   6.6.6.6          -       100     0      65010 i Or-ID: 6.6.6.6 C-LST: 2.2.2.222
```

**Note**

Each entry in the table represents a BGP path. The path specific information includes the Route-Distinguisher and the IP prefix. Paths are either received from VPN peers or exported from local VRFs.
The `show bgp vpn-ipv4 206.0.0.0/24 detail` and `show bgp vpn-ipv6 2206::/64 detail` commands display detailed view of the IP prefix route for 206.0.0.0/24 and 2206::/64 of the North Edge router.

```
north-edge#show bgp vpn-ipv4 206.0.0.0/24 detail
BGP routing table information for VRF default
Router identifier 1.1.1.111, local AS number 64512
BGP routing table entry for IPv4 prefix 206.0.0.0/24, Route Distinguisher: 6.6.6.6:64514
Paths: 1 available
65010
  6.6.6.6 from 2.2.2.222 (2.2.2.222)
    Origin IGP, metric -, localpref 100, weight 0, valid, internal, best
    Extended Community: Route-Target-AS:64512:4364
    MPLS label: 967920

north-edge#show bgp vpn-ipv6 2206::/64 detail
BGP routing table information for VRF default
Router identifier 1.1.1.111, local AS number 64512
BGP routing table entry for IPv6 prefix 2206::/64, Route Distinguisher: 6.6.6.6:64514
Paths: 1 available
65010
  6.6.6.6 from 2.2.2.222 (2.2.2.222)
    Origin IGP, metric -, localpref 100, weight 0, valid, internal, best
    Extended Community: Route-Target-AS:64512:4364
    MPLS label: 965242
```

Note

The output includes the RD and IP prefix identifying the route. As seen in the output, the IPv4 VPN route is received from 2.2.2.222 because it is set-up to be a route-reflector, but the next hop is 6.6.6.6. Both are advertised with tenant VPN label 967920 and 965242 and an RT.

```
north-edge#show ip bgp vrf tenant-d
BGP routing table information for VRF tenant-d
Router identifier 1.1.1.1, local AS number 64512
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e - ECMP
  S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast
  % - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop
Network  Next Hop       Metric  LocPref Weight Path
  * >Ec 10.255.255.0/30 6.6.6.6   - 100   0   65010 i Or-ID: 6.6.6.6 C-LST: 2.2.2.222
  * > 10.255.255.4/30 10.255.255.6 - 100   0   65011 i
  * > 201.0.0.0/24 10.255.255.6 - 100   0   65011 i
  * >Ec 206.0.0.0/24 6.6.6.6   - 100   0   65010 i Or-ID: 6.6.6.6 C-LST: 2.2.2.222
  * ec 206.0.0.0/24 6.6.6.6   - 100   0   65010 i Or-ID: 6.6.6.6 C-LST: 2.2.2.222
```

Note

Each entry in the table represent a BGP path that is either locally redistributed and received into the VRF or imported from the IPv4 VPN table. VPN routes are received from router 2.2.2.222 C-List (cluster list - basically identifying this route as from a route-reflector) with originating router being 6.6.6.6.
Finally, let us look at the routes in the VRF tenant-d.

VRF: tenant-d

Gateway of last resort is not set

B I 10.255.255.0/30 [200/0] via 6.6.6.6/32, IS-IS SR tunnel index 6, label 967920
via 192.168.58.12, Ethernet1/1, label 408006

C 10.255.255.4/30 is directly connected, Ethernet6/1.120

B E 201.0.0.0/24 [200/0] via 10.255.255.6, Ethernet6/1.120

B I 206.0.0.0/24 [200/0] via 6.6.6.6/32, IS-IS SR tunnel index 6, label 967920
via 192.168.58.12, Ethernet1/1, label 408006

Note

As displayed in the highlighted route above the label stack, the route is the transport label 408006 on top (this is the label to reach NH 6.6.6.6), with the tenant-a VPN label 967920 next in the stack, identifying the route as belonging to tenant-d.

A check of the Tunnel FIB confirms that 408006 is the ISIS-SR LSP.

north-edge#show mpls tunnel fib

23.8.4.2 IP VPNs Over LDP

Figure 23-61, Figure 23-62, and Figure 23-63 illustrate an overview of the combined control and data planes.

Figure 23-61: IPv4 VPN and IPv6 VPN Over LDP MPLS
To switch to using the MPLS LDP transport, we just need to change the next-hop we advertised for the VPN routes. As per Figure 23-62 and Figure 23-63, the next hop needs to be set to loopback 200 for using the LDP LSP.

This is achieved by configuring the next-hop for the EVPN routes on both north and south edge routers.

```
router bgp 64512
  address-family evpn
    neighbor default encapsulation mpls next-hop-self source-interface Loopback200
```
Once this is configured, we can check the BGP updates and the routes in the VRF. The output again includes the RD and IP prefix identifying the route. We now have the NH set to 6.6.6.200 for tenant-d.

```

Note
As seen from the highlighted route above the label stack, the route are the transport label 904097 on top (this is the label path to reach NH 6.6.6.200), with the tenant-d VPN label 967920 next in the stack, and identifying the route as belonging to tenant-a.
A capture of the dataplane on North-Edge matching on the LDP transport label confirms the encapsulated traffic on the wire. 904097:976920:[Source IP Address][Destination IP Address].
23.8.4.3 IP VPNs Over BGP-SR

Figure 23-64, Figure 23-65, and Figure 23-66 illustrate an overview of the combined control and data planes.

Figure 23-64: IPv4 VPN and IPv6 VPN Over BGP-SR MPLS
To switch to using the MPLS BGP-SR transport, we just need to change the next-hop we advertised for the VPN routes. As per Figure 23-65 and Figure 23-66, the next hop needs to be set to loopback 1 for using the BGP-SR LSP.

This is simply achieved by configuring the next-hop for EVPN routes.

```
router bgp 64512
  address-family evpn
    neighbor default encapsulation mpls next-hop-self source-interface Loopback1
```
Once this is configured, we can check the BGP updates and the routes in the VRF. The output again includes the RD and IP prefix identifying the route. As seen in the output, we now have the NH set to 6.6.6.66 for tenant-d.

23.9 EVPN and VCS Commands

**Router BGP Configuration Mode**
- next-hop resolution disabled
- redistribute service vxlan
- route-target
- route-target export
- route-target import
- route-target route-map
- vni-aware-bundle

**VCS Commands**
- redistribute bgp evpn vxlan

**Display Commands**
- show bgp evpn
- show ip bgp vrf
- show ip route vrf
- show ipv6 bgp vrf
- show ipv6 route vrf
- show service vxlan address-table
- show vrf leak flapping
next-hop resolution disabled

The `next-hop resolution disabled` command disables the next-hop resolution in routes received from BGP-EVPN peers.

The `no next-hop resolution disabled` and the `default next-hop resolution disabled` commands enable the next-hop resolution in routes received from BGP-EVPN peers.

**Command Mode**
Router-BGP Address-Family Configuration

**Command Syntax**
```
next-hop resolution disabled
```

**Example**
This command disables the next-hop resolution in routes received from BGP-EVPN peers.

```
cvx(config)#router bgp 65002
cvx(config-router-bgp)#address-family evpn
cvx(config-router-bgp-af)#next-hop resolution disabled
cvx(config-router-bgp-af)#
```
redistribute bgp evpn vxlan

The **redistribute bgp evpn vxlan** command enables BGP-EVPN routes to be redistributed to VCS which in turn advertises them to all VTEPs within the DC.

The **no redistribute bgp evpn vxlan** and the **default redistribute bgp evpn vxlan** commands disable the redistribution of BGP-EVPN routes to VCS.

**Command Mode**
CVX-VXLAN Configuration

**Command Syntax**

```
redistribute bgp evpn vxlan
```

**Example**

This command enables redistribution of BGP-EVPN routes to VCS.

```
cvx(config)#cvx
cvx(config-cvx)#no shutdown
cvx(config-cvx)#service vxlan
cvx(config-cvx-vxlan)#no shutdown
cvx(config-cvx-vxlan)#redistribute bgp evpn vxlan
```
**redistribute service vxlan**

The **redistribute service vxlan** command enables BGP to redistribute the Layer 2 bridging information received from VCS.

The **no redistribute service vxlan** and the **default redistribute service vxlan** commands disable the redistribution of the bridging information received from VCS.

**Command Mode**

Router-BGP VNI Configuration

**Command Syntax**

```
redistribute service vxlan
```

**Example**

This command enables redistribution of the Layer 2 bridging information received from VCS.

```
cvx(config)#router bgp 100
cvx(config-router-bgp)#vni-aware-bundle bundle1
cvx(config-macvrf-bundle1)#redistribute service vxlan
```
**router general**

The `router general` command configures a route-map to leak routes from one VRF to another VRF using a route-map named “RM1”.

The `no router general` and `default router general` commands disable the router general configuration from the *running-config*.

**Command Mode**

Router General Configuration

**Command Syntax**

- `router general`
- `no router general`
- `default router general`

**Examples**

- These commands configure a route-map to leak routes from “VRF1” to “VRF2” using a route-map “RM1”.

  ```
  switch(config)#router general
  switch(config-router-general)#vrf VRF2
  switch(config-router-general-vrf-VRF2)#leak routes source-vrf VRF1
  subscribe-policy RM1
  ```

- These commands configure a route-map with the prefix 10.0.0.0/8 and the administrative distance to 10 in the destination VRF.

  ```
  switch(config)#ip prefix-list PL1
  switch(config-ip-pfx)#permit 10.0.0.0/8
  switch(config)#ip route-map RM1
  switch(config-route-map-RM1)#match ip address prefix-list PL1
  switch(config-route-map-RM1)#set distance 10
  ```
route-target

The route-target command configures a well-known extended community that is used by BGP-EVPN to export routes from or import routes into MAC-VRF.

The no route-target and default route-target commands delete the route-target configuration.

Command Mode
Router-BGP VNI Configuration

Syntax
route-target {export | import | both} rt
no route-target
default route-target

Parameters
- export configures a well-known extended community that is attached to the routes exported by BGP-EVPN.
- import configures a well known extended community that identifies the received routes that need to be imported into the MAC-VRF specified by the VNI bundle.
- both configures the same extended community for import and export of routes.
- rt route-target extended community.

Example
This command configures a well-known extended community for import and export of routes.

cvx(config)#router bgp 100
cvx(config-router-bgp)#vni-aware-bundle bundle1
cvx(config-macvrf-bundle1)#route-target both 503:12
cvx(config-macvrf-bundle1)#
route-target export

The route-target export command allows the user to export routes from a VRF to the local VPN table using the route target extended community list.

The no route-target export and default route-target export commands remove the routes from the VPN table.

Command Mode

Router-BGP VNI Configuration

Syntax

```plaintext
route-target export [evpn|vpn-ipv4|vpn-ipv6] <RT>
no route-target export
default route-target export
```

Parameters

- **evpn**  EVPN address family.
- **vpn-ipv4**  MPLS L3 VPN IPv4 unicast address family.
- **vpn-ipv6**  MPLS L3 VPN IPv6 unicast address family.
- **RT**  route-target extended community.

Examples

- These commands export routes from vrf-red to the VPN table.

```plaintext
switch(config)#service routing protocols model multi-agent
switch(config)#mpls ip
switch(config)#router bgp 65001
switch(config-router-bgp)#vrf vrf-red
switch(config-router-bgp-vrf-vrf-red)#rd 1:1
switch(config-router-bgp-vrf-vrf-red)#route-target export vpn-ipv4 10:10
switch(config-router-bgp-vrf-vrf-red)#route-target export vpn-ipv6 10:20
```

- These commands export routes from vrf-red to the EVPN table.

```plaintext
switch(config)#router bgp 65001
switch(config-router-bgp)#vrf vrf-red
switch(config-router-bgp-vrf-vrf-red)#rd 1:1
switch(config-router-bgp-vrf-vrf-red)#route-target export evpn 10:1
```
route-target import

The `route-target import` command allows the user to import route target extended community lists from the local VPN table to the target VRF.

The `no route-target import` and `default route-target import` commands remove the routes from the VPN table.

**Command Mode**
Router-BGP VNI Configuration

**Syntax**
```
route-target import [evpn|vpn-ipv4|vpn-ipv6] <RT>
no route-target import
default route-target import
```

**Parameters**
- **evpn**  EVPN address family.
- **vpn-ipv4**  MPLS L3 VPN IPv4 unicast address family.
- **vpn-ipv6**  MPLS L3 VPN IPv6 unicast address family.
- **RT**  route-target extended community.

**Examples**
- These commands import routes from the VPN table to `vrf-blue`.
  ```
  switch(config)#service routing protocols model multi-agent
  switch(config)#mpls ip
  switch(config)#router bgp 65001
  switch(config-router-bgp)#vrf vrf-blue
  switch(config-router-bgp-vrf-vrf-blue)#rd 2:2
  switch(config-router-bgp-vrf-vrf-blue)#route-target import vpn-ipv4 10:10
  switch(config-router-bgp-vrf-vrf-blue)#route-target import vpn-ipv6 10:20
  ```

- These commands import routes from the EVPN table to `vrf-blue`.
  ```
  switch(config)#router bgp 65001
  switch(config-router-bgp)#vrf vrf-blue
  switch(config-router-bgp-vrf-vrf-blue)#rd 2:2
  switch(config-router-bgp-vrf-vrf-blue)#route-target import evpn 10:1
  ```
route-target route-map

The route-target route-map command allows the user to export and import route target extended community lists from one VRF to another using route maps.

The no route-target route-map and default route-target route-map commands remove the routes from the VPN table.

Command Mode
Router-BGP VNI Configuration

Syntax
route-target {import|export} [evpn|vpn-ipv4|vpn-ipv6] route-map RM
no route-target route-map
default route-target route-map

Parameters
- evpn EVPN address family.
- vpn-ipv4 MPLS L3 VPN IPv4 unicast address family.
- vpn-ipv6 MPLS L3 VPN IPv6 unicast address family.
- RM route-map extended community.

Examples
- These commands export routes from vrf-red to the VPN table.
  switch(config)#service routing protocols model multi-agent
  switch(config)#mpls ip
  switch(config)#router bgp 65001
  switch(config-router-bgp)#vrf vrf-red
  switch(config-router-bgp-vrf-vrf-red)#rd 1:1
  switch(config-router-bgp-vrf-vrf-red)#route-target export vpn-ipv4 10:10
  switch(config-router-bgp-vrf-vrf-red)#route-target export vpn-ipv6 10:20
  switch(config-router-bgp-vrf-vrf-red)#route-target export vpn-ipv4 route-map EXPORT_V4_ROUTES_TO_VPN_TABLE
  switch(config-router-bgp-vrf-vrf-red)#route-target export vpn-ipv6 route-map EXPORT_V6_ROUTES_TO_VPN_TABLE
  
  These commands export routes from vrf-red to the EVPN table.
  switch(config)#router bgp 65001
  switch(config-router-bgp)#vrf vrf-red
  switch(config-router-bgp-vrf-vrf-red)#rd 1:1
  switch(config-router-bgp-vrf-vrf-red)#route-target export evpn 10:1
  switch(config-router-bgp-vrf-vrf-red)#route-target export evpn route-map EXPORT_ROUTES_TO_EVPN_TABLE
  
  These commands import routes from the VPN table to vrf-blue.
  switch(config)#service routing protocols model multi-agent
  switch(config)#mpls ip
  switch(config)#router bgp 65001
  switch(config-router-bgp)#vrf vrf-blue
  switch(config-router-bgp-vrf-vrf-blue)#rd 1:1
  switch(config-router-bgp-vrf-vrf-blue)#route-target import vpn-ipv4 10:10
  switch(config-router-bgp-vrf-vrf-blue)#route-target import vpn-ipv6 10:20
  switch(config-router-bgp-vrf-vrf-blue)#route-target import vpn-ipv4 route-map IMPORT_V4_ROUTES_VPN_TABLE
  switch(config-router-bgp-vrf-vrf-blue)#route-target import vpn-ipv6 route-map IMPORT_V6_ROUTES_VPN_TABLE
These commands import routes from the EVPN table to `vrf-blue`.

```
switch(config)#router bgp 65001
switch(config-router-bgp)#vrf vrf-blue
switch(config-router-bgp-vrf-vrf-blue)#rd 2:2
switch(config-router-bgp-vrf-vrf-blue)#route-target import evpn 10:1
switch(config-router-bgp-vrf-vrf-blue)#route-target import evpn route-map
IMPORT_ROUTES_FROM_EVPN_TABLE
```
Chapter 23: EVPN

EVPN and VCS Commands

**show bgp evpn**

The `show bgp evpn` command displays information about the BGP-EVPN routes of the switch.

**Command Mode**

Global Configuration

**Command Syntax**

```
show bgp evpn [community | detail | esi esid | extcommunity | host-flap | instance
| large-community AS:nn:nn | next-hop | rd admin:local-assignment | route-type | summary | vni vni_num]
```

**Parameters**

- `<no parameters>` displays all routes of the switch.
- `community` displays routes filtered by the specified community. Options include:
  - `GSHUT` well known GSHUT community.
  - `aa:nn` AS and network number, separated by colon. The value ranges from 1 to 4294967295.
  - `internet` advertises route to the Internet community.
  - `local-as` advertises route only to local peers.
  - `no-advertise` does not advertise the route to any peer.
  - `no-export` advertises route only within the BGP-EVPN AS boundary
  - `comm_num` community number. Values range from 1 to 4294967040.
- `detail` displays detailed information of routes.
- `esi esid` displays routes filtered by the specified Ethernet Segment Identifier (ESI).
- `extcommunity` displays routes that match with BGP or VPN extended community list. Options include:
  - `esi-label esid` displays routes filtered by the specified value of ESI label. The value ranges from 0 to 16777215.
  - `mac-mobility` displays routes filtered by the specified MAC mobility.
  - `router-mac H.H.H` displays routes filtered by the specified router MAC address.
  - `rt` displays routes filtered by the specified route target.
  - `tunnel-encap vxlan` displays routes filtered by the VXLAN tunnel encapsulation.
- `host-flap` displays routes that contains MAC addresses that are blacklisted due to duplication.
- `instance` displays routes with EVPN instances.
- `large-community AS:nn:nn` displays routes filtered by the specified large community.
- `next-hop` displays routes filtered by next-hop IPv4 or IPv6 addresses of remote VTEP.
- `rd admin:local-assignment` displays routes filtered by the specified Route Distinguisher (RD).
- `route-type` displays routes filtered by NLRI route type.
- `summary` displays summary of routes.
- `vni vni_num` displays routes filtered by the specified VXLAN Network Identifier (VNI). Value ranges from 1 to 4294967294.
Example

- This command displays BGP-EVPN routes filtered by the VNI 3011.

```bash
switch(config-router-bgp-af)\#show bgp evpn vni 3011
BGP routing table information for VRF default
Router identifier 2.0.2.2, local AS number 65002
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e - ECMP
S - Stale, c - Contributing to ECMP, b - backup
% - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop

```
show ip bgp vrf

The `show ip bgp vrf` command displays the type of VPN from the imported route. It shows an indication that the IPv4 route has been leaked and source VRF information is displayed.

**Command Mode**
Global Configuration

**Command Syntax**
```
show ip bgp vrf {vrf_name | all | default}
```

**Parameters**
- `vrf_name` name of the VRF.
- `all` displays summary of all VRFs.
- `default` default virtual routing and forwarding instance.

**Example**
- This command displays the leaked and source VRF information.
  
  ```
  switch(config)#show ip bgp 13.0.0.0/24 vrf vrf-blue
  BGP routing table information for VRF vrf-blue
  Router identifier 5.0.0.2, local AS number 65001
  BGP routing table entry for 130.110.61.0/24
  4.0.0.3 from 4.0.0.3 (52.0.0.1), imported EVPN route, RD 400:1
  Origin IGP, metric -, localpref 100, weight 0, valid, external,best
  Extended Community: Route-Target-AS:4000:1 TunnelEncap:tunnelTypeVxlan
  EvpnRouterMac:74:83:ef:0b:70:f3
  Leaked from VRF vrf-red
  ```
show ipv6 bgp vrf

The `show ipv6 bgp vrf` command displays the type of VPN from the imported route. It shows an indication that the IPv6 route has been leaked and source VRF information is displayed.

**Command Mode**
Global Configuration

**Command Syntax**

```
show ipv6 bgp vrf {vrf_name | all | default}
```

**Parameters**

- `vrf_name` name of the VRF.
- `all` displays summary of all VRFs.
- `default` default virtual routing and forwarding instance.

**Example**

This command displays the leaked and source VRF information.

```
switch(config)#show ipv6 bgp 2001:10:1:0::102/64 vrf default
BGP routing table information for VRF default
Router identifier 218.218.218.218, local AS number 34
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e - ECMP
S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast
% - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop

<table>

</tr>
</tbody>
</table>
```
show ip route vrf

The **show ip route vrf** command displays leaked prefixes with the label “L” in the output that indicates that the IPv4 route has been leaked. It also displays information about the source VRF from which these prefixes have been leaked.

**Command Mode**
Global Configuration

**Command Syntax**

```
show ip route vrf {vrf_name | all}
```

**Parameters**
- **vrf_name** name of the VRF.
- **all** displays summary of all VRFs.

**Example**
- These commands display the OSPF or OSPFV3 leaked routes as “redistribute ospf” and “redistribute ospfv3” are configured on the source VRF vrf-red.

```
switch(config)#show ip route vrf vrf-blue
VRF: vrf-blue
Codes: C - connected, S - static, K - kernel, O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1, E2 - OSPF external type 2, N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP, R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2, O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary, NG - Nexthop Group Static Route, V - VXLAN Control Service, DH - DHCP client installed default route, M - Martian, DP - Dynamic Policy Route, L - VRF Leaked Gateway of last resort is not set
C 5.0.0.2/31 is directly connected, Ethernet14
B L 57.0.0.32 [200/0] (source VRF vrf-red) via 4.0.0.3, Ethernet11
B L 45.0.0.1/32 [200/0] (source VRF vrf-red) via 4.0.0.3, Ethernet11
B L 52.0.0.1/32 [200/0] (source VRF vrf-red) via 4.0.0.3, Ethernet11

B L 130.0.3.0/24 [200/0] (source VRF vrf-red) via 4.0.0.3, Ethernet11
```
**show ipv6 route vrf**

The `show ipv6 route vrf` command displays leaked prefixes with the label "L" in the output that indicates that the IPv6 route has been leaked. It also displays information about the source VRF from which these prefixes have been leaked.

**Command Mode**
Global Configuration

**Command Syntax**
```
show ipv6 route vrf {vrf_name | all}
```

**Parameters**
- `vrf_name` name of the VRF.
- `all` displays summary of all VRFs.

**Example**
- These commands display the OSPF or OSPFv3 leaked routes as “redistribute ospf” and “redistribute ospfv3” are configured on the source VRF vrf-red.

```bash
switch(config)#show ipv6 route vrf vrf-blue
VRF: vrf-blue
Displaying 802 of 802 IPv6 routing table entries
Codes: C - connected, S - static, K - kernel, O3 - OSPFv3, B - BGP, R - RIP, A B - BGP Aggregate, I L1 - IS-IS level 1, I L2 - IS-IS level 2, DH - DHCP, NG - Nexthop Group Static Route, M - Martian, DP - Dynamic Policy Route, L - VRF Leaked
B L 18:1/128 [200/0] (source VRF vrf-red)

  via fe80::7683:efff:fe0b:963d, Ethernet11
B L 130::0:0:3::/64 [200/0] (source VRF vrf-red)
```
show service vxlan address-table

The `show service vxlan address-table` command displays route entries in the MAC forwarding table that are added through the CVX.

**Command Mode**
CVX Global Configuration

**Command Syntax**
```
show service vxlan address-table {advertised | received} [address H.H.H | evpn | hsc | mss | switch [Word | all] | vni vnid | vtep A.B.C.D]
```

**Parameters**
- `advertised` displays the advertised route entries in the MAC forwarding table.
- `received` displays the received route entries in the MAC forwarding table.
- `address H.H.H` displays route entries that are filtered by the specified MAC addresses.
- `evpn` displays route entries filtered by BGP-EVPN.
- `hsc` displays route entries filtered by Hardware Switch Controller (HSC).
- `mss` displays route entries filtered by Macro Segmentation Service (MSS).
- `switch` displays route entries that are filtered by the specified switch or all switches. Options include:
  - `Word` Hostname, IP address or ID of the switch.
  - `all` all switches
- `vni vnid` displays route entries filtered by the specified VXLAN Network Identifier (VNI). Value ranges from 1 to 4294967294.
- `vtep A.B.C.D` displays route entries filtered by the specified IP address of the remote Virtual Tunnel End Point (VTEP).

**Examples**
- This command displays the route entries in MAC forwarding table advertised to BGP-EVPN peers.

```text
cvx#show service vxlan address-table advertised evpn
  Advertised Mac Address Table
  ______________________________________________________
  VNI      Mac Address   VTEP        Moves

```
### show vrf leak flapping

The **show vrf leak flapping** command displays the flapping prefixes of the routes leaked from one VRF to another VRF. Routes that are detected as “flapping” are blocked considering the future leaking policy execution.

**Command Mode**  
EXEC

**Command Syntax**  
```
show vrf leak flapping
```

**Parameters**
- `destination` displays flapping prefixes destined to a VRF.
- `prefix` displays flapping routes for a prefix.
- `source` displays flapping prefixes sourced from a VRF.
- `vrf` displays flapping prefixes associated with a VRF

**Example**
- This command displays the flapping prefixes of the leaked routes.
  ```
  switch#show vrf leak flapping
  Age       Source VRF       Destination VRF       Prefix            Created At
  -------- ----------------- -------------------- ----------------- --------------
  141       VRF1             VRF2                  10.0.2.0/24       3357281.40992
  ```
**vni-aware-bundle**

The `vni-aware-bundle` command configures a BGP MAC-VRF containing Layer 2 routes from a group of VXLAN Network Identifiers (VNI).

**Command Mode**
Router BGP Configuration

**Command Syntax**

```
vni-aware-bundle  vni_bundle_name
```

**Parameter**

- `vni_bundle_name`  VNI bundle name.

**Example**

This command configures MAC-VRF BGP to support VNI bundle1.

```
cvx(config)#router bgp 100
cvx(config-router-bgp)#vni-aware-bundle bundle1
cvx(config-macvrf-bundle1)#
```
Chapter 24

ACLs and Route Maps

The switch uses rule-based lists to control packet access to ports and to select routes for redistribution to routing domains defined by dynamic routing protocols. This chapter describes the construction of access control lists (ACLs), prefix lists, and route maps.

This chapter includes the following sections:

- Section 24.1: ACL, Service ACL, Route Map, Prefix List, and RACL Divergence Introduction
- Section 24.2: Access Control Lists
- Section 24.3: Service ACLs
- Section 24.4: RACL Sharing on SVIs
- Section 24.5: Route Maps
- Section 24.6: Prefix Lists
- Section 24.7: ACL, Route Map, and Prefix List Commands

24.1 ACL, Service ACL, Route Map, Prefix List, and RACL Divergence Introduction

Access control lists (ACLs), Service ACLs, route maps, and prefix lists are all processed in order, beginning with the first rule and proceeding until a match is encountered.

An access control list (ACL) is a list of rules that control the inbound flow of packets into Ethernet interfaces, subinterfaces, and port channel interfaces or the switch control plane. The switch supports the implementation of a wide variety of filtering criteria including IP and MAC addresses, TCP/UDP ports with include/exclude options without compromising its performance or feature set. Filtering syntax is industry standard.

A Service ACL is an ACL applied by a control-plane process to control connections to, or packets processed by, the agent process.

A route map is a list of rules that control the redistribution of IP routes into a protocol domain on the basis of such criteria as route metrics, access control lists, next hop addresses, and route tags. Route maps can also alter parameters of routes as they are redistributed.

A prefix list is a list of rules that defines route redistribution access for a specified IP address space. Route maps often use prefix lists to filter routes.

The RACL divergence optimizes the usage of hardware resources occupied on each forwarding ASIC by installing ACLs only on the hardware components corresponding to the member interfaces belonging to the SVIs on which ACL is applied. Hence, saving the hardware resources used and enables RACLs to scale-up to a larger configuration. The show commands are used to display the interface mapping, TCAM entries, and TCAM utilization information.
24.2 Access Control Lists

These sections describe access control lists:

- Section 24.2.1: ACL Description
- Section 24.2.2: ACL Configuration
- Section 24.2.3: Applying ACLs

24.2.1 ACL Description

This section describes ACL composition and function. The switch supports the following ACL types:

- IPv4
- IPv6
- Standard IPv4
- Standard IPv6
- MAC

24.2.1.1 ACL Structure

An ACL is an ordered list of rules that defines access restrictions for the entities (the control plane, or an interface) to which it is applied. ACLs are also used by route maps to select routes for redistribution into specified routing domains.

ACL rules specify the data to which packet contents are compared when filtering data.

- The interface forwards packets that match all commands in a permit rule.
- The interface drops packets that match all commands in a deny rule.
- The interface drops packets that do not match at least one rule.

Upon its arrival at an interface, a packet's fields are compared to the first rule of the ACL applied to the interface. Packets that match the rule are forwarded (permit rule) or dropped (deny rule). Packets that do not match the rule are compared to the next rule in the list. This process continues until the packet either matches a rule or the rule list is exhausted. The interface drops packets not matching a rule.

The sequence number designates the rule's placement in the ACL.

24.2.1.2 ACL Rules

ACL rules consist of a command list that is compared to inbound packet fields. When all of a rule's criteria match a packet's contents, the interface performs the action specified by the rule.

The set of available commands depend on the ACL type and the specified protocol within the rule. The following is a list of commands available for supported ACL types

**IPv4 ACL Rule Parameters**

All rules in IPv4 ACLs include the following criteria:

- **Protocol**: The packet’s IP protocol. Valid rule inputs include:
  - Protocol name for a limited set of common protocols.
  - Assigned protocol number for all IP protocols.
- **Source Address**: The packet’s source IPv4 address. Valid rule inputs include:
  - a subnet address (CIDR or address-mask). Discontiguous masks are supported.
• a host IP address (dotted decimal notation).
• *any* to denote that the rule matches all source addresses.

**Destination Address:** The packet’s destination IP address. Valid rule inputs include:
• a subnet address (CIDR or address-mask). Discontiguous masks are supported.
• a host IP address (dotted decimal notation).
• *any* to denote that the rule matches all destination addresses.

All rules in IPv4 ACLs *may* include the following criteria:

• **Fragment:** Rules filter on the fragment bit.
• **Time-to-live:** Compares the TTL (time-to-live) value in the packet to a specified value. Valid in ACLs applied to the control plane. Validity in ACLs applied to the data plane varies by switch platform. Comparison options include:
  • *Equal:* Packets match if packet value equals statement value.
  • *Greater than:* Packets match if packet value is greater than statement value.
  • *Less than:* Packets match if packet value is less than statement value.
  • *Not equal:* Packets match if packet value does not equal statement value.

The availability of the following optional criteria depends on the specified protocol:

• **Source Ports / Destination Ports:** A rule filters on ports when the specified protocol supports IP address-port combinations. Rules provide one of these port filtering values:
  • *any* denotes that the rule matches all ports.
  • A list of ports that matches the packet port. Maximum list size is 10 ports.
  • Negative port list. The rule matches any port not in the list. Maximum list size is 10 ports.
  • Integer (lower bound): The rule matches any port with a number larger than the integer.
  • Integer (upper bound): The rule matches any port with a number smaller than the integer.
  • Range integers: The rule matches any port whose number is between the integers.

• **Flag bits:** Rules filter TCP packets on flag bits.
• **Message type:** Rules filter ICMP type or code.
• **Tracked:** Matches packets in existing ICMP, UDP, or TCP connections. Valid in ACLs applied to the control plane. Validity in ACLs applied to the data plane varies by switch platform.

**IPv6 ACL Rule Parameters**

**Note**

When calculating the size of ACLs, be aware that Arista switches install four rules in every IPv6 ACL so that ICMPv6 neighbor discovery packets bypass the default drop rule.

All rules in IPv6 ACLs include the following criteria:

• **Protocol:** All rules filter on the packet’s IP protocol field. Rule input options include:
  • Protocol name for a limited set of common protocols.
  • Assigned protocol number for all IP protocols.
• **Source Address:** The packet’s source IPv6 address. Valid rule inputs include:
  • an IPv6 prefix (CIDR). Discontiguous masks are supported.
  • a host IP address (dotted decimal notation).
  • *any* to denote that the rule matches all addresses.
- **Destination Address**: The packet’s destination IP address. Valid rule inputs include:
  - a subnet address (CIDR or address-mask). Discontiguous masks are supported.
  - a host IP address (dotted decimal notation).
  - *any* to denote that the rule matches all addresses.

All rules in IPv6 ACLs may include the following criteria:
- **Fragment**: Rules filter on the fragment bit.
- **HOP**: Compares the packet’s hop-limit value to a specified value. Comparison options include:
  - *Equal*: Packets match if packet value equals statement value.

The availability of the following optional criteria depends on the specified protocol:
- **Source Ports / Destination Ports**: A rule filters on ports when the specified protocol supports IP address-port combinations. Rules provide one of these port filtering values:
  - *any* denotes that the rule matches all ports.
  - A list of ports that matches the packet port. Maximum list size is 10 ports.
  - Negative port list. The rule matches any port not in the list. Maximum list size is 10 ports.
  - Integer (lower bound): The rule matches any port with a number larger than the integer.
  - Integer (upper bound): The rule matches any port with a number smaller than the integer.
  - Range integers: The rule matches any port whose number is between the integers.
- **Flag bits**: Rules filter TCP packets on flag bits.
- **Message type**: Rules filter ICMP type or code.
- **Tracked**: Matches packets in existing ICMP, UDP, or TCP connections. Valid in ACLs applied to the control plane. Validity in ACLs applied to the data plane varies by switch platform.

**Standard IPv4 and IPv6 ACL Rule Parameters**

**Note** When calculating the size of ACLs, be aware that Arista switches install four rules in every IPv6 ACL so that ICMPv6 neighbor discovery packets bypass the default drop rule.

Standard ACLs filter only on the source address.

**MAC ACL Rule Parameters**

MAC ACLs filter traffic on a packet’s layer 2 header. Criteria that MAC ACLs use to filter packets include:

- **Source Address** and **Mask**: The packet’s source MAC address. Valid rule inputs include:
  - MAC address range (address-mask in 3x4 dotted hexadecimal notation).
  - *any* to denote that the rule matches all source addresses.

- **Destination Address** and **Mask**: The packet’s destination MAC address. Valid rule inputs include:
  - MAC address range (address-mask in 3x4 dotted hexadecimal notation).
  - *any* to denote that the rule matches all destination addresses.

- **Protocol**: The packet’s protocol as specified by its EtherType field contents. Valid inputs include:
  - Protocol name for a limited set of common protocols.
  - Assigned protocol number for all protocols.
24.2.1.3 Creating and Modifying Lists

The switch provides configuration modes for creating and modifying ACLs. The command that enters an ACL configuration mode specifies the name of the list that the mode modifies. The switch saves the list to the running configuration when the configuration mode is exited.

- ACLs are created and modified in ACL configuration mode.
- Standard ACLs are created and modified in Standard-ACL-configuration mode.
- MAC ACLs are created and modified in MAC-ACL-configuration mode.

Lists that are created in one mode cannot be modified in any other mode.

A sequence number designates the rule’s placement in a list. New rules are inserted into a list according to their sequence numbers. A rule’s sequence number can be referenced when deleting it from a list.

Section 24.2.2 describes procedures for configuring ACLs.

24.2.1.4 Implementing Access Control Lists

An access control list (ACL) is implemented by assigning the list to an Ethernet interface or subinterface, to a port channel interface, or to the control plane. The switch assigns a default ACL to the control plane unless the configuration contains a valid control-plane ACL assignment statement. Ethernet and port channel interfaces are not assigned an ACL by default. Standard ACLs are applied to interfaces in the same manner as other ACLs.

IPv4 and MAC ACLs are separately applied for inbound and outbound packets. An interface or subinterface can be assigned multiple ACLs, with a limit of one ACL per packet direction per ACL type. Egress ACLs are supported on a subset of all available switches. The control-plane does not support egress ACLs.

Section 24.2.3 describes procedures for applying ACLs to interfaces or the control plane.

24.2.1.5 ACL Rule Tracking

ACL rule tracking determines the impact of ACL rules on the traffic accessing interfaces upon which they are applied. ACLs provide two tracking mechanisms:

- ACL logging: A syslog entry is logged when a packet matches specified ACL rules.
- ACL counters: ACL counters increment when a packet matches a rule in specified ACLs.

**ACL Logging**

ACL rules provide a log option that produces a log message when a packet matches the rule. ACL logging creates a syslog entry when a packet matches an ACL rule where logging is enabled. Packets that match a logging-enabled ACL rule are copied to the CPU by the hardware. These packets trigger the creation of a syslog entry. The information provided in the entry depends on the ACL type or the protocol specified by the ACL. Hardware rate limiting is applied to packets written to the CPU, avoiding potential DoS attacks. The rate of logging is also software limited to avoid the creation of syslog lists that are too large for practical use by human operators.

Section 24.2.2.3 describes procedures for configuring and enabling ACL logging.
**ACL Counters**

An ACL counter is assigned to each ACL rule. The activity of the ACL counters for rules within a list depend on the list's counter state. When the list is in counting state, the ACL counter of a rule increments when the rule matches a packet. When the list is in non-counting state, the counter does not increment. A list's counter state applies to all rules in the ACL. The initial state for new ACLs is non-counting.

When an ACL changes from counting state to non-counting state, or when the ACL is no longer applied to any interfaces that increment counters, counters for all rules in the list maintain their values and do not reset. When the ACL returns to counting mode or is applied to an interface that increments counters, the counter operation resumes from its most recent value.

Counters never decrement and are reset only through CLI commands.

Section 24.2.2.3 describes procedures for configuring and enabling ACL counters.

### 24.2.1.6 AlgoMatch

AlgoMatch enables more flexible and scalable solutions for access control, telemetry, and enforcement networking whether the requirements are an on-premises or hybrid cloud model. By combining power-efficient and low-cost general purpose memory technology with advanced software algorithms, AlgoMatch provides greater scale, performance, and efficiency compared to common standard implementations with merchant silicon systems and TCAM.

In a typical TCAM solution, as additional lookup capacity is added, the power increases in-line with the scale. AlgoMatch utilizes power-efficient searching, only checking locations needed, and as a result lowers power draw by as much as half compared to TCAMs.

AlgoMatch utilizes a flexible and efficient packet matching algorithm with variable lookup sizes, rather than a fixed size lookup with TCAM. This enables full flow matching against source and destination criteria, or parts of the mask, and allows for multiple actions to be performed on a single packet or flow, with user defined filters for packet classification and custom actions in a single pass. A policy with multiple actions is not typically possible with a TCAM solution without using recirculation of chained lookups. However, with AlgoMatch, multiple actions can be applied in a single pass (For example, access control, telemetry, and counters) without losing either features or performance.

**AlgoMatch Benefits**

- Improved power efficiency: 50 percentage lower.
- Efficient Layer 4 rules: allows enhanced security policy.
- Counters: provide better visibility and flow filtering.

**Note**

AlgoMatch configuration and show commands are no different from security ACLs. For more information on ACL commands refer Section 24.7: ACL, Route Map, and Prefix List Commands.

### 24.2.2 ACL Configuration

Access control lists are created and modified in an ACL-configuration mode. A list can be edited only in the mode where it was created. The switch provides five configuration modes for creating and modifying access control lists:

- **ACL configuration mode** for IPv4 access control lists.
- **IPv6-ACL configuration mode** for IPv6 access control lists.
- **Std-ACL configuration mode** for Standard IPv4 access control lists.
24.2.2.1 Managing ACLs

Creating and Opening a List

To create an ACL, enter one of the following commands, followed by the name of the list:

- `ip access-list` for IPv4 ACLs.
- `ipv6 access-list` for IPv6 ACLs.
- `ip access-list standard` for standard IPv4 ACLs.
- `ipv6 access-list standard` for standard IPv6 ACLs.
- `mac access-list` for MAC ACLs.

The switch enters the appropriate ACL configuration mode for the list. If the command is followed by the name of an existing ACL, subsequent commands edit that list (see Modifying an ACL for additional information).

Examples

- This command places the switch in ACL configuration mode to create an ACL named `test1`.
  ```
  switch(config)#ip access-list test1
  switch(config-acl-test1)#
  ```
- This command places the switch in Standard-ACL-configuration mode to create a Standard ACL named `stest1`.
  ```
  switch(config)#ip access-list standard stest1
  switch(config-std-acl-stest1)#
  ```
- This command places the switch in MAC-ACL configuration mode to create an MAC ACL named `mtest1`.
  ```
  switch(config)#mac access-list mtest1
  switch(config-mac-acl-mtest1)#
  ```

Saving List Modifications

ACL configuration modes are group-change modes. Changes made in a group-change mode are saved by exiting the mode.

**Important!** After exiting ACL mode, the running-config file must be saved to the startup configuration file to preserve an ACL after a system restart.
Example

- The second example in Adding a Rule (page 1283) results in this edited ACL:

  ```
  switch(config-acl-test1)#show
  IP Access List test1
  10 permit ip 10.10.10.0/24 any
  20 permit ip 10.30.10.0/24 host 10.20.10.1
  30 deny ip host 10.10.10.1 host 10.20.10.1
  40 permit ip any any
  ```

  Because the changes were not yet saved, the ACL remains empty, as shown by `show ip access-lists`.

  ```
  switch(config-acl-test1)#show ip access-lists test1
  switch(config-acl-test1)#
  ```

  To save all current changes to the ACL and exit ACL configuration mode, type `exit`.

  ```
  switch(config-acl-test1)#exit
  switch(config)#show ip access-lists test1
  IP Access List test1
  10 permit ip 10.10.10.0/24 any
  20 permit ip 10.30.10.0/24 host 10.20.10.1
  30 deny ip host 10.10.10.1 host 10.20.10.1
  40 permit ip any any
  ```

Discarding List Changes

The `abort` command exits ACL configuration mode without saving pending changes.

Example

- Example 2 in Adding a Rule (page 1283) results in this edited ACL:

  ```
  switch(config-acl-test1)#show
  IP Access List test1
  10 permit ip 10.10.10.0/24 any
  20 permit ip 10.30.10.0/24 host 10.20.10.1
  30 deny ip host 10.10.10.1 host 10.20.10.1
  40 permit ip any any
  ```

  To discard the changes, enter `abort`. If the ACL existed before entering ACL-configuration mode, `abort` restores the version that existed before entering ACL-configuration mode. Otherwise, `show ip access-lists` shows the ACL was not created.

  ```
  switch(config-acl-test1)#abort
  switch(config)#
  ```

24.2.2.2 Modifying an ACL

An existing ACL, including those currently applied to interfaces, can be modified by entering the appropriate configuration mode for the ACL as described in Creating and Opening a List. By default, while an ACL is being modified all traffic is blocked on any interface to which the ACL has been applied.

Permit All Traffic During ACL Update

Because blocking ports during ACL modifications can result in packet loss and can interfere with features such as routing and dynamic NAT, 7050X, 7060X, 7150, 7250X, 7280, 7280R, 7300X, 7320X, and 7500 series switches can be configured instead to permit all traffic on Ethernet and VLAN interfaces while ACLs applied to those interfaces are being modified. This is done with the `hardware access-list update default-result permit` command.
These commands add deny rules to the appropriate ACL:

- **deny (IPv4 ACL)** adds a deny rule to an IPv4 ACL.
- **deny (IPv6 ACL)** adds a deny rule to an IPv6 ACL.
- **deny (Standard IPv4 ACL)** adds a deny rule to an IPv4 standard ACL.
- **deny (Standard IPv6 ACL)** adds a deny rule to an IPv6 standard ACL.
- **deny (MAC ACL)** adds a deny rule to a MAC ACL.

These commands add permit rules to the appropriate ACL:

- **permit (IPv4 ACL)** adds a permit rule to an IPv4 ACL.
- **permit (IPv6 ACL)** adds a permit rule to an IPv6 ACL.
- **permit (Standard IPv4 ACL)** adds a permit rule to an IPv4 standard ACL.
- **permit (Standard IPv6 ACL)** adds a permit rule to an IPv6 standard ACL.
- **permit (MAC ACL)** adds a permit rule to a MAC ACL.

### Adding a Rule

To append a rule to the end of a list, enter the rule without a sequence number while in ACL configuration mode for the list. The new rule’s sequence number is derived by adding 10 to the last rule’s sequence number.

### Examples

- This command configures the switch to permit all traffic during ACL modifications on interfaces to which the ACL has been applied. The rules in modified ACLs are applied after exiting ACL configuration mode, and after the ACL rules have been populated in hardware.

```bash
switch(config)#hardware access-list update default-result permit
```

- These commands enter the first three rules into a new ACL.

```bash
switch(config-acl-test1)#permit ip 10.10.10.0/24 any
switch(config-acl-test1)#permit ip any host 10.20.10.1
switch(config-acl-test1)#deny ip host 10.10.10.1 host 10.20.10.1
```

To view the edited list, type **show**.

```bash
switch(config-acl-test1)#show
IP Access List test1
  10 permit ip 10.10.0.24 any
  20 permit ip any host 10.20.10.1
  30 deny ip host 10.10.10.1 host 10.20.10.1
```

- This command appends a rule to the ACL. The new rule’s sequence number is 40.

```bash
switch(config-acl-test1)#permit ip any any
switch(config-acl-test1)#show
IP Access List test1
  10 permit ip 10.10.0.24 any
  20 permit ip any host 10.20.10.1
  30 deny ip host 10.10.10.1 host 10.20.10.1
  40 permit ip any any
```

### Inserting a Rule

To insert a rule into a ACL, enter the rule with a sequence number between the existing rules’ numbers.
Example

- This command inserts a rule between the first two rules by assigning it the sequence number 15.

Switch(config-acl-test1)#15 permit ip 10.30.10.0/24 host 10.20.10.1
Switch(config-acl-test1)#show
IP Access List test1
  10 permit ip 10.10.10.0/24 any
  15 permit ip 10.30.10.0/24 host 10.20.10.1
  20 permit ip any host 10.20.10.1
  30 deny ip host 10.10.10.1 host 10.20.10.1
  40 permit ip any any

Deleting a Rule

To remove a rule from the current ACL, perform one of these commands:

- Enter no, followed by the sequence number of the rule to be deleted.
- Enter no, followed by the rule be deleted.
- Enter default, followed by the rule to be deleted.

Example

- These equivalent commands remove rule 20 from the list.

  switch(config-acl-test1)#no 20

  switch(config-acl-test1)#no permit ip any host 10.20.10.1

  switch(config-acl-test1)#default permit ip any host 10.20.10.1

This ACL results from entering one of the preceding commands.

  switch(config-acl-test1)#show
  ip access list test1
    10 permit ip 10.10.10.0/24 any
    15 permit ip 10.30.10.0/24 host 10.20.10.1
    30 deny ip host 10.10.10.1 host 10.20.10.1
    40 permit ip any any

Resequencing Rule Numbers

Sequence numbers determine the order of the rules in an access control list. After a list editing session where existing rules are deleted and new rules are inserted between existing rules, the sequence number distribution may not be uniform. Resequencing rule numbers changes the sequence number of rules to provide a constant difference between adjacent rules. The resequence (ACLs) command adjusts the sequence numbers of ACL rules.
Example

- The `resequence` command renumbers rules in the test1 ACL. The sequence number of the first rule is 100; subsequent rules numbers are incremented by 20.

```plaintext
switch(config-acl-test1)#show
IP Access List test1
  10 permit ip 10.10.10.0/24 any
  25 permit ip any host 10.20.10.1
  30 deny ip host 10.10.10.1 host 10.20.10.1
  50 permit ip any any
  90 remark end of list
switch(config-acl-test1)#resequence 100 20
switch(config-acl-test1)#show
IP Access List test1
  100 permit ip 10.10.10.0/24 any
  120 permit ip any host 10.20.10.1
  140 deny ip host 10.10.10.1 host 10.20.10.1
  160 permit ip any any
  180 remark end of list
```

24.2.2.3 ACL Rule Tracking Configuration

ACL rules provide a log option that produces a syslog message about the packets matching packet. ACL logging creates a syslog entry when a packet matches an ACL rule with logging enabled.

This feature is currently available on Arad switches and on 7100 series switches. On 7100 series switches, matches are logged only on ingress, not on egress.

Example

- This command creates an ACL rule with logging enabled.

```plaintext
switch(config-acl-test1)#15 permit ip 10.30.10.0/24 host 10.20.10.1 log
```

The format of the generated syslog message depends on the ACL type and the specified protocol:

- Messages generated by a TCP or UDP packet matching an IP ACL use this format:
  ```plaintext
  IPACCESS: list acl intf filter protocol src-ip(src_port) -> dst-ip(dst_port)
  ```

- Messages generated by ICMP packets matching an IP ACL use this format:
  ```plaintext
  IPACCESS: list acl intf filter icmp src-ip(src-port) -> dst-ip(dst-port) type=n code=m
  ```

- Messages generated by all other IP packets matching an IP ACL use this format:
  ```plaintext
  IPACCESS: list acl intf filter protocol src-ip -> dst-ip
  ```

- Messages generated by packets matching a MAC ACL use this format:
  ```plaintext
  MACACCESS: list acl intf filter vlan ether src_mac -> dst_mac
  ```

- Messages generated by a TCP or UDP packet matching a MAC ACL use this format:
  ```plaintext
  MACACCESS: list acl intf filter vlan ether ip-prt src-mac src-ip:src-prt -> dst-mac dst-ip:dst-prt
  ```

- Messages generated by any other IP packet matching a MAC ACL use this format:
  ```plaintext
  MACACCESS: list acl intf filter vlan ether src_mac src_ip -> dst_mac dst_ip
  ```

Variables in the syslog messages display the following values:

- `acl` Name of ACL.
• **intf** Name of interface that received the packet.
• **filter** Action triggered by ACL (denied or permitted).
• **protocol** IP protocol specified by packet.
• **vlan** Number of VLAN receiving packet.
• **ether** EtherType protocol specified by packet.
• **src-ip** and **dst-ip** source and destination IP addresses.
• **src-prt** and **dst-prt** source and destination ports.
• **src-mac** and **dst-mac** source and destination MAC addresses.

ACLs provide a command that configures its counter state (counting or non-counting). The counter state applies to all rules in the ACL. The initial state for new ACLs is non-counting.

The **counters per-entry (ACL configuration modes)** command places the ACL in counting mode.

- This command places the configuration mode ACL in counting mode.
  
  switch(config-acl-test1)#counters per-entry
  switch(config-acl-test1)#exit
  switch(config-acl-test1)#show ip access-list test1

  IP Access List test1
  counters per-entry
  10 permit ip 10.10.10.0/24 any
  20 permit ip any host 10.20.10.1
  30 deny ip host 10.10.10.1 host 10.20.10.1
  40 permit ip any any
  50 remark end of list

The **clear ip access-lists counters** and **clear ipv6 access-lists counters** commands set the IP access list counters to zero for the specified IP access list.

- This command clears the ACL counter for the test1 ACL.
  
  switch(config)#clear ip access-lists counters test1
  switch(config)#

### 24.2.2.4 Displaying ACLs

ACLs can be displayed by a **show running-config** command. The **show ip access-lists** also displays ACL rosters and contents, as specified by command parameters.

When editing an ACL, the **show (ACL configuration modes)** command displays the current or pending list, as specified by command parameters.

**Displaying a List of ACLs**

To display the roster of ACLs on the switch, enter **show ip access-lists** with the **summary** option.
Example

- This command lists the available access control lists.

  switch(config)#show ip access-list summary
  IPV4 ACL default-control-plane-acl
    Total rules configured: 12
    Configured on: control-plane
    Active on    : control-plane

  IPV4 ACL list2
    Total rules configured: 3

  IPV4 ACL test1
    Total rules configured: 6

  IPV4 ACL test_1
    Total rules configured: 1

  IPV4 ACL test_3
    Total rules configured: 0

  switch(config)#

Displaying Contents of an ACL

These commands display ACL contents.

- `show ip access-lists`
- `show ipv6 access-lists`
- `show mac access-lists`

Each command can display the contents of one ACL or of all ACLs of the type specified by the command:

- To display the contents of one ACL, enter `show ip access-lists` followed by the name of the ACL.
- To display the contents of all ACLs on the switch, enter the command without any options.

ACLs that are in counting mode display the number of inbound packets each rule in the list matched and the elapsed time since the last match.

Example

- This command displays the rules in the `default-control-plane-acl` ACL.

  switch#show ip access-lists default-control-plane-acl
  IP Access List default-control-plane-acl [readonly]
    counters per-entry
    10 permit icmp any any
    20 permit ip any any tracked [match 1725, 0:00:00 ago]
    30 permit ospf any any
    40 permit tcp any any eq ssh telnet www snmp bgp https
    50 permit udp any any eq bootps bootpc snmp [match 993, 0:00:29 ago]
    60 permit tcp any any eq mlag ttl eq 255
    70 permit udp any any eq mlag ttl eq 255
    80 permit vrrp any any
    90 permit ahp any any [match 1316, 0:00:23 ago]
    100 permit pim any any
    110 permit igmp any any [match 1316, 0:00:23 ago]
    120 permit tcp any any range 5900 5910
This command displays the rules in all ACLs on the switch.

```
switch#show ip access-lists
IP Access List default-control-plane-acl [readonly]
   counters per-entry
    10 permit icmp any any
    20 permit ip any any tracked [match 1371, 0:00:00 ago]
    30 permit ospf any any
    40 permit tcp any any eq ssh telnet www snmp bgp https
    50 permit udp any any eq bootps bootpc snmp
    60 permit tcp any any eq mlag ttl eq 255
    70 permit udp any any eq mlag ttl eq 255
    80 permit vrrp any any
    90 permit ahp any any
   100 permit pim any any
   110 permit igmp any any [match 1316, 0:00:23 ago]
   120 permit tcp any any range 5900 5910

IP Access List list2
    10 permit ip 10.10.10.0/24 any
    20 permit ip 10.30.10.0/24 host 10.20.10.1
    30 permit ip any host 10.20.10.1
    40 deny ip host 10.10.10.1 host 10.20.10.1
    50 permit ip any any

IP Access List test1
  <-------OUTPUT OMITTED FROM EXAMPLE-------->

Switch(config)#
```

Displaying ACL Modifications

While editing an ACL in ACL-configuration mode, the `show` (ACL configuration modes) command provides options for displaying ACL contents.

- To display the list, as modified in ACL configuration mode, enter `show` or `show pending`.
- To display the list, as stored in `running-config`, enter `show active`.
- To display differences between the pending list and the stored list, enter `show diff`.

Examples

The examples in this section assume these ACL commands were previously entered.

**These commands are stored in the configuration:**

```
10 permit ip 10.10.10.0/24 any
20 permit ip any host 10.21.10.1
30 deny ip host 10.10.10.1 host 10.20.10.1
40 permit ip any any
50 remark end of list
```

**The current edit session removed this command. This change is not yet stored to running-config:**

```
20 permit ip any host 10.21.10.1
```
The current edit session added these commands ACL. They are not yet stored to running-config:

20 permit ip 10.10.0.0/16 any  
25 permit tcp 10.10.20.0/24 any  
45 deny pim 239.24.124.0/24 10.5.8.4/30

- This command displays the pending ACL, as modified in ACL configuration mode.

switch(config-acl-test_1)#show pending
IP Access List test_1
10 permit ip 10.10.0.0/24 any  
20 permit ip 10.10.0.0/16 any  
25 permit tcp 10.10.20.0/24 any  
30 deny ip host 10.10.10.1 host 10.20.10.1  
40 permit ip any any  
45 deny pim 239.24.124.0/24 10.5.8.4/30  
50 remark end of list

- This command displays the ACL, as stored in the configuration.

switch(config-acl-test_1)#show active
IP Access List test_1
10 permit ip 10.10.10.0/24 any  
20 permit ip any host 10.21.10.1  
30 deny ip host 10.10.10.1 host 10.20.10.1  
40 permit ip any any  
50 remark end of list

- This command displays the difference between the saved and modified ACLs.

- Rules added to the pending list are denoted with a plus sign (+).
- Rules removed from the saved list are denoted with a minus sign (-).

switch(config-acl-test_1)#show diff

```

24.2.2.5 Configuring Per-Port Per-VLAN QoS

To configure per-port per-VLAN QoS, first, configure the ACL policing for QoS, and then apply the policy-map on a single Ethernet or port-channel interfaces on a per-port per-VLAN basis. The per port per VLAN QoS allows a class-map to match traffic for a single VLAN or for a range of VLANs separated by commas.

**Note** To configure per-port per-VLAN QoS on DCS-7280(E/R) and DCS-7500(E/R), change the TCAM profile to QoS as shown below.

**Step 1** Change the TCAM profile to QoS.

```
switch#config
switch(config)#
switch(config)#hardware tcam profile qos
```
Step 2 Create an ACL and then match the traffic packets based on the VLAN value and the VLAN mask configured in the ACL.

```
switch(config)#ip access-list acl1
switch(config-acl-acl1)#permit vlan 100 0xfff ip any any
switch(config-acl-acl1)#exit
```

Step 3 Similarly, create a class-map and then match the traffic packets based on the range of VLAN values configured in the class-map.

```
switch(config)#class-map match-any class1
switch(config-cmap-qos-class1)#match vlan 20-40, 1000-1250, 2000
switch(config-cmap-qos-class1)#exit
```

**Note**

In ACLs, the VLAN configuration must have a VLAN mask, whereas the class-map allows the VLAN configuration without a VLAN mask, in such cases use 0xFFF as the default VLAN mask.

24.2.2.6 Displaying Per-Port Per-VLAN QoS

The following show commands display the status, traffic hit counts, tcam profile information, and policy-maps configured on an interface.

- The `show policy-map` command displays the policy-map information of the configured policy-map.

```
Example

switch#show policy-map policy1
Service-policy policy1
Class-map: class1 (match-any)
Match: ip access-group name acl1
Police cir 512000 bps bc 96000 bytes
Class-map: class-default (match-any)
```

- The `show policy-map interface` command displays the policy-map configured on an interface.

```
Example

switch#show policy-map interface ethernet 1
Service-policy input: p1
Hardware programming status: Successful
Class-map: c2001 (match-any)
Match: vlan 2001 0xfff
set dscp 4
Class-map: c2002 (match-any)
Match: vlan 2002 0xfff
set dscp 8
Class-map: c2003 (match-any)
Match: vlan 2003 0xfff
set dscp 12
```

24.2.2.7 On DCS-7010, DCS-7050X, DCS7250X, DCS-7300X series switches

- The `show policy-map policy-name counters` command displays the policy-map traffic match count for the policy-map configured.
Example

```
switch#show policy-map policy1 counters
  Service-policy input: policy1
  Hardware programming status: Successful
  Class-map: class1 (match-any)
    Match: vlan 20-40,1000-1250
    police rate 100 mbps burst-size 100 kbytes
    Interface: Ethernet16/1
    Conformed 28621 packets, 7098008 bytes --------------
    packet match count

  Class-map: class-default (match-any)
    Matched Packets: 19 --------------
    packet match count
```

- The `show platform trident tcam [detail]` displays the TCAM entries configured for each TCAM group including policy-maps and corresponding hits.

Example

```
switch#show platform trident tcam
  === TCAM summary for switch Linecard0/0 ===
  TCAM group 9 uses 42 entries and can use up to 1238 more.
    Mlag control traffic uses 4 entries.
    CVX traffic uses 6 entries.
    L3 Control Priority uses 23 entries.
    IGMP Snooping Flooding uses 8 entries.
    L4 MicroBfd traffic uses 1 entries.
  TCAM group 13 uses 99 entries and can use up to 1181 more.
    Dot1x MAB traffic uses 1 entries.
    ACL Management uses 10 entries.
    Vxlan Traffic uses 24 entries.
    L2 Control Priority uses 11 entries.
    Storm Control Management uses 2 entries.
    ARP Inspection uses 2 entries.
    L3 Routing uses 49 entries.
  TCAM group 14 uses 12 entries and can use up to 2548 more.
    Policy QOS uses 12 entries.
  TCAM group 16 uses 59 entries and can use up to 1221 more.
    PDP Reserved uses 1 entries.
    PDP uses 58 entries.
  TCAM group 67 uses 12 entries and can use up to 500 more.
    PDP Class Reservation uses 12 entries.
```
Example

```
switch#show platform trident tcam detail
=== TCAM detail for switch Linecard0/0 ===
TCAM group 9 uses 42 entries and can use up to 1238 more.
Mlag control traffic uses 4 entries.
  589826  0 hits - MLAG - SrcPort UDP Entry
  589827  0 hits - MLAG - DstPort UDP Entry
  589828  0 hits - MLAG - SrcPort TCP Entry
  589829  0 hits - MLAG - DstPort TCP Entry
CVX traffic reserves 6 entries (0 used).
L3 Control Priority uses 23 entries.
  589836  0 hits - URM - SelfIp UDP Entry
  589837  0 hits - URM - SelfIp TCP Entry
  589838  0 hits - URM - Ttl1 UDP Entry
  589839  0 hits - URM - Ttl1 TCP Entry
  589840  0 hits - BGP - Dst Port
  589841  0 hits - BGP - Src Port
  589842  0 hits - VRRP
  589843  0 hits - BFD
  589844  0 hits - BFD Multihop
  589845  0 hits - PIM
  589846  0 hits - PIM Null Register
  589847  0 hits - PIM Register
  589848  0 hits - OSPF - unicast
  589849   7196 hits - OSPFv2 - Multicast
  589850  0 hits - OSPFv3 - Multicast
  589851  0 hits - OSPF Auth ESP - Multicast
  589852  0 hits - OSPF Auth ESP - Unicast
  589853  0 hits - IP packets with GRE type and ISIS protocol
  589854  0 hits - RouterL3 Vlan Priority 6,7 Elevator
  589855  0 hits - RouterL3 DSCP 48-63 Elevator
  589856  0 hits - RouterL3 Priority Elevator
  589857  0 hits - NextHopToCpu, Clean
  589858  0 hits - L3MC Cpu OIF
IGMP Snooping Flooding reserves 8 entries (6 used).
  589860  0 hits - Drop All IGMP packets
  589861  0 hits - Flood link local packets
  589862  0 hits - IGMP Snooping Restricted Flooding L2 from local
  589863  0 hits - IGMP Snooping Restricted Flooding L2
  589864  0 hits - IGMP Snooping Restricted Flooding L3 from local
mlag peer
  589865  0 hits - IGMP Snooping Restricted Flooding L3
L4 MicroBfd traffic reserves 1 entries (0 used).
TCAM group 13 uses 99 entries and can use up to 1181 more.
Dot1x MAB traffic uses 1 entries.
  851968  0 hits - Dot1xMab Rule
<--------OUTPUT OMITTED FROM EXAMPLE-------->
```

24.2.2.8 On DCS-7280(E/R), DCS7500(E/R) series switches

- The `show platform fap [fapName] acl tcam hw` command displays the TCAM entries configured for each TCAM bank including policy-maps and corresponding traffic match.
### Example

```text
switch# show platform fap Arad1 acl tcam hw
```

```
Arad1 Bank 0 Type: dbPdpIp, dbPdpIp6, dbPdpMpls, dbPdpNonIp, dbPdpTunnel
```

Chapter 24: ACLs and Route Maps

Access Control Lists

24.2.3 Applying ACLs

Access control lists become active when they are assigned to an interface or subinterface or to the control plane. This section describes the process of adding and removing ACL interface assignments.

Applying an ACL to an Interface

The switch must be in interface configuration mode to assign an ACL to an interface or subinterface.
• The **ip access-group** command applies the specified IP or standard IP ACL to the configuration mode interface or subinterface.

• The **mac access-group** command applies the specified MAC ACL to the configuration mode interface.

IPv4, IPv6, and MAC ACLs are separately applied for inbound and outbound packets. An interface or subinterface can be assigned with multiple ACLs, with a limit of one ACL per packet direction per ACL type. Egress ACLs are supported on a subset of all available switches. IPv6 egress ACLs have limited availability, and IPv6 egress ACLs applied to routed interfaces or subinterfaces across the same chip on the DCS-7500E and the DCS-7280E series can be shared. In addition to that, the DSCP value can match on IPv6 egress ACLs. This result in a more efficient utilization of system resources, and is particularly useful for environments with few, potentially large, IPv6 egress ACLs applied across multiple routed interfaces.

**Example**

• These commands assign **test1** ACL to Ethernet interface 3, then verify the assignment.

  switch(config)#interface ethernet 3
  switch(config-if-Et3)#ip access-group test1 in
  switch(config-if-Et3)#show running-config interfaces ethernet 3
  interface Ethernet3
   ip access-group test1 in
  switch(config-if-Et3)#

• This command enables shared ACLs.

  switch(config)#hardware access-list resource sharing vlan ipv6 out
  switch(config)#

• This command disables shared ACLs.

  switch(config)#no hardware access-list resource sharing vlan ipv6 out
  switch(config)#

• These commands apply an IPv4 ACL named “test_ACL” to ingress traffic on Ethernet subinterface 5.1.

  switch(config)#interface ethernet 5.1
  switch(config-if-Et5.1)#ipv4 access-group test_ACL in
  switch(config-if-Et5.1)#

**Removing an ACL from an Interface**

The **no ip access-group** command removes an IP ACL assignment statement from **running-config** for the configuration mode interface. After an ACL is removed, the interface is not associated with an IP ACL.

The **no mac ip access-group** command removes a MAC ACL assignment statement from **running-config** for the configuration mode interface. After a MAC ACL is removed, the interface is not associated with an MAC ACL.

To remove an ACL from the control plane, enter the **no ip access-group** command in control plane configuration mode. Removing the control plane ACL command from **running-config** reinstates **default-control-plane-acl** as the control plane ACL.

**Examples**

• These commands remove the assigned IPv4 ACL from Ethernet interface 3.

  switch(config)#interface ethernet 3
  switch(config-if-Et3)#no ip access-group test in
  switch(config-if-Et3)#

---

1296
These commands place the switch in control plane configuration mode and remove the ACL assignment from running-config, restoring default-control-plane-acl as the Control Place ACL.

```sh
switch(config)#control-plane
switch(config-cp)#no ip access-group test_cp in
switch(config-cp)#
```
24.3 Service ACLs

These sections describe Service ACLs:

- Section 24.3.1: Service ACL Description
- Section 24.3.2: Configuring Service ACLs and Displaying Status and Counters

24.3.1 Service ACL Description

Service ACL enforcement is a feature added to a control plane service (the SSH server, the SNMP server, routing protocols, etc) that allows the switch administrator to restrict the processing of packets and connections by the control plane processes that implement that service. The control plane program run by the control plane process checks already received packets and connections against a user configurable access control list (ACL), a Service ACL. The Service ACL contains permit and deny rules matching any of the source address, destination address, and TCP or UDP ports of received packets or connections. After receiving a packet or connection, the control plane process evaluates the packet or connection against the rules of the Service ACL configured for the control plane process, and if the received packet or connection matches a deny rule the control plane process drops or closes it without further processing.

Control Plane Process Enforced Access Control enables the system administrator to restrict which systems on the network can access the services provided by the switch. Each service has its own access control list, giving the system administrator fine grained control over access to the switch's control plane services. The CLI for this uses the familiar pattern of access control lists assigned for a specific purpose, in this case for each control plane service.

24.3.2 Configuring Service ACLs and Displaying Status and Counters

24.3.2.1 SSH Server

To apply the SSH server Service ACLs for IPv4 and IPv6 traffic, use the `ip access-group (Service ACLs)` and `ipv6 access-group (Service ACLs)` commands in mgt-ssh configuration mode as shown below.

```
(config)# management ssh
(config-mgmt-ssh)# ip access-group <acl_name> [vrf <vrf_name>] in
(config-mgmt-ssh)# ipv6 access-group <acl_name> [vrf <vrf_name>] in
```

In EOS 4.19.0, all VRFs are required to use the same SSH server Service ACL. The Service ACL assigned without the `vrf` keyword is applied to all VRFs where the SSH server is enabled.

To display the status and counters of the SSH server Service ACLs, use the following commands.

```
(switch)>show management ssh ip access-list
(switch)>show management ssh ipv6 access-list
```

24.3.2.2 SNMP Server

To apply the SNMP server Service ACLs to restrict which hosts can access SNMP services on the switch, use the `snmp-server community` command as shown below.

```
(config)# snmp-server community <community-name> [view <viewname>] [ro | rw] <acl_name>
(config)# snmp-server community <community-name> [view <viewname>] [ro | rw] ipv6 <ipv6_acl_name>
```
24.3.2.3 **EAPI**

To apply Service ACLs to the EOS application programming interface (EAPI) server, use the `ip access-group` (Service ACLs) and `ipv6 access-group` (Service ACLs) commands as shown below.

```
(config)# management api http-commands
(config-mgmt-api-http-cmds)# vrf <vrf_name>
(config-mgmt-api-http-cmds-vrf-<vrf>)# ip access-group <acl_name>
(config-mgmt-api-http-cmds-vrf-<vrf>)# ipv6 access-group <ipv6_acl_name>
```

**Note** To configure a Service ACL for the EAPI server in the default VRF, use the `vrf default` command to enter the per-VRF configuration mode for the default VRF before using the `ip access-group` (Service ACLs) or `ipv6 access-group` (Service ACLs) command.

To display the status and counters of the EAPI server Service ACLs, use the following commands.

```
(switch)> show management api http-commands ip access-list
(switch)> show management api http-commands ipv6 access-list
```

24.3.2.4 **BGP**

To apply Service ACLs for controlling connections to the BGP routing protocol agent, use the `ip access-group` (Service ACLs) and `ipv6 access-group` (Service ACLs) commands as shown below.

```
(config)# router bgp <asn>
(config-router-bgp)# ip access-group <acl_name>
(config-router-bgp)# ipv6 access-group <ipv6_acl_name>
(config-router-bgp)# vrf <vrf_name>
(config-router-bgp-vrf-<vrf>)# ip access-group <acl_name>
(config-router-bgp-vrf-<vrf>)# ipv6 access-group <ipv6_acl_name>
```

To display the status and counters of the BGP routing protocol Service ACLs, use the following commands.

```
(switch)> show bgp ipv4 access-list
(switch)> show bgp ipv6 access-list
```

24.3.2.5 **OSPF**

To apply Service ACLs for controlling packets processed by the OSPF routing protocol agent, use the `ip access-group` (Service ACLs) and `ipv6 access-group` (Service ACLs) commands as shown below.

```
(config)# router ospf <id>
(config-router-ospf)# ip access-group <acl_name>
(config-router-ospf)# ipv6 access-group <ipv6_acl_name>
```

When using VRFs, each per-VRF OSPF instance must be assigned its Service ACL explicitly.

To display the status and counters of the OSPF routing protocol Service ACLs, use the following commands.

```
(switch)> show ospf ipv4 access-list
(switch)> show ospf ipv6 access-list
```
24.3.2.6  PIM

To apply Service ACLs for controlling packets processed by the PIM routing protocol agent, use the `access-group` command as shown below.

```
(config)# router pim
(config-router-pim)# ipv4
(config-router-pim-ipv4)# access-group <acl_name>
(config-router-pim-ipv4)# vrf <vrf_name>
(config-router-pim-vrf-<vrf>)# ipv4
(config-router-pim-vrf-<vrf>-ipv4)# access-group <acl_name>
```

To display the status and counters of the PIM routing protocol Service ACLs, use the following commands.

```
(switch)> show ip pim access-list
```

24.3.2.7  IGMP

To apply Service ACLs for controlling packets processed by the IGMP management protocol agent, use the `ip igmp access-group` command as shown below.

```
(config)# router igmp
(config-router-igmp)# ip igmp access-group <acl_name>
(config-router-igmp)# vrf <vrf_name>
(config-router-igmp-vrf-<vrf>)# ip igmp access-group <acl_name>
```

To display the status and counters of the IGMP management protocol Service ACLs, use the following commands.

```
(switch)> show ip igmp access-list
```

24.3.2.8  DHCP Relay

To apply Service ACLs for controlling packets processed by the DHCP relay agent, use the `ip dhcp relay access-group` and `ipv6 dhcp relay access-group` commands as shown below.

```
(config)# ip dhcp relay access-group <acl_name> [vrf <vrf_name>]
(config)# ipv6 dhcp relay access-group <acl_name> [vrf <vrf_name>]
```

To display the status and counters of the DHCP relay agent Service ACLs, use the following commands.

```
(switch)> show ip dhcp relay access-list
(switch)> show ipv6 dhcp relay access-list
```

24.3.2.9  LDP

To apply Service ACLs for controlling packets and connections processed by the LDP MPLS label distribution protocol, use the `ip access-group (Service ACLs)` command as shown below.

```
(config)# mpls ldp
(config-mpls-ldp)# ip access-group <acl_name>
```

To display the status and counters of the LDP Service ACLs, use the following command.

```
(switch)> show mpls ldp access-list
```
24.3.2.10 LANZ

To apply Service ACLs for controlling connections accepted by the LANZ agent, use the `ip access-group (Service ACLs)` and `ipv6 access-group (Service ACLs)` commands as shown below.

```
(config)# queue-monitor streaming
(config-qm-streaming)# ip access-group <acl_name>
(config-qm-streaming)# ipv6 access-group <ipv6_acl_name>
```

To display the status and counters of the LDP Service ACLs, use the following command.

```
(switch)> show queue-monitor streaming access-lists
```

24.3.2.11 MPLS Ping and Traceroute

To apply Service ACLs for controlling connections accepted by the MPLS Ping agent, use the `ip access-group (Service ACLs)` and `ipv6 access-group (Service ACLs)` commands as shown below.

```
(config)# mpls ping
(config-mpls-ping)# ip access-group <acl_name> [vrf <vrf_name>]
(config-mpls-ping)# ipv6 access-group <ipv6_acl_name> [vrf <vrf_name>]
```

24.3.2.12 Telnet Server

To apply Service ACLs to the Telnet server, use the `ip access-group (Service ACLs)` and `ipv6 access-group (Service ACLs)` commands as shown below.

```
(config)# management telnet
(config-mgmt-telnet)# ip access-group <acl_name> [vrf <vrf_name>] in
(config-mgmt-telnet)# ipv6 access-group <ipv6_acl_name> [vrf <vrf_name>] in
```

In EOS 4.19.0, all VRFs are required to use the same Telnet server Service ACL. The Service ACL assigned without the `vrf` keyword is applied to all VRFs where the Telnet server is enabled.

To display the status and counters of the LDP Service ACLs, use the following commands.

```
(switch)>show management telnet ip access-list
(switch)>show management telnet ipv6 access-list
```
24.4 RACL Sharing on SVIs

24.4.1 IPv4 Ingress Sharing

The IPv4 ingress sharing optimizes the utilization of hardware resources by sharing the hardware resources between different VLAN interfaces when they have same ACL attached.

Larger deployments are benefited with this function, where IPv4 ingress sharing is applied on multiple SVIs with member interfaces on same forwarding ASIC. For example, a trunk port carrying multiple VLANs and an ingress sharing is applied on all VLANs, it occupies lesser hardware resources irrespective of number of VLANs. By default, IPv4 ingress sharing is disabled on the switches.

To enable IPv4 Ingress Sharing use [no] hardware access-list resource sharing vlan in command. Note, enabling or disabling the IPv4 ingress sharing requires the restart of software agents on the switches which is a disruptive process and will impact the traffic forwarding. The no form of the command disables the IPv4 ingress sharing on the switch. To display the IPv4 ingress sharing information use show platform trident command on the switch.

24.4.2 IPv4 Egress Sharing

The IPv4 Egress Sharing optimizes the utilization of hardware resources by sharing TCAM entries for a group of SVIs on which IPv4 ACLs shared. The TCAM entries are shared for all the SVIs per chip, hence, saving a lot of hardware resources and enabling ACLs to scale to a larger configurations.

Larger deployments are benefited, where IPv4 Egress Sharing is applied on multiple SVIs with member interfaces on same forwarding ASIC. For example, a trunk port carrying multiple VLANs, and when Egress Sharing is applied on all VLANs it occupies lesser hardware resources irrespective of number of VLANs. By default, IPv4 Egress Sharing is enabled on the switches. However, both IPv4 Egress Sharing and uRPF cannot be enabled at the same time. Disabling IPv4 RACL sharing will allow uRPF configuration and make sure RACL configuration, non-shared mode, is configured at the same time.

To enable unicast Reverse Path Forwarding (uRPF) on the switch, the IPv4 Egress Sharing must me disabled using the no hardware access-list resource sharing vlan ipv4 out command.

To enable IPv4 Egress Sharing if previously disabled from the default configuration, use hardware access-list resource sharing vlan ipv4 out command. Note, enabling or disabling the IPv4 Egress Sharing requires the restart of software agents on the switches which is a disruptive process and will impact the traffic forwarding.

The following show commands can be used to verify the IPv4 Egress Sharing information on the switch.

- show ip access-lists
- show vlan
- show platform arad acl tcam
- show ip route
- show platform arad ip route

24.4.3 Configuring IPv4 Egress Sharing

Use hardware access-list resource sharing vlan ipv4 out command to enable the IPv4 Egress Sharing on the switch. By default, IPv4 Egress Sharing is enabled on the switch. The no form of the command disables the IPv4 Egress Sharing on the switch and user is allowed to configure the uRPF on the switch.
24.4.4 Displaying IPv4 Egress Sharing Information

Examples

- The `show ip access-lists` command displays the list of all the configured IPv4 ACLs.

  ```
  switch# show ip access-lists summary
  IPv4 ACL default-control-plane-acl [readonly]
  Total rules configured: 17
  Configured on Ingress: control-plane(default VRF)
  Active on Ingress: control-plane(default VRF)
  
  IPV4 ACL ipAclLimitTest
  Total rules configured: 0
  Configured on Egress: Vl2148,2700
  Active on Egress: Vl2148,2700
  ```

- The `show vlan` command displays the list of all the member interfaces under each SVI.

  ```
  switch# show vlan
  VLAN  Name                             Status    Ports
  ----- -------------------------------- --------- -------------------------------
  1     default                           active
  2148  VLAN2148                          active    Cpu, Et1, Et26
  2700  VLAN2700                          active    Cpu, Et18
  ```

- The `show platform arad acl tcam` command displays the number of TCAM entries (hardware resources) occupied by the ACL on each forwarding ASIC and the percentage of TCAM utilization per forwarding ASIC.

  ```
  switch# show platform arad acl tcam detail
  ip access-list ipAclLimitTest (Shared RACL, 0 rules, 1 entries, direction out, state success, Acl Label 2)
  Fap: Arad0, Shared: true, Interfaces: Vl2148, Vl2700
  Bank Offset Entries
  0  0  1
  Fap: Arad1, Shared: true, Interfaces: Vl2148
  Bank Offset Entries
  0  0  1
  ```

  ```
  switch# show platform arad acl tcam summary
  The total number of TCAM lines per bank is 1024.
  =========================================================
  Arad0:
  =========================================================
  Bank  Used  Used %  Used By
  0  1  0  IP Egress PACLs/RACLs
  Total Number of TCAM lines used is: 1
  =========================================================
  Arad1:
  =========================================================
  Bank  Used  Used %  Used By
  0  1  0  IP Egress PACLs/RACLs
  Total Number of TCAM lines used is: 1
  ```
The `show ip route` command displays the unicast ip routes installed in the system.

```
switch# show ip route
VRF name: default
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type 2, B I - iBGP, B E - eBGP,
       R - RIP, I - ISIS, A B - BGP Aggregate, A O - OSPF Summary,
       NG - Nexthop Group Static Route
Gateway of last resort is not set
C 10.1.0.0/16 is directly connected, Vlan2659
C 10.2.0.0/16 is directly connected, Vlan2148
C 10.3.0.0/16 is directly connected, Vlan2700
S 172.17.0.0/16 [1/0] via 172.24.0.1, Management1
S 172.18.0.0/16 [1/0] via 172.24.0.1, Management1
S 172.19.0.0/16 [1/0] via 172.24.0.1, Management1
S 172.20.0.0/16 [1/0] via 172.24.0.1, Management1
S 172.22.0.0/16 [1/0] via 172.24.0.1, Management1
C 172.24.0.0/18 is directly connected, Management1
```
The show platform arad ip route command displays the platform unicast forwarding routes.

```
switch#show platform arad ip route
Tunnel Type: M(mpls), G(gre)
```

24.5 Route Maps

A route map is an ordered set of rules that control the redistribution of IP routes into a protocol domain on the basis of such criteria as route metrics, access control lists, next hop addresses, and route tags. Route maps can also alter parameters of routes as they are redistributed.

These sections describe the route map implementation:

- Section 24.5.1 describes route maps.
- Section 24.5.2 describes the route map configuration process.
- Section 24.5.3 describes the usage of route maps.

24.5.1 Route Map Description

Route maps are composed of route map statements, each of which consists of a list of match and set commands.

**Route Map Statements**

Route map statements are categorized by the resolution of routes that the statement filters.

- Permit statements facilitate the redistribution of matched routes.
- Deny statements prevent the redistribution of matched routes.

Route map statement elements include name, sequence number, filter type, match commands, set commands, and continue commands.

- **name** identifies the route map to which the statement belongs.
- **sequence number** designates the statement’s placement within the route map.
- **filter type** specifies the route resolution. Valid types are *permit* and *deny*.
- **match commands** specify criteria that select routes that the statement is evaluating for redistribution.
- **set commands** modify route parameters for redistributed routes.
- **continue commands** prolong the route map evaluation of routes that match a statement.

Statements filter routes for redistribution. Routes that statements pass are redistributed (permit statements) or rejected (deny statements). Routes that statements fail are filtered by the next statement in the route map.

- When a statement does not contain a **match** command, the statement passes all routes.
- When a statement contains a single **match** command that lists a single object, the statement passes routes whose parameters match the object.
- When a statement contains a single **match** command that lists multiple objects, the statements passes routes whose parameters match at least one object.
- When a statement contains multiple **match** commands, the statement passes routes whose parameters match all match commands.

**Set** commands modify parameters for redistributed routes. Set commands are valid in permit statements.
Example
- The following route map statement is named MAP_1 with sequence number 10. The statement matches all routes from BGP Autonomous System 10 and redistributes them with a local preference set to 100. Routes that do not match the statement are evaluated against the next statement in the route map.

```plaintext
switch#route-map MAP_1 permit 10
  match as 10
  set local-preference 100
```

Route Maps with Multiple Statements
A route map consists of statements with the same name and different sequence numbers. Statements filter routes in ascending order of their sequence numbers. When a statement passes a route, the redistribution action is performed as specified by the filter type and all subsequent statements are ignored. When the statement fails the route, the statement with the smallest sequence number that is larger than the current one filters the route.

All route maps have an implied final statement that contains a single deny statement with no match command. This denies redistribution to routes that are not passed by any statement.

Example
- The following route map is named MAP_1 with two permit statements. Routes that do not match either statement are denied redistribution into the target protocol domain.

```plaintext
switch#route-map MAP_1 permit 10
  match as 10
  set local-preference 100

switch#route-map MAP_1 permit 20
  match metric-type type-1
  match as 100
```

Section 24.5.2 describes route map configuration procedures.

Route Maps with Multiple Statements and Continue Commands
Route map statements that contain a continue (route map) command support additional route map evaluation of routes whose parameters meet the statement’s match commands. Routes that match a statement containing a continue command are evaluated against the statement specified by the continue command.

When a route matches multiple route map statements, the filter action (deny or permit) is determined by the last statement that the route matches. The set commands in all statements matching the route are applied to the route after the route map evaluation is complete. Multiple set commands are applied in the same order by which the route was evaluated against the statements containing them.
**Example**

- The following route map is named MAP_1 with a permit statement and a deny statement. The permit statement contains a continue command. Routes that match statement 10 are evaluated against statement 20.

  ```
  route-map MAP_2 permit 10
  match as 10
  continue 20
  set local-preference 100
  
  route-map MAP_2 deny 20
  match metric-type type-1
  match as 100
  
  The route is redistributed if it passes statement 10 and is rejected by statement 20. The route is denied redistribution in all other instances. The **continue** command guarantees the evaluation of all routes against both statements.
  ```

24.5.2 Route Map Configuration

Route maps are created and modified in route map configuration mode. These sections describe the configuration mode and its commands.

- **Section 24.5.2.1: Route Map Creation and Editing**
- **Section 24.5.2.2: Modifying Route Map Components**

24.5.2.1 Route Map Creation and Editing

**Creating a Route Map Statement**

To create a route map, enter `route-map` followed by the map name and filter type (**deny** or **permit**). The default sequence number is assigned to the statement if the command does not include a number.

**Example**

- This command places the switch in route map configuration mode to create a route map statement named `map1` with a sequence number of 50.

  ```
  switch(config)#route-map map1 permit 50
  switch(config-route-map-map1)#
  ```

**Editing a Route Map Statement**

To edit an existing route map statement, enter `route-map` with the map’s name and statement’s number. The switch enters route map configuration mode for the statement. Subsequent `match (route-map)` and `set (route-map)` commands add the corresponding commands to the statement.

The `show` command displays contents of the existing route map.
Example

- This command places the switch in route map configuration mode to edit an existing route map statement. The `show` command displays contents of all statements in the route map.

```
switch(config)#route-map MAP2
switch(config-route-map-MAP2)#show
  Match clauses:
    match as 10
    match tag 333
  Set clauses:
    set local-preference 100
switch(config-route-map-MAP2)#
```

Saving Route Map Modifications

Route map configuration mode is a group-change mode. Changes are saved by exiting the mode, either with an explicit `exit` command or by switching directly to another configuration mode. This includes switching to the configuration mode for a different route map.

Example

- The first command creates the `map1` statement with sequence number of 10. The second command is not yet saved to the route map, as displayed by the `show` command.

```
switch(config)#route-map map1 permit
switch(config-route-map-map1)#match as 100
switch(config-route-map-map1)#show

switch(config-route-map-map1)#
```

The `exit` command saves the `match` command.

```
switch(config-route-map-map1)#exit
switch(config)#show route-map map1
route-map map1 permit 10
  Match clauses:
    match as 100
  Set clauses:
switch(config)#
```

Discarding Route Map Modifications

The `abort` command discards all pending changes and exits route map configuration mode.

Example

- The `abort` command discards the pending `match` command and restores the original route map.

```
switch(config)#route-map map1 permit
switch(config-route-map-map1)#match as 100
switch(config-route-map-map1)#abort
switch(config)#show route-map map1
switch(config)#
```

24.5.2.2 Modifying Route Map Components

These commands add rules to the configuration mode route map:

- `match (route-map)` adds a match rule to a route map.
- `set (route-map)` adds a set rule to a route map.
Inserting a Statement
To insert a new statement into an existing route map, create a new statement with a sequence number that differs from any existing statement in the map.

Example
- This command adds statement 50 to the \textit{Map1} route map, then displays the new route map.

\begin{verbatim}
switch(config)#route-map Map1 permit 50
switch(config-route-map-Map1)#match as 150
switch(config-route-map-Map1)#exit
switch(config)#show route-map Map1
route-map Map1 deny 10
  Match clauses:
    match as 10
    match tag 333
  Set clauses:
    set local-preference 100
route-map Map1 permit 50
  Match clauses:
    match as 150
  Set clauses:
switch(config)#
\end{verbatim}

Deleting Route Map Components
To remove a component from a route map, perform one of the following:
- To remove a command from a statement, enter \texttt{no}, followed by the command to be removed.
- To remove a statement, enter \texttt{no}, followed by the route map with the filter type and the sequence number of the statement to be removed.
- To remove a route map, enter \texttt{no} followed by the route map without a sequence number.

24.5.3 Using Route Maps
Protocol redistribution commands include a route map parameter that determines the routes to be redistributed into the specified protocol domain.

Example
- This command uses \textit{Map1} route map to select OSPFv2 routes for redistribution into BGP AS1.

\begin{verbatim}
switch(config)#router bgp 1
switch(config-router-bgp)#redistribute ospf route-map Map1
switch(config-router-bgp)#exit
switch(config)#
\end{verbatim}

24.6 Prefix Lists
A prefix list is an ordered set of rules that defines route redistribution access for a specified IP address space. A prefix list rules consists of a filter action (deny or permit), an address space identifier (IPv4 subnet address or IPv6 prefix), and a sequence number.

Prefix lists are referenced by route map match commands when filtering routes for redistribution.
- Section 24.6.1 describes the prefix list configuration process.
- Section 24.6.2 describes the use of prefix lists.
24.6.1 Prefix List Configuration

A prefix list is an ordered set of rules that defines route redistribution access for a specified IP address space. A prefix list rule consists of a filter action (deny or permit), a network address (IPv4 subnet or IPv6 prefix), and a sequence number. A rule may also include an alternate mask size.

The switch supports IPv4 and IPv6 prefix lists. The switch is placed in a Prefix-list configuration mode to create and edit IPv4 or IPv6 prefix lists.

24.6.1.1 IPv4 Prefix Lists

IPv4 prefix lists are created or modified by adding an IPv4 prefix list rule in the Prefix-list configuration mode. Each rule includes the name of a prefix list, in addition to the sequence number, network address, and filter action. A list consists of all rules that have the same prefix list name.

The ip prefix-list command creates a prefix list or adds a rule to an existing list. Route map match commands use prefix lists to filter routes for redistribution into OSPF, RIP, or BGP domains.

Creating an IPv4 Prefix List

To create an IPv4 prefix list, enter the ip prefix-list command, followed by the name of the list. The switch enters IPv4 prefix-list configuration mode for the list. If the command is followed by the name of an existing ACL, subsequent commands edit that list.

Example

- This command places the switch in IPv4 prefix list configuration mode to create an IPv4 prefix list named route-one.

  
  switch(config)#ip prefix-list route-one
  switch(config-ip-pfx)#

- These commands create four different rules for the prefix-list named route-one.

  
  switch(config)#ip prefix-list route-one
  switch(config-ip-pfx)#seq 10 deny 10.1.1.0/24
  switch(config-ip-pfx)#seq 20 deny 10.1.0.0/16
  switch(config-ip-pfx)#seq 30 permit 12.15.4.9/32
  switch(config-ip-pfx)#seq 40 deny 1.1.1.0/24

To view the list, save the rules by exiting the Prefix-list command mode, then re-enter the configuration mode and type show active.

  
  switch(config-ip-pfx)#exit
  switch(config)#ip prefix-list route-one
  switch(config)#show active
  ip prefix-list route-one
    seq 10 deny 10.1.1.0/24
    seq 20 deny 10.1.0.0/16
    seq 30 permit 12.15.4.9/32
    seq 40 deny 1.1.1.0/24

IPv4 prefix lists are referenced in route map match (route-map) commands.

24.6.1.2 IPv6 Prefix Lists

Creating an IPv6 Prefix List

The switch provides IPv6 prefix-list configuration mode for creating and modifying IPv6 prefix lists. A list can be edited only in the mode where it was created.
To create an IP ACL, enter the *ipv6 prefix-list* command, followed by the name of the list. The switch enters IPv6 prefix-list configuration mode for the list. If the command is followed by the name of an existing ACL, subsequent commands edit that list.

**Example**

- This command places the switch in IPv6 prefix list configuration mode to create an IPv6 prefix list named *map1*.

```
switch(config)#ipv6 prefix-list map1
switch(config-ipv6-pfx)#
```

**Adding a Rule**

To append a rule to the end of a list, enter the rule without a sequence number while in Prefix-List configuration mode for the list. The new rule’s sequence number is derived by adding 10 to the last rule’s sequence number.

**Example**

These commands enter the first two rules into a new prefix list.

```
switch(config-ipv6-pfx)#permit 3:4e96:8ca1:33cf::/64
switch(config-ipv6-pfx)#permit 3:11b1:8fe4:1aac::/64
```

To view the list, save the rules by exiting the prefix-list command mode, then re-enter the configuration mode and type *show active*.

```
switch(config-ipv6-pfx)#exit
switch(config)#ipv6 prefix-list map1
switch(config-ipv6-pfx)#show active
ipv6 prefix-list map1
  seq 10 permit 3:4e96:8ca1:33cf::/64
  seq 20 permit 3:11b1:8fe4:1aac::/64
switch(config-ipv6-pfx)#
```

This command appends a rule to the end of the prefix list. The new rule’s sequence number is 30.

```
switch(config-ipv6-pfx)#permit 3:1bca:1141:ab34::/64
switch(config-ipv6-pfx)#exit
switch(config)#ipv6 prefix-list map1
switch(config-ipv6-pfx)#show active
ipv6 prefix-list map1
  seq 10 permit 3:4e96:8ca1:33cf::/64
  seq 20 permit 3:11b1:8fe4:1aac::/64
  seq 30 permit 3:1bca:1141:ab34::/64
switch(config-ipv6-pfx)#
```

**Inserting a Rule**

To insert a rule into a prefix list, use the *seq (IPv6 Prefix Lists)* command to enter a rule with a sequence number that is between numbers of two existing rules.
Example
- This command inserts a rule between the first two rules by assigning it the sequence number 15.

```
switch(config-ipv6-pfx)#seq 15 deny 3:4400::/64
switch(config-ipv6-pfx)#exit
switch(config)#show ipv6 prefix-list map1
ipv6 prefix-list map1
  seq 10 permit 3:4e96:8ca1:33cf::/64
  seq 15 deny 3:4400::/64
  seq 20 permit 3:11b1:8fe4:1aac::/64
  seq 30 permit 3:1bca:3ff2:634a::/64
switch(config)#
```

Deleting a Rule
To remove a rule from the configuration mode prefix list, enter `no seq` (see `seq (IPv6 Prefix Lists)`), followed by the sequence number of the rule to be removed.

Example
- These commands remove rule 20 from the prefix list, then displays the resultant prefix list.

```
switch(config-ipv6-pfx)#no seq 20
switch(config-ipv6-pfx)#exit
switch(config)#show ipv6 prefix-list map1
ipv6 prefix-list map1
  seq 10 permit 3:4e96:8ca1:33cf::/64
  seq 15 deny 3:4400::/64
  seq 30 permit 3:1bca:3ff2:634a::/64
switch(config)#
```

24.6.2 Using Prefix Lists
Route map match commands include an option that matches a specified prefix list.

Example
- The MAP_1 route map uses a match command that references the PL_1 prefix list.

```
switch(config)#route-map MAP_1 permit
switch(config-route-map-MAP_1)#match ip address prefix-list PL_1
switch(config-route-map-MAP_1)#set community 500
switch(config-route-map-MAP_1)#exit
```
24.7 ACL, Route Map, and Prefix List Commands

This section describes CLI commands that this chapter references.

ACL Creation and Access Commands
- `ip access-list`
- `ip access-list standard`
- `ipv6 access-list`
- `ipv6 access-list standard`
- `mac access-list`
- `system profile`
- `hardware access-list resource sharing vlan in`
- `hardware access-list resource sharing vlan ipv4 out`

ACL Implementation Commands
- `ip access-group`
- `ipv6 access-group`
- `mac access-group`

Service ACL Implementation Commands
- `ip access-group (Service ACLs)`
- `ipv6 access-group (Service ACLs)`

ACL Edit Commands
- `counters per-entry (ACL configuration modes)`
- `hardware access-list update default-result permit`
- `no <sequence number> (ACLs)`
- `resequence (ACLs)`
- `show (ACL configuration modes)`

ACL Rule Commands
- `deny (IPv4 ACL)`
- `deny (IPv6 ACL)`
- `deny (MAC ACL)`
- `deny (Standard IPv4 ACL)`
- `deny (Standard IPv6 ACL)`
- `permit (IPv4 ACL)`
- `permit (IPv6 ACL)`
- `permit (MAC ACL)`
- `permit (Standard IPv4 ACL)`
- `permit (Standard IPv6 ACL)`
- `remark`

ACL List Counter Commands
- `clear ip access-lists counters`
- `clear ipv6 access-lists counters`
- `hardware counter feature acl out`

ACL Display Commands
- `show ip access-lists`
- `show ipv6 access-lists`
- `show mac access-lists`
Prefix List Creation and Access Commands
- `ip prefix-list`
- `ipv6 prefix-list`

Prefix List Edit Commands
- `deny (IPv6 Prefix List)`
- `permit (IPv6 Prefix List)`
- `seq (IPv6 Prefix Lists)`

Prefix List Display Commands
- `show ip prefix-list`
- `show ipv6 prefix-list`
- `show platform trident tcam`
- `show platform fap acl`
- `show platform fap acl tcam`
- `show platform arad acl tcam`
- `show platform arad acl tcam summary`
- `show platform arad mapping`
- `show hardware tcam profile`
- `show platform fap acl tcam hw`

Route Map Creation and Access Command
- `route-map`

Route Map Edit Commands
- `continue (route map)`
- `description (route map)`
- `match (route-map)`
- `set (route-map)`
- `set as-path prepend`
- `set as-path match`
- `set community (route-map)`
- `set extcommunity (route-map)`

Route Map Display Commands
- `show route-map`
clear ip access-lists counters

The `clear ip access-lists counters` command sets ACL counters to zero for the specified IPv4 access control list (ACL). The `session` parameter limits ACL counter clearing to the current CLI session.

**Command Mode**

Privileged EXEC

**Command Syntax**

```
clear ip access-lists counters [ACL_NAME] [SCOPE]
```

**Parameters**

- **ACL_NAME** Name of ACL. Options include:
  - `<no parameter>` all ACLs.
  - `access_list` name of ACL.
- **SCOPE** Session affected by command. Options include:
  - `<no parameter>` command affects counters on all CLI sessions.
  - `session` affects only current CLI session.

**Example**

- This command resets all IPv4 ACL counters.

```
switch(config)# clear ip access-lists counters
switch(config)#
```
clear ipv6 access-lists counters

The clear ipv6 access-lists counters command sets ACL counters to zero for the specified IPv6 access control list (ACL). The session parameter limits ACL counter clearing to the current CLI session.

Command Mode
Privileged EXEC

Command Syntax
  clear ipv6 access-lists counters [ACL_NAME] [SCOPE]

Parameters
- **ACL_NAME** name of ACL. Options include:
  - <no parameter> all IPv6 ACLs.
  - *access_list* name of IPv6 ACL.
- **SCOPE** Session affected by command. Options include:
  - <no parameter> command affects counters on all CLI sessions.
  - *session* affects only current CLI session.

Example
- This command resets all IPv6 ACL counters.
  switch(config)#clear ipv6 access-lists counters
  switch(config)#
**continue (route map)**

The `continue` command creates a route map statement entry that enables additional route map evaluation of routes whose parameters meet the statement's matching criteria.

A statement typically contains a `match (route-map)` and a `set (route-map)` command. The evaluation of routes whose settings are the same as `match` command parameters normally ends and the statement's `set` commands are applied to the route. Routes that match a statement containing a `continue` command are evaluated against the statement specified by the `continue` command.

When a route matches multiple route map commands, the filter action (deny or permit) is determined by the last statement that the route matches. The `set` commands in all statements matching the route are applied to the route after the route map evaluation is complete. Multiple set commands are applied in the same order by which the route was evaluated against the statement containing them.

The `no continue` and `default continue` commands remove the corresponding `continue` command from the configuration mode route map statement by deleting the corresponding command from `running-config`.

**Command Mode**

Route-Map Configuration

**Command Syntax**

```
continue NEXT_SEQ
no continue NEXT_SEQ
default continue NEXT_SEQ
```

**Parameters**

- `NEXT_SEQ` specifies next statement for evaluating matching routes. Options include:
  - `<no parameter>` Next statement in the route map, as determined by sequence number.
  - `seq_number` Specifies the number of the next statement. Values range from 1 to 16777215.

**Restrictions**

A `continue` command cannot specify a sequence number smaller than the sequence number of its route map statement.

**Related Commands**

- `route-map` enters route map configuration mode.

**Example**

- This command creates route map map1, statement 40 with a `match` command, a `set` command, and a `continue` command. Routes that match the statement are subsequently evaluated against statement 100. The `set local-preference` command is applied to matching routes regardless of subsequent matching operations.

```
switch(config)#route-map map1 deny 40
switch(config-route-map-map1)#match as 15
switch(config-route-map-map1)#continue 100
switch(config-route-map-map1)#set local-preference 50
switch(config-route-map-map1)#
```
counters per-entry (ACL configuration modes)

The **counters per-entry** command places the ACL in counting mode. An ACL in counting mode displays the number of instances each rule in the list matches an inbound packet and the elapsed time since the last match. The show access list commands display the statistics next to each rule in the ACL.

On the FM6000 platform, this command has no effect when used in an ACL that is part of a PBR class map.

The **no counters per-entry** and **default counters per-entry** command places the ACL in non-counting mode.

**Command Mode**
- ACL Configuration
- IPv6-ACL Configuration
- Std-ACL Configuration
- Std-IPv6-ACL Configuration
- MAC-ACL Configuration

**Command Syntax**
- `counters per-entry`
- `no counters per-entry`
- `default counters per-entry`

**Examples**

- This command places the test1 ACL in counting mode.
  ```
  switch(config)#ip access-list test1
  switch(config-acl-test1)#counters per-entry
  switch(config-acl-test1)#
  ```

- This command displays the ACL, with counter information, for an ACL in counting mode.
  ```
  switch#show ip access-lists
  IP Access List default-control-plane-acl [readonly]
  counters per-entry
  10 permit icmp any any
  20 permit ip any any tracked [match 12041, 0:00:00 ago]
  30 permit ospf any any
  40 permit tcp any any eq ssh telnet www snmp bgp https [match 11, 1:41:07 ago]
  50 permit udp any any eq bootps bootpc snmp rip [match 78, 0:00:27 ago]
  60 permit tcp any any eq mlag ttl eq 255
  70 permit udp any any eq mlag ttl eq 255
  80 permit vrrp any any
  90 permit ahp any any
  100 permit pim any any
  110 permit igmp any any [match 14, 0:23:27 ago]
  120 permit tcp any any range 5900 5910
  130 permit tcp any any range 50000 50100
  140 permit udp any any range 51000 51100
  ```
deny (IPv4 ACL)

The `deny` command adds a deny rule to the configuration mode IPv4 access control list (ACL). Packets filtered by a `deny` rule are dropped by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding 10 to the number of the ACL’s last rule.

The `no deny` and `default deny` commands remove the specified rule from the configuration mode ACL. The `no <sequence number> (ACLs)` command also removes the specified rule from the ACL.

**Command Mode**

ACL Configuration

**Command Syntax**

```
[SEQ_NUM] deny PROTOCOL SOURCE_ADDR [SOURCE_PORT] DEST_ADDR [DEST_PORT]
[FLAGS] [MESSAGE] [fragments] [tracked] [DSCP_FILTER] [TTL_FILTER] [log]
```

```
no deny PROTOCOL SOURCE_ADDR [SOURCE_PORT] DEST_ADDR [DEST_PORT]
[FLAGS] [MESSAGE] [fragments] [tracked] [DSCP_FILTER] [TTL_FILTER] [log]
```

```
default deny PROTOCOL SOURCE_ADDR [SOURCE_PORT] DEST_ADDR [DEST_PORT]
[FLAGS] [MESSAGE] [fragments] [tracked] [DSCP_FILTER] [TTL_FILTER] [log]
```

commands use a subset of the listed fields. Available parameters depend on specified protocol. Use CLI syntax assistance to view options for specific protocols when creating a deny rule.

**Parameters**

- **SEQ_NUM**  Sequence number assigned to the rule. Options include:
  - `<no parameter>`  Number is derived by adding 10 to the number of the ACL’s last rule.
  - `<1 – 4294967295>`  Number assigned to entry.
- **PROTOCOL**  protocol field filter. Values include:
  - `ah` Authentication Header Protocol (51).
  - `icmp`  Internet Control Message Protocol (1).
  - `igmp`  Internet Group Management Protocol (2).
  - `ip`  Internet Protocol v4 (4).
  - `ospf`  Open Shortest Path First (89).
  - `pim`  Protocol Independent Multicast (103).
  - `tcp`  Transmission Control Protocol (6).
  - `udp`  user datagram protocol (17).
  - `vrrp`  Virtual Router Reduncancy Protocol (112).
  - `protocol_num`  integer corresponding to an IP protocol. Values range from 0 to 255.
- **SOURCE_ADDR and DEST_ADDR**  source and destination address filters. Options include:
  - `network_addr`  subnet address (CIDR or address-mask).
  - `any`  Packets from all addresses are filtered.
  - `host ip_addr`  IP address (dotted decimal notation).
    Subnet addresses support discontiguous masks.
- **SOURCE_PORT and DEST_PORT**  source and destination port filters. Options include:
- **any** all ports
- **eq port-1 port-2 ... port-n** A list of ports. Maximum list size is 10 ports.
- **neq port-1 port-2 ... port-n** The set of all ports not listed. Maximum list size is 10 ports.
- **gt port** The set of ports with larger numbers than the listed port.
- **lt port** The set of ports with smaller numbers than the listed port.
- **range port_1 port_2** The set of ports whose numbers are between the range.
- **fragments** filters packets with FO bit set (indicates a non-initial fragment packet).
- **FLAGS** flag bit filters (TCP packets). Use CLI syntax assistance (?) to display options.
- **MESSAGE** message type filters (ICMP packets). Use CLI syntax assistance (?) to display options.
- **tracked** rule filters packets in existing ICMP, UDP, or TCP connections.
  - Valid in ACLs applied to the control plane.
  - Validity in ACLs applied to data plane varies by switch platform.
- **DSCP_FILTER** rule filters packet by its DSCP value. Values include:
  - **<no parameter>** Rule does not use DSCP to filter packets.
  - **dscp** dscp_value Packets match if DSCP field in packet is equal to dscp_value.
- **TTL_FILTER** rule filters packet by its TTL (time-to-live) value. Values include:
  - **ttl eq ttl_value** Packets match if ttl in packet is equal to ttl_value.
  - **ttl gt ttl_value** Packets match if ttl in packet is greater than ttl_value.
  - **ttl lt ttl_value** Packets match if ttl in packet is less than ttl_value.
  - **ttl neq ttl_value** Packets match if ttl in packet is not equal to ttl_value.
  - Valid in ACLs applied to the control plane.
  - Validity in ACLs applied to data plane varies by switch platform.
- **log** triggers an informational log message to the console about the matching packet.
  - Valid in ACLs applied to the control plane.
  - Validity in ACLs applied to data plane varies by switch platform.

**Examples**

- This command appends a **deny** statement at the end of the ACL. The **deny** statement drops OSPF packets from 10.10.1.1/24 to any host.
  
  ```
  switch(config)#ip access-list text
  switch(config-acl-text1)#deny ospf 10.1.1.0/24 any
  switch(config-acl-text1)#
  ```

- This command inserts a **deny** statement with the sequence number 65. The **deny** statement drops all PIM packets.
  
  ```
  switch(config-acl-text1)#65 deny pim any any
  switch(config-acl-text1)#
  ```
deny (IPv6 ACL)

The **deny** command adds a deny rule to the configuration mode IPv6 access control list (ACL). Packets filtered by a **deny** rule are dropped by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding 10 to the number of the ACL’s last rule.

The **no deny** and **default deny** commands remove the specified rule from the configuration mode ACL. The **no <sequence number> (ACLs)** command also removes the specified rule from the ACL.

**Command Mode**

IPv6-ACL Configuration

**Command Syntax**

```plaintext
[SEQ_NUM] deny PROT SRC_ADDR [SRC_PT] DEST_ADDR [DEST_PT] [FLAG] [MSG] [HOP] [tracked] [DSCP_FILTER] [log]

no deny PROT SRC_ADDR [SRC_PT] DEST_ADDR [DEST_PT] [FLAG] [MSG] [HOP] [tracked] [DSCP_FILTER] [log]

default deny PROT SRC_ADDR [SRC_PT] DEST_ADDR [DEST_PT] [FLAG] [MSG] [HOP] [tracked] [DSCP_FILTER] [log]
```

Commands use a subset of the listed fields. Available parameters depend on specified protocol. Use CLI syntax assistance to view options for specific protocols when creating a deny rule.

**Parameters**

- **SEQ_NUM**  
  Sequence number assigned to the rule. Options include:
  - `<no parameter>`  
    Number is derived by adding 10 to the number of the ACL’s last rule.
  - `<1 – 4294967295>`  
    Number assigned to entry.

- **PROT**  
  Protocol field filter. Values include:
  - `icmpv6`  
    Internet Control Message Protocol for version 6 (58).
  - `ipv6`  
    Internet Protocol – IPv6 (41).
  - `ospf`  
    Open Shortest Path First (89).
  - `tcp`  
    Transmission Control Protocol (6).
  - `udp`  
    User Datagram Protocol (17).
  - `protocol_num`  
    Integer corresponding to an IP protocol. Values range from 0 to 255.

- **SRC_ADDR** and **DEST_ADDR**  
  Source and destination address filters. Options include:
  - `ipv6_prefix`  
    IPv6 address with prefix length (CIDR notation).
  - `any`  
    Packets from all addresses are filtered.
  - `host ipv6_addr`  
    IPv6 host address.

- **SRC_PT** and **DEST_PT**  
  Source and destination port filters. Options include:
  - `any`  
    All ports.
  - `eq port-1 port-2 ... port-n`  
    A list of ports. Maximum list size is 10 ports.
  - `neq port-1 port-2 ... port-n`  
    The set of all ports not listed. Maximum list size is 10 ports.
  - `gt port`  
    The set of ports with larger numbers than the listed port.
  - `lt port`  
    The set of ports with smaller numbers than the listed port.
  - `range port_1 port_2`  
    The set of ports whose numbers are between the range.
- **HOP** filters by packet's hop-limit value. Options include:
  - *(no parameter)* Rule does not use hop limit to filter packets.
  - **hop-limit eq hop_value** Packets match if **hop-limit** value in packet equals **hop_value**.
  - **hop-limit gt hop_value** Packets match if **hop-limit** in packet is greater than **hop_value**.
  - **hop-limit lt hop_value** Packets match if **hop-limit** in packet is less than **hop_value**.
  - **hop-limit neq hop_value** Packets match if **hop-limit** in packet is not equal to **hop_value**.

- **FLAG** flag bit filters (TCP packets). Use CLI syntax assistance (?) to display options.

- **MSG** message type filters (ICMPv6 packets). Use CLI syntax assistance (?) to display options.

- tracked rule filters packets in existing ICMP, UDP, or TCP connections.
  - Valid in ACLs applied to the control plane.
  - Validity in ACLs applied to data plane varies by switch platform.

- **DSCP_FILTER** rule filters packet by its DSCP value. Values include:
  - *(no parameter)* Rule does not use DSCP to filter packets.
  - **dscp dscp_value** Packets match if DSCP field in packet is equal to **dscp_value**.
  - **log** triggers an informational log message to the console about the matching packet.
    - Valid in ACLs applied to the control plane.
    - Validity in ACLs applied to data plane varies by switch platform.

**Example**
- This command appends a **deny** statement at the end of the ACL. The **deny** statement drops IPv6 packets from 3710:249a:c643:ef11::/64 to any host.

  ```
  switch(config)#ipv6 access-list text1
  switch(config-acl-text1)#deny ipv6 3710:249a:c643:ef11::/64 any
  switch(config-acl-text1)#
  ```
deny (IPv6 Prefix List)

The **deny** command adds a rule to the configuration mode IPv6 prefix list. Route map match commands use prefix lists to filter routes for redistribution into OSPF, RIP, or BGP domains. Routes are denied access when they match the prefix that a **deny** statement specifies.

The **no deny** and **default deny** commands remove the specified rule from the configuration mode prefix list. The **no seq** (IPv6 Prefix Lists) command also removes the specified rule from the prefix list.

**Command Mode**
IPv6-pfx Configuration

**Command Syntax**

```
[SEQUENCE] deny ipv6_prefix [MASK]
```

**Parameters**

- **SEQUENCE**  
  Sequence number assigned to the rule. Options include:
  - `<no parameter>`  
    Number is derived by adding 10 to the number of the list’s last rule.
  - **seq** `seq_num`  
    Number is specified by `seq_num`. Value ranges from 0 to 65535.
  - **ipv6_prefix**  
    IPv6 prefix upon which command filters routes (CIDR notation).
  - **MASK**  
    Range of the prefix to be matched.
    - `<no parameter>`  
      Exact match with the subnet mask is required.
    - **eq** `mask_e`  
      Prefix length is equal to `mask_e`.
    - **ge** `mask_g`  
      Range is from `mask_g` to 128.
    - **le** `mask_l`  
      Range is from `subnet` mask length to `mask_l`.
    - **ge** `mask_l`  
      `ge` `mask_l`  
      Range is from `mask_g` to `mask_l`.
    - `mask_e`, `mask_l` and `mask_g` range from 1 to 128.

  When `le` and `ge` are specified, `subnet` mask > `mask_g` > `mask_l`

**Example**

- This command appends a **deny** statement at the end of the text1 prefix list. The **deny** statement denies redistribution of routes with the specified prefix.

  ```
  switch(config)#ipv6 prefix-list route-five
  switch(config-ipv6-pfx)#deny 3100::/64
  switch(config-ipv6-pfx)#
  ```
deny (MAC ACL)

The `deny` command adds a deny rule to the configuration mode MAC access control list (ACL). Packets filtered by a deny rule are dropped by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding 10 to the number of the ACL’s last rule.

The `no deny` and `default deny` commands remove the specified rule from the configuration mode ACL. The `no <sequence number> (ACLs)` command also removes the specified rule from the ACL.

Command Mode
MAC-ACL Configuration

Command Syntax

```
[SEQ_NUM] deny SOURCE_ADDR DEST_ADDR [PROTOCOL] [log]
no deny SOURCE_ADDR DEST_ADDR [PROTOCOL] [log]
default deny SOURCE_ADDR DEST_ADDR [PROTOCOL] [log]
```

Parameters
- `SEQ_NUM`  Sequence number assigned to the rule. Options include:
  - <no parameter>  Number is derived by adding 10 to the number of the ACL’s last rule.
  - `<1 – 4294967295>`  Number assigned to entry.
- `SOURCE_ADDR` and `DEST_ADDR`  source and destination address filters. Options include:
  - `mac_address mac_mask`  MAC address and mask
  - `any`  Packets from all addresses are filtered.

  - `mac_address` specifies a MAC address in 3x4 dotted hexadecimal notation (hhhh.hhhh.hhhh)
  - `mac_mask` specifies a MAC address mask in 3x4 dotted hexadecimal notation (hhhh.hhhh.hhhh)

- `PROTOCOL`  protocol field filter. Values include:
  - `aarp`  Appletalk Address Resolution Protocol (0x80f3)
  - `appletalk`  Appletalk (0x809b)
  - `arp`  Address Resolution Protocol (0x806)
  - `ip`  Internet Protocol Version 4 (0x800)
  - `ipx`  Internet Packet Exchange (0x8137)
  - `lldp`  LLDP (0x88cc)
  - `novell`  Novell (0x8138)
  - `rarp`  Reverse Address Resolution Protocol (0x8035)
  - `protocol_num`  integer corresponding to a MAC protocol. Values range from 0 to 65535
- `log`  triggers an informational log message to the console about the matching packet.
Examples

- This command appends a permit statement at the end of the ACL. The deny statement drops all aarp packets from 10.1000.0000 through 10.1000.FFFF to any host.

  switch(config)#mac access-list text1
deny 10.1000.0000 0.0.FFFF any aarp

- This command inserts a permit statement with the sequence number 25. The deny statement drops all packets through the interface.

  switch(config-mac-acl-text1)#25 deny any any
deny (Standard IPv4 ACL)

The **deny** command adds a deny rule to the configuration mode standard IPv4 access control list (ACL). Standard ACL rules filter on the source field.

Packets filtered by a **deny** rule are dropped by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding 10 to the number of the ACL’s last rule.

The **no deny** and **default deny** commands remove the specified rule from the configuration mode ACL. The **no <sequence number> (ACLs)** command also removes the specified rule from the ACL.

**Command Mode**

Std-ACL Configuration

**Command Syntax**

```
[SEQ_NUM] deny SOURCE_ADDR [log]
no deny SOURCE_ADDR [log]
default deny SOURCE_ADDR [log]
```

**Parameters**

- **SEQ_NUM**  Sequence number assigned to the rule. Options include:
  - `<no parameter>`  Number is derived by adding 10 to the number of the ACL’s last rule.
  - `<1 – 4294967295>`  Number assigned to entry.
- **SOURCE_ADDR**  source address filter. Options include:
  - **network_addr**  subnet address (CIDR or address-mask).
  - **any**  packets from all addresses are filtered.
  - **host ip_addr**  IP address (dotted decimal notation).
    Subnet addresses support discontiguous masks.
- **log**  triggers an informational log message to the console about the matching packet.
  - Valid in ACLs applied to the control plane.
  - Validity in ACLs applied to data plane varies by switch platform.

**Example**

- This command appends a **deny** statement at the end of the ACL. The **deny** statement drops packets from 10.10.1.1/24.

  ```
  switch(config)#ip access-list standard text1
  switch(config-std-acl-text1)#deny 10.1.1.1/24
  switch(config-std-acl-text1)#
  ```
deny (Standard IPv6 ACL)

The **deny** command adds a deny rule to the configuration mode standard IPv6 access control list (ACL). Standard ACL rules filter on the source field.

Packets filtered by a **deny** rule are dropped by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding 10 to the number of the ACL’s last rule.

The **no deny** and **default deny** commands remove the specified rule from the configuration mode ACL. The **no <sequence number> (ACLs)** command also removes the specified rule from the ACL.

**Command Mode**

Std-IPv6-ACL Configuration

**Command Syntax**

```
[SEQ_NUM] deny SOURCE_ADDR
no deny SOURCE_ADDR
default deny SOURCE_ADDR
```

**Parameters**

- **SEQ_NUM**  Sequence number assigned to the rule. Options include:
  - **<no parameter>**  Number is derived by adding 10 to the number of the ACL’s last rule.
  - **<1 – 4294967295>**  Number assigned to entry.

- **SOURCE_ADDR**  source address filter. Options include:
  - **ipv6_prefix**  IPv6 address with prefix length (CIDR notation).
  - **any**  Packets from all addresses are filtered.
  - **host ipv6_addr**  IPv6 host address.

**Example**

- This command appends a **deny** statement at the end of the ACL. The **deny** statement drops packets from 2103::/64.

```
switch(config)#ipv6 access-list standard text1
switch(config-std-acl-ipv6-text1)#deny 2103::/64
```
**description (route map)**

The `description` command adds a text string to the configuration mode route map. The string has no functional impact on the route map.

The `no description` and `default description` commands remove the text string from the configuration mode route map by deleting the corresponding `description` command from `running-config`.

**Command Mode**
- Route-Map Configuration

**Command Syntax**
```
description label_text
no description
default description
```

**Parameters**
- `label_text` character string assigned to the route map configuration.

**Related Commands**
- `route-map`

**Examples**
- These commands add description text to the XYZ-1 route map.
  ```
  switch(config)#route-map XYZ-1
  switch(config-route-map-XYZ-1)#description This is the first map.
  switch(config-route-map-XYZ-1)#exit
  switch(config)#show route-map XYZ-1
  route-map XYZ-1 permit 10
  Description:
  
  description This is the first map.
  Match clauses:
  Set clauses:
  switch(config)#
  ```
hardware access-list update default-result permit

The `hardware access-list update default-result permit` command configures the switch to permit all traffic on Ethernet and VLAN interfaces with ACLs applied to them while those ACLs are being modified. Traffic is permitted when the ACL is available for modification using one of the `ip access-list` commands, and ends when the ACL configuration mode is exited and rules are populated in hardware. This command is disabled by default.

The `no hardware access-list update default-result permit` and `default hardware access-list update default-result permit` commands restore the switch to its default state (blocking traffic during ACL modifications) by removing the corresponding `hardware access-list update default-result permit` command from the `running-config`.

Command Mode
Global Configuration

Command Syntax

```
 hardware access-list update default-result permit  
 no hardware access-list update default-result permit  
 default hardware access-list update default-result permit  
```

Restrictions

This command is available on the Arista 7050X, 7060X, 7150, 7250X, 7280, 7280R, 7300X, 7320X, and 7500 series switches.

This command does not support egress ACLs.

While this command is enabled, static NAT and ACL-based mirroring are affected during ACL updates.

Example

- This command configures a 7150 series switch to permit all traffic on Ethernet and VLAN interfaces with ACLs applied to them while those ACLs are being modified.

```
 switch(config)#hardware access-list update default-result permit  
 switch(config)#
```
hardware counter feature acl out

The `hardware counter feature acl out` command enables egress ACL hardware counters for IPv4 or IPv6, which count the number of packets hitting rules associated with egress ACLs applied to various interfaces on a switch.

The `no hardware counter feature acl out` and `default hardware counter feature acl out` commands disable or return the egress ACL hardware counters to the default state.

**Command Mode**

Global Configuration

**Command Syntax**

```
hardware counter feature acl out [OPTIONS]
no hardware counter feature acl out [OPTIONS]
default hardware counter feature acl out [OPTIONS]
```

**Parameters**

- `OPTIONS` ACL hardware counter options include:
  - `ipv4` address family IPv4.
  - `ipv6` address family IPv6.

**Example**

- This command enables IPv4 egress ACL hardware counters.
  ```
  switch(config)#hardware counter feature acl out ipv4
  switch(config)#
  ```
- This command disables IPv4 egress ACL hardware counters.
  ```
  switch(config)#no hardware counter feature acl out ipv4
  switch(config)#
  ```
ip access-group

The `ip access-group` command applies an IPv4 or standard IPv4 access control list (ACL) to the configuration mode interface or subinterface.

The `no ip access-group` and `default ip access-group` commands remove the corresponding `ip access-group` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `ip access-group list_name DIRECTION`
- `no ip access-group list_name DIRECTION`
- `default ip access-group list_name DIRECTION`

**Parameters**
- `list_name` name of ACL assigned to interface.
- `DIRECTION` transmission direction of packets, relative to interface. Valid options include:
  - `in` inbound packets.
  - `out` outbound packets.

**Restrictions**
Filtering of outbound packets by ACLs is not supported on Petra platform switches.
Filtering of outbound packets by ACLs on FM6000 switches is supported only on physical interfaces (Ethernet and port channels).

ACLs on sub-interfaces are supported on DCS-7280E, DCS-7500E, DCS-7280R, and DCS-7500R.

**Example**
- These commands apply the IPv4 ACL named `test2` to Ethernet interface 3.

```
switch(config)#interface ethernet 3
switch(config-if-Et3)#ip access-group test2 in
switch(config-if-Et3)#
```
Chapter 24: ACLs and Route Maps

ip access-group (Service ACLs)

The ip access-group (Service ACLs) command configures a Service ACL to be applied by a control-plane service. The service is specified by the command mode in which the Service ACL is applied.

The no ip access-group (Service ACLs) and default ip access-group (Service ACLs) commands remove the corresponding ip access-group (Service ACLs) command from running-config.

Command Mode

- Mgmt-SSH Configuration
- Mgmt-API Configuration
- Router-BGP Configuration
- Router-OSPF Configuration
- Router-IGMP Configuration
- MPLS-LDP Configuration
- Queue-Monitor-Streaming Configuration
- MPLS-Ping Configuration
- Mgmt-Telnet Configuration

Command Syntax

```
ip access-group acl_name [vrf vrf_name] [in]
no ip access-group [acl_name] [vrf vrf_name] [in]
default ip access-group acl_name [vrf vrf_name] [in]
```

Parameters

Parameters vary by process.

- **acl_name** name of the Service ACL assigned to control-plane service.
- **vrf vrf_name** specifies the VRF in which the Service ACL is to be applied.
- **in** specifies inbound connections or packets only (keyword required for SSH and Telnet services).

Example

- These commands apply the Service ACL bgpacl to the BGP routing protocol in VRF purple.

```
(config)# router bgp 5
(config-router-bgp)# vrf purple
(config-router-bgp-vrf-purple)# ip access-group bgpacl
```

For additional configuration examples, see Section 24.3.2: Configuring Service ACLs and Displaying Status and Counters.
**ip access-list**

The *ip access-list* command places the switch in ACL configuration mode, which is a group change mode that modifies an IPv4 access control list. The command specifies the name of the IPv4 ACL that subsequent commands modify and creates an ACL if it references a nonexistent list. All changes in a group change mode edit session are pending until the end of the session.

The *exit* command saves pending ACL changes to *running-config*, then returns the switch to global configuration mode. ACL changes are also saved by entering a different configuration mode.

The *abort* command discards pending ACL changes, returning the switch to global configuration mode.

The *no ip access-list* and *default ip access-list* commands delete the specified IPv4 ACL.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip access-list list_name
no ip access-list list_name
default ip access-list list_name
```

**Parameters**

- **list_name** Name of ACL.
  
  Must begin with an alphabetic character. Cannot contain spaces or quotation marks.

**Commands Available in ACL configuration mode:**

- deny (IPv4 ACL)
- no <sequence number> (ACLs)
- permit (IPv4 ACL)
- remark
- resequence (ACLs)
- show (ACL configuration modes)

**Related Commands**

- *ip access-list standard* enters std-acl configuration mode for editing standard IP ACLs.
- *show ip access-lists* displays IP and standard ACLs.

**Examples**

- This command places the switch in ACL configuration mode to modify the *filter1* IPv4 ACL.
  ```
  switch(config)#ip access-list filter1
  switch(config-acl-filter1)#
  ```

- This command saves changes to *filter1* ACL, then returns the switch to global configuration mode.
  ```
  switch(config-acl-filter1)#exit
  switch(config)#
  ```

- This command discards changes to *filter1*, then returns the switch to global configuration mode.
  ```
  switch(config-acl-filter1)#abort
  switch(config)#
  ```
ip access-list standard

The `ip access-list standard` command places the switch in std-ACL configuration mode, which is a group change mode that modifies a standard IPv4 access control list. The command specifies the name of the standard IPv4 ACL that subsequent commands modify, and creates an ACL if it references a nonexistent list. All group change mode edit session changes are pending until the session ends.

The `exit` command saves pending ACL changes to `running-config`, then returns the switch to global configuration mode. Pending changes are also saved by entering a different configuration mode.

The `abort` command discards pending ACL changes, returning the switch to global configuration mode.

The `no ip access-list standard` and `default ip access-list standard` commands delete the specified ACL.

Command Mode

- Global Configuration

Command Syntax

- `ip access-list standard list_name`
- `no ip access-list standard list_name`
- `default ip access-list standard list_name`

Parameters

- `list_name` Name of standard ACL.
  Must begin with an alphabetic character. Cannot contain spaces or quotation marks.

Commands Available in std-ACL configuration mode:

- `deny` (Standard IPv4 ACL)
- `no <sequence number> (ACLs)`
- `permit` (Standard IPv4 ACL)
- `remark`
- `resequence (ACLs)`
- `show (ACL configuration modes)`

Related Commands

- `ip access-list` enters ACL configuration mode for editing IPv4 ACLs.
- `show ip access-lists` displays IPv4 and standard IPv4 ACLs.

Examples

- This command places the switch in std-ACL configuration mode to modify the `filter2` IPv4 ACL.
  ```
  switch(config)#ip access-list standard filter2
  switch(config-std-acl-filter2)#
  ```

- This command saves changes to `filter2` ACL, then returns the switch to global configuration mode.
  ```
  switch(config-std-acl-filter2)#exit
  switch(config)#
  ```

- This command discards changes to `filter2`, then returns the switch to global configuration mode.
  ```
  switch(config-std-acl-filter2)#abort
  switch(config)#
  ```
**ip prefix-list**

The **ip prefix-list** command creates a prefix list or adds an entry to an existing list. Route map match commands use prefix lists to filter routes for redistribution into OSPF, RIP, or BGP domains.

A prefix list comprises all prefix list entries with the same label. The sequence numbers of the rules in a prefix list specify the order that the rules are applied to a route that the **match** command is evaluating.

The **no ip prefix-list** and **default ip prefix-list** commands delete the specified prefix list entry by removing the corresponding **ip prefix-list** statement from **running-config**. If the **no** or **default ip prefix-list** command does not list a sequence number, the command deletes all entries of the prefix list.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip prefix-list list_name [SEQUENCE] FILTER_TYPE network_addr [MASK]
no ip prefix-list list_name [SEQUENCE]
default ip prefix-list list_name [SEQUENCE]
```

**Parameters**

- **list_name**  The label that identifies the prefix list.
- **SEQUENCE**  Sequence number of the prefix list entry. Options include:
  - <no parameter>  entry’s number is ten plus highest sequence number in current list.
  - **seq seq_num**   number assigned to entry. Value ranges from 0 to 65535.
- **FILTER_TYPE**  specifies route access when it matches IP prefix list. Options include:
  - **permit**  routes are permitted access when they match the specified subnet.
  - **deny**  routes are denied access when they match the specified subnet.
- **network_addr**  Subnet upon which command filters routes. Format is CIDR or address-mask.
- **MASK**  range of the prefix to be matched.
  - <no parameter>  exact match with the subnet mask is required.
  - **eq mask_e**  prefix length is equal to mask_e.
  - **ge mask_g**  range is from mask_g to 32.
  - **le mask_l**  range is from subnet mask length to mask_l.
  - **ge mask_l ge mask_g**  range is from mask_g to mask_l.
    mask_e, mask_l and mask_g range from 1 to 32.
    when le and ge are specified, subnet mask > mask_g > mask_l

**Example**

- This command places the switch in IPv4 prefix list configuration mode to create an IPv4 prefix list named **route-one**.
  
  ```
  switch(config)#ip prefix-list route-one
  switch(config-ip-pfx)#
  ```
These commands create four different rules for the prefix-list named *route-one*.

```bash
switch(config)#ip prefix-list route-one
switch(config-ip-pfx)#seq 10 deny 10.1.1.0/24
switch(config-ip-pfx)#seq 20 deny 10.1.0.0/16
switch(config-ip-pfx)#seq 30 permit 12.15.4.9/32
switch(config-ip-pfx)#seq 40 deny 1.1.1.0/24
```
ipv6 access-group

The `ipv6 access-group` command applies an IPv6 or standard IPv6 access control list (ACL) to the configuration mode interface.

The `no ipv6 access-group` and `default ipv6 access-group` commands remove the corresponding `ipv6 access-group` command from `running-config`.

Command Mode

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

Command Syntax

```
ipv6 access-group list_name DIRECTION
no ipv6 access-group list_name DIRECTION
default ipv6 access-group list_name DIRECTION
```

Parameters

- `list_name` name of ACL assigned to interface.
- `DIRECTION` transmission direction of packets, relative to interface. Valid options include:
  - `in` inbound packets.
  - `out` outbound packets.

Examples

- These commands assign the IPv6 ACL named `test2` to the Ethernet 3 interface.

```
switch(config)#interface ethernet 3
switch(config-if-Et3)#ipv6 access-group test2 in
switch(config-if-Et3)#
```
ipv6 access-group (Service ACLs)

The `ipv6 access-group (Service ACLs)` command configures an IPv6 or standard IPv6 Service ACL to be applied by a control-plane service. The service is specified by the command mode in which the Service ACL is applied.

The `no ipv6 access-group (Service ACLs)` and `default ipv6 access-group (Service ACLs)` commands remove the corresponding `ipv6 access-group (Service ACLs)` command from `running-config`.

Command Mode

- Mgmt-SSH Configuration
- Mgmt-API Configuration
- Router-BGP Configuration
- Router-OSPF Configuration
- MPLS-LDP Configuration
- Queue-Monitor-Streaming Configuration
- MPLS-Ping Configuration
- Mgmt-Telnet Configuration

Command Syntax

```
ipv6 access-group ipv6_acl_name [vrf vrf_name] [in]
nipv6 access-group [ipv6_acl_name] [vrf vrf_name] [in]
default ip access-group ipv6_acl_name [vrf vrf_name] [in]
```

Parameters

Parameters vary by process.

- `ipv6_acl_name` name of the IPv6 Service ACL assigned to control-plane service.
- `vrf vrf_name` specifies the VRF in which the Service ACL is to be applied.
- `in` specifies inbound connections or packets only (keyword required for SSH and Telnet services).

Example

- These commands apply the IPv6 Service ACL `bgpacl` to the BGP routing protocol in VRF `purple`.

```
(config)# router bgp 5
(config-router-bgp)# vrf purple
(config-router-bgp-vrf-purple)# ipv6 access-group bgpacl
```

For additional configuration examples, see Section 24.3.2: Configuring Service ACLs and Displaying Status and Counters.
ipv6 access-list

The `ipv6 access-list` command places the switch in IPv6-ACL configuration mode, which is a group change mode that modifies an IPv6 access control list. The command specifies the name of the IPv6 ACL that subsequent commands modify and creates an ACL if it references a nonexistent list. All changes in a group change mode edit session are pending until the end of the session.

The `exit` command saves pending ACL changes to `running-config`, then returns the switch to global configuration mode. ACL changes are also saved by entering a different configuration mode.

The `abort` command discards pending ACL changes, returning the switch to global configuration mode.

The `no ipv6 access-list` and `default ipv6 access-list` commands delete the specified IPv6 ACL.

Command Mode

Global Configuration

Command Syntax

```
ipv6 access-list list_name
no ipv6 access-list list_name
default ipv6 access-list list_name
```

Parameters

- `list_name` Name of ACL.
  Must begin with an alphabetic character. Cannot contain spaces or quotation marks.

Commands Available in IPv6-ACL configuration mode:

- `deny (IPv6 ACL)`
- `no <sequence number> (ACLs)`
- `permit (IPv6 ACL)`
- `remark`
- `resequence (ACLs)`
- `show (ACL configuration modes)`

Related Commands

- `ipv6 access-list standard` enters std-ipv6-acl configuration mode for editing standard IPv6 ACLs.
- `show ipv6 access-lists` displays IPv6 and standard IPv6 ACLs.

Examples

- This command places the switch in IPv6-ACL configuration mode to modify the `filter1` IPv6 ACL.
  ```
  switch(config)#ipv6 access-list filter1
  switch(config-ipv6-acl-filter1)#
  ```

- This command saves changes to `filter1` ACL, then returns the switch to global configuration mode.
  ```
  switch(config-ipv6-acl-filter1)#exit
  switch(config)#
  ```

- This command discards changes to `filter1`, then returns the switch to global configuration mode.
  ```
  switch(config-ipv6-acl-filter1)#abort
  switch(config)#
  ```
ipv6 access-list standard

The `ipv6 access-list standard` command places the switch in std-IPv6-ACL-configuration mode, which is a group change mode that modifies a standard IPv6 access control list. The command specifies the name of the standard IPv6 ACL that subsequent commands modify and creates an ACL if it references a nonexistent list. All group change mode edit session changes are pending until the session ends.

The `exit` command saves pending ACL changes to `running-config`, then returns the switch to global configuration mode. Pending changes are also saved by entering a different configuration mode.

The `abort` command discards pending ACL changes, returning the switch to global configuration mode.

The `no ipv6 access-list standard` and `default ipv6 access-list standard` commands delete the specified ACL.

**Command Mode**

Global Configuration

**Command Syntax**

- `ipv6 access-list standard list_name`
- `no ipv6 access-list standard list_name`
- `default ipv6 access-list standard list_name`

**Parameters**

- `list_name` Name of ACL.
  - Must begin with an alphabetic character. Cannot contain spaces or quotation marks.

**Commands Available in std-IPv6-ACL configuration mode:**

- `deny` (Standard IPv6 ACL)
- `no <sequence number>` (ACLs)
- `permit` (Standard IPv6 ACL)
- `remark`
- `resequence` (ACLs)
- `show` (ACL configuration modes)

**Related Commands**

- `ipv6 access-list` enters IPv6-ACL configuration mode for editing IPv6 ACLs.
- `show ipv6 access-lists` displays IPv6 and standard IPv6 ACLs.

**Examples**

- This command places the switch in Std-IPv6 ACL configuration mode to modify the `filter2` ACL.
  
  ```
  switch(config)#ipv6 access-list standard filter2
  switch(config-std-ipv6-acl-filter2)#
  ```

- This command saves changes to `filter2` ACL, then returns the switch to global configuration mode.
  
  ```
  switch(config-std-ipv6-acl-filter2)#exit
  switch(config)#
  ```

- This command discards changes to `filter2`, then returns the switch to global configuration mode.
  
  ```
  switch(config-std-ipv6-acl-filter2)#abort
  switch(config)#
  ```
ipv6 prefix-list

The \texttt{ip prefix-list} command places the switch in IPv6 prefix-list configuration mode, which is a group change mode that modifies an IPv6 prefix list. The command specifies the name of the IPv6 prefix list that subsequent commands modify and creates a prefix list if it references a nonexistent list. All changes in a group change mode edit session are pending until the end of the session.

The \texttt{exit} command saves pending prefix list changes to \textit{running-config}, then returns the switch to global configuration mode. ACL changes are also saved by entering a different configuration mode.

The \texttt{abort} command discards pending changes, returning the switch to global configuration mode.

The \texttt{no ipv6 prefix-list} and \texttt{default ipv6 prefix-list} commands delete the specified IPv6 prefix list.

\textbf{Command Mode}

\begin{itemize}
  \item Global Configuration
\end{itemize}

\textbf{Command Syntax}

\begin{verbatim}
ipv6 prefix-list list_name
no ipv6 prefix-list list_name
default ipv6 prefix-list list_name
\end{verbatim}

\textbf{Parameters}

\begin{itemize}
  \item \textit{list_name} Name of prefix list.
  \hspace{1cm} Must begin with an alphabetic character. Cannot contain spaces or quotation marks.
\end{itemize}

\textbf{Commands Available in IPv6-pfx configuration mode:}

\begin{itemize}
  \item \texttt{deny (IPv6 Prefix List)}
  \item \texttt{permit (IPv6 Prefix List)}
  \item \texttt{seq (IPv6 Prefix Lists)}
\end{itemize}

\textbf{Examples}

\begin{itemize}
  \item This command places the switch in IPv6 prefix-list configuration mode to modify the \texttt{route-five} prefix list.
    \begin{verbatim}
    switch(config)#ipv6 prefix-list route-five
    switch(config-ipv6-pfx)#
    \end{verbatim}
  \item This command saves changes to the prefix list, then returns the switch to global configuration mode.
    \begin{verbatim}
    switch(config-ipv6-pfx)#exit
    switch(config)#
    \end{verbatim}
  \item This command saves changes to the prefix list, then places the switch in interface-Ethernet mode.
    \begin{verbatim}
    switch(config-ipv6-pfx)#interface ethernet 3
    switch(config-if-Et3)#
    \end{verbatim}
  \item This command discards changes to the prefix list, then returns the switch to global configuration mode.
    \begin{verbatim}
    switch(config-ipv6-pfx)#abort
    switch(config)#
    \end{verbatim}
\end{itemize}
mac access-group

The `mac access-group` command applies a MAC access control list (MAC ACL) to the configuration mode interface.

The `no mac access-group` and `default mac access-group` commands remove the specified `mac access-group` command from `running-config`.

Command Mode
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

Command Syntax
```
mac access-group list_name DIRECTION
no mac access-group list_name DIRECTION
default mac access-group list_name DIRECTION
```

Parameters
- `list_name` name of MAC ACL.
- `DIRECTION` transmission direction of packets, relative to interface. Valid options include:
  - In inbound packets.
  - Out outbound packets.

Restrictions
Filtering of outbound packets by MAC ACLs is supported only on Helix, Trident, and Trident-II platform switches.

Example
- These commands assign the MAC ACL named `mtest2` to the Ethernet 3 interface to filter inbound packets.

```
switch(config)#interface ethernet 3
switch(config-if-Et3)#mac access-group mtest2 in
switch(config-if-Et3)#
```
**mac access-list**

The `mac access-list` command places the switch in MAC-ACL configuration mode, which is a group change mode that modifies a MAC access control list. The command specifies the name of the MAC ACL that subsequent commands modify and creates an ACL if it references a nonexistent list. All changes in a group change mode edit session are pending until the end of the session.

The `exit` command saves pending ACL changes to `running-config`, then returns the switch to global configuration mode. ACL changes are also saved by entering a different configuration mode.

The `abort` command discards pending ACL changes, returning the switch to global configuration mode.

The `no mac access-list` and `default mac access-list` commands delete the specified list.

**Command Mode**

Global Configuration

**Command Syntax**

```plaintext
mac access-list list_name
no mac access-list list_name
default mac access-list list_name
```

**Parameters**

- `list_name` Name of MAC ACL. Names must begin with an alphabetic character and cannot contain a space or quotation mark.

**Commands Available in MAC-ACL configuration mode:**

- `deny` (MAC ACL)
- `no <sequence number>` (ACLs)
- `permit` (MAC ACL)
- `remark`
- `resequence` (ACLs)
- `show` (ACL configuration modes)

**Examples**

- This command places the switch in MAC-ACL configuration mode to modify the `mfilter1` MAC ACL.
  ```plaintext
  switch(config)#mac access-list mfilter1
  switch(config-mac-acl-mfilter1)#
  ```
- This command saves changes to `mfilter1` ACL, then returns the switch to global configuration mode.
  ```plaintext
  switch(config-mac-acl-mfilter1)#exit
  switch(config)#
  ```
- This command saves changes to `mfilter1` ACL, then places the switch in interface-Ethernet mode.
  ```plaintext
  switch(config-mac-acl-mfilter1)#interface ethernet 3
  switch(config-if-Et3)#
  ```
- This command discards changes to `mfilter1`, then returns the switch to global configuration mode.
  ```plaintext
  switch(config-mac-acl-mfilter1)#abort
  switch(config)#
  ```
match (route-map)

The **match** command creates a route map statement entry that specifies one route filtering command. When a statement contains multiple match commands, the permit or deny filter applies to a route only if its properties are equal to corresponding parameters in each **match** command. When a route’s properties do not equal the command parameters, the route is evaluated against the next statement in the route map, as determined by sequence number. If all statements fail to permit or deny the route, the route is denied.

The **no match** and **default match** commands remove the **match** command from the configuration mode route map statement by deleting the corresponding command from **running-config**.

**Note**
The route map configuration supports only standard ACL.

**Command Mode**
Route-Map Configuration

**Command Syntax**
```
match CONDITION
no match CONDITION
default match CONDITION
```

**Parameters**
- **CONDITION** specifies criteria for evaluating a route. Options include:
  - as <1 to 4294967295> BGP Autonomous System number.
  - as-path **path_name** BGP Autonomous System path access list.
  - community **NAME** BGP community. Options for **NAME** include:
    - **listname** BGP community.
    - **listname exact-match** BGP community; list must match set that is present.
  - extcommunity **listname** BGP extended community. Options for **NAME** include:
    - **listname** BGP community.
    - **listname exact-match** BGP community; list must match set that is present.
  - interface **INTF_NAME** Specifies an interface. Options for **INTF_NAME** include:
    - ethernet **e_num** Ethernet interface.
    - loopback **l_num** Loopback interface.
    - port-channel **p_num** Port channel interface.
    - vlan **v_num** VLAN interface.
  - ip address **LIST** IPv4 address filtered by an ACL or prefix list. **LIST** options include:
    - access-list **acl_name** IPv4 address filtered by access control list (ACL).
    - prefix-list **plv4_name** IPv4 address filtered by IP prefix list.
  - ip next-hop prefix-list **plv4_name** IPv4 next-hop filtered by IP prefix list.
  - ip resolved-next-hop prefix-list **plv4_name** IPv4 resolved nexthop filtered by IP prefix list.
  - ipv6 address prefix-list **plv6_name** IPv6 address filtered by IPv6 prefix list.
  - ipv6 next-hop prefix-list **plv6_name** IPv6 next-hop filtered by IPv6 prefix list.
  - ipv6 resolved-next-hop prefix-list **plv6_name** IPv6 resolved nexthop filtered by IPv6 prefix list.
• **local-preference <1 to 4294967295>**  BGP local preference metric.
• **metric <1 to 4294967295>**  route metric.
• **metric-type OSPF_TYPE**  OSPF metric type. Options include:
  • **type-1**  OSPF type 1 metric.
  • **type-2**  OSPF type 2 metric.
• **source-protocol protocol_type**  Routing protocol of route’s source. Options include:
  • bgp
  • connected
  • ospf
  • rip
  • static
• **tag <1 to 4294967295>**  route tag.

Related Commands
• **route-map**

Example
• This command creates a route map match rule that filters routes from BGP AS 15.
  
  switch(config)#route-map map1
  switch(config-route-map-map1)#match as 15
  switch(config-route-map-map1)#
no <sequence number> (ACLs)

The `no <sequence number>` command removes the rule with the specified sequence number from the ACL. The `default <sequence number>` command also removes the specified rule.

**Command Mode**
- ACL Configuration
- IPv6-ACL Configuration
- Std-ACL Configuration
- Std-IPv6-ACL Configuration
- MAC-ACL Configuration

**Command Syntax**

```plaintext
no line_num
default line_num
```

**Parameters**
- `line_num` sequence number of rule to be deleted. Values range from 1 to 4294967295.

**Example**
- This command removes statement 30 from the list
  ```plaintext
  switch(config-acl-test1)#show
  IP Access List test1
    10 permit ip 10.10.10.0/24 any
    20 permit ip any host 10.20.10.1
    30 deny ip host 10.10.10.1 host 10.20.10.1
    40 permit ip any any
    50 remark end of list
  switch(config-acl-test1)#no 30
  switch(config-acl-test1)#show
  IP Access List test1
    10 permit ip 10.10.10.0/24 any
    20 permit ip any host 10.20.10.1
    40 permit ip any any
    50 remark end of list
  ```
permit (IPv4 ACL)

The `permit` command adds a permit rule to the configuration mode IPv4 access control list (ACL). Packets filtered by a permit rule are accepted by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding 10 to the number of the ACL’s last rule.

The `no permit` and `default permit` commands remove the specified rule from the configuration mode ACL. The `no <sequence number> (ACLs)` command also removes a specified rule from the ACL.

**Command Mode**

ACL Configuration

**Command Syntax**

```
[SEQ_NUM] permit PROTOCOL SOURCE_ADDR [SOURCE_PORT] DEST_ADDR [DEST_PORT] [FLAGS] [MESSAGE] [fragments] [tracked] [DSCP_FILTER] [TTL_FILTER] [log]
```

```
no permit PROTOCOL SOURCE_ADDR [SOURCE_PORT] DEST_ADDR [DEST_PORT] [FLAGS] [MESSAGE] [fragments] [tracked] [DSCP_FILTER] [TTL_FILTER] [log]
```

```
default permit PROTOCOL SOURCE_ADDR [SOURCE_PORT] DEST_ADDR [DEST_PORT] [FLAGS] [MESSAGE] [fragments] [tracked] [DSCP_FILTER] [TTL_FILTER] [log]
```

Commands use a subset of the listed fields. Available parameters depend on specified protocol. Use CLI syntax assistance to view options for specific protocols when creating a permit rule.

**Parameters**

- **SEQ_NUM** Sequence number assigned to the rule. Options include:
  - `<no parameter>` Number is derived by adding 10 to the number of the ACL’s last rule.
  - `<1 – 4294967295>` Number assigned to entry.
- **PROTOCOL** protocol field filter. Values include:
  - `ahp` Authentication Header Protocol (51).
  - `icmp` Internet Control Message Protocol (1).
  - `igmp` Internet Group Management Protocol (2).
  - `ip` Internet Protocol v4 (4).
  - `ospf` Open Shortest Path First (89).
  - `pim` Protocol Independent Multicast (103).
  - `tcp` Transmission Control Protocol (6).
  - `udp` user datagram protocol (17).
  - `vrrp` Virtual Router Redundancy Protocol (112).
  - `protocol_num` integer corresponding to an IP protocol. Values range from 0 to 255.
- **SOURCE_ADDR and DEST_ADDR** source and destination address filters. Options include:
  - `network_addr` subnet address (CIDR or address-mask).
  - `any` Packets from all addresses are filtered.
  - `host ip_addr` IP address (dotted decimal notation).
  
  Source and destination subnet addresses support discontiguous masks.
- **SOURCE_PORT and DEST_PORT** source and destination port filters. Options include:
• any all ports
• eq port-1 port-2 ... port-n A list of ports. Maximum list size is 10 ports.
• neq port-1 port-2 ... port-n The set of all ports not listed. Maximum list size is 10 ports.
• gt port The set of ports with larger numbers than the listed port.
• lt port The set of ports with smaller numbers than the listed port.
• range port_1 port_2 The set of ports whose numbers are between the range.
• fragments filters packets with FO bit set (indicates a non-initial fragment packet).
• FLAGS flag bit filters (TCP packets). Use CLI syntax assistance (?) to display options.
• MESSAGE message type filters (ICMP packets). Use CLI syntax assistance (?) to display options.
• tracked rule filters packets in existing ICMP, UDP, or TCP connections.
  • Valid in ACLs applied to the control plane.
  • Validity in ACLs applied to data plane varies by switch platform.
• DSCP_FILTER rule filters packet by its DSCP value. Values include:
  • <no parameter> Rule does not use DSCP to filter packets.
  • dscp dscp_value Packets match if DSCP field in packet is equal to dscp_value.
• TTL_FILTER rule filters packet by its TTL (time-to-live) value. Values include:
  • ttl eq ttl_value Packets match if ttl in packet is equal to ttl_value.
  • ttl gt ttl_value Packets match if ttl in packet is greater than ttl_value.
  • ttl lt ttl_value Packets match if ttl in packet is less than ttl_value.
  • ttl neq ttl_value Packets match if ttl in packet is not equal to ttl_value.
  • Valid in ACLs applied to the control plane.
  • Validity in ACLs applied to data plane varies by switch platform.
• log triggers an informational log message to the console about the matching packet.
  • Valid in ACLs applied to the control plane.
  • Validity in ACLs applied to data plane varies by switch platform.

Examples
• This command appends a permit statement at the end of the ACL. The permit statement passes all OSPF packets from 10.10.1.1/24 to any host.
  switch(config)#ip access-list text1
  switch(config-acl-text1)#permit ospf 10.1.1.0/24 any
  switch(config-acl-text1)#

• This command inserts a permit statement with the sequence number 25. The permit statement passes all PIM packets through the interface.
  switch(config-acl-text1)#25 permit pim any any
  switch(config-acl-text1)#
permit (IPv6 ACL)

The **permit** command adds a permit rule to the configuration mode IPv6 access control list (ACL). Packets filtered by a permit rule are accepted by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding 10 to the number of the ACL’s last rule.

The **no permit** and **default permit** commands remove the specified rule from the configuration mode ACL. The **no <sequence number> (ACLs)** command also removes a specified rule from the ACL.

**Command Mode**

IPv6-ACL Configuration

**Command Syntax**

```
[SEQ_NUM] permit PROT SRC_ADDR [SRC_PT] DEST_ADDR [DEST_PT] [FLAG] [MSG] [HOP] [tracked] [DSCP_FILTER] [log]
```

```
no permit PROT SRC_ADDR [SRC_PT] DEST_ADDR [DEST_PT] [FLAG] [MSG] [HOP] [tracked] [DSCP_FILTER] [log]
```

```
default permit PROT SRC_ADDR [SRC_PT] DEST_ADDR [DEST_PT] [FLAG] [MSG] [HOP] [tracked] [DSCP_FILTER] [log]
```

Commands use a subset of the listed fields. Available parameters depend on specified protocol. Use CLI syntax assistance to view options for specific protocols when creating a permit rule.

**Parameters**

- **SEQ_NUM**  
  Sequence number assigned to the rule. Options include:
  - `<no parameter>`  
    Number is derived by adding 10 to the number of the ACL’s last rule.
  - `<1 – 4294967295>`  
    Number assigned to entry.
  - **PROT**  
    Protocol field filter. Values include:
    - `icmpv6`  
      Internet Control Message Protocol for v6 (58).
    - `ipv6`  
      Internet Protocol – IPv6 (41).
    - `ospf`  
      Open Shortest Path First (89).
    - `tcp`  
      Transmission Control Protocol (6).
    - `udp`  
      User Datagram Protocol (17).
    - `protocol_num`  
      Integer corresponding to an IP protocol. Values range from 0 to 255.
  - **SRC_ADDR** and **DEST_ADDR**  
    Source and destination address filters. Options include:
    - `ipv6_prefix`  
      IPv6 address with prefix length (CIDR notation).
    - `any`  
      Packets from all addresses are filtered.
    - `host ipv6_addr`  
      IPv6 host address.
  - **SRC_PT** and **DEST_PT**  
    Source and destination port filters. Options include:
    - `any`  
      All ports.
    - `eq port-1 port-2 ... port-n`  
      A list of ports. Maximum list size is 10 ports.
    - `neq port-1 port-2 ... port-n`  
      The set of all ports not listed. Maximum list size is 10 ports.
    - `gt port`  
      The set of ports with larger numbers than the listed port.
    - `lt port`  
      The set of ports with smaller numbers than the listed port.
    - `range port_1 port_2`  
      The set of ports whose numbers are between the range.
- **HOP** filters by packet’s hop-limit value. Options include:
  - `<no parameter>`  Rule does not use hop limit to filter packets.
  - **hop-limit eq hop_value**  Packets match if **hop-limit** value in packet equals **hop_value**.
  - **hop-limit gt hop_value**  Packets match if **hop-limit** in packet is greater than **hop_value**.
  - **hop-limit lt hop_value**  Packets match if **hop-limit** in packet is less than **hop_value**.
  - **hop-limit neq hop_value**  Packets match if **hop-limit** in packet is not equal to **hop_value**.
- **FLAG** flag bit filters (TCP packets). Use CLI syntax assistance (?) to display options.
- **MSG** message type filters (ICMPv6 packets). Use CLI syntax assistance (?) to display options.
- **tracked** rule filters packets in existing ICMP, UDP, or TCP connections.
  - Valid in ACLs applied to the control plane.
  - Validity in ACLs applied to data plane varies by switch platform.
- **DSCP_FILTER** rule filters packet by its DSCP value. Values include:
  - `<no parameter>`  Rule does not use DSCP to filter packets.
  - **dscp dscp_value**  Packets match if DSCP field in packet is equal to **dscp_value**.
  - **log**  triggers an informational log message to the console about the matching packet.
    - Valid in ACLs applied to the control plane.
    - Validity in ACLs applied to data plane varies by switch platform.

**Example**

- This command appends a **permit** statement at the end of the ACL. The **permit** statement passes all IPv6 packets with the source address 3710:249a:c643:ef11::/64 and with any destination address.

  ```
  switch(config)#ipv6 access-list text1
  switch(config-acl-text1)#permit ipv6 3710:249a:c643:ef11::/64 any
  switch(config-acl-text1)#
  ```
permit (IPv6 Prefix List)

The permit command adds a rule to the configuration mode IPv6 prefix list. Route map match commands use prefix lists to filter routes for redistribution into OSPF, RIP, or BGP domains. Routes are redistributed into the specified domain when they match the prefix that a permit statement specifies.

The no permit and default permit commands remove the specified rule from the configuration mode prefix list. The no seq (IPv6 Prefix Lists) command also removes the specified rule from the prefix list.

Command Mode
IPv6-pfx Configuration

Command Syntax

```
[SEQUENCE] deny ipv6_prefix [MASK]
```

Parameters
- **SEQUENCE** Sequence number assigned to the rule. Options include:
  - <no parameter> Number is derived by adding 10 to the number of the list's last rule.
  - seq seq_num Number is specified by seq_num. Value ranges from 0 to 65535.
  - ipv6_prefix IPv6 prefix upon which command filters routes (CIDR notation).
- **MASK** Range of the prefix to be matched.
  - <no parameter> exact match with the subnet mask is required.
  - eq mask_e prefix length is equal to mask_e.
  - ge mask_g range is from mask_g to 128.
  - le mask_l range is from subnet mask length to mask_l.
  - ge mask_l le mask_g range is from mask_g to mask_l.

When le and ge are specified, the prefix list size > mask_g>mask_l

Example
- This command appends a permit statement at the end of the text1 prefix list. The permit statement allows redistribution of routes with the specified prefix.

```
switch(config)#ipv6 prefix-list route-five
switch(config-ipv6-pfx)#permit 3100::/64
switch(config-ipv6-pfx)#
```
permits (MAC ACL)

The permit command adds a permit rule to the configuration mode MAC access control list packets through the interface to which the list is applied. Rule filters include protocol, source, and destination.

The no permit and default permit commands remove the specified rule from the configuration mode ACL. The no <sequence number> (ACLs) command also removes the specified rule from the ACL.

Command Mode
MAC-ACL Configuration

Command Syntax

```
[SEQ_NUM] permit SOURCE_ADDR DEST_ADDR [PROTOCOL] [log]
no permit SOURCE_ADDR DEST_ADDR [PROTOCOL] [log]
default permit SOURCE_ADDR DEST_ADDR [PROTOCOL] [log]
```

Parameters

- **SEQ_NUM**  Sequence number assigned to the rule. Options include:
  - `<no parameter>`  Number is derived by adding 10 to the number of the ACL's last rule.
  - `<1 – 4294967295>`  Number assigned to entry.
- **SOURCE_ADDR** and **DEST_ADDR**  Source and destination address filters. Options include:
  - `mac_address mac_mask`  MAC address and mask
  - `any`  Packets from all addresses are filtered.
    - `mac_address`  specifies a MAC address in 3x4 dotted hexadecimal notation (hhhh.hhhh.hhhh)
    - `mac_mask`  specifies a MAC address mask in 3x4 dotted hexadecimal notation (hhhh.hhhh.hhhh)
  - 0 bits require an exact match to filter
  - 1 bits filter on any value
- **PROTOCOL**  Protocol field filter. Values include:
  - `aarp`  AppleTalk Address Resolution Protocol (0x80f3)
  - `appletalk`  AppleTalk (0x809b)
  - `arp`  Address Resolution Protocol (0x806)
  - `ip`  Internet Protocol Version 4 (0x800)
  - `ipx`  Internet Packet Exchange (0x8137)
  - `lldp`  LLDP (0x88cc)
  - `novell`  Novell (0x8138)
  - `rarp`  Reverse Address Resolution Protocol (0x8035)
  - `protocol_num`  Integer corresponding to a MAC protocol. Values range from 0 to 65535
- **log**  Triggers an informational log message to the console about the matching packet.

Examples

- This command appends a permit statement at the end of the ACL. The permit statement passes all aarp packets from 10.1000.0000 through 10.1000.FFFF to any host.

  switch(config)#mac access-list text1
  switch(config-mac-acl-text1)#permit 10.1000.0000 0.0.FFFF any aarp
  switch(config-mac-acl-text1)#
This command inserts a `permit` statement with the sequence number 25. The `permit` statement passes all packets through the interface.

```plaintext
switch(config-mac-acl-text1)#25 permit any any
switch(config-mac-acl-text1)#
```
**permit (Standard IPv4 ACL)**

The `permit` command adds a permit rule to the configuration mode standard IPv4 access control list (ACL). Standard ACL rules filter on the source field.

Packets filtered by a permit rule are accepted by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding 10 to the number of the ACL’s last rule.

The `no permit` and `default permit` commands remove the specified rule from the configuration mode ACL. The `no <sequence number> (ACLs)` command also removes the specified rule from the ACL.

**Command Mode**

Std-ACL Configuration

**Command Syntax**

```plaintext
[SEQ_NUM] permit SOURCE_ADDR [log]
no permit SOURCE_ADDR [log]
default permit SOURCE_ADDR [log]
```

**Parameters**

- **SEQ_NUM**  
  Sequence number assigned to the rule. Options include:
  - `<no parameter>`  
    Number is derived by adding 10 to the number of the ACL’s last rule.
  - `<1 – 4294967295>`  
    Number assigned to entry.

- **SOURCE_ADDR**  
  Source address filter. Options include:
  - `network_addr`  
    Subnet address (CIDR or address-mask).
  - `any`  
    Packets from all addresses are filtered.
  - `host ip_addr`  
    IP address (dotted decimal notation).
  
    Subnet addresses support discontiguous masks.

- **log**  
  Triggers an informational log message to the console about the matching packet.
  - Valid in ACLs applied to the control plane.
  - Validity in ACLs applied to data plane varies by switch platform.

**Example**

- This command appends a `permit` statement at the end of the ACL. The `permit` statement passes all packets with a source address of 10.10.1.1/24.

```
switch(config)#ip access-list standard text1
switch(config-std-acl-text1)#permit 10.1.1.1/24
switch(config-std-acl-text1)#
```
permit (Standard IPv6 ACL)

The `permit` command adds a permit rule to the configuration mode standard IPv6 access control list. Standard ACL rules filter on the source field.

Packets filtered by a permit rule are accepted by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding 10 to the number of the ACL’s last rule.

The `no permit` and `default permit` commands remove the specified rule from the configuration mode ACL. The `no <sequence number> (ACLs)` command also removes the specified rule from the ACL.

**Command Mode**
- Std-IPv6-ACL Configuration

**Command Syntax**

```
[SEQ_NUM] permit SOURCE_ADDR
no permit SOURCE_ADDR
default permit SOURCE_ADDR
```

**Parameters**
- **SEQ_NUM** Sequence number assigned to the rule. Options include:
  - `<no parameter>` Number is derived by adding 10 to the number of the ACL’s last rule.
  - `{1 – 4294967295}` Number assigned to entry.
- **SOURCE_ADDR** source address filter. Options include:
  - `ipv6_prefix` IPv6 address with prefix length (CIDR notation).
  - `any` Packets from all addresses are filtered.
  - `host ipv6_addr` IPv6 host address.

**Example**
- This command appends a `permit` statement at the end of the ACL. The `permit` statement drops packets with a source address of 2103::/64.

```
switch(config)#ipv6 access-list standard text1
switch(config-std-acl-ipv6-text1)#permit 2103::/64
switch(config-std-acl-ipv6-text1)#
```
remark

The `remark` command adds a non-executable comment statement into the pending ACL. Remarks entered without a sequence number are appended to the end of the list. Remarks entered with a sequence number are inserted into the list as specified by the sequence number.

The `default remark` command removes the comment statement from the ACL.

The `no remark` command removes the comment statement from the ACL. The command can specify the remark by content or by sequence number.

**Command Mode**

- ACL Configuration
- IPv6-ACL Configuration
- Std-ACL Configuration
- Std-IPv6-ACL Configuration
- MAC-ACL Configuration

**Command Syntax**

```
remark text
line_num remark [text]
no remark text
default remark text
```

**Parameters**

- `text` the comment text.
- `line_num` sequence number assigned to the remark statement. Value ranges from 1 to 4294967295

**Example**

- This command appends a comment to the list.

  ```
  switch(config-acl-test1)#remark end of list
  switch(config-acl-test1)#show
  IP Access List test1
  10 permit ip 10.10.10.0/24 any
  20 permit ip any host 10.20.10.1
  30 deny ip host 10.10.10.1 host 10.20.10.1
  40 permit ip any any
  50 remark end of list
  ```
resequence (ACLs)

The `resequence` command assigns sequence numbers to rules in the configuration mode ACL. Command parameters specify the number of the first rule and the numeric interval between consecutive rules.

Maximum rule sequence number is 4294967295.

**Command Mode**

- ACL Configuration
- IPv6-ACL Configuration
- Std-ACL Configuration
- Std-IPv6-ACL Configuration
- MAC-ACL Configuration

**Command Syntax**

```
resequence [start_num [inc_num]]
```

**Parameters**

- `start_num` sequence number assigned to the first rule. Default is 10.
- `inc_num` numeric interval between consecutive rules. Default is 10.

**Example**

- The `resequence` command rennumbers the list, starting the first command at number 100 and incrementing subsequent lines by 20.

```
switch(config-acl-test1)#show
IP Access List test1
  10 permit ip 10.10.10.0/24 any
  20 permit ip any host 10.20.10.1
  30 deny ip host 10.10.10.1 host 10.20.10.1
  40 permit ip any any
  50 remark end of list
```

```
switch(config-acl-test1)#resequence 100 20
```

```
switch(config-acl-test1)#show
IP Access List test1
  100 permit ip 10.10.10.0/24 any
  120 permit ip any host 10.20.10.1
  140 deny ip host 10.10.10.1 host 10.20.10.1
  160 permit ip any any
  180 remark end of list
```
route-map

The route-map command places the switch in route map configuration mode, which is a group change mode that modifies a route map statement. The command specifies the name and number of the route map statement that subsequent commands modify and creates a route map statement if it references a nonexistent statement. All changes in a group change mode edit session are pending until the end of the session.

Route maps define commands for redistributing routes between routing protocols. A route map statement is identified by a name, filter type (permit or deny), and sequence number. Statements with the same name are components of a single route map; the sequence number determines the order in which the statements are compared to a route.

The exit command saves pending route map statement changes to running-config, then returns the switch to global configuration mode. ACL changes are also saved by entering a different configuration mode.

The abort command discards pending changes, returning the switch to global configuration mode.

The no route-map and default route-map commands delete the specified route map statement from running-config.

Note

The route map configuration supports only standard ACL.

Command Mode

Global Configuration

Command Syntax

route-map map_name [FILTER_TYPE] [sequence_number]
no route-map map_name [FILTER_TYPE] [sequence_number]
default route-map map_name [FILTER_TYPE] [sequence_number]

Parameters

• map_name label assigned to route map. Protocols reference this label to access the route map.
• FILTER_TYPE disposition of routes matching commands specified by route map statement.
  • permit routes are redistributed when they match route map statement.
  • deny routes are not redistributed when they match route map statement.
  • <No parameter> assigns permit as the FILTER_TYPE.

When a route does not match the route map criteria, the next statement within the route map is evaluated to determine the redistribution action for the route.

• sequence_number the route map position relative to other statements with the same name.
  • <no parameter> sequence number of 10 (default) is assigned to the route map.
  • <1-16777215> specifies sequence number assigned to route map.

Commands Available in route map configuration mode:

• continue (route map)
• match (route-map)
• set (route-map)
Examples

- This command creates the route map named `map1` and places the switch in route map configuration mode. The route map is configured as a permit map.

  ```
  switch(config)#route-map map1 permit 20
  switch(config-route-map-map1)#
  ```

- This command saves changes to `map1` route map, then returns the switch to global configuration mode.

  ```
  switch(config-route-map-map1)#exit
  switch(config)#
  ```

- This command saves changes to `map1` route map, then places the switch in interface-Ethernet mode.

  ```
  switch(config-route-map-map1)#interface ethernet 3
  switch(config-if-Et3)#
  ```

- This command discards changes to `map1` route map, then returns the switch to global configuration mode.

  ```
  switch(config-route-map-map1)#abort
  switch(config)#
  ```
seq (IPv6 Prefix Lists)

The no seq command removes the rule with the specified sequence number from the ACL. The default seq command also removes the specified rule.

The seq keyword is a command option used at the beginning of deny (IPv6 Prefix List) and permit (IPv6 Prefix List) commands that places a new rule between two existing rules.

**Command Mode**
IPv6-pfx Configuration

**Command Syntax**
- no seq line_num
- default seq line_num

**Parameters**
- line_num  sequence number of rule to be deleted. Valid rule numbers range from 0 to 65535.

**Example**
- These commands remove rule 20 from the map1 prefix list, then displays the resultant list.

```bash
switch(config)#ipv6 prefix-list map1
switch(config-ipv6-pfx)#no seq 20
switch(config-ipv6-pfx)#exit
switch(config)#show ipv6 prefix-list map1
ipv6 prefix-list map1
  seq 10 permit 3:4e96:8ca1:33cf::/64
  seq 15 deny 3:4400::/64
  seq 30 permit 3:1bca:3ff2:634a::/64
  seq 40 permit 3:1bca:1141:ab34::/64
switch(config)#
```
set (route-map)

The `set` command specifies modifications to routes that are selected for redistribution by the configuration mode route map.

The no set and default set commands remove the specified set command from the configuration mode route map statement by deleting the corresponding set command from `running-config`.

Command Mode

Route-Map Configuration

Command Syntax

```
set CONDITION
no set CONDITION
default set CONDITION
```

Parameters

- `CONDITION` specifies the route modification parameter and value. Options include:
  - as-path prepend BGP AS number that is prepended to as-path. For details, see the `set as-path prepend` command.
    - `<1 to 4294967295>` BGP AS number to prepend.
    - `auto` use peer AS number for inbound and local AS for outbound to prepend.
  - distance `<1 to 255>` Protocol independent administrative distance.
  - ip next-hop ipv4_address next hop IPv4 address.
  - ip next-hop peer-address Use BGP peering address as next hop IPv4 address.
  - ipv6 next-hop ipv6_address next hop IPv6 address.
  - ipv6 next-hop peer-address Use BGP peering address as next hop IPv6 address.
  - local-preference `<1 to 4294967295>` BGP local preference metric.
  - metric `<1 to 4294967295>` route metric.
  - metric + `<1 to 4294967295>` add specified value to current route metric.
  - metric – `<1 to 4294967295>` subtract specified value to current route metric.
  - metric-type OSPF_TYPE OSPF metric type. Options include:
    - `type-1` OSPF type 1 metric.
    - `type-2` OSPF type 2 metric.
  - origin O_TYPE BGP origin attribute. Options for O_TYPE include
    - `egp` exterior BGP route.
    - `igp` interior BGP route.
    - `incomplete` BGP route of unknown origin.
  - tag `<1 to 4294967295>` route tag.
  - weight `<1 to 65535>` BGP weight parameter.

Related Commands

- `route-map` enters route-map configuration mode.
- `set (route-map)` specifies community modifications for the redistributed routes.
- `set community (route-map)` specifies extended community modifications for the redistributed routes.
Example

- This command creates a route map entry that sets the local preference metric to 100 on redistributed routes.

```plaintext
switch(config)#route-map map1
switch(config-route-map-map1)#set local-preference 100
switch(config-route-map-map1)#
```
set as-path match

The **set as-path match** command configures the AS_PATH attribute for prefixes that are either received from a BGP neighbor or advertised to a BGP neighbor in the route map configuration mode. The **no set as-path match** command removes the AS path specified for the BGP prefix.

**Command Mode**

Route-Map Configuration

**Command Syntax**

```
set as-path match all replacement [[none | auto] as_path]
no set as-path match all replacement [[none | auto] as_path]
```

**Parameters**

- **none** replaces the AS-Path of the matching routes with a null or an empty AS-Path.
- **auto** if the specific route map is applied as an inbound policy to a corresponding BGP neighbor statement, then replace the AS_PATH of the prefixes received from this neighbor with the neighbor’s AS number. If this route map is applied as an outbound policy to a corresponding neighbor statement, then replace the AS_PATH of the prefixes advertised to this neighbor with the locally configured AS number.
- **as_path** replaces the AS-Path of the matching routes with an arbitrary AS-Path.
Example

- This command replaces the AS-Path with the “none” option.

```
switch#show ip bgp neighbors 80.80.1.2 advertised-routes
BGP routing table information for VRF default
Router identifier 202.202.1.1, local AS number 200
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e - ECMP
S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast, q - Queued for advertisement
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop

Network Next Hop Metric LocPref Weight Path

```

The AS-Path of matching prefixes are replaced with an empty or a null AS-Path. AS 302 is removed from prefix 103.103.1.0/24 as shown in the above output.
• This command replaces the AS-Path with the “auto” option.

switch(config)#route-map foo permit 10
switch(config-route-map-foo)#set as-path match all replacement auto
switch(config-route-map-foo)#end
switch#show ip bgp neighbors 80.80.1.2 advertised-routes

* > 202.202.1.0/24 80.80.1.1 - - - 200 500 600 i

The AS-Path of matching prefixes are replaced with 500 600 as configured.
This command replaces the AS-Path with a combination of ‘auto’ and an AS-Path.

switch(config)#route-map foo permit 10
switch(config-route-map-foo)#set as-path match all replacement auto 500 600

The AS-Path of matching prefixes are replaced with the locally configured AS – 200 and 500 600.
set as-path prepend

The `set as-path prepend` command adds a `set` statement to a route map to prepend one or more autonomous system (AS) numbers to the AS_PATH attribute of a BGP route.

The `no set as-path prepend` and `default set as-path prepend` commands remove the specified set statements from the route map and update all corresponding routes.

Command Mode

Route-Map Configuration

Command Syntax

```
set as-path prepend {{<auto> | as_number ... <auto> | as_number}} | last-as count
no set as-path prepend {{<auto> | as_number ... <auto> | as_number}} | last-as count
default set as-path prepend {{<auto> | as_number ... <auto> | as_number}} | last-as count
```

Parameters

- **auto** prepends the peer AS number for peer inbound route maps and the local AS number for peer outbound route maps.
- **as_number** prepends the specified AS number. Can be entered in plain notation (values range from 1-4294967295) or in asdot notation as described in RFC 5396. In asdot notation, AS numbers from 1-65535 are entered in plain notation, and AS numbers from 65536 to 4294967295 are entered as two values separated by a dot. The first value is high-order and represents a multiple of 65536; the second value is low-order and represents a decimal integer. For example, AS number 65552 can be entered as either 65552 or 1.16 (i.e., 1*65536+16). However they are entered, AS numbers are stored internally in plain decimal notation and will appear that way in `show` outputs.
- **last-as count** prepends the last AS number in the AS path `count` times. Values range from 1 to 15. This is mutually exclusive with the use of the `auto` keyword or the entry of one or more specified AS numbers, and is not supported in multi-agent mode.

Examples

- These commands create a route-map entry that prepends AS number 64496 and prepends either the peer or local AS number twice.

```
switch(config)#route-map map1
switch(config-route-map-map1)#set as-path prepend 64496 auto auto
switch(config-route-map-map1)#exit
switch(config)#show route-map map1
route-map map1 permit 10
  Description:
  Match clauses:
  SubRouteMap:
  Set clauses:
    set as-path prepend 64496 auto auto
switch(config)#
```
The commands create a route-map entry that prepends AS numbers 64496, 64498, and 65552.

```
switch(config)#route-map map2
switch(config-route-map-map2)#set as-path prepend 64496 64498 1.16
switch(config-route-map-map2)#exit
switch(config)#show route-map map2
route-map map2 permit 10
  Description:
  Match clauses:
  SubRouteMap:
  Set clauses:
    set as-path prepend 64496 64498 65552
  switch(config)#
```

These commands create a route map entry that prepends the last AS number 12 times.

```
switch(config)#route-map map3
switch(config-route-map-map3)#set as-path prepend last-as 12
switch(config-route-map-map3)#exit
switch(config)#show route-map map3
route-map map3 permit 10
  Description:
  Match clauses:
  SubRouteMap:
  Set clauses:
    set as-path prepend last-as 12
  switch(config)#
```
set community (route-map)

The set community command specifies community attribute modifications to routes that are selected for redistribution by the configuration mode route map. The set community none command removes community attributes from the route.

The no set community and default set community commands remove the specified community from the configuration mode route map statement by deleting the corresponding statement from the running configuration.

Command Mode

Route-Map Configuration

Command Syntax

set community [GSHUT | aa:nn | community-list | internet | local-as | no-advertise | no-export | none | number]

no set community [GSHUT | aa:nn | additive | community-list | delete | internet | local-as | no-advertise | no-export | none | number]

default set community [GSHUT | aa:nn | additive | community-list | delete | internet | local-as | no-advertise | no-export | none | number]

Parameters

- GSHUT configures a graceful shutdown in BGP.
- aa:nn configures the community AS and network number, separated by colon. Value ranges from 0:0 to 65535:65535.
- community-list A label for community list.
- internet advertises route to the Internet community.
- local-as advertises route only to local peers.
- no-advertise does not advertise route to any peer.
- no-export advertises route only within BGP AS boundary.
- none does not provide any community attributes.
- number configures the community number. Value ranges from 1 to 4294967040.
- additive adds specified attributes to the current community.
- delete removes specified attributes from the current community.

Related Commands

- ip community-list
- route-map
- set (route-map)
- set community (route-map)
Guideline

EOS does not support disabling the process of graceful shutdown community.

Example

- This command advertises routes only to local peers.

  ```
  switch(config-route-map-map1)#show active
  route-map map1 permit 10
  match community instances <= 50
  set community 0:456 0:2345
  switch(config-route-map-map1)#set community local-as
  switch(config-route-map-map1)#ip community-list 345 permit 23
  switch(config)#route-map map1
  switch(config-route-map-map1)#show active
  route-map map1 permit 10
  match community instances <= 50
  set community 0:456 0:2345 local-as
  switch(config-route-map-map1)#
  ```
**set extcommunity (route-map)**

The `set extcommunity` command specifies extended community attribute modifications to routes that are selected for redistribution by the configuration mode route map. The `set extcommunity none` command removes extended community attributes from the route.

The `no set extcommunity` and `default set extcommunity` commands remove the specified `set extcommunity` command from the configuration mode route map statement by deleting the corresponding statement from `running-config`.

**Command Mode**
Route-Map Configuration

**Command Syntax**
```
set extcommunity COND_1 [COND_2] [COND_N] [MOD_TYPE]
set extcommunity none
no set extcommunity COND_1 [COND_2] [COND_N] [MOD_TYPE]
no set extcommunity none
default set extcommunity COND_1 [COND_2] [COND_N] [MOD_TYPE]
default set extcommunity none
```

**Parameters**
- **COND_X**  Specifies extended community route map modification. Command may contain multiple attributes. Options include:
  - `rt ASN:nn`  Route target attribute (AS:network number).
  - `rt IP-address:nn`  Route target attribute (IP address: network number).
  - `soo ASN:nn`  Site of origin attribute (AS:network number).
  - `soo IP-address:nn`  Site of origin attribute (IP address: network number).
- **MOD_TYPE**  Specifies route map modification method. Options include:
  - `<no parameter>`  command replaces existing route map with specified parameters.
  - `additive`  command adds specified parameters to existing route map.
  - `delete`  command removes specified parameters from existing route map.

**Related Commands**
- `route-map` enters route map configuration mode.
- `set (route-map)` specifies attribute modifications for the redistributed routes
- `set (route-map)` specifies community modifications for the redistributed routes.

**Example**
- This command creates a route map entry in map1 that sets the route target extended community attribute.

```
switch(config)#route-map map1
switch(config-route-map-map1)#set extcommunity rt 10.13.2.4:100
switch(config-route-map-map1)#
```
show (ACL configuration modes)

The **show** command displays the contents of an access control list (ACL).

- **show** or **show pending** – displays the list as modified in ACL configuration mode.
- **show active** – displays the list as stored in `running-config`.
- **show comment** – displays the comment stored with the list.
- **show diff** – displays the modified and stored lists, with flags denoting the modified rules.

Exiting the ACL configuration mode stores all pending ACL changes to `running-config`.

**Command Mode**

- ACL Configuration
- IPv6-ACL Configuration
- Std-ACL Configuration
- Std-IPv6-ACL Configuration
- MAC-ACL Configuration

**Command Syntax**

- `show`
- `show active`
- `show comment`
- `show diff`
- `show pending`

**Examples**

The examples in this section assume these ACL commands are entered as specified.

These commands are stored in `running-config`:

```
10 permit ip 10.10.10.0/24 any
20 permit ip any host 10.21.10.1
30 deny ip host 10.10.10.1 host 10.20.10.1
40 permit ip any any
50 remark end of list
```

The current edit session removed this command. This change is not yet stored to `running-config`:

```
20 permit ip any host 10.21.10.1
```

The current edit session added these commands ACL. They are not yet stored to `running-config`:

```
20 permit ip 10.10.0.0/16 any
25 permit tcp 10.10.20.0/24 any
45 deny pim 239.24.124.0/24 10.5.8.4/30
```

- **This command displays the ACL, as stored in the configuration.**

  ```
  switch(config-acl-test_1)#show active
  IP Access List test_1
    10 permit ip 10.10.10.0/24 any
    20 permit ip any host 10.21.10.1
    30 deny ip host 10.10.10.1 host 10.20.10.1
    40 permit ip any any
    50 remark end of list
  ```
• This command displays the pending ACL, as modified in ACL configuration mode.

switch(config-acl-test_1)#show pending
IP Access List test_1
  10 permit ip 10.10.10.0/24 any
  20 permit ip 10.10.0.0/16 any
  25 permit tcp 10.10.20.0/24 any
  30 deny ip host 10.10.10.1 host 10.20.10.1
  40 permit ip any any
  45 deny pim 239.24.124.0/24 10.5.8.4/30
  50 remark end of list

• This command displays the difference between the saved and modified ACLs.
  ■ Rules added to the pending list are denoted with a plus sign (+).
  ■ Rules removed from the saved list are denoted with a minus sign (-)

switch(config-acl-test_1)#show diff

show ip access-lists

The `show ip access-lists` command displays the contents of IPv4 and standard IPv4 access control lists (ACLs) on the switch. Use the `summary` option to display only the name of the lists and the number of lines in each list.

**Command Mode**
Privileged EXEC

**Command Syntax**
```
show ip access-list [LIST] [SCOPE]
```

**Parameters**
- **LIST** name of lists to be displayed. Selection options include:
  - `<no parameter>` all IPv4 ACLs are displayed.
  - `list_name` specified IPv4 ACL is displayed.
- **SCOPE** information displayed. Selection options include:
  - `<no parameter>` all rules in the specified lists are displayed.
  - `summary` the number of rules in the specified lists are displayed.

**Examples**
- This command displays all rules in `test1` IPv4 ACL.
  ```
switch#show ip access-list list2
   IP Access List list2
     10 permit ip 10.10.10.0/24 any
     20 permit ip any host 10.20.10.1
     30 deny ip host 10.10.10.1 host 10.20.10.1
   switch#
  ```

- This command displays the name of, and number of rules in, each list on the switch.
  ```
switch#show ip access-list summary
   IPV4 ACL default-control-plane-acl
     Total rules configured: 12
     Configured on: control-plane
     Active on : control-plane
   IPV4 ACL list2
     Total rules configured: 3
   IPV4 ACL test1
     Total rules configured: 6
   Standard IPV4 ACL test_1
     Total rules configured: 1
   IPV4 ACL test_3
     Total rules configured: 0
   switch#
  ```
This command displays the summary and lists all the configured IPv4 ACLs.

```
switch #show ip access-lists summary
IPV4 ACL default-control-plane-acl [readonly]
  Total rules configured: 17
  Configured on Ingress: control-plane(default VRF)
  Active on Ingress: control-plane(default VRF)

IPV4 ACL ipAclLimitTest
  Total rules configured: 0
  Configured on Egress: V12148,2700
  Active on Egress: V12148,2700
```
show ip prefix-list

The `show ip prefix-list` command displays all rules for the specified IPv4 prefix list. The command displays all IPv4 prefix list rules if a prefix list name is not specified.

**Command Mode**

EXEC

**Command Syntax**

```
show ip prefix-list [DISPLAY_ITEMS]
```

**Parameters**

- **DISPLAY_ITEMS** specifies the name of prefix lists for which rules are displayed. Options include:
  - `<no parameter>` all IPv4 prefix list rules are displayed.
  - `list_name` specifies the IPv4 prefix list for which rules are displayed.

**Example**

- This command displays all rules in the route-one IPv4 prefix list:
  ```
  switch(config-ip-pfx)#show ip prefix-list
  ip prefix-list route-one
    seq 10 deny 10.1.1.0/24
    seq 20 deny 10.1.0.0/16
    seq 30 permit 12.15.4.9/32
    seq 40 deny 1.1.1.0/24
  switch(config-ip-pfx)#
  ```
show ipv6 access-lists

The `show ipv6 access-list` command displays the contents of all IPv6 access control lists (ACLs) on the switch. Use the `summary` option to display only the name of the lists and the number of lines in each list.

**Command Mode**
Privileged EXEC

**Command Syntax**
```
show ipv6 access-list [LIST] [SCOPE]
```

**Parameters**
- **LIST** name of lists to be displayed. Selection options include:
  - <no parameter> all IPv6 ACLs are displayed.
  - `list_name` specified IPv6 ACL is displayed.
- **SCOPE** information displayed. Selection options include:
  - <no parameter> all rules in the specified lists are displayed.
  - `summary` the number of rules in the specified lists are displayed.

**Examples**
- This command displays all rules in test1 IPv6 ACL.
  ```bash
  switch#show ipv6 access-list list2
  IP Access List list2
  10 permit ipv6 3891:3c58:6300::/64 any
  20 permit ipv6 any host 2fe1:b468:024a::
  30 deny ipv6 host 3411:91c1:: host 4210:cc23:d2de:::
  switch#
  ```

- This command displays the name of, and number of rules in, each list on the switch.
  ```bash
  switch#show ipv6 access-list summary
  IPV6 ACL list2
  Total rules configured: 3
  IPV6 ACL test1
  Total rules configured: 6
  IPV6 ACL test_1
  Total rules configured: 1
  Standard IPV6 ACL test_3
  Total rules configured: 0
  switch#
  ```
The `show ipv6 prefix-list` command displays all rules for the specified IPv6 prefix list. The command displays all IPv6 prefix lists if a prefix list name is not specified.

**Command Mode**
EXEC

**Command Syntax**
`show ipv6 prefix-list [DISPLAY_ITEMS]`

**Parameters**
- `DISPLAY_ITEMS` specifies the name of prefix lists for which rules are displayed. Options include:
  - `<no parameter>` all IPv6 prefix lists are displayed.
  - `list_name` specifies the IPv6 prefix list for which rules are displayed.

**Examples**
- This command displays all rules in the map1 IPv6 prefix list:
  ```
  switch>show ipv6 prefix-list map1
  ipv6 prefix-list map1
  seq 10 permit 3:4e96:8ca1:33cf::/64
  seq 15 deny 3:4400::/64
  seq 20 permit 3:11b1:8fe4:1aac::/64
  seq 30 permit 3:1bca:3ff2:634a::/64
  seq 40 permit 3:1bca:1141:ab34::/64
  switch>
  ```
- This command displays all prefix lists:
  ```
  switch>show ipv6 prefix-list
  ipv6 prefix-list map1
  seq 10 permit 3:4e96:8ca1:33cf::/64
  seq 15 deny 3:4400::/64
  seq 20 permit 3:11b1:8fe4:1aac::/64
  seq 30 permit 3:1bca:3ff2:634a::/64
  seq 40 permit 3:1bca:1141:ab34::/64
  ipv6 prefix-list FREDD
  ipv6 prefix-list route-five
  ipv6 prefix-list map2
  seq 10 deny 10:1::1::/64 ge 72 le 80
  seq 20 deny 10:1::/32
  switch>
  ```
**show mac access-lists**

The `show mac access-list` command displays the contents of all MAC access control lists (ACLs) on the switch. Use the summary to display only the name of the lists and the number of lines in each list.

**Command Mode**
Privileged EXEC

**Command Syntax**
```plaintext
show mac access-lists [LIST] [SCOPE]
```

**Parameters**
- **LIST** name of lists to be displayed. Selection options include:
  - <no parameter> command displays all ACLs.
  - `list_name` command displays ACL specified by parameter.
- **SCOPE** information displayed. Selection options include:
  - <no parameter> command displays all rules in specified lists.
  - `summary` command displays the number of rules in specified lists.

**Examples**
- This command displays all rules in `mtest2` MAC ACL.
  ```plaintext
  switch#show mac access-list mlist2
  IP Access List mlist2
      10 permit 1024.4510.F125 0.0.0 any aarp
      20 permit any 4100.4500.0000 0.FF.FFFF novell
      30 deny any any
  switch#
  ```
- This command displays the number of rules in each MAC ACL on the switch.
  ```plaintext
  switch#show mac access-list summary
  MAC ACL mlist1
      Total rules configured: 6
  MAC ACL mlist2
      Total rules configured: 3
  MAC ACL mlist3
      Total rules configured: 1
  MAC ACL mlist4
      Total rules configured: 0
  switch#
  ```
**show route-map**

The `show route-map` command displays the contents of configured route maps.

**Command Mode**
EXEC

**Command Syntax**

```
show route-map [map_name]
```

**Parameters**
- `<no parameter>` displays the content of all configured route maps
- `map_name` displays the content of the specified route map

**Example**
- This command displays the `map1` route map.

```
switch(config)#show route-map map1
route-map map1 permit 10
  Description:
  Match clauses:
  SubRouteMap:
  Set clauses:
    set as-path prepend last-as 12
    set as-path prepend auto auto
```

- This command displays the `map` route map.

```
switch>show route-map map
route-map map permit 5
  Match clauses:
    match as 456
  Set clauses:
  route-map map permit 10
  Match clauses:
    match ip next-hop 2.3.4.5
    match as-path path_2
  Set clauses:
    set local-preference 100
```
show platform fap acl

The `show platform fap acl` command displays the ACL information of Sand platform devices.

Command Mode

Privileged EXEC

Command Syntax

```
show platform fap acl [ipkgv | l4ops | mirroring | opkgv | pmf | tcam | udf | vsicfg]
```

Parameters

- `ipkgv` displays the ACL Ingress Interface Specification (IPKGV) information.
- `l4ops` displays the ACL Layer 4 Options (L4OPS) information.
- `mirroring` displays the mirroring ACL information.
- `opkgv` displays the ACL Egress Interface Specification (OPKGV) information.
- `pmf` displays the Pmf.
- `tcam` displays the ACL TCAM information.
- `udf` displays the ACL UDF information.
- `vsicfg` displays the ACL Virtual Switch Instance (VSI) CONFIG information.

Guidelines

This command is supported on DCS-7280SE and DCS-7500E series platforms only.

Examples

- This command displays the brief information of all installed mirroring ACLs.

```
switch(config)#show platform fap acl mirroring

=============

Interface-ACL Mapping
=====================

Ethernet1 => (list1:10->1,list3:20->3) [ ipv4 ]
Ethernet33 => (list2:0->2) [ mac ]
```
show platform fap acl tcam

The `show platform fap acl tcam` command displays the number of TCAM entries (hardware resources) occupied by the ACL on each forwarding ASIC of Sand platform devices.

**Command Mode**
Privileged EXEC

**Command Syntax**
```
show platform fap acl tcam [detail | diff | hw | shadow | summary]
```

**Parameter**
- `detail` displays the number of TCAM entries (hardware resources) occupied by the ACL on each forwarding ASIC.
- `diff` displays the difference between hardware and shadow.
- `hw` displays ACL entries from hardware.
- `shadow` displays ACL entries from shadow.
- `summary` displays the percentage of TCAM utilization per forwarding ASIC.

**Example**
- This command displays the number of TCAM entries and other ACL TCAM detail.

```
switch#show platform fap acl tcam detail
ip access-list ipAcl0000 (RACL, 1 rules, 2 entries, direction in, state success)
  Shared: false
  Interface: Vlan0002
  -------------------
  Fap: Arad3/0
  Bank Offset Entries
  1    0    2
  Interface: Vlan0003
  -------------------
  Fap: Arad3/0
  Bank Offset Entries
  1    2    2
  Fap: Arad3/4
  Bank Offset Entries
  1    0    2
```
show platform arad acl tcam

The `show platform arad acl tcam` command displays the number of TCAM entries (hardware resources) occupied by the ACL on each forwarding ASIC.

This command is applicable only on DCS-7500E, DCS-7280E series switches.

**Command Mode**

EXEC

**Command Syntax**

```
show platform arad acl tcam [scope]
```

**Parameters**

- `scope` specifies the information displayed. Options include:
  - `detail` Displays the ACL TCAM details
  - `diff` Displays the difference between hardware and shadow
  - `hw` Displays the ACL entries from hardware
  - `shadow` Displays the ACL entries from shadow
  - `summary` Displays the ACL TCAM summary

**Example**

- This command displays the number of TCAM entries used by Arad0 ASIC. In this example, ACL is applied on 2 VLANs (Vl2148 and Vl2700) but number of TCAM entries occupied is only 1.

  ```
  switch# show platform arad acl tcam detail
  ip access-list ipAclLimitTest (Shared RACL, 0 rules, 1 entries, direction out, state success, Acl Label 2)
  Fap: Arad0, Shared: true, Interfaces: Vl2148, Vl2700
  Bank Offset Entries
  0 0 1
  Fap: Arad1, Shared: true, Interfaces: Vl2148
  Bank Offset Entries
  0 0 1
  ```

- This command displays the percentage of TCAM utilization per forwarding ASIC.

  ```
  switch# show platform arad acl tcam summary
  The total number of TCAM lines per bank is 1024.
  ==============================================================
  Arad0:
  ==============================================================
  Bank  Used  Used %  Used By
          0     1     0  IP Egress PACLs/RACLs
  Total Number of TCAM lines used is: 1
  ==============================================================
  Arad1:
  ==============================================================
  Bank  Used  Used %  Used By
          0     1     0  IP Egress PACLs/RACLs
  Total Number of TCAM lines used is: 1
  ```
**show platform arad acl tcam summary**

The `show platform arad acl tcam summary` command displays the percentage of TCAM utilization per forwarding ASIC.

**Command Mode**

EXEC

**Command Syntax**

`show platform arad acl tcam summary`

**Parameter**

- `summary` displays the ACL TCAM summary.

**Example**

- This command displays the percentage of TCAM utilization per forwarding ASIC.

```
switch#show platform arad acl tcam summary
The total number of TCAM lines per bank is 1024.

========================================================
Arad3/0:
========================================================
Bank    Used    Used %   Used By
1        4        0       IP RACLs
Total Number of TCAM lines used is: 4

========================================================
Arad3/4:
========================================================
Bank    Used    Used %   Used By
1        2        0       IP RACLs
Total Number of TCAM lines used is: 2
```
show platform arad mapping

The show platform arad mapping command displays the mapping between the interfaces and the forwarding ASICs.

Command Mode

EXEC

Command Syntax

show platform arad chip_name mapping

Parameter

- chip_name specifies the Arad chip name.

Example

- This command displays the mapping between the interfaces and the forwarding ASICs on arad3/0 chip.

```plaintext
switch#show platform arad arad3/0 mapping
Arad3/0 Port                  SysPhyPort Voq  ( Fap,FapPort) Xlge   Serdes
-----------------------------------------------
Ethernet3/1/1                 34    288      (0,2) n/a     (20)
```

show platform trident tcam

The **show platform trident tcam** command displays the TCAM entries configured for each TCAM group including policy maps and corresponding hits.

**Command Mode**

EXEC

**Command Syntax**

```
show platform trident tcam [acl | cpu-bound | detail | entry | mirror | pbr | pipe | qos | shared | summary]
```

**Parameters**

- `<no parameters>` displays TCAM entries for each TCAM group.
- `acl` displays the trident ACL information.
- `cpu-bound` displays the trident cpu-bound information.
- `detail` Lists all TCAM entries.
- `entry` displays the TCAM entry information.
- `mirror` displays the trident Mirroring ACL information.
- `pbr` displays the trident PBR ACL information.
- `pipe` allows to specify a pipe for filtering.
- `qos` displays the trident QOS information.
- `shared` displays the ACL Sharing information.
- `summary` displays the TCAM allocation information.

**Guidelines**

This command is applicable only on DCS-7010, DCS-7050/DCS-7050X, DCS7250X, DCS-7300X series switches.

**Examples**

- This command displays the trident mirroring ACL information.

```
switch(config)#show platform trident tcam mirror
=== Mirroring ACLs on switch Linecard0/0 ===
Session: mir-sess2

INGRESS ACL mirAc12* uses 2 entries
Assigned to ports: Ethernet32/1
```
This command displays detailed information for the TCAM group.

```
switch#show platform trident tcam detail
=== TCAM detail for switch Linecard0/0 ===
TCAM group 9 uses 42 entries and can use up to 1238 more.
  Mlag control traffic uses 4 entries.
  589826 0 hits - MLAG - SrcPort UDP Entry
  589827 0 hits - MLAG - DstPort UDP Entry
  589828 0 hits - MLAG - SrcPort TCP Entry
  589829 0 hits - MLAG - DstPort TCP Entry
CVX traffic reserves 6 entries (0 used).
L3 Control Priority uses 23 entries.
  589836 0 hits - URM - SelfIp UDP Entry
  589837 0 hits - URM - SelfIp TCP Entry
  589848 0 hits - OSPF - unicast
  589849 71196 hits - OSPFv2 - Multicast
  589850 0 hits - OSPFv3 - Multicast
  589851 0 hits - OSPF Auth ESP - Multicast
  589852 0 hits - OSPF Auth ESP - Unicast
  589853 0 hits - IP packets with GRE type and ISIS protocol
  589854 0 hits - RouterL3 Vlan Priority 6,7 Elevator
  589855 0 hits - RouterL3 DSCP 48-63 Elevator
  589856 0 hits - RouterL3 Priority Elevator
  589857 0 hits - NextHopToCpu, Glean
  589858 0 hits - L3MC Cpu OIF
IGMP Snooping Flooding reserves 8 entries (6 used).
  589864 0 hits - IGMP Snooping Restricted Flooding L3 from local mlag peer
  589865 0 hits - IGMP Snooping Restricted Flooding L3
L4 MicroBfd traffic reserves 1 entries (0 used).
TCAM group 13 uses 99 entries and can use up to 1181 more.
Dot1x MAB traffic uses 1 entries.
  851968 0 hits - Dot1xMab Rule
<--------OUTPUT OMITTED FROM EXAMPLE-------->
```
**show hardware tcam profile**

The **show hardware tcam profile** command displays the hardware specific information for the current operational TCAM profile in the running configuration.

This command is applicable only on DCS-7280(E/R), DCS-7500(E/R) series switches.

**Command Mode**

EXEC

**Command Syntax**

```
show hardware tcam profile
```

**Parameters**

- `tcam` specifies the TCAM information.
- `profile` specifies the TCAM profile information.

**Example**

- This command displays the current operational TCAM profile details.

```
switch#show hardware tcam profile
Configuration   Status
FixedSystem     default   default
```
show platform fap acl tcam hw

The show platform fap acl tcam hw command displays the TCAM entries configured for each TCAM bank including policy-maps and corresponding traffic match.

This command is applicable only on DCS-7280(E/R), DCS-7500(E/R) series switches.

Command Mode
EXEC

Command Syntax

show platform fap fap_name acl tcam hw

Parameters
- **fap_name** specifies the switch chip-set name.
- **acl** specifies the Arad ACL information.
- **tcam** specifies the Arad TCAM information.
- **hw** specifies the ACL entries for hardware.

Example
- This command displays the TCAM entries configured for each TCAM bank including policy maps and corresponding traffic matches.

```
switch#show platform fap Arad1 acl tcam hw

```
system profile

The **system profile** command creates a new Ternary Content-Addressable Memory (TCAM) profile in the running configuration.

The **default system profile** and **no system profile** commands delete non-default TCAM profiles from the running configuration.

**Command Mode**

Hardware TCAM

**Command Syntax**

```
system profile [profile_name | default | mirroring-acl | pbr-match-nexthop-group 
| qos | tap-aggregation-default | tap-aggregation-extended | tc-counters]
default system profile
no system profile
```

**Parameters**

- **profile_name** creates a profile with the specified name.
- **default** creates a default profile.
- **mirroring-acl** creates a mirroring-ACL profile.
- **pbr-match-nexthop-group** creates a pbr-match-nexthop-group profile.
- **qos** creates a Quality of Service (QoS) profile.
- **tap-aggregation-default** creates a tap-aggregation-default profile.
- **tap-aggregation-extended** creates a tap-aggregation-extended profile.
- **tc-counters** creates a tc-counters profile.

**Guideline**

These commands are compatible with the DCS-7280SE and DCS-7500E series switches only.

**Examples**

- These commands create a mirroring-ACL profile.

```
switch(config)#hardware tcam
switch(config-hw-tcam)#system profile mirroring-acl
switch(config-hw-tcam)#show hardware tcam profile
    Configuration         Status
  FixedSystem           mirroring-acl          mirroring-acl
switch(config-hw-tcam)#
```
• These commands delete non-default TCAM profiles.
  
  switch(config)#hardware tcam
  switch(config-hw-tcam)#show hardware tcam profile

  switch(config-hw-tcam)#
hardware access-list resource sharing vlan in

The `hardware access-list resource sharing vlan in` command enables the IPv4 Ingress Sharing of hardware resources on the switch. The same ACL is applied on different VLANs.

The `no hardware access-list resource sharing vlan in` command disables the IPv4 Ingress Sharing of hardware resources on the switch.

**Command Mode**

Global Configuration

**Command Syntax**

```
hardware access-list resource sharing vlan in
no hardware access-list resource sharing vlan in
```

**Guideline**

- This command is compatible only with the DCS-7010 and DCS-7050x series switches.
- Enabling IPv4 Ingress Sharing requires the restart of software agents on the platform, this is a disruptive process and will impact traffic forwarding.

  Use `show platform trident` command to verify the Ingress IPv4 Sharing information.
**hardware access-list resource sharing vlan ipv4 out**

The `hardware access-list resource sharing vlan ipv4 out` command enables the IPv4 Egress RACL TCAM sharing on the switch.

The `no hardware access-list resource sharing vlan ipv4 out` command disables the IPv4 Egress RACL TCAM sharing on the switch. By default, the IPv4 Egress RACL sharing is enabled on the switch.

**Command Mode**

Global Configuration

**Command Syntax**

```
  hardware access-list resource sharing vlan ipv4 out  
  no hardware access-list resource sharing vlan ipv4 out
```

**Guideline**

- This command is compatible only with the DCS-7280E and DCS-7500E series switches.
- Disabling IPv4 RACL sharing requires the restart of software agents on the platform. This is a disruptive process and will impact traffic forwarding.
- Enabling IPv4 RACL sharing, if previously disabled from the default configuration, requires the restart of software agents on the platform. This is a disruptive process and will impact traffic forwarding. Enabling IPv4 RACL sharing if uRPF is configured will disable uRPF.
- Use `show running-config all | include sharing` command to verify whether or not sharing for egress IPv4 RACLs is enabled.

**Example**

- This command verifies whether IPv4 RACL sharing is enabled or disabled.

```
switch# show running-config all | include sharing  
  hardware access-list resource sharing vlan ipv4 out  
```

It returns the following output if IPv4 RACL sharing is enabled.
VRRP and VARP

A virtual IP (VIP) address is an IP address that does not directly connect to a specific interface. Inbound packets sent to a Virtual IP address are redirected to a physical network interface. VIPs support connection redundancy by assigning the address to multiple switches. If one device becomes unavailable, packets sent to the address are still serviced by the functioning device.

Arista switches support virtual IP addresses through Virtual Router Redundancy Protocol, version 2 (VRRPv2), Virtual Router Redundancy Protocol, version 3 (VRRPv3), and Virtual-ARP (VARP). This chapter describes the Arista switch support of virtual IP addresses and contains these sections:

- Section 25.1: VRRP and VARP Conceptual Overview
- Section 25.2: VRRP and VARP Implementation Procedures
- Section 25.3: VRRP and VARP Implementation Examples
- Section 25.4: VRRP and VARP Configuration Commands

25.1 VRRP and VARP Conceptual Overview

25.1.1 VRRPv2

A virtual router, also known as a virtual router group, is defined by a virtual router identifier (VRID) and a virtual IP address. A virtual router’s mapping of VRID and IP address must be consistent among all switches implementing the virtual router group. A virtual router’s scope is restricted to a single LAN.

A LAN may contain multiple virtual routers for distributing traffic. Each virtual router on a LAN is assigned a unique VRID. A switch may be configured with virtual routers among multiple LANs.

VRRP uses priority ratings to assign Master or Backup roles for each VRRP router configured for a virtual router group. The Master router sends periodic VRRP Advertisement messages along the LAN and forwards packets received by the virtual router to their destination. Backup routers are inactive but are available to assume Master router duties when the current Master fails.

A VRRP can be configured to allow VRRP routers with higher priority to take over Master router duties. Alternatively, the group can be configured to prevent a router from preemptively assuming the Master role. A VRRP router is always assigned the Master of any virtual router configured with the address owned by the VRRP router, regardless of the preemption prevention setting.

25.1.2 VRRPv3

RFC 5798 defines version 3 of the Virtual Router Redundancy Protocol (VRRP) for both IPv4 and IPv6. It is based on version 2 of VRRP, as defined in RFC 3768.
25.1.3 VARP

Virtual-ARP (VARP) allows multiple switches to simultaneously route packets from a common IP address in an active-active router configuration. Each switch is configured with the same set of virtual IP addresses on corresponding VLAN interfaces and a common virtual MAC address. In MLAG configurations, VARP is preferred over VRRP because VARP does not require traffic to traverse the peer-link to the master router as VRRP would.

A maximum of 500 virtual IP addresses can be assigned to a VLAN interface. All virtual addresses on all VLAN interfaces resolve to the same virtual MAC address.

VARP functions by having each switch respond to ARP and GARP requests for the configured router IP address with the virtual MAC address. The virtual MAC address is only for inbound packets and never used in the source field of outbound packets.

When `ip routing` is enabled, packets to the virtual MAC address are routed to the next hop destination.

Figure 25-1: VARP Configuration
25.2 VRRP and VARP Implementation Procedures

This section contains the following configuration instructions:

- Section 25.2.1: VRRP Configuration for IPv4
- Section 25.2.2: VRRP Configuration for IPv6
- Section 25.2.3: VARP Configuration

25.2.1 VRRP Configuration for IPv4

To implement a virtual router, it must be configured and enabled. A virtual router is typically configured before it is enabled; this ensures that the VRRP router operates as required before its priority settings immediately make it the master virtual router. Because assigning a primary address to a virtual router enables it, address assignment is normally performed after all other configuration tasks.

The no vrrp command removes all VRRP commands for the specified virtual router from running-config.

25.2.1.1 Virtual Router Configuration

Most configuration tasks are optional because all mandatory parameters have a default value. The following virtual router parameters are configurable:

- VRRP version (default = version 2)
- Router priority (default = 100)
- Preemption option (default is enabled)
- Advertisement timer (default = one second)
- Description (optional parameter)
- Peer authentication (optional parameter)
- Secondary IP addresses (optional parameter)

**VRRP Version**

The vrrp ipv4 version command sets the version of VRRP for the corresponding IPv4 virtual router. IPv6 version is not configurable as it only supports version 3. The version selected in a VRRP group can either be same for all group members or independent of each other. By default, Arista switches use VRRP version 2, which supports only IPv4 environments. VRRP version 3 supports both IPv4 and IPv6 environments.

**Example**

- This command causes VLAN 20 to use VRRP version 3.

  switch(config)#interface vlan 20
  switch(config-if-vl20)#vrrp 1 ipv4 version 3
  switch(config-if-vl20)#

**Master and Backup Router**

The VRRP routers within a virtual router group determine the Master router through priority settings. Priority values range from 254 (highest priority) to 1 (lowest priority). Priority is either set by a CLI command or is assigned the default value of 100. A switch specifies priority settings for each of its virtual routers. Once set, VRRP priority level can also be changed by a tracked object. The vrrp tracked-object command configures the VRRP client process to track an object created by the track command and react if its status changes to down.
Preemption mode determines when a VRRP router with a higher priority rating becomes the Master router. If preemption is enabled, the VRRP router with the highest priority immediately becomes the Master router. If preemption is disabled, a VRRP router with a higher priority value does not become the Master router unless the current Master becomes unavailable; this is applicable when a new VRRP router becomes available on the LAN or VRRP router’s priority value changes for the virtual router.

The `vrrp priority-level` command configures the switch’s priority setting for the specified virtual router.

**Example**

- This command sets the priority value of 250 for the virtual router with VRID 15 on VLAN 20.

```bash
switch(config-if-vl20)#vrrp 15 priority-level 250
switch(config-if-vl20)#
```

The `vrrp preempt` command controls the preempt mode setting of the specified virtual router. By default, preempt mode is enabled.

**Examples**

- This command disables preempt mode for the virtual router 15 on VLAN 20.

```bash
switch(config-if-vl20)#no vrrp 15 preempt
switch(config-if-vl20)#
```

- This command enables preempt mode for the virtual router 30 on VLAN 20.

```bash
switch(config-if-vl20)#vrrp 30 preempt
switch(config-if-vl20)#
```

The `vrrp preempt delay` command configures a period between an event that elevates a switch to master VRRP router status and the switch’s assumption of master VRRP router role. Command options configure delays during normal operation and after a switch reboot.

**Advertisement Interval**

The Master router sends periodic VRRP Advertisement messages to other VRRP routers. The `vrrp advertisement interval` command specifies the interval between successive advertisement message transmissions.

The advertisement interval also defines the timeout that determines when the switch assumes the Master router role. This timeout interval is three times the advertisement interval.

**Example**

- This command sets the advertisement interval of 10 seconds for virtual router 35 on VLAN 100.

```bash
switch(config-if-vl100)#vrrp 35 advertisement interval 10
switch(config-if-vl100)#
```

**Description**

The `vrrp session description` command associates a text string to the specified virtual router. The maximum string length is 80 characters. The string has no functional impact on the virtual router.

**Example**

- This command associates the text string `Laboratory Router` to virtual router 15 on VLAN 20.

```bash
switch(config-if-vl20)#vrrp 15 session description Laboratory Router
switch(config-if-vl20)#
```
Peer Authentication

VRRP peer authentication validates VRRP advertisement packets that the switch receives from other VRRP routers in a specified virtual router group. When a virtual router uses authentication, all VRRP routers in the group must use the same authentication parameters.

The `vrrp peer authentication` command configures virtual router authentication parameters for the specified virtual router.

Example

- This command implements plain-text authentication, using 12345 as the key, for virtual router 40 on VLAN 100.

  ```
  switch(config-if-vl100)#vrrp 40 peer authentication text 12345
  switch(config-if-vl100)#
  ```

Secondary Addresses

The `vrrp ipv4 secondary` command assigns a secondary IP address to a virtual router. Secondary addresses are optional; a virtual router’s configuration may include more than one secondary address command. The primary and secondary address list must be identical for all switches in a virtual router group.

A primary IP address is assigned to a virtual router with the `vrrp ipv4` command (Section 25.2.1.2).

Example

- This command assigns the IP address of 10.2.4.5 as the secondary IP address for the virtual router 15 on VLAN 20

  ```
  switch(config-if-vl20)#vrrp 15 ipv4 10.2.4.5 secondary
  switch(config-if-vl20)#
  ```

25.2.1.2 Virtual Router Enabling and the Primary IP address

The `vrrp ipv4` command configures the primary IP address of the specified virtual router and enables the virtual router if the primary address is contained within the configuration mode interface’s IP address subnet. A virtual router’s configuration may contain only one primary IP address assignment command; subsequent `vrrp ipv4` commands reassign the virtual router’s primary IP address.

Example

- This command enables virtual router group 15 (VRID) on VLAN 20 and assigns 10.1.1.5 as the virtual router’s primary address.

  ```
  switch(config-if-vl20)#vrrp 15 ipv4 10.1.1.5
  switch(config-if-vl20)#
  ```

25.2.1.3 Disabling VRRP

The `vrrp disabled` command places the switch in stopped state for the specified virtual router. While in stopped state, the switch cannot act as a Master or backup router for the virtual router group. The `no vrrp disabled` command changes the switch’s virtual router state to backup or master if the virtual router is properly configured.

VRRP can also be shut down when the status of a tracked object configured by the `vrrp tracked-object` command changes to down.
Examples

- This command places the switch in stopped mode for virtual router 24 on VLAN 20.
  
  ```
  switch(config-if-vl20)#vrrp 24 disabled
  switch(config-if-vl20)#
  ```

- This command moves the switch out of stopped mode for virtual router 24 on VLAN 20.
  
  ```
  switch(config-if-vl20)#no vrrp 24 disabled
  switch(config-if-vl20)#
  ```

- This command configures the switch to enter stopped mode for virtual router 24 on VLAN 20 if the status of tracked object interfaceE6/48 changes to down.
  
  ```
  switch(config-if-vl20)#vrrp 24 tracked-object interfaceE6/48 shutdown
  switch(config-if-vl20)#
  ```

The `no vrrp` and `no vrrp ipv4` commands delete the specified virtual IP address from the interface. Additionally, the `no vrrp` command removes all residual VRRP commands for the virtual router.

Examples

- This command removes all VRRP configuration commands for virtual router 10 on VLAN 15.
  
  ```
  switch(config-if-vl15)#no vrrp 10
  switch(config-if-vl15)#
  ```

- This command disables virtual router 25 on VLAN 20 and removes the primary IP address from its configuration.
  
  ```
  switch(config-if-vl20)#no vrrp 25 ipv4 10.1.1.5
  switch(config-if-vl20)#
  ```

25.2.2 VRRP Configuration for IPv6

To implement a virtual router, it must be configured and enabled. A virtual router is typically configured before it is enabled; this ensures that the VRRP router operates as required before its priority settings immediately make it the master virtual router. Because assigning a primary address to a virtual router enables it, address assignment is normally performed after all other configuration tasks.

The `no vrrp` command removes all VRRP commands for the specified virtual router from `running-config`.

25.2.2.1 Configuring VRRP for IPv6

Specify the VRRP Version

The `vrrp ipv4 version` command sets the version of VRRP used on an interface. The version selected in a VRRP group must be the same for all group members. By default, Arista switches use VRRP version 2, which is not compatible with IPv6.

Example

- This command causes VLAN 20 to use VRRP version 3.
  
  ```
  switch(config)#interface vlan 20
  switch(config-if-vl20)#vrrp 1 ipv4 version 3
  switch(config-if-vl20)#
  ```

Create a VRRP Group and Configure a Virtual IPv6 Address

The `vrrp ipv6` command assigns an IPv6 address to the interface being configured and creates a VRRP group.
Example

- These commands create VRRP group 3 and configure a virtual IPv6 address for the VRRP group on the VLAN 20 interface.

```plaintext
switch(config)#interface vlan 20
switch(config-if-vl20)#vrrp 3 ipv6 2001:db8:0:1::1
switch(config-if-vl20)#
```

Configure Tracking

The `vrrp tracked-object` command configures the VRRP client process to track an object created by the `track` command and react if its status changes to `down`.

Example

- This command causes interface VLAN 20 to disable VRRP when tracked object ETH8 changes state.

```plaintext
switch(config-if-vl20)#vrrp 1 tracked-object ETH8 shutdown
switch(config-if-vl20)#
```

Configure the Priority Level

The `vrrp priority-level` command configures the switch’s priority setting for the specified virtual router.

Example

- This command sets the priority value of 250 for the virtual router with VRID 15 on VLAN 20.

```plaintext
switch(config-if-vl20)#vrrp 15 priority-level 250
switch(config-if-vl20)#
```

Configure the Preemption Mode

Preemption mode determines when a VRRP router with a higher priority rating becomes the Master router. If preemption is enabled, the VRRP router with the highest priority immediately becomes the Master router. If preemption is disabled, a VRRP router with a higher priority value does not become the Master router unless the current Master becomes unavailable; this is applicable when a new VRRP router becomes available on the LAN or VRRP router’s priority value changes for the virtual router.

The `vrrp preempt` command controls the preempt mode setting of the specified virtual router. By default, preempt mode is enabled.

Example

- This command enables preempt mode for the virtual router 30 on VLAN 20.

```plaintext
switch(config-if-vl20)#vrrp 30 preempt
```

Configure the VRRP Advertisement Interval

The `ip virtual-router mac-address advertisement-interval` command specifies the interval between advertisement packets sent by the master router to the VRRP group members.

Examples

- This command configures a MAC address advertisement interval of one minute (60 seconds).

```plaintext
switch(config)#interface vlan 20
switch(config-if-vl20)#ip virtual-router mac-address advertisement-interval 60
switch(config-if-vl20)#
```
25.2.2.2 Verify VRRP IPv6 Configurations

Use the following commands to display the VRRP configurations and status.

**Show VRRP Group**

The `show vrrp` command displays information about the Virtual Router Redundancy Protocol (VRRP) groups configured on a specified interface.

**Examples**

- This command displays a table of information for VRRP groups on the switch.

```
switch> show vrrp interface vlan 3060 brief
Interface Id  Ver Pri Time  State   VrIps
Vlan3060  1   3   100 3609  Master  2001::2
           2001::3
Vlan3060  2   3   100 3609  Master  2002::2
           2002::3
switch>
```

25.2.3 VARP Configuration

Implementing VARP consists of assigning virtual IP addresses to VLAN interfaces and configuring a virtual MAC address.

**Virtual IP Addresses**

The `ip virtual-router address` command assigns a virtual IP address to the VLAN interface being configured. Unlike VRRP, the virtual IP address does not have to be in the same subnet as the physical interface.

A virtual IPv4 address may optionally be configured with a subnet, but doing so will modify the behavior of ARP requests sent from the router. When the router sends an ARP request for an IPv4 address in a virtual subnet, the ARP request will use the virtual IPv4 address as the source IP address and the virtual MAC address as the source MAC address inside the ARP header. For virtual IP addresses configured without the subnet option, no modifications are made to outgoing ARP requests.

**Examples**

- These commands configure a Switch Virtual Interface (SVI) and a virtual IP address for VLAN 10.

```
switch(config)#interface vlan 10
switch(config-if-Vl10)#ip address 10.0.0.2/24
switch(config-if-Vl10)#ip virtual-router address 10.0.0.6
switch(config-if-Vl10)#ipv6 address 2001::1/64
switch(config-if-Vl10)#ipv6 virtual-router address 2001::2
switch(config-if-Vl10)#exit
switch(config)#
```

- These commands configure a Switch Virtual Interface (SVI) and a virtual IPv4 address with a subnet for VLAN 10. A static route is added to indicate that the virtual subnet is reachable through VLAN 10.

```
switch(config)#ip route 192.0.0.0/24 vlan 10
switch(config)#interface vlan 10
switch(config-if-Vl10)#ip address 10.0.0.2/24
switch(config-if-Vl10)#ip virtual-router address 192.0.0.6/24
switch(config-if-Vl10)#exit
switch(config)#
```
Virtual MAC Address

The *ip virtual-router mac-address* command assigns a virtual MAC address to the switch. The switch maps all virtual router IP addresses to this MAC address. The address is receive-only; the switch never sends packets with this address as the source.

When the destination MAC of a packet destined to a remote network matches the virtual MAC address, the MLAG peer forwards the traffic to the next hop destination. Each MLAG peer must have the same routes available, either through static configuration or learned through a dynamic routing protocol.

**Example**

- This command configures a virtual MAC address.
  
  ```
  switch(config)#ip virtual-router mac-address 001c.7300.0099
  switch(config)#
  ```

**Show Virtual MAC Address**

To display the virtual router MAC and IP addresses, enter the *show ip virtual-router* command.

**Example**

- This command displays the virtual router addresses assigned on the switch.
  
  ```
  switch>show ip virtual-router
  IP virtual router is configured with MAC address: 24cd.5a29.cc31
  Interface IP Address Virtual IP Address Status Protocol
  Vlan15 10.1.1.3/24 10.1.1.15 up up
  Vlan15 10.1.1.3/24 10.1.1.16 up up
  Vlan15 10.1.1.3/24 10.1.1.17 up up
  Vlan20 10.12.1.6/24 10.1.1.51 up up
  Vlan20 10.12.1.6/24 10.1.1.53 up up
  Vlan20 10.12.1.6/24 10.1.1.55 up up
  switch>
  ```

**Show IPv6 Virtual-Router**

The *show ipv6 virtual-router* command displays the virtual MAC address assigned to the switch and all virtual IPv6 addresses assigned to each VLAN interface.

**Examples**

- This command displays a table of information for IPv6 VRRP groups on the switch.
  
  ```
  switch>show ipv6 virtual-router
  IP virtual router is configured with MAC address: 001c.7300.0099
  MAC address advertisement interval: 30 seconds
  Interface Vlan4094
  State is up
  Protocol is up
  IPv6 address
  2001:b8:2001::1011/64
  Virtual IPv6 address
  2001:db8:ac10:fe01:
  switch>
  ```
25.3 VRRP and VARP Implementation Examples

This section contains the following example set:

- Section 25.3.1: VRRP Examples
- Section 25.3.2: VARP Example

25.3.1 VRRP Examples

This section provides code that implements three VRRP configurations:

- Example 1 configures two switches in a single virtual router group. This implementation protects the LAN against the failure of one router.
- Example 2 configures two switches into two virtual routers within a single LAN. This implementation protects the LAN against the failure of one router and balances traffic between the routers.
- Example 3 configures three switches to implement virtual routers on two LANs. Each LAN contains two virtual routers. One switch is configured into four virtual routers – two on each LAN.

25.3.1.1 VRRP Example 1: One Virtual Router on One LAN

Figure 25-2 displays the Example 1 network. Two switches are configured as VRRP routers to form one virtual router.

The following code configures the first switch (Router A) as the master router and the second switch (Router B) as a backup router for virtual router 10 on VLAN 50. Router A becomes the Master virtual router by setting its priority at 200; Router B maintains the default priority of 100. The advertisement interval is three seconds on both switches. Priority preemption is enabled by default.

Switch code that implements Router A on the first switch

```
switch-A(config)#interface vlan 50
switch-A(config-if-vl50)#ip address 10.10.4.1/24
switch-A(config-if-vl50)#no vrrp 10
switch-A(config-if-vl50)#vrrp 10 priority 200
switch-A(config-if-vl50)#vrrp 10 advertisement interval 3
switch-A(config-if-vl50)#vrrp 10 ip 10.10.4.10
switch-A(config-if-vl50)#exit
```
Switch code that implements Router B on the second switch

```
switch-B(config)#interface vlan 50
switch-B(config-if-vl50)#ip address 10.10.4.2/24
switch-B(config-if-vl50)#no vrrp 10
switch-B(config-if-vl50)#vrrp 10 advertisement interval 3
switch-B(config-if-vl50)#vrrp 10 ip 10.10.4.10
switch-B(config-if-vl50)#exit
```

25.3.1.2 VRRP Example 2: Two Virtual Routers on One LAN

Figure 25-3 displays Example 2. Two switches are configured as VRRP routers to form two virtual routers on one LAN. Using two virtual routers distributes the LAN traffic between the switches.

**Figure 25-3: VRRP Example 2 Network Diagram**

The following code configures two switches as a master and a backup router for two virtual routers on VLAN 50.

- Router A is the master for virtual router 10 and backup for virtual router 20.
- Router B is the master for virtual router 20 and backup for virtual router 10.
- VRRP advertisement interval is 3 seconds on virtual router 10 and 5 seconds on virtual router 20.
- Priority preemption is enabled by default for both virtual routers.

Switch code that implements Router A on the first switch

```
switch-A(config)#interface vlan 50
switch-A(config-if-vl50)#ip address 10.10.4.1/24
switch-A(config-if-vl50)#no vrrp 10
switch-A(config-if-vl50)#vrrp 10 priority 200
switch-A(config-if-vl50)#vrrp 10 advertisement interval 3
switch-A(config-if-vl50)#vrrp 10 ip 10.10.4.10
switch-A(config-if-vl50)#no vrrp 20
switch-A(config-if-vl50)#vrrp 20 advertisement interval 5
switch-A(config-if-vl50)#vrrp 20 ip 10.10.4.20
switch-A(config-if-vl50)#exit
```
Switch code that implements Router B on the second switch

```bash
switch-B(config)#interface vlan 50
switch-B(config-if-vl50)#ip address 10.10.4.2/24
switch-B(config-if-vl50)#no vrrp 10
switch-B(config-if-vl50)#vrrp 10 advertisement interval 3
switch-B(config-if-vl50)#vrrp 10 ip 10.10.4.10
switch-B(config-if-vl50)#no vrrp 20
switch-B(config-if-vl50)#vrrp 20 priority 200
switch-B(config-if-vl50)#vrrp 20 advertisement interval 5
switch-B(config-if-vl50)#vrrp 20 ip 10.10.4.20
switch-B(config-if-vl50)#exit
```

25.3.1.3  VRRP Example 3: Two Virtual Routers on Two LANs

Figure 25-4 displays Example 3. Three switches are configured as VRRP routers to form four virtual router groups – two groups on each of two LANs.

Figure 25-4: VRRP Example 3 Network Diagram

The following code configures the three switches as follows:

- Router A is the master for virtual router 10 and backup for virtual router 20 on VLAN 100.
- Router A is the master for virtual router 30 and backup for virtual router 40 on VLAN 150.
- Router B is the master for virtual router 20 and backup for virtual router 10 on VLAN 100.
- Router C is the master for virtual router 40 and backup for virtual router 30 on VLAN 150.
- VRRP advertisement interval is set to one second on all virtual routers.
- Priority preemption is disabled on all virtual routers.
Switch code that implements Router A on the first switch

```bash
switch-A(config)#interface vlan 100
switch-A(config-if-vl100)#ip address 10.10.4.1/24
switch-A(config-if-vl100)#no vrrp 10
switch-A(config-if-vl100)#vrrp 10 priority 200
switch-A(config-if-vl100)#no vrrp 10 preempt
switch-A(config-if-vl100)#vrrp 10 ip 10.10.4.10
switch-A(config-if-vl100)#vrrp 10 advertisement interval 1
switch-A(config-if-vl100)#no vrrp 20
switch-A(config-if-vl100)#no vrrp 20 preempt
switch-A(config-if-vl100)#vrrp 20 ip 10.10.4.20
switch-A(config-if-vl100)#interface vlan 150
switch-A(config-if-vl150)#ip address 40.10.5.7/24
switch-A(config-if-vl150)#no vrrp 30
switch-A(config-if-vl150)#vrrp 30 priority 200
switch-A(config-if-vl150)#no vrrp 30 preempt
switch-A(config-if-vl150)#vrrp 30 ip 40.10.5.31
switch-A(config-if-vl150)#vrrp 30 advertisement interval 1
switch-A(config-if-vl150)#no vrrp 40
switch-A(config-if-vl150)#no vrrp 40 preempt
switch-A(config-if-vl150)#vrrp 40 ip 40.10.5.32
switch-A(config-if-vl150)#exit
```

Switch code that implements Router B on the second switch

```bash
switch-B(config)#interface vlan 100
switch-B(config-if-vl100)#ip address 10.10.4.2/24
switch-B(config-if-vl100)#no vrrp 10
switch-B(config-if-vl100)#no vrrp 10 preempt
switch-B(config-if-vl100)#vrrp 10 ip 10.10.4.10
switch-B(config-if-vl100)#no vrrp 20
switch-B(config-if-vl100)#vrrp 20 priority 200
switch-B(config-if-vl100)#no vrrp 20 preempt
switch-B(config-if-vl100)#vrrp 20 ip 10.10.4.20
switch-B(config-if-vl100)#vrrp 20 advertisement interval 1
switch-B(config-if-vl100)#exit
```

Switch code that implements Router C on the third switch

```bash
switch-C(config)#interface vlan 150
switch-C(config-if-vl150)#ip address 40.10.5.8/24
switch-C(config-if-vl150)#no vrrp 30
switch-C(config-if-vl150)#no vrrp 30 preempt
switch-C(config-if-vl150)#vrrp 30 ip 40.10.5.31
switch-C(config-if-vl150)#no vrrp 40
switch-C(config-if-vl150)#vrrp 40 priority 200
switch-C(config-if-vl150)#no vrrp 40 preempt
switch-C(config-if-vl150)#vrrp 40 ip 40.10.5.32
switch-C(config-if-vl150)#exit
```

25.3.2 VARP Example

This section provides code that implements a VARP configuration. Figure 25-5 displays the Example 1 network. Two switches in an MLAG domain are configured as VARP routers.

The following code configures 10.10.4.10 as the virtual IP address for VLAN 50, 10.24.4.1 as the virtual IP address for VLAN 70, and 001c.7300.0999 as the virtual MAC address on both switches.
Switch code that implements VARP on the first switch

```
switch-A(config)#ip virtual-router mac-address 001c.7300.0999
switch-A(config)#interface vlan 50
switch-A(config-if-vl50)#ip address 10.10.4.1/24
switch-A(config-if-vl50)#ip virtual-router address 10.10.4.10
switch-A(config-if-vl50)#interface vlan 70
switch-A(config-if-vl70)#ip address 10.24.4.17/24
switch-A(config-if-vl70)#ip virtual-router address 10.24.4.1
switch-A(config-if-vl70)#exit
```

Switch code that implements VARP on the second switch

```
switch-B(config)#ip virtual-router mac-address 001c.7300.0999
switch-B(config)#interface vlan 50
switch-B(config-if-vl50)#ip address 10.10.4.2/24
switch-B(config-if-vl50)#ip virtual-router address 10.10.4.10
switch-B(config-if-vl50)#interface vlan 70
switch-B(config-if-vl70)#ip address 10.24.4.18/24
switch-B(config-if-vl70)#ip virtual-router address 10.24.4.1
switch-B(config-if-vl70)#exit
```
25.4 VRRP and VARP Configuration Commands

This section contains descriptions of CLI commands that support VRRP and VARP.

Global Configuration Commands
- `ip fhrp accept-mode`
- `ip virtual-router mac-address`
- `ip virtual-router mac-address advertisement-interval`

Interface Configuration Commands – Ethernet, Port Channel, and VLAN Interfaces
- `ip virtual-router address`
- `ipv6 virtual-router address`
- `no vrrp`
- `vrrp advertisement interval`
- `vrrp disabled`
- `vrrp ipv4`
- `vrrp ipv4 secondary`
- `vrrp ipv4 version`
- `vrrp ipv6`
- `vrrp mac-address advertisement-interval`
- `vrrp peer authentication`
- `vrrp preempt`
- `vrrp preempt delay`
- `vrrp priority-level`
- `vrrp session description`
- `vrrp timers delay reload`
- `vrrp tracked-object`

Privileged EXEC Commands
- `show ip virtual-router`
- `show ipv6 virtual-router`
- `show vrrp`
ip fhrp accept-mode

The `ip fhrp accept-mode` command configures the switch to permit SSH access to the VRRP Master and VARP Master router. All routers within a VRRP or VARP group should be configured consistently. By default, SSH access to the VRRP and VARP Master routers is not permitted.

The `no ip fhrp accept-mode` and `default ip fhrp accept-mode` commands restores the default SSH access availability by removing the `ip fhrp accept-mode` command from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**

```
  ip fhrp accept-mode
  no ip fhrp accept-mode
  default ip fhrp accept-mode
```

**Example**

- This command configures the switch to permit SSH access to the VRRP and VARP Master routers.

```
  switch(config)#ip fhrp accept-mode
  switch(config)#show running-config

  !
  ip fhrp accept-mode
  !

  switch(config)#
```
**ip virtual-router address**

The `ip virtual-router address` command assigns a virtual IPv4 address to the VLAN interface being configured. (To assign a virtual IPv6 address to a VLAN interface, use the `ipv6 virtual-router address` command.) Unlike VRRP, the virtual IP address does not have to be in the same subnet as the physical interface.

A virtual IP address may optionally be configured with a subnet, but doing so will modify the behavior of ARP requests sent from the router. When the router sends an ARP request for an IP address in a virtual subnet, the ARP request will use the virtual IP address as the source IP address and the virtual MAC address as the source MAC address inside the ARP header. For virtual IP addresses configured without the subnet option, no modifications are made to outgoing ARP requests.

A maximum of 500 virtual IP addresses can be assigned to a VLAN interface. All virtual addresses on all VLAN interfaces resolve to the same virtual MAC address configured through the `ip virtual-router mac-address` command.

This command is typically used in MLAG configurations to create identical virtual routers on switches connected to the MLAG domain through an MLAG.

The `no ip virtual-router address` and `default ip virtual-router address` commands remove the specified virtual IP address from the configuration mode interface by deleting the corresponding `ip virtual-router address` command from `running-config`. If the command does not specify an address, all virtual IPv4 addresses are removed from the interface.

**Command Mode**

Interface-VLAN Configuration

**Command Syntax**

```
ip virtual-router address ipv4_addr
no ip virtual-router address [ipv4_addr]
default ip virtual-router address [ipv4_addr]
```

**Parameters**

- `ipv4_addr` IP address of router. Dotted decimal notation.

**Examples**

- These commands configure a Switch Virtual Interface (SVI) and a virtual IP address for VLAN 10.

  ```
  switch(config)#interface vlan 10
  switch(config-if-Vl10)#ip address 10.0.0.2/24
  switch(config-if-Vl10)#ip virtual-router address 10.0.0.6
  switch(config-if-Vl10)#exit
  switch(config)#
  ```

- These commands configure a Switch Virtual Interface (SVI) and a virtual IP address with a subnet for VLAN 10. A static route is added to indicate that the virtual subnet is reachable through VLAN 10.

  ```
  switch(config)#ip route 192.0.0.0/24 vlan 10
  switch(config)#interface vlan 10
  switch(config-if-Vl10)#ip address 10.0.0.2/24
  switch(config-if-Vl10)#ip virtual-router address 192.0.0.6/24
  switch(config-if-Vl10)#exit
  switch(config)#
  ```
ip virtual-router mac-address

The `ip virtual-router mac-address` command assigns a virtual MAC address to the switch. The switch maps all virtual router IP addresses to this MAC address. The address is receive-only; the switch never sends packets with this address as the source. The virtual router is not configured on the switch until this virtual mac-address is assigned.

This command is typically used in MLAG configurations to create identical virtual routers on switches connected to the MLAG domain through an MLAG. When the destination MAC of a packet destined to a remote network matches the virtual MAC address, the MLAG peer forwards the traffic to the next hop destination. Each MLAG peer must have the same routes available, either though static configuration or learned through a dynamic routing protocol.

The `no ip virtual-router mac-address` command removes a virtual MAC address from the interface by deleting the corresponding `ip virtual-router mac-address` command from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**

- `ip virtual-router mac-address mac_addr`
- `no ip virtual-router mac address [mac_addr]`

**Parameters**
- `mac_addr` MAC IP address (dotted hex notation). Select an address that will not otherwise appear on the switch.

**Examples**
- This command configures a virtual MAC address.

```
switch(config)#ip virtual-router mac-address 001c.7300.0099
switch(config)#
```
ip virtual-router mac-address advertisement-interval

The `ip virtual-router mac-address advertisement interval` command specifies the period between the transmission of consecutive gratuitous ARP requests that contain the virtual router mac address for each virtual-router IP address configured on the switch. The default period is 30 seconds.

The `no ip virtual-router mac-address advertisement-interval` command restores the default period of 30 seconds by removing the `ip virtual-router mac-address advertisement-interval` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip virtual-router mac-address advertisement-interval period
no ip virtual-router mac-address advertisement-interval
default ip virtual-router mac-address advertisement-interval
```

**Parameters**

- `period`  advertisement interval (seconds). Values range from 0 to 86400. Default is 30.

**Examples**

- This command configures a MAC address advertisement interval of one minute (60 seconds).

  ```
  switch(config)#ip virtual-router mac-address advertisement-interval 60
  switch(config)#
  ```
ipv6 virtual-router address

The `ipv6 virtual-router address` command assigns a virtual IPv6 address to the VLAN interface being configured. (To assign a virtual IPv4 address to a VLAN interface, use the `ip virtual-router address` command.) Unlike VRRP, the virtual IP address does not have to be in the same subnet as the physical interface.

A maximum of 500 virtual IP addresses can be assigned to a VLAN interface. All virtual addresses on all VLAN interfaces resolve to the same virtual MAC address configured through the `ip virtual-router mac-address` command.

This command is typically used in MLAG configurations to create identical virtual routers on switches connected to the MLAG domain through an MLAG.

The `no ipv6 virtual-router address` and `default ipv6 virtual-router address` commands remove the specified virtual IPv6 address from the configuration mode interface by deleting the corresponding `ipv6 virtual-router address` command from `running-config`. If the command does not specify an address, all virtual IPv6 addresses are removed from the interface.

Command Mode

    Interface-VLAN Configuration

Command Syntax

    ipv6 virtual-router address  net_addr
    no ipv6 virtual-router address  [net_addr]
    default ipv6 virtual-router address  [net_addr]

Parameters

-  `net_addr`  network IPv6 address.

Examples

-  These commands configure a Switch Virtual Interface (SVI) and a virtual IPv6 address for VLAN 10.

```
switch(config)#interface vlan 10
switch(config-if-Vl10)#ipv6 address 2001:0DB8:0:1::1/64
switch(config-if-Vl10)#ipv6 virtual-router address 2001:0DB8:0:1::2
switch(config-if-Vl10)#exit
switch(config)#
```
no vrrp

The no vrrp command removes all VRRP configuration commands for the specified virtual router on the configuration mode interface. The default vrrp command also reverts VRRP configuration parameters to default settings by removing the corresponding vrrp commands.

Commands removed by the no vrrp command include:

- vrrp advertisement interval
- vrrp disabled
- vrrp ipv4
- vrrp ipv4 secondary
- vrrp peer authentication
- vrrp preempt
- vrrp preempt delay
- vrrp priority-level
- vrrp session description

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
no vrrp group
default vrrp group
```

**Parameters**

- **group** virtual router identifier (VRID). Values range from 1 to 255.

**Examples**

- This command removes all VRRP configuration commands for virtual router group 10 on VLAN 15.

```
switch(config)#interface vlan 15
switch(config-if-vl15)#no vrrp 10
switch(config-if-vl15)#
```
show ip virtual-router

The `show ip virtual-router` command displays the virtual MAC address assigned to the switch and all virtual IP addresses assigned to each VLAN interface.

**Command Mode**

EXEC

**Command Syntax**

`show ip virtual-router`

**Messages**

- **IP virtual router is not configured**  
  a virtual MAC address is not assigned to the switch.

- **No interface with virtual IP address**  
  no virtual IP addresses are assigned to any VLAN interfaces.

**Examples**

- This command displays a table of information for VRRP groups on the switch.

  `switch>show ip virtual-router`

<table>
<thead>
<tr>
<th>Interface</th>
<th>IP Address</th>
<th>Virtual IP Address</th>
<th>Status</th>
<th>Protocol</th>
</tr>
</thead>
<tbody>

</table>

  `switch>

- This command generates a response that indicates a virtual MAC address is not assigned to the switch.

  `switch>show ip virtual-router`

  IP virtual router is not configured

  `switch>`
show ipv6 virtual-router

The `show ipv6 virtual-router` command displays the virtual MAC address assigned to the switch and all virtual IPv6 addresses assigned to each VLAN interface.

Command Mode

EXEC

Command Syntax

`show ipv6 virtual-router`

Messages

- **IPv6 virtual router is not configured** a virtual MAC address is not assigned to the switch.
- **No interface with virtual IPv6 address** no virtual IPv6 addresses are assigned to any VLAN interfaces.

Examples

- This command displays a table of information for IPv6 VRRP groups on the switch.

```
switch>show ipv6 virtual-router
IP virtual router is configured with MAC address: 001c.7300.0099
MAC address advertisement interval: 30 seconds
Interface Vlan4094
  State is up
  Protocol is up
  IPv6 address
    2001:b8:2001::1011/64
  Virtual IPv6 address
    2001:db8:ac10:fe01::
switch>
```
show vrrp

The `show vrrp` command displays information about the Virtual Router Redundancy Protocol (VRRP) groups configured on a specified interface. Parameter options control the amount and formatting of the displayed information.

**Command Mode**
Privileged EXEC

**Command Syntax**
```
show vrrp
show vrrp INTF [GROUP_NUM] [INFO_LEVEL] [STATES]
show vrrp GROUP_NUM INTF_GROUP [INFO_LEVEL] [STATES]
```

**Parameters**
- **INTF** specifies the VRRP groups for which the command displays status. When the parameter is omitted or specifies only an interface, the group list is filtered by the **STATES** parameter.
  - <no parameter> specified groups on all interfaces.
  - `interface ethernet e_num` specified groups on Ethernet interface.
  - `interface loopback i_num` specified groups on loopback interface.
  - `interface management m_num` specified groups on management interface.
  - `interface port-channel p_num` specified groups on port channel interface.
  - `interface vlan v_num` specified groups on VLAN interface.
  - `interface vxlan vx_num` specified groups on VXLAN interface.
- **GROUP_NUM** the VRRP ID number of the group for which the command displays status.
  - <no parameter> all groups on specified interface.
  - `vrid_num` virtual router identifier (VRID). Value ranges from 1 to 255.
- **INFO_LEVEL** Specifies format and amount of displayed information. Options include:
  - <no parameter> displays a block of data for each VRRP group.
  - `brief` displays a single table that lists information for all VRRP groups.
- **STATES** Specifies the groups, by VRRP router state, that are displayed. Options include:
  - <no parameter> displays data for groups in the master or backup states.
  - `all` displays all groups, including groups in the stopped and interface down states.

**Examples**
- This command displays a table of information for VRRP groups on the switch.
  ```
  switch>show vrrp brief
  Interface Id  Ver Pri Time  State   VrIps
  Vlan1006  3   2   100 3609  Master  127.38.10.2
  Vlan1006  4   3   100 3609  Master  127.38.10.10
  Vlan1010  1   2   100 3609  Master  128.44.5.3
  Vlan1014  2   2   100 3609  Master  127.16.14.2
  switch>
  ```
• This command displays data blocks for all VRRP groups on VLAN 46, regardless of the VRRP state.

switch> show vrrp interface vlan 1006 all
Vlan1010 - Group 1
  VRRP Version 2
  State is Stopped
  Virtual IPv4 address is 128.44.5.3
  Virtual MAC address is 0000.5e00.0101
  Mac Address Advertisement interval is 30s
  VRRP Advertisement interval is 1s
  Preemption is enabled
  Preemption delay is 0s
  Preemption reload delay is 0s
  Priority is 100
  Master Router is 0.0.0.0
  Master Advertisement interval is 1s
  Skew time is 0.609s
  Master Down interval is 3.609s
switch>

• This command displays data for all VRRP group 2 on VLAN 1014.

switch> show vrrp interface vlan 1014 group 2
Vlan1006 - Group 2
  VRRP Version 2
  State is Master
  Virtual IPv4 address is 127.38.10.2
  Virtual MAC address is 0000.5e00.0103
  Mac Address Advertisement interval is 30s
  VRRP Advertisement interval is 1s
  Preemption is enabled
  Preemption delay is 0s
  Preemption reload delay is 0s
  Priority is 100
  Master Router is 127.38.10.1 (local), priority is 100
  Master Advertisement interval is 1s
  Skew time is 0.609s
  Master Down interval is 3.609s
switch>
**vrrp peer authentication**

The `vrrp peer authentication` command configures parameters the switch uses to authenticate virtual router packets it receives from other VRRP routers in the group.

The `no vrrp peer authentication` and `default vrrp peer authentication` commands disable VRRP peer authentication of packets from the specified virtual router by removing the corresponding `vrrp peer authentication` command from *running-config*. The `no vrrp` command also removes the `vrrp peer authentication` command for the specified virtual router.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
vrrp group peer authentication AUTH_PARAMETER
no vrrp group peer authentication
default vrrp group peer authentication
```

**Parameters**

- `group` virtual router identifier (VRID). Values range from 1 to 255.
- `AUTH_PARAMETER` encryption level and authentication key used by router. Options include:
  - `text text_key` plain-text authentication, `text_key` is text.
  - `text_key` plain-text authentication, `text_key` is text.
  - `ietf-md5 key-string 0 text_key` IP authentication of MD5 key hash, `text_key` is text.
  - `ietf-md5 key-string text_key` IP authentication of MD5 key hash, `text_key` is text.
  - `ietf-md5 key-string 7 coded_key` IP authentication of MD5 key hash, `coded_key` is MD5 hash.

**Guidelines**

This command is applicable to VRRPv2 which supports IPv4 addresses only.

**Examples**

- This command implements plain-text authentication, using 12345 as the key, for virtual router 40 on VLAN 100.
  ```
  switch(config)#interface vlan 100
  switch(config-if-vl100)#vrrp 40 peer authentication text 12345
  switch(config-if-vl100)#
  ```

- This command implements ietf-md5 authentication, using 12345 as the key.
  ```
  switch(config-if-vl100)#vrrp 40 peer authentication ietf-md5 key-string 0 12345
  switch(config-if-vl100)#
  ```

- This command implements ietf-md5 authentication, using 12345 as the key. The key is entered as the MD5 hash equivalent of the text string.
  ```
  switch(config-if-vl100)#vrrp 40 peer authentication ietf-md5 key-string 7 EA3TUPzddFCLYT8mb+kxw==
  switch(config-if-vl100)#
  ```
vrrp timers delay reload

The `vrrp timers delay reload` command delays the time for VRRP initialization after a system reboot.

The `no vrrp timers delay reload` and `default vrrp timers delay reload` commands restore the default value of 0 by deleting the `vrrp timers delay reload` statement from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
vrrp group timers delay reload [INTERVAL]
no vrrp group timers delay reload
default vrrp group timers delay reload
```

**Parameters**

- **INTERVAL**  The number of seconds for the delay (seconds). Options include:
  - `<no parameter>`  Default value of 0 seconds.
  - `<0 to 3600>`  Ranges between 0 and 60 minutes.

**Example**

- These commands configure the VRRP reload delay interval to 15 minutes.
  
  switch(config)#interface vlan 100
  switch(config-if-Vl100)#vrrp 2 timers delay reload 900
  switch(config-if-Vl100)#

- These commands removes the VRRP reload delay interval.
  
  switch(config)#interface vlan 100
  switch(config-if-Vl100)#no vrrp 2 timers delay reload
  switch(config-if-Vl100)#
vrrp ipv4

The **vrrp ipv4** command configures the primary IP address for the specified VRRP virtual router. The command also activates the virtual router if the primary address is contained in the interface’s subnet. A VRRP virtual router’s configuration may contain only one primary IP address assignment command; subsequent **vrrp ipv4** commands replace the existing primary address assignment.

The **vrrp ipv4 secondary** command assigns a secondary IP address to the VRRP virtual router.

The **no vrrp ipv4** and **default vrrp ipv4** commands disable the VRRP virtual router and deletes the primary IP address by removing the corresponding **vrrp ipv4** statement from **running-config**. The **no vrrp** command also removes the **vrrp ipv4** command for the specified virtual router.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
```
  vrrp group ipv4 ipv4_address
  no vrrp group ipv4 ipv4_address
  default vrrp group ipv4 ipv4_address
```

**Parameters**
- **group** virtual router identifier (VRID). Values range from 1 to 255.
- **ipv4_address** IPv4 address of the virtual router.

**Related Commands**
- **vrrp ipv4 secondary**

**Example**
- This command enables virtual router 15 on VLAN 20 and designates 10.1.1.5 as the virtual router’s primary address.

```
switch(config)#interface vlan 20
switch(config-if-vl20)#vrrp 15 ipv4 10.1.1.5
switch(config-if-vl20)#
```
vrrp ipv4 version

The **vrrp ipv4 version** command enables VRRP on the configuration mode interface and configures the VRRP version for the specified VRRP virtual router.

The **no vrrp ipv4 version** and **default vrrp ipv4 version** commands restore the default VRRP version to VRRPv2 by removing the corresponding **vrrp ipv4 version** statement from **running-config**.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
vrrp group ipv4 version VERSION_NUMBER
no vrrp group ipv4 version
default vrrp group ipv4 version
```

**Parameters**
- **group** virtual router identifier (VRID). Values range from 1 to 255.
- **VERSION_NUMBER** Specifies VRRP version that the switch uses. Default value is 2 (VRRPv2)

  Options include:
  - 2 VRRP v2 supports IPv4 environment.
  - 3 VRRP v3 supports IPv4 and IPv6 environment.

**Example**
- This command enables VRRPv3 for IPv6 on interface Ethernet 3.
  
  ```
  switch#{config}#interface ethernet 3
  switch#{config-if-Et3}#vrrp 1 ipv4 version 3
  switch#
  ```

- This command removes VRRPv3 from interface Ethernet 3 and reverts to the default VRRPv2.
  
  ```
  switch#{config}#interface ethernet 3
  switch#{config-if-Et3}#no vrrp 1 ipv4 version
  switch#{config-if-Et3}#
  ```
vrrp ipv4 secondary

The `vrrp ipv4 secondary` command assigns a secondary IP address to the specified virtual router. Secondary IP addresses are an optional virtual router parameter. A virtual router may contain multiple secondary address commands. The IP address list must be identical for all VRRP routers in a virtual router group.

The virtual router is assigned a primary IP address with the `vrrp ipv4` command.

The `no vrrp ipv4 secondary` and `default vrrp ipv4 secondary` commands remove the secondary IP address for the specified VRRP virtual router by deleting the corresponding `vrrp ipv4 secondary` statement from `running-config`. The `no vrrp` command also removes all `vrrp ipv4 secondary` commands for the specified virtual router.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
vrrp group ipv4 ipv4_addr secondary
no vrrp group ipv4 ipv4_addr secondary
default vrrp group ipv4 ipv4_addr secondary
```

**Parameters**

- `group` virtual router identifier (VRID). Values range from 1 to 255.
- `ipv4_addr` secondary IPv4 address of the virtual router.

**Related Commands**

- `vrrp ipv4`

**Example**

- This command assigns the IP address of 10.2.4.5 as the secondary IP address for the virtual router with VRID of 15 on VLAN 20
  
  switch(config)#interface vlan 20
  switch(config-if-vl20)#vrrp 15 ipv4 10.2.4.5 secondary
  switch(config-if-vl20)#
The `vrrp ipv6` command configures the IPv6 address for the specified VRRP virtual router. The command also activates the virtual router if the primary address is contained in the interface’s subnet.

The no `vrrp ipv6` and default `vrrp ipv6` commands disable the VRRP virtual router and deletes the IPv6 address by removing the corresponding `vrrp ipv6` statement from `running-config`. The no `vrrp` command also removes the `vrrp ipv6` command for the specified virtual router.

### Command Mode
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

### Command Syntax

- `vrrp group ip ipv6_address`
- `no vrrp group ip ipv6_address`
- `default vrrp group ip ipv6_address`

### Parameters
- `group` virtual router identifier (VRID). Values range from 1 to 255.
- `ipv6_address` IPv6 address of the virtual router.

### Example
- This command enables address 2001:db8:0:1::1 for IPv6 VRRP on VLAN 20.
  ```
  switch(config)#interface vlan 20
  switch(config-if-vl20)#vrrp 3 ipv6 2001:db8:0:1::1
  switch(config-if-vl20)#
  ```
- This command disables VRRPv3 on VLAN 20 from virtual router 3.
  ```
  switch(config)#interface vlan 20
  switch(config-if-vl20)#no vrrp 3 ipv6 2001:db8:0:1::1
  switch(config-if-vl20)#
  ```
vrrp mac-address advertisement-interval

The `vrrp mac-address advertisement-interval` command specifies the interval between advertisement packets sent by the master router to the VRRP group members.

The `vrrp mac-address advertisement-interval 0, no vrrp mac-address advertisement-interval` and `default vrrp mac-address advertisement-interval` commands disable the feature by removing the `vrrp mac-address advertisement-interval` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
  vrrp group mac-address advertisement-interval period
  no vrrp group mac-address
  default vrrp group mac-address
```

**Parameters**
- `group` virtual router identifier (VRID). Values range from 1 to 255.
- `period` interval in which the master router sends advertisement packets (seconds). Value ranges from 0 to 3600. Selecting 0 as the interval disables this feature.

**Example**
- This command specifies the interval between advertisement packets sent to the members of VRRP group 3 on VLAN 20.
  ```
  switch(config)#interface vlan 20
  switch(config-if-vl20)#vrrp 3 mac-address advertisement-interval 60
  switch(config-if-vl20)#
  ```

- This command disables the feature on VLAN 20.
  ```
  switch(config)#interface vlan 20
  switch(config-if-vl20)#no vrrp 3 mac-address advertisement-interval
  switch(config-if-vl20)#
  ```
**vrrp preempt**

The `vrrp preempt` command controls a virtual router’s preempt mode setting. When preempt mode is enabled, if the switch has a higher priority it will preempt the current master virtual router. When preempt mode is disabled, the switch can become the master virtual router only when a master virtual router is not present on the subnet, regardless of VRRP priority level settings. By default, preempt mode is enabled.

The `no vrrp preempt` and `default vrrp preempt` commands disable preempt mode for the specified virtual router; the `default vrrp preempt` command stores a corresponding `no vrrp preempt` statement in `running-config`. The `vrrp preempt` command enables preempt mode by removing the corresponding `no vrrp preempt` statement from `running-config`.

The `no vrrp` command also enables preempt mode by removing the `no vrrp preempt` command for the specified virtual router.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```markdown
vrrp group preempt
no vrrp group preempt
default vrrp group preempt
```

**Parameters**

- `group` virtual router identifier (VRID). Values range from 1 to 255.

**Related Commands**

- `vrrp preempt delay`

**Examples**

- This command disables preempt mode for virtual router 20 on VLAN 40.
  ```
  switch(config)#interface vlan 40
  switch(config-if-vl40)#no vrrp 20 preempt
  switch(config-if-vl40)#
  ```

- This command enables preempt mode for virtual router 20 on VLAN 40.
  ```
  switch(config-if-vl40)#vrrp 20 preempt
  switch(config-if-vl40)#
  ```
vrrp preempt delay

The vrrp preempt delay command specifies the interval between a VRRP preemption event and the point when the switch becomes the master VRRP router. A preemption event is any event that results in the switch having the highest virtual router priority setting while preemption is enabled. The vrrp preempt command enables preemption for a specified virtual router.

The command configures two delay periods:

- **minimum** time delays master VRRP takeover when VRRP is fully implemented.
- **reload** time delays master VRRP takeover after VRRP is initialized following a switch reload (boot). The switch bypasses the reload time to become the VRRP master immediately if it senses there are no other active switches in the virtual router group.

*Running-config* maintains separate delay statements for **minimum** and **reload** parameters. Commands may list both parameters. Commands that list one parameter do not affect the omitted parameter. Values range from 0 to 3600 seconds (one hour). The default delay is zero seconds for both parameters.

The no vrrp preempt delay and default vrrp preempt delay commands reset the specified delay to the default of zero seconds. Commands that do no list either parameter resets both periods to zero. The no vrrp command also removes all vrrp preempt delay commands for the specified virtual router.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
  vrrp group preempt delay [MINIMUM_INTERVAL] [RELOAD_INTERVAL]
  no vrrp group preempt delay [DELAY_TYPE]
  default vrrp group preempt delay [DELAY_TYPE]
```

**Parameters**

- **group** virtual router identifier (VRID). Values range from 1 to 255.
- **MINIMUM_INTERVAL** period between preempt event and takeover of master VRRP router role.
  - <no parameter> minimum delay is not altered by command.
  - **minimum** min_time delay during normal operation (seconds). Values range from 0 to 3600.
- **RELOAD_INTERVAL** period after reboot-VRRP initialization and takeover of master VRRP router role.
  - <no parameter> reload delay is not altered by command.
  - **reload** reload_time delay after reboot (seconds). Values range from 0 to 3600.
- **DELAY_TYPE** delay type that is reset to default value.
  - <no parameter> reload and minimum delays are reset to default.
  - **minimum** minimum delay is reset to default.
  - **reload** reload delay is reset to default.

*(DELAY_TYPE) parameter is only used in no vrrp preempt delay and default vrrp preempt delay commands.*

**Related Commands**

- vrrp preempt
Examples

- This command sets the minimum preempt time of 90 seconds for virtual router 20 on VLAN 40.
  
  ```
  switch(config)#interface vlan 40
  switch(config-if-vl40)#vrrp 20 preempt delay minimum 90
  switch(config-if-vl40)#
  ```

- This command sets the minimum and reload preempt time to zero for virtual router 20 on VLAN 40.
  
  ```
  switch(config-if-vl40)#no vrrp 20 preempt delay
  switch(config-if-vl40)#
  ```
**vrrp priority-level**

The `vrrp priority-level` command configures the switch’s priority setting for a VRRP virtual router. Priority values range from 1 to 254. The default value is 100.

The router with the highest VRRP priority level setting for a group becomes the master virtual router for that group. The master virtual router controls the IP address and is responsible for forwarding traffic sent. The `vrrp preempt` command controls the time when a switch can become the master virtual router.

The `no vrrp priority-level` and `default vrrp priority-level` commands restore the default priority of 100 to the virtual router on the configuration mode interface by removing the corresponding `vrrp priority-level` command from `running-config`. The `no vrrp` command also removes the `vrrp priority-level` command for the specified virtual router.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
vrrp group priority-level level
no vrrp group priority-level
default vrrp group priority-level
```

**Parameters**

- `group` virtual router identifier (VRID). Values range from 1 to 255.
- `level` priority setting for the specified virtual router. Values range from 1 to 254.

**Examples**

- This command sets the virtual router priority value of 250 for virtual router group 45 on VLAN 20.
  ```
  switch(config)#interface vlan 20
  switch(config-if-vl20)#vrrp 45 priority-level 250
  switch(config-if-vl20)#
  ```
vrrp session description

The `vrrp session description` command associates a text string to a VRRP virtual router on the configuration mode interface. The string has no functional impact on the virtual router. The maximum length of the string is 80 characters.

The `no vrrp session description` and `default vrrp session description` commands remove the text string association from the VRRP virtual router by deleting the corresponding `vrrp session description` command from `running-config`. The `no vrrp` command also removes the `vrrp session description` command for the specified virtual router.

Command Mode
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

Command Syntax

```
vrrp group session description label_text
no vrrp group session description
default vrrp group session description
```

Parameters
- `group` virtual router identifier (VRID). Values range from 1 to 255.
- `label_text` text that describes the virtual router. Maximum string length is 80 characters.

Example
- This command associates the text string `Laboratory Router` to virtual router 15 on VLAN 20.

```
switch(config)#interface vlan 20
switch(config-if-vl20)#vrrp 15 session description Laboratory Router
switch(config-if-vl20)#
```
vrrp disabled

The `vrrp disabled` command places the switch in stopped state for the specified virtual router. While in stopped state, the switch cannot act as a Master or backup router for the virtual router group.

The `no vrrp disabled` and `default vrrp disabled` commands remove the corresponding `vrrp disabled` command from `running-config`. This changes the switch’s virtual router state to `backup` or `master` if the virtual router is properly configured.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
vrrp group disabled
no vrrp group disabled
default vrrp group disabled
```

**Parameters**

- `group` virtual router identifier (VRID). Values range from 1 to 255.

**Example**

- These commands place the switch in stopped mode for virtual router 24 on VLAN 20.
  ```
  switch(config)#interface vlan 20
  switch(config-if-vl20)#vrrp 24 disabled
  switch(config-if-vl20)#
  ```

- This command moves the switch out of stopped mode for virtual router 24 on VLAN 20.
  ```
  switch(config-if-vl20)#no vrrp 24 disabled
  switch(config-if-vl20)#
  ```
vrrp advertisement interval

The `vrrp advertisement interval` command configures the interval between successive advertisement messages that the switch sends to VRRP routers in the specified virtual router group. The switch must be the group’s Master virtual router to send advertisement messages. The advertisement interval must be configured identically on all physical routers in the virtual router group.

The advertisement interval also influences the timeout interval that defines when the virtual router becomes the master virtual router. When preemption is enabled, the virtual router becomes the master when three times the advertisement interval elapses after the switch detects master router priority conditions.

The `no vrrp advertisement interval` and `default vrrp advertisement interval` commands restore the default advertisement interval of one second for the specified virtual router by removing the corresponding `vrrp advertisement interval` command from `running-config`. The `no vrrp` command also removes the `vrrp advertisement interval` command for the specified virtual router.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
vrrp group advertisement interval adv_time
no vrrp group advertisement interval
default vrrp group advertisement interval
```

**Parameters**
- `group` virtual router identifier (VRID). Values range from 1 to 255.
- `adv_time` advertisement interval (seconds). Values range from 1 to 255. Default value is 1.

**Example**
- This command sets the advertisement interval of five seconds for the virtual router 35 on VLAN 100.

```
switch(config)#interface vlan 100
switch(config-if-vl100)#vrrp 35 advertisement interval 5
```

vrrp tracked-object

The `vrrp tracked-object` command configures the VRRP client process on the configuration mode interface to track the specified tracked object and react when its status changes to `down`. The tracked object is created by the `track` command.

The `no vrrp tracked-object` and `default vrrp tracked-object` commands cause the VRRP client process to stop tracking the specified tracked object by removing the corresponding `vrrp tracked-object` command from `running-config`.

Command Mode
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

Command Syntax

```plaintext
vrrp group tracked-object object_name ACTION amount
no vrrp group tracked-object object_name ACTION
default vrrp group tracked-object object_name ACTION
```

Parameters

- `group` virtual router identifier (VRID). Values range from 1 to 255.
- `object_name` name of tracked object.
- `amount` amount to decrement VRRP priority level. Values range from 1 to 254.
- `ACTION` The action that VRRP is to take when the tracked object's status changes to `down`. Options include:
  - `decrement` decrease VRRP priority level by `amount`.
  - `shutdown` shut down VRRP on the configuration mode interface.

If both `decrement` and `shutdown` are configured on the same interface for the same VRRP group, then VRRP will be shut down on the interface if the tracked object is down.

Related Commands

- `track`

Example

- This command causes Ethernet interface 5 to disable VRRP when tracked object ETH8 changes state.

```
switch(config-if-Et5)#vrrp 1 tracked-object ETH8 shutdown
switch(config-if-Et5)#
```
Spanning Tree Protocol

Spanning Tree Protocols prevent bridging loops in Layer 2 Ethernet networks. Arista switches support Rapid Spanning Tree, Multiple Spanning Tree, and Rapid-Per VLAN Spanning Tree protocols. These sections describe the Arista Spanning Tree Protocol implementation.

- Section 26.1: Introduction to Spanning Tree Protocols
- Section 26.2: Spanning Tree Overview
- Section 26.3: Configuring a Spanning Tree
- Section 26.4: STP Commands

26.1 Introduction to Spanning Tree Protocols

Arista Switches support the leading spanning tree protocols: RSTP, MST and Rapid-PVST. This variety of options simplifies integration into existing networks without compromising network reliability, scalability or performance.

26.2 Spanning Tree Overview

An Ethernet network functions properly when only one active path exists between any two stations. A spanning tree is a loop-free subset of a network topology. STP is a L2 network protocol that ensures a loop-free topology for any bridged Ethernet LAN. STP allows a network to include spare links as automatic backup paths that are available when an active link fails without creating loops or requiring manual intervention. The original STP is standardized as IEEE 802.1D.

Several variations to the original STP improve performance and add capacity. Arista switches support these STP versions:

- Rapid Spanning Tree (RSTP)
- Multiple Spanning Tree (MSTP)
- Rapid Per-VLAN Spanning Tree (Rapid-PVST)

The Overview contains the following sections:

- Section 26.2.1: Spanning Tree Protocol Versions
- Section 26.2.2: Structure of a Spanning Tree Instance
- Section 26.2.3: BPDUs

26.2.1 Spanning Tree Protocol Versions

STP versions supported by Arista switches address two limitations of the original Spanning Tree protocol that was standardized as IEEE 802.1D:
Spanning Tree Overview

- Slow convergence to the new spanning tree topology after a network change
- The entire network is covered by one spanning tree instance.

The following sections describe the supported STP versions, compatibility issues in networks containing switches running different STP versions, and supported alternatives to spanning tree.

26.2.1.1 Rapid Spanning Tree Protocol (RSTP)

RSTP is specified in 802.1w and supersedes STP. RSTP provides rapid convergence after network topology changes. Similar to STP, RSTP provides a single instance of spanning tree for the entire network. Standard 802.1D-2004 incorporates RSTP and obsoletes STP.

The RSTP instance is the base unit of MST and Rapid-PVST spanning trees.

26.2.1.2 Rapid Per-VLAN Spanning Tree Protocol (Rapid-PVST)

Rapid Per-VLAN Spanning Tree (PVST) extends the original STP to support a spanning tree instance on each VLAN in the network. The maximum number of PVST instances that can be created on a switch depends on the hardware platform. In most of the cases, it is 510. PVST can load balance layer-2 traffic without creating a loop because it handles each VLAN as a separate network. However, PVST does not address slow network convergence after a network topology change.

Arista switches support Rapid-PVST, which is a variation of PVST based on RSTP instances. Rapid-PVST provides rapid connectivity recovery after the failure of a bridge, port, or LAN. Rapid-PVST can be enabled or disabled on individual VLANs.

26.2.1.3 Multiple Spanning Tree Protocol (MSTP)

MST extends rapid spanning tree protocol (RSTP) to support multiple spanning tree instances on a network, but is still compatible with RSTP. By default, Arista switches use MSTP.

MST supports multiple spanning tree instances, similar to Rapid PVST. However, MST associates an instance with multiple VLANs. This architecture supports load balancing by providing numerous forwarding paths to data traffic. Network fault tolerance is improved because failures in one instance do not affect other instances.

**MST Regions**

An **MST region** is a group of connected switches with identical MST configuration. Each region can support a maximum of 65 spanning-tree instances. MST regions are identified by a version number, name, and VLAN-to-instance map. You must configure identical parameters on all switches in the regions. Only MST region members participate with the MST instances defined in the region. A VLAN can be simultaneously assigned to only one spanning-tree instance. MST does not specify the maximum number of regions that a network can contain.

**MST Instances**

Each MST instance is identified by an instance number that ranges from 0 to 4094 and is associated with a set of VLANs. An MST region contains two types of spanning tree instances: an Internal Spanning Tree Instance (IST) and Multiple Spanning Tree Instances (MSTI).

- IST is the default spanning tree instance in MST regions; and is always zero. It gives a root switch to the region that contains all VLANs configured across all switches in the region but not assigned to a MST instance.
Multiple Spanning Tree instances (MSTIs) consist of VLANs that are assigned through MST configuration statements. VLANs assigned to an MSTI are removed from the IST instance. VLANs in an MSTI operate as a part of a single Spanning Tree topology. Because each VLAN can belong to only one instance, MST instances (and the IST) are topologically independent.

26.2.1.4 Version Interoperability

A network can contain switches running different spanning tree versions. The common spanning tree (CST) is a single forwarding path the switch calculates for STP, RSTP, MSTP, and Rapid-PVST topologies in networks containing multiple spanning tree variations.

In multi-instance topologies, the following instances correspond to the CST:

- **Rapid-PVST**: VLAN 1
- **MST**: IST (instance 0)

RSTP and MSTP are compatible with other spanning tree versions:

- An RSTP bridge sends 802.1D (original STP) BPDUs on ports connected to an STP bridge.
- RSTP bridges operating in 802.1D mode remain in 802.1D mode even after all STP bridges are removed from their links.
- An MST bridge detects a port is at a region boundary when it receives an STP BPDU or an MST BPDU from a different region.
- MST ports assume they are boundary ports when the bridges to which they connect join the same region.

The `clear spanning-tree detected-protocols` command forces MST ports to renegotiate with their neighbors.

26.2.1.5 Switchport Interface Pairs

Switchport interface pairs associate two interfaces in a primary-backup configuration. When the primary interface is functioning, the backup interface remains dormant in standby mode. When the primary interface stops functioning, the backup interface handles the traffic.

An alternative implementation balances traffic between the primary and backup interfaces. If either interface shuts down, the other handles traffic addressed to the pair.

The following guidelines apply to switchport interface pairs.

- Ethernet and Port Channels can be primary interfaces.
- Ethernet, Port Channel, Management, Loopback, and VLAN interfaces can be backup interfaces.
- The primary and backup interfaces can be different interface types.
- Interface pairs should be similarly configured to ensure consistent behavior.
- An interface can be associated with a maximum of one backup interface.
- An interface can back up a maximum of one interface.
- Any Ethernet interface configured in an interface pair cannot be a port channel member.
- STP is disabled on ports configured as primary or backup interfaces.
- Static MAC addresses should be configured after primary-backup pairs are established.
26.2.1.6 Disabling Spanning Tree

When spanning tree is disabled and switchport interface pairs are not configured, all interfaces forward packets as specified by their configuration. STP packets are not generated and inbound STP packets are forwarded on the VLAN where they are received as normal multicast data packets.

Important! Disabling all Spanning Tree Protocols on the switch is strongly discouraged.

26.2.2 Structure of a Spanning Tree Instance

A layer 2 network consists of bridges and network segments. A loop exists when multiple active paths connect two components. Spanning tree protocols allow only one active path between any two network components. Loops are removed by blocking selected ports that connect bridges to network segments.

Ports are assigned cost values that reflect their transmission speed and any other criteria selected by the administrator. Ports with faster transmission speeds and other desirable characteristics are assigned lower costs. High cost ports are blocked in deference to lower cost ports.

A network topology defines multiple possible spanning trees. Network bridges collectively compute and implement one spanning tree to maintain connectivity between all network components while blocking ports that could result in loops. Administrators improve network performance by adjusting parameter settings to select the most efficient spanning tree.

Spanning tree bridges continuously transmit topology information to notify all other bridges on the network when topology changes are required, such as when a link fails. Bridge Protocol Data Units (BPDUs) are STP information packets that bridges exchange.

The following sections describe spanning tree configuration parameters.

26.2.2.1 Root and Designated Bridges

The root bridge is the center of the STP topology. A spanning tree instance has one root bridge. Spanning tree bases path calculations on each network component’s distance from the root bridge.

All other network bridges calculate paths to the root bridge when selecting spanning tree links. STP calculates the distance to the root bridge to build a loop-free topology that features the shortest distance between devices among all possible paths.

Each switch is assigned a unique bridge ID number for each instance. All network switches collectively elect the root bridge by comparing bridge IDs. The root bridge is the switch with the lowest bridge ID.

The bridge ID contains the following eight bytes, in order of decreasing significance:

- Port priority (four bits)
- Instance number (12 bits): VLAN number (Rapid-PVST); instance number (MST); 0 (RST)
- MAC address of switch (six bytes)

A designated bridge is defined for each network segment as the switch that provides the segment’s shortest path to the root bridge. A designated bridge is selected for each segment after a root bridge is selected; a switch can be a designated bridge for multiple segments.

The following network calculations in Figure 26-1 assume that each path has the same cost:

- Switch B is the root bridge – its bridge ID is lowest because it has the smallest port priority.
- Switch A is the designated bridge for VLAN 11.
- Switch B is the designated bridge for VLAN 10, VLAN 13, VLAN 16, VLAN 18, VLAN 19.
- Switch C is the designated bridge for VLAN 25.
Switch D is the designated bridge for VLAN 21, VLAN 23.

Figure 26-1: Spanning Tree Network Example

-- 26.2.2.2  Port Roles  --

Messages from connected devices to the root bridge traverse a least-cost path, which has the smallest cost among all possible paths to the root bridge. The cost of a path is the sum of the costs of all path segments, as defined through port cost settings.

Active ports in a least-cost path fulfill one of two possible roles: root port and designated port. STP blocks all other network ports. STP also defines alternate and backup ports to handle traffic when an active port is inaccessible.

- **Root port (RP) accesses the bridge’s least-cost path to the root bridge.** Each bridge selects its root port after calculating the cost of each possible path to the root bridge.

  The following ports in Figure 26-1 are root ports:
  - **Switch A:** port 2
  - **Switch C:** port 1
  - **Switch D:** port 3

- **Designated port (DP) accesses a network segment’s designated bridge.** Each segment defines one DP. Switches can provide DPs for multiple segments. All ports on the root bridge are DPs.

  The following ports in Figure 26-1 are designated ports:
  - **Switch A:** port 4 (VLAN 11)
  - **Switch B:** port 2 (VLAN 13), port 4 (VLAN 18), port 5 (VLAN 10), port 6 (VLAN 19), port 8 (VLAN 16)
  - **Switch C:** port 2 (VLAN 25)
  - **Switch D:** port 2 (VLAN 23), port 6 (VLAN 21)
• **Alternate ports** provide backup paths from their bridges to the root bridge. An alternate port is blocked until a network change transforms it into a root port.

• **Backup ports** provide alternative paths from VLANs to their designated bridges. A backup port is blocked until a network change transforms it into a designated port.

### 26.2.2.3 Port Activity States

A port’s activity state defines its current STP activity level. STP monitors BPDUs for network changes that require an activity state transition.

STP defines three port activity states:

- **Forwarding**: The port receives and sends data. Root ports and designated ports are either in, or transitioning to, this state.

- **Discarding**: The port does not receive or send data. Blocked ports receive BPDU packets. All ports except RPs and DPs are blocked, including alternate and backup ports.

- **Learning**: The transitional post-discarding state where the port prepares to forward frames by adding source addresses from inbound data packets to the switching database.

### 26.2.2.4 Port Types

Port type is a configurable parameter that reflects the type of network segment that is connected to the port. Proper port type configuration results in rapid convergence after network topology changes.

RSTP port types include normal, network, and edge ports. **Normal** is the default port type.

- **Normal** ports have an unspecified topology.

- **Network** ports connect only to switches or bridges.

  RSTP immediately transitions network ports to the discarding state.

- **Edge** ports connect directly to end stations.

  Edge ports transition directly to forwarding state because they do not create loops. An edge port becomes a normal port when it receives a BPDU.

### 26.2.2.5 Link Types

Link type is a configurable parameter that determines candidates for RSTP fast state transition.

- the default link type for full-duplex ports is **point-to-point**.

- the default link type for half-duplex ports is **shared**.

Fast state transitions are allowed on point-to-point links that connect bridges. Fast state transitions are not allowed on shared ports regardless of the duplex setting.

### 26.2.3 BPDUs

Spanning tree rules specify a root bridge, select designated bridges, and assign roles to ports. STP rule implementation requires that network topology information is available to each switch. Switches exchange topology information through bridge protocol data units (BPDUs). Information provided by BPDU packets include bridge IDs and root path costs.

### 26.2.3.1 BPDU Types

STP defines three BPDU types:

- Configuration BPDU (CBPDU), used for computing the spanning tree.
• Topology Change Notification (TCN) BPDU, announces network topology changes.
• Topology Change Notification Acknowledgment (TCA), acknowledges topology changes.

Bridges enter the following addresses in outbound BPDU frames:
• source address: outbound port’s MAC address.
• destination address: STP multicast address 01:80:C2:00:00:00.

Bridges regularly exchange BPDUs to track network changes that trigger STP recomputations and port activity state transitions. The **hello timer** specifies the period between consecutive BPDU messages; the default is two seconds.

### 26.2.3.2 Bridge Timers

Bridge timers specify parameter values that the switch includes in BPDU packets that it sends as a root bridge. Bridge timers include:

• **hello-time**: transmission interval between consecutive BPDU packets.
• **forward-time**: the period that ports remain in learning state.
• **max-age**: the period that BPDU data remains valid after it is received.
• **max-hop**: the number of bridges in an MST region that a BPDU can traverse before it is discarded.

The switch recomputes the spanning tree topology if it does not receive another BPDU before the max-age timer expires. When **edge** ports and **point-to-point** links are properly configured, RSTP network convergence does not require forward-delay and max-age timers.

### 26.2.3.3 MSTP BPDUs

MSTP BPDUs are targeted at a single instance and provide STP information for the entire region. MSTP encodes a standard BPDU for the IST, then adds region information and MST instance messages for all configured instances, where each message conveys spanning tree data for an instance. Frames assigned to VLANs operate in the instance to which the VLAN is assigned. Bridges enter an MD5 digest of the VLAN-to-instance map table in BPDUs to avoid including the entire table in each BPDU. Recipients use this digest and other administratively configured values to identify bridges in the same MST region.

MSTP BPDUs are compatible with RSTP. RSTP bridges view an MST region as a single-hop RSTP bridge regardless of the number of bridges inside the region because:

• RSTP bridges interpret MSTP BPDUs as RSTP BPDUs.
• RSTP bridges increment the **message age timer** only once while data flows through an MST region; MSTP measures **time to live** with a **remaining hops** variable, instead of the **message age timer**.

Ports at the edge of an MST region connecting to a bridge (RSTP or STP) or to an endpoint are **boundary ports**.
Chapter 26: Spanning Tree Protocol

26.3 Configuring a Spanning Tree

These sections describe the following configuration processes:

- **Section 26.3.1: Version Configuration and Instance Creation**
- **Section 26.3.2: Spanning Tree Instance Configuration**
- **Section 26.3.3: Port Roles and Rapid Convergence**
- **Section 26.3.4: Configuring BPDU Transmissions**

26.3.1 Version Configuration and Instance Creation

The switch supports three STP versions and switchport backup interface pairs. Disabling spanning tree is also supported but not recommended.

The `spanning-tree mode` global configuration command specifies the spanning tree version the switch runs. This section describes command options that enable and configure STP versions.

26.3.1.1 Multiple Spanning Tree (MST)

Multiple Spanning Tree is enabled by the `spanning-tree mode` command with the `mstp` option. MSTP is the default STP version.

**Example**

- This command enables Multiple Spanning Tree.

```plaintext
switch(config)#spanning-tree mode mstp
```

**Configuring MST Regions**

All switches in an MST region must have the same name, revision, and VLAN-to-instance map. MST configuration mode commands set the region parameters. MST configuration mode is a group-change mode where changes are saved by exiting the mode.

**Example**

- The `spanning-tree mst configuration` command places the switch in MST configuration mode.

```plaintext
switch(config)#spanning-tree mst configuration
```

The `instance` command assigns VLANs to MST instances. The `name (mst-configuration mode)` and `revision (mst-configuration mode)` commands configure the MST region name and revision.

**Examples**

- These commands assign VLANs 4-7 and 9 to instance 8 and remove VLAN 6 from instance 10.

```plaintext
switch(config-mst)#instance 8 vlans 4-7,9
switch(config-mst)#no instance 10 vlans 6
```

- These commands assign the `name (corporate_1)` and `revision (3)` to the switch.

```plaintext
switch(config-mst)#name corporate_1
switch(config-mst)#revision 3
```

The `exit (mst-configuration mode)` command transitions the switch out of MST configuration mode and saves all pending changes. The `abort (mst-configuration mode)` command exits MST configuration mode without saving the pending changes.
Example
- This command exits MST configuration mode and saves all pending changes.
  switch(config-mst)#exit
  switch(config)#

Configuring MST Instances
These STP commands provide an optional MST instance parameter. These commands apply to instance 0 when the optional parameter is not included.
- spanning-tree priority
- spanning-tree root
- spanning-tree port-priority

Examples
- This command configures priority for MST instance 4.
  switch(config)#spanning-tree mst 4 priority 4096
  switch(config)#
- Each of these commands configure priority for MST instance 0.
  switch(config)#spanning-tree mst 0 priority 4096
  or
  switch(config)#spanning-tree priority 4096

26.3.1.2 Rapid Spanning Tree (RST)
Rapid spanning tree is enabled through the spanning-tree mode command with the rstp option.

Example
- This command enables Rapid Spanning Tree.
  switch(config)#spanning-tree mode rstp
  switch(config)#

These STP commands, when they do not include an optional MST or VLAN parameter, apply to RSTP. Commands that configure MSTP instance 0 also apply to the RSTP instance.
- spanning-tree priority
- spanning-tree root
- spanning-tree port-priority

Examples
- These commands apply to the RST instance.
  switch(config)#spanning-tree priority 4096
  and
  switch(config)#spanning-tree mst 0 priority 4096
- These commands do not apply to the RST instance.
  switch(config)#spanning-tree mst 4 priority 4096
  and
  switch(config)#spanning-tree vlan-id 3 priority 4096
**Show** commands (such as `show spanning-tree`) displays the RSTP instance as MST0 (MST instance 0).

**Example**
- This command, while the switch is in RST mode, displays RST instance information.

```plaintext
switch(config)#show spanning-tree
MST0
  Spanning tree enabled protocol rstp
  Root ID    Priority    32768
  Address     001c.730c.1867
  This bridge is the root

  Bridge ID  Priority    32768 (priority 32768 sys-id-ext 0)
  Address     001c.730c.1867
  Hello Time  2.000 sec  Max Age 20 sec  Forward Delay 15 sec

  Interface        Role       State      Cost      Prio.Nbr Type
  ---------------- ---------- ---------- --------- -------- -------------------
  Et51             designated forwarding 2000      128.51   P2p

switch(config)#
```

### 26.3.1.3 Rapid Per-VLAN Spanning Tree (Rapid-PVST)

Rapid-PVST mode is enabled by the `spanning-tree mode` command with the `rapid-pvst` option.

**Example**
- This command enables Rapid Per-VLAN Spanning Tree.

```plaintext
switch(config)#spanning-tree mode rapid-pvst
switch(config)#
```

These commands provide an optional VLAN parameter for configuring Rapid-PVST instances.

- `spanning-tree priority`
- `spanning-tree root`
- `spanning-tree port-priority`

**Example**
- This command configures bridge priority for VLAN 4.

```plaintext
switch(config)#spanning-tree vlan-id 4 priority 4096
switch(config)#
```

### 26.3.1.4 Switchport Backup Mode

Switchport backup interface pairs are enabled through the `spanning-tree mode` command with the `backup` option. Enabling switchport backup disables all spanning-tree modes. For loop avoidance under switchport backup mode, use the Loop Protection feature.

**Example**
- This command enables switchport backup.

```plaintext
switch(config)#spanning-tree mode backup
switch(config)#
```
The `switchport backup-link` command establishes an interface pair between the command mode interface (primary) and the interface specified by the command (backup).

**Examples**

- These commands establish Ethernet interface 7 as the backup port for Ethernet interface 1.
  ```
  switch(config)#interface ethernet 1
  switch(config-if-Et1)#switchport backup-link ethernet 7
  ```

The `prefer` option of the `switchport backup-link` command establishes a peer relationship between the primary and backup interfaces and specifies VLAN traffic that the backup interface normally carries. If either interface goes down, the other interface carries traffic normally handled by both interfaces.

**Examples**

These steps perform the following:

- configures Ethernet interface 1 as a trunk port that handles VLANs 4 through 9 traffic.
- configures Ethernet interface 2 as the backup interface.
- assigns Ethernet 2 as the preferred interface for VLANs 7 through 9.

**Step 1** Enter configuration mode for the primary interface
  ```
  switch(config)#interface ethernet 1
  ```

**Step 2** Configure the primary interface as a trunk port that services VLANs 4-9
  ```
  switch(config-if-Et1)#switchport mode trunk
  switch(config-if-Et1)#switchport trunk allowed vlan 4-9
  ```

**Step 3** Configure the backup interface and specify the VLANs that it normally services.
  ```
  switch(config-if-Et1)#switchport backup-link Ethernet 2 prefer vlan 7-9
  ```
26.3.1.5 Loop Protection

Loop protection is a loop detection and prevention method which is independent of STP and is not disabled when the switch is in switchport backup mode. When loop protection is active on an interface, that interface periodically sends out loop-detection frames; if one is received that originated on the switch, the receiving port is errdisabled until a timeout period has passed or it is manually reset.

Loop protection is configured and enabled per VLAN, but individual ports in a VLAN can be configured to disable loop protection.

**Note**  
Loop protection cannot be enabled on an MLAG peer link.

This feature is disabled by default. To enable it, use the `monitor loop-protection` command to enter loop-protection configuration mode, then use the `no shutdown (Loop-protection)` command to enable the feature. To enable loop protection on a VLAN, use the `protect vlan` command. To exclude a port from loop protection, use the `no loop-protection` command.

The feature is configured with the following additional commands:

- `transmit-interval`
- `disabled-time`
- `rate-limit`

**Examples**

- This command enters loop protection configuration mode.
  
  ```
  switch(config)#monitor loop-protection
  switch(config-monitor-loop-protect)#
  ```

- These commands enable loop protection on VLANs 1025-2000.
  
  ```
  switch(config)#monitor loop-protection
  switch(config-monitor-loop-protect)#no shutdown
  switch(config-monitor-loop-protect)#protect vlan 1025-2000
  switch(config-monitor-loop-protect)#
  ```

- These commands exclude Ethernet interface 38 from loop protection.
  
  ```
  switch(config)#interface ethernet 38
  switch(config-if-Et38)#no loop-protection
  switch(config-if-Et38)#
  ```

- These commands configure loop protection with a transmission interval of 10 seconds, a disabled time of two days, and a maximum rate of 500 loop detection frames per second.
  
  ```
  switch(config-monitor-loop-protect)#transmit-interval 10
  switch(config-monitor-loop-protect)#disabled-time 172800
  switch(config-monitor-loop-protect)#rate-limit 500
  switch(config-monitor-loop-protect)#
  ```

26.3.1.6 Disabling Spanning Tree

Spanning tree is disabled by the `spanning-tree mode` command with the `none` option. The switch does not generate STP packets. Switchport interfaces forward packets when connected to other ports. The switch forwards inbound STP packets as multicast data packets on the VLAN where they are received.
Examples

- This command disables all STP functions.
  
  ```
  switch(config)#spanning-tree mode none
  switch(config)#
  ```

26.3.2 Spanning Tree Instance Configuration

A network performs these steps to set up an STP instance:

**Step 1** The bridge with the lowest ID is elected root bridge.

**Step 2** Root ports (RP) are selected on all other bridges.

**Step 3** Designated bridges are selected for each network segment.

**Step 4** Designated ports (DP) are selected on each designated bridge.

**Step 5** Networks begin forwarding data through RPs and DPs. All other ports are blocked.

26.3.2.1 Root Bridge Parameters

STPs use bridge IDs for electing the root bridge. Switches denote a bridge ID for each configured Spanning Tree instance. The bridge ID composition is:

- **Priority (four bits)**
  
  Priority is expressed as a multiple of 4096 because it is stored as the four most significant bits of a two-byte number.

- **Protocol Dependent (twelve bits)**
  - Rapid-PVST: VLAN number
  - MST: Instance number
  - RST: 0

- **MAC address of switch (six bytes)**

Example

- The switch defines bridge IDs for three MST instances:
  - MST 0: 32768 (Priority (32768)+Instance number(0)) and 001c.7301.23de (MAC address)
  - MST101: 32869 (Priority (32768)+Instance number(101)) and 001c.7301.23de (MAC address)
  - MST102: 32870 (Priority (32768)+Instance number(102)) and 001c.7301.23de (MAC address)

This command displays a table of root bridge information.

```
switch>show spanning-tree root

<table>
<thead>
<tr>
<th>Instance</th>
<th>Root ID</th>
<th>MAC addr</th>
<th>Root Cost</th>
<th>Hello Time</th>
<th>Max Age</th>
<th>Fwd Dly</th>
<th>Root Port</th>
</tr>
</thead>
<tbody>
<tr>
<td>MST0</td>
<td>32768</td>
<td>001c.7301.23de</td>
<td>0</td>
<td>2</td>
<td>20</td>
<td>15</td>
<td>Po937</td>
</tr>
<tr>
<td>MST101</td>
<td>32869</td>
<td>001c.7301.23de</td>
<td>3998</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>Po909</td>
</tr>
<tr>
<td>MST102</td>
<td>32870</td>
<td>001c.7301.23de</td>
<td>3998</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>Po911</td>
</tr>
</tbody>
</table>
```

The switch provides two commands that configure the switch priority: `spanning-tree priority` and `spanning-tree root`. The commands differ in the available parameter options:
• **spanning-tree priority** options are integer multiples of 4096 between 0 and 61440.
• **spanning-tree root** options are **primary** and **secondary**.
• **primary** assigns a priority of 8192.
• **secondary** assigns a priority of 16384.

The default priority value is 32768.

The following examples configure bridge IDs with both commands.

**Examples**

• These commands configure MST instance bridge priorities with the **root** command:

```
switch(config)#spanning-tree mst 0 root primary
switch(config)#spanning-tree mst 1 root secondary
switch>show spanning-tree root
```

<table>
<thead>
<tr>
<th>Instance</th>
<th>Root ID</th>
<th>MAC addr</th>
<th>Cost</th>
<th>Hello</th>
<th>Time</th>
<th>Age</th>
<th>Dly</th>
<th>Root Port</th>
</tr>
</thead>
<tbody>
<tr>
<td>MST0</td>
<td>8192</td>
<td>001c.7301.6017</td>
<td>0</td>
<td>2</td>
<td>20</td>
<td>15</td>
<td>None</td>
<td></td>
</tr>
<tr>
<td>MST1</td>
<td>16385</td>
<td>001c.7301.6017</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>None</td>
<td></td>
</tr>
<tr>
<td>MST2</td>
<td>32770</td>
<td>001c.7301.6017</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

- Instance 0 root priority is 8192: primary priority plus the instance number of 0.
- Instance 1 root priority is 16385: secondary priority plus the instance number of 1.
- Instance 2 root priority is 32770: default priority plus the instance number of 2.

These priority settings normally program the switch to be the primary root bridge for instance 0, the secondary root bridge for instance 1, and a normal bridge for instance 2. Primary and secondary root bridge elections also depend on the configuration of other network bridges.

• These priority commands configure Rapid-PVST VLAN bridge priorities:

```
switch(config)#spanning-tree vlan-id 1 priority 8192
switch(config)#spanning-tree vlan-id 2 priority 16384
switch(config)#spanning-tree vlan-id 3 priority 8192
switch(config)#no spanning-tree vlan-id 4 priority
switch(config)#show spanning-tree root
```

<table>
<thead>
<tr>
<th>Instance</th>
<th>Root ID</th>
<th>MAC addr</th>
<th>Cost</th>
<th>Hello</th>
<th>Time</th>
<th>Age</th>
<th>Dly</th>
<th>Root Port</th>
</tr>
</thead>
<tbody>
<tr>
<td>VL1</td>
<td>8193</td>
<td>001c.7301.6017</td>
<td>0</td>
<td>2</td>
<td>20</td>
<td>15</td>
<td>None</td>
<td></td>
</tr>
<tr>
<td>VL2</td>
<td>16386</td>
<td>001c.7301.6017</td>
<td>0</td>
<td>2</td>
<td>20</td>
<td>15</td>
<td>None</td>
<td></td>
</tr>
<tr>
<td>VL3</td>
<td>8195</td>
<td>001c.7301.6017</td>
<td>0</td>
<td>2</td>
<td>20</td>
<td>15</td>
<td>None</td>
<td></td>
</tr>
<tr>
<td>VL4</td>
<td>32778</td>
<td>001c.7301.6017</td>
<td>0</td>
<td>2</td>
<td>20</td>
<td>15</td>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

- VLAN 1 root priority is 8193: configured priority plus the VLAN number of 1.
- VLAN 2 root priority is 16386: configured priority plus the VLAN number of 2.
- VLAN 3 root priority is 8195: configured priority plus the VLAN number of 3.
- VLAN 4 root priority is 32778: default priority plus the VLAN number of 4.

These priority settings normally program the switch to be the primary root bridge for VLANs 1 and 3, the secondary root bridge for VLAN2, and a normal bridge for VLAN 4. Primary and secondary root bridge elections also depend on the configuration of other network bridges.
26.3.2.2 Path Cost

Spanning tree calculates the costs of all possible paths from each component to the root bridge. The path cost is equal to the sum of the cost assigned to each port in the path. Ports are assigned a cost by default or through CLI commands. Cost values range from 1 to 200000000 (200 million).

The default cost is a function of the interface speed:

- 1 gigabit interfaces have a default cost of 20000.
- 10 gigabit interfaces have a default cost of 2000.

The `spanning-tree cost` command configures the path cost of the configuration mode interface. Costs can be specified for Ethernet and port channel interfaces. The command provides a mode parameter for assigning multiple costs to a port for MST instances or Rapid-PVST VLANs.

**Examples**

- These commands configure a port cost of 25000 to Ethernet interface 5. This cost is valid for RSTP or MSTP instance 0.

  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#spanning-tree cost 25000
  switch(config-if-Et5)#
  ```

- This command configures a path cost of 300000 to Ethernet interface 5 in MST instance 200.

  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#spanning-tree mst 200 cost 300000
  switch(config-if-Et5)#
  ```

- This command configures a path cost of 10000 to Ethernet interface 5 in Rapid-PVST VLAN 200-220.

  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#spanning-tree vlan-id 200-220 cost 10000
  switch(config-if-Et5)#
  ```

26.3.2.3 Port Priority

STP uses the port priority interface parameter to select ports when resolving loops. The port with the lower port priority numerical value is placed in forwarding mode. When multiple ports are assigned equal port priority numbers, the port with the lower interface number is placed in forwarding mode. Valid port-priority numbers are multiples of 16 between 0 and 240; the default is 128.

The `spanning-tree port-priority` command configures the port-priority number for the configuration mode interface. The command provides a mode option for assigning different priority numbers to a port for multiple MST instances or Rapid-PVST VLANs. Port-priority can be specified for Ethernet and port channel interfaces.

**Examples**

- This command sets the access port priority of 144 for Ethernet 5 interface.

  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#spanning-tree port-priority 144
  switch(config-if-Et5)#
  ```

- This command sets the access port priority of 144 for Ethernet 5 interface in MST instance 10.

  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#spanning-tree mst 10 port-priority 144
  switch(config-if-Et5)#
  ```
26.3.3 Port Roles and Rapid Convergence

Spanning Tree provides the following options for controlling port configuration and operation:

- **PortFast**: Allows ports to skip learning state before entering the forwarding state.
- **Port type** and **link type**: Designates ports for rapid transitions to the forwarding state.
- **Root guard**: Ensures that a port will not become the root port.
- **Loop guard**: Prevents loops resulting from unidirectional failure of links.
- **Bridge assurance**: Prevents loops caused by unidirectional links or a malfunctioning switch.

### 26.3.3.1 PortFast

PortFast allows devices to gain immediate network access before convergence of the spanning tree. Enabling PortFast on ports connected to another switch can create loops.

A **portfast** port that receives a BPDU sets its operating state to **non-portfast** while remaining in **portfast** configured state. In this state, the port is subject to topology changes and can enter the discarding state.

The **spanning-tree portfast** command programs access ports to immediately enter the forwarding state. PortFast connects devices attached to an access port, such as a single workstation, to the network immediately without waiting for STP convergence. PortFast can also be enabled on trunk ports.

**Example**

- This command unconditionally enables portfast on Ethernet 5 interface.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree portfast
```

### 26.3.3.2 Port Type and Link Type Configuration

RSTP only achieves rapid transition to forwarding state on edge ports and point-to-point links.

#### Port Type

Edge ports are directly connected to end stations. Because edge ports do not create loops, they transition directly to forwarding state when a link is established.

The **spanning-tree portfast <port type>** command sets the configuration mode interface’s port type. Spanning tree ports can be configured as **edge** ports, **network** ports, or **normal** ports. The default port type is **normal**.

- **Edge ports** connect to a host (end station). Configuring a port that connects to a bridge as an edge port may create a loop. Edge ports that receive a BPDU become a normal spanning tree port.
- **Network ports** connect only to a Layer 2 switch or bridge. Configuring a port connected to a host as a network port transitions the port to the discarding state.
- **Normal ports** have an unspecified topology.

**Example**

- This command configures Ethernet 5 interface as a network port.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree portfast network
```

1450
Auto-edge detection converts ports into edge ports when they do not receive a new BPDU before the current BPDU expires, as measured by the max-age timer. The `spanning-tree portfast auto` command enables auto-edge detection on the configuration mode interface, superseding the `spanning-tree portfast` command. Auto-edge detection is enabled by default.

**Example**
- This command enables auto-edge detection on Ethernet interface 5.
```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree portfast auto
```

**Link Type**
The switch derives a port’s default link type from its duplex mode:
- full-duplex ports are **point-to-point**.
- half-duplex ports are **shared**.

The `spanning-tree link-type` command specifies the configuration mode interface’s link-type. RSTP fast transition is not allowed on **shared link** ports, regardless of their duplex setting. Because the ports are full-duplex by default, the default link-type setting is **point-to-point**.

**Example**
- This command configures Ethernet 5 interface as a shared port.
```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree link-type shared
```

### 26.3.3.3 Root Guard and Loop Guard

**Root guard** stops a port from becoming a root port, which stops connected switches from becoming root bridges. When a switch detects a new root bridge, its root-guard-enabled ports enter blocked (root-inconsistent) state. When the switch no longer detects a new root, these ports enter learning state.

Root guard is enabled on a per-port basis. The setting applies to all STP instances. Disabling root guard places the port in learning state.

The `spanning-tree guard` command, with the root option, enables root guard on the configuration mode interface.

**Example**
- This command enables root guard on Ethernet 5 interface.
```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree guard root
```

**Loop guard** prevents loops resulting from unidirectional failure of point-to-point links by verifying that non-designated ports (root, blocked, and alternate) are receiving BPDUs from their designated ports. A loop-guard-enabled root or blocked port that stops receiving BPDUs transitions to the discarding (loop-inconsistent) state. The port recovers from this state when it receives a BPDU.

Loop guard, when enabled globally, applies to all point-to-point ports. Loop guard is configurable on individual ports and applies to all STP instances of an enabled port. Loop-inconsistent ports transition to learning state when loop guard is disabled.
If loop guard is enabled on a root switch, it takes effect only if the switch becomes a nonroot switch. When using loop guard:

- Do not enable loop guard on portfast-enabled ports.
- Loop guard is not functional on ports not connected to point-to-point links.
- Loop guard has no effect on disabled spanning tree instances.

Loop guard aspects on port channels include:

- BPDUs are sent over the channel’s first operational port. Loop guard blocks the channel if that link becomes unidirectional even when other channel links function properly.
- Creating a new channel destroys state information for its component ports; new channels with loop-guard-enabled ports can enter forwarding state as a DP.
- Dissembling a channel destroys its state information; component ports from a blocked channel can enter the forwarding state as DPs, even if the channel contained unidirectional links.
- If a link on any port of the channel becomes unidirectional, the channel is blocked. Transmission resumes if the port is removed from the channel or the bidirectional communication is restored.

Loop guard configuration commands include:

- `spanning-tree guard loop default` command enables loop guard as a default on all switch ports.
- `spanning-tree guard` control the loop guard setting on the configuration mode interface. This command overrides the default command for the specified interface.

**Examples**

- This command enables loop guard as the default on all switch ports.
  ```
  switch(config)#spanning-tree guard loop default
  switch(config)#
  ```
- This command enables loop guard on Ethernet 6 interface.
  ```
  switch(config)#interface ethernet 6
  switch(config-if-Et6)#spanning-tree guard loop
  switch(config-if-Et6)#
  ```

### 26.3.3.4 Bridge Assurance

Bridge assurance protects against unidirectional link failures, other software failures, and devices that continue forwarding data traffic even after they quit running spanning tree.

Bridge assurance programs the switch to send BPDUs at each hello time period through all bridge assurance-enabled ports (i.e., network ports). Bridge assurance operates only on network ports with point-to-point links, ideally with bridge assurance enabled on each side of the link. Bridge assurance-enabled ports will not necessarily be blocked when they link to a port where bridge assurance is not enabled.

Ports not receiving a BPDU packet within a hello time period enter inconsistent (blocking) state. In this case, the `show spanning-tree transmit active` command will show a bridge assurance status of “inconsistent” for the port. If the other side of the link has bridge assurance enabled, or if the other switch is the root bridge, it will send periodic BPDUs, preventing an “inconsistent” blocking state.

Bridge assurance is globally enabled by default, but must also be enabled on a per-port basis by designating the port as a network port with the `spanning-tree portfast <port type>` command. The `no spanning-tree transmit active` command disables bridge assurance globally.
Example

- These commands enable bridge assurance on the switch, then enable bridge assurance on Ethernet port 5 by designating it a network port.

  switch(config)#spanning-tree transmit active
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#spanning-tree portfast network
  switch(config-if-Et5)#

26.3.4 Configuring BPDU Transmissions

The following sections describe instructions that configure BPDU packet contents and transmissions.

26.3.4.1 Bridge Timers

Bridge timers configure parameter values that the switch includes in BPDU packets that it sends as a root bridge. Bridge timers include:

- **hello-time**: the transmission interval between consecutive outbound BPDU packets.
- **forward-time**: the period that ports are in learning state prior to forwarding packets.
- **max-age**: the period that BPDU data remains valid after it is received. The switch recomputes the spanning tree topology if it does not receive another BPDU packet before the timer expires.
- **max-hop**: the number of bridges in an MST region that a BPDU can traverse before it is discarded.

In standard STP, ports passively wait for **forward_delay** and **max_age** periods before entering the forwarding state. RSTP achieves faster convergence by relying on edge port and link type definitions to start forwarding traffic. When edge ports and link types are properly configured, bridge timers are used in RSTP as backup or when interacting with networks running standard STP.

The **spanning-tree hello-time** command configures the hello time.

Example

- This command configures a hello-time of 1 second (1000 ms).

  switch(config)#spanning-tree hello-time 1000
  switch(config)#

The **spanning-tree max-hops** command specifies the max hop setting that the switch inserts into BPDUs that it sends out as the root bridge.

Example

- This command sets the max hop value to 40.

  switch(config)#spanning-tree max-hops 40
  switch(config)#

The **spanning-tree forward-time** command configures the forward delay setting that the switch inserts into BPDUs that it sends out as the root bridge.

Example

- This command sets the forward delay timer value to 25 seconds.

  switch(config)#spanning-tree forward-time 25
  switch(config)#

The **spanning-tree max-age** command configures the max age setting that the switch inserts into BPDUs that it sends out as the root bridge.
Example

- This command sets the max age timer value to 25 seconds.

```text
switch(config)#spanning-tree max-age 25
switch(config)#
```

26.3.4.2 BPDU Transmit Hold-Count

The `spanning-tree bpdu tx hold-count` command specifies the maximum number of BPDUs per second that the switch can send from an interface. Valid settings range from 1 to 10 BPDUs with a default of 6 BPDUs.

Higher hold-count settings can significantly impact CPU utilization, especially in Rapid-PVST mode. Smaller values can slow convergence in some configurations.

Example

- This command configures a transmit hold-count of 8 BPDUs.

```text
switch(config)#spanning-tree bpdu tx hold-count 8
switch(config)#
```

26.3.4.3 BPDU Guard

PortFast interfaces do not receive BPDUs in a valid configuration. BPDU Guard provides a secure response to invalid configurations by disabling ports when they receive a BPDU. Disabled ports differ from blocked ports in that they are re-enabled only through manual intervention.

- When configured globally, BPDU Guard is enabled on ports in the operational portfast state.
- When configured on an individual interface, BPDU Guard disables the port when it receives a BPDU, regardless of the port’s portfast state.

The `spanning-tree edge-port bpdu guard default` global configuration command enables BPDU guard by default on all portfast ports. BPDU guard is disabled on all ports by default.

The `spanning-tree bpdu guard` interface configuration command controls BPDU guard on the configuration mode interface. This command takes precedence over the default setting configured by `spanning-tree edge-port bpdu guard default`.

- `spanning-tree bpdu guard` enables BPDU guard on the configuration mode interface.
- `spanning-tree bpdu guard disable` disables BPDU guard on the configuration mode interface.
- `no spanning-tree bpdu guard` reverts the configuration mode interface to the default BPDU guard setting.

Example

- These commands enable BPDU guard by default on all portfast ports, then disable BPDU guard on Ethernet 5.

```text
switch(config)#spanning-tree edge-port bpdu guard default
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree bpdu guard disable
switch(config-if-Et5)
```

26.3.4.4 BPDU Filter

BPDU filtering prevents the switch from sending or receiving BPDUs on specified ports. BPDU filtering is configurable on Ethernet and port channel interfaces.
Ports with BPDU filtering enabled do not send BPDUs and drops inbound BPDUs. Enabling BPDU filtering on a port not connected to a host can result in loops as the port continues forwarding data while ignoring inbound BPDU packets.

The `spanning-tree bpdufilter` command controls BPDU filtering on the configuration mode interface. BPDU filtering is disabled by default.

**Example**

- These commands enable BPDU filtering on Ethernet 5.
  
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#spanning-tree bpdufilter enable
  switch(config-if-Et5)#

26.3.4.5 BPDU Rate Limit

BPDU input rate limiting restricts the number of BPDUs that a port with BPDU guard and BPDU filter disabled, can process during a specified interval. The port discards all BPDUs that it receives in excess of the specified limit. Configuring the rate limiter requires two steps:

- Establishing the rate limit threshold
- Enabling rate limiting

**Establishing the Rate Limit Threshold**

The `spanning-tree bpduguard rate-limit count (interface)` command specifies the BPDU reception rate (quantity per interval) that triggers the discarding of BPDUs. The command is available in global and interface configuration modes.

- The `spanning-tree bpduguard rate-limit count` global command specifies the maximum reception rate for ports that are not covered by interface rate limit count commands. The global command specifies the default limit.

  **Note**

  Arista Networks recommends to retain the default values of rate limit. In the PVST mode, when the VLAN membership of a port is changed by a significant margin, it is advisable to disable interface BPDU rate limit on both ends of a port. For example, if three VLANs are present on a port initially, the operator must first add 300 more VLANs on one side of the port and then add the same 300 VLANs on the other side of the port. In this case, if the VLANs are increased towards the root bridge first, then the other side can cross the rate-limit threshold.

- The `spanning-tree bpduguard rate-limit count` interface command defines the maximum BPDU reception rate for ports in the configuration mode interface.

**Examples**

- This command configures the global limit of 5000 BPDUs over a four second interval.
  
  switch(config)#spanning-tree bpduguard rate-limit count 5000 interval 4
  switch(config)#

- These commands configure a limit of 7500 BPDUs over an 8 second interval on the Ethernet interface 2.
  
  switch(config)#interface ethernet 2
  switch(config-if-Et2)#spanning-tree bpduguard rate-limit count 7500 interval 8
  switch(config-if-Et2)#
Enabling Rate Limiting

BPDU rate limiting is enabled globally or on individual ports:

- **spanning-tree bpduguard rate-limit default** enables rate limiting on all ports that are not covered by the interface rate limiting command. The default setting is *enabled*.
- **spanning-tree bpduguard rate-limit enable / disable** interface command enables or disables BPDU rate limiting on the configuration mode interface. This command has precedence over the global command.

Examples

- This command enables rate limiting on ports that are not covered by interface rate limit commands.
  
  switch(config)#spanning-tree bpduguard rate-limit default
  switch(config)#

- These commands enable rate limiting on the Ethernet interface 15.
  
  switch(config)#interface ethernet 15
  switch(config-if-Et15)#spanning-tree bpduguard rate-limit enable
  switch(config-if-Et15)#
26.4 STP Commands

Spanning Tree Commands: Global Configuration

- spanning-tree bpdu tx hold-count
- spanning-tree bpdu guard rate-limit default
- spanning-tree bpdu guard rate-limit count (global)
- spanning-tree edge-port bpdufilter default
- spanning-tree edge-port bpdu guard default
- spanning-tree forward-time
- spanning-tree guard loop default
- spanning-tree hello-time
- spanning-tree max-age
- spanning-tree max-hops
- spanning-tree mode
- spanning-tree mst configuration
- spanning-tree portchannel guard misconfig
- spanning-tree priority
- spanning-tree root
- spanning-tree transmit active
- spanning-tree vlan-id

Loop Protection Commands

- disabled-time
- loop-protection
- monitor loop-protection
- protect vlan
- rate-limit
- shutdown (Loop-protection)
- transmit-interval

Spanning Tree Commands: Interface Configuration Mode

- spanning-tree bpdufilter
- spanning-tree bpdu guard
- spanning-tree bpdu guard rate-limit count (interface)
- spanning-tree bpdu guard rate-limit enable / disable
- spanning-tree cost
- spanning-tree guard
- spanning-tree link-type
- spanning-tree port-priority
- spanning-tree portfast
- spanning-tree portfast auto
- spanning-tree portfast <port type>
- switchport backup-link

MST Configuration Commands

- abort (mst-configuration mode)
- exit (mst-configuration mode)
- instance
- name (mst-configuration mode)
- revision (mst-configuration mode)
- show (mst-configuration mode)
Display Commands

- show spanning-tree
- show spanning-tree blockedports
- show spanning-tree counters
- show spanning-tree instance
- show spanning-tree interface
- show spanning-tree mst
- show spanning-tree mst configuration
- show spanning-tree mst interface
- show spanning-tree mst test information
- show spanning-tree root
- show spanning-tree topology status
- show spanning-tree transmit active

Clear Commands

- clear spanning-tree counters
- clear spanning-tree counters session
- clear spanning-tree detected-protocols
**abort (mst-configuration mode)**

The `abort` command, in MST-configuration mode, discards pending changes to the MST region configuration, then returns the switch to global configuration mode.

The `exit (mst-configuration mode)` command saves MST region changes to `running-config` before returning the switch to global configuration mode.

**Command Mode**

MST-configuration

**Command Syntax**

`abort`

**Examples**

- This command discards changes to the MST region, then returns the switch to global configuration mode.

  ```
  switch(config-mst)#abort
  switch(config)#
  ```
clear spanning-tree counters

The clear spanning-tree counters command resets the BPDU counters for the specified interfaces to zero in all CLI sessions.

**Command Mode**

Privileged EXEC

**Command Syntax**

```
clear spanning-tree counters [INT_NAME]
```

**Parameters**

- `INT_NAME` Interface type and number. Options include:
  - `<no parameter>` resets counters for all interfaces.
  - `interface ethernet e_num` Ethernet interface specified by `e_num`.
  - `interface loopback l_num` Loopback interface specified by `l_num`.
  - `interface management m_num` Management interface specified by `m_num`.
  - `interface port-channel p_num` Port-Channel Interface specified by `p_num`.
  - `interface vlan v_num` VLAN interface specified by `v_num`.

**Examples**

- This command resets the BPDU counters on Ethernet 15 interface.

  ```
  switch# show spanning-tree counters
  Port       Sent      Received       Tagged Error    Other Error
  ----------------------------------------------------------------------
  Ethernet15      32721             0                  0              0
  Port-Channel10       8487             0                  0              0
  switch# clear spanning-tree counters interface ethernet 15
  switch# show spanning-tree counters
  Port      Sent       Received       Tagged Error    Other Error
  ----------------------------------------------------------------------
  Ethernet15        11              0                  0              0
  Port-Channel10         8494           2                  6              0
  ```
clear spanning-tree counters session

The `clear spanning-tree counter session` command resets the BPDU counters to zero on all interfaces in the current CLI session. Counters in other CLI sessions are not affected.

**Command Mode**

Privileged EXEC

**Command Syntax**

`clear spanning-tree counters session`

**Examples**

- This command resets the BPDU counters in the current CLI session.

  ```
  switch#show spanning-tree counters
  Port Sent Received Tagged Error Other Error
  --------------- ----------------------- ------- ------- ------- -------
  Ethernet15 32721 0 0 0
  Port-Channel10 8487 0 0 0
  switch#clear spanning-tree counters session
  switch#show spanning-tree counters
  Port Sent Received Tagged Error Other Error
  --------------- ----------------------- ------- ------- ------- -------
  Ethernet15 11 0 0 0
  Port-Channel10 7 2 6 0
  ```
clear spanning-tree detected-protocols

The `clear spanning-tree detected-protocols` command restarts the spanning tree protocol (STP) migration state machine on the specified interfaces. The switch is reset to running rapid spanning tree protocol on an interface where it previously detected a bridge running an old version of the protocol.

**Command Mode**
- Privileged EXEC

**Command Syntax**
```
clear spanning-tree detected-protocols [INT_NAME]
```

**Parameters**
- `INT_NAME` Interface type and number. Values include:
  - `<no parameter>` all interfaces.
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-Channel Interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.

**Examples**
- This command restarts the STP migration machine on all switch interfaces.
  
  ```
  switch# clear spanning-tree detected-protocols
  switch#
  ```
disabled-time

The disabled-time command sets the time for which the port remains disabled after a loop is detected by loop protection. The no disabled-time and default disabled-time commands reset the disabled time to the default of 604800 seconds (seven days).

Note
If this value is changed, interfaces that are already disabled by loop protection will remain disabled for the previously configured period.

Command Mode
Loop-protection Configuration

Command Syntax

- disabled-time period
- no disabled-time [period]
- default disabled-time [period]

Parameters

- period Time in seconds for which the port remains disabled. Values range from 0 to 604800 (seven days). Default is 604800. A value of 0 disables the interface until it is manually reset, even if the disabled time is later set to a non-zero value. To restore the port manually, shut it down and then re-enable it.

Example

- This command configures loop protection to disable a port on which a loop is detected for a period of two days (172800 seconds).
  switch(config-monitor-loop-protect)#disabled-time 172800
  switch(config-monitor-loop-protect)#
exit (mst-configuration mode)

The `exit` command, in MST-configuration mode, saves changes to the MST region configuration, then returns the switch to global configuration mode. MST region configuration changes are also saved by entering a different configuration mode.

**Command Mode**

MST-configuration

**Command Syntax**

`exit`

**Examples**

- This command saves changes to the MST region, then returns the switch to global configuration mode.

  ```
  switch(config-mst)#exit
  switch(config)#
  ```

- This command saves changes to the MST region, then places the switch in Interface-Ethernet mode.

  ```
  switch(config-mst)#interface ethernet 3
  switch(config-if-Et3)#
  ```
**instance**

The **instance** command inserts an entry into the VLAN-to-instance map that associates a set of VLANs to an MST instance. In addition to defining the MST topology, the VLAN-to-instance map is one of three parameters, along with the MST name and revision number, that identifies the switch’s MST region.

The **no instance** command removes specified entries from the VLAN-to-instance map. If the command does not provide a VLAN list, all entries are removed for the specified instance. The **no instance** and **default instance** commands function identically.

**Command Mode**
MST-Configuration

**Command Syntax**

```
instance mst_inst vlans v_range
no instance mst_inst [vlans v_range]
no default instance mst_inst [vlans v_range]
```

**Parameters**

- **mst_inst** MST instance number. Value of **mst_inst** ranges from 0 to 4094.
- **v_range** VLAN list. Formats include a number, number range, or comma-delimited list of numbers and ranges.

**Examples**

- This command maps VLANs 20-39 to MST instance 2
  
  ```
  switch(config)#spanning-tree mst configuration
  switch(config-mst)#instance 2 vlans 20-39
  switch(config-mst)#
  ```

- This command removes all VLAN mappings to MST instance 10.
  
  ```
  switch(config-mst)#no instance 10
  switch(config-mst)#
  ```
loop-protection

The `loop-protection` command enables loop protection on the configuration mode interface. All interfaces in a VLAN under loop protection have loop protection enabled by default. The `no loop-protection` and `default loop-protection` commands disable loop protection on the interface.

When loop protection is disabled (at the VLAN or interface level), the computed state of the interface is forgotten and packets queued to be sent are dropped. If an interface is err-disabled by loop protection, disabling loop protection removes the err-disable.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

- `loop-protection`
- `no loop-protection`
- `default loop-protection`

**Example**

- These commands disable loop protection on Ethernet interface 2/4. If the interface is currently err-disabled by loop protection, the err-disable will be removed.

```
switch(config)#interface ethernet 2/4
switch(config-if-Et2/4)#no loop-protection
switch(config-if-Et2/4)#
```
monitor loop-protection

The `monitor loop-protection` command places the switch in loop-protection configuration mode.

**Command Mode**

Global Configuration

**Command Syntax**

```
monitor loop-protection
```

Commands available in loop-protection configuration mode:

- `shutdown (Loop-protection)`
- `protect vlan`
- `transmit-interval`
- `disabled-time`
- `rate-limit`

**Example**

- This command places the switch in loop-protection configuration mode.

```
switch(config)#monitor loop-protection
switch(config-monitor-loop-protect)#
```
name (mst-configuration mode)

The **name** command configures the MST region name. The name is one of three parameters, along with the MST revision number and VLAN-to-instance map, that identifies the switch’s MST region.

The name has up to 32 characters. The default name is an empty string. The name string accepts all characters except the space.

The **no name** and **default name** commands restore the default name by removing the **name** command from **running-config**.

**Command Mode**

MST-Configuration

**Command Syntax**

```
name label_text
no name
default name
```

**Parameters**

- **label_text** character string assigned to name attribute. Maximum 32 characters. The space character is not permitted in the name string.

**Example**

- This command assigns corporate_100 as the MST region name.

  ```
  switch(config)#spanning-tree mst configuration
  switch(config-mst)#name corporate_100
  switch(config-mst)#show pending
  Active MST configuration
  Name        [corporate_100]
  Revision    0     Instances configured 1

  Instance Vlans mapped
  ---------
  0          1-4094
  ---------
  ```
**protect vlan**

The `protect vlan` command specifies which VLANs will participate in loop protection. The `no protect vlan` and `default protect vlan` commands remove loop protection from the specified VLANs.

**Command Mode**
- Loop-protection Configuration

**Command Syntax**

```
protect vlan vlan-range
```

**Parameters**
- `vlan-range` List of VLANs (number, range, comma-delimited list of numbers and ranges). Numbers range from 1 to 4094.

**Example**
- This command enables loop protection on VLANs 1025-2000.

```
switch(config-monitor-loop-protect)#protect vlan 1025-2000
switch(config-monitor-loop-protect)#
```
**rate-limit**

The `rate-limit` command sets the maximum number of loop detection frames which can be sent by the switch per second. The `no rate-limit` and `default rate-limit` commands return the rate limit to the default value of 1000.

**Command Mode**

Loop-protection Configuration

**Command Syntax**

```
rate-limit frames
no rate-limit [frames]
default rate-limit [frames]
```

**Parameters**

- `frames` Maximum number of frames sent per second. Values range from 0-1000, default is 1000. A value of zero disables throttling.

**Example**

- This command sets the maximum number of loop detection frames to 500 per second.

  ```
  switch(config-monitor-loop-protect)#rate-limit 500
  switch(config-monitor-loop-protect)#
  ```
**revision (mst-configuration mode)**

The *revision* command configures the MST revision number. The revision number is one of three parameters, along with the MST name and VLAN-to-instance map, that identifies the switch’s MST region. Revision numbers range from 0 to 65535. The default revision number is 0.

The *no revision* and *default revision* commands restore the revision number to its default value by removing the revision command from *running-config*.

**Command Mode**

MST-Configuration

**Command Syntax**

```
revision  rev_number
no revision
default revision
```

**Parameters**

- *rev_number*  revision number. Possible ranges from 0 to 65535 with a default of 0.

**Examples**

- This command sets the revision number to 15.

  ```
  switch(config)#spanning-tree mst configuration
  switch(config-mst)#revision 15
  switch(config-mst)#show pending
  Active MST configuration
  Name  []
  Revision 15  Instances configured 1

  Instance  Vlans mapped
  --------  ----------------------------------------
  0        1-4094
  ----------------------------------------
  ```
show (mst-configuration mode)

The show command displays the current and pending MST configuration:
Exiting MST configuration mode stores all pending configuration changes to running-config.

Command Mode

MST-Configuration

Command Syntax

show [EDIT_VERSION]

Parameters

- **EDIT_VERSION** specifies configuration version that the command displays. Options include:
  - <no parameter> command displays pending MST configuration.
  - active command displays MST configuration stored in running-config.
  - current command displays MST configuration stored in running-config.
  - pending command displays pending MST configuration.
Example

- These commands contrast the difference between the active and pending configuration by adding MST configuration commands, then showing the configurations.

```plaintext
switch(config-mst)#show pending
Active MST configuration
Name  []
Revision 0  Instances configured 1

Instance  Vlans mapped
--------

0       1-4094

switch(config-mst)#instance 2 vlan 20-29,102
switch(config-mst)#revision 2
switch(config-mst)#name baseline

switch(config-mst)#show pending
Pending MST configuration
Name  [baseline]
Revision 2  Instances configured 2

Instance  Vlans mapped
--------

0       1-19,30-101,103-4094
2       20-29,102

switch(config-mst)#show active

Active MST configuration
Name  []
Revision 0  Instances configured 1

Instance  Vlans mapped
--------

0       1-4094
```
show loop-protection

The `show loop-protection` command displays loop protection status.

**Command Syntax**

```
show loop-protection [detail]
```

**Examples**

- This command displays basic loop protection information.

```
switch> show loop-protection
Loop protection is enabled
Transmit interval: 5
Disable Time: 604800 (or Permanent)
Packets Transmitted rate: 12/second (or Unthrottled)
Total: 3 Vlans enabled.
switch>
```

- This command displays detailed information about loop protection.

```
switch> show loop-protection detail
Loop protection is enabled
Transmit interval: 5
Disable Time: 604800
Packets Transmitted rate: 12/second
Total: 3 Vlans enabled.
Destination address: ffff.ffff.ffff
Ethernet type: 0x88b7
Receive action: Interface Disable

show spanning-tree

The **show spanning-tree command** displays spanning tree protocol (STP) data, organized by instance.

**Command Mode**

EXEC

**Command Syntax**

```
show spanning-tree [VLAN_ID] [INFO_LEVEL]
```

**Parameters**

- **VLAN_ID** specifies the VLANs for which the command displays information. Formats include:
  - `<no parameter>` displays information for all VLANs.
  - `vlan` displays data for instances containing the first VLAN listed in `running-config`.
  - `vlan v_range` displays data for instances containing a VLAN in the specified range.

- **INFO_LEVEL** specifies level of information detail provided by the command.
  - `<no parameter>` displays table for each instance listing status, configuration, and history.
  - `detail` displays data blocks for each instance and all ports on each instance.

**Display Values**

- **Root ID** Displays information on the ROOT ID (elected spanning tree root bridge ID):
  - **Priority**: Priority of the bridge. Default value is 32768.
  - **Address**: MAC address of the bridge.

- **Bridge ID** bridge status and configuration information for the locally configured bridge:
  - **Priority**: Priority of the bridge. The default priority is 32768.
  - **Address**: MAC address of the bridge.
  - **Hello Time**: Interval (seconds) between bridge protocol data units (BPDUs) transmissions.
  - **Max Age**: Maximum time that a BPDU is saved.
  - **Forward Delay**: Time (in seconds) that is spent in the learning state.

- **Interface** STP configuration participants. Link-down interfaces are not shown.

- **Role** Role of the port as one of the following:
  - **Root**: The best port for a bridge to a root bridge used for forwarding.
  - **Designated**: A forwarding port for a LAN segment.
  - **Alternate**: A port acting as an alternate path to the root bridge.
  - **Backup**: A port acting as a redundant path to another bridge port.

- **State** Displays the interface STP state as one of the following:
  - Learning
  - Discarding
  - Forwarding

- **Cost** STP port path cost value.

- **Prio. Nbr.** STP port priority. Values range from 0 to 240. Default is 128.

- **Type** The link type of the interface (automatically derived from the duplex mode of an interface):
  - **P2p Peer (STP)** Point to point full duplex port running standard STP.
• *shr Peer (STP)* Shared half duplex port running standard STP.

**Examples**

- This command displays STP data, including a table of port parameters.

```plaintext
switch>show spanning-tree vlan 1000

```

switch>
**show spanning-tree instance**

The `show spanning-tree instance` command displays spanning tree protocol bridge configuration settings for each instance on the switch. The display includes Bridge ID, Hello Time, Max Age, and Forward Delay times.

The command also displays the restartability of the STP agent when the `detail` option is selected. A switch can continue support of MLAG operation when its peer is offline and the STP agent is unavailable.

**Command Mode**
EXEC

**Command Syntax**

```
show spanning-tree instance [INFO_LEVEL]
```

**Parameters**
- `INFO_LEVEL` specifies level of information detail provided by the command.
  - `<no parameter>` command displays information in a data table.
  - `detail` command displays bridge information in data blocks for each instance.

**Examples**
- This command displays a bridge data table.
  ```
switch>show spanning-tree instance
  Instance Bridge ID Priority MAC addr Hello Max Fwd
  --------- ------------------------ ----- --- ---
  MST0     32768 (32768, sys-id 0 ) 001c.7302.2f98 2000 20 15
  MST101   32869 (32768, sys-id 101) 001c.7302.2f98 2000 20 15
  MST102   32870 (32768, sys-id 102) 001c.7302.2f98 2000 20 15
  switch>
  ```
- This command displays bridge data blocks.
  ```
switch>show spanning-tree instance detail
  Stp Detailed Status:
  Stp agent restartable : True
  MST-PVST interoperation : Disabled

  switch>
```
show spanning-tree interface

The `show spanning-tree interface` command displays spanning tree protocol information for the specified interface.

**Command Mode**
EXEC

**Command Syntax**
```
show spanning-tree interface INT_NAME [INFO_LEVEL]
```

**Parameters**
- **INT_NAME** Interface type and number. Values include:
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `peerethernet e_num` Ethernet interface specified by `e_num`.
  - `port-channel p_num` Port-Channel Interface specified by `p_num`.
  - `peerport-channel p_num` Port-Channel Interface specified by `p_num`.
- **INFO_LEVEL** specifies level of detail provided by the output. Options include:
  - `<no parameter>` command displays a table of STP data for the specified interface.
  - `detail` command displays a data block for the specified interface.

**Examples**
- This command displays an STP table for Ethernet interface 5.
  ```bash
  switch> show spanning-tree interface ethernet 5
  Instance       Role       State      Cost      Prio.Nbr Type
  ---------------- ---------- ---------- --------- -------- -------------------
  MST0           designated forwarding 20000     128.5    P2p
  switch>
  ```
- This command displays a data block for Ethernet interface 5.
  ```bash
  switch> show spanning-tree interface ethernet 5 detail
  Port 5 (Ethernet5) of MST0 is designated forwarding
  Port path cost 20000, Port priority 128, Port Identifier 128.5.
  Designated root has priority 32768, address 001c.7301.07b9
  Designated bridge has priority 32768, address 001c.7304.195b
  Designated port id is 128.5, designated path cost 1999 (Ext) 0 (Int)
  Timers: message age 1, forward delay 15, hold 20
  Number of transitions to forwarding state: 1
  Link type is point-to-point by default, Internal
  BPDU: sent 1008766, received 0, taggedErr 0, otherErr 0, rateLimiterCount 0
  Rate-Limiter: enabled, Window: 10 sec, Max-BPDU: 400
  ```

switch>
show spanning-tree mst

The **show spanning-tree mst** command displays configuration and state information for Multiple Spanning Tree Protocol (MST) instances.

**Command Mode**
EXEC

**Command Syntax**
```
show spanning-tree mst [INSTANCE] [INFO_LEVEL]
```

**Parameters**
- **INSTANCE** – MST instance for which the command displays information. Options include:
  - `<no parameter>` all MST instances.
  - `mst_inst` MST instance number. Value of `mst_inst` ranges from 0 to 4094.
- **INFO_LEVEL** – type and amount of information in the output. Options include:
  - `<no parameter>` output is interface data in tabular format.
  - `detail` output is a data block for each interface.

**Examples**
- This command displays interface data blocks for MST instance 3.
```
switch>show spanning-tree mst 3 detail
##### MST3    vlans mapped: 3

**show spanning-tree mst configuration**

The `show spanning-tree mst configuration` command displays information about the MST region’s VLAN-to-instance mapping. The command provides two display options:

- **default**  displays a table that lists the instance to VLAN map.
- **digest**  displays the configuration digest.

The configuration digest is a 16-byte hex string calculated from the md5 encoding of the VLAN-to-instance mapping table. Switches with identical mappings have identical digests.

**Command Mode**
- EXEC

**Command Syntax**

`show spanning-tree mst configuration [INFO_LEVEL]`

**Parameters**

- **INFO_LEVEL**  specifies data provided by the output. Options include:
  - `<no parameter>`  command displays VLAN-to-instance map.
  - **digest**  command displays the MST configuration digest.

**Examples**

- **This command displays the MST region’s VLAN-to-instance map.**

  ```
  switch> show spanning-tree mst configuration
  Name     []
  Revision 0    Instances configured 3

  Instance  Vlans mapped
  -------
  0        1,4-4094
  2        2
  3        3
  ```

- **This command displays the MST region’s configuration digest.**

  ```
  switch> show spanning-tree mst configuration digest
  Name     []
  Revision 0    Instances configured 1
  Digest     0xAC36177F50283CD4B83821D8AB26DE62
  ```
show spanning-tree mst interface

The `show spanning-tree mst interface` command displays Multiple Spanning Tree Protocol (MSTP) information for a specified interface on the specified MST instances.

**Command Mode**

EXEC

**Command Syntax**

```
show spanning-tree mst [INSTANCE] interface INT_NAME [INFO_LEVEL]
```

**Parameters**

- **INSTANCE** MST instance for which the command displays information. Options include:
  - `<no parameter>` all MST instances.
  - `mst_inst` denotes a single MST instance. Value of `mst_inst` ranges from 0 to 4094.
- **INT_NAME** Interface type and number. Values include:
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `peerethernet e_num` Ethernet interface specified by `e_num`.
  - `port-channel p_num` Port-channel interface specified by `p_num`.
  - `peerport-channel p_num` Port-channel interface specified by `p_num`.
- **INFO_LEVEL** specifies level of detail provided by the output. Options include:
  - `<no parameter>` command displays a table of STP instance data for the specified interface
  - `detail` command displays a data block for all specified instance-interface combinations.

**Examples**

- This command displays an table of STP instance data for Ethernet 1 interface:
  
  ```
  switch>show spanning-tree mst interface ethernet 1
  Ethernet1 of MST0 is root forwarding
  Edge port: no                                bpdu guard: disabled
  Link type: point-to-point
  Boundary : Internal
  Bpdus sent 2120, received 2164, taggedErr 0, otherErr 0
  
  Instance Role Sts Cost      Prio.Nbr Vlans mapped
  -------- ---- --- --------- -------- -------------------------------
  0        Root FWD 2000      128.1    1,4-4094
  2        Desg FWD 2000      128.1    2
  3        Root FWD 2000      128.1    3
  ```

- This command displays blocks of STP instance information for Ethernet 1 interface.
  
  ```
  switch>show spanning-tree mst 3 interface ethernet 1 detail
  Ethernet1 of MST3 is root forwarding
  Vlans mapped to MST3 3
  Port info             port id          priority    cost
  Designated root       address 0011.2233.4401  priority 32768
  Designated bridge     address 0011.2233.4401  priority 32768
  ```
show spanning-tree mst test information

The `show spanning-tree mst test information` command displays diagnostic spanning tree protocol information.

**Command Mode**

EXEC

**Command Syntax**

```
show spanning-tree mst test information
```

**Examples**

- This command displays diagnostic STP information.

```
switch>show spanning-tree mst test information
bi = MstInfo.BridgeInfo( "dut" )
bi.stpVersion = "rstp"
bi.mstpRegionId = ""
bi.bridgeAddr = "00:1c:73:01:60:17"
si = MstInfo.BridgeStpiInfo( "Mst" )
bi.stpiInfoIs( "Mst", si )
si.cistRoot = Tac.Value( "Stp::BridgeId", priority=32768, systemId=0,
address='00:1c:73:01:60:17' )
si.cistPathCost = 0
bmi = MstInfo.BridgeMstiInfo( "Mst0" )
bmi.bridgeId = Tac.Value( "Stp::BridgeId", priority=32768, systemId=0,
address='00:1c:73:01:60:17' )
bmi.designatedRoot = Tac.Value( "Stp::BridgeId", priority=32768, systemId=0,
address='00:1c:73:01:60:17' )
si.mstiInfoIs( "Mst0", bmi )
bmii = MstInfo.BridgeMstiIntfInfo( "Mst0", "Ethernet15" )
bmii.portId = Tac.Value( "Stp::PortId",
portPriority=128, portNumber=15 )
bmii.role = "designated"
bmii.operIntPathCost = 2000
bmii.fdbFlush = 1
bmi.mstiIntfInfoIs( "Ethernet15", bmii )
bii = MstInfo.BridgeIntfInfo( "Ethernet15" )
bii.operExtPathCost = 2000
si.intfInfoIs( "Ethernet15", bii )
bmii = MstInfo.BridgeMstiIntfInfo( "Mst0", "Port-Channel10" )
bmii.portId = Tac.Value( "Stp::PortId",
portPriority=128, portNumber=101 )
bmii.role = "designated"
bmii.operIntPathCost = 1999
bmii.fdbFlush = 1
bmi.mstiIntfInfoIs( "Port-Channel10", bmii )
bii = MstInfo.BridgeIntfInfo( "Port-Channel10" )
bii.operExtPathCost = 1999
si.intfInfoIs( "Port-Channel10", bii )
switch>
```
show spanning-tree root

The `show spanning-tree root` command displays the Bridge-ID, cost to the root bridge, root port, and the root bridge timer settings for all instances.

**Command Mode**

EXEC

**Command Syntax**

`show spanning-tree root [INFO_LEVEL]`

**Parameters**

- `INFO_LEVEL` specifies output format. Options include:
  - `<no parameter>` output displays data in tabular format.
  - `detail` output displays a data block for each instance.

**Examples**

- This command displays a table of root bridge information.

  ```
  switch> show spanning-tree root
  Instance | Root ID | Priority | MAC addr | Cost | Hello | Max | Fwd | Root Port
  ---------- | ------- | -------- | -------- | ---- | ------ | ---- | ---- | ----------
  MST0      | 32768   | 001c.7301.23de |        | 0   | 2     | 20  | 15  | Po937
  MST101    | 32869   | 001c.7301.23de | 3998   | 0   | 0     | 0   | 0   | Po909
  MST102    | 32870   | 001c.7301.23de | 3998   | 0   | 0     | 0   | 0   | Po911
  switch>
  ```

- This command displays root bridge data blocks for each MSTP instance.

  ```
  switch> show spanning-tree root detail
  MST0
  MST0
  Root ID     Priority   32768
  Address     001c.7301.23de
  Cost        0 (Ext), 3998 (Int)
  Port        100 (Port-Channel937)
  Hello Time  2.000 sec Max Age 20 sec Forward Delay 15 sec
  ```

  ```
  MST101
  Root ID     Priority   32869
  Address     001c.7301.23de
  Cost        3998
  Port        107 (Port-Channel909)
  Hello Time  0.000 sec Max Age 0 sec Forward Delay 0 sec
  ```

  ```
  MST102
  Root ID     Priority   32870
  Address     001c.7301.23de
  Cost        3998
  Port        104 (Port-Channel911)
  Hello Time  0.000 sec Max Age 0 sec Forward Delay 0 sec
  ```

  switch>
show spanning-tree topology status

The `show spanning-tree topology status` command displays the forwarding state of ports on the specified VLANs.

**Command Mode**

EXEC

**Command Syntax**

```
show spanning-tree topology [VLAN_NAME] status [INFO_LEVEL]
```

**Parameters**

- **VLAN_NAME** specifies the VLANs that the output displays. Options include:
  - `<no parameter>` output includes all VLANs.
  - `vlan` output includes all VLANs.
  - `vlan v_num` command includes specified VLAN; `v_num` ranges from 1 to 4094.
- **INFO_LEVEL** specifies information provided by output. Options include:
  - `<no parameter>` output lists forwarding state of interfaces.
  - `detail` output lists forwarding state and change history of interfaces.

**Examples**

- This command displays forwarding state for ports mapped to all VLANs.
  ```
  switch>show spanning-tree topology status
  Topology: Cist
  Mapped Vlans: 1-4, 666, 1000-1001, 1004-1005
  Cpu:               forwarding
  Ethernet2:         forwarding
  Ethernet3:         forwarding
  Ethernet4:         forwarding
  Ethernet5:         forwarding
  Ethernet6:         forwarding
  Ethernet8:         forwarding
  Ethernet10:        forwarding
  Port-Channel1:     forwarding
  Port-Channel2:     forwarding
  Port-Channel3:     forwarding
  switch>
  ```
- This command displays forwarding state and history for ports mapped to VLAN 1000.
  ```
  switch>show spanning-tree topology vlan 1000 status detail
  Topology: Cist
  Mapped Vlans: 1000
  Cpu:               forwarding (1 changes, last 23 days, 22:54:43 ago)
  Ethernet2:         forwarding (3 changes, last 23 days, 22:48:59 ago)
  Ethernet4:         forwarding (3 changes, last 10 days, 19:54:17 ago)
  Ethernet5:         forwarding (3 changes, last 23 days, 22:54:38 ago)
  Ethernet6:         forwarding (3 changes, last 19 days, 15:49:10 ago)
  Ethernet10:        forwarding (3 changes, last 9 days, 7:37:05 ago)
  Port-Channel1:     forwarding (3 changes, last 23 days, 22:54:34 ago)
  Port-Channel3:     forwarding (5 changes, last 21 days, 4:56:41 ago)
  switch>
  ```
show spanning-tree transmit active

The **show spanning-tree transmit active** command displays spanning tree protocol bridge assurance information for network ports or for all ports. Bridge assurance-enabled ports will not necessarily be blocked when they link to a port where bridge assurance is not enabled, but if they do not receive periodic BPDUs from the other side of the link the **show spanning-tree transmit active** command will show a bridge assurance status of “inconsistent” (blocking) for that port.

**Command Mode**

EXEC

**Command Syntax**

```
show spanning-tree transmit active INFO_LEVEL
```

**Parameters**

- **INFO_LEVEL** specifies level of information detail provided by the command.
  - <no parameter> command displays bridge assurance information for network ports.
  - **detail** command displays bridge assurance information for all ports.

**Examples**

- This command displays the bridge assurance status of network ports.

  ```
  switch>show spanning-tree transmit active
  Name  Bridge Assurance Status
  VL1        Et5/1       consistent
  Number of bridge assurance inconsistent ports in the system : 0
  switch>
  ```
**shutdown (Loop-protection)**

The `shutdown (Loop-protection)` command disables loop protection globally. The feature is disabled by default, and is enabled by using the `no shutdown (Loop-protection)` command.

**Note**

To function, loop protection must also be enabled on a per-VLAN basis using the `protect vlan` command.

**Command Mode**

Loop-protection Configuration

**Command Syntax**

- `shutdown`
- `no shutdown`

**Example**

- This command enables loop protection globally on the switch.

```bash
switch(config-monitor-loop-protect)# no shutdown
switch(config-monitor-loop-protect)#
```
spanning-tree bpdu tx hold-count

The `spanning-tree bpdu tx hold-count` command specifies the maximum number of BPDUs per second that the switch can send from an interface. Valid settings range from 1 to 10 BPDUs with a default of 6 BPDUs.

The `no spanning-tree bpdu tx hold-count` and `default spanning-tree bpdu tx hold-count` commands restore the transmit hold count default of 6 BPDUs by removing the `spanning-tree bpdu tx hold-count` command from `running-config`.

Command Mode

Global Configuration

Command Syntax

```
spanning-tree bpdu tx hold-count max_bpdu
no spanning-tree bpdu tx hold-count
default spanning-tree bpdu tx hold-count
```

Parameters

- `max_bpdu` BPDUs packets. Value ranges from 1 to 10. Default is 6.

Examples

- This command configures a transmit hold-count of 8 BPDUs.
  ```
  switch(config)#spanning-tree bpdu tx hold-count 8
  switch(config)#
  ```
spanning-tree bpdudfilter

The `spanning-tree bpdudfilter` command controls bridge protocol data unit (BPDU) filtering on the configuration mode interface. BPDU filtering is disabled by default.

- `spanning-tree bpdudfilter enabled` enables BPDU filtering.
- `spanning-tree bpdudfilter disabled` disables BPDU filtering by removing the `spanning-tree bpdudfilter` command from `running-config`.

The BPDU filter default setting for portfast ports is configured by the `spanning-tree edge-port bpdudfilter default` command; BPDU filter is disabled by default on all non-portfast ports.

The `no spanning-tree bpdudfilter` and `default spanning-tree bpdudfilter` commands restore the global BPDU filter setting on the configuration mode interface by removing the corresponding `spanning-tree bpdudfilter` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

**Command Syntax**

```bash
spanning-tree bpdudfilter FILTER_STATUS
no spanning-tree bpdudfilter
default spanning-tree bpdudfilter
```

**Parameters**

- `FILTER_STATUS` BPDU filtering status. Options include:
  - `enabled` BPDU filter is enabled on the interface.
  - `disabled` BPDU filter is disabled on the interface.

**Examples**

- This command enables BPDU filtering on Ethernet 5 interface.
  ```bash
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#spanning-tree bpdudfilter enabled
  switch(config-if-Et5)#
  ```
spanning-tree bpduguard

The `spanning-tree bpduguard` command controls BPDU guard on the configuration mode interface. A BPDU guard-enabled port is disabled when it receives a BPDU packet.

The BPDU guard default setting for portfast ports is configured by the `spanning-tree edge-port bpduguard default` command; BPDU guard is disabled by default on all non-portfast ports.

The `no spanning-tree bpduguard` and `default spanning-tree bpduguard` commands restore the global BPDU guard setting on the configuration mode interface by removing the corresponding `spanning-tree bpduguard` command from `running-config`.

Command Mode
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

Command Syntax

```
spanning-tree bpduguard GUARD_ACTION
no spanning-tree bpduguard
default spanning-tree bpduguard
```

Parameters
- **GUARD_ACTION**  
  BPDU guard setting. Options include:
  - disable  
    Disable bpduguard
  - enable  
    Enable bpduguard
  - rate-limit  
    BPDU Input Rate Limiter options

Examples
- These commands enable BPDU guard on Ethernet interface 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree bpduguard enabled
switch(config-if-Et5)
```
spanning-tree bpduguard rate-limit count (global)

The `spanning-tree bpduguard rate-limit count` command sets the maximum BPDU reception rate (quantity per interval) for ports that are not covered by a `spanning-tree bpduguard rate-limit count (interface)` command.

BPDU rate limiting restricts the number of BPDUs that ports with BPDU guard or BPDU filter disabled can process during a specified interval. Ports discard BPDUs they receive in excess of the specified limit. BPDU rate limiting is enabled or disabled by `spanning-tree bpduguard rate-limit enable / disable` commands.

The `no spanning-tree bpduguard rate-limit count` and `default spanning-tree bpduguard rate-limit count` commands restore the global setting to its default value by removing the `spanning-tree bpduguard rate-limit count` command from `running-config`.

Command Mode
Global Configuration

Command Syntax
```
spanning-tree bpduguard rate-limit count max_bpdu [interval period]
no spanning-tree bpduguard rate-limit count
default spanning-tree bpduguard rate-limit count
```

Parameters
- `max_bpdu` configures the maximum number of BPDUs per timer interval. The value of `BPDU quantity` ranges from 1 to 20000.
- `interval period` configures the timer interval in seconds. The value of `period` ranges from 1 to 15.

Guidelines
Arista Networks recommends to retain the default values of rate limit.

In the PVST mode, when the VLAN membership of a port is changed by a significant margin, it is advisable to disable interface BPDU rate limit on both ends of a port. For example, if three VLANs are present on a port initially, the operator must first add 300 more VLANs on one side of the port and then add the same 300 VLANs on the other side of the port. In this case, if the VLANs are increased towards the root bridge first, then the other side can cross the rate-limit threshold.

Example
- This command configures the global rate limit as 5000 BPDUs per four second period.
```
switch(config)#spanning-tree bpduguard rate-limit count 5000 interval 4
switch(config)#
```
spanning-tree bpdu-guard rate-limit count (interface)

The **spanning-tree bpdu-guard rate-limit count** command configures the maximum BPDU reception rate for the configuration mode interface. The default rate limit is specified by the **spanning-tree bpdu-guard rate-limit count (global)** command.

BPDU rate limiting restricts the number of BPDUs that ports with BPDU guard or BPDU filter disabled can process during a specified interval. Ports discard BPDUs it receives in excess of the specified limit. BPDU rate limiting is enabled or disabled by **spanning-tree bpdu-guard rate-limit enable / disable** commands.

The **no spanning-tree bpdu-guard rate-limit count** and **default spanning-tree bpdu-guard rate-limit count** commands restore the interface value to the global setting by removing the corresponding **spanning-tree bpdu-guard rate-limit count** command from **running-config**.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

**Command Syntax**
```
spanning-tree bpdu-guard rate-limit count max_bpdu [TIMER]
no spanning-tree bpdu-guard rate-limit count
default spanning-tree bpdu-guard rate-limit count
```

**Parameters**
- **max_bpdu**  BPDU quantity. Value ranges from 1 to 20,000.
- **TIMER**  BPDU reception interval (seconds). Options include:
  - <no parameter>  reception interval defaults to **hello-time**.
  - **interval period**  Value of **period** ranges from 1 to 15.

**Example**
- These commands configure rate limit as 7500 BPDU's per 8 second period on Ethernet 2.

```
switch(config)#interface ethernet 2
switch(config-if-Et2)#spanning-tree bpdu-guard rate-limit count 7500 interval 8
switch(config-if-Et2)#
```
spanning-tree bpduguard rate-limit default

The `spanning-tree bpduguard rate-limit default` command configures the global BPDU rate limit setting. The global BPDU rate limit setting provides the default for individual ports whose configuration does not include a `spanning-tree bpduguard rate-limit enable / disable` command. The default global setting is `enabled`.

BPDU rate limiting restricts the number of BPDUs that ports with BPDU guard or BPDU filter disabled can process during a specified interval. Ports discard BPDUs it receives in excess of the specified limit. BPDU rate limits are established by `spanning-tree bpduguard rate-limit count (global)` commands.

The `no spanning-tree bpduguard rate-limit default` sets the global BPDU rate limit setting to `disabled`. The `spanning-tree bpduguard rate-limit default` and `default spanning-tree bpduguard rate-limit default` commands restore the default global rate limit setting to `enabled` by removing the `no spanning-tree bpduguard rate-limit default` command from `running-config`.

Command Mode
Global Configuration

Command Syntax
- `spanning-tree bpduguard rate-limit default`
- `no spanning-tree bpduguard rate-limit default`
- `default spanning-tree bpduguard rate-limit default`

Example
- This command enables rate limiting on all ports not covered by an interface rate limit command.

```
switch(config)# spanning-tree bpduguard rate-limit default
switch(config)#
```

spanning-tree bpduguard rate-limit enable / disable

These commands enable and disable BPDU rate limiting on the configuration mode interface:

- `spanning-tree bpduguard rate-limit enable` enables BPDU rate limiting.
- `spanning-tree bpduguard rate-limit disable` disables BPDU rate limiting.

The `spanning-tree bpduguard rate-limit default` command enables BPDU rate limiting on all ports not configured with a `spanning-tree bpduguard rate-limit` command.

BPDU rate limiting restricts the number of BPDUs that ports with BPDU guard or BPDU filter disabled can process during a specified interval. Ports discard BPDUs it receives in excess of the specified limit. BPDU rate limits are established by `spanning-tree bpduguard rate-limit count (interface)` commands.

The `no spanning-tree bpduguard rate-limit` and `default spanning-tree bpduguard rate-limit` commands restore the global rate limit setting on the configuration mode interface by removing the corresponding `spanning-tree bpduguard rate-limit` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

**Command Syntax**

- `spanning-tree bpduguard rate-limit enable`
- `spanning-tree bpduguard rate-limit disable`
- `no spanning-tree bpduguard rate-limit`
- `default spanning-tree bpduguard rate-limit`

**Example**

- These commands enable rate limiting on Ethernet 15.
  ```
  switch(config)#interface ethernet 15
  switch(config-if-Et15)#spanning-tree bpduguard rate-limit enable
  switch(config-if-Et15)#
  ```
spanning-tree cost

The `spanning-tree cost` command configures the path cost of the configuration mode interface. Cost values range from 1 to 200000000 (200 million). The default cost depends on the interface speed:

- 1 gigabit interface: cost = 20000
- 10 gigabit interface: cost = 2000

The `spanning-tree cost` command provides a mode option:

- RST instance cost is configured by not including a mode.
- MST instance 0 cost is configured by not including a mode or with the `mst` mode option.
- MST instance cost is configured with the `mst` mode option.
- Rapid-PVST VLAN cost is configured with the `vlan` mode option.

The `no spanning-tree cost` and `default spanning-tree cost` commands restore the default cost on the configuration mode interface by removing the corresponding `spanning-tree cost` command from `running-config`.

Command Mode

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

Command Syntax

```
spanning-tree MODE cost value
no spanning-tree MODE cost
default spanning-tree MODE cost
```

Parameters

- `MODE` specifies the spanning tree instances for which the cost is configured. Values include:
  - `<no parameter>` RST instance, MST instance 0, or all Rapid-PVST instances permitted on the interface.
  - `mst m_range` specified MST instances. `m_range` formats include a number, number range, or comma-delimited list of numbers and ranges. Instance numbers range from 0 to 4094.
  - `vlan v_range` specified Rapid-PVST instances. `v_range` formats include a number, number range, or comma-delimited list of numbers and ranges. VLAN numbers range from 1 to 4094.
  - `value` path cost assigned to interface. Values range from 1 to 200000000 (200 million). Default values are 20000 (1 G interfaces) or 2000 (10 G interfaces).

Examples

- These commands configure a port cost of 25000 for Ethernet interface 5 when configured as an RST port, as a port in MST instance 0, or all unconfigured Rapid-PVST instances that are not explicitly configured.

  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#spanning tree cost 25000
  ```

- This command configures a port cost of 30000 for Ethernet interface 5 when configured as a port in MST instance 200.

  ```
  switch(config-if-Et5)#spanning tree mst 200 cost 30000
  ```
This command configures a port cost of 100000 for Ethernet interface 5 when configured as a port in VLANs 200-220.

```
switch(config-if-Et5)#spanning tree vlan 200-220 cost 100000
switch(config-if-Et5)#
```
spanning-tree edge-port bpdufilter default

The **spanning-tree edge-port bpdufilter default** command configures the global BPDU filter setting as **enabled**. Ports not covered by a **spanning-tree bpdufilter** command use the global BPDU filter setting.

**Command Mode**
- Global Configuration

**Command Syntax**

```
spanning-tree edge-port bpdufilter default
no spanning-tree edge-port bpdufilter default
default spanning-tree edge-port bpdufilter default
```

**Example**

- This command configures the BPDU filter global setting to **enabled**.

```
switch(config)#spanning-tree edge-port bpdufilter default
switch(config)#
```
The `spanning-tree edge-port bpduguard default` command sets the global BPDU guard setting as enabled. Ports not covered by a `spanning-tree bpduguard` command use the global BPDU guard setting.

**Command Mode**
- Global Configuration

**Command Syntax**
- `spanning-tree edge-port bpduguard default`
- `no spanning-tree edge-port bpduguard default`
- `default spanning-tree edge-port bpduguard default`

**Example**
- This command configures the global BPDU guard setting to enabled.

```
switch(config)# spanning-tree edge-port bpduguard default
switch(config)#
```
spanning-tree forward-time

The `spanning-tree forward-time` command configures the forward delay timer. Forward delay is the time that a port is in learning state before it begins forwarding data packets.

The switch inserts the forward delay timer value in BPDU packets it sends as the root bridge. The forward delay value ranges from 4 to 30 seconds with a default of 15 seconds.

The `no spanning-tree forward-time` and `default spanning-tree forward-time` commands restore the forward delay timer default of 15 seconds by removing the `spanning-tree forward-time` command from `running-config`.

**Command Mode**
- Global Configuration

**Command Syntax**
- `spanning-tree forward-time period`
- `no spanning-tree forward-time`
- `default spanning-tree forward-time`

**Parameters**
- **period**  forward delay timer (seconds). Value ranges from 4 to 30. Default is 15.

**Examples**
- This command sets the forward delay timer value to 25 seconds.
  ```
  switch(config)#spanning-tree forward-time 25
  switch(config)#
  ```
spanning-tree guard

The `spanning-tree guard` command enables root guard or loop guard on the configuration mode interface. The `spanning-tree guard loop default` command configures the global loop guard setting.

- Root guard prevents a port from becoming a root or blocked port. A root guard port that receives a superior BPDU transitions to the root-inconsistent (blocked) state.
- Loop guard protects against loops resulting from unidirectional link failures on point-to-point links by preventing non-designated ports from becoming designated ports. When loop guard is enabled, a root or blocked port transitions to loop-inconsistent (blocked) state if it stops receiving BPDUs from its designated port. The port returns to its prior state when it receives a BPDU.

The `no spanning-tree guard` and `default spanning-tree guard` commands sets the configuration mode interface to the global loop guard mode by removing the `spanning-tree guard` statement from `running-config`. The `spanning-tree guard none` command disables loop guard and root guard on the interface, overriding the global setting.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

**Command Syntax**

```
spanning-tree guard PORT_MODE
no spanning-tree guard
default spanning-tree guard
```

**Parameters**
- `PORT_MODE` the port mode. Options include:
  - `loop` enables loop guard on the interface.
  - `root` enables root guard on the interface.
  - `none` disables root guard and loop guard.

**Examples**
- This command enables root guard on Ethernet 5 interface.
  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#spanning-tree guard root
  switch(config-if-Et5)#
  ```
spanning-tree guard loop default

The `spanning-tree guard loop default` command configures the global loop guard setting as *enabled*. Ports not covered by a `spanning-tree guard` command use the global loop guard setting. Loop guard prevents blocked or root ports from becoming a designated port due to failures resulting in a unidirectional link. The `spanning-tree guard` interface configuration statement overrides the global setting for a specified interface. The default global loop guard setting is *disabled*.

The `no spanning-tree guard loop default` and `default spanning-tree guard loop default` commands restore the global loop guard setting of *disabled* by removing the `spanning-tree guard loop default` command from `running-config`.

**Command Mode**
- Global Configuration

**Command Syntax**
- `spanning-tree guard loop default`
- `no spanning-tree guard loop default`
- `default spanning-tree guard loop default`

**Examples**
- This command enables loop guard as the default on all switch ports.

  ```
  switch(config)#spanning-tree guard loop default
  switch(config)#
  ```
spanning-tree hello-time

The **spanning-tree hello-time** command configures the hello time, which specifies the transmission interval between consecutive bridge protocol data units (BPDU) that the switch sends as a root bridge. The hello time is also inserted in outbound BPDUs.

This hello time ranges from 0.2 seconds to 10 seconds with a default of 2 seconds.

The **no spanning-tree hello-time** and **default spanning-tree hello-time** commands restore the hello time default of 2 seconds by removing the **spanning-tree hello-time** command from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

```
spanning-tree hello-time period
no spanning-tree hello-time
default spanning-tree hello-time
```

**Parameters**

- **period** hello-time (milliseconds). Value ranges from 200 to 10000. Default is 2000.

**Examples**

- This command configures a hello-time of one second.

```
switch(config)#spanning-tree hello-time 1000
```

```
switch(config)#
```
spanning-tree link-type

The `spanning-tree link-type` command specifies the configuration mode interface's link type, which is normally derived from the port's duplex setting. The default setting depends on a port's duplex mode:

- full-duplex ports are `point-to-point`.
- half-duplex ports are `shared`.

The `no spanning-tree link-type` and `default spanning-tree link-type` commands restore the default link type on the configuration mode interface by removing the corresponding `spanning-tree link-type` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

**Command Syntax**

```
spanning-tree link-type TYPE
no spanning-tree link-type
default spanning-tree link-type
```

**Parameters**

- `TYPE` link type of the configuration mode interface. Options include:
  - `point-to-point`
  - `shared`

**Examples**

- This command configures Ethernet 5 interface as a shared port.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree link-type shared
switch(config-if-Et5)#
```
spanning-tree max-age

The `spanning-tree max-age` command configures the switch’s max age timer, which specifies the max age value that the switch inserts in outbound BPDU packets it sends as a root bridge. The max-age time value ranges from 6 to 40 seconds with a default of 20 seconds.

Max age is the interval, specified in the BPDU, that BPDU data remains valid after its reception. The bridge recomputes the spanning tree topology if it does not receive a new BPDU before max age expiry.

The `no spanning-tree max-age` and `default spanning-tree max-age` commands restore the max-age default of 20 seconds by removing the `spanning-tree max-age` command from `running-config`.

**Command Mode**
- Global Configuration

**Command Syntax**

```
spanning-tree max-age period
no spanning-tree max-age
default spanning-tree max-age
```

**Parameters**
- `period` max age period (seconds). Value ranges from 6 to 40. Default is 20.

**Examples**
- This command sets the max age timer value to 25 seconds.
  
  switch(config)#spanning-tree max-age 25
  
  switch(config)#
spanning-tree max-hops

The `spanning-tree max-hops` command specifies the max hop setting that the switch inserts into BPDUs that it sends out as the root bridge. The max hop setting determines the number of bridges in an MST region that a BPU can traverse before it is discarded. The max-hop value ranges from 1 to 40 with a default of 20.

The `no spanning-tree max-hops` and `default spanning-tree max-hops` commands restore the max-hop setting to its default value of 20 by removing the `spanning-tree max-hops` command from `running-config`.

Command Mode
Global Configuration

Command Syntax
```
spanning-tree max-hops ports
no spanning-tree max-hops
default spanning-tree max-hops
```

Parameters
- `ports` max hops (bridges). Value ranges from 1 to 40. Default is 20.

Example
- This command sets the max hop value to 40.
  
  ```
  switch(config)#spanning-tree max-hop 40
  switch(config)#
  ```
spanning-tree mode

The **spanning-tree mode** command specifies the spanning tree protocol version that the switch runs. The default mode is Multiple Spanning Tree (mstp).

The **no spanning-tree mode** and **default spanning-tree mode** commands restore the default spanning tree protocol version.

---

**Caution**

The **spanning-tree mode** command may disrupt user traffic. When the switch starts a different STP version, all spanning-tree instances are stopped, then restarted in the new mode.

---

**Command Mode**

Global Configuration

**Command Syntax**

```
spanning-tree mode VERSION
no spanning-tree mode
default spanning-tree mode
```

**Parameters**

- **VERSION** spanning tree version that the switch runs. Options include:
  - `mstp` multiple spanning tree protocol described in the IEEE 802.1Q-2005 specification and originally specified in the IEEE 802.1s specification.
  - `rstp` rapid spanning tree protocol described in the IEEE 802.1D-2004 specification and originally specified in the IEEE 802.1w specification.
  - `rapid-pvst` rapid per-VLAN spanning tree protocol described in the IEEE 802.1D-2004 specification and originally specified in the IEEE 802.1w specification.
  - `backup` disables STP and enables switchport interface pairs configured with the `switchport backup-link` command.
  - `none` disables STP. The switch does not generate STP packets. Each switchport interface forwards data packets to all connected ports and forwards STP packets as multicast data packets on the VLAN where they are received.

**Guidelines**

Backup mode is not available on Trident platform switches.

**Example**

- This command configures the switch to run multiple spanning tree protocol.

  ```
  switch(config)#spanning-tree mode mstp
  switch(config)#
  ```
spanning-tree mst configuration

The `spanning-tree mst configuration` command places the switch in MST-configuration mode, which is the group change mode where MST region parameters are configured.

Changes made in a group change mode are saved by leaving the mode through the `exit` command or by entering another configuration mode. To discard changes from the current edit session, leave the mode with the `abort` command.

These commands are available in MST-configuration mode:

- `abort (mst-configuration mode)`
- `exit (mst-configuration mode)`
- `instance`
- `name (mst-configuration mode)`
- `revision (mst-configuration mode)`
- `show (mst-configuration mode)`

The `no spanning-tree mst configuration` and `default spanning-tree mst configuration` commands restore the MST default configuration.

**Command Mode**

Global Configuration

**Command Syntax**

```
spanning-tree mst configuration
no spanning-tree mst configuration
default spanning-tree mst configuration
```

**Examples**

- This command enters MST configuration mode.

  ```
  switch(config)# spanning-tree mst configuration
  switch(config-mst)#
  ```

- This command exits MST configuration mode, saving MST region configuration changes to `running-config`.

  ```
  switch(config-mst)# exit
  switch(config)#
  ```

- This command exits MST configuration mode without saving MST region configuration changes to `running-config`.

  ```
  switch(config-mst)# abort
  switch(config)#
  ```
spanning-tree portchannel guard misconfig

The `spanning-tree portchannel guard misconfig` command enables the switch to detect misconfigured port channels that may cause network loops by monitoring inbound BPDUs. When a port channel receives 75 inconsistent BPDUs within 30 seconds, the switch error disables the port. When a port channel receives 5 BPDUs with the same source BPDU during the 30 second measurement interval, the error counter is reset and the port continues normal port channel operation. Misconfigured port channel detection is disabled by default.

The `no spanning-tree portchannel guard misconfig` and `default spanning-tree portchannel guard misconfig` commands disables the detection of misconfigured port channels by removing the `spanning-tree portchannel guard misconfig` statement from `running-config`.

Command Mode
Global Configuration

Command Syntax

```
spanning-tree portchannel guard misconfig
no spanning-tree portchannel guard misconfig
default spanning-tree portchannel guard misconfig

spanning-tree etherchannel guard misconfig
no spanning-tree etherchannel guard misconfig
default spanning-tree etherchannel guard misconfig
```

Guidelines

The `spanning-tree portchannel guard misconfig` and `spanning-tree etherchannel guard misconfig` commands are equivalent.

Examples

- This command enables port channel misconfiguration detection on the switch.

  ```
  switch(config)#spanning-tree portchannel guard misconfig
  switch(config)#show running-config
  
  !
  spanning-tree mode mstp
  spanning-tree portchannel guard misconfig
  !
  <--------OUTPUT OMITTED FROM EXAMPLE--------->
  !
  end
  switch(config)#
  ```

- This command disables port channel misconfiguration detection on the switch.

  ```
  switch(config)#no spanning-tree portchannel guard misconfig
  switch(config)#show running-config
  
  !
  spanning-tree mode mstp
  !
  <--------OUTPUT OMITTED FROM EXAMPLE--------->
  !
  end
  switch(config)#
  ```
spanning-tree portfast

The `spanning-tree portfast` command programs configuration mode ports to immediately enter forwarding state when they establish a link. PortFast ports are included in spanning tree topology calculations and can enter discarding state. This command overrides the `spanning-tree portfast auto` command.

The `no spanning-tree portfast` and `default spanning-tree portfast` commands remove the corresponding `spanning-tree portfast` command from `running-config`.

Command Mode

   Interface-Ethernet Configuration
   Interface-Port-Channel Configuration

Command Syntax

   `spanning-tree portfast`
   `no spanning-tree portfast`
   `default spanning-tree portfast`

Example

   - This command unconditionally enables portfast on Ethernet 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree portfast
switch(config-if-Et5)#
```
**spanning-tree portfast auto**

The `spanning-tree portfast auto` command enables auto-edge detection on the configuration mode interface. When auto-edge detection is enabled, the port is configured as an edge port if it does not receive a new BPDU before the current BPDU expires. Auto-edge detection is enabled by default. The `spanning-tree portfast` command, when configured, has priority over this command.

The `no spanning-tree portfast auto` command disables auto-edge port detection. This command is removed from `running-config` with the `spanning-tree portfast auto` and `default spanning-tree portfast auto` commands.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

**Command Syntax**
- spanning-tree portfast auto
- no spanning-tree portfast auto
- default spanning-tree portfast auto

**Example**
- This command enables auto-edge detection on Ethernet interface 5.
  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#spanning-tree portfast auto
  switch(config-if-Et5)#
  ```
spanning-tree portfast <port type>

The `spanning-tree portfast <port-type>` command specifies the STP port mode for the configuration mode interface. Default port mode is `normal`.

Port modes include:

- **Edge**: Edge ports connect to hosts and transition to the forwarding state when the link is established. An edge port that receives a BPDU becomes a normal port.
- **Network**: Network ports connect only to switches or bridges and support bridge assurance. Network ports that connect to hosts or other edge devices transition to the discarding state.
- **Normal**: Normal ports function as normal STP ports and can connect to any type of device.

The `no spanning-tree portfast <port-type>` and `default spanning-tree portfast <port-type>` commands restore the default port mode of normal by removing the corresponding `spanning-tree portfast <port-type>` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

**Command Syntax**

- `spanning-tree portfast PORT_MODE`
- `no spanning-tree portfast PORT_MODE`
- `default spanning-tree portfast PORT_MODE`

**Parameters**

- **PORT_MODE** STP port mode. Options include:
  - `edge`
  - `network`
  - `normal`

  The `normal` option is not available for the `no` and `default` commands.

**Related Commands**

The `spanning-tree portfast <port-type>` command also affects the `spanning-tree portfast auto` and `spanning-tree portfast` configuration for the configuration mode interface:

- `spanning-tree portfast normal`: `spanning-tree portfast auto` is enabled.
- `spanning-tree portfast edge`: `spanning-tree portfast` is enabled.
- `spanning-tree portfast network`: `spanning-tree portfast auto` is disabled.

**Example**

- This command configures Ethernet 5 interface as a network port.

```bash
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree portfast network
switch(config-if-Et5)#!
```
spanning-tree port-priority

The spanning-tree port-priority command specifies the configuration mode interface’s port-priority number. The switch uses this number to determine which interface it places into forwarding mode when resolving a loop. Valid settings are all multiples of 16 between 0 and 240. Default value is 128. Ports with lower numerical priority values are selected over other ports.

The no spanning-tree port-priority and default spanning-tree port-priority commands restore the default of 128 for the configuration mode interface by removing the spanning-tree port-priority command from running-config.

The spanning-tree port-priority command provides a mode option:

- RST instance port-priority is configured by not including a mode.
- MST instance 0 port-priority is configured by not including a mode or with the mst mode option.
- MST instance port-priority is configured with the mst mode option.
- Rapid-PVST VLAN port-priority is configured with the vlan mode option.

Command Mode

Interface-Ethernet Configuration
Interface-Port-Channel Configuration

Command Syntax

spanning-tree [MODE] port-priority value
no spanning-tree [MODE] port-priority
default spanning-tree [MODE] port-priority

Parameters

- **MODE** specifies the spanning tree instances for which the cost is configured. Values include:
  - <no parameter> RST instance or MST instance 0.
  - **mst** m_range specified MST instances. m_range formats include a number, number range, or comma-delimited list of numbers and ranges. Instance numbers range from 0 to 4094.
  - **vlan** v_range specified Rapid-PVST instances. v_range formats include a number, number range, or comma-delimited list of numbers and ranges. VLAN numbers range from 1 to 4094.
  - **value** bridge priority number. Values range from 0 to 240 and must be a multiple of 16.

Example

- This command sets the port priority of Ethernet 5 interface to 144.

```bash
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree port-priority 144
switch(config-if-Et5)#
```
spanning-tree priority

The **spanning-tree priority** command configures the bridge priority number. The bridge priority is the four most significant digits of the bridge ID, which is used by spanning tree algorithms to select the root bridge and choose among redundant links. Bridge ID numbers range from 0 to 65535 (16 bits); bridges with smaller bridge IDs are elected over other bridges.

Because bridge priority sets the four most significant bits of the bridge ID, valid settings include all multiples of 4096 between 0 and 61440. Default value is 32768.

The **spanning-tree priority** command provides a mode option:

- RST instance priority is configured by not including a mode.
- MST instance 0 priority is configured by not including a mode or with the **mst** mode option.
- MST instance priority is configured with the **mst** mode option.
- Rapid-PVST VLAN priority is configured with the **vlan** mode option.

The **no spanning-tree priority** and **default spanning-tree priority** commands restore the bridge priority default of 32768 for the specified mode by removing the corresponding **spanning-tree priority** command from **running-config**.

Another method of adding **spanning-tree priority** commands to the configuration is through the **spanning-tree root** command. Similarly, the **no spanning-tree root** command removes the corresponding **spanning-tree priority** command from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

```
spanning-tree [MODE] priority level
no spanning-tree [MODE] priority
default spanning-tree [MODE] priority
```

**Parameters**

- **MODE** spanning tree instances for which the command configures priority. Options include:
  - <no parameter> RST instance or MST instance 0.
  - **mst m_range** specified MST instances. **m_range** formats include a number, number range, or comma-delimited list of numbers and ranges. Instance numbers range from 0 to 4094.
  - **vlan v_range** specified Rapid-PVST instances. **v_range** formats include a number, number range, or comma-delimited list of numbers and ranges. VLAN numbers range from 1 to 4094.
  - **level** priority number. Values include multiples of 4096 between 0 and 61440. Default is 32768.

**Examples**

- This command configures a bridge priority value of 20480 for Rapid-PVST VLANs 20, 24, 28, and 32.
  
  ```
  switch(config)#spanning-tree vlan-id 20,24,28,32 priority 20480
  switch(config)#
  ```

- This command configures a bridge priority value of 36864 for the RST instance. When MST is enabled, this command configures a priority of 36864 for MST instance 0.
  
  ```
  switch(config)#spanning-tree priority 36864
  switch(config)#
  ```
spanning-tree root

The **spanning-tree root** command configures the bridge priority number by adding a **spanning-tree priority** command to the configuration. Parameter settings set the following priority values:

- **primary** sets the bridge priority to 8192.
- **secondary** sets the bridge priority to 16384.

The bridge priority is the four most significant digits of the bridge ID, which is used by spanning tree algorithms to select the root bridge and choose among redundant links. Bridge ID numbers range from 0 to 65535 (16 bits); bridges with smaller bridge IDs are elected over other bridges.

When no other switch in the network is similarly configured, assigning the primary value to the switch facilitates its selection as the root switch. Assigning the secondary value to the switch facilitates its selection as the backup root in a network that contains one switch with a smaller priority number.

The **spanning-tree root** command provides a mode option:

- RST instance priority is configured by not including a mode.
- MST instance 0 priority is configured by not including a mode or with the **mst** mode option.
- MST instance priority is configured with the **mst** mode option.
- Rapid-PVST VLAN priority is configured with the **vlan** mode option.

The **no spanning-tree root** and **default spanning-tree root** commands restore the bridge priority default of 32768 by removing the corresponding **spanning-tree priority** command from **running-config**. The **no spanning-tree root**, **no spanning-tree priority**, **default spanning-tree root** and **default spanning-tree priority** commands perform the same function.

**Command Mode**

Global Configuration

**Command Syntax**

```
spanning-tree [MODE] root TYPE
no spanning-tree [MODE] root
default spanning-tree [MODE] root
```

**Parameters**

- **MODE** specifies the spanning tree instances for which priority is configured. Values include:
  - `<no parameter>` RST instance or MST instance 0.
  - **mst m_range** specified MST instances. **m_range** formats include a number, number range, or comma-delimited list of numbers and ranges. Instance numbers range from 0 to 4094.
  - **vlan v_range** specified Rapid-PVST instances. **v_range** formats include a number, number range, or comma-delimited list of numbers and ranges. VLAN numbers range from 1 to 4094.
- **TYPE** sets the bridge priority number. Values include:
  - **primary** sets the bridge priority to 8192.
  - **secondary** sets the bridge priority to 16384.
Examples

- This command configures a bridge priority value of 8192 for Rapid-PVST VLANs 20-36.
  `switch(config)#spanning-tree vlan-id 20-36 root primary`

- This command configures a bridge priority value of 16384 for the RSTP instance and MST instance 0.
  `switch(config)#spanning-tree root secondary`
spanning-tree transmit active

The **spanning-tree transmit active** command enables bridge assurance globally, which enables bridge assurance on all ports with a port type of **network**. Bridge assurance protects against unidirectional link failure, other software failure, and devices that quit running a spanning tree algorithm.

Bridge assurance is available only on point-to-point links on spanning tree **network** ports. Both ends of the link should ideally have bridge assurance enabled. Bridge assurance-enabled ports will not necessarily be blocked when they link to a port where bridge assurance is not enabled, but if they do not receive periodic BPDUs from the other side of the link the **show spanning-tree transmit active** command will show a bridge assurance status of “inconsistent” (blocking) for that port.

The **no spanning-tree transmit active** command disables bridge assurance.

The **spanning-tree transmit active** and **default spanning-tree transmit active** commands restore the default behavior by removing the **no spanning-tree transmit active** command from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

- `spanning-tree transmit active`
- `no spanning-tree transmit active`
- `default spanning-tree transmit active`

**Example**

- This command enables bridge assurance on the switch.

  ```
  switch(config)#spanning-tree transmit active
  switch(config)#
  ```
spanning-tree vlan-id

The `spanning-tree vlan-id` command enables Spanning Tree Protocol (STP) on specified VLANs by removing any corresponding `no spanning-tree vlan-id` statements from `running-config`. Spanning-tree is enabled on all VLANs by default.

The `no spanning-tree vlan-id` command disables STP on the specified interfaces. The `default spanning-tree vlan-id` enables STP on the specified interfaces.

**Warning**
Disabling STP is not recommended, even in topologies free of physical loops; STP guards against configuration mistakes and cabling errors. When disabling STP, ensure that there are no physical loops in the VLAN.

**Important!**
When disabling STP on a VLAN, ensure that all switches and bridges in the network disable STP for the same VLAN. Disabling STP on a subset of switches and bridges in a VLAN may have unexpected results because switches and bridges running STP will have incomplete information regarding the network's physical topology.

The following STP global configuration commands provide a `vlan` option for configuring Rapid-PVST VLAN instances:

- `spanning-tree priority`
- `spanning-tree root`

**Command Mode**
Global Configuration

**Command Syntax**

```
spanning-tree vlan-id v_range
no spanning-tree vlan-id v_range
default spanning-tree vlan-id v_range
```

**Parameters**

- `v_range` VLAN list. Formats include a number, number range, or comma-delimited list of numbers and ranges. VLAN numbers range from 1 to 4094.

**Examples**

- This command disables STP on VLANs 200-205
  ```
  switch(config)#no spanning-tree vlan-id 200-205
  switch(config)#
  ```

- This command enables STP on VLAN 203
  ```
  switch(config)#spanning-tree vlan-id 203
  switch(config)#
  ```
switchport backup-link

The `switchport backup-link` command establishes a primary-backup configuration for forwarding VLAN traffic between the command mode interface and a specified interface. The `show interfaces switchport backup-link` command displays the state of backup interface pairs on the switch:

- the primary interface is the command mode interface.
- the backup interface is the interface specified in the command.

The following guidelines apply to primary and backup interfaces.

- Ethernet and Port Channels can be primary interfaces.
- Ethernet, Port Channel, Management, Loopback, and VLANs can be backup interfaces.
- The primary and backup interfaces can be different interface types.
- Interface pairs should be similarly configured to ensure consistent behavior.
- An interface can be associated with a maximum of one backup interface.
- An interface can back up a maximum of one interface.
- Any Ethernet interface configured in an interface pair cannot be a port channel member.
- The STP mode is backup.
- Static MAC addresses should be configured after primary-backup pairs are established.

When load balancing is not enabled, the primary and backup interfaces cannot simultaneously forward VLAN traffic. When the primary interface is forwarding VLAN traffic, the backup interface drops all traffic. If the primary interface fails, the backup interface forwards VLAN traffic until the primary interface is functional.

The `prefer vlan` option balances the load across the primary and backup interfaces. When the command includes the `prefer vlan` option, each interface is the primary for a subset of the vlans carried by the pair. When both interfaces are up, prefer option vlans are forwarded on the backup interface and all other configured vlans are carried by the primary interface.

The `no switchport backup-link` and `default switchport backup-link` commands remove the primary-backup configuration for the configuration mode interface.

**Command Mode**

<table>
<thead>
<tr>
<th>Interface-Ethernet Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface-Port Channel Configuration</td>
</tr>
</tbody>
</table>

**Command Syntax**

```
switchport backup-link INT_NAME [BALANCE]
no switchport backup-link
default switchport backup-link
```

**Parameters**

- `INT_NAME` the backup interface. Options include:
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Channel group interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
  - `vxlan vx_num` VXLAN interface specified by `vx_num`.
- `BALANCE` VLANs whose traffic is normally handled on the backup interfaces. Values include:
Chapter 26: Spanning Tree Protocol

### STP Commands

- `<no parameter>` backup interface handles no traffic if the primary interface is operating.
- `prefer vlan v_range` list of VLANs whose traffic is handled by backup interface.

### Examples

- These commands establish Ethernet interface 7 as the backup port for Ethernet interface 1.
  
  switch(config)#interface ethernet 1
  switch(config-if-Et1)#switchport backup-link ethernet 7
  switch(config-if-Et1)#

- These commands configure the following:
  
  - Ethernet interface 1 as a trunk port that handles VLAN 4 through 9 traffic.
  - Ethernet interface 2 as its backup interface.
  - Ethernet 2 as the preferred interface for VLANs 7 through 9.

  switch(config-if-Et1)#switchport mode trunk
  switch(config-if-Et1)#switchport trunk allowed vlan 4-9
  switch(config-if-Et1)#switchport backup-link Ethernet 2 prefer vlan 7-9
  switch(config-if-Et1)#
transmit-interval

The transmit-interval command sets the interval at which loop detection packets are transmitted. The no transmit-interval and default transmit-interval commands restore the transmission interval to the default of 5 seconds.

Command Mode
Loop-protection Configuration

Command Syntax
transmit-interval interval

Parameters
- interval Interval in seconds at which loop-detection packets are transmitted. Values range from 1 to 10; default is 5.

Example
- This command sets the loop detection packet transmission interval to 10 seconds.
  switch(config-monitor-loop-protect)#transmit-interval 10
  switch(config-monitor-loop-protect)#
Chapter 27

Quality of Service

This chapter describes Arista’s Quality of Service (QoS) implementation, including configuration instructions and command descriptions. Topics covered by this chapter include:

- Section 27.1: Quality of Service Conceptual Overview
- Section 27.2: QoS Configuration: Platform-Independent Features
- Section 27.3: QoS Configuration: Arad Platform Switches
- Section 27.4: QoS Configuration: Jericho Platform Switches
- Section 27.5: QoS Configuration: FM6000 Platform Switches
- Section 27.6: QoS Configuration: Petra Platform Switches
- Section 27.7: QoS Configuration: Trident and Tomahawk Platform Switches
- Section 27.8: QoS Configuration: Trident-II and Helix Platform Switches
- Section 27.9: ACL based QoS Configuration
- Section 27.10: Quality of Service Configuration Commands

27.1 Quality of Service Conceptual Overview

QoS processes apply to traffic that flows through Ethernet ports and control planes. These processes can modify data fields (CoS or DSCP) or assign data streams to traffic classes for prioritized handling. Transmission queues are configurable for individual Ethernet ports to shape traffic based on its traffic class. Many switches also support traffic policies that apply to data that is filtered by access control lists.

The following sections describe QoS features:

- Section 27.1.1: QoS Data Fields and Traffic Classes
- Section 27.1.2: Transmit Queues and Port Shaping
- Section 27.1.3: Explicit Congestion Notification (ECN)
- Section 27.1.4: ACL Policing
- Section 27.1.5: Quality of Service (QoS) Profiles

27.1.1 QoS Data Fields and Traffic Classes

Quality of Service defines a method of differentiating data streams to provide varying levels of service to the different streams. Criteria determining a packet’s priority level include packet field contents and the port where data packets are received. QoS settings are translated into traffic classes, which are then used by switches to manage all traffic flows. Traffic flow management varies with each switch platform.
27.1.1.1 QoS Data Fields

Quality of service decisions are based on the contents of the following packet fields:

- CoS (three bits): Class of service (CoS) is a 3-bit field in Ethernet frame headers using VLAN tagging. The field specifies a priority value between zero and seven. Class of service operates at layer 2.
- DSCP (six bits): Differentiated Service Code Point (DSCP) is a 6-bit field in the Type Of Service (TOS) field of IP packet headers.

27.1.1.2 Port Settings – Trust Mode and Traffic Class

Ethernet and port channel interfaces support three QoS trust modes:

- CoS Trust: Ports use inbound packet CoS field contents to derive the traffic class.
- DSCP Trust: Ports use inbound packets DSCP field contents to derive the traffic class.
- Untrusted: Ports use their default values to derive the traffic class, ignoring packet contents.

The default mode setting is **CoS trust** for switched ports and **DSCP trust** for routed ports.

Ports are associated with default CoS, DSCP, and traffic class settings; defaults vary by platform.

These sections describe procedures for configuring port settings:

- Section 27.3.1: CoS and DSCP Port Settings – Arad Platform Switches
- Section 27.5.1: CoS and DSCP Port Settings – FM6000 Platform Switches
- Section 27.6.1: CoS and DSCP Port Settings – Petra Platform Switches
- Section 27.7.1: CoS and DSCP Port Settings – Trident and Tomahawk Platform Switches
- Section 27.8.1: CoS and DSCP Port Settings – Trident-II and Helix Platform Switches

27.1.1.3 Rewriting CoS and DSCP

**CoS Rewrite**

Switches can rewrite the CoS field for outbound tagged packets. The new CoS value is configurable, and is derived from a data stream’s traffic class as specified by the traffic class-to-CoS rewrite map. CoS rewrite is disabled on all the traffic received on CoS trusted ports.

On Arad, Jericho, FM6000, Trident and Tomahawk, Trident-II, and Helix platform switches, CoS rewrite can be enabled or disabled on DSCP trusted ports and untrusted ports.

- CoS rewrite is globally enabled by default for packets received on untrusted ports and DSCP trusted ports if at least one port is explicitly configured in **DSCP trust** or **untrusted** mode.
- CoS rewrite is globally disabled by default for packets received on untrusted ports and DSCP trusted ports if there are no ports explicitly configured in **DSCP trust** or **untrusted** mode.

On Petra platform switches, CoS rewrite is always enabled on DSCP trusted ports and untrusted ports.

**DSCP Rewrite**

Switches can rewrite the DSCP field for outbound IP packets. On FM6000, Trident and Tomahawk, Trident-II, and Helix platform switches, DSCP rewrite is disabled by default on all ports and always disabled for traffic received on DSCP trusted ports. On Petra, Arad, and Jericho platform switches, DSCP rewrite is always disabled.
FM6000, Trident and Tomahawk, Trident-II, and Helix platform switches provide a command that enables or disables DSCP rewrite for packets received on CoS trusted ports and untrusted ports. The new DSCP value is configurable, based on the data stream’s traffic class, as specified by the traffic class-to-DSCP rewrite map.

These sections describe procedures for rewriting CoS and DSCP fields:

- Section 27.3.3: CoS Rewrite – Arad Platform Switches
- Section 27.5.3: CoS and DSCP Rewrite – FM6000 Platform Switches
- Section 27.6.3: CoS Rewrite – Petra Platform Switches
- Section 27.7.3: CoS and DSCP Rewrite – Trident and Tomahawk Platform Switches
- Section 27.8.3: CoS and DSCP Rewrite – Trident-II and Helix Platform Switches

27.1.4 Traffic Classes

Data stream distribution is based on their traffic classes. Data stream management varies by switch platform. Traffic classes are derived from these data stream, inbound port, and switch attributes:

- CoS field contents
- DSCP field contents
- Inbound port trust setting
- CoS default setting (Arad, Jericho, FM6000, Trident and Tomahawk, Trident-II, and Helix platform switches)
- DSCP default setting (Arad, Jericho, FM6000, Trident and Tomahawk, and Trident-II platform switches)
- Traffic class default setting (Petra platform switches)

When a port is configured to derive a data stream’s traffic class from the CoS or DSCP value associated with the stream, the traffic class is determined from a conversion map.

- A CoS-to-traffic class map derives a traffic class from a CoS value.
- A DSCP-to-traffic class map derives a traffic class from a DSCP value.

Map entries are configurable through CLI commands. Default maps determine the traffic class value when CLI map entry commands are not configured. Default maps vary by switch platform.

These sections describe traffic class configuration procedures:

- Section 27.3.2: Traffic Class Derivations – Arad Platform Switches
- Section 27.4.2: Traffic Class Derivations – Jericho Platform Switches
- Section 27.5.2: Traffic Class Derivations – FM6000 Platform Switches
- Section 27.6.2: Traffic Class Derivations – Petra Platform Switches
- Section 27.7.2: Traffic Class Derivations – Trident and Tomahawk Platform Switches
- Section 27.8.2: Traffic Class Derivations – Trident-II and Helix Platform Switches

27.1.2 Transmit Queues and Port Shaping

Transmit queues are logical partitions of an Ethernet port’s egress bandwidth. Data streams are assigned to queues based on their traffic class, then sent as scheduled by port and transmit settings. Support varies by switch platform. A queue’s label determines its priority: queues with the suffix “0” have the lowest priority.

Parameters that determine transmission schedules include:
**Traffic class-to-transmit queue mapping** determines the transmit queue for transmitting data streams based on traffic class. The set of available transmit maps vary by switch platforms:

- Arad, Jericho, FM6000, Trident-II, and Helix platforms: one map for all unicast and multicast traffic.
- Trident and Tomahawk platform: one map for unicast traffic and one map for multicast traffic.
- Petra platform: one map for unicast traffic. Queue shaping is not available for multicast traffic.

**Port shaping** specifies a port's maximum egress bandwidth.

**Queue shaping** specifies a transmit queue's maximum egress bandwidth, and implementation varies by platform.

- Trident and Tomahawk platform: queue shaping is configurable separately for unicast and multicast queues.
- Trident-II platform: queue shaping is configurable for transmit queues. Port shaping and queue shaping are supported only in store-and-forward switching mode.
- Petra platform: queue shaping is not available for multicast traffic.
- Helix platform: queue shaping is configurable for transmit queues.
- FM6000 platform: switches do not support simultaneous port shaping and queue shaping. Enabling port shaping on an FM6000 switch disables queue shaping, regardless of the previous configuration.

**Guaranteed bandwidth** guarantees the allocation of a specified bandwidth for a transmit queue. Guaranteed bandwidth is supported only on Trident-II platforms.

**Queue priority** specifies the priority at which a transmit queue is serviced. The switch defines two queue priority types:

- **Strict priority** queues are serviced in the order of their priority rank - subject to each queue's configured maximum bandwidth. Data is not handled for a queue until all queues with higher priority are emptied or their transmission limit is reached. These queues typically carry low latency real time traffic and require highest available priority.
- **Round robin** queues are serviced simultaneously subject to assigned bandwidth percentage and configured maximum bandwidth. All round robin queues have lower priority than strict priority queues. Round robin queues can be starved by strict priority queues.

**Queue scheduling** determines how packets from different transmit queues are serviced to be sent out on the port.

**Queue bandwidth allocation** specifies the time slice (percentage) assigned to a round robin queue, relative to all other round robin queues.

These sections describe transmit queue and port shaping configuration procedures:

- Section 27.3.4: Transmit Queues and Port Shaping – Arad Platform Switches
- Section 27.4.4: Transmit Queues and Port Shaping – Jericho Platform Switches
- Section 27.5.4: Transmit Queues and Port Shaping – FM6000 Platform Switches
- Section 27.6.4: Transmit Queues and Port Shaping – Petra Platform Switches
- Section 27.7.4: Transmit Queues and Port Shaping – Trident and Tomahawk Platform Switches
- Section 27.8.4: Transmit Queues and Port Shaping – Trident-II and Helix Platform Switches
27.1.3 **Explicit Congestion Notification (ECN)**

Explicit Congestion Notification (ECN) is an IP and TCP extension that facilitates end-to-end network congestion notification without dropping packets. ECN recognizes early congestion and sets flags that signal affected hosts. Trident and Tomahawk, Trident II, and Helix platform switches extend ECN support to non-TCP packets.

ECN usage requires that it is supported and enabled by both endpoints. Although only unicast flows are modified by ECN markers, the multicast, broadcast, and unmarked unicast flows can affect network congestion and influence the indication of unicast packet congestion.

### 27.1.3.1 ECN Conceptual Overview

The ECN field in the IP header (bits 6 and 7 in the IPv4 TOS or IPv6 traffic class octet) advertises ECN capabilities:

- **00**: Router does not support ECN.
- **10**: Router supports ECN.
- **01**: Router supports ECN.
- **11**: Congestion encountered.

Networks typically signal congestion by dropping packets. After an ECN-capable host negotiates ECN, it signals impending congestion by marking the IP header of packets encountering the congestion instead of dropping the packets. The recipient echoes the congestion indication back to the sender, which reduces its transmission rate as if it had detected a dropped packet.

Switches support ECN for unicast queues through Weighted Random Early Detection (WRED), an active queue management (AQM) algorithm that extends Random Early Detection (RED) to define multiple thresholds for an individual queue. WRED determines congestion by comparing average queue size with queue thresholds. Average queue size depends on the previous average and current queue size:

\[
\text{average queue size} = (\text{old}_\text{avg} \times (1-2^{-\text{weight}})) + (\text{current}_\text{queue}_\text{size} \times 2^{-\text{weight}})
\]

where weight is the exponential weight factor used for averaging the queue size.

Packets are marked based on WRED as follows:

- If average queue size is below the minimum threshold, packets are queued as in normal operation without ECN.
- If average queue size is greater than the maximum threshold, packets are marked for congestion.
- If average queue size is between minimum and maximum queue threshold, packets are either queued or marked. The proportion of packets that are marked increases linearly from 0% at the minimum threshold to 100% at the maximum threshold.

Treatment of packets marked as not ECN capable varies by platform.

These sections describe ECN configuration procedures:

- **Section 27.3.5: ECN Configuration – Arad Platform Switches**
- **Section 27.7.5: ECN Configuration – Trident and Tomahawk Platform Switches**

### 27.1.4 ACL Policing

ACL policing monitors the ingress data rates for a particular class of traffic and performs the action configured when the traffic exceeds the user configured value. Hence, it allows the user to control ingress bandwidth based on packet classification. The incoming traffic is metered and marked by the policing, and based on the metering results the actions are performed.
The policing uses three types of traffic metering and coloring mechanisms.

- **Single Rate Two Color Marker**
- **Single Rate Three Color Marker**
- **Two Rate Three Color Marker**

### Single Rate Two Color Marker

It meters the packet stream and marks packets based on committed burst size (bc) and excess burst size (be).

### Single Rate Three Color Marker

It meters the packet stream and marks packets based on single rate committed information rate (cir), and committed burst size (bc) and excess burst size (be). The packets are marked in green if it does not exceed the set burst size, and marked in yellow if it does exceed the burst size but not the excess burst size, and marked red otherwise. The packets are marked in two color modes.

- **Color-blind Mode:** In color-blind mode the incoming packet color is ignored.
- **Color-aware Mode:** In color-aware mode it is assumed that incoming packet is colored by preceding entity. And, in color-aware mode, a packet never get better than it was. If the input color of the packet is green, it can be marked as green, yellow, or red. But if the input color is yellow, then it can be marked only yellow or red

### Two Rate Three Color Marker

It meters the packet stream and marks its packets based on two rates, peak information rate (pir) and committed information rate (cir), and associated burst sizes (bc and be). The packet is marked red if rate exceeds ‘pir’, and yellow if it exceeds ‘cir’ but not ‘pir’ and marked green if rate is lower than ‘cir’. The two rate mode is configured by setting four parameters pir, cir, bc, and be.

The ACL policing is supported on platforms specified in the table below.

**Table 27-1  ACL Policing Support Matrix**

27.1.4.1 Configuring ACL Policing

The policer is applied to the class inside the policy map. Policy maps can contain one or more policy map classes, each with different match criteria and policers. The following is the default behavior on conditions and available policing actions:

- Police command creates a per-interface policer. If you attach per-interface policers to multiple ingress ports, each one polices the matched traffic on each ingress port separately. Per interface statistics gathered for conformed/allowed traffic and exceeded/dropped traffic
- If there is no policer configured within a class, all traffic is transmitted without any policing. If there are any actions configured, the configured actions are applied
  - conform-action (green): transmit (default)
  - exceed-action (yellow): drop (default)
  - violate-action (red): drop (default)

Steps to Configure ACL Policing

These commands set the CIR, burst size, and creates a class and applies the policing to the policy map:

**Step 1** Create a policy map.

**Step 2** Create a class-map.

**Step 3** Apply the policer to the policy map created.

Example

- These commands configure the ACL policing for a policy map.
  
  ```
  switch(config)#policy-map [type qos] policy-name
  switch(config-pmap)#class { class-name }
  switch(config-pmap-c)#[no] police cir cir [{bps|kbps|mbps}] bc
  committed-burst-size [{bytes|kbytes|mbytes}]
  ```

Example

- These commands configure ACL policing in single-rate, two-color mode.
  
  ```
  switch(config)#class-map type qos match-any class1
  switch(config-cmap-class1)#match ip access-group acl1
  switch(config-cmap-class1)#exit

  switch(config)#policy-map type quality-of-service policy1
  switch(config-pmap)#class class1
  switch(config-pmap-c)#police cir 512000 bc 96000
  switch(config-pmap-c)#exit
  ```
Displaying ACL Policing Information

Examples

- This command shows the contents of all policy maps on the switch.

  ```
  switch(config)#show policy-map
  Service-policy p
  Class-map: c (match-any)
    Match: ip access-group name a
    police rate 1000 mbps burst-size 100 bytes
  Class-map: class-default (match-any)
  Service-policy p
  Class-map: c (match-any)
    Match: ip access-group name a
    police rate 1000 mbps burst-size 100 bytes
  Class-map: class-default (match-any)
  ```

- This command shows the interface-specific police counters for Ethernet interface 1.

  ```
  switch(config)#show policy-map interface Ethernet 1 input counters
  Service-policy input: policy1
  Hardware programming status: Successful
  Class-map: class1 (match-any) Match: ip access-group name acl1
  Police cir 512000 bps bc 96000 bytes Conformed 4351 packets, 1857386 bytes
  Conformed 2536 packets, 3384260 bytes
  Class-map: class-default (match-any) matched packets: 0
  ```

- This command shows the counters associated with the policy map called “p1.”

  ```
  switch(config)#show policy-map type qos p1 input counters
  Service-policy input: p1 Class-map: c1 (match-any)
  Match: ip access-group name a1
  Police cir 512000 bps bc 96000 bytes Interface: Ethernet1
  Conformed 4351 packets, 1857386 bytes
  Exceeded 2536 packets, 3384260 bytes
  Interface: Ethernet2
  Conformed 2351 packets, 957386 bytes
  Exceeded 1536 packets, 1384260 bytes
  Class-map: class-default (match-any)
  Matched packets: 3229
  ```

- This command shows the QoS policy map for Ethernet interface 1.

  ```
  switch(config)#show policy-map interface Ethernet 1 input type qos
  Interface: Ethernet 1 Service-policy input: policy1
  Hardware programming status: Successful Class-map: class1 (match-any)
  Match: ip access-group name acl1
  Police cir 512000 bps bc 9000 bytes
  Class-map: class2 (match-any)
  Match: ip access-group name acl2 set dscp 2
  Class-map: class3 (match-any) Match: ip access-group name acl3
  Police cir 1280000 bps bc 9000 bytes
  Class-map: class-default (match-any)
  ```

27.1.5 Quality of Service (QoS) Profiles

Quality of Service (QoS) profiles are sets of QoS configuration instructions defined and applied at the interface level. A QoS profile serves the traffic better by reducing disorder in the running configuration. QoS profiles can modify all interface-level QoS configurations, and are supported on fabric, Ethernet, and port-channel interfaces. Control-plane policies cannot be applied using QoS profiles. Because
configuration can be applied through QoS profiles or directly at the interface level, multiple configurations can be applied to the same interface. In such cases, QoS configurations with non-default values, whether configured through the CLI at the interface level or through a QoS profile, are given priority. In the case of multiple non-default values being configured, the interface-level CLI configuration is given priority.

Policy maps incorporating traffic resolution commands can also be applied by a QoS profile. If two policy maps are applied to the same interface (one through a QoS profile and another directly to the CLI).

Policy maps cannot be used on fabric interfaces. If a QoS profile which includes a policy map is applied to a fabric interface, a warning message will be displayed and the policy map will not be applied to the interface, but any additional supported configurations in the QoS profile will be applied. On SVIs and subinterfaces, QoS profiles are not supported, so policy maps must be applied directly through the CLI for these interfaces.

**Note**
For tx-queue configuration, conflicts between QoS profiles and configuration entered via the CLI are resolved at the tx-queue level and not at the tx-queue attribute level. If any non-default configuration has been entered for the tx-queue through the CLI, all tx-queue configuration included in the QoS profile is ignored.
27.2 QoS Configuration: Platform-Independent Features

27.2.1 Creating QoS Profiles

QoS profiles are created by using the `qos profile` command. This also places the switch in QoS profile configuration mode, where the QoS parameters applied to interfaces are configured. To delete a QoS profile from the running configuration, use the `no` form of the command.

**Example**

This command creates a QoS profile named “Test-Profile” and places the switch in QoS profile configuration mode for the profile.

```
switch(config)#qos profile Test-Profile
switch(config-qos-profile-Test-Profile)#
```

27.2.2 Configuring QoS Profiles

The parameters that a QoS profile will apply to interfaces are configured in QoS profile configuration mode by issuing the same QoS configuration commands that are available in interface configuration mode. QoS profile configuration mode is a group change mode, and changes made in the mode are not saved until the mode is exited. To abandon all changes made while in the mode, use the `abort` command.

**Example**

- These commands enter QoS profile configuration mode for a QoS profile named “Test Profile,” configure the CoS value and transmit queue, and save the changes to the profile.

```
switch(config)#qos profile Test-Profile
switch(config-qos-profile-Test-Profile)#qos cos 3
switch(config-qos-profile-Test-Profile)#priority-flow-control on
switch(config-qos-profile-Test-Profile)#exit
```

27.2.3 Attaching Policy-Map to a QoS Profile

The `qos profile` command places the switch in QoS profile configuration mode. The profile applies the QoS configurations to Ethernet and Port-Channel, and even to the Fabric interfaces, if it exists. A profile specifies the policy-map and other QoS supported configurations. The policy-map is then attached to the QoS profile using `service-policy` command.

Profiles are created in QoS-profile configuration mode, then applied to an interface in interface configuration mode.

**Example**

- This command places the switch in QoS profile configuration mode, the policy-map is then attached to the profile using `service-policy` command in this mode.

```
switch(config)#qos profile TP
switch(config-qos-profile-TP)#
```

- This command applies the policy-map to the QoS profile.

```
switch(config-qos-profile-TP)#service-policy type qos input PM-1
```

27.2.4 Applying a QoS profile on an Interface

The `service-profile` command applies a QoS profile to the configuration mode interface.
Example

- This command applies the QoS profile TP to Ethernet interface 13.
  
  ```
  switch(config)#interface ethernet 13
  switch(config-if-Et13)#service-profile TP
  ```

27.2.5 Displaying the QoS Profile Information

The `show qos profile` command displays information about the QoS profiles configured and their parameters. To display the attribute of a specific profile, add the name of the profile. To display a list of configured QoS profiles and the interfaces on which they are configured, add the `summary` keyword.

Examples

- This command displays the configured profiles and their configuration.
  
  ```
  switch#show qos profile
  qos profile p
  qos cos 1
  no priority-flow-control pause watchdog
  priority-flow-control priority 1 no-drop
  priority-flow-control priority 2 no-drop
  qos profile p2
  qos cos 3
  priority-flow-control priority 0 no-drop
  ```

- This command displays the contents of a specific profile.
  
  ```
  switch#show qos profile p2
  qos profile p2
  qos cos 3
  priority-flow-control priority 0 no-drop
  ```

- This command displays the interfaces on which each profile is applied.
  
  ```
  switch#show qos profile summary
  Qos Profile: p
  Configured on: Et13,7 Fabric Po12
  Qos Profile: p2
  Configured on: Et56
  ```
27.3  QoS Configuration: Arad Platform Switches

Implementing QoS on an Arad platform switch consists of configuring port trust settings, default port settings, default traffic classes, conversion maps, and transmit queues.

- Section 27.3.1: CoS and DSCP Port Settings – Arad Platform Switches
- Section 27.3.2: Traffic Class Derivations – Arad Platform Switches
- Section 27.3.3: CoS Rewrite – Arad Platform Switches
- Section 27.3.4: Transmit Queues and Port Shaping – Arad Platform Switches
- Section 27.3.5: ECN Configuration – Arad Platform Switches
- Section 27.3.6: ACL Policing – Arad Platform Switches

Note  QoS traffic policy is supported on Trident and Tomahawk, Trident-II, FM6000, Arad, and Jericho.

27.3.1  CoS and DSCP Port Settings – Arad Platform Switches

Section 27.1.1.2 describes port trust and default port CoS and DSCP values.

Configuring Port Trust Settings

The `qos trust` command configures the QoS port trust mode for the configuration mode interface. Trust enabled ports use packet CoS or DSCP values to classify traffic. The port-trust default for switched ports is `CoS`. The port-trust default for routed ports is `DSCP`.

- `qos trust cos` specifies `CoS` as the port’s port-trust mode.
- `qos trust dscp` specifies `DSCP` as the port’s port-trust mode.
- `no qos trust` specifies `untrusted` as the port’s port-trust mode.

The `show qos interfaces trust` command displays the trust mode of specified interfaces.

Example

- These commands configure and display the following trust modes:
  - Ethernet 3/5/1: dscp
  - Ethernet 3/5/2: untrusted
  - Ethernet 3/5/3: cos
  - Ethernet 3/5/4: default as a switched port
- Ethernet 3/6/1: default as a routed port

```
switch(config)#interface ethernet 3/5/1
switch(config-if-Et3/5/1)#qos trust dscp
switch(config-if-Et3/5/1)#interface ethernet 3/5/2
switch(config-if-Et3/5/2)#no qos trust
switch(config-if-Et3/5/2)#interface ethernet 3/5/3
switch(config-if-Et3/5/3)#qos trust cos
switch(config-if-Et3/5/3)#interface ethernet 3/5/4
switch(config-if-Et3/5/4)#switchport
switch(config-if-Et3/5/4)#default qos trust
switch(config-if-Et3/5/4)#interface ethernet 3/6/1
switch(config-if-Et3/5/4)#no switchport
switch(config-if-Et3/5/4)#default qos trust
switch(config-if-Et3/5/4)#show qos interface ethernet 3/5/1 - 3/6/1 trust
Port                           Operational          Configured
-----------------------------------------------
Ethernet3/5/1                  DSCP                  DSCP
Ethernet3/5/2                  UNTRUSTED             UNTRUSTED
Ethernet3/5/3                  COS                   COS
Ethernet3/5/4                  COS                   DEFAULT
Ethernet3/6/1                  DSCP                  DEFAULT
```

Configuring Default Port Settings

Default CoS and DSCP values are assigned to each Ethernet and port channel interface. These commands specify the configuration mode interface commands specify the port’s default CoS and DSCP values.

- `qos cos` configures a port’s default CoS value.
- `qos dscp` configures a port’s default DSCP value.

Example

These commands configure default CoS (4) and DSCP (44) values on Ethernet interface 3/6/2.

```
switch(config)#interface ethernet 3/6/2
switch(config-if-Et3/6/2)#qos cos 4
switch(config-if-Et3/6/2)#qos dscp 44
switch(config-if-Et3/6/2)#show active
qos cos 4
qos dscp 44
```

27.3.2 Traffic Class Derivations – Arad Platform Switches

Section 27.1.1.4 describes traffic classes.
Traffic Class Derivation Source

Table 27-2 displays the source for deriving a data stream’s traffic class.

Table 27-2  Traffic Class Derivation Source: Arad Platform Switches

<table>
<thead>
<tr>
<th>Untrusted</th>
<th>CoS Trusted</th>
<th>DSCP Trusted</th>
</tr>
</thead>
<tbody>
<tr>
<td>Untagged</td>
<td>Default CoS (port)</td>
<td>Default CoS (port)</td>
</tr>
<tr>
<td>Untagged IP</td>
<td>Default CoS (port)</td>
<td>Default CoS (port)</td>
</tr>
<tr>
<td>Tagged IP</td>
<td>Default CoS (port)</td>
<td>CoS (packet)</td>
</tr>
</tbody>
</table>

Section 27.3.1 describes the default CoS and DSCP settings for each port.

Mapping CoS to Traffic Class

The qos map cos command assigns a traffic class to a list of CoS values. Multiple commands create a complete CoS to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet’s CoS field or the chip upon which it is received.

Example

- This command assigns the traffic class of 5 to the classes of service 1, 3, 5, and 7.

  switch(config)#qos map cos 1 3 5 7 to traffic-class 5
  switch(config)#show qos maps

  Number of Traffic Classes supported: 8

  Cos-tc map:
  cos:  0  1  2  3  4  5  6  7
  tc:   1  5  2  5  4  5  6  5

Table 27-3 displays the default CoS to Traffic Class map on Arad platform switches.

Table 27-3  Default CoS to Traffic Class Map: Arad Platform Switches

<table>
<thead>
<tr>
<th>Inbound CoS</th>
<th>Traffic Class</th>
</tr>
</thead>
<tbody>
<tr>
<td>Untagged</td>
<td>Derived: use default CoS as inbound</td>
</tr>
<tr>
<td></td>
<td>0 1 2 3 4 5 6 7</td>
</tr>
</tbody>
</table>

Mapping DSCP to Traffic Class

The qos map dscp command assigns a traffic class to a set of DSCP values. Multiple commands create a complete DSCP to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet’s DSCP field or the chip upon which it is received.
Example

- This command assigns the traffic class of 0 to DSCP values of 12, 24, 41, and 44-47.

```
switch(config)# qos map dscp 12 24 41 44 45 46 47 to traffic-class 0
switch(config)# show qos maps
  Number of Traffic Classes supported: 8
  <-------OUTPUT OMITTED FROM EXAMPLE-------->
```

```
Dscp-tc map:
    d1 : d2 0 1 2 3 4 5 6 7 8 9
    -----------------------------
    0 : 1 1 1 1 1 1 1 1 0 0
    1 : 0 0 0 0 0 0 2 2 2 2
    2 : 2 2 2 2 0 3 3 3 3
    3 : 3 3 4 4 4 4 4 4
    4 : 5 0 5 5 0 0 0 6 6
    5 : 6 6 6 6 6 6 7 7 7
    6 : 7 7 7
  <-------OUTPUT OMITTED FROM EXAMPLE-------->
```

```
switch(config)#
```

Table 27-4 displays the default DSCP to traffic class map on Arad platform switches.

<table>
<thead>
<tr>
<th>Inbound DSCP</th>
<th>0-7</th>
<th>8-15</th>
<th>16-23</th>
<th>24-31</th>
<th>32-39</th>

<th>48-55</th>
<th>56-63</th>
</tr>
</thead>
<tbody>
<tr>
<td>Traffic Class</td>
<td>1</td>
<td>0</td>
<td>2</td>
<td>3</td>
<td>4</td>
<td>5</td>
<td>6</td>
<td>7</td>
</tr>
</tbody>
</table>

27.3.3 CoS Rewrite – Arad Platform Switches

Section 27.1.1.3 describes the CoS rewrite functions.

Traffic Class to CoS Rewrite Map

The CoS rewrite value is configurable and based on a data stream’s traffic class, as specified by the traffic class–CoS rewrite map. The `qos map traffic-class to cos` command assigns a CoS rewrite value to a list of traffic classes. Multiple commands create the complete traffic class–CoS rewrite map.

Example

- This command assigns the CoS of two to traffic classes 1, 3, and 5.

```
switch(config)# qos map traffic-class 1 3 5 to cos 2
switch(config)# show qos map
  Number of Traffic Classes supported: 8
  <-------OUTPUT OMITTED FROM EXAMPLE-------->
```

```
Tc-cos map:
  tc: 0 1 2 3 4 5 6 7
  -----------------------------
  cos: 1 2 2 2 4 2 6 7
  <-------OUTPUT OMITTED FROM EXAMPLE-------->
```

```
switch(config)#
```
Table 27-5 displays the default Traffic Class to CoS rewrite value map on Arad platform switches.

<table>
<thead>
<tr>
<th>Traffic Class</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
</tr>
</thead>
<tbody>
<tr>
<td>CoS Rewrite Value</td>
<td>1</td>
<td>0</td>
<td>2</td>
<td>3</td>
<td>4</td>
<td>5</td>
<td>6</td>
<td>7</td>
</tr>
</tbody>
</table>

Traffic Class to DSCP Rewrite Map

DSCP rewrite is always disabled on Arad platform switches.

27.3.4 Transmit Queues and Port Shaping – Arad Platform Switches

Section 27.1.2 describes transmit queues and port shaping.

Arad platform switches provide 16 physical queues for each egress port: eight unicast and eight multicast queues. Data is scheduled to the physical queues based on transmit queue assignments.

Multicast queue capacity that remains after multicast traffic is serviced is available for unicast traffic of a corresponding priority. Similarly, unicast queue capacity that remains after unicast traffic is serviced is available for overflow multicast traffic. Under conditions of unicast and multicast congestion, egress traffic is evenly split between unicast and multicast traffic.

A data stream’s traffic class determines the transmit queue it uses. The switch defines a single traffic class–transmit queue map for unicast and multicast traffic on all Ethernet and port channel interfaces. The `show qos maps` command displays the traffic class–transmit queue map.

Table 27-6 displays the default traffic class to transmit queue map on Arad platform switches.

<table>
<thead>
<tr>
<th>Traffic Class</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transmit Queue</td>
<td>0</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>
<td>5</td>
<td>6</td>
<td>7</td>
</tr>
</tbody>
</table>

Transmit queue parameters are configured in `tx-queue configuration` command mode, which is entered from `interface-ethernet configuration` mode.

Mapping Traffic Classes to a Transmit Queue

The `qos map traffic-class to tx-queue` command assigns traffic classes to a transmit queue. Multiple commands complete the traffic class–transmit queue map. Traffic class 7 and transmit queue 7 are always mapped to each other. This association is not editable.
Example

- These commands assign traffic classes of 1, 3, and 5 to transmit queue 1, traffic classes 2, 4, and 6 to transmit queue 2, and traffic class 0 to transmit queue 0, then display the resultant map.

```bash
switch(config)# qos map traffic-class 1 3 5 to tx-queue 1
switch(config)# qos map traffic-class 2 4 6 to tx-queue 2
switch(config)# qos map traffic-class 0 to tx-queue 0
```

```bash
switch(config)# show qos maps
Number of Traffic Classes supported: 8
Number of Transmit Queues supported: 8
<--------OUTPUT OMITTED FROM EXAMPLE-------->

Tc - tx-queue map:
 tc:        0  1  2  3  4  5  6  7
---------------------------------
 tx-queue:  0  1  2  1  2  1  2  7
```

```bash
switch(config)#
```

Entering Tx-Queue Configuration Mode

The `tx-queue (Arad/Jericho)` command places the switch in tx-queue configuration mode to configure a transmit queue on the configuration mode interface. Tx-queue 7 is not configurable. The `show qos interfaces` displays the transmit queue configuration for a specified port.

Example

- This command enters Tx-queue configuration mode for transmit queue 4 of Ethernet interface 3/3/3.

```bash
switch(config)# interface ethernet 3/3/3
switch(config-if-Et3/3/3)# tx-queue 4
switch(config-if-Et3/3/3-txq-4)#
```

Configuring the Shape Rate – Port and Transmit Queues

A port’s shape rate specifies its maximum outbound traffic bandwidth. A transmit queue’s shape rate specifies the queue’s maximum outbound bandwidth. Shape rate commands specify data rates in kbps.

- To configure a port’s shape rate, enter `shape rate (Interface – Arad/Jericho)` from the port’s interface configuration mode.
- To configure a transmit queue’s shape rate, enter `shape rate (Tx-queue – Arad/Jericho)` from the queue’s tx-queue configuration mode.
Examples

- This command configures a port shape rate of 5 Gbps on Ethernet interface 3/5/1.

```plaintext
switch(config)#interface ethernet 3/5/1
switch(config-if-Et3/5/1)#shape rate 5000000
switch(config-if-Et3/5/1)#show qos interfaces ethernet 3/5/1
Ethernet3/5/1:
<--------OUTPUT OMITTED FROM EXAMPLE-------->
Port shaping rate: 5000012 / 5000000 kbps

<table>
<thead>
<tr>
<th>Tx Queue</th>
<th>Bandwidth (percent)</th>
<th>Shape Rate (units)</th>
<th>Priority</th>
<th>ECN</th>
</tr>
</thead>
<tbody>
<tr>
<td>7</td>
<td>- / -</td>
<td>- / -</td>
<td>( - )</td>
<td>SP / SP</td>
</tr>
</tbody>
</table>

<--------OUTPUT OMITTED FROM EXAMPLE-------->
```

- These commands configure a shape rate of 1 Gbps on transmit queues 3 and 4 of Ethernet interface 3/4/1.

```plaintext
switch(config)#interface ethernet 3/4/1
switch(config-if-Et3/4/1)#tx-queue 4
switch(config-if-Et3/4/1-txq-4)#shape rate 1000000 kbps
switch(config-if-Et3/4/1-txq-4)#tx-queue 3
switch(config-if-Et3/4/1-txq-3)#shape rate 1000000 kbps
switch(config-if-Et3/4/1-txq-3)#show qos interface ethernet 3/4/1
Ethernet3/4/1:
<--------OUTPUT OMITTED FROM EXAMPLE-------->
Port shaping rate: disabled

</tbody>
</table>

<--------OUTPUT OMITTED FROM EXAMPLE-------->
```

Configuring Queue Priority

The `priority (Arad/Jericho)` command configures a transmit queue’s priority type:

- **The priority strict** command configures the queue as a strict priority queue.
- **The no priority** command configures the queue as a round robin queue.

A queue’s configuration as **round robin** also applies to all lower priority queues regardless of other configuration statements.

The `bandwidth percent (Arad/Jericho)` command configures a round robin queue’s bandwidth share. The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the cumulative configured bandwidth is greater than 100%, each port’s operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.
Example

- These commands configure queues 0 through 3 (Ethernet interface 3/5/1) as round robin, then allocate bandwidth for three queues at 30% and one queue at 10%.

The **no priority** statement for queue 3 also configures queues 0, 1, and 2 as round robin queues. Removing this statement reverts the other queues to **strict priority** type unless **running-config** contains a **no priority** statement for one of these queues.

```
switch(config)#interface ethernet 3/5/1
switch(config-if-Et3/5/1)#tx-queue 3
switch(config-if-Et3/5/1-txq-3)#no priority
switch(config-if-Et3/5/1-txq-3)#bandwidth percent 10
switch(config-if-Et3/5/1-txq-3)#tx-queue 2
switch(config-if-Et3/5/1-txq-2)#bandwidth percent 30
switch(config-if-Et3/5/1-txq-2)#tx-queue 1
switch(config-if-Et3/5/1-txq-1)#bandwidth percent 30
switch(config-if-Et3/5/1-txq-1)#tx-queue 0
switch(config-if-Et3/5/1-txq-0)#bandwidth percent 30
switch(config-if-Et3/5/1-txq-0)#show qos interfaces ethernet 3/5/1
```

Note: Values are displayed as Operational/Configured

```
switch(config-if-Et3/5/1-txq-3)#
```
Implementing ACL policing consists of configuring the following:

- policy-map settings
- class-name
- committed information rate (CIR) the data speed committed to any given circuit regardless of the number of users
- burst size the maximum burst size in bytes the network commits to moving under normal conditions

The default unit for the metering rate CIR is bits per second; the default unit for the burst size is bytes.

The policer is applied to the class inside the policy map. Policy maps can contain one or more policy map classes, each with different match criteria and policer.

Default behavior and available policing actions are as follows:

- Policy map can be applied on multiple interfaces. Interfaces on the same chip will share the policer.
  (Applicable for Arad only.)
- If there is no policer configured within a class, all traffic is transmitted without any policing.
- If there are any actions configured, the configured actions are applied:
  - Conform-action (green): transmit (default)
  - Violate-action (red): drop (default)

**Example**

These commands configure ACL policing in single-rate, two-color mode.

```
switch(config)#class-map type qos match-any class1
switch(config-cmap-class1)#match ip access-group acl1
switch(config-cmap-class1)#exit
switch(config)#policy-map type quality-of-service policy1
switch(config-policy1)#class class1
switch(config-policy1-class1)#police cir 512000 bc 96000
switch(config-policy1-class1)#exit
switch(config-policy1)#exit
switch(config)#
```

**Displaying ACL Policing Information**

**Examples**

- This command shows the contents of all policy maps on the switch.

```
switch(config)#show policy-map
Service-policy policy1

Class-map: class1 (match-any)
Match: ip access-group name acl1
Police cir 512000 bps bc 96000 bytes

Class-map: class-default (match-any)
switch(config)#
```
• This command shows the interface-specific police counters for Ethernet interface 1.

```
switch(config)#show policy-map interface Ethernet 1 input counters
Service-policy input: policy1
Hardware programming status: Successful

Class-map: class1 (match-any) Match: ip access-group name acl1
Police cir 512000 bps bc 96000 bytes Conformed 4351 packets, 1857386 bytes
Conformed 2536 packets, 3384260 bytes

Class-map: class-default (match-any) matched packets: 0
```

switch(config)#

• This command shows the counters associated with the policy map called “p1.”

```
switch(config)#show policy-map type qos p1 input counters
Service-policy input: p1 Class-map: c1 (match-any)
Match: ip access-group name a1
Police cir 512000 bps bc 96000 bytes Interface: Ethernet1
Conformed 4351 packets, 1857386 bytes
Exceeded 2536 packets, 3384260 bytes
Interface: Ethernet2
Conformed 2351 packets, 957386 bytes
Exceeded 1536 packets, 1384260 bytes
Class-map: class-default (match-any)
Matched packets: 3229
```

switch(config)#

• This command shows the QoS policy map for Ethernet interface 1.

```
switch(config)#show policy-map interface Ethernet 1 input type qos
Interface: Ethernet 1 Service-policy input: policy1
Hardware programming status: Successful Class-map: class1 (match-any)
Match: ip access-group name acl1
Police cir 512000 bps bc 9000 bytes

Match: ip access-group name acl2 set dscp 2
Class-map: class3 (match-any) Match: ip access-group name acl3
Police cir 1280000 bps bc 9000 bytes
Class-map: class-default (match-any)
```

switch(config)
27.4 QoS Configuration: Jericho Platform Switches

Implementing QoS on a Jericho platform switch consists of configuring port trust settings, default port settings, default traffic classes, conversion maps, and transmit queues.

- Section 27.4.1: CoS and DSCP Port Settings – Jericho Platform Switches
- Section 27.4.2: Traffic Class Derivations – Jericho Platform Switches
- Section 27.4.3: CoS Rewrite – Jericho Platform Switches
- Section 27.4.4: Transmit Queues and Port Shaping – Jericho Platform Switches
- Section 27.4.5: ACL Policing – Jericho Platform Switches

Note

QoS traffic policy is supported on Trident and Tomahawk, Trident-II, FM6000, Arad and Jericho.

27.4.1 CoS and DSCP Port Settings – Jericho Platform Switches

Section 27.1.1.2 describes port trust and default port CoS and DSCP values.

Configuring Port Trust Settings

The qos trust command configures the QoS port trust mode for the configuration mode interface. Trust enabled ports use packet CoS or DSCP values to classify traffic. The port-trust default for switched ports is CoS. The port-trust default for routed ports is DSCP.

- qos trust cos specifies CoS as the port's port-trust mode.
- qos trust dscp specifies DSCP as the port's port-trust mode.
- no qos trust specifies untrusted as the port's port-trust mode.

The show qos interfaces trust command displays the trust mode of specified interfaces.

Example

These commands configure and display the following trust modes:

- Ethernet 3/5/1: dscp
- Ethernet 3/5/2: untrusted
- Ethernet 3/5/3: cos
- Ethernet 3/5/4: default as a switched port
- Ethernet 3/6/1: default as a routed port

```plaintext
switch(config)#interface ethernet 3/5/1
switch(config-if-Et3/5/1)#qos trust dscp
switch(config-if-Et3/5/1)#interface ethernet 3/5/2
switch(config-if-Et3/5/2)#no qos trust
switch(config-if-Et3/5/2)#interface ethernet 3/5/3
switch(config-if-Et3/5/3)#qos trust cos
switch(config-if-Et3/5/3)#interface ethernet 3/5/4
switch(config-if-Et3/5/4)#switchport
switch(config-if-Et3/5/4)#default qos trust
switch(config-if-Et3/5/4)#interface ethernet 3/6/1
switch(config-if-Et3/5/4)#no switchport
switch(config-if-Et3/6/1)#default qos trust
switch(config-if-Et3/6/1)#show qos interface ethernet 3/5/1 - 3/6/1 trust
Port              Trust Mode
Eth 3/5/1          DSCP                  DSCP
Eth 3/5/2          UNTRUSTED             UNTRUSTED
Eth 3/5/3          COS                   COS
Eth 3/5/4          COS                   DEFAULT
Eth 3/6/1          DSCP                  DEFAULT
```

Configuring Default Port Settings

Default CoS and DSCP values are assigned to each Ethernet and port channel interface. These commands specify the configuration mode interface commands specify the port’s default CoS and DSCP values.

- `qos cos` configures a port’s default CoS value.
- `qos dscp` configures a port’s default DSCP value.

Example

These commands configure default CoS (4) and DSCP (44) values on Ethernet interface 3/6/2.

```plaintext
switch(config)#interface ethernet 3/6/2
switch(config-if-Et3/6/2)#qos cos 4
switch(config-if-Et3/6/2)#qos dscp 44
switch(config-if-Et3/6/2)#show active
  interface Ethernet3/6/2
    qos cos 4
    qos dscp 44
switch(config-if-Et3/6/2)#show qos interfaces ethernet 3/6/2
  Ethernet3/6/2:
    Trust Mode: COS
    Default COS: 4
    Default DSCP: 44
```

27.4.2 Traffic Class Derivations – Jericho Platform Switches

Section 27.1.1.4 describes traffic classes.
Traffic Class Derivation Source

Table 27-7 displays the source for deriving a data stream's traffic class on Jericho platform switches.

<table>
<thead>
<tr>
<th></th>
<th>Untrusted</th>
<th>CoS Trusted</th>
<th>DSCP Trusted</th>
</tr>
</thead>
<tbody>
<tr>
<td>Untagged Non-IP</td>
<td>Default CoS (port)</td>
<td>Default CoS (port)</td>
<td>Default DSCP (port)</td>
</tr>
<tr>
<td>Untagged IP</td>
<td>Default CoS (port)</td>
<td>Default CoS (port)</td>
<td>DSCP (packet)</td>
</tr>
<tr>
<td>Tagged IP</td>
<td>Default CoS (port)</td>
<td>CoS (packet)</td>
<td>DSCP (packet)</td>
</tr>
</tbody>
</table>

Section 27.3.1 describes the default CoS and DSCP settings for each port.

Mapping CoS to Traffic Class

The `qos map cos` command assigns a traffic class to a list of CoS values. Multiple commands create a complete CoS to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet's CoS field or the chip upon which it is received.

Example
- This command assigns the traffic class of 5 to the classes of service 1, 3, 5, and 7.

  ```sh
  switch(config)# qos map cos 1 3 5 7 to traffic-class 5
  switch(config)# show qos maps
  Number of Traffic Classes supported: 8
  <-------OUTPUT OMITTED FROM EXAMPLE-------->
  Cos-tc map:
  cos:  0  1  2  3  4  5  6  7
  tc:   1  5  2  5  4  5  6  5
  <-------OUTPUT OMITTED FROM EXAMPLE-------->
  switch(config)#
  ```

Table 27-8 displays the default CoS to Traffic Class map on Jericho platform switches.

<table>
<thead>
<tr>
<th>Inbound CoS</th>
<th>Traffic Class</th>
</tr>
</thead>
<tbody>
<tr>
<td>Untagged</td>
<td>Derived: use default CoS as inbound</td>
</tr>
<tr>
<td>0</td>
<td>1 0 2 3 4 5 6 7</td>
</tr>
</tbody>
</table>

Mapping DSCP to Traffic Class

The `qos map dscp` command assigns a traffic class to a set of DSCP values. Multiple commands create a complete DSCP to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet's DSCP field or the chip upon which it is received.
Example

- This command assigns the traffic class of 0 to DSCP values of 12, 24, 41, and 44-47.

```plaintext
switch(config)# qos map dscp 12 24 41 44 45 46 47 to traffic-class 0
switch(config)# show qos maps
  Number of Traffic Classes supported: 8
  <--------OUTPUT OMITTED FROM EXAMPLE-------->
```

```
Dscp-tc map:
   d1 : d2 0 1 2 3 4 5 6 7 8 9
--------------------------------------
0 :     1 1 1 1 1 1 1 1 0 0
1 :     0 0 0 0 0 0 2 2 2 2
2 :     2 2 2 2 0 3 3 3 3
3 :     3 3 4 4 4 4 4 4 4
4 :     5 5 5 5 0 0 0 0 6 6
5 :     6 6 6 6 6 6 7 7 7 7
6 :     7 7 7 7
```

```
<--------OUTPUT OMITTED FROM EXAMPLE-------->
```

```
switch(config)#
```

Table 27-9 displays the default DSCP to traffic class map on Jericho platform switches.

<table>
<thead>
<tr>
<th>Inbound DSCP</th>
<th>0-7</th>
<th>8-15</th>
<th>16-23</th>
<th>24-31</th>
<th>32-39</th>

<th>48-55</th>
<th>56-63</th>
</tr>
</thead>
<tbody>
<tr>
<td>Traffic Class</td>
<td>1</td>
<td>0</td>
<td>2</td>
<td>3</td>
<td>4</td>
<td>5</td>
<td>6</td>
<td>7</td>
</tr>
</tbody>
</table>

27.4.3 CoS Rewrite – Jericho Platform Switches

Section 27.1.1.3 describes the CoS rewrite functions.

Traffic Class to CoS Rewrite Map

The CoS rewrite value is configurable and based on a data stream’s traffic class, as specified by the traffic class-CoS rewrite map. The `qos map traffic-class to cos` command assigns a CoS rewrite value to a list of traffic classes. Multiple commands create the complete traffic class–CoS rewrite map.

Example

- This command assigns the CoS of two to traffic classes 1, 3, and 5.

```plaintext
switch(config)# qos map traffic-class 1 3 5 to cos 2
switch(config)# show qos maps
  Number of Traffic Classes supported: 8
  <--------OUTPUT OMITTED FROM EXAMPLE-------->
```

```
Tc-cos map:
  tc: 0 1 2 3 4 5 6 7
  ------------------------
  cos: 1 2 2 4 2 6 7
```

```
<--------OUTPUT OMITTED FROM EXAMPLE-------->
```

```
switch(config)#
```
Table 27-10 displays the default Traffic Class to CoS rewrite value map on Jericho platform switches.

<table>
<thead>
<tr>
<th>Traffic Class</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
</tr>
</thead>
<tbody>
<tr>
<td>CoS Rewrite Value</td>
<td>1</td>
<td>0</td>
<td>2</td>
<td>3</td>
<td>4</td>
<td>5</td>
<td>6</td>
<td>7</td>
</tr>
</tbody>
</table>

Traffic Class to DSCP Rewrite Map

DSCP rewrite is always disabled on Jericho platform switches.

27.4.4 Transmit Queues and Port Shaping – Jericho Platform Switches

Section 27.1.2 describes transmit queues and port shaping.

Jericho platform switches provide 16 physical queues for each egress port: eight unicast and eight multicast queues. Data is scheduled to the physical queues based on transmit queue assignments.

Multicast queue capacity that remains after multicast traffic is serviced is available for unicast traffic of a corresponding priority. Similarly, unicast queue capacity that remains after unicast traffic is serviced is available for overflow multicast traffic. Under conditions of unicast and multicast congestion, egress traffic is evenly split between unicast and multicast traffic.

A data stream’s traffic class determines the transmit queue it uses. The switch defines a single traffic class–transmit queue map for unicast and multicast traffic on all Ethernet and port channel interfaces. The show qos maps command displays the traffic class–transmit queue map.

Table 27-11 displays the default traffic class to transmit queue map on Jericho platform switches.

<table>
<thead>
<tr>
<th>Traffic Class</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transmit Queue</td>
<td>0</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>
<td>5</td>
<td>6</td>
<td>7</td>
</tr>
</tbody>
</table>

Transmit queue parameters are configured in tx-queue configuration command mode, which is entered from interface-ethernet configuration mode.

Mapping Traffic Classes to a Transmit Queue

The qos map traffic-class to tx-queue command assigns traffic classes to a transmit queue. Multiple commands complete the traffic class-transmit queue map. Traffic class 7 and transmit queue 7 are always mapped to each other. This association is not editable.
Example

- These commands assign traffic classes of 1, 3, and 5 to transmit queue 1, traffic classes 2, 4, and 6 to transmit queue 2, and traffic class 0 to transmit queue 0, then display the resultant map.

\[
\text{switch(config)}\# \text{qos map traffic-class 1 3 5 to tx-queue 1} \\
\text{switch(config)}\# \text{qos map traffic-class 2 4 6 to tx-queue 2} \\
\text{switch(config)}\# \text{qos map traffic-class 0 to tx-queue 0} \\
\text{switch(config)}\# \text{show qos maps} \\
\text{Number of Traffic Classes supported: 8} \\
\text{Number of Transmit Queues supported: 8} \\
\text{<--------OUTPUT OMITTED FROM EXAMPLE-------->} \\
\text{Tc - tx-queue map:} \\
\text{tc:} \begin{array}{cccccccc} 
0 & 1 & 2 & 3 & 4 & 5 & 6 & 7 \\
\end{array} \\
\text{tx-queue:} \begin{array}{cccccccc} 
0 & 1 & 2 & 1 & 2 & 1 & 2 & 7 \\
\end{array} \\
\text{switch(config)}\#
\]

Entering Tx-Queue Configuration Mode

The `tx-queue (Arad/Jericho)` command places the switch in tx-queue configuration mode to configure a transmit queue on the configuration mode interface. Tx-queue 7 is not configurable. The `show qos interfaces` displays the transmit queue configuration for a specified port.

Example

- This command enters Tx-queue configuration mode for transmit queue 4 of Ethernet interface 3/3/3.

\[
\text{switch(config)}\# \text{interface ethernet 3/3/3} \\
\text{switch(config-if-Et3/3/3)}\# \text{tx-queue 4} \\
\text{switch(config-if-Et3/3/3-txq-4)}\#
\]

Configuring the Shape Rate – Port and Transmit Queues

A port’s shape rate specifies its maximum outbound traffic bandwidth. A transmit queue’s shape rate specifies the queue’s maximum outbound bandwidth. Shape rate commands specify data rates in kbps.

- To configure a port’s shape rate, enter `shape rate (Interface – Arad/Jericho)` from the port’s interface configuration mode.

- To configure a transmit queue’s shape rate, enter `shape rate (Tx-queue – Arad/Jericho)` from the queue’s tx-queue configuration mode.
Examples

- This command configures a port shape rate of 5 Gbps on Ethernet interface 3/5/1.

  switch(config)#interface ethernet 3/5/1
  switch(config-if-Et3/5/1)#shape rate 5000000
  switch(config-if-Et3/5/1)#show qos interfaces ethernet 3/5/1
  Ethernet3/5/1:
  <--------OUTPUT OMITTED FROM EXAMPLE--------->
  Port shaping rate: 5000012 / 5000000 kbps
  Tx    Bandwidth       Shape Rate        Priority  ECN
  Queue  (percent)        (units)
  --------------------------
  7      - / -        - / -    (  -  )    SP / SP    D
  <--------OUTPUT OMITTED FROM EXAMPLE--------->
  switch(config-if-Et3/5/1)#

- These commands configure a shape rate of 1 Gbps on transmit queues 3 and 4 of Ethernet interface 3/4/1.

  switch(config)#interface ethernet 3/4/1
  switch(config-if-Et3/4/1)#tx-queue 4
  switch(config-if-Et3/4/1-txq-4)#shape rate 1000000 kbps
  switch(config-if-Et3/4/1-txq-4)#tx-queue 3
  switch(config-if-Et3/4/1-txq-3)#shape rate 1000000 kbps
  switch(config-if-Et3/4/1-txq-3)#show qos interface ethernet 3/4/1
  Ethernet3/4/1:
  <--------OUTPUT OMITTED FROM EXAMPLE--------->
  Port shaping rate: disabled
  Tx    Bandwidth       Shape Rate        Priority  ECN
  Queue  (percent)        (units)
  --------------------------
  7      - / -        - / -    (  -  )    SP / SP    D
  6      - / -        - / -    (  -  )    SP / SP    D
  5      - / -        - / -    (  -  )    SP / SP    D
  4      - / -        999 / 1000 ( Mbps )   SP / SP    D
  3      - / -        999 / 1000 ( Mbps )   SP / SP    D
  2      - / -        - / -    (  -  )    SP / SP    D
  1      - / -        - / -    (  -  )    SP / SP    D
  0      - / -        - / -    (  -  )    SP / SP    D
  <--------OUTPUT OMITTED FROM EXAMPLE--------->
  switch(config-if-Et3/4/1-txq-3)#

Configuring Queue Priority

The priority (Arad/Jericho) command configures a transmit queue’s priority type:

- The priority strict command configures the queue as a strict priority queue.
- The no priority command configures the queue as a round robin queue.

A queue’s configuration as round robin also applies to all lower priority queues regardless of other configuration statements.

The bandwidth percent (Arad/Jericho) command configures a round robin queue’s bandwidth share. The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the cumulative configured bandwidth is greater than 100%, each port’s operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.
Example

- These commands configure queues 0 through 3 (Ethernet interface 3/5/1) as round robin, then allocate bandwidth for three queues at 30% and one queue at 10%.

The **no priority** statement for queue 3 also configures queues 0, 1, and 2 as round robin queues. Removing this statement reverts the other queues to **strict priority** type unless **running-config** contains a **no priority** statement for one of these queues.

```plaintext
switch(config)#interface ethernet 3/5/1
switch(config-if-Et3/5/1)#tx-queue 3
switch(config-if-Et3/5/1-txq-3)#no priority
switch(config-if-Et3/5/1-txq-3)#bandwidth percent 10
switch(config-if-Et3/5/1-txq-3)#tx-queue 2
switch(config-if-Et3/5/1-txq-2)#bandwidth percent 30
switch(config-if-Et3/5/1-txq-2)#tx-queue 1
switch(config-if-Et3/5/1-txq-1)#bandwidth percent 30
switch(config-if-Et3/5/1-txq-1)#tx-queue 0
switch(config-if-Et3/5/1-txq-0)#bandwidth percent 30
switch(config-if-Et3/5/1-txq-0)#show qos interfaces ethernet 3/5/1
```

```

### 27.4.5 ACL Policing – Jericho Platform Switches

Section 27.1.4 describes ACL policing.

Implementing ACL policing consists of configuring the following:

- **policy-map settings**
- **class-name**
- **committed information rate (CIR)** the data speed committed to any given circuit regardless of the number of users
- **burst size** the maximum burst size in bytes the network commits to moving under normal conditions

The default unit for the metering rate CIR is bits per second; the default unit for the burst size is bytes.

The policer is applied to the class inside the policy map. Policy maps can contain one or more policy map classes, each with different match criteria and policer.

Default behavior and available policing actions are as follows:

- Policy map can be applied on multiple interfaces. Interfaces on the same chip will share the policer. (Applicable for Arad and Jericho only.)
- If there is no policer configured within a class, all traffic is transmitted without any policing.
- If there are any actions configured, the configured actions are applied:
  - Conform-action (green): transmit (default)
  - Violate-action (red): drop (default)
Example

These commands configure ACL policing in single-rate, two-color mode.

```
switch(config)# class-map type qos match-any class1
switch(config-cmap-class1)# match ip access-group acl1
switch(config-cmap-class1)# exit
switch(config)# policy-map type quality-of-service policy1
switch(config-policy1)# class class1
switch(config-policy1-class1)# police cir 512000 bc 96000
switch(config-policy1-class1)# exit
switch(config-policy1)# exit
switch(config)#
```

Displaying ACL Policing Information

Examples

- This command shows the contents of all policy maps on the switch.

```
switch(config)# show policy-map
Service-policy policy1

Class-map: class1 (match-any)
Match: ip access-group name acl1
Police cir 512000 bps bc 96000 bytes

Class-map: class-default (match-any)

switch(config)#
```

- This command shows the interface-specific police counters for Ethernet interface 1.

```
switch(config)# show policy-map interface Ethernet 1 input counters
Service-policy input: policy1
Hardware programming status: Successful

Class-map: class1 (match-any) Match: ip access-group name acl1
Police cir 512000 bps bc 96000 bytes Conformed 4351 packets, 1857386 bytes
Conformed 2536 packets, 3384260 bytes

Class-map: class-default (match-any) matched packets: 0

switch(config)#
```

- This command shows the counters associated with the policy map called “p1.”

```
switch(config)# show policy-map type qos p1 input counters
Service-policy input: p1 Class-map: cl (match-any)
Match: ip access-group name a1
Police cir 512000 bps bc 96000 bytes Interface: Ethernet1
Conformed 4351 packets, 1857386 bytes
Exceeded 2536 packets, 3384260 bytes
Interface: Ethernet2
Conformed 2351 packets, 957386 bytes
Exceeded 1536 packets, 1384260 bytes
Class-map: class-default (match-any)
Matched packets: 3229

switch(config)#
```
This command shows the QoS policy map for Ethernet interface 1.

```
switch(config)#show policy-map interface Ethernet 1 input type qos
Interface: Ethernet 1 Service-policy input: policy1
Hardware programming status: Successful Class-map: class1 (match-any)
  Match: ip access-group name acl1
  Police cir 512000 bps bc 9000 bytes
  Class-map: class2 (match-any)
  Match: ip access-group name acl2 set dscp 2
  Class-map: class3 (match-any) Match: ip access-group name acl3
  Police cir 1280000 bps bc 9000 bytes
  Class-map: class-default (match-any)
switch(config)#
```
Implementing QoS on an FM6000 platform switch consists of configuring port trust settings, default port settings, default traffic classes, conversion maps, and transmit queues.

- Section 27.5.1: CoS and DSCP Port Settings – FM6000 Platform Switches
- Section 27.5.2: Traffic Class Derivations – FM6000 Platform Switches
- Section 27.5.3: CoS and DSCP Rewrite – FM6000 Platform Switches
- Section 27.5.4: Transmit Queues and Port Shaping – FM6000 Platform Switches

27.5.1 CoS and DSCP Port Settings – FM6000 Platform Switches

Section 27.1.1.2 describes port trust and default port CoS and DSCP values.

Configuring Port Trust Settings

The `qos trust` command configures the QoS port trust mode for the configuration mode interface. Trust enabled ports use packet CoS or DSCP values to classify traffic. The port-trust default for switched ports is `cos`. The port-trust default for routed ports is `dscp`.

- `qos trust cos` specifies `cos` as the port’s port-trust mode.
- `qos trust dscp` specifies `dscp` as the port’s port-trust mode.
- `no qos trust` specifies `untrusted` as the port’s port-trust mode.

The `show qos interfaces trust` command displays the trust mode of specified interfaces.

Example

- These commands configure and display the following trust modes:
  - Ethernet 15: `dscp`
  - Ethernet 16: `untrusted`
  - Ethernet 17: `cos`
  - Ethernet 18: default as a switched port
• Ethernet 19: default as a routed port

```
switch(config)#interface ethernet 15
switch(config-if-Et15)#qos trust dscp
switch(config-if-Et15)#interface ethernet 16
switch(config-if-Et16)#no qos trust
switch(config-if-Et16)#interface ethernet 17
switch(config-if-Et17)#qos trust cos
switch(config-if-Et17)#interface ethernet 18
switch(config-if-Et18)#switchport
switch(config-if-Et18)#default qos trust
switch(config-if-Et19)#interface ethernet 19
switch(config-if-Et19)#no switchport
switch(config-if-Et19)#default qos trust
switch(config-if-Et19)#show qos interface ethernet 15 - 19 trust
```

<table>
<thead>
<tr>
<th>Port</th>
<th>Operational Trust Mode</th>
<th>Configured Trust Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ethernet15</td>
<td>DSCP</td>
<td>DSCP</td>
</tr>
<tr>
<td>Ethernet16</td>
<td>UNTRUSTED</td>
<td>UNTRUSTED</td>
</tr>
<tr>
<td>Ethernet17</td>
<td>COS</td>
<td>COS</td>
</tr>
<tr>
<td>Ethernet18</td>
<td>COS</td>
<td>DEFAULT</td>
</tr>
<tr>
<td>Ethernet19</td>
<td>DSCP</td>
<td>DEFAULT</td>
</tr>
</tbody>
</table>

```
switch(config-if-Et19)#
```

### Configuring Default Port Settings

Default CoS and DSCP settings are assigned to individual port channel and Ethernet interfaces. These configuration mode interface commands specify the port’s default CoS and DSCP values.

- **qos cos** configures a port’s default CoS value.
- **qos dscp** configures a port’s default DSCP value.

### Example

- These commands configure default CoS (4) and DSCP (44) settings on Ethernet interface 19.

```
switch(config)#interface ethernet 19
switch(config-if-Et19)#qos cos 4
switch(config-if-Et19)#qos dscp 44
switch(config-if-Et19)#show active interface Ethernet19
  qos cos 4
  qos dscp 44
switch(config-if-Et19)#show qos interfaces ethernet 19
  Ethernet19:
    Trust Mode: COS
    Default COS: 4
    Default DSCP: 44
```

```
<--------OUTPUT OMITTED FROM EXAMPLE-------->
```

```
switch(config-if-Et19)#
```

### 27.5.2 Traffic Class Derivations – FM6000 Platform Switches

Section 27.1.1.4 describes traffic classes.
Traffic Class Derivation Source

Table 27-12 displays the source for deriving a data stream’s traffic class.

Table 27-12 Traffic Class Derivation Source: FM6000 Platform Switches

<table>
<thead>
<tr>
<th></th>
<th>Untrusted</th>
<th>CoS Trusted</th>
<th>DSCP Trusted</th>
</tr>
</thead>
<tbody>
<tr>
<td>Untagged Non-IP</td>
<td>Default CoS (port)</td>
<td>Default CoS (port)</td>
<td>Default DSCP (port)</td>
</tr>
<tr>
<td>Untagged IP</td>
<td>Default CoS (port)</td>
<td>Default CoS (port)</td>
<td>DSCP (packet)</td>
</tr>
<tr>
<td>Tagged IP</td>
<td>Default CoS (port)</td>
<td>CoS (packet)</td>
<td>DSCP (packet)</td>
</tr>
</tbody>
</table>

Section 27.5.1 describes the default CoS and DSCP settings for each port.

Mapping CoS to Traffic Class

The `qos map cos` command assigns a traffic class to a list of CoS settings. Multiple commands create a complete CoS to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet’s CoS field or the port upon which it is received.

Example

- This command assigns the traffic class of 5 to the classes of service 1, 3, 5, and 7.

```plaintext
switch(config)#qos map cos 1 3 5 7 to traffic-class 5
switch(config)#show qos maps
    Number of Traffic Classes supported: 8
    Number of Transmit Queues supported: 8
        <-------OUTPUT OMITTED FROM EXAMPLE-------->

    Cos-tc map:
        cos:  0  1  2  3  4  5  6  7
        tc:   1  5  2  5  4  5  6  5
    <-------OUTPUT OMITTED FROM EXAMPLE-------->

switch(config)#
```

Table 27-13 displays the default CoS to Traffic Class map on FM6000 platform switches.

Table 27-13 Default CoS to Traffic Class Map: FM6000 Platform Switches

<table>
<thead>
<tr>

<th>Traffic Class</th>
<th>Derived: use default CoS as inbound CoS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Untagged</td>
<td>0 1 2 3 4 5 6 7</td>
<td>1 0 2 3 4 5 6 7</td>
</tr>
</tbody>
</table>

Mapping DSCP to Traffic Class

The `qos map dscp` command assigns a traffic class to a set of DSCP values. Multiple commands create a complete DSCP to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet’s DSCP field or the chip upon which it is received.
Example

- This command assigns the traffic class of three to the DSCP values of 12, 13, 25, and 37.

```bash
switch(config)# qos map dscp 12 13 25 37 to traffic-class 3
switch(config)# show qos map
Number of Traffic Classes supported: 8
<--------OUTPUT OMITTED FROM EXAMPLE-------->
```

Table 27-14 displays the default DSCP to Traffic Class map on FM6000 platform switches.

<table>
<thead>
<tr>
<th>Inbound DSCP</th>
<th>0-7</th>
<th>8-15</th>
<th>16-23</th>
<th>24-31</th>
<th>32-39</th>
<th>40-47</th>
<th>48-55</th>
<th>56-63</th>
</tr>
</thead>
<tbody>
<tr>
<td>Traffic Class</td>
<td>1</td>
<td>0</td>
<td>2</td>
<td>3</td>
<td>4</td>
<td>5</td>
<td>6</td>
<td>7</td>
</tr>
</tbody>
</table>

27.5.3 CoS and DSCP Rewrite – FM6000 Platform Switches

Section 27.1.1.3 describes the CoS and DSCP rewrite functions.

Traffic Class to CoS Rewrite Map

The CoS rewrite value is configurable and based on a data stream’s traffic class, as specified by the traffic class-CoS rewrite map. The `qos map traffic-class to cos` command assigns a CoS rewrite value to a list of traffic classes. Multiple commands create the complete traffic class–CoS rewrite map.

Example

- This command assigns the CoS rewrite value of two to traffic classes 1, 3, and 5.

```bash
switch(config)# qos map traffic-class 1 3 5 to cos 2
switch(config)# show qos map
Number of Traffic Classes supported: 8
<--------OUTPUT OMITTED FROM EXAMPLE-------->
```

Tc - tx-queue map:
```
tc: 0 1 2 3 4 5 6 7
------------------------
tx-queue: 0 1 2 3 4 5 6 7
<--------OUTPUT OMITTED FROM EXAMPLE-------->
```
Table 27-15 displays the default traffic class–CoS rewrite map on FM6000 platform switches.

Table 27-15 Default Traffic Class to CoS Rewrite Map: FM6000 Platform Switches

<table>
<thead>
<tr>
<th>Traffic Class</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
</tr>
</thead>
<tbody>
<tr>
<td>CoS Rewrite Value</td>
<td>1</td>
<td>0</td>
<td>2</td>
<td>3</td>
<td>4</td>
<td>5</td>
<td>6</td>
<td>7</td>
</tr>
</tbody>
</table>

Traffic Class to DSCP Rewrite Map

The DSCP rewrite value is configurable and based on a data stream’s traffic class, as specified by the traffic class-DSCP rewrite map. The `qos map traffic-class to dscp` command assigns a DSCP rewrite value to a list of traffic classes. Multiple commands create the complete traffic class-DSCP rewrite map.

Example

- This command assigns the DSCP rewrite value of 37 to traffic classes 2, 4, and 6.

  ```
  switch(config)# qos map traffic-class 2 4 6 to dscp 37
  switch(config)# show qos map
  Number of Traffic Classes supported: 8
  <--------OUTPUT OMITTED FROM EXAMPLE-------->
  Tc-dscp map:
  tc: 0 1 2 3 4 5 6 7
  -----------------------------
  dscp: 8 0 37 24 37 40 37 56
  <--------OUTPUT OMITTED FROM EXAMPLE-------->
  ```

  ```
  switch(config)#
  ```

Table 27-16 displays the default traffic class–DSCP rewrite map on FM6000 platform switches.

Table 27-16 Default Traffic Class to DSCP Rewrite Map: FM6000 Platform Switches

<table>
<thead>
<tr>
<th>Traffic Class</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSCP Rewrite Value</td>
<td>8</td>
<td>0</td>
<td>16</td>
<td>24</td>
<td>32</td>
<td>40</td>
<td>48</td>
<td>56</td>
</tr>
</tbody>
</table>

27.5.4 Transmit Queues and Port Shaping – FM6000 Platform Switches

Section 27.1.2 describes transmit queues and port shaping.

A data stream’s traffic class determines the transmit queue it uses. The switch defines a single traffic class-transmit queue map for all Ethernet and port channel interfaces and is used for unicast and multicast traffic. The `show qos maps` command displays the traffic class to transmit queue map.

Table 27-17 displays the default traffic class to transmit queue map on FM6000 platform switches.

Table 27-17 Default Traffic Class to Transmit Queue Map: FM6000 Platform Switches

<table>
<thead>
<tr>
<th>Traffic Class</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transmit Queue</td>
<td>0</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>
<td>5</td>
<td>6</td>
<td>7</td>
</tr>
</tbody>
</table>
Example

- These commands assign traffic classes of 1, 3, and 5 to transmit queue 1, traffic classes 2, 4, and 6 to transmit queue 2, and traffic class 0 to transmit queue 0, then display the resultant map.

  ```
  switch(config)#qos map traffic-class 1 3 5 to tx-queue 1
  switch(config)#qos map traffic-class 2 4 6 to tx-queue 2
  switch(config)#qos map traffic-class 0 to tx-queue 0
  switch(config)#show qos maps
  Number of Traffic Classes supported: 8
  Number of Transmit Queues supported: 8
  <--------OUTPUT OMITTED FROM EXAMPLE-------->

  Tc – tx-queue map:
  tc:        0  1  2  3  4  5  6  7
  ---------------------------------
  tx-queue:  0  1  2  1  2  1  2  7

  switch(config)#
  ```

Entering TX-Queue Configuration Mode

Transmit queues are configurable on Ethernet ports and port channels. Queue parameters are configured in tx-queue configuration command mode, which is entered from interface ethernet configuration mode. The `tx-queue (FM6000)` command places the switch in tx-queue configuration mode. The `show qos interfaces` displays the transmit queue configuration for a specified port.

Example

- This command enters tx-queue configuration mode for transmit queue 3 of Ethernet interface 5.

  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#tx-queue 3
  switch(config-if-Et5-txq-3)#
  ```

Configuring the Shape Rate – Port and Transmit Queues

A port’s shape rate specifies its maximum outbound traffic bandwidth. A transmit queue’s shape rate specifies the queue’s maximum outbound bandwidth. Shape rate commands specify data rates in kbps.

**Important!** Enabling port shaping on an FM6000 interface disables queue shaping internally. Disabling port shaping restores queue shaping as specified in `running-config`.

- To configure a port’s shape rate, enter `shape rate (Interface – FM6000)` from the port’s interface configuration mode.
- To configure a transmit queue’s shape rate, enter `shape rate (Tx-queue – FM6000)` from the queue’s tx-queue configuration mode.

Example

- These commands configure a shape rate of 5 Gbs on Ethernet port 3, then configure the shape rate for the following transmit queues:
  - transmit queues 0, 1, and 2: 500 Mbps
- transmit queues 3, 4, and 5: 400 Mbps

```
switch(config)#interface ethernet 3
switch(config-if-Et3)#shape rate 5000000
switch(config-if-Et3)#tx-queue 0
switch(config-if-Et3-txq-0)#shape rate 500000
switch(config-if-Et3-txq-0)#tx-queue 1
switch(config-if-Et3-txq-1)#shape rate 500000
switch(config-if-Et3-txq-1)#tx-queue 3
switch(config-if-Et3-txq-3)#shape rate 400000
switch(config-if-Et3-txq-3)#tx-queue 4
switch(config-if-Et3-txq-4)#shape rate 400000
switch(config-if-Et3-txq-4)#tx-queue 5
switch(config-if-Et3-txq-5)#shape rate 400000
switch(config-if-Et3-txq-5)#exit
switch(config-if-Et3)#show qos interface ethernet 3
Ethernet3:  
<--------OUTPUT OMITTED FROM EXAMPLE-------->

Port shaping rate: 5000000Kbps

<table>

<td>N/A</td>
<td>500000</td>
<td>strict</td>
</tr>
</tbody>
</table>
```

### Configuring Queue Priority

Queue priority rank is denoted by the queue number; transmit queues with higher numbers have higher priority. The `priority (FM6000)` command configures a transmit queue’s priority type:

- **priority strict** configures the queue as a strict priority queue.
- **no priority** configures the queue as a round robin queue.

A queue’s configuration as **round robin** also applies to all lower priority queues regardless of other configuration statements.

The `bandwidth percent (FM6000)` command configures a round robin queue’s bandwidth share. The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the cumulative configured bandwidth is greater than 100%, each port’s operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

### Example

- These commands configure transmit queue 3 (on Ethernet interface 19) as a round robin queue, then allocates 10%, 20%, 30%, and 40% bandwidth to queues 0 through 3.
The `no priority` statement for queue 3 also configures queues 0, 1, and 2 as round robin queues. Removing this statement reverts the other queues to `strict priority` type unless `running-config` contains a `no priority` statement for one of these queues.

```
switch(config)#interface ethernet 19
switch(config-if-Et19)#tx-queue 3
switch(config-if-Et19-txq-3)#no priority
switch(config-if-Et19-txq-3)#bandwidth percent 40
switch(config-if-Et19-txq-3)#tx-queue 2
switch(config-if-Et19-txq-2)#bandwidth percent 30
switch(config-if-Et19-txq-2)#tx-queue 1
switch(config-if-Et19-txq-1)#bandwidth percent 20
switch(config-if-Et19-txq-1)#tx-queue 0
switch(config-if-Et19-txq-0)#bandwidth percent 10
switch(config-if-Et19-txq-0)#show qos interface ethernet 19
Ethernet19:

Port shaping rate: disabled

27.6 **QoS Configuration: Petra Platform Switches**

Implementing QoS on a Petra platform switch consists of configuring port trust settings, default port settings, default traffic classes, conversion maps, and transmit queues.

- Section 27.6.1: CoS and DSCP Port Settings – Petra Platform Switches
- Section 27.6.2: Traffic Class Derivations – Petra Platform Switches
- Section 27.6.3: CoS Rewrite – Petra Platform Switches
- Section 27.6.4: Transmit Queues and Port Shaping – Petra Platform Switches

### 27.6.1 CoS and DSCP Port Settings – Petra Platform Switches

Section 27.1.1.2 describes port trust and default port CoS and DSCP values.

#### Configuring Port Trust Settings

The `qos trust` command configures the QoS port trust mode for the configuration mode interface. Trust enabled ports use packet CoS or DSCP values to classify traffic. The port-trust default for switched ports is `cos`. The port-trust default for routed ports is `dscp`.

- `qos trust cos` specifies `cos` as the port’s port-trust mode.
- `qos trust dscp` specifies `dscp` as the port’s port-trust mode.
- `no qos trust` specifies `untrusted` as the port’s port-trust mode.

The `show qos interfaces trust` command displays the trust mode of specified interfaces.

#### Example

- These commands configure and display the following trust modes:
  - Ethernet 3/25: dscp
  - Ethernet 3/26: untrusted
  - Ethernet 3/27: cos
  - Ethernet 3/28: default as a switched port
- Ethernet 3/29: default as a routed port

```plaintext
switch(config)#interface ethernet 3/25
switch(config-if-Et3/25)#qos trust dscp
switch(config-if-Et3/25)#interface ethernet 3/26
switch(config-if-Et3/26)#no qos trust
switch(config-if-Et3/26)#interface ethernet 3/27
switch(config-if-Et3/27)#qos trust cos
switch(config-if-Et3/27)#interface ethernet 3/28
switch(config-if-Et3/28)#switchport
switch(config-if-Et3/28)#default qos trust
switch(config-if-Et3/28)#interface ethernet 3/29
switch(config-if-Et3/29)#no switchport
switch(config-if-Et3/29)#default qos trust
switch(config-if-Et3/29)#show qos interface ethernet 3/25 - 3/29 trust
```

### Configuring Default Port Settings

Port channel and Ethernet interfaces are not assigned default CoS or DSCP settings.

### 27.6.2 Traffic Class Derivations – Petra Platform Switches

Section 27.1.1.4 describes traffic classes.

#### Traffic Class Derivation Source

Table 27-18 displays the source for deriving a data stream’s default traffic class.

<table>
<thead>
<tr>
<th>Traffic Class Derivation Source: Petra Platform Switches</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Port</strong></td>
</tr>
<tr>
<td>Ethernet3/25</td>
</tr>
<tr>
<td>Ethernet3/26</td>
</tr>
<tr>
<td>Ethernet3/27</td>
</tr>
<tr>
<td>Ethernet3/28</td>
</tr>
<tr>
<td>Ethernet3/29</td>
</tr>
</tbody>
</table>

```plaintext
switch(config-if-Et3/29)#
```

#### Configuring Default Traffic Class

Petra platform switches assign a default traffic class to the set of Ethernet interfaces controlled by individual PetraA chips. Default traffic class values are configurable for each PetraA chip, not individual interfaces.

The `platform petraA traffic-class` command specifies the default traffic class used by all ports controlled by a specified chip. The `show platform petraA traffic-class` command displays traffic class assignments.
Example

- This command configures the default traffic class to five for the ports 32-39 on linecard 3 (7500 Series).

  switch(config)#platform petraA petra3/4 traffic-class 5
  switch(config)#show platform petraA module 3 traffic-class
  Petra3/0 traffic-class: 1
  Petra3/1 traffic-class: 1
  Petra3/2 traffic-class: 1
  Petra3/3 traffic-class: 1
  Petra3/4 traffic-class: 5
  Petra3/5 traffic-class: 1
  switch(config)#

- This command configures the default traffic class to three for all ports on linecard 6 (7500 Series).

  switch(config)#platform petraA module 6 traffic-class 6
  switch(config)#show platform petraA module 6 traffic-class
  Petra6/0 traffic-class: 6
  Petra6/1 traffic-class: 6
  Petra6/2 traffic-class: 6
  Petra6/3 traffic-class: 6
  Petra6/4 traffic-class: 6
  Petra6/5 traffic-class: 6
  switch(config)#

Mapping CoS to Traffic Class

The qos map cos command assigns a traffic class to a list of CoS settings. Multiple commands create a complete CoS–traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet’s CoS field or the port upon which it is received.

Example

- This command assigns the traffic class of 4 to the classes of service 1, 3, 5, and 7.

  switch(config)#qos map cos 1 3 5 7 to traffic-class 4
  switch(config)#show qos maps
  Number of Traffic Classes supported: 8

<---------OUTPUT OMITTED FROM EXAMPLE--------->

  Cos-tc map:
  cos:  0  1  2  3  4  5  6  7
  ---------------
  tc:   1  4  2  4  4  4  6  4

<---------OUTPUT OMITTED FROM EXAMPLE--------->

  switch(config)#

Table 27-19 displays the default CoS to traffic class map on Petra platform switches.

<table>
<thead>
<tr>
<th>Inbound CoS</th>

<td>Derived: use default CoS as inbound CoS</td>
</tr>
</tbody>
</table>

Mapping DSCP to Traffic Class

The qos map dscp command assigns a traffic class to a set of DSCP values. Multiple commands create a complete DSCP to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet’s DSCP field or the chip upon which it is received.
Example

- This command assigns the traffic class of three to the DSCP values of 12, 13, 25, and 37.

```
switch(config)# qos map dscp 12 13 14 25 48 to traffic-class 3
switch(config)# show qos maps
Number of Traffic Classes supported: 8
<--------OUTPUT OMITTED FROM EXAMPLE-------->
```

27.6.3 CoS Rewrite – Petra Platform Switches

Section 27.1.1.3 describes the CoS rewrite function.

Traffic Class to CoS Rewrite Map

The CoS rewrite value is configurable and based on a data stream’s traffic class, as specified by the traffic class-CoS rewrite map. The `qos map traffic-class to cos` command assigns a CoS rewrite value to a list of traffic classes. Multiple commands create the complete traffic class-CoS rewrite map.

Example

- This command assigns the CoS of two to traffic classes 1, 3, and 5.

```
switch(config)# qos map traffic-class 1 3 5 to cos 2
switch(config)# show qos map
Number of Traffic Classes supported: 8
<--------OUTPUT OMITTED FROM EXAMPLE-------->
```

<table>
<thead>
<tr>
<th>Tc-cos map:</th>
</tr>
</thead>
<tbody>
<tr>
<td>tc: 0 1 2 3 4 5 6 7</td>
</tr>
<tr>
<td>-------------</td>
</tr>
<tr>
<td>cos: 1 2 2 2 4 2 6 7</td>
</tr>
</tbody>
</table>

<--------OUTPUT OMITTED FROM EXAMPLE-------->

switch(config)#
Table 27-21 displays the default Traffic Class to CoS rewrite value map on Petra platform switches.

<table>
<thead>

<td>7</td>
</tr>
</tbody>
</table>

**Traffic Class to DSCP Rewrite Map**

DSCP rewrite is always disabled on Petra platform switches.

### 27.6.4 Transmit Queues and Port Shaping – Petra Platform Switches

Section 27.1.2 describes transmit queues and port shaping.

Petra platform switches provide four physical queues for each egress port: Unicast High, Unicast Low, Multicast High, and Multicast Low. Data is scheduled for the high or low queue based on its priority as defined by its transmit queue assignment (unicast traffic) or traffic class (multicast traffic), as shown in Table 27-22. A Petra transmit queue is a data structure that defines scheduling of unicast traffic among physical egress queues.

Table 27-22 Traffic Distribution to Egress Port Queues

<table>
<thead>
<tr>
<th>Unicast Traffic</th>
<th>High Priority Queue</th>
<th>Low Priority Queue</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transmit Queue s5–7</td>
<td>Traffic Classes 0–4</td>
<td></td>
</tr>
<tr>
<td>Traffic Class 5–7</td>
<td>Traffic Classes 0–4</td>
<td></td>
</tr>
</tbody>
</table>

Multicast queue capacity that is available after multicast traffic is serviced is used for unicast traffic of a corresponding priority. Similarly, unicast queue capacity that is available after unicast traffic is serviced is used for overflow multicast traffic. Under conditions of unicast and multicast congestion, egress traffic is evenly split between unicast and multicast traffic.

Section 27.6.4.1 describes unicast transmit queues and shaping. Section 27.6.4.2 describes multicast priority and traffic classes.

#### 27.6.4.1 Unicast Transmit Queues and Port Shaping

A data stream’s traffic class determines the transmit queue it uses. The switch defines a single traffic class–transmit queue map for unicast traffic on all Ethernet interfaces. The show qos maps command displays the traffic class–transmit queue map. The show qos maps command displays the default traffic class to transmit queue map on Petra platform switches.

Table 27-23 Default Traffic Class to Transmit Queue Map: Petra Platform Switches

<table>
<thead>
<tr>
<th>Traffic Class</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
</tr>
</thead>
<tbody>

<td>Transmit Queue</td>
<td>0</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>
<td>5</td>
<td>6</td>
<td>7</td>
</tr>
</tbody>
</table>

Transmit queue parameters are configured in tx-queue configuration command mode.

**Mapping Traffic Classes to a Transmit Queue**

The qos map traffic-class to tx-queue command assigns traffic classes to a transmit queue. Multiple commands complete the traffic class-transmit queue map. Traffic class 7 and transmit queue 7 are always mapped to each other. This association is not editable.
Example

- These commands assign traffic classes of 1, 3, and 5 to transmit queue 1, traffic classes 2, 4, and 6 to transmit queue 2, and traffic class 0 to transmit queue 0, then display the resultant map.

  switch(config)#qos map traffic-class 1 3 5 to tx-queue 1
  switch(config)#qos map traffic-class 2 4 6 to tx-queue 2
  switch(config)#qos map traffic-class 0 to tx-queue 0

  switch(config)#show qos maps
  Number of Traffic Classes supported: 8
  Number of Transmit Queues supported: 8

  Tc - tx-queue map:
  tc:        0  1  2  3  4  5  6  7
  ---------------------------------
  tx-queue:  0  1  2  1  2  1  2  7

  switch(config)#

Entering Tx-Queue Configuration Mode

The tx-queue (Petra) command places the switch in tx-queue configuration mode to configure a transmit queue on the configuration mode interface. Tx-queue 7 is not configurable. The show qos interfaces displays the transmit queue configuration for a specified port.

Example

- This command enters tx-queue configuration mode for transmit queue 3 of Ethernet interface 3/28

  switch(config)#interface ethernet 3/28
  switch(config-if-Et3/28)#tx-queue 3

Configuring the Shape Rate – Port and Transmit Queues

A port’s shape rate specifies its maximum outbound traffic bandwidth. A transmit queue’s shape rate specifies the queue’s maximum outbound bandwidth. Shape rate commands specify data rates in kbps.

- To configure a port’s shape rate, enter shape rate (Interface – Petra) from the port’s interface configuration mode.

- To configure a transmit queue’s shape rate, enter shape rate (Tx-queue – Petra) from the queue’s tx-queue configuration mode.

Example

- These commands configure a shape rate of 5 Gbs on Ethernet port 3, then configure the shape rate for the following transmit queues:

  - transmit queues 0, 1, and 2: 500 Mbps
transmit queues 3, 4, and 5: 400 Mbps

```
switch(config)#interface ethernet 3/28
switch(config-if-Et3/28)#shape rate 5000000
switch(config-if-Et3/28)#tx-queue 0
switch(config-if-Et3/28-txq-0)#shape rate 500000
switch(config-if-Et3/28-txq-0)#tx-queue 1
switch(config-if-Et3/28-txq-1)#shape rate 500000
switch(config-if-Et3/28-txq-1)#tx-queue 2
switch(config-if-Et3/28-txq-2)#shape rate 500000
switch(config-if-Et3/28-txq-2)#tx-queue 3
switch(config-if-Et3/28-txq-2)#shape rate 400000
switch(config-if-Et3/28-txq-2)#tx-queue 4
switch(config-if-Et3/28-txq-4)#shape rate 400000
switch(config-if-Et3/28-txq-4)#tx-queue 5
switch(config-if-Et3/28-txq-5)#shape rate 400000
switch(config-if-Et3/28-txq-5)#show qos interface ethernet 3/28
```

```
Ethernet3/28:

</tbody>
</table>
```

Configuring Queue Priority

The `priority (Petra)` command configures a transmit queue’s priority type:

- The `priority strict` command configures the queue as a strict priority queue.
- The `no priority` command configures the queue as a round robin queue.

A queue’s configuration as `round robin` also applies to all lower priority queues regardless of other configuration statements.

The `bandwidth percent (Petra)` command configures a round robin queue’s bandwidth share. The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the cumulative configured bandwidth is greater than 100%, each port’s operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

Example

- These commands configure transmit queue 3 (on Ethernet interface 3/28) as a round robin queue, then allocates 10%, 20%, 30%, and 40% bandwidth to queues 0 through 3.
The **no priority** statement for queue 3 also configures queues 0, 1, and 2 as round robin queues. Removing this statement reverts the other queues to **strict priority** type unless **running-config** contains a **no priority** statement for one of these queues.

```
switch(config-if-Et3/28)#tx-queue 3
switch(config-if-Et3/28-txq-3)#no priority
switch(config-if-Et3/28-txq-3)#bandwidth percent 40
switch(config-if-Et3/28-txq-3)#tx-queue 2
switch(config-if-Et3/28-txq-2)#bandwidth percent 30
switch(config-if-Et3/28-txq-2)#tx-queue 1
switch(config-if-Et3/28-txq-1)#bandwidth percent 20
switch(config-if-Et3/28-txq-1)#tx-queue 0
switch(config-if-Et3/28-txq-0)#bandwidth percent 10
switch(config-if-Et3/28-txq-0)#show qos interface ethernet 3/28
```

27.6.4.2 Multicast Egress Scheduling

Multicast traffic is not affected by traffic class assignment or port shaping statements. Multicast traffic is assigned to port egress queues based on traffic class and uses strict priority to schedule egress between the high and low queues.
27.7 QoS Configuration: Trident and Tomahawk Platform Switches

Implementing QoS on a Trident and Tomahawk platform switch consists of configuring port trust settings, default port settings, default traffic classes, conversion maps, and transmit queues.

- Section 27.7.1: CoS and DSCP Port Settings – Trident and Tomahawk Platform Switches
- Section 27.7.2: Traffic Class Derivations – Trident and Tomahawk Platform Switches
- Section 27.7.3: CoS and DSCP Rewrite – Trident and Tomahawk Platform Switches
- Section 27.7.4: Transmit Queues and Port Shaping – Trident and Tomahawk Platform Switches
- Section 27.7.5: ECN Configuration – Trident and Tomahawk Platform Switches

27.7.1 CoS and DSCP Port Settings – Trident and Tomahawk Platform Switches

Configuring Port Trust Settings

The `qos trust` command configures the QoS port trust mode for the configuration mode interface. Trust-enabled ports use packet CoS or DSCP values to classify traffic. The port-trust default for switched ports is CoS. The port-trust default for routed ports is DSCP.

- `qos trust cos` specifies CoS as the port’s trust mode.
- `qos trust dscp` specifies DSCP as the port’s trust mode.
- `no qos trust` specifies untrusted as the port’s trust mode.

The `show qos interfaces trust` command displays the trust mode of specified interfaces.

Example

- These commands configure and display the following trust modes:
  - Ethernet 15: dscp
  - Ethernet 16: untrusted
  - Ethernet 17: cos
  - Ethernet 18: default as a switched port
• Ethernet 19: default as a routed port

```
switch(config)#interface ethernet 15
switch(config-if-Et15)#qos trust dscp
switch(config-if-Et15)#interface ethernet 16
switch(config-if-Et16)#no qos trust
switch(config-if-Et16)#interface ethernet 17
switch(config-if-Et17)#qos trust cos
switch(config-if-Et17)#interface ethernet 18
switch(config-if-Et18)#switchport
switch(config-if-Et18)#default qos trust
switch(config-if-Et18)#interface ethernet 19
switch(config-if-Et19)#show qos interface ethernet 15 - 19 trust
Port                      Operational         Configured
----------------------------------------
Ethernet15                  DSCP             DSCP
Ethernet16                  UNTRUSTED       UNTRUSTED
Ethernet17                  COS              COS
Ethernet18                  COS              DEFAULT
Ethernet19                  DSCP             DEFAULT
```

```
switch(config-if-Et19)#
```

Configuring Default Port Settings

Default CoS and DSCP settings are assigned to individual port channel and Ethernet interfaces. These configuration mode interface commands specify the port’s default CoS and DSCP values.

- `qos cos` configures a port’s default CoS value.
- `qos dscp` configures a port’s default DSCP value.

Example

- These commands configure default CoS (4) and DSCP (44) values on Ethernet interface 7.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#qos cos 4
switch(config-if-Et7)#qos dscp 44
switch(config-if-Et7)#show active
interface Ethernet7
  qos cos 4
  qos dscp 44
switch(config-if-Et7)#show qos interfaces ethernet 7
Ethernet7:
  Trust Mode: COS
  Default COS: 4
  Default DSCP: 44
  <--------OUTPUT OMITTED FROM EXAMPLE-------->
```

27.7.2 Traffic Class Derivations – Trident and Tomahawk Platform Switches

Section 27.1.1.4 describes traffic classes.
Traffic Class Derivation Source

Table 27-24 displays the source for deriving a data stream’s traffic class.

Table 27-24 Traffic Class Derivation Source: Trident and Tomahawk Platform Switches

<td>Default CoS (port)</td>
<td>CoS (packet)</td>
<td>DSCP (packet)</td>
</tr>
</tbody>
</table>

Section 27.7.1 describes the default CoS and DSCP settings for each port.

Mapping CoS to Traffic Class

The `qos map cos` command assigns a traffic class to a list of CoS settings. Multiple commands create a complete CoS to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet’s CoS field or the port upon which it is received.

Example

- This command assigns the traffic class of 5 to the classes of service 1, 3, 5, and 7.

  ```
  switch(config)#qos map cos 1 3 5 7 to traffic-class 5
  switch(config)#show qos maps
  Number of Traffic Classes supported: 8
  <-------OUTPUT OMITTED FROM EXAMPLE--------->
  Cos-tc map:
  cos:  0  1  2  3  4  5  6  7
  ------------------------------
  tc:   1  5  2  5  4  5  6  5
  <-------OUTPUT OMITTED FROM EXAMPLE--------->
  ```

Table 27-25 displays the default CoS–traffic class map on Trident and Tomahawk platform switches.

Table 27-25 Default CoS to Traffic Class Map: Trident and Tomahawk Platform Switches

<table>
<thead>
<tr>

<td>2</td>
<td>3</td>
<td>4</td>
<td>5</td>
<td>6</td>
<td>7</td>
</tr>
</tbody>
</table>

Mapping DSCP to Traffic Class

The `qos map dscp` command assigns a traffic class to a set of DSCP values. Multiple commands create a complete DSCP to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet’s DSCP field or the chip upon which it is received.
Example

- This command assigns the traffic class of 0 to DSCP values of 12, 24, 41, and 44-47.

\[
\text{switch(config)} \# \text{qos map dscp 12 24 41 44 45 46 47 to traffic-class 0}
\]

Example

- This command assigns the CoS of two to traffic classes 1, 3, and 5.

\[
\text{switch(config)} \# \text{qos map traffic-class 1 3 5 to cos 2}
\]

Table 27-26 displays the default DSCP–traffic class map on Trident and Tomahawk platform switches.

27.7.3 CoS and DSCP Rewrite – Trident and Tomahawk Platform Switches

Section 27.1.1.3 describes the CoS and DSCP rewrite functions.

Traffic Class to CoS Rewrite Map

The CoS rewrite value is configurable and based on a data stream’s traffic class, as specified by the traffic class-CoS rewrite map. The \text{qos map traffic-class to cos} command assigns a CoS rewrite value to a list of traffic classes. Multiple commands create the complete traffic class–CoS rewrite map.

Example

- This command assigns the CoS of two to traffic classes 1, 3, and 5.

\[
\text{switch(config)} \# \text{qos map traffic-class 1 3 5 to cos 2}
\]

\[
\text{switch(config)} \# \text{show qos map}

27.7.3 CoS and DSCP Rewrite – Trident and Tomahawk Platform Switches

Section 27.1.1.3 describes the CoS and DSCP rewrite functions.

Traffic Class to CoS Rewrite Map

The CoS rewrite value is configurable and based on a data stream’s traffic class, as specified by the traffic class-CoS rewrite map. The \text{qos map traffic-class to cos} command assigns a CoS rewrite value to a list of traffic classes. Multiple commands create the complete traffic class–CoS rewrite map.

Example

- This command assigns the CoS of two to traffic classes 1, 3, and 5.

\[
\text{switch(config)} \# \text{qos map traffic-class 1 3 5 to cos 2}
\]

\[
\text{switch(config)} \# \text{show qos map}
\]

\[
\text{Number of Traffic Classes supported: 8}
\]

\[
\text{Tc-cos map:}
\]

\[
tc: 0 1 2 3 4 5 6 7
\]

\[
\text{cos: 1 2 2 2 4 2 6 7}
\]

\[
\text{<------OUTPUT OMITTED FROM EXAMPLE------->}
\]

\[
\text{switch(config)}\#
\]
Table 27-27 displays the default Traffic Class to CoS rewrite value map on Trident and Tomahawk platform switches.

#### Traffic Class to DSCP Rewrite Map

The DSCP rewrite value is configurable and based on a data stream’s traffic class, as specified by the traffic class-DSCP rewrite map. The `qos map traffic-class to dscp` command assigns a DSCP rewrite value to a list of traffic classes. Multiple commands create the complete traffic class-DSCP rewrite map.

**Example**

- This command assigns the DSCP value of 29 to traffic classes 2, 4, and 6.

  ```
  switch(config)# qos map traffic-class 2 4 6 to dscp 29
  switch(config)# show qos map
  Number of Traffic Classes supported: 8
  <--------OUTPUT OMITTED FROM EXAMPLE-------->
  Tc-dscp map:
  tc: 0 1 2 3 4 5 6 7
  -----------------------------
  dscp: 8 0 29 24 29 40 29 56
  <--------OUTPUT OMITTED FROM EXAMPLE-------->
  ```

Table 27-28 displays the default traffic class to DSCP rewrite map on Trident and Tomahawk platform switches.

27.7.4 Transmit Queues and Port Shaping – Trident and Tomahawk Platform Switches

Section 27.1.2 describes transmit queues and port shaping.

Trident and Tomahawk platform switches define 12 transmit queues: eight unicast (UC0 – UC7) and four multicast (MC0 – MC03). The traffic class–transmit queue maps are configured globally and apply to all Ethernet interfaces. The `show qos maps` command displays the traffic class–transmit queue maps.

Table 27-29 displays the default traffic class–transmit queue maps.

### Table 27-29 Default Traffic Class to Transmit Queue Map: Trident and Tomahawk Platform Switches

<table>
<thead>

</tr>
</tbody>
</table>

#### Mapping Traffic Classes to a Transmit Queue

These commands assign traffic classes to a transmit queue:

- `qos map traffic-class to uc-tx-queue` associates a unicast queue to a traffic class set.
QoS Configuration: Trident and Tomahawk Platform Switches

Chapter 27: Quality of Service

- `qos map traffic-class to mc-tx-queue` associates a multicast queue to a traffic class set. Multiple commands create the complete maps.

**Example**
- These commands assign the following on Ethernet interface 7:
  - traffic classes 1, 3, and 5 to unicast queue 1
  - traffic classes 2, 4, and 6 to unicast queue 5
  - traffic classes 1, 2, and 3 to multicast queue 1
  - traffic classes 4, 5, and 6 to multicast queue 3
  - traffic class 0 to unicast queue 0 and multicast queue 0

```plaintext
switch(config)#default interface ethernet 7
switch(config)#qos map traffic-class 1 3 5 to uc-tx-queue 1
switch(config)#qos map traffic-class 2 4 6 to uc-tx-queue 5
switch(config)#qos map traffic-class 1 2 3 to mc-tx-queue 1
switch(config)#qos map traffic-class 4 5 6 to mc-tx-queue 3
switch(config)#qos map traffic-class 0 to uc-tx-queue 0
switch(config)#qos map traffic-class 0 to mc-tx-queue 0
```

**Entering a Transmit Queue Configuration Mode**
Transmit queues are configurable on individual Ethernet ports. Parameters for individual transmit queues are configured in one of two transmit queue configuration modes. Transmit queue modes are accessed from an interface-ethernet configuration mode.

- **uc-tx-queue** places the switch in uc-tx-queue mode to configure a unicast transmit queue.
- **mc-tx-queue** places the switch in mc-tx-queue mode to configure a multicast transmit queue.

The `show qos interfaces` displays the transmit queue configuration for a specified port. **Examples**

**Example**
- This command enters the mode that configures unicast transmit queue 3 of Ethernet interface 5.

```plaintext
switch(config)#interface ethernet 5
switch(config-if-Et5)#uc-tx-queue 3
switch(config-if-Et5-uc-txq-3)#
```
This command enters the mode to configure multicast transmit queue 3 of Ethernet interface 5.

```bash
switch(config-if-Et5)#mc-tx-queue 2
switch(config-if-Et5-mc-txq-2)#
```

### Configuring the Shape Rate – Port and Transmit Queues

A port’s shape rate specifies the port’s maximum outbound traffic bandwidth. A shape rate can also be configured for all transmit queues on each port. All shape rate commands use kbps to specify data rates.

- To configure a port’s shape rate, enter `shape rate (Interface – Trident and Tomahawk)` from the port’s interface configuration mode.
- To configure a transmit queue’s shape rate, enter `shape rate (Tx-queue – Trident and Tomahawk)` from the queue’s tx-queue configuration mode.

### Example

- These commands configure a shape rate of 5 Gbs on Ethernet port 7, then configure the shape rate for the following transmit queues:
  - unicast transmit queues 0 and 1: 500 Mbps
  - unicast transmit queues 3 and 4: 400 Mbps
multicast transmit queues 0 and 2: 300 Mbps

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#shape rate 5000000
switch(config-if-Et7)#uc-tx-queue 0
switch(config-if-Et7-uc-txq-0)#shape rate 500000
switch(config-if-Et7-uc-txq-0)#uc-tx-queue 1
switch(config-if-Et7-uc-txq-1)#shape rate 500000
switch(config-if-Et7-uc-txq-1)#uc-tx-queue 3
switch(config-if-Et7-uc-txq-3)#shape rate 400000
switch(config-if-Et7-uc-txq-3)#uc-tx-queue 5
switch(config-if-Et7-uc-txq-5)#shape rate 400000
switch(config-if-Et7-uc-txq-5)#mc-tx-queue 0
switch(config-if-Et7-mc-txq-0)#shape rate 300000
switch(config-if-Et7-mc-txq-0)#mc-tx-queue 2
switch(config-if-Et7-mc-txq-2)#shape rate 300000
switch(config-if-Et7-mc-txq-2)#exit
switch(config-if-Et7)#show qos interface ethernet 7
```

```

### Configuring Queue Priority

Trident and Tomahawk platform switch queues are categorized into two priority groups. Priority group 1 queues have priority over priority 0 queues. The following lists display the priority group queues in order from higher priority to lower priority.

- **Priority Group 1:** UC7, UC6, MC3
- **Priority Group 0:** UC5, UC4, MC2, UC3, UC2, MC1, UC1, UC0, MC0

The `priority` (Trident and Tomahawk) command configures a transmit queue’s priority type:

- The **priority strict** command configures the queue as a strict priority queue.
- The **no priority** command configures the queue as a round robin queue.

A queue’s configuration as **round robin** also applies to all lower priority queues regardless of other configuration statements.
The bandwidth percent (Trident and Tomahawk) command configures a round robin queue’s bandwidth share. The cumulative operational bandwidth of all round robin queues is always 100%. If the cumulative configured bandwidth is greater than 100%, each port’s operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

Priority Group 1 queues (UC7, UC6, MC3) are not configurable as round robin queues. The bandwidth percent command is not available for these queues.

**Example**

- These commands configure unicast transmit queue 3 as a round robin queue, then allocates 5%, 15%, 25%, 35%, 8%, and 12% bandwidth to unicast transmit queues 0 through 3 and multicast transmit queues 0 and 1, respectively.

The no priority statement for queue 3 also configures priority for all lower priority queues. Removing the statement reverts the other queues to strict priority type unless running-config contains a no priority statement for one of these queues.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#uc-tx-queue 3
switch(config-if-Et7-uc-txq-3)#no priority
switch(config-if-Et7-uc-txq-3)#bandwidth percent 5
switch(config-if-Et7-uc-txq-3)#uc-tx-queue 2
switch(config-if-Et7-uc-txq-2)#bandwidth percent 15
switch(config-if-Et7-uc-txq-2)#uc-tx-queue 1
switch(config-if-Et7-uc-txq-1)#bandwidth percent 25
switch(config-if-Et7-uc-txq-1)#uc-tx-queue 0
switch(config-if-Et7-uc-txq-0)#bandwidth percent 35
switch(config-if-Et7-uc-txq-0)#mc-tx-queue 1
switch(config-if-Et7-mc-txq-1)#bandwidth percent 12
switch(config-if-Et7-mc-txq-1)#mc-tx-queue 0
switch(config-if-Et7-mc-txq-0)#bandwidth percent 8
switch(config-if-Et7-mc-txq-0)#show qos interface ethernet 7
```

### 27.7.5 ECN Configuration – Trident and Tomahawk Platform Switches

Section 27.1.3 describes Explicit Congestion Notification (ECN).

ECN is independently configurable on all egress queues of each Ethernet interface. ECN settings for Port-Channels are applied on each of the channel’s member Ethernet interfaces. ECN is also globally configurable to mark packets from the shared pool used for dynamically allocating memory to the queues. Multicast packets contribute to the globally shared pool and can contribute to global level congestion that result in ECN marking of unicast packets queued after the multicast packets.

Average queue length is tracked for transmit queues and the global pool independently. When either entity reaches its maximum threshold, all subsequent packets are marked.

Although the switch does not limit the number of queues that can be configured for ECN, hardware table limitations restrict the number of queues (including the global shared pool) that can simultaneously implement ECN.

The `qos random-detect ecn global-buffer` (Trident and Tomahawk) command enables ECN marking for globally shared packet memory and specifies minimum and maximum queue threshold sizes.

**Example**

- This command enables ECN marking of unicast packets from the global data pool and sets the minimum and maximum thresholds at 20 and 500 segments.

  ```
  switch(config)# qos random-detect ecn global-buffer minimum-threshold 20 segments
  maximum-threshold 500 segments
  switch(config)#
  ```
Chapter 27: Quality of Service

QoS Configuration: Trident and Tomahawk Platform Switches

- This command disables ECN marking of unicast packets from the global data pool
  
  switch(config)#no qos random-detect ecn global-buffer
  switch(config)#

  The `random-detect ecn (Trident and Tomahawk)` command enables ECN marking for the configuration mode unicast transmit queue and specifies threshold queue sizes.

  **Example**

  - These commands enable ECN marking of unicast packets from transmit queue 4 of Ethernet interface 15, setting thresholds at 10 and 100 segments.
    
    switch(config)#interface ethernet 15
    switch(config-if-Et15)#uc-tx-queue 4
    switch(config-if-Et15-uc-txq-4)#random-detect ecn minimum-threshold 10 segments maximum-threshold 100 segments
    switch(config-if-Et15-uc-txq-4)#show active
    interface Ethernet15
      uc-tx-queue 4
        random-detect ecn minimum-threshold 10 segments maximum-threshold 100 segments
    switch(config-if-Et15-uc-txq-4)#exit
    switch(config-if-Et15)#

  - This command disables ECN marking of unicast packets from transmit queue 4 of Ethernet interface 15.
    
    switch(config-if-Et15-uc-txq-4)#no random-detect ecn
    switch(config-if-Et15-uc-txq-4)#show active
    interface Ethernet15
    switch(config-if-Et15-uc-txq-4)#exit
    switch(config-if-Et15)#
27.8 QoS Configuration: Trident-II and Helix Platform Switches
Implementing QoS on a Trident platform switch consists of configuring port trust settings, default port settings, default traffic classes, conversion maps, and transmit queues.

- Section 27.8.1: CoS and DSCP Port Settings – Trident-II and Helix Platform Switches
- Section 27.8.2: Traffic Class Derivations – Trident-II and Helix Platform Switches
- Section 27.8.3: CoS and DSCP Rewrite – Trident-II and Helix Platform Switches
- Section 27.8.4: Transmit Queues and Port Shaping – Trident-II and Helix Platform Switches
- Section 27.8.5: Ingress Policing on LAG
- Section 27.8.6: Fabric QoS -- – Trident-II Platform Switches

27.8.1 CoS and DSCP Port Settings – Trident-II and Helix Platform Switches

Configuring Port Trust Settings
The `qos trust` command configures the QoS port trust mode for the configuration mode interface. Trust enabled ports use packet CoS or DSCP values to classify traffic. The port-trust default for switched ports is `cos`. The port-trust default for routed ports is `dscp`.

- `qos trust cos` specifies `cos` as the port’s port-trust mode.
- `qos trust dscp` specifies `dscp` as the port’s port-trust mode.
- `no qos trust` specifies `untrusted` as the port’s port-trust mode.

The `show qos interfaces trust` command displays the trust mode of specified interfaces.

Example
- These commands configure and display the following trust modes:
  - Ethernet 7/1: `dscp`
  - Ethernet 7/2: `untrusted`
  - Ethernet 7/3: `cos`
  - Ethernet 7/4: default as a switched port
- Ethernet 8/1: default as a routed port

```
switch(config)#interface ethernet 7/
switch(config-if-Et7/1)#qos trust dscp
switch(config-if-Et7/1)#interface ethernet 7/2
switch(config-if-Et7/2)#no qos trust
switch(config-if-Et7/2)#interface ethernet 7/3
switch(config-if-Et7/3)#qos trust cos
switch(config-if-Et7/3)#interface ethernet 7/4
switch(config-if-Et7/4)#switchport
switch(config-if-Et7/4)#default qos trust
switch(config-if-Et7/4)#interface ethernet 8/1
switch(config-if-Et8/1)#no switchport
switch(config-if-Et8/1)#default qos trust
switch(config-if-Et8/1)#show qos interface ethernet 7/1 - 8/1 trust
```

### Configuring Default Port Settings

Default CoS and DSCP settings are assigned to individual port channel and Ethernet interfaces. These configuration mode interface commands specify the port's default CoS and DSCP values.

- `qos cos` configures a port's default CoS value.
- `qos dscp` configures a port's default DSCP value.

### Example

- These commands configure default CoS (4) and DSCP (44) values on Ethernet interface 7/3.

```
switch(config)#interface ethernet 7/3
switch(config-if-Et7/3)#qos cos 4
switch(config-if-Et7/3)#qos dscp 44
switch(config-if-Et7/3)#show active
interface Ethernet7/3
  qos cos 4
  qos dscp 44
switch(config-if-Et7/3)#show qos interfaces ethernet 7/3
Ethernet7/3:
  Trust Mode: COS
  Default COS: 4
  Default DSCP: 44

<--------OUTPUT OMITTED FROM EXAMPLE-------->
```

## 27.8.2 Traffic Class Derivations – Trident-II and Helix Platform Switches

Section 27.1.1.4 describes traffic classes.

### Note

Qos traffic policy is supported on Trident-II platform switches.
Traffic Class Derivation Source

Table 27-30 displays the source for deriving a data stream’s traffic class.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Section 27.8.1 describes the default CoS and DSCP settings for each port.

Mapping CoS to Traffic Class

The qos map cos command assigns a traffic class to a list of CoS settings. Multiple commands create a complete CoS to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet’s CoS field or the port upon which it is received.

Example

- This command assigns the traffic class of 5 to the classes of service 1, 3, 5, and 7.

  ```
  switch(config)# qos map cos 1 3 5 7 to traffic-class 5
  switch(config)# show qos maps
  Number of Traffic Classes supported: 8
  <--------OUTPUT OMITTED FROM EXAMPLE--------->

  Cos-tc map:
  cos: 0 1 2 3 4 5 6 7
  -----------------------------
  tc: 1 5 2 5 4 5 6 5
  <--------OUTPUT OMITTED FROM EXAMPLE--------->
  ```

  switch(config)#

Table 27-31 displays the default CoS–traffic class map on Trident-II platform switches.

<table>
<thead>
<tr>
<th>Table 27-31 Default CoS to Traffic Class Map: Trident-II Platform Switches</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Table 27-31 Default CoS to Traffic Class Map: Trident-II Platform Switches</strong></td>
</tr>
<tr>
<td>Inbound CoS</td>
</tr>
<tr>
<td>-------------</td>
</tr>
<tr>
<td>0 1 2 3 4 5 6 7</td>
</tr>
</tbody>
</table>

Mapping DSCP to Traffic Class

The qos map dscp command assigns a traffic class to a set of DSCP values. Multiple commands create a complete DSCP to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet’s DSCP field or the chip upon which it is received.
### Example

- This command assigns the traffic class of 0 to DSCP values of 12, 24, 41, and 44-47.

```
switch(config)# qos map dscp 12 24 41 44 45 46 47 to traffic-class 0
switch(config)# show qos maps
  Number of Traffic Classes supported: 8
  <--------OUTPUT OMITTED FROM EXAMPLE-------->
```

#### 27.8.3 CoS and DSCP Rewrite – Trident-II and Helix Platform Switches

Section 27.1.1.3 describes the CoS and DSCP rewrite functions.

### Traffic Class to CoS Rewrite Map

The CoS rewrite value is configurable and based on a data stream’s traffic class, as specified by the traffic class–CoS rewrite map. The `qos map traffic-class to cos` command assigns a CoS rewrite value to a list of traffic classes. Multiple commands create the complete traffic class–CoS rewrite map.

### Example

- This command assigns the CoS of two to traffic classes 1, 3, and 5.

```
switch(config)# qos map traffic-class 1 3 5 to cos 2
switch(config)# show qos map
  Number of Traffic Classes supported: 8
  <--------OUTPUT OMITTED FROM EXAMPLE-------->
```

Tc-cos map:
```
tc:  0 1 2 3 4 5 6 7
     -----------------------
cos: 1 2 2 2 4 2 6 7
```

<--------OUTPUT OMITTED FROM EXAMPLE-------->

```
switch(config)#
```
Table 27-33 displays the default Traffic Class to CoS rewrite value map on Trident-II platform switches.

**Traffic Class to DSCP Rewrite Map**

The DSCP rewrite value is configurable and based on a data stream's traffic class, as specified by the traffic class-DSCP rewrite map. The `qos map traffic-class to dscp` command assigns a DSCP rewrite value to a list of traffic classes. Multiple commands create the complete traffic class-DSCP rewrite map.

**Example**

- This command assigns the DSCP value of 29 to traffic classes 2, 4, and 6.

```bash
switch(config)# qos map traffic-class 2 4 6 to dscp 29
switch(config)# show qos map
Number of Traffic Classes supported: 8
<--------OUTPUT OMITTED FROM EXAMPLE-------->
```

### 27.8.4 Transmit Queues and Port Shaping – Trident-II and Helix Platform Switches

Section 27.1.2 describes transmit queues and port shaping.

A data stream's traffic class determines the transmit queue it uses. The switch defines a single traffic class-transmit queue map for all Ethernet interfaces and is used for unicast and multicast traffic. The traffic class to transmit queue maps are configured globally and apply to all Ethernet and port channel interfaces. The `show qos maps` command displays the traffic class to transmit queue map.

Trident-II platform switches have eight unicast (UC0 – UC7) and eight multicast (MC0 – MC7) queues. Each UCx-MCx queue set is combined into a single queue group (L1.x), which is exposed to the CLI through this command.

Table 27-35 displays the default traffic class to transmit queue maps.

### Table 27-35 Default Traffic Class to Transmit Queue Map: Trident-II Platform Switches

<table>
<thead>
<tr>
<th>Traffic Class</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transmit Queue Group</td>
<td>0</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>
<td>5</td>
<td>6</td>
<td>7</td>
</tr>
</tbody>
</table>

**Mapping Traffic Classes to a Transmit Queue**

The `qos map traffic-class to tx-queue` command assigns traffic classes to a transmit queue. Multiple commands create the complete map.
Example

- These commands assign traffic classes of 1, 3, and 5 to transmit queue 1, traffic classes 2, 4, and 6 to transmit queue 2, and traffic class 0 to transmit queue 0, then display the resultant map.

```bash
switch(config)# qos map traffic-class 1 3 5 to tx-queue 1
switch(config)# qos map traffic-class 2 4 6 to tx-queue 2
switch(config)# qos map traffic-class 0 to tx-queue 0
switch(config)# show qos maps
Number of Traffic Classes supported: 8
Number of Transmit Queues supported: 8

Tc - tx-queue map:
  tc:        0  1  2  3  4  5  6  7
  tx-queue:  0  1  2  1  2  1  2  7
```

Entering a Transmit Queue Configuration Mode

Transmit queues are configurable on Ethernet ports and port channels. Queue parameters are configured in tx-queue configuration command mode, which is entered from the appropriate interface configuration mode. The `tx-queue` (Trident-II) command places the switch in tx-queue configuration mode. The `show qos interfaces` displays the transmit queue configuration for a specified port.

Example

- This command enters tx-queue configuration mode for transmit queue 3 of Ethernet interface 5.

```bash
switch(config)# interface ethernet 5
switch(config-if-Et5)# tx-queue 3
```

Configuring the Shape Rate – Port and Transmit Queues

A port’s shape rate specifies the port’s maximum outbound traffic bandwidth. A shape rate can also be configured for all transmit queues on each port. All shape rate commands use kbps to specify data rates.

- To configure a port’s shape rate, enter `shape rate (Interface – Trident-II)` from the port’s interface configuration mode.
- To configure a transmit queue’s shape rate, enter `shape rate (Tx-queue – Trident-II)` from the queue’s tx-queue configuration mode.

Example

- These commands configure a shape rate of 5 Gbs on Ethernet port 3, then configure the shape rate for the following transmit queues:
  - transmit queues 0, 1, and 2: 500 Mbps
transmit queues 3, 4, and 5: 400 Mbps

```bash
switch(config)#interface ethernet 17/3
switch(config-if-Et17/3)#shape rate 5000000
switch(config-if-Et17/3)#tx-queue 0
switch(config-if-Et17/3-txq-0)#shape rate 500000
switch(config-if-Et17/3-txq-0)#tx-queue 1
switch(config-if-Et17/3-txq-1)#shape rate 500000
switch(config-if-Et17/3-txq-1)#tx-queue 3
switch(config-if-Et17/3-txq-3)#shape rate 400000
switch(config-if-Et17/3-txq-3)#tx-queue 4
switch(config-if-Et17/3-txq-4)#shape rate 400000
switch(config-if-Et17/3-txq-4)#tx-queue 5
switch(config-if-Et17/3-txq-5)#shape rate 400000
switch(config-if-Et17/3-txq-5)#exit

switch(config-if-Et17/3)#show qos interface ethernet 17/3

Ethernet17/3:

<table>
<thead>
<tr>
<th>Tx Queue</th>
<th>Guaranteed Bandwidth (units)</th>
<th>Shape Rate (units)</th>
<th>Priority</th>
</tr>
</thead>
<tbody>
<tr>
<td>7</td>
<td>- / -</td>
<td>- / -</td>
<td>SP / SP</td>
</tr>
<tr>
<td>6</td>
<td>- / -</td>

<td>SP / SP</td>
</tr>
<tr>
<td>0</td>
<td>- / -</td>
<td>500 / 500 Mbps</td>
<td>SP / SP</td>
</tr>
</tbody>
</table>

Configuring Queue Priority

Queue priority rank is denoted by the queue number; transmit queues with higher numbers have higher priority. Trident-II supports strict priority queues; round robin queues are not supported.

The bandwidth guaranteed (Trident-II) command configures specifies the minimum bandwidth for outbound traffic on the transmit queue.
Example

- These commands configure a minimum egress bandwidth of 1 Mbps for transmit queue 4 of Ethernet interface 17/3.

```
switch(config-if-Et17/3)#tx-queue 4
switch(config-if-Et17/3-txq-4)#show qos interface ethernet 17/3
```

<table>
<thead>
<tr>

<td>- / - ( - )</td>
<td>500 / 500 ( Mbps )</td>
<td>SP / SP</td>
</tr>
<tr>
<td>0</td>
<td>- / - ( - )</td>
<td>500 / 500 ( Mbps )</td>
<td>SP / SP</td>
</tr>
</tbody>
</table>

27.8.5 Ingress Policing on LAG

Ingress policing on a port-channel polices the matched traffic from all member interfaces combined, i.e. it provides aggregate policing and statistics (DCS-7050X, DCS-7010T, DCS-7250X, and DCS-7300X series). When a per-interface policer is attached to a port-channel, one set of TCAM entries is created for all member interfaces. The associated interface bitmap is updated, and aggregate policing is performed on all member interfaces.

Example

- These commands configure a service-policy (with policer action) on LAG by creating the service-policy and applying the service-policy on a port-channel.

```
switch(config)#policy-map policy-1
switch(config-pmap-qos-policy-1)#class class-1
switch(config-pmap-c-qos-policy-1-class-1)#police cir 512000 bps bc 96000
switch(config-pmap-c-qos-policy-1-class-1)#exit
switch(config-pmap-qos-policy-1)#exit
switch(config)#interface Et 4 / 5 / 4
switch(config-if-Et4/5/4)#channel-group 2 mode active
switch(config-if-Et4/5/4)#exit
switch(config)#interface po2
switch(config-if-Po2)#service-policy type qos input policy-1
switch(config-if-Po2)#exit
switch(config)#
These commands configure ACL policing in single-rate, two-color mode.

```
switch(config)#class-map type qos match-any class1
switch(config-cmap-qos-class1)#match ip access-group acl1
switch(config-cmap-qos-class1)#exit
switch(config)#policy-map type quality-of-service policy1
switch(config-pmap-qos-policy1)#class class1
switch(config-pmap-c-qos-policy1-class1)#police cir 512000 bc 96000
switch(config-pmap-c-qos-policy1-class1)#exit
switch(config-pmap-qos-policy1)#exit
switch(config)#show policy-map
Service-policy policy1
Class-map: class1 (match-any)
  Match: ip access-group name acl1
  police rate 512000 bps burst-size 96000 bytes

Class-map: class-default (match-any)
```

27.8.6 Fabric QoS -- Trident-II Platform Switches

EOS is optimized to support QoS configuration on the Fabric interfaces on 7250x and 7300 series switches. Configuring QoS on the Fabric interfaces in addition to front panel ports allows user to have end-to-end control and helps to manage traffic better over these switches. By default, tx queues are configured as strict priority on 7250X and 7300X series.

The following QoS configuration options are supported on Fabric interfaces on 7250x and 7300 series switches.

- **Guaranteed Bandwidth**: In order to prevent queue starvation on fabric ports EOS supports minimum bandwidth configuration on per queue basis across all fabric ports.
- **Explicit Congestion Notification (ECN)**: EOS supports enabling ECN on a per queue basis across all fabric ports.
- **Priority Flow Control (PFC)**: Queue back-pressure propagates across the backplane such that flow control messages can be generated to the upstream devices. This is done by enabling PFC for the desired backplane traffic-classes.
- **Weight Round Robin (WRR)**: EOS supports configuring Weighted Round Robin (WRR) on a per queue basis across all fabric ports.

27.8.6.1 Configuring Fabric QoS on 7250X and 7300X Series

Fabric QoS is configured using a QoS profiles which is then applied on fabric interfaces on 7250x and 7300x series. Following are the steps to configure Fabric QoS.

**Step 1** Use `qos profile` command to create a QoS profile.

**Step 2** Use `tx-queue (Trident-II)` command to configure a transmit queue on the configuration mode interface.

**Step 3** Use `bandwidth guaranteed (Trident-II)` command to specify the minimum bandwidth for outbound traffic on the transmit queue.

**Step 4** Use `random-detect ecn (Trident)` command to enable the ECN marking for the configuration mode unicast transmit queue and specifies threshold queue sizes.
Step 5 Use **priority-flow-control priority** command to configure the packet resolution setting on the configuration mode interface.

Step 6 Use **interface fabric** command to configure Fabric interface.

Step 7 Use **service-profile** command to apply the QoS profile to the Fabric interface.

**Example**

- These commands create a QoS profile named **fabricProfile** with tx queue, bandwidth, ECN, PFC and DLB values defined in it and then the profile is attached to Fabric interface of the switch.

**Note**

To support PFC on a particular priority, DLB is disabled for that priority.

```
switch(config)# qos profile fabricProfile
switch(config-qos-profile-fabricProfile)# tx-queue 0
switch(config-qos-profile-fabricProfile-txq-0)# bandwidth guaranteed 10000 kbps
switch(config-qos-profile-fabricProfile-txq-0)# random-detect ecn
minimum-threshold 10 mbytes maximum-threshold 10 mbytes
switch(config-qos-profile-fabricProfile)# priority-flow-control priority 1 no-drop
switch(config-qos-profile-fabricProfile)# priority-flow-control priority 6 no-drop dlb
```

Applying the QoS profile on ‘interface fabric’ of the switch.

```
switch# configure terminal
switch(config)# interface fabric
switch(config-if-fabric)# service-profile fabricProfile
```

27.8.6.2 Displaying Fabric QoS Information

These show commands display the configured Fabric QoS information on the switch.

- **show qos profile [profile Name]**: Displays the list of QoS profiles configured on the switch.
- **show qos interfaces fabric**: Displays the profile applied on the fabric interface on the switch.

**Examples**

- This command displays the fabricProfile profile information.

  switch# show qos profile fabricProfile
  qos profile fabricProfile
  priority-flow-control priority 1 no-drop
  priority-flow-control priority 6 no-drop dlb
  tx-queue 0
  bandwidth guaranteed 10000 kbps
  random-detect ecn minimum-threshold 10 mbytes maximum-threshold 10 mbytes

- This command displays the profile applied on the fabric interface.

  switch# show qos interfaces fabric
  qos profile fabricProfile
27.9 **ACL based QoS Configuration**

27.9.1 **ACL Based QoS (DCS-7160)**

The IPv4 ACL based QoS is enabled on switches through policy-map configuration. The ACL based QoS can be configured on front panel ports, port-channel interfaces on DCS-7160 series switches.

27.9.1.1 **ACL based QoS on SVIs**

The ACL based QoS policy applied on SVIs modify the QoS parameters for SVI traffic (L3 VLAN) based on ACL classification. The ACL based QoS on Switched Virtual Interface (SVI) ports is supported on DCS-7500E, DCS-7280E, DCS-7010, DCS-7050, DCS-7050X, DCS-7250X, DCS-7300X, DCS-7020TR.

27.9.1.2 **ACL Sharing on QoS**

The ACLs applied on QoS shares the hardware resources (TCAM) when potentially large QoS policy-maps are applied to multiple SVIs. For ACL based QoS on SVIs in sharing mode we share TCAM for class-maps without policer action and replicate entries for policer class-maps. The following platforms support ACL sharing on QoS - HelixFour, TridentTwo, Tomahawk, TomahawkPlus, TomahawkTwo, Trident3, TridentThreeXThree.

The QoS actions is applicable only to the routed traffic flowing through the members of the corresponding VLAN.

The steps to configure ACL based QoS is as follows:

**Step 1** Create a access list using `ip access-list` command.

**Step 2** Create a class map and attach it to the access list using `class-map` command.

**Step 3** Create a policy and attach the class map to the policy created, using the `policy-map` command.

**Step 4** Apply the policy to the interface using the `service-policy input` command.

**Examples**

- These command configure the access list acl1.
  ```
  switch(config)#ip access-list acl1
  switch(config-acl-acl1)#permit ip 10.1.1.1/24 any
  switch(config-acl-acl1)#exit
  ```

- These commands configure the class map class1.
  ```
  switch(config)#class-map match-any class1
  switch(config-cmap-qos-class1)#match ip access-group acl1
  switch(config-cmap-qos-class1)#exit
  ```

- These commands configure the policy map policy1.
  ```
  switch(config)#policy-map policy1
  switch(config-pmap-qos-policy1)#class class1
  switch(config-pmap-c-qos-policy1-class1)#set dscp 20
  switch(config-pmap-c-qos-policy1-class1)#set traffic-class 2
  switch(config-pmap-c-qos-policy1-class1)#exit
  ```
• These commands apply the policy1 to the interface Ethernet 1/1.
  ```
  switch(config)#interface Et1/1
  switch(config-if-Et1/1)#service-policy input policy1
  switch(config-if-Et1/1)#exit
  ```

• These commands configure a ACL based QoS on the SVI interface VLAN10.
  ```
  switch(config)#interface vlan 10
  switch(config-if-Vl10)#service-policy [type qos] input policy1
  ```

• This command enables the resource (hardware) sharing when a ACL based QoS is attached to VLAN interface. The no form of the command disables it.
  ```
  switch(config)#hardware access-list qos resource sharing vlan in
  ```

Show Commands

The following show commands display the status of policy-maps programmed on the interface, for more information on these commands refer Section 27.10: Quality of Service Configuration Commands

• `show policy-map [policy-name]`: Displays the policy-map programming status.
• `show policy-map interface interface-id`: Displays the policy-map that is currently programmed on the interface.
• `show policy-map [policy-name] counters`: Displays the policy-map traffic hits.
• `show platform xp qos tcam [hits]`: Displays the TCAM entries programmed for each policy-map as well as the traffic hits. The hits option is used to see the TCAM entries with nonzero traffic hits.
• `show run | grep sharing`: Displays if whether the ACL based QoS is enabled or disabled.
• `show platform trident tcam shared vlan interface-class-id`: Displays what SVIs are currently sharing the QoS policy-map.
• `show platform trident tcam qos detail`: Displays the list of all the SVIs that are sharing the TCAM entries.

27.9.1.3 Limitations

• Maximum number of TCAM entries that can be programmed in hardware for all QoS policy-maps on the box is 1024.
• Layer 4 port ranges are not supported for ACL based QoS. The ranges will be expanded into multiple TCAM rules and programmed in the hardware.
• Configured policer rate should be above 1mbps and recommended burst value is 2000 bytes.
• Policer action can’t be associated with policy-maps applied to Port-Channels.

The following are the limitations specific to DCS-7500E, DCS-7280E and DCS-7020TR:

• User cannot apply more than 31 QoS service policies per chip on L3 interfaces.
• When different QoS service policies are applied to the SVI and its member interfaces, the behavior is indeterministic.
• When QoS service policies are applied on SVIs with partial failures due to limited hardware resources, any event that triggers a forwarding agent restart will lead to indeterministic behavior.
• When QoS service policies are applied on 2 SVIs, any event that triggers the VLAN membership change of a member interface may result in a policy-map programming failure. To change the VLAN membership, remove the interface from the first VLAN and then add it to the other.
• Outgoing COS rewrite is not supported.
• QoS policy-map counters are not supported.

The following are the limitations specific to DCS-7010, DCS-7050, DCS-7050X, DCS-7250X, DCS-7300X:

• TCAM resources won’t be shared for the same policy-map applied to multiple SVIs.
• Policy-map applied to a SVI will result in TCAM allocation on all chips irrespective of whether the SVI members are present or not.

When QoS service policies are applied to both SVI and its member interfaces and packets hit both policies, the behavior is indeterministic.
27.10 Quality of Service Configuration Commands

QoS Data Field and Traffic Class Configuration Commands
- platform petraA traffic-class
- qos cos
- qos dscp
- qos map cos
- qos map dscp
- qos map traffic-class to cos
- qos map traffic-class to dscp
- qos map traffic-class to mc-tx-queue
- qos map traffic-class to tx-queue
- qos map traffic-class to uc-tx-queue
- qos profile
- qos rewrite cos
- qos rewrite dscp
- qos trust
- service-policy type qos input
- service-profile
- hardware access-list qos resource sharing vlan in

QoS and ECN Display Commands
- show platform petraA traffic-class
- show policy-map
- show policy-map interface
- show qos interfaces
- show qos interfaces trust
- show qos interfaces random-detect ecn
- show qos maps
- show qos profile
- show run|grep sharing
- show platform trident tcam shared vlan interface-class-id
- show platform trident tcam qos detail
- show qos profile summary
- show qos random-detect ecn
- show platform xp qos tcam hit

ECN Configuration Commands
- qos random-detect ecn global-buffer (Helix)
- qos random-detect ecn global-buffer (Trident and Tomahawk)
- random-detect ecn (Arad/Jericho)
- random-detect ecn (Helix)
- random-detect ecn (Trident and Tomahawk)

Transmit Queue and Port Shaping Commands – Arad and Jericho Platforms
- bandwidth percent (Arad/Jericho)
- priority (Arad/Jericho)
- shape rate (Interface – Arad/Jericho)
- shape rate (Tx-queue – Arad/Jericho)
- tx-queue (Arad/Jericho)
Transmit Queue and Port Shaping Commands – FM6000 Platform
- bandwidth percent (FM6000)
- priority (FM6000)
- shape rate (Interface – FM6000)
- shape rate (Tx-queue – FM6000)
- tx-queue (FM6000)

Transmit Queue and Port Shaping Commands – Helix Platform
- bandwidth guaranteed (Helix)
- shape rate (Interface – Helix)
- shape rate (Tx-queue – Helix)
- tx-queue (Helix)

Transmit Queue and Port Shaping Commands – Petra Platform
- bandwidth percent (Petra)
- priority (Petra)
- shape rate (Interface – Petra)
- shape rate (Tx-queue – Petra)
- tx-queue (Petra)

Transmit Queue and Port Shaping Commands – Trident and Tomahawk Platform
- bandwidth percent (Trident and Tomahawk)
- mc-tx-queue
- priority (Trident and Tomahawk)
- shape rate (Interface – Trident and Tomahawk)
- shape rate (Tx-queue – Trident and Tomahawk)
- uc-tx-queue

Transmit Queue and Port Shaping Commands – Trident-II Platform
- bandwidth guaranteed (Trident-II)
- shape rate (Tx-queue – Trident-II)
- shape rate (Interface – Trident-II)
- tx-queue (Trident-II)
- interface fabric (Trident-II)
bandwidth guaranteed (Helix)

The **bandwidth guaranteed** command specifies the minimum bandwidth for outbound traffic on the transmit queue. By default, no bandwidth is guaranteed to any transmit queue.

The **no bandwidth guaranteed** and **default bandwidth guaranteed** commands remove the minimum bandwidth guarantee on the transmit queue by deleting the corresponding **bandwidth guaranteed** command from **running-config**.

**Command Mode**

Tx-Queue Configuration

**Command Syntax**

```
bandwidth guaranteed rate DATA_MIN
no bandwidth guaranteed
default bandwidth guaranteed
```

**Parameters**

- **DATA_MIN**  minimum bandwidth. Value range varies with data unit:
  - `<8 to 40000000>`  8 to 40,000,000 kbytes per second.
  - `<8 to 40000000>`  kbps 8 to 40,000,000 kbytes per second.
  - `<8 to 60000000>`  pps 1 to 60,000,000 packets per second.

**Related Commands**

- **tx-queue (Helix)** places the switch in tx-queue configuration mode.

**Example**

- These commands configure a minimum egress bandwidth of 1 Mbps for transmit queue 4 of Ethernet interface 17/3.

  ```
  switch(config)#interface ethernet 17

bandwidth guaranteed (Trident-II)

The `bandwidth guaranteed` command specifies the minimum bandwidth for outbound traffic on the transmit queue. By default, no bandwidth is guaranteed to any transmit queue.

The `no bandwidth guaranteed` and `default bandwidth guaranteed` commands remove the minimum bandwidth guarantee on the transmit queue by deleting the corresponding `bandwidth guaranteed` command from `running-config`.

Command Mode
Tx-Queue Configuration

Command Syntax

```
bandwidth guaranteed rate DATA_MIN
no bandwidth guaranteed
default bandwidth guaranteed
```

Parameters

- `DATA_MIN` minimum bandwidth. Value range varies with data unit:
  - `<8` to `40000000` 8 to 40,000,000 kbytes per second.
  - `<8` to `40000000-` kbps 8 to 40,000,000 kbytes per second.
  - `<8` to `60000000-` pps 1 to 60,000,000 packets per second.

Related Commands

- `tx-queue (Trident-II)` places the switch in tx-queue configuration mode.

Example

- These commands configure a minimum egress bandwidth of 1 Mbps for transmit queue 4 of Ethernet interface 17/3.

```
switch(config)#interface ethernet 17/3
switch(config-if-Et17/3)#tx-queue 4
switch(config-if-Et17/3-txq-4)#bandwidth guaranteed 1000 kbps
switch(config-if-Et17/3-txq-4)#show qos interfaces ethernet 17/3
```

```
bandwidth percent (Arad/Jericho)

The **bandwidth percent** command configures the bandwidth share of the transmit queue when configured for round robin priority. Bandwidth is allocated to all queues based on the cumulative configured bandwidth of all the port’s round robin queues.

The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the cumulative configured bandwidth is greater than 100%, each port’s operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

The **no bandwidth percent** and **default bandwidth percent** commands restore the default bandwidth share of the transmit queue by removing the corresponding **bandwidth percent** command from running-config.

**Command Mode**

Tx-Queue Configuration

**Command Syntax**

```
bandwidth percent proportion
no bandwidth percent
default bandwidth percent
```

**Parameters**

- **proportion**  Bandwidth percentage assigned to queues. Values range from 1 to 100.

**Related Commands**

- **tx-queue (Arad/Jericho)** places the switch in tx-queue configuration mode.

**Example**

- These commands configure queues 0 through 3 (Ethernet interface 3/5/1) as round robin, then allocate bandwidth for three queues at 30% and one queue at 10%.

```
switch(config)#interface ethernet 3/5/1
switch(config-if-Et3/5/1)#tx-queue 3
switch(config-if-Et3/5/1-txq-3)#no priority
switch(config-if-Et3/5/1-txq-3)#bandwidth percent 10
switch(config-if-Et3/5/1-txq-3)#tx-queue 2
switch(config-if-Et3/5/1-txq-2)#bandwidth percent 30
switch(config-if-Et3/5/1-txq-2)#tx-queue 1
switch(config-if-Et3/5/1-txq-1)#bandwidth percent 30
switch(config-if-Et3/5/1-txq-1)#tx-queue 0
switch(config-if-Et3/5/1-txq-0)#bandwidth percent 30
switch(config-if-Et3/5/1-txq-0)#show qos interfaces ethernet 3/5/1
```

bandwidth percent (FM6000)

The bandwidth percent command configures the bandwidth share of the transmit queue when configured for round robin priority. Bandwidth is allocated to all queues based on the cumulative configured bandwidth of all the port’s round robin queues.

The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the cumulative configured bandwidth is greater than 100%, each port’s operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

The no bandwidth percent and default bandwidth percent commands restore the default bandwidth share of the transmit queue by removing the corresponding bandwidth percent command running-config.

**Command Mode**

Tx-Queue Configuration

**Command Syntax**

```
bandwidth percent proportion
no bandwidth percent
default bandwidth percent
```

**Parameters**

- **proportion** Configured bandwidth percentage. Value ranges from 1 to 100. Default value is 0.

**Related Commands**

- **tx-queue (FM6000)** places the switch in tx-queue configuration mode.
Example

- These commands configure queues 0 through 3 (Ethernet interface 19) as round robin, then allocate bandwidth for three queues at 30% and one queue at 10%.

```plaintext
switch(config)#interface Ethernet 19
switch(config-if-Et19)#tx-queue 3

bandwidth percent (Petra)

The `bandwidth percent` command configures the bandwidth share of the transmit queue when configured for round robin priority. Bandwidth is allocated to all queues based on the cumulative configured bandwidth of all the port’s round robin queues.

The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the cumulative configured bandwidth is greater than 100%, each port’s operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

The `no bandwidth percent` and `default bandwidth percent` commands restore the default bandwidth share of the transmit queue by removing the corresponding `bandwidth percent` command.

**Command Mode**

Tx-Queue Configuration

**Command Syntax**

```plaintext
bandwidth percent proportion
no bandwidth percent
default bandwidth percent
```

**Parameters**

- `proportion`  Bandwidth percentage assigned to queues. Values range from 1 to 100.

**Related Commands**

- `tx-queue (Petra)` places the switch in tx-queue configuration mode.

**Example**

- These commands configure queues 0 through 3 (Ethernet interface 3/28) as round robin, then allocate bandwidth for three queues at 30% and one queue at 10%.

```plaintext
switch(config)#interface ethernet 3/28
switch(config-if-Et3/28)#tx-queue 3
switch(config-if-Et3/28-txq-3)#no priority
switch(config-if-Et3/28-txq-3)#bandwidth percent 10
switch(config-if-Et3/28-txq-3)#tx-queue 2
switch(config-if-Et3/28-txq-2)#bandwidth percent 30
switch(config-if-Et3/28-txq-2)#tx-queue 1
switch(config-if-Et3/28-txq-1)#bandwidth percent 30
switch(config-if-Et3/28-txq-1)#tx-queue 0
switch(config-if-Et3/28-txq-0)#bandwidth percent 30
switch(config-if-Et3/28-txq-0)#show qos interface ethernet 3/28
```

switch(config-if-Et3/28-txq-3)#
bandwidth percent (Trident and Tomahawk)

The `bandwidth percent` command configures the bandwidth share of the transmit queue when configured for round robin priority. Bandwidth is allocated to all queues based on the cumulative configured bandwidth of all the port’s round robin queues.

The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the cumulative configured bandwidth is greater than 100%, each port’s operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

The `no bandwidth percent` and `default bandwidth percent` commands restore the default bandwidth share of the transmit queue by removing the corresponding `bandwidth percent` command `running-config`.

Command Mode
- Mc-Tx-Queue configuration
- Uc-Tx-Queue configuration

Command Syntax
```
bandwidth percent proportion
no bandwidth percent
default bandwidth percent
```

Parameters
- `proportion` Bandwidth percentage assigned to queues. Values range from 1 to 100.

Related Commands
- `mc-tx-queue` places the switch in mc-tx-queue configuration mode.
- `uc-tx-queue` places the switch in uc-tx-queue configuration mode.
Example

- These commands configure unicast transmit queue 3 (and all other queues of lower priority) as round robin, then allocate bandwidth for unicast transmit queues 1, 2, and 3 at 30% and multicast transmit queue 1 at 10%.

```plaintext
switch(config)#interface ethernet 7
switch(config-if-Et7)#uc-tx-queue 3
switch(config-if-Et7-uc-txq-3)#no priority
switch(config-if-Et7-uc-txq-3)#bandwidth percent 30
switch(config-if-Et7-uc-txq-3)#uc-tx-queue 2
switch(config-if-Et7-uc-txq-2)#bandwidth percent 30
switch(config-if-Et7-uc-txq-2)#uc-tx-queue 1
switch(config-if-Et7-uc-txq-1)#bandwidth percent 30

switch(config-if-Et7-uc-txq-3)#
mc-tx-queue

The mc-tx-queue command places the switch in mc-tx-queue configuration mode to configure a multicast transmit queue on the configuration mode interface. Mc-tx-queue configuration mode is not a group change mode; running-config is changed immediately after commands are executed. The exit command does not affect the configuration.

Trident and Tomahawk switches have four multicast queues (MC0 – MC03) and eight unicast queues (UC0 – UC7), categorized into two priority groups. All queues are exposed through the CLI and are user configurable.

- Priority Group 1: UC7, UC6, MC3
- Priority Group 0: UC5, UC4, MC2, UC3, UC2, MC1, UC1, UC0, MC0

The exit command returns the switch to the configuration mode for the base Ethernet or port channel interface.

The no mc-tx-queue and default mc-tx-queue commands remove the configuration for the specified transmit queue by deleting the all corresponding mc-tx-queue mode commands from running-config.

Command Mode

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

Command Syntax

```
mc-tx-queue queue_level
```

Parameters

- queue_level  The multicast transmit queue number. Values range from 0 to 3.

Commands Available in tx-queue Configuration Mode

- bandwidth percent (Trident and Tomahawk)
- priority (Trident and Tomahawk)
- shape rate (Tx-queue – Trident and Tomahawk)

Related Commands

- uc-tx-queue: Configures unicast transmit queues on Trident and Tomahawk platform switches.

Example

- This command enters mc-tx-queue configuration mode for multicast transmit queue 3 of Ethernet interface 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#mc-tx-queue 3
switch(config-if-Et5-mc-txq-3)#
```
The **platform petraA traffic-class** command configures the default traffic class used by all ports on a specified chip. The default traffic class is implemented by Petra platform switches to replace qos cos and qos dscp commands. Traffic class values range from 0 to 7. The default traffic class is one.

When **platform ?** returns Petra:

- CoS trusted ports: inbound untagged packets are assigned to the default traffic class. Tagged packets are assigned to the traffic class that corresponds to the contents of its CoS field.
- DSCP trusted ports: inbound non-IP packets are assigned to the default traffic class. IP packets are assigned to the traffic class that corresponds to the contents of its DSCP field.
- Untrusted ports: all inbound packets are assigned to the default traffic class.

The **no platform petraA traffic-class** and **default platform petraA traffic-class** commands restore the default traffic class of one for all ports on the specified chips by deleting the corresponding **platform petraA traffic-class** command from running-config.

**Command Mode**
- Global Configuration

**Command Syntax**

```
platform petraA [CHIP_NAME] traffic-class tc_value
no platform petraA [CHIP_NAME] traffic-class
default platform petraA [CHIP_NAME] traffic-class
```

**Parameters**

- **CHIP_NAME** trust mode assigned to the specified ports. Port designation options include:
  - <no parameter> all ports on the switch.
  - **module cardX** all ports on specified linecard (7500 Series).
  - **petra cardX chipY** all ports on PetraA chip chipY on linecard cardX (7500 Series).
  - **petra-chipZ** all ports on PetraA chip chipZ (7048 Series)

**7500 Series**

Switches can contain up to eight linecards. **cardX** varies from 3 to 10.

Each linecard contains six PetraA chips. Each chip controls eight ports. **chipY** varies from 0 to 5:

- 0 controls ports 1 through 8
- 1 controls ports 9 through 16
- 2 controls ports 17 through 24
- 3 controls ports 25 through 32
- 4 controls ports 33 through 40
- 5 controls ports 41 through 48

**7048 Series**

Each switch contains two PetraA chips. **chipZ** varies from 0 to 1:

- 0 controls ports 1 through 32
- 1 controls ports 33 through 52

- **tc_value** Traffic class value. Values range from 0 to 7. Default value is 1.
Quality of Service Configuration Commands

Chapter 27: Quality of Service

Related Commands
- show platform petraA traffic-class displays the traffic class assignment on all specified Petra chips.

Example
- This command configures the default traffic class to six for ports 25-32 on linecard 5.
  
  ```
  switch(config)#platform petraA petra5/3 traffic-class 6
  switch(config)#
  ```
**priority (Arad/Jericho)**

The `priority` command specifies the priority of the transmit queue. The switch supports two queue priorities:

- **strict priority**: contents are removed from the queue - subject to maximum bandwidth limits, before data from lower priority queues. The default setting on all queues is strict priority.
- **round robin priority**: contents are removed proportionately from all round robin queues - subject to maximum bandwidth limits assigned to the strict priority queues.

Tx-queue 7 is set to strict priority and is not configurable.

When a queue is configured as a round robin queue, all lower priority queues also function as round robin queues. A queue’s numerical label denotes its priority: higher labels denote higher priority. Tx-queue 6 has higher priority than Tx-queue 5, and Tx-queue 0 has the lowest priority.

The `priority strict` and `default priority` commands configure a transmit queue to function as a strict priority queue unless a higher priority queue is configured as a round robin queue.

The `no priority` command configures a transmit queue as a round robin queue. All lower priority queues also function as round robin queues regardless of their configuration.

**Command Mode**

- **Tx-Queue Configuration**

**Command Syntax**

```plaintext
priority strict
no priority
default priority
```

**Related Commands**

- `tx-queue (Arad/Jericho)` places the switch in tx-queue configuration mode.

**Example**

- These commands perform the following on Ethernet interface 3/4/1:
  - Displays the default state of all transmit queues.
  - Configures transmit queue 3 as a round robin queue.
• Displays the effect of the **no priority** command on all transmit queues on the interface.

```
switch(config)#interface ethernet 3/4/1
switch(config-if-Et3/4/1)#show qos interfaces ethernet 3/4/1

   0          25     disabled   round-robin
```

priority (Petra)

The `priority` command specifies the priority of the transmit queue. The switch supports two queue priorities:

- **strict priority**: contents are removed from the queue - subject to maximum bandwidth limits, before data from lower priority queues. The default setting on all queues is strict priority.
- **round robin priority**: contents are removed proportionately from all round robin queues - subject to maximum bandwidth limits assigned to the strict priority queues.

Tx-queue 7 is set to strict priority and is not configurable.

When a queue is configured as a round robin queue, all lower priority queues also function as round robin queues. A queue’s numerical label denotes its priority: higher labels denote higher priority. Tx-queue 6 has higher priority than Tx-queue 5, and Tx-queue 0 has the lowest priority.

The `priority strict` and `default priority` commands configure a transmit queue to function as a strict priority queue unless a higher priority queue is configured as a round robin queue.

The `no priority` command configures a transmit queue as a round robin queue. All lower priority queues also function as round robin queues regardless of their configuration.

**Command Mode**

Tx-Queue Configuration

**Command Syntax**

- `priority strict`
- `no priority`
- `default priority`

**Related Commands**

- `tx-queue (Petra)` places the switch in tx-queue configuration mode.

**Example**

- These commands perform the following on Ethernet interface 3/28:
  - Displays the default state of all transmit queues.
  - Configures transmit queue 3 as a round robin queue.
- Displays the effect of the `no priority` command on all transmit queues on the interface.

```
switch(config)#interface ethernet 3/28
switch(config-if-Et3/28)#show qos interface ethernet 3/28
Ethernet3/28:
  Trust Mode: COS

```

```
priority (Trident and Tomahawk)

The `priority` command specifies the priority of the transmit queue. The switch supports two queue priorities:

- **strict priority**: contents are removed from the queue - subject to maximum bandwidth limits, before data from lower priority queues. The default setting on all other queues is strict priority.
- **round robin priority**: contents are removed proportionately from all round robin queues - subject to maximum bandwidth limits assigned to the strict priority queues.

Trident and Tomahawk switches have eight unicast queues (UC0 – UC7) and four multicast queues (MC0 – MC03), categorized into two priority groups. Priority group 1 queues have priority over priority 0 queues. The following lists display the priority group queues in order from higher priority to lower priority.

- Priority Group 1: UC7, UC6, MC3
- Priority Group 0: UC5, UC4, MC2, UC3, UC2, MC1, UC1, UC0, MC0

Priority group 1 queues are strict priority queues and are not configurable as round robin. Priority 0 queues are strict priority by default and are configurable as round robin. When a queue is configured as a round robin queue, all lower priority queues automatically function as round robin queues.

The `priority strict` and `default priority` commands configure a transmit queue to function as a strict priority queue unless a higher priority queue is configured as a round robin queue.

The `no priority` command configures a transmit queue as a round robin queue. All lower priority queues also function as round robin queues regardless of their configuration.

**Command Mode**

- Mc-Tx-Queue configuration
- Uc-Tx-Queue configuration

**Command Syntax**

- `priority strict`
- `no priority`
- `default priority`

**Related Commands**

- `mc-tx-queue` places the switch in mc-tx-queue configuration mode.
- `uc-tx-queue` places the switch in uc-tx-queue configuration mode.

**Example**

- These commands perform the following on Ethernet interface 7:
  - Displays the default state of all transmit queues.
  - Configures transmit queue 3 as a round robin queue.
  - Displays the effect of the `no priority` command on all transmit queues on the interface.
switch(config)#interface ethernet 7

switch(config-if-Et7-uc-txq-3)#
**qos cos**

The `qos cos` command specifies the default class of service (CoS) value of the configuration mode interface. CoS values range from 0 to 7. Default value is 0.

**Arad, Jericho, fm6000, Trident, Tomahawk, and Trident-II** platform switches:

- CoS trusted ports: the default CoS value determines the traffic class for inbound untagged packets. Tagged packets are assigned to the traffic class that corresponds to the contents of its CoS field.
- Untrusted ports: the default CoS value determines the traffic class for all inbound packets.

**Petra** platform switches:

- CoS trusted ports: inbound untagged packets are assigned to the default traffic class, as configured by `platform petraA traffic-class`. Tagged packets are assigned to the traffic class that corresponds to the contents of its CoS field.
- Untrusted ports: all inbound packets are assigned to the default traffic class.

The `no qos cos` and `default qos cos` commands restore the port’s default CoS value to zero by deleting the corresponding `qos cos` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

**Command Syntax**

```
qos cos cos_value
no qos cos
default qos cos
```

**Parameters**

- `cos_value` CoS value assigned to port. Value ranges from 0 to 7. Default value is 0.

**Example**

- This command configures the default CoS of four on Ethernet interface 8.

  ```
  switch(config-if-Et8)#qos cos 4
  switch(config-if-Et8)#
  ```
qos dscp

The **qos dscp** command specifies the default Differentiated Services Code Point (DSCP) value of the configuration mode interface. The default DSCP determines the traffic class for non-IP packets that are inbound on DSCP trusted ports. DSCP trusted ports determine the traffic class for inbound packets as follows:

- **Arad, Jericho, fm6000, Trident, Tomahawk**, and **Trident-II** platform switches:
  - non-IP packets: default DSCP value specified by **qos dscp** determines the traffic class.
  - IP packets: assigned to the traffic class corresponding to its DSCP field contents.
- **Petra** platform switches:
  - non-IP packets: assigned to default traffic class configured by **platform petraA traffic-class**.
  - IP packets: assigned to the traffic class corresponding to its DSCP field contents.

The **no qos dscp** and **default qos dscp** commands restore the port’s default DSCP value to zero by deleting the corresponding **qos dscp** command from **running-config**.

**Command Mode**

Interface-Ethernet Configuration
Interface-Port-Channel Configuration

**Command Syntax**

```
qos dscp  dscp_value
no qos dscp
default qos dscp
```

**Parameters**

- **dscp_value**  DSCP value assigned to the port. Value ranges from 0 to 63. Default value is 0.

**Example**

- This command sets the default DSCP of 44 on Ethernet 7 interface.
  ```
  switch(config)#interface ethernet 7
  switch(config-if-Et7)#qos dscp 44
  switch(config-if-Et7)
  ```
**qos map cos**

The `qos map cos` command associates a traffic class to a list of class of service (CoS) settings. Multiple commands create a complete CoS to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet’s CoS field or the port upon which it is received.

The **no qos map cos** and **default qos map cos** commands restore the specified CoS values to their default traffic class setting by deleting the corresponding `qos map cos` statements from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```plaintext
qos map cos cos_value_1 [cos_value_2 ... cos_value_n] to traffic-class tc_value
no qos map cos cos_value_1 [cos_value_2 ... cos_value_n]
default qos map cos cos_value_1 [cos_value_2 ... cos_value_n]
```

**Parameters**

- `cos_value_x`  Class of service (CoS) value. Value ranges from 0 to 7.
- `tc_value`  Traffic class value. Value range varies by platform.

Default CoS to traffic class map varies by platform (Table 27-36).

**Default Inbound CoS to Traffic Class Map**

Table 27-36 displays the default CoS to traffic class map for each platform.

<table>
<thead>
<tr>
<th>Inbound CoS</th>
<th>Traffic Class (Arad /Jericho)</th>
<th>Traffic Class (FM6000)</th>
<th>Traffic Class (Helix)</th>
<th>Traffic Class (Petra)</th>
<th>Traffic Class (Trident and Tomahawk)</th>
<th>Traffic Class (Trident-II)</th>
</tr>
</thead>
<tbody>

<td>1 0 2 3 4 5 6 7</td>
<td>1 0 2 3 4 5 6 7</td>
</tr>
</tbody>
</table>

**Related Commands**

- `qos cos` specifies the default CoS
- `platform petraA traffic-class` specifies the default traffic class

**Example**

- This command assigns the traffic class of 5 to the classes of service 1, 3, 5, and 7.

  ```plaintext
  switch(config)#qos map cos 1 3 5 7 to traffic-class 5
  switch(config)#
  ```
**qos map dscp**

The qos map dscp command associates a traffic class to a set of Differentiated Services Code Point (DSCP) values. Multiple commands create a complete DSCP to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet’s DSCP field or the chip upon which it is received.

The no qos map dscp and default qos map dscp commands restore the specified DSCP values to their default traffic class settings by deleting corresponding qos map dscp statements from running-config.

**Command Mode**

Global Configuration

**Command Syntax**

```
qos map dscp dscpv_1 [dscpv_2 ... dscpv_n] to traffic-class tc_value
no qos map dscp dscpv_1 [dscpv_2 ... dscpv_n]
default qos map dscp dscpv_1 [dscpv_2 ... dscpv_n]
```

**Parameters**

- `dscpv_x` Differentiated services code point (DSCP) value. Value ranges from 0 to 63.
- `tc_value` Traffic class value. Value range varies by platform.

Default map varies by platform (Table 27-37).

**Default Inbound DSCP to Traffic Class Map**

Table 27-37 displays the default DSCP to traffic class map for each platform.

<table>
<thead>
<tr>
<th>Inbound DSCP</th>
<th>0-7</th>
<th>8-15</th>
<th>16-23</th>

</tbody>
</table>

**Example**

- This command assigns the traffic class of three to the DSCP values of 12, 13, 25, and 37.

```
switch(config)#qos map dscp 12 13 25 37 to traffic-class 3
switch(config)#
```
qos map traffic-class to cos

The qos map traffic-class to cos command associates a class of service (CoS) to a list of traffic classes. Multiple commands create a complete traffic class to CoS map. The switch uses this map in CoS rewrite operations to fill the CoS field in outbound packets. This map is applicable to DSCP trusted ports and untrusted ports. CoS rewrite is disabled on CoS trusted ports. The show qos maps command displays the CoS to traffic class map.

The no qos traffic-class to cos and default qos traffic-class to cos commands restore the specified traffic class values to their default CoS settings by removing the corresponding qos map traffic-class to cos command from running-config.

Command Mode
- Global Configuration

Command Syntax
- qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to cos cos_value
- no qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to cos
- default qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to cos

Parameters
- tc_num_x Traffic class value. Value range varies by switch platform.
- cos_value Class of service (CoS) value. Value ranges from 0 to 7.

Default Inbound Traffic Class to CoS Map
Table 27-38 displays the default traffic class to CoS map for each platform.

</tr>
</tbody>
</table>

Example
- This command assigns the CoS of two to traffic classes 1, 3, and 5.
  switch(config)#qos map traffic-class 1 3 5 to cos 2
  switch(config)#
The `qos map traffic-class to dscp` command associates a Differentiated Services Code Point (DSCP) value to a list of traffic classes. Multiple commands create a complete traffic class to DSCP map. The switch uses this map in DSCP rewrite operations to fill the DSCP field in outbound packets. This map is applicable to CoS trusted ports and untrusted ports but disabled by default on these ports. DSCP rewrite is disabled on DSCP trusted ports. The `show qos maps` command displays the traffic class to DSCP map.

The `no qos traffic-class to dscp` and `default qos traffic-class to dscp` commands restore the specified traffic class values to their default DSCP settings by removing the corresponding `qos map traffic-class to dscp` command from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**
- `qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to dscp dscp_value`
- `no qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to dscp`
- `default qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to dscp`

**Parameters**
- `tc_num_x` Traffic class value. Value range varies by switch platform.
- `dscp_value` Differentiated services code point (DSCP) value. Value ranges from 0 to 63.

**Default Inbound Traffic Class to DSCP Map**
Table 27-39 displays the default traffic class to DSCP map for each platform.

<table>
<thead>

<td>40</td>
<td>48</td>
<td>56</td>
</tr>
</tbody>
</table>

**Example**
- This command assigns the DSCP value of 17 to traffic classes 1, 2, and 4.

```
switch(config)#qos map traffic-class 1 2 4 to dscp 17
switch(config)#
```
qos map traffic-class to mc-tx-queue

The `qos map traffic-class to mc-tx-queue` command associates a multicast transmit queue to a list of traffic classes. Multiple commands create a complete traffic class to mc-tx-queue map. The switch uses this map to route outbound packets to transmit queues, which in turn schedules their transmission from the switch. The `show qos maps` command displays the traffic class to multicast transmit queue map.

The `no qos traffic-class to mc-tx-queue` and `default qos traffic-class to mc-tx-queue` commands restore the default traffic class to multicast transmit queue map for the specified traffic class values by removing the corresponding `qos map traffic-class to mc-tx-queue` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to mc-tx-queue mtq_value
no qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to mc-tx-queue
default qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to mc-tx-queue
```

**Parameters**

- `tc_num_x`  Traffic class value. Value ranges from 0 to 7.
- `mtq_value`  Multicast transmit queue number. Value ranges from 0 to 3.

**Default Inbound Traffic Class to Multicast Transmit Queue Map**

Table 27-40 displays the default traffic class to multicast transmit queue map for Trident and Tomahawk platform switches.

<table>
<thead>
<tr>
<th>Traffic Class</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
</tr>
</thead>
<tbody>
<tr>
<td>Multicast Transmit Queue (Trident and Tomahawk)</td>
<td>0</td>
<td>0</td>
<td>1</td>
<td>1</td>
<td>2</td>
<td>2</td>
<td>3</td>
<td>3</td>
</tr>
</tbody>
</table>

**Related Commands**

- `qos map traffic-class to uc-tx-queue` (Trident and Tomahawk) associates traffic classes to a multicast transmit queue.
- `qos map traffic-class to tx-queue` (all other platforms) associates traffic classes to a transmit queue.

**Example**

- This command maps traffic classes 0, 4, and 5 to mc-tx-queue 2.

```
switch(config)#qos map traffic-class 0 4 5 to mc-tx-queue 2
switch(config)#
```
qos map traffic-class to tx-queue

The `qos map traffic-class to tx-queue` command associates a transmit queue (tx-queue) to a list of traffic classes. Multiple commands create a complete traffic to tx-queue map. The switch uses this map to route outbound packets to transmit queues, which in turn schedules their transmission from the switch. The `show qos maps` command displays the transmit queue to traffic class map.

The `no qos traffic-class to tx-queue` and `default qos traffic-class to tx-queue` commands restore the specified traffic class values to their default transmit queue settings by removing the corresponding `qos map traffic-class to tx-queue` command from running-config.

**Command Mode**
Global Configuration

**Command Syntax**
```
qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to tx-queue txq_value
no qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to tx-queue
default qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to tx-queue
```

**Parameters**
- `tc_num_x` Traffic class value. Value range varies by platform.
- `txq_value` Transmit queue value. Value range varies by platform.

**Restrictions**
FM6000: When priority flow control (PFC) is enabled, traffic classes are mapped to their corresponding transmit queues, regardless of existing `qos map traffic-class to tx-queue` statements.

Arad, Jericho, and Petra: Traffic class 7 always maps to transmit queue 7. This association is not editable.

**Default Inbound Traffic Class to Transmit Queue Map**
Table 27-41 displays the transmit queue to traffic class map.

<table>
<thead>
<tr>
<th>Traffic Class (Arad / Jericho)</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>

</tbody>
</table>

**Related Commands**
- `qos map traffic-class to mc-tx-queue` (Trident and Tomahawk) associates traffic classes to a unicast transmit queue.
- `qos map traffic-class to uc-tx-queue` (Trident and Tomahawk) associates traffic classes to a multicast transmit queue.

**Example**
- This command maps traffic classes 0, 4, and 5 to tx-queue 4.
  ```
switch(config)# qos map traffic-class 0 4 5 to tx-queue 4
  switch(config)#
  ```
qos map traffic-class to uc-tx-queue

The **qos map traffic-class to uc-tx-queue** command associates a unicast transmit queue to a list of traffic classes. Multiple commands create a complete traffic class to unicast transmit queue map. The switch uses this map to route outbound packets to transmit queues, which in turn schedules their transmission from the switch. The **show qos maps** command displays the traffic class to unicast transmit queue map.

The **no qos traffic-class to uc-tx-queue** and **default qos traffic-class to uc-tx-queue** commands restore the default traffic class to unicast transmit queue map for the specified traffic class values by removing the corresponding **qos map traffic-class to uc-tx-queue** command from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

```
qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to uc-tx-queue utq_value
no qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to uc-tx-queue
default qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to uc-tx-queue
```

**Parameters**

- **tc_num_x**  Traffic class value. Value ranges from 0 to 7.
- **utq_value**  Unicast transmit queue number. Value ranges from 0 to 7.

**Default Inbound Traffic Class to Unicast Transmit Queue Map**

Table 27-42 displays the default traffic class to Unicast transmit queue map for Trident and Tomahawk platform switches.

**Table 27-42  Default Traffic Class to Unicast Transmit Queue Map**

<table>
<thead>

</tbody>
</table>

**Related Commands**

- **qos map traffic-class to mc-tx-queue** (Trident and Tomahawk) associates traffic classes to a unicast transmit queue.
- **qos map traffic-class to tx-queue** (all other platforms) associates traffic classes to a transmit queue.

**Example**

- This command maps traffic classes 0, 4, and 5 to unicast transmit queue 4.
  ```
  switch(config)#qos map traffic-class 0 4 5 to uc-tx-queue 4
  switch(config)#
  ```
**qos profile**

The `qos profile` command places the switch in QoS profile configuration mode and for the specified profile and creates the profile if it does not already exist. QoS profiles are used to apply the same QoS configuration to multiple interfaces.

The `no qos profile` and `default qos profile` command deletes the QoS profile from the running configuration.

The `exit` command returns the switch to global configuration mode.

**Command Mode**

Global Configuration

**Command Syntax**

```
qos profile profile_name
no qos profile profile_name
default qos profile profile_name
```

**Parameter**

- `profile_name` QoS profile name.

**Note**

Commands use a subset of the listed fields. Available subset depends on the specified parameter. Use CLI syntax assistance to view options for specific parameter when creating a QoS profile.

**Example**

- This command places the switch in QoS profile configuration mode for policy map policy map “TP” and creates the policy map if it does not already exist.

  ```
  switch(config)#qos profile TP
  switch(config-qos-profile-TP)#
  ```

**Related Commands**

- `service-policy type qos input`
**qos random-detect ecn global-buffer (Helix)**

The `qos random-detect ecn global-buffer` command enables ECN marking for globally shared packet memory and specifies minimum and maximum queue threshold sizes. Hosts can advertise their ECN capabilities in the ToS DiffServ field’s two least significant bits:

- 00 Non ECN Capable transport.
- 10 ECN Capable transport.
- 01 ECN Capable transport.
- 11 Congestion encountered.

Congestion is determined by comparing average queue size with queue thresholds. Average queue size is calculated through a formula based on the previous average and current queue size. Packets are marked based on this average size and the specified thresholds:

- Average queue size below minimum threshold: Packets are queued normally.
- Average queue size above maximum threshold: Packets are marked `congestion encountered`.
- Average queue size between minimum and maximum thresholds. Packets are queued or marked `congestion encountered`. The proportion of marked packets varies linearly with average queue size:
  - 0% are marked when average queue size is less than or equal to minimum threshold.
  - 100% are marked when average queue size is greater than or equal to maximum threshold.

When transmitted packets are marked `Non ECN Capable`, congestion packets are dropped, not marked.

The `no qos random-detect ecn global-buffer` and `default qos random-detect ecn global-buffer` commands disables ECN marking for the shared buffer by removing the `qos random-detect ecn global-buffer` command from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**
```
qos random-detect ecn global-buffer minimum-threshold MIN maximum-threshold MAX
no qos random-detect ecn global-buffer
default qos random-detect ecn global-buffer
```

**Guidelines**
Packet memory is divided into 46080 208-byte cells, whose allocation is managed by the memory management unit (MMU). The MMU tracks the cells that each entity uses and determines the number of cells that can be allocated to an entity.

**Related Commands**
- `random-detect ecn (Helix)` enables ECN marking for a unicast transmit queue.

**Parameters**
`MIN` and `MAX` parameters must use the same data unit.

- `MIN` Minimum threshold. Options include:
  - `<1 to 19456> segments` 208-byte segments units
  - `<1 to 4> mbytes` Megabyte units
  - `<1 to 4046> kbytes` Kilobyte units
• <1 to 404648> bytes   Byte units
• **MAX**   Maximum threshold. Options include:
  • <1 to 46080> segments   208-byte segments units
  • <1 to 4> mbytes   Megabyte units
  • <1 to 4046> kbytes   Kilobyte units
  • <1 to 4046848> bytes   Byte units

**Examples**

• This command enables ECN marking of unicast packets from the global data pool and sets the minimum and maximum thresholds at 20 and 500 segments.
  
  ```
  switch(config)#qos random-detect ecn global-buffer minimum-threshold 20 segments
  maximum-threshold 500 segments
  switch(config)#
  ```

• This command disables ECN marking of unicast packets from the global data pool
  
  ```
  switch(config)#no qos random-detect ecn global-buffer
  switch(config)#
  ```
qos random-detect ecn global-buffer (Trident and Tomahawk)

The `qos random-detect ecn global-buffer` command enables ECN marking for globally shared packet memory and specifies minimum and maximum queue threshold sizes. Hosts can advertise their ECN capabilities in the ToS DiffServ field’s two least significant bits:

- 00 Non ECN Capable transport.
- 10 ECN Capable transport.
- 01 ECN Capable transport.
- 11 Congestion encountered.

Congestion is determined by comparing average queue size with queue thresholds. Average queue size is calculated through a formula based on the previous average and current queue size. Packets are marked based on this average size and the specified thresholds:

- Average queue size below minimum threshold: Packets are queued normally.
- Average queue size above maximum threshold: Packets are marked `congestion encountered`.
- Average queue size between minimum and maximum thresholds. Packets are queued or marked `congestion encountered`. The proportion of marked packets varies linearly with average queue size:
  - 0% are marked when average queue size is less than or equal to minimum threshold.
  - 100% are marked when average queue size is greater than or equal to maximum threshold.

When transmitted packets are marked `Non ECN Capable`, congestion packets are dropped, not marked.

The `no qos random-detect ecn global-buffer` and `default qos random-detect ecn global-buffer` commands disable ECN marking for the shared buffer by removing the `qos random-detect ecn global-buffer` command from `running-config`.

Command Mode
Global Configuration

Command Syntax
```
qos random-detect ecn global-buffer minimum-threshold MIN maximum-threshold MAX
no qos random-detect ecn global-buffer
default qos random-detect ecn global-buffer
```

Guidelines
Packet memory is divided into 46080 208-byte cells, whose allocation is managed by the memory management unit (MMU). The MMU tracks the cells that each entity uses and determines the number of cells that can be allocated to an entity.

Related Commands
- `random-detect ecn (Trident and Tomahawk)` enables ECN marking for a unicast transmit queue.

Parameters
`MIN` and `MAX` parameters must use the same data unit.

- `MIN` Minimum threshold. Options include:
  - `<1 to 46080>` segments 208-byte segments units
  - `<1 to 9>` mbytes Megabyte units
  - `<1 to 9584>` kbytes Kilobyte units
• <1 to 9584640> bytes  Byte units
• **MAX**  Maximum threshold. Options include:
  • <1 to 46080> segments  208-byte segments units
  • <1 to 9> mbytes  Megabyte units
  • <1 to 9584> kbytes  Kilobyte units
  • <1 to 9584640> bytes  Byte units

**Examples**

• This command enables ECN marking of unicast packets from the global data pool and sets the minimum and maximum thresholds at 20 and 500 segments.

  ```
  switch(config)#qos random-detect ecn global-buffer minimum-threshold 20 segments
  maximum-threshold 500 segments
  switch(config)#
  ```

• This command disables ECN marking of unicast packets from the global data pool

  ```
  switch(config)#no qos random-detect ecn global-buffer
  switch(config)#
  ```
qos rewrite cos

The `qos rewrite cos` command enables the rewriting of the CoS field for outbound tagged packets that were received on DSCP trusted ports and untrusted ports. CoS rewrite is always disabled on CoS trusted ports. The CoS value that is written into the packet is based on the data stream’s traffic class. CoS rewriting is active by default.

The `no qos rewrite cos` command disables CoS rewriting on the switch. The default `qos rewrite cos` command restores the default setting of enabling CoS rewriting by removing the `no qos rewrite cos` command from `running-config`.

Command Mode
Global Configuration

Command Syntax
```
qos rewrite cos
no qos rewrite cos
default qos rewrite cos
```

Related Commands
- `qos map traffic-class to cos` configures the traffic class to CoS rewrite map.

Example
- This command enables CoS rewrite.

```
switch(config)#qos rewrite cos
switch(config)#
```
**qos rewrite dscp**

The `qos rewrite dscp` command enables the rewriting of the DSCP field for outbound tagged packets that were received on CoS trusted ports and untrusted ports. DSCP rewrite is always disabled on DSCP trusted ports. The DSCP value that is written into the packet is based on the data stream’s traffic class. DSCP rewriting is disabled by default.

The `no qos rewrite dscp` and `default qos rewrite dscp` commands disable DSCP rewriting on the switch by removing the `no qos rewrite dscp` command from `running-config`.

**Command Mode**
- Global Configuration

**Command Syntax**
- `qos rewrite dscp`
- `no qos rewrite dscp`
- `default qos rewrite dscp`

**Related Commands**
- `qos map traffic-class to dscp` configures the traffic class to DSCP rewrite map.

**Example**
- This command enables DSCP rewrite.
  ```
  switch(config)#qos rewrite dscp
  switch(config)#
  ```
qos trust

The `qos trust` command configures the quality of service port trust mode for the configuration mode interface. Trust-enabled ports classify traffic by examining the traffic's CoS or DSCP value. Port trust mode default setting is `cos` for switched interfaces and `dscp` for routed interfaces.

The `default qos trust` command restores the default trust mode on the configuration mode interface by removing the corresponding `qos trust` or `no qos trust` statement from `running-config`.

The `no qos trust` command performs the following:

- `no qos trust` places the port in `untrusted` mode.
- `no qos trust cos` removes the corresponding `qos trust cos` statement.
- `no qos trust dscp` removes the corresponding `qos trust dscp` statement.

**Command Mode**

Interface-Ethernet Configuration  
Interface-Port-Channel Configuration

**Command Syntax**

```
qos trust MODE
no qos trust [MODE]
default qos trust
```

**Parameters**

- `MODE` trust mode assigned to the port. Options include:
  - `cos` enables cos trust mode.
  - `dscp` enables dscp trust mode.
- `no qos trust` enables untrusted mode on the port.

**Examples**

- This command configures trust mode of dscp for Ethernet interface 5.
  
  ```
  switch(config)#interface Ethernet 7
  switch(config-if-Et7)#qos trust dscp
  switch(config-if-Et7)#show active
  interface Ethernet7
    qos trust dscp
  switch(config-if-Et7)#
  ```

- This command configures trust mode of untrusted for Port Channel interface 23.

  ```
  switch(config)#interface port-channel 23
  switch(config-if-Po23)#no qos trust
  switch(config-if-Po23)#show active
  interface Port-Channel23
    no qos trust
  switch(config-if-Po23)#
  ```
**random-detect ecn (Arad/Jericho)**

The `random-detect ecn` command enables ECN marking for the configuration mode unicast transmit queue and specifies threshold queue sizes. Hosts can advertise their ECN capabilities in the ToS DiffServ field’s two least significant bits:

- 00 Non ECN Capable transport.
- 10 ECN Capable transport.
- 01 ECN Capable transport.
- 11 Congestion encountered.

Congestion is determined by comparing average queue size with queue thresholds. Average queue size is calculated through a formula based on the previous average and current queue size. Packets are marked based on this average size and the specified thresholds:

- Average queue size below minimum threshold: Packets are queued normally.
- Average queue size above maximum threshold: Packets are marked *congestion encountered*.
- Average queue size between minimum and maximum thresholds. Packets are queued or marked *congestion encountered*. The proportion of marked packets varies linearly with average queue size:
  - 0% are marked when average queue size is less than or equal to minimum threshold.
  - 100% are marked when average queue size is greater than or equal to maximum threshold.

When transmitted packets are marked *Non ECN Capable*, congestion packets are dropped, not marked.

The `no random-detect ecn` and `default qos random-detect ecn` commands disables ECN marking for the shared buffer by removing the `qos random-detect ecn` command from *running-config*.

**Command Mode**

Tx-Queue configuration

**Command Syntax**

```
random-detect ecn minimum-threshold MIN maximum-threshold MAX
no random-detect ecn
default random-detect ecn
```

**Parameters**

`MIN` and `MAX` parameters must use the same data unit.

- `MIN` Minimum threshold. Options include:
  - `<1 to 256>` mbytes Megabyte units
  - `<1 to 256000>` kbytes Kilobyte units
  - `<1 to 256000000>` bytes Byte units
- `MAX` Maximum threshold. Options include:
  - `<1 to 256>` mbytes Megabyte units
  - `<1 to 256000>` kbytes Kilobyte units
  - `<1 to 256000000>` bytes Byte units

**Related Commands**

- `tx-queue (Arad/Jericho)` places the switch in tx-queue configuration mode.
Examples

- These commands enable ECN marking of unicast packets from unicast transmit queue 4 of Ethernet interface 3/5/1, setting thresholds at 128 kbytes and 1280 kbytes.

  switch(config)#interface ethernet 3/5/1
  switch(config-if-Et3/5/1)#tx-queue 4
  switch(config-if-Et3/5/1-txq-4)#random-detect ecn minimum-threshold 128 kbytes maximum-threshold 1280 kbyte
  switch(config-if-Et3/5/1-txq-4)#show active
  interface Ethernet3/5/1
    tx-queue 4
      random-detect ecn minimum-threshold 128 kbytes maximum-threshold 1280 kbytes
  switch(config-if-Et3/5/1-txq-4)#
random-detect ecn (Helix)

The `random-detect ecn` command enables ECN marking for the configuration mode unicast transmit queue and specifies threshold queue sizes. Hosts can advertise their ECN capabilities in the ToS DiffServ field’s two least significant bits:

- 00  Non ECN Capable transport.
- 10  ECN Capable transport.
- 01  ECN Capable transport.
- 11  Congestion encountered.

Congestion is determined by comparing average queue size with queue thresholds. Average queue size is calculated through a formula based on the previous average and current queue size. Packets are marked based on this average size and the specified thresholds:

- Average queue size below minimum threshold: Packets are queued normally.
- Average queue size above maximum threshold: Packets are marked `congestion encountered`.
- Average queue size between minimum and maximum thresholds. Packets are queued or marked `congestion encountered`. The proportion of marked packets varies linearly with average queue size:
  - 0% are marked when average queue size is less than or equal to minimum threshold.
  - 100% are marked when average queue size is greater than or equal to maximum threshold.

When transmitted packets are marked `Non ECN Capable`, congestion packets are dropped, not marked.

Average queue length is tracked for transmit queues and the global pool independently. When either entity reaches its maximum threshold, all subsequent packets are marked.

The `no random-detect ecn` and `default random-detect ecn` commands disable ECN marking on the configuration mode queue, deleting the corresponding `random-detect ecn` command from `running-config`.

Command Mode

   Tx-Queue configuration

Command Syntax

   random-detect ecn minimum-threshold MIN maximum-threshold MAX
   no random-detect ecn
   default random-detect ecn

Related Commands

- `tx-queue (Helix)` places the switch in tx-queue configuration mode.
- `qos random-detect ecn global-buffer (Helix)` enables ECN marking for globally shared packet memory.

Parameters

`MIN` and `MAX` parameters must use the same data unit.

- `MIN`  Minimum threshold. Options include:
  - `<1 to 46080>` segments  208-byte segments units
  - `<1 to 9>` mbytes  Megabyte units
  - `<1 to 9584>` kbytes  Kilobyte units
• `<1 to 9584640>` bytes  Byte units

• **MAX**  Maximum threshold. Options include:
  • `<1 to 46080>` segments  208-byte segments units
  • `<1 to 9>` mbytes  Megabyte units
  • `<1 to 9584>` kbytes  Kilobyte units
  • `<1 to 9584640>` bytes  Byte units

**Examples**

• These commands enable ECN marking of unicast packets from transmit queue 4 of Ethernet interface 15, setting thresholds at 10 and 100 segments.

```bash
switch(config)#interface ethernet 15
switch(config-if-Et15)#uc-tx-queue 4
switch(config-if-Et15-txq-4)#random-detect ecn minimum-threshold 10 segments maximum-threshold 100 segments
switch(config-if-Et15-txq-4)#show active
interface Ethernet15
   tx-queue 4
      random-detect ecn minimum-threshold 10 segments maximum-threshold 100 segments
switch(config-if-Et15-txq-4)#exit
switch(config-if-Et15)
```

• This command disables ECN marking of unicast packets from transmit queue 4 of Ethernet interface 15.

```bash
switch(config-if-Et15-txq-4)#no random-detect ecn
switch(config-if-Et15-txq-4)#show active
interface Ethernet15
switch(config-if-Et15-txq-4)#exit
switch(config-if-Et15)#
```
random-detect ecn (Trident and Tomahawk)

The `random-detect ecn` command enables ECN marking for the configuration mode unicast transmit queue and specifies threshold queue sizes. Hosts can advertise their ECN capabilities in the ToS DiffServ field’s two least significant bits:

- 00 Non ECN Capable transport.
- 10 ECN Capable transport.
- 01 ECN Capable transport.
- 11 Congestion encountered.

Congestion is determined by comparing average queue size with queue thresholds. Average queue size is calculated through a formula based on the previous average and current queue size. Packets are marked based on this average size and the specified thresholds:

- Average queue size below minimum threshold: Packets are queued normally.
- Average queue size above maximum threshold: Packets are marked `congestion encountered`.
- Average queue size between minimum and maximum thresholds. Packets are queued or marked `congestion encountered`. The proportion of marked packets varies linearly with average queue size:
  - 0% are marked when average queue size is less than or equal to minimum threshold.
  - 100% are marked when average queue size is greater than or equal to maximum threshold.

When transmitted packets are marked `Non ECN Capable`, congestion packets are dropped, not marked.

Average queue length is tracked for transmit queues and the global pool independently. When either entity reaches its maximum threshold, all subsequent packets are marked.

The `no random-detect ecn` and `default random-detect ecn` commands disable ECN marking on the configuration mode queue, deleting the corresponding `random-detect ecn` command from `running-config`.

**Command Mode**

Uc-Tx-Queue configuration

**Command Syntax**

```
random-detect ecn minimum-threshold MIN maximum-threshold MAX
no random-detect ecn
default random-detect ecn
```

**Related Commands**

- `uc-tx-queue` places the switch in uc-tx-queue configuration mode.
- `qos random-detect ecn global-buffer (Trident and Tomahawk)` enables ECN marking for globally shared packet memory.

**Parameters**

`MIN` and `MAX` parameters must use the same data unit.

- `MIN` Minimum threshold. Options include:
  - `<1 to 46080>` segments 208-byte segments units
  - `<1 to 9>` mbytes Megabyte units
  - `<1 to 9584>` kbytes Kilobyte units
• `<1 to 9584640> bytes` Byte units

• **MAX** Maximum threshold. Options include:
  • `<1 to 46080> segments` 208-byte segments units
  • `<1 to 9> mbytes` Megabyte units
  • `<1 to 9584> kbytes` Kilobyte units
  • `<1 to 9584640> bytes` Byte units

**Examples**

• These commands enable ECN marking of unicast packets from unicast transmit queue 4 of Ethernet interface 15, setting thresholds at 10 and 100 segments.

  switch(config)#interface ethernet 15
  switch(config-if-Et15)#uc-tx-queue 4
  switch(config-if-Et15-uc-txq-4)#random-detect ecn minimum-threshold 10 segments maximum-threshold 100 segments
  switch(config-if-Et15-uc-txq-4)#show active
  interface Ethernet15
  uc-tx-queue 4
  random-detect ecn minimum-threshold 10 segments maximum-threshold 100 segments
  switch(config-if-Et15-uc-txq-4)#exit
  switch(config-if-Et15)#

• This command disables ECN marking of unicast packets from unicast transmit queue 4 of Ethernet interface 15.

  switch(config-if-Et15-uc-txq-4)#no random-detect ecn
  switch(config-if-Et15-uc-txq-4)#show active
  interface Ethernet15
  switch(config-if-Et15-uc-txq-4)#exit
  switch(config-if-Et15)#
service-policy type qos input

The service-policy type qos input command applies the specified policy map to a QoS profile. The profile is then applied to an interface in interface configuration mode using the service-profile command.

The no service-policy type qos and default service-policy type qos command deletes the policy map from the profile.

The exit command returns the switch to global configuration mode.

Command Mode
QoS Profile Configuration

Command Syntax

service-policy type qos input policy_map_name
no service-policy type qos input policy_map_name
default service-policy type qos input policy_map_name

Parameter

• policy_map_name  QoS policy map name.

Example

• This command applies the policy map PM-1 to the QoS profile TP.

  switch(config-qos-profile-TP)#service-policy type qos input PM-1
  switch(config-qos-profile-TP)#

Related Commands

• service-profile
**service-profile**

The `service-profile` command applies the QoS profile to the configuration mode interface. The `no service-profile` and the `default service-profile` command removes the QoS profile from the interface.

The `exit` command returns the switch to global configuration mode.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

**Command Syntax**

```plaintext
service-profile profile_name
no service-profile profile_name
default service-profile profile_name
```

**Parameter**

- `profile_name` QoS profile name.

**Example**

- This commands applies the QoS profile TP to Ethernet interface 13.

  ```plaintext
  switch(config)#interface ethernet 13
  switch(config-if-Et13)#service-profile TP
  ```
**hardware access-list qos resource sharing vlan in**

The `hardware access-list qos resource sharing vlan in` command enables the ACL based QoS resources sharing on a VLAN interface.

The `no hardware access-list qos resource sharing vlan in` disables the ACL based QoS resources sharing on a VLAN interface. By default this function is disabled.

**Command Mode**

Global Configuration

**Command Syntax**

```
hardware access-list qos resource sharing vlan in
no hardware access-list qos resource sharing vlan in
```

**Example**

- This command enables the ACL based QoS resources sharing on a VLAN interface.

  ```bash
  switch(config)#hardware access-list qos resource sharing vlan in
  ```
shape rate (Interface – Arad/Jericho)

The **shape rate** command specifies the maximum bandwidth for outbound traffic on the configuration mode interface, also known as queue shaping. The shape rate for individual transmit queues is configured by the **shape rate (Tx-queue – Arad/Jericho)** command. By default, outbound transmission rate is not bounded by a shape rate.

The **no shape rate** and **default shape rate** commands remove the shape rate bandwidth limit on the configuration mode interface by deleting the corresponding **shape rate** command from **running-config**.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

**Command Syntax**

```
shape rate byte_limit [kbps]
no shape rate
default shape rate
```

**Parameters**

- **byte_limit**  shape rate applied to interface (Kbps). Value ranges from 162 to 100000000.

**Example**

- This command configures a port shape rate of 5 Gbps on Ethernet interface 3/5/1.

```
switch(config)#interface ethernet 3/5/1
switch(config-if-Et3/5/1)#shape rate 5000000
switch(config-if-Et3/5/1)#show qos interfaces ethernet 3/5/1
```

<<<OUTPUT OMITTED FROM EXAMPLE>>>>

```
switch(config-if-Et3/5/1)#
```
shape rate (Interface – FM6000)

The **shape rate** command specifies the maximum bandwidth for outbound traffic on the configuration mode interface, also known as queue shaping. The shape rate for individual transmit queues is configured by the **shape rate (Tx-queue – FM6000)** command. By default, outbound transmission rate is not bounded by a shape rate.

The **no shape rate** and **default shape rate** commands remove the shape rate bandwidth limit on the configuration mode interface by deleting the corresponding **shape rate** command from **running-config**.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

**Command Syntax**

```
shape rate byte_limit [kbps]
no shape rate
default shape rate
```

**Parameters**
- `byte_limit` shape rate applied to interface (Kbps). Value ranges from 7000 to 10000000.

**Guidelines**
Enabling port shaping on an FM6000 interface disables queue shaping internally. Disabling port shaping restores queue shaping as specified in **running-config**.

**Example**
- This command configures a port shape rate of 5 Gbps on Ethernet interface 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#shape rate 5000000
switch(config-if-Et5)#
```
shape rate (Interface – Helix)

The shape rate command specifies the maximum bandwidth for outbound traffic on the configuration mode interface, also known as queue shaping. The shape rate for individual transmit queues is configured by the shape rate (Tx-queue – Helix) command. By default, outbound transmission rate is not bounded by a shape rate.

The no shape rate and default shape rate commands remove the shape rate bandwidth limit on the configuration mode interface by deleting the corresponding shape rate command from running-config.

Command Mode

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

Command Syntax

- `shape rate DATA_LIMIT`
- `no shape rate`
- `default shape rate`

Parameters

- `DATA_LIMIT` shape rate applied to interface. Value range varies with data unit:
  - `<8 to 40000000>` 8 to 40,000,000 kbytes per second.
  - `<8 to 40000000>kbps` 8 to 40,000,000 kbytes per second.
  - `<8 to 60000000>pps` 8 to 60,000,000 packets per second.

Guidelines

Shaping rates of at least 8 kbps are supported. At shaping rates smaller than 1 Mbps, granularity and rounding errors may skew the actual shaping rate by 20% from the specified rate.

Example

- This command configures a port shape rate of 5 Gbps on Ethernet interface 17.

```bash
switch(config)#interface ethernet 17
switch(config-if-Et17)#shape rate 5000000 kbps
switch(config-if-Et17)#show qos interface ethernet 17/3
Ethernet17:
  Trust Mode: COS
  Default COS: 0
  Default DSCP: 0

  Port shaping rate: 5000000 / 5000000 kbps

</tr>
</tbody>
</table>

<--------OUTPUT OMITTED FROM EXAMPLE-------->
```

switch(config-if-Et17)#
shape rate (Interface – Petra)

The **shape rate** command specifies the maximum bandwidth for outbound traffic on the configuration mode interface, also known as queue shaping. The shape rate for individual transmit queues is configured by the **shape rate (Tx-queue – Petra)** command. By default, outbound transmission rate is not bounded by a shape rate.

The **no shape rate** and **default shape rate** commands remove the shape rate bandwidth limit on the configuration mode interface by deleting the corresponding **shape rate** command from **running-config**.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

**Command Syntax**
```
shape rate data_limit [kbps]
no shape rate
default shape rate
```

**Parameters**
- **data_limit** shape rate applied to interface (Kbps). Value ranges from 100 to 1000000.

**Guidelines**
The following port shaping rates are supported:
- 1G ports: above 100 kbps.
- 10G ports: above 7900 kbps.

Commands that specify a smaller shape rate disable port shaping on the interface.

**Example**
- This command configures a port shape rate of 5 Gbps on Ethernet interface 3/3.
```
switch(config)#interface ethernet 3/3
switch(config-if-Et3/3)#shape rate 5000000
switch(config-if-Et3/3)#show active
interface Ethernet3/3
  shape rate 5000000
switch(config-if-Et3/3)#
```
shape rate (Interface – Trident and Tomahawk)

The **shape rate** command specifies the maximum bandwidth for outbound traffic on the configuration mode interface, also known as queue shaping. The shape rate for individual transmit queues is configured by the **shape rate (Tx-queue – Trident and Tomahawk)** command. By default, outbound transmission rate is not bounded by a shape rate.

The **no shape rate** and **default shape rate** commands remove the shape rate bandwidth limit on the configuration mode interface by deleting the corresponding **shape rate** command from running-config.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

**Command Syntax**

```
shape rate DATA_LIMIT
no shape rate
default shape rate
```

**Parameters**
- **DATA_LIMIT**  shape rate applied to interface. Value range varies with data unit:
  - `<8 to 40000000>`  8 to 40,000,000 kbytes per second.
  - `<8 to 40000000>kbps`  8 to 40,000,000 kbytes per second.
  - `<8 to 60000000>pps`  8 to 60,000,000 packets per second.

**Guidelines**

Shaping rates of at least 8 kbps are supported. At shaping rates smaller than 1 Mbps, granularity and rounding errors may skew the actual shaping rate by 20% from the specified rate.

**Example**

- This command configures a port shape rate of 5 Gbps on Ethernet interface 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#shape rate 5000000
```
**shape rate (Interface – Trident-II)**

The `shape rate` command specifies the maximum bandwidth for outbound traffic on the configuration mode interface, also known as queue shaping. The shape rate for individual transmit queues is configured by the `shape rate (Tx-queue – Trident-II)` command. By default, outbound transmission rate is not bounded by a shape rate.

The `no shape rate` and `default shape rate` commands remove the shape rate bandwidth limit on the configuration mode interface by deleting the corresponding `shape rate` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

**Command Syntax**

```
shape rate DATA_LIMIT
no shape rate
default shape rate
```

**Parameters**

- **DATA_LIMIT**  
  shape rate applied to interface. Value range varies with data unit:
  - `<8 to 40000000>`  8 to 40,000,000 kbytes per second.
  - `<8 to 40000000-kbps`  8 to 40,000,000 kbytes per second.
  - `<8 to 60000000-pps`  8 to 60,000,000 packets per second.

**Guidelines**
Shaping rates of at least 8 kbps are supported. At shaping rates smaller than 1 Mbps, granularity and rounding errors may skew the actual shaping rate by 20% from the specified rate.

**Example**

- This command configures a port shape rate of 5 Gbps on Ethernet interface 17/3.

```bash
switch(config)#interface ethernet 17/3
switch(config-if-Et17/3)#shape rate 5000000 kbps
```

```
Ethernet17/3:
   Trust Mode: COS
   Default COS: 0
   Default DSCP: 0

   Port shaping rate: 5000000 / 5000000 kbps
```

```

-----------------------------------------------
 7       - / - (  -  )         - / - (  -  )    SP / SP
 6       - / - (  -  )         - / - (  -  )    SP / SP

<--------OUTPUT OMITTED FROM EXAMPLE--------->
```

```
switch(config-if-Et17/3)#
```
**shape rate (Tx-queue – Arad/Jericho)**

The `shape rate` command specifies the maximum bandwidth for outbound traffic on the transmit queue, also known as queue shaping. The shape rate for interfaces is configured by the `shape rate (Interface – Arad/Jericho)` command. By default, the configured outbound transmission rate is not bounded by a transmit queue shape rate.

Shaping rates greater than 50000 kbps are supported. At lower shaping rates (less than 10 Mbps), granularity and rounding errors may skew the actual shaping rate by 20% from the specified rate.

The `no shape rate` and `default shape rate` commands remove the shape rate bandwidth limit on the configuration mode queue by deleting the corresponding `shape rate` command from `running-config`.

**Command Mode**

Tx-Queue Configuration

**Command Syntax**

```
shape rate byte_limit [kbps]
no shape rate
default shape rate
```

**Parameters**

- `byte_limit`  shape rate applied to interface (Kbps). Value ranges from 50000 to 100000000.

**Related Commands**

- `tx-queue (Arad/Jericho)` places the switch in tx-queue configuration mode.

**Example**

- These commands configure a shape rate of 1 Gbps on transmit queues 3 and 4 of Ethernet interface 3/4/1.

```
switch(config)#interface ethernet 3/4/1
switch(config-if-Et3/4/1)#tx-queue 4
switch(config-if-Et3/4/1-txq-4)#shape rate 1000000 kbps
switch(config-if-Et3/4/1-txq-4)#tx-queue 3
switch(config-if-Et3/4/1-txq-3)#shape rate 1000000 kbps
switch(config-if-Et3/4/1-txq-3)#show qos interface ethernet 3/4/1
```

```
Ethernet3/4/1:
Port shaping rate: disabled

shape rate (Tx-queue – FM6000)

The `shape rate` command specifies the maximum bandwidth for outbound traffic on the transmit queue, also known as queue shaping. The shape rate for interfaces is configured by the `shape rate (Interface – FM6000)` command. By default, the configured outbound transmission rate is not bounded by a transmit queue shape rate.

Queue shaping on an FM6000 port is supported only when port shaping is not enabled on the interface. Enabling port shaping on a port disables queue shaping internally. Disabling port shaping restores queue shaping as specified by `running-config`.

Shaping rates greater than 460 kbps are supported. At lower shaping rates (less than 10 Mbps), granularity and rounding errors may skew the actual shaping rate by 20% from the specified rate.

The `no shape rate` and `default shape rate` commands remove the shape rate bandwidth limit on the transmit queue by deleting the corresponding `shape rate` command from `running-config`.

**Command Mode**
Tx-Queue Configuration

**Command Syntax**
```
shape rate byte_limit [kbps]
no shape rate
default shape rate
```

**Parameters**
- `byte_limit` shape rate applied to interface (Kbps). Value ranges from 464 to 1000000.

**Related Commands**
- `tx-queue (FM6000)` places the switch in tx-queue configuration mode
- `shape rate (Interface – FM6000)` configures the shape rate for a configuration mode interface.

**Example**
- These commands configure a shape rate of 1 Gbps (1,000,000 Kbps) on transmit queues 3 and 4 of Ethernet interface 19.

```
switch(config)#interface ethernet 19
switch(config-if-Et19)#tx-queue 4
switch(config-if-Et19-txq-4)#shape rate 1000000
switch(config-if-Et19-txq-4)#tx-queue 3
switch(config-if-Et19-txq-4)#shape rate 1000000
switch(config-if-Et19-txq-3)#show qos interface ethernet 19
```

```

shape rate (Tx-queue – Helix)

The `shape rate` command specifies the maximum bandwidth for outbound traffic on the transmit queue, also known as queue shaping. The shape rate for interfaces is configured by the `shape rate (Interface – Helix)` command. By default, the configured outbound transmission rate is not bounded by a transmit queue shape rate.

The `no shape rate` and `default shape rate` commands remove the shape rate bandwidth limit on the configuration mode transmit queue by deleting the corresponding `shape rate` command from `running-config`.

Command Mode

Tx-Queue Configuration

Command Syntax

```
shape rate byte_limit [kbps]
no shape rate
default shape rate
```

Parameters

- `DATA_LIMIT` shape rate applied to the queue. Value range varies with data unit:
  - `<8 to 40000000>` 8 to 40,000,000 kbytes per second.
  - `<8 to 40000000>-kbps` 8 to 40,000,000 kbytes per second.
  - `<8 to 60000000>-pps` 8 to 60,000,000 packets per second.

Restrictions

Queue shaping is not supported in cut-through mode.

Related Commands

- `tx-queue (Helix)` places the switch in tx-queue configuration mode.
- `shape rate (Interface – Helix)` configures the shape rate for a configuration mode interface.
Example

- These commands configure a shape rate of 1 Gbps (1,000,000 Kbps) on transmit queues 3 and 4 of Ethernet interface 17/3.

```
switch(config)#interface ethernet 17/3
switch(config-if-Et17/3)#tx-queue 4
switch(config-if-Et17/3-txq-4)#shape rate 1000000 kbps
switch(config-if-Et17/3-txq-4)#tx-queue 3
switch(config-if-Et17/3-txq-3)#shape rate 1000000 kbps
switch(config-if-Et17/3-txq-3)#show qos interface ethernet 17/3

**shape rate (Tx-queue – Petra)**

The `shape rate` command specifies the maximum bandwidth for outbound traffic on the configuration mode transmit queue, also known as queue shaping. The shape rate for interfaces is configured by the `shape rate (Interface – Petra)` command. By default, the configured outbound transmission rate is not bounded by a transmit queue shape rate.

Queue shaping applies only to unicast traffic. Shaping rates of at least 162 Kbps are supported.

The `no shape rate` and `default shape rate` commands remove the shape rate bandwidth limit on the configuration mode queue by deleting the corresponding `shape rate` command from `running-config`.

**Command Mode**

Tx-Queue Configuration

**Command Syntax**

```
shape rate DATA_LIMIT
no shape rate
default shape rate
```

**Parameters**

- `DATA_LIMIT` shape rate applied to the queue. Value range varies with data unit:
  - `<8 to 40000000>` 8 to 40,000,000 kbytes per second.
  - `<8 to 40000000>kbps` 8 to 40,000,000 kbytes per second.
  - `<8 to 60000000>pps` 8 to 60,000,000 packets per second.

Shaping rates greater than 460 kbps are supported. At lower shaping rates (less than 10 Mbps), granularity and rounding errors may skew the actual shaping rate by 20% from the specified rate.

**Related Commands**

- `tx-queue (Petra)` places the switch in tx-queue configuration mode
- `shape rate (Interface – Petra)` configures the shape rate for a configuration mode interface.
Example

- These commands configure a shape rate of 1 Gbps (1,000,000 Kbps) on transmit queues 3 and 4 of Ethernet interface 3/28.

```bash
switch(config)#interface ethernet 3/28
switch(config-if-Et3/28)#tx-queue 4
switch(config-if-Et3/28-txq-4)#shape rate 1000000
switch(config-if-Et3/28-txq-4)#tx-queue 3
switch(config-if-Et3/28-txq-3)#shape rate 1000000
switch(config-if-Et3/28-txq-3)#show qos interface ethernet 3/28
```

switch(config-if-Et3/28-txq-3)#
shape rate (Tx-queue – Trident and Tomahawk)

The shape rate command specifies the maximum bandwidth for outbound traffic on the configuration mode transmit queue, also known as queue shaping. The shape rate for interfaces is configured by the shape rate (Interface – Trident and Tomahawk) command. By default, the configured outbound transmission rate is not bounded by a transmit queue shape rate.

The no shape rate and default shape rate commands remove the shape rate limit from the configuration mode transmit queue by deleting the corresponding shape rate command from running-config.

Command Mode
- Mc-Tx-Queue configuration
- Uc-Tx-Queue configuration

Command Syntax
- shape rate DATA_LIMIT
- no shape rate
- default shape rate

Parameters
- DATA_LIMIT shape rate applied to the queue. Value range varies with data unit:
  - <8 to 40000000> 8 to 40,000,000 kbytes per second.
  - <8 to 40000000>kbps 8 to 40,000,000 kbytes per second.
  - <8 to 60000000>pps 8 to 60,000,000 packets per second.

Related Commands
- mc-tx-queue places the switch in mc-tx-queue configuration mode.
- uc-tx-queue places the switch in uc-tx-queue configuration mode.
- shape rate (Interface – Trident and Tomahawk) configures the shape rate for a configuration mode interface.

Guidelines
Shaping rates of at least 8 kbps are supported. At shaping rates smaller than 1 Mbps, granularity and rounding errors may skew the actual shaping rate by 20% from the specified rate.

When two queues source traffic from the same traffic class and the higher priority queue is shaped, that queue consumes all internal buffers, starving the lower priority queue even if bandwidth is available.
Example

- These commands configure a shape rate of 1 Gbps (1,000,000 Kbps) on unicast transmit queues 3 and multicast transmit 4 of Ethernet interface 7.

```plaintext
switch(config)#interface ethernet 7
switch(config-if-Et7)#uc-tx-queue 3
switch(config-if-Et7-uc-txq-3)#shape rate 1000000
switch(config-if-Et7-uc-txq-3)#mc-tx-queue 2
switch(config-if-Et7-mc-txq-2)#shape rate 1000000
switch(config-if-Et7-mc-txq-2)#show qos interface ethernet 7
```

switch(config-if-Et17/3-txq-3)#
show platform petraA traffic-class

The `show platform petraA traffic-class` command displays the traffic class assignment on all specified Petra chips. Each chip controls eight Ethernet interfaces. The default traffic class of an interface is specified by the traffic class assigned to the chip that controls the interface.

Traffic class assignments are configured with the `platform petraA traffic-class` command.

Valid command options include:

- `show platform petraA traffic-class` traffic class of all chips on all linecard.
- `show platform petraA CHIP_NAME traffic-class` traffic class of specified chip.
- `show platform petraA MODULE_NAME traffic-class` traffic class of all chips on specified linecard.

**Command Mode**

EXEC

**Command Syntax**

```
show platform petraA traffic-class
show platform petraA CHIP_NAME traffic-class
show platform petraA MODULE_NAME traffic-class
```

**Parameters**

- `CHIP_NAME` Name of Petra chip on linecard that control Ethernet ports. Options include:
  - `petracardX chipY` all ports on PetraA chip `chipY` on linecard `cardX` (7500 Series).
  - `petra-chipZ` all ports on PetraA chip `chipZ` (7048 Series)

**7500 Series**

Switches can contain up to eight linecards. `cardX` varies from 3 to 10.

Each linecard contains six PetraA chips. Each chip controls eight ports. `chipY` varies from 0 to 5:

- 0 controls ports 1 through 8
- 1 controls ports 9 through 16
- 2 controls ports 17 through 24
- 3 controls ports 25 through 32
- 4 controls ports 33 through 40
- 5 controls ports 41 through 48

**7048 Series**

Each switch contains two PetraA chips. `chipZ` varies from 0 to 1:

- 0 controls ports 1 through 32
- 1 controls ports 33 through 52

- `MODULE_NAME` Name and number of linecard (7500 Series). Options include:
  - `module linecard mod_num` Linecard number (3 to 10).
  - `module mod_num` Linecard number (3 to 10).

**Related Commands**

- `platform petraA traffic-class` configures the default traffic class used by all ports on a specified chip
Example

• This command displays the traffic class of all chips on linecard 3.

```bash
switch# show platform petraA module linecard 3 traffic-class
Petra3/0 traffic-class: 1
Petra3/1 traffic-class: 1
Petra3/2 traffic-class: 1
Petra3/3 traffic-class: 1
Petra3/4 traffic-class: 5
Petra3/5 traffic-class: 1
switch#
```
show policy-map

The `show policy-map` command displays the policy map information for the configured policy map.

**Command Mode**

EXEC

**Command Syntax**

```
show policy-map policy_map_name [counters | interface | summary]
```

**Parameters**

- `policy_map_name` QoS policy map name.
- `counters` specifies the policy map traffic match count (This parameter is applicable only on DCS-7010, DCS-7050X, DCS7250X, DCS-7300X and DCS-7280(E/R), DCS-7500(E/R) series switches.)
- `interface` specifies the service policy on an interface.
- `summary` policy map summary.

**Examples**

- The `show policy-map` command displays the information for the policy map `policy1`.
  ```
  switch#show policy-map policy1
  Service-policy policy1
  Class-map: class1 (match-any)
  Match: ip access-group name acl1
  Police cir 512000 bps bc 96000 bytes
  Class-map: class-default (match-any)
  ```

- The `show policy-map counters` command displays the policy map traffic match count for the policy map configured.
  ```
  switch#show policy-map policy1 counters
  Service-policy input: policy1
  Hardware programming status: Successful
  Class-map: class1 (match-any)
  Match: vlan 20-40,1000-1250
      police rate 100 mbps burst-size 100 kbytes
  Interface: Ethernet16/1
  Conformed 28621 packets, 7098008 bytes -------------- packet match count
  Class-map: class-default (match-any)
  Matched Packets: 19 -------------- packet match count
  ```
show policy-map interface

The **show policy-map interface** command displays contents of the policy map applied to specified the interface.

**Command Mode**

EXEC

**Command Syntax**

```
show policy-map interface interface_name
```

**Parameters**

- `interface_name` Interface for which command returns data. Options include:
  - `no parameter` returns data for all interfaces.
  - `ethernet e_range` Ethernet interfaces specified by `e_range`.
  - `port-channel p_range` Port channel interfaces specified by `p_range`.

**Example**

- This command displays the name and contents of the policy map applied to Ethernet interface 1.

```
switch#show policy-map interface ethernet 1
Service-policy input: p1
    Hardware programming status: Successful

Class-map: c2001 (match-any)
    Match: vid 2001 0xfff
    set dscp 4

Class-map: c2002 (match-any)
    Match: vid 2002 0xfff
    set dscp 8

Class-map: c2003 (match-any)
    Match: vid 2003 0xfff
    set dscp 12
```
show qos interfaces

The `show qos interfaces` command displays the QoS, DSCP, and transmit queue configuration on a specified interface. Information provided by this command includes the ports trust setting, the default CoS value, and the DSCP value.

**Command Mode**

EXEC

**Command Syntax**

`show qos interfaces INTERFACE_NAME`

**Parameters**

- `INTERFACE_NAME` Interface For which command returns data. Options include:
  - `<no parameter>` returns data for all interfaces.
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `port-channel p_num` Port-Channel Interface specified by `p_num`.

**Examples**

- This command lists the QoS configuration for Ethernet interface 4.

```
switch>show qos interfaces ethernet 4
Ethernet4:
  Trust Mode: COS
  Default COS: 0
  Default DSCP: 0

  Port shaping rate: 5000000Kbps

  Tx-Queue   Bandwidth  ShapeRate   Priority
            (percent) (Kbps)              -------
  0          50     disabled   round-robin
  1          50     disabled   round-robin
  2         N/A     disabled        strict
  3         N/A      1000000        strict
  4         N/A      1000000        strict
  5         N/A      1500000        strict
  6         N/A      2000000        strict

switch>
```
show qos interfaces random-detect ecn

The show qos interfaces random-detect ecn command displays the Explicit Congestion Notification (ECN) configuration for each transmit queue on the specified interfaces.

Command Mode
EXEC

Command Syntax
show qos interfaces [INTERFACE_NAME] random-detect ecn

Parameters
- INTERFACE_NAME Interface for which command returns data. Options include:
  - <no parameter> returns data for all interfaces.
  - ethernet e_range Ethernet interfaces specified by e_range.
  - port-channel p_range Port-Channel Interfaces specified by p_range.

Examples
- This command configures ECN parameters for transmit queues 0 through 3 on Ethernet interface 3/5/1, then displays that configuration.
  switch(config)#interface ethernet 3/5/1
  switch(config-if-Et3/5/1)#tx-queue 0
  switch(config-if-Et3/5/1-txq-0)#random-detect ecn minimum-threshold 2560 kbytes
  maximum-threshold 256000 kbytes
  switch(config-if-Et3/5/1-txq-0)#tx-queue 1
  switch(config-if-Et3/5/1-txq-1)#random-detect ecn minimum-threshold 25600 kbytes
  maximum-threshold 128000 kbytes
  switch(config-if-Et3/5/1-txq-1)#tx-queue 2
  switch(config-if-Et3/5/1-txq-2)#random-detect ecn minimum-threshold 25600 bytes
  maximum-threshold 128000 bytes
  switch(config-if-Et3/5/1-txq-2)#tx-queue 3
  switch(config-if-Et3/5/1-txq-3)#random-detect ecn minimum-threshold 25 mbytes
  maximum-threshold 128 mbytes
  switch(config-if-Et3/5/1-txq-3)#show qos interfaces ethernet 3/5/1 random-detect ecn

  switch(config-if-Et3/5/1-txq-3)#
show qos interfaces trust

The show qos interfaces trust command displays the configured and operational QoS trust mode of all specified interfaces.

Command Mode

EXEC

Command Syntax

show qos interfaces [INTERFACE_NAME] trust

Parameters

- INTERFACE_NAME Interface for which command returns data. Options include:
  - <no parameter> returns data for all interfaces.
  - ethernet e_range Ethernet interfaces specified by e_range.
  - port-channel p_range Port-Channel Interfaces specified by p_range.

Examples

- These commands configure a variety of QoS trust settings on a set of interfaces, then displays the QoS trust mode on these interfaces.

```
switch(config)#interface ethernet 1/1
switch(config-if-Et1/1)#qos trust cos
switch(config-if-Et1/1)#interface ethernet 1/2
switch(config-if-Et1/2)#qos trust dscp
switch(config-if-Et1/2)#interface ethernet 1/3
switch(config-if-Et1/3)#no qos trust
switch(config-if-Et1/3)#interface ethernet 1/4
switch(config-if-Et1/4)#default qos trust
switch(config-if-Et1/4)#interface ethernet 2/1
switch(config-if-Et2/1)#no switchport
switch(config-if-Et2/1)#default qos trust
switch(config-if-Et2/1)#show qos interface ethernet 1/1 - 2/4 trust
```

switch(config-if-Et2/1)#
**show qos maps**

The `show qos maps` command lists the number of traffic classes that the switch supports and displays the CoS-Traffic Class, DSCP-Traffic Class, Traffic Class-CoS, and Traffic Class-Transmit Queue maps.

**Command Mode**

EXEC

**Command Syntax**

`show qos maps`

**Examples**

- This command displays the QoS maps that are configured on the switch.

```
switch>show qos maps
Number of Traffic Classes supported: 8
Number of Transmit Queues supported: 8
Cos Rewrite: Disabled
Dscp Rewrite: Disabled

Cos-tc map:
  cos: 0 1 2 3 4 5 6 7
  tc: 1 0 2 3 4 5 6 7

Dscp-tc map:
  d1 : d2 0 1 2 3 4 5 6 7 8 9
  0 : 1 1 1 1 1 1 1 1 0 0
  1 : 0 0 0 0 0 0 2 2 2 2
  2 : 2 2 2 2 3 3 3 3 3 3
  3 : 3 3 4 4 4 4 4 4 4 4
  4 : 5 5 5 5 5 5 5 5 5 6 6
  5 : 6 6 6 6 6 6 7 7 7 7
  6 : 7 7 7 7

Tc-cos map:
  tc: 0 1 2 3 4 5 6 7
  cos: 1 0 2 3 4 5 6 7

Tc-dscp map:
  tc: 0 1 2 3 4 5 6 7
  dscp: 8 0 16 24 32 40 48 56

Tc - tx-queue map:
  tc: 0 1 2 3 4 5 6 7
  tx-queue: 0 1 2 3 4 5 6 7

switch>
```
**show qos profile**

The `show qos profile` command displays the contents of the specified QoS profile or of all QoS profiles in the running configuration.

**Command Mode**

EXEC

**Command Syntax**

```
show qos profile profile_name
```

**Parameter**

- `profile_name`  QoS profile name.

**Examples**

- This command displays the contents of all QoS profiles configured on the switch.

```
switch(config)#show qos profile
qos profile p
qos cos 1
  no priority-flow-control pause watchdog
  priority-flow-control priority 1 no-drop
  priority-flow-control priority 2 no-drop
qos profile p2
qos cos 3
  priority-flow-control priority 0 no-drop
```

- This command displays the configuration attached and information specific to QoS profile p2.

```
switch#show qos profile p2
qos profile p2
qos cos 3
  priority-flow-control priority 0 no-drop
```
show qos profile summary

The `show qos profile summary` command displays the QoS profile summary of those which are part of the running configuration.

**Command Mode**

EXEC

**Command Syntax**

`show qos profile summary`

**Example**

- This command shows a summary of all QoS profiles configured on the switch.

```
switch(config)#show qos profile summary
Qos Profile: p
  Configured on: Et13,7
  Fabric
  Po12
Qos Profile: p2
  Configured on: Et56
```
**show run|grep sharing**

The *show run|grep sharing* command displays whether the QoS policy-map sharing on SVIs is enabled or disabled.

**Command Mode**

EXEC

**Command Syntax**

```
show run|grep sharing
```

**Example**

- This command displays whether the QoS policy-map sharing on SVIs is enabled or disabled.

```
switch# show run|grep sharing
hardware access-list qos resource sharing vlan in ---- If this message is
displayed then QoS policy-map sharing on SVIs is enabled.
```
show platform trident tcam shared vlan interface-class-id

The `show platform trident tcam shared vlan interface-class-id` command displays what SVIs are currently sharing the QoS policy-map in the below output under QoS PMAP Data.

**Command Mode**

EXEC

**Command Syntax**

`show platform trident tcam shared vlan interface-class-id`

**Example**

- This command displays what SVIs are currently sharing the QoS policy-map in the below output under QoS PMAP Data.

```
switch(config)#show platform trident tcam shared vlan interface-class-id
=== Shared RACL Data on switch Linecard0/0 ===
=== Shared QoS Policy-map Data on switch Linecard0/0 ===
Interface Class Id            VLANs
1                               1 2
```
show platform trident tcam qos detail

The `show platform trident tcam qos detail` command displays the list of all the SVIs that are sharing the TCAM entries.

**Command Mode**

EXEC

**Command Syntax**

`show platform trident tcam qos detail`

**Example**

- This command displays the list of all the SVIs that are sharing the TCAM entries.

```
switch(config)#show platform trident tcam qos detail
=== Policy-map p01 type qos on switch Linecard0/0 ===
Interfaces : Vlan2 Vlan1
== Interface BitMap ==
0x00000000000000001FFFFE
```
show qos random-detect ecn

The `show qos random-detect ecn` command displays the global Explicit Congestion Notification (ECN) configuration.

**Command Mode**

EXEC

**Command Syntax**

```
show qos random-detect ecn
```

**Examples**

- These commands configure global ECN parameters, then displays that configuration.

```
switch(config)#qos random-detect ecn global-buffer minimum-threshold 2 mbytes maximum-threshold 5 mbytes
switch(config)#show qos random-detect ecn
  Minimum Threshold:  2
  Maximum Threshold:  5
  Threshold Unit:  mbytes

switch(config)#
```
show platform xp qos tcam hit

The **show platform xp qos tcam hit** command displays the TCAM entries programmed for each policy-map as well as the traffic hits. The **hits** option is used to see the TCAM entries with nonzero traffic hits.

**Command Mode**

EXEC

**Command Syntax**

`show platform xp qos tcam hit`

**Examples**

- This command displays the QoS TCAM hits on Ethernet interface 10/1.

```plaintext
switch#show platform xp qos tcam hit
=== Policy-map test type qos on switch 0 ===
Assigned to ports: Ethernet10/1

== Class-map test type qos ==

== Class-map class-default type qos ==
```
tx-queue (Arad/Jericho)

The tx-queue command places the switch in Tx-queue configuration mode to configure a transmit queue on the configuration mode interface. Tx-queue configuration mode is not a group change mode; running-config is changed immediately after commands are executed. The exit command does not affect the configuration.

Arad and Jericho platform switches have eight queues, 0 through 7, and all queues are exposed through the CLI. However, queue 7 is not user-configurable. Queue 7 is always mapped to traffic class 7, which is reserved for control traffic.

The exit command returns the switch to the configuration mode for the base Ethernet or port channel interface.

The no tx-queue and default tx-queue commands remove the configuration for the specified transmit queue by deleting all corresponding tx-queue mode statements from running-config.

Command Mode

Interface-Ethernet Configuration
Interface-Port-Channel Configuration

Command Syntax

```
    tx-queue queue_level
```

Parameters

- queue_level the transmit queue. Values range from 0 to 6.

Commands Available in tx-queue Configuration Mode

- bandwidth percent (Arad/Jericho)
- priority (Arad/Jericho)
- shape rate (Tx-queue – Arad/Jericho)

Guidelines

Arad and Jericho platform switch queues handle unicast traffic. Queues for multicast traffic are not supported.

Example

- This command enters Tx-queue configuration mode for transmit queue 4 of Ethernet interface 3/3/3.

```
switch(config)#interface ethernet 3/3/3
switch(config-if-Et3/3/3)#tx-queue 4
switch(config-if-Et3/3/3-txq-4)#
```
tx-queue (FM6000)

The tx-queue command places the switch in Tx-queue configuration mode to configure a transmit queue on the configuration mode interface. Tx-queue configuration mode is not a group change mode; running-config is changed immediately after commands are executed. The exit command does not affect the configuration.

FM6000 platform switches have eight queues, 0 through 7. All queues are exposed through the CLI and are user configurable.

The exit command returns the switch to the configuration mode for the base Ethernet or port channel interface.

The no tx-queue and default tx-queue commands remove the configuration for the specified transmit queue by deleting the all corresponding tx-queue mode commands from running-config.

Command Mode

Interface-Ethernet Configuration
Interface-Port-Channel Configuration

Command Syntax

```
  tx-queue  queue_level
```

Parameters

- `queue_level`  the transmit queue. Values range from 0 to 7.

Commands Available in tx-queue Configuration Mode

- `bandwidth percent` (FM6000)
- `priority` (FM6000)
- `shape rate` (Tx-queue – FM6000)

Guidelines

FM6000 platform switch queues handle unicast and multicast traffic.

Example

- This command enters Tx-queue configuration mode for transmit queue 3 of Ethernet interface 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#tx-queue 3
switch(config-if-Et5-txq-3)#
```
tx-queue (Helix)

The `tx-queue` command places the switch in Tx-queue configuration mode to configure a transmit queue on the configuration mode interface. Tx-queue configuration mode is not a group change mode; `running-config` is changed immediately after commands are executed. The `exit` command does not affect the configuration.

Helix platform switches have eight unicast (UC0 – UC7) and eight multicast (MC0 – MC7) queues. Each UCx-MCx queue set is combined into a single queue group (L1.x), which is exposed to the CLI through this command.

The `exit` command returns the switch to the configuration mode for the base Ethernet or port channel interface.

The `no tx-queue` and `default tx-queue` commands remove the configuration for the specified transmit queue by deleting the all corresponding `tx-queue` mode commands from `running-config`.

### Command Mode

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

### Command Syntax

```
tx-queue queue_level
```

### Parameters

- `queue_level` transmit queue group number. Values range from 0 to 7.

### Commands Available in tx-queue Configuration Mode

- `bandwidth guaranteed (Helix)`
- `shape rate (Tx-queue – Helix)`

### Guidelines

Helix platform switch queues handle unicast and multicast traffic.

### Example

- This command enters Tx-queue configuration mode for transmit queue 4 of Ethernet interface 17/3.

```
switch(config)#interface ethernet 17/3
switch(config-if-Et17/3)#tx-queue 4
switch(config-if-Et17/3-txq-4)#
```
tx-queue (Petra)

The `tx-queue` command places the switch in Tx-queue configuration mode to configure a transmit queue on the configuration mode interface. Tx-queue configuration mode is not a group change mode; `running-config` is changed immediately after commands are executed. The `exit` command does not affect the configuration.

Petra platform switches have eight queues, 0 through 7, and all queues are exposed through the CLI. However, queue 7 is not user-configurable. Queue 7 is always mapped to traffic class 7, which is reserved for control traffic.

The `exit` command returns the switch to the configuration mode for the base Ethernet or port channel interface.

The `no tx-queue` and `default tx-queue` commands remove the configuration for the specified transmit queue by deleting the all corresponding `tx-queue` mode commands from `running-config`.

Command Mode
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

Command Syntax
```
  tx-queue queue_level
```

Parameters
- `queue_level` the transmit queue. Values range from 0 to 6.

Commands Available in tx-queue Configuration Mode
- `bandwidth percent (Petra)`
- `priority (Petra)`
- `shape rate (Tx-queue – Petra)`

Guidelines
Petra platform switch queues handle unicast traffic. Queues for multicast traffic are not supported.

Example
- This command enters Tx-queue configuration mode for transmit queue 3 of Ethernet interface 3/3.
  ```
  switch(config)#interface ethernet 3/3
  switch(config-if-Et3/3)#tx-queue 3
  switch(config-if-Et3/3-txq-3)#
  ```
tx-queue (Trident-II)

The tx-queue command places the switch in Tx-queue configuration mode to configure a transmit queue on the configuration mode interface. Tx-queue configuration mode is not a group change mode; running-config is changed immediately after commands are executed. The exit command does not affect the configuration.

Trident-II platform switches have eight unicast (UC0 – UC7) and eight multicast (MC0 – MC7) queues. Each UCx-MCx queue set is combined into a single queue group (L1.x), which is exposed to the CLI through this command.

The exit command returns the switch to the configuration mode for the base Ethernet or port channel interface.

The no tx-queue and default tx-queue commands remove the configuration for the specified transmit queue by deleting the all corresponding tx-queue mode commands from running-config.

Command Mode

Interface-Ethernet Configuration
Interface-Port-Channel Configuration

Command Syntax

```
tx-queue queue_level
```

Parameters

- `queue_level` transmit queue group number. Values range from 0 to 7.

Commands Available in tx-queue Configuration Mode

- bandwidth guaranteed (Trident-II)
- shape rate (Tx-queue – Trident-II)

Guidelines

Trident-II platform switch queues handle unicast and multicast traffic.

Example

- This command enters Tx-queue configuration mode for transmit queue 4 of Ethernet interface 17/3.

```
switch(config)#interface ethernet 17/3
switch(config-if-Et17/3)#tx-queue 4
switch(config-if-Et17/3-txq-4)#
```
**uc-tx-queue**

The `uc-tx-queue` command places the switch in uc-tx-queue configuration mode to configure a unicast transmit queue on the configuration mode interface. Uc-tx-queue configuration mode is not a group change mode; `running-config` is changed immediately after commands are executed. The `exit` command does not affect the configuration.

Trident and Tomahawk switches have eight unicast queues (UC0 – UC7) and four multicast queues (MC0 – MC03), categorized into two priority groups. All queues are exposed through the CLI and are user-configurable.

- Priority Group 1: UC7, UC6, MC3
- Priority Group 0: UC5, UC4, MC2, UC3, UC2, MC1, UC1, UC0, MC0

The `exit` command returns the switch to the configuration mode for the base Ethernet or port channel interface.

The `no uc-tx-queue` and `default uc-tx-queue` commands remove the configuration for the specified transmit queue by deleting the all corresponding `uc-tx-queue` mode commands from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

**Command Syntax**
```
uc-tx-queue queue_level
```

**Parameters**

- `queue_level` The multicast transmit queue number. Values range from 0 to 7.

**Commands Available in uc-tx-queue Configuration Mode**

- `bandwidth percent` (Trident and Tomahawk)
- `priority` (Trident and Tomahawk)
- `shape rate` (Tx-queue – Trident and Tomahawk)

**Related Commands**

- `mc-tx-queue`: Configures multicast transmit queues on Trident and Tomahawk platform switches.

**Example**

- This command enters mc-tx-queue configuration mode for multicast transmit queue 3 of Ethernet interface 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#uc-tx-queue 4
switch(config-if-Et5-mc-txq-4)#
```
interface fabric (Trident-II)

The `interface fabric` command places the switch in Fabric-interface configuration mode and allows the user to attach the QoS profile to the fabric interface of the switch.

**Command Mode**
- Global Configuration

**Command Syntax**

```
interface fabric
```

**Example**

- This command places the switch in Fabric-interface configuration mode.

```
switch(config)#interface fabric
switch(config-if-fabric)#
```
IPv4

Arista switches support Internet Protocol version 4 (IPv4) and Internet Protocol version 6 (IPv6) for routing packets across network boundaries. This chapter describes Arista’s implementation of IPv4 and includes these sections:

- Section 28.1: IPv4 Addressing
- Section 28.2: IPv4 Routing
- Section 28.3: IPv4 Multicast Counters
- Section 28.4: Route Management
- Section 28.5: IPv4 Route Scale
- Section 28.6: IP Source Guard
- Section 28.7: DHCP Relay Across VRF
- Section 28.8: IP NAT
- Section 28.9: TCP MSS Ceiling
- Section 28.10: IPv4 GRE Tunneling
- Section 28.11: IPv4 Commands

### 28.1 IPv4 Addressing

Each IPv4 network device is assigned a 32-bit IP address that identifies its network location. These sections describe IPv4 address formats, data structures, configuration tasks, and display options:

- Section 28.1.1: IPv4 Address Formats
- Section 28.1.2: IPv4 Address Configuration
- Section 28.1.3: Address Resolution Protocol (ARP)
- Section 28.2.4: Viewing IPv4 Routes and Network Components

#### 28.1.1 IPv4 Address Formats

IPv4 addresses are composed of 32 bits, expressed in dotted decimal notation by four decimal numbers, each ranging from 0 to 255. A subnet is identified by an IP address and an address space defined by a routing prefix. The switch supports the following subnet formats:

- **IP address and subnet mask**: The subnet mask is a 32-bit number (dotted decimal notation) that specifies the subnet address space. The subnet address space is calculated by performing an AND operation between the IP address and subnet mask.
- **IP address and wildcard mask**: The wildcard mask is a 32-bit number (dotted decimal notation) that specifies the subnet address space. Wildcard masks differ from subnet masks in that the bits are inverted. Some commands use wildcard masks instead of subnet masks.

- **CIDR notation**: CIDR notation specifies the scope of the subnet space by using a decimal number to identify the number of leading ones in the routing prefix. When referring to wildcard notation, CIDR notation specifies the number of leading zeros in the routing prefix.

**Example**

- These subnets (subnet mask and CIDR notation) are calculated identically:
  
  `10.24.154.13 255.255.255.0`
  
  `10.24.154.13/24`

  The defined space includes all addresses between **10.24.154.0** and **10.24.154.255**.

- These subnets (wildcard mask and CIDR notation) are calculated identically:
  
  `124.17.3.142 0.0.0.15`
  
  `124.17.3.142/28`

  The defined space includes all addresses between **124.17.3.128** and **124.17.3.143**.

28.1.2 IPv4 Address Configuration

**Assigning an IPv4 Address to an Interface**

The `ip address` command specifies the IPv4 address of an interface and the mask for the subnet to which the interface is connected.

**Example**

- These commands configure an IPv4 address with subnet mask for VLAN 200:
  
  `switch(config)#interface vlan 200`
  
  `switch(config-if-Vl200)#ip address 10.0.0.1/24`
  
  `switch(config-if-Vl200)#`

28.1.3 Address Resolution Protocol (ARP)

Address Resolution Protocol (ARP) is a protocol that maps IP addresses to MAC addresses that local network devices recognize. The ARP cache is a table that stores the correlated addresses of the devices for which the router facilitates data transmissions.

After receiving a packet, routers use ARP to find the MAC address of the device assigned to the packet’s destination IP address. If the ARP cache contains both addresses, the router sends the packet to the specified port. If the ARP cache does not contain the addresses, ARP broadcasts a request packet to all devices in the subnet. The device at the requested IP address responds and provides its MAC address. ARP updates the ARP cache with a dynamic entry and forwards the packet to the responding device. Static ARP entries can also be added to the cache through the CLI.

Proxy ARP is an ARP variant. A network device (proxy) responds to ARP requests for network addresses on a different network with its MAC address. Traffic to the destination is directed to the proxy device which then routes the traffic toward the ultimate destination.
Configuring ARP

The switch uses ARP cache entries to correlate 32-bit IP addresses to 48-bit hardware addresses. The `arp aging timeout` command specifies the duration of dynamic address entries in the Address Resolution Protocol (ARP) cache for addresses learned through the layer 3 interface. The default duration is 14400 seconds (four hours).

Static ARP entries never time out and must be removed from the table manually.

Example

- This command specifies an ARP cache duration of 7200 seconds (two hours) for dynamic addresses added to the ARP cache that were learned through VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#arp aging timeout 7200
switch(config-if-Vl200)#show active
interface Vlan200
    arp timeout 7200
switch(config-if-Vl200)#
```

The `arp` command adds a static entry to an Address Resolution Protocol (ARP) cache.

Example

- This command adds a static entry to the ARP cache in the default VRF.

```
switch(config)#arp 172.22.30.52 0025.900e.c63c arpa
switch(config)#
```

Displaying ARP Entries

The `show ip arp` command displays ARP cache entries that map an IP address to a corresponding MAC address. The table displays addresses by their host names when the command includes the `resolve` argument.

Example

- This command displays ARP cache entries that map MAC addresses to IPv4 addresses.

```
switch>show ip arp
   Address         Age (min)  Hardware Addr   Interface
172.25.0.2              0  004c.6211.021e  Vlan101, Port-Channel2
172.22.0.1              0  004c.6214.3699  Vlan1000, Port-Channel1
172.22.0.2              0  004c.6219.a0f3  Vlan1000, Port-Channel1
172.22.0.3              0  0045.4942.a32c  Vlan1000, Ethernet33
172.22.0.5              0  f012.3118.c09d  Vlan1000, Port-Channel1
172.22.0.6              0  00e1.d11a.aleb  Vlan1000, Ethernet5
172.22.0.7              0  004f.e320.cd23  Vlan1000, Ethernet6
172.22.0.8              0  0032.48da.f9d9  Vlan1000, Ethernet37
172.22.0.9              0  0018.910a.1fc5  Vlan1000, Ethernet29
172.22.0.11             0  0056.cbe9.8510  Vlan1000, Ethernet26
switch>
```
This command displays ARP cache entries that map MAC addresses to IPv4 addresses. Host names assigned to IP addresses are displayed in place of the address.

```

royalblue.newco         0  0018.910a.1fc5  Vlan1000, Ethernet29
172.22.0.11             0  0056.cbe9.8510  Vlan1000, Ethernet26
```

28.1.3.1 ARP Inspection

Address Resolution Protocol (ARP) inspection command `ip arp inspection vlan` activates a security feature that protects the network from ARP spoofing. ARP requests and responses on untrusted interfaces are intercepted on specified VLANs, and intercepted packets are verified to have valid IP-MAC address bindings. All invalid ARP packets are dropped. On trusted interfaces, all incoming ARP packets are processed and forwarded without verification.

Enabling and Disabling ARP Inspection

By default, ARP inspection is disabled on all VLANs.

Examples

- This command enables ARP inspection on VLANs 1 through 150.
  
  ```
  switch(config)#ip arp inspection vlan 1 - 150
  switch(config)#
  ```

- This command disables ARP inspection on VLANs 1 through 150.
  
  ```
  switch(config)#no ip arp inspection vlan 1 - 150
  switch(config)#
  ```

- This command sets the ARP inspection default to VLANs 1 through 150.
  
  ```
  switch(config)#default ip arp inspection vlan 1 - 150
  switch(config)#
  ```

- These commands enable ARP inspection on multiple VLANs 1 through 150 and 200 through 250.
  
  ```
  switch(config)#ip arp inspection vlan 1-150,200-250
  switch(config)#
  ```

Syslog for Invalid ARP Packets Dropped

When an invalid ARP packet is dropped, the following syslog message appears. The log severity level can be set higher if required.

```
%SECURITY-4-ARP_PACKET_DROPPED: Dropped ARP packet on interface Ethernet28/1 Vlan 2121 because invalid mac and ip binding. Received: 00:0a:00:bc:00:de/1.1.1.1.
```
Displaying ARP Inspection States

The command `show ip arp inspection vlan` displays the configuration and operation state of ARP inspection. For a VLAN range specified by `show ip arp inspection vlan` only VLANs with ARP inspection enabled will be displayed. If no VLAN is specified, all VLANs with ARP inspection enabled are displayed. The operation state turns to Active when hardware is ready to trap ARP packets for inspection.

Example

- This command displays the configuration and operation state of ARP inspection for VLANs 1 through 150.

```
switch(config)#show ip arp inspection vlan 1 - 150
VLAN 1
----------
Configuration : Enabled
Operation State : Active
VLAN 2
----------
Configuration : Enabled
Operation State : Active
{...}
VLAN 150
----------
Configuration : Enabled
Operation State : Active

switch(config)#
```

Displaying ARP Inspection Statistics

The command `show ip arp inspection statistics` displays the statistics of inspected ARP packets. For a VLAN specified by `show ip arp inspection vlan` only VLANs with ARP inspection enabled will be displayed. If no VLAN is specified, all VLANs with ARP inspection enabled are displayed.

The command `clear arp inspection statistics` clears ARP inspection.
Examples

- This command displays ARP inspection statistics for VLAN 1.

```
switch(config)#show ip arp inspection statistics vlan 2
Vlan : 2
--------
ARP Req Forwarded = 20
ARP Res Forwarded = 20
ARP Req Dropped = 1
ARP Res Dropped = 1

Last invalid ARP:
Time: 10:20:30 ( 5 minutes ago )
Reason: Bad IP/Mac match
Received on: Ethernet 3/1
Packet:
  Source MAC: 00:01:00:01:00:01
  Dest MAC: 00:02:00:02:00:02
  ARP Type: Request
  ARP Sender MAC: 00:01:00:01:00:01
  ARP Sender IP: 1.1.1
```

```
switch(config)#
```

- This command displays ARP inspection statistics for Ethernet interface 3/1.

```
switch(config)#show ip arp inspection statistics ethernet interface 3/1
Interface : 3/1
--------
ARP Req Forwarded = 10
ARP Res Forwarded = 10
ARP Req Dropped = 1
ARP Res Dropped = 1

Last invalid ARP:
Time: 10:20:30 ( 5 minutes ago )
Reason: Bad IP/Mac match
Received on: VLAN 10
Packet:
  Source MAC: 00:01:00:01:00:01
  Dest MAC: 00:02:00:02:00:02
  ARP Type: Request
  ARP Sender MAC: 00:01:00:01:00:01
  ARP Sender IP: 1.1.1
```

```
switch(config)#
```

- This command clears ARP inspection statistics.

```
switch(config)#clear arp inspection statistics
switch(config)#
```

Configure Trust Interface

By default, all interfaces are untrusted. The command `ip arp inspection trust` configures the trust state of an interface.
Examples

- This command configures the trust state of an interface.
  
  ```
  switch(config)#ip arp inspection trust
  switch(config)#
  ```

- This command configures the trust state of an interface to untrusted.
  
  ```
  switch(config)#no ip arp inspection trust
  switch(config)#
  ```

- This command configures the trust state of an interface to its default (untrusted).
  
  ```
  switch(config)#default ip arp inspection trust
  switch(config)#
  ```

**Configure Rate Limit**

When ARP inspection is enabled, ARP packets are trapped to the CPU. Two actions can be taken when the incoming ARP rate exceeds expectation. For notification purpose, the command `ip arp inspection logging` will enable logging of the incoming ARP packets. To prevent a denial-of-service attack, the command `ip arp inspection limit` will error-disable interfaces.

Examples

- This command enables logging of incoming ARP packets when its rate exceeds the configured value, and sets the rate to 2048 (which is the upper limit for the number of invalid ARP packets allowed per second), and sets the burst consecutive interval over which the interface is monitored for a high ARP rate to 15 seconds.
  
  ```
  switch(config)#ip arp inspection logging rate 2048 burst interval 15
  switch(config)#
  ```

- This command configures the rate limit of incoming ARP packets to errdisable the interface when the incoming ARP rate exceeds the configured value, sets the rate to 512 (which is the upper limit for the number of invalid ARP packets allowed per second), and sets the burst consecutive interval over which the interface is monitored for a high ARP rate to 11 seconds.
  
  ```
  switch(config)#ip arp inspection limit rate 512 burst interval 11
  switch(config)#
  ```

- This command displays verification of the interface specific configuration.
  
  ```
  switch(config)#interface Ethernet 3 / 1
  switch(config)#ip arp inspection limit rate 20 burst interval 5
  switch(config)#interface Ethernet 3 / 3
  switch(config)#ip arp inspection trust
  switch(config)#show ip arp inspection interfaces

  Interface  Trust State  Rate (pps)  Burst Interval
  -------------  -----------  ----------  --------------
  Et3/1        Untrusted    20         5
  Et3/3        Trusted      None       N/A
  ```

**Configure Errdisable Caused by ARP Inspection**

If the incoming ARP packet rate on an interface exceeds the configured rate limit in burst interval, the interface will be errdisabled (by default). If errdisabled, the interface will stay in this state until you intervene with the command `errdisable detect cause arp-inspection` (e.g., after you perform a `shutdown` or `no shutdown` of the interface) or it automatically recovers after a certain time period. The
command **errdisable recovery cause arp-inspection** will enable auto recovery. The command **errdisable recovery interval** will enable sharing the auto recovery interval among all errdisable interfaces. (See the chapter “Data Transfer” for information on all **errdisable** commands.

**Examples**

- This command enables errdisable caused by an ARP inspection violation.
  
  switch(config)#errdisable detect cause arp-inspection

- This command disables errdisable caused by an ARP inspection violation.
  
  switch(config)#no errdisable detect cause arp-inspection

- This command enables auto recovery.
  
  switch(config)#errdisable recovery cause arp-inspection

- This command disables auto recovery.
  
  switch(config)#no errdisable recovery cause arp-inspection

- This command enables sharing the auto recovery interval of 10 seconds among all errdisable interfaces.
  
  switch(config)#errdisable recovery interval 10

- This command disables sharing the auto recovery interval of 10 seconds among all errdisable interfaces.
  
  switch(config)#no errdisable recovery interval 10

- This command displays the reason for a port entering the errdisable state.
  
  switch(config)#show interfaces status errdisabled

<table>
<thead>
<tr>
<th>Port</th>
<th>Name</th>
<th>Status</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>Et3/2</td>
<td></td>
<td>errdisabled</td>
<td>arp-inspection</td>
</tr>
</tbody>
</table>

**Configure Static IP MAC Binding**

The ARP inspection command **ip source binding** allows users to add static IP-MAC binding. If enabled, ARP inspection verifies incoming ARP packets based on the configured IP-MAC bindings. The static IP-MAC binding entry can only be configured on Layer 2 ports. By default, there is no binding entry on the system.

**Examples**

- This command configures static IP-MAC binding for IP address 127.0.0.1, MAC address 0001.0001.0001, VLAN 1, and Ethernet interface slot 4 and port 1.
  
  switch(config)#ip source binding 127.0.0.1 0001.0001.0001 vlan 1 interface ethernet 4/1

  switch(config)#
• This command configures static IP-MAC binding for IP address 127.0.0.1, MAC address 0001.0001.0001, VLAN 1, and port-channel interface 20.

switch(config)#ip source binding 127.0.0.1 0001.0001.0001 vlan 1 interface port-channel 20
switch(config)#

• This command displays the configured IP-MAC binding entries. Note that the Lease column is mainly used for displaying dynamic DHCP snooping binding entries. For static binding entries, lease time is shown as infinite.

switch(config)#show ip source binding 127.0.0.1 0001.0001.0001 static vlan 1 interface port-channel 20
MacAddress     IpAddress   Lease(sec)     Type   VLAN       Interface
-------------- ----------- ------------ -------- ------- ------------------
0001.0001.0001  127.0.0.1   infinite   static   1       Port-Channel20
switch(config)#
28.2 IPv4 Routing

Internet Protocol version 4 (IPv4) is a communications protocol used for relaying network packets across a set of connected networks using the Internet Protocol suite. Routing transmits network layer data packets over connected independent subnets. Each subnet is assigned an IP address range and each device on the subnet is assigned an IP address from that range. The connected subnets have IP address ranges that do not overlap.

A router is a network device that connects multiple subnets. Routers forward inbound packets to the subnet whose address range includes the packets’ destination address. IPv4 and IPv6 are internet layer protocols that define packet-switched internetworking, including source-to-destination datagram transmission across multiple networks.

These sections describe IPv4 routing and route creation options:

- Section 28.2.1: Enabling IPv4 Routing
- Section 28.2.2: Static and Default IPv4 Routes
- Section 28.2.3: Dynamic IPv4 Routes
- Section 28.2.4: Viewing IPv4 Routes and Network Components

28.2.1 Enabling IPv4 Routing

When IPv4 routing is enabled, the switch attempts to deliver inbound packets to destination IPv4 addresses by forwarding them to interfaces or next hop addresses specified by the forwarding table. The ip routing command enables IPv4 routing.

Example
- This command enables IP routing:
  
  ```
  switch(config)#ip routing
  switch(config)#
  ```

28.2.2 Static and Default IPv4 Routes

Static routes are entered through the CLI and are typically used when dynamic protocols are unable to establish routes to a specified destination prefix. Static routes are also useful when dynamic routing protocols are not available or appropriate. Creating a static route associates a destination IP address with a local interface. The routing table refers to these routes as connected routes that are available for redistribution into routing domains defined by dynamic routing protocols.

The ip route command creates a static route. The destination is a network segment; the nexthop is either an IP address or a routable interface port. When multiple routes exist to a destination prefix, the route with the lowest administrative distance takes precedence.

By default, the administrative distance assigned to static routes is 1. Assigning a higher administrative distance to a static route configures it to be overridden by dynamic routing data. For example, a static route with a distance value of 200 is overridden by OSPF intra-area routes, which have a default distance of 110.

A route tag is a 32-bit number that is attached to a route. Route maps use tags to filter routes. Static routes have a default tag value of 0.

Example
- This command creates a static route:
  
  ```
  switch(config)#ip route 172.17.252.0/24 vlan 500
  switch(config)#
  ```
Creating Default IPv4 Routes

The default route denotes the packet forwarding rule that takes effect when no other route is configured for a specified IPv4 address. All packets with destinations that are not established in the routing table are sent to the destination specified by the default route.

The IPv4 destination prefix is 0.0.0.0/0 and the next-hop is the default gateway.

Example

- This command creates a default route and establishes 192.14.0.4 as the default gateway address:
  
  switch(config)#ip route 0.0.0.0/0 192.14.0.4
  
  switch(config)#

28.2.3 Dynamic IPv4 Routes

Dynamic routes are established by dynamic routing protocols. These protocols also maintain the routing table and modify routes to adjust for topology or traffic changes. Routing protocols assist the switch in communicating with other devices to exchange network information, maintaining routing tables, and establishing data paths.

The switch supports these dynamic IPv4 routing protocols:

- Open Shortest Path First – Version 2
- Border Gateway Protocol (BGP)
- Routing Information Protocol
- IS-IS

28.2.4 Viewing IPv4 Routes and Network Components

Displaying the FIB and Routing Table

The show ip route command displays routing table entries that are in the forwarding information base (FIB), including static routes, routes to directly connected networks, and dynamically learned routes. Multiple equal-cost paths to the same prefix are displayed contiguously as a block, with the destination prefix displayed only on the first line.

The show running-config command displays configured commands not in the FIB. The show ip route summary command displays the number of routes, categorized by source, in the routing table.
Examples

- This command displays IP routes learned through BGP.

```
switch> show ip route bgp
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, A - Aggregate

B E    170.44.48.0/23 [20/0] via 170.44.254.78
B E    170.44.50.0/23 [20/0] via 170.44.254.78
B E    170.44.52.0/23 [20/0] via 170.44.254.78
B E    170.44.54.0/23 [20/0] via 170.44.254.78
B E    170.44.254.112/30 [20/0] via 170.44.254.78
B I    170.53.0.34/32 [1/0] via 170.44.254.78
       via 170.44.254.13
       via 170.44.254.20
       via 170.44.254.67
       via 170.44.254.35
       via 170.44.254.98

switch>
```

- This command displays a summary of routing table contents.

```
switch> show ip route summary
Route Source       Number Of Routes
------------------- -------------------
connected           15
static              0
ospf                74
       Intra-area: 32 Inter-area:33 External-1:0 External-2:9
       NSSA External-1:0 NSSA External-2:0
bgp                  7
       External: 6 Internal: 1
internal            45
attached             18
aggregate            0

switch>
```

Displaying the IP Route Age

The `show ip route age` command displays the time when the route for the specified network was present in the routing table. It does not account for the changes in parameters like metric, next-hop etc.

Example

- This command displays the amount of time since the last update to ip route 172.17.0.0/20.

```
switch> show ip route 172.17.0.0/20 age
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, I - ISIS, A - Aggregate

B E    172.17.0.0/20 via 172.25.0.1, age 3d01h

switch>
```
Displaying Gateways

A gateway is a router that provides access to another network. The gateway of last resort, also known as the default route, is the route that a packet uses when the route to its destination address is unknown. The IPv4 default route is 0.0.0.0/0.

The `show ip route gateway` command displays IP addresses of all gateways (next hops) used by active routes.

**Example**

- This command displays next hops used by active routes.

  ```text
  switch> show ip route gateway
  The following gateways are in use:
  172.25.0.1 Vlan101
  172.17.253.2 Vlan2000
  172.17.254.2 Vlan2201
  172.17.254.11 Vlan2302
  172.17.254.13 Vlan2302
  172.17.254.17 Vlan2303
  172.17.254.20 Vlan2303
  172.17.254.66 Vlan2418
  172.17.254.67 Vlan2418
  172.17.254.68 Vlan2768
  172.17.254.29 Vlan3020
  switch>
  ```

Displaying Host Routes

The `show ip route host` command displays all host routes in the host forwarding table. Host routes are those whose destination prefix is the entire address (mask = 255.255.255.255 or prefix = /32). Each displayed host route is labeled with its purpose:

- **F** static routes from the FIB.
- **R** routes defined because the IP address is an interface address.
- **B** broadcast address.
- **A** routes to any neighboring host for which the switch has an ARP entry.
Example

- This command displays all host routes in the host forwarding table.

```
switch# show ip route host
R - receive B - broadcast F - FIB, A - attached
F   127.0.0.1 to cpu
B   172.17.252.0 to cpu
A   172.17.253.2 on Vlan2000
R   172.17.253.3 to cpu
A   172.17.253.10 on Vlan2000
R   172.17.254.1 to cpu
A   172.17.254.2 on Vlan2901
B   172.17.254.3 to cpu
B   172.17.254.8 to cpu
A   172.17.254.11 on Vlan2902
R   172.17.254.12 to cpu

F   172.26.0.28 via 172.17.254.20 on Vlan3003
    via 172.17.254.67 on Vlan3008
    via 172.17.254.98 on Vlan3492
    via 172.17.254.86 on Vlan3884
    via 172.17.253.2 on Vlan3000
F   172.26.0.29 via 172.25.0.1 on Vlan101
F   172.26.0.30 via 172.17.254.29 on Vlan3910
F   172.26.0.31 via 172.17.254.33 on Vlan3911
F   172.26.0.32 via 172.17.254.105 on Vlan3912
switch#
```
28.3 IPv4 Multicast Counters

IPv4 multicast counters allow association of IPv4 multicast routes with a packet or byte counter.

This chapter contains the following sections.

- Section 28.3.1: Multicast Counters Hardware Overview
- Section 28.3.2: Multicast Counters iBGP and eBGP Configuration
- Section 28.3.3: Configuring IPv4 Multicast Counters

28.3.1 Multicast Counters Hardware Overview

This section describes a hardware overview for multicast counters, and contains the following sections.

- Section 28.3.1.1: Platform Independent Requirements for Counters
- Section 28.3.1.2: Policer Counter Overview
- Section 28.3.1.3: BGP Functions Supported for Arista Switches
- Section 28.3.1.4: Additional Requirements

28.3.1.1 Platform Independent Requirements for Counters

The following platform independent requirements include:

- Enable/Disable counters
- Clear counters
- Show counters
- Configure counter mode for byte (default) or frame mode

28.3.1.2 Policer Counter Overview

The switch hardware has two policer banks, each with 4k entries and each entry has one 32 bit entry1, and one 32 bit entry2, which can be used as either packet counter or byte counter.

In the pipeline, each bank can have one policer index coming from upstream blocks, which means different features cannot update multiple policer entries in the same bank simultaneously. Therefore, different features cannot share entries in the same bank.

In switch hardware routing, each FFU/BST entry points to a corresponding RAM. A policer index is saved in the action ram, so when installing a multicast route into hardware, platform code will get a policer index and saved in the action field. If a policer index is unavailable, a counter is not added to the action field.

Switch hardware can have multiple features competing for the policer banks. It is desirable to have a platform command to reserve policer banks dedicated for a certain feature.

The following command reserves one or two policer banks to be used only by the named feature:

```
[no] platform fm6000 [nat | acl | qos | multicast] policer banks <1|2>
```

Available bank(s) are reserved for the feature. Otherwise the command takes effect at the next reboot or FocalPointV2 agent restart. This reservation guarantees the configured number of bank(s) for this feature. However, the feature can still possibly obtain the other policer bank if it needs more, and the other bank is available.

If a feature has a pending reservation request which is not fulfilled because of availability, and some other feature frees a bank, the bank will be allocated to the pending feature.
28.3.1.3 BGP Functions Supported for Arista Switches

Arista switches support these BGP functions:

- A single BGP instance
- Simultaneous internal (IBGP) and external (EBGP) peering
- Multiprotocol BGP
- BGP Confederations

28.3.1.4 Additional Requirements

On switch hardware, the following additional requirements include:

- Reservation of policer banks
- Notification of policer bank availability when a policer entry is freed by other features

28.3.2 Multicast Counters iBGP and eBGP Configuration

This section describes the commands required to configure an iBGP and an eBGP topology, and contains the following sections.

- Section 28.3.2.1: Policer Usage

28.3.2.1 Policer Usage

There are two types of counters – those created by wildcard creation and by specific creation. When a specific counter is required and the hardware runs out of policer entries, a wildcard counter is forced to give up its policer entry.

If the user configures a specific counter and the starter group (SG) already has a wildcard-created counter for it, then this counter is upgraded to a specific one, with no change in hardware policer index. If the user configures both a wildcard counter and specific counter for this SG, and subsequently deletes the specific counter, the counter for this SG is downgraded to a wildcard, with no change in hardware policer index. However, if another specific counter is pending for a hardware policer index, then this policer entry will be assigned to that counter due to its higher precedence.

Even if a counter is configured by the user, in order to conserve the use of hardware resources, we should not allocate a policer entry until a real route (G, S) is programmed into the frame filtering and forwarding unit (FFU).

28.3.3 Configuring IPv4 Multicast Counters

Perform the following CLI steps to configure IPv4 multicast counters on the Alta platform:

**Step 1** Execute the global configuration command:

- `no | default ip multicast count bytes | packets`

  Enables wildcard counters. Also used to change bytes / packets mode. When hardware runs of resources, specific creation has priority to preempt counters from wildcard creation. The `bytes | packets` optional keyword enables the counter to be in either bytes mode or packets mode. This mode applies to all counters. When the counter mode changes, all counter values will be reset to zero.

- `no | default ip multicast count <G> <S>`

  This is only takes affect when `ip multicast count` is enabled. Either `<G, S>` or `bytes | packets` optional keyword is used. They can not be used concurrently.
Chapter 28: IPv4 IPv4 Multicast Counters

No I default Commands: (default is same as no)

- no ip multicast count
  - Deletes all multicast counters, including explicit <G> <S> routes
- no ip multicast count <G> <S>
  - Removes the config. Does not delete the counter because the wildcard is still active.
  - If no <G, S> is specified, all multicast routes will have counters unless the hardware runs out of resources. The creation of counters is referred to as “wildcard creation.”
  - If <G, S> is specified, only <G, S> will get a counter (and no other route). The creation of counters is referred to as “specific creation.” By default, all mcast routes will have counters allocated. This <G, S> configuration is applicable when the hardware runs out of resources. Specific <G, S> creation has priority to preempt counters from wildcard creation.

The byte | frame optional keyword enables the counter to be in either byte mode or frame mode. This mode applies to all counters. When the counter mode changes, all counter values will be reset to zero.

Either <G, S> or byte | frame optional keywords are used and cannot be used together. All counters are byte | frame. The byte | frame mode is global, and not applicable on a <G, S> basis.

Step 2  Execute clear command:

- clear ip multicast count <G> <S>

Step 3  Execute show command:

- show multicast fib ipv4 <G> count

This command currently exists but does not show anything.

This show command is intended to display the following (example):

```
switch>show multicast fib ipv4 count
Activity poll time: 60 seconds
225.1.1.1 100.0.0.2
Byte: 123
Vlan100 (iif)
Vlan200
Activity 0:00:47 ago
```

Total counts is the sum of counts from all sources in that group.

The count value can be N/A if a mroute does not have an associated counter.

If the count value for any source in a <G> is N/A, then the total counts for <G> will be shown as N/A. However, the count values for other sources are still shown.
28.4 Route Management

When routing is enabled, the switch discovers the best route to a packet's destination address by exchanging routing information with other devices. IP routing is disabled by default.

The following sections describe routing features that the switch supports:

- Section 28.4.1: Route Redistribution
- Section 28.4.2: Equal Cost Multipath Routing (ECMP) and Load Sharing
- Section 28.4.3: Unicast Reverse Path Forwarding (uRPF)
- Section 28.4.4: Routing Tables / Virtual Routing and Forwarding (VRF)
- Section 28.4.5: RIB Route Control

28.4.1 Route Redistribution

Route redistribution is the advertisement, into a dynamic routing protocol's routing domain, of connected (static) routes or routes established by other routing protocols. By default, the switch advertises only routes in a routing domain that are established by the protocol that defined the domain.

Route redistribution commands specify the scope of the redistribution action. By default, all routes from a specified protocol (or all static routes) are advertised into the routing domain. Commands can also filter routes by applying a route map, which defines the subset of routes to be advertised.

28.4.2 Equal Cost Multipath Routing (ECMP) and Load Sharing

Equal cost multi-path (ECMP) is a routing strategy where traffic is forwarded over multiple paths that have equal routing metric values.

Configuring ECMP (IPv4)

All ECMP paths are assigned the same tag value; commands that change the tag value of a path also change the tag value of all paths in the ECMP route.

In a network topology using ECMP routing, hash polarization may result when all switches perform identical hash calculations. Hash polarization leads to uneven load distribution among the data paths. Hash polarization is avoided when switches use different hash seeds to perform hash calculations.

The `ip load-sharing` command provides the hash seed to an algorithm that the switch uses to distribute data streams among multiple equal-cost routes to a specified subnet.

Example

- This command sets the IPv4 load sharing hash seed to 20:

```
switch(config)#ip load-sharing fm6000 20
switch(config)#
```

Multicast Traffic Over ECMP

The switch attempts to spread outbound unicast and multicast traffic to all ECMP route paths equally. To disable the sending of multicast traffic over ECMP, use the `multipath none` command or the `no multipath deterministic` command.

Resilient ECMP

Resilient ECMP is used for those prefixes where it is not desirable for routes to be rehashed due to link flap, typically where ECMP is being used for load balancing. Resilient ECMP configures a fixed number of next-hop entries in the hardware ECMP table for all the routes within a specified IP address prefix.
Implementing fixed table entries for a specified next-hop address allows data flows that are hashed to a valid next-hop number to remain intact even when some of the next hops go down or come back online.

Resilient ECMP is enabled for all routes within a specified prefix using the `ip hardware fib ecmp resilience` command. The command specifies the maximum number of next-hop addresses that the hardware ECMP table can contain for the specified IP prefix, and configures a redundancy factor that facilitates the duplication of next-hop addresses in the table. The fixed table space for the address is the maximum number of next hops multiplied by the redundancy factor. When the table contains the maximum number of next-hop addresses, the redundancy factor specifies the number of times each address is listed in the table. When the table contains fewer than the maximum number of next-hop addresses, the table space entries are filled by additional duplication of the next-hop addresses.

Resilient ECMP is also available for IPv6 IP addresses.

**Example**

- This command configures a hardware ECMP table space of 24 entries for the IP address 10.14.2.2/24. A maximum of six next-hop addresses can be specified for the IP address. When the table contains six next-hop addresses, each appears in the table four times. When the table contains fewer than six next-hop addresses, each is duplicated until the 24 table entries are filled.

```
switch(config)# ip hardware fib ecmp resilience 10.14.2.2/24 capacity 6 redundancy 4
```

28.4.3 Unicast Reverse Path Forwarding (uRPF)

Unicast Reverse Path Forwarding (uRPF) verifies the accessibility of source IP addresses in packets that the switch forwards. The switch drops a packet when uRPF determines that the routing table does not contain an entry with a valid path to that packet’s source IP address.

IPv4 and IPv6 uRPF operate independently. uRPF is VRF aware. Commands that do not specify a VRF utilize the default instance. Multicast routing is not affected by uRPF.

uRPF defines two operational modes: strict mode and loose mode.

- **Strict mode**: uRPF also verifies that a packet is received on the interface that its routing table entry will use for its return packet.
- **Loose mode**: uRPF validation does not consider the inbound packet’s ingress interface.

28.4.3.1 uRPF Operation

uRPF is configurable on interfaces. For packets arriving on a uRPF-enabled interfaces, the source IP address is verified by examining the source and destination addresses of unicast routing table entries.

uRPF requires a reconfigured routing table to support IP address verification. When uRPF is enabled for the first time, unicast routing is briefly disabled to facilitate the routing table reconfiguration. Multicast routing is not affected by the initial uRPF enabling.

A packet fails uRPF verification if the table does not contain an entry whose source or destination address matches the packet’s source IP address. In strict mode, the uRPF also fails when the matching entry’s outbound interface does not match the packet’s ingress interface.

uRPF verification is not available for the following packets:

- DHCP (Source is 0.0.0.0 – Destination is 255.255.255.255)
- IPv6 link local (FE80::/10)
- Multicast packets
ECMP uRPF
When verifying ECMP routes, strict mode checks all possible paths to determine that a packet is received on the correct interface. Strict mode is supported for ECMP groups with a maximum of eight routing table entries. The switch reverts to loose mode for ECMP groups that exceed eight entries.

Default Routes
uRPF strict mode provides an allow-default option that accepts default routes. On interfaces that enable allow-default and a default route is defined, uRPF strict mode validates a packet even when the routing table does not contain an entry that matches the packet’s source IP address. When allow-default is not enabled, uRPF does not consider the default route when verifying an inbound packet.

Null Routes
NULL0 routes drop traffic destined to a specified prefix. When uRPF is enabled, traffic originating from a null route prefixes is dropped in strict and loose modes.

28.4.3.2 uRPF Configuration
Unicast Reverse Path Forwarding (uRPF) is enabled for IPv4 packets ingressing the configuration mode interface through the ip verify command.

Note
uRPF cannot be enabled on interfaces with ECMP member FECs.

Example
- This command enables uRPF loose mode on VLAN interface 17.
  ```bash
  switch(config)#interface vlan 17
  switch(config-if-Vl17)#ip verify unicast source reachable-via any
  switch(config-if-Vl17)#show active
  interface Vlan17
  ip verify unicast source reachable-via any
  switch(config-if-Vl17)#
  ```
- This command enables uRPF strict mode on VLAN interface 18.
  ```bash
  switch(config)#interface vlan 18
  switch(config-if-Vl18)#ip verify unicast source reachable-via rx
  switch(config-if-Vl18)#show active
  interface Vlan18
  ip verify unicast source reachable-via rx
  switch(config-if-Vl18)#
  ```

28.4.4 Routing Tables / Virtual Routing and Forwarding (VRF)
An IP routing table is a data table that lists the routes to network destinations and metrics (distances) associated with those routes. A routing table is also known as a routing information base (RIB).

Virtual Routing and Forwarding (VRF) allows traffic separation by maintaining multiple routing tables. Arista switches support multiple VRF instances: one global or default VRF called “default” and multiple user-defined VRFs; the number of user-defined VRFs supported varies by platform. VRFs can be used as management or data plane VRFs.
- Management VRFs have routing disabled. They are typically used for management-related traffic.
- Dataplane VRFs have routing enabled. They support routing protocols and packet forwarding (hardware and software).
Dataplane VRFs are supported by Trident, FM6000, and Arad platform switches. VRFs support unicast IPv4 and IPv6 traffic and multicast traffic. Loopback, SVI, and routed ports may be added to VRFs. Management ports may be added without any hardware forwarding.

To allow overlap in the sets of IP addresses used by different VRF instances, a route distinguisher (RD) may be prepended to each address. RDs are defined in RFC 4364.

28.4.4.1 Default VRF

The default VRF on Arista switches is called “default.” It is created automatically and cannot be renamed or configured. Some configuration options accept “default” as a VRF input.

28.4.4.2 User-Defined VRFs

A user-defined VRF is created with the vrf instance command. After its creation, a VRF may be assigned a route distinguisher (RD) with the rd (Router-BGP VRF and VNI Configuration Modes) command in the VRF submode of Router-BGP Configuration Mode.

Example

- These commands create a VRF named “purple,” place the switch in BGP VRF configuration mode for that VRF, and specify a route distinguisher for the VRF identifying the administrator as AS 530 and assigning 12 as its local number.

  switch(config)#vrf instance purple
  switch(config-vrf-purple)#router bgp 50
  switch(config-router-bgp)#vrf purple
  switch(config-router-bgp-vrf-purple)#rd 530:12
  switch(config-router-bgp-vrf-purple)#

To add interfaces to a user-defined VRF, enter configuration mode for the interface and use the vrf (Interface mode) command. Loopback, SVI, and routed ports can be added to a VRF.

Example

- These commands add VLAN 20 to the VRF named “purple.”

  switch(config)#interface VLAN 20
  switch(config-if-Vl20)#vrf purple
  switch(config-if-Vl20)#

The show vrf command shows information about user-defined VRFs on the switch.

Example

- This command displays information for the VRF named “purple”.

  switch>show vrf purple
  Vrf          RD             Protocols      State        Interfaces
  ------------- -------------- -------------- -------------- ------------
  purple       64496:237      ipv4           no routing   Vlan42, Vlan43

  switch>

28.4.4.3 Context-Active VRF

The context-active VRF specifies the default VRF that VRF-context aware commands use when displaying or refreshing routing table data.

VRF-context aware commands include:
- clear arp-cache
- show ip
- show ip arp
- show ip route
- show ip route gateway
- show ip route host

The `cli vrf` command specifies the context-active VRF.

**Example**
- This command specifies `magenta` as the context-active VRF.
  ```
  switch#cli vrf magenta
  switch#show routing-context vrf
  Current VRF routing-context is magenta
  ```

The `show routing-context vrf` command displays the context-active VRF.

**Example**
- This command displays the context-active VRF.
  ```
  switch>show routing-context vrf
  Current VRF routing-context is magenta
  switch>
  ```

### 28.4.5 RIB Route Control

The routing database (RIB) is composed of the routing information learned by the routing protocols, including static routes. The forwarding database (FIB) is composed of the routes actually used to forward traffic through a router.

Forwarding Information Base (FIB) makes IP destination prefix-based switching decisions. The FIB is similar to a routing table or information base. It maintains the forwarding information for the winning routes from the RIB. When routing or topology changes occur in the network, the IP routing table information is updated, and those changes are reflected in the FIB.

### 28.4.5.1 Configuring FIB policy

The RIB calculates the best/winning routes to each destination and place these routes in the forwarding table. Based on the FIB policy configured the best routes are advertised.

For example, a FIB policy can be configured to deny the routes for FIB programming, however, it does not prevent these routes from being advertised by a routing protocol, or to be redistributed into another routing domain, or to be used for recursive resolution in the IP RIB. FIB policies control the size and content of the routing tables, and the best route to take to reach a destination.

The `rib ipv4 | ipv6 fib policy` command is used to enable FIB policy for a particular VRF under router general configuration mode.

The following match statements are supported:
- match interface
- match { ip | ipv6 } address prefix-list
- match { ip | ipv6 } resolved-next-hop prefix-list
- match isis level
- match metric
• match source-protocol

Example
• The following example enables FIB policy for IPv4 in the default VRF, using the route map, **map1**.

```
Switch(config)#router general
Switch(config-router-general)#vrf default
Switch(config-router-general-vrf-default)#rib ipv4 fib policy map1
```

### 28.4.5.2 Displaying FIB Information

Use the `show rib route <ipv4 | ipv6> fib policy exclude` command to display the RIB information. The **fib policy exclude** option displays the RIB routes that have been excluded from being programmed into FIB, by FIB policy.

Example
• The following example displays the routes filtered by FIB policy using the **fib policy excluded** option of the `show rib route ip|ipv6` command.

```
Switch#show rib route ipv6 fib policy excluded
Switch#show rib route ip bgp fib policy excluded
VRF name: default, VRF ID: 0xfe, Protocol: bgp
Codes: C - Connected, S - Static, P - Route Input
       B - BGP, O - Ospf, O3 - Ospf3, I - Isis
       > - Best Route, * - Unresolved Nexthop
       L - Part of a recursive route resolution loop
>B  10.1.0.0/24 [200/0]
   via 10.2.2.1 [115/20] type tunnel
   via 10.3.5.1, Ethernet1
   via 10.3.1.0/24 [115/20] type tunnel
   via 10.3.4.1, Ethernet2
   via 10.3.6.1, Ethernet3
>B  10.1.0.0/24 [200/0]
   via 10.2.2.1 [115/20] type tunnel
   via 10.3.5.1, Ethernet1
   via 10.3.1.0/24 [115/20] type tunnel
   via 10.3.4.1, Ethernet2
   via 10.3.6.1, Ethernet3
```

### 28.4.5.3 Displaying RIB Route Information

Use the `show rib route ip` command to view the IPv4 RIB information.

Example
• This command displays IPv4 RIB static routes.

```
switch#show rib route ip static
VRF name: default, VRF ID: 0xfe, Protocol: static
Codes: C - Connected, S - Static, P - Route Input
       B - BGP, O - Ospf, O3 - Ospf3, I - Isis
       > - Best Route, * - Unresolved Nexthop
       L - Part of a recursive route resolution loop
>S  10.80.0.0/12 [1/0]
   via 172.30.149.129 [0/1]
   via Management1, directly connected
>S  172.16.0.0/12 [1/0]
   via 172.30.149.129 [0/1]
   via Management1, directly connected
```
switch#
28.5 IPv4 Route Scale

IPv4 routes are optimized to achieve route scale when route distribution has a large number of routes of one or two parameters, with each parameter consisting of prefix lengths 12, 16, 20, 24, 28, and 32. If two separate prefix lengths are configured (in any order), one of them must be the prefix length of 32.

The following sections describes IPv4 route scale configuration, show commands, and system log messages:

- Section 28.5.1: Configuring IPv4 Route Scale
- Section 28.5.2: Show Commands
- Section 28.5.3: Syslog

28.5.1 Configuring IPv4 Route Scale

IPv4 route scale is enabled by the `ip hardware fib optimize` command for the configuration mode interface. The platform layer 3 agent is restarted to ensure IPv4 routes are optimized with the `agent SandL3Unicast terminate` command for the configuration mode interface.

Example

- This configuration command allows configuring prefix lengths 12 and 32.

  ```
  switch(config)#ip hardware fib optimize exact-match prefix-length 12 32
  ! Please restart layer 3 forwarding agent to ensure IPv4 routes are optimized
  ```

  One of the two prefixes in this command is a prefix-length of 32, which is required in the instance where there are two prefixes. For this command to take effect, the platform layer 3 agent must be restarted.

  This configuration command restarts the platform layer 3 agent to ensure IPv4 routes are optimized.

  ```
  switch(config)#agent SandL3Unicast terminate
  SandL3Unicast was terminated
  ```

  Restarting the platform layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.

Example

- This configuration command allows configuring prefix lengths 32 and 16.

  ```
  switch(config)#ip hardware fib optimize exact-match prefix-length 32 16
  ! Please restart layer 3 forwarding agent to ensure IPv4 routes are optimized
  ```

  One of the two prefixes in this command is a prefix-length of 32, which is required in the instance where there are two prefixes. For this command to take effect, the platform layer 3 agent must be restarted.

  This configuration command restarts the platform layer 3 agent to ensure IPv4 routes are optimized.

  ```
  switch(config)#agent SandL3Unicast terminate
  SandL3Unicast was terminated
  ```

  Restarting the platform layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.
Example

- This configuration command allows configuring prefix length 24.
  
  `switch(config)#ip hardware fib optimize exact-match prefix-length 24`  
  
  ! Please restart layer 3 forwarding agent to ensure IPv4 routes are optimized
  
  In this instance, there is only one prefix-length, so a prefix-length of 32 is not required. For this command to take effect, the platform layer 3 agent must be restarted.

  This configuration command restarts the platform layer 3 agent to ensure IPv4 routes are optimized.

  `switch(config)#agent SandL3Unicast terminate`  
  
  SandL3Unicast was terminated
  
  Restarting the platform layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.

Example

- This configuration command allows configuring prefix length 32.
  
  `switch(config)#ip hardware fib optimize exact-match prefix-length 32`  
  
  ! Please restart layer 3 forwarding agent to ensure IPv4 routes are optimized
  
  For this command to take effect, the platform layer 3 agent must be restarted.

  This configuration command restarts the platform layer 3 agent to ensure IPv4 routes are optimized.

  `switch(config)#agent SandL3Unicast terminate`  
  
  SandL3Unicast was terminated
  
  Restarting the platform layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.

Example

- This configuration command disables configuring prefix lengths 12 and 32.
  
  `switch(config)#no ip hardware fib optimize exact-match prefix-length 12 32`  
  
  ! Please restart layer 3 forwarding agent to ensure IPv4 routes are not optimized
  
  One of the two prefixes in this command is a prefix-length of 32, which is required in the instance where there are two prefixes. For this command to take effect, the platform layer 3 agent must be restarted.

  This configuration command restarts the platform layer 3 agent to ensure IPv4 routes are not optimized.

  `switch(config)#agent SandL3Unicast terminate`  
  
  SandL3Unicast was terminated
  
  Restarting the platform layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.

Example

- This configuration command attempts to configure prefix length 20 and 28 which triggers an error exception. One of the two prefixes in this command must be a prefix-length of 32, which is required in the instance where there are two prefixes.
  
  `switch(config)#ip hardware fib optimize exact-match prefix-length 20 28`  
  
  % One of the prefix lengths must be 32
28.5.2 Show Commands

The IPv4 route scale summary is displayed by the show platform arad ip route summary command for the configuration mode interface. Resources for all IPv4 route scale routes are displayed by the show platform arad ip route command for the configuration mode interface.

Example

This command shows hardware resource usage of IPv4 routes.

```
switch(config)#show platform arad ip route summary
Total number of VRFs: 1
Total number of routes: 25
Total number of route-paths: 21
Total number of lem-routes: 4
```

Example

This command shows resources for all IPv4 routes in hardware. Routes that use the additional hardware resources will appear with an asterisk.

```
switch(config)#show platform arad ip route
Tunnel Type: M(mpls), G(gre)
* - Routes in LEM

<table>
<thead>
<tr>
<th>VRF</th>
<th>Destination</th>
<th>Tunnel</th>
<th>Acl</th>
<th>ECMP</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0.0.0.0/8</td>

<td>Et10</td>
<td>-</td>
</tr>
</tbody>
</table>
```
28.5.3 Syslog

When the number of routes exceed additional hardware resources, the ROUTING_LEMRESOURCE_FULL syslog message is displayed.
28.6 IP Source Guard

IP Source Guard (IPSG) prevents IP spoofing attacks. It filters inbound IP packets based on their source MAC and IP addresses. IPSG is supported in hardware. IPSG enabled on a Layer 2 port verifies IP packets received on this port. Packets are permitted if each packet source MAC and IP addresses match any of the user-configured IP-MAC binding entries on the receiving VLAN and port. Packets with no match are dropped immediately.

28.6.1 Configuring IPSG

IPSG is applicable only to Layer 2 ports, and is enabled by the `ip verify source` command for the configuration mode interface. When configured on Layer 3 ports, IPSG does not take effect until this interface is converted to Layer 2.

IPSG is supported on Layer 2 Port-Channels, not member ports. The IPSG configuration on port channels supersedes the configuration on the physical member ports. Hence, source IP MAC binding entries should be configured on port channels using the `ip source binding` command. When configured on a port channel member port, IPSG does not take effect until this port is deleted from the port channel configuration.

Example

- These configuration commands exclude VLAN IDs 1 through 3 from IPSG filtering. When enabled on a trunk port, IPSG filters the inbound IP packets on all allowed VLANs. IP packets received on VLANs 4 through 10 on Ethernet 36 will be filtered by IPSG, while those received on VLANs 1 through 3 are permitted.

  ```
  switch(config)#no ip verify source vlan 1-3
  switch(config)#interface ethernet 36
  switch(config-if-Et36)#switchport mode trunk
  switch(config-if-Et36)#switchport trunk allowed vlan 1-10
  switch(config-if-Et36)#ip verify source
  switch(config-if-Et36)#
  ```

  This configuration command configures source IP-MAC binding entries to IP address 10.1.1.1, MAC address 0000.aaaa.1111, VLAN ID 4094, and Ethernet interface 36.

  ```
  switch(config)#ip source binding 10.1.1.1 0000.aaaa.1111 vlan 4094 interface ethernet 36
  switch(config)#
  ```

28.6.2 Show Commands

The IPSG configuration and operational states and IP-MAC binding entries are displayed by the `show ip verify source` command for the configuration mode interface.

Example

This command verifies the IPSG configuration and operational states.

```
switch(config)#show ip verify source
Interface       Operational State
--------------- ------------------------
Ethernet1       IP source guard enabled
Ethernet2       IP source guard disabled
```
Example

This command displays all VLANs configured in no ip verify source vlan. Hardware programming errors, e.g., VLAN classification failed, are indicated in the operational state. If an error occurs, this VLAN will be considered as enabled for IPSG. Traffic on this VLAN will still be filtered by IPSG.

```
switch(config)# show ip verify source vlan
IPSG disabled on VLANS: 1-2
VLAN Operational State
----------------- ------------------------
1 IP source guard disabled
2 Error: vlan classification failed
```

Example

This command displays all source IP-MAC binding entries configured for IPSG. A source binding entry is considered active if it is programmed in hardware. IP traffic matching any active binding entry will be permitted. If a source binding entry is configured on an interface or a VLAN whose operational state is IPSG disabled, this entry will not be installed in the hardware, in which case an “IP source guard disabled” state will be shown. If a port channel has no member port configured, binding entries configured for this port channel will not be installed in hardware, and a “Port-Channel down” state will be shown.

```
switch(config)# show ip verify source detail
Interface IP Address MAC Address VLAN State
--------------- ------------- ---------------- ------ ------------------------
Ethernet1 10.1.1.1 0000.aaaa.1111 5 active
Ethernet1 10.1.1.5 0000.aaaa.5555 1 IP source guard disabled
Port-Channel1 20.1.1.1 0000.bbbb.1111 4 Port-Channel down
```
DHCP Relay Across VRF

The EOS DHCP relay agent supports forwarding of DHCP requests to DHCP servers located in a different VRF to the DHCP client interface VRF. In order to enable VRF support for the DHCP relay agent, Option 82 (DHCP Relay Agent Information Option) must first be enabled. The DHCP relay agent uses Option 82 to pass client specific information to the DHCP server.

These sections describe DHCP Relay across VRF features:

- **Section 28.7.1: Global Configuration**
- **Section 28.7.2: Show Command**

The DHCP relay agent inserts Option 82 information into the DHCP forwarded request, which requires the DHCP server belongs to a network on an interface, and that interface belongs to a different VRF than the DHCP client interface. Option 82 information includes the following:

- **VPN identifier**: The VRF name for the ingress interface of the DHCP request, inserted as sub-option 151.

```
SubOpt | Len  | ASCII VRF Identifier
151    | 7    | V RF NAME
```

Figure 28-1: VPN Identifier

- **Link selection**: The subnet address of the interface that receives the DHCP request, inserted as sub-option 5. When the DHCP smart relay is enabled, the link selection is filled with the subnet of the active address. The relay agent will set the Gateway IP address (gIPaddr) to its own IP address so that DHCP messages can be routed over the network to the DHCP server.

```
SubOpt | Len | Subnet IP Address
5      | 4   | A1 A2 A3 A4
```

Figure 28-2: Link Selection

- **Server identifier override**: The primary IP address of the interface that receives the DHCP request, inserted as sub-option 11. When the DHCP smart relay is enabled, the server identifier is filled with the active address (one of the primary or secondary addresses chosen by smart relay mechanism).

```
SubOpt | Len | Overriding Server Identifier Address
11     | 4   | B1 B2 B3 B4
```

Figure 28-3: Link Selection

- **VSS control suboption as suboption 152**: The DHCP server will strip out this suboption when sending the response to the relay, indicating that the DHCP server used VPN information to allocate IP address.

Note
The DHCP server must be capable of handling VPN identifier information in option 82.

Direct communication between DHCP client and server may not be possible as they are in separate VRFs. The Server identifier override and Link Selection sub-options set the relay agent to act as the DHCP server, and enable all DHCP communication to flow through the relay agent.

The relay agent adds all the appropriate sub-options, and forwards all (including renew and release) request packets to the DHCP server. When the DHCP server response messages are received by the relay, Option 82 information is removed and the response is forwarded to the DHCP client in the client VRF.
28.7.1 Global Configuration

The DHCP relay agent information option is inserted in DHCP messages relayed to the DHCP server. The `ip helper-address` command enables DHCP relay on an interface; and relays DHCP messages to the specified IPv4 address.

**Example**

This command enables DHCP relay on the interface Ethernet 1/2; and relays DHCP messages to the server at 1.1.1.1.

```
switch(config)#interface ethernet 1/2
switch(config-if-Eт1/2)#ip helper-address 1.1.1.1
switch(config-if-Eт1/2)#
```

The commands provided in examples below will turn on the attachment of VRF-related tags in the relay agent information option. If both the DHCP client interface and server interface are on the same VRF (default or non-default), then no VRF-related DHCP relay agent information option is inserted.

**Examples**

- This command configures the DHCP relay to add option 82 information.
  ```
  switch(config)#ip dhcp relay information option
  ```

- These commands configures two new VRF instances and assign them Route Distinguishers (RDs).
  ```
  switch(config)#vrf instance mtxxg-vrf
  switch(config-vrf-mtxxg-vrf)#router bgp 50
  switch(config-router-bgp)#vrf mtxxg-vrf
  switch(config-router-bgp-vrf-mtxxg-vrf)#rd 5546:5546

  switch(config)#vrf instance qchyh-vrf
  switch(config-vrf-qchyh-vrf)#router bgp 50
  switch(config-router-bgp)#vrf qchyh-vrf
  switch(config-router-bgp-vrf-qchyh-vrf)#rd 218:218
  ```

- This command configures an interface connected to DHCP client in vrf mtxxg-vrf and assigns an IP address.
  ```
  switch(config)#interface Ethernet 9
  switch(config-if-Eт9)#no switchport
  ```

- This command configures the DHCP client interface in VRF mtxxg-vrf.
  ```
  switch(config-if-Eт9)#vrf mtxxg-vrf
  switch(config-if-Eт9)#ip address 10.10.0.1/16
  ```

- This command configures the server interface in VRF qchyh-vrf.
  ```
  switch(config-if-Eт11)#vrf qchyh-vrf
  switch(config-if-Eт11)#ip address 10.40.0.1/16
  ```

- This command configures a helper address for a DHCP server in VRF qchyh-vrf.
  ```
  switch(config-if-Eт11)#ip helper-address 10.40.2.3 vrf qchyh-vrf
  ```
28.7.2 Show Command

Example

This command displays the VRF specifier for the server:

```
rtr1#show ip dhcp relay
DHCP Relay is active
DHCP Relay Option 82 is enabled
DHCP Smart Relay is disabled
Interface: Ethernet9
Option 82 Circuit ID: Ethernet9
DHCP Smart Relay is disabled
DHCP servers: 10.40.2.3
10.40.2.3:vrf=qchyh-vrf
```
28.8 IP NAT

Network address translation (NAT) is a router process that modifies address information of IP packets in transit. NAT is typically used to correlate address spaces between a local network and a remote, often public, network. Static NAT defines a one-to-one map between local and remote IP addresses. Static maps are configured manually through CLI commands. An interface can support multiple NAT commands, but each command must specify a unique local IP address-port location.

NAT is configured on routers that have interfaces connecting to the local networks and interfaces connecting to a remote network.

NAT is available only on FM6000 platform switches (the 7150 series).

Inside and Outside Addresses

In NAT configurations, IP addresses are placed into one of two categories: inside or outside. Inside refers to IP addresses used within the organizational network. Outside refers to addresses on an external network outside the organizational network.

28.8.1 Static IP NAT

Static NAT configurations create a one-to-one mapping and translate a particular address to another address. This type of configuration creates a permanent entry in the NAT table as long as the configuration is present, and it enables both inside and outside hosts to initiate a connection.

Static NAT options include source NAT, destination NAT, and twice NAT.

- Source NAT modifies the source address in the IP header of a packet exiting the interface, and can optionally change the source port referenced in the TCP/UDP headers.
- Destination NAT modifies the destination address in the IP header of a packet entering the interface, and can optionally change the destination port referenced in the TCP/UDP headers.
- Twice NAT modifies both the source and destination address of packets entering and exiting the interface, and can optionally change the L4 port information in the TCP/UDP headers. Twice NAT is generally used when inside network addresses overlap or otherwise conflict with outside network addresses. When a packet exits the interface, local source and destination addresses are translated to global source and destination addresses. When a packet enters the interface, global source and destination addresses are translated to local source and destination addresses.

28.8.1.1 Configuring Static NAT

Configuring Source NAT

Network address translation of a source address (source NAT) is enabled by the `ip nat source static` command for the configuration mode interface. Applying source NAT to interfaces that connect to local hosts shields the IP address of the host when sending IP packets to remote destinations.

This command installs hardware translation entries for forward and reverse unicast traffic. When the rule specifies a multicast group, the command does not install the reverse path in hardware. The command may include an access control list to filter packets for translation.

Note

The switch uses a common NAT table for the entire switch, not a per interface one. For example, if a customer has the same inside local address translated to different inside global addresses depending on which interface it exits. It might be translated to exit interface B’s inside global address even though it exits through interface A. A way to avoid this is to use an access list that differentiates based on the destination IP address.
Example

These commands configure VLAN 201 to translate source address 10.24.1.10 to 168.32.14.15.

```
switch(config)#interface vlan 201
switch(config-if-Vl201)#ip nat source static 10.24.1.10 168.32.14.15
```

The `ip nat source static` command may include an ACL to limit packet translation. Only packets whose source IP address matches the ACL are cleared. ACLs configured for source NAT must specify a source IP address of `any`. Source port or protocol matching is not permitted. The destination may be an IP subnet. Commands referencing nonexistent ACLs are accepted by the CLI but not installed in hardware until the ACL is created. Modifying a referenced ACL causes the corresponding hardware entries to be replaced by entries that match the new command.

Example

These commands configure VLAN 101 to translate the source address 10.24.1.10 to 168.32.14.15 for all packets with IP destination addresses in the 168.10.1.0/24 subnet.

```
switch(config)#ip access-list ACL1
switch(config-acl-ACL1)#permit ip any 168.10.1.0/24
switch(config-acl-ACL1)#exit
switch(config)#interface vlan 101
switch(config-if-Vl101)#ip nat source static 168.32.14.15 access-list ACL1 10.24.1.10
```

Configuring Destination NAT

Network address translation of a destination address (destination NAT) is enabled by the `ip nat destination static` command for the configuration mode interface. Applying destination NAT to interfaces that connect to remote hosts shields the IP address of the recipient host when receiving IP packets from remote destinations.

This command installs hardware translation entries for forward and reverse unicast traffic. When the rule specifies a multicast group, the command does not install the reverse path in hardware. The command may include an access control list to filter packets for translation.
**Example**

- These commands configure VLAN 201 to translate destination address 168.32.14.15 to 10.24.1.10.

  ```
  switch(config)#interface vlan 201
  switch(config-if-Vl201)#ip nat destination static 168.32.14.15 10.24.1.10
  switch(config-if-Vl201)#
  ```

  The `ip nat destination static` command may include an ACL to limit packet translation. Only packets whose source IP address matches the ACL are cleared. ACLs configured for destination NAT must specify a destination IP address of `any`. Destination port or protocol matching is not permitted. The source may be an IP subnet. Commands referencing nonexistent ACLs are accepted by the CLI but not installed in hardware until the ACL is created. Modifying a referenced ACL causes the corresponding hardware entries to be replaced by entries that match the new command.

**Example**

- These commands configure VLAN 201 to translate the destination address 168.32.14.15 to 10.24.1.10 for all packets with IP source addresses in the 168.10.1.4/32 subnet.

  ```
  switch(config)#ip access-list ACL2
  switch(config-acl-ACL2)#permit ip 168.10.1.4/32 any
  switch(config-acl-ACL2)#exit
  switch(config)#interface vlan 201
  switch(config-if-Vl201)#ip nat destination static 168.32.14.15 access-list ACL2 10.24.1.10
  switch(config-if-Vl201)#
  ```

**Configuring Twice NAT**

Network address translation of both source and destination addresses on the same interface (twice NAT) is enabled by creating one source NAT rule and one destination NAT rule on the same interface and associating them through a NAT group using the `ip nat source static` and `ip nat destination static` commands.

The `ip nat source static` command translates the actual local source address to a source address which can be used outside the local network to reference the source. The `ip nat destination static` command translates an internally used destination address to the actual IP address that is the destination of the packet.
The source and destination NAT rules must reference the same NAT group, and both should either specify only IP addresses or specify both IP addresses and L4 port information. If L4 port information is configured in one rule but not in the other, an error message will be displayed.

Each NAT rule installs hardware translation entries for forward and reverse unicast traffic. When the rule specifies a multicast group, the command does not install the reverse path in hardware. Twice NAT does not support the use of access control lists to filter packets for translation.

**Example**

- These commands configure Ethernet interface 2 to translate the local source address 10.24.1.10 to the global source address 168.32.14.15, and to translate the local destination address 10.68.104.3 to the global destination address 168.25.10.7 for all packets moving through the interface. The use of NAT group 3 is arbitrary, but must be the same in both rules.

  switch(config)#interface ethernet 2
  switch(config-if-Et2)#ip nat source static 10.24.1.10 168.32.14.15 group 3
  switch(config-if-Et2)#ip nat destination static 10.68.104.3 168.25.10.7 group 3

**28.8.2 Dynamic NAT**

Dynamic NAT can be used when fewer addresses are accessible than the number of hosts to be translated. A NAT table entry is created when the host starts a connection and establishes a one-to-one mapping between addresses. The mapping can vary and is dependent upon the registered addresses in the pool at the time of the communication. Dynamic NAT sessions are only allowed to be initiated only from inside networks. NAT should be configured on a Layer 3 interface, either a routed port or
Switch Virtual Interface (SVI). If the host doesn't communicate for a specific period, dynamic NAT entries are removed from the translation table. The address will then returned to the pool for use by another host.

**Figure 28-6: Dynamic NAT Scenario**

Dynamic NAT options:

- **Many-to-Many NAT**
  Maps local addresses to a global address that is selected from a pool of global addresses. After pool is configured, the first available address from the pool is picked dynamically on receiving the first packet.

- **Many-to-One NAT (PAT)**
  PAT is a form of dynamic NAT where multiple local addresses are mapped to a single global address (many-to-one) using different source ports. This method is also called NAT Overloading, NAPT (Network and Port address translation), and Masquerade. The global address can be the IP address configured on the outside interface.

  Hardware entries that translate packets are created when the CLI command is processed. Entries for forward and reverse traffic are created for unicast traffic. The hardware entry for reverse traffic is not created for multicast traffic.

  Commands may include ACLs to filter packets that are cleared. Source NAT use ACLs to filter packets based on destination IP address. Destination NAT use ACLs to filter packets based on source IP address. Upon using NAT, inside usually refers to a private network while outside usually refers to a public network.

  A switch with NAT configured translates forwarded traffic between inside and outside interfaces, and the flow that matches the criteria specified for translation.

  The same IP address can't be used for the NAT static configuration and in the pool for dynamic NAT configurations. Public IP addresses must be unique. The global addresses used in static translations aren't excluded with dynamic pools containing the same global addresses.

  Hardware entries that translate packets are created when the CLI command is processed. Entries for forward and reverse traffic are created for unicast traffic. The hardware entry for reverse traffic is not created for multicast traffic.
Chapter 28: IPv4

Commands may include ACLs to filter packets that are cleared. Source NAT use ACLs to filter packets based on destination IP address. Destination NAT use ACLs to filter packets based on source IP address. When using NAT, inside usually refers to a private network while outside usually refers to a public network.

A switch with NAT configured translates forwarded traffic between inside and outside interfaces, and the flow that matches the criteria specified for translation.

Important! The same IP address can't be used for the NAT static configuration and in the pool for dynamic NAT configurations. Public IP addresses must be unique. The global addresses used in static translations aren't excluded with dynamic pools containing the same global addresses.

28.8.2.1 Configuring Dynamic NAT

Prerequisites
- Configure an ACL to specify IP addresses allowed to be translated.
- Determine if you should use an IP address as the translated source address.
- Decide on a public IP address pool for address translation.

Configure the Address Pool

The addresses used for translation are configured by issuing the `ip nat pool` command in global configuration mode.

Example
- This command configures the pool of addresses using start address, and end address.

```
switch(config)#ip nat pool p1 10.15.15.15 10.15.15.25
switch(config)#
```

Set the IP Address

The `ip address` command configures VLAN 201 with an IP address.

Example
- This command configures an IPv4 address for VLAN 201.

```
switch(config)#interface vlan 201
switch(config-if-Vl201)#ip address 10.0.0.1/24
switch(config-if-Vl201)#
```
- This command configures the dynamic NAT source address and sets the NAT overload for pool P2.

```
switch(config-if-Vl201)#ip nat source dynamic access-list ACL2 pool p2
switch(config-if-Vl201)#
```

Define the NAT Source Address for Translation

The `ip nat source dynamic` command specifies a dynamic translation from the source IP address to the pool and to overload the pool address (or addresses).

Example
- This command configures the dynamic NAT source address and sets the pool P2 NAT overload.

```
switch(config)#interface ethernet 3/1
switch(config-if-Et3/1)#ip nat source dynamic access-list ACL2 pool p2
switch(config-if-Et3/1)#
```
Specify the Timeout Values
The `ip nat translation tcp-timeout` or `ip nat translation udp-timeout` commands alter the translation timeout period for NAT translation table entries.

Example
- This command globally sets the timeout for TCP to 600 seconds.
  ```
  switch(config)# ip nat translation tcp-timeout 600
  switch(config)#
  ```
- This command globally sets the timeout for UDP to 800 seconds.
  ```
  switch(config)# ip nat translation udp-timeout 800
  switch(config)#
  ```

28.8.2.2 Verify the NAT Configuration

Display the Address Pools
The `show ip nat pool` command displays the configuration of the address pool.

Example
- This command displays all the address pools configured on the switch.
  ```
  switch#show ip nat pool
  Pool  StartIp               EndIp                 Prefix
  p1    10.15.15.15           10.15.15.25           24
  p2    10.10.15.15           10.10.15.25           22
  p3    10.12.15.15           10.12.15.25           12
  switch#
  ```

28.8.2.3 Clearing IP NAT Table Entries
Use the `clear ip nat flow translation` command to remove all or the specified NAT table entries.

Example
- This command clears all dynamic entries from the NAT table.
  ```
  switch#clear ip nat flow translation
  switch#
  ```

28.8.2.4 Dynamic NAT Configuration Considerations

Configuring Dynamic NAT Using Pools in a L2 Adjacent Network
When many-to-one dynamic NAT is configured using a NAT pool, and the next hop router for the NAT device is on the same network (L2 adjacent), then you must configure the IP addresses in the NAT pool as a secondary address on the interface.
Example

- The IP addresses in the NAT pool are configured as the secondary address on the interface.

```
switch(config)#ip nat pool p1 10.1.1.1 10.1.1.4 prefix-length 24
switch(config)#interface ethernet 1
switch(config-if-Et1)#ip nat source dynamic access-list a1 pool p1
switch(config-if-Et1)#ip address 10.1.1.1/24 secondary
switch(config-if-Et1)#ip address 10.1.1.2/24 secondary
switch(config-if-Et1)#ip address 10.1.1.3/24 secondary
switch(config-if-Et1)#ip address 10.1.1.4/24 secondary
```

Configuring Dynamic NAT Using Pool in a L3 Network

If the next hop of the NAT device is on a different subnet, then you should configure a static Null route for the IP addresses in the NAT pool. Redistribute the static route using BGP/OSPF.

Example

- Outside Interface

```
switch(config)#interface port-channel 319
switch(config-if-Po319)#ip nat source dynamic access-list dynamic-nat-m2m pool natpl-dynamic-nat-m2m
switch(config)#ip access-list dynamic-nat-m2m
switch(config-acl-dynamic-nat-m2m)#10 permit ip 192.168.93.0/24 any
switch(config)#ip nat pool natpl-dynamic-nat-m2m prefix-length 24
switch(config-natpool-p1)#range 11.3.3.2 11.3.3.10
```

- Static Null Route for Virtual IP

```
switch(config)#ip route 11.0.0.0/8 Null0
switch(config)#router ospf 1
switch(config-router-ospf)#redistribute static
```

Configuring Dynamic NAT Using Overload with ECMP Routes

Dynamic many-to-one NAT using overload (PAT) should not be configured on interfaces that form an ECMP group. When one interface in the group goes down, the return packet for connections that are already established will continue to go to the IP address of the interface that went down and will not be forwarded to the inside host. For this type of scenario, use Dynamic NAT with pool configurations.

28.8.2.5 Dynamic NAT Peer State Synchronization

The NAT peer state synchronization provides redundancy and resiliency for dynamic NAT across a pair of devices to avoid single NAT device failure. Both devices in redundant pair are active and they track new sessions and create or delete NAT entries dynamically. Essentially, an active NAT entry is maintained on both devices irrespective of who created the NAT entry.

Configuring Dynamic NAT Peer State Synchronization

The following prerequisites should be fulfilled before configuring NAT peer state synchronization on devices in a redundant pair.

- Both devices in redundant pair must be reachable across an IP address.
- NAT version on both devices in redundant pair must be compatible.
- Dynamic NAT configuration must be identical across both devices in redundant pair.
The following configuration output indicates a valid running configuration of the NAT peer state synchronization on one device.

```
ip nat pool POOL61 prefix-length 24
  range 170.24.0.2 170.24.0.200

ip access-list NatACL61
  10 permit ip 61.0.0.0/16 any

interface Port-Channel5
  mtu 9214
  no switchport
  ip address 10.0.0.1/31
  ip nat source dynamic access-list NatACL61 pool POOL61

ip nat synchronization
  peer-address 11.11.11.1
  local-interface Vlan1111
  port-range 1024 2048
```

The following limitations are applicable during NAT peer state synchronization.

- While configuring dynamic NAT peer state synchronization across peer switches, the port range values of the switches should always be disjoint to avoid virtual IP conflict.
- NAT peer state synchronization does not support asymmetrical TCP setup (SYN - SYNACK - ACK should always be hashed to the same peer.)
- The connection is only synchronized with a peer if the TCP state is established.
28.9 TCP MSS Ceiling

The TCP ceiling involves clamping the maximum segment size (MSS) in the TCP header of TCP SYN packets, if the MSS exceeds the configured ceiling limit for the interface. By clamping the MSS limit, you can avoid IP fragmentation in tunnel scenarios by ensuring this limit accommodates the extra overhead of GRE and tunnel outer IP headers.

A major use case of the TCP MSS ceiling is observed during connectivity towards cloud providers via GRE that requires asymmetric routing.

TCP MSS ceiling is supported on the following platforms:

- DCS-7020R series
- DCS-7280R series
- DCS-7280R2 series
- DCS-7500N series with R series and R2 series line cards

28.9.1 Configuring the TCP MSS Ceiling

The TCP MSS ceiling limit is set on an interface using the `tcp mss ceiling` command in the configuration mode.

TCP MSS ceiling limitations (specific to Sand platform):

- This command supports GRE tunnel interfaces and IPv4 routed interfaces in the egress direction only.
- TCP MSS ceiling is supported on IPv4 unicast packets entering the switch and the configuration has no effect on GRE transit packets post configuration of the TCP MSS ceiling.

Example

These commands configure a maximum MSS ceiling value of 1458 bytes in the egress direction on an Ethernet interface 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#no switchport
switch(config-if-Et5)#tcp mss ceiling ipv4 1458 egress
```
28.10 IPv4 GRE Tunneling

GRE tunneling supports the forwarding over IPv4 GRE tunnel interfaces. The GRE tunnel interfaces act as a logical interface that performs GRE encapsulation or decapsulation.

The following switches support the IPv4 forwarding of GRE tunnel interface.

- DCS-7020R
- DCS-7280R
- DCS-7500R

**Note**
The forwarding over GRE tunnel interface on DCS-7500R is supported only if all the line cards on the system have Jericho family chip-set.

28.10.1 Configuring GRE Tunneling Interface

On a local Arista switch
```
switch(config)#ip routing
switch(config)#interface Tunnel 10
switch(config-if-Tu10)#tunnel mode gre
switch(config-if-Tu10)#ip address 192.168.1.1/24
switch(config-if-Tu10)#tunnel source 10.1.1.1
switch(config-if-Tu10)#tunnel destination 10.1.1.2
switch(config-if-Tu10)#tunnel path-mtu-discovery
switch(config-if-Tu10)#tunnel tos 10
switch(config-if-Tu10)#tunnel ttl 10
```

On a remote Arista switch
```
switch(config)#ip routing
switch(config)#interface Tunnel 10
switch(config-if-Tu10)#tunnel mode gre
switch(config-if-Tu10)#ip address 192.168.1.2/24
switch(config-if-Tu10)#tunnel source 10.1.1.2
switch(config-if-Tu10)#tunnel destination 10.1.1.1
switch(config-if-Tu10)#tunnel path-mtu-discovery
switch(config-if-Tu10)#tunnel tos 10
switch(config-if-Tu10)#tunnel ttl 10
```

Alternative configuration for tunnel source IPv4 address
```
switch(config)#interface Loopback 10
switch(config-if-Lo10)#ip add 10.1.1.1/32
switch(config-if-Lo10)#exit

switch(config)#conf terminal
switch(config)#interface Tunnel 10
switch(config-if-Tu10)#tunnel source interface Loopback 10
```

Configuration for adding an IPv4 route over the GRE tunnel interface
```
switch(config)#ip route 192.168.100.0/24 Tunnel 10
```

**Tunnel Mode**
Tunnel Mode needs to be configured as `gre`, for GRE tunnel interface. Default value is `tunnel mode gre`.

IP address

Configures the IP address for the GRE tunnel interface. The IP address can be used for routing over the GRE tunnel interface. The configured subnet is reachable over the GRE tunnel interface and the packets to the subnet are encapsulated in the GRE header.

Tunnel Source

Specifies the source IP address for the outer IPv4 encapsulation header for packets going over the GRE tunnel interface. The tunnel source IPv4 address should be a valid local IPv4 address configured on the Arista Switch. The tunnel source can also be specified as any routed interface on the Arista Switch. The routed interface’s IPv4 address is assigned as the tunnel source IPv4 address.

Tunnel Destination

Specifies the destination IPv4 address for the outer IPv4 encapsulation header for packets going over the GRE tunnel interface. The tunnel destination IPv4 should be reachable from the Arista Switch.

Tunnel Path Mtu Discovery

Specifies if the “Do not Fragment” flag needs to set in the outer IPv4 encapsulation header for packets going over the GRE tunnel interface.

Tunnel TOS

Specifies the Tunnel type of service (ToS) value to be assigned to the outer IPv4 encapsulation header for packets going over the GRE tunnel interface. Default TOS value of 0 will be assigned if tunnel TOS is not configured.

Tunnel TTL

Specifies the TTL value to the assigned to the outer IPv4 encapsulation header for packet going over the GRE tunnel interface. The TTL value is copied from the inner IPv4 header if tunnel TTL is not configured. The tunnel TTL configuration requires the tunnel Path MTU Discovery to be configured.

28.10.2 Displaying GRE tunnel Information

- The following commands display the tunnel configuration.

```
switch#show interfaces Tunnel 10
Tunnel10 is up, line protocol is up (connected)  
Hardware is Tunnel, address is 0a01.0101.0800  
Internet address is 192.168.1.1/24  
Broadcast address is 255.255.255.255  
Tunnel source 10.1.1.1, destination 10.1.1.2  
Tunnel protocol/transport GRE/IP  
   Key disabled, sequencing disabled  
   Checksumming of packets disabled  
Tunnel TTL 10, Hardware forwarding enabled  
Tunnel TOS 10  
Path MTU Discovery  
Tunnel transport MTU 1476 bytes  
Up 3 seconds
```
switch#show gre tunnel static
Name       Index Source Destination Nexthop Interface
----------- ------- -------------- ----------------- -------------- -----------
Tunnel10    10      10.1.1.1       10.1.1.2          10.6.1.2    Ethernet6/1

switch#show tunnel fib static interface gre 10
Type 'Static Interface', index 10, forwarding Primary via 10.6.1.2, 'Ethernet6/1'
GRE, destination 10.1.1.2, source 10.1.1.1, ttl 10, tos 0xa

- Use show platform fap tcam summary to verify if the TCAM bank is allocated for GRE packet termination lookup.

switch#show platform fap tcam summary

<table>
<thead>
<tr>
<th>Bank</th>
<th>Tcam Allocation (Jericho0)</th>
<th>Used By</th>

28.11 IPv4 Commands

IP Routing and Address Commands
- agent SandL3Unicast terminate
- clear arp inspection statistics
- ip address
- ip arp inspection limit
- ip arp inspection logging
- ip arp inspection trust
- ip arp inspection vlan
- ip hardware fib ecmp resilience
- ip hardware fib optimize
- ip icmp redirect
- ip load-sharing
- ip route
- ip routing
- ip source binding
- ip verify
- ip verify source
- rib fib policy
- show ip
- show ip arp inspection vlan
- show ip arp inspection statistics
- show ip interface
- show ip interface brief
- show ip route
- show ip route age
- show ip route gateway
- show ip route host
- show ip route match tag
- show ip route summary
- show rib route ip
- show rib route <ipv4 | ipv6> fib policy excluded
- show routing-context vrf
- show vrf
- show ip verify source
- show platform arad ip route
- show platform arad ip route summary
- tcp mss ceiling

IPv4 DHCP Relay
- clear ip dhcp relay counters
- ip dhcp relay all-subnets
- ip dhcp relay all-subnets default
- ip dhcp relay always-on
- ip dhcp relay information option (Global)
- ip dhcp relay information option circuit-id
- ip helper-address
- show ip dhcp relay
- show ip dhcp relay counters
IPv4 DHCP Snooping
- clear ip dhcp snooping counters
- ip dhcp snooping
- ip dhcp snooping information option
- ip dhcp snooping vlan
- show ip dhcp snooping
- show ip dhcp snooping counters
- show ip dhcp snooping hardware

IPv4 Multicast Counters
- clear ip multicast count
- ip multicast count

IPv4 NAT
- clear ip nat flow translation
- ip nat destination static
- ip nat pool
- ip nat source dynamic
- ip nat source static
- ip nat translation counters
- ip nat translation low-mark
- ip nat translation max-entries
- ip nat translation tcp-timeout
- ip nat translation udp-timeout
- show ip nat access-list interface
- show ip nat pool
- show ip nat translation
- show ip nat synchronization peer
- show ip nat synchronization advertised-translations
- show ip nat synchronization discovered-translations

ARP Table
- arp
- arp aging timeout
- arp cache persistent
- clear arp-cache
- clear arp
- ip local-proxy-arp
- ip proxy-arp
- show arp
- show ip arp

VRF Commands
- cli vrf
- description (VRF)
- rd (VRF configuration mode)
- show routing-context vrf
- show vrf
- vrf (Interface mode)
- vrf instance
Trident Forwarding Table Commands

- platform trident forwarding-table partition
- platform trident routing-table partition
- show platform trident forwarding-table partition

IPv4 GRE Tunneling Commands

- interface tunnel
- tunnel
- show interface tunnel
- show platform fap eedb ip-tunnel gre interface tunnel
- show tunnel fib static interface gre
- show platform fap tcam summary
agent SandL3Unicast terminate

The agent SandL3Unicast terminate command restarts the platform layer 3 agent to ensure IPv4 routes are optimized.

Command Mode
  Global Configuration

Command Syntax
  agent SandL3Unicast terminate

Related Commands
  • ip hardware fib optimize enables IPv4 route scale.
  • show platform arad ip route shows resources for all IPv4 routes in hardware. Routes that use the additional hardware resources will appear with an asterisk.
  • show platform arad ip route summary shows hardware resource usage of IPv4 routes.

Example
  • This configuration command restarts the platform layer 3 agent to ensure IPv4 routes are optimized.

        switch(config)#agent SandL3Unicast terminate
        SandL3Unicast was terminated

        Restarting the platform layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.
arp

The `arp` command adds a static entry to an Address Resolution Protocol (ARP) cache. The switch uses ARP cache entries to correlate 32-bit IP addresses to 48-bit hardware addresses.

The `no arp` and `default arp` commands remove the ARP cache entry with the specified IP address. When multiple VRFs contain ARP cache entries for identical IP addresses, each entry can only be removed individually.

**Command Mode**

Global Configuration

**Command Syntax**

```
arp [VRF_INSTANCE] ipv4_addr mac_addr arpa
no arp [VRF_INSTANCE] ipv4_addr
default arp [VRF_INSTANCE] ipv4_addr
```

**Parameters**

- **VRF_INSTANCE** specifies the VRF instance being modified.
- `<no parameter>` changes are made to the default VRF.
- `vrf vrf_name` changes are made to the specified user-defined VRF.
- **ipv4_addr** IPv4 address of ARP entry.
- **mac_addr** local data-link (hardware) address (48-bit dotted hex notation – H.H.H).

**Examples**

- This command adds a static entry to the ARP cache in the default VRF.
  ```
  switch(config)#arp 172.22.30.52 0025.900e.c63c arpa
  switch(config)#
  ```

- This command adds the same static entry to the ARP cache in the VRF named "purple."
  ```
  switch(config)#arp vrf purple 172.22.30.52 0025.900e.c63c arpa
  switch(config)#
  ```
arp aging timeout

The **arp aging timeout** command specifies the duration of dynamic address entries in the Address Resolution Protocol (ARP) cache for addresses learned through the configuration mode interface. The default duration is 14400 seconds (four hours).

The **arp aging timeout** and **default arp aging timeout** commands restores the default ARP aging timeout for addresses learned on the configuration mode interface by deleting the corresponding **arp aging timeout** command from **running-config**.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
arp aging timeout arp_time
no arp aging timeout
default arp aging timeout
```

**Parameters**
- **arp_time**   ARP aging timeout period (seconds). Values range from 60 to 65535. Default value is 14400.

**Examples**
- This command specifies an ARP cache duration of 7200 seconds (two hours) for dynamic addresses added to the ARP cache that were learned through VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-V1200)#arp aging timeout 7200
switch(config-if-V1200)#show active
interface Vlan200
    arp timeout 7200
```

switch(config-if-V1200)#
arp cache persistent

The `arp cache persistent` command restores the dynamic entries in the Address Resolution Protocol (ARP) cache after reboot.

The `no arp cache persistent` and `default arp cache persistent` commands remove the ARP cache persistent configuration from the `running-config`.

**Command Mode**

- Global Configuration

**Command Syntax**

```
arp cache persistent
no arp cache persistent
default arp cache persistent
```

**Example**

- This command restores the ARP cache after reboot.

```
switch(config)#arp cache persistent
switch(config)#
```
clear arp-cache

The clear arp-cache command refreshes dynamic entries in the Address Resolution Protocol (ARP) cache. Refreshing the ARP cache updates current ARP table entries and removes expired ARP entries not yet deleted by an internal, timer-driven process.

The command, without arguments, refreshes ARP cache entries for all enabled interfaces. With arguments, the command refreshes cache entries for the specified interface. Executing clear arp-cache for all interfaces can result in extremely high CPU usage while the tables are resolving.

Command Mode
Privileged EXEC

Command Syntax
```
clear arp-cache [VRF_INSTANCE] [INTERFACE_NAME]
```

Parameters
- **VRF_INSTANCE** specifies the VRF instance for which arp data is refreshed.
  - <no parameter> specifies the context-active VRF.
  - vrf vrf_name specifies name of VRF instance. System default VRF is specified by default.
- **INTERFACE_NAME** interface upon which ARP cache entries are refreshed. Options include:
  - <no parameter> All ARP cache entries.
  - interface ethernet e_num ARP cache entries of specified Ethernet interface.
  - interface loopback l_num ARP cache entries of specified loopback interface.
  - interface management m_num ARP cache entries of specified management interface.
  - interface port-channel p_num ARP cache entries of specified port-channel Interface.
  - interface vlan v_num ARP cache entries of specified VLAN interface.
  - interface vxlan vx_num VXLAN interface specified by vx_num.

Related Commands
- cli vrf specifies the context-active VRF.

Example
- These commands display the ARP cache before and after ARP cache entries are refreshed.

```
switch#show arp
Address         Age (min)  Hardware Addr   Interface
172.22.30.1             0  001c.730b.1d15  Management1
172.22.30.118           0  001c.7301.6015  Management1

switch#clear arp-cache

switch#show arp
Address         Age (min)  Hardware Addr   Interface
172.22.30.1             0  001c.730b.1d15  Management1

switch#
```
clear arp

The clear arp command removes the specified dynamic ARP entry for the specified IP address from the Address Resolution Protocol (ARP) table.

Command Mode
Privileged EXEC

Command Syntax
```
clear arp [VRF_INSTANCE] ipv4_addr
```

Parameters
- **VRF_INSTANCE** specifies the VRF instance for which arp data is removed.
  - <no parameter> specifies the context-active VRF.
  - `vrf vrf_name` specifies name of VRF instance. System default VRF is specified by `default`.
- `ipv4_addr` IPv4 address of dynamic ARP entry.

Related Commands
- `cli vrf` specifies the context-active VRF.

Example
- These commands display the ARP table before and after the removal of dynamic ARP entry for IP address 172.22.30.52.

```
switch#show arp
Address         Age (min)  Hardware Addr   Interface
172.22.30.1     0 001c.730b.1d15  Management1
172.22.30.52    0 0025.900e.c468  Management1
172.22.30.53    0 0025.900e.c63c  Management1
172.22.30.133   0 001c.7304.3906  Management1
switch#clear arp 172.22.30.52
switch#show arp
Address         Age (min)  Hardware Addr   Interface
172.22.30.1     0 001c.730b.1d15  Management1
172.22.30.53    0 0025.900e.c63c  Management1
172.22.30.133   0 001c.7304.3906  Management1
switch#
```
clear arp inspection statistics

The clear arp inspection statistics command clears ARP inspection statistics.

Command Mode

EXEC

Command Syntax

  clear arp inspection statistics

Related Commands

- ip arp inspection limit
- ip arp inspection logging
- ip arp inspection trust
- ip arp inspection vlan
- show ip arp inspection vlan
- show ip arp inspection statistics

Examples

- This command clears ARP inspection statistics.
  
  switch(config)#clear arp inspection statistics
  switch(config)#
clear ip dhcp relay counters

The `clear ip dhcp relay counters` command resets the DHCP relay counters. The configuration mode determines which counters are reset:

- Interface configuration: command clears the counter for the configuration mode interface.

**Command Mode**

Privileged EXEC

**Command Syntax**

```
  clear ip dhcp relay counters [INTERFACE_NAME]
```

**Parameters**

- `INTERFACE_NAME` entity for which counters are cleared. Options include:
  - `<no parameter>` clears counters for the switch and for all interfaces.
  - `interface ethernet e_num` clears counters for the specified Ethernet interface.
  - `interface loopback l_num` clears counters for the specified loopback interface.
  - `interface port-channel p_num` clears counters for the specified port-channel Interface.
  - `interface vlan v_num` clears counters for the specified VLAN interface.

**Examples**

- These commands clear the DHCP relay counters for VLAN 1045 and shows the counters before and after the `clear` command.

  ```
  switch#show ip dhcp relay counters
  | Dhcp Packets |
  Interface | Rcvd Fwdd Drop | Last Cleared
  ---------|----- ----- |---------------------
  All Req | 376 376 0 | 4 days, 19:55:12 ago
  All Resp | 277 277 0 |
  Vlan1001 | 207 148 0 | 4 days, 19:54:24 ago
  Vlan1045 | 376 277 0 | 4 days, 19:54:24 ago
  
  switch#clear ip dhcp relay counters interface vlan 1045
  | Dhcp Packets |
  Interface | Rcvd Fwdd Drop | Last Cleared
  ---------|----- ----- |---------------------
  All Req | 380 380 0 | 4 days, 21:19:17 ago
  All Resp | 281 281 0 |
  Vlan1000 | 207 148 0 | 4 days, 21:19:30 ago
  Vlan1045 | 0 0 0 | 0:00:07 ago
  ```
• These commands clear all DHCP relay counters on the switch.

```yaml
switch(config-if-Vl1045)#exit
switch(config)#clear ip dhcp relay counters
switch(config)#show ip dhcp relay counters
```

<table>

clear ip dhcp snooping counters

The **clear ip dhcp snooping counters** command resets the DHCP snooping packet counters.

Command Mode
Privileged EXEC

Command Syntax

```
clear ip dhcp snooping counters [COUNTER_TYPE]
```

Parameters

- **COUNTER_TYPE**   The type of counter that the command resets. Options include:
  - <no parameter>   counters for each VLAN.
  - debug   aggregate counters and drop cause counters.

Example

- This command clears the DHCP snooping counters for each VLAN.

```
switch#clear ip dhcp snooping counters
switch#show ip dhcp snooping counters

<table>
<thead>
<tr>
<th>Vlan</th>

Last Cleared: 0:00:08 ago
```

switch#
clear ip multicast count

The clear ip multicast count command clears all counters associated with the multicast traffic.

**Command Mode**
Global Configuration

**Command Syntax**
```
clear ip multicast count [group_address [source_address]]
```

**Parameters**
- `<no parameters>` clears all counts of the multicast route traffic
- `group_address` clears the multicast traffic count of the specified group address
  - `source_address` clears the multicast traffic count of the specified group and source addresses

**Guidelines**
- This command functions only when the ip multicast count command is enabled.

**Examples**
- This command clears all counters associated with the multicast traffic.
  ```
  switch(config)#clear ip multicast count
  ```
- This command clears the multicast traffic count of the specified group address.
  ```
  switch(config)#clear ip multicast count 16.39.24.233
  ```
clear ip nat flow translation

The **clear ip nat flow translation** command clears all or the specified NAT table entries.

**Command Mode**
Privileged EXEC

**Command Syntax**
```
clear ip nat flow translation [HOST_ADDR [DEST_ADDR]] [INF] [PROT_TYPE]
```

**Parameters**

- **HOST_ADDR** Host address to be modified. Options include:
  - <no parameter> All packets with specified destination address are cleared.
  - address local_ipv4 IPv4 address.
  - address local_ipv4 local_port IPv4 address and port (port value ranges from 1 to 65535).

- **DEST_ADDR** Destination address of translated packet. Destination address can be entered only when the **HOST_ADDR** is specified. Options include:
  - <no parameter> All packets with specified destination address are cleared.
  - global_ipv4 IPv4 address.
  - global_ipv4 global_port IPv4 address and port (port value ranges from 1 to 65535).

- **INF** Route source. Options include:
  - <no parameter> All packets with specified destination address are cleared.
  - interface ethernet e_num Ethernet interface specified by e_num.
  - interface loopback l_num Loopback interface specified by l_num.
  - interface management m_num Management interface specified by m_num.
  - interface port-channel p_num Port-channel interface specified by p_num.
  - interface vlan v_num VLAN interface specified by v_num.

- **PROT_TYPE** Filters packets based on protocol type. Options include:
  - <no parameter> All packets with specified destination address are cleared.
  - tcp TCP packets with specified destination address are cleared.
  - udp UDP packets with specified destination address are cleared.

**Example**
- This command clears all dynamic entries from the NAT translation table
  ```
  switch#clear ip nat flow translation
  switch#
  ```
- This command clears a specific NAT IP address 172.22.30.52.
  ```
  switch#clear ip nat flow translation address 172.22.30.52
  switch#
  ```
- This command clears the inside entry that maps the private address 10.10.10.3 to Internet address 172.22.30.52.
  ```
  switch#clear ip nat flow translation address 172.22.30.52 10.10.10.3
  switch#
  ```
cli vrf

The **cli vrf** command specifies the context-active VRF. The context-active VRF determines the default VRF that VRF-context aware commands use when displaying routing table data.

**Command Mode**
Privileged EXEC

**Command Syntax**
```
cli vrf [VRF_ID]
```

**Parameters**
- **VRF_ID** Name of VRF assigned as the current VRF scope. Options include:
  - `vrf_name` Name of user-defined VRF.
  - `default` System-default VRF.

**Guidelines**
VRF-context aware commands include:

- `clear arp-cache`
- `show ip`
- `show ip arp`
- `show ip route`
- `show ip route gateway`
- `show ip route host`

**Related Commands**
- `show routing-context vrf` displays the context-active VRF.

**Example**
- These commands specify **magenta** as the context-active VRF, then display the context-active VRF.

```
switch#cli vrf magenta
switch#show routing-context vrf
Current VRF routing-context is magenta
switch#
```
**description (VRF)**

The `description` command adds a text string to the configuration mode VRF. The string has no functional impact on the VRF.

The `no description` and `default description` commands remove the text string from the configuration mode VRF by deleting the corresponding `description` command from `running-config`.

**Command Mode**

VRF Configuration

**Command Syntax**

```
    description label_text
    no description
    default description
```

**Parameters**

- `label_text` character string assigned to the VRF configuration.

**Related Commands**

- `vrf instance` places the switch in VRF configuration mode.

**Examples**

- These commands add description text to the magenta VRF.

  switch(config)#vrf instance magenta
  switch(config-vrf-magenta)#description This is the first vrf
  switch(config-vrf-magenta)#show active
  vrf instance magenta
  description This is the first vrf
  switch(config-vrf-magenta)#
ip address

The `ip address` command configures the IPv4 address and connected subnet on the configuration mode interface. Each interface can have one primary address and multiple secondary addresses.

The `no ip address` and `default ip address` commands remove the IPv4 address assignment from the configuration mode interface. Entering the command without specifying an address removes the primary and all secondary addresses from the interface. The primary address cannot be deleted until all secondary addresses are removed from the interface.

Removing all IPv4 address assignments from an interface disables IPv4 processing on that port.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
```plaintext
ip address ipv4_subnet [PRIORITY]
no ip address [ipv4_subnet] [PRIORITY]
default ip address [ipv4_subnet] [PRIORITY]
```

**Parameters**
- `ipv4_subnet` IPv4 and subnet address (CIDR or address-mask notation). *Running-config* stores value in CIDR notation.
- `PRIORITY` interface priority. Options include:
  - `<no parameter>` the address is the primary IPv4 address for the interface.
  - `secondary` the address is the secondary IPv4 address for the interface.

**Guidelines**
The `ip address` command is supported on routable interfaces.

**Example**
- This command configures an IPv4 address for VLAN 200.
  ```plaintext
  switch(config)#interface vlan 200
  switch(config-if-Vl200)#ip address 10.0.0.1/24
  switch(config-if-Vl200)#
  ```
**ip arp inspection limit**

The *ip arp inspection limit* command err-disables the interface if the incoming ARP rate exceeds the configured value rate limit the incoming ARP packets on an interface.

**Command Mode**

EXEC

**Command Syntax**

```
[no | default] ip arp inspection limit [RATE <pps>] [BURST_INTERVAL <sec> | none]
```

**Parameters**

- **RATE** specifies the ARP inspection limit rate in packets per second.
  - `<pps>` ARP inspection limit rate packets per second.
- **BURST_INTERVAL** specifies the ARP inspection limit burst interval.
  - `<sec>` burst interval second.

**Related Commands**

- `ip arp inspection limit`
- `ip arp inspection trust`
- `ip arp inspection vlan`
- `show ip arp inspection vlan`

**Examples**

- This command configures the rate limit of incoming ARP packets to errdisable the interface when the incoming ARP rate exceeds the configured value, sets the rate to 512 (which is the upper limit for the number of invalid ARP packets allowed per second), and sets the burst consecutive interval over which the interface is monitored for a high ARP rate to 11 seconds.

  ```
  switch(config)#ip arp inspection limit rate 512 burst interval 11
  ```

- This command displays verification of the interface specific configuration.

  ```
  switch(config)#interface Ethernet 3 / 1
  switch(config)#interface Ethernet 3 / 3
  ```

  ```
  switch(config)#ip arp inspection limit rate 20 burst interval 5
  ```

  ```
  switch(config)#ip arp inspection trust
  ```

  ```
  switch(config)#show ip arp inspection interfaces
  Interface       Trust State  Rate (pps) Burst Interval
  ---------------  ----------  ----------  ---------------
  Et3/1           Untrusted    20         5
  Et3/3           Trusted     None       N/A
  ```

  ```
  switch(config)#
  ```
**ip arp inspection logging**

The *ip arp inspection logging* command enables logging of incoming ARP packets on the interface if the rate exceeds the configured value.

**Command Mode**

EXEC

**Command Syntax**

```plaintext
[no | default] ip arp inspection logging [RATE <pps>] [BURST_INTERVAL <sec> | none]
```

**Parameters**

- **RATE** specifies the ARP inspection limit rate in packets per second.
  - `<pps>` ARP inspection limit rate packets per second.
- **BURST_INTERVAL** specifies the ARP inspection limit burst interval.
  - `<sec>` burst interval second.

**Related Commands**

- ip arp inspection limit
- ip arp inspection trust
- ip arp inspection vlan
- show ip arp inspection vlan

**Example**

- This command enables logging of incoming ARP packets when the incoming ARP rate exceeds the configured value on the interface, sets the rate to 2048 (which is the upper limit for the number of invalid ARP packets allowed per second), and sets the burst consecutive interval over which the interface is monitored for a high ARP rate to 15 seconds.

  ```plaintext
  switch(config)#ip arp inspection logging rate 2048 burst interval 15
  switch(config)#
  ```
**ip arp inspection trust**

The `ip arp inspection trust` command configures the trust state of an interface. By default, all interfaces are untrusted.

**Command Mode**

EXEC

**Command Syntax**

```
[no | default] ip arp inspection trust
```

**Related Commands**

- `ip arp inspection limit`
- `ip arp inspection logging`
- `ip arp inspection vlan`
- `show ip arp inspection vlan`

**Examples**

- This command configures the trust state of an interface.
  ```
  switch(config)#ip arp inspection trust
  switch(config)#
  ```

- This command configures the trust state of an interface to untrusted.
  ```
  switch(config)#no ip arp inspection trust
  switch(config)#
  ```

- This command configures the trust state of an interface to its default (untrusted).
  ```
  switch(config)#default ip arp inspection trust
  switch(config)#
  ```
The `ip arp inspection vlan` command enables ARP inspection. ARP requests and responses on untrusted interfaces are intercepted on specified VLANs, and intercepted packets are verified to have valid IP-MAC address bindings. All invalid ARP packets are dropped. On trusted interfaces, all incoming ARP packets are processed and forwarded without verification. By default, ARP inspection is disabled on all VLANs.

**Command Mode**

EXEC

**Command Syntax**

```
ip arp inspection vlan [LIST]
```

**Parameters**

- `LIST` specifies the VLAN interface number.

**Related Commands**

- `ip arp inspection limit`
- `ip arp inspection trust`
- `show ip arp inspection vlan`

**Examples**

- This command enables ARP inspection on VLANs 1 through 150.
  ```
  switch(config)#ip arp inspection vlan 1 - 150
  switch(config)#
  ```
- This command disables ARP inspection on VLANs 1 through 150.
  ```
  switch(config)#no ip arp inspection vlan 1 - 150
  switch(config)#
  ```
- This command sets the ARP inspection default to VLANs 1 through 150.
  ```
  switch(config)#default ip arp inspection vlan 1 - 150
  switch(config)#
  ```
- These commands enable ARP inspection on multiple VLANs 1 through 150 and 200 through 250.
  ```
  switch(config)#ip arp inspection vlan 1-150,200-250
  switch(config)#
  ```
ip dhcp relay all-subnets

The **ip dhcp relay all-subnets** command configures the DHCP smart relay status on the configuration mode interface. DHCP smart relay supports forwarding DHCP requests with a client’s secondary IP addresses in the gateway address field. Enabling DHCP smart relay on an interface requires that DHCP relay is also enabled on that interface.

By default, an interface assumes the global DHCP smart relay setting as configured by the **ip dhcp relay all-subnets default** command. The **ip dhcp relay all-subnets** command, when configured, takes precedence over the global smart relay setting.

The **no ip dhcp relay all-subnets** command disables DHCP smart relay on the configuration mode interface. The **default ip dhcp relay all-subnets** command restores the interface’s to the default DHCP smart relay setting, as configured by the **ip dhcp relay all-subnets default** command, by removing the corresponding **ip dhcp relay all-subnets** or **no ip dhcp relay all-subnets** statement from running-config.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `ip dhcp relay all-subnets`
- `no ip dhcp relay all-subnets`
- `default ip dhcp relay all-subnets`

**Examples**
- This command enables DHCP smart relay on VLAN interface 100.

```
switch(config)#interface vlan 100
switch(config-if-Vl100)#ip helper-address 10.4.4.4
switch(config-if-Vl100)#ip dhcp relay all-subnets
switch(config-if-Vl100)#show dhcp relay
DHCP Relay is active
DHCP Relay Option 82 is disabled
DHCP Smart Relay is enabled
Interface: Vlan100
    DHCP Smart Relay is enabled
    DHCP servers: 10.4.4.4
switch(config-if-Vl100)#
```

- This command disables DHCP smart relay on VLAN interface 100.

```
switch(config-if-Vl100)#no ip dhcp relay all-subnets
switch(config-if-Vl100)#show active
interface Vlan100
    no ip dhcp relay all-subnets
    ip helper-address 10.4.4.4
switch(config-if-Vl100)#show dhcp relay
DHCP Relay is active
DHCP Relay Option 82 is disabled
DHCP Smart Relay is enabled
Interface: Vlan100
    DHCP Smart Relay is enabled
    DHCP servers: 10.4.4.4
switch(config-if-Vl100)#
```
• This command enables DHCP smart relay globally, configures VLAN interface 100 to use the global setting, then displays the DHCP relay status

switch(config)#ip dhcp relay all-subnets default
switch(config)#interface vlan 100
switch(config-if-Vl100)#ip helper-address 10.4.4.4
switch(config-if-Vl100)#default ip dhcp relay
switch(config-if-Vl100)#show ip dhcp relay
DHCP Relay is active
DHCP Relay Option 82 is disabled
DHCP Smart Relay is enabled
Interface: Vlan100
  Option 82 Circuit ID: 333
  DHCP Smart Relay is enabled
  DHCP servers: 10.4.4.4
switch(config-if-Vl100)#
ip dhcp relay all-subnets default

The `ip dhcp relay all-subnets default` command configures the global DHCP smart relay setting. DHCP smart relay supports forwarding DHCP requests with a client's secondary IP addresses in the gateway address field. The default global DHCP smart relay setting is disabled.

The global DHCP smart relay setting is applied to all interfaces for which an `ip dhcp relay all-subnets` statement is not configured. Enabling DHCP smart relay on an interface requires that DHCP relay is also enabled on that interface.

The `no ip dhcp relay all-subnets default` and `default ip dhcp relay all-subnets default` commands restore the global DHCP smart relay default setting of disabled by removing the `ip dhcp relay all-subnets default` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip dhcp relay all-subnets default
no ip dhcp relay all-subnets default
default ip dhcp relay all-subnets default
```

**Related Commands**

- `ip helper-address` enables the DHCP relay agent on a configuration mode interface.
- `ip dhcp relay all-subnets` enables the DHCP smart relay agent on a configuration mode interface.

**Example**

- This command configures the global DHCP smart relay setting to `enabled`.

```
switch(config)#ip dhcp relay all-subnets default
switch(config)#
```
ip dhcp relay always-on

The **ip dhcp relay always-on** command enables the switch DHCP relay agent on the switch regardless of the DHCP relay agent status on any interface. By default, the DHCP relay agent is enabled only if at least one routable interface is configured with an **ip helper-address** statement.

The **no ip dhcp relay always-on** and **default ip dhcp relay always-on** commands remove the **ip dhcp relay always-on** command from **running-config**.

**Command Mode**

  - Global Configuration

**Command Syntax**

  - ip dhcp relay always-on
  - no ip dhcp relay always-on
  - default ip dhcp relay always-on

**Related Commands**

These commands implement DHCP relay agent.

- **ip helper-address**
- **ip dhcp relay information option (Global)**
- **ip dhcp relay information option circuit-id**

**Example**

- This command enables the DHCP relay agent.

  ```
  switch(config)#ip dhcp relay always-on
  switch(config)#
  ```
ip dhcp relay information option (Global)

The `ip dhcp relay information option` command configures the switch to attach tags to DHCP requests before forwarding them to the DHCP servers designated by `ip helper-address` commands. The `ip dhcp relay information option circuit-id` command specifies the tag contents for packets forwarded by the interface that it configures.

The `no ip dhcp relay information option` and `default ip dhcp relay information option` commands restore the switch’s default setting of not attaching tags to DHCP requests by removing the `ip dhcp relay information option` command from `running-config`.

Command Mode

Global Configuration

Command Syntax

- `ip dhcp relay information option`
- `no ip dhcp relay information option`
- `default ip dhcp relay information option`

Related Commands

These commands implement DHCP relay agent.

- `ip helper-address`
- `ip dhcp relay always-on`
- `ip dhcp relay information option circuit-id`

Example

- This command enables the attachment of tags to DHCP requests that are forwarded to DHCP server addresses.

  switch(config)#ip dhcp relay information option
  switch(config)#
**ip dhcp relay information option circuit-id**

The `ip dhcp relay information option circuit-id` command specifies the content of tags that the switch attaches to DHCP requests before they are forwarded from the configuration mode interface to DHCP server addresses specified by `ip helper-address` commands. Tags are attached to outbound DHCP requests only if the information option is enabled on the switch (`ip dhcp relay information option circuit-id`). The default value for each interface is the name and number of the interface.

The `no ip dhcp relay information option circuit-id` and `default ip dhcp relay information option circuit-id` commands restore the default content setting for the configuration mode interface by removing the corresponding command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `ip dhcp relay information option circuit-id id_label`
- `no ip dhcp relay information option circuit-id`
- `default ip dhcp relay information option circuit-id`

**Parameters**
- `id_label` Tag content. Format is alphanumeric characters (maximum 15 characters).

**Related Commands**
- `ip helper-address`
- `ip dhcp relay always-on`
- `ip dhcp relay information option (Global)`

**Example**
- This command configures `x-1234` as the tag content for packets send from VLAN 200.

```plaintext
switch(config)#interface vlan 200
switch(config-if-Vl200)#ip dhcp relay information option circuit-id x-1234
switch(config-if-Vl200)#
```
ip dhcp snooping

The `ip dhcp snooping` command enables DHCP snooping globally on the switch. DHCP snooping is a set of layer 2 processes that can be configured on LAN switches and used with DHCP servers to control network access to clients with specific IP/MAC addresses. The switch supports Option-82 insertion, which is a DHCP snooping process that allows relay agents to provide remote-ID and circuit-ID information to DHCP reply and request packets. DHCP servers use this information to determine the originating port of DHCP requests and associate a corresponding IP address to that port. DHCP servers use port information to track host location and IP address usage by authorized physical ports.

DHCP snooping uses the information option (Option-82) to include the switch MAC address (router-ID) along with the physical interface name and VLAN number (circuit-ID) in DHCP packets. After adding the information to the packet, the DHCP relay agent forwards the packet to the DHCP server as specified by the DHCP protocol.

DHCP snooping on a specified VLAN requires all of these conditions to be met:

- DHCP snooping is globally enabled.
- Insertion of option-82 information in DHCP packets is enabled.
- DHCP snooping is enabled on the specified VLAN.
- DHCP relay is enabled on the corresponding VLAN interface.

The `no ip dhcp snooping` and `default ip dhcp snooping` commands disables global DHCP snooping by removing the `ip dhcp snooping` command from `running-config`.

Command Mode

Global Configuration

Command Syntax

- `ip dhcp snooping`
- `no ip dhcp snooping`
- `default ip dhcp snooping`

Related Commands

- `ip dhcp snooping information option` enables insertion of option-82 snooping data.
- `ip helper-address` enables the DHCP relay agent on a configuration mode interface.

Example

- This command globally enables snooping on the switch, displaying DHCP snooping status prior and after invoking the command.

```
switch(config)#show ip dhcp snooping
DHCP Snooping is disabled
switch(config)#ip dhcp snooping
switch(config)#show ip dhcp snooping
DHCP Snooping is enabled
DHCP Snooping is operational on following VLANs:
  None
DHCP Snooping is configured on following VLANs:
  None
Insertion of Option-82 is disabled
switch(config)#
```
The **ip dhcp snooping information option** command enables the insertion of option-82 DHCP snooping information in DHCP packets on VLANs where DHCP snooping is enabled. DHCP snooping is a Layer 2 switch process that allows relay agents to provide remote-ID and circuit-ID information to DHCP reply and request packets. DHCP servers use this information to determine the originating port of DHCP requests and associate a corresponding IP address to that port.

DHCP snooping uses information option (Option-82) to include the switch MAC address (router-ID) along with the physical interface name and VLAN number (circuit-ID) in DHCP packets. After adding the information to the packet, the DHCP relay agent forwards the packet to the DHCP server through DHCP protocol processes.

DHCP snooping on a specified VLAN requires all of these conditions to be met:

- DHCP snooping is globally enabled.
- Insertion of option-82 information in DHCP packets is enabled.
- DHCP snooping is enabled on the specified VLAN.
- DHCP relay is enabled on the corresponding VLAN interface.

When global DHCP snooping is not enabled, the **ip dhcp snooping information option** command persists in `running-config` without any operational effect.

The **no ip dhcp snooping information option** and **default ip dhcp snooping information option** commands disable the insertion of option-82 DHCP snooping information in DHCP packets by removing the **ip dhcp snooping information option** statement from `running-config`.

### Command Mode

**Global Configuration**

### Command Syntax

```
ip dhcp snooping information option
no ip dhcp snooping information option
default ip dhcp snooping information option
```

### Related Commands

- **ip dhcp snooping** globally enables DHCP snooping.
- **ip helper-address** enables the DHCP relay agent on a configuration mode interface.

### Example

- These commands enable DHCP snooping on DHCP packets from ports on snooping-enabled VLANs. DHCP snooping was previously enabled on the switch.

  ```
  switch(config)#ip dhcp snooping information option
  switch(config)#show ip dhcp snooping
  DHCP Snooping is enabled
  DHCP Snooping is operational
  DHCP Snooping is configured on following VLANs:
    100
  DHCP Snooping is operational on following VLANs:
    100
  Insertion of Option-82 is enabled
  Circuit-id format: Interface name:Vlan ID
  Remote-id: 00:1c:73:1f:b4:38 (Switch MAC)
  switch(config)#
  ```
ip dhcp snooping vlan

The `ip dhcp snooping vlan` command enables DHCP snooping on specified VLANs. DHCP snooping is a layer 2 process that allows relay agents to provide remote-ID and circuit-ID information in DHCP packets. DHCP servers use this data to determine the originating port of DHCP requests and associate a corresponding IP address to that port. DHCP snooping is configured on a global and VLAN basis.

VLAN snooping on a specified VLAN requires each of these conditions:

- DHCP snooping is globally enabled.
- Insertion of option-82 information in DHCP packets is enabled.
- DHCP snooping is enabled on the specified VLAN.
- DHCP relay is enabled on the corresponding VLAN interface.

When global DHCP snooping is not enabled, the `ip dhcp snooping vlan` command persists in `running-config` without any operational affect.

The `no ip dhcp snooping information option` and `default ip dhcp snooping information option` commands disable DHCP snooping operability by removing the `ip dhcp snooping information option` statement from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip dhcp snooping vlan v_range
no ip dhcp snooping vlan v_range
default ip dhcp snooping vlan v_range
```

**Parameters**

- `v_range` VLANs upon which snooping is enabled. Formats include a number, a number range, or a comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.

**Related Commands**

- `ip dhcp snooping` globally enables DHCP snooping.
- `ip dhcp snooping information option` enables insertion of option-82 snooping data.
- `ip helper-address` enables the DHCP relay agent on a configuration mode interface.
Example

- These commands enable DHCP snooping globally, DHCP on VLAN interface100, and DHCP snooping on VLAN 100.

switch(config)#ip dhcp snooping
switch(config)#ip dhcp snooping information option
switch(config)#ip dhcp snooping vlan 100
switch(config)#interface vlan 100
switch(config-if-Vl100)#ip helper-address 10.4.4.4
switch(config-if-Vl100)#show ip dhcp snooping

DHCP Snooping is enabled
DHCP Snooping is operational
DHCP Snooping is configured on following VLANs:
  100
DHCP Snooping is operational on following VLANs:
  100

Insertion of Option-82 is enabled
  Circuit-id format: Interface name:Vlan ID
  Remote-id: 00:1c:73:1f:b4:38 (Switch MAC)
switch(config)#
ip hardware fib ecmp resilience

The **ip hardware fib ecmp resilience** command enables resilient ECMP for the specified IP address prefix and configures a fixed number of next hop entries in the hardware ECMP table for that prefix. In addition to specifying the maximum number of next hop addresses that the table can contain for the prefix, the command includes a redundancy factor that allows duplication of each next hop address. The fixed table space for the address is the maximum number of next hops multiplied by the redundancy factor.

Resilient ECMP is useful when it is not desirable for routes to be rehashed due to link flap, as when ECMP is being used for load balancing.

The **no ip hardware fib ecmp resilience** and **default ip hardware fib ecmp resilience** commands restore the default hardware ECMP table management by removing the **ip hardware fib ecmp resilience** command from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip hardware fib ecmp resilience net_addr capacity nhop_max redundancy duplicates
no ip hardware fib ecmp resilience net_addr
default ip hardware fib ecmp resilience net_addr
```

**Parameters**

- **net_addr**  IP address prefix managed by command. (CIDR or address-mask).
- **nhop_max**  Maximum number of nexthop addresses for specified IP address prefix. Value range varies by platform:
  - Helix: <2 to 64>
  - Trident: <2 to 32>
  - Trident II: <2 to 64>
- **duplicates**  Specifies the redundancy factor. Value ranges from 1 to 128.

**Example**

- This command configures a hardware ECMP table space of 24 entries for the IP address 10.14.2.2/24. A maximum of six next-hop addresses can be specified for the IP address. When the table contains six next-hop addresses, each appears in the table four times. When the table contains fewer than six next-hop addresses, each is duplicated until the 24 table entries are filled.

```
switch(config)#ip hardware fib ecmp resilience 10.14.2.2/24 capacity 6 redundancy 4
switch(config)#
```
ip hardware fib optimize

The `ip hardware fib optimize` command enables IPv4 route scale. The platform layer 3 agent is restarted to ensure IPv4 routes are optimized with the `agent SandL3Unicast terminate` command for the configuration mode interface.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip hardware fib optimize exact-match prefix-length <prefix-length>
<optional: prefix-length>
nof ip hardware fib optimize exact-match prefix-length <prefix-length>
<optional: prefix-length>
```

**Parameters**

- `prefix-length` The length of the prefix equal to 12, 16, 20, 24, 28, or 32. One additional prefix-length limited to the prefix-length of 32 is optional.

**Related Commands**

- `agent SandL3Unicast terminate` enables restarting the layer 3 agent to ensure IPv4 routes are optimized.
- `show platform arad ip route` shows resources for all IPv4 routes in hardware. Routes that use the additional hardware resources will appear with an asterisk.
- `show platform arad ip route summary` shows hardware resource usage of IPv4 routes.

**Examples**

- This configuration command allows configuring prefix lengths 12 and 32.

  ```
  switch(config)#ip hardware fib optimize exact-match prefix-length 12 32
  ! Please restart layer 3 forwarding agent to ensure IPv4 routes are optimized
  ```

  One of the two prefixes in this command is a prefix-length of 32, which is required in the instance where there are two prefixes. For this command to take effect, the platform layer 3 agent must be restarted.

  This configuration command restarts the platform layer 3 agent to ensure IPv4 routes are optimized.

  ```
  switch(config)#agent SandL3Unicast terminate
  SandL3Unicast was terminated
  ```

  Restarting the platform layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.

- This configuration command allows configuring prefix lengths 32 and 16.

  ```
  switch(config)#ip hardware fib optimize exact-match prefix-length 32 16
  ! Please restart layer 3 forwarding agent to ensure IPv4 routes are optimized
  ```

  One of the two prefixes in this command is a prefix-length of 32, which is required in the instance where there are two prefixes. For this command to take effect, the platform layer 3 agent must be restarted.

  This configuration command restarts the platform layer 3 agent to ensure IPv4 routes are optimized.

  ```
  switch(config)#agent SandL3Unicast terminate
  SandL3Unicast was terminated
  ```
Restarting the platform layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.

- This configuration command allows configuring prefix length 24.
  
  ```
  switch(config)#ip hardware fib optimize exact-match prefix-length 24
  ! Please restart layer 3 forwarding agent to ensure IPv4 routes are optimized
  ```

  In this instance, there is only one prefix-length, so a prefix-length of 32 is not required. For this command to take effect, the platform layer 3 agent must be restarted.

  This configuration command restarts the platform layer 3 agent to ensure IPv4 routes are optimized.

  ```
  switch(config)#agent SandL3Unicast terminate
  SandL3Unicast was terminated
  ```

  Restarting the platform layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.

- This configuration command allows configuring prefix length 32.

  ```
  switch(config)#ip hardware fib optimize exact-match prefix-length 32
  ! Please restart layer 3 forwarding agent to ensure IPv4 routes are optimized
  ```

  For this command to take effect, the platform layer 3 agent must be restarted.

  This configuration command restarts the platform layer 3 agent to ensure IPv4 routes are optimized.

  ```
  switch(config)#agent SandL3Unicast terminate
  SandL3Unicast was terminated
  ```

  Restarting the platform layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.

**Example**

- This configuration command disables configuring prefix lengths 12 and 32.

  ```
  switch(config)#no ip hardware fib optimize exact-match prefix-length 12 32
  ! Please restart layer 3 forwarding agent to ensure IPv4 routes are not optimized
  ```

  One of the two prefixes in this command is a prefix-length of 32, which is required in the instance where there are two prefixes. For this command to take effect, the platform layer 3 agent must be restarted.
### ip helper-address

The `ip helper-address` command enables the DHCP relay agent on the configuration mode interface and specifies a forwarding address for DHCP requests. An interface that is configured with multiple helper-addresses forwards DHCP requests to all specified addresses.

The `no ip helper-address` and `default ip helper-address` commands remove the corresponding `ip helper-address` command from `running-config`. Commands that do not specify an IP helper-address removes all helper-addresses from the interface.

#### Command Mode
- Interface-Ethernet Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

#### Command Syntax
```
ip helper-address ipv4_addr [vrf vrf_name] [source-address ipv4_addr | source-interface INTERFACES]]
no ip helper-address [ipv4_addr]
default ip helper-address [ipv4_addr]
```

#### Parameters
- **vrf vrf_name** specify the user-defined VRF for DHCP server.
- **ipv4_addr** specify the DHCP server address accessed by interface.
- **source-address ipv4_addr** specify the source IPv4 address to communicate with DHCP server.
- **source-interface INTERFACES** specify the source interface to communicate with DHCP server. Options include:
  - Ethernet `eth_num` specify the Ethernet interface number. Value ranges from 1 to 64.
  - Loopback `lpbck_num` specify the loopback interface number. Value ranges from 0 to 1000.
  - Management `mgmt_num` specify the management interface number. Accepted values are 1 and 2.
  - Port-Channel `int_num | sub_int_num` specify the port-channel interface number. Value of interface ranges from 1 to 2000. Value of sub-interface ranges from 1 to 4094.
  - Tunnel `tnl_num` specify the tunnel interface number. Value ranges from 0 to 255.
  - VLAN `vlan_num` specify the Ethernet interface number. Value ranges from 1 to 4094.

#### Related Commands
- `ip dhcp relay always-on`
- `ip dhcp relay information option (Global)`
- `ip dhcp relay information option circuit-id`

#### Guidelines
If the source-address parameter is specified, then the DHCP client receives an IPv4 address from the subnet of source IP address. The source-address must be one of the configured addresses on the interface.
Examples

- This command enables DHCP relay on the VLAN interface 200; and configure the switch to forward DHCP requests received on this interface to the server at 10.10.41.15.

  switch(config)# interface vlan 200
  switch(config-if-Vl200)# ip helper-address 10.10.41.15
  switch(config-if-Vl200)# show active
  interface Vlan200
    ip helper-address 10.10.41.15
  switch(config-if-Vl200)#

- This command enables DHCP relay on the interface Ethernet 1/2; and configures the switch to use 2.2.2.2 as the source IP address when relaying IPv4 DHCP messages to the server at 1.1.1.1.

  switch(config)# interface ethernet 1/2
  switch(config-if-Et1/2)# ip helper-address 1.1.1.1 source-address 2.2.2.2
  switch(config-if-Et1/2)#
**ip icmp redirect**

The *ip icmp redirect* command enables the transmission of ICMP redirect messages. Routers send ICMP redirect messages to notify data link hosts of the availability of a better route for a specific destination.

The *no ip icmp redirect* disables the switch from sending ICMP redirect messages.

**Command Mode**
- Global Configuration

**Command Syntax**

```plaintext
ip icmp redirect
no ip icmp redirect
default ip icmp redirect
```

**Example**
- This command disables the redirect messages.

```plaintext
switch(config)#no ip icmp redirect
switch(config)#show running-config
----------OUTPUT OMITTED FROM EXAMPLE----------
!
no ip icmp redirect
ip routing
!
----------OUTPUT OMITTED FROM EXAMPLE----------

switch(config)#
```
**ip load-sharing**

The `ip load-sharing` command provides the hash seed to an algorithm that the switch uses to distribute data streams among multiple equal-cost routes to an individual IPv4 subnet.

In a network topology using Equal-Cost Multipath routing, all switches performing identical hash calculations may result in hash polarization, leading to uneven load distribution among the data paths. Hash polarization is avoided when switches use different hash seeds to perform different hash calculations.

The `no ip load-sharing` and `default ip load-sharing` commands return the hash seed to the default value of zero by removing the `ip load-sharing` command from `running-config`.

**Command Mode**
- Global Configuration

**Command Syntax**

```
ip load-sharing HARDWARE seed
no ip load-sharing HARDWARE
default ip load-sharing HARDWARE
```

**Parameters**
- **HARDWARE**  The ASIC switching device. The available option depend on the switch platform. Verify available options with the CLI `?` command.
  - `arad`
  - `fm6000`
  - `petraA`
  - `trident`
- **seed**  The hash seed. Value range varies by switch platform. The default value on all platforms is 0:
  - when `HARDWARE=arad`  `seed` ranges from 0 to 2.
  - when `HARDWARE=fm6000`  `seed` ranges from 0 to 39.
  - when `HARDWARE=petraA`  `seed` ranges from 0 to 2.
  - when `HARDWARE=trident`  `seed` ranges from 0 to 5.

**Example**
- This command sets the IPv4 load sharing hash seed to one on FM6000 platform switches.
  ```
  switch(config)#ip load-sharing fm6000 1
  switch(config)#
  ```
**ip local-proxy-arp**

The `ip local-proxy-arp` command enables local proxy ARP (Address Resolution Protocol) on the configuration mode interface. When local proxy ARP is enabled, ARP requests received on the configuration mode interface will return an IP address even when the request comes from within the same subnet.

The `no ip local-proxy-arp` and `default ip local-proxy-arp` commands disable local proxy ARP on the configuration mode interface by removing the corresponding `ip local-proxy-arp` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

- `ip local-proxy-arp`
- `no ip local-proxy-arp`
- `default ip local-proxy-arp`

**Example**

- These commands enable local proxy ARP on VLAN interface 140.

```
switch(config)#interface vlan 140
switch(config-if-Vl140)#ip local-proxy-arp
switch(config-if-Vl140)#show active
interface Vlan140
    ip local-proxy-arp
switch(config-if-Vl140)#
```
**ip multicast count**

The `ip multicast count` command enables the IPv4 multicast route traffic counter of group and source addresses in either bytes or packets.

The `no ip multicast count` command deletes all multicast counters including the routes of group and source addresses.

The `no ip multicast count group_address source_address` command removes the current configuration of the specified group and source addresses. It does not delete the counter because the wildcard is still active.

The `default ip multicast count` command reverts the current counter configuration of multicast route to the default state.

**Command Mode**
Global Configuration

**Command Syntax**

```plaintext
ip multicast count [group_address [source_address] | bytes | packets]
no ip multicast count [group_address [source_address] | bytes | packets]
default ip multicast count [group_address [source_address] | bytes | packets]
```

**Parameters**

- `group_address` configures the multicast route traffic count of the specified group address
- `source_address` configures the multicast route traffic count of the specified group and source addresses
- `bytes` configures the multicast route traffic count to bytes
- `packets` configures the multicast route traffic count to packets

**Guidelines**
This command is supported on the Alta platform only.

**Examples**

- This command configures the multicast route traffic count to bytes.
  ```
  switch(config)#ip multicast count bytes
  ```

- This command configures the multicast route traffic count of the specified group and source addresses.
  ```
  switch(config)#ip multicast count 10.50.30.23 45.67.89.100
  ```

- This command deletes all multicast counters including the routes of group and source addresses.
  ```
  switch(config)#no ip multicast count
  ```

- This command reverts the current multicast route configuration to the default state.
  ```
  switch(config)#default ip multicast count
  ```
ip nat destination static

The **ip nat destination static** command enables NAT of a specified destination address for the configuration mode interface. This command installs hardware translation entries for forward and reverse unicast traffic. When the rule specifies a multicast group, the command does not install the reverse path in hardware. The command may include an access control list to filter packets for translation.

When configuring twice NAT, an arbitrary NAT group number is used to associate the source NAT and destination NAT rules. This number must be the same in both rules.

The **no ip nat destination static** and **default ip nat destination static** commands disable NAT translation of the specified destination address by removing the corresponding **ip nat destination static** command from **running_config**.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ip nat destination static ORIGINAL [FILTER] TRANSLATED [PROT_TYPE] [group group_number]
no ip nat destination static ORIGINAL [FILTER] TRANSLATED [PROT_TYPE] [group group_number]
default ip nat destination static ORIGINAL [FILTER] TRANSLATED [PROT_TYPE] [group group_number]
```

**Parameters**

- **ORIGINAL**  Destination address to be modified. Options include:
  - `local_ipv4`  IPv4 address.
  - `local_ipv4 local_port`  IPv4 address and port (port value ranges from 1 to 65535).
- **FILTER**  Access control list that filters packets. Options include:
  - `<no parameter>`  All packets with specified destination address are cleared.
  - `access-list list_name`  List that specifies the packets that are cleared. Not supported when configuring twice NAT.
- **TRANSLATED**  Destination address of translated packet. Options include:
  - `global_ipv4`  IPv4 address.
  - `global_ipv4 global_port`  IPv4 address and port (port value ranges from 1 to 65535). When configuring twice NAT, source and destination NAT rules must either both specify a port translation or both not specify a port translation.
- **PROT_TYPE**  Filters packets based on protocol type. Options include:
  - `<no parameter>`  All packets with specified destination address are cleared.
  - `protocol tcp`  TCP packets with specified destination address are cleared.
  - `protocol udp`  UDP packets with specified destination address are cleared.
- **group group_number**  Used only when configuring twice NAT, the NAT group number associates a source NAT rule with a destination NAT rule on the same interface. The group number (values range from 1 to 255) is arbitrary, but must be the same in both rules.
Example

- These commands configure VLAN 201 to translate destination address 10.24.1.10 to 168.32.14.15.

  switch(config)#interface vlan 201
  switch(config-if-Vl201)#ip nat destination static 10.24.1.10 168.32.14.15
  switch(config-if-Vl201)#

- These commands configure VLAN 201 to translate the source address 10.24.1.10 to 168.32.14.15 for all packets with IP destination addresses in the 168.10.1.1/32 subnet.

  switch(config)#ip access-list ACL2
  switch(config-acl-ACL2)#permit ip 168.10.1.1/32 any
  switch(config-acl-ACL2)#exit
  switch(config)#interface vlan 201
  switch(config-if-Vl201)#ip nat destination static 10.24.1.10 access-list ACL2 168.32.14.15
  switch(config-if-Vl201)#

- These commands configure Ethernet interface 2 to translate the local source address 10.24.1.10 to the global source address 168.32.14.15, and to translate the local destination address 10.68.104.3 to the global destination address 168.25.10.7 for all packets moving through the interface. The use of NAT group 3 is arbitrary, but must be the same in both rules.

  switch(config)#interface ethernet 2
  switch(config-if-Et2)#ip nat source static 10.24.1.10 168.32.14.15 group 3
  switch(config-if-Et2)#ip nat destination static 10.68.104.3 168.25.10.7 group 3
ip nat pool

The **ip nat pool** command identifies a pool of addresses using start address, end address, and either netmask or prefix length. If its starting IP address and ending IP address are the same, there is only one address in the address pool.

The **no ip nat pool** removes the **ip nat pool** command from **running_config**.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip nat pool pool_name [ADDRESS_SPAN] SUBNET_SIZE
no ip nat pool pool_name
default ip nat pool pool_name
```

**Parameters**

- **pool_name**  name of the IP address pool.
- **ADDRESS_SPAN**  Options include:
  - **start_addr**  The first IP address in the address pool (IPv4 addresses in dotted decimal notation).
  - **end_addr**  The last IP address in the address pool. (IPv4 addresses in dotted decimal notation).
- **SUBNET_SIZE**  this functions as a sanity check to ensure it is not a network or broadcast network. Options include:
  - **netmask ipv4_addr**  The netmask of the address pool’s network (dotted decimal notation).
  - **prefix-length <0 to 32>**  The number of bits of the netmask (of the address pool’s network) that are ones (how many bits of the address indicate network).

**Examples**

- This command configures the pool of addresses using start address, end address, and prefix length of 24.
  ```
  switch(config)#ip nat pool pool 10.15.15.15 10.15.15.25 prefix-length 24
  switch(config)
  ```
- This command removes the pool of addresses.
  ```
  switch(config)# no ip nat pool pool 10.15.15.15 10.15.15.25 prefix-length 24
  switch(config)
  ```
**ip nat source dynamic**

The `ip nat source dynamic` command enables NAT of a specified source address for packets sent and received on the configuration mode interface. This command installs hardware translation entries for forward and reverse traffic. When the rule specifies a multicast group, the command does not install the reverse path in hardware. The command may include an access control list to filter packets for translation.

The `no ip nat source dynamic` and `default ip nat source dynamic` commands disables NAT translation of the specified destination address by removing the corresponding `ip nat source dynamic` command from *running_config*.

**Note**

Ethernet and Port-channel interfaces should be configured as routed ports.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ip nat source dynamic access-list acl_name POOL_TYPE
no ip nat source dynamic access-list acl_name
default ip nat source dynamic access-list acl_name
```

**Parameters**

- `acl_name` Access control list that controls the internal network addresses eligible for NAT.
- `POOL_TYPE` Options include:
  - `overload` Translates multiple local addresses to a single global address. When overloading is enabled, conversations using the same IP address are distinguished by their TCP or UDP port number.
  - `pool pool_name` The name of the IP address pool. The pool is defined using the `ip nat pool` command.
    
    The pool option is required even if the pool has just one address. NAT uses that one address for all of the translations.
  - `pool_fullcone` Enables full cone NAT where all requests from the same internal IP address and port are mapped to the same external IP address and port.

**Example**

- This command configures the dynamic NAT source address and sets the NAT overload for pool P2.
  ```
  switch(config)#interface ethernet 3/1
  switch(config-if-Et3/1)#ip nat source dynamic access-list ACL2 pool p2
  switch#
  ```
- This command disables the NAT source translation on interface Ethernet 3/1.
  ```
  switch(config)#interface ethernet 3/1
  switch(config-if-Et3/1)# no ip nat source dynamic access-list ACL2
  switch(config-if-Et3/1)#
  ```
ip nat source static

The **ip nat source static** command enables NAT of a specified source address for the configuration mode interface. This command installs hardware translation entries for forward and reverse unicast traffic. When the rule specifies a multicast group, the command does not install the reverse path in hardware. The command may include an access control list to filter packets for translation.

When configuring twice NAT, an arbitrary NAT group number is used to associate the source NAT and destination NAT rules. This number must be the same in both rules.

The **no ip nat source static** and **default ip nat source static** commands disables NAT translation of the specified source address by removing the corresponding **ip nat source** command from **running_config**.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
```
ip nat source static ORIGINAL [FILTER] TRANSLATED [PROT_TYPE] [group group_number]
no ip nat source static ORIGINAL [FILTER] TRANSLATED [PROT_TYPE] [group group_number]
default ip nat source static ORIGINAL [FILTER] TRANSLATED [PROT_TYPE] [group group_number]
```

**Parameters**
- **ORIGINAL** Source address to be modified. Options include:
  - `original_ipv4` IPv4 address.
  - `original_ipv4 original_port` IPv4 address and port (port value ranges from 1 to 65535).
- **FILTER** Access control list that filters packets. Options include:
  - `<no parameter>` All packets with specified source address are cleared.
  - `access-list list_name` List that specifies the packets that are cleared. Not supported when configuring twice NAT.
- **TRANSLATED** Source address of translated packet. Options include:
  - `translated_ipv4` IPv4 address.
  - `translated_ipv4 translated_port` IPv4 address and port (port value ranges from 1 to 65535).
  - When configuring twice NAT, source and destination NAT rules must either both specify a port translation or both not specify a port translation.
- **PROT_TYPE** Filters packets based on protocol type. Options include:
  - `<no parameter>` All packets with specified source address are cleared.
  - `protocol tcp` TCP packets with specified source address are cleared.
  - `protocol udp` UDP packets with specified source address are cleared.
  - `group group_number` Used only when configuring twice NAT, the NAT group number associates a source NAT rule with a destination NAT rule on the same interface. The group number (values range from 1 to 255) is arbitrary, but must be the same in both rules.

**Restrictions**
- If **ORIGINAL** includes a port, **TRANSLATED** must also include a port.
- If **ORIGINAL** does not include a port, **TRANSLATED** cannot include a port.
Example

- These commands configure VLAN 101 to translate source address 10.24.1.10 to 168.32.14.15.
  ```
  switch(config)#interface vlan 101
  switch(config-if-Vl101)#ip nat source static 10.24.1.10 168.32.14.15
  ```

- These commands configure VLAN 100 to translate the source address 10.24.1.10 to 168.32.14.15 for all packets with IP destination addresses in the 168.10.1.1/32 subnet.
  ```
  switch(config)#ip access-list ACL1
  switch(config-acl-ACL1)#permit ip any 168.10.1.1/32
  switch(config-acl-ACL1)#exit
  switch(config)#interface vlan 101
  switch(config-if-Vl101)#ip nat source static 10.24.1.10 access-list ACL1 168.32.141.15
  ```

- These commands configure Ethernet interface 2 to translate the local source address 10.24.1.10 to the global source address 168.32.14.15, and to translate the local destination address 10.68.104.3 to the global destination address 168.25.10.7 for all packets moving through the interface. The use of NAT group 3 is arbitrary, but must be the same in both rules.
  ```
  switch(config)#interface ethernet 2
  switch(config-if-Et2)#ip nat source static 10.24.1.10 168.32.14.15 group 3
  switch(config-if-Et2)#ip nat destination static 10.68.104.3 168.25.10.7 group 3
  ```
The **ip nat translation counters** command enables the feature to count packets that are translated by static and twice NAT rules in hardware. Once this feature is enabled, all current rules in hardware and new rules that are configured after running this command receive policers for counting packets.

The **no ip nat translation counters** and **default ip nat translation counters** commands disable the packet counter feature for static and twice NAT connections.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip nat translation counters
no ip nat translation counters
default ip nat translation counters
```

**Guidelines**

The **ip nat translation counters** command is supported on the DCS-7150 series switches only. This command is solely intended to debug static and twice NAT translation failures in hardware. Disable this feature after completing troubleshooting. If this feature remains enabled even when the count of static connections exceed 275, it can cause unpredictable behavior including restart of FocalPointV2 agent. The restart of FocalPointV2 agent results in traffic disruption.

**Example**

- The **ip nat translation counters** command enables the packet counter feature for static and twice NAT connections. Using the **show ip nat translation hardware detail** and **show ip nat translation twice hardware detail** commands, you can verify the packet count.

```
switch(config)#ip nat translation counters
switch(config)#show ip nat translation hardware detail
Source IP           Destination IP      Translated IP     TGT Type Intf   Proto     Packets    Packets Reply

1783
**ip nat translation low-mark**

The `ip nat translation low-mark` command configures the minimum threshold that triggers the resumption of programming new NAT translation connections.

The `ip nat translation max-entries` command specifies the maximum number of NAT translation connections that can be stored. When this limit is reached, new connections are dropped instead of being programmed in hardware or software. At this point no new connections will be programmed until the number of stored entries drop below the configured low-mark, expressed as a percentage of the max-entries value. The default low mark value is 90%.

The `no ip nat translation low-mark` and `default ip nat translation low-mark` commands restores the default low-mark value by removing the `ip nat translation low-mark` command from `running_config`.

**Command Mode**

Global Configuration

**Command Syntax**

- `ip nat translation low-mark threshold`
- `no ip nat translation low-mark`
- `default ip nat translation low-mark`

**Parameters**

- `threshold` Percentage of maximum connection entries. Value ranges from 1 to 99. Default is 90.

**Examples**

- This command globally sets the translation low mark of 93%.

```bash
switch(config)#ip nat translation low-mark 93
switch(config)#
```
ip nat translation max-entries

The `ip nat translation max-entries` command specifies maximum number of NAT translation connections. After this threshold is reached, new connections are dropped until the number of programmed connections is reduced below the level specified by the `ip nat translation low-mark` command.

The `no ip nat translation max-entries` and `default ip nat translation max-entries` commands removes the maximum connection limit and resets the parameter value to zero by removing the `ip nat translation max-entries` command from `running_config`.

Command Mode

Global Configuration

Command Syntax

```
ip nat translation max-entries connections
no ip nat translation max-entries
default ip nat translation max-entries
```

Parameters

- `connections` The maximum number of NAT translation connections. Value ranges from 0 to 4294967295. Default value is 0, which removes the connection limit.

Examples

- This command limits the number of NAT translation connections the switch can store to 3000.
  
  ```
  switch(config)#ip nat translation max-entries 3000
  switch(config)#
  ```
ip nat translation tcp-timeout

The `ip nat translation tcp-timeout` command specifies the translation timeout period for translation table entries. The timeout period specifies the interval during which the switch will attempt to reuse an existing TCP translation for devices specified by table entries.

The `no ip nat translation tcp-timeout` and `default ip nat translation tcp-timeout` commands reset the timeout to its default by removing the corresponding `ip nat translation tcp-timeout` command from `running_config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip nat translation tcp-timeout period
no ip nat translation tcp-timeout
default ip nat translation tcp-timeout
```

**Parameters**

- `period` Time-out period in seconds for port translations. Value ranges from 0 to 4294967295. Default value is 86400 (24 hours).

**Examples**

- This command sets the TCP timeout for translations to 600 seconds.
  ```
  switch(config)# ip nat translation tcp-timeout 600
  switch(config)#
  ```

- This command removes the TCP translation timeout.
  ```
  switch(config)# no ip nat translation tcp-timeout
  switch(config)#
  ```
**ip nat translation udp-timeout**

The `ip nat translation udp-timeout` command specifies the translation timeout period for translation table entries. The timeout period specifies the interval the switch attempts to establish a UDP connection with devices specified by table entries.

The `no ip nat translation udp-timeout` and `default ip nat translation udp-timeout` commands disables NAT translation of the specified destination address by removing the corresponding `ip nat translation udp-timeout` command from *running-config*.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip nat translation udp-timeout period
no ip nat translation udp-timeout
default ip nat translation udp-timeout
```

**Parameters**

- `period` Value ranges from 0 to 4294967295. Default value is 300 (5 minutes).

**Examples**

- This command globally sets the timeout for UDP to 800 seconds.
  ```
  switch(config)# ip nat translation udp-timeout 800
  ```
- This command removes the timeout for UDP.
  ```
  switch(config)# no ip nat translation udp-timeout
  ```
**ip proxy-arp**

The `ip proxy-arp` command enables proxy ARP on the configuration mode interface. Proxy ARP is disabled by default.

The `no ip proxy-arp` and `default ip proxy-arp` commands disable proxy ARP on the configuration mode interface by removing the corresponding `ip proxy-arp` command from *running-config*.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ip proxy-arp
no ip proxy-arp
default ip proxy-arp
```

**Examples**

- This command enables proxy ARP on Ethernet interface 4.

  ```
  switch(config)# interface ethernet 4
  switch(config-if-Et4)# ip proxy-arp
  switch(config-if-Et4)#
  ```
ip route

The `ip route` command creates a static route. The destination is a network segment; the nexthop address is either an IPv4 address or a routable port. When multiple routes exist to a destination prefix, the route with the lowest administrative distance takes precedence.

By default, the administrative distance assigned to static routes is 1. Assigning a higher administrative distance to a static route configures it to be overridden by dynamic routing data. For example, a static route with an administrative distance value of 200 is overridden by OSPF intra-area routes, which have a default administrative distance of 110.

Tags are used by route maps to filter routes. The default tag value on static routes is 0.

Multiple routes with the same destination and the same administrative distance comprise an Equal Cost Multi-Path (ECMP) route. The switch attempts to spread outbound traffic equally through all ECMP route paths. All paths comprising an ECMP are assigned identical tag values; commands that change the tag value of a path change the tag value of all paths in the ECMP.

The `no ip route` and `default ip route` commands delete the specified static route by removing the corresponding `ip route` command from `running-config`. Commands that do not list a nexthop address remove all `ip route` statements with the specified destination from `running-config`. If an `ip route` statement exists for the same IP address in multiple VRFs, each must be removed separately. All static routes in a user-defined VRF are deleted when the VRF is deleted.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip route [VRF_INSTANCE] dest_net nexthop [DISTANCE] [TAG_OPTION] [RT_NAME]
no ip route [VRF_INSTANCE] dest_net [nexthop] [DISTANCE]
default ip route [VRF_INSTANCE] dest_net [nexthop] [DISTANCE]
```

**Parameters**

- **VRF_INSTANCE** Specifies the VRF instance being modified.
  - `<no parameter>` Changes are made to the default VRF.
  - `vrf vrf_name` Changes are made to the specified VRF.
- **dest_net** Destination IPv4 subnet (CIDR or address-mask notation).
- **nexthop** Location or access method of next hop device. Options include:
  - `ipv4_addr` An IPv4 address.
  - `null0` Null0 interface.
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-channel interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
  - `vxlan vx_num` VXLAN interface specified by `vx_num`.
- **DISTANCE** Administrative distance assigned to route. Options include:
  - `<no parameter>` Route assigned default administrative distance of one.
  - `<1-255>` The administrative distance assigned to route.
- **TAG_OPTION** static route tag. Options include:
• `<no parameter>` Assigns default static route tag of 0.
• `tag t_value` Static route tag value. `t_value` ranges from 0 to 4294967295.
• `RT_NAME` Associates descriptive text to the route. Options include:
  • `<no parameter>` No text is associated with the route.
  • `name descriptive_text` The specified text is assigned to the route.

**Related Commands**
• `ip route nexthop-group` command creates a static route that specifies a Nexthop Group to determine the Nexthop address.

**Example**
• This command creates a static route in the default VRF.
  ```
  switch(config)#ip route 172.17.252.0/24 vlan 2000
  switch(config)#
  ```
**ip routing**

The **ip routing** command enables IPv4 routing. When IPv4 routing is enabled, the switch attempts to deliver inbound packets to destination IPv4 addresses by forwarding them to interfaces or next hop addresses specified by the forwarding table.

The **no ip routing** and **default ip routing** commands disable IPv4 routing by removing the **ip routing** command from **running-config**. When IPv4 routing is disabled, the switch attempts to deliver inbound packets to their destination MAC addresses. When this address matches the switch’s MAC address, the packet is delivered to the CPU. IP packets with IPv4 destinations that differ from the switch’s address are typically discarded. The **delete-static-routes** option removes static entries from the routing table.

IPv4 routing is disabled by default.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip routing [VRF_INSTANCE]
oip routing [DELETE ROUTES] [VRF_INSTANCE]
default ip routing [DELETE ROUTES] [VRF_INSTANCE]
```

**Parameters**

- **DELETE ROUTES** Resolves routing table static entries when routing is disabled.
  - <no parameter> Routing table retains static entries.
  - **delete-static-routes** Static entries are removed from the routing table.
- **VRF_INSTANCE** specifies the VRF instance being modified.
  - <no parameter> changes are made to the default VRF.
  - **vrf vrf_name** changes are made to the specified user-defined VRF.

**Example**

- This command enables IPv4 routing.

  ```
switch(config)#ip routing
  switch(config)#
  ```
ip source binding

IP source guard (IPSG) is supported on Layer 2 Port-Channels, not member ports. The IPSG configuration on port channels supersedes the configuration on the physical member ports. Hence, source IP MAC binding entries should be configured on port channels. When configured on a port channel member port, IPSG does not take effect until this port is deleted from the port channel configuration.

Note

IP source bindings are also used by static ARP inspection.

The no ip source binding and default ip source binding commands exclude parameters from IPSG filtering, and set the default for ip source binding.

Command Mode

Interface-Ethernet Configuration

Command Syntax

```
ip source binding [IP_ADDRESS] [MAC_ADDRESS] vlan [VLAN_RANGE] interface [INTERFACE]
no ip source binding [IP_ADDRESS] [MAC_ADDRESS] vlan [VLAN_RANGE] interface [INTERFACE]
default ip source binding [IP_ADDRESS] [MAC_ADDRESS] vlan [VLAN_RANGE] interface [INTERFACE]
```

Parameters

- **IP_ADDRESS** Specifies the IP ADDRESS.
- **MAC_ADDRESS** Specifies the MAC ADDRESS.
- **VLAN_RANGE** Specifies the VLAN ID range.
- **INTERFACE** Specifies the Ethernet interface.

Related Commands

- ip verify source
- show ip verify source

Example

- This command configures source IP-MAC binding entries to IP address 10.1.1.1, MAC address 0000.aaaa.1111, VLAN ID 4094, and Ethernet interface 36.

  switch(config)#ip source binding 10.1.1.1 0000.aaaa.1111 vlan 4094 interface ethernet 36
  switch(config)#
**ip verify**

The `ip verify` command configures Unicast Reverse Path Forwarding (uRPF) for inbound IPv4 packets on the configuration mode interface. uRPF verifies the accessibility of source IP addresses in packets that the switch forwards.

uRPF defines two operational modes: strict mode and loose mode.

- **Strict mode:** uRPF verifies that a packet is received on the interface that its routing table entry specifies for its return packet.
- **Loose mode:** uRPF validation does not consider the inbound packet’s ingress interface only that there is a valid return path.

The `no ip verify` and `default ip verify` commands disable uRPF on the configuration mode interface by deleting the corresponding `ip verify` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `ip verify unicast source reachable-via RPF_MODE`
- `no ip verify unicast`
- `default ip verify unicast`

**Parameters**

- **RPF_MODE**  
  Specifies the uRPF mode. Options include:
  - `any`  
    Loose mode.
  - `rx`  
    Strict mode.
  - `rx allow-default`  
    Strict mode. All inbound packets are forwarded if a default route is defined.

**Guidelines**

The first IPv4 uRPF implementation briefly disrupts IPv4 unicast routing. Subsequent `ip verify` commands on any interface do not disrupt IPv4 routing.

**Example**

- This command enables uRPF loose mode on VLAN interface 17.
  ```
  switch(config)#interface vlan 17
  switch(config-if-Vl17)#ip verify unicast source reachable-via any
  switch(config-if-Vl17)#show active
  interface Vlan17
    ip verify unicast source reachable-via any
  switch(config-if-Vl17)#
  ```

- This command enables uRPF strict mode on VLAN interface 18.
  ```
  switch(config)#interface vlan 18
  switch(config-if-Vl18)#ip verify unicast source reachable-via rx
  switch(config-if-Vl18)#show active
  interface Vlan18
    ip verify unicast source reachable-via rx
  switch(config-if-Vl18)#
  ```
**ip verify source**

The *ip verify source* command configures IP source guard (IPSG) applicable only to Layer 2 ports. When configured on Layer 3 ports, IPSG does not take effect until this interface is converted to Layer 2.

IPSG is supported on Layer 2 Port-Channels, not member ports. The IPSG configuration on port channels supersedes the configuration on the physical member ports. Hence, source IP MAC binding entries should be configured on port channels. When configured on a port channel member port, IPSG does not take effect until this port is deleted from the port channel configuration.

The *no ip verify source* and *default ip verify source* commands exclude VLAN IDs from IPSG filtering, and set the default for *ip verify source*.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

```
  ip verify source vlan [VLAN_RANGE]
  no ip verify source [VLAN_RANGE]
  default ip verify source
```

**Parameters**

- **VLAN_RANGE** Specifies the VLAN ID range.

**Related Commands**

- *ip source binding*
- *show ip verify source*

**Example**

- This command excludes VLAN IDs 1 through 3 from IPSG filtering. When enabled on a trunk port, IPSG filters the inbound IP packets on all allowed VLANs. IP packets received on VLANs 4 through 10 on Ethernet 36 will be filtered by IPSG, while those received on VLANs 1 through 3 are permitted.

```
  switch(config)#no ip verify source vlan 1-3
  switch(config)#interface ethernet 36
  switch(config-if-Et36)#switchport mode trunk
  switch(config-if-Et36)#switchport trunk allowed vlan 1-10
  switch(config-if-Et36)#ip verify source
  switch(config-if-Et36)#
```
Platform trident forwarding-table partition

The platform trident forwarding-table partition command provides a shared table memory for L2, L3, and algorithmic LPM entries that can be partitioned in different ways.

Instead of having fixed-size tables for L2 MAC entry tables, L3 IP forwarding tables, and Longest Prefix Match (LPM) routes, the tables can be unified into a single shareable forwarding table.

**Important!** Changing the Unified Forwarding Table mode causes the forwarding agent to restart, briefly disrupting traffic forwarding on all ports.

The no platform trident forwarding-table partition and default platform trident forwarding-table partition commands remove the platform trident forwarding-table partition command from running-config.

**Command Mode**
Global Configuration

**Command Syntax**

```
platform trident forwarding-table partition SIZE
no platform trident forwarding-table partition
default platform trident forwarding-table partition
```

**Parameters**

- **SIZE** Size of partition. Options include:
  - 0 288k L2 entries, 16k host entries, 16k lpm entries
  - 1 224k L2 entries, 80k host entries, 16k lpm entries
  - 2 160k L2 entries, 144k host entries, 16k lpm entries
  - 3 96k L2 entries, 208k host entries, 16k lpm entries

  Default value is 2 (160k L2 entries, 144k host entries, 16k lpm entries).

**Example**

- This command sets the single shareable forwarding table to option 2 that supports 160k L2 entries, 144k host entries, and 16k LPM entries.

  ```
  switch(config)# platform trident forwarding-table partition 2
  switch(config)
  ```

- This command sets the single shareable forwarding table to option 3 that supports 96k L2 entries, 208k host entries, and 16k LPM entries. Since the switch was previously configured to option 2, you'll see a warning notice before the changes are implemented.

  ```
  #switch(config)# platform trident forwarding-table partition 3
  Warning: StrataAgent will restart immediately
  ```
platform trident routing-table partition

The platform trident routing-table partition command manages the partition sizes for the hardware LPM table that stores IPv6 routes of varying sizes.

An IPv6 route of length /64 (or shorter) requires half the hardware resources of an IPv6 route that is longer than /64. The switch installs routes of varying lengths in different table partitions. This command specifies the size of these partitions to optimize table usage.

Important! Changing the routing table partition mode causes the forwarding agent to restart, briefly disrupting traffic forwarding on all ports

The no platform trident routing-table partition and default platform trident routing-table partition commands restore the default partitions sizes by removing the platform trident routing-table partition command from running-config.

Command Mode
Global Configuration

Command Syntax

- platform trident routing-table partition SIZE
- no platform trident routing-table partition
- default platform trident routing-table partition

Parameters
- SIZE Size of partition. Options include:
  - 1 16k IPv4 entries, 6k IPv6 (/64 and smaller) entries, 1k IPv6 (any prefix length)
  - 2 16k IPv4 entries, 4k IPv6 (/64 and smaller) entries, 2k IPv6 (any prefix length)
  - 3 16k IPv4 entries, 2k IPv6 (/64 and smaller) entries, 3k IPv6 (any prefix length)

Default value is 2 (16k IPv4 entries, 4k IPv6 (/64 and smaller) entries, 2k IPv6 (any prefix length).

Restrictions
Partition allocation cannot be changed from the default setting when uRPF is enabled for IPv6 traffic.

Example
- This command sets the shareable routing table to option 1 that supports 6K prefixes equal to or shorter than /64 and 1K prefixes longer than /64.

  switch(config)#platform trident routing-table partition 1
  switch(config)
rd (VRF configuration mode)

The `rd` command issued in VRF Configuration Mode is a legacy command supported for backward compatibility. To configure a route distinguisher (RD) for a VRF, use the `rd (Router-BGP VRF and VNI Configuration Modes)` command.

**Note**
Legacy RDs that were assigned to a VRF in VRF Configuration Mode will still appear in `show vrf` outputs if an RD has not been configured in Router-BGP VRF Configuration Mode, but they no longer have an effect on the system.
rib fib policy

The rib fib policy command enables FIB policy for a particular VRF under router general configuration mode. The FIB policy can be configured to advertise only specific RIB routes and exclude all other routes.

For example, a FIB policy can be configured that will not place routes associated with a specific origin in the routing table. These routes will not be used to forward data packets and these routes are not advertised by the routing protocol to neighbors.

The no rib fib policy and default rib fib policy commands restore the switch to its default state by removing the corresponding rib fib policy command from running-config.

Command Mode

Router General Configuration

Command Syntax

```
rib <ipv4|ipv6> fib policy <name>
no rib <ipv4|ipv6> fib policy <name>
default rib <ipv4|ipv6> fib policy <name>
```

Parameters

- ipv4 IPv4 configuration commands.
- ipv6 IPv6 configuration commands.
- name Route map name.

Example

- The following example enables FIB policy for IPv4 in the default VRF, using the route map, map1.

```
Switch(config)#router general
Switch(config-router-general)#vrf default
Switch(config-router-general-vrf-default)#rib ipv4 fib policy map1
```
show arp

The `show arp` command displays all ARP tables. This command differs from the `show ip arp` command in that it shows MAC bindings for all protocols, whereas `show ip arp` only displays MAC address – IP address bindings. Addresses are displayed as their host name by including the `resolve` argument.

**Command Mode**

EXEC

**Command Syntax**

```
show arp [VRF_INST] [FORMAT] [HOST_ADD] [HOST_NAME] [INTF] [MAC_ADDR] [DATA]
```

**Parameters**

The `VRF_INST` and `FORMAT` parameters are always listed first and second. The `DATA` parameter is always listed last. All other parameters can be placed in any order.

- **VRF_INST**  
  - <no parameter>  context-active VRF.
  - `vrf vrf_name` specifies name of VRF instance. System default VRF is specified by `default`.
- **FORMAT**  
  - <no parameter> entries associate hardware address with an IPv4 address.
  - `resolve` entry associate hardware address with a host name (if it exists).
- **HOST_ADD**  
  - <no parameter> routing table entries are not filtered by host address.
  - `ipv4_addr` table entries matching specified IPv4 address.
- **HOST_NAME**  
  - <no parameter> routing table entries are not filtered by host name.
  - `host hostname` entries matching `hostname` (text).
- **INTF**  
  - <no parameter> Routing table entries are not filtered by interface.
  - `interface ethernet e_num` Routed Ethernet interface specified by `e_num`.
  - `interface loopback l_num` Routed loopback interface specified by `l_num`.
  - `interface management m_num` Routed management interface specified by `m_num`.
  - `interface port-channel p_num` Routed port channel Interface specified by `p_num`.
  - `interface vlan v_num` VLAN interface specified by `v_num`.
  - `interface vxlan vx_num` VXLAN interface specified by `vx_num`.
- **MAC_ADDR**  
  - <no parameter> Routing table entries are not filtered by interface MAC address.
  - `mac_address mac_address` entries matching `mac_address` (dotted hex notation – H.H.H).
- **DATA**  
  - <no parameter> Detail of information provided by command. Options include:
  - `summary` Summary of ARP table entries.
  - `summary total` Number of ARP table entries.

**Related Commands**

- `cli vrf` specifies the context-active VRF.
Example

- This command displays the ARP table.

  switch> **show arp**

  Address | Age (min) | Hardware Addr | Interface
  172.22.30.1 | 0 | 001c.730b.1d15 | Management1
  172.22.30.133 | 0 | 001c.7304.3906 | Management1

  switch>
**show ip**

The `show ip` command displays IPv4 routing, IPv6 routing, IPv4 multicast routing, and VRRP status on the switch.

**Command Mode**

- EXEC

**Command Syntax**

- `show ip`

**Example**

- This command displays IPv4 routing status.

```
switch>show ip

IP Routing : Enabled
IP Multicast Routing : Disabled
VRRP: Configured on 0 interfaces

IPv6 Unicast Routing : Enabled
IPv6 ECMP Route support : False
IPv6 ECMP Route nexthop index: 5
IPv6 ECMP Route num prefix bits for nexthop index: 10

switch>
```
show ip arp

The show ip arp command displays ARP cache entries that map an IPv4 address to a corresponding MAC address. The table displays addresses by their host names when the command includes the resolve argument.

Command Mode
EXEC

Command Syntax
show ip arp [VRF_INST] [FORMAT] [HOST_ADDR] [HOST_NAME] [INTF] [MAC_ADDR] [DATA]

Parameters
The VRF_INST and FORMAT parameters are always listed first and second. The DATA parameter is always listed last. All other parameters can be placed in any order.

- **VRF_INST** specifies the VRF instance for which data is displayed.
  - <no parameter> context-active VRF.
  - vrf vrf_name specifies name of VRF instance. System default VRF is specified by default.
- **FORMAT** Display format of host address. Options include:
  - <no parameter> entries associate hardware address with an IPv4 address.
  - resolve entry associate hardware address with a host name (if it exists).
- **HOST_ADDR** IPv4 address by which routing table entries are filtered. Options include:
  - <no parameter> routing table entries are not filtered by host address.
  - ipv4_addr table entries matching specified IPv4 address.
- **HOST_NAME** Host name by which routing table entries are filtered. Options include:
  - <no parameter> routing table entries are not filtered by host name.
  - host hostname entries matching hostname (text).
- **INTERFACE_NAME** interfaces for which command displays status.
  - <no parameter> Routing table entries are not filtered by interface.
  - interface ethernet e_num Routed Ethernet interface specified by e_num.
  - interface loopback l_num Routed loopback interface specified by l_num.
  - interface management m_num Routed management interface specified by m_num.
  - interface port-channel p_num Routed port channel Interface specified by p_num.
  - interface vlan v_num VLAN interface specified by v_num.
  - interface vxlan vx_num VXLAN interface specified by vx_num.
- **MAC_ADDR** MAC address by which routing table entries are filtered. Options include:
  - <no parameter> Routing table entries are not filtered by interface MAC address.
  - mac_address mac_address entries matching mac_address (dotted hex notation – H.H.H).
- **DATA** Detail of information provided by command. Options include:
  - <no parameter> Routing table entries.
  - summary Summary of ARP table entries.
  - summary total Number of ARP table entries.

Related Commands
- cli vrf specifies the context-active VRF.
Examples

- This command displays ARP cache entries that map MAC addresses to IPv4 addresses.

  ```
  switch>show ip arp
  Address         Age (min)  Hardware Addr   Interface
  172.25.0.2              0  004c.6211.021e  Vlan101, Port-Channel2
  172.22.0.1              0  004c.6214.3699  Vlan1000, Port-Channel1
  172.22.0.2              0  004c.6219.a0f3  Vlan1000, Port-Channel1

  switch>
  ```
**show ip arp inspection vlan**

The **show ip arp inspection vlan** command displays the configuration and operation state of ARP inspection. For a VLAN range specified, only VLANs with ARP inspection enabled will be displayed. If no VLAN is specified, all VLANs with ARP inspection enabled are displayed. The operation state turns to **Active** when hardware is ready to trap ARP packets for inspection.

**Command Mode**

EXEC

**Command Syntax**

```
show ip arp inspection vlan [LIST]
```

**Parameters**

- **LIST** specifies the VLAN interface number.

**Related Commands**

- ip arp inspection limit
- ip arp inspection trust
- show ip arp inspection statistics

**Example**

- This command displays the configuration and operation state of ARP inspection for VLANs 1 through 150.

```
switch(config)#show ip arp inspection vlan 1 - 150
VLAN 1
-------
Configuration  : Enabled
Operation State : Active
VLAN 2
-------
Configuration  : Enabled
Operation State : Active
{...}
VLAN 150
-------
Configuration  : Enabled
Operation State : Active

switch(config)#
```
show ip arp inspection statistics

The `show ip arp inspection statistics` command displays the statistics of inspected ARP packets. For a VLAN specified, only VLANs with ARP inspection enabled will be displayed. If no VLAN is specified, all VLANs with ARP inspection enabled are displayed.

**Command Mode**

EXEC

**Command Syntax**

```
show ip arp inspection statistics [vlan [VID] | [INTERFACE] interface <intf_slot/intf_port>]
```

**Parameters**

- `VID` specifies the VLAN interface ID.
- `INTERFACE` specifies the interface (e.g., Ethernet).
  - `<intf_slot>` interface slot.
  - `<intf_port>` interface port.
- `INTF` specifies the VLAN interface slot and port.

**Related Commands**

- `ip arp inspection limit`
- `ip arp inspection trust`
- `show ip arp inspection vlan`

**Examples**

- This command display statistics of inspected ARP packets for VLAN 10.

```
switch(config)#show ip arp inspection statistics vlan 10
Vlan : 10
--------
ARP
  Req Forwarded = 20
  ARP Res Forwarded = 20
  ARP Req Dropped = 1
  ARP Res Dropped = 1
Last invalid ARP:
  Time: 10:20:30 ( 5 minutes ago )
  Reason: Bad IP/Mac match
  Received on: Ethernet 3/1
  Packet:
    Source MAC: 00:01:00:01:00:01
    Dest MAC: 00:02:00:02:00:02
    ARP Type: Request
    ARP Sender MAC: 00:01:00:01:00:01
    ARP Sender IP: 1.1.1

switch(config)#
```
This command displays ARP inspection statistics for Ethernet interface 3/1.

```
switch(config)#show ip arp inspection statistics ethernet interface 3/1
Interface : 3/1
--------
ARP Req Forwarded = 10
ARP Res Forwarded = 10
ARP Req Dropped = 1
ARP Res Dropped = 1

Last invalid ARP:
Time: 10:20:30 ( 5 minutes ago )
Reason: Bad IP/Mac match
Received on: VLAN 10
Packet:
  Source MAC: 00:01:00:01:00:01
  Dest MAC: 00:02:00:02:00:02
  ARP Type: Request
  ARP Sender MAC: 00:01:00:01:00:01
  ARP Sender IP: 1.1.1

switch(config)#
```
show ip dhcp relay

The `show ip dhcp relay` command displays the DHCP relay agent configuration status on the switch.

**Command Mode**

EXEC

**Command Syntax**

`show ip dhcp relay`

**Example**

- This command displays the DHCP relay agent configuration status.

```
switch>show ip dhcp relay
DHCP Relay is active
DHCP Relay Option 82 is disabled
DHCP Smart Relay is enabled
Interface: Vlan100
  DHCP Smart Relay is disabled
  DHCP servers: 10.4.4.4
switch>
```
**show ip dhcp relay counters**

The **show ip dhcp relay counters** command displays the number of DHCP packets received, forwarded, or dropped on the switch and on all interfaces enabled as DHCP relay agents.

**Command Mode**

EXEC

**Command Syntax**

`show ip dhcp relay counters`

**Example**

- This command displays the IP DHCP relay counter table.

```
switch>show ip dhcp relay counters

<table>
<thead>
<tr>
<th>Dhcp Packets</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
</tr>
<tr>
<td>------------</td>
</tr>
<tr>
<td>All Req</td>
</tr>
<tr>
<td>All Resp</td>
</tr>
<tr>
<td>Vlan1000</td>
</tr>
<tr>
<td>Vlan1036</td>
</tr>
</tbody>
</table>
```

switch>
show ip dhcp snooping

The `show ip dhcp snooping` command displays the DHCP snooping configuration.

**Command Mode**

EXEC

**Command Syntax**

`show ip dhcp snooping`

**Related Commands**

- `ip dhcp snooping` globally enables DHCP snooping.
- `ip dhcp snooping vlan` enables DHCP snooping on specified VLANs.
- `ip dhcp snooping information option` enables insertion of option-82 snooping data.
- `ip helper-address` enables the DHCP relay agent on a configuration mode interface.

**Example**

- This command displays the switch’s DHCP snooping configuration.

```
switch>show ip dhcp snooping
DHCP Snooping is enabled
DHCP Snooping is operational
DHCP Snooping is configured on following VLANs:
  100
DHCP Snooping is operational on following VLANs:
  100
Insertion of Option-82 is enabled
  Circuit-id format: Interface name:Vlan ID
  Remote-id: 00:1c:73:1f:b4:38 (Switch MAC)
switch>
```
show ip dhcp snooping counters

The `show ip dhcp snooping counters` command displays counters that track the quantity of DHCP request and reply packets that the switch receives. Data is either presented for each VLAN or aggregated for all VLANs with counters for packets dropped.

**Command Mode**
EXEC

**Command Syntax**
```
show ip dhcp snooping counters [COUNTER_TYPE]
```

**Parameters**
- **COUNTER_TYPE** The type of counter that the command resets. Formats include:
  - `<no parameter>` command displays counters for each VLAN.
  - `debug` command displays aggregate counters and drop cause counters.

**Example**
- This command displays the number of DHCP packets sent and received on each VLAN.

  switch> `show ip dhcp snooping counters`
  
<table>
<thead>
<tr>
<th>Dhcp Request Pkts</th>
<th>Dhcp Reply Pkts</th>
<th>Vlan</th>
<th>Rcvd Fwdd Drop</th>
<th>Rcvd Fwdd Drop</th>
<th>Last Cleared</th>
</tr>
</thead>
<tbody>
<tr>
<td>-------</td>
<td>------</td>
<td>--------</td>
<td>------</td>
<td>---------------</td>
<td>---------------</td>
</tr>
<tr>
<td>100</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

  switch>

- This command displays the number of DHCP packets sent on the switch.

  switch> `show ip dhcp snooping counters debug`
  
  Counter Snoping to Relay Relay to Snooping
  ------------------------------- -------------------------------
  Received 0 0
  Forwarded 0 0
  Dropped - Invalid VlanId 0 0
  Dropped - Parse error 0 0
  Dropped - Invalid Dhcp Otype 0 0
  Dropped - Invalid Info Option 0 0
  Dropped - Snooping disabled 0 0

  Last Cleared: 3:37:18 ago
  switch>
show ip dhcp snooping hardware

The `show ip dhcp snooping hardware` command displays internal hardware DHCP snooping status on the switch.

**Command Mode**

EXEC

**Command Syntax**

    show ip dhcp snooping hardware

**Example**

- This command DHCP snooping hardware status.

    switch>show ip dhcp snooping hardware
    DHCP Snooping is enabled
    DHCP Snooping is enabled on following VLANs:
    None
    Vlans enabled per Slice
    Slice:  FixedSystem
    None

    switch>
show ip interface

The **show ip interface** command displays the status of specified interfaces that are configured as routed ports. The command provides the following information:

- Interface description
- Internet address
- Broadcast address
- Address configuration method
- Proxy-ARP status
- MTU size

**Command Mode**
EXEC

**Command Syntax**

```
show ip interface [INTERFACE_NAME] [VRF_INST]
```

**Parameters**

- **INTERFACE_NAME**  interfaces for which command displays status.
  - <no parameter>  all routed interfaces.
  - ipv4_addr  Neighbor IPv4 address.
  - ethernet e_range  Routed Ethernet interfaces specified by e_range.
  - loopback l_range  Routed loopback interfaces specified by l_range.
  - management m_range  Routed management interfaces specified by m_range.
  - port-channel p_range  Routed port channel Interfaces specified by p_range.
  - vlan v_range  VLAN interfaces specified by v_range.
  - vxlan vx_range  VXLAN interfaces specified by vx_range.
- **VRF_INST**  specifies the VRF instance for which data is displayed.
  - <no parameter>  context-active VRF.
  - vrf vrf_name  specifies name of VRF instance. System default VRF is specified by **default**.

**Example**

- This command displays IP status of configured VLAN interfaces numbered between 900 and 910.

```
switch>show ip interface vlan 900-910
! Some interfaces do not exist
Vlan901 is up, line protocol is up (connected)
  Description: ar.pqt.mlag.peer
  Internet address is 170.23.254.1/30
  Broadcast address is 255.255.255.255
  Address determined by manual configuration
  Proxy-ARP is disabled
  MTU 9212 bytes
Vlan903 is up, line protocol is up (connected)
  Description: ar.pqt.rn.170.23.254.16/29
  Internet address is 170.23.254.19/29
  Broadcast address is 255.255.255.255
  Address determined by manual configuration
  Proxy-ARP is disabled
  MTU 9212 bytes
```
This command displays the configured TCP maximum segment size (MSS) ceiling value of 1436 bytes for an Ethernet interface 25.

switch>show ip interface ethernet 25
Ethernet25 is up, line protocol is up (connected)
  Internet address is 10.1.1.1/24
  Broadcast address is 255.255.255.255
  IPv6 Interface Forwarding : None
  Proxy-ARP is disabled
  Local Proxy-ARP is disabled
  Gratuitous ARP is ignored
  IP MTU 1500 bytes
IPv4 TCP MSS egress ceiling is 1436 bytes
show ip interface brief

Use the `show ip interface brief` command output to display the status summary of the specified interfaces that are configured as routed ports. The command provides the following information for each specified interface:

- IP address
- Operational status
- Line protocol status
- MTU size

**Command Mode**

EXEC

**Command Syntax**

`show ip interface [INTERFACE_NAME][VRF_INST] brief`

**Parameters**

- `INTERFACE_NAME` interfaces for which command displays status.
  - `<no parameter>` all routed interfaces.
  - `ipv4_addr` Neighbor IPv4 address.
  - `ethernet e_range` Routed Ethernet interfaces specified by `e_range`.
  - `loopback l_range` Routed loopback interfaces specified by `l_range`.
  - `management m_range` Routed management interfaces specified by `m_range`.
  - `port-channel p_range` Routed port channel Interfaces specified by `p_range`.
  - `vlan v_range` VLAN interfaces specified by `v_range`.
  - `vxlan vx_range` VXLAN interface range specified by `vx_range`.
- `VRF_INST` specifies the VRF instance for which data is displayed.
  - `<no parameter>` context-active VRF.
  - `vrf vrf_name` specifies name of VRF instance. System default VRF is specified by `default`.

**Example**

- This command displays the summary status of VLAN interfaces 900-910

  ```
  switch#show ip interface vlan 900-910 brief
  ! Some interfaces do not exist
  Interface    IP Address      Status  Protocol  MTU
  Vlan901      170.33.254.1/30  up      up       9212
  Vlan902      170.33.254.14/29 up      up       9212
  Vlan905      170.33.254.17/29  up      up       1500
  Vlan907      170.33.254.67/29  up      up       9212
  Vlan910      170.33.254.30/30  up      up       9212
  ```
show ip nat access-list interface

The **show ip nat acl interface** command displays the access control lists (ACLs) that are configured as source NAT or destination NAT filters. The display indicates ACL rules that do not comply with these NAT requirements:

- Source IP address is *any*.
- Destination IP address may use any mask size.
- Source port matching is not allowed.
- Protocol matching is not allowed.

**Command Mode**

EXEC

**Command Syntax**

```
show ip nat access-list [INTF] [LISTS]
```

**Parameters**

- **INTF** Filters NAT statements by interface. Options include:
  - `<no parameter>` includes all statements on all interfaces.
  - `interface ethernet e_num` Statements on specified Ethernet interface.
  - `interface loopback l_num` Statements on specified Loopback interface.
  - `interface management m_num` Statements on specified Management interface.
  - `interface port-channel p_num` Statements on specified Port-Channel Interface.
  - `interface vlan v_num` Statements on specified VLAN interface.
  - `interface vxlan vx_num` Statements on specified VXLAN interface.
- **LISTS** ACLs displayed by command. Options include:
  - `<no parameter>` all ACLs.
  - `acl_name` Specifies individual ACL.

**Example**

- These commands display the NAT command usage of the ACL1 and ACL2 access control lists.

```
switch>show ip nat acl ACL1
acl ACL1
   (0.0.0.0/0, 168.10.1.1/32)
Interfaces using this ACL for Nat:
   Vlan100

switch>show ip nat acl ACL2
acl ACL2
   (168.10.1.1/32, 0.0.0.0/0)
Interfaces using this ACL for Nat:
   Vlan201
switch>
```
**show ip nat pool**

The *show ip nat pool* command displays the configuration of the address pool.

**Command Mode**

EXEC

**Command Syntax**

```
show ip nat pool  POOL_SET
```

**Parameters**

- *pool_name*  The name of the pool.
- *POOL_SET*  Options include:
  - `<no parameter>`  all configured port channels.
  - *pool_name*  The name of the pool.

**Example**

- This command displays all the address pools configured on the switch.

```
switch# show ip nat pool
Pool | StartIp | EndIp | Prefix
p1   | 10.15.15.15 | 10.15.15.25 | 24
p2   | 10.10.15.15 | 10.10.15.25 | 22
p3   | 10.12.15.15 | 10.12.15.25 | 12
switch#
```

- These commands display specific information for the address pools configured on the switch.

```
switch# show ip nat pool p1
Pool | StartIp | EndIp | Prefix
p1   | 4.1.1.1  | 4.1.1.2  | 24
     | 1.1.1.1  | 1.1.1.2  | 24
     | 3.1.1.1  | 3.1.1.2  | 24
switch# show ip nat pool p2
Pool | StartIp | EndIp | Prefix
p2   | 10.1.1.1 | 10.1.1.2 | 16
switch#
```
**show ip nat translation**

The `show ip nat translation` command displays configured NAT statements in the switch hardware.

**Command Mode**

EXEC

**Command Syntax**

```
show ip nat translation [address | address-only | destination | detail | dynamic
| hardware | interface | kernel | max-entries | source | static | summary | twice]
```

Command position of all parameters are interchangeable.

**Parameters**

- `<no parameter>` displays all NAT connections installed in software.
- `address ipv4_addr` displays NAT connections of the specified IPv4 host address.
- `address-only ipv4_addr` displays address-only NAT connections of the specified IPv4 host address.
- `destination` displays destination NAT connections installed in software.
- `detail` displays detailed output of all NAT connections.
- `dynamic` displays dynamic NAT connections.
- `hardware` displays NAT connections installed in hardware.
- `interface` Filters NAT connections by interface. Options include:
  - `interface ethernet e_num` displays NAT connections of the specified ethernet interface.
  - `interface port-channel p_num` displays NAT connections of the specified port-channel interface.
  - `interface vlan v_num` displays NAT connections of the specified VLAN interface.
- `kernel` displays NAT connections installed in kernel.
- `max-entries` displays the configured NAT connection limits of a hardware.
- `source` displays source NAT connections installed in software.
- `static` displays static NAT connections.
- `summary` displays summary of all NAT connections.
- `twice` displays twice NAT connections.

**Example**

- This command displays all configured NAT translations.
  ```
  switch>show ip nat translation
  Source IP            Destination IP        Translated IP         TGT Type Intf
  ----------------------------------------------------------------------
  -
  192.152.1.10:20342   172.22.22.40:80       172.17.254.161:22222  SRC STAT Vl3945
  switch#
  ```
- This command displays NAT connections of the specified ethernet interface.
  ```
  switch>show ip nat translation dynamic interface Ethernet 26
  Source IP            Destination IP        Translated IP         TGT Type Intf
  ----------------------------------------------------------------------
  -
  192.168.1.12:8080    10.1.1.5:600          20.1.1.5:8080         SRC DYN Et26
  ```
This command displays the configured NAT connection limits of a hardware.

```
switch> show ip nat translation max-entries
Global connection limit 100
Global connection limit low mark 90 (90%)
Hosts connection limit 20
Hosts connection limit low mark 18 (90%)
Total number of connections 1
Host Max-Entries Low-Mark Connections
-----------------------------------------------
10.1.1.1 10 9 (90%) 0
```
show ip nat synchronization peer

The `show ip nat synchronization peer` command displays the detailed status of a peer device.

**Command Mode**

EXEC

**Command Syntax**

`show ip nat synchronization peer`

**Example**

- This command displays details of a peer device with an IP address of 11.11.11.0 and interface Vlan1111 that is used to connect to the peer device.

```
switch#show ip nat synchronization peer
Description : Value
Peer : 11.11.11.0
Connection Port : 4532
Connection Source : 0.0.0.0
Kernel Interface : vlan1111
Local Interface : Vlan1111
Established Time : 1969-12-31 16:00:00
Connection Attempts : 0
Oldest Supported Version : 1
Newest Supported Version : 1
Version Compatible : True
Connection State : connected
Shutdown State : False
Status Mount State : mountMounted
Version Mount State : mountMounted
Recover Mount State : mountMounted
Reboot Mount State : mountMounted
```
show ip nat synchronization advertised-translations

The **show ip nat synchronization advertised-translations** command displays the detailed status of devices that are advertised to a peer device.

**Command Mode**

EXEC

**Command Syntax**

```
show ip nat synchronization advertised-translations
```

**Example**

- This command displays details of devices that are advertised to a peer device.

```
switch#show ip nat synchronization advertised-translations
Source IP       Destination IP     Translated IP              TGT  Type Intf
-----------------------------------------------------------------------------
61.0.0.15:6661   100.0.0.2:80     192.170.230.171:6661    SRC  DYN  Et5
61.0.0.41:2245   100.0.0.2:80     192.170.230.170:2245    SRC  DYN  Et5

```
show ip nat synchronization discovered-translations

The `show ip nat synchronization discovered-translations` command displays details of what has been advertised from a peer device.

**Command Mode**

EXEC

**Command Syntax**

`show ip nat synchronization discovered-translations`

**Example**

- This command displays details of devices that are advertised to a peer device.

```plaintext
switch#show ip nat synchronization discovered-translations
Source IP       Destination IP    Translated IP            TGT  Type  Intf
-------------------------------------------------------------------------------
61.0.2.229:63     100.0.0.2:63     170.24.86.180:63        SRC  DYN  Et5

61.0.6.68:63      100.0.0.2:63     170.24.110.128:63       SRC  DYN  Et5
61.0.7.163:63     100.0.0.2:63     170.24.104.35:63        SRC  DYN  Et5
```
show ip route

The show ip route command displays routing table entries that are in the Forwarding Information Base (FIB), including static routes, routes to directly connected networks, and dynamically learned routes. Multiple equal-cost paths to the same prefix are displayed contiguously as a block, with the destination prefix displayed only on the first line.

The show running-config command displays configured commands not in the FIB.

Command Mode

EXEC

Command Syntax

```
show ip route [VRF_INSTANCE] [ADDRESS] [ROUTE_TYPE] [INFO_LEVEL] [PREFIX]
```

Parameters

The VRF_INSTANCE and ADDRESS parameters are always listed first and second, respectively. All other parameters can be placed in any order.

- **VRF_INSTANCE** specifies the VRF instance for which data is displayed.
  - <no parameter> context-active VRF.
  - vrf vrf_name specifies name of VRF instance. System default VRF is specified by default.

- **ADDRESS** filters routes by IPv4 address or subnet.
  - <no parameter> all routing table entries.
  - ipv4_addr routing table entries matching specified address.
  - ipv4_subnet routing table entries matching specified subnet (CIDR or address-mask).

- **ROUTE_TYPE** filters routes by specified protocol or origin. Options include:
  - <no parameter> all routing table entries.
  - aggregate entries for BGP aggregate routes.
  - bgp entries added through BGP protocol.
  - connected entries for routes to networks directly connected to the switch.
  - isis entries added through ISIS protocol.
  - kernel entries appearing in Linux kernel but not added by EOS software.
  - ospf entries added through OSPF protocol.
  - rip entries added through RIP protocol.
  - static entries added through CLI commands.
  - vrf displays routes in a VRF.

- **INFO_LEVEL** filters entries by next hop connection. Options include:
  - <no parameter> filters routes whose next hops are directly connected.
  - detail displays all routes.

- **PREFIX** filters routes by prefix.
  - <no parameter> specific route entry that matches the ADDRESS parameter.
  - longer-prefixes all subnet route entries in range specified by ADDRESS parameter.

Related Commands

- cli vrf specifies the context-active VRF.
Chapter 28: IPv4

IPv4 Commands

Example

- This command displays IPv4 routes learned through BGP.

  switch>show ip route bgp
  Codes:  C - connected, S - static, K - kernel,
          O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,

- This command displays the leaked routes from a source VRF.

  switch#show ip route vrf VRF2 20.0.0.0/8

  ... 
  S L    20.0.0.0/8  [1/0] (source VRF VRF1) via 10.1.2.10, Ethernet1
**show ip route age**

The `show ip route age` command displays the time when the route for the specified network was present in the routing table. It does not account for the changes in parameters like metric, next-hop etc.

**Command Mode**

EXEC

**Command Syntax**

```
show ip route ADDRESS age
```

**Parameters**

- **ADDRESS** Filters routes by IPv4 address or subnet.
  - `ipv4_addr` routing table entries matching specified address.
  - `ipv4_subnet` routing table entries matching specified subnet (CIDR or address-mask).

**Example**

- This command shows the amount of time since the last update to ip route 172.17.0.0/20.

```
switch>show ip route 172.17.0.0/20 age
Codes: C - connected, S - static, K - kernel, O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1, E2 - OSPF external type 2, N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP, R - RIP, I - ISIS, A - Aggregate

B E    172.17.0.0/20 via 172.25.0.1, age 3d01h
switch>
```
**show ip route gateway**

The `show ip route gateway` command displays IP addresses of all gateways (next hops) used by active routes.

**Command Mode**

EXEC

**Command Syntax**

```
show ip route [VRF_INSTANCE] gateway
```

**Parameters**

- `VRF_INSTANCE` specifies the VRF instance for which data is displayed.
- `<no parameter>` context-active VRF.
- `vrf vrf_name` specifies name of VRF instance. System default VRF is specified by `default`.

**Related Commands**

- `cli vrf` specifies the context-active VRF.

**Example**

```
switch>show ip route gateway
The following gateways are in use:
  172.25.0.1 Vlan101
  172.17.253.2 Vlan3000
  172.17.254.2 Vlan3901
  172.17.254.11 Vlan3902
  172.17.254.13 Vlan3902
  172.17.254.17 Vlan3903
  172.17.254.20 Vlan3903
  172.17.254.66 Vlan3908
  172.17.254.67 Vlan3908
  172.17.254.68 Vlan3908
  172.17.254.29 Vlan3910
  172.17.254.33 Vlan3911
  172.17.254.35 Vlan3911
  172.17.254.105 Vlan3912
  172.17.254.86 Vlan3984
  172.17.254.98 Vlan3992
  172.17.254.99 Vlan3992
switch>
```
show ip route host

The `show ip route host` command displays all host routes in the host forwarding table. Host routes are those whose destination prefix is the entire address (mask = 255.255.255.255 or prefix = /32). Each entry includes a code of the route’s purpose:

- **F** static routes from the FIB.
- **R** routes defined because the IP address is an interface address.
- **B** broadcast address.
- **A** routes to any neighboring host for which the switch has an ARP entry.

**Command Mode**

EXEC

**Command Syntax**

```
show ip route [VRF_INSTANCE] host
```

**Parameters**

- **VRF_INSTANCE** specifies the VRF instance for which data is displayed.
  - `<no parameter>` context-active VRF.
  - `vrf vrf_name` specifies name of VRF instance. System default VRF is specified by `default`.

**Related Commands**

- `cli vrf` specifies the context-active VRF.

**Example**

- This command displays all host routes in the host forwarding table.

```
switch>show ip route host
R - receive B - broadcast F - FIB, A - attached

F 127.0.0.1 to cpu
B 172.17.252.0 to cpu
A 172.17.253.2 on Vlan2000
R 172.17.253.3 to cpu
A 172.17.253.10 on Vlan2000
B 172.17.253.255 to cpu
B 172.17.254.0 to cpu
R 172.17.254.1 to cpu
B 172.17.254.3 to cpu
B 172.17.254.8 to cpu
A 172.17.254.11 on Vlan2902
R 172.17.254.12 to cpu

F 172.26.0.28 via 172.17.254.20 on Vlan3003
    via 172.17.254.67 on Vlan3008
    via 172.17.254.98 on Vlan3492
    via 172.17.254.2 on Vlan3601
    via 172.17.254.13 on Vlan3602
via 172.17.253.2 on Vlan3000
F 172.26.0.29 via 172.25.0.1 on Vlan101
F 172.26.0.30 via 172.17.254.29 on Vlan3910
F 172.26.0.32 via 172.17.254.105 on Vlan3912
switch>
```
show ip route match tag

The **show ip route match tag** command displays the route tag assigned to the specified IPv4 address or subnet. Route tags are added to static routes for use by route maps.

**Command Mode**

EXEC

**Command Syntax**

```plaintext
show ip route [VRF_INSTANCE] ADDRESS match tag
```

**Parameters**

- **VRF_INSTANCE** specifies the VRF instance for which data is displayed.
- `<no parameter>` context-active VRF.
- **vrf vrf_name** specifies name of VRF instance. System default VRF is specified by `default`.
- **ADDRESS** displays routes of specified IPv4 address or subnet.
  - `ipv4_addr` routing table entries matching specified IPv4 address.
  - `ipv4_subnet` routing table entries matching specified IPv4 subnet (CIDR or address-mask).

**Example**

- This command displays the route tag for the specified subnet.

```
switch>show ip route 172.17.50.0/23 match tag
Codes: C - connected, S - static, K - kernel,
     O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
     E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
     N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
     R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
     O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
     NG - Nexthop Group Static Route, V - VXLAN Control Service,
     DH - DHCP client installed default route, M - Martian

   O E2   172.17.50.0/23 tag 0

switch>
```
**show ip route summary**

The `show ip route summary` command displays the number of routes, categorized by destination prefix, in the routing table.

**Command Mode**

EXEC

**Command Syntax**

```
show ip route [VRF_INSTANCE] summary
```

**Parameters**

- `VRF_INSTANCE` specifies the VRF instance for which data is displayed.
- `<no parameter>` context-active VRF.
- `vrf vrf_name` specifies name of VRF instance. System default VRF is specified by `default`.

**Example**

- This command displays a summary of the routing table contents.

  ```
  switch>show ip route summary
  Route Source         Number Of Routes
  ---------------------------------------
  connected            15
  static               0
  ospf                 74
  Intra-area: 32 Inter-area:33 External-1:0 External-2:9
                      Intra-area:1:0 NSSA External-2:0
  bgp                  7
  External: 6 Internal: 1
  internal             45
  attached             18
  aggregate            0
  switch>
  ```
show ip verify source

The `show ip verify source` command displays the IP source guard (IPSG) configuration, operational states, and IP-MAC binding entries for the configuration mode interface.

**Command Mode**

EXEC

**Command Syntax**

`show ip verify source [VLAN | DETAIL]`

**Parameters**

- **VLAN** displays all VLANs configured in `no ip verify source vlan`.
- **DETAIL** displays all source IP-MAC binding entries configured for IPSG.

**Related Commands**

- `ip source binding`
- `ip verify source`

**Example**

This command verifies the IPSG configuration and operational states.

```
switch(config)#show ip verify source
Interface   Operational State
------------ ------------------------
Ethernet1   IP source guard enabled
Ethernet2   IP source guard disabled
```

**Example**

This command displays all VLANs configured in `no ip verify source vlan`. Hardware programming errors, e.g., VLAN classification failed, are indicated in the operational state. If an error occurs, this VLAN will be considered as enabled for IPSG. Traffic on this VLAN will still be filtered by IPSG.

```
switch(config)#show ip verify source vlan
IPSG disabled on VLANS: 1-2
VLAN   Operational State
-------- ------------------------
1       IP source guard disabled
2       Error: vlan classification failed
```

**Example**

This command displays all source IP-MAC binding entries configured for IPSG. A source binding entry is considered active if it is programmed in hardware. IP traffic matching any active binding entry will be permitted. If a source binding entry is configured on an interface or a VLAN whose operational state is IPSG disabled, this entry will not be installed in the hardware, in which case an “IP source guard disabled” state will be shown. If a port channel has no member port configured, binding entries configured for this port channel will not be installed in hardware, and a “Port-Channel down” state will be shown.

```
switch(config)#show ip verify source detail
Interface   IP Address    MAC Address      VLAN    State
------------ ------------- ---------------- ------ ------------------------
Ethernet1    10.1.1.1    0000.aaaa.1111   5       active
Ethernet1    10.1.1.5    0000.aaaa.5555   1       IP source guard disabled
Port-Channel1 20.1.1.1    0000.bbbb.1111   4       Port-Channel down
```
show platform arad ip route

The **show platform arad ip route** command shows resources for all IPv4 routes in hardware. Routes that use the additional hardware resources will appear with an asterisk.

**Command Mode**

**EXEC**

**Command Syntax**

`show platform arad ip route`

**Example**

- This command displays the platform unicast forwarding routes. In this example, the ACL label field in the following table is 4094 by default for all routes. If an IPv4 egress RACL is applied to an SVI, all routes corresponding to that VLAN will have an ACL label value. In this case, the ACL Label field value is 2.

```
switch# show platform arad ip route
Tunnel Type: M(mpls), G(gre)
```

```

switch(config)#
```
**show platform arad ip route summary**

The `show platform arad ip route summary` command shows hardware resource usage of IPv4 routes.

**Command Mode**

EXEC

**Command Syntax**

`show platform arad ip route summary`

**Related Commands**

- `agent SandL3Unicast terminate` enables restarting the layer 3 agent to ensure IPv4 routes are optimized.
- `ip hardware fib optimize` enables IPv4 route scale.
- `show platform arad ip route` shows resources for all IPv4 routes in hardware. Routes that use the additional hardware resources will appear with an asterisk.

**Example**

- This command shows hardware resource usage of IPv4 routes.
  
  ```
  switch(config)#show platform arad ip route summary
  Total number of VRFs: 1
  Total number of routes: 25
  Total number of route-paths: 21
  Total number of lem-routes: 4
  
  switch(config)#
  ```
show platform trident forwarding-table partition

The `show platform trident forwarding-table partition` command displays the size of the L2 MAC entry tables, L3 IP forwarding tables, and Longest Prefix Match (LPM) routes.

**Command Mode**
- Privileged EXEC

**Command Syntax**

```
show platform trident forwarding-table partition
```

**Example**

- This command shows the Trident forwarding table information.

```
switch(config)#show platform trident forwarding-table partition
L2 Table Size: 96k
L3 Host Table Size: 208k
LPM Table Size: 16k
switch(config)#
```
show rib route ip

The `show rib route ip` command displays a list of IPv4 Routing Information Base (RIB) routes.

**Command Mode**

EXEC

**Command Syntax**

```
show rib route ip [vrf vrf_name] [PREFIX] [ROUTE TYPE]
```

**Parameters**

- `vrf vrf_name` displays RIB routes from the specified VRF.
- `PREFIX` displays routes filtered by the specified IPv4 information. Options include:
  - `ip_address` displays RIB routes filtered by the specified IPv4 address.
  - `ip_subnet_mask` displays RIB routes filtered by the specified IPv4 address and subnet mask.
  - `ip_prefix` displays RIB routes filtered by the specified IPv4 prefix.
- `ROUTE TYPE` displays routes filtered by the specified route type. Options include:
  - `bgp` displays RIB routes filtered by BGP.
  - `connected` displays RIB routes filtered by connected routes.
  - `dynamicPolicy` displays RIB routes filtered by dynamic policy routes.
  - `host` displays RIB routes filtered by host routes.
  - `isis` displays RIB routes filtered by ISIS routes.
  - `ospf` displays RIB routes filtered by OSPF routes.
  - `ospf3` displays RIB routes filtered by OSPF3 routes.
  - `reserved` displays RIB routes filtered by reserved routes.
  - `route-input` displays RIB routes filtered by route-input routes.
  - `static` displays RIB routes filtered by static routes.
  - `vrf` displays routes in a VRF.
  - `vrf-leak` displays leaked routes in a VRF.

**Examples**

- This command displays IPv4 RIB static routes.

  ```
  switch#show rib route ip static
  VRF name: default, VRF ID: 0xfe, Protocol: static
  Codes: C - Connected, S - Static, P - Route Input
  B - BGP, O - Osfp, O3 - Osfp3, I - Isis
  > - Best Route, * - Unresolved Nexthop
  L - Part of a recursive route resolution loop
  >S 10.80.0.0/12 [1/0]
     via 172.30.149.129 [0/1]
        via Management1, directly connected
  >S 172.16.0.0/12 [1/0]
     via 172.30.149.129 [0/1]
        via Management1, directly connected
  switch#
  ```
This command displays IPv4 RIB connected routes.

```
switch# show rib route ip connected
VRF name: default, VRF ID: 0xfe, Protocol: connected
Codes: C - Connected, S - Static, P - Route Input
       B - BGP, O - Ospf, O3 - Ospf3, I - Isis
       > - Best Route, * - Unresolved Nexthop
       L - Part of a recursive route resolution loop
> C  10.1.0.0/24 [0/1]
     via 10.1.0.102, Ethernet1
> C  10.2.0.0/24 [0/1]
     via 10.2.0.102, Ethernet2
> C  10.3.0.0/24 [0/1]
     via 10.3.0.102, Ethernet3
```

This command displays routes leaked through VRF leak agent.

```
switch# show rib route ip vrf VRF2 vrf-leak
VRF: VRF2, Protocol: vrf-leak
...>
V L  20.0.0.0/8 [1/0] source VRF: VRF1
     via 10.1.2.10 [0/0] type ipv4
     via 10.1.2.10, Ethernet1
```
show rib route <ipv4 | ipv6> fib policy excluded

The `show rib route <ipv4 | ipv6> fib policy excluded` command displays the RIB routes filtered by FIB policy. The `fib policy exclude` option displays the RIB routes that have been excluded from being programmed into FIB, by FIB policy.

**Command Mode**

EXEC

**Command Syntax**

`show rib route <ipv4 | ipv6> fib policy excluded`

**Example**

- The following example displays the RIB routes excluded by the FIB policy using the `fib policy excluded` option of the `show rib route <ipv4 | ipv6>` command.

```plaintext
Switch# show rib route ipv6 fib policy excluded
Switch# show rib route ip bgp fib policy excluded
VRF name: default, VRF ID: 0xfe, Protocol: bgp
Codes: C - Connected, S - Static, P - Route Input
      B - BGP, O - Ospf, O3 - Ospf3, I - Isis
      > - Best Route, * - Unresolved Nexthop
      L - Part of a recursive route resolution loop
>B 10.1.0.0/24 [200/0]
   via 10.2.2.1 [115/20] type tunnel
   via 10.3.5.1, Ethernet1
   via 10.2.0.1 [115/20] type tunnel
   via 10.3.4.1, Ethernet2
   via 10.3.6.1, Ethernet3
>B 10.1.0.0/24 [200/0]
   via 10.2.2.1 [115/20] type tunnel
   via 10.3.5.1, Ethernet1
   via 10.2.0.1 [115/20] type tunnel
   via 10.3.4.1, Ethernet2
   via 10.3.6.1, Ethernet3
```
**show routing-context vrf**

The `show routing-context vrf` command displays the context-active VRF. The context-active VRF determines the default VRF that VRF-context aware commands use when displaying routing table data from a specified VRF.

**Command Mode**

EXEC

**Command Syntax**

`show routing-context vrf`

**Related Commands**

- `cli vrf` specifies the context-active VRF.

**Example**

- This command displays the context-active VRF.
  
  ```
  switch>show routing-context vrf
  Current VRF routing-context is PURPLE
  switch>
  ```
**show vrf**

The `show vrf` command displays the VRF name, RD, supported protocols, state and included interfaces for the specified VRF or for all VRFs on the switch.

**Command Mode**

EXEC

**Command Syntax**

```
show vrf [VRF_INSTANCE]
```

**Parameters**

- `VRF_INSTANCE` specifies the VRF instance to display.
- `<no parameter>` information is displayed for all VRFs.
- `vrf vrf_name` information is displayed for the specified user-defined VRF.

**Example**

- This command displays information for the VRF named “purple.”

```
switch>show vrf purple
Vrf          RD              Protocols       State         Interfaces
------------ --------------- --------------- ---------------- --------------
purple       64496:237       ipv4            no routing     Vlan42, Vlan43

switch>
```
**tcp mss ceiling**

The **tcp mss ceiling** command configures the maximum segment size (MSS) limit in the TCP header in the interface configuration mode.

The **no tcp mss ceiling** and the **default tcp mss ceiling** commands disable the MSS ceiling limit that was previously configured.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

```
tcp mss ceiling {ipv4 segment size | ipv6 segment size} {egress | ingress}
no tcp mss ceiling
default tcp mss ceiling
```

**Parameters**

- **ipv4 segment size** The IPv4 segment size value in bytes. Values range from 64 to 65515.
- **ipv6 segment size** The IPv6 segment size value in bytes. Values range from 64 to 65495.
- **egress** The TCP SYN packets that are forwarded from the interface to the network.
- **ingress** The TCP SYN packets that are received from the network to the interface. The **ingress** keyword is not supported on the Sand platform.

**Related Commands**

- **show ip interface**

**Guidelines**

This command supports GRE tunnel interfaces and IPv4 routed interfaces in the egress direction only on a Sand platform.

TCP MSS ceiling is supported on IPv4 unicast packets entering the switch and the configuration has no effect on GRE transit packets post configuration of the TCP MSS ceiling on a Sand platform.

**Example**

- These commands configure a maximum MSS ceiling value of 1458 bytes in the egress direction on an Ethernet interface 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#no switchport
switch(config-if-Et5)#tcp mss ceiling ipv4 1458 egress
```
vrf (Interface mode)

The vrf command adds the configuration mode interface to the specified VRF. You must create the VRF first, using the vrf instance command.

The no vrf and default vrf commands remove the configuration mode interface from the specified VRF by deleting the corresponding vrf command from running-config.

All forms of the vrf command remove all IP addresses associated with the configuration mode interface.

Command Mode
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

Command Syntax
- vrf vrf_name
- no vrf [vrf_name]
- default vrf [vrf_name]

Parameters
- vrf_name name of configured VRF.

Examples
- These commands add the configuration mode interface (VLAN 20) to the VRF named “purple”.
  switch(config)#interface vlan 20
  switch(config-if-Vl20)#vrf purple
  switch(config-if-Vl20)#
- These commands remove the configuration mode interface from VRF “purple”.
  switch(config)#interface vlan 20
  switch(config-if-Vl20)#no vrf purple
  switch(config-if-Vl20)#
**vrf instance**

The `vrf instance` command places the switch in VRF configuration mode for the specified VRF. If the named VRF does not exist, this command creates it. The number of user-defined VRFs supported varies by platform.

To add an interface to the VRF once it is created, use the `vrf (Interface mode)` command.

The `no vrf instance` and `default vrf instance` commands delete the specified VRF instance by removing the corresponding `vrf instance` command from `running-config`. This also removes all IP addresses associated with interfaces that belong to the deleted VRF.

The `exit` command returns the switch to global configuration mode.

**Command Mode**

Global Configuration

**Command Syntax**

```
vrf instance vrf_name
no vrf instance vrf_name
default vrf instance vrf_name
```

**Parameters**

- `vrf_name` Name of VRF being created, deleted or configured. The names “main” and “default” are reserved.

**Example**

- This command creates a VRF named “purple” and places the switch in VRF configuration mode for that VRF.
  ```
  switch(config)#vrf instance purple
  switch(config-vrf-purple)#
  ```
interface tunnel

The `interface tunnel` command places the switch in the interface tunnel configuration mode. Interface tunnel configuration mode is not a group change mode; `running-config` is changed immediately after commands are executed. The `no interface tunnel` command deletes the interface tunnel configuration. The `exit` command returns the switch to the global configuration mode.

**Command Mode**
Global Configuration

**Command Syntax**

```
interface tunnel <value>
no interface tunnel <value>
```

**Parameter**

- `value` Tunnel interface number. The value ranges from 0 to 255.

**Example**

- This command places the switch in interface tunnel configuration mode with a tunnel value 10.

```
switch(config)#interface tunnel 10
switch(config-if-Tu10)#
```
The **tunnel** command places the switch in protocol-over-protocol tunneling configuration mode for specific tunnel options.

Tunnel configuration mode is not a group change mode; **running-config** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

The **no tunnel** command deletes the tunnel configuration.

The **exit** command returns the switch to global configuration mode.

### Command Mode

Interface Tunnel Configuration

### Command Syntax

- `tunnel <options>`
- `no tunnel <options>`

### Parameters

- **options** Specifies the various tunneling options as listed below.
  - `destination` destination address of the tunnel.
  - `ipsec` secures the tunnel with the IPsec address.
  - `key` sets the tunnel key.
  - `mode` tunnel encapsulation method.
  - `path-mtu-discovery` enables the Path MTU discovery on tunnel.
  - `source` source of the tunnel packets.
  - `tos` sets the IP type of service value.
  - `ttl` sets time to live value.
  - `underlay` tunnel underlay.

### Example

- These commands place the switch in interface tunnel configuration mode with a tunnel value 10 and with GRE tunnel configured on the interfaces specified.

```bash
switch(config)#ip routing
switch(config)#interface Tunnel 10
switch(config-if-Tu10)#tunnel mode gre
switch(config-if-Tu10)#ip address 192.168.1.1/24
switch(config-if-Tu10)#tunnel source 10.1.1.1
switch(config-if-Tu10)#tunnel destination 10.1.1.2
switch(config-if-Tu10)#tunnel path-mtu-discovery
switch(config-if-Tu10)#tunnel tos 10
switch(config-if-Tu10)#tunnel ttl 10
```
**show interface tunnel**

The *show interface tunnel* command displays the interface tunnel information.

**Command Mode**

EXEC

**Command Syntax**

```
show interface tunnel <number>
```

**Parameter**

- **number** Specifies the tunnel interface number.

**Example**

- This command displays tunnel interface configuration information for tunnel interface 10.

  switch# show interface tunnel 10

  Tunnel10 is up, line protocol is up (connected)
  Hardware is Tunnel, address is 0a01.0101.0800
  Internet address is 192.168.1.1/24
  Broadcast address is 255.255.255.255
  Tunnel source 10.1.1.1, destination 10.1.1.2
  Tunnel protocol/transport GRE/IP
    Key disabled, sequencing disabled
    Checksumming of packets disabled
  Tunnel TTL 10, Hardware forwarding enabled
  Tunnel TOS 10
  Path MTU Discovery
  Tunnel transport MTU 1476 bytes
  Up 3 seconds
show platform fap eedb ip-tunnel gre interface tunnel

The `show platform fap eedb ip-tunnel gre interface tunnel` command verifies the tunnel encapsulation programming for the tunnel interface.

**Command Mode**

EXEC

**Command Syntax**

`show platform fap eedb ip-tunnel gre interface tunnel <number>`

**Parameter**

- `number` Specifies the tunnel interface number.

**Examples**

- These commands verify the tunnel encapsulation programming for the tunnel interface 10.
  
  ```
  switch# show platform fap eedb ip-tunnel gre interface tunnel 10
  ```

  ```
<p>|                                                  Jericho0                                        |</p>

show tunnel fib static interface gre

The `show tunnel fib static interface gre` command displays the forwarding information base (FIB) information for a static interface GRE tunnel.

**Command Mode**

EXEC

**Command Syntax**

```
show tunnel fib static interface gre <number>
```

**Parameter**

- `number` Specifies the tunnel index number.

**Example**

- This command display the interface tunnel configuration with GRE configured.
  
  `switch#show tunnel fib static interface gre 10`

  Type 'Static Interface', index 10, forwarding Primary
  via 10.6.1.2, 'Ethernet6/1'
    GRE, destination 10.1.1.2, source 10.1.1.1, ttl 10, tos 0xa
show platform fap tcam summary

The `show platform fap tcam summary` command displays information about the TCAM bank that is allocated for GRE packet termination lookup.

**Command Mode**

EXEC

**Command Syntax**

```
show platform fap tcam summary
```

**Example**

- This command verifies if the TCAM bank is allocated for GRE packet termination lookup.

  ```
  switch# show platform fap tcam summary
  Tcam Allocation (Jericho0)
  Bank       Used By       Reserved By
  ---------  -------------------------  -----------
  0          dbGreTunnel     -
  ```
IPv6

Arista switches support Internet Protocol version 4 (IPv4) and Internet Protocol version 6 (IPv6) for routing packets across network boundaries. This chapter describes Arista’s implementation of IPv6 and includes these sections:

- Section 29.1: Introduction
- Section 29.2: IPv6 Description
- Section 29.3: Configuring IPv6
- Section 29.4: IPv6 Commands

29.1 Introduction

Routing transmits network layer data packets over connected independent subnets. Each subnet is assigned an IP address range and each device on the subnet is assigned an IP address from that range.

Connected subnets have IP address ranges that do not overlap. A router is a network device connecting multiple subnets. Routers forward inbound packets to the subnet whose address range includes the packets’ destination address.

IPv4 and IPv6 are Internet layer protocols that define packet-switched inter-networking, including source-to-destination datagram transmission across multiple networks. The switch supports IP Version 4 (IPv4) and IP Version 6 (IPv6).

29.2 IPv6 Description

Internet Protocol Version 6 is a communications protocol used for relaying network packets across a set of connected networks using the Internet Protocol suite. Each network device is assigned a 128 bit IP address that identifies its network location.

IPv6 specifies a packet format that minimizes router processing of packet headers. Since the IPv4 and IPv6 packet headers differ significantly, the protocols are not interoperable. Many transport and application-layer protocols require little or no change to operate over IPv6.

29.2.1 IPv6 Address Format

IPv6 addresses have 128 bits, represented by eight 16-bit hexadecimal numbers separated by colons. IPv6 addresses are abbreviated as follows:

- Leading zeros in each 16-bit number may be omitted.
- One set of consecutive 16-bit numbers that equal zero may be replaced by a double colon.

Example

- The following three IPv6 hexadecimal number representations refer to the same address:
  
  d28e:0000:0000:0000:0234:812f:61ed:4419
  d28e:0:0:0:234:812f:61ed:4419
  d28e::234:812f:61ed:4419

IPv6 addresses typically denote a 64-bit network prefix and a 64-bit host address.

Unicast and Anycast Addressing

Unicast addressing defines a one-to-one association between the destination address and a network endpoint. Each destination address uniquely identifies a single receiver endpoint. Anycast addressing defines a one-to-one-of-many association: packets to a single member of a group of potential receivers identified by the same destination address.

Unicast and anycast addresses are typically composed as follows:

- a 64-bit network prefix that identifies the network segment.
- a 64-bit interface identifier that is based on interface MAC address.

The format of a network address identifies the scope of the address

- Global address: valid in all networks and connect with other addresses with global scope anywhere or to addresses with link-local scope on the directly attached network.
- Link-local address: scope extends only to the link to which the interface is directly connected. Link-local addresses are not routable off the link.

Link-local addresses are created by the switch and are not configurable. Figure 29-1 depicts the switch’s link local address derivation method.

Multicast Addressing

Multicast addressing defines a one-to-many association: packets are simultaneously routed from a single sender to multiple endpoints in a single transmission. The network replicates packets as required by network links that contain a recipient endpoint. One multicast address is assigned to an interface for each multicast group to which the interface belongs.
A solicited-node multicast address is an IPv6 multicast address whose scope extends only to the link to which the interface is directly connected. All IPv6 hosts have at least one such address per interface. Solicited-node multicast addresses are used by the Neighbor Discovery Protocol to obtain layer 2 link-layer addresses of other nodes.

### 29.2.2 IPv6 DHCP Snooping

DHCP (Dynamic Host Configuration Protocol) snooping is a layer 2 feature that is configured on LAN switches. The Arista EOS switch supports Option-37 insertion that allows relay agents to provide remote-ID information in DHCP request packets. DHCP servers use this information to determine the originating port of DHCP requests and associate a corresponding IP address to that port. DHCP servers use port information to track host location and IP address usage by authorized physical ports.

DHCP snooping uses the information option (Option-37) to include the switch MAC address (router-ID) along with the physical interface name and VLAN number (remote-ID) in DHCP packets. After adding the information to the packet, the DHCP relay agent forwards the packet to the DHCP server as specified by the DHCP protocol.

#### Platform Compatibility

- DCS-7010
- DCS-7050
- DCS-7060
- DCS-7250
- DCS-7260
- DCS-7300

### 29.2.3 Neighbor Discovery Protocol

The Neighbor Discovery Protocol (RFC 4861) operates with IPv6 to facilitate the following tasks for nodes within a specified prefix space:
- autoconfiguring a node's IPv6 address
- sensing other nodes on the link
- discovering the link-local addresses of other nodes on the link
- detecting duplicate addresses
- discovering available routers
- discovering DNS servers
- discovering the link's address prefix
- maintaining path reachability data to other active neighbor nodes

The Neighbor Discovery Protocol protocol defines five different ICMPv6 packet types:

- Router Solicitation
- Router Advertisement
- Neighbor Solicitation
- Neighbor Advertisement
- Redirect
29.3 Configuring IPv6

These sections describe IPv6 configuration tasks:

- Section 29.3.1: Configuring IPv6 on the Switch
- Section 29.3.2: Configuring IPv6 on an Interface
- Section 29.3.3: Configuring IPv6 DHCP Snooping
- Section 29.3.4: Viewing IPv6 Network Components
- Section 29.3.5: DHCP Relay Agent for IPv6

29.3.1 Configuring IPv6 on the Switch

29.3.1.1 Enabling IPv6 Unicast Routing on the Switch

The `ipv6 unicast-routing` command enables the forwarding of IPv6 unicast packets. When routing is enabled, the switch attempts to deliver inbound packets to destination addresses by forwarding them to interfaces or next hop addresses specified by the IPv6 routing table.

**Example**

- This command enables IPv6 unicast-routing.

```
switch(config)#ipv6 unicast-routing
switch(config)#
```

29.3.1.2 Configuring Default and Static IPv6 Routes

The `ipv6 route` command creates an IPv6 static route. The destination is a IPv6 prefix; the source is an IPv6 address or a routable interface port. When multiple routes exist to a destination prefix, the route with the lowest administrative distance takes precedence.

By default, the administrative distance assigned to static routes is 1. Assigning a higher administrative distance to a static route configures it to be overridden by dynamic routing data. For example, a static route with a distance value of 200 is overridden by OSPF intra-area routes, which have a default distance of 110.

**Example**

- This command creates an IPv6 static route.

```
switch(config)#ipv6 route 10:23:31:00:01:32:93/24 vlan 300
switch(config)#
```

The default route denotes the packet forwarding rule that takes effect when no other route is configured for a specified IPv6 address. All packets with destinations that are not established in the routing table are sent to the destination specified by the default route.

The IPv6 default route source is ::/0. The default route destination is referred to as the default gateway.

**Example**

- This command creates a default route and establishes fd7a:629f:52a4:fe61::2 as the default gateway address.

```
switch(config)#ipv6 route ::/0 fd7a:629f:52a4:fe61::2
switch(config)#
```
29.3.1.3 IPv6 ECMP

Multiple routes that are configured to the same destination with the same administrative distance comprise an Equal Cost Multi-Path (ECMP) route. The switch attempts to spread outbound traffic across all ECMP route paths equally. All ECMP paths are assigned the same tag value; commands that change the tag value of any ECMP path change the tag value of all paths in the ECMP.

Resilient ECMP is available for IPv6 routes. Section 28.4.2 describes resilient ECMP. The ipv6 hardware fib ecmp resilience command implements IPv6 resilient ECMP.

Example
- This command implements IPv6 resilient ECMP by configuring a hardware ECMP table space of 15 entries for IPv6 address 2001:db8:0::/64. A maximum of five nexthop addresses can be specified for the address. When the table contains five addresses, each appears in the table three times. When the table contains fewer than five addresses, each is duplicated until the 15 table entries are filled.

```
switch(config)#ipv6 hardware fib ecmp resilience 2001:db8:0::/64 capacity 5 redundancy 3
switch(config)#
```

29.3.2 Configuring IPv6 on an Interface

29.3.2.1 Enabling IPv6 on an Interface

The ipv6 enable command enables IPv6 on the configuration mode interface if it does not have a configured IPv6 address. It also configures the interface with an IPv6 address.

The no ipv6 enable command disables IPv6 on a configuration mode interface not configured with an IPv6 address. Interfaces configured with an IPv6 address are not disabled by this command.

Example
- This command enables IPv6 on VLAN interface 200.

```
switch(config)#interface vlan 200
switch(config-vl200)#ipv6 enable
switch(config-vl200)#
```

29.3.2.2 Assigning an IPv6 Address to an Interface

The ipv6 address command enables IPv6 on the configuration mode interface, assigns a global IPv6 address to the interface, and defines the prefix length. This command is supported on routable interfaces. Multiple global IPv6 addresses can be assigned to an interface.

Example
- These commands configure an IPv6 address with subnet mask for VLAN 200:

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 address 10:23:31::1:32:93/64
switch(config-if-Vl200)#
```

29.3.2.3 IPv6 Neighbor Discovery

The IPv6 Neighbor Discovery protocol defines a method for nodes to perform the following network maintenance tasks:
- determine layer 2 addresses for neighbors known to reside on attached links
IPv6 Neighbor Discovery is defined by RFC 2461. IPv6 Stateless Address Autoconfiguration is described by RFC 2462.

The following sections describe Neighbor Discovery configuration tasks.

Reachable Time

The `ipv6 nd reachable-time` command specifies the time period that the switch includes in the reachable time field of Router Advertisements (RAs) sent from the configuration mode interface. The reachable time defines the period that a remote IPv6 node is considered reachable after a reachability confirmation event.

Example

- These commands configure the entry of 25000 (25 seconds) in the reachable time field of RAs sent from VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd reachable-time 25000
switch(config-if-Vl200)#show active
interface Vlan200
  ipv6 address fd7a:4321::1/64
  ipv6 nd reachable-time 25000
switch(config-if-Vl200)#
```

Router Advertisement Interval

The `ipv6 nd ra interval` command configures the interval between IPv6 RA transmissions from the configuration mode interface.

Example

- These commands configure a RA transmission interval of 60 seconds on VLAN interface 200, then displays the interface status.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd ra interval 60
switch(config-if-Vl200)#show active
interface Vlan200
  ipv6 nd ra interval 60
switch(config-if-Vl200)#
```

Router Lifetime

The `ipv6 nd ra lifetime` command specifies the value that the switch places in the `router lifetime` field of IPv6 RAs sent from the configuration mode interface.

If the value is set to 0, IPv6 peers connected to the specified interface will remove the switch from their lists of default routers. Values greater than 0 indicate the time in seconds that peers should keep the router on their default router lists without receiving further RAs from the switch. Unless the value is 0, the router lifetime value should be equal to or greater than the interval between unsolicited RAs sent on the interface.
Example

- This command configures the switch to enter 2700 in the router lifetime field of RAs transmitted from VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd ra lifetime 2700
switch(config-if-Vl200)#show active
interface Vlan200
  ipv6 nd ra lifetime 2700
switch(config-if-Vl200)#
```

Router Advertisement Prefix

The `ipv6 nd prefix` command configures neighbor discovery router advertisement prefix inclusion for RAs sent from the configuration mode interface.

By default, all prefixes configured as IPv6 addresses are advertised in the interface’s RAs. The `ipv6 nd prefix` command with the `no-advertise` option prevents advertising of the specified prefix without affecting the advertising of other prefixes specified as IPv6 addresses. When an interface configuration includes at least one `ipv6 nd prefix` command that enables prefix advertising, RAs advertise only prefixes specified through `ipv6 nd prefix` commands.

Commands enabling prefix advertising also specify the advertised valid and preferred lifetime periods. Default periods are 2,592,000 (valid) and 604,800 (preferred) seconds.

Example

- These commands enable neighbor discovery advertising for IPv6 address 3012:D678::/64, specifying a valid lifetime of 1,296,000 seconds and the default preferred lifetime.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd prefix 3012:D678::/64 1296000
switch(config-if-Vl200)#
```

Router Advertisement Suppression

The `ipv6 nd ra disabled` command suppress IPv6 RA transmissions on the configuration mode interface. By default, only unsolicited RAs that are transmitted periodically are suppressed. The `all` option configures the switch to suppress all RAs, including those responding to a router solicitation.

Example

- This command suppresses all RAs on VLAN interface 200.

```
switch(config)#interface vlan 200
switch(config-vl200)#ipv6 nd ra disabled all
switch(config-vl200)#
```

Router Advertisement MTU Suppression

The `ipv6 nd ra mtu suppress` command suppresses the router advertisement MTU option on the configuration mode interface. The MTU option causes an identical MTU value to be advertised by all nodes on a link. By default, the router advertisement MTU option is not suppressed.

Example

- This command suppresses the MTU option on VLAN interface 200.

```
switch(config)#interface vlan 200
switch(config-vl200)#ipv6 nd ra mtu suppress
switch(config-vl200)#
```
Router Advertisement Flag Configuration

The following commands sets the specified configuration flag in IPv6 RAs transmitted from the configuration mode interface:

- The `ipv6 nd managed-config-flag` command sets the `managed address configuration` flag. This bit instructs hosts to use stateful address autoconfiguration.
- The `ipv6 nd other-config-flag` command sets the `other stateful configuration` flag. This bit indicates availability of autoconfiguration information, other than addresses. Hosts should use stateful autoconfiguration when available. The setting of this flag has no effect if the `managed address configuration` flag is set.
- These commands configure the switch to set the `managed address configuration` flag in advertisements sent from VLAN interface 200.
  ```
  switch(config)#interface vlan 200
  switch(config-if-Vl200)#ipv6 nd managed-config-flag
  ```
- These commands configure the switch to set the `other stateful configuration` flag in advertisements sent from VLAN interface 200.
  ```
  switch(config)#interface vlan 200
  switch(config-if-Vl200)#ipv6 nd other-config-flag
  ```

29.3.2.4 IPv6 Router Preference

The IPv6 Router Preference protocol supports an extension to RA messages for communicating default router preferences and more specific routes from routers to hosts. This provides assistance to hosts when selecting a router. RFC 4191 describes the IPv6 Router Preference Protocol.

The `ipv6 nd router-preference` command specifies the value that the switch enters in the Default Router Preference (DRP) field of RAs that it sends from the configuration mode interface. The default field entry value is `medium`.

Example

- This command configures the switch as a medium preference router on RAs sent from VLAN 200.
  ```
  switch(config)#interface vlan 200
  switch(config-if-Vl200)#ipv6 nd router-preference medium
  ```

29.3.2.5 uRPF Configuration

Unicast Reverse Path Forwarding (uRPF) verifies the accessibility of source IP addresses in packets that the switch forwards. Section 28.4.3 describe uRPF. uRPF is enabled for IPv6 packets entering the configuration mode interface through the `ipv6 verify` command.

uRPF defines two operational modes: strict mode and loose mode.

- Strict mode: uRPF verifies that a packet is received on the interface that its routing table entry specifies for its return packet.
- Loose mode: uRPF validation does not consider the inbound packet’s ingress interface only that there is a valid return path.
Example

- This command enables uRPF strict mode on VLAN interface 100. If a default route is configured on the interface, all inbound packets will pass the uRPF check as valid.

  ```
  switch(config)# interface vlan 100
  switch(config-if-Vl100)# ipv6 verify unicast source reachable-via rx allow-default
  switch(config-if-Vl100)# show active
  interface Vlan100
  ipv6 verify unicast source reachable-via rx allow-default
  switch(config-if-Vl100)#
  ```

29.3.3 Configuring IPv6 DHCP Snooping

29.3.3.1 Enabling IPv6 DHCP Snooping on the switch

The `ipv6 dhcp snooping` command enables DHCP snooping globally on the switch. DHCP snooping is a layer 2 feature that can be configured on LAN switches. The Arista switch supports Option-37 insertion that allows relay agents to provide remote-ID information in DHCP request packets.

Example

- The following configuration enables IPv6 DHCP snooping feature at the global level.

  ```
  switch(config)# ipv6 dhcp snooping
  switch(config)# ipv6 dhcp snooping remote-id option
  switch(config)# ipv6 dhcp snooping vlan <vlan|vlan-range>
  ```

- The following command display IPv6 DHCP snooping state.

  ```
  switch(config)# ipv6 dhcp snooping
  switch(config)# show ipv6 dhcp snooping
  DHCPv6 Snooping is enabled
  DHCPv6 Snooping is operational
  DHCPv6 Snooping is configured on following VLANs:
  2789-2790
  DHCPv6 Snooping is operational on following VLANs:
  2789
  Insertion of Option-37 is enabled
  ```

29.3.4 Viewing IPv6 Network Components

Displaying RIB Route Information

Use the `show rib route ipv6` command view the IPv6 Routing Information Base (RIB) information.

Example
• This command displays IPv6 RIB BGP routes.

    switch#show rib route ipv6 bgp
    VRF name: default, VRF ID: 0xfe, Protocol: bgp
    Codes: C - Connected, S - Static, P - Route Input
            B - BGP, O - Ospf, O3 - Ospf3, I - Isis
            > - Best Route, * - Unresolved Nexthop
            L - Part of a recursive route resolution loop
    B  2001:10:1::/64 [200/42]
        via 2001:10:1::100 [0/1]
        via Ethernet1, directly connected
    >B 2001:10:100::/64 [200/200]
        via 2001:10:1::100 [0/1]
        via Ethernet1, directly connected
    >B 2001:10:100:1::/64 [200/0]
        via 2001:10:1::100 [0/1]
        via Ethernet1, directly connected
    >B 2001:10:100:2::/64 [200/42]
        via 2001:10:1::100 [0/1]
        via Ethernet1, directly connected

    switch#

Displaying the FIB and Routing Table

The show ipv6 route command displays routing table entries that are in the Forwarding Information Base (FIB), including static routes, routes to directly connected networks, and dynamically learned routes. Multiple equal cost paths to the same prefix are displayed contiguously as a block, with the destination prefix displayed only on the first line.

Example

• This command displays a route table entry for a specific IPv6 route.

    switch>show ipv6 route fd7a:3418:52a4:fe18::/64
    IPv6 Routing Table - 77 entries
    Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP, R - RIP, A - Aggregate

    0  fd7a:3418:52a4:fe18::/64 [10/20]
        via f180::21c:73ff:fe00:1319, Vlan3601
        via f180::21c:73ff:fe00:1319, Vlan3602
        via f180::21c:73ff:fe00:1319, Vlan3608
        via f180::21c:73ff:fe0f:6a80, Vlan3610
        via f180::21c:73ff:fe00:1319, Vlan3611

    switch>

Displaying the Route Age

The show ipv6 route age command displays the IPv6 route age to the specified IPv6 address or prefix.
Example

- This command displays the route age for the specified prefix.
  
  ```
  switch>show ipv6 route 2001::3:0/11 age
  IPv6 Routing Table - 74 entries
  Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP, R - RIP, A - Aggregate
  
  C 2001::3:0/11 age 00:02:34
  ```

Displaying Host Routes

The `show ipv6 route host` command displays all host routes in the IPv6 host forwarding table. Host routes are those whose destination prefix is the entire address (prefix = /128). Each displayed host route is labeled with its purpose:

- **F** static routes from the FIB.
- **R** routes defined because the IP address is an interface address.
- **A** routes to any neighboring host for which the switch has an ARP entry.

Example

- This command displays all IPv6 host routes in the host forwarding table.
  
  ```
  switch#show ipv6 route host
  R - receive F - FIB, A - attached
  
  F  ::1 to cpu
  A fee7:48a2:0c11:1900:400::1 on Vlan102
  R fee7:48a2:0c11:1900:400::2 to cpu
  F fee7:48a2:0c11:la00::b via fe80::21c:73ff:fe0b:a80e on Vlan3902
  R fee7:48a2:0c11:la00::17 to cpu
  F fee7:48a2:0c11:la00::20 via fe80::21c:73ff:fe0b:33e on Vlan3913
  F fee7:48a2:0c11:la00::22 via fe80::21c:73ff:fe01:5fe1 on Vlan3908
  via fe80::21c:73ff:fe01:5fe1 on Vlan3902
  ```

Displaying Route Summaries

The `show ipv6 route summary` command displays the current number of routes of the IPv6 routing table in summary format.
Example

- This command displays the route source and the corresponding number of routes in the IPv6 routing table.

```
switch> show ipv6 route summary
Route Source    Number Of Routes
------------------ ----------------
connected        2
static           0
ospf             5
bgp              7
isis             0
internal         1
attached         0
aggregate        2
Total Routes     17
switch>
```

29.3.5 DHCP Relay Agent for IPv6

29.3.5.1 Configuring IPv6 DHCP Relay

Configuring the IPv6 DHCP Relay Agent (Global)

The `ipv6 dhcp relay always-on` command enables the switch DHCP relay agent globally regardless of the DHCP relay agent status on any interface. The DHCP relay agent is enabled by default if at least one routable interface is configured with an `ipv6 dhcp relay destination` statement.

Example

- This command enables the DHCP relay agent.

```
switch(config)# ipv6 dhcp relay always-on
switch(config)#
```

Configuring DHCP for IPv6 relay agent

The `ipv6 dhcp relay destination` command enables the DHCPv6 relay agent function and specifies the client message destination address on an interface.

Example

This command enables the DHCPv6 relay agent function and sets the client message destination address to `2001:db8:0:1::1` on Ethernet interface 4.

```
switch(config)# interface ethernet 4
switch(config-if-Et4)# ipv6 dhcp relay destination 2001:db8:0:1::1
switch(config-if-Et4)
```

Configuring the Client Link Layer Address for the IPv6 DHCP relay agent

The `ipv6 dhcp relay option link-layer address` command enables the DHCPv6 relay agent to configure the link layer address option to solicit and request messages. In other words, the command enables the link layer address option (79) in the global configuration mode. The `no ipv6 dhcp relay option link-layer address` command disables the link layer address option (79) in the global configuration mode.
Example

- This command enables the insertion of link layer address option (79) in the global configuration mode.
  
  switch(config)#ipv6 dhcp relay option link-layer address

Clearing IPv6 DHCP Relay Counters

The clear ipv6 dhcp relay counters command resets the DHCP relay counters. The configuration mode determines which counters are reset:

- Global configuration: command clears the counters for the switch and for all interfaces.
- Interface configuration: command clears the counter for the configuration mode interface.

Example

- These commands clear all DHCP relay counters on the switch.
  
  switch(config-if-Et4)#exit
  switch(config)#clear ipv6 dhcp relay counters
  switch(config)#

- These commands clear the DHCP relay counters for Ethernet interface 4.
  
  switch(config)#interface ethernet 4
  switch(config-if-Et4)#clear ipv6 dhcp relay counters
  switch(config)#

29.3.5.2 Viewing IPv6 DHCP Relay Information

IPv6 DHCP Status

The show ip dhcp relay command displays the status of DHCP relay agent parameters on the switch and each interface where at least one feature parameter is listed. The command displays the status for both global and interface configurations.

Example

- This command displays the DHCP Agent Relay parameter status.
  
  switch(config)#interface ethernet 1/2
  switch(config-if-Et1/2)#show ip dhcp relay
  
  DHCP Relay is active
  DHCP Relay Option 82 is disabled
  DHCPv6 Relay Link-layer Address Option (79) is disabled
  DHCP Smart Relay is disabled
  Interface: Ethernet1/2
  
  DHCP Smart Relay is disabled
  DHCP servers: 1::1
  2001:db8:0:1::1
  switch(config-if-Et1/2)#

IPv6 DHCP Relay Counters

The show ipv6 dhcp relay counters command displays the number of DHCP packets received, forwarded, or dropped on the switch and on all interfaces enabled as DHCP relay agents.
Example

- This command displays the IP DHCP relay counter table.

```
switch>show ipv6 dhcp relay counters

+-----------------+--------+-----------------+---------------------+
| Interface       | Rcvd   | Fwdd Drop       | Last Cleared        |
|-----------------+--------+-----------------+---------------------+
| All Req         | 376    | 376             | 0                   |
| All Resp        | 277    | 277             | 0                   |
| Ethernet4       | 207    | 148             | 0                   |

switch>
```
29.4 IPv6 Commands

Global Configuration Commands
- ipv6 dhcp relay always-on
- ipv6 dhcp relay option link-layer address
- ipv6 hardware fib aggregate-address
- ipv6 hardware fib ecmp resilience
- ipv6 hardware fib nexthop-index
- ipv6 neighbor
- ipv6 neighbor cache persistent
- ipv6 route
- ipv6 unicast-routing

Interface Configuration Commands
- ipv6 address
- ipv6 dhcp relay destination
- ipv6 dhcp snooping
- ipv6 enable
- ipv6 nd managed-config-flag
- ipv6 nd managed-config-flag
- ipv6 nd ns-interval
- ipv6 nd other-config-flag
- ipv6 nd prefix
- ipv6 nd ra dns-server
- ipv6 nd ra dns-servers lifetime
- ipv6 nd ra dns-suffix
- ipv6 nd ra dns-suffixes lifetime
- ipv6 nd ra hop-limit
- ipv6 nd ra interval
- ipv6 nd ra lifetime
- ipv6 nd ra mtu suppress
- ipv6 nd ra disabled
- ipv6 nd reachable-time
- ipv6 nd router-preference
- ipv6 verify

Privileged EXEC Commands
- clear ipv6 dhcp relay counters
- clear ipv6 dhcp snooping counters
- clear ipv6 neighbors

EXEC Commands
- show ipv6 dhcp relay counters
- show ipv6 dhcp snooping
- show ipv6 dhcp snooping counters
- show ipv6 dhcp snooping hardware
- show ipv6 hardware fib aggregate-address
- show ipv6 interface
- show ipv6 nd ra internal state
- show ipv6 neighbors
- show ipv6 route
- show ipv6 route age
- show ipv6 route host
- show ipv6 route interface
- show ipv6 route match tag
- show ipv6 route summary
- show rib route ipv6
clear ipv6 dhcp relay counters

The clear ipv6 dhcp relay counters command resets the DHCP relay counters. When no port is specified, the command clears the counters for the switch and for all interfaces. Otherwise, the command clears the counter for the specified interface.

**Command Mode**
Privileged EXEC

**Command Syntax**
```
clear ipv6 dhcp relay counters [PORT]
```

**Parameters**
- **PORT** Interface through which neighbor is accessed. Options include:
  - <no parameter>  all dynamic entries are removed.
  - interface ethernet **e_num**  Ethernet interface specified by **e_num**.
  - interface loopback **l_num**  Loopback interface specified by **l_num**.
  - interface port-channel **p_num**  Port-channel interface specified by **p_num**.
  - interface vlan **v_num**  VLAN interface specified by **v_num**.
Examples

- These commands clear the DHCP relay counters for Ethernet interface 4 and shows the counters before and after the `clear` command.

```plaintext
switch(config)#show ipv6 dhcp relay counters

<table>
<thead>
<tr>

switch(config)#
```
clear ipv6 dhcp snooping counters

The clear ipv6 dhcp snooping counters command resets the DHCP snooping packet counters.

Command Mode
Privileged EXEC

Command Syntax
<command>
clear ipv6 dhcp snooping counters [COUNTER_TYPE]

Parameters
- COUNTER_TYPE The type of counter that the command resets.
- <no parameter> command clears the counters for each VLAN.
- debug command clears aggregate counters and drop cause counters.

Examples
- This command clears the number of DHCP packets sent and received on each VLAN.

```
switch# clear ipv6 dhcp snooping counters
switch# show ipv6 dhcp snooping counters
```

```

clear ipv6 neighbors

The clear ipv6 neighbors command removes the specified dynamic IPv6 neighbor discovery cache entries. Commands that do not specify an IPv6 address remove all dynamic entries for the listed interface. Commands that do not specify an interface remove all dynamic entries.

**Command Mode**
Privileged EXEC

**Command Syntax**
clear ipv6 neighbors [PORT] [DYNAMIC_IPV6]

**Parameters**
- **PORT** Interface through which neighbor is accessed. Options include:
  - <no parameter> all dynamic entries are removed.
  - ethernet e_num Ethernet interface specified by e_num.
  - loopback l_num Loopback interface specified by l_num.
  - management m_num Management interface specified by m_num.
  - port-channel p_num Port-channel interface specified by p_num.
  - vlan v_num VLAN interface specified by v_num.
  - vxlan vx_num VXLAN interface specified by vx_num.
- **DYNAMIC_IPV6** Address of entry removed by the command. Options include:
  - <no parameter> all dynamic entries for specified interface are removed.
  - ipv6_addr IPv6 address of entry.

**Example**
- This command removes all dynamic neighbor entries for VLAN interface 200.
  switch#clear ipv6 neighbors vlan 200
  switch#
**ipv6 address**

The `ipv6 address` command assigns a global IPv6 address to the IPv6 interface, and defines the prefix length. This command is supported on routable interfaces. Multiple global IPv6 addresses can be assigned to an interface.

The `no ipv6 address` and `default ipv6 address` commands remove the IPv6 address assignment from the configuration mode interface by deleting the corresponding `ipv6 address` command from `running-config`. If the command does not include an address, all address assignments are removed from the interface. IPv6 remains enabled on the interface after the removal of all IPv6 addresses only if an `ipv6 enable` command is configured on the interface.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
```
ipv6 address ipv6_prefix
no ipv6 address [ipv6_prefix]
default ipv6 address [ipv6_prefix]
```

**Parameters**
- `ipv6_prefix`: address assigned to the interface (CIDR notation).

**Guidelines**
This command is supported on routable interfaces.

**Example**
- These commands configure an IPv6 address and prefix length for VLAN 200:
  ```
  switch(config)#interface vlan 200
  switch(config-if-Vl200)#ipv6 address 10:23:31:00:01:32:93/64
  switch(config-if-Vl200)#
  ```
The *ipv6 dhcp relay always-on* command enables the switch DHCP relay agent on the switch regardless of the DHCP relay agent status on any interface. By default, the DHCP relay agent is enabled only if at least one routable interface is configured with an *ipv6 dhcp relay destination* statement.

The *no ipv6 dhcp relay always-on* and *default ipv6 dhcp relay always-on* commands remove the *ipv6 dhcp relay always-on* command from *running-config*.

**Command Mode**

Global Configuration

**Command Syntax**

- `ipv6 dhcp relay always-on`
- `no ipv6 dhcp relay always-on`
- `default ipv6 dhcp relay always-on`

**Example**

- This command enables the DHCP relay agent.

  ```
  switch(config)#ipv6 dhcp relay always-on
  switch(config)#
  ```
IPv6 dhcp relay destination

The **ipv6 dhcp relay destination** command enables the DHCPv6 relay agent and sets the destination address on the configuration mode interface.

The **no ipv6 dhcp relay destination** and **default ipv6 dhcp relay destination** commands remove the corresponding **ipv6 dhcp relay destination** command from **running-config**. When the commands do not list an IPv6 address, all **ipv6 dhcp relay destination** commands are removed from **running-config**.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ipv6 dhcp relay destination ipv6_addr [source-address ipv6_addr]
nov6 dhcp relay destination [ipv6_addr]
default ipv6 dhcp relay destination [ipv6_addr]
```

**Parameters**
- **ipv6_addr**  DCHP Server’s IPv6 address.
- **source-address ipv6_addr**  specify the source IPv6 address to communicate with DHCP server.

**Guidelines**
If the source-address parameter is specified, then the DHCP client receives an IPv6 address from the subnet of source IP address. The source-address must be one of the configured addresses on the interface.

**Example**
- This command enables the DHCPv6 relay agent and sets the destination address to 2001:0db8:0:1::1 on Ethernet interface 4.

```
switch(config)#interface ethernet 4
switch(config-if-Et4)#ipv6 dhcp relay destination 2001:0db8:0:1::1
switch(config-if-Et4)#show ip dhcp relay
DHCP Relay is active
DHCP Relay Option 82 is disabled
DHCPv6 Relay Link-layer Address Option (79) is disabled
DHCP Smart Relay is disabled
Interface: Ethernet4
  DHCP Smart Relay is disabled
  DHCP servers: l::1
  2001:db8:0:1::1
switch(config-if-Et4)#
```
ipv6 dhcp snooping

The ipv6 dhcp snooping command enables DHCP snooping globally on the switch.

The no ipv6 dhcp snooping and default ipv6 dhcp snooping commands disable global DHCP snooping by removing the ipv6 dhcp snooping command from running-config.

Command Mode

Global Configuration

Command Syntax

ipv6 dhcp snooping [remote-id option | vlan | $ | vlan-range]
no ipv6 dhcp snooping [remote-id option | vlan | $ | vlan-range]
default ipv6 dhcp snooping [remote-id option | vlan | $ | vlan-range]

Parameters

• remote-id option configures the remote ID option.
• vlan enables IPv6 DHCP snooping for a specific VLAN. Numbers range from 1 to 4094.
• $ end of range.
• vlan-range VLANs based on the snooping enabled. Formats include a number, a number range, or a comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.

Platform Compatibility

• DCS-7010
• DCS-7050
• DCS-7060
• DCS-7250
• DCS-7260
• DCS-7300

Examples

• The following configuration enables IPv6 DHCP snooping feature at the global level.
  
  switch(config)# ipv6 dhcp snooping
  switch(config)# ipv6 dhcp snooping remote-id option
  switch(config)# ipv6 dhcp snooping vlan <vlan|vlan-range>

• The following command display IPv6 DHCP snooping state.
  
  switch(config)# ipv6 dhcp snooping
  switch(config)# show ipv6 dhcp snooping
  DHCPv6 Snooping is enabled
  DHCPv6 Snooping is operational
  DHCPv6 Snooping is configured on following VLANs: 2789-2790
  DHCPv6 Snooping is operational on following VLANs: 2789
  Insertion of Option-37 is enabled
ipv6 dhcp relay option link-layer address

The `ipv6 dhcp relay option link-layer address` command enables the DHCPv6 relay agent to configure the client link layer address option to solicit and request messages. In other words, the command enables the link layer address option (79) in the global configuration mode.

The `no ipv6 dhcp relay option link-layer address` command disables the link layer address option (79) in the global configuration mode.

**Command Mode**

Global Configuration

**Command Syntax**

- `ipv6 dhcp relay option link-layer address`
- `no ipv6 dhcp relay option link-layer address`
- `default ipv6 dhcp relay option link-layer address`

**Example**

- This command enables the insertion of link layer address option (79) in the global configuration mode.

  ```
  switch(config)#ipv6 dhcp relay option link-layer address
  ```
ipv6 enable

The `ipv6 enable` command enables IPv6 on the configuration mode interface. Assigning an IPv6 address to an interface also enables IPv6 on the interface.

The `no ipv6 enable` and `default ipv6 enable` command remove the corresponding `ipv6 enable` command from `running-config`. This action disables IPv6 on interfaces that are not configured with an IPv6 address.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ipv6 enable
no ipv6 enable
default ipv6 enable
```

**Example**

- This command enables IPv6 on VLAN interface 200.

```
switch(config)#interface vlan 200
switch(config-vl200)#ipv6 enable
switch(config-vl200)#
```
ipv6 hardware fib aggregate-address

The `ipv6 hardware fib aggregate-address` command specifies the routing table repository of specified IPv6 route.

By default, routes that are created statically through the CLI or dynamically through routing protocols are initially stored in software routing tables, then entered in the hardware routing table by the routing agent. This command prevents the entry of the specified route into the hardware routing table. Specified routes that are in the hardware routing table are removed by this command. Specific routes that are encompassed within the specified route prefix are affected by this command.

The `no ipv6 hardware fib aggregate-address` and `default ipv6 hardware fib aggregate-address` commands remove the restriction from the hardware routing table for the specified routes by removing the corresponding `ipv6 hardware fib aggregate-address` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ipv6 hardware fib aggregate-address ipv6_prefix summary-only software-forward
no ipv6 hardware fib aggregate-address ipv6_prefix
default ipv6 hardware fib aggregate-address ipv6_prefix
```

**Parameters**

- **ipv6_prefix**  IPv6 prefix that is restricted from the hardware routing table (CIDR notation).

**Example**

- These commands configure a hardware routing restriction for an IPv6 prefix, then displays that restriction.

```
switch(config)#ipv6 hardware fib aggregate-address fd77:4890:5313:ffed::/64 summary-only software-forward
switch(config)#show ipv6 hardware fib aggregate-address
Codes: S - Software Forwarded
S fd77:4890:5313:ffed::/64

switch(config)#
```
ipv6 hardware fib ecmp resilience

The **ipv6 hardware fib ecmp resilience** command configures a fixed number of next hop entries in the hardware ECMP table for the specified IPv6 address prefix. In addition to specifying the maximum number of next hop addresses that the table can contain for the prefix, the command introduces a redundancy factor that allows duplication of each next hop address. The fixed table space for the address is the maximum number of next hops multiplied by the redundancy factor.

The default method of adding or removing next hop entries when required by the active hashing algorithm leads to inefficient management of the ECMP table, which can result in the rerouting of packets to different next hops that breaks TCP packet flows. Implementing fixed table entries for a specified IP address allows data flows that are hashed to a valid next hop number to remain intact. Additionally, traffic is evenly distributed over a new set of next hops.

The **no ipv6 hardware fib ecmp resilience** and **default ipv6 hardware fib ecmp resilience** commands restore the default hardware ECMP table management by removing the **ipv6 hardware fib ecmp resilience** command from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

```
ipv6 hardware fib ecmp resilience net_prfx capacity nhop_max redundancy duplicates
no ipv6 hardware fib ecmp resilience net_addr
default ipv6 hardware fib ecmp resilience net_addr
```

**Parameters**

- **net_prfx**  IPv6 address prefix managed by command.
- **nhop_max**  Specifies maximum number of nexthop entries for specified IP address prefix. Value range varies by platform:
  - Helix: <2 to 64>
  - Trident: <2 to 32>
  - Trident II: <2 to 64>
- **duplicates**  Specifies the redundancy factor. Value ranges from 1 to 128.

**Example**

- This command configures a hardware ECMP table space of 15 entries for the IPv6 address 2001:db8:0::/64. A maximum of five nexthop addresses can be specified for the address. When the table contains five nexthop addresses, each appears in the table three times. When the table contains fewer than five nexthop addresses, each is duplicated until the 15 table entries are filled.

```
switch(config)#ipv6 hardware fib ecmp resilience 2001:db8:0::/64 capacity 5 redundancy 3
```
ipv6 hardware fib nexthop-index

The \texttt{ipv6 hardware fib nexthop-index} command deterministically selects the next hop used for ECMP routes. By default, routes that are created statically through the CLI or dynamically through routing protocols are initially stored in software routing tables, then entered in the hardware routing table by the routing agent. This command specifies the method of creating an index-offset number that points to the next hop from the list of the route’s ECMP next hops.

The index-offset is calculated by adding the next hop index to a prefix offset.

- Next hop index: specified in the command.
- Prefix offset: the least significant bits of the route’s prefix.

The command specifies the number of bits that comprise the prefix offset. The prefix offset is set to the prefix when the command specifies a prefix size larger than the prefix. If the command specifies an prefix size of zero, the prefix-offset is also zero and the index-offset is set to the next hop index.

When the index-offset is greater than the number of next hops in the table, the position of the next hop is the remainder of the division of the index-offset by the number of next hop entries.

The \texttt{no ipv6 hardware fib nexthop-index} and \texttt{default ipv6 hardware fib nexthop-index} commands remove the specified nexthop used for ECMP routes by removing the \texttt{ipv6 hardware fib nexthop-index} command from \texttt{running-config}.

Command Mode

Global Configuration

Command Syntax

\begin{verbatim}
ipv6 hardware fib nexthop \texttt{nxthop\_index} [\texttt{PREFIX}]  
no ipv6 hardware fib nexthop  
default ipv6 hardware fib nexthop
\end{verbatim}

Parameters

- \texttt{nxthop\_index} specifies the next hop index. Value ranges from 0 to 32.
- \texttt{PREFIX} Number of bits of the route’s prefix to use as the prefix-offset. Value ranges from 0 to 64.
  - <no parameter> The prefix offset is set to zero.
  - \texttt{prefix-bits <0 to 64>} Specifies the number bits to use as the prefix-offset.

Example

- This command specifies the next hop from the list of ECMP next hops for the route.

\begin{verbatim}
switch(config)#ipv6 hardware fib nexthop-index 5 prefix-bits 10  
switch>show ip  
IP Routing : Enabled  
IP Multicast Routing : Disabled  
VRRP: Configured on 0 interfaces  

IPv6 Unicast Routing : Enabled  
IPv6 ECMP Route support : False  
IPv6 ECMP Route nexthop index: 5  
IPv6 ECMP Route num prefix bits for nexthop index: 10  
switch>
\end{verbatim}
**ipv6 nd managed-config-flag**

The `ipv6 nd managed-config-flag` command causes the *managed address configuration* flag to be set in IPv6 RA packets transmitted from the configuration mode interface.

The `no ipv6 nd managed-config-flag` and `default ipv6 nd managed-config-flag` commands restore the default setting where the *managed address configuration* flag is not set in IPv6 RA packets transmitted by the interface by removing the corresponding `ipv6 nd managed-config-flag` command from *running-config*.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```plaintext
ipv6 nd managed-config-flag
no ipv6 nd managed-config-flag
default ipv6 nd managed-config-flag
```

**Example**

- These commands cause the *managed address configuration* flag to be set in IPv6 RA packets sent from VLAN interface 200.

```plaintext
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd managed-config-flag
switch(config-if-Vl200)#
```
ipv6 nd ns-interval

The `ipv6 nd ns-interval` command configures the interval between IPv6 neighbor solicitation (NS) transmissions from the configuration mode interface.

The `no ipv6 nd ns-interval` and `default ipv6 nd ns-interval` commands return the IPv6 NS transmission interval for the configuration mode interface to the default value of 1000 milliseconds by removing the corresponding `ipv6 nd ns-interval` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ipv6 nd ns-interval period
no ipv6 nd ns-interval
default ipv6 nd ns-interval
```

**Parameters**

- `period` interval in milliseconds between successive IPv6 neighbor solicitation transmissions. Values range from 1000 to 4294967295. The default period is 1000 milliseconds.

**Example**

- This command configures a neighbor solicitation transmission interval of 30 seconds on VLAN interface 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd ns-interval 30000
switch(config-if-Vl200)#
```
**ipv6 nd other-config-flag**

The `ipv6 nd other-config-flag` command configures the configuration mode interface to send IPv6 RAs with the *other stateful configuration* flag set.

The `no ipv6 nd other-config-flag` and `default ipv6 nd other-config-flag` commands restore the default setting by removing the corresponding `ipv6 nd other-config-flag` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ipv6 nd other-config-flag
no ipv6 nd other-config-flag
default ipv6 nd other-config-flag
```

**Example**

- These commands configure the switch to set the other stateful configuration flag in advertisements sent from VLAN interface 200.

```bash
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd other-config-flag
switch(config-if-Vl200)#
```
ipv6 nd prefix

The ipv6 nd prefix command configures neighbor discovery Router Advertisements (RAs) prefix inclusion for RAs sent from the configuration mode interface.

By default, all prefixes configured as IPv6 addresses (ipv6 address) are advertised in the interface’s RAs. The ipv6 nd prefix command with the no-advertise option prevents advertising of the specified prefix without affecting the advertising of other prefixes specified as IPv6 addresses. When an interface configuration includes at least one ipv6 nd prefix command that enables prefix advertising, RAs advertise only prefixes specified through ipv6 nd prefix commands.

Commands enabling prefix advertising also specify the advertised valid and preferred lifetime periods. Default periods are 2,592,000 (valid) and 604,800 (preferred) seconds.

The no ipv6 nd prefix and default ipv6 nd prefix commands remove the corresponding ipv6 nd prefix command from running-config.

Command Mode
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

Command Syntax
ipv6 nd prefix ipv6_prefix LIFETIME [FLAGS]
ipv6 nd prefix ipv6_prefix no-advertise
no ipv6 nd prefix ipv6_prefix
default ipv6 nd prefix ipv6_prefix

Parameters
- ipv6_prefix IPv6 prefix (CIDR notation).
- no-advertise Prevents advertising of the specified prefix.
- LIFETIME Period that the specified IPv6 prefix is advertised (seconds). Options include
  - valid preferred Two values that set the valid and preferred lifetime periods.
  - valid One value that sets the valid lifetime. The preferred lifetime is set to the default value.
  - <no parameter> The valid and preferred lifetime periods are set to their default values.
    Options for valid: <0 to 4294967295> and infinite. Default value is 2592000
    Options for preferred: <0 to 4294967295> and infinite. Default value is 604800
    The maximum value (4294967295) and infinite are equivalent settings.
- FLAGS on-link and autonomous address-configuration flag values in RAs.
  - <no parameter> both flags are set.
  - no-autocfg autonomous address-configuration flag is reset.
  - no-onlink on-link flag is reset.
  - no-autocfg no-onlink both flags are reset.
  - no-onlink no-autocfg both flags are reset.
Example

- These commands enable neighbor discovery advertising for IPv6 address 3012:D678::/64, on VLAN interface 200, specifying a valid lifetime of 1,296,000 seconds and the default preferred lifetime.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd prefix 3012:D678::/64 1296000
```
ipv6 nd ra dns-server

The `ipv6 nd ra dns-server` command configures the IPv6 address of a preferred Recursive DNS Server (RDNSS) for the command mode interface to include in its neighbor-discovery Router Advertisements (RAs). Including RDNSS information in RAs provides DNS server configuration for connected IPv6 hosts without requiring DHCPv6.

Multiple servers can be configured on the interface by using the command repeatedly. A lifetime value for the RDNSS can optionally be specified with this command, and overrides any default value configured for the interface using the `ipv6 nd ra dns-servers lifetime` command.

The `no ipv6 nd ra dns-server` and `default ipv6 nd ra dns-server` commands remove the corresponding `ipv6 nd ra dns-server` command from `running-config`.

Command Mode

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

Command Syntax

```
ipv6 nd ra dns-server ipv6_addr SERVER_LIFE
no ipv6 nd ra dns-server ipv6_addr
default ipv6 nd ra dns-server ipv6_addr
```

Parameters

- `ipv6_addr` RDNSS address to be included in RAs from the command mode interface.
- `SERVER_LIFE` maximum lifetime value for the specified RDNSS entry. This value overrides any default lifetime value. Value should be between the RA interval configured on the interface and two times that interval. Options include:
  - `<no parameter>` lifetime period is the default lifetime period configured on the interface. If no lifetime period is configured on the interface, the default value is 1.5 times the maximum RA interval set by the `ipv6 nd ra interval` command.
  - `lifetime 0` the configured RDNSS is not to be used.
  - `lifetime <1 to 4294967295>` specifies the lifetime period for this RDNSS in seconds.

Example

- This command configures the RDNSS at 2001:0db8:0:1::1 as a preferred RDNSS for VLAN interface 200 to include in its neighbor-discovery route advertisements, and sets its lifetime value to 300 seconds.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd ra dns-server 2001:0db8:0:1::1 lifetime 300
switch(config-if-Vl200)#
```
**ipv6 nd ra dns-servers lifetime**

The `ipv6 nd ra dns-servers lifetime` command sets the default value that the configuration mode interface uses for the lifetime of any Recursive DNS Server (RDNSS) configured on the interface. A lifetime value set for an individual RDNSS overrides this value. The lifetime value is the maximum amount of time after a route advertisement packet is sent that the RDNSS referenced in the packet may be used for name resolution.

The `no ipv6 nd ra dns-servers lifetime` and `default ipv6 nd ra dns-servers lifetime` commands remove the default lifetime value from the interface by removing the corresponding `ipv6 nd ra dns-servers lifetime` command from `running-config`. When there is no default RDNSS lifetime value configured on the interface, an RDNSS without a custom lifetime value will default to 1.5 times the RA interval configured on the interface. A lifetime of zero seconds means that the RDNSS must not be used for name resolution.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ipv6 nd ra dns-servers lifetime period
no ipv6 nd ra dns-servers lifetime
default ipv6 nd ra dns-servers lifetime
```

**Parameters**

- `period` the RDNSS lifetime value for the configuration mode interface. Options include:
  - `<0>` any RDNSS configured on the command mode interface without a custom lifetime value must not be used.
  - `<1 to 4294967295>` maximum RDNSS lifetime value for the configuration mode interface. This value is overridden by any lifetime value set with the `ipv6 nd ra dns-server` command. Should be between the router advertisement interval configured on the interface and two times that interval.

**Example**

- This command sets the default RDNSS maximum lifetime value for VLAN 200 to 350 seconds.

```bash
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd ra dns-servers lifetime 350
switch(config-if-Vl200)#
```
ipv6 nd ra dns-suffix

The `ipv6 nd ra dns-suffix` command creates a DNS Search List (DNSSL) for the command mode interface to include in its neighbor-discovery Router Advertisements as defined in RFC 6106. The DNSSL contains the domain names of DNS suffixes for IPv6 hosts to append to short, unqualified domain names for DNS queries.

Multiple DNS domain names can be added to the DNSSL by using the command repeatedly. A lifetime value for the DNSSL can optionally be specified with this command, and overrides any default value configured for the interface using the `ipv6 nd ra dns-suffixes lifetime` command.

The `no ipv6 nd ra dns-suffix` and `default ipv6 nd ra dns-suffix` commands remove the corresponding `ipv6 nd ra dns-suffix` command from running-config.

Command Mode
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

Command Syntax
```
ipv6 nd ra dns-suffix domain SUFFIX_LIFE
no ipv6 nd ra dns-suffix ipv6_addr
default ipv6 nd ra dns-suffix ipv6_addr
```

Parameters
- `domain` domain suffix for IPv6 hosts to append to short, unqualified domain names for DNS queries. Suffix must contain only alphanumeric characters, “.” and “-” and must begin and end with an alphanumeric character.
- `SUFFIX_LIFE` maximum lifetime value for the specified domain suffix. This value overrides any default lifetime value. Value should be between the RA interval configured on the interface and two times that interval. Options include:
  - `<no parameter>` lifetime period is the default lifetime period configured on the interface. If no lifetime period is configured on the interface, the default value is 1.5 times the maximum RA interval set by the `ipv6 nd ra interval` command.
  - `lifetime 0` the configured domain suffix is not to be used.
  - `lifetime <1 to 4294967295>` specifies the lifetime period for this domain suffix in seconds.

Example
- These commands create a DNSSL for VLAN interface 200 to include in its neighbor-discovery route advertisements, and set its lifetime value to 300 seconds.
```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd ra dns-suffix test.com lifetime 300
switch(config-if-Vl200)#
```
ipv6 nd ra dns-suffixes lifetime

The `ipv6 nd ra dns-suffixes lifetime` command sets the default value that the configuration mode interface uses for the lifetime of any DNS Search List (DNSSL) configured on the interface. A lifetime value set for an individual DNSSL overrides this value. The lifetime value is the maximum amount of time after a route advertisement packet is sent that the DNSSL included in the packet may be used for name resolution.

The `no ipv6 nd ra dns-suffixes lifetime` and `default ipv6 nd ra dns-suffixes lifetime` commands remove the default lifetime value from the interface by removing the corresponding `ipv6 nd ra dns-suffixes lifetime` command from `running-config`. When there is no default DNSSL lifetime value configured on the interface, a DNSSL without a custom lifetime value will default to 1.5 times the RA interval configured on the interface. A lifetime of zero seconds means that the DNSSL must not be used for name resolution.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
```
ipv6 nd ra dns-suffixes lifetime period
no ipv6 nd ra dns-suffixes lifetime
default ipv6 nd ra dns-suffixes lifetime
```

**Parameters**
- `period`  the DNSSL lifetime value for the configuration mode interface. Options include:
  - `<0>`  any DNSSL configured on the command mode interface without a custom lifetime value must not be used.
  - `<1 to 4294967295>`  maximum DNSSL lifetime value for the configuration mode interface. This value is overridden by any lifetime value set with the `ipv6 nd ra dns-suffix` command. Should be between the RA interval configured on the interface and two times that interval.

**Example**
- This command sets the default DNSSL maximum lifetime value for VLAN 200 to 350 seconds.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd ra dns-suffixes lifetime 350
switch(config-if-Vl200)#
```
**ipv6 nd ra hop-limit**

The `ipv6 nd ra hop-limit` command sets a suggested hop-limit value to be included in Router Advertisement (RA) packets. The hop-limit value is to be used by attached hosts in outgoing packets.

The `no ipv6 nd ra hop-limit` and `default ipv6 nd ra hop-limit` commands remove the corresponding `ipv6 nd ra hop-limit` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ipv6 nd ra hop-limit quantity
no ipv6 nd ra hop-limit lifetime
default ipv6 nd ra hop-limit lifetime
```

**Parameters**

- `quantity` the hop-limit value to be included in RA packets sent by the configuration mode interface. Options include:
  - `<0>` indicates that outgoing packets from attached hosts are to be immediately discarded.
  - `<1 to 255>` number of hops. The default value is 64.

**Example**

- These commands include a hop-limit value of 100 in RA packets sent by VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd ra hop-limit
switch(config-if-Vl200)#
```
ipv6 nd ra interval

The `ipv6 nd ra interval` command configures the interval between IPv6 Router Advertisement transmissions from the configuration mode interface.

The `no ipv6 nd ra interval` and `default ipv6 nd ra interval` commands return the IPv6 RA transmission interval for the configuration mode interface to the default value of 200 seconds by removing the corresponding `ipv6 nd ra interval` command from `running-config`.

Command Mode

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

Command Syntax

```
ipv6 nd ra interval [SCALE] ra_period [minimum_period]
no ipv6 nd ra interval
default ipv6 nd ra interval
```

Parameters

- `SCALE` timescale in which command parameter values are expressed.
  - `<no parameter>` seconds
  - `msec` milliseconds

- `ra_period` maximum interval between successive IPv6 RA transmissions. The default period is 200 seconds.
  - `<4 - 1800>` valid range when `scale` is set to default value (seconds).
  - `<500 - 1800000>` valid range when `scale` is set to `msec`.

- `minimum_period` minimum interval between successive IPv6 RA transmissions. Must be smaller than `ra_period`. By default, a minimum period is not defined.
  - `<no parameter>` Command does not specify a minimum period.
  - `<3 - 1799>` valid range when `scale` is set to default value (seconds).
  - `<375 - 1799999>` valid range when `scale` is set to `msec`.

Example

These commands configure a RA transmission interval of 60 seconds on VLAN interface 200, then displays the interface status.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd ra interval 60
switch(config-if-Vl200)#show active
interface Vlan200
  ipv6 nd ra interval 60
switch(config-if-Vl200)#
```
ipv6 nd ra lifetime

The `ipv6 nd ra lifetime` command specifies the value that the switch places in the `router lifetime` field of IPv6 Router Advertisements sent from the configuration mode interface.

If the value is set to 0, IPv6 peers connected to the specified interface will remove the switch from their lists of default routers. Values greater than 0 indicate the time in seconds that peers should keep the router on their default router lists without receiving further RAs from the switch. Unless the value is 0, the router lifetime value should be equal to or greater than the interval between unsolicited RAs sent on the interface.

The `no ipv6 nd ra lifetime` and `default ipv6 nd ra lifetime` commands return the IPv6 RA lifetime data entry filed for the configuration mode interface to the default value of 1800 seconds by removing the corresponding `ipv6 nd ra lifetime` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
```
ipv6 nd ra lifetime ra_lifetime
no ipv6 nd ra lifetime
default ipv6 nd ra lifetime
```

**Parameters**
- `ra_lifetime` router lifetime period (seconds). Default value is 1800. Options include
  - `<0>` Router should not be considered as a default router
  - `<1 - 65535>` Lifetime period advertised in RAs. Should be greater than or equal to the interval between IPv6 RA transmissions from the configuration mode interface as set by the `ipv6 nd ra interval` command.

**Example**
- This command configures the switch to enter 2700 in the router lifetime field of RAs transmitted from VLAN 200.
```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd ra lifetime 2700
switch(config-if-Vl200)#show active
interface Vlan20
   ipv6 nd ra lifetime 2700
switch(config-if-Vl200)#
```
ipv6 nd ra mtu suppress

The `ipv6 nd ra mtu suppress` command suppresses the Router Advertisement (RA) MTU option on the configuration mode interface. The MTU option causes an identical MTU value to be advertised by all nodes on a link. By default, the RA MTU option is not suppressed.

The `no ipv6 nd ra mtu suppress` and `default ipv6 nd ra mtu suppress` commands restores the MTU option setting to enabled by for the configuration mode interface by removing the corresponding `ipv6 nd ra mtu suppress` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

- `ipv6 nd ra mtu suppress`
- `no ipv6 nd ra mtu suppress`
- `default ipv6 nd ra mtu suppress`

**Example**

- This command suppresses the MTU option on VLAN interface 200.
  ```
  switch(config)#interface vlan 200
  switch(config-vl200)#ipv6 nd ra mtu suppress
  switch(config-vl200)#
  ```
**ipv6 nd ra disabled**

The `ipv6 nd ra disabled` command suppress IPv6 Router Advertisement (RA) transmissions on the configuration mode interface. By default, only unsolicited RAs that are transmitted periodically are suppressed. The `all` option configures the switch to suppress all RAs, including those responding to a router solicitation.

The `no ipv6 nd ra disabled` and `default ipv6 nd ra disabled` commands restore the transmission of RAs on the configuration mode interface by deleting the corresponding `ipv6 nd ra disabled` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
```
ipv6 nd ra disabled [SCOPE]
no ipv6 nd ra disabled
do default ipv6 nd ra disabled
```

**Parameters**
- `SCOPE` specifies the RAs that are suppressed.
  - `<no parameter>` Periodic unsolicited RAs are suppressed.
  - `all` All RAs are suppressed.

**Example**
- This command suppresses all RAs on VLAN interface 200.
  ```
  switch(config)#interface vlan 200
  switch(config-vl200)#ipv6 nd ra disabled all
  switch(config-vl200)#
  ```
ipv6 nd reachable-time

The `ipv6 nd reachable-time` command specifies the time period that the switch includes in the reachable time field of RAs sent from the configuration mode interface. The reachable time defines the period that a remote IPv6 node is considered reachable after a reachability confirmation event.

RAs that advertise zero seconds indicate that the router does not specify a reachable time. The default advertisement value is 0 seconds. The switch reachability default period is 30 seconds.

The `no ipv6 nd reachable-time` and `default ipv6 nd reachable-time` commands restore the entry of the default value (0) in RAs sent from the configuration mode interface by deleting the corresponding `ipv6 nd reachable-time` command from `running-config`.

Command Mode

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

Command Syntax

```
ipv6 nd reachable-time period
no ipv6 nd reachable-time
default ipv6 nd reachable-time
```

Parameters

- `period` Reachable time value (milliseconds). Value ranges from 0 to 4294967295. Default is 0.

Example

- These commands configure the entry of 25000 (25 seconds) in the reachable time field of RAs sent from VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd reachable-time 25000
interface Vlan200
  ipv6 address fd7a:4321::1/64
  ipv6 nd reachable-time 25000
switch(config-if-Vl200)#
```
**ipv6 nd router-preference**

The `ipv6 nd router-preference` command specifies the value that the switch enters in the Default Router Preference (DRP) field of Router Advertisements (RAs) that it sends from the configuration mode interface. The default field entry value is `medium`.

The `no ipv6 nd router-preference` and `default ipv6 nd router-preference` commands restore the switch to enter the default DRP field value of `medium` in RAs sent from the configuration mode interface by deleting the corresponding `ipv6 nd router-preference` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `ipv6 nd router-preference RANK`
- `no ipv6 nd router-preference`
- `default ipv6 nd router-preference`

**Parameters**
- `RANK` Router preference value. Options include:
  - `high`
  - `low`
  - `medium`

**Example**
- This command configures the switch as a medium preference router on RAs sent from VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd router-preference medium
switch(config-if-Vl200)#
```
**ipv6 neighbor**

The *ipv6 neighbor* command creates an IPv6 neighbor discovery cache static entry. The command converts pre-existing dynamic cache entries for the specified address to static entries.

The *no ipv6 neighbor* and *default ipv6 neighbor* commands remove the specified static entry from the IPv6 neighbor discovery cache and delete the corresponding *ipv6 neighbor* command from *running-config*. These commands do not affect any dynamic entries in the cache.

**Command Mode**

Global Configuration

**Command Syntax**

```
ipv6 neighbor ipv6_addr PORT mac_addr
no ipv6 neighbor ipv6_address PORT
default ipv6 neighbor ipv6_addr PORT
```

**Parameters**

- `ipv6_addr` Neighbor’s IPv6 address.
- `PORT` Interface through which the neighbor is accessed. Options include:
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-channel interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
  - `vxlan vx_num` VXLAN interface specified by `vx_num`.
- `mac_addr` Neighbor’s data-link (hardware) address. (48-bit dotted hex notation – H.H.H).

**Example**

- This command will add a static entry to the neighbor discovery cache for the neighbor located at 3100:4219::3EF2 with hardware address 0100.4EA1.B100 and accessible through VLAN 200.

```
switch(config)#ipv6 neighbor 3100:4219::3EF2 vlan 200 0100.4EA1.B100
switch(config)#```
ipv6 neighbor cache persistent

The `ipv6 neighbor cache persistent` command restores the IPv6 neighbor cache after reboot.

The `no ipv6 neighbor cache persistent` and `default ipv6 neighbor cache persistent` commands remove the ARP cache persistant configuration from the `running-config`.

Command Mode

Global Configuration

Command Syntax

```
ipv6 neighbor cache persistent
no ipv6 neighbor cache persistent
default ipv6 neighbor cache persistent
```

Example

- This command restores the ipv6 neighbor cache after reboot.

```
switch(config)# ipv6 neighbor cache persistent
switch(config)#
```
ipv6 route

The `ipv6 route` command creates an IPv6 static route. The destination is an IPv6 prefix; the source is an IPv6 address or a routable interface port. When multiple routes exist to a destination prefix, the route with the lowest administrative distance takes precedence.

By default, the administrative distance assigned to static routes is 1. Assigning a higher administrative distance to a static route configures it to be overridden by dynamic routing data. For example, a static route with a distance value of 200 is overridden by OSPF intra-area routes, which have a default distance of 110.

The command provides these methods of designating the nexthop location:

- **null0**: Traffic to the specified destination is dropped.
- **IPv6 gateway**: Switch identifies egress interface by recursively resolving the next-hop.
- **Egress interface**: Switch assumes destination subnet is directly connected to interface; when routing to any subnet address, the switch sends an ARP request to find the MAC address for the first packet.
- **Combination Egress interface and IPv6 gateway**: Switch does not assume subnet is directly connected to interface; the only ARP traffic is for the nexthop address for the first packet on the subnet. Combination routes are not recursively resolved.

Multiple routes that are configured to the same destination with the same administrative distance comprise an Equal Cost Multi-Path (ECMP) route. The switch attempts to spread outbound traffic across all ECMP route paths equally. All ECMP paths are assigned the same tag value; commands that change the tag value of any ECMP path change the tag value of all paths in the ECMP.

The `no ipv6 route` and `default ipv6 route` commands delete static routes by removing the corresponding `ipv6 route` statements from `running-config`. Commands not including a source delete all statements to the destination. Only statements with parameters that match specified command arguments are deleted. Parameters that are not in the command line are not evaluated.

**Command Mode**

Global Configuration

**Command Syntax**

```
ipv6 route dest_prefix NEXTHOP [DISTANCE] [TAG_OPT] [RT_NAME]
no ipv6 route dest_prefix [nexthop_addr] [DISTANCE]
default ipv6 route dest_prefix [nexthop_addr] [DISTANCE]
```

**Parameters**

- **dest_prefix** destination IPv6 prefix (CIDR notation).
- **NEXTHOP** Access method of next hop device. Options include:
  - **null0** Null0 interface – route is dropped.
  - **nexthop_addr** IPv6 address of nexthop device.
  - **ethernet e_num** Ethernet interface specified by `e_num`.
  - **loopback l_num** Loopback interface specified by `l_num`.
  - **management m_num** Management interface specified by `m_num`.
  - **port-channel p_num** Port-channel interface specified by `p_num`.
  - **vlan v_num** VLAN interface specified by `v_num`.
  - **vxlan vx_num** VXLAN interface specified by `vx_num`.
  - **ethernet e_num nexthop_addr** Combination route (Ethernet interface and gateway).
- **loopback** *l_num* *nexthop_addr*  Combination route (loopback interface and gateway).
- **management** *m_num* *nexthop_addr*  Combination route (management interface and gateway).
- **port-channel** *p_num* *nexthop_addr*  Combination route (port channel interface and gateway).
- **vlan** *v_num* *nexthop_addr*  Combination route (VLAN interface and gateway).
- **vxlan** *vx_num* *nexthop_addr*  Combination route (VXLAN interface and gateway).

**DISTANCE** administrative distance assigned to route. Options include:
- <no parameter> route assigned default administrative distance of one.
- <1 to 255> The administrative distance assigned to route.

**TAG_OPT** static route tag. Options include:
- <no parameter> assigns default static route tag of 0.
- *tag* <0 to 4294967295> Static route tag value.

**RT_NAME** Associates descriptive text to the route. Options include:
- <no parameter> No text is associated with the route.
- *name* *descriptive_text* The specified text is assigned to the route.

**Example**
- This command creates an IPv6 static route.

```
switch(config)#ipv6 route 10:23:31:00:01:32:93/24 vlan 300
```
**ipv6 unicast-routing**

The `ipv6 unicast-routing` command enables the forwarding of IPv6 unicast packets. When routing is enabled, the switch attempts to deliver inbound packets to destination addresses by forwarding them to interfaces or next hop addresses specified by the IPv6 routing table.

The `no ipv6 unicast-routing` and default `ip ipv6 unicast-routing` commands disable IPv6 unicast routing by removing the `ipv6 unicast-routing` command from `running-config`. Dynamic routes added by routing protocols are removed from the routing table. Static routes are preserved by default; the `delete-static-routes` option removes static entries from the routing table.

IPv6 unicast routing is disabled by default.

**Command Mode**

Global Configuration

**Command Syntax**

```
ipv6 unicast-routing
no ipv6 unicast-routing [DELETE_ROUTES]
default ipv6 unicast-routing [DELETE_ROUTES]
```

**Parameters**

- `DELETE_ROUTES` Resolves routing table static entries when routing is disabled.
- `<no parameter>` Routing table retains static entries.
- `delete-static-routes` Static entries are removed from the routing table.

**Example**

- This command enables IPv6 unicast-routing.

```
switch(config)#ipv6 unicast-routing
switch(config)#
```
**ipv6 verify**

The `ipv6 verify` command configures Unicast Reverse Path Forwarding (uRPF) for inbound IPv6 packets on the configuration mode interface. uRPF verifies the accessibility of source IP addresses in packets that the switch forwards.

uRPF defines two operational modes: strict mode and loose mode.

- **Strict mode**: uRPF also verifies that a packet is received on the interface that its routing table entry specifies for its return packet.
- **Loose mode**: uRPF validation does not consider the inbound packet’s ingress interface.

The `no ipv6 verify` and `default ipv6 verify` commands disable uRPF on the configuration mode interface by deleting the corresponding `ipv6 verify` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```plaintext
ipv6 verify unicast source reachable-via RPF_MODE
no ipv6 verify unicast
default ipv6 verify unicast
```

**Parameters**

- **RPF_MODE** Specifies the uRPF mode.
  - **any** Loose mode.
  - **rx** Strict mode
  - **rx allow-default** Strict mode. All inbound packets are forwarded if a default route is defined.

**Guidelines**

The first IPv6 uRPF implementation briefly disables IPv6 unicast routing. Subsequent `ip verify` commands on any interface do not disable IPv6 routing.

**Example**

- This command enables uRPF strict mode on VLAN interface 100. When a default route is configured on the interface, all inbound packets are checked as valid.

```plaintext
switch(config)#interface vlan 100
switch(config-if-Vl100)#ipv6 verify unicast source reachable-via rx allow-default
switch(config-if-Vl100)#show active
interface Vlan100
  ipv6 verify unicast source reachable-via rx allow-default
switch(config-if-Vl100)#
```
**show ipv6 dhcp relay counters**

The `show ipv6 dhcp relay counters` command displays the number of DHCP packets received, forwarded, or dropped on the switch and on all interfaces enabled as DHCP relay agents.

**Command Mode**

EXEC

**Command Syntax**

`show ipv6 dhcp relay counters`

**Example**

- This command displays the IP DHCP relay counter table.

  ```
  switch> show ipv6 dhcp relay counters
  
  +-------------------+--------+--------+-------------------+
  | Dhcp Packets      |       |
  | Interface         | Rcvd  |
  +-------------------+--------+--------+-------------------+
  | All Req           |  376   |
  | All Resp          |  277   |
  | Ethernet4         |  207   |
  +-------------------+--------+--------+-------------------+
  | Rcvd              |  376   |
  | Fwdd              |  148   |
  | Drop              |  0     |
  +-------------------+--------+--------+-------------------+
  | Last Cleared      |        |
  |                   | 4 days, 19:55:12 ago |
  |                   | 4 days, 19:54:24 ago |
  +-------------------+--------+--------+-------------------+
  switch>
  ```
show ipv6 dhcp snooping

The `show ipv6 dhcp snooping` command displays information about the DHCP snooping configuration.

**Command Mode**

EXEC

**Command Syntax**

    switch# show ipv6 dhcp snooping

**Related Commands**

- ipv6 dhcp snooping
- ipv6 dhcp relay always-on
- ipv6 dhcp relay destination
- ipv6 dhcp relay option link-layer address
- show ipv6 dhcp relay counters
- show ipv6 dhcp snooping counters
- show ipv6 dhcp snooping hardware
- clear ipv6 dhcp snooping counters

**Example**

This command displays the switch’s DHCP snooping configuration.

    switch# show ipv6 dhcp snooping
    DHCPv6 Snooping is enabled
    DHCPv6 Snooping is operational
    DHCPv6 Snooping is configured on following VLANs:
        2789-2790
    DHCPv6 Snooping is operational on following VLANs:
        2789
    Insertion of Option-37 is enabled
show ipv6 dhcp snooping counters

The `show ipv6 dhcp snooping counters` command displays counters that track the quantity of DHCP request and reply packets that the switch receives. Data is either presented for each VLAN or aggregated for all VLANs with counters for packets dropped.

**Command Mode**

EXEC

**Command Syntax**

```
switch# show ipv6 dhcp snooping counters [COUNTER_TYPE]
```

**Parameters**

- `COUNTER_TYPE`  The type of counter that the command displays.
- `<no parameter>` command displays counters for each VLAN.
- `debug` command displays aggregate counters and drop cause counters.

**Examples**

- This command displays the number of DHCP packets sent and received on each VLAN.

```
switch# show ipv6 dhcp snooping counters

<table>
<thead>
<tr>
<th>Dhcpv6 Request Pkts</th>
<th>Dhcpv6 Reply Pkts</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vlan</td>
<td>Rcvd</td>
</tr>
<tr>
<td>-------</td>
<td>------</td>
</tr>
<tr>
<td>2789</td>
<td>1</td>
</tr>
</tbody>
</table>
```

- This command displays the number of DHCP packets sent on the switch.

```
switch# show ipv6 dhcp snooping counters debug

<table>
<thead>
<tr>
<th>Counter</th>
<th>Snooping to Relay</th>
<th>Relay to Snooping</th>
</tr>
</thead>
<tbody>
<tr>
<td>Received</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>Forwarded</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>Dropped - Invalid VlanId</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>Dropped - Parse error</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>Dropped - Invalid Dhcp Optype</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>Dropped - Invalid Remote-ID Option</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>Dropped - Snooping disabled</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

Last Cleared: 0:04:29 ago
show ipv6 dhcp snooping hardware

The `show ipv6 dhcp snooping hardware` command displays internal hardware DHCP snooping status on the switch.

**Command Mode**

EXEC

**Command Syntax**

```
switch# show ipv6 dhcp snooping hardware
```

**Example**

This command displays DHCP snooping hardware status.

```
switch# show ipv6 dhcp snooping hardware
DHCPv6 Snooping is enabled
DHCPv6 Snooping is enabled on following VLANs:
  2789
  VLANs enabled per Slice
  Slice: Linecard0-0
  2789
  Slice: Linecard0-1
  2789
  Slice: Linecard0-2
  2789
  Slice: Linecard0-3
  2789
```
show ipv6 hardware fib aggregate-address

The **show ipv6 hardware fib aggregate-address** command displays the IPv6 prefixes that are restricted from entry into the hardware routing table. The **ipv6 hardware fib aggregate-address** command configures IPv6 prefix restrictions.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 address fib aggregate-address [ADDRESS][RESTRICTION]
```

**Parameters**

- **ROUTE_FILTER** filters by IPv6 address. Options include:
  - <no parameter> Displays all routes.
  - `ipv6_addr` Command displays only specified address.
  - `ipv6_prefix` Command displays addresses filtered by specified prefix (CIDR notation).
- **RESTRICTION** filters by route restriction.
  - <no parameter> displays routes restricted from the hardware routing table.
  - `software-forward` displays routes restricted from the hardware routing table.

**Example**

This command displays the routes that are restricted from the hardware routing table.

```
switch>show ipv6 hardware fib aggregate-address
Codes: S - Software Forwarded
S  fd77:4890:5313:aaed::/64
S  fd77:4890:5313:ffed::/64
switch>
```
**show ipv6 interface**

The `ipv6 interface` command displays the status of specified routed interfaces that are configured for IPv6.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 interface [INTERFACE_NAME] [INFO_LEVEL]
```

**Parameters**

- **INTERFACE_NAME**  
  - `<no parameter>` all routed interfaces.
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-Channel Interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
  - `vxlan vx_num` VXLAN interface specified by `vx_num`.

- **INFO_LEVEL**  
  - `<no parameter>` command displays data block for each specified interface.
  - `brief` command displays table that summarizes IPv6 interface data.

**Example**

- This command displays the status of VLAN 903.

```
switch>show ipv6 interface vlan 903
Vlan903 is up, line protocol is up (connected)
    IPv6 is enabled, link-local is fe80::21c:73ff:fe01:21e/64
    Global unicast address(es):
        fd7a:629f:52a4:fe10::3, subnet is fd7a:629f:52a4:fe10::/64
    Joined group address(es):
        ff02::1
        ff02::1:ff01:21e
        ff02::1:ff00:3
        ff01::2
switch>
```
show ipv6 nd ra internal state

The `ipv6 nd ra internal state` command displays the state of the IPv6 Router Advertisement (RA) daemon for the specified routable interface.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 nd ra internal state [INTERFACE_NAME]
```

**Parameters**

- `INTERFACE_NAME` interfaces for which command displays status.
- `<no parameter>` all routed interfaces.
- `ethernet e_num` Ethernet interface specified by `e_num`.
- `loopback l_num` Loopback interface specified by `l_num`.
- `management m_num` Management interface specified by `m_num`.
- `port-channel p_num` Port-Channel Interface specified by `p_num`.
- `vlan v_num` VLAN interface specified by `v_num`.
- `vxlan vx_num` VXLAN interface specified by `vx_num`.

**Example**

- This command displays the IPv6 RA daemon for VLAN interface 1243.

```
switch>show ipv6 nd ra internal state vlan 1243
INTERFACE: Vlan3908
        ifindex : 0x00000021
        mtu : 9212
        numIpv6Addr : 2
        numPrefixToAdvertise : 0
        numPrefixToSuppress : 0
        RaSuppress : 0
        RsRspSuppress : 0
        raIntervalMaxMsec : 200000

```

switch>
show ipv6 neighbors

The `show ipv6 neighbors` command displays the IPv6 neighbor discovery cache. The command provides filters to restrict the list to a specified IPv6 address or routable interface.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 neighbors [PORT] [SOURCE] [INFO_LEVEL]
```

**Parameters**

- **PORT**  Filters by interface through which neighbor is accessed. Options include:
  - `<no parameter>` all routed interfaces.
  - `ethernet e_num`  Ethernet interface specified by `e_num`.
  - `loopback l_num`  Loopback interface specified by `l_num`.
  - `management m_num`  Management interface specified by `m_num`.
  - `port-channel p_num`  Port-channel interface specified by `p_num`.
  - `vlan v_num`  VLAN interface specified by `v_num`.
  - `vxlan vx_num`  VXLAN interface specified by `vx_num`.

- **SOURCE**  Filters by neighbor IPv6 address. Options include:
  - `<no parameter>` all IPv6 neighbors.
  - `ipv6_addr`  IPv6 address of individual neighbor.

- **INFO_LEVEL**  amount of information that is displayed. Options include:
  - `<no parameter>`  command displays the discovery cache for the specified interfaces.
  - `summary`  command displays summary information only.

**Example**

- This command displays the IPv6 neighbor discovery cache for IPv6 address `fe80::21c:73ff:fe01:5fe1`.

```
switch>show ipv6 neighbors fe80::21c:73ff:fe01:5fe1
IPv6 Address                        Age Hardware Addr    State Interface

```
show ipv6 route

The `show ipv6 route` command displays IPv6 routing table entries that are in the Forwarding Information Base (FIB), including static routes, routes to directly connected networks, and dynamically learned routes. Multiple equal cost paths to the same prefix are displayed contiguously as a block, with the destination prefix displayed only on the first line.

The `show running-config` command displays all configured routes.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 route [ADDRESS] [ROUTE_TYPE] [INFO_LEVEL]
```

**Parameters**

Address, when present, is always listed first. All other parameters can be placed in any order.

- **ADDRESS** filters routes by IPv6 address or prefix.
  - `<no parameter>` all routing table entries.
  - `ipv6_address` routing table entries matching specified IPv6 address.
  - `ipv6_prefix` routing table entries matching specified IPv6 prefix (CIDR notation).
- **ROUTE_TYPE** filters routes by specified protocol or origin.
  - `<no parameter>` all routing table entries.
  - `aggregate` entries for BGP aggregate routes.
  - `bgp` entries added through BGP protocol.
  - `connected` entries for routes to networks directly connected to the switch.
  - `kernel` entries appearing in Linux kernel but not added by EOS software.
  - `isis` entries added through IS-IS protocol.
  - `ospf` entries added through OSPF protocol.
  - `static` entries added through CLI commands.
- **INFO_LEVEL** Filters entries by next hop connection.
  - `<no parameter>` filters routes whose next hops are directly connected.
  - `detail` displays all routes.

**Example**

- This command displays a route table entry for a specific IPv6 route.

```
switch>show ipv6 route fd7a:3418:52a4:fe18::/64
IPv6 Routing Table - 77 entries
Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP, R - RIP, A - Aggregate
 O fd7a:3418:52a4:fe18::/64 [10/20]
   via fe80::21c:73ff:fe00:1319, Vlan3601
   via fe80::21c:73ff:fe00:1319, Vlan3602
   via fe80::21c:73ff:fe00:1319, Vlan3608
   via fe80::21c:73ff:fe0f:6a80, Vlan3610
   via fe80::21c:73ff:fe00:1319, Vlan3611
```

switch>
show ipv6 route age

The show ipv6 route age command displays the IPv6 route age to the specified IPv6 address or prefix.

**Command Mode**

**EXEC**

**Command Syntax**

`show ipv6 route ADDRESS age`

**Parameters**

- **ADDRESS** filters routes by IPv6 address or prefix.

**Example**

- This command displays the route age for the specified prefix.

`switch>show ipv6 route 2001::3:0/11 age`  
IPv6 Routing Table - 74 entries  
Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP, R - RIP, A - Aggregate

C 2001::3:0/11 age 00:02:34  
switch>`
show ipv6 route host

The `show ipv6 route host` command displays all host routes in the IPv6 host forwarding table. Host routes are those whose destination prefix is the entire address (prefix = /128). Each displayed host route is labeled with its purpose:

- **F** static routes from the FIB.
- **R** routes defined because the IP address is an interface address.
- **A** routes to any neighboring host for which the switch has an ARP entry.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 route host
```

**Example**

- This command displays all IPv6 host routes in the host forwarding table.

```
switch>show ipv6 route host
R - receive  F - FIB,  A - attached

F  ::1 to cpu
A  fee7:48a2:0c11:1900:400::1 on Vlan102
R  fee7:48a2:0c11:1900:400::2 to cpu
F  fee7:48a2:0c11:1a00::b via fe80::21c:73ff:fe0b:a80e on Vlan3902
R  fee7:48a2:0c11:1a00::17 to cpu
F  fee7:48a2:0c11:1a00::20 via fe80::21c:73ff:fe0b:33e on Vlan3913
F  fee7:48a2:0c11:1a00::22 via fe80::21c:73ff:fe01:5fe1 on Vlan3908
    via fe80::21c:73ff:fe01:5fe1 on Vlan3902

switch>
```
show ipv6 route interface

The `show ipv6 route interface` command displays routing table entries on a specified routed port.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 route [ADDRESS] interface PORT_NAME [INFO_LEVEL]
```

**Parameters**

- **ADDRESS**, when present, is always listed first. All other parameters can be placed in any order.
  - **ADDRESS** filters routes by IPv6 address or prefix.
    - `<no parameter>` all routing table entries.
    - `ipv6_address` routing table entries matching specified IPv6 address.
    - `ipv6_prefix` routing table entries matching specified IPv6 prefix (CIDR notation).
  - **PORT_NAME** interfaces for which command displays status.
    - `ethernet e_num` Ethernet interface specified by `e_num`.
    - `loopback l_num` Loopback interface specified by `l_num`.
    - `management m_num` Management interface specified by `m_num`.
    - `port-channel p_num` Port-Channel Interface specified by `p_num`.
    - `vlan v_num` VLAN interface specified by `v_num`.
    - `vxlan vx_num` VXLAN interface specified by `vx_num`.
  - **INFO_LEVEL** filters entries by next hop connection.
    - `<no parameter>` filters routes whose next hops are directly connected.
    - `detail` displays all routes.

**Example**

- This command displays the IPv6 routes in VLAN interface 661.

```
switch>show ipv6 route interface ethernet 8
IPv6 Routing Table - 77 entries
Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP, R - RIP, A - Aggregate

O  fd7a:629f:63af:1232::/64  [150/11]  
   via fe80::823c:73ff:fe00:3640, Ethernet8
O  fd7a:629f:63af:4118::/64  [150/11]  
   via fe80::823c:73ff:fe00:3640, Ethernet8
O  fd7a:629f:63af:4119::/64  [150/11]  
   via fe80::823c:73ff:fe00:3640, Ethernet8
O  fd7a:629f:63af:411a::/64  [150/11]  
   via fe80::823c:73ff:fe00:3640, Ethernet8
O  fd7a:629f:63af:fe88::/64  [0/1]  
   via ::, Ethernet12
O  fd7a:629f:63af:fe8c::/64  [10/20]  
   via fe80::21c:73ff:fe00:3640, Ethernet8
C  fe80::0:40::/64  [0/1]  
   via ::, Ethernet8
```
**show ipv6 route match tag**

The `show ipv6 route match tag` command displays the route tag assigned to the specified IPv6 address or prefix. Route tags are added to static routes for use by route maps.

**Command Mode**

**EXEC**

**Command Syntax**

```
show ipv6 route ADDRESS match tag
```

**Parameters**

- `ADDRESS` filters routes by IPv6 address or prefix.
- `ipv6_address` routing table entries matching specified address (A:B:C:D:E:F:G:H)

**Example**

- This command displays the route tag for the specified prefix.

  ```
  switch>show ipv6 route 2001:0DB8::/64 match tag
  IPv6 Routing Table - 74 entries
  Codes: C - connected, S - static, K - kernel, O3 - OSPFv3, B - BGP, R - RIP, A B - BGP Aggregate, I L1 - IS-IS level 1, I L2 - IS-IS level 2, DH - DHCP, NG - Nexthop Group Static Route, M - Martian, DP - Dynamic Policy Route, L - VRF Leaked
  C   2001:0DB8::/64 tag 0
  switch>
  ```
**show ipv6 route summary**

The `show ipv6 route summary` command displays the information about the IPv6 routing table.

**Command Mode**

EXEC

**Command Syntax**

`show ipv6 route summary`

**Example**

- This command displays the route source and the corresponding number of routes in the IPv6 routing table.

```
switch>show ipv6 route summary
Route Source    Number Of Routes
------------------ ----------------
connected                      2
static                         0
ospf                            5
bgp                             7
isis                            0
internal                       1
attached                       0
aggregate                     2

Total Routes                   17
switch>
```
show rib route ipv6

The `show rib route ipv6` command displays a list of IPv6 Routing Information Base (RIB) routes.

**Command Mode**

EXEC

**Command Syntax**

```
show rib route ipv6 [vrf vrf_name] [PREFIX] [ROUTE TYPE]
```

**Parameters**

- `vrf vrf_name` displays RIB routes from the specified VRF.
- `PREFIX` displays routes filtered by the specified IPv6 information. Options include:
  - `ipv6_address` displays RIB routes filtered by the specified IPv6 address.
  - `ipv6_subnet_mask` displays RIB routes filtered by the specified IPv6 address and subnet mask.
  - `ipv6_prefix` displays RIB routes filtered by the specified IPv6 prefix.
- `ROUTE TYPE` displays routes filtered by the specified route type. Options include:
  - `bgp` displays RIB routes filtered by BGP.
  - `connected` displays RIB routes filtered by connected routes.
  - `dynamicPolicy` displays RIB routes filtered by dynamic policy routes.
  - `host` displays RIB routes filtered by host routes.
  - `isis` displays RIB routes filtered by ISIS routes.
  - `ospf` displays RIB routes filtered by OSPF routes.
  - `ospf3` displays RIB routes filtered by OSPF3 routes.
  - `reserved` displays RIB routes filtered by reserved routes.
  - `route-input` displays RIB routes filtered by route-input routes.
  - `static` displays RIB routes filtered by static routes.

**Examples**

- This command displays IPv6 RIB BGP routes.
  
  ```
  switch# show rib route ipv6 bgp
  VRF name: default, VRF ID: 0xfe, Protocol: bgp
  Codes: C - Connected, S - Static, P - Route Input
  B - BGP, O - Ospf, O3 - Ospf3, I - Isis

switch#
```
This chapter describes Arista’s Traffic Management, including configuration instructions and command descriptions. Topics covered by this chapter include:

- Section 30.1: Traffic Management Conceptual Overview
- Section 30.2: Traffic Management Configuration – Arad Platform Switches
- Section 30.3: Traffic Management Configuration – FM6000 Platform Switches
- Section 30.4: Traffic Management Configuration – Petra Platform Switches
- Section 30.5: Traffic Management Configuration – Trident Platform Switches
- Section 30.6: Traffic Management Configuration – Trident-II Platform Switches
- Section 30.7: Traffic Management Configuration Commands
30.1  Traffic Management Conceptual Overview

Traffic is managed through policy maps that apply data shaping methods to specific data streams. A policy map is a data structure that identifies specific data streams and then defines shaping parameters that modify packets within the streams. The switch defines three types of policies:

- **Section 30.1.1: Control Plane Policies**: Control plane policy maps are applied to the control plane.
- **Section 30.1.2: QoS Policies**: QoS policy maps are applied to Ethernet and port channel interfaces.
- **Section 30.1.3: PBR Policies**: PBR policy maps are applied to Ethernet interfaces, port channel interfaces and switch virtual interfaces (SVIs).
- **Section 30.1.4: PDP Policies**: PDP policy maps are assigned to Ethernet interfaces.

Note  
PDP is available only in EOS versions 4.19.0F and above.

A policy map consists of classes. Each class contains an eponymous class map and traffic resolution commands.

- A class map is a data structure that defines a data stream by specifying characteristics of data packets that comprise that stream. Each class map is typed as either QoS, control plane, PBR, or PDP and is available only to identically typed policy maps.
- Traffic resolution commands specify data handling methods for traffic that matches a class map. Traffic resolution options vary by policy map type.

Data packets that enter an entity to which a policy map is assigned are managed with traffic resolution commands of the first class that matches the packets.
30.1.1 Control Plane Policies

The switch defines one control plane policy map named `copp-system-policy`. The `copp-system-policy` policy map is always applied to the control plane and cannot be removed from the switch. Other control plane policy maps cannot be added. `copp-system-policy` consists of preconfigured classes, each containing a static class map and traffic resolution commands. Preconfigured classes cannot be removed from `copp-system-policy`.

Static class maps are provided by the switch and cannot be modified or deleted. The naming convention of static class maps is `copp-system-name`, where `name` differentiates the class maps. Static class maps have pre-defined internal conditions, are not based on ACLs, and are only listed in `running-config` as components of `copp-system-policy`. The sequence of static class maps in the policy map is not significant. Traffic resolution commands define minimum (bandwidth) and maximum (shape) transmission rates for data streams matching the corresponding class map.

`Copp-system-policy` can be modified through the following steps:

- Add classes consisting of an eponymous dynamic class map and traffic resolution commands.
  Dynamic class maps are user created, can be edited or deleted, filter traffic with a single IPv4 ACL, and are listed in `running-config`.
- Change traffic resolution commands for a preconfigured class.

These sections describe control plane traffic policy configuration procedures:

- Section 30.2.1: Configuring Control Plane Traffic Policies – Arad Platform Switches
- Section 30.3.1: Configuring Control Plane Traffic Policies – FM6000 Platform Switches
- Section 30.4.1: Configuring Control Plane Traffic Policies – Petra Platform Switches
- Section 30.5.1: Configuring Control Plane Traffic Policies – Trident Platform Switches

30.1.2 QoS Policies

QoS policy maps are user defined. The switch does not provide preconfigured QoS policy maps and in the default configuration, policy maps are not applied to any Ethernet or port channel interface. Policy maps and class maps are created and applied to interfaces through configuration commands.

A QoS policy map is composed of one or more classes. Each class contains an eponymous dynamic class map and traffic resolution commands. Dynamic class maps are user created, can be edited or deleted, filter traffic with a single IPv4 ACL, and are listed in `running-config`.

QoS traffic resolution commands perform one of the following:

- Set the layer 2 CoS field
- Set the DSCP value in the ToS byte
- Specify a traffic class queue

The last class in all QoS policy maps is `class-default`, which is composed as follows:

- The `class-default` class map matches all traffic except IPv4 or IPv6 traffic and is not editable.
- By default, `class-default` class contains no traffic resolution commands. Traffic resolution commands can be added through configuration commands.

Data packets that enter an interface to which a policy map is assigned are managed with traffic resolution commands that correspond to the first class that matches the packet.

These sections describe QoS traffic policy configuration procedures:

- Section 30.2.2: Configuring QoS Traffic Policies – Arad Platform Switches.
30.1.3 PBR Policies

Policy-Based Routing (PBR) allows the operator to specify the next hop for selected incoming packets on an L3 interface, overriding the routing table. Incoming packets are filtered through a policy map referencing one or more ACLs, and matching packets are routed to the next hop specified.

A PBR policy map is composed of one or more classes and can include next-hop information for each class. It can also include single-line raw match statements, which have the appearance and function of a single line from an ACL. Each class contains an eponymous class map. Class maps are user-created, can be edited or deleted, filter traffic using IPv4 ACLs, and are listed in **running-config**.

These sections describe PBR policy configuration procedures:

- **Section 30.2.3: Configuring PBR Policies – Arad Platform Switches**
- **Section 30.3.3: Configuring PBR Policies – FM6000 Platform Switches**
- **Section 30.4.3: Configuring PBR Policies – Petra Platform Switches**
- **Section 30.5.3: Configuring PBR Policies – Trident Platform Switches**

30.1.4 PDP Policies

**Note**
PDP is available only in EOS versions 4.19.0F and above.

Per-port Denial-of-service Protection (PDP) is a new, specialized, port-level packet classification and policing service, similar to the existing port-level QoS policy service, targeted specifically at identifying and rate limiting potential denial of service traffic.

Default policies and shared-policy support vary by platform. **Arad and Jericho platforms** only shared policies are supported. **Alta and XP** only unshared policies are supported. **Trident II, Tomahawk, and Helix4** both shared and unshared policies are supported.

Creating a PDP policy and assigning it to an interface uses procedures similar to those for QoS, but with the following commands.

- To create an unshared PDP policy, use the `policy-map type pdp` command.
- To create a shared PDP policy, use the `policy-map type pdp` command with the `shared` keyword.
- To assign a policy to an input interface, use the `service-policy type pdp (Interface mode)` command in the configuration mode for the interface.
30.2 Traffic Management Configuration – Arad Platform Switches

Traffic policies are implemented by policy maps, which are applied to the control plane, or to L3 interfaces for Policy-Based Routing (PBR). Policy maps contain classes, which are composed of class maps and traffic resolution commands.

Section 30.1 describes traffic policies.

30.2.1 Configuring Control Plane Traffic Policies – Arad Platform Switches

Default control plane traffic policies are implemented automatically without user intervention. These policies are modified by associating traffic resolution commands with static classes that comprise the control plane policy map.

Static Class Maps

Control plane traffic policies utilize static class maps, which are provided by the switch, are not editable, and cannot be deleted.

Editing the Policy Map

The only control plane policy map is \texttt{copp-system-policy}, which cannot be deleted. In its default form, \texttt{copp-system-policy} consists of the classes listed in Table 30-1. Although the underlying class map of each class cannot be edited, the traffic resolution commands can be adjusted. The default classes cannot be removed from the policy map and their sequence within the policy map is not editable.

Table 30-1 \texttt{copp-system-policy} default classes: Arad Platform Switches

<tr>
<td>copp-system-sflow</td>
<td>2500</td>
<td>250</td>
</tr>
</tbody>
</table>
Policy maps are modified in policy-map configuration mode. The `policy-map type copp` command enters policy-map configuration mode.

**Example**
- This command enters policy-map configuration mode for editing `copp-system-policy`.
  ```
  switch(config)#policy-map type copp copp-system-policy
  switch(config-pmap-copp-system-policy)#
  ```

The `class (policy-map (control-plane) – Arad)` command enters policy-map-class configuration mode, where traffic resolution commands are modified for the configuration mode class.

**Example**
- This command enters policy-map-class configuration mode for the `copp-system-lacp` static class.
  ```
  switch(config-pmap-copp-system-policy)#class copp-system-lacp
  switch(config-pmap-c-copp-system-policy-copp-system-lacp)#
  ```

Two traffic resolution commands determine bandwidth parameters for class traffic:
- `bandwidth (policy-map-class (control-plane) – Arad)` specifies the minimum bandwidth.
- `shape (policy-map-class (control-plane) – Arad)` specifies the maximum bandwidth.

**Example**
- These commands configure a bandwidth range of 2000 to 4000 packets per seconds (pps) for traffic filtered by the `copp-system-lacp` class map:
  ```
  switch(config-pmap-c-copp-system-policy-copp-system-lacp)#bandwidth kbps 2000
  switch(config-pmap-c-copp-system-policy-copp-system-lacp)#shape kbps 4000
  switch(config-pmap-c-copp-system-policy-copp-system-lacp)#
  ```

Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the `exit` command or discarded with the `abort` command. The `show active` command displays the saved version of policy map. The `show pending` command displays the modified policy map.

**Example**
- These commands exit policy-map-class configuration mode, display the pending policy-map, then exit policy-map configuration mode, which saves the altered policy map to `running-config`.
  ```
  switch(config-pmap-c-copp-system-policy-copp-system-lacp)#exit
  switch(config-pmap-c-copp-system-policy)#show pending
  policy-map type copp copp-system-policy
  class copp-system-bpdu
  class copp-system-1ldp
  class copp-system-lacp
  shape kbps 4000
  bandwidth kbps 2000
  class copp-system-13ttl1
  class copp-system-13slowpath
  <--------OUTPUT OMITTED FROM EXAMPLE-------->
  ```

  ```
  switch(config-pmap-c-copp-system-policy)#exit
  switch(config)#
  ```
Applying Policy Maps to the Control Plane

The **copp-system-policy** policy map is always applied to the control plane. No commands are available to add or remove this assignment.

Displaying Policy Maps

The `show policy-map interface type qos` command displays the configured values of the policy map’s classes and the number of packets filtered and dropped as a result of the class maps.

Example

- These commands exit policy-map-class configuration mode, display the pending policy-map, then exit policy-map configuration mode, which saves the altered policy map to **running-config**.

```
switch(config)#show policy-map copp copp-system-policy
Service-policy input: copp-system-policy
Hardware programming status: InProgress
Class-map: copp-system-mlag (match-any)
  shape : 10000001 kbps
  bandwidth : 10000001 kbps
  Out Packets : 0
  Drop Packets : 0
Class-map: copp-system-bpdu (match-any)
  shape : 2604 kbps
  bandwidth : 1302 kbps
  Out Packets : 0
  Drop Packets : 0
Class-map: copp-system-lacp (match-any)
  shape : 4230 kbps
  bandwidth : 2115 kbps
  Out Packets : 0
  Drop Packets : 0

<--------OUTPUT OMITTED FROM EXAMPLE-------->
```

```
switch(config)#
```

```
switch(config-pmap-c-copp-system-policy-copp-system-lacp)#exit
```

30.2.2 Configuring QoS Traffic Policies – Arad Platform Switches.

QoS traffic policies are implemented by creating class maps and policy maps, then applying the policy maps to Ethernet and port channel interfaces.

Creating Class Maps

QoS traffic policies utilize dynamic class maps that are created and modified in class-map configuration mode. The `class-map type qos` command enters class-map configuration mode.

Example

- This command enters class-map configuration mode to create QoS class map named Q-CMap_1.

```
switch(config)#class-map type qos match-any Q-CMap_1
switch(config-cmap-Q-CMap_1)#
```
A class map contains one IPv4 access control list (ACL). The `match ip access-group` command assigns an ACL to the class map. Subsequent `match` commands replace the existing `match` command. Class maps filter traffic only on ACL permit rules. Deny ACL rules are disregarded.

**Example**
- This command adds the IPv4 ACL named ACL_1 to the class map.
  ```
  switch(config-cmap-Q-CMap_1)#match ip access-group ACL_1
  switch(config-cmap-Q-CMap_1)#
  ```

Class-map configuration mode is a group-change mode. Changes made in a group-change mode are saved by exiting the mode. The `show active` command displays the saved version of class map. The `show pending` command displays the unsaved class map.

**Example**
- The `show active` command indicates that the configuration mode class map is not stored in `running-config`. The `show pending` command displays the class map to be stored upon exiting class-map configuration mode.
  ```
  switch(config-cmap-Q-CMap_1)#show active
  switch(config-cmap-Q-CMap_1)#show pending
  class-map type qos match-any Q-CMap_1
  match ip access-group ACL_1
  
  switch(config-cmap-Q-CMap_1)#
  ```

The `exit` command returns the switch to global configuration mode and saves pending class map changes. The `abort` command returns the switch to global configuration mode and discards pending changes.

**Example**
- This command exits class-map configuration mode and stores pending changes to `running-config`.
  ```
  switch(config-cmap-CP-CMAP_1)#exit
  switch(config)#show class-map type control-plane CP-CMAP_1
  Class-map: CP-CMAP_1 (match-any)
  Match: ip access-group name ACLv4_1
  switch(config)#
  ```

**Creating Policy Maps**

Policy maps are created and modified in policy-map configuration mode. The `policy-map type quality-of-service` command enters policy-map configuration mode.

**Example**
- This command places the switch in policy-map configuration mode and creates a QoS policy map named Q-PMAP_1.
  ```
  switch(config)#policy-map type quality-of-service Q-PMAP_1
  switch(config-pmap-Q-PMAP_1)#
  ```

Policy map are edited by adding or removing classes. A class automatically contains its eponymous class map; traffic resolution commands are added or edited in policy-map-class configuration mode. The below command adds a class to the configuration mode policy map and places the switch in policy-map-class configuration mode, where traffic resolution commands are added to the class.
Chapter 30: Traffic Management

Traffic Management Configuration – Arad Platform Switches

Example

- This command adds the Q-CMap_1 class to the Q-PMAP_1 policy map and places the switch in policy-map-class configuration mode.

  ```
  switch(config-pmap-Q-PMAP_1)#class Q-CMap_1
  switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#
  ```

  The `set cos` commands configure traffic resolution methods for data that passes the class map:

  - `set cos` sets the layer 2 CoS field.
  - `set dscp` sets the DSCP value in the ToS byte.
  - `set traffic class` specifies a traffic class queue.

Example

- These commands configure the policy map to set the CoS field to 7 on packets filtered by the class map, then assigns those packets to traffic class 4.

  ```
  switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#set cos 7
  switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#set traffic-class 4
  ```

Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the `exit` command or discarded with the `abort` command. The `show active` and `show pending` commands display the saved and modified policy map versions, respectively.

Example

- These commands exit policy-map-class configuration mode, display the pending policy-map, then exit policy-map configuration mode to save the altered policy map to `running-config`.

  ```
  switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#exit
  switch(config-pmap-Q-PMAP_1)#show pending
  policy-map type quality-of-service Q-PMAP_1
  class Q-CMap_1
  set cos 7
  set traffic-class 4

  class class-default
  ```

  ```
  switch(config-pmap-Q-PMAP_1)#exit
  switch(config)#
  ```

The last class in all QoS policy maps is `class-default`. The `class-default` class map matches all traffic except IPv4 or IPv6 traffic and provides no traffic resolution commands. The `class-default` class map is not editable; traffic resolution commands can be added to the `class-default` class.

To modify traffic resolution commands for the `class-default` class, enter policy-map-class configuration mode for the class, then enter the desired `set` commands.
Example

- These commands enter policy-map-class configuration mode for **class-default**, configures the stream to enter traffic class 2, and saves the altered policy map to **running-config**.

```
switch(config)#policy-map type quality-of-service Q-PMap_1
switch(config-pmap-Q-PMap_1)#class class-default
switch(config-pmap-c-Q-PMap_1-class-default)#set traffic-class 2
switch(config-pmap-c-Q-PMap_1-class-default)#exit
switch(config-pmap-Q-PMap_1)#exit
switch(config)#show policy-map type qos Q-PMap_1
Service-policy Q-PMap_1

Class-map: Q-CMap_1 (match-any)
  Match: ipv6 access-group name ACLv6_1
    set cos 7
    set traffic-class 4

Class-map: class-default (match-any)
  set traffic-class 2
```

Applying Policy Maps to an Interface

The **service-policy type qos (Interface mode)** command applies a specified policy map to the configuration mode interface.

- These commands apply PMAP-1 policy map to Ethernet interface 8.

```
switch(config)#interface ethernet 8
switch(config-if-Et8)#show active
switch(config-if-Et8)#service-policy input PMAP-1
switch(config-if-Et8)#show active
  interface Ethernet8
    service-policy type qos input PMAP-1
switch(config-if-Et8)#
```

### 30.2.3 Configuring PBR Policies – Arad Platform Switches

Policy-Based Routing (PBR) is implemented by creating class maps and policy maps, then applying the policy maps to Ethernet interfaces, port channel interfaces or switch virtual interfaces (SVIs).

Creating PBR Class Maps

PBR policies utilize class maps that are created and modified in class-map configuration mode. The **class-map type pbr** command enters class-map configuration mode.

Example

- This command enters class-map configuration mode to create a PBR class map named CMAP1.

```
switch(config)#class-map type pbr match-any CMAP1
switch(config-cmap-PBR-CMAP1)#
```

A class map contains one or more access control lists (ACLs). The **match (policy-map (pbr))** command assigns an ACL to the class map. Subsequent **match** commands add additional ACLs to the class map. Class maps filter traffic only on ACL permit rules. Deny ACL rules are disregarded; if a class map includes ACLs with deny rules, the configuration reverts to its previous state.
Example

- This command adds the ACL named ACL1 to the class map.

```
switch(config-cmap-PBR-CMAP1)#match ip access-group ACL1
switch(config-cmap-PBR-CMAP1)#
```

Class-map configuration mode is a group-change mode. Changes made in a group-change mode are saved by exiting the mode. The `show active` command displays the saved version of class map.

- The `show active` command indicates that the configuration mode class map is not stored in `running-config`.

```
switch(config-cmap-PBR-CMAP1)#show active
switch(config-cmap-PBR-CMAP1)#
```

The `exit` command returns the switch to global configuration mode and saves pending class map changes. The `abort` command returns the switch to global configuration mode and discards pending changes.

Example

- This command exits class-map configuration mode and stores pending changes to `running-config`.

```
switch(config-cmap-PBR-CMAP1)#exit
switch(config)#show class-map type pbr CMAP1
class-map type pbr match-any CMAP1
10 match ip access-group ACL1
switch(config)#
```

Creating PBR Policy Maps

Policy maps are created and modified in policy-map configuration mode. The `policy-map type pbr` command enters policy-map configuration mode.

Example

- This command enters policy-map configuration mode for creating a PBR policy map named PMAP1.

```
switch(config)#policy-map type pbr PMAP1
switch(config-pmap-PMAP1)#
```

Policy map are edited by adding or removing classes. A class automatically contains its eponymous class map; next-hop commands are added or edited in policy-map-class configuration mode. The `class (policy-map (pbr))` command adds a class to the configuration mode policy map and places the switch in policy-map-class configuration mode, where next-hop commands are added to the class.

Example

- This command adds the CMAP1 class to the policy map and places the switch in policy-map-class configuration mode.

```
switch(config-pmap-PMAP1)#class CMAP1
switch(config-pmap-c-PMAP1-CMAP1)#
```

The `set nexthop (policy-map-class – pbr)` command configures the next hop for data that passes the class map.

- This command configures the policy map to set the next hop to 10.12.0.5 on packets filtered by the class map.

```
switch(config-pmap-c-PMAP1-CMAP1)#set nexthop 10.12.0.5
switch(config-pmap-c-PMAP1-CMAP1)#
```
The `set nexthop-group (policy-map-class(pbr) – Arad)` command configures a nexthop group as the next hop for data that passes the class map.

- These commands configure the policy map PMAP1 to set the next hop to a nexthop group named GROUP1 for traffic defined by class map CMAP1.

  ```
  switch(config)#policy-map type pbr PMAP1
  switch(config-pmap-PMAP1)#class CMAP1
  switch(config-pmap-c-PMAP1-CMAP1)#set nexthop-group GROUP1
  ```

Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the `exit` command or discarded with the `abort` command. The `show active` command displays the currently saved map version.

**Example**

- These commands exit policy-map-class configuration mode, then exit policy-map configuration mode to save the altered policy map to `running-config`.

  ```
  switch(config-pmap-c-PMAP1-CMAP1)#exit
  switch(config-pmap-PMAP1)#exit
  switch(config)#
  ```

**Applying a PBR Policy Map to an Interface**

The `service-policy type pbr (Interface mode)` command applies the specified PBR policy map to the configuration mode interface. Only one PBR service policy is supported per interface.

- These commands apply the PMAP1 PBR policy map to Ethernet interface 8.

  ```
  switch(config)#interface ethernet 8
  switch(config-if-Et8)#service-policy type pbr input PMAP1
  ```

**Hardware Decapsulation**

When hardware decapsulation takes place, PBR policy maps on Arad platform switches match on outer packet headers (i.e., they match based on the attributes of the packet before it is decapsulated).
30.3 **Traffic Management Configuration – FM6000 Platform Switches**

Traffic policies are implemented by policy maps, which are applied to the control plane or an interface. Policy maps contain classes, which are composed of class maps and traffic resolution commands. Section 30.1 describes traffic policies.

FM6000 platform switches support the following traffic policies:

- Control plane policies manage control plane traffic.
- QoS traffic policies manage traffic on Ethernet and port channel interfaces.

These sections describe the construction and application of policy maps on FM6000 platform switches:

- Section 30.3.1: Configuring Control Plane Traffic Policies – FM6000 Platform Switches
- Section 30.3.2: Configuring QoS Traffic Policies – FM6000 Platform Switches
- Section 30.3.3: Configuring PBR Policies – FM6000 Platform Switches

### 30.3.1 Configuring Control Plane Traffic Policies – FM6000 Platform Switches

Default control plane traffic policies are implemented automatically without user intervention. These policies are modified by associating traffic resolution commands with static classes that comprise the control plane policy map.

**Static Class Maps**

Control plane traffic policies utilize static class maps, which are provided by the switch, are not editable, and cannot be deleted.

**Editing the Policy Map**

The only control plane policy map is `copp-system-policy`, which cannot be deleted. In its default form, `copp-system-policy` consists of the classes listed in Table 30-2. Although the underlying class map of each class cannot be edited, the traffic resolution commands can be adjusted. The default classes cannot be removed from the policy map and their sequence within the policy map is not editable.

<table>
<thead>
<tr>
<th>Class Name</th>
<th>shape (pps)</th>
<th>bandwidth (pps)</th>
</tr>
</thead>
<tbody>
<tr>
<td>copp-system-arp</td>
<td>10000</td>
<td>100</td>
</tr>
<tr>
<td>copp-system-default</td>
<td>8000</td>
<td>100</td>
</tr>
<tr>
<td>copp-system-ipmcrsvd</td>
<td>10000</td>
<td>100</td>
</tr>
<tr>
<td>copp-system-ipmcmiss</td>
<td>10000</td>
<td>100</td>
</tr>
<tr>
<td>copp-system-igmp</td>
<td>10000</td>
<td>100</td>
</tr>
<tr>
<td>copp-system-l2rsvd</td>
<td>10000</td>
<td>10000</td>
</tr>
<tr>
<td>copp-system-l3slowpath</td>
<td>10000</td>
<td>1000</td>
</tr>
<tr>
<td>copp-system-pim-tp</td>
<td>10000</td>
<td>100</td>
</tr>
<tr>
<td>copp-system-ospf-isis</td>
<td>10000</td>
<td>100</td>
</tr>
<tr>
<td>copp-system-selfip</td>
<td>5000</td>
<td>5000</td>
</tr>
<tr>
<td>copp-system-selfip-tc6to7</td>
<td>5000</td>
<td>5000</td>
</tr>
<tr>
<td>copp-system-sflow</td>
<td>25000</td>
<td>1000</td>
</tr>
</tbody>
</table>
Policy maps are modified in policy-map configuration mode. The `policy-map type copp` command enters policy-map configuration mode.

**Example**
- This command enters policy-map configuration mode for editing `copp-system-policy`.
  ```
  switch(config)#policy-map type copp copp-system-policy
  switch(config-pmap-copp-system-policy)#
  ```

The `class (policy-map (control-plane) – FM6000)` command enters policy-map-class configuration mode, where traffic resolution commands are modified for the configuration mode class.

**Example**
- This command enters policy-map-class configuration mode for the `copp-system-arp` static class.
  ```
  switch(config-pmap-copp-system-policy)#class copp-system-arp
  switch(config-pmap-c-copp-system-policy-copp-system-arp)#
  ```

Two traffic resolution commands determine bandwidth parameters for class traffic:
- `bandwidth` (policy-map-class (control-plane) – FM6000) specifies the minimum bandwidth.
- `shape` (policy-map-class (control-plane) – FM6000) specifies the maximum bandwidth.

**Example**
- These commands configure a bandwidth range of 2000 to 4000 packets per seconds (pps) for traffic filtered by the `copp-system-arp` class map:
  ```
  switch(config-pmap-c-copp-system-policy-copp-system-arp)#bandwidth pps 2000
  switch(config-pmap-c-copp-system-policy-copp-system-arp)#shape pps 4000
  ```

Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the `exit` command or discarded with the `abort` command. The `show active` command displays the saved version of policy map. The `show pending` command displays the modified policy map.
Example

- These commands exit policy-map-class configuration mode, display the pending policy-map, then exit policy-map configuration mode, which saves the altered policy map to running-config.

```text
switch(config-pmap-c-copp-system-policy-CP-CMAP_1)#exit
switch(config-pmap-c-copp-system-policy)#show pending
policy-map type copp copp-system-policy
class CP-CMAP_1
    shape pps 4000
    bandwidth pps 2000
class copp-system-bpdu
class copp-system-lldp
class copp-system-lacp
class copp-system-arp

<--------OUTPUT OMITTED FROM EXAMPLE-------->

class copp-system-arpresolver

class copp-system-default

switch(config-pmap-c-copp-system-policy)#exit
switch(config)#
```

Applying Policy Maps to the Control Plane

The copp-system-policy policy map is always applied to the control plane. No commands are available to add or remove this assignment.

30.3.2 Configuring QoS Traffic Policies – FM6000 Platform Switches

QoS traffic policies are implemented by creating class maps and policy maps, then applying the policy maps to Ethernet and port channel interfaces.

Creating Class Maps

QoS traffic policies utilize dynamic class maps that are created and modified in class-map configuration mode. The class-map type qos command enters class-map configuration mode.

Example

- This command enters class-map configuration mode to create QoS class map named Q-CMap_1.

```text
switch(config)#class-map type qos match-any Q-CMap_1
switch(config-cmap-Q-CMap_1)#
```

A class map contains one IPv4 access control list (ACL). The match (class-map (qos) – FM6000) command assigns an ACL to the class map. Subsequent match commands replace the existing match command. Class maps filter traffic only on ACL permit rules. Deny ACL rules are disregarded.

Example

- This command adds the IPv4 ACL named ACL_1 to the class map.

```text
switch(config-cmap-Q-CMap_1)#match ip access-group ACL_1
switch(config-cmap-Q-CMap_1)#
```
Class-map configuration mode is a group-change mode. Changes made in a group-change mode are saved by exiting the mode. The `show active` command displays the saved version of class map. The `show pending` command displays the unsaved class map.

**Example**

- The `show active` command indicates that the configuration mode class map is not stored in `running-config`. The `show pending` command displays the class map to be stored upon exiting class-map configuration mode.

  ```
  switch(config-cmap-Q-CMap_1)#show active
  switch(config-cmap-Q-CMap_1)#show pending
  class-map type qos match-any Q-CMap_1
  match ip access-group ACL_1
  
  switch(config-cmap-Q-CMap_1)#
  ```

  The `exit` command returns the switch to global configuration mode and saves pending class map changes. The `abort` command returns the switch to global configuration mode and discards pending changes.

**Example**

- This command exits class-map configuration mode and stores pending changes to `running-config`.

  ```
  switch(config-cmap-CP-CMAP_1)#exit
  switch(config)#show class-map type control-plane CP-CMAP_1
  Class-map: CP-CMAP_1 (match-any)
  Match: ip access-group name ACLv4_1
  switch(config)#
  ```

**Creating Policy Maps**

Policy maps are created and modified in policy-map configuration mode. The `policy-map type quality-of-service` command enters policy-map configuration mode.

**Example**

- This command places the switch in policy-map configuration mode and creates a QoS policy map named `Q-PMAP_1`.

  ```
  switch(config)#policy-map type quality-of-service Q-PMAP_1
  switch(config-pmap-Q-PMAP_1)#
  ```

Policy map are edited by adding or removing classes. A class automatically contains its eponymous class map; traffic resolution commands are added or edited in policy-map-class configuration mode. The `class (policy-map (qos) – FM6000)` command adds a class to the configuration mode policy map and places the switch in policy-map-class configuration mode, where traffic resolution commands are added to the class.

**Example**

- This command adds the `Q-CMap_1` class to the `Q-PMAP_1` policy map and places the switch in policy-map-class configuration mode.

  ```
  switch(config-pmap-Q-PMAP_1)#class Q-CMap_1
  switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#
  ```

  `set (policy-map-class (qos) – FM6000)` commands configure traffic resolution methods for data that passes the class map:

  - `set cos` sets the layer 2 CoS field.
• **set dscp** sets the DSCP value in the ToS byte.
• **set traffic class** specifies a traffic class queue.

**Example**

• These commands configure the policy map to set the CoS field to 7 on packets filtered by the class map, then assigns those packets to traffic class 4.

```
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#set cos 7
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#set traffic-class 4
```

Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the `exit` command or discarded with the `abort` command. The `show active` and `show pending` commands display the saved and modified policy map versions, respectively.

**Example**

• These commands exit policy-map-class configuration mode, display the pending policy-map, then exit policy-map configuration mode to save the altered policy map to `running-config`.

```
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#exit
switch(config-pmap-Q-PMAP_1)#show pending
policy-map type quality-of-service Q-PMAP_1
    class Q-CMap_1
        set cos 7
        set traffic-class 4
    class class-default
```

The last class in all QoS policy maps is **class-default**. The **class-default** class map matches all traffic except IPv4 or IPv6 traffic and provides no traffic resolution commands. The **class-default** class map is not editable; traffic resolution commands can be added to the **class-default** class.

To modify traffic resolution commands for the **class-default** class, enter policy-map-class configuration mode for the class, then enter the desired `set` commands.
Example

- These commands enter policy-map-class configuration mode for `class-default`, configures the stream to enter traffic class 2, and saves the altered policy map to `running-config`.

```
switch(config)#policy-map type quality-of-service Q-PMap_1
switch(config-pmap-Q-PMap_1)#class class-default
switch(config-pmap-c-Q-PMap_1-class-default)#set traffic-class 2
switch(config-pmap-c-Q-PMap_1-class-default)#exit
switch(config-pmap-Q-PMap_1)#exit
switch(config)#show policy-map type qos Q-PMap_1
```

```
Service-policy Q-PMap_1
Class-map: Q-CMap_1 (match-any)
  Match: ipv6 access-group name ACLv6_1
    set cos 7
    set traffic-class 4

Class-map: class-default (match-any)
  set traffic-class 2
```

```
switch(config)#
```

Applying Policy Maps to an Interface

The `service-policy type qos (Interface mode)` command applies a specified policy map to the configuration mode interface.

- These commands apply PMAP-1 policy map to Ethernet interface 8.

```
switch(config)#interface ethernet 8
switch(config-if-Et8)#show active
switch(config-if-Et8)#service-policy input PMAP-1
switch(config-if-Et8)#show active
interface Ethernet8
  service-policy type qos input PMAP-1
switch(config-if-Et8)#
```

30.3.3 Configuring PBR Policies – FM6000 Platform Switches

Policy-Based Routing (PBR) is implemented by creating class maps and policy maps, then applying the policy maps to Ethernet interfaces, port channel interfaces or switch virtual interfaces (SVIs).

Creating PBR Class Maps

PBR policies utilize class maps that are created and modified in class-map configuration mode. The `class-map type pbr` command enters class-map configuration mode.

Example

- This command enters class-map configuration mode to create a PBR class map named CMAP1.

```
switch(config)#class-map type pbr match-any CMAP1
switch(config-cmap-PBR-CMAP1)#
```

A class map contains one or more IPv4 access control lists (ACLs). The `match (policy-map (pbr))` command assigns an ACL to the class map. Subsequent `match` commands add additional ACLs to the class map. Class maps filter traffic only on ACL permit rules. Deny ACL rules are disregarded; if a class map includes ACLs with deny rules, the configuration reverts to its previous state.

On FM6000 platform switches, counters are not supported, so a `counters per-entry (ACL configuration modes)` command in an ACL is ignored.
Example

- This command adds the IPv4 ACL named ACL1 to the class map.

```
switch(config-cmap-PBR-CMAP1)#match ip access-group ACL1
switch(config-cmap-PBR-CMAP1)#
```

Class-map configuration mode is a group-change mode. Changes made in a group-change mode are saved by exiting the mode. The `show active` command displays the saved version of class map.

- The `show active` command indicates that the configuration mode class map is not stored in `running-config`.

```
switch(config-cmap-PBR-CMAP1)#show active
switch(config-cmap-PBR-CMAP1)#
```

The `exit` command returns the switch to global configuration mode and saves pending class map changes. The `abort` command returns the switch to global configuration mode and discards pending changes.

Example

- This command exits class-map configuration mode and stores pending changes to `running-config`.

```
switch(config-cmap-PBR-CMAP1)#exit
switch(config)#show class-map type pbr CMAP1
class-map type pbr match-any CMAP1
  10 match ip access-group ACL1
switch(config)#
```

Creating PBR Policy Maps

Policy maps are created and modified in policy-map configuration mode. The `policy-map type pbr` command enters policy-map configuration mode.

Example

- This command enters policy-map configuration mode for creating a PBR policy map named PMAP1.

```
switch(config)#policy-map type pbr PMAP1
switch(config-pmap-PMAP1)#
```

Policy map are edited by adding or removing classes. A class automatically contains its eponymous class map; next-hop commands are added or edited in policy-map-class configuration mode. The `class (policy-map (pbr))` command adds a class to the configuration mode policy map and places the switch in policy-map-class configuration mode, where next-hop commands are added to the class.

Example

- This command adds the CMAP1 class to the policy map and places the switch in policy-map-class configuration mode.

```
switch(config-pmap-PMAP1)#class CMAP1
switch(config-pmap-c-PMAP1-CMAP1)#
```

The `set nexthop (policy-map-class – pbr)` command configures the next hop for data that passes the class map.

- This command configures the policy map to set the next hop to 10.12.0.5 on packets filtered by the class map.

```
switch(config-pmap-c-PMAP1-CMAP1)#set nexthop 10.12.0.5
switch(config-pmap-c-PMAP1-CMAP1)#
```
Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the `exit` command or discarded with the `abort` command. The `show active` command displays the currently saved map version.

Example

- These commands exit policy-map-class configuration mode, then exit policy-map configuration mode to save the altered policy map to `running-config`.

  ```
  switch(config-pmap-c-PMAP1-CMAP1)#exit
  switch(config-pmap-PMAP1)#exit
  switch(config)#
  ```

Applying a PBR Policy Map to an Interface

The `service-policy type pbr (Interface mode)` command applies the specified PBR policy map to the configuration mode interface. Only one PBR service policy is supported per interface.

- These commands apply the PMAP1 PBR policy map to Ethernet interface 8.

  ```
  switch(config)#interface ethernet 8
  switch(config-if-Et8)#service-policy type pbr input PMAP1
  switch(config-if-Et8)#
  ```

Hardware Decapsulation

When hardware decapsulation takes place, PBR policy maps on FM6000 platform switches match on outer packet headers (i.e., they match based on the attributes of the packet before it is decapsulated).
30.4 Traffic Management Configuration – Petra Platform Switches

Traffic policies are implemented by policy maps, which are applied to the control plane. Policy maps contain classes, which are composed of class maps and traffic resolution commands. QoS traffic policies are not supported on 7500 Series switches.

Section 30.1 describes traffic policies.

30.4.1 Configuring Control Plane Traffic Policies – Petra Platform Switches

Default control plane traffic policies are implemented automatically without user intervention. These policies are modified by associating traffic resolution commands with static classes that comprise the control plane policy map.

Static Class Maps

Control plane traffic policies utilize static class maps, which are provided by the switch, are not editable, and cannot be deleted.

Editing the Policy Map

The only control plane policy map is `copp-system-policy`, which cannot be deleted. In its default form, `copp-system-policy` consists of the classes listed in Table 30-3. Although the underlying class map of each class cannot be edited, the traffic resolution commands can be adjusted. The default classes cannot be removed from the policy map and their sequence within the policy map is not editable.

Table 30-3 copp-system-policy default classes: Petra Platform Switches

<table>
<thead>
<tr>
<th>Class Name</th>
<th>shape (pps)</th>
<th>bandwidth (pps)</th>
</tr>
</thead>
<tbody>
<tr>
<td>copp-system-bpdu</td>
<td>2500</td>
<td>1250</td>
</tr>
<tr>
<td>copp-system-default</td>
<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-igmp</td>
<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-ipbroadcast</td>
<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-ipmc</td>
<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-ipmcmiss</td>
<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-ipmcrsvd</td>
<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-ipunicast</td>
<td>NO LIMIT</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-l3destmiss</td>
<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-l3slowpath</td>
<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-l3ttl0</td>
<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-l3ttl1</td>
<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-lacp</td>
<td>2500</td>
<td>1250</td>
</tr>
<tr>
<td>copp-system-ldp</td>
<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-unicast-arp</td>
<td>2500</td>
<td>250</td>
</tr>
</tbody>
</table>

Policy maps are modified in policy-map configuration mode. The `policy-map type copp` command enters policy-map configuration mode.
Example

- This command enters policy-map configuration mode for editing `copp-system-policy`.

```bash
switch(config)#policy-map type copp copp-system-policy
```

The `class (policy-map (control-plane) – Petra)` command enters policy-map-class configuration mode, where traffic resolution commands are modified for the configuration mode class.

Example

- This command enters policy-map-class configuration mode for the `copp-system-lldp` static class.

```bash
switch(config-pmap-copp-system-policy)#class copp-system-lldp
```

Two traffic resolution commands determine bandwidth parameters for class traffic:

- `bandwidth (policy-map-class (control-plane) – Petra)` specifies the minimum bandwidth.
- `shape (policy-map-class (control-plane) – Petra)` specifies the maximum bandwidth.

Example

- These commands configure a bandwidth range of 2000 to 4000 packets per seconds (pps) for traffic filtered by the `copp-system-arp` class map:

```bash
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#bandwidth kbps 2000
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#shape kbps 4000
```

Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the `exit` command or discarded with the `abort` command. The `show active` command displays the saved version of policy map. The `show pending` command displays the configured policy map.

Petra platform switches do not support all discrete rate values. When a `bandwidth` or `shape` command specifies a value that is not supported, the switch converts the rate to the next highest discrete value that it supports. The `show policy-map interface type qos` command displays the converted rate and not the user configured rate.

Example

- These commands exit policy-map-class configuration mode, display the pending policy-map, then exit policy-map configuration mode, which saves the altered policy map to `running-config`.

```bash
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#exit
switch(config-pmap-c-copp-system-policy)#show pending
policy-map type copp copp-system-policy
  class copp-system-bpdu
    class copp-system-lldp
      shape kbps 4000
      bandwidth kbps 2000
  class copp-system-lacp

```

Changes are saved with the `exit` command or discarded with the `abort` command. The `show active` command displays the saved version of policy map. The `show pending` command displays the modified policy map.
Displaying Policy Maps

The `show policy-map interface type qos` command displays the traffic resolution rates of the policy map’s classes and the number of packets filtered and dropped as a result of the class maps. The shape and bandwidth rates may differ from configured values, because the switch does not support all discrete rate values.

Example

- These commands exit policy-map-class configuration mode, display the pending policy-map, then exit policy-map configuration mode, which saves the altered policy map to `running-config`.

```
switch(config)# show policy-map copp copp-system-policy
Service-policy input: copp-system-policy
Hardware programming status:InProgress

Class-map: copp-system-mlag (match-any)
  shape : 10000001 kbps
  bandwidth : 10000001 kbps
  Out Packets : 0
  Drop Packets : 0

<-------OUTPUT OMITTED FROM EXAMPLE-------->

Class-map: copp-system-lacp (match-any)
  shape : 2604 kbps
  bandwidth : 1302 kbps
  Out Packets : 0
  Drop Packets : 0

<-------OUTPUT OMITTED FROM EXAMPLE-------->

switch(config)#
```

Applying Policy Maps to the Control Plane

The `copp-system-policy` policy map is always applied to the control plane. No commands are available to add or remove this assignment.

30.4.2 Configuring QoS Traffic Policies – Petra Platform Switches

QoS traffic policies are not supported on Petra platform switches.

30.4.3 Configuring PBR Policies – Petra Platform Switches

PBR policies are not supported on Petra platform switches.
30.5 Traffic Management Configuration – Trident Platform Switches

Traffic policies are implemented by policy maps, which are applied to the control plane or an interface. Policy maps contain classes, which are composed of class maps and traffic resolution commands. Section 30.1 describes traffic policies.

Trident platform switches support the following traffic policies:
- Control plane policies manage control plane traffic.
- QoS traffic policies manage traffic on Ethernet and port channel interfaces.

These sections describe the construction and application of policy maps:
- Section 30.5.1: Configuring Control Plane Traffic Policies – Trident Platform Switches
- Section 30.5.2: Configuring QoS Traffic Policies – Trident Platform Switches
- Section 30.5.3: Configuring PBR Policies – Trident Platform Switches

30.5.1 Configuring Control Plane Traffic Policies – Trident Platform Switches

Default control plane traffic policies are implemented automatically without user intervention. These policies are modified by creating class maps and editing the policy map to include the new class maps.

Creating Class Maps

Control plane traffic policies utilize static and dynamic class maps. Static class maps are provided by the switch, are not editable, and cannot be deleted. Dynamic class maps are created and modified in class-map configuration mode. The `class-map type copp` command enters class-map configuration mode.

Example
- This command enters class-map configuration mode for creating or editing a control plane dynamic class map named CP-CMAP_1.
  ```
  switch(config)#class-map type copp match-any CP-CMAP_1
  switch(config-cmap-CP-CMAP_1)#
  ```

Class maps contain one IPv4 or IPv6 access control list (ACL). The `match (class-map (control-plane) – Trident)` command assigns an ACL to the class map. Subsequent `match` commands replace the existing `match` command. Class maps filter traffic only on ACL permit rules. Deny ACL rules are disregarded.

Example
- This command assigns the IPv4 ACL named ACLv4_1 to the class map.
  ```
  switch(config-cmap-CP-CMAP_1)#match ip access-group ACLv4_1
  switch(config-cmap-CP-CMAP_1)#
  ```

Class-map configuration mode is a group-change mode. Changes are saved by exiting the mode. The `show active` command displays the saved version of class map. The `show pending` command displays the unsaved class map.
Example

- The `show active` command indicates that the configuration mode class map is not stored in `running-config`. The `show pending` command displays the class map to be stored upon exiting class-map configuration mode.

  switch(config-cmap-CP-CMAP_1)#show active
  switch(config-cmap-CP-CMAP_1)#show pending
  class-map type copp match-any CP-CMAP_1
    match ip access-group ACLv4_1

  switch(config-cmap-CP-CMAP_1)#

The `exit` command returns the switch to global configuration mode and saves pending class map changes. The `abort` command returns the switch to global configuration mode and discards pending class map changes.

Example

- This command exits class-map configuration mode and stores pending changes to `running-config`.

  switch(config-cmap-CP-CMAP_1)#exit
  switch(config)#show class-map type control-plane CP-CMAP_1
  - Class-map: CP-CMAP_1 (match-any)
    - Match: ip access-group name ACLv4_1
  switch(config)#

Editing the Policy Map

The only control plane policy map is `copp-system-policy`, which cannot be deleted. In its default form, `copp-system-policy` consists of the classes listed in Table 30-4. Although the underlying class map of each class cannot be edited, the traffic resolution commands can be adjusted. The default classes cannot be removed from the policy map and their sequence within the policy map is not editable.

Table 30-4 `copp-system-policy` default classes: Trident Platform Switches

<table>
<thead>
<tr>
<th>Class Name</th>
<th>shape (pps)</th>
<th>bandwidth (pps)</th>
</tr>
</thead>
<tbody>
<tr>
<td>copp-system-bpdu</td>
<td>5000</td>
<td>5000</td>
</tr>
<tr>
<td>copp-system-lacp</td>
<td>5000</td>
<td>5000</td>
</tr>
<tr>
<td>copp-system-selfip-tc6to7</td>
<td>5000</td>
<td>5000</td>
</tr>
<tr>
<td>copp-system-selfip</td>
<td>5000</td>
<td>5000</td>
</tr>
<tr>
<td>copp-system-tc6to7</td>
<td>10000</td>
<td>1000</td>
</tr>
<tr>
<td>copp-system-ldp</td>
<td>10000</td>
<td>1000</td>
</tr>
<tr>
<td>copp-system-ipmcrsvd</td>
<td>10000</td>
<td>1000</td>
</tr>
<tr>
<td>copp-system-igmp</td>
<td>10000</td>
<td>1000</td>
</tr>
<tr>
<td>copp-system-ipmcmiss</td>
<td>10000</td>
<td>1000</td>
</tr>
<tr>
<td>copp-system-glean</td>
<td>10000</td>
<td>1000</td>
</tr>
<tr>
<td>copp-system-tc3to5</td>
<td>10000</td>
<td>1000</td>
</tr>
<tr>
<td>copp-system-arp</td>
<td>10000</td>
<td>1000</td>
</tr>
<tr>
<td>copp-system-arpresolver</td>
<td>10000</td>
<td>1000</td>
</tr>
<tr>
<td>copp-system-l3destmiss</td>
<td>10000</td>
<td>1000</td>
</tr>
<tr>
<td>copp-system-l3slowpath</td>
<td>10000</td>
<td>1000</td>
</tr>
<tr>
<td>copp-system-l3ttl1</td>
<td>10000</td>
<td>1000</td>
</tr>
</tbody>
</table>
Policy maps are modified in policy-map configuration mode. The `policy-map type copp` command enters policy-map configuration mode.

**Example**
- This command enters policy-map configuration mode for editing `copp-system-policy`.
  ```
  switch(config)#policy-map type copp copp-system-policy
  switch(config-pmap-copp-system-policy)#
  ```

Dynamic classes are inserted in front of the static classes. Classes automatically contain their eponymous class map; traffic resolution commands are created or edited in policy-map-class configuration mode. The `class (policy-map (control-plane) – Trident)` command adds a class to the policy map and places the switch in policy-map-class configuration mode, where traffic resolution commands are added to the class.

**Example**
- This command adds the CP-CMAP_1 class to the copp-system-policy policy map and places the switch in policy-map-class configuration mode.
  ```
  switch(config-pmap-copp-system-policy)#class CP-CMAP_1
  switch(config-pmap-c-copp-system-policy-CP-CMAP_1)#
  ```

Two traffic resolution commands determine bandwidth parameters for class traffic:
- `bandwidth (policy-map-class (control-plane) – Trident)` specifies the minimum bandwidth.
- `shape (policy-map-class (control-plane) – Trident)` specifies the maximum bandwidth.

**Example**
- These commands configure a bandwidth range of 2000 to 4000 packets per seconds (pps) for traffic filtered by the CP-CMAP_1 class map:
  ```
  switch(config-pmap-c-copp-system-policy-CP-CMAP_1)#bandwidth pps 2000
  switch(config-pmap-c-copp-system-policy-CP-CMAP_1)#shape pps 4000
  ```

Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the `exit` command or discarded with the `abort` command. The `show active` command displays the saved version of policy map. The `show pending` command displays the modified policy map.

<table>
<thead>
<tr>
<th>Class Name</th>
<th>shape (pps)</th>
<th>bandwidth (pps)</th>
</tr>
</thead>
<tbody>
<tr>
<td>copp-system-default</td>
<td>8000</td>
<td>1000</td>
</tr>
<tr>
<td>copp-system-acllog</td>
<td>10000</td>
<td>1000</td>
</tr>
<tr>
<td>copp-system-sflow</td>
<td>25000</td>
<td>0</td>
</tr>
</tbody>
</table>

**Table 30-4** copp-system-policy default classes: Trident Platform Switches

Policy maps are modified in policy-map configuration mode. The `policy-map type copp` command enters policy-map configuration mode.
Example

- These commands exit policy-map-class configuration mode, display the pending policy-map, then exit policy-map configuration mode, which saves the altered policy map to running-config.

  switch(config-pmap-c-copp-system-policy-CP-CMAP_1)#exit
  switch(config-pmap-copp-system-policy)#show pending
  policy-map type copp copp-system-policy
  class CP-CMAP_1
    shape pps 4000
    bandwidth pps 2000
  class copp-system-bpdu
  class copp-system-lldp
  class copp-system-lacp
  class copp-system-arp
  class copp-system-arpresolver
  class copp-system-default

  switch(config-pmap-copp-system-policy)#exit
  switch(config)#

  To modify traffic resolution commands for a static class, enter policy-map-class configuration mode for the class, then enter the desired **bandwidth** and **shape** commands.

Example

- These commands enter policy-map-class configuration mode for copp-system-bpdu class, change the bandwidth range for the class, then save the altered policy map to running-config.

  switch(config)#policy-map type copp copp-system-policy
  switch(config-pmap-copp-system-policy)#class copp-system-bpdu
  switch(config-pmap-copp-system-policy-copp-system-bpdu)#shape pps 200
  switch(config-pmap-copp-system-policy-copp-system-bpdu)#bandwidth pps 100
  switch(config-pmap-copp-system-policy-copp-system-bpdu)#exit
  switch(config-pmap-copp-system-policy)#show pending
  policy-map type copp copp-system-policy
  class CP-CMAP_1
    shape pps 4000
    bandwidth pps 2000
  class copp-system-bpdu
    shape pps 200
    bandwidth pps 100
  class copp-system-lldp

  <--------OUTPUT OMITTED FROM EXAMPLE-------->

  switch(config-pmap-copp-system-policy)#exit
  switch(config)#
Applying Policy Maps to the Control Plane

The `copp-system-policy` policy map is always applied to the control plane. No commands are available to add or remove this assignment.

30.5.2 Configuring QoS Traffic Policies – Trident Platform Switches

QoS traffic policies are implemented by creating class maps and policy maps, then applying the policy maps to Ethernet and port channel interfaces.

Creating Class Maps

QoS traffic policies utilize dynamic class maps that are created and modified in class-map configuration mode. The `class-map type qos` command enters class-map configuration mode.

Example

- This command enters class-map configuration mode to create QoS class map named Q-CMap_1.

```
switch(config)#class-map type qos match-any Q-CMap_1
switch(config-cmap-Q-CMap_1)#
```

A class map contains one IPv4 or IPv6 access control list (ACL). The `match (class-map (qos) – Trident)` command assigns an ACL to the class map. Subsequent `match` commands replace the existing `match` command. Class maps filter traffic only on ACL permit rules. Deny ACL rules are disregarded.

Example

- This command adds the IPv6 ACL named ACLv6_1 to the class map.

```
switch(config-cmap-Q-CMap_1)#match ipv6 access-group ACLv6_1
switch(config-cmap-Q-CMap_1)#
```

Class-map configuration mode is a group-change mode. Changes made in a group-change mode are saved by exiting the mode. The `show active` command displays the saved version of class map. The `show pending` command displays the unsaved class map.

Example

- The `show active` command indicates that the configuration mode class map is not stored in `running-config`. The `show pending` command displays the class map to be stored upon exiting class-map configuration mode.

```
switch(config-cmap-Q-CMap_1)#show active
switch(config-cmap-Q-CMap_1)#show pending
class-map type qos match-any Q-CMap_1
  match ipv6 access-group ACLv6_1

switch(config-cmap-Q-CMap_1)#
```

The `exit` command returns the switch to global configuration mode and saves pending class map changes. The `abort` command returns the switch to global configuration mode and discards pending class map changes.
Example

- This command exits class-map configuration mode and stores pending changes to running-config.
  
  switch(config-cmap-CP-CMAP_1)#exit
  switch(config)#show class-map type control-plane CP-CMAP_1
  
  Class-map: CP-CMAP_1 (match-any)
  Match: ip access-group name ACLv4_1
  switch(config)#

Creating Policy Maps

Policy maps are created and modified in policy-map configuration mode. The policy-map type quality-of-service command enters policy-map configuration mode.

Example

- This command enters policy-map configuration mode for creating a QoS policy map named Q-PMAP_1.
  
  switch(config)#policy-map type quality-of-service Q-PMAP_1
  switch(config-pmap-Q-PMAP_1)#

Policy maps are edited by adding or removing classes. A class automatically contains its eponymous class map; traffic resolution commands are added or edited in policy-map-class configuration mode. The class (policy-map (qos) – Trident) command adds a class to the configuration mode policy map and places the switch in policy-map-class configuration mode, where traffic resolution commands are added to the class.

Example

- This command adds the Q-CMap_1 class to the Q-PMAP_1 policy map and places the switch in policy-map-class configuration mode.
  
  switch(config-pmap-Q-PMAP_1)#class Q-CMap_1
  switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#

The set (policy-map-class (qos) – Trident) command configures traffic resolution methods for data that passes the class map:

- set cos sets the layer 2 CoS field.
- set dscp sets the DSCP value in the ToS byte.
- set traffic class specifies a traffic class queue.

Example

- These commands configure the policy map to set the CoS field to 7 on packets filtered by the class map, then assigns those packets to traffic class 4.
  
  switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#set cos 7
  switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#set traffic-class 4
  switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#

Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the exit command or discarded with the abort command. The show active and show pending commands display the saved and modified policy map versions, respectively.
Example

- These commands exit policy-map-class configuration mode, display the pending policy-map, then exit policy-map configuration mode to save the altered policy map to running-config.

```
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#exit
switch(config-pmap-Q-PMAP_1)#show pending
policy-map type quality-of-service Q-PMAP_1
  class Q-CMap_1
    set cos 7
    set traffic-class 4
  class class-default

switch(config-pmap-Q-PMAP_1)#exit
switch(config)#
```

The last class in all QoS policy maps is class-default. The class-default class map matches all traffic except IPv4 or IPv6 traffic and provides no traffic resolution commands. The class-default class map is not editable; traffic resolution commands can be added to the class-default class.

To modify traffic resolution commands for the class-default class, enter policy-map-class configuration mode for the class, then enter the desired set commands.

Example

- These commands enter policy-map-class configuration mode for class-default, configures the stream to enter traffic class 2, and saves the altered policy map to running-config.

```
switch(config)#policy-map type quality-of-service Q-PMap_1
switch(config-pmap-Q-PMap_1)#class class-default
switch(config-pmap-c-Q-PMap_1-class-default)#set traffic-class 2
switch(config-pmap-c-Q-PMap_1-class-default)#exit
switch(config-pmap-Q-PMap_1)#exit
switch(config)#show policy-map type qos Q-PMap_1
Service-policy Q-PMap_1

Class-map: Q-CMap_1 (match-any)
  Match: ipv6 access-group name ACLv6_1
    set cos 7
    set traffic-class 4

Class-map: class-default (match-any)
  set traffic-class 2
```

Applying Policy Maps to an Interface

The service-policy type qos (Interface mode) command applies a specified policy map to the configuration mode interface.
Example

- These commands apply PMAP-1 policy map to Ethernet interface 8.

```
switch(config)#interface ethernet 8
switch(config-if-Et8)#show active
switch(config-if-Et8)#service-policy input PMAP-1
switch(config-if-Et8)#show active
interface Ethernet8
  service-policy type qos input PMAP-1
switch(config-if-Et8)#
```

30.5.3 Configuring PBR Policies – Trident Platform Switches

Policy-Based Routing (PBR) is implemented by creating class maps and policy maps, then applying
the policy maps to Ethernet interfaces, port channel interfaces or switch virtual interfaces (SVIs).

Creating PBR Class Maps

PBR policies utilize class maps that are created and modified in class-map configuration mode. The
class-map type pbr command enters class-map configuration mode.

Example

- This command enters class-map configuration mode to create a PBR class map named CMAP1.

```
switch(config)#class-map type pbr match-any CMAP1
switch(config-cmap-PBR-CMAP1)#
```

A class map contains one or more access control lists (ACLs). The `match (policy-map (pbr))` command
assigns an ACL to the class map. Subsequent `match` commands add additional ACLs to the class map.
Class maps filter traffic only on ACL permit rules. Deny ACL rules are disregarded; if a class map
includes ACLs with deny rules, the configuration reverts to its previous state.

Example

- This command adds the ACL named ACL1 to the class map.

```
switch(config-cmap-PBR-CMAP1)#match ip access-group ACL1
switch(config-cmap-PBR-CMAP1)#
```

Class-map configuration mode is a group-change mode. Changes made in a group-change mode are
saved by exiting the mode. The `show active` command displays the saved version of class map.

- The `show active` command indicates that the configuration mode class map is not stored in
  running-config.

```
switch(config-cmap-PBR-CMAP1)#show active
switch(config-cmap-PBR-CMAP1)#
```

The `exit` command returns the switch to global configuration mode and saves pending class map
changes. The `abort` command returns the switch to global configuration mode and discards pending
changes.

Example

- This command exits class-map configuration mode and stores pending changes to
  running-config.

```
switch(config-cmap-PBR-CMAP1)#exit
switch(config)#show class-map type pbr CMAP1
class-map type pbr match-any CMAP1
  10 match ip access-group ACL1
switch(config)#
```
Creating PBR Policy Maps

Policy maps are created and modified in policy-map configuration mode. The `policy-map type pbr` command enters policy-map configuration mode.

Example

- This command enters policy-map configuration mode for creating a PBR policy map named PMAP1.

  ```
  switch(config)#policy-map type pbr PMAP1
  switch(config-pmap-PMAP1)#
  ```

Policy maps are edited by adding or removing classes. A class automatically contains its eponymous class map; next-hop commands are added or edited in policy-map-class configuration mode. The `class (policy-map (pbr))` command adds a class to the configuration mode policy map and places the switch in policy-map-class configuration mode, where next-hop commands are added to the class.

Example

- This command adds the CMAP1 class to the policy map and places the switch in policy-map-class configuration mode.

  ```
  switch(config-pmap-PMAP1)#class CMAP1
  switch(config-pmap-c-PMAP1-CMAP1)#
  ```

The `set nexthop (policy-map-class – pbr)` command configures the next hop for data that passes the class map.

- This command configures the policy map to set the next hop to 10.12.0.5 on packets filtered by the class map.

  ```
  switch(config-pmap-c-PMAP1-CMAP1)#set nexthop 10.12.0.5
  switch(config-pmap-c-PMAP1-CMAP1)#
  ```

Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the `exit` command or discarded with the `abort` command. The `show active` command displays the currently saved map version.

Example

- These commands exit policy-map-class configuration mode, then exit policy-map configuration mode to save the altered policy map to `running-config`.

  ```
  switch(config-pmap-c-PMAP1-CMAP1)#exit
  switch(config-pmap-PMAP1)#exit
  switch(config)#
  ```

Applying a PBR Policy Map to an Interface

The `service-policy type pbr (Interface mode)` command applies the specified PBR policy map to the configuration mode interface. Only one PBR service policy is supported per interface.

- These commands apply the PMAP1 PBR policy map to Ethernet interface 8.

  ```
  switch(config)#interface ethernet 8
  switch(config-if-Et8)#service-policy type pbr input PMAP1
  switch(config-if-Et8)#
  ```

Hardware Decapsulation

When hardware decapsulation takes place, PBR policy maps on Trident platform switches match on inner packet headers (i.e., they match based on the attributes of the decapsulated packet).
30.6 Traffic Management Configuration – Trident-II Platform Switches

Traffic policies are implemented by policy maps, which are applied to the control plane or an interface. Policy maps contain classes, which are composed of class maps and traffic resolution commands. Section 30.1 describes traffic policies.

Trident platform switches support the following traffic policies:
- Control plane policies manage control plane traffic.
- QoS traffic policies manage traffic on Ethernet and port channel interfaces.

30.6.1 Configuring Control Plane Traffic Policies – Trident-II Platform Switches

Default control plane traffic policies are implemented automatically without user intervention. These policies are modified by associating traffic resolution commands with static classes that comprise the control plane policy map.

Static Class Maps

Control plane traffic policies utilize static class maps, which are provided by the switch, are not editable, and cannot be deleted.

Editing the Policy Map

The only control plane policy map is `copp-system-policy`, which cannot be deleted. In its default form, `copp-system-policy` consists of the classes listed in Table 30-5. Although the underlying class map of each class cannot be edited, the traffic resolution commands can be adjusted. The default classes cannot be removed from the policy map and their sequence within the policy map is not editable.

Table 30-5 copp-system-policy default classes: Trident-II Platform Switches

<table>
<thead>
<tr>
<th>Class Name</th>
<th>shape (pps)</th>
<th>bandwidth (pps)</th>
</tr>
</thead>
<tbody>
<tr>

<td>5000</td>
<td>5000</td>
</tr>
<tr>
<td>copp-system-selfip</td>
<td>5000</td>
<td>5000</td>
</tr>
</tbody>
</table>
Policy maps are modified in policy-map configuration mode. The `policy-map type copp` command enters policy-map configuration mode.

Example
- This command enters policy-map configuration mode for editing `copp-system-policy`.
  ```
  switch(config)#policy-map type copp copp-system-policy
  switch(config-pmap-copp-system-policy)#
  ```

The `class (policy-map (control-plane) – Trident-II)` command enters policy-map-class configuration mode, where traffic resolution commands are modified for the configuration mode class.

Example
- This command enters policy-map-class configuration mode for the `copp-system-lacp` static class.
  ```
  switch(config-pmap-copp-system-policy)#class copp-system-lacp
  switch(config-pmap-c-copp-system-policy-copp-system-lacp)#
  ```

Two traffic resolution commands determine bandwidth parameters for class traffic:
- `bandwidth (policy-map-class (control-plane) – Trident-II)` specifies the minimum bandwidth.
- `shape (policy-map-class (control-plane) – Trident-II)` specifies the maximum bandwidth.

Example
- These commands configure a bandwidth range of 2000 to 4000 packets per seconds (pps) for traffic filtered by the `copp-system-lacp` class map:
  ```
  switch(config-pmap-c-copp-system-policy-copp-system-lacp)#bandwidth kbps 2000
  switch(config-pmap-c-copp-system-policy-copp-system-lacp)#shape kbps 4000
  ```

Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the `exit` command or discarded with the `abort` command. The `show active` command displays the saved version of policy map. The `show pending` command displays the modified policy map.

### Table 30-5 copp-system-policy default classes: Trident-II Platform Switches

<table>
<thead>
<tr>
<th>Class Name</th>
<th>shape (pps)</th>
<th>bandwidth (pps)</th>
</tr>

</tr>
<tr>
<td>copp-system-urm</td>
<td>1000</td>
<td>10000</td>
</tr>
</tbody>
</table>
Example

- These commands exit policy-map-class configuration mode, display the pending policy-map, then exit policy-map configuration mode, which saves the altered policy map to `running-config`.

```plaintext
switch(config-pmap-c-copp-system-policy-copp-system-lacp)#exit
switch(config-pmap-copp-system-policy)#show pending
policy-map type copp copp-system-policy
  class copp-system-bpdu
    class copp-system-lldp
    class copp-system-lacp
      shape pps 4000
      bandwidth pps 2000
    class copp-system-arp
      <--------OUTPUT OMITTED FROM EXAMPLE-------->
switch(config-pmap-copp-system-policy)#exit
switch(config)#
```

Applying Policy Maps to the Control Plane

The `copp-system-policy` policy map is always applied to the control plane. No commands are available to add or remove this assignment.
30.7 Traffic Management Configuration Commands

Traffic Policy (Control Plane) Configuration Commands

- class-map type copp
- policy-map type copp

- bandwidth (policy-map-class (control-plane) – Arad)
- class (policy-map (control-plane) – Arad)
- shape (policy-map-class (control-plane) – Arad)

- bandwidth (policy-map-class (control-plane) – FM6000)
- class (policy-map (control-plane) – FM6000)
- shape (policy-map-class (control-plane) – FM6000)

- bandwidth (policy-map-class (control-plane) – Helix)
- class (policy-map (control-plane) – Helix)
- match (class-map (control-plane) – Helix)
- shape (policy-map-class (control-plane) – Helix)

- bandwidth (policy-map-class (control-plane) – Petra)
- class (policy-map (control-plane) – Petra)
- shape (policy-map-class (control-plane) – Petra)

- bandwidth (policy-map-class (control-plane) – Trident)
- class (policy-map (control-plane) – Trident)
- match (class-map (control-plane) – Trident)
- shape (policy-map-class (control-plane) – Trident)

- bandwidth (policy-map-class (control-plane) – Trident-II)
- class (policy-map (control-plane) – Trident-II)
- match (class-map (control-plane) – Trident-II)
- shape (policy-map-class (control-plane) – Trident-II)

Traffic Policy (PBR) Configuration Commands

- class (policy-map (pbr))
- class-map type pbr
- match (class-map (pbr))
- match (policy-map (pbr))
- platform arad tcam counters feature
- policy-map type pbr
- resequence (class-map (pbr))
- resequence (policy-map (pbr))
- service-policy type pbr (Interface mode)
- set nexthop (policy-map-class – pbr)
Traffic Policy (PDP) Configuration Commands
- policy-map type pdp
- service-policy type pdp (Interface mode)

CPU Traffic Policy Command
- feature traffic-policy cpu (ipv4 | ipv6)

Traffic Policy (QoS) Configuration Commands
- class-map type qos
- policy-map type quality-of-service
- service-policy type qos (Interface mode)

- class (policy-map (qos) – FM6000)
- match (class-map (qos) – FM6000)
- set (policy-map-class (qos) – FM6000)

- class (policy-map (qos) – Helix)
- match (class-map (qos) – Helix)
- set (policy-map-class (qos) – Helix)

- class (policy-map (qos) – Trident)
- match (class-map (qos) – Trident)
- set (policy-map-class (qos) – Trident)

- class (policy-map (qos) – Trident II)
- match (class-map (qos) – Trident II)
- set (policy-map-class (qos) – Trident II)

Traffic Policy Display and Utility Commands
- clear policy-map counters
- show class-map type control-plane
- show class-map type pbr
- show class-map type qos
- show policy-map type copp
- show policy-map type pbr
- show policy-map type qos
- show policy-map type qos counters
- show policy-map copp
- show policy-map interface type qos
- show policy-map interface type qos counters
bandwidth (policy-map-class (control-plane) – Arad)

The bandwidth command specifies the minimum bandwidth for traffic filtered by the configuration mode policy map class.

The no bandwidth and default bandwidth commands remove the minimum bandwidth guarantee for the configuration mode class by deleting the corresponding bandwidth command from running-config.

Command Mode
Policy-map-class (control plane) configuration
accessed through class (policy-map (control-plane) – Arad)

Command Syntax
bandwidth kbps  kbits
no bandwidth
default bandwidth

Parameters
- kbits  Minimum data rate (kbits per second). Value ranges from 1 to 1000000.

Related Commands
- class (policy-map (control-plane) – Arad) places the switch in policy-map-class (control plane) configuration mode.
- shape (policy-map-class (control-plane) – Arad) specifies the maximum bandwidth for traffic defined by the associated class map in its configuration mode policy map class.

Static Classes Default Bandwidth
Arad platform switches define these default bandwidths for control plane static classes:
- copp-system-bgp250*copp-system-l3pmoveflow250
- copp-system-bpdu1250*copp-system-l3slowpath250
- copp-system-default250*copp-system-l3tt1250
- copp-system-ipbroadcast250*copp-system-l3lpmoverflow250
- copp-system-ipmc250*copp-system-l3lacp1250
- copp-system-ipmcmiss250*copp-system-lldp250
- copp-system-ipunicast250*copp-system-mlag250
- copp-system-l2broadcast250*copp-system-multicastsnoop250
- copp-system-l2unicast250*copp-system-Ospfisis250
- copp-system-l3destmiss250*copp-system-sflow250
Example

- These commands configure the minimum bandwidth of 500 kbps for data traffic specified by the class map copp-system-lldp of the default control-plane policy map.

```
switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#bandwidth kbps 500
switch(config-pmap-c-c-copp-system-policy-copp-system-lldp)#exit
switch(config-pmap-c-c-copp-system-policy-copp-system-lldp)#exit
switch(config)#show policy-map copp copp-system-policy
Service-policy input: copp-system-policy
Hardware programming status:InProgress

Class-map: copp-system-lldp (match-any)
  shape : 2500 kbps
  bandwidth : 500 kbps
Out Packets : 0
Drop Packets : 0

----------OUTPUT OMITTED FROM EXAMPLE---------->
```

```
switch(config)#
```
bandwidth (policy-map-class (control-plane) – FM6000)

The bandwidth command specifies the minimum bandwidth for traffic filtered by the configuration mode policy map class.

The no bandwidth and default bandwidth commands remove the minimum bandwidth guarantee for the configuration mode class by deleting the corresponding bandwidth command from running-config.

Command Mode
Policy-map-class (control plane) configuration
accessed through class (policy-map (control-plane) – FM6000)

Command Syntax
```
bandwidth pps packets
no bandwidth
default bandwidth
```

Parameters
- **packets** Minimum data rate (packets per second). Value ranges from 1 to 10000.

Related Commands
- class (policy-map (control-plane) – FM6000) places the switch in policy-map-class (control plane) configuration mode.
- shape (policy-map-class (control-plane) – FM6000) specifies the maximum bandwidth for traffic defined by the associated class map in its configuration mode policy map class.

Static Classes Default Bandwidth
FM6000 platform switches define these default bandwidths for control plane static classes:
- copp-system-arp1000
- copp-system-l3slowpath1000
- copp-system-default1000
- copp-system-pim-ptp1000
- copp-system-ipmcrsvd1000
- copp-system-ospf-isis1000
- copp-system-ipmcmiss1000
- copp-system-selfip5000
- copp-system-igmp1000
- copp-system-selfip-tc6to75000
- copp-system-l2rsvd1000
- copp-system-sflow1000

Example
- These commands configure the minimum bandwidth of 1000 packets per second for data traffic specified by the class map PMAP-1 in the policy map named copp-system-policy.
  ```
  switch(config)#policy-map type copp copp-system-policy
  switch(config-pmap-copp-system-policy)#class PMAP-1
  switch(config-pmap-c-copp-system-policy-PMAP-1)#bandwidth pps 1000
  ```
bandwidth (policy-map-class (control-plane) – Helix)

The bandwidth command specifies the minimum bandwidth for traffic filtered by the configuration mode policy map class.

The no bandwidth and default bandwidth commands remove the minimum bandwidth guarantee for the configuration mode class by deleting the corresponding bandwidth command from running-config.

Command Mode
Policy-map-class (control plane) configuration
accessed through class (policy-map (control-plane) – Helix)

Command Syntax

```
bandwidth pps packets
no bandwidth
default bandwidth
```

Parameters

- **packets** Minimum data rate (packets per second). Value ranges from 1 to 100000.

Related Commands

- class (policy-map (control-plane) – Helix) places the switch in policy-map-class (control plane) configuration mode.
- shape (policy-map-class (control-plane) – Helix) specifies the maximum bandwidth for traffic defined by the associated class map in its configuration mode policy map class.

Static Classes Default Bandwidth

Helix platform switches define these default bandwidths for control plane static classes:

- copp-system-acclog1000•copp-system-l3ttl11000
- copp-system-arp1000•copp-system-lacp5000
- copp-system-arpsresolver1000•copp-system-lldp1000
- copp-system-bfd5000•copp-system-mlag5000
- copp-system-bgp5000•copp-system-OspfIsis5000
- copp-system-bpdu5000•copp-system-selfip5000
- copp-system-default1000•copp-system-selfip-tc6to75000
- copp-system-glean1000•copp-system-sflow0
- copp-system-igmp1000•copp-system-tc3to51000
- copp-system-ipmcmss1000•copp-system-tc6to71000
- copp-system-ipmcrsvd1000•copp-system-urm1000
- copp-system-l3destmiss1000•copp-system-vrrp1000
- copp-system-l3slowpath1000
Example

- These commands configure the minimum bandwidth of 500 packets per second for data traffic specified by the class map copp-system-lldp.

```
switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#bandwidth pps 500
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#exit
switch(config-pmap-c copp-system-policy)#exit
switch(config)#show policy-map interface control-plan copp-system-policy
Service-policy input: copp-system-policy
  Number of units programmed: 4
  Hardware programming status: Successful
  <--------OUTPUT OMITTED FROM EXAMPLE-------->
Class-map: copp-system-lldp (match-any)
    shape : 10000 pps
    bandwidth : 500 pps
    Out Packets : 304996
    Drop Packets : 0
  <--------OUTPUT OMITTED FROM EXAMPLE-------->
```

switch(config)#
bandwidth (policy-map-class (control-plane) – Petra)

The `bandwidth` command specifies the minimum bandwidth for traffic filtered by the configuration mode policy map class.

The `no bandwidth` and `default bandwidth` commands remove the minimum bandwidth guarantee for the configuration mode class by deleting the corresponding `bandwidth` command from `running-config`.

**Command Mode**
- Policy-map-class (control plane) configuration
- accessed through `class (policy-map (control-plane) – Petra)`

**Command Syntax**

```
bandwidth kbps kbits
no bandwidth
default bandwidth
```

**Parameters**
- `kbits` Minimum data rate (kbits per second). Value ranges from 1 to 1000000.

**Related Commands**
- `class (policy-map (control-plane) – Petra)` places the switch in policy-map-class (control plane) configuration mode.
- `shape (policy-map-class (control-plane) – Petra)` specifies the maximum bandwidth for traffic defined by the associated class map in its configuration mode policy map class.

**Static Classes Default Bandwidth**
Petra platform switches define these default bandwidths for control plane static classes:

- copp-system-bpdu1250
- copp-system-l3destmiss250
- copp-system-default250
- copp-system-l3slowpath250
- copp-system-igmp250
- copp-system-l3ttl0250
- copp-system-ipbroadcast250
- copp-system-l3ttl1250
- copp-system-ipmc250
- copp-system-lacp1250
- copp-system-ipmcmmiss250
- copp-system-ldp250
- copp-system-ipmcrsvd250
- copp-system-unicast-arp250
- copp-system-ipunicast250

**Guidelines**
Petra does not support all discrete rate values. When a specified discrete value is not supported, the switch converts the rate to the next highest discrete value that it supports. The `show` commands displays the converted rate and not the user configured rate.
Example

- These commands configure the minimum bandwidth of 500 kbps for data traffic specified by the class map copp-system-lldp of the default control-plane policy map. Because the switch does not support the discrete value of 500 kbps, it converts the bandwidth up to 651 kbps.

```plaintext
switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#bandwidth kbps 500
switch(config-pmap-c-c copp-system-policy-copp-system-lldp)#exit
switch(config-pmap-c-copp-system-policy)#exit
switch(config)#show policy-map copp copp-system-policy
Service-policy input: copp-system-policy
   Hardware programming status: InProgress
       <--------OUTPUT OMITTED FROM EXAMPLE--------->

Class-map: copp-system-lldp (match-any)
   shape : 2766 kbps
   bandwidth : 651 kbps
   Out Packets : 0
   Drop Packets : 0

       <--------OUTPUT OMITTED FROM EXAMPLE--------->

switch(config)#
bandwidth (policy-map-class (control-plane) – Trident)

The `bandwidth` command specifies the minimum bandwidth for traffic filtered by the configuration mode policy map class.

The `no bandwidth` and `default bandwidth` commands remove the minimum bandwidth guarantee for the configuration mode class by deleting the corresponding `bandwidth` command from `running-config`.

**Command Mode**

Policy-map-class (control plane) configuration accessed through `class (policy-map (control-plane) – Trident)`

**Command Syntax**

```
bandwidth pps packets
no bandwidth
default bandwidth
```

**Parameters**

- `packets` Minimum data rate (packets per second). Value ranges from 1 to 100000.

**Related Commands**

- `class (policy-map (control-plane) – Trident)` places the switch in policy-map-class (control plane) configuration mode.
- `shape (policy-map-class (control-plane) – Trident)` specifies the maximum bandwidth for traffic defined by the associated class map in its configuration mode policy map class.

**Static Classes Default Bandwidth**

Trident platform switches define these default bandwidths for control plane static classes:

- copp-system-arp1000
- copp-system-lldp1000
- copp-system-arpsolver1000
- copp-system-l3destmiss1000
- copp-system-bpdu5000
- copp-system-l3slowpath1000
- copp-system-default1000
- copp-system-l3ttl11000
- copp-system-glean1000
- copp-system-selfip5000
- copp-system-igmp1000
- copp-system-selfip-tc6to75000
- copp-system-ipmcmisst1000
- copp-system-sflow0
- copp-system-ipmcrsvd1000
- copp-system-tc6to71000
- copp-system-lacp5000
- copp-system-tc3to51000

**Example**

- These commands configure the minimum bandwidth of 1000 packets per second for data traffic specified by the class map PMAP-1 in the policy map named copp-system-policy.

```
switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#class PMAP-1
switch(config-pmap-c-copp-system-policy-PMAP-1)#bandwidth pps 1000
switch(config-pmap-c-copp-system-policy-PMAP-1)#
```
bandwidth (policy-map-class (control-plane) – Trident-II)

The bandwidth command specifies the minimum bandwidth for traffic filtered by the configuration
mode policy map class.

The no bandwidth and default bandwidth commands remove the minimum bandwidth guarantee for
the configuration mode class by deleting the corresponding bandwidth command from
running-config.

Command Mode
Policy-map-class (control plane) configuration
accessed through class (policy-map (control-plane) – Trident-II)

Command Syntax
bandwidth pps packets
no bandwidth
default bandwidth

Parameters
• packets Minimum data rate (packets per second). Value ranges from 1 to 100000.

Related Commands
• class (policy-map (control-plane) – Trident-II) places the switch in policy-map-class (control plane)
configuration mode.
• shape (policy-map-class (control-plane) – Trident-II) specifies the maximum bandwidth for traffic
defined by the associated class map in its configuration mode policy map class.

Static Classes Default Bandwidth
Trident-II platform switches define these default bandwidths for control plane static classes:
• copp-system-aclog1000•copp-system-l3slowpath1000
• copp-system-arp1000•copp-system-l3ttl11000
• copp-system-arpresolver1000•copp-system-lacp5000
• copp-system-bfd5000•copp-system-lldp1000
• copp-system-bgp5000•copp-system-mlag5000
• copp-system-bpdu5000•copp-system-selfip5000
• copp-system-default1000•copp-system-selfip-tc6to75000
• copp-system-glean1000•copp-system-sflow0
• copp-system-igmp1000•copp-system-tc3to51000
• copp-system-ipmcmmiss1000•copp-system-tc6to71000
• copp-system-ipmcrsvd1000•copp-system-urm1000
• copp-system-l3destmiss1000
Example

- These commands configure the minimum bandwidth of 500 packets per second for data traffic specified by the class map copp-system-lldp.

```
switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#bandwidth pps 500
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#exit
switch(config-pmap-copp-system-policy)#exit
switch(config)#show policy-map interface control-plan copp-system-policy
Service-policy input: copp-system-policy
  Number of units programmed: 4
  Hardware programming status: Successful
  <--------OUTPUT OMITTED FROM EXAMPLE-------->
Class-map: copp-system-lldp (match-any)
  shape : 10000 pps
  bandwidth : 500 pps
  Out Packets : 304996
  Drop Packets : 0
  <--------OUTPUT OMITTED FROM EXAMPLE-------->
switch(config)#
```
class (policy-map (control-plane) – Arad)

The **class** command places the switch in policy-map-class (control plane) configuration mode, which is a group change mode for changing bandwidth and shape parameters associated with a specified class. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. The control plane policy map contains 20 static classes. Each class contains an eponymous class map and may contain **bandwidth** and **shape** commands.

- The class map identifies a data stream.
- **Bandwidth** command defines the stream’s minimum transmission rate through the control plane.
- **Shape** command defines the stream’s maximum transmission rate through the control plane.

Static class maps identify a data stream by definition. Each data packet is managed by commands of the first class whose map matches the packet’s content. Dynamic classes are not supported for control plane policing on Arad platform switches.

Each class corresponds to a transmission queue. Queue scheduling is round-robin until **bandwidth** rate for a queue is exceeded. Scheduling becomes strict-priority with CPU queue number determining priority until the **shape** rate is reached. Packets are dropped after the shape rate is exceeded.

The **exit** command returns the switch to policy-map configuration mode. Saving policy-map-class changes also require an exit from policy-map mode, which saves pending policy-map-class and policy-map changes to **running-config** and returns the switch to global configuration mode. The **abort** command discards pending changes, returning the switch to global configuration mode.

The **no class** and **default class** commands remove policy-map-class commands for the specified class assignment from the policy map.

**Command Mode**

Policy-Map (control plane) configuration
accessed through **policy-map type copp** command

**Command Syntax**

```
class class_name
no class class_name
default class class_name
```

**Parameters**

- **class_name** name of the class.

**Static Classes**

Arad platform switches provide the following static control plane classes:

- copp-system-bgp•copp-system-l2broadcast•copp-system-linklocal
- copp-system-bpdu•copp-system-l2unicast•copp-system-lldp
- copp-system-default•copp-system-l3destmiss•copp-system-mlag
- copp-system-ipbroadcast•copp-system-l3ipmoverflow•copp-system-multicastsnoop
- copp-system-ipmc•copp-system-l3slowpath•copp-system-Ospfls
- copp-system-ipmcmiss•copp-system-l3tt1•copp-system-sflow
- copp-system-ipunicast•copp-system-lacp

**Commands Available in Policy-map-class (control plane) Configuration Mode**

- **bandwidth (policy-map-class (control-plane) – Arad)**
- **shape (policy-map-class (control-plane) – Arad)**
• `exit` saves pending class map changes, then returns the switch to global configuration mode.
• `abort` discards pending class map changes, then returns the switch to global configuration mode.

**Related Commands**

• `policy-map type copp` places switch in policy-map (control plane) configuration mode.

**Example**

• These commands enters policy-map-class configuration mode to modify the shape, bandwidth parameters associated with the static class named `copp-system-lldp`.

```plaintext
switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#
```
class (policy-map (control-plane) – FM6000)

The **class** command places the switch in policy-map-class (control plane) configuration mode, which is a group change mode for changing bandwidth and shape parameters associated with a specified class. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. The control plane policy map contains 12 static classes. Each class contains an eponymous class map and may contain **bandwidth** and **shape** commands.

- The class map identifies a data stream.
- **Bandwidth** command defines the stream’s minimum transmission rate through the control plane.
- **Shape** command defines the stream’s maximum transmission rate through the control plane.

Static class maps identify a data stream by definition. Each data packet is managed by commands of the first class whose map matches the packet’s content. Dynamic classes are not supported for control plane policing on FM6000 platform switches.

Each class corresponds to a transmission queue. Queue scheduling is round-robin until **bandwidth** rate for a queue is exceeded. Scheduling becomes strict-priority with CPU queue number determining priority until the **shape** rate is reached. Packets are dropped after the shape rate is exceeded.

The **exit** command returns the switch to policy-map configuration mode. Saving policy-map-class changes also require an exit from policy-map mode, which saves pending policy-map-class and policy-map changes to **running-config** and returns the switch to global configuration mode. The **abort** command discards pending changes, returning the switch to global configuration mode.

The **no class** and **default class** commands remove policy-map-class commands for the specified class assignment from the policy map. The class is removed from the policy map if it is a dynamic class.

**Command Mode**

- Policy-Map (control plane) configuration
  - accessed through **policy-map type copp** command

**Command Syntax**

- `class class_name`
- `no class class_name`
- `default class class_name`

**Parameters**

- `class_name` name of the class.

**Static Classes**

FM6000 platform switches provide the following static control plane classes:

- `copp-system-arp`
- `copp-system-igmp`
- `copp-system-PimPtp`
- `copp-system-default`
- `copp-system-l2svd`
- `copp-system-selfip`
- `copp-system-ipmcmiss`
- `copp-system-l3slowpath`
- `copp-system-selfip-tc6to7`
- `copp-system-ipmcrsrvd`
- `copp-system-OspfIsis`
- `copp-system-sflow`

**Commands Available in Policy-map-class (control plane) Configuration Mode**

- `bandwidth (policy-map-class (control-plane) – FM6000)`
- `shape (policy-map-class (control-plane) – FM6000)`
- `exit` saves pending class map changes, then returns the switch to global configuration mode.
- `abort` discards pending class map changes, then returns the switch to global configuration mode.
Related Commands

- `policy-map type copp` places switch in policy-map (control plane) configuration mode.

Example

- These commands enters policy-map-class configuration mode to modify the shape, bandwidth parameters associated with the static class named `copp-system-arp`.

```plaintext
switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#class copp-system-arp
switch(config-pmap-c-copp-system-policy-copp-system-arp)#
```
The `class` command places the switch in policy-map-class (control plane) configuration mode, which is a group change mode for changing bandwidth and shape parameters associated with a specified class. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. The control plane policy map contains 23 static classes. Each class contains an eponymous class map and may contain `bandwidth` and `shape` commands.

- The class map identifies a data stream.
- **Bandwidth** command defines the stream’s minimum transmission rate through the control plane.
- **Shape** command defines the stream’s maximum transmission rate through the control plane.

Static class maps identify a data stream by definition. Each data packet is managed by commands of the first class whose map matches the packet’s content. Dynamic classes are not supported for control plane policing on Helix platform switches.

Each class corresponds to a transmission queue. Queue scheduling is strict-priority; CPU queue number determines priority until the `shape` rate is reached. Packets are dropped after the shape rate is exceeded.

The `exit` command returns the switch to policy-map configuration mode. Saving policy-map-class changes also require an exit from policy-map mode, which saves pending policy-map-class and policy-map changes to `running-config` and returns the switch to global configuration mode. The `abort` command discards pending changes, returning the switch to global configuration mode.

The `no class` and `default class` commands remove policy-map-class commands for the specified class assignment from the policy map.

**Command Mode**

Policy-Map (control plane) configuration
accessed through `policy-map type copp` command

**Command Syntax**

```
class class_name
no class class_name
default class class_name
```

**Parameters**

- `class_name` name of the class.

**Static Classes**

Helix platform switches provide the following static control plane classes:

- `copp-system-aclog`
- `copp-system-ipmcmss`
- `copp-system-Ospfsis`
- `copp-system-arp`
- `copp-system-ipmcrsvd`
- `copp-system-selfip`
- `copp-system-arpresolver`
- `copp-system-l3destmiss`
- `copp-system-selfip-tc6to7`
- `copp-system-bfd`
- `copp-system-l3slowpath`
- `copp-system-sflow`
- `copp-system-bgp`
- `copp-system-l3ttl1`
- `copp-system-tc3to5`
- `copp-system-bpdu`
- `copp-system-lacp`
- `copp-system-tc6to7`
- `copp-system-default`
- `copp-system-lldp`
- `copp-system-urm`
- `copp-system-glean`
- `copp-system-lldp`
- `copp-system-vrrp`
- `copp-system-igmp`
Commands Available in Policy-map-class (control plane) Configuration Mode

- **bandwidth (policy-map-class (control-plane) – Helix)**
- **shape (policy-map-class (control-plane) – Helix)**
- **exit** saves pending class map changes, then returns the switch to global configuration mode.
- **abort** discards pending class map changes, then returns the switch to global configuration mode.

Related Commands

- **policy-map type copp** places switch in policy-map (control plane) configuration mode.

Example

- These commands enters policy-map-class configuration mode to modify the shape, bandwidth parameters associated with the static class named **copp-system-arp**.

```
switch(config)#policy-map
switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#
```
class (policy-map (control-plane) – Petra)

The class command places the switch in policy-map-class (control plane) configuration mode, which is a group change mode for changing bandwidth and shape parameters associated with a specified class. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. The control plane policy map contains 15 static classes. Each class contains an eponymous class map and may contain bandwidth and shape commands.

- The class map identifies a data stream.
- Bandwidth command defines the stream’s minimum transmission rate through the control plane.
- Shape command defines the stream’s maximum transmission rate through the control plane.

Static class maps identify a data stream by definition. Each data packet is managed by commands of the first class whose map matches the packet’s content. Dynamic classes are not supported for control plane policing on Petra platform switches.

Each class corresponds to a transmission queue. Queue scheduling is round-robin until bandwidth rate for a queue is exceeded. Scheduling becomes strict-priority with CPU queue number determining priority until the shape rate is reached. Packets are dropped after the shape rate is exceeded.

The exit command returns the switch to policy-map configuration mode. Saving policy-map-class changes also require an exit from policy-map mode, which saves pending policy-map-class and policy-map changes to running-config and returns the switch to global configuration mode. The abort command discards pending changes, returning the switch to global configuration mode.

The no class and default class commands remove policy-map-class commands for the specified class assignment from the policy map.

Command Mode
Policy-Map (control plane) configuration
accessed through policy-map type copp command

Command Syntax

```
class class_name
no class class_name
default class class_name
```

Parameters

- **class_name**  name of the class.

Static Classes

Petra platform switches provide the following static control plane classes:

- copp-system-bpdu
- copp-system-ipmcmiss
- copp-system-l3ttl0
- copp-system-default
- copp-system-ipmcrsvd
- copp-system-l3ttl1
- copp-system-igmp
- copp-system-ipunicast
- copp-system-lacp
- copp-system-ipbroadcast
- copp-system-l3destmiss
- copp-system-lldp
- copp-system-ipmc
- copp-system-l3slowpath
- copp-system-unicast-arp

Commands Available in Policy-map-class (control plane) Configuration Mode

- **bandwidth** (policy-map-class (control-plane) – Petra)
- **shape** (policy-map-class (control-plane) – Petra)
- **exit** saves pending class map changes, then returns the switch to global configuration mode.
- **abort** discards pending class map changes, then returns the switch to global configuration mode.
Related Commands

- `policy-map type copp` places switch in policy-map (control plane) configuration mode.

Example

- These commands enters policy-map-class configuration mode to modify the shape, bandwidth parameters associated with the static class named `copp-system-lldp`.

```
switch(config)#policy-map
switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#
```
class (policy-map (control-plane) – Trident)

The class command places the switch in policy-map-class (control plane) configuration mode, which is a group change mode for changing bandwidth and shape parameters associated with a specified class. The command adds the specified class to the policy map if it was not previously included. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. The control plane policy map contains 18 static classes and up to 30 dynamic classes. Dynamic classes contain an eponymous class map. All classes may contain bandwidth and shape commands.

- The class map identifies a data stream.
- Bandwidth command defines the stream’s minimum transmission rate through the control plane.
- Shape command defines the stream’s maximum transmission rate through the control plane.

Dynamic class maps identify a data stream with an ACL assigned by match (class-map (control-plane) – Trident). Static class maps identify a data stream by definition. Each data packet is managed by commands of the first class whose map matches the packet’s content.

Static classes are provided with the switch and cannot be removed from the policy map or modified by the class command. Dynamic classes are user defined and added to the policy map by this command. Dynamic classes are always placed in front of the static classes. Bandwidth and shape parameters are editable for all classes.

Each class corresponds to a transmission queue. Queue scheduling is round-robin until bandwidth rate for a queue is exceeded. Scheduling becomes strict-priority with CPU queue number determining priority until the shape rate is reached. Packets are dropped after the shape rate is exceeded.

The exit command returns the switch to policy-map configuration mode. Saving policy-map-class changes also require an exit from policy-map mode, which saves pending policy-map-class and policy-map changes to running-config and returns the switch to global configuration mode. The abort command discards pending changes, returning the switch to global configuration mode.

The no class and default class commands remove policy-map-class commands for the specified class assignment from the policy map. The class is removed from the policy map if it is a dynamic class.

Command Mode
Policy-Map (control plane) configuration
accessed through policy-map type copp command

Command Syntax
class class_name [PLACEMENT]
noclass class_name [PLACEMENT]
default class class_name [PLACEMENT]

Parameters
- class_name name of the class.
- PLACEMENT Specifies the class’s map placement. Configurable only for dynamic classes.
  - <no parameter> New classes are placed between the dynamic and static classes. Previously defined classes retain their current policy map placement.
  - insert-before dynamic_class Class is inserted in front of the specified dynamic class.

Static Classes
Trident switches provide the following static control plane classes:
- copp-system-acllog
- copp-system-ipmcmiss
- copp-system-lldp
• copp-system-arp
• copp-system-ipmcrsvd
• copp-system-selfip
• copp-system-arpresolver
• copp-system-l3destmiss
• copp-system-selfip-tc6to7
• copp-system-bpdu
• copp-system-l3slowpath
• copp-system-sflow
• copp-system-glean
• copp-system-l3ttl1
• copp-system-tc3to5
• copp-system-igmp
• copp-system-lacp
• copp-system-tc6to7

**Commands Available in Policy-map-class (control plane) Configuration Mode**

• **bandwidth** (policy-map-class (control-plane) – Trident)
• **shape** (policy-map-class (control-plane) – Trident)
• **exit** saves pending class map changes, then returns the switch to global configuration mode.
• **abort** discards pending class map changes, then returns the switch to global configuration mode.

**Related Commands**

• **class-map type copp** places switch in class-map (control-plane) configuration mode.
• **policy-map type copp** places switch in policy-map (control plane) configuration mode.

**Example**

• These commands add CM-1 class to the copp-system-policy policy map.

```
switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#class CM-1
switch(config-pmap-c-copp-system-policy-CM-1)#
```
**class (policy-map (control-plane) – Trident-II)**

The **class** command places the switch in policy-map-class (control plane) configuration mode, which is a group change mode for changing bandwidth and shape parameters associated with a specified class. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. The control plane policy map contains 23 static classes. Each class contains an eponymous class map and may contain **bandwidth** and **shape** commands.

- The class map identifies a data stream.
- **Bandwidth** command defines the stream’s minimum transmission rate through the control plane.
- **Shape** command defines the stream’s maximum transmission rate through the control plane.

Static class maps identify a data stream by definition. Each data packet is managed by commands of the first class whose map matches the packet’s content. Dynamic classes are not supported for control plane policing on Trident-II platform switches.

Each class corresponds to a transmission queue. Queue scheduling is strict-priority; CPU queue number determines priority until the **shape** rate is reached. Packets are dropped after the shape rate is exceeded.

The **exit** command returns the switch to policy-map configuration mode. Saving policy-map-class changes also require an exit from policy-map mode, which saves pending policy-map-class and policy-map changes to **running-config** and returns the switch to global configuration mode. The **abort** command discards pending changes, returning the switch to global configuration mode.

The **no class** and **default class** commands remove policy-map-class commands for the specified class assignment from the policy map.

**Command Mode**

Policy-Map (control plane) configuration
accessed through **policy-map type copp** command

**Command Syntax**

```
class class_name
no class class_name
default class class_name
```

**Parameters**

- **class_name** name of the class.

**Static Classes**

Trident-II platform switches provide the following static control plane classes:

- copp-system-acllog
- copp-system-igmp
- copp-system-mlag
- copp-system-arp
- copp-system-ipmcmiss
- copp-system-selfip
- copp-system-arpresolver
- copp-system-ipmcrsvd
- copp-system-selfip-tc6to7
- copp-system-bfd
- copp-system-l3destmiss
- copp-system-sflow
- copp-system-bgp
- copp-system-l3slowpath
- copp-system-tc3to5
- copp-system-bpdu
- copp-system-l3ttl1
- copp-system-tc6to7
- copp-system-default
- copp-system-lacp
- copp-system-urm
- copp-system-glean
- copp-system-lldp

**Commands Available in Policy-map-class (control plane) Configuration Mode**

- **bandwidth (policy-map-class (control-plane) – Trident-II)**
Chapter 30: Traffic Management

Traffic Management Configuration Commands

- shape (policy-map-class (control-plane) – Trident-II)
- exit saves pending class map changes, then returns the switch to global configuration mode.
- abort discards pending class map changes, then returns the switch to global configuration mode.

Related Commands
- policy-map type copp places switch in policy-map (control plane) configuration mode.

Example
- These commands enters policy-map-class configuration mode to modify the shape, bandwidth parameters associated with the static class named copp-system-arp.

```plaintext
switch(config)#policy-map
switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#
```
class (policy-map (pbr))

The **class (policy-map (pbr))** command places the switch in policy-map-class (pbr) configuration mode, which is a group change mode that modifies the specified class of the configuration mode Policy-Based Routing (PBR) policy map. The command adds the class to the policy map if it was not previously included in the policy map. All changes in a group change mode edit session are pending until the mode is exited, and can be canceled by using the **abort** command.

A PBR policy map is an ordered list of classes. Each class contains an eponymous class map and can contain set commands to specify next hop. Classes without set commands translate to no action being performed on that class of packets.

- The class map identifies a data stream through ACLs. Class maps are configured in class-map (pbr) configuration mode.
- **Set** commands can be used to specify the next hop for a given class. **Set** commands are configured in policy-map-class (pbr) configuration mode.

PBR policy maps can also contain one or more raw match statements which filter incoming traffic without using ACLs. Data packets are managed by commands of the first class or raw match statement matching the packet’s contents.

The **exit** command returns the switch to policy-map (pbr) configuration mode. However, saving policy-map-class changes also requires an exit from policy-map (pbr) configuration mode. This saves all pending policy map and policy-map-class changes to **running-config** and returns the switch to global configuration mode. The **abort** command discards pending changes, returning the switch to global configuration mode.

The **no class** and **default class** commands remove the class assignment from the configuration mode policy map by deleting the corresponding **class** configuration from **running-config**.

**Command Mode**

Policy-Map (pbr) Configuration
accessed through **policy-map type pbr**

**Command Syntax**

```
[sequence_number] class class_name
no [sequence_number] class class_name
default [sequence_number] class class_name
no sequence_number
default sequence_number
```

**Parameters**

- **sequence_number**  Sequence number (1 to 4294967295) assigned to the rule. If no number is entered, the number is derived by adding 10 to the number of the policy map’s last numbered line. To increase the distance between existing entries, use the **resequence** command.
- **class_name**  name of the class.

**Commands Available in Policy-map-class (pbr) Configuration Mode**

- **set nexthop (policy-map-class – pbr)** sets next hop for the class.
- **exit** saves pending class changes and returns switch to policy-map (pbr) configuration mode.
- **abort** discards pending class changes and returns switch to policy-map (pbr) configuration mode.

**Related Commands**

- **class-map type pbr** places switch in class-map (pbr) configuration mode.
- **policy-map type pbr** places switch in policy-map (pbr) configuration mode.
Examples

• These commands add the **CMAP1** class map to the **PMAP1** policy map, then place the switch in policy-map-class configuration mode where the next hops can be assigned to the class. Changes will not take effect until both modes are exited.

```bash
switch(config)#policy-map type pbr PMAP1
switch(config-pmap-PMAP1)#class CMAP1
switch(config-pmap-c-PMAP1-CMAP1)#
```
class (policy-map (qos) – FM6000)

The class command places the switch in policy-map-class (qos) configuration mode, which is a group change mode that modifies the specified class of the configuration mode policy map. The command adds the class to the policy map if it was not previously included in the policy map. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. Each class contains an eponymous class map and at least one set command:

- The class map identifies a data stream through an ACL. Class maps are configured in class-map (qos) configuration mode.
- Set commands either modify a packet’s content (CoS or DSCP fields) or assigns it to a traffic class queue. Set commands are configured in policy-map-class (qos) configuration mode.

Data packets are managed by commands of the first class whose map matches the packet’s content.

The exit command returns the switch to policy-map configuration mode. However, saving policy-map-class changes also require an exit from policy-map mode. This saves all pending policy map and policy-map-class changes to running-config and returns the switch to global configuration mode. The abort command discards pending changes, returning the switch to global configuration mode.

The no class and default class commands remove the class assignment from the configuration mode policy map by deleting the corresponding class configuration from running-config.

Command Mode
Policy-Map (qos) Configuration
accessed through policy-map type quality-of-service

Command Syntax
```
class class_name [PLACEMENT]
no class class_name [PLACEMENT]
default class class_name [PLACEMENT]
```

Parameters
- class_name name of the class.
- PLACEMENT Specifies the map placement within the list of class maps.
  - <no parameter> Class is placed at the top of the list.
  - insert-before existing_class Class is inserted in front of the specified class.

Commands Available in Policy-map-class (qos) Configuration Mode
- set (policy-map-class (qos) – FM6000)
- exit saves pending class changes and returns switch to policy-map (qos) configuration mode.
- abort discards pending class changes and returns switch to policy-map (qos) configuration mode.

Related Commands
- class-map type qos places switch in class-map (qos) configuration mode.
- policy-map type quality-of-service places switch in policy-map (qos) configuration mode
Example

- These commands add the **CMAP_1** class map to the **PMAP_1** policy map, then places the switch in policy-map-class configuration mode.

```plaintext
switch(config)#policy-map type quality-of-service PMAP-1
switch(config-pmap-PMAP-1)#class CMAP-1
switch(config-pmap-c-PMAP-1-CMAP-1)#
```
class (policy-map (qos) – Helix)

The `class` command places the switch in policy-map-class (qos) configuration mode, which is a group change mode that modifies the specified class of the configuration mode policy map. The command adds the class to the policy map if it was not previously included in the policy map. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. Each class contains an eponymous class map and at least one set command:

- The class map identifies a data stream through an ACL. Class maps are configured in class-map (qos) configuration mode.
- **Set** commands either modify a packet’s content (CoS or DSCP fields) or assigns it to a traffic class queue. **Set** commands are configured in policy-map-class (qos) configuration mode.
  
  Data packets are managed by commands of the first class whose map matches the packet’s content.

The `exit` command returns the switch to policy-map configuration mode. However, saving policy-map-class changes also require an exit from policy-map mode. This saves all pending policy map and policy-map-class changes to `running-config` and returns the switch to global configuration mode. The `abort` command discards pending changes, returning the switch to global configuration mode.

The `no class` and `default class` commands remove the class assignment from the configuration mode policy map by deleting the corresponding class configuration from `running-config`.

**Command Mode**

Policy-Map (qos) Configuration

accessed through `policy-map type quality-of-service` command

**Command Syntax**

```
class class_name [PLACEMENT]
noclass class_name [PLACEMENT]
default class class_name [PLACEMENT]
```

**Parameters**

- `class_name` name of the class.
- `PLACEMENT` Specifies the map placement within the list of class maps.
  
  - `<no parameter>` Class is placed at the top of the list.
  
  - `insert-before existing_class` Class is inserted in front of the specified class.

**Commands Available in Policy-map-class (qos) Configuration Mode**

- **set (policy-map-class (qos) – Helix)**
- **exit** saves pending class changes and returns switch to policy-map (qos) configuration mode.
- **abort** discards pending class changes and returns switch to policy-map (qos) configuration mode.

**Related Commands**

- `class-map type qos` places switch in class-map (qos) configuration mode.
- `policy-map type quality-of-service` places switch in policy-map (qos) configuration mode
Example

- These commands add the CMAP_1 class map to the PMAP_1 policy map, then places the switch in policy-map-class configuration mode.

```
switch(config)#policy-map type quality-of-service PMAP-1
switch(config-pmap-PMAP-1)#class CMAP-1
switch(config-pmap-c-PMAP-1-CMAP-1)#
```
class (policy-map (qos) – Trident)

The **class** command places the switch in policy-map-class (qos) configuration mode, which is a group change mode that modifies the specified class of the configuration mode policy map. The command adds the class to the policy map if it was not previously included in the policy map. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. Each class contains an eponymous class map and at least one set command:

- The class map identifies a data stream through an ACL. Class maps are configured in class-map (qos) configuration mode.
- **Set** commands either modify a packet’s content (CoS or DSCP fields) or assigns it to a traffic class queue. **Set** commands are configured in policy-map-class (qos) configuration mode.

  Data packets are managed by commands of the first class whose map matches the packet’s content.

The **exit** command returns the switch to policy-map configuration mode. However, saving policy-map-class changes also require an exit from policy-map mode. This saves all pending policy map and policy-map-class changes to **running-config** and returns the switch to global configuration mode. The **abort** command discards pending changes, returning the switch to global configuration mode.

The **no class** and **default class** commands remove the class assignment from the configuration mode policy map by deleting the corresponding **class** configuration from **running-config**.

**Command Mode**

Policy-Map (qos) Configuration

accessed through **policy-map type quality-of-service** command

**Command Syntax**

```
class class_name [PLACEMENT]
no class class_name [PLACEMENT]
default class class_name [PLACEMENT]
```

**Parameters**

- **class_name**  name of the class.
- **PLACEMENT**  Specifies the map placement within the list of class maps.
  - <no parameter>  Class is placed at the top of the list.
  - **insert-before existing_class**  Class is inserted in front of the specified class.

**Commands Available in Policy-map-class (qos) Configuration Mode**

- **set (policy-map-class (qos) – Trident)**
- **exit** saves pending class changes and returns switch to policy-map (qos) configuration mode.
- **abort** discards pending class changes and returns switch to policy-map (qos) configuration mode.

**Related Commands**

- **class-map type qos** places switch in class-map (qos) configuration mode.
- **policy-map type quality-of-service** places switch in policy-map (qos) configuration mode.
Example

- These commands add the $CMAP_1$ class map to the $PMAP_1$ policy map, then places the switch in policy-map-class configuration mode.

```bash
switch(config)#policy-map type quality-of-service PMAP-1
switch(config-pmap-PMAP-1)#class CMAP-1
switch(config-pmap-c-PMAP-1-CMAP-1)#
```
class (policy-map (qos) – Trident II)

The `class` command places the switch in policy-map-class (qos) configuration mode, which is a group change mode that modifies the specified class of the configuration mode policy map. The command adds the class to the policy map if it was not previously included in the policy map. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. Each class contains an eponymous class map and at least one set command:

- The class map identifies a data stream through an ACL. Class maps are configured in class-map (qos) configuration mode.
- Set commands either modify a packet’s content (CoS or DSCP fields) or assigns it to a traffic class queue. Set commands are configured in policy-map-class (qos) configuration mode.

Data packets are managed by commands of the first class whose map matches the packet’s content.

The `exit` command returns the switch to policy-map configuration mode. However, saving policy-map-class changes also require an exit from policy-map mode. This saves all pending policy map and policy-map-class changes to `running-config` and returns the switch to global configuration mode. The `abort` command discards pending changes, returning the switch to global configuration mode.

The `no class` and `default class` commands remove the class assignment from the configuration mode policy map by deleting the corresponding `class` configuration from `running-config`.

Command Mode

Policy-Map (qos) Configuration
accessed through `policy-map type quality-of-service` command

Command Syntax

```
class class_name [PLACEMENT]
no class class_name [PLACEMENT]
default class class_name [PLACEMENT]
```

Parameters

- `class_name` name of the class.
- `PLACEMENT` Specifies the map placement within the list of class maps.
  - `<no parameter>` Class is placed at the top of the list.
  - `insert-before existing_class` Class is inserted in front of the specified class.

Commands Available in Policy-map-class (qos) Configuration Mode

- `set (policy-map-class (qos) – Trident II)`
- `exit` saves pending class changes and returns switch to policy-map (qos) configuration mode.
- `abort` discards pending class changes and returns switch to policy-map (qos) configuration mode.

Related Commands

- `class-map type qos` places switch in class-map (qos) configuration mode.
- `policy-map type quality-of-service` places switch in policy-map (qos) configuration mode
Example

- These commands add the `CMAP_1` class map to the `PMAP_1` policy map, then places the switch in policy-map-class configuration mode.

```
switch(config)#policy-map type quality-of-service PMAP-1
switch(config-pmap-PMAP-1)#class CMAP-1
switch(config-pmap-c-PMAP-1-CMAP-1)#
```
class-map type copp

The class-map type copp command places the switch in Class-Map (control plane) configuration mode, which is a group change mode that modifies a control-plane dynamic class map. A dynamic class map is a data structure that uses access control lists (ACLs) to define a data stream by specifying characteristics of data packets that comprise that stream. Control-plane policy maps use class maps to specify which control plane traffic is controlled by policy map criteria.

The exit command saves pending class map changes to running-config and returns the switch to global configuration mode. Class map changes are also saved by entering a different configuration mode. The abort command discards pending changes and returns the switch to global configuration mode.

The no class-map type copp and default class-map type copp commands delete the specified class map by removing the corresponding class-map type copp command and its associated configuration.

Command Mode
Global Configuration

Command Syntax
```
class-map type copp match-any class_name
no class-map type copp [match-any] class_name
default class-map type copp [match-any] class_name
```

Parameters
- **class_name** Name of class map.

Commands Available in Class-Map (Control Plane) Configuration Mode
- match (class-map (control-plane) – Trident)

Related Commands
- policy-map type copp
- class (policy-map (control-plane) – Trident)
- class-map type qos

Example
- This command creates the control plane class map named CP-MAP-1 and places the switch in class-map configuration mode.
  ```
  switch(config)#class-map type copp match-any CP-CMAP-1
  switch(config-cmap-CP-CMAP-1)#
  ```
class-map type pbr

The **class-map type pbr** command places the switch in class-map (pbr) configuration mode for the specified class map, and creates the class map if one does not already exist. Class-map (pbr) configuration mode is a group change mode that modifies a class map for Policy-Based Routing (PBR). PBR class maps contain one or more **match** statements which filter incoming traffic using ACLs. PBRs can then use these class maps to set next-hop IP addresses for the traffic that matches them. (Classes without set commands translate to no action being performed on that class of packets.)

The **exit** command saves pending class map changes to **running-config**, then returns the switch to global configuration mode. Class map changes are also saved by directly entering a different configuration mode. The **abort** command discards pending changes and returns the switch to global configuration mode.

The **no class-map type pbr** and **default class-map type pbr** commands delete the specified class map by removing the corresponding **class-map type pbr** command and its associated configuration.

**Command Mode**

Global Configuration

**Command Syntax**

```
class-map type pbr match-any map_name
no class-map type pbr match-any map_name
default class-map type pbr match-any map_name
```

**Parameters**

- `map_name`: Name of class map.

**Commands Available in Class-Map (PBR) configuration mode**

- `match (class-map (pbr))`
- `resequence (class-map (pbr))`

**Related Commands**

- `policy-map type pbr`
- `class (policy-map (pbr))`

**Example**

- This command creates the PBR class map named MAP1 and places the switch in class-map (pbr) configuration mode where match criteria can be configured for the class.

```
switch(config)#class-map type pbr match-any MAP1
switch(config-cmap-MAP1)#
```
class-map type qos

The **class-map type qos** command places the switch in Class-Map (qos) configuration mode, which is a group change mode that modifies a QoS dynamic class map. A dynamic class map is a data structure that uses access control lists (ACLs) to define a data stream by specifying characteristics of data packets that comprise that stream. QoS policy maps use class maps to specify the traffic (to which the policy map is assigned) that is transformed by policy map criteria.

The **exit** command saves pending class map changes to **running-config**, then returns the switch to global configuration mode. Class map changes are also saved by entering a different configuration mode. The **abort** command discards pending changes and returns the switch to global configuration mode.

The **no class-map type qos** and **default class-map type qos** commands delete the specified class map by removing the corresponding **class-map type qos** command and its associated configuration. The **class-map** and **class-map type qos** commands are equivalent.

**Command Mode**
Global Configuration

**Command Syntax**

```
class-map [type qos] match-any class_name
no class-map [type qos] [match-any] class_name
default class-map [type qos] [match-any] class_name
```

**Parameters**

- **class_name** Name of class map.

**Commands Available in Class-Map (QoS) Configuration Mode**

- **match (class-map (qos) – FM6000)**
- **match (class-map (qos) – Trident)**

**Related Commands**

- **policy-map type quality-of-service**
- **class (policy-map (qos) – FM6000)**
- **class (policy-map (qos) – Trident)**

**Example**

- This command creates the QoS class map named MAP-1 and places the switch in class-map configuration mode.

```
switch(config)#class-map type qos match-any MAP-1
switch(config-cmap-MAP-1)#
```
clear policy-map counters

The clear policy-map command resets the specified policy map counters to zero. Policy map counters record the quantity of packets that are filtered by the ACLs that comprise a specified policy map.

Command Mode
Privileged EXEC

Command Syntax
   clear policy-map INTERFACE_NAME counters MAP_NAME

Parameters
   • INTERFACE_NAME   Interface for which command clears table counters. Options include:
      • interface control-plane   Control plane.
   • MAP_NAME   Policy map for which command clears counters. Options include:
      • copp-system-policy   Name of only policy map supported for the control plane.
match (class-map (control-plane) – Helix)

The **match** command assigns an ACL to the configuration mode class map. A class map can contain only one ACL. Class maps only use permit rules to filter data; deny rules are ignored. The command accepts IPv4 and IPv4 standard ACLs.

A class map is assigned to a policy map by the **class (policy-map (control-plane) – Helix)** command.

Class map (control plane) configuration mode is a group change mode. **Match** statements are not saved to **running-config** until the edit session is completed by exiting the mode.

The **no match** and **default match** commands remove the **match** statement from the configuration mode class map by deleting the corresponding command from **running-config**.

**Command Mode**

Class-Map (control plane) configuration
accessed through **class-map type copp** command

**Command Syntax**

```
match ip access-group list_name
no match ip access-group list_name
default match ip access-group list_name
```

**Parameters**

- **list_name** name of ACL assigned to class map.

**Related Commands**

- **class-map type copp** places the switch in Class-Map configuration mode.
- **exit** saves pending class map changes, then returns the switch to global configuration mode.
- **abort** discards pending class map changes, then returns the switch to global configuration mode.
- **class (policy-map (control-plane) – Helix)** assigns a class map to a policy map.

**Guidelines**

Static class maps cannot be modified by this command.

**Match** statements are saved to **running-config** only upon exiting Class-Map (control plane) configuration mode.

**Example**

- These commands add the IP ACL **list_1** to the **map_1** class map, then saves the command by exiting class-map mode.

```
switch(config)#class-map type copp map_1
switch(config-cmap-map_1)#match ip access-group list_1
switch(config-cmap-map_1)#exit
switch(config)#
```
match (class-map (control-plane) – Trident)

The **match** command assigns an ACL to the configuration mode class map. A class map can contain only one ACL. Class maps only use permit rules to filter data; deny rules are ignored. The command accepts IPv4, IPv6, IPv4 standard, and IPv6 standard ACLs.

A class map is assigned to a policy map by the **class (policy-map (control-plane) – Trident)** command.

Class map (control plane) configuration mode is a group change mode. **Match** statements are not saved to **running-config** until the edit session is completed by exiting the mode.

The **no match** and **default match** commands remove the **match** statement from the configuration mode class map by deleting the corresponding command from **running-config**.

**Command Mode**

Class-Map (control plane) configuration accessed through **class-map type copp** command

**Command Syntax**

```
match IP_VERSION access-group list_name
no match IP_VERSION access-group list_name
default match IP_VERSION access-group list_name
```

**Parameters**

- **IP_VERSION** IP version of the specified ACL. Options include:
  - `ip` IPv4.
  - `ipv6` IPv6.
- **list_name** name of ACL assigned to class map.

**Related Commands**

- **class-map type copp** places the switch in Class-Map configuration mode.
- **exit** saves pending class map changes, then returns the switch to global configuration mode.
- **abort** discards pending class map changes, then returns the switch to global configuration mode.
- **class (policy-map (control-plane) – Trident)** assigns a class map to a policy map.

**Guidelines**

Static class maps cannot be modified by this command.

**Match** statements are saved to **running-config** only upon exiting Class-Map (control plane) configuration mode.

**Example**

- These commands add the IPv4 ACL names `list_1` to the `map_1` class map, then saves the command by exiting class-map mode.

```
switch(config)#class-map type copp map_1
switch(config-cmap-map_1)#match ip access-group list_1
switch(config-cmap-map_1)#exit
switch(config)#
```
**match (class-map (control-plane) – Trident-II)**

The `match` command assigns an ACL to the configuration mode class map. A class map can contain only one ACL. Class maps only use permit rules to filter data; deny rules are ignored. The command accepts IPv4 and IPv4 standard ACLs.

A class map is assigned to a policy map by the `class (policy-map (control-plane) – Trident-II)` command.

Class map (control plane) configuration mode is a group change mode. **Match** statements are not saved to **running-config** until the edit session is completed by exiting the mode.

The **no match** and **default match** commands remove the **match** statement from the configuration mode class map by deleting the corresponding command from **running-config**.

**Command Mode**

- Class-Map (control plane) configuration accessed through `class-map type copp` command

**Command Syntax**

```
match ip access-group list_name
no match ip access-group list_name
default match ip access-group list_name
```

**Parameters**

- `list_name` name of ACL assigned to class map.

**Related Commands**

- `class-map type copp` places the switch in Class-Map configuration mode.
- `exit` saves pending class map changes, then returns the switch to global configuration mode.
- `abort` discards pending class map changes, then returns the switch to global configuration mode.
- `class (policy-map (control-plane) – Trident-II)` assigns a class map to a policy map.

**Guidelines**

Static class maps cannot be modified by this command.

**Match** statements are saved to **running-config** only upon exiting Class-Map (control plane) configuration mode.

**Example**

- These commands add the IP ACL `list_1` to the `map_1` class map, then saves the command by exiting class-map mode.

```
switch(config)#class-map type copp map_1
switch(config-cmap-map_1)#match ip access-group list_1
switch(config-cmap-map_1)#exit
switch(config)#
```
match (class-map (pbr))

The match command assigns ACLs to the configuration mode Policy-Based Routing (PBR) class map. The command accepts IPv4, IPv4 standard, IPv6 and IPv6 standard ACLs.

Class map (pbr) configuration mode is a group change mode. Match statements are not saved to running-config until the edit session is completed by exiting the mode.

The no match and default match commands remove the match statement from the configuration mode class map by deleting the corresponding command from running-config.

Important! PBR ACLs use only permit rules to filter data; if there are deny rules in an ACL used by PBR, the configuration will be reverted.

Command Mode
Class-map (pbr) configuration
accessed through class-map type pbr command

Command Syntax

```
[sequence_number] match {ip|ipv6} access-group list_name
no [sequence_number] match {ip|ipv6} access-group list_name
default [sequence_number] match {ip|ipv6} access-group list_name
no sequence_number
default sequence_number
```

Parameters

- `sequence_number` Sequence number (1 to 4294967295) assigned to the rule. If no number is entered, the number is derived by adding 10 to the number of the class map’s last numbered line. To increase the distance between existing entries, use the resequence command.
- `list_name` name of ACL assigned to class map.

Related Commands

- class-map type pbr places the switch in class-map configuration mode.
- exit saves pending class map changes, then returns the switch to global configuration mode.
- abort discards pending class map changes, then returns the switch to global configuration mode.
- class (policy-map (pbr)) assigns a class map to a policy map.

Example

- These commands add the IPv4 ACL named list1 to the map1 class map, then save the change by exiting class-map mode.

  switch(config)#class-map type pbr map1
  switch(config-cmap-map1)#match ip access-group list1
  switch(config-cmap-map1)#exit
  switch(config)#
match (class-map (qos) – FM6000)

The **match** command assigns an ACL to the configuration mode class map. A class map can contain only one ACL. Class maps only use permit rules to filter data; deny rules are ignored. The command accepts IPv4 and IPv4 standard ACLs.

Class map (qos) configuration mode is a group change mode. **Match** statements are not saved to **running-config** until the edit session is completed by exiting the mode.

The **no match** and **default match** commands remove the **match** statement from the configuration mode class map by deleting the corresponding command from **running-config**.

**Command Mode**

Class-map (qos) configuration

accessed through **class-map type qos** command

**Command Syntax**

```
match IP_VERSION access-group list_name
no match IP_VERSION access-group list_name
default match IP_VERSION access-group list_name
```

**Parameters**

- **IP_VERSION** IP version of the specified ACL. Options include:
  - **ip** IPv4.
- **list_name** name of ACL assigned to class map.

**Related Commands**

- **class-map type qos** places the switch in Class-Map configuration mode.
- **exit** saves pending class map changes, then returns the switch to global configuration mode.
- **abort** discards pending class map changes, then returns the switch to global configuration mode.
- **class (policy-map (qos) – FM6000)** assigns a class map to a policy map.

**Example**

- These commands add the IPv4 ACL named **list_1** to the **map_1** class map, then saves the command by exiting class-map mode.

```
switch(config)#class-map type qos map_1
switch(config-cmap-map_1)#match ip access-group list_1
switch(config-cmap-map_1)#exit
switch(config)#
```
match (class-map (qos) – Helix)

The `match` command assigns an ACL to the configuration mode class map. A class map can contain only one ACL. Class maps only use permit rules to filter data; deny rules are ignored. The command accepts IPv4, IPv4 standard, IPv6, and IPv6 standard ACLs.

Class map (qos) configuration mode is a group change mode. **Match** statements are not saved to `running-config` until the edit session is completed by exiting the mode.

The `no match` and `default match` commands remove the `match` statement from the configuration mode class map by deleting the corresponding command from `running-config`.

**Command Mode**

Class-Map (qos) configuration accessed through `class-map type qos` command

**Command Syntax**

```
match IP_VERSION access-group list_name
no match IP_VERSION access-group list_name
default match IP_VERSION access-group list_name
```

**Parameters**

- **IP_VERSION** IP version of the specified ACL. Options include:
  - `ip` IPv4.
  - `ipv6` IPv6.
- **list_name** name of ACL assigned to class map.

**Related Commands**

- `class-map type qos` places the switch in Class-Map configuration mode.
- `exit` saves pending class map changes, then returns the switch to global configuration mode.
- `abort` discards pending class map changes, then returns the switch to global configuration mode.
- `class (policy-map (qos) – Helix)` assigns a class map to a policy map.

**Example**

- These commands add the IPv4 ACL named `list_1` to the `map_1` class map, then saves the command by exiting class-map mode.

```
switch(config)#class-map type qos map_1
switch(config-cmap-map_1)#match ip access-group list_1
switch(config-cmap-map_1)#exit
switch(config)#
```
**match (class-map (qos) – Trident)**

The `match` command assigns an ACL to the configuration mode class map. A class map can contain only one ACL. Class maps only use permit rules to filter data; deny rules are ignored. The command accepts IPv4, IPv4 standard, IPv6, and IPv6 standard ACLs.

Class map (qos) configuration mode is a group change mode. **Match** statements are not saved to *running-config* until the edit session is completed by exiting the mode.

The `no match` and `default match` commands remove the **match** statement from the configuration mode class map by deleting the corresponding command from *running-config*.

**Command Mode**

Class-Map (qos) configuration
accessed through **class-map type qos** command

**Command Syntax**

```plaintext
match IP_VERSION access-group list_name
no match IP_VERSION access-group list_name
default match IP_VERSION access-group list_name
```

**Parameters**

- **IP_VERSION** IP version of the specified ACL. Options include:
  - `ip` IPv4.
  - `ipv6` IPv6.
- **list_name** name of ACL assigned to class map.

**Related Commands**

- **class-map type qos** places the switch in Class-Map configuration mode.
- **exit** saves pending class map changes, then returns the switch to global configuration mode.
- **abort** discards pending class map changes, then returns the switch to global configuration mode.
- **class (policy-map (qos) – Trident)** assigns a class map to a policy map.

**Example**

- These commands add the IPv4 ACL named `list_1` to the `map_1` class map, then saves the command by exiting class-map mode.

  ```plaintext
  switch(config)#class-map type qos map_1
  switch(config-cmap-map_1)#match ip access-group list_1
  switch(config-cmap-map_1)#exit
  switch(config)#
  ```
match (class-map (qos) – Trident II)

The `match` command assigns an ACL to the configuration mode class map. A class map can contain only one ACL. Class maps only use permit rules to filter data; deny rules are ignored. The command accepts IPv4, IPv4 standard, IPv6, and IPv6 standard ACLs.

Class map (qos) configuration mode is a group change mode. **Match** statements are not saved to `running-config` until the edit session is completed by exiting the mode.

The `no match` and `default match` commands remove the `match` statement from the configuration mode class map by deleting the corresponding command from `running-config`.

**Command Mode**

Class-Map (qos) configuration accessed through `class-map type qos` command

**Command Syntax**

```
match IP_VERSION access-group list_name
no match IP_VERSION access-group list_name
default match IP_VERSION access-group list_name
```

**Parameters**

- **IP_VERSION** IP version of the specified ACL. Options include:
  - `ip` IPv4.
  - `ipv6` IPv6.
- **list_name** name of ACL assigned to class map.

**Related Commands**

- `class-map type qos` places the switch in Class-Map configuration mode.
- `exit` saves pending class map changes, then returns the switch to global configuration mode.
- `abort` discards pending class map changes, then returns the switch to global configuration mode.
- `class (policy-map (qos) – Trident)` assigns a class map to a policy map.

**Example**

- These commands add the IPv4 ACL named `list_1` to the `map_1` class map, then saves the command by exiting class-map mode.

```
switch(config)#class-map type qos map_1
switch(config-cmap-map_1)#match ip access-group list_1
switch(config-cmap-map_1)#exit
switch(config)#
```
match (policy-map (pbr))

The `match` command creates a policy map clause entry that specifies one filtering condition. When a packet matches the filtering criteria, its next hop is set as specified. When a packet's properties do not equal the statement parameters, the packet is evaluated against the next clause or class map in the policy map, as determined by sequence number. If all clauses fail to set a next hop for the packet, the packet is routed according to the FIB.

The `no match` and `default match` commands remove the `match` statement from the configuration mode policy map by deleting the corresponding command from `running-config`.

**Command Mode**

Policy-Map (pbr) Configuration
accessed through `policy-map type pbr` command

**Command Syntax**

```
[sequence_number] match ip SOURCE_ADDR DEST_ADDR [set nexthop [recursive]
NH-addr_1 [NH-addr_2] ... [NH-addr_n]]
```

```
no match ip SOURCE_ADDR DEST_ADDR [set nexthop [recursive] NH-addr_1 [NH-addr_2] ... [NH-addr_n]]
```

```
no SEQ_NUM
```

```
default match match ip SOURCE_ADDR DEST_ADDR [set nexthop [recursive] NH-addr_1 [[NH-addr_2] ... [NH-addr_n]]
```

```
default SEQ_NUM
```

**Parameters**

- `sequence_number` Sequence number assigned to the rule. If no number is entered, the number is derived by adding 10 to the number of the policy map's last numbered line. To increase the distance between existing entries, use the `resequence` command.
- `SOURCE_ADDR` and `DEST_ADDR` source and destination address filters. Options include:
  - `network_addr` subnet address (CIDR or address-mask).
  - `any` packets from or to all addresses are matched.
  - `host ip_addr` IP address (dotted decimal notation).
    Source and destination subnet addresses support discontiguous masks.
  - `recursive` enables recursive next hop resolution.
  - `NH_addr` IP address of next hop. If multiple addresses are entered, they are treated as an ECMP group.

**Related Commands**

- `policy-map type pbr` enters policy-map (PBR) configuration mode.

**Example**

- These commands create a match rule in policy map “PMap1” which sets the next hop to 192.168.3.5 for packets received from 172.16.0.0/12 regardless of their destination, then exit the mode to save the changes.

  switch(config)#policy-map type pbr PMap1
  switch(config-pmap-PMap1)#match ip 172.16.0.0/12 any set nexthop 192.163.3.5
  switch(config-pmap-PMap1)#exit
  switch(config)#
platform arad tcam counters feature

The `platform arad tcam counters feature` command enables incrementing PBR hardware counters corresponding to ACL. If counters for PBR are enabled, then counters for ACL will be automatically disabled in all cases. If counters for ACL are enabled, then counters for PBR will be automatically disabled in all cases.

The `no platform arad tcam counters feature` command disables PBR/ACL counters selection. The `default platform arad tcam counters feature` commands resets the default behavior.

**Command Mode**

Global Configuration

**Command Syntax**

```
platform arad tcam counters feature [OPTIONS]
no platform arad tcam counters feature [OPTIONS]
default platform arad tcam counters feature [OPTIONS]
```

**Parameters**

- `OPTIONS` Assign the TCAM counters feature. Options include:
  - `pbr` assign the TCAM counters feature PBR hardware counters.
  - `acl` assign the TCAM counters feature ACL hardware counters.

**Example**

- This command enables incrementing ACL hardware counters selection.
  ```
  switch(config)#platform arad tcam counters feature acl
  switch(config)#
  ```
- This command disables incrementing ACL hardware counters selection.
  ```
  switch(config)#no platform arad tcam counters feature acl
  switch(config)#
  ```
**policy-map type copp**

The **policy-map type copp** command places the switch in Policy-Map (control plane) configuration mode, which is a group change mode that modifies a control-plane policy map. A policy map is a data structure that consists of class maps that identify a specific data stream and specify bandwidth and shaping parameters that controls its transmission. Control plane policy maps are applied to the control plane to manage traffic.

The **copp-system-policy** policy map is supplied with the switch and is always applied to the control plane. **Copp-system-policy** is the only valid control plane policy map.

The **exit** command saves pending policy map changes to **running-config** and returns the switch to global configuration mode. Policy map changes are also saved by entering a different configuration mode. The **abort** command discards pending changes, returning the switch to global configuration mode.

The **no policy-map type copp** and **default policy-map type copp** commands delete the specified policy map by removing the corresponding **policy-map type copp** command and its associated configuration.

**Command Mode**

- Global Configuration

**Command Syntax**

```
policy-map type copp copp-system-policy
no policy-map type copp copp-system-policy
default policy-map type copp copp-system-policy
```

**copp-system-policy** is supplied with the switch and is the only valid control plane policy map.

**Commands Available in Policy-Map Configuration Mode**

- class (policy-map (control-plane) – FM6000)
- class (policy-map (control-plane) – Trident)

**Related Commands**

- **class-map type copp** enters control-plane class-map configuration mode for modifying a control-plane dynamic class map.

  Only Helix and Trident platform switches support dynamic classes for control plane policing.

**Example**

- This command places the switch in policy-map configuration mode to edit the copp-system-policy policy map.

  ```
  switch(config)#policy-map type copp copp-system-policy
  switch(config-pmap-copp-system-policy)#
  ```
policy-map type pbr

The \texttt{policy-map type pbr} command places the switch in policy-map (pbr) configuration mode, which is a group change mode that modifies a Policy-Based Routing (PBR) policy map. The command also creates the specified policy map if it does not already exist. A PBR policy map is a data structure that consists of class maps that identify specific packets and the next hops for those packets. Policy maps are applied to Ethernet or port channel interfaces to manage traffic.

The \texttt{exit} command saves pending policy map changes to \texttt{running-config} and returns the switch to global configuration mode. Policy map changes are also saved by entering a different configuration mode. The \texttt{abort} command discards pending changes, returning the switch to global configuration mode.

The \texttt{no policy-map type pbr} and \texttt{default policy-map type pbr} commands delete the specified policy map by removing the corresponding \texttt{policy-map type pbr} command and its associated configuration.

\textbf{Command Mode}

Global Configuration

\textbf{Command Syntax}

\begin{itemize}
  \item \texttt{policy-map type pbr map\_name}
  \item \texttt{no policy-map type pbr map\_name}
  \item \texttt{default policy-map type pbr map\_name}
\end{itemize}

\textbf{Parameters}

\begin{itemize}
  \item \texttt{map\_name} Name of policy map.
\end{itemize}

\textbf{Commands Available in Policy-Map configuration mode}

\begin{itemize}
  \item \texttt{class (policy-map (pbr))}
  \item \texttt{match (policy-map (pbr))}
\end{itemize}

\textbf{Related Commands}

\begin{itemize}
  \item \texttt{class-map type pbr}
  \item \texttt{service-policy type pbr (Interface mode)}
\end{itemize}

\textbf{Example}

\begin{itemize}
  \item This command creates the PBR policy map named PMAP1 and places the switch in policy-map configuration mode.
    \begin{verbatim}
    switch(config)#policy-map type pbr PMAP1
    switch(config-pmap-PMAP1)#
    \end{verbatim}
\end{itemize}
policy-map type pdp

The **policy-map type pdp** command places the switch in policy-map (pdp) configuration mode, which is a group change mode that modifies a Per-port Denial-of-service Protection (PDP) policy map. The command also creates the specified policy map if it does not already exist.

The **exit** command saves pending policy map changes to **running-config** and returns the switch to global configuration mode. Policy map changes are also saved by entering a different configuration mode. The **abort** command discards pending changes, returning the switch to global configuration mode.

The **no policy-map type pdp** and **default policy-map type pdp** commands delete the specified policy map by removing the corresponding **policy-map type pdp** command and its associated configuration.

---

**Note**

PDP is available only in EOS versions 4.19.0F and above.

---

**Command Mode**

Global Configuration

**Command Syntax**

```
policy-map type pdp [shared] map_name
no policy-map type pdp [shared] map_name
default policy-map type pdp [shared] map_name
```

**Parameters**

- **shared** optional keyword designating a shared policy map.
- **map_name** name of policy map.

**Example**

- This command creates the unshared PDP policy map named PMAP1 and places the switch in policy-map configuration mode.

  ```
  switch(config)#policy-map type pdp PMAP1
  switch(config-pmap-PMAP1)#
  ```
policy-map type quality-of-service

The `policy-map type quality-of-service` command places the switch in Policy-Map (qos) configuration mode, which is a group change mode that modifies a QoS policy map. A policy map is a data structure that consists of class maps that identify a specific data stream and shaping parameters that controls its transmission. Policy maps are applied to Ethernet or port channel interfaces to manage traffic.

The `exit` command saves pending policy map changes to `running-config` and returns the switch to global configuration mode. Policy map changes are also saved by entering a different configuration mode. The `abort` command discards pending changes, returning the switch to global configuration mode.

The `no policy-map type quality-of-service` and `default policy-map type quality-of-service` commands delete the specified policy map by removing the corresponding `policy-map type quality-of-service` command and its associated configuration. The `policy-map` and `policy-map type quality-of-service` commands are equivalent.

Command Mode
Global Configuration

Command Syntax
```
policy-map type quality-of-service  map_name
no policy-map type quality-of-service  map_name
default policy-map type quality-of-service  map_name
```

The `policy-map map_name` and `policy-map type quality-of-service map_name` are identical commands.

Parameters
- `map_name` Name of policy map.

Commands Available in Policy-Map Configuration Mode
- `class (policy-map (qos) – FM6000)`
- `class (policy-map (qos) – Trident)`

Related Commands
- `class-map type qos`
- `service-policy type qos (Interface mode)`

Example
- This command creates the QoS policy map named PMAP-1 and places the switch in policy-map configuration mode.

```
switch(config)#policy-map PMAP-1
switch(config-pmap-PMAP-1)#
```
**resequence (class-map (pbr))**

The `resequence` command assigns sequence numbers to rules in the configuration mode class map. Command parameters specify the number of the first rule and the numeric interval between consecutive rules. Once changed, rule numbers persist unless changed again using the `resequence` command, but the interval used for numbering new rules reverts to 10 on exiting class-map (pbr) configuration mode.

Maximum rule sequence number is 4294967295.

**Command Mode**

- Class-Map (PBR) Configuration
  - accessed through `class-map type pbr` command

**Command Syntax**

```
resequence [start_num [inc_num]]
```

**Parameters**
- `start_num` sequence number assigned to the first rule. Default is 10.
- `inc_num` numeric interval between consecutive rules. Default is 10.

**Example**

- The `resequence` command renumbers the rules in CMAP1, starting the first command at number 100 and incrementing subsequent lines by 20.

```
switch(config)#class-map type pbr match-any CMAP1
switch(config-cmap-CMAP1)#show active
class-map type pbr match-any CMAP1
    10 match ip access-group group1
    20 match ip access-group group2
    30 match ip access-group group3
switch(config-cmap-CMAP1)#resequence 100 20
switch(config-cmap-CMAP1)#exit
switch(config)#class-map type pbr match-any CMAP1
switch(config-cmap-CMAP1)#show active
class-map type pbr match-any CMAP1
    100 match ip access-group group1
    120 match ip access-group group2
    140 match ip access-group group3
```
resequence (policy-map (pbr))

The `resequence` command assigns sequence numbers to rules in the configuration mode policy map. Command parameters specify the number of the first rule and the numeric interval between consecutive rules. Once changed, rule numbers persist unless changed again using the `resequence` command, but the interval used for numbering new rules reverts to 10 on exiting policy-map (pbr) configuration mode.

Maximum rule sequence number is 4294967295.

**Command Mode**

Policy-Map (PBR) Configuration
accessed through `policy-map type pbr` command

**Command Syntax**

```
resequence [start_num [inc_num]]
```

**Parameters**

- `start_num` sequence number assigned to the first rule. Default is 10.
- `inc_num` numeric interval between consecutive rules. Default is 10.

**Example**

- The `resequence` command renumbers the rules in PMAP1, starting the first command at number 100 and incrementing subsequent lines by 20.

```plaintext
switch(config)#policy-map type pbr PMAP1
switch(config-pmap-PMAP1)#show active
policy-map type pbr PMAP1
  10 class CMAP1
    set nexthop 172.16.1.1
  20 class CMAP2
    set nexthop 172.16.2.2
  30 class CMAP3
    set nexthop 172.16.3.3
switch(config-pmap-PMAP1)#resequence 100 20
switch(config-pmap-PMAP1)#exit
switch(config)#policy-map type pbr PMAP1
switch(config-pmap-PMAP1)#show active
class-map type pbr PMAP1
  100 class CMAP1
    set nexthop 172.16.1.1
  120 class CMAP2
    set nexthop 172.16.2.2
  140 class CMAP3
    set nexthop 172.16.3.3
switch(config-pmap-PMAP1)#
```
service-policy type pbr (Interface mode)

The **service-policy pbr** command applies the specified Policy-Based Routing (PBR) policy map to the configuration mode interface. A PBR policy map is a data structure that consists of class maps that identify specific packets and the next hops for those packets. Policy maps are applied to Ethernet or port channel interfaces to manage traffic. Only one service policy is supported per interface.

The **no service-policy pbr** and **default service-policy pbr** commands remove the service policy assignment from the configuration mode interface by deleting the corresponding **service-policy pbr** command from **running-config**.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
```
service-policy type pbr TRAFFIC_DIRECTION map_name
no service-policy pbr TRAFFIC_DIRECTION map_name
default service-policy pbr TRAFFIC_DIRECTION map_name
```

**Parameters**
- **TRAFFIC_DIRECTION** IP address or peer group name. Values include:
  - **input** Policy map applies to inbound packet streams.
  - **map_name** Name of policy map.

**Guidelines**
A policy map that is attached to a port channel interface takes precedence for member interfaces of the port channel over their individual Ethernet interface configuration. Members that are removed from a port channel revert to the policy map implementation specified by its Ethernet interface configuration.

**Related Commands**
- **policy-map type pbr**

**Example**
- This command applies the PBR policy map “PMAP1” to Ethernet interface 8.

```
switch#config
switch(config)#interface ethernet 8
switch(config-if-Et8)#service-policy type pbr input PMAP1
switch(config-if-Et8)#
```
service-policy type pdp (Interface mode)

The service-policy pdp command assigns the specified Per-port Denial-of-service (PDP) policy map to the configuration mode interface.

The no service-policy pdp and default service-policy pdp commands remove the service policy assignment from the configuration mode interface by deleting the corresponding service-policy pdp command from running-config.

Note

PDP is available only in EOS versions 4.19.0F and above.

Command Mode

Interface-Ethernet Configuration

Command Syntax

service-policy type pdp input map_name
no service-policy pdp input [map_name]
default service-policy pdp input [map_name]

Parameters

• map_name name of policy map.

Example

• This command assigns the PDP policy map “PMAP1” to Ethernet interface 8.

  switch#config
  switch(config)#interface ethernet 8
  switch(config-if-Et8)#service-policy type pdp input PMAP1
  switch(config-if-Et8)#
service-policy type qos (Interface mode)

The service-policy command applies a specified policy map to the configuration mode interface. A policy map is a data structure that identifies data traffic through class maps, then specifies actions to classify the traffic (by setting the traffic class), mark the traffic (by setting the cos and dscp values), and police the traffic (by setting the police rate) through data packet field modifications.

The no service-policy and default service-policy commands remove the service policy assignment from the configuration mode interface by deleting the corresponding service-policy command from running-config.

Command Mode
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

Command Syntax
- service-policy [type qos] TRAFFIC_DIRECTION map_name
- no service-policy [type qos] TRAFFIC_DIRECTION map_name
- default service-policy [type qos] TRAFFIC_DIRECTION map_name

Parameters
- type qos Parameter has no functional effect.
- TRAFFIC_DIRECTION Direction of data stream to which command applies. Options include:
  - input Policy map applies to inbound packet streams.
- map_name Name of policy map.

Guidelines
A policy map that is attached to a port channel interface takes precedence for member interfaces of the port channel over their individual Ethernet interface configuration. Members that are removed from a port channel revert to the policy map implementation specified by its Ethernet interface configuration.

DCS-7500E and DCS-7280E limitations:
- A maximum of 31 QoS service policies per chip may be applied on L3 interfaces.
- Applying different QoS service policies to an SVI and its member interfaces causes unpredictable behavior.
- When an SVI on which QoS service policies are applied experiences partial failure due to limited hardware resources, a forwarding agent restart will cause unpredictable behavior.
- Policy-map programming may fail when QoS service policies are applied on two SVIs if an event causes a member interface to switch membership from one to the other. To change the VLAN membership of an interface in this case, remove the interface from one VLAN before adding it to the other.
- Outgoing COS rewrite is not supported.
- QoS policy-map counters are not supported.

DCS-7010, DCS-7050, DCS-7050X, DCS-7250X, and DCS-7300X limitations:
- When the same policy map is applied to multiple SVIs, TCAM resources are not shared.
- A policy map applied to an SVI will result in TCAM allocation on all chips whether SVI members are present or not.
- Applying different QoS service policies to an SVI and its member interfaces causes unpredictable behavior.
Related Commands

- `policy-map type quality-of-service`

Example

- This command applies the PMAP-1 policy map to Ethernet interface 8.

```
switch#config
switch(config)#interface ethernet 8
switch(config-if-Et8)#show active
switch(config-if-Et8)#service-policy input PMAP-1
switch(config-if-Et8)#show active
interface Ethernet8
    service-policy type qos input PMAP-1
switch(config-if-Et8)#
```
set (policy-map-class (qos) – FM6000)

The set command specifies traffic resolution methods for traffic defined by its associated class map in its configuration mode policy map class. Three set statements are available for each class:

- **cos**  Sets the layer 2 class of service field.
- **dscp** Sets the differentiated services code point value in the type of service (ToS) byte.
- **traffic-class** Sets the traffic class queue for data packets.

Each type of set command can be assigned to a class, allowing for the simultaneous modification of both (cos, dscp) fields and assignment to a traffic class.

The no set and default set commands remove the specified data action from the class map by deleting the associated set command from running-config.

**Command Mode**

Policy-map-class (qos) configuration
accessed through class (policy-map (qos) – FM6000) command

**Command Syntax**

```
set QOS_TYPE value
no set QOS_TYPE
default set QOS_TYPE
```

**Parameters**

- **QOS_TYPE** Specifies the data stream resolution method. Valid options include:
  - **cos** Layer 2 class of service field of outbound packet is modified.
  - **dscp** Differentiated services code point value in the ToS byte is modified.
  - **traffic-class** Data stream is assigned to a traffic class queue.

- **value** Specifies the data field value or traffic class queue. Valid data range depends on
  **QOS_TYPE**.
    - **QOS_TYPE is cos** Value ranges from 0 to 7.
    - **QOS_TYPE is dscp** Value ranges from 0 to 63.
    - **QOS_TYPE is traffic-class** Value ranges from 0 to 7.

**Related Commands**

- policy-map type quality-of-service
- class (policy-map (qos) – FM6000)

**Example**

- These commands configure the policy map to set the CoS field to 7 to data traffic specified by the class map CMAP-1, then assigns that data to traffic class queue 4.

  ```
  switch(config)#policy-map type quality-of-service PMAP-1
  switch(config-pmap-PMAP-1)#class CMAP-1
  switch(config-pmap-c-PMAP-1-CMAP-1)#set cos 7
  switch(config-pmap-c-PMAP-1-CMAP-1)#set traffic-class 4
  ```
set (policy-map-class (qos) – Helix)

The set command specifies traffic resolution methods for traffic defined by its associated class map in its configuration mode policy map class. Three set statements are available for each class:

- **cos**  Sets the layer 2 class of service field.
- **dscp** Sets the differentiated services code point value in the type of service (ToS) byte.
- **traffic-class**  Sets the traffic class queue for data packets.

Each type of set command can be assigned to a class, allowing for the simultaneous modification of both (cos, dscp) fields and assignment to a traffic class.

The **no set** and **default set** commands remove the specified data action from the class map by deleting the associated set command from running-config.

**Command Mode**

Policy-map-class (qos) configuration accessed through class (policy-map (qos) – Helix) command

**Command Syntax**

```
set QOS_TYPE value
no set QOS_TYPE
default set QOS_TYPE
```

**Parameters**

- **QOS_TYPE**  Specifies the data stream resolution method. Valid options include:
  - **cos**  Layer 2 class of service field of outbound packet is modified.
  - **dscp** Differentiated services code point value in the ToS byte is modified.
  - **traffic-class**  Data stream is assigned to a traffic class queue.

- **value**  Specifies the data field value or traffic class queue. Valid data range depends on QOS type.
  - **QOS_TYPE is cos**  Value ranges from 0 to 7.
  - **QOS_TYPE is dscp**  Value ranges from 0 to 63.
  - **QOS_TYPE is traffic-class**  Value ranges from 0 to 7.

**Related Commands**

- **policy-map type quality-of-service**
- **class (policy-map (qos) – Helix)**

**Example**

- These commands configure the policy map to set the CoS field to 7 to data traffic specified by the class map CMAP-1, then assigns that data to traffic class queue 4.

```
switch(config)#policy-map type quality-of-service PMAP-1
switch(config-pmap-PMAP-1)#class CMAP-1
switch(config-pmap-c-PMAP-1-CMAP-1)#set cos 7
switch(config-pmap-c-PMAP-1-CMAP-1)#set traffic-class 4
switch(config-pmap-c-PMAP-1-CMAP-1)#
```
set (policy-map-class (qos) – Trident)

The set command specifies traffic resolution methods for traffic defined by its associated class map in its configuration mode policy map class. Three set statements are available for each class:

- **cos**  Sets the layer 2 class of service field.
- **dscp** Sets the differentiated services code point value in the type of service (ToS) byte.
- **traffic-class**  Sets the traffic class queue for data packets.

Each type of set command can be assigned to a class, allowing for the simultaneous modification of both (cos, dscp) fields and assignment to a traffic class.

The **no set** and **default set** commands remove the specified data action from the class map by deleting the associated set command from running-config.

**Command Mode**

Policy-map-class (qos) configuration
accessed through class (policy-map (qos) – Trident) command

**Command Syntax**

```
set QOS_TYPE value
no set QOS_TYPE
default set QOS_TYPE
```

**Parameters**

- **QOS_TYPE**  Specifies the data stream resolution method. Valid options include:
  - **cos**  Layer 2 class of service field of outbound packet is modified.
  - **dscp** Differentiated services code point value in the ToS byte is modified.
  - **traffic-class**  Data stream is assigned to a traffic class queue.
- **value**  Specifies the data field value or traffic class queue. Valid data range depends on QOS type.
  - **QOS_TYPE is cos**  Value ranges from 0 to 7.
  - **QOS_TYPE is dscp**  Value ranges from 0 to 63.
  - **QOS_TYPE is traffic-class**  Value ranges from 0 to 7.

**Related Commands**

- **policy-map type quality-of-service**
- **class (policy-map (qos) – Trident)**

**Example**

- These commands configure the policy map to set the CoS field to 7 to data traffic specified by the class map CMAP-1, then assigns that data to traffic class queue 4.

```
switch(config)#policy-map type quality-of-service PMAP-1
switch(config-pmap-PMAP-1)#class CMAP-1
switch(config-pmap-c-PMAP-1-CMAP-1)#set cos 7
switch(config-pmap-c-PMAP-1-CMAP-1)#set traffic-class 4
```
set (policy-map-class (qos) – Trident II)

The set command specifies traffic resolution methods for traffic defined by its associated class map in its configuration mode policy map class. Three set statements are available for each class:

- **cos** Sets the layer 2 class of service field.
- **dscp** Sets the differentiated services code point value in the type of service (ToS) byte.
- **traffic-class** Sets the traffic class queue for data packets.

Each type of set command can be assigned to a class, allowing for the simultaneous modification of both (cos, dscp) fields and assignment to a traffic class.

The **no set** and **default set** commands remove the specified data action from the class map by deleting the associated set command from **running-config**.

**Command Mode**

Policy-map-class (qos) configuration
accessed through class (policy-map (qos) – Trident) command

**Command Syntax**

```
set QOS_TYPE value
no set QOS_TYPE
default set QOS_TYPE
```

**Parameters**

- **QOS_TYPE** Specifies the data stream resolution method. Valid options include:
  - **cos** Layer 2 class of service field of outbound packet is modified.
  - **dscp** Differentiated services code point value in the ToS byte is modified.
  - **traffic-class** Data stream is assigned to a traffic class queue.
- **value** Specifies the data field value or traffic class queue. Valid data range depends on QOS type.
  - **QOS_TYPE is cos** Value ranges from 0 to 7.
  - **QOS_TYPE is dscp** Value ranges from 0 to 63.
  - **QOS_TYPE is traffic-class** Value ranges from 0 to 7.

**Related Commands**

- **policy-map type quality-of-service**
- **class (policy-map (qos) – Trident)**

**Example**

- These commands configure the policy map to set the CoS field to 7 to data traffic specified by the class map CMAP-1, then assigns that data to traffic class queue 4.

```
switch(config)#policy-map type quality-of-service PMAP-1
switch(config-pmap-PMAP-1)#class CMAP-1
switch(config-pmap-c-PMAP-1-CMAP-1)#set cos 7
switch(config-pmap-c-PMAP-1-CMAP-1)#set traffic-class 4
```

2013
set nexthop (policy-map-class – pbr)

The `set nexthop` command specifies the next hop for traffic defined by its associated class map in its configuration mode policy map class.

The `no set nexthop` and `default set nexthop` commands remove the specified action from the class map by deleting the associated `set nexthop` command from `running-config`.

**Command Mode**

Policy-map-class (pbr) configuration
  accessed through `class (policy-map (pbr))` command

**Command Syntax**

    set nexthop [recursive] NH-addr_1 [NH-addr_2] ... [NH-addr_n]
    no set nexthop [recursive]
    default set nexthop [recursive]

**Parameters**

- `recursive` enables recursive next hop resolution.
- `NH_addr` IP address of next hop. If multiple addresses are entered, they are treated as an ECMP group.

**Related Commands**

- `policy-map type pbr`
- `class (policy-map (pbr))`

**Example**

- These commands configure the policy map PMAP1 to set the next hop to 192.168.5.3 for traffic defined by class map CMAP1.

  switch(config)#policy-map type pbr PMAP1
  switch(config-pmap-PMAP1)#class CMAP1
  switch(config-pmap-c-PMAP1-CMAP1)#set nexthop 192.168.5.3
  switch(config-pmap-c-PMAP1-CMAP1)#
set nexthop-group (policy-map-class(pbr) – Arad)

The `set nexthop-group` command specifies a nexthop group as the next hop for traffic defined by its associated class map in its configuration mode policy map class.

The `no set nexthop-group` and `default set nexthop-group` commands remove the specified action from the class map by deleting the associated `set nexthop-group` command from `running-config`.

Command Mode
- Policy-map-class (pbr) configuration accessed through `class (policy-map (pbr))` command

Command Syntax

```plaintext
set nexthop-group group_name
no set nexthop-group
default set nexthop-group
```

Parameters
- `group_name` name of ECMP group to use as next hop.

Related Commands
- `policy-map type pbr`
- `class (policy-map (pbr))`

Example
- These commands configure the policy map PMAP1 to set the next hop to a nexthop group named GROUP1 for traffic defined by class map CMAP1.
  ```plaintext
  switch(config)#policy-map type pbr PMAP1
  switch(config-pmap-PMAP1)#class CMAP1
  switch(config-pmap-c-PMAP1-CMAP1)#set nexthop-group GROUP1
  switch(config-pmap-c-PMAP1-CMAP1)#
  ```
shape (policy-map-class (control-plane) – Arad)

The **shape** command specifies the maximum bandwidth for traffic filtered by the configuration mode policy map class.

The **no shape** and **default shape** commands remove the maximum bandwidth restriction for the configuration mode class by deleting the corresponding **bandwidth** command from **running-config**.

**Command Mode**
- Policy-map-class (control plane) configuration
  - accessed through **class (policy-map (control-plane) – Arad)**

**Command Syntax**
```
shape kbps kbits
no shape
default shape
```

**Parameters**
- **kbits** Maximum data rate (kbps per second). Value ranges from 1 to 10000000.

**Related Commands**
- **class (policy-map (control-plane) – Arad)** places the switch in policy-map-class (control plane) configuration mode.
- **bandwidth (policy-map-class (control-plane) – Arad)** specifies the minimum bandwidth for traffic defined by its associated class map in its configuration mode policy map class.

**Static Classes Default Shape**
Arad platform switches define these default shapes for static classes:
- copp-system-bgp2500•copp-system-l3pmoverflow2500
- copp-system-bpdu2500•copp-system-l3slowpath2500
- copp-system-default2500•copp-system-l3ttl12500
- copp-system-ipbroadcast2500•copp-system-lacp2500
- copp-system-ipmc2500•copp-system-linklocal2500
- copp-system-ipmcmiss2500•copp-system-lldp2500
- copp-system-ipunicastNO LIMIT•copp-system-mlag2500
- copp-system-l2broadcast2500•copp-system-multicastsnoop2500
- copp-system-l2unicastNO LIMIT•copp-system-Ospflsisis2500
- copp-system-l3destmiss2500•copp-system-sflow2500
Example

- These commands configure the maximum bandwidth of 2000 kbps for data traffic specified by the class map copp-system-lldp of the default control-plane policy map.

```plaintext
switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#shape kbps 2000
switch(config-pmap-c-c Copp-system-policy-copp-system-lldp)#exit
switch(config-pmap-c copp-system-policy)#exit
switch(config)#show policy-map copp copp-system-policy
Service-policy input: copp-system-policy

<--------OUTPUT OMITTED FROM EXAMPLE-------->

Class-map: copp-system-lldp (match-any)
  shape : 200 kbps
  bandwidth : 250 kbps
  Out Packets : 0
  Drop Packets : 0

<--------OUTPUT OMITTED FROM EXAMPLE-------->

switch(config)#
```
shape (policy-map-class (control-plane) – FM6000)

The **shape** command specifies the maximum bandwidth for traffic filtered by the configuration mode policy map class.

The **no shape** and **default shape** commands remove the maximum bandwidth restriction for the configuration mode class by deleting the corresponding **bandwidth** command from *running-config*.

**Command Mode**
- Policy-map-class (control plane) configuration accessed through **class (policy-map (control-plane) – FM6000)**

**Command Syntax**

```
shape packets
no shape
default shape
```

**Parameters**

- **packets** Minimum data rate (packets per second). Value ranges from 1 to 100000.

**Related Commands**

- **class (policy-map (control-plane) – FM6000)** places the switch in policy-map-class (control plane) configuration mode.
- **bandwidth (policy-map-class (control-plane) – FM6000)** specifies the minimum bandwidth for traffic defined by its associated class map in its configuration mode policy map class.

**Static Classes Default Shape**

FM6000 platform switches define these default shapes for static classes:

- copp-system-arp10000
- copp-system-l3slowpath10000
- copp-system-default8000
- copp-system-pim-ptp10000
- copp-system-ipmcrsvd10000
- copp-system-ospf-isis10000
- copp-system-ipmcmiss10000
- copp-system-igmp10000
- copp-system-selfip-tc6to75000
- copp-system-l2rsvd10000
- copp-system-sflow25000

**Example**

- These commands configure the maximum bandwidth of 5000 packets per second for data traffic specified by the class map PMAP-1 in the policy map named copp-system-policy.

```
switch(config)#policy-map type copp copp-system-policy
switch(config-map-copp-system-policy)#class PMAP-1
switch(config-pmap-c-copp-system-policy-PMAP-1)#shape pps 5000
switch(config-pmap-c-copp-system-policy-PMAP-1)#
```
**shape (policy-map-class (control-plane) – Helix)**

The *shape* command specifies the maximum bandwidth for traffic filtered by the configuration mode policy map class.

The *no shape* and *default shape* commands remove the maximum bandwidth restriction for the configuration mode class by deleting the corresponding *bandwidth* command from *running-config*.

**Command Mode**

- Policy-map-class (control plane) configuration
- accessed through *class (policy-map (control-plane) – Helix)*

**Command Syntax**

```
shape pps packets
no shape
default shape
```

**Parameters**

- *packets* Minimum data rate (packets per second). Value ranges from 1 to 100000.

**Static Classes Default Shape**

Trident platform switches define these default shapes for static classes:

- copp-system-aclog10000
- copp-system-l3ttl110000
- copp-system-arp10000
- copp-system-lacp5000
- copp-system-arpresolver10000
- copp-system-lldp10000
- copp-system-bfd10000
- copp-system-mlag5000
- copp-system-bgp5000
- copp-system-ospfisis10000
- copp-system-bpdu5000
- copp-system-selfip5000
- copp-system-default8000
- copp-system-selfip-tc6to75000
- copp-system-glean10000
- copp-system-sflow25024
- copp-system-igmp10000
- copp-system-tc3to510000
- copp-system-ipmcmiss10000
- copp-system-tc6to710000
- copp-system-ipmcrsvd10000
- copp-system-graphql10000
- copp-system-rrp5000
- copp-system-l3destmiss10000
- copp-system-vrrp5000
- copp-system-l3slowpath10000

**Related Commands**

- *class (policy-map (control-plane) – Helix)* places the switch in policy-map-class (control plane) configuration mode.
- *bandwidth (policy-map-class (control-plane) – Helix)* specifies the minimum bandwidth for traffic defined by its associated class map in its configuration mode policy map class.
Example

- These commands configure the maximum bandwidth of 5000 packets per second for data traffic specified by the copp-system-lldp of the default control-plane policy map

  switch(config)#policy-map type control-plan copp-system-policy
  switch(config-pmap-copp-system-policy)#class copp-system-lldp
  switch(config-pmap-c-copp-system-policy-copp-system-lldp)#shape pps 5000
  switch(config-pmap-c-c copp-system-policy-copp-system-lldp)#exit
  switch(config-pmap-copp-system-policy)#exit
  switch(config)#show policy-map copp copp-system-policy

  Service-policy input: copp-system-policy

  <--------OUTPUT OMITTED FROM EXAMPLE--------->
  Class-map: copp-system-lldp (match-any)
    shape : 5000 pps
    Out Packets : 305961
    Drop Packets : 0

  <--------OUTPUT OMITTED FROM EXAMPLE--------->

  switch(config)#
shape (policy-map-class (control-plane) – Petra)

The `shape` command specifies the maximum bandwidth for traffic filtered by the configuration mode policy map class.

The `no shape` and `default shape` commands remove the maximum bandwidth restriction for the configuration mode class by deleting the corresponding `bandwidth` command from `running-config`.

**Command Mode**

Policy-map-class (control plane) configuration
accessed through `class (policy-map (control-plane) – Petra)`

**Command Syntax**

```
shape kbps kbits
no shape
default shape
```

**Parameters**

- `kbits` Maximum data rate (kbps per second). Value ranges from 1 to 10000000.

**Related Commands**

- `class (policy-map (control-plane) – Petra)` places the switch in policy-map-class (control plane) configuration mode.
- `bandwidth (policy-map-class (control-plane) – Petra)` specifies the minimum bandwidth for traffic defined by its associated class map in its configuration mode policy map class.

**Static Classes Default Shape**

Petra platform switches define these default shapes for static classes:

- `copp-system-bpdu2500`
- `copp-system-l3destmiss2500`
- `copp-system-default2500`
- `copp-system-l3slowpath2500`
- `copp-system-igmp2500`
- `copp-system-l3ttl02500`
- `copp-system-ipbroadcast2500`
- `copp-system-l3ttl12500`
- `copp-system-ipmc2500`
- `copp-system-lacp2500`
- `copp-system-ipmcmisss2500`
- `copp-system-lldp2500`
- `copp-system-ipmcrsvd2500`
- `copp-system-unicast-arp2500`
- `copp-system-ipunicastNo Limit`

**Guidelines**

Petra does not support all discrete rate values. When a specified discrete value is not supported, the switch converts the rate to the next highest discrete value that it supports. The `show` commands displays the converted rate and not the user configured rate.
Example

- These commands configure the maximum bandwidth of 2000 kbps for data traffic specified by the class map copp-system-lldp of the default control-plane policy map. Because the switch does not support the discrete value of 2000 kbps, it converts the bandwidth up to 2115 kbps.

```plaintext
switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#shape kbps 2000
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#exit
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#exit
switch(config)#show policy-map copp copp-system-policy
Service-policy input: copp-system-policy

Class-map: copp-system-lldp (match-any)
    shape : 2115 kbps
    bandwidth : 325 kbps
    Out Packets : 0
    Drop Packets : 0

switch(config)#
```
shape (policy-map-class (control-plane) – Trident)

The `shape` command specifies the maximum bandwidth for traffic filtered by the configuration mode policy map class.

The `no shape` and `default shape` commands remove the maximum bandwidth restriction for the configuration mode class by deleting the corresponding `bandwidth` command from `running-config`.

**Command Mode**

Policy-map-class (control plane) configuration
accessed through `class (policy-map (control-plane) – Trident)`

**Command Syntax**

```
shape pps packets
no shape
default shape
```

**Parameters**

- `packets` Minimum data rate (packets per second). Value ranges from 1 to 100000.

**Static Classes Default Shape**

Trident platform switches define these default shapes for static classes:

- `copp-system-arp10000`
- `copp-system-lldp10000`
- `copp-system-arpresolver10000`
- `copp-system-l3destmiss10000`
- `copp-system-bpdu5000`
- `copp-system-l3slowpath10000`
- `copp-system-default8000`
- `copp-system-l3tl110000`
- `copp-system-glean10000`
- `copp-system-selfip5000`
- `copp-system-igmp10000`
- `copp-system-selfip-tc6to75000`
- `copp-system-ipmcmis10000`
- `copp-system-sflow25000`
- `copp-system-ipmcrsvd10000`
- `copp-system-tc3to510000`
- `copp-system-lacp5000`
- `copp-system-tc6to710000`

**Related Commands**

- `class (policy-map (control-plane) – Trident)` places the switch in policy-map-class (control plane) configuration mode.
- `bandwidth (policy-map-class (control-plane) – Trident)` specifies the minimum bandwidth for traffic defined by its associated class map in its configuration mode policy map class.

**Example**

- These commands configure the maximum bandwidth of 5000 packets per second for data traffic specified by the class map PMAP-1 in the policy map named `copp-system-policy`.

```bash
switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#class PMAP-1
switch(config-pmap-c-copp-system-policy-PMAP-1)#shape pps 5000
switch(config-pmap-c-copp-system-policy-PMAP-1)#
```
The **shape** command specifies the maximum bandwidth for traffic filtered by the configuration mode policy map class.

The **no shape** and **default shape** commands remove the maximum bandwidth restriction for the configuration mode class by deleting the corresponding **bandwidth** command from **running-config**.

**Command Mode**
- Policy-map-class (control plane) configuration
  accessed through **class (policy-map (control-plane) – Trident-II)**

**Command Syntax**
```
shape pps packets
no shape
default shape
```

**Parameters**
- **packets** Minimum data rate (packets per second). Value ranges from 1 to 100000.

**Static Classes Default Shape**
Trident-II platform switches define these default shapes for static classes:
- copp-system-aclog10000
- copp-system-l3slowpath10000
- copp-system-arp10000
- copp-system-l3ttl110000
- copp-system-arpresolver10000
- copp-system-lacp5000
- copp-system-bfd10000
- copp-system-lldp10000
- copp-system-bgp5000
- copp-system-mlag5000
- copp-system-bpdu5000
- copp-system-selfip5000
- copp-system-default8000
- copp-system-selfip-tc6to75000
- copp-system-glean10000
- copp-system-sflow25024
- copp-system-igmp10000
- copp-system-tc3to510000
- copp-system-ipmcmisss10000
- copp-system-tc6to710000
- copp-system-ipmcrsved10000
- copp-system-urm10000
- copp-system-l3destmiss10000

**Related Commands**
- **class (policy-map (control-plane) – Trident-II)** places the switch in policy-map-class (control plane) configuration mode.
- **bandwidth (policy-map-class (control-plane) – Trident-II)** specifies the minimum bandwidth for traffic defined by its associated class map in its configuration mode policy map class.
Example

- These commands configure the maximum bandwidth of 5000 packets per second for data traffic specified by the copp-system-lldp of the default control-plane policy map

  ```
  switch(config)#policy-map type control-plan copp-system-policy
  switch(config-pmap-copp-system-policy)#class copp-system-lldp
  switch(config-pmap-c-copp-system-policy-copp-system-lldp)#shape pps 5000
  switch(config-pmap-c-copp-system-policy-copp-system-lldp)#exit
  switch(config-pmap-copp-system-policy)#exit
  switch(config)#show policy-map copp copp-system-policy
  Service-policy input: copp-system-policy
  <--------OUTPUT OMITTED FROM EXAMPLE--------->
  Class-map: copp-system-lldp (match-any)
  shape : 5000 pps
  bandwidth : 500 pps
  Out Packets : 305961
  Drop Packets : 0
  <--------OUTPUT OMITTED FROM EXAMPLE--------->
  switch(config)#
  ```
**feature traffic-policy cpu (ipv4 | ipv6)**

The `feature traffic-policy cpu` command configures the CPU traffic policy features for the IPv4 and IPv6 traffic in user-defined TCAM profile.

The `no feature traffic-policy cpu` and `default feature traffic-policy cpu` commands remove the CPU policy configurations from `running-config`.

**Command Mode**
- Hardware TCAM

**Command Syntax**

```
feature traffic-policy cpu <ipv4 | ipv6>
no feature traffic-policy cpu <ipv4 | ipv6>
default feature traffic-policy cpu <ipv4 | ipv6>
```

**Parameters**
- `ipv4` CPU traffic policy for IPv4 traffic.
- `ipv6` CPU traffic policy for IPv6 traffic.

**Example**
- These commands places the switch in the hardware TCAM profile mode and configures the CPU traffic policy features for IPv4 traffic in the TCAM profile “test”.

```
switch(config)#hardware tcam
switch(config-hw-tcam)#profile test
switch(config-hw-tcam-profile-test)#feature traffic-policy cpu ipv4
```
show class-map type control-plane

The `show class-map` command displays contents of available control-plane class maps. Control-plane class maps can be added to the copp-system-policy policy map. Control-plane class maps can be static class maps defined by the system or dynamic maps created in class-map-configuration mode.

Dynamic class maps are composed of statements that match IPv4 access control lists. Static class maps are defined by the switch and cannot be altered.

**Command Mode**

EXEC

**Command Syntax**

```
show class-map type control-plane [MAP_NAME]
```

**Parameters**

- `MAP_NAME` Name of class map displayed by the command. Options include:
  - `<no parameter>` Command displays all control plane class maps.
  - `name_text` Command displays specified control-plane class maps.

**Related Commands**

- `show class-map type qos` displays control plane class maps.

**Example**

- This command displays all control plane class maps.
- This command displays the available control plane class maps.

```
switch>show class-map type control-plane
Class-map: CM-CP1 (match-any)
  Match: ip access-group name LIST-CP1
Class-map: copp-system-acllog (match-any)
Class-map: copp-system-arp (match-any)
Class-map: copp-system-arpresolver (match-any)
Class-map: copp-system-bpdu (match-any)
Class-map: copp-system-glean (match-any)
Class-map: copp-system-igmp (match-any)
Class-map: copp-system-ipmcmiss (match-any)
Class-map: copp-system-ipmcrsvd (match-any)
Class-map: copp-system-l3destmiss (match-any)
Class-map: copp-system-l3slowpath (match-any)
Class-map: copp-system-l3tttl1 (match-any)
Class-map: copp-system-lacp (match-any)
Class-map: copp-system-lldp (match-any)
Class-map: copp-system-selfip (match-any)
Class-map: copp-system-selfip-tc6to7 (match-any)
Class-map: copp-system-sflow (match-any)
Class-map: copp-system-tc3to5 (match-any)
Class-map: copp-system-tc6to7 (match-any)
switch>
```
show class-map type pbr

The `show class-map` command displays contents of all available Policy-Based Routing (PBR) class maps, or of a specified PBR class map. PBR class maps are used by PBR policy maps. PBR class maps are dynamic maps that are created in class-map-configuration mode. Dynamic class maps are composed of statements that match IPv4 or IPv6 access control lists.

**Command Mode**

EXEC

**Command Syntax**

```
show class-map type pbr [map_name]
```

**Parameters**

- `map_name`  Name of class map displayed by the command. If no parameter is entered, command show all available PBR class maps.

**Related Commands**

- `show policy-map type pbr` displays PBR policy maps.

**Example**

- This command displays the contents of the PBR class map CMAP1.

  switch>show class-map type pbr CMAP1
  Class-map: CMAP1 (match-any)
  Match: 10 ip access-group PBRgroup1
  Match: 20 ip access-group PBRgroup2
  Match: 30 ip access-group PBRgroup3
  switch>
show class-map type qos

The **show class-map** command displays contents of all available QoS class maps. QoS class maps are used by QoS policy maps. QoS class maps are dynamic maps that are created in class-map-configuration mode. Dynamic class maps are composed of statements that match IPv4 or IPv6 access control lists.

**Command Mode**

EXEC

**Command Syntax**

```
show class-map [type qos] [MAP_NAME]
```

**Parameters**

- **MAP_NAME** Name of class map displayed by the command.
- **<no parameter>** Command displays all QoS class maps.
- **name_text** Command displays specified QoS class maps.

**show class-map** and **show class-map type qos** are identical commands.

**Related Commands**

- **show class-map type control-plane** displays control plane class maps.

**Example**

- This command displays the available QoS class maps.

```
switch>show class-map type qos
Class-map: CM-Q1 (match-any)
  Match: ipv6 access-group name LIST-1
Class-map: CM-Q2 (match-any)
  Match: ip access-group name LIST-2
switch>
```
**show policy-map type copp**

The `show policy-map type copp` command displays contents of control plane policy maps. Control-plane policy maps are applied to the control plane; copp-system-policy is the only supported policy map.

Command options filter the output to display contents of all policy maps, contents of a specified policy map, or contents of a single class map within a specified policy map.

**Command Mode**

EXEC

**Command Syntax**

```markdown
show policy-map type copp copp-system-policy [CMAP_NAME]
```

**Parameters**

- **CMAP_NAME** Name of class map displayed by the command.
- `<no parameter>` Command displays all class maps in specified policy map.
- **class_name** Command displays specified class map.

**Example**

- This command displays the contents of the copp-system-bpdu class map in the copp-system-policy policy maps.

```
switch>show policy-map type copp copp-system-policy class copp-system-bpdu
Class-map: copp-system-bpdu (match-any)
  shape : 5000 pps
  bandwidth : 5000 pps

switch>
```
show policy-map type pbr

The `show policy-map pbr` command displays contents of Policy-Based Routing (PBR) policy maps. PBR policy maps are applied to Ethernet interfaces, port channel interfaces or switch virtual interfaces (SVIs).

Command options filter the output to either display contents of all policy maps, contents of a specified policy map, or summary contents of all or a specified policy map.

**Command Mode**

EXEC

**Command Syntax**

```
show policy-map type pbr [PMAP_NAME] [DATA_LEVEL]
```

**Parameters**

- `PMAP_NAME` Name of policy map displayed by the command.
  - `<no parameter>` Command displays all policy maps.
  - `policy_map` Command displays specified policy map.
- `DATA_LEVEL` Type of information the command displays. Values include:
  - `<no parameter>` Command displays all class maps in specified policy map.
  - `summary` Command displays summary data for the specified policy map.

**Example**

- This command displays the contents of all PBR policy maps in *running-config*.

  ```
  switch#show policy-map type pbr
  Service policy PMAP1
  Configured on:
  Applied on:
  10: Class-map: CMAP1 (match-any)
      Match: 10 ip access-group PBRgroup1
      Match: 20 ip access-group PBRgroup2
      Match: 30 ip access-group PBRgroup3
      Configured actions: set nexthop 172.16.10.12
  20: Class-map: CMAP2 (match-any)
      Match: 10 ip access-group PBRgroup1
      Match: 10 ip access-group PBRgroup4
      Match: 20 ip access-group PBRgroup5
      Configured actions: set nexthop 192.168.15.15
  switch#
  ```
show policy-map type qos

The `show policy-map qos` command displays contents of QoS policy maps. QoS policy maps are applied to Ethernet or port channel interfaces.

Command options filter the output to either display contents of all policy maps, contents of a specified policy map, or contents of a single class map within a specified policy map.

Command Mode

EXEC

Command Syntax

```
show policy-map [type qos] [P\_MAP\_NAME [C\_MAP\_NAME]]
```

Parameters

- `P\_MAP\_NAME` Name of policy map displayed by the command.
  - `<no parameter>` Command displays all policy maps.
  - `policy_map` Command displays specified policy map.
- `C\_MAP\_NAME` Name of class map displayed by the command. This option is available only when the command includes a policy map name.
  - `<no parameter>` Command displays all class maps in specified policy map.
  - `class_name` Command displays specified class map.

Example

- This command displays the contents of all QoS policy maps in `running-config`.

```
switch#show policy-map type qos
Service-policy input: PMAP-1
  Hardware programming status: Successful

  Class-map: xeter (match-any)
    Match: ip access-group name LIST-1
       set cos 6

  Class-map: class-default (match-any)

Service-policy PMAP-2

  Class-map: class-default (match-any)

switch#
```
show policy-map type qos counters

The `show policy-map counters` command displays the quantity of packets that are filtered by the ACLs that comprise a specified QoS policy map.

**Command Mode**

EXEC

**Command Syntax**

```
show policy-map [type qos] pmap_name [TRAFFIC] counters [INFO_LEVEL]
```

**Parameters**

- `pmap_name` Name of policy map displayed by the command.
- `TRAFFIC` Filters policy maps by the traffic they manage. Options include:
  - `<no parameter>` Policy maps that manage interface’s ingress traffic (same as `input` option).
  - `input` Policy maps that manage interface’s ingress traffic.
- `INFO_LEVEL` amount of information that is displayed. Options include:
  - `<no parameter>` displays summarized information about the policy map.
  - `detail` displays detailed policy map information.
**show policy-map copp**

The *show policy-map copp* command displays contents of the control-plane policy map. Control-plane policy maps are applied to the control plane, and copp-system-policy is the only supported policy map.

**Command Mode**

EXEC

**Command Syntax**

```
show policy-map copp copp-system-policy
```

**Example**

- This command displays the contents and throughput of the policy map applied to the control plane.

  ```
  switch> show policy-map copp copp-system-policy
  Service-policy input: copp-system-policy
  Number of units programmed: 1
  Hardware programming status: Successful

  Class-map: copp-system-bpdu (match-any)
  shape : 5000 pps
  bandwidth : 5000 pps
  Out Packets : 2
  Drop Packets : 0

  Class-map: copp-system-lacp (match-any)
  shape : 5000 pps
  bandwidth : 5000 pps
  Out Packets : 0
  Drop Packets : 0
  
  <-------OUTPUT OMITTED FROM EXAMPLE-------->
  ```

  switch>
  ```
show policy-map interface type qos

The `show policy-map interface` command displays contents of the policy maps applied to specified interfaces or to the control plane.

**Command Mode**

EXEC

**Command Syntax**

```
show policy-map interface INTERFACE_NAME [type qos] [TRAFFIC]
```

**Parameters**

- **INTERFACE_NAME** Filters policy map list by interfaces. Options include:
  - `ethernet e_range` Ethernet ports for which command displays policy maps.
  - `port-channel p_range` Port channels for which command displays policy maps.
- **TRAFFIC** Filters policy maps by the traffic they manage. Options include:
  - `<no parameter>` Policy maps that manage interface’s ingress traffic (same as `input` option).
  - `input` Policy maps that manage interface’s ingress traffic.

**Example**

- This command displays the policy maps applied to Ethernet interfaces 7 and 8.

```
switch#show policy-map interface ethernet 7-8
Service-policy input: PMAP-1
  Hardware programming status: Successful

  Class-map: cmap-1 (match-any)
    Match: ip access-group name LIST-2
    set cos 6

  Class-map: class-default (match-any)

Service-policy input: PMAP-2
  Hardware programming status: Successful

  Class-map: cmap-2 (match-any)
    Match: ip access-group name LIST-2
    set dscp 10

  Class-map: class-default (match-any)

switch#
```
show policy-map interface type qos counters

The `show policy-map interface` command displays displays the quantity of packets that are filtered by ACLs applied to a interface.

**Command Mode**
EXEC

**Command Syntax**
```
show policy-map [INTERFACE_NAME] [type qos] [TRAFFIC] counters
```

**Parameters**
- **INTERFACE_NAME** Filters policy map list by interfaces. Options include:
  - `<no parameter>` Displays data for all configured interfaces.
  - `interface ethernet e_range` Ethernet ports for which command displays policy maps.
  - `interface port-channel p_range` Port channels for which command displays policy maps.
- **TRAFFIC** Filters policy maps by the traffic they manage. Options include:
  - `<no parameter>` Policy maps that manage interface’s ingress traffic (same as `input` option).
  - `input` Policy maps that manage interface’s ingress traffic.

**Example**
- This command displays the policy maps applied to Ethernet interfaces 7 and 8.

```bash
switch#show policy-map interface ethernet 7-8
Service-policy input: PMAP-1
  Hardware programming status: Successful

  Class-map: cmap-1 (match-any)
    Match: ip access-group name LIST-2
    set cos 6

  Class-map: class-default (match-any)

Service-policy input: PMAP-2
  Hardware programming status: Successful

  Class-map: cmap-2 (match-any)
    Match: ip access-group name LIST-2
    set dscp 10

  Class-map: class-default (match-any)
```

switch#
Chapter 31

Open Shortest Path First – Version 2

Open Shortest Path First (OSPF) is a link-state routing protocol that operates within a single autonomous system. OSPF version 2 is defined by RFC 2328.

This chapter contains the following sections.

- Section 31.1: OSPFv2 Introduction
- Section 31.2: OSPFv2 Conceptual Overview
- Section 31.3: Configuring OSPFv2
- Section 31.4: OSPFv2 Examples
- Section 31.5: OSPFv2 Commands

31.1 OSPFv2 Introduction

31.1.1 Supported Features

Arista switches support the following OSPFv2 functions:

- A single OSPFv2 instance
- Intra- and inter-area routing
- Type 1 and 2 external routing
- Broadcast and P2P interfaces
- Stub areas
- Not so stubby areas (NSSA) (RFC 3101)
- MD5 Authentication
- Redistribution of static, IP, and BGP routes into OSPFv2 with route map filtering
- Opaque LSAs (RFC 2370)
- Graceful restart (RFC 3623)

31.1.2 Features Not Supported

The following OSPFv2 functions are not supported in the current version:

- NBMA, demand circuit, and P2MP interfaces
- OSPFv2 MIB support
31.2 OSPFv2 Conceptual Overview

31.2.1 Storing Link States

OSPFv2 is a dynamic, link-state routing protocol, where links represent interfaces or routable paths. Dynamic routing protocols calculate the most efficient path between locations based on bandwidth and device status.

A link state advertisement (LSA) is an OSPFv2 packet that communicates a router’s topology to other routers. The link state database (LSDB) stores an area’s topology database and is composed of LSAs received from other routers. Routers update the LSDB by storing LSAs from other routers.

31.2.2 Topology

An autonomous system (AS) is the IP domain within which a dynamic protocol controls the routing of traffic. In OSPFv2, an AS is composed of areas, which define the LSDB computation boundaries. All routers in an area store identical LSDBs. Routers in different areas exchange updates without storing the entire database, reducing information maintenance on large, dynamic networks.

An AS shares internal routing information from its areas and external routing information from other processes to inform routers outside the AS about routes the network can access. Routers that advertise routes on other ASs commit to carry data to the IP space on the route.

OSPFv2 defines these routers:

- Internal router (IR) – a router whose interfaces are contained in a single area. All IRs in an area maintain identical LSDBs.
- Area border router (ABR) – a router that has interfaces in multiple areas. ABRs maintain one LSDB for each connected area.
- Autonomous system boundary router (ASBR) – a gateway router connecting the OSPFv2 domain to external routes, including static routes and routes from other autonomous systems.

Figure 31-1 displays the OSPFv2 router types.

Figure 31-1: OSPFv2 Router Types
OSPFv2 areas are assigned a number between 0 and 4,294,967,295 ($2^{32} - 1$). Area numbers are often expressed in dotted decimal notation, similar to IP addresses.

Each AS has a backbone area, designated as area 0, that connects to all other areas. The backbone receives routing information from all areas, then distributes it to the other areas as required.

OSPFv2 area types include:
- Normal area – accepts intra-area, inter-area, and external routes. The backbone is a normal area.
- Stub area – does not receive router advertisements external to the AS. Stub area routing is based on a default route.
- Not-so-stubby-area (NSSA) – may import external routes from an ASBR, does not receive external routes from the backbone, and does not propagate external routes to other areas.

### 31.2.3 Link Updates

Routers periodically send hello packets to advertise status and establish neighbors. A router’s hello packet includes IP addresses of other routers from which it received a hello packet within the time specified by the router dead interval. Routers become neighbors when they detect each other in their hello packets if they:

- share a common network segment.
- are in the same area.
- have the same hello interval, dead interval, and authentication parameters.

Neighbors form adjacencies to exchange LSDB information. A neighbor group uses hello packets to elect a Designated Router (DR) and Backup Designated Router (BDR). The DR and BDR become adjacent to all other neighbors, including each other. Only adjacent neighbors share database information.

Figure 31-2 illustrates OSPFv2 neighbors.

**Figure 31-2: OSPFv2 Neighbors**

If Routers A, B, and C have the same Hello interval, Dead interval, and authentication parameters, then:

- Area 1 – Router A and Router B are neighbors.
- Area 0 – Router A, Router B, and Router C are neighbors.
- Area 2 – Router C has no neighbors.
The DR is the central contact for database exchanges. Switches send database information to their DR, which relays the information to the other neighbors. All routers in an area maintain identical LSDBs. Switches also send database information to their BDR, which stores this data without distributing it. If the DR fails, the BDR distributes LSDB information to its neighbors.

OSPFv2 routers distribute LSAs by sending them on all of their active interfaces. The router will generate an LSA for a network defined and active on a passive interface but will not transmit this LSA on the passive interface as no adjacencies are formed.

When a router's LSDB is changed by an LSA, it sends the changes to the DR and BDR for distribution to the other neighbors. Routing information is updated only when the topology changes.

Routers use Dijkstra's algorithm to calculate the shortest path to all known destinations, based on cumulative route cost. The cost of an interface indicates the transmission overhead and is usually inversely proportional to its bandwidth.
31.3 Configuring OSPFv2

These sections describe basic OSPFv2 configuration steps:

- Section 31.3.1: Configuring the OSPFv2 Instance
- Section 31.3.2: Configuring OSPFv2 Areas
- Section 31.3.3: Configuring Interfaces for OSPFv2
- Section 31.3.4: Enabling OSPFv2
- Section 31.3.5: Displaying OSPFv2 Status

31.3.1 Configuring the OSPFv2 Instance

31.3.1.1 Entering OSPFv2 Configuration Mode

The `router ospf` command places the switch in router-ospf configuration mode and creates an OSPFv2 instance if one was not previously created. The switch only supports one OSPFv2 instance and all OSPFv2 configuration commands apply to this instance.

When an OSPFv2 instance is already configured, the command must specify its process ID. Any attempt to define additional instances will fail and generate errors.

The process ID is local to the router and is used to identify the running OSPFv2 process. Neighbor OSPFv2 routers can have different process ID's.

**Example**

- This command places the switch in router-ospf configuration mode and, if not previously created, creates an OSPFv2 instance with a process ID of 100.

```
switch(config)#router ospf 100
switch(config-router-ospf)#
```

31.3.1.2 Defining the Router ID

The router ID is a 32-bit number assigned to a router running OSPFv2. This number uniquely labels the router within an Autonomous System. Status commands identify the switch through the router ID.

The switch sets the router ID to the first available alternative in the following list:

1. The `router-id` command.
2. The loopback IP address, if a loopback interface is active on the switch.
3. The highest IP address on the router.

**Important!** When configuring VXLAN on an MLAG, always manually configure the OSPFv2 router ID to prevent the switch from using the common VTEP IP address as the router ID.

The `router-id (OSPFv2)` command configures the router ID for an OSPFv2 instance.

**Example**

- This command assigns 10.1.1.1 as the OSPFv2 router ID.

```
switch(config-router-ospf)#router-id 10.1.1.1
switch(config-router-ospf)#
```

31.3.1.3 Global OSPFv2 Parameters

These router-ospf configuration mode commands define OSPFv2 behavior.
LSA Overload

The `max-lsa` (OSPFv2) command specifies the maximum number of LSAs allowed in an LSDB database and configures the switch behavior when the limit is approached or exceeded. An LSA overload condition triggers these actions:

- Warning: The switch logs OSPF MAXLSAWARNING if the LSDB contains a specified percentage of the LSA maximum.
- Temporary shutdown: When the LSDB exceeds the LSA maximum, OSPFv2 is disabled and does not accept or acknowledge new LSAs. The switch re-starts OSPFv2 after a specified period.
- Permanent shutdown: The switch permanently disables OSPFv2 after performing a specified number of temporary shutdowns. This state usually indicates the need to resolve a network condition that consistently generates excessive LSA packets.

OSPFv2 is re-enabled with a `router ospf` command.

The LSDB size restriction is removed by setting the LSA limit to zero.

Example

- This command configures the OSPFv2 maximum LSA count to 20,000 and triggers these actions:
  - The switch logs an OSPF MAXLSAWARNING if the LSDB has 8,000 LSAs (40% of 20,000).
  - The switch temporarily disables OSPFv2 for 10 minutes if the LSDB contains 20,000 LSAs.
  - The switch permanently disables OSPFv2 after four temporary OSPFv2 shutdowns.
  - The shutdown counter resets if the LSDB contains less than 20,000 LSAs for 20 minutes.

```
switch(config-router-ospf)#max-lsa 20000 40 ignore-time 10 ignore-count 4 reset-time 20
```

Logging Adjacency Changes

The `log-adjacency-changes` (OSPFv2) command configures the switch to log OSPFv2 link-state changes and transitions of OSPFv2 neighbors into the up or down state.

Examples

- This command configures the switch to log transitions of OSPFv2 neighbors into the up or down state.

```
switch(config-router-ospf)#log-adjacency-changes
```

- This command configures the switch to log all OSPFv2 link-state changes.

```
switch(config-router-ospf)#log-adjacency-changes detail
```

OSPF RFC Compatibility

RFC 2328 and RFC 1583 specify different methods for calculating summary route metrics. The `compatible` (OSPFv2) command allows the selective disabling of compatibility with RFC 2328.

Example

- This command sets the OSPF compatibility list with RFC 1583.

```
switch(config)#router ospf 6
switch(config-router-ospf)#compatible rfc1583
```

2042
Intra-Area Distance
The `distance ospf (OSPFv2)` command configures the administrative distance for routes contained in a single OSPFv2 area. Administrative distances compare dynamic routes configured by different protocols. The default administrative distance for intra-area routes is 110.

Example
- This command configures an administrative distance of 95 for OSPFv2 intra-area routes.
  
  ```
  switch(config-router-ospf)#distance ospf intra-area 95
  switch(config-router-ospf)#
  ```

Passive Interfaces
The `passive-interface <interface> (OSPFv2)` command prevents the transmission of hello packets on the specified interface. Passive interfaces drop all adjacencies and do not form new adjacencies. Passive interfaces send LSAs but do not receive them. The router does not send or process OSPFv2 packets received on passive interfaces. The router advertises the passive interface in the router LSA.

The `no passive-interface` command re-enables OSPFv2 processing on the specified interface.

Examples
- This command configures VLAN 2 as a passive interface.
  
  ```
  switch(config-router-ospf)#passive-interface vlan 2
  switch(config-router-ospf)#
  ```

- This command configures VLAN 2 as an active interface.
  
  ```
  switch(config-router-ospf)#no passive-interface vlan 2
  switch(config-router-ospf)#
  ```

Redistributing Connected Routes
Redistributing connected routes causes the OSPFv2 instance to advertise all connected routes on the switch as external OSPFv2 routes. Connected routes are routes that are established when IPv4 is enabled on an interface.

Example
- The `redistribute (OSPFv2) connected` command converts connected routes to OSPFv2 external routes.
  
  ```
  switch(config-router-ospf)#redistribute connected
  switch(config-router-ospf)#
  ```

Redistributing Static Routes
Redistributing static routes causes the OSPFv2 instance to advertise all static routes on the switch as external OSPFv2 routes. The switch does not support redistributing individual static routes.

Example
- The `redistribute (OSPFv2) static` command converts the static routes to OSPFv2 external routes.
  
  ```
  switch(config-router-ospf)#redistribute static
  switch(config-router-ospf)#
  ```

- The `no redistribute (OSPFv2)` command stops the advertising of the static routes as OSPFv2 external routes.
  
  ```
  switch(config-router-ospf)#no redistribute static
  switch(config-router-ospf)#
  ```
Filtering Routes with Distribute Lists

An OSPF distribute list uses a route map or prefix list to filter specific routes from incoming OSPF LSAs; this filtering occurs after SPF calculation. The filtered routes are not installed on the switch, but are still included in LSAs sent by the switch. An OSPF router instance can have one distribute list configured.

If a prefix list is used, destination prefixes that do not match the prefix list will not be installed. If a route map is used, routes may be filtered based on address, next hop, or metric. OSPF external routes may also be filtered by metric type or tag.

The **distribute-list in** command specifies the filter to be used and applies it to the OSPF instance.

**Example**

- These commands configure a prefix-list named “dist_list1” in OSPF instance 5 to filter certain routes from incoming OSPF LSAs.

```plaintext
switch(config)#router ospf 5
switch(config-router-ospf)#distribute-list prefix-list dist_list1 in
```

31.3.2 Configuring OSPFv2 Areas

OSPFv2 areas are configured through area commands. The switch must be in router-ospf configuration mode, as described in Section 31.3.1.1: Entering OSPFv2 Configuration Mode, to run area commands.

Areas are assigned a 32-bit number that is expressed in decimal or dotted-decimal notation. When an OSPFv2 instance configuration contains multiple areas, the switch only configures areas associated with its interfaces.

31.3.2.1 Configuring the Area Type

The **area (OSPFv2)** command specifies the area type. The switch supports three area types:

- **Normal area:** Area that accepts intra-area, inter-area, and external routes. The backbone area (area 0) is a normal area.
- **Stub area:** Area that does not advertise external routes. External routes are reached through a default summary route (0.0.0.0). Networks with no external routes do not require stub areas.
- **NSSA (Not So Stubby Area):** ASBRs advertise external LSAs directly connected to the area. External routes from other areas are not advertised and are reached through a default summary route.

The default area type is normal.

**Examples**

- This command configures area 45 as a stub area.

```plaintext
switch(config-router-ospf)#area 45 stub
```

- This command configures area 10.92.148.17 as an NSSA.

```plaintext
switch(config-router-ospf)#area 10.92.148.17 NSSA
```
31.3.2.2 Blocking All Summary Routes from Flooding the NSSA

The `area nssa no-summary (OSPFv2)` command configures the router to not import type-3 summary LSAs into the not-so-stubby area (NSSA) and injects a default summary route (0.0.0.0/0) into the NSSA to reach the inter-area prefixes.

**Example**
- This command directs the device not to import type-3 summary LSAs into the NSSA area and injects a default summary route (0.0.0.0/0) into the NSSA area.
  
  switch(config)# router ospf 6
  switch(config-router-ospf)# area 1.1.1.1 nssa no-summary
  switch(config-router-ospf)#

31.3.2.3 Assigning Network Segments to the Area

**Assigning Routes to an Area**

The `network area (OSPFv2)` command assigns the specified network segment to an OSPFv2 area. The network can be entered in CIDR notation or by an address and wildcard mask.

The switch zeroes the host portion of the specified network address e.g. 1.2.3.4/24 converts to 1.2.3.0/24 and 1.2.3.4/16 converts to 1.2.0.0/16

**Example**
- Each of these equivalent commands assign the network segment 10.1.10.0/24 to area 0.
  
  switch(config-router-ospf)# network 10.1.10.0 0.0.0.255 area 0
  switch(config-router-ospf)#
  
  switch(config-router-ospf)# network 10.1.10.0/24 area 0
  switch(config-router-ospf)#

  In each case, `running-config` stores the command in CIDR (prefix) notation.

**Summarizing Routes**

By default, ABRs create a summary LSA for each route in an area and advertise them to adjacent routers. The `area range (OSPFv2)` command aggregates routing information, allowing the ABR to advertise multiple routes with one LSA. The `area range` command can be used to suppress route advertisements.

**Examples**
- Two `network area` commands assign subnets to an area. The `area range` command summarizes the addresses, which the ABR advertises in a single LSA.
  
  switch(config-router-ospf)# network 10.1.25.80 0.0.0.240 area 5
  switch(config-router-ospf)#
  
  switch(config-router-ospf)# network 10.1.25.112 0.0.0.240 area 5
  switch(config-router-ospf)#
  
  switch(config-router-ospf)# area 5 range 10.1.25.64 0.0.0.192
  switch(config-router-ospf)#

- The `network area` command assigns a subnet to an area, followed by an `area range` command that suppresses the advertisement of that subnet.
  
  switch(config-router-ospf)# network 10.12.31.0 0.0.0.255 area 5
  switch(config-router-ospf)#
  
  switch(config-router-ospf)# area 5 range 10.12.31.0 0.0.0.255 not-advertise
  switch(config-router-ospf)#
31.3.2.4 Configuring Area Parameters

These router-ospf configuration mode commands define OSPFv2 behavior in a specified area.

**Default Summary Route Cost**

The `area default-cost (OSPFv2)` command specifies the cost of the default summary route that ABRs send into a stub area or NSSA. Summary routes, also called inter-area routes, originate in areas different than their destination.

**Example**
- This command configures a cost of 15 for the default summary route in area 23.
  
  switch(config-router-ospf)#area 23 default-cost 15
  switch(config-router-ospf)#

**Filtering Type 3 LSAs**

The `area filter (OSPFv2)` command prevents an area from receiving Type 3 (Summary) LSAs from a specified subnet. Type 3 LSAs are sent by ABRs and contain information about one of its connected areas.

**Example**
- This command prevents the switch from entering Type 3 LSAs originating from the 10.1.1.2/24 subnet into its area 2 LSDB.
  
  switch(config-router-ospf)#area 2 filter 10.1.1.2/24
  switch(config-router-ospf)#

31.3.3 Configuring Interfaces for OSPFv2

OSPFv2 interface configuration commands specify transmission parameters for routed ports and SVIs that handle OSPFv2 packets.

31.3.3.1 Configuring Authentication

OSPFv2 authenticates packets through passwords configured on VLAN interfaces. Interfaces connecting to the same area can authenticate packets if they have the same key. By default, OSPFv2 does not authenticate packets.

OSPFv2 supports simple password and message digest authentication:

- **Simple password authentication**: A password is assigned to an area. Interfaces connected to the area can authenticate packets if they have the same key. By default, OSPFv2 does not authenticate packets.

  OSPFv2 supports simple password and message digest authentication:

  - **Simple password authentication**: A password is assigned to an area. Interfaces connected to the area can authenticate packets if they have the same key. By default, OSPFv2 does not authenticate packets.

  - **Message digest authentication**: Each interface is configured with a key (password) and key-id pair. When transmitting a packet, the interface generates a string, using the MD5 algorithm, based on the OSPFv2 packet, key, and key ID, then appends that string to the packet.

  Message digest authentication supports uninterrupted transmissions during key changes by allowing each interface to have two keys with different key IDs. When a new key is configured on an interface, the router transmits OSPFv2 packets for both keys. Once the router detects that all neighbors are using the new key, it stops sending the old one.

Implementing authentication on an interface is a two step process:

1. Enabling authentication.
2. Configuring a key (password).
To configure simple authentication on a VLAN interface:

**Step 1** Enable simple authentication with the `ip ospf authentication` command.

```
switch(config-if-vl12)#ip ospf authentication
```

**Step 2** Configure the password with the `ip ospf authentication-key` command.

```
switch(config-if-vl12)#ip ospf authentication-key 0 code123
```

*Running-config* stores the password as an encrypted string, using a proprietary algorithm.

To configure Message-Digest authentication on a VLAN interface:

**Step 1** Enable Message-Digest authentication with the `ip ospf authentication` command.

```
switch(config-if-vl12)#ip ospf authentication message-digest
```

**Step 2** Configure the key ID and password with the `ip ospf message-digest-key` command.

```
switch(config-if-vl12)#ip ospf message-digest-key 23 md5 0 code123
```

*Running-config* stores the password as an encrypted string, using a proprietary algorithm. The key ID (23) is between keywords `message-digest-key` and `md5`.

### 31.3.3.2 Configuring Intervals

Interval configuration commands determine OSPFv2 packet transmission characteristics for the specified VLAN interface and are entered in interface-vlan configuration mode.

#### Hello Interval

The hello interval specifies the period between consecutive hello packet transmissions from an interface. Each OSPFv2 neighbor should specify the same hello interval, which should not be longer than any neighbor’s dead interval.

The `ip ospf hello-interval` command configures the hello interval for the configuration mode interface. The default is 10 seconds.

**Example**

- This command configures a hello interval of 30 seconds for VLAN 2.

```
switch(config-if-Vl2)#ip ospf hello-interval 30
```

#### Dead Interval

The dead interval specifies the period that an interface waits for an OSPFv2 packet from a neighbor before it disables the adjacency under the assumption that the neighbor is down. The dead interval should be configured identically on all OSPFv2 neighbors and be longer than the hello interval of any neighbor.

The `ip ospf dead-interval` command configures the dead interval for the configuration mode interface. The default is 40 seconds.

**Example**

- This command configures a dead interval of 120 seconds for VLAN 4.

```
switch(config-if-Vl4)#ip ospf dead-interval 120
```
Retransmit Interval

Routers that send OSPFv2 advertisements to an adjacent router expect to receive an acknowledgment from that neighbor. Routers that do not receive an acknowledgment will retransmit the advertisement. The retransmit interval specifies the period between retransmissions.

The `ip ospf retransmit-interval` command configures the LSA retransmission interval for the configuration mode interface. The default retransmit interval is 5 seconds.

Example

- This command configures a retransmit interval of 15 seconds for VLAN 3.

  switch(config-if-Vl3)#ip ospf retransmit-interval 15
  switch(config-if-Vl3)#

Transmission Delay

The transmission delay is an estimate of the time that an interface requires to transmit a link-state update packet. OSPFv2 adds this delay to the age of outbound packets to more accurately reflect the age of the LSA when received by a neighbor. The default transmission delay is one second.

The `ip ospf transmit-delay` command configures the transmission delay for the configuration mode interface.

Example

- This command configures a transmission delay of 5 seconds for VLAN 6.

  switch(config-if-Vl6)#ip ospf transmit-delay 5
  switch(config-if-Vl6)#

31.3.3.3 Configuring Interface Parameters

Interface Cost

The OSPFv2 interface cost (or metric) reflects the overhead of sending packets across the interface. The cost is typically inversely proportional to the bandwidth of the interface. The default cost is 10.

The `ip ospf cost` command configures the OSPFv2 cost for the configuration mode interface.

Example

- This command configures a cost of 15 for VLAN 2.

  switch(config-if-Vl2)#ip ospf cost 15
  switch(config-if-Vl2)#

Router Priority

Router priority determines preference during designated router (DR) and backup designated router (BDR) elections. Routers with higher priority numbers have preference over other routers. Routers with a priority of zero cannot be elected as a DR or BDR.

The `ip ospf priority` command configures router priority for the configuration mode interface. The default priority is 1.

Examples

- This command configures a router priority of 15 for VLAN 8.

  switch(config-if-Vl8)#ip ospf priority 15
  switch(config-if-Vl8)#
• This command restores the router priority of 1 for VLAN 7.
  switch(config-if-Vl7)#no ip ospf priority
  switch(config-if-Vl7)#

31.3.4 Enabling OSPFv2

31.3.4.1 IPv4 Routing
OSPFv2 requires that IPv4 routing is enabled on the switch. When IP routing is not enabled, entering OSPFv2 configuration mode generates a message.

Example
• This message is displayed if, when entering router-ospf configuration mode, IP routing is not enabled.
  switch(config)#router ospf 100
  ! IP routing not enabled
  switch(config-router-ospf)#

• This command enables IP routing on the switch.
  switch(config)#ip routing
  switch(config)#

31.3.4.2 Disabling OSPFv2
The switch can disable OSPFv2 operations without disrupting the OSPFv2 configuration.

• shutdown (OSPFv2) disables all OSPFv2 activity.
• ip ospf disabled disables OSPFv2 activity on a VLAN interface.

The no shutdown and no ip ospf disabled commands resume OSPFv2 activity.

Examples
• This command disables OSPFv2 activity on the switch.
  switch(config-router-ospf)#shutdown
  switch(config-router-ospf)#

• This command resumes OSPFv2 activity on the switch.
  switch(config-router-ospf)#no shutdown
  switch(config-router-ospf)#

• This command disables OSPFv2 activity on VLAN 5.
  switch(config-if-Vl5)#ip ospf disabled
  switch(config-if-Vl5)#

31.3.5 Displaying OSPFv2 Status
This section describes OSPFv2 show commands that display OSPFv2 status. General switch methods that provide OSPFv2 information include pinging routes, viewing route status (show ip route command), and viewing the configuration (show running-config command).

31.3.5.1 OSPFv2 Summary
The show ip ospf command displays general OSPFv2 configuration information and operational statistics.
Example

- This command displays general OSPFv2 information.

```bash
switch#show ip ospf
Routing Process "ospf 1" with ID 10.168.103.1
Supports opaque LSA
Maximum number of LSA allowed 12000
Threshold for warning message 75%
Ignore-time 5 minutes, reset-time 5 minutes
Ignore-count allowed 5, current 0
It is an area border router
Hold time between two consecutive SPFs 5000 msecs
SPF algorithm last executed 00:00:09 ago
Minimum LSA interval 5 secs
Minimum LSA arrival 1000 msecs
Number of external LSA 0. Checksum Sum 0x000000
Number of opaque AS LSA 0. Checksum Sum 0x000000
Number of LSA 27.
Number of areas in this router is 3. 3 normal 0 stub 0 nssa
Area BACKBONE(0.0.0.0)
   Number of interfaces in this area is 2
   It is a normal area
   Area has no authentication
   SPF algorithm executed 153 times
   Number of LSA 8. Checksum Sum 0x03e13a
   Number of opaque link LSA 0. Checksum Sum 0x000000
Area 0.0.0.2
   Number of interfaces in this area is 1
   It is a normal area
   Area has no authentication
   SPF algorithm executed 153 times
   Number of LSA 11. Checksum Sum 0x054e57
   Number of opaque link LSA 0. Checksum Sum 0x000000
Area 0.0.0.3
   Number of interfaces in this area is 1
   It is a normal area
   Area has no authentication
   SPF algorithm executed 5 times
   Number of LSA 6. Checksum Sum 0x02a401
   Number of opaque link LSA 0. Checksum Sum 0x000000
```

The output lists configuration parameters and operational statistics and status for the OSPFv2 instance, followed by a brief description of the areas located on the switch.

31.3.5.2 Viewing OSPFv2 on the Interfaces

The `show ip ospf interface` command displays OSPFv2 information for switch interfaces configured for OSPFv2. Different command options allow the display of either all interfaces or a specified interface. The command can also be configured to display complete information or a brief summary.
Example

- This command displays complete OSPFv2 information for VLAN 1.

  `switch#show ip ospf interface vlan 1`

  Vlan1 is up, line protocol is up (connected)
  Internet Address 10.168.0.1/24, Area 0.0.0.0
  Process ID 1, Router ID 10.168.103.1, Network Type BROADCAST, Cost: 10
  Transmit Delay is 1 sec, State BDR, Priority 1
  Designated Router is 10.168.104.2
  Backup Designated router is 10.168.103.1
  Timer intervals configured, Hello 10, Dead 40, Retransmit 5
  Neighbor Count is 1
  MTU is 1500
  switch#

  The display indicates the switch is an ABR by displaying a neighbor count, the Designated Router, and Backup Designated Router.

- This command displays a summary of interface information for the switch.

  `switch#show ip ospf interface brief`

<table>
<thead>
<tr>
<th>Interface</th>
<th>PID</th>
<th>Area</th>
<th>IP Address</th>
<th>Cost</th>
<th>State</th>
<th>Nbrs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Loopback0</td>
<td>1</td>
<td>0.0.0.0</td>
<td>10.168.103.1/24</td>
<td>10</td>
<td>DR</td>
<td>0</td>
</tr>
<tr>
<td>Vlan1</td>
<td>1</td>
<td>0.0.0.0</td>
<td>10.168.0.1/24</td>
<td>10</td>
<td>BDR</td>
<td>1</td>
</tr>
<tr>
<td>Vlan2</td>
<td>1</td>
<td>0.0.0.2</td>
<td>10.168.2.1/24</td>
<td>10</td>
<td>BDR</td>
<td>1</td>
</tr>
<tr>
<td>Vlan3</td>
<td>1</td>
<td>0.0.0.3</td>
<td>10.168.3.1/24</td>
<td>10</td>
<td>DR</td>
<td>0</td>
</tr>
</tbody>
</table>
  switch#

Configuration information includes the Process ID (PID), area, IP address, and cost. OSPFv2 operational information includes the Designated Router status and number of neighbors.

31.3.5.3 Viewing the OSPFv2 Database

The `show ip ospf database <link state list>` command displays the LSAs in the LSDB for the specified area. If no area is listed, the command displays the contents of the database for each area on the switch. The database command provides options to display subsets of the LSDB database, a summary of database contents, and the link states that comprise the database.
Examples

- This command displays LSDB contents for area 2.

```text
switch#show ip ospf 1 2 database
```

OSPF Router with ID(10.168.103.1) (Process ID 1)

```
switch#
```

### 31.3.5.4 Viewing OSPFv2 Neighbors

The `show ip ospf neighbor` command displays information about the routers that are neighbors to the switch. Command options allow the display of summary or detailed information about the neighbors for all areas and interfaces on the switch. The command also allows the display of neighbors for individual interfaces or areas. The `adjacency-changes` option displays the interface’s adjacency changes.

**Example**

• This command displays the switch’s neighbors.

```
switch#show ip ospf neighbor
Neighbor ID Pri State Dead Time Address Interface
10.168.104.2 1 FULL/DR 00:00:35 10.168.0.2 Vlan1
10.168.104.2 8 FULL/BDR 00:00:31 10.168.2.2 Vlan2
switch#
```
• This command displays details about the neighbors to VLAN 2.
  ```
  switch#show ip ospf neighbor vlan 2 detail
  Neighbor 10.168.104.2, interface address 10.168.2.2
  In the area 0.0.0.2 via interface Vlan2
  Neighbor priority is 8, State is FULL, 13 state changes
  Adjacency was established 00:01:25:48 ago
  DR is 10.168.2.1 BDR is 10.168.2.2
  Options is E
  Dead timer due in 00:00:34
  switch#
  ```
• This command displays the adjacency changes to VLAN 2.
  ```
  switch#show ip ospf neighbor vlan 2 adjacency-changes
  [08-04 09:58:58] 10.168.104.2, interface Vlan2 adjacency established
  [08-04 09:59:34] 10.168.104.2, interface Vlan2 adjacency dropped: interface went down
  [08-04 10:01:40] 10.168.104.2, interface Vlan2 adjacency dropped: nbr did not list our router ID
  [08-04 10:01:46] 10.168.104.2, interface Vlan2 adjacency established
  switch#
  ```

The **show ip ospf neighbor state** command displays the state information for OSPF neighbors on a per-interface basis.

**Examples**

• This command displays OSPF information for neighboring routers that are fully adjacent.
  ```
  switch>show ip ospf neighbor state full
  Neighbor ID     VRF Pri State          Dead Time Address       Interface
  Test1           default 1 FULL/BDR 00:00:35 10.17.254.105 Vlan3912
  Test2           default 1 FULL/BDR 00:00:36 10.17.254.29  Vlan3910
  Test3           default 1 FULL/DR 00:00:36 10.25.0.1    Vlan101
  Test4           default 1 FULL/DROTHER 00:00:36 10.17.254.67 Vlan3908
  Test5           default 1 FULL/DROTHER 00:00:36 10.17.254.68 Vlan3908
  Test6           default 1 FULL/BDR 00:00:36 10.17.254.66 Vlan3908
  Test7           default 1 FULL/DROTHER 00:00:34 10.17.36.4  Vlan3036
  Test8           default 1 FULL/BDR 00:00:35 10.17.36.3   Vlan3036
  Test9           default 1 FULL/DROTHER 00:00:31 10.17.254.13 Vlan3902
  Test10          default 1 FULL/BDR 00:00:37 10.17.254.11 Vlan3902
  Test11          default 1 FULL/DROTHER 00:00:33 10.17.254.163 Vlan3925
  Test12          default 1 FULL/DR 00:00:37 10.17.254.161 Vlan3925
  Test13          default 1 FULL/DROTHER 00:00:31 10.17.254.154 Vlan3923
  Test14          default 1 FULL/BDR 00:00:39 10.17.254.156 Vlan3923
  Test15          default 1 FULL/DROTHER 00:00:33 10.17.254.35 Vlan3911
  Test16          default 1 FULL/DR 00:00:34 10.17.254.33 Vlan3911
  Test17          default 1 FULL/DR 00:00:36 10.17.254.138 Ethernet12
  Test18          default 1 FULL/DR 00:00:37 10.17.254.2  Vlan3901
  ```
  The **show ip ospf neighbor summary** command displays a single line of summary information for each OSPFv2 neighbor.
Example

- This command displays the summary information for the OSPFv2 neighbors.

  
  switch> \texttt{show ip ospf neighbor summary}
  
  OSPF Router with (Process ID 1) (VRF default)
  0 neighbors are in state DOWN
  0 neighbors are in state GRACEFUL RESTART
  2 neighbors are in state INIT
  0 neighbors are in state LOADING
  0 neighbors are in state ATTEMPT
  18 neighbors are in state FULL
  0 neighbors are in state EXCHANGE
  0 neighbors are in state 2 WAYS
  0 neighbors are in state EXCH START

  switch>

31.3.5.5 Viewing OSPFv2 Routes

The \texttt{show ip routes} command provides an OSPFv2 option.

Examples

- This command displays all of a switch’s routes.

  \texttt{switch>show ip route}

  Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP

  Gateway of last resort:
  S  0.0.0.0/0 [1/0] via 10.255.255.1

  C  10.255.255.0/24 is directly connected, Management1
  C  10.168.0.0/24 is directly connected, Vlan1
  C  10.168.2.0/24 is directly connected, Vlan2
  O  10.168.3.0/24 [110/20] via 10.168.0.1
  O  10.168.103.0/24 [110/20] via 10.168.0.1
  C  10.168.104.0/24 is directly connected, Loopback0

  switch#

- This command displays the switch’s OSPFv2 routes.

  \texttt{switch>show ip route ospf}

  Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP

  O  10.168.3.0/24 [110/20] via 10.168.0.1
  O  10.168.103.0/24 [110/20] via 10.168.0.1

  switch#

Use the \texttt{ping} command to determine the accessibility of a route.
Example

- This command pings an OSPFv2 route.

```plaintext
switch#ping 10.168.0.1
PING 10.168.0.1 (10.168.0.1) 72(100) bytes of data.
80 bytes from 10.168.0.1: icmp_seq=1 ttl=64 time=0.148 ms
80 bytes from 10.168.0.1: icmp_seq=2 ttl=64 time=0.132 ms
80 bytes from 10.168.0.1: icmp_seq=3 ttl=64 time=0.136 ms
80 bytes from 10.168.0.1: icmp_seq=4 ttl=64 time=0.137 ms
80 bytes from 10.168.0.1: icmp_seq=5 ttl=64 time=0.136 ms

--- 10.168.0.1 ping statistics ---
5 packets transmitted, 5 received, 0% packet loss, time 7999ms
rtt min/avg/max/mdev = 0.132/0.137/0.148/0.015 ms
switch#
```

31.3.5.6 Viewing OSPFv2 SPF Logs

The `show ip ospf spf-log` command displays when and how long the switch took to run a full SPF calculation for OSPF.

Examples

- This command displays the SPF information for OSPF.

```plaintext
switch>show ip ospf spf-log
OSPF Process 172.26.0.22
When Duration(msec)
13:01:34 1.482
13:01:29 1.547
13:01:24 1.893
13:00:50 1.459
13:00:45 1.473
13:00:40 2.603
11:01:49 1.561
11:01:40 1.463
11:01:35 1.467
11:01:30 1.434
11:00:54 1.456
11:00:49 1.472
11:00:44 1.582
15:01:49 1.575
15:01:44 1.470
15:01:39 1.679
15:01:34 1.601
15:00:57 1.454
15:00:52 1.446
15:00:47 1.603
switch>
```
31.4 OSPFv2 Examples

This section describes the commands required to configure three OSPFv2 topologies.

31.4.1 OSPFv2 Example 1

The AS in example 1 contains two areas that are connected through two routers. The backbone area also contains an internal router that connects two subnets.

31.4.1.1 Example 1 Diagram

Figure 31-3 displays the Example 1 topology. Two ABRs connect area 0 and area 1 – Router A and Router B. Router C is an internal router that connects two subnets in area 0.

Figure 31-3: OSPFv2 Example 1

Area 1 Configuration

Area 1 contains one subnet that is accessed by Router A and Router B.

- Router A: The subnet 10.10.1.0/24 is accessed through VLAN 1.
- Router B: The subnet 10.10.1.0/24 is accessed through VLAN 1.
- Each router uses simple authentication, with password abcdefgh.
- Designated Router (DR): Router A.
- Backup Designated Router (BDR): Router B.
- Each router defines an interface cost of 10.
- Router priority is not specified for either router on area 1.

Area 0 ABR Configuration

Area 0 contains one subnet that is accessed by ABRs Router A and Router B.

- Router A: The subnet 10.10.2.0/24 is accessed through VLAN 2.
- Router B: The subnet 10.10.2.0/24 is accessed through VLAN 2.
- Designated Router (DR): Router B.
• Backup Designated Router (BDR): Router A.
• Each router uses simple authentication, with password ijklnmop.
• Each router defines an interface cost of 20.
• Each router defines a retransmit-interval of 10.
• Each router defines a transmit-delay of 2.
• Router priority is specified such that Router B will be elected as the Designated Router.

Area 0 IR Configuration
Area 0 contains one internal router that connects two subnets.
• Router C: The subnet 10.10.2.0/24 is accessed through VLAN 2.
• Router C: The subnet 10.10.3.0/24 is accessed through VLAN 3.
• The subnet 10.10.2.0/24 link is configured as follows:
  • Interface cost of 20.
  • Retransmit-interval of 10.
  • Transmit-delay of 2.
• The subnet 10.10.3.0/24 link is configured as follows:
  • Interface cost of 20.
  • Dead interval of 80 seconds.

31.4.1.2 Example 1 Code
This code configures the OSPFv2 instances on the three switches.

Step 1 Configure the interface addresses.

a Router A interfaces:
  switch-A(config)#interface vlan 1
  switch-A(config-if-vl1)#ip address 10.10.1.1/24
  switch-A(config-if-vl1)#interface vlan 2
  switch-A(config-if-vl2)#ip address 10.10.2.1/24

b Router B interfaces:
  switch-B(config)#interface vlan 1
  switch-B(config-if-vl1)#ip address 10.10.1.2/24
  switch-B(config-if-vl1)#interface vlan 2
  switch-B(config-if-vl2)#ip address 10.10.2.2/24

c Router C interfaces:
  switch-C(config)#interface vlan 2
  switch-C(config-if-vl2)#ip address 10.10.2.3/24
  switch-C(config-if-vl2)#interface vlan 3
  switch-C(config-if-vl3)#ip address 10.10.3.3/24
Step 2  Configure the interface OSPFv2 parameters.

a  Router A interfaces:

```bash
switch-A(config-if-vl2)#interface vlan 1
switch-A(config-if-vl1)#ip ospf authentication-key abcdefgh
switch-A(config-if-vl1)#ip ospf cost 10
switch-A(config-if-vl1)#ip ospf priority 6
switch-A(config-if-vl2)#interface vlan 2
switch-A(config-if-vl2)#ip ospf authentication-key ijklmnop
switch-A(config-if-vl2)#ip ospf cost 20
switch-A(config-if-vl2)#ip ospf retransmit-interval 10
switch-A(config-if-vl2)#ip ospf transmit-delay 2
switch-A(config-if-vl2)#ip ospf priority 4
```

b  Router B interfaces:

```bash
switch-B(config-if-vl2)#interface vlan 1
switch-B(config-if-vl1)#ip ospf authentication-key abcdefgh
switch-B(config-if-vl1)#ip ospf cost 10
switch-B(config-if-vl1)#ip ospf priority 4
switch-B(config-if-vl2)#interface vlan 2
switch-B(config-if-vl2)#ip ospf authentication-key ijklmnop
switch-B(config-if-vl2)#ip ospf cost 20
switch-B(config-if-vl2)#ip ospf retransmit-interval 10
switch-B(config-if-vl2)#ip ospf transmit-delay 2
switch-B(config-if-vl2)#ip ospf priority 6
```

c  Router C interfaces:

```bash
switch-C(config-if-vl3)#interface vlan 2
switch-C(config-if-vl2)#ip ospf cost 20
switch-C(config-if-vl2)#ip ospf retransmit-interval 10
switch-C(config-if-vl2)#ip ospf transmit-delay 2
switch-C(config-if-vl3)#interface vlan 3
switch-C(config-if-vl3)#ip ospf cost 20
switch-C(config-if-vl3)#ip ospf dead-interval 80
```

Step 3  Attach the network segments to the areas.

a  Router A interfaces:

```bash
switch-A(config-if-vl2)#router ospf 1
switch-A(config-router-ospf)#router-id 169.10.0.1
switch-A(config-router-ospf)#network 10.10.1.0/24 area 1
switch-A(config-router-ospf)#network 10.10.2.0/24 area 0
```

b  Router B interfaces:

```bash
switch-B(config-if-vl2)#router ospf 1
switch-B(config-router-ospf)#router-id 169.10.0.2
switch-B(config-router-ospf)#network 10.10.1.0/24 area 1
switch-B(config-router-ospf)#network 10.10.2.0/24 area 0
```

c  Router C interfaces:

```bash
switch-C(config-if-vl3)#router ospf 1
switch-C(config-router-ospf)#router-id 169.10.0.3
switch-C(config-router-ospf)#network 10.10.2.0/24 area 0
switch-C(config-router-ospf)#network 10.10.3.0/24 area 0
```

31.4.2  OSPFv2 Example 2

The AS in example 2 contains three areas. Area 0 connects to the other areas through different routers. The backbone area contains an internal router that connects two subnets. Area 0 is normal; the other areas are stub areas.
31.4.2.1 Example 2 Diagram

Figure 31-4 displays the Example 2 topology. One ABR (Router B) connects area 0 and area 10.42.110.0; another ABR (router C) connects area 0 and area 36.56.0.0. Router A is an internal router that connects two subnets in area 0.

Figure 31-4: OSPFv2 Example 2

Area 10.42.110.0 Configuration
Area 10.42.110.0 contains one subnet that is accessed by Router B.
- Router B: The subnet 10.42.110.0 is accessed through VLAN 15.
- Router B uses simple authentication, with password abcdefgh.
- Each router defines a interface cost of 10.

Area 10.56.0.0 Configuration
Area 10.56.0.0 contains one subnet that is accessed by Router C.
- Router C: The subnet 10.56.0.0 is accessed through VLAN 21.
- Router C uses simple authentication, with password ijklmnop.
- Each router defines a interface cost of 20.

Area 0 ABR Configuration
Area 0 contains two subnets. ABR Router B connects one subnet to area 10.42.110.0. ABR Router C connects the other subnet to area 10.56.0.0.
- Router B: The subnet 10.119.254.0/24 is accessed through VLAN 16.
- Router C: The subnet 10.119.251.0/24 is accessed through VLAN 20.
Designated Router (DR): Router B.
Backup Designated Router (BDR): Router C.
Each ABR uses simple authentication, with password ijklmnop
Each router defines an interface cost of 20.
Each router defines a retransmit-interval of 10.
Each router defines a transmit-delay of 2.

Area 0 IR Configuration
Area 0 contains two subnets connected by an internal router.

- Router A: The subnet 10.119.254.0/24 is accessed through VLAN 16.
- Router A: The subnet 10.119.251.0/24 is accessed through VLAN 20.
- The subnet 10.42.110.0 is configured as follows:
  - Interface cost of 10.
- The subnet 10.56.0.0/24 is configured as follows:
  - Interface cost of 20.
  - Retransmit-interval of 10.
  - Transmit-delay of 2.

31.4.2.2 Example 2 Code

**Step 1** Configure the interface addresses.

a. Router A interfaces:
   ```
   switch-A(config)#interface vlan 16
   switch-A(config-if-vl16)#ip address 10.119.254.2/24
   switch-A(config-if-vl16)#interface vlan 20
   switch-A(config-if-vl20)#ip address 10.119.251.1/24
   ```

b. Router B interfaces:
   ```
   switch-B(config)#interface vlan 15
   switch-B(config-if-vl15)#ip address 10.42.110.1/24
   switch-B(config-if-vl15)#interface vlan 16
   switch-B(config-if-vl16)#ip address 10.119.254.1/24
   ```

c. Router C interfaces:
   ```
   switch-C(config)#interface vlan 20
   switch-C(config-if-vl20)#ip address 10.119.251.2/24
   switch-C(config-if-vl20)#interface vlan 21
   switch-C(config-if-vl21)#ip address 10.56.0.1/24
   ```

**Step 2** Configure the interface OSPFv2 parameters.

a. Router A interfaces:
   ```
   switch-A(config-if-vl20)#interface vlan 16
   switch-A(config-if-vl16)#ip ospf cost 10
   switch-A(config-if-vl16)#interface vlan 20
   switch-A(config-if-vl20)#ip ospf cost 20
   switch-A(config-if-vl20)#ip ospf retransmit-interval 10
   switch-A(config-if-vl20)#ip ospf transmit-delay 2
   ```
b  Router B interfaces:

```
switch-B(config-if-vl16)#interface vlan 15
switch-B(config-if-vl15)#ip ospf authentication-key abcdefgh
switch-B(config-if-vl15)#ip ospf cost 10
switch-B(config-if-vl15)#interface vlan 16
switch-B(config-if-vl16)#ip ospf authentication-key ijklnmop
switch-B(config-if-vl16)#ip ospf cost 20
switch-B(config-if-vl16)#ip ospf retransmit-interval 10
switch-B(config-if-vl16)#ip ospf transmit-delay 2
switch-B(config-if-vl16)#ip ospf priority 6
```

c  Router C interfaces:

```
switch-C(config-if-vl21)#interface vlan 20
switch-C(config-if-vl20)#ip ospf authentication-key ijklnmop
switch-C(config-if-vl20)#ip ospf cost 20
switch-C(config-if-vl20)#ip ospf retransmit-interval 10
switch-C(config-if-vl20)#ip ospf transmit-delay 2
switch-C(config-if-vl20)#ip ospf priority 4
switch-C(config-if-vl20)#interface vlan 21
switch-C(config-if-vl21)#ip ospf authentication-key ijklnmop
switch-C(config-if-vl21)#ip ospf cost 20
switch-C(config-if-vl21)#ip ospf dead-interval 80
```

Step 3  Attach the network segments to the areas.

a  Router A interfaces:

```
switch-A(config-if-vl20)#router ospf 1
switch-A(config-router-ospf)#router-id 10.24.1.1
switch-A(config-router-ospf)#network 10.119.254.0/24 area 0
switch-A(config-router-ospf)#network 10.119.251.0/24 area 0
switch-A(config-router-ospf)#area 0 range 10.119.251.0 0.0.7.255
```

b  Router B interfaces:

```
switch-B(config-if-vl16)#router ospf 1
switch-B(config-router-ospf)#router-id 10.24.1.2
switch-B(config-router-ospf)#area 10.42.110.0 stub
switch-B(config-router-ospf)#network 10.42.110.0/24 area 10.42.110.0
switch-B(config-router-ospf)#network 10.119.254.0/24 area 0
```

c  Router C interfaces:

```
switch-C(config-if-vl21)#router ospf 1
switch-C(config-router-ospf)#router-id 10.24.1.3
switch-C(config-router-ospf)#area 10.56.0.0 stub 0
switch-C(config-router-ospf)#network 10.119.251.0/24 area 0
switch-C(config-router-ospf)#network 10.56.0.0/24 area 36.56.0.0
```

31.4.3  OSPFv2 Example 3

The AS in example 3 contains two areas that connect through one ABR.

- Area 0: Backbone area contains two internal routers that connect three subnets, one ASBR, and one ABR that connects to Area 1.
- Area 1: NSSA contains one internal router, one ASBR, and one ABR that connects to the backbone.
31.4.3.1 Example 3 Diagram

Figure 31-5 displays the Example 3 topology. One ABR connects area 0 and area 1. Router C is an ABR that connects the areas. Router A is an internal router that connects two subnets in area 1. Router D and Router E are internal routers that connect subnets in area 0. Router B and Router F are ASBRs that connect static routes outside the AS to area 1 and area 0, respectively.

Figure 31-5: OSPFv2 Example 3

---

**Area 0 ABR Configuration**

ABR Router C connects one area 0 subnet to an area 1 subnet.

- Router C: The subnet 10.10.2.0/24 is accessed through VLAN 11.
- Authentication is not configured on the interfaces.
- All interface OSPFv2 parameters are set to their default values.

**Area 0 IR Configuration**

Area 0 contains two internal routers, each of which connects two of the three subnets in the area.

- Router D: The subnet 10.10.2.0/24 is accessed through VLAN 11.
- Router D: The subnet 10.10.3.0/24 is accessed through VLAN 12.
- Router E: The subnet 10.10.3.0/24 is accessed through VLAN 12.
- Router E: The subnet 10.10.4.0/24 is accessed through VLAN 13.
- All interface OSPFv2 parameters are set to their default values.

**Area 0 ASBR Configuration**

ASBR Router F connects one area 0 subnet to an external subnet.
• Router F: The subnet 10.10.4.0/24 is accessed through VLAN 13.
• Router F: The subnet 12.15.1.0/24 is accessed through VLAN 14.
• All interface OSPFv2 parameters are set to their default values.

Area 1 ABR Configuration
ABR Router C connects one area 0 subnet to area 1.
• Router C: The subnet 10.10.1.0/24 is accessed through VLAN 10.
• Authentication is not configured on the interface.
• All interface OSPFv2 parameters are set to their default values.

Area 1 IR Configuration
Area 1 contains one internal router that connects two subnets in the area.
• Router A: The subnet 10.10.1.0/24 is accessed through VLAN 10.
• Router A: The subnet 10.10.5.0/24 is accessed through VLAN 9.
• All interface OSPFv2 parameters are set to their default values.

Area 1 ASBR Configuration
ASBR Router B connects one area 1 subnet to an external subnet.
• Router B: The subnet 10.10.1.0/24 is accessed through VLAN 10.
• Router B: The subnet 16.29.1.0/24 is accessed through VLAN 15.
• All interface OSPFv2 parameters are set to their default values.

31.4.3.2 Example 3 Code
Step 1 Configure the interfaces.

a Router A interfaces:
switch-A(config)#interface vlan 10
switch-A(config-if-vl10)#ip address 10.10.1.1/24
switch-A(config-if-vl10)#interface vlan 9
switch-A(config-if-vl11)#ip address 10.10.5.1/24

b Router B interfaces:
switch-B(config)#interface vlan 10
switch-B(config-if-vl10)#ip address 10.10.1.2/24
switch-B(config-if-vl10)#interface vlan 15
switch-B(config-if-vl18)#ip address 16.29.1.1/24

c Router C interfaces:
switch-C(config)#interface vlan 10
switch-C(config-if-vl10)#ip address 10.10.1.3/24
switch-C(config-if-vl10)#interface vlan 11
switch-C(config-if-vl11)#ip address 10.10.2.2/24

d Router D interfaces:
switch-D(config)#interface vlan 11
switch-D(config-if-vl11)#ip address 10.10.2.1/24
switch-D(config)#interface vlan 12
switch-D(config-if-vl12)#ip address 10.10.3.1/24
e  Router E interfaces:
  switch-E(config)#interface vlan 12
  switch-E(config-if-vl12)#ip address 10.10.3.2/24
  switch-E(config)#interface vlan 13
  switch-E(config-if-vl13)#ip address 10.10.4.1/24
f  Router F interfaces:
  switch-F(config)#interface vlan 13
  switch-F(config-if-vl13)#ip address 10.10.4.2/24
  switch-F(config)#interface vlan 14
  switch-F(config-if-vl14)#ip address 12.15.1.1/24

Step 2  Attach the network segments to the areas.

a  Router A interfaces:
  switch-A(config-if-vl10)#router ospf 1
  switch-A(config-router-ospf)#router-id 170.21.0.1
  switch-A(config-router-ospf)#area 1 NSSA
  switch-A(config-router-ospf)#network 10.10.1.0/24 area 1
b  Router B interfaces:
  switch-B(config-if-vl10)#router ospf 1
  switch-B(config-router-ospf)#router-id 170.21.0.2
  switch-B(config-router-ospf)#area 1 NSSA
  switch-B(config-router-ospf)#network 10.10.1.0/24 area 1
c  Router C interfaces:
  switch-C(config-if-vl11)#router ospf 1
  switch-C(config-router-ospf)#router-id 170.21.0.3
  switch-C(config-router-ospf)#area 1 NSSA
  switch-C(config-router-ospf)#network 10.10.1.0/24 area 1
  switch-C(config-router-ospf)#network 10.10.2.0/24 area 0
d  Router D interfaces:
  switch-D(config-if-vl12)#router ospf 1
  switch-D(config-router-ospf)#router-id 170.21.0.4
  switch-D(config-router-ospf)#network 10.10.2.0/24 area 0
  switch-D(config-router-ospf)#network 10.10.3.0/24 area 0
e  Router E interfaces:
  switch-E(config-if-vl13)#router ospf 1
  switch-E(config-router-ospf)#router-id 170.21.0.5
  switch-E(config-router-ospf)#network 10.10.3.0/24 area 0
  switch-E(config-router-ospf)#network 10.10.4.0/24 area 0
f  Router F interfaces:
  switch-F(config-if-vl14)#router ospf 1
  switch-F(config-router-ospf)#router-id 170.21.0.6
  switch-F(config-router-ospf)#network 10.10.4.0/24 area 0

  switch-F(config-router-ospf)#redistribute static
31.5 OSPFv2 Commands

**Global Configuration Mode**
- ip ospf router-id output-format hostnames
- router ospf

**Interface Configuration Mode**
- ip ospf area
- ip ospf authentication
- ip ospf authentication-key
- ip ospf cost
- ip ospf dead-interval
- ip ospf disabled
- ip ospf hello-interval
- ip ospf message-digest-key
- ip ospf network point-to-point
- ip ospf priority
- ip ospf retransmit-interval
- ip ospf transmit-delay

**Router-OSPFv2 Configuration Mode**
- adjacency exchange-start threshold (OSPFv2)
- area default-cost (OSPFv2)
- area filter (OSPFv2)
- area nssa (OSPFv2)
- area nssa default-information originate (OSPFv2)
- area nssa no-summary (OSPFv2)
- area not-so-stubby lsa type-7 convert type-5 (OSPFv2)
- area range (OSPFv2)
- area stub (OSPFv2)
- auto-cost reference-bandwidth (OSPFv2)
- compatible (OSPFv2)
- default-information originate (OSPFv2)
- distance ospf (OSPFv2)
- log-adjacency-changes (OSPFv2)
- max-lsa (OSPFv2)
- max-metric router-lsa (OSPFv2)
- maximum-paths (OSPFv2)
- network area (OSPFv2)
- no area (OSPFv2)
- passive-interface default (OSPFv2)
- passive-interface <interface> (OSPFv2)
- point-to-point routes (OSPFv2)
- redistribute (OSPFv2)
- router-id (OSPFv2)
- shutdown (OSPFv2)
- summary-address
- timers lsa rx min interval (OSPFv2)
- timers lsa tx delay initial (OSPFv2)
- timers spf delay initial (OSPFv2)
Display and Clear Commands

- clear ip ospf neighbor
- show ip ospf
- show ip ospf border-routers
- show ip ospf database database-summary
- show ip ospf database <link state list>
- show ip ospf database <link-state details>
- show ip ospf interface
- show ip ospf interface brief
- show ip ospf lsa-log
- show ip ospf neighbor
- show ip ospf neighbor adjacency-changes
- show ip ospf neighbor state
- show ip ospf neighbor summary
- show ip ospf request queue
- show ip ospf retransmission queue
- show ip ospf spf-log
adjacency exchange-start threshold (OSPFv2)

The `adjacency exchange-start threshold` command sets the exchange-start options for an OSPF instance.

The `no adjacency exchange-start threshold` and `default adjacency exchange-start threshold` command resets the default by removing the corresponding `adjacency exchange-start threshold` command from `running-config`.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```
adjacency exchange-start threshold peers
no adjacency exchange-start threshold
default adjacency exchange-start threshold
```

**Parameters**

- `peers` Value ranges from 1 4294967295. Default value is 10.

**Example**

- This command sets the adjacency exchange start threshold to 20045623.

```
switch(config)#router ospf 6
switch(config-router-ospf)#adjacency exchange-start threshold 20045623
switch(config-router-ospf)#
```
area default-cost (OSPFv2)

The `area default-cost` command specifies the cost for the default summary routes sent into a specified area. The default-cost is set to 10.

The `no area default-cost` and `default area default-cost` command resets the default-cost value of the specified area to 10 by removing the corresponding `area default-cost` command from `running-config`. The `no area (OSPFv2)` command removes all area commands for the specified area from `running-config`, including the `area default-cost` command.

Command Mode
- Router-OSPF Configuration

Command Syntax
```
area area_id default-cost def_cost
no area area_id default-cost
default area area_id default-cost
```

Parameters
- `area_id` area number. `<0 to 4294967295>` or `<0.0.0.0 to 255.255.255.255>`
  - `running-config` stores value in dotted decimal notation.
- `def_cost` Value ranges from 1 to 65535. Default value is 10.

Example
- This command configures a cost of 15 for default summary routes that an ABR sends into area 23.
```
switch(config)#router ospf 6
switch(config-router-ospf)#area 23 default-cost 15
switch(config-router-ospf)#
```
area filter (OSPFv2)

The area filter command prevents an area from receiving Type 3 Summary LSAs from a specified subnet.

The no area filter and default area filter commands remove the specified area filter command from running-config. The no area command (see no area (OSPFv2) removes all area commands for the specified area from running-config, including area filter commands.

Command Mode

Router-OSPF Configuration

Command Syntax

area area_id filter net_addr
no area area_id filter net_addr
default area area_id filter net_addr

Parameters

- area_id area number. <0 to 4294967295> or <0.0.0.0 to 255.255.255.255>
  running-config stores value in dotted decimal notation.
- net_addr network IP address. Entry formats include address-prefix (CIDR) and address-mask.
  running-config stores value in CIDR notation.

Example

- This command prevents the switch from entering Type 3 LSAs originating from the 10.1.1.0/24 subnet into its area 2 LSDB.
  
  switch(config)#router ospf 6
  switch(config-router-ospf)#area 2 filter 10.1.1.0/24
  switch(config-router-ospf)#
area nssa (OSPFv2)

The `area nssa` command configures an OSPFv2 area as a not-so-stubby area (NSSA). All routers in an AS must specify the same area type for identically numbered areas.

NSSA ASBRs advertise external LSAs that are part of the area, but do not advertise external LSAs from other areas.

Areas are **normal** by default; area type configuration is required only for stub NSSA areas. Area 0 is always a normal area and cannot be configured through this command.

The `no area nssa` command configures the specified area as a normal area by removing the specified `area nssa` command from **running-config**.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```
area area_id nssa [TYPE]
no area area_id nssa [TYPE]
default area area_id nssa [TYPE]
```

All parameters except `area_id` can be placed in any order.

**Parameters**

- `area_id`
  - Valid formats: integer `<1` to `4294967295>` or dotted decimal `<0.0.0.1` to `255.255.255.255>`
  - Area 0 (or `0.0.0.0`) is not configurable; it is always **normal**.
  - `running-config` stores value in dotted decimal notation.

- `TYPE`  area type. Values include:
  - `<no parameter>`
  - `nssa-only`

**Example**

- This command configures area 3 as a NSSA area.
  ```
  switch(config-router-ospf)#area 3 nssa nssa-only
  switch(config-router-ospf)#
  ```
area nssa default-information-originate (OSPFv2)

The `default area nssa default-information-originate` command sets default route origination for the NSSA, allowing the redistribute policy to advertise a default route if one is present. The resulting OSPF behavior depends on the presence of an installed static default route and on whether static routes are redistributed in OSPF (using the `redistribute (OSPFv2)` command). The `no area nssa default-information-originate` command disables advertisement of the default route for the NSSA regardless of the redistribute policy. See Table 31-1 for details.

Areas are `normal` by default; area type configuration is required only for stub and NSSA areas. Area 0 is always a normal area and cannot be configured through this command.

Default route origination is configured differently for different area types and supports three area types:

- Normal areas: advertisement of the default route is configured for all normal areas using the `default-information originate (OSPFv2)` command.
- Stub areas: the default route is automatically advertised in stub areas and cannot be configured.
- Not So Stubby Areas (NSSAs): advertisement of the default route is configured per area using the `area nssa default-information-originate (OSPFv2)` or `area nssa no-summary (OSPFv2)` command.

Command Mode
Router-OSPF Configuration

Command Syntax

```
area area_id nssa default-information-originate [VALUE] [TYPE] [EXCL]
no area area_id nssa default-information-originate
default area area_id nssa default-information-originate
```

All parameters except `area_id` can be placed in any order.

Parameters

- `area_id`
  - Valid formats: integer `<1` to `<4294967295>` or dotted decimal `<0.0.0.1` to `<255.255.255.255>`
  - Area 0 (or `0.0.0.0`) is not configurable; it is always `normal`.
  - `running-config` stores value in dotted decimal notation.
• **VALUE** Values include:
  • <no parameter> Default value of 1.
  • **metric** <1-65535>

• **TYPE** Values include:
  • <no parameter>
  • **metric-type** <1-2>

• **EXCL** Values include:
  • <no parameter>.
  • **nssa-only**

**Example**

• This command configures area 3 as an NSSA and generates a type 7 default LSA within the NSSA.

  switch(config-router-ospf)#**area 3 nssa default-information-originate nssa-only**
  switch(config-router-ospf)#
area nssa no-summary (OSPFv2)

The **area nssa no-summary** command configures the switch stop importing type-3 summary LSAs into the not-so-stubby area and sets the default summary route into the NSSA in order to reach the inter-area prefixes.

The **no area nssa no-summary** and **default area nssa no-summary** commands allow type-3 summary LSAs into the NSSA area.

The **no area nssa** and **default area nssa** commands configure the specified area as a normal area.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```text
area area_id nssa no-summary
no area area_id nssa no-summary
default area area_id nssa no-summary
```

**Parameters**

- `area_id` area number.
  - Valid formats: integer `<1 to 4294967295>` or dotted decimal `<0.0.0.1 to 255.255.255.255>`
  - Area 0 (or 0.0.0.0) is not configurable; it is always `normal`.
  - `running-config` stores value in dotted decimal notation.

**Example**

- This command directs the device not to import type-3 summary LSAs into the NSSA area.
  ```
  switch(config)# router ospf 6
  switch(config-router-ospf)# area 1.1.1.1 nssa no-summary
  switch(config-router-ospf)#
  ```

- This command directs the device to import type-3 summary LSAs into the NSSA area.
  ```
  switch(config)# router ospf 6
  switch(config-router-ospf)# no area 1.1.1.1 nssa no-summary
  switch(config-router-ospf)#
  ```
area not-so-stubby lsa type-7 convert type-5 (OSPFv2)

The `area not-so-stubby lsa type-7 convert type-5` command configures the switch to always translate Type-7 link-state advertisement (LSAs) to Type-5 LSAs.

The `no area not-so-stubby lsa type-7 convert type-5` and `no area not-so-stubby lsa type-7 convert type-5` commands allow LSAs to be translated dynamically by removing the `no area not-so-stubby lsa type-7 convert type-5` command from `running-config`.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```
area area_id not-so-stubby lsa type-7 convert type-5
no area_id not-so-stubby lsa type-7 convert type-5
default area_id not-so-stubby lsa type-7 convert type-5
```

**Parameters**

- `area_id`  area number.
  - Valid formats: integer `<1` to `<4294967295>` or dotted decimal `<0.0.0.1` to `<255.255.255.255>`
  - Area 0 (or `0.0.0.0`) is not configurable; it is always `normal`.
  - `running-config` stores value in dotted decimal notation.

**Example**

- This command configures the switch to always translate Type-7 link-state advertisement (LSAs) to Type-5 LSAs.

  ```
  switch(config-router-ospf)#area 3 not-so-stubby lsa type-7 convert type-5
  switch(config-router-ospf)#
  ```
area range (OSPFv2)

The area range command configures OSPF area border routers (ABRs) to consolidate or summarize routes, to set the cost setting routes, and to suppress summary route advertisements.

The no area (OSPFv2) command removes all area commands for the specified area from running-config.

Command Mode
Router-OSPF Configuration

Command Syntax
area area_id range net_addr [ADVERTISE_SETTING] [COST_SETTING]
no area area_id range net_addr [ADVERTISE_SETTING] [COST_SETTING]
default area area_id range net_addr [ADVERTISE_SETTING] [COST_SETTING]

Parameters
• area_id  area number. <0 to 4294967295> or <0.0.0.0 to 255.255.255.255>
  running-config stores value in dotted decimal notation.
• net_addr
• ADVERTISE_SETTING  Values include
  • <no parameter>
  • advertise
  • not-advertise
• COST_SETTING  Values include
  • <no parameter>
  • cost range_cost  Value ranges from 1 to 65535.

Examples
• The network area commands assign two subnets to an area. The area range command summarizes the addresses, which the ABR advertises in a single LSA.

  switch(config)#router ospf 6
  switch(config-router-ospf)#network 10.1.25.80 0.0.0.240 area 5
  switch(config-router-ospf)#network 10.1.25.112 0.0.0.240 area 5
  switch(config-router-ospf)#area 5 range 10.1.25.64 0.0.0.192

• The network area command assigns a subnet to an area, followed by an area range command that suppresses the advertisement of that subnet.

  switch(config-router-ospf)#network 10.12.31.0/24 area 5
  switch(config-router-ospf)#area 5 range 10.12.31.0/24 not-advertise
  switch(config-router-ospf)#
area stub (OSPFv2)

The `area stub` command sets the area type of an OSPF area to `stub`. All devices in an AS must specify the same area type for identically numbered areas.

The `no area stub` command remove the specified stub area from the OSPFv2 instance by deleting all `area stub` commands from `running-config` for the specified area.

The `no area stub` command configure the specified area as a normal area.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```
area area_id stub [summarize]
no area area_id stub [summarize]
default area area_id stub [summarize]
```

**Parameters**

- `area_id` area number.
  - Valid formats: integer `<1 to 4294967295>` or dotted decimal `<0.0.0.1 to 255.255.255.255>`
  - Area 0 (or 0.0.0.0) is not configurable; it is always `normal`.
  - `running-config` stores value in dotted decimal notation.
- `SUMMARIZE` area type. Values include:
  - `<no parameter>`
  - `no-summary`

**Examples**

- These commands configure area 45 as a stub area.
  ```
  switch(config)#router ospf 3
  switch(config-router-ospf)#area 45 stub
  switch(config-router-ospf)#
  ```

- This command configures area 10.92.148.17 as a stub area.
  ```
  switch(config-router-ospf)#area 10.92.148.17 stub
  switch(config-router-ospf)#
  ```
**auto-cost reference-bandwidth (OSPFv2)**

The **auto-cost reference-bandwidth** command is a factor in the formula that calculates the default OSPFv2 cost for Ethernet interfaces.

\[
\text{OSPFv2-cost} = \frac{(\text{auto-cost value} \times 1 \text{ Mbps})}{\text{interface bandwidth}}
\]

The switch uses a minimum OSPFv2-cost of one. The switch rounds down all non-integer results.

On a 10G Ethernet interface:
- if auto-cost = 100, then OSPFv2-cost = 100 Mbps / 10 Gbps = 0.01, and the default cost is set to 1.
- if auto-cost = 59000, then OSPFv2-cost = 59000 Mbps / 10 Gbps = 5.9, and the default cost is set to 5.

The **no auto-cost reference-bandwidth** and **default auto-cost reference-bandwidth** command removes the **auto-cost reference-bandwidth** command from *running-config*. When this parameter is not set, the default cost for Ethernet interfaces is the default **ip ospf cost** value of 10.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```
auto-cost reference-bandwidth rate
no auto-cost reference-bandwidth
default auto-cost reference-bandwidth
```

**Parameters**

- **rate** Values range from 1 to 4294967. Default is 100.

**Example**

To configure a default cost of 20 on 10G Ethernet interfaces:

**Step 1** calculate the required auto-cost value:

\[
\text{auto-cost} = \frac{\text{OSPFv2-cost} \times \text{interface bandwidth}}{1 \text{ Mbps}} = \frac{20 \times 10000 \text{ Mbps}}{1 \text{ Mbps}} = 200000
\]

**Step 2** Configure this value as the auto-cost reference-bandwidth.

```
switch(config)#router ospf 6
switch(config-router-ospf)#auto-cost reference-bandwidth 200000
switch(config-router-ospf)#
```
clear ip ospf neighbor

The `clear ip ospf` command clears the neighbors statistics per interface.

**Command Mode**
Privileged EXEC

**Command Syntax**
```
clear ip ospf [PROCESS_ID] neighbor[LOCATION] [VRF_INSTANCE]
```

**Parameters**
- **PROCESS_ID** OSPFv2 process ID. Values include:
  - <no parameter>
  - `<1 to 65535>`
- **LOCATION** IP address or interface peer group name. Values include:
  - `*` clears all OSPF IPv4 neighbors.
  - `ipv4_addr`
  - `ethernet e_num`
  - `loopback l_num`
  - `port-channel p_num`
  - `vlan v_num`
- **VRF_INSTANCE** specifies the VRF instance.
  - `vrf vrf_name` configures the vrf_name instance.

**Examples**
- This command resets all OSPF neighbor statistics.
  ```
  switch#clear ip ospf neighbor *
  switch#
  ```
- This command resets the OSPF neighbor statistics for the specified Ethernet 3 interface.
  ```
  switch#clear ip ospf neighbor ethernet 3
  switch##
  ```
compatible (OSPFv2)

The `compatible` command allows the selective disabling of compatibility with RFC 2328. The `no compatible` and `default compatible` commands reverts OSPF to RFC 2328 compatible and removes the `compatible` statement from `running-config`.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```plaintext
compatible rfc1583
no compatible rfc1583
default compatible rfc1583
```

**Example**

- This command sets the OSPF compatibility list with RFC 1583.
  
  switch(config)#router ospf 6
  switch(config-router-ospf)#compatible rfc1583
  switch(config-router-ospf)#

- This command disables RFC 1583 compatibility.
  
  switch(config)#router ospf 6
  switch(config-router-ospf)# no compatible rfc1583
  switch(config-router-ospf)#
default-information originate (OSPFv2)

The `default-information originate` command enables default route origination for normal areas. The user may configure the metric value and metric type used in LSAs. The `always` option will cause the ASBR to create and advertise a default route whether or not one is configured.

The `no default-information originate` command prevents the advertisement of the default route. The `default default-information originate` command enables default route origination with default values (metric type 2, metric=1).

**Command Mode**
Router-OSPF Configuration

**Command Syntax**

```
default-information originate [FORCE][VALUE][TYPE][MAP]
no default-information originate
default default-information originate
```

All parameters can be placed in any order.

**Parameters**

- **FORCE** advertisement forcing option. Values include:
  - `<no parameter>`
  - `always`

- **VALUE** Values include:
  - `<no parameter>`
  - `metric <1-65535>`

- **TYPE** Values include:
  - `<no parameter>`
  - `metric-type <1-2>`

- **MAP** sets attributes in the LSA based on a route map. Values include:
  - `<no parameter>`
  - `route-map map_name`.

**Examples**

- These commands will always advertise the OSPFv2 default route regardless of whether the switch has a default route configured.
  ```
  switch(config)#router ospf 1
  switch((config-router-ospf)#default-information originate always
  switch(config-router-ospf)#show active
  router ospf 1
  default-information originate always
  ```

- These commands advertise a default route with a metric of 100 and an external metric type of 1 if a default route is configured.
  ```
  switch(config)#router ospf 1
  switch((config-router-ospf)#default-information originate metric 100 metric-type 1
  ```
distance ospf (OSPFv2)

The `distance ospf intra-area` command specifies the administrative distance for routes in a single OSPFv2 area. The default administrative distance for intra-area, inter-area and external routes is 110.

The `no distance ospf intra-area` and `default distance ospf intra-area` commands remove the `distance ospf intra-area` command from `running-config`, returning the OSPFv2 administrative distance settings to the default value of 110.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```
distance ospf AREA_TYPE distance
no distance ospf AREA_TYPE
default distance ospf AREA_TYPE
```

**Parameters**

- **AREA_TYPE** specifies routes for which administrative distance is to be set. Values include:
  - external
  - inter-area
  - intra-area
- **distance** Values range from 1 to 255. Default value is 110 for all types.

**Example**

- This command configures a distance of 85 for all OSPFv2 intra-area routes on the switch.

```
switch(config)#router ospf 6
switch(config-router-ospf)#distance ospf intra-area 85
switch(config-router-ospf)#
```
**distribute-list in**

A distribute list uses a route map or prefix list to filter specific routes from incoming OSPF LSAs. Filtering occurs after SPF calculation. The filtered routes are not installed on the switch, but are still included in LSAs sent by the switch. The `distribute-list in` command creates a distribute list in the configuration mode OSPF instance.

If a prefix list is used, destination prefixes that do not match the prefix list will not be installed. If a route map is used, routes may be filtered based on address, next hop, or metric. OSPF external routes may also be filtered by metric type or tag.

The `no distribute-list in` and `default distribute-list in` commands remove the `distribute-list in` command from `running-config`.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```
distribute-list {prefix-list|route-map} list_name in
no distribute-list {prefix-list|route-map}
default distribute-list {prefix-list|route-map}
```

**Parameters**

- `prefix-list` specifies a prefix-list as the filter.
- `route-map` specifies a route-map as the filter.
- `list_name` the name of the prefix-list or route-map used to filter routes from incoming LSAs.

**Related Commands**

- `area filter (OSPFv2)`
- `redistribute (OSPFv2)`

**Example**

- These commands configure a prefix list named "dist_list1" in OSPF instance 5 to filter certain routes from incoming OSPF LSAs.

```
switch(config)#router ospf 5
switch(config-router-ospf)#distribute-list prefix-list dist_list1 in
switch(config-router-ospf)#
```
**ip ospf area**

The `ip ospf area` command enables OSPFv2 on an interface and associates the area to the interface.

The `no ip ospf area` and `default ip ospf area` commands disable OSPFv2 on the configuration mode interface and remove the configured area from the system.

**Note**

The per interface configuration has precedence over the OSPF Configuration mode. In other words, the area configured by the `ip ospf area` command has precedence over the area configured by the `network area` command.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ip ospf area area_id
no ip ospf [area area_id]
default ip ospf [area area_id]
```

**Parameters**

- `area_id` the area ID. The valid values are 0 to 4294967295 or a decimal range between 0.0.0.0 and 255.255.255.255.

**Example**

- These commands enable OSPFv2 on the “et2” interface and associates area identifier 1.1.1.1 to the interface.

  ```
  switch(config)#Interface ethernet 2
  switch(config-if-Et2)# ip address 1.0.0.1/24
  switch(config-if-Et2)# ip ospf area 1.1.1.1
  router ospf 1
  ```
ip ospf authentication

The `ip ospf authentication` command enables OSPFv2 authentication for the configuration mode interface.

The `no ip ospf authentication` and `default ip ospf authentication` commands disable OSPFv2 authentication on the configuration mode interface by removing the corresponding `ip ospf authentication` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `ip ospf authentication [METHOD]
- no ip ospf authentication
- default ip ospf authentication`

**Parameters**
- `METHOD` OSPFv2 authentication method. Options include:
  - `<no parameter>`
  - `message-digest`

**Examples**
- This command enables simple authentication on VLAN 12.
  ```
  switch(config)#interface vlan 12
  switch(config-if-vl12)#ip ospf authentication
  switch(config-if-vl12)#
  ```
- This command enables message-digest authentication on VLAN 12.
  ```
  switch(config-if-vl12)#ip ospf authentication message-digest
  switch(config-if-vl12)#
  ```
**ip ospf authentication-key**

The `ip ospf authentication-key` command configures the OSPFv2 authentication password for the configuration mode interface.

The **no ip ospf authentication-key** and **default ip ospf authentication-key** commands removes the OSPFv2 authentication password from the configuration mode interface by removing the corresponding `ip ospf authentication-key` command from **running-config**.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
```
ip ospf authentication-key [ENCRYPT_TYPE] key_text  
nop ip ospf authentication-key  
default ip ospf authentication-key
```

**Parameters**
- **ENCRYPT_TYPE** encryption level of the `key_text` parameter. Values include:
  - `<no parameter>` the `key_text` is in clear text.
  - `0` `key_text` is in clear text. Equivalent to `<no parameter>`.
  - `7` `key_text` is MD5 encrypted.
- `key_text` the authentication-key password.

**Example**
- This command specifies a password in clear text.
  ```
  switch(config)#interface vlan 12  
  switch(config-if-Vl12)#ip ospf authentication-key 0 code123  
  switch(config-if-Vl12)#show active  
  interface Vlan12  
    ip ospf authentication-key 7 baYllFzVbcx4yHq1IhmMdw==  
  switch(config-if-Vl12)#
  ```

**Running-config** stores the password as an encrypted string.
**ip ospf cost**

The `ip ospf cost` command configures the OSPFv2 cost for the configuration mode interface. The default cost depends on the interface type:

- Ethernet: determined by the `auto-cost reference-bandwidth (OSPFv2)` command.
- Port channel: 10.
- VLAN: 10.

The `no ip ospf cost` and `default ip ospf cost` commands restore the default OSPFv2 cost for the configuration mode interface by removing the corresponding `ip ospf cost` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ip ospf cost interface_cost
no ip ospf cost
default ip ospf cost
```

**Parameters**
- `interface_cost` Value ranges from 1 to 65535; default is 10.

**Examples**

- This command configures a cost of 15 for VLAN 2.

```
switch(config)#interface vlan 2
switch(config-if-Vl2)#ip ospf cost 15
switch(config-if-Vl2)#
```
**ip ospf dead-interval**

The `ip ospf dead-interval` command configures the dead interval for the configuration mode interface.

The `no ip ospf dead-interval` and `default ip ospf dead-interval` commands restore the default dead interval of 40 seconds on the configuration mode interface by removing the corresponding `ip ospf dead-interval` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ip ospf dead-interval time
no ip ospf dead-interval
default ip ospf dead-interval
```

**Parameters**

- `time` Value ranges from 1 to 8192; default is 40.

**Example**

- This command configures a dead interval of 120 seconds for VLAN 4.

```
switch(config)#interface vlan 4
switch(config-if-Vl4)#ip ospf dead-interval 120
switch(config-if-Vl4)##
```
**ip ospf disabled**

The `ip ospf disabled` command disables OSPFv2 on the configuration mode interface without disrupting the OSPFv2 configuration. When OSPFv2 is enabled on the switch, it is also enabled by default on all interfaces.

The OSPFv2 instance is disabled on the entire switch with the `shutdown (OSPFv2)` command.

The `no ip ospf disabled` and `default ip ospf disabled` commands enable OSPFv2 on the configuration mode interface by removing the corresponding `ip ospf disabled` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `ip ospf disabled`
- `no ip ospf disabled`
- `default ip ospf disabled`

**Examples**
- This command shuts down OSPFv2 activity on VLAN 5.
  ```
  switch(config)#interface vlan 5
  switch(config-if-Vl5)#ip ospf disabled
  switch(config-if-Vl5)#
  ```
- This command resumes OSPFv2 activity on VLAN 5.
  ```
  switch(config-if-Vl5)#no ip ospf disabled
  switch(config-if-Vl5)#
  ```
**ip ospf hello-interval**

The *ip ospf hello-interval* command configures the OSPFv2 hello interval for the configuration mode interface.

The same hello interval should be specified for each OSPFv2 neighbor, and should not be longer than any neighbor’s dead interval.

The *no ip ospf hello-interval* and *default ip ospf hello-interval* commands restore the default hello interval of 10 seconds on the configuration mode interface by removing the *ip ospf hello-interval* command from *running-config*.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `ip ospf hello-interval time`
- `no ip ospf hello-interval`
- `default ip ospf hello-interval`

**Parameters**
- *time* hello interval (seconds). Values range from 1 to 8192; default is 10.

**Example**
- This command configures a hello interval of 30 seconds for VLAN 2.

```
switch(config)#interface vlan 2
switch(config-if-Vl2)#ip ospf hello-interval 30
switch(config-if-Vl2)#
```
ip ospf message-digest-key

The `ip ospf message-digest-key` command configures a message digest authentication key for the configuration mode interface.

The `no ip ospf message-digest-key` and `default ip ospf message-digest-key` commands remove the message digest authentication key for the specified key ID on the configuration mode interface by deleting the corresponding `ip ospf message-digest-key` command from running-config.

Command Mode

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

Command Syntax

```
ip ospf message-digest-key key_id md5 ENCRIPT_TYPE key_text
no ip ospf message-digest-key key_id
default ip ospf message-digest-key key_id
```

Parameters

- `key_id`: key ID number. Value ranges from 1 to 255.
- `ENCRIPT_TYPE`: encryption level of the `key_text` parameters. Values include:
  - `<no parameter>`
  - `0` `key_text`
  - `7` `key_text`
- `key_text`: message key (password).

Example

- This command configures `code123` as the MD5 key with a corresponding key ID of 23.

  ```
  switch(config)#interface vlan 12
  switch(config-if-vl12)#ip ospf message-digest-key 23 md5 0 code123
  switch(config-if-vl12)#
  ```

  Running-config stores the password as an encrypted string.
ip ospf router-id output-format hostnames

The `ip ospf router-id output-format hostnames` command causes the switch to display DNS names in place of numeric OSPFv2 router IDs in all OSPFv2 show commands, including:

- `show ip ospf`
- `show ip ospf border-routers`
- `show ip ospf database <link-state list>`
- `show ip ospf database database-summary`
- `show ip ospf database <link-state details>`
- `show ip ospf interface`
- `show ip ospf neighbor`
- `show ip ospf request queue`
- `show ip ospf retransmission queue`

The `no ip ospf router-id output-format hostnames` and `default ip ospf router-id output-format hostnames` commands remove the `ip ospf router-id output-format hostnames` command from `running-config`, restoring the default behavior of displaying OSPFv2 router IDs by their numeric value.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip ospf router-id output-format hostnames
no ip ospf router-id output-format hostnames
default ip ospf router-id output-format hostnames
```

**Example**

- This command programs the switch to display OSPFv2 router IDs by the corresponding DNS name in subsequent show commands.

  ```
  switch(config)#ip ospf router-id output-format hostnames
  switch(config)#
  ```
ip ospf network point-to-point

The `ip ospf network point-to-point` command sets the configuration mode interface as a point-to-point link. By default, interfaces are configured as broadcast links.

The `no ip ospf network` and `default ip ospf network` commands set the configuration mode interface as a broadcast link by removing the corresponding `ip ospf network` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

- `ip ospf network point-to-point`
- `no ip ospf network`
- `default ip ospf network`

**Examples**

- These commands configure Ethernet interface 10 as a point-to-point link.

```
switch(config)#interface ethernet 10
switch(config-if-Et10)#ip ospf network point-to-point
switch(config-if-Et10)#
```

- This command restores Ethernet interface 10 as a broadcast link.

```
switch(config-if-Et10)#no ip ospf network
switch(config-if-Et10)#
```
ip ospf priority

The **ip ospf priority** command configures OSPFv2 router priority for the configuration mode interface.

The **no ip ospf priority** and **default ip ospf priority** commands restore the default priority (1) on the configuration mode interface by removing the corresponding **ip ospf priority** command from *running-config*.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `ip ospf priority priority_level`
- `no ip ospf priority`
- `default ip ospf priority`

**Parameters**
- **priority_level** priority level. Value ranges from 0 to 255. Default value is 1.

**Examples**
- This command configures a router priority of 15 for VLAN 8.
  ```
  switch(config)#interface vlan 8
  switch(config-if-VI8)#ip ospf priority 15
  switch(config-if-VI8)#
  ```
- This command restores the router priority of 1 for VLAN 7.
  ```
  switch(config)#interface vlan 7
  switch(config-if-VI7)#no ip ospf priority
  switch(config-if-VI7)#
  ```
ip ospf retransmit-interval

The `ip ospf retransmit-interval` command configures the link state advertisement retransmission interval for the interface.

The `no ip ospf retransmit-interval` and `default ip ospf retransmit-interval` commands restore the default retransmission interval of 5 seconds on the configuration mode interface by removing the corresponding `ip ospf retransmit-interval` command from `running-config`.

Command Mode
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

Command Syntax
- `ip ospf retransmit-interval period`
- `no ip ospf retransmit-interval`
- `default ip ospf retransmit-interval`

Parameters
- `period` retransmission interval (seconds). Value ranges from 1 to 8192; default is 5.

Example
- This command configures a retransmission interval of 15 seconds for VLAN 3.
  `switch(config)#interface vlan 3`
  `switch(config-if-Vl3)#ip ospf retransmit-interval 15`
  `switch(config-if-Vl3)#`
ip ospf transmit-delay

The `ip ospf transmit-delay` command configures the transmission delay for OSPFv2 packets over the configuration mode interface.

The `no ip ospf transmit-delay` and `default ip ospf transmit-delay` commands restore the default transmission delay (one second) on the configuration mode interface by removing the corresponding `ip ospf transmit-delay` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `ip ospf transmit-delay trans`
- `no ip ospf transmit-delay`
- `default ip ospf transmit-delay`

**Parameters**
- `trans` LSA transmission delay (seconds). Value ranges from 1 to 8192; default is 1.

**Example**
- This command configures a transmission delay of 5 seconds for VLAN 6.
  ```
  switch(config)#interface vlan 6
  switch(config-if-Vl6)#ip ospf transmit-delay 5
  switch(config-if-Vl6)#
  ```
log-adjacency-changes (OSPFv2)

The log-adjacency-changes command enables syslog messages to be sent when it detects OSPFv2 link state changes or when it detects that a neighbor has gone up or down. Log message sending is enabled by default.

The default log-adjacency-changes command restores the default state by removing the log-adjacency-changes statement from running-config.

The default option (sending a message only when a neighbor goes up or down) is active when running-config does not contain any form of the command. Entering the command in any form replaces the previous command state in running-config.

The no log-adjacency-changes disables link state change syslog reporting.

The default log-adjacency-changes detail or no log-adjacency-changes statement from running-config.

Command Mode
Router-OSPF Configuration

Command Syntax
- log-adjacency-changes
- log-adjacency-changes detail
- no log-adjacency-changes
- default log-adjacency-changes

Examples
- This command configures the switch to send a syslog message when a neighbor goes up or down.
  ```
  switch(config)#router ospf 6
  switch(config-router-ospf)#log-adjacency-changes
  switch(config-router-ospf)#
  ```
  After entering the command, show active does not display a log-adjacency-changes statement.

  ```
  switch(config-router-ospf)#show active
  router ospf 1
  switch(config-router-ospf)#
  ```

- This command configures the switch to send a syslog message when it detects any link state change.

  ```
  switch(config-router-ospf)#log-adjacency-changes detail
  switch(config-router-ospf)#
  ```
  After entering the command, show active displays a log-adjacency-changes detail command.

  ```
  switch(config-router-ospf)#show active
  router ospf 1
    log-adjacency-changes detail
  switch(config-router-ospf)#
  ```
max-lsa (OSPFv2)

The `max-lsa` command specifies the number of LSAs allowed in the LSDB. Setting the limit to zero removes the LSDB restriction and disables LSA overload actions. Actions triggered by LSDB overload conditions include:

- Warning
- Temporary shutdown
- Permanent shutdown

The `no max-lsa` and `default max-lsa` commands restore all LSA overload parameters to their default settings by placing the `max-lsa 12000` statement in `running-config`.

Command Mode
Router-OSPF Configuration

Command Syntax
```
max-lsa  lsa_num [WARNING] [IGNORE_TIME] [IGNORE_COUNT] [RESET]
no max-lsa
default max-lsa
```

Parameters

- **lsa_num** maximum number of LSAs. Value ranges from 0 to 100,000.
  - 0 disables overload protection
  - 1 to 100000 Default value is 12,000.
- **WARNING** warning threshold, as a percentage of the maximum number of LSAs (% of lsa_num).
  - <no parameter> Default of 75%.
  - percent Ranges from 25 to 99.
- **IGNORE_TIME** temporary shutdown period (minutes). Options include:
  - <no parameter> Default value of 5 minutes.
  - ignore-time period Value ranges from 1 to 60.
- **IGNORE_COUNT** number of temporary shutdowns required to trigger a permanent shutdown.
  - <no parameter> Default value of 5.
  - ignore-count episodes Ranges from 1 to 20.
- **RESET** period of not exceeding LSA limit required to reset temporary shutdown counter to zero.
  - <no parameter> Default value of 5 minutes
  - reset-time r_period Ranges from 1 to 60.

Example

- This command defines an LSA limit of 8,000 and other parameters.
```
switch(config-router-ospf)#max-lsa 8000 40 ignore-time 6 ignore-count 3
reset-time 20
```
max-metric router-lsa (OSPFv2)

The **max-metric router-lsa** command configures OSPF to include the maximum value in LSA metric fields to keep other network devices from using the switch as a preferred intermediate SPF hop.

The **no max-metric router-lsa** and **default max-metric router-lsa** commands disable the advertisement of a maximum metric.

**Command Mode**
- Router-OSPF Configuration

**Command Syntax**
```plaintext
max-metric router-lsa [EXTERNAL][STUB][STARTUP][SUMMARY]
no max-metric router-lsa [EXTERNAL][STUB][STARTUP][SUMMARY]
default max-metric router-lsa [EXTERNAL][STUB][STARTUP][SUMMARY]
```

All parameters can be placed in any order.

**Parameters**
- **EXTERNAL** advertised metric value. Values include:
  - <no parameter> Default value of 1.
  - external-lsa
  - external-lsa <1 to 16777215> Default value is **0xFF0000**.
- **STUB** advertised metric type. Values include:
  - <no parameter> Default value of 2.
  - include-stub
- **STARTUP** limit scope of LSAs. Values include:
  - <no parameter>
  - on-startup
  - on-startup wait-for-bgp
  - on-startup <5 to 86400>
    - **wait-for-bgp** or an **on-start** time value is not included in **no** and **default** commands.
- **SUMMARY** advertised metric value. Values include:
  - <no parameter>
  - summary-lsa
  - summary-lsa <1 to 16777215>

**Example**
- This command configures OSPF to to include the maximum value in LSA metric fields until BGP has converged:
  ```plaintext
  switch(config-router-ospf)#max-metric router-lsa on-startup wait-for-bgp
  switch(config-router-ospf)#
  ```
**maximum-paths (OSPFv2)**

The `maximum-paths` command controls the number of parallel routes that OSPFv2 supports. The default maximum is 16 paths.

The `no maximum-paths` and `default maximum-paths` commands restore the maximum number of parallel routes that OSPFv2 supports on the switch to the default value of 16 by placing the `maximum-paths 16` statement in `running-config`.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```plaintext
maximum-paths paths
no maximum-paths
default maximum-paths
```

**Parameters**

- `paths`: maximum number of parallel routes.
  
  Value ranges from 1 to the number of interfaces available per ECMP group, which is platform dependent.
  
  - Arad: Value ranges from 1 to 128. Default value is 128.
  - FM6000: Value ranges from 1 to 32. Default value is 32.
  - PetraA: Value ranges from 1 to 16. Default value is 16.
  - Trident: Value ranges from 1 to 32. Default value is 32.
  - Trident-II: Value ranges from 1 to 128. Default value is 128.

**Example**

- This command configures the maximum number of OSPFv2 parallel paths to 12.

  ```plaintext
  switch(config)#router ospf 6
  switch(config-router-ospf)#maximum-paths 12
  switch(config-router-ospf)#
  ```
network area (OSPFv2)

The **network area** command assigns the specified IPv4 subnet to an OSPFv2 area.

The **no network area** and **default network area** commands delete the specified network area assignment by removing the corresponding **network area** command from **running-config**.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```
network ipv4_subnet area area_id
no network ipv4_subnet area area_id
default network ipv4_subnet area area_id
```

**Parameters**

- **ipv4_subnet** IPv4 subnet. Entry formats include address-prefix (CIDR) or address-wildcard mask.
  
  **running-config** stores value in CIDR notation.

- **area_id** area number. `<0 to 4294967295>` or `<0.0.0.0 to 255.255.255.255>`

  **Running-config** stores value in dotted decimal notation.

**Example**

- These equivalent commands each assign the subnet 10.1.0.0/24 to area 0.

  ```
  switch(config-router-ospf)#network 10.1.0.0 0.0.0.255 area 0
  switch(config-router-ospf)#
  ```

  ```
  switch(config-router-ospf)#network 10.1.0.0/24 area 0
  switch(config-router-ospf)#
  ```
no area (OSPFv2)

The no area <type> command removes the corresponding area <type> command from running-config:

- `no/default area not-so-stubby lsa type-7 convert type-5` commands remove the translate type7 always parameter without changing the area type.
- `no/default area nssa , no/default area stub, and no/default area stub no-summary` commands restore the area’s type to normal. Section 31.5: OSPFv2 Commands
- `no/default area default-information-originate` command removes all area commands for the specified area from running-config
- `no/default area` command removes all area commands for the specified area from running-config.

Command Mode
Router-OSPF Configuration

Command Syntax

```
no area area_id [TYPE]
default area area_id [TYPE]
```

Parameters

- `area_id` area number.
  - Valid formats: integer <1 to 4294967295> or dotted decimal <0.0.0.1 to 255.255.255.255>
  - Area 0 (or 0.0.0.0) is not configurable; it is always normal.
  - `Running-config` stores value in dotted decimal notation.
- `TYPE` area type. Values include:
  - nssa
  - nssa translate type7 always
  - stub
  - stub no-summary

Examples

- These commands remove area 1 from the running configuration.
  ```
  switch(config)#router ospf 6
  switch(config-router-ospf)# no area 1
  switch(config-router-ospf)#
  ```
- These commands remove area 10.92.148.17 as an NSSA.
  ```
  switch(config-router-ospf)#no area 10.92.148.17 nssa
  switch(config-router-ospf)#
  ```
passive-interface default (OSPFv2)

The **passive-interface default** command configures all interfaces as OSPFv2 passive by default. The switch advertises the passive interface as part of the router LSA.

The **passive-interface <interface> (OSPFv2)** configures the OSPFv2 active-passive status for a specific interface:

- When **passive-interface default** is not set, all interfaces are OSPFv2 active by default and passive interfaces are denoted by **passive-interface <interface>** statements in **running-config**.
- When **passive-interface default** is set, all interfaces are OSPFv2 passive by default and active interfaces are denoted by **no passive-interface <interface>** statements in **running-config**.

The **no passive-interface** and **default passive-interface** commands configures all interfaces as OSPFv2 active by default by removing the **passive-interface default** statement from **running-config**.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```
passive-interface default
no passive-interface default
default passive-interface default
```

**Examples**

- This command configures the default interface setting as OSPFv2 passive. This command also removes all **passive-interface <interface>** statements from **running-config**.

  ```
  switch(config)#router ospf 6
  switch(config-router-ospf)#passive-interface default
  switch(config-router-ospf)#
  ```

- This command configures the default interface setting as OSPFv2 active. This command also removes all **no passive-interface <interface>** statements from **running-config**.

  ```
  switch(config-router-ospf)#no passive-interface default
  switch(config-router-ospf)#
  ```
passive-interface <interface> (OSPFv2)

The `passive-interface` command disables OSPFv2 on an interface range. The switch advertises the passive interface as part of the LSA.

The default OSPFv2 interface activity is configured by the `passive-interface default (OSPFv2)` command:

- When `passive-interface default` is not set, all interfaces are OSPFv2 active by default and passive interfaces are denoted by `passive-interface <interface>` statements in `running-config`.
- When `passive-interface default` is set, all interfaces are OSPFv2 passive by default and active interfaces are denoted by `no passive-interface <interface>` statements in `running-config`.

The `no passive-interface` command enables OSPFv2 on the specified interface range. The `default passive-interface` command sets the interface to the default interface activity setting by removing the corresponding `passive-interface` or `no passive-interface` statement from `running-config`.

Command Mode
Router-OSPF Configuration

Command Syntax

```
passive-interface INTERFACE_NAME
no passive-interface INTERFACE_NAME
default passive-interface INTERFACE_NAME
```

Parameters

- `INTERFACE_NAME`: interface to be configured. Options include:
  - `ethernet e_range`
  - `port-channel p_range`
  - `vlan v_range`
  - `vxlan vx_range`

Examples

- These commands configure Ethernet interfaces 2 through 5 as passive interfaces.
  ```
  switch(config)#router ospf 6
  switch(config-router-ospf)#passive-interface ethernet 2-5
  switch(config-router-ospf)#
  ```
- This command configures VLAN interfaces 50-54, 61, 68, and 102-120 as passive interfaces.
  ```
  switch(config-router-ospf)#passive-interface vlan 50-54,61,68,102-120
  switch(config-router-ospf)#
  ```
- This command configures VLAN 2 as an active interface.
  ```
  switch(config-router-ospf)#no passive-interface vlan 2
  switch(config-router-ospf)#
  ```
point-to-point routes (OSPFv2)

The point-to-point routes command enables the switch to maintain a local routing information base (RIB) to store information it learns from its neighbors.

The **point-to-point routes** and **default point-to-point routes** commands program the switch to include point-to-point links in its RIB by removing the **no point-to-point routes** command from **running-config**.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

- **point-to-point routes**
- **no point-to-point routes**
- **default point-to-point routes**

**Examples**

- This command configures the switch to optimize the local RIB by not including point-to-point routes.
  
  switch(config)#router ospf 6
  switch(config-router-ospf)#no point-to-point routes
  switch(config-router-ospf)#

- This command configures the switch to include point-to-point routes.
  
  switch(config-router-ospf)#point-to-point routes
  switch(config-router-ospf)#
**redistribute (OSPFv2)**

The `redistribute` command enables the advertising of all specified routes on the switch into the OSPFv2 domain as external routes.

The `no redistribute` and `default redistribute` commands remove the corresponding `redistribute` command from `running-config`, disabling route redistribution for the specified route type.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```
redistribute ROUTE_TYPE [ROUTE_MAP]
no redistribute ROUTE_TYPE
default redistribute ROUTE_TYPE
```

**Parameters**

- **ROUTE_TYPE**  
  source from which routes are redistributed. Options include:
  - **connected**  
    routes that are established when IPv4 is enabled on an interface.
  - **BGP**  
    routes from a BGP domain.
  - **RIP**  
    routes from a RIP domain.
  - **static**  
    IP static routes.

- **ROUTE_MAP**  
  route map that determines the routes that are redistributed. Options include:
  - <no parameter >
  - `route-map map_name`

**Examples**

- The `redistribute static` command starts the advertising of static routes as OSPFv2 external routes.

  ```
  switch(config)#router ospf 6
  switch(config-router-ospf)#redistribute static
  switch(config-router-ospf)#
  ```

- The `no redistribute bgp` command stops the advertising of BGP routes as OSPFv2 external routes.

  ```
  switch(config-router-ospf)#no redistribute bgp
  switch(config-router-ospf)#
  ```
**router-id (OSPFv2)**

The `router-id` command assigns a router ID for an OSPFv2 instance. This number uniquely identifies the router within an Autonomous System. Status commands use the router ID to identify the switch.

The switch sets the router ID to the first available alternative in the following list:

1. The `router-id` command.
2. The loopback IP address, if a loopback interface is configured on the switch.
3. The highest IP address present on the router.

**Important!** When configuring VXLAN on an MLAG, always manually configure the OSPFv2 router ID to prevent the switch from using the common VTEP IP address as the router ID.

The `no router-id` and `default router-id` commands remove the router ID command from `running-config`; the switch uses the loopback or highest address as the router ID.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```
router-id identifier
no router-id [identifier]
default router-id [identifier]
```

**Parameters**

- `identifier` Value ranges from 0.0.0.0 to 255.255.255.255.

**Example**

- This command assigns 10.5.4.2 as the router ID for the OSPFv2 instance.

```
switch(config)#router ospf 6
switch(config-router-ospf)#router-id 10.5.4.2
switch(config-router-ospf)#
```
router ospf

The router ospf command places the switch in router-ospf configuration mode. The switch will create a process ID for the new instance if one does not already exist. The exit command returns the switch to global configuration mode.

The show ip ospf command displays the process ID of the OSPFv2 instances configured on the switch.

The no router ospf and default router ospf commands delete the specified OSPFv2 instance.

Router-ospf configuration mode is not a group change mode; running-config is changed immediately upon entering commands. Exiting router-ospf configuration mode does not affect running-config. The exit command returns the switch to global configuration mode.

Refer to Router-OSPFv2 Configuration Mode (page 2066) for a list of commands available in router-ospf configuration mode.

Command Mode
Global Configuration

Command Syntax

```
router ospf process_id [VRF_INSTANCE]
no router ospf process_id [VRF_INSTANCE]
default router ospf process_id [VRF_INSTANCE]
```

Parameters

- **process_id** OSPFv2 process ID. Values range from 1 to 65535.
- **VRF_INSTANCE**
  - <no parameter> configures the default VRF instance.
  - `vrf vrf_name` configures the `vrf_name` instance.

Examples

- This command creates an OSPFv2 instance with process ID 145 in the main VRF.
  
  ```
  switch(config)#router ospf 145
  switch(config-router-ospf)#
  ```

- This command deletes the specified OSPFv2 instance.
  
  ```
  switch(config)#no router ospf 145
  switch(config)#
  ```
show ip ospf

The `show ip ospf` command displays OSPFv2 routing information

**Command Mode**
EXEC

**Command Syntax**
```
show ip ospf [PROCESS_ID] [VRF_INSTANCE]
```

**Parameters**
- **PROCESS_ID** OSPFv2 process ID. Values include:
  - <no parameter>
  - <1 to 65535>
- **VRF_INSTANCE** specifies the VRF instance.
  - <no parameter> configures the default VRF instance.
  - `vrf vrf_name` configures the vrf_name instance.
Example

- This command displays configuration parameters, operational statistics, status of the OSPFv2 instance, and a brief description of the areas on the switch.

```
switch>show ip ospf
Routing Process "ospf 1" with ID 10.168.103.1 VRF default
  Supports opaque LSA
  Maximum number of LSA allowed 12000
  Threshold for warning message 75%
  Ignore-time 5 minutes, reset-time 5 minutes
  Ignore-count allowed 5, current 0
  It is an area border router
  Hold time between two consecutive SPF's 5000 msecs
  SPF algorithm last executed 00:00:09 ago
  Minimum LSA interval 5 secs
  Minimum LSA arrival 1000 msecs
  Number of external LSA 0. Checksum Sum 0x000000
  Number of opaque AS LSA 0. Checksum Sum 0x000000
  Number of LSA 27.
  Number of areas in this router is 3. 3 normal 0 stub 0 nssa
  Area BACKBONE(0.0.0.0)
    Number of interfaces in this area is 2
    It is a normal area
    Area has no authentication
    SPF algorithm executed 153 times
    Number of LSA 8. Checksum Sum 0x03e13a
    Number of opaque link LSA 0. Checksum Sum 0x000000
  Area 0.0.0.2
    Number of interfaces in this area is 1
    It is a normal area
    Area has no authentication
    SPF algorithm executed 153 times
    Number of LSA 11. Checksum Sum 0x054e57
    Number of opaque link LSA 0. Checksum Sum 0x000000
  Area 0.0.0.3
    Number of interfaces in this area is 1
    It is a normal area
    Area has no authentication
    SPF algorithm executed 5 times
    Number of LSA 6. Checksum Sum 0x02a401
    Number of opaque link LSA 0. Checksum Sum 0x000000
```
show ip ospf border-routers

The `show ip ospf border-routers` command displays the internal OSPFv2 routing table entries to area border routers (ABRs) and autonomous system boundary routers (ASBRs) for each of the OSPFv2 areas.

**Command Mode**

EXEC

**Command Syntax**

```
show ip ospf border-routers [VRF_INSTANCE]
```

**Parameters**

- `VRF_INSTANCE` specifies the VRF instance.
- `<no parameter>` displays information from all VRFs, or from context-active VRF if set.
- `vrf vrf_name` displays information from the specified VRF.

**Example**

- This command displays the ABRs and ASBRs

  ```
  switch>show ip ospf border-routers
  OSPF Process 10.17.0.42, VRF default
  
  Router ID       Area            Type
  10.17.0.1      0.0.0.0         ASBR
  switch>
  ```
**show ip ospf database database-summary**

The show ip ospf database database-summary command displays the number of link state advertisements in the OSPFv2 database.

**Command Mode**

EXEC

**Command Syntax**

```
show ip ospf [AREA] database database-summary [VRF_INSTANCE]
```

**Parameters**

- **VRF_INSTANCE** specifies the VRF instance.
  - <no parameter> displays information from all VRFs, or from context-active VRF if set.
  - vrf vrf_name displays information from the specified VRF.
- **AREA** areas for which command displays data. Specifying an individual area requires entering the process ID where the area is located. Options include:
  - <no parameter>
  - process_id
  - process_id area_id
    - process_id input range: <1 to 65535>
    - area_id input range: <0 to 4294967295> or <0.0.0.0 to 255.255.255.255>

**Example**

- This command displays the LSDB content summary for area 0.

```
switch>show ip ospf 1 0 database database-summary

LSA Type      Count
Router        18
Network       21
Summary Net   59
Summary ASBR  4
Type-7 Ext    0
Opaque Area   0
Type-5 Ext    4238
Opaque AS     0
Total         4340
```

switch>
show ip ospf database <link state list>

The `show ip ospf database <link state list>` command displays the OSPFv2 link state advertisements that originate on a specified switch.

**Command Mode**

EXEC

**Command Syntax**

```
show ip ospf [AREA] database [ROUTER] [VRF_INSTANCE]
```

**Parameters**

- **AREA** areas for which command displays data. Specifying an individual area requires entering the process ID where the area is located. Options include:
  - `<no parameter>`
  - `process_id`
  - `process_id area_id`
  - `process_id` value ranges from 1 to 65535.
  - `area_id` is entered in decimal or dotted decimal notation.

- **ROUTER** router or switch for which the command provides data. Options include:
  - `<no parameter>`
  - `adv-router [a.b.c.d]`
  - `self-originate`

- **VRF_INSTANCE** specifies the VRF instance.
  - `<no parameter>` displays information from all VRFs, or from context-active VRF if set.
  - `vrf vrf_name` displays information from the specified VRF.

**Example**

This command displays OSPFv2 LSAs that originate at the router with a router ID of 10.26.0.31.

```
switch> show ip ospf database adv-router 10.26.0.31
```

```
OSPF Router with ID(10.26.0.23) (Process ID 1) (VRF default)

10.26.0.31    10.26.0.31    918   0x80002b4a   0x1315   3

switch>
```
show ip ospf database <link-state details>

The `show ip ospf database <link-state details>` command displays details of the specified link state advertisements.

**Command Mode**

EXEC

**Command Syntax**

```
show ip ospf [AREA] database LINKSTATE_TYPE linkstate_id [ROUTER] [VRF_INSTANCE]
```

**Parameters**

- **AREA** areas for which command displays data. Specifying an individual area requires entering the process ID where the area is located. Options include:
  - `<no parameter>`
  - `process_id`
  - `process_id area_id`
  - `process_id` input range: `<1 to 65535>`
  - `area_id` input range: `<0 to 4294967295>` or `<0.0.0.0 to 255.255.255.255>`

- **LINKSTATE_TYPE** link state types. Parameter options include:
  - `detail` Displays all link states.
  - `router`
  - `network`
  - `summary`
  - `asbr-summary`
  - `external`
  - `nssa-external`
  - `opaque-link`
  - `opaque-area`
  - `opaque-as`
  - `linkstate_id` Network segment described by the LSA (dotted decimal notation). Value depends on the LSA type.

- **ROUTER** router or switch for which the command provides data. Options include:
  - `<no parameter>`
  - `adv-router [a.b.c.d]`
  - `self-originate`

- **VRF_INSTANCE** parameter has no effect; this command displays information about the specified process and area regardless of VRF.
  - `<no parameter>` displays information from all VRFs, or from context-active VRF if set.
  - `vrf vrf_name` displays information from the specified VRF.
Examples

- This command displays the router link states contained in the area 2 LSDB.

  `switch>show ip ospf 1 2 database router`

  
  **OSPF Router with ID(10.168.103.1) (Process ID 1) (VRF default)**

  **Router Link States (Area 0.0.0.2)**

```
switch>
```
**show ip ospf interface**

The `show ip ospf interface` command displays interface information that is related to OSPFv2.

**Command Mode**
EXEC

**Command Syntax**

```
show ip ospf [PROCESS_ID] interface [INTERFACE_NAME] [VRF_INSTANCE]
```

**Parameters**

- **PROCESS_ID**  OSPFv2 process ID. Values include:
  - <no parameter>
  - <1 to 65535>
- **INTERFACE_NAME**  Interface type and number. Values include
  - <no parameter>
  - ethernet e_num
  - loopback l_num
  - port-channel p_num
  - vlan v_num
- **VRF_INSTANCE**  specifies the VRF instance.
  - <no parameter>  displays information from all VRFs, or from context-active VRF if set.
  - vrf vrf_name  displays information from the specified VRF.

**Related Command**

`show ip ospf interface brief`

**Example**

- This command displays complete OSPFv2 information for VLAN 1.

  ```
  switch>show ip ospf interface vlan 1
  Vlan1 is up, line protocol is up (connected)
  Internet Address 10.168.0.1/24, VRF default, Area 0.0.0.0
  Process ID 1, Router ID 10.168.103.1, Network Type BROADCAST, Cost: 10
  Transmit Delay is 1 sec, State BDR, Priority 1
  Designated Router is 10.168.104.2
  Backup Designated router is 10.168.103.1
  Timer intervals configured, Hello 10, Dead 40, Retransmit 5
  Neighbor Count is 1
  MTU is 1500
  switch>
  ```
**show ip ospf interface brief**

The `show ip ospf interface brief` command displays a summary of OSPFv2 information.

**Command Mode**

EXEC

**Command Syntax**

```plaintext
show ip ospf [PROCESS_ID] interface brief [VRF_INSTANCE]
```

**Parameters**

- **PROCESS_ID** OSPFv2 process ID. Values include:
  - `<no parameter>`
  - `<1 to 65535>`
- **VRF_INSTANCE** specifies the VRF instance.
  - `<no parameter>` displays information from all VRFs, or from context-active VRF if set.
  - `vrf vrf_name` displays information from the specified VRF.

**Related Commands**

- `show ip ospf interface`

**Example**

- This command displays a summary of interface information for the switch.

```
switch>show ip ospf interface brief
Interface    PID   Area            IP Address         Cost  State    Nbrs
Loopback0    1     0.0.0.0         10.168.103.1/24   10    DR       0
Vlan1        1     0.0.0.0         10.168.0.1/24     10    BDR      1
Vlan2        1     0.0.0.2         10.168.2.1/24     10    BDR      1
Vlan3        1     0.0.0.3         10.168.3.1/24     10    DR       0
switch>
```
show ip ospf lsa-log

The `show ip ospf lsa-log` command displays log entries when LSA update messages are sent or received for OSPF.

**Command Mode**

EXEC

**Command Syntax**

`show ip ospf [PROCESS_ID] ospf-log`

**Parameters**

- `PROCESS_ID` OSPFv2 process ID. Values include:
  - `<no parameter>`
  - `<1 to 65535>`

**Examples**

- This command displays log entries when LSA update messages are sent or received for OSPF.

  switch>show ip ospf lsa-log
  OSPF Process 3.3.3.3, LSA Throttling Log:
  [04:21:09] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 2000 msecs
  [04:21:08] type 1: 3.3.3.3/32 [3.3.3.3], event 2, backoff restarted, new hold value 900 msecs
  [04:21:00] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 3000 msecs
  [04:23:00] type 1: 3.3.3.3/32 [3.3.3.3], event 4, maxwait value changed, new hold value 3000 msecs
  /* Here the maxwait value was changed to 3000 from earlier 32000, this is not part of the log */
  [04:20:42] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 32000 msecs
  [04:20:10] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 32000 msecs
  [04:19:46] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 8000 msecs
  [04:19:42] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 4000 msecs
  [04:19:40] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 2000 msecs
  [04:19:39] type 1: 3.3.3.3/32 [3.3.3.3], event 2, backoff restarted, new hold value 980 msecs
  [04:19:22] type 1: 4.4.4.4/32 [4.4.4.4], event 3, discarded, was early by 995 msecs
  [04:19:22] type 1: 3.3.3.3/32 [3.3.3.3], event 0, backoff started, new hold value 1000 msecs
  switch>
show ip ospf neighbor

The `show ip ospf neighbor` command displays OSPFv2 neighbor information for specified interfaces.

**Command Mode**

EXEC

**Command Syntax**

```bash
show ip ospf [PROCESS_ID] neighbor
[INTERFACE_NAME] [NEIGHBOR] [DATA] [VRF_INSTANCE]
```

**Parameters**

- **PROCESS_ID**   OSPFv2 process ID. Values include:
  - <no parameter>
  - <1 to 65535>
- **INTERFACE_NAME** Interface type and number. Values include:
  - <no parameter>
  - `ethernet e_num`
  - `loopback l_num`
  - `port-channel p_num`
  - `vlan v_num`
- **NEIGHBOR**   OSPFv2 neighbor. Options include:
  - <no parameter>
  - `ipv4_addr`
- **DATA**   Type of information the command displays. Values include:
  - <no parameter>
  - `detail`
- **VRF_INSTANCE** specifies the VRF instance.
  - <no parameter>   displays information from all VRFs, or from context-active VRF if set.
  - `vrf vrf_name`   displays information from the specified VRF.

**Examples**

- This command displays the switch’s neighbors.

  ```bash
  switch>show ip ospf neighbor
  Neighbor ID  VRF  Pri  State  Dead Time  Address   Interface
  10.168.104.2  default  1  FULL/DR  00:00:35  10.168.0.2  Vlan1
  10.168.104.2  default  8  FULL/BDR  00:00:31  10.168.2.2  Vlan2
  switch>
  ```

- This command displays details about the neighbors to VLAN 2.

  ```bash
  switch>show ip ospf neighbor vlan 2 detail
  Neighbor 10.168.104.2, VRF default, interface address 10.168.2.2
  In the area 0.0.0.2 via interface Vlan2
  Neighbor priority is 8, State is FULL, 13 state changes
  Adjacency was established 00:01:25:48 ago
  DR is 10.168.2.1 BDR is 10.168.2.2
  Options is E
  Dead timer due in 00:00:34
  switch>
  ```
show ip ospf neighbor adjacency-changes

The `show ip ospf neighbor adjacency-changes` command displays the OSPFv2 neighbor adjacency change log for specified interfaces.

**Command Mode**

EXEC

**Command Syntax**

```
show ip ospf neighbor [INTERFACE_NAME] [NEIGHBOR] adjacency-changes [VRF_INSTANCE]
```

**Parameters**

- `INTERFACE_NAME` Interface type and number. Values include:
  - `<no parameter>`
  - `ethernet e_num`
  - `loopback l_num`
  - `port-channel p_num`
  - `vlan v_num`
- `NEIGHBOR` OSPFv2 neighbor. Options include:
  - `<no parameter>`
  - `ipv4_addr`
  - `host_name`
- `VRF_INSTANCE` specifies the VRF instance.
  - `<no parameter>` displays information from all VRFs, or from context-active VRF if set.
  - `vrf vrf_name` displays information from the specified VRF.

**Examples**

- This command displays the adjacency changes to VLAN 2.

  ```
  switch>show ip ospf neighbor vlan 2 adjacency-changes
  [08-04 09:58:58] 10.168.104.2, interface Vlan2 adjacency established
  [08-04 09:59:34] 10.168.104.2, interface Vlan2 adjacency dropped: interface went down
  [08-04 09:59:42] 10.168.104.2, interface Vlan2 adjacency established
  [08-04 10:01:40] 10.168.104.2, interface Vlan2 adjacency dropped: nbr did not list our router ID
  [08-04 10:01:46] 10.168.104.2, interface Vlan2 adjacency established
  switch>
  ```
**show ip ospf neighbor state**

The `show ip ospf neighbor state` command displays the state information on OSPF neighbors on a per-interface basis.

**Command Mode**

EXEC

**Command Syntax**

`show ip ospf neighbor state STATE_NAME [VRF_INSTANCE]`

**Parameters**

- **STATE_NAME**
  
  Output filtered by the devices OSPF state. Options include valid OSPF states:
  - 2-ways
  - attempt
  - down
  - exch-start
  - exchange
  - full
  - graceful-restart
  - init
  - loading

- **VRF_INSTANCE**
  
  specifies the VRF instance.
  - `<no parameter>`
    
    displays information from all VRFs, or from context-active VRF if set.
  - `vrf vrf_name`
    
    displays information from the specified VRF.

**Examples**

- This command displays OSPF information for neighboring routers that are fully adjacent.

```
switch>show ip ospf neighbor state full
Neighbor ID     VRF Pri State         Dead Time Address    Interface
Test1           default 1 FULL/BDR 00:00:35 10.17.254.105 Vlan3912
Test2           default 1 FULL/BDR 00:00:36 10.17.254.29  Vlan3910
Test3           default 1 FULL/DR  00:00:35 10.25.0.1     Vlan101
Test4           default 1 FULL/DROTHER 00:00:36 10.17.254.67 Vlan3908
Test5           default 1 FULL/DROTHER 00:00:36 10.17.254.68 Vlan3908
Test6           default 1 FULL/BDR  00:00:32 10.17.254.66 Vlan3908
Test7           default 1 FULL/DROTHER 00:00:34 10.17.36.4  Vlan3036
Test8           default 1 FULL/BDR  00:00:35 10.17.36.3  Vlan3036
Test9           default 1 FULL/DROTHER 00:00:31 10.17.254.13 Vlan3902
Test10          default 1 FULL/BDR  00:00:37 10.17.254.11 Vlan3902
Test11          default 1 FULL/DROTHER 00:00:33 10.17.254.163 Vlan3925
Test12          default 1 FULL/DR  00:00:37 10.17.254.161 Vlan3925
Test13          default 1 FULL/DROTHER 00:00:31 10.17.254.154 Vlan3923

Test15          default 1 FULL/DROTHER 00:00:33 10.17.254.35  Vlan3911
Test16          default 1 FULL/DR  00:00:34 10.17.254.33  Vlan3911
Test17          default 1 FULL/DR  00:00:36 10.17.254.138 Ethernet12
Test18          default 1 FULL/DR  00:00:37 10.17.254.2   Vlan3901
switch>
```
show ip ospf neighbor summary

The `show ip ospf neighbor summary` command displays a single line of summary information for each OSPFv2 neighbor.

**Command Mode**

EXEC

**Command Syntax**

```
show ip ospf [PROCESS_ID] neighbor summary [VRF_INSTANCE]
```

**Parameters**

- **PROCESS_ID** OSPFv2 process ID. Values include:
  - `<no parameter>`
  - `<1 to 65535>`
- **VRF_INSTANCE** specifies the VRF instance.
  - `<no parameter>` displays information from all VRFs, or from context-active VRF if set.
  - `vrf vrf_name` displays information from the specified VRF.

**Examples**

- This command displays the summary information for the OSPFv2 neighbors.

  switch> `show ip ospf neighbor summary`
  OSPF Router with (Process ID 1) (VRF default)
  0 neighbors are in state DOWN
  0 neighbors are in state GRACEFUL RESTART
  2 neighbors are in state INIT
  0 neighbors are in state LOADING
  0 neighbors are in state ATTEMPT
  18 neighbors are in state FULL
  0 neighbors are in state EXCHANGE
  0 neighbors are in state 2 WAYS
  0 neighbors are in state EXCH START
  switch>

```
show ip ospf request queue

The **show ip ospf request queue** command displays a list of all OSPFv2 link state advertisements (LSAs) requested by a router.

**Command Mode**
- EXEC

**Command Syntax**

```
show ip ospf request queue [VRF_INSTANCE]
```

**Parameters**
- **VRF_INSTANCE** specifies the VRF instance.
  - <no parameter> displays information from all VRFs, or from context-active VRF if set.
  - `vrf vrf_name` displays information from the specified VRF.

**Example**
- This command displays an LSA request list.
  
```bash
switch>show ip ospf request queue
Neighbor 10.168.104.2 vrf default interface: 10.168.0.2 address vlan1
Type LS ID ADV RTR Seq No Age Checksum
Neighbor 10.168.104.2 vrf default interface: 10.168.2.2 address vlan2
Type LS ID ADV RTR Seq No Age Checksum
switch>
```
show ip ospf retransmission queue

The `show ip ospf retransmission queue` command displays a list of all OSPFv2 link state advertisements (LSAs) waiting to be re-sent.

**Command Mode**

EXEC

**Command Syntax**

```
show ip ospf retransmission queue [VRF_INSTANCE]
```

**Parameters**

- **VRF_INSTANCE** specifies the VRF instance.
  - `<no parameter>` displays information from all VRFs, or from context-active VRF if set.
  - `vrf vrf_name` displays information from the specified VRF.

**Example**

- This command displays an empty retransmission list.

```
switch> show ip ospf retransmission queue
Neighbor 10.168.104.2 vrf default interface vlan1 address 10.168.0.2
LSA retransmission not currently scheduled. Queue length is 0

Type Link ID ADV Router Age Seq# Checksum
Neighbor 10.168.104.2 vrf default interface vlan2 address 10.168.2.2
LSA retransmission not currently scheduled. Queue length is 0

Type Link ID ADV Router Age Seq# Checksum
switch>
```
**show ip ospf spf-log**

The `show ip ospf spf-log` command displays when and how long the switch took to run a full SPF calculation for OSPF.

**Command Mode**

EXEC

**Command Syntax**

```
show ip ospf [PROCESS_ID] ospf-log
```

**Parameters**

- `PROCESS_ID` OSPFv2 process ID. Values include:
  - `<no parameter>`
  - `<1 to 65535>`

**Examples**

- This command displays the SPF information for OSPF.

```
switch>show ip ospf spf-log
OSPF Process 172.26.0.22
When Duration(msec)
13:01:34 1.482
13:01:29 1.547
13:01:24 1.893
13:00:50 1.459
13:00:45 1.473
13:00:40 2.603
11:01:49 1.561
11:01:40 1.463
11:01:35 1.467
11:01:30 1.434
11:00:54 1.456
11:00:49 1.472
11:00:44 1.582
15:01:49 1.575
15:01:44 1.470
15:01:39 1.679
15:01:34 1.601
15:00:57 1.454
15:00:52 1.446
15:00:47 1.603
switch>
```
**shutdown (OSPFv2)**

The `shutdown` command disables OSPFv2 on the switch. OSPFv2 is disabled on individual interfaces with the `shutdown (OSPFv2)` command.

The `no shutdown` and `default shutdown` commands enable the OSPFv2 instance by removing the `shutdown` statement from the OSPF block in `running-config`.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```
shutdown
no shutdown
default shutdown
```

**Examples**

- This command disables OSPFv2 activity on the switch.
  
  switch(config)#router ospf 6
  switch(config-router-ospf)#shutdown
  switch(config-router-ospf)#

- This command resumes OSPFv2 activity on the switch.
  
  switch(config-router-ospf)#no shutdown
  switch(config-router-ospf)#
summary-address

The **summary-address** command allows aggregation of external routes advertised by an OSPF ASBR. It is used to aggregate AS External and NSSA External LSAs.

The **default summary-address** and **no summary-address** commands delete the current summary-address configurations.

**Command Mode**
Router Configuration Mode

**Command Syntax**
```
summary-address {ip_address subnet_mask | ip_prefix} [attribute_map WORD | not_advertise | tag]
default summary-address {ip_address summary_mask | ip_prefix}
no summary-address {ip_address summary_mask | ip_prefix}
```

**Parameters**
- `ip_address subnet_mask` IPv4 subnet in dotted decimal notation.
- `ip_prefix` IPv4 subnet in CIDR notation.
- `attribute_map WORD` allows using a route-map to set the attributes to be advertised in the LSA. Options include:
  - set metric
  - set metric-type
  - set tag
- `not_advertise` suppresses the advertisement of contributing external prefixes by the router
- `tag` allows setting the tag in the advertised external LSA. The tag value ranges from 0 to 4294967295. The default value is zero.

**Guidelines**
This feature reduces the size of External LSDB in OSPF, does not impact inter area and intra area LSAs. This command installs a Null0 route in FIB when at least one contributor is present.

**Restriction**
Only OSPF redistributed routes are aggregated.

**Examples**
- This command advertises an external LSA for 50.0.0.0/16 prefix if at least one BGP contributing route is present which falls in the subnet 50.0.0.0/16.
The `show` commands display aggregation of BGP prefixes 50.0.0.0/24 and 50.0.1.0/24 into one OSPF AS External LSA for 50.0.0.0/16 prefix. A route-map is to set metric and tag for the advertised LSA.

```
switch(config)#router ospf 5
switch(config-router-ospf)#redistribute bgp
switch(config-router-ospf)#summary-address 50.0.0.0/16 attribute-map BGP_AGGR
switch(config-router-ospf)#exit
switch(config)#show ip route bgp
```

**timers lsa rx min interval (OSPFv2)**

The `timers lsa rx min interval` command sets the minimum interval for acceptance of identical link-state advertisements (LSAs) from OSPFv2 neighbors.

The `no timers lsa rx min interval` and `default timers lsa rx min interval` commands restore the minimum interval to the default of one second by removing the `timers lsa rx min interval` command from `running-config`.

**Command Mode**
- Router-OSPF Configuration

**Command Syntax**
```
  timers lsa rx min interval lsa_time
  no timers lsa rx min interval
  default timers lsa rx min interval
```

**Parameters**
- `lsa_time`: minimum time (in milliseconds) after which the switch will accept an identical LSA from OSPFv2 neighbors. Default is 1000 (1 second).

**Example**
- This command sets the minimum LSA arrival interval to ten milliseconds.
  ```
  switch(config)#router ospf 6
  switch(config-router-ospf)#timers lsa rx min interval 10
  switch(config-router-ospf)#
  ```
timers lsa tx delay initial (OSPFv2)

The `timers lsa tx delay initial` command sets the rate-limiting values for OSPF link-state advertisement generation.

The `no timers lsa tx delay initial` and `default timers throttle lsa all` commands restore the defaults by removing the `timers lsa tx delay initial` command from `running-config`.

**Command Mode**
- Router-OSPF Configuration

**Command Syntax**

```
timers lsa tx delay initial initial_delay min_hold max_wait
no timers lsa tx delay initial
default timers lsa tx delay initial
```

**Parameters**
- `initial_delay` Value ranges from 0 to 600000 (ms). Default is 1000.
- `min_hold` Value ranges from 0 to 600000 (ms). Default is 5000.
- `max_wait` Value ranges from 0 to 600000 (ms). Default is 5000.

**Example**
- This command sets the rate-limiting values for OSPF link-state advertisement to 10 milliseconds.

```
switch(config)#router ospf 6
switch(config-router-ospf)#timers lsa tx delay initial 10
switch(config-router-ospf)#
```
timers spf delay initial (OSPFv2)

The purpose of SPF throttling is to delay shortest path first (SPF) calculations when network topology is changing rapidly. The `timers spf delay initial` command controls the intervals at which the switch will perform SPF calculations. The command sets three values:

- **Initial delay**: how long the switch waits to perform an SPF calculation after a topology change in a network that has been stable throughout the hold interval. Because a topology change often causes several link state updates to be sent, the initial delay is configured to allow the network to settle before the switch performs an SPF calculation. If an additional topology change occurs during the initial interval, the SPF calculation still takes place after the expiration of the initial delay period and no other change is made to the throttle timers.

- **Hold interval**: this is an additional wait timer which scales to slow SPF calculations during periods of network instability. If a network change occurs during the hold period, an SPF calculation is scheduled to occur at the expiration of the hold interval. Subsequent hold intervals are doubled if further topology changes occur during a hold interval until either the hold interval reaches its configured maximum or no topology change occurs during the interval. If the next topology change occurs after the expiration of the hold interval, the hold interval is reset to its configured value and the SPF calculation is scheduled to take place after the initial delay.

- **Maximum interval**: the maximum time the switch will wait after a topology change before performing an SPF calculation.

The `no timers spf delay initial` and `default timers spf delay initial` commands restore the default OSPFv2 SPF calculation intervals by removing the `timers spf delay initial` command from running-config.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```
timers spf delay initial initial_delay hold_interval max_interval
no timers spf
default timers spf
```

**Parameters**

- **initial_delay**: Initial delay between a topology change and SPF calculation. Value ranges from 0 to 65535000 (ms). Default is 0 (ms).
- **hold_interval**: Additional wait time after SPF calculation to allow the network to settle. If a topology change occurs during the hold interval, another SPF calculation is scheduled to occur after the hold interval expires. The next hold interval is doubled if topology changes occur during the hold interval. If doubling exceeds the maximum value, the maximum value is used instead. Value ranges from 0 to 65535000 (ms). Default is 5000 (ms).
- **max_interval**: Maximum hold interval before the switch will perform an SPF calculation. Value ranges from 0 to 65535000 (ms). Default is 5000 (ms).

**Example**

- These commands set the SPF timers on the switch.

  ```
  switch(config)#router ospf 6
  switch(config-router-ospf)#timers spf 5 100 20000
  switch(config-router-ospf)#
  ```
Open Shortest Path First (OSPF) is a link-state routing protocol that operates within a single autonomous system. OSPF version 3 is defined by RFC 5340.

This chapter contains the following sections.

- Section 32.1: OSPFv3 Introduction
- Section 32.2: OSPFv3 Conceptual Overview
- Section 32.3: Configuring OSPFv3
- Section 32.4: OSPFv3 Examples
- Section 32.5: OSPFv3 Commands

### 32.1 OSPFv3 Introduction

OSPFv3 is based on OSPF version 2 and includes enhancements that utilize IPv6 features. However, OSPFv3 is configured and operates independently of any implementation of OSPFv2 on the switch. OSPFv2 features that OSPFv3 implements include:

- Packet types
- Neighbor discovery and adjacency formation mechanisms
- LSA aging and flooding
- SPF calculations
- DR election procedure
- Multiple area support
- Router-ID (32 bits)
The following list describes the OSPFv3 differences and enhancements from OSPFv2:

- IPv6 128-bit addresses
- Use of link-local addresses
- OSPFv3 runs over links instead of subnets
- Support flood pacing

Arista switches support the following OSPFv3 functions:

- A single OSPFv3 instance for each VRF
- Intra- and inter-area routing
- Type 1 and 2 external routing
- Broadcast and P2P interfaces
- Stub areas
- Redistribution of static and connected routes into OSPFv3

### 32.2 OSPFv3 Conceptual Overview

#### 32.2.1 Storing Link States

OSPFv3 is a dynamic, link-state routing protocol, where links represent routable paths. Dynamic routing protocols calculate the most efficient path between locations based on bandwidth and device status.

A link state advertisement (LSA) is an OSPFv3 packet that communicates a router's topology to other routers. The link state database (LSDB) stores an area's topology database and is composed of LSAs received from other routers. Routers update the LSDB by storing LSAs from other routers.

#### 32.2.2 Topology

An autonomous system (AS) is the IP domain within which a dynamic protocol controls the routing of traffic. In OSPFv3, an AS is composed of areas, which define the LSDB computation boundaries. All routers in an area store identical LSDBs. Routers in different areas exchange updates without storing the entire database, reducing information maintenance on large, dynamic networks.

An AS shares internal routing information from its areas and external routing information from other processes to inform routers outside the AS about routes the network can access. Routers that advertise routes on other ASs commit to carry data to the IP space on the route.

OSPFv3 defines these routers:

- Internal router (IR) – a router whose interfaces are contained in a single area. All IRs in an area maintain identical LSDBs.
- Area border router (ABR) – a router that has interfaces in multiple areas. ABRs maintain one LSDB for each connected area.
- Autonomous system boundary router (ASBR) – a gateway router connecting the OSPFv3 domain to external routes, including static routes and routes from other autonomous systems.
OSPFv3 areas are assigned a number between 0 and 4,294,967,295. Area numbers are often expressed in dotted decimal notation, similar to IP addresses.

Each AS has a backbone area, designated as area 0, that connects to all other areas. The backbone receives routing information from all areas, then distributes it to the other areas as required.

OSPFv3 area types include:

- Normal area – accepts intra-area, inter-area, and external routes. The backbone is a normal area.
- Stub area – does not receive router advertisements external to the AS. Stub area routing is based on a default route.

### 32.2.3 Link Updates

Routers periodically send hello packets to advertise status and establish neighbors. A router’s hello packet includes IP addresses of other routers from which it received a hello packet within the time specified by the router dead interval. Routers become neighbors when they detect each other in their hello packets if they:

- share a common network segment.
- are in the same area.
- have the same hello interval, dead interval, and authentication parameters.

Neighbors form adjacencies to exchange LSDB information. A neighbor group uses hello packets to elect a Designated Router (DR) and Backup Designated Router (BDR). The DR and BDR become adjacent to all other neighbors, including each other. Only adjacent neighbors share database information.
The DR is the central contact for database exchanges. Switches send database information to their DR, which relays the information to the other neighbors. All routers in an area maintain identical LSDBs. Switches also send database information to their BDR, which stores this data without distributing it. If the DR fails, the BDR distributes LSDB information to its neighbors.

OSPFv3 routers distribute LSAs by sending them on all of their active interfaces. The router does not send hello packets from passive interfaces preventing adjacencies. The router does not process any OSPFv2 packets received on a passive interface.

When a router’s LSDB is changed by an LSA, it sends the changes to the BDR and DR for distribution to the other neighbors. Routing information is updated only when the topology changes.

Routing devices use Dijkstra’s algorithm to calculate the shortest path to all known destinations, based on cumulative route cost. The cost of an interface indicates the transmission overhead and is usually inversely proportional to its bandwidth.

### 32.2.4 OSPFv3 Security

The OSPFv3 protocol relies on the IPsec Authentication Header (AH) and Encapsulating Security Payload (ESP) header to provide data integrity, authentication and confidentiality. Transport mode provides IPsec to OSPFv3 packets.

The IPsec SA has Security Policy Index (SPI), HMAC algorithm, and a secret key as parameters. These parameters are used to compute Integrity Check Value (ICV), that is used to authenticate peers. When authentication is enabled, all corresponding peers must use same SA parameters to clear OSPFv3 ICV verification. SA can be configured at both area and interface levels.

**Note**

On the same area or interface, EOS allows security configuration with either AH or ESP but not both. We can have one area or interface configured with AH and another with ESP.
32.2.4.1 OSPFv3 Authentication

While sending OSPFv3 packets, the HMAC-MD5 or SHA algorithm hash is inserted in the IPsec header and the packet is sent over the wire for peer authentication. While receiving OSPFv3 packets, the computed hash is verified with the one present in the IPsec header. If it fails, OSPFv3 packets are discarded.

32.2.4.2 OSPFv3 Encryption

ESP provides confidentiality to OSPFv3 packets. When confidentiality is enabled, ESP encrypts the sent data and decrypts the received data. OSPFv3 packets that are not encapsulated with security payload are discarded.

OSPFv3 encryption uses algorithms of Triple Data Encryption Standard (3DES) and Advanced Encryption Standard (AES). 3DES uses a 192 bit key, whereas the AES key length varies by 128, 192 and 256 bits.

32.2.5 Flood Pacing

OSPFv3 flood pacing allows configuring the minimum interval between the transmission of consecutive Link State (LS) update packets in a network. Flood pacing provides the following benefits:

- Prevents the rapid drain of flood queue by sending consecutive LSU packets with a delay
- Helps mitigate high CPU or socket buffer utilization issues that occur when a switch instantly floods a large number of LSAs
- When LSDB is updated frequently, an incremented flood pacing interval scales down LSA flooding

Note

A high flood pacing interval may lead to convergence delays in large OSPF LSDBs.
32.3 Configuring OSPFv3

These sections describe basic OSPFv3 configuration steps:

- Section 32.3.1: Configuring an OSPFv3 Instance
- Section 32.3.2: Configuring OSPFv3 Areas
- Section 32.3.3: Configuring Interfaces for OSPFv3
- Section 32.3.4: Enabling OSPFv3
- Section 32.3.5: Configuring OSPFv3 Security
- Section 32.3.6: Configuring OSPFv3 Flood Pacing
- Section 32.3.7: Displaying OSPFv3 Status

32.3.1 Configuring an OSPFv3 Instance

32.3.1.1 Entering OSPFv3 Configuration Mode

OSPFv3 configuration commands apply to the specified OSPFv3 instance. To perform OSPFv3 configuration commands, the switch must be in router-OSPFv3 configuration mode. The `ipv6 router ospf` command places the switch in router-OSPFv3 configuration mode, creating an OSPFv3 instance if OSPFv3 was not previously instantiated on the switch. If no VRF is specified, the OSPFv3 instance is in the default VRF. To instantiate or configure OSPFv3 on a non-default VRF, specify that VRF when using the `ipv6 router ospf` command.

The process ID identifies the OSPFv3 instance and is local to the router. Neighbor OSPFv3 routers can have different process IDs. OSPFv3 instances configured in different VRFs on the switch must have different process IDs.

The switch supports one OSPFv3 instance for each VRF. When an OSPFv3 instance already exists, the `ipv6 router ospf` command must specify its process ID (and VRF, if it is not configured in the default VRF). Attempts to define additional instances in the same VRF will generate errors. The `show ipv6 ospf` command displays information about OSPFv3 instances, including their process IDs.

Example

- This command places the switch in router-OSPFv3 configuration mode for the default VRF. If OSPFv3 was not previously instantiated in the default VRF, the command creates an OSPFv3 instance in the default VRF with a process ID of 9.

  switch(config)#ipv6 router ospf 9
  switch(config-router-ospf3)#show active
  ipv6 router ospf 9
  switch(config-router-ospf3)#

32.3.1.2 Defining the Router ID

The router ID is a 32-bit number assigned to a router running OSPFv3. This number uniquely labels the router within an Autonomous System. Status commands identify the switch through the router ID.

When configuring OSPFv3 instances in multiple VRFs, each should have a different router ID.

The switch sets the router ID to the first available alternative in the following list:

1. The `router-id` command.
2. The loopback IPv6 address, if a loopback interface is active on the switch.
3. The highest IPv6 address on the router.
Important! When configuring VXLAN on an MLAG, always manually configure the OSPFv3 router ID to prevent the switch from using the common VTEP IP address as the router ID.

The **router-id (OSPFv3)** command configures the router ID for an OSPFv3 instance.

**Example**
- This command assigns 15.1.1.1 as the OSPFv3 router ID.
  ```
  switch(config-router-ospf3)#router-id 15.21.4.9
  switch(config-router-ospf3)#show active
  ipv6 router ospf 9
  router-id 15.21.4.9
  switch(config-router-ospf3)#
  ```

### 32.3.1.3 Global OSPFv3 Parameters

These router-OSPFv3 configuration mode commands define OSPFv3 behavior for the OSPFv3 instance under which they are used.

**Logging Adjacency Changes**

The **log-adjacency-changes (OSPFv3)** command configures the switch to log OSPFv3 link-state changes and transitions of OSPFv3 neighbors into the up or down state.

**Examples**
- This command configures the switch to log transitions of OSPFv3 neighbors into the up or down state.
  ```
  switch(config-router-ospf3)#log-adjacency-changes
  switch(config-router-ospf3)#
  ```
- This command configures the switch to log all OSPFv3 link-state changes.
  ```
  switch(config-router-ospf3)#log-adjacency-changes detail
  switch(config-router-ospf3)#
  ```

**Intra-Area Distance**

The **distance ospf intra-area (OSPFv3)** command configures the administrative distance for routes contained in a single OSPFv3 area. Administrative distances compare dynamic routes configured by different protocols. The default administrative distance for intra-area routes is 10.

**Example**
- This command configures an administrative distance of 90 for OSPFv3 intra-area routes.
  ```
  switch(config-router-ospf3)#distance ospf intra-area 90
  switch(config-router-ospf3)#show active
  ipv6 router ospf 9
  distance ospf intra-area 90
  switch(config-router-ospf3)#
  ```

**Passive Interfaces**

The **passive-interface (OSPFv3)** command prevents the transmission of hello packets on the specified interface. Passive interfaces drop all adjacencies and do not form new adjacencies. Although passive interfaces do not send or receive LSAs, other interfaces may generate LSAs for the network segment. The router does not send OSPFv3 packets from a passive interface or process OSPFv3 packets received on a passive interface. The router advertises the passive interface in the router LSA.
The **no passive-interface** command re-enables OSPFv3 processing on the specified interface.

**Examples**

- This command configures VLAN 200 as a passive interface.
  
  ```
  switch(config-router-ospf3)#passive-interface vlan 200
  switch(config-router-ospf3)#show active
  ipv6 router ospf 9
  passive-interface Vlan200
  switch(config-router-ospf3)#
  ```

- This command configures VLAN 200 as an active interface.
  
  ```
  switch(config-router-ospf3)#no passive-interface vlan 200
  switch(config-router-ospf3)#show active
  ipv6 router ospf 9
  switch(config-router-ospf3)#
  ```

**Redistributing Connected Routes**

Redistributing connected routes causes the OSPFv3 instance to advertise all connected routes on the switch as external OSPFv3 routes. Connected routes are routes that are established when IPv6 is enabled on an interface.

**Example**

- The **redistribute (OSPFv3) connected** command converts connected routes to OSPFv3 external routes.
  
  ```
  switch(config-router-ospf3)#redistribute connected
  switch(config-router-ospf3)#show active
  ipv6 router ospf 9
  redistribute connected
  switch(config-router-ospf3)#
  ```

**Redistributing Static Routes**

Redistributing static routes causes the OSPFv3 instance to advertise all static routes on the switch as external OSPFv3 routes. The switch does not support redistributing individual static routes.

**Example**

- The **redistribute (OSPFv3) static** command converts static routes to OSPFv3 external routes.
  
  ```
  switch(config-router-ospf3)#redistribute static
  switch(config-router-ospf3)#show active
  ipv6 router ospf 9
  redistribute static
  switch(config-router-ospf3)#
  ```

### 32.3.2 Configuring OSPFv3 Areas

OSPFv3 areas are configured through area commands. The switch must be in router-OSPFv3 configuration mode, as described in [Section 32.3.1.1: Entering OSPFv3 Configuration Mode](#), to run area commands.

Areas are assigned a 32-bit number that is expressed in decimal or dotted-decimal notation. When an OSPFv3 instance configuration contains multiple areas, the switch only configures areas associated with its interfaces.
32.3.2.1 Configuring the Area Type

The `no area (OSPFv3)` command specifies the area type. The switch supports three area types:

- **Normal area**: Area that accepts intra-area, inter-area, and external routes. The backbone area (area 0) is a normal area.
- **Stub area**: Area where external routes are not advertised. External routes are reached through a default summary route (0.0.0.0) inserted into stub areas. Networks with no external routes do not require stub areas.

The default area type is normal.

**Example**

- These commands configures area 200 as a NSSA area and 300 as a stub area.

```bash
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#area 200 nssa
switch(config-router-ospf3)#area 300 stub
switch(config-router-ospf3)#show active
ipv6 router ospf 9
  area 0.0.0.200
  area 0.0.1.44 stub
switch(config-router-ospf3)#
```

32.3.2.2 Configuring Area Parameters

These router-OSPFv3 configuration mode commands define OSPFv3 behavior in a specified area.

**Default Summary Route Cost**

The `area default-cost (OSPFv3)` command specifies the cost of the default summary route that ABRs send into a stub area or NSSA. Summary routes, also called inter-area routes, originate in areas different than their destination. When the `area default-cost` command is not configured for an area, the default-cost of that area is set to 10.

**Example**

- This command configures a cost of 25 for the default summary route in area 0.0.1.194 (450).

```bash
switch(config-router-ospf3)#area 450 default-cost 25
switch(config-router-ospf3)#show active
ipv6 router ospf 9
  area 0.0.0.200
  area 0.0.1.44 stub
switch(config-router-ospf3)#
```

**Area Stub**

The `area stub (OSPFv3)` command configures the area type of an OSPFv3 area. All routers in an AS must specify the same area type for identically numbered areas.

Stub areas are areas in which external routes are not advertised. To reach these external routes, the stub area uses a default summary route (0.0.0.0). Networks without external routes do not require stub areas.

Areas are **normal** by default; area type configuration is required only for stub NSSA areas. Area 0 is always a normal area and cannot be configured through this command.
Examples

- This command configures area 45 as a stub area.
  
  switch(config)#ipv6 router ospf 3
  switch(config-router-ospf3)#area 45 stub
  switch(config-router-ospf3)#

- This command configures area 10.92.148.17 as a stub area.
  
  switch(config-router-ospf3)#area 10.92.148.17 stub
  switch(config-router-ospf3)#

Area Range

The area range (OSPFv3) command is used by OSPFv3 area border routers (ABRs) to consolidate or summarize routes, to configure a cost setting for those routes, and to suppress summary route advertisements.

By default, an ABR creates a summary LSA for each route in an area and advertises that LSA to adjacent areas. The area range (OSPFv3) command aggregates routing information on area boundaries, allowing the ABR to use one summary LSA to advertise multiple routes.

Examples

- These commands consolidate and summarize routes at an area boundary 1.
  
  switch(config)#ipv6 router ospf 1
  switch(config-router-ospf3)#area 1 range 2001:0DB8:0:1::/64
  switch(config-router-ospf3)#

- These commands change the address range status to DoNotAdvertise. Neither one of the individual intra-area routes falling under range or the ranged prefix is advertised as summary LSA.
  
  switch(config)#ipv6 router ospf 1
  switch(config-router-ospf3)#area 1 range 2001:0DB8:0:1::/64 not-advertise
  switch(config-router-ospf3)#

32.3.3 Configuring Interfaces for OSPFv3

OSPFv3 interface configuration commands enable OSPFv3 on an interface, assign the interface to an area, and specify transmission parameters for routed ports and SVIs that handle OSPFv3 packets.

32.3.3.1 Assigning an Interface to an Area

The ipv6 ospf area command enables OSPFv3 on the configuration mode interface and associates the specified area to the interface. Each routed interface can be associated with one OSPFv3 area; subsequent ipv6 ospf area commands that designate a different area on an interface replace any existing command for the interface.

Example

- These commands enable OSPFv3 instance 9 on VLAN interface 200 and associate area 0 to the interface.
  
  switch(config)#interface vlan 200
  switch(config-if-Vl200)#ipv6 ospf 9 area 0
  switch(config-if-Vl200)#show active
  interface Vlan200
  ipv6 ospf 9 area 0.0.0.0
  switch(config-if-Vl200)#
32.3.3.2 Configuring Intervals

Interval configuration commands determine OSPFv3 packet transmission characteristics for a specified VLAN interface. Interval configuration commands are entered in vlan-interface configuration mode.

Hello Interval

The hello interval specifies the period between consecutive hello packet transmissions from an interface. Each OSPFv3 neighbor should specify the same hello interval, which should not be longer than any neighbor’s dead interval.

The `ospfv3 hello-interval` command configures the hello interval for the configuration mode interface. The default is 10 seconds.

Example

- These commands configure a hello interval of 45 seconds for VLAN 200.

  ```
  switch(config)#interface vlan 200
  switch(config-if-Vl200)#ospfv3 hello-interval 45
  switch(config-if-Vl200)#show active
  interface Vlan200
  ospfv3 hello-interval 45
  switch(config-if-Vl200)#
  ```

Dead Interval

The dead interval specifies the period that an interface waits for an OSPFv3 packet from a neighbor before it disables the adjacency under the assumption that the neighbor is down. The dead interval should be configured identically on all OSPFv3 neighbors and be longer than the hello interval of any neighbor.

The `ospfv3 dead-interval` command configures the dead interval for the configuration mode interface. The default is 40 seconds.

Example

- This command configures a dead interval of 75 seconds for VLAN 200.

  ```
  switch(config)#interface vlan 200
  switch(config-if-Vl200)#ospfv3 dead-interval 75
  switch(config-if-Vl200)#show active
  interface Vlan200
  ospfv3 dead-interval 75
  switch(config-if-Vl200)#
  ```

Retransmission Interval

Routers that send OSPFv3 advertisements to an adjacent router expect to receive an acknowledgment from that neighbor. Routers that do not receive an acknowledgment will retransmit the advertisement. The retransmission interval specifies the period between retransmissions.

The `ospfv3 ipv6 retransmit-interval` command configures the LSA retransmission interval for the configuration mode interface. The default retransmission interval is 5 seconds.
Example

- This command configures a retransmission interval of 25 seconds for VLAN 200.
  ```
  switch(config)#interface vlan 200
  switch(config-if-Vl200)#ospfv3 ipv6 retransmit-interval 25
  switch(config-if-Vl200)#show active
  interface Vlan200
      ospfv3 ipv6 retransmit-interval 25
  switch(config-if-Vl200)#
  ```

Transmission Delay

The transmission delay is an estimate of the time that an interface requires to transmit a link-state update packet. OSPFv3 adds this delay to the age of outbound packets to more accurately reflect the age of the LSA when received by a neighbor.

The `ospfv3 transmit-delay` command configures the transmission delay for the configuration mode interface. The default transmission delay is one second.

Example

- This command configures a transmission delay of 10 seconds for VLAN 200.
  ```
  switch(config)#interface vlan 200
  switch(config-if-Vl200)#ospfv3 transmit-delay 10
  switch(config-if-Vl200)#show active
  interface Vlan200
      ospfv3 transmit-delay 10
  switch(config-if-Vl200)#
  ```

32.3.3.3 Configuring Interface Parameters

Interface Cost

The OSPFv3 interface cost reflects the overhead of sending packets across the interface. The cost is typically assigned to be inversely proportional to the bandwidth of the interface. The `ospfv3 cost` command configures the OSPFv3 cost for the configuration mode interface. The default cost is 10.

Example

- This command configures a cost of 50 for VLAN 200.
  ```
  switch(config)#interface vlan 200
  switch(config-if-Vl200)#ospfv3 cost 50
  switch(config-if-Vl200)#show active
  interface Vlan200
      ospfv3 cost 50
  switch(config-if-Vl200)#
  ```

Router Priority

Router priority determines preference during designated router (DR) and backup designated router (BDR) elections. Routers with higher priority numbers have preference over other routers. Routers with a priority of zero cannot be elected as a DR or BDR.

The `ospfv3 priority` command configures router priority for the configuration mode interface. The default priority is 1.
Example

- This command configures a router priority of 128 for VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ospfv3 priority 128
switch(config-if-Vl200)#show active
```

32.3.4 Enabling OSPFv3

32.3.4.1 IP Routing

OSPFv3 requires that IPv6 unicast routing is enabled on the switch. When IP routing is not enabled, entering OSPFv3 configuration mode generates a message.

Examples

- This message is displayed if, when entering router-OSPFv3 configuration mode, IPv6 unicast routing is not enabled.

```
switch(config)#ipv6 router ospf 9
! IPv6 routing not enabled
switch(config-router-ospf3)#
```

- This command enables IP routing on the switch.

```
switch(config)#ipv6 unicast-routing
```

32.3.4.2 Disabling OSPFv3

The `shutdown (OSPFv3)` disables OSPFv3 operations on the switch without disrupting the OSPFv3 configuration. To disable OSPFv3 on an interface, remove the `ipv6 ospf area` statement for the corresponding interface.

The `no shutdown` command resumes OSPFv3 activity.

Examples

- This command disables OSPFv3 activity on the switch.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#shutdown
switch(config-router-ospf3)#show active
ipv6 router ospf 9
    shutdown
switch(config-router-ospf3)#
```

- This command resumes OSPFv3 activity on the switch.

```
switch(config-router-ospf3)#no shutdown
switch(config-router-ospf3)#show active
ipv6 router ospf 9
switch(config-router-ospf3)#
```
32.3.5 Configuring OSPFv3 Security

You can configure OSPFv3 security for either an area or an interface, or both, using either an Authentication Header (AH) or an Encapsulating Security Payload (ESP). When OSPFv3 security is configured on an area, the configured settings apply to all interfaces in that area. Interface-specific configuration overrides configuration on the area to which the interface belongs.

32.3.5.1 Configuring OSPFv3 Authentication

Configuring OSPFv3 Authentication for Areas

The `area authentication ipsec spi` command configures OSPFv3 authentication on an area.

**Example**

This command configures OSPFv3 authentication on an area with MD5 hash algorithm.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#area 0.0.0.0 authentication ipsec spi 34 md5 0 8FD6158BE81ADD961241D8E4169D4111
switch(config-router-ospf3)#show active
ipv6 router ospf 9
  area 0.0.0.0 authentication ipsec spi 34 md5 7 $1$cNpcrQl1czqdvKAzKLzYv6l77+R3niiwouDKKycFNa4/Y0Wg/1ap5Q==
switch(config-router-ospf3)#
```

Configuring OSPFv3 Authentication for Interfaces

The `ospfv3 authentication ipsec spi` command configures OSPFv3 authentication on an interface.

**Example**

This command configures OSPFv3 authentication on an interface with MD5 hash algorithm.

```
switch(config-if-Et9)#ospfv3 authentication ipsec spi 3456 md5 0 8FD6158BE81ADD961241D8E4169D4111
switch(config-if-Et9)#show active
interface Ethernet9
  no switchport
  ospfv3 authentication ipsec spi 3456 md5 7 $1$xtmcMSPzEn+Njp8Lb4qyV0jKcjsrYuv6dx1O+nSwWQdaiRt1ZTQ==
switch(config-if-Et9)#
```

32.3.5.2 Configuring OSPFv3 Encryption

Configuring OSPFv3 Encryption for Areas

The `area encryption ipsec spi` command configures OSPFv3 security on an area.

**Example**

This command configures OSPFv3 security on an area with 3DES-CBC encryption and MD5 hash algorithm.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#area 0.0.0.0 encryption ipsec spi 5678 esp 3des-cbc md5 passphrase 0 8FD6158BE81ADD961241D8E4169D4111
switch(config-router-ospf3)#show active
ipv6 router ospf 9
  area 0.0.0.0 encryption ipsec spi 5678 esp 3des-cbc md5 passphrase 7 $1$OnpcrQl1czqdvKAzKLzYv6l77+R3niiwouDKKycFNa4/Y0Wg/1ap5Q==
switch (config-router-ospf3)#
```

Configuring OSPFv3 Encryption for Interfaces

The `ospfv3 encryption ipsec spi` command configures OSPFv3 security on an interface.
Example
This command configures OSPFv3 security on an interface with 3DES-CBC encryption and SHA1 algorithm.

```
switch(config)#interface ethernet 9
switch(config-if-Et9)#ospfv3 encryption ipsec spi 345 esp 3des-cbc sha1 passphrase 0
2fd4e1c67a2d28fcedb490e68b3f67a743591b93eb12
switch(config-if-Et9)#show active
interface Ethernet9
  no switchport
  ospfv3 encryption ipsec spi 345 esp 3des-cbc sha1 passphrase 7
$1$VmUkWk6IL2S343bR3BbH0RhgvxHhwBpfvB4VXKNOQQF7HJ8p5VxXtfBaYybCkhWU
switch(config-if-Et9)#
```

32.3.6 Configuring OSPFv3 Flood Pacing
Flood pacing can be configured for global OSPFv3 instances and address families. The `timers pacing flood` command configures OSPFv3 flood pacing.

Examples
- This command configures OSPFv3 flood pacing timer to 50 ms in the global OSPFv3 instance.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#timers pacing flood 50
switch(config-router-ospf3)#show ipv6 ospf
Routing Process "ospfv3 9" with ID 13.13.13.13 and Instance 0 VRF default
  FIPS mode disabled
  It is not an autonomous system boundary router and is not an area border router
  Minimum LSA arrival interval 1000 msecs
  Initial LSA throttle delay 1000 msecs
  Minimum hold time for LSA throttle 5000 msecs
  Maximum wait time for LSA throttle 5000 msecs
  Interface flood pacing timer 50 msecs
  It has 0 fully adjacent neighbors
  Number of areas in this router is 1. 1 normal, 0 stub, 0 nssa
  Number of LSAs 1
  Initial SPF schedule delay 0 msecs
  Minimum hold time between two consecutive SPFIs 5000 msecs
  Current hold time between two consecutive SPFIs 5000 msecs
  Maximum wait time between two consecutive SPFIs 5000 msecs
  SPF algorithm last executed 21d19h ago
  No scheduled SPF
  Adjacency exchange-start threshold is 20
  Maximum number of next-hops supported in ECMP is 32
  Number of backbone neighbors is 0
  Graceful-restart is not configured
  Graceful-restart-helper mode is enabled
  Area 0.0.0.0
    Number of interface in this area is 0
    It is a normal area
    SPF algorithm executed 2 times
```
• This command configures OSPFv3 flood pacing timer to 50 ms for ipv4 address family.

switch(config)#router ospfv3
switch(config-router-ospfv3)#address-family ipv4
switch(config-router-ospfv3-af)#timers pacing flood 50

Example
• This command displays OSPFv3 routing process information.

32.3.7 Displaying OSPFv3 Status

This section describes OSPFv3 show commands that display OSPFv3 status. General switch methods that provide OSPFv3 information include pinging routes, viewing route status (show ip route command), and viewing the configuration (show running-config command).

32.3.7.1 OSPFv3 Summary

The show ipv6 ospf command displays general OSPFv3 configuration information, operational statistics and status for the OSPFv3 instance, followed by a brief description of the areas configured on the switch.

Example
• This command displays OSPFv3 routing process information.
This command displays OSPFv3 routing process information.

```
switch(config-router-ospf3)#show ipv6 ospf
Routing Process "ospfv3 1" with ID 1.1.1.1 and Instance 0 VRF default
  It is not an autonomous system boundary router and is not an area border router
  Minimum LSA arrival interval 1000 msecs
  Initial LSA throttle delay 1000 msecs
  Minimum hold time for LSA throttle 5000 msecs
  Maximum wait time for LSA throttle 5000 msecs
  Interface flood pacing timer 50 msecs
  It has 0 fully adjacent neighbors
  ...
  Graceful-restart is not configured
  Graceful-restart-helper mode is enabled
```

32.3.7.2 Viewing OSPFv3 on the Interfaces

The `show ipv6 ospf interface` command displays OSPFv3 information for switch interfaces configured for OSPFv3. Different command options allow the display of either all interfaces or a specified interface. The command can also be configured to display complete information or a brief summary.

**Example**

This command displays OSPFv3 information for interfaces where OSPFv3 is enabled.

```
switch#show ipv6 ospf interface
Ethernet17 is up
  Interface Address fe80::48c:73ff:fe00:1319%Ethernet12, Area 0.0.0.0
  Network Type Broadcast, Cost 10
  Transmit Delay is 1 sec, State Backup DR, Priority 1
  Designated Router is 10.37.0.37
  Backup Designated Router is 10.37.0.23
  Timer intervals configured, Hello 10, Dead 40, Retransmit 5
  Neighbor Count is 1
Vlan31 is up
  Interface Address fe80::48c:73ff:fe00:1319%Vlan31, Area 0.0.0.0
  Network Type Broadcast, Cost 10
  Transmit Delay is 1 sec, State Backup DR, Priority 1
  Designated Router is 10.37.0.22
  Backup Designated Router is 10.37.0.23
  Timer intervals configured, Hello 10, Dead 40, Retransmit 5
  Neighbor Count is 1
Vlan32 is up
  Interface Address fe80::48c:73ff:fe00:1319%Vlan32, Area 0.0.0.0
  Network Type Broadcast, Cost 10
  Transmit Delay is 1 sec, State DR Other, Priority 1
  Designated Router is 10.37.0.11
  Backup Designated Router is 10.37.0.22
  Timer intervals configured, Hello 10, Dead 40, Retransmit 5
  Neighbor Count is 2
```

32.3.7.3 Viewing the OSPFv3 Database

The `show ipv6 ospf database <link state list>` command displays the LSAs in the LSDB for the specified area. If no area is listed, the command displays the contents of the database for each area on the switch. The database command provides options to display subsets of the LSDB database, a summary of database contents, and the link states that comprise the database.
Example

- This command displays the OSPFv3 database of link state advertisements (LSAs).

  switch# show ipv6 ospf database
  Routing Process "ospf 9":

  AS Scope LSDB

  switch#

32.3.7.4 Viewing OSPFv3 Neighbors

The `show ipv6 ospf neighbor` command displays information about the routers that are neighbors to the switch. Command options allow the display of summary or detailed information about the neighbors to all areas and interfaces on the switch. The command also allows for the display of neighbors to individual interfaces or areas. The `adjacency-changes` option displays the interface’s adjacency changes.
Example

- This command displays the switch’s neighbors.

```
switch# show ipv6 ospf neighbor
Routing Process "ospf 9":
Neighbor 10.37.0.37 priority is 1, state is Full
  In area 0.0.0.0 interface et12
  DR is 10.37.0.37 BDR is 10.37.0.23
  Options is 0
  Dead timer is due in 37 seconds
Neighbor 10.37.0.22 priority is 1, state is Full
  In area 0.0.0.0 interface vlan3911
  DR is 10.37.0.22 BDR is 10.37.0.23
  Options is 0
  Dead timer is due in 31 seconds
Neighbor 10.37.0.22 priority is 1, state is Full
  In area 0.0.0.0 interface vlan3902
  DR is 10.37.0.11 BDR is 10.37.0.22
  Options is 0
  Dead timer is due in 31 seconds
Neighbor 10.37.0.22 priority is 1, state is Full
  In area 0.0.0.0 interface vlan3908
  DR is 10.37.0.22 BDR is 10.37.0.21
  Options is 0
  Dead timer is due in 39 seconds
```

switch#

32.3.7.5 Viewing OSPFv3 Routes

The `show ipv6 routes` command provides an OSPFv3 option.

Example

- This command displays the switch’s OSPFv3 routes.

```
switch# show ipv6 route ospf
IPv6 Routing Table - 43 entries
Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP, R - RIP, A - Aggregate
  O  fd7a:3279:81a4:1112::/64  [150/11]
     via fe80::21c:41ff:fe00:d120, Ethernet12
  O  fd7a:3279:81a4:1114::/64  [150/11]
     via fe80::21c:41ff:fe00:d120, Ethernet12
  O  fd7a:3279:81a4:1124::/64  [10/20]
     via fe80::21c:41ff:fe01:5fe1, Vlan3901
     via fe80::21c:41ff:fe01:5fe1, Vlan3902
     via fe80::21c:41ff:fe01:5fe1, Vlan3908
  O  fd7a:3279:81a4:1a00::25/128  [150/11]
     via fe80::21c:41ff:fe00:d120, Ethernet12
  O  fd7a:3279:81a4:1a00::28/128  [150/11]
     via fd7a:3279:81a4:fe40::5, Vlan3908
```
32.4 OSPFv3 Examples

This section describes the commands required to configure three OSPFv3 topologies.

32.4.1 OSPFv3 Example 1

The AS in Example 1 contains two areas that are connected through two routers. The backbone area also contains an internal router that connects two links.

32.4.1.1 Example 1 Diagram

Figure 32-3 displays the Example 1 topology. Two ABRs connect area 0 and area 1 – Router A and Router B. Router C is an internal router that connects two links in area 0. Area 0 is normal; area 1 is stub.

Figure 32-3: OSPFv3 Example 1

Area 1 Configuration

Area 1 contains links to ABRs Router A and Router B.

- Router A is accessed through VLAN 301.
- Router B is accessed through VLAN 401.
- Designated Router (DR): Router A.
- Backup Designated Router (BDR): Router B.
- Each router defines an interface cost of 10.
- Router priority is not specified for either router on area 1.

Area 0 ABR Configuration

Area 0 contains links to ABRs Router A and Router B.

- Router A is accessed through VLAN 302.
- Router B is accessed through VLAN 402.
- Designated Router (DR): Router B.
- Backup Designated Router (BDR): Router A.
- Each router defines an interface cost of 20.
- Each router defines a retransmit-interval of 10.
- Each router defines a transmit-delay of 2.
• Router priority is specified such that Router B will be elected as the Designated Router.

**Area 0 IR Configuration**

Area 0 contains two links to an internal router.

• Router C is accessed through VLAN 501 and VLAN 502.
• VLAN 501 is configured as follows:
  • Interface cost of 20.
  • Retransmit-interval of 10.
  • Transmit-delay of 2.
• VLAN 502 is configured as follows:
  • Interface cost of 20.
  • Dead interval of 80 seconds.

### 32.4.1.2 Example 1 Code

This code configures the OSPFv3 instances on the three switches.

**Step 1** Configure the areas and router IDs.

a  Router A OSPFv3 instance configuration:

```bash
switch-A(config)#ipv6 router ospf 100
switch-A(config-router-ospfv3)#area 1 stub
switch-A(config-router-ospfv3)#router-id 10.17.0.1
```

b  Router B OSPFv3 instance configuration:

```bash
switch-B(config)#ipv6 router ospf 100
switch-B(config-router-ospfv3)#area 1 stub
switch-B(config-router-ospfv3)#router-id 10.17.0.2
```

c  Router C OSPFv3 instance configuration: interfaces:

```bash
switch-C(config)#ipv6 router ospf 100
switch-C(config-router-ospfv3)#router-id 10.17.0.3
```

**Step 2** Configure the interface OSPFv3 area and transmission parameters.

a  Router A interfaces:

```bash
switch-A(config)#interface vlan 301
switch-A(config-if-Vl301)#ipv6 ospf 100 area 1
switch-A(config-if-Vl301)#ospfv3 cost 10
switch-A(config-if-Vl301)#ospfv3 priority 6
switch-A(config-if-Vl301)#exit
switch-A(config)#interface vlan 302
switch-A(config-if-Vl302)#ipv6 ospf 100 area 0
switch-A(config-if-Vl302)#ospfv3 cost 20
switch-A(config-if-Vl302)#ospfv3 ipv6 retransmit-interval 10
switch-A(config-if-Vl302)#ospfv3 transmit-delay 2
switch-A(config-if-Vl302)#ospfv3 priority 4
```
b Router B interfaces:

```bash
switch-B(config)#interface vlan 401
switch-B(config-if-Vl401)#ipv6 ospf 100 area 1
switch-B(config-if-Vl401)#ospfv3 cost 10
switch-B(config-if-Vl401)#ospfv3 priority 4
switch-B(config-if-Vl401)#exit
switch-B(config)#interface vlan 402
switch-B(config-if-Vl402)#ipv6 ospf 100 area 0
switch-B(config-if-Vl402)#ospfv3 cost 20
switch-B(config-if-Vl402)#ospfv3 ipv6 retransmit-interval 10
switch-B(config-if-Vl402)#ospfv3 transmit-delay 2
switch-B(config-if-Vl402)#ospfv3 priority 6
```

c Router C interfaces:

```bash
switch-C(config)#interface vlan 501
switch-C(config-if-Vl501)#ipv6 ospf 100 area 0
switch-C(config-if-Vl501)#ospfv3 cost 20
switch-C(config-if-Vl501)#ospfv3 ipv6 retransmit-interval 10
switch-C(config-if-Vl501)#ospfv3 transmit-delay 2
switch-C(config-if-Vl501)#exit
switch-C(config)#interface vlan 502
switch-C(config-if-Vl502)#ipv6 ospf 100 area 0
switch-C(config-if-Vl502)#ospfv3 cost 20
switch-C(config-if-Vl502)#ospfv3 dead-interval 80
```

32.4.2 OSPFv3 Example 2

The AS in Example 2 contains three areas. Area 0 connects to the other areas through different routers and contains an internal router connecting two links. Area 0 is normal; the other areas are stub areas.
32.4.2.1  Example 2 Diagram

Figure 32-4 displays the Example 2 topology. One ABR (Router B) connects area 0 and area 1; another ABR (router C) connects area 0 and area 2. Router A is an internal router that connects two links in area 0.

Figure 32-4: OSPFv3 Example 2

Area 1 Configuration
Area 1 contains one link that is accessed by Router B.

- Router B is accessed through VLAN 601.
- The router defines a interface cost of 10.

Area 2 Configuration
Area 2 contains one link that is accessed by Router C.

- Router C is accessed through VLAN 802.
- The router defines a interface cost of 20.

Area 0 ABR Configuration
One ABR Router B link connects area 1 to area 0. One ABR Router C link connects area 0 to area 2.

- Router B is accessed through VLAN 602.
- Router C is accessed through VLAN 801.
- Designated Router (DR): Router B.
- Backup Designated Router (BDR): Router C.
- Each router defines an interface cost of 20.
- Each router defines a retransmit-interval of 10.
- Each router defines a transmit-delay of 2.

**Area 0 IR Configuration**

Area 0 contains links connected by an internal router.
- Router A is accessed through VLAN 701 and 702.
- The VLAN 701 link is configured as follows:
  - Interface cost of 10.
- The VLAN 702 link is configured as follows:
  - Interface cost of 20.
  - Retransmit-interval of 10.
  - Transmit-delay of 2.

### 32.4.2.2 Example 2 Code

**Step 1** Configure the areas and router IDs.

a. Router A OSPFv3 instance configuration:
   ```
   switch-A(config)#ipv6 router ospf 200
   switch-A(config-router-ospfv3)#router-id 10.24.1.10
   ```

b. Router B OSPFv3 instance configuration:
   ```
   switch-B(config)#ipv6 router ospf 200
   switch-B(config-router-ospfv3)#area 1 stub
   switch-B(config-router-ospfv3)#router-id 10.24.2.10
   ```

c. Router C OSPFv3 instance configuration:
   ```
   switch-C(config)#ipv6 router ospf 200
   switch-C(config-router-ospfv3)#area 1 stub
   switch-C(config-router-ospfv3)#router-id 10.25.2.12
   ```

**Step 2** Configure the interface OSPFv3 area and transmission parameters.

a. Router A interfaces:
   ```
   switch-A(config)#interface vlan 701
   switch-A(config-if-Vl701)#ipv6 ospf 200 area 0
   switch-A(config-if-Vl701)#ospfv3 cost 10
   switch-A(config-if-Vl701)#exit
   switch-A(config)#interface vlan 702
   switch-A(config-if-Vl702)#ipv6 ospf 200 area 0
   switch-A(config-if-Vl702)#ospfv3 cost 20
   switch-A(config-if-Vl702)#ospfv3 ipv6 retransmit-interval 10
   switch-A(config-if-Vl702)#ospfv3 transmit-delay 2
   ```
b  Router B interfaces:

```
switch-B(config)#interface vlan 601
switch-B(config-if-Vl601)#ospfv3 200 area 1
switch-B(config-if-Vl601)#ospfv3 cost 10
switch-B(config-if-Vl601)#exit
switch-B(config)#interface vlan 602
switch-B(config-if-Vl602)#ospfv3 200 area 0
switch-B(config-if-Vl602)#ospfv3 cost 20
switch-B(config-if-Vl602)#ospfv3 ipv6 retransmit-interval 10
switch-B(config-if-Vl602)#ospfv3 transmit-delay 2
switch-B(config-if-Vl602)#ospfv3 priority 6
```

c  Router C interfaces:

```
switch-C(config)#interface vlan 801
switch-C(config-if-Vl801)#ospfv3 200 area 0
switch-C(config-if-Vl801)#ospfv3 cost 20
switch-C(config-if-Vl801)#ospfv3 ipv6 retransmit-interval 10
switch-C(config-if-Vl801)#ospfv3 transmit-delay 2
switch-C(config-if-Vl801)#exit
switch-C(config)#interface vlan 802
switch-C(config-if-Vl802)#ospfv3 200 area 2
switch-C(config-if-Vl802)#ospfv3 cost 20
switch-C(config-if-Vl802)#ospfv3 dead-interval 80
```

32.4.3  OSPFv3 Example 3

The AS in Example 3 contains two areas that connect through one ABR. Each area also contains an ASBR that connects static routes to the AS.
32.4.3.1 Example 3 Diagram

Figure 32-5 displays the Example 3 topology. One ABR connects area 0 and area 1. Router C is an ABR that connects the areas. Router A is an internal router that connects two links in area 1. Router D and Router E are internal routers that connect links in area 0. Router B and Router F are ASBRs that connect static routes outside the AS to area 1 and area 0, respectively.

Figure 32-5: OSPFv3 Example 3

Area 0 ABR Configuration
ABR Router C connects one area 0 link to an area 1 link.
- Router C is accessed through VLAN 1302.
- All interface OSPFv3 parameters are set to their default values.

Area 0 IR Configuration
Area 0 contains two internal routers, each of which connects two of the three links in the area.
- Router D is accessed through VLAN 1401 and VLAN 1402.
- Router E is accessed through VLAN 1501 and VLAN 1502.
- All interface OSPFv3 parameters are set to their default values.

Area 0 ASBR Configuration
ASBR Router F connects one area 0 link to an external link.
- Router F is accessed through VLAN 1601.
- Router F connects to the external AS through VLAN 1602.
- All interface OSPFv3 parameters are set to their default values.
Area 1 ABR Configuration
ABR Router C connects one area 0 link to an area 1 link.
- Router C is accessed by area 1 through VLAN 1301.
- Router C is accessed by area 0 through VLAN 1302.
- All interface OSPFv3 parameters are set to their default values.

Area 1 IR Configuration
Area 1 contains one internal router that connects two links in the area.
- Router A is accessed through VLAN 1101 and VLAN 1102.
- All interface OSPFv3 parameters are set to their default values.

Area 1 ASBR Configuration
ASBR Router B connects one area 1 link to an external link.
- Router B is access through VLAN 1201.
- Router B connects to the external AS through VLAN 1202.
- All interface OSPFv3 parameters are set to their default values.

32.4.3.2 Example 3 Code

Step 1 Configure the areas and router IDs.

a  Router A OSPFv3 instance configuration:
switch-A(config)#ipv6 router ospf 300
switch-A(config-router-ospfv3)#router-id 10.12.15.10
switch-A(config-router-ospfv3)#area 1 stub

b  Router B OSPFv3 instance configuration:
switch-B(config)#ipv6 router ospf 300
switch-B(config-router-ospfv3)#router-id 10.12.15.12
switch-B(config-router-ospfv3)#area 1 stub

c  Router OSPFv3 instance configuration:
switch-C(config)#ipv6 router ospf 300
switch-C(config-router-ospfv3)#router-id 10.12.15.13
switch-C(config-router-ospfv3)#area 1 stub

d  Router D OSPFv3 instance configuration:
switch-D(config)#ipv6 router ospf 300
switch-D(config-router-ospfv3)#router-id 10.12.15.14

e  Router E OSPFv3 instance configuration:
switch-E(config)#ipv6 router ospf 300
switch-E(config-router-ospfv3)#router-id 10.12.15.15

f  Router F OSPFv3 instance configuration:
switch-F(config)#ipv6 router ospf 300
switch-F(config-router-ospfv3)#router-id 10.12.15.31
Step 2 Configure the interfaces.

a Router A interfaces:

switch-A(config)#interface vlan 1101
switch-A(config-if-Vl1101)#ospfv3 300 area 1
switch-A(config-if-Vl1101)#exit

b Router B interfaces:

switch-B(config)#interface vlan 1201
switch-B(config-if-Vl1201)#ospfv3 300 area 1
switch-B(config-if-Vl1201)#exit

c Router C interfaces:

switch-C(config)#interface vlan 1301
switch-C(config-if-Vl1301)#ospfv3 300 area 1
switch-C(config-if-Vl1301)#exit
switch-C(config)#interface vlan 1302
switch-C(config-if-Vl1302)#ospfv3 300 area 0

d Router D interfaces:

switch-D(config)#interface vlan 1401
switch-D(config-if-Vl1401)#ospfv3 300 area 0
switch-D(config-if-Vl1401)#exit
switch-D(config)#interface vlan 1402
switch-D(config-if-Vl1402)#ospfv3 300 area 0

e Router E interfaces:

switch-E(config)#interface vlan 1501
switch-E(config-if-Vl1501)#ospfv3 300 area 0
switch-E(config-if-Vl1501)#exit
switch-E(config)#interface vlan 1502
switch-E(config-if-Vl1502)#ospfv3 300 area 0

f Router F interfaces:

switch-F(config)#interface vlan 1601
switch-F(config-if-Vl1601)#ospfv3 300 area 0
switch-F(config-if-Vl1601)#exit
32.5 OSPFv3 Commands

**Global Configuration Mode**
- clear ospfv3 ipv6 force-spf
- ipv6 router ospf

**Interface Configuration Mode**
- ipv6 ospf area
- ospfv3 authentication ipsec spi
- ospfv3 cost
- ospfv3 dead-interval
- ospfv3 encryption ipsec spi
- ospfv3 hello-interval
- ospfv3 ipv6 retransmit-interval
- ospfv3 network
- ospfv3 priority
- ospfv3 transmit-delay

**Router-OSPFv3 Configuration Mode**
- adjacency exchange-start threshold (OSPFv3)
- area authentication ipsec spi
- area default-cost (OSPFv3)
- area encryption ipsec spi
- area nssa (OSPFv3)
- area nssa default-information-originate (OSPFv3)
- area not-so-stubby lsa type-7 convert type-5 (OSPFv3)
- area range (OSPFv3)
- area stub (OSPFv3)
- default-information originate (OSPFv3)
- default-metric (OSPFv3)
- distance ospf intra-area (OSPFv3)
- log-adjacency-changes (OSPFv3)
- max-metric router-lsa (OSPFv3)
- maximum-paths (OSPFv3)
- no area (OSPFv3)
- passive-interface (OSPFv3)
- redistribute (OSPFv3)
- router-id (OSPFv3)
- shutdown (OSPFv3)
- timers
- timers lsa rx min interval (OSPFv3)
- timers lsa tx delay initial (OSPFv3)
- timers spf delay initial (OSPFv3)

**Display Commands**
- show ipv6 ospf
- show ipv6 ospf border-routers
- show ipv6 ospf database
- show ipv6 ospf database<link-state details>
- show ipv6 ospf database <link state list>
- show ipv6 ospf database link
- show ipv6 ospf database link if-name
- show ipv6 ospf database link if-type
- show ipv6 ospf interface
- show ipv6 ospf ls-a-log
- show ipv6 ospf neighbor
- show ipv6 ospf neighbor state
- show ipv6 ospf neighbor summary
- show ipv6 ospf spf-log
- show ospfv3
adjacency exchange-start threshold (OSPFv3)

The adjacency exchange-start threshold command sets the exchange-start options for an OSPF instance.

The no adjacency exchange-start threshold and default adjacency exchange-start threshold command resets the default by removing the corresponding adjacency exchange-start threshold command from running-config.

**Command Mode**
Router-OSPFv3 Configuration

**Command Syntax**

```
adjacency exchange-start threshold peers
no adjacency exchange-start threshold
default adjacency exchange-start threshold
```

**Parameters**
- **peers** Value ranges from 1 4294967295. Default value is 10.

**Example**
- This command sets the adjacency exchange start threshold to 156923.

```
switch(config)#ipv6 router ospf 3
switch(config-router-ospf3)#adjacency exchange-start threshold 156923
switch(config-router-ospf3)#
```
area authentication ipsec spi

The `area authentication ipsec spi` command configures OSPFv3 authentication on an area.

The `default area authentication` and `no area authentication` commands delete the OSPFv3 authentication on an area.

**Command Mode**

Router-OSPFv3 Configuration

**Command Syntax**

```
area area_id authentication ipsec spi spi_value {md5 | sha1} {0 unencrypted_key | 7 hidden_key | KEY}

area area_id authentication ipsec spi spi_value {md5 | sha1} passphrase {0 unencrypted_key | 7 hidden_key | LINE}

default area area_id authentication

no area area_id authentication
```

**Parameters**

- `area area_id` configures OSPF area ID in either IP address or decimal formats. The value for decimal format ranges from 0 to 4294967295.
- `spi spi_value` configures the IPsec Security Parameter Index. The value ranges from 0 to 4294967295.
- `md5` configures HMAC-MD5 hash algorithm.
- `sha1` configures HMAC-SHA1 algorithm.
- `0 unencrypted_key` configures either a 192 bit 3DES key or 128/192/256 bit AES key in an unencrypted format.
- `7 encrypted_key` configures either a 192 bit 3DES key or 128/192/256 bit AES key in an encrypted format.
- `KEY` configures either a 128 bit MD5 key or a 140 bit SHA1 key.
- `passphrase` configures passphrase for authentication and encryption. Options include:
  - `0 unencrypted_passphrase` configures an unencrypted key.
  - `7 encrypted_passphrase` configures an encrypted key.
  - `LINE` uses passphrase string to derive keys for authentication and encryption.

**Related Commands**

- `ospfv3 authentication ipsec spi`
- `area encryption ipsec spi`

**Guidelines**

Passphrase and key value are exclusive. MD5 and SHA1 keys are derived from the configured passphrase.

**Restriction**

On the same area, EOS allows security configuration with either AH or ESP but not both. We can have one area configured with AH and another with ESP.
Chapter 32: Open Shortest Path First – Version 3

OSPFv3 Commands

Examples

• This command configures OSPFv3 authentication on an area with MD5 hash algorithm.

```}
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#area 0.0.0.0 authentication ipsec spi 34 md5 7 $1$cNpcrQl1czqdvKAzKl9YVr6i7+R3niuWouDJKYCFNs4/XOWG/Iap5Q==
switch(config-router-ospf3)#show active
switch(config-router-ospf3)#
```

• This command configures OSPFv3 authentication on an area with SHA1 algorithm.

```}
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#area 0.0.0.0 authentication ipsec spi 5789 sha1 passphrase 7 Ab754G0OHbGllIKqlCl7lyUKscU1pPtpvcQxQihJjm1OuGJDb4bLWXsDKhVMNo6
switch(config-router-ospf3)#show active
ipv6 router ospf 9
area 0.0.0.0 authentication ipsec spi 5789 sha1 passphrase 7 Ab754G0OHbGllIKqlCl7lyUKscU1pPtpvcQxQihJjm1OuGJDb4bLWXsDKhVMNo6
switch(config-router-ospf3)#
```

• This command deletes the OSPFv3 authentication on an area.

```}
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#show active
ipv6 router ospf 9
  area 1.1.1.1 authentication ipsec spi 2437 md5 7 cNpcrQl1czqdvKAzKl9YVr6i7+R3niuWouDJKYCFNs4/XOWG/Iap5Q==
  area 0.0.0.0 authentication ipsec spi 5789 sha1 passphrase 7 Ab754G0OHbGllIKqlCl7lyUKscU1pPtpvcQxQihJjm1OuGJDb4bLWXsDKhVMNo6
switch(config-router-ospf3)#no area 0.0.0.0 authentication
switch(config-router-ospf3)#show active
ipv6 router ospf 9
  area 1.1.1.1 authentication ipsec spi 2437 md5 7 cNpcrQl1czqdvKAzKl9YVr6i7+R3niuWouDJKYCFNs4/XOWG/Iap5Q==
switch(config-router-ospf3)#
```
area default-cost (OSPFv3)

The **area default-cost** command sets the cost for the default summary routes sent into an area. When the **area default-cost** command is not configured for an area, the default-cost of that area is set to 10.

The **no area default-cost** and **default area default-cost** command resets the default-cost value of the specified area to 10 by removing the corresponding **area default-cost** command from **running-config**. The **no area (OSPFv3)** command removes all area commands for the specified area from **running-config**, including the **area default-cost** command.

**Command Mode**
- Router-OSPFv3 Configuration

**Command Syntax**

```
area area_id default-cost def_cost
no area area_id default-cost
default area area_id default-cost
```

**Parameters**
- **area_id**  area number. `<0` to `4294967295>` or `<0.0.0.0` to `255.255.255.255>`
  - `Running-config` stores value in dotted decimal notation.
- **def_cost**  Values range from 1 to 65535.

**Example**
- These commands configure a cost of 15 for default summary routes that an ABR sends into area 100.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#area 100 default 15
switch(config-router-ospf3)#show active
ipv6 router ospf 9
  area 0.0.0.100 default-cost 15
switch(config-router-ospf3)#
```
area encryption ipsec spi

The `area encryption ipsec spi` command configures OSPFv3 security on an area.

The `default area area_id encryption` and `no area area_id encryption` commands delete the OSPFv3 security on an area.

Command Mode

Router-OSPFv3 Configuration

Command Syntax

```
area area_id encryption ipsec spi spi_value esp {3des-cbc | aes-128-cbc | aes-192-cbc | aes-256-cbc} {0 unencrypted_key | 7 encrypted_key} {md5 | sha1} {0 unencrypted_key | 7 encrypted_key | KEY}

area area_id encryption ipsec spi spi_value esp null {md5 | sha1} {0 unencrypted_key | 7 encrypted_key | KEY}

area area_id encryption ipsec spi spi_value esp {3des-cbc | aes-128-cbc | aes-192-cbc | aes-256-cbc | null} {md5 | sha1} passphrase {0 unencrypted_passphrase | 7 encrypted_passphrase | LINE}

default area area_id encryption

no area area_id encryption
```

Parameters

- `area area_id` configures OSPF area ID in either IP address or decimal formats. The value for decimal format ranges from 0 to 4294967295.
- `spi spi_value` configures the value for IPsec Security Parameter Index. The value ranges from 0 to 4294967295.
- `3des-cbc` configures ESP with 3DES-CBC encryption.
- `aes-128-cbc` configures ESP with AES-128-CBC encryption.
- `aes-192-cbc` configures ESP with AES-192-CBC encryption.
- `aes-256-cbc` configures ESP with AES-256-CBC encryption.
- `null` configures ESP with null encryption.
- `0 unencrypted_key` configures either a 192 bit 3DES key or 128/192/256 bit AES key in an unencrypted format.
- `7 encrypted_key` configures either a 192 bit 3DES key or 128/192/256 bit AES key in an encrypted format.
- `KEY` configures either a 128 bit MD5 key or a 140 bit SHA1 key.
- `md5` configures HMAC-MD5 hash algorithm.
- `sha1` configures HMAC-SHA1 algorithm.
- `passphrase` configures passphrase for authentication and encryption. Options include:
  - `0 unencrypted_passphrase` configures an unencrypted key.
  - `7 encrypted_passphrase` configures an encrypted key.
  - `LINE` uses passphrase string to derive keys for authentication and encryption.

Related Commands

- `area authentication ipsec spi`
**ospfv3 encryption ipsec spi**

**Guidelines**
Passphrase and key value are exclusive. MD5 and SHA1 keys are derived from the configured passphrase.

**Restriction**
On the same area, EOS allows security configuration with either AH or ESP but not both. We can have one area configured with AH and another with ESP.

**Examples**
- This command configures OSPFv3 security on an area with 3DES-CBC encryption and MD5 hash algorithm.

```plaintext
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#area 0.0.0.0 encryption ipsec spi 5678 esp 3des-cbc md5 passphrase 0 8FD6158BBFEB1ADD961241DB4169D411
switch(config-router-ospf3)#show active
ipv6 router ospf 9
  area 0.0.0.0 encryption ipsec spi 5678 esp 3des-cbc md5 passphrase 7 $10$cNpcrQl1czqdvKAzKLtYVr617+R3niuWouBKYC3PNs4/XWIG/1ap5Q==
switch (config-router-ospf3)#
```
- This command deletes the OSPFv3 security on an area.

```plaintext
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#show active
ipv6 router ospf 9
  area 0.0.0.0 encryption ipsec spi 5678 esp 3des-cbc md5 passphrase 7 $10$cNpcrQl1czqdvKAzKLtYVr617+R3niuWouBKYC3PNs4/XWIG/1ap5Q==
switch(config-router-ospf3)#no area 0.0.0.0 encryption
switch(config-router-ospf3)#show active
ipv6 router ospf 9
switch(config-router-ospf3)#
```
area nssa (OSPFv3)

The `area nssa` command configures an OSPFv3 area as a not-so-stubby area (NSSA). All routers in an AS must specify the same area type for identically numbered areas.

NSSA ASBRs advertise external LSAs that are part of the area, but do not advertise external LSAs from other areas.

Areas are normal by default; area type configuration is required only for stub NSSA areas. Area 0 is always a normal area and cannot be configured through this command.

The `no area nssa` command configures the specified area as a normal area by removing the specified `area nssa` command from `running-config`.

**Command Mode**

Router-OSPFv3 Configuration

**Command Syntax**

```
area area_id nssa [TYPE]
noc area area_id nssa [TYPE]
default area area_id nssa [TYPE]
```

**Parameters**

- `area_id`
  - Valid formats: integer <1 to 4294967295> or dotted decimal <0.0.0.1 to 255.255.255.255>
  - Area 0 (or 0.0.0.0) is not configurable; it is always normal.
  - Running-config stores value in dotted decimal notation.

- `TYPE`
  - Values include:
    - <no parameter>
    - nssa-only

**Example**

- This command configures area 3 as a NSSA area.

```
switch(config)#ipv6 router ospf 1
switch(config-router-ospf3)#area 3 nssa nssa-only
switch(config-router-ospf3)#
```
area nssa default-information-originate (OSPFv3)

The **area nssa default-information-originate** command sets an area as an NSSA and the generation of a type 7 default LSAs is created if a default route exists in the routing table.

The switch supports three area types:

Areas are **normal** by default; area type configuration is required only for stub NSSA areas. Area 0 is always a normal area and cannot be configured through this command.

The **no area** and **default area** commands remove the specified area from the OSPFv3 instance by deleting all **area** commands from **running-config** for the specified area, including the **area default-cost (OSPFv3)** command.

The **no area stub** and **default area stub** commands configure the specified area as a normal area.

**Command Mode**

Router-OSPFv3 Configuration

**Command Syntax**

```
area area_id nssa default-information-originate [VALUE] [TYPE] [EXCL]
no area area_id nssa default-information-originate [VALUE] [TYPE] [EXCL]
default area area_id nssa default-information-originate [VALUE] [TYPE] [EXCL]
```

All parameters except **area_id** can be placed in any order.

**Parameters**

- **area_id**
  - Valid formats: integer <1 to 4294967295> or dotted decimal <0.0.0.1 to 255.255.255.255>
  - Area 0 (or 0.0.0.0) is not configurable; it is always **normal**.
  - **Running-config** stores value in dotted decimal notation.
- **VALUE** Values include:
  - <no parameter>
  - **metric** <1-65535>
- **TYPE** Values include:
  - <no parameter>
  - **metric-type** <1-2>
- **EXCL** Values include:
  - <no parameter>
  - **nssa-only**

**Example**

- These commands sets area 1 as NSSA only and generates a type 7 default LSA if a default route exists in the routing table.
  
  ```
  switch(config-router-ospf3)#area 3 nssa default-information-originate nssa-only
  switch(config-router-ospf3)#
  ```

- These commands generates a type 7 default route.
  
  ```
  switch(config-router-ospf3)#area 3 nssa default-information-originate
  switch(config-router-ospf3)#
  ```
area not-so-stubby lsa type-7 convert type-5 (OSPFv3)

The area not-so-stubby lsa type-7 convert type-5 command configures the switch to always translate Type-7 link-state advertisement (LSAs) to Type-5 LSAs.

The no area not-so-stubby lsa type-7 convert type-5 and no area not-so-stubby lsa type-7 convert type-5 commands allow LSAs to be translated dynamically by removing the no area not-so-stubby lsa type-7 convert type-5 command from running-config.

Command Mode
Router-OSPfv3 Configuration

Command Syntax

area area_id not-so-stubby lsa type-7 convert type-5
no area_id not-so-stubby lsa type-7 convert type-5
default area_id not-so-stubby lsa type-7 convert type-5

Parameters

- area_id
  - Valid formats: integer <1 to 4294967295> or dotted decimal <0.0.0.1 to 255.255.255.255>
  - Area 0 (or 0.0.0.0) is not configurable; it is always normal.
  - Running-config stores value in dotted decimal notation.

Example

- These commands configure the switch to always translate Type-7 link-state advertisement (LSAs) to Type-5 LSAs.

  switch(config)#ipv6 router ospf 3
  switch(config-router-ospf3)#area 3 not-so-stubby lsa type-7 convert type-5
  switch(config-router-ospf)#
area range (OSPFv3)

The area range command is used by OSPFv3 area border routers to summarize routes. The no area range and default area range commands remove the area-range by deleting the corresponding area range command from running-config.

Command Mode
Router-OSPFv3 Configuration

Command Syntax

code{area area_id range net_addr [ADVERTISE_SETTING] [COST_SETTING]}
no area area_id range net_addr [ADVERTISE_SETTING] [COST_SETTING]
default area area_id range net_addr [ADVERTISE_SETTING] [COST_SETTING]

Parameters
- area_id 0 to 4294967295 or 0.0.0.0 to 255.255.255.255
- net_addr
- ADVERTISE_SETTING specifies the LSA advertising activity. Values include
  - <no parameter>
  - advertise
  - not-advertise
- COST_SETTING Values include
  - <no parameter>
  - cost range_cost Value ranges from 1 to 65535.

Examples
- These commands summarize routes at an area boundary 1.
  ```
  switch(config)#ipv6 router ospf 1
  switch(config-router-ospf6)#area 1 range 2001:0DB8:0:1::/64
  switch(config-router-ospf6)#
  ```
- These commands modify the address range status to DoNotAdvertise.
  ```
  switch(config)#ipv6 router ospf 1
  switch(config-ospf6-router)#area 1 range 2001:0DB8:0:1::/64 not-advertise
  switch(config-ospf6-router)#
  ```
area stub (OSPFv3)

The `area stub` command configures the area type of an OSPFv3 area. Areas are `normal` by default.

The `no area stub` command configures the specified area as a normal area.

**Command Mode**

Router-OSPFv3 Configuration

**Command Syntax**

```
area area_id stub
no area area_id stub
default area area_id stub
```

**Parameters**

- `area_id`
  - Valid formats: integer `<1` to `4294967295>` or dotted decimal `<0.0.0.1` to `255.255.255.255>`
  - Area 0 (or `0.0.0.0`) is not configurable; it is always `normal`.
  - *Running-config* stores value in dotted decimal notation.

**Examples**

- This command configures area 45 as a stub area.
  ```
  switch(config)#ipv6 router ospf 3
  switch(config-router-ospf3)#area 45 stub
  switch(config-router-ospf3)#
  ```
- This command configures area `10.92.148.17` as a stub area.
  ```
  switch(config-router-ospf3)#area 10.92.148.17 stub
  switch(config-router-ospf3)#
  ```
clear ospfv3 ipv6 force-spf

The clear ospfv3 ipv6 force-spf command starts the SPF algorithm without clearing the OSPF database.

Command Mode
Privileged EXEC

Command Syntax
    clear ospfv3 ipv6 force-spf [VRF_INSTANCE]

Parameters
•  VRF_INSTANCE Values include:
  •  <no parameter> Action is performed in the default VRF.
  •  vrf vrf_name Action is performed in the specified VRF.

Example
•  This command restarts the SPF algorithm in the default VRF without first clearing the OSPFv3 database.

    switch(config)#clear ospfv3 ipv6 force-spf
    switch(config)#
default-information originate (OSPFv3)

The `default-information originate` command generates a default external route into an OSPF domain.

The `no default-information originate` and `default default-information originate` command removes the configuration from the `running-config`.

Command Mode

Router-OSPFv3 Configuration

Command Syntax

```
default-information originate [DURATION][VALUE][TYPE][MAP]
nodefault-information originate
default default-information originate
```

All parameters can be placed in any order.

Parameters

- **DURATION** Values include:
  - `<no parameter>`
  - `always`
- **VALUE** Values include:
  - `<no parameter>`
  - `metric <1-65535>`
- **TYPE** Values include:
  - `<no parameter>`
  - `metric-type <1-2>`
- **MAP** Values include:
  - `<no parameter>`
  - `route-map map_name`

Examples

- These commands will advertise the OSPFv3 default route regardless of whether the switch has a default route configured.

  ```
  switch(config)#ipv6 router ospf 1
  switch(config-router-ospf3)#default-information originate always
  switch(config-router-ospf3)#show active
  ipv6 route ospf 1
  default-information originate always
  ```

- These commands configures OSPF area 1 as metric of 100 for the default route with an external metric type of Type 1.

  ```
  switch(config)#ipv6 router ospf 1
  switch(config-router-ospf3)#default-information originate metric 100 metric-type 1
  switch(config-router-ospf3)#show active
  ipv6 route ospf 1
  default-information originate metric 100 metric-type 1
  ```
**default-metric (OSPFv3)**

The `default-metric` command sets default metric value for routes redistributed into the OSPFv3 domain.

The `no default-metric` and `default default-metric` commands restores the default metric to its default value of 10 by removing the `default-metric` command from *running-config*.

**Command Mode**

Router-OSPFv3 Configuration

**Command Syntax**

```
default-metric def_metric  
no default-metric  
default default-metric
```

**Parameters**

- `def_metric` Values range from 1 to 65535. Default value is 10.

**Example**

- These commands configure a default metric of 30 for routes redistributed into OSPFv3.

  ```
  switch(config)#ipv6 router ospf 9  
  switch(config-router-ospf3)#default-metric 30  
  switch(config-router-ospf3)#show active  
  ipv6 router ospf 9  
  default-metric 30  
  switch(config-router-ospf3)#
  ```
distance ospf intra-area (OSPFv3)

The distance ospf intra-area command sets the administrative distance for routes in a single OSPFv3 area. The default is 110.

The no distance ospf intra-area and default distance ospf intra-area commands remove the distance ospf intra-area command from running-config, returning the OSPFv3 intra-area distance setting to the default value of 110.

**Command Mode**

Router-OSPFv3 Configuration

**Command Syntax**

distance ospf intra-area distance
no distance ospf intra-area
default distance ospf intra-area

**Parameters**

- **distance** Values range from 1 to 255. Default is 110.

**Example**

- This command configures a distance of 90 for all OSPFv3 intra-area routes on the switch.

```plaintext
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#distance ospf intra-area 90
switch(config-router-ospf3)#show active
ipv6 router ospf 9
distance ospf intra-area 90
switch(config-router-ospf3)#
```
**ipv6 ospf area**

The **ipv6 ospf area** command enables OSPFv3 on the interface and associates the area to the interface.

OSPFv3 areas are configured in by **no area (OSPFv3)** commands in router-OSPFv3 configuration mode.

The **no ipv6 ospf area** and **default ipv6 ospf area** commands disable OSPFv3 on the configuration mode interface by removing the corresponding **ipv6 ospf area** command from **running-config**.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ipv6 ospf  process_id  area  area_id
no ipv6 ospf  process_id  [area  area_id]
default ipv6 ospf  process_id  [area  area_id]
```

**Parameters**

- **process_id** 
  Values range from 1 to 65535.

- **area_id**
  
  - Valid formats: integer <0 to 4294967295> or dotted decimal <0.0.0.0 to 255.255.255.255>
  
  - **Running-config** stores value in dotted decimal notation.

**Example**

- These commands enable OSPFv3 on VLAN interface 200 and associates area 0 to the interface.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 ospf 9 area 0
switch(config-if-Vl200)#show active
interface Vlan200
    ipv6 ospf 9 area 0.0.0.0
switch(config-if-Vl200)#
```
ospfv3 authentication ipsec spi

The `ospfv3 authentication ipsec spi` command configures OSPFv3 authentication on an interface. The `default ospfv3 authentication` and `no ospfv3 authentication` commands delete the OSPFv3 authentication on an interface.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

```
ospfv3 authentication ipsec spi spi_value {md5 | sha1} {0 unencrypted_key | 7 hidden_key | KEY}
```

```
ospfv3 authentication ipsec spi spi_value {md5 | sha1} passphrase {0 unencrypted_passphrase | 7 encrypted_passphrase | LINE}
```

```
default ospfv3 authentication
```

```
no ospfv3 authentication
```

**Parameters**

- `spi spi_value` configures IPsec Security Parameter Index. The value ranges from 0 to 4294967295.
- `md5` configures HMAC-MD5 hash algorithm.
- `sha1` configures HMAC-SHA1 algorithm.
- `0 unencrypted_key` configures either a 192 bit 3DES key or 128/192/256 bit AES key in an unencrypted format.
- `7 encrypted_key` configures either a 192 bit 3DES key or 128/192/256 bit AES key in an encrypted format.
- `KEY` configures either a 128 bit MD5 key or a 140 bit SHA1 key.
- `passphrase` configures passphrase for authentication and encryption. Options include:
  - `0 unencrypted_passphrase` configures an unencrypted passphrase.
  - `7 encrypted_passphrase` configures an encrypted passphrase.
  - `LINE` uses passphrase string to derive keys for authentication and encryption.

**Related Commands**

- `area authentication ipsec spi`
- `ospfv3 encryption ipsec spi`

**Guidelines**

Passphrase and key value are exclusive. MD5 and SHA1 keys are derived from the configured passphrase.

Arista devices also support the legacy `ipv6 ospf authentication ipsec spi` command in certain software releases of the EOS.

**Restriction**

On the same interface, EOS allows security configuration with either AH or ESP but not both. We can have one interface configured with AH and another with ESP.
Examples

- This command configures OSPFv3 authentication on an interface with MD5 hash algorithm.

  ```
  switch(config)#interface ethernet 9
  switch(config-if-Et9)#ospfv3 authentication ipsec spi 3456 md5 0 8FD6158BFE81ADD961241D0E4169D411
  switch(config-if-Et9)#show active
  interface Ethernet9
  no switchport
  ospfv3 authentication ipsec spi 3456 md5 7 $1$xtmcMSFpZEn+Njp8Ib4qRYVoYKcjsrYuv6dx10+nSwKQdaisRt2RPTQ==
  switch(config-if-Et9)#
  ```

- This command configures OSPFv3 authentication on an interface with SHA1 algorithm.

  ```
  switch(config)#interface ethernet 9
  switch(config-if-Et9)#ospfv3 authentication ipsec spi 987 sha1 7 $1$VmUkWk6IL2S343bR3BbH0RhgvxHhwBpfvB4VXKNOQF7HJBp5VvXTfBaVYbCkWU
  switch(config-if-Et9)#show active
  interface Ethernet9
  no switchport
  ospfv3 authentication ipsec spi 987 sha1 7 $1$VmUkWk6IL2S343bR3BbH0RhgvxHhwBpfvB4VXKNOQF7HJBp5VvXTfBaVYbCkWU
  switch(config-if-Et9)#
  ```

- This command deletes the OSPFv3 authentication on an interface.

  ```
  switch(config)#interface ethernet 9
  switch(config-if-Et9)#show active
  interface Ethernet9
  no switchport
  ospfv3 authentication ipsec spi 3456 md5 7 $1$xtmcMSFpZEn+Njp8Ib4qRYVoYKcjsrYuv6dx10+nSwKQdaisRt2RPTQ==
  switch(config-if-Et9)#no ospfv3 authentication
  switch(config-if-Et9)#show active
  interface Ethernet9
  no switchport
  switch(config-if-Et9)#
  ```
ospfv3 cost

The `ospfv3 cost` command sets the OSPFv3 cost for the interface. The default OSPFv3 cost is 10. The `no ospfv3 cost` and `default ospfv3 cost` commands restore the default cost of 10 for the configuration mode interface by removing the corresponding `ospfv3 cost` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
```plaintext
ospfv3 cost interface_cost
no ospfv3 cost
default ospfv3 cost
```

**Parameters**
- `interface_cost` Value ranges from 1 to 65535; default is 10.

**Guideline**
Arista devices also support the legacy `ipv6 ospf cost` command in certain software releases of the EOS.

**Example**
- This command configures a cost of 50 for VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ospfv3 cost 50
switch(config-if-Vl200)#show active
table:
  Interface Vlan200
    ospfv3 cost 50

switch(config-if-Vl200)#
```
ospfv3 dead-interval

The `ospfv3 dead-interval` command sets the OSPFv3 dead interval.

The `no ospfv3 dead-interval` and `default ospfv3 dead-interval` commands restore the default dead interval of 40 seconds on the configuration mode interface by removing the corresponding `ospfv3 dead-interval` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
```
ospfv3 dead-interval time
no ospfv3 dead-interval
default ospfv3 dead-interval
```

**Parameters**
- `time` Value ranges from 1 to 65535; default is 40.

**Guideline**
Arista devices also support the legacy `ipv6 ospf dead-interval` command in certain software releases of the EOS.

**Example**
- This command configures a dead interval of 75 seconds for VLAN 200.
```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ospfv3 dead-interval 75
switch(config-if-Vl200)#show active
interface Vlan200
    ospfv3 dead-interval 75
switch(config-if-Vl200)#
```
ospfv3 encryption ipsec spi

The ospfv3 encryption ipsec spi command configures OSPFv3 security on an interface. The default ospf3 encryption and no ospfv3 encryption commands delete the OSPFv3 security on an interface.

Command Mode
- Interface-Ethernet Configuration

Command Syntax

ospfv3 encryption ipsec spi spi_value esp {3des-cbc | aes-128-cbc | aes-128-cbc | aes-192-cbc} {0 unencrypted_key | 7 encrypted_key} {md5 | sha1} {0 unencrypted_key | 7 encrypted_key | KEY}

ospfv3 encryption ipsec spi spi_value esp {3des-cbc | aes-128-cbc | aes-128-cbc | aes-192-cbc} [md5 | sha1] passphrase {0 unencrypted_passphrase | 7 encrypted_passphrase | LINE}

ospfv3 encryption ipsec spi spi_value esp null {md5 | sha1} {0 unencrypted_key | 7 encrypted_key | KEY}

ospfv3 encryption ipsec spi spi_value esp null {md5 | sha1} passphrase {0 unencrypted_passphrase | 7 encrypted_passphrase | LINE}

default ospfv3 encryption

no ospfv3 encryption

Parameters
- **spi** *spi_value* configures the value for IPsec Security Parameter Index. The value ranges from 0 to 4294967295.
- **3des-cbc** configures ESP with 3DES-CBC encryption.
- **aes-128-cbc** configures ESP with AES-128-CBC encryption.
- **aes-192-cbc** configures ESP with AES-192-CBC encryption.
- **aes-256-cbc** configures ESP with AES-256-CBC encryption.
- **null** configures ESP with null encryption.
- **0 unencrypted_key** configures either a 192 bit 3DES key or 128/192/256 bit AES key in an unencrypted format.
- **7 encrypted_key** configures either a 192 bit 3DES key or 128/192/256 bit AES key in an encrypted format.
- **md5** configures HMAC-MD5 hash algorithm.
- **sha1** configures HMAC-SHA1 algorithm.
- **KEY** configures either a 128 bit MD5 key or a 140 bit SHA1 key.
- **passphrase** configures passphrase for authentication and encryption. Options include:
  - **0 unencrypted_passphrase** configures an unencrypted passphrase.
  - **7 encrypted_passphrase** configures an encrypted passphrase.
  - **LINE** uses passphrase string to derive keys for authentication and encryption.

Related Commands
- area encryption ipsec spi
• **ospfv3 authentication ipsec spi**

**Guidelines**
Passphrase and key value are exclusive. MD5 and SHA1 keys are derived from the configured passphrase.

Arista devices also support the legacy ipv6 ospf encryption ipsec spi command in certain software releases of the EOS.

**Restrictions**
On the same interface, EOS allows security configuration with either AH or ESP but not both. We can have one interface configured with AH and another with ESP.

**Examples**
- This command configures OSPFv3 security on an interface with 3DES-CBC encryption and SHA1 algorithm.

```
switch(config)#interface ethernet 9
switch(config-if-Et9)#ospfv3 encryption ipsec spi 345 esp 3des-cbc sha1 passphrase 0 2fd8e1c67a24d28feced849eefbb76e7391b3eb12
switch(config-if-Et9)#show active
  interface Ethernet9
    no switchport
    ospfv3 encryption ipsec spi 345 esp 3des-cbc sha1 passphrase 7 $1$VmUkWk6IL2S343bR3b880RhgycrHdMgfh8B86V8X9NOCQF7HJ8p5VvX7fBaY7bgC7KU
switch(config-if-Et9)#
```

- This command configures OSPFv3 security on an interface with 3DES-CBC encryption and MD5 hash algorithm.

```
switch(config)#interface ethernet 9
switch(config-if-Et9)#ospfv3 encryption ipsec spi 345 esp 3des-cbc md5 passphrase 7 $1$VmUkWk6IL2S343bR3b880RhgycrHdMgfh8B86V8X9NOCQF7HJ8p5VvX7fBaY7bgC7KU
switch(config-if-Et9)#show active

switch(config-if-Et9)#no ospfv3 encryption
switch(config-if-Et9)#show active
  interface Ethernet9
    no switchport
switch(config-if-Et9)#
```
**ospfv3 hello-interval**

The `ospfv3 hello-interval` command sets the OSPFv3 hello interval. The hello interval is the period between the transmission of consecutive hello packets.

Each OSPFv3 neighbor should be the same hello interval and should not be longer than any neighbor’s dead interval.

The `no ospfv3 hello-interval` and `default ospfv3 hello-interval` commands restore the default hello interval of 10 seconds on the configuration mode interface by removing the `ospfv3 hello-interval` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ospfv3 hello-interval time
no ospfv3 hello-interval
default ospfv3 hello-interval
```

**Parameters**

- `time` Values range from 1 to 65535; default is 10.

**Guideline**

Arista devices also support the legacy `ipv6 ospf hello-interval` command in certain software releases of the EOS.

**Example**

- This command configures a hello interval of 45 seconds for VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ospfv3 hello-interval 45
switch(config-if-Vl200)#show active
interface Vlan200
  ospfv3 hello-interval 45
switch(config-if-Vl200)#
```
**ospfv3 ipv6 retransmit-interval**

The `ospfv3 ipv6 retransmit-interval` command configures the link state advertisement retransmission interval.

The `no ospfv3 ipv6 retransmit-interval` and `default ospfv3 ipv6 retransmit-interval` commands restore the default retransmission interval of 5 seconds on the configuration mode interface by removing the corresponding `ospfv3 ipv6 retransmit-interval` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

- `ospfv3 ipv6 retransmit-interval period`
- `no ospfv3 ipv6 retransmit-interval`
- `default ospfv3 ipv6 retransmit-interval`

**Parameters**

- `period` Value ranges from 1 to 65535; default is 5.

**Example**

- This command configures a retransmission interval of 25 seconds for VLAN 200.

```bash
switch(config)#interface vlan 200
switch(config-if-Vl200)#ospfv3 ipv6 retransmit-interval 25
switch(config-if-Vl200)#show active
interface Vlan200
  ospfv3 ipv6 retransmit-interval 25
switch(config-if-Vl200)#
```
ospfv3 network

The `ospfv3 network` command sets the configuration mode interface as a point-to-point link. By default, interfaces are set as broadcast links.

The `no ospfv3 network` and `default ospfv3 network` commands set the configuration mode interface as a broadcast link by removing the corresponding `ospfv3 network` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ospfv3 network point-to-point
no ospfv3 network
default ospfv3 network
```

**Guideline**

Arista devices also support the legacy `ipv6 ospf network` command in certain software releases of the EOS.

**Examples**

- This command configures VLAN interface 200 as a point-to-point link.

  ```
  switch(config)#interface vlan 200
  switch(config-if-Vl200)#ospfv3 network point-to-point
  switch(config-if-Vl200)#show active
  interface Vlan200
      ospfv3 network point-to-point
  switch(config-if-Vl200)#
  ```

- This command restores Ethernet interface 10 as a broadcast link.

  ```
  switch(config)#interface vlan 200
  switch(config-if-Vl200)#no ospfv3 network
  switch(config-if-Vl200)#show active
  interface Vlan200
  switch(config-if-Vl200)#
  ```
**ospfv3 priority**

The `ospfv3 priority` command configures the OSPFv3 router priority.

The `no ospfv3 priority` and `default ospfv3 priority` commands restore the default priority (1) on the interface by removing the corresponding `ospfv3 priority` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ospfv3 priority priority_level
no ospfv3 priority
default ospfv3 priority
```

**Parameters**

- `priority_level`  Settings range from 0 to 255.

**Guideline**

Arista devices also support the legacy `ipv6 ospf priority` command in certain software releases of the EOS.

**Example**

- This command configures a router priority of 128 for VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ospfv3 priority 128
switch(config-if-Vl200)#show active
interface Vlan200
    ospfv3 priority 128
switch(config-if-Vl200)#
```
ospfv3 transmit-delay

The `ospfv3 transmit-delay` command configures the transmission delay for OSPFv3 packets.

The `no ospfv3 transmit-delay` and `default ospfv3 transmit-delay` commands restore the default transmission delay of one second on the configuration mode interface by removing the corresponding `ospfv3 transmit-delay` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

- `ospfv3 transmit-delay trans`
- `no ospfv3 transmit-delay`
- `default ospfv3 transmit-delay`

**Parameters**
- `trans` Value ranges from 1 to 65535; default is 1.

**Guideline**

Arista devices also support the legacy `ipv6 ospf transmit-delay` command in certain software releases of the EOS.

**Example**
- This command configures a transmission delay of 10 seconds for VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ospfv3 transmit-delay 10
switch(config-if-Vl200)#show active
interface Vlan200
  ospfv3 transmit-delay 10
switch(config-if-Vl200)#
```
**ipv6 router ospf**

The `ipv6 router ospf` command places the switch in router-OSPFv3 configuration mode and creates an OSPFv3 instance if one does not already exist. Note that each OSPFv3 instance on the switch must have a unique process ID. A router ID for the new instance will be created if one does not already exist.

The `show ipv6 ospf` command displays the router ID of each OSPFv3 instance configured on the switch.

The `no ipv6 router ospf` and `default ipv6 router ospf` command deletes the OSPFv3 instance.

Refer to the [Router-OSPFv3 Configuration Mode](#) command for a list of commands available in router-OSPFv3 configuration mode.

**Command Mode**

- Global Configuration

**Command Syntax**

```
ipv6 router ospf process_id [VRF_INSTANCE]
no ipv6 router ospf process_id [VRF_INSTANCE]
default ipv6 router ospf process_id [VRF_INSTANCE]
```

**Parameters**

- `process_id`  Values range from 1 to 65535.
- `VRF_INSTANCE`  Values include:
  - `<no parameter>`  OSPF instance is in the default VRF.
  - `vrf vrf_name`  OSPF instance is the specified VRF.

**Examples**

- This command creates an OSPFv3 instance in the default VRF with process ID 9.
  ```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#show active
ipv6 router ospf 9
switch(config-router-ospf3)#
  ```
- This command deletes the OSPFv3 instance.
  ```
switch(config)#no ipv6 router ospf 9
switch(config)#
  ```
log-adjacency-changes (OSPFv3)

The log-adjacency-changes command enables syslog messages to be sent when it detects OSPFv3 link state changes or when it detects that a neighbor has gone up or down. Log message sending is enabled by default.

The default log-adjacency-changes command restores the default state by removing the log-adjacency-changes statement from running-config.

The default option (sending a message only when a neighbor goes up or down) is active when running-config does not contain any form of the command. Entering the command in any form replaces the previous command state in running-config.

The no log-adjacency-changes disables link state change syslog reporting.

The default log-adjacency-changes command restores the default state by removing the log-adjacency-changes detail or no log-adjacency-changes statement from running-config.

Command Mode
Router-OSPFv3 Configuration

Command Syntax
   log-adjacency-changes [INFO_LEVEL]
   no log-adjacency-changes
   default log-adjacency-changes

Parameters
   • INFO_LEVEL Options include
     • <no parameter> Sends messages when a neighbor goes up or down.
     • detail Sends messages for all neighbor state changes.

Example
   • This command configures the switch to send a syslog message when a neighbor state changes.
     switch(config)#ipv6 router ospf 9
     switch(config-router-ospf3)#log-adjacency-changes
     switch(config-router-ospf3)#show active
     ipv6 router ospf 9
     log-adjacency-changes
     switch(config-router-ospf3)#
max-metric router-lsa (OSPFv3)

The `max-metric router-lsa` command configures OSPF to include the maximum value in LSA metric fields to keep other network devices from using the switch as a preferred intermediate SPF hop.

The `no max-metric router-lsa` and `default max-metric router-lsa` commands disable the advertisement of a maximum metric.

Command Mode

Router-OSPFv3 Configuration

Command Syntax

```
max-metric router-lsa [EXTERNAL][STUB][STARTUP][SUMMARY]
no max-metric router-lsa [EXTERNAL][STUB][STARTUP][SUMMARY]
default max-metric router-lsa [EXTERNAL][STUB][STARTUP][SUMMARY]
```

All parameters can be placed in any order.

Parameters

- **EXTERNAL** Values include:
  - <no parameter> Default value of 1.
  - `external-lsa`
  - `external-lsa <1 to 16777215>` The default value is 0xFF0000.
- **STUB** Values include:
  - <no parameter> Default value of 2.
  - `include-stub`
- **STARTUP** Values include:
  - <no parameter>
  - `on-startup`
  - `on-startup wait-for-bgp`
  - `on-startup <5 to 86400>`
    - `wait-for-bgp` or an `on-start` time value is not included in `no` and `default` commands.
- **SUMMARY** Values include:
  - <no parameter> Metric is set to the default value of 1.
  - `summary-lsa`
  - `summary-lsa <1 to 16777215>`

Example

- This command configures OSPFv3 to include the maximum value in LSA metric fields until BGP has converged:
  ```
  switch(config-router-ospf3)#max-metric router-lsa on-startup wait-for-bgp
  switch(config-router-ospf3)#
  ```
maximum-paths (OSPFv3)

The **maximum-paths** command sets the maximum number of parallel routes that OSPFv3 supports on the switch.

The **no maximum-paths** command restores the maximum number of parallel routes that OSPFv3 supports on the switch to the default value of 16 by removing the maximum-paths command from **running-config**.

**Command Mode**

Router-OSPFv3 Configuration

**Command Syntax**

```
maximum-paths paths
no maximum-paths
default maximum-paths
```

**Parameters**

- **paths** Value range is platform dependent:
  - Arad: Value ranges from 1 to 128. Default value is 128.
  - FM6000: Value ranges from 1 to 32. Default value is 32.
  - PetraA: Value ranges from 1 to 16. Default value is 16.
  - Trident: Value ranges from 1 to 32. Default value is 32.
  - Trident-II: Value ranges from 1 to 128. Default value is 128.

**Example**

- This command configures the maximum number of OSPFv3 parallel paths to 12.
  ```
  switch(config)#ipv6 router ospf 9
  switch(config-router-ospf3)#maximum-paths 12
  switch(config-router-ospf3)#
  ```
no area (OSPFv3)

The no area command removes all area configuration commands for the specified OSPFv3 area. Commands removed by the no area command include:

- area
- nssa
- range
- stub

Area settings can be removed individually; refer to the command description page of the desired command for details.

Command Mode

Router-OSPFv3 Configuration

Command Syntax

```
no area area_id [TYPE]
default area area_id [TYPE]
```

Parameters

- **area_id**  area number.
  - Valid formats: integer <1 to 4294967295> or dotted decimal <0.0.0.1 to 255.255.255.255>
  - Area 0 (or 0.0.0.0) is not configurable; it is always normal.
  - Running-config stores value in dotted decimal notation.
- **TYPE**  area type. Values include:
  - nssa
  - nssa translate type7 always
  - stub
  - stub no-summary

Example

- This command remove the area 1 stub configuration.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)# no area 1 stub
switch(config-router-ospf3)#
```
passive-interface (OSPFv3)

The `passive-interface` command disables OSPF on an interface range. All interfaces are active by default.

The `no passive-interface` and `default passive-interface` commands enable OSPFv3 on the specified interface range by removing the corresponding `passive-interface` statements from `running-config`.

**Command Mode**

Router-OSPFv3 Configuration

**Command Syntax**

```
passive-interface INTERFACE_NAME
no passive-interface INTERFACE_NAME
default passive-interface INTERFACE_NAME
```

**Parameters**

- `INTERFACE_NAME`
  - Options include:
    - `ethernet e_range`
    - `loopback l_range`
    - `management m_range`
    - `port-channel p_range`
    - `vlan v_range`
    - `vxlan vx_range`
    - `default`

Valid `e_range`, `l_range`, `m_range`, `p_range`, `v_range`, and `vx_range` formats include number, range, or comma-delimited list of numbers and ranges.

**Example**

- This command configures VLAN interfaces 101 through 103 as passive interfaces.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#passive-interface vlan 101-103
switch(config-router-ospf3)#show active
ipv6 router ospf 9
  passive-interface Vlan101
  passive-interface Vlan102
  passive-interface Vlan103
switch(config-router-ospf3)#
```
redistribute (OSPFv3)

The **redistribute** command enables the advertising of all specified routes into the OSPFv3 domain as external routes.

The **no redistribute** and **default redistribute** commands remove the corresponding **redistribute** command from **running-config**, disabling route redistribution for the specified route type.

**Command Mode**

Router-OSPFv3 Configuration

**Command Syntax**

```
redistribute ROUTE_TYPE [ROUTE_MAP]
no redistribute ROUTE_TYPE
default redistribute ROUTE_TYPE
```

**Parameters**

- **ROUTE_TYPE** Options include:
  - BGP
  - connected
  - static

- **ROUTE_MAP** Options include:
  - route-map map_name

**Example**

- The **redistribute static** command starts the advertising of static routes as OSPFv3 external routes.

```bash
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#redistribute static
switch(config-router-ospf3)#show active
ipv6 router ospf 9
    redistribute connected
    redistribute static
switch(config-router-ospf3)#
```
router-id (OSPFv3)

The `router-id` command assigns the router ID for an OSPFv3 instance. The switch sets the router ID to the first available alternative in the following list:

1. The `router-id` command
2. The loopback IP address
3. The highest IP address present on the device

**Important!** When configuring VXLAN on an MLAG, always manually configure the OSPFv3 router ID to prevent the switch from using the common VTEP IP address as the router ID.

The `no router-id` and `default router-id` commands remove the router ID command from `running-config`.

**Command Mode**

Router-OSPFv3 Configuration

**Command Syntax**

```
router-id identifier
no router-id
default router-id
```

**Parameters**

- `identifier` Value ranges from 0.0.0.0 to 255.255.255.255 (dotted decimal notation).

**Example**

- This command assigns 10.10.1.4 as the router ID for the OSPFv3 instance.

  ```
  switch(config)#ipv6 router ospf 9
  switch(config-router-ospf3)#router-id 10.10.1.4
  switch(config-router-ospf3)#show active
  ipv6 router ospf 9
  router-id 15.10.1.4
  switch(config-router-ospf3)#
  ```
show ipv6 ospf

The `show ipv6 ospf` command displays information about OSPFv3 routing.

Command Mode

**EXEC**

Command Syntax

```
show ipv6 ospf [access-list | border-routers | database | interface | lsa-log | neighbor | request-list | retransmission-list | spf-log | vrf | Process ID]
```

Parameters

- `<no parameters>` displays the complete configuration of OSPFv3 address family and routing process.
- `access-list` displays the information of configured OSPFv3 access-list. Options include:
  - `<no parameters>` displays the information of all configured OSPFv3 access lists.
  - `WORD` displays the information of the specified access list.
  - `summary` displays the summary of all configured access lists.
- `border-routers` displays the information of configured OSPFv3 border and boundary routers. Options include:
  - `<no parameters>` displays the information of all configured OSPFv3 borders and boundary routers.
  - `vrf` displays the OSPFv3 borders and boundary routers information of the specified Virtual Routing and Forwarding (VRF).
- `database` displays the summary of database. Options include:
  - `<no parameters>` displays the complete summary of database.
  - `ipv4` displays the database information of link state ID.
  - `adv-router` displays the database information of advertising router link states.
  - `area` displays the database information filtered by area scope LSAs.
  - `as` displays the database information filtered by AS scope LSAs.
  - `database-summary` displays the count of LSAs in OSPFv3 database.
  - `detail` displays the detailed information of LSA.
  - `link` displays the database information filtered by link scoped LSAs.
  - `self originate` displays the database information of self-originated link states.
  - `vrf` displays the VRF information in OSPFv3 database.
- `interface` displays the information of OSPFv3 interfaces. Options include
  - `<no parameters>` displays the information of all OSPFv3 interfaces.
  - `Ethernet eth_num` displays the information of the specified Ethernet interface. The value ranges from 1 to 24.
  - `Loopback lb_num` displays the information of the specified loop back interface. The value ranges from 0 to 1000.
  - `Port-Channel pc_num` displays the interface or sub-interface information of the specified port channel. The interface and sub-interface values of port channel ranges from `<1-1000>` and `<1-2000>`, `<1-4094>` respectively.
  - `Tunnel t_num` displays the information of the specified tunnel. The value ranges from 0 to 255.
• **Vlan vlan_num** displays the information of the specified VLAN interface. The value ranges from 1 to 4094.
• **vrf vrf_name** displays the information of the specified VRF.
• **lsa-log** displays the log entries of OSPFv3 LSA updates.
• **neighbor** displays the list of OSPFv3 neighbors.
• **request-list** displays the list of all OSPFv3 LSAs requested by a router.
• **retransmission-list** displays the list of all OSPFv3 LSAs waiting to be re-sent.
• **spf-log** displays the start-time, duration of completion, and reason of delay to calculate the OSPFv3 Sender Policy Framework (SPF).
• **vrf vrf_name** displays the information of specified VRF.
• **Process ID** displays the OSPFv3 configuration of the specified process ID. The value ranges from 1 to 65535.

**Example**

- This command displays OSPFv3 routing information for all VRFs.

```plaintext
switch>show ipv6 ospf
Routing Process "ospfv3 0" with ID 11.1.11.1 and Instance 0 VRF default
FIPS mode disabled
It is not an autonomous system boundary router and is not an area border router
Minimum LSA arrival interval 1000 msecs
Initial LSA throttle delay 1000 msecs
Minimum hold time for LSA throttle 5000 msecs
Maximum wait time for LSA throttle 5000 msecs
It has 0 fully adjacent neighbors
Number of areas in this router is 0. 0 normal, 0 stub, 0 nssa
Number of LSAs 0
Initial SPF schedule delay 0 msecs
Minimum hold time between two consecutive SPF 5000 msecs
Current hold time between two consecutive SPF 5000 msecs
Maximum wait time between two consecutive SPF 5000 msecs
SPF algorithm last executed 00:07:13 ago
No scheduled SPF
Adjacency exchange-start threshold is 20
Maximum number of next-hops supported in ECMP is 32
Number of backbone neighbors is 0
Graceful-restart is not configured
Graceful-restart-helper mode is enabled
```
This command displays the log entries of OSPFv3 LSA updates.

```
switch>show ipv6 ospf lsa-log

<-------OUTPUT OMITTED FROM EXAMPLE-------->
```
show ipv6 ospf border-routers

The `show ipv6 ospf border-routers` command displays the OSPF routing table entries.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 ospf border-routers [VRF_INSTANCE]
```

**Parameters**

- **VRF_INSTANCE** Values include:
  - `<no parameter>` Displays information for all VRFs.
  - `vrf vrf_name` Displays information for the specified VRF.

**Example**

- This command displays the ABRs and ASBRs configured in the switch in all VRFs.

```
switch> show ipv6 ospf border-routers
Routing Process "ospf 9", VRF default
  Router 10.37.0.32 area 0.0.0.0 ASBR
  Router 10.37.0.18 area 0.0.0.0 ASBR
  Router 10.37.0.22 area 0.0.0.0 ASBR ABR
  Router 10.37.0.31 area 0.0.0.0 ASBR ABR
  Router 10.37.0.58 area 0.0.0.0 ASBR
  Router 10.37.0.37 area 0.0.0.0 ASBR
  Router 10.37.0.22 area 0.0.0.2 ASBR ABR
  Router 10.37.0.31 area 0.0.0.2 ASBR ABR
switch>
```
show ipv6 ospf database

The `show ipv6 ospf database` command displays data from the OSPF database. The switch can return link state data for a single VRF or for all VRFs on the switch.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 ospf database [VRF_INSTANCE]
```

**Parameters**

- **VRF_INSTANCE** Values include:
  - `<no parameter>` Displays information for all VRFs.
  - `vrf vrf_name` Displays information for the specified VRF.

**Example**

- This command displays OSPF database information for VRF blue.

```
switch>show ipv6 ospf database vrf blue
Codes: AEX - AS External, GRC - Grace,
IAP - Inter Area Prefix, IAR - Inter Area Router,
LNK - Link, NAP - Intra Area Prefix,
NSA - Not So Stubby Area, NTW - Network,
RTR - Router
Routing Process "ospf 9", VRF blue
AS Scope LSDB
switch>
```
show ipv6 ospf database<link-state details>

The `show ipv6 ospf database <link-state details>` command displays detailed information about the specified link state advertisements. The switch can return link state data about a single area or for all areas on the switch.

**Command Mode**
EXEC

**Command Syntax**
```
show ipv6 ospf database [FILTER] LINK_TYPE [LINKSTATE_ID] [ROUTER] [DATA_LEVEL]
```

**Parameters**
- **FILTER** filters the output of the command by specifying areas. Options include:
  - area <A.B.C.D>
  - area backbone
- **LINK_TYPE** Parameter options include:
  - router
  - network
  - inter-area-prefix
  - inter-area-router
  - intra-area-prefix
  - nssa
- **LINKSTATE_ID** Options include:
  - <no parameter>
  - <A.B.C.D>
- **ROUTER** Options include:
  - <no parameter>
  - adv-router [a.b.c.d]
  - self-originate
- **DATA_LEVEL** Options include:
  - <no parameter>
  - detail
Example

- This command displays the OSPF database summary.

  switch> show ipv6 ospf database detail

  Codes:  AEX - AS External,  GRC - Grace,
         IAP - Inter Area Prefix,  IAR - Inter Area Router,
         LNK - Link,  NAP - Intra Area Prefix,
         NSA - Not So Stubby Area,  NTW - Network,
         RTR - Router

switch>
**show ipv6 ospf database <link state list>**

The `show ipv6 ospf database <link state list>` command displays the OSPF link state advertisements that originate on a switch.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 ospf database [FILTER] [LINKSTATE_ID] [ROUTER] [DATA_LEVEL]
```

**Parameters**

- **FILTER** filters the output of the command by specifying areas. Options include:
  - `<no parameter>`
  - `area <A.B.C.D>`
  - `area backbone`
  - `as`
  - `as external`
- **LINKSTATE_ID** Options include:
  - `<no parameter>`
  - `<A.B.C.D>`
- **ROUTER** Options include:
  - `<no parameter>`
  - `adv-router [a.b.c.d]`
  - `self-originate`
- **DATA_LEVEL** Options include:
  - `<no parameter>`
  - `detail`
Example

- This command displays the OSPFv3 database of link state advertisements.

```
switch>show ipv6 ospf database 10.26.0.23
Codes: AEX - AS External, GRC - Grace,
      IAP - Inter Area Prefix, IAR - Inter Area Router,
      LNK - Link, NAP - Intra Area Prefix,
      NSA - Not So Stubby Area, NTW - Network,
      RTR - Router

switch>
```
show ipv6 ospf database link

The `show ipv6 ospf database link` command displays details of the specified link state advertisements. The switch can return link state data about a single area or for all areas on the switch.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 ospf database link [LINKSTATE_ID] [ROUTER] [DATA_LEVEL]
```

**Parameters**

- `LINKSTATE_ID` Options include:
  - <no parameter>
  - <A.B.C.D>
- `ROUTER` Options include:
  - <no parameter>
  - `adv-router [a.b.c.d]`
  - `self-originate`
- `DATA_LEVEL` Options include:
  - <no parameter>
  - `detail`

**Example**

This command displays information about the Open Shortest Path First (OSPF).

```
switch> show ipv6 ospf database link
Codes: AEX - AS External, GRC - Grace,
       IAP - Inter Area Prefix, IAR - Inter Area Router,
       LNK - Link, NAP - Intra Area Prefix,
       NSA - Not So Stubby Area, NTW - Network,
       RTR - Router

Routing Process "ospf 9":

switch>
```
show ipv6 ospf database link if-name

The `show ipv6 ospf database link` command displays link state advertisement details. The switch can return link state data about a single area or for all areas on the switch.

**Command Mode**
EXEC

**Command Syntax**
```
show ipv6 ospf database link if-name [INTF_ID] [LS_ID] [ROUTER] [DATA_LEVEL]
```

**Parameters**
- **INTF_ID** Options include:
  - `ethernet e_range` Ethernet interface list.
  - `loopback l_range` Loopback interface list.
  - `management m_range` Management interface list.
  - `port-channel p_range` Channel group interface list.
  - `vlan v_range` VLAN interface list.
  - `vxlan vx_range` VXLAN interface list.
  Valid range formats include number, range, or comma-delimited list of numbers and ranges.
- **LS_ID** Options include:
  - `<no parameter>`
  - `<A.B.C.D>`
- **ROUTER** Options include:
  - `<no parameter>`
  - `adv-router [a.b.c.d]`
  - `self-originate`
- **DATA_LEVEL** Options include:
  - `<no parameter>`
  - `detail`

**Example**
- This command displays information for Ethernet 4/1 link state advertisements.

```
switch>show ipv6 ospf database link if-name ethernet 4/1
Codes: AEX - AS External, GRC - Grace,
      IAP - Inter Area Prefix, IAR - Inter Area Router,
      LNK - Link, NAP - Intra Area Prefix,
      NSA - Not So Stubby Area, NTW - Network,
      RTR - Router

Routing Process "ospf 1":

switch>
```
show ipv6 ospf database link if-type

The `show ipv6 ospf database link` command displays information of the link state advertisements. The switch can return link state data about a single area or for all areas on the switch.

Command Mode
EXEC

Command Syntax
`show ipv6 ospf database link if-type [INTF_TYPE] [LS_ID] [ROUTER] [DATA_LEVEL]`

Parameters
- **INTF_TYPE**
  - broadcast
  - nbma
  - p2mp
  - p2p
- **LS_ID** Options include:
  - <no parameter>
  - <A.B.C.D>
- **ROUTER** Options include:
  - <no parameter>
  - adv-router [a.b.c.d]
  - self-originate
- **DATA_LEVEL** Options include:
  - <no parameter>
  - detail
Example

- This command displays LSA information for the interfaces configured for broadcast transmissions.

```plaintext
switch>show ipv6 ospf database link if-type broadcast
Codes: AEX - AS External, GRC - Grace,
      IAP - Inter Area Prefix, IAR - Inter Area Router,
      LNK - Link, NAP - Intra Area Prefix,
      NSA - Not So Stubby Area, NTW - Network,
      RTR - Router

**show ipv6 ospf interface**

The *show ipv6 ospf interface* command displays OSPFv3 information on interfaces where OSPFv3 is enabled.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 ospf interface [VRF_INSTANCE]
```

**Parameters**

- **VRF_INSTANCE** Values include:
  - `<no parameter>` Displays information for all VRFs.
  - `vrf vrf_name` Displays information for the specified VRF.

**Example**

This command displays OSPFv3 information for interfaces where OSPFv3 is enabled.

```
switch>show ipv6 ospf interface
Ethernet17 is up
  Interface Address fe80::48c:73ff:fe00:1319, VRF default, Area 0.0.0.0

  Options are R E V6
switch>
```
show ipv6 ospf lsa-log

The `show ipv6 ospf lsa-log` command displays log entries when LSA update messages are sent or received for OSPFv3.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 ospf [PROCESS_ID] lsa-log [VRF_INSTANCE]
```

**Parameters**

- **PROCESS_ID** OSPFv3 process ID. Values include:
  - `<no parameter>` Displays information for all process IDs.
  - `<1 to 65535>` Displays information for the specified process ID.
- **VRF_INSTANCE** Values include:
  - `<no parameter>` Displays information for all VRFs.
  - `vrf vrf_name` Displays information for the specified VRF.

**Examples**

- This command displays log entries when LSA update messages are sent or received for OSPFv3.

```
switch>show ipv6 ospf lsa-log
OSPF3 Process 3.3.3.3, VRF default, LSA Throttling Log:
[04:21:09] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 2000 msecs
[04:21:08] type 1: 3.3.3.3/32 [3.3.3.3], event 2, backoff restarted, new hold value 900 msecs
[04:21:00] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 3000 msecs
[04:21:00] type 1: 3.3.3.3/32 [3.3.3.3], event 4, maxwait value changed, new hold value 3000 msecs

switch>
```
show ipv6 ospf neighbor state

The `show ipv6 ospf neighbor state` command displays the state information on OSPF neighbors on a per-interface basis.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 ospf neighbor state STATE_NAME [VRF_INSTANCE]
```

**Parameters**

- **STATE_NAME** Values include:
  - 2-ways
  - attempt
  - down
  - exch-start
  - exchange
  - full
  - restart
  - init
  - loading
- **VRF_INSTANCE** Values include:
  - <no parameter> Displays information for all VRFs.
  - `vrf vrf_name` Displays information for the specified VRF.

**Examples**

- This command displays OSPF information for neighboring devices that are adjacent.

```
switch>show ipv6 ospf neighbor state full
Routing Process "ospf 3":
switch>
```
show ipv6 ospf neighbor summary

The `show ipv6 ospf neighbor summary` command displays a single line of state information for each OSPFv3 neighbor.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 ospf neighbor summary
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VRF_INSTANCE</td>
<td>Values include:</td>
</tr>
<tr>
<td></td>
<td>&lt;no parameter&gt; Displays information for all VRFs.</td>
</tr>
<tr>
<td></td>
<td><code>vrf vrf_name</code> Displays information for the specified VRF.</td>
</tr>
</tbody>
</table>

**Examples**

- This command shows the summary information for the OSPFv3 neighbors.

  ```
  switch>show ipv6 ospf neighbor summary
  Routing Process "ospf 1":
  3 neighbors are in state Down
  3 neighbors are in state Full
  5 neighbors are in state Init
  0 neighbors are in state Loading
  0 neighbors are in state Attempt
  3 neighbors are in state Restarting
  0 neighbors are in state Exchange
  3 neighbors are in state 2 Ways
  0 neighbors are in state Exch Start
  switch>
  ```
show ipv6 ospf spf-log

The `show ipv6 ospf spf-log` command displays when and how long the switch took to run a full SPF calculation for OSPFv3.

**Command Mode**

EXEC

**Command Syntax**

`show ipv6 ospf [PROCESS_ID] spf-log [VRF_INSTANCE]`

**Parameters**

- **PROCESS_ID** OSPFv3 process ID. Values include:
  - <no parameter> Displays information for all process IDs.
  - <1 to 65535> Displays information for the specified process ID.
- **VRF_INSTANCE** Values include:
  - <no parameter> Displays information for all VRFs.
  - vrf `vrf_name` Displays information for the specified VRF.

**Examples**

- This command displays the SPF information for OSPFv3 in all VRFs.

```
switch>show ipv6 ospf spf-log
OSPF3 Process 172.26.0.22, VRF default
TIME EVENT REASON
04:54:52.070 SPF ran for 0.70 ms

04:53:33.081 SPF ran for 0.3 ms
04:53:33.081 Scheduled after 0 ms ECMP max nexthop cfg change
switch>
```
show ospfv3

The show ospfv3 command displays the OSPFv3 configuration of OSPFv3 address family and routing process.

Command Mode
EXEC

Command Syntax
show ospfv3 [access-list | border-routers | database | interface | ipv4 | ipv6 | lsa-log | neighbor | request-list | retransmission-list | spf-log | vrf]

Parameters
- <no parameters> displays the complete configuration of OSPFv3 address family and routing process.
- access-list displays the information of configured OSPFv3 access-list. Options include:
  - <no parameters> displays the information of all configured OSPFv3 access lists.
  - WORD displays the information of the specified access list.
  - summary displays the summary of all configured access lists.
- border-routers displays the information of configured OSPFv3 border and boundary routers. Options include:
  - <no parameters> displays the information of all configured OSPFv3 borders and boundary routers.
  - vrf displays the OSPFv3 borders and boundary routers information of the specified Virtual Routing and Forwarding (VRF).
- database displays the summary of database. Options include:
  - <no parameters> displays the complete summary of database.
  - ipv4 displays the database information of link state ID.
  - adv-router displays the database information of advertising router link states.
  - area displays the database information filtered by area scope LSAs.
  - as displays the database information filtered by AS scope LSAs.
  - database-summary displays the count of LSAs in OSPFv3 database.
  - detail displays the detailed information of LSA.
  - link displays the database information filtered by link scoped LSAs.
  - self-originate displays the database information of self-originated link states.
  - vrf displays the VRF information in OSPFv3 database.
- interface displays the information of OSPFv3 interfaces. Options include
  - <no parameters> displays the information of all OSPFv3 interfaces.
  - Ethernet eth_num displays the information of the specified Ethernet interface. The value ranges from 1 to 24.
  - Loopback lb_num displays the information of the specified loop back interface. The value ranges from 0 to 1000.
  - Port-Channel pc_num displays the interface or sub-interface information of the specified port channel. The interface and sub-interface values of port channel ranges from <1-1000> and <1-2000>.<1-4094> respectively.
• **Tunnel** _t_num_ displays the information of the specified tunnel. The value ranges from 0 to 255.

• **Vlan** _vlan_num_ displays the information of the specified VLAN interface. The value ranges from 1 to 4094.

• **vrf** _vrf_name_ displays the information of the specified VRF.

• **ipv4** displays the IPv4 address family information.

• **ipv6** displays the IPv6 address family information.

• **lsa-log** displays the log entries of OSPFv3 LSA updates.

• **neighbor** displays the list of OSPFv3 neighbors.

• **request-list** displays the list of all OSPFv3 LSAs requested by a router.

• **retransmission-list** displays the list of all OSPFv3 LSAs waiting to be re-sent.

• **spf-log** displays the start-time, duration of completion, and reason of delay to calculate the OSPFv3 Sender Policy Framework (SPF).

• **vrf** _vrf_name_ displays the information of specified VRF.

**Examples**

This command displays the complete configuration of OSPFv3 address family and routing process.

```
switch#show ospfv3
OSPFv3 address-family ipv6
Routing Process "ospfv3" with ID 13.13.13.13 and Instance 0 VRF default
  FIPS mode disabled
  It is not an autonomous system boundary router and is not an area border router
  Minimum LSA arrival interval 1000 msecs
  Initial LSA throttle delay 1000 msecs
  Minimum hold time for LSA throttle 5000 msecs
  Maximum wait time for LSA throttle 5000 msecs
  Interface flood pacing timer 50 msecs
  It has 0 fully adjacent neighbors
  Number of areas in this router is 1. 1 normal, 0 stub, 0 nssa
  Number of LSAs 1
  Initial SPF schedule delay 0 msecs
  Minimum hold time between two consecutive SPFs 5000 msecs
  Current hold time between two consecutive SPFs 5000 msecs
  Maximum wait time between two consecutive SPFs 5000 msecs
  SPF algorithm last executed 3d23h ago
  No scheduled SPF
  Adjacency exchange-start threshold is 20
  Maximum number of next-hops supported in ECMP is 32
  Number of backbone neighbors is 0
  Graceful-restart is not configured
  Graceful-restart-helper mode is enabled
  Area 0.0.0.0
    Number of interface in this area is 0
    It is a normal area
    SPF algorithm executed 2 times
```

ro301.02:04:06(config-router-ospfv3-af)#
shutdown (OSPFv3)

The `shutdown` command disables OSPFv3 on the switch. OSPFv3 is disabled by default on individual interfaces and enabled through `ipv6 ospf area` commands. The `no shutdown` and `default shutdown` commands enable the OSPFv3 instance by removing the `shutdown` statement from the OSPFv3 block in `running-config`.

**Command Mode**
- Router-OSPFv3 Configuration

**Command Syntax**
- `shutdown`
- `no shutdown`
- `default shutdown`

**Example**
- This command disables OSPFv3 activity on the switch.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#shutdown
switch(config-router-ospf3)#show active
ipv6 router ospf 9
  shutdown
switch(config-router-ospf3)#
```
timers

The timers command configures the minimum interval between the transmission of consecutive LS update packets in a network.

The no timers and default timers commands set the configured timer value to its default.

Command Mode

Router-OSPFv3 Configuration

Command Syntax

timers {lsa | out-delay | pacing | throttle}
default timers {lsa | out-delay | pacing | throttle}
no timers {lsa | out-delay | pacing | throttle}

Parameters

- lsa configures threshold for the retransmission of LSA. Option includes:
  - arrival configures the OSPF LSA arrival timer.
- out-delay configures the delay to flood router LSA in milliseconds. Option includes:
  - out-delay_time minimum interval in milliseconds between accepting the same LSAs. The value ranges from 0 to 65000 milliseconds. The default value is zero.
- pacing configures the OSPF packet pacing. Option includes:
  - flood configures the OSPF flood pacing.
- throttle configures ospf throttle timers. Options include:
  - lsa configures threshold for the retransmission of LSA.
  - spf configures the time between SPF calculations.
Examples

- This command configures OSPFv3 flood pacing timer to 50 ms in the global OSPFv3 instance.

```plaintext
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#timers pacing flood 50
switch(config-router-ospf3)#show ospfv3
Routing Process "ospfv3 9" with ID 13.13.13.13 and Instance 0 VRF default
  FIPS mode disabled
  It is not an autonomous system boundary router and is not an area border router
  Minimum LSA arrival interval 1000 msecs
  Initial LSA throttle delay 1000 msecs
  Minimum hold time for LSA throttle 5000 msecs
  Maximum wait time for LSA throttle 5000 msecs
  Interface flood pacing timer 50 msecs
  It has 0 fully adjacent neighbors
  Number of areas in this router is 1. 1 normal, 0 stub, 0 nssa
  Number of LSAs 1
  Initial SPF schedule delay 0 msecs
  Minimum hold time between two consecutive SPFs 5000 msecs
  Current hold time between two consecutive SPFs 5000 msecs
  Maximum wait time between two consecutive SPFs 5000 msecs
  SPF algorithm last executed 21d19h ago
  No scheduled SPF
  Adjacency exchange-start threshold is 20

```

<--------OUTPUT OMITTED FROM EXAMPLE--------->
timers lsa rx min interval (OSPFv3)

The **timers lsa rx min interval** command sets the minimum interval for accepting identical link-state advertisements (LSAs) from OSPFv3 neighbors.

The **no timers lsa rx min interval** and **default timers lsa rx min interval** commands restore the minimum interval to the default value of one second by removing the **timers lsa rx min interval** command from **running-config**.

**Command Mode**
- Router-OSPFv3 Configuration
- Router-OSPFv3 Address-Family IPv4/IPv6 Configuration

**Command Syntax**
```
timers lsa rx min interval lsa_time  
no timers lsa rx min interval  
default timers lsa rx min interval
```

**Parameters**
- **lsa_time**  minimum time (in milliseconds) after which the switch accepts an identical LSA from OSPFv3 neighbors. Value ranges from 0 to 600000 (ms). Default value is 1000 milliseconds (1 second).

**Example**
This command sets the minimum LSA arrival interval to ten milliseconds.

```
switch(config)#router ospfv3
switch(config-router-ospfv3)#timers lsa rx min interval 10
switch(config-router-ospfv3)#
```
timers lsa tx delay initial (OSPFv3)

The `timers lsa tx delay initial` command sets the rate-limiting values for OSPFv3 Link-State Advertisement (LSA) generation.

The `no timers lsa tx delay initial` and `default timers lsa tx delay initial` commands restore the default LSA rate-limiting values by removing the `timers lsa tx delay initial` command from `running-config`.

**Command Mode**
- Router-OSPFv3 Configuration
- Router-OSPFv3 Address-Family IPv4/IPv6 Configuration

**Command Syntax**
- `timers lsa tx delay initial initial_delay min_hold max_wait`
- `no timers lsa tx delay initial`
- `default timers lsa tx delay initial`

**Parameters**
- `initial_delay` Initial delay in milliseconds to generate the first instance of LSAs. Value ranges from 0 to 600000 (ms). The default value is 1000 ms.
- `min_hold` Minimum hold interval availed in milliseconds between the generation of same LSA. Value ranges from 1 to 600000 (ms). The default interval is 5000 ms.
- `max_wait` Maximum hold interval availed in milliseconds between the generation of same LSA. Value ranges from 1 to 600000 (ms). The default interval is 5000 ms.

**Example**
These commands set the LSA transmission timers on the switch.

```
switch(config)#router ospfv3
switch(config-router-ospfv3)#
switch(config-router-ospfv3)#timers lsa tx delay initial 5 100 20000
switch(config-router-ospfv3)#
```
timers spf delay initial (OSPFv3)

The purpose of SPF throttling is to delay Shortest Path First (SPF) calculations when network topology is changing rapidly. The `timers spf delay initial` command controls the intervals of SPF calculations in a switch. The command sets three values:

- **Initial delay**: Initial wait by a switch to calculate SPF after a topology change in a network that has been stable throughout the hold interval. Because a topology change often requires several link state updates to be sent, the initial delay is configured to allow the network to settle before the switch calculates SPF. If an additional topology change occurs during the initial interval, the SPF calculation still takes place after the initial delay period has expired and no other change is made to the throttle timers.

- **Hold interval**: This is an additional wait timer that reduces the frequency of SPF calculations during periods of network instability. If a network change occurs during the hold period, an SPF calculation is scheduled to occur when the hold interval expires. Subsequent hold intervals are doubled if further topology changes occur during a hold interval until either the hold interval reaches its configured maximum or no topology change occurs during the interval. If the next topology change occurs after the hold interval expires, the hold interval is reset to its configured value and the SPF calculation is scheduled to take place after the initial delay.

- **Maximum interval**: The maximum wait time of a switch after a topology change before performing an SPF calculation.

The `no timers spf delay initial` and `default timers spf delay initial` commands restore the default OSPFv3 SPF calculation intervals by removing the `timers spf delay initial` command from running-config.

**Command Mode**

Router-OSPFv3 Configuration

Router-OSPFv3 Address-Family IPv4/IPv6 Configuration

**Command Syntax**

```
timers spf delay initial initial_delay hold_interval max_interval
no timers spf
default timers spf
```

**Parameters**

- **initial_delay**  Initial delay between a topology change and SPF calculation. Value ranges from 0 to 65535000 (ms). The default value is 0 ms.

- **hold_interval**  Additional wait time after SPF calculation to allow the network to settle. If a topology change occurs during the hold interval, another SPF calculation is scheduled to occur after the hold interval expires. The next hold interval is doubled if topology changes occur during the hold interval. If doubling exceeds the maximum value, the maximum value is used instead. Value ranges from 0 to 65535000 (ms). The default value is 5000 ms.

- **max_interval**  The maximum hold interval before a switch calculates SPF. Value ranges from 0 to 65535000 (ms). The default value is 5000 ms.

**Example**

These commands set the SPF timers on the switch.

```
switch(config)#router ospfv3
switch(config-router-ospfv3)#
switch(config-router-ospfv3)#timers spf delay initial 5 100 20000
switch(config-router-ospfv3)#
```
Border Gateway Protocol (BGP)

Border Gateway Protocol (BGP) exchanges routing information among neighboring routers in different Autonomous Systems (AS). Arista switches use BGP version 4+, incorporating the multiprotocol extensions defined by RFC 4760 so that BGP can carry both IPv4 and IPv6 routes simultaneously over a single BGP peering.

This chapter contains the following sections.

- Section 33.1: BGP Conceptual Overview
- Section 33.2: Configuring BGP
- Section 33.3: BGP Examples
- Section 33.4: BGP Commands

Arista switches support these BGP functions:

- A single BGP instance
- Simultaneous internal (iBGP) and external (eBGP) peering
- Multiprotocol BGP
- BGP confederations
33.1 BGP Conceptual Overview

BGP is a protocol that exchanges routing information among neighboring routers in different autonomous systems through TCP sessions.

BGP neighbors (peers) communicate through a TCP session on port 179. They are established by manual configuration commands (static peers) or by creating a peer group listen range and accepting incoming peering requests in that range (dynamic peers). Internal BGP (iBGP) peers operate within a single autonomous system (AS). External BGP (eBGP) peers operate between autonomous systems. Border routers are on AS boundaries and exchange information with other autonomous systems; the primary function of border routers is distributing routes. Internal routers do not distribute route updates that they receive.

BGP defines a state machine for establishing connections. BGP routers maintain a state variable for each peer-to-peer session to track connection status. The state machine consists of these states:

- **Idle**: The router initializes BGP resources, refuses inbound BGP connection attempts, initiates a TCP connection to the peer, then transitions to the **Connect** state.
- **Connect**: The router waits for the TCP connection to complete, then sends an OPEN message to the peer and transitions to the **OpenSent** state if successful. If unsuccessful, it sets the **ConnectRetry** timer and transitions to the **Active** state upon expiry.
- **Active**: The router sets the **ConnectRetry** timer to zero and returns to the **Connect** state.
- **OpenSent**: The router waits for an OPEN message from the peer. After receiving a valid message, it transitions to the **OpenConfirm** state.
- **OpenConfirm**: The router waits for a keepalive message from its peer. If the message is received prior to a timeout expiry, the router transitions to the **Established** state. If the timeout expires or an error condition exists, the router transitions to the **Idle** state.
- **Established**: Peers exchange UPDATE messages about routes they advertise. If an UPDATE message contains an error, the router sends a NOTIFICATION message and transitions to the **Idle** state.

During established BGP sessions, routers exchange UPDATE messages about the destinations to which they offer connectivity. The route description includes the destination prefix, prefix length, autonomous systems in the path, the next hop, and information that affects the acceptance policy of the receiving router. UPDATE messages also list destinations to which the router no longer offers connectivity.

BGP detects and eliminates routing loops while making routing policy decisions by using the network topology as defined by AS paths and path attributes.

33.1.1 Multiprotocol BGP

Multiprotocol BGP facilitates the advertisement of network routes and switch capabilities to neighbors from multiple address families over a single BGP peering. The switch supports IPv4 unicast and IPv6 unicast address families.

Neighbors negotiate to select an address family when establishing a connection. The peer session is based on this address family, which identifies the following:

- The set of network layer protocols to which the address carried in the Next Hop field must belong.
- The encoding format of the next hop address.
- The semantics of Network Layer Reachability Information (NLRI).
33.1.2 BGP Confederations

BGP confederations divide an autonomous system (AS) into subsystems (sub-ASs), each identified by a unique sub-AS number, while still appearing externally as a single AS.

33.1.3 QoS Control of Neighbor Discovery and ARP Packets

To help prevent BGP sessions from being affected by dropped neighbor discovery and ARP packets, some Arista switches assign those packets to a higher priority output queue when they are being software forwarded. This helps minimize hardware drops from competition with data plane packets traffic congestion.

The switch platforms which use this feature are:

- DCS-7500E
- DCS-7250X
- DCS-7300X
- DCS-7010X
- DCS-7050X

33.1.4 Best-Path Selection

Routing information received via the BGP protocol often contains more than one route to the same destination: the BGP best-path selection algorithm determines which of these routes will be installed in the routing table. The following criteria are evaluated in order; at each step, if there is a tie for best path the next criterion is applied. If there is still a tie at the end of the process, BGP installs the route received from the peer with the lowest address. When equal cost multi path (ECMP) routing is enabled, multiple paths to a single destination may be installed in the IP routing table.

Route preferences can be shaped through configuration choices as described in Configuring Best-path Selection. The steps in Arista’s best-path selection process are described below.

**Step 1** Select the route that has the highest weight value. The weight of paths learned from a specific neighbor can be adjusted using the `neighbor weight` or `neighbor route-map (BGP)` command. Weight is only significant locally, and is not communicated in update messages.

**Step 2** Select the route that has the highest LOCAL_PREF value.

**Step 3** If `bgp bestpath as-path ignore` is disabled (the default), select the route that has the shortest AS path, excluding confederation segments; otherwise skip ahead to the next step.

**Step 4** Select the route that has the lower ORIGIN value. The lowest ORIGIN value is IGP (Interior Gateway Protocol), which is better than EGP (Exterior Gateway Protocol), which is better than INCOMPLETE.

**Note** Exterior Gateway Protocol (EGP), as described in RFC 904, is the predecessor of BGP and is included in the selection algorithm for legacy reasons. It is rarely if ever used, and should not be confused with eBGP (see step 6 below).

**Step 5** Select the route that has the lower MED value. The MED values are comparable if `bgp always-compare-med` is enabled or if the routes have the same neighbor AS. The neighbor AS of a path is determined as follows:

a If the router is in a confederation: if `bgp bestpath med confed` is configured, the confederation ID is used for the neighbor AS. Otherwise, the MED values of the routes are not comparable.
b If the router is not in a confederation: the first AS number in the first AS_SEQUENCE segment is used as the neighbor AS. If such a segment does not exist, the local router AS number is used.

Step 6 Prefer routes received from external peers (eBGP routes) over those received from internal peers (iBGP routes).

Step 7 Select the route that has the lowest IGP cost to the BGP NEXT_HOP. The IGP cost is determined using the metric of the resolving route for the BGP next-hop.

Step 8 If bgp bestpath as-path multipath-relax is enabled (default), then skip ahead to the next step; otherwise the AS_PATH path lengths are compared. The path length is determined by adding the total number of AS and segment types in the AS_PATH field. Prefer the route with the shorter path length. If path lengths are equal, then prefer the route with the first smaller non-matching AS, and then prefer the route with the first smaller non-matching segment type (sub-AS).

Step 9 If the selection process reaches this stage, then the routes being considered are eligible for multipath task.

a If multipath routes are being evaluated and bgp bestpath ecmp-fast is enabled (default) and none of the bgp bestpath tie-break configurations is enabled (default), then there is no preferred route in the multipath group and routes are not evaluated further. The effective ordering of routes in the multipath group is implementation-dependent and routes that were added to the multipath group first are preferred over routes that are added to the multipath group later. The path selection process ends here.

b If multipath routes are being evaluated and bgp bestpath ecmp-fast is not enabled, continue to step 10.

Step 10 If the routes are eligible for multipath task and none of the bgp bestpath tie-break configurations is enabled (default), skip ahead to step 11. Otherwise, continue as follows:

a If bgp bestpath tie-break router-id is enabled, prefer the route with the lowest ROUTER_ID. If the route is a reflected route (that is if it contains route reflector attributes), use the ORIGINATOR_ID as the ROUTER_ID for comparison.

b If bgp bestpath tie-break cluster-list-length is enabled, prefer the route with the shortest CLUSTER_LIST length. The cluster list length is assumed to be 0 if the route doesn’t carry a CLUSTER_LIST attribute.

c If there isn’t a preferred route yet, go to step 13.

Step 11 Prefer the route with the lowest ROUTER_ID. If the route is a reflected route (i.e., if it contains route reflector attributes), use the ORIGINATOR_ID as the ROUTER_ID for comparison.

Step 12 Prefer the route with the shortest CLUSTER_LIST length. The cluster list length is assumed to be 0 if the route doesn’t carry a CLUSTER_LIST attribute.

Step 13 Prefer the route received from the lowest peer address.

Step 14 If the peer address is the same for routes under comparison and bgp additional-path receive is enabled (the default), then the routes should differ in the received path IDs. Prefer the route with the lower received path ID. The path selection process ends here.

33.1.5 BGP Convergence

BGP supports convergence where it waits for all peers to join and receive all the routes from other peers. Before declaring convergence, BGP also waits for IGP protocols to converge so that all IBGP sessions are established, and routes that were learned over IBGP sessions, are resolved via the IGP routes. BGP declares convergence when it has received route updates from all its peers and EOR.
(End-Of-RIB) markers from all the expected peers and IGP protocols have converged. Using BGP convergence, you can avoid hardware updates or route advertisement churn during a switch reload or a BGP instance start.

33.1.6 BGP Communities

A BGP community is a group of subnet address prefixes that share a common identifying attribute. Communities simplify routing policies by consolidating IP network spaces into logical entities that BGP speakers can address to accept, prefer, and distribute routing information. BGP communities are defined by setting the community value within route maps. Community lists then reference one or more communities as follows:

- **Standard** community lists refer to communities by name or number.
- **Expanded** community lists reference communities using regular expressions.

33.1.7 BGP Graceful Shutdown Community

Autonomous System Boundary Routers (ASBRs) do not update all paths received from external BGP sessions and routers. They hide inefficient alternate paths and update only best paths in the routing table. BGP route policies are applied to all internal BGP sessions of ASBRs that support the graceful shutdown procedure.

As a part of maintenance mode, these route policies perform the following functionalities on routing advertisements:

- Match the graceful shutdown community with route map rules.
- Set the local preference attribute value of the paths that are tagged with the graceful shutdown community as zero.

Refer to Chapter 10: Maintenance Mode for the detailed information on maintenance mode.

33.1.8 BGP Labeled-Unicast (LU) path Nexthop resolution over Tunnel RIB Entries

BGP Labeled-Unicast protocol (BGP LU) path next-hop is enhanced to allow BGP in “ribd” mode to support resolution of BGP LU path next-hop over entries in the Tunnel RIB and fall-back to resolving over connected route when there is no entry in Tunnel RIB that provides a direct match for the BGP LU path next-hop. Previously, BGP in “ribd” mode allowed resolution of BGP Labeled-Unicast protocol (BGP LU) path next-hop over only connected routes, resolution of the next-hop over IGP or static routes was not allowed since the next-hop router may not be in the MPLS forwarding path in which case the traffic will get dropped by the next-hop router (per IGP).

**Note**

There are no new CLIs or show commands added with this enhancement.

The following two use cases explain how BGP LU path next-hop resolution over tunnels would help in achieving desired or efficient traffic forwarding:

- **Egress Peer Engineering (EPE)**
- **Inter-AS Option C**

**Egress Peer Engineering (EPE)**

Egress Peer Engineering is a source-routing paradigm that provides ability to select an egress node/interface through which traffic goes out of an Autonomous System (AS). As shown in Figure 1 below R1, R2, ASBR1 & ASBR2 are in AS 1 and E1, E2, E3 & E4 are in different Ases. R1, R2, ASBR1 & ASBR2 could be connected each other directly or reachable to each other over an IGP (OSPF/ISIS)
or MPLS tunnel. Let’s assume reachability of loop-back addresses 1.1.1.1, 2.2.2.2, 3.3.3.3 & 4.4.4.4 through LDP or Segment Routing (SR). There exists an iBGP Full Mesh between R1, R2, ASBR1 & ASBR2. eBGP session is present between ASBR1 & E1, ASBR1 & E2, ASBR2 & E3 and ASBR2 & E4. Consider following BGP updates are received on ASBR1:

Prefix 50.0.0.0/8 next-hop 10.0.0.2 as-path 2 100 from E1
Prefix 50.0.0.0/8 next-hop 11.0.0.2 as-path 3 200 300 from E2

BGP path from E1 will be selected as best path due to shorter AS path length. ASBR1 advertises this prefix to both R1 & R2. Any traffic destined to prefix 50.0.0.0/8 from R1 will always be tunneled to ASBR1 and then it will always be sent on an interface connected to E1. Traditional Destination based routing enforced by BGP policy and best path selection on the ASBRs may route traffic to a single AS as exit when a case can be made that for some prefixes an exit via some other AS may be preferable. BGP LU can be used here to perform traffic engineering or selecting Egress peer through which traffic should be forwarded.

A Centralized EPE Controller can be used to establish iBGP session with R1 & R2. Let’s assume Controller advertises BGP LU routes for E2, i.e., 11.0.0.2/32, with next-hop set to loop-back IP address of ASBR1, that is, 1.1.1.1 and a label 111 to R1 & R2.

```
Switch# show ip bgp 11.0.0.2/32
BGP routing table information for VRF default
Router identifier 3.3.3.3, local AS number 1
BGP routing table entry for 11.0.0.2/32
Paths: 1 available
Local

S  111       [100]
    via M, 11.0.0.2, pop
    payload ipv4, apply egress-acl
    interface Ethernet 4
For prefixes to which traffic should be sent over interface connected E2 controller will advertise a BGP route with next-hop being BGP LU prefix and higher local-preference compared to paths advertised by ASBR1 & ASBR2, so that path received from controller will be preferred over paths coming from ASBR1 & ASBR2.

Switch# show ip bgp 50.0.0.0/8
BGP routing table information for VRF default
Router identifier 3.3.3.3, local AS number 1
BGP routing table entry for 50.0.0.0/8
Paths: 3 available
Local
  11.0.0.2 from 100.100.100.1 (100.100.100.1)
    Origin IGP, metric 0, localpref 200, IGP metric 0, weight 0, received 00:00:15 ago, valid, internal, best
    Rx SAFI: Unicast 2 100
  1.1.1.1 from 1.1.1.1 (1.1.1.1)
    Origin IGP, metric 0, localpref 100, IGP metric 0, weight 0, received 00:04:49 ago, valid, internal
    Rx SAFI: Unicast 2 200 300
  2.2.2.2 from 2.2.2.2 (2.2.2.2)
    Origin IGP, metric 0, localpref 100, IGP metric 0, weight 0, received 00:30:38 ago, valid, internal
    Rx SAFI: Unicast

This results in pushing 2 labels on R1, top label is the label corresponding to ISIS SR tunnel to reach ASBR1 and bottom label is the label that corresponds to egress interface. Similarly LU route for 12.0.0.0.2 or 13.0.0.2 can be advertised from controller to select egress peer between E3 & E4. This approach provides Egress peer selection on an ingress router R1/R2.

  B I 50.0.0.0/8 [200/0] via 11.0.0.2/32, BGP LU tunnel index 1
    via 6.6.6.6, Ethernet 5, label 900001 l11

Inter-AS Option C
Inter-AS Option C is an efficient and scalable MPLS IP VPN solution to provide connectivity between two sites of a customer connected to Provider Edge (PE) routers in different ASes. Following diagram shows a typical topology.
PE1 & ASBR1 and PE2 & ASBR2 distribute loop-back addresses using an IBGP Labeled Unicast (LU) session. ASBR2 advertises system addresses in AS200 to ASBR1 with next-hop as itself over EBGP LU session between them and installing Label swap entry of label sent to ASBR1 (L2) to label received from PE2 (L1) in MPLS forwarding table. ASBR1 further propagates system addresses in AS200 learned from ASBR2 into AS100 or to PE1 using IBGP LU session with next-hop as itself and installing Label swap entry with label advertised to PE1 (L3) to Label received from ASBR2 (L2) in MPLS forwarding table. Similarly ASBR1 sends system addresses in AS100 to ASBR2 over EBGP LU session, ASBR2 forwards them into AS200 or to PE2 using IBGP LU session with itself as next-hop and this would trigger installing appropriate label swap actions into MPLS forwarding table. These advertisements results in the creation of a label switched path from PE1 to PE2.

PE1 & PE2 exchange VPN routes between each other using a Multi hop EBGP session with next-hop being their own loop-back/system addresses. This method eliminates the requirement of storing or sending/receiving VPN routes at ASBR routers. When PE & ASBR routers are non-adjacent, but in the same AS, then LDP or ISIS-SR can be used as a transport label signaling protocol and this would need resolving BGP LU path next-hop over LDP or ISIS-SR tunnel. An IP packet destined to an address in CE1 site 2 is received on PE1 from CE1 site 1 PE1 would need to push 3 labels onto it. Bottom label corresponds to packet destination address in a particular VRF of CE1 site 2 advertised by PE2 to PE1 over Multi hop EBGP session, Middle label belongs to PE2 system address sent by ASBR1 and top label corresponding to ASBR1 system address assigned by transport label signaling protocol.
33.2 Configuring BGP

These sections describe basic BGP configuration steps:

- Section 33.2.1: Configuring BGP Instances
- Section 33.2.2: Configuring BGP Neighbors
- Section 33.2.3: Configuring GTSM for BGP
- Section 33.2.4: Configuring Routes
- Section 33.2.5: Configuring Address Families
- Section 33.2.6: Configuring Best-path Selection
- Section 33.2.7: Configuring BGP Convergence
- Section 33.2.8: Configuring BGP Graceful Shutdown Community
- Section 33.2.9: BGP Confederations
- Section 33.2.10: BGP Operational Commands

33.2.1 Configuring BGP Instances

33.2.1.1 Creating an Instance and Entering BGP Configuration Mode

The switch supports one BGP instance, which is associated with a specified autonomous system (AS). To other BGP peers, the AS number uniquely identifies the network to which the switch belongs. Arista switches support four-byte AS numbers as described in RFC 4893. Four-byte AS number capability is communicated to BGP peers in OPEN messages. When communicating with a BGP peer which does not support four-byte AS numbers, the switch will replace AS numbers greater than 65535 with the well-known two-byte AS number 23456 (also called AS_TRANS), and encode the actual four-byte AS numbers using the AS4_PATH attribute.

The switch must be in router-BGP configuration mode to run BGP configuration commands. The `router bgp` command places the switch in router-BGP configuration mode for creating a BGP instance if one was not previously created. BGP configuration commands apply globally to the BGP instance.

**Example**

- This command places the switch in router-BGP configuration mode. It also creates a BGP instance in AS 50 if an instance was not previously created.

```
switch(config)#router bgp 50
```

```
switch(config-router-bgp)#
```

When a BGP instance exists, the `router bgp` command must include its autonomous system. Any attempt to create a second instance results in an error message.

**Example**

- This command attempts to open a BGP instance with a different AS number from that of the existing instance. The switch displays an error and stays in global configuration mode.

```
switch(config)#router bgp 100
```

% BGP is already running with AS number 50
```
switch(config)#
```
33.2.1.2 Configuring BGP in a VRF

IPv6 VRF support in EOS allows application of a BGP configuration to a single VRF instance, overriding global commands. To apply VRF-specific BGP configuration, use the `vrf` command within router-BGP configuration mode to enter BGP VRF configuration mode. IPv6 BGP VRF configuration is performed in the VRF submode of the router-BGP configuration mode. This submode is also where a route distinguisher (RD) is configured for a VRF on switches running Ethernet VPN (EVPN): use the `rd` (Router-BGP VRF and VNI Configuration Modes) command to configure an RD for a VRF.

Examples

- These commands place the switch in BGP VRF configuration mode for VRF “purple.” Commands issued in this mode will override global BGP configuration for the specified VRF instance.
  
  ```
  switch(config)#router bgp 1
  switch(config-router-bgp)#vrf purple
  ```

- These commands activate IPv6 address-family support for the IPv6 neighbor 2001:0DB8:8c01::1 in VRF “purple.”
  
  ```
  switch(config-router-bgp-vrf-purple)#router-id 1.1.1.1
  switch(config-router-bgp-vrf-purple)#neighbor 2001:0DB8:8c01::1 remote-as 16
  switch(config-router-bgp-vrf-purple)#address-family ipv6
  switch(config-router-bgp-vrf-purple-af)#neighbor 2001:0DB8:8c01::1 activate
  ```

- This command configures a route distinguisher for VRF “purple.”
  
  ```
  switch(config-router-bgp-vrf-purple)#rd 530:12
  ```

33.2.2 Configuring BGP Neighbors

33.2.2.1 Establishing BGP Neighbors

BGP neighbors, or peers, are established by configuration commands that initiate a TCP connection. BGP supports two types of neighbors:

- Internal neighbors are in the same autonomous system.
- External neighbors are in different autonomous systems.

BGP neighbors can be either static or dynamic:

- Static neighbors are established by manually configuring the connection.
- Dynamic neighbors are established by creating a listen range and accepting incoming connections from neighbors in that address range.

Static neighbors may belong to a static peer group, allowing them to be configured as a group. Configuration applied to an individual member of a static peer group overrides the group configuration for that peer. Dynamic neighbors must belong to a dynamic peer group, and can only be configured as a group.

**Static BGP Neighbors**

The `neighbor remote-as` command connects the switch with a peer, establishing a static neighbor.

Once established, a static neighbor may be added to an existing peer group. Any configuration applied to the peer group then is inherited by the neighbor, unless a conflicting configuration has been entered for that peer. Settings applied to a member of the peer group override group settings.
Note

To establish a BGP session, there must be an IPv4 router ID configured in the same VRF or at least one L3 interface with an IPv4 address in the same VRF. If the VRF contains no L3 interfaces with IPv4 addresses (for example, in an IPv6-only environment), configure an appropriate router ID using the `router-id (BGP)` command.

Example

- These commands establish an internal BGP connection with the peer at 10.1.1.14.

  ```sh
  switch(config)#router bgp 50
  switch(config-router-bgp)#neighbor 10.1.1.14 remote-as 50
  switch(config-router-bgp)#
  ```

- These commands establish an external BGP connection with the peer at 192.168.2.5.

  ```sh
  switch(config)#router bgp 50
  switch(config-router-bgp)#neighbor 192.168.2.5 remote-as 100
  switch(config-router-bgp)#
  ```

Dynamic BGP Neighbors

The `bgp listen range` command specifies a range of IPv4 addresses from which the switch will accept incoming dynamic BGP peering requests, and creates the named dynamic peer group to which those peers belong. Dynamic BGP neighbors are peers which have not been manually established, but are accepted into a dynamic peer group when the switch receives a peering request from them.

Dynamic peers cannot be configured individually, but inherit any configuration that is applied to the peer group to which they belong. Peering relationships with dynamic peers are terminated if the peer group is deleted.

Example

- These commands create a peer group called “brazil” which accepts dynamic peering requests from the 192.168.2.0/24 subnet.

  ```sh
  switch(config)#router bgp 50
  switch(config-router-bgp)#bgp listen range 192.168.2.0/24 peer-group brazil remote-as 50
  switch(config-router-bgp)#
  ```

Displaying Neighbor Connections

The `show ip bgp summary` and `show ip bgp neighbors` commands display neighbor connection status.

Example

- This command indicates the connection state with the peer at 192.168.2.5 is `Estab` (established). The peer is an external neighbor because it is in AS 100 and the local server is in AS 50.

  ```sh
  switch>show ip bgp summary
  BGP summary information for VRF default
  BGP router identifier 192.168.104.2, local AS number 50
  Neighbor Status Codes: m - Under maintenance
  Neighbor     V  AS  MsgRcvd  MsgSent  InQ OutQ  Up/Down State  PfxRcd PfxAcc
  192.168.2.5  4  100     198      281    0    0 03:11:31 Estab  12     12
  ```
Static BGP Peer Groups

A static BGP peer group is a collection of BGP neighbors which can be configured as a group. Once a static peer group is created, the group name can be used as a parameter in neighbor configuration commands, and the configuration will be applied to all members of the group. Neighbors added to the group will inherit any settings already created for the group. Static peer group members may also be configured individually, and the settings of an individual neighbor in the peer group override group settings for that neighbor.

When the default form of a BGP configuration command is entered for a member of a static peer group, the peer inherits that configuration from the peer group.

A static peer group is created with the neighbor peer group (create) command, or by using the bgp listen range command to accept dynamic peering requests. Once a static peer group has been created, static neighbors can be manually added to the group by using the neighbor peer-group (neighbor assignment) command. The no neighbor peer-group (neighbor assignment) command removes a neighbor from a static peer group.

The no neighbor peer group (create) command will delete a static peer group. When a peer group is deleted, the members of that group revert to their individual configurations, or to the system default for any attributes that have not been specifically configured for that peer.

Examples

- These commands create a peer group named “akron.”
  ```
  switch(config)#router bgp 50
  switch(config-router-bgp)#neighbor akron peer-group
  switch(config-router-bgp)#
  ```

- This command adds the neighbors at 1.1.1.1 and 2.2.2.2 to peer group akron.
  ```
  switch(config-router-bgp)#neighbor 1.1.1.1 peer-group akron
  switch(config-router-bgp)#neighbor 2.2.2.2 peer-group akron
  switch(config-router-bgp)#
  ```

- These commands configure the members of peer group akron, but cause the neighbor at 1.1.1.1 to use the system default value for out-delay.
  ```
  switch(config-router-bgp)#neighbor akron remote-as 109
  switch(config-router-bgp)#neighbor akron out-delay 101
  switch(config-router-bgp)#neighbor akron maximum-routes 12000
  switch(config-router-bgp)#no neighbor 1.1.1.1 out-delay
  switch(config-router-bgp)#
  ```

Dynamic BGP Peer Groups

A dynamic BGP peer group is a collection of BGP neighbors in a specified address range which makes a peer request to the switch. Members of dynamic peer group are configured in groups and not as individuals. A dynamic peer group name is used as a parameter to apply the configuration across all the members in the group. Neighbors joining the group inherit any settings already created for the group.

The bgp listen range command is used to create a dynamic peer group. This command identifies the BGP peering request from a range of IP address, and names the dynamic peer group to which those peers belong to. The bgp listen range command can be configured to accept a peering request from a single AS number or to accept peer request from the range of AS numbers. To accept the request from the range of AS numbers use the peer filter option in the command as shown. If the peer filter referred by the bgp listen range command does not exist, or if the filter exists but has no match commands, it will accept any AS number.
Configuring BGP

Chapter 33: Border Gateway Protocol (BGP)

Note

When a listen range command is modified, any existing dynamic neighbor that is already established will get reset.

To delete a dynamic peer group, use the no or default form of the `bgp listen range` command. All peering relationships with group members are terminated when the dynamic peer group is deleted.

Example

- These commands create a dynamic peer group called “brazil” in a single AS, which accepts peering requests from the 192.0.2.0/24 subnet the single AS is 5.

  ```
  switch(config)#router bgp 1
  switch(config-router-bgp)#bgp listen range 192.0.2.0/24 peer-group brazil
  remote-as 5
  ```

- These commands create a dynamic peer group called “brazil” in a range of ASNs, which accepts peering requests from the 192.0.2.0/24 subnet. The range of AS numbers is defined by peer filter option.

  ```
  switch(config)#router bgp 1
  switch(config-router-bgp)#bgp listen range 192.0.2.0/24 peer-group brazil peer-filter group-1
  ```

The `show ip bgp peer-group` command displays the source of a listen range’s remote AS number definition as shown.

  ```
  switch(config-router-bgp)#show ip bgp peer-group
  BGP peer-group is brazil
  BGP version 4
  Listen-range subnets:
  VRF default:
    192.0.2.0/24, remote AS 5
    192.0.2.0/24, peer filter group1
  ```

33.2.2.2 Peer Filter

A peer filter defines a set of rules which decides whether to accept or reject the incoming peer request, based on the specific peer attributes. The peer filter is defined using a sequence number and a match statement, today it does support one new match statement for matching against a range of BGP AS numbers. A peer filter is defined using a peer filter configuration mode as shown. The peer filter command supports only matching AS ranges. Unlike route maps, peer filter do not support sets, continues or subroutines.

To delete a peer filter, use the no or default form of the peer filter command.

Example

- These commands define a peer filter that accepts any AS number.

  ```
  switch(config)#peer-filter group1
  switch(config-peer-filter-group1)#10 match as-range 1-4294967295 result accept
  ```

- These commands define a peer filter that accepts any AS number within 65000 and 65100 (inclusive) except 65008 and 65009.

  ```
  switch(config)#peer-filter group2
  switch(config-peer-filter-group2)#10 match as-range 65008-65009 result reject
  switch(config-peer-filter-group2)#20 match as-range 65000-65100 result accept
  ```
These commands define a peer filter that accepts 3 specific remote AS numbers.

```
switch(config)#peer-filter group3
switch(config-peer-filter-group3)#10 match as-range 65003 result accept
switch(config-peer-filter-group3)#20 match as-range 65007 result accept
switch(config-peer-filter-group3)#30 match as-range 65009 result accept
```

The `show peer-filter` command displays the peer filter definition.

```
switch(config)#show ip bgp peer-group3
peer-filter group3
  10 match as-range 65003 result accept
  20 match as-range 65007 result accept
  30 match as-range 65009 result accept
```

### 33.2.2.3 Special Considerations for IPv6

BGP predates the use of IPv6, and BGP configuration assumes IPv4 connections by default. The following additional steps are used to configure IPv6 BGP neighbors.

**Note**

To establish a BGP session, there must be an IPv4 router ID configured in the same VRF or at least one L3 interface with an IPv4 address in the same VRF. If the VRF contains no L3 interfaces with IPv4 addresses (e.g., in an IPv6-only environment), configure an appropriate router ID using the `router-id (BGP)` command.

### Activating IPv6 Neighbors

By default, the switch does not negotiate or advertise IPv6 BGP routes. In order to establish a session with an IPv6 neighbor, it must be made active in the IPv6 address family. The `bgp default ipv6-unicast` command causes the switch to send IPv6 capability messages and all network advertisements with IPv6 prefixes to all BGP neighbors. The `neighbor activate` command issued in IPv6 address family configuration mode does the same for a single BGP neighbor.

### Examples

- These commands make all BGP neighbors active in the IPv6 address family.
  
  ```
  switch(config)#router bgp 11
  switch(config)#address-family ipv6
  switch(config-router-bgp-af)#bgp default ipv6-unicast
  switch(config-router-bgp-af)#exit
  switch(config-router-bgp-af)#
  ```
- These commands make the BGP neighbor at 2001:0DB8:8c01::1 active in the IPv6 address family.
  
  ```
  switch(config)#router bgp 11
  switch(config)#address-family ipv6
  switch(config-router-bgp-af)#neighbor 2001:0DB8:8c01::1 activate
  switch(config-router-bgp-af)#exit
  switch(config-router-bgp-af) #
  ```

### Sending IPv4 NLRIs over IPv6 Connections

The switch supports the exchange of IPv4 NLRIs with IPv6 neighbors. To enable this feature for all IPv6 neighbors, use the command `bgp default ipv4-unicast transport ipv6` in IPv4 address family configuration mode. To enable it for a single IPv6 neighbor, use the `neighbor activate` command for that neighbor in IPv4 address family configuration mode.
To send IPv4 NLRI transport over all IPv6 connections by making the IPv4 address family active on IPv6 BGP neighbors, then configure the switch to automatically select a local IPv4 address to be sent in NLRI to the IPv6 neighbors in a peer group called “indianapolis”.

```
switch(config)#router bgp 11
switch(config-router-bgp)#address-family ipv4
switch(config-router-bgp-af)#bgp default ipv4-unicast transport ipv6
switch(config-router-bgp-af)#exit
switch(config-router-bgp)#neighbor indianapolis auto-local-addr
```

These commands permit IPv4 NLRI transport with the IPv6 neighbor at 2001:0DB8:8c01::1 using a local IPv4 address of 10.7.5.11.

```
switch(config)#router bgp 11
switch(config-router-bgp)#address-family ipv4
switch(config-router-bgp-af)#neighbor 2001:0DB8:8c01::1 activate
switch(config-router-bgp-af)#exit
switch(config-router-bgp)#neighbor 2001:0DB8:8c01::1 local-v4-addr 10.7.5.11
```

33.2.2.4 Maintaining Neighbor Connections

BGP neighbors maintain connections by exchanging keepalive, UPDATE, and NOTIFICATION messages. Neighbors that do not receive a message from a peer within a specified period (hold time) close the BGP session with that peer. Hold time is typically three times the period between scheduled keepalive messages. The default keepalive period is 60 seconds; default hold time is 180 seconds.

The `timers bgp` command configures the hold time and keepalive period. A peer retains its BGP connections indefinitely when its hold time is zero.

**Example**

```
switch(config-router-bgp)#timers bgp 15 45
```

The `show ip bgp neighbors` command displays the hold time.
Example

- This command indicates the BGP hold time is 45 seconds.

```
switch>show ip bgp neighbors 10.100.100.2
BGP neighbor is 10.100.100.2, remote AS 100
BGP version 4, remote router ID 192.168.100.13, VRF default
  Negotiated BGP version 4
  Last read 00:00:05, last write 00:00:05
  Hold time is 45, keepalive interval is 15 seconds <= hold time
  Configured hold time is 45, keepalive interval is 15 seconds
  Connect timer is inactive
  Idle-restart timer is inactive
  BGP state is Established, up for 04:44:05
  Number of transitions to established: 11
  Last state was OpenConfirm
  Last event was RecvKeepAlive
  Last sent notification: Cease/administrative reset, Last time 04:44:09
  Last rcvd notification: Cease/peer de-configured, Last time 2d02h, First time 7d08h, Repeats 1
  Neighbor Capabilities:
    Multiprotocol IPv4 Unicast: advertised and received and negotiated
    Four Octet ASN: advertised and received
```

33.2.2.5 Neighbor – Route Configuration

Maximum Routes

The `neighbor maximum-routes` command determines the number of BGP routes the switch accepts from a specified neighbor. The switch disables peering with the neighbor when this number is exceeded.

Example

- This command configures the switch to accept 15,000 routes from the peer at 192.168.18.24.

```
switch(config-router-bgp)#neighbor 192.168.18.24 maximum-routes 15000
```

Route Reflection

Participating BGP routers within an AS communicate eBGP-learned routes to all of their peers; they do not re-advertise iBGP-learned routes within the AS to prevent routing loops. Although a fully meshed network topology ensures that all AS members share routing information, this topology can result in high volumes of iBGP messages when scaled. Alternatively, one or more routers are configured as route reflectors in larger networks.

A route reflector re-advertises routes learned through iBGP to a group of BGP neighbors within the AS, replacing the function of a fully meshed topology. The `neighbor route-reflector-client` command configures the switch to act as a route reflector and configures the specified neighbor as a client. The `bgp client-to-client reflection` command enables client-to-client reflection.

When using route reflectors, an AS is divided into clusters. A cluster contains at least one route reflector and a group of clients to which they re-advertise route information. A cluster may contain multiple route reflectors to provide redundancy protection. Each reflector has a cluster ID. When the cluster has a single route reflector, the cluster ID is its router ID. When a cluster has multiple route reflectors
reflectors, a 4-byte cluster ID is assigned to all route reflectors in the cluster, allowing them to recognize updates from other cluster reflectors. The `bgp cluster-id` command configures the cluster ID in a cluster with multiple route reflectors.

**Example**

- These commands configure the switch as a route reflector and the neighbor at 172.72.14.5 as one of its clients, and set the cluster ID to 172.22.30.101.

  ```
  switch(config-router-bgp)# neighbor 172.72.14.5 route-reflector-client
  switch(config-router-bgp)# bgp cluster-id 172.22.30.101
  switch(config-router-bgp)#
  ```

Usually the clients of a route reflector are not interconnected, and any routes learned by a client are mirrored to other clients and re-advertised within the AS by the route reflector. If the clients of a route reflector are fully meshed, routes received from a client do not need to be mirrored to other clients. In this case, client-to-client reflection should be disabled (no bgp client-to-client reflection).

**Route Preference**

The primary function of external peers is to distribute routes they learn from their peers. Internal peers receive route updates without distributing them. External peers receive route updates, then distribute them to internal and external peers.

**Local preference** is a metric that iBGP sessions use to select an external route. Preferred routes have the highest local preference value. UPDATE packets include this metric in the LOCAL_PREF field.

The `neighbor export-localpref` command specifies the LOCAL_PREF that the switch sends to an internal peer. The command overrides previously assigned preferences and has no effect on external peers.

**Example**

- This command configures the switch to enter 200 in the LOCAL_PREF field of UPDATE packets it sends to the peer at 10.1.1.45.

  ```
  switch(config-router-bgp)# neighbor 10.1.1.45 export-localpref 200
  switch(config-router-bgp)#
  ```

The `neighbor import-localpref` command assigns a local preference to routes received through UPDATE packets from an external peer. This command has no effect when the neighbor is an internal peer.

**Example**

- This command configures the switch to assign the local preference of 50 for routes advertised from the peer at 172.16.5.2.

  ```
  switch(config-router-bgp)# neighbor 172.16.5.2 import-localpref 50
  switch(config-router-bgp)#
  ```

The `show ip bgp` command displays the LOCAL_PREF value for all listed routes.
Example

- This command indicates the route to network 10.10.20.0/24 has a local preference of 400.

```
switch# show ip bgp
BGP routing table information for VRF default
Router identifier 192.168.100.23, local AS number 64512
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e - ECMP
S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop

<table>
<thead>
<tr>
<th>Network</th>
<th>Next Hop</th>
<th>Metric</th>
<th>LocPref</th>
<th>Weight</th>
<th>Path</th>
</tr>
</thead>
<tbody>
<tr>
<td>* &gt;Ec 10.10.20.0/24</td>
<td>192.168.31.3</td>
<td>0</td>
<td>400</td>
<td>0</td>
<td>64521</td>
</tr>
</tbody>
</table>
```

Graceful Restart

Graceful BGP restart allows a BGP speaker with separate control plane and data plane processing to continue forwarding traffic during a BGP restart. Its neighbors (receiving speakers) may retain routing information from the restarting speaker while a BGP session with it is being re-established, reducing route flapping.

Arista switches can act as helpers (receiving speakers) for graceful BGP restart with neighbors that advertise graceful restart capability.

Graceful restart helper mode is enabled by default, but can be turned off globally with the `no graceful-restart-helper` command. Per-peer configuration takes precedence over the global configuration.

Example

- This command disables graceful restart helper mode for all BGP peers.

```
switch(config-router-bgp)# no graceful-restart-helper
switch(config-router-bgp)#
```

- This command disables graceful restart helper mode for the neighbor at 192.168.32.5 regardless of global configuration.

```
switch(config-router-bgp)# no neighbor 192.168.32.5 graceful-restart-helper
switch(config-router-bgp)#
```

Peers with graceful restart capability advertise a restart time value as an estimate of the time it will take them to restart a BGP session. When a BGP session with a restarting speaker goes down, the switch (receiving speaker) marks routes from that peer as stale and starts the restart timer. If the session with the peer is not re-established before the restart time runs out, the switch deletes the stale routes from that peer. If the session is re-established within that time, the stale path timer is started. If the stale paths are not updated by the restarting speaker before the stale path time runs out, they are deleted. The maximum time these stale paths will be retained after the BGP session is re-established is 300 seconds by default, but can be configured using the `graceful-restart stalepath-time` command.

Example

- This command configures BGP to discard stale paths from a restarting peer 500 seconds after the BGP session with that peer is re-established.

```
switch(config-router-bgp)# graceful-restart stalepath-time 500
switch(config-router-bgp)#
```
33.2.2.6 Filtering Routes

Filtering with Route Maps

Route maps are used in BGP to directly filter IPv4 unicast routes. The neighbor route-map (BGP) command applies a route map to inbound or outbound BGP routes. To display the route maps associated with a specific BGP neighbor, use the show ip bgp neighbors command.

Filtering with BGP Communities

Community values are assigned to a set of subnet prefixes through route map set commands. Route map match commands subsequently use community values to filter routes. The switch uses the following ip community-list commands to filter community routes into a BGP domain:

- **ip community-list** creates a community list by explicitly referencing one or more communities by name or number.
- **ip community-list regexp** creates a community list by referencing one or more communities by regular expression.
- **ip extcommunity-list** creates an extended community list to identify routes for VRFs or for link bandwidth (LBW) by explicitly referencing extended communities by prefix and number.
- **ip extcommunity-list regexp** creates an extended community list to identify routes for VRFs or for link bandwidth (LBW) by regular expression.

The BGP community attribute is a 32 bit value formatted as follows:

- an integer between 0 and 4294967040.
- AA:NN, where AA is 65535 and NN specifies the community number (0-65535) within the AS.

These four community attribute values, and the associated BGP speaker actions, are predefined:

- **no-export**: speaker does not advertise the routes beyond the BGP domain.
- **no-advertise**: speaker does not advertise the routes to any BGP peers.
- **local-as**: speaker does not advertise route to any external peers.
- **internet**: speaker advertises the route to the Internet community. By default, this includes all prefixes.

Example

- These commands assign two network subnets to a prefix list, assign a community number to the prefix list members, then utilize that community in an **ip community-list** command to permit the routes into the BGP domain.

**Step 1** Compose the IP prefix list.

```plaintext
switch(config)#ip prefix-list PL_1 permit 10.1.2.5/24
switch(config)#ip prefix-list PL_1 permit 10.2.5.1/28
```

**Step 2** Create a route map that matches the IP prefix list and sets the community value.

```plaintext
switch(config)#route-map MAP_1 permit
switch(config-route-map-MAP_1)#match ip address prefix-list PL_1
switch(config-route-map-MAP_1)#set community 500
switch(config-route-map-MAP_1)#exit
```

**Step 3** Create a community list that references the community.

```plaintext
switch(config)#ip community-list CL_1 permit 500
```

2250
BGP extended communities identify routes for VRFs or for link bandwidth (LBW). Extended community clauses utilize route target (rt) and site of origin options (soo):

- **route targets** identify sites that may receive appropriately tagged routes.
- **site of origin** identifies the site where the router learned the route.

### Filtering with AS Path Access Lists

An AS path access list is a named list of permit and deny statements which use regular expressions to filter BGP routes based on their AS path attribute. AS path access lists are created using the `ip as-path access-list` command, and are applied using a route map `match` clause with the name of the access list as a parameter.

**Example**

- These commands create an AS path access list identifying routes which pass through AS 3, create a route map which references the access list, assign the routes it filters to community 300, and apply the route map to the neighbor at 192.68.14.5 to assign a community value of 300 to inbound routes received from that neighbor.

**Step 1** Create the AS path access list.

```bash
switch(config)#ip as-path access-list as_list3 permit _3_
```

**Step 2** Create a route map that matches the AS path access list and sets the community value.

```bash
switch(config)#route-map MAP_3 permit
switch(config-route-map-MAP_3)#match as-path as_list3
switch(config-route-map-MAP_3)#set community 300
switch(config-route-map-MAP_3)#exit
```

**Step 3** Apply the route map to the neighbor.

```bash
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 192.68.14.5 route-map MAP_3 in
```

### 33.2.3 Configuring GTSM for BGP

The Generalized TTL Security Mechanism (GTSM) uses a packet's Time to Live (TTL) (IPv4) or Hop Limit (IPv6) to protect BGP peering sessions from denial-of-service (DoS) attacks based on forged protocol packets.

An IP packet received from a BGP peer is discarded when its current TTL value is less than \((255-n)\) where \(n\) is the configured maximum number of hops to the peer. Use the `neighbor ttl maximum-hops` command to configure the maximum hop count.

**Note**

IP packets to GTSM enabled BGP peers are sent with the configured TTL value of 255.

### 33.2.4 Configuring Routes

#### 33.2.4.1 Advertising Routes

A BGP neighbor advertises routes it can reach through UPDATE packets. The `network (BGP)` command specifies a prefix that the switch advertises as a route originating from its AS.

The configuration clears the host portion of addresses entered in `network` commands. For example, `192.0.2.4/24` is stored as `192.0.2.0/24`. 
Example

- This command configures the switch to advertise the 10.5.8.0/24 network.
  ```
  switch(config-router-bgp)#network 10.5.8.0/24
  switch(config-router-bgp)#
  ```

By default, BGP will advertise only those routes that are active in the switch’s RIB. This can contribute to dropped traffic. If a preferred route is available through another protocol (like OSPF), the BGP route will become inactive and not be advertised; if the preferred route is lost, there is no available route to the affected peers. Advertising inactive BGP routes minimizes traffic loss by providing alternative routes.

The `bgp advertise-inactive` command causes BGP to advertise inactive routes to BGP neighbors. Inactive route advertisement is configured globally, but the global setting can be overridden on a per-VRF basis.

Examples

- This command configures the switch to advertise routes learned through BGP even if they are not active on the switch.
  ```
  switch(config-router-bgp)#bgp advertise-inactive
  switch(config-router-bgp)#
  ```

- This command overrides inactive route advertisement for VRF “purple.”
  ```
  switch(config-router-bgp)#vrf purple
  switch(config-router-bgp-vrf-purple)#no bgp advertise-inactive
  switch(config-router-bgp-vrf-purple)#
  ```

33.2.4.2 Advertising ISIS Routes into BGP Network

The `redistribute isis route-map isis-to-bgp` command advertises the routes learned through IS-IS routes into BGP network. It also allows to selectively advertise some routes and modify route attributes before advertising using route-maps.

The command is available in both address-family mode and router BGP mode, however, the command is rejected if configured in both address-family mode and router mode at the same time.

While redistributing IS-IS routes into BGP, Level-1| Level-2 keyword can be used to selectively redistribute Level-1 routes or Level-2 routes into BGP. The level-1|level-2 keyword is optional and it defaults to level-2 when not configured.

Use `show ipv6 bgp <detail>` command to verify that routes are advertised with correct attributes.

Note

If the command is configured in router-af mode, it only redistributes routes with matching address family. If it is configured in router mode, it applies to all enabled address-families.

Examples

- In this example the `redistribute isis route-map isis-to-bgp` command redistributes the IS-IS routes into BGP, in `address-family` mode.
  ```
  Switch(config)#router bgp 1
  Switch(config-router-bgp)#address-family ipv4
  Switch(config-router-bgp-af)#redistribute isis level-1 route-map isis-to-bgp-v4
  ```

- In this example the `redistribute isis route-map isis-to-bgp` command redistributes the IS-IS routes into BGP, in `router bgp` mode.
  ```
  Switch(config)#router bgp 1
  Switch(config-router-bgp)#redistribute isis level-1 route-map isis-to-bgp
  ```
33.2.4.3 BGP Route Aggregation

Aggregation combines the characteristics of multiple routes into a single route for advertisement by the BGP speaker. Aggregation can reduce the amount of information that a BGP speaker is required to store and transmit when advertising routes to other BGP speakers. Aggregation options affect the attributes associated with the aggregated route, the advertisement of the contributor routes that comprise the aggregate, and which contributor routes are included.

Aggregate routes are created with the `aggregate-address` command, which takes an IP subnet as an argument; any routes configured on the switch that lie within that subnet then become contributors to the aggregate. Note that on Arista switches the BGP aggregate route will become active if there are any available contributor routes on the switch, regardless of the originating protocol. This includes routes configured statically.

BGP speakers display aggregate routes that they create as null routes (with one exception: if all the contributors to the aggregate have the same BGP path attributes, then the BGP aggregate copies those attributes and is no longer a null route). Aggregate routes are advertised into the BGP autonomous system and redistributed automatically, and their redistribution cannot be disabled. BGP neighbors display inbound aggregate routes as normal BGP routes. Null routes are displayed with the `show ip route` command; normal BGP routes (and null aggregate routes) are displayed with the `show ip bgp` and `show ip route` commands.

Aggregation Options

The `aggregate-address` command provides the following aggregate route options:

- **AS_PATH attribute inclusion**: the `as-set` option controls the aggregate route’s AS_PATH and ATOMIC_AGGREGATE attribute contents. AS_PATH identifies the autonomous systems through which UPDATE message routing information passes. ATOMIC_AGGREGATE indicates that the route is an aggregate or summary of more specific routes.

  When the command includes `as-set`, the aggregate route’s AS_SET attribute contains the AS numbers of contributor routes. This can help BGP neighbors to prevent loops by rejecting aggregate routes that include their AS number in the AS_SET.

  When the command does not include `as-set`, the aggregate route’s ATOMIC_AGGREGATE attribute is set and the AS_PATH attribute does not include AS numbers of contributing routes.

- **Attribute assignment**: The `attribute-map` option assigns attributes contained in set commands in a specified route map’s lowest sequence with any set command to the aggregated route, overriding the automatic determination of the aggregate route’s attributes by the switch.

- **Route suppression**: The `summary-only` option suppresses the advertisement of the contributor routes that comprise the aggregate.

- **Contributor filtering**: The `match-map` option uses a route map to filter out contributor routes that would otherwise be included in the aggregate.

Example

- These commands create an aggregate route (10.16.48.0/20) from four contributor routes (10.16.48.0/23, 10.16.50.0/23, 10.16.52.0/23, and 10.16.54.0/23). The aggregate route includes the AS_PATH information from the contributor routes.

```bash
switch(config)#router bgp 1
switch(config-router-bgp)#aggregate-address 10.16.48.0/20 as-set
switch(config-router-bgp)#exit
switch(config)#
```
These commands create an aggregate route and use a route map to add a local-preference attribute to the route.

```
switch(config)#route-map map1 permit 10
switch(config-route-map-map1)#set local-preference 40
switch(config)#router bgp 1
switch(config-router-bgp)#aggregate-address 10.16.48.0/20 attribute-map map1
switch(config-router-bgp)#exit
switch(config)#
```

These commands create an aggregate route and use a route map to allow only those contributors which match a specified prefix list to be included in the aggregate route.

```
switch(config)#route-map matchmap permit 10
switch(config-route-map-matchmap)#match ip address prefix-list agglist
switch(config-route-map-matchmap)#exit
switch(config)#router bgp 1
switch(config-router-bgp)#aggregate-address 1.1.0.0/16 match-map matchmap
```

### 33.2.4.4 Customizing the BGP AS-Path Attribute

The BGP Replace AS-Path feature enables customizing the AS_PATH attribute for prefixes that are either received from a BGP neighbor or advertised to a BGP neighbor. To configure the BGP Replace AS-Path feature, use the `set as-path match` and `set as-path prepend` commands.

To replace the AS_PATH attribute of routes received from a BGP neighbor, configure a route map and attach the policy to the corresponding BGP neighbor statement in the inbound direction.

To replace the AS_PATH attribute of routes that are advertised to a neighbor, configure a route map and attach the policy to the corresponding BGP neighbor statement in the outbound direction.

The Replace AS-Path feature works in conjunction with the AS-Path Prepend feature which is also used to modify the AS_PATH attribute. However, if both features are configured within the same route map, then the replace AS-Path feature takes precedence over the AS-Path Prepend.

**Note**

The BGP Replace AS-Path feature supports both eBGP and iBGP neighbors. The locally configured AS number is always prefixed to the AS-Path of routes advertised to the eBGP neighbors. This RFC behavior is retained in Arista’s implementation of the Replace AS-Path feature as well.

BGP Replace AS-Path has the following limitations:

- Replacing the AS-Path should be used cautiously since it may impact BGP loop prevention.
- A few duplicated routes may be advertised and installed on a router after the original AS-Path of those routes are replaced. To fix this issue, it is always suggested to filter out such routes by prefix with BGP Community.
Example

- This command replaces the AS-Path with the “none” option.

```plaintext
switch#show ip bgp neighbors 80.80.1.2 advertised-routes
BGP routing table information for VRF default
Router identifier 202.202.1.1, local AS number 200
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e - ECMP
S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast, q - Queued for advertisement
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop

Network Next Hop Metric LocPref Weight Path
* > 101.101.1.0/24 80.80.1.1 - - - 200 i
* > 102.102.1.0/24 80.80.1.1 - - - 200 i
* > 103.103.1.0/24 80.80.1.1 - - - 200 302 i
* > 202.202.1.0/24 80.80.1.1 - - - 200 i

switch#configuration terminal
switch(config)#route-map foo permit 10
switch(config-route-map-foo)#set as-path match all replacement none
switch(config-route-map-foo)#exit
switch(config)#router bgp 200
switch(config-router-bgp)#neighbor 80.80.1.2 route-map foo out
switch(config-router-bgp)#end

switch#show ip bgp neighbors 80.80.1.2 advertised-routes
BGP routing table information for VRF default
Router identifier 202.202.1.1, local AS number 200
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e - ECMP
S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast, q - Queued for advertisement
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop

Network Next Hop Metric LocPref Weight Path
* > 101.101.1.0/24 80.80.1.1 - - - 200 i
* > 102.102.1.0/24 80.80.1.1 - - - 200 i
* > 103.103.1.0/24 80.80.1.1 - - - 200 i
* > 202.202.1.0/24 80.80.1.1 - - - 200 i
```

The AS-Path of matching prefixes are replaced with an empty or a null AS-Path. AS 302 is removed from prefix 103.103.1.0/24 as shown in the above output.
33.2.5 Configuring Address Families

The switch determines the network prefixes that peering sessions advertise and the BGP neighbor addresses that receive advertisements through address family activity configuration.

An address family is a data structure that defines route advertising status to BGP neighbor addresses. Each BGP neighbor address is assigned an activity level for each address family on the switch. The switch sends capability and network prefix advertisements to neighbor addresses that are active within specified address families:

- IPv4 address family: switch advertises IPv4 capability and network commands with IPv4 prefixes to neighbor addresses configured as IPv4 address family active.
- IPv6 address family: switch advertises IPv6 capability and network commands with IPv6 prefixes to neighbor addresses configured as IPv6 address family active.

33.2.5.1 Neighbor Address Family Configuration

Address family activity levels for neighbor addresses are configured through bgp default and neighbor activate commands.

- The bgp default command specifies the default activity level of BGP neighbor addresses for a specified address family.
- The neighbor activate command specifies deviations from default address family activity level for a specified BGP neighbor address.

Default neighbor activation

The bgp default command configures the default address family activity level of all configured BGP neighbor addresses. The switch advertises the following to address family active addresses:

- IPv4 address family active: IPv4 capability and all network advertisements with IPv4 prefixes.
- IPv6 address family active: IPv6 capability and all network advertisements with IPv6 prefixes.

These commands configure default address family activity levels for configured BGP neighbor addresses.
Chapter 33: Border Gateway Protocol (BGP)  Configuring BGP

- bgp default ipv4-unicast  all BGP neighbor addresses are IPv4 address family active (this is the switch default).
- no bgp default ipv4-unicast  no BGP neighbor addresses are IPv4 address family active.
- bgp default ipv6-unicast  all BGP neighbor addresses are IPv6 address family active.
- no bgp default ipv6-unicast  no BGP neighbor addresses are IPv6 address family active (this is the switch default).
- bgp default ipv4-unicast transport ipv6  all BGP neighbor addresses are IPv4 address family active and IPv6 neighbors can receive IPv4 NLRI.

Note  If it is necessary to exchange IPv4 NLRIIs over an IPv6 connection, the IPv4 address family must be activated on the IPv6 neighbor. To do this for all IPv6 neighbors, use the command bgp default ipv4-unicast transport ipv6. For an individual neighbor, use the neighbor activate command for the IPv6 neighbor in the IPv4 address-family configuration mode as described below.

Activating Individual Neighbor Addresses

The address-family command places the switch in address family mode to configure the address family activity level of individual BGP neighbor addresses. The switch supports these address families:

- ipv4-unicast
- ipv6-unicast

Running-config displays address family commands in sub-blocks of the BGP configuration. The neighbor activate command is available in each address family configuration mode and defines the configuration mode address family activity level of a specified configured BGP neighbor address. Addresses are assigned one of the following states by the activate command:

- neighbor activate  configures the address as active in the configuration mode address family.
- no neighbor activate  configures the address as not active in the configuration mode address family.

The switch sends the following announcements to addresses that are active in an address family:

- IPv4 address family: IPv4 capability and all network routes with IPv4 prefixes.
- IPv6 address family: IPv6 capability and all network routes with IPv6 prefixes.

The neighbor route-map (BGP) command applies a route map to inbound or outbound BGP routes. In address-family mode, the route map is applied to routes corresponding to the configuration mode address family. When a route map is applied to outbound routes, the switch advertises only routes matching at least one section of the route map. One outbound and one inbound route map can be applied to a neighbor for each address family. Applying a route map to a route replaces the previous corresponding route map assignment.

Network Route Advertising in Address Families

The network (BGP) command specifies a network for advertisement through UPDATE packets to BGP peers. The command is available in Router-BGP and Router-BGP-Address-Family configuration modes; the mode in which the command is issued does not affect the command's execution.

- Commands with an IPv4 address are advertised to peers that are IPv4 address family-active.
- Commands with an IPv6 address are advertised to peers that are IPv6 address family-active.

Examples

- These commands instantiate BGP, configure three neighbors, and configure 2 network routes.
The default activity level for IPv4 and IPv6 address families is set to the default; all neighbor addresses are IPv4 address family active and IPv6 address family not active. IPv4 capability and network routes with IPv4 prefixes are advertised to all neighbor IPv4 addresses.

```
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor 172.21.14.8 remote-as 15
switch(config-router-bgp)#neighbor 172.23.18.6 remote-as 16
switch(config-router-bgp)#neighbor 2001:0DB8:8c01::1 remote-as 16
switch(config-router-bgp)#network 172.18.23.9/24
switch(config-router-bgp)#network 2001:0DB8:de29::/64
```

- These commands instantiate BGP on the switch, set IPv4 default activity level (not active), set IPv6 default activity level (active), and configure three neighbor addresses and two network route prefixes.

IPv6 capability and network routes with IPv6 prefixes are advertised to all neighbor addresses.

```
switch(config)#router bgp 10
switch(config-router-bgp)#bgp default ipv6-unicast
switch(config-router-bgp)#no bgp default ipv4-unicast
switch(config-router-bgp)#neighbor 172.21.14.8 remote-as 15
switch(config-router-bgp)#neighbor 172.23.18.6 remote-as 16
switch(config-router-bgp)#neighbor 2001:0DB8:8c01::1 remote-as 16
switch(config-router-bgp)#network 172.18.23.9/24
switch(config-router-bgp)#network 2001:0DB8:de29::/64
```

- These commands configure three neighbors, two network routes, and the default activity level for each address family (not active), and specify neighbor addresses for each address family that is active.

```
switch(config)#router bgp 11
switch(config-router-bgp)#neighbor 172.21.14.8 remote-as 15
switch(config-router-bgp)#neighbor 172.23.18.6 remote-as 16
switch(config-router-bgp)#neighbor 2001:0DB8:8c01::1 remote-as 16
switch(config-router-bgp)#network 172.18.23.9/24
switch(config-router-bgp)#network 2001:0DB8:de29::/64
switch(config-router-bgp)#no bgp default ipv4-unicast
switch(config-router-bgp)#no bgp default ipv6-unicast
switch(config-router-bgp)#address-family ipv4
switch(config-router-bgp-af)#neighbor 172.21.14.8 activate
switch(config-router-bgp-af)#neighbor 172.23.18.6 activate
switch(config-router-bgp-af)#exit
switch(config-router-bgp)#address-family ipv6
switch(config-router-bgp-af)#neighbor 2001:0DB8:8c01::1 activate
switch(config-router-bgp-af)#exit
```

- These commands permit IPv4 NLRI transport over all IPv6 connections by making the IPv4 address family active on IPv6 BGP neighbors.

```
switch(config)#router bgp 11
switch(config)#address-family ipv4
switch(config-router-bgp-af)#bgp default ipv4-unicast transport ipv6
switch(config-router-bgp-af)#exit
```

2258
33.2.6 Configuring Best-path Selection

The best-path selection algorithm (described under Best-Path Selection) determines which of multiple paths to the same destination received by BGP will be added to the IP routing table. To shape route preferences and influence best-path selection, use the following commands in router-BGP configuration mode.

- `bgp always-compare-med` configures the switch to always consider the multi-exit discriminator (MED) value when comparing paths (disabled by default).
- `bgp bestpath as-path ignore` configures the switch to ignore the length of the autonomous system (AS) path when comparing routes (disabled by default).
- `bgp bestpath as-path multipath-relax` used in equal-cost multi path (ECMP configuration) and enabled by default; the `no` form of the command configures the switch to consider paths unequal if their AS paths have different contents.
- `bgp bestpath ecmp-fast` the `no` form of this command causes the switch to ignore order of arrival in evaluating paths within an ECMP group.
- `bgp bestpath med confed` causes comparison of multi-exit discriminator (MED) values in routes originating within the same confederation as the switch and received from confederation peers (disabled by default).
- `bgp bestpath med missing-as-worst` configures the switch to treat a missing MED as having the highest (least preferred) value (disabled by default). This command overrides the `missing-as-worst` setting of the `bgp bestpath med confed` command.
- `bgp bestpath tie-break cluster-list-length` configures the switch to prefer the multipath route with the shortest CLUSTER_LIST length in case of a tie in step 10 of the selection process (disabled by default).
- `bgp bestpath tie-break router-id` configures the switch to prefer the multipath route with the lowest ROUTER_ID in case of a tie in step 10 (disabled by default).

33.2.6.1 Displaying Reasons for Best-path Selection

To see the reasons why certain routes were excluded by the best-path selection process, use the `detail` option of the `show ip bgp` command. Enter the prefix to which BGP has selected a best path, and the output will display all learned paths. Paths which were not selected as best will display the reason they were not selected after the label `not best`.

The reason will be listed as one of the following:

- Path weight
- Local preference
- AS path length
- Origin
- Path MED
- eBGP path preferred
- IGP cost
- AS path details
- ECMP-Fast configured
- Router ID
- Originator ID
- Router ID tie-break configured
Example

This command displays the reasons why three routes to 172.16.0.0/24 were rejected by the best-path algorithm. The reason for rejection is preceded by the label Not best:

```
switch>##show ip bgp 172.16.0.0/24 detail
BGP routing table information for VRF default
Router identifier 192.168.100.18, local AS number 64524
Route status: [a.b.c.d] - Route is queued for advertisement to peer.
BGP routing table entry for 204.1.47.220/30
Paths: 4 available
  64512 64550 65100
      Origin IGP, metric 0, localpref 100, weight 0, received 19:15:29 ago, valid, external, ECMP head, ECMP, best, ECMP contributor
    Rx SAFI: Unicast
  64512 64550 65100
    192.168.24.2 from 192.168.24.2 (192.168.100.22)
      Origin IGP, metric 0, localpref 100, weight 0, received 19:15:29 ago, valid, external, ECMP, ECMP contributor
    Rx SAFI: Unicast
      Not best: ECMP-Fast configured
  64512 64550 65100
    192.168.34.2 from 192.168.34.2 (192.168.100.23)
      Origin IGP, metric 0, localpref 100, weight 0, received 19:15:29 ago, valid, external, ECMP, ECMP contributor
    Rx SAFI: Unicast
      Not best: Redistributed route exists
  64512 64550 65100
    192.168.44.2 from 192.168.44.2 (192.168.100.24)
      Origin IGP, metric 0, localpref 100, weight 0, received 19:15:29 ago, valid, external, ECMP, ECMP contributor
    Rx SAFI: Unicast
      Not best: eBGP path preferred
Not advertised to any peer
switch>
```

33.2.7 Configuring BGP Convergence

To avoid hardware updates and route advertisement churn during switch reload or BGP instance start, BGP enters into the convergence state where it waits for all peers to join and receive all routes from all the peers.

BGP Convergence is bound by an upper value of convergence time (default value is 5 minutes) and BGP declares convergence on expiry of convergence timer. At the end of convergence, BGP updates the routes in FIB and advertises to all the peers.
To configure BGP convergence and the different timeout features, use the following commands in the router-BGP configuration mode.

- `update wait-for-convergence` enables the BGP convergence feature.
- `bgp convergence slow-peer time` configures the BGP convergence idle peer timeout value. The default timeout value is 90 seconds.
- `bgp convergence time` configures the BGP convergence timeout value. The default timeout value is 300 seconds.

**Different cases for convergence with default timeout configuration**

- Convergence Time < 90 seconds after the first peer has joined: This is the best case when all the configured peers have joined and EORs have been received from all peers in less than 90 seconds after the first peer has joined.
- Convergence Time = 90 seconds after the first peer has joined: This is the case when one or more BGP peers have joined within 90 seconds and EORs have been received from all peers within 90 seconds, but there are still some configured peers which have not joined yet. In this case, the convergence is declared after slow-peer timeout is reached.
- Convergence Time > 90 seconds after the first peer has joined: This is the case when one or more BGP peers have joined after 90 seconds, but EORs have not been received from all peers. As soon as EORs are received from all peers which have joined during the first 90 seconds, the convergence is declared.
- Convergence Time = 300 seconds after the first peer has joined: This is the case when EOR is not received till 300 seconds from some of the peers that have joined during 90 seconds after the first peer has joined.

### 33.2.7.1 Displaying BGP Convergence Status

Use the `show bgp convergence` command to view information about the BGP convergence status, and to know if the convergence timer has started or not.
No peers have joined

- This command displays the output when no peers have joined before convergence.

```
switch(config-router-bgp)#show bgp convergence
BGP Convergence information for VRF: default
Configured convergence timeout: 00:02:30
Configured convergence slow peer timeout: 00:00:55
Convergence based update synchronization is enabled
Last Bgp convergence event : None
Bgp convergence state : Not Initiated (Waiting for the first peer to join)
  Convergence timer is not running
  Convergence timeout in use: 00:02:30
  Convergence slow peer timeout in use: 00:00:55
  First peer is not up yet
  All the expected peers are up: no
  All IGP protocols have converged: yes
  Outstanding EORs: 0, Outstanding Keepalives: 0
Pending Peers: 2
Total Peers: 2
Established Peers: 0
Disabled Peers: 0
Peers that have not converged yet:
  IPv4 peers:
    201.1.1.1 (Session : Connect)
    202.1.1.1 (Session : Connect)
  IPv6 peers:
    None
```

First peer has joined

- This command displays the output when the first peer has joined before convergence.

```
switch#show bgp convergence
BGP Convergence information for VRF: default
Configured convergence timeout: 00:02:30
Configured convergence slow peer timeout: 00:00:55
Convergence based update synchronization is enabled
Last Bgp convergence event 00:00:40 ago
Bgp convergence state : Pending (Waiting for EORs/Keepalives from peer(s) and IGP convergence)
  Convergence timer running, will expire in 00:01:50
  Convergence timeout in use: 00:02:30
  Convergence slow peer timeout in use: 00:00:55
  First peer came up 00:00:13 ago
  All the expected peers are up: no
  All IGP protocols have converged: yes
  Outstanding EORs: 0, Outstanding Keepalives: 0
Pending Peers: 1
Total Peers: 2
Established Peers: 1
Disabled Peers: 0
Peers that have not converged yet:
  IPv4 peers:
    201.1.1.1 (Session : Active)
  IPv6 peers:
    None
```
Convergence timeout reached

- This command displays the output when the convergence timeout value is reached.

```
switch(config-router-bgp)#show bgp convergence
BGP Convergence information for VRF: default
Configured convergence timeout: 00:02:30
Configured convergence slow peer timeout: 00:00:55
Convergence based update synchronization is enabled
Last Bgp convergence event 00:02:44 ago
Bgp convergence state : Timeout reached
  Time taken to converge 00:02:30
  Pending Peers: 1
  Total Peers: 2
  Established Peers: 1
  Disabled Peers: 0
  Peers that did not converge before local bgp convergence:
  IPv4 peers:
  201.1.1.1 (Session : Active)
  202.1.1.1 (Session : Established)
  IPv6 peers:
  None
```

Converged state

- This command displays the output during the converged state.

```
switch(config-router-bgp)#show bgp convergence
BGP Convergence information for VRF: default
Configured convergence timeout: 00:05:00
Configured convergence slow peer timeout: 00:01:30
Convergence based update synchronization is enabled
Last Bgp convergence event 00:00:05 ago
Bgp convergence state : Converged
  Time taken to converge 00:00:02
  First peer came up 00:00:05 ago
  Pending Peers: 0
  Total Peers: 3
  Established Peers: 3
  Disabled Peers: 0
  Peers that did not converge before local bgp convergence:
    IPv4 peers:
    None
    IPv6 peers:
    None
```

33.2.8 Configuring BGP Graceful Shutdown Community

33.2.8.1 Creating a Route-Map Entry that Sets the Community for Graceful Shutdown

The `set community (route-map)` command specifies community attribute modifications to BGP routes.

**Example**

```
switch(config)#route-map map1
switch(config-route-map-map1)#set community GSHUT
switch(config)#exit
```
33.2.8.2 Creating a Route-Map Entry with Matching Preferences on Graceful Shutdown Community

The **ip community-list** command creates and configures a BGP access list that is based on BGP communities.

The **match (route-map)** command creates a route map clause entry that specifies one route filtering condition.

**Example**

```
switch(config)#ip community-list gshut_list permit GSHUT
switch(config)#route-map map1
switch(config-route-map-map1)#match community gshut_list
switch(config-route-map-map1)#exit
```

33.2.8.3 Validating the Route-Map

The **show route-map** command displays the contents of the specified route maps.

**Example**

```
switch#show route-map map1
route-map map1 permit 10
Description:
Match clauses:
Set clauses:
set community GSHUT
```

33.2.9 BGP Confederations

BGP confederations allow you to break an autonomous system (AS) into multiple sub-ASs, and then to group the sub-ASs as a confederation.

The sub-ASs exchange iBGP routing information (next-hop, local-preference and MED), but communicate via eBGP.

Configure a BGP confederation by completing the following tasks on each BGP device in the confederation.

- Configuring the local AS number: The local AS number is the membership number in a sub-AS. BGP devices with the same local AS number are identified as members of the same sub-AS. BGP devices always use the local AS number when communicating with other BGP4 devices in the confederation.
- Configuring the confederation ID: The confederation ID is the AS number for those BGP devices that are outside of the confederation. A BGP device outside the confederation is not aware that BGP devices are in multiple sub-ASs. The confederation ID must differ from the sub-AS numbers.
- Configuring the list of sub-AS numbers that are confederation members. Devices in a sub-AS exchange information via iBGP, while devices in different sub-ASs use eBGP.

**Example**

- The **router bgp** command enables BGP and configures the router in sub-autonomous system 65050. The **bgp confederation identifier** command specifies confederation 65050 belongs to autonomous system 100.
The neighbors from other autonomous systems within the confederation are treated as special eBGP peers when using the `bgp confederation peers` command.

```
switch(config)#router bgp 65050
switch(config-router-bgp)#bgp confederation identifier 100
switch(config-router-bgp)#bgp confederation peers 65060
```

- The Arista EOS will group the maximum ranges together. In this example, peers 65032 and 65036 are not included in BGP confederation 100.

```
switch(config)#router bgp 65050
switch(config-router-bgp)#bgp confederation identifier 100
switch(config-router-bgp)#bgp confederation peers 65060
switch(config-router-bgp)#no bgp confederation peers 65032, 65036
```

### 33.2.10 BGP Operational Commands

#### 33.2.10.1 Shutdown

The `shutdown` (BGP) command disables BGP operations without disrupting the BGP configuration. The `no router bgp` command disables BGP and removes the BGP configuration.

The `no shutdown` command resumes BGP activity.

**Example**

- This command disables BGP activity on the switch.

```
switch(config-router-bgp)#shutdown
switch(config-router-bgp)#
```
• This command resumes BGP activity on the switch.
  ```
  switch(config-router-bgp)#no shutdown
  switch(config-router-bgp)#
  ```

33.2.10.2 Clearing the Routing Table and Resetting BGP Sessions

When entered without parameters, the `clear ip bgp` command clears all BGP learned routes from the routing table, reads routes from designated peers, and sends routes required by those peers. Routes that are read or sent are processed through any modified route map or AS-path access list.

Followed by an asterisk (*), it clears the BGP sessions with all BGP peers. To reset the session with a specific peer, enter the peer’s IP address at the end of the command.

**Example**

• This command removes all BGP learned routes from the routing table.
  ```
  switch#clear ip bgp
  switch#
  ```
33.3 **BGP Examples**

This section describes the commands required to configure an iBGP and an eBGP topology.

33.3.1 **Example 1**

Example 1 features an internal BGP link that connects peers in AS 100.

33.3.1.1 **Diagram**

*Figure 33-2* displays BGP Example 1. The BGP link establishes iBGP neighbors in AS 100. Each switch advertises two subnets. In UPDATE packets sent by Switch A, the LOCAL_PREF field is 150. In UPDATE packets sent by Switch B, the LOCAL_PREF field is 75.

*Figure 33-2: BGP Example 1*

33.3.1.2 **Code**

This code configures the Example 1 BGP instance on both switches.

**Step 1** Configure the neighbor addresses.

a. Specify the neighbor to Switch A.

```
switchA(config)#router bgp 100
switchA(config-router-bgp)#neighbor 10.100.100.2 remote-as 100
```

b. Specify the neighbor to Switch B.

```
switchB(config)#router bgp 100
switchB(config-router-bgp)#neighbor 10.100.100.1 remote-as 100
```

**Step 2** Configure the routes to be advertised.

a. Advertise Switch A’s routes.

```
switchA(config-router-bgp)#network 10.10.1.0/24
switchA(config-router-bgp)#network 10.10.2.0/24
```

b. Advertise Switch B’s routes.

```
switchB(config-router-bgp)#network 10.10.3.0/24
switchB(config-router-bgp)#network 10.10.4.0/24
```
### Step 3 Configure the LOCAL_PREF.

```config
switchA(config-router-bgp)#neighbor 10.100.100.2 export-localpref 150
switchB(config-router-bgp)#neighbor 10.100.100.1 export-localpref 75
```

### Step 4 Modify the hold time and keepalive interval.

```config
switchA(config-router-bgp)#timer bgp 30 90
switchB(config-router-bgp)#timer bgp 30 90
```

#### 33.3.2 Example 2

Example 2 creates an external BGP link that connects routers in AS 100 and AS 200.

#### 33.3.2.1 Diagram

Figure 33-3 displays BGP Example 2. The BGP link connects a switch in AS 100 to a switch in AS 200. Each switch advertises two subnets.

Switch A assigns a local preference of 150 to networks advertised by Switch B. Switch B assigns a local preference of 75 to networks advertised by Switch A.

![Figure 33-3: BGP Example 2](image)

#### 33.3.2.2 Code

This code configures the Example 2 BGP instance on both switches.

### Step 1 Configure the neighbor addresses.

a. Specify the neighbor to Switch A.

```config
switchA(config)#router bgp 100
switchA(config-router-bgp)#neighbor 10.100.100.2 remote-as 200
```

b. Specify the neighbor to Switch B.

```config
switchB(config)#router bgp 200
switchB(config-router-bgp)#neighbor 10.100.100.1 remote-as 100
```
Step 2  Configure the routes to be advertised.
   a  Advertise Switch A’s routes.
      `switchA(config-router-bgp)#network 10.10.1.0/24`
      `switchA(config-router-bgp)#network 10.10.2.0/24`
   b  Advertise Switch B’s routes.
      `switchB(config-router-bgp)#network 10.10.3.0/24`
      `switchB(config-router-bgp)#network 10.10.4.0/24`

Step 3  Assign local preference values to routes received from their respective peers.
      `switchA(config-router-bgp)#neighbor 10.100.100.2 import-localpref 150`
      `switchB(config-router-bgp)#neighbor 10.100.100.2 import-localpref 75`

Step 4  Modify the hold timer and keepalive interval.
      `switchA(config-router-bgp)#timer bgp 30 90`
      `switchB(config-router-bgp)#timer bgp 30 90`
### 33.4 BGP Commands

#### Global Configuration Commands
- `router bgp`
- `ip as-path access-list`
- `ip as-path regex-mode`
- `ip community-list regexp`
- `ip community-list`
- `ip extcommunity-list regexp`
- `ip extcommunity-list`
- `ip large-community-list regexp`

#### Router-BGP Configuration Mode (Includes Address-Family Mode)
- `address-family`
- `aggregate-address`
- `bgp advertise-inactive`
- `bgp always-compare-med`
- `bgp bestpath as-path ignore`
- `bgp bestpath as-path multipath-relax`
- `bgp bestpath ecmp-fast`
- `bgp bestpath med confed`
- `bgp bestpath med missing-as-worst`
- `bgp bestpath tie-break cluster-list-length`
- `bgp bestpath tie-break router-id`
- `bgp client-to-client reflection`
- `bgp cluster-id`
- `bgp confederation identifier`
- `bgp confederation peers`
- `bgp convergence slow-peer time`
- `bgp convergence time`
- `bgp default`
- `bgp enforce-first-as`
- `bgp listen range`
- `bgp log-neighbor-changes`
- `bgp redistribute-internal (BGP)`
- `distance bgp`
- `dynamic peer max`
- `graceful-restart stalepath-time`
- `graceful-restart-helper`
- `maximum paths (BGP)`
- `match as-range`
- `no neighbor`
- `neighbor activate`
- `neighbor allowas-in`
- `neighbor auto-local-addr`
- `neighbor default-originate`
- `neighbor description`
- `neighbor ebgp-multihop`
- `neighbor enforce-first-as`
- `neighbor export-localpref`
• neighbor graceful-restart
• neighbor graceful-restart-helper
• neighbor import-localpref
• neighbor local-as
• neighbor local-v4-addr
• neighbor local-v6-addr
• neighbor maximum-routes
• neighbor next-hop-peer
• neighbor next-hop-self
• neighbor out-delay
• neighbor passive

- show ipv6 bgp peers (route type) community
- show ipv6 bgp peers regexp
- show ipv6 bgp regexp
- show ipv6 bgp summary
- show peer-filter
address-family

The **address-family** command places the switch in address-family configuration mode to configure the address family setting of addresses configured as BGP neighbors. Address-family configuration mode is not a group change mode; **running-config** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

The switch supports these address families:

- ipv4-unicast
- ipv6-unicast

**Running-config** displays address family commands in sub-blocks of the BGP configuration. The following commands are available in address family configuration mode:

- **neighbor activate** configures the address as active in the configuration mode address family.
- **no neighbor activate** configures the address as not active in the configuration mode address family.
- **neighbor default-originate** advertises a default route to the specified BGP neighbor.
- **neighbor route-map (BGP)** applies a route map to the specified BGP route.
- **network (BGP)** specifies a network for advertisement through UPDATE packets to BGP peers.

The **no address-family** and **default address-family** commands delete the specified address-family from **running-config** by removing all commands previously configured in the corresponding address-family mode.

The **exit** command returns the switch to router-BGP configuration mode.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
bgp ADDRESS_TYPE
no bgp ADDRESS_TYPE
default bgp ADDRESS_TYPE
```

**Parameters**

- **ADDRESS_FAMILY** Address family affected by subsequent commands. Options include:
  - ipv4 IPv4 unicast
  - ipv6 IPv6 unicast

**Example**

- These commands enter address family mode for IPv6-unicast, insert a command, then exit the mode:
  ```
  switch(config)#router bgp 1
  switch(config-router-bgp)#address-family ipv6
  switch(config-router-bgp-af)#neighbor 172.10.1.1 activate
  switch(config-router-bgp-af)#exit
  switch(config-router-bgp-af)#
  ```
aggregate-address

The `aggregate-address` command creates an aggregate route in the Border Gateway Protocol (BGP) database. Aggregate routes combine the characteristics of multiple routes into a single route that the switch advertises. Aggregation can reduce the amount of information that a BGP speaker is required to store and transmit when advertising routes to other BGP speakers. Aggregate routes are advertised only after they are redistributed.

The advertised address of the aggregate is entered as an IP subnet; any routes configured on the switch that lie within that subnet then become contributors to the aggregate. Note that on Arista switches the BGP aggregate route will become active if there are any available contributor routes on the switch, regardless of the originating protocol. This includes routes configured statically.

**Important!** Aggregate routes are redistributed automatically, and their redistribution cannot be disabled.

Command options affect the attributes associated with the aggregated route, the advertisement of the contributor routes that comprise the aggregate, and which contributor routes are included.

Command options affect the following aggregate routing attributes:

- **AS_PATH attribute inclusion:** the `as-set` option controls the aggregate route’s AS_PATH and ATOMIC_AGGREGATE attribute contents. AS_PATH identifies the autonomous systems through which UPDATE message routing information passes. ATOMIC_AGGREGATE indicates that the route is an aggregate or summary of more specific routes.

  When the command includes `as-set`, the aggregate route’s AS_SET attribute contains the AS numbers of contributor routes. This can help BGP neighbors to prevent loops by rejecting aggregate routes that include their AS number in the AS_SET.

  When the command does not include `as-set`, the aggregate route’s ATOMIC_AGGREGATE attribute is set and the AS_PATH attribute does not include AS numbers of contributing routes.

- **Attribute assignment:** The `attribute-map` option assigns attributes contained in set commands in a specified route map’s lowest sequence with any set command to the aggregated route, overriding the automatic determination of the aggregate route’s attributes by the switch.

- **Route suppression:** The `summary-only` option suppresses the advertisement of the contributor routes that comprise the aggregate.

- **Contributor filtering:** The `match-map` option uses a route map to filter out contributor routes that would otherwise be included in the aggregate.

The `no aggregate-address` and `default aggregate-address` commands remove the corresponding `aggregate-address` command from `running-config`.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
aggregate-address AGGREGATE_NET [AS_SET] [SUMMARY] [ATTRIBUTE_MAP] [MATCH_MAP]
no aggregate-address AGGREGATE_NET
default aggregate-address AGGREGATE_NET
```

**Parameters**

- **AGGREGATE_NET** aggregate route IP address. Options include:
  - `netv4_addr` IPv4 subnet address (CIDR or address-mask notation).
  - `netv6_addr` IPv6 subnet address (CIDR notation).
Chapter 33: Border Gateway Protocol (BGP) BGP Commands

- **AS_SET** controls AS_PATH attribute values associated with aggregate route. Options include:
  - <no parameter> ATOMIC_AGGREGATE attribute is set. Route contains no AS_PATH data.
  - as-set route includes AS_PATH information from contributor routes as AS_SET attributes.

- **SUMMARY** controls advertisement of contributor routes. Options include:
  - <no parameter> contributor and aggregate routes are advertised.
  - summary-only contributor routes are not advertised.

- **ATTRIBUTE_MAP** controls attribute assignments to the aggregate route. Options include:
  - <no parameter> attribute values are not assigned to route.
  - attribute-map map_name assigns attribute values in set commands of the map’s permit clauses. Deny clauses and match commands in permit clauses are ignored.

- **MATCH_MAP** filters contributors to the aggregate route. Options include:
  - <no parameter> no contributors are filtered.
  - match-map map_name filters contributor routes using the named match-map.

**Examples**

- These commands create an aggregate route (10.16.48.0/20) from the contributor routes 10.16.48.0/23, 10.16.50.0/23, 10.16.52.0/23, and 10.16.54.0/23. The aggregate route includes the AS_PATH information from the contributor routes.

  ```
  switch(config)#router bgp 1
  switch(config-router-bgp)#aggregate-address 10.16.48.0/20 as-set
  switch(config-router-bgp)#exit
  switch(config)#
  ```

- These commands create an aggregate route and use a route map to add a local-preference attribute to the route.

  ```
  switch(config)#route-map map1 permit 10
  switch(config-route-map-map1)#set community 45
  switch(config-route-map-map1)#exit
  switch(config)#router bgp 1
  switch(config-router-bgp)#aggregate-address 10.16.48.0/20 attribute-map map1
  switch(config-router-bgp)#exit
  switch(config)#
  ```

- These commands create an aggregate route and use a route map to allow only those contributors which match a specified prefix list to be included in the aggregate route.

  ```
  switch(config)#route-map matchmap permit 10
  switch(config-route-map-matchmap)#match ip address prefix-list agglist
  switch(config-route-map-matchmap)#exit
  switch(config)#router bgp 1
  switch(config-router-bgp)#aggregate-address 1.1.0.0/16 match-map matchmap
  ```
bpg advertise-inactive

By default, BGP will advertise only those routes that are active in the switch’s RIB. This can contribute to dropped traffic. If a preferred route is available through another protocol (like OSPF), the BGP route will become inactive and not be advertised; if the preferred route is lost, there is no available route to the affected peers. Advertising inactive BGP routes minimizes traffic loss by providing alternative routes.

The `bpg advertise-inactive` command configures BGP to advertise inactive routes to BGP neighbors. Inactive route advertisement is configured globally, but the global setting can be overridden on a per-VRF basis.

The `no bpg advertise-inactive` and `default bpg advertise-inactive` commands restore the default BGP behavior (advertising only active routes) by removing the corresponding `bpg advertise-inactive` command from `running-config`.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
bpg advertise-inactive
no bpg advertise-inactive
default bpg advertise-inactive
```

**Example**

- These commands configure BGP to advertise inactive routes.

```
switch(config)#router bpg 64500
switch(config-router-bgp)#bpg advertise-inactive
switch(config-router-bgp)#
```
bgp always-compare-med

The **bgp always-compare-med** command configures the switch to always consider multi-exit discriminator (MED) values (also known as “metric”) in best-path selection. By default, this function is disabled, and MED values are compared only if two paths have the same neighbor AS.

When there are two or more links between autonomous systems, MED values may be set by a router in the originating AS to give preferences to certain routes. In comparing MED values, the lower value is preferred.

The **no bgp always-compare-med** and **default bgp always-compare-med** commands restore the default behavior of comparing MED values only on paths with the same neighbor AS.

**Command Mode**
Router-BGP Configuration

**Command Syntax**
- bgp always-compare-med
- no bgp always-compare-med
- default bgp always-compare-med

**Related Commands**
- bgp bestpath as-path ignore
- bgp bestpath as-path multipath-relax
- bgp bestpath ecmp-fast
- bgp bestpath med confed
- bgp bestpath med missing-as-worst
- bgp bestpath tie-break cluster-list-length
- bgp bestpath tie-break router-id

**Example**
- These commands configure BGP to always consider MED values in best-path comparisons.

```
switch(config)#router bgp 64500
switch(config-router-bgp)#bgp always-compare-med
switch(config-router-bgp)#
```
**bgp bestpath as-path ignore**

The `bgp bestpath as-path ignore` command configures BGP to ignore the length of the autonomous system (AS) path when comparing routes. This behavior is disabled by default. Normally, the switch compares AS paths as the third step in the best-path selection process (see [Best-Path Selection](#)), preferring the route with the shorter AS path.

The `no bgp bestpath as-path ignore` and `default bgp bestpath as-path ignore` commands restore the default behavior of considering AS path length in route comparisons.

**Command Mode**

   Router-BGP Configuration

**Command Syntax**

- `bgp bestpath as-path ignore`
- `no bgp bestpath as-path ignore`
- `default bgp bestpath as-path ignore`

**Related Commands**

- `bgp always-compare-med`
- `bgp bestpath as-path multipath-relax`
- `bgp bestpath ecmp-fast`
- `bgp bestpath med confed`
- `bgp bestpath med missing-as-worst`
- `bgp bestpath tie-break cluster-list-length`
- `bgp bestpath tie-break router-id`

**Example**

- These commands configure BGP to ignore AS path lengths when comparing routes.

```
switch(config)#router bgp 64500
switch(config-router-bgp)#bgp bestpath as-path ignore
switch(config-router-bgp)#
```
bgp bestpath as-path multipath-relax

The `bgp bestpath as-path multipath-relax` command allows multiple eBGP routes to a destination to be considered equal in ECMP if their AS paths are the same length despite having different autonomous systems in those paths. The `no bgp bestpath as-path multipath-relax` command configures best-path selection to consider two paths unequal if their AS path contents are different, and prefers the first path received.

Multipath-relax is enabled by default. The `bgp bestpath as-path multipath-relax` and `default bgp bestpath as-path multipath-relax` commands restore the default behavior by removing the corresponding `no bgp bestpath as-path multipath-relax` command from `running-config`.

For BGP to support equal cost multipath (ECMP) routing, the `maximum paths (BGP)` command must be issued in router-BGP configuration mode.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
bgp bestpath as-path multipath-relax
no bgp bestpath as-path multipath-relax
default bgp bestpath as-path multipath-relax
```

**Related Commands**

- `bgp always-compare-med`
- `bgp bestpath as-path ignore`
- `bgp bestpath ecmp-fast`
- `bgp bestpath med confed`
- `bgp bestpath med missing-as-worst`
- `bgp bestpath tie-break cluster-list-length`
- `bgp bestpath tie-break router-id`

**Example**

These commands configure BGP best-path selection to consider routes unequal if the contents of their AS paths differ.

```bash
switch(config)#router bgp 64500
switch(config-router-bgp)#no bgp bestpath as-path multipath-relax
switch(config-router-bgp)#
```
bgp bestpath ecmp-fast

By default, within an ECMP group the BGP best-path selection process prefers the active path (the first path received by the switch) unless a relevant tie-breaker is enabled. The `no bgp bestpath ecmp-fast` command causes the best-path selection process to ignore order of arrival and continue evaluating paths on other criteria.

The `bgp bestpath ecmp-fast` and `default bgp bestpath ecmp-fast` commands restore the default behavior by removing the corresponding `no bgp bestpath ecmp-fast` command from `running-config`.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
bgp bestpath ecmp-fast
no bgp bestpath ecmp-fast
default bgp bestpath ecmp-fast
```

**Related Commands**

- `bgp always-compare-med`
- `bgp bestpath as-path ignore`
- `bgp bestpath as-path multipath-relax`
- `bgp bestpath med confed`
- `bgp bestpath med missing-as-worst`
- `bgp bestpath tie-break cluster-list-length`
  - `bgp bestpath tie-break router-id`

**Example**

- These commands configure BGP to ignore order of arrival in best-path comparisons of paths within an ECMP group.

```
switch(config)#router bgp 64500
switch(config-router-bgp)#no bgp bestpath ecmp-fast
switch(config-router-bgp)#
```
bgp bestpath med confed

By default, paths originating within the same confederation as the switch and received from confederation peers do not have their multi-exit discriminator (MED) values compared as part of the best-path selection process. The `bgp bestpath med confed` command causes comparison of MED values in such routes. To ensure that MED values are considered in the best-path selection process for all routes received, use the `bgp always-compare-med` command.

The `no bgp bestpath med confed` and `default bgp bestpath med confed` commands restore the default behavior by removing the corresponding `bgp bestpath ecmp-fast` command from `running-config`.

**Command Mode**
Router-BGP Configuration

**Command Syntax**
```
bgp bestpath med confed [missing-as-worst]
no bgp bestpath med confed [missing-as-worst]
default bgp bestpath med confed [missing-as-worst]
```

**Related Commands**
- `bgp always-compare-med`
- `bgp bestpath as-path ignore`
- `bgp bestpath as-path multipath-relax`
- `bgp bestpath ecmp-fast`
- `bgp bestpath med missing-as-worst`
- `bgp bestpath tie-break cluster-list-length`
- `bgp bestpath tie-break router-id`

**Parameters**

**missing-as-worst** By default, best-path selection considers a missing MED value to be 0, so paths with missing MED values will be preferred. This option reverses the behavior in comparisons of routes originating within the same confederation as the switch, treating a missing MED as having the highest (least preferred) value.

**Note** The `bgp bestpath med missing-as-worst` command controls how best-path selection treats missing MED values for all routes received, and, if configured, overrides the `missing-as-worst` option of this command.

**Example**
- These commands configure the BGP best-path selection process to consider MED values in comparisons between routes originating within the same confederation as the switch.

```bash
switch(config)#router bgp 64500
switch(config-router-bgp)#bgp bestpath med confed
switch(config-router-bgp)#
```
**bgp bestpath med missing-as-worst**

By default, BGP best-path selection considers a missing MED value to be 0, so paths with missing MED values will be preferred. The `bgp bestpath med missing-as-worst` command reverses the behavior, treating a missing MED as having the highest (least preferred) value.

The `no bgp bestpath med missing-as-worst` and `default bgp bestpath med missing-as-worst` commands restore the default behavior (giving preference to missing MED values) by removing the corresponding `bgp bestpath med missing-as-worst` command from `running-config`.

**Note**

This command overrides the `missing-as-worst` setting of the `bgp bestpath med confed` command.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
bgp bestpath med missing-as-worst
no bgp bestpath med missing-as-worst
default bgp bestpath med missing-as-worst
```

**Related Commands**

- `bgp always-compare-med`
- `bgp bestpath as-path ignore`
- `bgp bestpath as-path multipath-relax`
- `bgp bestpath ecmp-fast`
- `bgp bestpath med confed`
- `bgp bestpath tie-break cluster-list-length`
- `bgp bestpath tie-break router-id`

**Example**

- These commands configure the BGP best-path selection process to consider a missing MED value to be considered highest (least preferred) in MED comparisons for all routes received.

  ```
  switch(config)#router bgp 64500
  switch(config-router-bgp)#bgp bestpath med missing-as-worst
  switch(config-router-bgp)#
  ```
**bgp bestpath tie-break cluster-list-length**

The `bgp bestpath tie-break cluster-list-length` command causes the best-path selection process to prefer the multipath route with the shortest CLUSTER_LIST length in case of a tie in step 10. The cluster list length is assumed to be 0 if the route doesn’t carry a CLUSTER_LIST attribute.

The `no bgp bestpath tie-break cluster-list-length` and `default bgp bestpath tie-break cluster-list-length` commands restore the default behavior by removing the associated `bgp bestpath tie-break cluster-list-length` command from `running-config`.

**Command Mode**
- Router-BGP Configuration

**Command Syntax**
- `bgp bestpath tie-break cluster-list-length`
- `no bgp bestpath tie-break cluster-list-length`
- `default bgp bestpath tie-break cluster-list-length`

**Related Commands**
- `bgp always-compare-med`
- `bgp bestpath as-path ignore`
- `bgp bestpath as-path multipath-relax`
- `bgp bestpath ecmp-fast`
- `bgp bestpath med confed`
- `bgp bestpath med missing-as-worst`
- `bgp bestpath tie-break router-id`

**Example**
- These commands configure the BGP selection process to prefer the multipath route with the shortest CLUSTER_LIST length in case of a tie.

```
switch(config)#router bgp 64500
switch(config-router-bgp)#bgp bestpath tie-break cluster-list-length
switch(config-router-bgp)#
```
bogp bestpath tie-break router-id

The **bogp bestpath tie-break router-id** command causes the best-path selection process to prefer the multipath route with the lowest ROUTER_ID in case of a tie in step 10. If the route is a reflected route (i.e., if it contains route reflector attributes), the process will use the ORIGINATOR_ID as the ROUTER_ID for comparison. This behavior is disabled by default.

The **no bogp bestpath tie-break router-id** and **default bogp bestpath tie-break router-id** commands restore the default behavior by removing the associated **bogp bestpath tie-break router-id** command from **running-config**.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
bogp bestpath tie-break router-id
no bogp bestpath tie-break router-id
default bogp bestpath tie-break router-id
```

**Related Commands**

- **bogp always-compare-med**
- **bogp bestpath as-path ignore**
- **bogp bestpath as-path multipath-relax**
- **bogp bestpath ecmp-fast**
- **bogp bestpath med confed**
- **bogp bestpath med missing-as-worst**
- **bogp bestpath tie-break cluster-list-length**

**Example**

- These commands configure the best-path selection process to prefer the multipath route with the lowest ROUTER_ID in case of a tie.

```
switch(config)#router bogp 64500
switch(config-router-bgp)#bogp bestpath tie-break router-id
switch(config-router-bgp)#
```
bgp client-to-client reflection

By default, routes received from a route reflector client and selected as best routes are propagated to all BGP peers, including other route reflector clients. If the clients are fully meshed, however, routes received from a client do not need to be mirrored to other clients. In this case, client-to-client reflection should be disabled.

The no bgp client-to-client reflection command disables client-to-client reflection.

The bgp client-to-client reflection and default bgp client-to-client reflection commands restore the default behavior by removing the no bgp client-to-client reflection command from running-config.

Command Mode
Router-BGP Configuration

Command Syntax
- bgp client-to-client reflection
- no bgp client-to-client reflection
- default bgp client-to-client reflection

Example
- This command disables client-to-client reflection on the switch.

```
switch(config)#router bgp 1
switch(config-router-bgp)#no bgp client-to-client reflection
switch(config-router-bgp)#
```
**bgp cluster-id**

When using route reflectors, an AS is divided into clusters. A cluster consists of one or more route reflectors and a group of clients to which they re-advertise route information, and for redundancy a single cluster may contain multiple route reflectors. Each route reflector has a cluster ID. If the cluster has only one route reflector the cluster ID is its router ID, but if a cluster has multiple route reflectors a 4-byte cluster ID must be assigned to all route reflectors in the cluster. All must be configured with the same cluster ID to allow them to identify updates from the cluster’s other route reflectors.

The `bgp cluster-id` command configures the cluster ID in a cluster with multiple route reflectors.

The `no bgp cluster-id` and `default bgp cluster-id` commands remove the cluster ID by removing the corresponding `bgp cluster-id` command from *running-config*. Do not remove the cluster ID if there are multiple route reflectors in the cluster.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
bgp cluster-id ID_NUM
no bgp cluster-id
default bgp cluster-id
```

**Parameters**

- `ID_NUM`  
  Cluster ID shared by all route reflectors in the cluster (32-bit dotted-decimal notation).  
  Options include:
  - `0.0.0.1` to `255.255.255.255`  
    valid cluster ID number.
  - `0.0.0.0`  
    removes the cluster-ID from the switch. Equivalent to `no bgp cluster-id` command.

**Example**

- This command sets the cluster ID for the switch to 172.22.30.101.
  ```
  switch(config)#router bgp 1
  switch(config-router-bgp)#bgp cluster-id 172.22.30.101
  switch(config-router-bgp)#
  ```
bgp confederation identifier

The `bgp confederation identifier` command configures the confederation identifier. Confederation can reduce the number of iBGP connections in a large AS domain. The AS domain is divided into several smaller sub-ASs, and each sub-AS remains fully connected. Devices in a sub-AS exchange information via iBGP, while devices in different sub-ASs use eBGP.

The `no bgp confederation identifier` and `default bgp confederation identifier` commands remove the `bgp confederation identifier` command from `running-config`.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
bgp confederation identifier as_number
no bgp confederation identifier
default bgp confederation identifier
```

**Parameters**

- `as_number` the ID of BGP AS confederation. Value ranges from 1 to 4294967295.

**Example**

- This command sets the BGP confederation identifier to 9.
  ```
  switch(config)#router bgp 1
  switch(config-router-bgp)#bgp confederation identifier 9
  switch(config-router-bgp)#
  ```
bpg confederation peers

The `bpg confederation peers` command configures a confederation consisting of sub-ASs.

Before this command is executed, the confederation ID should be configured by the `bpg confederation identifier` command. Otherwise this configuration is invalid. The configured ASs in this command are inside the confederation and each AS uses a fully meshed network. The confederation appears as a single AS to the devices outside it.

The `no bpg confederation peers` and `default bpg confederation peers` commands delete the specified sub-AS from the confederation by removing the corresponding `bpg confederation peers` command from `running-config`.

Command Mode
- Router-BGP Configuration

Command Syntax
- `bpg confederation peers as_range`
- `no bpg confederation peers as_range`
- `default bpg confederation peers as_range`

Parameters
- `as_range` the Sub-AS number.
  - `as_range` formats include number (from 1 to 4294967295), number range, or comma-delimited list of numbers and ranges.

Example
- This command configures the confederation that contains AS 1000 and 1002.
  ```
  switch(config)#router bgp 1
  switch(config-router-bgp)#bpg confederation peers 1000 1002
  switch(config-router-bgp)#
  ```
**bgp convergence slow-peer time**

The `bgp convergence slow-peer time` command configures the idle peer time to wait for the slow peers to establish a session in a BGP convergence state.

The `no bgp convergence slow-peer time` command disables the inheritance of the configuration from the global BGP configuration mode. The `default bgp convergence slow-peer time` command sets the timeout value to the default value.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
bgp convergence slow-peer time timeout_range
no bgp convergence slow-peer time
default bgp convergence slow-peer time
```

**Parameters**

- `time timeout_range`  The maximum time to wait for the slow peers to establish a session connection. The time ranges from 1 to 3600 seconds. The default value is 90 seconds.

**Example**

- This command configures an idle peer timeout of 40 seconds to wait before establishing a session.

  ```
  switch(config)#router bgp 1
  switch(config-router-bgp)#bgp convergence slow-peer time 40
  switch(config-router-bgp)#
  ```
bgp convergence time

The `bgp convergence time` command configures the time to wait before the BGP convergence starts in a session.

The `no bgp convergence time` command removes the configured convergence time to wait. The `default bgp convergence time` command sets the timeout value to the default value.

**Command Mode**
Router-BGP Configuration

**Command Syntax**
```
bgp convergence time timeout_range
no bgp convergence time
default bgp convergence time
```

**Parameters**
- `time timeout_range` The maximum time to wait for the BGP convergence. The time ranges from 1 to 3600 seconds. The default value is 300 seconds.

**Example**
- This command configures a convergence time of 200 seconds to wait before establishing a session.
  ```
  switch(config)#router bgp 1
  switch(config-router-bgp)#bgp convergence time 200
  switch(config-router-bgp)#
  ```
**bgp default**

The `bgp default` command configures the default address family activation level of all addresses configured as BGP neighbors. The switch sends the following announcements to addresses active in an address family:

- **IPv4 address family**: IPv4 capability and all network advertisements with IPv4 prefixes.
- **IPv6 address family**: IPv6 capability and all network advertisements with IPv6 prefixes.

The following commands configure default address family activation levels for addresses configured as BGP neighbors:

- `bgp default ipv4-unicast`   all addresses are IPv4 address family active.
- `no bgp default ipv4-unicast` all addresses are not IPv4 address family active.
- `bgp default ipv6-unicast`   all addresses are IPv6 address family active.
- `no bgp default ipv6-unicast` all addresses are not IPv6 address family active.
- `bgp default ipv4-unicast transport ipv6` all BGP neighbor addresses are IPv4 address family active and IPv6 neighbors can receive IPv4 NLRIs.

**Note**

If it is necessary to exchange IPv4 NLRIs over an IPv6 connection, the IPv4 address family must be activated on the IPv6 neighbor. To do this for all IPv6 neighbors, use the command `bgp default ipv4-unicast transport ipv6`. For an individual neighbor, use the `neighbor activate` command for the IPv6 neighbor in the IPv4 address-family configuration mode as described below.

The activation state of an individual BGP neighbor address is configured by the `neighbor activate` commands. The `neighbor activate` command overrides the address’s default activation state for the address family configuration mode in which the command is issued:

- **neighbor activate**: the specified address is active.
- **no neighbor activate**: the specified address is not active.

The `default-default address family` activation state defines address family activation level of all addresses configured as BGP neighbors when `running-config` does not contain any `bgp default` commands. The default state of the BGP default activation level varies by address family:

- **IPv4 address family**   all BGP addresses are IPv4 address family active.
- **IPv6 address family**   all BGP addresses are not IPv6 address family active.

The `default bgp default` command restores the default-default activation setting for BGP neighbor addresses in the specified address family:

- **default bgp ipv4-unicast** is equivalent to `bgp ipv4-unicast`
- **default bgp ipv6-unicast** is equivalent to `no bgp ipv6-unicast`

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
bgp default ADDRESS_FAMILY
no bgp default ADDRESS_FAMILY
default bgp default ADDRESS_FAMILY
```

**Parameters**

- **ADDRESS_FAMILY**   BGP address family. Options include:
- **ipv4-unicast** IPv4-unicast peering sessions.
- **ipv6-unicast** IPv6-unicast peering sessions.

**Example**

- These commands configure the switch to configure all BGP neighbor addresses as IPv4 address family active and IPv6 address family active.

  switch(config)#router bgp 1
  switch(config-router-bgp)#bgp default ipv4-unicast
  switch(config-router-bgp)#bgp default ipv6-unicast
  switch(config-router-bgp)#show active
  router bgp 65533
  bgp log-neighbor-changes
  distance bgp 20 200 200
  neighbor 172.23.254.2 remote-as 65533
  neighbor 172.41.254.78 remote-as 65534
  neighbor 2001:0DB8:52a4:fe01::2 remote-as 65533
  neighbor 2001:0DB8:52a4:fe4c::1 out-delay 10
  switch(config-router-bgp)#

  The show active command does not display the **bgp default ipv4-unicast** command because it is the default setting for IPv4 peering sessions.
**bgp enforce-first-as**

The **bgp enforce-first-as** command causes a forced comparison of the first autonomous system (AS) in the AS path of eBGP routes received from BGP neighbors to the configured remote external peer autonomous system number (ASN). Updates from eBGP peers that do not include that ASN as the first item in the AS path (in the AS_PATH attribute) are discarded.

This behavior is enabled by default upon BGP configuration, and disabled globally by the **no** form of this command. To configure enforce-first-as for an individual neighbor or peer group, use the **neighbor enforce-first-as** command.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
bgp enforce-first-as
default bgp enforce-first-as
no bgp enforce-first-as
```

**Example**

- This command configures BGP to enforce the first AS globally.

```
switch(config-router-bgp)#bgp enforce-first-as
switch(config-router-bgp)#abgp enforce-first-as
```
bgp listen range

The `bgp listen range` command identifies the BGP peering request from a range of IPv4 or IPv6 address, and names the dynamic peer group to which those peers belong to. To create a static peer group, use the neighbor peer group (create) command.

The request can be from a single AS number or from a range of AS numbers configured. To accept the peering request from single ASN use the `remote-as` option, and to accept request from multiple ASNs use the `peer-filter` option.

Members of dynamic peer group are configured in groups and not as individuals. Once a new peer group is created with a group name, the group name is then used as a parameter by the following `neighbor` commands:

- neighbor ebgp-multihop
- neighbor import-localpref
- neighbor maximum-routes
- neighbor route-map (BGP)
- neighbor timers
- neighbor update-source.

The `no bgp listen range` and `default bgp listen range` commands remove the dynamic peer group by deleting the corresponding command from `running-config`. To remove a static peer group, use the `no neighbor` command. All peering relationships with group members are terminated when the dynamic peer group is deleted.

Command Mode

Router-BGP Configuration

Command Syntax

```
bgp listen range  NET_ADDRESS peer-group group_name [remote-as as_number | peer-filter filter_name]
```

```
o bgp listen range  NET_ADDRESS peer-group group_name
```

```
default bgp listen range  NET_ADDRESS peer-group group_name
```

Parameters

- **NET_ADDRESS** IP address range. Entry options include:
  - `IPv4 subnet` IPv4 subnet (CIDR notation).
  - `IPv4_address mask subnet` IPv4 subnet (dotted decimal notation).
  - `IPv6_prefix` IPv6 subnet (dotted decimal notation).
- **group_name** name of the peer group.
- **as_number** the autonomous system number, ranges from 1 to 4294967295.
- **filter_name** name of the peer filter.

Example

- These commands create a dynamic peer group called “brazil” in AS 5 which accepts peering requests from the 192.168.6.0/24 subnet.

```
switch(config)#router bgp 1
switch(config-router-bgp)#bgp listen range 192.168.6.0/24 peer-group brazil
remote-as 5
```
- These commands create a dynamic peer group called “brazil” in a range of ASNs, which accepts peering requests from the 192.0.2.0/24 subnet. The range of AS numbers is defined by `peer filter` option.

```
switch(config)#router bgp 1
switch(config-router-bgp)#bgp listen range 192.0.2.0/24 peer-group brazil
peer-filter group-1
```
**bgp log-neighbor-changes**

The `bgp log-neighbor-changes` command configures the switch to generate a log message when a BGP peer enters or exits the Established state. This is the default behavior.

The `no bgp log-neighbor-changes` command disables the generation of these log messages. The `default bgp log-neighbor-changes` command enables the generation of these log messages.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
bgp log-neighbor-changes
no bgp log-neighbor-changes
default bgp log-neighbor-changes
```

**Example**

- These commands configure the switch to generate a message when a BGP peer enters or exits the `established` state.

  ```
  switch(config)#router bgp 1
  switch(config-router-bgp)#bgp log-neighbor-changes
  switch(config-router-bgp)#
  ```
bGP redistribute-internal (BGP)

The **bgp redistribute-internal** command enables the redistribution of iBGP routes into an interior gateway protocol (IGP).

The **no bgp redistribute-internal** and **default bgp redistribute-internal** commands disable route redistribution from the specified domain by removing the corresponding **bgp redistribute-internal** command from **running-config**.

**Command Mode**
- Router-BGP Configuration
- Router-BGP Address-Family Configuration

**Command Syntax**
- `bgp redistribute internal`
- `no bgp redistribute internal`
- `default bgp redistribute internal`

**Example**
- This command redistributes internal BGP routes.

```
switch(config)#router bgp 9
switch(config-router-bgp)#bgp redistribute-internal
switch(config-router-bgp)#
```
clear ip bgp

The `clear ip bgp` command removes learned BGP routes from the routing table, reads all routes from designated peers, and sends routes to those peers as required. This command can also clear the switch’s BGP sessions with its peers.

Routes that are read or sent are processed through modified route maps or AS-path access lists. The command can also clear the switch’s BGP sessions with its peers.

**Command Mode**
Privileged EXEC

**Command Syntax**
```
    clear ip bgp [PEERS] [RESET_TYPE] [DATA_FLOW] [VRF_INSTANCE]
```

**Parameters**
- **PEERS** specifies targeted BGP peers. Options include:
  - `<no parameters>` all IPv4 and IPv6 peers.
  - `*` all IPv4 and IPv6 peers.
  - `ipv4_addr` the IPv4 peer with the specified IPv4 address.
  - `ipv6_addr` the IPv6 peer with the specified IPv6 address.
  - `intrf_ipv6_addr` the peer using the specified IPv6 link-local address.
  - `peer-group peer_grp_name` the peers using the specified BGP peer group.
- **RESET_TYPE** specifies the method used to reset routes. Options include:
  - `<no parameters>` performs a hard reset that terminates current BGP sessions and recreates the local routing information base.
  - `soft` performs a soft reset that maintains current BGP sessions and reconfigures the local routing information base using stored routes.
- **DATA_FLOW** restricts soft reset to inbound or outbound routes. Hard reset is bidirectional. Options include:
  - `<no parameters>` resets inbound and outbound routes.
  - `in` resets inbound peer routes.
  - `out` resets outbound peer routes.
- **VRF_INSTANCES** specifies the VRF(s) examined for BGP peers. Options include:
  - `<no parameters>` resets matching peers in the context-active VRF.
  - `vrf_name` resets matching peers in the specified VRF.
  - `all` resets matching peers in all VRFs.
  - `default` resets matching peers in the default VRF.

**Related Commands**
- `clear ip bgp counters`
- `clear ip bgp errors`
- `clear ip bgp neighbor`

**Guidelines**
Use the `clear ip bgp` command after changing any of the following BGP attributes:
- Weights
- Distribution lists
- Timers
- Administrative distance

**Examples**
- This command performs a hard reset of all IPv4 and IPv6 peers in the context-active VRF.
  ```bash
  switch# clear ip bgp
  switch#
  ```
- This command has the same behavior as in `clear ip bgp` command.
  ```bash
  switch# clear ip bgp *
  switch#
  ```
**clear ip bgp counters**

The `clear ip bgp counters` command resets general statistics of peers. It primarily consists of message related counts.

**Command Mode**

Privileged EXEC

**Command Syntax**

```
clear ip bgp [PEERS] counters [VRF_INSTANCES]
```

**Parameters**

- **PEERS** specifies targeted BGP peers. Options include:
  - `<no parameters>` all IPv4 and IPv6 peers.
  - `*` all IPv4 and IPv6 peers.
  - `ipv4_addr` the IPv4 peer with the specified IPv4 address.
  - `ipv6_addr` the IPv6 peer with the specified IPv6 address.
  - `intrf_ipv6_addr` the peer using the specified IPv6 link-local address.
  - `peer-group peer_grp_name` the peers using the specified BGP peer group.

- **VRF_INSTANCES** specifies the VRF(s) examined for BGP peers. Options include:
  - `<no parameters>` resets matching peers in the context-active VRF.
  - `vrf_name` resets matching peers in the specified VRF.
  - `all` resets matching peers in all VRFs.
  - `default` resets matching peers in the default VRF.

**Related Commands**

- `clear ip bgp`
- `clear ip bgp errors`
- `clear ipv6 bgp counters`

**Example**

- This command resets general statistics of all IPv4 and IPv6 peers in the context-active VRF.

```
switch#clear ip bgp counters
! Clearing all IPv4 and IPv6 peering sessions
switch#
```
clear ip bgp errors

The `clear ip bgp errors` command resets the error statistics and history of peers. Peer general statistics primarily consists of notification errors, socket errors, and update errors.

**Command Mode**
Privileged EXEC

**Command Syntax**
```
clear ip bgp [PEERS] errors [VRF_INSTANCES]
```

**Parameters**
- **PEERS** specifies targeted BGP peers. Options include:
  - `<no parameters>` all IPv4 and IPv6 peers.
  - `*` all IPv4 and IPv6 peers.
  - `ipv4_addr` the IPv4 peer with the specified IPv4 address.
  - `ipv6_addr` the IPv6 peer with the specified IPv6 address.
  - `intrf_ipv6_addr` the peer using the specified IPv6 link-local address.
  - `peer-group peer_grp_name` the peers using the specified BGP peer group.
- **VRF_INSTANCES** specifies the VRF(s) examined for BGP peers. Options include:
  - `<no parameters>` resets matching peers in the context-active VRF.
  - `vrf_name` resets matching peers in the specified VRF.
  - `all` resets matching peers in all VRFs.
  - `default` resets matching peers in the default VRF.

**Related Commands**
- `clear ip bgp`
- `clear ip bgp counters`
- `clear ipv6 bgp errors`

**Example**
- This command resets the error statistics of all IPv4 and IPv6 peers in the context-active VRF.
  ```
  switch# clear ip bgp errors
  ! Clearing all IPv4 and IPv6 peering sessions
  switch#
  ```
clear ip bgp neighbor *

The clear ip bgp neighbor * command clears BGP neighbors belonging to the IPv4 transport address family. To clear BGP neighbors in the IPv6 transport address family, use the clear ipv6 bgp neighbor * command.

Command Mode
Privileged EXEC

Command Syntax
clear ip bgp neighbor * [VRF_INSTANCE]

Parameters
- **VRF_INSTANCE** specifies VRF instance for which IPv4 transport address family BGP neighbors will be cleared. Options include:
  - <no parameter> clears IPv4 BGP neighbors in the context-active VRF.
  - vrf vrf_name clears IPv4 BGP neighbors in the specified VRF.
  - vrf all clears IPv4 BGP neighbors in the all VRFs.
  - vrf default clears IPv4 BGP neighbors in the default VRF.

Related Commands
- clear ip bgp
- clear ip bgp counters
- clear ip bgp errors

Examples
- This command clears all IPv4 BGP neighbors in the context-active VRF.
  ```
  switch#clear ip bgp neighbor *
  switch#
  ```
- This command clears all IPv4 BGP neighbors in VRF “purple.”
  ```
  switch#clear ip bgp neighbor * vrf purple
  switch#
  ```
clear ipv6 bgp

The clear ipv6 bgp command removes learned BGP routes from the routing table, reads all routes from designated peers, and sends routes to those peers as required. This command can also clear the switch’s BGP sessions with its peers.

Routes that are read or sent are processed through modified route maps or AS-path access lists. The command can also clear the switch’s BGP sessions with its peers.

**Command Mode**
Privileged EXEC

**Command Syntax**
clear ipv6 bgp [PEERS] [RESET_TYPE] [DATA_FLOW] [VRF_INSTANCE]

**Parameters**
- **PEERS** specifies targeted BGP peers. Options include:
  - <no parameters> all IPv4 and IPv6 peers.
  - * all IPv4 and IPv6 peers.
  - ipv4_addr the IPv4 peer with the specified IPv4 address.
  - ipv6_addr the IPv6 peer with the specified IPv6 address.
  - intf_ipv6_addr the peer using the specified IPv6 link-local address.
  - peer-group peer_grp_name the peers using the specified BGP peer group.
- **RESET_TYPE** specifies the method used to reset routes. Options include:
  - <no parameters> performs a hard reset that terminates current BGP sessions and recreates the local routing information base.
  - soft performs a soft reset that maintains current BGP sessions and reconfigures the local routing information base using stored routes.
- **DATA_FLOW** restricts soft reset to inbound or outbound routes. Hard reset is bidirectional. Options include:
  - <no parameters> resets inbound and outbound routes.
  - in resets inbound peer routes.
  - out resets outbound peer routes.
- **VRF_INSTANCES** specifies the VRF(s) examined for BGP peers. Options include:
  - <no parameters> resets matching peers in the context-active VRF.
  - vrf_name resets matching peers in the specified VRF.
  - all resets matching peers in all VRFs.
  - default resets matching peers in the default VRF.

**Related Commands**
- clear ipv6 bgp counters
- clear ipv6 bgp errors
- clear ipv6 bgp neighbor *

**Guidelines**
Use the clear ipv6 bgp command after changing any of the following BGP attributes:
- Weights
• Distribution lists
• Timers
• Administrative distance

Examples
• This command performs a hard reset of all IPv4 and IPv6 peers in the context-active VRF.
  
  switch# clear ipv6 bgp
  switch#

• This command has the same behavior as in clear ipv6 bgp command.
  
  switch# clear ipv6 bgp *
  switch#
clear ipv6 bgp counters

The clear ipv6 bgp counters command resets general statistics of peers. Peer general statistics primarily consists of message related counts.

Command Mode
Privileged EXEC

Command Syntax
```plaintext
clear ipv6 bgp [PEERS] counters [VRF_INSTANCES]
```

Parameters
- **PEERS** specifies targeted BGP peers. Options include:
  - <no parameters> all IPv4 and IPv6 peers.
  - * all IPv4 and IPv6 peers.
  - ipv4_addr the IPv4 peer with the specified IPv4 address.
  - ipv6_addr the IPv6 peer with the specified IPv6 address.
  - intrf_ipv6_addr the peer using the specified IPv6 link-local address.
  - peer-group peer_grp_name the peers using the specified BGP peer group.
- **VRF_INSTANCES** specifies the VRF(s) examined for BGP peers. Options include:
  - <no parameters> resets matching peers in the context-active VRF.
  - vrf_name resets matching peers in the specified VRF.
  - all resets matching peers in all VRFs.
  - default resets matching peers in the default VRF.

Related Commands
- clear ip bgp counters
- clear ipv6 bgp
- clear ipv6 bgp errors

Example
- This command resets general statistics of all IPv4 and IPv6 peers in the context-active VRF.
  ```plaintext
  switch#clear ipv6 bgp counters
  ! Clearing all IPv4 and IPv6 peering sessions
  switch#
  ```
clear ipv6 bgp errors

The clear ipv6 bgp errors command resets the error statistics and history of peers. Peer error statistics primarily consists of notification errors, socket errors, and update errors.

Command Mode
Privileged EXEC

Command Syntax
clear ipv6 bgp [PEERS] errors [VRF_INSTANCES]

Parameters
- **PEERS** specifies targeted BGP peers. Options include:
  - <no parameters> all IPv4 and IPv6 peers.
  - * all IPv4 and IPv6 peers.
  - ipv4_addr the IPv4 peer with the specified IPv4 address.
  - ipv6_addr the IPv6 peer with the specified IPv6 address.
  - intrf_ipv6_addr the peer using the specified IPv6 link-local address.
  - peer-group peer_grp_name the peers using the specified BGP peer group.
- **VRF_INSTANCES** specifies the VRF(s) examined for BGP peers. Options include:
  - <no parameters> resets matching peers in the context-active VRF.
  - vrf_name resets matching peers in the specified VRF.
  - all resets matching peers in all VRFs.
  - default resets matching peers in the default VRF.

Related Commands
- clear ip bgp errors
- clear ipv6 bgp
- clear ipv6 bgp counters

Example
- This command resets the error statistics of all IPv4 and IPv6 peers in the context-active VRF.

  switch#clear ipv6 bgp errors
  ! Clearing all IPv4 and IPv6 peering sessions
  switch#
clear ipv6 bgp neighbor *

The clear ipv6 bgp neighbor * command clears BGP neighbors belonging to the IPv6 transport address family. To clear BGP neighbors in the IPv4 transport address family, use the clear ip bgp neighbor * command.

Command Mode
Privileged EXEC

Command Syntax
   clear ipv6 bgp neighbor * [VRF_INSTANCE]

Parameters
   •  VRF_INSTANCE specifies VRF instance for which IPv6 transport address family BGP neighbors will be cleared. Options include:
      •  <no parameter> clears IPv6 BGP neighbors in the context-active VRF.
      •  vrf vrf_name clears IPv6 BGP neighbors in the specified VRF.
      •  vrf all clears IPv6 BGP neighbors in the all VRFs.
      •  vrf default clears IPv6 BGP neighbors in the default VRF.

Examples
   •  This command clears all IPv6 BGP neighbors in the context-active VRF.
      switch#clear ipv6 bgp neighbor *
      switch#
   •  This command clears all IPv6 BGP neighbors in VRF “purple.”
      switch#clear ipv6 bgp neighbor * vrf purple
      switch#
distance bgp

The **distance bgp** command assigns an administrative distance to routes that the switch learns through BGP. Routers use administrative distances to select a route when two protocols provide routing information to the same destination. Distance values range from 1 to 255; lower distance values correspond to higher reliability. BGP routing tables do not include routes with a distance of 255.

The distance command assigns distance values to external, internal, and local BGP routes:

- **external**: Best-path routes learned from a neighbor external to the autonomous system. Default distance is 200.
- **internal**: Internal routes are routes learned from a BGP entity within the same autonomous system. Default distance is 200.
- **local**: Local routes are networks listed with a network router configuration command for that router or for networks that are redistributed from another process. Default distance is 200.

The **no distance bgp** and **default distance bgp** commands restore the default administrative distances by removing the distance bgp command from running-config.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
distance bgp  external_dist [INTERNAL_LOCAL]
no distance bgp
default distance bgp
```

**Parameters**

- **external_dist**  distance assigned to external routes. Values range from 1 to 255.
- **INTERNAL LOCAL** distance assigned to internal and local routes. Values for both routes range from 1 to 255. Options include:
  - <no parameter>  **external_dist** value is assigned to internal and local routes.
  - **internal_dist**  **local_dist** values assigned to internal (**internal_dist**) and local (**local_dist**) routes.

**Example**

- This command assigns an administrative distance of 150 to external routes, 200 to internal, and 150 to local routes.

  ```
  switch(config)#router bgp 1
  switch(config-router-bgp)#distance bgp 150 200 150
  switch(config-router-bgp)#
  ```
**dynamic peer max**

The `dynamic peer max` command limits the number of dynamic BGP peers allowed on the switch. The `no dynamic peer max` and `default dynamic peer max` commands restore the default limit of dynamic BGP peers by removing the `dynamic peer max` command from `running-config`.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
dynamic peer max maximum
no dynamic peer max
default dynamic peer max
```

**Parameters**

- `maximum` the maximum number of dynamic BGP peers to be allowed on the switch. Values range from 1 to 1000; default value is 100.

**Example**

- This command sets the maximum number of dynamic BGP peers allowed on the switch to 200.

```
switch(config)#router bgp 1
switch(config-router-bgp)#dynamic peer max 200
switch(config-router-bgp)#
```
**graceful-restart stalepath-time**

The `graceful-restart stalepath-time` command specifies the maximum time that stale routes from a restarting BGP neighbor will be retained after a BGP session is re-established with that peer.

The `no graceful-restart stalepath-time` and `default graceful-restart stalepath-time` commands restore the default value of 300 seconds by deleting the `graceful-restart stalepath-time` statement from `running-config`.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
graceful-restart stalepath-time interval
no graceful-restart stalepath-time
default graceful-restart stalepath-time
```

**Parameters**

- `interval`  Maximum period (in seconds) that stale routes from a restarting BGP neighbor will be retained after the BGP session is re-established. Value ranges from 1 to 3600 (60 minutes). Default is 300.

**Example**

- These commands configure the stale path retention interval to 15 minutes.

```
switch(config)#router bgp 1
switch(config-router-bgp)#graceful-restart stalepath-time 900
switch(config-router-bgp)#
```
graceful-restart-helper

The **graceful-restart helper** command enables BGP graceful restart helper mode on the switch for all BGP neighbors. When graceful restart helper mode is enabled, the switch will retain routes from neighbors which are capable of graceful restart while those neighbors are restarting BGP. Graceful restart is enabled by default. To configure graceful restart helper mode for a specific neighbor or peer group, use the `neighbor graceful-restart-helper` command. Individual neighbor configuration takes precedence over the global configuration.

The **no graceful-restart helper** command disables graceful restart helper mode on the switch. The **default graceful-restart helper** command enables graceful restart helper mode by removing the corresponding `no graceful-restart helper` command from **running-config**.

**Command Mode**

  Router-BGP Configuration

**Command Syntax**

  - `graceful-restart helper`
  - `no graceful-restart helper`
  - `default graceful-restart helper`

**Example**

  - These commands disable graceful restart helper mode on the switch.
    ```
    switch(config)#router bgp 1
    switch(config-router-bgp)#no graceful-restart-helper
    switch(config-router-bgp)#
    ```
ip as-path access-list

The **ip as-path access-list** command creates an access list to filter BGP route updates. If access list **list_name** does not exist, this command creates it. If it already exists, this command appends statements to the list.

The **no ip as-path access-list** and **default ip as-path access-list** commands delete the named access list.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip as-path access-list list_name FILTER_TYPE regex ORIGIN
no ip as-path access-list list_name
    default ip as-path access-list list_name
```

**Parameters**

- **list_name** the name of the AS path access list.
- **FILTER_TYPE** access resolution of the specified AS path. Options include:
  - **permit** access is permitted.
  - **deny** access is denied.
- **regex** a regular expression describing the AS path being filtered. Regular expressions are pattern matching strings that are composed of text characters and operators.
- **ORIGIN** the origin of the path information. Values include:
  - **<no parameter>** sets the origin to any.
  - **any** any BGP origin.
  - **egp** EGP origin.
  - **igp** IGP origin.
  - **incomplete** incomplete origin.

**Example**

- These commands create an AS path access list named “list1” which allows all BGP routes except those originating in AS 3.

  switch(config)#ip as-path access-list list1 deny _3$
  switch(config)#ip as-path access-list list1 permit .*
  switch(config)#
**ip as-path regex-mode**

The **ip as-path regex-mode** command specifies how the switch will evaluate regular expressions describing AS paths in ACLs. When the regex mode is set to **asn**, AS numbers in the ACL are interpreted as AS numbers; only complete AS number matches in the AS path return a match. When it is set to **string**, AS numbers in the ACL are interpreted as strings; both complete AS number matches and longer AS numbers that include the target string return a match. The default mode is **asn**.

For example, **asn** mode will return “false” and **string** mode will return “true” when searching for “10” in an AS path of “100 200”.

The **no ip as-path regex-mode** and **default ip as-path regex-mode** commands restore the regex mode to **asn** by removing the **ip as-path regex-mode** command from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip as-path regex-mode MODE_SETTING
no ip as-path regex-mode
default ip as-path regex-mode
```

**Parameters**

- **MODE_SETTING** Specifies how regular expressions describing AS paths in AS path ACLs will be evaluated. Options include:
  - **asn** AS numbers in the ACL are interpreted as AS numbers; only complete AS number matches in the AS path return a match.
  - **string** AS numbers in the ACL are interpreted as strings; both complete AS number matches and longer AS numbers that include the target string return a match.

**Example**

- This command sets the regex mode to **string**.

```bash
switch(config)#ip as-path regex-mode string
switch(config)#
```
ip community-list

The *ip community-list* command creates and configures a BGP access list based on BGP communities.

The *no ip community-list* and *default ip community-list* commands delete the specified community list by removing the corresponding *ip community-list* command from the running configuration.

**Command Mode**

Global Configuration

**Command Syntax**

```plaintext
ip community-list listname [permit | deny] [GSHUT | aa:nn | internet | local-as | no-advertise | no-export | number]
no ip community-list listname
default ip community-list listname
```

**Parameters**

- *listname* name of the community list. Valid input is text.
- *permit* permits access to the specified community.
- *deny* denies access to the specified community.
- *GSHUT* well-known graceful shutdown community.
- *aa:nn* AA is 65535 and NN specifies the community number (0-65535) within the AS.
- *internet* advertises route to the Internet community.
- *local-as* advertises route only to local peers.
- *no-advertise* does not advertise route to any peer.
- *no-export* advertises route only within BGP AS boundary.
- *number* community number. Value ranges from 0 to 4294967040.

**Related Commands**

- route-map
- match (route-map)
- show ip community-list
- show ip extcommunity-list

**Guideline**

EOS does not support disabling the process of graceful shutdown community.

**Examples**

- This command creates a BGP community list (named list_9) that does not match members of route maps configured as AS-network number 100:250.
  ```plaintext
  switch(config)#ip community-list list_9 deny 100:250
  switch(config)#
  ```
This command creates a BGP community list that permits the graceful shutdown community, and uses it in a route map to permit routes with that community.

```
switch(config)#ip community-list gshut_list permit GSHUT
switch(config)#route-map map1
switch(config-route-map-map1)#match community gshut_list
switch(config-route-map-map1)#exit
switch(config)#show route-map map1
route-map map1 permit 10
  Description:
    Match clauses:
      match community gshut_list
SubRouteMap:
Set clauses:
  switch(config)#
```
**ip community-list regexp**

The **ip community-list regexp** command creates and configures a BGP access list based on BGP communities. A BGP community access list filters prefixes based on their BGP communities. The command uses regular expressions to identify the communities specified by the list. To create a community list by explicitly specifying one or more communities, use the **ip community-list** command.

The **no ip community-list regexp** and **default ip community-list regexp** commands delete the specified community list. To delete a specific community-list entry, specify the entry in the **no ip community-list regexp** command.

**Command Mode**  
Global Configuration

**Command Syntax**

```
ip community-list regexp listname FILTER_TYPE R_EXP
no ip community-list regexp listname FILTER_TYPE R_EXP
default ip community-list regexp listname
```

**Parameters**

- **listname**  
  name of the community list. Valid input is text.

- **FILTER_TYPE**  
  access resolution of the specified community. Options include:
  - **permit**  
    access is permitted.
  - **deny**  
    access is denied.

- **R_EXP**  
  list of communities, formatted as a regular expression. Regular expressions are pattern matching strings that are composed of text characters and operators.

- **entry**  
  specifies a single entry to be removed from the list and leaves the rest of the list intact. Valid input is text. If no entry is specified, the **no** form of the command removes the entire list.

**Related Commands**

- **route-map**
- **match (route-map)**
- **show ip community-list**
- **show ip extcommunity-list**

**Example**

- This command creates a BGP community list that permits routes from networks 20-24 and 30-34 in autonomous system 10.
  
  ```
  switch(config)#ip community-list regexp list_2 permit 10:[2-3][0-4]_
  switch(config)#
  ```

- This command removes the above statement from the community list named "list_2," leaving any other statements in the list intact.
  
  ```
  switch(config)#no ip community-list regexp list_2 permit 10:[2-3][0-4]_
  switch(config)#
  ```

- This command deletes the community list named "list_2" entirely.
  
  ```
  switch(config)#no ip community-list regexp list_2
  switch(config)#
  ```
ip extcommunity-list

The **ip extcommunity-list** command creates an extended community list to filter VRF routes or for link bandwidth (LBW) advertisement.

The following extcommunity-list types are supported:

- **Route Target (rt)** identifies sites that may receive appropriately tagged routes.
- **Site of Origin (soo)** identifies sites where the switch learned the route.
- **Link Bandwidth (lbw)** advertises BGP link bandwidth.

The **no ip extcommunity-list** and **default ip extcommunity-list** commands delete the specified extended community list by removing the corresponding **ip extcommunity-list** statement from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip extcommunity-list listname FILTER_TYPE COMM_1 [COMM_2...COMM_n]
no ip extcommunity-list listname
default ip extcommunity-list listname
```

**Parameters**

- **listname** name of the extended community list. Valid input is text.
- **FILTER_TYPE** access resolution of the specified extended community list. Options include:
  - **permit** access is permitted.
  - **deny** access is denied.
- **COMM_x** extended community attribute. Options include:
  - **rt** route target, as specified by autonomous system:network number
  - **rt** ip_addr:nn route target, as specified by ip address:network number
  - **soo** aa:nn Site of Origin, as specified by autonomous system:network number
  - **soo** ip_addr:nn site of origin, as specified by ip address:network number
  - **lbw** link bandwidth in bits per second

**Related Commands**

- **route-map**
- **match (route-map)**
- **show ip community-list**
- **show ip extcommunity-list**

**Example**

- This command creates a BGP extended community list that denies routes from route target 100:250.

  ```
  switch(config)#ip extcommunity-list list_9 deny rt 100:250
  switch(config)#
  ```
The `ip extcommunity-list regexp` command creates an extended community list to filter VRF routes or for link bandwidth (LBW) advertisement. The command uses regular expressions to define the extended communities specified by the list. To specify particular values, use the `ip extcommunity-list` command.

The following extcommunity-list types are supported:

- **Route Target (rt)** identifies sites that may receive appropriately tagged routes.
- **Site of Origin (soo)** identifies sites where the switch learned the route.
- **Link Bandwidth (lbw)** advertises BGP link bandwidth.

The `no ip extcommunity-list regexp` and `default ip extcommunity-list regexp` commands delete the specified extended community list by removing the corresponding `ip extcommunity-list regexp` statement from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip extcommunity-list regexp listname FILTER_TYPE R_EXP
no ip extcommunity-list regexp listname FILTER_TYPE R_EXP
default ip extcommunity-list regexp listname
```

**Parameters**

- `listname` name of the extended community list. Valid input is text.
- `FILTER_TYPE` access resolution of the specified extended community list. Options include:
  - `permit` access is permitted.
  - `deny` access is denied.
- `R_EXP` list of communities, formatted as a regular expression. Regular expressions are pattern matching strings that are composed of text characters and operators.
  - Expressions beginning with `RT:` match the route target extended community attribute option.
  - Expressions beginning with `SoO:` match the site of origin extended community attribute option.

`RT:` and `SoO:` are case sensitive.

**Related Commands**

- `route-map`
- `match (route-map)`
- `show ip community-list`
- `show ip extcommunity-list`

**Example**

- This command creates a BGP extended community list that denies routes from route target networks 20-24 and 30-34 in autonomous system 10.

  switch(config)#ip extcommunity-list regexp list_1 deny RT:10:[2-3][0-4]_
  switch(config)#
ip large-community-list regexp

The `ip large-community-list regexp` command creates and configures a BGP access list based on BGP large communities. A BGP large-community access list filters prefixes based on their BGP large community values. The command uses regular expressions to match large communities. Multiple large-community lists with the same name may be specified. To create a large-community list by explicitly specifying one or more communities, use the `ip large-community-list` command.

Large-communities are represented as follows: [ASN]:local-part1:local-part2.

The `no ip large-community-list regexp` and `default ip large-community-list regexp` commands delete the specified large community list. To delete a specific community-list entry, specify the entry in the `no ip large-community-list regexp` command.

Command Mode

Global Configuration

Command Syntax

```
ip large-community-list regexp listname {deny | permit} R_EXP
no ip large-community-list regexp listname {deny | permit} R_EXP
default ip large-community-list regexp listname {deny | permit}
```

Parameters

- **listname** name of the community list. Valid input is text.
- **deny** access is denied
- **permit** access is permitted
- **R_EXP** list of communities that are formatted as a regular expression. Regular expressions are pattern matching strings that are composed of text characters and operators.

Example

- This command creates a BGP large community list that permits routes from autonomous system 10 with local-part1 value of 20-24 or 30-34.
  ```
  switch(config)#ip large-community-list regexp list_2 permit 10:[2-3][0-4]:_
  switch(config)#
  ```
- This command removes the above statement from the large community list named “list_2,” leaving any other statements in the list intact.
  ```
  switch(config)#no ip large-community-list regexp list_2 permit 10:[2-3][0-4]_
  switch(config)#
  ```
- This command deletes the large community list named “list_2” entirely.
  ```
  switch(config)#no ip large-community-list regexp list_2
  switch(config)#
  ```
maximum paths (BGP)

The `maximum-paths` command controls the maximum number of parallel eBGP routes that the switch supports. The default maximum is one route. The command provides an ECMP (equal cost multiple paths) parameter that controls the number of equal-cost paths that the switch stores in the routing table for each route.

For paths to be considered equal, they must have the same weight, local preference, AS-path length, and origin. To require that they also have the same multi-exit discriminator (MED) value, use the `bgp always-compare-med` command. To require that their AS paths have the same contents, use the `no bgp bestpath as-path multipath-relax` command.

The `no maximum-paths` and `default maximum-paths` commands restore the default values of the maximum number of parallel routes and the maximum number of ECMP paths by removing the corresponding command from `running-config`.

Command Mode

Router-BGP Configuration

Command Syntax

```
maximum-paths paths [ecmp ecmp_paths]
no maximum-paths
default maximum-paths
```

Parameters

- `paths` maximum number of parallel routes. Default value is 1. Value must be less than or equal to the maximum number of ECMP paths.
- `ecmp_paths` maximum number of ECMP paths for each route. Default is maximum value.

Value for each parameter ranges from 1 to the number of interfaces available per ECMP group, which is platform dependent.

- Arad: Value ranges from 1 to 128. Default value is 128.
- FM6000: Value ranges from 1 to 32. Default value is 32.
- PetraA: Value ranges from 1 to 16. Default value is 16.
- Trident: Value ranges from 1 to 32. Default value is 32.
- Trident-II: Value ranges from 1 to 128. Default value is 128.

Examples

- This command configures the maximum number of BGP parallel paths to 12 without changing the default ECMP value.

  ```
  switch(config)#router bgp 1
  switch(config-router-bgp)#maximum-paths 12
  switch(config-router-bgp)#
  ```

- This command configures the maximum number of eBGP parallel routes to 2, with a maximum of 4 equal cost (ECMP) paths for each route.

  ```
  switch(config)#router bgp 1
  switch(config-router-bgp)#maximum-paths 2 ecmp 4
  switch(config-router-bgp)#
  ```
match as-range

The **match as-range** command defines the match statement for the peer-filter, based on the match statement the peer-filter accept or reject the incoming peer request. The match statement includes a sequence number, AS number range and a match condition to accept or reject a peer by comparing its remote AS number to the specified range. A peer filter can consist of a single match statement or multiple match statements. The match statement for the peer filter is configured under **peer-filter** configuration mode.

The **no match as-range** or **default match as-range** command deletes the peer-filter condition from the group from the running configuration.

**Command Mode**
Peer-Filter Configuration

**Command Syntax**

```
[sequence_number] match as-range [as_number1] [- as_number2] result {accept | reject} group_name
no [sequence_number] match as-range [ASN1] [- ASN2] result {accept | reject} group_name
default [sequence_number] match as-range [ASN1] [- ASN2] result {accept | reject} group_name
```

**Parameters**
- `sequence_number` number ranges from 0 to 65535.
- `group_name` name of the peer filter group.
- `as_number` the autonomous system number, ranges from 1 to 4294967295.

**Example**
- These commands define a peer filter that accepts any AS number.
  ```
  switch(config)#peer-filter group1
  switch(config-peer-filter-group1)#10 match as-range 1-4294967295 result accept
  ```

- These commands define a peer filter that accepts any AS number within 65000 and 65100 (inclusive) except 65008 and 65009.
  ```
  switch(config)#peer-filter group2
  switch(config-peer-filter-group2)#10 match as-range 65008-65009 result reject
  switch(config-peer-filter-group2)#20 match as-range 65000-65100 result accept
  ```

- These commands define a peer filter that accepts 3 specific remote AS numbers.
  ```
  switch(config)#peer-filter group3
  switch(config-peer-filter-group3)#10 match as-range 65003 result accept
  switch(config-peer-filter-group3)#20 match as-range 65007 result accept
  switch(config-peer-filter-group3)#30 match as-range 65009 result accept
  ```
neighbor activate

The **neighbor activate** command defines the configuration mode address family activation state of a specified address that is configured as a BGP neighbor. The switch sends the following announcements to addresses active in an address family:

- IPv4 address family: IPv4 capability and all network advertisements with IPv4 prefixes.
- IPv6 address family: IPv6 capability and all network advertisements with IPv6 prefixes.

The **bgp default** command configures the default address family activation state of addresses configured as BGP neighbors. The **neighbor activate** and **no neighbor activate** commands override the neighbor’s default activation state within the configuration mode address family.

- **neighbor activate**: the specified address is active in the address family.
- **no neighbor activate**: the specified address is not active in the address family.

The **default neighbor activate** command removes the corresponding **neighbor activate** or **no neighbor activate** command from **running-config**, restoring the default address family activation state for the specified neighbor address.

**Command Mode**

Router-BGP Address-Family Configuration

**Command Syntax**

```
neighbor neighbor_ID activate
no neighbor neighbor_ID activate
default neighbor neighbor_ID activate
```

**Parameters**

- **neighbor_ID**  neighbor’s IPv4 or IPv6 address or peer group name

**Limitations**

The switch supports the advertisement of networks with IPv6 prefixes to IPv4 transport neighbors. The switch does not support the advertisement of networks with IPv4 prefixes to IPv6 transport neighbors.

**Example**

- The two neighbor activation commands activate the advertising of specified neighbors during IPv4 peering sessions. The **show active** command displays the result of the previous commands.

```
switch(config)#router bgp 1
switch(config-router-bgp)#no address-family ipv4
switch(config-router-bgp-af)#neighbor 172.41.18.15 activate
switch(config-router-bgp-af)#neighbor 172.49.22.6 activate
switch(config-router-bgp-af)#no neighbor 172.15.21.18 activate
switch(config-router-bgp-af)#show active
  address-family ipv4
    no neighbor 172.15.21.18 activate
    neighbor 172.49.22.6 activate
    neighbor 172.41.18.15 activate
switch(config-router-bgp-af)#exit
switch(config-router-bgp)#
```
neighbor allowas-in

The `neighbor allowas-in` command configures the switch to permit the advertisement of prefixes containing duplicate autonomous switch numbers (ASNs). This command programs the switch to ignore its ASN in the AS path of routes and allow them into the routing domain. This function is disabled by default.

The `no neighbor allowas-in` command applies the system default configuration.

The `default neighbor allowas-in` command applies the system default configuration for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

The `no neighbor` command removes all configuration commands for the neighbor at the specified address.

**Command Mode**
- Router-BGP Configuration

**Command Syntax**

```
neighbor  neighbor_ID  allowas-in [asn_quantity]
no neighbor  neighbor_ID  allowas-in
default neighbor  neighbor_ID  allowas-in
```

**Parameters**
- `neighbor_ID` neighbor’s IPv4 or IPv6 address or peer group name
- `asn_quantity` number of switches (ASN) allowed in path. Values range from 1 to 10. Default is 3.

**Example**
- This command activates the allowas-in function for the neighbor at 192.168.1.30.

```
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 192.168.1.30 allowas-in
switch(config-router-bgp)#
```
### neighbor auto-local-addr

The `neighbor auto-local-addr` command configures the switch to automatically determine the local address to be used for the non-transport address family in NLRIs sent to the specified neighbor or peer group. This allows IPv4 NLRIs to be carried over IPv6 transport, or IPv6 NLRIs to be carried over IPv4 transport.

The `no neighbor auto-local-addr` command applies the system default configuration.

The `default neighbor auto-local-addr` command applies the system default configuration for individual neighbors, and applies the peer group’s setting for neighbors that are members of a peer group.

---

**Note**

While this feature works well in eBGP deployments in which the pairing routers are directly connected and have matching IP address configurations, multi-hop eBGP or iBGP deployments may require manual local address configuration.

To explicitly configure a local address for the non-transport address family for a specific neighbor or peer group, use the `neighbor local-v4-addr` command for IPv6 neighbors, or the `neighbor local-v6-addr` for IPv4 neighbors.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID auto-local-addr
no neighbor neighbor_ID auto-local-addr
default neighbor neighbor_ID auto-local-addr
```

**Parameters**

- `neighbor_ID` neighbor’s IPv4 or IPv6 address or peer group name

**Example**

- For the IPv6 neighbor at 2001:0DB8:c2a4:1761::2, these commands configure the switch to automatically determine the IPv4 NLRI value to be sent during peering sessions.

```
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 2001:0DB8:c2a4:1761::2 auto-local-addr
switch(config-router-bgp)#
```
neighbor default-originate

The `neighbor default-originate` command advertises a default route to a BGP neighbor or peer group. This default route overrides the default route advertised by any other means to the specified neighbor or peer group. However, the update generated by `neighbor default-originate` is not processed by neighbor route map out policies.

If a route map is specified in this command, its set clauses are used to modify attributes of the exported default route, but its match clauses are not used to conditionally advertise the route. The default route is always advertised to the specified neighbor.

The `no neighbor default-originate` command applies the system default configuration.

The `default neighbor default-originate` command applies the system default configuration for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

The `no neighbor` command removes all configuration commands for the neighbor at the specified address.

Command Mode

- Router-BGP Configuration
- Router-BGP Address-Family Configuration

Command Syntax

```
neighbor neighbor_ID default-originate [MAP]
no neighbor neighbor_ID default-originate
default neighbor neighbor_ID default-originate
```

Parameters

- `neighbor_ID` neighbor’s IPv4 or IPv6 address or peer group name
- `MAP` specifies route map that modifies attributes of the exported default route. Options include:
  - `<no parameter>` attributes are not modified by a route map.
  - `route-map map_name` attributes set by specified route map are assigned to the exported default route.

Example

- These commands advertise a default route to the BGP neighbor at 192.168.14.5.

  switch(config)#router bgp 9
  switch(config-router-bgp)#neighbor 192.168.14.5 default-originate
  switch(config-router-bgp)#ab
neighbor description

The *neighbor description* command associates descriptive text with the specified peer or peer group. The *no neighbor description* command removes the text association from the specified peer or peer group. The *default neighbor description* command removes the text association from the specified peer for individual neighbors, and applies the peer group’s description to neighbors that are members of a peer group. The *no neighbor* command removes all configuration commands for the neighbor at the specified address or for the specified peer group.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID description description_string
no neighbor neighbor_ID description
default neighbor neighbor_ID description
```

**Parameters**

- *neighbor_ID* neighbor’s IPv4 or IPv6 address or peer group name
- *description_string* text string to be associated with the neighbor or peer group.

**Example**

- This command associates the string PEER_1 with the peer located at 192.168.1.30.

```
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 192.168.1.30 description PEER_1
switch(config-router-bgp)#
```
neighbor ebgp-multihop

The **neighbor ebgp-multihop** command programs the switch to accept and attempt BGP connections to the external peers residing on networks not directly connected to the switch. The command does not establish the multihop if the only route to the peer is the default route (0.0.0.0).

The **no neighbor ebgp-multihop** command applies the system default configuration.

The **default neighbor ebgp-multihop** command applies the system default configuration for individual neighbors, and applies the peer group’s setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID ebgp-multihop [hop_number]
no neighbor neighbor_ID ebgp-multihop
default neighbor neighbor_ID ebgp-multihop
```

**Parameters**

- **neighbor_ID** neighbor’s IPv4 or IPv6 address or peer group name
- **hop_number** time-to-live (hops). Values range from 1 to 255. Default value is 255.

**Example**

- These commands configure the switch to accept and attempt BGP connections to the external peer located at 192.168.1.30, setting the hop limit to 32.

```
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 192.168.1.30 ebgp-multihop 32
switch(config-router-bgp)#
```
**neighbor enforce-first-as**

The `neighbor enforce-first-as` command causes a forced comparison of the first autonomous system (AS) in the AS path of eBGP routes received from a specified BGP peer or peer group to the configured remote external peer autonomous system number (ASN). Updates from the specified eBGP peers that do not include an ASN as first AS path (in the AS_PATH attribute) are discarded.

This behavior is enabled globally by default upon BGP configuration, and disabled for the specified neighbor or peer group by the `no` form of the command. To configure enforce-first-as globally, use the `bgp enforce-first-as` command.

**Command Mode**
- Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID enforce-first-as
default neighbor neighbor_ID enforce-first-as
no neighbor neighbor_ID enforce-first-as
```

**Parameters**
- `neighbor_ID` neighbor’s IPv4 or IPv6 address or peer group name

**Example**
- This command disables BGP enforce-first-as for the neighbors in peer group “region-3”.

  switch(config-router-bgp)# no neighbor region-3 enforce-first-as
  switch(config-router-bgp)#
**neighbor export-localpref**

The `neighbor export-localpref` command determines the LOCAL_PREF value that is sent in BGP UPDATE packets to the specified peer or peer group. This command has no effect on external peers.

The `no neighbor export-localpref` command resets the LOCAL_PREF value to the system default of 100 in packets sent to the specified peer or peer group.

The `default neighbor export-localpref` command resets the LOCAL_PREF value to the system default of 100 for individual neighbors, and applies the peer group’s setting for neighbors that are members of a peer group.

The `no neighbor` command removes all configuration commands for the neighbor at the specified address or the specified peer group.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID export-localpref preference
no neighbor neighbor_ID export-localpref
default neighbor neighbor_ID export-localpref
```

**Parameters**

- `neighbor_ID` neighbor’s IPv4 or IPv6 address or peer group name
- `preference` preference value. Values range from 0 to 4294967295.

**Example**

- This command configures the switch to fill the LOCAL_PREF field with 200 in UPDATE packets that it sends to the peer located at 10.1.1.45.

```
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 10.1.1.45 export-localpref 200
switch(config-router-bgp)#
```
**neighbor graceful-restart**

The `neighbor graceful-restart` command enables the BGP graceful restart mode for a specified BGP neighbor or peer group. When graceful restart mode is enabled, the switch retains routes from neighbors that are capable of graceful restart. By default, graceful restart is enabled for all BGP neighbors. Individual neighbor configuration takes precedence over the global configuration.

The `no neighbor graceful-restart` and `default neighbor graceful-restart` commands disable graceful restart mode for the specified BGP neighbor or peer group by removing the corresponding `no neighbor graceful-restart` command from `running-config`.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID graceful-restart
no neighbor neighbor_ID graceful-restart
default neighbor neighbor_ID graceful-restart
```

**Parameters**

- `neighbor_ID` neighbor’s IPv4 or IPv6 address or peer group name

**Example**

- This command enables graceful restart mode for the neighbor with the IP address 192.168.12.1.

  ```
  switch(config)#router bgp 1
  switch(config-router-bgp)#neighbor 192.168.12.1 graceful-restart
  switch(config-router-bgp)#
  ```
neighbor graceful-restart-helper

The `neighbor graceful-restart helper` command enables BGP graceful restart helper mode for the specified BGP neighbor or peer group. When graceful restart helper mode is enabled, the switch will retain routes from neighbors which are capable of graceful restart while those neighbors are restarting BGP. Graceful restart is enabled by default for all BGP neighbors. To configure graceful restart helper mode for all BGP neighbors, use the `graceful-restart-helper` command. Individual neighbor configuration takes precedence over the global configuration.

The `no neighbor graceful-restart helper` command disables graceful restart helper mode for the specified BGP neighbor or peer group. The `default neighbor graceful-restart helper` command enables graceful restart helper mode for the specified BGP neighbor or peer group by removing the corresponding `no neighbor graceful-restart helper` command from `running-config`.

**Command Mode**
- Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID graceful-restart helper
no neighbor neighbor_ID graceful-restart helper
default neighbor neighbor_ID graceful-restart helper
```

**Parameters**
- `neighbor_ID` neighbor’s IPv4 or IPv6 address or peer group name

**Example**
- These commands disable graceful restart helper mode for the neighbor at 192.168.12.1.

```
switch(config)#router bgp 1
switch(config-router-bgp)#no neighbor 192.168.12.1 graceful-restart-helper
switch(config-router-bgp)#
```
neighbor import-localpref

The **neighbor import-localpref** command determines the local preference assigned to routes received from the specified external peer or peer group. This command has no effect on routes received from internal peers.

The **no neighbor import-localpref** command resets the local preference to the default of 100 for routes received from the specified peer or peer group.

The **default neighbor import-localpref** command resets the local preference to the default of 100 for individual neighbors, and applies the peer group’s setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address.

**Command Mode**
- Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID import-localpref preference
no neighbor neighbor_ID import-localpref
default neighbor neighbor_ID import-localpref
```

**Parameters**
- **neighbor_ID**  neighbor’s IPv4 or IPv6 address or peer group name
- **preference**  preference value. Values range from 0 to 4294967295.

**Example**
- This command configures the switch to assign a local preference of 50 to routes received from the peer located at 192.168.1.30.
  
  switch(config)#router bgp 1
  switch(config-router-bgp)#neighbor 192.168.1.30 import-localpref 50
  switch(config-router-bgp)#
neighbor local-as

The `neighbor local-as` command enables AS_PATH attribute modification for received eBGP routes, allowing the switch to appear as a member of a different AS to external peers. Arista switches do not prepend the local AS number to routes received from the eBGP neighbor; currently, we implement the command only as `neighbor local-as no-prepend replace-as`.

The `no neighbor local-as` command disables AS_PATH modification for the specified peer or peer group. The `default neighbor local-as` command disables AS_PATH modification for individual neighbors, and applies the peer group's setting for neighbors that are members of a peer group.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```plaintext
neighbor neighbor_ID local-as as_id no-prepend replace-as
no neighbor neighbor_ID local-as
default neighbor neighbor_ID local-as
```

**Parameters**

- `neighbor_ID` neighbor's IPv4 or IPv6 address or peer group name
- `as_id` AS number that is sent in outbound routing updates in place of the actual AS of the switch. Values range from 1 to 4294967295.

This parameter cannot be set to the switch's AS number or to any AS number in the peer’s network.

**Example**

- For the neighbor at 10.13.64.1, this command removes AS 300 from outbound routing updates and replaces it with AS 600.

```plaintext
switch(config)#router bgp 300
switch(config-router-bgp)#neighbor 10.13.64.1 local-as 600 no-prepend replace-as
switch(config-router-bgp)#
```
neighbor local-v4-addr

The **neighbor local-v4-addr** command specifies the next-hop value that the switch sends as the IPv4 NLRI value to neighbors with whom IPv6 transport peering is established.

The **no neighbor local-v4-addr** command applies the system default configuration.

The **default neighbor local-v4-addr** command applies the system default configuration for individual neighbors, and applies the peer group’s setting for neighbors that are members of a peer group.

To configure the switch to automatically determine the IPv4 address to be sent as the next-hop in IPv4 NLRIs to an IPv6 neighbor, use the **neighbor auto-local-addr** command.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID local-v4-addr ipv4_local
no neighbor neighbor_ID local-v4-addr
default neighbor neighbor_ID local-v4-addr
```

**Parameters**

- **neighbor_ID**  neighbor’s IPv6 address or peer group name
- **ipv4_local**  Next hop address.

**Example**

- For the neighbor at 2001:0DB8:c2a4:1761::2, these commands specify an IPv4 NLRI value of 10.7.5.11 to be sent during IPv6 transport peering sessions.

```
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 2001:0DB8:c2a4:1761::2 local-v4-addr 10.7.5.11
switch(config-router-bgp)#
```
**neighbor local-v6-addr**

The `neighbor local-v6-addr` command specifies the next-hop value that the switch sends as the IPv6 NLRI value to neighbors with whom IPv4 transport peering is established.

In IPv6 peering sessions, the switch sends the global IPv6 address of the interface that is used to transmit BGP updates.

The `no neighbor local-v6-addr` command applies the system default configuration.

The `default neighbor local-v6-addr` command applies the system default configuration for individual neighbors, and applies the peer group's setting for neighbors that are members of a peer group.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID local-v6-addr ipv6_local
no neighbor neighbor_ID local-v6-addr
default neighbor neighbor_ID local-v6-addr
```

**Parameters**

- `neighbor_ID` neighbor's IPv4 address or peer group name

**Example**

- For the neighbor at 10.7.5.11, these commands specify an IPv6 NLRI value that is sent during IPv4 transport peering sessions.
  
  ```
  switch(config)#router bgp 1
  switch(config-router-bgp)#neighbor 10.7.5.11 local-v6-addr 2001:0DB8:c2a4:1761::2
  switch(config-router-bgp)#show active
  router bgp 1
    bgp log-neighbor-changes
    bgp default ipv6-unicast
    neighbor 10.7.5.11 local-v6-addr 2001:0DB8:c2a4:1761::2
  switch(config-router-bgp)#
  ```
**neighbor maximum-routes**

The `neighbor maximum-routes` command determines the number of BGP routes the switch accepts from a specified neighbor and defines an action when the limit is exceeded. The default value is 12,000. To remove the maximum routes limit, select a limit of zero.

When the number of routes received from a peer exceeds the limit, the switch generates an error message. This command can also configure the switch to disable peering with the neighbor. In this case, the neighbor state is reset only through a `clear ip bgp` command.

The `no neighbor maximum-routes` command applies the system default maximum-routes value of 12,000 for the specified peer.

The `default neighbor maximum-routes` command applies the system default value for individual neighbors, and applies the peer group’s setting for neighbors that are members of a peer group.

The `no neighbor` command removes all configuration commands for the neighbor at the specified address.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID maximum-routes quantity [ACTION]
no neighbor neighbor_ID maximum-routes
default neighbor neighbor_ID maximum-routes
```

**Parameters**

- `neighbor_ID` neighbor’s IPv4 or IPv6 address or peer group name
- `quantity` maximum number of routes. Values include:
  - 0 the switch does not define a route limit.
  - 1 to 4294967294 maximum number of routes.
- `ACTION` switch action when the route limit is exceeded. Values include:
  - `<no parameter>` peering is disabled and an error message is generated.
  - `warning-only` peering is not disabled, but an error message is generated.

**Example**

- This command configures the switch to accept 15000 routes for the neighbor at 10.3.16.210. If the neighbor exceeds 15000 routes, the switch disables peering with the neighbor.

  ```
  switch(config)#router bgp 1
  switch(config-router-bgp)#neighbor 110.3.16.210 maximum-routes 15000
  switch(config-router-bgp)#
  ```
neighbor next-hop-peer

The `neighbor next-hop-peer` command configures the switch to list the peer address as the next hop in routes that it receives from the specified peer BGP-speaking neighbor or members of the specified peer group. This command overrides the next hop for all routes received from this neighbor or peer group.

The `no neighbor next-hop-peer` command applies the system default (no next-hop override) for the specified peer.

The `default neighbor next-hop-peer` command applies the system default for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

The `no neighbor` command removes all configuration commands for the neighbor at the specified address or the specified peer group.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID next-hop-peer
no neighbor neighbor_ID next-hop-peer
default neighbor neighbor_ID next-hop-peer
```

**Parameters**

- `neighbor_ID` neighbor’s IPv4 or IPv6 address or peer group name

**Example**

- This command configures the peer address of 10.3.2.24 as the next hop for routes advertised to the switch from the peer BGP neighbor.

  ```
  switch(config)#router bgp 9
  switch(config-router-bgp)#neighbor 10.3.2.24 next-hop-peer
  switch(config-router-bgp)#
  ```
neighbor next-hop-self

The `neighbor next-hop-self` command configures the switch to list its address as the next hop in routes that it advertises to the specified BGP-speaking neighbor or neighbors in the specified peer group. This is used in networks where BGP neighbors do not directly access all other neighbors on the same subnet.

The `no neighbor next-hop-self` command applies the system default (no next-hop override) for the specified peer.

The `default neighbor next-hop-self` command applies the system default for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

The `no neighbor` command removes all configuration commands for the neighbor at the specified address or for the specified peer group.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID next-hop-self
no neighbor neighbor_ID next-hop-self
default neighbor neighbor_ID next-hop-self
```

**Parameters**

- `neighbor_ID` neighbor's IPv4 or IPv6 address or peer group name

**Example**

- This command configures the switch as the next hop for the peer at 10.4.1.30.

```
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 10.4.1.30 next-hop-self
switch(config-router-bgp)#
```
neighbor out-delay

The **neighbor out-delay** command sets the period of time that a route update for the specified neighbor must be in the routing table before the switch exports it to BGP. The out delay interval is used for bundling routing updates.

The **no neighbor out-delay** command applies the system default (out-delay value of zero) for the specified peer.

The **default neighbor out-delay** command applies the system default for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the specified neighbor.

**Command Mode**

- Router-BGP Configuration

**Command Syntax**

```
neighbor  neighbor_ID out-delay  delay_time
no neighbor  neighbor_ID out-delay
default neighbor neighbor_ID out-delay
```

**Parameters**

- **neighbor_ID** neighbor’s IPv4 or IPv6 address or peer group name
- **delay_time** the out delay period (seconds). Values range from 0 to 600. Default value is 0.

**Example**

- These commands set the out delay period to 5 seconds for the connection with the peer at 10.24.15.9.

```
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 10.24.15.9 out-delay 5
switch(config-router-bgp)#
```
neighbor passive

The **neighbor passive** command sets the TCP connection for the specified BGP neighbor or peer group to passive mode. When the peer’s transport connection mode is set to passive, it accepts TCP connections for BGP but does not initiate them.

The **no neighbor passive** command sets the specified BGP neighbor or peer group to active connection mode. BGP peers in active mode can both accept and initiate TCP connections for BGP. This is the default behavior.

The **default neighbor passive** command restores the default connection mode. The default mode is “active” for individual BGP peers, or the mode inherited from the peer group for peer group members.

**Command Mode**  
Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID passive
no neighbor neighbor_ID passive
default neighbor neighbor_ID passive
```

**Parameters**

- **neighbor_ID** neighbor’s IPv4 or IPv6 address or peer group name

**Example**

- These commands configure the neighbor at IP address 10.2.2.14 to not initiate TCP connections for BGP peering.

```
switch(config)#router bgp 300
switch(config-router-bgp)#neighbor 10.2.2.14 passive
switch(config-router-bgp)#
```
neighbor password

The neighbor password command enables authentication on a TCP connection with a BGP peer. The plain-text version of the password is a string, up to 8 bytes in length. Peers must use the same password to ensure proper communication.

Running-config displays the encrypted version of the password. The encryption scheme is not strong by cryptographic standards; encrypted passwords should be treated in the same manner as plain-text passwords.

The no neighbor password command applies the system default for the specified peer, removing the neighbor password from the configuration and disabling authentication with the specified peer.

The default neighbor password command applies the system default for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

The no neighbor password and default neighbor password commands remove the neighbor password from the configuration, disabling authentication with the specified peer.

The no neighbor command removes all configuration commands for the neighbor at the specified address.

Command Mode
Router-BGP Configuration

Command Syntax

neighbor neighbor_ID password [ENCRYPT_LEVEL] key_text
no neighbor neighbor_ID password
default neighbor neighbor_ID password

Parameters

- **neighbor_ID** neighbor’s IPv4 or IPv6 address or peer group name
- **ENCRYPT_LEVEL** the encryption level of the key_text parameter. Values include:
  - <no parameter> indicates the key_text is in clear text.
  - 0 indicates key_text is in clear text. Equivalent to the <no parameter> case.
  - 7 indicates key_text is md5 encrypted.
- **key_text** the password.

Example

- This command specifies a password in clear text.

  switch(config)#router bgp 1
  switch(config-router-bgp)#neighbor 10.25.25.13 password 0 code123
  switch(config-router-bgp)#

  Running-config stores the password as an encrypted string.
neighbor peer group (create)

Peer groups allow the user to apply settings to a group of BGP neighbors simultaneously. Once a peer group is created, the group name can be used as a parameter in neighbor configuration commands, and the configuration will be applied to all members of the group. Settings applied to an individual neighbor in the peer group override group settings.

The `neighbor peer group (create)` command is used to create static BGP peer groups. Static peer groups are peer groups whose members are added manually. To assign BGP neighbors to a static peer group, use the `neighbor peer-group (neighbor assignment)` command. To create a dynamic peer group, use the `bgp listen range` command.

The `no neighbor peer group (create)` and `default neighbor peer group (create)` commands remove the specified static peer group from `running-config`. When a static peer group is deleted, the neighbors that were members of that peer group lose any configuration that was inherited from the peer group. The `no bgp listen range` command removes a dynamic peer group.

The `no neighbor` command removes all configuration commands for the specified neighbor.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor group_name peer group
no neighbor group_name peer group
default neighbor group_name peer group
```

**Parameters**

- `group_name` peer group name.

**Examples**

- These commands create a BGP peer group called bgpgroup1, assign several neighbors to the group, apply a route map and adjust the configuration for one group member.

```sh
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor bgpgroup1 peer group
switch(config-router-bgp)#neighbor 10.1.1.1 peer group bgpgroup1
switch(config-router-bgp)#neighbor 10.2.2.2 peer group bgpgroup1
switch(config-router-bgp)#neighbor 10.3.3.3 peer group bgpgroup1
switch(config-router-bgp)#neighbor bgpgroup1 route-map corporate in
switch(config-router-bgp)#neighbor bgpgroup1 maximum-routes 5000
switch(config-router-bgp)#show active
router bgp 9
bgp log-neighbor-changes
  neighbor bgpgroup1 peer-group
  neighbor bgpgroup1 route-map corporate in
  neighbor bgpgroup1 maximum-routes 12000
  neighbor 10.1.1.1 peer-group bgpgroup1
  neighbor 10.2.2.2 peer-group bgpgroup1
  neighbor 10.3.3.3 peer-group bgpgroup1
  neighbor 10.3.3.3 maximum-routes 5000
switch(config-router-bgp)#
```
- This command removes peer group “bgpgroup1” from `running-config`. The group members remain, but all settings that group members inherited from the peer group are removed.

```bash
switch(config-router-bgp)#no neighbor bgpgroup1 peer-group
switch(config-router-bgp)#show active
router bgp 9
bgp log-neighbor-changes
  neighbor 10.1.1.1 maximum-routes 12000
  neighbor 10.2.2.2 maximum-routes 12000
  neighbor 10.3.3.3 maximum-routes 5000
switch(config-router-bgp)#
```
neighbor peer-group (neighbor assignment)

Peer groups allow the user to apply settings to a group of BGP neighbors simultaneously. Once a peer group is created, the group name can be used as a parameter in neighbor configuration commands, and the configuration will be applied to all members of the group. Settings applied to an individual neighbor in the peer group override group settings.

The `neighbor peer-group` command is used to assign BGP neighbors to an existing static peer group. To create a static peer group, use the `neighbor peer-group (create)` command. A neighbor can only belong to one peer group, so issuing this command for a neighbor that is already a member of another group will remove it from that group.

The `no neighbor peer-group` and `default neighbor peer-group` commands remove the specified neighbor from all peer groups. When a neighbor is removed from a peer group, the neighbor retains the configuration inherited from the peer group.

The `no neighbor` command removes all configuration commands for the specified neighbor.

**Command Mode**
Router-BGP Configuration

**Command Syntax**

```
neighbor NEIGHBOR_ADDR peer-group group_name
no neighbor NEIGHBOR_ADDR peer-group
default neighbor NEIGHBOR_ADDR peer-group
```

**Parameters**
- `NEIGHBOR_ADDR` Address of a neighbor being added to peer group. Values include:
  - `ipv4_addr` neighbor’s IPv4 address.
  - `ipv6_addr` neighbor’s IPv6 address.
- `group_name` peer group name.

**Examples**
- These commands create a BGP peer group called bgpgroup1, assign several neighbors to the group, and apply a route map.
  ```
  switch(config)#router bgp 9
  switch(config-router-bgp)#neighbor bgpgroup1 peer-group
  switch(config-router-bgp)#neighbor 10.1.1.1 peer-group bgpgroup1
  switch(config-router-bgp)#neighbor 10.2.2.2 peer-group bgpgroup1
  switch(config-router-bgp)#neighbor 10.3.3.3 peer-group bgpgroup1
  switch(config-router-bgp)#neighbor bgpgroup1 route-map corporate in
  switch(config-router-bgp)#
  ```
- This command removes the neighbor at 1.1.1.1 from the peer group. All settings that neighbor 10.1.1.1 inherited from the peer group are maintained.
  ```
  switch(config-router-bgp)#no neighbor 10.1.1.1 peer-group
  switch(config-router-bgp)#
  ```
neighbor remote-as

The `neighbor remote-as` command configures the expected AS number for a neighbor (peer). This configuration is required to establish a neighbor connection. Internal neighbors have the same AS number; external neighbors have different AS numbers.

**Note**

To establish a BGP session, there must be an IPv4 router ID configured in the same VRF or at least one L3 interface with an IPv4 address in the same VRF. If the VRF contains no L3 interfaces with IPv4 addresses (e.g., in an IPv6-only environment), configure an appropriate router ID using the `router-id` (BGP) command.

The `no neighbor remote-as` command applies the system default for the specified peer or peer group.

The `default neighbor remote-as` command applies the system default for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

The `no neighbor` command removes all configuration commands for the neighbor at the specified address.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID remote-as as_id
no neighbor neighbor_ID remote-as
default neighbor neighbor_ID remote-as
```

**Parameters**

- `neighbor_ID`  neighbor's IPv4 or IPv6 address or peer group name
- `as_id`  Autonomous system (AS) of the peer. Values range from 1 to 4294967295.

**Example**

- This command establishes a BGP connection with the router at 10.4.3.10 in AS 300.

```
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor 10.4.3.10 remote-as 300
switch(config-router-bgp)#
```
neighbor remove-private-as

The `neighbor remove-private-as` command removes private autonomous system numbers from outbound routing updates for external BGP (eBGP) neighbors. When the autonomous system path includes only private autonomous system numbers, the **REMOVAL** parameter specifies how the private autonomous system number is removed.

The `no neighbor remove-private-as` command applies the system default (preserves private AS numbers) for the specified peer.

The `default neighbor remove-private-as` command applies the system default for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

The `no neighbor` command removes all configuration commands for the neighbor at the specified address.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID remove-private-as [REMOVAL]
no neighbor neighbor_ID remove-private-as
default neighbor neighbor_ID remove-private-as
```

**Parameters**

- `neighbor_ID` neighbor’s IPv4 or IPv6 address or peer group name

**REMOVAL** Specifies removal of all private AS numbers when the AS path contains only private AS numbers. Values include:

- `all` removes all private AS numbers from AS path in outbound updates.
- `all replace-as` all private AS numbers in AS path are replaced with router’s local AS number.

**Note**

This command does not support a mix of public and private AS numbers.

**Example**

- These commands program the switch to remove all private AS numbers from outbound routing updates for the eBGP neighbor at 10.5.2.11 only if the AS path does not contain any public AS number.

  ```
  switch(config)#router bgp 9
  switch(config-router-bgp)#neighbor 10.5.2.11 remove-private-as
  switch(config-router-bgp)#
  ```

- This command replaces all private AS numbers in the AS path with the switch’s local AS number.

  ```
  switch(config)#router bgp 9
  switch(config-router-bgp)#neighbor 10.5.2.11 remove-private-as all replace-as
  switch(config-router-bgp)#
  ```
neighbor rib-in pre-policy retain

By default, inbound BGP routes that are filtered out by the import policy are still stored on the switch. Because all routes are retained, this allows policies to be changed without resetting BGP sessions. It also allows the switch to display all advertised routes when the `show ip bgp neighbor advertised-routes` command is issued.

The `no neighbor rib-in pre-policy retain` command configures the switch to discard information about routes received from the specified neighbor or group that fail the import policy.

The `neighbor rib-in pre-policy retain` command restores the system default behavior (retaining routes from the specified neighbor or group regardless of import policy).

The `default neighbor rib-in pre-policy retain` command applies the system default (retaining all routes) for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID rib-in pre-policy retain inbound [SCOPE]
no neighbor neighbor_ID rib-in pre-policy retain inbound
default neighbor neighbor_ID rib-in pre-policy retain inbound
```

**Parameters**

- `neighbor_ID` neighbor's IPv4 or IPv6 address or peer group name
- `SCOPE` determines how routes including the switch’s AS number are handled. Values include:
  - `<no parameter>` routes including the switch’s AS number are discarded.
  - `all` routes including the switch’s AS number are retained.

**Example**

- This command configures the switch to discard information about routes from the neighbor at 10.5.2.23 which are filtered out by the switch’s import policies.

  ```
  switch(config)#router bgp 9
  switch(config-router-bgp)#no neighbor 10.5.2.23 rib-in pre-policy retain inbound
  switch(config-router-bgp)#
  ```
neighbor route-map (BGP)

The `neighbor route-map` command applies a route map to inbound or outbound BGP routes. When a route map is applied to outbound routes, the switch will advertise only routes matching at least one section of the route map. Only one outbound route map and one inbound route map can be applied to a given neighbor. A new route map applied to a neighbor will replace the previous route map.

The command is available in Router-BGP and Router-BGP-Address-Family configuration modes. The mode in which the command is executed determines the scope of the command:

- In Router-BGP mode, the route map is applied to specified neighbor in all peering sessions where it is advertised.
- In Router-BGP-Address-Family mode, the route map is applied to the neighbors only in peering sessions corresponding to the configuration mode address family.

The `no neighbor route-map` command discontinues the application of the specified route map for the specified neighbor and direction. Removing a route map from one direction does not remove it from the other if it has been applied to both.

The `default neighbor route-map` command applies the system default (no route map) for individual neighbors, and applies the peer group's setting for neighbors that are members of a peer group.

Command Mode
- Router-BGP Configuration
- Router-BGP Address-Family Configuration

Command Syntax

```
neighbor neighbor_ID route-map map_name DIRECTION
no neighbor neighbor_ID route-map map_name DIRECTION
default neighbor neighbor_ID route-map map_name DIRECTION
```

Parameters

- `neighbor_ID` neighbor's IPv4 or IPv6 address or peer group name
- `map_name` name of a route map.
- `DIRECTION` routes to which the route map is applied. Options include:
  - `in` route map is applied to inbound routes.
  - `out` route map is applied to outbound routes.

Example

- This command applies a route map named `inner-map` to a BGP inbound route from 10.5.2.11
  
  ```
  switch(config)#router bgp 9
  switch(config-router-bgp)#neighbor 10.5.2.11 route-map inner-map in
  switch(config-router-bgp)#
  ```
neighbor route-reflector-client

Participating BGP routers within an AS communicate eBGP-learned routes to all of their peers, but to prevent routing loops they must not re-advertise iBGP-learned routes within the AS. To ensure that all members of the AS share the same routing information, a fully meshed network topology (in which each member router of the AS is connected to every other member) can be used, but this topology can result in high volumes of iBGP messages when it is scaled. Instead, in larger networks one or more routers can be configured as route reflectors.

A route reflector is configured to re-advertise routes learned through iBGP to a group of BGP neighbors within the AS (its clients), eliminating the need for a fully meshed topology.

The neighbor route-reflector-client command configures the switch to act as a route reflector and configures the specified neighbor as one of its clients. Additional clients are specified by re-issuing the command.

The no neighbor route-reflector-client and default neighbor route-reflector-client commands disable route reflection by deleting the neighbor route-reflector-client command from running-config.

Command Mode
Router-BGP Configuration

Command Syntax
neighbor neighbor_ID route-reflector-client
no neighbor neighbor_ID route-reflector-client
default neighbor neighbor_ID route-reflector-client

Parameters
• neighbor_ID neighbor’s IPv4 or IPv6 address or peer group name

Related Commands
• bgp client-to-client reflection

Example
• This command configures the switch as a route reflector and the neighbor at 10.5.2.1 as one of its clients.
  switch(config)#router bgp 9
  switch(config-router-bgp)#neighbor 10.5.2.11 route-reflector-client
  switch(config-router-bgp)#
neighbor send-community

The **neighbor send-community** command configures the switch to send community attributes to the specified BGP neighbor.

The **no neighbor send-community** command applies the system default (not sending community attributes) for the specified peer.

The **default neighbor send-community** command applies the system default for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
        neighbor neighbor_ID send-community [add | extended | large | link-bandwidth | remove | standard]
        no neighbor neighbor_ID send-community
        default neighbor neighbor_ID send-community
```

**Parameters**

- **neighbor_ID** neighbor’s IPv4 or IPv6 address or peer group name
- **add** adds community attributes to be sent to the specified neighbor
- **extended** sends extended community attribute to the specified neighbor
- **large** sends large community attribute to the specified neighbor
- **link-bandwidth** sends link-bandwidth community attribute to the specified neighbor
- **remove** removes community attributes that are sent to the specified neighbor
- **standard** sends standard community attribute to the specified neighbor

**Examples**

- These commands configure the switch to send community attributes to the neighbor at address 10.5.2.23.
  
  ```
  switch(config)#router bgp 9
  switch(config-router-bgp)#neighbor 10.5.2.23 send-community
  switch(config-router-bgp)#
  ```

- These commands configure the switch to add large community attributes to the neighbor at address 10.5.2.23.
  
  ```
  switch(config)#router bgp 9
  switch(config-router-bgp)#neighbor 10.5.2.23 send-community add large
  switch(config-router-bgp)#
  ```

- These commands configure the switch to remove link-bandwidth community attributes to the neighbor at address 10.5.2.23.
  
  ```
  switch(config)#router bgp 9
  switch(config-router-bgp)#neighbor 10.5.2.23 send-community remove link-bandwidth
  switch(config-router-bgp)#
  ```

- These commands configure the switch to send standard large community attributes to the neighbor at address 10.5.2.23.
  
  ```
  switch(config)#router bgp 9
  switch(config-router-bgp)#neighbor 10.5.2.23 send-community standard large
  switch(config-router-bgp)#
  ```
neighbor shutdown

The **neighbor shutdown** command disables the specified neighbor. Disabling a neighbor also terminates all of its active sessions and removes associated routing information.

The **no neighbor shutdown** command enables the specified peer.

The default neighbor shutdown command enables individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID shutdown
no neighbor neighbor_ID shutdown
default neighbor neighbor_ID shutdown
```

**Parameters**

- `neighbor_ID` neighbor's IPv4 or IPv6 address or peer group name

**Example**

- This command disables the neighbor at 10.5.2.23.

  ```
  switch(config)#router bgp 9
  switch(config-router-bgp)#neighbor 10.5.2.23 shutdown
  switch(config-router-bgp)#
  ```
neighbor timers

The neighbor timers command configures the BGP keepalive and hold times for a specified peer connection. The timers bgp command configures the times on all peer connections for which an individual command is not specified.

- Keepalive time is the period between the transmission of consecutive keepalive messages.
- Hold time is the period the switch waits for a KEEPALIVE or UPDATE message before it disables peering.

The hold time must be at least 3 seconds and should be three times longer than the keepalive setting.
The no neighbor timers command applies the system default for the specified peer or group (the timers specified by the timers bgp command).
The default neighbor timers command applies the system default for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.
The no neighbor command removes all configuration commands for the neighbor at the specified address.

Command Mode
Router-BGP Configuration

Command Syntax

```
neighbor neighbor_ID timers keep_alive hold_time
no neighbor neighbor_ID timers
default neighbor neighbor_ID timers
```

Parameters

- **neighbor_ID** neighbor’s IPv4 or IPv6 address or peer group name
- **keep_alive** keepalive period, in seconds. Values include
  - 0 keepalive messages are not sent
  - 1 to 3600 keepalive time (seconds).
- **hold_time** hold time. Values include
  - 0 peering is not disabled by timeout expiry; keepalive packets are not sent.
  - 3 to 7200 hold time (seconds).

Example

- This command sets the keepalive time to 30 seconds and the hold time to 90 seconds for the connection with the peer at 10.24.15.9.

```
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor 10.24.15.9 timers 30 90
switch(config-router-bgp)#
```
neighbor ttl maximum-hops

The `neighbor ttl maximum-hops` command configures the Generalized TTL Security Mechanism (GTSM) for the specified neighbor(s).

The `no neighbor ttl maximum-hops` command disables the GTSM configuration in the specified neighbor.

The `default neighbor ttl maximum-hops` command applies the system default configuration for individual neighbors; and applies the peer group’s setting for neighbors that are members of a peer group.

**Command-Mode**
Router-BGP Configuration

**Command Syntax**
```
neighbor neighbor_ID ttl maximum-hops n
default neighbor neighbor_ID ttl maximum-hops
no neighbor neighbor_ID ttl maximum-hops
```

**Parameters**
- `neighbor_ID` neighbor's IPv4 or IPv6 address or peer group name
- `n` Maximum count of hops from a BGP peer. The value ranges from 0 to 254.

**Example**
- This command configures the TTL security for 10.20.20.30 with a maximum of 4 hops.
  ```
  switch(config)#router bgp 9
  switch(config-router-bgp)#neighbor 10.20.20.30 ttl maximum-hops 4
  switch(config-router-bgp)#
  ```
neighbor update-source

The **neighbor update-source** command specifies the interface that BGP sessions use for TCP connections. By default, BGP sessions use the neighbor’s closest interface (also known as the best local address).

The **no neighbor update-source** command applies the system default (using best local address for TCP connections) for the specified peer or group.

The default neighbor update-source command applies the system default for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address.

**Command Mode**
- Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID update-source INTERFACE
no neighbor neighbor_ID update-source
default neighbor neighbor_ID update-source
```

**Parameters**
- *neighbor_ID* neighbor’s IPv4 or IPv6 address or peer group name
- **INTERFACE** Interface type and number. Options include:
  - *ethernet e_num* Ethernet interface specified by *e_num*.
  - *loopback l_num* loopback interface specified by *l_num*.
  - *management m_num* management interface specified by *m_num*.
  - *port-channel p_num* port channel interface specified by *p_num*.
  - *vlan v_num* VLAN interface specified by *v_num*.

**Example**
- This command configures the switch to use Ethernet interface 10 for TCP connections for the neighbor at 10.2.2.14.

```
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor 10.2.2.14 update-source ethernet 10
```

2354
neighbor weight

The `neighbor weight` command assigns a weight attribute value to paths from the specified neighbor. Weight is the first parameter that the BGP best-path selection algorithm considers. When multiple paths to a destination prefix exist, the best-path selection algorithm prefers the path with the highest weight. Other attributes are used only when all paths to the prefix have the same weight.

Weight values range from 0 to 65535 and are not propagated to other switches through route updates. The default weight for paths that the router originates is 32768; the default weight for routes received through BGP is 0.

A path's BGP weight is also configurable through route maps. Weight values set through route map commands have precedence over neighbor weight command values.

The `no neighbor weight` command applies the system default (32768 for router-originated paths, 0 for routes received through BGP) for the specified peer or group.

The `default neighbor weight` command applies the system default for individual neighbors, and applies the peer group's setting for neighbors that are members of a peer group.

The `no neighbor` command removes all configuration commands for the neighbor at the specified address.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID weight weight_value
no neighbor neighbor_ID weight
default neighbor neighbor_ID weight
```

**Parameters**

- `neighbor_ID` neighbor's IPv4 or IPv6 address or peer group name
- `weight_value` weight value. Values range from 1 to 65535.

**Example**

- This command specifies a weight of 4000 for all paths from the neighbor at 10.1.2.5

  switch(config)#router bgp 9
  switch(config-router-bgp)#neighbor 10.1.2.5 weight 4000
  switch(config-router-bgp)#

network (BGP)

The `network` command specifies a network for advertisement through UPDATE packets to BGP peers. The configuration zeros the host portion of the specified network address; for example, 192.0.2.4/24 is stored as 192.0.2.0/24. A route map option is available for assigning attributes to the network.

The command is available in Router-BGP and Router-BGP-Address-Family configuration modes. The mode in which the command is issued does not affect the command. The scope of the command depends on the specified network address:

- Commands with an IPv4 address are advertised to peers activated in the IPv4 address family.
- Commands with an IPv6 address are advertised to peers activated in the IPv6 address family.

The `no network` and `default network` commands remove the network from the routing table, preventing its advertisement.

**Command Mode**
- Router-BGP Configuration
- Router-BGP Address-Family Configuration

**Command Syntax**

```
network NET_ADDRESS [ROUTE_MAP]
no network NET_ADDRESS
default network NET_ADDRESS
```

**Parameters**

- **NET_ADDRESS** IP address range. Entry options include:
  - `ipv4_subnet` IPv4 subnet (CIDR notation).
  - `ipv4_addr mask subnet` IPv4 subnet (address-mask notation).
  - `ipv6_prefix` neighbor’s IPv6 prefix (CIDR notation).
- **ROUTE_MAP** specifies route map that assigns attribute values to the network. Options include:
  - `<no parameter>` attributes are not assigned through a route map.
  - `route-map map_name` attributes listed by specified route map are assigned to the network.

**Example**

- This command enables BGP advertising for the network located at 10.1.2.5. The configuration stores the network as 10.1.2.5.

```
switch(config)#router bgp 9
switch(config-router-bgp)#network 10.1.2.5/24
switch(config-router-bgp)#
```
no neighbor

The no neighbor command removes all neighbor configuration commands for the specified neighbor. Commands removed by the no neighbor command include:

- neighbor description
- neighbor ebgp-multihop
- neighbor export-localpref
- neighbor import-localpref
- neighbor local-as
- neighbor maximum-routes
- neighbor next-hop-peer
- neighbor next-hop-self
- neighbor out-delay
- neighbor password
- neighbor peer group (create)
- neighbor peer-group (neighbor assignment)
- neighbor remote-as
- neighbor remove-private-as
- neighbor route-map (BGP)
- neighbor route-reflector-client
- neighbor send-community
- neighbor timers
- neighbor update-source

Neighbor settings can be removed individually; refer to the command description page of the desired command for details. Neighbor settings for a peer group must be removed individually.

Command Mode
Router-BGP Configuration

Command Syntax

no neighbor neighbor_ID
default neighbor neighbor_ID

Parameters
- neighbor_ID neighbor's IPv4 or IPv6 address

Example
- This command removes all neighbor configuration commands for the neighbor at 10.1.1.1.

switch(config)#router bgp 9
switch(config-router-bgp)#no neighbor 10.1.1.1
switch(config-router-bgp)#
**peer-filter**

The *peer-filter* command places the switch in the peer-filter configuration mode and allows to create a peer-filter group. The peer-filter group parameters are defined using the *match as-range* command.

The *no peer-filter* or *default peer-filter* command removes the *peer-filter group* from the running configuration.

**Command Mode**
- Router-BGP Configuration
- Peer-Filter Configuration

**Command Syntax**

```
peer-filter filter_name
```

**Parameters**
- *filter_name*  
  name of the peer filter.

**Example**
- This command places the switch in the peer-filter configuration mode and creates a peer-filter "group1".

```
switch(config-router-bgp)#peer-filter group1
switch(config-peer-filter-group1)#
```
**rd (Router-BGP VRF and VNI Configuration Modes)**

The `rd` command adds a route distinguisher (RD) to VRF and VNI configuration modes. RDs internally identify routes belonging to a VRF or VNI to distinguish overlapping or duplicate IP address ranges. This allows the creation of distinct routes to the same IP address for different VPNs. The RD is a 64-bit number made up of an AS number or IPv4 address followed by a user-selected ID number.

If the switch is not running EVPN, an RD is not required for a VRF or VNI to function. Use `no` or `default` command forms to remove an RD from a VRF or VNI.

**Note**

Legacy RDs that were assigned in VRF Configuration Mode appear in `show vrf` outputs if an RD has not been configured using this command, but they no longer have an effect on the system. RDs assigned in the VNI Configuration Mode are displayed in the output of `show bgp evpn` command.

**Command Modes**

- Router-BGP VRF Configuration
- Router-BGP VNI Configuration

**Command Syntax**

```
rd admin_ID:local_assignment
no rd
default rd
```

**Parameters**

- **admin_ID** An AS number or globally assigned IPv4 address identifying the entity assigning the RD. This should be an IANA-assigned identifying number.
- **local_assignment** A locally assigned number distinguishing the VRF. Values range from 0-65535 if the `admin_ID` is an IPv4 address, or from 0-4,294,967,295 if the `admin_ID` is an AS number. If the `admin_ID` is an AS number, the `local_assignment` can also be entered in the form of an IPv4 address.

**Examples**

- These commands identify the administrator of the VRF called “purple” as AS 530 and assign 12 as its local number.
  ```
  switch(config)#router bgp 50
  switch(config-router-bgp)#vrf purple
  switch(config-router-bgp-vrf-purple)#rd 530:12
  switch(config-router-bgp-vrf-purple)#
  ```
- These commands identify the administrator of the MAC-VRF called “bundle1” as AS 530 and assign 12 as its local number.
  ```
  cvx(config)#router bgp 100
  cvx(config-router-bgp)#vni-aware-bundle bundle1
  cvx(config-macvrf-bundle1)#rd 530:12
  cvx(config-macvrf-bundle1)#
  ```
redistribute (BGP)

The `redistribute` command enables the redistribution of specified routes to the BGP domain.

The `no redistribute` and `default redistribute` commands disable route redistribution from the specified domain by removing the corresponding `redistribute` command from `running-config`.

**Important!** Aggregate routes are redistributed automatically, and their redistribution cannot be disabled.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
redistribute ROUTE_TYPE [ROUTE_MAP]
no redistribute ROUTE_TYPE
default redistribute ROUTE_TYPE
```

**Parameters**

- **ROUTE_TYPE** source from which routes are redistributed. Options include:
  - `connected` routes that are established when IP is enabled on an interface.
  - `match nssa-external` all OSPF NSSA external routes.
  - `match nssa-external 1` type 1 OSPF NSSA external routes.
  - `match nssa-external 2` type 2 OSPF NSSA external routes.
  - `ospf` routes from an OSPF domain.
  - `ospf match external` routes external to the AS, but imported from OSPF.
  - `ospf match internal` OSPF routes that are internal to the AS.
  - `ospf match nssa-external` all OSPF NSSA external routes.
  - `ospf match nssa-external 1` type 1 OSPF NSSA external routes.
  - `ospf match nssa-external 2` type 2 OSPF NSSA external routes.
  - `ospf3` routes from an OSPFv3 domain.
  - `ospf3 match external` routes external to the AS, but imported from OSPFv3.
  - `ospf3 match internal` OSPFv3 routes that are internal to the AS.
  - `rip` routes from a RIP domain.
  - `static` IP static routes.
  - `isis` IS-IS routes. Sub-options include.
    - `level-1` Redistribute IS-IS level-1 routes
    - `level-1-2` Redistribute IS-IS level-1 and level-2 routes
    - `level-2` Redistribute IS-IS level-2 routes
    - `route-map` Route map reference

**Important!** While redistributing IS-IS routes into BGP, Level-1 or Level-2 keyword can be used to selectively redistribute Level-1 routes or Level-2 routes into BGP. The Level-1 or Level-2 keyword is optional and it defaults to Level-2 when not configured.

- **ROUTE_MAP** route map that determines the routes that are redistributed. Options include:
  - `<no parameter>` all routes are redistributed.
• `route-map map_name` only routes in the specified route map are redistributed.

**Example**

- This command redistributes OSPF routes into the BGP domain.
  ```
  switch(config)#router bgp 9
  switch(config-router-bgp)#redistribute ospf
  ```

- These commands redistributes ISIS routes into BGP domain in address-family mode.
  ```
  Switch(config)#router bgp 1
  Switch(config-router-bgp)#address-family ipv4
  Switch(config-router-bgp-af)#redistribute isis level-1 route-map isis-to-bgp-v4
  ```

- These commands redistributes ISIS routes into BGP domain in router-bgp mode.
  ```
  Switch(config)#router bgp 1
  Switch(config-router-bgp)#redistribute isis level-1 route-map isis-to-bgp
  ```
router-id (BGP)

The `router-id` command sets the local router BGP router ID.

When no ID has been specified, the local router ID is set to the following:

- The loopback IP address when a single loopback interface is configured.
- The loopback with the highest IP address when multiple loopback interfaces are configured.
- The highest IP address on a physical interface when no loopback interfaces are configured.

**Important!** The router-id must be specified if the switch has no IPv4 addresses configured.

The `no router-id` and `default router-id` commands remove the `router-id` command from `running-config`.

**Command Mode**

   Router-BGP Configuration

**Command Syntax**

```
router-id  id_num
no router-id [id_num]
default router-id [id_num]
```

**Parameters**

- `id_num` router ID number (32-bit dotted decimal notation).

**Example**

- This command configures the fixed router ID address of 10.10.4.11

```
switch(config)#router bgp 9
switch(config-router-bgp)#router-id 10.10.4.11
switch(config-router-bgp)#
```
router bgp

The `router bgp` command places the switch in router-BGP configuration mode. If BGP was not previously instantiated, this command creates a BGP instance with the specified AS number. Router-BGP configuration mode is not a group change mode; `running-config` is changed immediately after commands are executed. The `exit` command does not affect the configuration.

When a BGP instance exists, the command must include the AS number of the existing BGP instance. Running this command with a different AS number generates an error message.

The `no router bgp` and `default router bgp` commands delete the BGP instance.

Refer to Router-BGP Configuration Mode (Includes Address-Family Mode) (page 2270) for a list of commands available in router-BGP configuration mode.

The `exit` command returns the switch to global configuration mode.

**Command Mode**

Global Configuration

**Command Syntax**

```
router bgp as_id
no router bgp
default router bgp
```

**Parameters**

- `as_id` Autonomous system (AS) number. Values range from 1 to 4294967295.

**Examples**

- This command creates a BGP instance with AS number 64500.
  ```
  switch(config)#router bgp 64500
  switch(config-router-bgp)#
  ```

- This command attempts to open a BGP instance with a different AS number from that of the existing instance. The switch displays an error and stays in global configuration mode.
  ```
  switch(config)#router bgp 64501
  % BGP is already running with AS number 64500
  switch(config)#
  ```

- This command exits BGP configuration mode.
  ```
  switch(config-router-bgp)#exit
  switch(config)#
  ```

- This command deletes the BGP instance.
  ```
  switch(config)#no router bgp
  switch(config)#
  ```
show bgp convergence

The `show bgp convergence` command displays information about the Border Gateway Protocol (BGP) convergence state and other statistics about the BGP instance in the specified VRF or in all VRFs.

**Command Mode**

EXEC

**Command Syntax**

```
show bgp convergence [VRF_INSTANCE]
```

**Parameters**

- `VRF_INSTANCE` specifies VRF instances.
  - `<no parameter>` displays BGP information for the context-active VRF.
  - `vrf vrf_name` displays BGP information for the specified VRF.
  - `vrf all` displays BGP information for all VRFs.
  - `vrf default` displays BGP information for the default VRF.

**Examples**

- This command displays the output when no peers have joined before convergence.
  
  ```
  switch(config-router-bgp)#show bgp convergence
  BGP Convergence information for VRF: default
  Configured convergence timeout: 00:02:30
  Configured convergence slow peer timeout: 00:00:55
  Convergence based update synchronization is enabled
  Last Bgp convergence event : None
  Bgp convergence state : Not Initiated (Waiting for the first peer to join)
  Convergence timer is not running
  Convergence timeout in use: 00:02:30
  Convergence slow peer timeout in use: 00:00:55
  First peer is not up yet
  All the expected peers are up: no
  All IGP protocols have converged: yes
  Outstanding EORs: 0, Outstanding Keepalives: 0
  Pending Peers: 2
  Total Peers: 2
  Established Peers: 0
  Disabled Peers: 0
  Peers that have not converged yet:
  IPv4 peers:
  201.1.1.1 (Session : Connect)
  202.1.1.1 (Session : Connect)
  IPv6 peers:
  None
  ```

This command displays the output when the first peer has joined before convergence.

```
switch#show bgp convergence
BGP Convergence information for VRF: default
Configured convergence timeout: 00:02:30
Configured convergence slow peer timeout: 00:00:55
Convergence based update synchronization is enabled
Last Bgp convergence event 00:00:40 ago
Bgp convergence state: Pending (Waiting for EORs/Keepalives from peer(s) and IGP convergence)
Convergence timer running, will expire in 00:01:50
Convergence timeout in use: 00:02:30
Convergence slow peer timeout in use: 00:00:55
First peer came up 00:00:13 ago
All the expected peers are up: no
All IGP protocols have converged: yes
Outstanding EORs: 0, Outstanding Keepalives: 0
Pending Peers: 1
Total Peers: 2
Established Peers: 1
Disabled Peers: 0
Peers that have not converged yet:
IPv4 peers:
201.1.1.1 (Session: Active)
IPv6 peers:
None
```

This command displays the output when the convergence timeout value is reached.

```
switch(config-router-bgp)#show bgp convergence
BGP Convergence information for VRF: default
Configured convergence timeout: 00:02:30
Configured convergence slow peer timeout: 00:00:55
Convergence based update synchronization is enabled
Last Bgp convergence event 00:02:44 ago
Bgp convergence state: Timeout reached
Time taken to converge 00:02:30
Pending Peers: 1
Total Peers: 2
Established Peers: 1
Disabled Peers: 0
Peers that did not converge before local bgp convergence:
IPv4 peers:
201.1.1.1 (Session: Active)
202.1.1.1 (Session: Established)
IPv6 peers:
None
```
This command displays the output during the converged state.

```bash
switch(config-router-bgp)#show bgp convergence
BGP Convergence information for VRF: default
Configured convergence timeout: 00:05:00
Configured convergence slow peer timeout: 00:01:30
Convergence based update synchronization is enabled
Last Bgp convergence event 00:00:05 ago
Bgp convergence state : Converged
Time taken to converge 00:00:02
First peer came up 00:00:05 ago
Pending Peers: 0
Total Peers: 3
Established Peers: 3
Disabled Peers: 0
Peers that did not converge before local bgp convergence:
IPv4 peers: None
IPv6 peers: None
```
show bgp instance

The `show bgp instance` command displays summary Border Gateway Protocol (BGP) information about the BGP instance in the specified VRF or in all VRFs.

**Command Mode**

EXEC

**Command Syntax**

```
show bgp instance [VRF_INSTANCE]
```

**Parameters**

- `VRF_INSTANCE` specifies VRF instances.
  - `<no parameter>` displays BGP information for the context-active VRF.
  - `vrf vrf_name` displays BGP information for the specified VRF.
  - `vrf all` displays BGP information for all VRFs.
  - `vrf default` displays BGP information for the default VRF.

**Examples**

- This command displays information about the BGP instance in the context-active VRF.

  ```
  switch>show bgp instance
  BGP instance information for VRF purple
  BGP Local AS: 64497, Router ID: 1.2.3.5
  Total peers: 5
  Configured peers: 3
    UnConfigured peers: 2
    Established peers: 3
  Graceful restart helper mode enabled
  End of rib timer timeout: 00:05:00
  BGP Convergence timer is inactive
  BGP Convergence information:
    BGP has converged: no
    Outstanding EORs: 0, Outstanding Keepalives: 0
    Convergence timeout: 00:10:00
  switch>
  ```

- This command displays information about the BGP instance in the default VRF.

  ```
  switch>show bgp instance vrf default
  BGP instance information for VRF default
  BGP Local AS: 64503, Router ID: 1.2.3.5
  Total peers: 1
  Configured peers: 1
    UnConfigured peers: 0
    Established peers: 0
  Graceful restart helper mode enabled
  End of rib timer timeout: 00:05:00
  BGP Convergence timer is inactive
  BGP Convergence information:
    BGP has converged: no
    Outstanding EORs: 0, Outstanding Keepalives: 0
    Convergence timeout: 00:10:00
  switch>
  ```
show ip as-path access-list

The `show ip as-path access-list` command displays BGP filters on the switch. Specifying an access list displays the statements from that access list. Entering the command without parameters displays the statements from all access lists on the switch.

**Command Mode**

EXEC

**Command Syntax**

```plaintext
show ip as-path access-list [list_name]
```

**Parameters**

- `list_name` the name of an AS path access list.

**Example**

- This command displays the contents of the AS path access list named “list1.”

```plaintext
switch>show ip as-path access-list list1
ip as-path access-list list1 deny _3$
ip as-path access-list list1 permit .*
switch>
```
show ip bgp

The `show ip bgp` command displays Border Gateway Protocol (BGP) IPv4 routing table entries. The output format depends on the command parameters:

- Data block format displays comprehensive information for each specified BGP routing table entry.
- Tabular format displays routing table entries for the specified IPv4 addresses.

**Command Mode**
EXEC

**Command Syntax**
```
show ip bgp [FILTER] [VRF_INSTANCE]
```

**Parameters**

- `FILTER` routing table entries that the command displays. Options include:
  - `<no parameter>` displays all routing table entries in tabular format.
  - `detail` displays all routing table entries in data block format.
  - `ipv4_addr` displays IPv4 host address in data block format.
  - `ipv4_prefix` displays the route information of specified IPv4 prefix in data block format.
    Options include:
    - `detail` displays the detailed route information of specified IPv4 prefix in data block format.
    - `longer-prefixes` displays the route information of IPv4 prefix in tabular block format.
    - `longer-prefixes detail` displays the detailed route information of specified IPv4 prefix in data block format.
  - `community-list cmnty_list_name` displays BGP routes filtered by the specified community list.
  - `installed` displays the information of installed BGP routes.
  - `labeled-unicast` displays the information of labeled-unicast BGP routes only.
  - `not-installed` displays the information of BGP routes that are not installed.
- `VRF_INSTANCE` specifies VRF instances.
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Guidelines**
You must provide the IPv4 prefix in CIDR notation.
Examples

- This command displays the BGP routing table with prefix 'L' flag for all BGP LU route entries.

```
switch# show ip bgp
BGP routing table information for VRF default
Router identifier 0.0.0.1, local AS number 100
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e - ECMP
S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop

switch#
```
**show ip bgp community**

The `show ip bgp community` command displays Border Gateway Protocol (BGP) routing table entries, filtered by community.

**Command Mode**

EXEC

**Command Syntax**

```
show ip bgp community COMM_1 [COMM_2... COMM_n] [MATCH_TYPE] [DATA_OPTION] [VRF_INSTANCE]
```

**Parameters**

- `COMM_x` community number or name, as specified in the route map that sets the community list number.
  - `GSHUT` well-known graceful shutdown community.
  - `aa:nn` AS and network number, separated by colon. Each value ranges from 1 to 4294967295.
  - `comm_num` community number. Values range from 1 to 429467040.
  - `internet` advertises route to Internet community.
  - `local-as` advertises route only to local peers.
  - `no-advertise` does not advertise the route to any peer.
  - `no-export` advertises route only within BGP AS boundary.
- `MATCH_TYPE` routes are filtered based on their communities.
  - `<no parameter>` routes must match at least one community in the list
  - `exact` route must match all communities and include no other communities.
  - `regex` display routes matching the regular expression of communities.
- `DATA_OPTION` type of information the command displays. Values include:
  - `<no parameter>` displays table of the routing entry line items.
  - `detail` displays data block for each routing table entry.
- `VRF_INSTANCE` specifies VRF instances.
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Guidelines**

The interpretation of regular expressions is always based on string mode but not on the ACL configuration.
Example

- This command displays the BGP routing table entries with the community 64496:1000.

```
switch#show ip bgp community 64496:1000 detail
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
BGP routing table entry for 10.100.1.0/24
Paths: 1 available
  64496 64497 65536
    10.1.0.100 from 10.1.0.100 (10.0.0.100)
      Origin IGP, metric 0, localpref 100, IGP metric 1, weight 0, received 00:03:16 ago, valid, external, best
      Community: 655323590 64496:1000
      Rx SAFI: Unicast
switch#
```
show ip bgp neighbors

The `show ip bgp neighbors` command displays Border Gateway Protocol (BGP) and TCP session data for a specified IPv4 BGP neighbor, or for all IPv4 BGP neighbors if an address is not included.

Command Mode

EXEC

Command Syntax

`show ip bgp neighbors [NEIGHBOR_ADDR][VRF_INSTANCE]`

Parameters

- **NEIGHBOR_ADDR** location of the neighbors. Options include:
  - `<no parameter>` command displays information for all IPv4 BGP neighbors.
  - `ipv4_addr` command displays information for specified neighbor.
- **VRF_INSTANCE** specifies VRF instances.
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

Related Command

- `show ip bgp neighbors (route type)`
- `show ip bgp neighbors (route-type) community`
Example

- This command displays information of the neighbor at 10.1.0.100.

switch(config)#show ip bgp neighbors 10.1.0.100
BGP neighbor is 10.1.0.100, remote AS 64496, external link

switch(config)#

- This command displays information of the neighbor for IPv4 labeled-unicast capabilities.

switch#show ip bgp neighbors
BGP neighbor is 172.24.77.5, remote AS 100, external link
   BGP version 4, remote router ID 172.24.77.5, VRF default
   ...
   Neighbor Capabilities:
      Multiprotocol IPv4 Unicast: advertised
      Multiprotocol IPv4 Labeled Unicast: advertised and received and negotiated
      Four Octet ASN: advertised and received
      Route Refresh: advertised
      Send End-of-RIB messages: advertised
      Additional-paths Receive:
         IPv4 Unicast: advertised
         IPv4 Labeled Unicast: advertised
   ...
   Inbound updates dropped by reason:
      AS path loop detection: 0
      Enforced First AS: 0
      Malformed MPBGP routes: 0
      Originator ID matches local router ID: 0
      Nexthop matches local IP address: 0
      Unexpected IPv6 nexthop for IPv4 routes: 0
   Inbound paths dropped by reason:
      IPv4 labeled-unicast NLRIs dropped due to excessive labels: 0
show ip bgp neighbors (route type)

The `show ip bgp neighbors (route type)` command displays information for next hop routes to a specified IPv4 neighbor. The `show ip bgp neighbors (route-type) community` command displays the same information for routes filtered by communities.

The output format depends on the selected `FILTER` parameter:

- Data block format displays comprehensive information for each specified route.
- Tabular format displays routing table entries in tabular format for the specified IP addresses.

Commands that do not include a route type revert to the `show ip bgp neighbors` command.

**Command Mode**
EXEC

**Command Syntax**
```
show ip bgp neighbors neighbor_addr [HOPDIRECT [FILTER] [VRF_INSTANCE]]
show ip bgp neighbors neighbor_addr [ROUTE_TYPE] HOPDIRECT
show ip bgp neighbors neighbor_addr [ROUTE_TYPE] HOPDIRECT detail
```

**Related Command**
- `show ip bgp neighbors`
- `show ip bgp neighbors (route-type) community`

**Parameters**
- `neighbor_addr` location of the neighbor.
- `ROUTE_TYPE` filters route on route type. Options include:
  - `ipv4 unicast` displays IPv4 unicast routes.
  - `ipv6 unicast` displays IPv6 unicast routes.
- `HOPDIRECT` filters route on the basis of direction from neighbor. Options include:
  - `advertised-routes` displays routes advertised to the specified neighbor.
  - `received-routes` displays routes received from the specified neighbor (accepted and rejected).
  - `routes` displays routes received and accepted from specified neighbor.
- `FILTER` routing table entries that the command displays. Values include:
  - `<no parameter>` displays all routing table entries. Tabular format.
  - `detail` displays all routing table entries. Data block format.
  - `ipv4_addr` displays IPv4 host address in data block format.
  - `ipv4_prefix` displays the route information of specified IPv4 prefix in data block format. Option includes:
    - `longer-prefixes` displays the route information of IPv4 prefix in tabular block format.
- `VRF_INSTANCE` specifies VRF instances.
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.
Example

- This command displays information for routes advertised to the neighbor at 10.3.0.103.

```
switch#show ip bgp neighbors 10.3.0.103 advertised-routes
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e - ECMP
S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop

```

switch#
**show ip bgp neighbors (route-type) community**

The `show ip bgp neighbors (route type) community` command displays information for next hop routes to a specified neighbor. Routes are filtered by community.

The `show ip bgp neighbors (route type)` command displays the same information for routes filtered by IP addresses and subnets.

**Command Mode**

EXEC

**Command Syntax**

```
show ip bgp neighbors addr RTE community CM_1 [CM_2...CM_n] [MATCH] [INFO] [VRF_INST]
```

**Related Command**

- `show ip bgp neighbors`
- `show ip bgp neighbors (route type)`

**Parameters**

- `addr` location of the neighbor.
- `RTE` type of route that the command displays. Options include:
  - `advertised-routes` displays routes advertised to the specified neighbor.
  - `received-routes` displays routes received from the specified neighbor (accepted and rejected).
  - `routes` displays routes received and accepted from specified neighbor.
- `CM_x` community number or name, as specified in the route map that sets the community list number. The command must list at least one of the following community identifiers:
  - `GSHUT` well-known graceful shutdown community.
  - `aa:nn` AS and network number, separated by colon. Each value ranges from 1 to 4294967295.
  - `comm_num` community number. Values range from 1 to 4294967040.
  - `internet` advertises route to Internet community.
  - `local-as` advertises route only to local peers.
  - `no-advertise` does not advertise route to any peer.
  - `no-export` advertises route only within BGP AS boundary.
- `MATCH` Routes are filtered based on their communities.
  - `<no parameter>` routes must match at least one community in the list
  - `exact` route must match all communities and include no other communities.
- `INFO` Type of information the command displays. Values include:
  - `<no parameter>` Displays table of routing entry line items.
  - `detail` Displays data block for each routing table entry.
- `VRF_INST` specifies VRF instances.
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
• **vrf default** displays routing table for default VRF.

**Example**

• This command lists the routes advertised to the neighbor at 10.3.0.103 with community 655:23590.

```text
switch#show ip bgp neighbors 10.3.0.103 advertised-routes community 655:23590
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e - ECMP
S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop

```

switch#
**show ip bgp neighbors regexp**

The `show ip bgp neighbors regexp` command displays information for next hop routes to a specified IPv4 neighbor that match the AS path attributes specified in the given regular expression.

**Command Mode**

EXEC

**Command Syntax**

```
show ip bgp neighbors addr RTE regexp as_paths [VRF_INST]
```

**Related Command**

- `show ip bgp neighbors`
- `show ip bgp neighbors (route type)`

**Parameters**

- `addr` location of the neighbor.
- `RTE` type of route that the command displays. Options include:
  - `advertised-routes` displays routes advertised to the specified neighbor.
  - `received-routes` displays routes received from the specified neighbor (accepted and rejected).
  - `routes` displays routes received and accepted from specified neighbor.
- `as_paths` list of AS paths, formatted as a regular expression. Regular expressions are pattern matching strings that are composed of text characters and operators.
- `VRF_INST` specifies VRF instances.
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Example**

- This command lists the routes advertised to the neighbor at 10.3.0.103 where the AS path is 64496.

```
switch#show ip bgp neighbors 10.3.0.103 advertised-routes regex ^64496$
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e - ECMP
S - Stale, c - Contributing to ECMP, b - backup, L = labeled-unicast
% - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST -Cluster List, LL Nexthop - Link Local Nexthop

<table>

</tr>
</tbody>
</table>
```

switch#
**show ip bgp paths**

The `show ip bgp paths` command displays all BGP AS paths in the database.

**Command Mode**

EXEC

**Command Syntax**

```
show ip bgp paths [VRF_INSTANCE]
```

**Parameters**

- **VRF_INSTANCE** specifies VRF instances.
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Display Values**

- **Refcount**: Number of routes using a listed path.
- **Metric**: The path’s Multi Exit Discriminator (MED).
- **Path**: The route’s AS path and its origin code.

The MED (the path’s external metric) provides information to external neighbors about the preferred path into an AS that has multiple entry points. Lower MED values are preferred.

**Example**

- This command displays all BGP AS paths in the switch’s database.

```
switch#show ip bgp paths
Refcount Metric     Path
6        0          64510 64505 64506 64507 i (HashID 9)
6        0          64510 ? (HashID 8)
12       0          65530 65531 65532 e (HashID 5)
12       0          i (HashID 6)
6        0          64100 64200 i (HashID 4)
28       0          i (HashID 1)
7        0          ? (HashID 2)
40       0          64510 i (HashID 10)
19       0          64510 i (HashID 7)
2        0          i (HashID 3)
switch#
```
The `show ip bgp peer-group` command displays the BGP version, address family and group members for all BGP peer groups defined on the switch.

**Command Mode**

EXEC

**Command Syntax**

```
show ip bgp peer-group [GROUP][VRF_INSTANCE]
```

**Parameters**

- **GROUP** peer group for which command displays information. Options include:
  - `<no parameter>` command displays information for all peer groups.
  - `group_name` name of peer group for which command displays information.
- **VRF_INSTANCE** specifies VRF instances.
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Example**

- This command displays BGP peer group information for all peer groups on the switch.

  ```
  switch#show ip bgp peer-group
  BGP peer-group is EXTERNAL
  BGP version 4
  Static peer-group members:
  VRF default:
    10.1.0.100, state: Connect
    Negotiated MP Capabilities:
    IPv4 Unicast: No
    IPv6 Unicast: No
    IPv4 SR-TE: No
    IPv6 SR-TE: No
  10.2.0.101, state: Connect
    Negotiated MP Capabilities:
    IPv4 Unicast: No
    IPv6 Unicast: No
    IPv4 SR-TE: No
    IPv6 SR-TE: No
  BGP peer-group is INTERNAL
  BGP version 4
  Listen-range subnets:
  VRF default:
    10.3.0.0/24, remote AS 64500
  Dynamic peer-group members:
  VRF default:
  switch#
  ```
show ip bgp regexp

The `show ip bgp regexp` command displays Border Gateway Protocol (BGP) IPv4 routing table entries that match the AS path attributes specified in the given regular expression.

**Command Mode**
EXEC

**Command Syntax**
```
show ip bgp regexp as_paths [VRF_INSTANCE]
```

**Parameters**
- `as_paths` list of AS paths, formatted as a regular expression. Regular expressions are pattern matching strings that are composed of text characters and operators.
- `VRF_INSTANCE` specifies the VRF instance of the BGP routing table to be displayed.
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Example**
- This command displays information about the BGP IPv4 routes in the context-active VRF where the AS path is 64510.

```
switch#show ip bgp regex ^64510$
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e - ECMP S - Stale, c - Contributing to ECMP, b - backup, L = labeled-unicast
% - Pending BGP convergence

switch#
show ip bgp summary

The **show ip bgp summary** command displays the summary of all IPv4 and IPv6 BGP neighbors based on exchanged Address Family Identifiers (AFI) and Subsequent Address Family Identifiers (SAFI) negotiations where AFI is ‘IP’ and SAFI is ‘unicast’ information.

**Command Mode**

EXEC

**Command Syntax**

```
show ip bgp summary [VRF_INSTANCE]
```

**Parameters**

- **VRF_INSTANCE** specifies VRF instances.
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Display Values**

**Header Row**

- **BGP router identifier**: The router identifier – loopback address or highest IP address.
- **Local AS Number**: AS number assigned to switch

**Neighbor Table Columns**

- **(First) Neighbor**: Neighbor’s IP address.
- **(Second) V**: BGP version number.
- **(Third) AS**: Neighbor’s AS number.
- **(Fourth) MsgRcvd**: Messages received from the neighbor.
- **(Fifth) MsgSent**: Messages sent to neighbor.
- **(Sixth) InQ**: Messages queued from neighbor.
- **(Seventh) OutQ**: Messages queued to send neighbor.
- **(Eighth) Up/Down**: Period the BGP session has been Established, or its current status.
- **(Ninth) State**: State of the BGP session and the number of routes received from a neighbor.

After the maximum number of routes are received, the ninth field displays `PfxRcd`, and the connection becomes Idle. Maximum number of routes is set using the `maximum paths (BGP)` command.

**Related Commands**

- `show ipv6 bgp summary`

**Example**

- This command displays the status of the switch’s BGP connections.

```
switch#show ip bgp summary
BGP summary information for VRF default
Router identifier 10.0.0.102, local AS number 64500
Neighbor Status Codes: m = Under maintenance

Neighbor     V  AS  MsgRcvd  MsgSent  InQ  OutQ  Up/Down State  PfxRcd  PfxAcc
10.1.0.100     4 64496      1075      1083    0    0  00:04:04 Connect
10.2.0.101     4 64510      1079      1088    0    0  00:04:14 Connect
switch#
```
show ip community-list

The `show ip community-list` command displays the BGP community lists configured on the switch.

**Command Mode**

EXEC

**Command Syntax**

```
show ip community-list [COMMUNITY_LIST]
```

**Parameters**

- `COMMUNITY_LIST` community list for which command displays information.
- `<no parameter>` command displays information for all community lists.
- `listname` name of the community list (text string).

**Example**

- This command displays the BGP paths in the switch’s database.

```
switch>show ip community-list hs-comm-list
ip community-list hs-comm-list permit 0:10
switch>
```
show ip extcommunity-list

The `show ip extcommunity-list` command displays the BGP extended community lists configured on the switch.

**Command Mode**
EXEC

**Command Syntax**
```
show ip extcommunity-list [COMMUNITY_LIST]
```

**Parameters**
- `COMMUNITY_LIST` extended community list for which command displays information.
- `<no parameter>` command displays information for all extended community lists.
- `listname` name of the extended community list (text string).

**Example**
- This command displays the extended extcommunity lists on the switch.
```
switch>show ip extcommunity-list
ip extcommunity-list hs-extcomm-list permit rt 3050:20
ip extcommunity-list hs-extcomm-list permit soo 172.17.52.2:30
ip extcommunity-list hs-extcomm-list permit rt 3050:70000
switch>
```
show ipv6 bgp

The **show ipv6 bgp** command displays IPv6 Border Gateway Protocol (BGP) routing table entries. The output format depends on the command parameters:

- Data block format displays comprehensive information for each specified BGP routing table entry.
- Tabular format displays routing table entries for specified IPv6 addresses.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 bgp [FILTER][VRF_INSTANCE]
```

**Parameters**

- **FILTER** routing table entries that the command displays. Options include:
  - `<no parameter>` displays all routing table entries in tabular format.
  - `detail` displays all routing table entries in data block format.
  - `ipv6_addr` displays IPv6 host address in data block format.
  - `ipv6_prefix` displays the route information of specified IPv6 prefix address in data block format. Options include:
    - `detail` displays the detailed route information of specified IPv6 prefix address in data block format.
    - `longer-prefixes` displays the route information of IPv6 prefix in tabular block format.
    - `longer-prefixes detail` displays the detailed route information of specified IPv6 prefix in data block format.
  - `community-list cmnty_list_name` displays BGP routes filtered by the specified community list.
  - `installed` displays the information of installed BGP routes.
  - `labeled-unicast` displays the information of labeled-unicast BGP routes only.
  - `not-installed` displays the information of BGP routes that are not installed.
- **VRF_INSTANCE** specifies VRF instances. Options include:
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Guidelines**

You must provide the IPv6 prefix in CIDR notation.

**Related Command**

- **show ip bgp**
Examples

- This command displays the route information of 2001:10:1:0::102/64 in data block format.

```
switch#show ipv6 bgp 2001:10:1:0::102/64
BGP routing table information for VRF default

    Rx SAFI: Unicast
switch#
```
show ipv6 bgp match community

The `show ipv6 bgp match community` command displays IPv6 Border Gateway Protocol (BGP) routing table entries, filtered by community.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 bgp match community [COMM_1 ... COMM_n][MATCH_TYPE][INFO][VRF_INSTANCE]
```

**Parameters**

- **COMM_x** community number or name, as specified in the route map that sets the community list number. Options include:
  - `aa:nn` AS and network number, separated by colon. Each value ranges from 1 to 4294967295.
  - `comm_num` community number. Values range from 1 to 4294967040.
  - `internet` advertises route to Internet community.
  - `local-as` advertises route only to local peers.
  - `no-advertise` does not advertise route to any peer.
  - `no-export` advertises route only within BGP AS boundary.

- **MATCH_TYPE** routes are filtered based on their communities. Options include:
  - `<no parameter>` routes must match at least one community in the list.
  - `exact` route must match all communities and include no other communities.

- **INFO** type of information the command displays. Values include:
  - `<no parameter>` displays table of the routing entry line items.
  - `detail` displays data block for each routing table entry.

- **VRF_INSTANCE** specifies VRF instances. Options include:
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Example**

This command displays data block for each routing table entry with community 655:23590.

```
switch(config)# show ipv6 bgp match community 655:23590 detail
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
BGP routing table entry for 2001:10:100:1::/64
Paths: 1 available
64496 64497 65536
2001:10:1::100 from 2001:10:1::100 (10.0.0.100)
Origin IGP, metric 0, localpref 100, IGP metric 1, weight 0, received 01:09:29 ago, valid, external, best
Community: 655:23590 64496:1000
Rx SAFI: Unicast
switch(config)#
```
show ipv6 bgp peers

The `show ipv6 bgp peers` command displays IPv6 Border Gateway Protocol (BGP) and TCP session data for a specified neighbor. Command displays data for all neighbors if an address is not included.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 bgp peers [NEIGHBOR_ADDR] [VRF_INSTANCE]
```

**Parameters**

- **NEIGHBOR_ADDR** location of the neighbors. Options include:
  - `<no parameter>` command displays information for all neighbors.
  - `ipv6_addr` command displays information for specified neighbor.

- **VRF_INSTANCE** specifies VRF instances. Options include:
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Related Commands**

- `show ip bgp peer-group`
Example

- This command displays information of the neighbor at 2001:10:1:0::100.

```plaintext
switch>show ipv6 bgp peers 2001:10:1:0::100

BGP neighbor is 2001:10:1::100, remote AS 64496, external link
BGP version 4, remote router ID 10.0.0.100, VRF default
Inherits configuration from and member of peer-group EXTERNAL
Negotiated BGP version 4
Member of update group 3
Last read 00:00:01, last write 00:00:01
Hold time is 180, keepalive interval is 60 seconds
Configured hold time is 180, keepalive interval is 60 seconds
Connect timer is inactive
Idle-restart timer is inactive
BGP state is Established, up for 00:12:01
Number of transitions to established: 1
Last state was OpenConfirm
Last event was RecvKeepAlive
Neighbor Capabilities:
  Multiprotocol IPv6 Unicast: advertised and received and negotiated
  Four Octet ASN: advertised and received and negotiated
  Route Refresh: advertised and received and negotiated
  Send End-of-RIB messages: advertised and received and negotiated
  Additional-paths recv capability:
    IPv6 Unicast: advertised
  Additional-paths send capability:
    IPv6 Unicast: received
Restart timer is inactive
End of rib timer is inactive
Message Statistics:
  InQ depth is 0
  OutQ depth is 0

switch>
show ipv6 bgp peers (route type)

The `show ipv6 bgp peers (route type)` command displays information about the routes either advertised to or received from a specified IPv6 BGP neighbor. The `show ipv6 bgp peers (route type) community` command displays the same information for routes filtered by communities. Commands that do not include a route type revert to the `show ipv6 bgp peers` command.

The output format depends on the selected `FILTER` parameter:

- Data block format displays comprehensive information for each specified route.
- Tabular format displays routing table entries in tabular format for the specified IP addresses.

Output produced by the `longer-prefixes` option includes the specified route and all more specific routes.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 bgp peers neighbor_addr HOPDIRECT [FILTER] [VRF_INSTANCE]
show ipv6 bgp peers neighbor_addr [ROUTE_TYPE] HOPDIRECT
show ipv6 bgp peers neighbor_addr [ROUTE_TYPE] HOPDIRECT detail
```

**Parameters**

- `neighbor_addr` location of the neighbor.
- `ROUTE_TYPE` filters route on route type. Options include:
  - `ipv4 unicast` displays IPv4 unicast routes.
  - `ipv6 unicast` displays IPv6 unicast routes.
- `HOPDIRECT` filters route on the basis of direction from neighbor. Options include:
  - `advertised-routes` displays routes advertised to the specified neighbor.
  - `received-routes` displays routes received from the specified neighbor (accepted and rejected).
  - `routes` displays routes received and accepted from specified neighbor.
- `FILTER` routing table entries that the command displays. Values include:
  - `<no parameter>` displays all routing table entries. Tabular format.
  - `detail` displays all routing table entries. Data block format.
  - `ipv6_addr` displays the IPv6 host address in data block format.
  - `ipv6_prefix` displays the route information of specified IPv6 prefix in data block format. Option includes:
    - `longer-prefixes` displays the route information of IPv4 prefix in tabular block format.
- `VRF_INSTANCE` specifies VRF instances. Options include:
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Related Commands**

- `show ipv6 bgp peers (route type) community`
Example

- This command displays information of all routes advertised to the neighbor at 2001:10:1:0::100.

```
switch#show ipv6 bgp peers 2001:10:1:0::100 advertised-routes
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e - ECMP
$ - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop

```

switch#
show ipv6 bgp peers (route type) community

The `show ipv6 bgp peers (route type) community` command displays information about the routes either advertised to or received from a specified IPv6 BGP neighbor. The routes are filtered by community.

The `show ipv6 bgp peers (route type)` command displays the same information for routes filtered by IP addresses and prefixes.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 bgp peers adr RTE community CM_1 [CM_2..CM_n][MATCH][INFO][VRF_INST]
```

**Parameters**

- `adr` Neighbor location (IPv6 address).
- `RTE` type of route that the command displays. Options include:
  - `advertised-routes` displays routes advertised to the specified neighbor.
  - `received-routes` displays routes received from the specified neighbor (accepted and rejected).
  - `routes` displays routes received and accepted from specified neighbor.
- `CM_x` community number or name, as specified in the route map that sets the community list number. The command must list at least one of the following community identifiers:
  - `GSHUT` well-known graceful shutdown community.
  - `aa:nn` AS and network number, separated by colon. Each value ranges from 1 to 4294967295.
  - `comm_num` community number. Values range from 1 to 4294967040.
  - `internet` advertises route to Internet community.
  - `local-as` advertises route only to local peers.
  - `no-advertise` does not advertise route to any peer.
  - `no-export` advertises route only within BGP AS boundary.
- `MATCH` Routes are filtered based on their communities. Options include:
  - `<no parameter>` routes must match at least one community in the list
  - `exact` route must match all communities and include no other communities.
- `INFO` Type of information the command displays. Values include:
  - `<no parameter>` Displays table of the routing entry line items.
  - `detail` Displays data block for each routing table entry.
- `VRF_INST` specifies VRF instances. Options include:
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Related Commands**

- `show ipv6 bgp peers`
Example

- This command lists the routes advertised to the neighbor at 2001:10:1:0::102 with the community 64496:1000.

```
switch>show ipv6 bgp peers 2001:10:1:0::102 advertised-routes community 64496:1000
BGP routing table information for VRF default
Router identifier 10.0.0.100, local AS number 64496
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e - ECMP
S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop

* >     2001:10:100:1::/64     2001:10:1::100        -       -       -       64496 64497 65536 i
```

switch>
show ipv6 bgp peers regexp

The `show ipv6 bgp peers regexp` command displays information about routes (advertised or received) from a specified IPv6 neighbor that match the AS path attributes specified in the given regular expression.

**Command Mode**
EXEC

**Command Syntax**
```
show ipv6 bgp peers addr RTE regexp as_paths [VRF_INST]
```

**Parameters**
- `addr` Neighbor location (IPv6 address).
- `RTE` type of route that the command displays. Options include:
  - `advertised-routes` displays routes advertised to the specified neighbor.
  - `received-routes` displays routes received from the specified neighbor (accepted and rejected).
  - `routes` displays routes received and accepted from specified neighbor.
- `as_paths` list of AS paths, formatted as a regular expression. Regular expressions are pattern matching strings that are composed of text characters and operators.
- `VRF_INST` specifies VRF instances. Options include:
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Related Command**
- `show ip bgp regexp`
- `show ipv6 bgp peers`

**Examples**
- This command displays information of routes received from the neighbor at 2001:10:1:0::100 which include AS number 64496 in their AS paths.

```
switch> show ipv6 bgp peers 2001:10:1:0::100 received-routes regex 64496
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e - ECMP
S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop

switch>
```
**show ipv6 bgp regexp**

The `show ipv6 bgp regexp` command displays Border Gateway Protocol (BGP) IPv6 routing table entries that match the AS path attributes specified in the given regular expression.

**Command Mode**
EXEC

**Command Syntax**
```
show ipv6 bgp regexp as_paths [VRF_INSTANCE]
```

**Parameters**
- `as_paths` list of AS paths, formatted as a regular expression. Regular expressions are pattern matching strings that are composed of text characters and operators.
- `VRF_INSTANCE` specifies the VRF instance of the BGP routing table to be displayed. Options include:
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Related Command**
- `show ip bgp regexp`

**Examples**
- This command displays information about the BGP IPv6 routes in the context-active VRF that pass through AS 64496.

```
switch>show ipv6 bgp regexp _64496_
BGP routing table information for VRF default
 Router identifier 10.0.0.102, local AS number 64500
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e - ECMP
S - Stale, c - Contributing to ECMP, b - backup, L = labeled-unicast
% - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST -Cluster List, LL Nexthop - Link Local Nexthop

```

switch>
show ipv6 bgp summary

The `show ipv6 bgp summary` command displays the summary of all IPv4 and IPv6 BGP neighbors based on exchanged Address Family Identifiers (AFI) and Subsequent Address Family Identifiers (SAFI) negotiations where AFI is ‘IPv6’ and SAFI is ‘Unicast’ information.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 bgp summary [VRF_INSTANCE]
```

**Parameters**

- **VRF_INSTANCE** specifies VRF instances. Options include:
  - <no parameter> displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Display Values**

**Header Row**

- **BGP router identifier**: The router identifier - loopback address or highest IP address.
- **Local AS Number**: AS number assigned to switch.

**Neighbor Table Columns**

- **(First) Neighbor**: Neighbor's IP address.
- **(Second) V**: BGP version number.
- **(Third) AS**: Neighbor's AS number.
- **(Fourth) MsgRcvd**: Messages received from the neighbor.
- **(Fifth) MsgSent**: Messages sent to neighbor.
- **(Sixth) InQ**: Messages queued from neighbor.
- **(Seventh) OutQ**: Messages queued to send neighbor.
- **(Eighth) Up/Down**: Period the BGP session has been Established, or its current status.
- **(Ninth) State**: State of the BGP session and the number of routes received from a neighbor.
- **(Tenth) PfxRcd**: The count of prefixes received by BGP per neighbor.
- **(Eleventh) PfxAcc**: The count of prefixes added to the BGP RIB among all received prefixes.

**Related Commands**

- `show ip bgp summary`

**Example**

- This command displays the status of the switch’s BGP connections.

```
switch>show ipv6 bgp summary
BGP summary information for VRF default
Router identifier 10.0.0.102, local AS number 64500
Neighbor Status Codes: m - Under maintenance
Neighbor         V  AS           MsgRcvd   MsgSent  InQ OutQ  Up/Down State   PfxRcd PfxAcc
2001:10:1::100   4  64496             37        36    0    0 00:29:33 Estab   4      4
2001:10:2::101   4  64510             35        38    0    0 00:29:37 Estab   4      4
switch>
```
show peer-filter

The `show peer-filter` command displays the definition of a peer filter.

**Command Mode**
EXEC

**Command Syntax**
```
show peer-filter filter_name
```

**Parameters**
- `filter_name`: name of the peer filter group.

**Example**
- This command displays the peer-filter group information.
```
switch#show peer-filter group3
peer-filter group3
  10 match as-range 65003 result accept
  20 match as-range 65007 result accept
  30 match as-range 65009 result accept
```
shutdown (BGP)

The `shutdown` command disables BGP on the switch without modifying the BGP configuration. The `no shutdown` and `default shutdown` commands enable the BGP instance by removing the `shutdown` command from `running-config`.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
shutdown
no shutdown
default shutdown
```

**Examples**

- This command disables BGP on the switch.
  ```
  switch(config)#router bgp 9
  switch(config-router-bgp)#shutdown
  switch(config-router-bgp)#
  ```

- This command enables BGP on the switch.
  ```
  switch(config)#router bgp 9
  switch(config-router-bgp)#no shutdown
  switch(config-router-bgp)#
  ```
**timers bgp**

The `timers bgp` command configures the BGP keepalive and hold times. Timer settings apply to each peer connection. The `neighbor timers` command configures the times on a specified peer connection.

- Keepalive time: period between the transmission of consecutive keepalive messages.
- Hold time: period the switch waits for a keepalive or UPDATE message before it disables peering.

The hold time must be at least 3 seconds and should be three times longer than the keepalive setting.

The `no timers bgp` and `default timers bgp` commands return the time settings to their default values by removing the `timers bgp` command from `running-config`.

- keepalive: 60 seconds
- hold time: 180 seconds

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
timers bgp keep_alive hold_time
no timers bgp
default timers bgp
```

**Parameters**

- `keep_alive` keepalive period, in seconds. Values include
  - 0 keepalive messages are not sent
  - 1 to 3600 keepalive time (seconds).
- `hold_time` hold time. Values include
  - 0 peering is not disabled by timeout expiry; keepalive packets are not sent.
  - 3 to 7200 hold time (seconds).

**Example**

- This command sets the keepalive time to 30 seconds and the hold time to 90 seconds.

```
switch(config)#router bgp 9
switch(config-router-bgp)#timers bgp 30 90
switch(config-router-bgp)#
```
update wait-for-convergence

The **update wait-for-convergence** command disables FIB update and route advertisement when the BGP instance is initiated until the BGP convergence state is reached.

The **no update wait-for-convergence** command allows FIB update and route advertisement irrespective of the BGP convergence state.

**Command Mode**
- Router-BGP Configuration

**Command Syntax**
- `update wait-for-convergence`
- `no update wait-for-convergence`
- `default update wait-for-convergence`

**Related Commands**
- `clear ip bgp` removes learned BGP routes from the routing table, reads all routes from designated peers, and sends routes to those peers as required.
- `bgp convergence slow-peer time` configures the BGP convergence idle peer timeout value.
- `bgp convergence time` configures the BGP convergence timeout value.
- `show bgp convergence` displays information about the BGP convergence state; and other statistics about the BGP instance in either the specified VRF or all VRFs.

**Guidelines**
The initiation of BGP instance includes the following scenarios:
- The BGP instance starts for the first time after a switch is reloaded
- The BGP instance restarts
- All sessions are cleared by using the `clear ip bgp *` command

Configuration changes made by using this command are effective from the next initiation of BGP instance.

**Example**
- This command disables FIB update and route advertisement when the BGP instance is initiated until the BGP convergence state is reached.

```
switch(config)#router bgp 9
switch(config-router-bgp)#update wait-for-convergence
switch(config-router-bgp)#
```
vrf

The `vrf` command places the switch in BGP VRF configuration mode for the specified VRF. Commands issued in this mode will override global BGP configuration for the specified VRF.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```plaintext
vrf vrf_instance
```

**Parameters**

- `vrf_instance` VRF to be configured.

**Example**

- These commands place the switch in BGP VRF configuration mode for VRF “purple.”

```plaintext
switch(config)#router bgp 9
switch(config-router-bgp)#vrf purple
switch(config-router-bgp-vrf-purple)#
```
34.1 RIP Conceptual Overview

Routing Information Protocol (RIP) is a routing protocol typically used as an interior gateway protocol (IGP). RIP uses hop counts only to determine the shortest path to a destination. To avoid loops, RIP limits its paths to a maximum of 15 hops, making it an ineffective protocol for large networks. RIP Version 2 supports Classless Inter-Domain Routing (CIDR) and uses IP multicast at address 224.0.0.9 to share the routing table with adjacent routers.

RIP sends updates whenever there is a change in the network topology and periodic updates when there are no changes. Receiving switches update their routing table whenever the update includes topology changes. Because RIP transmits the entire routing table every 30 seconds, RIP updates can generate heavy traffic loads in large or complicated networks.

Each switch also sends a list of distance-vectors to each of its neighbors periodically. The distance-vector is the metric RIP uses to express the cost of a route, and it describes the number of hops required to reach a destination. Each hop is typically assigned a hop count value of 1, and the router adds 1 to the metric when it receives a routing update and adds the network to its routing table.

To remove dead routes from its routing table, RIP marks a route for deletion if the router does not receive an advertisement for it within the expiration interval, then removes it from the routing table after the deletion interval.
34.2 Running RIP on the Switch

34.2.1 Accessing RIP Configuration Mode and Enabling RIP

34.2.1.1 RIP Configuration Mode

The `router rip` command places the switch in router-RIP configuration mode to configure the Routing Information Protocol (RIP) routing.

**Example**

- This command places the switch in router-rip configuration mode.

```
switch(config)#router rip
switch(config-router-rip)#
```

Using the `router rip` command puts the switch in router-RIP configuration mode, but does not enable RIP on the switch.

34.2.1.2 Enabling RIP

Routing Information Protocol (RIP) is disabled on the switch by default. The `no shutdown (RIP)` command in router-RIP configuration mode will enable RIP.

**Example**

- This command enables RIP on the switch.

```
switch(config-router-rip)#no shutdown
switch(config-router-rip)#
```

Issuing this command enables RIP, but to send and receive RIP route updates and to route packets via RIP you must also specify interfaces on which RIP will run by using the `network (RIP)` command.

34.2.1.3 Disabling RIP

You can disable RIP in two ways. The `shutdown (RIP)` command disables RIP on the switch but maintains all user-entered router-RIP configuration statements in the `running-config`. The `no router rip` command disables RIP and removes all user-entered router-RIP configuration statements from the `running-config`.

**Examples**

- This command disables RIP on the switch and removes all user-entered router-RIP configuration.

```
switch(config)#no router rip
switch(config)#
```

- This command disables RIP on the switch, but preserves all user-entered router-RIP configuration.

```
switch(config-router-rip)#shutdown
switch(config-router-rip)#
```

34.2.2 Configuring RIP

Issuing the `no shutdown (RIP)` command in router-RIP configuration mode enables RIP, but to run RIP on an interface you must specify a RIP network by using the `network (RIP)` command.

You can also configure the redistribution of routes learned from other protocols, set the default metric and administrative distance for redistributed routes, configure the timing of various RIP events, and configure specific interfaces to send RIP update packets by broadcast instead of multicast.
34.2.2.1 Specifying RIP Networks

The network (RIP) command identifies networks on which RIP will run and also specifies which routes RIP will accept into its routing table. You can issue the network (RIP) command multiple times to build up a list of RIP networks. No RIP networks are configured by default, so in order to route packets and send and receive RIP updates you must specify one or more RIP networks.

To disable RIP on a specific network, use the no network (RIP) command.

Examples
- This command enables RIP on 10.168.1.1/24
  switch(config-router-rip)#network 10.168.1.1/24
  switch(config-router-rip)#
- This command disables RIP on 10.168.1.1/24
  switch(config-router-rip)#no network 10.168.1.1/24
  switch(config-router-rip)#

34.2.2.2 Redistributing Routes Learned from Other Protocols into RIP

To enable route import from a specified protocol into RIP, use the redistribute (RIP) command. Additionally, you can apply a route map to the incoming routes to filter which routes are added to the RIP routing table. All connected routes are redistributed into RIP by default.

Example
- This command redistributes all routes learned from OSPF into RIP.
  switch(config-router-rip)#redistribute OSPF
  switch(config-router-rip)#

34.2.2.3 Configuring RIP Timers

When RIP is running on the switch, it sends unsolicited route updates and deletes expired routes at regular intervals. To configure the timing of those events, use the timers (RIP) command. The command takes three parameters: the update interval, the route expiration time, and the route deletion time.

The update interval is the amount of time in seconds that the switch waits between sending unsolicited RIP route updates to its neighbors. The route expiration time is how long the switch waits before marking an unadvertised route for deletion (the counter resets whenever an advertisement for the route is received). And the route deletion time is how long the switch waits between marking a route for deletion and removing it from the routing table. During the deletion interval, the switch continues to forward packets on the route.

Example
- This command sets the update interval to 60 seconds, expiration time to 90 seconds, and deletion time to 150 seconds.
  switch(config-router-rip)#timers 60 90 150
  switch(config-router-rip)#

34.2.2.4 Configuring an Interface to Transmit Broadcast RIP Updates

By default, the switch uses RIP version 2 and multicasts RIP update packets from all participating interfaces. To reconfigure a specific interface to send updates as broadcast packets, use the rip v2 multicast disable command in the configuration mode for the interface.
Example

- The following commands configure RIP version 2 broadcasting on interface Ethernet 5.

  switch(config)#interface ethernet5
  switch(config-if-Et5)#rip v2 multicast disable
  switch(config-if-Et5)#exit
  switch(config)#

34.2.3 Displaying RIP Information

34.2.3.1 Displaying RIP Routes

To see a listing of the RIP routes in the switch’s routing table, use the `show ip rip database` command. (You can also display similar information using the RIP option in the `show ip route` command)

Examples

- This command displays all active rip routes.

  switch>show ip rip database
  10.168.11.0/24 directly connected, Et4
  10.168.13.0/24
  [1] via 10.168.14.2, 00:00:25, Et4
  [2] via 10.168.15.2, 00:00:20, Et1
  10.168.13.0/24
  [1] via 10.168.14.2, 00:00:25, Et3

- This command submits a query for RIP route information for a network.

  switch>show ip rip database 10.168.13.0/16
  10.168.13.0/24
  [1] via 10.168.14.2, 00:00:25, Et4
  [2] via 10.168.15.2, 00:00:20, Et1

34.2.3.2 Displaying RIP Route Gateways

To see information about the switch’s RIP route gateways, use the `show ip rip neighbors` command. The output displays the IPv4 address, the last heard time of the gateway, and characteristic flags applying to the gateway.

Example

- This command displays information about all the gateways of RIP routes.

  switch>show ip rip neighbors
  Gateway     Last-Heard     Bad-Packets  Bad-Routes  Flags
  10.2.12.33   00:00:15      0            0            SRC, TRSTED, ACCEPTED, RJCTED, Q_RJCTED, AUTHFAIL
34.3 Configuring RIP on Multiple VRFs

VRF support for Routing Information Protocol (RIP) allows instances of RIP on multiple non-default VRFs on the same router. By default, all interfaces belong to the default VRF until VRF forwarding is executed.

The `vrf instance` and `vrf (interface mode)` commands configure a non-default VRF, enable routing in it, and configure the network command under the configuration router RIP for the prefix to which the interface belongs.

The `router rip vrf` command places the switch in router-RIP configuration mode to configure a RIP routing instance in a non-default VRF.

**Examples**

- These commands configure a non-default VRF and enable unicast routing in it.

  ```
  switch(config)#vrf instance test
  switch(config-vrf-test)#exit
  switch(config)#ip routing vrf test
  switch(config)#
  ```

- This command configures a RIP instance in a non-default VRF.

  ```
  switch(config)#router rip vrf test
  switch(config-router-rip-router-rip-vrf-test)#no shutdown
  switch(config-router-rip)#exit
  switch(config)#
  ```

- This command configures an interface as part of a non-default VRF by configuring the network command under the configuration router RIP for the prefix to which the interface belongs.

  ```
  switch(config)#interface Ethernet 3 / 1
  switch(config-if-Et3/1)#no switchport
  switch(config-if-Et3/1)#ip address 1.0.0.1/24
  switch(config-if-Et3/1)#vrf test
  switch(config-if-Et3/1)#network 1.0.0.1
  switch(config-if-Et3/1)#exit
  switch(config)#
  ```
34.4 **RIP Commands**

**Global Configuration Commands**
- `router rip`
- `router rip vrf`

**Interface Configuration Commands**
- `rip v2 multicast disable`

**Router-RIP Configuration Mode**
- `distance (RIP)`
- `distribute-list (RIP)`
- `metric default`
- `network (RIP)`
- `redistribute (RIP)`
- `shutdown (RIP)`
- `timers (RIP)`

**Display Commands – EXEC Mode**
- `show ip rip database`
- `show ip rip neighbors`
distance (RIP)

The `distance` command assigns an administrative distance to routes that the switch learns through RIP. Routers use administrative distances to select a route when two protocols provide routing information to the same destination. Distance values range from 1 to 255; lower distance values correspond to higher reliability. The default RIP distance value is 120.

The `no distance` and `default distance` commands restore the administrative distance default value of 120 by removing the `distance` command from `running-config`.

**Command Mode**
 Router-RIP Configuration

**Command Syntax**

```
 distance distance_value  
 no distance  
 default distance
```

**Parameters**

- `distance_value` distance assigned to RIP routes. Values range from 1 to 255.

**Examples**

- These commands assign an administrative distance of 75 to RIP routes.
  
  ```
  switch(config)#router rip  
  switch(config-router-rip)#distance 75  
  switch(config-router-rip)#
  ```
distribute-list (RIP)

The **distribute-list** command allows users to filter out routes that are received or sent out. The distribute-list command influences which routes the router installs into its routing table and advertises to its neighbors.

**Configuration Notes:**
- Only one inbound distribute-list is allowed per interface.
- Only one outbound distribute-list is allowed per interface.
- Only one globally-defined inbound distribute-list is allowed.
- Only one globally-defined outbound distribute-list is allowed.
- Not all match clauses in a route-map are supported using RIP routes filtering. These match clauses for distribute-lists are supported:
  - match ip address access-list
  - match ip address prefix-list
- The **distribute-list** command does not enforce the specified route-map to contain only supported match clauses.
- Permit or deny can be specified in both prefix/access list and route-map configurations. The following rules apply when filtering routes:
  - Routes permitted by the prefix/access lists are treated as matched.
  - Matched routes are filtered based on the permit or deny option configured for the route-map clause.
  - Unmatched routes are further evaluated by the next route-map clause.
  - If a route does not match any clause in a route-map, it is denied.
  - If the route-map given in the **distribute-list** command is not configured, then all routes are permitted.
  - When multiple inbound (or outbound) distribute-lists are configured, only the most specific one is applied.

The **no distribute-list** and **default distribute-list** commands remove the corresponding **distribute-list** command from **running-config**.

**Command Mode**
- Router-RIP Configuration

**Command Syntax**

```
distribute-list DIRECTION MAP [INTF]
no distribute-list DIRECTION MAP [INTF]
default distribute-list DIRECTION MAP [INTF]
```

**Parameters**
- **DIRECTION** direction specifies if distribute-list is applied on inbound or outbound traffic. Valid options include:
  - in specifies inbound as the direction the distribute-list is applied.
  - out specifies outbound as the direction the distribute-list is applied.
- **MAP** specifies route map that assigns attribute values to the network. Options include:
  - <no parameter> attributes are not assigned through a route map.
  - route-map map_name attributes listed by specified route map are assigned to the network.
Chapter 34: Routing Information Protocol

RIP Commands

- **INTF** interface to be configured. Options include:
  - **ethernet e_num** Ethernet interface.
  - **loopback l_num** Loopback interface.
  - **port-channel p_num** Port channel interface.
  - **vlan v_num** VLAN interface.

**Example**

- The following commands demonstrate that an access-list or prefix-list can be used within a route-map for use in a distribute-list.

  ```
  switch(config)#ip prefix-list 8to24 seq 5 permit 0.0.0.0/0 ge 8 le 24
  switch(config)#route-map myRouteMap permit 10
  switch(config-route-map-myRouteMap)#match ip address prefix-list 8to24
  switch(config-route-map-myRouteMap)#exit
  switch(config)#router rip
  switch(config-router-rip)#distribute-list in route-map myRouteMap
  ```

- These commands suppress routes advertised on a particular interface.

  ```
  switch(config)#ip prefix-list 2 seq 10 deny 30.1.1.0/24
  switch(config)#route-map myRmOut permit 10
  switch(config-route-map-myRmOut)#match ip address prefix-list 2
  switch(config-route-map-myRmOut)#exit
  switch(config)#router rip
  switch(config-router-rip)#distribute-list out route-map myRmOut
  ```
metric default

The `metric default` command specifies the metric value assigned to RIP routes learned from other protocols. All routes imported into RIP receive the default metric unless a matching route-map exists for the route. The route metric of 0 is assigned to redistributed connected and static routes. The default metric values range from 0 to 16 with a default value of 1.

The `no metric default` and `default metric default` commands remove the `metric default` command from `running-config` and returns the metric value to its default value of 1.

**Command Mode**

Router-RIP Configuration

**Command Syntax**

```
metric default metric_value
no metric default
default metric default
```

**Parameters**

- `metric_value` default metric value assigned. Values range from 0 to 16; default is 1.

**Example**

- This command sets the default metric value to five.
  ```
  switch(config)#router rip
  switch(config-router-rip)#metric default 5
  switch(config-router-rip)#
  ```
network (RIP)

The **network** command specifies which network the switch runs Routing Information Protocol (RIP), and also specifies which routes will be accepted into the RIP routing table. Multiple network commands can be issued to create a network list on which RIP runs.

The switch enables RIP on all interfaces in the specified network.

The **no network** and **default network** commands disable RIP on the specified network by removing the corresponding **network** command from *running-config*.

**Command Mode**

- Router-RIP Configuration

**Command Syntax**

```text
network NETWORK_ADDRESS
no network NETWORK_ADDRESS
default network NETWORK_ADDRESS
```

**Parameters**

- **NETWORK_ADDRESS** network IP address. Entry formats include the following:
  - *ipv4_subnet* IPv4 subnet (CIDR notation).
  - *ipv4_addr mask wildcard_mask* IP address and wildcard-mask.

**Examples**

- This command enables RIP on 10.168.1.1/24

  ```text
  switch(config)#router rip
  switch(config-router-rip)#network 10.168.1.1/24
  switch(config-router-rip)#
  ```

- This command also enables RIP on 10.168.1.1/24

  ```text
  switch(config-router-rip)#network 10.168.1.1 mask 0.0.0.255
  switch(config-router-rip)#
  ```
**redistribute (RIP)**

The `redistribute` command enables the importing of routes from a specified routing domain to RIP.

- **connected** by default, RIP redistributes all connected routes that are established when IP is enabled on an interface. The route-map parameter facilitates the exclusion of connected routes from redistribution by specifying a route map that denies the excluded routes.

- **BGP, OSPF, and IP static routes** by default, routes are not redistributed. The redistribution command without the route-map parameter facilitates the redistribution of all routes from the specified source.

The `no redistribute` and `default redistribute` commands reset the default route redistribution setting by removing the `redistribute` statement from `running-config`.

**Command Mode**

Router-RIP Configuration

**Command Syntax**

```
redistribute connected ROUTE_MAP
redistribute ROUTE_TYPE [ROUTE_MAP]
no redistribute connected ROUTE_MAP
no redistribute ROUTE_TYPE
default redistribute connected ROUTE_MAP
default redistribute ROUTE_TYPE
```

**Parameters**

- **ROUTE_TYPE** source from which routes are redistributed. Options include:
  - **BGP** routes from a BGP domain.
  - **OSPF** routes from an OSPF domain.
  - **OSPF match external** Routes external to RIP, but imported from OSPF.
  - **OSPF match internal** OSPF routes that are internal to the AS.
  - **static** IP static routes.

- **ROUTE_MAP** route map that determines the routes that are redistributed. Options include:
  - `<no parameter>` all routes are redistributed.
  - `route-map map_name` only routes in the specified route map are redistributed.

**Example**

- These commands redistribute OSPF routes into RIP.

```
switch(config)#router rip
switch(config-router-rip)#redistribute OSPF
switch(config-router-rip)#
```
rip v2 multicast disable

The `rip v2 multicast disable` command specifies the transmission of Routing Information Protocol (RIP) Version 2 update packets from the configuration mode interface as broadcast to 255.255.255.255.

The `no rip v2 multicast disable` and `default rip v2 multicast disable` commands specify the transmission of update packets as multicast to 224.0.0.9 if the configuration mode interface is multicast capable. Updates are broadcast if the interface is not multicast capable.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `rip v2 multicast disable`
- `no rip v2 multicast disable`
- `default rip v2 multicast disable`

**Example**
- The following example configures version 2 broadcasting on interface Ethernet 5.

```bash
switch(config)#interface ethernet 5
switch(config-if-Et5)#rip v2 multicast disable
switch(config-if-Et5)#exit
switch(config)#
```
**router rip**

The **router rip** command places the switch in router-rip configuration mode to configure the Routing Information Protocol (RIP) routing process. Router-rip configuration mode is not a group change mode; **running-config** is changed immediately upon command entry. The **exit** command does not affect **running-config**.

The **no router rip** and **default router rip** commands disable RIP and remove all user-entered **router-rip** configuration statements from **running-config**. To disable RIP without removing configuration statements, use the **shutdown (RIP)** command.

The **exit** command returns the switch to global configuration mode.

**Command Mode**

Global Configuration

**Command Syntax**

```
router rip
no router rip
default router rip
```

**Commands Available in router-rip Configuration Mode**

- **distance (RIP)**
- **distance (RIP)**
- **network (RIP)**
- **redistribute (RIP)**
- **shutdown (RIP)**
- **timers (RIP)**

**Example**

- This command places the switch in router-rip configuration mode.

```
switch(config)#router rip
switch(config-router-rip)#
```
**router rip vrf**

The `router rip` command places the switch in router-RIP configuration mode to configure an RIP routing instance in the non-default VRF.

The `no router rip vrf` and `default router rip vrf` commands disable an RIP routing instance in the non-default VRF, and remove all user-entered `router-rip` configuration statements from `running-config`. To disable RIP without removing configuration statements, use the `shutdown (RIP)` command.

The `exit` command returns the switch to global configuration mode.

**Command Mode**

Global Configuration

**Command Syntax**

```
router rip vrf [RIP_INSTANCE]
no router rip vrf [RIP_INSTANCE]
default router rip vrf [RIP_INSTANCE]
```

**Parameters**

- `RIP_INSTANCE` configure a RIP VRF instance in the non-default VRF:

**Example**

- This command configures a RIP instance in the non-default VRF.
  ```
  switch(config)#router rip vrf test
  switch(config-router-rip-router-rip-vrf-test)#no shutdown
  switch(config-router-rip)#exit
  switch(config)#
  ```

- This command disables a RIP instance in the non-default VRF.
  ```
  switch(config)#no router rip vrf test
  switch(config)#
  ```
The `show ip rip database` command displays information about routes in the Routing Information Base. The default command displays active routes and learned routes not used in deference to higher priority routes from other protocols.

This command has the following forms:

- **default** (no arguments): information about all RIP routes.
- **IPv4 address and mask**: information about the referenced addresses
- **active**: information about routes not superseded by routes from other protocols.

**Command Mode**

**EXEC**

**Command Syntax**

```
show ip rip database [FILTER]
```

**Parameters**

- **FILTER** routing table entries that the command displays. Values include:
  - `<no parameter>` displays all routing table entries
  - **active** displays all active routing table entries.
  - **net_addr** subnet address (CIDR or address-mask). Command displays entries in this subnet.

**Examples**

- This command displays all active rip routes.
  
  ```
  switch>show ip rip database active
  10.168.11.0/24 directly connected, Et4
  10.168.13.0/24
  [1] via 10.168.14.2, 00:00:25, Et4
  [2] via 10.168.15.2, 00:00:20, Et1
  10.168.13.0/24
  [1] via 10.168.14.2, 00:00:25, Et3
  ```

- This command submits a query for RIP route information for a network.
  
  ```
  switch>show ip rip database 10.168.13.0/16
  10.168.13.0/24
  [1] via 10.168.14.2, 00:00:25, Et4
  [2] via 10.168.15.2, 00:00:20, Et1
  ```

- This command returns information for all RIP routes.
  
  ```
  switch>show ip rip database
  10.1.0.0/255.255.255.0
  [1] via 10.8.31.15, 00:00:21, Et2, holddown
  10.2.0.0/255.255.255.0
  [1] via 10.8.31.15, 00:00:21, Et2, holddown
  10.3.0.0/255.255.255.0
  [1] via 10.8.31.15, 00:00:21, Et2, inactive
  10.212.0.0/255.255.255.0
  [1] via 10.8.31.15, 00:00:21, Et2, active
  10.214.0.0/255.255.255.0
  [1] via 10.8.12.17, 00:00:30, Et4, active
  ```
show ip rip neighbors

The `show ip rip neighbors` command displays information about all RIP route gateways. The output displays the IPv4 address, the last heard time of the gateway, and characteristic flags applying to the gateway.

**Command Mode**
EXEC

**Command Syntax**
```
show ip rip neighbors
```

**Example**
- The `show ip rip neighbors` command displays information about all gateways of RIP routes.

```
switch>show ip rip neighbors
Gateway     Last-Heard      Bad-Packets  Bad-Routes   Flags
10.2.12.33  00:00:15                                      SRC, TRSTED, ACCEPTED, RJCTED, Q_RJCTED, AUTHFAIL
```
**shutdown (RIP)**

The `shutdown` command disables RIP on the switch without modifying the RIP configuration. RIP is disabled by default.

The `no shutdown` command enables RIP. The `default shutdown` command disables RIP.

**Command Mode**

  Router-RIP Configuration

**Command Syntax**

  - shutdown
  - no shutdown
  - default shutdown

**Examples**

- This command disables RIP on the switch.
  ```
  switch(config)#router rip
  switch(config-router-rip)#shutdown
  switch(config-router-rip)#
  ```

- This command enables RIP on the switch.
  ```
  switch(config-router-rip)#no shutdown
  switch(config-router-rip)#
  ```
timers (RIP)

The timers command configures the update interval, the expiration time, and the deletion time for routes received and sent through RIP. The command requires value declaration of all values.

- The update time is the interval between unsolicited route responses.
- The expiration time is initialized when a route is established and any time an update is received for the route.
- The deletion time is initialized when the expiration time elapses and the route is invalid. It is retained in the routing table until deletion time expiry.

The no timers and default timers commands return the timer values to their default values by removing the timers command from running-config.

Command Mode
Router-RIP Configuration

Command Syntax

```
timers update_time expire_time deletion_time	no timers
default timers
```

Parameters

- `update_time` Default is 30 seconds
- `expire_time` Default is 180 seconds.
- `deletion_time` Default is 120 seconds.

Parameter values are in seconds and range from 5 to 2147483647.

Example

- This command sets the update (60 seconds), expiration (90 seconds), and deletion (150 seconds) times.

```
switch(config)#router rip
switch(config-router-rip)#timers 60 90 150
switch(config-router-rip)#
```
IS-IS

Intermediate System-to-Intermediate System (IS-IS) intra-domain routing information exchange protocol is designed by the International Organization for Standardization to support connectionless networking. This protocol is a dynamic routing protocol.

This chapter contains the following sections.

- Section 35.1: IS-IS Introduction
- Section 35.2: IS-IS
- Section 35.3: ISIS Graceful Restart
- Section 35.4: IS-IS Commands

35.1 IS-IS Introduction

IS-IS is a link state protocol, which uses the shortest path first (SPF) algorithm. IS-IS and the OSPF protocol are similar in many aspects. As an interior gateway protocol (IGP), IS-IS runs inside an AS. To enable IS-IS, you must instantiate an IS-IS routing instance and assign it to an interface.

35.2 IS-IS

These sections describe IS-IS configuration tasks:

- Section 35.2.1: Enabling IS-IS
- Section 35.2.2: IS-IS Optional Global Parameters
- Section 35.2.3: IS-IS Interface Optional Parameters
- Section 35.2.4: Disabling IS-IS
- Section 35.2.5: Verifying IS-IS
35.2.1 Enabling IS-IS

For the normal operation of the IS-IS protocol, the `set-overload-bit` command must be used to enable the IS-IS instance. Then the `net` command is used to set a Network Entity Title (NET) for the device. Next you must configure at least one `address-family`. Lastly, the `isis enable` command is used to enable IS-IS on the desired interface. The IS-IS protocol is enabled upon the completion of these configurations.

To enable IS-IS, the following tasks must be performed in the global configuration mode.

- **Section 35.2.1.1: Enable IS-IS Globally and Specify an IS-IS Instance**
- **Section 35.2.1.2: Configure the Network Entity Title (NET)**
- **Section 35.2.1.4: Enable IS-IS on a Specified Interface**
- **Section 35.2.1.3: Set the Address Family Configuration**

### 35.2.1.1 Enable IS-IS Globally and Specify an IS-IS Instance

The switch supports only one IS-IS routing instance. The routing instance uniquely identifies the switch to other devices. IS-IS configuration commands apply globally to the IS-IS instance.

The switch must be in router IS-IS configuration mode to run IS-IS configuration commands. The `set-overload-bit` command places the switch in router IS-IS configuration mode.

**Example**

- These commands place the switch in router IS-IS configuration mode. It also creates an IS-IS routing instance named Osiris.

```plaintext
switch(config)#router isis Osiris
switch(config-router-isis)#
```

### 35.2.1.2 Configure the Network Entity Title (NET)

After creating an IS-IS routing instance, you should also configure the Network Entity Title (NET) with the `net` command. The NET defines the current IS-IS area address and the system ID of the device.

**Example**

- These commands define the current IS-IS area address and the system ID of the device.

```plaintext
switch(config)#router isis Osiris
switch(config-router-isis)# net 49.0001.1010.1040.1030.00
```

### 35.2.1.3 Set the Address Family Configuration

The `address-family` command allows you to enable the address families that IS-IS will route and also enter a configuration sub-mode to configure settings that are distinct to that address family. Currently Arista does not support per address family options. The address families supported are IPv4 unicast and IPv6 unicast.

**Example**

- These commands enable and enter the address family mode for IPv4 unicast.

```plaintext
switch(config)#router isis Osiris
switch(config-router-isis)#address-family ipv4 unicast
switch(config-router-isis-af)#
```
35.2.1.4 Enable IS-IS on a Specified Interface

After enabling IS-IS, you need to specify on which interface IS-IS will be run with the `isis enable` command.

**Example**
- These commands enable IS-IS on the specified interface Ethernet 4.
  ```
  switch(config-router-isis)#interface ethernet 4
  switch(config-if-Eth4)#isis enable Osiris
  ```

35.2.2 IS-IS Optional Global Parameters

After globally enabling IS-IS, the following global parameters can be configured.

- **Section 35.2.2.1: Set the Router Type**
- **Section 35.2.2.2: Configuring Redistribution of Connected or Static non-ISIS Routes**
- **Section 35.2.2.3: Configuring Redistribution of Connected or Static non-ISIS Routes into Level-1 Router**
- **Section 35.2.2.4: Configuring Redistribution of BGP Routes into ISIS Network**
- **Section 35.2.2.5: Set the Overload Bit**
- **Section 35.2.2.6: Configure IS-IS full MD5**
- **Section 35.2.2.7: Set the SPF Interval**
- **Section 35.2.2.8: Configuring IS-IS Segment Routing Global Adjacency-SID**
- **Section 35.2.2.9: Enable Logging for Peer Changes**
- **Section 35.2.2.10: Set the IS-IS hostname**

35.2.2.1 Set the Router Type

The `log-adjacency-changes (IS-IS)` command sets the routing level for an IS-IS instance.

**Example**
- These commands specify level-2 for the IS-IS instance.
  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#is-type level-2
  switch(config-router-isis)#
  ```

35.2.2.2 Configuring Redistribution of Connected or Static non-ISIS Routes

The `redistribute (IS-IS)` command configures redistribution of connected or static non-ISIS routes.

**Example**
- These commands redistribute connected routes into the IS-IS domain.
  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#redistribute connected
  switch(config-router-isis)#
  ```
35.2.2.3 Configuring Redistribution of Connected or Static non-IS-IS Routes into Level-1 Router

The non-IS-IS routes can be exported into Level-1, Level-2 or both by using route map’s set condition. By default the routes are exported only to Level-2 router. The Level-1 or Level-2 routes can also be filtered using the route map’s match statement. The route map is then used when redistributing routes in ISIS.

The following example are the steps to configure non-IS-IS routes redistribution into Level-1 or Level-2 router:

**Example**

**Step 1** Place the switch in route-map mode and use `set isis level [level-1|level-2|level-1-2]` command to configure a route map to set ISIS level, or use `match isis level [level-1|level-2]` command to configure route-map match on ISIS level.

```
Switch(config-route-map-rm)#set isis level [level-1|level-2|level-1-2]
Switch(config-route-map-rm)#match isis level [level-1|level-2]
```

**Step 2** The configured route map is then used while redistributing routes in ISIS using the `redistribute (IS-IS)` command.

```
Switch(config-router-isis)#redistribute [connected|static] route-map <route-map name>
```

Use `show ipv6 route` command to verify on the respective Level-1 or Level-2 router to make sure routes are exported/filtered. Output of `show isis database detail` is used to make sure that the route shows up in the exported level.

35.2.2.4 Configuring Redistribution of BGP Routes into ISIS Network

The `redistribute bgp route-map bgp-to-isis` command advertises the routes learned through BGP routes into ISIS network. It also allows to selectively advertise some routes and modify route attributes before advertising using route-maps.

The command is available in both address-family mode and router ISIS mode, however, the command is rejected if configured in both address-family mode and router mode at the same time.

**Note**

If the command is configured in router-af mode, it only redistributes routes with matching address family. If it is configured in router mode, it applies to all enabled address-families.

Use `show isis database <detail>` command to verify that routes are advertised with correct attributes.

**Examples**

- In this example the `redistribute bgp route-map bgp-to-isis` command redistributes the BGP routes into ISIS domain, in `address-family` mode.
  ```
  Switch(config)#router isis 1
  Switch(config-router-isis)#address-family ipv4
  Switch(config-router-isis-af)#redistribute bgp route-map bgp-to-isis-v4
  ```
- In this example the `redistribute bgp route-map bgp-to-isis` command redistributes the BGP routes into ISIS, in `router isis` mode.
  ```
  Switch(config)#router isis 1
  Switch(config-router-isis)#redistribute bgp route-map bgp-to-isis
  ```
35.2.2.5 Set the Overload Bit

The `set-overload-bit` command used without the `on-startup` option, informs other devices not to use the local router to forward transit traffic. When used with the `on-startup` option, the overload bit is set for the interval specified after startup.

In scenarios when Border Gateway Protocol (BGP) routes are resolved using Interior Gateway Protocol (IGP), if the transit router reboots and becomes available again, IGP will consider the transit router for an optimal path again. After rebooting, it will black hole traffic until the transit router learns the external destination reachability information via BGP.

**Examples**

- These commands configure the switch and sets the overload bit to 120 seconds after startup.
  
  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#set-overload-bit on-startup 120
  switch(config-router-isis)#
  ```

- These commands configure the overload bit until BGP converges. If BGP fails to converge within the set timeout default period, then the overload bit gets cleared.
  
  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#set-overload-bit on-startup wait-for-bgp
  switch(config-router-isis)#set-overload-bit on-startup wait-for-bgp timeout 750
  switch(config-router-isis)#
  ```

35.2.2.6 Configure IS-IS full MD5

To configure authentication for the IS-IS instance causing LSPs, CSNPs and PSNPs to be authenticated, use the `authentication mode` and `clear isis neighbor` commands. To configure authentication on the interface, causing IS-IS Hellos to be authenticated, use the `isis authentication mode` and `isis enable` commands.

Two forms of authentication are supported by the IS-IS routing protocol: Clear text authentication and MD5 authentication. The difference between the two forms of authentication is in the level of security provided. In the case of clear text authentication, the password is specified as text in the authentication TLV, making it possible for an attacker to break authentication by sniffing and capturing IS-IS PDUs on the network.

HMAC MD5 authentication provides much stronger authentication by computing the message digest (on the IS-IS PDU contents) using the secret key to produce a hashed message authentication code (HMAC). Different modes of authentication can be specified on the interface, which authenticates IIH PDUs (IS-IS hello PDUs), and globally in the router IS-IS mode, in which the LSPs, CSNPs and PSNPs are authenticated. Area wide and domain wide authentication can be specified for L1 and L2 routers respectively.

**Example**

- These commands configure authentication for the IS-IS instance causing LSPs, CSNPs and PSNPs to be authenticated.
  
  ```
  switch(config)#router isis 1
  switch(config-router-isis)#authentication mode md5
  switch(config-router-isis)#authentication key secret
  switch(config-router-isis)#
  ```
These commands configure authentication on the interface causing IS-IS Hellos to be authenticated.

```
switch(config)#interface Ethernet 3/6
switch(config-if-Et3/6)#isis authentication mode text
switch(config-if-Et3/6)#isis authentication key 7 cAm28+9a/xPi04o7hjd8Jw==
```

### 35.2.2.7 Set the SPF Interval

The SPF timer interval defines the maximum interval between two successive SPF calculations in an IS-IS environment using the `spf-interval` command. IS-IS runs SPF calculations following a change in the network topology or the link state database. The SPF timer defines the following intervals in an IS-IS environment:

- **Maximum wait interval:** This interval defines the maximum time a switch will wait before running an SPF after a topology change.
- **Initial wait interval:** In a network that has been stable throughout the hold interval, this interval defines the initial wait time of a switch for performing an SPF calculation after a topology change. As several link state updates must be sent after a topology change, the initial wait interval allows the network to settle before a switch computes an SPF. If the topology changes during an initial wait interval, an SPF is calculated after the initial wait interval expires and no further changes are made to throttle timers.
- **Hold time:** This interval delays SPF calculations during network instability. If the topology changes during a hold time, an SPF is computed when the hold time expires. Subsequent hold intervals are doubled up to the configured maximum wait interval for continuous topology changes. If the next topology change occurs after the hold interval expires, the hold interval is reset to its configured value and the SPF is computed after the initial wait interval.

**Note**

EOS does not support configuring topology-specific SPF timers in multi-topology deployments and IS-IS level-specific SPF timers.

**Example**

This command configures maximum wait interval, initial wait interval, and hold time to 10 seconds, 2000 ms, and 1000 ms respectively.

```
switch(config)#router isis inst1
switch(config-router-isis)#spf-interval 10 2000 1000
```

### 35.2.2.8 Configuring IS-IS Segment Routing Global Adjacency-SID

IS-IS Segment Routing (SR) now supports global adjacency-SID for P2P interface for IS-IS adjacencies and are configured per address family on any interface. They are configured as index and are advertised as those. The Global adjacency SID is configured on interface configuration mode using `adjacency-segment` command.

Global adjacency segments are represented using index instead of actual MPLS labels. These index are offset on the Segment Routing Global Block (SRGB) advertised by a router to derive the respective MPLS label. The default value of SRGB in EOS is Base: 900000 and Size: 65536.

Same index is used to configure multiple interfaces so that MPLS forms ECMP, and same value is applied to IPv4 and IPv6 adjacency.
### Example

- In this example the global adjacency is configured on a p2p interface Ethernet Et1, with an index value 10.

  ```
  Arista(config-if-Et1)# adjacency-segment ipv4 p2p index 10 global
  ```

### Displaying Adjacency SID Information

The command `show isis segment-routing adjacency-segments` displays the global adjacency SID value and other related informations.

### Examples

- In this example the `show isis segment-routing adjacency-segments` command displays the output for the interface configured like this:

  ```
  interface Ethernet1
  ip address 1.1.1.1/24
  ipv6 address 1000::1/64
  isis enable isis1
  isis network point-to-point
  adjacency-segment ipv4 p2p index 1 global
  adjacency-segment ipv6 p2p index 2 global
  ```

- The show output for the above interface configuration:

  ```
  Switch# show isis segment-routing adjacency-segments
  System ID: 1000.0000.0002                       Instance: isis1
  SR supported Data-plane: MPLS                   SR Router ID: 1.1.1.4
  Adjacency Segment Count: 2                     Adjacency Segment Count: 2
  Flag Descriptions: F: Ipv6 address family, B: Backup, V: Value
                     L: Local, S: Set
  Segment Status codes: L1 - Level-1 adjacency, L2 - Level-2 adjacency, P2P - Point-to-Point adjacency, LAN - Broadcast adjacency
  Locally Originated Adjacency Segments
  Adj IP Address     Local Intf    SID      SID Source    Flags                Type
  ----------------  ----------    ------  -------------  ---------------     -------
  1.1.1.2         Et1         1        Configured   F:0 B:0 V:0 L:0 S:0  P2P L1
  fe80::1:ff:fe65:0 Et1         2        Configured   F:1 B:0 V:0 L:0 S:0  P2P L1
  ```

- Received Global Adjacency Segments

  ```
  SID         Originator       Neighbor     Flags
  -------  -----------------  ------------  -------------
  0       rtrmpls1          1000.0000.0002  F:0 B:0 V:0 L:0 S:0
  ```
- The following is the C-API output for the `show isis segment-routing adjacency-segments` command.

```
Arista# show isis segment-routing adjacency-segments | json
{
    "vrfs": {
        "default": {
            "isisInstances": {
                "isis1": {

                        },
                        {
                            "lan": false,
                            "sidOrigin": "configured",
                            "flags": {
                                "s": false,
                                "b": false,
                                "v": false,
                                "f": true,
                                "l": false
                            },
                            "sid": 2,
                            "localIntf": "Ethernet1",
                            "ipAddress": "fe80::1:ff:fe65:0",
                            "level": 1
                        }
                    ]
                }
            }
        }
    }
}
```
35.2.2.9 Enable Logging for Peer Changes

The log-adjacency-changes (IS-IS) command configures the switch to send syslog messages when it detects IS-IS neighbor adjacency state changes.

Example

- These commands configure the switch to send a syslog message when a neighbor goes up or down.

  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#log-adjacency-changes
  switch(config-router-isis)#
  ```

35.2.2.10 Set the IS-IS hostname

The is-hostname command configures the use of a human readable string to represent the symbolic name of an IS-IS router, and map the IS-IS system IDs and IS-IS hostnames. It also changes the output of IS-IS show commands, to show the IS-IS hostname in place of system IDs if the corresponding IS-IS hostname is known. However, syslogs still use IS-IS system IDs and not the IS-IS hostname.

By default if there’s a hostname configured on the switch, it is used as the IS-IS hostname. It is also possible to un-configure an assigned hostname for IS-IS using the `no is-hostname` command. When the IS-IS hostname is removed, the switch goes back to using the switch’s hostname as the IS-IS hostname.

Examples

- These commands configure the IS-IS hostname to the symbolic name foobar for the IS-IS router.

  ```
  switch(config)#router isis inst1
  switch(config-router-isis)#is-hostname ishost1
  switch(config-router-isis)#
  ```

- These commands unconfigure the IS-IS hostname of the symbolic name foobar for the IS-IS router.

  ```
  switch(config)#router isis inst1
  switch(config-router-isis)#no is-hostname ishost1
  switch(config-router-isis)#
  ```

35.2.2.11 Configuring IS-IS Multi-Topology

The multi-topology command configures IS-IS Multi-Topology (MT) support (disabled by default), enabling an IS-IS router to compute a separate topology for IPv4 and IPv6 links in the network. With MT configured, not all the links in a network need to support both IPv4 and IPv6. Some can support IPv4 or IPv6 individually. The IPv4 SPF will install IPv4 routes using the IPv4 topology, and similarly the IPv6 SPF will install IPv6 routes using the IPv6 topology. Without MT support, all links in an IS-IS network need to support the same set of address families.

When MT is enabled, and each link has a separate IPv4 metric and IPv6 metric.
The `isis ipv6 metric` command configures the IPv6 metric.

The `isis network` command configures the IPv4 or IPv6 address family individually on an interface with both IPv4 and IPv6 addresses.

The address families that are enabled on an interface are based on the global address families enabled in router IS-IS configuration mode, and the addresses configured on the interface. To enable a particular address family on an interface, it needs to have an address configured in that address family. In the case where both IPv4 and IPv6 address families are enabled in router IS-IS configuration mode, then if an interface has IPv4 and IPv6 addresses, both IPv4 and IPv6 address families are enabled on that interface. In the case of an interface with only an IPv4 address family, the IPv4 address family is enabled on that interface. Where an interface only has an IPv6 address family, the IPv6 address family is enabled on that interface. Finally, where only the IPv6 address family is enabled in router IS-IS config mode and MT is enabled, then the IPv6 address family is enabled on all interfaces which have an IPv6 address configured.

**Examples**

- These commands configure MT for the IS-IS router.

```
switch(config)#router isis 1
switch(config-router-isis)#address-family ipv6 unicast
switch(config-router-isis-af)#multi-topology
```

- These commands unconfigure MT for the IS-IS router.

```
switch(config)#router isis 1
switch(config-router-isis)#address-family ipv6 unicast
switch(config-router-isis-af)#no multi-topology
```

- These commands configure the IPv6 metric.

```
switch(config)#interface Ethernet 5/6
switch(config-if-Et5/6)#isis ipv6 metric 30
```

- These commands configure the IPv4 address family on an interface with both IPv4 and IPv6 addresses.

```
switch(config)#interface Ethernet1
switch(config-if-Et1)#isis multi-topology address-family ipv4 unicast
```

- These commands configure the IPv6 address family on an interface with both IPv4 and IPv6 addresses.

```
switch(config)#interface Ethernet1
switch(config-if-Et1)#isis multi-topology address-family ipv6 unicast
```

- These commands configure both the IPv4 and IPv6 address families on an interface.

```
switch(config)#interface Ethernet1
switch(config-if-Et1)#no isis multi-topology address-family unicast
```

### 35.2.3 IS-IS Interface Optional Parameters

After globally enabling IS-IS, the following parameters can be configured on individual interfaces.

- **Section 35.2.3.1: Set the Hello Packet Interval**
- **Section 35.2.3.2: Configure the Hello Multiplier for the Interface**
- **Section 35.2.3.3: Configure the IS-IS Metric**
35.2.3.1 Set the Hello Packet Interval

The isis hello-interval command periodically sends hello packets to maintain adjacency through the transmitting/receiving of the hello packets. The hello packet interval can be modified.

Example
- These commands configure a hello interval of 60 seconds for Ethernet 4.

```
switch(config)#interface ethernet 4
switch(config-if-Et4)#isis hello-interval 60
```

35.2.3.2 Configure the Hello Multiplier for the Interface

The switch maintains the adjacency by sending/receiving hello packets. When receiving no hello packets from the peer within a time interval, the local switch considers the neighbors invalid.

The isis hello-multiplier command calculates the hold time announced in hello packets by multiplying this number with the configured isis hello-interval.

Example
- These commands configure a hello multiplier of 45 for Ethernet 4.

```
switch(config)#interface ethernet 4
switch(config-if-Et4)#isis hello-interval 60
switch(config-if-Et4)#isis hello-multiplier 45
```

35.2.3.3 Configure the IS-IS Metric

The isis metric command sets cost for sending information over a specific interface. At present only wide metrics are supported.

Example
- These commands configure a metric cost of 30 for sending information over Ethernet 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#isis metric 30
```

35.2.3.4 Set the LSP Interval

The isis lsp tx interval command configures the minimum interval between successive LSP transmissions on an interface.

Example
- This command sets the LSP interval on interface Ethernet 5 to 600 milliseconds.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#isis lsp tx interval 600
```
35.2.3.5 Set the IS-IS Priority

The `isis priority` command determines which device will be the Designated Intermediate System (DIS). The device with the highest priority will become the DIS.

**Example**
- These commands configure a device priority of 60 on interface Ethernet 5.

  switch(config)#interface ethernet 5
  switch(config-if-Et5)#isis priority 60
  switch(config-if-Et5)#

35.2.3.6 Configure an Interface as Passive

The `isis passive` and `passive (IS-IS)` commands configure IS-IS interfaces as passive to interfaces where adjacencies are wanted. The interface does not send or receive IS-IS packets on an interface configured as passive.

**Examples**
- These commands configure Ethernet interface 10 as a passive interface. The switch neither sends IS-IS packets received on passive interfaces.

  switch(config)#interface ethernet 10
  switch(config-if-Et10)#isis passive
  switch(config-if-Et10)#

- These commands configure Ethernet interface 10 as a passive interface in the router IS-IS mode.

  switch(config)#router isis Osiris
  switch(config-router-isis)#passive interface ethernet 10
  switch(config-router-isis)#

35.2.3.7 Configure BFD support for IS-IS for IPv4

The `isis bfd` and `isis hello-interval` commands configure Bidirectional Forwarding Detection (BFD), a low overhead protocol designed to provide rapid detection of failures at any protocol layer in the path between adjacent forwarding engines over any media. BFD is supported for IS-IS IPv4 routes.

**Examples**
- These commands enable BFD for all the interfaces on which IS-IS is enabled. By default BFD is disabled on all the interfaces.

  switch(config)#router isis 1
  switch(config-router-isis)#address-family ipv4
  switch(config-router-af)#bfd default
  switch(config-router-af)#

- These commands enable BFD on IS-IS interfaces.

  switch(config)#interface Ethernet 5/6
  switch(config-if-Et5/6)#isis bfd
  switch(config-if-Et5/6)#

35.2.4 Disabling IS-IS

An IS-IS instance can be shut down globally, or the IS-IS protocol can be disabled on individual interfaces.

The `shutdown (IS-IS)` command shuts down an IS-IS instance globally.
Chapter 35: IS-IS

Example

- These commands disable IS-IS globally without modifying the IS-IS configuration.

  switch(config)#router isis Osiris
  switch(config-router-isis)#shutdown
  switch(config-router-isis)#

  The no isis enable command disables IS-IS on an interface.

Example

- These commands disable IS-IS on interface Ethernet 4.

  switch(config-router-isis)#interface ethernet 4
  switch(config-if-Eth4)#no isis enable

35.2.5 Verifying IS-IS

The following tasks verify the IS-IS peer and connection configuration:

- Section 35.2.5.1: Verify the Link State Database
- Section 35.2.5.2: Verify the Interface Information for the IS-IS Instance
- Section 35.2.5.3: Verify the IS-IS Neighbor Information
- Section 35.2.5.4: Verify IS-IS Instance Information

35.2.5.1 Verify the Link State Database

To display the link state database of IS-IS, use the show isis database command.

Example

- This command displays the IS-IS link state database.

  switch>show isis database

  ISIS Instance: Osiris
  ISIS Level 2 Link State Database
  LSPID    Seq Num  Cksum  Life  IS  Flags
  1212.1212.1212.00-00  4     714    1064  L2  <>
  1212.1212.1212.0a-00  1    57417   1064  L2  <>
  2222.2222.2222.00-00  6    15323   1116  L2  <>
  2727.2727.2727.00-00 10   15596   1050  L2  <>
  3030.3030.3030.00-00 12   62023   1104  L2  <>
  3030.3030.3030.c7-00  4    53510   1104  L2  <>

  switch>

35.2.5.2 Verify the Interface Information for the IS-IS Instance

To display interface information related to the IS-IS instance, use the show isis interface command.
Example

- This command displays IS-IS interface information.

```
switch>show isis interface

ISIS Instance: Osiris
Interface Vlan20:
   Index: 59 SNPA: 0:1c:73:c:5:7f
   MTU: 1497 Type: broadcast
   Level 2:
      Metric: 10, Number of adjacencies: 2
      LAN-ID: 1212.1212.1212, Priority: 64
      DIS: 1212.1212.1212, DIS Priority: 64
Interface Ethernet30:
   Index: 36 SNPA: 0:1c:73:c:5:7f
   MTU: 1497 Type: broadcast
   Level 2:
      Metric: 10, Number of adjacencies: 1
      LAN-ID: 3030.3030.3030, Priority: 64
      DIS: 3030.3030.3030, DIS Priority: 64
```

35.2.5.3 Verify the IS-IS Neighbor Information

To display general information for IS-IS neighbors that the device sees, use `show isis neighbors`.

```
Example

- This command displays information for IS-IS neighbors that the device sees.

switch>show isis neighbors

Inst Id   System Id            Type Interface       SNPA              State Hold time
10        2222.2222.2222       L2   Vlan20          2:1:0:c:0:0       UP    30
10        1212.1212.1212       L2   Vlan20          2:1:0:d:0:0       UP    9
10        3030.3030.3030       L2   Ethernet30      2:1:0:b:0:0       UP    9
```

35.2.5.4 Verify IS-IS Instance Information

To display the system ID, Type, Interface, IP address, State and Hold information for IS-IS instances, use the `show isis summary` command.

```
Example

- This command displays general information about IS-IS instances.

switch>show isis summary

ISIS Instance: Osiris
   System ID: 1010.1040.1030, administratively enabled, attached
   Internal Preference: Level 1: 115, Level 2: 115
   External Preference: Level 1: 115, Level 2: 115
   IS-Type: Level 2, Number active interfaces: 1
   Routes IPv4 only
   Last Level 2 SPF run 2:32 minutes ago
   Area Addresses:
      10.0001
      level 2: number dis interfaces: 1, LSDB size: 1
```

2440
35.2.5.5 Verify IS-IS Interval Information

To verify the configured maximum wait interval, initial wait interval, and hold time of SPF timers in IS-IS instances, use the `show isis summary` command. This command also displays values of the current SPF interval, last level-1 SPF run, and last level-2 SPF run.

Example

- This command displays the SPF interval information about IS-IS instances.

```
switch(config-router-isis-af)#show isis summary

IS-IS Instance: 1 VRF: default
System ID: 0000.0000.0001, administratively enabled
Multi Topology disabled, not attached
IPv4 Preference: Level 1: 115, Level 2: 115
IPv6 Preference: Level 1: 115, Level 2: 115
IS-Type: Level 1 and 2, Number active interfaces: 0
Routes both IPv4 and IPv6

Max wait(s) Initial wait(ms) Hold interval(ms)
LSP Generation Interval: 5 50 50
SPF Interval: 2 1000 1000
Current SPF hold interval(ms): Level 1: 1000, Level 2: 1000
Last Level 1 SPF run 1 seconds ago
Last Level 2 SPF run 1 seconds ago
Authentication mode: Level 1: None, Level 2: None
Graceful Restart: Disabled, Graceful Restart Helper: Enabled
Area Addresses:
  49.0001
  level 1: number dis interfaces: 0, LSDB size: 1
  level 2: number dis interfaces: 0, LSDB size: 1
```
35.3 ISIS Graceful Restart

ISIS Graceful Restart (GR) is a mechanism to prevent routing protocol re-convergence during a processor switchover or device downtime. Which means when a router restarts, all the neighboring routers associated with that router detect the device has gone down and routes from that neighbor are removed. Upon the restart of the router, the session is re-established and data transfer continues. However, during the restart the removal and re-insertion of routes occur which may result in data-loss, and such data-loss can be prevented by configuring graceful restart on the device.

When IS-IS is used as the interior gateway protocol (IGP), the following EOS features require nonstop forwarding (NSF) and support for the graceful restart from IS-IS:

- ASU2 – Software upgrades.
- SSO – Planned SSO initiated by an operator for maintenance or Unplanned SSO due to failures on the active supervisor.
- RIB agent restart due to software failures.

With IS-IS Graceful Restart (GR) configured, a redundancy switchover from active to standby supervisor or ASU2 or restart of the IS-IS software (the RIB Agent) should be a hitless event, if the GR completes successfully. Which means that, the neighbor routers continue to forward traffic to the restarting router, and traffic forwarding through the restarting router continues without loss. If GR is successful, the failure of a router should be completely transparent to network applications.

ISIS Graceful Restart (GR) is compatible with the following platforms.

- IS-IS GR with unplanned software restart is supported on all platforms.
- IS-IS GR with SSO is supported on modular dual-supervisor platforms.
- IS-IS GR with ASU2 is supported on platforms that support ASU2.

35.3.1 Configuring ISIS Graceful Restart (GR)

By default ISIS graceful restart is disabled. Use `graceful-restart` command to configure the ISIS graceful restart on a ISIS router. However, by default IS-IS `graceful-restart-helper` functionality is enabled, and to disable it use `no graceful-restart-helper` command.

**Examples**

- In this example an ISIS graceful restart is configured with t2 wait time of 30 seconds for level-1 routes.
  ```
  switch(config)# router isis 1
  switch(config-router-isis)# graceful-restart t2 level-1 30
  ```
  t2 is the maximum wait time for LSP database of each level to synchronize (SPF computation is not done while t2 is running). t2 can be configured for either level-1 or level-2 routes through the CLI. The default value is 30 seconds, and the allowed configuration range is 5 to 300 seconds.

- In this example an ISIS graceful restart is configured with restart-hold-time of 50 seconds.
  ```
  switch(config)# router isis 1
  switch(config-router-isis)# graceful-restart restart-hold-time 50
  ```

In case of a planned restart, the hold time advertised by the IS-IS router prior to restart should be greater than the time for which the router is expected to be offline. Otherwise, neighboring routers will bring down the adjacency before the restarting router has a chance to send a restart request in its hello packet, which may result in traffic loss.

In case of ASU2, the IS-IS router instance will advertise a hold time of `<restart-hold-time>` on those interfaces for which the configured hold time is less than restart-hold-time. This is done just before the router restarts.
Chapter 35: IS-IS

IS-IS Graceful Restart

Once the router has restarted, the router's advertised hold time will depend on the “hello-interval” and “hello-multiplier” configuration on each interface as before. By default restart-hold-time is disabled.

Note

Importantly, for Graceful Restart to be successful hold time advertised by the router should be greater than the time it takes for Graceful Restart to complete. If the restarting router is DIS, hold time advertised is 1/3rd of the configured value (default is 9s). We recommend to increase the hold time for DIS to a higher value before a planned restart; otherwise, it may result in traffic loss.

35.3.2 Displaying ISIS Graceful Restart (GR) Information

GR State can be any one of the following:

- Last Start/Restart was completed successfully.
- Last Start/Restart exited after t2 (level-1/level-2) expiry.
- Last Restart exited after t3 expiry.
- Start/Restart in progress.
- Graceful Restart was disabled during startup.

The following show commands are used to verify the ISIS graceful restart information.

- The show isis graceful-restart vrf [vrf-name] command displays the GR configuration and graceful-restart related state of the IS-IS instance as well as its neighbors.

Example

```
switch#show isis graceful-restart vrf default
IS-IS Instance: 1 VRF: default
System ID: 0000.0000.0001
Graceful Restart: Enabled, Graceful Restart Helper: Enabled
State: Last Start exited after T2 (level-1) expiry
  T1 : 3s
  T2 (level-1) : 30s/20s remaining
  T2 (level-2) : 30s/not running
  T3 : not running

System ID       Type   Interface     Restart Capable  Status
is-hostname-1   L1L2   Ethernet1     Yes              Running
is-hostname-2   L1     Ethernet2     Yes              Restarting
```

- The show isis summary vrf [vrf-name] command displays the graceful restart state and helper configuration.

Example

```
switch#show isis summary vrf default
IS-IS Instance: 1 VRF: default
System ID: 0000.0000.0001, administratively enabled
....
Graceful Restart: Enabled, Graceful Restart Helper: Enabled
```

- The show isis neighbors detail vrf [vrf-name] command displays the helper’s view of a restarting router.
Example

switch#show isis neighbors detail vrf default
    Instance  VRF      System Id    Type Interface     SNPA              State Hold
time Circuit Id
1 default OT1    L1 Ethernet1  2:1:0:b4:0:0      UP 29839    OT3.05
    Area Address(es): 49.0001
    SNPA: 2:1:0:b4:0:0
    ....
    Graceful Restart: Supported, Status: Restarting (RR rcvd, RA sent, CSNP sent)

- The `show isis interface detail vrf [vrf-name]` command displays the graceful restart related stats for that interface.

Example

switch#show isis interface detail vrf default
    ISIS Instance: ISISQ VRF: default
    Interface Ethernet1:
        Index: 2 SNPA: P2P
        ...
        Level 1:
        Graceful Restart Status: RR sent, SA sent, RA rcvd, CSNP rcvd
35.4 IS-IS Commands

Global Configuration Commands
- clear isis neighbor
- router isis

Interface Configuration Commands
- adjacency-segment
- authentication key
- authentication mode
- isis authentication key
- isis authentication mode
- isis bfd
- isis enable
- isis hello-interval
- isis hello-multiplier
- isis ipv6 metric
- isis lsp tx interval
- isis metric
- isis multi-topology
- isis network
- isis passive
- isis priority

Router IS-IS Configuration Mode (Includes Address-Family Mode)
- address-family
- graceful-restart (IS-IS)
- is-hostname
- is-type
- log-adjacency-changes (IS-IS)
- match isis level
- multi-topology
- net
- passive (IS-IS)
- redistribute (IS-IS)
- set isis level
- set-overload-bit
- shutdown (IS-IS)
- spf-interval

Display Commands – EXEC Mode
- show isis database
- show isis graceful-restart vrf
- show isis hostname
- show isis interface
- show isis neighbors
- show isis network topology
- show isis segment-routing adjacency-segments
- show isis summary
address-family

The **address-family** command places the switch in address-family configuration mode.

Address-family configuration mode is not a group change mode; **running-config** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

The switch supports these address families:

- ipv4-unicast
- ipv6-unicast

The **no address-family** and **default address-family** commands delete the specified address-family from **running-config** by removing all commands previously configured in the corresponding address-family mode.

The **exit** command returns the switch to router IS-IS configuration mode.

**Command Mode**

Router-IS-IS Configuration

**Command Syntax**

```
isis ADDRESS_FAMILY [TRANSMISSION]
no isis ADDRESS_FAMILY
default isis ADDRESS_FAMILY
```

**Parameters**

- **ADDRESS_FAMILY** Options include:
  - ipv4 IPv4 unicast
  - ipv6 IPv6 unicast
- **MODE** Options include:
  - <no parameter>  Defaults to unicast.
  - unicast  All IPv4 or IPv6 addresses are active.

**Example**

- These commands enter the address family mode for IPv4 unicast.
  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#address-family ipv4 unicast
  switch(config-router-isis-af)#
  ```
- To exit from the IPv4 IS-IS unicast address family configuration mode, enter the following command.
  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#address-family ipv4 unicast
  switch(config-router-isis-af)#exit
  switch(config-router-isis)#
  ```
adjacency-segment

The adjacency-segment command configures the global adjacency-SID for P2P interface for IS-IS adjacencies.

The no adjacency-segment and default adjacency-segment commands restore the switch to its default state by removing the corresponding adjacency-segment command from running-config.

Command Mode
Interface Configuration

Command Syntax
adjacency-segment <ipv4|ipv6> p2p <index|label> global
no adjacency-segment <ipv4|ipv6> p2p <index|label> global
default adjacency-segment <ipv4|ipv6> p2p <index|label> global

Parameters
- ipv4 IS-IS SR adjacency segment IPv4 interface configuration.
- ipv6 IS-IS SR adjacency segment IPv6 interface configuration.
- index Index to be assigned as Adj-SID for adjacency on this interface. The value ranges from 0 to 65535.
- label Label value to be assigned as Adj-SID for adjacency on this interface. The value ranges from 16 to 1048575.
- global global adjacency SID.

Example
- In this example the global adjacency is configured on a p2p interface Ethernet Et1, with an index value 10.
  Switch(config-if-Et1)#adjacency-segment ipv4 p2p index 10 global
authentication key

The `authentication key` command configures the authentication key for the IS-IS instance causing LSPs, CSNPs and PSNPs to be authenticated.

The `no authentication key` and `default authentication key` commands disable the authentication key for the IS-IS instance.

**Command Mode**

ISIS-Router Configuration

**Command Syntax**

```
authentication key [0 | 7] [LAYER_VALUE]
no authentication key [0 | 7] [LAYER_VALUE]
default authentication key [0 | 7] [LAYER_VALUE]
```

**Parameters**

- `LAYER_VALUE` layer value; options include:
  - `level-1`
  - `level-2`

**Examples**

- These commands configure authentication for the IS-IS instance causing LSPs, CSNPs and PSNPs to be authenticated.

```
switch(config)#router isis 1
switch(config-router-isis)##authentication key secret
switch(config-router-isis)#
```
**authentication mode**

The `authentication mode` command configures authentication for the IS-IS instance causing LSPs, CSNPs and PSNPs to be authenticated.

The `no authentication mode` and `default authentication mode` commands disables authentication for the IS-IS instance.

**Command Mode**

ISIS-Router Configuration

**Command Syntax**

```
authentication mode <md5 | text> [LAYER_VALUE]
no authentication mode <md5 | text> [LAYER_VALUE]
default authentication mode <md5 | text> [LAYER_VALUE]
```

**Parameters**

- `LAYER_VALUE` layer value; options include:
  - `level-1`
  - `level-2`

**Examples**

- These commands configure authentication for the IS-IS instance causing LSPs, CSNPs and PSNPs to be authenticated.

```
switch(config)#router isis 1
switch(config-router-isis)#authentication mode md5
switch(config-router-isis)#
```
clear isis neighbor

The clear isis neighbor command clears IS-IS adjacencies that exist on an interface, or at a specific level, or the adjacencies formed with a given neighbor (either with a system ID or a hostname).

Command Mode
Privileged EXEC

Command Syntax
```
clear isis neighbor {Neighbor-ID | all | interface} [level-1 | level-2 | level-1-2]
```

Parameters
- **Neighbor-ID** clears adjacencies based on the system ID or the host name of a neighbor.
- **all** clears adjacencies at different levels of routers.
- **interface** clears adjacencies for a specific interface. The available interfaces are: Ethernet, Loopback, Management, Port-Channel, Tunnel, VLAN, and VXLAN.
- **level-1** level 1 only.
- **level-1-2** level 1-2 point-to-point only.
- **level-2** level 2 only.

Examples
- This command clears IS-IS adjacencies with a neighbor af86.3032.1a0f.
  ```bash
  switch#clear isis neighbor af86.3032.1a0f
  2 neighbors cleared on instance 1
  switch#
  ```
- This command clears all IS-IS adjacencies on an interface et1.
  ```bash
  switch#clear isis neighbor interface et1
  4 neighbors cleared on instance 1
  switch#
  ```
- This command clears IS-IS adjacencies with a neighbor af86.3032.1a0f and on interface et1.
  ```bash
  switch#clear isis neighbor af86.3032.1a0f interface et1
  2 neighbors cleared on instance 1
  switch#
  ```
- This command clears all IS-IS adjacencies at Level 1 and on interface et1.
  ```bash
  switch#clear isis neighbor interface et1 level-1
  2 neighbors cleared on instance 1
  switch#
  ```
- This command clears Level 1-2 point-to-point adjacencies only.
  ```bash
  switch#clear isis neighbor all level-1-2
  0 neighbors cleared on instance 1
  switch#
  ```
graceful-restart (IS-IS)

The `graceful-restart` command configures the IS-IS graceful-restart on the ISIS routers, the command provides the options to configure the `t2` time or the `restart-hold-time`.

`t2` is the maximum wait time for LSP database of each level to synchronize (SPF computation is not done while `t2` is running). `t2` can be configured for either level-1 or level-2 routes.

`restart-hold-time` is the time in seconds before after which the router restarts.

The `no graceful-restart` and `default graceful-restart` commands disables the IS-IS graceful-restart configuration from `running-config`.

**Command Mode**
- Router-IS-IS Configuration

**Command Syntax**
- `graceful-restart <t2 | restart-hold-time> <value>`
- `no graceful-restart <t2 | restart-hold-time> <value>`
- `default graceful-restart <t2 | restart-hold-time> <value>`

**Parameters**
- `value` The time in seconds. Value ranges from 5 to 300 seconds.
- `restart-hold-time` Sets the hold time when restarting.
- `t2` Sets the LSP database sync wait time. Options include.
  - `level-1` Set `t2` for level-1 only.
  - `level-2` Set `t2` for level-2 only.

**Examples**
- In this example an ISIS graceful restart is configured with `t2` wait time of 30 seconds for level-1 routes.
  ```
  switch(config)# router isis 1
  switch(config-router-isis)# graceful-restart t2 level-1 30
  ```
- In this example an ISIS graceful restart is configured with `restart-hold-time` of 50 seconds.
  ```
  switch(config)# router isis 1
  switch(config-router-isis)# graceful-restart restart-hold-time 50
  ```
**is-hostname**

The `is-hostname` command configures the use of a human readable string to represent the symbolic name of an IS-IS router, and map the IS-IS system IDs and IS-IS hostnames. It also changes the output of IS-IS show commands, to show the IS-IS hostname in place of system IDs if the corresponding IS-IS hostname is known. However, syslogs still use IS-IS system IDs and not the IS-IS hostname.

By default if there’s a hostname configured on the switch, it is used as the IS-IS hostname. It is also possible to unconfigure an assigned hostname for IS-IS using the `no is-hostname` command. When the IS-IS hostname is removed, the switch goes back to using the switch’s hostname as the IS-IS hostname.

**Command Mode**

Router-IS-IS Configuration

**Command Syntax**

```bash
is-hostname
no is-hostname
```

**Example**

- These commands configure the IS-IS hostname to the symbolic name `ishost1` for the IS-IS router.
  ```bash
  switch(config)#router isis inst1
  switch(config-router-isis)#is-hostname ishost1
  switch(config-router-isis)#
  ```

- These commands unconfigure the IS-IS hostname of the symbolic name `ishost1` for the IS-IS router.
  ```bash
  switch(config)#router isis inst1
  switch(config-router-isis)#no is-hostname ishost1
  switch(config-router-isis)#
  ```
is-type

The **is-type** command configures the routing level for an IS-IS instance.

An IS-IS router can be configured as Level-1-2 which can form adjacencies and exchange routing information with both Level-1 and Level-2 routers. A Level-1-2 router can be configured to transfer routing information from Level-1 to Level-2 areas and vice versa (via route leaking). By default, all routes from Level-1 area are always leaked into Level-2 network.

**Command Mode**

   - Router-IS-IS Configuration

**Command Syntax**

   - `is-type LAYER_VALUE`

**Parameters**

- **LAYER_VALUE** layer value options include:
  - level-1
  - level-1-2
  - level-2

**Example**

- These commands configure Level 1-2 routing on interface Ethernet 5.
  
  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#is-type level-1-2
  switch(config-router-isis)#
  ```

- These commands configure Level 2 routing on interface Ethernet 5.
  
  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#is-type level-2
  switch(config-router-isis)#
  ```
**isis authentication key**

The *isis authentication key* command configures the authentication key on the interface causing IS-IS Hellos to be authenticated.

The *no isis authentication mode* and *default isis authentication mode* commands disables the authentication key for the IS-IS instance.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

- `isis authentication key [0 | 7] [LAYER_VALUE]`
- `no isis authentication key [0 | 7] [LAYER_VALUE]`
- `default isis authentication key [0 | 7] [LAYER_VALUE]`

**Parameters**

- `LAYER_VALUE` layer value; options include:
  - `level-1`
  - `level-2`

**Examples**

- These commands configure authentication on the interface causing IS-IS Hellos to be authenticated.

  ```
  switch(config)#interface Ethernet 3/6
  switch(config-if-Et3/6)#isis authentication mode text
  switch(config-if-Et3/6)#isis authentication key 7 cAm28+9a/xPi04o7hjd8Jw==
  switch(config-if-Et3/6)#
  ```
**isis authentication mode**

The **isis authentication mode** command configures authentication on the interface causing IS-IS Hellos to be authenticated.

The **no isis authentication mode** and **default isis authentication mode** commands disables authentication for the IS-IS instance.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

```
isis authentication mode <md5 | text> [LAYER_VALUE]
no isis authentication mode <md5 | text> [LAYER_VALUE]
default isis authentication mode <md5 | text> [LAYER_VALUE]
```

**Parameters**

- **LAYER_VALUE** layer value; options include:
  - level-1
  - level-2

**Examples**

- These commands configure authentication on the interface causing IS-IS Hellos to be authenticated.

  ```
  switch(config)#interface Ethernet 3/6
  switch(config-if-Et3/6)#isis authentication mode text
  switch(config-if-Et3/6)#isis authentication key 7 cAm28+9a/xPi04o7hjd8Jw==
  switch(config-if-Et3/6)#
  ```
isis bfd

The `isis bfd` command activates the corresponding IS-IS routing instance on the configuration mode interface. By default, the IS-IS routing instance is not enabled on an interface.

The `no isis enable` and `default isis enable` commands disable IS-IS on the configuration mode interface by removing the corresponding `isis enable` command from `running-config`.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

```plaintext
isis bfd
no isis bfd
default isis bfd
```

**Examples**

- These commands enable BFD on IS-IS interfaces.

```plaintext
switch(config)#interface Ethernet 5/6
switch(config-if-Et5/6)#isis bfd
switch(config-if-Et5/6)#
```
**isis enable**

The `isis enable` command activates the corresponding IS-IS routing instance on the configuration mode interface. By default, the IS-IS routing instance is not enabled on an interface.

The `no isis enable` and `default isis enable` commands disable IS-IS on the configuration mode interface by removing the corresponding `isis enable` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
isis enable instance_id
no isis enable
default isis enable
```

**Parameters**
- `instance_id` IS-IS instance name.

**Examples**

- These commands enable the IS-IS protocol on the interface Ethernet 4.
  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)# net 49.0001.1010.1040.1030.00
  switch(config-router-isis)#interface ethernet 4
  switch(config-if-Eth4)#isis enable Osiris
  ```

- These commands disable the IS-IS protocol on the interface Ethernet 4.
  ```
  switch(config)#interface ethernet 4
  switch(config-if-Eth4)# no isis enable
  ```
**isis hello-interval**

The **isis hello-interval** command sends Hello packets from applicable interfaces to maintain the adjacency through the transmitting and receiving of Hello packets. The Hello packet interval can be modified.

The **no isis hello-interval** and **default isis hello-interval** commands restore the default hello interval of 10 seconds on the configuration mode interface by removing the **isis hello-interval** command from **running-config**.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
isis hello-interval time
no isis hello-interval
default isis hello-interval
```

**Parameters**
- **time**  Values range from 1 to 300; default is 10.

**Examples**
- These commands configure a hello interval of 45 seconds for VLAN 200.
  ```
  switch(config)#interface vlan 200
  switch(config-if-Vl200)#isis hello-interval 45
  switch(config-if-Vl200)#
  ```
- These commands remove the configured hello interval of 45 seconds from VLAN 200.
  ```
  switch(config)#interface vlan 200
  switch(config-if-Vl200)#no isis hello-interval
  switch(config-if-Vl200)#
  ```
- These commands configure a hello interval of 60 seconds for Ethernet 5.
  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#isis hello-interval 60
  switch(config-if-Et5)#
  ```
- These commands remove the configured hello interval of 60 seconds from Ethernet 5.
  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#no isis hello-interval
  switch(config-if-Et5)#
  ```
**isis hello-multiplier**

The `isis hello-multiplier` command specifies the number of IS-IS hello packets missed by a neighbor before the adjacency is considered down.

The `no isis hello-multiplier` and `default isis hello-multiplier` commands restore the default hello interval of 3 on the configuration mode interface by removing the `isis hello-multiplier` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

- `isis hello-multiplier factor`
- `no isis hello-multiplier`
- `default isis hello-multiplier`

**Parameters**
- `factor` Values range from 3 to 100; default is 3

**Examples**

- These commands configure a hello multiplier of 4 for VLAN 200.
  ```
  switch(config)#interface vlan 200
  switch(config-if-Vl200)#isis hello-multiplier 4
  switch(config-if-Vl200)#
  ```

- These commands remove the configured hello multiplier of 4 from VLAN 200.
  ```
  switch(config)#interface vlan 200
  switch(config-if-Vl200)# no isis hello-multiplier
  switch(config-if-Vl200)#
  ```

- These commands configure a hello multiplier of 45 for Ethernet 5.
  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#isis hello-multiplier 45
  switch(config-if-Et5)#
  ```

- These commands remove the configured hello multiplier of 45 from Ethernet 5.
  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#no isis hello-multiplier
  switch(config-if-Et5)#
  ```
isis ipv6 metric

The `isis ipv6 metric` command configures the IPv6 metric.

The `no isis ipv6 metric` and `default isis ipv6 metric` commands restore the default metric of 10 on the configuration mode interface.

**Command Mode**

- Interface-Ethernet Configuration

**Command Syntax**

```
isis ipv6 metric metric_value
no isis ipv6 metric
default isis ipv6 metric
```

**Parameters**

- `metric_value` Values range from 1 to 16777214; default is 10.

**Examples**

- These commands configure the IPv6 metric.

  ```
  switch(config)#interface Ethernet 5/6
  switch(config-if-Et5/6)#isis ipv6 metric 30
  switch(config-if-Et5/6)#
  ```
**isis lsp tx interval**

The `isis lsp tx interval` command sets the interval at which IS-IS sends link-state information on the interface.

The `no isis lsp tx interval` and `default isis lsp tx interval` commands restores the default setting of 33 ms. by removing the `isis lsp tx interval` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
isis lsp tx interval period
no isis lsp tx interval
default isis lsp tx interval
```

**Parameters**
- `period` Value ranges from 1 through 3000. Default interval is 33 ms.

**Examples**
- This command sets the LSP interval on interface Ethernet 5 to 600 milliseconds.
  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)# isis lsp tx interval 600
  switch(config-if-Et5)#
  ```
- This command removes the LSP interval on interface Ethernet 5.
  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)# no isis lsp tx interval
  switch(config-if-Et5)#
  ```
**isis metric**

The `isis metric` command sets cost for sending information over an interface.

The `no isis metric` and `default isis metric` commands restores the default metric to its default value of 10 by removing the `isis metric` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
isis metric metric_cost
no isis metric
default isis metric
```

**Parameters**

- `metric_cost` Values range from 1 to 16777214. Default value is 10.

**Examples**

- These commands configure a metric cost of 30 for sending information over Ethernet 5.
  
  switch(config)#router isis Osiris
  switch(config-router-isis)#interface ethernet 5
  switch(config-if-Et5)#isis metric 30
  switch(config-if-Et5)#

- These commands remove the configured metric cost of 30 from Ethernet 5.
  
  switch(config)#router isis Osiris
  switch(config-router-isis)#interface ethernet 5
  switch(config-if-Et5)#no isis metric
  switch(config-if-Et5)#
isis multi-topology

The **isis multi-topology** command configures the IPv4 or IPv6 address family individually on an interface with both IPv4 and IPv6 addresses.

The **no isis multi-topology** and **default isis multi-topology** commands restores the default interface to both IPv4 and IPv6 address families.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

- `isis multi-topology address-family ipv4 unicast`
- `no isis multi-topology address-family ipv4 unicast`
- `default isis multi-topology address-family ipv4 unicast`

**Examples**

- These commands configure the IPv4 address family on an interface with both IPv4 and IPv6 addresses.

  ```
  switch(config)#interface Ethernet 5/6
  switch(config-if-Et5/6)#isis multi-topology address-family ipv4 unicast
  switch(config-if-Et5/6)#
  ```

- These commands configure the IPv6 address family on an interface with both IPv4 and IPv6 addresses.

  ```
  switch(config)#interface Ethernet 5/6
  switch(config-if-Et5/6)#isis multi-topology address-family ipv6 unicast
  switch(config-if-Et5/6)#
  ```

- These commands configure both the IPv4 and IPv6 address families on an interface.

  ```
  switch(config)#interface Ethernet 5/6
  switch(config-if-Et5/6)#no isis multi-topology address-family unicast
  switch(config-if-Et5/6)#
  ```
**isis network**

The `ip isis network` command sets the configuration mode interface as a point-to-point link. By default, interfaces are configured as broadcast links.

The `no ip isis network` and `default ip isis network` commands set the configuration mode interface as a broadcast link by removing the corresponding `ip isis network` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `ip isis network point-to-point`
- `no ip isis network`
- `default ip isis network`

**Examples**
- These commands configure Ethernet interface 10 as a point-to-point link.
  ```
  switch(config)#interface ethernet 10
  switch(config-if-Et10)# isis network point-to-point
  switch(config-if-Et10)#
  ```
- This command restores Ethernet interface 10 as a broadcast link.
  ```
  switch(config-if-Et10)#no isis network
  switch(config-if-Et10)#
  ```
### isis passive

The `isis passive` command disables IS-IS on an interface configured as passive. The switch won’t send or process IS-IS packets received on passive interfaces. The switch will continue to advertise the IP address in the LSP.

The `no isis passive` command enables IS-IS on the interface. The `default isis passive` command sets the interface to the default interface activity setting by removing the corresponding `isis passive` or `no isis passive` statement from `running-config`.

#### Command Mode
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

#### Command Syntax

- `isis passive`
- `no isis passive`
- `default isis passive`

#### Examples

- These commands configure Ethernet interface 10 as a passive interface.
  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#interface ethernet 10
  switch(config-if-Et10)# isis passive
  switch(config-if-Et10)#
  ```

- This command restores Ethernet interface 10 as a broadcast link.
  ```
  switch(config-if-Et10)#no isis passive
  switch(config-if-Et10)#
  ```
**isis priority**

The `isis priority` command sets IS-IS priority for the interface.

The default priority is 64. The network device with the highest priority will be elected as the designated intermediate router to send link-state advertisements for that network.

The `no isis priority` and `default isis priority` commands restore the default priority (64) on the configuration mode interface.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
isis priority priority_level
no isis priority
default isis priority
```

**Parameters**
- `priority_level`  Value ranges from 0 to 127. Default value is 64.

**Examples**

- These commands configure a IS-IS priority of 60 on interface Ethernet 5.

```plaintext
switch(config)#router isis Osiris
switch(config-router-isis)#interface ethernet 5
switch(config-if-Et5)#priority 60
switch(config-if-Et5)#
```

- These commands restores the default IS-IS priority of 64 from interface Ethernet 5.

```plaintext
switch(config)#router isis Osiris
switch(config-router-isis)#interface ethernet 5
switch(config-if-Et5)# no priority
switch(config-if-Et5)#
```

- These commands configure the switch with a priority of 64 for VLAN 7.

```plaintext
switch(config)#interface vlan 7
switch(config-if-Vl7)#isis priority 64
switch(config-if-Vl7)#
```

- These command restores the default IS-IS priority of 64 for VLAN 7.

```plaintext
switch(config)#interface vlan 7
switch(config-if-Vl7)#no isis priority
switch(config-if-Vl7)#
```
log-adjacency-changes (IS-IS)

The **log-adjacency-changes** command sets the switch to send syslog messages when it detects link state changes or when it detects that a neighbor state has changed.

The default option is active when `running-config` does not contain any form of the command. Entering the command in any form replaces the previous command state in `running-config`.

**Command Mode**

Router-IS-IS Configuration

**Command Syntax**

```
log-adjacency-changes
no log-adjacency-changes
default log-adjacency-changes
```

**Examples**

- These commands configure the switch to send a syslog message when a neighbor state changes.

  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#log-adjacency-changes
  switch(config-router-isis)#
  ```

- These commands configure not to log the peer changes.

  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#no log-adjacency-changes
  switch(config-router-isis)#
  ```
**match isis level**

The *match isis level* command configures a route map to match on ISIS level. It filters the Level-1 or Level-2 routes by using route map’s match statement.

The *no match isis level* and *default match isis level* commands disables the match ISIS level configuration from *running-config*.

**Command Mode**

Route-map Configuration

**Command Syntax**

```
match isis level [level-1|level-2]
no match isis level [level-1|level-2]
default set isis level [level-1|level-2]
```

**Parameters**

- **level-1**  IS-IS level 1
- **level-2**  IS-IS level 2

**Example**

- These commands place the switch in route-map mode, and configures a route map to match isis level to level-1.
  ```
  switch(config)#route-map Test
  switch(config-route-map-test)# match isis level level-1
  ```
multi-topology

The multi-topology command configures IS-IS Multi-Topology (MT) support (disabled by default), enabling an IS-IS router to compute a separate topology for IPv4 and IPv6 links in the network. With MT configured, not all the links in a network need to support both IPv4 and IPv6. Some can support IPv4 or IPv6 individually. The IPv4 SPF will install IPv4 routes using the IPv4 topology, and similarly the IPv6 SPF will install IPv6 routes using the IPv6 topology. Without MT support, all links in an IS-IS network need to support the same set of address families. When MT is enabled, and each link has a separate IPv4 metric and IPv6 metric.

The no multi-topology and default multi-topology commands restores the default interface to both IPv4 and IPv6 address families.

Command Mode
- Interface-Ethernet Configuration

Command Syntax
- multi-topology
- no multi-topology
- default multi-topology

Examples
- These commands configure MT for the IS-IS router.

```bash
switch(config)#router isis 1
switch(config-router-isis)#address-family ipv6 unicast
switch(config-router-isis-af)#multi-topology
```

- These commands unconfigure MT for the IS-IS router.

```bash
switch(config)#router isis 1
switch(config-router-isis)#address-family ipv6 unicast
switch(config-router-isis-af)#no multi-topology
```

The **net** command configures the name of Network Entity Title of the IS-IS instance. By default, no NET is defined.

The **no net** and **default net** commands removes the NET from **running-config**.

**Command Mode**

Router-IS-IS Configuration

**Command Syntax**

```
net mask_hex
no net
default net
```

**Parameters**

- **mask_hex** mask value. Format is hh.hhhh.hhhh.hhhh.hhhh.hhhh.hhhh.hhhh.hhhh.00.

**Examples**

- These commands specify the NET as 49.0001.1010.1040.1030.00, in which the system ID is 1010.1040.1030, area ID is 49.0001.
  
  switch(config)#router isis Osiris
  switch(config-router-isis)# net 49.0001.1010.1040.1030.00
  switch(config-router-isis)#

- These commands remove NET 49.0001.1010.1040.1030.00 from **running-config**.
  
  switch(config)#router isis Osiris
  switch(config-router-isis)# no net 49.0001.1010.1040.1030.00
  switch(config-router-isis)#
passive (IS-IS)

The **passive** command disables IS-IS on a passive interface. The switch will continue to advertise the IP address in the LSP.

The **no passive** command enables IS-IS on the interface. The **default passive** command sets the interface to the default interface activity setting by removing the corresponding **passive** or **no passive** statement from **running-config**.

**Command Mode**

Router-IS-IS Configuration

**Command Syntax**

- `passive INTERFACE_NAME`
- `no passive INTERFACE_NAME`
- `default passive INTERFACE_NAME`

**Parameters**

- **INTERFACE_NAME**
  - Options include:
    - `ethernet e_range` Ethernet interface list.
    - `loopback l_range` Loopback interface list.
    - `port-channel p_range` Channel group interface list.
    - `vlan v_range` VLAN interface list.

Valid `e_range`, `l_range`, `p_range`, and `v_range` formats include number, range, or comma-delimited list of numbers and ranges.

**Examples**

- These commands configure Ethernet interface 10 as a passive interface.
  
  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)# passive interface ethernet 10
  ```

- This command restores Ethernet interface 10 as an active interface.
  
  ```
  switch(config-if-Et10)#no passive
  switch(config-if-Et10)#
  ```
**redistribute (IS-IS)**

The `redistribute` command redistributes the connected or static routes specified.

The `no redistribute` and `default redistribute` commands disable route redistribution from the specified domain by removing the corresponding `redistribute` statement from `running-config`.

**Command Mode**
- Router-IS-IS Configuration

**Command Syntax**

```
redistribute ROUTE_TYPE
no redistribute ROUTE_TYPE
default redistribute ROUTE_TYPE
```

**Parameters**

- `ROUTE_TYPE` The route type for which routes are redistributed. These are the option to include.
  - bgp Redistribution of BGP routes.
  - connected Redistribution of connected routes.
  - ospf Redistribution of OSPF routes.
  - ospfv3 Redistribution of OSPFv3 routes.
  - static Redistribution of static routes.

**Examples**

- These commands redistribute connected routes into the IS-IS domain.
  ```
  switch(config)#router isis Test
  switch(config-router-isis)#redistribute connected
  ```

- These commands redistribute static routes into the IS-IS domain.
  ```
  switch(config)#router isis Test
  switch(config-router-isis)#redistribute static
  ```

- These commands redistribute the BGP routes into ISIS domain in `address-family` mode.
  ```
  Switch(config)#router isis 1
  Switch(config-router-isis)#address-family ipv4
  Switch(config-router-isis-af)#redistribute bgp route-map bgp-to-isis-v4
  ```

- These commands redistribute the BGP routes into ISIS domain in `router-isis` mode.
  ```
  Switch(config)#router isis 1
  Switch(config-router-isis)#redistribute bgp route-map bgp-to-isis
  ```
router isis

The `router isis` command places the switch in router ISIS configuration mode. Router ISIS configuration mode is not a group change mode; `running-config` is changed immediately after commands are executed. The `exit` command does not affect the configuration. The `no router isis` command deletes the IS-IS instance. The `exit` command returns the switch to global configuration mode.

**Command Mode**

Global Configuration

**Command Syntax**

```
router isis instance_name [VRF_INSTANCE]
no router isis instance_name
default router isis instance_name
```

**Parameters**

- `instance_name` routing instance.
- `VRF_INSTANCE`
  - `<no parameter>`
  - `vrf vrf_name`

**Examples**

- These commands places the switch in router IS-IS mode and creates an IS-IS routing instance named Osiris.
  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#
  ```

- This command attempts to open an instance with a different routing instance name from that of the existing instance. The switch displays an error and stays in global configuration mode.
  ```
  switch(config)#router isis Osiris
  % More than 1 ISIS instance is not supported
  switch(config)#
  ```

- This command deletes the IS-IS instance.
  ```
  switch(config)#no router isis Osiris
  switch(config)#
  ```
**set isis level**

The `set isis level` command configures a route map to set ISIS level.

The `no set isis level` and `default set isis level` commands disable the set ISIS level configuration from `running-config`.

**Command Mode**

Route-map Configuration

**Command Syntax**

```
set isis level [level-1|level-2|level-1-2]
no set isis level [level-1|level-2|level-1-2]
default set isis level [level-1|level-2|level-1-2]
```

**Parameters**

- `level-1` IS-IS level 1
- `level-2` IS-IS level 2
- `level-1-2` IS-IS level 1 and level 2

**Example**

- These commands place the switch in route-map mode, and configures a route map to set isis level to level-1.

  ```
  switch(config)#route-map Test
  switch(config-route-map-test)# set isis level level-1
  ```
set-overload-bit

The `set-overload-bit` command used without the on-startup option will inform other devices not to use this switch in SPF computation. When used with the on-startup parameter, the overload bit is set for the interval after startup.

The `no set-overload-bit` and `default set-overload-bit` commands removes the corresponding `set-overload-bit` command from `running-config`.

**Command Mode**

Router-IS-IS Configuration

**Command Syntax**

```
set-overload-bit TIMING
no set-overload-bit
default set-overload-bit
```

**Parameters**

- **TIMING** Options include:
  - `<no parameter>`
  - `on-startup <1 to 3600>`

**Example**

- These commands configure the switch to set the overload bit to 120 seconds after startup.
  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#set-overload-bit on-startup 120
  switch(config-router-isis)#
  ```

- These commands remove the configured overload bit of 120 seconds from the `running-config`.
  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#no set-overload-bit on-startup
  switch(config-router-isis)#
  ```
show isis database

The `show isis database` command displays the link state database of IS-IS. The default command displays active routes and learned routes.

**Command Mode**

EXEC

**Command Syntax**

```
show isis database [INSTANCES] [INFO_LEVEL]
show isis database [INFO_LEVEL] VRF_INSTANCE
```

**Parameters**

- **INSTANCES** Options include:
  - <no parameter>
  - `instance_name`
- **INFO_LEVEL** Options include:
  - <no parameter>
  - `detail`
- **VRF_INSTANCE** specifies the VRF instance.
  - <no parameter>
  - `vrf vrf_name`

**Display Values**

- ISIS Instance
- LSPID
- Seq Num
- Cksum
- Life
- IS

**Examples**

- This command displays general information about the link state database of IS-IS.
  ```
  switch>show isis database
  ISIS Instance: Osiris
  ISIS Level 2 Link State Database
  LSPID     Seq Num  Cksum  Life  IS Flags

show isis graceful-restart vrf

The `show isis graceful-restart vrf` command displays the GR configuration and graceful-restart related state of the IS-IS instance as well as its neighbors.

**Command Mode**

EXEC

**Command Syntax**

`show isis graceful-restart vrf <vrf-name>`

**Example**

- In this example the `show isis graceful-restart` command displays the output for the `default` vrf instance.

```
switch#show isis graceful-restart vrf default
IS-IS Instance: 1 VRF: default
System ID: 0000.0000.0001
Graceful Restart: Enabled, Graceful Restart Helper: Enabled
State: Last Start exited after T2 (level-1) expiry
  T1 : 3s
  T2 (level-1) : 30s/20s remaining
  T2 (level-2) : 30s/not running
  T3 : not running

System ID       Type   Interface     Restart Capable  Status
is-hostname-1   L1L2   Ethernet1     Yes              Running
is-hostname-2   L1     Ethernet2     Yes              Restarting
```
show isis hostname

The **show isis hostname** command displays mapping between the System ID and IS-IS hostname.

**Command Mode**

EXEC

**Command Syntax**

`show isis hostname`

**Examples**

- This command mapping between the System ID and IS-IS hostnames host1 and host2.

  switch>**show isis hostname**
  ISIS Instance: 1 VRF: default
  Level System ID Hostname
  L1 1111.1111.1001 host1
  L1 1111.1111.1002 host2
show isis interface

The show isis interface command displays interface information for the IS-IS instance.

Command Mode
EXEC

Command Syntax
show isis interface [INSTANCES] [INTERFACE_NAME] [INFO_LEVEL]
show isis interface [INTERFACE_NAME] [INFO_LEVEL] VRF_INSTANCE

Parameters
• INSTANCES Options include:
  • <no parameter>
  • instance_name
• INTERFACE_NAME Values include
  • <no parameter> all interfaces.
  • ethernet e_num Ethernet interface specified by e_num.
  • loopback l_num Loopback interface specified by l_num.
  • management m_num Management interface specified by m_num.
  • port-channel p_num Port channel interface specified by p_num.
  • vlan v_num VLAN interface specified by v_num.
  • vxlan vx_num VXLAN interface specified by vx_num.
• INFO_LEVEL Options include:
  • <no parameter>
  • detail
• VRF_INSTANCE specifies the VRF instance.
  • <no parameter>
  • vrf vrf_name

Display Values
• ISIS Instance
• System ID
• Index
• MTU
• Metric
• LAN-ID
• DIS
• Type
• Interface
• SNPA
• State
• Hold time
Examples

- This command displays general IS-IS information for instance Osiris.

```plaintext
switch>show isis interface

ISIS Instance: Osiris
Interface Vlan20:
  Index: 59 SNPA: 0:1c:73:c:5:7f
  MTU: 1497 Type: broadcast
  Level 2:
    Metric: 10, Number of adjacencies: 2
    LAN-ID: 1212.1212.1212, Priority: 64
    DIS: 1212.1212.1212, DIS Priority: 64
Interface Ethernet30:
  Index: 36 SNPA: 0:1c:73:c:5:7f
  MTU: 1497 Type: broadcast
  Level 2:
    Metric: 10, Number of adjacencies: 1
    LAN-ID: 3030.3030.3030, Priority: 64
    DIS: 3030.3030.3030, DIS Priority: 64
```
- This command displays detailed IS-IS information for instance Osiris.

    switch>show isis interface detail

    ISIS Instance: Osiris
    Interface Vlan20:
        Index: 59 SNPA: 0:1c:73:c:5:7f
        MTU: 1497 Type: broadcast
        Level 2:
            Metric: 10, Number of adjacencies: 2
            LAN-ID: 1212.1212.1212, Priority: 64
            DIS: 1212.1212.1212, DIS Priority: 64

                SNPA: 2:1:0:b:0:0, Priority: 64
                IPv4 Interface Address: 30.1.1.2
                IPv6 Interface Address: fe80::1:ff:fe0b:0
                Areas:
                49.0001
show isis neighbors

The show isis neighbors command displays IS-IS information.

Command Mode

EXEC

Command Syntax

show isis neighbors [INSTANCES] [INFO_LEVEL]
show isis neighbors [INFO_LEVEL] VRF_INSTANCE

Parameters

- **INSTANCES**  Options include:
  - <no parameter>
  - instance_name
- **INFO_LEVEL**  Options include:
  - <no parameter>
  - detail
- **VRF_INSTANCE** specifies the VRF instance.
  - <no parameter>
  - vrf vrf_name

Display Values

- Inst. ID
- System ID
- Type
- Interface
- SNPA
- State
- Hold time
- Area Address

Examples

- This command displays general information about the IS-IS neighbors.

  switch(config)#show isis neighbors

<table>

  switch(config)#
show isis network topology

The show isis network topology command displays a list of all connected devices in all areas.

Command Mode
EXEC

Command Syntax
show isis network topology
show isis INSTANCES topology
show isis network topology VRF_INSTANCE

Parameters
• INSTANCES Options include:
  • <no parameter>
  • instance_name
• VRF_INSTANCE specifies the VRF instance.
  • <no parameter>
  • vrf vrf_name

Display Values
• System Id
• Metric
• Next-Hop
• Interface
• SNPA

Examples
• This command displays forwarding state for ports mapped to all VLANs.
  switch>show isis network topology

switch(config)#
show isis segment-routing adjacency-segments

The `show isis segment-routing adjacency-segments` command displays the global adjacency SID value and other related informations.

**Command Mode**

EXEC

**Command Syntax**

`show isis segment-routing adjacency-segments`

**Examples**

- In this example the `show isis segment-routing adjacency-segments` command displays the output for the interface configured like this:
  ```
  interface Ethernet1
  ip address 1.1.1.1/24
  ipv6 address 1000::1/64
  isis enable isis1
  isis network point-to-point
  adjacency-segment ipv4 p2p index 1 global
  adjacency-segment ipv6 p2p index 2 global
  ```
- The show output for the above interface configuration:

  ```
  Switch# show isis segment-routing adjacency-segments

  System ID: 1000.0000.0002                       Instance: isis1
  SR supported Data-plane: MPLS                   SR Router ID: 1.1.1.4
  Adj-SID allocation mode: SR-adjacencies
  Adj-SID allocation pool: Base: 100000     Size: 16384
  Adjacency Segment Count: 2
  Flag Descriptions: F: Ipv6 address family, B: Backup, V: Value
                   L: Local, S: Set
  Segment Status codes: L1 - Level-1 adjacency, L2 - Level-2 adjacency, P2P - Point-to-Point adjacency, LAN - Broadcast adjacency

  Locally Originated Adjacency Segments
  Adj IP Address     Local Intf    SID      SID Source    Flags                Type
  ----------------  ----------    ------  -------------  ---------------     -------
  1.1.1.2         Et1         1        Configured   F:0 B:0 V:0 L:0 S:0  P2P L1
  fe80::1:ff:fe65:0    Et1         2        Configured   F:1 B:0 V:0 L:0 S:0  P2P L1

  Received Global   Adjacency Segments
  SID      Originator                  Neighbor             Flags

      }
    }
  }
}
```
show isis summary

The show isis summary command displays information about the configured IS-IS instances.

Command Mode

EXEC

Command Syntax

show isis summary
show isis [INSTANCES] summary
show isis summary VRF_INSTANCE

Parameters

• INSTANCES Options include:
  • <no parameter>
  • instance_name

• VRF_INSTANCE specifies the VRF instance.
  • <no parameter>
  • vrf vrf_name

Display Values

• System ID
• IPv4 Preference
• IPv6 Preference
• IS-Types
• LSP Generation interval
• SPF Interval
• Current SPF Hold Interval
• IS-Types Run Time
• Area Addresses
• Designated Intermediate Systems (DIS) Interfaces
• Link State Database (LSDB) size

Display Status

• Multi Topology
• Authentication Mode
• Graceful Restart
• Graceful Restart Helper
Example

- This command displays general information about the configured IS-IS instances.

```plaintext
switch(config-router-isis-af)#show isis summary

IS-IS Instance: 1 VRF: default
System ID: 0000.0000.0001, administratively enabled
Multi Topology disabled, not attached
IPv4 Preference: Level 1: 115, Level 2: 115
IPv6 Preference: Level 1: 115, Level 2: 115
IS-Type: Level 1 and 2, Number active interfaces: 0
Routes both IPv4 and IPv6

Max wait(s) Initial wait(ms) Hold interval(ms)
LSP Generation Interval: 5 50 50
SPF Interval: 2 1000 1000
Current SPF hold interval(ms): Level 1: 1000, Level 2: 1000
Last Level 1 SPF run 1 seconds ago
Last Level 2 SPF run 1 seconds ago
Authentication mode: Level 1: None, Level 2: None
Graceful Restart: Disabled, Graceful Restart Helper: Enabled
Area Addresses:
  49.0001
  level 1: number dis interfaces: 0, LSDB size: 1
  level 2: number dis interfaces: 0, LSDB size: 1
```
shutdown (IS-IS)

The shutdown command disables IS-IS on the switch without modifying the IS-IS configuration. The no shutdown and default shutdown commands enable the IS-IS instance by removing the shutdown command from running-config.

Command Mode
   Router-IS-IS Configuration

Command Syntax
   shutdown
   no shutdown
   default shutdown

Examples
   • These commands disable IS-IS on the switch.
     switch(config)#router isis Osiris
     switch(config-router-isis)#shutdown
     switch(config-router-isis)#
   • This command enables IS-IS on the switch.
     switch(config)#router isis Osiris
     switch(config-router-isis)#no shutdown
     switch(config-router-isis)#
**spf-interval**

The `spf-interval` command sets the Shortest Path First (SPF) timer that defines the interval between IS-IS path calculations. The default value is two seconds.

This command also configures the maximum wait interval between any two SPF runs, initial wait interval before executing the first SPF computation, and the hold time between the first and second SPF runs.

The `no spf-interval` and `default spf-interval` commands restore the default maximum IS-IS path calculation interval to two seconds by removing the `spf-interval` command from `running-config`.

For information about viewing SPF interval values, see Verify IS-IS Interval Information.

**Command Mode**
- Router-IS-IS Configuration

**Command Syntax**

```
spf-interval max-wait [initial-wait | hold-time]
default spf-interval
no spf-interval
```

**Parameters**

- `max-wait` Value ranges from 1 through 300 seconds. Default maximum wait interval is two seconds.
- `initial-wait` Value ranges from 1 through 300000 ms. Default initial wait interval is 1000 ms.
- `hold-time` Value ranges from 1 through 300000 ms. Default hold interval is 1000 ms.

**Guidelines**

EOS does not support configuring topology-specific SPF timers in multi-topology deployments and IS-IS level-specific SPF timers.

**Examples**

- This command configures the SPF maximum wait interval to 50 seconds.
  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#spf-interval 50
  ```

- This command configures maximum wait interval, initial wait interval, and hold time to 20 seconds, 10000 ms, and 5000 ms respectively.
  ```
  switch(config)#router isis inst1
  switch(config-router-isis)#spf-interval 20 10000 5000
  ```

- This command reverts the SPF interval configuration to its default value.
  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#no spf-interval
  ```
Multiprotocol Label Switching (MPLS)

Tunneling protocols encapsulate packets of a different protocol as the payload of a larger frame for delivery within networks utilizing the encapsulating protocol. Tunneling facilitates the delivery of payload over an incompatible delivery network and creates a secure path through an untrusted network. Protocols that this chapter describes include MPLS, Decap Groups, and Nexthop Groups.

Sections in this chapter include:
- Section 36.1: MPLS
- Section 36.2: BGP/MPLS L3 VPN
- Section 36.3: Decap Groups
- Section 36.4: Nexthop Groups
- Section 36.5: MPLS Commands

36.1 MPLS

These sections describe the Arista MPLS implementation:
- Section 36.1.1: MPLS Description
- Section 36.1.2: MPLS Configuration

36.1.1 MPLS Description

36.1.1.1 MPLS Overview

Multiprotocol Label Switching (MPLS) is a networking process that replaces complete network addresses with short path labels for directing data packets to network nodes. The labels identify virtual links (paths) between distant nodes rather than endpoints. MPLS is scalable and protocol-independent. Data packets are assigned labels, which are used to determine packet forwarding destinations without examining the packet.

Arista switches utilize MPLS to improve efficiency and control from servers through data centers and to the WAN. The MPLS implementation supports static MPLS tunneling that is manually configured on each switch or established over a network by an SDN controller. The configuration is specified by a set of rules that filter packets based on matching criteria. Each rule applies MPLS-related actions to packets that match the rule's criteria. Each rule includes a metric that the switch uses to select an action when multiple rules match a packet.
36.1.1.2 MPLS Implementation

MPLS static rule parameters contain the following:

- A 20-bit value that is compared to the top header label of each MPLS packet. Other rule parameters may be applied to packets whose top label match this value.
- A nexthop location that specifies the packet’s next destination (IPv4 or IPv6) and the interface through which the switch forwards the packet.
- An MPLS label stack management action that is performed on filtered packets:
  - pop-payload: removes the top label from stack; this terminates an LSP (label-switched path).
  - swap-label: replaces top label with a specified new label; this passes a packet along an LSP.
- A rule metric that the switch uses to select a rule when multiple rules match an MPLS packet.

Packets that do not match any MPLS rules are dropped.

36.1.1.3 MPLSoGRE Filtered Mirroring

In MPLS over Generic Routing Encapsulation (MPLSoGRE) filtered mirroring, IPv4 over MPLS over GRE (IPv4oMPLSoGRE) and IPv6 over MPLS over GRE (IPv6oMPLSoGRE) packets that enter a GRE tunnel endpoint on which MPLS lookup is performed, are selected for mirroring based on the destination IP address field in the inner IPv4 or IPv6 header.

Note

These packets are not selected for mirroring if they are forwarded based on either the L2 or outer L3 header destination address.

Figure 36-1 shows the header format of the packets that are selected for mirroring.

Figure 36-1: Header Format of Packets

<table>
<thead>
<tr>
<th>Ethernet</th>
<th>Outer IPv4</th>
<th>GRE</th>
<th>MPLS</th>
<th>Inner IPv4</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ethernet</td>
<td>Outer IPv4</td>
<td>GRE</td>
<td>MPLS</td>
<td>Inner IPv6</td>
</tr>
</tbody>
</table>

When mirroring to a GRE tunnel, the payload of the outgoing GRE packet contains the payload of the incoming source packet starting from the MPLS header. L2 and outer L3 headers are stripped from the mirror copy. When the MPLS lookup fails, the packet is still eligible for mirroring based on the selection criteria defined in the ACL.

36.1.2 MPLS Configuration

MPLS routing is enabled through the `mpls ip` command.

- This command enables MPLS routing.

```
switch(config)#mpls ip
switch(config)#show running-config
```
Example

mpls ip
!
end

switch(config)#

MPLS rules are created by the mpls static command. MPLS static rules identify a set of MPLS packets by a common top label and defines the method of handling these packets.

Examples

• These commands create an MPLS rule that matches packets with a top label value of 3400 and causes the removal of the top label from the header stack. The nexthop destination of the IPv4 payload is IP address 10.14.4.4 through Ethernet interface 3/3/3. This rule has a metric value of 100.

switch(config)#mpls static top-label 3400 ethernet 3/3/3 10.14.4.4 pop
payload-type ipv4
switch(config)#show running-config

! mpls static top-label 3400 Ethernet3/3/3 10.14.4.4 pop payload-type ipv4
!
end
switch(config)#

• These commands create a backup rule that forwards the packet through Ethernet interface 4/3. This rule's metric value of 150 assigns it backup status prior to the first rule.

switch(config)#mpls static top-label 3400 ethernet 4/3 10.14.4.4 pop payload-type ipv4 metric 150
switch(config)#show running-config

! mpls static top-label 3400 Ethernet4/3 10.14.4.4 pop payload-type ipv4 metric 150
mpls static top-label 3400 Ethernet3/3/3 10.14.4.4 pop payload-type ipv4
!
end
switch(config)#

• These commands create an MPLS rule that forwards the packet to the nexthop address through any interface.

switch(config)#mpls static top-label 4400 10.15.46.45 pop payload-type ipv4
switch(config)#show running-config

<----------OUTPUT OMITTED FROM EXAMPLE---------->

! mpls static top-label 3400 Ethernet4/3 10.14.4.4 pop payload-type ipv4 metric 150
mpls static top-label 3400 Ethernet3/3/3 10.14.4.4 pop payload-type ipv4
mpls static top-label 4400 10.15.46.45 pop payload-type ipv4
!
end
switch(config)#
This command configures a static tunnel for the tunnel endpoint 64.0.0.1 and pushes a label 11111 to it.

```
switch(config)# mpls static STATIC 64.0.0.1/32 54.0.0.1 Port-Channel7 label-stack 11111
```

The switch’s MPLS static rule configuration for specified routes and rules is displayed by `show mpls route`.

**Example**

- This command displays the MPLS rule configuration.

```
switch> show mpls config route
In-Label  Out-Label  Metric  Payload  NextHop
3400      pop        100     ipv4     10.14.4.4,Et3/3/3
3400      pop        150     ipv4     10.14.4.4,Et4/3
switch>
```

Statistics about the configuration and implementation of MPLS rules are displayed by the `show mpls route summary` command.

**Example**

- This command displays a summary of MPLS rule implementation.

```
switch> show mpls route summary
Number of Labels: 1 (1 unprogrammed)
Number of adjacencies in hardware: 0
Number of backup adjacencies: 2
switch>
```

### 36.1.2.1 Egress IPv4/IPv6 over MPLS ACLs

IPv4/IPv6 over MPLS packets are now eligible for ACLs at the egress stage by default, applicable only to IPv4/IPv6 over MPLS packets that are MPLS label popped (i.e., if the label is at the bottom of stack). The user can override this behavior if required, thereby disabling egress ACLs for certain MPLS labels by configuration. No special configuration is required to enable egress ACLs on IPv4/IPv6 over MPLS packets.

**Example**

- This command disables egress ACLs for MPLS top-label 12000 on the egress interface 120.1.1.1 nexthop address.

```
switch(config)# no mpls static top-label 12000 120.1.1.1 pop payload-type ipv6
switch(config)#
```

- This command enables egress ACLs for MPLS top-label 12000 on the egress interface 120.1.1.1 nexthop address.

```
switch(config)# mpls static top-label 12000 120.1.1.1 pop payload-type ipv6
switch(config)#
```

### 36.1.2.2 Configuring MPLS0GRE Filtered Mirroring

The filtered mirroring of terminated MPLS0GRE packets is configured by creating an IPv4 access-list, and then attaching the IPv4 access-list to a monitor session source where a tunnel decap group has been configured. This IPv4 access-list has rules that match to either inner IPv4 or IPv6 destination addresses.
Enabling the TC-Counters TCAM Profile

The following limitations are applicable to MPLSoGRE filtered mirroring in tc-counters TCAM profile:

- Security ACLs are not enforced on IPv4oMPLSoGRE and IPv6oMPLSoGRE terminated packets.
- The rules of a mirroring-ACL are set to match either inner IPv4 or inner IPv6 header fields, but not both.

The ACLs containing rules to match both inner IPv4 and inner IPv6 header fields are not applicable to a single source interface in multiple mirroring sessions. In other words, all ACLs applied to a shared source interface must contain either inner IPv4 rules or inner IPv6 rules.

The commands below switch to the tc-counters TCAM profile in the running configuration.

Example

```
switch(config)#hardware tcam
switch(config-hw-tcam)#system profile tc-counters
switch(config-hw-tcam)#exit
```

Defining Two IPv4 Access-Lists

The `ip access-list` command places the switch in ACL configuration mode, which is a group change mode that modifies an IPv4 access control list. The command specifies the name of the IPv4 ACL that subsequent commands modify and creates an ACL if it references a nonexistent list. All changes in a group change mode edit session are pending till the end of the session.

The `permit (Role)` command configures one access-list to match the inner IPv4 address, and the other access-list to match the inner IPv6 address.

Example

```
switch(config)# ip access-list dIPv4
switch(config)# 10 permit ip any any inner ip any host 5.5.5.5
switch(config)# exit
switch(config)# ip access-list dIPv6
switch(config)# 10 permit ip any any inner ipv6 any host 55::55
switch(config)# exit
```

Attaching Access-Lists

The `monitor session source` and `monitor session destination` commands allow to attach two access-lists to two different monitor session sources.
Example

switch(config)# monitor session sess1 source et1 rx ip access-group dIPv4
switch(config)# monitor session sess1 destination tunnel mode gre source 1.1.1.1
destination 2.2.2.2
switch(config)# monitor session sess2 source et2 rx ip access-group dIPv6
switch(config)# monitor session sess2 destination tunnel mode gre source 3.3.3.3
destination 4.4.4.4
switch(config)# show monitor session

Session sess1
------------------------
Source Ports:
  Rx Only:   Et1(IP ACL: dIPv4)

Destination Ports:
  status   source      dest TTL DSCP  proto       VRF fwd-drop
  Gre1 :    active 1.1.1.1  2.2.2.2 128 0 0x88be    default   no

Session sess2
------------------------
Source Ports:
  Rx Only:   Et2(IP ACL: dIPv6), Et5(IP ACL: dIPv6)

Destination Ports:
  status   source      dest TTL DSCP  proto       VRF fwd-drop
  Gre2 :    active 3.3.3.3  4.4.4.4 128 0 0x88be    default   no

switch(config)#
36.2 **BGP/MPLS L3 VPN**

Border Gateway Protocol/ Multiprotocol Label Switching (BGP/MPLS) L3 Virtual Private Network (VPN) allows a Service Provider (SP) or an Enterprise to provide the service of interconnecting geographically dispersed customer sites. This type of service can be provided to multiple customers over the common network backbone infrastructure of the Service Provider, while:

- Maintaining privacy of each customer
- Allowing for overlapping IP addresses among customers
- Having constrained route distribution – such as, only those routers in the Service Provider’s network that need the customer routes, have them.

Achieve the above through the extensions to BGP as defined in RFC 4364 for IPv4 and RFC 4659 for IPv6, and the use of VPN Routing and Forwarding Tables (VRFs), Route Distinguishers (RDs), and Route Targets (RTs).

BGP/MPLS L3 VPN is available when configuring BGP in the multi-agent routing protocol model.

- **Section 36.2.1: Platform Compatibility**
- **Section 36.2.2: Operation**
- **Section 36.2.3: Configuration**
- **Section 36.2.4: Show Commands**
- **Section 36.2.5: Syslog Messages**
- **Section 36.2.6: Limitations**

### 36.2.1 Platform Compatibility

The following platforms support BGP/MPLS L3 VPN.

- 7280R
- 7500R

### 36.2.2 Operation

A Virtual Private Network, or VPN, is a set of geographically dispersed sites attached to the Service Provider’s (SP) backbone, with IP interconnectivity amongst the sites. Using this scenario, the customer can obtain “VPN service” from the SP. The SP will provide a VPN service to multiple customers, using this common backbone network infrastructure. The sample VPN topology diagram below illustrates three sites where a customer is being interconnected over the SP backbone network.

At each site, the Customer Edge router (CE) attaches to the Provider’s Edge router (PE). The CE can attach to more than one PE, and in these cases the CE is said to be “multi-homed”. The routers in the SP core network, those which do not attach to any CE, are referred to as “P” routers. The “P” routers do not need to know about the customer routes.

The CE attaches to PE in a VRF. The routes learned from the CE are programmed in the corresponding VRF and the PE then distributes the routes to other PEs as “VPN routes” using MP-BGP. This is done by using two new BGP address families, VPN-IPv4 (AFI=1, SAFI=128) and VPN-IPv6 (AFI=2, SAFI=128).

On the PEs, corresponding to the VPN, VRFs configure with the RD and one or more import and export RTs. The RD attaches to the customer route to create a VPN route. By picking a unique RD for each VRF and attaching it to the customer route, the VPN route is unique. This allows for customers with overlapping IP addresses to be managed by the Service Provider. This unique VPN route is advertised to other PEs along with the configured export RT and the VPN label. The PE router allocates a VPN label per VRF and address family. The PE router programs its Label FIB (LFIB) with this label.
information. When the PE router receives an incoming MPLS packet with the VPN label as the topmost label, it pops the label and does an IP lookup in the associated VRF. The PE router also maintains a mapping of import RTs to the corresponding VRFs. This mapping is used later when deciding into which VRFs a received VPN route should be imported into.

The PE learns customer routes from the CE through the PE-CE routing protocol, which could be Static routing, EBGP, OSPF, or ISIS. The PE will install those customer routes in the associated VRF, with the CE as the nexthop. The customer routes in the VRF are exported into the BGP VPN table as VPN routes, along with the VPN label and the configured export RTs as BGP path attributes. These VPN routes are then advertised to other PEs which have been activated for the VPN address-families (VPN-IPv4/VPN-IPv6). The PE then sets itself as the nexthop while advertising the VPN routes. The PE which receives those VPN routes strips out the RD and import them as IPv4 or IPv6 routes into the VRFs. The list of VRFs into which the route is imported is determined based on the mapping of import RTs to VRFs. These routes will be programmed into the FIB along with the VPN label and the remote PE as the nexthop. Once these routes are installed in the VRF, the CE connected to that VRF will learn those routes (based on the PE-CE routing protocol) and make it available in the customer network that it is attached to. This way the geographically dispersed customer sites learn of each other’s networks and IP reachability is established between the them.

36.2.2.1 Forwarding

In the Service Provider’s core network there should be MPLS LSPs between the PEs. That is, the connection to the VPN next-hop should be over an MPLS tunnel. The MPLS LSPs in the core could be setup using RSVP-TE or LDP in conjunction with OSPF/ISIS or ISIS-SR.

When the PE receives an IP packet from the CE destined to the remote site, it does an IP lookup in the VRF to which the CE is connected. This lookup provides the VPN label to be used and the nexthop, which would be the remote-PE. The VPN label is imposed on the IP packet and the resulting MPLS packet is then tunneled through the MPLS LSP to the remote PE. As result of penultimate hop popping, the MPLS packet arrives at the remote PE with the VPN label as the topmost label. The label lookup results in the VPN label being popped and an IP lookup will be done in the associated VRF. Note that the PE would have programmed this label action when it allocated the label to start with. That IP lookup will result in the IP packet being forwarded out to the CE.

36.2.3 Configuration

Configuring BGP/MPLS L3 VPN involves enabling the SP core for MPLS and then configuring the PEs with the required BGP configuration.
It is assumed that the SP core network is enabled for MPLS. This involves configuring an IGP (OSPF/ISIS) followed by a label distribution protocol such as LDP, RSVP-TE or ISIS-SR. Typically, loopback interfaces are configured on all the PE and the P routers and the IGPs exchange reachability to those loopback interfaces. And then the MPLS Label Distribution Protocol will set up MPLS LSPs/tunnels between all those loopbacks.

Enabling MPLS and LDP on the PE involves the following steps:

**Step 1** Configure terminal.

```
switch#configure terminal
```

**Step 2** Enter destination IP address

```
switch(config)#ip address 11.0.0.1/32
```

**Step 3** Enable MPLS routing.

```
switch(config)#mpls ip
```

**Step 4** Configure MPLS LDP.

```
switch(config)#mpls ldp
```

**Step 5** Configure the router ID interface.

```
switch(config-mpls-ldp)#router-id interface Loopback0
```

**Step 6** Configure for no shutdown.

```
switch(config-mpls-ldp)#no shutdown
```

Example:

```
switch#configure terminal
switch(config)#ip address 11.0.0.1/32
switch(config)#mpls ip
switch(config)#mpls ldp
switch(config-mpls-ldp)#router-id interface Loopback0
switch(config-mpls-ldp)#no shutdown
```

Configuring BGP on the PE involves the following steps.

**Step 1** Configure terminal.

```
switch#configure terminal
```

**Step 2** Configure the BGP router. In this scenario, the BGP router is configured AS 64512.

```
switch(config)#router bgp 64512
```
Step 3 Configure the neighbor IPv4 address, then the neighbor’s autonomous system. In this example, the IPv4 address is 10.0.0.2 and the neighbor’s autonomous system is AS 64512.

```
switch(config-router-bgp)#neighbor 10.0.0.2 remote-as 64512
```

Step 4 Enable extended send communities attributes.

```
switch(config-router-bgp)#neighbor 10.0.0.2 send-community extended
```

Step 5 Enable MPLS L3 VPN IP-v4 unicast address family.

```
switch(config-router-bgp)#address-family vpn-ipv4
```

Step 6 Activate the neighbor for the VPN address family on neighbor 10.0.0.2.

```
switch(config-router-bgp-af)#neighbor 10.0.0.2 activate
```

Step 7 Optionally, configure the interface from which the system will pick the nexthop while advertising the VPN routes.

```
switch(config-router-bgp-af)#neighbor default encapsulation mpls next-hop-self source-interface Loopback0
```

Step 8 Enable MPLS L3 VPN IP-v6 unicast address family.

```
switch(config-router-bgp)#address-family vpn-ipv6
```

Step 9 Configure MPLS L3 VPN IP-v6 unicast address family on neighbor 10.0.0.2.

```
switch(config-router-bgp-af)#neighbor 10.0.0.2 activate
```

Step 10 Configure MPLS encapsulation next hop on the Loopback0 interface.

```
switch(config-router-bgp-af)#neighbor default encapsulation mpls next-hop-self source-interface Loopback0
```

Step 11 Configure VRF. In the example, vrf1 is selected.

```
switch(config-router-bgp)#vrf vrf1
```

Step 12 Configure the BGP router distinguisher. In this example, 11.0.0.1:0 is selected.

```
switch(config-router-bgp-vrf-vrf1)#rd 11.0.0.1:0
```

Step 13 Configure the import route targets. In this example, the route import targets for the VPN IPv4 and VPN IPv6 are 300:0.

```
switch(config-router-bgp-vrf-vrf1)#route-target import vpn-ipv6 300:0
switch(config-router-bgp-vrf-vrf1)#route-target import vpn-ipv4 300:0
```

Step 14 Configure the export route targets. In this example, the route export targets for the VPN IPv4 and VPN IPv6 are 300:0.

```
switch(config-router-bgp-vrf-vrf1)#route-target export vpn-ipv6 300:0
switch(config-router-bgp-vrf-vrf1)#route-target export vpn-ipv4 300:0
```
Step 15 Connect the interface routes.

```
switch(config-router-bgp-vrf-vrf1)#redistribute connected
```

Step 16 Redistribute static routes into BGP.

```
switch(config-router-bgp-vrf-vrf1)#redistribute static
```

Example:

```
switch#configure terminal
switch(config)#router bgp 64512
switch(config-router-bgp)#neighbor 10.0.0.2 remote-as 64512
switch(config-router-bgp)#neighbor 10.0.0.2 send-community extended
switch(config-router-bgp)#address-family vpn-ipv4

switch(config-router-bgp-af)#neighbor 10.0.0.2 activate
switch(config-router-bgp-af)#neighbor default encapsulation mpls next-hop-self
source-interface Loopback0
switch(config-router-bgp)#address-family vpn-ipv6
switch(config-router-bgp-af)#neighbor 10.0.0.2 activate
switch(config-router-bgp-af)#neighbor default encapsulation mpls next-hop-self
source-interface Loopback0

switch(config-router-bgp)#vrf vrf1
switch(config-router-bgp-vrf-vrf1)#rd 11.0.0.1:0
switch(config-router-bgp-vrf-vrf1)#route-target import vpn-ipv6 64512:0
switch(config-router-bgp-vrf-vrf1)#route-target import vpn-ipv4 64512:0
switch(config-router-bgp-vrf-vrf1)#route-target export vpn-ipv6 64512:0
switch(config-router-bgp-vrf-vrf1)#route-target export vpn-ipv4 64512:0
switch(config-router-bgp-vrf-vrf1)#redistribute connected
switch(config-router-bgp-vrf-vrf1)#redistribute static
```

36.2.3.1 Enabling BGP to Exchange the Routing Tables with the Peer

- Enabling the send-community extended knob on the neighbor. This essentially enables BGP to exchange the RTs with the peer.
- Activating the peer (the remote PE) under the address-family VPN-IPv4 and address-family VPN-IPv6 modes enables BGP to negotiate the MPLS L3 VPN address families.
- Specify the address for the VPN next-hop using the command, `neighbor default encapsulation mpls next-hop-self source-interface Loopback0`.

In the above configuration example, the system uses the address 11.0.0.1 from interface Loopback0 as the nexthop in the VPN route advertisements.

36.2.3.2 Configuring the VRF Information

First, the VRF must be configured in the global mode and IPv4 and IPv6 routing must be enabled in the VRF. After that, under the router bgp mode, we need to configure the VRF and provide the information related to RD and import and export RTs.

Step 1 Configure terminal.

```
switch#configure terminal
```
Step 2 Enable IP routing.

switch(config)#ip routing

Step 3 Enable IP routing for the VRF.

switch(config)#ip routing vrf vrf1

Step 4 Enable IPv6 routing for the VRF.

switch(config)#ipv6 unicast-routing vrf vrf1

Example:

switch#configure terminal
switch(config)#ip routing
switch(config)# ip routing vrf vrf1
switch(config)#ipv6 unicast-routing vrf vrf1

The VRF configuration under router BGP mode is shown below.

switch(config-router-bgp-vrf-vrf1)#show active
router bgp 300
  vrf vrf1
    rd 11.0.0.1:0
    route-target import vpn-ipv6 300:0
    route-target import vpn-ipv4 300:0
    route-target export vpn-ipv6 300:0
    route-target export vpn-ipv4 300:0
    redistribute connected
    redistribute static
switch(config-router-bgp-vrf-vrf1)#

36.2.3.3 Configuring the Route Distinguisher

The Route Distinguisher (RD) is structured such that it can be easily configured and managed. It is configured by specifying two fields separated by a colon, as in administrative-subfield: assigned-number-subfield. The administrative subfield could contain either an IP address, as shown in the example (the PEs loopback address), or the AS number. The assigned-number-subfield can be any number which is determined by the SP. The primary requirement of the RD is that it must be unique per VRF. It is possible to have overlapping address space between VRFs, the intent of the RD is to ensure that a VPN route can be uniquely identified as it is received by a remote PE. However, the identification of which VRF(s) the received VPN route should be imported into is handled by the import RTs configured on the remote PE.

36.2.3.4 Configuring Route Targets

Next is the import and export Route Target configuration. The RTs are structured similar to the RDs. They too are made up of administrative-subfield: assigned-number-subfield. In the example shown, the AS number has been used as the administrative subfield. And the value 0 has been used for the assigned number subfield. It is the RT that plays an important role in identifying the VPN.

- Received VPN routes with the import RT as path attributes will be imported into the VRF will have RTs has extended-community BGP path attributes. They will be imported into VRFs which import RT configuration for RTs in the received VPN route.
• And while advertising the routes from the VRF as VPN routes, the export RT will be attached to the route as an extended-community BGP attribute.
  a. In the example shown, the connected and static routes in the VRF are redistributed into BGP. And these routes will be exported as VPN routes.
  b. It is also possible to have a BGP session with the CE. In that case, routes received over that session are exported as VPN routes. And imported routes are advertised to the CE.

36.2.3.5 Configuring Import / Export Route-maps

The routes that are imported into a VRF can be further controlled by applying an import route-map. And the routes that are exported from the VRF can be controlled by applying an export route-map.

Complete the following steps:

Step 1 Configure terminal.

```
switch#configure terminal
```

Step 2 Configure BGP. In this example, BGP is configured as 4274781899.

```
switch(config)#router bgp 4274781899
```

Step 3 Configure the VRF under router bgp mode

```
switch(config-router-bgp)#vrf vrf1
```

Step 4 Select the BGP route distinguisher. In this example, 36351:268450419 is selected.

```
switch(config-router-bgp-vrf-vrf1)#rd 36351:268450419
```

Step 5 Configure the import route-target VPN-IPv4, unicast address family. In this example, 36351:1001 is selected.

```
switch(config-router-bgp-vrf-vrf1)#route-target import vpn-ipv4 36351:1001
```

Step 6 Configure another import route-target for VPN-IPv4 unicast address family. In this example, 36351:268450419 is selected.

```
switch(config-router-bgp-vrf-vrf1)#route-target import vpn-ipv4 36351:268450419
```

Step 7 Configure the export route-target for VPN-IPv4 unicast address family. In this example, 36351:268450419 is selected.

```
switch(config-router-bgp-vrf-vrf1)#route-target export vpn-ipv4 36351:268450419
```

Step 8 Configure the import route-map. In this example, the import router-map name is BGP-IMPORT-VRF-SERVICES.

```
switch(config-router-bgp-vrf-vrf1)#route-target import vpn-ipv4 route-map BGP-IMPORT-VRF-SERVICES
```

Step 9 Configure the export route-map. In this example, the export route-map name is BGP-EXPORT-VRF-VRF1.

```
switch(config-router-bgp-vrf-vrf1)#route-target export vpn-ipv4 route-map BGP-EXPORT-VRF-VRF1
```
Step 10 Optionally, redistribute connected routes in the VRF into BGP, with the associated route-map `BGP-ANNOUNCE-CONNECTED`.

```
switch(config-router-bgp-vrf-vrf1)#redistribute connected route-map BGP-ANNOUNCE-CONNECTED
```

Step 11 Optionally, redistribute static routes in the vrf into BGP, with associated route-map `BGP-ANNOUNCE-STATIC`.

```
switch(config-router-bgp-vrf-vrf1)#redistribute static route-map BGP-ANNOUNCE-STATIC
```

Step 12 The import and export route-maps should be separately configured. The configuration snippet below shows the configuration of the same route-map `BGP-IMPORT-VRF-SERVICES`.

```
switch(config-router-bgp-vrf-vrf1)#route-map BGP-IMPORT-VRF-SERVICES permit 10
switch(config-route-map-BGP-IMPORT-VRF-SERVICES)#match extcommunity SERVICES
switch(config-route-map-BGP-IMPORT-VRF-SERVICES)#match ip address prefix-list SERVICES
```

Example:

```
switch#configure terminal
switch(config)#router bgp 4274781899
switch(config-router-bgp)#vrf vrf1
switch(config-router-bgp-vrf-vrf1)#rd 36351:268450419
switch(config-router-bgp-vrf-vrf1)#route-target import vpn-ipv4 36351:1001
switch(config-router-bgp-vrf-vrf1)#route-target import vpn-ipv4 36351:268450419
switch(config-router-bgp-vrf-vrf1)#route-target export vpn-ipv4 36351:268450419
switch(config-router-bgp-vrf-vrf1)#route-target export vpn-ipv4 route-map BGP-IMPORT-VRF-SERVICES
switch(config-router-bgp-vrf-vrf1)#route-target export vpn-ipv4 route-map BGP-EXPORT-VRF-VRF1
switch(config-router-bgp-vrf-vrf1)#redistribute connected route-map BGP-ANNOUNCE-CONNECTED
switch(config-router-bgp-vrf-vrf1)#redistribute static route-map BGP-ANNOUNCE-STATIC
switch(config-router-bgp-vrf-vrf1)#route-map BGP-IMPORT-VRF-SERVICES permit 10
switch(config-route-map-BGP-IMPORT-VRF-SERVICES)#match extcommunity SERVICES
switch(config-route-map-BGP-IMPORT-VRF-SERVICES)#match ip address prefix-list SERVICES
```

36.2.3.6 VPN Next-hop

By default, the system uses the source address of the BGP session as the nexthop in the VPN advertisements. This source address is determined by the system while establishing the TCP session between the PEs. If the SP want to use a different address as the VPN next-hop, then an interface with that address must be specified under the BGP address-family VPN-IPv4 or address-family VPN-IPv6 configuration modes. For example,

```
switch(config-router-bgp)#address-family vpn-ipv4
switch(config-router-bgp-af)#neighbor 10.0.0.2 activate
switch(config-router-bgp-af)#neighbor default encapsulation mpls next-hop-self source-interface Loopback0
```

```
switch(config-router-bgp)#address-family vpn-ipv6
switch(config-router-bgp-af)#neighbor 10.0.0.2 activate
switch(config-router-bgp-af)#neighbor default encapsulation mpls next-hop-self source-interface Loopback0
```
Note
Configuring the next-hop-self source interface described above results in the BGP session being reset.

In the previous example, the interface *Loopback 0* has been specified. The system picks the VPN next-hop address from the interface based on the following rules:

- For VPN-IPv4, the IPv4 address from the interface is picked.
- For VPN-IPv6,
  - For an IPv4 peer,
    - Pick the IPv4 address from the interface.
    - If the interface does not have a IPv4 address, pick the IPv6 address.
  - For an IPv6 peer,
    - Pick the IPv6 address from the interface.
    - If the interface does not have an IPv6 address, pick the IPv4 address.

For VPN-IPv6, when an IPv4 address is picked as the next-hop, it is encoded as a IPv4-mapped IPv6 address in the VPN route advertisement. This is as per RFC 4659.
36.2.4  Show Commands

Use the `show bgp instance vrf vrf1` command to show the BGP instance status for a specific VRF to verify the route-targets and import/export route-maps being used. The command also displays the locally allocated MPLS label that the system has allocated for IPv4 and IPv6.

```
switch#show bgp instance vrf vrf1
BGP instance information for VRF vrf1
BGP Local AS: 4274781899, Router ID: 169.254.156.10
Total peers: 0
  Static peers: 0
  Dynamic peers: 0
  Disabled peers: 0
  Established peers: 0
Four Octet ASN mode enabled
Graceful restart helper mode disabled
Graceful restart mode disabled
Graceful restart timer timeout: 00:05:00
End of rib timer timeout: 00:05:00
Attributes of the reflected routes are not preserved
UCMP mode: disabled
Peer mac resolution timeout: 00:00:00
BGP IPv4 Listen Port Status: listening on port 179
BGP IPv6 Listen Port Status: listening on port 179
BGP Convergence information:
  BGP has converged: yes, Time taken to converge: 00:00:31
  Outstanding EORs: 0, Outstanding Keepalives: 0
  Convergence timeout: 00:05:00
BGP Convergence timer is inactive
BGP Convergence based update synchronization is disabled
BGP Convergence slow-peer timeout: 00:01:30
Address-family IPv4 Unicast:
  Redistributed routes into BGP:

Prefix Statistics:
  Sent  Rcvd
  IPv4 Unicast:  1   1
  IPv6 Unicast:  0   0
Configured maximum total number of routes is 12000
Inbound updates dropped by reason:
  AS path loop detection: 0
  Malformed MPBGP routes: 0
  Originator ID matches local router ID: 0
  Nexthop matches local IP address: 0
Local AS is 300, local router ID 0.0.0.1
Local TCP address is 10.0.0.1, local port is 179
Remote TCP address is 10.0.0.2, remote port is 47400
Use the `show bgp vpn-ipv4 summary` command to show the status of VPN-IPv4 peers. While the examples below are with respect to VPN-IPv4, the same set of commands are applicable to VPN-IPv6.

```
switch# show bgp vpn-ipv4 summary
BGP summary information for VRF default
Router identifier 0.0.0.1, local AS number 300
Neighbor Status Codes: m - Under maintenance
   Neighbor  V  AS  MsgRcvd   MsgSent  InQ OutQ  Up/Down State  PfxRcd PfxAcc
10.0.0.2   4  300    3379        60    0    0    1d23h Estab  1      1
```

Use the `show bgp vpn-ipv4` command to show how the VPN-IPv4 routes sent and received.

```
switch# show bgp vpn-ipv4
BGP routing table information for VRF default
Router identifier 0.0.0.1, local AS number 300
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e - ECMP
   S - Stale, c - Contributing to ECMP, b - backup
   % - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop
   Network Next Hop Metric LocPref Weight Path
* >      RD: 11.0.0.1:0 IPv4 prefix 20.0.0.0/24
      -        -      -      0       i
* >      RD: 11.0.1.1:0 IPv4 prefix 20.0.1.0/24
          11.0.1.1    -     100     0      1
```

Each entry in the output represent a VPN path in the VPN table. For each VPN path, the RD and actual prefix along with the nexthop information is shown. Paths in the VPN table are either received from other VPN-IPv4 peers (other PEs) or exported from local VRFs.

In the above output, 20.0.0.0/24 is a local route that has been exported. Notice that it has been prepended with the RD `11.0.0.1:0` to make it a VPN-IPv4 route. And the prefix of `20.0.1.0/24` has been received from another PE. It has the RD of `11.0.1.1:0` with a nexthop of `11.0.1.1`. Looking at each of those prefixes in detail:

**20.0.0.0/24** is a local route from one of the VRFs that has been exported. Notice that along with the prefix, the RD, the export RT and the MPLS label information is displayed. In this case, the MPLS label is a locally allocated label.

```
switch# show bgp vpn-ipv4 20.0.0.0/24
BGP routing table information for VRF default
Router identifier 0.0.0.1, local AS number 300
BGP routing table entry for IPv4 prefix 20.0.0.0/24, Route Distinguisher: 11.0.0.1:0
Paths: 1 available
Local
   11.0.1.1 from 10.0.0.2 (0.0.1.1)
      Origin IGP, metric -, localpref 100, weight 0, valid, internal, best
      Extended Community: Route-Target-AS:300:0
      MPLS label: 100123
```

**20.0.1.0/24** is a prefix that has been received from the VPN-IPv4 peer, `10.0.0.2`. The next-hop in this case is `11.0.1.1`. This VPN route is imported into a VRF based on the import RT configuration matching the RT received in the VPN route (300:0).
Note
Route-Distinguishers for the non-default VRFs must be configured under the `router bgp` mode. Route-Distinguisher configured under the VRF definition mode are ignored.

The route is installed in the VRF only when the VPN next-hop is reachable through an MPLS tunnel. The presence of such an MPLS tunnel can be verified using the `show tunnel fib` command. The output below shows that there is an MPLS tunnel setup by LDP to the VPN nexthop 11.0.1.1.

```
switch# show tunnel fib
Type 'LDP', index 1, endpoint 11.0.1.1/32, forwarding None
  via 10.0.0.2, 'Ethernet6'
  label stack 3
```

Use the `show ip bgp vrf vrf1` command to show the BGP table for the VRF which contains the imported VPN-IPv4 route.

```
switch# show ip bgp vrf vrf1
BGP routing table information for VRF vrf1
Router identifier 11.0.0.1, local AS number 300
Route status codes:  s - suppressed,  * - valid, > - active, # - not installed, E - ECMP head, e - ECMP
     S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast
        % - Pending BGP convergence
Origin codes:  i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop

     Network       Next Hop         Metric  LocPref Weight Path
   * >     20.0.0.0/24         -                -       -       0      i
   * >     20.0.1.0/24         11.0.1.1         -       100     0      i
```

Each entry in the table represents a path either locally redistributed/received into the VRF (from a BGP peer) or imported from the VPN table.

Use the `show ip bgp 20.0.1.0/24 vrf vrf1` command for a more detailed view of the imported IP prefix 20.0.1.0/24:

```
switch# show ip bgp 20.0.1.0/24 vrf vrf1
BGP routing table information for VRF vrf1
Router identifier 11.0.0.1, local AS number 300
BGP routing table entry for 20.0.1.0/24
Paths: 1 available
Local 11.0.1.1 from 10.0.0.2 (0.0.1.1), imported VPN-IPv4 route, RD 11.0.1.1:0
 Origin IGP, metric -, localpref 100, weight 0, valid, internal, best
 Extended Community: Route-Target-AS:300:0
 Remote MPLS label: 100123
```
Use the `show ip route vrf vrf1` command to view the prefix installed in route table of the VRF:

```
switch#show ip route vrf vrf1
VRF: vrf1
Codes: C - connected, S - static, K - kernel,
      O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
      E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
      N2 - OSPF NSSA external type 2, B I - iBGP, B E - eBGP,
      R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
      O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
      NG - Nexthop Group Static Route, V - VXLAN Control Service,
      DH - DHCP client installed default route, M - Martian,
      DP - Dynamic Policy Route
Gateway of last resort is not set
  C      20.0.0.0/24 is directly connected, Ethernet5
  B I    20.0.1.0/24 [200/0] via 11.0.1.1/32, LDP tunnel index 1, label 100123
         via 10.0.0.2, Ethernet3, label imp-null(3)
```

The output displays both the VPN label, as well as the underlay tunnel (LDP) information.

### 36.2.5 Syslog Messages

While transmitting an update, if there is no valid next-hop that could be sent, then the `%BGP-3-VPN-DROP_TXUPDATE` syslog is generated. In the case of MPLS L3 VPN, it can occur in the following scenarios:

- When BGP is attempting to advertise a received VPN route to an eBGP and next-hop-unchanged is not configured for that peer. The resolution is to configure next-hop-unchanged for that eBGP peer.
- When next-hop-self is configured on the Route-Reflector and the RR is trying to reflect the received.

### 36.2.6 Limitations

- While configuring a BGP Route-Reflector for the VPN-IPv4/VPN-IPv6 address families, the route-reflector must have transport MPLS LSPs to reach the PE nexthop addresses. Even though the route-reflector may not be in the data path and does not use the transport LSPs to forward traffic, the LSPs are required in order for the BGP nexthops to be considered as reachable valid candidates in the bestpath computation.
- When configuring eBGP peers, which receive routes over an eBGP session and re-advertise the same to a different eBGP peer, next-hop-unchanged knob must be configured, so that the original nexthop is retained.
- With iBGP route-reflector topology, next-hop-self knob must not be configured.
- Even with directly connected PEs, the VPN nexthops should be the loopback on the directly connected PEs with an MPLS tunnel between them.
  - For a VPN route to be installed in the VRF, the VPN nexthop must resolve over a MPLS tunnel.
- With OSPF as the PE-CE protocol, RFC 4576, setting of the DN bit in the LSA, is not supported.
- Internal BGP (iBGP) as the PE-CE protocol, RFC 6368, is not supported.
### 36.3 Decap Groups

These sections describe the Decap groups:

- Section 36.3.1: Decap Groups Description
- Section 36.3.2: Decap Groups Configuration

#### 36.3.1 Decap Groups Description

The decap group is a data structure that receives encapsulated packets and extracts the payload. The switch then processes or forwards the extracted payload as required. Although packets cannot be transmitted through decap groups, nexthop groups can be used to create a packet's reverse path. Decap groups support payload extraction of packets received from GRE and IP-in-IP tunnels.

Decap groups have these limitations:

- Tunnels are terminated using destination IP address; source IP address has no influence.
- Packets matching a decap group are not processed through their ingress interface and VLAN.
- During a tunnel termination, ingress ACL filter each decap group packet's inner header.
- Packet counters are not available.
- VRF is not supported.

Decap groups are defined by their tunnel type and decap IP address:

- **Tunnel type** specifies the tunnel protocol that the switch uses to extract payload.
- **Decap IP address** specifies the IP address where the switch receives decap group packets.

Decap groups support Generic Routing Encapsulation (GRE) and IP-in-IP tunnels.

#### 36.3.2 Decap Groups Configuration

Decap groups are configured in decap-group configuration mode. Decap-group configuration mode is not a group change mode; running-config is changed immediately upon entering commands. Exiting decap-group configuration mode does not affect running-config. The exit command returns the switch to global configuration mode.

- The static CLI entry for the incoming label is specified by the `mpls static` command.
- The tunnel type is specified by the `tunnel type (Decap Group)` command.
- The Decap IP address is specified by the `tunnel decap-ip (Decap Group)` command.
- The locally configured IP addresses are added to the Layer 3 interfaces using the `tunnel decap-interface (Decap Group)` command for a specified decap group.

Decap groups do not define a default destination address or tunnel type and is not functional until both parameters are configured. A decap group can contain multiple tunnel decap-ip statements.

**Example**

- This command defines a static CLI entry for the incoming-label.

  ```
  switch(config)# #mpls static top-label 3400 ethernet 3/3/3 10.14.4.4 pop payload-type ipv4
  ```
This command creates a decap group named DC-1 and configures the group to terminate packets from GRE tunnel packets with the destination IP address of 10.14.3.2

```
switch(config)#ip decap-group DC-1
switch(config-dg-DC-1)#tunnel type gre
switch(config-dg-DC-1)#tunnel decap-ip 10.14.3.2
switch(config-dg-DC-1)#show active
  ip decap-group DC-1
    tunnel type gre
      tunnel decap-ip 10.14.3.2
switch(config-dg-DC-1)#end
switch(config)#
```

### 36.4 Nexthop Groups

#### 36.4.1 Nexthop Group Description

Each routing table entry provides the next hop address to its specified destination. A nexthop address is the address of the next device on the path to the entry’s specified destination.

A nexthop group is a data structure that defines a list of nexthop addresses and a tunnel type for packets routed to the specified address. When an IP route statement specifies a nexthop group as the nexthop address, the switch configures a static route with a nexthop group member as the nexthop address and encapsulates packets forwarded to that address as required by the group’s tunnel type.

The nexthop group size is a configurable parameter that specifies the number of entries that the group contains. Group entries that are not explicitly configured are filled with drop routes. The switch uses ECMP hashing to select the address within the nexthop group when forwarding packets. When a packet’s hash selects a drop route, the packet is dropped.

Nexthop groups are supported on Trident platform switches and subject to the following restrictions:

- Each switch can support 512 IPv4 or IPv6 Tunnels
- Nexthop groups can contain 256 nexthops.
- The switch supports 1024 nexthop groups.
- Multiple routes can share a tunnel.
- Tunnels do not support IP multicast packets.

Nexthop groups support IP-in-IP tunnels. The entry IP address family within a particular nexthop group cannot be mixed, i.e. either they are all IPv4 or they are all IPv6 entries.

#### 36.4.2 Nexthop Group Configuration

Nexthop groups are configured and modified in nexthop-group configuration mode. After a group is created, it is associated to a static route through an `ip route nexthop-group` statement.

These tasks are required to configure a nexthop group and apply it to a static route.

- Creating and Editing Nexthop Groups
- Configuring a Group’s Encapsulation Parameters
- Configuring the Group’s Size
- Creating Nexthop Group Entries
- Displaying Nexthop Groups
- Applying a Nexthop Group to a Static Route
Creating and Editing Nexthop Groups

Nexthop groups are created by a `nexthop-group` command that specifies a group that isn’t already configured. The switch enters nexthop-group configuration mode for the new group. Nexthop-group mode is also accessible for modifying existing groups. When in nexthop-group configuration mode, the `show active` command displays the group’s configuration.

Example

- This command creates a nexthop group named NH-1.
  
  ```
  switch(config)#nexthop-group NH-1
  switch(config-nexthop-group-NH-1)#
  ```

- These commands enter nexthop-group configuration mode for the group named NH3, then displays the previously configured group parameters.
  
  ```
  switch(config)#nexthop-group NH3
  switch(config-nexthop-group-NH3)#show active
  nexthop-group NH3
    size 4
    ttl 10
    entry 0 tunnel-destination 10.14.21.3
    entry 1 tunnel-destination 10.14.21.5
    entry 2 tunnel-destination 10.14.22.5
    entry 3 tunnel-destination 10.14.22.6
  switch(config-nexthop-group-NH3)#
  ```

Configuring a Group’s Encapsulation Parameters

Packets in static routes that are associated with the nexthop group are encapsulated to support the group’s tunnel type. Nexthop groups support IP-in-IP tunnels. The group also defines the source IP address and TTL field contents that are included in the packet encapsulation.

Example

- This command configures the TTL setting to 32 for nexthop group NH-1 encapsulation packets.
  
  ```
  switch(config)#nexthop-group NH-1
  switch(config-nexthop-group-NH-1)#ttl 32
  switch(config-nexthop-group-NH-1)#show active
  nexthop-group NH-1
    size 128
    ttl 32
  switch(config-nexthop-group-NH-1)#
  ```

The address is inserted in the encapsulation source IP fields is specified by `tunnel-source (Nexthop Group)`.
Example

- These commands create loopback interface 100, assign an IP address to the interface, then specifies that address as the tunnel source for packets designated by nexthop-group NH-1.

```
switch(config)#interface loopback 100
switch(config-if-Lo100)#ip address 10.1.1.1/32
switch(config-if-Lo100)#exit
switch(config)#nexthop-group NH-1
switch(config-nexthop-group-NH-1)#tunnel-source intf loopback 100
```

Configuring IP-in-IP Encapsulation

Through IP-in-IP encapsulation, IP packets matching a static Nexthop-Group route are encapsulated within an IP-in-IP tunnel and forwarded.

Example

- This command configures a static Nexthop-Group route and an IP-in-IP Nexthop-Group for IP-in-IP encapsulation.

```
switch(config)#ip route 124.0.0.1/32 nexthop-group abc
switch(config)#nexthop-group abc type ip-in-ip
switch(config-nexthop-group-abc)#size 512
switch(config-nexthop-group-abc)#tunnel-source 1.1.1.1
switch(config-nexthop-group-abc)#entry 0 tunnel-destination 1.1.1.2
switch(config-nexthop-group-abc)#entry 1 tunnel-destination 10.1.1.1
switch(config-nexthop-group-abc)#ttl 64
```

Configuring the Group’s Size

The group’s size specifies the number of entries in the group. A group can contain up to 256 entries, which is the default size. The group’s size is specified by `size (Nexthop Group)`.

Example

- This command configures the nexthop group NH-1 to contain 128 entries.

```
switch(config)#nexthop-group NH-1
switch(config-nexthop-group-NH-1)#size 128
```

Creating Nexthop Group Entries

Each entry specifies a nexthop address that is used to forward packets. A nexthop group contains one entry statement for each nexthop address. The group’s size specifies the number of entry statements the group may contain. Each entry statement is assigned an index number to distinguish it from other entries within the group; entry index numbers range from zero to the group size minus one.

Nexthop group entries are configured by `entry (Nexthop Group)`.
Example

- These commands set the nexthop group size at four entries, then create three entries. Packets that are hashed to the fourth entry are dropped.

```
switch(config)#nexthop-group NH-1
switch(config-nexthop-group-NH-1)#size 4
switch(config-nexthop-group-NH-1)#entry 0 tunnel-destination 10.13.4.4
switch(config-nexthop-group-NH-1)#entry 1 tunnel-destination 10.15.4.22
switch(config-nexthop-group-NH-1)#entry 2 tunnel-destination 10.15.5.37
switch(config-nexthop-group-NH-1)#show active
nexthop-group NH-1
  size 4
  ttl 64
  entry 0 tunnel-destination 10.13.4.4
  entry 1 tunnel-destination 10.15.4.22
  entry 2 tunnel-destination 10.15.5.37
```

- These commands configure a nexthop group with three IPv6 nexthop entries.

```
switch(config)#nexthop-group nhg-v6-mpls type ip
switch(config-nhg-v6-mpls)#size 3
switch(config-nhg-v6-mpls)#entry 0 nexthop 2002::6401:1
switch(config-nhg-v6-mpls)#entry 1 nexthop 2002::6404:1
switch(config-nhg-v6-mpls)#entry 2 nexthop 2002::6404:2
```

- These commands configure an IPv4 route to point to the nexthop group `nhg-v6-mpls`. (Both IPv4 routes and IPv6 routes can point to this nexthop group.)

```
switch#ip route 100.5.0.0/16 Nexthop-Group nhg-v6-mlsp
switch#
```

Displaying Nexthop Groups

The `show nexthop-group` command displays a group’s configured parameters.

Example

- This command displays the properties of the nexthop group named NH-1.

```
switch>show nexthop-group NH-1
Name             Id       type     size   ttl    sourceIp
NH-1             4        ipInIp   256    64     0.0.0.0
switch>
```

Applying a Nexthop Group to a Static Route

The `ip route nexthop-group` associates a nexthop group with a specified destination address and configures the encapsulation method for packets tunneled to that address.

Example

- This command creates a static route in the default VRF, using the nexthop group of NH-1 to determine the next hop address.

```
switch(config)#ip route 10.17.252.0/24 nexthop-group NH-1
```

The `show ip route` command displays the routing table for a specified VRF. Routes that utilize a nexthop group entry are noted with a route type code of NG.
Example

- This command displays a routing table that contains a static route with its nexthop specified by a nexthop group.

```
switch> show ip route
Codes: C - connected, S - static, K - kernel, 
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1, 
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1, 
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP, 
       R - RIP, I - ISIS, A B - BGP Aggregate, A O - OSPF Summary, 
       NG - Nexthop Group Static Route

Gateway of last resort is not set

C      10.3.3.1/32 is directly connected, Loopback0
C      10.9.1.0/24 is directly connected, Ethernet51/3
C      10.10.10.0/24 is directly connected, Ethernet51/1
S      10.20.0.0/16 [20/0] via 10.10.10.13, Ethernet51/1
C      10.10.11.0/24 is directly connected, Ethernet3

```

```
switch>
```

### 36.4.3 MPLS Tunnel Support for Traceroute and PMTU Discovery

IP traceroute and path MTU (PMTU) discovery function only when the routers send ICMP reply messages to the host that invokes each network function. When the route to the destination host traverses an MPLS label-switched path (LSP), the label switching routers (LSRs) also need to send ICMP reply messages to the originating host.

The MPLS ICMP tunneling feature enables these LSRs to generate ICMP reply messages and deliver them to the originating host using the same LSP on which the frame was received.

Once the frame exits the LSP, it assumes that the ICMP reply can be routed or label switched back to the originating host.

PMTU discovery requires MPLS tunneling of MTU exceeded ICMP replies (fragmentation needed, packet too big). Traceroute requires MPLS tunneling of TTL exceeded ICMP replies.

The following sections provide further information on MPLS tunnel support for Traceroute and PMTU discovery:

- **Platform Compatibility**
- **MPLS Tunnel Support for Traceroute and PMTU Discovery Configuration**
- **Troubleshooting**
- **Limitations**
36.4.3.1 Platform Compatibility

MPLS tunnel support for traceroute and PMTU discovery is available on the following platforms:

Figure 36-2:

36.4.3.2 MPLS Tunnel Support for Traceroute and PMTU Discovery Configuration

To enable traceroute and PMTU discovery, complete the following steps:

Step 1 Enable the device for configuration.

switch>configure terminal
switch(config)#

Step 2 Enable MPLS ICMP fragmentation.

switch(config)# mpls icmp fragmentation-needed tunneling

Step 3 Enable MPLS ICMP TTL.

switch(config)# mpls icmp ttl-exceeded tunneling

To disable traceroute and PMTU discovery, use the no form of the commands stated above.

Step 1 Enable the device for configuration.

switch>configure terminal
switch(config)#

Step 2 Disable MPLS ICMP fragmentation.

switch(config)# no mpls icmp fragmentation-needed tunneling

Step 3 Disable MPLS ICMP TTL.

switch(config)# no mpls icmp ttl-exceeded tunneling
36.4.3.3 Troubleshooting

- If the IP address of the interface through which an offending packet was received could not be retrieved, the source IP address of the ICMP reply has a default value of 240.0.0.0 in the case of IPv4, and 2001::1 in the case of IPv6. In the case of traceroute, this IP address appears in the output and could potentially indicate a misconfiguration at this node.

- If a specific node does not tunnel ICMP replies, it is possible to run `tcpdump` on a local interface called `fwd0`. If the replies do not appear on this interface, the tunneling agent is likely to be at fault. If the replies do appear on this interface, the tunneling agent is most likely not at fault, and the issue might be happening in the platform.

36.4.3.4 Limitations

Traceroute using ICMP tunneling requires that the ingress and egress of the tunnel process the TTL using the uniform mode (as described in RFC3443 section 3.1).
36.5 **MPLS Commands**

**MPLS Commands**
- mpls ip
- mpls static
- show mpls route
- show mpls route summary

**Decap Group Commands**
- ip decap-group
- show ip decap-group
- tunnel decap-interface (Decap Group)
- tunnel decap-ip (Decap Group)
- tunnel type (Decap Group)

**Nexthop Group Commands**
- entry (Nexthop Group)
- ip route nexthop-group
- nexthop-group
- show nexthop-group
- size (Nexthop Group)
- ttl (Nexthop Group)
- tunnel-source (Nexthop Group)
entry (Nexthop Group)

The `entry` command defines a nexthop entry in the configuration mode `nexthop group`. Each nexthop entry specifies a nexthop IP address for static routes to which the nexthop group is assigned. The group size (size (Nexthop Group)) specifies the quantity of entries a group contains. Each entry is created by an individual command. Entries within a group are distinguished by an index number.

The `no entry` and `default entry` commands delete the specified nexthop group entry, as referenced by index number, by removing the corresponding `entry` statement from `running-config`.

Command Mode

Nexthop-group Configuration

Command Syntax

```
entry index tunnel-destination ipv4_address
no entry index
default entry index
```

Parameters

- `index` Entry index. Values range from 0 to `group-size – 1`.
- `ipv4_address` Nexthop IPv4 address.

`group-size` is the group’s entry capacity, as specified by the `size (Nexthop Group)` command.

Example

- These commands sets the nexthop group size at 4 entries, then creates three nexthop entries. Packets that are hashed to the fourth entry are dropped.

  switch(config)#nexthop-group NH-1
  switch(config-nexthop-group-NH-1)#size 4
  switch(config-nexthop-group-NH-1)#entry 0 tunnel-destination 10.13.4.4
  switch(config-nexthop-group-NH-1)#entry 1 tunnel-destination 10.15.4.22
  switch(config-nexthop-group-NH-1)#entry 2 tunnel-destination 10.15.5.37
  switch(config-nexthop-group-NH-1)#show active
  nexthop-group NH-1
  size 4
  ttl 64
  entry 0 tunnel-destination 10.13.4.4
  entry 1 tunnel-destination 10.15.4.22
  entry 2 tunnel-destination 10.15.5.37
  switch(config-nexthop-group-NH-1)#
ip decap-group

The **ip decap-group** command places the switch in decap-group configuration mode, through which decap groups are created or modified. A decap group is a data structure that defines a method of extracting the payload from an encapsulated packet that the switch receives on a specified IP address.

Decap groups do not specify a default IP address group or tunnel type. These parameters must be explicitly configured before a decap group can function.

Decap-group configuration mode is not a group change mode; **running-config** is changed immediately upon entering commands. Exiting decap-group configuration mode does not affect **running-config**. The **exit** command returns the switch to global configuration mode.

The **no ip decap-group** and **default ip decap-group** commands delete previously configured commands in the specified **decap-group** mode.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip decap-group group_name
no ip decap-group group_name
default ip decap-group group_name
```

**Parameters**

- **group_name**  Decap group name.

**Commands Available in Decap-group Configuration Mode**

- **tunnel decap-ip (Decap Group)** specifies the IP address of packets handled by the decap group.
- **tunnel type (Decap Group)** specifies the tunnel protocol for extracting payload.
- **show ip decap-group**

**Examples**

- This command creates a decap group named DC-1.
  ```
  switch(config)#ip decap-group DC-1
  switch(config-dg-DC-1)#
  ```

- This command exits decap-group mode for the DC-1 decap group.
  ```
  switch(config-dg-DC-1)#exit
  switch(config)#
  ```

- This command delete the decap group named DC-1.
  ```
  switch(config)#no ip decap-group DC-1
  switch(config)#
  ```
ip route nexthop-group

The `ip route nexthop-group` command creates a static route. The destination is a network segment. The nexthop address is one of the IP addresses that comprise the specified nexthop group. Packets forwarded as a result of this command are encapsulated as specified by the tunnel-type parameter of the specified nexthop group.

When multiple routes exist to a destination prefix, the route with the lowest administrative distance takes precedence. When a route created through this command has the same administrative distance as another static route (ECMP), the route that was created earliest has preference; `running-config` stores static routes in the order that they are created.

By default, the administrative distance assigned to static routes is 1. Assigning a higher administrative distance to a static route configures it to be overridden by dynamic routing data. For example, a static route with a distance value of 200 is overridden by OSPF intra-area routes, which have a default distance of 110.

The `no ip route nexthop-group` and `default ip route nexthop-group` commands delete the specified route by removing the corresponding `ip route nexthop-group` command from `running-config`. `Ip route nexthop-group` statements for an IP address in multiple VRFs must be removed separately.

A `no ip route` or `default ip route` command without a nexthop parameter deletes all corresponding `ip route nexthop-group` statements. Deleting a user-defined VRF also deletes its static routes.

Command Mode

Global Configuration

Command Syntax

```
ip route [VRF_INST] dest_net nexthop-group nhgp_name [dist] [TAG_OPTION] [RT_NAME]
no ip route [VRF_INST] dest_net [nexthop-group nhgp_name] [distance]
default ip route [VRF_INST] dest_net [nexthop-group nhgroup_name] [distance]
```

Parameters

- **VRF_INST**  Specifies the VRF instance being modified.
  - <no parameter>  Changes are made to the default VRF.
  - `vrf vrf_name`  Changes are made to the specified VRF.
- **dest_net**  Destination IPv4 subnet (CIDR or address-mask notation).
- **nhgp_name**  Name of nexthop group.
- **dist**  Administrative distance assigned to route. Options include:
  - <no parameter>  Route assigned default administrative distance of one.
  - <1-255>  The administrative distance assigned to route.
- **TAG_OPTION**  static route tag. Options include:
  - <no parameter>  Assigns default static route tag of 0.
  - `tag t_value`  Static route tag value. `t_value` ranges from 0 to 4294967295.
- **RT_NAME**  Associates descriptive text to the route. Options include:
  - <no parameter>  No text is associated with the route.
  - `name descriptive_text`  The specified text is assigned to the route.

Related Commands

- `ip route`  creates a static route that specifies the nexthop address without using nexthop groups.
Example

- This command creates a static route in the default VRF, using the nexthop group of NH-1 to determine the next hop address.

  switch(config)#ip route 10.17.252.0/24 nexthop-group NH-1
  switch(config)#
mpls ip

The mpls ip command enables MPLS routing. Multiprotocol Label Switching (MPLS) is a networking process that avoids complex lookups in a routing table by replacing complete network addresses with short path labels for directing data packets to network nodes. MPLS data paths are serviced through a tunnel encapsulation data structure that adds four-byte label headers to packets.

The no mpls ip and default mpls ip commands disable MPLS routing by removing the mpls ip command from running-config. When MPLS routing is disabled, routed MPLS packets are dropped and all MPLS routes and adjacencies are removed. MPLS routing is disabled by default.

Command Mode
Global Configuration

Command Syntax
mpls ip
no mpls ip
default mpls ip

Example
• This command enables MPLS routing. Previous commands enabled IP routing and configured MPLS static routes.
  switch(config)#mpls ip
  switch(config)#show running-config
  ! Command: show running-config
  
  !
  ip routing
  !
  mpls ip
  !
  mpls static top-label 3400 10.14.4.4 pop payload-type ipv4
  mpls static top-label 4400 10.15.46.45 pop payload-type ipv4
  !
  
  !
  end
  switch(config)#

• This command disables MPLS routing.
  switch(config)#no mpls ip
  switch(config)#show running-config
  ! Command: show running-config
  
  !
  ip routing
  !
  mpls static top-label 3400 10.14.4.4 pop payload-type ipv4
  mpls static top-label 4400 10.15.46.45 pop payload-type ipv4
  !
  
  !
  end
  switch(config)#
mpls static

The `mpls static` command creates an MPLS rule that specifies the method of handling of inbound MPLS traffic. Multiprotocol Label Switching (MPLS) is a networking process that replaces complete network addresses with short path labels for directing data packets to network nodes.

Static rules specify these parameters:

- **MPLS filter:** The top-label parameter specifies the 20-bit value that the MPLS packet’s top header label must match to be handled by the rule.
- **Nexthop location:** Specifies the destination nexthop address (IPv4 or IPv6) and the interface through which the switch forwards the packet.
- **MPLS action:** Specifies the MPLS label stack management action performed on the packet:
  - `pop-payload`: removes the top label from stack; this terminates an LSP (label-switched path).
  - `swap-label`: replaces top label with a specified new label; this passes a packet along an LSP.
- **Rule priority:** Specifies the rule to be used when an MPLS packet matches multiple rules.

The `no mpls static` and `default mpls static` commands delete the specified MPLS rule from `running-config`.

- Commands that include only a top label tag remove all MPLS rules with the matching top label.
- Commands with no `PRIORITY` parameter remove all matching routes of every metric value.

**Command Mode**
Global Configuration

**Command Syntax**

```plaintext
mpls static top-label top_tag [DEST_INTF] NEXTHOP_ADDR ACTION [PRIORITY]
no mpls static top-label top_tag
no mpls static top-label top_tag [DEST_INTF] NEXTHOP_ADDR ACTION [PRIORITY]
default mpls static top-label top_tag
default mpls static top-label top_tag [DEST_INTF] NEXTHOP_ADDR ACTION [PRIORITY]
```

**Parameters**

- **top_tag**  Top header’s label field contents. Value ranges from 0 to 1048575 (20 bits).
- **DEST_INTF**  Specifies interface through which `NEXTHOP_ADDR` is accessed. Options include:
  - `<no parameter>`  Any interface.
  - `ethernet e_num`  Ethernet interface specified by `e_num`.
  - `loopback l_num`  Loopback interface specified by `l_num`.
  - `management m_num`  Management interface specified by `m_num`.
  - `port-channel p_num`  Port-channel interface specified by `p_num`.
  - `vlan v_num`  VLAN interface specified by `v_num`.
  - `vxlan vx_num`  VXLAN interface specified by `vx_num`.
- **NEXTHOP_ADDR**  Nexthop address for MPLS for filtered MPLS packets. Options include:
  - `ipv4_addr`  IPv4 address.
  - `ipv6_addr`  IPv6 address.
- **ACTION**  MPLS header stack management action performed on packet. Options include:
  - `pop payload-type ipv4`  Removes top layer from stack. Payload is handled as IPv4 packet.
  - `pop payload-type ipv6`  Removes top layer from stack. Payload is handled as IPv6 packet.
- **swap-label** <0 to 1048575> Replaces header label with specified label value (20 bits).
- **PRIORITY** Specifies rule priority when multiple rules match a packet. Options include:
  - <no parameter> Assigns a metric value of 100 to the rule.
  - **metric** <1 to 255> Lower values denote higher priority. Value ranges from 1 to 255.

**Parameters**
The mpls static command does not support push label actions.

**Example**
- These commands create an MPLS rule that matches packets with a top label value of 3400 and causes the removal of the top label from the header stack. The nexthop destination of the IPv4 payload is IP address 10.14.4.4 through Ethernet interface 3/3/3. This rule has a metric value of 100.

  ```
  switch(config)# mpls static top-label 3400 ethernet 3/3/3 10.14.4.4 pop payload-type ipv4
  switch(config)# show running-config
  
  !
  mpls static top-label 3400 Ethernet3/3/3 10.14.4.4 pop payload-type ipv4
  
  end
  switch(config)#
  ```

- These commands create a backup rule that forwards the packet through Ethernet interface 4/3. This rule's metric value of 150 assigns it backup status prior to the first rule.

  ```
  switch(config)# mpls static top-label 3400 ethernet 4/3 10.14.4.4 pop payload-type ipv4 metric 150
  switch(config)# show running-config
  
  !
  mpls static top-label 3400 Ethernet4/3 10.14.4.4 pop payload-type ipv4 metric 150
  mpls static top-label 3400 Ethernet3/3/3 10.14.4.4 pop payload-type ipv4
  
  <--------OUTPUT OMITTED FROM EXAMPLE--------->
  
  end
  switch(config)#
  ```

- These commands create an MPLS rule that forwards the packet to the nexthop address through any interface.

  ```
  switch(config)# mpls static top-label 4400 10.15.46.45 pop payload-type ipv4
  switch(config)# show running-config
  
  !
  mpls static top-label 3400 Ethernet4/3 10.14.4.4 pop payload-type ipv4 metric 150
  mpls static top-label 3400 Ethernet3/3/3 10.14.4.4 pop payload-type ipv4
  
  <--------OUTPUT OMITTED FROM EXAMPLE--------->
  
  end
  switch(config)#
  ```
**nexthop-group**

The **nexthop-group** command places the switch in nexthop-group configuration mode, through which nexthop groups are created or modified. The command also specifies the tunnel protocol for extracting payload from encapsulated packets that arrive through an IP address upon which the group is applied.

A nexthop group is a data structure that defines a list of nexthop addresses and the encapsulation process for packets routed to the specified address. The command either accesses an existing nexthop group configuration or creates a new group if it specifies a non-existent group. Supported tunnel protocols include IP ECMP and IP-in-IP.

Nexthop-group configuration mode is not a group change mode; **running-config** is changed immediately upon entering commands. Exiting nexthop-group configuration mode does not affect **running-config**. The **exit** command returns the switch to global configuration mode.

The **no nexthop-group** and **default nexthop-group** commands delete previously configured commands in the specified **nexthop-group** mode. When the command does not specify a group, it removes all nexthop-groups. When the command specifies a tunnel type without naming a group, it removes all nexthop-groups of the specified type.

**Command Mode**
Global Configuration

**Command Syntax**

```
 nexthop-group  group_name  type  TUNNEL_TYPE
 no  nexthop-group  [group_name]  [type  TUNNEL_TYPE]
 default  nexthop-group  [group_name]  [type  TUNNEL_TYPE]
```

**Parameters**

- **group_name**  Nexthop group name.
- **TUNNEL_TYPE**  Tunnel protocol of the nexthop-group. Options include:
  - **ip**  ECMP nexthop.
  - **ip-in-ip**  IP in IP tunnel.
  - **gre**  Encapsulates the Layer 3 protocols overs IP networks.
  - **mpls-over-gre**  Tunnels MPLS over a non-MPLS network.

**Commands Available in Nexthop-group Configuration Mode**

- **entry** (Nexthop Group)
- **size** (Nexthop Group)
- **ttl** (Nexthop Group)
- **tunnel-source** (Nexthop Group)

**Restrictions**

Tunnel type availability varies by switch platform.

**Examples**

- This command creates a nexthop group named NH-1 that specifies ECMP nexthops.
  
  ```
  switch(config)#nexthop-group  NH-1  type  ip
  switch(config-nexthop-group-NH-1)#
  ```

- This command exits nexthop-group mode for the NH-1 nexthop group.
  
  ```
  switch(config-nexthop-group-NH-1)#exit
  switch(config)#
  ```
**show ip decap-group**

The **show ip decap-group** command displays the IP decap groups that are available in the switch.

**Command Mode**

Global Configuration

**Command Syntax**

```
show ip decap-group [decap-group name | dynamic]
```

**Parameters**

- `decap-group name`  The decap group name.
- `dynamic` Displays the dynamic entries only.

**Related Commands**

- `ip decap-group`
- `tunnel decap-ip (Decap Group)`
- `tunnel type (Decap Group)`

**Example**

This command displays the IP decap groups that are available in a switch.

```
switch(config)#show ip decap-group
NOTE: "D" column indicates dynamic entries

**Note**

GRE type decap groups are supported in Sand platform only.
show mpls route

The **show mpls config route** command displays the switch’s MPLS static rule configuration for the specified routes and rules.

**Command Mode**

EXEC

**Command Syntax**

```
show mpls [INFO_LEVEL] route [header_label]
```

**Parameters**

- **INFO_LEVEL**  Specifies the filters that are used to select the routes to display. Options include:
  - `<no parameter>` displays routes published by the forwarding agent.
  - `config` displays all configured routes.
  - `lfib` displays routes stored to the Label Forwarding Information Base (LFIB)
- **header_label**  Filters routes by MPLS top header label. Options include:
  - `<no parameter>` Displays routes for all header values.
  - `<0 to 1048575>` Specifies header for which command displays information.

**Example**

- This command displays the MPLS rule configuration.

```
switch>show mpls config route
In-Label Out-Label Metric Payload NextHop
3400  pop  100  ipv4  10.14.4.4,Et3/3/3
3400  pop  150  ipv4  10.14.4.4,Et4/3
switch>
```
show mpls route summary

The `show mpls route summary` command displays statistics about the configuration and implementation of MPLS rules.

**Command Mode**

EXEC

**Command Syntax**

`show mpls route summary`

**Example**

- This command displays a summary of MPLS rule implementation.

```plaintext
switch>show mpls route summary
Number of Labels: 1 (1 unprogrammed)
Number of adjacencies in hardware: 0
Number of backup adjacencies: 2
switch>
```
show nexthop-group

The `show nexthop-group` command displays properties of the specified nexthop group.

Command Mode

EXEC

Command Syntax

```
show nhgroup_name [VRF_INST]
```

Parameters

- `nhgroup_name` Name of the group displayed by command.
- `VRF_INST` specifies the VRF instance for which data is displayed.
  - `<no parameter>` context-active VRF.
  - `vrf vrf_name` specifies name of VRF instance. System default VRF is specified by `default`.

Related Commands

- `nexthop-group` places the switch in nexthop-group configuration mode to create a new group or modify an existing group.

Example

- This command displays the properties of the nexthop group named NH-1.

```
switch>show nexthop-group NH-1
Name     Id  type  size   ttl  sourceIp
NH-1     4    ipInIp 256    64   0.0.0.0
switch>
```
size (Nexthop Group)

The `size` command configures the quantity of nexthop entries in the configuration mode nexthop group. Each entry specifies a nexthop IP address for static routes to which the group is assigned. Entries are configured with the `entry (Nexthop Group)` command. The default size is 256 entries.

The `no size` and `default size` commands restore the size of the configuration mode nexthop group to its default of 256 by removing the corresponding `size` command from `running-config`.

Command Mode

Nexthop-group Configuration

Command Syntax

```
size entry_size
no size entry_size
default size entry_size
```

Parameters

- `entry_size` Group size (entries). Value ranges from 1 to 255. Default value is 256.

Example

- This command configures the nexthop group NH-1 to contain 128 entries.

  ```
  switch(config)#nexthop-group NH-1
  switch(config-nexthop-group-NH-1)#size 128
  switch(config-nexthop-group-NH-1)#show active
  nexthop-group NH-1
  size 128
  ttl 64
  switch(config-nexthop-group-NH-1)#
  ```
Chapter 36: Multiprotocol Label Switching (MPLS)  MPLS Commands

**ttl (Nexthop Group)**

The `ttl` command specifies the number entered into the TTL (time to live) encapsulation field of packets that are transmitted to the address designated by the configuration mode nexthop group. The default TTL value is 64.

The `no ttl` and `default ttl` commands restore the default TTL value written into TTL fields for the configuration mode nexthop group by deleting the corresponding `ttl` command from `running-config`.

**Command Mode**

Nexthop-group Configuration

**Command Syntax**

```
ttl hop_expiry
no ttl hop_expiry
default ttl hop_expiry
```

**Parameters**

- `hop_expiry`  Period that the packet remains valid (seconds or hops) Value ranges from 1 to 64.

**Restrictions**

This command is available only to Nexthop groups for tunnels of type **IP-in-IP, GRE, MPLS, and MPLS over GRE**.

**Related Commands**

- **nexthop-group** places the switch in Nexthop-group configuration mode.

**Example**

- This command configures the `ttl` setting to 32 for nexthop group NH-1 packets.
  ```
  switch(config)#nexthop-group NH-1
  switch(config-nexthop-group-NH-1)#ttl 32
  switch(config-nexthop-group-group-NH-1)#show active
  nexthop-group NH-1
  size 128
  ttl 32
  switch(config-nexthop-group-group-NH-1)#
  ```

- This command restores the default `ttl` setting for nexthop group NH-1 packets.
  ```
  switch(config-nexthop-group-NH-1)#no ttl
  switch(config-nexthop-group-NH-1)#show active
  nexthop-group NH-1
  size 128
  ttl 64
  switch(config-nexthop-group-NH-1)#
  ```
tunnel decap-interface (Decap Group)

The **tunnel decap-interface** command adds all locally configured IP addresses to the specific Layer 3 interface per decap group.

The **no tunnel decap-interface** command and the **default tunnel decap-interface** command restores the default state by removing the locally added IP addresses from the decap group.

**Command Mode**
Decap-Group Configuration

**Command Syntax**
- `tunnel decap-interface {Ethernet | Loopback | Management | Port-Channel | Tunnel | Vlan | Vxlan | all}
- `no tunnel decap-interface {Ethernet | Loopback | Management | Port-Channel | Tunnel | Vlan | Vxlan | all}
- `default tunnel decap-interface {Ethernet | Loopback | Management | Port-Channel | Tunnel | Vlan | Vxlan | all}

**Parameters**
- **Ethernet e_num** Ethernet interface specified by `e_num`. The Ethernet port number ranges from 1 to 36.
- **Loopback l_num** Loopback interface specified by `l_num`. The loopback interface number ranges from 0 to 1000.
- **Management m_num** Management interface specified by `m_num`. The management port number ranges from 1 to 1.
- **Port-channel p_num** Port-channel interface specified by `p_num`. Options include:
  - **Port-channel interface number** The port-channel interface number ranges from 1 to 2000.
  - **Port-channel sub interface number** The port-channel sub interface number `<1-2000>,<1-4094>`.
- **Tunnel t_num** Tunnel interface specified by `t_num`. The tunnel interface number ranges from 0 to 255.
- **vlan v_num** VLAN interface specified by `v_num`. The VLAN interface number ranges from 1 to 4094.
- **vxlan vx_num** VXLAN interface specified by `vx_num`. The VXLAN tunnel interface number ranges from 1 to 1.
- **all address-family** This parameter configures all L3 interfaces as a decap interface.

**Related Commands**
- **ip decap-group**
- **tunnel type (Decap Group)**
- **show ip decap-group**
Example

- These commands add locally configured IP addresses to the Ethernet interface 1/1 for the dg1 decap group.

  switch(config)#ip decap-group dg1
  switch(config-dg-dg1)#tunnel decap-interface Ethernet1/1

  switch(config-dg-dg1)#show active
  ip decap-group dg1
    tunnel type ipip
    tunnel decap-interface Ethernet1/1
    tunnel decap-interface all address-family ipv6 address all
tunnel decap-ip (Decap Group)

The tunnel decap-ip command specifies the IP address of packets that are handled by the configuration mode decap group. A decap group is a data structure that defines a method of extracting the payload from an encapsulated packet that the switch receives on a specified IP address.

Decap groups do not define a default decap-ip address. A decap group is not functional until an IP address is specified. Decap groups can contain only one tunnel decap-ip statement; subsequent commands replace any previously configured statements.

Command Mode
Decap-Group Configuration

Command Syntax
```
tunnel decap-ip ipv4_address
```

Parameters
- **ipv4_addr** An IPv4 address.

Related Commands
- **ip decap-group** places the switch in decap-group configuration mode.
- **tunnel type (Decap Group)** specifies the tunnel protocol for extracting payload.
- **show ip decap-group**

Guidelines
A decap group does not specify a default IP address group or tunnel type. These parameters must be explicitly configured before a decap group can function.

Example
- These commands configure 10.14.3.2 as the decap-IP address for the DC-1 decap group.

```
switch(config)#ip decap-group DC-1
switch(config-dg-DC-1)#tunnel decap-ip 10.14.3.2
switch(config-dg-DC-1)#show active
  ip decap-group DC-1
    tunnel decap-ip 10.14.3.2
switch(config-dg-DC-1)#
```
tunnel-source (Nexthop Group)

The `tunnel-source` command specifies the address that is entered into the source IP address encapsulation field of packets that are transmitted as designated by the configuration mode nexthop group. The command may directly specify an IP address or specify an interface from which an IP address is derived. The default source address IP address is 0.0.0.0.

The no `tunnel-source` and default `tunnel-source` commands remove the source IP address setting from the configuration mode nexthop group by deleting the `tunnel-source` command from `running-config`.

Command Mode

Nexthop-group Configuration

Command Syntax

tunnel-source `SOURCE`
no tunnel-source `SOURCE`
default tunnel-source `SOURCE`

Parameters

- **SOURCE** IP address or derivation interface. Options include:
  - `ipv4_addr` An IPv4 address.
  - `intf ethernet ` `e_num` Ethernet interface specified by `e_num`.
  - `intf loopback ` `l_num` Loopback interface specified by `l_num`.
  - `intf management ` `m_num` Management interface specified by `m_num`.
  - `intf port-channel ` `p_num` Port-channel interface specified by `p_num`.
  - `intf vlan ` `v_num` VLAN interface specified by `v_num`.

Restrictions

This command is available only to Nexthop groups for tunnels of type `ip-in-ip`.

Related Commands

- `nexthop-group` places the switch in Nexthop-group configuration mode.

Example

- These commands create loopback interface 100, assign an IP address to the interface, then specifies that address as the tunnel source for packets designated by nexthop-group NH-1.

```
switch(config)#interface loopback 100
switch(config-if-Lo100)#ip address 10.1.1.1/32
switch(config-if-Lo100)#exit
switch(config)#tunnel-source intf loopback 100
switch(config)#show active
nexthop-group NH-1
  size 256
  ttl 64
  tunnel-source intf Loopback100
switch(config)#show nexthop-group NH-1
Name        Id     type    size  ttl  sourceIp
NH-1        2      ipInIp  256   64    10.1.1.1
```

```
tunnel type (Decap Group)

The tunnel type command specifies the tunnel protocol for extracting payload from encapsulated packets that arrive on the IP address specified for the configuration mode decap group. Supported tunnel protocols include GRE (General Routing Encapsulation) and IP-in-IP.

Decap groups do not define a default tunnel type. A decap group is not functional until an IP address is specified. Decap groups can contain only one tunnel decap-ip statement; subsequent commands replace any previously configured statements.

Command Mode

Decap-group Configuration

Command Syntax

tunnel type gre

Related Commands

- ip decap-group places the switch in decap-group configuration mode.
- tunnel decap-ip (Decap Group) specifies the IP address of packets handled by the decap group.
- show ip decap-group

Guidelines

A decap group does not specify a default IP address group or tunnel type. These parameters must be explicitly configured before a decap group can function.

Example

- This command configures decap group DC-1 to terminate packets from GRE tunnel packets.

  switch(config)#ip decap-group DC-1
  switch(config-dg-DC-1)#tunnel type gre
  switch(config-dg-DC-1)#show active
  ip decap-group DC-1
tunnel type gre
  switch(config-dg-DC-1)#
Chapter 37

Bidirectional Forwarding Detection

This chapter describes Bidirectional Forwarding Detection (BFD) and how it is configured in relation to various protocols. Sections in this chapter include:

- Section 37.1: Introduction
- Section 37.2: BFD Configuration
- Section 37.3: BFD Commands

37.1 Introduction

In networks without data link signaling, connection failures are usually detected by the hello mechanisms of routing protocols. Detection can take over a second, and reducing detection time by increasing the rate at which hello packets are exchanged can create an excessive burden on the participating CPUs.

BFD is a low-overhead, protocol-independent mechanism which adjacent systems can use instead for faster detection of faults in the path between them. BFD is strictly a failure-detection mechanism, and does not discover neighbors or reroute traffic.

BFD is a simple mechanism which detects the liveness of a connection between adjacent systems, allowing it to quickly detect failure of any element in the connection. It does not operate independently, but only as an adjunct to routing protocols. The routing protocols are responsible for neighbor detection, and create BFD sessions with neighbors by requesting failure monitoring from BFD.

Once a BFD session is established with a neighbor, BFD exchanges control packets to verify connectivity and informs the requesting protocol of failure if a specified number of successive packets are not received. The requesting protocol is then responsible for responding to the loss of connectivity.

Routing protocols using BFD for failure detection continue to operate normally when BFD is enabled, including the exchange of hello packets.

The basic behavior of BFD is defined in RFC 5880.

37.1.1 BFD Modes

BFD functions in asynchronous or demand mode, and also offers an echo function. EOS supports asynchronous mode and the echo function.
37.1.1 Asynchronous Mode

In asynchronous mode, BFD control packets are exchanged by neighboring systems at regular intervals. If a specified number of sequential packets are not received, BFD declares the session to be down.

37.1.2 Demand Mode

In demand mode, once the BFD session is established, the participating systems can request that BFD packets not be sent, then request an exchange of packets only when needed to verify connectivity. EOS does not support demand mode.

37.1.2 Echo Function

When the echo function is in use, echo packets are looped back through the hardware forwarding path of the neighbor system without involving the CPU. Failure is detected by an interruption in the stream of echoed packets. The minimum reception rate for BFD control packets from the neighbor is also changed automatically when the echo function is operational, because liveness detection is supplied by the echo packets.

While BFD control messages are transmitted to port 3786, BFD echo messages use UDP port 3785 for both source and destination.
37.1.3 BFD on Port Channels

On port channels, the BFD per-link feature can be used to add resiliency to the port channel’s BFD sessions. When BFD per-link is enabled, BFD considers the port channel “up” as long as any link in the port channel is functioning properly.

BFD per-link can be configured in full compliance with RFC 7130, causing member ports to be removed from the port channel when their BFD micro sessions are down, or in legacy mode, which relies on the LAG itself to detect and remove unresponsive member ports. By default, BFD per-link operates in legacy mode, which allows the switch to inter-operate more effectively with older equipment, but which may drop traffic if downed links are not detected by other means. RFC7130 mode allows for faster detection and removal of downed links within the port channel and can be used in situations where LACP is not supported. For the BFD session to come up, both peers must be configured in the same way.
37.2 BFD Configuration

To use BFD as the failure detection mechanism for a routing protocol, it must be enabled for each participating protocol.

These sections describe BFD configuration tasks:

- Section 37.2.1: Configuring BFD on an Interface
- Section 37.2.2: Configuring BFD on a Port Channel
- Section 37.2.3: Configuring the Echo Function
- Section 37.2.4: Configuring BFD for PIM
- Section 37.2.5: Configuring BFD for BGP
- Section 37.2.6: Configuring BFD for VRRP
- Section 37.2.7: Configuring BFD for OSPF
- Section 37.2.8: Configure BFD for IS-IS
- Section 37.2.9: Displaying BFD Neighbor Information

37.2.1 Configuring BFD on an Interface

The transmission rate for BFD control packets, the minimum rate at which control packets are expected from the peer, and the multiplier (the number of packets that must be missed in succession before BFD declares the session to be down) can all be configured per interface. The values configured apply to all BFD sessions that pass through the interface.

The default values for these parameters are:

- **transmission rate** 300 milliseconds
- **minimum receive rate** 300 milliseconds
- **multiplier** 3

To configure different values for these parameters on an interface, use the `bfd interval` command.

For BFD to function as a failure detection mechanism, it must be enabled for each participating protocol.

**Example**

- These commands set the transmit and receive intervals to 200 milliseconds and the multiplier to 2 for all BFD sessions passing through Ethernet interface 3/20.

```bash
switch(config)#interface ethernet 3/20
switch(config-if-Et3/20)#bfd interval 200 min_rx 200 multiplier 2
switch(config-if-Et3/20)#
```
37.2.2 Configuring BFD on a Port Channel

Basic BFD parameters are configured on a port channel as described in Configuring BFD on an Interface above.

Additionally, BFD can be configured in per-link mode on a port channel so that the port channel will be considered up as long as any link in the channel is up. BFD per-link can be configured in compliance with RFC 7130 (causing member ports to be removed from the port channel when their BFD micro session is down), or in legacy mode for interoperability with older equipment. For the BFD session to come up, both peers must be configured in the same way (either RFC-7130 or legacy mode).

Note
In RFC 7130 mode, if multiple IP addresses are configured for a member of a port channel (e.g., one IPv4 address and one IPv6 address), the member will be removed from the port channel if the micro session associated with either IP address goes down.

37.2.2.1 Enabling BFD Per-link

To enable BFD per-link on a port channel, use the bfd per-link command.

Example
- These commands enabled BFD per-link on port channel 5.

```
switch(config)#interface port-channel 5
switch(config-if-Po5)#bfd per-link
switch(config-if-Po5)#
```

37.2.2.2 Configuring BFD Per-link in RFC 7130 Mode

By default, BFD per-link operates in legacy mode. To enable RFC 7130 mode (in which a member port is removed from the port channel when its BFD micro session is down), configure the switch as follows.

Step 1 If you are configuring an L2 interface, specify a local L3 BFD address for the switch using the bfd local-address command. This is not necessary when configuring an L3 interface with an IP address configured on the port channel.

Step 2 Enable BFD per-link on the port channel using the bfd per-link command.

Step 3 Specify the L3 address of the port channel’s BFD neighbor using the bfd neighbor command. For an L2 port channel, the address is the globally configured BFD local address on the peer switch. For an L3 port channel, the address is the IP address configured on the peer port channel.

Examples
- These commands configure BFD per-link in RFC 7130 mode over an L2 port channel.

```
switch1(config)#bfd local-address 10.0.0.5
switch1(config)#interface port-channel 5
switch1(config-if-Po5)#bfd per-link rfc-7130
switch1(config-if-Po5)#bfd neighbor 10.0.0.4
switch1(config-if-Po5)#
```
Switch 2 configuration:

switch2(config)#bfd local-address 10.0.0.4
switch2(config)#interface port-channel 5
switch2(config-if-Po5)#bfd per-link rfc-7130
switch2(config-if-Po5)#bfd neighbor 10.0.0.5
switch2(config-if-Po5)#

These commands configure BFD per-link in RFC 7130 mode over an L3 port channel.

Switch 1 configuration:

switch1(config)#interface port-channel 5
switch1(config-if-Po5)#no switchport
switch1(config-if-Po5)#bfd per-link rfc-7130
switch1(config-if-Po5)#ip address 10.0.0.5/24
switch1(config-if-Po5)#bfd neighbor 10.0.0.4
switch1(config-if-Po5)#

Switch 2 configuration:

switch2(config)#interface port-channel 5
switch2(config-if-Po5)#no switchport
switch2(config-if-Po5)#bfd per-link rfc-7130
switch2(config-if-Po5)#ip address 10.0.0.4/24
switch2(config-if-Po5)#bfd neighbor 10.0.0.5
37.2.3 Configuring the Echo Function

The echo function is disabled by default, and is enabled on an interface using the `bfd echo` command.

When the BFD echo function is enabled, a “slow-timer” value replaces the minimum receive interval value in BFD packets sent from the switch. The default value is 2000 milliseconds. To configure a different value for the slow-timer, use the `bfd slow-timer` command.

**Examples**

- These commands enable the BFD echo function on Ethernet interface 5. If a slow-timer value has been configured on the switch, the minimum receive rate expected from the BFD neighbor will be reset to that value; otherwise, the minimum receive rate will be set to 2000 milliseconds.

  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#bfd echo
  switch(config-if-Et5)#
  ```

- This command configures BFD to expect control packets from the peer every 10000 milliseconds when the BFD echo function is enabled.

  ```
  switch(config)#bfd slow-timer 10000
  switch(config)#
  ```

37.2.4 Configuring BFD for PIM

The `bfd (Router-PIM Sparse-mode)` command enables or disables Bidirectional Forwarding Detection (BFD) globally for all protocol-independent multicast (PIM) neighbors.

To enable or disable PIM BFD on a specific interface, use the `pim ipv4 bfd` command. The interface-level configuration supersedes the global setting.

**Example**

- These commands enable PIM BFD globally on the switch in the default VRF, enabling it on all PIM-SM interfaces where it is not explicitly disabled.

  ```
  switch(config)#router pim sparse-mode
  switch(config-router-pim-sparse)#ipv4
  switch(config-router-pim-sparse-ipv4)#bfd
  switch(config-router-pim-sparse-ipv4)#
  ```

- These commands configure VLAN interface 200 to use BFD for PIM-SM connection failure detection regardless of the global PIM BFD configuration.

  ```
  switch(config)#interface vlan 200
  switch(config-if-VL200)#pim ipv4 bfd
  switch(config-if-VL200)#
  ```

37.2.5 Configuring BFD for BGP

To enable or disable Bidirectional Forwarding Detection (BFD) for border gateway protocol (BGP) connections with a BGP neighbor or peer group, use the `neighbor bfd` command.

**Example**

- These commands enable BFD failure detection for BGP connections with the neighbor at 10.13.64.1.

  ```
  switch(config)#router bgp 300
  switch(config-router-bgp)#neighbor 10.13.64.1 bfd
  switch(config-router-bgp)#
  ```
37.2.6 Configuring BFD for VRRP

To enable or disable Bidirectional Forwarding Detection (BFD) for virtual router redundancy protocol (VRRP), use the `vrrp bfd ip` command.

When enabled, BFD provides failure detection for a 2-router VRRP system. When the master is configured with the physical IP address of the backup router, and the backup is configured with the address of the master, a BFD session is established between them. If the BFD session goes down, the backup router immediately assumes the master role.

VRRP master advertisement packets are still sent even when the BFD session is established to accommodate VRRP systems involving more than two routers.

**Example**

- These commands enable BFD on Ethernet interface 3/20 for VRRP ID 15 with a connection to a router at IP address 192.168.2.1.

```
switch(config)#interface ethernet 3/20
switch(config-if-Et3/20)#vrrp 15 bfd ip 192.168.2.1
```

37.2.7 Configuring BFD for OSPF

To enable or disable BFD globally for all OSPF neighbors, use the `bfd default (OSPF)` command in OSPF configuration mode.

To enable or disable BFD for OSPF on a specific interface, use the `ip ospf neighbor bfd` command. The interface-level configuration supersedes the global setting.

**Example**

- These commands enable BFD in OSPF instance 100 for all OSPF neighbors on BFD-enabled interfaces except those connected to interfaces on which OSPF BFD has been explicitly disabled.

```
switch(config)#router ospf 100
switch(config-router-ospf)#bfd default
switch(config-router-ospf)#
```

- This command enables OSPF BFD on Ethernet interface 3/21.

```
switch(config)#interface ethernet 3/21
switch(config-if-Et3/21)#ip ospf neighbor bfd
switch(config-if-Et3/21)#
```

37.2.8 Configure BFD for IS-IS

The `isis bfd` and `isis bfd` commands configure Bidirectional Forwarding Detection (BFD), a low overhead protocol designed to provide rapid detection of failures at any protocol layer in the path between adjacent forwarding engines over any media. BFD is supported for IS-IS IPv4 routes.

**Examples**

- These commands enable BFD for all the interfaces on which IS-IS is enabled. By default BFD is disabled on all the interfaces.

```
switch(config)#router isis 1
switch(config-router-isis)#address-family ipv4
switch(config-router-af)#bfd default
switch(config-router-af)#
```
These commands enable BFD on IS-IS interfaces.

```
switch(config)#interface Ethernet 5/6
switch(config-if-Et5/6)#isis bfd
```

### 37.2.9 Displaying BFD Neighbor Information

Use the `show bfd peers` command to display information about Bidirectional Forwarding Detection (BFD) neighbors.

**Example**

- This command displays general information about BFD neighbors.

  ```
  switch>show bfd peers
  DstAddr   MyDisc YoDisc  If            LUp     LDown  Ldiag           Stat
  10.168.1.56  16      13      et52_1(81)    17151450 0      No Diagnostic    Up
  10.168.1.58  17      14      et52_2(65)    17151883 0      No Diagnostic    Up
  10.168.1.24  18      15      et51_1(73)    17152175 0      No Diagnostic    Up
  ```

  <---------OUTPUT OMITTED FROM EXAMPLE-------->

- This command displays detailed information about BFD neighbors.

  ```
  switch>show bfd peers detail
  Peer Addr 10.168.1.56, Intf Ethernet52/1, State Up
  VRF default, LAddr 10.168.1.57, LD/RD 16/13
  Last Up 17151450
  Last Down 0
  Last Diag: No Diagnostic
  TxInt: 300, RxInt: 300, Multiplier: 3
  Received RxInt: 300, Received Multiplier: 3
  Rx Count: 433987, Tx Count: 433829
  Detect Time: 900
  Registered protocols: bgp

  Peer Addr 10.168.1.58, Intf Ethernet52/2, State Up
  VRF default, LAddr 10.168.1.59, LD/RD 17/14
  Last Up 17151883
  Last Down 0
  Last Diag: No Diagnostic
  TxInt: 300, RxInt: 300, Multiplier: 3
  Received RxInt: 300, Received Multiplier: 3
  Rx Count: 434235, Tx Count: 434050
  Detect Time: 900
  Registered protocols: bgp
  ```
37.3 BFD Commands

BFD Configuration Command
- bfd echo
- bfd interval
- bfd local-address
- bfd neighbor
- bfd per-link
- bfd slow-timer

BFD Display Commands
- show bfd peers

PIM-BFD Configuration Commands
- bfd (Router-PIM Sparse-mode)
- pim ipv4 bfd

BGP-BFD Configuration Commands
- neighbor bfd

VRRP-BFD Configuration Commands
- vrrp bfd ip

OSPF-BFD Configuration Commands
- bfd default (OSPF)
- ip ospf neighbor bfd

ISIS-BFD Configuration Commands
- isis bfd
- isis bfd
The `bfd (Router-PIM Sparse-mode)` command enables Bidirectional Forwarding Detection (BFD) globally for use as a failure-detection mechanism for Protocol-Independent Multicast Sparse-Mode (PIM-SM) on the switch. To override the global configuration for a specific interface, use the `pim ipv4 bfd` command. All PIM-SM interfaces will use the global setting if they are not individually configured.

When PIM BFD is enabled, a BFD session is created for each PIM-SM neighbor and used to detect a loss of connectivity with the neighbor. PIM hello packets are still exchanged with PIM-SM neighbors when BFD is enabled.

The `no bfd` and `default bfd` commands disable PIM BFD globally by deleting the `bfd` statement from `running-config`. When this is done, only interfaces with PIM BFD explicitly enabled will use PIM BFD.

**Command Mode**
- Router-PIM Sparse-mode IPv4 Configuration
- Router-PIM Sparse-mode VRF IPv4 Configuration

**Command Syntax**

```
bfd
no bfd
default bfd
```

**Example**
- These commands enable PIM BFD globally on the switch in the default VRF, enabling it on all PIM-SM interfaces where it is not explicitly disabled.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#bfd
switch(config-router-pim-sparse-ipv4)#
```
**bfd default (ISIS)**

The *bfd default* command places the switch in address-family configuration mode.

The *bfd default* and *isis bfd* commands configure Bidirectional Forwarding Detection (BFD), a low overhead protocol designed to provide rapid detection of failures at any protocol layer in the path between adjacent forwarding engines over any media. BFD is supported for IS-IS IPv4 routes.

**Command Mode**
- Router-Address-Family Configuration

**Command Syntax**

```
bfd default
```

**Example**

- These commands enable BFD for all the interfaces on which IS-IS is enabled. By default BFD is disabled on all the interfaces.

```
switch(config)#router isis 1
switch(config-router-isis)#address-family ipv4
switch(config-router-af)#bfd default
switch(config-router-af)#
```
**bfd default (OSPF)**

The `bfd default` command globally configures OSPF to use Bidirectional Forwarding Detection (BFD). When this command is issued, BFD sessions will be established with all OSPF neighbors connected to BFD-enabled interfaces unless OSPF BFD has been disabled on a participating interface using the `ip ospf neighbor bfd` command. BFD is globally disabled in OSPF by default.

For OSPF BFD to function on an interface, BFD must also be enabled and configured on that interface using the `bfd interval` command.

The `no bfd default` and `default bfd default` commands disable OSPF BFD on all interfaces except those where it has been explicitly enabled using the `ip ospf neighbor bfd` command.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```
bfd default
no bfd default
default bfd default
```

**Examples**

These commands enable BFD for OSPF instance 100 on all interfaces except those on which OSPF BFD has been explicitly disabled.

```
switch(config)#router ospf 100
switch(config-router-ospf)#bfd default
switch(config-router-ospf)#
```
**bfd echo**

The `bfd echo` command enables the BFD echo function on the configuration mode interface.

The `no bfd echo` and `default bfd echo` commands disable the BFD echo function by removing the corresponding `bfd echo` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
bfd echo
no bfd echo
default bfd echo
```

**Example**

- These commands enable the BFD echo function on Ethernet interface 5. If a slow-timer value has been configured on the switch, the minimum receive rate expected from the BFD neighbor will be reset to that value; otherwise, the minimum receive rate will be set to 2000 milliseconds.

  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#bfd echo
  switch(config-if-Et5)#
  ```
**bfd interval**

The `bfd interval` command configures the BFD control packet transmission rate, minimum control packet receive rate, and the number of missed packets that will signal that the session is down. These parameters can be configured globally for the switch or for the configuration mode interface. If a parameter is configured both globally and on the interface, the value configured on the interface takes precedence.

**Important!** For a BFD session to be established, BFD must be enabled for any routing protocol using BFD for failure detection.

The `no bfd interval` and `default bfd interval` commands return the BFD parameters on the configuration mode interface to default values by removing the corresponding `bfd interval` command from `running-config`.

**Command Mode**
- Global Configuration
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
```
bfd interval transmit_rate min_rx receive_minimum multiplier factor
no bfd interval
default bfd interval
```

**Parameters**
- `transmit_rate` rate in milliseconds at which control packets will be sent. Values range from 50 to 60000; the default value is 300.
- `receive_minimum` rate in milliseconds at which control packets will be expected. Values range from 50 to 60000.
- `factor` number of consecutive missed BFD control packets after which BFD will declare the session as down. Values range from 3 to 50.

**Examples**
- These commands configure BFD on Ethernet interface 5 to expect packets from the peer every 200 milliseconds and declare the session down after failing to receive 5 consecutive packets. This configuration overrides any values configured globally.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#bfd interval 200 min_rx 200 multiplier 5
switch(config-if-Et5)#
```
**bfd local-address**

The `bfd local-address` command specifies the local L3 address for use in Bidirectional Forwarding Detection (BFD). When configuring an L2 interface, specification of a local L3 address is required in order to run BFD per-link in RFC 7130 mode. (This is not necessary when configuring an L3 interface with an IP address configured on the port channel.)

The `no bfd local-address` and `default bfd local-address` commands remove the local L3 address by removing the corresponding `bfd local-address` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
  bfd local-address address
  no bfd local-address [address]
  default bfd local-address [address]
```

**Parameters**

- `address` local IPv4 or IPv6 address for BFD.

**Example**

- This command specifies the local L3 address for BFD.

```
switch(config)#bfd local-address 10.0.0.4
switch(config#)
```
**bfd neighbor**

The `bfd neighbor` command specifies the L3 address of the BFD neighbor of the port channel being configured. This is required to run BFD per-link in RFC 7130 mode. For an L2 port channel, this address should be the BFD per-link “local address” globally configured on the peer switch. For an L3 port channel, this address should be the IP address configured on the peer port channel.

The `no bfd neighbor` and `default bfd neighbor` commands remove the BFD neighbor address by removing the corresponding `bfd neighbor` command from `running-config`.

**Command Mode**
- Interface-Port-channel Configuration

**Command Syntax**

```
  bfd neighbor address
  no bfd neighbor [address]
  default bfd neighbor [address]
```

**Parameters**

- `address` IPv4 or IPv6 address of the port channel’s BFD neighbor.

**Example**

- These commands specify the L3 address of the port channel’s BFD neighbor.

```
  switch(config)#interface port-channel 5
  switch(config-if-Po5)#bfd neighbor 10.0.0.5
  switch(config-if-Po5)#
```
**bfd per-link**

The `bfd per-link` command enables the BFD per-link function on the port channel being configured. When BFD per-link is enabled, BFD sub-sessions are run on each link of the port channel; BFD considers the port-channel to be “up” as long as any one of the links is live.

BFD per-link runs by default in legacy mode, which allows downed links to remain members of the port channel and relies on LACP or other means to prune the dead links. Legacy mode is provided for interoperability with older switches.

RFC 7130 mode runs BFD per-link in full compliance with RFC 7130, and automatically removes links in down state from the port-channel, then adds them back again when they come up. Use the `rfc-7130` keyword to enable per-link in RFC 7130 mode. You must also configure an L3 BFD neighbor address for each port-channel running RFC 7130 per-link using the `bfd neighbor` command. When configuring an L2 interface, you must also globally configure a local L3 BFD address on the switch using the `bfd local-address` command.

For the BFD session to come up, both peers must be configured in the same way (either RFC-7130 or legacy mode).

The `no bfd per-link` and `default bfd per-link` commands disable the BFD per-link function by removing the corresponding `bfd per-link` command from `running-config`.

**Command Mode**

Interface-Port-channel Configuration

**Command Syntax**

```
bfd per-link [rfc-7130]
no bfd per-link [rfc-7130]
default bfd per-link [rfc-7130]
```

**Example**

- These commands enable the BFD per-link function in legacy mode on port channel 5.
  
  ```
  switch(config)#interface port-channel 5
  switch(config-if-Po5)#bfd per-link
  switch(config-if-Po5)#
  ```

- These commands globally specify a local L3 BFD address for the switch, enable the BFD per-link function in RFC 7130 mode on port channel 5, and specify the L3 address of the port channel’s BFD neighbor.
  
  ```
  switch(config)#bfd local-address 10.0.0.5
  switch(config)#interface port-channel 5
  switch(config-if-Po5)#bfd per-link rfc-7130
  switch(config-if-Po5)#bfd neighbor 10.0.0.4
  switch(config-if-Po5)#
  ```
**bfd slow-timer**

The `bfd slow-timer` command configures the minimum reception rate for BFD control packets which will be used if the BFD echo function is enabled. The default value is 2000 milliseconds.

**Important!** For a BFD session to be established, BFD must be enabled for any routing protocol using BFD for failure detection.

The `no bfd slow-timer` and `default bfd slow-timer` commands return the BFD slow-timer to the default value of 2000 milliseconds by removing the corresponding `bfd interval` command from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**
```
bfd slow-timer receive_minimum
no bfd slow-timer
default bfd slow-timer
```

**Parameters**
- `receive_minimum` rate in milliseconds at which control packets will be expected when the BFD echo function is enabled. Values range from 2000 to 60000; default value is 2000.

**Examples**
- This command configures BFD to expect control packets from the peer every 10000 milliseconds when the BFD echo function is enabled.
  ```
  switch(config)#bfd slow-timer 10000
  switch(config)#
  ```
ip ospf neighbor bfd

The `ip ospf neighbor bfd` command enables Bidirectional Forwarding Detection (BFD) for the open shortest path first protocol (OSPF) on the configuration mode interface regardless of the global settings for the OSPF instance. All OSPF neighbors associated with the interface become BFD peers, and OSPF uses BFD for failure detection.

For OSPF BFD to function on an interface, BFD must also be enabled and configured on that interface using the `bfd interval` command.

The `no ip ospf neighbor bfd` command disables OSPF BFD on the interface and terminates all BFD sessions with the interface’s OSPF peers. The `default ip ospf neighbor bfd` command causes the interface to follow global OSPF BFD settings configured by the `bfd default (OSPF)` command.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `ip ospf neighbor bfd`
- `no ip ospf neighbor bfd`
- `default ip ospf neighbor bfd`

**Example**
- These commands enable BFD on Ethernet interface 3/20.
  
  switch(config)#interface ethernet 3/20
  switch(config-if-Et3/20)#ip ospf neighbor bfd
  switch(config-if-Et3/20)#

- These commands cause Ethernet interface 3/20 to follow the global OSPF BFD configuration.

  switch(config)#interface ethernet 3/20
  switch(config-if-Et3/20)#default ip ospf neighbor bfd
  switch(config-if-Et3/20)#
**isis bfd**

The `isis bfd` command activates the corresponding IS-IS routing instance on the configuration mode interface. By default, the IS-IS routing instance is not enabled on an interface.

The `no isis enable` and `default isis enable` commands disable IS-IS on the configuration mode interface by removing the corresponding `isis enable` command from `running-config`.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

```
isis bfd
no isis bfd
default isis bfd
```

**Examples**

- These commands enable BFD on IS-IS interfaces.
  ```
  switch(config)#interface Ethernet 5/6
  switch(config-if-Et5/6)#isis bfd
  switch(config-if-Et5/6)#
  ```
neighbor bfd

The `neighbor bfd` command enables Bidirectional Forwarding Detection (BFD) for use as a failure detection mechanism for border gateway protocol (BGP) connections to the specified BGP neighbor or peer group.

Once a BFD session is established with a BGP neighbor, if the BFD session goes down the status of the BGP session is changed to “down” as well.

The `no neighbor bfd` and `default neighbor bfd` commands disable BFD for BGP connections to the specified neighbor or peer group by removing the corresponding `neighbor bfd` command from `running-config`.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor NEIGHBOR_ID bfd
no neighbor NEIGHBOR_ID bfd
default neighbor NEIGHBOR_ID bfd
```

**Parameters**

- `NEIGHBOR_ID` IP address or peer group name. Values include:
  - `ipv4_addr` neighbor’s IPv4 address.
  - `ipv6_addr` neighbor’s IPv6 address.
  - `group_name` peer group name.

**Example**

- These commands enable BFD failure detection for BGP connections with the neighbor at 10.13.64.1.

```
switch(config)#router bgp 300
switch(config-router-bgp)#neighbor 10.13.64.1 bfd
switch(config-router-bgp)#
```
pim ipv4 bfd

The `pim ipv4 bfd` command enables Bidirectional Forwarding Detection (BFD) on the configuration mode interface as a failure detection mechanism for Protocol-Independent Multicast Sparse-Mode (PIM-SM). To enable PIM BFD globally on the switch, use the `bfd (Router-PIM Sparse-mode)` command. Interface-level settings override the global setting.

When PIM BFD is enabled, a BFD session is created for each PIM-SM neighbor and used to detect a loss of connectivity with the neighbor. PIM-SM hello packets are still exchanged with PIM-SM neighbors when BFD is enabled.

The `no pim ipv4 bfd` disables PIM BFD on the configuration mode interface regardless of global settings. The `default pim ipv4 bfd` command causes the configuration mode interface to follow the global setting for PIM BFD by removing the corresponding `pim ipv4 bfd` statement from `running-config`.

Command Mode
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

Command Syntax
- `pim ipv4 bfd`
- `no pim ipv4 bfd`
- `default pim ipv4 bfd`

Example
- These commands configure VLAN interface 200 to use BFD for PIM-SM connection failure detection regardless of the global PIM BFD configuration.
  
  ```
  switch(config)#interface vlan 200
  switch(config-if-VL200)#pim ipv4 bfd
  ```
show bfd peers

The `show bfd peers` command displays information about the neighbors with which the switch currently has a Bidirectional Forwarding Detection (BFD) session.

**Command Mode**

EXEC

**Command Syntax**

```
show bfd peers [INFO_LEVEL]
```

**Parameters**

- **INFO_LEVEL** amount of information that is displayed. Options include:
  - `<no parameter>` command displays data block for each specified interface.
  - `detail` command displays table that summarizes interface data.

**Display Values**

- **DstAddr** IP address of the BFD neighbor.
- **MyDisc** Local discriminator value of the BFD session.
- **YoDisc** Neighbor’s discriminator value for the BFD session.
- **If** Interface to which the neighbor is connected.
- **LUp** Last up.
- **LDown** Last down.
- **Ldiag** Diagnostic for the last change in session state.
- **State** State of the BFD session.
- **TxInt** Transmit interval of the local interface.
- **RxInt** Minimum receive interval set on the local interface.
- **Multiplier** Local multiplier (number of packets that must be missed to declare session down).
- **Received RxInt** Minimum receive interval set on the neighbor interface.
- **Received Multiplier** Neighbor’s multiplier (number of packets that must be missed to declare session down).
- **Rx Count** BFD control packets transmitted.
- **Tx Count** BFD control packets received.
- **Detect Time** Total time in milliseconds it takes for BFD to detect connection failure.
- **Registered Protocols** Protocols using BFD with this neighbor.
Examples

- This command displays general information about BFD neighbors.
  
  ```
  switch>show bfd peers
  DstAddr        MyDisc YoDisc  If            LUp     LDown   Ldiag             S
  tate

  ```
**vrrp bfd ip**

The `vrrp bfd ip` command enables and configures Bidirectional Forwarding Detection (BFD) for virtual router redundancy protocol (VRRP) on the configuration mode interface.

When enabled, BFD provides failure detection for a 2-router VRRP system. When the master is configured with the physical IP address of the backup router, and the backup is configured with the address of the master, a BFD session is established between them. If the BFD session goes down, the backup router immediately assumes the master role.

VRRP master advertisement packets are still sent even when the BFD session is established to accommodate VRRP systems involving more than two routers.

The `no vrrp bfd ip` and `default vrrp bfd ip` commands disable BFD for VRRP on the configuration mode interface by removing the corresponding `vrrp bfd ip` statement from `running-config`. The `no vrrp` command also removes the `vrrp bfd ip` command for the specified virtual router.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
vrrp group bfd ip ipv4_address
no vrrp group bfd ip
default vrrp group bfd ip
```

**Parameters**

- `group` virtual router identifier (VRID). Values range from 1 to 255.
- `ipv4_address` IPv4 address of the other VRRP router. On the master router, enter the physical IP address of the backup; on the backup, enter the physical IP address of the master.

**Example**

- These commands enable BFD on Ethernet interface 3/20 for VRRP ID 15 with a connection to a router at IP address 192.168.2.1.

  ```
  switch(config)#interface ethernet 3/20
  switch(config-if-Et3/20)#vrrp 15 bfd ip 192.168.2.1
  switch(config-if-Et3/20)#
  ```
Multicast Architecture

IP multicast is the transmission of data packets to multiple hosts through a common IP address. Arista switches support multicast transmissions through IGMP, IGMP Snooping, and PIM-SM. These sections describe the Arista multicast architecture.

- Section 38.1: Overview
- Section 38.2: Multicast Architecture Description
- Section 38.3: Multicast Configuration
- Section 38.4: Multicast Commands

38.1 Overview

Arista switches provide layer 2 multicast filtering and layer 3 routing features for applications requiring IP multicast services. The switches support over a thousand separate routed multicast sessions at wire speed without compromising other layer 2/3 switching features. Arista switches support IGMP, IGMP snooping, PIM-SM, and MSDP to simplify and scale data center multicast deployments.

Supported Features

Feature support varies by platform; please consult the release notes for multicast support information by platform.

Multicast and unicast use the same routing table. Unicast routes use TCAM resources, which may also impact the maximum number of multicast routes.

Features Not Supported

The multicast functions not supported by Arista switches include (*,* G) forwarding or boundary routers, multicast MIBs, and router applications joining multicast groups.
38.2 Multicast Architecture Description

IP multicast is data transmission to a subset of all hosts through a single multicast group address. Multicast packets are delivered using best-effort reliability, similar to unicast packets. Senders use the multicast address as the destination address. Any host, regardless of group membership, can send to a group. However, only group members receive messages sent to a group address.

IP multicast addresses range from 224.0.0.0 to 239.255.255.255. Multicast routing protocol control traffic reserves the address range 224.0.0.0 to 224.0.0.255. The address 224.0.0.0 is never assigned to any group.

Multicast group membership is dynamic; a group’s activity level and membership can vary over time. A host can also simultaneously belong to multiple multicast groups.

Figure 38-1 depicts the components that comprise the multicast architecture. The remainder of this section describes the multicast components depicted in the figure.

Figure 38-1: Multicast Architecture

---

38.2.1 Multicast Control Plane

The multicast control plane builds and maintains multicast distribution trees. It communicates changes in the multicast routing table to the MFIB for multicast forwarding.

- Protocol Independent Multicast (PIM) builds and maintains multicast routing trees using reverse path forwarding (RPF) on a unicast routing table.
- Internet Group Management Protocol (IGMP) identifies multicast group members on subnets directly connected to the switch. Hosts manage multicast group membership with IGMP messages.
- The switch maintains an mroute (multicast routing) table when running PIM to provide forwarding tables used to deliver multicast packets.

The mroute table stores the states of inbound and outbound interfaces for each source/group pair \((S,G)\). The switch discards and forwards packets on the basis of this state information. Each table entry, referred to as an mroute, corresponds to a unique \((S,G)\) and contains:

- the multicast group address
- the multicast source address (or \(*\) for all sources)
38.2.2 Multicast Routing Information Base (MRIB)

The MRIB is the channel between multicast control plane clients and the multicast forwarding plane. The `show ip mroute` command displays MRIB entries as (*, G), (S, G), and (*, G/m) multicast entries. MRIB entries are based on source, group, and group masks. The entries are associated with a list of interfaces whose forwarding state is described with flags. MRIB communication is based on the state change of entry and interface flags. Flags are significant to MRIB clients but are not interpreted by the MRIB.

38.2.3 Multicast Forwarding Plane

The multicast forwarding plane consists of the multicast forwarding information base (MFIB), a forwarding engine that is independent of multicast routing protocols.

MFIB formats PIM and IGMP multicast routes for protocol-independent hardware packet forwarding and adds them to the hardware multicast expansion table (MET) and the hardware FIB.

MFIB uses a core forwarding engine for interrupt-level (fast switching) and process-level (process switching) forwarding. MFIB fast-switches inbound multicast packets that match an MFIB forwarding entry and process-switches packets requiring a forwarding entry if a matching entry does not exist.

38.2.4 Hardware Dependent Forwarding and Fast Drop

In IP multicast protocols, each (S,G) and (*,G) route corresponds to an inbound reverse path forwarding (RPF) interface. Packets arriving on non-RPF interfaces may require PIM processing, as performed by the CPU subsystem software.

By default, hardware sends all packets arriving on non-RPF interfaces to the CPU subsystem software. However, the CPU can be overwhelmed by non-RPF packets that do not require software processing. The CPU subsystem software prevents CPU overload by creating a fast-drop entry in hardware for inbound non-RPF packets not requiring PIM processing. Packets matching a fast-drop entry are bridged in the ingress VLAN but not sent to the software, avoiding CPU subsystem software overload. Fast-drop entry usage is critical in topologies with persistent RPF failures.

Protocol events, such as links going down or unicast routing table changes, can change the set of packets that can be fast dropped. Packets that were correctly fast dropped before a topology change may require forwarding to the CPU subsystem software after the change. The CPU subsystem software handles fast-drop entries that respond to protocol events so that PIM can process all necessary non-RPF packets.
38.3 Multicast Configuration

This section describes the following configuration tasks:

- Section 38.3.1: Multicast Configuration
- Section 38.3.2: Configuring MFIB
- Section 38.3.3: Configuring Static IP Mroute
- Section 38.3.4: Displaying and Clearing the Mroute Table

38.3.1 Multicast Configuration

Enabling Multicast Routing

Enabling IP multicast routing allows the switch to forward multicast packets. The `routing` command enables multicast routing. When multicast routing is enabled, `running-config` contains a `routing` statement.

Example

- These commands enable multicast routing on the switch.

```
switch(config)#router multicast
switch(config-router-multicast)#ipv4
switch(config-router-multicast-ipv4)#routing
```

Multicast Boundary Configuration

The multicast boundary specifies subnets where source traffic entering an interface is filtered to prevent the creation of mroute states on the interface. The interface is not included in the outgoing interface list (OIL). Multicast PIM, IGMP and other multicast data cannot cross the boundary, facilitating the use of a multicast group address in multiple administrative domains.

The `ip multicast boundary` command configures the multicast boundary. The multicast boundary can be specified through multiple IPv4 subnets or one standard IPv4 ACL.

In an ACL method, the multicast subnets are allowed only from the permit entries of the ACL and rest is either denied or filtered. Whereas, in a non-ACL method the statements configure subnets that are only denied or filtered.

Examples

- These commands configure the multicast address of 229.43.23.0/24 as a multicast boundary where source traffic is restricted from VLAN interface 300.

```
switch(config)#interface vlan 300
switch(config-if-vl300)#ip multicast boundary 229.43.23.0/24
switch(config-if-vl300)#
```
These commands create a standard ACL, then implement the ACL in an `ip multicast boundary` command to allow multicast for subnet (224.0.0.0/4) and create a multicast boundary for all remaining subnets by denying them.

```
switch(config)#ip access-list standard mbac1
switch(config-std-acl-mbac1)#10 deny 225.123.0.0/16
switch(config-std-acl-mbac1)#20 deny 239.120.10.0/24
switch(config-std-acl-mbac1)#30 permit 224.0.0.0/4
switch(config-std-acl-mbac1)#exit
switch(config)#interface vlan 200
switch(config-if-Vl200)#ip multicast boundary mbac1
switch(config-if-Vl200)#exit
switch(config)#
```

### 38.3.2 Configuring MFIB

MFIB formats PIM and IGMP multicast routes for protocol-independent hardware packet forwarding and adds them to the hardware multicast expansion table (MET) and the hardware FIB.

#### MFIB Polling Interval

The switch records activity levels for multicast routes in the MFIB after polling the corresponding hardware activity bits. The `activity polling-interval` command specifies the frequency at which the switch polls the hardware activity bits for the multicast routes.

**Example**

- These commands set the MFIB activity polling period to 15 seconds.

```
switch(config)#router multicast
switch(config-router-multicast)#ipv4
switch(config-router-multicast-ipv4)#activity polling-interval 15
switch(config-router-multicast-ipv4)#
```

#### MFIB Fast Drops

In IP multicast protocols, every (S,G) or (*,G) route is associated with an inbound RPF (reverse path forwarding) interface. Packets arriving on an interface not associated with the route may need CPU-dependent PIM processing, so packets received by non-RPF interfaces are sent to the CPU by default, causing heavy CPU processing loads.

Multicast routing protocols often do not require non-RPF packets; these packets do not require software processing. The CPU therefore updates the hardware MFIB with a fast-drop entry when it receives a non-RPF interface packet that PIM does not require. Additional packets that match the fast-drop entry are not sent to the system software.

Fast drop is enabled on all interfaces by default. The `no ip mfib fastdrop` command disables MFIB fast drop for the configuration mode interface.

**Example**

- This command disables MFIB fast drop for the VLAN interface 120.

```
switch(config)#interface vlan 120
switch(config-if-Vl120)#no ip mfib fastdrop
switch(config-if-Vl120)#
```

The `ip mfib max-fastdrops` command limits the number of fast-drop routes that the switch's MFIB table can contain. The default fast-drop route limit is 1024.
Example

- This command sets the maximum number of fast-drop routes to 2000.

```
switch(config)#ip mfib max-fastdrops 2000
switch(config)#
```

The `clear ip mfib fastdrop` command, in global configuration mode, removes all MFIB fast-drop entries on all interfaces.

Example

- This command removes all fast-drop entries from the MFIB table.

```
switch#clear ip mfib fastdrop
switch#
```

The `show multicast fib ipv4` command displays information about the routes and interfaces in the IPv4 MFIB.

- `show multicast fib ipv4` displays MFIB information for hardware-forwarded routes.
- `show multicast fib ipv4 software` displays MFIB information for software-forwarded routes.

Example

- This command displays MFIB information for hardware-forwarded routes.

```
switch>show multicast fib ipv4
Activity poll time: 60 seconds
239.255.255.250 172.17.26.25
  Vlan26 (iif)
  Vlan2028
  Cpu
  Activity 0:02:11 ago
239.255.255.250 172.17.26.156
  Vlan26 (iif)
  Vlan2028
  Cpu
  Activity 0:02:11 ago
239.255.255.250 172.17.26.178
  Vlan26 (iif)
  Vlan2028
  Cpu
  Activity 0:03:37 ago
```

MFIB Unresolved Cache-entries Max

The `unresolved cache-entries max` command configures the maximum number of unresolved (S,G) routes that the switch can cache packets. All packets belonging to (S,G) routes exceeding the limit are dropped. The default buffer size is 4000 routes. See `ip multicast boundary` to limit the number of cached packets per S,G.

Example

- This command sets the maximum MFIB unresolved cache-entry buffer size to 6000 routes in the default VRF.

```
switch(config)#router multicast
switch(config-router-multicast)#ipv4
switch(config-router-multicast-ipv4)#unresolved cache-entries max 6000
switch(config-router-multicast-ipv4)#
```
MFIB Unresolved Packet-buffers Max

The ip multicast boundary command specifies the number of packets per unresolved route that are queued while the route is being resolved by the switch. The limit for ip multicast boundary is for an individual route, packets that exceed this limit are dropped. By default, the switch processes 3 unresolved packets for an individual route. See unresolved cache-entries max to limit the number of unresolved routes that are cached.

Example

- This command configures the switch in the default VRF to cache up to thirty multicast packets from any route before that route is resolved.

```
switch(config)#router multicast
switch(config-router-multicast)#ipv4
switch(config-router-multicast-ipv4)#unresolved packet-buffers max 30
```

38.3.3 Configuring Static IP Mroute

The static IP multicast route (or static mroute) interface overrides the interface that is ordinarily selected from the matching route in the unicast routing table, providing a means for breaking dependence on the unicast topology for the multicast topology. The command multipath deterministic specifies a candidate for the multicast reverse path forwarding (RPF) interface of any (S,G) multicast route, where the source falls within the given network prefix.

38.3.3.1 Selecting RPF interface

Static mroutes are BGP IP Multicast (SAFI 2) learned routes. These routes are stored in the multicast routing information base (MRIB), a separate routing table. The RPF interface is selected for a source as follows:

Initially, a source route is looked up in the MRIB. If the MRIB lookup yields a route, that route is used for selecting the RPF interface. Therefore, any configured static mroutes matching the source wins the selection process over a 'Connected' route to the source. For a static mroute to be considered for selection, the specified interface must be up and PIM must be enabled on it. By default, static mroutes have an admin distance of 1. If multiple static mroutes exist with equal longest prefix match, the mroute with the lowest admin distance will win. Admin distance is not be used to compare selection between unicast RIB and MRIB routes. Successful static mroutes looked up in the MRIB are always chosen over unicast RIB lookups.

If MRIB lookup does not yield a route, then the unicast RIB is looked up for a route to select the RPF interface. If the selected route has ECMP, one of the corresponding paths is selected as RPF neighbor.

**Note**
The path to choose RPF neighbor is selected based on the hashing scheme; and protocols specified for valid paths, multipath configuration, directly connected sources, and assert winners.

38.3.3.2 Selecting Static Mroutes

The longest match is selected when a source matches multiple static mroutes in the MRIB. The order in which static mroutes were configured is not a factor.
Example

- These commands select the longest match when a source matches multiple static mroutes in the MRIB.

```
switch(config)#router multicast
switch(config-router-multicast)#ipv4
switch(config-router-multicast-ipv4)#rpf route 10.0.0.0/16 Ethernet 4
switch(config-router-multicast-ipv4)#rpf route 11.10.1.0/24 Ethernet 5
switch(config-router-multicast-ipv4)#rpf route 11.10.1.2/32 Ethernet 6
switch(config-router-multicast-ipv4)##
```

- These commands include an administrative distance of 255 on Ethernet interface 5 with static mroute.

```
switch(config)#router multicast
switch(config-router-multicast)#ipv4
switch(config-router-multicast-ipv4)#rpf route 10.0.0.0/16 Ethernet 4
switch(config-router-multicast-ipv4)#rpf route 11.10.1.0/24 Ethernet 5 255
switch(config-router-multicast-ipv4)#rpf route 11.10.1.2/32 Ethernet 6
switch(config-router-multicast-ipv4)#
```

38.3.4 Displaying and Clearing the Mroute Table

The mroute table stores the states of inbound and outbound interfaces for each source/group pair (S,G). The switch discards and forwards packets on the basis of this state information. Each table entry, referred to as an mroute, corresponds to a unique (S,G) and contains:

- the multicast group address
- the multicast source address (or * for all sources)
- the inbound interface
- a list of outbound interfaces

Clearing mroute Entries

The `clear ip mroute` command removes route entries from the mroute table:

- `clear ip mroute *` all entries from the mroute table.
- `clear ip mroute gp_ipv4` all entries for the specified multicast group.
- `clear ip mroute gp_ipv4 src_ipv4` all entries for the specified source sending to a specified group.

Examples

- This command removes all route entries from the mroute table.

```
switch#clear ip mroute *
switch#
```

- This command removes entries for source 228.3.10.1 sending to multicast group 224.2.205.42.

```
switch#clear ip mroute 224.2.205.42 228.3.10.1
switch#
```

Displaying the mroute Table

The `show ip mroute count` command displays IP multicast routing table statistics.
Example

- This command displays IP multicast routing table statistics.

  ```
  switch>show ip mroute count
  IP Multicast Statistics
  1 groups and 1 sources
  Multicast routes: 1 (*,G), 1 (S,G)
  Average of 1.00 sources per group
  Maximum of 1 sources per group:
   228.24.12.1
  switch>
  ```

The `show ip mroute` command displays information from the IP multicast routing table.

- `show ip mroute` displays information for all routes in the table.
- `show ip mroute gp_addr` displays information for the specified multicast group.

Example

- This command displays the IP multicast routing table for the multicast group 225.1.1.1.

  ```
  switch>show ip mroute 225.1.1.1
  PIM Sparse Mode Multicast Routing Table
  Flags: E - Entry forwarding on the RPT, J - Joining to the SPT
  R - RPT bit is set, S - SPT bit is set
  W - Wildcard entry, X - External component interest
  I - SG Include Join alert rcvd, P - Ex-Prune alert rcvd
  H - Joining SPT due to policy, D - Joining SPT due to protocol
  Z - Entry marked for deletion
  A - Learned via Anycast RP Router
  225.1.1.1
   172.28.1.100, 5d04h, flags: S
   Incoming interface: Vlan281
   Outgoing interface list:
    Port-Channel1999
  switch>
  ```
### Multicast Commands

**Multicast Configuration Commands (Global)**
- activity polling-interval
- ip mfib max-fastdrops
- multipath deterministic
- multipath none
- route
- routing
- multipath deterministic
- unresolved cache-entries max
- ip multicast boundary

**Multicast Configuration Commands (Interface)**
- ip mfib fastdrop
- ip multicast boundary

**Multicast Clear Commands**
- clear ip mfib fastdrop
- clear ip mroute

**Multicast Display Commands**
- show ip mroute
- show ip mroute count
- show ip multicast boundary
- show multicast fib ipv4
- show multicast fib ipv4 software
activity polling-interval

The switch records activity levels for multicast routes in the mfib after polling the corresponding hardware activity bits. The activity polling-interval command specifies the frequency at which the switch polls the hardware activity bits for the multicast routes.

The no activity polling-interval and default activity polling-interval commands restore the default interval of 60 seconds by removing the activity polling-interval command from running-config.

Command Mode
   Router Multicast IPv4 Configuration

Command Syntax
   activity polling-interval period
   no activity polling-interval
   default activity polling-interval

Parameters
   • period   interval (seconds) between polls. Values range from 1 to 60. Default is 60.

Example
   • These commands set the MFIB activity polling period to 15 seconds.

switch(config)#router multicast
switch(config-router-multicast)#ipv4
switch(config-router-multicast-ipv4)#activity polling-interval 15
switch(config-router-multicast-ipv4)#
clear ip mfib fastdrop

The `clear ip mfib fastdrop` command removes all fast-drop entries from the MFIB table.

**Command Mode**
Privileged EXEC

**Command Syntax**
```
clear ip mfib fastdrop
```

**Example**
- This command removes all fast-drop entries from the MFIB table.
  ```
  switch#clear ip mfib fastdrop
  switch#
  ```
clear ip mroute

The clear ip mroute command removes route entries from the mroute table, as follows:

- clear ip mroute * removes all entries from the mroute table.
- clear ip mroute gp_ipv4 removes all entries for the specified multicast group.
- clear ip mroute gp_ipv4 src_ipv4 removes all entries for the specified source sending to the specified group.

Command Mode
Privileged EXEC

Command Syntax
  clear ip mroute ENTRY_LIST

Parameters
  - ENTRY_LIST entries that the command removes from the mroute table. Options include:
    - * all route entries
    - gp_ipv4 all entries for multicast group gp_ipv4 (dotted decimal notation)
    - gp_ipv4 src_ipv4 all entries for source (src_ipv4) sending to group (gp_ipv4)

Examples
  - This command removes all route entries from the mroute table.
    switch#clear ip mroute *
    switch#
  - This command removes entries for the source 228.3.10.1 sending to multicast group 224.2.205.42.
    switch#clear ip mroute 224.2.205.42 228.3.10.1
    switch#
ip mfib fastdrop

In IP multicast protocols, every (S,G) or (*,G) route is associated with an inbound RPF (reverse path forwarding) interface. Packets arriving on an interface not associated with the route may need CPU-dependent PIM processing, so packets received by non-RPF interfaces are sent to the CPU by default, causing heavy CPU processing loads.

Multicast routing protocols often do not require non-RPF packets; these packets do not require software processing. The CPU therefore updates the hardware MFIB with a fast-drop entry when it receives a non-RPF interface packet that PIM does not require. Additional packets that match the fast-drop entry are not sent to the system software.

Fast drop is enabled on all interfaces by default. The **no ip mfib fastdrop** command disables MFIB fast drop for the configuration mode interface.

The **ip mfib fastdrop** and **default ip mfib fastdrop** commands enable MFIB fast drop for the configuration mode interface by removing the corresponding no ip mfib fastdrop command from **running-config**.

The **clear ip mfib fastdrop** command, in global configuration mode, removes all MFIB fast-drop entries on all interfaces.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- ip mfib fastdrop
- no ip mfib fastdrop
- default ip mfib fastdrop

**Examples**
- This command disables MFIB fast drop for VLAN interface 120.

```
switch(config)#interface vlan 120
switch(config-if-Vl120)#no ip mfib fastdrop
switch(config-if-Vl120)#
```
**ip mfib max-fastdrops**

The `ip mfib max-fastdrops` command limits the number of fast-drop routes that the switch’s MFIB table can contain.

The `no ip mfib max-fastdrops` and `default ip mfib max-fastdrops` commands restore the default fast-drop route limit of 1024 by removing the `ip mfib max-fastdrops` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip mfib max-fastdrops quantity
no ip mfib max-fastdrops
default ip mfib max-fastdrops
```

**Parameters**

- `quantity` maximum number of fast-drop routes. Value ranges from 0 to 1000000 (one million). Default is 1024.

**Example**

- This command sets the maximum number of fast-drop routes to 2000.

  ```
switch(config)#ip mfib max-fastdrops 2000
switch(config)#
```
ip multicast boundary

The **ip multicast boundary** command specifies subnets where source traffic entering the configuration mode interface is dropped, preventing the creation of mrout e states on the interface. The interface is not included in the outgoing interface list (OIL). The multicast boundary can be specified through multiple IPv4 subnets or one standard IPv4 ACL.

In an ACL method, the multicast subnets are allowed only from the permit entries of the ACL and rest is either denied or filtered. Whereas, in a non-ACL method the statements configure subnets that are only denied or filtered.

Multicast PIM, IGMP and other multicast data cannot cross the boundary, facilitating the use of a multicast group address in multiple administrative domains.

The **no ip multicast boundary** and **default ip multicast boundary** commands delete the specified subnet restriction by removing the corresponding **ip multicast boundary** command from **running-config**. When these commands do not specify a subnet address, all **ip multicast boundary** statements for the configuration mode interface are removed.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
```
ip multicast boundary SUBNET [TCAM]
no ip multicast boundary [SUBNET]
default ip multicast boundary [SUBNET]
```

**Parameters**
- **SUBNET** the subnet address configured as the multicast boundary. Options include:
  - **net_addr** multicast subnet address (CIDR or address mask).
  - **acl_name** standard access control list (ACL) that specifies the multicast group addresses.
- **TCAM** specifies address inclusion in the routing table. Options include:
  - **<no parameter>** boundaries ((S,G) entries) are added to routing table.
  - **out** boundaries are not added to routing table.

**Guidelines**
When **out** is selected, the first inbound data packet corresponding to the **SUBNET** may be sent to the CPU. In response, the packet is dropped and the boundary prefix is added to the hardware table. In this scenario, the mroute entry is added only when data traffic is received.

**Restrictions**
Only one command that specifies an ACL can be assigned to an interface. Commands that specify an ACL and a subnet cannot be simultaneously assigned to an interface.

**Examples**
- This command configures the multicast address of 229.43.23.0/24 as a multicast boundary where source traffic is restricted from VLAN interface 300.
```
switch(config)#interface vlan 300
switch(config-if-vl300)#ip multicast boundary 229.43.23.0/24
switch(config-if-vl300)#
```
These commands create a standard ACL, then implement the ACL in an **ip multicast boundary** command to allow multicast for subnet (224.0.0.0/4) and create a multicast boundary for all remaining subnets by denying them.

```plaintext
switch(config)#ip access-list standard mbac1
switch(config-std-acl-mbac1)#10 deny 225.123.0.0/16
switch(config-std-acl-mbac1)#20 deny 239.120.10.0/24
switch(config-std-acl-mbac1)#30 permit 224.0.0.0/4
switch(config-std-acl-mbac1)#exit
switch(config)#interface vlan 200
switch(config-if-Vl200)#ip multicast boundary mbac1
switch(config-if-Vl200)#exit
switch(config)#
```
**multipath deterministic**

By default, multicast traffic is load balanced by distributing packets over all ECMP links. The `no multipath deterministic` command routes multicast ECMP traffic to the neighbor with the highest IPv4 address.

The `multipath deterministic` and `default multipath deterministic` commands restore the default behavior of randomly distributing multicast traffic over all ECMP links.

**Command Mode**

Router Multicast IPv4 Configuration

**Command Syntax**

- `multipath deterministic`
- `no multipath deterministic`
- `default multipath deterministic`

**Related Commands**

- `multipath none` performs the same function as `no multipath deterministic`

**Example**

- These commands configure the switch to route multicast traffic through the ECMP link to the neighbor with the highest IP address.
  
  ```
  switch(config)#router multicast
  switch(config-router-multicast)#ipv4
  switch(config-router-multicast-ipv4)#no multipath deterministic
  switch(config-router-multicast-ipv4)#
  ```

- These commands configure the switch to load balance multicast traffic by distributing packets over all ECMP links.
  
  ```
  switch(config)#router multicast
  switch(config-router-multicast)#ipv4
  switch(config-router-multicast-ipv4)#multipath deterministic
  switch(config-router-multicast-ipv4)#
  ```
**multipath none**

By default, multicast traffic is load balanced by distributing packets over all ECMP links. The `multipath none` command routes multicast ECMP traffic to the neighbor with the highest IPv4 address.

The `no multipath none` and `default multipath none` commands restore the default behavior of randomly distributing multicast traffic over all ECMP links by removing the `multipath none` command from `running-config`.

**Command Mode**
- Global Configuration

**Command Syntax**

- `multipath none`
- `no multipath none`
- `default multipath none`

**Related Commands**
- `multipath deterministic` performs the same function as `no multipath none`

**Example**
- These commands configure the switch to route multicast traffic through the ECMP link to the neighbor with the highest IP address.

```plaintext
switch(config)#router multicast
switch(config-router-multicast)#ipv4
switch(config-router-multicast-ipv4)#multipath none
```

- These commands configure the switch to load balance multicast traffic by distributing packets over all ECMP links.

```plaintext
switch(config)#router multicast
switch(config-router-multicast)#ipv4
switch(config-router-multicast-ipv4)#no multipath none
```

```plaintext
switch(config-router-multicast-ipv4)#
```
route

The `route` command configures a static multicast route for the specified source, destination group, and incoming interface on the router.

The `no route` and `default route` commands remove the specified static multicast route by removing the corresponding `route` command from `running-config`.

**Command Mode**
- Router Multicast IPv4 Configuration
- Router Multicast VRF IPv4 Configuration

**Command Syntax**

```
route group_address source_address iif {Ethernet ethernet_port | Null0 | Port-Channel lag_no | Register0 | Vlan vlan_no}
no route group_address
default route group_address
```

**Parameters**
- `group_address` the multicast group address
- `source_address` the source address
- `iif` specifies an incoming interface for the static route
  - `Ethernet ethernet_port` incoming Ethernet interface
  - `Null0` drops all incoming traffic
  - `Port-Channel lag_no` incoming port-channel interface or sub-interface; values range from 1-2000 or 1-2000.1-4094
  - `Register0` drops all incoming traffic
  - `Vlan` VLAN interface

**Examples**
- These commands create a static multicast route in the default VRF. The static route has a group address of 225.3.3.3 and source address of 1.1.1.1. It uses VLAN 100 as its incoming interface, VLANs 200 and 300 as its outgoing interfaces, and Ethernet interface 2 as its MoFrr interface.

  ```
  switch(config)#router multicast
  switch(config-router-multicast)#ipv4
  switch(config-router-multicast-ipv4)#route 225.3.3.3 1.1.1.1 iif Vlan100 oif Vlan200 Vlan300 iifFrr Ethernet2
  ```
routing

The `routing` command allows the switch to forward multicast packets. Multicast routing is disabled by default.

The `no routing` and `default routing` commands disable multicast routing by removing the `routing` command from `running-config`.

**Command Mode**
- Router Multicast IPv4 Configuration
- Router Multicast VRF IPv4 Configuration

**Command Syntax**
- `routing`
- `no routing`
- `default routing`

**Example**
- These commands enable multicast routing on the switch.
  ```
  switch(config)#router multicast
  switch(config-router-multicast)#ipv4
  switch(config-router-multicast-ipv4)#routing
  ```
rpf route

The **rpf route** command specifies a candidate for the multicast reverse path forwarding (RPF) interface of any (S,G) multicast route (mroute), where the source falls within the given network prefix. Static mroutes are stored in a separate routing table, the multicast routing information base (MRIB).

**Command Mode**
- Router Multicast IPv4 Configuration
- Router Multicast VRF IPv4 Configuration

**Command Syntax**

```
rpf route {<source_prefix>|<source_address> <mask>}
   {<rpf_interface>|<rpf_neighbor>}
   [admin_distance]
no rpf route {<source_prefix>|<source_address> <mask>}
   {<rpf_interface>|<rpf_neighbor>}
default rpf route {<source_prefix>|<source_address> <mask>}
   {<rpf_interface>|<rpf_neighbor>}
```

**Parameters**
- **source_prefix** specifies the source prefix.
- **source_address** specifies the source address.
- **mask** specifies the address mask.
- **rpf_interface** specifies the multicast RPF interface.
- **rpf_neighbor** specifies the multicast RPF neighbor.
- **admin_distance** specifies the administrative distance (optional). Values range from 1 to 255.

**Examples**
- These commands select the longest match when a source matches multiple static mroutes in the MRIB.

```
switch(config)#router multicast
switch(config-router-multicast)#ipv4
switch(config-router-multicast-ipv4)#rpf route 10.0.0.0/16 Ethernet 4
switch(config-router-multicast-ipv4)#rpf route 11.10.1.0/24 Ethernet 5
switch(config-router-multicast-ipv4)#rpf route 11.10.1.2/32 Ethernet 6
switch(config-router-multicast-ipv4)##
```
- These commands include an administrative distance of 255 on Ethernet interface 5 with static mroute.

```
switch(config)#router multicast
switch(config-router-multicast)#ipv4
switch(config-router-multicast-ipv4)#rpf route 10.0.0.0/16 Ethernet 4
switch(config-router-multicast-ipv4)#rpf route 11.10.1.0/24 Ethernet 5 255
switch(config-router-multicast-ipv4)#rpf route 11.10.1.2/32 Ethernet 6
switch(config-router-multicast-ipv4)#
```
**show ip mroute**

The `show ip mroute` command displays information from the IP multicast routing table.

- **show ip mroute** displays information for all routes in the table.
- **show ip mroute gp_addr** displays information for the specified multicast group.

**Command Mode**

EXEC

**Command Syntax**

```
show ip mroute
show ip mroute gp_addr
```

**Parameters**

- **gp_addr** group IP address (dotted decimal notation).

**Example**

- This command displays the IP multicast routing table entry for the multicast group 225.1.1.11

```
switch>show ip mroute 225.1.1.1
PIM Sparse Mode Multicast Routing Table
Flags: E - Entry forwarding on the RPT, J - Joining to the SPT
       R - RPT bit is set, S - SPT bit is set
       W - Wildcard entry, X - External component interest
       I - SG Include Join alert rcvd, P - Ex-Prune alert rcvd
       H - Joining SPT due to policy, D - Joining SPT due to protocol
       Z - Entry marked for deletion
       A - Learned via Anycast RP Router

225.1.1.1

172.28.1.100, 5d04h, flags: S
Incoming interface: Vlan281
Outgoing interface list:
  Port-Channel1999
```

switch>
**show ip mroute count**

The `show ip mroute count` command displays IP multicast routing table statistics.

The `show ip mroute` command displays information from the IP multicast routing table.

**Command Mode**

EXEC

**Command Syntax**

`show ip mroute count`

**Example**

- This command displays IP multicast routing table statistics.

```
switch>show ip mroute count
IP Multicast Statistics
1 groups and 1 sources
Multicast routes: 1 (*,G), 1 (S,G)
Average of 1.00 sources per group
Maximum of 1 sources per group:
    228.24.12.1
switch>
```
show ip multicast boundary

The show ip multicast boundary command displays the summary of all IP multicast boundaries across all interfaces.

**Command Mode**

**EXEC**

**Command Syntax**

```
show ip multicast boundary [group_prefix | group_prefix/length [out] | interface {ethernet e_num | loopback l_num | management m_num | port-channel p_num | vlan v_num} | out]
```

**Parameters**

- `<no parameters>` displays the summary of all IP multicast boundaries across all interfaces
- `group_prefix` displays the list of IP multicast boundaries matching the specified group address with subnet mask.
- `group_prefix/length` displays the list of IP multicast boundaries matching the specified group address with CIDR notation. Option includes:
  - `out` displays the specified group address's IP multicast boundaries whose control plane filtering is enabled
- `interface` displays IP multicast boundary of the specified interface. Options include:
  - `ethernet e_num` displays IP multicast boundaries of the specified Ethernet interface
  - `loopback l_num` displays IP multicast boundaries of the specified Loopback interface
  - `management m_num` displays IP multicast boundaries of the specified management interface
  - `port-channel p_num` displays IP multicast boundaries of the specified port channel interface
  - `vlan v_num` displays IP multicast boundaries of the specified VLAN interface
- `out` displays all IP multicast boundaries whose only control plane filtering is enabled

**Examples**

- This command displays the summary of all IP multicast boundaries across all interfaces.
  
  ```
  switch(config-if-Et24)show ip multicast boundary
  Interface Denied Prefix Data Plane Filtered
  Ethernet1 224.5.5.0/24 Yes
  Ethernet1 224.6.6.0/24 Yes
  Ethernet2 224.4.4.0/24 Yes
  Ethernet3 224.5.5.0/24 No
  ```

- This command displays all IP multicast boundaries matching 224.5.5.0 255.255.255.255.
  
  ```
  switch(config-if-Et24)#show ip multicast boundary 224.5.5.0 255.255.255.255
  Interface Denied Prefix Data Plane Filtered
  Ethernet1 224.5.5.0/24 Yes
  Ethernet3 224.5.5.0/24 No
  ```

- This command displays all IP multicast boundaries matching 224.5.5.0/24.
  
  ```
  switch(config-if-Et24)#show ip multicast boundary 224.5.5.0/24
  Interface Denied Prefix Data Plane Filtered
  Ethernet1 224.5.5.0/24
  Ethernet3 224.5.5.0/24 No
  ```
• This command displays all IP multicast boundaries of the Ethernet1 interface.
  
  ```
  switch(config-if-Et24)# show ip multicast boundary interface Ethernet1
  Interface Denied Prefix Data Plane Filtered
  Ethernet1 224.5.5.0/24
  Ethernet1 224.6.6.0/24 No
  ```

• This command displays the list of IP multicast boundaries whose only control plane filtering is enabled.
  
  ```
  switch(config-if-Et24)#show ip multicast boundary out
  Interface Denied Prefix Data Plane Filtered
  Ethernet1 224.5.5.0/24 No
  Ethernet3 224.5.5.0/24 No
  ```
show multicast fib ipv4

The `show multicast fib ipv4` command displays information about interfaces and the hardware-forwarded routes included in the IPv4 Multicast Forwarding Information Base (MFIB).

Command Mode
EXEC

Command Syntax
```
show multicast fib ipv4 [group_address [source_address] | bidirectional | count
| counter | df | rpa | software | sparse-mode | static | summary | vrf]
```

Parameters
- `<no parameters>` displays information for all hardware-forwarded routes in the MFIB
- `group_address` displays the information of the specified multicast group address. Options include:
  - `source_address` displays the information of the specified multicast group and source addresses
  - `count` displays the multicast routes count of the specified group address
  - `counters` displays the multicast route traffic count of the specified group address
  - `bidirectional` displays the information of bidirectional routes
  - `count` displays the count of multicast routes
  - `counter` displays the count of multicast route traffic in either bytes or packets
  - `df` displays the bidirectional Protocol Independent Multicast (PIM) Designated Forwarder (DF) bitmap
  - `rpa` displays the bidirectional PIM Rendezvous Point Address (RPA) index
  - `software` displays the software multicast FIB
  - `sparse-mode` displays the sparse-mode information
  - `static` displays the static multicast information
  - `summary` displays the multicast FIB summary
  - `vrf vrf_name` displays information of the corresponding VRF

Guidelines
The counter is not available (N/A) if a multicast route does not have an associated counter. If the counter value for any source in a group address is N/A, then the sum of counters for the group address is N/A. However, the counter values for other sources are still displayed.

Examples
- This command displays the bidirectional PIM RPA index.
  ```
  switch>show multicast fib ipv4 rpa
  Prefix                              Rpa Index
  225.0.0.0/8                          1
  226.0.0.0/8                          1
  ```
- This command displays the static multicast route information.
  ```
  switch>show multicast fib ipv4 static count
  (S,G) routes: 34
  (*,G) routes: 31
  Fastdrop routes: 0
  Prefix routes: 12
  ```
• This command displays the multicast routes' count of the specified group and source addresses.

```bash
switch>show multicast fib ipv4 229.0.0.0 10.1.5.101 count
```

Activity poll time: 60 seconds
(S,G) routes: 1
Fastdrop routes: 0

• This command displays the multicast route traffic count of the specified group and source addresses.

```bash
switch>show multicast fib ipv4 229.0.0.0 10.1.5.101 counters
```

Activity poll time: 60 seconds
229.0.0.0 10.1.5.101
  Byte: 46128
  Packet: 93
  Port-Channel100 (iif)
  Activity 0:53:52 ago

• This command displays the multicast FIB summary.

```bash
switch>show multicast fib ipv4 summary
```

Number of multicast routes: 12
  Number of fastdrop routes : 45
show multicast fib ipv4 software

The `show multicast fib ipv4 software` command displays information about the interfaces and the software-forwarded routes included in the IPv4 multicast forwarding information base (MFIB). Use the `show multicast fib ipv4` command for hardware-forwarded routes.

Parameter options are available to filter output by group address or group and source address.

**Command Mode**

EXEC

**Command Syntax**

`show multicast fib ipv4 software [INFO_LEVEL][ROUTE]`

**Parameters**

- `INFO_LEVEL` specifies the type of information displayed. Options include:
  - `<no parameter>` displays packet reception counters.
  - `detail` displays packet reception counters and packet queued/dropped counters.

- `ROUTE` routes displayed, filtered by multicast group and source IP addresses:
  - `<no parameter>` shows information for all software-forwarded routes in the MFIB.
  - `group_addr` shows information only for the specified multicast group.
  - `group_addr source address` shows information only for the specified group and source.

**Example**

- This command displays MFIB information for all software-forwarded routes in the MFIB.

  ```
  switch>show multicast fib ipv4 software
  239.255.255.250 172.17.41.150
  Vlan3040 (iif)
  Packets Received: 18
  Bytes Received : 9147
  RPF Failures : 0
  239.255.255.250 172.17.41.120
  Vlan3040 (iif)
  Packets Received: 6
  Bytes Received : 966
  RPF Failures : 0
  ```

- This command displays detailed MFIB information for all software-forwarded routes in the MFIB.

  ```
  switch>show multicast fib ipv4 software detail
  239.255.255.250 172.17.41.150
  Vlan3040 (iif)
  Packets Received: 18
  Bytes Received : 9147
  RPF Failures : 0
  Packets Queued/Dropped : 0 / 0
  239.255.255.250 172.17.41.120
  Vlan3040 (iif)
  Packets Received: 6
  Bytes Received : 966
  RPF Failures : 0
  Packets Queued/Dropped : 0 / 0
  ```
unresolved cache-entries max

The **unresolved cache-entries max** command configures the maximum number of unresolved (S,G) routes that the switch can cache packets. The default buffer size is 4000 (S,G) routes.

The **no unresolved cache-entries max** and **default unresolved cache-entries max** commands restore the default unresolved cache-entries buffer size of 4000 (S,G) routes by removing the **unresolved cache-entries max** command from **running-config**. See **ip multicast boundary** to limit the number of cached packets per S,G.

**Command Mode**
- Router Multicast IPv4 Configuration
- Router Multicast VRF IPv4 Configuration

**Command Syntax**

unresolved cache-entries max  *quantity_entries*

no unresolved cache-entries max

default unresolved cache-entries max

**Parameters**
- **quantity_entries**  maximum buffer size (routes). Value ranges from 10 to 10000000. Default is 4000.

**Example**
- This command sets the maximum MFIB unresolved cache-entry buffer size to 6000 routes in the default VRF.

```
switch(config)#router multicast
switch(config-router-multicast)#ipv4
switch(config-router-multicast-ipv4)#unresolved cache-entries max 6000
switch(config-router-multicast-ipv4)#
```
unresolved packet-buffers max

The `unresolved packet-buffers max` command specifies the number of (S,G) multicast packets for an individual route that the switch can process before the (S,G) entry is entered into cache. Packets that are received in excess of this limit before the route is programmed into the cache are dropped. By default, the switch processes 3 unresolved packets for an individual route.

The `no unresolved packet-buffers max` and `default unresolved packet-buffers max` commands restore the number of unresolved packets that the switch processes to the default value of 3 packets by removing the `unresolved packet-buffers max` command from `running-config`. See `unresolved cache-entries max` to limit the number of unresolved routes that are cached.

**Command Mode**
- Router Multicast IPv4 Configuration
- Router Multicast VRF IPv4 Configuration

**Command Syntax**
- `unresolved packet-buffers max quantity_packets`
- `no unresolved packet-buffers max`
- `default unresolved packet-buffers max`

**Parameters**
- `quantity_packets` packets per unresolved route that the switch processes. Values range from 3 to 10000000. Default is 3.

**Example**
- This command programs the switch in the default VRF to process thirty multicast packets from any route regardless of its entry’s presence in the multicast routing cache.

```
switch(config)#router multicast
switch(config-router-multicast)#ipv4
switch(config-router-multicast-ipv4)#unresolved packet-buffers max 30
switch(config-router-multicast-ipv4)#
```
IGMP and IGMP Snooping

IP multicast is the transmission of data packets to multiple hosts through a common IP address. Networks use Internet Group Management Protocol (IGMP) to control the flow of layer 3 multicast traffic. Hosts request and maintain multicast group membership through IGMP messages. IGMP snooping is a layer 2 optimization for the layer 3 IGMP protocol that extracts lists of hosts receiving multicast group traffic by monitoring IGMP network packets.

These sections describe the Arista IGMP and IGMP snooping implementation.

- Section 39.1: Introduction
- Section 39.2: IGMP Protocols
- Section 39.3: Configuring IGMP
- Section 39.4: Configuring IGMP Snooping
- Section 39.5: IGMP Host Proxy
- Section 39.6: IGMP and IGMP Snooping Commands

39.1 Introduction

39.1.1 Supported Features

For a list of the IGMP features that each Arista switch platform supports, referred to the supported features table here: [https://www.arista.com/en/support/product-documentation/supported-features](https://www.arista.com/en/support/product-documentation/supported-features).
39.2 IGMP Protocols

39.2.1 IGMP

Networks use Internet Group Management Protocol (IGMP) to control the flow of layer 3 multicast traffic. Hosts request and maintain multicast group membership through IGMP messages. Multicast routers use IGMP to maintain a membership list of active multicast groups for each attached network.

- IGMP version 1 is defined in RFC 1112. Hosts can join multicast groups without a method to leave a group. Routers use a timeout-based process to determine when hosts lose interest in a group.
- IGMP version 2 is defined in RFC 2236. Version 2 adds leave messages that hosts use to terminate group membership.
- IGMP version 3 is defined in RFC 4604. Version 3 allows hosts to specify IP addresses within a group from where they receive traffic. Traffic from all other group addresses is blocked from the host.

With respect to each of its attached networks, a multicast router is either a querier or non-querier. Each physical network contains only one querier. A network with more than one multicast router designates the router with the lowest IP address as its querier.

Queriers solicit group membership information by periodically sending General Query messages. Queriers also receive unsolicited messages from hosts joining or leaving a multicast group. When a querier receives a message from a host, it updates its membership list for the group referenced in the message and the network where the message originated.

Queriers forward multicasts from remote sources only to networks as specified by its membership list. If a querier does not receive a report from a network host for a specific group, it removes the corresponding entry from the table and discontinues forwarding multicasts for that group on the network. Queriers also send group-specific queries after receiving a leave request from a host to determine if the network still contains active multicast group members. If it does not receive a membership report during the period defined by the last member query response interval, the querier removes the group-network entry from the membership list.

When a host receives a General Query, it responds with Membership Report messages for each of its multicast groups within the interval specified by the Max Response Time field in the query. IGMP suppresses multiple messages from different hosts on a network for the same group. Hosts send unsolicited Membership reports to join a multicast group and send leave messages to exit a group.

39.2.2 IGMP Snooping

IGMP snooping is a layer 2 switch process that extracts lists of hosts receiving multicast group traffic by monitoring IGMP network packets. The switch uses these lists to avoid flooding hosts with extraneous multicast traffic by sending group packets only to group members. Besides preventing local hosts from receiving traffic for groups they did not join, snooping prunes multicast traffic from links that do not contain IGMP clients.

When snooping is enabled, a switch examines IGMP packets sent between hosts connected to network switches and multicast routers (mroutes). When a switch finds an IGMP report from a multicast group recipient, it adds the recipient’s port to the group multicast list. When the switch receives an IGMP leave, it removes the recipient’s port from the list. Groups are removed upon the group timer expiry. When the switch finds an IGMP query packet or PIM hello packet from a multicast router, it adds the router’s port to the port list for all multicast groups.
Snooping Querier

Snooping requires an IGMP querier in the network to create multicast group tables. An IGMP snooping querier performs the multicast router (mrouter) role when the network does not have a router. When the snooping querier is enabled on a VLAN, the switch periodically broadcasts IGMP queries and listens for IGMP Reports that indicate host group memberships.

Networks that contain multiple snooping queriers elect one as the querier, based on IP address. When IGMP snooping querier is enabled on a VLAN, the switch performs as a querier only when it is elected or it is the only snooping querier on the network.

L2 Report Flooding

L2 report flooding is an IGMP snooping feature that forwards membership report messages to specified ports. Relying on a single switch to maintain and send report messages can degrade performance. L2 report flooding addresses this by facilitating report message forwarding through any network port. This allows switches to bypass the querier when forwarding multicast traffic to its interested ports.

IGMP Snooping Proxy

IGMP snooping proxy is an enhancement over IGMP snooping. When snooping proxy is enabled, the switch starts sending proxy queries periodically to the downstream hosts and collects the IGMP reports and updates the local state. Later, when the switch receives an IGMP query from an upstream router, the switch immediately responds with a report based on its local state.

When IGMP snooping proxy is disabled, the IGMP queries in VLAN, and the reports from hosts are flooded. Enabling IGMP snooping proxy prevents a sudden burst in IGMP report traffic in response to every query. It also reduces the number of reports that the IGMP Querier needs to process in the VLAN. However, it introduces a latency in the propagation of the IGMP state through the VLAN.
39.3 Configuring IGMP

This section describes the following configuration tasks:

- Section 39.3.1: Enabling IGMP
- Section 39.3.2: Configuring IGMP Settings

39.3.1 Enabling IGMP

Enabling PIM also enables IGMP on that interface. When the switch fills the multicast routing table, it only adds interfaces when the interface receives join messages from downstream devices or when the interface is directly connected to a member of the IGMP group.

By default, PIM and IGMP are disabled on an interface. Use the `pim ipv4 sparse-mode` or `pim ipv4 bidirectional` command to enable PIM and IGMP on the configuration mode interface.

Example

- This command enables PIM and IGMP on VLAN interface 8.
  
  ```
  switch(config)#interface vlan 8
  switch(config-if-Vl8)#pim ipv4 sparse-mode
  switch(config-if-Vl8)#
  ```

  In the unlikely event that the IGMP agent needs to run on an interface without PIM being enabled, use the `ip igmp` command.

Example

- This command enables IGMP on VLAN interface 8 without enabling PIM.
  
  ```
  switch(config)#interface vlan 8
  switch(config-if-Vl8)#ip igmp
  switch(config-if-Vl8)#
  ```

39.3.2 Configuring IGMP Settings

An interface that runs IGMP uses default protocol settings unless otherwise configured. The switch provides commands that alter startup query, last member query, and normal query settings.

IGMP Version

The switch supports IGMP versions 1 through 3. The `ip igmp version` command configures the IGMP version on the configuration mode interface. Version 3 is the default IGMP version.

Example

- This command configures IGMP version 3 on VLAN interface 4
  
  ```
  switch(config)#interface vlan 4
  switch(config-if-Vl4)#ip igmp version 3
  switch(config-if-Vl4)#
  ```

Startup Query

Membership queries are sent at an increased frequency immediately after an interface starts up to quickly establish the group state. Query count and query interval commands adjust the period between membership queries for a specified number of messages.

The `ip igmp startup-query-interval` command specifies the interval between membership queries that an interface sends immediately after it starts up. The `ip igmp startup-query-count` command specifies the number of queries that the switches sends from the interface at the startup interval rate.
Example

- These commands define a startup interval of 15 seconds for the first 10 membership queries sent from VLAN interface 12.

```
switch(config)#interface vlan 12
switch(config-if-Vl12)#ip igmp startup-query-interval 150
switch(config-if-Vl12)#ip igmp startup-query-count 10
switch(config-if-Vl12)#
```

Membership Queries

The router with the lowest IP address on a subnet sends membership queries as the IGMP querier. When a membership query is received from a source with a lower IP address, the router resets its query response timer. Upon timer expiry, the router begins sending membership queries. If the router subsequently receives a membership query originating from a lower IP address, it stops sending membership queries and resets the query response timer.

The `ip igmp query-interval` command configures the frequency at which the active interface, as an IGMP querier, sends membership query messages.

The `igmp query-max-response-time` command configures the time that a host has to respond to a membership query.

Example

- These commands define a membership query interval of 75 seconds and a query response timer reset value of 45 seconds for queries sent from VLAN interface 15.

```
switch(config)#interface vlan 15
switch(config-if-Vl15)#ip igmp query-interval 75
switch(config-if-Vl15)#igmp query-max-response-time 450
switch(config-if-Vl15)#
```

Last Member Query

When the querier receives an IGMP leave message, it verifies the group has no remaining hosts by sending a set of group-specific queries at a specified interval. If the querier does not receive a response to the queries, it removes the group state and discontinues multicast transmissions.

The `ip igmp last-member-query-count` (LMQC) command specifies the number of query messages the router sends in response to a group-specific or group-source-specific leave message.

The `ip igmp last-member-query-interval` command configures the transmission interval for sending group-specific or group-source-specific query messages to the active interface.

Example

- These commands program the switch to send 3 query messages, one every 25 seconds, when VLAN interface 15 receives an IGMP leave message.

```
switch(config)#interface vlan 15
switch(config-if-Vl15)#ip igmp last-member-query-interval 250
switch(config-if-Vl15)#ip igmp last-member-query-count 3
switch(config-if-Vl15)#
```

Static Groups

The `ip igmp static-group` command configures the configuration mode interface as a static member of the multicast group at the specified address. The router forwards multicast group packets through the interface without otherwise appearing or acting as a group member. No interface is a static member of a multicast group by default.
Note
To become a static member of a multicast group, the switch must be the PIM designated router (DR) for the network. If it is not, you can use the `pim ipv4 dr-priority` command to make it the DR by configuring its PIM DR value to be the highest on the network.

Example
- These commands configure VLAN interface 15 as the PIM designated router, then configure it as a static member of the multicast group at address 231.1.1.15 for multicast data packets that originate at 10.1.1.1.

```
switch(config)#interface vlan 15
switch(config-if-Vl15)#pim ipv4 dr-priority 5000
switch(config-if-Vl15)#ip igmp static-group 231.1.1.15 10.1.1.1
switch(config-if-Vl15)#
```
39.4 Configuring IGMP Snooping

This section describes the following configuration tasks:

- Section 39.4.1: Enabling Snooping
- Section 39.4.2: Configuring Snooping Parameters
- Section 39.4.3: Snooping Querier
- Section 39.4.4: IGMP Snooping L2 Report Flooding
- Section 39.4.5: IGMP Snooping Filters
- Section 39.4.6: Configuring IGMP Snooping Proxy

39.4.1 Enabling Snooping

The switch provides two control settings for snooping IGMP packets:

- Global settings control the availability of IGMP snooping on the switch. Snooping is globally enabled by default.
- Per-VLAN settings control IGMP on individual VLANs. If snooping is enabled on the VLAN, it follows the global snooping state.

The `ip igmp snooping` command controls the global snooping setting. The `ip igmp snooping vlan` command configures snooping on individual VLANs.

**Examples**

- This command globally enables snooping on the switch.
  ```
  switch(config)#ip igmp snooping
  switch(config)#
  ```
- This command disables snooping on VLANs 2 through 4.
  ```
  switch(config)#no ip igmp snooping vlan 2-4
  switch(config)#
  ```

39.4.2 Configuring Snooping Parameters

**Specifying a Static Multicast Router Connection**

The `ip igmp snooping vlan multicast-router` command statically configures a port that connects to a multicast router to join all multicast groups. The port to the router must be in the specified VLAN range.

Snooping may not always be able to locate the IGMP querier. This command is for IGMP queriers that are known to connect through the network to a port on the switch.

**Example**

- This command configures the static connection to a multicast router through Ethernet port 3.
  ```
  switch(config)#ip igmp snooping vlan 2 mrouter interface ethernet 3
  switch(config)#
  ```

**Adding a Port to a Multicast Group**

The `ip igmp snooping vlan member` command adds an a port to a multicast group. The IP address must be an unreserved IPv4 multicast address. The interface to the port must be in the specified VLAN range.
Example

- This command configures the static connection to a multicast group at 237.2.1.4 through Ethernet port 3.

  switch(config)#ip igmp snooping vlan 7 static 237.2.1.4 interface ethernet 3
  switch(config)#

Robustness Variable

The robustness variable specifies the number of unacknowledged snooping queries that a switch sends before removing the recipient from the group list.

The `ip igmp snooping robustness-variable` command configures the robustness variable for all snooping packets sent from the switch. The default value is 2.

Example

- This command sets the robustness-variable value to 3.

  switch(config)#ip igmp snooping robustness-variable 3
  switch(config)#

Configuring Interface Startup Initial Query Times

The `ip igmp snooping interface-restart-query` command configures the interface startup initial query times in milliseconds. If nothing is configured, a default value of 2000 milliseconds is used. Issuing the command replaces any values already configured. Multiple values may be input in a single command; this makes the mechanism more resilient in the case of dropped packets.

Examples

- This command configures interfaces to send IGMP queries at 1000, 2000, and 4000 milliseconds (i.e., 1 second, 2 seconds, and 4 seconds) after an interface restart or spanning tree change.

  switch(config)#ip igmp snooping interface-restart-query 1000 2000 4000
  switch(config)#

Example

- This command configures interfaces to send a single IGMP query of 5000 milliseconds (5 seconds) after an interface restart or spanning tree change.

  switch(config)#ip igmp snooping interface-restart-query 5000
  switch(config)#

39.4.3 Snooping Querier

The IGMP snooping querier supports snooping by sending layer 2 membership queries to hosts attached to the switch. Note that if IGMP snooping is enabled, QoS will not apply to IGMP packets.

39.4.3.1 Enabling the Snooping Querier

Enabling the snooping querier on an interface requires the explicit configuration of a global querier address or a local querier address for the interface. See Section 39.4.3.2.

The switch provides two control settings for controlling the snooping querier:

- The global setting controls the querier on VLANs for which there is no snooping querier command.
- VLAN querier settings take precedence over the global querier setting.

The `ip igmp snooping querier` command controls the global querier setting. When enabled globally, the querier is controlled on individual VLANs through the `ip igmp snooping vlan querier` command.
The `ip igmp snooping vlan querier` command controls the querier for the specified VLANs. VLANs follow the global querier setting unless overridden by one of these commands:

- `ip igmp snooping vlan querier` enables the querier on specified VLANs.
- `no ip igmp snooping vlan querier` disables the querier on specified VLANs.

**Example**

- These commands globally enables the snooping querier on the switch, explicitly disables snooping on VLANs 1-4, and explicitly enables snooping on VLANs 5-8.

```
switch(config)#ip igmp snooping querier
switch(config)#no ip igmp snooping vlan 1-4 querier
switch(config)#ip igmp snooping vlan 5-8 querier
switch(config)#
```

- This command removes the querier setting for VLANs 3-6:

```
switch(config)#default ip igmp snooping vlan 3-6 querier
switch(config)#
```

**Globally Set the Snooping Querier Version**

The `ip igmp snooping querier version` command configures the IGMP snooping querier version. Version 2 is the default IGMP snooping version.

**Example**

- This command globally configures IGMP snooping querier version 2.

```
switch(config)#ip igmp snooping querier version 2
switch(config)#
```

The `ip igmp snooping vlan querier version` command configures IGMP globally on the VLAN. Version 2 is the default IGMP snooping version.

**Example**

- This command configures IGMP snooping vlan querier version VLAN 5.

```
switch(config)#ip igmp snooping vlan 5 querier version 2
switch(config)#
```

### 39.4.3.2 Configuring Snooping Querier Parameters

**Querier Address**

The switch provides two IP addresses for setting the querier source:

- The global address is used by VLANs for which there is no querier address command.
- VLAN querier address settings take precedence over the global querier address.

The snooping querier address specifies the source IP address for IGMP snooping query packets that the switch transmits. The source address is also used to elect a snooping querier when the subnet contains multiple snooping queriers.

The default global querier address is not defined. When the configuration includes a snooping querier, a querier address must be defined globally or for each interface that enables a querier.

The `ip igmp snooping querier address` command sets the global querier source IP address for the switch. VLANs use the global address unless overwritten with the `ip igmp snooping vlan querier address` command. The default global address is not defined.
The `ip igmp snooping vlan querier address` command sets the source IP address for query packets transmitted from the specified VLAN. This command overrides the `ip igmp snooping querier address` for the specified VLAN.

**Examples**

- This command sets the source IP address for query packets that the switch transmits to 10.1.1.41.
  
  ```
  switch(config)#ip igmp snooping querier address 10.1.1.41
  switch(config)#
  ```

- This command sets the source IP address for query packets that VLAN 2 transmits to 10.14.1.1.
  
  ```
  switch(config)#ip igmp snooping vlan 2 querier address 10.14.1.1
  switch(config)#
  ```

**Membership Query Interval**

The query interval is the period (seconds), between IGMP Membership Query message transmissions. The interval ranges from 5 to 3600 seconds.

The `ip igmp snooping querier query-interval` command specifies the global query interval for packets the switch sends as a snooper querier. The default global setting is 125 seconds.

The `ip igmp snooping vlan querier query-interval` command specifies the query interval for packets sent from the snooping querier to the specified VLAN, overriding the global setting. VLANs that do not specify a query interval use the global setting.

**Examples**

- This command sets a query interval of 150 seconds for queries transmitted from VLANs for which a query interval is not configured.
  
  ```
  switch(config)#ip igmp snooping querier query-interval 150
  switch(config)#
  ```

- This command sets the query interval of 240 seconds for queries transmitted from VLAN 2.
  
  ```
  switch(config)#ip igmp snooping vlan 2 querier query-interval 240
  switch(config)#
  ```

**Membership Query Response Interval**

The Max Response Time field, in Membership Query messages, specifies the longest time a host can wait before responding with a Membership Report message. In all other messages, the sender sets the field to zero and the receiver ignores it. The switch provides two values for setting this field:

- The global value is used by VLANs for which there is no Max Response Time command.
- VLAN values take precedence over the global value for the specified VLAN.

The `ip igmp snooping querier max-response-time` command specifies the global Max Response Time value used in snooping query packets transmitted from the switch. Values range from 1 to 25 seconds with a default of 10 seconds. VLANs use the global setting unless overwritten with the `ip igmp snooping vlan querier max-response-time` command.

The `ip igmp snooping vlan querier max-response-time` command configures the Max Response Time field contents for packets transmitted from the specified VLAN, overriding the global setting.
Examples

- This command sets the maximum response time of 15 seconds for queries transmitted from VLANs for which a maximum response time is not configured.
  switch(config)#ip igmp snooping querier max-response-time 15
  switch(config)#

- This command sets a maximum response time of 5 seconds for queries that VLAN 2 transmits.
  switch(config)#ip igmp snooping vlan 2 querier max-response-time 5
  switch(config)#

Last Member Query

When the querier receives an IGMP leave message, it verifies the group has no remaining hosts by sending a set of group-specific queries at a specified interval. If the querier does not receive a response to the queries, it removes the group state and discontinues multicast transmissions.

The switch provides two values for setting this field:

- The global value is used by VLANs for which there is no last-member-query-interval defined.
- VLAN values take precedence over the global value for the specified VLAN.

The `ip igmp snooping querier last-member-query-interval` command specifies the global last-member-query-interval used in snooping query packets transmitted from the switch. This value is used for VLANs that do not have a value specified. Values range from 1 to 25 seconds with a global default of one second.

The `ip igmp snooping vlan querier last-member-query-interval` command configures the last-member-query-interval field contents for packets transmitted from the specified VLAN, overriding the global setting.

Example

- This command sets the global snooping querier last-member-query-interval to five seconds and the VLAN 10 last-member-query-interval to 12 seconds.
  switch(config)#ip igmp snooping querier last-member-query-interval 5
  switch(config)#ip igmp snooping vlan 10 querier last-member-query-interval 12
  switch(config)#

Interface Restart Query Spoofing

When the port status (link status or spanning tree status) changes, an IGMP general query is spoofed based on the information of the last known IGMP querier. This facilitates faster network convergence time.

By default, interfaces wait 2000 milliseconds before sending the spoofed IGMP query. To configure the delay before the spoofed query is sent, use the `ip igmp snooping interface-restart-query` command. This setting is applied to all ports.

Example

- This command configures the switch to send general IGMP queries at 100 milliseconds, 200 milliseconds, and 300 milliseconds after interface restart or spanning tree status change.
  switch(config)# ip igmp snooping interface-restart-query 100 200 300
39.4.4 IGMP Snooping L2 Report Flooding

L2 report flooding is an IGMP snooping feature that forwards membership report messages to specified ports. Report flooding is disabled by default and must be enabled globally before it can be enabled on individual interfaces.

The list of ports that can forward membership report messages must be explicitly configured. Commands are available to define lists of ports that are valid for all VLANs and port lists that are valid for specified VLAN ranges. Ports can forward membership reports only if they are configured to handle VLAN traffic, regardless of any report flooding configuration settings.

Enabling L2 Report Flooding

These commands enable L2 report flooding:

- `ip igmp snooping report-flooding` enables report flooding globally.
- `ip igmp snooping vlan report-flooding` enables report flooding on a specified VLAN range.

Example

- These commands enable L2 report flooding globally, and on VLANs 201-205.

```
switch(config)#ip igmp snooping report-flooding
switch(config)#ip igmp snooping vlan 201-205 report-flooding
switch(config)#
```

Configuring Forwarding Ports

These commands specify the ports that forward membership report messages:

- `ip igmp snooping report-flooding switch-port` configures ports globally.
- `ip igmp snooping vlan report-flooding switch-port` configures ports for a specified VLAN range.

Example

- These commands enable Ethernet ports 5-9 to forward reports on all VLANs and ports 12-15 on VLANs 201-205.

```
switch(config)#ip igmp snooping report-flooding switch-port ethernet 5-9
switch(config)#ip igmp snooping vlan 201-205 report-flooding switch-port ethernet 12-15
switch(config)#
```

39.4.5 IGMP Snooping Filters

IGMP snooping filters assigns IGMP profiles only to Layer 2 interfaces, and for Layer 3 interfaces use multicast boundary filters to control the multicast groups that the interfaces can join. An IGMP profile specifies a filter type and a list of address ranges. The address ranges comprise the multicast groups covered by the profile. The filter type determines an interface’s accessibility to the multicast groups:

- Permit filters define the multicast groups the interface can join.
- Deny filters define the multicast groups the interface cannot join.

Profiles are created in IGMP-profile configuration mode, then applied to an interface in interface configuration mode.

The `ip igmp profile` command places the switch in IGMP profile configuration mode. The `permit / deny` and `range` commands specify the profile’s filter type and address range. A profile may contain multiple range statements to define a discontiguous address range.
Example

- These commands create an IGMP profile named list_1 by entering IGMP-profile configuration mode, configure the profile to permit multicast groups 231.22.24.0 through 231.22.24.127, and return the switch to global configuration mode.

```
switch(config)#ip igmp profile list_1
switch(config-igmp-profile-list_1)#permit
switch(config-igmp-profile-list_1)#range 231.22.24.0 231.22.24.127
switch(config-igmp-profile-list_1)#exit
switch(config)#
```

The `ip igmp snooping filter` command applies an IGMP profile to the configuration mode interface.

Example

- These commands apply the `list_1` snooping profile to Ethernet interface 7.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#ip igmp snooping filter list_1
switch(config-if-Et7)#
```

39.4.5.1 Verifying IGMP Snooping

Show commands are available to display various configurations and IGMP snooping status. IGMP snooping that are viewable include:

- `show ip igmp snooping`
- `show ip igmp snooping counters`
- `show igmp snooping querier`
- `show igmp snooping querier counters`
- `show igmp snooping querier membership`

IGMP Snooping Status

The `show ip igmp snooping` command displays the switch’s IGMP snooping configuration.

Example

- This command displays the switch’s IGMP snooping configuration.

```
switch>show ip igmp snooping
Global IGMP Snooping configuration:
-------------------------------------------
IGMP snooping                  : Enabled
Robustness variable            : 2

Vlan 1 :
--------
IGMP snooping                  : Enabled
Multicast router learning mode : pim-dvmrp

Vlan 20 :
--------
IGMP snooping                  : Enabled
Multicast router learning mode : pim-dvmrp

Vlan 2028 :

switch>
```
IGMP Snooping Counters

The `show ip igmp snooping counters` command displays the number of IGMP messages sent and received through each switch port. The display table sorts the messages by type.

**Example**

- This command displays the number of messages received on each port.

```
switch>show ip igmp snooping counters

<table>

IGMP Snooping Querier

The `show igmp snooping querier` command displays snooping querier configuration and status information. Command provides options to only include specific VLANs.

**Example**

- This command displays the querier IP address, version, and port servicing each VLAN.

```
switch>show igmp snooping querier

<table>
<thead>
<tr>
<th>Vlan</th>
<th>IP Address</th>
<th>Version</th>
<th>Port</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>172.17.0.37</td>

<td>v2</td>
<td>Cpu</td>
</tr>
<tr>
<td>2028</td>
<td>172.17.255.29</td>
<td>v2</td>
<td>Po1</td>
</tr>
</tbody>
</table>
```

2612
IGMP Snooping Querier Counters

The `show igmp snooping querier counters` command displays the counters from the querier, as learned through Internet Group Management Protocol (IGMP).

Example

- This command displays the counters from the querier.

```
switch>show igmp snooping querier counters
-----------------------------------------------------------------------
Vlan: 1    IP Addr: 100.0.0.1       Op State: Querier     Version:  v3
v1 General Queries Sent         :0
v1 Queries Received             :0
v1 Reports Received             :0
v2 General Queries Sent         :1
v2 Queries Received             :0
v2 Reports Received             :25
v2 Leaves Received              :0
v3 General Queries Sent         :655
v3 GSQ Queries Sent             :0
v3 GSSQ Queries Sent            :8
v3 Queries Received             :654
v3 Reports Received             :2385
Error Packets                   :0
Other Packets                   :0
switch>
```

IGMP Snooping Querier Membership

The `show igmp snooping querier membership` command displays the membership from the querier, as learned through Internet Group Management Protocol (IGMP).

Example

- This command displays the membership from the querier for VLAN 1.

```
switch>show igmp snooping querier membership
-------------------------------------------------------------------------
Vlan: 1    Elected: 100.0.0.1       QQI: 125  QRV: 2  QRI: 10  GMI: 260
Groups           Mode  Ver  Num of Sources
-------------------------------------------------------------------------
10.0.0.2        EX    v3   0 [ ]
10.0.0.3        IN    v3   2 [ 3.3.3.3, 3.3.3.4 ]
10.0.0.4        EX    v3   0 [ ]
10.0.0.13       EX    v3   0 [ ]
10.0.0.22       EX    v3   0 [ ]
10.0.0.1        IN    v3   3 [ 5.6.7.9, 5.6.7.8, ... ]
switch>
```

39.4.6 Configuring IGMP Snooping Proxy

Use the `ip igmp snooping proxy` command to enable IGMP snooping proxy globally. Enabling IGMP snooping proxy enables it for all VLANs where IGMP snooping is enabled. IGMP snooping proxy is globally disabled by default.

Use the `ip igmp snooping proxy` command to enable IGMP snooping proxy globally. Use the `no ip igmp snooping vlan` proxy command to disable IGMP snooping proxy on specified VLANs.
Examples

- This command globally enables IGMP snooping proxy on the switch.
  
  ```
  switch(config)#ip igmp snooping proxy
  switch(config)#
  ```

- This command disables IGMP snooping proxy on VLANs 2 through 4.
  
  ```
  switch(config)#no ip igmp snooping proxy vlan 2-4 proxy
  switch(config)#
  ```

39.4.6.1 Configuring Snooping Proxy Querier

To configure the IGMP snooping proxy querier use the existing `ip igmp snooping querier` commands. For more information on these commands, please refer to section 35.4.3 from the document.

Note

The proxy querier by default uses 0.0.0.0 IP address.

Example

In this example, IGMP snooping proxy is enabled using the `ip igmp snooping proxy` command and the snooping proxy is set to reports for all the VLANs except VLANs 100 through 110 using the `ip igmp snooping vlan` command. The proxy querier operates in version 3 and sends queries at a 15-second interval and hosts can take up to 5 seconds to respond.

  ```
  switch(config)#ip igmp snooping proxy
  switch(config)#no ip igmp snooping vlan 100-110 proxy
  switch(config)#ip igmp snooping querier query-interval 15
  switch(config)#ip igmp snooping querier max-response-time 5
  switch(config)#ip igmp snooping querier version 3
  switch(config)#ip igmp snooping querier
  ```
39.5 **IGMP Host Proxy**

Interfaces on the switch can be configured to serve as IGMP host proxies. An IGMP host proxy exchanges IGMP reports (joins/leaves) between networks whose connection does not support PIM along network boundaries.

39.5.1 **IGMP Host Proxy Description**

Figure 39-1 displays a typical IGMP host-proxy implementation. The customer network connects to the sender network through the edge switch’s Ethernet 1 interface, which is configured as an IGMP host proxy. PIM is enabled within the sender and customer networks but not on the connection between the networks.

The IGMP proxy agent sends unsolicited IGMP joins when a (S,G) or (*,G) entry arrives in the multicast routing table (mroute table). Subsequently, IGMP reports are sent when queries or group-specific queries arrive on the host proxy interface. When the customer network is void of active listeners, the connection eventually expires and the senders stop transmitting to the network.

IGMP host proxy requires the following:

- *PIM multicast border router (MBR) must be enabled on the interface.*
- *IP IGMP and IP multicast must be enabled.*
- *The switch must be an RP or in each host’s RP path.*
- *Fast-drop entries are required when there are no interested listeners for the group.*

IGMP host proxy is configurable to filter for specific multicast groups and sources.

39.5.2 **IGMP Host Proxy Configuration**

**Enabling IGMP Host Proxy**

Enable PIM MBR on the interface using the `pim ipv4 border-router` command. The IGMP host proxy service is then configured on the interface using the `ip igmp host-proxy` command. When the host proxy is configured, it sends reports for (S,G) entries in the multicast routing (mroute) table if these are the only routes there; if there are any (*,G) entries, it sends reports only for these. To send reports for a specific group even when there is no (*, G) entry in the mroute table for that group, include the group address in the `ip igmp host-proxy` command. Multiple `ip igmp host-proxy` statements are required to specify multiple groups. The interval between IGMP reports is configured by `ip igmp host-proxy report-interval`.

---

**Figure 39-1: IP IGMP Host Proxy Implementation**

[Diagram showing IGMP host proxy implementation]
Host Proxy IGMP Version and Source Filtering

IGMP host proxies can be configured with IGMP versions 1, 2, or 3, and use version 3 by default. When the host-proxy IGMP version is set to 3, the proxy can explicitly include or exclude source addresses. Otherwise, include/exclude configuration for source addresses is ignored. The IGMP version of unsolicited reports is specified with the `ip igmp host-proxy version` command. Reports that are triggered by IGMP queries, however, are sent in the same IGMP version as the received query. (An interface may also have a different IGMP version configured on it for other purposes using the `ip igmp version` command.)

Using ACLs

IGMP host proxy can also be enabled for the addresses defined by an ACL; if one or more groups are configured in addition to ACLs, the groups are processed first. Implicit deny in the ACL is ignored, but if the ACL includes an explicit deny rule, then the interface sends joins only to groups configured directly on the interface or included in a permit ACL. Deny rules take precedence over permit rules. If a group is configured with no filters and a host-proxy is configured with an ACL with rules having filters for the group, or configured with groups and source filters, then the filters are applied to the group.

Disabling Host Proxy or Removing an Individual Group or Source

The `no igmp host-proxy` command can be entered with group or source parameters to remove the specified group or source from the list. Entering the `no igmp host-proxy` command without specifying group or source disables the forwarding of all IGMP reports on the interface.

Examples

- These commands enable IGMP host proxy on Ethernet interface 17 for all multicast group addresses.
  ```
  switch(config)#interface ethernet 17
  switch(config-if-Et17)#pim ipv4 border-router
  switch(config-if-Et17)#ip igmp host-proxy
  switch(config-if-Et17)#
  ```

- These commands enable IGMP host proxy on Ethernet interface 18 for the multicast group at 231.10.10.1. The list of source addresses is not restricted.
  ```
  switch(config)#interface ethernet 18
  switch(config-if-Et18)#pim ipv4 border-router
  switch(config-if-Et18)#ip igmp host-proxy 231.10.10.1
  switch(config-if-Et18)#
  ```

- These commands enable IGMP host proxy on Ethernet interface 19 for the multicast group at 231.10.10.2. The list of source addresses only excludes 10.4.4.1 and 10.4.5.2.
  ```
  switch(config)#interface ethernet 19
  switch(config-if-Et19)#pim ipv4 border-router
  switch(config-if-Et19)#ip igmp host-proxy 231.10.10.2 exclude 10.4.4.1
  switch(config-if-Et19)#ip igmp host-proxy 231.10.10.2 exclude 10.4.5.2
  switch(config-if-Et19)#
  ```

- These commands enable IGMP host proxy on Ethernet interface 16 for the multicast group at 231.10.10.3. The list of source address for this group only includes 10.5.5.1 and 10.5.5.2
  ```
  switch(config)#interface ethernet 16
  switch(config-if-Et16)#pim ipv4 border-router
  switch(config-if-Et16)#ip igmp host-proxy 231.10.10.3 include 10.5.5.1
  switch(config-if-Et16)#ip igmp host-proxy 231.10.10.3 include 10.5.5.2
  switch(config-if-Et16)#
  ```
• These commands configure an IGMP host proxy interval of five seconds on port channel 100.
  
  ```
  switch(config)#interface port-channel 100
  switch(config-if-Po100)#ip igmp host-proxy report-interval 5
  ```

• These commands enable IGMP host proxy on Ethernet interface 17 for the group address(es) specified in ACL “acl1.”
  
  ```
  switch(config)#interface ethernet 17
  switch(config-if-Et17)#pim ipv4 border-router
  switch(config-if-Et17)#ip igmp host-proxy access-list acl1
  ```
39.6 IGMP and IGMP Snooping Commands

**IGMP Configuration Commands (Interface Configuration Mode)**
- `igmp query-max-response-time`
- `ip igmp last-member-query-count`
- `ip igmp last-member-query-interval`
- `ip igmp query-interval`
- `ip igmp router-alert`
- `ip igmp startup-query-count`
- `ip igmp startup-query-interval`
- `ip igmp static-group`
- `ip igmp static-group acl`
- `ip igmp static-group range`
- `ip igmp version`

**IGMP Clear Commands**
- `clear ip igmp group`
- `clear ip igmp statistics`

**IGMP Display Commands**
- `show ip igmp groups`
- `show ip igmp groups count`
- `show ip igmp interface`
- `show ip igmp static-groups`
- `show ip igmp static-groups acl`
- `show ip igmp static-groups group`
- `show ip igmp statistics`

**IGMP Snooping Configuration Commands (Global Configuration Mode)**
- `ip igmp`
- `ip igmp profile`
- `ip igmp snooping`
- `ip igmp snooping proxy`
- `ip igmp snooping querier`
- `ip igmp snooping querier address`
- `ip igmp snooping querier last-member-query-count`
- `ip igmp snooping querier last-member-query-interval`
- `ip igmp snooping querier max-response-time`
- `ip igmp snooping querier query-interval`
- `ip igmp snooping querier startup-query-count`
- `ip igmp snooping querier startup-query-interval`
- `ip igmp snooping querier version`
- `ip igmp snooping report-flooding`
- `ip igmp snooping report-flooding switch-port`
- `ip igmp snooping restart query-interval`
- `ip igmp snooping robustness-variable`
- `ip igmp snooping vlan`
- `ip igmp snooping vlan fast-leave`
- `ip igmp snooping vlan max-groups`
- `ip igmp snooping vlan member`
- `ip igmp snooping vlan multicast-router`
- `ip igmp snooping vlan proxy`
- `ip igmp snooping vlan querier`
- `ip igmp snooping vlan querier address`
- `ip igmp snooping vlan querier last-member-query-count`
- `ip igmp snooping vlan querier last-member-query-interval`
- `ip igmp snooping vlan querier max-response-time`
- `ip igmp snooping vlan querier query-interval`
- `ip igmp snooping vlan querier startup-query-count`
- `ip igmp snooping vlan querier startup-query-interval`
- `ip igmp snooping vlan querier version`
- `ip igmp snooping vlan report-flooding`
- `ip igmp snooping vlan report-flooding switch-port`

**IGMP Configuration Commands (Interface Configuration Mode)**
- `ip igmp snooping filter`

**IGMP Snooping Clear Commands**
- `clear ip igmp snooping counters`

**IGMP Snooping Display Commands**
- `show igmp snooping querier`
- `show igmp snooping querier counters`
- `show igmp snooping querier membership`
- `show ip igmp profile`
- `show ip igmp snooping`
- `show ip igmp snooping counters`
- `show ip igmp snooping counters ethdev-pams`
- `show ip igmp snooping groups`
- `show ip igmp snooping groups count`
- `show ip igmp snooping mrouter`
- `show ip igmp snooping report-flooding`

**IGMP Profile Configuration Mode Commands**
- `permit / deny`
- `range`

**IGMP Host Proxy Commands**
- `ip igmp host-proxy`
- `ip igmp host-proxy report-interval`
- `ip igmp host-proxy version`
- `show ip igmp host-proxy config-sanity`
- `show ip igmp host-proxy interface`
clear ip igmp group

The clear ip igmp group command deletes IGMP cache entries as follows:

- clear ip igmp group all entries from the IGMP cache.
- clear ip igmp group gp_addr all entries for a specified multicast group.
- clear ip igmp group interface int_id all entries that include a specified interface.
- clear ip igmp group gp_addr interface int_id all entries for a specified interface in a specified group.

Command Mode
Privileged EXEC

Command Syntax

    clear ip igmp group [gp_addr] [interface INT_ID]

Parameters

- gp_addr multicast group IP address (dotted decimal notation).
- INT_ID interface name. Options include:
  - ethernet e_num Ethernet interface specified by e_num.
  - loopback l_num Loopback interface specified by l_num.
  - management m_num Management interface specified by m_num.
  - port-channel p_num Port-channel interface specified by p_num.
  - vlan v_num VLAN interface specified by v_num.
  - vxlan vx_num VXLAN interface specified by vx_num.

Examples

- This command deletes all IGMP cache entries for the multicast group 231.23.23.14.

  switch#clear ip igmp group 231.23.23.14
  switch#

- This command deletes IGMP cache entries for Ethernet interface 16 in multicast group 226.45.10.45.

  switch#clear ip igmp group 226.45.10.45 interface ethernet 16
  switch#
clear ip igmp snooping counters

The clear ip igmp snooping counters command resets the snooping message counters for the specified interface. The snooping counters for all interfaces are reset if the command does not include an interface name.

The show ip igmp snooping counters command displays the counter contents. See the show ip igmp snooping counters command description for a list of available snooping counters.

Command Mode
- Privileged EXEC

Command Syntax
  clear ip igmp snooping counters [INT_NAME]

Parameters
- INT_NAME  interface name. Formats include:
  - ethernet e_num  Ethernet interface specified by e_num.
  - port-channel p_num  Port-channel interface specified by p_num.
  - switch  virtual interface to an L2 querier.

Example
- This command clears the snooping counters for messages received on Ethernet interface 15.

```
switch(config)#clear ip igmp snooping counters ethernet 15
switch(config)#
```
clear ip igmp statistics

The `clear ip igmp statistics` command resets IGMP transmission statistic counters for the specified interface.

**Command Mode**

Privileged EXEC

**Command Syntax**

`clear ip igmp statistics [INFG_ID]`

**Parameters**

- `INFG_ID` interface name. Options include:
  - `<no parameter>` all interfaces.
  - `interface ethernet e_num` Ethernet interface specified by `e_num`.
  - `interface loopback l_num` Loopback interface specified by `l_num`.
  - `interface management m_num` Management interface specified by `m_num`.
  - `interface port-channel p_num` Port-channel interface specified by `p_num`.
  - `interface vlan v_num` VLAN interface specified by `v_num`.
  - `interface xlan vx_num` VXLAN interface specified by `vx_num`.

**Examples**

- This command resets IGMP transmission statistic counters on Ethernet 1 interface.

  switch#clear ip igmp statistics interface ethernet 1
  switch#
**igmp query-max-response-time**

The `igmp query-max-response-time` command configures the `query-max-response-time` variable for the configuration mode interface. This variable is used to set the Max Response Time field in outbound Membership Query messages. Max Response Time specifies the maximum period a recipient can wait before responding with a Membership Report.

The router with the lowest IP address on a subnet sends membership queries as the IGMP querier. When a membership query is received from a source with a lower IP address, the router resets its query response timer. Upon timer expiry, the router begins sending membership queries. If the router subsequently receives a membership query originating from a lower IP address, it stops sending membership queries and resets the query response timer.

The `no igmp query-max-response-time` and `default igmp query-max-response-time` commands restore the default query-max-response-time of 10 seconds for the configuration mode interface by removing the corresponding `igmp query max-response-time` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration
- Router-IGMP Configuration

**Command Syntax**

- Interface-Ethernet Configuration, Interface-Port-Channel Configuration, and Interface-VLAN Configuration modes
  
  `igmp query-max-response-time period`
  `no igmp query-max-response-time`
  `default igmp query-max-response-time`

- Router-IGMP Configuration mode
  
  `query-max-response-time period`
  `no query-max-response-time`
  `default query-max-response-time`

**Parameters**

- `period` maximum response time (deciseconds). Values range from 1 to 31744 (52 minutes, 54 seconds). Default is 100 (ten seconds).

**Example**

- This command configures the query-max-response-time of 18 seconds for VLAN interface 4.

  ```
  switch(config)#interface vlan 4
  switch(config-if-Vl4)# igmp query-max-response-time 180
  switch(config-if-Vl4)#
  ```
**ip igmp host-proxy**

The `ip igmp host-proxy` command enables the IGMP host proxy service on the configuration mode interface. The IGMP host proxy performs IGMP joins and leaves between networks that are directly connected by an exchange that does not support PIM on the network boundary.

**Note**

For an interface to serve as an IGMP host proxy, PIM MBR must also be enabled on that interface using the `pim ipv4 border-router` command.

The IGMP host proxy sends unsolicited IGMP join reports when an (S,G) or (*,G) entry arrives in the multicast routing (mroute) table. Reports are subsequently sent upon the arrival of queries on the interface. The interval between IGMP reports is configured through `ip igmp host-proxy report-interval`.

The `ip igmp host-proxy` command can also specify a group address; this ensures that reports are generated for the specified group even if there is no (*,G) entry in the mroute table for that group. Multiple `ip igmp host-proxy` statements are required to specify multiple groups.

When the host proxy IGMP version is set to 3 using the `ip igmp host-proxy version` command, the `ip igmp host-proxy` command can also include or exclude source addresses. These options are ignored when the interface runs host proxy IGMP version 1 or 2. Note that the IGMP version set using the `ip igmp version` command does not affect host proxy behavior.

An ACL can also be used in place of a group address by using the `access-list` option. If one or more groups are configured in addition to ACLs, the groups are processed first. Implicit deny in the ACL is ignored, but if the ACL includes an explicit deny rule, then the interface sends joins only to groups configured directly on the interface or included in a permit ACL. Deny rules take precedence over permit rules. If a group is configured with no filters and a host-proxy is configured with an ACL with rules having filters for the group, or configured with groups and source filters, then the filters are applied to the group.

The `no ip igmp host-proxy` and `default ip igmp host-proxy` commands remove the corresponding `ip igmp host-proxy` command from **running-config**. When these commands do not include a group address, all `ip igmp host-proxy` statements are deleted. When inclusion or exclusion parameters are not specified, all statements with the specified group address are deleted.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
        ip igmp host-proxy [GROUP_ADDRESS [SOURCE_ADDRESS] | [access-list acl]]
        no ip igmp host-proxy [GROUP_ADDRESS [SOURCE_ADDRESS]]
        default ip igmp host-proxy [GROUP_ADDRESS [SOURCE_ADDRESS]]
```

**Parameters**

- **GROUP_ADDRESS** IPv4 address of group address for which host proxy sends reports.
- `<no parameter>` only groups for which there is a (*,G) entry in the mroute table.
- `ipv4_address` IP address of multicast group (dotted decimal notation). This ensures that reports are generated for this group even if it does not have a (*,G) entry in the mroute table.
- **SOURCE_ADDRESS** IP address of a host that originates multicast data packets.
- `<no parameter>` Proxy sends report for all received or configured groups regardless of source address.
- `exclude ipv4_address` Proxy does not send reports for specified source address.
• **include ipv4_address**  Proxy always sends reports for specified source address.

  Commands that list at least one parameter must specify a group address.
  Parameters may be listed in any order.
  When a command specifies include and exclude parameters, the exclude parameter is ignored.

• **access-list acl**  specifies an access control list (ACL); a join is sent for all groups and/or sources obtained by processing the rules from all configured ACLs.

• **version version**  specifies the IGMP version on IGMP host-proxy interface. The value ranges from 1 to 3. Default value is 3.

**Guidelines**

Multiple statements for a group address may be configured. The effect of entering a command depends on previously entered commands. The following describes command combination:

• **ip igmp host-proxy**: IGMP host proxy is enabled for all multicast groups and their source addresses. When enabled for all group addresses, the source address list cannot be restricted.

• **ip igmp host-proxy group_ipv4**: IGMP host proxy is enabled for a specified multicast group. The list of source addresses for this group is not restricted. Enabling host proxy for another group address requires another **ip igmp host-proxy** command.

• **ip igmp host-proxy group_ipv4 exclude source_ipv4**: IGMP host proxy is enabled for the specified multicast group. Sources for this group include all addresses not in an exclude statement. Multiple source addresses for the group are excluded by multiple statements.

• **ip igmp host-proxy group_ipv4 include source_ipv4**: IGMP host proxy is enabled for the specified group address for only the specified source address. Additional statements are required to include other source addresses for the group. The presence of one include parameter invalidates all exclude statements for the specified multicast group.

• **ip igmp host-proxy access-list acl**: IGMP host proxy is enabled for the addresses defined by the specified ACL. If one or more groups are configured in addition to ACLs, the groups are processed first. If the ACL has a “deny all” rule for a group, then this filter takes precedence over configurations with include/exclude keywords or permit/deny rules for that group. If a group is configured with no filters and a host-proxy is configured with an ACL with rules having filters for the group, or configured with groups and source filters, then the filters are applied to the group.

**Example**

• These commands enable IGMP host proxy on Ethernet interface 17 for all multicast group addresses.

```
switch(config)#interface ethernet 17
switch(config-if-Et17)#pim ipv4 border-router
switch(config-if-Et17)#ip igmp host-proxy
switch(config-if-Et17)#
```

• These commands enable IGMP host proxy on Ethernet interface 17 for the multicast group at 231.10.10.1. The list of source addresses is not restricted.

```
switch(config)#interface ethernet 17
switch(config-if-Et17)#pim ipv4 border-router
switch(config-if-Et17)#ip igmp host-proxy 231.10.10.1
switch(config-if-Et17)#
```
These commands enable IGMP host proxy on Ethernet interface 17 for the multicast group at 231.10.10.2. The list of source addresses only excludes 10.4.4.1 and 10.4.5.2.

```
switch(config)#interface ethernet 17
switch(config-if-Et17)#pim ipv4 border-router
switch(config-if-Et17)#ip igmp host-proxy 231.10.10.2 exclude 10.4.4.1
switch(config-if-Et17)#ip igmp host-proxy 231.10.10.2 exclude 10.4.5.2
```

These commands enable IGMP host proxy on Ethernet interface 17 for the multicast group at 231.10.10.3. The list of source address for this group only includes 10.5.5.1 and 10.5.5.2.

```
switch(config)#interface ethernet 17
switch(config-if-Et17)#pim ipv4 border-router
switch(config-if-Et17)#ip igmp host-proxy 231.10.10.3 include 10.5.5.1
switch(config-if-Et17)#ip igmp host-proxy 231.10.10.3 include 10.5.5.2
```

These commands enable IGMP host proxy on Ethernet interface 17 for the group address(es) specified in ACL "acl1".

```
switch(config)#interface ethernet 17
switch(config-if-Et17)#pim ipv4 border-router
switch(config-if-Et17)#ip igmp host-proxy access-list acl1
```
**ip igmp host-proxy report-interval**

The `ip igmp host-proxy report-interval` command configures the period between unsolicited join reports that the switch sends as an IGMP host proxy from the configuration mode interface to a sender network after a (S,G) or (*,G) entry arrives in the multicast route (mroute) table. When the interface receives a query in response, this interval is set to the `ip igmp last-member-query-interval`. This command also enables the host proxy on the configuration mode interface if it was not previously enabled.

The `no ip igmp host-proxy report-interval` and `default ip igmp host-proxy report-interval` commands reset the query interval to the default value of one second by removing the corresponding `ip igmp host-proxy report-interval` command from `running-config`. The `no ip igmp host-proxy` and `default ip igmp host-proxy` commands also remove the corresponding `report-interval` command.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ip igmp host-proxy report-interval period
no ip igmp host-proxy report-interval
default ip igmp host-proxy report-interval
```

**Parameters**

- `period` transmission interval (seconds) between consecutive reports.
  
  Value range: 1 (one second) to 31744 (8 hours, 49 minutes, 4 seconds). Default is 1 (one second).

**Example**

- These commands configures a IGMP host proxy interval of five seconds on port channel 100.

  ```
  switch(config)#interface port-channel 100
  switch(config-if-Po100)#ip igmp host-proxy report-interval 5
  switch(config-if-Po100)#
  ```
**ip igmp host-proxy version**

The **ip igmp host-proxy version** command configures the version number to be used in unsolicited reports when the interface is serving as an IGMP host proxy. To configure the IGMP version used by the interface for other purposes, use the **ip igmp version** command instead.

The **no ip igmp host-proxy version** and **default ip igmp host-proxy version** commands reset the version to the default value of 3.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ip igmp host-proxy version version_number
no ip igmp host-proxy version
default ip igmp host-proxy version
```

**Parameters**

- **version_number** values range from 1-3; default value is 3.

**Example**

- These commands configure the IGMP host proxy version on port channel interface 100 to 2.

```
switch(config)#interface port-channel 100
switch(config-if-Po100)#ip igmp host-proxy version 2
switch(config-if-Po100)#
```
**ip igmp last-member-query-count**

The `ip igmp last-member-query-count` command specifies the number of query messages the switch sends in response to a group-specific or group-source-specific leave message.

After receiving a message from a host leaving a group, the switch sends query messages at intervals specified by `ip igmp last-member-query-interval`. If the switch does not receive a response to the queries after sending the number of messages specified by this parameter, it stops forwarding messages to the host.

Setting the last member query count (LMQC) to 1 causes the loss of a single packet to stop traffic forwarding. While the switch can start forwarding traffic again after receiving a response to the next general query, the host may not receive that query for a period defined by `ip igmp query-interval`.

The `no ip igmp last-member-query-count` and `default ip igmp last-member-query-count` commands reset the LMQC to the default value by removing the corresponding `ip igmp last-member-query-count` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
```
ip igmp last-member-query-count number
no ip igmp last-member-query-count
default ip igmp last-member-query-count
```

**Parameters**
- `number` query message quantity. Values range from 0 to 3. Default is 2.

**Example**
- This command configures the last-member-query-count to 3 on VLAN interface 4.
```
switch(config)#interface vlan 4
switch(config-if-Vl4)#ip igmp last-member-query-count 3
switch(config-if-Vl4)#
```
ip igmp last-member-query-interval

The **ip igmp last-member-query-interval** command configures the switch’s transmission interval for sending group-specific or group-source-specific query messages from the configuration mode interface.

When a switch receives a message from a host that is leaving a group it sends query messages at intervals set by this command. The **ip igmp startup-query-count** specifies the number of messages that are sent before the switch stops forwarding packets to the host.

If the switch does not receive a response after this period, it stops forwarding traffic to the host on behalf of the group, source, or channel.

The **no ip igmp last-member-query-interval** and **default ip igmp last-member-query-interval** commands reset the query interval to the default value of one second by removing the **ip igmp last-member-query-interval** command from **running-config**.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip igmp last-member-query-interval <em>period</em></td>
<td>sets the transmission interval (deciseconds) between consecutive group-specific query messages. Value range: 10 (one second) to 317440 (8 hours, 49 minutes, 4 seconds). Default is 10 (one second).</td>
</tr>
<tr>
<td>no ip igmp last-member-query-interval</td>
<td>resets the query interval to the default value of one second</td>
</tr>
<tr>
<td>default ip igmp last-member-query-interval</td>
<td>removes the <strong>ip igmp last-member-query-interval</strong> command from <strong>running-config</strong></td>
</tr>
</tbody>
</table>

**Parameters**
- **period** transmission interval (deciseconds) between consecutive group-specific query messages. Value range: 10 (one second) to 317440 (8 hours, 49 minutes, 4 seconds). Default is 10 (one second).

**Example**
- This command configures the last member query interval of 6 seconds for VLAN interface 4.

```
switch(config)#interface vlan 4
switch(config-if-Vl4)#ip igmp last-member-query-interval 60
switch(config-if-Vl4)#
```
**ip igmp**

The `ip igmp` command enables IGMP on a routed interface or on SVI (VLAN interface) without enabling PIM.

The `no igmp` command removes the corresponding `ip igmp` command from `running-config`.

**Command Mode**

Interface Configuration

**Command Syntax**

```
ip igmp
no ip igmp
```

**Example**

- This command enables IGMP on Ethernet interface 5/2.
  ```
switch(config)#interface ethernet 5/2
switch(config-if-Et5/2)#ip igmp
switch(config-if-Et5/2)#
  ```
The `ip igmp profile` command places the switch in IGMP-profile configuration mode to configure an IGMP profile. IGMP profiles control the multicast groups that an interface can join.

Profiles consist of the filter type and an address range:

- Filter types specify accessibility to the listed address range:
  - Permit filters define the multicast groups the interface can join.
  - Deny filters define the multicast groups the interface cannot join.

Profiles are deny filters by default.

- Address ranges specify a list of addresses and ranges:
  - In permit filters, permitted groups are specified by the address range.
  - In deny filters, all groups are permitted except those specified by the address range.

Implementing IGMP filtering affects IGMP report forwarding as follows:

- IGMPv2: Report is forwarded to mrouters for permitted groups and dropped for disallowed groups.
- IGMPv3: There may be multiple group records in a report.
  - No groups are allowed: The report is dropped.
  - All groups are allowed: The report is forwarded to mrouter ports as normal.
  - Some groups are allowed: A revised report is forwarded to mrouter ports.

The revised report includes records for the allowed group addresses with the same source MAC and IP addresses.

The `no ip igmp profile` and `default ip igmp profile` commands delete the specified IGMP profile from `running-config`.

IGMP-profile configuration mode is not a group change mode; `running-config` is changed immediately upon entering commands. Exiting IGMP-profile configuration mode does not affect the configuration. The `exit` command returns the switch to global configuration mode.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip igmp profile profile_name
no ip igmp profile profile_name
default ip igmp profile profile_name
```

**Parameters**

- `profile_name` name of the IGMP profile.

**Commands Available in igmp-profile Configuration Mode**

- `permit / deny`
- `range`

**Related Commands**

- `ip igmp snooping filter` applies an IGMP snooping filter to a configuration mode interface.
Example

- These commands enter IGMP-profile configuration mode and configure the profile as a permit list.

```bash
switch(config)#ip igmp profile list_1
switch(config-igmp-profile-list_1)#permit
switch(config-igmp-profile-list_1)#
```
**ip igmp query-interval**

The `ip igmp query-interval` command configures the frequency at which the configuration mode interface, as an IGMP querier, sends host-query messages.

An IGMP querier sends host-query messages to discover the multicast groups that have members on networks attached to the interface. The switch implements a default query interval of 125 seconds.

The `no ip igmp query-interval` and `default ip igmp query-interval` commands reset the IGMP query interval to the default value of 125 seconds by removing the `ip igmp query-interval` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ip igmp query-interval period
no ip igmp query-interval
default ip igmp query-interval
```

**Parameters**

- `period` interval (seconds) between IGMP query messages. Values range from 1 to 3175 (52 minutes, 55 seconds). Default is 125.

**Example**

- This command configures the query-interval of 2 minutes, 30 seconds for VLAN interface 4.

```
switch(config)#interface vlan 4
switch(config-if-Vl4)#ip igmp query-interval 150
switch(config-if-Vl4)#
```
**ip igmp router-alert**

The `ip igmp router-alert` command configures the switch disposition of inbound IGMP packets to the configuration mode interface based on the presence of the router-alert option in the IP header. By default, the port accepts all IGMP packets that arrive on the local subnet and rejects all other packets that arrive without the router-alert option.

The command provides three IGMP packet disposition options:

- **mandatory**: packets are accepted only when router-alert is present.
- **optional**: packets are accepted regardless of router-alert presence.
- **optional connected**: packets are accepted from the same subnet; other packets require router-alert.

The `no ip igmp router-alert` and `default ip igmp router-alert` commands reset the default setting of `optional connected` on the configuration mode interface by removing the corresponding `ip igmp router-alert` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ip igmp router-alert DISPOSITION
no ip igmp router-alert
default ip igmp router-alert
```

**Parameters**

- **DISPOSITION**  IGMP packet disposition method. Options include:
  - **mandatory**  Rejects packets if router-alert is not present.
  - **optional**  Accepts packets regardless of router-alert presence.
  - **optional connected**  Accepts packets from same subnet. Other packets require router-alert.

**Example**

- This command configures the switch to accept IGMP packets on Ethernet interface 8 only if the IP header contains router alert.

  ```
  switch(config)#interface ethernet 8
  switch(config-if-Et8)#ip igmp router-alert mandatory
  switch(config-if-Et8)#
  ```
**ip igmp snooping**

The **ip igmp snooping** command enables snooping globally. By default, global snooping is enabled.

When global snooping is enabled, **ip igmp snooping vlan** enables or disables snooping on individual VLANs. When global snooping is disabled, snooping cannot be enabled on individual VLANs.

QoS cannot be used for IGMP packets when IGMP snooping is enabled.

The **no ip igmp snooping** command disables global snooping. The **default ip igmp snooping** command restores the global snooping default setting of enabled by removing the **ip igmp snooping** command from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

- `ip igmp snooping`
- `no ip igmp snooping`
- `default ip igmp snooping`

**Example**

- This command globally enables snooping on the switch.

```
switch(config)#ip igmp snooping
switch(config)#
```
ip igmp snooping proxy

The `ip igmp snooping proxy` command enables snooping proxy globally. By default, IGMP snooping proxy is disabled globally.

When the snooping proxy is enabled globally, it enables IGMP snooping proxy on an individual VLANs and when the IGMP snooping proxy is globally disabled the snooping proxy is disabled on individual VLANs.

The **no** and **default** form of `ip igmp snooping proxy` command disables snooping proxy globally and on individual VLANs by removing the `ip igmp snooping proxy` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

- `ip igmp snooping proxy`
- `no ip igmp snooping proxy`
- `default ip igmp snooping proxy`

**Examples**

- This command globally enables snooping proxy on the switch.
  
  ```bash
  switch(config)#ip igmp snooping proxy
  switch(config)#
  ```

- This command explicitly disables IGMP snooping proxy on VLAN 20.
  
  ```bash
  switch(config)#no ip igmp snooping vlan 20 proxy
  switch(config)#
  ```
### ip igmp snooping filter

The `ip igmp snooping filter` command applies the specified IGMP snooping profile to the configuration mode interface. An IGMP snooping profile specifies the multicast groups that an interface may join. Profiles consist of the filter type and an address range:

- **Filter type**: Specifies accessibility to the listed address range:
  - Permit filters define the multicast groups the interface can join.
  - Deny filters define the multicast groups the interface cannot join.
- **Address range**: Specifies a list of addresses and ranges:
  - In permit filters, the permitted groups are specified by the address range.
  - In deny filters, all groups are permitted except those specified by the address range.

An interface without a snooping profile assignment may join any multicast group.

Snooping profiles are configured in IGMP-profile configuration mode (`ip igmp profile`).

The `no ip igmp snooping filter` and `default ip igmp snooping filter` commands restore the default setting of allowing an interface to join any multicast group by deleting the corresponding `ip igmp snooping filter` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

**Command Syntax**

```
  ip igmp snooping filter profile_name
  no ip igmp snooping filter [profile_name]
  default ip igmp snooping filter [profile_name]
```

**Parameters**

- `profile_name` name of profile assigned to interface.

**Example**

- This command applies the `list_1` snooping profile to Ethernet interface 7.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#ip igmp snooping filter list_1
switch(config-if-Et7)#
```
ip igmp snooping interface-restart-query

The `ip igmp snooping interface-restart-query` command configures the interface startup initial query time used for IGMP query spoofing. When an interface restarts or there is a change to the spanning tree, the interface will send general IGMP queries after this interval. The query is based on the information of the last known IGMP querier, and serves to facilitate faster network convergence times.

Multiple values can be configured with a single command; issuing the command again replaces any previously configured value(s).

The `no ip igmp snooping interface-restart-query` and `default ip igmp snooping interface-restart-query` commands restore the default setting of 2000 milliseconds by deleting the corresponding `ip igmp snooping interface-restart-query` command from `running-config`.

**Command Mode**
- General Configuration

**Command Syntax**
- `ip igmp snooping interface-restart-query query_time`
- `no ip igmp snooping interface-restart-query`
- `default ip igmp snooping interface-restart-query`

**Parameters**
- `query_time` interval (in milliseconds) after an interface restart or spanning tree change at which the interface will send general IGMP queries. Values range from 100 to 50000 milliseconds; default is 2000.

**Example**
- This command configures interfaces to send IGMP queries at 100, 200, and 300 milliseconds after an interface restart or spanning tree change.
  
  `switch(config)#ip igmp snooping interface-restart-query 100 200 300`
  
  `switch(config)#`
The `ip igmp snooping querier` command enables the snooping querier globally, which controls the querier for VLANs that are not configured with a snooping querier command. The `ip igmp snooping vlan querier` command controls the querier on individual VLANs.

The IGMP snooping querier supports snooping by sending layer 2 membership queries to hosts attached to the switch. The snooping querier is functional on VLANs where hosts receive IP multicast traffic without access to a network IP multicast router. A snooping querier avoids flooding multicast packets in the VLAN by querying for hosts and routers.

The IGMP snooping querier is functional on VLANs that meet these criteria:

- Snooping is enabled.
- The corresponding SVI (VLAN interface) is active.
- The VLAN’s querier IP address or the global querier IP address is configured.

The `no ip igmp snooping querier` and `default ip igmp snooping querier` commands disable the snooping querier globally by removing the `ip igmp snooping querier` statement from `running-config`. The snooping querier is globally disabled by default.

**Command Mode**

Global Configuration

**Command Syntax**

- `ip igmp snooping querier`
- `no ip igmp snooping querier`
- `default ip igmp snooping querier`

**Guidelines**

- Enabling a querier after it was disabled is equivalent to establishing a new querier.
- Changing the querier’s IP address is equivalent to establishing a new querier.

**Example**

- This command globally enables the snooping querier on the switch.

```bash
switch(config)#ip igmp snooping querier
switch(config)#
```
ip igmp snooping querier address

The **ip igmp snooping querier address** command sets the global querier source IP address, which specifies the source address for packets transmitted from VLANs for which a querier address (**ip igmp snooping vlan querier address**) is not configured. To use a snooping querier, an address must be explicitly configured globally or for the VLAN.

The switch does not define a default global querier address.

The **no ip igmp snooping querier address** and **default ip igmp snooping querier address** commands remove the global querier address command from **running-config**.

**Command Mode**
- Global Configuration

**Command Syntax**

```
ip igmp snooping querier address ipv4_address
no ip igmp snooping querier address
default ip igmp snooping querier address
```

**Parameters**

- **ipv4_address** source IPv4 address.

**Example**

- This command sets the source IP address to 10.1.1.41 for query packets transmitted from the switch.

```
switch(config)#ip igmp snooping querier address 10.1.1.41
switch(config)#
```
**ip igmp snooping querier last-member-query-count**

The `ip igmp snooping querier last-member-query-count` command configures the global IGMP **snooping querier last member query count** (LMQC) value. LMQC specifies the number of query messages the switch sends in response to group-specific or group-source-specific leave messages it receives from a host; the transmission frequency is specified by **IGMP snooping querier last member query interval**. The switch stops forwarding messages to the host if it does not receive a response to these query messages.

Setting LMQC to 1 causes the loss of one packet to stop traffic forwarding. While the switch can start forwarding traffic again after receiving a response to the next general query, the host may not receive that query for a period defined by `ip igmp snooping querier query-interval`.

VLANs use the global value when they are not assigned a value (`ip igmp snooping vlan querier last-member-query-count`). VLAN commands take precedence over the global value. The default global value is specified by the robustness variable (`ip igmp snooping robustness-variable`).

The `no igmp snooping querier last-member-query-count` and `default igmp snooping querier last-member-query-count` commands reset the LMQC to the default value by removing the corresponding `ip igmp snooping querier last-member-query-count` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
  ip igmp snooping querier last-member-query-count number
  no ip igmp snooping querier last-member-query-count
  default ip igmp snooping querier last-member-query-count
```

**Parameters**

- `number` query message quantity. Value ranges from 1 to 3. Default is set by robustness-variable.

**Example**

- This command configures the global last-member-query-count to 3.

```
switch(config)#ip igmp snooping querier last-member-query-count 3
switch(config)#show igmp snooping querier status
  Global IGMP Querier status
    ------------------------------------------
    admin state                      : Disabled
    source IP address                : 0.0.0.0
    query-interval (sec)             : 125.0
    max-response-time (sec)          : 10.0
    querier timeout (sec)            : 255.0
    last-member-query-interval (sec) : 1.0
    last-member-query-count          : 3
    startup-query-interval (sec)     : 31.25 (query-interval/4)
    startup-query-count              : 2 (robustness)
  ------------------------------------------

  Vlan Admin IP Query Interval Response Time Querier Timeout State
  Vlan State       Interval       Time      Querier    Operational Ver
  State     IP                        Interval   Time  Timeout State
  --------------------------------------------------------------
   1    Disabled 0.0.0.0  125.0  10.0  255.0 Non-Querier v2
  100  Disabled 0.0.0.0  125.0  10.0  255.0 Non-Querier v2
  101  Disabled 0.0.0.0  125.0  10.0  255.0 Non-Querier v2
switch(config)#
```
ip igmp snooping querier last-member-query-interval

The `ip igmp snooping querier last-member-query-interval` command sets the global IGMP snooping last member query interval. The default interval is one second.

A multicast host sends an IGMP leave report when it leaves a group. To determine if the host was the last group member, the leave message recipient sends an IGMP query. The last-member-query-interval determines when the group record is deleted if no subsequent reports are received.

VLANs not assigned a `last member query interval` value (`ip igmp snooping vlan querier last-member-query-interval`) use the global value. VLAN commands take precedence over the global value.

The `no ip igmp snooping querier last-member-query-interval` and `default ip igmp snooping querier last-member-query-interval` commands reset the `last-member-query-interval` value the default interval of one second by removing the `ip igmp snooping querier last-member-query-interval` statement from `running-config`.

**Command Mode**
- Global Configuration

**Command Syntax**
```
ip igmp snooping querier last-member-query-interval <period>
no ip igmp snooping querier last-member-query-interval
default ip igmp snooping querier last-member-query-interval
```

**Parameters**
- `<period>` last member query interval (seconds). Value ranges from 1 to 25. Default is one second.

**Related Commands**
- `ip igmp snooping vlan querier last-member-query-interval` assign a last member query interval value to the specified VLANs.

**Example**
- This command sets the IGMP snooping querier last-member-query-interval to five seconds.
  ```
  switch(config)#ip igmp snooping querier last-member-query-interval 5
  switch(config)#
  ```
**ip igmp snooping querier max-response-time**

The `ip igmp snooping querier max-response-time` command specifies the global `max-response-time` value. The switch uses `max-response-time` to set the Max Response Time field in outbound Membership Query messages. Max Response Time specifies the maximum period a recipient can wait before responding with a Membership Report.

VLANs not assigned a `max-response-time` value (ip igmp snooping vlan querier max-response-time) use the global value. VLAN commands take precedence over the global value.

Values range from 1 to 25 seconds. The default global value is 10 seconds.

The `no ip igmp snooping querier max-response-time` and `default ip igmp snooping querier max-response-time` commands restore the global `max-response-time` default value by removing the `ip igmp snooping querier max-response-time` statement from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**

```
ip igmp snooping querier max-response-time resp_sec
no ip igmp snooping querier max-response-time
default ip igmp snooping querier max-response-time
```

**Parameters**

- `resp_sec` `max-response-time` value (seconds). Values range from 1 to 25. Default (global) is 10.

**Example**

- This command sets the global max-response-time to 15 seconds.

```
switch(config)#ip igmp snooping querier max-response-time 15
switch(config)#
```
**ip igmp snooping querier query-interval**

The `ip igmp snooping querier query-interval` command sets the global query interval. This command also sets the query-interval of IGMP Snooping when using IGMP version 2. Values range from 5 to 3600 seconds. The default global value is 125 seconds. The query interval is the period between IGMP Membership Query messages sent from the querier. The global value specifies the query interval for VLANs with no query-interval command.

VLANs not assigned a `query interval` value (`ip igmp snooping vlan querier query-interval`) use the global value. VLAN commands take precedence over the global value.

The `no ip igmp snooping querier query-interval` and `default ip igmp snooping querier query-interval` commands reset the global query-interval value to 125 seconds by removing the `ip igmp snooping querier query-interval` statement from `running-config`.

**Command Mode**
- Global Configuration

**Command Syntax**

```
ip igmp snooping querier query-interval query_sec
no ip igmp snooping querier query-interval
default ip igmp snooping querier query-interval
```

**Parameters**
- `query_sec` query interval (seconds). Values range from 5 to 3600. Default (global) is 125.

**Example**
- This command sets the global query interval to 150 seconds.
  ```
  switch(config)#ip igmp snooping querier query-interval 150
  switch(config)#
  ```
**ip igmp snooping querier startup-query-count**

The `ip igmp snooping querier startup-query-count` command configures the global *startup query count* value. The *startup query count* specifies the number of query messages that the querier sends on a VLAN during the *startup query interval* (ip igmp snooping querier startup-query-interval).

When snooping is enabled, the group state is more quickly established by sending query messages at a higher frequency. The *startup-query-interval* and *startup-query-count* parameters define the startup period by defining the number of queries to be sent and transmission frequency for these messages.

VLANs use the global *startup query count* value when they are not assigned a value (ip igmp snooping vlan querier startup-query-count). VLAN commands take precedence over the global value. The default global value is specified by the robustness variable (ip igmp snooping robustness-variable).

The `no ip igmp snooping querier startup-query-count` and `default ip igmp snooping querier startup-query-count` commands restore the default *startup-query-count* value by removing the corresponding `ip igmp snooping querier startup-query-count` command from *running-config*.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip igmp snooping querier startup-query-count number
no ip igmp snooping querier startup-query-count
default ip igmp snooping querier startup-query-count
```

**Parameters**

- `number`  global startup query count. Value ranges from 1 to 3.

**Example**

- These commands configure the global startup query count value of 2, then displays the status of the snooping querier.

```
switch(config)#ip igmp snooping querier startup-query-count 2
switch(config)#show igmp snooping querier status

Global IGMP Querier status
--------------------------------------------------------------------------------
admin state : Disabled
source IP address : 0.0.0.0
query-interval (sec) : 125.0
max-response-time (sec) : 10.0
querier timeout (sec) : 255.0
last-member-query-interval (sec) : 1.0
last-member-query-count : 2 (robustness)
startup-query-interval (sec) : 31.25 (query-interval/4)
startup-query-count : 2

Vlan Admin IP Query Interval Response Timeout Querier Operational Ver
State      State   Time   State
--------------------------------------------------------------------------------
1  Disabled  0.0.0.0 125.0  10.0  255.0 Non-Querier v2
100 Disabled 0.0.0.0 125.0  10.0  255.0 Non-Querier v2
101 Disabled 0.0.0.0 125.0  10.0  255.0 Non-Querier v2
```

switch(config)#
**ip igmp snooping querier startup-query-interval**

The `ip igmp snooping querier startup-query-interval` command configures the global startup query interval value. The *startup query interval* specifies the period between query messages that the querier sends upon startup.

When snooping is enabled, the group state is more quickly established by sending query messages at a higher frequency. The *startup-query-interval* and *startup-query-count* parameters define the startup period by defining the number of queries to be sent and transmission frequency for these messages.

VLANs use the global *startup query interval* value when they are not assigned a value (*ip igmp snooping vlan querier startup-query-interval*). VLAN commands take precedence over the global value. The default global value equals the query interval divided by four. (*ip igmp snooping querier query-interval*).

The `no ip igmp snooping querier startup-query-interval` and `default ip igmp snooping querier startup-query-interval` commands restore the default method of specifying the startup query interval by removing the corresponding `ip igmp snooping querier startup-query-interval` command from *running-config*.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip igmp snooping querier startup-query-interval period
no ip igmp snooping querier startup-query-interval
default ip igmp snooping querier startup-query-interval
```

**Parameters**

- *period*  startup query interval (seconds). Value ranges from 1 to 3600 (1 hour).

**Example**

- This command configures the startup query count of one minute for VLAN interface 4.

```
switch(config)#ip igmp snooping querier startup-query-interval 40
```

```
switch(config)#show igmp snooping querier status

Global IGMP Querier status
-------------------------------------------------------
admin state                      : Enabled
source IP address                : 0.0.0.0
query-interval (sec)             : 125.0
max-response-time (sec)          : 10.0
querier timeout (sec)            : 255.0
last-member-query-interval (sec) : 1.0
last-member-query-count          : 2 (robustness)
startup-query-interval (sec)     : 40.0
startup-query-count              : 2

Vlan Admin    IP              Query    Response Querier Operational Ver
State                    Interval Time     Timeout State
-----------------------------------------------------------------------
  1    Enabled  0.0.0.0         125.0    10.0     255.0   Non-Querier v3
  100   Enabled  0.0.0.0         125.0    10.0     255.0   Non-Querier v3
  101   Enabled  0.0.0.0         125.0    10.0     255.0   Non-Querier v3
```

```
switch(config)#
```
**ip igmp snooping querier version**

The `ip igmp snooping querier version` command configures the Internet Group Management Protocol (IGMP) snooping querier version on the configuration mode interfaces. Version 3 is the default IGMP version.

IGMP is enabled by the `pim ipv4 sparse-mode` or `pim ipv4 bidirectional` command. The `ip igmp snooping querier version` command does not affect the IGMP enabled status.

The `no ip igmp snooping querier version` and `default ip igmp snooping querier version` commands restore the configuration mode to IGMP version 3 by removing the `ip igmp snooping querier version` statement from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip igmp snooping querier version version_number
no ip igmp snooping querier version
default ip igmp snooping querier version
```

**Parameters**

- `version_number` IGMP version number. Value ranges from 1 to 3. Default value is 3.

**Example**

- This command configures IGMP snooping querier version 2.
  ```
  switch(config)#ip igmp snooping querier version 2
  switch(config)#
  ```

- This command restores the IGMP snooping querier to version 3.
  ```
  switch(config)# no ip igmp snooping querier version
  switch(config)#
  ```
ip igmp snooping report-flooding

The `ip igmp snooping report-flooding` command globally enables L2 report flooding on the switch. When report flooding is globally enabled, the `ip igmp snooping vlan report-flooding` configures a VLAN range to forward membership report messages to specified ports. When report flooding is not globally enabled, L2 report flooding cannot be enabled on individual VLANs.

L2 report flooding is an IGMP snooping feature that forwards membership report messages to specified ports. Relying on a single switch to maintain and send report messages can result in performance issues. L2 report flooding addresses this by facilitating report message transmissions through any network port. This allows switches to bypass the querier when forwarding multicast traffic to its interested ports.

The `no ip igmp snooping report-flooding` and `default ip igmp snooping report-flooding` commands disable global L2 report flooding by removing `ip igmp report flooding` from `running-config`. L2 report flooding is disabled by default.

**Command Mode**
- Global Configuration

**Command Syntax**
- `ip igmp snooping report-flooding`
- `no ip igmp snooping report-flooding`
- `default ip igmp snooping report-flooding`

**Related Commands**
- `ip igmp snooping vlan report-flooding` enables L2 report flooding on a specified VLAN range.

**Example**
- This command globally enables the snooping L2 report-flooding.

```
switch(config)#ip igmp snooping report-flooding
switch(config)#
```
ip igmp snooping report-flooding switch-port

The `ip igmp snooping report-flooding switch-port` command specifies Ethernet ports or port channels that can forward IGMP membership report messages for all VLANs where L2 report flooding is enabled. Ports that are connected to multicast routers or queriers continue to forward traffic as previously specified and are not affected by L2 report flooding commands.

L2 report flooding is an IGMP snooping feature that forwards membership report messages to specified ports. The `ip igmp snooping vlan report-flooding switch-port` command configures a list of forwarding ports for a specified VLAN range.

The `no ip igmp snooping report-flooding switch-port` and `default ip igmp snooping report-flooding switch-port` commands remove the specified ports from the global report flooding port list by deleting the corresponding `ip igmp snooping report-flooding switch-port` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

- `ip igmp snooping report-flooding switch-port INTERFACE`
- `no ip igmp snooping report-flooding switch-port INTERFACE`
- `default ip igmp snooping report-flooding switch-port INTERFACE`

**Parameters**

- `INTERFACE` Membership report message forwarding is enabled on these ports:
  - `ethernet e_range` where `e_range` is the number, range, or list of ethernet ports
  - `port-channel p_range` where `p_range` is the number, range, or list of channel ports

**Related Commands**

- `ip igmp snooping report-flooding` globally enables L2 report flooding.
- `ip igmp snooping vlan report-flooding switch-port` specifies a port list for a VLAN range.

**Example**

- This command configures Ethernet ports 7-9 for report message forwarding for any VLAN where L2 report flooding is enabled.

```
switch(config)#ip igmp snooping report-flooding switch-port ethernet 7-9
switch(config)#
```
ip igmp snooping restart query-interval

The ip igmp snooping restart query-interval command sets the query interval for all VLANs during an IGMP snooping restart. By default, the query interval during an IGMP snooping restart is a VLAN's configured query interval divided by five. This accelerates the transmission of robustness queries to establish the IGMP snooping state more quickly. However, some large scale configurations may not be able to process all of the queries at this query interval rate. The restart query interval, when configured, is valid for all VLANs.

The no ip igmp snooping restart query-interval and default ip igmp snooping restart query-interval commands removes the global restart query interval by deleting the ip igmp snooping restart query-interval statement from running-config.

Command Mode
Global Configuration

Command Syntax
ip igmp snooping restart query-interval query_sec
no ip igmp snooping restart query-interval
default ip igmp snooping restart query-interval

Parameters
• query_sec query interval (seconds). Values range from 2 to 400. Default (global) is 125.

Example
• This command sets the global query interval to 35 seconds.
  switch(config)#ip igmp snooping restart query-interval 35
  switch(config)#
ip igmp snooping robustness-variable

The `ip igmp snooping robustness-variable` command configures the robustness variable for snooping packets sent from any VLAN. Values range from 1 to 3 with a default of 2.

The robustness variable specifies the number of unacknowledged snooping queries that a switch sends before removing the recipient from the group list.

The `no ip igmp snooping robustness-variable` and `default ip igmp snooping robustness-variable` commands reset the robustness variable to 2 by removing the `ip igmp snooping robustness-variable` command from `running-config`.

**Command Mode**
- Global Configuration

**Command Syntax**

```
ip igmp snooping robustness-variable robust_value
no ip igmp snooping robustness-variable
default ip igmp snooping robustness-variable
```

**Parameters**
- `robust_value`  robustness variable. Values range from 1 to 3. Default is 2.

**Example**
- This command sets the robustness-variable value to 3.

```
switch(config)#ip igmp snooping robustness-variable 3
switch(config)#
```
**ip igmp snooping vlan**

The *ip igmp snooping vlan* command enables snooping on the specified VLANs if snooping is globally enabled. IGMP snooping is globally enabled by default. The *ip igmp snooping* command enables snooping globally.

Note that if IGMP snooping is enabled, QoS will not apply to IGMP packets.

The *no ip igmp snooping vlan* command disables snooping on the specified VLANs.

The *default ip igmp snooping vlan* command returns the snooping setting for the specified VLANs to enabled by removing the corresponding *ip igmp snooping vlan* command from *running-config*.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip igmp snooping vlan v_range
no ip igmp snooping vlan v_range
default ip igmp snooping vlan v_range
```

**Parameters**

- **v_range** VLANs upon which snooping is enabled. Formats include a number, a number range, or a comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.

**Example**

- This command disables snooping on VLANs 2 through 4.
  ```
  switch(config)#no ip igmp snooping vlan 2-4
  switch(config)#
  ```
ip igmp snooping vlan fast-leave

The **ip igmp snooping vlan fast-leave** command enables fast-leave processing on specified VLANs. When fast-leave processing is enabled, the removal of a VLAN interface's multicast group entry from the IGMP table is not preceded by an IGMP group-specific query to the interface. The switch removes an interface from the forwarding table when it detects an IGMP leave message on the interface. IGMP fast-leave processing is enabled on all VLANs by default.

The **no ip igmp snooping vlan fast-leave** command disables fast-leave processing on the specified VLANs. The **default ip igmp snooping vlan fast-leave** command restores fast-leave processing on the specified VLANs by removing the corresponding **no ip igmp snooping vlan fast-leave** statement from **running-config**.

**Command Mode**  
Global Configuration

**Command Syntax**

- `ip igmp snooping vlan v_range fast-leave`
- `no ip igmp snooping vlan v_range fast-leave`
- `default ip igmp snooping vlan v_range fast-leave`

**Parameters**

- `v_range`  VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.

**Example**

- This command enables IGMP fast-leave processing on VLAN 10.

  `switch(config)#ip igmp snooping vlan 10 fast-leave`
  `switch(config)#`
ip igmp snooping vlan max-groups

The `ip igmp snooping vlan max-groups` command configures the quantity of multicast groups that the specified VLAN’s forwarding table can contain. After the limit is reached, attempts to join new groups are ignored. There is no default limit.

The `no ip igmp snooping vlan max-groups` and `default ip igmp snooping vlan max-groups` removes the maximum group limit by deleting the `ip igmp snooping vlan max-groups` statement from `running-config`.

Command Mode
Global Configuration

Command Syntax

```
ip igmp snooping vlan v_range max-groups quantity
no ip igmp snooping vlan v_range max-groups
default ip igmp snooping vlan v_range max-groups
```

Parameters

- `v_range` VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- `quantity` maximum number of groups that can access the VLAN. Value ranges from 0 to 65534.

Examples

- This command limits the number of multicast groups that hosts on VLAN 6 can simultaneously access to 25.
  ```
  switch(config)#ip igmp snooping vlan 6 max-groups 25
  switch(config)#
  ```
- This command allows each VLAN between 8 and 15 to receive multicast packets from 30 groups.
  ```
  switch(config)#ip igmp snooping vlan 8-15 max-groups 30
  switch(config)#
  ```
- This command removes the maximum group restriction from all VLAN interfaces between 1 and 50.
  ```
  switch(config)#no ip igmp snooping vlan 1-50 max-groups
  switch(config)#
  ```
**ip igmp snooping vlan member**

The `ip igmp snooping vlan member` command adds ports as static members to a multicast group. The ports must be in the specified VLAN range.

The `no ip igmp snooping vlan member` and `default ip igmp snooping vlan member` commands remove the specified ports from the multicast group by deleting the corresponding `ip igmp snooping member` statements from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip igmp snooping vlan v_num member ipv4_addr interface STATIC_INT
no ip igmp snooping vlan v_num member ipv4_addr interface STATIC_INT
default ip igmp snooping vlan v_num member ipv4_addr interface STATIC_INT
```

**Parameters**

- `v_num` VLAN number. Value ranges from 1 to 4094.
- `ipv4_addr` multicast group IPv4 address.
- `STATIC_INT` interface the command configures as the static group member. Options include:
  - `ethernet e_range`, where `e_range` is the number, range, or list of Ethernet ports
  - `port-channel p_range`, where `p_range` is the number, range, or list of channel ports

**Example**

- This command configures the static connection to a multicast group at 237.2.1.4 through Ethernet port 3.

  ```
  switch(config)#ip igmp snooping vlan 7 member 237.2.1.4 interface ethernet 3
  switch(config)#
  ```
ip igmp snooping vlan multicast-router

The **ip igmp snooping vlan multicast-router** command adds a multicast router as a static port to the specified VLANs. The router port must be in the specified VLAN range.

Snooping may not always be able to locate the IGMP querier. This command should specify IGMP queriers that are known to connect to the network through a port on the switch.

The **no ip igmp snooping vlan multicast-router** and **default ip igmp snooping vlan multicast-router** commands remove the specified static port configuration by deleting the corresponding **ip igmp snooping vlan multicast-router** command from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip igmp snooping vlan v_range multicast-router interface STATIC_INT
no ip igmp snooping vlan v_range multicast-router interface STATIC_INT
default ip igmp snooping vlan v_range multicast-router interface STATIC_INT
```

**Parameters**

- **v_range** VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- **STATIC_INT** interface the command configures as a static port. Selection options include:
  - **ethernet e_range** where **e_range** is the number, range, or list of ethernet ports
  - **port-channel p_range** where **p_range** is the number, range, or list of channel ports

The **STATIC_INT** interface must route traffic through a VLAN specified within **v_range**.

**Example**

- This command configures the static connection to a multicast router through Ethernet port 3.

```
switch(config)#ip igmp snooping vlan 2 multicast-router interface ethernet 3
switch(config)#
```
ip igmp snooping vlan proxy

The `ip igmp snooping vlan proxy` command enables snooping proxy on individual VLAN, and to enable or disable IGMP snooping vlan proxy globally, use `ip igmp snooping proxy` command.

**Note**
The `ip igmp snooping proxy` command enables snooping proxy on all VLANs only where IGMP snooping is enabled.

The **no and default** form of `ip igmp snooping vlan proxy` command disables snooping proxy globally and on individual VLANs by removing the `ip igmp snooping vlan proxy` command from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**
```
ip igmp snooping vlan [ID | range] proxy
no ip igmp snooping vlan [ID | range] proxy
default ip igmp snooping vlan [ID | range] proxy
```

**Parameters**
- `v_range` specifies the range of VLAN IDs. Numbers range from 1 to 4094.
- `v_ID` specifies a individual VLAN ID. Numbers range from 1 to 4094.

**Examples**
- This command globally enables IGMP snooping proxy on the switch and on all VLANs where IGMP snooping is enabled.
  ```
  switch(config)#ip igmp snooping proxy
  switch(config)#
  ```
- This command enables IGMP snooping proxy on VLAN 20.
  ```
  switch(config)#ip igmp snooping vlan 20 proxy
  switch(config)#
  ```
- This command disables IGMP snooping proxy on VLAN 20.
  ```
  switch(config)#no ip igmp snooping vlan 20 proxy
  switch(config)#
  ```
ip igmp snooping vlan querier

The `ip igmp snooping vlan querier` command controls the querier for the specified VLANs. VLANs follow the global querier setting unless overridden by one of these commands:

- `ip igmp snooping vlan querier` enables the querier on specified VLANs.
- `no ip igmp snooping vlan querier` disables the querier on specified VLANs.

VLAN querier commands take precedence over the global querier setting. The `ip igmp snooping querier` controls the querier for VLANs with no snooping querier command.

The IGMP snooping querier supports snooping by sending layer 2 membership queries to hosts attached to the switch. The snooping querier is functional on VLANs where hosts receive IP multicast traffic without access to a network IP multicast router. A snooping querier avoids flooding multicast packets in the VLAN by querying for hosts and routers.

The IGMP snooping querier is functional on VLANs that meet these criteria:

- Snooping is enabled.
- The corresponding SVI (VLAN interface) is active.
- The VLAN’s querier IP address or the global querier IP address is configured.

The `default ip igmp snooping vlan querier` command restores the usage of the global setting for the specified VLAN by removing the corresponding `ip igmp snooping vlan querier` or `no ip igmp snooping vlan querier` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip igmp snooping vlan v_range querier
no ip igmp snooping vlan v_range querier
default ip igmp snooping vlan v_range querier
```

**Parameters**

- `v_range` VLAN IDs. Formats include a number, a number range, or a comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.

**Examples**

- These commands globally enable the snooping querier on the switch, explicitly disable snooping on VLANs 1-3, and explicitly enable snooping on VLANs 4-6.

  ```
switch(config)#ip igmp snooping querier
switch(config)#no ip igmp snooping vlan 1-3 querier
switch(config)#ip igmp snooping vlan 4-6 querier
  ```

  After running these commands, the running-config file contains these lines, which indicate that the snooping querier is enabled on VLANs 4-6.

  ```
switch(config)#show running-config
<-------OUTPUT OMITTED FROM EXAMPLE-------->
nip igmp snooping vlan 1 querier
no ip igmp snooping vlan 2 querier
no ip igmp snooping vlan 3 querier
ip igmp snooping vlan 4 querier
ip igmp snooping vlan 5 querier
ip igmp snooping vlan 6 querier
ip igmp snooping querier
<-------OUTPUT OMITTED FROM EXAMPLE-------->
```
• This command removes the querier setting for VLANs 2-5:

```
switch(config)#default ip igmp snooping vlan 2-5 querier
```

When executed after the previous commands, the snooping querier is disabled explicitly on VLANs 1-2, enabled implicitly on VLANs 3-6, and enabled explicitly on VLANs 7-8, as shown by `running-config`:

```
<-------OUTPUT OMITTED FROM EXAMPLE------->
no ip igmp snooping vlan 1 querier
ip igmp snooping vlan 6 querier
ip igmp snooping querier
<-------OUTPUT OMITTED FROM EXAMPLE------->
```

• This command sets the global snooping querier to disabled by removing the global querier setting from `running-config`:

```
switch(config)#no ip igmp snooping querier
switch(config)#
```

When executed after the previous commands, the snooping querier is disabled explicitly on VLANs 1-2, disabled implicitly on VLANs 3-6 and enabled explicitly on VLANs 7-8, as shown by `running-config`:

```
<-------OUTPUT OMITTED FROM EXAMPLE------->
no ip igmp snooping vlan 1 querier
ip igmp snooping vlan 6 querier
<-------OUTPUT OMITTED FROM EXAMPLE------->
```
**ip igmp snooping vlan querier address**

The `ip igmp snooping vlan querier address` command sets the source address for query packets sent from specified VLANs. VLANs not assigned an address use the global address (`ip igmp snooping querier address`). VLAN querier address commands take precedence over the global address.

To use a snooping querier, an address must be explicitly configured globally or for the querier’s VLAN.

The `no ip igmp vlan snooping querier address` and `default ip igmp snooping vlan querier address` commands reset the specified VLAN to use the global address by removing the corresponding `ip igmp snooping vlan querier address` command from `running-config`.

**Command Mode**
- Global Configuration

**Command Syntax**

```
ip igmp snooping vlan v_range querier address ipv4_address
no ip igmp snooping vlan v_range querier address
default ip igmp snooping vlan v_range querier address
```

**Parameters**

- `v_range`  VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- `ipv4_address`  source IPv4 address.

**Example**

- This command sets the source IPv4 address of 10.14.1.1 for query packets transmitted from VLAN 2.

  ```
  switch(config)#ip igmp snooping vlan 2 querier address 10.14.1.1
  switch(config)#
  ```
The `ip igmp snooping vlan querier last-member-query-count` command specifies an **IGMP snooping querier last member query count** (LMQC) value for the specified VLANs. LMQC specifies the number of query messages the switch sends in response to group-specific or group-source-specific leave messages it receives from a host; the transmission frequency is specified by **IGMP snooping querier last member query interval**. The switch stops forwarding messages to the host if it does not receive a response to these query messages.

VLANs not assigned an LMQC value use the global value (`ip igmp snooping querier last-member-query-count`). VLAN commands take precedence over the global command.

Setting the last member query count (LMQC) to 1 causes the loss of a single packet to stop traffic forwarding. While the switch can start forwarding traffic again after receiving a response to the next general query, the host may not receive that query for a period defined by `ip igmp snooping querier query-interval`.

The `no igmp snooping vlan querier last-member-query-count` and `default igmp snooping vlan querier last-member-query-count` commands reset the specified VLAN to use the global LMQC by removing the corresponding `ip igmp snooping vlan querier last-member-query-count` command from `running-config`.

### Command Mode
Global Configuration

### Command Syntax
```plaintext
ip igmp snooping vlan v_range querier last-member-query-count number
no ip igmp snooping vlan v_range querier last-member-query-count
default ip igmp snooping vlan v_range querier last-member-query-count
```

### Parameters
- **v_range** VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- **number** query message quantity. Value ranges from 1 to 3.

### Example
- This command configures the last-member-query-count to 1 on VLAN interface 3.

```plaintext
switch(config)#ip igmp snooping vlan 3 querier last-member-query-count 1
switch(config)#
```
ip igmp snooping vlan querier last-member-query-interval

The **ip igmp snooping vlan querier last-member-query-interval** command configures **last-member-query-interval** for packets sent from the specified VLANs. VLANs not assigned a value use the global setting (**ip igmp snooping querier last-member-query-interval**). VLAN commands take precedence over the global value. The global default is one second.

A multicast host sends an IGMP leave report when it leaves a group. To determine if the host was the last group member, the leave message recipient sends an IGMP query. The last-member-query-interval determines when the group record is deleted if no subsequent reports are received.

The **no ip igmp snooping vlan querier last-member-query-interval** and **default ip igmp snooping vlan querier last-member-query-interval** commands reset the specified VLAN to use the global **last-member-query-interval** by removing the corresponding **ip igmp snooping vlan querier last-member-query-interval** command from **running-config**.

### Command Mode
- **Global Configuration**

### Command Syntax

```
ip igmp snooping vlan v_range querier last-member-query-interval period
no ip igmp snooping vlan v_range querier last-member-query-interval
default ip igmp snooping vlan v_range querier last-member-query-interval
```

### Parameters
- **v_range** VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- **period** last member query interval (seconds). Value ranges from 1 to 25.

### Example
- This command sets the last-member-query-interval for VLAN 10 to 12 seconds.

```
switch(config)#ip igmp snooping vlan 10 querier last-member-query-interval 12
switch(config)#
```
**ip igmp snooping vlan querier max-response-time**

The `ip igmp snooping vlan querier max-response-time` command configures `max-response-time` for packets sent from the specified VLANs. VLANs not assigned a value use the global setting (`ip igmp snooping querier max-response-time`). VLAN commands take precedence over the global value. The global default is 10 seconds.

Switches use `max-response-time` to set the Max Response Time field in outbound Membership Query messages. Max Response Time specifies the maximum period a recipient can wait before responding with a Membership Report.

The `no ip igmp snooping vlan querier max-response-time` and `default ip igmp snooping vlan querier max-response-time` commands reset the specified VLAN to use the global `max-response-time` by removing the corresponding `ip igmp snooping vlan querier max-response-time` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip igmp snooping vlan v_range querier max-response-time resp_sec
no ip igmp snooping vlan v_range querier max-response-time
default ip igmp snooping vlan v_range querier max-response-time
```

**Parameters**

- `v_range` VLAN ID. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- `resp_sec` `max-response-time` value (seconds). Values range from 1 to 25.

**Example**

- This command sets the max-response-time for VLAN 2 to 5 seconds.

```
switch(config)#ip igmp snooping vlan 2 querier max-response-time 5
```

```
switch(config)#
```
ip igmp snooping vlan querier query-interval

The `ip igmp snooping vlan querier query-interval` command sets the query interval for the specified VLAN. VLANs not assigned a value use the global value (`ip igmp snooping querier query-interval`). VLAN commands have precedence over the global value. The query interval is the period between IGMP Membership Query messages sent from the querier.

The `no ip igmp snooping vlan querier query-interval` and `default ip igmp snooping vlan querier query-interval` commands reset the specified VLAN to use the global value by removing the corresponding `ip igmp snooping vlan querier query-interval` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

- `ip igmp snooping vlan v_range querier query-interval query_sec`
- `no ip igmp snooping vlan v_range querier query-interval`
- `default ip igmp snooping vlan v_range querier query-interval`

**Parameters**

- `v_range` VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- `query_sec` query interval (seconds). Values range from 5 to 3600. Default (global) is 125.

**Example**

- This command sets the query interval for VLAN 10 to 240 seconds.

  ```
  switch(config)#ip igmp snooping vlan 10 querier query-interval 240
  switch(config)#
  ```
ip igmp snooping vlan querier startup-query-count

The *ip igmp snooping vlan querier startup-query-count* command specifies the startup query count value for the specified VLANs. The *startup query count* specifies the number of query messages that the querier sends on a VLAN during the *startup query interval* (*ip igmp snooping vlan querier startup-query-interval*).

When an interface starts running IGMP, it can establish the group state more quickly by sending query messages at a higher frequency. The *startup-query-interval* and *startup-query-count* parameters define the startup period and the query message transmission frequency during that period.

VLANs not assigned a *startup query count* value use the global value (*ip igmp snooping querier startup-query-count*). VLAN commands take precedence over the global command.

The *no ip igmp snooping vlan querier startup-query-count* and *default ip igmp snooping vlan querier startup-query-count* commands restore the default condition of using the global *startup query count* value by removing the corresponding *ip igmp snooping vlan querier startup-query-count* command from *running-config*.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip igmp snooping vlan v_range querier startup-query-count number
no ip igmp snooping vlan v_range querier startup-query-count
default ip igmp snooping vlan v_range querier startup-query-count
```

**Parameters**

- **v_range** VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- **number** startup query count. Value ranges from 1 to 3.

**Example**

- This command configures the startup query count of 3 for VLAN 100.

```
switch(config)#ip igmp snooping vlan 100 querier startup-query-count 3
switch(config)#
```
The `ip igmp snooping vlan querier startup-query-interval` command specifies the `startup query interval` value for the specified VLANs. The `startup query interval` specifies the period between query messages that the querier sends upon startup.

When snooping is enabled, the group state is more quickly established by sending query messages at a higher frequency. The `startup-query-interval` and `startup-query-count` parameters define the startup period by defining the number of queries to be sent and transmission frequency for these messages.

VLANs not assigned a `startup query interval` value use the global value (`ip igmp snooping querier startup-query-count`). VLAN commands take precedence over the global command.

The `no ip igmp snooping vlan querier startup-query-interval` and `default ip igmp snooping vlan querier startup-query-interval` commands restore the default condition of using the global `startup query interval` value by removing the corresponding `ip igmp snooping vlan querier startup-query-interval` command from `running-config`.

**Command Mode**
- Global Configuration

**Command Syntax**
```
ip igmp snooping vlan v_range querier startup-query-interval period
no ip igmp snooping vlan v_range querier startup-query-interval
default ip igmp snooping vlan v_range querier startup-query-interval
```

**Parameters**
- `v_range` VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- `period` startup query interval (seconds). Value ranges from 1 to 3600 (1 hour). Default is 31.

**Example**
- This command configures the startup query count of one minute for VLAN interface 100.
  ```
  switch(config)#ip igmp snooping vlan 100 querier startup-query-interval 60
  ```
ip igmp snooping vlan querier version

The `ip igmp snooping vlan querier version` command configures the Internet Group Management Protocol (IGMP) snooping querier function on the VLAN. Version 3 is the default IGMP snooping version.

IGMP is enabled by the `pim ipv4 sparse-mode` or `pim ipv4 bidirectional` command. The `ip igmp snooping vlan querier version` command does not affect the IGMP enabled status.

The `no ip igmp snooping vlan querier version` and `default ip igmp snooping vlan querier version` commands restore the configuration mode interface to IGMP snooping VLAN querier version 3 by removing the `ip igmp snooping vlan querier version` statement from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**
```
ip igmp snooping vlan v_range querier version version_number
no ip igmp snooping vlan v_range querier version
default ip igmp snooping vlan v_range querier version
```

**Parameters**
- `v_range` VLAN ID. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- `version_number` IGMP version number. Value ranges from 1 to 3. Default value is 3.

**Example**
- The example sets the querier version to 2 on vlan 5.
  ```
  switch(config)#ip igmp snooping vlan 5 querier version 2
  switch(config)#
  ```
- This command restores IGMP snooping querier version 3 to VLAN 5.
  ```
  switch(config)# no ip igmp snooping vlan 5 querier version
  switch(config)#
  ```
**ip igmp snooping vlan report-flooding**

The `ip igmp snooping vlan report-flooding` command enables L2 report flooding on the specified VLANs if report flooding is globally enabled. When L2 report flooding is not globally enabled, this command has no effect. The `ip igmp snooping report-flooding` command globally enables L2 report flooding.

L2 report flooding is an IGMP snooping feature that forwards membership report messages to specified ports. Relying on a single switch to maintain and send report messages can degrade performance. L2 report flooding addresses this by facilitating report message forwarding through any network port. This allows switches to bypass the querier when forwarding multicast traffic to its interested ports.

Two commands specify the ports that forward reports:
- `ip igmp snooping vlan report-flooding switch-port` for a VLAN range.
- `ip igmp snooping report-flooding switch-port` for all VLANs where report flooding is enabled.

The `no ip igmp snooping vlan report-flooding` and `default ip igmp snooping vlan report-flooding` commands disable L2 report flooding for the specified VLAN by removing the corresponding `ip igmp snooping vlan report-flooding` statement from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**

```
ip igmp snooping vlan v_range report-flooding
no ip igmp snooping vlan v_range report-flooding
default ip igmp snooping vlan v_range report-flooding
```

**Parameters**
- `v_range` VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.

**Related Commands**
- `ip igmp snooping report-flooding` globally enables L2 report flooding.

**Example**
- These commands enable L2 report flooding globally and on VLANs 201 through 205.

```
switch(config)#ip igmp snooping report-flooding
switch(config)#ip igmp snooping vlan 201-205 report-flooding
switch(config)#
```
ip igmp snooping vlan report-flooding switch-port

The `ip igmp snooping vlan report-flooding switch-port` command configures Ethernet ports or port channels to forward IGMP membership report messages for a specified VLAN range where L2 report flooding is enabled. Ports that are connected to multicast routers or queriers continue to forward traffic as previously specified and are not affected by L2 report flooding commands.

L2 report flooding is an IGMP snooping feature that forwards membership report messages to specified ports. The `ip igmp snooping report-flooding switch-port` command configures a list of forwarding ports for all VLANs where L2 report flooding is enabled.

The `no ip igmp snooping vlan report-flooding switch-port` and `default ip igmp snooping vlan report-flooding switch-port` commands remove the listed ports from the specified report flooding port list by deleting the corresponding `ip igmp snooping vlan report-flooding switch-port` statements from `running-config`.

Command Mode
Global Configuration

Command Syntax
```
ip igmp snooping vlan v_range report-flooding switch-port INTERFACE
no ip igmp snooping vlan v_range report-flooding switch-port INTERFACE
default ip igmp snooping vlan v_range report-flooding switch-port INTERFACE
```

Parameters
- `v_range` VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- `INTERFACE` Membership report message forwarding is enabled on these ports:
  - ethernet `e_range` where `e_range` is the number, range, or list of ethernet ports
  - port-channel `p_range` where `p_range` is the number, range, or list of channel ports

Related Commands
- `ip igmp snooping report-flooding` globally enables L2 report flooding.
- `ip igmp snooping vlan report-flooding switch-port` specifies a port list for a VLAN range.
- `ip igmp snooping report-flooding switch-port` specifies a port list for all VLANs.

Example
- These commands globally enable L2 report flooding, enable flooding on VLANs 201 through 205, and specify Ethernet ports 8-10 as the report flooding port list for VLANS 201-205.

```
switch(config)#ip igmp snooping report-flooding
switch(config)#ip igmp snooping vlan 201-205 report-flooding
switch(config)#ip igmp snooping vlan 201-205 report-flooding switch-port ethernet 8-10
switch(config)#
```
The `ip igmp startup-query-count` command specifies the number of query messages that an interface sends during the startup interval defined by `ip igmp startup-query-interval`.

When an interface starts running IGMP, it can establish the group state more quickly by sending query messages at a higher frequency. The `startup-query-interval` and `startup-query-count` parameters define the startup period and the query message transmission frequency during that period.

The `no ip igmp startup-query-count` and `default ip igmp startup-query-count` commands restore the default `startup-query-count` value of 2 for the configuration mode interface by removing the corresponding `ip igmp startup-query-count` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `ip igmp startup-query-count number`
- `no ip igmp startup-query-count`
- `default ip igmp startup-query-count`

**Parameters**
- `number` quantity of queries. Values range from 1 to 65535. Default is 2.

**Example**
- This command configures the startup query count of 10 for VLAN interface 4.

```
switch(config)#interface vlan 4
switch(config-if-Vl4)#ip igmp startup-query-count 10
switch(config-if-Vl4)#
```
ip igmp startup-query-interval

The ip igmp startup-query-interval command specifies the configuration mode interface’s IGMP startup period, during which query messages are sent at an accelerated rate.

When an interface starts running IGMP, it can establish the group state quicker by sending query messages at a higher frequency. The startup-query-interval and startup-query-count parameters define the startup period and the query message transmission frequency during that period.

The no ip igmp startup-query-interval and default ip igmp startup-query-interval commands restore the configuration mode interface’s default IGMP startup-query-interval of 31 seconds by removing the corresponding ip igmp startup-query-interval command from running-config.

Command Mode
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

Command Syntax
```
ip igmp startup-query-interval period
no ip igmp startup-query-interval
default ip igmp startup-query-interval
```

Parameters
- **period** startup query interval, in deciseconds. Value ranges from 10 (one second) to 317440 (8 hours, 49 minutes, 4 seconds). Default is 31 seconds.

Example
- This command configures the startup query count of one minute for VLAN interface 4.
  ```
switch(config)#interface vlan 4
switch(config-if-Vl4)#ip igmp startup-query-interval 600
switch(config-if-Vl4)#
```
**ip igmp static-group**

The `ip igmp static-group` command configures the configuration mode interface as a static member of a specified multicast group. This allows the router to forward multicast group packets through the interface without otherwise appearing or acting as a group member. By default, static group memberships are not configured on any interfaces.

If the command includes a source address, only multicast group messages received from the specified host address are fast-switched. Otherwise, all multicast messages of the specified group are fast-switched.

**Note**

To become a static member of a multicast group, the switch must be the PIM designated router (DR) for the network. If it is not, you can use the `pim ipv4 dr-priority` command to make it the DR by configuring its PIM DR value to be the highest on the network.

The `no ip igmp static-group` and `default ip igmp static-group` commands remove the configuration mode interface’s group membership by removing the corresponding `ip igmp static-group` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ip igmp static-group group_address [SOURCE_ADDRESS]
no ip igmp static-group group_address [SOURCE_ADDRESS]
default ip igmp static-group group_address [SOURCE_ADDRESS]
```

**Parameters**

- `group_address` IPv4 address of multicast group for which the interface fast-switches packets.
- `SOURCE_ADDRESS` IP address of host that originates multicast data packets.
  - `<no parameter>` all multicast messages of the specified group are fast-switched.
  - `ipv4_address` source IP address (dotted decimal notation).

**Related Commands**

- `ip igmp static-group acl` configures the configuration mode interface as a static member of the multicast groups specified by an IP access control list (ACL).
- `ip igmp static-group range` configures the configuration mode interface as a static member of multicast groups specified by an address range.

One `ip igmp static-group range` command is equivalent to multiple `ip igmp static-group` commands.

**Example**

These commands configure VLAN interface 15 as the PIM designated router, then configure it as a static member of the multicast group at address 231.1.1.15 for multicast data packets that originate at 10.1.1.1.

```
switch(config)#interface vlan 15
switch(config-if-Vl15)#pim ipv4 dr-priority 5000
switch(config-if-Vl15)#ip igmp static-group 231.1.1.45 10.1.1.1
switch(config-if-Vl15)#
```
ip igmp static-group acl

The `ip igmp static-group acl` command configures the configuration mode interface as a static member of the multicast groups specified by an IP access control list (ACL). This command is a variant of the `ip igmp static-group` command that uses ACL rules to specify a set of source-multicast group address pairs instead of specifying a single pair. Multiple static-group ACLs can be assigned to an interface. Static groups can be assigned manually and through ACLs simultaneously.

Access control lists that this command references must contain rules of the following format.

- `permit <protocol><source><destination>`, where
  - `<protocol>` has no effect on the static group.
  - `<source>` address of host originating multicast data packets. Must be a host address.
  - `<destination>` multicast group IP address or subnet. Must be a valid multicast address.

An ACL can contain multiple rules. An ACL can be applied to an interface only when all of its rules comply to the specified restrictions. The `show ip igmp static-groups acl` displays the source-multicast group pairs that the specified list configures and lists issues with illegal rules.

The `no ip igmp static-group acl` and `default ip igmp static-group acl` commands remove the specified static group ACL command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ip igmp static-group acl  list_name
no ip igmp static-group acl  list_name
default ip igmp static-group acl  list_name
```

**Parameters**

- `list_name` ACL that specifies multicast group addresses for which interface fast-switches packets.

**Example**

- This command configures VLAN interface 4 as a static member of the multicast group specified by the ACL named `LIST_1`.
  
  ```
  switch(config)#interface vlan 4
  switch(config-if-Vl4)#ip igmp static-group acl LIST_1
  switch(config-if-Vl4)#
  ```
**ip igmp static-group range**

The `ip igmp static-group range` command configures the configuration mode interface as a static member of multicast groups specified by an address range. This allows the router to forward multicast group packets through the interface without otherwise appearing or acting as a group member. By default, no static group memberships are configured on interfaces.

This command is a variant of the `ip igmp static-group` command that allows the assignment of a subnet range of source addresses or a subnet range of multicast groups. A single `ip igmp static-group range` command is the equivalent of multiple `ip igmp static-group` commands, each of which can only assign a single multigroup-source pair to an interface. Running-config converts the range command to the equivalent list of `ip igmp static-group` commands.

If the command includes a source address range, only multicast group messages received from the range are fast-switched. Otherwise, all multicast messages of the specified group are fast-switched.

The `no ip igmp static-group range` and `default ip igmp static-group range` commands remove the specified range of static group statements from `running-config`. The `no ip igmp static-group` and `default ip igmp static-group` commands can remove an individual static-group command that was initially added to `running-config` by an `ip igmp static-group range` command.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
```
  ip igmp static-group range GROUP_ADDR [SOURCE_ADDR]
  no ip igmp static-group range GROUP_ADDR [SOURCE_ADDR]
  default ip igmp static-group range GROUP_ADDR [SOURCE_ADDR]
```

**Parameters**
- `GROUP_ADDR` address of multicast group for which the interface fast-switches packets.
  - `gp_ipv4_addr` multicast group IPv4 address.
  - `gp_ipv4_subnet` IPv4 subnet address of multicast groups (CIDR or address-mask).
- `SOURCE_ADDR` IP address of a host range that originates multicast data packets.
  - `<no parameter>` all multicast messages of the specified range are fast-switched.
  - `source sr_ipv4_address` source IPv4 address (dotted decimal notation).
  - `source sr_ipv4_subnet` IPv4 subnet address of source hosts (CIDR or address-mask).

**Warning**
A command cannot specify a subnet address for both multicast group and source.

**Examples**
- This command configures VLAN interface 4 as a static member of the multicast group range 241.1.4.1/24 for data packets that originate at 10.1.1.1.
  ```
  switch(config)#interface vlan 4
  switch(config-if-Vl4)#ip igmp static-group range 239.1.4.1/24 source 10.1.1.1
  switch(config-if-Vl4)#
  ```
• This command attempts to configure VLAN interface 4 as a static member of the multicast group range 241.1.4.1/24 for data packets that originate at the 10.1.1.1/29 subnet. Because the range and source cannot both be subnets, this command generates an error message.

```
switch(config-if-Vl4)#ip igmp static-group range 239.1.1.1/29 source 16.1.1.1/29
% Error: cannot specify source range with group range
switch(config-if-Vl4)#
```
**ip igmp version**

The `ip igmp version` command configures the Internet Group Management Protocol (IGMP) version on the configuration mode interface. Version 3 is the default IGMP version.

IGMP is enabled by the `pim ipv4 sparse-mode` or `pim ipv4 bidirectional` command. The `ig igmp version` command does not affect the IGMP enabled status.

The `no ip igmp version` and `default ip igmp version` commands restore the configuration mode interface to IGMP version 3 by removing the `ip igmp version` statement from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ip igmp version version_number
no ip igmp version
default ip igmp version
```

**Parameters**

- `version_number` IGMP version number. Value ranges from 1 to 3.

**Example**

- This command configures IGMP version 3 on VLAN interface 4.
  
  ```
  switch(config)#interface vlan 4
  switch(config-if-Vl4)#ip igmp version 3
  switch(config-if-Vl4)#
  ```
**permit / deny**

The `permit` command configures the configuration mode IGMP profile as a permit list. Applying a permit list to an interface restricts that interface from joining any multicast group not included in the list.

IGMP profiles are deny lists by default. When applied to an interface, a deny list allows the interface to join any multicast group that is not included in the list.

The `deny` command restores the IGMP list to its default type by removing the corresponding `permit` statement from `running-config`.

The `range` command adds and removes address ranges from the configuration mode profile.

**Command Mode**
- IGMP-profile Configuration

**Command Syntax**

- `permit`
- `deny`

**Related Commands**

- `ip igmp profile` places the switch in IGMP-profile configuration mode.

**Example**

- These commands enter IGMP profile configuration mode and configure the profile as a permit list.

```
switch(config)#ip igmp profile list_1
switch(config-igmp-profile-list_1)#permit
switch(config-igmp-profile-list_1)#
```
range

The `range` command specifies an address range for the configuration mode IGMP profile. A permit range specifies the groups that an interface is permitted to join. A deny range specifies the groups that an interface is not permitted to join. The `permit / deny` command specifies the range type.

A profile may contain multiple range statements to define a discontiguous address range.

The `no range` and `default range` commands remove the specified address range from a previous specified list.

**Command Mode**
IGMP-profile Configuration

**Command Syntax**

- `range init_address [UPPER_RANGE]`
- `no range init_address [UPPER_RANGE]`
- `default range init_address [UPPER_RANGE]`

**Parameters**

- `init_address` IP address of lower boundary of the address range (dotted decimal notation).

- `UPPER_RANGE` sets the upper boundary of the address range. Options include:
  - `<no parameter>` upper boundary is equal to lower boundary: range consists of one address.
  - `range_address` IP address of upper boundary.

All addresses must be multicast addresses (10.0.0.0 to 239.255.255.255).

**Related Commands**

- `ip igmp profile` places the switch in IGMP-profile configuration mode.

**Example**

- These commands enter IGMP profile configuration mode, configure the profile as a permit list, and define the permit address list of 232.1.1.0 to 232.1.1.255 and 233.1.1.10.

```plaintext
switch(config)#ip igmp profile list_1
switch(config-igmp-profile-list_1)#permit
switch(config-igmp-profile-list_1)#232.1.1.0 232.1.1.255
switch(config-igmp-profile-list_1)#233.1.1.10
switch(config-igmp-profile-list_1)#ip igmp profile
```
show igmp snooping querier

The **show igmp snooping querier** command displays snooping querier configuration and status information. Command provides options to only include specific VLANs.

**Command Mode**

EXEC

**Command Syntax**

```plaintext
show igmp snooping querier [STATUS][VLAN_ID][DATA]
```

**Parameters**

- **STATUS** specifies the type of information displayed. Options include:
  - `<no parameter>` querier IP address, port, and IGMP version.
  - `status` querier configuration parameters.
- **VLAN_ID** specifies VLANs for which command displays information. Options include:
  - `<no parameter>` all VLANs.
  - `vlan v_num` specified VLAN.
- **DATA** specifies the type of information displayed. Options include:
  - `<no parameter>` displays VLAN number and port-list for each group.
  - `detail` displays port-specific data for each group; includes transmission times and expiration.

**Example**

- This command displays the querier IP address, version, and port servicing each VLAN.

```
switch>show igmp snooping querier
  Vlan | IP Address | Version | Port
  ------+------------+---------+-----
  1    | 172.17.0.37| v2      | Po1
  20   | 172.17.20.1| v2      | Po1
  26   | 172.17.26.1| v2      | Cpu
  2028 | 172.17.255.29| v2    | Po1
switch>
```

- This command displays the querier configuration parameters for each VLAN.

```
switch>show igmp snooping querier status
  Global IGMP Querier status
  ------------------------------------
  admin state : Enabled
  source IP address : 0.0.0.0
  query-interval (sec) : 125.0
  max-response-time (sec) : 10.0
  querier timeout (sec) : 130.0

  Vlan | Admin State | IP Address | Query Interval | Response Time | Queryer Timeout | Operational State
  ------+-------------+------------+----------------+---------------+-------------------+-------------------
  1    | Enabled     | 0.0.0.0    | 125.0          | 10.0          | 130.0             | Non-Querier
  4    | Enabled     | 0.0.0.0    | 125.0          | 10.0          | 130.0             | Non-Querier
  20   | Enabled     | 0.0.0.0    | 125.0          | 10.0          | 130.0             | Non-Querier
  22   | Enabled     | 0.0.0.0    | 125.0          | 10.0          | 130.0             | Non-Querier

```
show igmp snooping querier counters

The `show igmp snooping querier counters` command displays the counters from the querier, as learned through Internet Group Management Protocol (IGMP).

**Command Mode**
- EXEC

**Command Syntax**
```
show igmp snooping querier counters [VLAN_ID]
```

**Parameters**
- `VLAN_ID` specifies VLANs for which command displays information. Options include:
  - `<no parameter>` displays information for all VLANs.
  - `vlan v_num` displays information for specified VLAN.

**Example**
- This command displays the counters from the querier.

```
switch>show igmp snooping querier counters
-------------------------------------------------------------
Vlan: 1   IP Addr: 100.0.0.1       Op State: Querier     Version: v3

Other Packets             :0
switch>
```
show igmp snooping querier membership

The **show igmp snooping querier membership** command displays the membership from the querier, as learned through Internet Group Management Protocol (IGMP).

**Command Mode**

EXEC

**Command Syntax**

```
show igmp snooping querier membership [VLAN_ID [GROUP_LIST]]
```

**Parameters**

- **VLAN_ID** specifies VLANs for which command displays information. Options include:
  - `<no parameter>` displays information for all VLANs.
  - `vlan v_num` displays information for specified VLAN.
- **GROUP_LIST** list of groups for which the command displays information. Options include:
  - `<no parameter>` all multicast groups within specified VLAN.
  - `group ipv4_addr` single multicast group address (dotted decimal notation).

**Example**

- This command displays the membership from the querier for VLAN 1.

  switch>show igmp snooping querier membership
  ____________________________________________________________
  Vlan: 1 Elected: 10.0.0.1 QQI: 125 QRV: 2 QRI: 10 GMI: 260

  switch>
**show ip igmp groups**

The `show ip igmp groups` command displays multicast groups that have receivers directly connected to the switch, as learned through Internet Group Management Protocol (IGMP).

- `show ip igmp groups all` multicast groups.
- `show ip igmp groups group_addr` listed multicast group.
- `show ip igmp groups interface int_name` all multicast groups on specified interfaces
- `show ip igmp groups group_addr interface int_name` listed multicast group on specified interface.

**Command Mode**

EXEC

**Command Syntax**

```
show ip igmp groups GROUP_LIST [DATA]
```

**Parameters**

- `GROUP_LIST` list of groups for which the command displays information. Options include:
  - `<no parameter>` all multicast groups.
  - `group_addr` single multicast group address (dotted decimal notation).
  - `interface ethernet e_num` all multicast groups on specified Ethernet interface.
  - `interface loopback l_num` all multicast groups on specified Loopback interface.
  - `interface management m_num` all multicast groups on specified Management interface.
  - `interface port-channel p_num` all multicast groups on specified Port-Channel Interface.
  - `interface vlan v_num` all multicast groups on specified VLAN interface.
  - `interface vxlan vx_num` all multicast groups on specified VXLAN interface.
- `DATA` specifies the type of information displayed. Options include:
  - `<no parameter>` provides uptime, expiration, and address of reporter.
  - `detail` also include group mode and group source list.

**Example**

- This command displays multicast groups with receivers directly connected to the switch.

  ```
  switch>show ip igmp groups
  NOTE: static-group information not shown below. Use the
  'show ip igmp static-groups' command.
  IGMP Connected Group Membership
  Group Address  Interface     Uptime    Expires   Last Reporter

  switch>
  ```
**show ip igmp groups count**

The `show ip igmp groups count` command displays the number of multicast groups that are joined across the specified interfaces.

**Command Mode**

EXEC

**Command Syntax**

```
show ip igmp groups [GROUP_LIST] count
```

**Parameters**

- `INTERF` Specifies the interface for which the command displays information. Options include:
  - `<no parameter>` all IGMP interfaces.
  - `interface ethernet e_num` Ethernet interface.
  - `interface loopback l_num` Loopback interface.
  - `interface management m_num` Management interface.
  - `interface port-channel p_num` Port-Channel Interface.
  - `interface vlan v_num` VLAN interface.
  - `interface vxlan vx_num` VXLAN interface.

**Example**

- This command displays the number of multicast groups joined across all interfaces.
  ```
  switch>show ip igmp groups count
  Number of total groups joined across all IGMP interfaces: 5
  switch>
  ```

- This command displays the number of multicast groups joined on Ethernet 3/4 interface.
  ```
  switch>show ip igmp groups interface ethernet 3/4 count
  Number of groups joined on Ethernet3/4: 2
  switch>
  ```
show ip igmp host-proxy config-sanity

The `show ip igmp host-proxy config-sanity` command displays diagnostic information about an IGMP host proxy configuration.

**Command Mode**

EXEC

**Command Syntax**

`show ip igmp host-proxy config-sanity`

**Example**

- This command displays IGMP host proxy configuration diagnostic information.
  
  `switch>show ip igmp host-proxy config-sanity`
  
  Below are hints of potential IGMP Host-Proxy misconfigurations:
  
  IGMP host-proxy configured on interface Test3:
  
  Access-lists having "deny ip any any" rule:
  
  acl1
  
  acl2
  
  Groups with overlapping permit and deny configurations:
  
  192.168.1.1/32
  
  192.168.2.2/32
  
  192.168.4.4/32
  
  Groups with source filters configured with IGMP Host-Proxy set to version 2:
  
  192.168.2.2/32
  
  192.168.3.0/24
  
  192.168.3.3/32
  
  192.168.8.8/32
  
  `switch>`
**show ip igmp host-proxy interface**

The `show ip igmp host-proxy interface` command displays per-interface IGMP host-proxy configuration information, including the IGMP groups joined on the interface. Command filters allow the list to display only data for a specified interface and to include packet counter statistics in the display.

**Command Mode**

EXEC

**Command Syntax**

```
show ip igmp host-proxy interface [interface] [detail]
```

**Parameters**

- `interface` optional parameter to limit the display to a single interface. Omitting the parameter displays host-proxy configuration information for all interfaces on which IGMP host-proxy is configured. Options include:
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `port-channel p_num` port-channel Interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
- `detail` use this optional keyword to include packet counter statistics in the display.

**Examples**

- This command displays host-proxy information for all switch interfaces on which IGMP host-proxy is configured.

  ```
  switch>show ip igmp host-proxy interface
  IGMP host-proxy configured on: Test2
  IGMP host-proxy version: 3
  Unsolicited-report interval: 1.0
  Device name: Test2
  Interface     Group Address     IncludeSrc        ExcludeSrc
  Test2         172.16.89.0
  Test2         172.16.0.0        20.0.0.0
  Test2         172.16.0.0        10.0.0.0
  Test2         192.168.110.0                     20.0.0.0
  ```
• This command displays host-proxy information for all switch interfaces on which IGMP host-proxy is configured, plus host-proxy statistics.

```
switch>show ip igmp host-proxy interface detail
IGMP host-proxy configured on: Test2
IGMP host-proxy version: 3
Unsolicited-report interval: 1.0
Device name: Test2
Interface     Group Address     IncludeSrc        ExcludeSrc
Test2        172.16.89.0
Test2        172.16.0.0        20.0.0.0
Test2        172.16.0.0        10.0.0.0
Test2        192.168.110.0                       20.0.0.0

IGMP host-proxy statistics:
IGMP v1 Queries received: 0
IGMP v2 General-Queries received: 0
IGMP v2 Group-Queries received: 0
IGMP v3 General-Queries received: 0
IGMP v3 Group-Queries received: 0
IGMP v3 Group-Source Queries received: 0
IGMP v1 Reports sent: 0
IGMP v2 Reports sent: 0
IGMP v3 Reports sent: 1
```
show ip igmp interface

The **show ip igmp interface** command displays multicast information about the specified interface.

**Command Mode**
EXEC

**Command Syntax**
```
show ip igmp interface [INT_NAME]
```

**Parameters**
- **INT_NAME**  
  Interface type and number. Values include
  - <no parameter>  
    Displays information for all interfaces.
  - ethernet e_num  
    Ethernet interface specified by e_num.
  - loopback l_num  
    Loopback interface specified by l_num.
  - management m_num  
    Management interface specified by m_num.
  - port-channel p_num  
    Port-Channel Interface specified by p_num.
  - vlan v_num  
    VLAN interface specified by v_num.
  - vxlan vx_num  
    VXLAN interface specified by vx_num.

**Example**

- This command displays multicast related information about VLAN 26.
```
switch>show ip igmp interface vlan 26
Vlan26 is up
  Interface address: 172.17.26.1/23
  IGMP on this interface: enabled
  Multicast routing on this interface: enabled
  Multicast TTL threshold: 1
  Current IGMP router version: 2
  IGMP query interval: 125 seconds
  IGMP max query response time: 100 deciseconds
  Last member query response interval: 10 deciseconds
  Last member query response count: 2
  IGMP querier: 172.17.26.1
  Robustness: 2
  Require router alert: enabled
  Startup query interval: 312 deciseconds
  Startup query count: 2
  General query timer expiry: 00:00:22
  Multicast groups joined: 239.255.255.250

switch>
```
**show ip igmp profile**

The `show ip igmp profile` command displays the contents of the specified IGMP profile. IGMP snooping filters use an IGMP profile to control the multicast groups that an interface can join.

**Command Mode**

EXEC

**Command Syntax**

`show ip igmp profile [PROFILES]`

**Parameters**

- **PROFILES** IGMP profiles for which command displays contents. Options include:
  - `<no parameter>` displays all IGMP profiles.
  - `profile_name` displays specified profile.

**Example**

- This command displays the IGMP profiles configured on the switch.

```
switch>show ip igmp profile
IGMP Profile list_1
  permit
    range 229.1.24.0 229.1.25.255
IGMP Profile list_2
  deny
    range 234.1.1.0 234.1.255.255
switch>
```
**show ip igmp snooping**

The `show ip igmp snooping` command displays the switch's IGMP snooping configuration.

**Command Mode**

EXEC

**Command Syntax**

```
show ip igmp snooping [VLAN_ID]
```

**Parameters**

- `VLAN_ID` specifies VLANs for which command displays information. Options include:
  - `<no parameter>` displays information for all VLANs.
  - `vlan v_num` displays information for specified VLAN.

**Example**

- This command displays the switch’s IGMP snooping configuration.

  ```
  switch>show ip igmp snooping
  Global IGMP Snooping configuration:
  -------------------------------------------
  IGMP snooping                  : Enabled
  Robustness variable            : 2

  Vlan 1 :
  ---------
  IGMP snooping                  : Enabled
  Multicast router learning mode : pim-dvmrp

  Vlan 20 :
  ---------
  IGMP snooping                  : Enabled
  Multicast router learning mode : pim-dvmrp

  Vlan 26 :
  ---------
  IGMP snooping                  : Enabled
  Multicast router learning mode : pim-dvmrp

  Vlan 2028 :
  ---------
  IGMP snooping                  : Enabled
  Multicast router learning mode : pim-dvmrp
  ```

  switch>
show ip igmp snooping counters

The `show ip igmp snooping counters` command displays the number of IGMP messages sent and received through each switch port. The display table sorts the messages by type.

**Command Mode**

EXEC

**Command Syntax**

`show ip igmp snooping counters [DATA_TYPE][DATA_LEVEL]`

**Parameters**

- **DATA_TYPE** Information displayed by the command. Options include:
  - `<no parameter>` displays transmission counters.
  - `errors` displays error counters.

- **DATA_LEVEL** specifies the type of information displayed. Options include:
  - `<no parameter>` number of packets on physical ports.
  - `detail` number of packets on physical ports.

**Example**

This command displays the number of messages received on each port.

```
switch#show ip igmp snooping counters
```

show ip igmp snooping counters ethdev-pams

The `show ip igmp snooping counters` command displays the number of dropped IGMP packets messages sent and received through each switch port at the kernel level. The display table sorts the messages by type.

**Command Mode**
EXEC

**Command Syntax**
`show ip igmp snooping counters ethdev-pams`

**Example**

- This command displays the number of messages dropped at the kernel level.

  ```
  switch> show ip igmp snooping counters ethdev-pams
  IntfName   rxErrors   txErrors    txDrops
  et9          1          0          0

  et13          1          0          0
  switch>
  ```
show ip igmp snooping groups

The `show ip igmp snooping groups` command displays IGMP snooping statistics. Available information includes the physical ports that send and receive information, the time when multicast data was originally and most recently heard on the ports, and the version number of the IGMP messages. Command provides options that restrict the output to specific VLANs, ports, and groups.

**Command Mode**

EXEC

**Command Syntax**

```
show ip igmp snooping groups proxy [VLAN_ID] [PORT_INT] [GROUPS] [DATA]
```

**Parameters**

- **VLAN_ID** specifies VLAN for which command displays information. Options include:
  - `<no parameter>` displays information for all VLANs.
  - `vlan v_num` displays information for VLAN `v_num` (1 to 4094).

- **PORT_INT** specifies physical ports for which command displays information. Options include:
  - `<no parameter>` displays information for all physical ports.
  - `interface ethernet e_range`, where `e_range` is the number, range, or list of Ethernet ports.
  - `interface port-channel p_range`, where `p_range` is the number, range, or list of channel ports.

- **GROUPS** specifies the multicast groups. Options include:
  - `<no parameter>` all multicast groups on all specified ports.
  - `mgroup_address` multicast group specified by IPv4 address (dotted decimal notation).
  - `dynamic` multicast groups learned through IGMP.
  - `user` multicast groups manually added.

- **DATA** specifies the type of information displayed. Options include:
  - `<no parameter>` VLAN number and port-list for each group.
  - `detail` port-specific information for each group, including transmission times and expiration.
  - `proxy` displays IGMP snooping proxy information.

**Examples**

- This command displays the port lists for all multicast groups.

  ```
  switch>show ip igmp snooping groups
  Vlan Group     Type Version Port-List
  ---------------------------------------------------------------
  -             -     -     -

                  150.227.112.250
```
show ip igmp snooping groups count

The `show ip igmp snooping groups count` command displays the number of multicast groups on the switch. Command provides options to only include specific VLANs and ports.

**Command Mode**

EXEC

**Command Syntax**

```
show ip igmp snooping groups [VLAN_ID][PORT_INT] count [DATA]
```

**Parameters**

- **VLAN_ID** specifies VLAN for which command displays information. Options include:
  - `<no parameter>` all VLANs.
  - `vlan v_num` specified VLAN.
- **PORT_INT** specifies physical ports for which command displays information. Options include:
  - `<no parameter>` all physical ports.
  - `interface ethernet e_range` specified Ethernet ports.
  - `interface port-channel p_range` specified port channels.

Valid `e_range` and `p_range` formats include number, number range, or comma-delimited list of numbers and ranges.

- **DATA** specifies the type of information displayed. Options include:
  - `<no parameter>` number of multicast group on specified VLAN and ports.
  - `detail` number of multicast group on specified VLAN and ports.

**Example**

- This command displays the number of multicast groups on the switch.

  ```
  switch>show ip igmp snooping groups count
  Total number of multicast groups: 2
  switch>
  ```
**show ip igmp snooping mrouter**

The `show ip igmp snooping mrouter` command displays the status of dynamic and static multicast router ports. Command provides options to include only specific VLANs.

**Command Mode**

EXEC

**Command Syntax**

```
show ip igmp snooping mrouter [VLAN_ID] [DATA]
```

**Parameters**

- **VLAN_ID** specifies VLAN for which command displays information. Options include:
  - `<no parameter>` all VLANs.
  - `vlan v_num` specified VLAN.
- **DATA** specifies the type of information displayed. Options include:
  - `<no parameter>` displays VLAN number and port-list for each group.
  - `detail` displays port-specific data for each group; includes transmission times and expiration.

**Examples**

- This command displays port information of each multicast router on all VLANs.

```
switch>show ip igmp snooping mrouter
Vlan  Interface-ports
------------------------------------------------------------
1       Po1(dynamic)
20      Po1(dynamic)
26      Cpu(dynamic)
2028    Cpu(dynamic), Po1(dynamic)
switch>
```

- This command displays multicast router information for each port.

```
switch>show ip igmp snooping mrouter detail
Vlan  Intf  Address   FirstHeard  LastHeard  Expires  Type
-------------------------------------------------------------
1     Po1   172.17.0.37 31549:12   0:12       1:33   pim
20    Po1   172.17.20.1 7066:51   0:19       1:26   pim
26    Cpu   172.17.26.1 31549:16   0:28       1:17   pim
2028  Po1   172.17.255.29 31549:10  0:10       1:27   pim
2028  Cpu   172.17.255.30 31549:14  0:20       1:17   pim
switch>
```
show ip igmp snooping report-flooding

The `show ip igmp snooping report-flooding` command displays IGMP snooping L2 report flooding configuration and status information. Command provides options to only include specific VLANs.

**Command Mode**

EXEC

**Command Syntax**

`show ip igmp snooping report-flooding [VLAN_ID][DATA]

**Parameters**

- **VLAN_ID** specifies VLANs for which command displays information. Options include:
  - `<no parameter>` all VLANs.
  - `vlan v_num` specified VLAN.

- **DATA** specifies the type of information displayed. Options include:
  - `<no parameter>` displays VLAN number and port-list for each group.
  - `detail` displays port-specific data for each group; includes transmission times and expiration.
show ip igmp static-groups

The show ip igmp static-groups command displays information about all configured IGMP multicast static groups. IGMP multicast static groups are assigned with the ip igmp static-group command.

Command Mode

EXEC

Command Syntax

show ip igmp static-groups [INFO_LEVEL] [interface INT_NAME]

Parameters

- **INFO_LEVEL** specifies the type of information displayed. Options include
  - <no parameter> VLAN number and port-list for each group.
  - **detail** port-specific information for each group, including transmission times and expiration.
- **INT_NAME** Interface type and number. Values include
  - <no parameter> static groups on all interfaces.
  - **ethernet e_num** Ethernet interface specified by e_num.
  - **loopback l_num** Loopback interface specified by l_num.
  - **management m_num** Management interface specified by m_num.
  - **port-channel p_num** Port-Channel Interface specified by p_num.
  - **vlan v_num** VLAN interface specified by v_num.
  - **vxlan vx_num** VXLAN interface specified by vx_num.

Related Commands

- show ip igmp static-groups acl
- show ip igmp static-groups group

Examples

- This command displays information about all multicast static groups.
  switch>show ip igmp static-groups
  Interface Vlan281:
  Manually configured groups:
  Interface Port-Channel999:
  Manually configured groups:
  switch>

- This command displays information about the multicast static groups on VLAN interface 21.
  switch>show ip igmp static-groups interface vlan 21
  Interface Vlan281:
  Manually configured groups:
  switch>
show ip igmp static-groups acl

The `show ip igmp static-groups acl` command displays information about the IGMP multicast static groups that are configured by the specified access control list (ACL). The command also displays problems with an ACL that prevent its assignment to an interface.

**Command Mode**

EXEC

**Command Syntax**

`show ip igmp static-groups acl`

**Example**

The following `show ip igmp static-group acl` command example references these ACLs:

```plaintext
ip access-list 1
   10 permit igmp host 10.1.1.1 10.1.1.0/29
   20 permit igmp host 10.1.1.2 10.1.1.0/29
!
ip access-list 2
   10 permit igmp 10.1.1.0/29 host 10.1.1.1
!
ip access-list 3
   10 deny igmp host 10.1.1.1 255.1.1.0/29
!
ip access-list 4
   10 permit igmp host 10.1.1.1 10.1.1.0/29
   20 permit igmp 10.1.1.0/29 host 10.1.1.1
```

- This command displays static group configuration data about the various ACLs.

```plaintext
switch>show ip igmp static-group acl 1
acl 1
   ( 10.1.1.1, 10.1.1.0/29 )
   ( 10.1.1.2, 10.1.1.0/29 )
Interfaces using this ACL for static groups:
   Ethernet12
switch>show ip igmp static-group acl 2
acl 2
   Seq no 30: source address must be a single host or *, not a range
Interfaces using this ACL for static groups:
   Ethernet8
switch>show ip igmp static-group acl 3
acl 4
   Seq no 10: action must be 'permit'
Interfaces using this ACL for static groups:
   none
switch>show ip igmp static-group acl 4
acl 5
   ( 10.1.1.1, 10.1.1.0/29 )
   Seq no 20: source address must be a single host or *, not a range
Interfaces using this ACL for static groups:
   none
switch>
```
show ip igmp static-groups group

The `show ip igmp static-groups group` command displays information about all specified IGMP multicast static groups. IGMP multicast static groups are assigned with the `ip igmp static-group` command.

**Command Mode**

EXEC

**Command Syntax**

```
show ip igmp static-groups group [GROUP_LIST]
```

**Parameters**

- **GROUP LIST**  Groups for which command displays information
  - <no parameter>  all multicast groups.
  - `group_address`  single multicast group address (dotted decimal notation).

**Related Commands**

- `show ip igmp static-groups`
show ip igmp statistics

The `show ip igmp statistics` command displays IGMP transmission statistics for the specified interface.

**Command Mode**

EXEC

**Command Syntax**

```
show ip igmp statistics [INTERFACE_ID]
```

**Parameters**

- **INTERFACE_ID** Specifies interface for which command returns data. Options include:
  - <no parameter> all interfaces.
  - `interface ethernet e_num` Ethernet interface specified by `e_num`.
  - `interface loopback l_num` Loopback interface specified by `l_num`.
  - `interface management m_num` Management interface specified by `m_num`.
  - `interface port-channel p_num` Port-Channel Interface specified by `p_num`.
  - `interface vlan v_num` VLAN interface specified by `v_num`.
  - `interface vxlan vx_num` VXLAN interface specified by `vx_num`.

**Example**

- This command displays IGMP transmission statistics for ethernet 1 interface.

```
switch>show ip igmp statistics interface ethernet 1
IGMP counters for Ethernet1:
  V1 queries sent: 0
  V2 queries sent: 0
  V3 queries sent: 3
  Total general queries sent: 3
  V3 group specific queries sent: 0
  V3 group-source specific queries sent: 0
  V1 queries received: 0
  V2 queries received: 0
  V3 queries received: 0
  V1 reports received: 0
  V2 reports received: 0
  V3 reports received: 14
  V2 leaves received: 0
  Error Packets received: 0
  Other Packets received: 0
switch>
```
Protocol Independent Multicast

Protocol Independent Multicast (PIM) distributes multicast data using routes gathered by other protocols. Arista switches support two types of PIM: PIM Sparse Mode (PIM-SM) and Bidirectional PIM (Bidir-PIM).

These sections describe the Arista PIM implementation:

- Section 40.1: Introduction
- Section 40.2: Overview
- Section 40.3: Configuring PIM
- Section 40.4: Multicast Example
- Section 40.5: PIM Commands

40.1 Introduction

Protocol Independent Multicast (PIM) distributes multicast data using routes gathered by other protocols. PIM Sparse Mode (PIM-SM), defined in RFC 4601, is a multicast routing protocol intended for networks where multicast group recipients are sparsely distributed, including wide-area and inter-domain networks. Bidirectional PIM (Bidir-PIM), defined in RFC 5015, is a variant of PIM-SM designed for cases in which the receivers of multicast traffic are also sources and where scalability could affect optimization.

Arista switches support both PIM Sparse-Mode (PIM-SM) and Bidirectional PIM (Bidir-PIM).
Overview

PIM builds and maintains multicast routing trees using reverse path forwarding (RPF) on a unicast routing table. PIM is protocol-independent, and can use routing tables consisting of OSPF, BGP, RIP, and static routes. All sources send traffic to multicast groups through shared trees that have a common root node called the rendezvous point (RP).

PIM uses a multicast routing information base (MRIB) that is populated from the unicast table. The MRIB provides the next-hop router for each multicast destination subnet. This determines the next-hop neighbor for sending PIM join or prune messages.

40.2.1 PIM Sparse Mode

In PIM-SM, each host (sender or receiver) is associated with a designated router (DR) that acts for all directly connected hosts in PIM-SM transactions, and trees are unidirectional. Once sufficient traffic is flowing on a route it usually does not pass through the RP.

PIM-SM establishes multicast routes through three phases:

- Establishing the RP Tree
- Eliminating Encapsulation
- Establishing the Shortest Path Tree (SPT)

40.2.1.1 Establishing the RP Tree (Phase 1)

The RP tree is a distribution network that all sources share to deliver multicast data. The root of the RP tree is the Rendezvous Point.

The process starts when a receiver requests multicast data from a group (G). The receiver’s DR sends a PIM (*,G) Join message toward the multicast group’s RP. As the message travels towards the RP, it instantiates the multicast (*,G) state in each router on the path. Join messages converge on the RP to form the RP tree.

The DR resends Join messages periodically, while it has a receiver in the group, to prevent state timeout expiry in the routers along the path. When all receivers on a DR’s subnet leave a group, the DR sends a (*,G) Prune message towards the RP to remove the state from the routers.

A multicast sender transmits multicast data to the RP through its DR. The DR encapsulates the multicast packets and sends them as unicast packets. The RP extracts the native multicast packet and sends it to the RP tree towards the group members.

40.2.1.2 Eliminating Multicast Encapsulation (Phase 2)

Data encapsulation, while initially required before the multicast path is established, is inefficient because it requires the transmission of data that is extraneous to multicast. Phase 2 establishes states in the routers that support the transmission of native multicast packets.

When the RP receives an encapsulated packet from source S on group G, it sends an (S,G) join message toward the source. As the message travels towards S, it instantiates the (S,G) state on each router in the path which is used to forward packets from source S destined for group G. Data packets on the (S,G) path are also routed into the RP tree when they encounter an (*,G) router.

When the RP starts receiving native packets from the sources, it sends a Register-Stop message to the source’s DR, halting packet encapsulation. At this time, traffic flows natively from the source along a source-specific tree to the RP, then along the shared RP tree to the receivers.
40.2.1.3 Establishing the Shortest Path Tree (Phase 3)

The third phase establishes the shortest path from the multicast source to all receivers. When a multicast packet arrives at the receiver, its router (typically the DR) sends a Join message towards the source to instantiate the (S,G) state in all routers along its path. The message eventually reaches either the source's subnet or a router that already has an (S,G) state. This causes data to flow from the source to the receiver following the (S,G) path. At this time, the receiver is receiving data from the shortest path tree (SPT) and the RP tree (RPT).

The DR (or upstream router) eliminates the data transmission along the RPT by sending a prune message (S,G,rpt) towards the RP. The message instantiates the state on each router in the path, continuing until it reaches the RP or a router that needs traffic from the same source for other receivers.

40.2.2 Bidirectional PIM

Bidirectional PIM (Bidir-PIM) builds shared trees, rooted at the rendezvous point (RP), for each multicast group. Because the trees are based only on (*,G) routes, they can accommodate a much larger number of sources without overfilling the MFIB.

In Bidir-PIM, there is no multicast encapsulation or SPT establishment. All packets are natively forwarded toward the RP along shared, bidirectional trees. There are also no designated routers. Instead, a single designated forwarder (DF) is elected on each link to each RP, usually during the RP discovery process. The DF is the router with the shortest route to the RP based on the unicast routing table. It is responsible for forwarding upstream traffic towards the RP and forwarding downstream traffic toward the groups on its link. All routes pass through the RP, and multicast packets are sent from sources toward the RP and to receivers at each hop along the route.

Bidir-PIM elects DFs when a new RP is discovered, when the DF fails, or when there is a change that affects the topology of the link.

40.2.3 Rendezvous Points (RP)

In PIM-SM, an RP is a router that is configured as the root of multicast group’s distribution tree. These distribution trees are not source-specific. The RP is the destination for both join messages from receivers and data from senders, allowing receivers discover sender identity and begin receiving group traffic. In PIM-SM, paths through RP routers are temporary; when traffic volume reaches a sufficient level, the receiver joins a source-specific tree and the path through the RP is dropped. In Bidir-PIM, all paths pass through the RP, and all packets destined for a given multicast group are forwarded to the RP for that group.

RP addresses in Bidir-PIM must be routable from all sources in the domain, but do not have to correspond to any specific physical interface. Multiple groups can use the same RP for distribution.

The switch supports two methods of mapping RPs to multicast groups:

- Static: RPs are statically configured through a CLI statement.
- Dynamic: RPs are dynamically selected by a bootstrap router from a set of candidate RPs.

While dynamic RP mappings have priority over static maps by default, a static RP can be configured to override dynamic mappings.

Section 40.3.4 describes the configuration of rendezvous points.
40.3 Configuring PIM

This section describes the following configuration tasks:

- Section 40.3.1: Enabling PIM Sparse Mode
- Section 40.3.2: Enabling the S, G Expiry Timer Interval
- Section 40.3.3: Enabling PIM Bidirectional
- Section 40.3.4: Rendezvous Points (RPs)
- Section 40.3.5: Hello Messages
- Section 40.3.6: Hello Hold Time
- Section 40.3.7: Designated Router Election
- Section 40.3.8: Designated Forwarder Election
- Section 40.3.9: Join-Prune Messages
- Section 40.3.10: Legacy PIM Configuration in Global Configuration Mode
- Section 40.3.11: Configuring PIM in a Non-default VRF

40.3.1 Enabling PIM Sparse Mode

By default, PIM is disabled on an interface. The `pim ipv4 sparse-mode` command enables PIM Sparse Mode (PIM-SM) on the configuration mode interface. Enabling PIM on an interface enables IGMP on the interface as well.

**Example**

- This command enables PIM-SM and IGMP on VLAN interface 8.

  ```
  switch(config)#interface vlan 8
  switch(config-if-Vl8)#pim IPv4 sparse-mode
  switch(config-if-Vl8)#
  ```

40.3.2 Enabling the S, G Expiry Timer Interval

The `sg-expiry-timer` command enables expiry timer interval for the PIM-SM multicast routes. By default, the `sg-expiry-timer` command applies to the default VRF when the command is issued in the Router-Multicast Configuration mode. During the time of interval, there is no multicast traffic activity on the route.

**Example**

- This command configures 150 seconds as the (S,G) expiry timer interval is in the default VRF.

  ```
  switch(config)#router pim sparse-mode
  switch(config-router-pim-sparse)#ipv4
  switch(config-router-pim-sparse-ipv4)#sg-expiry-timer 150
  switch(config-router-pim-sparse-ipv4)#
  ```

40.3.3 Enabling PIM Bidirectional

By default, PIM is disabled on an interface. The `pim ipv4 bidirectional` command enables Bidirectional PIM (Bidir-PIM) on the configuration mode interface. Enabling PIM on an interface also enables IGMP on that interface.
Example

- These commands enable Bidir-PIM and IGMP on VLAN interface 9.

  ```
  switch(config)#interface vlan 9
  switch(config-if-Vl9)#pim ipv4 bidirectional
  switch(config-if-Vl9)#
  ```

40.3.4 Rendezvous Points (RPs)

The switch supports dynamic RPs, static RPs, and anycast RPs.

Configuring Static RPs

The `rp address` command configures a static RP, providing an option to override dynamic RPs.

Examples

- This command creates a static RP at 10.17.255.83 in the default VRF that maps to all multicast groups (224/4) and overrides dynamic RPs.

  ```
  switch(config)#router pim sparse-mode
  switch(config-router-pim-sparse)#ipv4
  switch(config-router-pim-sparse-ipv4)#rp address 10.17.255.83 override
  switch(config-router-pim-sparse-ipv4)#
  ```

- This command creates a static RP at 10.21.18.23 in the default VRF that maps to the multicast groups at 238.1.12.0/24.

  ```
  switch(config)#router pim sparse-mode
  switch(config-router-pim-sparse)#ipv4
  switch(config-router-pim-sparse-ipv4)#rp address 10.21.18.23 238.1.12.0/24
  switch(config-router-pim-sparse-ipv4)#
  ```

Configuring Dynamic RPs

Dynamic RP selection is implemented through a bootstrap router (BSR), which is a PIM router within the PIM domain that selects RPs from a list of candidates. A subset of PIM routers within the domain are configured as candidate bootstrap routers (C-BSRs). Through the exchange of bootstrap messages (BSMs), the C-BSRs elect the BSR, which then uses BSMs to inform all domain routers of its status.

The BSR holdtime defines the timeout period that an elected BSR remains valid after the receipt of a BSM and is also used in dynamic RP configuration. Holdtime is designated by the BSR router and communicated to other routers through BSMs.

Another subset of domain PIM routers are configured as candidate RPs (C-RPs). The BSR creates a set of qualifying RPs from the list of C-RPs, then distributes the group-to RP mapping set to all domain routers through BSMs. Each PIM router, after receiving this set, uses a standard algorithm defined in RFC 6226 to select one RP per multicast group.

The `candidate` command configures the switch as a candidate BSR router (C-BSR). Command parameters specify the switch’s BSR address, the interval between BSM transmissions, and the switch’s BSR priority rating. Priority ratings range from 0 to 255 with a default of 64. Higher numbers denote higher priority during BSR elections.
**Example**

- These commands configure the switch as a BSR candidate in the default VRF, using the IP address assigned to VLAN interface 24 as its BSR address. The BSM transmission interval is set to 30 seconds and the priority is set to 192.

```plaintext
switch(config)#router pim bsr
switch(config-router-pim-bsr)#ipv4
switch(config-router-pim-bsr-ipv4)#candidate vlan 24 priority 192 interval 30
```

The `holdtime` command specifies the value the switch inserts in the *holdtime* field of bootstrap messages (BSMs) that it sends. This value becomes the holdtime for the PIM domain if the switch is elected as the BSR.

**Example**

- These commands specify 75 seconds as the value that the switch inserts into BSM holdtime fields in the default VRF.

```plaintext
switch(config)#router pim bsr
switch(config-router-pim-bsr)#ipv4
switch(config-router-pim-bsr-ipv4)#holdtime 75
```

The `rp candidate` command configures the switch as a candidate rendezvous point (C-RP). The BSR selects a multicast group’s dynamic RP set from the list of C-RPs. Command parameters specify the switch’s RP address, C-RP advertisement interval, and priority rating. The priority rating is used by the BSR when selecting RPs. The C-RP advertisement interval specifies the period between successive C-RP advertisement message transmissions to the BSR.

**Running-config** may contain multiple `rp candidate` statements to support multiple multicast groups:

- All commands must specify the same interface. Issuing a command with an interface that differs from existing commands removes all existing commands from *running-config*.
- *Running-config* stores the `interval` setting in a separate statement that applies to all `rp candidate` statements. Commands that specify an interval that differs from the previously configured value place the new value in *running-config*. This new value applies to all `rp candidate` statements.

**Example**

- These commands configure a switch as a candidate RP for the multicast group 235.1.1.0/24, with a priority of 48 and a RP advertisement interval of 45 seconds, in the default VRF.

```plaintext
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#rp candidate vlan 24 235.1.1.0/24 priority 48 interval 45
```

By default, the switch transmits bootstrap router messages (BSMs) over all PIM-enabled interfaces. The `pim bsr ipv4 border` command prevents the switch from transmitting BSMs over the configuration mode interface.

**Example**

- This command prevents the switch from sending BSMs from VLAN interface 10.

```plaintext
switch(config)#interface vlan 10
switch(config-if-Vl10)#pim bsr ipv4 border
```
Anycast Rendezvous Points

A PIM anycast rendezvous point (anycast RP) defines a single RP address that exists on multiple devices. An anycast-RP set consists of the routers configured with the same anycast-RP address. An anycast RP provides redundancy protection and load balancing. The anycast-RP set supports all multicast groups.

The anycast-rp command configures the switch as a member of an anycast-RP set and establishes a communication link with another member of the set.

Example

- These commands configure a switch (IP address 10.1.1.14) into an anycast-RP set with an RP address of 10.17.255.2 in the default VRF. The anycast-RP set contains three other routers, located at 10.1.2.14, 10.1.3.14, and 10.1.4.14. It sets the number of unacknowledged register messages it sends to each router at 15.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#anycast-rp 10.17.255.2 10.1.1.14
register-count 15
switch(config-router-pim-sparse-ipv4)#anycast-rp 10.17.255.2 10.1.2.14
register-count 15
switch(config-router-pim-sparse-ipv4)#anycast-rp 10.17.255.2 10.1.3.14
register-count 15
switch(config-router-pim-sparse-ipv4)#anycast-rp 10.17.255.2 10.1.4.14
register-count 15
```

40.3.5 Hello Messages

PIM-SM multicast routers send PIM router query messages (hello messages) to elect a designated router (DR) for each subnet. The DR then sends registration messages to the RP.

The `pim ipv4 hello interval` command specifies the transmission interval between PIM hello messages originating from the specified VLAN interface.

Example

- This command configures 45 second intervals between hello messages originating from VLAN interface 4.

```
switch(config)#interface vlan 4
switch(config-if-Vl4)#pim ipv4 hello interval 45
```

40.3.6 Hello Hold Time

A PIM interface maintains a hold timer for each of its neighbors. The timer is reset whenever a hello message is received from the neighbor. When the timer expires, the neighbor is considered DOWN. The PIM interface can advertise its neighbor to use a higher hold time by modifying the hello interval, or by setting a higher hello count using the `pim ipv4 hello count` command. The hello count specifies how many hello messages can be missed before the neighbor is considered down; the hold time is therefore the hello interval multiplied by the hello count.
Example

- This command configures the PIM hold time on VLAN 2925 to 225 seconds (7.5 times the 30-second hello interval).

```markdown
switch(config)#interface vlan2925
switch(config-if-Vl2925)#ip pim query-count 7.5
```

- This command displays the hold time on VLAN 2925.

```markdown
switch#show ip pim interface vlan2925 details
Interface Vlan2925 address is 1.0.1.1
Vif number is 0
PIM: enabled
PIM version: 2, mode: sparse
PIM neighbor count: 0
PIM Effective DR: 1.0.1.1 (this system)
PIM Effective DR Priority: 1
PIM Effective Propagation Delay: 500 milliseconds
PIM Effective Override Interval: 2500 milliseconds
PIM Effective Tracking Support: disabled
PIM Hello Interval: 30 seconds
PIM Hello Hold Time: 225 seconds \(= 7.5 \times 30\)
PIM Hello Priority: 1 seconds
PIM Hello Lan Delay: 500 milliseconds
PIM Assert Override Interval: 3 seconds
switch#
```

40.3.7 Designated Router Election

PIM-SM uses these criteria for electing a designated router (DR):

- If at least one router does not advertise a DR priority value, then PIM-SM elects the router with the highest IP address as the DR.
- If all routers advertise a DR priority value, then PIM-SM elects the router with the highest DR priority value as the DR.

The `group-expiry-timer` command sets the DR priority value that the switch advertises. If `running-config` does not contain a `pim ipv4 dr-priority` statement, the switch does not advertise a DR priority value.

Examples

- This command configures a DR priority value of 15 on VLAN interface 4.

```markdown
switch(config-if-Vl4)#pim ipv4 dr-priority 15
switch(config-if-Vl4)#
```

- This command removes the DR priority from VLAN interface 4.

```markdown
switch(config-if-Vl4)#no pim ipv4 dr-priority
switch(config-if-Vl4)#
```

40.3.8 Designated Forwarder Election

Designated forwarders (DFs) are elected based on route metrics in the unicast routing table; there are no configuration options that affect the selection of DFs.
Join/prune messages are sent by the PIM-SM designated router (DR) or the Bidir-PIM designated forwarder (DF) toward the rendezvous point (RP). These messages inform other PIM routers about clients that want to become receivers (join) or stop being receivers (prune) for the groups.

The `pim ipv4 join-prune interval` command specifies the period between join/prune messages that the switch originates from the specified VLAN interface and sends to the upstream RPF neighbor.

**Example**

- This command configures 75 second intervals between join/prune messages originating from VLAN interface 4.

```
switch(config-if-Vl4)#pim ipv4 join-prune interval 75
```

### 40.3.10 Legacy PIM Configuration in Global Configuration Mode

Earlier versions of the EOS managed all non-interface-specific PIM configuration from Global Configuration Mode. Legacy configurations retain these global commands in `running-config` after upgrading to a newer version of the EOS, and the configurations are applied unchanged to the default VRF. PIM configuration commands entered in Global Configuration Mode which can be applied to either PIM-SM or Bidir-PIM will be applied to PIM-SM. If any commands are added to `running-config` using the new configuration modes, all legacy commands will be converted to the new modal commands and applied in the default VRF.

**Note**

Multicast configuration commands issued in Global Configuration Mode are now deprecated, and Arista recommends configuring all multicast parameters in the appropriate configuration mode (i.e., Router-Multicast Configuration, Router-PIM Sparse-mode Configuration, Router-PIM Bidirectional Configuration, Router-PIM BSR Configuration, or Router-MSDP Configuration).

### 40.3.11 Configuring PIM in a Non-default VRF

For PIM to function in a non-default VRF, the VRF must be created and configured for multicast traffic, and routed ports must be added to the VRF. Once this is accomplished, configure VRF-global PIM parameters by using the `vrf` command within a PIM configuration mode to place the switch in a PIM VRF configuration submode.

Interface-specific PIM parameters are configured in the interface-configuration mode for VRF-member interface.

Legacy multicast routing commands issued in Global Configuration Mode are applied to the default VRF, but are now deprecated and are available only for backward compatibility. If any PIM commands are issued in the new format, all legacy commands remaining in `running-config` will be replaced with their updated equivalents and applied to the default VRF.

#### 40.3.11.1 Preparing the VRF for PIM Configuration

The following steps prepare a non-default VRF to use PIM:

**Step 1** Enable unicast routing in the default VRF.

```
switch(config)#ip routing vrf default
```

**Step 2** Create the non-default VRF if not already created.

```
switch(config)#vrf instance purple
```
**Step 3**  Enable unicast routing on the new VRF.

```
switch(config-vrf-purple)#exit
switch(config)#ip routing vrf purple
```

**Step 4**  Add participating routed ports to the new VRF.

```
switch(config)#interface ethernet 9/2-9/4
switch(config-if-Et9/2-4)#no switchport
switch(config-if-Et9/2-4)#vrf purple
switch(config-if-Et9/2-4)#exit
```

**Step 5**  Enable multicast routing on the new VRF.

```
switch(config)#router multicast
switch(config-router-multicast)#vrf purple
switch(config-router-multicast-vrf-purple)#ip multicast routing
```

## 40.3.11.2 Configuring Global PIM Parameters in a Non-default VRF

Global PIM parameters for non-default VRFs are configured in the VRF submode of the appropriate PIM configuration mode.

### Examples

- These commands configure a switch as a candidate RP for the multicast group 235.1.1.0/24, with a priority of 48 and a RP advertisement interval of 45 seconds, in VRF “purple.”

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#vrf purple
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-vrf-purple-ipv4)#rp candidate vlan 24 235.1.1.0/24 priority 48 interval 45
switch(config-router-pim-sparse-vrf-purple-ipv4)#
```

## 40.3.11.3 Configuring Interface-specific PIM Parameters in a Non-default VRF

Interface-specific PIM parameters for member interfaces of a non-default VRF are configured just as they are for the default VRF: in the interface-configuration mode for the interface.
### 40.4 Multicast Example

This section provides an example network that implements multicast (PIM-SM) in the default VRF and includes the required commands.

#### 40.4.1 Diagram

Figure 40-1 displays the multicast network example. The network contains four routers. Multicast routing (PIM-SM) is enabled on two switches. One switch has its IGMP Snooping Querier enabled.

**Figure 40-1: Multicast Example**

The example multicast network implements these multicast parameters:

**Rendezvous Point Address:** 10.25.10.15

**Switch Clara**
- IGMP Snooping: disabled
- Subnet Summary:
  - 10.40.10.0/24: VLAN 11
  - 10.15.10.0/24: VLAN 12
  - 10.15.11.0/24: VLAN 13
  - 10.15.12.0/24: VLAN 14
  - 10.5.1.0/20: VLAN 10

**Switch Mateo**
- IGMP Snooping: disabled
- Subnet Summary:
  - 10.20.13.0/24: VLAN 18
  - 10.20.10.0/24: VLAN 15
  - 10.20.11.0/24: VLAN 16
• 10.20.12.0/24: VLAN 17
• 10.15.10.0/24: VLAN 12
• 10.15.11.0/24: VLAN 13
• 10.15.12.0/24: VLAN 14
• 10.25.10.12/30: VLAN 19
• 10.5.1.0/20: VLAN 10

Switch Allie
• IGMP Snooping: enabled
• Multicast Routing: enabled
• Querier: enabled
• Rendezvous Point Address: 10.25.10.15
• MFIB activity polling interval: 5 second

Subnet Summary:
• 10.30.13.0/24: VLAN 23
• 10.30.10.0/24: VLAN 20 – PIM-SM enabled
• 10.30.11.0/24: VLAN 21 – PIM-SM enabled
• 10.30.12.0/24: VLAN 22
• 10.25.10.12/30: VLAN 19
• 10.35.10.0/30: VLAN 24 – PIM-SM enabled
• 10.5.1.0/20: VLAN 10 – PIM-SM enabled

Switch Francis
• IGMP Snooping: enabled
• Multicast Routing: enabled

Subnet Summary:
• 10.40.10.0/24: VLAN 25 – PIM-SM enabled
• 10.35.10.0/30: VLAN 24 – PIM-SM enabled
• 10.5.1.0/20: VLAN 10
40.4.2 Example

This example configures PIM-SM.

Step 1 Configure the interface addresses

a Router Clara interfaces

Clara(config)#interface vlan 11
Clara(config-if-vl11)#ip address 10.40.10.1/24
Clara(config-if-vl11)#interface vlan 12
Clara(config-if-vl12)#ip address 10.15.10.42/24
Clara(config-if-vl12)#interface vlan 13
Clara(config-if-vl13)#ip address 10.15.11.21/24
Clara(config-if-vl13)#interface vlan 14
Clara(config-if-vl14)#ip address 10.15.12.50/24
Clara(config-if-vl14)#interface vlan 10
Clara(config-if-vl10)#ip address 10.5.1.33/20
Clara(config-if-vl10)#router ospf 1
Clara(config-router-ospf)#redistribute static

b Router Mateo interfaces

Mateo(config)#interface vlan 18
Mateo(config-if-vl18)#ip address 10.20.13.1/24
Mateo(config-if-vl18)#interface vlan 15
Mateo(config-if-vl15)#ip address 10.20.10.1/24
Mateo(config-if-vl15)#interface vlan 16
Mateo(config-if-vl16)#ip address 10.20.11.1/24
Mateo(config-if-vl16)#interface vlan 17
Mateo(config-if-vl17)#ip address 10.20.12.16/24
Mateo(config-if-vl17)#interface vlan 12
Mateo(config-if-vl12)#ip address 10.15.10.41/24
Mateo(config-if-vl12)#interface vlan 13
Mateo(config-if-vl13)#ip address 10.15.11.17/24
Mateo(config-if-vl13)#interface vlan 14
Mateo(config-if-vl14)#ip address 10.15.12.49/24
Mateo(config-if-vl14)#interface vlan 19
Mateo(config-if-vl19)#ip address 10.25.10.13/30
Mateo(config-if-vl19)#interface vlan 10
Mateo(config-if-vl10)#ip address 10.5.1.1/20
Mateo(config-if-vl10)#router ospf 1
Mateo(config-router-ospf)#redistribute static

c Router Allie interfaces

Allie(config)#interface vlan 23
Allie(config-if-vl23)#ip address 10.30.13.34/24
Allie(config-if-vl23)#interface vlan 20
Allie(config-if-vl20)#ip address 10.30.10.1/24
Allie(config-if-vl20)#interface vlan 21
Allie(config-if-vl21)#ip address 10.30.11.25/24
Allie(config-if-vl21)#interface vlan 22
Allie(config-if-vl22)#ip address 10.30.12.254/24
Allie(config-if-vl22)#interface vlan 19
Allie(config-if-vl19)#ip address 10.25.10.14/30
Allie(config-if-vl19)#interface vlan 24
Allie(config-if-vl24)#ip address 10.35.10.29/30
Allie(config-if-vl24)#interface vlan 10
Allie(config-if-vl10)#ip address 10.5.1.1/20
Allie(config-if-vl10)#router ospf 1
Allie(config-router-ospf)#redistribute static
**Multicast Example Chapter 40: Protocol Independent Multicast**

**d  Router Francis interfaces**

Francis(config)#interface vlan 25
Francis(config-if-vl25)#ip address 10.40.10.1/24
Francis(config-if-vl25)#interface vlan 24
Francis(config-if-vl24)#ip address 10.35.10.30/24
Francis(config-if-vl24)#interface vlan 10
Francis(config-if-vl10)#ip address 10.5.1.35/24
Francis(config-if-vl10)#router ospf 1
Francis(config-router-ospf)#redistribute static

**Step 2  Configure the interface multicast parameters**

**a  Router Allie interfaces**

Allie(config-router-ospf)#interface vlan 20
Allie(config-if-vl20)#pim ipv4 sparse-mode
Allie(config-if-vl20)#interface vlan 21
Allie(config-if-vl21)#pim ipv4 sparse-mode
Allie(config-if-vl21)#interface vlan 24
Allie(config-if-vl24)#pim ipv4 sparse-mode
Allie(config-if-vl24)#interface vlan 10
Allie(config-if-vl10)#pim ipv4 sparse-mode

**b  Router Francis interfaces**

Francis(config-router-ospf)#interface vlan 25
Francis(config-if-vl25)#pim ipv4 sparse-mode
Francis(config-if-vl25)#interface vlan 24
Francis(config-if-vl24)#pim ipv4 sparse-mode

**Step 3  Configure the router multicast parameters**

**a  Router Clara parameters**

Clara(config-router-ospf)#exit
Clara(config)#no ip igmp snooping

**b  Router Mateo router**

Mateo(config-router-ospf)#exit
Mateo(config)#no ip igmp snooping

**c  Router Allie router**

Allie(config-if-vl10)#exit
Allie(config)#router multicast
Allie(config-router-multicast)#ipv4
Allie(config-router-multicast-ipv4)#routing
Allie(config-router-multicast-ipv4)#activity polling-interval 5
Allie(config-router-multicast-ipv4)#router pim sparse-mode
Allie(config-router-pim-sparse-ipv4)#ipv4
Allie(config-router-pim-sparse-ipv4)#rp address 10.25.10.15

**d  Router Francis router**

Francis(config-if-vl24)#exit
Francis(config)#router multicast
Francis(config-router-multicast)#ipv4
Francis(config-router-multicast-ipv4)#routing
Francis(config-router-multicast-ipv4)#router pim sparse-mode
Francis(config-router-pim-sparse-ipv4)#ipv4
Francis(config-router-pim-sparse-ipv4)#rp address 10.25.10.15
40.5 **PIM Commands**

**PIM Configuration Commands (Global)**
- anycast-rp
- candidate
- fast-reroute
- group-expiry-timer
- holdtime
- ip pim dr-notify-delay
- log neighbors
- register local-interface
- router pim bidirectional
- router pim bsr
- router pim sparse-mode
- rp address
- rp allow
- rp candidate
- rp-candidate advertisement-filter
- rp hash algorithm modulo
- sg-expiry-timer
- spt threshold
- ssm range

**PIM Configuration Commands (Interface)**
- ipv4
- pim bsr ipv4 border
- pim ipv4 bidirectional
- pim ipv4 border-router
- pim ipv4 dr-priority
- pim ipv4 hello count
- pim ipv4 hello interval
- pim ipv4 join-prune count
- pim ipv4 join-prune interval
- pim ipv4 neighbor-filter
- pim ipv4 sparse-mode

**PIM Display Commands**
- show ip pim bsr
- show ip pim config-sanity
- show ip pim interface
- show ip pim neighbor
- show ip pim protocol counters
- show ip pim register-source
- show ip pim rp
- show ip pim rp-candidate
- show ip pim rp-hash
- show ip pim upstream joins
anycast-rp

The `anycast-rp` command configures the switch as a member of an anycast-RP set and establishes a communication link with another member of the set.

When the command is issued in Router-Multicast IPv4 Configuration Mode it applies to the default VRF; to use this command in a non-default VRF, issue it in Router-Multicast VRF IPv4 Configuration Mode.

The `no anycast-rp` and `default anycast-rp` commands remove the corresponding `anycast-rp` command from `running-config`. When the `no` and `default` commands do not include a peer address, all commands for the specified RP address are removed.

**Command Mode**
- Router-Multicast IPv4 Configuration
- Router-Multicast VRF IPv4 Configuration

**Command Syntax**
```
anycast-rp rp_addr peer_addr [REGISTER]
no anycast-rp rp_addr [peer_addr]
default anycast-rp rp_addr [peer_addr]
```

**Parameters**
- **rp_addr** Rendezvous point IP address (dotted decimal notation).
- **peer_addr** IP address of another anycast-RP set member (dotted decimal notation).
- **REGISTER** Number of unacknowledged register messages the switch sends to the peer router.
  - `<no parameter>` register count is set to default value of 10.
  - `register-count r_num` where `r_num` is an integer that ranges from 1 to 4294967295.
  - `register-count infinity`

**Example**
- These commands configure a switch (IP address 10.1.1.14) into an anycast-RP set with an RP address of 10.17.255.2 in the default VRF. The anycast-RP set contains three other routers, located at 10.1.2.14, 10.1.3.14, and 10.1.4.14. It sets the number of unacknowledged register messages it sends to each router at 15.
  ```
  switch(config)#router pim sparse-mode
  switch(config-router-pim-sparse)#ipv4
  switch(config-router-pim-sparse-ipv4)#anycast-rp 10.17.255.2 10.1.1.14
  register-count 15
  switch(config-router-pim-sparse-ipv4)#anycast-rp 10.17.255.2 10.1.2.14
  register-count 15
  switch(config-router-pim-sparse-ipv4)#anycast-rp 10.17.255.2 10.1.3.14
  register-count 15
  switch(config-router-pim-sparse-ipv4)#anycast-rp 10.17.255.2 10.1.4.14
  register-count 15
  ```
**pim ipv4 bidirectional**

The **pim ipv4 bidirectional** command enables PIM bidirectional and IGMP (router mode) on the configuration mode interface.

---

**Important!** PIM and multicast border router (MBR) must be mutually exclusive on an interface. If the interface is configured as an MBR, do not enable PIM on the interface.

---

The **no pim ipv4 bidirectional**, **no pim ipv4**, **default pim ipv4 bidirectional**, and **default pim ipv4** commands restore the default PIM and IGMP (router mode) settings of disabled on the configuration mode interface by removing the **pim ipv4 bidirectional** statement from running-config.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

- **pim ipv4 bidirectional**
- **no pim ipv4**
- **no pim ipv4 bidirectional**
- **default pim ipv4**
- **default pim ipv4 bidirectional**

**Example**

- This command enables PIM bidirectional on VLAN 4 interface.

```bash
switch(config)#interface vlan 4
switch(config-if-Vl4)#pim ipv4 bidirectional
switch(config-if-Vl4)#
```
**pim ipv4 border-router**

The `pim ipv4 border-router` command configures the configuration mode interface as a PIM multicast border router (MBR). A PIM MBR interface allows multicast traffic from sources that are outside of the PIM domain.

This command does not control the transmission or reception of PIM protocol packets by the interface. Sources learned through an MBR interface are treated as local sources (directly connected to the switch). The border-bit is set in all PIM register messages sent for these sources.

**Important!** Configuration as an MBR and configuration in PIM sparse mode must be mutually exclusive. Ensure that PIM sparse mode is not configured by issuing the `no pim ipv4 sparse-mode` command on the interface before issuing this command.

The `no pim ipv4 border-router` and `default pim ipv4 border-router` commands removes the PIM MBR configuration for the configuration mode interface by removing the corresponding `pim ipv4 border-router` statement from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

- `pim ipv4 border-router`
- `no pim ipv4 border-router`
- `default pim ipv4 border-router`

**Example**

- These commands configure VLAN interface 200 as a PIM MBR, then display its status.

```
switch(config)#interface vlan 200
switch(config-if-VL200)#ip address 10.44.2.1/24
switch(config-if-VL200)#no pim ipv4 sparse-mode
switch(config-if-VL200)#pim ipv4 border-router
switch(config-if-VL200)#show active
interface Vlan200
  ip address 10.44.2.1/24
  pim ipv4 border-router
switch(config-if-VL200)#exit
switch(config)#show ip pim interface
Address     Interface   Mode    Neighbor   Hello DR   DR
Address     PktsQed    PktsDropped
           Count       Intvl    Pri
10.44.2.1   Vlan200    mbr     0       30  1   10.44.2.1  0   0
switch(config)#
```

2720
**pim bsr ipv4 border**

The `pim bsr ipv4 border` command prevents the switch from sending bootstrap router messages (BSMs) over the configuration mode interface. By default, BSMs are transmitted over all PIM-enabled interfaces.

The `no pim bsr ipv4 border` and `default pim bsr ipv4 border` commands restore the transmission of BSMs over the configuration mode interface by removing the corresponding `pim bsr ipv4 border` statement from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `pim bsr ipv4 border`
- `no pim bsr ipv4 border`
- `default pim bsr ipv4 border`

**Example**
- This command prevents the switch from sending BSMs from VLAN interface 10.

```bash
switch(config)#interface vlan 10
switch(config-if-Vl10)#pim bsr ipv4 border
switch(config-if-Vl10)#
```
candidate

The *candidate* command configures the switch as a candidate BSR router (C-BSR). A BSR is a PIM router within the PIM domain through which dynamic RP selection is implemented. The BSR selects RPs from a list of candidate RPs and exchange bootstrap messages (BSM) with all routers in the domain. The BSR is elected from one of the C-BSRs through an exchange of BSMs.

A subset of PIM routers within the domain are configured as candidate bootstrap routers (C-BSRs). Through the exchange of bootstrap messages (BSMs), the C-BSRs elect the BSR, which then uses BSMs to inform all domain routers of its status.

Command parameters specify the switch’s BSR address, the interval between BSM transmissions, the length of the hash mask, and the priority assigned to the switch when electing a BSR.

Entering an *candidate* command replaces any previously configured *candidate* command. If the new command does not specify a priority, hash mask length, or interval, the previously configured values persist in *running-config*.

When the command is issued in Router-PIM BSR IPv4 Configuration Mode it applies to the default VRF; to use this command in a non-default VRF, issue it in Router-PIM BSR VRF IPv4 Configuration Mode for the appropriate VRF.

The *no candidate* and *default candidate* commands remove the corresponding *candidate* commands from *running-config*. The *no* and *default* commands restore the priority, hash mask length, and interval parameters to their default values.

**Command Mode**
- Router-PIM BSR IPv4 Configuration
- Router-PIM BSR VRF IPv4 Configuration

**Command Syntax**
```
candidate INTERFACE [HASHMASK_LENGTH] [INTERVAL_PERIOD] [PRIORITY_NUM]
no candidate [priority] [interval]
default candidate [priority] [interval]
```

**Parameters**
- **INTERFACE** Switch uses IP address of specified interface as its BSR address. Options include:
  - *ethernet e_num* Ethernet interface specified by *e_num*.
  - *loopback l_num* Loopback interface specified by *l_num*.
  - *management m_num* Management interface specified by *m_num*.
  - *port-channel p_num* Port-Channel Interface specified by *p_num*.
  - *vlan v_num* VLAN interface specified by *v_num*.
- **HASHMASK_LENGTH** Length (in bits) of the hash mask.
  - *<no parameter>* hash mask remains unchanged from previous setting.
  - *hashmask <0 - 32>* hash mask length (in bits). Default value is 30.
- **INTERVAL_PERIOD** Period between the transmission of BSMs (seconds). Default value is 60.
  - *<no parameter>* interval remains unchanged from previous setting.
  - *interval <10 - 536870906>* transmission interval in seconds.
- **PRIORITY_NUM** BSR election priority rating. Larger numbers denote higher priority. Default value is 64.
  - *<no parameter>* priority remains unchanged from previous setting.
  - *priority <0 - 255>* priority rating.
Example

- These commands configure the switch as a BSR candidate in the default VRF, using the IP address assigned to VLAN interface 24 as its BSR address. The BSM transmission interval is set to 30 seconds and the priority is set to 192.

```
switch(config)#router pim bsr
switch(config-router-pim-bsr)#ipv4
switch(config-router-pim-bsr-ipv4)#candidate vlan 24 priority 192 interval 30
switch(config-router-pim-bsr-ipv4)#
```
fast-reroute

The **fast-reroute** command enables Multicast only Fast Re-Route (MoFRR) to minimize traffic loss in a network when a link or node failure occurs. Traffic loss is minimized by allowing the traffic to flow from the secondary path upon the failure of the primary path.

The **no fast-reroute** and **default fast-reroute** commands disable MoFRR by removing the corresponding **fast-reroute** command from **running-config**.

**Command Mode**
- Router-PIM BSR IPv4 Configuration
- Router-PIM BSR VRF IPv4 Configuration

**Command Syntax**
- `fast-reroute acl_name`
- `no fast-reroute acl_name`
- `default fast-reroute acl_name`

**Parameters**
- **acl_name** standard access list name

**Examples**
- These commands enable fast reroute for ACL “acl2” in the default VRF under the IPv4 configuration.
  ```
  switch(config)#router pim sparse-mode
  switch(config-router-pim-sparse)#ipv4
  switch(config-router-pim-sparse-ipv4)#fast-reroute acl2
  switch(config-router-pim-sparse-ipv4)#
  ```
- These commands enable fast reroute for ACL “acl2” in VRF “red” under the IPv4 configuration.
  ```
  switch(config)#router pim sparse-mode
  switch(config-router-pim-sparse)#vrf red
  switch(config-router-pim-sparse-vrf-red)#ipv4
  switch(config-router-pim-sparse-vrf-red-ipv4)#fast-reroute acl2
  switch(config-router-pim-sparse-vrf-red-ipv4)#
  ```
holdtime

The `holdtime` command specifies the value the switch inserts in the `holdtime` parameter field in bootstrap messages (BSM) that it sends. The BSR holdtime defines the timeout period that an elected BSR remains valid after the receipt of a BSM and is also used in dynamic RP configuration. BSR holdtime is designated by the BSR router and communicated to other routers through BSMs.

When the command is issued in Router-PIM BSR IPv4 Configuration Mode it applies to the default VRF; to use this command in a non-default VRF, issue it in Router-PIM BSR VRF IPv4 Configuration Mode for the appropriate VRF.

The `no holdtime` and `default holdtime` commands restore the default holdtime parameter field insertion value of 130 seconds by removing the `holdtime` statement from `running-config`.

Command Mode

- Router-PIM BSR IPv4 Configuration
- Router-PIM BSR VRF IPv4 Configuration

Command Syntax

```
holdtime period
no holdtime
default holdtime
```

Parameters

- `period` BSR holdtime (seconds). Value ranges from 12 to 1073741823 (1.073 billion seconds, approximately 34 years). Default is 130.

Example

- These commands specify 75 seconds as the value that the switch inserts into BSM holdtime fields in the default VRF.

  ```
  switch(config)#router pim bsr
  switch(config-router-pim-bsr)#ipv4
  switch(config-router-pim-bsr-ipv4)#holdtime 75
  switch(config-router-pim-bsr-ipv4)#
  ```
**ip pim dr-notify-delay**

The `ip pim dr-notify-delay` command configures the designated router’s (DR) notification delay time. The command is more effective when all PIM routers on the LAN segment have PIM DR priority that is greater than 1.

When the command is issued in Router-Multicast Configuration Mode it applies to the default VRF; to use this command in a non-default VRF, issue it in Router-Multicast VRF Configuration Mode.

The `no ip pim dr-notify-delay` command removes the previously configured DR notification delay time.

**Command Mode**
- Router-Multicast Configuration
- Router-Multicast VRF Configuration

**Command Syntax**

```
ip pim dr-notify-delay notify_delay_time
no ip pim dr-notify-delay
```

**Parameters**
- `notify_delay_time` the PIM-designated router notify delay time in seconds. The value ranges from -32767 to 32768.

**Guidelines**

The notification delay time is configured with a positive or negative value. The timer influences DR election timing when a router with the highest DR priority on a LAN segment is reloaded. In an MLAG configuration, the notification delay time begins shortly after the MLAG reload delay expires (before which the PIM hello messages are sent with a priority of 1). In a non-MLAG configuration, the notification delay time begins as soon as the PIM is configured first on the interface.

Positive values for notify delay time cause the device to send PIM hello messages with a priority of 1 until the time the notify delay time expires. During this time, DR responsibilities of the device will continue according to configured DR priority. Negative values configured for the notification delay time will not modify the priority sent in PIM hello messages, but the device will not perform any DR responsibility until the notify delay time expires. Positive values are used to avoid loss of multicast packets, but they may create a few duplicate packets from multiple PIM routers forwarding traffic for the same S,G. Negative values are used to avoid duplicate packets, but they may cause packet loss when there are no PIM routers forwarding traffic for an S,G.

**Example**

- These commands configure a DR notification delay time of 2 seconds.

```
switch(config)#router multicast
switch(config-router-multicast)#ip pim dr-notify-delay 2
switch(config-router-multicast)#
```
**pim ipv4 dr-priority**

PIM-SM uses these criteria for electing a designated router (DR):

- If at least one router does not advertise a DR priority value, then PIM-SM elects the router with the highest IP address as the DR.
- If all routers advertise a DR priority value, then PIM-SM elects the router with the highest DR priority value as the DR.

The `pim ipv4 dr-priority` command sets the DR priority value that the configuration mode interface advertises. By default, the interface does not advertise a DR priority value.

The `no pim ipv4 dr-priority` and `default pim ipv4 dr-priority` commands force the use of IP addresses to elect the designated router by removing the corresponding `pim ipv4 dr-priority` statement from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

- `pim ipv4 dr-priority level`
- `no pim ipv4 dr-priority [level]`
- `default pim ipv4 dr-priority [level]`

**Parameters**

- `level` DR selection priority rating. Value ranges from 0 to 4294967295.

**Examples**

- This command configures the dr-priority value of 15 on VLAN interface 4.
  ```
  switch(config)#interface vlan 4
  switch(config-if-Vl4)#pim ipv4 dr-priority 15
  switch(config-if-Vl4)#
  ```

- This command force the use of IP addresses to elect the designated router.
  ```
  switch(config-if-Vl4)#no pim ipv4 dr-priority
  switch(config-if-Vl4)#
  ```
**group-expiry-timer**

The `group-expiry-timer` command sets the group-expiry-timer in seconds after which a group with no activity gets deleted from the PIM rendezvous point (RP) tree.

When the command is configured in Global Configuration Mode, the configuration is applied globally on the switch. To apply the configuration only in Bidir-PIM mode, the command is configured in Router-PIM Bidirectional Configuration Mode. To apply the configuration for a specific VRF, the command is configured in the VRF sub-mode of the Router-PIM Bidirectional Configuration Mode. Use the `router pim bidirectional` command to enter Router-PIM Bidirectional Configuration Mode.

The `no group-expiry-timer` and `default group-expiry-timer` applies the system default configuration and removes the corresponding `group-expiry-timer` command from `running-config`.

**Command Mode**
- Router-PIM Bidirectional IPv4 Configuration
- Router-PIM Bidirectional VRF IPv4 Configuration

**Command Syntax**

```
group-expiry-timer value
no group-expiry-timer value
default group-expiry-timer value
```

**Parameter**

`value` specifies the time in seconds after which a group with no activity expires from the PIM RP. Values range from 1 to 210. There is no default value.

**Examples**

- This command configures PIM expiry-timer of 40 seconds in PIM-bidirectional sub-mode.
  
  ```
  switch(config)#router pim bidirectional
  switch(config-router-pim-bidir)#ipv4
  switch(config-router-pim-bidir-ipv4)#group-expiry-timer 40
  ```

- This command configures PIM expiry-timer of 120 seconds for VRF v1.
  
  ```
  switch(config)#router pim bidirectional
  switch(config-router-pim-bidir)#vrf v1
  switch(config-router-pim-bidir-vrf-v1)#ipv4
  switch(config-router-pim-bidir-vrf-v1-ipv4)#group-expiry-timer 120
  ```
**pim ipv4 join-prune count**

The `pim ipv4 join-prune count` command configures the number of times a join or prune messages can be missed before the upstream neighbor time expires.

The join-prune interval multiplied by the count is considered as join or prune hold time (specified in seconds), which is used in the join or prune messages. It is recommended to use the default configuration for “pim ipv4 join-prune interval”, and modify the “pim ipv4 join-prune count” to increase the join or prune holdtime. Increasing the join-prune hold time delays the deletion of an S,G route on the upstream neighbor when join-prune messages are not sent to the neighbor. The maximum possible value for join or prune hold-time is 65535.

The `no pim ipv4 join-prune count` and `default pim ipv4 join-prune count` commands restore the default join or prune count for the configuration mode interface by removing the corresponding `pim ipv4 join-prune count` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-VLAN Configuration

**Command Syntax**
```
pim ipv4 join-prune count count_value
no pim ipv4 join-prune count count_value
default pim ipv4 join-prune count count_value
```

**Parameters**
- `count_value` The number of missed join or prune after which the route expires. Value ranges from 1.5 to 65535.

**Example**
- This command indicates the number of times a join or prune messages can be missed.

```
switch(config)# interface Ethernet 1/1
switch(config-if-Et1/1)# pim ipv4 join-prune count 5
switch(config-if-Et1/1)#
```
**pim ipv4 join-prune interval**

The `pim ipv4 join-prune interval` command specifies the period between join or prune messages that the configuration mode interface originates and sends to the upstream RPF neighbor.

The `no pim ipv4 join-prune interval` and `default pim ipv4 join-prune interval` commands restores the default join or prune interval to 60 seconds for the configuration mode interface by removing the corresponding `pim ipv4 join-prune interval` command from *running-config*.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
pim ipv4 join-prune interval [period]
no pim ipv4 join-prune interval [period]
default pim ipv4 join-prune interval [period]
```

**Parameters**
- **period** join or prune interval (seconds). Value ranges from 1 to 18724. Default is 60.

**Example**
- This command configures 75-second intervals between join or prune messages originating from VLAN interface 4.

```
switch(config)#interface vlan 4
switch(config-if-Vl4)#pim ipv4 join-prune interval 75
switch(config-if-Vl4)#
```
pim ipv4 hello count

The `pim ipv4 hello count` command sets the PIM hello count for the interface being configured. PIM hold time is calculated by multiplying the configured hello interval by the hello count, ensuring that the PIM neighbor stays up for the specified time after which the neighbor expires.

The `no pim ipv4 hello count` command removes the corresponding `pim ipv4 hello count` command from `running-config`.

Command Mode
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

Command Syntax
```
pim ipv4 hello count [multiple]
no pim ipv4 hello count [multiple]
```

Parameters
- `multiple` hello count multiplier. Value ranges from 1.5 to 65535. The hello hold time is the configured hello interval multiplied by the hello count.

Examples
- This command configures a hold time interval of 225 seconds on VLAN interface 2925 by multiplying the default 30-second hello interval by a hello count of 7.5.
  ```
  switch(config)#interface vlan2925
  switch(config-if-Vl2925)#pim ipv4 hello count 7.5
  switch(config-if-Vl2925)#
  ```
- This show command displays the hold time and other configuration details on VLAN 2925.
  ```
  switch(config)#show ip pim interface vlan2925 details
  Interface Vlan2925 address is 1.0.1.1
  Vif number is 0
  PIM: enabled
  PIM version: 2, mode: sparse
  PIM neighbor count: 0
  PIM Effective DR: 1.0.1.1 (this system)
  PIM Effective DR Priority: 1
  PIM Effective Propagation Delay: 500 milliseconds
  PIM Effective Override Interval: 2500 milliseconds
  PIM Effective Tracking Support: disabled
  PIM Hello Interval: 30 seconds
  PIM Hello Hold Time: 225 seconds <= New Hold Time (= 7.5 * 30)
  PIM Hello Priority: 1 seconds
  PIM Hello Lan Delay: 500 milliseconds
  PIM Assert Override Interval: 3 seconds
  ```
pim ipv4 sparse-mode

The `pim ipv4 sparse-mode` command enables PIM Sparse Mode (PIM-SM) and IGMP (router mode) on the configuration mode interface.

**Important!** PIM and multicast border router (MBR) must be mutually exclusive on an interface. If the interface is configured as an MBR, do not enable PIM on the interface.

The `no pim ipv4 sparse-mode`, `no pim ipv4`, `default pim ipv4 sparse-mode`, and `default pim ipv4` commands restore the default PIM and IGMP (router mode) settings of `disabled` on the configuration mode interface by removing the `pim ipv4 sparse-mode` statement from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `pim ipv4 sparse-mode`
- `no pim ipv4`
- `no pim ipv4 sparse-mode`
- `default pim ipv4`
- `default pim ipv4 sparse-mode`

**Example**
- This command enables PIM sparse mode on VLAN 4 interface.

```bash
switch(config)#interface vlan 4
switch(config-if-Vl4)#pim ipv4 sparse-mode
switch(config-if-Vl4)#
```
**rp address**

The `rp address` command configures the address of a Protocol Independent Multicast (PIM) static rendezvous point (RP) for a specified multicast subnet. If the command does not specify a subnet, the static RP maps to all multicast groups (224/4). Dynamic RPs override static RPs unless the static RP is given priority by using the `override` option of this command.

Multicast groups use RPs to connect sources and receivers. A PIM domain requires that all routers have consistently configured RP addresses.

The switch uses multiple `rp address` commands to configure multiple RPs or to assign multiple subnets to an RP. When the address of a multicast group falls within multicast subnets configured by multiple `rp address` commands, the group’s RP address is selected by comparing the commands’ multicast subnet size.

- Different size subnets: group uses command with the largest subnet.
- Same size subnets: group uses command as determined by hash algorithm.

When the command is issued in Router-Multicast Configuration Mode it applies to the default VRF; to use this command in a non-default VRF, issue it in Router-Multicast VRF Configuration Mode.

The `no rp address` and `default rp address` commands remove the corresponding `rp address` command from `running-config`.

**Command Mode**

Router-PIM Sparse-mode IPv4 Configuration
Router-PIM Sparse-mode VRF IPv4 Configuration

**Command Syntax**

```
rp address rp_addr [MULTICAST_SUBNET] [HASHMASK_LENGTH] [BSR_OVERRIDE] [PRIORITY_NUM]
no rp address rp_addr [MULTICAST_SUBNET]
default rp address rp_addr [MULTICAST_SUBNET]
```

**Parameters**

- `rp_addr` Rendezvous point IP address (dotted decimal notation).
- `MULTICAST_SUBNET` Multicast IP address space (CIDR or address-mask).
  - `<no parameter>` Default multicast group IP address of 224/4.
  - `gp_addr` Multicast group IP address (CIDR or address-mask).
  - `access-list acl_name` Standard access control list that specifies the multicast group address.
  - `acl_name` Standard access control list that specifies the multicast group address.
- `HASHMASK_LENGTH` Length (in bits) of the hash mask.
  - `<no parameter>` hash mask remains unchanged from previous setting.
  - `hashmask <0 - 32>` hash mask length (in bits). Default value is 30.
- `BSR_OVERRIDE` Configures priority relative to dynamic RPs selected by BSR.
  - `<no parameter>` Dynamic RPs have priority over specified RP.
  - `override` RP has priority over dynamic RPs.
- `PRIORITY_NUM` BSR election priority rating. Larger numbers denote higher priority. Default value is 0.
  - `<no parameter>` priority remains unchanged from previous setting.
  - `priority <0 - 255>` priority rating.
Example

- These commands configure 10.17.255.2 as a static RP for all multicast groups in the default VRF.

```text
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#rp address 10.17.255.2
switch(config-router-pim-sparse-ipv4)#
```
**rp allow**

The `rp allow` command accepts and allows PIM (*,G) join message with an RP address that is different from the configured RPs for that particular (*,G).

The `no rp allow` and `default rp allow` commands disable this behavior by removing the corresponding `rp allow` command from *running-config*.

**Command Mode**

- Router-PIM Sparse-mode IPv4 Configuration
- Router-PIM Sparse-mode VRF IPv4 Configuration

**Command Syntax**

```
rp allow
no rp allow
default rp allow
```

**Example**

- These commands configure the switch to accept PIM (*,G) join messages in the default VRF that include RP addresses not configured on the switch for that (*,G) route.

  ```
  switch(config-router-pim-sparse)# ipv4
  switch(config-router-pim-sparse-ipv4)# rp allow
  ```

- These commands configure the switch to accept PIM (*,G) join messages in VRF “blue” that include RP addresses not configured on the switch for that (*,G) route.

  ```
  switch(config-router-pim-sparse)# vrf blue
  switch(config-router-pim-sparse-vrf-blue)# ipv4
  switch(config-router-pim-sparse-vrf-blue-ipv4)# rp allow
  ```
**rp candidate**

The `rp candidate` command configures the switch as a candidate rendezvous point (C-RP). The BSR selects a multicast group's dynamic RP set from the list of C-RPs in the PIM domain. The command specifies the interface (used to derive the RP address), C-RP advertisement interval, and priority rating. The BSR selects the RP set by comparing C-RP priority ratings. The C-RP advertisement interval specifies the period between successive C-RP advertisement message transmissions to the BSR.

**Running-config** supports multiple multicast groups through multiple `rp candidate` statements:

- All commands must specify the same interface. Issuing a command with an interface that differs from existing commands removes all existing commands from `running-config`.
- `Running-config` stores the `interval` setting in a separate statement that applies to all `rp candidate` statements. When a command specifies an interval that differs from the previously configured value, the new value replaces the old value and applies to all configured `rp candidate` statements. The default `interval` value is 60 seconds.

When the command is issued in Router-Multicast Configuration Mode it applies to the default VRF; to use this command in a non-default VRF, issue it in Router-Multicast VRF Configuration Mode.

The `no rp candidate` and `default rp candidate` commands remove `rp candidate` from `running-config` for the specified group. When these commands do not specify a multicast group, all `rp candidate` statements are removed from `running-config`.

The `no rp candidate interval` and `default rp candidate interval` commands restore the interval setting to the default value of 60 seconds. The `no rp candidate priority` and `default rp candidate priority` commands restore the priority setting to the default value of 0.

**Command Mode**

- Router-PIM Sparse-mode IPv4 Configuration
- Router-PIM Sparse-mode VRF IPv4 Configuration
- Router-PIM Bidirectional IPv4 Configuration
- Router-PIM Bidirectional VRF IPv4 Configuration

**Command Syntax**

The `INTERFACE` parameter is always listed first. All other parameters can be placed in any order.

```
rp candidate INTERFACE [GROUP_ADDR] [PRIORITY_NUM] [INTERVAL_PERIOD]
no rp candidate [INTERFACE] [GROUP_ADDR]
no rp candidate [INTERFACE] interval
no rp candidate [INTERFACE] priority
default rp candidate [INTERFACE] [GROUP_ADDR]
default rp candidate [INTERFACE] interval
default rp candidate [INTERFACE] priority
```

**Parameters**

- **INTERFACE** Switch uses IP address of specified interface as its C-RP address. Options include:
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-Channel Interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
  - `vxlan vx_num` VXLAN interface specified by `vx_num`.
  - `GROUP_ADDR` address of multicast group for which candidate is configured. Options include:
Chapter 40: Protocol Independent Multicast

- `<no parameter>` default multicast group (224.0.0.0/4).
- `net_addr` multicast IPv4 subnet address (CIDR or address mask).
- `access-list acl_name` standard access control list that specifies the multicast group address.

- **PRIORITY_NUM** RP selection priority rating. Smaller numbers denote higher priority.
  - `<no parameter>` priority rating is set to the default value of 0.
  - `priority <0 - 255>` priority rating.
- **INTERVAL_NUM** Period between consecutive RP-advertisement message transmissions (seconds). Value also applies to previously configured `rp candidate` statements.
  - `<no parameter>` interval remains unchanged from previous setting.
  - `interval <10 - 16383>` transmission interval.

**Example**

- These commands configure a switch as a candidate RP for the multicast group 235.1.1.0/24 with a priority of 48 and an RP advertisement interval of 45 seconds in the default VRF. The switch advertises the IP address assigned to VLAN 24 as its RP address.

```
switch(config)# router pim sparse-mode
switch(config-router-pim-sparse)# ipv4
switch(config-router-pim-sparse-ipv4)# rp candidate vlan 24 235.1.1.0/24 priority 48 interval 45
switch(config-router-pim-sparse-ipv4)#
```
rp-candidate advertisement-filter

The **rp-candidate advertisement-filter** command filters the RP candidate advertisements from certain IP addresses. When **rp-candidate advertisement-filter** command is configured, PIM BSR filters RP candidate messages from ip-addresses matching the prefix list from the access-list that is configured.

The **no rp-candidate advertisement-filter** and **default rp-candidate advertisement-filter** commands removes **rp-candidate advertisement-filter** from *running-config* for the specified group.

**Command Mode**

- Router-PIM BSR IPv4 Configuration
- Router-PIM BSR VRF IPv4 Configuration

**Command Syntax**

```
rp-candidate advertisement-filter access-list access-list_name
no rp-candidate advertisement-filter access-list access-list_name
default rp-candidate advertisement-filter access-list access-list_name
```

**Parameters**

- **access-list_name**  Standard access control list that specifies the multicast group address.

**Example**

- These commands configure the switch as a candidate RP advertisement filter for the multicast group in the non-default VRF.

  ```
  switch(config-router-pim-bsr)# ipv4
  switch(config-router-pim-bsr-ipv4)# rp-candidate advertisement-filter
  access-list test1
  switch(config-router-pim-bsr-vrf-red-ipv4)# rp-candidate advertisement-filter
  access-list test2
  ```
rp hash algorithm modulo

The **rp hash algorithm modulo** command configures the load-balancing scheme across available rendezvous points (RP).

The configuration results in a round robin-based load balancing across available RPs, achieved by module operation of the destination group address with the number of RPs available.

The **no rp hash algorithm modulo** and **default rp hash algorithm modulo** commands result in the default load-balancing scheme which is to use a hash function to get a group-RP mapping.

**Command Mode**
- Router-PIM Sparse-mode IPv4 Configuration
- Router-PIM Sparse-mode VRF IPv4 Configuration
- Router-PIM Sparse-mode IPv6 Configuration
- Router-PIM Sparse-mode VRF IPv6 Configuration
- Router-PIM Bidirectional VRF IPv4 Configuration

**Command Syntax**
- `rp hash algorithm modulo`
- `no rp hash algorithm modulo`
- `default rp hash algorithm modulo`

**Example**
- These commands configures the hash algorithm module for a VRF named *blue* in the Router-PIM sparse-mode IPv4 configuration mode.

  ```
  switch(config)#router pim sparse-mode
  switch(config-router-pim-sparse)#ipv4
  switch(config-router-pim-sparse-ipv4)#vrf red
  switch(config-router-pim-sparse-vrf-red-ipv4)#rp hash algorithm modulo
  ```

- These commands configures the hash algorithm module for a VRF named *blue* in the Router-PIM bidirectional-mode VRF IPv4 configuration mode.

  ```
  switch(config)#router pim bidirectional
  switch(config-router-pim-bidir)#ipv4
  switch(config-router-pim-bidir-ipv4)#vrf red
  switch(config-router-pim-bidir-vrf-red-ipv4)#rp hash algorithm modulo
  ```
sg-expiry-timer

The sg-expiry-timer command configures the (S, G) expiry timer interval for PIM-SM (S, G) multicast routes. The command does not apply to (*, G) mroutes.

When the command is issued in Router-Multicast Configuration mode it applies to the default VRF; to use this command in a non-default VRF, issue it in Router-Multicast VRF Configuration mode.

The no sg-expiry-timer and default sg-expiry-timer commands restore the default setting of 210 seconds by removing the sg-expiry-timer statement from running-config.

Command Mode
- Router-PIM Sparse-mode IPv4 Configuration
- Router-PIM Sparse-mode VRF IPv4 Configuration

Command Syntax
- sg-expiry-timer period
- no sg-expiry-timer
- default sg-expiry-timer

Parameters
- period  expiry timer interval (seconds). Value ranges from 120 to 65535 seconds. The default value is 210 seconds.

Example
- These commands configure 150 seconds as the (S,G) expiry timer interval is in the default VRF.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#sg-expiry-timer 150
switch(config-router-pim-sparse-ipv4)#
```
**ipv4**

The `ipv4` command places the switch in the IPv4 submode for the PIM configuration mode in which it is entered.

**Command Mode**
- Router Multicast Configuration
- Router-PIM Bidirectional Configuration
- Router-PIM BSR Configuration
- Router-PIM Sparse-mode Configuration

**Command Syntax**

```
ipv4
```

**Examples**

- These commands place the switch in Router Multicast IPv4 Configuration Mode.
  
  ```
  switch(config)#router multicast
  switch(config-router-multicast)#ipv4
  switch(config-router-multicast-ipv4)#
  ```

- These commands place the switch in Router-PIM Bidirectional IPv4 Configuration Mode.
  
  ```
  switch(config)#router pim bidirectional
  switch(config-router-pim-bidir)#ipv4
  switch(config-router-pim-bidir-ipv4)#
  ```

- These commands place the switch in Router-PIM BSR IPv4 Configuration Mode.
  
  ```
  switch(config)#router pim bsr
  switch(config-router-pim-bsr)#ipv4
  switch(config-router-pim-bsr-ipv4)#
  ```

- These commands place the switch in Router-PIM Sparse-mode IPv4 Configuration Mode.
  
  ```
  switch(config)#router pim sparse-mode
  switch(config-router-pim-sparse)#ipv4
  switch(config-router-pim-sparse-ipv4)#
  ```
**log neighbors**

The `log neighbors` command configures the switch to generate a log message when a neighbor entry is added or removed from the PIM Neighbor table. This function is enabled by default.

The `no log neighbors` command disables log message generation based on changes to the PIM Neighbor table; this command is stored in the *running-config*. The `log neighbors` and `default log neighbors` commands restore the default setting of generating log messages by deleting the `no log neighbors` statement from *running-config*.

**Command Mode**
- Router-PIM Sparse-mode IPv4 Configuration
- Router-PIM Sparse-mode VRF IPv4 Configuration
- Router-PIM Bidirectional IPv4 Configuration
- Router-PIM Bidirectional VRF IPv4 Configuration

**Command Syntax**
- `log neighbors`
- `no log neighbors`
- `default log neighbors`

**Examples**
- These commands configure the switch to stop generating log messages based on PIM Neighbor table changes in the default VRF.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#no log neighbors
switch(config-router-pim-sparse-ipv4)#
```

- These commands configure the switch to generate log messages when a neighbor entry is added or removed from the PIM Neighbor table in the default VRF.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#log neighbors
  switch(config-router-pim-sparse-ipv4)#
```
pim ipv4 hello interval

The **pim ipv4 hello interval** command specifies the transmission interval between PIM hello messages originating from the configuration mode interface.

The **no pim ipv4 hello interval** and **default pim ipv4 hello interval** commands restore the default query interval of 30 seconds for the configuration mode interface by removing the corresponding **pim ipv4 hello interval** command from **running-config**.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

- `pim ipv4 hello interval period`
- `no pim ipv4 hello interval [period]`
- `default pim ipv4 hello interval [period]`

**Parameters**
- `period` query interval (seconds). Value ranges from 1 to 1000000 (1 million). Default is 30.

**Example**
- This command configures 45 second intervals between hello messages originating from VLAN interface 4.

  `switch(config)#interface vlan 4`
  `switch(config-if-Vl4)#pim ipv4 hello interval 45`
  `switch(config-if-Vl4)#`
pim ipv4 neighbor-filter

The `pim ipv4 neighbor-filter` command configures the configuration mode interface to filter PIM control packets on the basis of neighbor addresses listed in a specified standard access list.

The `no pim ipv4 neighbor-filter` and `default pim ipv4 neighbor-filter` commands disable the configuration mode interface from filtering PIM control packets by removing the corresponding `ip pim ipv4 neighbor-filter` command from `running-config`.

Command Mode
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

Command Syntax
- `pim ipv4 neighbor-filter access_list`
- `no pim ipv4 neighbor-filter`
- `default pim ipv4 neighbor-filter`

Parameters
- `access_list` name of the standard IP access list.

Example
- This command configures the IP access list named filter_1 to filter neighbor PIM control messages for VLAN 4.

```
switch(config)#ip access-list standard filter_1
switch(config-standard-acl-filter_1)#permit 10.13.24.9/24
switch(config-standard-acl-filter_1)#exit
switch(config)#interface vlan 4
switch(config-if-Vl4)#pim ipv4 neighbor-filter filter_1
  switch(config-if-Vl4)#
```
register local-interface

The `register local-interface` command programs the switch to fill the source field in all outbound PIM SM register packets with the IP address of a specified interface or the incoming interface of the group specified by the message. By default, the source field is filled with the IP address from the interface associated with the best route to the RP.

When the command is issued in Router-PIM Sparse-mode IPv4 ConfigurationMode, it applies to the default VRF; to use this command in a non-default VRF, issue it in Router-PIM Sparse-mode VRF IPv4 Configuration.

The `no register local-interface` and `default register local-interface` commands restore the default method of filling the register packet source field by removing the `ip register local-interface` statement from `running-config`.

**Command Mode**
- Router-PIM Sparse-mode IPv4 Configuration
- Router-PIM Sparse-mode VRF IPv4 Configuration

**Command Syntax**

```
register local-interface INT_NAME
no register local-interface
default register local-interface
```

**Parameters**
- `INT_NAME` Interface type and number. Values include:
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port channel interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.

**Example**
- These commands program the switch to fill the source field of outbound PIM SM register packets in the default VRF with the IPv4 address of loopback interface 2.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#register local-interface loopback 2
switch(config-router-pim-sparse-ipv4)#
```
**router pim bidirectional**

The `router pim bidirectional` command places the switch in Router-PIM Bidirectional Configuration Mode.

**Command Mode**

Global Configuration

**Command Syntax**

`router pim bidirectional`

**Example**

- This command places the switch in Router-PIM Bidirectional Configuration Mode.

  ```
  switch(config)#router pim bidirectional
  switch(config-router-pim-bidir)#
  ```
**router pim bsr**

The `router pim bsr` command places the switch in Router-PIM BSR Configuration Mode.

**Command Mode**

  Global Configuration

**Command Syntax**

  `router pim bsr`

**Example**

  - This command places the switch in Router-PIM BSR Configuration Mode.

    ```
    switch(config)#router pim bsr
    switch(config-router-pim-bsr)#
    ```
**router pim sparse-mode**

The `router pim sparse-mode` command places the switch in Router-PIM Sparse-Mode Configuration Mode.

**Command Mode**

Global Configuration

**Command Syntax**

`router pim sparse-mode`

**Example**

- This command places the switch in Router-PIM Sparse-Mode Configuration Mode.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#
```
**show ip pim bsr**

The `show ip pim bsr` command displays the switch’s bootstrap router (BSR) information.

**Command Mode**

EXEC

**Command Syntax**

```
show ip pim bsr [GROUP_FILTER]
```

**Parameters**

- `GROUP_FILTER` specifies groups for which command displays information.
  - `<no parameter>` Displays data for all groups.
  - `net_addr` Displays message for specified group address. (CIDR or address mask).

**Example**

- This command configures the switch’s BSR information.

  ```
  switch>show ip pim bsr
  PIMv2 Bootstrap information
  This system is the Bootstrap Router (BSR)
  BSR address: 10.1.1.1
  Uptime: 00:14:42, BSR Priority: 0, Hash mask length: 30
  Next bootstrap message in 00:00:05
  ```
show ip pim config-sanity

The `show ip pim config-sanity` command displays diagnostic information about the switch's PIM configuration.

**Command Mode**

EXEC

**Command Syntax**

`show ip pim config-sanity`

**Example**

- This command displays PIM configuration diagnostic information.

```
switch>show ip pim config-sanity
DISCLAIMER: Below are only hints of potential PIM misconfiguration. They do not necessary imply that there is a real problem.

The interfaces with PIM which are down: V14

switch>
```
show ip pim interface

The `show ip pim interface` command displays information about interfaces configured for PIM.

Command Mode

EXEC

Command Syntax

```
show ip pim interface [INT_NAME] [INFO_LEVEL]
```

Parameters

- **INT_NAME** Interface type and number. Values include
  - `<no parameter>` displays information for all interfaces.
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `port-channel p_num` Port-Channel Interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
  - `vxlan vx_num` VXLAN interface specified by `vx_num`.
- **INFO_LEVEL** specifies level of information detail provided by the command.
  - `<no parameter>` table of basic configuration information.
  - `detail` list of complete configuration information.

Examples

- This command displays information about all interfaces on which PIM is enabled.

```
switch>show ip pim interface
Address        Interface      Mode      Neighbor   Hello DR   DR Address     PktsQed
PktsDropped
10.17.254.30   Vlan3910       sparse    1          30    1    10.17.254.30   0
0

  PIM State-Refresh processing: disabled
  PIM State-Refresh Interval: unknown seconds
  PIM Graft Retry Interval: unknown seconds
  PIM domain border: disabled
switch>
```
show ip pim neighbor

The **show ip pim neighbor** command displays information about Protocol Independent Multicast (PIM) neighbors discovered by hello messages.

**Command Mode**

EXEC

**Command Syntax**

```
show ip pim neighbor [INT_NAME] [BFD_DATA]
```

**Parameters**

- **INT_NAME** Interface type and number. Values include
  - <no parameter> displays information for all interfaces.
  - ethernet e_num Ethernet interface specified by e_num.
  - loopback l_num Loopback interface specified by l_num.
  - management m_num Management interface specified by m_num.
  - port-channel p_num Port-Channel Interface specified by p_num.
  - vlan v_num VLAN interface specified by v_num.
  - vxlan vx_num VXLAN interface specified by vx_num.
- **BFD_DATA** Specifies inclusion of BFD data.
  - <no parameter> BFD data is not displayed.
  - bfd BFD data is displayed.

**Example**

- This command displays information about neighbor PIM routers.
  
  ```
  switch>show ip pim neighbor
  PIM Neighbor Table
  Neighbor Address   Interface       Uptime     Expires    Mode
  10.17.255.2      Vlan2028        21d22h     00:01:31   sparse
  switch>
  ```

- This command displays information about neighbor PIM routers and the status of BFD.
  
  ```
  switch>show ip pim neighbor bfd
  PIM Neighbor Table
  Flags: U - BFD is enabled and is UP
         I - BFD is enabled and is INIT
         D - BFD is enabled and is DOWN
         N - Not running BFD
  Neighbor Address   Interface       Uptime     Expires    Mode   Flags
  10.17.255.2      Vlan2028        21d22h     00:01:31   sparse   U
  switch>
  ```
**show ip pim protocol counters**

The `show ip pim protocol` command displays statistics about Protocol Independent Multicast (PIM) control messages sent and received by the switch.

**Command Mode**

EXEC

**Command Syntax**

`show ip pim protocol counters [INT_NAME]`

**Parameters**

- **INT_NAME**  Interface type and number. Values include
  - `<no parameter>` displays information for all interfaces.
  - `ethernet e_num`  Ethernet interface specified by `e_num`.
  - `loopback l_num`  Loopback interface specified by `l_num`.
  - `management m_num`  Management interface specified by `m_num`.
  - `port-channel p_num`  Port-Channel Interface specified by `p_num`.
  - `vlan v_num`  VLAN interface specified by `v_num`.
  - `vxlan vx_num`  VXLAN interface specified by `vx_num`.

**Example**

- This command displays statistics about inbound and outbound PIM control messages.

  ```
  switch>show ip pim protocol counters
  PIM Control Counters
  Received          Sent        Invalid
  Assert            0            37           0
  Bootstrap Router  0            0            0
  CRP Advertisement 0            0            0
  Graft             0            0            0
  Graft Ack         0            0            0
  Hello             63168       126355       0
  J/P               275714      143958       0
  Join              0            0            0
  Prune             0            0            0
  Register          0           13643        0
  Register Stop     11839       0            0
  State Refresh     0            0            0
  ```

  switch>

show ip pim register-source

The `show ip pim register-source` command displays the name of the interface from where the switch derives the IP address that it uses to fill the source field in all outbound PIM SM register packets. The `register local-interface` command specifies this interface.

By default, the source field is filled with the IP address from the interface associated with the best route to the RP. The `show ip pim register-source` command does not return a value when the source field is filled with the default value.

**Command Mode**

EXEC

**Command Syntax**

`show ip pim register-source`

**Example**

- This command displays the register-source interface.
  
  ```
  switch>show ip pim register-source
  Ethernet22
  switch>
  ```
show ip pim rp

The `show ip pim rp` command displays the status and multicast group of each cached rendezvous point (RP).

**Command Mode**

EXEC

**Command Syntax**

`show ip pim rp`

**Example**

- This command displays the cached RPs.

  ```
  switch>show ip pim rp
  show ip pim rp
  The PIM RP Set
  Group: 224.0.0.0/4
  RP: 10.1.2.3
  Uptime: 00:05:12, Expires: never, Priority: 1 Override: 1
  ```
show ip pim rp-candidate

The `show ip pim rp-candidate` command displays the rendezvous point (RP) that is used for a specified multicast group.

**Command Mode**
- EXEC

**Command Syntax**
- `show ip pim rp-candidate`

**Example**
- This command displays the switch’s candidate-RP information.

```
switch>show ip pim rp-candidate
Candidate RP information
  Candidate RP Address: 10.0.12.2
  CRP Holdtime: 150 seconds
  Group 224.2.0.0/16 Priority 2
```
show ip pim rp-hash

The `show ip pim rp-hash` displays the group to RP-hash mapping for the specified group and the list of qualifying candidate RPs.

**Command Mode**

EXEC

**Command Syntax**

```
show ip pim rp-hash ipv4_addr [INFO_LEVEL]
```

**Parameters**

- `ipv4_addr` multicast group IPv4 address.
- `INFO_LEVEL` specifies level of information detail provided by the command.
  - `<no parameter>` RP-hash map and list of candidate RPs.
  - `detail` includes data about the selected RP.

**Example**

- This command displays the RP that the switch uses for multicast group 224.1.0.0.

```
switch>show ip pim rp-hash 224.1.0.0
RP 10.1.2.3
```
**show ip pim upstream joins**

The `show ip pim upstream joins` command displays the join messages that the switch is scheduled to send.

**Command Mode**

EXEC

**Command Syntax**

```
show ip pim upstream joins [JOIN_ADDRESSES] [NEIGHBOR_FILTER]
```

**Parameters**

- **JOIN_ADDRESSES**
  - Filters messages by source and group addresses.
  - `<no parameter>` displays all join messages.
  - `source_addr` displays all join messages for specified source group IPv4 address.
  - `group_addr` displays all join messages for specified multicast IPv4 address.
  - `source_addr group_addr` displays join message with specified source and group addresses.
  - `group_addr source_addr` displays join message with specified group and source addresses.
    - `group_addr` must be a valid multicast IPv4 address.

- **NEIGHBOR_FILTER**
  - Specifies neighbors for which command provides data.
  - `<no parameter>` Displays messages for all neighbors.
  - `neighbor neighbor_addr` Displays message for specified neighbor address.

**Example**

- This command displays the list of join messages the switch is scheduled to send. The example only displays the first two messages.

  switch>show ip pim upstream joins

  ------------ show ip pim upstream joins ------------

  Neighbor address: 10.1.1.1
  Via interface: 10.1.1.2
  Next message in 1 seconds
  Group: 10.10.10.3
    Joins:
      10.25.1.1/32 SPT
    Prunes:
      No prunes included
  Neighbor address: 10.1.1.6
  Via interface: 10.1.1.5
  Next message in 1 seconds
  Group: 10.14.1.69
    Joins:
      10.105.14.3/32 SPT
    Prunes:
      No prunes included
switch>
**ssm range**

The `ssm range` command defines the source specific multicast (SSM) range of IP multicast addresses.

SSM is a multicast packet delivery method where only packets originating from a specific source address requested by a receiver are routed to that receiver. SSM explicitly excludes the use of (*,G) join for applicable multicast groups. Source-specific multicast differs from any-source multicast (ASM), where a receiver expresses interest in traffic to a multicast address, then receives traffic from all multicast sources sending to that address.

When the command is issued in Router-PIM Sparse-mode IPv4 Configuration Mode it applies to the default VRF; to use this command in a non-default VRF, issue it in Router-PIM Sparse-mode VRF IPv4 Configuration Mode.

The `no ssm range` and `default ssm range` commands remove the SSM IP multicast address range by deleting the `ssm range` statement from `running-config`.

**Command Mode**

- Router-PIM Sparse-mode IPv4 Configuration
- Router-PIM Sparse-mode VRF IPv4 Configuration

**Command Syntax**

```plaintext
ssm range {acl_name | standard}
no ssm range
default ssm range
```

**Parameters**

- `acl_name` sets the SSM range to address set specified by the standard ACL.
- `standard` sets the SSM range to 232/8.

**Examples**

- These commands configure the SSM address range to 232/8 in the default VRF.

  ```plaintext
  switch(config)#router pim sparse-mode
  switch(config-router-pim-sparse)#ipv4
  switch(config-router-pim-sparse-ipv4)#ssm range standard
  switch(config-router-pim-sparse-ipv4)#
  ```

- These commands configure the SSM address range to those permitted by the LIST_1 standard ACL in the default VRF. The ACL permits the subnet address range 233.0.0.0/24.

  ```plaintext
  switch(config)#ip access-list standard LIST_1
  switch(config-std-acl-LIST_1)#permit 233.0.0.0/24
  switch(config-std-acl-LIST_1)#exit
  switch(config)#router pim sparse-mode
  switch(config-router-pim-sparse)#ipv4
  switch(config-router-pim-sparse-ipv4)#ssm range LIST_1
  switch(config-router-pim-sparse-ipv4)#
  ```
The `spt threshold` command configures shortest path tree (SPT) threshold actions for IPv4 multicast groups. To specify the threshold action for multicast groups that match a specified access control list (ACL), use the `match list` option. When the command is issued without this option, it is applied throughout the configuration-mode VRF. Any ACL-based configuration overrides global configuration.

- When `running-config` does not list this command, the switch joins the SPT immediately after receiving the first PIM packet from a new source. The switch joins the SPT by sending PIM join message toward the source.
- When `running-config` lists this command with a value of infinity, the switch never joins the SPT.

The `no spt threshold` and `default spt threshold` commands remove the corresponding `spt threshold` command from `running-config`.

**Command Mode**
- Router-PIM Sparse-mode IPv4 Configuration
- Router-PIM Sparse-mode VRF IPv4 Configuration

**Command Syntax**

```
spt threshold {0 | infinity} [match list acl_name]
no spt threshold {0 | infinity} [match list acl_name]
default spt threshold {0 | infinity} [match list acl_name]
```

**Parameters**

- **0** The switch immediately joins the SPT. This is the default value.
- **infinity** The switch never joins the SPT.
- **acl_name** name of access control list. If no ACL is supplied, the configuration is applied to all multicast groups within the VRF which are not configured by an ACL.

**Examples**

- This command configures the switch in the default VRF to immediately join the SPT for multicast groups matched by the ACL “group-1.”
  ```
  switch(config)#router pim sparse-mode
  switch(config-router-pim-sparse)#ipv4
  switch(config-router-pim-sparse-ipv4)#spt threshold 0 match list group-1
  switch(config-router-pim-sparse-ipv4)#
  ```
sztimeout

The `sztimeout` command configures the maximum span of active scope-zone.

The `no sztimeout` and `default sztimeout` commands delete the current scope zoned timeout configuration.

**Command Modes**

- Router-PIM BSR IPv4 Configuration
- Router-PIM BSR VRF IPv4 Configuration

**Syntax**

```plaintext
sztimeout timeout
no sztimeout
default sztimeout
```

**Parameter**

- `timeout` Maximum span of active scope-zone in seconds. The value ranges from 120 to 4294967295. The default value is 1300.

**Guideline**

The scope zoned timeout must contain a minimum value of 10 times of configured holdtime; else the system displays a warning message.

**Examples**

- This command configures 600 seconds as the maximum of active scope-zone in router-pim bsr ipv4 configuration mode.
  ```plaintext
  switch(config)#router pim bsr
  switch(config-router-pim-bsr)#ipv4
  switch(config-router-pim-bsr-ipv4)#sztimeout 600
  switch(config-router-pim-bsr-ipv4)#
  ```

- This command configures 2200 seconds as the maximum of active scope-zone in router-pim bsr vrf ipv4 configuration mode.
  ```plaintext
  switch0(config)#router pim bsr
  switch(config-router-pim-bsr)#vrf vrf01
  switch(config-router-pim-bsr-vrf-vrf01)#ipv4
  switch(config-router-pim-bsr-vrf-vrf01-ipv4)#sztimeout 2200
  switch(config-router-pim-bsr-vrf-vrf01-ipv4)#
  ```
Multicast Source Discovery Protocol (MSDP) describes a topology that connects multiple IPv4 Protocol Independent Multicast Sparse-Mode (PIM-SM) domains. Each PIM-SM domain uses its independent Rendezvous Point (RP) without depending on RPs in other domains.

These sections describe the Arista MSDP implementation.

- Section 41.1: MSDP Introduction
- Section 41.2: MSDP Description
- Section 41.3: MSDP Configuration
- Section 41.4: MSDP Commands

41.1 MSDP Introduction

Arista switches support these MSDP features:

- Basic MSDP speaker functions.
- MSDP peer configuration: description, connect-source interface, keepalive time, and hold time.
- ACL filtering of inbound and outbound Source-Active (SA) messages.
- Mesh groups.
- Display of peer status.
- Display of filtered SA messages received from MSDP peers.

These MSDP features are not supported:

- MSDP is not supported with Anycast-RP (RFC4610).
- IP packet encapsulation.
41.2 MSDP Description

The Multicast Source Discovery Protocol (MSDP) defines a topology connecting Protocol Independent Multicast sparse mode (PIM-SM) domains. MSDP provides inter-domain access to multicast sources in all domains by enabling all rendezvous points (RPs) to discover multicast sources outside of their domains. RPs also use MSDP to announce sources that are sending to a multicast group.

41.2.1 MSDP Speakers

An MSDP speaker is a router in a PIM-SM domain that has MSDP peering sessions with MSDP peers in other domains. An MSDP peering session is a TCP connection through which peers exchange MSDP control information. An MSDP peer is a router that is connected to the speaker through a peering session.

PIM uses MSDP to register a local source with remote domain RPs through Source Active (SA) messages, which originate at the local domain’s RP. Receivers in remote PIM-SM domains depend only on RPs in their domains to learn of multicast data sources in other domains. Multicast data is subsequently delivered from a source to receivers in different domains through a PIM-SM source tree. Section 41.3.1: MSDP Speaker Configuration describes the process of configuring MSDP speakers.

41.2.2 Network Configuration

The TCP connections between RPs are defined either through an underlying unicast routing table or by configuring a default MSDP peer. A typical MSDP configuration utilizes a BGP specified routing table. SA messages are MSDP control messages that peers exchange during peering sessions.

41.2.2.1 Source Active Messages

A Source Active (SA) message is a message that an RP creates and sends to MSDP peers when it learns of a new multicast source through a PIM register message. RPs that intend to originate or receive SA messages must establish MSDP peering with other RPs, either directly or through intermediate MSDP peers. An RP that is not a DR on a shared network should only originate SAs in response to register messages it receives from the DR. It does not originate SA’s for directly connected sources in its domain.

SA messages contain the following fields:
- Source address of the data source.
- Group address that receives data sent by the source.
- IP address of the RP.

The SA Cache is the repository of SA messages received by the MSDP speaker. The switch always stores received SA messages. Section 41.3.4: Managing the SA Cache describes procedures that limit the size of the SA cache and options for displaying the cache.

41.2.2.2 Reverse Path Forwarding

Reverse path forwarding (RPF) is a multicast packet transport technique that ensures loop-free packet forwarding by using a router’s unicast routing table. Traffic forwarding is based on source addresses instead of destination addresses. RPF is implemented as defined in RFC 3618.

Packet forwarding is based on the packet’s unicast reverse path. An RPF router prevents network loops by only forwarding a packet when it enters through the interface holding its source routing entry.
When a multicast packet enters a router's interface, the router checks the reverse path of the packet by examining the list of networks that are reachable through the input interface. If the list contains a matching routing entry for the multicast packet's source IP address, the packet is forwarded to all other interfaces that are participants in the multicast group. Otherwise, the packet is dropped.

RPF requires that the unicast routing table is correct and converged. It also assumes that the use of symmetric forward and reverse paths between router and sender. RPF fails on uni-directional links. Section 41.3.3.1: Displaying RPF Peers describes commands that display RPF peers.

41.2.2.3 Default MSDP Peers

The default peer is the MSDP peer from which the MSDP speaker accepts SA messages. If there is only one MSDP peer, all of its SA messages will be accepted. When multiple default peers are configured the switch uses the first default peer to appear in `running-config`. Default MSDP peers invalidate the use of RPF over unicast routing tables.

Each default peer may be associated with a prefix list. The prefix list specifies the RPs from where the speaker accepts SA messages. When `running-config` contains multiple default peers with prefix lists, an SA is accepted from the first default peer in `running-config` whose prefix list contains the RP in the SA. The speaker accepts all remaining SAs from the first default peer that is not associated with a prefix list. Section 41.3.3.2: Configuring the Default Peer describes commands that configure default peers.

41.2.3 MSDP Exchange Processes

41.2.3.1 Control Information Exchange

An RP originates an SA message when a source registers with the RP to send data to a multicast group. RPs periodically originate SA messages while its registered sources send data to maintain messages in SA caches of its MSDP peers. RPs that have no registered sources periodically send keepalive messages to maintain TCP connections with its peers.

MSDP defines the following timers that specify the transmission frequency of control messages:

- **SA Advertisement Time**: Duration of SA Advertisement intervals. An RP sends periodic SA messages to reference each registered source once per interval. SA advertisement time is 60 seconds.
- **Keepalive Time**: Period between the transmission of consecutive keepalive messages. Default keepalive time is 60 seconds. Minimum keepalive time is one second.
- **Hold Timer**: Period an MSDP speaker maintains a peer TCP connection after receiving an SA or keepalive message from the peer. Default time is 75 seconds. Minimum hold time is three seconds.

41.2.3.2 MSDP Data Exchange

This sequence describes the exchange of multicast data across PIM domains through MSDP:

**Step 1** When a source’s first data packet is registered by the first hop router, the RP extracts the data from the packet and forwards it down the shared tree in the PIM domain.

**Step 2** The RP informs MSDP peers of the new source by sending a Source-Active (SA) message that identifies the source, the recipient group, and the RP’s address or originator ID.

**Step 3** Upon receiving the SA message, an MSDP peer which is the RP for a multicast tree that includes members interested in the multicast sends a PIM join message (S,G) toward the data source.
Step 4 The PIM designated router (DR) sends subsequent data encapsulated in PIM register messages directly to the remote domain’s RP when the source becomes active.

Step 5 If the source times out, this process repeats when the source goes active again.
41.3 MSDP Configuration

These sections describe the configuration of the switch as an MSDP speaker and the establishment of MSDP peering sessions.

- Section 41.3.1: MSDP Speaker Configuration
- Section 41.3.2: Establishing MSDP Peers
- Section 41.3.3: MSDP Network Configuration
- Section 41.3.4: Managing the SA Cache
- Section 41.3.5: Configuring MSDP in a non-default VRF

MSDP requires that TCP port 639 (MSDP) is open on the control plane. The default control-plane ACL includes a permit rule that allows TCP packets access through the MSDP port.

41.3.1 MSDP Speaker Configuration

The switch is configured as an MSDP speaker when MSDP is enabled. MSDP is enabled by configuring an MSDP peer. Section 41.3.2.1 describes the process of configuring an MSDP peer.

Source-Address (SA) messages that an MSDP speaker originates contain the speaker’s rendezvous point (RP) address, as configured through PIM statements and processes. MSDP provides a method of assigning an originator ID address, which the speaker uses in place of its RP address when advertising SA messages. The `originator-id local-interface` command configures the switch to set the RP address to the specified interface’s IP address in SA messages that it originates as an MSDP speaker.

Only RPs originate SA messages and only for its registered sources. RPs do not originate periodic SA messages for sources in other PIM domains. MSDP speakers that are not RPs do not originate periodic SA messages. Intermediate MSDP speakers forward SA messages received from other domains. Intermediate speakers are not required to be RPs.

Example

- This command configures the switch to use the IP address assigned to loopback interface 100 as the RP address in SA messages that it originates.

```
switch(config)#originator-id local-interface loopback 100
switch(config)#
```

41.3.2 Establishing MSDP Peers

These sections describe MSDP Peer configuration tasks.

- Section 41.3.2.1: Configuring an MSDP Peer
- Section 41.3.2.2: Mesh Groups
- Section 41.3.2.3: Filtering SA Messages
- Section 41.3.2.4: Keep-alive, Hold Time, and Reset Time Configuration
- Section 41.3.2.5: Displaying Peer Information

41.3.2.1 Configuring an MSDP Peer

The switch attempts to establish MSDP peering sessions through IP addresses configured as MSDP peers. The `peer` command configures a specified address as an MSDP peer and enables the switch as an MSDP speaker if no other peers are configured. The peering session with the device at the
specified network is established over a TCP connection. The `local-interface` command can be used to specify an interface through which the switch establishes the TCP session. When no interface is specified, the connection is established through an interface determined by existing routing algorithms.

To display MSDP peer information, enter `show ip msdp peer`.

**Example**

- These commands assign an IP address to loopback interface 100, then configure 10.4.4.12 as an MSDP peer and establish the TCP peer session through the loopback.

```plaintext
switch(config)#router msdp
switch(config-router-msdp)#interface loopback 100
switch(config-if-Lo100)#ip address 10.6.8.6/24
switch(config-if-Lo100)#exit
switch(config)#router msdp
switch(config-router-msdp)#peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)#local-interface loopback 100
switch(config-router-msdp-peer-10.4.4.12)#show ip msdp peer
MSDP Peer 10.4.4.12
Connection status:
  State: Connect
  Resets: 0
  Connection Source: Loopback100 (10.6.8.6)
SAs accepted:
switch(config-router-msdp-peer-10.4.4.12)#
```

To associate descriptive text with the specified MSDP peer, use the `description (MSDP)` command.

**Example**

- These commands associate the string NORTH with the MSDP peer located at 10.4.4.12.

```plaintext
switch(config)#router msdp
switch(config-router-msdp)#peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)#description NORTH
switch(config-router-msdp-peer-10.4.4.12)#show ip msdp peer
MSDP Peer 10.4.4.12
Description: NORTH
Connection status:
  State: Connect
  Resets: 0
  Connection Source: Loopback100 (10.6.8.6)
SAs accepted:
switch(config-router-msdp-peer-10.4.4.12)#
```

To close the peering session with the specified MSDP peer, use the `disabled (MSDP)` command. This terminates the TCP connection between the switch and the peer. The peer remains configured and the peer session can be resumed by removing the `disabled` command from `running-config`.

```plaintext
switch(config-router-msdp-peer-10.4.4.12)#disabled
```

```plaintext
switch(config-router-msdp-peer-10.4.4.12)#show ip msdp peer
MSDP Peer 10.4.4.12
Description: NORTH
Connection status:
  State: Connect

41.3.2.2 Mesh Groups

Each node in a fully meshed network is directly connected to every other node in the network. Each peer in a fully meshed MSDP speaker network can be configured as a member of a mesh group. SA messages received from a mesh group peer are not forwarded to other members of the mesh group.

To configure an MSDP peer connection as an MSDP mesh group member, use the mesh-group command. An MSDP peer can be assigned to multiple mesh groups. Multiple peer connections can be assigned to the same mesh group.

Note

Peer-specific mesh-group configuration is performed in Router MSDP Peer Configuration or Router MSDP Peer VRF Configuration Mode. To remove all configured connections from a mesh group, use the no mesh-group command in Router MSDP Configuration Mode.

To display the mesh group membership of configured MSDP peers, enter show msdp mesh-group.
Example

- These commands configure the MSDP peer connection to 10.1.1.14 as a member of the AREA-1 mesh group, then displays members of mesh groups to which configured MSDP peers belong.

```
switch(config)#router msdp
switch(config-router-msdp)#peer 10.1.1.14
switch(config-router-msdp-peer-10.1.1.14)#mesh-group AREA-1
switch(config-router-msdp-peer-10.1.1.14)#show msdp mesh-group
Mesh Group: AREA-1
  10.1.1.14
Mesh Group: tier_01
  10.24.18.13
Mesh Group: tier_02
  10.26.101.18
switch(config-router-msdp-peer-10.1.1.14)#
```

41.3.2.3 Filtering SA Messages

The switch can filter Source-Active (SA) messages that it sends and receives with access control lists (ACLs). The commands accept standard and extended ACLs. The address field in standard ACLs filter an SA message on its group address.

The `sa-filter in` command assigns an ACL to filter inbound SA messages from the MSDP peer connection being configured. The switch only accepts SA messages from the peer that pass the ACL. The switch accepts all SA messages from peers that are not assigned an input ACL. A peer can be assigned only one input filter ACL. Subsequent `sa-filter in` commands for a peer replace the existing command.

The `sa-filter out` command assigns an ACL as a filter for outbound SA messages to the MSDP peer connection being configured. The switch only sends SA messages to the peer that pass the ACL. The switch sends all specified SA messages to peers not assigned an output filter ACL. A peer can be assigned only one output ACL. Subsequent `sa-filter out` commands for a peer replace the existing command.

Example

- These commands assign the IP ACLs named LIST-IN as the inbound SA message filter and LIST-OUT as the outbound SA message filter for the MSDP peer connection to 10.4.4.12.

```
switch(config)#router msdp
switch(config-router-msdp)#peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)#sa-filter in list LIST-IN
switch(config-router-msdp-peer-10.4.4.12)#sa-filter out list LIST-OUT
switch(config-router-msdp-peer-10.4.4.12)#show ip msdp peer
MSDP Peer 10.4.4.12
  Connection status:
    State: Listen
    Connection Source: Loopback100 (10.6.8.6)
SA Filtering:
  Input Filter: LIST-IN
  Output Filter: LIST-OUT
switch(config-router-msdp-peer-10.4.4.12)#
```

41.3.2.4 Keep-alive, Hold Time, and Reset Time Configuration

To configure the MSDP keep-alive and hold time intervals for a specified MSDP peer connection, use the `keepalive (MSDP)` command.
• Keep-alive time interval is the period between the transmission of consecutive keep-alive messages. The default keep-alive time interval is 60 seconds.
• Hold time interval is the period the switch waits for a KEEPALIVE or UPDATE message before it disables peering. The default hold time interval is 75 seconds.

The hold time interval must be longer than or equal to the keep-alive time interval.

**Example**

• This command sets the keep-alive time to 45 seconds and the hold time to 80 seconds for the MSDP peer connection to 10.4.4.12.

  ```
  switch(config)#router msdp
  switch(config-router-msdp)#peer 10.4.4.12
  switch(config-router-msdp-peer-10.4.4.12)#keepalive 45 80
  switch(config-router-msdp-peer-10.4.4.12)#
  ```

To specify the period that the switch waits after an MSDP peering session is reset before attempting to reestablish the session, enter *connection retry interval*. The default period is 30 seconds.

**Example**

• This command configures the switch to wait 45 seconds after an MSDP peering session is reset before attempting to reestablish the session.

  ```
  switch(config)#router msdp
  switch(config-router-msdp)#connection retry interval 45
  switch(config-router-msdp)#
  ```

41.3.2.5 Displaying Peer Information

To display the MSDP peers, enter *show ip msdp summary*. The command also displays the operational status of each peer and the number of messages from the peers in the SA cache.

**Example**

• This command displays the configured peers, the status of the peers, and the number of SA messages received from those peers.

  ```
  switch(config)#show ip msdp summary
  MSDP Peer Status Summary
  Peer Address     State  SA Count
  192.168.3.18     Up     0
  192.168.3.16     Up     0
  192.168.3.37     Listen 0
  192.168.3.46     Up     0
  192.168.3.47     Up     0
  ```

41.3.3 MSDP Network Configuration

41.3.3.1 Displaying RPF Peers

The switch uses the unicast routing table to define TCP connections between RPs by selecting the next hop peer toward the originating RP of an SA message as the reverse path forwarding (RPF) peer. The switch forwards SA messages that it receives from the RPF peer to all other MSDP peers. The switch rejects SA messages that it receives from non-RPF peers.

To display MSDP information for the peer from which the switch accepts SA messages for a specified rendezvous point (RP), enter *show msdp rpf-peer*. 
Example
- This command displays MSDP information for the peer from which the switch accepts SA messages for the RP at 10.5.29.4.

```
switch(config)#show msdp rpf-peer 10.5.29.4
Rpf Peer is 10.5.29.4 for RP 10.5.29.4
```

41.3.3.2 Configuring the Default Peer

The default peer is the MSDP peer from which the MSDP speaker is configured to accept all SA messages. A default peer may be associated with a prefix list. The prefix list specifies the RPs from where the speaker accepts SA messages.

The switch can designate multiple default peers:
- Switch defines one peer: A default peer statement is not required; the switch accepts SA traffic from the configured peer.
- Switch defines one default peer (no prefix list): The switch accepts all SA messages from only the default peer.
- Switch defines multiple default peers (no prefix lists): The switch accepts all SA messages from only the first default peer listed in `running-config`. Other listed default peers take effect only if the peer named in the first default-peer statement is not accessible.
- First default-peer statement includes a prefix list: The switch accepts all SA messages from the default peer whose originating RP is covered in the prefix list. The disposition of SA messages originating from other RPs is determined by subsequent `default-peer` statements.

To configure the specified MSDP peer connection as a default peer on the switch, use the `default-peer` command. The default peer address must be a previously configured MSDP peer (configured using the `peer` command).

Example
- These commands configure an MSDP default peer.

```
switch(config)#router msdp
switch(config-router-msdp)#peer 10.5.2.2
default-peer
```

41.3.4 Managing the SA Cache

The switch stores Source Active (SA) messages after forwarding the information. This allows new group members to learn about the source before the next SA message is received. The caching action is not configurable and cannot be disabled.

SA messages have an expiration period of 90 seconds and remain in the SA cache until they expire. A peer’s SA limit defines the number of SA messages the switch stores from the peer. The switch does not store SA messages from a peer whose SA limit is reached until its cached messages start expiring.

41.3.4.1 Limiting SA Cache Contents

To configure the maximum number of SA messages from a specified MSDP peer that the switch stores in the SA cache, use the `sa-limit` command. The default limit of SA messages that the switch can store from a specified peer is 40000.
Example

- This command sets the SA limit of 500 for the MSDP peer at 10.1.1.5.

  
  switch(config)#router msdp
  switch(config-router-msdp)#peer 10.1.1.5
  switch(config-router-msdp-peer-10.1.1.5)#sa-limit 500
  switch(config-router-msdp-peer-10.1.1.5)#

The maximum number of SA messages that the switch can store in the SA cache for a specified multicast group address is configured by the group-limit command. The default limit of SA messages that the switch can store from a specified group is 40000.

Example

- This command sets the maximum number of 1000 SAs for multicast group 225.13.15.8/29

  
  switch(config)#router msdp
  switch(config-router-msdp)#group-limit 1000 source 225.13.15.8/29

The maximum number of rejected SA messages that the switch can store in the SA cache is configured by the ip msdp rejected-limit command. The default limit of rejected SA messages that the switch can store is 40000.

Example

- This command sets 5000 as the maximum number of rejected SAs that the SA cache can contain.

  
  switch(config)#router msdp
  switch(config-router-msdp)#ip msdp rejected-limit 5000

Contents of the SA message cache are removed by the clear ip msdp sa-cache command. The command provides options for removing all cache contents or only contents of a specific multicast group.

Example

- This command deletes all SA message cache contents.

  
  switch(config)#router msdp
  switch(config-router-msdp)#clear ip msdp sa-cache

41.3.4.2 Displaying SA Cache Contents

SA message cache contents are displayed by the show ip msdp sa-cache command. Filter options provided by the command for displaying partial cache contents include:

- multicast group address: multicast group
- source address and group address

The command can also display unexpired SAs rejected by ACL filters or cache limit exceeded conditions.
Example

- This command displays the contents of the SA message cache.

```
switch(config)#show ip msdp sa-cache
MSDP Source Active Cache
  (10.61.71.29, 234.1.4.2), RP 10.5.29.4, heard from 10.5.29.4
  (10.51.71.23, 234.1.4.1), RP 10.5.29.4, heard from 10.5.29.4
  (10.53.71.27, 234.1.4.2), RP 10.3.25.4, heard from 10.3.25.4
  (10.10.101.24, 234.1.4.1), RP 10.2.44.4, heard from 10.2.44.4
  (10.10.151.22, 234.1.4.1), RP 10.1.12.4, heard from 10.1.12.4
```

Information about specified MSDP peers, including SAs accepted from the peer is displayed by the `show ip msdp peer` command.

Example

- This command displays data for the peer at 10.2.42.4, including SAs accepted from the peer.

```
switch(config)#show ip msdp peer 10.2.42.4 accepted-sas
MSDP Peer 10.2.42.4
  Connection status:
    State: Up
    Connection Source: Loopback4 (10.2.43.4)
  SA Filtering:
    Input Filter: allow-multicast-for-msdp
    Output Filter: allow-multicast-for-msdp
  SAs accepted:
    (10.62.79.30, 234.1.4.2), RP 10.2.42.4
    (10.61.79.29, 234.1.4.1), RP 10.2.42.4
    (10.62.79.30, 234.1.4.1), RP 10.2.42.4
```

The SA cache for the local PIM domain is displayed by the `show ip msdp pim sa-cache` command.

Example

- This command displays the SA cache for the local PIM domain.

```
switch(config)#show ip msdp pim sa-cache
MSDP Source Active Messages for local Pim RP
  (10.51.71.23, 234.1.4.1), RP 10.2.43.4
  (10.20.91.26, 234.1.4.1), RP 10.2.43.4
  (10.20.91.26, 234.1.4.2), RP 10.2.43.4
  (10.20.91.24, 234.1.4.1), RP 10.2.43.4
```

41.3.4.3 Verifying Consistency Between the SA Cache and the Routing Table

To check the consistency between the multicast routing table and the MSDP Source-Address (SA) caches, enter `show ip msdp sanity`. When the command detects inconsistencies, it displays the cache entries that are not in the table.
Example

- This command displays a sanity check that detects inconsistencies between the SA cache and the multicast routing table.

```
switch(config)#show ip msdp sanity
  PIM SA cache entries not in the MRT
  Msdp-learnt MRT entries not in the SA cache
  SA cache entries not in the MRT
  (192.168.3.8, 224.1.154.1)
  (192.168.3.35, 224.1.167.1)
  (192.168.3.16, 224.1.226.1)
  (192.168.3.12, 224.1.182.1)
  (192.168.3.33, 224.1.150.1)
  May-Notify-MSDP entries not in the PIM SA cache
  (need not be an error condition)
  4.1), RP 10.2.42.4
```

41.3.5 Configuring MSDP in a non-default VRF

The MSDP can also be configured in a non-default VRF, when the default VRF used does not have a name. The following commands configure MSDP in a non-default VRF.

Example

- These commands configure MSDP peer 1.1.1.1 in a non-default VRF blue.

```
switch(config)#router msdp
switch(config-router-msdp)#vrf blue
switch(config-router-msdp-vrf-blue)#peer 1.1.1.1
```
41.4 MSDP Commands

MSDP Configuration Commands (Global)
- connection retry interval
- group-limit
- ip msdp rejected-limit
- originator-id local-interface
- peer
- router msdp

MSDP Peer Configuration Commands
- default-peer
- description (MSDP)
- disabled (MSDP)
- keepalive (MSDP)
- local-interface
- mesh-group
- sa-filter in
- sa-filter out
- sa-limit

MSDP SA Cache Commands
- clear ip msdp sa-cache

MSDP Display Commands
- show ip msdp peer
- show ip msdp pim sa-cache
- show ip msdp sa-cache
- show ip msdp sanity
- show ip msdp summary
- show msdp mesh-group
- show msdp rpf-peer
clear ip msdp sa-cache

The `clear ip msdp sa-cache` command removes contents of the Source-Active (SA) message cache. The command provides these filter options for removing partial cache contents:

- contents of a multicast group by specifying its group address
- all cache contents

**Command Mode**

- Router MSDP Configuration
- Router MSDP VRF Configuration

**Command Syntax**

```
clear ip msdp sa-cache [ADDRESS_FILTER]
```

**Parameters**

- `ADDRESS_FILTER` IPv4 address used to select table entries for removal.
- `<no parameter>` All SA messages
- `grp_addr` Multicast group address (IPv4 address). The `grp_addr` must be a valid multicast address.

**Example**

- This command deletes all SA message cache contents.

```
switch(config)#router msdp
switch(config-router-msdp)#clear ip msdp sa-cache
```
connection retry interval

The `connection retry interval` command specifies the period that the switch waits after an MSDP peering session is reset before trying to reestablish the session. The default period is 30 seconds.

The `no connection retry interval` and `default connection retry interval` commands reset the timer interval to the default period of 30 seconds by removing the `connection retry interval` command from `running-config`.

**Command Mode**
- Router MSDP Configuration
- Router MSDP VRF Configuration

**Command Syntax**

- `connection retry interval` `connect_retry`
- `no connection retry interval` `connect_retry`
- `default connection retry interval` `connect_retry`

**Parameter**
- `connect_retry` Reconnect period (seconds). Value ranges from 1 to 65535. Default is 30.

**Example**
- This command configures the switch to wait 45 seconds after an MSDP peering session is reset before attempting to reestablish the session.

```
switch(config)#router msdp
switch(config-router-msdp)#connection retry interval 45
```
default-peer

The default-peer command configures the specified MSDP peer connection as a default peer on the switch. The default peer configuration defines the peers from which the switch accepts Source-Active (SA) messages. When the command includes a prefix list parameter, the specified peer is the default peer for only SA messages originating from rendezvous points (RPs) covered by prefix list entries. The default peer address must be a previously configured MSDP peer (configured using the peer command).

Default peers provide an alternative to reverse packet forwarding (RPF) typically used by MSDP to specify the peers from which a switch accepts SA messages. However, RPF requires a unicast routing table that is correct and converged. RPF also assumes symmetric forward and reverse paths between router and sender. RPF fails on uni-directional links. Default MSDP peers invalidate the use of RPF over unicast routing tables.

The switch can designate multiple default peers:

- Switch defines one peer: A default peer statement is not required; the switch accepts SA traffic from the configured peer.
- Switch defines one default peer (no prefix list): The switch accepts all SA messages from only the default peer.
- Switch defines multiple default peers (no prefix lists): The switch accepts all SA messages from only the first default peer listed in running-config. Other listed default peers are used only when peers listed before them in running-config are not accessible.
- First default-peer statement includes a prefix list: The switch accepts all SA messages from the default peer whose originating RP is covered in the prefix list. The disposition of SA messages originating from other RPs is determined by subsequent default-peer statements.

The no default-peer and default default-peer commands remove the corresponding default-peer command from running-config.

Command Mode

Router MSDP Peer Configuration
Router MSDP Peer VRF Configuration

Command Syntax

default-peer [PREFIX]
no default-peer
default default-peer

Parameters

- **PREFIX**  List of RPs from the SA messages originate for which the default peer is valid.
  - <no parameter>  default peer is valid for SAs from all originating RPs.
  - prefix-list list_name  name of the prefix list that defines affected originating RP prefixes.
Example

- These commands configure two MSDP peers and configure the peer at 10.5.2.2 as the default peer.

```bash
switch(config)#router msdp
switch(config-router-msdp)#peer 10.6.2.2
switch(config-router-msdp-peer-10.6.2.2)#exit
switch(config-router-msdp)#peer 10.5.2.2
switch(config-router-msdp-peer-10.5.2.2)#default-peer
switch(config-router-msdp-peer-10.5.2.2)#
```
description (MSDP)

The **description** command associates descriptive text with the configuration-mode MSDP peer. The **no description** and **default description** commands remove the text association from the specified peer.

**Command Mode**
- Router MSDP Peer Configuration
- Router MSDP Peer VRF Configuration

**Command Syntax**
```
description description_string
no description
default description
```

**Parameters**
- **description_string** text string that is associated with the peer.

**Example**
- These commands associate the string NORTH with the MSDP peer located at 10.4.4.12.

```
switch(config)#router msdp
switch(config-router-msdp)#peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)#description NORTH
switch(config-router-msdp-peer-10.4.4.12)#show ip msdp peer
MSDP Peer 10.4.4.12
Description: NORTH
Connection status:
   State: Connect
   Resets: 0
   Connection Source: Loopback100 (10.6.8.6)
SAs accepted:
switch(config-router-msdp-peer-10.4.4.12)#
```
disabled (MSDP)

The `disabled` command closes the peering session with the specified MSDP peer by terminating the TCP connection between the switch and the peer. The connection is not resumed until the shutdown command is removed from `running-config`.

The `no disabled` and `default disabled` commands establish an MSDP peering session with the specified peer by removing the corresponding `disabled` command from `running-config`.

**Command Mode**

- Router MSDP Peer Configuration
- Router MSDP Peer VRF Configuration

**Command Syntax**

```
disabled
no disabled
default disabled
```

**Examples**

- This command closes the peering session with the MSDP peer at 10.4.4.12.

```
switch(config)#router msdp
switch(config-router-msdp)#peer 10.4.4.12
disable
show ip msdp peer
```

**MSDP Peer 10.4.4.12**

- Description: NORTH
- Connection status:
  - State: Disabled
  - Resets: 0
  - Connection Source: Loopback100 (10.6.8.6)
- SAs accepted:

```
switch(config-router-msdp-peer-10.4.4.12)#
```

- This command reopens the peering session with the peer at 10.4.4.12.

```
switch(config)#router msdp
switch(config-router-msdp)#peer 10.4.4.12
no disable
show ip msdp peer
```

**MSDP Peer 10.4.4.12**

- Description: NORTH
- Connection status:
  - State: Connect
  - Resets: 0
  - Connection Source: Loopback100 (10.6.8.6)
- SAs accepted:

```
switch(config-router-msdp-peer-10.4.4.12)#
```
**group-limit**

The `group-limit` command specifies the maximum number of Source-Active (SA) messages that the switch allows in the SA cache for a specified multicast group address.

SA messages have an expiration period of 90 seconds and remain in the SA cache until they expire. The switch does not accept SA messages for a group whose cache limit is reached until its cached messages start expiring.

The `no group-limit` and `default group-limit` command removes the maximum group limit for the specified prefix by removing the corresponding `group-limit` statement from `running-config`.

**Command Mode**
- Router MSDP Configuration
- Router MSDP VRF Configuration

**Command Syntax**

```
group-limit quantity source src_subnet
no group-limit quantity source src_subnet
default group-limit quantity source src_subnet
```

**Parameters**
- `quantity` maximum number of groups that can access the interface. Value ranges from 1 to 40000.
- `src_subnet` Source IPv4 subnet (CIDR or address-mask notation).

**Example**
- This command sets the maximum number of 1000 SAs for multicast group 10.13.15.8/29.
  
  switch(config)#router msdp
  switch(config-router-msdp)#group-limit 1000 source 10.13.15.8/29
**ip msdp rejected-limit**

The `ip msdp rejected-limit` command specifies the maximum number of rejected Source-Active messages that the switch allows in the SA cache.

SA messages have an expiration period of 90 seconds. They remain in the SA cache during this time. The default limit of rejected SA messages that the switch can store is 40000.

The `no ip msdp rejected-limit` and `default ip msdp rejected-limit` commands restore the rejected SA limit of 40000 by removing the `ip msdp rejected-limit` statement from `running-config`.

**Command Mode**
- Router MSDP Configuration
- Router MSDP VRF Configuration

**Command Syntax**

```
ip msdp rejected-limit quantity
no ip msdp rejected-limit
default ip msdp rejected-limit
```

**Parameter**
- `quantity` maximum rejected SA messages the SA cache can store. Value ranges from 0 to 40000.

**Example**
- This command sets 5000 as the maximum number of rejected SAs that the SA cache can contain.

```
switch(config)#router msdp
switch(config-router-msdp)#ip msdp rejected-limit 5000
```
keepalive (MSDP)

The `keepalive` command configures the MSDP keep-alive and hold time intervals for a specified MSDP peer connection.

- Keep-alive time interval is the period between the transmission of consecutive keep-alive messages. The default keep-alive time interval is 60 seconds.
- Hold time interval is the period the switch waits for a KEEPALIVE or UPDATE message before it disables peering. The default hold time interval is 75 seconds.

The `no keepalive` and `default keepalive` commands restore the default keep-alive and hold time intervals for the specified MSDP peer connection by removing the corresponding `keepalive` command from `running-config`.

**Command Mode**
- Router MSDP Peer Configuration
- Router MSDP Peer VRF Configuration

**Command Syntax**
```
keepalive keep_alive hold_time
no keepalive
default keepalive
```

**Parameters**
- `keep_alive` keep-alive period in seconds. Value ranges from 1 to 65535. Default value is 60.
- `hold_time` hold time in seconds. Value ranges from 1 to 65535. Default value is 75.

**Note**
The hold time interval must be longer than or equal to the keep-alive time interval.

**Example**
- This command sets the keep-alive time to 45 seconds and the hold time to 80 seconds for the connection with the MSDP peer at 10.4.4.12.

```
switch(config)#router msdp
switch(config-router-msdp)#peer 10.4.4.12
switch(config-router-msdp)#peer 10.4.4.12) #keepalive 45 80
switch(config-router-msdp-peer-10.4.4.12)#
```
**local-interface**

MSDP peering sessions are established over a TCP connection. The `local-interface` command specifies the interface through which the TCP connection is established with the configuration-mode MSDP peer. When the `local-interface` command is not used to specify an interface, the connection is established through an interface determined by existing routing algorithms.

The `no local-interface` and `default local-interface` commands remove the corresponding `local-interface` command from `running-config`, returning selection of the connecting interface to the routing algorithm.

**Command Mode**
- Router MSDP Peer Configuration
- Router MSDP VRF Peer Configuration

**Command Syntax**

```
local-interface interface
no local-interface
default local-interface
```

**Parameters**

- `interface` local interface through which the TCP connection is established. Options include:
  - `ethernet e_num` Ethernet interface.
  - `loopback l_num` Loopback interface.
  - `management m_num` Management interface.
  - `port-channel p_num` Port-Channel Interface.
  - `vlan v_num` VLAN interface.
  - `vxlan vx_num` VXLAN interface.

**Example**

- These commands assign an IP address to loopback interface 100, then establish the TCP peer session to the MSDP peer at 10.4.4.12 through the loopback in the default VRF.

```
switch(config)#interface loopback 100
switch(config-if-Lo100)#ip address 10.6.8.6/24
switch(config-if-Lo100)#exit
switch(config)#router msdp
switch(config-router-msdp)#peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)#local-interface loopback 100
switch(config-router-msdp-peer-10.4.4.12)#show ip msdp peer
MSDP Peer 10.4.4.12
Connection status:
  State: Connect
  Resets: 0
  Connection Source: Loopback100 (10.6.8.6)
SAs accepted:
switch(config-router-msdp-peer-10.4.4.12)#
```
**mesh-group**

The **mesh-group** command configures the configuration-mode MSDP peer connection as an MSDP mesh group member. A peer can be assigned to multiple mesh groups. Multiple MSDP peers can be assigned to a common mesh group.

An MSDP mesh group is a network of MSDP speakers where each speaker directly connects to every other speaker. The switch does not forward Source-Active (SA) messages that it receives from a mesh group peer to other peers of the same group.

The **no mesh-group** and **default mesh-group** commands delete the configuration-mode peer connection from a mesh group by removing the corresponding **mesh-group** command from **running-config** when issued in Router MSDP Peer Configuration or Router MSDP Peer VRF Configuration Mode.

**Note**
To delete all configured connections from a specified mesh group, use the **no mesh-group** command in Router MSDP Configuration mode.

**Command Mode**
- Router MSDP Configuration
- Router MSDP Peer Configuration
- Router MSDP Peer VRF Configuration

**Command Syntax**

```
mesh-group  group_name
no mesh-group  group_name
default mesh-group  group_name
```

**Parameters**
- **group_name** name of mesh group.

**Related Command**
- **show msdp mesh-group**

**Example**
- These commands configure the MSDP peer connection to 10.1.1.14 as a member of the AREA-1 mesh group, then display members of mesh groups to which configured MSDP peers belong.

```
switch(config)#router msdp
switch(config-router-msdp)#peer 10.1.1.14
switch(config-router-msdp-peer-10.1.1.14)#mesh-group AREA-1
switch(config-router-msdp-peer-10.1.1.14)#show msdp mesh-group
Mesh Group: AREA-1
  10.1.1.14
Mesh Group: tier_01
  10.24.18.13
Mesh Group: tier_02
  10.26.101.18
switch(config-router-msdp-peer-10.1.1.14)#
```

- These commands delete all configured connections from the AREA-1 mesh group.

```
switch(config)#router msdp
switch(config-router-msdp)#no mesh-group AREA-1
switch(config-router-msdp)#
```
originator-id local-interface

The `originator-id local-interface` command configures an originator ID to replace the rendezvous point (RP) address in source-address (SA) messages that it originates as an MSDP speaker.

SA messages that an MSDP speaker originates contain the speaker’s rendezvous point (RP) address, as configured through PIM statements and processes. An originator ID is an alternative IPv4 address that a speaker uses in place of its RP address when advertising SA messages. This command configures the switch to use the specified interface’s IP address as the RP address in SA messages that it originates.

The `no originator-id local-interface` and `default originator-id local-interface` commands configure the switch to use its RP address in SA messages that it sends by removing the `originator-id local-interface` command from `running-config`.

Command Mode
- Router MSDP Configuration
- Router MSDP VRF Configuration

Command Syntax

```
originator-id local-interface INTERFACE
no originator-id local-interface INTERFACE
default originator-id local-interface INTERFACE
```

Parameters
- `INTERFACE` Specifies the interface from which the IP address is derived. Options include:
  - `ethernet e_num` Ethernet interface.
  - `loopback l_num` Loopback interface.
  - `management m_num` Management interface.
  - `port-channel p_num` Port-Channel Interface.
  - `vlan v_num` VLAN interface.
  - `vxlan vx_num` VXLAN interface.

Example
- This command configures the switch to use the IP address assigned to loopback 100 as the RP address in SA messages that it originates.
  ```
  switch(config)#router msdp
  switch(config-router-msdp)#originator-id local-interface loopback 100
  ```
**peer**

The `peer` command configures the specified address as an MSDP peer, enables MSDP on the switch if it was not previously enabled, and places the switch in Router MSDP Peer Configuration Mode for the specified peer.

The peering session with the device at the specified network is established over a TCP connection. The `local-interface` command can specify an interface through which the TCP connection is established. When the `local-interface` command is not used to specify an interface, the connection is established through an interface determined by existing routing algorithms.

The `no peer` and `default peer` commands remove the specified MSDP peer configuration by deleting the corresponding `peer` command from `running-config`. MSDP is disabled when the last `peer` command is removed.

**Command Mode**

Router MSDP Configuration

**Command Syntax**

```
peer ip_address
```

**Parameters**

- `ip_address` IP address of the MSDP peer to be configured.

**Example**

- These commands establish an MSDP peer relationship with the peer at 192.168.3.17 and place the switch in the Router MSDP Peer Configuration Mode for that peer.

```
switch(config)#router msdp
switch(config-router-msdp)#peer 192.168.3.17
switch(config-router-msdp-peer-192.168.3.17)#
```
**router msdp**

The `router msdp` command places the switch in the router MSDP configuration mode, and allows to configure the global IP configuration commands and VRF commands in this mode.

The `no router msdp` and `default router msdp` commands removes the corresponding `router msdp` command from *running-config*.

**Command Mode**
- Global Configuration

**Command Syntax**

```plaintext
router msdp
no router msdp
default router msdp
```

**Example**
- This command places the switch in the router MSDP configuration mode.

```
switch(config)#router msdp
switch(config-router-msdp)#
```

**Related Commands**
- `connection retry interval`
- `default-peer`
- `description (MSDP)`
- `disabled (MSDP)`
- `group-limit`
- `ip msdp rejected-limit`
- `keepalive (MSDP)`
- `mesh-group`
- `originator-id local-interface`
- `peer`
- `sa-filter in`
- `sa-filter out`
- `sa-limit`
sa-filter in

The sa-filter in command assigns an IP access control list (ACL) as a filter for inbound Source-Active (SA) messages from the configuration-mode MSDP peer connection. The switch only accepts SA messages from the peer that are accepted by the assigned ACL. The switch accepts all SA messages from the peer when an ACL is not assigned as an inbound filter.

Only one ACL can be assigned as an inbound filter to an MSDP peer. Any subsequent sa-filter in commands for the peer replace the existing command.

The no sa-filter in and default sa-filter in commands remove the ACL assignment as an inbound filter by removing the corresponding sa-filter in command from running-config.

Command Mode

Router MSDP Peer Configuration
Router MSDP Peer VRF Configuration

Command Syntax

```
sa-filter in list list_name
no sa-filter in
default sa-filter in
```

Parameters

- **peer_id** MSDP peer address (IPv4 address).
- **list_name** name of ACL that filters SA messages.

Related Command

- sa-filter out

Guideline

- The command accepts standard and extended ACLs. The address field in a standard ACL filters an SA message on its group address.

Example

- These commands create an IP ACL named LIST-IN as the inbound SA message filter for the MSDP peer connection to 10.4.4.12. The ACL permits SAs from the multicast group 239.14.4.2/28.

```
switch(config)#ip access-list LIST-IN
switch(config-acl-LIST-IN)#permit ip any 239.14.4.2/28
switch(config-acl-LIST-IN)#exit
switch(config)#router msdp
switch(config-router-msdp)#peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)#sa-filter in list LIST-IN
switch(config-router-msdp-peer-10.4.4.12)#show ip msdp peer
  MSDP Peer 10.4.4.12
  Connection status:
    State: Listen
    Connection Source: Loopback100 (10.6.8.6)
  SA Filtering:
    Input Filter: LIST-IN
```
**sa-filter out**

The **sa-filter out** command assigns an IP access control list (ACL) as a filter for outbound Source-Active (SA) messages to the configuration-mode MSDP peer connection, after which the switch only sends SA messages to the peer that are accepted by the assigned ACL. The switch sends all SA messages to the peer when an ACL is not assigned as an output filter to the peer.

Only one ACL can be assigned as an outbound filter to an MSDP peer. Any subsequent **sa-filter out** commands for the peer replace the existing command.

The **no sa-filter out** and **default sa-filter out** commands remove the ACL assignment as an outbound filter by removing the corresponding **sa-filter out** command from **running-config**.

**Command Mode**
- Router MSDP Peer Configuration
- Router MSDP Peer VRF Configuration

**Command Syntax**

```
    sa-filter out list  list_name
    no sa-filter out
    default sa-filter out
```

**Parameters**

- **peer_id**  MSDP peer address (IPv4 address).
- **list_name**  name of ACL that filters SA messages.

**Related Commands**

- **sa-filter in** assigns an IP ACL to filter inbound SA messages from the MSDP peer being configured.

**Guidelines**

The command accepts standard and extended ACLs. The address field in a standard ACLs filters an SA message on its group address.

**Example**

- These commands assign the IP ACL named LIST-OUT as the outbound SA message filter for the MSDP peer connection to 10.4.4.12.

```
switch(config)#router msdp
switch(config-router-msdp)#ip access-list LIST-OUT
switch(config-acl-LIST-OUT)#permit ip any 239.14.4.2/28
switch(config-acl-LIST-OUT)#exit
switch(config)#router msdp
switch(config-router-msdp)#peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)#sa-filter out list LIST-OUT
switch(config-router-msdp-peer-10.4.4.12)#show ip msdp peer
MSDP Peer 10.4.4.12
Connection status:  
    State: Listen  
    Connection Source: Loopback100 ( 10.6.8.6 )
SA Filtering:  
    Output Filter: LIST-OUT
switch(config-router-msdp-peer-10.4.4.12)#
```
**sa-limit**

The `sa-limit` command specifies the maximum number of Source-Active messages from a specified MSDP peer that the switch allows in the SA cache. SA messages have an expiration period of 90 seconds, during which time they remain in the SA cache. The switch does not accept SA messages from a peer after the peer's SA limit is reached. By default, the limit to the number of SA messages that the switch can store from a specified peer is 40000, by default.

The `no sa-limit` and `default sa-limit` commands restore the SA limit of 40000 for the specified MSDP peer by removing the corresponding `sa-limit` statement from *running-config*.

**Command Mode**

- Router MSDP Peer Configuration
- Router MSDP Peer VRF Configuration

**Command Syntax**

```
  sa-limit quantity
  no sa-limit
  default sa-limit
```

**Parameters**

- `peer_id` MSDP peer (IPv4 address).
- `quantity` maximum number of SA messages that the switch can store. Value ranges from 0 to 40000.

**Example**

- This command sets the SA limit of 500 for the MSDP peer at 10.1.1.5

```
  switch(config)#router msdp
  switch(config-router-msdp)#peer 10.1.1.5
  switch(config-router-msdp-peer-10.1.1.5)#sa-limit 500
  switch(config-router-msdp-peer-10.1.1.5)#
```
**show ip msdp peer**

The `show ip msdp peer` command displays information about specified MSDP peers. The command includes an optional parameter for displaying SAs accepted from the peer.

**Command Mode**

EXEC

**Command Syntax**

```
show ip msdp peer [PEER_ADDR] [SA_ACCEPT]
```

**Parameters**

- **PEER_ADDR** Peers for which command displays information.
  - `<no parameter>` All peers configured on the switch.
  - `ipv4_addr` Address of specified MSDP peer.
- **SA_ACCEPT** Command displays SAs accepted from the specified peers.
  - `<no parameter>` Accepted SAs are not displayed.
  - `accepted-sas` Accepted SAs are displayed.

**Example**

- This command displays MSDP information concerning the peer located at 10.2.42.4, including SAs that the switch accepted from this peer.

```
switch(config)#show ip msdp peer 10.2.42.4 accepted-sas
MSDP Peer 10.2.42.4
  Connection status:
    State: Up
    Connection Source: Loopback4 ( 10.2.43.4 )
  SA Filtering:
  Input Filter: allow-multicast-for-msdp
  Output Filter: allow-multicast-for-msdp
  SAs accepted:
    (10.62.79.30, 234.1.4.2), RP 10.2.42.4
    (10.61.79.29, 234.1.4.1), RP 10.2.42.4
    (10.62.79.30, 234.1.4.1), RP 10.2.42.4
```
show ip msdp pim sa-cache

The `show ip msdp pim sa-cache` command displays the SA cache for the local PIM domain configured on the switch. An SA cache is a table of Source-Active messages that are generated or accepted by the PIM domain.

Command Mode

EXEC

Command Syntax

`show ip msdp pim sa-cache`

Example

- This command displays the SA cache for the local PIM domain.

```
switch(config)#show ip msdp pim sa-cache
MSDP Source Active Messages for local Pim RP
(10.51.71.23, 234.1.4.1), RP 10.2.43.4
(10.20.91.26, 234.1.4.1), RP 10.2.43.4
(10.51.71.23, 234.1.4.2), RP 10.2.43.4
(10.20.91.21, 234.1.4.1), RP 10.2.43.4
(10.51.79.23, 234.1.4.1), RP 10.2.43.4
(10.20.91.24, 234.1.4.2), RP 10.2.43.4
(10.51.79.23, 234.1.4.2), RP 10.2.43.4
(10.20.91.21, 234.1.4.2), RP 10.2.43.4
(10.20.91.26, 234.1.4.2), RP 10.2.43.4
(10.20.91.24, 234.1.4.1), RP 10.2.43.4
```
show ip msdp sa-cache

The `show ip msdp sa-cache` command displays contents of the Source-Active (SA) message cache. The command provides these filter options for displaying partial cache contents:

- multicast group address: multicast group
- source address and group address

The command can also display unexpired SAs that were rejected by ACL filters or cache limit exceeded conditions.

**Command Mode**
EXEC

**Command Syntax**
```
show ip msdp sa-cache [ADDRESS_FILTER] [CONTENTS]
```

**Parameters**
- **ADDRESS_FILTER** IPv4 address used to filter SA messages.
  - <no parameter> All SA messages.
  - `grp_addr` Multicast group address (IPv4 address).
  - `src_addr grp_addr` Source and multicast group addresses (two IPv4 addresses).
    - `grp_addr` must be a valid multicast address.
- **CONTENTS** type of SAs that the command displays.
  - <no parameter> Displays contents of SA Cache.
  - `rejected` Displays rejected SAs in addition to the SA cache contents.

**Example**
- This command displays the contents of the SA message cache.

```
switch(config)#show ip msdp sa-cache
MSDP Source Active Cache
(10.61.71.29, 234.1.4.2), RP 10.5.29.4, heard from 10.5.29.4
(10.51.71.23, 234.1.4.1), RP 10.5.29.4, heard from 10.5.29.4

(10.10.151.22, 234.1.4.1), RP 10.1.12.4, heard from 10.1.12.4
```
**show ip msdp sanity**

The *show ip msdp sanity* command performs a consistency check between the multicast routing table and the MSDP Source-Address (SA) caches. When the command detects inconsistencies, it displays the cache entries that are not in the table.

**Command Mode**

EXEC

**Command Syntax**

```
show ip msdp sanity
```

**Examples**

- This command displays a sanity check that detects no inconsistencies between the SA cache and the multicast routing table.

  switch(config)#show ip msdp sanity
  PIM SA cache entries not in the MRT
  Msdp-learnt MRT entries not in the SA cache
  SA cache entries not in the MRT
  May-Notify-MSDP entries not in the PIM SA cache
  (need not be an error condition)

- This command displays inconsistencies between the SA cache and the multicast routing table.

  switch(config)#show ip msdp sanity
  PIM SA cache entries not in the MRT
  Msdp-learnt MRT entries not in the SA cache
  SA cache entries not in the MRT
  (192.168.3.8, 224.1.154.1)
  (192.168.3.35, 224.1.167.1)
  (192.168.3.16, 224.1.226.1)
  (192.168.3.19, 224.1.246.1)
  (192.168.3.17, 224.1.204.1)
  (192.168.3.12, 224.1.182.1)
  (192.168.3.33, 224.1.150.1)
  (192.168.3.26, 224.1.198.1)
  (192.168.3.33, 224.1.195.1)

  (192.168.3.12, 224.1.245.1)
  (192.168.3.31, 224.1.206.1)
  (192.168.3.35, 224.1.178.1)
  (192.168.3.6, 224.1.155.1)
  May-Notify-MSDP entries not in the PIM SA cache
  (need not be an error condition)
  4.1), RP 10.2.42.4
**show ip msdp summary**

The `show ip msdp summary` command displays a list of peer addresses, the operational status of the peer, and the number of Source-Active messages in the SA cache from that peer.

**Command Mode**

EXEC

**Command Syntax**

`show ip msdp summary`

**Example**

- This command displays the configured peers, the status of the peers, and the number of SA message received from those peers.

```
switch(config)#show ip msdp summary
MSDP Peer Status Summary
  Peer Address   State  SA Count
  192.168.3.18   Up     0
  192.168.3.16   Up     0
  192.168.3.37   Listen 0
  192.168.3.46   Up     0
  192.168.3.47   Up     0
```
show msdp mesh-group

The `show msdp mesh-group` command displays the mesh group membership of MSDP peers that are configured on the switch. An MSDP mesh group is a network of MSDP speakers where each speaker is directly connected to every other speaker. The switch does not forward Source-Active (SA) messages that it receives from a mesh group peer to other peers of the same group.

**Command Mode**

EXEC

**Command Syntax**

`show msdp mesh-group`

**Related Command**

- `mesh-group` configures the MSDP peer connection as an MSDP mesh group member.

**Example**

- This command displays the mesh group membership of configured MSDP peers.

```
switch(config)#show msdp mesh-group
  Mesh Group: tier_01
  10.24.18.13
  Mesh Group: tier_02
  10.26.101.18
```
**show msdp rpf-peer**

The `show msdp rpf-peer` command displays MSDP information for the peer from which the switch accepts SA messages for a specified rendezvous point (RP).

The switch examines the BGP routing table to determine the next hop peer toward the originating RP of an SA message. This next hop peer is the reverse path forwarding (RPF) peer. Because the switch receives SA messages from the RPF peer, it forwards the message to all other MSDP peers. The switch rejects identical SA messages that it receives from a non-RPF peer.

**Command Mode**

EXEC

**Command Syntax**

```
show msdp rpf-peer rp_addr
```

**Parameter**

- `rp_addr`  PIM RP IPv4 address.

**Example**

- This command displays MSDP information for the peer from which the switch accepts SA messages for the RP at 10.5.29.4.

```
switch(config)#show msdp rpf-peer 10.5.29.4
Rpf Peer is 10.5.29.4 for RP 10.5.29.4
```
Audio Video Bridging (AVB)

Arista switches support Audio Video Bridging (AVB) and the associated protocols. This chapter describes AVB concepts and the implementation of associated protocols.

Sections in this chapter include:

- Section 42.1: AVB Overview
- Section 42.2: AVB Protocols
- Section 42.3: AVB Configuration
- Section 42.4: AVB Command Descriptions

42.1 AVB Overview

Audio Video Bridging (AVB) is a protocol set that provides precision time synchronization, admission control, queuing reservation, and guaranteed bandwidth of professional grade quality audio and video across an IP network.

Supported AVB protocols include:

- Generalized Precision Time Protocol (gPTP)
- Multiple Stream Reservation Protocol (MSRP)
- Multiple VLAN Registration Protocol (MVRP)

These AVB features are supported on Arista 7280, 7150 Series, and 7500E Series switches:

- gPTP with hardware time stamping
- gPTP Grandmaster function
- MSRP protocol on Ethernet interfaces: stream admission control and propagation
- Control plane protection for PTP and MSRP control frames
- MVRP
- Traffic classes 2 and 3 for AVB traffic
- Traffic shaping on egress ports
These AVB features are not available on Arista switches:

- MSRP protocol on LAGs
- MSRP co-ordination with gPTP; streams are allowed even when gPTP is not in sync
- MMRP
- Signaling message support in gPTP
- Running peer delay mechanism on STP blocked ports
- Grandmaster-specific state machines (gPTP)

42.2 AVB Protocols

This section describes supported AVB protocols:

- Section 42.2.1: gPTP
- Section 42.2.2: MVRP
- Section 42.2.3: MSRP
- Section 42.2.4: MRP

42.2.1 gPTP

Generalized Precision Time Protocol (gPTP) is a network time synchronization standard for bridged Local Area Networks based on the IEEE 1588v2 Precision Time Protocol and supports the AVB protocol standards. Time synchronization in a gPTP domain is conducted the same way as in a PTP 1588 domain. A grandmaster is selected through the best grand master clock algorithm and distributes timing synchronization information to all directly attached peers. This information is propagated across the network to provide a common time reference to all Audio and Video end stations.

42.2.2 MVRP

Multiple VLAN Registration Protocol (MVRP) is an application of Multiple Registration Protocol used by AVB endpoints to dynamically register and unregister VLANs on an interface.

When an interface wishes to join a VLAN advertised by an MSRP talker (to receive a stream), MVRP sends a Join message. On receiving the Join message, the interface is added to the VLAN. If the VLAN does not already exist, MVRP dynamically creates the VLAN and propagates it through the network.

MVRP events post Syslog messages, with the severity level of INFO for each message.

- MVRP_VLAN_JOIN
  MVRP VLAN Join received/transmitted on an interface.
- MVRP_VLAN_LV
  MVRP VLAN Leave received/transmitted on an interface.
- MVRP_ERROR
  MVRP Join was discarded due to an error.
42.2.3 MSRP

Multiple Stream Registration Protocol (MSRP) is a signaling protocol that allows end stations (nodes) to reserve network resources and ensure QoS for communicating with other end stations.

MSRP nodes are specified as talkers or listeners:

- Talker nodes transmit multimedia streams to other nodes in the AVB network.
- Listener nodes receive multimedia streams from the AVB talker nodes.

MSRP is implemented by the switch on individual interfaces. MSRP is active when it is enabled on at least one interface, and stopped when it is disabled on all interfaces. MSRP uses Multiple Registration Protocol (MRP) to facilitate attribute registrations and distribution across connected end points in a LAN environment.

MSRP events post Syslog messages, with the severity level of INFO for each message.

- **MSRP_SR_CLASS_TRANSITION**
  MSRP SR Class state transition occurred on an interface.

- **MSRP_TALKER_ADV_JOIN**
  Talker Advertise Join message for a stream was transmitted/received on an interface.

- **MSRP_TALKER_FAIL_JOIN**
  Talker Failed Join message for a stream was transmitted/received on an interface.

- **MSRP_LISTENER_JOIN**
  Listener Join message for a stream was transmitted/received on an interface.

- **MSRP_DOMAIN_JOIN**
  Domain Join message was transmitted/received on an interface.

- **MSRP_TALKER_ADV_LV**
  Talker Advertise Leave message for a stream was transmitted/received on an interface.

- **MSRP_TALKER_FAIL_LV**
  Talker Failed Leave message for a stream was transmitted/received on an interface.

- **MSRP_LISTENER_LV**
  Listener Leave message for a stream was transmitted/received on an interface.

- **MSRP_DOMAIN_LV**
  Domain Leave message was transmitted/received on an interface.

- **MSRP_BW_ALLOC_SUCCESS**
  MSRP Bandwidth was allocated for a listener on an interface.

- **MSRP_BW_ALLOC_FAIL**
  MSRP Bandwidth could not be allocated for a listener on an interface.

- **MSRP_BW_DEALLOC**
  MSRP Bandwidth was de-allocated for a listener on an interface.

- **MSRP_ERROR**
  MSRP Join was discarded because of an error.
42.2.4 MRP

Multiple Registration Protocol (MRP) protocol includes MSRP and MVRP, and allows participants in an MRP application to register attributes with participants in a Bridged Local Area Network (BLAN).
42.3 AVB Configuration

This section describes the AVB configuration:

- Section 42.3.1: Enabling gPTP
- Section 42.3.2: Enabling MSRP
- Section 42.3.3: Displaying MSRP Configuration and Status
- Section 42.3.4: Enabling MVRP
- Section 42.3.5: Displaying MVRP Configuration and Status

42.3.1 Enabling gPTP

Configure gPTP on the switch though the ptp mode command. PTP is enabled on individual interfaces with the ptp enable command.

**Example**

- These commands configure gPTP on the switch and enable PTP on Ethernet interfaces 41-45.

  ```bash
  switch(config)#ptp mode gptp
  switch(config)#interface ethernet 41-45
  switch(config-if-Et41-45)#ptp enable
  switch(config)#show running-config
  !
  ptp mode gptp
  !
  end
  switch(config-if-Et41-45)#show active
  interface Ethernet41
      speed forced 10000full
      msrp
      ptp enable
  interface Ethernet42
      speed forced 10000full
      msrp
      ptp enable
  interface Ethernet43
      speed forced 10000full
      msrp
      ptp enable
  interface Ethernet44
      speed forced 10000full
      ptp enable
  interface Ethernet45
      ptp enable
  switch(config-if-Et41-45)#
  ```

42.3.2 Enabling MSRP

MSRP is enabled on an interface with the msrp command.
Example

- These commands enable MSRP on Ethernet interfaces 41-43.

```
switch(config)#interface ethernet 41-43
switch(config-if-Et41-43)#msrp
switch(config-if-Et41-43)#show active
interface Ethernet41
  speed forced 10000full
  msrp
interface Ethernet42
  speed forced 10000full
  msrp
interface Ethernet43
  speed forced 10000full
  msrp
switch(config-if-Et41-43)#
```

42.3.3 Displaying MSRP Configuration and Status

MSRP configuration information and status is displayed with the `show msrp` command.

Example

- This command displays the MSRP status for Ethernet interfaces 41-43.

```
switch(config)#show msrp interfaces ethernet 41-43

MSRP Global Status : Enabled
Max Frame Size : 1522
Max Fan-In Ports : No limit

<table>

switch(config)#
```

Stream data is available for the talker and listener. The `show msrp interfaces` command displays the status and configuration information for each stream.
Examples

- This command displays data for listener station streams on Ethernet interfaces 1 and 2.

  ```
  switch(config)#show msrp interfaces ethernet 1-2
  MSRP Global Status : Enabled
  Max Frame Size : 1522
  Max Fan-In Ports : No limit

  switch(config)#
  ```

42.3.4 Enabling MVRP

MVRP is disabled by default. To enable MVRP on an interface, use the `mvrp` command. MVRP is enabled globally if it is enabled on at least one interface.
Example

- These commands enable MVRP on Ethernet interface 34.
  
  switch(config)#interface ethernet 34
  switch(config-if-Et34)#mvrp
  switch(config-if-Et34)#

42.3.5 Displaying MVRP Configuration and Status

MVRP configuration information and status are displayed with the `show mvrp` command.

Example

- This command displays the MVRP status for Ethernet interfaces 30 through 40.
  
  switch(config)#show mvrp interfaces Ethernet 30-40

  MVRP Global Status : Enabled

<table>

  switch(config)#
42.4 AVB Command Descriptions

MSRP Commands
- msrp
- msrp streams load-file
- show msrp
- show msrp interfaces
- show msrp streams

MRP Commands
- mrp leave-all-timer
- mrp leave-timer

MVRP Commands
- mvrp
- show mvrp
msrp

MSRP enables Multiple Stream Registration Protocol (MSRP), which is a signaling protocol that provides nodes with the ability to reserve network resources to ensure Quality of Service (QoS) between talker and listener endpoints. The Stream Reservation Protocol (SRP) utilizes MSRP to reserve bandwidth for data streams, and configure a complete path between endpoints.

The `msrp` command enables MSRP on the configuration mode interface. If MSRP was not previously enabled on any interface, the MSRP agent is launched by this command.

The `no msrp` and `default msrp` commands disable MSRP on the configuration mode interface, and removes the corresponding `msrp` command from `running-config`. The command stops the MSRP agent when MSRP is no longer enabled on any interface.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

```
msrp
no msrp
default msrp
```

**Example**

- These commands enable MSRP on Ethernet interface 3/3/3. Because it was not previously enabled on any other interface, the command launches the MSRP agent.

  ```
  switch(config)#interface ethernet 3/3/3
  switch(config-if-Et3/3/3)#msrp
  Launching MSRP Agent
  switch(config-if-Et3/3/3)#show active
    interface Ethernet3/3/3
    msrp
  switch(config-if-Et3/3/3)#
  ```

- These commands disable the MSRP agent on Ethernet interface 3/3/3. Because it is not enabled on any other interface, the command stops the MSRP agent.

  ```
  switch(config-if-Et3/3/3)#no msrp
  Stopping MSRP agent
  switch(config-if-Et3/3/3)#show active
    interface Ethernet3/3/3
  switch(config-if-Et3/3/3)#msrp
  ```
mrp leave-all-timer

The `mrp leave-all-timer` command specifies the mrp leave all timer interval for the configuration mode interface.

When starting MRP, a participant starts its LeaveAll timer. Upon timer expiry, it sends a LeaveAll message and restarts its timer. When other participants receive the message, they register their attributes and restart their leave-all timers.

The default leave-all timer interval is a randomly selected value from 10 to 15 seconds. Under normal conditions, this value should not be adjusted.

The `no mrp leave-all-timer` and `default mrp leave-all-timer` commands restore the default leave-all timer interval on the configuration mode interface by removing the corresponding `mrp leave-all-timer` command from `running-config`.

Command Mode

Interface-Ethernet Configuration

Command Syntax

```
mrp leave-all-timer period
no mrp leave-all-timer
default mrp leave-all-timer
```

Parameters

- `period` leave all timer interval (seconds). Values range from 10 to 60. Default value is a randomly selected value from 10 to 15.

Example

- This command sets the MRP leave-all timer interval on Ethernet interface 17 to twelve seconds.

```
switch(config)#interface ethernet 17
switch(config-if-Et17)#mrp leave-all-timer 12
switch(config-if-Et17)#
```
**mrp leave-timer**

The leave-timer controls the deregistration of attributes. If an MRP participant needs other participants to unregister their attributes, it sends a Leave message. When receiving a Leave message, the Leave-timer starts and unregisters the attributes if it doesn't receive Join messages for the attributes before the Leave-timer expires.

The `mrp leave-timer` command specifies the mrp leave-timer interval for the configuration mode interface. The default leave-timer interval is 0.6 seconds. Under normal operation conditions, this value should not be adjusted.

The `no mrp leave-timer` and `default mrp leave-timer` commands restore the default leave-timer interval of 0.6 seconds on the configuration mode interface by removing the corresponding `mrp leave-timer` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration

**Command Syntax**

```
  mrp leave-timer period
  no mrp leave-timer
  default mrp leave-timer
```

**Parameters**

- `period` leave all timer (seconds). Values range from 0.6 to 30.

**Example**

- This command sets the MRP leave timer interval on Ethernet interface 17 to 0.8 seconds.

  ```
  switch(config)#interface ethernet 17
  switch(config-if-Et17)#mrp leave-timer 0.8
  switch(config-if-Et17)#
  ```
msrp streams load-file

The load-file for MSRP streams provides a file that contains an alias that can be substituted in the name (stream-id) of a string.

The **msrp streams load-file** command allows users to include a line in the file (example: `0102.0304.0506 XYZW4` or `0102.0304 XYZW5`) that causes the bytes to be replaced with the accompanying string in **show msrp streams** commands.

The **no msrp streams load-file** and **default msrp streams load-file** commands remove the alias assignment by removing the corresponding **msrp streams load-file** command from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

```
msrp streams load-file [FILE TYPE]
no msrp streams load-file
default msrp streams load-file
```

**Parameters**

- **FILE TYPE**   
  The options include:
  - **certificate**: device name, directory, or file name
  - **extension**: device name, directory, or file name
  - **file**: device name, directory, or file name
  - **flash**: device name, directory, or file name
  - **ftp**: device name, directory, or file name
  - **http**: device name, directory, or file name
  - **https**: device name, directory, or file name
  - **scp**: device name, directory, or file name
  - **sftp**: device name, directory, or file name
  - **sslkey**: device name, directory, or file name
  - **system**: device name, directory, or file name
  - **terminal**: device name, directory, or file name
  - **tftp**: device name, directory, or file name
  - **usb1**: device name, directory, or file name

**Example**

- This command indicates that the file named file1 contains the alias names that is used in MSRP stream names.
  ```
  switch(config)#msrp streams load-file file1
  switch(config)#
  ```
**mvrp**

MVRP dynamically registers and unregisters VLANs on an interface. When an interface wishes to join a VLAN advertised by an MSRP talker (to receive a stream), MVRP sends a Join message. On receipt of the Join message, the interface is added to the VLAN. If the VLAN does not already exist, MVRP dynamically creates the VLAN and propagates it through the network.

The `mvrp` command enables Multiple VLAN Registration Protocol (MVRP) on the configuration mode interface. If MVRP was not previously enabled on any interface, MVRP is also enabled globally by this command.

The `no mvrp` and `default mvrp` commands disable MVRP on the configuration mode interface by removing the corresponding `mvrp` command from `running-config`. These commands also disable MVRP globally when MVRP is no longer enabled on any interface.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

```
mvrp
no mvrp
default mvrp
```

**Example**

- These commands enable MVRP on Ethernet interface 34. If MVRP was not previously enabled on any other interface, these commands also enable MVRP globally.

```
switch(config)#interface ethernet 34
switch(config-if-Et34)#mvrp
switch(config-if-Et34)#
```
show msrp

The `show msrp` command displays MSRP operational information for the specified interfaces.

**Command Mode**

EXEC

**Command Syntax**

```
show msrp [INTERFACE_NAME]
```

**Parameters**

- `INTERFACE_NAME` Interface type and number. Values include
  - `<no parameter>` all Ethernet interfaces.
  - `interfaces ethernet e_range` Ethernet interface list.

Valid `e_range` formats include number, range, or comma-delimited list of numbers and ranges.

**Example**

- This command displays the MSRP status for Ethernet interfaces 41 through 43.

  ```
  switch(config)#show msrp interfaces ethernet 41-43
  
  MSRP Global Status : Enabled
  Max Frame Size : 1522

  Et43 Disabled 3
  
  switch(config)#
  ```
The `show msrp interfaces` command displays station stream information for the specified station type, interfaces and streams.

**Command Mode**

**EXEC**

**Command Syntax**

```
show msrp interfaces [INTERFACE_NAME] STATION_TYPE_NAME [STREAMS]
```

**Parameters**

- **INTERFACE_NAME** Interface type and number. Values include:
  - `<no parameter>` all Ethernet interfaces.
  - `ethernet e_range` Ethernet interface list.
- **STATION_TYPE** Endpoint type. Values include:
  - `talker` Command displays data for talker station streams.
  - `listeners` Command displays data for listener station streams.
  - `streams` Command displays data for talker and listener station streams.
- **STREAMS** Streams for which command displays information. Options include:
  - `<no parameter>` all streams.
  - `stream-id hex_string` specifies the stream command for which command displays information.

Valid `e_range` formats include number, range, or comma-delimited list of numbers and ranges.
Valid `hex_string` formats include `<H>, <H.H>, <H.H.H>, or <H.H.H.H>`, where `H` is a four-digit hex number that ranges from `0` to `FFFF`.

**Example**

- This command displays data for listener station streams on Ethernet interfaces 1 and 2.

```
switch(config)#show msrp interfaces ethernet 1-2 listeners

switch(config)#
show msrp streams

The `show msrp streams` command displays configuration and status information on the specified MSRP streams.

**Command Mode**

EXEC

**Command Syntax**

```plaintext
show msrp streams [STREAM_NAME] [INFO_LEVEL]
```

**Parameters**

- `STREAMS` Streams for which command displays information. Options include:
  - `<no parameter>` all streams.
  - `stream-id hex_string` specifies the stream command for which command displays information.

Valid `hex_string` formats include `<H>`, `<H.H>`, `<H.H.H>`, or `<H.H.H.H>`, where `H` is a four-digit hex number that ranges from `0` to `FFFF`.

- `INFO_LEVEL` type of information that the command displays. Options include:
  - `<no parameter>` command displays stream identification information.
  - `detail` command displays identification and transmission characteristics.
  - `propagation` command displays ingress and egress port information.

**Examples**

- This command displays stream identification information.

  ```plaintext

switch(config)#
```
show mvrp

The `show mvrp` command displays MVRP operational information for the specified interfaces.

**Command Mode**
EXEC

**Command Syntax**
```
show MVRP [INTERFACE_NAME]
```

**Parameters**
- `INTERFACE_NAME` Interface type and number. Values include
  - `<no parameter>` all Ethernet interfaces.
  - `interfaces ethernet e_range` Ethernet interface list.
 Valid `e_range` formats include number, range, or comma-delimited list of numbers and ranges.

**Example**
- This command displays the MVRP status for Ethernet interfaces 30 through 40.
  ```
  switch(config)# show mvrp interfaces Ethernet 30-40
  ```
  MVRP Global Status : Enabled

  switch(config)#
This chapter describes the Arista switch SNMP agent and contains these sections:

- Section 43.1: SNMP Introduction
- Section 43.2: SNMP Conceptual Overview
- Section 43.3: Configuring SNMP
- Section 43.4: SNMP Commands

### 43.1 SNMP Introduction

Arista Networks switches support many standard SNMP MIBs, making it easier to integrate these platforms into existing network management infrastructures. With only a few configurations, many public domain and commercially available network management tools can quickly manage Arista switches out of the box. Support of SNMP V2 groups and views and V3 security allow network managers to tune switch monitoring to match the administration policy of the IT organization.

### 43.2 SNMP Conceptual Overview

Simple Network Management Protocol (SNMP) is a protocol that provides a standardized framework and a common language to monitor and manage network devices.

#### 43.2.1 SNMP Structure

The SNMP framework has three parts:

- **SNMP manager**: The SNMP manager controls and monitors network host activities and is typically part of a Network Management System (NMS).
- **SNMP agent**: The SNMP agent is the managed device component that manages and reports device information to the manager.
- **Management Information Base (MIB)**: The MIB stores network management information.

The agent and MIB reside on the switch. Enabling the SNMP agent requires the definition of the manager-agent relationship. The agent contains MIB variables whose values the manager can request or change. The agent gathers data from the MIB and responds to requests for information. For a list of supported MIBs, please refer to the release notes for a specific EOS version.

This chapter discusses enabling the SNMP agent on an Arista switch and controlling notification transmissions from the agent. Information on using SNMP management systems is available in the appropriate documentation for the corresponding NMS application.
43.2.2 SNMP Notifications

SNMP notifications are messages, sent by the agent, informing of an event or a network condition. A trap is an unsolicited notification. An inform (or inform request) is a trap that includes a request for a confirmation that the message is received. Events that a notification can indicate include improper user authentication, restart, and connection losses.

For a list of supported traps, please refer to the release notes for a specific EOS version.

43.2.3 SNMP Versions

Arista switches support the following SNMP versions:

- **SNMPv1**: The Simple Network Management Protocol, defined in RFC 1157. Security is based on community strings.
- **SNMPv2c**: Community-string based Administrative Framework for SNMPv2, defined in RFC 1901, RFC 1905, and RFC 1906. Security is based on SNMPv1.
- **SNMPv3**: Version 3, as defined in RFCs 2273 to 2275.

43.3 Configuring SNMP

This section describes the steps that configure the switch SNMP agent to communicate with an SNMP manager, including the following:

- Enabling and Disabling SNMP
- Configuring Community Access Control
- Configuring SNMP Parameters
- Configuring the Agent to Send Notifications
- Extending the SNMP Agent Through Run Time Scripts

43.3.1 Enabling and Disabling SNMP

SNMP is enabled globally by issuing any `snmp-server community` or `snmp-server user` command. The `no snmp-server` command disables SNMP agent operation by removing all non-default `snmp-server` commands from `running-config`.

43.3.2 Enabling SNMP in a VRF

By default, SNMP is enabled only in the default VRF. The switch can only send SNMP traps and informs if the host that has been configured to receive them is accessible through an interface in a VRF in which SNMP has been enabled.

To enable or disable SNMP in a VRF, use the `snmp-server vrf` command.

43.3.3 Configuring Community Access Control

SNMP community strings serve as passwords that permit an SNMP manager to access the agent on the switch. A Network Management System (NMS) can access the switch only if its community string matches at least one of the switch’s community strings.

The `snmp-server community` command configures the community string.
Example

- This command adds the community string \texttt{ab\_1} to provide read-only access to the switch agent.
  
  \begin{verbatim}
  switch(config)#snmp-server community ab_1 ro
  switch(config)#
  \end{verbatim}

Community statements can reference views to limit MIB objects that are available to a manager. A view is a community string object that specifies a subset of MIB objects. The \texttt{snmp-server view} command configures the community string.

Example

- These commands create a view that includes all objects in the \texttt{system} group except for those in \texttt{system.2}.
  
  \begin{verbatim}
  switch(config)#snmp-server view sys-view system include
  switch(config)#snmp-server view sys-view system.2 exclude
  switch(config)#
  \end{verbatim}

- This command adds the community string \texttt{lab\_1} to provide read-only access to the switch agent for the previously defined view.
  
  \begin{verbatim}
  switch(config)#snmp-server community lab_1 view sys-view
  switch(config)#
  \end{verbatim}

43.3.4 Configuring SNMP Parameters

This section describes these SNMP parameter configuration tasks:

- Configuring the Engine ID
- Configuring the Group
- Configuring the User
- Configuring the Host
- Enabling Link Trap Generation
- Configuring the Chassis-id String
- Configuring the Contact String
- Configuring the Location String

Configuring the Engine ID

The \texttt{snmp-server engineID remote} command configures the name of a Simple Network Management Protocol (SNMP) engine located on a remote device. Use the \texttt{snmp-server engineID local} command for the local engine.

A remote agent’s engine ID must be configured before remote users for that agent are configured. User authentication and privacy digests are derived from the engine ID and user passwords. The configuration command fails if the remote engine ID is not configured first.

\textbf{Important!} When the remote engine ID is changed, all user passwords associated with the engine must be reconfigured.

Example

- This command configures DC945798CAB4 as the name of the remote SNMP engine located at 12.23.104.25, UDP port 162
  
  \begin{verbatim}
  switch(config)#snmp-server engineID remote 10.23.104.25 udp-port DC945798CA
  switch(config)#
  \end{verbatim}
Configuring the Group

An SNMP group grants specific levels of SNMP access to group users. The `snmp-server group` command configures a new SNMP group.

Example

- This command configures `normal_one` as an SNMPv3 group (authentication and encryption) that provides access to the `all-items` read view.

  ```
  switch(config)#snmp-server group normal_one v3 priv read all-items
  switch(config)#
  ```

Configuring the User

Members of SNMP groups are called “users.” The `snmp-server user` command allows a new user to be added an SNMP group and configures that user’s parameters. Remote users are configured by specifying the IP address or port number that accesses the user’s SNMP agent.

Example

- This command configures the local SNMPv3 user `tech-1` as a member of the SNMP group `tech-sup`.

  ```
  switch(config)#snmp-server user tech-1 tech-sup v3
  switch(config)#
  ```

- This command configures the remote SNMPv3 user `tech-2` as a member of the SNMP group `tech-sup`. The remote user is on the agent located at 13.1.1.4.

  ```
  switch(config)#snmp-server user tech-2 tech-sup remote 13.1.1.4 v3
  switch(config)#
  ```

Configuring the Host

The `snmp-server host` command configures an SNMP host (to which SNMP traps will be sent). The `snmp-server host` command sets the community string if it was not previously configured.

Example

- This command adds a v2c inform notification recipient at 12.15.2.3 using the community string `comm-1`.

  ```
  switch(config)#snmp-server host 12.15.2.3 informs version 2c comm-1
  switch(config)#
  ```

Enabling Link Trap Generation

The `snmp trap link-change` command enables SNMP link trap generation on the configuration mode interface. SNMP link trap generation is enabled by default. If SNMP link trap generation was previously disabled, this command removes the corresponding `no snmp link-status` statement from the configuration. The `show snmp notification` command displays the SNMP link trap generation information.

Example

- This command disables SNMP link trap generation on the Ethernet 5 interface.

  ```
  switch(config-if-Et5)#no snmp trap link-change
  switch(config-if-Et5)#
  ```
Specifying the Source Interface

The `snmp-server local-interface` command specifies the interface from where an SNMP trap originates. The `show snmp local-interface` command displays the interface of the IP address for SNMP traps.

**Example**

- This command configures the Ethernet 1 interface as the source of SNMP traps and informs.
  
  ```
  switch(config)#snmp-server local-interface ethernet 1
  switch(config)#
  ```

Configuring the Chassis-id String

The chassis ID string is typically set to the serial number of the switch. The SNMP manager uses this string to associate all data retrieved from the switch with a unique identifying label. Under normal operating conditions, editing the chassis ID string contents is unnecessary.

The `snmp-server chassis-id` command configures the chassis ID string. The default chassis ID string is the serial number of the switch. The `show snmp` command displays the chassis ID.

**Example**

- This command configures `xyz-1234` as the chassis-ID string, then displays the result.
  
  ```
  switch(config)#snmp-server chassis-id xyz-1234
  switch(config)#show snmp
  Chassis: xyz-1234
  <---chassis ID
  8 SNMP packets input
  0 Bad SNMP version errors
  0 Unknown community name
  0 Illegal operation for community name supplied
  0 Encoding errors
  8 Number of requested variables
  0 Number of altered variables
  4 Get-request PDUs
  4 Get-next PDUs
  0 Set-request PDUs
  21 SNMP packets output
  0 Too big errors
  0 No such name errors
  0 Bad value errors
  0 General errors
  8 Response PDUs
  0 Trap PDUs
  SNMP logging: enabled
  Logging to taccon.162
  SNMP agent enabled
  switch(config)#
  ```

Configuring the Contact String

The SNMP contact string is information text that typically displays the name of a person or organization associated with the SNMP agent.

The `snmp-server contact` command configures the system contact string. The contact string is displayed by the `show snmp` and `show snmp v2-mib contact` commands.
Example

- These commands configure *Bonnie H at 3-1470* as the contact string.

  switch(config)#snmp-server contact Bonnie H at 3-1470
  switch(config)#

Configuring the Location String

The location string typically provides information about the physical location of the SNMP agent. The `snmp-server location` command configures the system location string. By default, the system location string is not set.

Example

- These commands configure *lab-25* as the location string.

  switch(config)#snmp-server location lab_25
  switch(config)#show snmp v2-mib location
  Location: lab_25
  switch(config)#

43.3.5 Configuring the Agent to Send Notifications

The following steps are mandatory when setting up the SNMP agent to send notifications:

**Step 1** Configure the remote engine ID.
**Step 2** Configure the group.
**Step 3** Configure the user.
**Step 4** Configure the host.
**Step 5** Enable link trap generation on the interfaces.

Section 43.3.4 describes each of these tasks.

43.3.6 Extending the SNMP Agent Through Run Time Scripts

The switch supports the execution of user supplied scripts to service portions of the OID space. Scripts run under one of two operational modes:

- Normal: scripts run over an indefinite period to process subsequent objects after the initial request. Maintaining an executing script avoids startup and connection delay each time an object requires processing.
- One-shot mode: scripts process a single object, then terminates execution.

Normal extension scripts are conceptually multithreaded: one thread collects data and the other thread is ready to communicate with snmpd. One-shot scripts process a single object, running once and exiting. Startup and data collection overhead is required for each request. In both modes, the SNMP server is blocked from serving other requests when waiting for script responses.

The `snmp-server extension` command configures the execution of user supplied scripts to service portions of the OID space.

Example

- This command specifies the file *example.sh*, located in flash as the script file that services the specified OID space in normal mode.

  switch(config)#snmp-server extension .1.3.6.1.4.1.8072.2 flash:example.sh
  switch(config)#
43.3.6.1 Normal Script Behavior

The first time the SNMP server requires a script result, it launches it with no arguments. The server communicates with the script through stdin/stdout. Before each request, the script is the string `PING
` on stdin. The expected response is printing `PONG
` to stdout.

GET and GETNEXT Requests

For GET and GETNEXT requests, the script is passed two lines on stdin, the command (get or getnext) and the requested OID. The expected response from the script is the printing of three lines to stdout: , the TYPE, the OID for the result varbind, and the VALUE itself.

Table 43-1 lists legal TYPE values and resulting VALUE encodings. If the command does not return an appropriate varbind, it should print "NONE
" to stdout and continue running; this results in an SNMP `noSuchName` error or a `noSuchInstance` exception.

Table 43-1 Extension Script Type and Encoding

<table>

<tr>
<td>opaque</td>
<td>Opaque</td>
<td>hexadecimal string</td>
</tr>
<tr>
<td>string</td>
<td>OctetString</td>
<td>ascii string</td>
</tr>
</tbody>
</table>

SET Requests

For SET requests, script is passed three lines on stdin: the command (set), and the requested OID, and the type and value, both on the same line. If the assignment is successful, the expected script response is to print `DONE
` to stdout. Indicated errors by writing one of the error strings described in Table 43-2. In each case, the command should continue running.

<table>
<thead>
<tr>

</tr>
<tr>
<td>gen-error</td>
<td>wrong-length</td>
</tr>
</tbody>
</table>

Table 43-2 Set Request Error Strings

43.3.6.2 One Shot Script Behavior

The command should exit after it finishes processing a single object.
GET and GETNEXT

For each GET or GETNEXT request, the script is invoked once for each OID in the space that it serves. It receives two arguments: -g for GET or -n for GETNEXT, and the requested OID.

The expected script response is the response varbind as three separate lines printed to stdout: the result OID, the type, and the value.

If the command does not return an appropriate varbind, then the script should exit without producing any output. This results in an SNMP NoSuchName error, or a NoSuchInstance exception.

Possible reasons that a command would not return an appropriate varbind includes:

- The specified OID didn’t correspond to a valid instance for a GET request.
- There were no following instances for a GETNEXT.

SET

A SET request results in the command being called with the arguments: -s, OID, TYPE and VALUE, where TYPE is a listed token. Table 43-1 indicates the type of the value passed as the third parameter.

When the assignment is successful, the script exits without producing any output. Errors are indicated by writing just the error name (Table 43-2); the agent generates the appropriate error response.
43.4 SNMP Commands

Global Configuration Commands
- `no snmp-server`
- `snmp-server chassis-id`
- `snmp-server community`
- `snmp-server contact`
- `snmp-server enable traps`
- `snmp-server engineID local`
- `snmp-server engineID remote`
- `snmp-server extension`
- `snmp-server group`
- `snmp-server host`
- `snmp-server location`
- `snmp-server local-interface`
- `snmp-server user`
- `snmp-server view`
- `snmp-server vrf`

Interface Configuration Commands
- `snmp trap link-change`

Display Commands
- `show snmp`
- `show snmp community`
- `show snmp engineID`
- `show snmp group`
- `show snmp local-interface`
- `show snmp mib`
- `show snmp notification host`
- `show snmp notification`
- `show snmp user`
- `show snmp v2-mib chassis`
- `show snmp v2-mib contact`
- `show snmp v2-mib location`
- `show snmp view`
no snmp-server

The `no snmp-server` and `default snmp-server` commands disable Simple Network Management Protocol (SNMP) agent operation by removing all `snmp-server` commands from `running-config`.

SNMP is enabled with any `snmp-server community` or `snmp-server user` command.

**Command Mode**
- Global Configuration

**Command Syntax**
- `no snmp-server`
- `default snmp-server`

**Example**
- This command disables SNMP agent operation on the switch.
  
```plaintext
switch(config)#no snmp-server
switch(config)#
```
show snmp

The `show snmp` command displays SNMP information including the SNMP counter status and the chassis ID string.

**Example**

```
EXEC
```

**Command Syntax**

```
show snmp
```

**Example**

- This command displays SNMP counter status, the chassis ID, the previously configured location string, logging status and destination, and the VRFs in which the SNMP agent is operating.

```
switch>show snmp
Chassis: JFL08320162
Location: 5470ga.dc
2329135 SNMP packets input
  0 Bad SNMP version errors
  0 Unknown community name
  0 Illegal operation for community name supplied
  0 Encoding errors
  38132599 Number of requested variables
  0 Number of altered variables
  563934 Get-request PDUs
  148236 Get-next PDUs
  0 Set-request PDUs
2329437 SNMP packets output
  0 Too big errors
  0 No such name errors
  0 Bad value errors
  0 General errors
  2329135 Response PDUs
  0 Trap PDUs
SNMP logging: enabled
  Logging to 172.22.22.20.162
SNMP agent configured in VRFs: default
SNMP agent enabled in default VRF
switch>
```
**show snmp community**

The *show snmp community* command displays the Simple Network Management Protocol (SNMP) community access strings configured by the *snmp-server community* command.

**Example**

EXEC

**Command Syntax**

```
show snmp community
```

**Example**

- This command displays the list of community access strings configured on the switch.

```
switch>show snmp community
Community name: public
switch>
```
show snmp engineID

The **show snmp engineID** command displays the local SNMP engine information configured on the switch.

**Example**

```plaintext
EXEC

Command Syntax

show snmp engineID

Example

- This command displays the ID of the local SNMP engine.

  switch>show snmp engineid
  Local SNMP EngineID: f5717f001c730436d700
  switch>
  ```
show snmp group

The `show snmp group` command shows the names of configured SNMP groups along with the security model, and view status of each group.

**Example**

```
EXEC
```

**Command Syntax**

```
show snmp group [GROUP_LIST]
```

**Parameters**

- `GROUP_LIST`  the name of the group.
- `<no parameter>`  displays information about all groups.
- `group_name`  the name of the group.

**Field Descriptions**

- `groupname`  name of the SNMP group.
- `security model`  security model used by the group: `v1`, `v2c`, or `v3`.
- `readview`  string identifying the group’s read view. Refer to `show snmp view`.
- `writeview`  string identifying the group’s write view.
- `notifyview`  string identifying the group’s notify view.

**Example**

```
This command displays the groups configured on the switch.
```

```
switch>show snmp group
  groupname : normal                          security model:v3 priv
  readview  : all                             writeview: <no writeview specified>
  notifyview: <no notifyview specified>

switch>
```
**show snmp local-interface**

The `show snmp local-interface` command displays the interface whose IP address is the source address for SNMP traps.

**Example**

```
EXEC
```

**Command Syntax**

```
show snmp local-interface
```

**Example**

- This command displays the source interface for the SNMP notifications.

```
switch>show snmp local-interface
SNMP source interface: Ethernet1
switch>
```
**show snmp mib**

The `show snmp mib` command displays values associated with specified MIB object identifiers (OIDs) that are registered on the switch.

**Example**

```
EXEC
```

**Command Syntax**

```
show snmp mib OBJECTS
```

**Parameters**

- **OBJECTS** object identifiers for which the command returns data. Options include:
  - `get oid_1 [oid_2 ... oid_x]` values associated with each listed OID.
  - `get-next oid_1 [oid_2 ... oid_x]` values associated with subsequent OIDs relative to listed OIDs.
  - `table oid` table associated with specified OID.
  - `translate oid` object name associated with specified OID.
  - `walk oid` objects below the specified subtree.

**Example**

- This command uses the get option to retrieve information about the sysORID.1 OID.
  ```
  switch#show snmp mib get sysORID.1
  SNMPv2-MIB::sysORID[1] = OID: TCP-MIB::tcpMIB
  ```

- This command uses the get-next option to retrieve information about the OID that is after sysORID.8.
  ```
  switch#show snmp mib get-next sysORID.8
  SNMPv2-MIB::sysORDescr[1] = STRING: The MIB module for managing TCP implementations
  ```
show snmp notification host

The **show snmp notification host** command displays information for Simple Network Management Protocol notification. Details include IP address and port number of the Network Management System, notification type, and SNMP version.

**Example**

EXEC

**Command Syntax**

```
show snmp notification host
```

**Field Descriptions**

- **Notification host** IP address of the host.
- **udp-port** port number.
- **type** notification type.
- **user** access type of the user.
- **security model** SNMP version used.
- **traps** details of the notification.

**Example**

- This command displays the hosts configured on the switch.

```
switch>show snmp notification host
Notification host: 172.22.22.20  udp-port: 162  type: trap
        user: public                        security model: v2c

switch>
```
**show snmp notification**

The `show snmp notification` command displays the SNMP trap generation information.

**Example**

EXEC

**Command Syntax**

```
show snmp notification
```

**Example**

- This command displays the SNMP traps configured on the switch.

```
switch>show snmp notification

<table>

switch>
```
show snmp user

The `show snmp user` command shows information about Simple Network Management Protocol (SNMP) users. Information that the command displays about each user includes their SNMP version, the engine ID of the host where they reside, and security information.

Example

```
EXEC
```

Command Syntax

```
show snmp user [USER_LIST]
```

Parameters

- `USER_LIST` the name of the group.
  - `<no parameter>` displays information about all users.
  - `user_name` specifies name of displayed user.

Example

```
This command displays information about the users configured on the switch.

switch>show snmp user

User name: test

Security model: v3
Engine ID: f5717f001c73010e0900
Authentication protocol: SHA
Privacy protocol: AES-128
Group name: normal
```

switch>
**show snmp v2-mib chassis**

The **show snmp v2-mib chassis** command displays the Simple Network Management Protocol (SNMP) server serial number or the chassis ID string configured by the **snmp-server chassis-id** command.

**Example**

EXEC

**Command Syntax**

```
show snmp v2-mib chassis
```

**Example**

- This command displays the chassis ID string.

```
switch>show snmp v2-mib chassis
Chassis: JFL08320162
switch>
```
show snmp v2-mib contact

The `show snmp v2-mib contact` command displays the Simple Network Management Protocol (SNMP) system contact string configured by the `snmp-server contact` command. The command has no effect if a contact string was not previously configured.

**Example**

**EXEC**

**Command Syntax**

```
show snmp v2-mib contact
```

**Example**

- This command displays the contact string contents.

```
switch>show snmp v2-mib contact
Contact: John Smith
switch>
```
**show snmp v2-mib location**

The **show snmp v2-mib location** command displays the Simple Network Management Protocol (SNMP) system location string. The **snmp-server location** command configures system location details. The command has no effect if a location string was not previously configured.

**Example**

```
EXEC
```

**Command Syntax**

```
show snmp v2-mib location
```

**Example**

- This command displays the location string contents.

```
switch>show snmp v2-mib location
Location: santa clara
switch>
```
show snmp view

The `show snmp view` command displays the information of a Simple Network Management Protocol configuration and the associated MIB. SNMP views are configured with the `snmp-server view` command.

Example

EXEC

Command Syntax

`show snmp view [VIEW_LIST]`

Parameters

- **VIEW_LIST** the name of the view.
  - `<no parameter>` displays information about all views.
  - `view_name` the name of the view.

Field Descriptions

- **First column** view name.
- **Second column** name of the MIB object or family.
- **Third column** inclusion level of the specified family within the view.

Example

- These commands configure an SNMP view, then displays that view.

  `switch(config)#snmp-server view sys-view system include`
  `switch(config)#snmp-server view sys-view system.2 exclude`
  `switch(config)#show snmp view`
  `sys-view system - included`
  `sys-view system.2 - excluded`
snmp-server chassis-id

The `snmp-server chassis-id` command configures the chassis ID string. The default chassis ID string is the serial number of the switch. The `show snmp` command displays the chassis ID.

The `no snmp-server chassis-id` and `default snmp-server chassis-id` commands restore the default chassis ID string by removing the `snmp-server chassis-id` command from the configuration.

**Command Mode**
Global Configuration

**Command Syntax**

```
  snmp-server chassis-id  id_text
  no snmp-server chassis-id
  default snmp-server chassis-id
```

**Parameters**

- `id_text`  chassis ID string

**Example**

- These commands configure `xyz-1234` as the chassis-id string, then display the result.

  ```
  switch(config)#snmp-server chassis-id xyz-1234
  switch(config)#show snmp
  Chassis: xyz-1234
  <--chassis ID
  8 SNMP packets input
  0 Bad SNMP version errors
  0 Unknown community name
  0 Illegal operation for community name supplied
  0 Encoding errors
  8 Number of requested variables
  0 Number of altered variables
  4 Get-request PDUs
  4 Get-next PDUs
  0 Set-request PDUs
  8 SNMP packets output
  0 Too big errors
  0 No such name errors
  0 Bad value errors
  0 General errors
  8 Response PDUs
  0 Trap PDUs
  SNMP logging: enabled
     Logging to taccon.162
  SNMP agent enabled
  switch(config)#
  ```
**snmp-server community**

The `snmp-server community` command configures the community string. SNMP community strings serve as passwords that permit an SNMP manager to access the agent on the switch. The Network Management System (NMS) must define a community string that matches at least one of the switch community strings to access the switch.

The `no snmp-server community` and `default snmp-server community` commands remove the community access string from the configuration.

**Command Mode**

Global Configuration

**Command Syntax**

```
  snmp-server community string_text [MIB_VIEW] [ACCESS] [ACL_NAMES]
  no snmp-server community string_text
  default snmp-server community string_text
```

**Parameters**

- `string_text`  community access string.
- `MIB_VIEW`  community access availability. Options include:
  - `<no parameter>`  community string allows access to all objects.
  - `view view_name`  community string allows access only to objects in the `view_name` view.
- `ACCESS`  community access availability. Options include:
  - `<no parameter>`  read-only access (default setting).
  - `ro`  read-only access.
  - `rw`  read-write access.
- `ACL_NAMES`  community access availability. Options include:
  - `<no parameter>`  community string allows access to all objects.
  - `list_v4`  IPv4 ACL list.
  - `ipv6 list_v6`  IPv6 ACL list.
  - `ipv6 list_v6 list_v4`  IPv4 and IPv6 ACL list.

**Example**

- This command adds the community string `lab_1` to provide read-only access to the switch agent.

  ```
  switch(config)#snmp-server community lab_1 ro
  switch(config)#
  ```
**snmp-server contact**

The `snmp-server contact` command configures the system contact string. The contact is displayed by the `show snmp` and `show snmp v2-mib contact` commands.

The `no snmp-server contact` and `default snmp-server contact` commands remove the `snmp-server contact` command from the configuration.

**Command Mode**
Global Configuration

**Command Syntax**

```
snmp-server contact contact_string
no snmp-server contact
default snmp-server contact
```

**Parameters**
- `contact_string` system contact string.

**Example**
- These commands configure *Bonnie H* as the contact string, then display the result.
  ```
switch(config)#snmp-server contact Bonnie H
switch(config)#show snmp
Chassis: xyz-1234
Contact: Bonnie H.
8 SNMP packets input
  0 Bad SNMP version errors
  0 Unknown community name
  0 Illegal operation for community name supplied
  0 Encoding errors
  8 Number of requested variables
  0 Number of altered variables
  4 Get-request PDUs
  4 Get-next PDUs
  0 Set-request PDUs
24 SNMP packets output
  0 Too big errors
  0 No such name errors
  0 Bad value errors
  0 General errors
  8 Response PDUs
  0 Trap PDUs
SNMP logging: enabled
  Logging to taccon.162
SNMP agent enabled
switch(config)#
```
snmp-server enable traps

The `snmp-server enable traps` command enables both Simple Network Management Protocol (SNMP) traps and SNMP inform requests; use the `snmp-server host` command to specify which will receive SNMP notifications. Sending notifications requires at least one `snmp-server host` command.

The `snmp-server enable traps` and `no snmp-server enable traps` commands, without a MIB parameter, specify the default notification trap generation setting for all MIBs. These commands, when specifying a MIB, control notification generation for the specified MIB. The `default snmp-server enable traps` command resets notification generation to the default setting for the specified MIB.

Command Mode
Global Configuration

Command Syntax

```
snmp-server enable traps [trap_type]
no snmp-server enable traps [trap_type]
default snmp-server enable traps [trap_type]
```

Parameters

- `trap_type` controls the generation of informs or traps for the specified MIB:
  - `<no parameter>` controls notifications for MIBs not covered by specific commands.
  - `entity` controls entity-MIB modification notifications.
  - `lldp` controls LLDP notifications.
  - `msdpBackwardTransition` controls msdpBackwardTransition notifications.
  - `msdpEstablished` controls msdpEstablished notifications.
  - `snmp` controls SNMP-v2 notifications.
  - `switchover` controls switchover notifications.
  - `snmpConfigManEvent` controls snmpConfigManEvent notifications.
  - `test` controls test traps.

Examples

- These commands enables notification generation for all MIBs except spanning tree.
  ```
  switch(config)#snmp-server enable traps
  switch(config)#no snmp-server enable traps spanning-tree
  switch(config)#
  ```

- This command enables spanning-tree MIB notification generation, regardless of the default setting.
  ```
  switch(config)#snmp-server enable traps spanning-tree
  switch(config)#
  ```

- This command resets the spanning-tree MIB notification generation to follow the default setting.
  ```
  switch(config)#default snmp-server enable traps spanning-tree
  switch(config)#
  ```

- This command enables switchover MIB notification generation, regardless of the default setting.
  ```
  switch(config)#snmp-server enable traps switchover
  switch(config)#
  ```

- This command resets the switchover MIB notification generation to follow the default setting.
  ```
  switch(config)# default snmp-server enable traps switchover
  switch(config)#
  ```
The `snmp-server engineID local` command configures the name for the local Simple Network Management Protocol (SNMP) engine. The default SNMP engineID is generated by the switch and is used when an engineID is not configured with this command. The `show snmp engineID` command displays the default or configured engine ID.

SNMPv3 authenticates users through security digests (MD5 or SHA) that are based on user passwords and the local engine ID. Passwords entered on the CLI are similarly converted, then compared to the user's security digest to authenticate the user.

**Important!** Changing the local engineID value invalidates SNMPv3 security digests, requiring the reconfiguration of all user passwords.

The `no snmp-server engineID local` and `default snmp-server engineID local` commands restore the default engineID by removing the `snmp-server engineID local` command from the configuration.

**Command Mode**
Global Configuration

**Command Syntax**
```
snmp-server engineID local engine_hex
no snmp-server engineID local
default snmp-server engineID
```

**Parameters**
- `engine_hex` the switch’s name for the local SNMP engine (hex string).
  
The string must consist of at least ten characters with a maximum of 64 characters.

**Example**
- This command configures DC945798CAB4 as the name of the local SNMP engine.
```
switch(config)#snmp-server engineID local DC945798CAB4
switch(config)#
```
snmp-server engineID remote

The `snmp-server engineID remote` command configures the name of a Simple Network Management Protocol (SNMP) engine located on a remote device. The switch generates a default engineID; use the `show snmp engineID` command to view the configured or default engineID.

An SNMPv3 inform requires a remote engine ID to compute the security digest that authenticates and encrypts data transmitted to remote users. SNMPv3 authenticates users with MD5 or SHA through the engine ID and user passwords. CLI passwords are similarly authenticated.

**Important!** Changing the engineID value invalidates SNMPv3 security digests, requiring the reconfiguration of all user passwords.

The `no snmp-server engineID remote` and `default snmp-server engineID remote` commands remove the `snmp-server engineID remote` command from the configuration.

**Command Mode**
Global Configuration

**Command Syntax**
```
  snmp-server engineID remote engine_addr [PORT] engine_hex
  no snmp-server engineID remote engine_addr [PORT]
  default snmp-server engineID remote engine_addr [PORT]
```

**Parameters**
- `engine_addr` location of remote engine (IP address or host name).
- `PORT` udp port location of the remote engine. Options include:
  - `<No parameter>` port number 161 (default).
  - `udp-port port_num` port number. Ranges from 0 to 65535.
- `engine_hex` the switch’s name for the remote SNMP engine (hex string).
  The string must have at least ten characters and can contain a maximum of 64 characters.

**Example**
- This command configures DC945798CA as the engineID of the remote SNMP engine located at 10.23.10.25, UDP port 162.
  ```
  switch(config)#snmp-server engineID remote 10.23.10.25 udp-port 162 DC945798CA
  switch(config)#
  ```
The `snmp-server extension` command configures the execution of user supplied scripts to service portions of the OID space.

The `no snmp-server extension` and `default snmp-server extension` commands deletes the `snmp-server extension` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
snmp-server extension OID_space FILE_PATH [DURATION]
```

**Parameters**

- **OID_space**: OID branch serviced by the script, in numerical format.
- **FILE_PATH**: path and name of the script file. Options include:
  - `file`: file is located in the switch file directory.
  - `flash`: file is located in flash memory.
- **DURATION**: the execution scope of the script.
  - `<no parameter>`: script runs after initial request to process subsequent requests.
  - `one-shot`: script processes a single object (runs once), then terminates.

**Examples**

- This command specifies the file `example.sh`, located in flash, as the script file that services the listed OID space.

  ```
  switch(config)#snmp-server extension .1.3.6.1.4.1.8072.2 flash:example.sh
  ```
snmp-server group

The **snmp-server group** command configures a new Simple Network Management Protocol (SNMP) group or modifies an existing group. An SNMP group is a data structure that user statements reference to map SNMP users to SNMP contexts and views, providing a common access policy to the specified users.

An SNMP context is a collection of management information items accessible by an SNMP entity. Each item may exist in multiple contexts. Each SNMP entity can access multiple contexts. A context is identified by the EngineID of the hosting device and a context name.

The **no snmp-server group** and **default snmp-server group** commands delete the specified group by removing the corresponding **snmp-server group** command from the configuration.

**Command Mode**
- Global Configuration

**Command Syntax**

```
snmp-server group group_name VERSION [CNTX] [READ] [WRITE] [NOTIFY]
no snmp-server group group_name VERSION
default snmp-server group group_name VERSION
```

**Parameters**

- **group_name** the name of the group.
- **VERSION** the security model utilized by the group.
  - v1 SNMPv1. Uses a community string match for authentication.
  - v2c SNMPv2c. Uses a community string match for authentication.
  - v3 no auth SNMPv3. Uses a username match for authentication.
  - v3 auth SNMPv3. HMAC-MD5 or HMAC-SHA authentication.
  - v3 priv SNMPv3. HMAC-MD5 or HMAC-SHA authentication. AES or DES encryption.
- **CNTX** associates the SNMP group to an SNMP context.
  - <no parameter> command does not associate group with an SNMP context.
  - **context context_name** associates group with context specified by **context_name**.
- **READ** specifies read view for SNMP group.
  - <no parameter> command does not specify read view.
  - **read read_name** read view specified by **read_name** (string – maximum 64 characters).
- **WRITE** specifies write view for SNMP group.
  - <no parameter> command does not specify write view.
  - **write write_name** write view specified by **write_name** (string – maximum 64 characters).
- **NOTIFY** specifies notify view for SNMP group.
  - <no parameter> command does not specify notify view.
  - **notify notify_name** notify view specified by **notify_name** (string – maximum 64 characters).

**Example**

- This command configures normal_one as SNMP version 3 group (authentication and encryption) that provides access to the **all-items** read view.

```
switch(config)#snmp-server group normal_one v3 priv read all-items
switch(config)#
```
**snmp-server host**

The **snmp-server host** command command configures an SNMP host (to which SNMP traps will be sent) and sets the community string if it was not previously configured. The host is denoted by host location and community string. The command also specifies the type of SNMP notifications that are sent: a **trap** is an unsolicited notification; an **inform** is a trap that includes a request for a confirmation that the message is received.

The configuration can contain multiple statements to the same host location with different community strings. For instance, a configuration can simultaneously contain all of the following:

- `snmp-server host host-1 version 2c comm-1`
- `snmp-server host host-1 informs version 2c comm-2`
- `snmp-server host host-1 version 2c comm-3 udp-port 666`
- `snmp-server host host-1 version 3 auth comm-3`

The **no snmp-server host** and **default snmp-server host** commands remove the specified host by deleting the corresponding **snmp-server host** statement from the configuration. When removing a statement, the host (address and port) and community string must be specified.

**Command Mode**

Global Configuration

**Command Syntax**

```plaintext
snmp-server host host_id [VRF_INST] [MESSAGE] [VERSION] comm_str [PORT]
no snmp-server host host_id [VRF_INST] [MESSAGE] [VERSION] comm_str [PORT]
default snmp-server host host_id [VRF_INST] [MESSAGE] [VERSION] comm_str [PORT]
```

**Parameters**

- **host_id**   hostname or IP address of the SNMP host.
- **VRF_INST** specifies the VRF instance being modified.
  - <no parameter> changes are made to the default VRF.
  - `vrf vrf_name` changes are made to the specified user-defined VRF.
- **MESSAGE** message type that is sent to the host.
  - <no parameter> sends SNMP traps to host (default).
  - `informs` sends SNMP informs to host.
  - `traps` sends SNMP traps to host.
- **VERSION** SNMP version. Options include:
  - <no parameter> SNMPv2c (default).
  - `version 1` SNMPv1; option not available with informs.
  - `version 2c` SNMPv2c.
  - `version 3 noauth` SNMPv3; enables user-name match authentication.
  - `version 3 auth` SNMPv3; enables MD5 and SHA packet authentication.
  - `version 3 priv` SNMPv3. HMAC-MD5 or HMAC-SHA authentication. AES or DES encryption.
- **comm_str** community string to be sent with the notification as a password.
  - Arista recommends setting this string separately before issuing the **snmp-server host** command.
  - To set the community string separately, use the **snmp-server community** command.
- **PORT** port number of the host.
Guidelines
The switch can only send SNMP traps and informs if the host that has been configured to receive them is accessible through an interface in a VRF in which SNMP has been enabled. SNMP is enabled by default only in the default VRF. Enable or disable SNMP in a VRF with the `snmp-server vrf` command.

Example
This command adds a version 2c inform notification recipient.

```
switch(config)#snmp-server host 10.15.2.3 informs version 2c comm-1
switch(config)#
```
snmp-server location

The `snmp-server location` command configures the system location string. By default, no system location string is set.

The `no snmp-server location` and `default snmp-server location` commands delete the location string by removing the `snmp-server location` command from the configuration.

**Command Mode**
- Global Configuration

**Command Syntax**

```plaintext
snmp-server location node_locate
no snmp-server location
default snmp-server location
```

**Parameters**
- `node_locate` system location information (string).

**Example**
- These commands configure `lab-east` as the location string.
  ```plaintext
  switch(config)#snmp-server location lab_east
  ```
snmp-server local-interface

The `snmp-server local-interface` command specifies the interface where SNMP originates informs and traps.

The `no snmp-server local-interface` and `default snmp-server local-interface` commands remove the inform or trap source assignment by removing the `snmp-server local-interface` command from `running-config`.

Command Mode

Global Configuration

Command Syntax

```
snmp-server local-interface INTERFACE
no snmp-server local-interface
default snmp-server local-interface
```

Parameters

- `INTERFACE` Interface type and number. Values include:
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-Channel Interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
  - `vrf vrf_name` The VRF in which SNMP is enabled. The keyword `default` specifies the default VRF.

Example

- This command configures the Ethernet 1 interface as the source of SNMP traps and informs.

  `switch(config)#snmp-server local-interface ethernet 1`
snmp-server user

The `snmp-server user` command adds a user to a Simple Network Management Protocol (SNMP) group or modifies an existing user’s parameters.

To configure a user, the IP address or port number of the device where the user’s remote SNMP agent resides must be specified. A user’s authentication comes from the engine ID and the user’s password. Remote user configuration commands fail if the remote engine ID is not configured first.

The `no snmp-server user` and `default snmp-server user` commands remove the user from an SNMP group by removing the user command from `running-config`.

**Command Mode**
- Global Configuration

**Command Syntax**

```
snmp-server user user_name group_name [AGENT] VERSION [ENGINE] [SECURITY]
no snmp-server user user_name group_name [AGENT] VERSION
default snmp-server user user_name group_name [AGENT] VERSION
```

**Parameters**
- `user_name` name of user.
- `group_name` name of group to which user is being added.
- `AGENT` Options include:
  - `<no parameter>` local SNMP agent.
  - `remote addr [udp-port p_num]` remote SNMP agent location.
    - `addr` denotes the IP address; `p_num` denotes the udp port socket. (default port is 162).
- `VERSION` SNMP version; options include:
  - `v1` SNMPv1.
  - `v2c` SNMPv2c.
  - `v3` SNMPv3.
- `ENGINE` engine ID used to localize passwords. Available only if `VERSION` is `v3`.
  - `<no parameter>` Passwords localized by SNMP copy specified by `agent`.
  - `localized engineID` octet string of `engineID`.
- `SECURITY` Specifies authentication and encryption levels. Available only if `VERSION` is `v3`.
  - `<no parameter>` no authentication or encryption.
  - `auth a_meth a_pass [priv e_meth e_pass]` authentication parameters.
    - `a_meth` authentication method: options are `md5` (HMAC-MD5-96) and `sha` (HMAC-SHA-96).
    - `a-pass` authentication string for users receiving packets.
    - `e-meth` encryption method: Options are `aes` (AES-128) and `des` (CBC-DES).
    - `e-pass` encryption string for the users sending packets.

**Example**
- This command configures the remote SNMP user `tech-1` to the `tech-sup` SNMP group.
  ```
  switch(config)#snmp-server user tech-1 tech-sup remote 10.1.1.2 v3
  ```
The `snmp-server view` command defines a view. An SNMP view defines a subset of objects from an MIB. Every SNMP access group specifies views, each associated with read or write access rights, to allow or limit the group’s access to MIB objects.

The `no snmp-server view` command deletes a view entry by removing the corresponding `snmp-server view` command from the `running-config`.

**Command Mode**
- Global Configuration

**Command Syntax**
```
snmp-server view view_name family_name [INCLUSION]
no snmp-server view view_name [family_name]
```

**Parameters**
- `view_name` Label for the view record that the command updates. Other commands reference the view with this label.
- `family_name` name of the MIB object or family.
  - MIB objects and MIB subtrees can be identified by name or by the numbers representing the position of the object or subtree in the MIB hierarchy.
- `INCLUSION` inclusion level of the specified family within the view. Options include:
  - `include` view includes the specified subtree.
  - `exclude` view excludes the specified subtree.

**Example**
- These commands create a view named `sys-view` that includes all objects in the `system` subtree except for those in `system.2`.
  ```
  switch(config)#snmp-server view sys-view system include
  switch(config)#snmp-server view sys-view system.2 exclude
  ```
**snmp-server vrf**

The `snmp-server vrf` command enables SNMP in the specified VRF. By default, SNMP is enabled only in default VRF.

- **User-defined VRFs**: The `no snmp-server vrf` command disables SNMP in the specified VRF by removing the corresponding `snmp-server vrf` command from the `running-config`.
- **Default VRF**: The `no snmp-server vrf` command disables SNMP in the VRF by adding a `no snmp-server vrf default` statement to `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
snmp-server vrf vrf_name
no snmp-server vrf vrf_name
default snmp-server vrf vrf_name
```

**Parameters**

- `vrf_name` The VRF in which SNMP is enabled. The keyword `default` specifies the default VRF.

**Guidelines**

The switch can only send SNMP traps and informs if the host that has been configured to receive them is accessible through an interface in a VRF in which SNMP has been enabled. SNMP is enabled by default only in the `default` VRF. Enable or disable SNMP in a VRF with the `snmp-server vrf` command.

**Example**

- These commands disable SNMP in the default VRF, then enable it in the user-defined VRFs named “magenta” and “columbia.”
  
  ```
  switch(config)#no snmp-server vrf default
  switch(config)#snmp-server vrf magenta
  switch(config)#snmp-server vrf columbia
  switch(config)#
  ```
**snmp trap link-change**

The `snmp trap link-change` command enables Simple Network Management Protocol (SNMP) link-status trap generation on the configuration mode interface. The generation of link-status traps is enabled by default. If SNMP link-trap generation was previously disabled, this command removes the corresponding `no snmp link-status` statement from the configuration to re-enable link-trap generation.

The `no snmp trap link-change` command disables SNMP link trap generation on the configuration mode interface.

The `snmp trap link-change` and `default snmp trap link-change` commands restore the default behavior by removing the `no snmp trap link-change` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration
- Interface-VXLAN Configuration

**Command Syntax**

```
snmp trap link-change
no snmp trap link-change
default snmp trap link-change
```

**Guidelines**

The switch can only send SNMP traps and informs if the host that has been configured to receive them is accessible through an interface in a VRF in which SNMP has been enabled. SNMP is enabled by default only in the `default` VRF. Enable or disable SNMP in a VRF with the `snmp-server vrf` command.

**Example**

- This command disables SNMP link trap generation on the Ethernet 5 interface.

```
switch(config-if-Et5)#no snmp trap link-change
switch(config-if-Et5)#
```
Latency Analyzer (LANZ)

Arista Networks’ Latency Analyzer (LANZ) is a family of EOS features that provide enhanced visibility into network dynamics, particularly in areas related to the delay packets experience through the network. The LANZ feature is available on the FM6000, Petra, Arad, Trident II, Jericho, Tomahawk and XP80 switch platforms.

This chapter describes the purpose, behavior, and configuration of LANZ features. Topics covered by this chapter include:

- Section 44.1: Introduction to LANZ
- Section 44.2: LANZ Overview
- Section 44.3: Configuring LANZ
- Section 44.4: LANZ Commands

44.1 Introduction to LANZ

LANZ tracks interface congestion and queuing latency with real-time reporting. With LANZ application layer event export, external applications can predict impending congestion and latency. This enables the application layer to make traffic routing decisions with visibility into the network layer.

With LANZ, network operations teams and administrators have near real-time visibility into the network, enabling early detection of microbursts. LANZ continually monitors congestion, allowing for rapid detection of congestion and sending of application layer messages.

44.2 LANZ Overview

LANZ monitors output queue lengths to provide congestion information for individual interfaces. This allows for more detailed analysis of congestion events, and allows identification of potential latency problems before they arise. On some platforms, LANZ also monitors global buffer usage.

Output queues for each port are monitored, and information about queue congestion events can be accessed in the form of system log messages, reports, or streaming.

44.2.1 LANZ Monitoring Mechanism

LANZ provides congestion data by continuously monitoring each port’s output queue lengths. When the length of an output queue exceeds the upper threshold for that port, LANZ generates an over-threshold event.
In the default Polling Mode, LANZ polls the most congested queue in each ASIC and continues to report an over-threshold state every 800 microseconds until all queue lengths for the port pass below the lower threshold. In Notifying Mode (available on selected platforms), LANZ monitors congestions on all queues and generates Start, Update, and End events every five seconds or at user-configured intervals.

44.2.2 LANZ Logging

Over-threshold events generated by LANZ can be logged as system log messages. Log messages are generated for events on all ports, at a maximum rate of one message per second per interface. The interval between messages can be configured globally.

Log messages indicate the time of the event, the interface affected, the threshold set for that interface, and the actual number of entries in the port’s queue.

44.2.3 LANZ Reporting

Detailed LANZ data can be viewed through the CLI or exported as a CSV-formatted report.

A circular FIFO event buffer is dynamically shared by all interfaces. When an interface begins generating LANZ over-threshold events it can fill all available buffer space. However, each interface is guaranteed sufficient resources for a minimum of 500 entries.

44.2.4 LANZ Streaming

On some platforms, external client applications can also receive congestion event information as a data stream. The switch can stream LANZ data to up to 100 clients via TCP through port 50001. Streamed data is in Google protocol buffer format, and includes both over-threshold events and LANZ configuration information.

44.2.5 Platforms

The LANZ feature is available on the FM6000, Petra, Arad, Trident II, Jericho and Tomahawk switch platforms. To determine the switch platform from the CLI, enter `show platform ?` at the prompt.

Settings and capabilities differ slightly between the platforms:

- The Petra and Arad chips measure threshold values in bytes; FM6000, Trident II, and Tomahawk chips measure threshold values in 512-byte segments.
- FM6000, Trident II, and Tomahawk chips allow configuration of both upper and lower threshold values.
- FM6000, Arad, Trident II, and Tomahawk chips support LANZ data streaming.
- Only FM6000 chips support global buffer monitoring.
- While the FM6000, Trident II, Jericho and Tomahawk chips can monitor congestion events for all queues, the Petra and Arad chips only monitor the most congested queues.
- Notifying Mode is available on Arad and Jericho platforms.
- LANZ is available on CPU ports on Trident II and Tomahawk platforms.
- LANZ is available on fabric ports on Trident, Trident II, and Tomahawk platforms.
44.3 Configuring LANZ

LANZ is disabled by default and must be enabled to function. Upper and lower queue-length thresholds can be defined for individual interfaces.

These sections describe the basic LANZ configuration steps:

- Section 44.3.1: Enabling and Disabling LANZ
- Section 44.3.2: Polling and Notifying Modes
- Section 44.3.3: Setting LANZ Congestion Thresholds
- Section 44.3.4: Setting LANZ Traffic Sampling
- Section 44.3.5: Logging LANZ Congestion Events
- Section 44.3.6: Viewing LANZ Data
- Section 44.3.7: Streaming LANZ Data

44.3.1 Enabling and Disabling LANZ

For the switch to collect and display latency information, LANZ must be enabled. The `queue-monitor length (global configuration mode)` command enables LANZ with the current settings, or with the default settings if none have been configured. LANZ is disabled by default.

When LANZ is enabled, the switch monitors queue lengths on all front-panel ports, and on CPU and fabric ports on selected platforms. Queue length data is available in the following forms:

- syslog data (see `queue-monitor length log`)
- CLI display or CSV-format output (see `show queue-monitor length`)
- data stream (see `queue-monitor streaming`)

To disable LANZ globally, enter the `no queue-monitor length` command in global configuration mode. Disabling LANZ globally also discards LANZ log data, but retains settings. To disable LANZ on an individual interface, enter the `no queue-monitor length` command in interface Ethernet configuration mode.

Examples

- This command enables LANZ on the switch.
  ```
  switch(config)#queue-monitor length
  ```
- This command disables LANZ on the switch.
  ```
  switch(config)#no queue-monitor length
  ```
- These commands disable LANZ on Ethernet interface 7.
  ```
  switch(config)#interface ethernet 7
  switch(config-if-Et7)#no queue-monitor length
  ```

44.3.2 Polling and Notifying Modes

LANZ operates by default in Polling Mode, which provides congestion data for the most congested queue per ASIC. Arad and Jericho platform switches also support Notifying Mode, which generates Start, Update, and End events for all queues.

- **Start** event is generated when any queue on an interface exceeds the upper threshold.
- **Update** events are generated periodically while the congested queue remains above the lower threshold. The interval at which Update events are generated is configured using the `queue-monitor length update-interval` command.
• **End** event is generated when the congested queue drops below the lower threshold. Notifying Mode is enabled using the `queue-monitor length notifying` command.

**Examples**

• This command enables Notifying Mode on the switch.
  
  ```
  switch(config)#queue-monitor length notifying
  ```

• This command disables Notifying Mode on the switch, returning LANZ to the default Polling Mode.
  
  ```
  switch(config)#no queue-monitor length notifying
  ```

• This command sets the time between congestion updates to 10 seconds.
  
  ```
  switch(config)#queue-monitor length update-interval 1000000
  ```

• This command resets the time between congestion updates to its default value of 5 seconds.
  
  ```
  switch(config)#default queue-monitor length update-interval
  ```

44.3.3 Setting LANZ Congestion Thresholds

When LANZ is enabled on the switch, it generates over-threshold events when queue lengths on any monitored interface exceed the upper threshold value and continues generating them until all the queue lengths on that interface drop back below the lower threshold.

44.3.3.1 Congestion Thresholds on FM6000, Trident II, and Tomahawk Switches

Queue lengths are measured in 480-byte segments on FM6000 switches and in 208-byte segments on Trident II and Tomahawk switches. The default threshold values are 512 segments and 256 segments. To change the threshold values for a specific interface, use the `queue-monitor length thresholds` (FM6000, Trident II, and Tomahawk) command.

FM6000 switches can also monitor global buffer usage. Global buffers are measured in 160-byte segments; the default threshold values are 10940 segments and 4376 segments. To enable global buffer monitoring, use the `queue-monitor length global-buffer` command. To change the threshold values for global buffer usage monitoring on the switch, use the `queue-monitor length global-buffer thresholds` command.

**Examples**

• These commands set the upper and lower queue-length thresholds on Ethernet interface 5 to 300 segments and 200 segments.
  
  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#queue-monitor length thresholds 300 200
  switch(config-if-Et5)#
  ```

• These commands enable global buffer monitoring on the switch and set the upper and lower thresholds to 9000 segments and 4000 segments.
  
  ```
  switch(config)#queue-monitor length global-buffer
  switch(config)#queue-monitor length global-buffer thresholds 9000 4000
  switch(config)#
  ```

44.3.3.2 Congestion Thresholds on Petra and Arad Switches

Queue lengths are measured in bytes. The top threshold value can be between 2 and 52428800 bytes (the default value is 52428800 bytes). To change the upper threshold value for a specific interface, use the `queue-monitor length threshold` (Arad and Petra) command.
Example

- These commands set the upper queue-length threshold on Ethernet interface 5 to 2614400 bytes.

  switch(config)#interface ethernet 5
  switch(config-if-Et5)#queue-monitor length thresholds 2614400
  switch(config-if-Et5)#

44.3.3.3 CPU Port Congestion Thresholds

CPU port queue lengths are also monitored on selected platforms. All CPU ports share common threshold values, which are configured using the `queue-monitor length cpu thresholds` command. Individual CPU port congestion thresholds cannot be separately configured.

Examples

- This command sets the upper queue-length threshold for congestion monitoring on all CPU ports to 1000 segments and the lower limit to 300 segments.

  switch(config)#queue-monitor length cpu thresholds 1000 300
  switch(config)#

- This command resets the queue-length thresholds for CPU port congestion to the default values of 512 and 256.

  switch(config)#default queue-monitor length cpu thresholds
  switch(config)#

44.3.3.4 Fabric Port Congestion Thresholds

Fabric port queue lengths are also monitored on selected platforms. All fabric ports share common threshold values, which are configured using the `queue-monitor length fabric thresholds` command. Individual fabric port congestion thresholds cannot be separately configured.

Examples

- This command sets the upper queue-length threshold for congestion monitoring on all fabric ports to 1000 segments and the lower limit to 300 segments.

  switch(config)#queue-monitor length fabric thresholds 1000 300
  switch(config)#

- This command resets the queue-length thresholds for fabric port congestion to the default values of 512 and 256.

  switch(config)#default queue-monitor length fabric thresholds
  switch(config)#

44.3.4 Setting LANZ Traffic Sampling

Traffic experiencing congestion can be configured to automatically send congested traffic to either the CPU or an Ethernet egress interface destination, once a queue threshold is crossed, by enabling LANZ mirroring through the command `queue-monitor length mirror`. The CPU or an egress interface mirror destination is then configured through the command `queue-monitor length mirror destination`. LANZ traffic sampling includes exporting congested traffic to a packet capture device or another tool for analysis, or directly to the switch CPU for inspection through the command `tcpdump queue-monitor`.

Example

- This command enables LANZ traffic sampling.

  switch(config)#queue-monitor length mirror
  switch(config)#
- This command disables LANZ traffic sampling.
  
  ```
  switch(config)#no queue-monitor length mirror
  switch(config)#
  ```

**Examples**

- This command configures LANZ traffic sampling for a CPU interface mirror destination.
  
  ```
  switch(config)#queue-monitor length mirror destination cpu
  switch(config)#
  ```

- This command configures LANZ traffic sampling for an Ethernet interface mirror destination for ports 1 through 5.
  
  ```
  switch(config)#queue-monitor length mirror destination Ethernet 1-5
  switch(config)#
  ```

- This command configures LANZ traffic sampling for an Ethernet interface mirror destination for ports 6, 10, and 12 through 14.
  
  ```
  switch(config)#queue-monitor length mirror destination Ethernet 6,10,12-14
  switch(config)#
  ```

**Example**

- This command inspects traffic on the switch.
  
  ```
  switch(config)#tcpdump queue-monitor
  tcpdump: WARNING: lanz: no IPv4 address assigned
  tcpdump: verbose output suppressed, use -v or -vv for full protocol decode
  listening on lanz, link-type EN10MB (Ethernet), capture size 65535 bytes
  ...
  0 packets captured
  0 packets received by filter
  0 packets dropped by kernel
  switch(config)#
  ```

### 44.3.5 Logging LANZ Congestion Events

To generate syslog messages when queue lengths on an interface exceed its upper threshold, enable logging with the `queue-monitor length log` command. When logging is enabled, a log message is generated each time one or more queues on an interface exceed the upper threshold value for that interface (see `queue-monitor length threshold (Arad and Petra)` or `queue-monitor length thresholds (FM6000, Trident II, and Tomahawk)`). Once an interface is over threshold, additional messages are generated at a maximum rate of one per `interval` as long as the queue length remains above the lower threshold for that interface. No syslog message is generated when queue length drops back under threshold.

Queue length information is not included in log messages, but can be accessed by displaying LANZ data or exporting reports.

On FM6000 platforms, log messages can also be created whenever global buffer usage exceeds its upper threshold value (see `queue-monitor length global-buffer thresholds`). To enable global buffer monitoring, use the `queue-monitor length global-buffer` command. To log over-threshold events for the global buffer, use the `queue-monitor length global-buffer log` command.

**Examples**

- This command enables queue-length over-threshold logging with a minimum interval of 10 seconds between messages for a given interface.
  
  ```
  switch(config)#queue-monitor length log 10
  ```
• This command disables queue-length over-threshold logging on the switch.
  switch(config)#queue-monitor length log 0

• This is an example of a queue-length log message.
  Oct 27 12:48:22 switch QUEUE_MONITOR-6-LENGTH_OVER_THRESHOLD: Interface Ethernet6 queue length is over threshold of 512, current length is 1024.

• This command enables global buffer over-threshold logging on the switch with a minimum interval of 60 seconds between messages.
  switch(config)#queue-monitor length global-buffer log 60

44.3.6 Viewing LANZ Data

LANZ status, and the data stored in the LANZ data buffer, can be viewed using the CLI. Output varies by switch platform, and can be limited to a specified number of records.

44.3.6.1 Viewing LANZ Data on Petra and Arad Platform Switches

When LANZ is enabled on a Petra or Arad platform switch, the `show queue-monitor length` command displays a report of recent over-threshold events for a range of interfaces or for all interfaces. By default, the command displays data for all interfaces, limited to the last 1000 records, with the most recent events listed first. To view a subset of the LANZ data, limited to a specified number of records, use the `show queue-monitor length limit` command.

Example

• This command displays the last 100 records for Ethernet interfaces 6 through 8.
  switch#show queue-monitor length ethernet 6-8 limit 100
  Report generated at 2010-01-01 12:56:13

<table>
<thead>
<tr>
<th>Time</th>
<th>Interface</th>
<th>Queue length (segments, 1 to 512 bytes)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0:00:07.43393 ago</td>
<td>Et6</td>
<td>1049</td>
</tr>
<tr>
<td>0:00:39.22856 ago</td>
<td>Et7</td>
<td>2039</td>
</tr>
<tr>
<td>1 day, 4:33:23.12345 ago</td>
<td>Et6</td>
<td>1077</td>
</tr>
</tbody>
</table>

To view the current LANZ configuration for the switch and for each interface, use the `show queue-monitor length status` command.

Example

• This command displays LANZ configuration and status information.
  switch(config)#show queue-monitor length status
  Per-Interface Queue Length Monitoring
  -------------------------------------
  Queue length monitoring is enabled
  Maximum queue length in bytes: 52428800
  Port threshold in bytes:
  Port    High threshold
  Et3/1    5242880
  Et3/2    5242880
  Et3/3    5242880
  Et3/4    5242880
  Et3/5    5242880

  <--------OUTPUT OMITTED FROM EXAMPLE-------->
44.3.6.2 Viewing LANZ Data on FM6000, Trident II, and Tomahawk Platform Switches

When LANZ is enabled on an FM6000, Trident II, or Tomahawk platform switch, the `show queue-monitor length` command displays a report of recent over-threshold events for a range of interfaces or for all interfaces. By default, the command displays data for all interfaces, limited to the last 1000 records, with the most recent events listed first. To view a subset of the LANZ data, limited to a specified number of records, use the `show queue-monitor length limit` command.

Example

- This command displays the last 100 records for Ethernet interfaces 6 through 8.

```
switch# show queue-monitor length ethernet 6-8 limit 100
```

```
Report generated at 2010-01-01 12:56:13

<table>
<thead>
<tr>
<th>Time</th>
<th>Interface</th>
<th>Queue length (segments, 1 to 512 bytes)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0:00:07.43393 ago</td>
<td>Et6</td>
<td>1049</td>
</tr>
<tr>
<td>0:00:39.22856 ago</td>
<td>Et7</td>
<td>2039</td>
</tr>
<tr>
<td>1 day, 4:33:23.12345 ago</td>
<td>Et6</td>
<td>1077</td>
</tr>
</tbody>
</table>
```

To view the current LANZ configuration for the switch and for each interface, use the `show queue-monitor length status` command.

Example

- This command displays LANZ configuration and status information.

```
switch(config)# show queue-monitor length status
```

```
queue-monitor length enabled
Global Buffer Monitoring
----------
Global buffer monitoring is enabled
Segment size in bytes : 160
Total buffers in segments : 36864
High threshold : 10940
Low threshold : 4376

<tr>
<td>Et5</td>
<td>512</td>
<td>256</td>
</tr>
</tbody>
</table>

<----OUTPUT OMITTED FROM EXAMPLE---->
```

To view all available LANZ records, use the `show queue-monitor length all` command.
Chapter 44: Latency Analyzer (LANZ)

Section 44.3.7: Streaming LANZ Data

44.3.7.1 Enabling and Disabling LANZ Data Streaming

LANZ data streaming is disabled by default. To enable streaming, issue the `no show queue-monitor streaming clients` command in queue-monitor streaming configuration mode. To disable streaming, use the `show queue-monitor streaming clients` command.

When streaming is disabled, a message is sent to any connected clients and the connections are closed.
To ensure client access to LANZ data, add a rule to any relevant ACL permitting traffic destined for the LANZ port (50001) before initiating a client connection for streaming from a remote host. A static rule (sequence number 130) in the default control plane ACL permits LANZ traffic, but a similar rule must be added to any user-created ACL.

**Examples**

- These commands enable the streaming of LANZ data from the switch.

  ```
  switch(config)#queue-monitor streaming
  switch(config-qm-streaming)#no shutdown
  switch(config-qm-streaming)#
  ```

- These commands disable LANZ data streaming.

  ```
  switch(config)#queue-monitor streaming
  switch(config-qm-streaming)#shutdown
  switch(config-qm-streaming)#
  ```

### 44.3.7.2 Configuring Maximum Connections

By default, the switch will accept a maximum of 10 client connections for LANZ data streaming. This maximum can be configured using the `max-connections` command. If a client connects to the switch after the limit has been reached, an error message is sent and the connection is closed.

**Example**

- This command sets the maximum number of client connections for LANZ data streaming to 50.

  ```
  switch(config-qm-streaming)#max-connections 50
  ```

### 44.3.7.3 LANZ Streaming Messages

When streaming is enabled, LANZ sends a message whenever a congestion event or a configuration event occurs. The messages are streamed in Google protocol buffer format.

**Configuration Messages**

A configuration message is sent whenever a change is made to the LANZ configuration settings on the switch. The switch also sends a configuration message when a new client connection is established.

The configuration message includes the following information:

- `timestamp`  
  time of change in configuration in tens of microseconds (UTC).
- `lanzVersion`  
  LANZ feature version.
- `numOfPorts`  
  number of ports in the switch.
- `segmentSize`  
  segment size.
- `maxQueueSize`  
  maximum queue size in segments.
- `qLenInterval`  
  frequency of updates.
- `intfName`  
  name of the port.
- `switchId`  
  ID of the chip on a multi-chip system.
- `portId`  
  ID of the port.
- `internalPort`  
  “true” if it is an internal port.
- `highThreshold`  
  higher threshold value.
- `lowThreshold`  
  lower threshold value.
Congestion Messages
A congestion message is sent whenever LANZ generates an over-threshold event.

The congestion message includes the following information:

- **timestamp**  time of congestion in micro-seconds (UTC).
- **intfName**  name of the port.
- **switchId**  ID of the chip on a multi-chip system.
- **portId**  ID of the port.
- **queueSize**  queue size in segments at time of congestion.

44.3.7.4 Creating the LANZ Client

For a client device to receive streaming data from the LANZ server, it must be running a client application designed to receive LANZ data. Client programs must be based on the Google protocol buffer schema file describing the structure of the congestion and configuration messages which LANZ streams.

**Google Protocol Buffers**

Google protocol buffers provide an efficient mechanism for serializing LANZ data for streaming. A protocol buffer package is needed in order to run a LANZ client.

The latest version of the Google protocol buffer source code is available at this address: [http://code.google.com/p/protobuf/downloads/list](http://code.google.com/p/protobuf/downloads/list)
LANZ Message Schema

LANZ client applications must be designed based on the LANZ protocol buffer schema, which defines the format and contents of the streamed messages. The schema file is shown below, and is also available on the Arista FTP site at this address: https://www.arista.com/support/download/Extensions/Lanz.proto

```proto
package LanzProtobuf;

message ConfigRecord {
  required uint64 timestamp = 1; // Time of change in configuration in micro-seconds (UTC)
  required uint32 lanzVersion = 2; // LANZ feature version
  required uint32 numOfPorts = 3; // Num of ports in the switch
  required uint32 segmentSize = 4; // Segment size
  required uint32 maxQueueSize = 5; // Maximum queue size in segments
  optional uint32 qLenInterval = 10; // Frequency of update
  message PortConfigRecord {
    required string intfName = 1; // Name of the port
    required uint32 switchId = 2; // Id of the chip on a multi-chip system
    required uint32 portId = 3; // Id of the port
    required bool internalPort = 4; // 'True' if it's an internal port
    required uint32 highThreshold = 5; // Higher threshold
    required uint32 lowThreshold = 6; // Lower threshold
  }
  repeated PortConfigRecord portConfigRecord = 6; // Lanz config details of each port
}

message CongestionRecord {
  required uint64 timestamp = 1; // Time of congestion in micro-seconds (UTC)
  required string intfName = 2; // Name of the port
  required uint32 switchId = 3; // Id of the chip on a multi-chip system
  required uint32 portId = 4; // Id of the port
  required uint32 queueSize = 5; // Queue size in segments at time of congestion
}

message ErrorRecord {
  required uint64 timestamp = 1; // Time of event in micro-seconds (UTC)
  required string errorMessage = 2; // Text message
}

message LanzRecord {
  optional ConfigRecord configRecord = 1;
  optional CongestionRecord congestionRecord = 2;
  optional ErrorRecord errorRecord = 3;
}
```

**Implementation Procedure**

The following steps create and install a functional client to receive streamed LANZ data. This procedure assumes a functional Python programming environment.

**Step 1** Download the example client from the Arista FTP server at this address: https://www.arista.com/support/download/Extensions/lanz_client.py

**Step 2** Decompress the GPB archive to a directory.
Step 3 Run the GPB C++ compilation and install. With default flags using GCC on *nix platforms, this will produce a binary called “protoc” in your /usr/local/bin directory.

Step 4 From the archive root, cd to python, and run the following commands:

```bash
python setup.py build
python setup.py test
```

Step 5 Next, use the protoc compiler to convert the Lanz.proto file into a Python program called Lanz_pb2.py, used by the client. The command to do so is:

```bash
protoc --python_out=. Lanz.proto
```

The --python_out= flag drops the compiled Python program in the directory where you ran the command.

Step 6 Run lanz_client.py -h to activate the LANZ client.
44.4 LANZ Commands

LANZ Commands: Global Configuration

- clear queue-monitor length statistics
- queue-monitor length (global configuration mode)
- queue-monitor length cpu thresholds
- queue-monitor length fabric thresholds
- queue-monitor length global-buffer
- queue-monitor length global-buffer log
- queue-monitor length global-buffer thresholds
- queue-monitor length log
- queue-monitor length mirror
- queue-monitor length mirror destination
- queue-monitor length notifying
- queue-monitor length update-interval
- queue-monitor streaming
- tcpdump queue-monitor

LANZ Commands: Interface Ethernet Configuration Mode

- queue-monitor length threshold (Arad and Petra)
- queue-monitor length thresholds (FM6000, Trident II, and Tomahawk)

LANZ Commands: Queue-Monitor Streaming Configuration Mode

- max-connections

LANZ Display Commands

- show queue-monitor length
- show queue-monitor length all
- show queue-monitor length cpu
- show queue-monitor length csv
- show queue-monitor length drops
- show queue-monitor length ethernet
- show queue-monitor length global-buffer
- show queue-monitor length limit
- show queue-monitor length drops
- show queue-monitor length statistics
- show queue-monitor length status
- show queue-monitor length tx-latency
- show queue-monitor streaming clients
clear queue-monitor length statistics

The clear queue-monitor length statistics command resets the occurrences of all over-threshold events on the switch including global buffer information (if supported).

**Command Mode**
Privileged EXEC

**Command Syntax**
```
clear queue-monitor length statistics
```

**Example**
- This command resets all over-threshold events and global buffer information on an FM6000 switch.

```
switch# clear queue-monitor length statistics
switch#
```
max-connections

The `max-connections` command sets the maximum number of client connections the switch accepts for streaming LANZ data. The default maximum is 10 connections. To stream LANZ data, you must use the `queue-monitor streaming` command to enable LANZ data streaming.

**Command Mode**

Queue-Monitor-Streaming Configuration

**Command Syntax**

```
max-connections connections
```

**Parameters**

- `connections` maximum number of simultaneous LANZ streaming client connections the switch will accept. Values range from 1 through 100.

**Related Commands**

- `queue-monitor streaming` places the switch in queue-monitor-streaming configuration mode.

**Examples**

- This command sets the maximum number of client connections the switch accepts for LANZ data streaming to 50.

```
switch(config-qm-streaming)#max-connections 50
switch(config-qm-streaming)#
```
queue-monitor length (global configuration mode)

The `queue-monitor length (global configuration mode)` command enables LANZ with the current settings, or with the default settings if LANZ has not yet been configured. LANZ is disabled by default.

When LANZ is enabled, the switch monitors queue lengths on all ports and generates over-threshold events when an output queue becomes congested. Over-threshold event data is available in the following forms:

- syslog data (see `queue-monitor length log`)
- CLI display or CSV-format output (see `show queue-monitor length`)
- data stream (see `queue-monitor streaming`)

The `no queue-monitor length` and `default queue-monitor length` commands entered in global configuration mode disable LANZ and discard LANZ log data, but retain settings. LANZ settings include:

- logging settings (see `queue-monitor length log`)
- queue length thresholds (see `queue-monitor length threshold (Arad and Petra)` or `queue-monitor length thresholds (FM6000, Trident II, and Tomahawk)`)
- data streaming settings (see `queue-monitor streaming`)

**Command Mode**

Global Configuration

**Command Syntax**

```
queue-monitor length
no queue-monitor length
default queue-monitor length
```

**Examples**

- This command enables LANZ on the switch.
  
  ```
  switch(config)#queue-monitor length
  switch(config)#
  ```

- This command disables LANZ on the switch.
  
  ```
  switch(config)#no queue-monitor length
  switch(config)#
  ```
queue-monitor length cpu thresholds

The `queue-monitor length cpu thresholds` command sets the queue length threshold to define "congested" on all CPU ports for purposes of LANZ reporting. If LANZ is enabled (see `queue-monitor length` (global configuration mode)), an over-threshold event is generated when one or more queues on a CPU interface exceed the upper threshold, and over-threshold events continue to be generated until all queue lengths on the interface drop below the lower threshold. (To log these events, use the `queue-monitor length log` command.) Different monitoring thresholds cannot be set for individual CPU ports.

The `no queue-monitor length cpu thresholds` and `default queue-monitor length cpu thresholds` commands reset thresholds to the default values (high: 512 segments; low: 256 segments).

**Command Mode**
Global Configuration

**Command Syntax**
```
queue-monitor length cpu thresholds upper_limit lower_limit
no queue-monitor length cpu thresholds
default queue-monitor length cpu thresholds
```

**Parameters**
- `upper_limit` is the queue length in 512-byte segments that triggers an over-threshold event. Values range from 8 to 16382. Default setting is 512.
- `lower_limit` When logging is enabled, an over-threshold interface continues generating over-threshold events until all its queues drop back below this length. Must be lower than `upper_limit`. Values range from 1 to 16382. Default setting is 256.

**Examples**
- This command sets the upper queue-length threshold for congestion monitoring on all CPU ports to 1000 segments and the lower limit to 300 segments.
  ```
  switch(config)#queue-monitor length cpu thresholds 1000 300
  switch(config)#
  ```
- This command resets the queue-length thresholds for CPU port congestion to the default values of 512 and 256.
  ```
  switch(config)#default queue-monitor length cpu thresholds
  switch(config)#
  ```
queue-monitor length fabric thresholds

The **queue-monitor length fabric thresholds** command sets the queue length threshold to define "congested" on all fabric ports for purposes of LANZ reporting. If LANZ is enabled (see queue-monitor length (global configuration mode)), an over-threshold event is generated when one or more queues on a fabric interface exceed the upper threshold, and over-threshold events continue to be generated until all queue lengths on the interface drop below the lower threshold. (To log these events, use the queue-monitor length log command.) Different monitoring thresholds cannot be set for individual fabric ports.

The **no queue-monitor length fabric thresholds** and **default queue-monitor length fabric thresholds** commands reset thresholds to the default values (high: 512 segments; low: 256 segments).

**Command Mode**
Global Configuration

**Command Syntax**

```
queue-monitor length fabric thresholds upper_limit lower_limit
no queue-monitor length fabric thresholds
default queue-monitor length fabric thresholds
```

**Parameters**

- **upper_limit** is the queue length in 512-byte segments that triggers an over-threshold event. Values range from 8 to 16382. Default setting is 512.
- **lower_limit** When logging is enabled, an over-threshold interface continues generating over-threshold events until all its queues drop back below this length. Must be lower than **upper_limit**. Values range from 1 to 16382. Default setting is 256.

**Examples**

- This command sets the upper queue-length threshold for congestion monitoring on all fabric ports to 1000 segments and the lower limit to 300 segments.
  ```
  switch(config)#queue-monitor length fabric thresholds 1000 300
  switch(config)#
  ```

- This command resets the queue-length thresholds for fabric port congestion to the default values of 512 and 256.
  ```
  switch(config)#default queue-monitor length fabric thresholds
  switch(config)#
  ```
queue-monitor length global-buffer

The **queue-monitor length global-buffer** command includes global buffer usage in LANZ reporting. When global buffer reporting is enabled, over-threshold events are generated when global buffer usage exceeds the upper threshold. To set the threshold value, use the **queue-monitor length global-buffer thresholds** command. Usage data may be viewed using the **show queue-monitor length global-buffer** command. To view status and threshold information, use the **show queue-monitor length status** command.

Global buffer usage is measured in segments of 160 bytes.

The **no queue-monitor length global-buffer** and **default queue-monitor length global-buffer** commands disable global buffer usage reporting by removing the corresponding queue-monitor length global-buffer command from running-config.

**Command Mode**
- Global Configuration

**Command Syntax**
- `queue-monitor length global-buffer`
- `no queue-monitor length global-buffer`
- `default queue-monitor length global-buffer`

**Guidelines**
This command is available on FM6000 platform switches.

**Examples**
- This command enables global buffer monitoring on the switch.
  ```
  switch(config)#queue-monitor length global-buffer
  switch(config)#
  ```
- This command disables global buffer monitoring on the switch.
  ```
  switch(config)#no queue-monitor length global-buffer
  switch(config)#
  ```
queue-monitor length global-buffer log

The `queue-monitor length global-buffer log` command enables logging of global buffer over-threshold events. When logging is enabled, a log message is generated each time the contents of the global buffer exceed the upper threshold value set for the switch (see `queue-monitor length global-buffer thresholds`). Once the global buffer is over the threshold, additional messages are generated at a maximum rate of one per `interval` as long as the buffer value remains above the lower threshold for the switch.

Global buffer logging is disabled by default.

Log messages do not include buffer usage or congestion information. To view this information, use the `show queue-monitor length global-buffer` command.

The `no queue-monitor length global-buffer log` and `default queue-monitor length global-buffer log` commands disable global buffer logging by removing the corresponding `queue-monitor length global-buffer log` command from `running-config`. The `queue-monitor length global-buffer log` command with an interval value of 0 also disables global buffer logging.

**Command Mode**

Global Configuration

**Command Syntax**

```
queue-monitor length global-buffer log interval
no queue-monitor length global-buffer log
default queue-monitor length global-buffer log
```

**Parameters**

- `interval` minimum interval in seconds between logged messages.
  - 0 global buffer logging is disabled on the switch (the default setting).
  - 1 to 65535 minimum logging interval (in seconds).

**Guidelines**

This command is available on FM6000 platform switches.

**Examples**

- This command enables global buffer logging with a minimum interval of 10 seconds between messages.

  ```
  switch(config)#queue-monitor length global-buffer log 10
  ```

- This command disables global buffer logging on the switch.

  ```
  switch(config)#no queue-monitor length global-buffer log
  ```
queue-monitor length global-buffer thresholds

The `queue-monitor length global-buffer thresholds` command sets global buffer thresholds for the switch. An over-threshold event is generated when usage of the global buffer exceeds the upper threshold, and over-threshold events continue to be generated until usage drops below the lower threshold. (To log these events, use the `queue-monitor length global-buffer log` command.)

The `no queue-monitor length global-buffer` and `default queue-monitor length global-buffer` commands disable global buffer reporting.

The `no queue-monitor length global-buffer thresholds` and `default queue-monitor length global-buffer thresholds` commands erase custom global buffer threshold settings.

**Command Mode**

Global Configuration

**Command Syntax**

```
queue-monitor length global-buffer thresholds max_segments min_segments
no queue-monitor length global-buffer log
default queue-monitor length global-buffer log
```

**Parameters**

- `max_segments` upper threshold in 160-byte segments. Value ranges from 2 to 36864. Default is 10940.
- `min_segments` lower threshold in 160-byte segments. Value ranges from 1 to 36864. Default is 4376.

**Examples**

- This command sets the upper and lower global buffer thresholds to 9000 segments and 3000 segments.
  
  `switch(config)#queue-monitor length global-buffer thresholds 9000 3000`

- This command resets the upper and lower global buffer thresholds to their default values.
  
  `switch(config)#no queue-monitor length global-buffer thresholds 9000 3000`
queue-monitor length log

The queue-monitor length log command enables logging of queue-length over-threshold events when LANZ is enabled on the switch (see queue-monitor length (global configuration mode)). When logging is enabled, a log message is generated each time one or more queues on an interface exceed the upper threshold value for that interface (see queue-monitor length threshold (Arad and Petra)). Once an interface is over threshold, additional messages are generated at a maximum rate of one per interval as long as the queue length remains above the lower threshold for that interface. No syslog message is generated when queue length drops back under threshold.

Logging is disabled by default.

Log messages do not include queue length information. To view queue length information, use the show queue-monitor length command.

The queue-monitor length log command with an interval value of 0 disables event logging.

Command Mode
Global Configuration

Command Syntax
queue-monitor length log interval

Parameters
• interval minimum interval in seconds between logged messages from a single interface.
  • 0 queue-length logging is disabled on the switch (the default setting).
  • 1 to 65535 minimum logging interval (in seconds).

Examples
• This command enables over-threshold logging with a minimum interval of 10 seconds between messages for a given interface.
  switch(config)#queue-monitor length log 10

• This command disables queue-length over-threshold logging on the switch.
  switch(config)#queue-monitor length log 0

• This is an example of a queue-length log message.
  Oct 27 12:48:22 switch QUEUE_MONITOR-6-LENGTH_OVER_THRESHOLD: Interface Ethernet6 queue length is over threshold of 512, current length is 1024.
queue-monitor length mirror

The queue-monitor length mirror command enables LANZ mirroring. As a result, traffic experiencing congestion can be configured to automatically send congested traffic to either the CPU or an Ethernet egress interface destination, once a queue threshold is crossed (see queue-monitor length mirror destination).

Command Mode
Global Configuration

Command Syntax
queue-monitor length mirror

Example
- This command enables LANZ traffic sampling.
  switch(config)#queue-monitor length mirror
  switch(config)#

- This command disables LANZ traffic sampling.
  switch(config)#no queue-monitor length mirror
  switch(config)#
queue-monitor length mirror destination

The queue-monitor length mirror destination command results in automatically sending traffic experiencing congestion to either the CPU or an Ethernet egress interface destination, once a queue threshold is crossed. Before using this command, first enable LANZ mirroring through the command queue-monitor length mirror.

Command Mode
Global Configuration

Command Syntax
queue-monitor length mirror destination cpu | Ethernet <ports 1-24>

Parameters
- **ports** any combination of Ethernet ports 1 through 24.

Examples
- This command configures LANZ traffic sampling for a CPU interface mirror destination.
  ```
  switch(config)#queue-monitor length mirror destination cpu
  switch(config)#
  ```
- This command configures LANZ traffic sampling for an Ethernet interface mirror destination for ports 3, 11, and 15 through 20.
  ```
  switch(config)#queue-monitor length mirror destination Ethernet 3,11,15-20
  switch(config)#
  ```
queue-monitor length notifying

The `queue-monitor length notifying` command enables Notifying Mode. By default, LANZ operates in Polling Mode.

When Notifying Mode is enabled, the switch provides detailed congestion information including Start, Update, and Stop events, rather than only polling the most congested queue in each ASIC. Notifying Mode uses both upper and lower threshold values. Both can be set with the `queue-monitor length thresholds (FM6000, Trident II, and Tomahawk)` command. While a queue is congested, the maximum queue size is updated every five seconds by default; this interval can be configured using the `queue-monitor length update-interval` command.

The `no queue-monitor length notifying` and `default queue-monitor length notifying` commands reset LANZ to the default Polling Mode.

**Command Mode**

Global Configuration

**Command Syntax**

```
queue-monitor length notifying
no queue-monitor length notifying
default queue-monitor length notifying
```

**Guidelines**

- Notifying mode is available on Arad, Jericho, Qumran-MX platform switches.
- Notifying Mode is incompatible with DCS-7500 linecards. In mixed systems that include both DCS-7500 and DCS-7500E linecards, enabling Notifying Mode will cause LANZ to operate in Notifying Mode for the 7500E linecards and in Polling Mode for the 7500 linecards.
- On Arad platforms, Notifying Mode is incompatible with SSO. Enabling SSO while Notifying Mode is enabled will cause LANZ to revert to Polling Mode.
- On Arad platforms, Notifying Mode is not available for CPU queues. Use Polling Mode when monitoring congestion on CPU queues on Arad switches.
- If the switch is rebooted while Notifying Mode is enabled, queue threshold values may be lost.

**Examples**

- This command enables Notifying Mode on the switch.
  ```
  switch(config)#queue-monitor length notifying
  switch(config)#
  ```
- This command disables Notifying Mode on the switch, returning LANZ to Polling Mode.
  ```
  switch(config)#no queue-monitor length notifying
  switch(config)#
  ```
queue-monitor length threshold (Arad and Petra)

The `queue-monitor length` threshold command sets the queue length threshold to define "congested" on the command-mode interface for purposes of LANZ reporting. If LANZ is enabled (see `queue-monitor length (global configuration mode)`), an over-threshold event is generated when one or more queues on the interface exceed the upper threshold, and over-threshold events continue to be generated until all queue lengths on the interface drop below the lower threshold. (To log these events, use the `queue-monitor length log` command.)

Entering the `no queue-monitor length` command in interface configuration mode disables LANZ on the interface. Entering either the `queue-monitor length threshold` command or the `default queue-monitor length threshold` command enables LANZ on the interface by removing the `no queue-monitor length` command from the configuration.

The `no queue-monitor length threshold` and `default queue-monitor length threshold` commands erase custom queue length threshold settings for the interface.

**Command Mode**
- Interface-Ethernet Configuration

**Command Syntax**

```
queue-monitor length threshold upper_limit
no queue-monitor length
default queue-monitor length
```

**Parameters**
- `upper_limit` is the queue length in bytes that triggers an over-threshold event. Values range from 2 to 52428800 bytes. Default setting is 52428800.

**Guidelines**
Queue length is measured in bytes. Only the upper threshold is configurable, and it is set at a default value of 52428800 bytes.

**Examples**
- These commands set the upper queue-length threshold on Ethernet interface 3/30 to 40000000 bytes.
  
  ```
  switch(config)#interface ethernet 3/30
  switch(config-if-Et3/30)#queue-monitor length threshold 40000000
  switch(config-if-Et3/30)#
  ```

- These commands reset the upper queue-length threshold on Ethernet interface 3/30 to its default value of 52428800 bytes.
  
  ```
  switch(config)#interface ethernet 3/30
  switch(config-if-Et3/30)#default queue-monitor length threshold
  switch(config-if-Et3/30)#
  ```
queue-monitor length thresholds (FM6000, Trident II, and Tomahawk)

The `queue-monitor length thresholds` command sets queue length thresholds to define “congested” on the command-mode interface for purposes of LANZ reporting. If LANZ is enabled (see `queue-monitor length (global configuration mode)`), an over-threshold event is generated when one or more queues on the interface exceed the upper threshold, and over-threshold events continue to be generated until all queue lengths on the interface drop below the lower threshold. (To log these events, use the `queue-monitor length log` command.)

Entering the `no queue-monitor length` command in interface configuration mode disables LANZ on the interface. Entering either the `queue-monitor length` command or the `default queue-monitor length` command in interface configuration mode enables LANZ on the interface by removing the `no queue-monitor length` command from the configuration.

The `no queue-monitor length thresholds` and `default queue-monitor length thresholds` commands in interface configuration mode both erase custom queue length threshold settings for the interface.

Command Mode

```
Interface-Ethernet Configuration
```

Command Syntax

```
queue-monitor length thresholds upper_limit lower_limit
no queue-monitor length
default queue-monitor length
```

Parameters

- `upper_limit`  queue length in segments that triggers an over-threshold event. Must be higher than `lower_limit`. The minimum value is 2. The maximum is the largest number of segments which can be queued before packets are dropped, and varies based on factors including flow control state and private buffer settings. Default setting is 512.
- `lower_limit`  lower queue length threshold in segments. When logging is enabled, an over-threshold interface continues generating over-threshold events until all its queues drop back below this length. Must be lower than `upper_limit`. Values range from 1 to 4806. Default setting is 256.

Guidelines

Queue lengths are measured in 480-byte segments on FM6000 switches and in 208-byte segments on Trident II and Tomahawk switches. Default upper threshold is 512 segments and lower threshold is 256 segments. Both upper and lower thresholds are configurable.

Examples

- These commands set the upper and lower queue-length thresholds on Ethernet interface 5 to 300 segments and 200 segments.

  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#queue-monitor length thresholds 300 200
  switch(config-if-Et5)#
  ```

- These commands reset the upper and lower queue-length thresholds on Ethernet interface 5 to their default values.

  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#default queue-monitor length thresholds
  switch(config-if-Et5)#
  ```
These commands disable LANZ on Ethernet interface 5.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# no queue-monitor length
switch(config-if-Et5)#
```
queue-monitor length update-interval

The `queue-monitor length update-interval` command sets the interval between congestion updates when LANZ is in Notifying Mode.

The `no queue-monitor length update-interval` and `default queue-monitor length update-interval` command reset the update interval to its default value of 5000000 (5 seconds).

**Command Mode**
Global Configuration

**Command Syntax**

```
queue-monitor length update-interval interval
no queue-monitor length
default queue-monitor length
```

**Parameters**
- `interval` is the time in microseconds between congestion updates. Values range from 80-10000000; default setting is 5000000 (5 seconds).

**Examples**
- This command sets the time between congestion updates to 10 seconds.

```
switch(config)#queue-monitor length update-interval 10000000
switch(config)#
```

- This command resets the time between congestion updates to its default value of 5 seconds.

```
switch(config)#default queue-monitor length update-interval
switch(config)#
```
queue-monitor streaming

The **queue-monitor streaming** command places the switch in queue-monitor-streaming configuration mode. Queue-monitor-streaming configuration mode is not a group change mode; **running-config** is changed immediately upon command entry. The exit command does not affect **running-config**.

To enable LANZ data streaming on the switch, use the **no show queue-monitor streaming clients** command.

The **exit** command returns the switch to global configuration mode.

**Command Mode**

Global Configuration

**Command Syntax**

```plaintext
queue-monitor streaming
```

**Commands Available in queue-monitor streaming Configuration Mode**

- max-connections
- show queue-monitor streaming clients

**Example**

- This command places the switch in queue-monitor streaming configuration mode.

  ```plaintext
  switch(config)#queue-monitor streaming
  switch(config-qm-streaming)#
  ```
**show queue-monitor length**

The **show queue-monitor length** command displays a report of recent over-threshold events for all interfaces, limited to the last 1000 records, with the newest events listed first.

LANZ must be enabled to use this command (see **queue-monitor length (global configuration mode)**). If LANZ is disabled, the command displays “queue-monitor is disabled.”

To limit the output to a specified number of seconds and/or records, use the **show queue-monitor length limit** command.

**Command Mode**

EXEC

**Command Syntax**

`show queue-monitor length`

**Example**

- This command displays the last 1000 LANZ records on an Arad or Jericho platform switch in Polling Mode.

```plaintext
switch>show queue-monitor length
Report generated at 2017-03-10 16:04:28
E-End, S-Start, P-Polling, TC-Traffic Class
* Max queue length during period of congestion

```
show queue-monitor length all

The `show queue-monitor length all` command displays all available over-threshold event records on the switch including global buffer information, with the most recent events listed first.

LANZ must be enabled to use this command (see `queue-monitor length (global configuration mode)`). If LANZ is disabled, the command displays “queue-monitor is disabled.”

**Command Mode**

EXEC

**Command Syntax**

`show queue-monitor length all`

**Guidelines**

This command is available on FM6000 platform switches.

**Example**

- This command displays all available LANZ records from the switch.

  ```
  switch>show queue-monitor length all
  
  E-End, U-Update, S-Start, TC-Traffic Class
  GH-High, GU-Update, GL-Low
  Segment size for E, U and S congestion records is 480 bytes
  Segment size for GL, GU and GH congestion records is 160 bytes
  * Max queue length during period of congestion
  + Period of congestion exceeded counter

  switch>
  ```
show queue-monitor length cpu

The `show queue-monitor length cpu` command displays LANZ data for CPU ports on the switch. On Trident II and Tomahawk platforms, the “Interface” column identifies the CPU port by its card slot and chip index.

LANZ must be enabled to use this command (see `queue-monitor length (global configuration mode)`). If LANZ is disabled, the command displays “queue-monitor is disabled.”

**Command Mode**

EXEC

**Command Syntax**

`show queue-monitor length cpu`

**Examples**

- This command displays LANZ data for CPU ports on a Trident II or Tomahawk switch.

```
switch>show queue-monitor length cpu

**show queue-monitor length csv**

The `show queue-monitor length csv` command displays LANZ records in comma-separated value (CSV) format with the oldest samples displayed first.

LANZ must be enabled to use this command (see `queue-monitor length (global configuration mode)`). If LANZ is disabled, the command displays “queue-monitor is disabled.”

**Command Mode**

EXEC

**Command Syntax**

`show queue-monitor length csv`

**Example**

- This command displays LANZ records in CSV format.

```
switch>show queue-monitor length csv

```
show queue-monitor length drops

The `show queue-monitor length drops` command displays a report of cumulative transmission drop totals for a range of interfaces or for all interfaces. Output can be limited to a specified number of seconds or records. The most recent events are listed first. By default, the command displays data for all interfaces, limited to the last 1000 records. Newest events are listed first.

LANZ must be enabled to use this command (see `queue-monitor length (global configuration mode)`). If LANZ is disabled, the command displays “queue-monitor is disabled.”

**Command Mode**

EXEC

**Command Syntax**

```
show queue-monitor length [INTERFACES] [FACTOR] drops
```

**Parameters**

- `INTERFACES` interface type and number for report. Values include:
  - `<no parameter>` displays information for all interfaces.
  - `ethernet e-range` e-range formats include a number, number range, or comma-delimited list of numbers and ranges
- `FACTOR` limiting parameter for report. Values include:
  - `<no parameter>` displays the last 1000 records.
  - `limit number samples` displays the last `number` records.
  - `limit number seconds` displays all records generated during the last `number` seconds.
  
Value of `number` ranges from 1 to 1000000.

**Guidelines**

This command is available on FM6000, Trident II, and Tomahawk platform switches.

**Example**

- This command displays the last 10 records of transmission drop data on an FM6000 switch.

```
switch>show queue-monitor length limit 10 samples drops

switch>
**show queue-monitor length ethernet**

The `show queue-monitor length ethernet` command displays a report of recent over-threshold events for a range of interfaces, with the newest events listed first.

LANZ must be enabled to use this command (see `queue-monitor length (global configuration mode)`). If LANZ is disabled, the command displays “queue-monitor is disabled.”

**Command Mode**

EXEC

**Command Syntax**

```
show queue-monitor length ethernet e-range
```

**Parameters**

`e-range`  the range of interfaces to be included in the report; formats include a number, number range, or comma-delimited list of numbers and ranges

**Examples**

- This command displays the last 1000 records for Ethernet interface 9 on an FM6000 platform switch.

```
switch>show queue-monitor length ethernet 9

**Note**

The non-sequential listing of ingress ports shown here is specific to Jericho switches; interfaces on Arad switches are always displayed sequentially.
show queue-monitor length global-buffer

The `show queue-monitor length global-buffer` command displays a report of recent high usage, low usage and update events for the global buffer. Newest events are listed first.

LANZ must be enabled to use this command (see `queue-monitor length (global configuration mode)`). If LANZ is disabled, the command displays “queue-monitor is disabled.”

**Command Mode**

EXEC

**Command Syntax**

```
show queue-monitor length global-buffer
```

**Guidelines**

This command is available on FM6000 platform switches.

**Example**

- This command displays the global buffer event records for the switch.

```
switch>show queue-monitor length global buffer

switch>
```
show queue-monitor length limit

The **show queue-monitor length limit** command displays a report of recent over-threshold events for a range of interfaces or for all interfaces, limited by a specified number of records.

LANZ must be enabled to use this command (see **queue-monitor length (global configuration mode)**). If LANZ is disabled, the command displays “queue-monitor is disabled.”

**Command Mode**

**EXEC**

**Command Syntax**

```plaintext
show queue-monitor length limit [INTERFACES] [number]
```

**Parameters**

- **INTERFACES** interface type and number for report. Values include:
  - <no parameter> displays information for all interfaces.
  - `ethernet e-range` e-range formats include a number, number range, or comma-delimited list of numbers and ranges
  - `number` number of records to display. Values range from 1 to 1000000.

**Example**

- This command displays the last 100 records for Ethernet interfaces 6 through 8.

```plaintext
switch> show queue-monitor length ethernet 6-8 limit 100 samples
Report generated at 2010-01-01 12:56:13

**switch>**
show queue-monitor length statistics

The `show queue-monitor length statistics` command displays LANZ statistics for all interfaces, showing the traffic class and number of recorded congestion events for each interface.

LANZ must be enabled to use this command (see `queue-monitor length (global configuration mode)`). If LANZ is disabled, the command displays “queue-monitor is disabled.”

**Command Mode**

EXEC

**Command Syntax**

```
show queue-monitor length statistics
```

**Example**

- This command displays LANZ statistics for all interfaces on the switch.

```
switch>show queue-monitor length statistics

Report generated at 2016-02-09 22:59:56
Interface      Traffic Class  Count
-----------------------------------------------------------------
Et29            11             1
```

show queue-monitor length status

The **show queue-monitor length status** command displays the current LANZ configuration for the switch and for each interface. On certain platforms, the status of global buffer monitoring and per-linecard LANZ mode are displayed.

**Command Mode**

- EXEC
- Global Configuration

**Command Syntax**

```
show queue-monitor length status
```

**Guidelines**

On FM6000 platform switches, this command includes status information about global buffer monitoring.

On Arad and Jericho based linecards, if LANZ is globally enabled (using the **queue-monitor length** command), the command displays the monitoring mode per linecard.

Even when all linecards are configured in Notifying Mode (using the **queue-monitor length notifying** command), some may still run LANZ in Polling Mode under the following circumstances:

- On Arad-based linecards, LANZ falls back to polling mode when SSO redundancy mode is configured on the card (here, the mode is "polling due to SSO configured").
- On Jericho-based linecards, when many features that use the switch’s statistic capabilities have been configured (here, the mode is "polling due to counters exhausted").
Examples

- This command displays the current LANZ configuration on an FM6000 device.

```
switch# show queue-monitor length status
queue-monitor length enabled
queue-monitor length packet sampling is disabled
queue-monitor length update interval in micro seconds: 5000000
Global Buffer Monitoring
----------------------------------
Global buffer monitoring is enabled
Segment size in bytes: 160
Total buffers in segments: 49152
High threshold: 16862
Low threshold: 6745

Per-Interface Queue Length Monitoring
-------------------------------------
Queue length monitoring is enabled
Segment size in bytes: 480
Maximum queue length in segments: 5621
Port thresholds in segments:
Port     High threshold  Low threshold    Mirroring Enabled
  Cpu     512            256                True
  Et1     512            256                True
  Et2     512            256                True
  Et3     512            256                True
  Et4     512            256                True
  Et5     512            256                True
  Et6     512            256                True
  Et7     512            256                True
```

- This command displays the current LANZ configuration on a Trident II or Tomahawk device.

```
switch# show queue-monitor length status
queue-monitor length enabled
queue-monitor length packet sampling is disabled
queue-monitor length update interval in micro seconds: 5000000
Per-Interface Queue Length Monitoring
-------------------------------------
Queue length monitoring is enabled
Segment size in bytes: 208
Maximum queue length in segments: 16382
Port thresholds in segments:

```
show queue-monitor length tx-latency

The `show queue-monitor length tx-latency` command displays the latency data of recent LANZ events for a range of interfaces or for all interfaces. Output can be limited to a specified number of seconds or records. The most recent events are listed first. By default, the command displays data for all interfaces, limited to the last 1000 records. Newest events are listed first.

LANZ must be enabled to use this command (see `queue-monitor length (global configuration mode)`). If LANZ is disabled, the command displays “queue-monitor is disabled.”

**Command Mode**

EXEC

**Command Syntax**

```
show queue-monitor length [INTERFACES] [FACTOR] tx-latency
```

**Parameters**

- **INTERFACES**  interface type and number for report. Values include:
  - `<no parameter>`  displays information for all interfaces.
  - `ethernet e-range`  e-range formats include a number, number range, or comma-delimited list of numbers and ranges

- **FACTOR**  limiting parameter for report. Values include:
  - `<no parameter>`  displays the last 1000 records.
  - `limit number samples`  displays the last number records.
  - `limit number seconds`  displays all records generated during the last number seconds.

  Value of number ranges from 1 to 1000000.

**Guidelines**

This command is available on FM6000, Trident II, and Tomahawk platform switches.

**Example**

- This command displays transmission latency data for the last 1000 LANZ events on the switch.

```
switch> show queue-monitor length tx-latency
```

```
Report generated at 2017-03-10 15:40:02

switch>
```
show queue-monitor streaming clients

The `show queue-monitor streaming clients` command displays the number of presently connected clients through LANZ streaming, and also displays their host-names. Ensure that both LANZ and LANZ streaming are enabled in order to use this command.

Command Mode
EXEC

Command Syntax

```
show queue-monitor streaming clients
```

Example

- This command displays the number of clients connected to LANZ streaming.

```
switch#show queue-monitor streaming clients
Number of clients connected: 3
--------------------------------
172.20.63.161:6565
172.24.17.58:42
172.38.54.142:333
```
shutdown (queue-monitor-streaming configuration)

The **shutdown** command disables the streaming of LANZ data to external clients. The **no shutdown** command enables LANZ data streaming. Streaming is disabled by default.

**Command Mode**

Queue-Monitor-Streaming Configuration

**Command Syntax**

- `shutdown`
- `no shutdown`

**Example**

- These commands enable the streaming of LANZ data on the switch.

```bash
switch(config)#queue-monitor streaming
switch(config-qm-streaming)#no shutdown
switch(config-qm-streaming)#
```
**tcpdump queue-monitor**

The `tcpdump queue-monitor` command exports congested traffic to a packet capture device or another tool for analysis, or directly to the switch CPU for inspection.

**Command Mode**

Global Configuration

**Command Syntax**

```
tcpdump queue-monitor
```

```
tcpdump queue-monitor <file | filecount | filter | lookup-names | max-file-size | packet-count | size | verbose>
```

**Parameters**

- `file` output file.
  - `certificate`: certificate file.
  - `flash`: flash file.
  - `sslkey`: sslkey file.
  - `usb1`: usb1 file.
- `filecount` specify the number of output files: 1 to 100.
- `filter` set the filtering expression to select which packets will be dumped.
- `lookup-names` enable reverse DNS lookups.
- `max-file-size` specify the maximum file size by entering 1 to 100 million bytes.
- `packet-count` specify 1 to 10000 packets to capture.
- `size` specify the maximum number of bytes to dump per packet with a size of 1 to 65536 bytes.
- `verbose` enable verbose mode.

**Example**

- This command inspects traffic on the switch.

```bash
switch(config)#tcpdump queue-monitor
tcpdump: WARNING: lanz: no IPv4 address assigned
tcpdump: verbose output suppressed, use -v or -vv for full protocol decode
listening on lanz, link-type EN10MB (Ethernet), capture size 65535 bytes
...
0 packets captured
0 packets received by filter
0 packets dropped by kernel
switch(config)#
```
VM Tracer

This chapter describes VM Tracer configuration and usage and contains these sections:

- Section 45.1: VM Tracer Introduction
- Section 45.2: VM Tracer Description
- Section 45.3: VM Tracer Configuration Procedures
- Section 45.4: VM Tracer Configuration Commands

45.1 VM Tracer Introduction

VM Tracer is a switch feature that determines the network configuration and requirements of connected VMware hypervisors. The switch uses VMware's SOAP XML API to discover VMware host server components, including:

- instantiated VMs with their network configuration (VLANs and distributed/virtual Switches).
- server hardware IPMI data which can be shown to the network manager.

VM Tracer also supports adaptive auto-segmentation, which automatically provisions and prunes VLANs from server-switched ports as VMs are instantiated and moved within the data center.
45.2  VM Tracer Description

Cloud operating systems manage large virtualized computing infrastructures, including software and hardware. Cloud operating systems consist of virtual machines and hypervisors:

- A virtual machine (VM) is a software implementation of a computer that operates as running on dedicated physical hardware. Multiple VMs share physical machine resources from a single physical device. Each VM is controlled by its operating system.
- A hypervisor, also called a virtual Machine Manager (VMM), is software that manages multiple operating systems running concurrently on a physical device.

VM Tracer tracks activity of VMs that are controlled by hypervisors connected to the switch’s Ethernet or LAG ports. VM Tracer supports vSphere versions 6.0–6.5. vSphere features include distributed virtual switches (DVS) and VM movement among VMware servers (VMotion).

vSphere components include:

- ESX and ESXi: hypervisors that run on VMware host server hardware.
- vCenter: centralized tool that manages multiple servers running VMware hypervisors.
- NSX for vSphere® (NSX-V): network virtualization platform delivering networking and security.

Monitoring VLAN based configurations requires vCenter access. Monitoring VXLAN based configurations requires access to vCenter and NSX-V. The following sections describe topologies that monitor these networks:

- Section 45.2.1: Monitoring VLAN Based Configurations
- Section 45.2.2: Monitoring VXLAN Based Configurations

45.2.1 Monitoring VLAN Based Configurations

vCenter manages ESX hosts and VMs through a central database. VM Tracer identifies interfaces connected to a specified ESX host and sends discovery packets (CDP or LLDP) on interfaces where VM Tracer is enabled. The ESX host updates the vCenter when it receives a discovery packet. VM Tracer reads this data from the vCenter through a SOAP XML API to associate the ESX host to the connected switch ports. Figure 45-1 displays the network topology of this configuration.
VM Tracer connects to a maximum of four vCenters through a SOAP (Simple Object Access Protocol) API to discover VMs in the data centers that the vCenters manage. VM Tracer maintains a list of VMs in the data center and gathers network related information about each VM, including the number of Vnics (virtual network interface card), the MAC address of each Vnic, the switch to which it connects, and the host on which it resides. VM Tracer also identifies the host NICs connected to the switch through the bridge MAC address and the interface port name. VM Tracer then searches for VMs on this host and connected to the vswitch or dvswitch whose uplink is mapped to the connected NIC.

For each connected interface, VM Tracer creates a VM Table that lists its active VMs, sorted by Vnic MAC address. Each VM entry includes its name, Vnic name, VLAN, switch name, datacenter name, and portgroup. An entry is deleted when the corresponding VM is removed, moved to a different host, or its Vnic is no longer part of the vswitch or dvswitch. An entry is added when a VM is created or moved to a host connected to the interface. VM Tracer monitors vCenter for VM management updates. If an interface goes down, all VM entries for that interface are removed from the VM Table.

45.2.2 Monitoring VXLAN Based Configurations

Monitoring VXLAN based configurations require access to the NSX for vSphere® (NSX-V), in addition to the configuration described in Section 45.2.1. Each VM Tracer session can communicate with one NSX-V through a REST interface over XML and gathers VXLAN information by polling it on a 30 second polling cycle. VXLAN data that the switch receives from the NSX-V includes:

- VNI range.
- VXLAN segment.
- Multicast address range.
- network scope.

The network scope specifies the virtual address space the VXLAN segments span and is defined by the server group (cluster) collections within the segments, which in turn contain a collection of distributed virtual switches (DVS) from ESX hosts within the clusters.

VM Tracer uses this information to build a network model. Communications with NSX-V requires a single polling thread that detects network connectivity and constantly updates the local data model.

*Figure 45-2* displays the network topology of this configuration.

*Figure 45-2: VM Tracer Topology – Monitoring VXLAN Based Configurations*
45.3 VM Tracer Configuration Procedures

The following sections describe the session configuration process, configuring the NSX-V connection for VXLAN based configurations, and the procedure for enabling VM Tracer on individual interfaces. The switch defines vmtracer configuration mode and VMtracer mode:

- **vmtracer configuration mode** is a command mode for configuring VM Tracer monitoring sessions.
- **VMtracer mode** is defines an interface state where discovery packets are sent to attached vSwitches.

### 45.3.1 Configuring vCenter Monitoring Sessions

A VM Tracer session connects the switch to a vCenter server for downloading data about VMs and vSwitches managed by ESX hosts connected to the switch’s ports. The switch supports four VM Tracer sessions.

The switch is placed in vmtracer configuration mode to edit session parameters, including the vCenter location and dynamic VLAN usage. Changes take effect by exiting vmtracer mode.

The **vmtracer session** command places the switch in vmtracer configuration mode for a specified session. The command either creates a new session or loads an existing session for editing.

- **This command enters vmtracer configuration mode for the system_1 session.**
  
  ```
  switch(config)#vmtracer session system_1
  switch(vmtracer-system_1)#
  ```

  In vmtracer configuration mode, the **url (vmtracer mode)**, **username (vmtracer mode)**, and **password (vmtracer mode)** commands specify the location and the account information that authenticates the switch. The url parameter must reference a fully formed secure URL.

  - **These commands specify the IANA url along with the username and password that allow the switch to access the location.**
    
    ```
    switch(vmtracer-system_1)#url https://example.com
    switch(vmtracer-system_1)#username a-switch_01
    switch(vmtracer-system_1)#password abcde
    switch(vmtracer-system_1)#
    ```

  Default session settings allow auto-segmentation, or the dynamic allocation and pruning of VLANs when a VM managed by the ESX host connected to the switch is created, deleted, or moved to a different host. The **autovlan disable** command prevents auto-segmentation, regardless of VM activity. The **allowed-vlan** command specifies the VLANs that may be added when a VM is added or moved. By default, all VLANs are allowed.

  - **This command disables auto-segmentation.**
    
    ```
    switch(vmtracer-system_1)#autovlan disable
    switch(vmtracer-system_1)#
    ```

  - **These commands enable auto-segmentation and limit the list of allowed VLANs to VLAN 1-2000.**
    
    ```
    switch(vmtracer-system_1)#no autovlan disable
    switch(vmtracer-system_1)#allow-vlan 1-2000
    switch(vmtracer-system_1)#
    ```

  The **exit** command returns the switch to Global configuration mode and enables the VM Tracer session. Vmtracer configuration mode can be re-entered for this session to edit session parameters.

  - **This command exits vmtracer configuration mode.**
    
    ```
    switch(vmtracer-system_1)#exit
    switch(config)#
    ```
The `no vmtracer session` command disables the session and removes it from `running-config`.

- This command disables and deletes the system_1 VM Tracer session.
  
  ```
  switch(config)#no vmtracer session system_1
  switch(config)#
  ```

45.3.2 Configuring vShield Monitoring Sessions

To monitor VXLAN based VMware configurations, the switch must communicate with a NSX for vSphere® (NSX-V). Vmtracer-vxlan configuration mode specifies the location and user account data that allows the switch to access a NSX-V within the configuration mode vmtracer session.

The switch is placed in vmtracer configuration mode to edit session parameters, including the vCenter location and dynamic VLAN usage. Changes take effect by exiting vmtracer mode.

- The `vxlan (vmtracer mode)` command is executed from vmtracer mode for a specified session and places the switch in vmtracer-vxlan configuration mode for that session. Each VM Tracer session can be associated with one vShield instance.
  
  ```
  switch(config)#vmtracer session vnet-1
  switch(config-vmtracer-vnet-1)#vxlan
  switch(config-vmtracer-vnet-1-vxlan)#
  ```

In vmtracer-vxlan configuration mode, the `url (vmtracer-vxlan mode)`, `username (vmtracer-vxlan mode)`, and `password (vmtracer-vxlan mode)` commands specify the vShield server’s location and the account information that authenticates the switch to the vShield server. The url parameter must reference a fully formed secure url, such as `https://vcshield.democorp.com/sdk`.

- These commands specify the vShield’s URL along with the username and password that allow the switch to access the vShield server.
  
  ```
  switch(config-vmtracer-vnet-1-vxlan)#url https://vshieldserver.company1.org/sdk
  switch(config-vmtracer-vnet-1-vxlan)#username a-shield_01
  switch(config-vmtracer-vnet-1-vxlan)#password home
  switch(config-vmtracer-vnet-1-vxlan)#
  ```

45.3.3 Enabling vmtracer Mode

VMtracer mode is an interface setting that enables interfaces to send discovery packets to the connected vSwitch. The `vmtracer` command enables VMtracer mode on the configuration mode interface.

- These commands enable VMtracer mode on the Ethernet 3 interface.
  
  ```
  switch(config)#interface Ethernet3
  switch(config-if-Et3)#vmtracer vmware-esx
  switch(config-if-Et3)#
  ```

The `no vmtracer` command disables vmtracer mode on the configuration mode interface.

- This command disables vmtracer mode on the Ethernet 3 interface.
  
  ```
  switch(config-if-Et3)#no vmtracer vmware-esx
  switch(config-if-Et3)#
  ```

45.3.4 Displaying VM Tracer Data

45.3.4.1 Displaying Session Status

The `show vmtracer session` command displays information about the specified session.
Without the `detail` parameter, the command displays connection parameters and status for the vCenter associated to the specified session.

- This command displays connection parameters for the vCenter associated with the `system_1` session.

```
switch# show vmtracer session system_1
  vCenter URL https://vmware-vcenter1/sdk
  username arista
  password arista
  Session Status Disconnected
```

With the `detail` parameter, the command displays connection status and data concerning messages the vCenter previously received from ESX hosts connected to the switch.

- This command displays connection parameters and message details for the vCenter associated with the `system_1` session.

```
switch# show vmtracer session system_1 detail
  vCenter URL https://vmware-vcenter1/sdk
  username arista
  sessionState Connected
  lastStateChange 19 days, 23:03:59 ago
  lastMsgSent CheckForUpdatesMsg
  timeOfLastMsg 19 days, 23:14:09 ago
  responseTimeForLastMsg 0.0
  numSuccessfulMsg 43183
  lastSuccessfulMsg CheckForUpdatesMsg
  lastSuccessfulMsgTime 19 days, 23:14:19 ago
  numFailedMsg 1076
  lastFailedMsgTime 19 days, 23:14:19 ago
  lastErrorCode Error -1 fault: SOAP-ENV:Client [no subcode]
  "End of file or no input: Operation interrupted or timed out after 600s send or 600s receive delay"
  Detail: [no detail]
  CheckForUpdates:
```

45.3.4.2 Displaying VM Interfaces

The `show vmtracer interface` command displays the VM interfaces (Vnics) that are active on switch interfaces where vmtracer mode is enabled. For each Vnic, the command displays the name of the attached VM, the adapter name, its VLAN, the VM power state, and the presence status of its MAC address in the switch’s MAC table.
This command displays the Vnics connected to all VM Tracer-enabled interfaces.

```
switch#show vmtracer interface
```

```
Ethernet8 : example.com
  VM Name VM Adapter VLAN Status
  esx3.aristanetworks.com vmk0 0 Up/Down
  vspheremanagement Network adapter 1 0 Up/Down

Ethernet15 : example.cm
  VM Name VM Adapter VLAN Status
  Openview Network adapter 1 123 Up/Down
  VmTracerVm Network adapter 1 123 Down/Down

Ethernet23 : example.com
  VM Name VM Adapter VLAN Status

Ethernet24 : example.com
  VM Name VM Adapter VLAN Status
```

### 45.3.4.3 Displaying VMs

The `show vmtracer vm` command displays VM interfaces (Vnics) accessible to the VM Tracer-enabled interfaces. For each active listed VM, the command displays its name, adapter, and the connected hypervisor.

This command displays the VMs connected to all VM Tracer-enabled interfaces.

```
switch#show vmtracer vm
```

```
VM Name VM Adapter Interface VLAN
Openview Network adapter 1 Et15 123
vspheremanagement Network adapter 1 Et8 0
VmTracerVm Network adapter 1 Et15 123
example.com vmk0 Et8 0
```

This command displays connection data for the VMs connected to all VM Tracer-enabled interfaces.

```
switch#show vmtracer vm detail
```

```
VM Name Openview
  intf : Et15
  vnic : Network adapter 1
  mac : 00:0c:29:ae:7e:90
  portgroup : dvPortGroup
  vlan : 123
  switch : vds
  host : example.com
```
45.4 VM Tracer Configuration Commands

Global Configuration Commands
- `vmtracer session`

Interface Configuration (Ethernet and Port Channel) Commands
- `vmtracer`

VMTracer Configuration Commands
- `allowed-vlan`
- `autovlan disable`
- `password (vmtracer mode)`
- `url (vmtracer mode)`
- `username (vmtracer mode)`
- `vxlan (vmtracer mode)`

VMTracer-VXLAN Configuration Commands
- `password (vmtracer-vxlan mode)`
- `url (vmtracer-vxlan mode)`
- `username (vmtracer-vxlan mode)`

VM Tracer Display Commands
- `show vmtracer all`
- `show vmtracer interface`
- `show vmtracer session`
- `show vmtracer session vcenter`
- `show vmtracer session vsm`
- `show vmtracer vm`
- `show vmtracer vm detail`
- `show vmtracer vnic counters`
- `show vmtracer vxlan segment`
- `show vmtracer vxlan vm`
allowed-vlan

The `allowed-vlan` command specifies the VLANs that may be added when a VM is added or moved from the hypervisor connected to the session specified by the `vmtracer mode`. By default, all VLANs are allowed.

**Command Mode**

Vmtracer Configuration

**Command Syntax**

```
allowed-vlan  \textit{VLAN\_LIST}
no allowed-vlan vlan
default allowed-vlan vlan
```

**Parameters**

- \textit{VLAN\_LIST}   The VLAN list or the edit actions to the current VLAN list. Valid \textit{v\_range} formats include number, or number range.
  - \textit{v\_range}   The list consists of the \textit{v\_range} VLANs.
  - \textit{add v\_range}   The \textit{v\_range} VLANs are added to the current VLAN list.
  - \textit{all}   The list consists of all VLANs (1-4094).
  - \textit{except v\_range}   The list consists of all VLANs except for those specified by \textit{v\_range}.
  - \textit{none}   The list of VLANs is empty.
  - \textit{remove v\_range}   The \textit{v\_range} VLANs are removed from the current VLAN list.

**Related Commands**

- `vmtracer session` places the switch in vmtracer configuration mode.

**Examples**

- This command sets the list of allowed VLANs to 1 through 2000.
  
  ```
  switch(vmtracer-system_1)#allow-vlan 1-2000
  switch(vmtracer-system_1)#
  ```

- This command adds VLANs to 2501 through 3000.
  
  ```
  switch(vmtracer-system_1)#allow-vlan add 2051-3000
  switch(vmtracer-system_1)#
  ```
**autovlan disable**

Default VM Tracer session settings enable auto provisioning, which allows the dynamic assignment and pruning of VLANs when a VM attached to the ESX connected to the switch is created, deleted, or moved to a different ESX host. The autovlan setting controls auto provisioning.

The **autovlan disable** command disables auto provisioning, which prevents the creation or deletion of VLANs regardless of VM activity. The **allowed-vlan** command specifies the VLANs that may be added when a VM is added or moved. By default, all VLANs are allowed.

The **no autovlan disable** command enables the creation and deletion of VLANs caused by VM activity. This is the default setting.

**Command Mode**

Vmtracer Configuration

**Command Syntax**

- `autovlan disable`
- `no autovlan disable`
- `default autovlan disable`

**Related Commands**

- `vmtracer session` places the switch in vmtracer configuration mode.

**Example**

- This command disables dynamic VLAN creation or pruning within the configuration mode VM Tracer session.

```plaintext
switch(vmtracer-system_1)#autovlan disable
switch(vmtracer-system_1)#
```
password (vmtracer mode)

The `password` command specifies the token that authorizes the username to the vCenter associated with the VM Tracer mode session.

**Command Mode**

Vmtracer Configuration

**Command Syntax**

```
password [ENCRYPTION] [password]
```

**Parameters**

- `ENCRYPTION` encryption level of the password.
  - `<no parameter>` `password` is a clear-text string.
  - `0` the `password` is a clear-text string. Equivalent to `<no parameter>`.
  - `7` the `password` is an encrypted string.
- `password` text that authenticates the username.
  - `password` is a clear-text string if `ENCRYPTION` specifies clear text.
  - `password` is an encrypted string if `ENCRYPTION` specifies an encrypted string.

**Related Commands**

- `vmtracer session` places the switch in vmtracer configuration mode.

**Example**

- This command configures `abode` as the clear-text string that authorizes the username `a-switch_01` located at `example.com`.

```
switch(vmtracer-system_1)#url https://example.com
switch(vmtracer-system_1)#username a-switch_01
switch(vmtracer-system_1)#password abode
switch(vmtracer-system_1)#
```
password (vmtracer-vxlan mode)

The `password` command specifies the token that authorizes the username on the NSX for vSphere® (NSX-V) server located at the URL configured for the configuration mode VM Tracer. The switch uses this account to access NSX-V information.

The `password` statement is replaced in `running-config` for the configuration mode interface by a subsequent `password` command. The statement is removed by deleting the NSX-V instance through a `no vxlan (vmtracer mode)` command in vmtracer configuration mode.

**Command Mode**
Vmtracer-vxlan Configuration

**Command Syntax**

```
password [ENCRYPTION] password
```

**Parameters**

- **ENCRYPTION** encryption level of the password.
  - `<no parameter>` `password` is a clear-text string.
  - `0` the `password` is a clear-text string. Equivalent to `<no parameter>`.
  - `7` the `password` is an encrypted string.
- `password` text that authorizes the username.
  - `password` is a clear-text string if `ENCRYPTION` specifies clear text.
  - `password` is an encrypted string if `ENCRYPTION` specifies an encrypted string.

**Related Commands**

- `vxlan (vmtracer mode)` places the switch in vmtracer-vxlan configuration mode.

**Example**

- This command configures **5678** as the clear-text string that authorizes the username `admin` to the NSX-V located at `https://example.com`.

```
switch(config)#vmtracer session vnet-1
switch(config-vmtracer-vnet-1)#vxlan
switch(config-vmtracer-vnet-1-vxlan)#url https://example.com
switch(config-vmtracer-vnet-1-vxlan)#username admin
switch(config-vmtracer-vnet-1-vxlan)#password 5678
switch(config-vmtracer-vnet-1-vxlan)#exit
vmtracer session vnet-1
    allowed-vlan 1-4094
    vxlan
        url https://example.com
        username admin
        password 7 s2Xq4G3B1YU=
switch(config-vmtracer-vnet-1)#
```
**show vmtracer all**

The `show vmtracer all` command displays VM Tracer data for all switches with the vSphere scope.

**Command Mode**
EXEC

**Command Syntax**
`show vmtracer all`

**Example**
- This command displays data for both switches in the vSphere scope.
  
  ```
  switch>show vmtracer all
  
  Switch: a109(10.10.30.109)
  Ethernet49: 10.102.28.3/10G
  VM Name  VM Adapter  VLAN  Status  State
  ABCD     Network adapter 2 native Up/-- --
  
  Switch: a164(10.10.30.172.22.30.164)
  Ethernet49: 10.102.28.3/10G Storage Network/dvUplink1
  VM Name  VM Adapter  VLAN  Status  State
  WXYZ    Network adapter 2 native Up/-- --
  
  switch>
  ```
show vmtracer interface

The `show vmtracer interface` command displays the VM interfaces (Vnics) that are active on the VM Tracer enabled interface. For each Vnic, the command displays the name of the attached VM, the adapter name, its VLAN, the VM power state, and the presence status of its MAC address in the switch’s MAC table.

**Command Mode**
EXEC

**Command Syntax**
```
show vmtracer interface [INT_NAME] [INFO_LEVEL]
```

**Parameters**
- **INT_NAME** the interfaces to be configured. Values include:
  - `<no parameter>` command returns information for all interfaces.
  - `ethernet e_range` Ethernet interface range.
  - `port-channel p_range` Port Channel interface range.
    Valid `e_range` and `p_range` formats include number, number range, or comma-delimited list of numbers and ranges.
- **INFO_LEVEL** specifies information that the command returns.
  - `<no parameter>` connection parameters and status for VM associated to specified sessions.
  - `detail` connection status and data concerning messages the VM.
  - `host` name of the connected host.

**Examples**
- This command displays the Vnics connected to all VM Tracer enabled interfaces.
  ```
  switch> show vmtracer interface
  Ethernet8 : example.com
  VM Name                     VM Adapter          VLAN          Status
  esx3.aristanetworks.com     vmk0                0             Up/Down
  vspheremanagement           Network adapter 1   0             Up/Down
  Ethernet15 : example.com
  VM Name                     VM Adapter          VLAN          Status
  Openview                    Network adapter 1   123           Up/Down
  VmTracerVm                  Network adapter 1   123           Down/Down
  Ethernet23 : example.com
  VM Name                     VM Adapter          VLAN          Status
  example.com                 vmk0                0             Up/Down
  vspheremanagement           Network adapter 1   0             Up/Down
  switch>
  ```
- This command displays the Vnics connected to the Ethernet 8 interface.
  ```
  switch> show vmtracer interface Ethernet8
  Ethernet8 : example.com
  VM Name                     VM Adapter          VLAN          Status
  example.com                 vmk0                0             Up/Down
  vspheremanagement           Network adapter 1   0             Up/Down
  ```
show vmtracer session

The `show vmtracer session` command displays vCenter and vShield connection information for a specified VM Tracer session.

**Command Mode**

EXEC

**Command Syntax**

```
show vmtracer session [SESSION_LIST]
```

**Parameters**

- `SESSION_LIST` VM Tracer sessions for which the command returns information.
- `<no parameter>` all configured VM Tracer sessions.
- `session_name` name of one VM Tracer session.

**Examples**

- This command displays connection parameters associated to the abcde session.

```
switch>show vmtracer session abcde

Session abcde
vCenter URL       https://example.com
username                        Administrator
autovlan                        enabled
allowed-vlans     1-4094
sessionState      Connected
VShield URL       https://vmware-vshield5.1.xyz.abcde.com
username                    admin
sessionState      Connected

switch>
```
show vmtracer session vcenter

The show vmtracer session vcenter command displays vCenter information for a specified VM Tracer session.

Command Mode

EXEC

Command Syntax

show vmtracer session session_name vcenter [INFO_LEVEL]

Parameters

- session_name VM Tracer sessions for which the command returns information.
- INFO_LEVEL specifies information that the command returns.
  - <no parameter> displays connection and status information for the specified vCenter.
  - detail displays connection, status, and history information for the specified vCenter.

Examples

- This command displays connection parameters for the vCenter associated to the abcde session.

  switch>show vmtracer session abcde vcenter

  Session abcde
  vCenter URL       https://vmware-vcenter5.1/sdk
  username                        Administrator
  autovlan                        enabled
  allowed-vlans     1-4094
  sessionState      Connected
  switch>

- This command displays connection parameters and history details from the vCenter associated to the abcde session.

  switch>show vmtracer session abcde vcenter detail

  Session abcde
  vCenter URL       https://vmware-vcenter5.1/sdk
  username                        Administrator
  autovlan                        enabled
  allowed-vlans     1-4094
  SessionState       Connected
  lastStateChange      2:46:50 ago
  lastMsgSent          Query network hint message
  timeOfLastMsg       0:00:20 ago
  responseTimeForLastMsg 0.000102301000479
  numSuccessfulMsg     998
  lastSuccessfulMsg    Query network hint message
  lastSuccessfulMsgTime 0:00:20 ago
  numFailedMsg         0
  lastFailedMsg        --
  lastFailedMsgTime    never
  lastErrorCode        --
  switch>
show vmtracer session vsm

The `show vmtracer session vsm` command displays NSX-V information for a specified VM Tracer session.

**Command Mode**

EXEC

**Command Syntax**

```
show vmtracer session session_name vsm [INFO_LEVEL]
```

**Parameters**

- `session_name` VM Tracer sessions for which the command returns information.
- `INFO_LEVEL` specifies information that the command returns.
  - `<no parameter>` connection and status information for the specified NSX-V.
  - `detail` connection, status, and history information for the specified NSX-V.

**Examples**

- This command displays connection parameters for the NSX-V associated to the abcde session.

```
switch>show vmtracer session abcde vsm
```

<table>
<thead>
<tr>
<th>Session</th>
<th>abcde</th>
</tr>
</thead>
<tbody>
<tr>
<td>VShield URL</td>
<td><a href="https://example.com">https://example.com</a></td>
</tr>
<tr>
<td>username</td>
<td>admin</td>
</tr>
<tr>
<td>sessionState</td>
<td>Connected</td>
</tr>
</tbody>
</table>

```
switch>
```

- This command displays connection parameters and history details from the vShield Manager associated to the abcde session.

```
switch>show vmtracer session abcde vsm detail
```

<table>
<thead>

The given remote host was not resolved.
```
show vmtracer vm

The `show vmtracer vm` command displays VMs interfaces (Vnics) that are accessible to VM Tracer enabled interfaces. For each active VM, the command displays the name of the VM, its adapter, and the hypervisor to which it connects.

**Command Mode**
EXEC

**Command Syntax**
```
show vmtracer [INT_NAME] vm [VM_LIST]
```

**Parameters**
- **INT_NAME** the interfaces name Values include:
  - `<no parameter>` command returns information for all interfaces.
  - `interface ethernet e_range` Ethernet interface range.
  - `interface port-channel p_range` Port Channel interface range.
    Valid `e_range` and `p_range` formats include a number, number range, or comma-delimited list of numbers and ranges.
- **VM_LIST** The virtual machines for which the command displays information. Options include:
  - `<no parameter>` command returns information for all present VMs.
  - `vm_name` command returns information only for specified VM.

**Related Commands**
- `show vmtracer vm detail` displays connection information for one or more specified VMs.

**Examples**
- This command displays the VMs connected to all VM Tracer enabled interfaces.

```
switch>show vmtracer vm
VM Name       Esx Host     Interface   VLAN    Status
vCenter1      172.22.28.8  Po45        native  Down/Down
vCenter2      172.22.28.8  Po45        native  Up/Up
vCenter3      172.22.28.8  Po45        11       Down/Down
vCenter4      172.22.28.8  Po45        native  Down/Down
VMKernel      Po43        native  Up/Up
demo vcenter 5 clone  Po43        native  Up/Up
switch>
```
show vmtracer vm detail

The *show vmtracer vm detail* command displays connection data for VMs interfaces (Vnics) that are accessible to VM Tracer enabled interfaces.

**Command Mode**

EXEC

**Command Syntax**

```
show vmtracer vm [VM_LIST] detail
```

**Parameters**

- **VM_LIST** The virtual machines for which the command displays information. Options include:
  - `<no parameter>` command returns information for all present VMs.
  - `vm_name` command returns information only for specified VM.

**Examples**

- This command displays connection data for the VMs connected to all VM Tracer enabled interfaces.

  ```
  switch#show vmtracer vm vmcenter1
  VM Name  vCenter1 Server App
  Interface   :     Po45
  vNIC        :     Network adapter 1
  MAC         :     00:31:22:8e:b8:41
  Portgroup   :     VM Network
  VLAN        :     native
  Switch      :     Switch2
  Status      :     Down/Down
  Host        :     10.22.18.28
  Data Center :     vcenter-5
  switch>
  ```

- This command displays connection data for the VMs connected to all VM Tracer enabled interfaces.

  ```
  switch#show vmtracer vm detail
  VM Name  vCenter1 Server App
  Interface   :     Po45
  vNIC        :     Network adapter 1
  MAC         :     00:31:22:8e:b8:41
  Portgroup   :     VM Network
  VLAN        :     native
  Switch      :     Switch2
  Status      :     Down/Down
  Host        :     10.22.18.28
  Data Center :     vcenter-5

  VM Name  vCenter2 Server App
  Interface   :     Po45
  vNIC        :     vmk0
  MAC         :     00:33:23:3c:e1:4e
  Portgroup   :     Management Network
  VLAN        :     native
  ```
**show vmtracer vnic counters**

The *show vmtracer interface vnic counters* command displays input and output packet counts for VM interfaces (Vnics) that are active on the specified interface or VM.

**Command Mode**

 EXEC

**Command Syntax**

   show vmtracer [ENTITY] vnic counters

**Parameters**

- **ENTITY** the virtual machine or interface over which statistics are gathered and displayed.
- `<no parameter>` command returns information for all active VMs.
- `interface ethernet e_range` Ethernet interface range.
- `interface port-channel p_range` Port Channel interface range.
- `vm vm_name` command returns information for specified VM.

   Valid *e_range* and *p_range* formats include a number, number range, or comma-delimited list of numbers and ranges.

**Examples**

- This command displays the Vnics connected to Ethernet interface 24.

```
switch>show vmtracer interface ethernet 24 vnic counters
Physical Intf: Ethernet24
Host: 10.17.28.8/site1/dvUplink1
VM Name        vNic                           Input Pkt/Byte/%               Output Pkt/Byte/%
  vCenter1      Network adapter 2          2550/    187175/  0.6              6/7360/  0.0
  vCenter2      Network adapter 2        418615/ 30678024/ 99.4        1904439/1145654613/100.0
Summary                                  421165/ 30865199/100.0        1904445/1145654973/100.0
switch>
```
show vmtracer vxlan segment

The **show vmtracer vxlan segment** command displays information about the VXLAN segments that are managed by the connected NSX for vSphere® (NSX-V).

**Command Mode**

EXEC

**Command Syntax**

```
show vmtracer segment ENTITY
```

**Parameters**

- **ENTITY** specifies the information that the command displays. Options include:
  - <no parameter> displays information for VXLAN segments.
  - `pool` displays resource pools available to segments.
  - `pool pool_name` displays connection information about the specified pool.
  - `range` displays the VNI range of the managed segments.

**Examples**

- This command displays the VXLAN segments managed by the NSX-V.

```
switch>show vmtracer vxlan segment

Name                   VNI     Multicast IP     Network Scope
------------------------------------------------------------------
Eng Wire                5002    237.0.0.1        abcde
HR Wire                 5000    237.0.0.2        abcde

switch>
```

- This command displays the resource pools available to the VXLANs.

```
switch>show vmtracer vxlan segment pool

Name                  Description                     Segments
------------------------------------------------------------------
abcde                 Spans Cluster 1 and Cluster 2   Eng Wire, HR Wire

switch>
```

- This command displays connection and packet information for the abcde pool.

```
switch>show vmtracer vxlan segment pool abcde

Name:                  abcde
Description:          Spans Cluster 1 and Cluster 2
Segments:             Eng Wire, HR Wire

Vxlan Segment         Cluster   Host                      VTEP IP           DVS           VLAN  MTU
Eng Wire              Cluster2  test2.example.com       10.168.200.1/24  dvs-test2  200   1600
Eng Wire              Cluster1  test2.example.com       10.168.100.1/24  dvs-test1  100   1600
HR Wire               Cluster1  test2.example.com       10.168.100.1/24  dvs-test1  100   1600
HR Wire               Cluster2  test2.example.com       10.168.200.1/24  dvs-test2  200   1600

switch>
```
This command displays the VNI range of the VXLAN segments.

```
switch> show vmtracer vxlan segment range
```

**show vmtracer vxlan vm**

The `show vmtracer interface vnic counters` command displays the VXLAN segments, their VTEP IP numbers, and their VM endpoints that are managed by the connected NSX for vSphere® (NSX-V).

**Command Mode**

EXEC

**Command Syntax**

`show vmtracer vxlan vm`

**Examples**

- This command displays the VM endpoints of the VXLAN segments managed by the NSX-V.

```
switch>show vmtracer vxlan vm

<table>

switch>
```
url (vmtracer mode)

The `url` command specifies the vCenter server location that is monitored by the session being edited by the current vmtracer mode. The command must reference a fully formed secure url.

**Command Mode**

Vmtracer Configuration

**Command Syntax**

```
url url_name
```

**Parameters**

- `url_name` location of the vCenter server. Valid formats include IP address (dotted decimal notation) and fully qualified domain name.

**Related Commands**

- `vmtracer session` places the switch in vmtracer configuration mode.

**Example**

- This command specifies the location of the vCenter monitored by the system_1 VM Tracer session.

```
switch(vmtracer-system_1)#url https://example.com
switch(vmtracer-system_1)#
```
url (vmtracer-vxlan mode)

The url command specifies the NSX for vSphere® (NSX-V) server location that is monitored for VXLAN information by the configuration mode VM Tracer session. The command must reference a fully formed secure URL.

The url statement is replaced in running-config for the configuration mode session by a subsequent url command. The statement is removed by deleting the NSX-V instance through a no vxlan (vmtracer mode) command in vmtracer configuration mode.

Command Mode
Vmtracer-vxlan Configuration

Command Syntax
url url_name

Parameters
- url_name location of the NSX-V server. Valid formats include IP address (dotted decimal notation) and fully qualified domain name.

Related Commands
- vxlan (vmtracer mode) places the switch in vmtracer-vxlan configuration mode.

Example
- This command configures the location of the NSX-V monitored by the vnet-1 VM Tracer session.

```
switch(config)#vmtracer session vnet-1
switch(config-vmtracer-vnet-1)#vxlan
switch(config-vmtracer-vnet-1-vxlan)#url https://example.com
switch(config-vmtracer-vnet-1-vxlan)#exit
switch(config-vmtracer-vnet-1)#show active
vmtracer session vnet-1
  allowed-vlan 1-4094
  vxlan
    url https://example.com
switch(config-vmtracer-vnet-1)#
```
username (vmtracer mode)

The `username` command identifies the switch’s account name on the vCenter server. The switch uses this user name to access vCenter information.

**Command Mode**

Vmtracer Configuration

**Command Syntax**

```
username name_string
```

**Parameters**

- `name_string` vCenter account user name. Parameter must match the user name configured on the vCenter.

**Related Commands**

- `vmtracer session` places the switch in vmtracer configuration mode.

**Example**

- This command configures the user name for the vCenter associated with the system_1 session. The session uses this user name to log into the vCenter server.

  ```
  switch(vmtracer-system_1)#username a-switch_01
  switch(vmtracer-system_1)#
  ```
username (vmtracer-vxlan mode)

The `username` command identifies the switch’s account name on the NSX for vSphere® (NSX-V) server located at the URL configured for the configuration mode VM Tracer. The switch uses this user name to access NSX-V information.

The `username` statement is replaced in `running-config` for the configuration mode interface by a subsequent `username` command. The statement is removed by deleting the NSX-V instance through a `no vxlan (vmtracer mode)` command in vmtracer configuration mode.

**Command Mode**

Vmtracer-vxlan Configuration

**Command Syntax**

```
username name_string
```

**Parameters**

- `name_string` NSX-V account user name. Parameter must match a user name configured on the NSX-V.

**Related Commands**

- `vxlan (vmtracer mode)` places the switch in vmtracer-vxlan configuration mode.

**Example**

- This command configures the user name of admin for the NSX-V located at the URL specified by the URL command.

```
switch(config)#vmtracer session vnet-1
switch(config-vmtracer-vnet-1)#vxlan
switch(config-vmtracer-vnet-1-vxlan)#url https://example.com
switch(config-vmtracer-vnet-1-vxlan)#username admin
switch(config-vmtracer-vnet-1-vxlan)#exit
switch(config-vmtracer-vnet-1)#show active
vmtracer session vnet-1
  allowed-vlan 1-4094
  vxlan
    url https://example.com
    username admin
switch(config-vmtracer-vnet-1)#
```
**vmtracer**

The `vmtracer` command enables vmtracer mode on the configuration mode interface. Interfaces with vmtracer mode enabled send discovery packets to the connected vSwitch.

The `no vmtracer` and `default vmtracer` commands disable vmtracer mode on the configuration mode interface by removing the corresponding `vmtracer` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-channel Configuration

**Command Syntax**
```
vmtracer HOST_TYPE
no vmtracer HOST_TYPE
default vmtracer HOST_TYPE
```

**Parameters**
- `HOST_TYPE`: the type of hypervisor that controls the vSwitch to which the interface connects.
  - `vmware-esx`: ESX or ESXi hypervisor (VMware).

**Examples**
- These commands enable vmtracer mode on the Ethernet 3 interface.
  ```
  switch(config)#interface Ethernet 3
  switch(config-if-Et3)#vmtracer vmware-esx
  switch(config-if-Et3)#
  ```
- This command disables vmtracer mode on the Ethernet 3 interface.
  ```
  switch(config-if-Et3)#no vmtracer vmware-esx
  switch(config-if-Et3)#
  ```
The `vmtracer session` command places the switch in vmtracer mode for the specified session. The command creates a new session or loads an existing session for editing.

A VM Tracer session connects the switch to a vCenter server at a specified location, then downloads data about VMs and vSwitches managed by ESX hosts connected to switch ports. The switch supports a maximum of four VM Tracer sessions.

VM Tracer session parameters are configured in vmtracer mode. Parameters configured in vmtracer mode include the vCenter location and dynamic VLAN usage.

The `no vmtracer session` and `default vmtracer session` commands disable the session and remove its configuration from `running-config`.

**Command Mode**

- Global Configuration

**Command Syntax**

```
vmtracer session name
no vmtracer session name
default vmtracer session name
```

**Parameters**

- `name` The label assigned to the VM Tracer session.

**Commands Available in vmtracer Configuration Mode**

- `allowed-vlan`
- `autovlan disable`
- `password (vmtracer mode)`
- `url (vmtracer mode)`
- `username (vmtracer mode)`
- `vxlan (vmtracer mode)`

**Examples**

- This command enters vmtracer mode for the `system_1` session.

  ```
  switch(config)#vmtracer session system_1
  switch(vmtracer-system_1)#
  ```

- This command disables the `system_1` VM Tracer session. The `system_1` session and all of its parameters are removed from `running-config`.

  ```
  switch(config)#no vmtracer session system_1
  switch(config)#
  ```
The `vxlan` command places the switch in vmtracer-vxlan configuration mode. To monitor VXLAN based VMware configurations, the switch must communicate with a NSX for vSphere® (NSX-V). Vmtracer-vxlan configuration mode specifies the location and user account data that allows the switch to access a NSX-V within the configuration mode vmtracer session. Each VM Tracer session can be associated with one NSX-V instance.

The `no vxlan` and `default interface vxlan` commands delete the NSX-V instance from the configuration mode vmtracer session by removing all vmtracer-vxlan mode commands from `running-config`.

**Command Mode**

Vmtracer Configuration

**Command Syntax**

```
vxlan
no vxlan
default vxlan
```

**Related Commands**

- `vmtracer session` places the switch in vmtracer configuration mode.

**Commands Available in vmtracer-vxlan Configuration Mode**

- `password (vmtracer mode)`
- `url (vmtracer mode)`
- `username (vmtracer mode)`

**Example**

- These commands create the vShield instance for the VMTracer session named vnet-1.

```
switch(config)#vmtracer session vnet-1
switch(config-vmtracer-vnet-1)#vxlan
switch(config-vmtracer-vnet-1-vxlan)#
```
Chapter 46

MapReduce Tracer

This chapter describes Arista’s implementation of MapReduce Tracer, including configuration instructions and command descriptions. Topics covered by this chapter include:

- Section 46.1: MapReduce Tracer Introduction
- Section 46.2: MapReduce Tracer Configuration
- Section 46.3: Displaying MapReduce Tracer Results
- Section 46.4: MapReduce Tracer Command Descriptions

46.1 MapReduce Tracer Introduction

MapReduce Tracer is a network tool that monitors Hadoop nodes that are directly connected to Arista switches. MapReduce Tracer requires the following:

- Hadoop clusters are deployed with a L3 design.
- The top of rack switch is the default gateway to all attached TaskTracker nodes.
- JobTracker RPC ports do not require authentication.
- Nodes cannot simultaneously belong to multiple Hadoop clusters.
- All TaskTrackers within a cluster are accessed through a common HTTP access port.
- The switch’s DNS or static host configuration facilitates TaskTracker name resolution.

Map Reduce Tracer supports these Hadoop releases:

- Apache 0.20.205
- Apache 1.2.1
- Cloudera 3u6
- Cloudera 4.1.3
- Cloudera 4.3.0
- HortonWorks 1.3
- Cloudera 4.5.0

These sections briefly describe Hadoop, Hadoop data structures, and MapReduce Tracer.
46.1.1 Hadoop Description

Apache Hadoop is an open-source, Java-based software framework that supports large dataset storage and processing in a distributed computational environment. Hadoop is licensed under Apache License 2.0 and developed through a global community.

Hadoop facilitates application execution on systems composed of thousands of nodes utilizing petabytes of data. Its distributed file system facilitates rapid data transfer among nodes and supports continued operations when individual nodes fail or become inaccessible.

Hadoop Distributed File System (HDFS) is a distributed file-system that stores data on the commodity machines to provide high aggregate bandwidth across the cluster.

46.1.2 Hadoop Cluster Structure

A cluster is a group of servers that function as a single system to provide high availability through load balancing and parallel processing. A Hadoop cluster is a type of computational cluster designed for storing and analyzing large amounts of unstructured data in a distributed computing environment.

Typical Hadoop clusters include one master and multiple worker nodes. The master node consists of a TaskTracker, JobTracker, NameNode and DataNode. Worker nodes include a TaskTracker and DataNode.

46.1.3 Map Reduce

MapReduce is an algorithm that Hadoop implements to process large datasets by distributing parallel tasks to nodes within a cluster. The MapReduce program includes a Map procedure that filters data and a Reduce procedure that processes the data.

MapReduce manages task and data distribution to cluster nodes such that tasks are executed in parallel, and data transfers between cluster components support redundancy and fault tolerance.

The MapReduce engine consists of one JobTracker and multiple TaskTrackers – all nodes within the Hadoop cluster. The JobTracker receives MapReduce jobs from a client application and manages the completion of these jobs by submitting tasks to available TaskTracker nodes. If a TaskTracker fails to perform the assigned task, the JobTracker reschedules that part of the job to another node.

46.1.4 MapReduce Tracer Function

MapReduce Tracer is a feature that tracks and interacts with Hadoop nodes directly connected to Arista switches in a cluster. It communicates with a JobTracker to obtain a list of all nodes in a cluster and then queries JobTracker and TaskTrackers on these nodes for information regarding the jobs they are running and progress of those jobs. This creates a map of TaskTrackers with kinds of jobs they are running. Commands are available to display this data in tables through the CLI and EAPI.

MapReduce Tracer monitors only nodes that connect directly to the switch in L3 networks. Directly connected nodes use the top-of-rack switch as their default gateway and the switch learns ARP entries for these nodes. The list of nodes provided by JobTracker is filtered by tracking ARP entries to remove nodes that are not directly accessible.

MapReduce Tracer creates a database of nodes from the filtered list. After the database is created, the switch queries the JobTracker and TaskTrackers to obtain the following:

- The number of monitored Hadoop nodes.
- The list of monitored nodes, including their IP addresses.
- Jobs that the TaskTrackers are running.
- JobTracker and TaskTracker statistics.
MapReduce Tracer can simultaneously monitor multiple clusters. This means the directly connected
TaskTracker nodes can belong to different clusters. A maximum of 5 clusters are supported per switch.

46.2  MapReduce Tracer Configuration
MapReduce Tracer configuration commands are structured into two configuration levels:

- Monitor-hadoop configuration mode is a child of global configuration mode and controls global
  MapReduce Tracer settings.
- Monitor-hadoop-cluster configuration mode is a child of Monitor-hadoop configuration mode and
  defines polling configurations that monitor individual Hadoop clusters.

These sections describe MapReduce Tracer configuration processes:

- Section 46.2.1: MapReduce Tracer Global Configuration
- Section 46.2.2: Hadoop Cluster Access Configuration

MapReduce Tracer functions after it is enabled globally. Each polling configuration can be individually
enabled after the feature is enabled globally.

46.2.1  MapReduce Tracer Global Configuration
MapReduce Tracer global parameters are configured in Monitor-hadoop configuration mode. Tasks
performed from this mode include specifying connection parameters to Hadoop clusters and globally
enabling MapReduce Tracer.

Entering Monitor-Hadoop Configuration Mode
Monitor-hadoop configuration mode is entered by `monitor hadoop`. Monitor-hadoop configuration
mode is not a group change mode; statements are stored in the `running-config` when they are entered
through the CLI. The `exit` command returns the switch to global configuration mode.

Examples

- These commands place the switch in monitor-hadoop configuration mode.
  
  ```bash
  switch(config)#monitor hadoop
  switch(config-monitor-hadoop)#
  ```

- This command exits monitor-hadoop mode.
  
  ```bash
  switch(config-monitor-hadoop)#exit
  switch(config)#
  ```

- This command deletes all previously configured monitor-hadoop configuration mode commands.
  
  ```bash
  switch(config)#no monitor hadoop
  switch(config)#
  ```

Globally Enabling MapReduce Tracer
MapReduce Tracer is globally enabled by `no shutdown (Monitor-Hadoop)`. MapReduce Tracer is
globally disabled by default.
Example

- These commands globally enable MapReduce Tracer.
  
  ```
  switch(config)#monitor hadoop
  switch(config-monitor-hadoop)#no shutdown
  switch(config-monitor-hadoop)#show active
  monitor hadoop
  no shutdown
  switch(config-monitor-hadoop)#
  ```

Creating a Cluster Monitor

A cluster monitor is created by entering monitor-hadoop-cluster mode with `cluster (Monitor Hadoop)`. Each monitor is labeled with a cluster ID and probes one Hadoop cluster. When the command specifies a monitor with a previously defined cluster ID, subsequent commands edit that monitor’s parameters. A monitor with a new cluster ID is created by a command that specifies a nonexistent cluster ID.

Example

- These commands enter monitor-hadoop-cluster mode to edit a cluster monitor. The monitor’s cluster-id is CL2.
  
  ```
  switch(config-monitor-hadoop)#
  cluster CL2
  switch(config-monitor-hadoop-CL2)#show active
  monitor hadoop
  cluster CL2
  switch(config-monitor-hadoop-CL2)#
  ```

46.2.2 Hadoop Cluster Access Configuration

Cluster monitors are configured in monitor-hadoop-cluster configuration mode. Each monitor corresponds to a hadoop cluster through these configurable parameters:

- JobTracker access parameters (address, port number, and username)
- TaskTracker access port
- Polling interval
- Cluster description
- Enabled setting

The minimum explicit configuration includes JobTracker address and username; default values are defined for all other parameters. By default, cluster monitors are disabled.

The `cluster (Monitor Hadoop)` command places the switch in monitor-hadoop-cluster mode for the specified monitor, where a cluster’s connection parameters are specified. Monitor-hadoop-cluster mode is not a group change mode.

A cluster monitor is enabled by `no shutdown (Monitor Hadoop Cluster)` when MapReduce Tracer is globally enabled.

46.2.2.1 JobTracker Configuration

A cluster’s JobTracker is located on the master node and schedules work to the cluster’s TaskTracker nodes. The `jobtracker (Monitor Hadoop Cluster)` command specifies connection parameters to the monitored cluster.

JobTracker parameters include its node location (IPv4 address or hostname), RPC port, and username. The default RPC port is 8021. Location and username parameters do not have default values and must be explicitly configured.
Example

- For the CL2 monitor, these commands configure connection parameters to a JobTracker node at 10.4.4.4 with the username account1. The default RPC port (8021) is implicitly specified.

  switch(config)#monitor hadoop
  switch(config-monitor-hadoop)#cluster CL2
  switch(config-monitor-hadoop-CL2)#jobtracker host 10.4.4.4 username account1
  switch(config-monitor-hadoop-CL2)#show active

46.2.2.2 TaskTracker Configuration

The tasktracker (Monitor Hadoop Cluster) command specifies the HTTP port that access TaskTrackers of the Hadoop cluster probed by the configuration mode monitor. The switch compiles a list of the cluster’s TaskTracker addresses by periodically polling the cluster’s JobTracker.

The default TaskTracker HTTP port is 50060.

Examples

- For the CL2 monitor, these commands configure a TaskTracker access port of 51000.

  switch(config)#monitor hadoop
  switch(config-monitor-hadoop)#cluster CL2
  switch(config-monitor-hadoop-CL2)#tasktracker http-port 51000
  switch(config-monitor-hadoop-CL2)#show active

- These commands restore the default TaskTracker HTTP access port address of 50060.

  switch(config-monitor-hadoop-CL2)#no tasktracker http-port
  switch(config-monitor-hadoop-CL2)#show active

46.2.2.3 Polling Interval Configuration

When the monitor configuration is complete, the switch polls the cluster’s JobTracker to maintain the list of active TaskTracker nodes associated with the monitored cluster and compile Hadoop job statistics. The interval (Monitor Hadoop Cluster) command specifies the interval between polls to the JobTracker of the monitored cluster. The default interval is 10 seconds.
Example

- This command sets the JobTracker polling interval to 25 seconds for the cluster monitored by the CL2 MapReduce Tracer configuration.

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#interval 25
switch(config-monitor-hadoop-CL2)#show active
monitor hadoop
    cluster CL2
    interval 25
switch(config-monitor-hadoop-CL2)#
```

46.2.3 MapReduce Tracer Example

The commands in this section create monitors that probe two Hadoop clusters, enables each monitor individually, then enables MapReduce Tracer globally. Monitor parameters for the clusters include:

- **Cluster ID: CL_1**
  - Jobtracker: IP address 10.15.2.2; RPC port 8021; username xyz1
  - TaskTracker: HTTP address 54000
  - JobTracker polling interval: 10 seconds (default)

- **Cluster ID: CL_2**
  - Jobtracker: IP address 10.21.5.2; RPC port 9521; username qrst4
  - TaskTracker: HTTP address 50060 (default)
  - JobTracker polling interval: 5 seconds

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#cluster CL_1

switch(config-monitor-hadoop-CL_1)#jobtracker host 10.15.2.2 username xyz1
switch(config-monitor-hadoop-CL_1)#tasktracker http-port 54000
switch(config-monitor-hadoop-CL_1)#no shutdown
switch(config-monitor-hadoop-CL_1)#exit

switch(config-monitor-hadoop)#cluster CL_2
switch(config-monitor-hadoop-CL_2)#jobtracker host 10.21.5.2 rpc-port 9521 username qrst4
switch(config-monitor-hadoop-CL_2)#interval 5
switch(config-monitor-hadoop-CL_2)#no shutdown
switch(config-monitor-hadoop-CL_2)#exit

switch(config-monitor-hadoop)#no shutdown
switch(config-monitor-hadoop)#show active
monitor hadoop
    no shutdown
    cluster CL_1
    jobtracker host 10.15.2.2 user xyz1
tasktracker http-port 54000
    no shutdown

    cluster CL_2
    jobtracker host 10.21.5.2 rpc-port 9521 user qrst4
    interval 5
```
no shutdown

switch(config-monitor-hadoop)#show active all
monitor hadoop
  no shutdown
cluster CL_1
  jobtracker host 10.15.2.2 rpc-port 8021 user xyz1
tasktracker http-port 54000
  interval 10
  no shutdown
!
cluster CL_2
  jobtracker host 10.21.5.2 rpc-port 9521 user qrst4
tasktracker http-port 50060
  interval 5
  no shutdown
switch(config-monitor-hadoop)#exit
switch(config)#
46.3 Displaying MapReduce Tracer Results

MapReduce Tracer display commands provide information about the configuration and activity on the monitored clusters.

46.3.1 MapReduce Tracer Status

MapReduce Tracer status is accessed through `show monitor hadoop status`. Status information includes the enabled status and the number of monitored clusters, TaskTrackers, and locally running jobs.

Example

- This command displays MapReduce Tracer status for all connected clusters and TaskTrackers.

```
switch>show monitor hadoop status
Last updated: 2013-10-06 18:14:23
Mapreduce Tracer status:
  Admin status                            : Enabled
  Operational status                      : Enabled
  Number of clusters configured           : 3
  Number of local TaskTrackers            : 4
  Number of jobs running locally          : 4
```

46.3.2 Cluster Configuration and Connections

The following cluster configuration and connection information is available through these commands:

- Configuration and connection data for all monitored clusters – `show monitor hadoop cluster all`.
- Configuration and connection data for a specified cluster – `show monitor hadoop cluster status`.
- Connection and activity information for TaskTrackers in a specified cluster, on a specified node, or accessed through a specified interface – `show monitor hadoop tasktracker status`.

Example

- This command displays configuration and connection data for the \textit{Cluster0} cluster.

```
switch>show monitor hadoop cluster Cluster0 status
Last updated: 2013-10-06 18:14:23
Cluster status for cluster:  Cluster0
  Admin status : Enabled
  JobTracker host : host0
  JobTracker RPC port : 9000
  JobTracker user : user0
  JobTracker polling interval : 100 seconds
  TaskTracker HTTP port : 8800
  Operational status : Enabled
  Active TaskTrackers : 31
  Blacklisted TaskTrackers : 1
  Decommissioned TaskTrackers : 1
  Tracker expiry interval : 20.0
  Map slots (used/total) : 10/100
  Reduce slots (used/total) : 11/110
  JobTracker heap size : 1.04GB (max: 2.08GB)
```

switch>
### 46.3.3 Job Lists

The following commands display rosters of currently running job or jobs that previously ran:

- Jobs running on all monitored Hadoop clusters – `show monitor hadoop`.
- Jobs running on a specified cluster and byte counter data – `show monitor hadoop cluster counters`.
- Jobs that previously ran on a specified cluster – `show monitor hadoop cluster history`.
  - Includes jobs that ran since the monitor was enabled, the switch was reloaded, or the job history was cleared (`clear monitor hadoop job-history`).
- Jobs running on a specified cluster – `show monitor hadoop cluster jobs`.
- Jobs that ran on all configured clusters is accessed through `show monitor hadoop history`.
  - Includes jobs that ran since the monitor was enabled, the switch was reloaded, or the job history was cleared (`clear monitor hadoop job-history`).
- Jobs running on a specified TaskTracker and byte counter data – `show monitor hadoop tasktracker counters`.

#### Examples

- This command displays the jobs that are running on all monitored clusters.

  ```
  switch> show monitor hadoop
  Last updated: 2013-10-06 18:14:23
  Currently running jobs: 4
<table>
<thead>

46.3.4 Job Data

The following commands display information about jobs that are running or previously ran on monitored clusters. Available data include job identifiers, JobTracker ID, start time, stop time, data consumption, and progress statistics.

- Data consumption, start and stop times, and JobTracker ID for a specific job – `show monitor hadoop cluster history jobs`.
- Data consumption, start and stop times, priority, JobTracker ID, and progress statistics for a specified job – `show monitor hadoop cluster jobs <job number>`.
- HDFS (Hadoop Distributed File System) data consumption and and shuffle byte counters for a specified job – `show monitor hadoop cluster jobs counter`.
- Data through and start time for jobs running on all monitored clusters – `show monitor hadoop counters`.
- Progress statistics and start times are available for jobs running on specified TaskTracker – `show monitor hadoop tasktracker jobs`.
- Job progress and byte counts of jobs running on a specified Hadoop cluster – `show monitor hadoop tasktracker running-tasks`.
- Progress statistics, HDFS data consumption, start time, and progress information for the specified task of a running job – `show monitor hadoop tasktracker running-tasks cluster job task`.
- Data consumption and start times for jobs running on a specified TaskTracker – `show monitor hadoop tasktracker counters`.

Examples

- This command displays information about job 1 that ran on cluster Cluster0.

```
switch> show monitor hadoop cluster Cluster0 history job 1
Job history data for job: HistoryJob1
Cluster: Cluster0
Job Id: 1
JT Id: 201310110013
User: HistoryUser1
Job start time: 2013-10-06 17:57:43
Job end time: 2013-10-08 00:31:03

Per Interface job counters:

<table>
<thead>
<tr>

<th>Bytes Out</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ethernet7</td>
<td>TaskTracker2</td>
<td>26.08GB</td>
<td>13.04GB</td>
</tr>
</tbody>
</table>
```

switch>
This command displays information about job 1 that is running on cluster \textit{Cluster0}.

```
switch>show monitor hadoop cluster Cluster0 jobs 1
Last updated: 2013-10-06 18:14:23
Information for job: ReallyAVeryLongNameForAJob1 running on cluster: Cluster0
  Cluster : Cluster0
  Id : 1
  Name : ReallyAVeryLongNameForAJob1
  User : JobUser1
  Priority : veryHigh
  Running state : running
  Number of map tasks : 2
  Number of reduce tasks : 0
  Start time : 2013-10-06 17:56:03
  Bytes In : 37.36GB
  Bytes Out : 76.29MB
  Map Progress : 12.34%
  Reduce Progress : 13.45%
  Cleanup Progress : 14.56%
  Setup Progress : 15.67%
```

This command displays data for jobs running on \textit{TaskTracker1}.

```
switch>show monitor hadoop tasktracker host TaskTracker1 jobs
Last updated: 2013-10-06 18:14:23
Running job for TaskTracker: TaskTracker1
  JobId  Job Name         Cluster   Maps(#/%)   Reduces(#/%)  Start Time
  ------ ----------------- --------- ---------- -------------- -------------------
    1       ReallyAVeryLon\  Cluster0  2/12.34%    0/13.45%      2013-10-06 17:56:03

```

\section*{46.3.5 TaskTracker Lists}

These commands display lists of TaskTrackers that are active on monitored clusters:

\begin{itemize}
  \item TaskTrackers on a specified cluster – \texttt{show monitor hadoop cluster tasktracker}.
  \item TaskTrackers on all monitored clusters – \texttt{show monitor hadoop tasktracker all}.
\end{itemize}

\section*{Example}

This command displays the TaskTrackers on the \textit{Cluster0} cluster.

```
switch>show monitor hadoop cluster Cluster0 tasktracker
Last updated: 2013-10-06 18:14:23
Total 2 TaskTrackers on cluster Cluster0:
  Node          IP Address  Interface   Maps  Reduces
  ------------------ ------------------- ---------- -------
TaskTracker1       10.100.0.1       Ethernet7   4      0
TaskTracker2       10.100.0.2       Port-Channel7 4      0
```

\section*{46.3.6 TaskTracker Connection and Activity}

The following TaskTracker connection and activity data is available through these commands:
• Connection and activity information for TaskTrackers on a specified cluster or accessed through a specified interface – *show monitor hadoop tasktracker status*.
• Data consumption for TaskTrackers connected to monitored clusters – *show monitor hadoop tasktracker all counters*.

**Example**

• This command displays connection and activity data for TaskTracker on the *TaskTracker1* node.

```plaintext
switch>show monitor hadoop tasktracker host TaskTracker1 status
```

<table>
<thead>
<tr>
<th>TaskTracker</th>
<th>TaskTracker1</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP Address</td>
<td>10.100.0.1</td>
</tr>
<tr>

<td>0</td>
</tr>
<tr>
<td>Total bytes read</td>
<td>2.08GB</td>
</tr>
<tr>
<td>Total bytes written</td>
<td>4.24MB</td>
</tr>
</tbody>
</table>

**46.3.7 Data Bursts**

The *show monitor hadoop traffic burst* command displays the largest data bursts for jobs running on a specified cluster or accessed through a specified node or interface. A data burst is the data consumed during a polling interval.

**Example**

• This command displays traffic burst data for all running jobs that are accessible through port channel interface 7.

```plaintext
switch>show monitor hadoop traffic burst interface Port-Channel 7
```

<table>
<thead>
<tr>
<th>JobId</th>
<th>Job Name</th>
<th>Burst</th>
<th>Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>ShortName</td>
<td>3.07GB</td>
<td>2013-10-06 17:57:43</td>
</tr>
<tr>
<td>2</td>
<td>ReallyAVeryLong\gNameForAJob</td>
<td>6.15GB</td>
<td>2013-10-06 17:41:03</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>JobId</th>
<th>Job Name</th>
<th>Burst</th>
<th>Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>ShortName</td>
<td>4.10GB</td>
<td>2013-10-06 17:55:13</td>
</tr>
<tr>
<td>2</td>

46.4 MapReduce Tracer Command Descriptions

Global Configuration Commands

- monitor hadoop

Clear Hadoop Monitor Commands

- clear monitor hadoop burst-counters
- clear monitor hadoop job-history

Display Commands

- show monitor hadoop
- show monitor hadoop cluster all
- show monitor hadoop cluster counters
- show monitor hadoop cluster history
- show monitor hadoop cluster history jobs
- show monitor hadoop cluster jobs
- show monitor hadoop cluster jobs <job number>
- show monitor hadoop cluster jobs counter
- show monitor hadoop cluster status
- show monitor hadoop cluster tasktracker
- show monitor hadoop counters
- show monitor hadoop history
- show monitor hadoop status
- show monitor hadoop tasktracker all
- show monitor hadoop tasktracker all counters
- show monitor hadoop tasktracker counters
- show monitor hadoop tasktracker jobs
- show monitor hadoop tasktracker running-tasks
- show monitor hadoop tasktracker running-tasks cluster job task
- show monitor hadoop tasktracker status
- show monitor hadoop traffic burst

Hadoop Commands

- cluster (Monitor Hadoop)
- shutdown (Monitor-Hadoop)

Hadoop-Cluster Commands

- description (Monitor Hadoop Cluster)
- interval (Monitor Hadoop Cluster)
- jobtracker (Monitor Hadoop Cluster)
- shutdown (Monitor Hadoop Cluster)
- tasktracker (Monitor Hadoop Cluster)
clear monitor hadoop burst-counters

The clear monitor hadoop burst-counters command resets MapReduce Tracer burst counters for all jobs running on specified clusters.

Command Mode
Privileged EXEC

Command Syntax

```
clear monitor hadoop burst-counters [CLUSTERS]
```

Parameters

- **CLUSTERS**  
  Hadoop clusters for which command displays data. Options include:
  - <no parameter>  
    all clusters.
  - **cluster c_name**  
    Cluster name.

Example

- This command clears the burst counters for all jobs running on CL2 cluster.

```
switch#clear monitor hadoop burst-counters cluster CL2
Cleared burst counters
switch#
```
clear monitor hadoop job-history

The *clear monitor hadoop job-history* command resets the job history database for all specified clusters.

**Command Mode**
Privileged EXEC

**Command Syntax**
```
clear monitor hadoop job-history [CLUSTERS]
```

**Parameters**
- **CLUSTERS** Hadoop clusters for which command displays data. Options include:
  - `<no parameter>` all clusters.
  - `cluster c_name` Cluster name.

**Example**
- This command clears the job history on the CL2 cluster.

  ```
  switch# clear monitor hadoop job-history cluster CL2
  Cleared job history
  switch#
  ```
cluster (Monitor Hadoop)

The `cluster` command is a monitor-hadoop command that places the switch in monitor-hadoop-cluster mode for configuring and enabling a MapReduce Tracer monitor for a Hadoop cluster. The command either accesses an existing monitor configuration or creates a monitor.

Monitor-hadoop-cluster configuration mode is not a group change mode; `running-config` is changed immediately upon entering commands. Exiting monitor-hadoop-cluster mode does not affect `running-config`. The `exit` command returns the switch to monitor-hadoop configuration mode.

The configuration mode monitor is enabled by `no shutdown (Monitor Hadoop Cluster)`. Enabling a monitor also requires that MapReduce Tracer is globally enabled (`no shutdown (Monitor-Hadoop)`).

The `no cluster` and `default cluster` commands remove the specified Hadoop cluster configuration from `running-config`.

**Command Mode**

Monitor-hadoop Configuration

**Command Syntax**

```
classer cluster cluster_name
no cluster cluster_name
default cluster cluster_name
```

**Parameters**

- `cluster_name`  Hadoop cluster name.

**Related Commands**

- `monitor hadoop` places the switch in monitor-hadoop configuration mode.

**Commands Available in Monitor-hadoop-cluster Configuration Mode**

- `description (Monitor Hadoop Cluster)`
- `interval (Monitor Hadoop Cluster)`
- `jobtracker (Monitor Hadoop Cluster)`
- `shutdown (Monitor Hadoop Cluster)`
- `tasktracker (Monitor Hadoop Cluster)`

**Examples**

- These commands create the CL2 monitor and enters monitor-hadoop-cluster mode for the monitor.
  
  ```
  switch(config)#monitor hadoop
  switch(config-monitor-hadoop)#cluster CL2
  switch(config-monitor-hadoop-CL2)#show active
  monitor hadoop
    cluster CL2
  switch(config-monitor-hadoop-CL2)#
  ```

- These commands exit monitor-hadoop-cluster mode.

  ```
  switch(config-monitor-hadoop-CL2)#exit
  switch(config-monitor-hadoop)#show active
  monitor hadoop
    cluster CL2
  switch(config-monitor-hadoop)#
  ```
• These commands remove the CL2 monitor.
  switch(config-monitor-hadoop)#no cluster CL2
  switch(config-monitor-hadoop)#show active
  switch(config-monitor-hadoop)#
description (Monitor Hadoop Cluster)

The `description` command adds a text string to the configuration mode MapReduce Tracer cluster monitor. The string has no functional impact on the monitor.

The `no description` and `default description` commands remove the text string from the configuration mode monitor by removing the corresponding `description` command from `running-config`.

Command Mode  
Monitor-hadoop-cluster Configuration

Command Syntax

```
description label_text
no description
default description
```

Parameters

- `label_text` character string assigned to the monitor configuration.

Related Commands

- `cluster (Monitor Hadoop)` places the switch in monitor-hadoop-cluster configuration mode.

Examples

- These commands add description text to the CL2 monitor.

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#description First Cluster
monitor hadoop
  cluster CL2
    description First Cluster
    jobtracker host 10.3.3.3 user JANE
switch(config-monitor-hadoop-CL2)#
```
interval (Monitor Hadoop Cluster)

The `interval` command specifies the polling interval between queries to the Hadoop cluster JobTracker specified by configuration mode statements. The switch polls a cluster’s JobTracker to update its list of active TaskTracker nodes and the statistics of jobs running in the cluster. This command controls the frequency of these polls. The default interval is 10 seconds.

The `no interval` and `default interval` commands restore the default interval of 10 seconds by removing the `interval` command from `running-config`.

Command Mode

Monitor-hadoop-cluster Configuration

Command Syntax

```
interval period
no interval
default interval
```

Parameters

- `period` interval (seconds) between JobTracker polls. Value ranges from 1 to 600. Default is 10.

Related Commands

- `cluster (Monitor Hadoop)` places the switch in monitor-hadoop-cluster configuration mode.

Example

- This command sets the JobTracker polling interval to 25 seconds for the CL2 cluster configuration.

  ```
  switch(config)#monitor hadoop
  switch(config-monitor-hadoop)#cluster CL2
  switch(config-monitor-hadoop-CL2)#interval 25
  switch(config-monitor-hadoop-CL2)#show active
  monitor hadoop
    cluster CL2
      interval 25
  switch(config-monitor-hadoop-CL2)#
  ```
jobtracker (Monitor Hadoop Cluster)

The **jobtracker** command specifies JobTracker access parameters for the cluster monitored by configuration mode monitor statements. A cluster’s JobTracker is located on the master node and schedules work to the cluster’s TaskTracker nodes.

Parameters required to communicate with a JobTracker include its node location (IPv4 address or hostname), RPC port, and username. The default RPC port is 8021. Location and username parameters do not have default values and must be explicitly configured. A JobTracker command that specifies a partial parameter list modifies the existing corresponding `jobtracker` statement in `running-config`.

The **no jobtracker** and **default jobtracker** commands perform the following:

- removes the `jobtracker` statement from `running config` when it lists all command parameters.
- modifies the existing `jobtracker` statement when it lists a subset of command parameters.

### Command Mode
Monitor-hadoop-cluster Configuration

#### Command Syntax

```
jobtracker [LOCATION] [PORT] [USER]
no jobtracker [LOCATION] [PORT] [USER]
default jobtracker [LOCATION] [PORT] [USER]
```

All parameters can be placed in any order.

### Parameters

- **LOCATION** Address or hostname of JobTracker node. Options include:
  - `<no parameter>` location remains undefined or unchanged from a previous configuration.
  - `host ipv4_addr` IPv4 address of master (JobTracker) node.
  - `host hostname` Hostname of master (JobTracker) node.

- **PORT** JobTracker RPC port number. Default value is 8021. Options include:
  - `<No parameter>` Port number remains unchanged from previous configuration.
  - `rdp-port port_num` Port number of master (JobTracker) node. Value ranges from 1 to 65535.

- **USER** Username that accesses JobTracker node. Options include:
  - `<No parameter>` username remains undefined or unchanged from previous configuration.
  - `username name_string` JobTracker username.

### Related Commands

- **cluster (Monitor Hadoop)** places the switch in monitor-hadoop-cluster configuration mode.
Example

- For the CL2 cluster configuration, these commands establish a connection to the JobTracker node at 10.4.4.4 with the username `account1`. The default RPC port (8021) is implicitly specified.

  switch(config)#monitor hadoop
  switch(config-monitor-hadoop)#cluster CL2
  switch(config-monitor-hadoop-CL2)#jobtracker host 10.4.4.4 username account1
  switch(config-monitor-hadoop-CL2)#show active
  monitor hadoop
  cluster CL2
  jobtracker host 10.4.4.4 user account1
  switch(config-monitor-hadoop-CL2)#

- These commands modify the JobTracker configuration to specify an RPC port of 9000.

  switch(config-monitor-hadoop-CL2)#jobtracker rpc-port 9000
  switch(config-monitor-hadoop-CL2)#show active
  monitor hadoop
  cluster CL2
  jobtracker host 10.4.4.4 rpc-port 9000 user account1
  switch(config-monitor-hadoop-CL2)#
monitor hadoop

The **monitor hadoop** command places the switch in monitor-hadoop configuration mode for configuring MapReduce Tracer monitors. A MapReduce Tracer monitor interacts with Hadoop cluster nodes that are directly attached to the switch. Tasks that the switch can perform through this interaction include:

- compile a list of nodes in the cluster
- compile a list of jobs the nodes are running
- download progress of the running jobs

Monitor-hadoop configuration mode is not a group change mode; **running-config** is changed immediately upon entering commands. Exiting monitor-hadoop configuration mode does not affect **running-config**. The **exit** command returns the switch to global configuration mode. MapReduce Tracer is enabled in monitor-hadoop mode through the **no shutdown (Monitor-Hadoop)** command.

The **no monitor hadoop** and **default monitor hadoop** commands delete previously configured **monitor hadoop mode** configuration commands.

**Command Mode**

Global Configuration

**Command Syntax**

```plaintext
monitor hadoop
no monitor hadoop
default monitor hadoop
```

**Commands Available in Monitor-hadoop Configuration Mode**

- **cluster (Monitor Hadoop)**
- **shutdown (Monitor-Hadoop)**

**Examples**

- These commands place the switch in monitor-hadoop configuration mode.
  ```plaintext
  switch(config)#monitor hadoop
  switch(config-monitor-hadoop)#
  ```

- This command exits monitor-hadoop mode.
  ```plaintext
  switch(config-monitor-hadoop)#exit
  switch(config)#
  ```

- This command deletes all previously configured monitor-hadoop configuration mode commands.
  ```plaintext
  switch(config)#no monitor hadoop
  switch(config)#
  ```
show monitor hadoop

The `show monitor hadoop` command displays a list of jobs that are running on all monitored Hadoop clusters.

**Command Mode**

EXEC

**Command Syntax**

`show monitor hadoop`

**Example**

- This command displays the jobs that are running on all monitored clusters.

```
switch>show monitor hadoop
Last updated: 2013-10-06 18:14:23
Currently running jobs: 4

JobId  Job Name            Cluster  Maps(#/%)  Reduces(#/%)  Start Time

```
**show monitor hadoop cluster counters**

The `show monitor hadoop cluster counters` command displays a list of jobs running on the specified Hadoop cluster and data consumption associated with these jobs.

**Command Mode**

EXEC

**Command Syntax**

```
show monitor hadoop cluster c_name counters
```

**Parameters**

- `c_name` Cluster name.

**Examples**

- This command displays jobs running on cluster `Cluster0`.

```
switch> show monitor hadoop cluster Cluster0 counters
Last updated: 2013-10-06 18:14:23
Counters for currently running jobs on cluster: Cluster0

```

```
switch>
```
show monitor hadoop cluster history

The `show monitor hadoop cluster history` command displays all jobs that ran on the specified cluster. The list includes all jobs that ran since the switch was reloaded, the job history was cleared (clear monitor hadoop job-history), or MapReduce Tracer was enabled.

**Command Mode**

EXEC

**Command Syntax**

`show monitor hadoop cluster c_name history`

**Parameters**

- `c_name` Cluster name.

**Examples**

- This command displays the jobs that were ran on the cluster named `Cluster0`.

```
switch> show monitor hadoop cluster Cluster0 history
Jobs history on cluster: Cluster0

<table>

switch>
```
show monitor hadoop cluster history jobs

The `show monitor hadoop cluster history jobs` command displays data about the specified job. Hadoop jobs are identified by job number and the cluster that ran the job.

Data that the command returns include job identifiers, JobTracker ID, start and stop times, and data consumption.

**Command Mode**

EXEC

**Command Syntax**

```
show monitor hadoop cluster c_name history jobs job_number
```

**Parameters**

- `c_name`   Cluster name.
- `job_number`  Job number. Value ranges from 0 to 2147483647.

**Examples**

- This command displays information about job 1 that ran on cluster Cluster0.

```
switch>show monitor hadoop cluster Cluster0 history job 1
Job history data for job: HistoryJob1
  Cluster : Cluster0
  Job Id : 1
  JT Id : 201310110013
  User : HistoryUser1
  Job start time : 2013-10-06 17:57:43
  Job end time : 2013-10-08 00:31:03
Per Interface job counters:
  Interface     TaskTracker        Bytes In       Bytes Out
                ------------------ -------------- ---------
  Ethernet7     TaskTracker2       26.08GB        13.04GB

switch>
```
**show monitor hadoop cluster jobs**

The `show monitor hadoop cluster jobs` command displays a list of jobs that are running on the specified cluster.

**Command Mode**
- EXEC

**Command Syntax**

```
show monitor hadoop cluster c_name jobs
```

**Parameters**
- `c_name`   Cluster name.

**Examples**
- This command displays the list of jobs running on cluster *Cluster0*.

```
switch>show monitor hadoop cluster Cluster0 jobs
Last updated: 2013-10-06 18:14:23
Currently running jobs on cluster: Cluster0
JobId    Job Name           User        Maps     Reduces   Start Time

gNameForAJob1
switch>
```
show monitor hadoop cluster jobs <job number>

The `show monitor hadoop cluster jobs <job number>` command displays information about the specified job. Hadoop jobs are identified by job ID and the cluster that is running the job.

Data that the command returns include time of update, job identifiers, start times, data consumption, and completion progress.

**Command Mode**

EXEC

**Command Syntax**

```
show monitor hadoop cluster c_name jobs job_number
```

**Parameters**

- `c_name` Cluster name.
- `job_number` Job number. Value ranges from 0 to 2147483647.

**Examples**

- This command displays information about job 1 that is running on cluster `Cluster0`.

  ```
  switch>show monitor hadoop cluster Cluster0 jobs 1
  Last updated: 2013-10-06 18:14:23
  Information for job: ReallyAVeryLongNameForAJob1 running on cluster: Cluster0
  Cluster : Cluster0
  Id : 1
  Name : ReallyAVeryLongNameForAJob1
  User : JobUser1
  Priority : veryHigh
  Running state : running
  Number of map tasks : 2
  Number of reduce tasks : 0
  Start time : 2013-10-06 17:56:03
  Bytes In : 37.36GB
  Bytes Out : 76.29MB
  Map Progress : 12.34%
  Reduce Progress : 13.45%
  Cleanup Progress : 14.56%
  Setup Progress : 15.67%
  ```

  switch>
show monitor hadoop cluster jobs counter

The **show monitor hadoop cluster jobs counter** command displays data consumption and progress statistics for the specified job.

**Command Mode**

EXEC

**Command Syntax**

```
show monitor hadoop cluster c_name jobs job_number counter
```

**Parameters**

- **c_name**  Cluster name.
- **job_number**  Job number. Value ranges from 0 to **2147483647**.

**Examples**

- This command displays byte counters for the job named **1** that is running on the cluster named **Cluster0**.

```
switch> show monitor hadoop cluster Cluster0 jobs 1 counters
Last updated: 2013-10-06 18:14:23

```

switch>
show monitor hadoop cluster status

The **show monitor hadoop cluster status** command displays configuration and connection information for the specified cluster.

**Command Mode**

EXEC

**Command Syntax**

```
show monitor hadoop cluster c_name status
```

**Parameters**

- **c_name**  Cluster name.

**Example**

- This command displays configuration and connection data for the *Cluster0* cluster.

  ```
  switch>show monitor hadoop cluster Cluster0 status
  Last updated: 2013-10-06 18:14:23
  Cluster status for cluster: Cluster0
  Admin status : Enabled
  JobTracker host : host0
  JobTracker RPC port : 9000
  JobTracker user : user0
  JobTracker polling interval : 100 seconds
  TaskTracker HTTP port : 8800
  Operational status : Enabled
  Active TaskTrackers : 31
  Blacklisted TaskTrackers : 1
  Decommissioned TaskTrackers : 1
  Tracker expiry interval : 20.0
  Map slots (used/total) : 10/100
  Reduce slots (used/total) : 11/110
  JobTracker heap size : 1.04GB (max: 2.08GB)
  switch>
  ```
show monitor hadoop cluster tasktracker

The `show monitor hadoop cluster tasktracker` command displays a list of TaskTrackers in the specified cluster. The IP address and access interface is included in the table.

Command Mode

EXEC

Command Syntax

    show monitor hadoop cluster c_name tasktracker

Parameters

• `c_name` Cluster name.

Example

• This command displays the TaskTrackers on the `Cluster0` cluster.

    switch>show monitor hadoop cluster Cluster0 tasktracker
    Last updated: 2013-10-06 18:14:23
    Total 2 TaskTrackers on cluster Cluster0:

    Node        IP Address     Interface       Maps  Reduces
    -------------- -------------- ------------- ------- -------
    TaskTracker1  10.100.0.1     Ethernet7       4      0
    TaskTracker2  10.100.0.2     Port-Channel7  4      0

    switch>
show monitor hadoop counters

The **show monitor hadoop counters** command displays byte counter data for all jobs running on clusters for which MapReduce Tracer is configured.

**Command Mode**

EXEC

**Command Syntax**

```
show monitor hadoop counters
```

**Examples**

- This command displays byte counter data for all jobs running on clusters that the switch is accessing through MapReduce Tracer.

```
switch>show monitor hadoop counters
Last updated: 2013-10-06 18:14:23
Counters for running jobs:

<table>
<thead>
<tr>
<th>JobId</th>
<th>Job Name</th>
<th>Cluster</th>
<th>Bytes In</th>
<th>Bytes Out</th>
<th>Start Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>510002</td>
<td>ShortName12</td>
<td>Cluster1</td>
<td>37.36GB</td>
<td>76.29MB</td>
<td>2013-10-06 17:37:43</td>
</tr>
<tr>

</tr>
</tbody>
</table>

switch>
```
show monitor hadoop history

The `show monitor hadoop history` command displays jobs that ran on clusters for which MapReduce Tracer is configured. The list includes all jobs that ran since the switch was reloaded, MapReduce Tracer was enabled, or the job history was cleared (clear monitor hadoop job-history).

Command Mode
EXEC

Command Syntax
`show monitor hadoop history`

Example
- This command displays data that jobs that previously ran on connected Hadoop clusters.

```
switch>show monitor hadoop history
Job history for all clusters:
JobId  Job Name              Cluster   Start Time   End Time     Bytes In  Bytes Out
------ ---------------- --------- ----------- ------------ ---------- ---------
2      AReallyBigHist\oricalJobName  Cluster0  2013-10-06   2013-10-09   26.08GB   13.04GB
442    AReallyBigHist\oricalJobName  Cluster1  2013-10-06   2013-10-09   26.08GB   13.04GB

441    HistoryJob1              Cluster1  2013-10-06   2013-10-08   26.08GB   13.04GB
1      HistoryJob1              Cluster0  2013-10-06   2013-10-08   26.08GB   13.04GB

switch>
```
show monitor hadoop status

The **show monitor hadoop status** command displays system status for MapReduce Tracer.

**Command Mode**

EXEC

**Command Syntax**

```
show monitor hadoop status
```

**Example**

- This command displays MapReduce Tracer status for all connected clusters and TaskTrackers.

```
switch>show monitor hadoop status
Last updated: 2013-10-06 18:14:23
Mapreduce Tracer status:
  Admin status              : Enabled
  Operational status       : Enabled
  Number of clusters configured : 3
  Number of local TaskTrackers : 4
  Number of jobs running locally : 4
```

switch>
**show monitor hadoop tasktracker all**

The `show monitor hadoop tasktracker all` command displays a list of TaskTrackers that are on all monitored Hadoop clusters.

**Command Mode**

EXEC

**Command Syntax**

`show monitor hadoop tasktracker all`

**Examples**

- This command displays the TaskTrackers of all monitored clusters that are connected to the switch.

```
switch> show monitor hadoop tasktracker all
Last updated: 2013-10-06 18:14:23
All local TaskTrackers:

<table>
<thead>
<tr>
<th>Node</th>
<th>Cluster</th>
<th>IP Address</th>
<th>Interface</th>
<th>Maps</th>
<th>Reduces</th>
</tr>
</thead>
<tbody>
<tr>
<td>TaskTracker1</td>

<td>10.100.0.4</td>
<td>Port-Channel8</td>
<td>4</td>
<td>0</td>
</tr>
</tbody>
</table>
```

switch>
show monitor hadoop tasktracker all counters

The **show monitor hadoop tasktracker all counters** command displays byte counters for the TaskTrackers of all monitored Hadoop clusters.

**Command Mode**

EXEC

**Command Syntax**

```
show monitor hadoop tasktracker all counters
```

**Examples**

- This command displays byte counter data for the TaskTrackers servicing all MapReduce Tracer Hadoop clusters.

```
switch>show monitor hadoop tasktracker all counters
Last updated: 2013-10-06 18:14:23
Counters for all TaskTrackers:

<table>
<thead>
<tr>
<th>Node</th>
<th>IP Address</th>
<th>Interface</th>

<td>8.30GB</td>
<td>16.95MB</td>
</tr>
</tbody>
</table>
```

switch>
show monitor hadoop tasktracker counters

The **show monitor hadoop tasktracker counters** command displays a list of jobs running on the specified TaskTracker and output from byte counters associated with these jobs.

**Command Mode**

EXEC

**Command Syntax**

```
show monitor hadoop tasktracker NODES counters
```

**Parameters**

- **NODES** TaskTracker node access point. Options include:
  - **host hostname** Node name.
  - **interface ethernet e_range** Ethernet interfaces through which node connects.
  - **interface port-channel p_range** Port channel interfaces through which node connects.

**Examples**

- This command displays the jobs running on the TaskTracker on the **TaskTracker1** node.

```
switch>show monitor hadoop tasktracker host TaskTracker1 counters

**show monitor hadoop tasktracker jobs**

The **show monitor hadoop tasktracker jobs** command displays data about the jobs that are running on TaskTrackers located on the specified node or accessed through the listed interfaces.

Including a cluster parameter filters results to include data only from the cluster polled by the specified monitor.

**Command Mode**

EXEC

**Command Syntax**

```
show monitor hadoop tasktracker NODES jobs [CLUSTERS]
```

**Parameters**

- **NODES**  TaskTracker node access point. Options include:
  - `host hostname`  Node name.
  - `interface ethernet e_range`  Ethernet interfaces through which node connects.
  - `interface port-channel p_range`  Port channel interfaces through which node connects.
- **CLUSTERS**  Hadoop cluster for which command displays data. Options include:
  - `<no parameter>`  TaskTracker on specified NODE can be in any cluster.
  - `cluster c_name`  TaskCluster on specified NODE must be in named cluster.

**Examples**

- This command displays data for jobs running on **TaskTracker1**.

  ```
  switch>show monitor hadoop tasktracker host TaskTracker1 jobs

show monitor hadoop tasktracker running-tasks

The **show monitor hadoop tasktracker running-tasks** command displays progress and byte counts of tasks executed by TaskTrackers located on the specified node or accessed through the listed interfaces.

Including a cluster-ID parameter filters results to include data only from the specified cluster.

**Command Mode**

EXEC

**Command Syntax**

```
show monitor hadoop tasktracker NODES running-tasks [CLUSTERS] [JOBS]
```

**Parameters**

- **NODES** TaskTracker node access point. Options include:
  - `host hostname` Node name.
  - `interface ethernet e_range` Ethernet interfaces through which node connects.
  - `interface port-channel p_range` Port channel interfaces through which node connects.

- **CLUSTERS** Hadoop cluster for which command displays data. Options include:
  - `<no parameter>` TaskTracker on specified **NODE** can be in any cluster.
  - `cluster c_name` TaskCluster on specified **NODE** must be in named cluster.

- **JOBS** Job list. Options include:
  - `<no parameter>` all jobs.
  - `job <0 to 2147483647>` Specifies number of single job.

**Examples**

- This command displays data for tasks running on TaskTracker named **TaskTracker1**.

```
switch>show monitor hadoop tasktracker host TaskTracker1 running-tasks

switch>
show monitor hadoop tasktracker running-tasks cluster job task

The `show monitor hadoop tasktracker running-tasks cluster job task` command displays detailed data for the specified task.

**Command Mode**

EXEC

**Command Syntax**

```
show monitor hadoop tasktracker NODE running-tasks cluster name job jnum task tnum
```

**Parameters**

- **NODE**  TaskTracker node access point. Options include:
  - host *hostname*  Node name.
  - interface ethernet *e_range*  Ethernet interfaces through which node connects.
  - interface port-channel *p_range*  Port channel interfaces through which node connects.
- **name**  Cluster name.
- **jnum**  Job number. Value ranges from 0 to 2147483647
- **tnum**  Task number. Value ranges from 0 to 2147483647

**Examples**

- This command displays data for task 1 of job 1 on TaskTracker1 of Cluster0.

```
switch>show monitor hadoop tasktracker host TaskTracker1 running-tasks cluster Cluster0 job 1 task 1
Last updated: 2013-10-06 18:14:23

```bash
switch>
```
show monitor hadoop tasktracker status

The `show monitor hadoop tasktracker status` command displays connection and activity information for the TaskTracker on the specified clusters or accessed through the specified interface. The following command formats display the listed TaskTracker information:

- `show monitor hadoop cluster c_name tasktracker status`: TaskTrackers on specified cluster.
- `show monitor hadoop tasktracker node status`: TaskTrackers on specified nodes or interfaces.
- `show monitor hadoop tasktracker all status`: all connected TaskTrackers.

**Command Mode**

EXEC

**Command Syntax**

```
show monitor hadoop cluster c_name tasktracker status
show monitor hadoop tasktracker NODES status
show monitor hadoop tasktracker all status
```

**Parameters**

- `c_name` Cluster name.
- `NODES` TaskTracker node access point. Options include:
  - `host hostname` Node name.
  - `interface ethernet e_range` Ethernet interfaces through which node connects.
  - `interface port-channel p_range` Port channel interfaces through which node connects.

**Examples**

- This command displays connection and activity information for all TaskTrackers connected through Ethernet interfaces 7 and 8.

```
switch>show monitor hadoop tasktracker interface Ethernet7,8 status

```

switch>
show monitor hadoop traffic burst

The *show monitor hadoop traffic burst* command displays the largest data bursts for specified Hadoop cluster jobs. A data burst is the data consumed during a polling interval. The command displays input and output burst:

- Input bursts include bytes written to the host.
- Output bursts include bytes written by the host.

**Command Mode**

EXEC

**Command Syntax**

`show monitor hadoop [CLUSTERS] traffic burst [NODE]`

**Parameters**

- **CLUSTERS** Hadoop clusters for which command displays data. Options include:
  - `<no parameter>` all clusters.
  - `cluster c_name` Cluster name.
- **NODES** TaskTracker node access point. Options include:
  - `host hostname` Node name.
  - `interface ethernet e_range` Ethernet interfaces through which node connects.
  - `interface port-channel p_range` Port channel interfaces through which node connects.
Examples

- This command displays traffic burst data for all running jobs.

```
switch>show monitor hadoop traffic burst

Chapter 46: MapReduce Tracer

MapReduce Tracer Command Descriptions

This command displays traffic burst for all jobs running on TaskTrackers that are accessible through Ethernet interfaces 7 and 8.

```
switch> show monitor hadoop traffic burst interface Ethernet 7,8
Last updated: 2013-10-06 18:14:23
Bursts on Interface: 'Ethernet7' in cluster: Cluster0
Top 2 input bursts:

shutdown (Monitor-Hadoop)

The **shutdown** command globally disables MapReduce Tracer on the switch. Enabling MapReduce Tracer for an individual cluster requires the feature to be globally enabled through this command and enabled for the individual cluster thorough the **shutdown (Monitor Hadoop Cluster)** command. By default, MapReduce Tracer is globally disabled.

The **no shutdown** command globally enables MapReduce Tracer. The **shutdown** and **default shutdown** commands globally disable MapReduce Tracer by removing the corresponding **no shutdown** command from *running-config*.

**Command Mode**

Monitor-hadoop Configuration

**Command Syntax**

- shutdown
- no shutdown
- default shutdown

**Related Commands**

- **monitor hadoop** places the switch in monitor-hadoop configuration mode.

**Example**

- These commands globally enable MapReduce Tracer.
  
  ```
  switch(config)#monitor hadoop
  switch(config-monitor-hadoop)#no shutdown
  switch(config-monitor-hadoop)#show active
  ```

- This command globally disables MapReduce Tracer.

  ```
  switch(config-monitor-hadoop)#shutdown
  switch(config-monitor-hadoop)#show active
  ```
shutdown (Monitor Hadoop Cluster)

The **shutdown** command disables MapReduce Tracer for the configuration mode cluster. Globally disabling MapReduce Tracer (**shutdown (Monitor-Hadoop)**) also disables the function on the individual cluster. Enabling MapReduce Tracer for the cluster requires the function to be enabled globally and for the individual cluster.

The **no shutdown** command configures the MapReduce Tracer setting as **enabled** for the configuration mode cluster. The **shutdown** and **default shutdown** commands disable MapReduce Tracer for the cluster by removing the corresponding **no shutdown** command from **running-config**.

**Command Mode**

Monitor-hadoop-cluster Configuration

**Command Syntax**

```
shutdown
no shutdown
default shutdown
```

**Related Commands**

- **cluster (Monitor Hadoop)** places the switch in monitor-hadoop-cluster configuration mode.

**Example**

- These commands globally enable MapReduce Tracer, then enables it for the CL2 cluster.

  switch(config)#monitor hadoop
  switch(config-monitor-hadoop)#no shutdown
  switch(config-monitor-hadoop)#cluster CL2
  switch(config-monitor-hadoop-CL2)#no shutdown
  switch(config-monitor-hadoop-CL2)#show active
  monitor hadoop
  cluster CL2
  no shutdown
  switch(config-monitor-hadoop-CL2)#exit
  switch(config-monitor-hadoop)#show active
  monitor hadoop
  no shutdown
  cluster CL2
  no shutdown
  switch(config-monitor-hadoop-CL2)#

- These commands disable MapReduce Tracer for the CL2 cluster. MapReduce Tracer remains globally enabled.

  switch(config-monitor-hadoop-CL2)#cluster CL2
  switch(config-monitor-hadoop-CL2)#shutdown
  switch(config-monitor-hadoop-CL2)#show active
  monitor hadoop
  cluster CL2
  switch(config-monitor-hadoop-CL2)#exit
  switch(config-monitor-hadoop)#show active
  monitor hadoop
  no shutdown
  cluster CL2
  switch(config-monitor-hadoop-CL2)#
tasktracker (Monitor Hadoop Cluster)

The tasktracker command specifies the HTTP port for accessing TaskTrackers of the Hadoop cluster monitored through configuration mode statements. The switch compiles a list of the cluster’s TaskTracker addresses by periodically polling the cluster’s JobTracker (jobtracker (Monitor Hadoop Cluster)). The default TaskTracker HTTP port is 50060.

The no tasktracker and default tasktracker commands restore the configuration mode TaskTracker HTTP port to 50060 by removing the corresponding tasktracker command from running-config.

Command Mode
Monitor-hadoop-cluster Configuration

Command Syntax
```
tasktracker http-port port_number
no tasktracker http-port
default tasktracker http-port
```

Parameters
- `port_num` TaskTracker HTTP port number. Value ranges from 1 to 65535. Default value is 50060.

Related Commands
- `cluster (Monitor Hadoop)` places the switch in monitor-hadoop-cluster configuration mode.

Example
- These commands specify a TaskTracker HTTP port address of 51000.
  
  switch(config)#monitor hadoop
  switch(config-monitor-hadoop)#cluster CL2
  switch(config-monitor-hadoop-CL2)#tasktracker http-port 51000
  switch(config-monitor-hadoop-CL2)#show active
  monitor hadoop
  cluster CL2
  tasktracker http-port 51000
  switch(config-monitor-hadoop-CL2)#

- These commands restore the default TaskTracker HTTP port address of 50060.
  
  switch(config-monitor-hadoop-CL2)#no tasktracker http-port
  switch(config-monitor-hadoop-CL2)#show active
  monitor hadoop
  cluster CL2
  switch(config-monitor-hadoop-CL2)#show active all
  monitor hadoop
  cluster CL2
  jobtracker rpc-port 8021
  tasktracker http-port 50060
  interval 10
  shutdown
  switch(config-monitor-hadoop-CL2)#
Chapter 47

sFlow

This chapter describes Arista’s implementation of sFlow, including configuration instructions and command descriptions. Topics covered by this chapter include:

- Section 47.1: sFlow Conceptual Overview
- Section 47.2: sFlow Configuration Procedures
- Section 47.3: sFlow Configuration Commands

47.1 sFlow Conceptual Overview

47.1.1 sFlow Technology

sFlow is a multi-vendor sampling technology that continuously monitors application level traffic flow at wire speed simultaneously on all interfaces. sFlow provides gigabit speed quantitative traffic measurements without impacting network performance.

sFlow has the following network traffic monitoring characteristics:

- sFlow provides a network view of active route usage that measures network traffic.
- sFlow is scalable to 10 Gb/s without impacting switch performance or the network load.
- sFlow is implemented on a wide range of devices, without requiring additional memory and CPU.
- sFlow is an industry standard.

An sFlow configuration consists of:

- sFlow agents, embedded on network equipment, that monitor traffic and generate data.
- sFlow collectors that receive and analyze sFlow data.

Arista switches include an sFlow agent that monitors ingress data through all Ethernet interfaces.

47.1.2 sFlow Agents

The sFlow agent is a software process that runs as part of the network management software within an Arista switch. It combines interface counters and flow samples into sFlow datagrams that are sent to an sFlow collector. Packets typically include flow samples and state information of the forwarding/routing table entries associated with each sample. Additional data can be gathered for entries originated by BGP.

The sFlow Agent performs minimal processing when packaging data into datagrams. Immediate data forwarding minimizes agent memory and CPU requirements.
47.1.2 sFlow Collector

An sFlow collector is a server that runs software that analyzes and reports network traffic. Collectors receive flow samples and counter samples respectively as sFlow datagrams from sFlow agents. Arista switches reference a collector’s IP address and UDP port as a configurable setting through a CLI command. Arista switches do not include sFlow collector software.

47.1.3 sFlow Data

The sFlow Agent uses two forms of sampling: statistical packet-based sampling of switched flows and time-based sampling of network interface statistics.

- **Switched flow sampling**: A sample is taken by either copying the packet’s header or extracting feature data from the packet.
- **Interface statistics sampling**: Counter sampling extracts statistics by periodically polling each data source on the device.

sFlow implements flow sampling and counter sampling as part of an integrated system. An sFlow datagram incorporates both sample types.

47.1.2 Arista sFlow Implementation

Arista switches provide a single sFlow agent instance that samples ingress traffic from all Ethernet and port channel interfaces. The switch provides two levels of settings for enabling sFlow:

- a global setting that enables packet sampling on the entire switch.
- interface settings that control sampling on individual interfaces when sFlow is globally enabled.

sFlow default settings include:

- **global**: sFlow and BGP sFlow export are globally disabled.
- **Ethernet and port channel interfaces**: sFlow is enabled on all interfaces when it is enabled globally. BGP sFlow export is likewise enabled on all interfaces when it is enabled globally.

The switch performs sFlow polling when sFlow is globally enabled. The CLI provides commands that globally disable sampling while counter polling remains enabled. Sample enabling is not controllable on individual interfaces.

The switch sends sFlow datagrams to the collector located at an IP address specified by a global configuration command. If the collector destination is not configured, the switch samples data without transmitting the resulting datagrams.

Although the CLI enforces the configured sampling rate limit, it may drop samples if it cannot handle the number of samples it receives over a specified period. Under normal operation, the maximum packet sample rate is one per 16384 packets. The CLI allows for higher sampling rates by using the `dangerous` keyword.

The switch can also be configured to allow the routing agent to export BGP information to the sFlow agent. When BGP sFlow export is enabled, sFlow will add BGP information to packets whose destination is a BGP route.

The following lists describe sFlow’s sampling behavior relative to different packet types:

- Packets that are sampled:
  - CPU
  - IP Options and MTU violations
  - Flooded packets
- Multicast packets
- Packets that are not sampled:
  - LACP frames
  - LLDP frames
  - STP BPDUs
  - IGMP packets
  - PAUSE frames
  - PIM hello packets
  - CRC error frames
  - Packets dropped by ACLs or due to VLAN violations
47.2 sFlow Configuration Procedures

Implementing sFlow on an Arista switch consists of configuring the following agent parameters:

1. Collector location address.
2. Agent source address.
3. Polling interval.
4. Sampling rate.

Optionally, sFlow can be configured to include output interface and traffic class information in samples using the `sflow sample` command, and to include BGP information in samples whose destination is a BGP route using the `sflow extension bgp` command.

After configuring the sFlow agent, sampling is initiated by globally enabling sFlow on the switch.

Platform-specific Considerations

When BGP sFlow export is enabled on Arad platform switches (DCS-7280E and DCS-7500E), BGP information can be added to some sFlow packets with ECMP destinations. See Enabling BGP sFlow Export for details.

DCS-7500E switches use actual hardware egress port information in sFlow packets. All other platforms use software simulation to determine the egress port.

Configuring the Collector Location

The `sflow destination` command specifies the IP address and UDP port of an sFlow collector. The switch supports multiple collectors.

Example

- This command configures the switch to send sFlow data to collectors at 10.42.15.12, port 6100 and 10.52.12.2 port 6343 (the default sFlow port).

```
switch(config)#sflow destination 10.42.15.12 6100
switch(config)#sflow destination 10.52.12.2
switch(config)#
```

Configuring the Agent Source Address

The `sflow source` command specifies the source address that the switch places in all sFlow datagrams that it sends to the collector. This address is normally set to an IP address configured on the switch.

Example

- This command configures 10.2.9.21 as the sFlow source address.

```
switch(config)#sflow source 10.2.9.21
switch(config)#
```

The `sflow source-interface` command can be alternatively used to specify the interface from which an IP address is derived that the switch places in all sFlow datagrams that it sends to the collector. This address is normally set to an IP address configured on the switch.

Example

- This command configures VLAN interface 25 as the sFlow source interface. The switch enters the IP address for VLAN 25 in the source field of sFlow datagrams.

```
switch(config)#sflow source-interface vlan 25
switch(config)#
```
**Running-config** cannot simultaneously contain **sflow source** and **sflow source-interface** commands.

### Configuring the Polling Interval

The **sflow polling-interval** command specifies the interval for sending counter data to the sFlow collector. The default interval is two seconds.

**Example**

- This command configures the switch to send sFlow data every ten seconds.

  ```
  switch(config)#sflow polling-interval 10
  ```

### Configuring the Sampling Rate and Sample Contents

The **sflow sample** command sets the packet sampling rate. Packets are sampled at random intervals to avoid inaccurate sampling of periodic events. A rate of 16384 corresponds to an average sample of one per 16,384 packets. The default rate is 1048576.

**Example**

- This command configures the sFlow sampling rate as 65536 (one per 65,536 packets).

  ```
  switch(config)#sflow sample 65536
  ```

The **sflow sample** command can also optionally configure sample packets to include information about the traffic class of the sample. Traffic class is communicated by rewriting the DSCP field in the sample packet.

By default, samples include information about the output interface. To remove this information, use the **[no] sflow sample output interface** command.

- These commands configure sFlow to include traffic class information in samples but to exclude output interface data.

  ```
  switch(config)#no sflow sample output interface
  ```

### Enabling BGP sFlow Export

The **sflow extension bgp** command enables BGP sFlow export. When it is enabled, the routing agent will export the BGP routing table and autonomous system path information to the sFlow agent. When sFlow receives a sampled packets whose destination is a BGP route, it will look up the following additional BGP routing information and include it in the sample:

- next hop IP
- AS numbers
- AS system path to the destination
- communities
- local pref

On Arad platform switches (DCS-7280E and DCS-7500E), BGP sFlow export will also add the above BGP information to sample packets with ECMP destination routes unless they exit the switch via a trunk port or subinterface. When egress port is a trunk port or subinterface, the sample packet will only include AS path information from the first path of the ECMP route and a BGP next hop of “0.”
On all other switch platforms, ECMP destination routes will include AS path information from the first path, but will identify the BGP next hop as “0.”

**Note**

A BGP instance must be configured on the switch for BGP sFlow export to operate. See the “Border Gateway Protocol (BGP)” chapter for details.

**Example**

- These commands configure a BGP instance in AS 50 and enable BGP sFlow export globally.

```bash
switch(config)#router bgp 50
switch(config-router-bgp)#exit
switch(config)#sflow extension bgp
switch(config)#
```

**Extended Switch and Router Information**

By default, extended switch and router information is added to sFlow sample packets.

Extended switch information includes the following:

- source and destination VLANs and priorities

Extended router information includes the following:

- IP version and address of next-hop router
- source and destination mask lengths

The `no sflow extension switch` and `no sflow extension router` commands prevent the addition of extended switch and router information to sFlow sample packets.

**Example**

- These commands prevent extended switch and router information from being added to sFlow sample packets.

```bash
switch(config)#no sflow extension switch
switch(config)#no sflow extension router
switch(config)#
```

**Enabling sFlow**

The `sflow run` command globally enables sFlow on the switch. The `sflow enable` command controls sFlow operation on Ethernet and port channel interfaces when sFlow is globally enabled. The `sflow enable` command has no effect when sFlow is globally disabled.

**Example**

- These commands enable sFlow on the switch, then disables sFlow on Ethernet interface 10.

```bash
switch(config)#sflow run
switch(config)#interface ethernet 10
switch(config-if-Et10)#no sflow enable
switch(config)#
```
47.3 sFlow Configuration Commands

This section contains descriptions of sFlow commands.

Global Configuration Commands

- sflow extension bgp
- sflow extension router
- sflow extension switch
- sflow destination
- sflow polling-interval
- sflow run
- sflow sample
- sflow source
- sflow source-interface

Interface Configuration Commands

- sflow enable

Privileged EXEC Command

- clear sflow counters

sFlow Display Commands

- show sflow
- show sflow interfaces
**clear sflow counters**

The `clear sflow counters` command resets the global sFlow statistics, which includes the number of samples and sample pool. The hardware trigger count is not reset.

The `show sflow` command displays global sFlow statistics.

**Command Mode**

Privileged EXEC

**Command Syntax**

```
clear sflow counters
```

**Example**

- This command resets the sFlow counters.

  ```
  switch#clear sflow counters
  switch#
  ```
sflow extension bgp

The sflow extension bgp command enables BGP export to sFlow. When enabled, this feature the routing agent will export the BGP routing table and autonomous system path information to the sFlow agent. When sFlow receives a sampled packets whose destination is a BGP route, it will look up the following additional BGP routing information and include it in the sample:

- next hop IP
- AS numbers
- AS system path to the destination
- communities
- local pref

The no sflow extension bgp and default sflow extension bgp commands disable BGP export to sFlow by deleting the corresponding sflow extension bgp command from running-config.

Note

A BGP instance must be configured on the switch for BGP sFlow export to operate. See the “Border Gateway Protocol” chapter for details.

Command Mode

Global Configuration

Command Syntax

sflow extension bgp
no sflow extension bgp
default sflow extension bgp

guidelines

BGP sFlow export behaves differently on different switch platforms as follows:

- DCS-7500E switches use actual hardware egress port information in sFlow packets. All other platforms use software simulation to determine the egress port.
- On Arad platform switches (DCS-7280E and DCS-7500E), BGP sFlow export works for sample packets with ECMP destination routes unless they exit the switch via a trunk port or subinterface. When egress port is a trunk port or subinterface, the sample packet will only include AS path information from the first path of the ECMP route and a BGP next hop of “0.”
- On all other switch platforms, ECMP destination routes will include AS path information from the first path, but will identify the BGP next hop as “0.”
- DCS-7500E switches use actual hardware egress port information in sFlow packets. All other platforms use software simulation to determine the egress port.

Example

- These commands configure a BGP instance in AS 50 and enable BGP sFlow export globally.

  switch(config)#router bgp 50
  switch(config-router-bgp)#exit
  switch(config)#sflow extension bgp
  switch(config)#

  3013
**sflow extension router**

By default, the switch provides extended router information in sFlow packets, including the IP version and address of the next-hop router and source and destination mask lengths.

The **no** version of the **sflow extension router** command prevents this information from being included in sFlow packets.

The **sflow extension router** and **default sflow extension router** commands restore the default behavior by deleting the corresponding **no sflow extension router** command from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

- `sflow extension router`
- `no sflow extension router`
- `default sflow extension router`

**Example**

- This command prevents the switch from including extended router information in sFlow packets.

  ```
  switch(config)#no sflow extension router
  switch(config)#
  ```
sflow extension switch

By default, the switch provides extended switch information in sFlow packets, including source and destination VLANs and priorities.

The **no** version of the `sflow extension switch` command prevents this information from being included in sFlow packets.

The `sflow extension switch` and `default sflow extension switch` commands restore the default behavior by deleting the corresponding `no sflow extension switch` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

- `sflow extension switch`
- `no sflow extension switch`
- `default sflow extension switch`

**Example**

- This command prevents the switch from including extended switch information in sFlow packets.

```
switch(config)#no sflow extension switch
switch(config)#
```
sFlow Configuration Commands

sflow destination

The sflow destination command specifies an sFlow collector IP address and UDP port. The switch supports sFlow collector addresses through multiple sFlow destination commands in running-config.

The no sflow destination and default sflow destination commands remove the specified sFlow collector IP address by deleting the corresponding sflow destination command from running-config.

Command Mode
Global Configuration

Command Syntax

- `sflow destination dest_addr [UDP_PORT]`
- `no sflow destination dest_addr [UDP_PORT]`
- `default sflow destination dest_addr [UDP_PORT]`

Parameters
- `dest_addr` sflow collector’s IP address.
- `UDP_PORT` sFlow collector’s data reception port. Options include:
  - `<No parameter>` port number 6343 (default).
  - `port_num` port number. Value ranges from 0 to 65535.

Example

- This command configures the switch to send sFlow data to the collector located at 10.42.15.12; the collector receives the data through UDP port 6100.

  `switch(config)#sflow destination 10.42.15.12 6100
  switch(config)#`
sflow enable

The `sflow enable` command enables sFlow on the configuration mode interface when sFlow is globally enabled. By default, sFlow is enabled on all interfaces when sFlow is globally enabled (sflow run). The `sflow enable` command is required only when `running-config` contains a `no sflow enable` statement for the specified interface.

The `no sflow enable` command disables sFlow on the configuration mode interface. When sFlow is globally disabled, this command persists in `running-config` but has no effect on switch operation.

The `default sflow enable` command removes the corresponding `no sflow enable` command from `running-config`, enabling sFlow capability on the interface.

Command Mode
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

Command Syntax
- `sflow enable`
- `no sflow enable`
- `default sflow enable`

Examples
- These commands enable sFlow on the switch and disable sFlow on Ethernet interface 12.
  ```
  switch(config)#sflow run
  switch(config)#interface ethernet 12
  switch(config-if-Et12)#no sflow enable
  switch(config-if-Et12)#
  ```
- This command removes the `no sflow enable` command for Ethernet interface 12 from `running-config`, enabling sFlow on the interface whenever sFlow is globally enabled.
  ```
  switch(config-if-Et12)#sflow enable
  switch(config-if-Et12)#
  ```
sFlow Configuration Commands

Chapter 47: sFlow

sflow polling-interval

The sflow polling-interval command specifies the counter’s polling interval. The switch uses this interval to schedule a port’s counter data transmissions to the sFlow collector.

The default interval is two seconds.

The no sflow polling-interval and default sflow polling-interval commands revert the polling interval to the default of two seconds by removing the sflow polling-interval command from running-config.

Command Mode
Global Configuration

Command Syntax

sflow polling-interval interval_period
no sflow polling-interval
default sflow polling-interval

Parameters

\* interval_period polling interval (seconds). Value ranges from 0 to 3600 (60 minutes). Default is 2.

Example

\* This command configures the switch to send sFlow counter data every ten seconds.

switch(config)#sflow polling-interval 10
switch(config)#
sflow run

The `sflow run` command globally enables sFlow on the switch. The default sFlow global setting is `disabled`. sFlow cannot be enabled on individual interfaces when it is globally disabled.

The `sflow enable` interface configuration command controls sFlow operation on individual Ethernet and port channel interfaces when sFlow is globally enabled. When sFlow is enabled globally, sFlow is also enabled on all interfaces by default.

The `no sflow run` and `default sflow run` commands globally disable sFlow on the switch.

**Command Mode**

Global Configuration

**Command Syntax**

- `sflow run`
- `no sflow run`
- `default sflow run`

**Examples**

- This command enables sFlow on the switch.
  
  ```
  switch(config)#sflow run
  switch(config)#
  ```

- This command globally disables sFlow.
  
  ```
  switch(config)#no sflow run
  switch(config)#
  ```
sflow sample

The `sflow sample` command sets the packet sampling rate. Packets are sampled at random intervals to avoid inaccurate sampling of periodic events; the packet sampling rate defines the average number of ingress packets that pass through an interface for every packet that is sampled. A rate of 16384 corresponds to an average sample of one per 16,384 packets. The switch may drop samples if it cannot handle the configured sample rate. Under normal operation, the maximum packet sample rate is one per 16384 packets. Higher sampling rates can be specified with the `dangerous` option.

By default, samples include information about the output interface. To remove this information, use the `[no] sflow sample output interface` command.

The `sflow sample` command can also optionally configure sample packets to include information about the traffic class of the sample. Traffic class is communicated by rewriting the DSCP field in the sample packet.

The `no sflow sample` and `default sflow sample` commands reset the packet sampling rate to the default of 1,048,576 and remove output interface and traffic class information from samples by removing the `sflow sample` command from the configuration.

Command Mode
Global Configuration

Command Syntax
```
sflow sample SAMPLE_RATE [rewrite dscp]
no sflow sample
default sflow sample
```

Parameters
- **SAMPLE_RATE** size of the packet sample from which one packet is selected. Default sample size is 1048576 packets. Options include:
  - `recommended_rate` Integer between 16384 to 16777215.
  - `dangerous any_rate` permits overriding the recommended range of sampling rates. The `any_rate` value range varies by platform:
    - `fm6000` 1 to 65535
    - `trident` 1 to 16777216
- `rewrite dscp` configures sFlow to rewrite the DSCP field of sample packets to indicate the traffic class of the original packet.

Examples
- This command configures the sFlow sampling rate as 65536 (one per 65,536 packets).
  ```
  switch(config)#sflow sample 65536
  ```
- This command configures the sFlow sampling rate as 256 (one per 256 packets).
  ```
  switch(config)#sflow sample dangerous 256
  ```
- This command configures sFlow to include traffic class information in samples.
  ```
  switch(config)#sflow sample rewrite dscp
  ```
[no] sflow sample output interface

By default, sFlow samples include information about the output interface of the sampled packet. The **no sflow sample output interface** command prevents sFlow from including that information.

**Command Mode**

Global Configuration

**Command Syntax**

```
no sflow sample output interface
```

**Examples**

- This command configures sFlow to *not* include output interface information in samples.

  ```
  switch(config)#no sflow sample output interface
  switch(config)#
  ```
**sflow source**

The `sflow source` command specifies the address that is listed as the source in all sFlow datagrams that the switch sends to the collector. The source address is normally set to an IP address configured on the switch. This command cannot be used if `running-config` contains an `sflow source-interface` command.

The `no sflow source` and `default sflow source` commands remove the `sflow source` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
sflow source source_addr
no sflow source
default sflow source
```

**Parameters**

- `source_addr` source IP address (dotted decimal notation).

**Example**

- This command configures 10.2.9.21 as the sFlow source address.

```
switch(config)#sflow source 10.2.9.21
switch(config)#
```
sflow source-interface

The `sflow source-interface` command specifies the interface from which the sFlow source IP address is derived. The switch enters the interface’s IP address as the source in sFlow datagrams that it sends to the collector. This command cannot be used if `running-config` contains an `sflow source` command.

The `no sflow source-interface` and `default sflow source-interface` commands remove the `sflow source-interface` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
sflow source-interface INT_NAME
no sflow source-interface
default sflow source-interface
```

**Parameters**

- `INT_NAME` Interface type and number. Options include:
  - `interface ethernet e_num` Ethernet interface specified by `e_num`.
  - `interface loopback l_num` Loopback interface specified by `l_num`.
  - `interface management m_num` Management interface specified by `m_num`.
  - `interface port-channel p_num` Port-Channel Interface specified by `p_num`.
  - `interface vlan v_num` VLAN interface specified by `v_num`.

**Example**

- This command configures the sFlow source address as the IP address assigned to the loopback 0 interface.
  ```
  switch(config)#sflow source-interface loopback 0
  switch(config)#
  ```
show sflow

The `show sflow` command displays configured sFlow parameters, operational status, and statistics. The `show sflow interfaces` command displays the interfaces where sFlow is enabled.

**Command Mode**

EXEC

**Command Syntax**

```
show sflow [detail]
```

**Parameters**

- `detail` adds hardware sampling status and number of discarded samples to the information displayed.
Examples

- This command displays the base sFlow information.

OpenFlow

This chapter describes Arista’s OpenFlow implementation. Sections in this chapter include:

- Section 48.1: OpenFlow Introduction
- Section 48.2: OpenFlow Description
- Section 48.3: OpenFlow Configuration
- Section 48.4: OpenFlow Command Descriptions

48.1 OpenFlow Introduction
Arista EOS supports OpenFlow 1.0 controlled by OpenFlow controllers for filtering and redirecting traffic.

48.2 OpenFlow Description
OpenFlow is a programmable network protocol that manages and directs traffic among Ethernet switches, routers, and wireless access points over the network in support of Software-Defined Networking (SDN) applications. OpenFlow can be used for traffic flow management in metro, WAN, and data center networks, and also security management in enterprise and campus data center applications, and other applications with the appropriate use of OpenFlow controllers.
48.2.1 OpenFlow Controller

The Arista device supports an active controller connection for which the Arista device will initiate (seek) the TCP connection to a given OpenFlow Controller address.

Figure 48-1: Reactive and proactive modes

The controller can be any standard OpenFlow controller.

Switch consists of three parts:

- A flow table, to tell the switch how to process the flow.
- A channel that connects the switch to a remote controller, allowing commands and packets to be sent between a controller and the switch.
- The OpenFlow Protocol, which provides a way for a controller to communicate with a switch.

An OpenFlow-enabled device supports an OpenFlow Client (control plane software), which communicates with an OpenFlow Controller using the OpenFlow protocol. The OpenFlow Controller runs on a server or a server cluster. OpenFlow-enabled devices support the abstraction of a flow table, which is manipulated by the OpenFlow Controller. A flow is a collection of packets where some selected header fields match particular values for those fields. The flow table is sorted by flow priority, which is defined by the controller.

Flow table

Forwarding decisions for incoming packets are decided by a simple lookup on its flow-table entries. Packets that don’t match any flow entry are dropped by default. Every flow entry in the flow-table contains:

- Header fields to match against packets: Each entry contains a specific value, or ANY, which matches any value.

<table>
<thead>
<tr>
<th>Ingress Port</th>
<th>Ether Source</th>
<th>Ether Dst</th>
<th>Ether Type</th>
<th>VLAN Id</th>
<th>IP Proto</th>
<th>Src Port</th>
<th>Dst Port</th>
</tr>
</thead>
</table>

- Counters to update for matching packet: These counters are used for statistics purposes, in order to keep track of the number of packets and bytes for each flow and the time that has elapsed since the flow initiation.
- Actions to apply to matching packets: The action specifies the way in which the packets of a flow will be processed. An action can be one of the following: 1) forward the packet to a given port or ports, after optionally rewriting some header fields, 2) drop the packet 3) forward the packet to the controller.
Chapter 48: OpenFlow

OpenFlow Description

Channel

The channel is the interface that connects each OpenFlow switch to a controller. Through this interface the controller exchanges messages with the switches in order to configure and manage them.

48.2.2 OpenFlow Modes

Bind modes

The switch can be configured to divide traffic entering the switch in either of two ways:

- By interface, so that only packets arriving on certain interfaces are processed by OpenFlow (interface bind mode, the default).
- By VLAN, so that only packets associated with certain VLAN IDs are processed by OpenFlow (VLAN bind mode).

Other packets are forwarded normally according to the MAC address table, filtered by ACLs, mirrored to other ports.

Note

The hybrid mode of operation is experimental.

The switch can also be configured to apply a limited set of OpenFlow actions to any packets, regardless of ingress interface or VLAN, as well as forward the packets normally (monitor bind mode).

Interface bind mode

When the switch is configured in interface bind mode, the ingress interface of a packet is processed according to entries in the OpenFlow table.

Only interfaces bound to OpenFlow are mapped to OpenFlow ports and exposed to the controller via features reply and port status messages. Output actions in flow table entries and in packet out messages can refer only to mapped ports. Use the `show openflow ports` command to see which interfaces the switch maps to OpenFlow ports and exposes to the controller.

- In OpenFlow configuration mode, use the `bind mode (OpenFlow)` command to select interface bind mode.
- In the OpenFlow configuration mode, use the bind interface command to bind one or more interfaces to OpenFlow.

When an interface is bound to OpenFlow, certain switch functions are disabled on the interface, including spanning tree protocol (STP). The OpenFlow controller and application must ensure that flow table entries do not allow traffic to loop in the network.

Only Ethernet and Port-Channel interfaces can be bound to OpenFlow. If an Ethernet interface is configured as a member of a LAG, attempting to bind the interface to OpenFlow has no effect. However, the Port-Channel interface of which it is a member may itself be bound to OpenFlow.

VLAN bind mode

When a packet arrives at a switch interface, the switch assigns it a VLAN for internal processing, based on the switchport configuration of the ingress interface and on the packet's VLAN tag (if any). If the switch is configured in VLAN bind mode, the internal VLAN determines whether the packet is processed according to entries in the OpenFlow table and whether the packet is matched by a given entry in the OpenFlow table. After the switch has processed the packet, the switchport configuration of each potential egress interface controls whether the packet is transmitted tagged with the internal VLAN ID, transmitted untagged, or filtered.
Several configuration commands affect whether packets received on a given interface are processed by OpenFlow, and whether packets directed to an interface via an OpenFlow output action are transmitted or filtered:

Use the VLAN configuration mode command to create the VLANs to be accepted by the switch and processed by OpenFlow.

In the interface configuration mode, use switchport commands to configure the interface as either an access port or a trunk port. For an access port, set the VLAN to an OpenFlow VLAN; for a trunk port, configure which OpenFlow VLANs are allowed.

In OpenFlow configuration mode, use the bind mode (OpenFlow) command to select VLAN bind mode, and use the bind vlan (OpenFlow) command to bind one or more VLANs to OpenFlow.

**Untagged packet processing in VLAN bind mode**

The OpenFlow protocol also allows a flow table entry to explicitly match untagged packets, or to strip the VLAN tag from matched packets. Since the switch actually assigns a VLAN internally to packets received without a tag, the OpenFlow function on the switch must be configured with a single "native" VLAN ID in order to make sense of such flow entries. When an OpenFlow native VLAN is configured:

- A flow table entry defined to match untagged packets actually matches packets whose internal VLAN is the OpenFlow native VLAN.
- A flow table entry with a strip VLAN tag action actually sets the packet's internal VLAN to the OpenFlow native VLAN.
- Packets sent to the controller via a packet-in message are sent untagged if they are assigned to the native VLAN, and tagged otherwise.
- Untagged packets received from the controller via a packet-out message are assigned to the native VLAN.

In contrast, when no OpenFlow native VLAN is configured:

- Flow table entries defined to match untagged packets or with a strip VLAN tag action are rejected.
- All packets sent to the controller via a packet-in message are sent tagged.
- Untagged packets received from the controller via a packet-out message are dropped.

There is no explicit command to configure the OpenFlow native VLAN. To configure a VLAN as the OpenFlow native VLAN:

- Use the VLAN configuration mode command.
- Every interface handling the OpenFlow traffic, in interface configuration mode, uses switchport commands to configure the interface as either an access port or a trunk port. For an access port, set the access VLAN to N; for a trunk port, either set the native VLAN to N or configure the interface to drop untagged frames.
- In OpenFlow configuration mode, use the bind vlan (OpenFlow) command to assign VLAN N to OpenFlow.

Configuring two interfaces as access ports with different OpenFlow-bound VLANs, or as trunk ports with different native OpenFlow-bound VLANs, violates these constraints and causes the OpenFlow function to behave as no OpenFlow native VLAN is configured.

Use the show openflow command to see whether an OpenFlow native VLAN has been configured.
Spanning Tree Protocol in VLAN bind mode

STP can operate on OpenFlow-bound VLANs. The switch default STP configuration is one multiple spanning tree (MST) instance containing all VLANs, including OpenFlow-bound VLANs. When STP is configured on OpenFlow-bound VLANs, packets received from or sent to blocked ports are dropped, regardless of the rules defined in the OpenFlow flow table.

For some applications, you may want to disable STP on OpenFlow-bound VLANs. Before doing so, be sure that the OpenFlow controller and application is configured properly to manage multiple redundant paths through the network without allowing traffic to loop.

To ensure proper operation of STP on the switch and to support OpenFlow applications that inter-operate with STP, OpenFlow forwards inbound STP packets both to the spanning tree agent on the switch and to the OpenFlow controller as packet-in messages. This behavior overrides any flow table entries that might otherwise match STP packets, and is not configurable.

Monitor bind mode

Unlike interface and VLAN bind modes, monitor bind mode is tailored for specific applications. The switch both forwards traffic normally and selectively mirrors packets under OpenFlow control.

When the switch is configured in monitor bind mode, all traffic entering the switch is forwarded normally, regardless of ingress interface or internal VLAN. All Ethernet and Port-Channel interfaces are mapped to OpenFlow ports and exposed to the controller (except LAG members and mirror destination ports). In this mode, the entire switch is bound to OpenFlow, and OpenFlow processing is applied to packets in addition to the normal forwarding behavior.

Currently the only actions that can be performed on packets in monitor bind mode are:

- Output normally
- Copy to mirror destination port

In monitor bind mode, the default action taken on packets that are not matched by any flow table entry is output normally. The switch rejects flow entries not conforming to these restrictions.

Routing Between the OpenFlow and Non-OpenFlow Domain

The switch can be configured to perform standard IP routing of traffic processed by OpenFlow. From the controller's point of view, the switch appears to have a virtual port 40000 (OpenFlowRouter) in addition to the physical ports.

Packets sent out the OpenFlowRouter port can undergo standard IP routing into a different IP subnet. After routing, those packets can either exit the switch or be processed by OpenFlow again.

48.2.2.1 Port mapping

For switches that support QSFP+ modules, a 40G interface can be configured as four 10G ports. These Ethernet interfaces are mapped to OpenFlow ports according to the formula port = M * 200 + N for EthernetM/N. For example, interface Ethernet1/1 is mapped to OpenFlow port 201; Ethernet1/2 to OpenFlow port 202; Ethernet16/1 to OpenFlow port 3201, Ethernet16/2 to OpenFlow port 3202, and so on.

When IP routing is configured, the OpenFlow Router interface is mapped to OpenFlow port 40000. Port-Channel (LAG) interfaces are mapped to OpenFlow ports according to the formula port = 40000 + N for Port-ChannelN. For example, interface Port-Channel23 is mapped to OpenFlow port 40023.
The OpenFlow virtual ports all and flood refer to all Ethernet interfaces on the switch, but normal VLAN egress policies apply: a packet tagged with a given OpenFlow-bound VLAN (or untagged, if a native OpenFlow VLAN is configured) will egress a given interface only if the interface is configured to handle traffic for that VLAN. If an interface is not configured to handle traffic for any OpenFlow-bound VLAN, then no packets sent to all or flood will egress on that interface.

48.2.2.2 Queue mapping

All multicast transmit queues that are configured to be mapped from a QoS traffic class are mapped to OpenFlow. OpenFlow-mapped queues can be used by the enqueue action in flow table entries and are included in queue stats reply messages. By default, all the multicast queues 0 to 3 are mapped.

Use the `show qos maps` command to view the current mapping of traffic class to multicast transmit queue, and use the `qos map traffic-class to mc-tx-queue` configuration command to modify it. If no traffic class is mapped to a given multicast transmit queue, the queue will not be mapped to OpenFlow and will be unavailable for use by the enqueue action.

48.2.2.3 Table size

The switch supports one flow table. OpenFlow packet processing is performed in hardware; software forwarding (via the switch CPU) is not supported.

The switch advertises the table size for the l2-match profile. This should be taken as an approximation, as other switch features such as ACLs can consume hardware resources shared with OpenFlow. If the controller attempts to add a flow entry but there are insufficient resources to implement it in hardware, the switch returns an error message.

48.2.2.4 Match fields

A flow table entry can specify an exact value or wildcard for any of the following fields:

- L2 source and destination addresses
- VLAN ID (and untagged packets, if the native OpenFlow VLAN is configured)
- VLAN priority
- L2 frame type
- IPv4 source and destination addresses with subnet masking
- IPv4 TOS/DSCP field
- IPv4 protocol
- TCP/UDP source and destination port numbers

Matching the IPv4 source or destination address within an ARP message is not supported, nor is matching the ARP opcode.

48.2.2.5 Actions

In VLAN and interface bind modes, the following flow entry actions are supported:

- Copy packet on ingress to a mirror destination port (vendor-specific extension)
- Set L2 source and destination addresses
- Set VLAN ID
- Strip VLAN tag (if the native OpenFlow VLAN is configured)
- Set VLAN priority
- Set IPv4 TOS/DSCP
• Output or enqueue to physical port (see Section 48.2.3 for restrictions on multiple output actions)
• Output or enqueue to all or flood (see Section 48.2.3)
• Output to controller (buffering not supported; entire packet contents are always sent)
• Drop (no action)
• Copy packet on egress to a mirror destination port (vendor-specific extension)

In monitor bind mode, only the following actions are supported:
• Copy packet on ingress to a mirror destination port (vendor-specific extension)
• Output per normal forwarding (this action is required in every flow entry)
• Copy packet on egress to a mirror destination port (vendor-specific extension)

### 48.2.3 OpenFlow Limitations

Consider the following when using OpenFlow:

• OpenFlow is supported on both the 7050 and 7050X series of switches.
• OpenFlow Hybrid mode is not supported.
• Output to an ingress port is silently dropped. Flow table entries with an output to ingress port action are accepted by the switch, but matching packets are not actually forwarded via the ingress port. (But for packet-out, the output to ingress port action is supported.)
• Output/enqueue actions must follow modify actions. The switch will return an error if a modify action follows an output/enqueue action.
• Each action can be performed at most once. The switch will return an error if the same action appears more than once. Output and enqueue actions may appear at most once per port.
• Support output to only one queue. The switch will return an error if multiple enqueue actions appear with different queue ids, or if both enqueue and output actions appear.
• Packet is sent at most once per port even if there are overlapping output or enqueue actions. For example, the switch will accept a rule with actions output to all ports and output to a specific port 12, but will transmit the packet on port 12 only once even though it is contained in both actions.
• Flow entry priority is always respected, even for exact-match flow entries. The switch does not force exact-match flow entries to be processed at the highest priority.
• For packet-out messages, only output actions are supported (to a physical port, or to all, flood, or ingress port). The switch will return an error if a packet-out message is received with any other action.
• The switch-to-controller connection is plain TCP. The switch does not support encrypted TLS connections to the controller.
• Matching source and destination IP and operation code in ARP packets is not supported. Flow entries with matching the ARP Ethernet type are accepted by the switch, but the source and destination IP and protocol (opcode) match field values are ignored (i.e. the fields are wildcarded).
• A flow mod message with modify or modify_strict command does not modify the cookie value of existing flow entries. If the modify is treated as an add, however, the new entry will be assigned the specified cookie value.
• Matching all 802.3 packets without SNAP headers is not supported. The switch does not treat a dl_type value of 0x5ff as special.
• The port_mod message is not supported. It is not possible to modify the behavior of physical ports via the port_mod message. In particular, the no_flood port_config bit cannot be used to exclude ports from the flood virtual output port set.
• Changing the list of controllers causes the current controller connection to be dropped. When the OpenFlow feature is enabled and the list of controllers is changed in any fashion (e.g. by adding or deleting a controller), the current controller connection will be dropped.

• When adding a large number of flow table entries, add higher-priority entries before lower-priority entries. Due to hardware limitations, the switch will take much longer to add a new flow entry if the table already contains many entries with lower priority.
48.3 OpenFlow Configuration

By default, the OpenFlow feature is disabled on Arista devices. You must first enable the OpenFlow feature on the device. These sections describe OpenFlow configuration tasks:

- Section 48.3.1: Configuration Procedures
- Section 48.3.2: Enabling Basic OpenFlow
- Section 48.3.3: Optional OpenFlow Commands
- Section 48.3.4: Displaying OpenFlow Configurations

48.3.1 Configuration Procedures

Use the OpenFlow configuration mode commands to configure the following basic parameters:

- **openflow**: places the switch in OpenFlow configuration mode.
- **controller (OpenFlow)**: set the controller IP address and port
- **bind interface (OpenFlow)**: bind interfaces to OpenFlow
- **shutdown (Openflow)**: enable or disable OpenFlow

48.3.2 Enabling Basic OpenFlow

Configure the management interface. Assign an IP address to the interface and set the default gateway IP address, allowing the OpenFlow function on the switch establish a TCP connection with the OpenFlow controller.

The following commands turn on OpenFlow pointing to a controller, ready to receive flow setup messages to be programmed in hardware for all traffic.

- The **openflow** command places the switch in OpenFlow configuration mode.
  
  switch(config)#openflow
  switch(config-OpenFlow)#

- The **controller (OpenFlow)** command points to the primary OpenFlow controller. Others can be configured as a standby list.
  
  switch(config)#OpenFlow
  switch(config-OpenFlow)#controller tcp:15.16.15.16:6633
  switch(config-OpenFlow)#

- The **bind vlan (OpenFlow)** command dictates what VLAN or interfaces are tied to OpenFlow. Since hybrid mode is not supported, Arista recommends binding all VLANs or all interfaces to OpenFlow.
  
  switch(config)#openflow
  switch(config-openflow)#controller tcp:1.2.3.4:6633
  switch(config-openflow)#
  switch(config-openflow)#bind mode vlan
  switch(config-openflow)#bind vlan 1

- The **shutdown (Openflow)** command determines if the configuration takes effect or not. The following command enables OpenFlow on the switch.
  
  switch(config-OpenFlow)#no shutdown
  switch(config-OpenFlow)#
48.3.3 Optional OpenFlow Commands

**Keepalive**

The keepalive (OpenFlow) command allows you to set the interval for switch to controller keepalives (default of 10 seconds scales best for large scale multi-node OpenFlow switch networks). After three consecutive reply (from the controller) misses, the switch will try to connect to the second configured controller, if configured.

```
switch(config-OpenFlow)#keepalive
```

**Profile**

The profile (OpenFlow) command determines the type of flows. To double flow table size (in case all flows are L2 only), setting a profile of l2-match is best suited. Default is full-match (includes L3/4 field match).

```
switch(config-OpenFlow)#profile l2-match
```

**Default-action**

The default-action (OpenFlow) command tells the Arista OpenFlow agent the action that needs to be taken for packets (drop or send-to-controller) that don’t match any existing flows programmed locally on the hardware.

```
switch(config-OpenFlow)#default-action drop
```

48.3.4 Displaying OpenFlow Configurations

Show commands display the state of OpenFlow running on the Arista switch.

- The show openflow command displays the configuration state of the OpenFlow feature and the flows that are actively installed in the hardware of the Arista switch.

```
switch(config)# show openflow
OpenFlow configuration: Enabled
DPID: 0x0000001c73111a92
Description: sw3-Arista
Controllers:
  configured: tcp:172.22.28.228:6633
  connected: tcp:172.22.28.228:6633
  connection count: 3
  keepalive period: 10 sec
Flow table state: Enabled
Flow table profile: full-match
Bind mode: VLAN
  VLANs: 1-2
  native VLAN: 1
IP routing state: Disabled
Shell command execution: Disabled
Total matched: 7977645 packets
```
The `show openflow flows` command show the default flow that is installed when OpenFlow is enabled.

```
switch(config)# show OpenFlow flows
Flow flow00000000000000000005:
priority: 100
cookie: 45035996453121666 (0xa000000ab1ae82)
match:
   ingress interface: Ethernet3
   Ethernet type: IPv4
   source IPv4 address: 10.0.0.0/255.255.255.0
actions:
   output interfaces: Ethernet11
matched: 0 packets, 0 bytes
Flow __default__:
priority: -1
cookie: 0 (0x0)
match:
actions:
   output to controller
matched: 5519922 packets, 433188045 bytes
```
48.4 OpenFlow Command Descriptions

OpenFlow Global Configuration Mode

- openflow

Openflow Configuration Commands

- bind interface (OpenFlow)
- bind mode (OpenFlow)
- bind vlan (OpenFlow)
- controller (OpenFlow)
- default-action (OpenFlow)
- description (OpenFlow)
- keepalive (OpenFlow)
- profile (OpenFlow)
- routing recirculation-interface (OpenFlow)
- routing vlan (OpenFlow)
- shell-command allowed (OpenFlow)
- shutdown (Openflow)

OpenFlow Display and Clear Commands

- clear openflow statistics
- show openflow
- show openflow flows
- show openflow ports
- show openflow profiles
- show openflow queues
- show openflow statistics
bind interface (OpenFlow)

When the switch is configured in interface bind mode, the ingress interface of a packet determines whether the packet is processed according to entries in the OpenFlow table or forwarded normally by the switch.

Only interfaces bound to OpenFlow are mapped to OpenFlow ports and exposed to the controller via features reply and port status messages. Output actions in flow table entries and in packet out messages can refer only to mapped ports. Use the `show openflow ports` command to see which interfaces the switch maps to OpenFlow ports and exposes to the controller.

In the OpenFlow configuration mode, use the `bind mode interface` command to select the interface bind mode.

When an interface is bound to OpenFlow, certain switch functions are disabled on the interface, including spanning tree protocol (STP). The OpenFlow controller and application must ensure that flow table entries do not allow traffic to loop in the network.

Only Ethernet and Port-Channel interfaces can be bound to OpenFlow. If an Ethernet interface is configured as a member of a LAG, attempting to bind the interface to OpenFlow has no effect. However, the Port-Channel interface of which it is a member may itself be bound to OpenFlow.

The `no bind interface` and `default bind interface` commands revert the specified list configuration to its default by removing the corresponding `bind interface` command from `running-config`.

**Command Mode**
- OpenFlow Configuration

**Command Syntax**

```
bind interface INTF
no bind interface [INTF]
default bind interface [INTF]
```

**Parameters**
- `INTF` Interface that are tied to OpenFlow. Options include:
  - `ethernet e_range` Ethernet interfaces specified by `e_range`.
  - `port-channel p_range` Port channel interfaces specified by `p_range`.

Valid `e_range` and `p_range` formats include number, range, or comma-delimited list of numbers and ranges.

**Example**
- This command binds Ethernet 1 to OpenFlow.

```
switch(config)# openflow
switch(config-openflow)# bind interface ethernet 1
```
bind mode (OpenFlow)

The `bind mode` command controls the way packets are divided on ingress between OpenFlow processing and normal switch processing.

The switch can be configured to divide traffic entering the switch in the following ways:

- **Interface bind mode**: Packets entering the switch from certain interfaces are only processed by OpenFlow according to flow table entries; packets entering from other interfaces are forwarded normally. (Interface bind mode is the default).
- **VLAN bind mode**: Only packets associated with certain VLAN IDs are processed by OpenFlow.
- **Monitor bind mode**: All packets are forwarded normally, and are also processed by OpenFlow; a restricted set of actions are applied to packets matching a flow table entry.

Other packets are forwarded normally according to the MAC address table, filtered by ACLs, mirrored to other ports.

The switch can also be configured to apply a limited set of OpenFlow actions to any packets, regardless of ingress interface or VLAN, as well as forward the packets normally (monitor bind mode).

The `no bind mode` and `default bind mode` commands revert the specified list configuration to its default by removing the corresponding `bind mode` command from `running-config`.

**Command Mode**

Open flow Configuration

**Command Syntax**

```
bind mode METHOD
no bind mode
default bind mode
```

**Parameters**

- **METHOD** bind interfaces to OpenFlow. Options include:
  - *interface* Only packets arriving on certain interfaces are processed by OpenFlow.
  - *monitor* All packets are forwarded normally, and are also processed by OpenFlow.
  - *vlan* Only packets associated with certain VLAN IDs are processed by OpenFlow.

**Example**

- In this example, packets received without VLAN tags are assigned to the default VLAN 1 upon entering the switch and are processed by OpenFlow. All VLAN-tagged packets are dropped.

```
switch>enable
switch#configure
switch(config)#interface et1-48
switch(config-if-Et1-48)#switchport mode access
switch(config-if-Et1-48)#switchport access vlan 1
switch(config-if-Et1-48)#exit
switch(config)#openflow
switch(config-openflow)#controller tcp:1.2.3.4:6633
switch(config-openflow)#bind mode vlan
switch(config-openflow)#bind vlan 1
```
bind vlan (OpenFlow)

The bind vlan command adds one or more VLAN IDs to the set of VLANs that are processed by OpenFlow in VLAN bind mode. The VLANs must be created separately using the VLAN configuration mode commands.

If you specify a nonexistent VLAN with the bind vlan command, the binding will be stored in the running configuration but will not take effect until the VLAN is created.

A range of VLANs may be passed to the bind vlan command to add more than one at a time.

The number of VLANs that may be bound to OpenFlow depends on available hardware resources, which are shared with other features including IP routing and ACLs. On the 7050 Series switches the maximum number is 1024.

Use the show openflow command to verify which VLANs are bound to OpenFlow; this command reflects the actual hardware state rather than the configuration.

The no bind vlan and default bind vlan commands removes one or more VLANs from the set of VLANs that are processed by OpenFlow in VLAN bind mode.

Command Mode

OpenFlow Configuration

Command Syntax

bind vlan v_range
no bind vlan [v_range]
default bind vlan [v_range]

Parameters

- **v_range** VLAN list. VLAN numbers range from 1 to 4094.

Examples

- These command bind VLANs 1 and 2 to OpenFlow.
  
  switch(config-openflow)#bind mode vlan
  switch(config-openflow)#bind vlan 1,2
clear openflow statistics

The `clear openflow statistics` command resets the flow statistics for OpenFlow.

**Command Mode**
Privileged EXEC

**Command Syntax**
```
clear openflow statistics
```

**Example**
- This command resets the OpenFlow counters.
  ```
  switch# clear openflow statistics
  switch#
  ```
controller (OpenFlow)

The controller command adds the address of an OpenFlow controller to which the switch should connect. The parameter must take the form tcp:1.2.3.4:6633 where 1.2.3.4 is the IP address of the controller and 6633 is the TCP port number.

The controller command may be used multiple times to add multiple controllers. The switch will attempt to connect to the first controller in the list of controllers. If the connection attempt fails, or the current connection terminates, the switch will try the next controller in that list, and so on. If the switch cannot connect to the last controller in the list, it will retry with the first controller in the list.

The order in which controllers are added is the order that the switch uses to establish controller connections. This ordering can be seen in the output of the show openflow command.

The no controller command either removes the specified controller from the list of controllers if a controller address is given as a parameter, or removes all controllers from the list of controllers if no parameter is given. If there are no controllers remaining after this command is executed, the OpenFlow function is effectively disabled.

Warning
Adding or removing a controller will cause the current controller connection to be dropped. The switch will then attempt to connect to the first controller in the list of controllers, then second controller, and so on.

The no controller and default controller commands delete the controller statement from running-config.

Command Mode
OpenFlow Configuration

Command Syntax
controller tcp:ip_address:tcp_port
no controller tcp:ip_address:tcp_port default controller tcp:ip_address:tcp_port

Parameters
- ip_address ip address used for OpenFlow. Dotted decimal location.
- tcp_port name of the TCP port used for OpenFlow. Value ranges from 0 to 65535.

Example
- These commands enable OpenFlow and sets the controller for an OpenFlow instance.

switch(config)# openflow
switch(config-OpenFlow)# controller tcp:1.2.3.4:6633
default-action (OpenFlow)

The **default-action** command sets the action for the default flow table entry. This entry is automatically added by the switch. It has the lowest priority, and matches packets that are not matched by any other entry.

Use **default-action drop** to change the default entry’s action to drop packets instead of sending them to the controller. (Note: In this mode, the switch deviates from the OpenFlow specification.)

The **no default-action** command restores the default entry's action to send packets to the controller.

**Command Mode**

OpenFlow Configuration

**Command Syntax**

```
  default-action  ACTION_TYPE
  no default-action
  default default-action
```

**Parameters**

- **ACTION_TYPE**  Action for the default flow table entry. Options include:
  - **controller**  Sets the default entry's action to send packets to the controller.
  - **drop**  Changes the default entry's action to drop packets instead of sending them to the controller.

**Example**

- This command sets the default entry's action to drop packets instead of sending them to the controller.
  
  ```
  switch(config)# openflow
  switch(config-OpenFlow)# default-action drop
  ```
description (OpenFlow)

The `description` command allows overriding the switch description string (normally the switch hostname) sent to the controller.

The `no description` and `default description` commands remove the description text for the switch hostname from `running-config`.

**Command Mode**
- OpenFlow Configuration

**Command Syntax**
```
description label_text
no description
default description
```

**Parameters**
- `label_text` character string up to 256 characters assigned to describe the switch.

**Examples**
- These commands add the description test to the switch
  ```
  switch(config-openflow)#description test
  switch(config-openflow)#
  ```
**keepalive (OpenFlow)**

The `keepalive` command alters how often the switch sends an OpenFlow echo request to the currently connected controller (every 10 seconds by default). If an echo reply is not received after three successive echo requests, the switch disconnects from the controller. It then attempts to establish a new controller connection depending on the controller configuration.

The `no keepalive` command restores the default keepalive period by removing the `keepalive` command from the `running-config`.

**Command Mode**

OpenFlow Configuration

**Command Syntax**

- `keepalive keep_alive_time`
- `no keepalive`
- `default keepalive`

**Parameters**

- `keep_alive_interval` keepalive period, in seconds. Value ranges from 1 to 100000. Default value is 10 seconds.

**Example**

- This command sets the keepalive time for OpenFlow to 30 seconds.

```plaintext
switch(config)#openflow
switch(config-openflow)#keepalive 30
switch(config-openflow)#
```
openflow

The **openflow** command places the switch in OpenFlow configuration mode.

The **no openflow** and **default openflow** commands delete the openflow configuration mode statements from **running-config**.

OpenFlow configuration mode is not a group change mode; **running-config** is changed immediately upon entering commands. Exiting OpenFlow configuration mode does not affect **running-config**. The **exit** command returns the switch to global configuration mode.

**Command Mode**
Global Configuration

**Command Syntax**

```
openflow
no openflow
default openflow
```

**Commands Available in OpenFlow Configuration Mode**

- **bind interface (OpenFlow)**
- **bind mode (OpenFlow)**
- **bind vlan (OpenFlow)**
- **controller (OpenFlow)**
- **default-action (OpenFlow)**
- **description (OpenFlow)**
- **keepalive (OpenFlow)**
- **profile (OpenFlow)**
- **routing recirculation-interface (OpenFlow)**
- **routing vlan (OpenFlow)**
- **shell-command allowed (OpenFlow)**
- **shutdown (OpenFlow)**

**Example**

- This command places the switch in OpenFlow configuration mode:
  ```
  switch(config)#openflow
  switch(config-openflow)#
  ```

- This command returns the switch to global management mode:
  ```
  switch(config-openflow)#exit
  switch(config)#
  ```
profile (OpenFlow)

The `profile` command sets an alternate flow table profile. Use the `show openflow profiles` command to see the flow table profiles supported by the switch.

The `no profile` and `default profile` commands restores the default flow table profile by removing the profile command from the `running-config`.

**Command Mode**
- OpenFlow Configuration

**Command Syntax**
- `profile FIELD_TYPE`
- `no profile`
- `default profile`

**Parameters**
- `FIELD_TYPE`: Profiles supported by the switch for the active bind mode. Options include:
  - `full-match`: Supports matching the full set of OpenFlow match fields.
  - `l2-match`: Supports matching only a subset but with a larger maximum number of flow table entries.

**Example**
- This command advertises the table size for the full-match flow table profile.

```
switch(config-openflow)# profile full-match
switch(config-openflow)#
```
routing recirculation-interface (OpenFlow)

The **routing recirculation-interface** command designates a switch interface to recirculate routed OpenFlow traffic for a second pass of processing. Exactly one recirculation interface must be configured to use routing, regardless of the number of VLANs being routed.

Any Ethernet or Port-Channel interface can be used for OpenFlow routing recirculation.

When an interface is configured for OpenFlow routing recirculation:

- The switch programs the hardware into a special MAC loopback mode, so the interface cannot be used to carry normal traffic.
- The link LED turns green and the recirculation function works even if a transceiver is not present or a cable is not inserted.
- The link speed is forced to the maximum.
- Interface configuration commands such as switchport and shutdown are ineffective, although they are preserved in the running configuration and become effective again when the interface is no longer configured for OpenFlow routing recirculation.

The **routing recirculation-interface** and **default routing recirculation-interface** commands revert the configuration to its default by removing the corresponding **routing recirculation-interface** command from **running-config**.

**Command Mode**

OpenFlow Configuration

**Command Syntax**

```
bind interface INTF
no bind interface [INTF]
default bind interface [INTF]
```

**Parameters**

- **INTF** Options include:
  - **ethernet e_range** Ethernet interfaces specified by `e_range`.
  - **port-channel p_range** port channel interfaces specified by `p_range`.

Valid `e_range` and `p_range` formats include number, range, or comma-delimited list of numbers and ranges.

**Example**

- This command recirculates traffic routed to and from VLAN 1 via the routed transit VLAN 401.

  ```
  switch(config-openflow)#bind mode vlan
  switch(config-openflow)#bind vlan 1
  switch(config-openflow)#routing recirculation-interface et48
  switch(config-openflow)#routing vlan 1 routed-vlan 401
  switch(config-openflow)#enable
  ```
routing vlan (OpenFlow)

The `routing vlan` command enables IP routing of traffic processed by OpenFlow for a specific VLAN. The `no routing vlan` and `default routing vlan` command disables IP routing of traffic processed by OpenFlow for a VLAN.

**Command Mode**
OpenFlow Configuration

**Command Syntax**
```
routing vlan VLAN_ID routed-vlan vlan_transit
no routing vlan VLAN_ID
default routing vlan VLAN_ID
```

**Parameters**
- `VLAN_ID` Options include
  - `v_num` The full form of the command is `routing vlan 123 routed-vlan 456`, where 123 is the VLAN of the OpenFlow traffic to be routed, and 456 is a (non-OpenFlow-bound) VLAN configured for standard IP routing.
  - `untagged` To route untagged OpenFlow traffic, use the command `routing vlan untagged routed-vlan 456`

**Examples**
- This command associates the VLAN with an untagged VLAN 22 to match during the OpenFlow pass.
  ```
  switch(config-openflow)# routing vlan untagged routed-vlan 22
  ```
shell-command allowed (OpenFlow)

The `shell-command allowed` command allows the controller to run shell or CLI vendor extension commands on the switch.

When this extension is enabled, the switch will execute any CLI command sent by the controller, bypassing normal access controls, so enable it only if the controller is trusted.

The `no shell-command allowed` and `default shell-command allowed` commands disables the corresponding `shell-command allowed` from the `running-config`.

**Command Mode**

OpenFlow Configuration

**Command Syntax**

```
shell-command allowed
no shell-command allowed
default shell-command allowed
```

**Example**

- This command allows the controller to run arbitrary CLI commands on the switch.

```bash
switch(config)#openflow
switch(config-openflow)#shell-command allowed
switch(config-openflow)#
```
show openflow

The show openflow command shows the effective OpenFlow configuration parameters.

Command Mode

EXEC

Command Syntax

show openflow

Example

- This command displays the actual hardware state of OpenFlow.

  switch# show openflow
  OpenFlow configuration: Enabled
  DPID: 0x000000123456789a
  Description: My awesome OpenFlow switch
  Controllers:
    configured: tcp:1.2.3.4:6633 tcp:5.6.7.8:6633
    connected: tcp:1.2.3.4:6633
    attempted connection count: 24
    successful connection count: 1
    keepalive period: 10 sec
  Flow table state: Enabled
  Flow table profile: full-match
  Bind mode: interface
    interfaces: Ethernet2, Ethernet4, Ethernet6, Ethernet8
  IP routing state: Enabled
    recirculation interface: Ethernet44
    VLAN untagged: routed to/from VLAN 3636
  Shell command execution: Disabled
  Total matched: 4601 packets
  switch#
show openflow flows

The `show openflow flows` command displays the contents of the flow table, showing each entry with its match rules, actions, packet counters, and timeouts.

The default flow table entry is automatically created by the switch. It always has the lowest priority, and matches packets that are not matched by any other entry. The default entry’s action is to send the packet to the controller.

**Command Mode**

EXEC

**Command Syntax**

`show openflow flows`

**Example**

- This command displays the contents of the flow table.

```bash
switch# show openflow flows
Flow flow00000000000000000002:
  priority: 0
  cookie: 0 (0x0)
  idle timeout: 60.0 sec
  match:
    ingress interface: Ethernet2
    source Ethernet address: 00:a9:87:65:43:21
    destination Ethernet address: 00:12:34:56:78:9a
    untagged/native VLAN ID
    VLAN PCP: 0
    Ethernet type: IPv4
    source IPv4 address: 10.0.1.1
    destination IPv4 address: 10.0.1.2
    IPv4 TOS: 0
    IPv4 protocol: ICMP
    source TCP/UDP port or ICMP type: 8
    destination TCP/UDP port or ICMP code: 0
  actions:
    output interfaces: OpenFlowRouter
  matched: 4 packets, 408 bytes
Flow __default__:
  priority: -1
  cookie: 0 (0x0)
  match:
  actions:
    output to controller
switch#
```
**show openflow ports**

The **show openflow ports** command displays the mapping between OpenFlow port number and switch interface.

In interface bind mode, all OpenFlow-bound interfaces (except routed ports and LAG members) are mapped to OpenFlow ports and exposed to the controller.

In VLAN bind mode, Ethernet and Port-Channel interfaces (except routed ports and LAG members) configured to carry traffic for one or more OpenFlow-bound VLANs are mapped to OpenFlow ports and exposed to the controller.

In monitor bind mode, all Ethernet and Port-Channel interfaces (except routed ports and LAG members) are mapped to OpenFlow ports and exposed to the controller.

**Command Mode**

EXEC

**Command Syntax**

```
show openflow ports
```

**Example**

- This command displays which interfaces the switch maps to OpenFlow ports.

```
switch# show openflow ports
Port 1: Ethernet1
Port 15: Ethernet15
switch#
```
show openflow profiles

The `show openflow profiles` command displays the flow table profiles supported by the switch for the active bind mode. For each profile, it shows:

- Which fields can be matched by a flow table entry and which can be wildcarded
- Which actions are supported for matched packets (in monitor bind mode, only normal and mirror actions are supported)
- The maximum number of entries that can be added to the flow table

The actual maximum number of flow entries may be lower than the number shown by `show openflow profiles` command.

On Series 7050 switches, two profiles are available: the full-match profile supports matching the full set of OpenFlow match fields with a maximum of 750 flow table entries, while the l2-match profile supports matching only a subset but with a larger maximum number of flow table entries (1500).

**Command Mode**

EXEC

**Command Syntax**

`show openflow profiles`
Example

- This command displays the flow table profiles.

```
switch#show openflow profiles
full-match:
  Match fields:
    ingress interface
    source Ethernet address
    destination Ethernet address
    VLAN ID
    VLAN PCP
    Ethernet type
    source IPv4 address
    destination IPv4 address
    IPv4 TOS
    IPv4 protocol
    source TCP/UDP port or ICMP type
    destination TCP/UDP port or ICMP code
  Wildcard fields:
    ingress interface
    source Ethernet address
    destination Ethernet address
    VLAN ID
    VLAN PCP
    Ethernet type
    source IPv4 address
    destination IPv4 address
    IPv4 TOS
    IPv4 protocol
    source TCP/UDP port or ICMP type
    destination TCP/UDP port or ICMP code
  Actions:
    copy ingress to mirror dest interfaces
    forward normally
    copy egress to mirror dest interfaces
  Table size: 750 entries max
12-match:
  Match fields:
    ingress interface
    source Ethernet address
    destination Ethernet address
    VLAN ID
    VLAN PCP
    Ethernet type
  Wildcard fields:
    ingress interface
    source Ethernet address
    destination Ethernet address
    VLAN ID
    VLAN PCP
    Ethernet type
  Actions:
    copy ingress to mirror dest interfaces
```
forward normally
  copy egress to mirror dest interfaces
Table size: 1500 entries max
switch#
show openflow queues

The **show openflow queues** command displays the queues exposed to the OpenFlow controller for each switch interface, and packet and byte counters for each queue.

**Command Mode**

EXEC

**Command Syntax**

```
show openflow queues
```

**Example**

- This command displays the packet and byte counters for each queue on the active OpenFlow interfaces.

```bash
switch#show openflow queues
Port 1 (Ethernet1):
  Queue 0: 0 packets (0 bytes) transmitted, 0 dropped
  Queue 1: 0 packets (0 bytes) transmitted, 0 dropped
  Queue 2: 0 packets (0 bytes) transmitted, 0 dropped
  Queue 3: 0 packets (0 bytes) transmitted, 0 dropped
Port 15 (Ethernet15):
  Queue 0: 0 packets (0 bytes) transmitted, 0 dropped
  Queue 1: 0 packets (0 bytes) transmitted, 0 dropped
  Queue 2: 0 packets (0 bytes) transmitted, 0 dropped
  Queue 3: 0 packets (0 bytes) transmitted, 0 dropped
switch#
```
**show openflow statistics**

The *show openflow statistics* command displays statistics sampled every 5 seconds over the past 5 minutes:

- Number of entries in the flow table
- Number of flow_mod, packet_out and packet_in messages processed in the 5-second interval
- Number of packet_out messages dropped in the 5-second interval (the OpenFlow agent starts dropping packet_out messages when the transmit queue of the controller TCP connection exceeds 50% of capacity)

**Command Mode**

EXEC

**Command Syntax**

```
show openflow statistics
```
### Example

- This command displays statistics sampled every 5 seconds.

```
switch# show openflow statistics
```

</table>

switch#
shutdown (Openflow)

The `shutdown` command, in OpenFlow mode, disables OpenFlow on the switch. OpenFlow is disabled by default.

The `no shutdown` and `default shutdown` commands re-enable OpenFlow by removing the `shutdown` command from `running-config`.

**Command Mode**

Openflow Configuration

**Command Syntax**

- `shutdown`
- `no shutdown`
- `default shutdown`

**Example**

- These commands enable OpenFlow on the switch.
  ```
  switch(config)#openflow
  switch(config-openflow)#no shutdown
  switch(config-openflow)#
  ```

- This command disables OpenFlow.
  ```
  switch(config-openflow)#shutdown
  ```
DirectFlow

This chapter describes Arista’s DirectFlow implementation. Sections in this chapter include:

- Section 49.1: Introduction
- Section 49.2: DirectFlow Configuration
- Section 49.3: DirectFlow Feature Interactions
- Section 49.4: DirectFlow Command Descriptions

49.1 Introduction

Like OpenFlow, DirectFlow exposes the underlying forwarding ASICs capabilities through a programmable interface like EAPI or the standard CLI.

Unlike OpenFlow, DirectFlow works in conjunction with all other aspects of standard L2/L3 bridging or forwarding, and DirectFlow traffic is subject to the standard packet processing pipeline within the ASIC. You can think of DirectFlow as a stage in packet processing that processes traffic after ingress checks and before any egress actions.

This feature enables you to configure flows that consist of a matching criteria and actions, and to modify how traffic is processed (for example, by overriding the L2 lookup decision or rewriting a mac address or VLAN).

Features like MAC learning, STP state checks, ingress or egress VLAN membership checks on ports, ACLs, QoS and other features are all respected by DirectFlow. Traffic that doesn't match any programmed flow is processed normally while traffic that matches programmed flows is now subject to the actions specified in the flows.

DirectFlow and OpenFlow are mutually exclusive and you can run only one of the two at any given time.

How DirectFlow is different from OpenFlow

There is no default flow matching all traffic, so traffic not matched by other rules is forwarded as normal. This means the configuration/ controller/ application doesn’t consume TCAM space programming flows for normal forwarding.

DirectFlow works with other features and so the user can use ACL, rate limiting, STP etc. in their network as normal and not build all of that into the application used to inject flows.

DirectFlow flows can be configured from the CLI or using EAPI, giving users the option of using flow based forwarding without an external controller. This is especially useful where the number of flows is small and static e.g.to process a small subset of the traffic in a different manner to the normal L2/L3 pipeline.
Unlike OpenFlow which requires the switch support OUTPUT NORMAL or re-circulate a packet in order to send a packet from the OpenFlow domain to non-OpenFlow domain, there is just one domain with DirectFlow.

49.1.1 DirectFlow Flows

Similar to OpenFlow, you can define a relative priority between flows and define idle or hard timeouts for the flow. DirectFlow also enables you to insert a flow entry that matches on specified criteria, and define actions to be taken on traffic that matches the specified matching conditions. You can define flows to match on TCP flags, IPv6 source and destination addresses, input ports, and more.

For more information, see:

- Section 49.1.1.1: DirectFlow Non-persistent Flows
- Section 49.1.1.2: Supported matches
- Section 49.1.1.3: Supported actions

49.1.1.1 DirectFlow Non-persistent Flows

DirectFlow enables you to configure flows that are not visible in the startup or running configurations and do not persist over a reboot. This feature is designed to be used for flows that are configured by a custom agent using the EOS SDK or eAPI and age out (expire) after a specified time period.

For example, if you are using a custom agent that reacts to traffic sent to the CPU (the redirect to CPU action), and you want to use a flow that will drop all matching traffic for 5 minutes, the agent can program a non-persistent flow that expires after a hard timeout of 300 seconds.

Using a non-persistent flow for this purpose ensures that other administrator actions (for example, saving the configuration) do not result in the flow being resurrected on startup or reverting to the saved configuration. It also removes the need for the agent to delete the expired flow.

**Note**

By default, all DirectFlow flows are persistent. You must use the `no persistent` command to configure a non-persistent flow.

49.1.1.2 Supported matches

DirectFlow supports all matches supported on EOS with OpenFlow 1.0.

This includes matches on VLAN, ether type, source or destination MAC address, COS, source or destination IP address, IP protocol, IP TOS, L4 source, destination ports, ICMP type, and code.

In addition, DirectFlow also allows matching on:

- TCP flags
- IPv6 source address
- IPv6 destination address
- Traffic injected from the CPU
- Input port

DirectFlow also permits re-using the same flow on multiple input ports, saving valuable TCAM space.

49.1.1.3 Supported actions

DirectFlow supports all actions supported on EOS with OpenFlow 1.0, including:

- Setting the source or destination MAC address
- VLAN
- COS
- IP TOS
- Transmit queue
- Output port list and mirroring traffic pre-modification (ingress mirror) and post-modification (egress mirror).
- Redirect to CPU

The redirect to CPU action is useful in cases in which a custom agent is running on EOS and you want to trap specific traffic (matching traffic) and send the trapped traffic to the agent. See the example “Redirect to CPU” on page 3069.
49.2 DirectFlow Configuration

Consider the following when using DirectFlow.

- DirectFlow takes effect ONLY after exiting the individual flow configuration sub-mode.
- Match criteria are connected with Boolean AND operators i.e. they must all match for the condition to be true and action to be taken.
- CLI is automatically set to match the ethtype to IP if IP fields (such as source or destination address or L4 ports) are chosen as part of other match/ action commands.
- In a single flow, only the following fields can be matched along with IPv6 source and destination addresses:
  - VLAN priority
  - VLAN ID
  - EtherType
  - Source interface
  - Class of Service (CoS)

49.2.1 Commands Used to Enable DirectFlow, Configure and Display Flows

A number of different commands are provided for the DirectFlow feature. The different commands enable you to enter the DirectFlow configuration mode, enable DirectFlow, configure flows, and display configured flows.

Important! ALL match criteria specified in a flow definition must match in the packet for the actions specified to be applied to the traffic.

Enter the DirectFlow Configuration Mode

The `directflow` command places the switch in DirectFlow configuration mode.

```
switch(config)#directflow
switch(config-directflow)#
```

Enable DirectFlow

The `shutdown (DirectFlow)` command determines if the configuration takes effect or not. To enable DirectFlow, enter the following command.

```
switch(config-directflow)#no shutdown
```

Create the Flow

The `flow (DirectFlow)` command creates a new flow entry. It must be unique or it will be overwritten by an existing entry.

```
switch(config-directflow)#flow Test-1
switch(config-directflow-Test-1)#
```

Create the DirectFlow Match Criteria

The `match (DirectFlow-flow mode)` command allows you to configure a rule or a flow which match on L2, L3, L4 fields of a packet and specify a certain action to either modify, drop or redirect the packet.

```
switch(config-directflow-Test-1)#match ethertype ip
switch(config-directflow-Test-1)#match source ip 10.10.10.10
```
Action Set

The **action set (DirectFlow-flow mode)** command allows you to configure a packet to be routed out a layer three interface using a DirectFlow entry.

```
switch(config-directflow-Test-1)#action egress mirror ethernet 7
switch(config-directflow-Test-1)#action set destination mac 0000.aaaa.bbbb
```

Finalize the Flow

DirectFlow flows do not take effect until you exit the configuration sub-mode for the specified flow. Use the **exit** command to finalize the flow and put it into effect.

```
switch(config-directflow-Test-1)#exit
switch(config-directflow)#
```

Redirect to CPU

The **action output interface cpu (DirectFlow-flow mode)** command allows you to configure flows so that traffic that matches the matching conditions specified in the flow is redirected to the CPU.

```
switch (config)#directflow
switch (config-directflow)#flow redirect-http-cpu
switch (config-directflow-redirect-http-cpu)#match ip protocol tcp
switch (config-directflow-redirect-http-cpu)#match destination port 80
switch (config-directflow-redirect-http-cpu)#action output interface cpu
```

Configuring a Non-persistent Flow

DirectFlow flows are persistent by default. Use the **no persistent** command to configure non-persistent flows.

```
switch (config)#directflow
switch (config-directflow)#flow example-non-persistent
switch (config-directflow-example-non-persistent)#match input interface ethernet 25
switch (config-directflow-example-non-persistent)#action drop
switch (config-directflow-example-non-persistent)#no persistent
switch (config-directflow-example-non-persistent)#timeout hard 300
```

Display details for configured flows

The **detail** option of the **show directflow flows** command enables you to display the details of configured flows. You can use this command to verify that a non-persistent flow is deleted after the timeout period configured for the flow has elapsed.

The following example shows the use of this command to view the configuration of a non-persistent flow before the timeout period has elapsed, and a second time, after the timeout period has expired.
The initial use of the command displays the flow configuration (before the timeout expires).

```plaintext
switch (config-directflow)#show directflow flows example-non-persistent detail
Flow example-non-persistent: (Flow programmed)
persistent: False
priority: 0
hard timeout: 300
idle timeout: 0
match:
ingress interface:
Et25
actions:
drop
matched: 0 packets, 0 bytes
```

The **second** use of the command displays the flow details (after the timeout expires). The output shows that the flow is no longer programmed.

```plaintext
switch (config-directflow)#show directflow flows example-non-persistent detail
Flow example-non-persistent: (Flow not programmed)
persistent: False
priority: 0
hard timeout: 300
idle timeout: 0
match:
ingress interface:
Et25
actions:
drop
matched: 0 packets, 0 bytes
```
49.3 **DirectFlow Feature Interactions**

DirectFlow flow entries can have one of the following actions:

- A set of egress ports for sending a matched packet
- Copy to CPU
- Redirect to CPU
- Drop
- No specified action (in this case, the traffic is output normally).

The only exception is the ingress or egress mirroring action, where the DirectFlow entry causes the packet to be mirrored.

When the ingress or egress packets are mirrored, the original traffic is sent out normally.

**Bridging Features**

- DirectFlow entries have precedence over all entries in the MAC table, including static MAC entries and static MAC drop entries. Packets that do not match DirectFlow entries are forwarded based on the MAC address table.
- VLANs: DirectFlow entries can modify the VLAN of a packet. MAC learning takes place in the original VLAN for DirectFlow entries that modify the VLAN. The modified packet will be subject to VLAN membership checks on the egress port. If a packet has no VLAN tag, DirectFlow assumes it came in on the native VLAN for the ingress interface. A VLAN override causes the packet to obey the VLAN rules on the egress port.
- Q-in-Q: Q-in-Q is supported as DirectFlow entries match only on the outer tag.
- Counters: All packets that match DirectFlow entries cause interface counters to increment as usual.

**Spanning Tree**

DirectFlow runs alongside MSTP, RSTP, and PVST. DirectFlow entries do not match on packets that ingress an STP discarding port. DirectFlow entries that cause a packet to be forwarded out an STP discarding port will result in the packets being dropped on egress.

When STP is enabled, BPDUs will always be trapped to the CPU. When STP is disabled, BPDUs will be subject to DirectFlow entries and not be copied to the CPU by default.

**LLDP, LAGs, and LACP**

- LLDP packets are always trapped to the CPU. DirectFlow entries can never match LLDP packets.
- LAGs are fully supported, and can be part of a match criteria and part of an output action to an interface.
- LACP packets are always trapped to CPU. DirectFlow entries can never match LACP packets.

**sFlow**

sFlow is unaffected by DirectFlow.

**IGMP Snooping**

IGMP control packets are trapped to the CPU when IGMP Snooping is enabled. DirectFlow entries can match IGMP Snooping control traffic and override the trap to CPU.
DirectFlow Feature Interactions

Link-local-multicast packets are flooded in hardware in the VLAN via a TCAM entry. DirectFlow entries can match link-local-multicast packets and change the flooding behavior. As DirectFlow entries have to specify output interfaces or drop, the action will conflict and so matching DirectFlow entries will get precedence.

When IGMP snooping is enabled, unknown IPV4 multicast packets are flooded to the multicast-router ports in the VLAN. If DirectFlow entries match unknown IPV4 multicast packets, they will override the flooding behavior.

Data packets in groups under IGMP snooping control are sent to the group members through a MAC table entry. Matching DirectFlow entries override the MAC table entries.

**ACLs**

DirectFlow entries are lower priority than any configured Port ACLs (ingress). Packets coming in on a port that match DirectFlow entries obey any configured ACL on that port, and will only apply to packets that have a `permit` action.

DirectFlow entries are higher priority than any configured RACLs. Packets coming in on an L3 interface that match DirectFlow entries ignore any RACLs configured on that interface.

DirectFlow entries are lower priority than any configured Egress ACLs.

### 49.3.1 Layer Three Features and DirectFlow

DirectFlow runs alongside IP routing. If a packet is routed out a layer three interface using a DirectFlow entry, the actions associated with the entry will have to specify the new source MAC and destination MAC for the packet, as well as the physical port or LAG. If there are no output ports specified in an entry, packets that match that entry will be dropped.

**Unicast Routing**

When unicast routing is enabled, DirectFlow entries that match take precedence for all packets that would have been otherwise been routed. The three exceptions are the ingress mirror, egress mirror and copy-to-CPU actions where the packets will be routed normally in addition to the action being performed. Routed packets that do not match DirectFlow entries are forwarding based on the L3 lookup.

**Multicast Routing**

When multicast routing is enabled, DirectFlow entries that match take precedence for all packets that would have otherwise been multicast routed. The packets are not replicated based on the hardware multicast tables, but are forwarded strictly according to the actions specified by the DirectFlow entry. The entry can specify a set of output interfaces, which will result in the packet being replicated based on the DirectFlow entry.
49.3.2 Displaying DirectFlow Configurations

To `show directflow flows` command displays the contents of the flow table, showing each entry with its match rules, actions, and packet counters.

- This example shows the status of a default (persistent) flow.

  ```
  switch(config-directflow)#show directflow flows
  Flow Test1:
  priority: 0
  match:
    ingress interface: Ethernet1
    ethertype ip
    source ip address: 10.10.10.10
  actions:
    output mirror: Ethernet2
  matched: 0 packets, 0 bytes
  switch(config-directflow)#
  ```

- This example shows the status of a non-persistent flow. The flow will be deleted once 5 minutes have elapsed.

  ```
  switch(config-directflow)#show directflow flows example-non-persistent
  Flow example-non-persistent:
  persistent: False
  priority: 0
  hard timeout: 300
  idle timeout: 0
  match:
    ingress interface:
      Et25
  actions:
  drop
  matched: 0 packets, 0 bytes
  ```
49.4 DirectFlow Command Descriptions

DirectFlow Global Configuration Mode
- `directflow`

DirectFlow Configuration Command
- `action drop (DirectFlow-flow mode)`
- `action mirror (DirectFlow-flow mode)`
- `action output (DirectFlow-flow mode)`
- `action output interface cpu (DirectFlow-flow mode)`
- `action set (DirectFlow-flow mode)`
- `flow (DirectFlow)`
- `match (DirectFlow-flow mode)`
- `persistent`
- `priority (DirectFlow-flow mode)`
- `shutdown (DirectFlow)`
- `timeout (DirectFlow-flow mode)`

DirectFlow and Clear Commands
- `show directflow`
- `show directflow flows`
action drop (DirectFlow-flow mode)

The action drop command configures packets that match an entry to be dropped.

The no action drop and default action drop commands remove the statement from the DirectFlow configuration mode.

Command Mode

Directflow-flow Configuration

Command Syntax

action drop
no action drop
default action drop

Example

• This command sets the action for packets from Test-1 to be dropped.

  switch(config-directflow-Test-1)#action drop
  switch#
action mirror (DirectFlow-flow mode)

The action mirror command can be used to ingress or egress mirror traffic to a mirror destination. This requires a mirror destination to be setup on the switch. If a packet comes in or goes out an interface that is part of another mirror session, then the destination for that destination as well as the DirectFlow destination will receive a copy of the packet.

The no action mirror and default action mirror commands remove the statement from DirectFlow configuration mode.

Command Mode

Directflow-flow Configuration

Command Syntax

```
action DIRECTION mirror INT_NAME
no action DIRECTION mirror INT_NAME
default action DIRECTION mirror INT_NAME
```

Parameters

- **DIRECTION** transmission direction of traffic to be mirrored.
  - ingress mirrors before any rewrites.
  - egress mirrors after rewrites.
- **INT_NAME** Source interface for the mirroring session.
  - ethernet *e_range* Ethernet interfaces specified by *e_range*.
  - port-channel *p_range* Port channel interfaces specified by *p_range*.

Example

- This command configures mirror traffic to Ethernet 2.

```
switch(config-directflow)# flow Test1
switch(config-directflow-Test1)#match ethertype ip
switch(config-directflow-Test1)#match source ip 10.10.10.10
switch(config-directflow-Test1)#action egress mirror ethernet 2
switch(config-directflow-Test1)#
```
action output (DirectFlow-flow mode)

The **action output** command configures an Ethernet or port channel interface as the output of a specified port mirroring session.

The **no action output** and **default action output** commands remove the statement from DirectFlow configuration mode.

**Command Mode**
Directflow-flow Configuration

**Command Syntax**

```
  action output  DESTINATION
  no action output  DESTINATION
  default action output  DESTINATION
```

**Parameters**

- **DESTINATION**  transmission direction of traffic to be mirrored.
  - **all**  mirrors transmitted and received traffic.
  - **flood**  mirrors received traffic only.
  - **interface ethernet  e_range**  Ethernet interfaces specified by  `e_range`.
  - **interface port-channel  p_range**  Port channel interfaces specified by  `p_range`.

**Example**

- This command configures Ethernet interface 7 as the output for the mirroring session.

```
switch(config-directflow-Test1)#action output interface ethernet  7
switch(config-directflow-Test1)#
```
**action output interface cpu (DirectFlow-flow mode)**

The **action output interface cpu** command configures the action (other commands are used to define the traffic matching conditions).

The **no action output interface cpu** and **default action output** commands remove the statement from DirectFlow configuration mode.

**Command Mode**
- Directflow-flow Configuration

**Command Syntax**
```plaintext
action output DESTINATION
no action output DESTINATION
default action output DESTINATION
```

**Parameters**
- **DESTINATION** transmission direction of traffic to be mirrored.
  - **all** mirrors transmitted and received traffic.
  - **flood** mirrors received traffic only.
  - **interface cpu** Ethernet interfaces specified by `e_range`.

**Example**
- This command configures Ethernet interface 7 as the output for the mirroring session.
  ```plaintext
  switch(config-directflow-Test1)#action output interface ethernet 7
  switch(config-directflow-Test1)#
  ```
- These commands configure the action to redirect traffic matching the flow to the CPU and the matching conditions for the flow.
  ```plaintext
  switch (config)#directflow
  switch (config-directflow)#flow redirect-http-cpu
  switch (config-directflow-redirect-http-cpu)#match ip protocol tcp
  switch (config-directflow-redirect-http-cpu)#match destination port 80
  switch (config-directflow-redirect-http-cpu)#action output interface cpu
  ```
action set (DirectFlow-flow mode)

The **action set** command allows you to configure a packet to be routed out a layer three interface using a DirectFlow entry. The actions associated with the entry will have to specify the new source MAC and destination MAC for the packet, as well as the physical port or LAG. If there are no output ports specified in an entry, packets that match that entry will be dropped.

The **no action set** and **default action set** commands remove **action set** statement from DirectFlow configuration mode.

**Command Mode**

Directflow-flow Configuration

**Command Syntax**

```
action set CONDITION
no action set CONDITION
default action set CONDITION
```

**Parameters**

- **CONDITION** specifies parameter and value. Options include:
  - **cos <0 to 7>** cost of service.
  - **destination mac mac_addr** Dotted hex notation.
  - **ip tos <0 to 255>** Type of service.
  - **source mac mac_addr** Dotted hex notation.
  - **traffic-class <0 to 7>** Dotted hex notation.
  - **vlan <1 to 4094>** Number of VLAN.

The **no action set** and **default action set** commands require only the **CONDITION** type without a specific condition value.

**Example**

- These commands change the destination MAC of the frame.

```
switch(config-directflow)#flow Test1
switch(config-directflow-Test1)#action egress mirror ethernet 7
switch(config-directflow-Test1)#action set destination mac 0000.aaaa.bbbb
```
directflow

The `directflow` command places the switch in DirectFlow configuration mode.

The `no directflow` and `default directflow` commands delete the DirectFlow configuration mode statements from `running-config`.

DirectFlow configuration mode is not a group change mode; `running-config` is changed immediately upon entering commands. Exiting OpenFlow configuration mode does not affect `running-config`. The `exit` command returns the switch to global configuration mode.

**Command Mode**

Global Configuration

**Command Syntax**

```plaintext
directflow
no directflow
default directflow
```

**Commands Available in DirectFlow-Flow configuration mode:**

- `flow (DirectFlow)`
- `shutdown (DirectFlow)`

**Example**

- This command places the switch in DirectFlow configuration mode:
  ```plaintext
  switch(config)#directflow
  switch(config-directflow)#
  ```

- This command returns the switch to global management mode:
  ```plaintext
  switch(config-directflow)#exit
  switch(config)#
  ```
flow (DirectFlow)

The flow command places the switch in flow configuration mode.

The flow command specifies the name of the flow that subsequent commands modify and creates a new flow definition if it references a nonexistent flow. All changes in a flow configuration mode edit session are pending until the session ends:

- The exit command saves pending changes to running-config and returns the switch to DirectFlow configuration mode. Changes are also saved by entering a different configuration mode.
- The abort command discards pending changes, returning the switch to DirectFlow configuration mode.

The no flow and default flow commands delete the specified role by removing the role and its statements from running-config.

Command Mode
DirectFlow Configuration

Command Syntax
flow flow_name
no flow flow_name
default flow flow_name

Parameters
- flow_name Name of flow.

Commands Available in DirectFlow-Flow configuration mode:
- action drop (DirectFlow-flow mode)
- action mirror (DirectFlow-flow mode)
- action output (DirectFlow-flow mode)
- action set (DirectFlow-flow mode)
- match (DirectFlow-flow mode)
match (DirectFlow-flow mode)

The `match` command allows you to configure a rule or a flow which could match on L2, L3, L4 fields of a packet and specify a certain action to modify, drop or redirect the packet.

All traffic ingressing on the switch will be matched against the flows installed. In cases where none of the packets match, normal switching or routing behavior will take over. When multiple entries match a packet, precedence is given to the entry that was installed first.

The `no match` and `default match` commands remove the `match` statement from the configuration mode.

Command Mode

- Directflow-flow Configuration

Command Syntax

```plaintext
match CONDITION
no match CONDITION
default match CONDITION
```

Parameters

- `CONDITION` specifies criteria for evaluating a route. Options include:
  - `cos <0 to 7>` cost of service.
  - `destination ip ipv4_sub` destination IPv4 subnet. L3 fields valid only if ethertype is IP (0x0800).
  - `destination mac mac_addr` Add to the existing community. Dotted hex notation.
  - `destination mac mac_addr mask mac_mask` Add to the string community. Dotted hex notation.
  - `destination port <0 to 65535>` Fields accepted only if protocol is TCP|UDP
  - `ethertype <0 to 65535>` Layer 4 destination port.
  - `ethertype ARP` Layer 4 destination port.
  - `ethertype IP` Layer 4 destination port.
  - `icmp code <0 to 255>` Fields accepted only if protocol is ICMP
  - `icmp type <0 to 255>` Fields accepted only if protocol is ICMP
  - `input interface ethernet e_num` Ethernet interface specified by `e_num`.
  - `input interface port-channel p_num` Port channel interface specified by `p_num`.
  - `ip protocol <0 to 255>` Type of service.
  - `ip protocol icmp` L3 fields valid only if ethertype is IP (0x0800).
  - `ip protocol tcp` L3 fields valid only if ethertype is IP (0x0800).
  - `ip protocol udp` L3 fields valid only if ethertype is IP (0x0800).
  - `ip tos <0 to 255>` L3 fields valid only if ethertype is IP (0x0800).
  - `source ip ipv4_subnet` L3 fields valid only if ethertype is IP (0x0800).
  - `source mac mac_addr` Add to the existing community. Dotted hex notation.
  - `source mac mac_addr mask mac_mask` Add to the string community. Dotted hex notation.
  - `source port <0 to 65535>` Fields accepted only if protocol is TCP|UDP
  - `tcp flag ack` Layer 4 destination port.
  - `tcp flag fin` Layer 4 destination port.
• **tcp flag psh**  Layer 4 destination port.
• **tcp flag rst**  Layer 4 destination port.
• **tcp flag syn**  Layer 4 destination port.
• **tcp flag urg**  Layer 4 destination port.
• **tcp flag urg**  Layer 4 destination port
• **vlan <1 to 4094> mask <1 to 4095>**  Number of VLAN.

The **no match** and **default match** commands require only the **CONDITION** type without a specific condition value.

**Example**

• This command creates the rules to match on Ethertype IP and Source IP 10.10.10.10.

```
switch(config-directflow)# flow Test1
switch(config-directflow-Test1)#persistent
switch(config-directflow-Test1)#match ethertype ip
switch(config-directflow-Test1)#match source ip 10.10.10.10
```
**persistent**

DirectFlow flows are persistent by default. Once finalized, they appear in the running configuration, and if saved to *startup config* they will persist over a reboot. The **no** form of the **persistent** command prevents the flow from showing up in *running config*, ensuring that it will not persist over a reboot.

**Command Mode**
Directflow-flow Configuration

**Command Syntax**

```plaintext
no persistent
```

**Example**

- These commands create and enable a non-persistent DirectFlow flow.

```plaintext
switch(config)#directflow
switch(config-directflow)#flow example-non-persistent
switch(config-directflow-example-non-persistent)#match input interface ethernet 25
switch(config-directflow-example-non-persistent)#action drop
switch(config-directflow-example-non-persistent)#no persistent
switch(config-directflow-example-non-persistent)#timeout hard 300
switch(config-directflow-example-non-persistent)#exit
switch(config-directflow)#
```
priority (DirectFlow-flow mode)

The **priority** command sets the priority for the flow match rules. Each flow-table entry has an optional priority field, with a higher number indicating a higher priority. Flows with the same priority may be loaded in any order, and the order may be changed at any time. If multiple entries match a packet, precedence is given to the entry that was installed first.

Priority numbers range from 0 to 65535. The default is 0. The higher priority rules match first.

The **no priority** and **default priority** commands remove **priority** statement from the DirectFlow configuration mode.

**Command Mode**
- Directflow-flow Configuration

**Command Syntax**

```
priority priority_value
no priority
default priority
```

**Parameters**
- **priority_level**  priority xxx. Value ranges from 0 to 65535. Default is 0.

**Example**
- These commands assign the priority of 150 to flow Test-1.
  
  switch(config-directflow-Test-1)#priority 150
  switch(config-directflow-Test-1)#
**show directflow**

The **show directflow** command displays summary information for DirectFlow. With the **counters** or **details** options, it displays counters or details for all flows configured on the switch.

**Command Mode**

EXEC

**Command Syntax**

```
show directflow [counters|details]
```

**Example**

- This command displays summary information for DirectFlow.

  ```
  switch# show directflow
  DirectFlow configuration: Enabled
  Total matched: 0 packets
  Total programmed flows: 3 flows
  switch#
  ```

- This command displays counters for all DirectFlow flows configured on the switch.

  ```
  switch# show directflow counters
  Flow Name    Source    Matched packets    Matched bytes
  ---------    ------    ---------------    -------------
  test3        config    0                0
  test2        config    0                0
  test1        config    0                0
  
  Total matched packets: 0
  switch>
  ```
• This command displays details for all DirectFlow flows configured on the switch.

```
switch# show directflow detail
Flow test3: (Flow programmed)
persistent: True
priority: 0
priorityGroupType: default
tableType: ifp
hard timeout: 0
idle timeout: 0

switch>
```
show directflow flows

The **show directflow flows** command displays the contents of the flow table, showing each entry with its match rules, actions, and packet counters. Including the name of a specific flow limits the output to information about the specified flow.

**Command Mode**

EXEC

**Command Syntax**

```
show directflow flows [flow_name [counters|detail]]
```

**Parameters**

- **flow_name** name of flow for which to display information. If no flow name is entered, command displays information for all flows.
- **counters** displays DirectFlow counters for the specified flow.
- **detail** displays detailed information for the specified flow.
Example

- This command displays the contents of the flow table.

```plaintext
switch# show directflow flows
Flow test3:
    persistent: True
    priority: 0
    priorityGroupType: default
    tableType: ifp
    hard timeout: 0
    idle timeout: 0
    match:
        Ethernet type: 0x86dd
    actions:
        output interfaces:
            Et32
    source: config
    matched: 0 packets, 0 bytes
Flow test2:
    persistent: True
    priority: 0
    priorityGroupType: default
    tableType: ifp
    hard timeout: 0
    idle timeout: 0
    match:
        Ethernet type: IPv4
        source IPv4 address: 10.1.2.12/255.255.255.255
        IPv4 protocol: TCP
        destination TCP/UDP port or ICMP type: 8080
    actions:
        output interfaces:
            Et3/1
    source: config
    matched: 0 packets, 0 bytes
Flow test1:
    persistent: True
    priority: 0
    priorityGroupType: default
    tableType: ifp
    hard timeout: 0
    idle timeout: 0
    match:
        ingress interface:
            Et1/1
    actions:
        output interfaces:
            Et2/1
    source: config
    matched: 0 packets, 0 bytes
switch>
```
- This command displays information about flow “test-1.”

```plaintext
switch# show directflow flows test-1
Flow test1:
    persistent: True
    priority: 0
    priorityGroupType: default
    tableType: ifp
    hard timeout: 0
    idle timeout: 0
    match:
        ingress interface:
            Et1/1
    actions:
        output interfaces:
            Et2/1
    source: config
    matched: 0 packets, 0 bytes
switch>
```

- This command displays counters for flow “test-1.”

```plaintext
switch# show directflow flows test-1 counters
Flow Name                Source                Matched packets    Matched bytes
---------                ------                ---------------    --------------
test1                    config                             0              0
switch>
```

- This command displays detailed information for flow “test-1.”

```plaintext
switch# show directflow flows test-1 detail
switch>show directflow flows test1 detail
Flow test1: (Flow programmed)
    persistent: True
    priority: 0
    priorityGroupType: default
    tableType: ifp
    hard timeout: 0
    idle timeout: 0
    match:
        ingress interface:
            Et1/1
    actions:
        output interfaces:
            Et2/1
    source: config
    matched: 0 packets, 0 bytes
switch>
```
shutdown (DirectFlow)

The shutdown command, in DirectFlow mode, disables DirectFlow on the switch. DirectFlow is disabled by default.

The no shutdown command re-enables DirectFlow.

**Command Mode**

  Directflow Configuration

**Command Syntax**

  shutdown
  no shutdown
  default shutdown

**Example**

  These commands enable DirectFlow on the switch.

  switch(config)#directflow
  switch(config-directflow)#no shutdown
  switch(config-directflow)#

  This command disables DirectFlow Flow.

  switch(config-directflow-Test1)#shutdown
timeout (DirectFlow-flow mode)

The `timeout` command, in DirectFlow mode, command configures the connection timeout period for connection sessions. The connection timeout period defines the interval between a user’s most recently entered command and an automatic connection shutdown. Automatic connection timeout is disabled by setting the idle-timeout to zero, which is the default setting.

**Command Mode**
Directflow-flow Configuration

**Command Syntax**
- `no priority`
- `no timeout hard`
- `no timeout idle`

**Parameters**
- `idle`  session idle timeout length.
  - `0` Automatic connection timeout is disabled.
  - `<1-4294967295>` Automatic timeout period (seconds).
- `hard`  session hard timeout length.
  - `0` Automatic connection timeout is disabled.
  - `<1-4294967295>` Automatic timeout period (seconds).

**Example**
- These commands enable a hard timeout period of 5 seconds on the switch.
  ```
  switch(config)#directflow
  switch(config-directflow-Test1)#timeout hard 5
  switch(config-directflow-Test1)#
  ```
- These commands enable DirectFlow on the switch.
  ```
  switch(config)#directflow
  switch(config-directflow-Test1)#no timeout hard
  switch(config-directflow-Test1)#
  ```
