```
45.4 OpenFlow Command Descriptions

OpenFlow Global Configuration Mode
- openflow

Openflow Configuration Commands
- bind interface (OpenFlow)
- bind mode (OpenFlow)
- bind vlan (OpenFlow)
- controller (OpenFlow)
- default-action (OpenFlow)
- description (OpenFlow)
- keepalive (OpenFlow)
- profile (OpenFlow)
- routing recirculation-interface (OpenFlow)
- routing vlan (OpenFlow)
- shell-command allowed (OpenFlow)
- shutdown (Openflow)

OpenFlow Display and Clear Commands
- clear openflow statistics
- show openflow
- show openflow flows
- show openflow ports
- show openflow profiles
- show openflow queues
- show openflow statistics
bind interface (OpenFlow)

When the switch is configured in interface bind mode, the ingress interface of a packet determines whether the packet is processed according to entries in the OpenFlow table or forwarded normally by the switch.

Only interfaces bound to OpenFlow are mapped to OpenFlow ports and exposed to the controller via features reply and port status messages. Output actions in flow table entries and in packet out messages can refer only to mapped ports. Use the `show openflow ports` command to see which interfaces the switch maps to OpenFlow ports and exposes to the controller.

In the OpenFlow configuration mode, use the `bind mode interface` command to select the interface bind mode.

When an interface is bound to OpenFlow, certain switch functions are disabled on the interface, including spanning tree protocol (STP). The OpenFlow controller and application must ensure that flow table entries do not allow traffic to loop in the network.

Only Ethernet and Port-Channel interfaces can be bound to OpenFlow. If an Ethernet interface is configured as a member of a LAG, attempting to bind the interface to OpenFlow has no effect. However, the Port-Channel interface of which it is a member may itself be bound to OpenFlow.

The `no bind interface` and `default bind interface` commands revert the specified list configuration to its default by removing the corresponding `bind interface` command from `running-config`.

**Command Mode**
OpenFlow Configuration

**Command Syntax**

```
bind interface [INTF]
no bind interface [INTF]
default bind interface [INTF]
```

**Parameters**

- `INTF` Interface that are tied to OpenFlow. Options include:
  - `ethernet e_range` Ethernet interfaces specified by `e_range`.
  - `port-channel p_range` Port channel interfaces specified by `p_range`.

Valid `e_range` and `p_range` formats include number, range, or comma-delimited list of numbers and ranges.

**Example**

- This command binds Ethernet 1 to OpenFlow.
  ```bash
  switch(config)# openflow
  switch(config-openflow)#bind interface ethernet 1
  ```
bind mode (OpenFlow)

The **bind mode** command controls the way packets are divided on ingress between OpenFlow processing and normal switch processing.

The switch can be configured to divide traffic entering the switch in the following ways:

- **Interface bind mode**: Packets entering the switch from certain interfaces are only processed by OpenFlow according to flow table entries; packets entering from other interfaces are forwarded normally. (interface bind mode is the default).
- **VLAN bind mode**: Only packets associated with certain VLAN IDs are processed by OpenFlow.
- **Monitor bind mode**: All packets are forwarded normally, and are also processed by OpenFlow; a restricted set of actions are applied to packets matching a flow table entry.

Other packets are forwarded normally according to the MAC address table, filtered by ACLs, mirrored to other ports.

The switch can also be configured to apply a limited set of OpenFlow actions to any packets, regardless of ingress interface or VLAN, as well as forward the packets normally (monitor bind mode).

The **no bind mode** and **default bind mode** commands revert the specified list configuration to its default by removing the corresponding **bind mode** command from **running-config**.

**Command Mode**

Open flow Configuration

**Command Syntax**

```
bind mode METHOD
no bind mode
default bind mode
```

**Parameters**

- **METHOD**  
  bind interfaces to OpenFlow. Options include:
  - **interface**  
    Only packets arriving on certain interfaces are processed by OpenFlow.
  - **monitor**  
    All packets are forwarded normally, and are also processed by OpenFlow.
  - **vlan**  
    Only packets associated with certain VLAN IDs are processed by OpenFlow.

**Example**

- In this example, packets received without VLAN tags are assigned to the default VLAN 1 upon entering the switch and are processed by OpenFlow. All VLAN-tagged packets are dropped.

```
switch>enable
switch#configure
switch(config)#interface et1-48
switch(config-if-Et1-48)#switchport mode access
switch(config-if-Et1-48)#switchport access vlan 1
switch(config-if-Et1-48)#exit
switch(config)#openflow
switch(config-openflow)#controller tcp:1.2.3.4:6633
switch(config-openflow)#bind mode vlan
switch(config-openflow)#bind vlan 1
```
bind vlan (OpenFlow)

The bind vlan command adds one or more VLAN IDs to the set of VLANs that are processed by OpenFlow in VLAN bind mode. The VLANs must be created separately using the VLAN configuration mode commands.

If you specify a nonexistent VLAN with the bind vlan command, the binding will be stored in the running configuration but will not take effect until the VLAN is created.

A range of VLANs may be passed to the bind vlan command to add more than one at a time.

The number of VLANs that may be bound to OpenFlow depends on available hardware resources, which are shared with other features including IP routing and ACLs. On the 7050 Series switches the maximum number is 1024.

Use the show openflow command to verify which VLANs are bound to OpenFlow; this command reflects the actual hardware state rather than the configuration.

The no bind vlan and default bind vlan commands removes one or more VLANs from the set of VLANs that are processed by OpenFlow in VLAN bind mode.

**Command Mode**
OpenFlow Configuration

**Command Syntax**

```bash
bind vlan v_range
no spanning-tree vlan [v_range]
default spanning-tree vlan [v_range]
```

**Parameters**
- `v_range` VLAN list. VLAN numbers range from 1 to 4094.

**Examples**
- These command bind VLANs 1 and 2 to OpenFlow.
  ```bash
  switch(config-openflow)#bind mode vlan
  switch(config-openflow)#bind vlan 1,2
  ```
clear openflow statistics

The **clear openflow statistics** command resets the flow statistics for OpenFlow.

**Command Mode**

Privileged EXEC

**Command Syntax**

```
clear openflow statistics
```

**Example**

- This command resets the OpenFlow counters.

  ```
  switch#clear openflow statistics
  switch#
  ```
controller (OpenFlow)

The `controller` command adds the address of an OpenFlow controller to which the switch should connect. The parameter must take the form tcp:1.2.3.4:6633 where 1.2.3.4 is the IP address of the controller and 6633 is the TCP port number.

The `controller` command may be used multiple times to add multiple controllers. The switch will attempt to connect to the first controller in the list of controllers. If the connection attempt fails, or the current connection terminates, the switch will try the next controller in that list, and so on. If the switch cannot connect to the last controller in the list, it will retry with the first controller in the list.

The order in which controllers are added is the order that the switch uses to establish controller connections. This ordering can be seen in the output of the `show openflow` command.

The `no controller` command either removes the specified controller from the list of controllers if a controller address is given as a parameter, or removes all controllers from the list of controllers if `no` parameter is given. If there are no controllers remaining after this command is executed, the OpenFlow function is effectively disabled.

---

Warning

Adding or removing a controller will cause the current controller connection to be dropped. The switch will then attempt to connect to the first controller in the list of controllers, then second controller, and so on.

---

The `no controller` and `default controller` commands delete s the `controller` statement from `running-config`.

Command Mode

OpenFlow Configuration

Command Syntax

controller tcp:ip_address:tcp_port
no controller tcp:ipaddress:tcp_port default controller tcp:ipaddress:tcp_port

Parameters

- `ip_address` ip address used for OpenFlow. Dotted decimal location.
- `tcp_port` name of the TCP port used for OpenFlow. Value ranges from 0 to 65535.

Example

- These commands enable OpenFlow and sets the controller for an OpenFlow instance.

 switch(config)# openflow
 switch(config-OpenFlow)# controller tcp:1.2.3.4:6633
default-action (OpenFlow)

The `default-action` command sets the action for the default flow table entry. This entry is automatically added by the switch. It has the lowest priority, and matches packets that are not matched by any other entry.

Use `default-action drop` to change the default entry's action to drop packets instead of sending them to the controller. (Note: In this mode, the switch deviates from the OpenFlow specification.)

The `no default-action` command restores the default entry's action to send packets to the controller.

**Command Mode**

Openflow Configuration

**Command Syntax**

```
default-action ACTION_TYPE
no default-action
default default-action
```

**Parameters**

- `ACTION_TYPE` Action for the default flow table entry. Options include:
  - `controller` Sets the default entry's action to send packets to the controller.
  - `drop` Changes the default entry's action to drop packets instead of sending them to the controller.

**Example**

- This command sets the default entry's action to drop packets instead of sending them to the controller.

  ```
  switch(config)# openflow
  switch(config-OpenFlow)# default-action drop
  ```
description (OpenFlow)

The `description` command allows overriding the switch description string (normally the switch hostname) sent to the controller.

The `no description` and `default description` commands remove the description text for the switch hostname from `running-config`.

**Command Mode**
- OpenFlow Configuration

**Command Syntax**
- `description label_text`
- `no description`
- `default description`

**Parameters**
- `label_text` character string up to 256 characters assigned to describe the switch.

**Examples**
- These commands add the description test to the switch
  ```
  switch(config-openflow)#description test
  switch(config-openflow)#
  ```
keepalive (OpenFlow)

The `keepalive` command alters how often the switch sends an OpenFlow echo request to the currently connected controller (every 10 seconds by default). If an echo reply is not received after three successive echo requests, the switch disconnects from the controller. It then attempts to establish a new controller connection depending on the controller configuration.

The `no keepalive` command restores the default keepalive period by removing the `keepalive` command from the `running-config`.

**Command Mode**
- OpenFlow Configuration

**Command Syntax**
- `keepalive keep_alive_time`
- `no keepalive`
- `default keepalive`

**Parameters**
- `keep_alive_interval` _keepalive period, in seconds. Value ranges from 1 to 100000. Default value is 10 seconds._

**Example**
- This command sets the keepalive time for OpenFlow to 30 seconds.
  
  ```
  switch(config)#openflow
  switch(config-openflow)#keepalive 30
  switch(config-openflow)#
  ```
openflow

The `openflow` command places the switch in OpenFlow configuration mode.

The `no openflow` and `default openflow` commands delete the openflow configuration mode statements from `running-config`.

OpenFlow configuration mode is not a group change mode; `running-config` is changed immediately upon entering commands. Exiting OpenFlow configuration mode does not affect `running-config`. The `exit` command returns the switch to global configuration mode.

**Command Mode**
- Global Configuration

**Command Syntax**
```
openflow
no openflow
default openflow
```

**Commands Available in OpenFlow Configuration Mode**
- `bind interface (OpenFlow)`
- `bind mode (OpenFlow)`
- `bind vlan (OpenFlow)`
- `controller (OpenFlow)`
- `default-action (OpenFlow)`
- `description (OpenFlow)`
- `keepalive (OpenFlow)`
- `profile (OpenFlow)`
- `routing recirculation-interface (OpenFlow)`
- `routing vlan (OpenFlow)`
- `shell-command allowed (OpenFlow)`
- `shutdown (OpenFlow)`

**Example**
- This command places the switch in OpenFlow configuration mode:
  ```
  switch(config)#openflow
  switch(config-openflow)#
  ```
- This command returns the switch to global management mode:
  ```
  switch(config-openflow)#exit
  switch(config)#
  ```
The `profile` command sets an alternate flow table profile. Use the `show openflow profiles` command to see the flow table profiles supported by the switch.

The `no profile` and `default profile` commands restores the default flow table profile by removing the profile command from the `running-config`.

**Command Mode**
- OpenFlow Configuration

**Command Syntax**
- `profile FIELD_TYPE`
- `no profile`
- `default profile`

**Parameters**
- `FIELD_TYPE` Profiles supported by the switch for the active bind mode. Options include:
  - `full-match` Supports matching the full set of OpenFlow match fields.
  - `l2-match` Supports matching only a subset but with a larger maximum number of flow table entries.

**Example**
- This command advertises the table size for the full-match flow table profile.

```
switch#(config-openflow)# profile full-match
switch#(config-openflow)#
```
Chapter 45: OpenFlow

OpenFlow Command Descriptions

**routing recirculation-interface (OpenFlow)**

The *routing recirculation-interface* command designates a switch interface to recirculate routed OpenFlow traffic for a second pass of processing. Exactly one recirculation interface must be configured to use routing, regardless of the number of VLANs being routed.

Any Ethernet or Port-Channel interface can be used for OpenFlow routing recirculation.

When an interface is configured for OpenFlow routing recirculation:

- The switch programs the hardware into a special MAC loopback mode, so the interface cannot be used to carry normal traffic.
- The link LED turns green and the recirculation function works even if a transceiver is not present or a cable is not inserted.
- The link speed is forced to the maximum.
- Interface configuration commands such as switchport and shutdown are ineffective, although they are preserved in the running configuration and become effective again when the interface is no longer configured for OpenFlow routing recirculation.

The *routing recirculation-interface* and *default routing recirculation-interface* commands revert the configuration to its default by removing the corresponding *routing recirculation-interface* command from *running-config*.

**Command Mode**

OpenFlow Configuration

**Command Syntax**

```
bind interface [INTF]
no bind interface [INTF]
default bind interface [INTF]
```

**Parameters**

- **INTF**  
  Options include:
  - *ethernet e_range*  
    Ethernet interfaces specified by *e_range*.
  - *port-channel p_range*  
    port channel interfaces specified by *p_range*.

Valid *e_range* and *p_range* formats include number, range, or comma-delimited list of numbers and ranges.

**Example**

- This command recirculates traffic routed to and from VLAN 1 via the routed transit VLAN 401.

```
switch(config-openflow)#bind mode vlan
switch(config-openflow)#bind vlan 1
switch(config-openflow)#routing recirculation-interface et48
switch(config-openflow)#routing vlan 1 routed-vlan 401
switch(config-openflow)#enable
```
routin vlan (OpenFlow)

The `routin vlan` command enables IP routing of traffic processed by OpenFlow for a specific VLAN. The `no routin vlan` and `default routin vlan` command disables IP routing of traffic processed by OpenFlow for a VLAN.

**Command Mode**

OpenFlow Configuration

**Command Syntax**

```
routin vlan VLAN_ID routed-vlan vlan_transit
no routin vlan VLAN_ID
default routin vlan VLAN_ID
```

**Parameters**

- `VLAN_ID` Options include
  - `v_num` The full form of the command is `routin vlan 123 routed-vlan 456`, where 123 is the VLAN of the OpenFlow traffic to be routed, and 456 is a (non-OpenFlow-bound) VLAN configured for standard IP routing.
  - `untagged` To route untagged OpenFlow traffic, use the command `routin vlan untagged routed-vlan 456`

**Examples**

- This command associates the VLAN with an untagged VLAN 22 to match during the OpenFlow pass.
  ```
  switch(config-openflow)# routin vlan untagged routed-vlan 22
  ```
**shell-command allowed (OpenFlow)**

The **shell-command allowed** command allows the controller to run shell or CLI vendor extension commands on the switch.

When this extension is enabled, the switch will execute any CLI command sent by the controller, bypassing normal access controls, so enable it only if the controller is trusted.

The **no shell-command allowed** and **default shell-command allowed** commands disables the corresponding **shell-command allowed** from the *running-config*.

**Command Mode**
- OpenFlow Configuration

**Command Syntax**
- `shell-command allowed`
- `no shell-command allowed`
- `default shell-command allowed`

**Example**
- This command allows the controller to run arbitrary CLI commands on the switch.

```
switch(config)#openflow
switch(config-openflow)#shell-command allowed
switch(config-openflow)#
```
show openflow

The `show openflow` command shows the effective OpenFlow configuration parameters.

**Command Mode**

EXEC

**Command Syntax**

```plaintext
show openflow
```

**Example**

- This command displays the actual hardware state of OpenFlow.

```plaintext
switch# show openflow
OpenFlow configuration: Enabled
DPID: 0x000000123456789a
Description: My awesome OpenFlow switch
Controllers:
  configured: tcp:1.2.3.4:6633 tcp:5.6.7.8:6633
  connected: tcp:1.2.3.4:6633
  attempted connection count: 24
  successful connection count: 1
  keepalive period: 10 sec
Flow table state: Enabled
Flow table profile: full-match
Bind mode: interface
  interfaces: Ethernet2, Ethernet4, Ethernet6, Ethernet8
IP routing state: Enabled
  recirculation interface: Ethernet4
  VLAN untagged: routed to/from VLAN 3636
Shell command execution: Disabled
Total matched: 4601 packets
switch#
```
**show openflow flows**

The `show openflow flows` command displays the contents of the flow table, showing each entry with its match rules, actions, packet counters, and timeouts.

The default flow table entry is automatically created by the switch. It always has the lowest priority, and matches packets that are not matched by any other entry. The default entry’s action is to send the packet to the controller.

**Command Mode**

EXEC

**Command Syntax**

```
show openflow flows
```

**Example**

- This command displays the contents of the flow table.

```
switch# show openflow flows
Flow flow00000000000000000002:
  priority: 0
  cookie: 0 (0x0)
  idle timeout: 60.0 sec
  match:
    ingress interface: Ethernet2
    source Ethernet address: 00:a9:87:65:43:21
    destination Ethernet address: 00:12:34:56:78:9a
    untagged/native VLAN ID
    VLAN PCP: 0
    Ethernet type: IPv4
    source IPv4 address: 10.0.1.1
    destination IPv4 address: 10.0.1.2
    IPv4 TOS: 0
    IPv4 protocol: ICMP
    source TCP/UDP port or ICMP type: 8
    destination TCP/UDP port or ICMP code: 0
  actions:
    output interfaces: OpenFlowRouter
  matched: 4 packets, 408 bytes
Flow __default__:
  priority: -1
  cookie: 0 (0x0)
  match:
  actions:
    output to controller
switch#
```
show openflow ports

The **show openflow ports** command displays the mapping between OpenFlow port number and switch interface.

In interface bind mode, all OpenFlow-bound interfaces (except routed ports and LAG members) are mapped to OpenFlow ports and exposed to the controller.

In VLAN bind mode, Ethernet and Port-Channel interfaces (except routed ports and LAG members) configured to carry traffic for one or more OpenFlow-bound VLANs are mapped to OpenFlow ports and exposed to the controller.

In monitor bind mode, all Ethernet and Port-Channel interfaces (except routed ports and LAG members) are mapped to OpenFlow ports and exposed to the controller.

**Command Mode**

EXEC

**Command Syntax**

```
show openflow ports
```

**Example**

- This command displays which interfaces the switch maps to OpenFlow ports.

```
switch# show openflow ports
Port 1: Ethernet1
Port 15: Ethernet15
switch#
```
show openflow profiles

The `show openflow profiles` command displays the flow table profiles supported by the switch for the active bind mode. For each profile, it shows:

- Which fields can be matched by a flow table entry and which can be wildcarded
- Which actions are supported for matched packets (in monitor bind mode, only normal and mirror actions are supported)
- The maximum number of entries that can be added to the flow table

The hardware resources available to OpenFlow are shared with other switch features like ACLs, so the actual maximum number of flow entries may be lower than the number shown by `show openflow profiles` command.

On Series 7050 switches, two profiles are available: the full-match profile supports matching the full set of OpenFlow match fields with a maximum of 750 flow table entries, while the l2-match profile supports matching only a subset but with a larger maximum number of flow table entries (1500).

**Command Mode**

EXEC

**Command Syntax**

`show openflow profiles`
Example

This command displays the flow table profiles.

```
switch# show openflow profiles
full-match:
  Match fields:
    ingress interface
    source Ethernet address
    destination Ethernet address
    VLAN ID
    VLAN PCP
    Ethernet type
    source IPv4 address
    destination IPv4 address
    IPv4 TOS
    IPv4 protocol
    source TCP/UDP port or ICMP type
    destination TCP/UDP port or ICMP code
Wildcard fields:
  ingress interface
  source Ethernet address
  destination Ethernet address
  VLAN ID
  VLAN PCP
  Ethernet type
  source IPv4 address
  destination IPv4 address
  IPv4 TOS
  IPv4 protocol
  source TCP/UDP port or ICMP type
  destination TCP/UDP port or ICMP code
Actions:
  copy ingress to mirror dest interfaces
  forward normally
  copy egress to mirror dest interfaces
```

Table size: 750 entries max

```
12-match:
  Match fields:
    ingress interface
    source Ethernet address
    destination Ethernet address
    VLAN ID
    VLAN PCP
    Ethernet type
Wildcard fields:
  ingress interface
  source Ethernet address
  destination Ethernet address
  VLAN ID
  VLAN PCP
  Ethernet type
Actions:
  copy ingress to mirror dest interfaces
```

forward normally
    copy egress to mirror dest interfaces
    Table size: 1500 entries max
switch#
**show openflow queues**

The **show openflow queues** command displays the queues exposed to the OpenFlow controller for each switch interface, and packet and byte counters for each queue.

**Command Mode**

EXEC

**Command Syntax**

`show openflow queues`

**Example**

- This command displays the packet and byte counters for each queue on the active OpenFlow interfaces.

  switch#`show openflow queues`

  Port 1 (Ethernet1):
  - Queue 0: 0 packets (0 bytes) transmitted, 0 dropped
  - Queue 1: 0 packets (0 bytes) transmitted, 0 dropped
  - Queue 2: 0 packets (0 bytes) transmitted, 0 dropped
  - Queue 3: 0 packets (0 bytes) transmitted, 0 dropped

  Port 15 (Ethernet15):
  - Queue 0: 0 packets (0 bytes) transmitted, 0 dropped
  - Queue 1: 0 packets (0 bytes) transmitted, 0 dropped
  - Queue 2: 0 packets (0 bytes) transmitted, 0 dropped
  - Queue 3: 0 packets (0 bytes) transmitted, 0 dropped

  switch#
show openflow statistics

The show openflow statistics command displays statistics sampled every 5 seconds over the past 5 minutes:

- Number of entries in the flow table
- Number of flow_mod, packet_out and packet_in messages processed in the 5-second interval
- Number of packet_out messages dropped in the 5-second interval (the OpenFlow agent starts dropping packet_out messages when the transmit queue of the controller TCP connection exceeds 50% of capacity)

Command Mode
EXEC

Command Syntax
show openflow statistics
Example

- This command displays statistics sampled every 5 seconds.

```plaintext
switch# show openflow statistics

switch#
shutdown (Openflow)

The shutdown command, in OpenFlow mode, disables OpenFlow on the switch. OpenFlow is disabled by default.

The no shutdown and default shutdown commands re-enable OpenFlow by removing the shutdown command from running-config.

Command Mode
Openflow Configuration

Command Syntax

- shutdown
- no shutdown
- default shutdown

Example

- These commands enable OpenFlow on the switch.
  switch(config)#openflow
  switch(config-openflow)#no shutdown
  switch(config-openflow)#

- This command disables OpenFlow.
  switch(config-openflow)#shutdown
This chapter describes Arista’s DirectFlow implementation. Sections in this chapter include:

- **Section 46.1: Introduction**
- **Section 46.2: DirectFlow Configuration**
- **Section 46.3: DirectFlow Feature Interactions**
- **Section 46.4: DirectFlow Command Descriptions**

### 46.1 Introduction

Like OpenFlow, DirectFlow exposes the underlying forwarding ASICs capabilities through a programmable interface like EAPI or the standard CLI.

Unlike OpenFlow, DirectFlow works in conjunction with all other aspects of standard L2/L3 bridging or forwarding, and DirectFlow traffic is subject to the standard packet processing pipeline within the ASIC. You can think of DirectFlow as a stage in packet processing that processes traffic after ingress checks and before any egress actions.

This feature enables you to configure flows that consist of a matching criteria and actions, and to modify how traffic is processed (for example, by overriding the L2 lookup decision or rewriting a mac address or VLAN).

Features like MAC learning, STP state checks, ingress or egress VLAN membership checks on ports, ACLs, QoS and other features are all respected by DirectFlow. Traffic that doesn't match any programmed flow is processed normally while traffic that matches programmed flows is now subject to the actions specified in the flows.

DirectFlow and OpenFlow are mutually exclusive and you can run only one of the two at any given time.

**How DirectFlow is different from OpenFlow**

There is no default flow matching all traffic, traffic not matched by other rules is forwarded as normal. This means the configuration/ controller/ application doesn’t consume TCAM space programming flows for normal forwarding.

DirectFlow works with other features and so the user can use ACL, rate limiting, STP etc. in their network as normal and not build all of that into the application used to inject flows.

DirectFlow flows can be configured from the CLI or using EAPI, giving users the option of using flow based forwarding without an external controller. This is especially useful where the number of flows is small and static e.g.to process a small subset of the traffic in a different manner to the normal L2/L3 pipeline.
Unlike OpenFlow which requires the switch support OUTPUT NORMAL or re-circulate a packet in order to send a packet from the OpenFlow domain to non-OpenFlow domain, there is just one domain with DirectFlow.

### 46.1.1 DirectFlow Flows

Similar to OpenFlow, you can define a relative priority between flows and define idle or hard timeouts for the flow. DirectFlow also enables you to insert a flow entry that matches on specified criteria, and define actions to be taken on traffic that matches the specified matching conditions. You can define flows to match on TCP flags, IPv6 source and destination addresses, input ports, and more.

For more information, see:

- Section 46.1.1.1: DirectFlow Non-persistent Flows
- Section 46.1.1.2: Supported matches
- Section 46.1.1.3: Supported actions

### 46.1.1.1 DirectFlow Non-persistent Flows

DirectFlow enables you to configure flows that are not visible in the startup or running configurations. This feature is designed to be used for flows that are configured by a custom agent using the EOS SDK or eAPI and age out (expire) after a specified time period.

For example, if you are using a custom agent that reacts to traffic sent to the CPU (the redirect to CPU action), and you want to use a flow that will drop all matching traffic for 5 minutes, the agent can program a non-persistent flow that expires after a hard timeout of 300 seconds.

Using a non-persistent flow for this purpose ensures that other administrator actions (for example, saving the configuration) does not result in the flow being resurrected on startup or reverting to the saved configuration. It also removes the need for the agent to delete the expired flow.

**Note**

By default, all direct flow flows are persistent. You must use the `no persistent` command to configure a non-persistent flow.

### 46.1.1.2 Supported matches

DirectFlow supports all matches supported on EOS with OpenFlow 1.0. This includes matches on VLAN, ether type, source or destination MAC address, COS, source or destination IP address, IP protocol, IP TOS, L4 source, destination ports, ICMP type and code).

In addition, DirectFlow also allows matching on:

- TCP flags
- IPv6 source address
- IPv6 destination address
- Traffic injected from the CPU
- Input port

DirectFlow also permits re-using the same flow on multiple input ports, saving valuable TCAM space.

### 46.1.1.3 Supported actions

DirectFlow supports all actions supported on EOS with OpenFlow 1.0, including:

- Setting the source or destination MAC address
Chapter 46: DirectFlow

Introduction

- VLAN
- COS
- IP TOS
- Transmit queue
- Output port list and mirroring traffic pre-modification (ingress mirror) and post-modification (egress mirror).
- Redirect to CPU

The redirect to CPU action is useful in cases in which a custom agent is running on EOS and you want to trap specific traffic (matching traffic) and send the trapped traffic to the agent. See the example “Redirect to CPU” on page 2523.
46.2 DirectFlow Configuration

Consider the following when using DirectFlow.

- DirectFlow takes effect ONLY after exiting the individual flow configuration sub-mode.
- Match criteria are connected with Boolean AND operators i.e. they must all match for the condition to be true and action to be taken.
- CLI is automatically set to match the ethertype to IP if IP fields (such as source or destination address or L4 ports) are chosen as part of other match/ action commands.
- In a single flow, only the following fields can be matched along with IPv6 source and destination addresses:
  - VLAN priority
  - VLAN ID
  - EtherType
  - Source interface
  - Class of Service (CoS)

46.2.1 Commands Used to Enable DirectFlow, Configure and Display Flows

A number of different commands are provided for the DirectFlow feature. The different commands enable you to enter the DirectFlow configuration mode, enable DirectFlow, configure flows, and display configured flows.

Important! ALL match criteria specified in a flow definition must match in the packet for the actions specified to be applied to the traffic.

Enter the DirectFlow configuration mode

The `directflow` command places the switch in DirectFlow configuration mode.

```
switch(config)#directflow
switch(config-directflow)#
```

Enable DirectFlow

The `shutdown (DirectFlow)` command determines if the configuration takes effect or not. To enable DirectFlow, enter the following command.

```
switch(config-directflow)#no shutdown
switch(config-directflow)#
```

Create the flow

The `flow (DirectFlow)` command creates a new flow entry. It must be unique or it will be overwritten by an existing entry.

```
switch(config-directflow)#flow Test-1
switch(config-directflow-Test-1)#
```
Create the DirectFlow match criteria

The **match (DirectFlow-flow mode)** command allows you to configure a rule or a flow which match on L2, L3, L4 fields of a packet and specify a certain action to either modify, drop or redirect the packet.

```
switch(config-directflow)#flow Test1
switch(config-directflow-Test1)#match ethertype ip
switch(config-directflow-Test1)#match source ip 10.10.10.10
```

**Action Set**

The **action set (DirectFlow-flow mode)** command allows you to configure a packet to be routed out a layer three interface using a DirectFlow entry.

```
switch(config-directflow)#flow Test1
switch(config-directflow-Test1)#action egress mirror ethernet 7
switch(config-directflow-Test1)#action set destination mac 0000.aaaa.bbbb
```

**Redirect to CPU**

The **action output interface cpu (DirectFlow-flow mode)** command allows you to configure flows so that traffic that matches the matching conditions specified in the flow is redirected to the CPU.

```
switch(config)#directflow
switch(config-directflow)#flow redirect-http-cpu
switch(config-directflow-redirect-http-cpu)#match ip protocol tcp
switch(config-directflow-redirect-http-cpu)#match destination port 80
switch(config-directflow-redirect-http-cpu)#action output interface cpu
```

**Configuring a non-persistent flow**

Including the **no persistent** command allows you to configure non-persistent direct flow flows.

```
switch (config-directflow)#flow example-non-persistent
switch (config-directflow-example-non-persistent)#match input interface ethernet 25
switch (config-directflow-example-non-persistent)#action drop
switch (config-directflow-example-non-persistent)#no persistent
switch (config-directflow-example-non-persistent)#timeout hard 300
```

**Display details for configured flows**

The **show directflow flow <flow name> detail** command enables you to display the details of configured flows. You can use this command to verify that a non-persistent flow is deleted after the timeout period configured for the flow has elapsed.

The following example shows the use of this command to view the configuration of a non-persistent flow before the timeout period has elapsed, and a second time, after the timeout period has expired.

```
switch (config-directflow)#show directflow flows example-non-persistent detail
Flow example-non-persistent: (Flow programmed)
persistent: False
priority: 0
hard timeout: 300
idle timeout: 0
match:
ingress interface:
   Et25
actions:
drop
matched: 0 packets, 0 bytes
```
The second use of the command displays the flow details (after the timeout expires). The output shows that the flow is no longer programmed.

```
switch (config-directflow)#show directflow flows example-non-persistent detail
Flow example-non-persistent: (Flow not programmed)
persistent: False
priority: 0
hard timeout: 300
idle timeout: 0
match:
  ingress interface:
    Et25
actions:
  drop
matched: 0 packets, 0 bytes
```
46.3 **DirectFlow Feature Interactions**

DirectFlow flow entries can have one of the following actions:

- A set of egress ports for sending a matched packet
- Copy to CPU
- Redirect to CPU
- Drop (default)
- No specified action (in this case, the traffic is output normally).

The only exception is the ingress or egress mirroring action, where the DirectFlow entry causes the packet to be mirrored.

When the ingress or egress packets are mirrored, the original traffic is sent out normally.

**Bridging Features**

- DirectFlow entries have precedence over all entries in the MAC table, including static MAC entries and static MAC drop entries. Packets that do not match DirectFlow entries are forwarded based on the MAC address table.
- VLANs: DirectFlow entries can modify the VLAN of a packet. MAC learning takes place in the original VLAN for DirectFlow entries that modify the VLAN. The modified packet will be subject to VLAN membership checks on the egress port. If a packet has no VLAN tag, DirectFlow assumes it came in on the native VLAN for the ingress interface. A VLAN override causes the packet to obey the VLAN rules on the egress port.
- Q-in-Q: Q-in-Q is supported as DirectFlow entries match only on the outer tag.
- Counters: All packets that match DirectFlow entries cause interface counters to increment as usual.

**Spanning Tree**

DirectFlow runs alongside MSTP, RSTP, and PVST. DirectFlow entries do not match on packets that ingress an STP discarding port. DirectFlow entries that cause a packet to be forwarded out an STP discarding port will result in the packets being dropped on egress.

When STP is enabled, BPDUs will always be trapped to the CPU. When STP is disabled, BPDUs will be subject to DirectFlow entries and not be copied to the CPU by default.

**LLDP, LAGs, and LACP**

- LLDP packets are always trapped to the CPU. DirectFlow entries can never match LLDP packets.
- LAGs are fully supported, and can be part of a match criteria and part of an output action to an interface.
- LACP packets are always trapped to CPU. DirectFlow entries can never match LACP packets.

**sFlow**

sFlow is unaffected by DirectFlow.

**IGMP Snooping**

IGMP control packets are trapped to the CPU when IGMP Snooping is enabled. DirectFlow entries can match IGMP Snooping control traffic and override the trap to CPU.
Link-local-multicast packets are flooded in hardware in the VLAN via a TCAM entry. DirectFlow entries can match link-local-multicast packets and change the flooding behavior. As DirectFlow entries have to specify output interfaces or drop, the action will conflict and so matching DirectFlow entries will get precedence.

When IGMP snooping is enabled, unknown IPV4 multicast packets are flooded to the multicast-router ports in the VLAN. If DirectFlow entries match unknown IPV4 multicast packets, they will override the flooding behavior.

Data packets in groups under IGMP snooping control are sent to the group members through a MAC table entry. Matching DirectFlow entries override the MAC table entries.

**ACLS**

DirectFlow entries are lower priority than any configured Port ACLs (ingress). Packets coming in on a port that match DirectFlow entries obey any configured ACL on that port, and will only apply to packets that have a *permit* action.

DirectFlow entries are higher priority than any configured RACLs. Packets coming in on an L3 interface that match DirectFlow entries ignore any RACLs configured on that interface.

DirectFlow entries are lower priority than any configured Egress ACLs.

### 46.3.1 Layer Three Features and DirectFlow

DirectFlow runs alongside IP routing. If a packet is routed out a layer three interface using a DirectFlow entry, the actions associated with the entry will have to specify the new source MAC and destination MAC for the packet, as well as the physical port or LAG. If there are no output ports specified in an entry, packets that match that entry will be dropped.

**Unicast Routing**

When unicast routing is enabled, DirectFlow entries that match take precedence for all packets that would have been otherwise been routed. The three exceptions are the ingress mirror, egress mirror and copy-to-CPU actions where the packets will be routed normally in addition to the action being performed. Routed packets that do not match DirectFlow entries are forwarding based on the L3 lookup.

**Multicast Routing**

When multicast routing is enabled, DirectFlow entries that match take precedence for all packets that would have otherwise been multicast routed. The packets are not replicated based on the hardware multicast tables, but are forwarded strictly according to the actions specified by the DirectFlow entry. The entry can specify a set of output interfaces, which will result in the packet being replicated based on the DirectFlow entry.
46.3.2 Displaying DirectFlow Configurations

To `show directflow flows` command displays the contents of the flow table, showing each entry with its match rules, actions, and packet counters.

- This example shows the status of a default (persistent) flow.
  
  ```
  switch(config-directflow)#show directflow flows
  Flow Test1:
  priority: 0
  match:
    ingress interface: Ethernet1
    ethertype ip
    source ip address: 10.10.10.10
  actions:
    output mirror: Ethernet2
  matched: 0 packets, 0 bytes
  switch(config-directflow)#
  ```

- This example shows the status of a non-persistent flow. The flow will be deleted once 5 minutes have elapsed.

  ```
  switch(config-directflow)#show directflow flows example-non-persistent
  Flow example-non-persistent:
  persistent: False
  priority: 0
  hard timeout: 300
  idle timeout: 0
  match:
    ingress interface:
      Et25
  actions:
    drop
  matched: 0 packets, 0 bytes
  ```
46.4 **DirectFlow Command Descriptions**

*DirectFlow Global Configuration Mode*
- `directflow`

*DirectFlow Configuration Command*
- `action drop (DirectFlow-flow mode)`
- `action mirror (DirectFlow-flow mode)`
- `action output (DirectFlow-flow mode)`
- `action output interface cpu (DirectFlow-flow mode)`
- `action set (DirectFlow-flow mode)`
- `flow (DirectFlow)`
- `match (DirectFlow-flow mode)`
- `priority (DirectFlow-flow mode)`
- `shutdown (DirectFlow)`
- `timeout (DirectFlow-flow mode)`

*DirectFlow and Clear Commands*
- `show directflow`
- `show directflow flows`
action drop (DirectFlow-flow mode)

The action drop command configures packets that match an entry to be dropped. The no action drop and default action drop commands remove the statement from the DirectFlow configuration mode.

Command Mode

Directflow-flow Configuration

Command Syntax

- action drop
- no action drop
- default action drop

Example

- This command sets the action for packets from Test-1 to be dropped.

  switch(config-directflow-Test-1)#action drop
  switch#
**action mirror (DirectFlow-flow mode)**

The `action mirror` command can be used to ingress or egress mirror traffic to a mirror destination. This requires a mirror destination to be setup on the switch. If a packet comes in or goes out an interface that is part of another mirror session, then the destination for that destination as well as the DirectFlow destination will receive a copy of the packet.

The `no action mirror` and `default action mirror` commands remove the statement from DirectFlow configuration mode.

**Command Mode**

Directflow-flow Configuration

**Command Syntax**

```
action DIRECTION mirror INT_NAME
no action DIRECTION mirror INT_NAME
default action DIRECTION mirror INT_NAME
```

**Parameters**

- `DIRECTION` transmission direction of traffic to be mirrored.
  - `ingress` mirrors before any rewrites.
  - `egress` mirrors after rewrites.
- `INT_NAME` Source interface for the mirroring session.
  - `ethernet e_range` Ethernet interfaces specified by `e_range`.
  - `port-channel p_range` Port channel interfaces specified by `p_range`.

**Example**

- This command configures mirror traffic to Ethernet 2.
  ```
  switch(config-directflow)# flow Test1
  switch(config-directflow-Test1)#match ethertype ip
  switch(config-directflow-Test1)#match source ip 10.10.10.10
  switch(config-directflow-Test1)#action egress mirror ethernet 2
  switch(config-directflow-Test1)#
  ```
action output (DirectFlow-flow mode)

The action output command configures an Ethernet or port channel interface as the output of a specified port mirroring session.

The no action output and default action output commands remove the statement from DirectFlow configuration mode.

Command Mode
   Directflow-flow Configuration

Command Syntax
   action output DESTINATION
   no action output DESTINATION
   default action output DESTINATION

Parameters
   • DESTINATION   transmission direction of traffic to be mirrored.
     • all    mirrors transmitted and received traffic.
     • flood   mirrors received traffic only.
     • interface ethernet e_range    Ethernet interfaces specified by e_range.
     • interface port-channel p_range    Port channel interfaces specified by p_range.

Example
   • This command configures Ethernet interface 7 as the output for the mirroring session.
     switch(config-directflow-Test1)#action output interface ethernet 7
     switch(config-directflow-Test1)#
**action output interface cpu (DirectFlow-flow mode)**

The **action output interface cpu** command configures the action (other commands are used to define the traffic matching conditions).

The **no action output interface cpu** and **default action output** commands remove the statement from DirectFlow configuration mode.

**Command Mode**

Directflow-flow Configuration

**Command Syntax**

```
action output DESTINATION
no action output DESTINATION
default action output DESTINATION
```

**Parameters**

- **DESTINATION** transmission direction of traffic to be mirrored.
  - **all** mirrors transmitted and received traffic.
  - **flood** mirrors received traffic only.
  - **interface cpu** Ethernet interfaces specified by `e_range`.

**Example**

- This command configures Ethernet interface 7 as the output for the mirroring session.
  ```
  switch(config-directflow-Test1)#action output interface ethernet 7
  switch(config-directflow-Test1)#
  ```

- These commands configure the action to redirect traffic matching the flow to the CPU and the matching conditions for the flow.
  ```
  switch (config)#directflow
  switch (config-directflow)#flow redirect-http-cpu
  switch (config-directflow-redirect-http-cpu)#match ip protocol tcp
  switch (config-directflow-redirect-http-cpu)#match destination port 80
  switch (config-directflow-redirect-http-cpu)#action output interface cpu
  ```
action set (DirectFlow-flow mode)

The action set command allows you to configure a packet to be routed out a layer three interface using a DirectFlow entry. The actions associated with the entry will have to specify the new source MAC and destination MAC for the packet, as well as the physical port or LAG. If there are no output ports specified in an entry, packets that match that entry will be dropped.

The no action set and default action set commands remove action set statement from DirectFlow configuration mode.

Command Mode

Directflow-flow Configuration

Command Syntax

- action set CONDITION
- no action set CONDITION
- default action set CONDITION

Parameters

- **CONDITION** specifies parameter and value. Options include:
  - cos <0 to 7> cost of service.
  - destination mac mac_addr Dotted hex notation.
  - ip tos <0 to 255> Type of service.
  - source mac mac_addr Dotted hex notation.
  - traffic-class <0 to 7> Dotted hex notation.
  - vlan <1 to 4094> Number of VLAN.

The no action set and default action set commands require only the **CONDITION** type without a specific condition value.

Example

- These commands change the destination MAC of the frame.

  switch(config-directflow)#flow Test1
  switch(config-directflow-Test1)#action egress mirror ethernet 7
  switch(config-directflow-Test1)#action set destination mac 0000.aaaa.bbbb
directflow

The **directflow** command places the switch in DirectFlow configuration mode.

The **no directflow** and **default directflow** commands delete the DirectFlow configuration mode statements from **running-config**.

DirectFlow configuration mode is not a group change mode; **running-config** is changed immediately upon entering commands. Exiting OpenFlow configuration mode does not affect **running-config**. The **exit** command returns the switch to global configuration mode.

**Command Mode**

Global Configuration

**Command Syntax**

```
directflow
no directflow
default directflow
```

**Commands Available in DirectFlow-Flow configuration mode:**

- **flow (DirectFlow)**
- **shutdown (DirectFlow)**

**Example**

- This command places the switch in DirectFlow configuration mode:
  
  ```
  switch(config)#directflow
  switch(config-directflow)#
  ```

- This command returns the switch to global management mode:
  
  ```
  switch(config-directflow)#exit
  switch(config)#
  ```
flow (DirectFlow)

The flow command places the switch in flow configuration mode. The flow command specifies the name of the flow that subsequent commands modify and creates a new flow definition if it references a nonexistent flow. All changes in a flow configuration mode edit session are pending until the session ends:

• The exit command saves pending changes to running-config and returns the switch to DirectFlow configuration mode. Changes are also saved by entering a different configuration mode.

• The abort command discards pending changes, returning the switch to DirectFlow configuration mode.

The no flow and default flow commands delete the specified role by removing the role and its statements from running-config.

Command Mode
DirectFlow Configuration

Command Syntax
flow  flow_name
no  flow  flow_name
default flow  flow_name

Parameters
• flow_name Name of flow.

Commands Available in DirectFlow-Flow configuration mode:
• action drop (DirectFlow-flow mode)
• action mirror (DirectFlow-flow mode)
• action output (DirectFlow-flow mode)
• action set (DirectFlow-flow mode)
• match (DirectFlow-flow mode)
match (DirectFlow-flow mode)

The `match` command allows you to configure a rule or a flow which could match on L2, L3, L4 fields of a packet and specify a certain action to modify, drop or redirect the packet.

All traffic ingressing on the switch will be matched against the flows installed. In cases where none of the packets match, normal switching or routing behavior will take over. When multiple entries match a packet, precedence is given to the entry that was installed first.

The `no match` and `default match` commands remove the `match` statement from the configuration mode.

**Command Mode**

Directflow-flow Configuration

**Command Syntax**

```
match CONDITION
no match CONDITION
default match CONDITION
```

**Parameters**

- `CONDITION` specifies criteria for evaluating a route. Options include:
  - `cos <0 to 7>` cost of service.
  - `destination ip ipv4_sub` destination IPv4 subnet. L3 fields valid only if ethertype is IP (0x0800).
  - `destination mac mac_addr` Add to the existing community. Dotted hex notation.
  - `destination mac mac_addr mask mac_mask` Add to the sting community. Dotted hex notation.
  - `destination port <0 to 65535>` Fields accepted only if protocol is TCP|UDP
  - `ethertype <0 to 65535>` Layer 4 destination port.
  - `ethertype ARP` Layer 4 destination port.
  - `ethertype IP` Layer 4 destination port.
  - `icmp code <0 to 255>` Fields accepted only if protocol is ICMP
  - `icmp type <0 to 255>` Fields accepted only if protocol is ICMP
  - `input interface ethernet e_num` Ethernet interface specified by `e_num`.
  - `input interface port-channel p_num` Port channel interface specified by `p_num`.
  - `ip protocol <0 to 255>` Type of service.
  - `ip protocol icmp` L3 fields valid only if ethertype is IP (0x0800).
  - `ip protocol tcp` L3 fields valid only if ethertype is IP (0x0800).
  - `ip protocol udp` L3 fields valid only if ethertype is IP (0x0800).
  - `ip tos <0 to 255>` L3 fields valid only if ethertype is IP (0x0800).
  - `source ip ipv4_subnet` L3 fields valid only if ethertype is IP (0x0800).
  - `source mac mac_addr` Add to the existing community. Dotted hex notation.
  - `source mac mac_addr mask mac_mask` Add to the sting community. Dotted hex notation.
  - `source port <0 to 65535>` Fields accepted only if protocol is TCP|UDP
  - `tcp flag ack` Layer 4 destination port.
  - `tcp flag fin` Layer 4 destination port.
Chapter 46: DirectFlow  

DirectFlow Command Descriptions

- **tcp flag psh**  Layer 4 destination port.
- **tcp flag rst**  Layer 4 destination port.
- **tcp flag syn**  Layer 4 destination port.
- **tcp flag urg**  Layer 4 destination port.
- **tcp flag urg**  Layer 4 destination port.
- **vlan <1 to 4094> mask <1 to 4095>**  Number of VLAN.

The **no match** and **default match** commands require only the **CONDITION** type without a specific condition value.

**Example**

- This command creates the rules to match on Ethertype IP and Source IP 10.10.10.10.

```
switch(config-directflow)# flow Test1
switch(config-directflow-Test1)#persistent
switch(config-directflow-Test1)#match ethertype ip
switch(config-directflow-Test1)#match source ip 10.10.10.10
```
priority (DirectFlow-flow mode)

The `priority` command sets the priority for the flow match rules. Each flow-table entry has an optional priority field, with a higher number indicating a higher priority. Flows with the same priority may be loaded in any order, and the order may be changed at any time. If multiple entries match a packet, precedence is given to the entry that was installed first.

Priority numbers range from 0 to 65535. The default is 0. The higher priority rules match first.

The `no priority` and `default priority` commands remove `priority` statement from the DirectFlow configuration mode.

**Command Mode**
- Directflow-flow Configuration

**Command Syntax**

```
priority priority_value
no priority
default priority
```

**Parameters**
- `priority_level` priority xxx. Value ranges from 0 to 65535. Default is 0.

**Example**
- These commands assign the priority of 150 to flow Test-1.

```
switch(config-directflow-Test-1)#priority 150
switch(config-directflow-Test-1)#
```
show directflow

The show directflow command shows the effective DirectFlow configuration parameters.

Command Mode
EXEC

Command Syntax
  show directflow

Example
  • This command displays the actual hardware state of DirectFlow.
    
    switch# show directflow
    DirectFlow configuration: Enabled
    Total matched: 23 packets
    switch#
show directflow flows

The `show directflow flows` command displays the contents of the flow table, showing each entry with its match rules, actions, and packet counters.

**Command Mode**

EXEC

**Command Syntax**

```
show directflow flows
```

**Example**

- This command displays the contents of the flow table.

```
switch# show directflow flows
Flow Test-1:
  priority: 0
  match:
    VLAN ID: 0xa/0x1
    Ethernet type: IPv4
    source IPv4 address: 10.10.10.1
  actions:
    set destination Ethernet address to: 00:00:aa:aa:bb:bb
    output interfaces: Port-Channel100
  matched: 0 packets, 0 bytes
switch#
```
shutdown (DirectFlow)

The `shutdown` command, in DirectFlow mode, disables DirectFlow on the switch. DirectFlow is disabled by default.

The `no shutdown` command re-enables DirectFlow.

**Command Mode**
- Directflow Configuration

**Command Syntax**

```
shutdown
no shutdown
default shutdown
```

**Example**

- These commands enable DirectFlow on the switch.
  ```
  switch(config)#directflow
  switch(config-directflow)#no shutdown
  switch(config-directflow)#
  ```

- This command disables DirectFlow Flow.
  ```
  switch(config-directflow-Test1)#shutdown
  ```
timeout (DirectFlow-flow mode)

The `timeout` command, in DirectFlow mode, command configures the connection timeout period for connection sessions. The connection timeout period defines the interval between a user’s most recently entered command and an automatic connection shutdown. Automatic connection timeout is disabled by setting the idle-timeout to zero, which is the default setting.

**Command Mode**
Directflow-flow Configuration

**Command Syntax**
```plaintext
no priority
no timeout hard
no timeout idle
```

**Parameters**
- `idle` session idle timeout length.
  - `0` Automatic connection timeout is disabled
  - `<1-4294967295>` Automatic timeout period (seconds).
- `hard` session hard timeout length.
  - `0` Automatic connection timeout is disabled.
  - `<1-4294967295>` Automatic timeout period (seconds).

**Example**
- These commands enable a hard timeout period of 5 seconds on the switch.
  ```plaintext
  switch(config)#directflow
  switch(config-directflow-Test1)#timeout hard 5
  switch(config-directflow-Test1)#
  ```
- These commands enable DirectFlow on the switch.
  ```plaintext
  switch(config)#directflow
  switch(config-directflow-Test1)#no timeout hard
  switch(config-directflow-Test1)#
  ```
