Overview

Arista Networks features switches with high-density, non-blocking Ethernet ports that are controlled through an extensible, Linux-based, modular network operating system. The intended audience for this manual is network administrators who configure Arista switches. A working knowledge of network administration is assumed.

New Features

This guide may not describe the features added in the most recent EOS version. For information on undocumented features, consult the TOI documents here: https://eos.arista.com/toi/

Switch Platforms

A list of Arista switches and detailed information about each is available online here: https://www.arista.com/en/products

Recently released switches may not appear in the list, but can be found in the most recent Release Notes (found under Active Releases here: https://www.arista.com/support/software-download).

CloudVision™

The configuration tasks required for deployment of CloudVision, CVX, and CVP are described in the CloudVision Configuration Guide. The latest version can be found here: https://www.arista.com/en/cg-cv/

Supported Features

For the complete supported-features list in the latest EOS release, see https://www.arista.com/en/support/product-documentation/supported-features.

For details on a specific release, please see the Release Notes (found under Active Releases here: https://www.arista.com/support/software-download).
Chapter 2

Initial Configuration and Recovery

This chapter describes initial configuration and recovery tasks. Subsequent chapters provide details about features introduced in this chapter.

This chapter contains these sections:

- Section 2.1: Initial Switch Access
- Section 2.2: Connection Management
- Section 2.3: Configure Session
- Section 2.4: Recovery Procedures
- Section 2.5: Session Management Commands

2.1 Initial Switch Access

Arista network switches provide two initial configuration methods:

- Zero Touch Provisioning (ZTP) configures the switch without user interaction (Section 2.1.1).
- Manual provisioning configures the switch through commands entered by a user through the CLI (Section 2.1.2).

2.1.1 Zero Touch Provisioning

Zero Touch Provisioning (ZTP) configures a switch without user intervention by downloading a startup configuration file (`startup-config`) or a boot script from a location specified by a DHCP server. Section 7.5.2 describes network tasks required to set up ZTP.

The switch enters ZTP mode when it boots if flash memory does not contain `startup-config`. It remains in ZTP mode until a user cancels ZTP mode, or until the switch retrieves a `startup-config` or a boot script. After downloading a file through ZTP, the switch reboots again, using the retrieved file.

**Security Considerations**

The ZTP process cannot distinguish an approved DHCP server from a rogue DHCP server. For secure provisioning, you must ensure that only approved DHCP servers are able to communicate with the switch until after the ZTP process is complete. Arista also recommends validating the EOS image on your ZTP server by confirming that its MD5 checksum matches the MD5 checksum that can be found on the EOS download page of the Arista website.

On a UNIX server, the `md5sum` command calculates this checksum:

```
% md5sum EOS.swi
3bac45b96bc820eb1d10c9ee33108a25  EOS.swi
```
This command is also available on Arista switches from the CLI or from within the Bash shell.

```
switch# bash md5sum /mnt/flash/EOS-4.18.0F.swi
73435f0db3af785011f88743f4c01abd /mnt/flash/EOS-4.18.0F.swi
switch#

[admin@switch ~]$ md5sum /mnt/flash/EOS-4.18.0F.swi
73435f0db3af785011f88743f4c01abd /mnt/flash/EOS-4.18.0F.swi
[admin@switch ~]$ 
```

To provision the switch through Zero Touch Provisioning:

**Step 1** Mount the switch in its permanent location.

**Step 2** Connect at least one management or Ethernet port to a network that can access the DHCP server and the configuration file.

**Step 3** Provide power to the switch.

ZTP provisioning progress can be monitored through the console port. Section 2.1.2.1 provides information for setting up the console port. Section 2.1.2.2 provides information for monitoring ZTP progress and canceling ZTP mode.

### 2.1.2 Manual Provisioning

Initial manual switch provisioning requires the cancellation of ZTP mode, the assignment of an IP address to a network port, and the establishment of an IP route to a gateway. Initial provisioning is performed through the serial console and Ethernet management ports.

- The console port is used for serial access to the switch. These conditions may require serial access:
  - management ports are not assigned IP addresses
  - the network is inoperable
  - the password for the user’s log on is not available
  - the password to access the enable mode is not available
- The Ethernet management ports are used for out-of-band network management tasks. Before using a management port for the first time, an IP address must be assigned to that port.
2.1.2.1 Console Port

The console port is a serial port located on the front of the switch. Figure 2-1 shows the console port on the DCS-7050T-64 switch. Use a serial or RS-232 cable to connect to the console port. The accessory kit also includes an RJ-45 to DB-9 adapter cable for connecting to the switch.

Figure 2-1: Switch Ports

USB Flash Port
Ethernet Management Port
Console (Serial) Port

Port Settings
Use these settings when connecting the console port:
- 9600 baud
- no flow control
- 1 stop bit
- no parity bits
- 8 data bits

Admin Username
The initial configuration provides one username, admin, that is not assigned a password. When using the admin username without a password, you can only log into the switch through the console port. After a password is assigned to the admin username, it can log into the switch through any port.

The username command assigns a password to the specified username.

Example
This command assigns the password pxq123 to the admin username:
```
switch(config)#username admin secret pxq123
switch(config)#
```

New and altered passwords that are not saved to the startup configuration file are lost when the switch is rebooted.
2.1.2.2 Canceling Zero Touch Provisioning

Zero Touch Provisioning (ZTP) installs a startup-config file from a network location if flash memory does not contain a startup-config when the switch reboots. Canceling ZTP is required if the switch cannot download a startup-config or boot script file.

When the switch boots without a startup-config file, it displays the following message through the console port:

No startup-config was found.

The device is in Zero Touch Provisioning mode and is attempting to download the startup-config from a remote system. The device will not be fully functional until either a valid startup-config is downloaded from a remote system or Zero Touch Provisioning is cancelled. To cancel Zero Touch Provisioning, login as admin and type 'zerotouch cancel' at the CLI.

localhost login:

To cancel ZTP mode, log into the switch with the admin password, then enter the zerotouch cancel command. The switch immediately boots without installing a startup-config file.

localhost login: admin

Aboot 1.9.0-52504.EOS2.0
Press Control-C now to enter Aboot shell

To avoid entering ZTP mode on subsequent reboots, create a startup-config file as described in step 8 of Section 2.1.2.3.
2.1.2.3 Ethernet Management Port

Arista switches provide one or more Ethernet management ports for configuring the switch and managing the network out of band. Figure 2-1 shows the location of the Ethernet management ports on a DCS-7050T-64 switch. Only one port is required to manage the switch.

You can access the Ethernet management port(s) remotely over a common network or locally through a directly connected PC. Before you can access the switch through a remote connection, an IP address and a static route to the default gateway are required. On a modular switch with dual supervisors, a virtual IP address can also be configured to access the management port on whichever supervisor is active.

Assigning a Virtual IP Address to Access the Active Ethernet Management Port

On modular switches with dual supervisors, this procedure assigns a virtual IP address which will connect to the Ethernet management port of the active supervisor. (To assign a physical IP address to an individual Ethernet management port, see Assigning an IP Address to a Specific Ethernet Management Port below.)

**Step 1** Connect a PC or terminal server to the console port. Use the settings listed in Section 2.1.2.1 under Port Settings.

**Step 2** Type `admin` at the login prompt to log into the switch. Initial login through the console port does not require a password.

```
Arista EOS
switch login: admin
Last login: Fri Apr 9 14:22:18 on Console
```

**Step 3** Type `enable` at the command prompt to enter Privileged EXEC mode.

```
switch>enable
switch#
```

**Step 4** Type `configure terminal` (or `config`) to enter global configuration mode.

```
switch#configure terminal
switch(config)#
```

**Step 5** Type `interface management 0` to enter interface configuration mode for the virtual interface which accesses management port 1 on the currently active supervisor.

```
switch(config)#interface management 0
switch(config-if-Ma0)#
```

**Step 6** Type `ip address`, followed by the desired address, to assign a virtual IP address for access to the active management port.

This command assigns IP address 10.0.2.5 to management port 0.

```
switch(config-if-Ma0)#ip address 10.0.2.5/24
```

**Step 7** Type `exit` at both the interface configuration and global configuration prompts to return to Privileged EXEC mode.

```
switch(config-if-Ma0)#exit
switch(config)#exit
switch#
```
Step 8 Type write (or copy running-config startup-config) to save the new configuration to the startup-config file.

switch# write
switch#

Assigning an IP Address to a Specific Ethernet Management Port

This procedure assigns an IP address to a specific Ethernet management port:

Step 1 Connect a PC or terminal server to the console port. Use the settings listed in Section 2.1.2.1 under Port Settings.

Step 2 Type admin at the login prompt to log into the switch. The initial login does not require a password.

Arista EOS
switch login:admin
Last login: Fri Apr 9 14:22:18 on Console

switch>

Step 3 Type enable at the command prompt to enter Privileged EXEC mode.

switch>enable
switch#

Step 4 Type configure terminal (or config) to enter global configuration mode.

switch# configure terminal

Step 5 Type interface management 1 to enter interface configuration mode. (Any available management port can be used in place of management port 1.)

switch(config)# interface management 1
switch(config-if-Ma1)#

Step 6 Type ip address, followed by the desired address, to assign an IP address to the port.

This command assigns the IP address 10.0.2.8 to management port 1.

switch(config-if-Ma1)# ip address 10.0.2.8/24

Step 7 Type exit at both the interface configuration and global configuration prompts to return to Privileged EXEC mode.

switch(config-if-Ma1)# exit
switch(config)# exit
switch#

Step 8 Type write (or copy running-config startup-config) to save the new configuration to the startup-config file.

switch# write
switch#

Configuring a Default Route to the Gateway

This procedure configures a default route to a gateway located at 10.0.2.1.

Step 1 Enter global configuration mode.

switch> enable
switch# configure terminal
Step 2  Create a static route to the gateway with the IP route command.

```
switch(config)#ip route 0.0.0.0/0 10.0.2.1
```

Step 3  Save the new configuration.

```
switch#write
switch#
```
2.2 Connection Management

The switch supports three connection methods:

- console
- SSH
- Telnet

The switch always enables console and SSH. Telnet is disabled by default.

Management commands place the switch in a configuration mode for changing session connection parameters.

Examples

- The **management console** command places the switch in console management mode:
  
  ```
  switch(config)#management console
  switch(config-mgmt-console)#
  ```

- The **management ssh** command places the switch in SSH management mode:
  
  ```
  switch(config)#management ssh
  switch(config-mgmt-ssh)#
  ```

- The **management telnet** command places the switch in Telnet management mode:
  
  ```
  switch(config)#management telnet
  switch(config-mgmt-telnet)#
  ```

- The **exit** command returns the switch to global configuration mode:
  
  ```
  switch(config-mgmt-ssh)#exit
  switch(config)#
  ```

The **idle-timeout** commands shown below configure the idle-timeout period for the connection type being configured. The idle timeout is the interval that the connection waits after a user’s most recent command before shutting down the connection. Automatic connection timeout is disabled by setting the idle-timeout to zero, which is the default setting.

Examples

- This **idle-timeout (SSH Management)** command configures an SSH idle-timeout period of three hours.
  
  ```
  switch(config)#management ssh
  switch(config-mgmt-ssh)#idle-timeout 180
  ```

- This **idle-timeout (Telnet Management)** command disables automatic connection timeout for telnet connections.
  
  ```
  switch(config)#management telnet
  switch(config-mgmt-telnet)#idle-timeout 0
  ```

The **shutdown (Telnet Management)** command enables and disables Telnet on the switch.

Examples

- These commands enable Telnet.
  
  ```
  switch(config)#management telnet
  switch(config-mgmt-telnet)#no shutdown
  ```

- These commands disable Telnet.
  
  ```
  switch(config)#management telnet
  switch(config-mgmt-telnet)#shutdown
  ```
2.3 Configure Session

The command `configure session` allows users to issue configuration sessions as CLI commands that do not take effect immediately. Each `configure session` is saved with a unique name. A session can be entered, modified and exited at any time without impacting the currently running system configuration.

A session is defined as a collection of configuration changes that are grouped together.

When a session is committed, the configuration that was modified during the session is copied into `running-config`. A session can be aborted or removed, thereby removing the session completely and freeing up memory used by the session. The user must explicitly request that the changes in a deferred session be applied to the configuration of the router by entering a `commit` command and exiting the mode. Alternately, the user may abandon the changes by entering an `abort` command.

Configuration sessions are used to make sets of changes, after verifying that there are no CLI errors. Configuration sessions allow the administrator to pre-provision a group of CLI commands in a named session, then execute each configuration session at specified times.

This chapter contains the following sections:

- Section 2.3.1: Configuration Session
- Section 2.3.2: Configure Replace
- Section 2.3.3: Configuration CLI
- Section 2.3.4: Show Commands

2.3.1 Configuration Session

The `configure session` command allows users to make a series of configuration changes in a temporary location and commit them to `running-config` at once by issuing the `commit` command.

- `configure session <name of session>` and `running-config` — The user enters a session (versus `configure terminal` in the case where configuration sessions are not used). If a session name is not specified, a system named session is created. A snapshot of the current `running-config` is copied into the session’s data structure as the basis of further configuration changes.
- CLI configuration commands — User can run any configuration commands inside the session.
- `rollback clean-config` — User can run `rollback` command to revert the session’s configuration to the factory-default configuration (or clean configuration).
- `show session-config` — User can run `show session-config` to show the session’s configuration, which will be the future `running-config` once committed.
- `commit` — User issues `commit` to commit the changes, which will replace the current `running-config`.
- `abort` — To abort the session and throw away all changes.
- `exit` — User can `exit` from the session, and later return to the same session by running `configure session <name>` again.
- For named session — More than one CLI instance can enter the same session and make changes to the session configuration. Once the session is committed in any of the CLIs, no other CLI can commit or make any other changes in that session.
2.3.2 Configure Replace

The command `configure replace <URL>` replaces the current `running-config` with the configuration saved in `<URL>`. By default, `configure replace <URL>` will replace `running-config` only if the configuration in `<URL>` loads without errors. The command `configure replace <URL> ignore-errors` forces the operation in spite of errors.

Note

The command `copy <URL> running-config` was typically used to apply a saved configuration file to the system, and append that configuration to the current `running-config` (in lieu of replacing it). However, it is recommended the user uses the CLI command `configure replace <URL>` to streamline the process of deterministically restoring the system back to a known good configuration.

The normal workflow internally uses a configuration session to perform the replace.

2.3.3 Configuration CLI

In the CLI, execute the following configuration steps to create a configuration session.

Step 1 `configure session [name of session]`

Create or enter a session. If a name is not specified, it is automatically generated. The user is put in the session configuration mode and the prompt will change to show the first six characters of the session name. Designating the name of a session is optional. When `name of session` is not specified, a unique name is assigned.

`no configure session name of session`

Delete the specified configuration session. Designating the name of a session is required.

Step 2 `commit`

Commit the changes made in the session. This command must be issued from within the session configuration mode.

`abort`

Abort the session, which is the same as deleting it. This command must be issued from within the session configuration mode.

Step 3 `rollback clean-config`

Revert configuration in the session to the clean, factory-default configuration. This command must be issued from within the session configuration mode.

Step 4 `service configuration session max completed number`

Set a limit on the maximum number of committed sessions that are saved.

Step 5 `service configuration session max pending number`

Set a limit on the maximum number of uncommitted sessions that can be outstanding.

2.3.4 Show Commands

2.3.4.1 `show configuration sessions [detail]`

This command displays the following information about the sessions that exist in the system:

- The name of each session and its state (completed, pending, aborted, etc.) are displayed.
• If a user has currently entered the session, the user name and the associated terminal are also shown.
• With the detail flag, the process ID of the CLI process that is using the session is also displayed.
• Commit Time Left shows the countdown until the configuration is reverted back. It shows data only when the configuration session command `commit timer hh:mm:ss` has been used.

Note
An asterisk (*) indicates that the user running the show command is currently in the marked session.

Example

```
switch(config-s-s2)#show configuration sessions detail
Maximum number of completed sessions: 1
Maximum number of pending sessions: 5

<table>
<thead>
<tr>
<th>Name</th>
<th>State</th>
<th>User</th>
<th>Terminal</th>
<th>PID</th>
<th>Commit Time Left</th>
</tr>
</thead>
<tbody>
<tr>
<td>session10</td>
<td>completed</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>session20</td>
<td>pendingCommitTimer</td>
<td></td>
<td></td>
<td></td>
<td>2m20s</td>
</tr>
</tbody>
</table>
```
In order for the commit to persist, confirm the **commit** before the timer expires. This is used to prevent configurations that would lock you out of the device due to loss of connectivity or when performing security changes such as user account, password, RADIUS, or TACACS changes.

### Example

This example displays how to set the commit timer.

```
switch(config)#configure session routingChanges
switch(config-s-routin)#ip route 10.2.5.0/24 10.0.0.1
switch(config-s-routin)#commit timer 00:02:00
```

This show command displays the configuration sessions.

```
switch#show configuration sessions
Maximum number of completed sessions: 1
Maximum number of pending sessions: 5

<table>
<thead>
<tr>
<th>Name</th>
<th>State</th>
<th>User</th>
<th>Terminal</th>
</tr>
</thead>
<tbody>
<tr>
<td>routingChanges</td>
<td>pendingCommitTimer</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

This show command displays detailed information for the configuration sessions.

```
switch#show configuration sessions detail
Maximum number of completed sessions: 1
Maximum number of pending sessions: 5

<table>
<thead>
<tr>
<th>Name</th>
<th>State</th>
<th>User</th>
<th>Terminal</th>
<th>PID</th>
<th>Commit Time Left</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cfg0</td>
<td>completed</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>routingChanges</td>
<td>pendingCommitTimer</td>
<td></td>
<td></td>
<td></td>
<td>1m49s</td>
<td></td>
</tr>
</tbody>
</table>
```

**Note**

You cannot enter session routingChanges, when the switch is in pendingCommitTimer state.

```
Arista(config)#configure session routingChanges commit
Arista(config)#show configuration sessions detail
Maximum number of completed sessions: 1
Maximum number of pending sessions: 5

<table>
<thead>
<tr>
<th>Name</th>
<th>State</th>
<th>User</th>
<th>Terminal</th>
<th>PID</th>
<th>Commit Time Left</th>
</tr>
</thead>
<tbody>
<tr>
<td>routingChanges</td>
<td>completed</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

### 2.3.4.2 show session-config [diff]

This command must be issued from within a session. It shows the following:

- The session configuration, including the changes made in the session.
• The diff flag shows the differences with the **running-config**, which helps highlight the changes made in the session.

**Example 1**

```
Arista(config-s-s2)#show session-config
! Command: show session-configuration named s2
ip dhcp relay all-subnets default
! transceiver qsfp default-mode 4x10G
! candidate Loopback0 224.0.0.0/4 priority 64 hashmask 30 interval 60
! hostname Arista
ip host one 1.1.1.1
! no aaa root
! spanning-tree mode mstp
! interface Ethernet1
! interface Ethernet2
! interface Ethernet3
! interface Ethernet4
! interface Ethernet5
! interface Ethernet6
! no ip routing
!
end
```

**Example 2**

```
Arista(config-s-s2)#show session-config diff
--- system:/running-config
+++ session:/s2
@@ -5,6 +5,7 @@
candidate Loopback0 224.0.0.0/4 priority 64 hashmask 30 interval 60
! hostname Arista
+ip host one 1.1.1.1
!
```

2.3.4.3 **show session-config name <name of session>**

Show the session configuration of the named session.
Example

Arista#show session-configuration named s1
! Command: show session-configuration named s1
ip dhcp relay all-subnets default
!
transceiver qsfp default-mode 4x10G
!
candidate Loopback0 224.0.0.0/4 priority 64 hashmask 30 interval 60

!
interface Ethernet2
!
interface Ethernet3
!
interface Ethernet4
!
interface Ethernet5
!
interface Ethernet6
!
no ip routing
!
!
end
2.4 Recovery Procedures

These sections describe switch recovery procedures:

- Section 2.4.1: Removing the Enable Password from the Startup Configuration
- Section 2.4.2: Reverting the Switch to the Factory Default Startup Configuration
- Section 2.4.3: Restoring the Factory Default EOS Image and Startup Configuration
- Section 2.4.4: Restoring the Configuration and Image from a USB Flash Drive

The first three procedures require Aboot Shell access through the console port. If the console port is not accessible, use the last procedure in the list to replace the configuration file through the USB Flash Drive.

Boot Loader – Aboot describes the switch booting process and includes descriptions of the Aboot shell, Aboot boot loader, and required configuration files.

2.4.1 Removing the Enable Password from the Startup Configuration

The enable password controls access to Privileged EXEC mode. To prevent unauthorized disclosure, the switch stores the enable password as an encrypted string that it generates from the clear-text password. When the switch authentication mode is local and an enable password is configured, the CLI prompts the user to enter the clear-text password after the user types enable at the EXEC prompt.

The startup-config file stores the encrypted enable password to ensure that the switch loads it when rebooting. If the text version of the enable password is lost or forgotten, access to enable mode is restored by removing the encrypted enable password from the startup configuration file.

This procedure restores access to enable mode without changing any other configuration settings.

**Step 1** Access the Aboot shell:

a. Power cycle the switch by successively removing and restoring access to its power source.

b. Type Ctrl-C when prompted, early in the boot process.

c. Enter the Aboot password, if prompted.

If the Aboot password is unknown, refer to Section 2.4.3: Restoring the Factory Default EOS Image and Startup Configuration for instructions on reverting all flash directory contents to the factory default, including the startup configuration and EOS image.

**Step 2** Change the active directory to /mnt/flash directory.

```
Aboot#cd /mnt/flash
```

**Step 3** Open the startup-config file in vi.

```
Aboot#vi startup-config
```

**Step 4** Remove the enable password line.

This is an example of an enable password line:

```
enable password 5 $1$dBXo2KpF$Pd4XYLpI0ap12aU7glG1w/
```

**Step 5** Save the changes and exit vi.

**Step 6** Exit Aboot. This boots the switch.

```
Aboot#exit
```
2.4.2 Reverting the Switch to the Factory Default Startup Configuration

The *startup-config* file contains configuration parameters that the switch uses during a boot. Parameters that do not appear in *startup-config* are set to their factory defaults when the switch reloads. The process requires the Aboot password if Aboot is password protected.

This procedure reverts EOS configuration settings to the default state through bypassing the *startup-config* file during a switch boot.

**Step 1** Access the Aboot shell through the console port:

a. Type `reload` at the Privileged EXEC prompt.

b. Type `Ctrl-C` when prompted, early in the boot process.

c. Enter the Aboot password, if prompted.

If the Aboot password is unknown, refer to Section 2.4.3: Restoring the Factory Default EOS Image and Startup Configuration for instructions on reverting all flash directory contents to the factory default, including *startup-config* and EOS image.

**Step 2** Change the active directory to `/mnt/flash` directory.

Aboot# `cd /mnt/flash`

**Step 3** Rename the startup configuration file.

Aboot# `mv startup-config startup-config.old`

**Step 4** Exit Aboot. This boots the switch

Aboot# `exit`

**Step 5** Cancel Zero Touch Provisioning (ZTP). Refer to Section 2.1.2.2: Canceling Zero Touch Provisioning for instructions.

If ZTP is not canceled, the switch either:

- boots, using the *startup-config* file or boot script that it obtains from the network, or
- remains in ZTP mode if the switch is unable to download a *startup-config* file or boot script.

**Step 6** Configure the *admin* and *enable* passwords.

```
switch>enable
switch#configure terminal
switch(config)#enable password xyz1
switch(config)#username admin secret abc41
```

**Step 7** Save the new *running-config* to the startup configuration file.

```
switch#write
```

**Step 8** (Optional) Delete the old startup configuration file.

```
switch#delete startup-config.old
```

After ZTP is canceled, the switch reboots, using the factory default settings. To avoid entering ZTP mode on subsequent reboots, create a *startup-config* file before the next switch reboot.

2.4.3 Restoring the Factory Default EOS Image and Startup Configuration

A *fullrecover* command removes all internal flash contents (including configuration files, EOS image files, and user files), then restores the factory default EOS image and *startup-config*. A subsequent installation of the current EOS image may be required if the default image is outdated. This process requires Aboot shell access through the console port.
Chapter 2: Initial Configuration and Recovery

Recovery Procedures

Note
For hardware that is purchased after June 2017, the factory default partition will not have the backup EOS software image. This is done to increase the flash size on smaller flash size disks and also since other options are available in the fullrecover command functionality to restore factory default EOS image. This is applicable to both fixed system and modular system hardware.

This procedure restores the factory default EOS image and startup configuration.

**Step 1** Access the Aboot shell through the console port:
- a. Type `reload` at the Privileged EXEC prompt.
- b. Type `Ctrl-C` when prompted, early in the boot process.
- c. Enter the Aboot password, if prompted.
  
  If the Aboot password is not known, enter an empty password three times, after which the CLI displays:

  Type "fullrecover" and press Enter to revert /mnt/flash to factory default state, or just press Enter to reboot:

- d. Type `fullrecover` and go to step 4.

**Step 2** Type `fullrecover` at the Aboot prompt.

Aboot#fullrecover

Aboot displays this warning:

All data on /mnt/flash will be erased; type "yes" and press Enter to proceed, or just press Enter to cancel:

**Step 3** Type `yes` and press `Enter`.

The switch performs these actions:

- erases the contents of /mnt/flash
- writes new boot-config, startup-config, and EOS.swi files to /mnt/flash
- returns to the Aboot prompt

**Step 4** Exit Aboot. This boots the switch.

Aboot#exit

The serial console settings are restored to their default values (9600/N/8/1/N).

**Step 5** Reconfigure the console port if non-default settings are required.

**Step 6** Cancel Zero Touch Provisioning (ZTP). Refer to Section 2.1.2.2: Canceling Zero Touch Provisioning for instructions.

If ZTP is not canceled, the switch either:

- boots, using the `startup-config` file or boot script that it obtains from the network, or
- remains in ZTP mode if the switch is unable to download a `startup-config` file or boot script.

After ZTP is canceled, the switch reboots, using the factory default settings. To avoid entering ZTP mode on subsequent reboots, create a `startup-config` file before the next switch reboot.

### 2.4.4 Restoring the Configuration and Image from a USB Flash Drive

The USB flash drive port can be used to restore an original configuration when you cannot establish a connection to the console port. This process removes the contents of the internal flash drive, restores the factory default configuration, and installs a new EOS image from the USB flash drive.
This procedure restores the factory default configuration and installs an EOS image stored on a USB flash drive.

**Step 1** Prepare the USB flash drive:

a. Verify the drive is formatted with MS-DOS or FAT file system.

   Most USB drives are pre-formatted with a compatible file system.

b. Create a text file named `fullrecover` on the USB flash drive.

   The filename does not have an extension. The file may be empty.

c. Create a text file named `boot-config`.

   The last modified timestamp of the `boot-config` file on the USB flash must differ from the timestamp of the `boot-config` file on the switch.

d. Enter this line in the new `boot-config` file on the USB flash:

   `SWI=flash:EOS.swi`

e. Copy an EOS image file to the flash drive. Rename it `EOS.swi` if it has a different file name.

   For best results, the flash drive should contain only these three files, because the procedure copies all files and directories on the USB flash drive to the switch.
   - `fullrecover`
   - `boot-config`
   - `EOS.swi`

**Step 2** Insert the USB flash drive into the USB flash port on the switch, as shown in Figure 2-1.

**Step 3** Connect a terminal to the console port and configure it with the default terminal settings (9600/N/8/1) to monitor progress messages on the console.

**Step 4** Power up or **reload** the switch.

   The switch erases internal flash contents and copies the files from the USB flash drive to internal flash. The switch then boots automatically.

**Step 5** Cancel Zero Touch Provisioning (ZTP). Refer to Section 2.1.2.2: Canceling Zero Touch Provisioning for instructions.

   If ZTP is not canceled, the switch either:
   - boots, using the `startup-config` file or boot script that it obtains from the network, or
   - remains in ZTP mode if the switch is unable to download a `startup-config` file or boot script.

   After ZTP is canceled, the switch reboots using the factory default settings. To avoid entering ZTP mode on subsequent reboots, create a `startup-config` file before the next switch reboot.
2.5 **Session Management Commands**

**Global Configuration Commands**
- configure replace
- configure session
- management api http-commands
- management console
- management ssh
- management telnet
- management xmpp

**Management Configuration Commands**
- domain (XMPP Management)
- idle-timeout (Console Management)
- idle-timeout (SSH Management)
- idle-timeout (Telnet Management)
- protocol http (API Management)
- protocol https (API Management)
- protocol https certificate (API Management)
- server (XMPP Management)
- session privilege (XMPP Management)
- shutdown (API Management)
- shutdown (Telnet Management)
- shutdown (XMPP Management)
- switch-group (XMPP Management)
- username (XMPP Management)
- vrf (API Management)
- vrf (XMPP Management)
- xmpp send
- xmpp session

**Display Commands**
- show inventory
- show xmpp neighbors
- show xmpp status
- show xmpp switch-group
configure replace

The **configure replace** command replaces the current configuration with the new configuration from the specified source.

**Command Mode**
Privileged EXEC

**Command Syntax**
```
configure replace {source_file_path:source_file_name | boot-extensions |
clean-config | installed-extensions | running-config | startup-config}
[ignore-errors] [md5 md5sum] [skip-checkpoint]
```

**Parameters**
- **source_file_path:source_file_name** replaces current configuration with the configuration from the specified source file.
- **boot-extensions** replaces current configuration with the boot extensions configuration.
- **clean-config** replaces current configuration with clean and default configurations.
- **installed-extensions** replaces current configuration with the installed extensions configuration.
- **running-config** obsolete.
- **startup-config** replaces current configuration with the startup configuration.
- **ignore-errors** ignores errors while loading the new configuration.
- **md5 md5sum** performs a checksum to validate data integrity with the specified MD5 hashing algorithm.
- **skip-checkpoint** skips creating the checkpoint file of **running-config**.

**Example**
- This command replaces the current configuration state with the startup configuration.
  ```
switch#configure replace startup-config
  ! Preserving static routes. Use 'no ip routing delete-static-routes' to clear them.
  switch#
  ```
configure session

The **configure session** command allows making a series of configuration changes in a temporary location and commit them to **running-config** at once by issuing the **commit** command.

The **no configure session** *session_name* and **default configure session** *session_name* commands delete the specified configuration session.

**Command Mode**
- Privileged EXEC

**Command Syntax**

```
configure session [session_name]
no configure session session_name
default configure session session_name
```

**Parameter**
- *session_name*    session name

**Guidelines**

If a session name is not specified, a system named session is created. The switch permits up to five uncommitted sessions.

**Example**

- This command creates a session with a name created automatically.

  ```
  switch(config)#configure session
  switch(config-s-sess-1)#
  ```
domain (XMPP Management)

The domain command configures the switch’s XMPP domain name. Only messages using a domain matching the locally configured one are accepted by the XMPP client. The switch’s domain name is used if none is specified.

Management over XMPP is disabled by default. To enable it, you must provide the location of the server along with the domain, username and password for the switch.

Arista recommends configuring the XMPP domain before the username, because it will provide shortcuts for the switch-group and username so they can be configured without the domain attached to it (e.g., USERNAME instead of USERNAME@DOMAIN).

The no domain and default domain commands delete the domain name by removing the domain command from running-config.

Command Mode

Mgmt-xmpp Configuration

Command Syntax

domain string
no domain
default domain

Parameters

• string  domain name (text string)

Example

• This command configures test.aristanetworks.com as the switch’s domain name.

```
switch(config)#management xmpp
test1(config-mgmt-xmpp)#server arista-xmpp
test1(config-mgmt-xmpp)#domain test.aristanetworks.com
test1(config-mgmt-xmpp)#username test1@test.aristanetworks.com password 0 arista
test1(config-mgmt-xmpp)#no shutdown
```

• This command removes the domain name from the XMPP configuration.

```
switch(config-mgmt-xmpp)#no domain
switch(config-mgmt-xmpp)#
```
idle-timeout (Console Management)

The **idle-timeout (Console Management)** command configures the idle-timeout period for console connection sessions. The idle timeout is the interval that the connection waits after a user’s most recent command before shutting down the connection. Automatic connection timeout is disabled by setting the idle-timeout to zero, which is the default setting.

The **no idle-timeout** and **default idle-timeout** commands disables the automatic connection timeout by removing the **idle-timeout** statement from **running-config**.

**Command Mode**

Mgmt-console

**Command Syntax**

```
idle-timeout idle_period
no idle-timeout
default idle-timeout
```

**Parameters**

- **idle_period** session idle-timeout length. Options include:
  - 0 Automatic connection timeout is disabled
  - `<1 to 86400>` Automatic timeout period (minutes).

**Example**

- These commands configure a console idle-timeout period of three hours, then return the switch to global configuration mode.

  ```
  switch(config)#management console
  switch(config-mgmt-console)#idle-timeout 180
  switch(config-mgmt-console)#exit
  switch(config)#
  ```

- These commands disable automatic connection timeout.

  ```
  switch(config)#management console
  switch(config-mgmt-console)#idle-timeout 0
  switch(config-mgmt-console)#
  ```
idle-timeout (SSH Management)

The `idle-timeout (SSH Management)` command configures the idle-timeout period for SSH connection sessions. The idle timeout is the interval that the connection waits after a user’s most recent command before shutting down the connection. Automatic connection timeout is disabled by setting the idle-timeout to zero, which is the default setting.

The `no idle-timeout` and `default idle-timeout` commands disables the automatic connection timeout by removing the `idle-timeout` statement from `running-config`.

**Command Mode**

Mgmt-ssh Configuration

**Command Syntax**

```plaintext
idle-timeout idle_period
no idle-timeout
default idle-timeout
```

**Parameters**

- `idle_period` session idle-timeout length. Options include:
  - 0 Automatic connection timeout is disabled
  - `<1 to 86400>` Automatic timeout period (minutes).

**Example**

- These commands configure an ssh idle-timeout period of three hours, then return the switch to global configuration mode.

  ```plaintext
  switch(config)#management ssh
  switch(config-mgmt-ssh)#idle-timeout 180
  switch(config-mgmt-ssh)#exit
  switch(config)#
  ```

- These commands disable automatic connection timeout.

  ```plaintext
  switch(config)#management ssh
  switch(config-mgmt-ssh)#idle-timeout 0
  switch(config-mgmt-ssh)#
  ```
idle-timeout (Telnet Management)

The `idle-timeout` (Telnet Management) command configures the idle-timeout period for Telnet connection sessions. The idle timeout is the interval that the connection waits after a user’s most recent command before shutting down the connection. Automatic connection timeout is disabled by setting the idle-timeout to zero, which is the default setting.

The `no idle-timeout` and `default idle-timeout` commands disables the automatic connection timeout by removing the `idle-timeout` statement from `running-config`.

**Command Mode**

Mgmt-telnet

**Command Syntax**

```plaintext
idle-timeout idle_period
no idle-timeout
default idle-timeout
```

**Parameters**

- `idle_period`  session idle-timeout length. Options include:
  - 0 Automatic connection timeout is disabled
  - `<1 to 86400>` Automatic timeout period (minutes).

**Example**

- These commands configure a telnet idle-timeout period of three hours, then return the switch to global configuration mode.
  ```plaintext
  switch(config)#management telnet
  switch(config-mgmt-telnet)#idle-timeout 180
  switch(config-mgmt-telnet)#exit
  switch(config)#
  ```

- These commands disable automatic connection timeout.
  ```plaintext
  switch(config)#management telnet
  switch(config-mgmt-telnet)#idle-timeout 0
  switch(config-mgmt-telnet)#
  ```
management api http-commands

The `management api http-commands` command places the switch in mgmt-API configuration mode. The `no management api http-commands` and `default management api http-commands` commands delete mgmt-api-http-command configuration mode statements from `running-config`.

Mgmt-api-http-cmds configuration mode is not a group change mode; `running-config` is changed immediately upon entering commands. Exiting mgmt-api-http-cmds configuration mode does not affect `running-config`. The `exit` command returns the switch to global configuration mode.

Command Mode
- Global Configuration

Command Syntax

```
management api http-commands
no management api http-commands
default management api http-commands
```

Commands Available in Mgmt-API Configuration Mode
- `protocol http (API Management)`
- `protocol https (API Management)`
- `protocol https certificate (API Management)`
- `shutdown (API Management)`
- `vrf (API Management)`

Example
- This command places the switch in mgmt-api-http-cmds configuration mode.
  ```
  switch(config)#management api http-commands
  switch(config-mgmt-api-http-cmds)#
  ```
- This command returns the switch to global management mode.
  ```
  switch(config-mgmt-api-http-cmds)#exit
  switch(config)#
  ```
management console

The management console command places the switch in mgmt-console configuration mode to adjust the idle-timeout period for console connection sessions. The idle-timeout period determines the inactivity interval that terminates a connection session.

The no management console and default management console commands delete mgmt-console configuration mode statements from running-config.

Mgmt-console configuration mode is not a group change mode; running-config is changed immediately upon entering commands. Exiting mgmt-console configuration mode does not affect running-config. The exit command returns the switch to global configuration mode.

Command Mode
Global Configuration

Command Syntax
management console
no management console
default management console

Commands Available in mgmt-console Configuration Mode
- idle-timeout (Console Management)

Example
- This command places the switch in mgmt-console configuration mode:
  ```
  switch(config)#management console
  switch(config-mgmt-console)#
  ```
- This command returns the switch to global management mode:
  ```
  switch(config-mgmt-console)#exit
  switch(config)#
  ```
management ssh

The `management ssh` command places the switch in mgmt-ssh configuration mode to adjust SSH session connection parameters.

The `no management ssh` and `default management ssh` commands delete the mgmt-ssh configuration mode statements from `running-config`.

Mgmt-ssh configuration mode is not a group change mode; `running-config` is changed immediately upon entering commands. Exiting mgmt-ssh configuration mode does not affect `running-config`. The `exit` command returns the switch to global configuration mode.

**Command Mode**
Global Configuration

**Command Syntax**
- `management ssh`
- `no management ssh`
- `default management ssh`

**Commands Available in Mgmt-ssh Configuration Mode**
- authentication mode (Management-SSH)
- cipher (Management-SSH)
- fips restrictions (Management-SSH)
- hostkey (Management-SSH)
- idle-timeout (Management-SSH)
- ip access group (Management-SSH)
- ipv6 access group (Management-SSH)
- key-exchange (Management-SSH)
- login timeout (Management-SSH)
- mac hmac (Management-SSH)
- server-port (Management-SSH)
- shutdown (Management-SSH)
- vrf (Management-SSH)

**Example**
- This command places the switch in mgmt-ssh configuration mode:
  ```
  switch(config)#management ssh
  switch(config-mgmt-ssh)#
  ```
- This command returns the switch to global management mode:
  ```
  switch(config-mgmt-ssh)#exit
  switch(config)#
  ```
management telnet

The management telnet command places the switch in mgmt-telnet configuration mode to adjust telnet session connection parameters.

The no management telnet and default management telnet commands delete the mgmt-telnet configuration mode statements from running-config.

Mgmt-telnet configuration mode is not a group change mode; running-config is changed immediately upon entering commands. Exiting mgmt-telnet configuration mode does not affect running-config. The exit command returns the switch to global configuration mode.

Command Mode
Global Configuration

Command Syntax
management telnet
no management telnet
default management telnet

Commands Available in mgmt-telnet Configuration Mode
- idle-timeout (Management-Telnet)
- ip access group (Management-Telnet)
- ipv6 access group (Management-Telnet)
- shutdown (Management-Telnet)
- vrf (Management-Telnet)

Example
- This command places the switch in mgmt-telnet configuration mode:
  switch(config)#management telnet
  switch(config-mgmt-telnet)#
- This command returns the switch to global management mode:
  switch(config-mgmt-telnet)#exit
  switch(config)##
management xmpp

The management xmpp command places the switch in mgmt-xmpp configuration mode. Management over XMPP is disabled by default. To enable XMPP, you must provide the location of the XMPP server along with the username and password for the switch.

The no management xmpp and default management xmpp commands delete the mgmt-xmpp configuration mode statements from running-config.

Mgmt-xmpp configuration mode is not a group change mode; running-config is changed immediately upon entering commands. Exiting mgmt-xmpp configuration mode does not affect running-config. The exit command returns the switch to global configuration mode.

Command Mode
Global Configuration

Command Syntax
management xmpp
no management xmpp
default management xmpp

Commands Available in Mgmt-xmpp Configuration Mode
- domain (Management-xmpp)
- server (Management-xmpp)
- session (Management-xmpp)
- shutdown (Management-xmpp)
- switch-group (Management-xmpp)
- username (Management-xmpp)
- vrf (Management-xmpp)

Example
- This command places the switch in mgmt-xmpp configuration mode:
  switch(config)#management xmpp
  switch(config-mgmt-xmpp)#

- This command returns the switch to global management mode:
  switch(config-mgmt-xmpp)#exit
  switch(config-mgmt-xmpp)#
protocol http (API Management)

The `protocol http` command enables the hypertext transfer protocol (HTTP) server.

The `no protocol http` and `default protocol http` commands disable the HTTP server by removing the `protocol http` statement from `running-config`.

Command Mode
- Mgmt-API Configuration

Command Syntax
- `protocol http [TCP_PORT]`
- `no protocol http`
- `default protocol http`

Parameters
- **TCP_PORT**  
  *Port number to be used for the HTTP server.* Options include:
  - `<no parameter>`  
    *Specifies default port number 80.*
  - `port <1 to 65535>`  
    *Specifies HTTP server port number. Value ranges from 1 to 65535.*
  - `localhost`  
    *The name of the server bound on the localhost.*
  - `port`  
    *The number of the TCP port to serve on.*

Related Commands
- `management api http-commands` places the switch in mgmt-api configuration mode.

Examples
- These commands enables the management API for the HTTP server.

```plaintext
switch(config)#management api http-commands
switch(config-mgmt-api-http-cmds)#
```
protocol https (API Management)

The protocol https command enables the HTTP secure server. The HTTP secure server is active by default.

The default protocol https command restores the default setting by removing the no protocol https statement from running-config. The no protocol https command disables the HTTP secure server.

Command Mode
Mgmt-API Configuration

Command Syntax
```
protocol https [TCP_PORT]
no protocol https
default protocol https
```

Parameters
- **TCP_PORT** Port number to be used for the HTTPS server. Options include:
  - <no parameter> Specifies default port number 443.
  - **port** <1 to 65535> Specifies HTTP server port number. Value ranges from 1 to 65535.
- certificate The HTTPS key and certificate to use.
- cipher Exclusive list of cryptographic ciphers.
- key-exchange Exclusive list of key-exchange algorithms.
- mac Exclusive list of MAC algorithms.
- port The number of the TCP port to serve on.
- ssl Configure SSL options.

Related Commands
- management api http-commands places the switch in mgmt-api configuration mode.

Examples
- These commands enables service to the HTTP server. The no shutdown command allows access to the service.

  switch(config)#management api http-commands
  switch(config-mgmt-api-http-cmds)#protocol https
  switch(config-mgmt-api-http-cmds)# no shutdown

- These commands specifies the port number that should be used for the HTTPS server. The no shutdown command allows access to the service.

  switch(config)#management api http-commands
  switch(config-mgmt-api-http-cmds)#protocol https port 52
  switch(config-mgmt-api-http-cmds)#no shutdown
protocol https certificate (API Management)

The **protocol https certificate** command configures the HTTP secure server to request an X.509 certificate from the client. The client then authenticates the certificate with a public key.

The **no protocol https certificate** and **default protocol https certificate** commands restore default behavior by removing the **protocol https certificate** statement from **running-config**.

**Command Mode**
Mgmt-API Configuration

**Command Syntax**
- `protocol https certificate`
- `no protocol https certificate`
- `default protocol https certificate`

**Related Commands**
- `management api http-commands` places the switch in mgmt-api configuration mode.

**Examples**
- These commands configure the HTTP secure server to request an X.509 certificate from the client for authentication.

```
switch(config)#management api http-commands
switch(config-mgmt-api-http-cmds)#protocol https certificate
switch(config-mgmt-api-http-cmds)#
```
server (XMPP Management)

The `server` command adds a XMPP server to `running-config`. Multiple XMPP servers can be set up for redundancy. For redundant configurations, the XMPP server location should be a DNS name and not a raw IP address. The DNS server is responsible for returning the list of available XMPP servers, which the client can go through until an accessible server is found.

User authentication is provided by the XMPP server. Command authorization can be provided by EOS local configuration or TACACS+. The XMPP server should use the same authentication source as the switches. RADIUS is not supported as an XMPP authorization mechanism.

The `no server` and `default server` commands remove the specified XMPP server from `running-config`.

**Command Mode**
Mgmt-xmpp Configuration

**Command Syntax**
```
server SERVER_NAME [SERVER_PORT]
no server
default server
```

**Parameters**
- `SERVER_NAME`  XMPP server location. Options include:
  - `IP address` in dotted decimal notation.
  - a host name for the XMPP server.
- `SERVER_PORT`  Server port. Options include:
  - `port <1 to 65535>` where `number` ranges from 1 to 65535. If no port is specified, the default port 5222 is used.

**Examples**
- This command configures the server hostname `arista-xmpp` to server port 1.
  ```
  switch(config)#management xmpp
  switch(config-mgmt-xmpp)#server arista-xmpp port 1
  ```
- This command removes the XMPP server.
  ```
  switch(config-mgmt-xmpp)# no server
  ```
session privilege (XMPP Management)

The session privilege command will place the user in EXEC mode. The initial privilege level is meaningless by default. However, with the configuration of roles, users can add meaning to the different privilege levels. By default, XMPP does not limit access to any command.

Level 1-15: Commands accessible from EXEC Mode.

If AAA is not configured and the switch is configured to connect to the XMPP client, any message received is executed with privilege level 1 by default.

The no session privilege and default session privilege commands revert the list contents to none for the specified privilege levels.

Command Mode
Mgmt-xmpp Configuration

Command Syntax
- session privilege PRIV_LEVEL
- no session privilege
- default session privilege

Parameters
- PRIV_LEVEL Privilege levels of the commands. Value ranges from 0 and 15.

Examples
- These commands authorizes configuration commands (privilege level config 5) for XMPP.
  
  switch(config)#(config)#management xmpp
  switch(config-mgmt-xmpp)#session privilege 5
  switch(config-mgmt-xmpp)#

- This command removes the privilege levels set for the XMPP session.
  
  switch(config)#management xmpp
  switch(config-mgmt-xmpp)#no session privilege
**show inventory**

The *show inventory* command displays the hardware components installed in the switch. Serial numbers and a description is also provided for each component.

**Command Mode**

EXEC

**Command Syntax**

```
show inventory
```

**Examples**

- This command displays the hardware installed in a DCS-7150S-52 switch.

```
switch>show inventory

switch>
```
show xmpp neighbors

The `show xmpp neighbors` command displays all neighbors and their connection status. The XMPP server keeps track of all relationships between its users.

**Command Mode**

`EXEC`

**Command Syntax**

`show xmpp neighbors`

**Example**

- This command displays all the XMPP neighbors and their connection status.

```
switch#show xmpp neighbors
Neighbor                          State           Last Seen Login Time
------------------------------    --------------- -------------------------
admin@test.aristanetworks.com    present         0:01:40 ago

Neighbor                          Status Message
------------------------------    ----------------------------------------
admin@test.aristanetworks.com
test1@test.aristanetworks.com   Arista Networks DCS-7048T-4S
switch#
```
**show xmpp status**

The *show xmpp status* command displays the current XMPP connection status to the server.

The XMPP server keeps track of all relationships between its users. In order for two users to directly communicate, this relationship must first be established and confirmed by the other party.

Switches automatically confirm requests from outside parties as long as they are a user from the same domain name, for example when you chat with your switch from your own XMPP chat client.

**Command Mode**

EXEC

**Command Syntax**

`show xmpp status`

**Example**

- This command displays the current XMPP connection status to the server.

```
switch# show xmpp status
XMPP Server: port 5222
Client username: test@test.aristanetworks.com
Default domain: test.aristanetworks.com
Connection status: connected
switch#
```
show xmpp switch-group

The show xmpp switch-group command displays the configured and active switch groups for the switch.

Command Mode

EXEC

Command Syntax

  show xmpp switch-group

Example

  • This command displays the configured and active switch groups.

    switch#show xmpp switch-group
    testroom@conference.test.aristanetworks.com
    switch#
shutdown (API Management)

The `shutdown` command, in mgmt-api configuration mode, disables management over API on the switch. API is disabled by default.

The `no shutdown` command, in mgmt-api configuration mode, enables the management API access.

The `default shutdown` command, in mgmt-api configuration mode, disables the management API access.

**Command Mode**

Mgmt-API Configuration

**Command Syntax**

```
shutdown
no shutdown
default shutdown
```

**Related Commands**

- `management api http-commands` places the switch in mgmt-api configuration mode.

**Example**

- These commands disables API access to the HTTP server.

  ```
  switch(config)#management api http-commands
  switch(config-mgmt-api-http-cmds)# shutdown
  switch(config-mgmt-api-http-cmds)#
  ```

- These commands enables API access to the HTTP server.

  ```
  switch(config)#management api http-commands
  switch(config-mgmt-api-http-cmds)# no shutdown
  switch(config-mgmt-api-http-cmds)#
  ```
shutdown (Telnet Management)

The `shutdown` command, in management-telnet mode, disables or enables Telnet on the switch. Telnet is disabled by default. The `management telnet` command places the switch in management-telnet mode.

- To enable Telnet, enter `no shutdown` at the management-telnet prompt.
- To disable Telnet, enter `shutdown` at the management-telnet prompt.

**Command Mode**
Management-Telnet Configuration

**Command Syntax**

```
shutdown
no shutdown
```

**Example**

- These commands enable Telnet, then return the switch to global configuration mode.

  ```
  switch(config)#management telnet
  switch(config-mgmt-telnet)#no shutdown
  switch(config-mgmt-telnet)#exit
  switch(config)#
  ```

- This command disables Telnet.

  ```
  switch(config-mgmt-telnet)#shutdown
  ```
shutdown (XMPP Management)

The `shutdown` command, in mgmt-xmpp mode, disables or enables management over XMPP on the switch. XMPP is disabled by default.

The `no shutdown` and `default shutdown` commands re-enable XMPP by removing the `shutdown` command from `running-config`.

**Command Mode**
Mgmt-xmpp Configuration

**Command Syntax**
```
shutdown
no shutdown
default shutdown
```

**Example**
- These commands enable management over XMPP, then return the switch to global configuration mode.
  ```
  switch(config-mgmt-xmpp)#no shutdown
  switch(config-mgmt-xmpp)#exit
  switch(config)#
  ```
- This command disables management over XMPP.
  ```
  switch(config-mgmt-xmpp)#shutdown
  switch(config-mgmt-xmpp)#
  ```
switch-group (XMPP Management)

The `switch-group` command allows you to configure each switch to join specified chat rooms on startup. In order for the switch to participate in a chat group, the switch has to be configured to belong to the specified chat room.

The `no username` and `default username` commands delete the specified username by removing the corresponding `username` statement from `running-config`.

Command Mode
Mgmt-xmpp Configuration

Command Syntax
```
switch-group name SECURITY
no switch-group
default switch-group
```

Parameters
- `name` Group name text that the user enters at the login prompt to access the CLI.
  Valid usernames begin with A-Z, a-z, or 0-9 and may also contain any of these characters:
  @ # $ % ^ & * - _
= + ; < > , . ~ |
- `SECURITY` password assignment.
  - `password pwd_txt name` is protected by specified password. `pwd_txt` is a clear-text string.
  - `password 0 pwd_txt name` is protected by specified password. `pwd_txt` is a clear-text string.
  - `password 7 pwd_txt name` is protected by specified password. `pwd_txt` is encrypted string.

Guidelines
- A switch group is an arbitrary grouping of switches within the network which belong to one chat group.
- In order to belong to one or more switch groups, the switch has to be manually assigned to it.
- Switch groups are defined dynamically based on the configuration of all of the switches in the network.
- As per the multi-user chat XMPP standard (XEP-0045), switch groups have a full name of `GROUPNAME@conference.DOMAIN`
- All CLI commands allow either the full group name or the short name, which are appended the `@conference.DOMAIN`
- If the switch belongs to multiple chat rooms, you must configure each group with a separate command.

Examples
- These commands configures the switch-group to be part of the chat room.
  ```
  switch(config)#management xmpp
  switch(config-mgmt-xmpp)# switch-group
  testroom@conference.test.aristanetworks.com password 0 arista
  ```
- Use the `show xmpp switch-group` to verify the active switch-group for the switch.
  ```
  switch# show xmpp switch-group
  testroom@conference.test.aristanetworks.com
  ```
username (XMPP Management)

The `username` command configures the switch’s username and password on the XMPP server. The `no username` and `default username` commands delete the specified username by removing the corresponding `username` statement from `running-config`.

**Command Mode**
Mgmt-xmpp Configuration

**Command Syntax**
```
username name SECURITY
no username
default username
```

**Parameters**
- `name` username text that defines the XMPP username and password.
  Valid usernames begin with A-Z, a-z, or 0-9 and may also contain any of these characters:
  `@ # $ % ^ & * ( ) _ = + { ] [ ] ; < > , . ~ |`
- `SECURITY` password assignment.
  - `password pwd_txt name` specifies and unencrypted shared key. `pwd_txt` is a clear-text string.
  - `password 0 pwd_txt name` specifies and unencrypted key. `pwd_txt` is a clear-text string.
  - `password 7 pwd_txt name` specifies a hidden key. `pwd_txt` is encrypted string.

**Guidelines**
Encrypted strings entered through this parameter are generated elsewhere. The `password 7` option (`SECURITY`) is typically used to enter a list of username-passwords from a script.

**Examples**
- These commands create the username and assigns it a password. The password is entered in clear text because the parameter is set to 0.
  ```
  switch(config)#management xmpp
  switch(config-mgmt-xmpp)#server arista-xmpp
  switch(config-mgmt-xmpp)#domain test.aristanetworks.com
  switch(config-mgmt-xmpp)#username test1@test.aristanetworks.com password 0
  switch(config-mgmt-xmpp)#
  ```
- This command removes all usernames from the XMPP server.
  ```
  switch(config-mgmt-xmpp)#no username
  switch(config-mgmt-xmpp)#
  ```
vrf (API Management)

The vrf command places the switch in VRF configuration mode for the server. If the named VRF does not already exist, this command creates it.

Command Mode

Mgmt-API Configuration

Command Syntax

vrf VRF_INSTANCE

Parameters

- **VRF_INSTANCE** specifies the VRF instance.
  - **default** Instance is created in the default VRF.
  - **vrf_name** Instance is created in the specified user-defined VRF.

Related Commands

- **management api http-commands** places the switch in mgmt-api configuration mode.

Example

- This command creates a VRF named management-vrf and places the switch in VRF configuration mode for the new VRF.

```plaintext
switch(config)#management api http-commands
switch(config-mgmt-api-http-cmds)#vrf management-vrf
switch(config-mgmt-api-http-cmds-vrf-management-vrf)#
```
vrf (XMPP Management)

The vrf command places the switch in VRF configuration mode for the XMPP server. If the named VRF does not already exist, this command creates it.

The VRF configuration for the client is for the entire XMPP service, rather than per server. All servers resolving on a particular hostname must be reachable in the same VRF.

Command Mode

Mgmt-xmpp Configuration

Command Syntax

```
vrf [VRF_INSTANCE]
```

Parameters

- **VRF_INSTANCE** specifies the VRF instance.
  - default Instance is created in the default VRF.
  - vrf_name Instance is created in the specified user-defined VRF.

Example

- This command creates a VRF named management-vrf and places the switch in VRF configuration mode for the server.

```
switch(config)#management xmpp
switch(config-mgmt-xmpp)#vrf management-vrf
switch(config-mgmt-xmpp)
```
The `xmpp send` command can be used to connect to the XMPP server and send messages to switches or switch groups within the network.

Before switches can send messages to each other, they must friend each other. An easy way to have them auto friend each other is to have them join the same chat room. The friendship between switches can be verified by using the `show xmpp neighbor` command.

**Command Mode**
Privileged EXEC

**Command Syntax**
```
xmpp send to neighbor XMIT_TYPE content
```

**Parameters**
- `neighbor` Options include switches or switch groups within the network that are connected as friends in a chat room.
- `XMIT_TYPE` Transmission type. Valid options include:
  - `command` Sends an XMPP command.
  - `message` Sends an XMPP message.
- `content` The command you want the friends within the chat room to display or execute.

**Configuration Restrictions**
- Only enable-mode commands are allowed within the multi-switch CLI.
- Changing into a different CLI mode and running several commands in that mode is not supported (e.g., into configuration mode)
- An external XMPP client (for example Adium) can be used to send multiple lines within a single message. By sending multiple lines, it is possible to change into another CLI mode. After the message is processed, the switch automatically return to the enable mode.
- Commands that prompt for a response (like `reload`) are not supported.
- Long commands, such as image file copies, may cause the switch XMPP client to momentarily stop responding and disconnect. The switch should reconnect and the long command should complete.
- Many command outputs display in a specific table format. To achieve the same visual feel as through a terminal, use a monospaced font, such as Courier, for the incoming messages.

**Example**
- This command sends the switch in the chat room the request to execute the `show version` command.

```
switch# xmpp send test2 command show version
message from user: test2@test.aristanetworks.com
--------------------
Hardware version: 04.40
Serial number: JFL08432083
System MAC address: 001c.7301.7d69
Software image version: 4.12.3
Architecture: i386
Internal build version: 4.12.3
Internal build ID: f5ab5f57-9c26-4fe4-aaca-fb60fa55d01d
Uptime: 2 hours and 38 minutes
Total memory: 1197548 kB
Free memory: 182452 kB
```
xmpp session

The **xmpp session** command is similar to running SSH from the switch. The user is required to input their username (default is to USER@DEFAULTDOMAIN) and password in order to connect to the XMPP server. This command allows you to interact in the enable mode with a switch or switch group over XMPP using the standard CLI, with access to help and tab completion. All commands are then executed remotely and only the non-empty results are displayed on the screen.

**Command Mode**

Privileged EXEC

**Command Syntax**

```
xmpp session switchgroup
```

**Parameters**

- **switchgroup**  The option includes the switch group within the network that is connected as friends in a chat room.

**Configuration Restrictions**

- Only enable-mode commands are allowed within the multi-switch CLI.
- Changing into a different CLI mode and running several commands in that mode is not supported (e.g., into configuration mode)
- An external XMPP client (for example Adium) can be used to send multiple lines within a single message. By sending multiple lines, it is possible to change into another CLI mode. After the message is processed, the switch automatically return to the enable mode.
- Commands that prompt for a response (like reload) are not supported.
- Long commands, such as image file copies, may cause the switch XMPP client to momentarily stop responding and disconnect. The switch should reconnect and the long command should complete.
- Many command outputs display in a specific table format. To achieve the same visual feel as through a terminal, use a monospaced font, such as Courier, for the incoming messages.

**Example**

- This command displays the status of Ethernet 3 from `test1`, which is a member of the switch group chat room.

```
switch# xmpp session all@test.aristanetworks.com
xmpp-all# show int Eth3 status

response from: test1@test.aristanetworks.com

--------------------------------------------------
Port  Name  Status     Vlan     Duplex  Speed    Type
Et3   bs3   connected  in Po3   a-full  a-1000  10GBASE-SR
switch#
```

Chapter 3

Command-Line Interface

The command-line interface (CLI) is one tool for controlling the switch and displaying information about its status and configuration. This chapter describes the use of the CLI.

This chapter includes these sections:

- Section 3.1: Accessing the EOS CLI
- Section 3.2: Processing Commands
- Section 3.3: Kernel-based Virtual Machine Commands and Configuration
- Section 3.4: Switch Platforms
- Section 3.5: Command Modes
- Section 3.6: Managing Switch Configuration Settings
- Section 3.7: Other Command-Line Interfaces
- Section 3.8: Directory Structure
- Section 3.9: Command-Line Interface Commands

3.1 Accessing the EOS CLI

You can open an EOS CLI session through these connections:

- Ethernet management ports
- console port
- Telnet connections
- Secure Shell (SSH)

Figure 3-1 displays the EOS CLI in a Secure Shell connection.

Figure 3-1: EOS Command-Line Interface
3.2 Processing Commands

3.2.1 Command Execution

Command keywords are not case-sensitive. The CLI also accepts truncated keywords that uniquely correspond to one command.

- The command abbreviation `con` does not execute a command in Privileged EXEC mode because the names of two commands begin with these letters: `configure` and `connect`.
  
  ```
  switch#con
  % Ambiguous command
  ```

- The command abbreviation `conf` executes `configure` in Privileged EXEC mode because no other command name begins with `conf`.
  
  ```
  switch#conf
  switch(config)#
  ```

3.2.2 Alias

The `alias` command creates an alias for a CLI command. Entering the alias in the CLI executes the corresponding command.

Example

- This command makes `srie` an alias for the command `show running-config interface ethernet 1-5`.
  
  ```
  switch(config)#alias srie show running-config interface ethernet 1-5
  switch(config)#srie
  interface Ethernet1
  switchport access vlan 33
  storm-control broadcast level 1
  spanning-tree portfast
  spanning-tree bpduguard enable
  interface Ethernet2
  switchport access vlan 33
  spaning-tree portfast
  interface Ethernet3
  switchport access vlan 33
  spaning-tree portfast
  spaning-tree bpduguard enable
  interface Ethernet4
  interface Ethernet5
  shutdown
  ```

3.2.3 Cursor Movement Keystrokes

EOS supports these cursor movement keystrokes:

- **Ctrl-B** or the **Left Arrow** key: moves cursor to the left.
- **Ctrl-F** or the **Right Arrow** key: moves cursor to the right.
- **Ctrl-A**: moves cursor to beginning of line.
- **Ctrl-E**: moves cursor to end of line.
- **Esc-B**: moves cursor left one word.
- **Esc-F**: moves cursor right one word.
3.2.4 History Substitution Keystrokes

The history buffer retains the last 20 commands entered. History substitution keystrokes that access previously entered commands include:

- **Ctrl-P** or the **Up Arrow** key: Recalls the most recent buffered commands. Repeat to recall older commands.
- **Ctrl-N** or the **Down Arrow** key: Recalls more recent commands after using the **Ctrl-P** or the **Up Arrow**. Repeat to recall newer commands.

The `show history` command in Privileged EXEC mode displays the history buffer contents.

```
switch#show history
en
config
exit
show history
```

3.2.5 Command Lists and Syntax Assistance

EOS CLI uses widely followed conventions for providing command lists and syntax assistance. These conventions are available in all command modes.

- To display all commands available at this level, type a question mark (`?`):

```
switchName>?
clear    Reset functions
connect  Open a terminal connection
default   Set a command to its defaults
disable  Turn off privileged commands
enable    Turn on privileged commands
exit      Exit from the EXEC
logout    Exit from the EXEC
no        Negate a command or set its defaults
ping      Send echo messages
show      Show running system information
ssh       Open ssh connection
tcpdump   Monitor packets with tcpdump
telnet    Open a telnet connection
terminal  Configure the terminal
traceroute Trace route to destination
watch     Execute a command repeatedly
who       Display information about terminal lines
zerotouch ZeroTouch configuration
```

- To display a list of commands beginning with a specific character sequence, type the sequence followed by a question mark.

```
switch#di?
diff    dir   disable
```

- To display a command’s keywords or arguments, type a question mark as an argument.

```
switch>ping ?
WORD    Ping destination address or hostname
ip       IPv4 echo
ipv6     IPv6 echo
mpls     Send echo messages for LSP
vrf      Ping in a VRF
```
The switch accepts an address-mask or CIDR notation (address-prefix) in commands that require an IP address and mask. For example, these commands are processed identically:

```
switch(config)#ip route 0.0.0.0 255.255.255.255 10.1.1.254
switch(config)#ip route 0.0.0.0/32 10.1.1.254
```

The switch accepts an address-wildcard or CIDR notation in commands requiring an IP address and wildcard. Wildcards use zeros to mask portions of the IP address and are found in some protocol configuration statements, including OSPF. The switch processes these commands identically:

```
switch(config-router-ospf)#network 10.255.255.1 0.0.0.255 area 15
switch(config-router-ospf)#network 10.255.255.1/24 area 15
```

### 3.2.6 Regular Expressions

A regular expression is a search pattern composed of symbols, letters and numbers. Some CLI parameters are defined as regular expressions for specifying more expressive search criteria. The switch uses regular expression pattern matching in several BGP commands.

The functionality of a regular expression for an AS-Path varies based on BGP regex asn and string mode configurations in the `ip as-path regex-mode` command.

**Table 3-1** and **Table 3-2** describe the behavior of special characters in asn and string modes respectively.

**Table 3-1  Functionality of Special Characters in ASN Mode**

<table>
<thead>
<tr>
<th>Special Characters</th>
<th>Characters Names</th>
<th>Description</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>^</td>
<td>Caret</td>
<td>Matches the specified expression at the beginning of an input string. Also used to exclude expressions in brackets while matching.</td>
<td>‘^123’ matches ‘123’, ‘123 456’, ‘123 456 789’, and so on; but does not match ‘1234’. ‘[^12]’ matches ‘1’, ‘2’, ‘3’, and so on; but does not match ‘12’.</td>
</tr>
<tr>
<td>*</td>
<td>Asterisk</td>
<td>Matches an entire AS number that appears either zero or more times.</td>
<td>‘200_100<em>_300’ matches ‘200 300’, ‘200 100 300’, ‘200 100 100 300’, and so on. ‘^100</em>$’ matches empty AS path, ‘100’, ‘100 100’, ‘100 100 100’, and so on.</td>
</tr>
<tr>
<td>+</td>
<td>Plus sign</td>
<td>Matches an entire AS number appearing either one or more times.</td>
<td>‘10_20+.30’ matches ‘10 20 30’, ‘10 20 20 30’ and so on; but does not match ‘10 200 30’.</td>
</tr>
<tr>
<td>$</td>
<td>Dollar sign</td>
<td>Matches the specified expression at the end of an input string.</td>
<td>‘1_2_3$’ matches ‘1 2 3’, but does not match ‘1 2 3 4’.</td>
</tr>
<tr>
<td>[]</td>
<td>Brackets</td>
<td>Matches either an AS number, or a range of AS numbers separated by a hyphen.</td>
<td>‘[10_20_30-39]’ matches ‘10’, ‘20’, ‘30’, ‘31’,...‘39’.</td>
</tr>
</tbody>
</table>
### Chapter 3: Command-Line Interface Processing Commands

#### Table 3-2  Functionality of Special Characters in String Mode

<table>
<thead>
<tr>
<th>Special Characters</th>
<th>Characters Names</th>
<th>Description</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>?</td>
<td>Question mark</td>
<td>Matches either zero or one occurrence of the pattern but the previous operand or entire AS number may appear zero or one time.</td>
<td>‘100_200?’ matches ‘100’ and ‘100 200’. ‘100_200?$’ does not match with ‘100 20’.</td>
</tr>
<tr>
<td>I</td>
<td>Pipe</td>
<td>Matches the specified AS number on either side of the vertical bar.</td>
<td>‘6400/6500’ matches either ‘6400’ or ‘6500’.</td>
</tr>
<tr>
<td>()</td>
<td>Parenthesis</td>
<td>Nests specified AS numbers for matching.</td>
<td>‘(^{100(200(300))})$’ matches either ‘100 200’ or ‘100 300’. ‘(^{100_200(300_400)})$’ matches AS path either “100 200” or “300 400”.</td>
</tr>
<tr>
<td>_</td>
<td>Underscore</td>
<td>Matches specified AS numbers that are converted into AS number delimiters.</td>
<td>‘(<em>123_456</em>)’ matches ‘123 456’. ‘(<em>333_444</em>)’ matches ‘111 222 {333 444}’</td>
</tr>
<tr>
<td>.</td>
<td>Period</td>
<td>Matches any single character.</td>
<td>‘1.2’ matches ‘102’.</td>
</tr>
<tr>
<td>^</td>
<td>Caret</td>
<td>Matches the specified expression at the beginning of an input string.</td>
<td>‘(^{123})’ matches ‘123’, ‘1234’, ‘12345’, and so on. It also matches ‘123 456’, ‘123 456 789’, and so on.</td>
</tr>
<tr>
<td>*</td>
<td>Asterisk</td>
<td>Matches either zero or more sequences of the expression preceding the asterisk.</td>
<td>‘(^{5})$’ matches an empty AS path, ‘5’, ‘55’, ‘555’, and so on.</td>
</tr>
<tr>
<td>+</td>
<td>Plus sign</td>
<td>Matches either one or more sequences of the expression preceding the plus sign.</td>
<td>‘5+’ matches to ‘5’, ‘55’, ‘555’, and so on.</td>
</tr>
<tr>
<td>$</td>
<td>Dollar sign</td>
<td>Matches the expression at the end of an input string.</td>
<td>‘123$’ matches ‘123’, but does not match ‘1234’.</td>
</tr>
<tr>
<td>[]</td>
<td>Brackets</td>
<td>Matches either characters or a range of characters separated by a hyphen, within left and right brackets.</td>
<td>[025-7] matches ‘0’, ‘2’, and digits from ‘5’ to ‘7’; but does not match digits from ‘1’, ‘3’, ‘4’, ‘8’, and ‘9’.</td>
</tr>
<tr>
<td>?</td>
<td>Question mark</td>
<td>Matches either zero or one occurrence of the pattern.</td>
<td>‘12?3’ matches ‘13’ and ‘123’.</td>
</tr>
<tr>
<td>I</td>
<td>Pipe</td>
<td>Matches either one of the expressions or expression patterns on either side of the vertical bar.</td>
<td>‘14(36/75)12’ matches either ‘143612’ or ‘147512’; but does not match ‘1412’, ‘14367512’, ‘14363612’ or ‘14757512’.</td>
</tr>
</tbody>
</table>

**Note**

Precede the question mark (?) with Ctrl+V sequence to prevent it from being interpreted as a help command.
3.2.7 Scheduling CLI Commands

The `schedule` command facilitates the periodic execution of the specified CLI command. Command parameters configure the time to start script execution, the interval between consecutive execution instances, the maximum time to execute the script, and the maximum number of files log that needs to be created.

The `schedule config` command sets configuration parameters to the CLI scheduler.

The `show schedule` command lists the commands currently scheduled for periodic execution and displays the summary of the specified scheduled command.

**Examples**

- This command schedules the execution of a script once every 12 hours and the script execution is terminated if it exceeds 40 minutes. When max-log-files is set to zero, the script output is not logged.

  ```bash
  switch# schedule ms_1 interval 720 timeout 40 max-log-files 0 command bash /mnt/flash/myscript.sh
  ```

- This command saves the running configuration contents to a log file every hour, terminates the script execution if it exceeds 30 minutes and creates up to 24 log files.

  ```bash
  switch# schedule backup-test interval 60 max-log-files 24 command show running-config
  ```

- This command allows the switch to concurrently execute up to 2 scheduled commands.

  ```bash
  switch(config)# schedule config max-concurrent-jobs 2
  switch(config)#
  ```
• This command lists the commands that are scheduled for periodic execution.

```
switch(config)#schedule config max-concurrent-jobs 3
switch(config)#show schedule summary
Maximum concurrent jobs 3
Prepend host name to logfile: No
Name            At time     Last    Interval   Timeout   Max     Logfile Location               Status
              (mins)      time     (mins)    log files               -------
------------- ------------- ------- ---------- -------- -------- ------------------------------- ------
technology     now          00:29      60        30      100     flash:schedule/technology/    Success
thelp           12:02:00     00:02      60        40      100     flash:schedule/thelp/          Fail
06/05/2018
```

3.2.8 Running Bash Shell Commands Automatically with Event Handlers

Event handlers execute a Linux Bash shell command in response to a specific system event. An event handler consists of a Bash command, a trigger and a delay; when the trigger event occurs, the action is scheduled to run after delay seconds.

To create an event handler, use the `event-handler` command. This creates a new event handler and places the CLI in event handler configuration mode for that handler. Use the `action bash` command to configure a Bash command to run when the handler is triggered, and the `trigger` command to specify the trigger. Event handlers can be triggered by various events, including:

- system booting
- a change in a specified interface’s operational status or IP address
- a change in the `startup-config` file
- a state change in a virtual machine monitored by VM Tracer

To change the delay period between the trigger and the action, use the `delay` command.

When an action is run, certain information is passed to it through environment variables. For the `boot` trigger, no variables are set. For the `interface` triggers, the following variables are set and passed to the action:

- `$INTF` interface name
- `$OPERSTATE` current operational status of the specified interface
- `$IP-PRIMARY` current primary IP address of the specified interface

To execute more than one Bash command in response to a trigger, create a script containing the desired commands and enter the file path to the script as the argument of the `action bash` command.

To display information about all event handlers or about a specific event handler, use the `show event-handler` command.

The `no event-handler` command deletes an event handler.

Examples

- These commands create an event handler named “eth_4” which will send email to a specified address when there is a change in the operational status of Ethernet interface 4:

```
switch(config)#event-handler eth_4
switch(config-event-eth_4)#action bash email x@yz.com -s "Eth4 $OPERSTATE"
switch(config-event-eth_4)#trigger on-intf ethernet 4 operstatus
switch(config-event-eth_4)#delay 60
switch(config-event-eth_4)#exit
switch(config)#
```
The above handler uses the $OPERSTATE variable to include the current operational state ("linkup" or "linkdown") in the subject of the email. Note that the action will only function if email has been configured on the switch.

- These commands create an event handler named “onStartup” which will execute a user-defined script 60 seconds after the system boots.

```plaintext
switch(config)#event-handler onStartup
switch(config-event-onStartup)#action bash /mnt/flash/startupScript1
switch(config-event-onStartup)#trigger onboot
switch(config-event-onStartup)#delay 60
switch(config-event-onStartup)#exit
switch(config)#
```

The above handler will also be executed on exiting from event-handler configuration mode.

- This command displays information about all event handlers configured on the system.

```plaintext
switch#show event-handler
Event-handler onStartup
Trigger: onBoot delay 60 seconds
Action: /mnt/flash/startupScript1
Last Trigger Activation Time: 1 minutes 51 seconds ago
Total Trigger Activations: 1
Last Action Time: 51 seconds ago
Total Actions: 1
```

- This command deletes the event handler named “onStartup”.

```plaintext
switch(config)#no event-handler onStartup
switch(config)#
```

3.2.9 Running Adverse Drop Counters Monitor with Event Handlers

A monitoring capability for adverse drop counters can be used as a warning that the system is encountering an abnormal condition. The adverse drop counter monitor runs periodically (with a default of 60 seconds) and performs the following actions:

- Reads the values of adverse drop counters.
- Compares each value to the value read in the previous run.
- If counter values increase more than a certain threshold (with a default of 100), it is considered as a threshold violation.
- If any counter has more than a certain number of threshold violations within a specific time window (with a default of 3 violations within 15 minutes) a syslog message is logged.

No configuration is required to enable adverse drop counters monitor with event handlers. It is enabled by default and can be disabled, and can be customized for duration of time window and threshold levels. To customize the delay, polling interval, and condition for width, violation count, and threshold of this event handler, use the `event-handler DropCountersHandler` command. To display details of this event handler, use the `show event-handler DropCountersHandler` command.
Examples

- These commands customize the delay, polling interval, and condition for width, violation count, and threshold of this event handler. Each parameter may be customized separately, with all other parameters remaining unchanged.

  switch(config)#event-handler DropCountersHandler
  switch(config-DropCountersHandler)#action bash DropCounterLog.py -l
  switch(config-DropCountersHandler)#delay 0
  switch(config-DropCountersHandler)#trigger on-counters
  switch(config-DropCountersHandler-counters)#poll interval 60
  switch(config-DropCountersHandler-counters)#condition bashCmd."DropCounterMonitor.py" -w 800" > 0
  switch(config-DropCountersHandler-counters)#condition bashCmd."DropCounterMonitor.py" -c 5" > 0
  switch(config-DropCountersHandler-counters)#condition bashCmd."DropCounterMonitor.py" -t 200" > 0

- This command disables this event handler.

  switch(config)#no event-handler DropCountersHandler
  switch(config)#

- This command displays details of this event-handler.

  switch(config)#show event-handler DropCountersHandler
  Event-handler DropCountersHandler (BUILT-IN)
  Trigger: on-counters delay 0 seconds
  Polling Interval: 60 seconds
  Condition: bashCmd."DropCounterMonitor.py" > 0
  Threshold Time Window: 0 Seconds, Event Count: 1 times
  Action: DropCounterLog.py -l
  Action expected to finish in less than 20 seconds
  Total Polls: 39
  Last Trigger Detection Time: 38 minutes 22 seconds ago
  Total Trigger Detections: 1
  Last Trigger Activation Time: 38 minutes 22 seconds ago
  Total Trigger Activations: 1
  Last Action Time: Never
  Total Actions: 1

  switch(config)#
3.3 **Kernel-based Virtual Machine Commands and Configuration**

Arista’s EOS has leveraged its unmodified Linux kernel, and embraced open source standards-based technology that has brought operating system virtualization to Ethernet switching, utilizing the kernel-based virtual machine (KVM) as follows:

- The hypervisor is the Linux kernel.
- The core virtualization infrastructure is provided by the kernel module.
- The CPU-specific implementation is provided by the processor-specific module (Intel or AMD).
- The generic machine emulator and virtualizer KVM is provided by a Modified Quick Emulator (QEMU), which transforms the Linux kernel into the hypervisor.

The standard Linux kernel is the hypervisor, resulting in changes to the standard kernel (such as memory support and scheduler). Optimizations to these Linux components (such as a new scheduler in the 2.6 kernel) benefit both the hypervisor (host operating system) and Linux guest operating systems. With the kernel acting as the hypervisor, the switch can run other operating systems, such as Windows or Linux.

All components required are pre-installed with the Arista EOS software image, requiring only the download of the image. A few additional configuration steps get the KVM fully operational.

This chapter contains the following sections:

- **Section 3.3.1: KVM Commands**
- **Section 3.3.2: KVM Configuration**

### 3.3.1 KVM Commands

The following table covers KVM commands used throughout the configuration.

**Table 3-3  KVM Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comment</td>
<td>Up to 240 character comment for this mode.</td>
</tr>
<tr>
<td>default</td>
<td>Set a command to its defaults.</td>
</tr>
<tr>
<td>disk-image</td>
<td>Add Virtual Machine disk image.</td>
</tr>
<tr>
<td>enable</td>
<td>Enable VM.</td>
</tr>
<tr>
<td>exit</td>
<td>Exit from Virtual Machine configuration mode.</td>
</tr>
<tr>
<td>memory-size</td>
<td>Set memory size.</td>
</tr>
<tr>
<td>no</td>
<td>Negate a command or set its defaults.</td>
</tr>
<tr>
<td>show</td>
<td>Show running system information.</td>

<tr>
<td>virtual-nic</td>
<td>Add virtual NIC.</td>
</tr>
<tr>
<td>vnc-port</td>
<td>Set VNC server port.</td>
</tr>
<tr>
<td>!</td>
<td>Append to comment</td>
</tr>
</tbody>
</table>

#### 3.3.1.1 CLI Commands

The following KVM CLI commands are used throughout the configuration.
vm

In config mode, the vm CLI command creates or deletes a KVM configuration, or enters config-vm mode. A newly created KVM will have an empty config file path and is disabled.

The CLI command syntax is as follows:

```
[no] vm NAME
```

Note Deleting an enabled KVM first disables it, using the same process as the no enabled command in the config-vm mode.

config-file

In config-vm mode, the config-file CLI command sets the path of the libvirt config file, using standard file syntax (e.g. flash:vm/NetscalerVPX.xml or sata1:vm/NetscalerVPX.xml or /mnt/sata1/vm/NetscalerVPX.xml). Changing this value does not affect the state of a currently enabled KVM. To use the new file, the user must disable and then re-enable the KVM.

The CLI command syntax is as follows:

```
config-file [PATH]
```

Note If the file does not exist, a warning is printed and the new value is stored.

enabled

In config-vm mode, the enabled CLI command allows enabling a currently disabled VM, causing it to start up immediately. If a VM is enabled in the startup-config, it starts up automatically when EOS boots (or when VirtAgent starts).

The CLI command syntax is as follows:

```
[no] enabled
```

Disabling a currently enabled VM initiates a shutdown process in the following sequence:

- Attempt to shut down the VM politely if the guest OS supports ACPI.
- If the VM is still running after 30 seconds, terminate it.

show vm

In enable mode, the show vm CLI command prints information about the configuration and status of a KVM, or of all KVMs if NAME is omitted, as follows:

- Configuration:
  - Name, config file path, and enabled.
- Status:
  - PID, log file path, and serial console pty path.
- Current resource usage:
  - RES, CPU%
- (Detailed only) contents of the config file.
- ( Detailed only) contents of the log file.

The CLI command syntax is as follows:

```
show vm [detailed] [NAME]
```
**attach vm**

In **enable** mode, the **attach vm** CLI command connects to a KVM's serial console pty (using **virsh** console).

**Note**

Press `Ctrl-]` to exit to the CLI.

The **CLI command syntax is as follows:**

```
attach vm [NAME]
```

**show tech-support**

The **CLI command syntax is as follows:**

```
show tech-support [detailed] [NAME]
```

**reload**

In **enable** mode, the **reload** CLI command is executed before restarting the system, and will shut down currently enabled KVMs using the same process as the **no enabled** command in **config-vm** mode.

The CLI command syntax is as follows:

```
reload
```

### 3.3.2 KVM Configuration

Arista EOS enables kernel-based virtual machine (KVM) instances by running KVM on the control-plane CPU of the switch. KVM instances can be defined from the CLI.

To configure a KVM, you must download the virtual machine image and configure the EOS.

This section contains the following topics:

- Section 3.3.2.1: Configuring a KVM
- Section 3.3.2.2: Configuring a Guest KVM

#### 3.3.2.1 Configuring a KVM

To configure a KVM, perform the following steps:

**Step 1** Download the Virtual Machine Image to `/mnt/flash`

**Step 2** Name the virtual machine:

```
switch(config)#virtual-machine [kvm_name]
```

Example:

```
switch(config)#virtual-machine foo
```

**Step 3** Provide a pointer to the image:

```
switch(config-vm-foo)#disk-image [file:[path] image-format [format]
```

Example:

```
disk-image file:/mnt/flash/fedora.img image-format qcow2
```

**Step 4** Define the amount of memory allocated:

```
switch(config-vm-foo)#memory-size [size in bytes]
```

**Step 5** Bind the virtual NIC to an SVI (or management interface):

```
switch(config-vm-foo)#virtual-nic 1 vlan [1-4]
```

```
switch(config-vm-foo)#virtual-nic 1 management [1-4]
```
Step 6  Create the VNC server's tcp port (display):
  switch(config-vm-foo)#vnc-port [vnc-port number]

Step 7  Enable the virtual machine:
  switch(config-vm-foo)#enable

Optionally attach to the virtual machine via VNC client pointed to the switch's IP address. However, if Kernel hair-pinning is currently not enabled, preventing communication directly with the local switch, all traffic must have a destination on another networked device (such as a router, switch, or server).

**Note**

In the Real VNC Viewer for Options, Expert, and ColorLevel, if the default value is `pal8`, establishing a session may fail. If this occurs, set this value to `full` and reconnect.

---

3.3.2.2 Configuring a Guest KVM

To configure a guest KVM, perform the following steps:

**Step 1**  Download the Virtual Machine Image to `/mnt/flash`

**Step 2**  Name the virtual machine:
  switch(config)#virtual-machine [guest_name]

  **Example:**
  switch(config)#virtual-machine guest123

**Step 3**  Provide a pointer to the image:
  switch(config-vm-guest123)#disk-image [file:[path] image-format [format]

  **Example:**
  switch(config-vm-guest123)#disk-image file:/mnt/flash/fedora.img image-format qcow2

**Step 4**  Define the amount of memory allocated:
  switch(config-vm-guest123)#memory-size [size in bytes]
Step 5  Bind the virtual NIC to an SVI (or management interface):
switch(config-vm-guest123)#virtual-nic 1 vlan [1-4]
switch(config-vm-guest123)#virtual-nic 2 management [1-4]

Step 6  Create the VNC server’s tcp port (display):
switch(config-vm-guest123)#vnc-port [vnc-port number]

Step 7  Enable the virtual machine:
switch(config-vm-guest123)#enable
Example

```plaintext
switch#copy http://berrange.fedorapeople.org/images/2012-02-29/f16-x86_64-openstack-sda.qcow2
(http://berrange.fedorapeople.org/images/2012-02-29/f16-x86_64-openstack-sda.qcow2) flash:
...
switch#config terminal
switch(config)#virtual-machine ?
  WORD Virtual Machine name
switch(config)#virtual-machine foo
switch(config-vm-foo)#disk-image flash:f16-x86_64-openstack-sda.qcow2

switch(config-vm-foo)#disk-image flash:f16-x86_64-openstack-sda.qcow2
image-format qcow2
switch(config-vm-foo)#memory-size 1024
switch(config-vm-foo)#virtual-nic ?
  <1-4>         Virtual NIC Id
switch(config-vm-foo)#virtual-nic 1 ?
  Management    Management interface
  Vlan          Vlan interface
switch(config-vm-foo)#virtual-nic 1 vlan 1
switch(config-vm-foo)#virtual-nic 2 management 1
switch(config-vm-foo)#enable
switch(config-vm-foo)#
switch(config-vm-foo)#^Z
switch(config-vm-foo)#write mem
switch(config-vm-foo)#
switch#write mem
switch#show virtual-machine detail
Virtual Machine: foo
  Enabled:    Yes
  State:      Running
  Disk Image: /mnt/flash/f16-x86_64-openstack-sda.qcow2
  Disk Image Format: qcow2
  Memory Size: 1024MB
  VNC port: 5900
  Virtual Nic: vnic1
    Mac Address: 52:54:00:ee:11:c9
    Device: Vlan1
    Model Type: e1000
  Virtual Nic: vnic2
    Mac Address: 52:54:00:df:2a:e1
    Device: Management1
    Model Type: e1000
switch#
```

Note

Once a Guest KVM has its configuration setup correctly, it can have virtual NIC connections in VLANs (inband), or on out-of-band management interfaces.
3.4 Switch Platforms

Features and CLI commands vary by switch platform. CLI options may also vary by switch platform for commands that are available on all platforms. Command descriptions in this manual describe feature availability and command parameters on the basis of switch platform, noting exceptions that exist among models that use a common platform.

These sections describe the following topics:

- Section 3.4.1: Viewing the Model Number
- Section 3.4.2: Determining a Switch’s Operating Platform
- Section 3.4.3: Modular System Platforms – 7500 and 7500E Series Switches
- Section 3.4.4: Viewing Modules on 7300 Series Modular Switches
- Section 3.4.5: Multi-Chip Devices

3.4.1 Viewing the Model Number

To view the switch’s model number through the CLI, enter `show version`.

**Example**

- This command displays the model number, serial number, system MAC address, and manufacturing information of a DCS-7150S-64 switch.

  ```
  switch>show version
  Arista DCS-7150S-64-CL-F
  Hardware version: 01.01
  Serial number: JPE13120819
  System MAC address: 001c.7326.fd0c

  Software image version: 4.13.2F
  Architecture: i386
  Internal build version: 4.13.2F-1649184.4132F.2
  Internal build ID: eeb3c212-b4bd-4c19-ba34-1b0aa36e43f1

  Uptime: 16 hours and 39 minutes
  Total memory: 4017088 kB
  Free memory: 1348228 kB
  switch>
  ```

3.4.2 Determining a Switch’s Operating Platform

**FM6000 Platforms**

To determine the operating platform on switch, display `platform` command options from Global Configuration command mode.
Chapter 3: Command-Line Interface

Switch Platforms

- This command displays the operating platform of a switch operating on the FM6000 platform (7150 Series switches).

  switch(config)#platform ?
  fm6000 FM6000 chip

  switch(config)#platform

Arad and Petra Platforms

The `platform ?` command displays the same options on Arad and Petra platform switches. Refer to Section 3.4.1 to determine the switch's model number.

- Fixed system switches (DCS-7048 Series) operate on the Petra platform.
- Modular switches (DCS-7500 Series) operate on Arad and Petra platforms. Section 3.4.3: Modular System Platforms – 7500 and 7500E Series Switches describe platform usage on these switches.

Arad and Petra platform switch typically utilize multiple chips. Section 3.4.5 describe methods of determining the port distribution on multi-chip platforms.

Example

- These commands display platform options of a switch operating on either Petra or Arad platforms.

  switch(config)#platform ?
  arad    Arad switch chip
  fe1600  Fe1600 chip
  fe600   Fe600 fabric chip
  petraA  PetraA switch chip
  ptp     Precision Time Protocol
  sand    Sand platform

  switch(config)#platform

Trident and Trident II Platforms

The `platform ?` command returns `trident` on switches that operate on Trident or Trident II platforms. Trident II platform switches include options that configure the forwarding and routing tables. To determine the Trident platform that a switch uses, display `platform trident` options.

- These commands indicate that the switch is operating on the Trident II platform:

  switch(config)#platform trident ?
  fabric    Fabric configuration
  forwarding-table    Forwarding table configuration
  mmu        Trident MMU configuration
  routing-table    Routing table configuration

  switch(config)#platform trident

Fixed and Modular switches are available that operate on the Trident II platform. Refer to Section 3.4.1 to determine the switch's model number. Section 3.4.4: Viewing Modules on 7300 Series Modular Switches displays the modules on a Trident II platform modular switch.

Trident II platform switches typically utilize multiple chips. Section 3.4.5 describe methods of determining port distribution on multi-chip platforms.
3.4.3 Modular System Platforms – 7500 and 7500E Series Switches

Modular switch platforms depend on their installed modules along with the fabric and forwarding software modes. The `show module` command displays the fabric modules in the switch. System performance in switches containing both module types is based on first-generation fabric capabilities. Best practice is to avoid switch configurations with mixed fabric modules.

These sections describe modular switch components and software modes that program their capacities.

3.4.3.1 Fabric Modules and Fabric Mode – 7500 and 7500E Series Switches

Each modular switch fabric module is categorized as first-generation or E-Series:

- First-generation fabric modules support all basic switch functions.
- E-Series fabric modules support faster fabric link speeds, greater internal table capacities, and advanced encoding formatting.

Fabric mode determines the switch’s fabric performance capabilities. This mode must match the fabric modules in the switch. Fabric mode settings include:

- **fe600**: Supports first-generation fabric modules.
- **fe1600**: Supports E-Series fabric modules.

E-series fabric modules can operate in **fe600** mode, but are limited to first-generation fabric performance. First-generation modules cannot operate in **fe1600** mode. Switches containing both types of modules must be set to **fe600** mode. Best practice is to avoid switch configurations with mixed fabric modules.

When a switch reloads, fabric mode is determined by the following (in order of precedence):

**Step 1** Switches reloading in **petraA** forwarding compatibility mode (Section 3.4.3.2) also reload in **fe600** fabric mode.

**Step 2** As specified by the `platform sand fabric mode` (7500 and 7500E Series) statement in `running-config`.

**Step 3** The first fabric module that becomes operational as the switch reloads.

In switches with a homogeneous module set, the fabric mode matches its fabric modules. Switches with a mixed set of modules are typically reloaded in **fe600** mode because first generation modules are usually operational before E-Series modules. However, the fabric mode in mixed module switches that are reloading cannot be guaranteed in the absence of the first two conditions.

**Example**

- This command configures the switch to reload in **fe1600** fabric mode to support E-series fabric modules. After issuing this command, the switch should be reset only after exchanging all switch fabric modules to E-series modules.

```
switch(config)#platform sand fabric mode fe1600
switch(config)#exit
switch#show platform sand compatibility
Configuration   Status
Forwarding mode None     Arad
Fabric mode    Fe1600     Fe600
switch#
```
3.4.3.2 Linecard Modules and Forwarding Compatibility Mode – 7500 and 7500E Series

Each modular switch linecard module is categorized as first-generation or E-Series:

- First-generation linecard modules support all basic switch functions.
- E-Series linecard modules support provide faster data processing, greater internal table capacities, and advanced encoding formatting.

The forwarding compatibility mode determines the switch’s performance capabilities when forwarding data between linecard interfaces. Forwarding compatibility mode settings include:

- **PetraA**: Supports first-generation linecard modules.
- **Arad**: Supports E-Series linecard modules.

Forwarding compatibility mode determines the operational capacity of installed linecards. Table 3-4 lists the affect of the forwarding compatibility mode on linecard module types.

Table 3-4 Linecard Module and Forwarding Mode Performance

<table>
<thead>
<tr>
<th>Linecard Module Type</th>
<th>Forwarding Compatibility Mode</th>
<th>Linecard Operating Capacity</th>
</tr>
</thead>
<tbody>
<tr>
<td>First-generation</td>
<td>petraA</td>
<td>First-generation performance capacity.</td>
</tr>
<tr>
<td>First-generation</td>
<td>arad</td>
<td>Linecard is powered-down.</td>
</tr>
<tr>
<td>E-Series</td>
<td>petraA</td>
<td>First-generation performance capacity.</td>
</tr>
<tr>
<td>E-Series</td>
<td>arad</td>
<td>E-series performance capacity.</td>
</tr>
</tbody>
</table>

**Important!** Switches must contain E-Series fabric modules to operate at E-Series performance capacities.

The forwarding compatibility mode is configured by the *platform sand forwarding mode (7500 and 7500E Series)* command. This command may be required after exchanging a linecard for a different module type or in switches containing first-generation and E-series linecards.

Without a *platform sand forwarding mode* command, forwarding compatibility mode is determined by the first linecard that is operational after reloading the switch. In a switch that is reloaded with a homogeneous module set, forwarding compatibility mode matches its linecards. Switches with a mixed set of modules are typically reloaded in *petraA* mode because first generation modules are usually operational before E-Series modules. However, forwarding compatibility mode in mixed module switches that are reloading is not guaranteed without a *platform sand forwarding mode* command.

**Example**

- This command changes the forwarding software mode to support E-series linecard modules. This command should be run only after exchanging all linecards to E-series modules.

  switch(config)#platform sand forwarding mode arad
  switch(config)#

3.4.3.3 Viewing Modules – 7500 and 7500E Series

The *show module* command displays the model number of all installed modules.
This command displays the modules of a 7504 switch that contains first-generation modules.

```
switch> show module
```

3.4.5 Multi-Chip Devices

Trident II, Petra, and Arad platform switches and linecards utilize multiple chips, with Ethernet ports evenly distributed among the chips. Creating multi-port data structures (including port channels) that include ports from multiple chips protects against the failure of an individual chip on a device.

The following sections describe methods of determining port distribution on various switch platforms.

**Petra Fixed Switches**

7048-Series switches are Petra platform devices that distribute ports among two PetraA chips. The `show platform petraA port-info routing` command displays the ports that are controlled by each chip.

**Example**

- This command displays the following Ethernet port distribution on a DCS-7048-T switch:
  - Petra0 chip controls Ethernet 1 through Ethernet 32
• Petra1 chip controls Ethernet 33 through Ethernet 52

```
switch# show platform petraA port-info routing

Petra Modular Switches

Linecards on 7500-Series modular switches distribute Ethernet ports among multiple petraA chips. The `show platform petraA port-info routing` command displays the ports that are controlled by each chip on all PetraA linecards or on a single linecard.

**Example**

• This command displays the following Ethernet port distribution on linecard 4 of a DCS-7504 switch:
  • Petra4/0 chip controls Ethernet 4/1 through Ethernet 4/8
  • Petra4/1 chip controls Ethernet 4/9 through Ethernet 4/16
  • Petra4/2 chip controls Ethernet 4/17 through Ethernet 4/24
  • Petra4/3 chip controls Ethernet 4/25 through Ethernet 4/32
  • Petra4/4 chip controls Ethernet 4/33 through Ethernet 4/40
• Petra4/5 chip controls Ethernet 4/41 through Ethernet 4/48

Arad Modular Switches

7500-E Series linecards distribute Ethernet ports among multiple Arad chips. The `show platform arad port-info routing` command displays the ports that are controlled by each chip on all Arad linecards.

Example

• This command displays the following Ethernet port distribution on the 7500E-72S-LC linecard that is inserted as module 3 in a DCS-7508E switch:
  • Arad3/0 chip: Ethernet 3/1– Ethernet 3/20

```

Trident II Fixed Switches

Trident II platform devices distribute their ports among multiple Trident II chips. The `show platform trident system port` command displays the ports that are controlled by each chip.

Example
- This command displays the following Ethernet port distribution on a DCS-7250QX-64-F switch:
  - Trident 0 chip controls Ethernet 1/1 through Ethernet 16/4
  - Trident 1 chip controls Ethernet 17/1 through Ethernet 32/4
  - Trident 2 chip controls Ethernet 33/1 through Ethernet 48/4
  - Trident 3 chip controls Ethernet 49/1 through Ethernet 64/4

Trident II Modular Switches

Linecards on 7300-Series modular switches distribute Ethernet ports among multiple Trident II chips. The `show platform trident system port` command can display the ports that are controlled by each chip on all linecards or on a single chip.

- This command displays the following Ethernet port distribution on DCS-7304-F switch that contains a 7300X-32Q-LC linecard as module 3:
  - Trident 0 chip controls Ethernet 1/1 through Ethernet 16/4 (on module 3)
- Trident 1 chip controls Ethernet 17/1 through Ethernet 32/4 (on module 3)

```
switch# show platform trident system port

Port Intf              Chip       ModId       Logical       Physical    MMU
-----------------------------------------------
Ethernet3/1/1       Linecard3/0           5             1             17      4
Ethernet3/2/1       Linecard3/0           5             2             21      5
Ethernet3/16/3      Linecard3/0           5            51            111    102
Ethernet3/16/4      Linecard3/0           5            52            112    103
Ethernet3/32/3      Linecard3/1           6            63            111    102
Ethernet3/32/4      Linecard3/1           6            64            112    103
```

switch#
```
3.5 Command Modes

Command modes define the user interface state. Each mode is associated with commands that perform a specific set of network configuration and monitoring tasks.

- **Section 3.5.1: Mode Types** lists the available modes.
- **Section 3.5.2: Navigating Through Command Modes** lists mode entry and exit commands.
- **Section 3.5.3: Command Mode Hierarchy** describes the mode structure.
- **Section 3.5.4: Group-Change Configuration Modes** describes editing aspects of these modes.

3.5.1 Mode Types

The switch includes these command modes:

- **EXEC**: EXEC mode commands display system information, perform basic tests, connect to remote devices, and change terminal settings. When logging into EOS, you enter EXEC mode.
  
  EXEC mode prompt: `switch>`

- **Privileged EXEC**: Privileged EXEC mode commands configure operating and global parameters. The list of Privileged EXEC commands is a superset of the EXEC command set. You can configure EOS to require password access to enter Privileged EXEC from EXEC mode.
  
  Privileged EXEC mode prompt: `switch#`

- **Global Configuration**: Global Configuration mode commands configure features that affect the entire system, such as system time or the switch name.
  
  Global Configuration mode prompt: `switch(config)#`

- **Interface Configuration**: Interface configuration mode commands configure or enable Ethernet, VLAN, and Port-Channel interface features.
  
  Interface Configuration mode prompt: `switch(config-if-Et24)#`

- **Protocol specific mode**: Protocol specific mode commands modify global protocol settings. Protocol specific mode examples include **ACL Configuration** and **Router BGP Configuration**.

  The prompt indicates the active command mode. For example, the Router BGP command prompt is `switch(config-router-bgp)#`

3.5.2 Navigating Through Command Modes

To change the active command mode, perform one of these actions:

- To enter EXEC mode, log into the switch.
- To enter Privileged EXEC mode from EXEC, type `enable` (or `en`) followed, if prompted, by the enable password:

  ```
  switch>en
  Password:
  switch#
  ```

- To enter Global Configuration mode from Privileged EXEC, type `configure` (or `config`):

  ```
  switch#config
  switch(config)#
  ```

**Note**: EOS supports `copy <url> running-config` in place of the `configure network` command.
• To enter Interface Configuration mode from Global Configuration, type `interface` and the name of the interface to be modified:
  switch(config)#interface Et24
  switch(config-if-Et24)#

• To enter a protocol specific configuration mode from Global Configuration, type the required command for the desired mode.
  switch(config)#router bgp 100
  switch(config-router-bgp)#

• To return one level from any configuration mode, type `exit`.
  switch(config)#exit
  switch#

• To return to Privileged EXEC mode from any configuration mode, type `end` or `Ctrl-Z`.
  switch(config-if-Et24)#<Ctrl-z>
  switch#

• To return to EXEC mode from Privileged EXEC mode, type `disable` (or `dis`).
  switch#dis
  switch>

• To exit EOS and log out of the CLI, type `exit` from EXEC mode or Privileged EXEC mode.
  switch#exit
  login:

### 3.5.3 Command Mode Hierarchy

Command modes are hierarchical. The parent mode of a specified command mode is the mode that contains the command that enters the specified mode.

**Example**

• EXEC mode contains the `enable` command, which enters Privileged EXEC mode. Therefore, EXEC is the parent mode of Privileged EXEC.

Commands that are executable in a specified command mode include all commands available in the specified mode plus all commands executable from its parent mode.

**Example**

• EXEC mode includes the `ping` command. EXEC mode is the parent mode of Privileged EXEC mode. Therefore, Privileged EXEC mode includes `ping`.

  Additionally, Privileged EXEC is the parent mode of Global Configuration mode. Therefore, Global Configuration mode also includes `ping`.

Executing a configuration mode command from a child mode may change the active command mode.

**Example**

• Global Configuration mode contains `interface ethernet` and `ip access-list` commands, which enter Interface Configuration and Access Control List (ACL) Configuration modes, respectively. When the switch is in Interface Configuration mode, the `ip access-list` command is available and changes the active mode to ACL Configuration.
  switch(config)#interface ethernet 1
  switch(config-if-Et1)#ip access-list master-list
  switch(config-acl-master-list)#
The `exit` command changes the active command mode to its parent mode. When executed from Privileged EXEC or EXEC modes, the exit command terminates the session.

**Example**

- This command exits Global Configuration mode to Privileged EXEC mode.
  ```
  switch(config)#exit
  switch#
  ```
- This command terminates the user session.
  ```
  switch#exit
  ```

### 3.5.4 Group-Change Configuration Modes

Group-change modes apply all changes made during an edit session only after exiting the mode. Changes are stored when the user exits the mode, either through an `exit` or `end` command or through a command that enters a different configuration mode.

The `abort` command discards all changes not previously applied.

Access Control List (ACL) and Multiple Spanning Tree (MST) configuration modes are examples of group-change modes.
### 3.6 Managing Switch Configuration Settings

#### 3.6.1 Verifying the Running Configuration Settings

`running-config` is the virtual file that stores the operating configuration. The `show running-config` command displays the `running-config`. The command is supported in Privileged EXEC mode.

**Example**

- Type `show running-config` in Privileged EXEC mode. The response in the example is truncated to display only the ip route configured.

  ```
  switch#show running-config
  ! Command: show running-config
  ! <--------OUTPUT OMITTED FROM EXAMPLE-------->
  !
  ip route 0.0.0.0/0 192.0.2.1
  !
  <--------OUTPUT OMITTED FROM EXAMPLE-------->
  end
  switch#
  ```

#### 3.6.2 Verifying Settings for the Current Mode

To display only the lines of `running-config` that affect the current mode, use the `active` option of the `show (various configuration modes)` command. This command option is available in all configuration modes except global configuration.

**Example**

- Type `show active` to display the content of `running-config` that affects the current mode. To include default settings in the display, type `show active all`.

  ```
  switch(config-router-ospf3)#show active all
  ipv6 router ospf 9
    router-id 0.0.0.0
    default-metric 10
    distance ospf intra-area 10
    area 0.0.0.200 default-cost 10
    area 0.0.0.200
    no log-adjacency-changes
    timers spf 5
  switch(config-router-ospf3)#
  ```

To display any comments associated with the current mode, use the `comment` option of the `show (various configuration modes)` command.

**Example**

- Type `show comment` to display any comments attached to the current mode.

  ```
  switch(config-router-ospf3)#show comment
  Comment for router-ospf3:
    Consult Thomas Morton before making changes to the OSPF configuration.
  switch(config-router-ospf3)#
  ```
3.6.3 Adding a Comment to a Configuration Mode

To add a comment to most switch configuration modes, use the `comment (various configuration modes)` command. Comments cannot be modified, but can be replaced by entering the `comment` command again and entering new text. Comments cannot be added to global configuration mode.

To append to an existing comment, enter `!!` followed by additional comment text. To display comments for the active mode, use the `show comment` command. The `no comment` and `default comment` commands remove the comment from `running-config`.

Examples

- These commands enter a comment in Router OSPF3 Mode.
  
  ```
  switch(config-router-ospf3)#comment
  Enter TEXT message. Type 'EOF' on its own line to end.
  Consult Thomas Morton before making changes to the OSPF configuration.
  EOF
  switch(config-router-ospf3)#
  ```

- These commands append additional information to the comment entered above.
  
  ```
  switch(config-router-ospf3)#!! x2735
  switch(config-router-ospf3)#show comment
  Comment for router-ospf3:
  Consult Thomas Morton before making changes to the OSPF configuration.
  x2735
  switch(config-router-ospf3)#
  ```

3.6.4 Saving the Running Configuration Settings

`startup-config` is the file, stored in internal flash memory, that the switch loads when it boots. Configuration changes that are not saved to `startup-config` are lost the next time the switch is booted.

The `write` and `copy running-config startup-config` commands store the operating configuration to `startup-config`. Both commands are supported in Privileged EXEC mode.

Example

- These equivalent commands save the current operating configure to the startup-config file.
  
  ```
  switch#write
  switch#copy running-config startup-config
  ```

The `show startup-config` command displays the startup configuration file. The command is supported in Privileged EXEC mode.
Example

- Type `show startup-config` to display the startup configuration file. The response in the example is truncated to display only the ip route configured in Admin Username.

```
switch#show startup-config
! Command: show startup-config
! Startup-config last modified at  Wed Feb 19 08:34:31 2014 by admin
!

  <--------OUTPUT OMITTED FROM EXAMPLE-------->
!
ip route 0.0.0.0/0 192.0.2.1
!
  <--------OUTPUT OMITTED FROM EXAMPLE-------->
end
switch#
```
3.7 Other Command-Line Interfaces

EOS can access other CLIs that provide switch commands, files, and services.

- **Section 3.7.1: Aboot Command-Line Interface** describes the boot-loader CLI
- **Section 3.7.2: Bash Shell** describes the Bash shell CLI.

3.7.1 Aboot Command-Line Interface

Aboot is the switch boot loader. It reads a configuration file from the internal flash or a USB flash drive and attempts to boot a software image. The switch opens an Aboot shell if the switch does not find a software image, the configuration is corrupted, or the user terminates the boot process. The Aboot shell provides a CLI for manually booting a software image, recovering the internal flash to its default factory state, running hardware diagnostics, and managing files.

3.7.2 Bash Shell

The switch provides a Linux Bash shell for accessing the underlying Linux operating system and extensions. The Bash shell is accessible in all command modes except EXEC. **Section 3.5.1: Mode Types** describes EOC command modes.

- **To enter the Bash**, type `bash` at the prompt.
  
  switch#bash

  Arista Networks EOS shell

  [admin@Switch ~]$ 

- **To exit the Bash**, type `logout`, `exit`, or `Ctrl-D` at the Bash prompt.
  
  [admin@Switch ~]$ logout

  switch#
3.8 Directory Structure

EOS operates from a flash drive root mounted as the /mnt/flash directory on the switch. The EOS CLI supports these file and directory commands:

- **delete**: Delete a file or directory tree.
- **copy**: Copy a file.
- **more**: Display the file contents.
- **diff**: Compares the contents of files located at specified URLs.
- **rename**: Rename a file
- **cd**: Change the current working directory.
- **dir**: Lists directory contents, including files and subdirectories.
- **mkdir**: Create a directory.
- **rmdir**: Remove a directory.
- **pwd**: Display the current working directory.

Verify flash memory space before copying a file. When a file is copied to flash, it is first written to a temporary file and then renamed to the destination rather than directly overwriting the destination file. This protects the integrity of the existing file if the **copy** command is interrupted, but requires more free space to complete the process.

Switch directory files are accessible through the Bash shell and Aboot. When entering the Bash shell from the switch, the working directory is located in /home and has the name of the user name from which Bash was entered.

**Example**

- These commands were entered from the user name john:

  ```
  switch#bash
  [john@switch ~]$ pwd
  /home/john
  [john@switch ~]$
  
  In this instance, the working directory is /home/john
  ```

When a flash drive is inserted in the USB flash port, flash drive contents are accessible through /mnt/usb1.

When entering Aboot, the working directory is the root directory of the boot.
3.9 Command-Line Interface Commands

Mode Navigation Commands
- alias
- bash
- configure (configure terminal)
- configure network
- copy running-config
- daemon
- disable
- enable
- end
- exit

File Transfer Commands
- ip ftp client source-interface
- ip http client local-interface
- ip ssh client source-interface
- ip tftp client source-interface

File Management Commands
- copy running-config
- dir
- pwd

Modular Switch Platform Commands
- platform arad lag mode
- platform arad lag mode
- platform sand fabric mode (7500 and 7500E Series)
- platform sand forwarding mode (7500 and 7500E Series)
- platform sand lag hardware-only
- show platform sand compatibility
- show platform sand lag hardware-only

CLI Scheduling Commands
- schedule
- schedule config
- show schedule

Event Handler Commands
- action bash
- delay
- event-handler
- event-handler DropCountersHandler
- show event-handler
- show event-handler DropCountersHandler
- trigger

Terminal Parameter Commands
- terminal length
- terminal monitor
Display and Comment Commands

- comment (various configuration modes)
- show (various configuration modes)
- show module
- show version
action bash

The action bash command specifies a Bash shell command to be run when an event handler is triggered. When an event handler is triggered, execution of the associated shell command is delayed by a configurable period set by the delay command. Only a single Bash command may be configured for an event handler, but the command may have multiple arguments. If more than one Bash command must be executed in response to a trigger, create a script containing the desired commands and enter the file path to the script as the argument of the action bash command.

To specify the event that will trigger the action, use the trigger command.

If the event handler uses an on-intf trigger, the following environment variables are passed to the action and can be used as arguments to the Bash command:

- $INTF    interface name.
- $OPERSTATE    current operational status of the specified interface.
- $IP-PRIMARY    current primary IP address of the specified interface.

Command Mode
Event-Handler Configuration

Command Syntax
action bash command

Parameters
- command    Bash shell command to be executed when the event handler is triggered.

Example
- This command configures the event handler “onStartup” to run a script on the flash drive.
  
  switch(config-handler-onStartup)#action bash /mnt/flash/myScript1
  
- This command configures the event handler “eth_4” to send email to the specified address when there is a change in the operational status of Ethernet interface 4.
  
  switch(config-event-eth_4)#action bash email x@yz.com -s "Et4 $OPERSTATE"

The above action uses the $OPERSTATE variable to include the current operational state (“linkup” or “linkdown”) in the subject of the email. Note that the action will only function if email has been configured on the switch.
alias

The alias command creates an alias for a CLI command. Entering the alias in the CLI executes the corresponding command. Once created, an alias is accessible in all modes and all user sessions, but is subject to all the restrictions of the original command.

When using a command alias, no tokens may precede the alias except the no and default keywords. However, an alias can incorporate positional parameters.

In online help, aliases are preceded by an asterisk (*) in this format:

*alias_name=command_name

The no alias and default alias commands remove the specified alias.

Command Mode

Global Configuration

Command Syntax

```
alias alias_name command_name
no alias alias_name
default alias alias_name
```

Parameters

- **alias_name** the string which is to be substituted for the original command. The string can include letters, numbers, and punctuation, but no spaces. If the alias_name string is identical to an existing command, the alias will supercede the original command.

- **command_name** the command which is to be executed when the alias is entered in the CLI. If the original command requires additional parameters, they must be included in the command_name string in the following manner:

  Positional parameters are of the form "%n" and must be whitespace-delimited. The first parameter is represented by "%1" and any additional parameters must be numbered sequentially. When executing the alias a value must be entered for each parameter or the CLI will display the error "% incomplete command".

Examples

- This command makes e an alias for the command enable.

  ```
  switch(config)#alias e enable
  ```

- This command makes srie an alias for the command show running-config interface ethernet 1-6.

  ```
  switch(config)#alias srie show running-config interface ethernet 1-6
  ```

- These commands make ss an alias for the command show interfaces ethernet <range> status with a positional parameter for the port range, then use the alias to display the status of ports 4/1-4/5.

  ```
  switch(config)#alias ss show interfaces ethernet %1 status
  switch(config)#ss 4/1-4/5
  ```

</tbody>
</table>
The `bash` command starts the Linux Bash shell. The Bash shell gives you access to the underlying Linux operating system and system extensions.

To exit the Bash, type `logout`, `exit`, or Ctrl-D at the Bash prompt.

**Command Mode**
- Privileged EXEC

**Command Syntax**
- `bash`

**Examples**
- This command starts the Bash shell.
  ```
  switch#bash
  Arista Networks EOS shell
  [admin@switch ~]$ 
  ```
- This command, executed within Bash, exits the Bash shell.
  ```
  [admin@switch ~]$ logout
  switch#
  ```
comment (various configuration modes)

The `comment` command adds a comment for the active configuration mode to `running-config`. Comments cannot be modified, but can be replaced by entering the `comment` command again and entering new text. To append to an existing comment, enter `!!` followed by additional comment text. To display comments, use the `comment` option of the `show (various configuration modes)` command.

The `no comment` and `default comment` commands remove the comment from `running-config`. Comments cannot be added to the global configuration mode through the EOS.

**Command Mode**

All configuration modes except Global Configuration

**Command Syntax**

```
comment comment_text EOF
no comment
default comment
!! comment_text
```

**Parameters**

- `comment_text` To create a comment, enter a message when prompted. The message may span multiple lines.
- `EOF` To end a comment, type EOF on its own line (case sensitive) and press `enter`.

**Example**

- This command adds a comment to the active configuration mode.

  ```
  switch(config-sg-radius-RAD-SV1)#comment
  Enter TEXT message. Type 'EOF' on its own line to end.
  Consult Thomas Morton before making changes to the RADIUS configuration.
  EOF
  switch(config-sg-radius-RAD-SV1)#
  ```

- This command appends a line to the comment for the active configuration mode.

  ```
  switch(config-sg-radius-RAD-SV1)##
  x3452
  switch(config-sg-radius-RAD-SV1)#
  ```
configure (configure terminal)

The `configure` command places the switch in the Global Configuration mode to configure features at the system level. You can move to Interface Configuration mode and protocol-specific mode from the Global Configuration mode. The command may also be entered as `configure terminal`.

**Command Mode**
Privileged EXEC

**Command Syntax**

```
configure [terminal]
```

**Example**

- This command places the switch in the Global Configuration mode.

```
switch>enable
switch#configure
switch(config)#
```
configure checkpoint

The configure checkpoint command saves the running configuration to a checkpoint file. This checkpoint file can be used for restoring the current running configuration in future, if required.

**Command Mode**
Privileged EXEC

**Command Syntax**
```plaintext
configure checkpoint {restore checkpoint_name | save [checkpoint_name]}
```

**Parameters**
- `restore checkpoint_name` restores the running configuration from the specified checkpoint file.
- `save checkpoint_name` saves running configuration to the specified checkpoint file.

**Guidelines**
If the filename already exists, EOS overwrites the filename. If the command is entered without a checkpoint name, the switch automatically saves the checkpoint under the name `ckpt-date-number` where `date` is the date in YYYYMMDD format and `number` increments by one for each automatically named checkpoint file.

**Examples**
- This command saves `running-config` to the `ca_test` checkpoint file.
  ```plaintext
  switch#configure checkpoint save ca_test
  ```
- This command restores the `running-config` from the `ca_test` checkpoint file.
  ```plaintext
  switch#configure checkpoint restore ca_test
  ! Preserving static routes. Use 'no ip routing delete-static-routes' to clear them.
  ```
- This command saves `running-config` to the 13Aug2018 checkpoint file. The `dir` command shows the contents of the checkpoint directory.
  ```plaintext
  switch#configure checkpoint save
  switch#dir checkpoint:
  Directory of checkpoint:/
  -rw-  7426 Aug 13 12:00  ckp-20180813-17
  -rw-  7588 Aug 13 12:10  ckp-20180813-18
  -rw-  8499 Aug 13 12:13  ckp-20180813-19
  -rw-  8499 Aug 13 12:13  ckp-20180813-20
  ```
configure convert

The `configure convert` command converts the current configuration syntax to the specified syntax.

**Command Mode**

Privileged EXEC

**Command Syntax**

```
configure convert new-syntax
```

**Parameter**

- `new-syntax` converts `running-config` to the current version of EOS.

**Example**

- This command converts `running-config` to the current version of EOS.

```
switch#configure convert new-syntax
```

**WARNING!**

Converting existing configuration to new syntax will lose backward compatibility. Make sure you won't downgrade to releases that only support the old syntaxes.

Proceed [ y/n ]
configure network

The configure network command is deprecated. Use the copy <url> running-config command to configure the switch from a local file or network location.
**copy running-config**

The current operating configuration of the switch is stored in a virtual file called *running-config*. The `copy running-config` command saves the contents of the *running-config* virtual file to a new location.

**Command Mode**

Privileged EXEC

**Command Syntax**

```
copy running-config DESTINATION
```

**Parameters**

- **DESTINATION**  
  destination for the contents of the *running-config* file. Values include:
  - `startup-config`  
    the configuration file that the switch loads when it boots.
    - The `copy running-config startup-config` and `write` commands are equivalent.
  - `file:`  
    a file in the switch file directory.
  - `flash:`  
    a file in flash memory.
  - `url`  
    any valid URL.

  The `copy running-config url` and `write network url` commands are equivalent.

**Examples**

- This command copies *running-config* to the *startup-config* file.
  ```
  switch#copy running-config startup-config
  switch#
  ```

- This command copies *running-config* to a file called rc20110617 in the dev subdirectory of the switch directory.
  ```
  switch#copy running-config file:dev/rc20110617
  switch#
  ```
daemon

The `daemon` command accesses daemon configuration mode for adding or removing external daemons and scripts, which are then managed by ProcMgr.

The `no daemon` and `default daemon` commands delete the daemon by removing the corresponding `daemon` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
daemon daemon_name
no daemon daemon_name
default daemon daemon_name
```

**Parameters**

- `daemon_name` label that references the daemon configuration mode.

**Examples**

- These commands enters daemon configuration mode and initiates the daemon script.

```
switch(config)#daemon process1
switch(config-daemon-process1)#command process-script -i -m
switch(config-daemon-process1)#
```
delay

The `delay` command specifies the time in seconds the system will delay between a triggering event and the execution of an event handler action. The default delay is 20 seconds.

**Command Mode**

Event-Handler Configuration

**Command Syntax**

```
delay seconds
```

**Parameters**

- `seconds` number of seconds to delay before executing the action. The default is 20.

**Example**

- This command configures the event handler Eth5 to delay 10 seconds before executing.

```
switch(config-handler-Eth5)#delay 10
switch(config-handler-Eth5)#
```
**dir**

The `dir` command displays a list of files on a file system.

**Command Mode**

Privileged EXEC

**Command Syntax**

```
dir [SCOPE][FILE TYPE]
```

**Parameters**

- **SCOPE** the files to display. Options include
  - `<no parameter>` lists normal files in current directory.
  - `/all` list all files, including hidden files
  - `/recursive` list files recursively
- **FILE TYPE** The options include:
  - `<no parameter>` lists undeleted files
  - `all_filesystems` list files on all filesystems including deleted files, undeleted files, and files with errors
  - `extensions` directory or file name
  - `file` directory or file name
  - `flash` directory or file name
  - `supervisor-peer` directory or file name
  - `system` directory or file name
  - `usb1` directory or file name

**Example**

- This command displays the flash directory.
  ```
  switch# dir flash:
  Directory of flash:/
  
  -rwx  293409892   Oct 23 08:55  EOS-4.11.0.swi
  -rwx  221274543   Sep  6 13:37  EOS-4.7.5.swi
  -rwx  271453650   Sep  4 19:13  EOS_4.10.1-SSO.swi
  -rwx     135168  Dec 31  1979  FSCK0000.REC
  -rwx       26   Oct 23 13:51  boot-config
  -rwx      8570   Sep 10 12:22  cfg_sso_mst
  -rwx      5642  Sep 20 10:35  config.reset
drwx      4096   Oct 23 13:59  debug
drwx      4096   Oct 23 13:59  kernel-params
drwx      4096  Sep  6 14:50  schedule
drwx      4096  Sep  6 14:50  schedule
-rwx      5970   Oct 23 13:53  startup-config
  ```

switch#
disable

The disable command exchanges the session’s current command mode with the specified privilege level.

Command Mode
Privileged EXEC

Command Syntax
disable [PRIVILEGE_LEVEL]

Parameters
- **PRIVILEGE_LEVEL**  Session’s new privilege level. Value ranges from 0 to 15. Levels 2 through 15 place the switch in Privileged EXEC mode. Values of 0 or 1 leave the switch in EXEC mode.
  - <no parameter>  Session is assigned default level of 1.
  - <0 to 15>  Specifies session level.

Restrictions
New privilege level must be less than the session’s current level.

Examples
- This command exits Privileged EXEC mode level of 15 to enter EXEC mode level 1.
  
  switch# disable
  switch>
enable

The `enable` command places the switch in Privileged EXEC mode. If an `enable` password is set, the CLI displays a password prompt when a user enters the `enable` command. If the user enters an incorrect password three times, the CLI displays the EXEC mode prompt.

To set a local `enable` password, use the `enable password` command.

**Command Mode**

EXEC

**Command Syntax**

```
enable [PRIVILEGE_LEVEL]
```

**Parameters**

- `PRIVILEGE_LEVEL`  Session’s privilege level. Values range from 0 to 15. Values of 0 or 1 places the switch in EXEC mode. Any level above 1 leaves the switch in Privileged EXEC mode.
  - `<no parameter>`  Session is assigned default level of 15.
  - `<0 to 15>`  Specifies session level.

**Example**

- This command places the switch in Privileged EXEC mode with the default privilege level of 15.

```
switch>enable
switch#
```
The **end** command exits to Privileged Exec mode from any Configuration mode. If the switch is in a group-change mode (such as ACL-Configuration mode or MST-Configuration mode), the **end** command also saves all pending changes made in that mode to *running-config*.

**Command Mode**

All configuration modes

**Command Syntax**

```plaintext
end
```

**Example**

- This command exits to Privileged Exec mode.

  ```plaintext
  switch(config-if-Et25)#end
  switch#
  ```
**event-handler**

An event handler executes a Linux Bash shell command in response to a specific system event. An event handler consists of a Bash command, a trigger and a delay; when the trigger event occurs, the action is scheduled to run after delay seconds.

The event-handler command places the switch in event-handler configuration mode for the specified event handler. If the named event handler does not already exist, this command creates it. Event-handler configuration mode is a group change mode that configures event handlers.

Changes made in a group change mode are saved by leaving the mode through the exit command or by entering another configuration mode.

These commands are available in event-handler configuration mode:

- action bash
- delay
- trigger

The no event-handler and default event-handler commands delete the specified event handler by removing it from running config.

**Command Mode**

Global Configuration

**Command Syntax**

```
  event-handler name
  no event-handler name
  default event-handler name
```

**Parameters**

- **name** name of the event handler to be configured. If the named event handler does not already exist, this command will create it.

**Example**

- This command places the switch in event-handler configuration mode for an event handler called “Eth_5”.

  ```
  switch(config)#event-handler Eth_5
  switch(config-handler-Eth_5)#
  ```
**event-handler DropCountersHandler**

The **event-handler DropCountersHandler** command enables the adverse drop counters monitor with event handlers. The DropCountersHandler event handler is enabled by default, and can be customized for duration of time window and threshold levels.

The **no event-handler DropCountersHandler** command disables the adverse drop counters monitor with event handlers. The **default event-handler DropCountersHandler** command resets the DropCountersHandler event handler to the system default.

**Command Mode**
- Global Configuration

**Command Syntax**
- `event-handler DropCountersHandler`
- `no event-handler DropCountersHandler`
- `default event-handler DropCountersHandler`

**Examples**
- These commands customize the delay, polling interval, and condition for width (-w), violation count (-c), and threshold (-t) of this event handler. Each parameter may be customized separately, with all other parameters remaining unchanged.

```plaintext
switch(config)#event-handler DropCountersHandler
switch(config-DropCountersHandler)#action bash DropCounterLog.py -l
switch(config-DropCountersHandler)#delay 0
switch(config-DropCountersHandler)#trigger on-counters
switch(config-DropCountersHandler-counters)#poll interval 60
switch(config-DropCountersHandler-counters)#condition bashCmd."DropCounterMonitor.py" -w 800" > 0
switch(config-DropCountersHandler-counters)#condition bashCmd."DropCounterMonitor.py" -c 5" > 0
switch(config-DropCountersHandler-counters)#condition bashCmd."DropCounterMonitor.py" -t 200" > 0
```

- This command disables this event handler.

```plaintext
switch(config)#no event-handler DropCountersHandler
switch(config)#
```
**exit**

The `exit` command places the switch in the parent of the command mode from which the exit command was entered.

- When used in Global configuration, the switch enters Privileged EXEC mode.
- When used in EXEC or Privileged EXEC mode, the `exit` command terminates the user session.
- When the command is used in a group-change mode (such as ACL-Configuration mode or MST-Configuration mode), the `exit` command also applies all pending changes made in that mode.

**Command Mode**

All modes

**Command Syntax**

`exit`

**Example**

- This command exits Global Configuration mode to Privileged EXEC mode.
  
  ```
  switch(config)#exit
  switch#
  ```

- This command terminates the user session.
  
  ```
  switch#exit
  ```
ip ftp client source-interface

By default, the FTP (File Transfer Protocol) source IP address is selected by the switch (the IP address of the source interface if one is assigned). The `ip ftp client source-interface` command allows the user to override the default FTP source address.

The `ip ftp client source-interface` and `ip ftp source-interface` commands are functionally equivalent. In each case, `ip ftp client source-interface` is stored in `running-config`.

The `no ip ftp client source-interface` and `default ip ftp client source-interface` commands restore default behavior by removing the `ip ftp client source-interface` statement from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip ftp [client] source-interface INTERFACE [vrf vrf_name]
no ip ftp [client] source-interface
default ip ftp [client] source-interface
```

**Parameters**

- **client** Parameter has no functional effect.
- **INTERFACE** Interface providing the IP address. Options include:
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-channel interface specified by `p_num`.
  - `tunnel t_num` Tunnel interface specified by `t_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
  - `vrf vrf_name` Uses the specified user-defined VRF.

**Examples**

- These commands configure the 10.10.121.15 as the source IP address the switch uses when communicating with FTP servers.
  ```
  switch(config)#interface ethernet 17
  switch(config-if-Et17)#ip address 10.10.121.15/24
  switch(config-if-Et17)#ip ftp client source-interface ethernet 17
  switch(config)#
  ```

- This command configures the switch to use interface tunnel 45 and vrf vrf01 when communicating with FTP servers.
  ```
  switch(config)#ip ftp client source-interface tunnel 45 vrf vrf01
  switch(config)#
  ```
ip http client local-interface

The `ip http client local-interface` command specifies the source IP address for hypertext transfer protocol (HTTP) connections. By default, the source IP address is selected by the switch when this command is not configured or when the specified interface is not assigned an IP address.

The `no ip http client local-interface` and `default ip http client local-interface` commands restore default behavior by removing the `ip http client local-interface` statement from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**

```
ip http client local-interface INTERFACE [vrf vrf_name]
no ip http client local-interface
default ip http client local-interface
```

**Parameters**
- **INTERFACE** Interface providing the IP address. Options include:
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-channel interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
- **vrf vrf_name** Uses the specified user-defined VRF.

**Examples**
- These commands configure the 10.15.17.9 as the source IP address the switch uses when communicating with HTTP servers.
  
  ```
  switch(config)#interface vlan 10
  switch(config-if-Vl10)#ip address 10.15.17.9/24
  switch(config-if-Vl10)#ip http client local-interface vlan 10
  switch(config)#
  ```

- This command configures the switch to use interface tunnel 45 and vrf vrf01 when communicating with HTTP servers.
  
  ```
  switch(config)#ip http client local-interface tunnel 45 vrf vrf01
  switch(config)#
  ```
ip ssh client source-interface

The **ip ssh client source-interface** command specifies the source IP address for secure shell (SSH) connections. By default, the source IP address is selected by the switch when this command is not configured or when the specified interface is not assigned an IP address.

The **ip ssh client source-interface** and **ip ssh source-interface** commands are functionally equivalent. In each case, **ip ssh client source-interface** is stored in **running-config**.

The **no ip ssh client source-interface** and **default ip ssh client source-interface** commands restore default behavior by removing the **ip ssh client source-interface** statement from **running-config**.

**Command Mode**
- Global Configuration

**Command Syntax**

```
ip ssh [client] source-interface INTERFACE [vrf vrf_name]
no ip ssh [client] source-interface
default ip ssh [client] source-interface
```

**Parameters**
- **client**  Parameter has no functional effect.
- **INTERFACE**  Interface providing the IP address. Options include:
  - **ethernet e_num**  Ethernet interface specified by **e_num**.
  - **loopback l_num**  Loopback interface specified by **l_num**.
  - **management m_num**  Management interface specified by **m_num**.
  - **port-channel p_num**  Port-channel interface specified by **p_num**.
  - **vlan v_num**  VLAN interface specified by **v_num**.
  - **vrf vrf_name**  Uses the specified user-defined VRF.

**Examples**
- These commands configure the 10.17.17.9 as the source IP address the switch uses when communicating with SSH servers.
  ```
  switch(config)#interface vlan 10
  switch(config-if-Vl10)#ip address 10.17.17.9/24
  switch(config-if-Vl10)#ip ssh client source-interface vlan 10
  switch(config)#
  ```
- This command configures the switch to use interface tunnel 45 and vrf vrf01 when communicating with SSH servers.
  ```
  switch(config)#ip ssh client source-interface tunnel 45 vrf vrf01
  switch(config)#
  ```
**ip tftp client source-interface**

The *ip tftp client source-interface* command specifies the source IP address for Trivial File Transfer Protocol (TFTP) connections. By default, the source IP address is selected by the switch when this command is not configured or when the specified interface is not assigned an IP address.

The *ip tftp client source-interface* and *ip tftp source-interface* commands are functionally equivalent. In each case, *ip tftp client source-interface* is stored in *running-config*.

The *no ip tftp client source-interface* and *default ip tftp client source-interface* commands restore default behavior by removing the *ip tftp client source-interface* statement from *running-config*.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip tftp [client] source-interface INTERFACE [vrf vrf_name]
no ip tftp [client] source-interface
default ip tftp [client] source-interface
```

**Parameters**

- **client** Parameter has no functional effect.
- **INTERFACE** Interface providing the IP address. Options include:
  - **ethernet e_num** Ethernet interface specified by *e_num*.
  - **loopback l_num** Loopback interface specified by *l_num*.
  - **management m_num** Management interface specified by *m_num*.
  - **port-channel p_num** Port-channel interface specified by *p_num*.
  - **vlan v_num** VLAN interface specified by *v_num*.
  - **vrf vrf_name** Uses the specified user-defined VRF.

**Examples**

- These commands configure the 10.15.17.9 as the source IP address the switch uses when communicating with TFTP servers.

  ```
  switch(config)#interface vlan 10
  switch(config-if-Vl10)#ip address 10.15.17.9/24
  switch(config-if-Vl10)#ip tftp client source-interface vlan 10
  switch(config)#
  ```

- This command configures the switch to use interface tunnel 45 and vrf vrf01 when communicating with TFTP servers.

  ```
  switch(config)#ip tftp client source-interface tunnel 45 vrf vrf01
  switch(config)#
  ```
platform arad lag mode

The `platform arad lag mode` command allows configuration of LAGs with more than 16 members.

**Command Mode**
- Global Configuration

**Command Syntax**

```
platform arad lag mode [1024x16 | 256x64 | 512x32]
```

**Examples**
- This command configures 1024 LAGs with 16 members each.
  
  `switch(config)# platform arad lag mode 1024x16`
  
  `! Change will take effect only after switch reboot.`
  
  `switch(config)#`

- This command configures 256 LAGs with 64 members each.
  
  `switch(config)# platform arad lag mode 256x64`
  
  `! Change will take effect only after switch reboot.`
  
  `switch(config)#`

- This command configures 512 LAGs with 32 members each.
  
  `switch(config)# platform arad lag mode 512x32`
  
  `! Change will take effect only after switch reboot.`
  
  `switch(config)#`
platform sand fabric mode (7500 and 7500E Series)

The platform sand fabric mode command specifies the fabric mode under which the switch operates after the next system reload. The command has no operational effect until the switch reloads.

The fabric mode determines the modular switch’s fabric performance capabilities and must be compatible with the installed fabric modules. Fabric mode settings include:

- **fe600**: Supports first-generation fabric modules.
- **fe1600**: Supports E-Series fabric modules.

**Important!** Switches that reload in petraA forwarding compatibility mode (platform sand forwarding mode (7500 and 7500E Series)) also reload in fe600 fabric mode regardless of the presence of a platform sand fabric mode statement in running-config.

The switch’s fabric mode setting must match the capabilities of its installed fabric modules. Reloading the switch in a different mode may be required after exchanging fabric modules for a different module type. The show module command displays the fabric modules in the switch.

Each fabric module is categorized as first-generation or E-Series:

- First-generation fabric modules support all basic switch functions.
- E-Series fabric modules support faster fabric link speeds, greater internal table capacities, and advanced encoding formatting.

E-series fabric modules can operate in fe600 mode, but are limited to first-generation fabric performance. First-generation modules cannot operate in fe1600 mode. Switches containing both types of modules must be set to fe600 mode. Best practice is to avoid switch configurations with mixed fabric modules.

When a switch reloads, fabric mode is determined by the following (in order of precedence):

**Step 1** Switches reloading in petraA forwarding compatibility mode also reload in fe600 fabric mode.

**Step 2** As specified by the platform sand fabric mode statement in running-config.

**Step 3** The first fabric module that becomes operational as the switch reloads.

In switches with a homogeneous module set, the fabric mode matches its fabric modules. Switches with a mixed set of modules are typically reloaded in fe600 mode because first generation modules are usually operational before E-Series modules. However, the fabric mode in mixed module switches that are reloading cannot be guaranteed in the absence of the first two conditions.

The no platform sand fabric mode and default platform sand fabric mode commands remove the platform sand fabric mode command from running-config.

**Command Mode**

- Global Configuration

**Command Syntax**

```
platform sand fabric mode [MODE_SETTING]
no platform sand fabric mode
default platform sand fabric mode
```

**Parameters**

- **MODE_SETTING** Specifies the switch’s fabric mode. Options include:
  - fe1600  E-Series fabric mode.
  - fe600  First-generation fabric mode.
Examples

- This command configures the switch to reload in `fe1600` fabric mode to support E-series fabric modules. After issuing this command, the switch should be reset only after exchanging all switch fabric modules to E-series modules.

```
switch(config)#platform sand fabric mode fe1600
switch(config)#exit
switch#show platform sand compatibility
```

<table>
<thead>
<tr>

</tr>
<tr>
<td>Fabric mode</td>
<td>Fe1600</td>
</tr>
</tbody>
</table>

switch#
platform sand forwarding mode (7500 and 7500E Series)

The platform sand forwarding mode command specifies the forwarding compatibility mode under which the switch operates after the next system reload. The command has no operational effect until the switch reloads.

Forwarding compatibility mode specifies switch forwarding capabilities and configures performance capacity of installed linecards. Forwarding compatibility modes settings include:

- **petraA**: Supports first-generation fabric modules.
- **arad**: Supports E-Series fabric modules.

**Important!** Switches that reload in petraA forwarding compatibility mode also reload in fe600 fabric mode regardless of the presence of a platform sand fabric mode (7500 and 7500E Series) statement in running-config.

This command may be required after exchanging a linecard for a different module type or in switches containing first-generation and E-series linecards. The **show module** command displays the linecard modules in the switch.

Each modular switch linecard module is categorized as first-generation or E-Series:

- First-generation linecards support all basic switch functions.
- E-Series linecards support provide faster data processing, greater internal table capacities, and advanced encoding formatting.

The forwarding compatibility mode determines the operational capacity of installed linecards. Table 3-5 lists the affect of the forwarding compatibility mode on all linecard module types.

**Table 3-5 Linecard Module and Forwarding Mode Performance**

<table>
<thead>
<tr>
<th>Linecard Module Type</th>
<th>Forwarding Software Mode</th>
<th>Linecard Operating Capacity</th>
</tr>
</thead>
<tbody>
<tr>
<td>First-generation</td>
<td>petraA</td>
<td>Linecard performs at first-generation performance capacity.</td>
</tr>
<tr>
<td>First-generation</td>
<td>arad</td>
<td>Linecard is powered-down.</td>
</tr>
<tr>
<td>E-Series</td>
<td>petraA</td>
<td>Linecard performs at first-generation performance capacity.</td>
</tr>
<tr>
<td>E-Series</td>
<td>arad</td>
<td>Linecard performs at E-series performance capacity.</td>
</tr>
</tbody>
</table>

**Important!** Linecards operate at E-Series performance capacities only on switches that contain E-Series fabric modules and have a fabric mode setting of fe1600 fabric mode (platform sand fabric mode (7500 and 7500E Series)).

Without a platform sand forwarding mode command, forward compatibility mode is determined by the first linecard that becomes operational after reloading the switch. In a switch that is reloaded with a homogeneous module set, forwarding compatibility mode matches its linecards. Switches with a mixed set of modules are typically reloaded in petraA mode because first generation modules are usually operational before E-Series modules. However, forwarding compatibility mode in mixed module switches that are reloading is not guaranteed without a platform sand forwarding mode command.

The no platform sand forwarding mode and default platform sand forwarding mode commands restore the platform sand forwarding mode command from running-config.

**Command Mode**

Global Configuration
Command Syntax

platform sand forwarding mode [MODE_SETTING]
no platform sand forwarding mode
default platform sand forwarding mode

Parameters

- **MODE_SETTING**  Specifies the switch’s software forwarding mode. Options include:
  - **arad**  the switch supports E-Series linecard capabilities.
  - **petraA**  the switch supports first-generation linecard capabilities.

Examples

- This command changes the forwarding software mode to support E-series linecard modules. This command should be run only after exchanging all linecards to E-series modules.

  switch(config)#platform sand forwarding mode arad
  switch(config)#
platform sand lag hardware-only

The platform sand lag hardware-only command specifies that all LAGs will use hardware resources including single member LAGs. Hardware resource allocation and deallocation traffic disruption occurs on the first member addition or deletion, rather than the second member addition or deletion.

The no platform sand lag hardware-only and default platform sand lag hardware-only commands specify that LAGs are not required to be implemented in hardware, and therefore some LAGs may be implemented in software. Permitting both hardware and software LAGs may increase the total number of port-channels because we have no resource limit on the number of software LAGs.

Command Mode
  Global Configuration

Command Syntax
  - platform sand lag hardware-only
  - no platform sand lag hardware-only
  - default platform sand lag hardware-only

Examples
  - This command configures all LAGs to use hardware resources. All existing one member LAGs will be allocated hardware resources, when available.
    switch(config)#platform sand lag hardware-only
    switch(config)#
  - This command allows certain LAGs (single member LAGs) to not consume hardware resources. All existing one member LAGs will release their hardware resources.
    switch(config)#no platform sand lag hardware-only
    switch(config)#
**pwd**

The `pwd` command displays the working directory.

**Command Mode**

Privileged EXEC

**Command Syntax**

```
pwd
```

**Examples**

- This command shows that the working is Flash.
  ```
  switch# pwd
  flash:/
  switch#
  ```
schedule

The `schedule` command facilitates the periodic execution of a specified CLI command. Command parameters configure the start time of periodic execution, the interval between consecutive execution instances, the maximum time allotted for command execution, and the maximum number of log files that can be created.

The `no schedule` and `default schedule` commands disable execution of the specified command.

Command Mode
Global Configuration

Command Syntax
```
schedule schedule_name PERIOD (max-log-files count | timeout timeout_interval)
{command cmd | logging verbose | loglocation flash:}
no schedule schedule_name
default schedule schedule_name
```

Parameters
- **name**  label associated with the scheduled command.
- **PERIOD** start time for execution and interval between consecutive execution instances. The interval ranges from 2 to 1440 minutes. The default interval while scheduling the `show tech-support` command is 60 minutes. Options include:
  - **at** start time for execution. Options include:
    - `hh:mm:ss interval interval` The command execution starts at the specified time and repeats at the specified interval.
    - `hh:mm:ss mm/dd/yyyy interval interval` The command execution starts at the specified time on the specified day and repeats at the specified interval.
    - `hh:mm:ss once` The command execution starts at the specified time and does not repeat.
    - `hh:mm:ss mm/dd/yyyy once` The command execution starts at the specified time on the specified day and does not repeat.
    - `hh:mm:ss yyyy-mm-dd interval interval` The command execution starts at the specified time on the specified day and repeats at the specified interval.
    - `hh:mm:ss yyyy-mm-dd once` The command execution starts at the specified time on the specified day and does not repeat.
  - **interval interval** The command execution starts immediately and repeats at the specified interval.
  - **now interval interval** The command execution starts immediately and repeats at the specified interval.
- **max-log-files count** maximum number of log files command generates for command output. The count of maximum log files ranges from 1 to 10000. The default count of maximum log files while scheduling the `show tech-support` command is 100.
- **timeout timeout_interval** maximum time allotted for the script execution. The timeout interval ranges from 1 to 480 minutes. The default timeout is 30 minutes.

Note
The command execution is terminated if it exceeds the specified `timeout` interval. The timeout allotted for the scheduled command must not be greater than the corresponding interval.

- **command cmd** The command that needs to be executed.
• **logging verbose**  Sets the logging level to “verbose.” A syslog entry is added after the execution of the scheduled command, regardless of whether the scheduled command has succeeded or failed. In the absence of **logging verbose**, the syslog entry is added only if the execution of the scheduled command fails with an error.

• **loglocation destination**  The flash destination for scheduled command output files.

**Guidelines**

Log files created by the command are stored in the `flash:/schedule/scheduled_name` directory. Empty log files are created for commands that do not generate any output.

**Examples**

• This command saves the running configuration contents to the log file every hour with immediate effect and creates a maximum of 24 log files.

```
switch(config)#schedule backup-test interval 60 max-log-files 24 command show running-config
```

• This command starts the script execution at 12:00:00 and repeats every 720 minutes. The script execution is terminated if it exceeds 20 minutes. It generates a maximum of one log file because the specified bash command does not have an output.

```
switch(config)#schedule ms1 at 12:00:00 interval 720 timeout 20 max-log-files 1 command bash /mnt/flash/myscript.sh
```

The `show schedule` command lists the commands currently scheduled for periodic execution and displays the summary of the specified scheduled command.

```
switch#show schedule summary
Maximum concurrent jobs  1
Prepend host name to logfile: Yes
Name  At time    Last    Interval  Timeout   Max   Logfile Location      Status
     time      (mins)   (mins)    log
---- ------- ------- --------- -------- ------ --------------------- -------
ms1 now     23:03    720       20        1    flash:/schedule/ms1   Success
switch#
```
schedule config

The **schedule config** command sets configuration parameters to the CLI scheduler.

The **no schedule config max-concurrent-jobs** and **default schedule config max-concurrent-jobs** commands reset the limit of maximum concurrent jobs to the default value of 1 by removing the corresponding schedule config max-concurrent-jobs statement from running-config.

The **no schedule config prepend-hostname-logfile** and **default schedule config prepend-hostname-logfile** commands reset the log filenames to the default state.

**Command Mode**
Global Configuration

**Command Syntax**

```
schedule config {max-concurrent-jobs limit | prepend-hostname-logfile}
no schedule config {max-concurrent-jobs limit | prepend-hostname-logfile}
default schedule config {max-concurrent-jobs limit | prepend-hostname-logfile}
```

**Parameters**

- **max-concurrent-job limit** specifies the maximum number of concurrent commands that can run on the switch. The maximum concurrent jobs ranges from 1 to 4. The default value is 1.
- **prepend-hostname-logfile** enables prepending hostnames to log filenames. By default, this option is enabled.

**Examples**

- This command configures to concurrently run a maximum of three commands on the switch.
  ```
  switch(config)#schedule config max-concurrent-jobs 3
  switch(config)#show schedule summary
  Maximum concurrent jobs 3
  Prepend host name to logfile: No
  Name At time Last Interval Timeout Max Logfile Location
  Status time (mins) (mins) log files
  ----------------- --------------- ------- ---------- -------- --------
  tech-support      now 00:29 60 30 100 flash:schedule/tech-support/
  flash:schedule/tech-support/ Success
  thelp 12:02:00 00:02 60 40 100 flash:schedule/thelp/
  Fail
  06/05/2018
  switch(config)#
  ```
This command enables prepending the hostname to log filenames.

```
switch(config)#schedule config prepend-hostname-logfile
switch(config)#show schedule summary
Maximum concurrent jobs 3
Prepend host name to logfile: Yes
Name At time Last Interval Timeout Max Logfile Location Status
time (mins) (mins) log files
------------- ------------- ------- --------- -------- -------- ----------
technical-support now 00:29 60 30 100 flash:schedule/technical-support/ Success
thelp 12:02:00 00:02 60 40 100 flash:schedule/thelp/ Fail
06/05/2018
```

switch(config)#
**show (various configuration modes)**

The `show` command, when executed within a configuration mode, can display data in `running-config` for the active configuration mode.

**Command Mode**
All configuration modes except Global Configuration

**Command Syntax**
```
show [DATA_TYPE]
```

**Parameters**
- `DATA_TYPE` Specifies display contents. Values include:
  - `active` Displays `running-config` settings for the configuration mode.
  - `active all` Displays `running-config` plus defaults for the configuration mode.
  - `active all detail` Displays `running-config` plus defaults for the configuration mode.
  - `comment` Displays comment entered for the configuration mode.

**Related Commands**
The `show` commands in ACL-configuration mode and MST-configuration mode include the `active` and `comment` options along with additional mode-specific options.

**Example**
- This command shows the server-group-TACACS+ configuration commands in `running-config`.

```
switch(config-sg-tacacs+-TAC-GR)#show active
  server TAC-1
  server 10.1.4.14
switch(config-sg-tacacs+-TAC-GR)#
```
show event-handler

The show event-handler command displays the contents and activation history of a specified event handler or all event handlers.

Command Mode
Privileged EXEC

Command Syntax
show event-handler [handler_name]

Parameters
- handler_name optional name of an event handler to display. If no parameter is entered, the command displays information for all event handlers configured on the system.

Example
- This command displays information about an event handler called “eth_5”.

```
switch# show event-handler Eth_5
Event-handler Eth_5
Trigger: on-intf Ethernet5 on ip delay 20 seconds
Threshold Time Window: 0 Seconds, Event Count: 1 times
Action: :
Device-health Action: None
Action expected to finish in less than 10 seconds
Last Trigger Detection Time: 15 days 2 hours 19 minutes ago
Total Trigger Detections: 1
Last Trigger Activation Time: 15 days 2 hours 19 minutes ago
Total Trigger Activations: 1
Last Action Time: 15 days 2 hours 19 minutes ago
Total Actions: 1
switch#
```
**show event-handler DropCountersHandler**

The `show event-handler` command displays details of the DropCountersHandler event handler.

**Command Mode**
- Privileged EXEC

**Command Syntax**

```
show event-handler DropCountersHandler
```

**Example**

- This command displays details of this event handler.

```
switch(config)#show event-handler DropCountersHandler
Event-handler DropCountersHandler (BUILT-IN)
Trigger: on-counters delay 0 seconds
  Polling Interval: 60 seconds
  Condition: bashCmd."DropCounterMonitor.py" > 0
Threshold Time Window: 0 Seconds, Event Count: 1 times
Action: DropCounterLog.py -l
Action expected to finish in less than 20 seconds
Total Polls: 39
Last Trigger Detection Time: 38 minutes 22 seconds ago
Total Trigger Detections: 1
Last Trigger Activation Time: 38 minutes 22 seconds ago
Total Trigger Activations: 1
Last Action Time: Never
Total Actions: 1

switch(config)#
```
show module

The show module command displays information that identifies the supervisor, fabric, and linecard modules in a modular switch, including model number, serial number, hardware version number, software version (supervisors only), MAC address (supervisors and linecards), and operational status.

**Command Mode**

EXEC

**Command Syntax**

`show module [MODULE_NAME]`

**Parameters**

- **MODULE_NAME** Specifies modules for which data is displayed. Options include:
  - `<no parameter>` All modules (identical to `all` option).
  - `linecard line_num` Linecard module. Number range varies with switch model.
  - `supervisor super_num` Supervisor module. Number range varies with switch model.
  - `mod_num` Supervisor (1 to 2) or linecard (3 to 18) module.
  - `all` All modules.

**Related Commands**

- `show version` displays model and serial numbers of modular system components.
Example

This command displays information about all installed modules on a DCS-7504 switch.

```
switch# show module
```

switch#
```
**show platform sand compatibility**

The `show sand platform compatibility` command displays the fabric and forwarding modes. These modes determine switch forwarding capabilities and programs performance capacity of installed linecards.

Information that identifies the supervisor, fabric, and linecard modules in the modular switch, including model number, serial number, hardware version number, software version (supervisors only), MAC address (supervisors and linecards), and operational status.

**Command Mode**
Privileged EXEC

**Command Syntax**

```
show platform sand compatibility
```

**Related Commands**
- `platform sand fabric mode (7500 and 7500E Series)` specifies the fabric software mode.
- `platform sand forwarding mode (7500 and 7500E Series)` specifies the forwarding software mode.

**Example**

```
switch#show platform sand compatibility

<table>
<thead>
<tr>
<th>Configuration</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Forwarding mode</td>
<td>None</td>
</tr>
<tr>
<td>Fabric mode</td>
<td>None</td>
</tr>
</tbody>
</table>

switch#
```

show platform sand lag hardware-only

The `show platform sand lag hardware-only` command displays whether or not LAGs are hardware-only.

**Command Mode**

Privileged EXEC

**Command Syntax**

```
show platform sand lag hardware-only
```

**Examples**

- This command indicates that LAGs are hardware-only.
  
  ```
  switch(config)#platform sand lag hardware-only
  switch(config)#exit
  switch#show platform sand lag hardware-only
  Hardware resources are used for all LAGs: True
  switch#
  ```

- This command indicates that LAGs are not hardware-only.
  
  ```
  switch(config)#no platform sand lag hardware-only
  switch(config)#exit
  switch#show platform sand lag hardware-only
  Hardware resources are used for all LAGs: False
  switch#
  ```
show schedule

The **show schedule** command displays logging output on the terminal during the current terminal session. This command affects only the local monitor. The **no terminal monitor** command disables direct monitor display of logging output for the current terminal session.

The **show schedule** command displays the list of active scheduled commands and the summary of specified scheduled command.

**Command Mode**
Global Configuration

**Command Syntax**
```
show schedule {schedule_name | summary}
```

**Parameters**
- **schedule_name** displays the summary of the specified scheduled command
- **summary** displays the list of active scheduled commands

**Examples**
- This command displays the summary of the “thelp” schedule.
  ```
  switch(config)#show schedule thelp
  The last CLI command failed with exit status 1
  CLI command "show THelp" is scheduled next at "02:02:35 06/19/2018", interval is 60 minutes
  Timeout is 40 minutes
  Maximum of 100 log files will be stored
  Verbose logging is off
  100 log files currently stored in flash:/schedule/thelp
  Start time          Size          Filename
  ------------------ ---------------- -------------------------------
  Jun 19 2018 01:02  60.0 bytes    ro301_thelp_2018-06-19.0102.log.gz
  Jun 19 2018 00:02  60.0 bytes    ro301_thelp_2018-06-19.0002.log.gz
  Jun 18 2018 23:02  60.0 bytes    ro301_thelp_2018-06-18.2302.log.gz
  Jun 18 2018 22:02  60.0 bytes    ro301_thelp_2018-06-18.2202.log.gz
  Jun 18 2018 21:02  60.0 bytes    ro301_thelp_2018-06-18.2102.log.gz
  <--------OUTPUT OMITTED FROM EXAMPLE-------->
  switch(config)#
  ```

- This command displays the summary of scheduled commands.
  ```
  switch(config)#show schedule summary
  Maximum concurrent jobs  1
  Prepend host name to logfile: Yes
  Name   At time    Last  Interval   Timeout   Max     Logfile Location
      Status   (mins)  (mins)    log files
  ------------------------------ --------------- -------------------------------

  thelp           12:02:00   00:02      60        40      100     flash:schedule/thelp/
  Fail            06/05/2018
  switch(config)#
  ```
**show version**

The `show version` command displays information that identifies the switch, including its model number, serial number, and system MAC address. The command also provides hardware and software manufacturing information, along with the available memory and elapsed time from the most recent reload procedure.

**Command Mode**

EXEC

**Command Syntax**

```
show version [INFO_LEVEL]
```

**Parameters**

- `INFO_LEVEL` Specifies information the command displays. Options include
  - `<no parameter>` Model and serial numbers, manufacturing data, uptime, and memory.
  - `detail` Data listed `<no parameter>` option plus version numbers of internal components.

**Related Commands**

- `show module` displays model and serial numbers of modular system components.

**Examples**

- This command displays the switch’s model number, serial number, hardware and software manufacturing information, uptime, and memory capacity,

  ```
  switch>show version
  Arista DCS-7150S-64-CL-F
  Hardware version:    01.01
  Serial number:       JPE13120819
  System MAC address:  001c.7326.fd0c
  
  Software image version: 4.13.2F
  Architecture:           i386
  Internal build version: 4.13.2F-1649184.4132F.2
  Internal build ID:      eeb3c212-b4bd-4c19-ba34-1b0aa36e43f1
  
  Uptime:                 1 hour and 36 minutes
  Total memory:           4017088 kB
  Free memory:            1473280 kB
  
  switch>
  ```
terminal length

The terminal length command overrides automatic pagination and sets pagination length for all show commands on a terminal. If the output of a show command is longer than the configured terminal length, the output will be paused after each screenful of output, prompting the user to continue.

To disable pagination for an SSH session, set terminal length to 0. By default, all console sessions have pagination disabled.

The no terminal length and default terminal length commands restore automatic pagination by removing the terminal length command from running-config.

The pagination setting is persistent if configured from Global Configuration mode. If configured from EXEC mode, the setting applies only to the current CLI session. Pagination settings may also be overridden when you adjust the size of the SSH terminal window, but can be reconfigured by running the terminal length command again.

Command Mode

EXEC

Command Syntax

terminal length lines
no terminal length
default terminal length

Parameters

- lines number of lines to be displayed at a time. Values range from 0 through 32767. A value of 0 disables pagination.

Example

- This command sets the pagination length for the current terminal session to 10 lines.
  switch#terminal length 10
  Pagination set to 10 lines.

- This command configures the switch to paginate terminal output automatically based on screen size for the current terminal session.
  switch#no terminal length

- These commands disable pagination globally.
  switch#configure
  switch(config)#terminal length 0
  Pagination disabled.
**terminal monitor**

The `terminal monitor` command enables the display of logging output on the terminal during the current terminal session. This command affects only the local monitor. The `no terminal monitor` command disables direct monitor display of logging output for the current terminal session.

**Command Mode**

Privileged EXEC

**Command Syntax**

- `terminal monitor`
- `no terminal monitor`
- `default terminal monitor`

**Example**

- This command enables the display of logging to the local monitor during the current terminal session.

```
switch#terminal monitor
switch#
```
**trigger**

The `trigger` command specifies what event will trigger the event handler. Handlers can be triggered either by the system booting or by a change in a specified interface’s IP address or operational status.

To specify the action to be taken when the handler is triggered, use the `action bash` command.

**Command Mode**

Event-Handler Configuration

**Command Syntax**

```
trigger EVENT
```

**Parameters**

- **EVENT** event which will trigger the configuration mode event handler. Values include:
  - `onboot` triggers when the system reboots, or when you exit event-handler configuration mode. This option takes no further arguments, and passes no environment variables to the action triggered.
  - `on-intf INTERFACE CHANGE` triggers when a change is made to the specified interface.
  - `on-startup-config` triggers when a change is made to the `startup-config` file.
  - `vm-tracer vm` triggers when a virtual machine monitored by VM Tracer changes state.

- **INTERFACE** the triggering interface. Values include:
  - `ethernet number` Ethernet interface specified by `number`.
  - `loopback number` loopback interface specified by `number`.
  - `management number` management interface specified by `number`.
  - `port-channel number` channel group interface specified by `number`.
  - `vlan numver` VLAN interface specified by `number`.

- **CHANGE** the change being watched for in the triggering interface. Values include:
  - `ip` triggers when the IPv4 address of the specified interface is changed.
  - `ip6` triggers when the IPv6 address of the specified interface is changed.
  - `operstatus` triggers when the operational status of the specified interface changes.

**Examples**

- This command configures the event handler “Eth5” to be triggered when there is a change in the operational status or IP address of Ethernet interface 5.
  ```
  switch(config-handler-Eth5)#trigger on-intf Ethernet 5 operstatus ip
  switch(config-handler-Eth5)#
  ```

- This command configures the event handler “onStartup” to be triggered when the system boots, or on exiting event-handler configuration mode.
  ```
  switch(config-handler-onStartup)#trigger onboot
  switch(config-handler-onStartup)#
  ```
AAA Configuration

This chapter describes Authentication, Authorization, and Accounting (AAA), and contains these sections:

- Section 4.1: Authentication, Authorization, and Accounting Overview
- Section 4.2: Configuring the Security Services
- Section 4.3: Server Groups
- Section 4.4: Role-Based Authorization
- Section 4.5: Activating Security Services
- Section 4.6: TACACS+ Configuration Examples
- Section 4.7: AAA Commands

4.1 Authentication, Authorization, and Accounting Overview

4.1.1 Methods

The switch controls access to EOS commands by authenticating user identity and verifying user authorization. Authentication, Authorization, and Accounting (AAA) activities are conducted through three data services – a local security database, TACACS+ servers, and RADIUS servers. Section 4.2: Configuring the Security Services describes these services.

4.1.2 Configuration Statements

Enabling AAA on the switch requires two steps:

**Step 1** Configure security service parameters.

The switch provides configuration commands for each security service:

- A local file supports authentication through `username` and `enable password` commands.
- TACACS+ servers provide security services through `tacacs-server` commands.
- RADIUS servers provide security services through `radius-server` commands.

Section 4.2: Configuring the Security Services describes security service configuration commands.

**Step 2** Activate AAA services.

EOS provides `aaa authorization`, `aaa authentication`, and `aaa accounting` commands to select the primary and backup services. Section 4.5: Activating Security Services provides information on implementing a security environment.
4.1.3 Encryption

The switch uses clear-text passwords and server access keys to authenticate users and communicate with security systems. To prevent accidental disclosure of passwords and keys, *running-config* stores their corresponding encrypted strings. The encryption method depends on the type of password or key.

Commands that configure passwords or keys can accept the clear-text password or an encrypted string that was generated by the specified encryption algorithm with the clear-text password as the seed.
4.2 Configuring the Security Services

The switch can access three security data services to authenticate users and authorize switch tasks: a local file, TACACS+ servers, and RADIUS Servers.

4.2.1 Local Security File

The local file uses passwords to provide these authentication services:

- authenticate users as they log into the switch
- control access to configuration commands
- control access to the switch root login

The local file contains username-password combinations to authenticate users. Passwords also authorize access to configuration commands and the switch root login.

4.2.1.1 Passwords

The switch recognizes passwords as clear text and encrypted strings.

- **Clear-text** passwords are the text that a user enters to access the CLI, configuration commands, or the switch root login.

- **Encrypted strings** are MD5-encrypted strings generated with the clear text as the seed. The local file stores passwords in this format to avoid unauthorized disclosure. When a user enters the clear-text password, the switch generates the corresponding secure hash and compares it to the stored version.

**Note**

The switch cannot recover the clear text from which an encrypted string is generated.

Valid passwords contain the characters A-Z, a-z, 0-9 and any of these punctuation characters:

```
! @ # $ % ^ & * ( ) _ = + {} [ ] ; : < > , . ? / ~ \ 
```

4.2.1.2 Usernames

Usernames control access to the EOS and all switch commands. The switch is typically accessed through an SSH login, using a previously defined username-password combination. To create a new username or modify an existing username, use the `username` command.

Valid usernames begin with A-Z, a-z, or 0-9 and may also contain any of these characters:

```
@ # $ % ^ & * - _ = + ; : < > , . ? / ~ \ 
```

The default username is **admin**, which is described in Admin Username.

**Examples**

- These equivalent commands create the username “john” and assign it the password “x245.” The password is entered in clear text because the encrypt-type parameter is omitted or zero.

```
switch(config)#username john secret x245
```

```
switch(config)#username john secret 0 x245
```
• This command creates the username “john” and assigns it to the text password that corresponds to the encrypted string “$1$sU.7hptc$TsJ1qs1CL7ZYVbyXNG1wg1.” The string was generated by an MD5-encryption program using “x245” as the seed.

switch(config)#username john secret 5
$1$sU.7hptc$TsJ1qs1CL7ZYVbyXNG1wg1

The username is authenticated by entering “x245” when the CLI prompts for a password.

• This command creates the username “jane” without securing it with a password. It also removes a password if the “jane” username exists.

switch(config)#username jane nopassword

• This command removes the username “william” from the local file.

switch(config)#no username william

4.2.1.3 Logins by Unprotected Usernames

The default switch configuration allows usernames that are not password-protected to log in only from the console. The `aaa authentication policy local allow-nopassword-remote-login` command configures the switch to allow unprotected usernames to log in from any port. To reverse this setting to the default state, use `no aaa authentication policy local allow-nopassword-remote-login`.

**Warning**

Allowing remote access to accounts without passwords is a severe security risk. Arista Networks recommends assigning strong passwords to all usernames.

**Examples**

• This command configures the switch to allow unprotected usernames to log in from any port.

switch(config)#aaa authentication policy local allow-nopassword-remote-login

• This command configures the switch to allow unprotected usernames to log in only from the console port.

switch(config)#no aaa authentication policy local allow-nopassword-remote-login

4.2.1.4 Enable Command Authorization

The `enable` command controls access to Privileged EXEC and all configuration command modes. The enable password authorizes users to execute the `enable` command. When the enable password is set, the CLI displays a password prompt when a user attempts to enter Privileged EXEC mode.

```
main-host>enable
Password:
main-host#
```

If an incorrect password is entered three times in a row, the CLI displays the EXEC mode prompt.

If no enable password is set, the CLI does not prompt for a password when a user attempts to enter Privileged EXEC mode.

To set the enable password, use the `enable password` command.

**Examples**

• These equivalent commands assign “xyrt1” as the enable password.

switch(config)#enable password xyrt1

switch(config)#enable password 0 xyrt1
This command assigns the enable password to the clear text “12345” corresponding to the encrypted string “$1$8bPBrJnd$Z8wbKLHpJEd7d4tc5Z/6h/.” The string was generated by an MD5-encryption program using “12345” as the seed.

```
switch(config)#enable password 5 $1$8bPBrJnd$Z8wbKLHpJEd7d4tc5Z/6h/
```

This command deletes the enable password.

```
switch(config)#no enable password
```

### 4.2.1.5 Root Account Password

The root account accesses the root directory in the underlying Linux shell. When it is not password protected, you can log into the root account only through the console port. After you assign a password to the root account, you can log into it through any port.

To set the password for the root account, use the **aaa root** command.

#### Examples

- These equivalent commands assign “f4980” as the root account password.
  
  ```
  switch(config)#aaa root secret f4980
  ```

  ```
  switch(config)#aaa root secret 0 f4980
  ```

- This command assigns the text “ab234” that corresponds to the encrypted string “$1$HW05LEY8$QEVw6JqjD9VqDfh.O8r.b.” as the root password.
  
  ```
  switch(config)#aaa root secret 5 $1$HW05LEY8$QEVw6JqjD9VqDfh.O8r.b
  ```

- This command removes the password from the root account.
  
  ```
  switch(config)#aaa root nopassword
  ```

- This command disables the root login.
  
  ```
  switch(config)#no aaa root
  ```

### 4.2.2 TACACS+

Terminal Access Controller Access-Control System Plus (TACACS+), derived from the TACACS protocol defined in RFC 1492, is a network protocol that provides centralized user validation services. TACACS+ information is maintained on a remote database. EOS support of TACACS+ services requires access to a TACACS+ server.

TACACS+ manages multiple network access points from a single server. The switch defines a TACACS+ server connection by its address and port, allowing the switch to conduct multiple data streams to a single server by addressing different ports on the server.

These sections describe steps that configure access to TACACS+ servers. Configuring TACACS+ access is most efficiently performed when TACACS+ is functioning prior to configuring switch parameters.

#### 4.2.2.1 Configuring TACACS+ Parameters

TACACS+ parameters define settings for the switch to communicate with TACACS+ servers. A set of values can be configured for individual TACACS+ servers that the switch accesses. Global parameters define settings for communicating with servers for which parameters are not individually configured.

The switch supports the following TACACS+ parameters.
Encryption Key
The encryption key is code that the switch and the TACACS+ server share to facilitate communications.

- The `tacacs-server host` command defines the encryption key for a specified server.
- The `tacacs-server key` command defines the global encryption key.

Examples
- This command configures the switch to communicate with the TACACS+ server assigned the host name “TAC_1” using the encryption key “rp31E2v.”
  ```
  switch(config)#tacacs-server host TAC-1 key rp31E2v
  ```
- This command configures “cv90jr1” as the global encryption key.
  ```
  switch(config)#tacacs-server key 0 cv90jr1
  ```
- This command assigns “cv90jr1” as the global key, using the corresponding encrypted string.
  ```
  switch(config)#tacacs-server key 7 020512025B0C1D70
  ```

Session Multiplexing
The switch supports multiplexing sessions on a single TCP connection.

- The `tacacs-server host` command configures the multiplexing option for a specified server.
- There is no global multiplexing setting.

Example
- This command configures the switch to communicate with the TACACS+ server at 10.12.7.9 and indicates the server supports session multiplexing on a TCP connection.
  ```
  switch(config)#tacacs-server host 10.12.7.9 single-connection
  ```

Timeout
The timeout is the period the switch waits for a successful connection to, or response from, the TACACS+ server. The default is 5 seconds.

- The `tacacs-server host` command defines the timeout for a specified server.
- The `tacacs-server timeout` command defines the global timeout.

Examples
- This command configures the switch to communicate with the TACACS+ server assigned the host name “TAC_1” and configures the timeout period as 20 seconds.
  ```
  switch(config)#tacacs-server host TAC_1 timeout 20
  ```
- This command configures 40 seconds as the period that the server waits for a response from a TACACS+ server before issuing an error.
  ```
  switch(config)#tacacs-server timeout 40
  ```

Port
The port specifies the port number through which the switch and the servers send information. The TACACS+ default port is 49.

- The `tacacs-server host` command specifies the port number for an individual TACACS+ server.
- The global TACACS+ port number cannot be changed from the default value of 49.
4.2.2 TACACS+ Status

To display the TACACS+ servers and their interactions with the switch, use the `show tacacs` command.

Example

- This command lists the configured TACACS+ servers.

```
switch(config)#show tacacs

server1: 10.1.1.45
Connection opens: 15
Connection closes: 6
Connection disconnects: 6
Connection failures: 0
Connection timeouts: 2
Messages sent: 45
Messages received: 14
Receive errors: 2
Receive timeouts: 2
Send timeouts: 3

Last time counters were cleared: 0:07:02 ago
```

To reset the TACACS+ status counters, use the `clear aaa counters tacacs+` command.

Example

- This command clears all TACACS+ status counters.

```
switch(config)#clear aaa counters tacacs
```

4.2.3 RADIUS

Remote Authentication Dial-In User Service (RADIUS) is a networking protocol that provides centralized AAA services for computers connecting to and using network resources. RADIUS is used to manage access to the Internet, internal networks, wireless networks, and integrated email services.

These sections describe steps that configure RADIUS server access. Configuring RADIUS parameters is most efficiently performed when RADIUS is functioning prior to configuring switch parameters.

4.2.3.1 RADIUS Vendor-Specific Attribute-Value Pairs

RADIUS servers and client companies extend basic RADIUS functionality through vendor-specific attributes. A dictionary file includes a list of RADIUS attribute-value pairs that Arista switches use to perform AAA operations through the RADIUS server.

Arista switches use the following attribute values:

- Arista Vendor number: 30065
- Attribute: Arista-AVPair 1 string

Acceptable string values for Arista-AVPair include:

- "shell:priv-lvl=< privilege level of a user, 0-15>"
"shell:roles=<list of roles for a user>"

**Example**

- This is a sample dictionary file that identifies Arista RADIUS vendor-specific attribute value pairs.

```shell
# dictionary.arista
#
VENDOR Arista 30065
# Standard Attribute
BEGIN-VENDOR Arista
ATTRIBUTE Arista-AVPair 1 string
END-VENDOR Arista
```

### 4.2.3.2 Configuring RADIUS Defaults

RADIUS policies specify settings for the switch to communicate with RADIUS servers. A set of values can be configured for individual RADIUS servers that the switch accesses. Global parameters define settings for communicating with servers for which parameters are not individually configured.

The switch defines the following RADIUS parameters.

**Encryption Key**

The encryption key is the key shared by the switch and RADIUS servers to facilitate communications.

- The `radius-server host` command defines the encryption key for a specified server.
- The `radius-server key` command specifies the global encryption key.

**Examples**

- This command configures the switch to communicate with the RADIUS server assigned the host name "RAD-1" using the encryption key "rp31E2v."
  ```shell
  switch(config)#radius-server host RAD-1 key rp31E2v
  ```
- This command configures "cv90jr1" as the global encryption key.
  ```shell
  switch(config)#radius-server key 0 cv90jr1
  ```
- This command assigns cv90jr1 as the key by specifying the corresponding encrypted string.
  ```shell
  switch(config)#radius-server key 7 020512025B0C1D70
  ```

**Timeout**

The timeout is the period that the switch waits for a successful connection to, or response from, a RADIUS server. The default period is 5 seconds.

- The `radius-server host` command defines the timeout for a specified server.
- The `radius-server timeout` command defines the global timeout.

**Examples**

- This command configures the switch to communicate with the RADIUS server assigned the host name `RAD-1` and configures the timeout period as **20 seconds**.
  ```shell
  switch(config)#radius-server host RAD-1 timeout 20
  ```
- This command configures **50 seconds** as the period that the server waits for a response from a RADIUS server before issuing an error.
  ```shell
  switch(config)#radius-server timeout 50
  ```
Retransmit
Retransmit is the number of times the switch attempts to access the RADIUS server after the first server timeout expiry. The default value is 3 times.

- The `radius-server host` command defines the retransmit for a specified server.
- The `radius-server retransmit` command defines the global retransmit value.

Examples
- This command configures the switch to communicate with the RADIUS server assigned the host name “RAD-1” and configures the retransmit value as 2.
  ```
  switch(config)#radius-server host RAD-1 retransmit 2
  ```
- This command configures the switch to attempt five RADIUS server contacts after the initial timeout. If the timeout parameter is set to 50 seconds, then the total period that the switch waits for a response is \((5+1)*50\) = 300 seconds.
  ```
  switch(config)#radius-server retransmit 5
  ```

Deadtime
Deadtime is the period when the switch ignores a non-responsive RADIUS server or a server that does not answer retransmit attempts after timeout expiry. Deadtime is disabled if a value is not specified.

- The `radius-server host` command defines the deadtime for a specified server.
- The `radius-server deadtime` command defines the global deadtime setting.

Examples
- This command configures the switch to communicate with the RADIUS server assigned the host name “RAD-1” and configures the deadtime period as 90 minutes.
  ```
  switch(config)#radius-server host RAD-1 deadtime 90
  ```
- This command programs the switch to ignore a server for two hours if the server does not respond to a request during the timeout-retransmit period.
  ```
  switch(config)#radius-server deadtime 120
  ```

Port
The port specifies the port number through which the switch and servers send information.

- The `radius-server host` command specifies the port numbers for an individual RADIUS server.
- The global RADIUS port numbers cannot be changed from the default values of 1812 for an authorization port and 1813 for an accounting port.

Example
- These commands configure the switch to communicate with the RADIUS server named “RAD-1” through port number 1850 for authorization and port number 1851 for accounting.
  ```
  switch(config)#radius-server host RAD-1 auth-port 1850
  switch(config)#radius-server host RAD-1 acct-port 1851
  ```
  To remove the configuration for this server, use `no radius-server host` command and specify the hostname or IP address with both the authorization and accounting port numbers.

4.2.3.3 RADIUS Status
The `show radius` command displays configured RADIUS servers and their interactions with the switch.
Example

- This command lists the configured RADIUS servers.
  
  `switch(config)#show radius`

  `server1: 10.1.1.45`
  `Messages sent: 24`
  `Messages received: 20`
  `Requests accepted: 14`
  `Requests rejected: 8`
  `Requests timeout: 2`
  `Requests retransmitted: 1`
  `Bad responses: 1`
  `Last time counters were cleared: 0:07:02 ago`

To reset the RADIUS status counters, use the `clear aaa counters radius` command.

Example

- This command clears all RADIUS status counters.
  
  `switch(config)#clear aaa counters radius`
4.3 Server Groups

A server group is a collection of servers that are associated with a single group name. Subsequent authorization and authentication commands can access all servers in a group by invoking the group name. The switch supports TACACS+ and RADIUS server groups.

The `aaa group server` commands create server groups and place the switch in a server-group configuration mode to assign servers to the group. Commands that reference an existing group place the switch in a server-group configuration mode to modify the group.

These commands create named server groups and enter the appropriate command mode for the specified group:

- `aaa group server radius`
- `aaa group server tacacs+`

The `server` (server-group-RADIUS configuration mode) and `server` (server-group-RADIUS configuration mode) commands add servers to the configuration mode server group. Servers must be previously configured with a `radius-server host` or `tacacs-server host` command before they are added to a group.

Examples

- This command creates the TACACS+ server group named “TAC-GR” and enters server-group configuration mode for the new group.

  ```
  switch(config)#aaa group server tacacs+ TAC-GR
  switch(config-sg-tacacs+-TAC-GR)#
  ```

- These commands add two servers to the “TAC-GR” server group. To add servers to this group, the switch must be in sg-tacacs+-TAC-GR configuration mode.

  The CLI remains in server-group configuration mode after adding the “TAC-1” server (port 49) and the server located at 10.1.4.14 (port 151) to the group.

  ```
  switch(config-sg-tacacs+-TAC-GR)#server TAC-1
  switch(config-sg-tacacs+-TAC-GR)#server 10.1.4.14 port 151
  switch(config-sg-tacacs+-TAC-GR)#
  ```

- This command exits server-group configuration mode.

  ```
  switch(config-sg-tacacs+-TAC-GR)#exit
  switch(config)#
  ```

- This command creates the RADIUS server group named “RAD-SV1” and enters server-group configuration mode for the new group.

  ```
  switch(config)#aaa group server radius RAD-SV1
  switch(config-sg-radius-RAD-SV1)#
  ```

- These commands add two servers to the “RAD-SV1” server group. To add servers to this group, the switch must be in sg-radius-RAD-SV1 configuration mode.

  The CLI remains in server-group configuration mode after adding the RAC-1 server (authorization port 1812, accounting port 1813) and the server located at 10.1.5.14 (authorization port 1812, accounting port 1850) to the group.

  ```
  switch(config-sg-radius-RAD-SV1)#server RAC-1
  switch(config-sg-radius-RAD-SV1)#server 10.1.5.14 acct-port 1850
  switch(config-sg-radius-RAD-SV1)#
  ```
4.4 Role-Based Authorization

Role-based authorization is a method of restricting access to CLI commands through the assignment of profiles, called "roles," to user accounts. Each role consists of rules that permit or deny access to a set of commands within specified command modes.

All roles are accessible to the local security file through a username parameter and to remote users through RADIUS servers. Each role can be applied to multiple user accounts. Only one role may be applied to a user.

4.4.1 Role Types

The switch defines two types of roles: user-defined and built-in.

- User-defined roles are created and edited through CLI commands.
- Built-in roles are supplied with the switch and are not user-editable.

Built-in roles supplied by the switch are “network-operator” and “network-admin.”

4.4.2 Role Structure

A role is an ordered list of rules that restricts access to specified commands from users on whom it is applied. Roles consist of deny and permit rules. Each rule references a set of command modes and contains a regular expression that specifies one or more CLI commands. Commands are compared sequentially to the rules within a role until a rule’s regular expression matches the command.

- Commands that match a regular expression in a permit rule are executed.
- Commands that match a regular expression in a deny rule are disregarded.
- Commands that do not match a regular expression are evaluated against the next rule in the role.

Upon its entry in the CLI, a command is compared to the first rule of the role. Commands that match the rule are executed (permit rule) or disregarded (deny rule). Commands that do not match the rule are compared to the next rule. This process continues until the command either matches a rule or the rule list is exhausted. The switch disregards commands not matching any rule.

4.4.3 Role Rules

Role rules consist of four components: sequence number, filter type, mode expression, and command expression.

**Sequence Number**

The sequence number designates a rule’s placement in the role. Sequence numbers range in value from 1 to 256. Rule commands that do not include a sequence number append the rule at the end of the list, deriving its sequence number by adding 10 to the sequence number of the last rule in the list.

**Example**

- These rules have sequence numbers 10 and 20.
  
  10 deny mode exec command reload
  20 deny mode config command (no |default )?router

**Filter Type**

The filter type specifies the disposition of matching commands. Filter types are permit and deny. Commands matching permit rules are executed. Commands matching deny rules are disregarded.
Example

- These rules are deny and permit rules, respectively.
  
  10 deny mode exec command reload
  20 permit mode config command interface

Mode Expression

The mode expression specifies the command mode under which the command expression is effective. The mode expression may be a regular expression or a designated keyword. Rules support the following mode expressions:

- **exec** EXEC and Privileged EXEC modes
- **config** Global Configuration Mode
- **config-all** All configuration modes, including Global Configuration Mode
- **short_name** short key name of a command mode (exact match)
- **long_name** long key name of a command mode (regular expression match of one or more modes)
- **<no parameter>** all command modes

The prompt command configures the CLI to display a configuration mode’s key name:

- `%P` long key name
- `%p` short key name

Example

- These commands use the prompt command to display short key name (`if`) and long key name (`if-Et1`) for interface-ethernet 1.

  switch(config)#prompt switch%p
  switch(config)#interface ethernet 1
  switch(config-if)#exit
  switch(config)#prompt switch%P
  switch(config)#interface ethernet 1
  switch(config-if-Et1)#

The command supports the use of regular expressions to reference multiple command modes.

Example

These regular expressions correspond to the listed command modes:

- **if-Vlan(1/2)** matches interface-VLAN 1 or interface-VLAN 2
- **if** matches all interface modes
- **acl-text1** matches ACL configuration mode for “text1” ACL

Command Expression

The command expression is a regular expression that corresponds to one or more CLI commands.

Examples

These regular expressions correspond to the specified commands:

- **reload** reload command
- **(no |default )?router** commands that enter routing protocol configuration modes
- **(no |default )?(ip|mac) access-list** commands that enter ACL configuration modes
4.4.4 Creating and Modifying Roles

4.4.4.1 Built-in Role

The switch provides the following two built-in roles:

- **network-operator**: Allows all commands in EXEC (Privileged) modes. Commands in all other modes are denied.
- **network-admin**: Allows all CLI commands in all modes.

The `network-admin` role is typically assigned to the `admin` user to allow it to run any command.

Built-in roles are not editable.

**Examples**

- These `show users roles` commands display the contents of the built-in roles.

  ```
  switch(config)#show users roles network-operator
  The default role is network-operator
  role: network-operator
    10 deny mode exec command bash|\|
    20 permit mode exec command .*
  switch(config)#show users roles network-admin
  The default role is network-operator
  role: network-admin
    10 permit command .*
  switch(config)#
  ```

4.4.4.2 Managing Roles

**Creating and Opening a Role**

Roles are created and modified in Role Configuration Mode. To create a role, enter the `role` command with the role’s name. The switch enters Role Configuration Mode. If the command is followed by the name of an existing role, subsequent commands edit that role.

**Example**

- This command places the switch in Role Configuration Mode to create a role named “sysuser.”

  ```
  switch(config)#role sysuser
  switch(config-role-sysuser)#
  ```

**Saving Role Changes**

Role Configuration Mode is a group-change mode; changes are saved by exiting the mode.
Examples

- These commands create a role, then add a deny rule to the role. Because the changes are not yet saved, the role remains empty, as shown by `show users roles`.

```
switch(config)#role sysuser
switch(config-role-sysuser)#deny mode exec command reload
switch(config-role-sysuser)#show users roles sysuser
```

The default role is network-operator

```
switch(config-role-sysuser)#
```

To save all current changes to the role and exit role configuration mode, type `exit`.

```
switch(config-role-sysuser)#exit
switch(config)#show users roles sysuser
```

The default role is network-operator

```
role: sysuser
  10 deny mode exec command reload
```

**Important!** After exiting role mode, `running-config` must be saved to `startup-config` to preserve role changes past system restarts.

Discarding Role Changes

The `abort` command exits Role Configuration Mode without saving pending changes.

Example

- These commands enter Role Configuration Mode to add deny rules, but discard the changes before saving them to the role.

```
switch(config)#role sysuser
switch(config-role-sysuser)#deny mode exec command reload
switch(config-role-sysuser)#abort
switch(config)#show users roles sysuser
```

The default role is network-operator

```
role: sysuser
```

4.4.4.3 Modifying Roles

Adding Rules to a Role

The `deny (Role)` command adds a deny rule to the configuration mode role. The `permit (Role)` command adds a permit rule to the configuration mode role.

To append a rule to the end of a role, enter the rule without a sequence number while in Role Configuration Mode. The new rule’s sequence number is derived by adding 10 to the last rule’s sequence number.
Examples

- These commands enter the first three rules into a new role.

```plaintext
switch(config)#role sysuser
switch(config-role-sysuser)#deny mode exec command reload
switch(config-role-sysuser)#deny mode config command (no |default )?router
switch(config-role-sysuser)#permit command .*
switch(config-role-sysuser)#exit
switch(config)#show users roles sysuser
```

The default role is network-operator

```
role: sysuser
  10 deny mode exec command reload
  20 deny mode config command (no |default )?router
  30 permit command .*
```

Inserting a Rule

To insert a rule into a role, enter the rule with a sequence number between the existing rules’ numbers.

Example

- This command inserts a rule between the first two rules by assigning it the sequence number 15.

```plaintext
switch(config)#role sysuser
switch(config-role-sysuser)#15 deny mode config-all command lacp
switch(config-role-sysuser)#exit
switch(config)#show users roles sysuser
```

The default role is network-operator

```
role: sysuser
  10 deny mode exec command reload
  15 deny mode config-all command lacp
  20 deny mode config command (no |default )?router
  30 permit command .*
```

Deleting a Rule

To remove a rule from the current role, perform one of these commands:

- Enter `no`, followed by the sequence number of the rule to be deleted.
- Enter `no`, followed by the rule to be deleted.
- Enter `default`, followed by the sequence number of the rule to be deleted.
- Enter `default`, followed by the rule to be deleted.

Example

- These equivalent commands remove rule 30 from the list.

```plaintext
switch(config-role-sysuser)#no 30
switch(config-role-sysuser)#default 30
switch(config-role-sysuser)#no permit command .*
switch(config-role-sysuser)#default permit command .*
```
This role results from entering one of the preceding commands.

```
switch(config)#show users roles sysuser
The default role is network-operator

role: sysuser
  10 deny mode exec command reload
  15 deny mode config-all command lacp|spanning-tree
  20 deny mode config command (no |default |)router
switch(config)#
```

Redistributing Sequence Numbers

Sequence numbers determine the order of the rules in a role. After a list editing session where existing rules are deleted and new rules are inserted between existing rules, the sequence number distribution may not be uniform. Redistributing rule numbers changes adjusts the sequence number of rules to provide a constant difference between adjacent rules. The `resequence (Role)` command adjusts the sequence numbers of role rules.

Example

- The `resequence` command renumbers rules in the `sysuser` role. The sequence number of the first rule is 100; subsequent rules numbers are incremented by 20.

```
switch(config)#show users roles sysuser
The default role is network-operator

role: sysuser
  10 deny mode exec command reload
  20 deny mode config-all command lacp|spanning-tree
  25 deny mode config command (no |default |)router
  30 permit command .*
switch(config)#role sysuser
switch(config-role-sysuser)#resequence 100 20
switch(config-role-sysuser)#exit
switch(config)#show users roles sysuser
The default role is network-operator

role: sysuser
  100 deny mode exec command reload
  120 deny mode config-all command lacp|spanning-tree
  140 deny mode config command (no |default |)router
  160 permit command .*
switch(config)#
```

4.4.5 Assigning a Role to a Username

Roles are assigned to local users through the `username` command and to remote users through RADIUS servers. Each user is assigned one role. Each role can be assigned to multiple local and remote users.

4.4.5.1 Default Roles

Users that are not explicitly assigned a role are assigned the default role. The `aaa authorization policy local default-role` command designates the default role. The “network-operator” built-in role is the default role when the default role is not configured.
Examples

- These commands assign “sysuser” as the default role, then display the name of the default role.

  ```
  switch(config)#aaa authorization policy local default-role sysuser
  switch(config)#show users roles
  The default role is sysuser
  
  switch(config)#
  
  <--------OUTPUT OMITTED FROM EXAMPLE--------->
  ```

- These commands restore “network-operator” as the default role by deleting the `aaa authorization policy local default-role` statement from `running-config`, then display the default role name.

  ```
  switch(config)#no aaa authorization policy local default-role
  switch(config)#show users roles
  The default role is network-operator
  
  switch(config)#
  
  <--------OUTPUT OMITTED FROM EXAMPLE--------->
  ```

4.4.5.2 Local Security File (Username command)

Roles are assigned to users with the `username` command’s `role` parameter. A username whose `running-config username` statement does not include a `role` parameter is assigned the default role.

The `role` parameter function in a command creating a username is different from its function in a command editing an existing name.

Assigning a Role to a New Username

A `username` command creating a username explicitly assigns a role to the username by including the `role` parameter; commands without a `role` parameter assigns the default role to the username.

Example

- These commands create two usernames. The first user is assigned a role; the second user assumes the default role.

  ```
  switch(config)#username FRED secret 0 axced role sysuser1
  switch(config)#username JANE nopassword
  switch(config)#show running-config
  
  !
  username FRED role sysuser1 secret 5 $1$dhJ6vrPV$PFOvJCX/vcqyIHV.vd.120
  username JANE nopassword
  !
  
  <--------OUTPUT OMITTED FROM EXAMPLE--------->
  ```

Editing the Role of an Existing Username

The role of a previously configured username may be edited by a `username` command without altering its password. The role assignment of a username is not changed by `username` commands that do not include a `role` parameter.
Examples

- These commands assign a role to a previously configured username.

```shell
switch(config)#username JANE role sysuser2
switch(config)#show running-config
  !
username FRED role sysuser1 secret 5 $1$dhJ6vrPV$PFOvJXC/vcqyIHV.vd.120
username JANE role sysuser2 nopassword
!
```

- These commands revert a username to the default role by removing its role assignment.

```shell
switch(config)#no username FRED role
switch(config)#show running-config
  !
username FRED secret 5 $1$dhJ6vrPV$PFOvJXC/vcqyIHV.vd.120
username JANE role sysuser2 nopassword
!
```

Displaying the Role Assignments

The `show users accounts` command displays role assignment of the configured users. The `show users detail` command displays roles of users that are currently logged into the switch.

Example

- This command displays the configured users and their role assignments.

```shell
switch(config)#show users accounts
user: FRED
  role: <unknown>
  privilege level: 1
user: JANE
  role: sysuser2
  privilege level: 1
user: admin
  role: network-admin
  privilege level: 1
switch(config)#
```

- This command displays information about the active AAA login sessions.

```shell
switch(config)#show aaa session
  Session  Username  Roles       TTY      State       Duration  Auth          Remote Host
  -------  -------  -------       ------      ------       --------  ------------  ------------
  2       admin   network-operator ttyS0  E  0:01:21     local
  4       Fred    sysadmin            telnet E  0:02:01     local       sf.example.com
  6       Jane    sysuser2            ssh    E  0:00:52     group radius       ny.example.com
  9       admin   network-admin      ssh    E  0:00:07     local       bj.example.com
  10      max     network-admin      telnet E  0:00:07     local       sf.example.com
```
4.4.5.3 Radius Servers

A role can be assigned to a remote user authenticated through a RADIUS server. Roles are assigned through the vendor-specific attribute-value (AV) pair named “Arista-AVPair.” The switch extracts the remote user’s role upon a successful authentication when RADIUS authentication is enabled.

Example

- This file extract is sample FreeRadius server code that includes the AV pair that assigns roles to three remote users.

```
# Sample RADIUS server users file
"Jane"          Cleartext-Password := "Abc1235"
Arista-AVPair = "shell:roles=sysuser2",
Service-Type = NAS-Prompt-User

"Mary"          Cleartext-Password := "xYz$2469"
Arista-AVPair = "shell:roles=sysadmin",
Service-Type = NAS-Prompt-User

"Fred"          Cleartext-Password := "rjx4#222"
Arista-AVPair = "shell:roles=network-operator",
Service-Type = NAS-Prompt-User
```

The `aaa authentication login` command selects the user authentication service (see Configuring Service Lists).

Example

- This command configures the switch to authenticate users through all RADIUS servers.

```
switch(config)#aaa authentication login default group radius
```

4.4.5.4 Enable Role-Based Access Control

To enable Role-Based Access Control on the switch, apply the following configuration:

```
switch(config)#aaa authorization commands all default local
```
4.5 Activating Security Services

After configuring the access databases, `aaa authentication`, `aaa authorization`, and `aaa accounting` commands designate active and backup services for handling access requests. These sections describe the methods of selecting the database that the switch uses to authenticate users and authorize access to network resources.

4.5.1 Authenticating Usernames and the Enable Password

Service lists specify the services the switch uses to authenticates usernames and the enable password.

4.5.1.1 Service List Description

Service list elements are service options, ordered by their priority. Important! When the local file is one of the service list elements, any attempts to locally authenticate a username that is not included in the local file will result in the switch continuing to the next service list element.

Example

- This is an example service list for username authentication:
  1. Location_1 server group – specifies a server group (see Server Groups).
  2. Location_2 server group – specifies a server group.
  3. TACACS+ servers – specifies all hosts for which a `tacacs-server host` command exists.
  4. Local file – specifies the local file.
  5. None – specifies that no authentication is required – all access attempts succeed.

To authenticate a username, the switch checks Location_1 server group. If a server in the group is available, the switch authenticates the username through that group. Otherwise, it continues through the list until it finds an available service or utilizes option 5, which allows the access attempt to succeed without authentication.

4.5.1.2 Configuring Service Lists

Service lists are incorporated into these `aaa authentication` commands to specify services the switch uses to authenticate usernames and the enable password.

- `aaa authentication login` specifies services the switch uses to authenticate usernames
- `aaa authentication enable` specifies services the switch uses to authenticate the enable password

Examples

- This command configures the switch to authenticate usernames through the TAC-1 server group. The local database is the backup method if TAC-1 servers are unavailable.

```
switch(config)#aaa authentication login default group TAC-1 local
```

- This command configures the switch to authenticate usernames through all TACACS+ servers, then all RADIUS servers if the TACACS+ servers are not available. If the RADIUS servers are unavailable, the switch does not authenticate any login attempts.

```
switch(config)#aaa authentication login default group tacacs+ group radius none
```
• This command configures the switch to authenticate the enable password through all TACACS+ servers, then through the local database if the TACACS+ servers are unavailable.

switch(config)#aaa authentication enable default group TACACS+ local

4.5.2 Authorization

Authorization commands control EOS shell access, CLI command access, and configuration access through the console port. The switch also supports role-based authorization, which allows access to specified CLI commands by assigning command profiles (or roles) to usernames. See Role-Based Authorization for details.

During the exec authorization process, TACACS+ server responses may include attribute-value (AV) pairs. The switch recognizes the mandatory AV pair named “priv-lvl=x” (where x is between 0 and 15).

By default, a TACACS+ server that sends any other mandatory AV pair is denied access to the switch. The receipt of optional AV pairs by the switch has no affect on decisions to permit or deny access to the TACACS+ server. The tacacs-server policy command programs the switch to allow access to TACACS+ servers that send unrecognized mandatory AV pairs.

Authorization to switch services is configured by the following aaa authorization commands.

• To specify the method of authorizing the opening of an EOS shell, enter aaa authorization exec.
• To specify the method of authorizing CLI commands, enter aaa authorization commands.

Examples

• This command specifies that TACACS+ servers authorize users attempting to open a CLI shell.

switch(config)#aaa authorization exec default group tacacs+

• This command programs the switch to authorize configuration commands (privilege level 15) through the local file and to deny command access to users not listed in the local file.

switch(config)#aaa authorization commands all default local

• This command programs the switch to permit all commands entered on the CLI.

switch(config)#aaa authorization commands all default none

• This command configures the switch to permit access to TACACS+ servers that send unrecognized mandatory AV pairs.

switch(config)#tacacs-server policy unknown-mandatory-attribute ignore

All commands are typically authorized through aaa authorization commands. However, the no aaa authorization config-commands command disables the authorization of configuration commands. In this state, authorization to execute configuration commands can be managed by controlling access to global configuration commands. The default setting authorizes configuration commands through the policy specified for all other commands.

• To enable the authorization of configuration commands with the policy specified for all other commands, enter aaa authorization config-commands.

• To require authorization of commands entered on the console, enter aaa authorization serial-console.

By default, EOS does not verify authorization of commands entered on the console port.

Examples

• This command disables the authorization of configuration commands.

switch(config)#no aaa authorization config-commands
• This command enables the authorization of configuration commands.
  
  ```
  switch(config)#aaa authorization config-commands
  ```

• This command configures the switch to authorize commands entered on the console, using the method specified through a previously executed `aaa authorization command`.
  
  ```
  switch(config)#aaa authorization serial-console
  ```

### 4.5.3 Accounting

The accounting service collects information for billing, auditing, and reporting. The switch supports TACACS+ and RADIUS accounting by reporting user activity to either the TACACS+ server or RADIUS server in the form of accounting records.

The switch supports two types of accounting:

- EXEC: Provides information about user CLI sessions.
- Commands: Command authorization for all commands, including configuration commands that are associated with a privilege level.

The accounting mode determines when accounting notices are sent. Mode options include:

- start-stop: a `start` notice is sent when a process begins; a `stop` notice is sent when it ends.
- stop-only: a `stop` accounting record is generated after a process successfully completes.

Accounting is enabled by the `aaa accounting` command.

#### Examples

• This command configures the switch to maintain start-stop accounting records for all commands executed by switch users and submits them to all TACACS+ hosts.
  
  ```
  switch(config)#aaa accounting commands all default start-stop group tacacs+
  ```

• This command configures the switch to maintain stop accounting records for all user EXEC sessions performed through the console and submits them to all TACACS+ hosts.

  ```
  switch(config)#aaa accounting exec console stop group tacacs+
  ```
4.6 TACACS+ Configuration Examples

These sections describe two sample TACACS+ host configurations.

4.6.1 Single Host Configuration

The example single host configuration consists of a TACACS+ server with these attributes:

- IP address: 10.1.1.10
- encryption key: example_1
- port number: 49 (global default)
- timeout: 5 seconds (global default)

The switch authenticates the username and enable command against all TACACS+ servers which, in this case, is one host. If the TACACS+ server is unavailable, the switch authenticates with the local file.

**Step 1** This step configures TACACS+ server settings – port number and timeout are global defaults.

```
switch(config)#tacacs-server host 10.1.1.10 key example_1
```

**Step 2** This step configures the login authentication service.

```
switch(config)#aaa authentication login default group tacacs+ local
```

**Step 3** This step configures the `enable` command password authentication service.

```
switch(config)#aaa authentication enable default group tacacs+ local
```

4.6.2 Multiple Host Configuration

The example multiple host configuration consists of three TACACS+ servers at these locations:

- IP address 10.1.1.12 – port 49
- IP address 172.16.4.12 – port 4900
- IP address – 192.168.2.10 – port 49

The configuration combines the servers into these server groups:

- Bldg_1 group consists of the servers at 10.1.1.2 and 172.16.4.12
- Bldg_2 group consists of the servers at 192.168.2.10

All servers use these global TACACS+ defaults:

- encryption key – example_2
- timeout – 10 seconds

The switch authenticates these access methods:

- username access against Bldg_1 group then, if they are not available, against the local file.
- enable command against Bldg_2 group, then Bldg_1 group, then against the local file.

**Step 1** TACACS+ Host commands:

These commands configure the IP address and ports for the three TACACS+ servers. The port for the first and third server is default 49.

```
switch(config)#tacacs-server host 10.1.1.12
switch(config)#tacacs-server host 172.16.4.12 port 4900
switch(config)#tacacs-server host 192.168.2.10
```

**Step 2** Global Configuration Commands:
These commands configure the global encryption key and timeout values.

```
switch(config)#tacacs-server key example_2
switch(config)#tacacs-server timeout 10
```

**Step 3  Group Server Commands:**

The `aaa group server` commands create the server groups and place the CLI in server group configuration mode, during which the servers are placed in the group. The port number must be included if it is not the default port, as in the line that adds 192.168.1.1.

```
switch(config)#aaa group server tacacs+ Bldg_1
switch(config-sg-tacacs+-Bldg_1)#server 10.1.1.2
switch(config-sg-tacacs+-Bldg_1)#server 192.168.1.1 port 4900
switch(config-sg-tacacs+-Bldg_1)#exit
switch(config)#aaa group server tacacs+ Bldg_2
switch(config-sg-tacacs+-Bldg_2)#server 192.168.2.2
switch(config-sg-tacacs+-Bldg_2)#exit
switch(config)#
```

**Step 4  Login and enable configuration authentication responsibility commands:**

These commands configure the username and enable command password authentication services.

```
switch(config)#aaa authentication login default group Bldg_1 local
switch(config)#aaa authentication enable default group Bldg_1 group Bldg_2 local
```
4.7 **AAA Commands**

**Local Security File Commands**
- `aaa root`
- `enable password`
- `show privilege`
- `show users`
- `show users accounts`
- `username`
- `username ssh-key`

**Accounting, Authentication, and Authorization Commands**
- `aaa accounting`
- `aaa accounting dot1x`
- `aaa accounting system`
- `aaa authentication dot1x`
- `aaa authentication enable`
- `aaa authentication login`
- `aaa authentication policy local allow-nopassword-remote-login`
- `aaa authentication policy log`

• show users roles
aaa accounting

The aaa accounting command configures accounting method lists for a specified authorization type. Each list consists of a prioritized list of methods. The accounting module uses the first available listed method for the authorization type.

The no aaa accounting and default aaa accounting commands clear the specified method list by removing the corresponding aaa accounting command from running-config.

Command Mode
Global Configuration

Command Syntax

    aaa accounting TYPE CONNECTION MODE [METHOD_1] [METHOD_2] ... [METHOD_N]
    no aaa accounting TYPE CONNECTION
    default aaa accounting TYPE CONNECTION

Parameters

- **TYPE** authorization type for which the command specifies a method list. Options include:
  - EXEC records user authentication events.
  - COMMANDS ALL records all entered commands.
  - COMMANDS level records entered commands of the specified level (ranges from 0 to 15).
- **CONNECTION** connection type of sessions for which method lists are reported. Options include:
  - console console connection.
  - default all connections not covered by other command options.
- **MODE** accounting mode that defines when accounting notices are sent. Options include:
  - none no notices are sent.
  - start-stop a start notice is sent when a process begins; a stop notice is sent when it ends.
  - stop-only a stop accounting record is generated after a process successfully completes.
- **METHOD_X** server groups (methods) to which the switch can send accounting records. The switch sends the method list to the first listed group that is available.

Parameter value is not specified if **MODE** is set to **none**. If **MODE** is not set to **none**, the command must provide at least one method. Each method is composed of one of the following:

- **group name** the server group identified by name.
- **group radius** server group that includes all defined RADIUS hosts.
- **group tacacs+** server group that includes all defined TACACS+ hosts.
- **logging** log all accounting messages to syslog.

Examples

- This command configures the switch to maintain start-stop accounting records for all commands executed by switch users and submits them to all TACACS+ hosts.
  switch(config)#aaa accounting commands all default start-stop group tacacs+
  switch(config)#

- This command configures the switch to maintain stop accounting records for all user EXEC sessions performed through the console and submits them to all TACACS+ hosts.
  switch(config)#aaa accounting exec console stop group tacacs+
  switch(config)#
aaa accounting dot1x

The `aaa accounting dot1x` command enables the accounting of requested 802.1X services for network access.

The `no aaa accounting dot1x` and `default aaa accounting dot1x` commands disable the specified method list by removing the corresponding `aaa accounting dot1x` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
aaa accounting dot1x default MODE [METHOD_1] [METHOD_2] ... [METHOD_N]
no aaa accounting dot1x default
default aaa accounting dot1x default
```

**Parameters**

- **MODE** accounting mode that defines when accounting notices are sent. Options include:
  - `start-stop` a `start` notice is sent when a process begins; a `stop` notice is sent when it ends.
  - `METHOD_X` server groups (methods) to which the switch can send accounting records. The switch sends the method list to the first listed group that is available.

Parameter value is not specified if `MODE` is set to `none`. If `MODE` is not set to `none`, the command must provide at least one method. Each method is composed of one of the following:

- `group name` the server group identified by `name`.
- `group radius` server group that includes all defined RADIUS hosts.
- `logging` server group that includes all defined TACACS+ hosts.

**Examples**

- This example configures IEEE 802.1X accounting on the switch.
  ```
  switch(config)#aaa accounting dot1x default start-stop group radius
  switch(config)#
  ```

- This example disables IEEE 802.1X accounting on the switch.
  ```
  switch(config)#no aaa accounting dot1x default
  switch(config)#
  ```
aaa accounting system

The aaa accounting system command performs accounting for all system-level events.

The no aaa accounting system and default aaa accounting system commands clear the specified method list by removing the corresponding aaa accounting system command from running-config.

Command Mode
Global Configuration

Command Syntax

aaa accounting system default MODE [METHOD_1] [METHOD_2] ... [METHOD_N]
no aaa accounting system default
default aaa accounting system default

Parameters

- **MODE** accounting mode that defines when accounting notices are sent. Options include:
  - none no notices are sent.
  - start-stop a start notice is sent when a process begins; a stop notice is sent when it ends.
  - stop-only a stop accounting record is generated after a process successfully completes.
- **METHOD_X** server groups (methods) to which the switch can send accounting records. The switch sends the method list to the first listed group that is available.

Parameter value is not specified if **MODE** is set to none. If **MODE** is not set to none, the command must provide at least one method. Each method is composed of one of the following:

- group name the server group identified by name.
- group radius server group that includes all defined RADIUS hosts.
- group tacacs+ server group that includes all defined TACACS+ hosts.
- logging server group that includes all defined TACACS+ hosts.

Examples

- This command configures AAA accounting to not use any accounting methods for system events.
  
  switch(config)#aaa accounting system default none
  switch(config)#

- This command configures the switch to maintain stop accounting records for system events to all defined RADIUS hosts.
  
  switch(config)#aaa accounting system default stop-only group radius
  switch(config)#
aaa authentication dot1x

The `aaa authentication dot1x` command configures the default authentication list of requested 802.1X services for network access.

The `no aaa authentication dot1x` and `default aaa authentication dot1x` commands remove the default authentication list for IEEE 802.1X.

**Command Mode**
Global Configuration

**Command Syntax**
```
aaa authentication dot1x default group {group_name | radius}
no aaa authentication dot1x default
default aaa authentication dot1x default
```

**Parameters**
- `default` configures the default authentication list of requested 802.1X services for network access
- `group` configures server group
- `group_name` server group name; multiple group names can be entered in a single command
- `radius` list of all defined RADIUS hosts

**Examples**
- This command configures the switch in the `auth1` group for IEEE 802.1X authentication.
  ```
  switch(config)#aaa authentication dot1x default group auth1
  switch(config)#
  ```
aaa authentication enable

The `aaa authentication enable` command configures the service list that the switch references to authorize access to Privileged EXEC command mode.

The list consists of a prioritized list of service options. Available service options include:

- a named server group
- all defined TACACS+ hosts
- all defined RADIUS hosts
- local authentication
- no authentication

The switch authorizes access by using the first listed service option that is available. When the local file is a service list element, attempts to locally authenticate a username that is not in the local file result in the switch continuing to the next service list element.

When the list is not configured, it is set to `local`.

The `no aaa authentication enable` and `default aaa authentication enable` commands revert the list configuration as `local` by removing the `aaa authentication enable` command from `running-config`.

**Command Mode**
- Global Configuration

**Command Syntax**

```
aaa authentication enable default [METHOD_1 [METHOD_2] ... [METHOD_N]]
no aaa authentication enable default
default aaa authentication enable default
```

**Parameters**

- `METHOD_X` authentication service method list. The command must provide at least one method. Each method is composed of one of the following:
  - `group name` the server group identified by `name`.
  - `group radius` a server group that consists of all defined RADIUS hosts.
  - `group tacacs+` a server group that consists of all defined TACACS+ hosts.
  - `local` local authentication.
  - `none` users are not authenticated; all access attempts succeed.

**Example**

- This command configures the switch to authenticate the enable password through all configured TACACS+ servers. Local authentication is the backup if TACACS+ servers are unavailable.

```
switch(config)#aaa authentication default enable group TACACS+ local
switch(config)#
```
aaa authentication login

The `aaa authentication login` command configures service lists the switch references to authenticate usernames. Service lists consist of service options ordered by usage priority. The switch authenticates usernames through the first available service option. Supported service options include:

- a named server group
- all defined TACACS+ hosts
- all defined RADIUS hosts
- local authentication
- no authentication

When the local file is a service list element, attempts to locally authenticate a username that is not in the local file result in the switch continuing to the next service list element.

The switch supports a `console` list for authenticating usernames through the console and a default list for authenticating usernames through all other connections.

- When the `console` list is not configured, the console connection uses the `default` list.
- When the `default` list is not configured, it is set to `local`.

The `no aaa authentication login` and `default aaa authentication login` commands revert the specified list configuration to its default by removing the corresponding `aaa authentication login` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```plaintext
aaa authentication login CONNECTION SERVICE_1 [SERVICE_2] ... [SERVICE_N]
nov aaa authentication login CONNECTION
default aaa authentication login CONNECTION
```

**Parameters**

- `CONNECTION` connection type of sessions for which authentication list is used
  - `default` the default authentication list
  - `console` the authentication list for console logins
- `SERVICE_X` an authentication service. Settings include:
  - `group name` identifies a previously defined server group
  - `group radius` a server group that consists of all defined RADIUS hosts
  - `group tacacs+` a server group that consists of all defined TACACS+ hosts
  - `local` local authentication
  - `none` the switch does not perform authentication. All access attempts succeed.

**Examples**

- This command configures the switch to authenticate usernames through the TAC-1 server group. The local database is the backup method if TAC-1 servers are unavailable.

  ```plaintext
  switch(config)#aaa authentication login default group TAC-1 local
  switch(config)#
  ```
This command configures the switch to authenticate usernames through all TACACS+ servers, then all RADIUS servers if the TACACS+ servers are not available. If the RADIUS servers are also unavailable, the switch allows access to all login attempts without authentication.

```
switch(config)#aaa authentication login default group tacacs+ group radius none
switch(config)#
```
aaa authentication policy local allow-nopassword-remote-login

The `aaa authentication policy local allow-nopassword-remote-login` command permits usernames without passwords to log in from any port. The default switch setting only allows unprotected usernames to log in from the console.

The `no aaa authentication policy local allow-nopassword-remote-login` and `default aaa authentication policy local allow-nopassword-remote-login` commands return the switch to the default setting of allowing unprotected usernames to log in only from the console.

**Command Mode**
- Global Configuration

**Command Syntax**

```
aaa authentication policy local allow-nopassword-remote-login
no aaa authentication policy local allow-nopassword-remote-login
default aaa authentication policy local allow-nopassword-remote-login
```

**Examples**

- This command configures the switch to allow unprotected usernames to log in from any port.
  ```
  switch(config)#aaa authentication policy local allow-nopassword-remote-login
  switch(config)#
  ```

- This command configures the switch to allow unprotected usernames to log in only from the console port.
  ```
  switch(config)#no aaa authentication policy local allow-nopassword-remote-login
  switch(config)#
  ```
aaa authentication policy log

The **aaa authentication policy log** command configures the switch to generate syslog messages for login authentication success or failure events.

The **no aaa authentication policy log** and the **default aaa authentication policy log** commands restore the default behavior of not generating syslog messages for these events.

**Command Mode**

Global Configuration

**Command Syntax**

```plaintext
aaa authentication policy {on-failure | on-success} log
no aaa authentication policy {on-failure | on-success} log
default aaa authentication policy {on-failure | on-success} log
```

**Parameters**

- **on-failure** generates syslog messages for failed login events.
- **on-success** generates syslog messages for successful login events.

**Examples**

This command configures the switch to log successful and failed login attempts.

```
switch(config)#aaa authentication policy on-success log
switch(config)#aaa authentication policy on-failure log
```
### aaa authorization commands

The **aaa authorization commands** command configures the service list that authorizes CLI command access. All switch commands are assigned a privilege level that corresponds to the lowest level command mode from which it can be executed:

- **Level 1**: Commands accessible from EXEC mode.
- **Level 15**: Commands accessible from any mode except EXEC.

Command usage is authorized for each privilege level specified in the command.

The list consists of a prioritized list of service options. The switch authorizes access by using the first listed service option that is available. The available service options include:

- a named server group
- all defined TACACS+ hosts
- all defined RADIUS hosts
- local authorization
- no authorization

The list is set to **none** for all unconfigured privilege levels, allowing all CLI access attempts to succeed. The **no aaa authorization commands** and **default aaa authorization commands** commands revert the list contents to **none** for the specified privilege levels.

#### Command Mode

- **Global Configuration**

#### Command Syntax

```plaintext
aaa authorization commands PRIV default SERVICE_1 [SERVICE_2] ... [SERVICE_N]
no aaa authorization commands PRIV default
default aaa authorization commands PRIV default
```

#### Parameters

- **PRIV** Privilege levels of the commands. Options include:
  - **level** numbers from 0 and 15. Number, range, comma-delimited list of numbers and ranges.
  - **all** commands of all levels.
- **SERVICE_X** Authorization service. Command must list at least one service. Options include:
  - **group name** the server group identified by name.
  - **group tacacs+** a server group that consists of all defined TACACS+ hosts.
  - **local** local authorization.
  - **none** the switch does not perform authorization. All access attempts succeed.

#### Examples

- This command authorizes configuration commands (privilege level 15) through the local file. The switch denies command access to users not listed in the local file.
  ```plaintext
  switch(config)#aaa authorization commands all default local
  switch(config)#
  ```
- This command authorizes all commands entered on the CLI.
  ```plaintext
  switch(config)#aaa authorization commands all default none
  switch(config)#
  ```
**aaa authorization config-commands**

The `aaa authorization config-commands` command enables authorization of commands in any configuration mode, such as Global Configuration and all interface configuration modes. Commands are authorized through the policy specified by the `aaa authorization commands` setting. Authorization is enabled by default, so issuing this command has no effect unless `running-config` contains the `no aaa authorization config-commands` command.

The `no aaa authorization config-commands` command disables configuration command authorization. When configuration command authorization is disabled, `running-config` contains the `no aaa authorization config-commands` command. The `default aaa authorization config-commands` command restores the default setting by removing the `no aaa authorization config-commands` from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

- `aaa authorization config-commands`
- `no aaa authorization config-commands`
- `default aaa authorization config-commands`

**Example**

- This command disables the authorization of configuration commands.
  ```
  switch(config)#no aaa authorization config-commands
  switch(config)#
  ```

- This command enables the authorization of configuration commands.
  ```
  switch(config)#aaa authorization config-commands
  switch(config)#
  ```
aaa authorization exec

The **aaa authorization exec** command configures the service list that the switch references to authorize access to open an EOS CLI shell.

The list consists of a prioritized list of service options. The switch authorizes access by using the first listed service option to which the switch can connect. When the switch cannot communicate with an entity that provides a specified service option, it attempts to use the next option in the list.

The available service options include:

- a named server group
- all defined TACACS+ hosts
- all defined RADIUS hosts
- local authentication
- no authentication

When the list is not configured, it is set to **none**, allowing all CLI access attempts to succeed.

The **no aaa authorization exec** and **default aaa authorization exec** commands set the list contents to **none**.

**Command Mode**

Global Configuration

**Command Syntax**

```
aaa authorization exec default METHOD_1 [METHOD_2] ... [METHOD_N]
no aaa authorization exec default
default aaa authorization exec default
```

**Parameters**

- **METHOD_X**  authorization service (method). The switch uses the first listed available method.

  The command must provide at least one method. Each method is composed of one of the following:

  - **group name**  the server group identified by *name*.
  - **group radius**  a server group that consists of all defined RADIUS hosts.
  - **group tacacs+**  a server group that consists of all defined TACACS+ hosts.
  - **local**  local authentication.
  - **none**  the switch does not perform authorization. All access attempts succeed.

**Guidelines**

During the exec authorization process, the TACACS+ server response may include attribute-value (AV) pairs. The switch recognizes **priv-lvl=x** (where *x* is an integer between 0 and 15), which is a mandatory AV pair. A TACACS+ server that sends any other mandatory AV pair is denied access to the switch. The receipt of optional AV pairs by the switch has no affect on decisions to permit or deny access to the TACACS+ server.

**Example**

- This command specifies that the TACACS+ servers authorize users that attempt to open an EOS CLI shell.

  ```
  switch(config)#aaa authorization exec default group tacacs+
  switch(config)#
  ```
aaa authorization policy local default-role

The **aaa authorization policy local** command specifies the name of the default role. A role is a data structure that supports local command authorization through its assignment to user accounts. Roles consist of permit and deny rules that define authorization levels for specified commands. Applying a role to a username authorizes the user to execute commands specified by the role.

The default role is assigned to the following users:

- local or remote users assigned to a role that is not configured.
- local users to whom a role is not assigned.

When the default-role is not specified, **network-operator** is assigned to qualified users as the default role. The network-operator role authorizes assigned users access to all CLI commands in EXEC and Privileged EXEC modes.

The **no aaa authentication policy local default-role** and **default aaa authorization policy local default-role** commands remove the **authentication policy local default-role** statement from **running-config**. Removing this statement restores **network-operator** as the default role.

**Command Mode**

Global Configuration

**Command Syntax**

```
aaa authorization policy local default-role role_name
no aaa authorization policy local default-role
default aaa authorization policy local default-role
```

**Parameters**

- **role_name** Name of the default role.

**Related Commands**

The **role** command places the switch in role configuration mode for creating and editing roles.

**Examples**

- This command configures the sysuser as the default role.

```
switch(config)#aaa authorization policy local default-role sysuser
switch(config)#
```

- This command restores **network-operator** as the default role.

```
switch(config)#no aaa authorization policy local default-role
switch(config)#
```

- This command displays the contents of the **network-operator** role.

```
switch#show users roles network-operator
The default role is network-operator

role: network-operator
    10 deny mode exec command bash\|\|
    20 permit mode exec command .*
switch#
```
aaa authorization serial-console

The **aaa authorization serial-console** command configures the switch to authorize commands entered through the console. By default, commands entered through the console do not require authorization.

The **no aaa authorization serial-console** and **default aaa authorization serial-console** commands restore the default setting.

**Command Mode**

Global Configuration

**Command Syntax**

```
aaa authorization serial-console
no aaa authorization serial-console
default aaa authorization serial-console
```

**Example**

- This command configures the switch to authorize commands entered on the console, using the method specified through a previously executed **aaa authorization commands** command.

  ```
  switch(config)#aaa authorization serial-console
  switch(config)#
  ```
aaa group server radius

The `aaa group server radius` command enters the Server-group-RADIUS Configuration Mode for the specified group name. The command creates the specified group if it was not previously created. Commands are available to add servers to the group.

A server group is a collection of servers that are associated with a single label. Subsequent authorization and authentication commands access all servers in a group by invoking the group name. Server group members must be previously configured with a `radius-server host` command.

The `no aaa group server radius` and `default aaa group server radius` commands delete the specified server group from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
aaa group server radius group_name
no aaa group server radius group_name
default aaa group server radius group_name
```

**Parameters**

- `group_name` name (text string) assigned to the group. Cannot be identical to a name already assigned to a TACACS+ server group.

**Commands Available in Server-group-RADIUS Configuration Mode**

- `server` (server-group-RADIUS configuration mode)

**Related Commands**

- `aaa group server tacacs+

**Example**

- This command creates the RADIUS server group named RAD-SV1 and enters Server-group-RADIUS Configuration Mode for the new group.

```
switch(config)#aaa group server radius RAD-SV1
switch(config-sg-radius-RAD-SV1)#
```
aaa group server tacacs+

The `aaa group server tacacs+` command enters Server-group-TACACS+ Configuration Mode for the specified group name. The command creates the specified group if it was not previously created. Commands are available to add servers to the group.

A server group is a collection of servers that are associated with a single label. Subsequent authorization and authentication commands access all servers in a group by invoking the group name. Server group members must be previously configured with a `tacacs-server host` command.

The `no aaa group server tacacs+` and `default aaa group server tacacs+` commands delete the specified server group from **running-config**.

**Command Mode**
Global Configuration

**Command Syntax**

```
aaa group server tacacs+ group_name
no aaa group server tacacs+ group_name
default aaa group server tacacs+ group_name
```

**Parameters**
- `group_name` name (text string) assigned to the group. Cannot be identical to a name already assigned to a RADIUS server group.

**Commands Available in Server-group-TACACS+ Configuration Mode**
- `server` (server-group-TACACS+ configuration mode)

**Related Commands**
- `aaa group server radius`

**Example**
- This command creates the TACACS+ server group named TAC-GR and enters Server-group-TACAS+ Configuration Mode for the new group.

```
switch(config)#aaa group server tacacs+ TAC-GR
switch(config-sg-tacacs+-TAC-GR)#
```
aaa root

The **aaa root** command specifies the password security level for the root account and can assign a password to the account.

The **no aaa root** and **default aaa root** commands disable the root account by removing the **aaa root** command from *running-config*. The root account is disabled by default.

**Command Mode**

Global Configuration

**Command Syntax**

aaa root *SECURITY_LEVEL* [ENCRYPT_TYPE] [password]

no aaa root
default aaa root

**Parameters**

- **SECURITY_LEVEL** password assignment level. Settings include:
  - secret the root account is assigned to the password.
  - nopassword the root account is not password protected.
- **ENCRYPT_TYPE** encryption level of the *password* parameter. This parameter is present only when **SECURITY_LEVEL** is secret. Settings include:
  - <no parameter> the password is entered as clear text.
  - 0 the password is entered as clear text. Equivalent to <no parameter>.
  - 5 the password is entered as an MD5-encrypted string.
  - sha512 the password is entered as a SHA-512-encrypted string.
- **password** text that authenticates the username. The command includes this parameter only if **SECURITY_LEVEL** is secret.
  - **password** must be in clear text if **ENCRYPT_TYPE** specifies clear text.
  - **password** must be an appropriately encrypted string if **ENCRYPT_TYPE** specifies encryption.

Encrypted strings entered through this parameter are generated elsewhere.

**Examples**

- These equivalent commands assign f4980 as the root account password.
  
  switch(config)#aaa root secret f4980
  switch(config)#aaa root secret 0 f4980

- This command assigns the text (ab234) that corresponds to the encrypted string of $1$HW05LEY8$QEVw6Jqjd9VqDfh.08r.b. as the root password.
  
  switch(config)#aaa root secret 5 $1$HW05LEY8$QEVw6Jqjd9VqDfh.08r.b
  switch(config)#

- This command removes the password from the root account.
  
  switch(config)#aaa root nopassword
  switch(config)#

- This command disables the root login.
  
  switch(config)#no aaa root
  switch(config)#
clear aaa counters

The clear aaa counters command resets the counters that track the number of service transactions performed by the switch since the last time the counters were reset. The show aaa counters command displays the counters reset by the clear aaa counters command.

Command Mode
Privileged EXEC

Command Syntax
   clear aaa counters [SERVICE_TYPE]

Example
   These commands display the effect of the clear aaa counters command on the AAA counters.

switch#clear aaa counters
switch#show aaa counters
Authentication
   Successful: 0
   Failed: 0
   Service unavailable: 0

Authorization
   Allowed: 1
   Denied: 0
   Service unavailable: 0

Accounting
   Successful: 0
   Error: 0
   Pending: 0

Last time counters were cleared: 0:00:44 ago
clear aaa counters radius

The `clear aaa counters radius` command resets the counters that track the statistics for the RADIUS servers that the switch accesses. The `show radius` command displays the counters reset by the `clear aaa counters radius` command.

**Command Mode**
Privileged EXEC

**Command Syntax**
`clear aaa counters radius`

**Example**
- These commands display the effect of the `clear aaa counters radius` command on the RADIUS counters.

```
switch#show radius
RADIUS server : radius/10
    Connection opens: 204
    Connection closes: 0
    Connection disconnects: 199
    Connection failures: 10
    Connection timeouts: 2
    Messages sent: 1490
    Messages received: 1490
    Receive errors: 0
    Receive timeouts: 0
    Send timeouts: 0

Last time counters were cleared: never
switch#clear aaa counters radius
switch#show radius
RADIUS server : radius/10
    Connection opens: 0
    Connection closes: 0
    Connection disconnects: 0
    Connection failures: 0
    Connection timeouts: 0
    Messages sent: 0
    Messages received: 0
    Receive errors: 0
    Receive timeouts: 0
    Send timeouts: 0

Last time counters were cleared: 0:00:03 ago
switch#
```
clear aaa counters tacacs+

The clear aaa counters tacacs+ command resets the counters that track the statistics for the TACACS+ servers that the switch accesses. The show tacacs command displays the counters reset by the clear aaa counters tacacs+ command.

Command Mode
Privileged EXEC

Command Syntax

    clear aaa counters tacacs+

Example

- These commands display the effect of the clear aaa counters tacacs+ command on the tacacs+ counters.

```bash
switch# show tacacs
TACACS+ server : tacacs/49
    Connection opens: 15942
    Connection closes: 7
    Connection disconnects: 1362
    Connection failures: 0
    Connection timeouts: 0
    Messages sent: 34395
    Messages received: 34392
    Receive errors: 0
    Receive timeouts: 2
    Send timeouts: 0

Last time counters were cleared: never

TACACS+ source-interface: Enabled

TACACS+ outgoing packets will be sourced with an IP address associated with the Loopback0 interface
switch#
```
deny (Role)

The deny command adds a deny rule to the configuration mode role. Deny rules prohibit access of specified commands from usernames to which the role is applied. Sequence numbers determine rule placement in the role. Commands are compared sequentially to rules within a role until it matches a rule. A command’s authorization is determined by the first rule it matches. Sequence numbers for commands without numbers are derived by adding 10 to the number of the role’s last rule.

Deny rules use regular expressions to denote commands. A mode parameter specifies command modes from which commands are restricted. Modes are denoted either by predefined keywords, a command mode’s short key, or a regular expression that specifies the long key of one or more command modes.

The no deny and default deny commands remove the specified rule from the configuration mode role. The no <sequence number> (Role) command also removes the specified rule from the role.

Command Mode
Role Configuration

Command Syntax

<table>
<thead>
<tr>
<th>SEQ_NUM</th>
<th>deny</th>
<th>MODE_NAME</th>
<th>command</th>
<th>command_name</th>
</tr>
</thead>
<tbody>
<tr>
<td>no deny</td>
<td>[MODE_NAME]</td>
<td>command</td>
<td>command_name</td>
<td></td>
</tr>
<tr>
<td>default deny</td>
<td>[MODE_NAME]</td>
<td>command</td>
<td>command_name</td>
<td></td>
</tr>
</tbody>
</table>

Parameters
- **SEQ_NUM** Sequence number assigned to the rule. Options include:
  - <no parameter> Number is derived by adding 10 to the number of the role’s last rule.
  - <1 – 256> Number assigned to entry.
- **MODE_NAME** Command mode from which command access is prohibited. Values include:
  - <no parameter> All command modes
  - mode short_name Exact match of a mode’s short key name.
  - mode long_name Regular expression matching long key name of one or more modes.
  - mode config Global configuration mode.
  - mode config-all All configuration modes, including global configuration mode.
  - mode exec EXEC and Privileged EXEC modes.
  - command_name Regular expression that denotes the name of one or more commands.

Guidelines
These CLI prompt format commands program the prompt to display the following mode keys:
- %p short mode key.
- %P long mode key.

Deny statements are saved to running-config only upon exiting Role Configuration Mode.

Related Commands
The role command places the switch in Role Configuration Mode.
Example

These commands append a deny rule at the end of the sysuser role that restricts access to the reload command from EXEC and Privileged EXEC mode.

```
switch(config)#role sysuser
switch(config-mode-sysuser)#deny mode exec command reload
switch(config-mode-sysuser)#
```
enable password

The `enable password` command creates a new enable password or changes an existing password.

The `no enable password` and `default enable password` commands delete the `enable password` by removing the `enable password` command from `running-config`.

Command Mode
Global Configuration

Command Syntax
```
enable password [ENCRYPT_TYPE] password
no enable password
default enable password
```

Parameters
- `ENCRYPT_TYPE` encryption level of the `password` parameter. Settings include:
  - `<no parameter>` the password is entered as clear text.
  - `0` the password is entered as clear text. Equivalent to `<no parameter>`.
  - `5` the password is entered as an MD5 encrypted string.
  - `sha512` the password is entered as an SHA-512-encrypted string.
- `password` text that authenticates the username.
  - `password` must be in clear text if `ENCRYPT_TYPE` specifies clear text.
  - `password` must be an appropriately encrypted string if `ENCRYPT_TYPE` specifies encryption.

Encrypted strings entered through this parameter are generated elsewhere.

Examples
- These equivalent commands assign `xyrt1` as the enable password.
  ```
  switch(config)#enable password xyrt1
  switch(config)#enable password 0 xyrt1
  ```
- This command assigns the enable password to the clear text (12345) that corresponds to the encrypted string `$1$8bPBrJnd$Z8wbKLHpJEEd7d4tc5Z/6h/`. The string was generated by an MD5-encryption program using 12345 as the seed.
  ```
  switch(config)#enable password 5 $1$8bPBrJnd$Z8wbKLHpJEEd7d4tc5Z/6h/
  ```
- This command deletes the enable password.
  ```
  switch(config)#no enable password
  ```
**ip radius source-interface**

The **ip radius source-interface** command specifies the interface from which the IPv4 address is derived for use as the source for outbound RADIUS packets. When a source interface is not specified, the switch selects an interface.

The **no ip radius source-interface** and **default ip radius source-interface** commands remove the **ip radius source-interface** command from **running-config**.

**Command Mode**
- Global Configuration

**Command Syntax**

```
ip radius [VRF_INST] source-interface INT_NAME
no ip radius [VRF_INST] source-interface
default ip radius [VRF_INST] source-interface
```

**Parameters**

- **VRF_INST** specifies the VRF instance used to communicate with the specified server.
- `<no parameter>` switch communicates with the server using the default VRF.
- **vrf vrf_name** switch communicates with the server using the specified user-defined VRF.
- **INT_NAME** Interface type and number. Options include:
  - **interface ethernet e_num** Ethernet interface specified by `e_num`.
  - **interface loopback l_num** Loopback interface specified by `l_num`.
  - **interface management m_num** Management interface specified by `m_num`.
  - **interface port-channel p_num** Port-channel interface specified by `p_num`.
  - **interface vlan v_num** VLAN interface specified by `v_num`.

**Example**

- This command configures the source address for outbound RADIUS packets as the IPv4 address assigned to the loopback interface.

```
switch(config)#ip radius source-interface loopback 0
switch(config)#
```
**ip tacacs source-interface**

The `ip tacacs source-interface` command specifies the interface from which the IPv4 address is derived for use as the source for outbound TACACS+ packets. When a source interface is not specified, the switch selects an interface.

The `no ip tacacs source-interface` and `default ip tacacs source-interface` commands remove the `ip tacacs source-interface` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip tacacs [VRF_INST] source-interface INT_NAME
no ip tacacs [VRF_INST] source-interface
default ip tacacs [VRF_INST] source-interface
```

**Parameters**

- **VRF_INST** specifies the VRF instance used to communicate with the specified server.
  - `<no parameter>` switch communicates with the server using the default VRF.
  - `vrf vrf_name` switch communicates with the server using the specified user-defined VRF.
- **INT_NAME** Interface type and number. Options include:
  - `interface ethernet e_num` Ethernet interface specified by `e_num`.
  - `interface loopback l_num` Loopback interface specified by `l_num`.
  - `interface management m_num` Management interface specified by `m_num`.
  - `interface port-channel p_num` Port-channel interface specified by `p_num`.
  - `interface vlan v_num` VLAN interface specified by `v_num`.

**Example**

- This command configures the source address for outbound TACACS+ packets as the IPv4 address assigned to the loopback interface.

```
switch(config)#ip tacacs source-interface loopback 0
switch(config)#
```
no <sequence number> (Role)

The `no <sequence number>` command removes the rule with the specified sequence number from the configuration-mode role. The `default <sequence number>` command also removes the specified rule.

**Command Mode**
- Role Configuration

**Command Syntax**
```
no sequence_num
default sequence_num
```

**Parameters**
- `sequence_num` sequence number of rule to be deleted. Values range from 1 to 256.

**Guidelines**
- Role statement changes are saved to `running-config` only upon exiting Role Configuration Mode.

**Related Commands**
- The `role` command places the switch in Role Configuration Mode.

**Example**
- These commands display the rules in the sysuser role, remove rule 30 from the role, then display the edited role.

```
switch(config)#show users roles sysuser
The default role is network-operator

role: sysuser
  10 deny mode exec command reload
  20 deny mode config command (no |default )?router
  30 deny mode config command (no |default )?(ip|mac) access-list
  40 deny mode if command (no |default )?(ip|mac) access-group
  50 deny mode config-all command lacp|spanning-tree
  60 permit command .*
switch(config)#role sysuser
switch(config-role-sysuser)#no 30
switch(config-role-sysuser)#exit
switch(config)#show users roles sysuser
The default role is network-operator

role: sysuser
  10 deny mode exec command reload
  20 deny mode config command (no |default )?router
  40 deny mode if command (no |default )?(ip|mac) access-group
  50 deny mode config-all command lacp|spanning-tree
  60 permit command .*
switch(config)#
```
AAA Commands

Chapter 4: AAA Configuration

**permit (Role)**

The `permit` command adds a permit rule to the configuration mode role. Permit rules authorize access to specified commands for usernames to which the role is applied. Sequence numbers determine rule placement in the role. Commands are compared sequentially to rules within a role until it matches a rule. A command’s authorization is determined by the first rule it matches. Sequence numbers for commands without numbers are derived by adding 10 to the number of the role’s last rule.

Permit rules use regular expression to denote commands. A `mode` parameter specifies command modes in which commands are authorized. Modes are denoted either by predefined keywords, a command mode’s short key, or a regular expression that specifies the long key of one or more command modes.

The `no deny` and `default deny` commands remove the specified rule from the configuration mode role. The `no <sequence number> (Role)` command also removes the specified rule from the role.

**Command Mode**

Role Configuration

**Command Syntax**

```bash
[SEQ_NUM] permit [MODE_NAME] command command_name
no permit [MODE_NAME] command command_name
default permit [MODE_NAME] command command_name
```

**Parameters**

- **SEQ_NUM**  Sequence number assigned to the rule. Options include:
  - `<no parameter>` Number is derived by adding 10 to the number of the role’s last rule.
  - `<1 – 256>` Number assigned to entry.
- **MODE_NAME**  Command mode in which command access is authorized. Values include:
  - `<no parameter>` All command modes
  - `mode short_name` Exact match of a mode’s short-key name.
  - `mode long_name` Regular expression matching long-key name of one or more modes.
  - `mode config` Global configuration mode.
  - `mode config-all` All configuration modes, including global configuration mode.
  - `mode exec` EXEC and Privileged EXEC modes.
  - `command_name` Regular expression that denotes the name of one or more commands.

**Guidelines**

These CLI `prompt` format commands program the prompt to display the following mode keys:

- `%p` short-mode key.
- `%P` long-mode key.

Permit statements are saved to `running-config` only upon exiting Role Configuration Mode.

**Related Commands**

The `role` command places the switch in Role Configuration Mode.
Example

- These commands append a `permit` rule at the end of the sysuser role that authorizes all commands from VLAN 1 or VLAN 2 interface configuration modes.

```plaintext
switch(config)#role sysuser
switch(config-mode-sysuser)#permit mode if-Vl(1|2) command .*
switch(config-mode-sysuser)#
```
radius-server deadtime

The `radius-server deadtime` command defines global deadtime period, when the switch ignores a non-responsive RADIUS server. A non-responsive server is one that fails to answer any attempt to retransmit after a timeout expiry. Deadtime is disabled if a value is not configured.

The `no radius-server deadtime` and `default radius-server deadtime` commands restore the default global deadtime period of three minutes by removing the `radius-server deadtime` command from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**
```
radius-server deadtime dead_interval
no radius-server deadtime
default radius-server deadtime
```

**Parameters**
- `dead_interval` period that the switch ignores non-responsive servers (minutes). Values range from 1 to 1000. Default is 3.

**Related Commands**
- `radius-server host`

**Example**
- This command programs the switch to ignore a server for two hours if it fails to respond to a request during the period defined by timeout and retransmit parameters.

```
switch(config)#radius-server deadtime 120
switch(config)#
```
radius-server host

The `radius-server host` command sets parameters for communicating with a specific RADIUS server. These values override global settings when the switch communicates with the specified server.

A RADIUS server is defined by its server address, authorization port, and accounting port. Servers with different address-authorization port-accounting port combinations have separate configurations.

The `no radius-server host` and `default radius-server` commands remove settings for the RADIUS server configuration at the specified address-authorization port-accounting port location by deleting the corresponding `radius-server host` command from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**

```
radius-server host ADDR [VRF_INST] [AUTH] [ACCT] [TIMEOUT] [DEAD] [RETRAN] [ENCRYPT]
no radius-server host [ADDR][VRF_INST][AUTH][ACCT]
default radius-server host [ADDR][VRF_INST][AUTH][ACCT]
```

**Parameters**

- **ADDR** RADIUS server location. Options include:
  - `ipv4_addr` server’s IPv4 address.
  - `host_name` server’s DNS host name (FQDN).

- **VRF_INST** specifies the VRF instance used to communicate with the specified server.
  - `<no parameter>` switch communicates with the server using the default VRF.
  - `vrf vrf_name` switch communicates with the server using the specified user-defined VRF.

- **AUTH** Authorization port number.
  - `<no parameter>` default port of 1812.
  - `auth-port number` `number` ranges from 1 to 65535.

- **ACCT** Accounting port number.
  - `<no parameter>` default port of 1813.
  - `acct-port number` `number` ranges from 1 to 65535.

- **TIMEOUT** timeout period (seconds). Ranges from 1 to 1000.
  - `<no parameter>` assigns global timeout value (see `radius-server timeout`).
  - `timeout number` assigns `number` as the timeout period. Ranges from 1 to 1000.

- **DEAD** period (minutes) when the switch ignores a non-responsive RADIUS server.
  - `<no parameter>` assigns global deadtime value (see `radius-server deadtime`).
  - `deadtime number` specifies deadtime, where `number` ranges from 1 to 1000.

- **RETRAN** attempts to access RADIUS server after the first timeout expiry.
  - `<no parameter>` assigns global retransmit value (see `radius-server retransmit`).
  - `retransmit number` specifies number of attempts, where `number` ranges from 1 to 100.

- **ENCRYPT** encryption key that switch and server use to communicate.
  - `<no parameter>` assigns global encryption key (see `radius-server key`).
  - `key key_text` where `key_text` is in clear text.
  - `key 5 key_text` where `key_text` is in clear text.
  - `key 7 key_text` where `key_text` is provide in an encrypted string.
Examples

- This command configures the switch to communicate with the RADIUS server located at 10.1.1.5. The switch uses the global timeout, deadtime, retransmit, and key settings to communicate with this server, and communicates through port 1812 for authorization and 1813 for accounting.

  ```
  switch(config)#radius-server host 10.1.1.5
  switch(config)#
  ```

- This command configures the switch to communicate with the RADIUS server assigned the host name RAD-1. Communication for authorization is through port 1850; communication for accounting is through port 1813 (the default).

  ```
  switch(config)#radius-server host RAD-1 auth-port 1850
  switch(config)#
  ```
radius-server key

The `radius-server key` command defines the global encryption key the switch uses when communicating with any RADIUS server for which a key is not defined.

The `no radius-server key` and `default radius-server key` commands remove the global key from `running-config`.

Command Mode

Global Configuration

Command Syntax

```
radius-server key [ENCRYPT_TYPE] encrypt_key
no radius-server key
default radius-server key
```

Parameters

- **ENCRYPT_TYPE** encryption level of `encrypt_key`.
  - `<no parameter>` encryption key is entered as clear text.
  - `0` encryption key is entered as clear text. Equivalent to `<no parameter>`.
  - `7` `encrypt_key` is an encrypted string.
- `encrypt_key` shared key that authenticates the username.
  - `encrypt_key` must be in clear text if `ENCRYPT_TYPE` specifies clear text.
  - `encrypt_key` must be an encrypted string if `ENCRYPT_TYPE` specifies an encrypted string.

Encrypted strings entered through this parameter are generated elsewhere.

Related Commands

- `radius-server host`

Examples

- This command configures `cv90jr1` as the global encryption key.
  ```
  switch(config)#radius-server key 0 cv90jr1
  switch(config)#
  ```
- This command assigns `cv90jr1` as the key by specifying the corresponding encrypted string.
  ```
  switch(config)#radius-server key 7 020512025B0C1D70
  switch(config)#
  ```
**radius-server retransmit**

The `radius-server retransmit` command defines the global retransmit count, which specifies the number of times the switch attempts to access the RADIUS server after the first timeout expiry.

The **no radius-server retransmit** and **default radius-server retransmit** commands restore the global retransmit count to its default value of three by deleting the `radius-server retransmit` command from **running-config**.

**Command Mode**

- Global Configuration

**Command Syntax**

```
radius-server retransmit count
no radius-server retransmit
default radius-server retransmit
```

**Parameters**

- **count** retransmit attempts after first timeout expiry. Values range from 1 to 100. Default is 3.

**Related Commands**

- `radius-server host`

**Example**

- This command configures the switch to attempt five RADIUS server contacts after the initial timeout. If the timeout parameter is set to 50 seconds, then the total period that the switch waits for a response is \((5+1)^*50\) = 300 seconds.

  switch(config)#radius-server retransmit 5
  switch(config)#
**radius-server timeout**

The `radius-server timeout` command defines the global timeout the switch uses when communicating with any RADIUS server for which a timeout is not defined.

The `no radius-server timeout` and `default radius-server timeout` commands restore the global timeout default period of five seconds by removing the `radius-server timeout` command from `running-config`.

**Command Mode**
- Global Configuration

**Command Syntax**

```plaintext
radius-server timeout time_period
no radius-server timeout
default radius-server timeout
```

**Parameters**

- `time_period`  
  timeout period (seconds). Values range from 1 to 1000. Default is 5.

**Related Commands**

- `radius-server host`
- `radius-server key`
- `radius-server deadtime`
- `radius-server retransmit`

**Example**

- This command configures the switch to wait 50 seconds for a RADIUS server response before issuing an error.

```
switch(config)#radius-server timeout 50
switch(config)#
```
resequence (Role)

The resequence command assigns sequence numbers to rules in the configuration mode role. Command parameters specify the number of the first rule and the numeric interval between consecutive rules.

The maximum sequence number is 256.

Command Mode

Role Configuration

Command Syntax

resequence start_num inc_num

Parameters

• start_num sequence number assigned to the first rule. Value ranges from 1 to 256. Default is 10.
• inc_num numeric interval between consecutive rules. Value ranges from 1 to 256. Default is 10.

Guidelines

Role statement changes are saved to running-config only upon exiting Role Configuration Mode.

Related Commands

The role command places the switch in Role Configuration Mode.

Example

• The resequence command renumbers the rules in the sysuser role, starting the first rule at 15 and incrementing subsequent lines by 5.

  switch(config)#show users roles sysuser
  The default role is network-operator
  
  role: sysuser
    10 deny mode exec command reload
    20 deny mode config command (no |default )?router
    30 deny mode if command (no |default )?(ip|mac) access-group
    40 deny mode config-all command lacp|spanning-tree
    50 deny mode config-all command lacp|spanning-tree
    60 permit command .*
  switch(config)#role sysuser
  switch(config-role-sysuser)#resequence 15 5
  switch(config-role-sysuser)#exit
  switch(config)#show users roles sysuser
  The default role is network-operator
  
  role: sysuser
    15 deny mode exec command reload
    20 deny mode config command (no |default )?router
    25 deny mode if command (no |default )?(ip|mac) access-group
    30 deny mode config-all command lacp|spanning-tree
    35 permit command .*
  switch(config)#
role

The `role` command places the switch in Role Configuration Mode, which is a group-change mode that modifies a role. A role is a data structure that supports local command authorization through its assignment to user accounts. Roles consist of permit and deny rules that define authorization levels for specified commands. Applying a role to a username authorizes the user to execute commands specified by the role.

The `role` command specifies the name of the role that subsequent commands modify and creates a role if it references a nonexistent role. All changes in a group change mode edit session are pending until the session ends:

- The `exit` command saves pending changes to `running-config` and returns the switch to Global Configuration Mode. Changes are also saved by entering a different configuration mode.
- The `abort` command discards pending changes, returning the switch to Global Configuration Mode.

The `no role` and `default role` commands delete the specified role by removing the role and its statements from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
role role_name
no role role_name
default role role_name
```

**Parameters**

- `role_name` Name of role.

**Commands Available in Role Configuration Mode:**

- `deny (Role)`
- `permit (Role)`
- `no <sequence number> (Role)`
- `resequence (Role)`

**Related Commands**

- `show users roles`

**Examples**

- This command places the switch in Role Configuration Mode to modify the speaker role.
  ```
  switch(config)# role speaker
  switch(config-role-speaker)#
  ```

- This command saves changes to `speaker` role, then returns the switch to Global Configuration Mode.
  ```
  switch(config-role-speaker)# exit
  switch(config)#
  ```

- This command discards changes to `speaker`, then returns the switch to Global Configuration Mode.
  ```
  switch(config-role-speaker)# abort
  switch(config)#
  ```
server (server-group-RADIUS configuration mode)

The **server (server-group-RADIUS configuration mode)** command adds the specified RADIUS server to the configuration-mode group. Servers must be configured with the **radius-server host** command before adding them to the server group.

A RADIUS server is defined by its server address, authorization port, and accounting port. A group can contain multiple servers with the same IP address that have different authorization or accounting ports.

The **no server** and **default server** commands remove the specified server from the group.

**Command Mode**

Server-Group-RADIUS Configuration

**Command Syntax**

```
server LOCATION [VRF_INST] [AUTH] [ACCT]
no server LOCATION [VRF_INST] [AUTH] [ACCT]
default server LOCATION [VRF_INST] [AUTH] [ACCT]
```

**Parameters**

- **LOCATION**  
  RADIUS server location. Options include:
  - `ipv4_addr`  
    server’s IPv4 address.
  - `host_name`  
    server’s DNS host name (FQDN).
  - `VRF_INST`  
    specifies the VRF instance used to communicate with the specified server.
    - `<no parameter>`  
      switch communicates with the server using the default VRF.
    - `vrf vrf_name`  
      switch communicates with the server using the specified user-defined VRF.
  - **AUTH**  
    Authorization port number.
    - `<no parameter>`  
      default port of 1812.
    - `auth-port number`  
      number ranges from 1 to 65535.
  - **ACCT**  
    Accounting port number.
    - `<no parameter>`  
      default port of 1813.
    - `acct-port number`  
      number ranges from 1 to 65535.

**Related Commands**

The **aaa group server radius** command places the switch in Server-group-RADIUS Configuration Mode.

**Example**

- These commands add two servers to the RAD-SV1 server group.
  ```
  switch(config)#aaa group server radius RAD-SV1
  switch(config-sg-radius-RAD-SV1)#server RAC-1
  switch(config-sg-radius-RAD-SV1)#server 10.1.5.14 acct-port 1851
  switch(config-sg-radius-RAD-SV1)#
  ```
server (server-group-TACACS+ configuration mode)

The server (server-group-TACACS+ configuration mode) command adds the specified TACACS+ server to the configuration-mode group. Servers must be configured with the tacacs-server host command before adding them to the server group.

A TACACS+ server is defined by its server address and port number. Servers with different address-port combinations have separate statements in running-config.

The no server and default server commands remove the specified server from the group.

Command Mode

Server-group-TACACS+ Configuration

Command Syntax

server LOCATION [VRF_INST] [PORT]
no server LOCATION [VRF_INST] [PORT]
default server LOCATION [VRF_INST] [PORT]

Parameters

- **LOCATION** TACACS+ server location. Options include:
  - ipv4_addr server’s IPv4 address.
  - ipv6_addr server’s IPv6 address.
  - host_name server’s DNS host name (FQDN).
- **VRF_INST** specifies the VRF instance used to communicate with the specified server.
  - <no parameter> switch communicates with the server using the default VRF.
  - vrf vrf_name switch communicates with the server using the specified user-defined VRF.
- **PORT** TCP connection port number.
  - <no parameter> default port of 49.
  - port number number ranges from 1 to 65535.

Related Commands

The aaa group server tacacs+ command places the switch in Server-group-TACACS+ Configuration Mode.

Example

- These commands add two servers to the TAC-GR server group with default port number 49.

```bash
switch(config)#aaa group server tacacs+ TAC-GR
switch(config-sg-tacacs+-TAC-GR)#server TAC-1
switch(config-sg-tacacs+-TAC-GR)#server 10.1.4.14
switch(config-sg-tacacs+-TAC-GR)#
```
**show aaa**

The `show aaa` command displays the user database. The command displays the encrypted enable password first, followed by a table of usernames and their corresponding encrypted password. The command does not display unencrypted passwords.

**Command Mode**
Privileged EXEC

**Command Syntax**
`show aaa`

**Example**
- This command displays the local user database.

```plaintext
switch#show aaa
Enable password (encrypted): $1$UL4gDWy6$3KqCPYFGRvxDuqUq3qA/Hs/
Username      Encrypted passwd
-------------- -----------------------------
admin          -----------------------------
janis          $1$VVnDH/Ea$iwsfnrGNO8nbDsf0tazp9/
thomas         $1$/MmXTUil$.fJxLfcumzppNSEDVDWq9.
switch#
```
show aaa counters

The **show aaa counters** command displays the number of service transactions performed by the switch since the last time the counters were reset.

**Command Mode**

Privileged EXEC

**Command Syntax**

```
show aaa counters
```

**Example**

- This command displays the number of AAA transactions.

```
switch#show aaa counters
Authentication
   Successful: 30
   Failed: 0
   Service unavailable: 0

Authorization
   Allowed: 188
   Denied: 0
   Service unavailable: 0

Accounting
   Successful: 0
   Error: 0
   Pending: 0

Last time counters were cleared: never
switch#
```
show aaa methods

The `show aaa methods` command displays all the named method lists defined in the specified Authentication, Authorization, and Accounting (AAA) service.

**Command Mode**
Privileged EXEC

**Command Syntax**
```
show aaa methods SERVICE_TYPE
```

**Parameters**
- `SERVICE_TYPE` the service type of the method lists that the command displays.
  - `accounting` accounting services.
  - `authentication` authentication services.
  - `authorization` authorization services.
  - `all` accounting, authentication, and authorization services.

**Example**
- This command configures the named method lists for all AAA services.

```
switch#show aaa methods all
Authentication method lists for LOGIN:
  name=default methods=group tacacs+, local
Authentication method list for ENABLE:
  name=default methods=local
Authorization method lists for COMMANDS:
  name=privilege0-15 methods=group tacacs+, local
Authentication method list for EXEC:
  name=exec methods=group tacacs+, local
Accounting method lists for COMMANDS:

switch#
```
show users detail

The `show users detail` command displays information about active AAA login sessions. Information includes username, roles, TTY, state of the session (pending or established), duration, authentication method, and if available, remote host and remote username.

**Command Mode**
Privileged EXEC

**Command Syntax**

```
show users detail
```

**Example**

- This command displays information about the active AAA login sessions.

```
switch# show users detail
Session Username Roles TTY State Duration Auth          Remote Host
-------  ---------- ------ ----- -------- ------------- ------------
          2 admin network-admin ttyS0 E 0:01:21 local
          4 joe sysadmin telnet E 0:02:01 local
                          sf.example.com
          6 alice sysadmin ssh E 0:00:52 group radius ny.example.com
                          e.com
          7 bob sysadmin ssh E 0:00:48 group radius la.example.com
e.com
          8 kim network-admin1 ssh E 0:00:55 group radius de.example.com
e.com
          9 admin network-admin ssh E 0:00:07 local bj.example.com
e.com
         10 max network-admin telnet E 0:00:07 local sf.example.com
e.com
```
show privilege

The `show privilege` command displays the current privilege level for the CLI session.

**Command Mode**

EXEC  

**Command Syntax**

`show privilege`

**Example**

- This command displays the current privilege level.

  `switch>show privilege`
  
  Current privilege level is 15
  
  `switch>`
show radius

The **show radius** command displays statistics for the RADIUS servers that the switch accesses.

**Command Mode**

EXEC

**Command Syntax**

```
show radius
```

**Example**

- This command displays statistics for connected RADIUS servers.

```
switch>show radius
RADIUS server            : radius/10
    Connection opens: 204
    Connection closes: 0
    Connection disconnects: 199
    Connection failures: 10
    Connection timeouts: 2
    Messages sent: 1490
    Messages received: 1490
    Receive errors: 0
    Receive timeouts: 0
    Send timeouts: 0

Last time counters were cleared: never
switch>
```
**show tacacs**

The `show tacacs` command displays statistics for the TACACS+ servers that the switch accesses.

**Command Mode**

EXEC

**Command Syntax**

`show tacacs`

**Example**

- This command displays statistics for connected TACACS+ servers.

  ```
  switch>show tacacs
  TACACS+ server : tacacs/49
  Connection opens: 15942
  Connection closes: 7
  Connection disconnects: 1362
  Connection failures: 0
  Connection timeouts: 0
  Messages sent: 34395
  Messages received: 34392
  Receive errors: 0
  Receive timeouts: 2
  Send timeouts: 0

  Last time counters were cleared: never
  ```

  TACACS+ source-interface: Enabled
  TACACS+ outgoing packets will be sourced with an IP address associated with the Loopback0 interface

  switch>
  ```
show users accounts

The **show users accounts** command displays the names, roles, and privilege levels of users that are listed in **running-config**. The SSH public key is also listed for names for which an SSH key is configured.

**Command Mode**

Privileged EXEC

**Command Syntax**

show users accounts

**Example**

- This command displays the usernames that are configured on the switch.

```plaintext
switch#show users accounts
user: FRED
  role: <unknown>
  privilege level: 1
  ssh public key: ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAABAQDjUg2VDiBX7In0qHtN5PyHOWtYv1oe2sxF5YmesQ/rh++mbpT504dL7So+Bpr9T/0qIj+zilat8fX/J1O42+3pjfkHY/+lst2EPnjGTK7uJv1wSgmhc3+90dNmjtr5YV1JFjjQ5m+5Pa+PGe3z4JIV11Y2NhLrV2fXtbc1Ldjinj6FAlhxjilh51DjhGl3uUxGBJe0+N1GvpEsTJVJvMdJuS6weMi+xSXc9yQimVD2weJBHsYFngh5T2j0pAyF2S7/EOU13pY4ZrzdD5s42mMNnrtPT0q5Z17aAKvhpD0d1c+qiwrCrXbeICbRem7+0N8/zA3aLBk4eK5F5ZBd3Pb admin@switch
switch#
user: JANE
  role: sysuser2
  privilege level: 1
user: admin
  role: network-admin
  privilege level: 1
```
**show users**

The `show users` command displays the usernames that are currently logged into the switch.

**Command Mode**

Privileged EXEC

**Command Syntax**

```
show users
```

**Example**

- This command displays the users that are logged into the switch.

```
switch#show users
Line       User       Host(s)              Idle       Location
1 vty 2     john       idle                       1d 10.22.6.113
2 vty 4     jane       idle                 21:33:00  10.22.26.26
* 3 vty 6     ted        idle                 00:00:01  10.17.18.71

switch#
```
show users roles

The show users roles command displays the name of the default role and the contents of the specified roles. Commands that do not specify a role display the rules in all built-in and configured roles.

Command Mode
Privileged EXEC

Command Syntax
show users roles [ROLE_LIST]

Parameters
- ROLE_LIST Roles that the command displays. Options include:
  - <no parameter> Command displays all roles.
  - role_name Name of role displayed by command.

Related Commands
The role command places the switch in Role Configuration Mode, which is used to create new roles or modify existing roles.

Example
- This command displays the contents of all user-defined and built-in roles.

```
switch#show users roles
The default role is network-operator

role: network-admin
  10 permit command .*
role: network-operator
  10 deny mode exec command bash|\|
  20 permit mode exec command .*
role: sysuser
  15 deny mode exec command reload
  20 deny mode config command (no |default )?router
  25 deny mode if command (no |default )?(ip|mac) access-group
  30 deny mode config-all command lacp|spanning-tree
  35 permit command .*
  40 deny mode exec command .*
  50 permit mode exec command show|clear (counters|platform)|configure
```
**tacacs-server host**

The `tacacs-server host` command sets communication parameters for communicating with a specific TACACS+ server. These values override global settings when the switch communicates with the specified server.

A TACACS+ server is defined by its server address and port number. Servers with different combinations of address-port-VRF-multiplex settings have separate statements in `running-config`.

The `no tacacs-server host` and `default tacacs-server host` commands remove settings for the TACACS+ server configuration at the specified address-port-VRF combination by deleting the corresponding `tacacs-server host` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
tacacs-server host SERVER_ADDR [MULTIPLEX] [VRF_INST] [PORT] [TIMEOUT] [ENCRYPT]
no tacacs-server host [SERVER_ADDR] [MULTIPLEX] [VRF_INST] [PORT]
default tacacs-server host [SERVER_ADDR] [MULTIPLEX] [VRF_INST] [PORT]
```

**Parameters**

- **SERVER_ADDR**  TACACS+ server location. Options include:
  - `ipv4_addr`  server’s IPv4 address.
  - `ipv6_addr`  server’s IPv6 address.
  - `host_name`  server’s DNS host name (FQDN).
- **MULTIPLEX**  TACACS+ server support of multiplex sessions on a TCP connection.
  - `<no parameter>`  server does not support multiplexing.
  - `single-connection`  server supports session multiplexing.
- **VRF_INST**  specifies the VRF instance used to communicate with the specified server.
  - `<no parameter>`  switch communicates with the server using the default VRF.
  - `vrf vrf_name`  switch communicates with the server using the specified user-defined VRF.
- **PORT**  port number of the TCP connection.
  - `<no parameter>`  default port of 49.
  - `port number`  port number ranges from 1 to 65535.
- **TIMEOUT**  timeout period (seconds).
  - `<no parameter>`  assigns the globally configured timeout value (see `tacacs-server timeout`).
  - `timeout number`  timeout period (seconds). `number` ranges from 1 to 1000.
- **ENCRYPT**  encryption key the switch and server use to communicate. Settings include
  - `<no parameter>`  assigns the globally configured encryption key (see `tacacs-server key`).
  - `key key_text`  where `key_text` is in clear text.
  - `key 5 key_text`  where `key_text` is in clear text.
  - `key 7 key_text`  where `key_text` is an encrypted string.
Examples

- This command configures the switch to communicate with the TACACS+ server located at 10.1.1.5. The switch uses the global timeout, encryption key, and port settings.

```console
switch(config)#tacacs-server host 10.1.1.5
switch(config)#
```

- This command configures the switch to communicate with the TACACS+ server assigned the host name TAC_1. The switch defines the timeout period as 20 seconds and the encryption key as rp31E2v.

```console
switch(config)#tacacs-server host TAC_1 timeout 20 key rp31E2v
switch(config)#
```

- This command configures the switch to communicate with the TACACS+ server located at 10.12.7.9, indicates that the server supports multiplexing sessions on the same TCP connection, and that access is through port 54.

```console
switch(config)#tacacs-server host 10.12.7.9 single-connection port 54
switch(config)#
```

tacacs-server key

The `tacacs-server key` command defines the global encryption key the switch uses when communicating with any TACACS+ server for which a key is not defined.

The `no tacacs-server key` and `default tacacs-server key` commands remove the global key from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**
```
tacacs-server key [ENCRYPT_TYPE] encrypt_key
no tacacs-server key
default tacacs-server key
```

**Parameters**
- `ENCRYPT_TYPE` encryption level of `encrypt_key`.
  - `<no parameter>` encryption key is entered as clear text.
  - `0` encryption key is entered as clear text. Equivalent to `<no parameter>`.
  - `7` `encrypt_key` is an encrypted string.
- `encrypt_key` shared key that authenticates the username.
  - `encrypt_key` must be in clear text if `ENCRYPT_TYPE` specifies clear text.
  - `encrypt_key` must be an encrypted string if `ENCRYPT_TYPE` specifies an encrypted string.

Encrypted strings entered through this parameter are generated elsewhere.

**Related Commands**
- `tacacs-server host`

**Examples**
- This command configures `cv90jr1` as the encryption key.
  ```
  switch(config)#tacacs-server key 0 cv90jr1
  switch(config)#
  ```
- This command assigns `cv90jr1` as the key by specifying the corresponding encrypted string.
  ```
  switch(config)#tacacs-server key 7 020512025B0C1D70
  switch(config)#
  ```
tacacs-server policy

The `tacacs-server policy` command programs the switch to permit access to TACACS+ servers that send mandatory attribute-value (AV) pairs that the switch does not recognize. By default, the switch denies access to TACACS+ servers when it receives unrecognized AV pairs from the server.

The switch recognizes the following mandatory AV pairs:

- `priv-lvl=x` where x is an integer between 0 and 15.

The `no tacacs-server policy` and `default tacacs-server policy` commands restore the switch default of denying access to servers from which it receives unrecognized mandatory AV pair by deleting the `tacacs-server policy` statement from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```bash
tacacs-server policy unknown-mandatory-attribute ignore
no tacacs-server policy unknown-mandatory-attribute ignore
default tacacs-server policy unknown-mandatory-attribute ignore
```

**Example**

- This command configures the switch to permit access to TACACS+ servers that send unrecognized mandatory AV pairs.
  ```bash
  switch(config)##tacacs-server policy unknown-mandatory-attribute ignore
  switch(config)#
  ```
tacacs-server timeout

The **tacacs-server timeout** command defines the global timeout the switch uses when communicating with any TACACS+ server for which a timeout is not defined.

The **no tacacs-server timeout** and **default tacacs-server timeout** commands restore the global timeout default period of five seconds by removing the **tacacs-server timeout** command from **running-config**.

**Command Mode**
Global Configuration

**Command Syntax**
```
tacacs-server timeout time_period
no tacacs-server timeout
default tacacs-server timeout
```

**Parameters**
- **time_period** timeout period (seconds). Values range from 1 to 1000. Default is 5.

**Related Commands**
- **tacacs-server host**

**Example**
- This command configures the switch to wait 20 seconds for a TACACS+ server response before issuing an error.

```
switch(config)#tacacs-server timeout 20
switch(config)#
```
username

The `username` command adds a username to the local file and assigns a password to the username. If the command specifies an existing username, the command replaces the password in the local file. The command can define a username without a password or remove the password from a username.

The `no username` and `default username` commands delete the specified username by removing the corresponding `username` statement from `running-config`.

The `no username role` command assigns the default role assignment to the specified `username` statement by editing the corresponding `username` statement in `running-config`. The `default username role` command reverts the specified username to its default role by editing the corresponding `username` statement in `running-config`. For the admin username, this restores `network-admin` as its role.

**Command Mode**
Global Configuration

**Command Syntax**
```
username name [PRIVILEGE_LEVEL] SECURITY [ROLE_USER]
no username name [role]
default username name [role]
```

All parameters except `name` can be placed in any order.

**Parameters**
- **name**  username text that the user enters at the login prompt to access the CLI.
  
  Valid usernames begin with A-Z, a-z, or 0-9 and may also contain any of these characters:
  
  `@ # $ % ^ & * _ - = + ; < > , . ~ |`

- **PRIVILEGE_LEVEL**  user’s initial session privilege level. This parameter is used when an authorization command includes the local option.
  
  - `<no parameter>`  the privilege level is set to 1.
  
  - **privilege rank**  where `rank` is an integer between 0 and 15.

- **SECURITY**  password assignment option.
  
  - **nopassword**  `name` is not password protected.
  
  - **secret password**  `name` is protected by specified password (clear-text string).
  
  - **secret 0 password**  `name` is protected by specified password (clear-text string).
  
  - **secret 5 password**  `name` is protected by specified password. (MD5-encrypted string).
  
  - **secret sha5 password**  `name` is protected by specified password (SHA-512-encrypted string).

- **ROLE_USER**  specifies the role for performing command authorization. Options include:
  
  - `<no parameter>`  user is assigned default role (aaa authorization policy local default-role).
  
  - **role role_name**  specifies role assigned to the user.

**Guidelines**

Encrypted strings entered through this parameter are generated elsewhere. The `secret 5` option (SECURITY) is typically used to enter a list of username-passwords from a script.

The SECURITY parameter is mandatory for unconfigured usernames. For previously configured users, the command can specify a PRIVILEGE_LEVEL or ROLE without a SECURITY setting.
**admin** is a reserved username that is provided by the initial configuration. The **admin** username cannot be deleted, but its parameters are editable. The initial **admin** configuration is:

```
username admin privilege 1 role network-admin nopassword
```

**Examples**

- These equivalent commands create the username **john** and assigns it the password **x245**. The password is entered in clear text because the **ENCRYPTION** parameter is either omitted or zero.
  ```
  switch(config)#username john secret x245
  switch(config)#username john secret 0 x245
  ```

- This command creates the username **john** and assigns it to the text password that corresponds to the encrypted string `$1$sU.7hptc$TsJ1qslCL7ZYVbyXNG1wg1`. The string was generated by an MD5-encryption program using x245 as the seed.
  ```
  switch(config)#username john secret 5 $1$sU.7hptc$TsJ1qslCL7ZYVbyXNG1wg1
  ```

A user authenticates the username **john** by entering **x245** when the CLI prompts for a password.

- This command creates the username **jane** without securing it with a password. It also removes a password if the **jane** username exists.
  ```
  switch(config)#username jane nopassword
  ```

- This command removes the username **william** from the local file.
  ```
  switch(config)#no username william
  ```
username ssh-key

The `username ssh-key` command configures an SSH key for the specified username. Command options allow the key to be entered directly into the CLI or referenced from a file.

The specified username must be previously configured through a `username` command.

The `no username ssh-key` and `default username ssh-key` commands delete the SSH key for the specified username by removing the corresponding `username ssh-key` command from `running-config`.

The `no username ssh-key role` and `default username ssh-key role` commands perform the following:

- delete the SSH key for the specified username by removing the corresponding `username ssh-key` command from `running-config`.
- delete the role assignment from the specified username by editing the corresponding `username` statement in `running-config`.

Command Mode

Global Configuration

Command Syntax

```
username name sshkey KEY
no username name sshkey [role]
default username name sshkey [role]
```

Parameters

- `name`  username text that the user enters at the login prompt to access the CLI. Valid usernames begin with A-Z, a-z, or 0-9 and may also contain any of these characters:
  
  `@ # $ % ^ & * _ - = + ; < > , . ~ |`

- `KEY`  SSH key. Options include:
  
  - `key_text`  username is associated with ssh key specified by `key_text` string.
  - `file key_file`  username is associated with SSH key in the specified file.

Example

- These commands create the username `john`, assign it the password `x245`, then associate it to the SSH key listed in the file named `john-ssh`.

```
switch(config)#username john secret x245
switch(config)#username john sshkey file john-ssh
switch(config)#
```
Transport Layer Security

Transport Layer Security (TLS), the successor to Secure Sockets Layer (SSL), is a security protocol used to communicate between client and server. It establishes an encrypted communication channel to secure data.

By default EOS uses a self signed certificate for client and server connections. However, some browsers or TLS libraries may refuse connections to the default self-signed certificates on EOS and in such case it is recommended to install the TLS server certificates that meet the following criteria:

- RSA key sizes must be greater than or equal to 2048 bits.
- There must be less than 825 days to expiry.
- Certificate must use SHA-2 family of Hashing function.

Note

Although Arista switches use TLS, the terms TLS and SSL are used interchangeably in this document.

Following are the two main components used by TLS for authentication of identity before any communication starts.

- Certificate
- Key

An SSL certificate is required to establish a secure connection between the client and server. The certificate includes all of the details which are necessary for authentication. Cryptographic keys are used to provide a secure channel of communication. TLS uses two cryptographic keys: a private key known only to the server and a public key embedded in the certificate. The keys are used to validate the certificate.

This chapter contains the following sections.

Section 5.1: Overview
Section 5.2: Configuration
Section 5.3: Resetting Diffie-Hellman Parameters
Section 5.4: Configuring the TLS Handshake Settings
Section 5.5: Displaying Certificate and Key Information
Section 5.6: TLS Commands
5.1 Overview

With SSL certificate, key, and profile management framework we can manage and configure SSL certificates, keys and profiles. The SSL is an application-layer protocol which transfers the data securely between the client and server using a combination of authentication, encryption, and data integrity. The SSL uses certificates and private-public key pairs to provide this security. An user can configure a SSL profile which includes certificate, key and trusted CA certificates used in SSL communication. A user can manage certificates, keys, and also multiple SSL profiles. A SSL profile can be configured and attached to any other EOS configuration which supports SSL communication. The individual EOS configuration using this framework includes details of using SSL profile in their configuration.

The only private keys supported are those using the RSA algorithm. Both the certificate and keys must be encoded in Privacy Enhanced Mail (PEM) format.

Example

- This is a code sample of a PEM encoded certificate.

```bash
$ cat server.crt

5.2 Configuration

Section 5.2.1: Configuring Certificates

Section 5.2.2: Configuring Keys

Section 5.2.3: Configuring a certificate with a RSA key in SSL Profile

5.2.1 Configuring Certificates

Copying a certificate to the Switch

The `copy certificate` command copies the certificate to the `certificate: file system` from any supported source URLs of the `copy` command.

Example

- This command copies a `server.crt` certificate to `certificate: file system`.
  
  ```
  switch# copy file:/tmp/ssl/server.crt certificate:
  Copy completed successfully.
  ```

Errors while Copying the certificates

Example

- A single source file can contain multiple PEM encoded certificates but only one PEM encoded certificate per file is supported. An error occurs when such multiple PEM encoded file is copied and the copy fails and error is displayed as shown.

  ```
  switch# copy file:/tmp/ssl/multi.crt certificate:
  % Error copying file:/tmp/ssl/multi.crt to certificate: (Multiple PEM entities in single file not supported)
  ```

Example

- An error occurs when a source file containing an invalid PEM encoded certificate is copied. When such files are copied, the copy fails and an error is displayed as shown.

  ```
  switch# copy file:/tmp/ssl/bad.crt certificate:
  % Error copying file:/tmp/ssl/bad.crt to certificate: (Invalid certificate)
  ```

Example

- An error occurs when a source file containing a certificate with password protected key is copied. When such files are copied, the copy fails and an error is displayed as shown.

  ```
  switch# copy file:/tmp/ssl/pass.key sslkey:
  % Error copying file:/tmp/ssl/pass.key to sslkey: (Password protected keys are not supported)
  ```

Note

Only certificates with RSA public keys are supported. When a certificate, without RSA public keys, is copied, the copy fails and an error is displayed as shown below.

```
switch# copy file:/tmp/ssl/dsa.crt certificate:
% Error copying file:/tmp/ssl/dsa.crt to certificate: (Certificate does not have RSA key)
```
5.2.2 Configuring Keys

Copying a key to the Switch

The copy command copies the RSA key to sslkey: file system. The key can be copied from any supported source URLs of the ‘copy’ command.

Example

• This command copies a server.key RSA key to sslkey: file system.

    switch#copy file:/tmp/ssl/server.key sslkey:
    Copy completed successfully.

Errors While Copying the keys

Example

• Generally a single source file can contain multiple PEM encoded keys but only one PEM encoded key per file is supported. An error occurs when such multiple PEM encoded file is copied and the copy fails and error is displayed as shown.

    switch#copy file:/tmp/ssl/multi.key sslkey:
    % Error copying file:/tmp/ssl/multi.key to sslkey: (Multiple PEM entities in single file not supported)

Example

• An error occurs when a source file containing invalid PEM encoded key is copied. When such files are copied the copy fails, and an error is displayed as shown.

    switch#copy file:/tmp/ssl/bad.key sslkey:
    % Error copying file:/tmp/ssl/bad.key to sslkey: (Invalid RSA key)
Deleting a key
The `delete` command deletes the `key` configuration from the switch.

Example
This command deletes the `server.key` key from the switch.
```
switch# delete sslkey:server.key
```

Generating keys
The following commands help user to generate RSA keys.

Examples
- This command generate a 2048-bit long RSA private key and saves it to `sslkey:test.key`.
  ```
  switch# security pki key generate rsa 2048 test.key
  ```
- This command generate a 4096-bit long self-signed certificate RSA key and 2048-bit long certificate signing request RSA key.
  ```
  switch# security pki certificate generate self-signed test.crt key test.key generate rsa 4096
  switch# security pki certificate generate signing-request key test.key generate rsa 2048
  ```

5.2.3 Configuring a certificate with a RSA key in SSL Profile
A SSL profile is configured with a certificate and its corresponding RSA key. The public key information in the certificate must match the RSA key. This certificate and RSA key pair are used to authenticate to the peer during SSL negotiation. The individual EOS features that use SSL profile configuration will decide whether the certificate and key configuration is optional or mandatory.

Example
```
switch# config
switch(config)# management security
switch(config-mgmt-security)# ssl profile server
switch(config-mgmt-sec-ssl-profile-server)# certificate server.crt key server.key
```

In case, if the RSA key configured in SSL profile does not match with the configured certificate, the SSL profile state becomes `invalid`, and an error is displayed.

Example
```
switch(config-mgmt-security)# ssl profile server
switch(config-mgmt-sec-ssl-profile-server)# certificate server.crt key client.key
switch(config-mgmt-sec-ssl-profile-server)# show management security ssl profile

<table>
<thead>
<tr>
<th>Profile</th>
<th>State</th>
<th>Error</th>
</tr>
</thead>
<tbody>
<tr>
<td>server</td>
<td>invalid</td>
<td>Certificate 'server.crt' does not match with key</td>
</tr>
</tbody>
</table>
```
5.2.3.1 Configuring SSL Profile with a certificate authority (CA)

During SSL negotiation with mutual authentication, the peer (or client) certificate is verified by checking if it is signed by one of these trusted certificates. For peer certificates that do not have a chain to a trusted certificate, the full bundle of certificates leading to the trusted certificates must be included. The individual EOS features that use SSL profile configuration will decide whether the trusted certificate configuration is optional or mandatory.

Example

```
switch#config
switch(config)#management security
switch(config-mgmt-security)#ssl profile server
switch(config-mgmt-sec-ssl-profile-server)#trust certificate ca1.crt
switch(config-mgmt-sec-ssl-profile-server)#trust certificate ca2.crt
```

5.2.3.2 Configuring certificate chains

The certificate chains are used to provide a chain of trust for the SSL Profile server certificate to a remote party. Several chain certificate commands can be issued to build a certificate chain with many intermediate CAs, regardless of the order. Use the `trust certificate` command to configure the certificate chain for a SSL profile. The `no` form of the command deletes the certificate configuration.

Example

- These commands configure the certificate chains for intermediate.crt, assuming that server.crt is issued by an intermediate CA intermediate.crt and intermediate.crt is itself issued by the root CA ca.crt.

```
switch#config
switch(config)#management security
switch(config-mgmt-security)#ssl profile server
switch(config-mgmt-sec-ssl-profile-server)#certificate server.crt key server.key
switch(config-mgmt-sec-ssl-profile-server)#chain certificate intermediate.crt
```

Example

- The other peer can be configured to trust ca.crt in order to verify the certificate chain during the TLS handshake as shown in the below example.

```
switch#config
switch(config)#management security
switch(config-mgmt-security)#ssl profile client
switch(config-mgmt-sec-ssl-profile-client)#certificate client.crt key client.key
switch(config-mgmt-sec-ssl-profile-client)#trust certificate ca.crt
```

Example

- To check the revocation status of the server certificate chain, the client can add the certificate Revocation List (CRLs) to its SSL profile configuration. One CRL needs to be specified for every CA in the chain, even if it's not revoking any certificate.

```
switch#config
switch(config)#management security
switch(config-mgmt-security)#ssl profile client
switch(config-mgmt-sec-ssl-profile-client)#crl intermediate.crl
switch(config-mgmt-sec-ssl-profile-client)#crl ca.crl
```

---

225
Configuration

Chapter 5: Transport Layer Security

5.2.3.3 Local certificate checks

The way certificates are verified locally before SSL negotiation can be modified to add or relax some checks. The following are the few checks to perform before any communication with the peer.

Example

- Check if the certificate has an extended key usage attribute:

  switch(config-mgmt-sec-ssl-profile-client)#certificate requirement extended-key-usage

Example

- Check if all the trusted certificates or certificates in the chain have a CA basic constraints set to true.

  switch(config-mgmt-sec-ssl-profile-client)#trust certificate requirement basic-constraints ca true
  switch(config-mgmt-sec-ssl-profile-client)#chain certificate requirement basic-constraints ca true

Example

- Do not mark an expired certificate as invalid.

  switch(config-mgmt-sec-ssl-profile-client)#certificate policy expiry-date ignore

5.2.3.4 Displaying SSL profile status and SSL profile errors

The show management security ssl profile command displays the SSL profile status information. To view a specific SSL profile status use the name of the SSL profile, else all SSL profile status are displayed.

Example

- This command displays the status of SSL profile server.

  switch#show management security ssl profile server
  Profile  State
  -----------
  server    valid

If there are any errors in the SSL profile, an invalid state is displayed and the errors are listed in the third column. Once the error is fixed, the SSL profile becomes valid.

Examples

- When the certificate 'server.crt' does not match with the key the following error is shown.

  switch#show management security ssl profile server
  Profile  State  Error
  -----------  ------------
  server      invalid  Certificate 'server.crt' does not match with key

Both the ‘chain certificate’ and ‘crl’ commands look into the certificate: directory to find the right PEM file.
• When a trusted certificate 'ca2.crt' does not exist the following error is shown.

```
switch#show management security ssl profile server
Profile     State       Error
------------- ------------- ----------------------------------------
server      invalid     Certificate 'ca2.crt' does not exist
```

• When a trusted certificate 'foo.crt' is not self-signed root certificate the following error is shown.

```
switch#show management security ssl profile server
Profile     State       Error
------------- ------------- ----------------------------------------
server      invalid     Certificate 'foo.crt' is trusted and not a root certificate
```

• When the certificate 'server.crt' is expired the following error is shown.

```
switch#show management security ssl profile server
Profile     State       Error
------------- ------------- ----------------------------------------
server      invalid     Certificate 'server.crt' has expired
```

• When the certificate chain is missing an intermediate certificate the following error is shown.

```
switch#show management security ssl profile server
Profile     State       Error
------------- ------------- ----------------------------------------
server      invalid     Profile has invalid certificate chain
Certificate 'intermediate.crt' does not exist
```
5.3 Resetting Diffie-Hellman Parameters

The Diffie-Hellman parameters file is used for symmetric key exchange during SSL negotiation. When the system is booted, the system auto generates a Diffie-Hellman parameters file if one does not exist. To reset the auto generated Diffie-Hellman parameters file, use the `reset` command. The individual features that use SSL profile configuration will decide whether they also use the Diffie-Hellman parameters file. The switch uses 2048-bit Diffie-Hellman parameters with no options to select the size.

Note
Not all features that use SSL profile configuration will use Diffie-Hellman parameters file.

Example
- This command resets the Diffie-Hellman parameters file.
  ```
  switch# reset ssl diffie-hellman parameters
  ```

5.3.0.1 Displaying the Diffie-Hellman parameters

The `show management security ssl diffie-hellman` command displays the Diffie-Hellman parameters.

Example
- This command displays the Diffie-Hellman parameters.
  ```
  switch# show management security ssl diffie-hellman
  Last successful reset on Apr 10 16:18:08 2015
  Diffie-Hellman Parameters 1024 bits
    Generator: 2
    Prime: dc47b5edc0d2b41451432f79f45efab452bba7b1ab118c194d671d6752ed1c550
          664ed8f052ad0f8ad6231d54ae5ae5e728d2bd7a6221636b787a4c08d1f8c
          6dcd10759d38f8b70b471c7972d69b0b295a2ee6ab44cfc7352cb133e85197c8
          9f1fc27aac7e8e02af4bb01c1cb055587be7505b73a8d06c6e403576b
  ```
5.4 Configuring the TLS Handshake Settings

During a TLS handshake, both peers send each other a list of the TLS versions they support as a way to agree on and use the highest common version. In a SSL profile the following allowable versions can be configured using the `tls versions` command. By default, TLSv1, TLSv1.1 and TLSv1.2 are enabled.

Example

- This command will force TLSv1.2 to be used. If the other peer doesn’t support this version, the TLS handshake will fail.

```
switch(config-mgmt-sec-ssl-profile-client)#tls versions 1.2
```

Example

- These commands add support for TLSv1.1 on top of the already configured TLSv1.2.

```
switch(config-mgmt-sec-ssl-profile-client)#tls versions add 1.1
switch(config-mgmt-sec-ssl-profile-client)#tls versions 1.1 1.2
```

Similarly to the TLS version, the cipher suite is negotiated between the client and the server during a TLS handshake. Ideally, the client will send the list of cipher suites it supports and the server will choose a common cipher suite after looking at the client’s list as well as its own list of cipher suites. The the cipher-list setting here is an Open SSL “cipher string” that is `HIGH:!NULL:!MD5`, which only allows key length larger than 128 bits and forbids cipher suites using MD5. The full list of cipher suites can be expanded using the shell command `openssl ciphers 'HIGH:!NULL:!MD5`

Example

- This command builds a cipher suite list.

```
switch(config-mgmt-sec-ssl-profile-client)#cipher-list AESGCM
switch(config-mgmt-sec-ssl-profile-client)#cipher-list SHA256:SHA384
switch(config-mgmt-sec-ssl-profile-client)#cipher-list ECDHE-ECDSA-AES256-GCM-SHA384
```

5.4.1 Enabling the Federal Information Processing Standards (FIPS) Mode

Federal Information Processing Standards (FIPS) is a cryptographic standard used to restrict the cryptographic functions and protocol versions that are used by OpenSSL.

Example

- This command enables the FIPS mode for a SSL profile.

```
switch(config-mgmt-sec-ssl-profile-client)#fips restrictions
```
5.5 Displaying Certificate and Key Information

Section 5.5.1: Displaying Certificate Information
Section 5.5.2: Displaying Key Information

5.5.1 Displaying Certificate Information

Displaying the directory information

The `dir` command displays the directory output of certificate file systems.

Example

- This command displays the directory output of certificate: file-system.

```
switch# dir certificate:
Directory of certificate: /
   -rw- 3319 Apr 10 11:50 server.crt
No space information available
```

Displaying the certificate information

The `show management security ssl certificate` command displays the certificate information. To view a specific certificate use the name of the certificate, else all the certificates are displayed.
Example

- This command displays the server.crt certificate information.

```
switch\# show management security ssl certificate server.crt
Certificate server.crt:
  Version: 1
  Serial Number: 9
  Issuer:
    Common name: ca
    Email address: ca@foo.com
    Organizational unit: Foo Org
    Organization: Foo
    Locality: SC
    State: CA
    Country: US
  Validity:
    Not before: Aug 11 21:44:17 2014 GMT
    Not After: May 14 21:44:17 2069 GMT
  Subject:
    Common name: server
    Email address: server@arista.com
    Organizational unit: Foo Org
    Organization: Foo
    Locality: SC
    State: CA
    Country: US
  Subject public key info:
    Encryption Algorithm: RSA
    Size: 2048 bits
    Public exponent: 65537
    Modulus: e04e3ff8e1c64dbc141fe96133f998e90a322c671b9f28307bf873
             2239f69804a77fbb8f146841eb6253b7bb50bf6c66bbf3097ec695b
             0d7985cfdd939c9913b4ba4f6cb8655b208ed0254a269ecab574987
             ea5ee80085f5216d303cf704372b2faaee62756c3762441fcc1c04
             635a831d5ec96d841
```

Displaying Certificate Revocation List (CRL) information

The `show management security ssl crl` command displays the installed Certificate Revocation List (CRL) information. To view a specific CRL use the name of the CRL, else all the CRLs are displayed.

Example

- This command displays the intermediate.crl information.

```
switch\# show management security ssl crl intermediate.crl
CRL intermediate.crl:
  CRL Number: 11
  Issuer:
    Common name: intermediate
    Email address: intermediate@foo.com
    Organizational unit: Foo Org
    Organization: Foo
    State: CA
    Country: US
  Validity:
    Last Update: Jul 19 19:27:34 2016 GMT
    Next Update: Dec 05 19:27:34 2043 GMT
```
5.5.2 Displaying Key Information

Displaying the directory information

The `dir` command displays the directory output of SSL key file systems.

**Example**

- This command displays the directory output of `sslkey`: file-system.

```
switch#dir sslkey:
Directory of sslkey:
  -rw-  1675 Apr 10 12:55 server.key
No space information available
```

Displaying the RSA key information

The `show management security ssl key` command displays the RSA key information. To view a specific RSA key use the name of the key, else all the keys are displayed. For security reasons, only the public part of the key is displayed.

**Example**

- This command displays the `server.key` key information.

```
switch#show management security ssl key server.key
Key server.key:
  Encryption Algorithm: RSA
  Size:                  2048 bits
  Public exponent:       65537
  Modulus:              e04e3ff8e1c64dbcb141fe96133f998e90a322c671b9f28307bf873
                        2239f69804a77fbb8f146841eb6253b7bb50bf6c66bbf3097ec695b
                        0d7985cfd939c9913b4ba4f6cb8655b208ed0254a269ecab574987
                        b502f9c3f541fa3b0ae59743cceed6e6ca04f6ca6c9268744add79c3a
                        f8178d12dd744dd5db100b33c46b40e53f0a1c7d49f83488976c5d
```
5.6 TLS Commands

Configuration Commands
- copy file: certificate:
- copy file: sslkey:
- delete certificate:
- delete sslkey:
- dir certificate:
- dir sslkey:
- security pki certificate generate
- security pki key generate
- ssl profile

Show Commands
- show management security ssl certificate
- show management security ssl crl
- show management security ssl diffie-hellman
- show management security ssl key
- show management security ssl profile
copy file: certificate:

The `copy file: certificate:` command copies the certificate to `certificate:` file system. The certificate can be copied from any supported source URLs of the `copy` command.

Command Mode
Global Configuration

Command Syntax
```
copy file: file_name certificate:
```

Parameters
- `file_name` location or the path of the file or the directory where the certificate is saved.

Guidelines
The following points to be considered while using the copy command:

- Generally a single source file can contain multiple PEM encoded certificates but only one PEM encoded certificate per file is supported. An error occurs when such multiple PEM encoded file is copied and the copy fails and displays an error.
- An error occurs when a source file containing invalid PEM encoded certificate is copied. When such files are copied the copy fails, and displays an error.
- An error occurs when a source files containing a certificate with password protected key is copied. When such files are copied the copy fails, and displays an error.

The following errors occur while copying the certificates:

- When multiple PEM encoded certificates are copied, the copy task fails and the following error is displayed.
  ```
  switch(config)#copy file:/tmp/ssl/multi.crt certificate:
  % Error copying file:/tmp/ssl/multi.crt to certificate: (Multiple PEM entities in single file not supported)
  ```
- When a source file containing invalid PEM encoded certificate is copied, the copy task fails and the following error is displayed.
  ```
  switch(config)#copy file:/tmp/ssl/bad.crt certificate:
  % Error copying file:/tmp/ssl/bad.crt to certificate: (Invalid certificate)
  ```
- When a source file containing a certificate with password protected key is copied, the copy task fails and the following error is displayed.
  ```
  switch(config)#copy file:/tmp/ssl/pass.key sslkey:
  % Error copying file:/tmp/ssl/pass.key to sslkey: (Password protected keys are not supported)
  ```
- Only certificates with RSA public keys are supported. When a certificate without RSA public key is copied the copy fails, and an error is displayed.
  ```
  switch(config)#copy file:/tmp/ssl/dsa.crt certificate:
  % Error copying file:/tmp/ssl/dsa.crt to certificate: (Certificate does not have RSA key)
  ```

Example
- This command copies a `server.crt` certificate to `certificate:` file system.
  ```
  switch(config)#copy file:/tmp/ssl/server.crt certificate:
  Copy completed successfully.
  ```
**copy file: sslkey:**

The `copy file: sslkey:` command copies the SSL key to the `sslkey:` file system. The key can be copied from any supported source URLs of the `copy` command.

**Command Mode**

Global Configuration

**Command Syntax**

```
copy file: file_name sslkey:
```

**Parameters**

- `file_name` location or the path of the file or the directory where the key is saved.

**Guidelines**

The following points to be considered while using the copy command:

- Generally a single source file can contain multiple PEM encoded keys but only one PEM encoded key per file is supported. An error occurs when such multiple PEM encoded file is copied and the copy fails and shows an error.
- An error occurs when a source file containing invalid PEM encoded key is copied. When such files are copied the copy fails, and shows an error.

The following errors occur while copying the certificates:

- When multiple PEM encoded keys are copied, the copy fails and the following error occurs.
  ```
  switch#copy file:/tmp/ssl/multi.key sslkey:
  % Error copying file:/tmp/ssl/multi.key to sslkey: (Multiple PEM entities in single file not supported)
  ```
- When a source file containing invalid PEM encoded key is copied, the following error occurs.
  ```
  switch#copy file:/tmp/ssl/bad.key sslkey:
  % Error copying file:/tmp/ssl/bad.key to sslkey: (Invalid RSA key)
  ```

**Example**

- This command copies a `server.key` key to the `sslkey:` file system.
  ```
  switch(config)#copy file:/tmp/ssl/server.key sslkey:
  Copy completed successfully.
  ```
delete certificate:

The delete certificate: command deletes a specified certificate from certificate: file system on the switch.

Command Mode

Global Configuration

Command Syntax

del**e certificate: certificate_name

Parameters

- certificate_name name of the certificate to be deleted.

Example

- This command deletes the server.crt certificate from the switch.

  switch(config)#delete certificate:server.crt
delete sslkey:

The `delete sslkey:` command deletes a SSL key from `sslkey:` file system on a switch.

**Command Mode**

Global Configuration

**Command Syntax**

```
delete sslkey: key_name
```

**Parameters**

- `key_name` name of the key.

**Example**

- This command deletes the `server.key` SSL key on the switch.

  ```
  switch(config)#delete sslkey:server.key
  ```
**dir certificate:**

The `dir certificate:` command displays the directory output of `certificate:` file system on the switch.

**Command Mode**

Global Configuration

**Command Syntax**

`dir certificate:`

**Example**

- This command shows the directory output of `certificate:` file system on the switch.

```plaintext
switch(config)#dir certificate:
Directory of certificate:/
  -rw- 3319 Apr 10 11:50 server.crt
No space information available
```
dir sslkey:

The `dir sslkey:` command displays the directory output of `sslkey:` file system on the switch.

**Command Mode**
- Global Configuration

**Command Syntax**

`dir sslkey:`

**Example**
- This command shows the directory output of `sslkey:` file system on the switch.

```
switch(config)#dir sslkey:
Directory of sslkey:/
   -rw- 1675 Apr 10 12:55 server.key
No space information available
```
reset ssl diffie-hellman parameters

The `reset ssl diffie-hellman parameters` command resets the Diffie-Hellman parameters file after a system reboot.

**Command Mode**

Global Configuration

**Command Syntax**

```
reset ssl diffie-hellman parameters
```

**Example**

- This command resets the Diffie-Hellman parameters file.

```
switch(config)#reset ssl diffie-hellman parameters
```
security pki certificate generate

The `security pki certificate generate` command is used to generate a self-signed certificate or a certificate signing request (CSR) certificate. The generated CSR is displayed on the CLI, whereas a self-signed certificate is saved to the `certificate:` file system.

Many other parameters can be entered and applied to the certificate as shown in the following examples below.

Command Mode

Global Configuration

Command Syntax

```
security pki certificate generate {self-signed | signing-request} certificate_name Key key_name
```

Parameters

- `certificate_name` name of the certificate to generate. Options includes.
  - `self-signed` request to generate self-signed certificate.
  - `signing-request` request to generate signing-request.
  - `digest` signs the certificate or key with the following cryptographic hash algorithm (sha256, sha384, sha512).
  - `key_name` name of the key to modify.
- `parameters` signing request parameters for a certificate. Option includes.
  - `common-name` common name for use in subject.
  - `country` two-letter country code for use in subject
  - `email` email address for use in subject
  - `locality` locality name for use in subject
  - `organization` organization name for use in subject
  - `organization-unit` organization Unit Name for use in subject
  - `state` state for use in subject
  - `subject-alternative-name` subject alternative name extension
- `validity` validity of the certificate in days. Value ranges from 1 to 30000.

Examples

- This command generates a self-signed certificate or CSR certificate. In the example below an existing private key (test.key) is used to generate the certificates.

  ```
  switch(config)#security pki certificate generate self-signed test.crt key test.key
  ```

- This command specifies the digest and the validity (in days) of the certificate or key.

  ```
  switch(config)#security pki certificate generate signing-request key test.key digest sha256 validity 365
  ```

- This command adds the certificate parameters such as common-name, country, email, and others.

  ```
  switch(config)#security pki certificate generate signing-request key test.key parameters common-name Test [country US ...]
  ```
security pki key generate

The `security pki key generate` command generates a RSA key used to validate a specific certificate. The key generated can be modified and saved by entering the value of the length in `generate rsa <length>` parameter.

**Command Mode**
- Global Configuration

**Command Syntax**

```
security pki key generate rsa key_name
```

**Parameters**

- `rsa` use Rivest-Shamir-Adleman (RSA) algorithm. Options include.
  - `2048` Use 2048-bit keys
  - `3072` Use 3072-bit keys
  - `4096` Use 4096-bit keys
- `key_name` name of the key to generate.

**Examples**

- This command generates a a 2048-bit long RSA private key(test.key) and save it to `sslkey:test.key`.
  
```
switch(config)#security pki key generate rsa 2048 test.key
```

- This command modifies the generated RSA key length value.
  
```
switch(config)#security pki certificate generate self-signed test.crt key test.key generate rsa 4096
switch(config)#security pki certificate generate signing-request key test.key generate rsa 2048
```
ssl profile

The `ssl profile` command places the switch in the SSL profile configuration mode. Various SSL profile management configurations are allowed in this mode. For example, this mode allows to configure a SSL profile with a certificate and its corresponding RSA key.

Similarly, other configurations such as trust certificate, chain certificate, crl, tls, cipher-list can be configured to a SSL profile in this mode.

The no form of the command deletes the SSL profile management configuration from `running-config`.

**Command Mode**
- Management Security Mode
- SSL Profile Mode

**Command Syntax**
```
ssl profile profile_name
```

**Parameter**
- `profile_name` name of the profile.

**Examples**
- These commands place the switch in SSL profile mode.
  ```
  switch#config
  switch(config)#management security
  switch(config-mgmt-security)#ssl profile server
  ```
- These commands configure SSL profile “server” with a certificate and its corresponding RSA key. The `no` command deletes the certificate configuration.
  ```
  switch#config
  switch(config)#management security
  switch(config-mgmt-security)#ssl profile server
  switch(config-mgmt-sec-ssl-profile-server)#certificate server.crt key server.key
  switch(config-mgmt-sec-ssl-profile-server)#no certificate server.crt key server.key
  ```
- These commands configure the trust certificate “ca1.crt” to an SSL profile. The `no` command deletes a trusted certificate configuration.
  ```
  switch#config
  switch(config)#management security
  switch(config-mgmt-security)#ssl profile server
  switch(config-mgmt-sec-ssl-profile-server)#trust certificate ca1.crt
  switch(config-mgmt-sec-ssl-profile-server)#no trust certificate ca1.crt
  ```
- These commands configure the “intermediate.crt” chain certificate to an SSL profile. The `no` command deletes a chain certificate configuration.
  ```
  switch#config
  switch(config)#management security
  switch(config-mgmt-security)#ssl profile server
  switch(config-mgmt-sec-ssl-profile-server)#certificate server.crt key server.key
  switch(config-mgmt-sec-ssl-profile-server)#chain certificate intermediate.crt
  switch(config-mgmt-sec-ssl-profile-server)#no chain certificate intermediate.crt
  ```
• These commands provide certificate revocation list (CRL) to a SSL profile to check the revocation status of the certificate chain. The `no` command deletes the crl configuration.

```
switch#config
switch(config)#management security
switch(config-mgmt-security)#ssl profile server
switch(config-mgmt-sec-ssl-profile-server)#crl intermediate.crl
switch(config-mgmt-sec-ssl-profile-server)#crl ca.crl
switch(config-mgmt-sec-ssl-profile-server)#no crl ca.crl
```

• These commands configure TLSv1.2 to be used in the SSL profile.

```
switch#config
switch(config)#management security
switch(config-mgmt-security)#ssl profile server
switch(config-mgmt-sec-ssl-profile-server)#tls versions 1.2
```

• These commands build a cipher suite list.

```
switch#config
switch(config)#management security
switch(config-mgmt-security)#ssl profile server
switch(config-mgmt-sec-ssl-profile-server)#cipher-list AESGCM
switch(config-mgmt-sec-ssl-profile-server)#cipher-list SHA256:SHA38
switch(config-mgmt-sec-ssl-profile-server)#cipher-list ECDHE-ECDSA-AES256-GCM-SHA38
```

• This command check that the certificate has an extended key usage attribute.

```
switch(config-mgmt-sec-ssl-profile-client)#certificate requirement extended-key-usage
```

• These commands check that all the trusted certificates or certificates in the chain have a CA basic constraints set to true.

```
switch(config-mgmt-sec-ssl-profile-client)#trust certificate requirement basic-constraints ca true
switch(config-mgmt-sec-ssl-profile-client)#chain certificate requirement basic-constraints ca true
```

• This command enables the Federal Information Processing Standards (FIPS) mode for a SSL profile.

```
switch(config-mgmt-sec-ssl-profile-client)#fips restrictions
```
show management security ssl certificate

The `show management security ssl certificate` command displays information about the certificate. Provide the name of the certificate if you want to view more information of the certificate. If no name is provided, this command displays information of all the certificates.

**Command Mode**
EXEC

**Command Syntax**

```
show management security ssl certificate [certificate_name]
```

**Parameter**
- `certificate_name` name of the certificate. This is optional.

**Example**
- This command displays the `server.crt` certificate information.

```bash
switch# show management security ssl certificate server.crt
Certificate server.crt:
    Version:                    1
    Serial Number:              9
    Issuer:
        Common name:             ca
        Email address:           ca@foo.com
        Organizational unit:     Foo Org
        Organization:            Foo
        Locality:                SC
        State:                   CA
        Country:                 US
    Validity:
        Not before:             Aug 11 21:44:17 2014 GMT
        Not After:              May 14 21:44:17 2069 GMT
    Subject:
        Common name:            server
        Email address:          server@arista.com
        Organizational unit:    Foo Org
        Organization:           Foo
        Locality:               SC
        State:                  CA
        Country:                US
    Subject public key info:
        Encryption Algorithm:   RSA
        Size:                   2048 bits
        Public exponent:        65537
        Modulus:                e04e3ff8e1c64dbcb141fe96133f998e90a322c671b9f28307bf873 2239f69804a77fbb8f146841eb6253b7bb50bf6c66bfb3097ec695b 0d7985cfd939c9913b4ba4f6cb8655b208ed0254a259ecab5759371 9f54c8c7f0b3a57a7ab826870119083222ad5e776b0f3ae49d36e b502f8c3f541fa3b4e59743cced6e6ca04f6ca6c9268744add79c3a c08af6b451455b4a61071f4c0b3ec3553585312783e9381f65bb0e2 ea5e80085f5216d303cf704372b2faaee62756c3762441fccc1c04 97ee5190586ed28c0e376f48e53f05a40c7e1f3a65e3c6165b9e54f e8178d12d7744d8f5db100b33c46b40e53f0a1c7d49f83488976c5d 635a831d5ec96d841
```
**show management security ssl crl**

The `show management security ssl crl` command displays the basic information on the installed certificate revocation list (CRLs). To view information of a specific CRL provide the name of the CRL. If no name is provided, this command shows information of all the CRLs.

**Note**

The command only shows basic information and does not show any information on the revocation status of certificates.

**Command Mode**

EXEC

**Command Syntax**

`show management security ssl crl`

**Example**

- This command displays the basic information of the `intermediate.crl` CRL.

```
switch# show management security ssl crl intermediate.crl
CRL intermediate.crl:
  CRL Number: 11
  Issuer:
    Common name: intermediate
    Email address: intermediate@foo.com
    Organizational unit: Foo Org
    Organization: Foo
    State: CA
    Country: US
  Validity:
    Last Update: Jul 19 19:27:34 2016 GMT
    Next Update: Dec 05 19:27:34 2043 GMT
```
show management security ssl diffie-hellman

The show management security ssl diffie-hellman command displays the Diffie-Hellman parameter information.

**Command Mode**

EXEC

**Command Syntax**

show management security ssl diffie-hellman

**Example**

- This command displays the Diffie-Hellman parameter information.

```
switch# show management security ssl diffie-hellman
Last successful reset on Apr 10 16:18:08 2015
Diffie-Hellman Parameters 1024 bits
Generator: 2
Prime: dc47b5edc0d2b41451432f79f45efab452bba7b1ab118c194d671d6752ed1c550

```
show management security ssl key

The `show management security ssl key` command displays the RSA key information. To view information of a specific key, provide the name of the key in the command. If no name is provided, this command displays information of all the keys.

**Note**
For security reasons, only the public part of the key is shown.

**Command Mode**
EXEC

**Command Syntax**
```
show management security ssl key [key_name]
```

**Parameter**
- `key_name` name of the key. This is optional.

**Example**
- This command displays the `server.key` key information.

```
switch#show management security ssl key server.key
Key server.key:
  Encryption Algorithm: RSA
  Size: 2048 bits
  Public exponent: 65537
  Modulus: e04e3ff8e1c64dbcbl41fe96133f998e90a322c671b9f28307bf873

            f8178d12dd744ddf5db100b33c46b40e53f0a1c7d49f83488976c5d
            635a831d5ec96d841
```
show management security ssl profile

The `show management security ssl profile` command displays the SSL profile status information. To display information of a specific SSL profile, provide the name of the profile. If no name is provided, this command displays profile status of all the SSL profiles.

If there are any errors in the SSL profile, the state is shown ‘invalid’ and the errors are listed in the third column as shown in the example below.

**Command Mode**

EXEC

**Command Syntax**

```
show management security ssl profile [profile_name]
```

**Parameter**

- `profile_name` name of the SSL profile, this is optional.

**Example**

- This command displays the SSL profile status of profile `server`.
  
  ```
  switch# show management security ssl profile server
  Profile   State
  ----------- -----------
  server    valid
  ```

- If the certificate 'server.crt' does not match with the key the following error occurs.
  
  ```
  switch# show management security ssl profile server
  Profile   State   Error
  ----------- ----------- ----------------------------------------
  server    invalid Certificate 'server.crt' does not match with key
  ```

- If a trusted certificate 'ca2.crt' does not exist the following error occurs.
  
  ```
  switch# show management security ssl profile server
  Profile   State   Error
  ----------- ----------- ----------------------------------------
  server    invalid Certificate 'ca2.crt' does not exist
  ```

- If a trusted certificate 'foo.crt' is not self-signed root certificate the following error occurs.
  
  ```
  switch# show management security ssl profile server
  Profile   State   Error
  ----------- ----------- ----------------------------------------
  server    invalid Certificate 'foo.crt' is trusted and not a root certificate
  ```

- If the certificate 'server.crt' is expired the following error occurs.
  
  ```
  switch# show management security ssl profile server
  Profile   State   Error
  ----------- ----------- ----------------------------------------
  server    invalid Certificate 'server.crt' has expired
  ```

- If the certificate chain is missing an intermediate certificate the following error occurs.
  
  ```
  switch# show management security ssl profile server
  Profile   State   Error
  ----------- ----------- ----------------------------------------
  server    invalid Profile has invalid certificate chain
              Certificate 'intermediate.crt' does not exist
  ```
Chapter 6

Administering the Switch

This chapter describes administrative tasks that are typically performed only after initially configuring the switch or after recovery procedures.

This chapter includes these sections:

- Section 6.1: Managing the Switch Name
- Section 6.2: System Clock and Time Protocols
- Section 6.3: Managing Display Attributes
- Section 6.4: Logging of Event Notifications
- Section 6.5: Event Monitor
- Section 6.6: Managing EOS Extensions
- Section 6.7: Switch Administration Commands

6.1 Managing the Switch Name

These sections describe how to configure the switch’s domain and host name.

- Section 6.1.1: Assigning a Name to the Switch describes the assigning of an FQDN to the switch.
- Section 6.1.2: Specifying DNS Addresses describes the adding of name servers to the configuration.

6.1.1 Assigning a Name to the Switch

A fully qualified domain name (FQDN) labels the switch and defines its organization ID in the Domain Name System hierarchy. The switch’s FQDN consists of a host name and domain name.

The host name is uniquely associated with one device within an IP-domain. The default host name is localhost. You can configure the prompt to display the host name, as described in Section 6.3.2: Prompt.

- To assign a host name to the switch, use the hostname command. To return the switch’s host name to the default value of localhost, use the no hostname command.
- To specify the domain location of the switch, use the dns domain command.

Example

- This command assigns the string main-host as the switch’s host name.

  switch(config)#hostname main-host
  main-host(config)#
• This command configures *aristanetworks.com* as the switch’s domain name.

```bash
switch(config)#dns domain aristanetworks.com
switch(config)#
```

• This procedure configures *sales1.samplecorp.org* as the switch’s FQDN.

```bash
switch(config)#dns domain samplecorp.org
switch(config)#
```

• This *running-config* extract contains the switch’s host name and IP-domain name.

```bash
switch#show running-config
! Command: show running-config
! device: switch (DCS-7150S-64-CL, EOS-4.13.2F)
!
   <--------OUTPUT OMITTED FROM EXAMPLE-------->

   vlan 3-4
   !
   username john secret 5 $1$a7Hjept9STIKRX6ytkg8o.EiJa.na50
   !
   hostname sales1
   ip name-server vrf default 172.17.0.22
   dns domain samplecorp.org
   !

   <--------OUTPUT OMITTED FROM EXAMPLE-------->

end
switch#
```

### 6.1.2 Specifying DNS Addresses

The Domain Name Server (DNS) maps FQDN labels to IP addresses and provides addresses for network devices. Each network requires at least one server to resolve addresses. The configuration file can list a maximum of three server addresses.

To add name servers to the configuration, use the *ip name-server* command. Each command can add one to three servers. The switch disregards any attempt to add a fourth server to the configuration. All server addresses must be in a single VRF. If servers have been previously configured in a different VRF they must be removed before adding a new server to the configuration.

**Example**

• This code performs these actions:
  • adds three names servers to the configuration in the default VRF
  • attempts to add a fourth server, resulting in an error message
The switch assigns source IP addresses to outgoing DNS requests. To force the switch to use a single, user-defined source interface for all requests, use the `ip domain lookup` command.

**Example**

- This command forces the switch to use VLAN 5 as the source interface for DNS requests originating from the default VRF.
  
  ```
  switch(config)#ip domain lookup source-interface Vlan5
  switch(config)#
  ```

- This command forces the switch to use VLAN 10 as the source interface for DNS requests originating from VRF “purple.”
  
  ```
  switch(config)#ip domain lookup vrf purple source-interface Vlan10
  switch(config)#
  ```
6.2 System Clock and Time Protocols

The switch uses the system clock for displaying the time and for time-stamping messages. The system clock is set to Coordinated Universal Time (UTC); the switch calculates local time based on the time zone setting. Time-stamps and time displays are in local time. The system clock can be set either manually or via Network Time Protocol (NTP); any NTP servers properly configured on the switch override time that is manually entered.

The following sections deal with the configuration of the system clock and the use of NTP and PTP.

- Configuring the Time Zone
- Setting the System Clock Manually
- Displaying the Time
- Network Time Protocol (NTP)
- Precision Time Protocol (PTP)

6.2.1 Configuring the Time Zone

The time zone setting is used by the switch to convert the system time (UTC) to local time. To specify the time zone, use the `clock timezone` command.

**Examples**

- These commands configure the switch for the United States Central Time Zone.
  
  ```
  switch(config)#clock timezone US/Central
  switch(config)#show clock
  Mon Jan 14 18:42:49 2013
timezone is US/Central
  switch(config)#
  ```

- To view the predefined time zone labels, enter `clock timezone` with a question mark.
  
  ```
  switch(config)#clock timezone ?
  Africa/Abidjan                    Africa/Accra
  WET                               WET timezone
  Zulu                              Zulu timezone
  ```

- This command displays all time zone labels that start with America.
  
  ```
  switch(config)#clock timezone AMERICA?
  America/Adak                        America/Anchorage
  America/Yellowknife
  ```

6.2.2 Setting the System Clock Manually

The `clock set` command manually configures the system clock time and date, in local time. Any NTP servers properly configured on the switch override time that is manually entered.
Example

- This command manually sets the switch time.

```
switch#clock set 08:15:24 14 Jan 2013
Mon Jan 14 08:15:25 2013
timezone is US/Central
```

6.2.3 Displaying the Time

To display the local time and configured time zone, enter the `show clock` command.

Example

- This command displays the switch time.

```
switch(config)#show clock
Mon Jan 14 16:32:46 2013
timezone is America/Los_Angeles
```

6.2.4 Network Time Protocol (NTP)

Network Time Protocol (NTP) is enabled on the switch by default, and time settings from any properly configured NTP server will override manual setting of the system clock.

NTP servers synchronize time settings of systems running an NTP client. The switch supports NTP versions 1 through 4. The default is version 4. After configuring the switch to synchronize with an NTP server, it may take up to ten minutes for the switch to set its clock. The `running-config` lists NTP servers that the switch is configured to use.

The following NTP sections deal with NTP on the switch:

- Configuring the NTP Server
- Configuring the NTP Source
- Configuring the Switch as an NTP Server
- Configuring NTP Authentication
- Viewing NTP Settings and Status

6.2.4.1 Configuring the NTP Server

The `ntp server` command adds a server to the list or modifies the parameters of a previously listed address. When the system contains multiple NTP servers, the `prefer` keyword can be used to specify a preferred NTP server, which will be used as the NTP server if not discarded by NTP.

Note that all NTP servers must be in the same VRF, and that they are added in the default VRF if no VRF is specified.

The system clock will be set via NTP if NTP is enabled and there is at least one NTP server properly configured on the switch, and NTP overrides manual setting of the system clock. NTP is enabled by default. To disable NTP, use the `no ntp` command.

Example

- These commands add three NTP servers, designating the second server as preferred.

```
switch(config)#ntp server local-NTP
switch(config)#ntp server 172.16.0.23 Prefer
switch(config)#ntp server 172.16.0.25
```
6.2.4.2 Configuring the NTP Source

The `ntp local-interface` command configures an interface as the source of NTP packets. That interface’s IP address is then used as the source address for all NTP packets unless a server-specific source is configured using the `source` option of the `ntp server` command. For an `ntp local-interface` command to take effect, the specified interface and the NTP server must both belong to the same VRF.

**Example**
- This command configures VLAN interface 25 as the source of NTP update packets.
  
  ```
  switch(config)# ntp local-interface vlan 25
  switch(config)#
  ```

6.2.4.3 Configuring the Switch as an NTP Server

To configure the switch to accept NTP requests on all interfaces, use the `ntp serve all` command to enable NTP server mode globally on the switch. To configure an individual interface to accept or deny NTP requests, use the `ntp serve` command. Interface level settings override the global settings, and changing the settings at either the global or interface level also causes the switch to re-synchronize with its upstream NTP server. NTP server mode is disabled by default.

**Example**
- This command configures the switch to act as an NTP server, accepting NTP requests.
  
  ```
  switch(config)# ntp serve all
  switch(config)#
  ```
- These commands configure Ethernet interface 5 to accept NTP requests regardless of global settings.
  
  ```
  switch(config)# interface ethernet 5
  switch(config-if-Et5)# ntp serve
  switch(config-if-Et5)#
  ```

6.2.4.4 Configuring NTP Authentication

The switch can be configured to synchronize its clock using NTP packets only from an authenticated source. NTP authentication is disabled by default.

To configure the switch to authenticate NTP packets, create one or more authentication keys using the `ntp authentication-key` command, specify which keys are trusted by using the `ntp trusted-key` command, and use the `ntp authenticate` command to enable NTP authentication. The NTP server must be configured to use the same authentication key and key ID number.

**Example**
- These commands configure the switch to authenticate NTP packets using key 328 with the plaintext password “timeSync.”
  
  ```
  switch(config)# ntp authentication-key 328 md5 timeSync
  switch(config)# ntp trusted-key 328
  switch(config)# ntp authenticate
  switch(config)#
  ```
6.2.4.5 Viewing NTP Settings and Status

To display the status of Network Time Protocol (NTP) on the switch, use the `show ntp status` command. To display the status of connections to NTP servers, use the `show ntp associations` command. Note that for IPv4 addresses, the reference ID is the IPv4 address of the NTP server. For IPv6 addresses, the reference ID is the first four octets of the MD5 hash of the NTP server’s IP address.

Example

- This command displays the status of the switch’s NTP connection.

  switch#show ntp status
  unsynchronised
time server re-starting
  polling server every 64 s
  switch #

- This command displays data about the NTP servers in the configuration.

  switch#show ntp associations
  remote           refid      st t when poll reach   delay   offset  jitter
  ===============================================================================
  moose.aristanet 66.187.233.4     2 u    9   64 377    0.118 9440498  0.017
  172.17.2.6 .INIT.          16 u    - 1024 0    0.000 0.000  0.000
  *LOCAL(0)        .LOCL.          10 l   41   64 377    0.000 0.000  0.000
  switch #

6.2.5 Precision Time Protocol (PTP)

The Precision Time Protocol (PTP) provides a greater degree of clock accuracy for networked devices, allowing clocks to be synchronized locally in increments of less than a microsecond. PTP uses a master-slave hierarchy similar to that used by NTP. The most precise clock available is referred to as the master clock, and “slave” devices use the signal from the master to synchronize their own clocks.

The master clock sends out a `sync` message (referred to as an `announce` message in IEEE 1588-2008) at a regular interval. The slave clock responds with a time-stamped delay request message in order to measure and compensate for packet delays between the devices. The slave then receives a message from the master specifying when the delay message was received, which allows the slave to calculate final values for clock synchronization. Synchronization is maintained by the regular exchange of PTP packets between master and slave.

Note

Arista switches do not support setting of the system clock using PTP. System clock synchronization is best supported by the NTP service on the PTP grandmaster.

PTP is disabled globally by default. The following steps are required to enable PTP on an interface:

- Setting the PTP Mode
- Enabling PTP on an Interface

The following PTP global configurations are optional:

- Configuring the PTP Domain
- Configuring the Offset Hold Time
- Setting the PTP Priority
- Configuring the Source IP
- Configuring the TTL for PTP Packets
- Configuring PTP Monitoring
The following PTP interface-level configurations are optional:

- Setting the PTP Announce Interval
- Setting the PTP Timeout Interval
- Configuring the PTP Delay Mechanism
- Setting the Delay Request Interval
- Setting the Peer Delay Request Interval
- Setting the Peer Link Propagation Threshold
- Setting the Interval for Sending Synchronization Messages
- Setting the PTP Transport Type

### 6.2.5.1 Setting the PTP Mode

To allow PTP to be used on switch interfaces, first set the PTP mode using the `ptp mode` command. PTP mode options include:

- **boundary**  The device acts as a boundary clock, and both runs and participates in the best master clock algorithm.
- **disabled**  PTP is disabled, and the device forwards all PTP packets as normal traffic.
- **end-to-end transparent**  The device acts as an end-to-end transparent clock, synchronizing all ports to a connected master clock and updating the time interval field of forwarded PTP packets using switch residence time.
- **peer-to-peer transparent**  The device acts as a peer-to-peer transparent clock, synchronizing all ports to a connected master clock and updating the time interval field of forwarded PTP packets using switch residence time and inbound path delays.
- **generalized Precision Time Protocol (gPTP)**  The device runs generalized Precision Time Protocol (gPTP), participating in the best master clock algorithm but also updating the interval field of forwarded PTP packets using switch residence time and inbound path delays.

To disable PTP globally on the switch, use the **no** or **default** forms of the `ptp mode` command.

**Example**

- This command configures the device as a PTP boundary clock.

```
switch(config)# ptp mode boundary
switch(config)#
```

### 6.2.5.2 Enabling PTP on an Interface

To enable PTP on a specific interface on the device, use the `ptp enable` command.

**Example**

- This command enables PTP on Ethernet interface 5.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# ptp enable
```

### 6.2.5.3 Configuring the PTP Domain

To set the domain number to use for the clock, use the `ptp domain` command.
• This command configures the domain 1 to use with a clock.
  
  switch(config)# ptp domain 1
  switch(config)#

### 6.2.5.4 Configuring the Offset Hold Time

To set the PTP offset hold time, use the ptp hold-ptp-time command.

• This command configures the PTP offset hold time to 600 seconds.
  
  switch(config)# ptp hold-ptp-time 600
  switch(config)#

### 6.2.5.5 Setting the PTP Priority

To set the priority 1 value, use the ptp priority1 command. Lower values take precedence.

• This command configures the priority 1 value of 120 to use when advertising the clock.
  
  switch(config)# ptp priority1 120
  switch(config)#

To set the priority 2 value for the clock, use the ptp priority2 command.

• This command configures the priority 2 value of 128.
  
  switch(config)# ptp priority2 128
  switch(config)#

### 6.2.5.6 Configuring the Source IP

To set the source IP address for all PTP packets, use the ptp source ip command.

• This command configures the source IP address of 10.0.2.1 for all PTP packets.
  
  switch(config)# ptp source ip 10.0.2.1
  switch(config)#

### 6.2.5.7 Configuring the TTL for PTP Packets

To set the time to live (TTL) of PTP packets, use the ptp ttl command. TTL is the maximum number of hops that a PTP packet may make.

• This command configures a TTL of 64 hops for PTP packets.
  
  switch(config)# ptp ttl 64
  switch(config)#

### 6.2.5.8 Configuring PTP Monitoring

PTP monitoring records PTP information including offset from master, mean path delay, and skew values, which can then be viewed using a show command. When this feature is enabled, PTP Syslog messages will also be generated for those metrics for which threshold values have been configured on the switch. PTP monitoring is enabled by default.

#### Enabling and Disabling PTP Monitoring

Use the ptp monitor command to enable PTP monitoring on the device (it is enabled by default). The no form of the command disables PTP monitoring and clears all the recorded PTP data.
Example

- This command disables PTP monitoring and clears all recorded PTP data from the switch.

  ```
  switch(config)#no ptp monitor
  ```

Configuring the Offset-from-master Threshold

The offset is the difference in nanoseconds between master and slave time. Use the `ptp monitor threshold offset-from-master` command to specify the offset-from-master threshold in nanoseconds. A Syslog message is generated if the most recently calculated time offset from the PTP master is outside of the range \((-<\text{threshold}>,, <\text{threshold}>\)). The maximum offset threshold is one second. The `no` form of the command clears the threshold value and prevents further Syslog messages from being generated for this parameter.

Example

- This command sets an offset-from-master threshold value of 500 nanoseconds.

  ```
  switch(config)#ptp monitor threshold offset-from-master 500
  ```

Configuring the Mean-path-delay Threshold

Mean path delay is the mean time in nanoseconds that PTP packets take to travel between master and slave. Use the `ptp monitor threshold mean-path-delay` command to specify the mean-path-delay threshold in nanoseconds. A Syslog message is generated if the value of the most recently calculated mean path delay is greater than or equal to this threshold. The maximum mean-path-delay threshold is one second. The `no` form of the command clears the threshold value and prevents further Syslog messages from being generated for this parameter.

**Note** Mean path delay is always non-negative.

Example

- This command sets a mean-path-delay threshold value of 2000 nanoseconds.

  ```
  switch(config)#ptp monitor threshold mean-path-delay 2000
  ```

Configuring the Skew Threshold

PTP skew is the clock frequency difference between master and slave. Use the `ptp monitor threshold skew` command to configure the value of the skew-threshold percentage. A Syslog message is generated if the value of the most recently calculated skew is not in the range \((1/(1+<\text{threshold}>), 1*(1+<\text{threshold}>))\). Skew threshold percentage is represented a double precision (16 digit) real number ranging from 0 (0%) to 10 (1000%). The `no` form of the command clears the threshold value and prevents further Syslog messages from being generated for this parameter.

Example

- This command sets a skew threshold value of 5 (500%).

  ```
  switch(config)#ptp monitor threshold skew 5
  ```

6.2.5.9 Setting the PTP Announce Interval

To set the interval at which an interface sends PTP `announce` messages, use the `ptp announce interval` command. The interval is measured in log seconds. This value also affects the timeout interval.
Chapter 6: Administering the Switch System Clock and Time Protocols

- This command configures the interval between PTP announcement messages on Ethernet interface 5 to 4 seconds.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# ptp announce interval 2
switch(config-if-Et5)#
```

6.2.5.10 Setting the PTP Timeout Interval

To set the timeout multiplier for an interface, use the `ptp announce timeout` command. The timeout multiplier is the number of announcement intervals that the interface will wait without receiving a PTP announcement before a timeout occurs; values range from 2 to 255. The default multiplier is 3, which results in a 6-second timeout interval when the announcement interval is set to the default of 2 seconds.

- This command sets timeout multiplier for the interface to 5; since the announcement interval has just been set to 2 (4 seconds), this means the interface will time out if it doesn’t receive a PTP announcement for 20 seconds.

```
switch(config-if-Et5)# ptp announce timeout 5
switch(config-if-Et5)#
```

6.2.5.11 Configuring the PTP Delay Mechanism

To set the delay mechanism used in boundary-mode, use the `ptp delay-mechanism` command.

- This command sets the delay mechanism in boundary clock mode for the interface to peer-to-peer.

```
switch(config-if-Et5)# ptp delay-mechanism p2p
switch(config-if-Et5)#
```

6.2.5.12 Setting the Delay Request Interval

To set the time for the slave devices to send delay request messages, use the `ptp delay-req interval` command.

- This command sets the time the slave devices to send delay request messages to the master state to 3 for the interface.

```
switch(config-if-Et5)# ptp delay-request interval 3
switch(config-if-Et5)#
```

6.2.5.13 Setting the Peer Delay Request Interval

To set the minimum interval between the PTP peer delay-request messages, use the `ptp pdelay-req interval` command.

- This command sets the interval between PTP peer delay-request messages on the interface to 3.

```
switch(config-if-Et5)# ptp pdelay-request interval 3
switch(config-if-Et5)#
```

6.2.5.14 Setting the Peer Link Propagation Threshold

To set the delay threshold for which the peer will be considered unable to run generalized Precision Time Protocol (gPTP), use the `ptp pdelay-neighbor-threshold` command.

- This command sets the link propagation delay threshold on the interface to 200000 nanoseconds.

```
switch(config-if-Et5)# ptp pdelay-neighbor-threshold 200000
switch(config-if-Et5)#
```
6.2.5.15 Setting the Interval for Sending Synchronization Messages

To set the interval (in log seconds) for sending synchronization messages, use the `ptp sync-message interval` command. Value ranges and defaults vary based on the PTP mode of the switch.

- This command configures the interval for sending synchronization messages on the interface to 3 (8 seconds).

```
switch(config-if-Et5)# ptp sync-message interval 3
switch(config-if-Et5)#
```

6.2.5.16 Setting the PTP Transport Type

To set the PTP transport type, use the `ptp transport` command.

- This command configures the PTP transport type for the interface to IPv4.

```
switch(config-if-Et5)# ptp transport ipv4
switch(config-if-Et5)#
```

6.2.6 Viewing PTP Settings and Status

The following commands display the status of the switch PTP server connections:

- Displaying General PTP Information
- Displaying PTP Local Clock and Offset
- Displaying PTP Masters Information
- Displaying PTP Clock Properties
- Displaying PTP Information for all Interfaces
- Displaying PTP Interface Counters
- Displaying PTP Foreign Master
- Displaying PTP Source IP
- Displaying PTP Monitoring Information
6.2.6.1 Displaying General PTP Information

To display general Precision Time Protocol (PTP) information, use the `show ptp` command.

```
switch#show ptp
PTP Mode: gptp - Generalized PTP Clock
Clock Identity: 2001:0DB8:73:ff:ff:26:fd:90
Grandmaster Clock Identity: 2001:0DB8:96:ff:fe:6c:ed:02
Number of slave ports: 1
Number of master ports: 6
Slave port: Ethernet33
Mean Path Delay (nanoseconds): 718
Steps Removed: 1
Neighbor Rate Ratio: 1.00000007883
Rate Ratio: 1.00000007883
```

<table>
<thead>
<tr>
<th>Interface</th>
<th>State</th>

</tbody>
</table>

6.2.6.2 Displaying PTP Local Clock and Offset

To display the local PTP clock and offset, use the `show ptp local-clock` command.

```
switch#show ptp local-clock
PTP Mode: Boundary Clock
Clock Identity: 0x00:1c:73:ff:ff:1e:83:24
Clock Domain: 1
Number of PTP ports: 24
Priority1: 128
Priority2: 128
Clock Quality:
  Class: 248
  Accuracy: 0x30
  OffsetScaledLogVariance: 0xffff
Offset From Master: 0
Mean Path Delay: 0
Steps Removed: 0
```
6.2.6.3 Displaying PTP Masters Information

To display the PTP clock's master and grandmaster identity and configuration, use the `show ptp masters` command.

```
switch# show ptp masters
Parent Clock:
Parent Clock Identity: 0x00:1c:73:ff:ff:00:72:40
Parent Port Number: 0
Parent IP Address: N/A
Observed Parent Offset (log variance): N/A
Observed Parent Clock Phase Change Rate: N/A

Grandmaster Clock:
Grandmaster Clock Identity: 0x00:1c:73:ff:ff:00:72:40
Grandmaster Clock Quality:
  Class: 248
  Accuracy: 0x30
  OffsetScaledLogVariance: 0xffff
  Priority1: 128
  Priority2: 128
```

6.2.6.4 Displaying PTP Clock Properties

To display PTP clock properties, use the `show local-clock time-properties` command.

```
switch# show local-clock time-properties
Current UTC offset valid: False
Current UTC offset: 0
Leap 59: False
Leap 61: False
Time Traceable: False
Frequency Traceable: False
PTP Timescale: False
Time Source: 0x0
```

```
6.2.6.5 Displaying PTP Information for all Interfaces

To display PTP information for specified interfaces, use the `show ptp interface` command.

```
switch# show ptp interface
Interface Ethernet1
  PTP: Disabled
  Port state: Disabled
  Sync interval: 1.0 seconds
  Announce interval: 2.0 seconds
  Announce interval timeout multiplier: 3
  Delay mechanism: end to end
  Delay request message interval: 32.0 seconds
  Transport mode: ipv4

Interface Ethernet5
  PTP: Disabled
  Port state: Disabled
  Sync interval: 8.0 seconds
  Announce interval: 2.0 seconds
  Announce interval timeout multiplier: 5
  Delay mechanism: peer to peer
  Peer delay request message interval: 8.0 seconds
  Peer Mean Path Delay: 0
  Transport mode: ipv4
```

6.2.6.6 Displaying PTP Interface Counters

To display PTP interface counters for specified interfaces, use the `show ptp interface counters` command.

```
switch# show ptp interface ethernet 5 counters
Interface Ethernet5
  Announce messages sent: 0
  Announce messages received: 0
  Sync messages sent: 0
  Sync messages received: 0
  Follow up messages sent: 0
  Follow up messages received: 0
  Delay request messages sent: 0
  Delay request messages received: 0
  Delay response messages sent: 0
  Delay response messages received: 0
  Peer delay request messages sent: 0
  Peer delay request messages received: 0
  Peer delay response messages sent: 0
  Peer delay response messages received: 0
  Peer delay response follow up messages sent: 0
  Peer delay response follow up messages received: 0
switch#
```
6.2.6.7 Displaying PTP Foreign Master

To display information about foreign masters (PTP sources not designated as the switch’s master from which the switch has received sync packets), use the `show ptp foreign-master-record` command.

```
switch# show ptp foreign-master-record
No Foreign Master Records
switch#
```

6.2.6.8 Displaying PTP Source IP

To display PTP IP source information, use the `show ptp source ip` command.

```
switch# show ptp source ip
PTP source IP: 10.0.2.1
switch#
```

6.2.6.9 Displaying PTP Monitoring Information

To display the list of up to 100 recorded entries of offset from master, mean path delay and skew values, the current PTP mode, whether or not the feature is enabled, the number of entries displayed, and the configured thresholds for each metric, use the `show ptp monitor` command. Entries are sorted by the system time at which the value was calculated, starting with the most recent data at the top.

```
Switch# show ptp monitor
PTP Mode: Boundary Clock
Ptp monitoring: enabled
Number of entries: 5
Offset from master threshold: 1500
Mean path delay threshold: not configured
Skew threshold: 0.5

<table>

</table>
```
6.3 Managing Display Attributes

Display commands control the content of the banner and the command line prompt.

6.3.1 Banners

The switch can display two banners:

- **Login banner**: The login banner precedes the login prompt. One common use for a login banner is to warn against unauthorized network access attempts.
- **motd banner**: The message of the day (motd) banner is displayed after a user logs into the switch.

This output displays both banners in bold:

```
This is a login banner
switch login: john
Password:
Last login: Mon Jan 14 09:24:36 2013 from adobe-wrks.aristaneetworks.com
This is an motd banner
switch>
```

These commands create the login and motd banner shown earlier in this section.

```
switch(config)#banner login
Enter TEXT message. Type 'EOF' on its own line to end.
This is a login banner
EOF
switch(config)#banner motd
Enter TEXT message. Type 'EOF' on its own line to end.
This is an motd banner
EOF
switch(config)#
```

To create a banner:

**Step 1** Enter global configuration mode.

```
switch#config
switch(config)#
```

**Step 2** Enter banner edit mode by typing the desired command:

- To create a login banner, type **banner login**.
- To create a motd banner, type **banner motd**.

The switch responds with instructions on entering the banner text.

```
switch(config)#banner login
Enter TEXT message. Type 'EOF' on its own line to end.
```

**Step 3** Enter the banner text.

```
This is the first line of banner text.
This is the second line of banner text.
```

**Step 4** Press **Enter** to place the cursor on a blank line after completing the banner text.

**Step 5** Exit banner edit mode by typing **EOF**.

```
EOF
switch(config)#
```
6.3.2 Prompt

The prompt provides an entry point for EOS commands. The `prompt` command configures the contents of the prompt. The `no prompt` command returns the prompt to the default of `%H%P`.

Characters allowed in the prompt include A-Z, a-z, 0-9, and these punctuation marks:

`! @ # $ % ^ & * ( ) - = + f g [ ] ; : < > , . ? / ˜ n`

The prompt supports these control sequences:

- `%s` – space character
- `%t` – tab character
- `%%` – percent character
- `%H` – host name
- `%D` – time and date
- `%D{f_char}` – time and date, format specified by the BSD `strftime(f_char)` time conversion function.
- `%h` – host name up to the first '.'
- `%P` – extended command mode
- `%p` – command mode
- `%r` – redundancy status on modular systems (has no effect on a fixed system)
- `%R` – extended redundancy status on modular systems – includes status and slot number (has no effect on a fixed system)

Example

- This command creates a prompt that displays `system 1` and the command mode.
  
  `host-name.dut103(config)#prompt system%s1%P
system 1(config) #`

- This command creates a prompt that displays the command mode.
  
  `host-name.dut103(config)#prompt %p
(config)#`

- These equivalent commands create the default prompt.
  
  `% prompt %H%P
host-name.dut103(config)#`

  `% no prompt
host-name.dut103(config)#`
6.4 Logging of Event Notifications

Arista switches log event notifications using the Syslog protocol. By default, event notifications are logged internally to `/var/log/messages`, but they can also be displayed on the console or logged to an external server. Severity levels and log message destinations can be configured via the CLI, and individual processes and protocols can also be configured to adjust or limit the messages that they log. Details of the current logging configuration may be viewed using the `show logging` command.

For a full list of Syslog messages, visit the Arista website.

6.4.1 Managing TCAM Capacity Warnings

Strata chipsets (Helix, Trident, Trident2, and Tomahawk) provide event logging for the hardware capacity of TCAM tables on a per-slice basis, triggering a capacity warning by default whenever any slice exceeds 90% capacity. As a result, default TCAM logging can generate high levels of syslog messages on Strata platforms. If this presents a problem, the `hardware capacity alert table` command can be used to adjust the capacity levels at which warnings occur to above the 90% default; this adjustment can be made per TCAM resource and per slice. The command can also be used to disable TCAM hardware capacity messages of level “Warning” and below entirely for a given slice by setting the threshold to 0 or using the `no` version of the command.

To determine the chipset of your device, enter `show platform ?` in the CLI.

Examples

- This command reduces hardware capacity Syslog warnings by increasing the capacity threshold to 99% for EFP table monitoring in slice 2.
  ```
  switch(config)#hardware capacity alert table EFP feature Slice-2 threshold 99
  ```
- This command reduces messages by disabling hardware capacity Syslog warnings entirely for the IFP table in slice 5.
  ```
  switch(config)#hardware capacity alert table IFP feature Slice-5 threshold 0
  ```
- This command reduces messages by disabling hardware capacity Syslog warnings entirely for the VFP table in all slices.
  ```
  switch(config)#no hardware capacity alert table VFP
  ```

Note

Hardware capacity messages are user-configurable only at or below the “Warning” level. The TCAM management software always sends “Error” messages to Syslog and to affected features when all TCAM resources are depleted.
6.5 Event Monitor

The event monitor writes system event records to local files for access by SQLite database commands.

Note

Beginning with release EOS-4.20.5F, `event-monitor` is not enabled by default. Use the `config# event-monitor` command to explicitly enable event-monitor.

6.5.1 Description

The event monitor receives notifications for important events or changes to the enabled event monitor tables. These changes are logged to a fixed-size circular buffer. The size of this buffer is configurable, but it does not grow dynamically. Buffer contents can be stored to permanent files to increase the event monitor effective capacity. The permanent file size and the number of permanent files is configurable. The buffer is stored at a fixed location on the switch.

Specific event monitor queries are available through CLI commands. For queries not available through specific commands, manual queries are supported through other CLI commands. When the user issues a query command, the relevant events from the circular buffer and permanent files are written to and accessed from a temporary SQLite database file. The database keeps a separate table for each logging type (such as mac, arp, route, and others). When the monitor receives notification of a new event, the database file is deleted, then recreated.

6.5.2 Configuring the Event Monitor

Enabling the Event Monitor

The `event-monitor` command enables the event monitor and specifies the types of events that are logged. The event monitor is an event logging service that records system events to a local database. The event monitor records these events:

- `all` changes to all events.
- `arp` changes to the ARP table (IPv4 address to MAC address mappings).
- `Neighbor` changes to the neighbor table (IPv6 address to MAC address mappings)
- `backup` backed up log files.
- `buffer` changes to the local buffer settings.
- `IGMP snooping` changes to the IGMP snooping table.
- `lacp` changes to the LACP table events.
- `mac` changes to the MAC address table (MAC address to port mappings).
- `mroute` changes to the IP multicast routing table.
- `neighbor` changes to the neighbor routing table.
- `route` changes to the IPv4 routing table.
- `route6` changes to the IPv6 routing table.
- `stpunstable` events that cause STP instability.

Beginning with release EOS-4.20.5F, `event-monitor` is not enabled by default. Use the `event-monitor` command to explicitly enable event-monitor. The `no event-monitor all` command disables the event monitor. The `no event-monitor` command, followed by a log type parameter, disables event recording for the specified type.
Example

- This command disables the event monitor for all types of events.
  
  `switch(config)#no event-monitor all`

- This command enables the event monitor for routing table changes.
  
  `switch(config)#event-monitor route`

The `event-monitor clear` command removes the contents of the event monitor buffer. If event monitor backup is enabled, this command removes the contents from all event monitor backup files.

Example

- This command clears the contents of the event monitor buffer.
  
  `switch#event-monitor clear`
  
  `switch(config)#`

Configuring the Buffer

The `event-monitor buffer max-size` command specifies the size of the event monitor buffer. The event monitor buffer is a fixed-size circular data structure that receives event records from the event monitor. When event monitor backup is enabled, the buffer is copied to a backup file before each rollover. Buffer size ranges from 6 Kb to 50 Kb. The default size is 32 Kb.

Example

- This command configures a buffer size of 48 Kb.
  
  `switch(config)#event-monitor buffer max-size 48`
  
  `switch(config)#`

Configuring Permanent Files

The `event-monitor backup path` command enables storage of the event monitor buffer to permanent switch files and specifies the path/name of these files. The command references file location either from the flash drive root directory where the CLI operates (`/mnt/flash`) or from the switch root directory (`/`).

The event monitor buffer is circular – after the buffer is filled, new data replaces older data at the beginning of the buffer. The buffer is copied into a new backup file after each buffer writing cycle before the switch starts re-writing the buffer.

Example

- These commands configure the switch to store the event monitor buffer in sw-event.log, then display the new file in the flash directory.
  
  `switch(config)#event-monitor backup path eventmon_backup_dir/event.log`
  
  `switch(config)#`
  
  `bash-4.3# ls /mnt/flash/eventmon_backup_dir/

  arpevent.log.1 lacpevent.log.1 neighborevent.log.1 routeevent.log.1 igmpsnoopingevent.log.1 macevent.log.1 route6event.log.1 stpunstablevent.log.1`

The `event-monitor backup max-size` command specifies the quantity of event monitor backup files the switch maintains. The switch appends an extension number to the file name when it creates a new file. After every 500 events, the switch deletes the oldest backup file if the file limit is exceeded.
Example

- These commands configure the switch to back up the event buffer to a series of files named `sw-event.log`. The switch can store a maximum of four files.

  ```
  switch(config)#event-monitor backup path sw-event.log
  switch(config)#event-monitor backup max-size 4
  ```

  The first five files that the switch creates to store event monitor buffer contents are:
  
  `sw-event.log.0`
  `sw-event.log.1`
  `sw-event.log.2`
  `sw-event.log.3`
  `sw-event.log.4`

  The switch deletes `sw-event.log.0` the first time it verifies the number of existing backup files after the creation of `sw-event.log.4`.

6.5.3 Querying the Event Monitor

These CLI commands perform SQL-style queries on the event monitor database:

- The `show event-monitor arp` command displays ARP table events.
- The `show event-monitor mac` command displays MAC address table events.
- The `show event-monitor route` command displays routing table events.

Example

- This command displays all events triggered by MAC address table events.

  ```
  switch#show event-monitor mac
  % Writing 0 Arp, 0 Route, 1 Mac events to the database
  2012-01-19 13:57:55|1|0808.0808.0808|Ethernet1|configuredStaticMac|added|0
  ```

  For other database queries, the `show event-monitor sqlite` command performs an SQL-style query on the database, using the statement specified in the command.

Example

- This command displays all entries from the route table.

  ```
  switch#show event-monitor sqlite select * from route;
  2019-09-30 14:01:21.659542|192.168.166.255/32|default|receiveBcast|0|0|updated|20
  2019-09-30 14:01:21.659543|192.168.201.12/30|default|connected|1|0|updated|21
  2019-09-30 14:01:21.659544|192.168.1.255/32|default|receiveBcast|0|0|updated|22
  2019-09-30 14:01:21.659545|192.168.201.8/32|default|receiveBcast|0|0|updated|23
  2019-09-30 14:01:21.659546|192.168.201.12/32|default|receiveBcast|0|0|updated|24
  2019-09-30 14:01:21.659547|192.168.201.9/32|default|receiveBcast|0|0|updated|25
  2019-09-30 14:01:21.659548|192.168.201.15/32|default|receiveBcast|0|0|updated|26
  ```
6.5.4 Accessing Event Monitor Database Records

The `event-monitor interact` command replaces the CLI prompt with an SQLite prompt. The event monitor buffer and all backup logs are synchronized into a single SQLite file and loaded for access from the prompt.

- To access help from the SQLite prompt, enter `.help`
- To exit SQLite and return to the CLI prompt, enter `.quit` or `.exit`

The `event-monitor sync` command combines the event monitor buffer and all backup logs and synchronizes them into a single SQLite file. The data can be accessed through SQLite or by using the `show event-monitor` commands described above.

**Examples**

- This command replaces the EOS CLI prompt with an SQLite prompt.
  
  ```
  switch# event-monitor interact
  sqlite>
  ```

- This command exits SQLite and returns to the EOS CLI prompt.
  
  ```
  sqlite> .quit
  switch#
  ```

- This command synchronizes the buffer and backup logs into a single SQLite file.
  
  ```
  switch(config)# event-monitor sync
  switch(config)#
  ```
6.6 Managing EOS Extensions

The most simple and efficient way to make the most of the extensibility on which EOS is built is through the use of extensions. An extension is a pre-packaged optional feature or a set of scripts in an RPM Package Manager (RPM) or Software image extension (SWIX) format. A variety of extensions are available from the EOS Central page at http://eos.arista.com.

These sections describe basic EOS extension tasks:

- Section 6.6.1: Installing EOS Extensions
- Section 6.6.2: Installing EOS Extensions on a Dual-Supervisor Switch
- Section 6.6.3: Verifying EOS Extensions Installation
- Section 6.6.4: Uninstalling an EOS Extension

6.6.1 Installing EOS Extensions

Complete the following steps to install an EOS extension.

**Step 1** Download the desired extension and copy it onto the device’s flash storage.

```
switch#dir
Directory of flash:
  -rw 479183792 Jun 23 09:46 EOS-4.13.3F.swi
  -rw 21280296 Feb 6 16:48 arista-splunk-extension.swix
  -rw  27 Jun 23 10:08 boot-config
  drwx  4096 Sep 26 2012 schedule
  -rw 1481 Jun 27 05:54 startup-config
```

**Step 2** Copy the file from the flash storage to the extensions partition.

```
switch#copy flash:arista-splunk-extension.swix extension:
Copy completed successfully.
```

**Step 3** Install the EOS extension.

```
switch#extension arista-splunk-extension.swix
```

If this extension modifies the behavior of the CLI, any running CLI sessions will need to be reset in order for the CLI modifications to take effect.

**Step 4** If extension persistence across reboots is required, the extension should also be copied into the boot-extensions partition.

```
switch#copy installed-extensions boot-extensions
```

**Step 5** Run the extension. As the CloudVision extension adds additional CLI commands to EOS, the CLI session must be restarted so that the additional commands are available. To achieve this, close the SSH or the telnet session and open a new session.

6.6.2 Installing EOS Extensions on a Dual-Supervisor Switch

Complete the following steps to install an EOS extension on a dual-supervisor switch.

**Step 1** Copy the extension from the primary supervisor to the standby supervisor’s flash directory.

```
switch(s1)#copy flash:<filename>.swix supervisor-peer://mnt/flash/
```
Chapter 6: Administering the Switch

Managing EOS Extensions

Step 2  Establish a session to the standby supervisor from the primary.

```
switch(s1)#session peer-supervisor
Warning: Permanently added '[127.1.0.2]:3601' (RSA) to the list of known hosts.
Last login: Mon Aug 27 17:32:00 2018 from supervisor1

WARNING - you are currently logged in to the standby supervisor.
Not all cli commands are available or supported. Any configuration
done from this cli will not be reflected in the active supervisor's
running config and will be lost when the active supervisor writes
its startup config.
```

```
switch(s2)#
```

Step 3  Repeat the steps listed in the Installing EOS Extensions to install the EOS extension.

Step 4  Repeat the steps listed in the Verifying EOS Extensions Installation to verify the extension installation.

Step 5  Exit standby supervisor.

```
switch(s2)#exit
Connection to 127.1.0.1 closed.
```

```
switch(s1)#
```

6.6.3 Verifying EOS Extensions Installation

Complete the steps to verify that the EOS extensions are installed correctly.

Step 1  Run the `show extensions` command to verify that the EOS extensions are available and installed correctly.

```
switch#show extensions
+-----------------+-----------------+---------+--------+
| Name            | Version/Release | Status  | Extension |
|-----------------+-----------------+---------+--------+
| EosSdk-1.2.1-fl.boca-1943435.i686.rpm | 1.2.1/1943435.flbocaeossd | A, NI   | 1      |
| arista-splunk-extension.swix       | 0.95/1498976.2013ltdsplun | A, I    | 2      |
| fping-2.4b2-10.fc12.i686.rpm       | 2.4b2/10.fc12    | A, I    | 1      |
| gnuplot.swix                    | 1.10.0/1.fc14    | A, I    | 16     |
| splunkforwarder-5.0.9-213964.i386.rpm | 5.0.9/213964    | A, NI   | 1      |
+-----------------+-----------------+---------+--------+
A: available | NA: not available | I: installed | NI: not installed | F: forced
```

Step 2  Run the `show boot-extensions` command to verify that the EOS extensions are enabled for boot persistence.

```
switch#show boot-extensions
arista-splunk-extension.swix
fping-2.4b2-10.fc12.i686.rpm
gnuplot.swix
```
6.6.4 Uninstalling an EOS Extension

Complete the following steps to uninstall an EOS extension.

**Step 1** Uninstall the existing EOS extension using the **no extension** command.

```
switch#no extension fping-2.4b2-10.fc12.i686.rpm
switch#show extensions
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Version/Release</th>
<th>Status extension</th>
</tr>
</thead>
<tbody>
<tr>
<td>EosSdk-1.2.1-fl.boca-1943435.i686.rpm</td>
<td>1.2.1/1943435.flbocaerossd</td>
<td>A, NI 1</td>
</tr>
<tr>
<td>arista-splunk-extension.swix</td>
<td>0.95/1498976.2013Ldsplun</td>
<td>A, I 2</td>
</tr>
<tr>
<td>fping-2.4b2-10.fc12.i686.rpm</td>
<td>2.4b2/10.fc12</td>
<td>A, NI 1</td>
</tr>
<tr>
<td>gnuplot.swix</td>
<td>1.10.0/1.fc14</td>
<td>A, I 16</td>
</tr>
<tr>
<td>splunkforwarder-5.0.9-213964.i386.rpm</td>
<td>5.0.9/213964</td>
<td>A, NI 1</td>
</tr>
</tbody>
</table>

A: available | NA: not available | I: installed | NI: not installed | F: forced

**Step 2** Remove the extension from the boot-extension using the **copy installed-extensions boot-extensions** command.

```
switch#copy installed-extensions boot-extensions
```

**Note** If your system is a Dual-Supervisor Switch, connect to the secondary supervisor using the **session peer-supervisor** command, repeat steps 1 and 2, and finally exit from the secondary supervisor.
6.7 Switch Administration Commands

Switch Name Configuration Commands
- dns domain
- hostname
- ip domain-list
- ip domain lookup
- ip host
- ip name-server
- ipv6 host
- show hostname
- show hosts
- show ip domain-name
- show ip name-server

Banner Configuration Commands
- banner login
- banner motd
- show banner

Prompt Configuration Command
- prompt

Event Manager Commands
- event-monitor
- event-monitor backup max-size
- event-monitor backup path
- event-monitor buffer max-size
- event-monitor clear
- event-monitor interact
- event-monitor sync
- no event-monitor
- show event-monitor arp
- show event-monitor igmpsnoping
- show event-monitor mac
- show event-monitor mroute
- show event-monitor neighbor
- show event-monitor route6
- show event-monitor route
- show event-monitor sqlite
- show event-monitor stpunstable

Email Configuration Command
- email

System Clock Commands
- clock set
- clock timezone
- show clock

NTP Commands
- ntp authenticate
Switch Administration Commands

Chapter 6: Administering the Switch

- ntp authentication-key
- ntp local-interface
- ntp serve
- ntp serve all
- ntp server
- ntp trusted-key
- show ntp associations
- show ntp status

**PTP Commands**
- clear ptp interface counters
- ptp announce interval
- ptp announce timeout
- ptp delay-mechanism
- ptp delay-req interval
- ptp domain
- ptp enable
- ptp forward-v1
- ptp hold-tp-time
- ptp mode
- ptp monitor
- ptp monitor threshold mean-path-delay
- ptp monitor threshold offset-from-master
- ptp monitor threshold skew
- ptp pdelay-neighbor-threshold
- ptp pdelay-req interval
- ptp priority1
- ptp priority2
- ptp role
- ptp source ip
- ptp sync-message interval
- ptp sync timeout
- ptp transport
- ptp ttl
- show local-clock time-properties
- show ptp
- show ptp foreign-master-record
- show ptp interface
- show ptp interface counters
- show ptp local-clock
- show ptp masters
- show ptp monitor
- show ptp source ip

**Syslog Configuration Commands**
- logging format sequence-numbers
- logging repeat-messages
**banner login**

The `banner login` command configures a message that the switch displays before login and password prompts. The login banner is available on console, telnet, and ssh connections.

The `no banner login` and `default banner login` commands delete the login banner.

**Command Mode**

Global Configuration

**Command Syntax**

```
banner login
no banner login
default banner login
```

**Parameters**

- `banner_text`  To configure the banner, enter a message when prompted. The message may span multiple lines. Banner text supports the following keywords:
  - `${hostname}` displays the switch’s host name.
  - `EOF` To end the banner editing session, type EOF on its own line and press enter.

**Examples**

- These commands create a two-line login banner.
  ```
  switch(config)#banner login
  Enter TEXT message. Type 'EOF' on its own line to end.
  This is a login banner for ${hostname}.
  Enter your login name at the prompt.
  EOF
  switch(config)#
  ```

  This output displays the login banner.

  This is a login banner for switch.
  Enter your login name at the prompt.
  switch login: john
  Password:
  Last login: Mon Jan 14 09:05:23 2013 from adobe-wrks.aristanetworks.com
  switch>
**banner motd**

The `banner motd` command configures a “message of the day” (motd) that the switch displays after a user logs in. The motd banner is available on console, telnet, and ssh connections.

The `no banner motd` and `default banner motd` commands delete the motd banner.

**Command Mode**
Global Configuration

**Command Syntax**
- `banner motd`
- `no banner motd`
- `default banner motd`

**Parameters**
- **banner_text** To configure the banner, enter a message when prompted. The message may span multiple lines. Banner text supports this keyword:
  - `${hostname}` displays the switch’s host name.
- **EOF** To end the banner editing session, type `EOF` on its own line and press **enter**.

**Examples**
- These commands create an motd banner.
  ```
  switch(config)#banner motd
  Enter TEXT message. Type 'EOF' on its own line to end.
  This is an motd banner for `${hostname}`
  EOF
  switch(config)#
  ```
  This output displays the motd banner.
  ```
  switch login: john
  Password:
  Last login: Mon Jan 14 09:17:09 2013 from adobe-wrks.aristanetworks.com
  This is an motd banner for Switch
  ```
clear ptp interface counters

The clear ptp interface counters command resets the Precision Time Protocol (PTP) packet counters.

Command Mode
Privileged EXEC

Command Syntax

clear ptp interface [INTERFACE_NAME] counters

Parameters

- INTERFACE_NAME Interface type and numbers. Options include:
  - <no parameter> Display information for all interfaces.
  - ethernet e_range Ethernet interface range specified by e_range.
  - loopback l_range Loopback interface specified by l_range.
  - management m_range Management interface range specified by m_range.
  - port-channel p_range Port-Channel Interface range specified by p_range.
  - vlan v_range VLAN interface range specified by v_range.
  - vxlan vx_range VXLAN interface range specified by vx_range.

Valid parameter formats include number, number range, or comma-delimited list of numbers and ranges.

Example

- This command clears all PTP counters.

    switch# clear ptp counters
    switch#
**clock set**

The **clock set** command sets the system clock time and date. If the switch is configured with an NTP server, NTP time synchronizations override manually entered time settings.

Time entered by this command is local, as configured by the **clock timezone** command.

**Command Mode**

Privileged EXEC

**Command Syntax**

```
clock set hh:mm:ss date
```

**Parameters**

- **hh:mm:ss** is the current time (24-hour notation).
- **date** is the current date. Date formats include:
  - **mm/dd/yy** example: 05/15/2012
  - **Month day year** example: May 15 2012
  - **day month year** example: 15 May 2012

**Example**

- This command manually sets the switch time.

  switch#clock set 08:15:24 14 Jan 2013

  Mon Jan 14 08:15:25 2013
  timezone is US/Central
**clock timezone**

The `clock timezone` command specifies the UTC offset that converts system time to local time. The switch uses local time for time displays and to time-stamp system logs and messages.

The no clock timezone and default clock timezone commands delete the `timezone` statement from running-config, setting local time to UTC.

**Command Mode**

Global Configuration

**Command Syntax**

- `clock timezone zone_name`
- `no clock timezone`
- `default clock timezone`

**Parameters**

- `zone_name`: the time zone. Settings include a list of predefined time zone labels.

**Examples**

- This command configures the switch for the United States Central Time Zone.

  ```
  switch(config)#clock timezone US/Central
  switch(config)#show clock
  Fri Jan 11 18:42:49 2013
timezone is US/Central
  switch(config)#
  ```

- To view the predefined time zone labels, enter `clock timezone` with a question mark.

  ```
  switch(config)#clock timezone ?
  Africa/Abidjan                    Africa/Accra
  Africa/Addis_Ababa                Africa/Algiers
  Africa/Asmara                     Africa/Asmera
  Africa/Bamako                     Africa/Bangui
  W-SU                              W-SU timezone
  WET                               WET timezone
  Zulu                              Zulu timezone
  
  switch(config)#clock timezone
  ```

- This command displays all time zone labels that start with America.

  ```
  switch(config)#clock timezone AMERICA?
  America/Adak                      America/Anchorage
  America/Anguilla                  America/Antigua
  America/Araguaina                 America/Argentina/Buenos_Aires
  America/Virgin                    America/Whitehorse
  America/Winnipeg                  America/Yakutat
  America/Yellowknife
  
  switch(config)#clock timezone AMERICA
  ```
**dns domain**

The `dns domain` command configures the switch’s domain name. The switch uses this name to complete unqualified host names.

The `no dns domain` and `default dns domain` commands delete the domain name by removing the `dns domain` command from `running-config`.

**Command Mode**
- Global Configuration

**Command Syntax**
```
dns domain string
no dns domain
default dns domain
```

**Parameters**
- `string`  domain name (text string)

**Example**
- This command configures `aristanetworks.com` as the switch’s domain name.

```
switch(config)# dns domain aristanetworks.com
switch(config)#
```
email

The `email` command places the switch in email client configuration mode. If you configure a `from-user` and an outgoing SMTP server on the switch, you can then use an email address as an output modifier to a `show` command and receive the output as email.

**Command Mode**
Global Configuration

**Command Syntax**
```
email
```

**Example**
- This command places the switch in email client configuration mode.
  ```
  switch(config)#email
  switch(config)#
  ```
no event-monitor

The no event-monitor and default event-monitor commands remove the specified event-monitor configuration statements from running-config, returning the switch to the specified default state.

- no event-monitor <with no parameters> restores all default setting states:
  - event monitor is enabled.
  - buffer backup is disabled.
- no event-monitor backup disables the backup.

To disable the event monitor, enter the no event-monitor all command (event-monitor).

**Command Mode**
Global Configuration

**Command Syntax**

```
no event-monitor [PARAMETER]
default event-monitor [PARAMETER]
```

**Parameters**

- **PARAMETER** the event monitor property that is returned to the default state.
  - <no parameter> all event monitor properties.
  - backup event monitor buffer backup is disabled.

**Example**

- This command removes all event monitor configuration statements from running-config.

  switch(config)#no event-monitor
  switch(config)#
  ```
event-monitor

The `event-monitor` command enables the event monitor and specifies the types of events that are logged. The event monitor is an event logging service that records system events to a local database.

The database maintains a separate table for each event type.

Beginning with release EOS-4.20.5F, `event-monitor` is not enabled by default. Use the `event-monitor` command to explicitly enable event-monitor.

- The `no event-monitor all` command disables the event monitor.
- The `no event-monitor` command, followed by a log type parameter, disables event recording for the specified type.
- The `event-monitor` and `default event-monitor` commands enable the specified event logging type by removing the corresponding `no event-monitor` command from `running-config`.

The `no event-monitor` and `default event-monitor` commands, without a `LOG_TYPE` parameter, restore the default event monitor settings by deleting all event monitor related commands from `running-config`.

Command Mode

Global Configuration

Command Syntax

```
event-monitor LOG_TYPE
no event-monitor LOG_TYPE
default event-monitor LOG_TYPE
```

Parameters

- `LOG_TYPE` specifies the event logging type. Options include:
  - `all` all event logging types.
  - `arp` changes to ARP table.
  - `backup` backed up log files.
  - `buffer` changes to the local buffer settings.
  - `igmpsnooping` changes to IGMP snooping table.
  - `lacp` changes to the LACP table events.
  - `mac` changes to MAC address table.
  - `mroute` changes to multicast routing table.
  - `neighbor` changes to the neighbor routing table.
  - `route` changes to IP routing table.
  - `route6` changes to IP route6 table.
  - `stpunstable` events that cause STP instability.

Related Commands

- `no event-monitor`

Examples

- This command disables the event monitor for all types of events.
  ```
  switch(config)#no event-monitor all
  switch(config)#
  ```
• This command enables the event monitor for routing table changes.

  switch(config)#event-monitor route
  switch(config)#
**event-monitor backup max-size**

The `event-monitor backup max-size` command specifies the quantity of event monitor backup files the switch maintains. Values range from 1 to 200 files with a default of ten files.

The `event-monitor backup path` command specifies the path/name of these files. The switch appends an extension to the file name that tracks the creation order of backup files. When the quantity of files exceeds the configured limit, the switch deletes the oldest file.

The `no event-monitor backup max-size` and `default event-monitor backup max-size` command restores the default maximum number of backup files the switch can store to ten by removing the corresponding `event-monitor backup max-size` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
event-monitor backup max-size file_quantity
no event-monitor backup max-size
default event-monitor backup max-size
```

**Parameters**

- `file_quantity` maximum number of backup files. Value ranges from 1 to 200. Default is 10.

**Examples**

- These commands configure the switch to back up the event buffer to a series of files named `sw-event.log`. The switch can store a maximum of four files.

```
switch(config)#event-monitor backup path sw-event.log
switch(config)#event-monitor backup max-size 4
switch(config)#
```

The first five files that the switch creates to store event monitor buffer contents are:

```
sw-event.log.0
sw-event.log.1
sw-event.log.2
sw-event.log.3
sw-event.log.4
```

The switch deletes `sw-event.log.0` the first time it verifies the number of existing backup files after the creation of `sw-event.log.4`. 
event-monitor backup path

The **event-monitor backup path** command enables the storage of the event monitor buffer to switch files and specifies the path/name of these files. The command references the file location either from the flash drive root directory (/mnt/flash) where the CLI operates or from the switch root directory (/).

The event monitor buffer is circular – after the buffer is filled, new data is written to the beginning of the buffer, replacing old data. At the conclusion of each buffer writing cycle, it is copied into a new backup file before the switch starts re-writing the buffer. The switch appends an extension number to the file name when it creates a new file. After every 500 events, the switch deletes the oldest backup file if the file limit specified by the **event-monitor backup max-size** command is exceeded.

**running-config** can contain a maximum of one **event-monitor backup path** statement. Subsequent **event-monitor backup path** commands replace the existing statement in **running-config**, changing the name of the file where event monitor backup files are stored.

The **no event-monitor backup path** and **default event-monitor backup path** commands disable the storage of the event monitor buffer to switch files by deleting the **event-monitor backup path** command from **running-config**.

**Command Mode**
- Global Configuration

**Command Syntax**

```plaintext
  event-monitor backup path URL_FILE
  no event-monitor backup path
  default event-monitor backup path
```

**Parameters**

- **URL_FILE** path and file name of the backup file
  - **path_string** specified path is appended to /mnt/flash/
  - **file:** specified path is appended to /
  - **flash:** specified path is appended to /mnt/flash/

**Examples**

- These commands configure the switch to store the event monitor buffer in sw-event.log, then display the new file in the flash directory.

```plaintext
  switch(config)#event-monitor backup path eventmon_backup_dir/event.log
  switch(config)#
  bash-4.3# ls /mnt/flash/eventmon_backup_dir/
  arpevent.log.1 lacpevent.log.1 neighborevent.log.1 routeevent.log.1 igmpsnopingevent.log.1 macevent.log.1 route6event.log.1 stpunstableevent.log.1
```
**event-monitor buffer max-size**

The `event-monitor buffer max-size` command specifies the size of the event monitor buffer. The event monitor buffer is a fixed-size circular data structure that receives event records from the event monitor. When event monitor backup is enabled (`event-monitor backup path`), the buffer is copied to a backup file before each rollover.

Buffer size ranges from 6 Kb to 50 Kb. The default size is 32 Kb.

The `no event-monitor buffer max-size` and `default event-monitor buffer max-size` commands restore the default buffer size of 32 Kb by removing the `event-monitor buffer max-size` command from `running-config`.

**Command Mode**
- Global Configuration

**Command Syntax**
```
  event-monitor buffer max-size buffer_size
  no event-monitor buffer max-size
  default event-monitor buffer max-size
```

**Parameters**
- `buffer_size` buffer capacity (Kb). Values range from 6 to 50. Default value is 32.

**Example**
- This command configures a buffer size of 48 Kb.
```
switch(config)#event-monitor buffer max-size 48
switch(config)#
```
event-monitor clear

The `event-monitor clear` command removes the contents of the event monitor buffer. If event monitor backup is enabled, this command removes the contents from all event monitor backup files.

**Command Mode**
Privileged EXEC

**Command Syntax**
```
event-monitor clear
```

**Example**
- This command clears the contents of the event monitor buffer.

```
switch# event-monitor clear
switch#
```
event-monitor interact

The `event-monitor interact` command replaces the CLI prompt with an SQLite prompt. The event monitor buffer and all backup logs are synchronized into a single SQLite file and loaded for access from the prompt.

- To access help from the SQLite prompt, enter `.help`
- To exit SQLite and return to the CLI prompt, enter `.quit` or `.exit`

Command Mode

Privileged EXEC

Command Syntax

```
event-monitor interact
```

Examples

- This command replaces the EOS CLI prompt with an SQLite prompt.
  ```
  switch# event-monitor interact
  sqlite>
  ```
- This command exits SQLite and returns to the EOS CLI prompt.
  ```
  sqlite> .quit
  switch#
  ```
event-monitor sync

The `event-monitor buffer sync` command combines the event monitor buffer and all backup logs and synchronizes them into a single SQLite file, which is stored at `/var/log/eventMon.db`

**Command Mode**
Privileged EXEC

**Command Syntax**
```
event-monitor sync
```

**Example**
- This command synchronizes the buffer and backup logs into a single SQLite file.

```
switch(config)#event-monitor sync
switch(config)#
```
hostname

The hostname command assigns a text string as the switch’s host name. The default host name is localhost.

The prompt displays the host name when appropriately configured through the prompt command.

The no hostname and default hostname commands return the switch’s host name to the default value of localhost.

Command Mode
Global Configuration

Command Syntax

hostname string
no hostname
default hostname

Parameters

- **string**  host name assigned to the switch.

Example

- This command assigns the string main-host as the switch’s host name.

  switch(config)#hostname main-host
  main-host(config)#

  The prompt was previously configured to display the host name.
The `ip domain-list` command specifies a domain name to add to the IP domain list.

The `no ip domain-list` and `default ip domain-list` commands return the IP domain list to its default state, in which the switch selects source IP addresses for each DNS request from the specified VRF.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip domain-list [IP_DOMAIN_NAME]
no ip domain-list [IP_DOMAIN_NAME]
default ip domain-list [IP_DOMAIN_NAME]
```

**Parameters**

- `IP_DOMAIN_NAME` specifies the IP domain name.

**Examples**

- This command specifies foo.com as the IP domain name to add to the IP domain list.
  ```
  switch(config)#ip domain-list foo.com
  switch(config)#
  ```

- This command removes foo.com and returns the IP domain list to its default state.
  ```
  switch(config)#no ip domain-list foo.com
  switch(config)#
  ```
ip domain lookup

The `ip domain lookup` command specifies the source interface for all DNS requests sent from the specified VRF.

The `no ip domain lookup` and `default ip domain lookup` commands return the switch to its default state, in which the switch selects source IP addresses for each DNS request from the specified VRF.

Command Mode
Global Configuration

Command Syntax
```
ip domain lookup [VRF_INSTANCE] source-interface INTF_NAME
no ip domain lookup [VRF_INSTANCE] source-interface
default ip domain lookup [VRF_INSTANCE] source-interface
```

Parameters
- `VRF_INSTANCE` specifies the VRF instance being modified.
- `<no parameter>` changes are made to the default VRF.
- `vrf vrf_name` changes are made to the specified VRF.
- `INTF_NAME` name of source interface to be used for DNS requests. Options include:
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-channel interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.

Examples
- This command specifies VLAN 5 as the source interface for DNS requests originating from the default VRF.
  ```
  switch(config)#ip domain lookup source-interface Vlan5
  switch(config)#
  ```
- This command specifies VLAN 10 as the source interface for DNS requests originating from VRF "purple."
  ```
  switch(config)#ip domain lookup vrf purple source-interface Vlan10
  switch(config)#
  ```
The `ip host` command associates a hostname to an IPv4 address. This command supports local hostname resolution based on local hostname-IP address maps. Multiple hostnames can be mapped to an IP address. IPv4 and IPv6 addresses can be mapped to the same hostname (to map an IPv6 address to a hostname, use the `ipv6 host` command). The `show hosts` command displays the local hostname-IP address mappings.

The `no ip host` and `default ip host` commands removes hostname-IP address maps by deleting the corresponding `ip host` command from `running-config`, as specified by command parameters:

- no parameters: command removes all hostname-IP address maps.
- `hostname` parameter: command removes all IP address maps for the specified hostname.
- `hostname` and `IP address` parameters: command removes specified hostname-IP address maps.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip host hostname hostadd_1 [hostadd_2] ... [hostadd_X]
nop ip host [hostname] [hostadd_1] [hostadd_2] [hostadd_X]
default ip host [hostname] [hostadd_1] [hostadd_2] [hostadd_X]
```

**Parameters**

- `hostname` hostname (text).
- `hostadd_N` IPv4 address associated with hostname (dotted decimal notation).

**Related Commands**

- `ipv6 host`
- `show hosts`

**Examples**

- This command associates the hostname `test_lab` with the IP addresses `10.24.18.5` and `10.24.16.3`.
  ```
switch(config)#ip host test_lab 10.24.18.5 10.24.16.3
  ```
- This command removes all IP address maps for the hostname `production_lab`.
  ```
switch(config)#no ip host production_lab
switch(config)#
  ```
ip name-server

The ip name-server command adds name server addresses to running_config. The switch uses name servers for name and address resolution. The switch can be configured with up to three name servers. Although a command can specify multiple name server addresses, running_config stores each address in a separate statement. Name server addresses can be IPv4 and IPv6; each command can specify both address types.

Attempts to add a fourth server generate an error message. All name server addresses must be configured in the same VRF. When name servers were previously configured in a VRF, they must all be removed before adding new name server entries.

The no ip name-server and default ip name-server commands remove specified name servers from running_config. Commands that do not list an address remove all name servers.

Command Mode
Global Configuration

Command Syntax

<table>
<thead>
<tr>
<th>Command</th>
<th>Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip name-server</td>
<td>ip name-server [VRF_INSTANCE] SERVER_1 [SERVER_2] [SERVER_3]</td>
</tr>
<tr>
<td>no ip name-server</td>
<td>no ip name-server [VRF_INSTANCE] [SERVER_1] [SERVER_2] [SERVER_3]</td>
</tr>
<tr>
<td>default ip name-server</td>
<td>default ip name-server [VRF_INSTANCE] [SERVER_1] [SERVER_2] [SERVER_3]</td>
</tr>
</tbody>
</table>

Parameters

- **VRF_INSTANCE** specifies the VRF instance containing the addresses.
  - <no parameter> default VRF.
  - vrf vrf_name a user-defined VRF.
- **SERVER_X** IP address of the name server (dotted decimal notation). Options include:
  - ipv4_addr (A.B.C.D)
  - ipv6_addr (A:B:C:D:E:F:G:H)

A command can contain both (IPv4 and IPv6) address types.

Guidelines

All configured name server addresses must come from the same VRF. To use a user defined VRF for connection to a name server, first remove any name servers configured in the default VRF.

Examples

- This command adds two name servers to the configuration.
  ```
  switch(config)#ip name-server 172.0.14.21 3:4F21:1902::
  switch(config)#
  ```

- This command attempts to add a name server when the configuration already lists three servers.
  ```
  switch(config)#ip name-server 172.1.10.22
  % Maximum number of nameservers reached. '172.1.10.22' not added
  switch(config)#
  ```
ipv6 host

The **ipv6 host** command associates a hostname to an IPv6 address. This command supports local hostname resolution based on local hostname-IP address maps. Multiple hostnames can be mapped to an IPv6 address. IPv4 and IPv6 addresses can be mapped to the same hostname (to map IPv4 addresses to a hostname, use the ip host command). The **show hosts** command displays the local hostname-IP address mappings.

The **no ipv6 host** and **default ipv6 host** commands remove hostname-IP address maps by deleting the corresponding **ipv6 host** command from **running-config**, as specified by command parameters:

- no parameters: command removes all hostname-IPv6 address maps.
- **hostname** parameter: command removes all IPv6 address maps for the specified hostname.
- **hostname** and **IP address** parameters: command removes specified hostname-IP address maps.

**Command Mode**

Global Configuration

**Command Syntax**

```
ipv6 host  hostname hostadd_1 [hostadd_2] ... [hostadd_X]
no ipv6 host [hostname] [hostadd_1] [hostadd_2] [hostadd_X]
default ipv6 host [hostname] [hostadd_1] [hostadd_2] [hostadd_X]
```

**Parameters**

- **hostname** hostname (text).
- **hostadd_\_N** IPv6 addresses associated with hostname (dotted decimal notation).

**Related Commands**

- ip host
- show hosts

**Example**

- This command associates the hostname **support_lab** with the IPv6 address 2001:0DB8:73:ff:ff:26:fd:90.

```
switch(config)#ipv6 host support_lab 2001:0DB8:73:ff:ff:26:fd:90
switch(config)#
```
logging format sequence-numbers

The **logging format sequence-numbers** command causes the sequence numbers of syslog messages to be visible when the messages are displayed.

The **no logging format sequence-numbers** and **default logging format sequence-numbers** commands remove the **logging format sequence-numbers** command from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

```
logging format sequence-numbers
no logging format sequence-numbers
default logging format sequence-numbers
```

**Examples**

- This command enables sequence numbering that can be seen when syslog messages are displayed.

```
switch(config)#logging format sequence-numbers
switch(config)#
```

- To display the sequence numbers, issue the **show logging** command.

```
switch#show logging
Syslog logging: enabled
 Buffer logging: level debugging
 Console logging: level informational
 Synchronous logging: disabled
 Trap logging: level informational
 Sequence numbers: enabled
 Syslog facility: local4
 Hostname format: Hostname only
 Repeat logging interval: disabled

switch#
logging repeat-messages

The **logging repeat-messages** command configures repetition of syslog messages instead of summarizing the count of repeats.

The **no logging repeat-messages** and **default logging repeat-messages** commands disable the functionality to repeat logging messages in **running-config**.

**Command Mode**
Global Configuration

**Command Syntax**
- `logging repeat-messages`
- `no logging repeat-messages`
- `default logging repeat-messages`

**Examples**
- This command repeats syslog messages instead of summarizing the count of repeats.
  ```
  switch(config)#logging repeat-messages
  switch(config)#
  ```
- This command displays the status of logging repeat messages command.
  ```
  switch(config)#show logging

  aaa          debugging   debugging
  accounting   debugging   debugging
  <--------OUTPUT OMITTED FROM EXAMPLE-------->
  switch(config)#
  ```
**ntp authenticate**

The `ntp authenticate` command enables the authentication of incoming NTP packets. When authentication is enabled, NTP packets will be used to synchronize time on the switch only if they include a trusted authentication key. Authentication keys are created on the switch using the `ntp authentication-key` command, and the `ntp trusted-key` command is used to specify which keys are trusted. NTP authentication is disabled by default.

The `no ntp authenticate` and `default ntp authenticate` commands disable NTP authentication on the switch by removing the corresponding `ntp authenticate` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

- `ntp authenticate`
- `no ntp authenticate`
- `default ntp authenticate`

**Examples**

- This command enables NTP authentication on the switch.
  
  ```
  switch(config)# ntp authenticate
  switch(config)#
  ```

- This command disables NTP authentication on the switch.
  
  ```
  switch(config)# no ntp authenticate
  switch(config)#
  ```
ntp authentication-key

The `ntp authentication-key` command creates an authentication key for use in authenticating incoming NTP packets. For the key to be used in authentication:

- It must be configured as a trusted key using the `ntp trusted-key` command.
- NTP authentication must be enabled on the switch using the `ntp authenticate` command.
- The same key must be configured on the NTP server.

The `no ntp authentication-key` and `default ntp authentication-key` commands remove the specified authentication key by removing the corresponding `ntp authentication-key` command from `running-config`.

Command Mode

Global Configuration

Command Syntax

```
ntp authentication-key key_id ENCRYPT_TYPE password_text
no ntp authentication-key key_id
default ntp authentication-key key_id
```

Parameters

- `key_id` key ID number. Value ranges from 1 to 65534.
- `ENCRYPT_TYPE` encryption method. Values include:
  - `md5` key_text is MD5 encrypted.
  - `sha1` key_text is SHA-1 encrypted.
- `password_text` the authentication-key password.

Example

- This command creates an NTP authentication key with ID 234 and password “timeSync” using MD5 encryption.
  ```
  switch(config)#ntp authentication-key 234 md5 timeSync
  ```

  `Running-config` stores the password as plain text.

- This command removes NTP authentication key 234.
  ```
  switch(config)#no ntp authentication-key 234
  ```
**ntp local-interface**

The **ntp local-interface** command configures an interface as the source of NTP updates. That interface’s IP address is then used as the source address for all NTP packets sent to all destinations unless a server-specific source interface has been specified using the **source** option of the **ntp server** command.

The **no ntp local-interface** and **default ntp local-interface** commands remove the **ntp local-interface** command from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

```
ntp local-interface [VRF_INSTANCE] INT_PORT
no ntp local-interface
default ntp local-interface
```

**Parameters**

- **VRF_INSTANCE**  the VRF instance to be used for connection to the specified server.
  - <no parameter>  connects using the default VRF.
  - `vrf vrf_name`  connects using the specified user-defined VRF.
- **INT_PORT**  the interface port that specifies the NTP local interface. Settings include:
  - `ethernet e_range`  Ethernet interface list.
  - `loopback l_range`  loopback interface list.
  - `management m_range`  management interface list.
  - `port-channel c_range`  port channel interface list.
  - `vlan v_range`  VLAN interface list.

**Examples**

- This command configures VLAN interface 25 as the source of NTP update packets.

```
switch(config)# ntp local-interface vlan 25
switch(config)#
```

- This command removes the **ntp local-interface** command from the configuration.

```
switch(config)# no ntp local-interface
switch(config)#
```
**ntp serve**

The *ntp serve* command configures the command mode interface to accept incoming NTP requests regardless of the global setting.

The *no ntp serve* command configures the command mode interface to refuse incoming NTP requests regardless of the global setting. The *default ntp serve* command configures the command mode interface to follow the global setting.

Using this command also causes the switch to re-synchronize with its upstream NTP server.

**Command Modes**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration
- Interface-VXLAN Configuration

**Command Syntax**

```
ntp serve
no ntp serve
default ntp serve
```

**Example**

- These commands configure Ethernet interface 5 to accept incoming NTP requests regardless of global settings.
  
  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#ntp serve
  switch(config-if-Et5)#
  ```

- These commands configure Ethernet interface 5 to deny incoming NTP requests regardless of global settings.
  
  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#no ntp serve
  switch(config-if-Et5)#
  ```

- These commands configure Ethernet interface 5 to use global settings in responding to incoming NTP requests.
  
  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#default ntp serve
  switch(config-if-Et5)#
  ```
**ntp serve all**

The `ntp serve all` command configures the switch to act as an NTP server by accepting incoming NTP requests.

Using this command also causes the switch to re-synchronize with its upstream NTP server.

Individual interfaces can be configured separately to accept or deny NTP requests by using the `ntp serve` command, and these settings override the global setting.

**Command Mode**

Global Configuration

**Command Syntax**

```
ntp serve all
no ntp serve all
default ntp serve all
```

**Example**

- This command configures the switch to accept incoming NTP requests.
  ```
  switch(config)# ntp serve all
  switch(config)#
  ```

- This command configures the switch to deny incoming NTP requests.
  ```
  switch(config)# no ntp serve all
  switch(config)#
  ```
ntp server

The `ntp server` command adds a Network Time Protocol (NTP) server to `running-config`. If the command specifies a server that already exists in `running-config`, it will modify the server settings. The switch synchronizes the system clock with an NTP server when `running-config` contains at least one valid NTP server.

The switch supports NTP versions 1 through 4. The default is version 4.

The `prefer` option specifies a preferred NTP server, which will be used as the NTP server if not discarded by NTP.

The `no ntp server` and `default ntp server` commands remove the specified NTP server from `running-config`. To remove an NTP server configured in a user-defined VRF, include the VRF name in the `no ntp server` command.

Command Mode

Global Configuration

Command Syntax

```
ntp server [VRF_INSTANCE] SERVER_NAME
  [PREference] [NTP_VERSION] [IP_SOURCE] [burst] [iburst] [AUTH_KEY] [MAX_POLL_INT]
  [MIN_POLL_INT]
no ntp [server [VRF_INSTANCE] SERVER_NAME]
default ntp [server [VRF_INSTANCE] SERVER_NAME]
```

All parameters except `VRF_INSTANCE` and `SERVER_NAME` can be placed in any order.

Parameters

- **VRF_INSTANCE** the VRF instance to be used for connection to the specified server.
  - `<no parameter>` connects using the default VRF.
  - `vrf vrf_name` connects using the specified user-defined VRF.
- **SERVER_NAME** NTP server location. Options include:
  - `IP address` in dotted decimal notation
  - an FQDN host name
- **PREference** indicates priority of this server when the switch selects a synchronizing server.
  - `<no parameter>` server has no special priority.
  - `prefer` server has priority when the switch selects a synchronizing server.
- **NTP_VERSION** specifies the NTP version. Settings include:
  - `<no parameter>` sets NTP version to 4 (default).
  - `version number`, where `number` ranges from 1 to 4.
- **IP_SOURCE** specifies the source interface for NTP updates for the specified NTP server. This option overrides global settings created by the `ntp local-interface` command. Options include:
  - `<no parameter>` sets the source interface to the global default.
  - `source ethernet e_num` Ethernet interface specified by `e_num`.
  - `source loopback l_num` loopback interface specified by `l_num`.
  - `source management m_num` management interface specified by `m_num`.
  - `source port-channel p_num` port-channel interface specified by `p_num`.
  - `source vlan v_num` VLAN interface specified by `v_num`.  

Chapter 6: Administering the Switch

Switch Administration Commands

- **burst** indicates that when the NTP server is reached, the switch sends packets to the server in bursts of eight instead of the usual one. Recommended only for local servers. Off by default.

- **iburst** indicates that the switch sends packets to the server in bursts of eight instead of the usual one until the server is reached. Recommended for general use to speed synchronization. Off by default.

- **AUTH_KEY** the authentication key to use in authenticating NTP packets from the server.
  - <no parameter> no authentication key is specified.
  - **key <1 to 65534>** switch will use the specified key to authenticate NTP packets from the server.

- **MAX_POLL_INT** specifies the maximum polling interval for the server (as the base-2 logarithm of the interval in seconds). Settings include:
  - <no parameter> sets the maximum polling interval to 10 (1,024 seconds, the default).
  - **maxpoll number**, where **number** is the base-2 logarithm of the interval in seconds. Values range from 3 (8 seconds) to 17 (131,072 seconds, approximately 36 hours).

- **MIN_POLL_INT** specifies the minimum polling interval for the server (as the base-2 logarithm of the interval in seconds). Settings include:
  - <no parameter> sets the minimum polling interval to 6 (64 seconds, the default).
  - **minpoll number** where **number** is the base-2 logarithm of the interval in seconds. Values range from 3 (8 seconds) to 17 (131,072 seconds, approximately 36 hours).

**Guidelines**

To configure multiple parameters for a single server, include them all in a single **ntp server** command. Using the command again for the same server overwrites parameters previously configured in **running-config**.

All NTP servers must use the same VRF. If no VRF is specified, the server is configured in the default VRF. To use a user-defined VRF for connection to an NTP server, first use the **no ntp server** command to remove any NTP servers configured in the default VRF.

When specifying a source interface, choose an interface in the same VRF as the server. If the source interface is not in the same VRF, the source data will be included in **running-config** but will not be added to NTP packets.

An NTP server may be configured using an invalid or inactive VRF, but the status of the NTP server will remain inactive until the VRF is active.

**Examples**

- This command configures the switch to update its time with the NTP server at address 172.16.0.23 and designates it as a preferred NTP server.
  
  ```
  switch(config)#ntp server 172.16.0.23 prefer
  ```

- This command configures the switch to update its time through an NTP server named **local-nettime**.
  
  ```
  switch(config)#ntp server local-nettime
  ```

- This command configures the switch to update its time through a version 3 NTP server.
  
  ```
  switch(config)#ntp server 171.18.1.22 version 3
  ```
- These commands reconfigure the switch to access the above NTP servers through VRF “magenta.”

```
switch(config)#no ntp server 172.16.0.23
switch(config)#no ntp server local-nettime
switch(config)#no ntp server 171.18.1.22
switch(config)#ntp server vrf magenta 172.16.0.23 prefer
switch(config)#ntp server vrf magenta local-nettime
switch(config)#ntp server vrf magenta 171.18.1.22 version 3
switch(config)#
```
ntp trusted-key

The `ntp trusted-key` command specifies which authentication keys will be trusted for authentication of NTP packets. A packet with a trusted key will be used to update the local time if authenticated.

The `no ntp trusted-key` and `default ntp trusted-key` commands remove the specified authentication keys from the trusted key list by removing the corresponding `ntp trusted-key` command from `running-config`.

Command Mode

Global Configuration

Command Syntax

```
ntp trusted-key key_list
no ntp trusted-key
default ntp trusted-key
```

Parameters

- `key_list` specified one or more keys. Formats include a number (1 to 65534), number range, or comma-delimited list of numbers and ranges.

Examples

- This command configures the switch to trust authentication keys 234 and 237 for authentication of NTP packets.

  ```
switch(config)#ntp trusted-key 234,237
switch(config)#
```
prompt

The **prompt** command specifies the contents of the CLI prompt. Characters allowed in the prompt include A-Z, a-z, 0-9, and these punctuation marks:

```
! @ # $ % ^ & * ( ) - = + f g [ ] ; : < > , . ? / ˜ n
```

The prompt supports these control sequences:

- `%%` – space character
- `%t` – tab character
- `%%` – percent character
- `%D` – time and date
- `%D{f_char}` – time and date, format specified by the BSD `strftime (f_char)` time conversion function.
- `%H` – host name
- `%h` – host name up to the first ‘.’
- `%P` – extended command mode
- `%p` – command mode
- `%r1` – redundancy status on modular systems
- `%R2` – extended redundancy status on modular systems – includes status and slot number

Table 6-1 displays Command Mode and Extended Command Mode prompts for various modes.

</table>

The **no prompt** and **default prompt** commands return the prompt to the default of `%H%R%P`.

**Command Mode**

Global Configuration

**Command Syntax**

```
prompt p_string
no prompt
default prompt
```

1. When logged into a fixed system or a supervisor on a modular system, this option has no effect.
2. When logged into a fixed system, this option has no effect.
Parameters

- **p_string**: prompt text (character string). Elements include letters, numbers, and control sequences.

Examples

- This command creates a prompt that displays `system 1` and the command mode.
  ```plaintext
  host-name.dut103(config)#prompt system%s1%P
  system 1(config) #
  ```

- This command creates a prompt that displays the command mode.
  ```plaintext
  host-name.dut103(config)#prompt %p
  (config) #
  ```

- These equivalent commands create the default prompt.
  ```plaintext
  % prompt %H%P
  host-name.dut103(config) #

  % no prompt
  host-name.dut103(config) #```
ptp announce interval

The ptp announce interval command configures the interval at which the configuration mode interface sends PTP announce messages. The no ptp announce interval command resets the announce interval to its default of 1 (2 seconds).

Command Mode
Interface-Ethernet Configuration
Interface-Port Channel Configuration

Command Syntax

```
ptp announce interval log_interval
no ptp announce interval
default ptp announce interval
```

Parameters
- `log_interval` The number of log seconds between PTP announce messages (base 2 log (seconds)). Value ranges from -3 (1/8 second) to 4 (16 seconds); default value is 1 (2 seconds).

Examples
- These commands set the interval between PTP announce messages sent by Ethernet interface 5 to 4 seconds.

  ```
  switch(config)# interface ethernet 5
  switch(config-if-Et5)# ptp announce interval 2
  switch(config-if-Et5)#
  ```

- These commands reset the PTP announce interval on Ethernet interface 5 to the default value of 1 (2 seconds).

  ```
  switch(config)# interface ethernet 5
  switch(config-if-Et5)# no ptp announce interval
  switch(config-if-Et5)#
  ```
**ptp announce timeout**

The **ptp announce timeout** sets the timeout multiplier for the configuration-mode interface. The timeout multiplier is the number of announcement intervals that the interface will wait without receiving a PTP **announce** message before a timeout occurs; the range is from 2 to 255. The default multiplier is 3, which results in a 6-second timeout interval when the announce interval is set to the default of 2 seconds. To configure the announce interval, use the **ptp announce interval** command.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port Channel Configuration

**Command Syntax**
- `ptp announce timeout multiplier`
- `no ptp announce timeout`
- `default ptp announce timeout`

**Parameters**
- **multiplier**: Number of announce intervals after which the interface will time out if it does not receive a PTP **announce** message. The range is from 2 to 255; default value is 3.

**Examples**
- This command sets the timeout multiplier for Ethernet interface 5 to 5. This means that the interface will time out if it doesn’t receive a PTP **announce** message within five announce intervals.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# ptp announce timeout 5
switch(config-if-Et5)#
```

- These commands reset the PTP timeout interval on interface Ethernet 5 to the default value of 3.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# no ptp announce timeout
switch(config-if-Et5)#
```
**ptp delay-mechanism**

The `ptp delay-mechanism` command configures the delay mechanism in boundary clock mode. The `no ptp delay-mechanism` command disables the feature.

**Command Mode**
Interface-Ethernet Configuration
Interface-Port Channel Configuration

**Command Syntax**
```
ptp delay-mechanism mech_type
no ptp delay-mechanism
default ptp delay-mechanism
```

**Parameters**
- `mech_type`  The delay mechanism. Options include:
  - `e2e`  end-to-end delay mechanism
  - `p2p`  peer-to-peer mechanism

**Examples**
- This command sets the delay mechanism to peer-to-peer in the boundary clock mode.
  ```
  switch(config)# interface ethernet 5
  switch(config-if-Et5)# ptp delay-mechanism p2p
  switch(config-if-Et5)#
  ```
- This command sets the delay mechanism to end-to-end in the boundary clock mode.
  ```
  switch(config)# interface ethernet 5
  switch(config-if-Et5)# ptp delay-mechanism e2e
  switch(config-if-Et5)#
  ```
- This command removes the delay mechanism configuration from Ethernet 5.
  ```
  switch(config)# interface ethernet 5
  switch(config-if-Et5)# no ptp delay-mechanism e2e
  switch(config-if-Et5)#
  ```
**ptp delay-req interval**

The **ptp delay-req interval** command specifies the time in log seconds recommended to the slave devices to send delay request messages. You must enable PTP on the switch first and configure the source IP address for PTP communication. The **no ptp delay-req interval** command resets the interval to its default of 5 (32 seconds).

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port Channel Configuration

**Command Syntax**

```
ptp delay-req interval log_interval
no ptp delay-req interval
default ptp delay-req interval
```

**Parameters**

- **log_interval**  The range is -1 to 8 log seconds (base 2 log (seconds)). The default is 5 (32 seconds).

**Examples**

- These commands set the minimum interval allowed between PTP delay request messages on Ethernet interface 5 to 3 (8 seconds).

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# ptp delay-request interval 3
```

- These commands reset the minimum interval allowed between PTP delay-request messages to the default of 5 (32 seconds).

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# no ptp delay-request interval
```

switch(config-if-Et5)#
ptp domain

The `ptp domain` command sets the domain number to use for the clock. The `no ptp domain` command disables the feature.

**Command Mode**

Global Configuration

**Command Syntax**

```
ptp domain domain_number
no ptp domain
default ptp domain
```

**Parameters**

- `domain_number` Value ranges from 0 to 255.

**Examples**

- This command shows how to configure domain 1 for use with a clock.

  ```
  switch(config)# ptp domain 1
  switch(config)#
  ```

- This command removes the configured domain 1 for use with a clock.

  ```
  switch(config)# no ptp domain 1
  switch(config)#
  ```
**ptp enable**

The `ptp enable` command enables PTP on the interface. The `no ptp enable` command disables PTP on the interface.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port Channel Configuration

**Command Syntax**

```plaintext
ptp enable
no ptp enable
default ptp enable
```

**Examples**

- This command enables PTP on Ethernet interface 5.
  ```plaintext
  switch(config)# interface ethernet 5
  switch(config-if-Et5)# ptp enable
  ```

- This command disables PTP on Ethernet interface 5.
  ```plaintext
  switch(config)# interface ethernet 5
  switch(config-if-Et5)# no ptp enable
  ```
**ptp forward-v1**

The `ptp forward-v1` command configures the switch to forward Precision Time Protocol version packets as regular multicast traffic. By default, PTP v1 packets are trapped by the CPU, logged and discarded.

The `no ptp forward-v1` and `default ptp forward-v1` commands restore the default forwarding behavior by removing the corresponding `ptp forward-v1` command from `running-config`.

**Command Mode**
- Global Configuration

**Command Syntax**

```
ptp forward-v1
no ptp forward-v1
default ptp forward-v1
```

**Examples**

- This command configures the switch to forward PTP v1 packets as regular multicast traffic.
  ```
  switch(config)# ptp forward-v1
  switch(config)#
  ```

- This command configures the switch to log and discard PTP v1 packets.
  ```
  switch(config)# no ptp forward-v1
  switch(config)#
  ```
**ptp hold-ptp-time**

The *ptp hold-ptp-time* command configures the PTP offset hold time in seconds. The *no ptp hold-ptp-time* command disables the feature.

**Command Mode**
- Global Configuration

**Command Syntax**
- `ptp hold-ptp-time offset`
- `no ptp hold-ptp-time`
- `default ptp hold-ptp-time`

**Parameters**
- `offset` Value ranges from 0 to 86400.

**Examples**
- This command shows how to configure the PTP offset hold time.
  ```
  switch(config)# ptp hold-ptp-time 600
  switch(config)#
  ```
- This command removes the configured PTP offset hold time.
  ```
  switch(config)# no ptp hold-ptp-time
  switch(config)#
  ```
**ptp mode**

The **ptp mode** command configures the Precision Time Protocol (PTP) packet forwarding mode for the switch. By default, PTP is disabled globally; the mode must be changed to use PTP on switch interfaces.

The **no ptp mode** and **default ptp mode** commands return the forwarding mode to **disabled** by removing the **ptp mode** command from **running-config**.

**Command Mode**
- Global Configuration

**Command Syntax**
- `ptp mode mode_name`
- `no ptp mode`
- `default ptp mode`

**Parameters**
- **mode_name**  
  Default mode is **disabled**. Options include:
  - **boundary**  
    The device acts as a boundary clock, and both runs and participates in the best master clock algorithm.
  - **disabled**  
    The default mode. PTP is disabled, and the device forwards all PTP packets as normal traffic.
  - **e2etransparent**  
    The device acts as an end-to-end transparent clock, synchronizing all ports to a connected master clock and updating the time interval field of forwarded PTP packets using switch residence time.
  - **p2ptransparent**  
    The device acts as a peer-to-peer transparent clock, synchronizing all ports to a connected master clock and updating the time interval field of forwarded PTP packets using switch residence time and inbound path delays.
  - **gptp**  
    The device runs generalized Precision Time Protocol (gPTP), participating in the best master clock algorithm but also updating the interval field of forwarded PTP packets using switch residence time and inbound path delays.

**Examples**
- This command configures the switch to act as a PTP boundary clock.
  ```sh
  switch(config)# ptp mode boundary
  switch(config)#
  ```
- This command restores PTP to disabled mode.
  ```sh
  switch(config)# no ptp mode
  switch(config)#
  ```
ptp monitor

The **ptp monitor** command enables and disables PTP monitoring on the switch. When PTP monitoring is enabled, the switch records PTP status and configuration information (which can be viewed using the **show ptp monitor** command) and generates Syslog messages for metrics whose threshold values have been configured. PTP monitoring is enabled by default.

The **no ptp monitor** command disables the PTP monitoring and clears all the recorded data from **running-config**.

**Command Mode**

  - Global Configuration

**Command Syntax**

  ```
  ptp monitor
  no ptp monitor
  ```

**Related Commands**

- **ptp monitor threshold mean-path-delay**
- **ptp monitor threshold offset-from-master**
- **ptp monitor threshold skew**
- **show ptp monitor**

**Example**

- This command disables **ptp monitor** PTP monitoring on the switch and clears all the recorded data.

  ```
  switch(config)#ptp monitor
  switch(config)#
  ```
**ptp monitor threshold mean-path-delay**

Mean path delay is the mean time in nanoseconds that PTP packets take to travel between PTP master and slave. The `ptp monitor threshold mean-path-delay` command configures the mean-path-delay threshold in nanoseconds. When this threshold is configured, a Syslog message is generated if the value of the most recently calculated mean path delay is greater than or equal to this value.

The `no ptp monitor threshold mean-path-delay default ptp monitor threshold mean-path-delay` commands clear the threshold value and prevent further Syslog messages from being generated for this parameter.

**Command Mode**

Global Configuration

**Command Syntax**

- `ptp monitor threshold mean-path-delay threshold`
- `no ptp monitor threshold mean-path-delay`
- `default ptp monitor threshold mean-path-delay`

**Parameter**

- `threshold`  threshold in nanoseconds. Values range from 0 to 1000000000 (1 second).

**Example**

- This command sets a mean-path-delay threshold value of 2000 nanoseconds.

  ```
  switch(config)#ptp monitor threshold mean-path-delay 2000
  ```
**ptp monitor threshold offset-from-master**

PTP offset is the difference in nanoseconds between master and slave time. The `ptp monitor threshold offset-from-master` command configures the offset-from-master threshold in nanoseconds. A Syslog message is generated if the most recently calculated time offset from the PTP master is outside of the range (-<threshold>, <threshold>). The maximum offset threshold is one second.

The `no ptp monitor threshold offset-from-master` and `no ptp monitor threshold offset-from-master` commands clear the threshold value and prevents further Syslog messages from being generated for this parameter.

**Command Mode**
- Global Configuration

**Command Syntax**
- `ptp monitor threshold offset-from-master threshold`
- `no ptp monitor threshold offset-from-master`
- `default ptp monitor threshold offset-from-master`

**Parameter**
- `threshold` Offset threshold value in nanoseconds. Values range from 0 to 1000000000.

**Example**
- This command sets an offset-from-master threshold value of 500 nanoseconds.

```bash
switch(config)# ptp monitor threshold offset-from-master 500
switch(config)#
```
ptp monitor threshold skew

PTP skew is the clock frequency difference between master and slave. The ptp monitor threshold skew command configures the value of the skew-threshold percentage. A Syslog message is generated if the value of the most recently calculated skew is not in the range \( \frac{1}{1+ threshold} \), \( 1*(1+threshold) \).

The no ptp monitor threshold skew and default ptp monitor threshold skew commands clear the threshold value and prevent further Syslog messages from being generated for this parameter.

**Command Mode**

Global Configuration

**Command Syntax**

```
ptp monitor threshold skew threshold
no ptp monitor threshold skew
default ptp monitor threshold skew
```

**Parameters**

- **threshold** skew percentage threshold represented as a double precision (16 digit) real number ranging from 0 (0%) to 10 (1000%).

**Example**

- This command sets a skew threshold value of 5 (500%).

```
switch(config)#ptp monitor threshold skew 5
switch(config)#
```
**ptp pdelay-neighbor-threshold**

The `ptp pdelay-neighbor-threshold` command configures the propagation delay threshold above which the switch will consider the neighbor connected to this port to be incapable of participating in generalized Precision Time Protocol (gPTP).

The `no ptp pdelay-neighbor-threshold` and `default ptp pdelay-neighbor-threshold` commands restore the threshold to 100000 nanoseconds by removing the corresponding `ptp pdelay-neighbor-threshold` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port Channel Configuration

**Command Syntax**

```
ptp pdelay-neighbor-threshold link_prop
no ptp pdelay-neighbor-threshold
default ptp pdelay-neighbor-threshold
```

**Parameters**

- `link_prop`  Threshold in nanoseconds. Value ranges from 0 to 10000000000 (ten billion). Default is 100000.

**Examples**

- These commands set the link propagation delay threshold on Ethernet interface 5 to 200000 nanoseconds.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# ptp pdelay-neighbor-threshold 200000
switch(config-if-Et5)#
```

- These commands restore the link propagation delay threshold on Ethernet interface 5 to its default value of 100000 nanoseconds.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# no ptp pdelay-neighbor-threshold
switch(config-if-Et5)#
```
**ptp pdelay-req interval**

The **ptp pdelay-req interval** command configures the interval between Precision Time Protocol peer delay-request messages. The **no ptp pdelay-req interval** command removes the configuration.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port Channel Configuration

**Command Syntax**

```
ptp pdelay-req interval log_interval
no ptp pdelay-req interval
default ptp pdelay-req interval
```

**Parameters**

- **log_interval** The log interval in seconds (base 2 log (seconds)). Value ranges from 0 to 5.

**Examples**

- This command shows how to configure the interval allowed between PTP peer delay request messages on interface Ethernet 5.
  ```
  switch(config)# interface ethernet 5
  switch(config-if-Et5)# ptp pdelay-request interval 3
  ```

- This command removes the configure the interval allowed between PTP peer delay request messages on interface Ethernet 5.
  ```
  switch(config)# interface ethernet 5
  switch(config-if-Et5)# no ptp pdelay-request interval
  ```
**ptp priority1**

The `ptp priority1` command configures the priority 1 value for advertising the switch’s PTP clock. Priority 1 is the most significant of the six factors used by devices in the selection of a master clock. Lower values indicate higher priority.

The `no ptp priority1` and `default ptp priority1` commands restore the priority 1 default setting of 128.

**Command Mode**  
Global Configuration

**Command Syntax**

```plaintext
ptp priority1 priority_rate  
no ptp priority1  
default ptp priority1
```

**Parameters**

- `priority_rate`  
  Value ranges from 0 to 255. Default is 128.

**Examples**

- This command sets the priority 1 level for the switch’s PTP clock to 120.
  ```plaintext
  switch(config)# ptp priority1 120
  switch(config)#
  ```

- This command restores the default priority 1 level of 128.
  ```plaintext
  switch(config)# no ptp priority1
  switch(config)#
  ```
ptp priority2

The ptp priority2 command sets the priority 2 value for the clock. The range is from 0 to 255. Priority 2 is the fifth most significant of the six factors used by devices in the selection of a master clock. Lower values indicate higher priority.

The no ptp priority2 and default ptp priority2 commands restore the priority 2 default setting of 128.

Command Mode
Global Configuration

Command Syntax

```
ptp priority2 priority_rate
no ptp priority2
default ptp priority2
```

Parameters

- **priority_rate** Specifies the priority 2 level for the PTP clock. Value ranges from 0 to 255; default value is 128.

Examples

- This command sets the priority 2 level for the switch’s PTP clock to 120.

```
switch(config)# ptp priority2 120
switch(config)#
```

- This command restores the default priority 2 level of 128.

```
switch(config)# no ptp priority2
switch(config)#
```
ptp role

The `ptp role` command configures a port to operate either in the master mode or the dynamic mode when it is executed in the interface configuration mode.

The `no ptp role` command removes the master or dynamic mode if it was previously configured on an interface.

**Command Mode**
- Interface-Ethernet Configuration

**Command Syntax**
```
ptp role [dynamic | master]
no ptp role
default ptp role
```

**Related Commands**
- `ptp enable`
- `ptp enable`
- `show ptp interface`

**Parameters**
- `dynamic` the dynamic mode.
- `master` the master clock mode that has the most precise time.

**Examples**
- This command configures a port to operate in the master mode for Ethernet interface 1.
  ```
  switch(config)#interface ethernet 1
  switch(config-if-Et1)#ptp role master
  ```
- This command configures a port to operate in the dynamic mode for Ethernet interface 1.
  ```
  switch(config)#interface ethernet 1
  switch(config-if-Et1)#ptp role dynamic
  ```
**ptp source ip**

The `ptp source ip` command configures the source IP address for all PTP packets. The IP address can be in IPv4 format. The `no ptp source ip` command removes this configuration.

**Command Mode**

Global Configuration

**Command Syntax**

```
ptp source ip ipv4_addr
no ptp source ip
```

**Parameters**

- `ipv4_addr` IPv4 address

**Examples**

- This command configures the source IP address `10.0.2.1` for all PTP packets.

  ```
  switch(config)# ptp source ip 10.0.2.1
  switch(config)#
  ```

- This command removes the source IP address `10.0.2.1` for all PTP packets.

  ```
  switch(config)# no ptp source ip
  switch(config)#
  ```
**ptp sync-message interval**

The `ptp sync-message interval` command configures the time for sending synchronization messages by specifying its \( \log_2 \) value. Default values and ranges depend on the PTP mode, which is set using the `ptp mode` command.

The no `ptp sync-message interval` and default `ptp sync-message interval` commands restore the sync interval to its default (1 second in `boundary` mode, 1/8 second in `gptp` mode) by removing the corresponding `ptp sync-message interval` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port Channel Configuration

**Command Syntax**

```plaintext
ptp sync-message interval log_interval
no ptp sync-message interval
default ptp sync-message interval
```

**Parameters**

- `log_interval` The interval between PTP synchronization messages sent from the master to the slave (base 2 \( \log(\text{seconds}) \)). Values vary according to PTP mode: in `boundary` mode, the range is from -7 (1/128 second) to 3 (8 seconds) and the default value is 0 (1 second). In `gptp` mode, the range is from -3 (1/8 second) to 17 (131072 seconds, approximately 36 hours) with a default of -3.

**Examples**

- These commands set the interval for PTP synchronization messages on Ethernet interface 5 to 3 (8 seconds).
  ```plaintext
  switch(config)# interface ethernet 5
  switch(config-if-Et5)# ptp sync-message interval 3
  switch(config-if-Et5)#
  ```

- In `boundary` mode, these commands restore the interval for PTP synchronization messages on Ethernet interface 5 to its default of 0 (1 second).
  ```plaintext
  switch(config)# interface ethernet 5
  switch(config-if-Et5)# no ptp sync-message interval
  switch(config-if-Et5)#
  ```
ptp sync timeout

A PTP synchronization timeout occurs if a sync message is not received for a specified period of time, calculated as a multiple of the PTP sync-message interval. The `ptp sync timeout` command configures the sync timeout multiplier. The range is 2 to 255, with a default of 20 (20 times the sync interval). To configure the sync interval, use the `ptp sync-message interval` command.

The `no ptp sync timeout` and `default ptp sync timeout` commands restore the PTP sync timeout multiplier to its default value of 20.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

```
ptp sync timeout interval_multiplier
no ptp sync timeout
default ptp sync timeout
```

**Parameters**

- `interval_multiplier`  The number of sync intervals that must pass without the configuration mode interface receiving a PTP sync message before a timeout occurs. Value ranges from 2 to 255. Default value is 20.

**Examples**

- These commands configure the sync timeout on Ethernet interface 5 to ten times the configured sync interval.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# ptp sync timeout 10
switch(config-if-Et5)#
```
ptp transport

The ptp transport command configures the PTP transport type for a specific interface. Any values set in interface PTP configuration mode override the settings in the PTP configuration profile associated with the interface. The no ptp transport command removes the setting from the running configuration.

Command Mode
- Interface-Ethernet Configuration
- Interface-Port Channel Configuration

Command Syntax

```
ptp transport TRANSPORT_TYPE
no ptp transport
default ptp transport
```

Parameters

- **TRANSPORT_TYPE** The transport mode in boundary clock mode. Options include:
  - ipv4 The IPv4 address used as the transport type on the interface.
  - layer2 The Layer 2 protocol used as the transport type on the interface.

Examples

- This command overrides the transport type in the profile and sets it to be IPv4 for the interface.

  ```
  switch(config)# interface ethernet 5
  switch(config-if-Et5)# ptp transport ipv4
  switch(config-if-Et5)#
  ```

- This command removes the interval for PTP synchronization messages on interface Ethernet 5.

  ```
  switch(config)# interface ethernet 5
  switch(config-if-Et5)# no ptp transport
  switch(config-if-Et5)#
  ```
**ptp ttl**

The `ptp ttl` command configures the Time To Live (TTL) value of the PTP packets. The `no ptp ttl` resets the TTL value to the default value of 1 hop by removing the `ptp ttl` command from the running configuration.

**Command Mode**

- Global Configuration

**Command Syntax**

```
ptp ttl hop_count
no ptp ttl
default ptp ttl
```

**Parameters**

- `hop_count` The TTL value measured in hops. Value ranges from 1 to 255, default is 1.

**Example**

- This command sets the time to live of the PTP packets to 60 hops.
  ```
  switch(config)# ptp ttl 60
  switch(config)#
  ```

- This command resets the time to live of the PTP packets to the default value of 1 hop.
  ```
  switch(config)# no ptp ttl
  switch(config)#
  ```
show banner

The show banner command displays the specified banner.

Command Mode
Privileged EXEC

Command Syntax
show banner BANNER_TYPE

Parameters
- BANNER_TYPE banner that the command displays. Options include
  - login command displays login banner.
  - motd command displays message of the day banner.

Example
- These commands configure and display the message of the day banner.
  switch(config)#banner motd
  Enter TEXT message. Type 'EOF' on its own line to end.
  This is an motd banner for $(hostname)
  EOF
  switch(config)#show banner motd
  This is an motd banner for $(hostname)

  switch(config)#
**show clock**

The *show clock* command displays the current system clock time and configured time zone. The switch uses the system clock for system log messages and debugging traces.

**Command Mode**

 EXEC

**Command Syntax**

 `show clock`

**Example**

- This command displays the current system clock time and configured time zone.

  switch>**show clock**
  Wed Nov  2 10:29:32 2011
  timezone is America/Los_Angeles
  switch>
Chapter 6: Administering the Switch

Switch Administration Commands

show event-monitor arp

The show event-monitor arp command performs an SQL-style query on the event monitor database and displays ARP table events as specified by command parameters. The event monitor buffer and all backup logs are synchronized into a single SQLite file.

Command Mode
Privileged EXEC

Command Syntax

```
show event-monitor arp [GROUP] [MESSAGES] [INTERFACE] [IP] [MAC] [TIME] [VRF]
```

Optional parameters can be placed in any order.

Parameters

- **GROUP** used with aggregate functions to group results. Analogous to SQL `group by` command.
  - <no parameter> results are not grouped.
  - group-by `interface` results are grouped by interface.
  - group-by `ip` results are grouped by IP address.
  - group-by `mac` results are grouped by MAC address.
  - group-by `vrf` results are grouped by VRF.
- **MESSAGES** number of messages returned from query. Analogous to SQL `limit` command.
  - <no parameter> result-set size is not limited.
  - limit `msg_quantity` number of results that are displayed. Values range from 1 to 15,000.
- **INTERFACE** restricts result-set to events that include specified interface (SQL Like command).
  - <no parameter> result-set not restricted by interface.
  - match-interface ethernet `e_range` Ethernet interface list.
  - match-interface loopback `l_range` loopback interface list.
  - match-interface management `m_range` management interface list.
  - match-interface port-channel `c_range` port channel interface list.
  - match-interface tunnel `t_range` tunnel interface list.
  - match-interface vxlan `vx_range` VXLAN interface list.
  - match-interface port-channel `c_range` port channel interface list.
- **IP** restricts result-set to events that include specified IP address (SQL Like command).
  - <no parameter> result-set not restricted to specific IP addresses.
  - match-ip `ip_address_rex` IP address, as represented by regular expression.
- **MAC** restricts result-set to events that include specified MAC address (SQL Like command).
  - <no parameter> result-set not restricted to specific MAC addresses.
  - match-mac `mac_address_rex` MAC address, as represented by regular expression.
- **TIME** restricts result-set to events generated during specified period.
  - <no parameter> result-set not restricted by time of event.
  - match-time `last-minute` includes events generated during last minute.
  - match-time `last-day` includes events generated during last day.
  - match-time `last-hour` includes events generated during last hour.
  - match-time `last-week` includes events generated during last week.
• **VRF** restricts result-set to events that include a specific VRF.
• `<no parameter>` result-set not restricted by time of event.
• `match-vrf vrf_name` the VRF name.

**Example**

- This command displays ARP table events listed in the event monitor database.

```plaintext
switch# show event-monitor arp
% Writing 220017 Arp, 234204 Route, 1732559 Mac events to the database

```
show event-monitor igmpsnooping

The `show event-monitor igmpsnooping` command performs an SQL-style query on the event-monitor database, using the statement specified in the command.

**Command Mode**
Privileged EXEC

**Command Syntax**
```
show event-monitor igmpsnooping [GROUP] [MESSAGES] [MAC] [INTERFACE] [VLAN] [TIME]
```

**Parameters**
- **GROUP** used with aggregate functions to group results. Analogous to SQL `group by` command.
  - `<no parameter>` results are not grouped.
  - `group-by interface` results are grouped by interface.
  - `group-by mac` results are grouped by MAC address.
  - `group-by vlan` results are grouped by VLAN.
- **MESSAGES** number of messages returned from query. Analogous to SQL `limit` command.
  - `<no parameter>` result-set size is not limited.
  - `limit msg_quantity` number of results that are displayed. Values range from 1 to 15,000.
- **MAC** restricts result-set to events that include specified MAC address (SQL Like command).
  - `<no parameter>` result-set not restricted to specific MAC addresses.
  - `match-mac mac_address_rex` MAC address, as represented by regular expression.
- **INTERFACE** restricts result-set to events that include specified interface (SQL Like command).
  - `<no parameter>` result-set not restricted by interface.
  - `match-interface ethernet e_range` Ethernet interface list.
  - `match-interface loopback l_range` loopback interface list.
  - `match-interface management m_range` management interface list.
  - `match-interface port-channel c_range` port channel interface list.
  - `match-interface vlan v_range` VLAN interface list.
  - `match-interface tunnel t_range` tunnel interface list.
  - `match-interface vxlan vx_range` VXLAN interface list.
- **TIME** restricts result-set to events with specified period.
  - `<no parameter>` result-set not restricted by time of event.
  - `match-time last-minute` includes events generated during last minute.
  - `match-time last-day` includes events generated during last day.
  - `match-time last-hour` includes events generated during last hour.
  - `match-time last-week` includes events generated during last week.
- **VLAN** restricts result-set to events that include a specific VLAN (SQL Like command).
  - `<no parameter>` result-set not restricted by time of event.
  - `match-vlan vlan` VLAN interface number.
Examples

switch#show event-monitor igmpsnoping
switch#
show event-monitor mac

The `show event-monitor mac` command performs an SQL-style query on the event monitor database and displays MAC address table events as specified by command parameters. The event monitor buffer and all backup logs are synchronized into a single SQLite file.

**Command Mode**
Privileged EXEC

**Command Syntax**
```
show event-monitor mac [GROUP] [MESSAGES] [INTERFACE] [MAC] [TIME]
```
Optional parameters can be placed in any order.

**Parameters**
- **GROUP** used with aggregate functions to group results. Analogous to SQL `group by` command.
  - `<no parameter>` results are not grouped.
  - `group-by interface` results are grouped by interface.
  - `group-by mac` results are grouped by MAC address.
- **MESSAGES** number of messages returned from query. Analogous to SQL `limit` command.
  - `<no parameter>` result-set size is not limited.
  - `limit msg_quantity` number of results that are displayed. Values range from 1 to 15,000.
- **INTERFACE** restricts result-set to events that include specified interface (SQL Like command).
  - `<no parameter>` result-set not restricted by interface.
  - `match-interface ethernet e_range` Ethernet interface list.
  - `match-interface loopback l_range` loopback interface list.
  - `match-interface management m_range` management interface list.
  - `match-interface port-channel c_range` port channel interface list.
  - `match-interface vlan v_range` VLAN interface list.
  - `match-interface tunnel t_range` tunnel interface list.
  - `match-interface vxlan vx_range` VXLAN interface list.
- **MAC** restricts result-set to events that include specified MAC address (SQL Like command).
  - `<no parameter>` result-set not restricted to specific MAC addresses.
  - `match-mac mac_address_rex` MAC address, as represented by regular expression.
- **TIME** restricts result-set to events with specified period.
  - `<no parameter>` result-set not restricted by time of event.
  - `match-time last-minute` includes events generated during last minute.
  - `match-time last-day` includes events generated during last day.
  - `match-time last-hour` includes events generated during last hour.
  - `match-time last-week` includes events generated during last week.

**Examples**
- This command displays all events triggered by MAC address table events.

```
switch# show event-monitor mac
% Writing 0 Arp, 0 Route, 1 Mac events to the database
2012-01-19 13:57:55|1|0808.0808.0808|Ethernet1|configuredStaticMac|added|0
```
• This command displays events triggered by MAC address table changes.

```bash
switch#show event-monitor mac match-mac 08:08:08:%
2012-01-19 13:57:55|1|0808.0808.0808|Ethernet1|configuredStaticMac|added|0
```
show event-monitor mroute

The `show event-monitor mroute` command performs an SQL-style query on the event-monitor database, using the statement specified in the command.

**Command Mode**
Privileged EXEC

**Command Syntax**
```
show event-monitor mroute [GROUP] [MESSAGES] [IP] [INTERFACE] [SRC_IP] [TIME]
```
Optional parameters can be placed in any order.

**Parameters**
- **GROUP** used with aggregate functions to group results. Analogous to SQL `group by` command.
  - `<no parameter>` results are not grouped.
  - `group-by interface` results are grouped by interface.
  - `group-by ip6` results are grouped by IPv6 address.
  - `group-by mac` results are grouped by MAC address.
  - `group-by vrf` results are grouped by VRF.
- **MESSAGES** number of messages returned from query. Analogous to SQL `limit` command.
  - `<no parameter>` result-set size is not limited.
  - `limit msg_quantity` number of results that are displayed. Values range from 1 to 15,000.
- **IP** restricts result-set to events that include specified IP address (SQL Like command).
  - `<no parameter>` result-set not restricted to specific IP addresses.
  - `match-ipv6 ip_address_rex` IP address, as represented by regular expression.
- **INTERFACE** restricts result-set to events that include specified interface (SQL Like command).
  - `<no parameter>` result-set not restricted by interface.
  - `match-interface ethernet e_range` Ethernet interface list.
  - `match-interface loopback l_range` loopback interface list.
  - `match-interface management m_range` management interface list.
  - `match-interface port-channel c_range` port channel interface list.
  - `match-interface vlan v_range` VLAN interface list.
  - `match-interface tunnel t_range` tunnel interface list.
  - `match-interface vxlan vx_range` VXLAN interface list.
- **SRC_IP** restricts result-set to events that include specified Source IP address (SQL Like command).
  - `<no parameter>` result-set not restricted to specific IP addresses.
  - `match-ip ip_address_rex` IP address, as represented by regular expression.
- **TIME** restricts result-set to events with specified period.
  - `<no parameter>` result-set not restricted by time of event.
  - `match-time last-minute` includes events generated during last minute.
  - `match-time last-day` includes events generated during last day.
  - `match-time last-hour` includes events generated during last hour.
  - `match-time last-week` includes events generated during last week.
Examples

- This command displays neighbor table events listed in the event monitor database.

  switch# show event-monitor mroute
  2011-07-28 12:33:28 | default | 16.17.18.19/32 | 225.0.0.1/32 | Vlan2 | iif | join | 31
  2011-07-28 12:33:28 | default | 16.17.18.19/32 | 225.0.0.1/32 | Vlan3 | oif | join | 32
  2011-07-28 12:33:28 | default | 16.17.18.19/32 | 225.0.0.1/32 | Vlan4 | oif | join | 33
  2011-07-28 12:33:28 | default | 10.11.12.13/32 | 225.0.0.2/32 | added | 34
  2011-07-28 12:33:28 | default | 10.11.12.13/32 | 225.0.0.2/32 | Vlan3 | iif | join | 35
  2011-07-28 12:33:28 | default | 10.11.12.13/32 | 225.0.0.2/32 | Vlan2 | oif | join | 36
  2011-07-28 12:33:28 | default | 16.17.18.19/32 | 225.0.0.1/32 | Vlan4 | leave | 37
  2011-07-28 12:33:28 | default | 16.17.18.19/32 | 225.0.0.1/32 | deleted | 38
  2011-07-28 12:33:28 | default | 10.11.12.13/32 | 225.0.0.2/32 | deleted | 39
show event-monitor neighbor

The show event-monitor neighbor command performs an SQL-style query on the event monitor database and displays neighbor table events as specified by command parameters. The event monitor buffer and all backup logs are synchronized into a single SQLite file.

Command Mode
Privileged EXEC

Command Syntax
show event-monitor neighbor [GROUP] [MESSAGES] [INTERFACE] [IP6] [MAC] [TIME] [VRF]

Optional parameters can be placed in any order.

Parameters
- **GROUP** used with aggregate functions to group results. Analogous to SQL group by command.
  - <no parameter> results are not grouped.
  - group-by interface results are grouped by interface.
  - group-by ip6 results are grouped by IPv6 address.
  - group-by mac results are grouped by MAC address.
  - group-by vrf results are grouped by VRF.
- **MESSAGES** number of messages returned from query. Analogous to SQL limit command.
  - <no parameter> result-set size is not limited.
  - limit msg_quantity number of results that are displayed. Values range from 1 to 15,000.
- **INTERFACE** restricts result-set to events that include specified interface (SQL Like command).
  - <no parameter> result-set not restricted by interface.
  - match-interface ethernet e_range Ethernet interface list.
  - match-interface loopback l_range loopback interface list.
  - match-interface management m_range management interface list.
  - match-interface port-channel c_range port channel interface list.
  - match-interface vlan v_range VLAN interface list.
  - match-interface tunnel t_range tunnel interface list.
  - match-interface vxlan vx_range VXLAN interface list.
- **IP6** restricts result-set to events that include specified IP address (SQL Like command).
  - <no parameter> result-set not restricted to specific IP addresses.
  - match-ipv6 ip6_address_rex IPv6 address, as represented by regular expression.
- **MAC** restricts result-set to events that include specified MAC address (SQL Like command).
  - <no parameter> result-set not restricted to specific MAC addresses.
  - match-mac mac_address_rex MAC address, as represented by regular expression.
- **TIME** restricts result-set to events with specified period.
  - <no parameter> result-set not restricted by time of event.
  - match-time last-minute includes events generated during last minute.
  - match-time last-day includes events generated during last day.
  - match-time last-hour includes events generated during last hour.
Switch Administration Commands

Chapter 6: Administering the Switch

- **match-time last-week** includes events generated during last week.
- **VRF** restricts result-set to events that include a specific VRF (SQL Like command).
- `<no parameter>` result-set not restricted by time of event.
- **match-vrf vrf_name** VRF name, as represented by a regular expression.

Examples

- This command displays neighbor table events listed in the event monitor database.

  ```
  switch# show event-monitor neighbor
  2019-09-30 14:37:32.894147|def0::1|Vlan1|default|0005.0005.0005|1|added|1

  ```
**show event-monitor route6**

The `show event-monitor route6` command performs an SQL-style query on the event monitor database and displays routing6 table events as specified by command parameters. The event monitor buffer and all backup logs are synchronized into a single SQLite file.

**Command Mode**
Privileged EXEC

**Command Syntax**
```
show event-monitor route6 [GROUP] [MESSAGES] [IP6] [TIME]
```

Optional parameters can be placed in any order.

**Parameters**
- **GROUP** used with aggregate functions to group results. Analogous to SQL `group by` command.
  - `<no parameter>` results are not grouped.
  - `group-by interface` results are grouped by interface.
  - `group-by ip6` results are grouped by IPv6 address.
  - `group-by mac` results are grouped by MAC address.
  - `group-by vrf` results are grouped by VRF.
- **MESSAGES** number of messages returned from query. Analogous to SQL `limit` command.
  - `<no parameter>` result-set size is not limited.
  - `limit msg_quantity` number of results that are displayed. Values range from 1 to 15,000.
- **IP6** restricts result-set to events that include specified IP address (SQL Like command).
  - `<no parameter>` result-set not restricted to specific IP addresses.
  - `match-ipv6 ip6_address_rex` IPv6 address, as represented by regular expression.
- **TIME** restricts result-set to events with specified period.
  - `<no parameter>` result-set not restricted by time of event.
  - `match-time last-minute` includes events generated during last minute.
  - `match-time last-day` includes events generated during last day.
  - `match-time last-hour` includes events generated during last hour.
  - `match-time last-week` includes events generated during last week.

**Examples**
- This command displays neighbor table events listed in the event monitor database.

```bash
switch#show event-monitor route6

switch#
```
show event-monitor route

The **show event-monitor route** command performs an SQL-style query on the event monitor database and displays routing table events as specified by command parameters. The event monitor buffer and all backup logs are synchronized into a single SQLite file.

**Command Mode**

Privileged EXEC

**Command Syntax**

```
show event-monitor route [GROUP] [MESSAGES] [IP] [TIME]
```

Optional parameters can be placed in any order.

**Parameters**

- **GROUP** used with aggregate functions to group results. Analogous to SQL `group by` command.
  - `<no parameter>` results are not grouped.
  - `group-by ip` results are grouped by IPv4 address.
- **MESSAGES** number of messages returned from query. Analogous to SQL `limit` command.
  - `<no parameter>` result-set size is not limited.
  - `limit msg_quantity` number of results that are displayed. Values range from 1 to 15,000.
- **IP** restricts result-set to events that include specified IP address (SQL Like command).
  - `<no parameter>` result-set not restricted to specific IP addresses.
  - `match-ip ip_address_rex` IP address, as represented by regular expression.
- **TIME** restricts result-set to events with specified period.
  - `<no parameter>` result-set not restricted by time of event.
  - `match-time last-minute` includes events generated during last minute.
  - `match-time last-day` includes events generated during last day.
  - `match-time last-hour` includes events generated during last hour.
  - `match-time last-week` includes events generated during last week.

**Example**

- This command displays 10 routing table events listed in the event monitor database.

```
switch#show event-monitor route limit 10
2019-09-30 14:01:21.659428|16.16.16.255/32|default|receiveBcast|0|0|updated|20

```

switch#
show event-monitor sqlite

The `show event-monitor sqlite` command performs an SQL-style query on the event monitor database, using the statement specified in the command.

Command Mode

Privileged EXEC

Command Syntax

```
show event-monitor sqlite statement
```

Parameters

- `statement` SQLite statement.

Example

- This command displays all entries from the route table.

```
switch# show event-monitor sqlite select * from route;
2019-09-30 14:01:21.659428|16.16.16.255/32|default|receiveBcast|0|0|updated|20

switch#
```
show event-monitor stpunstable

The `show event-monitor stpunstable` command performs an SQL-style query on the event-monitor database, using the statement specified in the command.

**Command Mode**
Privileged EXEC

**Command Syntax**
```
show event-monitor stpunstable [MESSAGES] [TIME]
```
Optional parameters can be placed in any order.

**Parameters**
- `MESSAGES` number of messages returned from query. Analogous to SQL `limit` command.
  - `<no parameter>` result-set size is not limited.
  - `limit msg_quantity` number of results that are displayed. Values range from 1 to 15,000.
- `TIME` restricts result-set to events with specified period.
  - `<no parameter>` result-set not restricted by time of event.
  - `match-time last-minute` includes events generated during last minute.
  - `match-time last-day` includes events generated during last day.
  - `match-time last-hour` includes events generated during last hour.
  - `match-time last-week` includes events generated during last week.

**Example**
```
switch#show event-monitor stpunstable limit 5
2019-02-07 07:22:10.286164|Cist|Ethernet5|forward-delay-while|1
2019-02-07 07:22:10.286651|Cist|Ethernet6|forward-delay-while|2
2019-02-07 07:22:10.286844|Cist|Ethernet8|forward-delay-while|3
2019-02-07 07:22:10.287030|Cist|Ethernet14|forward-delay-while|4
2019-02-07 07:22:10.287215|Cist|Ethernet21|forward-delay-while|5
switch#
```
show hostname

The show hostname command displays the hostname and the fully qualified domain name (FQDN) of the switch.

**Command Mode**

EXEC

**Command Syntax**

text

**Example**

- This command displays the hostname and FQDN of the switch.

  switch>show hostname
  Hostname: switch_1
  FQDN:     switch_1.aristanetworks.com

  switch>
**show hosts**

The *show hosts* command displays the default domain name, name lookup service style, a list of name server hosts, and the static hostname-IP address maps.

**Command Mode**

EXEC

**Command Syntax**

```
show hosts
```

**Example**

- This command displays the switch’s IP domain name:

  ```
switch>show hosts
  Default domain is: aristanetworks.com
  Name/address lookup uses domain service
  Name servers are: 172.22.22.40, 172.22.22.10
  
  Static Mappings:

<table>
<thead>
<tr>
<th>Hostname</th>
<th>IP</th>
<th>Addresses</th>
</tr>
</thead>
<tbody>
<tr>
<td>TEST_LAB</td>
<td>IPV4</td>
<td>10.24.18.6</td>
</tr>
<tr>
<td>PRODUCTION_LAB</td>
<td>IPV4</td>
<td>10.24.18.7</td>
</tr>
<tr>
<td>SUPPORT_LAB</td>
<td>IPV6</td>
<td>2001:0DB8:73:ff:ff:26:fd:90</td>
</tr>
</tbody>
</table>

  switch>
  ```
**show ip domain-name**

The `show ip domain-name` command displays the switch’s IP domain name that is configured with the `ip domain name` command.

**Command Mode**

EXEC

**Command Syntax**

`show ip domain-name`

**Example**

- This command displays the switch’s IP domain name:

```
switch>show ip domain-name
aristanetworks.com
switch>
```
**show ip name-server**

The `ip name-server` command displays the ip addresses of name-servers in *running-config*. The name servers are configured by the `ip name-server` command.

**Command Mode**

EXEC

**Command Syntax**

```
show ip name-server
```

**Example**

- This command displays the IP address of name servers that the switch is configured to access.

```
switch>show ip name-server
172.22.22.10
172.22.22.40
switch>
```
show local-clock time-properties

The show local-clock time-properties command displays the Precision Time Protocol (PTP) clock properties.

Command Mode
Privileged EXEC

Command Syntax
show local-clock time-properties

Examples
• This command shows the PTP clock properties.

switch# show local-clock time-properties
Current UTC offset valid: False
Current UTC offset: 0
Leap 59: False
Leap 61: False
Time Traceable: False
Frequency Traceable: False
PTP Timescale: False
Time Source: 0x0
switch#
show ntp associations

The **show ntp associations** command displays the status of connections to NTP servers.

**Command Mode**

EXEC

**Command Syntax**

```
show ntp associations
```

**Display Values**

- **st** (stratum): number of steps between the switch and the reference clock.
- **t** (transmission type): u – unicast; b – broadcast; l – local.
- **when**: interval since reception of last packet (seconds unless unit is provided).
- **poll**: interval between NTP poll packets. Maximum (1024) reached as server and client syncs.
- **reach**: octal number that displays status of last eight NTP messages (377 - all messages received).
- **delay**: round trip delay of packets to selected reference clock.
- **offset**: difference between local clock and reference clock.
- **jitter**: maximum error of local clock relative to reference clock.

**Example**

- This command displays the status of the switch’s NTP associations.

```
switch>show ntp associations
remote           refid      st  t  when  poll  reach  delay   offset
jitter
=================================================================================================================
172.1.1.1         .INIT. 16  u   -1024  0  0.000  0.000
0.000
moose.aristanet 192.187.233.4  2  u   9  64  377  0.118  9440498
0.017
172.17.2.6      .INIT. 16  u   -1024  0  0.000  0.000
*LOCAL(0)        .LOCL. 10  l   41  64  377  0.000  0.000  0.000
```
show ntp status

The **show ntp status** command displays the status of NTP on the switch. If the switch clock is not synchronized to an NTP server, the status reads “unsynchronised” and shows the server polling interval. If the clock is synchronized to an NTP server, the status shows the reference ID and stratum of the server, the precision of the synchronization, and the polling interval.

**Important!** As specified in RFC5905, for servers with IPv4 addresses the reference ID is the four-octet IPv4 address, but for servers with IPv6 addresses the reference ID is the first four octets of the MD5 hash of the IPv6 address.

**Command Mode**

EXEC

**Command Syntax**

```
show ntp status
```

**Example**

- This command displays the switch’s NTP status.

  ```
  switch>show ntp status
  synchronised to NTP server (172.16.1.50) at stratum 4
  time correct to within 77 ms
  polling server every 1024 s
  switch>
  ```
**show ptp**

The `show ptp` command displays summary Precision Time Protocol (PTP) information and PTP status of switch ports.

**Command Mode**

EXEC

**Command Syntax**

`show ptp`

**Example**

- This command displays summary PTP information.

```
switch#show ptp
PTP Mode: gptp - Generalized PTP Clock
Clock Identity: 2001:0DB8:73:ff:ff:26:fd:90
Grandmaster Clock Identity: 2001:0DB8:96:ff:fe:6c:ed:02
Number of slave ports: 1
Number of master ports: 6
Slave port: Ethernet33
Mean Path Delay (nanoseconds): 718
Steps Removed: 1
Neighbor Rate Ratio: 1.00000007883
Rate Ratio: 1.00000007883
Interface State AS Time Since Last Neighbor Mean Path Residence
Capable Changed Rate Ratio Delay (ns) Time (ms)
--------- -------- ------- ------------------ ----------- ----------- --------
Et1 Disabled No Never 1.0 0 0
Et2 Disabled No Never 1.0 0 0
Et3 Disabled No Never 1.0 0 0
Et4 Disabled No Never 1.0 0 0
Et5 Disabled No Never 1.0 0 0
Et6 Disabled No Never 1.0 0 0
Et7 Master Yes 0:21:08 1.00000009 420 0
```

<-------OUTPUT OMITTED FROM EXAMPLE--------->
show ptp foreign-master-record

The `show ptp foreign-master-record` command displays information about foreign masters (PTP sources not designated as the switch's master from which the switch has received sync packets).

**Command Mode**

EXEC

**Command Syntax**

`show ptp foreign-master-record`

**Examples**

- This command displays information about PTP foreign masters.

  `switch# show ptp foreign-master-record`
  
  No Foreign Master Records

  `switch#`
show ptp interface

The `show ptp interface` command displays PTP information for all the interfaces on the device.

**Command Mode**

EXEC

**Command Syntax**

```
show ptp [INTERFACE_NAME] [STATUS_FILTER]
```

**Parameters**

- **INTERFACE_NAME** Interface type and numbers. Options include:
  - `<no parameter>` Display information for all interfaces.
  - `ethernet e_range` Ethernet interface range specified by `e_range`.
  - `loopback l_range` Loopback interface specified by `l_range`.
  - `management m_range` Management interface range specified by `m_range`.
  - `port-channel p_range` Port-Channel Interface range specified by `p_range`.
  - `vlan v_range` VLAN interface range specified by `v_range`.

Valid range formats include number, number range, or comma-delimited list of numbers and ranges.

- **STATUS_FILTER** Filters interfaces by their configuration status. Options include:
  - `<no parameter>` all interfaces.
  - `enabled` PTP configured interfaces.

**Examples**

This command displays PTP information for all the interfaces on the device.

```
switch# show ptp interface
Interface Ethernet1
PTP: Disabled
Port state: Disabled
Sync interval: 1.0 seconds
Announce interval: 2.0 seconds
Announce interval timeout multiplier: 3
Delay mechanism: end to end
Delay request message interval: 32.0 seconds
Transport mode: ipv4

<-------OUTPUT OMITTED FROM EXAMPLE-------->

Interface Ethernet5
PTP: Disabled
Port state: Disabled
Sync interval: 8.0 seconds
Announce interval: 2.0 seconds
Announce interval timeout multiplier: 5
Delay mechanism: peer to peer
Peer delay request message interval: 8.0 seconds
Peer Mean Path Delay: 0
Transport mode: ipv4

<-------OUTPUT OMITTED FROM EXAMPLE-------->

switch#
```
show ptp interface counters

The `show ptp interface counters` command displays PTP interface counters for all interfaces.

**Command Mode**

EXEC

**Command Syntax**

```
show ptp [INTERFACE_NAME] counters
```

**Parameters**

- **INTERFACE_NAME** Interface type and numbers. Options include:
  - `<no parameter>` Display information for all interfaces.
  - `ethernet e_range` Ethernet interface range specified by `e_range`.
  - `loopback l_range` Loopback interface specified by `l_range`.
  - `management m_range` Management interface range specified by `m_range`.
  - `port-channel p_range` Port-Channel Interface range specified by `p_range`.
  - `vlan v_range` VLAN interface range specified by `v_range`.
  - `vxlan vx_range` VXLAN interface range specified by `vx_range`.

Valid range formats include number, number range, or comma-delimited list of numbers and ranges.

**Examples**

- This command displays the PTP interface counters.

```
switch# show ptp interface ethernet 5 counters
Interface Ethernet5
  Announce messages sent: 0
  Announce messages received: 0
  Sync messages sent: 0
  Sync messages received: 0
  Follow up messages sent: 0
  Follow up messages received: 0
  Delay request messages sent: 0
  Delay request messages received: 0
  Delay response messages sent: 0
  Delay response messages received: 0
  Peer delay request messages sent: 0
  Peer delay request messages received: 0
  Peer delay response messages sent: 0
  Peer delay response messages received: 0
  Peer delay response follow up messages sent: 0
  Peer delay response follow up messages received: 0
switch#
```
**show ptp local-clock**

The `show ptp local-clock` command displays the Precision Time Protocol (PTP) clock information.

**Command Mode**
EXEC

**Command Syntax**

```
show ptp local-clock
```

**Example**

- This command shows how to display the PTP local clock and offset.

```
switch#show ptp local-clock
PTP Mode: Boundary Clock
Clock Identity: 0x00:1c:73:ff:ff:1e:83:24
Clock Domain: 1
Number of PTP ports: 24
Priority1: 128
Priority2: 128
Clock Quality:
  Class: 248
  Accuracy: 0x30
  OffsetScaledLogVariance: 0xffff
Offset From Master: 0
Mean Path Delay: 0
Steps Removed: 0
switch#
```
show ptp masters

The **show ptp masters** command displays information about the switch’s PTP master and grand master clocks.

**Command Mode**
- Privileged EXEC

**Command Syntax**
- `show ptp masters`

**Examples**
- This command displays information about the switch's PTP master and grand master clocks.

```
switch# show ptp masters
Parent Clock:
Parent Clock Identity: 0x00:1c:73:ff:ff:00:72:40
Parent Port Number: 0
Parent IP Address: N/A
Observed Parent Offset (log variance): N/A
Observed Parent Clock Phase Change Rate: N/A

Grandmaster Clock:
Grandmaster Clock Identity: 0x00:1c:73:ff:ff:00:72:40
Grandmaster Clock Quality:
  Class: 248
  Accuracy: 0x30
  OffsetScaledLogVariance: 0xffff
  Priority1: 128
  Priority2: 128
switch#
```
**show ptp monitor**

The `show ptp monitor` command to displays the list of up to 100 recorded entries of offset from master, mean path delay and skew values, along with current PTP mode, whether or not the feature is enabled, number of entries displayed and the configured thresholds for each metric. Entries are sorted by the system time at which the value was calculated, starting with the most recent data at the top.

**Command Mode**

EXEC

**Command Syntax**

`show ptp monitor`

**Example**

- This command displays the information recorded by PTP monitoring.

```
Switch# show ptp monitor
PTP Mode: Boundary Clock
Ptp monitoring: enabled
Number of entries: 5
Offset from master threshold: 1500
Mean path delay threshold: not configured
Skew threshold: 0.5

<table>
<thead>
<tr>
<th>Interface</th>
<th>Time</th>
<th>Offset from Master (ns)</th>
<th>Mean Path Delay (ns)</th>
<th>Skew</th>
</tr>
</thead>
<tbody>
<tr>
<td>Et8</td>
<td>21:23:12.901 UTC Feb 22 2018</td>
<td>71</td>
<td>5849</td>
<td>1.003159918</td>
</tr>
<tr>
<td>Et1</td>
<td>21:23:12.901 UTC Feb 22 2018</td>
<td>113</td>
<td>3672</td>
<td>1.004990621</td>
</tr>
<tr>
<td>Et2</td>
<td>21:23:12.901 UTC Feb 22 2018</td>

<td>0.998974658</td>
</tr>
</tbody>
</table>
```
show ptp source ip

The `show ptp source ip` command displays the PTP source IP for the device.

**Command Mode**
Privileged EXEC

**Command Syntax**

`show ptp source ip`

**Examples**

- This command shows the PTP source IP to be 10.0.2.1.

  switch#show ptp source ip
  PTP source IP: 10.0.2.1
  switch#
Chapter 7

Booting the Switch

This chapter describes the switch boot process, describes configuration options, and lists the components it requires, including the boot loader, the boot loader shell, and other configuration files.

This chapter includes the following sections:

- Section 7.1: Boot Loader – Aboot
- Section 7.2: Configuration Files
- Section 7.3: Supervisor Redundancy
- Section 7.4: System Reset
- Section 7.5: Aboot Shell
- Section 7.6: Aboot Configuration Commands
- Section 7.7: Switch Booting Commands

7.1 Boot Loader – Aboot

Aboot is the boot loader for Arista switches. In addition to booting the switch EOS, Aboot provides a shell for changing boot parameters, restoring default switch settings, diagnosing hardware problems, and managing switch files. Section 7.5: Aboot Shell describes the Aboot shell.

The boot process loads an EOS image file, initiates switch processes, performs self tests, restores interface settings, and configures other network parameters. The replacement image file can be in the switch’s flash or on a device in the flash drive port. Configuration files stored in flash memory specify boot parameters.

Aboot supports most available USB flash drive models. The flash drive must be formatted with the FAT or VFAT file system. Windows NT File System (NTFS) is not supported.

Aboot initiates a system reboot upon a reload command or by restoring power to the switch. Before loading the EOS image file, Aboot provides an option to enter the Aboot shell. The user can either enter the shell to modify boot parameters or allow the switch to boot.

The boot process can be monitored through a terminal connected to the console port. The console port is configured to interact with the terminal by configuration file settings.
7.2 Configuration Files

Three files define boot and running configuration parameters.

- **boot-config**: Contains the location and name of the image to be loaded.
- **running-config**: Contains the current switch configuration.
- **startup-config**: Contains the switch configuration that is loaded when the switch boots.

The **running-config** and **startup-config** are different when configuration changes have not been saved since the last boot.

7.2.1 boot-config

The **boot-config** file is an ASCII file that Aboot uses to configure console communication settings, locate the EOS flash image, and specify initial network configuration settings.

Aboot attempts to boot the EOS flash software image (with the extension .swi) referenced by **boot-config** if the user does not interrupt the boot process. See Section 7.5: Aboot Shell describes how Aboot uses **boot-config**.

You can view and edit the **boot-config** file contents. Viewing and editing options include:

- **View boot-config** file contents with the **more boot-config** command:
  
  ```
  switch(config)#more boot-config
  SWI=flash:/EOS.swi
  CONSOLESPEED=2400
  Aboot password (encrypted): $1$A8dZ3GLZ$knKrBpTyg5dhmtGdCdwNM.
  switch(config)#
  ```

- **View boot-config** settings with the **show boot-config** command:
  
  ```
  switch(config)#show boot-config
  Software image: flash:/EOS.swi
  Console speed: 2400
  Aboot password (encrypted): $1$A8dZ3GLZ$knKrBpTyg5dhmtGdCdwNM.
  Memory test iterations: (not set)
  switch(config)#
  ```

- **Modify file settings from the command line with EOS boot commands.**
  
  See Section 7.2.1.3: Programming boot-config from the CLI for a list of **boot** commands.

- **Edit the file directly by using vi from the Bash shell.**
  
  See Section 7.2.1.2: boot-config Command Line Content for a list of **boot-config** parameters.

7.2.1.1 boot-config File Structure

Each line in the **boot-config** file specifies a configuration setting and has this format:

```
NAME=VALUE
```

- **NAME** is the parameter label.
- **VALUE** indicates the parameter’s bootup setting.

The **NAME** and **VALUE** fields cannot contain spaces.

Aboot ignores blank lines and lines that begin with a # character.

7.2.1.2 boot-config Command Line Content

Aboot configuration commands that **boot-config** files can contain include:
Chapter 7: Booting the Switch

- **SWI** specifies the location and file name of the EOS image file that Aboot loads when booting, using the same format as the boot command to designate a local or network path.

  **Example**
  - SWI=flash:EOS.swi (flash drive location)
  - SWI=usb1:/EOS1.swi (USB drive location)
  - SWI=file:/tmp/EOSexp.swi (switch directory location)
  - SWI=/mnt/flash/EOS.swi
  - SWI=http://foo.com/images/EOS.swi
  - SWI=ftp://foo.com/images/EOS.swi
  - SWI=tftp://foo.com/EOS.swi
  - SWI=nfs://foo.com/images/EOS.swi

- **CONSOLESPEED** specifies the console baud rate. To communicate with the switch, the connected terminal must match the specified rate. Baud rates are 1200, 2400, 4800, 9600, 19200, or 38400. The default baud rate is 9600.

  **Example**
  - CONSOLESPEED=2400
  - CONSOLESPEED=19200

- **PASSWORD (ABOOT)** specifies the Aboot password, as described in Section 7.5.2: Accessing the Aboot Shell. If `boot-config` does not contain a PASSWORD line, the Aboot shell does not require a password.

  **Example**
  - PASSWORD=$1$CdWp5wfe$pzNtE3ujBcFEFL8vjcq7jo/

- **NET commands** NET commands in the `boot-config` file are used by Aboot during switch booting to configure the network interface that will be used for switch configuration. These commands can also be entered manually in Aboot.

  NETDEV indicates which network interface is being configured. If `boot-config` does not contain a NETDEV setting, the booting process does not attempt to configure a network interface. Other NET commands specify settings that Aboot uses to configure the interface.

  **Examples**
  - This NETDEV command specifies management port 1 as the network interface to be configured by `boot-config`.
    - NETDEV=ma1
    - This NETAUTO command instructs the switch to configure the network interface through a DHCP server, ignoring other NET settings.
      - NETAUTO=dhcp
    - These NET commands configure the network interface.
      - NETIP=10.12.15.10
      - NETMASK=255.255.255.0
      - NETGW=10.12.15.24
      - NETDOMAIN=mycompany.com
      - NETDNS=10.12.15.13
7.2.1.3 Programming boot-config from the CLI

The switch CLI provides `boot` commands for editing `boot-config` contents. The `boot` commands are not accessible from a console port CLI. Parameters not configurable from a boot command can be modified by directly editing the `boot-config` file.

Commands that configure boot parameters include `boot system`, `boot secret`, and `boot console`.

**boot system**

The `boot system` command provides the EOS image file location to Aboot.

**Example**

- This command specifies EOS1.swi on USB flash memory as the software image load file.

  ```
  switch(config)#boot system usb1:EOS1.swi
  ```

  The `boot system` command above adds this line to `boot-config`.

  ```
  SWI=usb1:/EOS1.swi
  ```

- This command designates EOS.swi, on the switch flash, as the EOS software image load file.

  ```
  switch(config)#boot system flash:EOS.swi
  ```

  The `boot system` command above adds this line to `boot-config`.

  ```
  SWI=flash:/EOS.swi
  ```

**boot secret**

The `boot secret` command sets the Aboot password.

**Example**

- These equivalent commands set the Aboot password to `xr19v`.

  ```
  switch(config)#boot secret xr19v
  switch(config)#boot secret 0 xr19v
  ```

  This command shows the password that has been set.

  ```
  switch(config)#show boot-config
  Software image: flash:/EOS.swi
  Console speed: (not set)
  Aboot password (encrypted): $1$k9YHFW8D$cgM8DSN.e/yY0p3k3RUvk.
  ```

  The `boot secret` commands above add this line to `boot-config`.

  ```
  PASSWORD=$1$k9YHFW8D$cgM8DSN.e/yY0p3k3RUvk.
  ```

  The user must enter `xr19v` at the login prompt to access the Aboot shell.

- This command sets the Aboot password to `xr123`. The encrypted string was previously generated with `xr123` as the clear-text seed.

  ```
  switch(config)#boot secret 5 $1$QfbYkVWb$PIXG0udEquW0wOSiZBN3D/
  ```

  This command shows the password that has been set.

  ```
  switch(config)#show boot-config
  Software image: flash:/EOS.swi
  Console speed: (not set)
  Aboot password (encrypted): $1$QfbYkVWb$PIXG0udEquW0wOSiZBN3D/
  ```
The **boot secret** command above adds this line to **boot-config**.

```
PASSWORD=$1$QfbYkVWB$PIXGOudEquW0wOSiZBN3D/
```

The user must enter **xr123** at the login prompt to access the Aboot shell.

- This command removes the Aboot password; subsequent Aboot access is not authenticated.
  
  ```
  switch(config)#no boot secret
  ```
  
  This command shows that there is now no Aboot password.
  
  ```
  switch(config)#show boot-config
  Software image: flash:/EOS.swi
  Console speed: (not set)
  Aboot password (encrypted): (not set)
  ```

**boot console**

The **boot console** command sets console settings for attaching devices.

**Example**

- This command sets the console speed to 4800 baud:
  
  ```
  switch(config)#boot console speed 4800
  ```
  
  This command shows the console speed.
  
  ```
  switch(config)#show boot-config
  Software image: flash:/EOS.swi
  Console speed: 4800
  Aboot password (encrypted): (not set)
  ```
  
  The **boot console** command above adds this line to **boot-config**.

```
CONSOLESPEED=4800
```

7.2.2 Running-Config

**running-config** is a virtual file that contains the system's operating configuration, formatted as a command sequence. Commands entered from the CLI modify **running-config**. Copying a file to **running-config** updates the operating configuration by executing the commands in the copied file.

**running-config** commands include:

- **show running-config** displays **running-config**.
- **copy running-config startup-config** copies **running-config** contents to the **startup-config**.
- **write** copies **running-config** contents to the **startup-config** file.

7.2.3 Startup-Config

The **startup-config** file is stored in flash memory and contains the configuration that the switch loads when booting. During a switch boot, **running-config** is replaced by **startup-config**. Changes to **running-config** that are not copied to **startup-config** are lost when the system reboots.

Commands affecting **startup-config** include:

- **show startup-config** displays **startup-config**.
- **copy <filename> startup-config** copies contents of the specified file to **startup-config**.
- **delete startup-config** deletes the **startup-config** file.
7.3 Supervisor Redundancy

On modular switches with redundant supervisor modules, control of the switch can be transferred to the standby supervisor to minimize downtime and data loss in the case of a reset, reload, or failure of the active supervisor. How the switchover takes place is determined by the redundancy protocol on the active supervisor.

To display the state and the current redundancy protocol of both supervisors, use the `show redundancy status` command. To display the state of configuration file synchronization between the supervisors, use the `show redundancy file-replication` command.

7.3.1 Redundancy Supervisor Protocols

There are three available supervisor redundancy protocols.

**Route Processor Redundancy (RPR)**

The default redundancy protocol is route processor redundancy (RPR), which synchronizes `startup-config` files between the supervisor modules and partially boots the standby supervisor to a “standby warm” state, but does not synchronize `running-config`. If the active supervisor fails, or a manual switchover is initiated with the `redundancy manual switchover` command, the standby supervisor will become active. Running state, including spanning tree, is lost, and all links are temporarily brought down.

Under RPR, the CLI of the standby supervisor can be accessed by SSH or through the console port, but the available command set is limited. Any configuration changes made to the standby supervisor will be lost when the supervisor reboots.

**Stateful Switchover (SSO)**

In stateful switchover (SSO) protocol, the switch synchronizes both `startup-config` and `running-config` files between the supervisor modules and fully boots the standby module to a “standby hot” state to speed the switchover process and minimize packet loss. If the active supervisor fails, or a manual switchover is initiated, the standby supervisor immediately becomes active, and L2 running state is maintained. An SSO switchover is largely transparent from the outside, but because L3 state is not synchronized the switchover can result in traffic loss for traffic forwarded on routes learned by a dynamic routing protocol. Enabling nonstop forwarding can eliminate most packet loss for BGP and OSPF.

Under SSO, the CLI of the standby supervisor can be accessed only through the console port, and the command set is limited. Any configuration changes made on the standby supervisor will be lost when the supervisor reboots.

**Important!** When upgrading the EOS on a dual-supervisor switch to an SSO-capable version (4.11.0 or higher) from a version that does not support SSO, both supervisors will reset simultaneously, causing several seconds of system downtime.

**Simplex**

When the switch is set to simplex protocol, the standby supervisor is disabled and switchover will not occur even if the active supervisor fails. Reloading the active supervisor results in system downtime while the supervisor reboots, and the standby supervisor remains disabled. To transfer control of the switch to the standby supervisor, the redundancy protocol must be changed to RPR or SSO.

Under simplex protocol, the CLI of the disabled supervisor can be accessed only through the console port, and the command set is limited. Any configuration changes made on the standby supervisor will be lost when the supervisor reboots.
7.3.2 Configuring Supervisor Redundancy

The supervisor redundancy protocol is configured using the `protocol` command in redundancy configuration mode (accessed with the `redundancy` command).

Changing the redundancy protocol on the active supervisor resets the standby supervisor regardless of redundancy protocol, and executing the `write` command on the active supervisor synchronizes the `startup-config` files between supervisors in RPR and SSO modes.

Examples

- These commands display the current redundancy state of the switch and the most recent file synchronization information.

  ```
  switch# show redundancy state
  my state = ACTIVE
  peer state = STANDBY WARM
  Unit = Primary
  Unit ID = 1

  Redundancy Protocol (Operational) = Route Processor Redundancy
  Redundancy Protocol (Configured) = Route Processor Redundancy
  Communications = Up
  Ready for switchover

  Last switchover time = 7:23:56 ago
  Last switchover reason = Supervisor has control of the active supervisor lock
  Switch# show redundancy file-replication
  0 files unsynchronized, 2 files synchronized, 0 files failed, 2 files total.
  
  File                      Status       Last Synchronized
  ------------------------  ----------  -------------------
  file:persist/sys          Synchronized  0:10:04 ago
  flash:startup-config      Synchronized  0:10:04 ago
  
  These commands set the redundancy protocol for the active supervisor to stateful switchover (SSO).
  ```

  ```
  switch# config
  switch(config)# redundancy
  switch(config-redundancy)# protocol sso
  Peer supervisor will be restarted.
  switch(config-redundancy)#
  ```
7.4 System Reset

When a reset condition exists, Aboot can either reset the switch without user intervention or facilitate a manual reset through the Aboot shell. A reset operation clears the switch, including memory states and other hardware logic.

- **Fixed systems**: The power supply remains powered up through the reset. Power is removed from all other switch components for two to five seconds.

- **Modular systems**: The power supply on the active supervisor remains powered up through the reset. Power is removed from all other supervisor components for at least one second. In stateful switchover (SSO) and route processor redundancy (RPR) modes, resetting the standby supervisor has no effect on the active supervisor, but resetting the active supervisor causes the standby supervisor to immediately become active. After the supervisor becomes functional, it manages the power-cycling of all line cards.

The `reload` command initiates an immediate reset, terminating all CLI instances not running through the console port. The console port CLI displays messages that the switch generates during a reset. On modular switches with redundant supervisors, CLI sessions on the standby supervisor are not terminated.

The `reload <scheduled>` command schedules a reset operation to initiate at a specific time or after a specified period.

7.4.1 Typical Reset Sequence

The `reload` command power cycles the switch, then resets it under Aboot control. The hard reset clears the switch, including memory states and other hardware logic.

By default, the `reload` command triggers a request to store unsaved `running-config` commands and an option to open the Aboot shell before starting the reboot when accessing the CLI through the console port. The switch then begins the reboot process controlled by Aboot.

This procedure is an example of a typical restart.

**Step 1** Begin the reboot process by typing the `reload` command:

```
switch#reload
```

The switch sends a message to confirm the reload request:

```
Proceed with reload? [confirm]
```

**Step 2** Press `enter` or type `y` to confirm the requested reload. Pressing any other key terminates the reload operation.

The switch sends a series of messages, including a notification that a message was broadcast to all open CLI instances, informing them that the system is being rebooted. The reload pauses when the CLI displays the Aboot shell notification line.

```
Broadcast message from root@mainStopping sshd: [ OK ]
SysRq : Remount R/O
Restarting system

Aboot 1.9.0-52504.EOS2.0

Press Control-C now to enter Aboot shell
```

**Step 3** To continue the reload process, do nothing. Typing `Ctrl-C` opens the Aboot shell; see Section 7.5.5: Commands for Aboot editing instructions.
The switch continues the reset process, displaying messages to indicate the completion of individual tasks. The reboot is complete when the CLI displays a login prompt.

```
Booting flash:/EOS.swi
Unpacking new kernel
Starting new kernel
Switching to rootWelcome to Arista Networks EOS 4.4.0
Mounting filesystems:  [ OK ]
Entering non-interactive startup
Starting EOS initialization stage 1: [ OK ]

Starting isshd: [ OK ]
Starting sshd: [ OK ]
Starting xinetd: [ OK ]
[ OK ] crond: [ OK ]

switch login:
```

**Step 4** Log into the switch to resume configuration tasks.

### 7.4.2 Switch Recovery

Aboot can automatically erase the internal flash and copy the contents of a USB drive that has been inserted before powering up or rebooting the switch. This recovery method does not require access to the switch console or Aboot password entry, even if the `boot-config` file lists one.

Aboot invokes the recovery mechanism only if each of these two conditions is met:

- The USB drive must contain a file called `fullrecover`
  - The file’s contents are ignored; an empty text file is sufficient.

- If the USB drive contains a file named `boot-config`, its timestamp must differ from the timestamp of the `boot-config` file on the internal flash.
  - This prevents Aboot from invoking the recovery mechanism again on every boot if you leave the flash key inserted.

To use this recovery mechanism, set up a USB drive with the files to be installed on the internal flash – for example, a current EOS software image, and a customized or empty `boot-config` – plus an empty file named `fullrecover`.

Check that the timestamp of `boot-config` is current to ensure that the above conditions are met.

### 7.4.3 Display Reload Cause

The `show reload cause` command displays the cause of the most recent system reset and lists recommended actions, if any exist, to avoid future spontaneous resets or resolve other issues that may have cause the reset.
Example

- To display the reset cause, type `show reload cause` at the prompt.

  ```
  switch# show reload cause
  Reload Cause 1:
  -------------------
  Reload requested by the user.

  Recommended Action:
  -------------------
  No action necessary.

  Debugging Information:
  ----------------------
  None available.
  switch#
  ```

7.4.4 Configuring Zero Touch Provisioning

Zero Touch Provisioning (ZTP) is a switch configuration method that uses files referenced by a DHCP server to initially provision the switch without user intervention. A switch enters ZTP mode when it is reloaded if flash memory does not contain a `startup-config`.

Canceling ZTP boots the switch without using a `startup-config` file. When ZTP mode is canceled, a `startup-config` file is not stored to flash memory. Until a `startup-config` file is stored to flash, the switch returns to ZTP mode on subsequent reboots. This section describes steps required to implement, monitor, and cancel ZTP.

7.4.4.1 Configuring the Network for ZTP

A switch performs the following after booting in ZTP mode:

- Configures each physical interface to `no switchport` mode.
- Sends a DHCP query packet on all Ethernet and management interfaces.

After the switch receives a DHCP offer, it responds with a DHCP request for Option 66 (TFTP server name), Option 67 (bootfile name), and dynamic network configuration settings. When the switch receives a valid DHCP response, it configures the network settings, then fetches the file from the location listed in Option 67. If Option 67 returns a network URL (http:// or ftp://), the switch obtains the file from the network. If Option 67 returns a file name, the switch retrieves the file from the TFTP server listed in Option 66.

The Option 67 file can be a `startup-config` file or a boot script. The switch distinguishes between a `startup-config` file and a boot script by examining the first line in the file:

- The first line of a boot file must consist of the `#!` characters followed by the interpreter path. The switch executes the code in the script, then reboots. The boot script may fetch an EOS software image or perform required customization tasks.

  The following boot file fetches an EOS software image and stores a startup configuration file to flash.

  ```
  #!/usr/bin/Cli -p2
  copy http://company.com/startup-config flash:/startup-config
  config
  boot system flash:/EOS-2.swi
  ```

- The switch identifies any other file as a `startup-config` file. The switch copies the `startup-config` file into flash as `mnt/flash/startup-config`, then reboots.
The switch uses its system MAC address as the DHCP client identifier and **Arista** as the Vendor Class Identifier (Option 60). When the switch receives an http URL through Option 67, it sends the following http headers in the GET request:

- `X-Arista-SystemMAC:
- X-Arista-HardwareVersion:
- X-Arista-SKU:
- X-Arista-Serial:
- X-Arista-Architecture:

### 7.4.4.2 Monitoring ZTP Progress

A switch displays the following message after rebooting when it does not contain a **startup-config** file:

No startup-config was found.

The device is in Zero Touch Provisioning mode and is attempting to download the startup-config from a remote system. The device will not be fully functional until either a valid startup-config is downloaded from a remote system or Zero Touch Provisioning is cancelled. To cancel Zero Touch Provisioning, login as admin and type 'zerotouch cancel' at the CLI.

switch login:

The switch displays a **CONFIG_DOWNLOAD_SUCCESS** message after it successfully downloads a **startup-config** file, then continues the reload process as described in Section 7.4.1.

```
Apr 15 21:36:46 switch ZeroTouch: %ZTP-5-DHCP_QUERY: Sending DHCP request on [ Ethernet10, Ethernet13, Ethernet14, Ethernet17, Ethernet18, Ethernet21, Ethernet22, Ethernet23, Ethernet24, Ethernet7, Ethernet8, Ethernet9, Management1, Management2 ]
Apr 15 21:36:56 switch ZeroTouch: %ZTP-5-DHCP_SUCCESS: DHCP response received on Ethernet24 [ Mtu: 1500; Ip Address: 10.10.0.4/16; Nameserver: 10.10.0.1; Domain: aristanetworks.com; Gateway: 10.10.0.1; Boot File: http://10.10.0.2:8080/tmp/172.17.11.196-startup-config.1 ]
Apr 15 21:37:01 switch ZeroTouch: %ZTP-5-CONFIG_DOWNLOAD: Attempting to download the startup-config from http://10.10.0.2:8080/tmp/172.17.11.196-startup-config.1
Apr 15 21:37:02 switch ZeroTouch: %ZTP-5-CONFIG_DOWNLOAD_SUCCESS: Successfully downloaded startup-config from http://10.10.0.2:8080/tmp/172.17.11.196-startup-config.1
Apr 15 21:37:02 switch ZeroTouch: %ZTP-5-RELOAD: Rebooting the system
Broadcast message Stopping sshd: [ OK ]
watchdog is not running
SysRq: Remount R/O
Restarting system
Ø
Aboot 1.9.0-52504.EOS2.0
```

Press Control-C now to enter Aboot shell
7.4.4.3 ZTP Failure Notification

The switch displays a DHCP_QUERY_FAIL message when it does not receive a valid DHCP response within 30 seconds of sending the query. The switch then sends a new DHCP query and waits for a response. The switch continues sending queries until it receives a valid response or until ZTP mode is canceled.

```
switch login: admin
admin
switch>Apr 15 21:28:21 localhost ZeroTouch: %ZTP-5-DHCP_QUERY: Sending DHCP request on [ Ethernet10, Ethernet13, Ethernet14, Ethernet17, Ethernet18, Ethernet21, E-thernet22, Ethernet23, Ethernet24, Ethernet7, Ethernet8, Ethernet9, Management1, Management2 ]
Apr 15 21:28:51 localhost ZeroTouch: %ZTP-5-DHCP_QUERY_FAIL: Failed to get a valid DHCP response
Apr 15 21:28:51 localhost ZeroTouch: %ZTP-5-RETRY: Retrying Zero Touch Provisioning from the begining (attempt 1)
Apr 15 21:29:22 localhost ZeroTouch: %ZTP-5-DHCP_QUERY: Sending DHCP request on [ Ethernet10, Ethernet13, Ethernet14, Ethernet17, Ethernet18, Ethernet21, Ethernet22, Ethernet23, Ethernet24, Ethernet7, Ethernet8, Ethernet9, Management1, Management2 ]
```

7.4.4.4 Canceling ZTP Mode

To boot the switch without a `startup-config` file, log into the console, then cancel ZTP mode. After the switch boots, it uses all factory default settings. A `startup-config` file must be saved to flash memory to prevent the switch from entering ZTP mode on subsequent boots.

7.4.5 Configuring the Networks

If the `boot-config` file contains a NETDEV statement, Aboot attempts to configure the network interface, as specified by Network configuration commands. See Section 7.2.1.2: boot-config Command Line Content for a list of commands that define the network configuration.
7.5 Aboot Shell

The Aboot shell is an interactive command-line interface used to manually boot a switch, restore the internal flash to its factory-default state, run hardware diagnostics, and manage files. The Aboot shell is similar to the Linux Bourne Again Shell (Bash).

The Aboot shell provides commands for restoring the state of the internal flash to factory defaults or a customized default state. You can use these recovery methods to:

- restore the factory-default flash contents before transferring the switch to another owner.
- restore Aboot shell access if the Aboot password is lost or forgotten.
- restore console access if baud rate or other settings are incompatible with the terminal.
- replace the internal flash contents with configuration or image files stored on a USB flash drive.

7.5.1 Operation

When the switch is powered on or rebooted, Aboot reads its configuration from `boot-config` on the internal flash and attempts to boot an EOS software image (with the extension .swi) automatically if one is configured.

You can monitor the automatic boot process or enter the Aboot shell only from the console port. You can connect a PC or terminal directly to the port and run a terminal emulator to interact with the serial port or access it through a serial concentrator device.

Console settings are stored in `boot-config`; the factory-default settings for Arista switches are 9600 baud, no parity, 8 character bits, and 1 stop bit. If you do not know the current settings, perform a full flash recovery to restore the factory-default settings. When the console port is connected and the terminal settings are configured properly, the terminal displays a message similar to the following a few seconds after powering up the switch:

```
Aboot 1.0.0
Press Control-C now to enter the Aboot shell
```

To abort the automatic boot process and enter the Aboot shell, press `Ctrl-C` (ASCII 3 in the terminal emulator) after the `Press Control-C now to enter Aboot shell` message appears. Pressing `Ctrl-C` can interrupt the boot process up through the starting of the new kernel.

If the `boot-config` file does not contain a password command, the Aboot shell starts immediately. Otherwise, you must enter the correct password at the password prompt to start the shell. If you enter the wrong password three times, Aboot displays this message:

```
Type "fullrecover" and press Enter to revert /mnt/flash to factory default state, or just press Enter to reboot:
```

- Pressing `Enter` continues a normal soft reset without entering the Aboot shell.
- Typing `fullrecover` and pressing `Enter` performs a full flash recovery to restore the factory-default settings, removing all previous contents of the flash drive.

The Aboot shell starts by printing:

```
Welcome to Aboot.
```

Aboot then displays the Aboot# prompt.

Aboot reads its configuration from `boot-config` on the internal flash.
7.5.2 Accessing the Aboot Shell

This procedure accesses the Aboot Shell:

**Step 1** Reload the switch and press `enter` or type `y` when prompted, as described by step 1 and step 2 in Section 7.4.1: Typical Reset Sequence.

The command line displays this Aboot entry prompt.

Press Control-C now to enter Aboot shell

**Step 2** Type `Ctrl-C`.

If the `boot-config` file does not contain a PASSWORD command, the CLI displays an Aboot welcome banner and prompt.

```
^CWelcome to Aboot.
Aboot#
```

If the `boot-config` file contains a PASSWORD command, the CLI displays a password prompt. In this case, proceed to step 3. Otherwise, the CLI displays the Aboot prompt.

**Step 3** If prompted, enter the Aboot password.

Press Control-C now to enter Aboot shell

```
^CWelcome to Aboot.
Aboot#
```

Aboot allows three attempts to enter the correct password. After the third attempt, the CLI prompts the user to either continue the reboot process without entering the Aboot shell or to restore the flash drive to the factory default state.

Press Control-C now to enter Aboot shell

```
^Cincorrect password
Aboot password:
incorrect password
Aboot password:
incorrect password
```

Type "fullrecover" and press Enter to revert /mnt/flash to factory default state, or just press Enter to reboot: fullrecover

All data on /mnt/flash will be erased; type "yes" and press Enter to proceed, or just press Enter to cancel:

```
The fullrecover operation replaces the flash contents with a factory default configuration. The CLI displays text similar to the following when performing a fullrecover, finishing with another entry option into the Aboot shell.

Erasing /mnt/flash
Writing recovery data to /mnt/flash
boot-config
startup-config
EOS.swi
210770 blocks
Restarting system.

Aboot 1.9.0-52504.EOS2.0
```

Press Control-C now to enter Aboot shell
7.5.3 File Structure

When you enter the Aboot CLI, the current working directory is the root directory on the switch. Switch image and configuration files are at /mnt/flash. When exiting the Aboot shell, only the contents of /mnt/flash are preserved. The /mnt directory contains the file systems of storage devices. Aboot mounts the internal flash device at /mnt/flash.

When a USB flash drive is inserted in one of the flash ports, Aboot mounts its file system on /mnt/usb1. The file system is unmounted when the USB flash drive is removed from the port. Most USB drives contain an LED that flashes when the system is accessing it; do not remove the drive from the flash port until the LED stops flashing.

7.5.4 Booting From the Aboot Shell

Aboot attempts to boot the EOS software image (with the extension .swi) configured in boot-config automatically if you take no action during the boot process. If the boot process fails for any reason, such as an incorrectly configured software image, Aboot enters the shell, allowing you to correct the configuration or boot a software image manually. The boot command loads and boots an EOS software image file.

The boot command syntax is

```
boot SWI
```

where SWI lists the location of the EOS image that the command loads. SWI settings include:

- **DEVICE:PATH** loads the image file from the specified storage device. The default DEVICE value is flash; other values include file and usb1.
- **/PATH** loads the image file from the specified path in the switch directory.
- **http://SERVER/PATH** loads the image file from the HTTP server on the host server.
- **ftp://SERVER/PATH** loads the image file from the FTP server on the host server.
- **tftp://SERVER/PATH** loads the image file from the TFTP server on the host server.
- **nfs://SERVER/PATH** mounts the path’s parent directory from the host server and loads the image file from the loaded directory.

The accepts the same commands as the SWI variable in the boot-config file. See Section 7.2.1.2: boot-config Command Line Content for a list of boot command formats.

If an image file is not specified in boot-config, or if booting the image results in an error condition (for example, an incorrect path or unavailable HTTP server), Aboot halts the boot process and drops into the shell.

**Example**

- To boot EOS.swi from internal flash, enter one of these commands on the Aboot command line:
  ```
  boot flash:EOS.swi
  boot /mnt/flash/EOS.swi.
  ```

7.5.5 Commands

To list the contents of the internal flash, enter `ls /mnt/flash` at the Aboot# prompt.

**Example**

```
Aboot# ls /mnt/flash
EOS.swi boot-config startup-config
```
Commonly used commands include:

- `ls`  Prints a list of the files in the current working directory.
- `cd`  Changes the current working directory.
- `cp`  Copies a file.
- `more`  Prints the contents of a file one page at a time.
- `vi`  Edits a text file.
- `boot`  Boots a software image file.
- `swiinfo`  Prints information about a software image.
- `recover`  Recovers the factory-default configuration.
- `reboot`  Reboots the switch.
- `udhcpc`  Configures a network interface automatically via DHCP.
- `ifconfig`  Prints or alters network interface settings.
- `wget`  Downloads a file from an HTTP or FTP server.

Many Aboot shell commands are provided by Busybox, an open-source implementation of UNIX utilities. Busybox command help is found at http://www.busybox.net/downloads/BusyBox.html. Aboot provides access to only a subset of the documented commands.

Aboot can access networks through the Ethernet management ports. Aboot provides network interfaces mgmt1 and mgmt2. These ports are unconfigured by default; you can configure management port settings using Aboot shell commands like `ifconfig` and `udhcpc`. When a management interface is configured, use `wget` to transfer files from an HTTP or FTP server, `tftp` to transfer files from a TFTP server, or `mount` to mount an NFS filesystem.
7.6 Aboot Configuration Commands

This section describes the Aboot configuration commands that a *boot-config* file can contain.

- SWI
- CONSOLESpeed
- PASSWORD (ABOOT)
- NET commands
CON SO LESPEED

CONSOLESPEED specifies the console baud rate. To communicate with the switch, the connected terminal must match the specified rate. Baud rates are 1200, 2400, 4800, 9600, 19200, or 38400. The default baud rate is 9600.

Command Syntax

```
CONSOLESPEED=baud_rate
```

Parameters

- `baud_rate` specifies the console speed. Values include 1200, 2400, 4800, 9600, 19200, or 38400.

Examples

- These lines are CONSOLESPEED command examples:
  ```
  CONSOLESPEED=2400
  CONSOLESPEED=19200
  ```
NET commands

NET commands in the `boot-config` file are used by Aboot during switch booting to configure the network interface that will be used for switch configuration. These commands can also be entered manually in Aboot.

NETDEV indicates which network interface is being configured. If `boot-config` does not contain a NETDEV setting, the booting process does not attempt to configure a network interface. Other NET commands specify settings that Aboot uses to configure the interface.

Command Syntax

```
NETDEV=interface
NETAUTO=auto_setting
NETIP=interface_address
NETMASK=interface_mask
NETGW=gateway_address
NETDOMAIN=domain_name
NETDNS=dns_address
```

Parameters

- **interface** the network interface. Settings include:
  - `NETDEV=ma1` management port 1.
  - `NETDEV=ma2` management port 2.
- **auto_setting** the configuration method. Settings include
  - `NETAUTO=dhcp` interface is configured through a DHCP server; other NET commands are ignored.
  - `NETAUTO` command is omitted interface is configured with other NET commands,
- **interface_address** interface IP address, in dotted-decimal notation.
- **interface_mask** interface subnet mask, in dotted-decimal notation.
- **gateway_address** default gateway IP address, in dotted decimal notation.
- **domain_name** interface domain name.
- **dns_address** IP address of the Domain Name Server, in dotted decimal notation.

Examples

- This NETDEV command specifies management port 1 as the network interface to be configured for management traffic.
  
  `NETDEV=ma1`

- This NETAUTO command instructs the switch to configure the network interface through a DHCP server, ignoring other NET settings.
  
  `NETAUTO=dhcp`

- These NET commands configure the network interface.
  
  `NETIP=10.12.15.10
  NETMASK=255.255.255.0
  NETGW=10.12.15.24
  NETDOMAIN=mycompany.com
  NETDNS=10.12.15.13`
PASSWORD (ABOOT)

PASSWORD specifies the Aboot password, as described in Section 7.5.2: Accessing the Aboot Shell. If boot-config does not contain a PASSWORD line, the Aboot shell does not require a password.

boot-config stores the password as an MD5-encrypted string as generated by the UNIX passwd program or the crypt library function from a clear-text seed. When entering the Aboot password, the user types the clear-text seed.

There is no method of recovering the password from the encrypted string. If the clear-text password is lost, delete the corresponding PASSWORD command line from the boot-config file.

The EOS boot secret command is the recommended method of adding or modifying the PASSWORD configuration line.

Command Syntax

PASSWORD=encrypted_string

Parameters

- encrypted_string the encrypted string that corresponds to the clear-text Aboot password.

Example

- This line is a PASSWORD command example where the encrypted string corresponds with the clear-text password abcde.

PASSWORD=$1$CdWp5wfe$pzNtE3ujBoFEL8vjcq7jo/
**SWI**

SWI specifies the location and file name of the EOS image file that Aboot loads when booting, using the same format as `boot-config` to designate a local or network path.

**Command Syntax**

\[ SWI=FILE\_LOCATION \]

**Parameters**

- **FILE\_LOCATION** specifies the location of the EOS image file. Formats include:
  - `device:path` storage device location:
    - `device` denotes a storage device. Settings include `flash`, `file` and `usb1`. Default is `flash`
    - `path` denotes a file location.

**Examples**

- **flash drive location**
  \[ SWI=flash:EOS.swi \]
- **usb drive location**
  \[ SWI=usb1:/EOS1.swi \]
- **switch directory location**
  \[ SWI=file:/tmp/EOSexp.swi \]
- **switch directory location**
  \[ SWI=/mnt/flash/EOS.swi \]
- **HTTP server location**
  \[ SWI=http://foo.com/images/EOS.swi \]
- **FTP server location**
  \[ SWI=ftp://foo.com/images/EOS.swi \]
- **TFTP server location**
  \[ SWI=tftp://foo.com/EOS.swi \]
- **nfs server location**
  \[ SWI=nfs://foo.com/images/EOS.swi \]
7.7 **Switch Booting Commands**

- boot console
- boot secret
- boot system
- delete startup-config
- protocol
- redundancy
- redundancy manual switchover
- reload
- reload <scheduled>
- show redundancy file-replication
- show redundancy status
- show redundancy switchover sso
- show reload
- show reload cause
**boot console**

The `boot console` command configures terminal settings for serial devices connecting to the console port. Console settings that you can specify from `boot-config` include:

- **speed**

Factory-default console settings are 9600 baud, no parity, 8 character bits, and 1 stop bit. If you do not know the current settings, restore the factory-default settings as described in Section 2.4.3: Restoring the Factory Default EOS Image and Startup Configuration.

The `no boot console` and `default boot console` commands restore the factory default settings on the switch and remove the corresponding CONSOLESPEED command from the `boot-config` file.

**Command Mode**

Global Configuration

**Command Syntax**

```
boot console speed baud
no boot console speed
default boot console speed
```

**Parameters**

- **baud** console baud rate. Settings include 1200, 2400, 4800, 9600, 19200, and 38400.

**Example**

- This command sets the console speed to 4800 baud
  
  ```
  switch(config)#boot console speed 4800
  ```
  
  This code displays the result of the command:
  
  ```
  switch(config)#show boot-config
  Software image: flash:/EOS.swi
  Console speed: 4800
  Aboot password (encrypted): (not set)
  ```

  The above `boot console` command adds the following line to `boot-config`.

  ```
  CONSOLESPEED=4800
  ```
boot secret

The `boot secret` command creates or edits the Aboot shell password and stores the encrypted string in the `PASSWORD` command line of the `boot-config` file.

The `no boot secret` and `default boot secret` commands remove the Aboot password from the `boot-config` file. When the Aboot password does not exist, entering Aboot shell does not require a password.

**Command Mode**
Global Configuration

**Command Syntax**
```
boot secret [ENCRYPT_TYPE] password
no boot secret
default boot secret
```

**Parameters**

- `ENCRYPT_TYPE` indicates the encryption level of the password parameter. Settings include:
  - `<no parameter>` the `password` is clear text.
  - `0` the `password` is clear text. Equivalent to the `<no parameter>` case.
  - `5` the `password` is an md5 encrypted string.
  - `sha512` the password is entered as an sha512 encrypted string.
- `password` specifies the boot password.
  - `password` must be in clear text if `ENCRYPT_TYPE` specifies clear text.
  - `password` must be an appropriately encrypted string if `ENCRYPT_TYPE` specifies encryption.

**Restrictions**
The `sha512` encryption option is not available on Trident platform switches.

**Examples**

- These equivalent commands set the Aboot password to `xr19v`:

  ```
  switch(config)#boot secret xr19v
  switch(config)#boot secret 0 xr19v
  ```

  This CLI code displays the result:

  ```
  switch(config)#show boot-config
  Software image: flash:/EOS.swi
  Console speed: (not set)
  Aboot password (encrypted): $1$k9YHFW8D$cgM8DSN.e/yY0p3k3RUvk.
  ```

  The `boot secret` commands above add this line to `boot-config`.

  `PASSWORD=$1$k9YHFW8D$cgM8DSN.e/yY0p3k3RUvk.`

  The user must enter `xr19v` at the login prompt to access the Aboot shell.

- These commands set the Aboot password to `xr123`, then displays the resulting `boot-config` code. The encrypted string was previously generated with `xr123` as the clear-text seed.

  ```
  switch(config)#boot secret 5 $1$QfbYkVWb$PIXG0udEquW0wOSiZBN3D/
  switch(config)#show boot-config
  Software image: flash:/EOS.swi
  Console speed: (not set)
  Aboot password (encrypted): $1$QfbYkVWb$PIXG0udEquW0wOSiZBN3D/
  ```
The `boot secret` command above adds this line to `boot-config`.

```
PASSWORD=$1$QfbYkVWb$PIXG0udEquW0wOSiZBN3D/
```

The user must enter xr123 at the login prompt to access the Aboot shell.

- This command removes the Aboot password, allowing access to the Aboot shell without a password.

```
switch(config)#no boot secret
```
**boot system**

The **boot system** command specifies the location of the EOS software image that Aboot loads when the switch boots. The command can refer to files on flash or on a module in the USB flash port.

**Command Mode**

Global Configuration

**Command Syntax**

```
boot system DEVICE file_path
```

**Parameters**

- **DEVICE**  Location of the image file. Options include
  - **file**: file is located in the switch file directory.
  - **flash**: file is located in flash memory.
  - **usb1**: file is located on a drive inserted in the USB flash port. Available if a drive is in the port.
- **file_path**  Path and name of the file.

**Examples**

- This command designates EOS1.swi, on USB flash memory, as the EOS software image load file.
  ```
  switch(config)#boot system usb1:EOS1.swi
  SWI=usb1:/EOS1.swi
  ```
  The **boot system** command above adds this line to **boot-config**.

- This command designates EOS.swi, on the switch flash, as the EOS software image load file.
  ```
  switch(config)#boot system flash:EOS.swi
  SWI=flash:/EOS.swi
  ```
  The **boot system** command above adds this line to **boot-config**.
delete startup-config

The `delete startup-config` command erases or deletes the startup configuration.

**Command Mode**

Privileged EXEC

**Command Syntax**

`delete startup-config [CONFIRMATION]`

**Parameters**

- CONFIRMATION
  - `<no parameter>` the switch requires a confirmation before starting the erase.
  - `now` the erase begins immediately without prompting the user to confirm the request.

**Examples**

- This command deletes the startup configuration from the switch. When the `delete startup-config` command is entered, the switch sends a message prompting the user to confirm the `delete startup-config` request.

```
switch# delete startup-config
Proceed with erasing startup configuration? [confirm]y
switch#
```

- This command deletes the startup configuration from the switch immediately without prompting.

```
switch# delete startup-config now
switch#
```
The `protocol` command configures how the supervisors on a modular switch will handle switchover events. By default, the switch is set to route processor redundancy (RPR), which synchronizes `startup-config` files between the supervisor modules and partially boots the standby supervisor. The mode can also be set to simplex (manual switchover only) or to stateful switchover (SSO) which synchronizes both `startup-config` and `running-config` files between the supervisor modules and fully boots the standby module to speed the switchover process and minimize packet loss. Note that SSO synchronizes L2 state between the supervisors, but that L3 state is not synchronized. This can result in traffic loss for traffic forwarded on routes learned by a dynamic routing protocol. Enabling nonstop forwarding can eliminate most packet loss for BGP and OSPF.

The `no protocol` and `default protocol` commands set the redundancy protocol to the default value (rpr) by removing the `protocol` command from `running-config`.

**Command Mode**
- Redundancy Configuration

**Command Syntax**
```
protocol PROTOCOL_NAME
no protocol
default protocol
```

**Parameters**
- `PROTOCOL_NAME` specifies the location of the image file. Settings include
  - `rpr` route processor redundancy protocol (the default).
  - `simplex` no redundancy. Switchover must be initiated manually.
  - `sso` stateful switchover.

**Related Commands**
- `redundancy` Places switch in redundancy configuration mode.

**Example**
- These commands enter redundancy configuration mode and set the redundancy protocol to stateful switchover.

```
switch(config)#redundancy
switch(config-redundancy)#protocol sso
switch(config-redundancy)#
```
redundancy

The **redundancy** command places the switch in redundancy configuration mode.

**Command Mode**
- Global Configuration

**Command Syntax**
- `redundancy`

**Commands Available in Redundancy Configuration Mode**
- `protocol`

**Related Commands**
- **redundancy manual switchover**  Manually initiates a switchover.

**Example**
- These commands enter redundancy configuration mode and set the redundancy protocol to stateful switchover.
  
  ```
  switch(config)#redundancy
  switch(config-redundancy)#protocol sso
  switch(config-redundancy)#
  ```
redundancy manual switchover

The `redundancy manual switchover` command immediately switches control of the switch to the standby supervisor. If the redundancy mode is set to simplex or the standby supervisor is unavailable for any other reason, this command will not function.

**Command Mode**

Privileged EXEC

**Command Syntax**

`redundancy manual switchover`

**Related Commands**

- `redundancy` Places the switch in redundancy configuration mode.

**Example**

- This command forces a switchover to the standby supervisor. The switchover is executed immediately without further confirmation from the user.

```
switch# redundancy manual switchover
This supervisor will be restarted.
```
**reload**

The `reload` command power cycles the switch, then resets it under Aboot control. The hard reset clears the switch, including memory states and other hardware logic.

**Important!** The `reload` commands are used to initiate Accelerated Switch Update (ASU) and Smart Switch Update (SSU); for descriptions of these features and the appropriate command syntax, please refer to the Accelerated Software Upgrade (ASU) and Leaf Smart System Upgrade (Leaf SSU) sections.

- Fixed 1-RU systems: The power supply remains powered up through the reset. Power is removed from all other switch components for two to five seconds.
- Modular systems: The power supply on the active supervisor remains powered up through the reset. Power is removed from all other supervisor components for at least one second. After the supervisor becomes functional, it manages the power-cycling of all line cards.

**Command Mode**
Privileged EXEC

**Command Syntax**
```
reload [TARGET] [CONFIRMATION]
```

**Parameters**
- **TARGET** specifies which supervisor(s) will be reset. Some options are available only on dual-supervisor switches.
  - <no parameter> the active supervisor is reset.
  - all both supervisors are reset.
  - peer the peer supervisor is reset.
  - power the active supervisor is reset.
- **CONFIRMATION** specifies when the switch resets.
  - <no parameter> the switch requires a confirmation before starting the reset.
  - now the reset begins immediately without prompting the user to confirm the request.

**Related Commands**
- `reload <scheduled>` Schedules a pending reload operation.
- `show reload cause` Displays cause of most recent reload.

**Example**
- Begin the reboot process by typing the `reload` command:
  ```
  switch#reload
  ```
  When the `reload` command is entered, the switch sends a message prompting the user to save the configuration if it contains unsaved modifications, then asks the user to confirm the reload request.

  ```
  System configuration has been modified. Save? [yes/no/cancel/diff]:n
  Proceed with reload? [confirm]
  ```
The switch responds by broadcasting a series of messages, including a notification that the system is being rebooted, to all open CLI instances. The reload pauses to provide an option for the user to enter Aboot shell; the Aboot shell supports commands that restore the state of the internal flash to factory defaults or create a customized default state.

```
Broadcast message from root@mainStopping sshd: [  OK  ]
SysRq : Remount R/O
Restarting system

Aboot 1.9.0-52504.EOS2.0

Press Control-C now to enter Aboot shell

No action is required to continue the reset process. The switch displays messages to indicate the completion of individual tasks. The reboot is complete when the CLI displays a login prompt.

switch login:
```
**reload <scheduled>**

The `reload <scheduled>` command configures the switch to reset at a specified time or after a specified interval. Refer to `reload` for details on the functional details of the reset operation.

The switch prompts to save the configuration and confirm the reload request. After the request is confirmed, the switch resumes normal operation until the reload initiates.

The `reload cancel`, `no reload`, and `default reload` commands cancel the pending reload operation.

**Command Mode**

Privileged EXEC

**Command Syntax**

```
reload [power] TIMEFRAME [COMMENT]
reload cancel
no reload
default reload
```

**Parameters**

- **power** Parameter has no functional affect.
- **TIMEFRAME** specifies when the switch resets.
  - **at absolute** specifies the time when a reset begins.
  - **in relative** specifies the period until the reset begins.

  \[
  \text{absolute} \quad \text{denotes time-date (24-hour notation): } hh:mm [month date] \text{ or } hh:mm [date month]
  \]

  \[
  \text{relative} \quad \text{designates a time period: } hhh:mm
  \]

- **COMMENT** descriptive text for denoting the reset reason. This option has no functional effect on the reset operation.
  - **<no parameter>** reason for system reset is not stated.
  - **reason comment_string** text that describes the reset.

**Related Commands**

- **reload** Initiate an immediate reload operation.
- **show reload** Displays time and reason of any pending reload operation.

**Examples**

- This command schedules a switch reset to begin in twelve hours.

  ```
  switch#reload in 12:00
  System configuration has been modified. Save? [yes/no/cancel/diff]:y
  Proceed with reload? [confirm]
  Reload scheduled for Tue Mar 27 05:57:25 2012 ( in 11 hours 59 minutes )
  ```

- This command cancels a scheduled switch reset.

  ```
  switch#no reload
  Scheduled reload has been cancelled
  switch#
  ```
**show redundancy file-replication**

The *show redundancy file-replication* command displays the status and last synchronization date of file replication between the supervisors on the switch.

**Command Mode**

EXEC

**Command Syntax**

`show redundancy file-replication`

**Related Commands**

- *show redundancy status* Displays status and redundancy protocol of supervisors.
- *show redundancy switchover sso* Displays stateful switchover information since last reload.

**Example**

- This command displays the current file replication status of the supervisors.

  ```
  switch# show redundancy file-replication
  0 files unsynchronized, 2 files synchronized, 0 files failed, 2 files total.

  File Status Last Synchronized
  ---------------------- -------------- -----------------------
  file:persist/sys Synchronized 25 days, 19:48:26 ago
  flash:startup-config Synchronized 25 days, 19:48:26 ago
  switch#
  ```
show redundancy status

The `show redundancy status` command displays the current status (active or standby) and the configured redundancy protocol of both supervisors, as well as summary information about the latest switchover event.

**Command Mode**

EXEC

**Command Syntax**

`show redundancy status`

**Related Commands**

- `show redundancy file-replication` Displays status of file replication between supervisors.
- `show redundancy switchover sso` Displays stateful switchover information since last reload.

**Example**

- This command displays redundancy information for both supervisors and a summary of the latest switchover.

```
switch# show redundancy status
my state = ACTIVE
peer state = STANDBY HOT
    Unit = Primary
    Unit ID = 1

Redundancy Protocol (Operational) = Stateful Switchover
Redundancy Protocol (Configured) = Stateful Switchover
Communications = Up
switchover completion timeout = 720.0 seconds (default)
Ready for switchover

    Last switchover time = 0:32:15 ago
    Last switchover reason = Supervisor has control of the active supervisor lock
```
**show redundancy switchover sso**

The *show redundancy switchover sso* command displays the number of stateful switchovers since the last reload and a log of the events in the latest stateful switchover.

**Command Mode**

EXEC

**Command Syntax**

```
show redundancy switchover sso
```

**Related Commands**

- *show redundancy file-replication*  
  Displays status of file replication between supervisors.
- *show redundancy status*  
  Displays status and redundancy protocol of supervisors.

**Example**

- This command displays stateful switchover information.

```bash
switch#show redundancy switchover sso
Total number of Stateful Switchover completed since reload: 4

Latest Stateful Switchover occurred 29 days, 12:48:22 ago @ 2012-06-09 19:47:50 (completed)
0.000000: switchover started
0.000235: stage PCIEAcquired started
0.000349: event PCIEAcquired:__dummyInternal1__ completed
0.000394: event PCIEAcquired:PlxPcie-system started
0.027738: event PCIEAcquired:PlxPcie-system completed
0.027829: stage PCIEAcquired is complete
0.027935: stage DmaReady started
0.028042: event DmaReady:ForwardingAgent started
0.079620: event DmaReady:ForwardingAgent completed
0.079699: stage DmaReady is complete
0.079781: stage TimeCriticalServices started
0.079887: event TimeCriticalServices:__dummyInternal1__ completed
0.079928: event TimeCriticalServices:Stp started
0.208035: event TimeCriticalServices:Stp completed
0.208120: stage TimeCriticalServices is complete

<--------OUTPUT OMITTED FROM EXAMPLE-------->

39.675076: stage NonCriticalServices started
39.675145: event NonCriticalServices:__dummyInternal1__ completed
39.675183: stage NonCriticalServices is complete
39.675399: switchover is complete
```
**show reload**

The `show reload` command displays the time and reason of any pending reload operation. The `reload <scheduled>` command schedules a reload operation and can be used to cancel a pending reload.

**Command Mode**

EXEC

**Command Syntax**

`show reload`

**Related Commands**

- `reload <scheduled>` Schedules a pending reload operation.
- `show reload cause` Displays cause of most recent reload.

**Example**

- These commands schedule a reload for 2:45 pm, display the time of the pending reload, then cancel the scheduled reload.

```
switch>reload at 14:45
Proceed with reload? [confirm]
Reload scheduled for Tue Mar 27 14:45:00 2012 ( in 4 hours 11 minutes )
switch#show reload
Reload scheduled for Tue Mar 27 14:45:00 2012 ( in 4 hours 11 minutes )
switch#reload cancel
Scheduled reload has been cancelled
switch>
```
**show reload cause**

The `show reload cause` command displays the reason of the most recent reload operation. The command displays recommended actions and debug information related to the executed reload.

**Command Mode**

EXEC

**Command Syntax**

```
show reload cause
```

**Related Commands**

- `reload` Initiates an immediate reload operation.
- `show reload` Displays time and reason of all pending reload operations.

**Example**

```
This command displays the cause of the recent reload operation.

switch> show reload cause
Reload Cause 1:
-------------------
Reload requested by the user.

Recommended Action:
-------------------
No action necessary.

Debugging Information:
----------------------
None available.
switch>
```
8.1 Upgrade/Downgrade Overview

Upgrading or downgrading Arista switch software is accomplished by replacing the EOS image and reloading the switch. Depending on the switch model and the software change being made, there are different options for minimizing (or potentially eliminating) downtime and packet loss during the upgrade/downgrade.

Accelerated Software Upgrade (ASU): ASU is available on the 7050SX-64, 7050SX-128, 7050Q-32, and 7050Q-32S and can be used on both leaf and spine switches. It significantly reduces reload time by streamlining and optimizing the reload procedure for upgrades, and continues sending LACP PDUs while the CPU is rebooting, keeping port channels operational during the reload. Downtime during the upgrade is reduced to 30 seconds. Note: ASU does not support software downgrades.

Leaf Smart System Upgrade (Leaf SSU): SSU is available only on 7050X platforms (excluding 7050SX-72 and 7050SX-96), and can only be used on leaf switches. It includes the core functionality of ASU, plus additional elements that permit a hitless restart of several features. SSU does not support software downgrades, and is incompatible with VRRP.

Standard Upgrades and Downgrades: In those cases where an accelerated upgrade is not an option (such as software downgrades and unsupported platforms), performing a standard upgrade or downgrade using the steps described here will minimize downtime and packet loss.

Important! To upgrade the software on switches participating in an MLAG, see Section 13.3.3: Upgrading MLAG Peers.
8.2 Accelerated Software Upgrade (ASU)

The Accelerated Software Upgrade (ASU) process significantly decreases downtime and packet loss during a software upgrade in three ways:

- performing time-intensive tasks (including copying the EOS image) before rebooting the control plane
- forwarding packets in hardware (based on the last known state) while the control-plane is offline
- optimizing the boot process by performing only tasks essential for software upgrade

After the control plane has fully loaded, the data plane is restarted, causing approximately 30 seconds of downtime.

8.2.1 Upgrading the EOS image with Accelerated Software Upgrade

Using ASU to upgrade the active EOS image is a five-step process:

Step 1 Prepare switch for upgrade (Section 8.2.1.1).

Step 2 Transfer image file to the switch (Section 8.2.1.2). (Not required if desired file is on the switch).

Step 3 Modify boot-config file to point to the desired image file (Section 8.2.1.3).

Step 4 Start the ASU process (Section 8.2.1.4).

Step 5 Verify that switch is running the new image (Section 8.2.1.5).

8.2.1.1 Prepare the Switch

Before upgrading the EOS image, ensure that backup copies of the currently running EOS version and the running-config file are available in case of corruption during the upgrade process. To copy the running-config file, use the `copy running-config` command. In this example, running-config is copied to a file in the flash drive on the switch.

```
switch#copy running-config flash:/cfg_06162014
Copy completed successfully.
switch#
```

Determine the size of the new EOS image. Then verify that there is enough space available on the flash drive for two copies of this image (use the `dir` command to check the “bytes free” figure).

```
switch#dir flash:
Directory of flash:
-rwx 293168526 Nov 4 22:17 EOS4.11.0.swi
-rwx 36 Nov 8 10:24 boot-config
-rwx 37339 Jun 16 14:18 cfg_06162014

606638080 bytes total (602841088 bytes free)
```
Chapter 8: Upgrades and Downgrades

Ensure that the switch has a management interface configured with an IP addresses and default gateway (see Assigning an IP Address to a Specific Ethernet Management Port and Configuring a Default Route to the Gateway), and confirm that it can be reached through the network by using the show interfaces status command and pinging the default gateway.

```
switch#show interfaces status
Port   Name    Status   Vlan Duplex Speed   Type
Et3/1  notconnect 1   auto  auto  1000BASE-T
Ma1/1  connected routed unconf unconf  Unknown
```

```
switch#ping 1.1.1.10
PING 172.22.26.1 (172.22.26.1) 72(100) bytes of data.
80 bytes from 1.1.1.10: icmp_seq=1 ttl=64 time=0.180 ms
80 bytes from 1.1.1.10: icmp_seq=2 ttl=64 time=0.076 ms
80 bytes from 1.1.1.10: icmp_seq=3 ttl=64 time=0.084 ms
80 bytes from 1.1.1.10: icmp_seq=4 ttl=64 time=0.073 ms
80 bytes from 1.1.1.10: icmp_seq=5 ttl=64 time=0.071 ms
```

8.2.1.2 Transfer the Image File

The target image must be copied to the file system on the switch, typically onto the flash drive. After verifying that there is space for two copies of the image, use the copy command to copy the image to the flash drive, then confirm that the new image file has been correctly transferred.

These command examples transfer an image file to the flash drive from various locations.

**USB Memory**

**Command**

```
copy usb1:/sourcefile flash:/destfile
```

**Example**

```
Sch#copy usb1:/EOS-4.14.4.swi flash:/EOS-4.14.4.swi
```

**FTP Server**

**Command**

```
copy ftp:/ftp-source/sourcefile flash:/destfile
```

**Example**

```
Sch#copy ftp:/user:password@10.0.0.3/EOS-4.14.4.swi flash:/EOS-4.14.4.swi
```

**SCP**

**Command**

```
copy scp://scp-source/sourcefile flash:/destfile
```

**Example**

```
sch#copy scp://user@10.1.1.8/user/EOS-4.14.4.swi flash:/EOS-4.14.4.swi
```

**HTTP**

**Command**

```
copy http://http-source/sourcefile flash:/destfile
```
Example

```bash
```

Once the file has been transferred, verify that it is present in the directory, then confirm the MD5 checksum using the `verify` command. The MD5 checksum is available from the EOS download page of the Arista website.

```
switch# dir flash:
Directory of flash:/
-rwx 293168526 Nov 4 22:17 EOS4.14.2.swi
-rwx 36 Nov 8 10:24 boot-config
-rwx 37339 Jun 16 14:18 cfg_06162014
-rwx 39459902 May 30 02:57 EOS-4.13.1.swi
```

```
606638080 bytes total (208281186 bytes free)
switch#53# verify /md5 flash:EOS-4.14.4.swi
verify /md5 (flash:EOS-4.14.4.swi) =c277a965d0ed48534de6647b12a86991
```

8.2.1.3 Modify boot-config

After transferring and confirming the desired image file, use the `boot system` command to update the `boot-config` file to point to the new EOS image.

This command changes the `boot-config` file to point to the image file located in flash memory at EOS-4.14.4.swi.

```
switch# configure terminal
switch(config)# boot system flash:/EOS-4.14.4.swi
```

Use the `show boot-config` command to verify that the boot-config file is correct:

```
switch(config)# show boot-config
Software image: flash:/EOS-4.14.4.swi
Console speed: (not set)
Aboot password (encrypted): $1$ap1QMbmz$DTqsFYeauuMSa7/Qxbi211
```

Save the configuration to the `startup-config` file with the `write` command.

```
switch# write
```

8.2.1.4 Start the ASU Process

After updating the `boot-config` file, start the ASU process using the `reload fast-boot` command to reload the switch and activate the new image. If `running-config` has not been saved, the CLI will prompt to save any modifications to the system configuration; failure to save modifications will abort the reload.

**Note** Once the system configuration is saved, there is a significant delay before the user is prompted to confirm the reload.

```
switch# reload fast-boot
System configuration has been modified. Save? [yes/no/cancel/diff]:y
Proceed with reload? [confirm]y
Proceeding with reload
```
8.2.1.5 Verify

After the switch finishes reloading, log into the switch and use the `show version` command to confirm the correct image is loaded. The `Software image version` line displays the version of the active image file.

```
switch#show version
Arista DCS-7150S-64-CL-F
Hardware version: 01.01
Serial number: JPE13120819
System MAC address: 001c.7326.fd0c

Software image version: 4.14.4F
Architecture: i386
Internal build version: 4.14.4F-1649184.4144F.2
Internal build ID: eeb3c212-b4bd-4c19-ba34-1b0aa36e43f1

Uptime: 14 hours and 48 minutes
Total memory: 4017088 kB
Free memory: 1569760 kB
```

switch>
8.3 Leaf Smart System Upgrade (Leaf SSU)

The Smart System Upgrade (SSU) process includes the core functionality of Accelerated Software Upgrade, plus additional optimizations that permit a hitless restart of several features. SSU leverages protocols capable of graceful restart to minimize traffic loss during upgrade. For protocols not capable of graceful restart, SSU generates control plane messages and buffers them in hardware to be slowly released when the control plane is offline. Additionally, under SSU, the forwarding ASIC does not get reset and ports do not flap.

Features capable of hitless restart under SSU include:

- QinQ
- 802.3ad Link Aggregation/LACP
- 802.3x flow control
- BGP (BGP graceful restart must be enabled: see Configuring BGP)
- MP-BGP (BGP graceful restart must be enabled: see Configuring BGP)
- 128-way Equal Cost Multipath Routing (ECMP)
- VRF
- route maps
- L2 MTU
- QoS

**Important!** SSU is not compatible with VRRP. If VRRP is configured on the switch, another upgrade method must be used.

8.3.1 Upgrading the EOS image with Smart System Upgrade

Using SSU to upgrade the active EOS image is a five-step process:

**Step 1** Prepare switch for upgrade (Section 8.3.1.1).

**Step 2** Transfer image file to the switch (Section 8.3.1.2). (Not required if desired file is on the switch).

**Step 3** Modify `boot-config` file to point to the desired image file (Section 8.3.1.3).

**Step 4** Start the SSU process (Section 8.3.1.4).

**Step 5** Verify that the upgrade was successful (Section 8.3.1.5).

8.3.1.1 Prepare the Switch

Preparation of the switch for SSU includes:

- Backing Up Critical Software
- Making Room on the Flash Drive
- Verifying Connectivity
- Verifying Configuration
- Configuring BGP
Back up Critical Software

Before upgrading the EOS image, ensure that copies of the currently running EOS version and the running-config file are available in case of corruption during the upgrade process. To copy the running-config file, use the copy running-config command. In this example, running-config is copied to a file in the flash drive on the switch.

switch# copy running-config flash:/cfg_06162014
Copy completed successfully.
switch#

Making Room on the Flash Drive

Determine the size of the new EOS image. Then verify that there is enough space available on the flash drive for two copies of this image, plus a recommended 240MB (if available) for diagnostic information in case of a fatal error. Use the dir command to check the “bytes free” figure.

switch# dir flash:
Directory of flash: /
-rwx 293168526 Nov 4 22:17 EOS4.11.0.swi
-rwx 36 Nov 8 10:24 boot-config
-rwx 37339 Jun 16 14:18 cfg_06162014

606638080 bytes total (602841088 bytes free)

Verifying Connectivity

Ensure that the switch has a management interface configured with an IP addresses and default gateway (see Assigning an IP Address to a Specific Ethernet Management Port and Configuring a Default Route to the Gateway), and confirm that it can be reached through the network by using the show interfaces status command and pinging the default gateway.

switch# show interfaces status
Port Name Status Vlan Duplex Speed Type
Et3/1 notconnect 1 auto auto 1000BASE-T

<--------OUTPUT OMITTED FROM EXAMPLE--------->

Mai/1 connected routed unconf unconf Unknown

switch# ping 1.1.1.10
PING 172.22.26.1 (172.22.26.1) 72(100) bytes of data.
80 bytes from 1.1.1.10: icmp_seq=1 ttl=64 time=0.180 ms
80 bytes from 1.1.1.10: icmp_seq=2 ttl=64 time=0.076 ms
80 bytes from 1.1.1.10: icmp_seq=3 ttl=64 time=0.084 ms
80 bytes from 1.1.1.10: icmp_seq=4 ttl=64 time=0.073 ms
80 bytes from 1.1.1.10: icmp_seq=5 ttl=64 time=0.071 ms
Verifying Configuration

Verify that the switch configuration is valid for SSU by using the `show reload hitless` command. If parts of the configuration are blocking execution of SSU, an error message will be displayed explaining what they are. For SSU to proceed, the configuration conflicts must be corrected before issuing the `reload hitless` command.

```
switch#show reload hitless
switch#'reload hitless' cannot proceed due to the following:
  Spanning-tree portfast is not enabled for one or more ports
  Spanning-tree BPDU guard is not enabled for one or more ports
switch#
```

Configuring BGP

For hitless restart of BGP and MP-BGP, BGP graceful restart must first be enabled using the `graceful-restart` command. The default restart time value (300 seconds) is appropriate for most configurations.

The BGP configuration mode in which the `graceful-restart` command is issued determines which BGP connections will restart gracefully.

- For all BGP connections, use the `graceful-restart` command in BGP configuration mode:
  ```
  switch#config
  switch(config)#router bgp 64496
  switch(config-router-bgp)#graceful-restart
  switch(config-router-bgp)#
  ```

- For all BGP connections in a specific VRF, use the `graceful-restart` command in BGP VRF configuration mode:
  ```
  switch#config
  switch(config)#router bgp 64496
  switch(config-router-bgp)#vrf purple
  switch(config-router-bgp-vrf-purple)#graceful-restart
  switch(config-router-bgp-vrf-purple)#exit
  switch(config-router-bgp)#
  ```

- For all BGP connections in a specific BGP address family, use the `graceful-restart` command in BGP address-family configuration mode:
  ```
  switch#config
  switch(config)#router bgp 64496
  switch(config-router-bgp)#address-family ipv6
  switch(config-router-bgp-af)#graceful-restart
  switch(config-router-bgp-af)#exit
  switch(config-router-bgp)#
  ```

BGP graceful restart can also be configured for a specific interface.

8.3.1.2 Transfer the Image File

The target image must be copied to the file system on the switch, typically onto the flash drive. After verifying that there is space for two copies of the image plus an optional 240MB for diagnostic information, use the `copy` command to copy the image to the flash drive, then confirm that the new image file has been correctly transferred.

These command examples transfer an image file to the flash drive from various locations.
USB Memory

Command

```
copy usb1:/sourcefile flash:/destfile
```

Example

```
Sch#copy usb1:/EOS-4.14.4.swi flash:/EOS-4.14.4.swi
```

FTP Server

Command

```
copy ftp:/ftp-source/sourcefile flash:/destfile
```

Example

```
Sch#copy ftp:/user:password@10.0.0.3/EOS-4.14.4.swi flash:/EOS-4.14.4.swi
```

SCP

Command

```
copy scp://scp-source/sourcefile flash:/destfile
```

Example

```
sch#copy scp://user@10.1.1.8/user/EOS-4.14.4.swi flash:/EOS-4.14.4.swi
```

HTTP

Command

```
copy http://http-source/sourcefile flash:/destfile
```

Example

```
```

Once the file has been transferred, verify that it is present in the directory, then confirm the MD5 checksum using the `verify` command. The MD5 checksum is available from the EOS download page of the Arista website.

```
switch#dir flash:
Directory of flash:/
-rwx 293168526 Nov 4 22:17 EOS4.14.2.swi
-rwx 36 Nov 8 10:24 boot-config
-rwx 37339 Jun 16 14:18 cfg_06162014
-rwx 394559902 May 30 02:57 EOS-4.13.1.swi
<--------OUTPUT OMITTED FROM EXAMPLE-------->
```

```
606638080 bytes total (208281186 bytes free)
```

```
switch#53#verify /md5 flash:EOS-4.14.4.swi
```

```
verify /md5 (flash:EOS-4.14.4.swi) =c277a965d0ed48534de6647b12a86991
```

8.3.1.3 Modify boot-config

After transferring and confirming the desired image file, use the `boot system` command to update the `boot-config` file to point to the new EOS image.
This command changes the `boot-config` file to point to the image file located in flash memory at EOS-4.14.4.swi.

```
switch#configure terminal
switch(config)#boot system flash:/EOS-4.14.4.swi
```

Use the `show boot-config` command to verify that the boot-config file is correct:

```
switch(config)#show boot-config
Software image: flash:/EOS-4.14.4.swi
Console speed: (not set)
Aboot password (encrypted): $1$ap1QMbmz$DTqsFyeauuMSa7/Qxbi211
```

Save the configuration to the `startup-config` file with the `write` command.

```
switch#write
```

### 8.3.1.4 Start the SSU Process

After updating the `boot-config` file, verify that your configuration supports SSU (if you have not already done so) by using the `show reload hitless` command. If parts of the configuration are blocking execution of SSU, an error message will be displayed explaining what they are.

```
switch#show reload hitless
switch#'reload hitless' cannot proceed due to the following:
  Spanning-tree portfast is not enabled for one or more ports
  Spanning-tree BPDU guard is not enabled for one or more ports
```

Then start the SSU process using the `reload hitless` command to reload the switch and activate the new image. The CLI will identify any changes that must be made to the configuration before starting SSU, prompt to save any modifications to the system configuration, and request confirmation before reloading.

```
switch#reload hitless
System configuration has been modified. Save? [yes/no/cancel/diff]: y
Copy completed successfully.
Proceed with reload? [confirm] y
```

**Important!** Any configuration changes must be saved for SSU to continue. However, once the upgrade has begun, no changes should be made to the configuration until the “LAUNCHER-6-BOOT_STATUS: 'reload hitless' reconciliation complete.” syslog message has been generated by the switch.

### 8.3.1.5 Verify Success of the Upgrade

Before making any configuration changes to the switch after reload, verify that the SSU process is complete using the command `show boot stages log`. If the process is complete, the last message should be “Asu Hitless boot stages complete.”

```
switch#show boot stages log
Timestamp          Delta Begin Msg
2015-03-28 15:18:30 000.000000 Asu Hitless boot stages started
2015-03-28 15:18:30 000.069732 stage CriticalAgent started
2015-03-28 15:18:30 000.069811   event CriticalAgent:SuperServer completed
2015-03-28 15:20:20 110.225439 Asu Hitless boot stages complete
```

Completion of the SSU process may also be verified by checking the syslog for the following message:

```
LAUNCHER-6-BOOT_STATUS: 'reload hitless' reconciliation complete
```
To verify whether the SSU upgrade was successful, use the `show reload cause` command. If a fatal error occurred during the upgrade process, the switch will have completely rebooted and the fatal error will be displayed along with the directory in which diagnostic information can be found. If the SSU upgrade succeeded, it will read “Hitless reload requested by the user.”

**Fatal Error Display**

```
switch#show reload cause
Reload Cause 1:
-------------------
Reload requested by the user.

Reload Time:
------------
Reload occurred at Sat Feb 28 02:34:26 2015 PST.

Recommended Action:
-------------------
No action necessary.

Debugging Information:
----------------------
None available.

Reload Cause 2:
-------------------
Fatal error during 'reload hitless'. (stageMgr - LinkStatusUpdate timed out)

Reload Time:
------------
Reload occurred at Sat Feb 28 02:33:54 2015 PST.

Recommended Action:
-------------------
A fatal error occurred during hitless reload.
If the problem persists, contact your customer support representative.

Debugging Information:
----------------------
/mnt/flash/persist/fatalError-2015-02-28_023355
```

switch#
Successful Upgrade Display

switch#show reload cause
Reload Cause 1:
-------------------
Hitless reload requested by the user.

Reload Time:
------------
Reload occurred at Wed Mar 25 14:49:04 2015 PDT.

Recommended Action:
-------------------
No action necessary.

Debugging Information:
----------------------
None available.

switch#

The `show version` command will confirm whether the correct image is loaded. The `Software image version` line displays the version of the active image file.

switch#show version
Arista DCS-7050QX-32-F
Hardware version: 02.00
Serial number: JPE14071098
System MAC address: 001c.7355.556f

Software image version: 4.14.5F-2353054.EOS4145F
Architecture: i386
Internal build version: 4.14.5F-2353054.EOS4145F
Internal build ID: e8748ea7-916d-4217-878f-4bfe2adc7122

Uptime: 4 minutes
Total memory: 3981328 kB
Free memory: 1342408 kB

switch#

**Important!** If a fatal error occurs during the SSU process, the new EOS image will still be loaded and booted.
8.4 Standard Upgrades and Downgrades

Standard software upgrades and downgrades on Arista switches are accomplished by installing a different EOS image and reloading the switch. On switches with redundant supervisors, the EOS image must be installed on both supervisors. Using the procedure described below will minimize packet loss during a standard upgrade or downgrade.

These sections describe standard switch upgrade and downgrade procedures:
- Section 8.4.1: Upgrading or Downgrading the EOS on a Single-Supervisor Switch
- Section 8.4.2: Upgrading or Downgrading the EOS on a Dual-Supervisor Switch

8.4.1 Upgrading or Downgrading the EOS on a Single-Supervisor Switch

Modifying the active EOS image is a five-step process:
- **Step 1** Prepare switch for upgrade (Prepare the Switch).
- **Step 2** Transfer image file to the switch (Transfer the Image File). (Not required if desired file is on the switch).
- **Step 3** Modify `boot-config` file to point to the desired image file (Modify boot-config).
- **Step 4** Reload switch (Reload).
- **Step 5** Verify that switch is running the new image (Verify).

8.4.1.1 Prepare the Switch

Before upgrading the EOS image, ensure that backup copies of the currently running EOS version and the `running-config` file are available in case of corruption during the upgrade process. To copy the `running-config` file, use the `copy running-config` command. In this example, `running-config` is copied to a file in the flash drive on the switch.

```
switch# copy running-config flash:/cfg_06162014
Copy completed successfully.
```

Determine the size of the new EOS image and verify that there is enough space available for two copies of it on the flash drive, using the `dir` command to check the “bytes free” figure. The EOS boot process makes a copy of the .swi image file to the internal flash, and the switch will boot to the Aboot prompt if there is insufficient room for both copies.

```
switch# dir flash:/
Directory of flash:/
-rwx 293168526 Nov 4 22:17 EOS4.11.0.swi
-rwx 36 Nov 8 10:24 boot-config
-rwx 37339 Jun 16 14:18 cfg_06162014

<-------OUTPUT OMITTED FROM EXAMPLE------->
```

606638080 bytes total (602841088 bytes free)

Ensure that the switch has a management interface configured with an IP addresses and default gateway (see Assigning an IP Address to a Specific Ethernet Management Port and Configuring a Default Route to the Gateway), and confirm that it can be reached through the network by using the
**show interfaces status** command and pinging the default gateway. To configure a virtual IP address to access the active supervisor on a modular switch, see also Assigning a Virtual IP Address to Access the Active Ethernet Management Port.

```
switch#show interfaces status
Port  Name  Status  Vlan  Duplex  Speed  Type
Et3/1  notconnect  1  auto  auto  1000BASE-T

<--------OUTPUT OMITTED FROM EXAMPLE-------->
Ma1/1  connected  routed  unconf  unconf  Unknown
```

```
switch#ping 1.1.1.10
PING 172.22.26.1 (172.22.26.1) 72(100) bytes of data.
80 bytes from 1.1.1.10: icmp_seq=1 ttl=64 time=0.180 ms
80 bytes from 1.1.1.10: icmp_seq=2 ttl=64 time=0.076 ms
80 bytes from 1.1.1.10: icmp_seq=3 ttl=64 time=0.084 ms
80 bytes from 1.1.1.10: icmp_seq=4 ttl=64 time=0.073 ms
80 bytes from 1.1.1.10: icmp_seq=5 ttl=64 time=0.071 ms
```

### 8.4.1.2 Transfer the Image File

The target image must be copied to the file system on the switch, typically onto the flash drive. After verifying that there is space for the image, use the CLI **copy** command to copy the image to the flash drive, then confirm that the new image file has been correctly transferred.

These command examples transfer an image file to the flash drive from various locations.

**USB Memory**

Command

```
copy usb1:/sourcefile flash:/destfile
```

Example

```
Sch#copy usb1:/EOS-4.13.2.swi flash:/EOS-4.13.2.swi
```

**FTP Server**

Command

```
copy ftp:/ftp-source/sourcefile flash:/destfile
```

Example

```
sch#copy ftp:/user:password@10.0.0.3/EOS-4.13.2.swi flash:/EOS-4.13.2.swi
```

**SCP**

Command

```
copy scp://scp-source/sourcefile flash:/destfile
```

Example

```
sch#copy scp://user:password@10.1.1.8/user/EOS-4.13.2.swi flash:/EOS-4.13.2.swi
```

**HTTP**

Command

```
copy http://http-source/sourcefile flash:/destfile
```
Example

sch#copy http://10.0.0.10/EOS-4.13.2.swi flash:/EOS-4.13.2.swi

Once the file has been transferred, verify that it is present in the directory, then confirm the MD5 checksum using the verify command. The MD5 checksum is available from the EOS download page of the Arista website.

switch#dir flash:
Directory of flash:/
-rwx 293168526 Nov 4 22:17 EOS4.11.0.swi
-rwx 36 Nov 8 10:24 boot-config
-rwx 37339 Jun 16 14:18 cfg_06162014
-rwx 394559902 May 30 02:57 EOS-4.12.2.swi

verify /md5 flash:EOS-4.13.2.swi
verify /md5 (flash:EOS-4.13.2.swi) =c277a965d0ed48534de6647b12a86991

8.4.1.3 Modify boot-config

After transferring and confirming the desired image file, use the boot system command to update the boot-config file to point to the new EOS image.

This command changes the boot-config file to point to the image file located in flash memory at EOS-4.12.2.swi.

switch#configure terminal
switch(config)#boot system flash:/EOS-4.13.2.swi

Use the show boot-config command to verify that the boot-config file is correct:

switch(config)#show boot-config
Software image: flash:/EOS-4.13.2.swi
Console speed: (not set)
Aboot password (encrypted): $1$ap1QMbmz$DTqsFYeauuMSa7Qxbi211

Save the configuration to the startup-config file with the write command.

switch#write

8.4.1.4 Reload

After updating the boot-config file, reset the switch to activate the new image. The reload command resets the switch, resulting in temporary downtime and packet loss on single supervisor switches.

When reloading from the console port, all rebooting messages are displayed on the terminal. From any port except the console, the CLI displays this text:

switch#reload
The system is going down for reboot NOW!

Important! The EOS boot process makes a copy of the .swi image file in the internal flash while booting, so sufficient space for two copies must be present when loading the new EOS image. If the switch is reloaded without adequate space on the flash drive, it will boot to the Aboot prompt from which you can delete files from /mnt/flash to free up additional space. Exiting Aboot will begin the boot process again.
8.4.1.5 Verify

After the switch finishes reloading, log into the switch and use the `show version` command to confirm the correct image is loaded. The **Software image version** line displays the version of the active image file.

```
switch#show version
Arista DCS-7150S-64-CL-F
Hardware version: 01.01
Serial number: JPE13120819
System MAC address: 001c.7326.fd0c

Software image version: 4.13.2F
Architecture: i386
Internal build version: 4.13.2F-1649184.4132F.2
Internal build ID: eeb3c212-b4bd-4c19-ba34-1b0aa36e43f1

Uptime: 14 hours and 48 minutes
Total memory: 4017088 kB
Free memory: 1569760 kB
```

8.4.2 Upgrading or Downgrading the EOS on a Dual-Supervisor Switch

Modifying the active EOS image is a four-step process:

**Step 1** Prepare switch for upgrade (*Prepare the Switch*).

**Step 2** Transfer image file to primary supervisor (*Transfer the Image File to the Primary Supervisor*). (Not required if desired file is on switch)

**Step 3** Use the `install` command to install the new EOS image and update `boot-config` (*Install the New EOS Image*).

**Step 4** Verify that the switch is running the new image (*Verify the New Image*).

**Important!** Due to a change in the supervisor heartbeat timeout, booting one supervisor with a post-SSO image (version 4.10.0-SSO, 4.11.X and later) while the other supervisor is running a pre-SSO image will cause the supervisor running the pre-SSO image to reload. This will cause a disruption as both supervisors will be inactive for a short time. To minimize downtime, upgrade the images on both supervisors and reload the entire chassis using the `install` command.

8.4.2.1 Prepare the Switch

To prepare the switch for an EOS upgrade, take the following steps:

- Back up essential files.
- Ensure that you are logged in to the primary supervisor.
- Ensure that the primary supervisor is reachable and that the management interfaces are configured.
- Ensure that there is enough room on both supervisors for the new image file.
- Ensure that any extensions running on the active supervisor are also available on the standby.
Before upgrading the EOS image, ensure that backup copies of the currently running EOS version and the `running-config` file are available in case of corruption during the upgrade process. To copy the `running-config` file, use the `copy running-config` command. In this example, `running-config` is being copied to a file called “backup2” on the flash drive.

```
switch#copy running-config backup2
switch#
```

Ensure that you are logged in to the primary supervisor, not the standby. Use the `show redundancy status` command, and verify that `my state` reads “ACTIVE” and not “STANDBY.”

```
switch#show redundancy status
my state = ACTIVE
peer state = STANDBY HOT
  Unit = Secondary
  Unit ID = 1

Redundancy Protocol (Operational) = Stateful Switchover
Redundancy Protocol (Configured) = Stateful Switchover
Communications = Up
Ready for switchover

  Last switchover time = 25 days, 19:51:34 ago
  Last switchover reason = Other supervisor stopped sending heartbeats
```

Ensure that both supervisors have a management interface configured with an IP address and default gateway (see Assigning a Virtual IP Address to Access the Active Ethernet Management Port and Configuring a Default Route to the Gateway), and confirm that both management interfaces are in the up state and can ping the default gateway by using the `show interfaces status` command and `ping` command.

```
switch#show interfaces status
Port Name Status Vlan Duplex Speed Type
Et3/1 notconnect 1 auto auto 1000BASE-T
Ma1/1 connected routed unconf unconf Unknown
Ma2/1 connected routed a-full a-100M 10/100/1000

switch#ping 1.1.1.10
PING 172.22.26.1 (172.22.26.1) 72(100) bytes of data.
80 bytes from 1.1.1.10: icmp_seq=1 ttl=64 time=0.180 ms
80 bytes from 1.1.1.10: icmp_seq=2 ttl=64 time=0.076 ms
80 bytes from 1.1.1.10: icmp_seq=3 ttl=64 time=0.084 ms
80 bytes from 1.1.1.10: icmp_seq=4 ttl=64 time=0.073 ms
80 bytes from 1.1.1.10: icmp_seq=5 ttl=64 time=0.071 ms
```

Determine the size of the new EOS image and verify that there is space available for it on the flash drive of both supervisors, using the `dir` command to check the “bytes free” figure.
Primary supervisor:

```
switch#dir flash:
Directory of flash:/
-rwx 293168526 Nov 4 22:17 EOS4.11.0.swi
-rwx 36 Nov 8 10:24 boot-config
-rwx 37339 Jun 16 14:18 cfg_06162014
```

606638080 bytes total (602841088 bytes free)

Standby supervisor:

```
switch#dir supervisor-peer:mnt/flash/
Directory of flash:/
-rwx 293168526 Nov 4 22:17 EOS4.11.0.swi
-rwx 36 Nov 8 10:24 boot-config
-rwx 37339 Jun 16 14:18 cfg_06162014
```

606638080 bytes total (602841088 bytes free)

And, finally, ensure that any extensions running on the primary supervisor are also available on the secondary supervisor.

8.4.2.2 Transfer the Image File to the Primary Supervisor

Load the desired image to the file system on the primary supervisor, typically into the flash. Use the CLI `copy` command to load files to the flash on the primary supervisor, then confirm that the new image file has been correctly transferred.

These command examples transfer an image file to flash from various locations.

**USB Memory**

**Command**

```
copy usb1:/sourcefile flash:/destfile
```

**Example**

```
Sch#copy usb1:/EOS-4.13.2.swi flash:/EOS-4.13.2.swi
```

**FTP Server**

**Command**

```
copy ftp:/ftp-source/sourcefile flash:/destfile
```

**Example**

```
Sch#copy ftp://user:password@10.0.0.3/EOS-4.13.2.swi flash:/EOS-4.13.2.swi
```

**SCP**

**Command**

```
copy scp://scp-source/sourcefile flash:/destfile
```
Chapter 8: Upgrades and Downgrades

Standard Upgrades and Downgrades

Example

sch# copy scp://user:password@10.1.1.8/user/EOS-4.13.2.swi flash:/EOS-4.13.2.swi

HTTP

Command

copy http://http-source/sourcefile flash:/destfile

Example

sch# copy http://10.0.0.10/EOS-4.13.2.swi flash:/EOS-4.13.2.swi

Once the file has been transferred, verify that it is present in the directory, then confirm the MD5 checksum using the verify command. The MD5 checksum for each available image can be found on the EOS download page of the Arista website.

switch# dir flash:
Directory of flash:
-rwx 293168526 Nov 4 22:17 EOS4.11.0.swi
-rwx 36 Nov 8 10:24 boot-config
-rwx 37339 Jun 16 14:18 cfg_06162014
-rwx 394559902 May 30 02:57 EOS-4.12.2.swi

<--------OUTPUT OMITTED FROM EXAMPLE-------->

606638080 bytes total (208281186 bytes free)
switch#53# verify /md5 flash:EOS-4.13.2.swi
verify /md5 (flash:EOS-4.13.2.swi) =c277a965d0ed48534de6647b12a86991

8.4.2.3 Install the New EOS Image

Once the EOS image has been copied to the flash drive of the primary supervisor, use the install command to update the boot-config, copy the new image to the secondary supervisor and reload both supervisors. When upgrading to a new image, both supervisors will briefly be unavailable; using the install command minimizes packet loss during reload.

switch(config)# install source EOS-4.13.2.swi reload
Preparing new boot-config... done.
Copying new software image to standby supervisor... done.
Copying new boot-config to standby supervisor... done.
Committing changes on standby supervisor... done.
Reloading standby supervisor... done.
Committing changes on this supervisor... done.
Reloading this supervisor...
8.4.2.4 Verify the New Image

After the switch finishes reloading, log into the switch and use the **show version** command to confirm the correct image is loaded. The **Software image version** line displays the version of the active image file.

```
switch#show version
Arista DCS-7504
Hardware version: 01.01
Serial number: JPE13120819
System MAC address: 001c.7326.fd0c

Software image version: 4.13.2F
Architecture: i386
Internal build version: 4.13.2F-1649184.4132F.2
Internal build ID: eeb3c212-b4bd-4c19-ba34-1b0aa36e43f1

Uptime: 1 hour and 36 minutes
Total memory: 4017088 kB
Free memory: 1473280 kB
```

switch#
8.5 Upgrade/Downgrade Commands

- install
- reload fast-boot
- reload hitless
install

The install command copies the specified EOS image onto the switch (if the source is external), configures the boot-config file to point to the specified EOS image, copies the image to the standby supervisor (on dual-supervisor switches), and optionally reloads the switch to run the new EOS.

Command Mode
Privileged EXEC

Command Syntax
install source source_path [destination destination_path] [now] [reload]

Parameters
- **source_path** file path and name of EOS image. If no file path is specified, the switch will look for the image on the flash drive of the primary supervisor.
- **destination destination_path** destination file path and name of the EOS image. If no destination or name is specified, the EOS image will be stored on the flash drive with its original file name.
- **now** command is executed immediately without further prompts.
- **reload** supervisor is reloaded after the image and updated boot-config file are installed. On dual-supervisor switches, reloads both supervisors, after which control is returned to the primary supervisor.

Example
- This command updates the boot-config file to point to the EOS.swi file on the primary supervisor’s flash drive, copies the image and boot-config file to the secondary supervisor, and reboots both.

  switch(config)#install source EOS.swi reload
  Preparing new boot-config... done.
  Copying new software image to standby supervisor... done.
  Copying new boot-config to standby supervisor... done.
  Committing changes on standby supervisor... done.
  Reloading standby supervisor... done.
  Committing changes on this supervisor... done.
  Reloading this supervisor...
**reload fast-boot**

The `reload fast-boot` command starts the Accelerated Software Upgrade (ASU) process using the EOS image specified by the `boot-config` file (configured by the `boot system` command).

ASU significantly decreases downtime and packet loss during a software upgrade, but the data plane is still restarted after the control plane has loaded, resulting in approximately 30 seconds of downtime. If available, Arista recommends using Smart System Upgrade (SSU) instead.

ASU shortens downtime and minimizes packet loss during EOS upgrades in three ways:

- performing time-intensive tasks (including copying the EOS image) before rebooting the control plane
- forwarding packets in hardware (based on the last known good state) while the control-plane is offline
- optimizing the boot process by performing only tasks essential for software upgrade

**Command Mode**

Privileged EXEC

**Command Syntax**

`reload fast-boot`

**Guidelines**

- ASU is supported only for upgrades (not downgrades).
- ASU is not supported if the EOS upgrade requires an FPGA upgrade.
- Enough free space must be available on the flash drive to store two copies of the target EOS image.

**Example**

- This command starts the Accelerated Software Upgrade process.

```
switch#reload fast-boot
Proceed with reload? [confirm]
```

When the `reload fast-boot` command is entered, the switch sends a message prompting the user to save the configuration if it contains unsaved modifications, then asks the user to confirm the reload request.
**reload hitless**

The *reload hitless* command starts the Smart System Upgrade (SSU) process using the EOS image specified by the *boot-config* file (configured by the *boot system* command).

**Command Mode**

Privileged EXEC

**Command Syntax**

```
reload hitless
```

**Guidelines**

- SSU is supported only for upgrades (not downgrades).
- SSU is not supported if the EOS upgrade requires an FPGA upgrade.
- Enough free space must be available on the flash drive to store two copies of the target EOS image. It is also recommended that an additional 240MB be available to store diagnostic information.

**Example**

- This command starts the SSU process.
  ```
  switch#reload hitless
  Proceed with reload? [confirm]
  
  If there are issues with the current switch configuration that will prevent SSU from being performed, the switch lists the changes that must be made before SSU can begin.
  
  switch#reload hitless
  switch#'reload hitless' cannot proceed due to the following:
  - Spanning-tree portfast is not enabled for one or more ports
  - Spanning-tree BPDU guard is not enabled for one or more ports
  switch#
  
  When the *reload hitless* command is entered, the switch sends a message prompting the user to save the configuration if it contains unsaved modifications, then asks the user to confirm the reload request.
  
  switch#reload hitless
  System configuration has been modified. Save? [yes/no/cancel/diff]:y
  Copy completed successfully.
  Proceed with reload? [confirm]y
Switch Environment Control

The following sections describe the commands that display temperature, fan, and power supply status:

- Section 9.1: Environment Control Introduction
- Section 9.2: Environment Control Overview
- Section 9.3: Configuring and Viewing Environment Settings
- Section 9.4: Environment Commands

The switch chassis, fans, power supplies, line cards, and supervisors also provide LEDs that signal status and conditions that require attention. The Quick Start Guide for the individual switches provides information about their LEDs.

9.1 Environment Control Introduction

Arista Networks switching platforms are designed to work reliably in common data center environments. To ensure their reliable operation and to monitor or diagnose the switch's health, Arista provides a set of monitoring capabilities available through the CLI or SNMP entity MIBs to monitor and diagnose potential problems with the switching platform.

9.2 Environment Control Overview

9.2.1 Temperature

Arista switches include internal temperature sensors. The number and location of the sensors vary with each switch model. Each sensor is assigned temperature thresholds that denote alert and critical conditions. Temperatures that exceed the threshold trigger the following:

- **Alert Threshold**: All fans run at maximum speed and a warning message is logged.
- **Critical Threshold**: The component is shut down immediately and its Status LED flashes orange.

In modular systems, cards are shut down when their temperatures exceed the critical threshold. The switch is shut down if the temperature remains above the critical threshold for three minutes.
9.2.2 Fans

Arista switches include fan modules that maintain internal components at proper operating temperatures. The number and type of fans vary with switch chassis type:

- **Fixed configuration switches** contain hot-swappable independent fans. Fan models with different airflow directions are available. All fans within a switch must have the same airflow direction.

- **Modular switches** contain independent fans that circulate air from front-to-rear panel. Power supplies for modular switches also include fans that cool the power supply and supervisors.

The switch operates normally when one fan is not operating. Non-functioning modules should not be removed from the switch unless they are immediately replaced; adequate switch cooling requires the installation of all components, including a non-functional fan.

Two non-operational fans trigger an *insufficient fan shutdown* condition. Under normal operations, this condition initiates a switch power down procedure.

Fans are accessible from the rear panel.

9.2.2.1 Power

Arista switches contain power supplies which provide power to internal components.

- **Fixed configuration switches** contain two power supplies, providing 1+1 redundancy.

- **Modular switches** contain four power supplies, providing a minimum of 2+2 redundancy.

Power supply LED indicators are visible from the rear panel.
9.3 Configuring and Viewing Environment Settings

9.3.1 Overriding Automatic Shutdown

9.3.1.1 Overheating

The switch can be configured to continue operating during temperature shutdown conditions. Ignoring a temperature shutdown condition is strongly discouraged because operating at high temperatures can damage the switch and void the warranty.

Temperature shutdown condition actions are specified by the environment overheat action command. The switch displays this warning when configured to ignore shutdown temperature conditions.

Switch(config)#environment overheat action ignore

====================================================================
WARNING: Overriding the system shutdown behavior when the system is overheating is unsupported and should only be done under the direction of an Arista Networks engineer. You risk damaging hardware by not shutting down the system in this situation, and doing so without direction from Arista Networks can be grounds for voiding your warranty. To re-enable the shutdown-on-overheat behavior, use the 'environment overheat action shutdown' command.
====================================================================

Switch(config)#

The running-config contains the environment overheat action command when it is set to ignore. When the command is not in running-config, the switch shuts down when an overheating condition exists.

The following running-config file lists the environment overheat action command.

switch#show running-config
! Command: show running-config
! device: switch (DCS-7150S-64-CL, EOS-4.13.2F)

ip route 0.0.0.0/0 10.255.255.1
!
environment overheat action ignore
!
!
end
switch#

9.3.1.2 Insufficient Fans

The switch can be configured to ignore the insufficient fan shutdown condition. This is strongly discouraged because continued operation without sufficient cooling may lead to a critical temperature condition that can damage the switch and void the warranty.
Insufficient-fans shutdown override is configured by the `environment insufficient-fans action` command. The switch displays this warning when configured to ignore insufficient-fan conditions.

```
switch(config)#environment insufficient-fans action ignore
```

WARNING: Overriding the system shutdown behavior when the system has insufficient fans inserted is unsupported and should only be done under the direction of an Arista Networks engineer. You risk damaging hardware by not shutting down the system in this situation, and doing so without direction from Arista Networks can be grounds for voiding your warranty. To re-enable the shutdown-on-overheat behavior, use the 'environment insufficient-fans action shutdown' command.

```
switch(config)#
```

The `running-config` contains the `environment insufficient-fans action` command when it is set to `ignore`. When `running-config` does not contain this command, the switch shuts down when it detects an insufficient-fans condition.

### 9.3.1.3 Fan Speed

The switch can be configured to override the automatic fan speed. The switch normally controls the fan speed to maintain optimal operating temperatures. The fans can be configured to operate at a constant speed regardless of the switch temperature conditions.

Fan speed override is configured by the `environment fan-speed` command. The switch displays this warning when its control of fan speed is overridden.

```
switch(config)#environment fan-speed override 50
```

WARNING: Overriding the system fan speed is unsupported and should only be done under the direction of an Arista Networks engineer. You can risk damaging hardware by setting the fan speed too low and doing so without direction from Arista Networks can be grounds for voiding your warranty. To set the fan speed back to automatic mode, use the 'environment fan-speed auto' command.

```
switch(config)#
```

The `running-config` contains the `environment fan-speed override` command if it is set to override. When `running-config` does not contain this command, the switch controls the fan speed.
Chapter 9: Switch Environment Control

Configuring and Viewing Environment Settings

9.3.2 Viewing Environment Status

9.3.2.1 Temperature Status

To display internal temperature sensor status, enter `show environment temperature`.

```
switch> show environment temperature
System temperature status is: Ok
```

System temperature status is the first line that the command displays. System temperature status values indicate the following:

- **Ok**: All sensors report temperatures below the alert threshold.
- **Overheating**: At least one sensor reports a temperature above its alert threshold.
- **Critical**: At least one sensor reports a temperature above its critical threshold.
- **Unknown**: The switch is initializing.
- **Sensor Failed**: At least one sensor is not functioning.

<table>
<thead>
<tr>
<th>Sensor</th>
<th>Description</th>
<th>Temperature</th>
<th>Alert</th>
<th>Critical</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Front-panel temp sensor</td>
<td>22.000C</td>
<td>65C</td>
<td>75C</td>
</tr>
<tr>
<td>2</td>
<td>Fan controller 1 sensor</td>
<td>23.000C</td>
<td>75C</td>
<td>85C</td>
</tr>
<tr>
<td>3</td>
<td>Fan controller 2 sensor</td>
<td>28.000C</td>
<td>75C</td>
<td>85C</td>
</tr>
<tr>
<td>4</td>
<td>Switch chip 1 sensor</td>
<td>40.000C</td>
<td>105C</td>
<td>115C</td>
</tr>
<tr>
<td>5</td>
<td>VRM 1 temp sensor</td>
<td>48.000C</td>
<td>105C</td>
<td>110C</td>
</tr>
</tbody>
</table>

```

9.3.2.2 Fans

The `show system environment cooling` command displays the cooling and fan status.

**Example**

```
switch> show system environment cooling
System cooling status is: Ok
Ambient temperature: 22C
Airflow: port-side-intake
Fan Tray Status Speed
--------- --------------- -----
1         Ok            35%
2         Ok            35%
3         Ok            35%
4         Ok            35%
5         Ok            35%
switch>
```

9.3.2.3 Power

The `show environment power` command displays the status of the power supplies.
Example

- This command displays the status of the power supplies:

  ```
  switch> show environment power
  Power Supply Model               Capacity Input Current Output Current Power Status
  -------- ------------------------ --------- -------- -------- -------- --------------
  1        PWR-650AC              650W    0.44A   10.50A   124.0W Ok
  Switch>
  ```

9.3.2.4 System Status

The `show system environment all` command lists the temperature, cooling, fan, and power supply information that the individual `show environment` commands display, as described in Section 9.3.2.1, Section 9.3.2.2, and Section 9.3.2.3.

Example

- This command displays the temperature, cooling, fan, and power supply status:

  ```
  switch> show system environment all
  System temperature status is: Ok
  Alert    Critical
  Sensor   Description                            Temperature  Threshold  Threshold
  -------  ---------------------------------------- ------------- ---------- ----------
  1        Front-panel temp sensor              22.750C        65C        75C
  2        Fan controller 1 sensor              24.000C        75C        85C
  3        Fan controller 2 sensor              29.000C        75C        85C
  4        Switch chip 1 sensor                 41.000C       105C       115C
  5        VRM 1 temp sensor                   49.000C       105C       110C
  System cooling status is: Ok
  Ambient temperature: 22C
  Airflow: port-side-intake
  Fan Tray Status Speed
  -------           ------
  1                Ok     35%
  2                Ok     35%
  3                Ok     35%
  4                Ok     35%
  5                Ok     35%
  Power Supply Model               Capacity Input Current Output Current Power Status
  -------- ------------------------ --------- -------- -------- -------- --------------
  1        PWR-650AC              650W    0.44A   10.50A   124.0W Ok
  ```

9.3.3 Locating Components on the Switch

When a component requires service, the switch administrator may use the `locator-led` command to assist a technician in finding the component. The command causes the status LED on the specified component to flash, and also displays a “service requested” message on the LCD panel of modular switches or lights the blue locator light on the front of fixed switches. Use the `show locator-led` command to display all locator LEDs currently enabled on the switch.
Examples

- This command enables the locator LED on fan tray 3:

  ```
  switch#locator-led fantray 3
  Enabling locator led for FanTray3
  switch#
  ```

- This command displays all locator LEDs enabled on the switch:

  ```
  switch#show locator-led
  There are no locator LED enabled
  switch#
  ```
9.4 Environment Commands

Environment Control Configuration Commands
- `environment fan-speed`
- `environment insufficient-fans action`
- `environment overheat action`
- `locator-led`

Environment Display Commands
- `show environment power`
- `show environment temperature`
- `show locator-led`
- `show system environment all`
- `show system environment cooling`
environment fan-speed

The `environment fan-speed` command determines the method of controlling the speed of the switch fans. The switch automatically controls the fan speed by default.

The switch normally controls the fan speed to maintain optimal operating temperatures. The fans can be configured to operate at a constant speed regardless of the switch temperature conditions.

The `no environment fan-speed` and `default environment fan-speed` commands restore the default action of automatic fan-speed control by removing the `environment fan-speed override` statement from `running-config`.

**Important!** Overriding the system fan speed is unsupported and should only be done under the direction of an Arista Networks engineer. You can risk damaging hardware by setting the fan speed too low. Doing so without direction from Arista Networks can be grounds for voiding your warranty.

**Command Mode**
Global Configuration

**Command Syntax**
```
environment fan-speed ACTION
no environment fan-speed
default environment fan-speed
```

**Parameters**
- **ACTION**  
  fan speed control method. Valid settings include:
  - **auto**  
    fan speed is controlled by the switch.
    This option restores the default setting by removing the `environment fan-speed override` command from `running-config`.
  - **override percent**  
    fan speed is set to the specified percentage of the maximum. Valid `percent` settings range from 30 to 100.

**Examples**
- This command overrides the automatic fan speed control and configures the fans to operate at 50% of maximum speed.
  ```
  switch(config)#environment fan-speed override 50
  ```
  WARNING: Overriding the system fan speed is unsupported and should only be done under the direction of an Arista Networks engineer. You can risk damaging hardware by setting the fan speed too low and doing so without direction from Arista Networks can be grounds for voiding your warranty.
  To set the fan speed back to automatic mode, use the 'environment fan-speed auto' command.
  ```
  switch(config)#
  ```
- This command restores control of the fan speed to the switch.
  ```
  switch(config)#environment fan-speed auto
  ```
environment insufficient-fans action

The environment insufficient-fans command controls the switch response to the insufficient fan condition. By default, the switch initiates a shutdown procedure when it senses insufficient fans.

The switch operates normally when one fan is not operating. Non-functioning modules should not be removed from the switch unless they are immediately replaced; adequate switch cooling requires the installation of all components, including a non-functional fan.

Two non-operational fans trigger an insufficient fan shutdown condition. This condition normally initiates a power down procedure.

The no environment insufficient-fans and default environment insufficient-fans commands restore the default shutdown response to the insufficient-fans condition by removing the environment insufficient-fans action ignore statement from running-config.

Important! Overriding the system shutdown behavior when the system has insufficient fans inserted is unsupported and should only be done under the direction of an Arista Networks engineer. You risk damaging hardware by not shutting down the system in this situation, and doing so without direction from Arista Networks can be grounds for voiding your warranty.

Command Mode
Global Configuration

Command Syntax
environment insufficient-fans action REMEDY
no environment insufficient-fans action
default environment insufficient-fans action

Parameters
- REMEDY configures action when switch senses an insufficient fan condition. Settings include:
  - ignore switch continues operating when insufficient fans are operating.
  - shutdown switch shuts power down when insufficient fans are operating.

The shutdown parameter restores default behavior by removing the environment insufficient-fans command from running-config.

Examples
- This command configures the switch to continue operating after it senses insufficient fan condition.

  switch(config)#environment insufficient-fans action ignore
  =================================================================
  WARNING: Overriding the system shutdown behavior when the system has insufficient fans inserted is unsupported and should only be done under the direction of an Arista Networks engineer. You risk damaging hardware by not shutting down the system in this situation, and doing so without direction from Arista Networks can be grounds for voiding your warranty. To re-enable the shutdown-on-overheat behavior, use the 'environment insufficient-fans action shutdown' command.
  =================================================================

  switch(config)#

- This command configures the switch to shut down when it senses an insufficient fan condition.

  switch(config)#environment insufficient-fans action shutdown
  switch(config)#
**environment overheat action**

The `environment overheat` command controls the switch response to an overheat condition. By default, the switch shuts down when it senses an overheat condition.

**Important!** Overriding the system shutdown behavior when the system is overheating is unsupported and should only be done under the direction of an Arista Networks engineer. You risk damaging hardware by not shutting down the system in this situation, and doing so without direction from Arista Networks can be grounds for voiding your warranty.

Arista switches include internal temperature sensors. The number and location of the sensors vary with each switch model. Each sensor is assigned temperature thresholds that denote alert and critical conditions. Temperatures that exceed the threshold trigger the following:

- **Alert Threshold:** All fans run at maximum speed and a warning message is logged.
- **Critical Threshold:** The component is shut down immediately and its Status LED flashes orange.

In modular systems, cards are shut down when their temperatures exceed the critical threshold. The switch normally shuts down if the temperature remains above the critical threshold for three minutes.

The `no environment overheat action` and `default environment overheat action` commands restore the default shutdown response to the environment overheat condition by removing the `environment overheat action ignore` statement from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
environment overheat action REMEDY
no environment overheat action
default environment overheat action
```

**Parameters**

- **REMEDY** reaction to an overheat condition. Default value is `shutdown`.
  - `shutdown` switch shuts power down by an overheat condition.
  - `ignore` switch continues operating during an overheat condition.

**Examples**

- This command configures the switch to continue operating after it senses an overheat condition.
  ```
switch(config)#environment overheat action ignore
```

WARNING: Overriding the system shutdown behavior when the system is overheating is unsupported and should only be done under the direction of an Arista Networks engineer. You risk damaging hardware by not shutting down the system in this situation, and doing so without direction from Arista Networks can be grounds for voiding your warranty. To re-enable the shutdown-on-overheat behavior, use the 'environment overheat action shutdown' command.

```
switch(config)#
```

- This command configures the switch to shut down when it senses an overheat condition.
  ```
switch(config)#environment overheat action shutdown
switch(config)#
```
locator-led

When a component requires service, the locator-led command activates a locator to assist a technician in finding the component. The command causes the status LED on the specified component to flash, and also displays a "service requested" message on the LCD panel of modular switches or lights the blue locator light on the front of fixed switches. The available locators vary by platform; to see a list of the locator LEDs available on the switch, use the locator-led ? command. To disable the locator LED, use the no locator-led command.

Command Mode
Privileged EXEC

Command Syntax
locator-led {fantray tray_num | interface interface | module module_num | powersupply supply_num}
no locator-led {fantray tray_num | interface interface | module module_num | powersupply supply_num}

Parameters
- fantray tray_num activates locator on specified fan tray.
- interface interface activates locator on specified interface.
- module module_num activates locator on specified module.
- powersupply supply_num activates locator on specified power supply.

Examples
- This command enables the locator LED on fan tray 3.
  switch#locator-led fantray 3
  Enabling locator led for FanTray3
  switch#

- This command disables the locator LED on fan tray 3.
  switch#no locator-led fantray 3
  Disabling locator led for FanTray3
  switch#

- This command displays the locator LEDs available on the switch.
  switch#locator-led ?
  fantray Fan tray LED
  interface Interface LED
  module Module LED
  powersupply Power supply LED
  switch#
show environment power

The `show environment power` command displays the status of all power supplies in the switch.

**Command Mode**

EXEC

**Command Syntax**

`show environment power [INFO_LEVEL]`

**Parameters**

- `INFO_LEVEL` specifies level of detail that the command displays. Options include:
  - `<no parameter>` displays current and power levels for each supply.
  - `detail` also includes status codes that can report error conditions.

**Example**

- This command displays the status of power supplies on the switch.

```
switch>show environment power

Power Supply Model       Capacity Input Current Output Current Output Power Status
----------- -------------- ----------- -------- -------- -------- --------- ------------
1           PWR-760AC    760W       0.81A   11.00A   132.8W   Ok
2           PWR-760AC    760W       0.00A   0.00A    0.0W     AC Loss
switch>
```
show environment temperature

The `show environment temperature` command displays the operating temperature of all sensors on the switch.

**Command Mode**

EXEC

**Command Syntax**

`show environment temperature [MODULE_NAME] [INFO_LEVEL]`

**Parameters**

- **MODULE_NAME** Specifies modules for which data is displayed. This parameter is only available on modular switches. Options include:
  - `<no parameter>` All modules (identical to `all` option).
  - `linecard line_num` Line card module. Number range varies with switch model.
  - `supervisor super_num` Supervisor module. Number range varies with switch model.
  - `mod_num` Supervisor (1 to 2) or line card (3 to 18) module.
  - `all` All modules.
- **INFO_LEVEL** specifies level of detail that the command displays. Options include:
  - `<no parameter>` displays table that lists the temperature and thresholds of each sensor.
  - `detail` displays data block for each sensor listing the current temperature and historic data.

**Display Values**

- **System temperature status** is the first line that the command displays. Values report the following:
  - `Ok` All sensors report temperatures below the alert threshold.
  - `Overheating` At least one sensor reports a temperature above its alert threshold.
  - `Critical` At least one sensor reports a temperature above its critical threshold.
  - `Unknown` The switch is initializing.
  - `Sensor Failed` At least one sensor is not functioning.

**Examples**

- This command displays a table that lists the temperature measured by each sensor.

  ```
  switch>show environment temperature
  System temperature status is: Ok
  Sensor               Description                  Temperature  Alert Threshold  Critical Threshold
  ------------------- ----------------------------- --------------- --------------------- ---------------------
  1                   Front-panel temp sensor     30.750C        65C                 75C
  2                   Fan controller 1 sensor     32.000C        75C                 85C
  3                   Fan controller 2 sensor     38.000C        75C                 85C
  4                   Switch chip 1 sensor        50.000C        105C                115C
  5                   VRM 1 temp sensor           60.000C        105C                110C
  switch>
  ```
This command lists the temperature detected by each sensor, and includes the number of previous alerts, the time of the last alert, and the time of the last temperature change.

```
switch> show environment temperature detail
TempSensor1 - Front-panel temp sensor
  Current State  Count  Last Change
  Temperature    30.750C
  Max Temperature 35.000C  4 days, 23:35:24 ago
  Alert          False  0  never

TempSensor2 - Fan controller 1 sensor
  Current State  Count  Last Change
  Temperature    32.000C
  Max Temperature 36.000C  4 days, 23:32:46 ago
  Alert          False  0  never

TempSensor3 - Fan controller 2 sensor
  Current State  Count  Last Change
  Temperature    38.000C
  Max Temperature 41.000C  4 days, 23:37:56 ago
  Alert          False  0  never

TempSensor4 - Switch chip 1 sensor
  Current State  Count  Last Change
  Temperature    51.000C
  Max Temperature 53.000C  4 days, 23:35:16 ago
  Alert          False  0  never

TempSensor5 - VRM 1 temp sensor
  Current State  Count  Last Change
  Temperature    60.000C
  Max Temperature 62.000C  4 days, 22:54:51 ago
  Alert          False  0  never
```

switch>
**show locator-led**

The `show locator-led` command displays the status of locator LEDs enabled on the switch.

**Command Mode**

Privileged EXEC

**Command Syntax**

```plaintext
show locator-led
```

**Example**

- This command displays all locator LEDs enabled on the switch.

  ```plaintext
  switch#show locator-led
  There are no locator LED enabled
  switch#
  ```
show system environment all

The show system environment all command displays temperature, cooling, and power supply status.

**Command Mode**

EXEC

**Command Syntax**

`show system environment all`

**Examples**

- This command displays the switch’s temperature, cooling, and power supply status

```plaintext
switch>show system environment all
System temperature status is: Ok

<table>

show system environment cooling

The `show system environment cooling` command displays fan status, air flow direction, and ambient temperature on the switch.

Command Mode

EXEC

Command Syntax

```
show system environment cooling [INFO_LEVEL]
```

Parameters

- `INFO_LEVEL` specifies level of detail that the command displays. Options include:
  - `<no parameter>` displays the fan status, air flow direction, and ambient switch temperature.
  - `detail` also displays actual and configured fan speed of each fan.

Display Values

- **System cooling status:**
  - `Ok` no more than one fan has failed or is not inserted.
  - `Insufficient fans` more than one fan has failed or is not inserted. This status is also displayed if fans with different airflow directions are installed. The switch shuts down if the error is not resolved.

- **Ambient temperature** temperature of the surrounding area.

- **Airflow** indicates the direction of the installed fans:
  - `port-side-intake` all fans flow air from the front (port side) to the rear of the chassis.
  - `port-side-exhaust` all fans flow air from the rear to the front (port side) of the chassis.
  - `incompatible fans` fans with different airflow directions are inserted.
  - `Unknown` The switch is initializing.

- **Fan Tray Status** table displays the status and operating speed of each fan. Status values indicate the following conditions:
  - `OK` The fan is operating normally.
  - `Failed` The fan is not operating normally.
  - `Unknown` The system is initializing.
  - `Not Inserted` The system is unable to detect the specified fan.
  - `Unsupported` The system detects a fan that the current software version does not support.
Example

- This command displays the fan status, air flow direction, and ambient switch temperature.

```
switch>show system environment cooling
System cooling status is: Ok
Ambient temperature: 30C
Airflow: port-side-intake

Fan Tray Status Speed
--------- --------------- -----
 1         Ok                 51%
 2         Ok                 51%
 3         Ok                 51%
 4         Ok                 51%
 5         Ok                 51%

switch>
```
Maintenance Mode

This chapter describes configuration for performing maintenance of switch elements.

This chapter contains these sections:

- Section 10.1: Overview
- Section 10.2: Maintenance Mode Elements
- Section 10.3: Maintenance Mode Features
- Section 10.4: Maintenance Mode Configuration
- Section 10.5: Maintenance Mode Commands
10.1 **Overview**

Using maintenance mode, you can perform several maintenance activities such as:

- EOS image upgrade
- Initial configuration or reconfiguration of a production system
- Replacement of hardware
- Changing linecards or transceiver modules
- Replace, reattach, and reroute cables

Maintenance mode uses BGP to divert traffic away from the switch on which the maintenance tasks need to be performed, minimizing traffic impact. You can set the traffic thresholds and time limits at which the switch, or parts of the switch, is considered to be available for maintenance tasks.

Maintenance mode can be activated on a switch at boot-up or during operation. The mode provides the following benefits:

- Rerouting of traffic when the mode is activated during operation and other routes are present
- Replacement of hardware in modular systems or systems with redundant hardware

The switch is placed into maintenance mode, serviced, and then returned to normal operation.
10.2 Maintenance Mode Elements

Maintenance mode elements include **Units, Groups of Interfaces and BGP Peers**, and **Profiles**. Arista Network switches provide maintenance mode operations performed on a fundamental, configurable element, referred to as a Unit. Maintenance mode will quiesce a unit, which places the unit into maintenance mode by gracefully transitioning traffic away from it.

The most common maintenance mode operations such as removing from service an entire switch system or individual components of the switch, including a single linecard, interface, or BGP peer, can be achieved using minimal configuration.

10.2.1 Units

Units are configurable maintenance mode elements that comprise a collection of various groups. In addition, units contain policies which decide whether the member groups should be put into maintenance mode automatically upon boot. Built-in units are configured by default, such as the System unit representing the entire system. All maintenance mode operations are executed at the unit level.

An interface, interface range, and BGP peer (or peer-group) can be directly put under maintenance.

10.2.1.1 Built-in Units

There are various built-in units such as **System** and **Linecard<n>**. Fixed systems contain only one built-in unit called **System**, which comprises the interface group containing all Ethernet interfaces and sub-interfaces; and BGP groups per VRF containing all the peers in the respective VRF.

Modular Systems have both **System** and **Linecard<n>** units. **Linecard<n>** units are present for each linecard which comprises the **Linecard<n>** groups containing all Ethernet interfaces and sub-interfaces of that linecard.
10.2.1.2 User-configured Units

You can also configure customized units containing user-defined groups and policies as shown in the following example. A custom group called BG1 with a custom interface IG1 and a unit profile UP1 is created. The show command displays the details.

```
switch(config)#maintenance
switch(config-maintenance)# unit UNIT1
switch(config-unit-UNIT1)# group bgp BG1
switch(config-unit-UNIT1)# group interface IG1
switch(config-unit-UNIT1)# profile unit UP1
switch(config-unit-UNIT1)# exit
switch(config-maintenance)# show maintenance units
Unit Name: System
  Origin: Built-in
  Status: Not Under Maintenance
  Unit Profile: Default
  Time Since Last State Change: never
  Bgp Groups:
    AllBgpNeighborVrf-default
  Interface Groups:
    AllEthernetInterface
Unit Name: UNIT1
  Origin: User Configured
  Status: Under Maintenance
  Unit Profile: UP1
  Time Since Last State Change: 0:00:08 ago
  Bgp Groups:
    BG1
  Interface Groups:
    IG1
```

10.2.2 Groups of Interfaces and BGP Peers

Maintenance mode group types include the groups for interfaces and BGP peers. Groups are identified by a group name unique to a particular group type.

By default, several built-in groups are available on the device such as linecard groups containing physical interfaces.

10.2.2.1 Built-in Groups

There are several built-in groups such as `AllEthernetInterface`, `Linecard1`, `Linecard2`, etc., `AllBgpNeighborVrf-<vrf_name>`. `AllEthernetInterface` is the built-in interface group which contains all physical Ethernet interfaces and sub-interfaces on the switch, and is a part of System unit. Whereas on modulars `Linecard1`, `Linecard2`, etc., are the built-in groups which contain respective linecard interfaces and sub-interfaces; and are part of the `Linecard1` and `Linecard2` units respectively. `AllBgpNeighborVrf-<vrf_name>` is the built-in BGP group which contains all the BGP peers in that particular VRF.
10.2.2.2 User-defined Groups

The following set of commands sets up a custom group (IG1) of interfaces, which includes physical ports, port-channels and SVIs.

```
switch(config)#group interface IG1
switch(config-group-if-IG1)#interface Ethernet1
switch(config-group-if-IG1)#interface Port-Channel1,20
switch(config-group-if-IG1)#interface Vlan1-20
switch(config-group-if-IG1)#exit
switch(config)#
```

**Note**

User-defined interface groups do not contain sub-interfaces.

The following set of commands sets up a custom group (BG1) of BGP peers.

```
switch(config)#group bgp BG1
switch(config-group-bgp-BG1)#neighbor 10.0.0.1
switch(config-group-bgp-BG1)#neighbor BGP_PG1
switch(config-group-bgp-BG1)#vrf vrf1
switch(config-group-bgp-BG1)#exit
switch(config)#
```

**Note**

BGP groups are specific to VRF.

10.2.3 Profiles

Profiles are configurable maintenance mode elements that define policies for related software or hardware components to carry out maintenance mode operations.

10.2.3.1 Default Profiles

Default profiles are the built-in policies which are applied to groups interface/BGP and unit.

The default profile is used in the absence of an explicit interface/BGP profile associated with the group, or explicit unit profile associated with the unit.

- **Interface Profile**

Default interface profile has rate-monitoring load-interval set to 60 seconds, threshold set to 100 kbps, and shutdown disabled as shown. The max-delay parameter is set to 300 seconds but is not enabled.

```
switch(config-maintenance)#show maintenance profile interface default
Interface Profile: Default
Rate Monitoring:
  load-interval: 60 seconds
  threshold (in/out): 100 kbps
shutdown:
  enabled: no
  max-delay: 300 seconds
```
• **BGP Profile**
  Default BGP profile has route-map with set clauses—set community GSHUT additive and set local-preference 0.

  ```
  switch(config-maintenance)#show maintenance profile bgp default
  Bgp Profile: Default
  Initiator route-map: SystemGenerated
  route-map SystemGenerated permit 10
  Description:
  description System generated initiator route-map
  Match clauses:
  SubRouteMap:
  Set clauses:
  set local-preference 0
  set community GSHUT additive
  ```

• **Unit Profile**
  Default unit profile has on-boot setting disabled.

  ```
  switch(config-maintenance)#show maintenance profiles unit default
  Unit Profile: Default
  On-boot:
  enabled: no
  duration: 300 seconds
  ```

10.2.3.2 **User-defined Profiles**

You can define your own profiles which can be associated to groups or set as default profiles.

**Interface Profile:** The following set of commands sets up an Interface Profile(IP1) with load interval set to 10 seconds, rate-monitoring threshold set to 100kbps and the maximum delay for shutting down the interface set to 100 seconds. The interface will be shutdown with cause maint-down if traffic does not drain below the threshold even after the specified maximum delay period of 100 seconds.

  ```
  switch(config)#maintenance
  switch(config-maintenance)#profile interface IP1
  switch(config-profile-intf-IP1)#rate-monitoring load-interval 10
  switch(config-profile-intf-IP1)#rate-monitoring threshold 100
  switch(config-profile-intf-IP1)#shutdown max-delay 100
  switch(config-profile-intf-IP1)#exit
  switch(config-maintenance)#
  ```

An interface profile can be associated to only interface groups using the following set of commands.

  ```
  switch(config)#group interface IG1
  switch(config-group-if-IG1)#maintenance profile interface IP1
  switch(config-group-if-IG1)#exit
  switch(config)#
  ```

You can set the interface profile as the default interface profile using the following set of commands.

  ```
  switch(config)#maintenance
  switch(config-maintenance)# profile interface IP1 default
  switch(config-maintenance)# exit
  switch(config)#
  ```
Bgp Profile: The following set of commands sets up a BGP profile (BP1) with initiator route-map called RM which will be applied for both inbound and outbound directions.

```
switch(config)#maintenance
switch(config-maintenance)#profile bgp BP1
switch(config-profile-bgp-BP1)#initiator route-map RM inout
switch(config-profile-bgp-BP1)#exit
switch(config-maintenance)#
```

A BGP profile can be associated to both interface and bgp groups using the following commands.

```
switch(config)#group interface IG1
switch(config-group-if-IG1)#maintenance profile bgp BP1
switch(config-group-if-IG1)#exit
switch(config)# group bgp BG1
switch(config-group-bgp-BG1)# maintenance profile bgp BP1
switch(config-group-bgp-BG1)# exit
switch(config)#
```

You can set the bgp profile as the default bgp profile using the following set of commands.

```
switch(config)# maintenance
switch(config-maintenance)# profile bgp BP1 default
switch(config-maintenance)# exit
switch(config)#
```

Unit Profile: The following set of commands sets up a Unit profile (UP1) with on-boot duration of 300 seconds. The unit will enter into maintenance mode at boot-up and exit maintenance mode at the end of 5 minutes (300sec) after boot-up.

```
switch(config-maintenance)#profile unit UP1
switch(config-profile-unit-UP1)#on-boot duration 300
switch(config-profile-unit-UP1)#exit
switch(config-maintenance)#
```

A Unit profile can be associated to a Unit using the following commands.

```
switch(config)# maintenance
switch(config-maintenance)# unit UNIT1
switch(config-unit-UNIT1)# profile unit UP1
switch(config-unit-UNIT1)# exit
switch(config-maintenance)#
```

You can set the Unit profile as the default Unit profile using the following set of commands.

```
switch(config)# maintenance
switch(config-maintenance)# profile unit UP1 default
switch(config-maintenance)# exit
switch(config)#
```
10.3 Maintenance Mode Features

Arista Network switches provide maintenance mode features including rate monitoring, BGP maintenance route map, on-boot maintenance, and EventMgr integration.

10.3.1 Rate Monitoring

Rate monitoring provides a mechanism to monitor traffic on interfaces identified for maintenance. You can set the traffic threshold and a time limit for the interface to be shutdown for maintenance tasks.

A shutdown parameter can be configured in the interface profile that signals the interface to be shutdown after it has entered maintenance mode.

The max-delay parameter specifies the maximum number of seconds to allow for traffic to dissipate from the interface before the interface is shutdown. The default interface profile settings are shown in the output of the `show maintenance profile interface default` command.

**Note**
The exclusive rate monitoring of sub-interfaces is not supported. Sub-interfaces inherit the interface profile from its parent interface. In case of multiple sub-interfaces configured for single parent interface, rate monitoring of parent interface include aggregate values of all respective sub-interfaces.

10.3.2 BGP Maintenance Route Map

Route-maps are used within a BGP maintenance profile to tag the inbound and outbound routes in order to direct traffic away from the unit. The default profile tags the inbound and outbound routes with the global shutdown community. Other methods can be configured under the route-map such as alternate communities, or by using AS_PATH prepend operations.

10.3.3 On-boot Maintenance

There are two ways of placing a unit in maintenance mode on switch boot-up:

- The unit is placed into maintenance mode prior to the switch reboot, and the running-config is saved prior to switch boot-up.
- The on-boot property in the unit maintenance profile specifies that the unit will be placed into maintenance mode as part of boot-up, and remains so for the specified duration.

**Note**
The duration value in the on-boot unit maintenance profile starts as soon as the unit is put into maintenance mode on boot-up.
10.4 Maintenance Mode Configuration

You can configure maintenance mode for the entire device, specific linecards, or any other Unit. You can set up configuration for maintenance mode for the device at boot-up or while it is running.

Note

Explicit maintenance of sub-interfaces is not supported. Sub-interfaces are put into maintenance implicitly in case of built-in unit maintenance and interface maintenance but not in case of user-configured units.

10.4.1 Unit (System, Linecard\textit{n}, etc.) Configuration

Arista Network switches provide the ability to place the switch in maintenance mode, and configuration options for groups, profiles, associating profiles with groups, units, and maintenance mode operations. System is a predefined (built-in) unit on all switches. Built-in groups include AllEthernetInterface, AllBgpNeighborVRF-\textless vrf\textunderscore name\textgreater, and Linecard\textit{n}. Linecard\textit{n} can also be a built-in unit and can be differentiated depending on the command being used as shown.

- switch(config-maintenance)# unit Linecard\textit{n}
- switch(config)# group interface Linecard\textit{n}

Built-in unit System comprises the following groups:

- AllEthernetInterface - a built-in interface group which contains all physical Ethernet interfaces on the switch on a fixed system
- Linecard\textit{n} - a built-in interface group which contains all interfaces for the linecard numbered ‘\textit{n}’ for modular systems
- AllBgpNeighborVRF-\textless vrf\textunderscore name\textgreater - a built-in BGP group which contains all the BGP peers in the named VRF.

For each Linecard ‘\textit{n}’, there is a built-in unit which consists of all the Linecard\textit{n} groups.

By default, the default interface and BGP profiles are applied to the built-in interface and BGP groups and the default built-in unit profile is applied to the built-in unit. You can also configure your own profiles and choose a default.

In the following example, traffic is flowing through multiple switches in the spine to and from one switch to another, when you elect to put one of the Units (entire switch or parts thereof) in the spine switch in maintenance mode. The traffic is then gracefully steered away from the Unit, provided other paths are available. Traffic will continue to flow through the Unit placed into maintenance mode, if no other path is available.
Example

Note
The illustration shows an entire switch as the Unit. You can replace switch with Linecard\(n\) or another relevant Unit as appropriate.

Figure 10-1: Traffic flow pattern between TOR and Core – Before Maintenance

![Figure 10-1: Traffic flow pattern between TOR and Core – Before Maintenance](image)

Figure 10-2: Traffic flow pattern between TOR and Core – After unit on Spine-1 is put into Maintenance

![Figure 10-2: Traffic flow pattern between TOR and Core – After unit on Spine-1 is put into Maintenance](image)

You can see the status of the Unit (System) using the `show maintenance units System` command for the example above before the system is placed into maintenance mode. If the device being placed into maintenance mode is modular and the Unit is a linecard, replace the argument `System` with `Linecard\(n\)` to see the status of the Unit (Linecard\(n\)).

```bash
switch(config)# show maintenance units System
Unit Name: System
  Origin: Built-in
  Status: Not Under Maintenance
  Unit Profile: Default
  Time Since Last State Change: never
  Bgp Groups:
    AllBgpNeighborVrf-default
  Interface Groups:
    AllEthernetInterface
```
You can then place the Unit (System) into maintenance mode and recheck the status using the sequence of commands shown.

```
switch(config-maintenance)# unit System
switch(config-built-in-unit-System)# quiesce
switch(config-built-in-unit-System)# exit
switch(config-maintenance)# show maintenance
Flags:
o - On-boot maintenance
v - Violating traffic threshold
```

<table>
<thead>
<tr>
<th>Unit Name</th>
<th>Status</th>
<th>Time since last change</th>
<th>Flags</th>
</tr>
</thead>
<tbody>
<tr>
<td>System</td>
<td>Under Maintenance</td>
<td>0:02:03 ago</td>
<td></td>
</tr>
</tbody>
</table>

```
switch(config-maintenance)# show ip bgp summary
BGP summary information for VRF default
Router identifier 1.1.1.1, local AS number 101
Neighbor Status Codes: m - Under maintenance
Neighbor         V  AS           MsgRcvd   MsgSent  InQ OutQ  Up/Down State
PfxRcd PfxAcc
m 1.1.1.2          4  100               24        17    0    0 00:00:40 Estab  5      5
m 3.3.3.33         4  102               15        16    0    0 00:06:23 Estab  1      1
```

**Note** The 'o' flag is shown for on-boot maintenance in the `show maintenance` command and the 'm' neighbor status flag in the `show ip bgp summary` command indicates that the peer is in maintenance mode.

### 10.4.2 On-boot Maintenance Mode Configuration

To configure on-boot maintenance, you can use one of two methods:

- Use `quiesce config`
- Use on-boot profile

#### 10.4.2.1 Using `quiesce config`

You must perform the following tasks to place the Unit in maintenance mode on boot-up using the `quiesce` command.

**Step 1** Place the unit into maintenance mode prior to switch reboot using the following commands.

```
switch(config)# maintenance
switch(config-maintenance)# unit System
switch(config-unit-System)# quiesce
switch(config-unit-System)# exit
switch(config-maintenance)# show maintenance
```

<table>
<thead>
<tr>
<th>Unit Name</th>
<th>Status</th>
<th>Time since last change</th>
<th>Flags</th>
</tr>
</thead>
<tbody>
<tr>
<td>System</td>
<td>Under Maintenance</td>
<td>00:01:10 ago</td>
<td></td>
</tr>
</tbody>
</table>

**Step 2** Save the running-config using the following command.

```
switch(config)# copy running-config startup-config
Copy completed successfully
```

`switch(config)#`
**Step 3**  Reload the device.

```
switch(config)# reload
Proceed with reload? [Confirm] Yes
Connection to switch closed.
```

After the device comes up, you must execute the **no quiesce** command for the Unit to come out of maintenance mode. You can check the status of the device after it comes up using the **show maintenance** command.

```
switch# show maintenance
Flags:
  o - On-boot maintenance
  v - Violating traffic threshold

<table>
<thead>
<tr>
<th>Unit Name</th>
<th>Status</th>
<th>Time since last change</th>
<th>Flags</th>
</tr>
</thead>
<tbody>
<tr>
<td>System</td>
<td>Under Maintenance</td>
<td>00:03:10 ago</td>
<td></td>
</tr>
</tbody>
</table>
```

**10.4.2.2 Using on-boot profile:** The on-boot property in the Unit maintenance profile specifies that the Unit will be placed into maintenance mode as part of boot-up for the specified duration. You must perform the following tasks to use this method.

**Step 1**  Check to see if the on-boot maintenance mode is enabled using the **show maintenance profiles unit default**.

```
switch# show maintenance profiles unit default
Unit Profile: Default
On-boot:
  enabled: no
  duration: 300 seconds
```

**Step 2**  Configure an on-boot profile with on-boot enabled and a duration specified. Make this the default Unit profile. The following code example shows the creation of an on-boot duration of 300 seconds in the profile unit UP1

```
switch(config)#maintenance
switch(config-maintenance)#profile unit UP1
switch(config-profile-unit-UP1)#on-boot duration 300
switch(config-profile-unit-UP1)#exit
switch(config-maintenance)#profile unit UP1 default
switch(config-maintenance)#show maintenance profiles unit default
Unit Profile: UP1
  On-boot:
    enabled: yes
    duration: 300 seconds
```

**Step 3**  Save the running-config and reload the device.

```
switch(config)# copy running-config startup-config
Copy completed successfully
switch(config)# reload
Connection to switch closed.
```
Step 4  After the device comes up, execute the `show maintenance` and `show maintenance units System` commands.

```
switch(config)# show maintenance
Flags:
o - On-boot maintenance
v - Violating traffic threshold
Unit Name Status Time since last change Flags
---------------------- ----------------------- -------------------------- -----
System Under Maintenance 00:00:08 ago o
```

switch(config)# show maintenance units System

```
Unit Name: System
Origin: Built-in
Status: Under Maintenance (on-boot)
Unit Profile: UP1
Time Since Last State Change: 0:00:16 ago
Will come out of on-boot Maintenance after 0:04:43
Interface Groups:
  AllEthernetInterface
History:
  2017-01-18 00:44:39  old state: 'maintenanceModeEnter' to new state: 'underMaintenance' 0:00:16 ago
  2017-01-18 00:43:54  old state: 'active' to new state: 'maintenanceModeEnter' 0:01:01 ago
```

The ‘o’ - flag shows that unit System is under maintenance due to on-boot profile. Also, `show maintenance units System` output shows the following - 'Will come out of on-boot Maintenance after 0:04:43', which is the time remaining of the specified duration of 5 minutes.

The Unit will come up in maintenance mode when the device boots up and will exit maintenance mode once the specified duration of 300 seconds in the default profile is completed. The BGP sessions will remain under maintenance for the duration and will resume after the specified duration is over.

10.4.3  Interface-level Maintenance Mode Configuration

To configure the maintenance mode at interface-level, you must perform the following tasks:

Step 1  Configure an interface-level profile (or use a pre-configured one). The following code example creates a user-defined interface profile IP1 with a rate-monitoring load-interval of 100 seconds, a rate-monitoring threshold of 500 kbps and a maximum shutdown delay of 100 seconds.

```
switch(config)# maintenance
switch(config-maintenance)# profile interface IP1
switch(config-maint-if-Et5)# rate-monitoring load-interval 100
switch(config-maint-if-Et5)# rate-monitoring threshold 500
switch(config-maint-if-Et5)# shutdown max-delay 100
```

Step 2  Make the user-defined interface profile IP1 as the default interface profile.

```
switch(config-maintenance)# profile interface IP1 default
```

Step 3  Place the interface into maintenance mode.

```
switch(config)# maintenance
switch(config-maintenance)# interface Ethernet 1
switch(config-maint-if-Et1)# quiesce
```

Step 4  Remove the interface from maintenance mode once the service has been performed.
Example

```
switch(config-maintenance)#interface Ethernet 1
switch(config-maint-if-Et1)#no quiesce
```

Note

If interface Et1 has sub-interfaces (Et1.1, Et1.2,...) with BGP peers on these sub-interfaces, then these sub-interfaces are also placed into maintenance mode. The `show maintenance interface <sub-interface> detail` command displays the maintenance state of sub-interfaces.

10.4.4 Entering Maintenance Mode

Enter configuration commands `unit` and `quiesce` using the `maintenance profile bgp` mode command to place the switch into maintenance mode. The following code sequence places unit foo, the interface 3/3, and BGP 1.1.1.1 in maintenance mode.

Example

```
switch(config)#maintenance
switch(config-maintenance)#unit foo
switch(config-unit-foo)#quiesce
switch(config-unit-foo)#exit
switch(config-maintenance)#interface ethernet 3/3
switch(config-maint-if-Et3/3)#quiesce
switch(config-unit-if-Et3/3)#exit
switch(config-maintenance)#bgp 1.1.1.1
switch(config-maint-bgp-1.1.1.1)#quiesce
switch(config-maint-bgp-1.1.1.1)#exit
switch(config-maintenance)#
```

10.4.5 Exiting Maintenance Mode

Enter configuration commands `unit` and `no quiesce` using the `maintenance profile bgp` mode command for the switch to exit maintenance mode. The following code sequence causes unit foo, the interface 3/3, and BGP 1.1.1.1 to exit maintenance mode.

Example

```
switch(config)#maintenance
switch(config-maintenance)#unit foo
switch(config-unit-foo)#no quiesce
switch(config-unit-foo)#exit
switch(config-maintenance)#interface ethernet 3/3
switch(config-maint-if-Et3/3)#no quiesce
switch(config-unit-if-Et3/3)#exit
switch(config-maintenance)#bgp 1.1.1.1
switch(config-maint-bgp-1.1.1.1)#no quiesce
switch(config-maint-bgp-1.1.1.1)#exit
switch(config-maintenance)#
```

10.4.6 Configuring Event Handlers

Enter configuration options for the `show maintenance` command to fire at different stages while entering or exiting maintenance mode.
Chapter 10: Maintenance Mode

10.4.7 Configuring Groups

Enter the maintenance mode configuration options for groups with the maintenance and group bgp commands.

Example for group interface IG1

```
switch(config)#group interface IG1
switch(config-group-if-IG1)#interface Ethernet1
switch(config-group-if-IG1)#interface Port-Channel1,20
switch(config-group-if-IG1)#interface Vlan1-20
switch(config-group-if-IG1)#exit
switch(config)#
```

Example for group bgp BG1

```
switch(config)#group bgp BG1
switch(config-group-bgp-BG1)#neighbor 10.0.0.1
switch(config-group-bgp-BG1)#neighbor BGP_PG1
switch(config-group-bgp-BG1)#vrf vrf1
switch(config-group-bgp-BG1)#exit
switch(config)#
```

Note

BGP groups are specific to VRF.

10.4.8 Configuring Profiles

Enter the maintenance mode configuration options for profiles with the profile interface, rate-monitoring threshold, profile bgp, and profile unit <profile_name> commands.

These command examples assign a user configured profile as the default profile.
Example for profile interface IP1

```
switch(config)#maintenance
switch(config-maintenance)#profile interface IP1
switch(config-profile-intf-IP1)#rate-monitoring load-interval 10
switch(config-profile-intf-IP1)#rate-monitoring threshold 100
switch(config-profile-intf-IP1)#shutdown max-delay 100
switch(config-profile-intf-IP1)#profile interface IP1 default
switch(config-profile-intf-IP1)#exit
switch(config-maintenance)#
```

Example for profile bgp BP1

```
switch(config-maintenance)#profile bgp BP1
switch(config-profile-bgp-BP1)#initiator route-map rmap inout
switch(config-profile-bgp-BP1)#profile bgp BP1 default
switch(config-profile-bgp-BP1)#exit
switch(config-maintenance)#
```

Example for profile unit UP1

```
switch(config-maintenance)#profile unit UP1
switch(config-profile-unit-UP1)#on-boot duration 300
switch(config-profile-unit-UP1)#profile unit UP1 default
switch(config-profile-unit-UP1)#exit
switch(config-maintenance)#
```

10.4.9 Associating Profiles with Groups

Enter the maintenance mode configuration options for associating profiles with groups using the `maintenance` and `group bgp` command.

**Example**

```
switch(config)#group interface IG1
switch(config-group-if-IG1)#maintenance profile bgp BP1
switch(config-group-if-IG1)#maintenance profile interface IP1
switch(config-group-if-IG1)#
```

**Note**

An interface/BGP profile can be associated with the interface group, and a BGP profile can be associated with the BGP group.

10.4.10 Configuring Units

Enter the maintenance mode configuration options for units using the `unit`, `group bgp`, and `maintenance` commands.

**Example**

```
switch(config)#maintenance
switch(config-maintenance)#unit foo
switch(config-unit-foo)#group bgp BG1
switch(config-unit-foo)#group interface IG1
switch(config-unit-foo)#profile unit UP1
```
10.4.11 Show Commands

Maintenance mode show commands display general and detailed information associated with maintenance mode.

10.4.11.1 show maintenance

This example of the show maintenance command displays maintenance mode details.

Example

```
switch(config)#show maintenance
Flags:
  o - On-boot maintenance
  v - Violating traffic threshold
Unit Name Status Time since last change Flags
---------------------- ----------------------- -------------------------- -----  
System Not Under Maintenance never
Foo Under Maintenance 0:00:14 ago ov

Interface Name Status Time since last change Flags
---------------------- ----------------------- -------------------------- ----- 
Ethernet4 Entering Maintenance 0:00:24 ago
Bgp Neighbor(vrf: defa
Status Time since last change Flags
---------------------- ----------------------- -------------------------- ----- 
12.12.12.12 Under Maintenance 0:00:04 ago
Bgp Neighbor(vrf: red)
Status Time since last change Flags
---------------------- ----------------------- -------------------------- ----- 
12.12.12.13 Under Maintenance 0:00:34 ago

switch(config)#
```

10.4.11.2 show maintenance summary

This example of the show maintenance summary command displays a summary of maintenance mode information.

Example

```
switch(config)#show maintenance summary
Number of Units configured: 3
Number of Units not under maintenance: 2
Number of Units entering maintenance: 1
Number of Units under maintenance: 0
Number of Units exiting maintenance: 0
Directly Put Under Maintenance:
  Number of interfaces entering maintenance: 0
  Number of interfaces under maintenance: 2
  Number of bgp peers entering maintenance: 0
  Number of bgp peers under maintenance: 3
Rate Monitoring:
  Number of interfaces entering maintenance: 0
  Number of interfaces under maintenance: 4
  Number of interfaces under maintenance with threshold violation: 0
  Number of interfaces shutdown for maintenance: 0

switch(config)#
```
10.4.11.3 show maintenance units

This example of the `show maintenance units` command displays maintenance mode units details.

**Example**

```
switch(config)#show maintenance units
Unit Name: Linecard3
  Origin: User Configured
  Status: Under Maintenance
  Unit Profile: Default
  Time Since Last State Change: 0:12:07 ago
  Interface Groups:
     IG1
  Interface Traffic Threshold violations:
     Current violations: 1
           Et1
     Total violations, during maintenance: 5
  History:
     2016-04-27 04:00:42 old state: 'maintenanceModeEnter' to new state: 'underMaintenance' 0:12:07 ago
Unit Name: System
  Origin: Built-in
  Status: Not Under Maintenance
  Unit Profile: Default
  Time Since Last State Change: never
  Interface Groups:
     AllEthernetInterface
```

switch(config)#

10.4.11.4 show maintenance bgp

This example of the `shutdown max-delay` command displays maintenance mode BGP details for all IPs and VRFs.
Example

`switch(config)#show maintenance bgp ip all vrf all`
BGP peer maintenance information for VRF default
Router identifier 2.2.2.1, local AS number 1
   Neighbor: 2.2.2.2
       Maintenance State: Not Under Maintenance
BGP peer maintenance information for VRF red
Router identifier 6.6.6.1, local AS number 1
   Neighbor: 1.1.1.2
       Maintenance State: Not Under Maintenance
Router identifier 2.2.2.1, local AS number 1
   Neighbor: 2.2.2.2
       Maintenance State: Not Under Maintenance
       Maintenance route-map: SystemGenerated
       route-map SystemGenerated permit 10
       Description:
       Match clauses:
       Set clauses:
       set community GSHUT additive
       set local-preference 0
       Selected profile from BGP groups: Default

`switch(config)#`

10.4.11.5 show maintenance interface

This example of the `show maintenance interface status` command displays maintenance mode interface details.

Example

`switch(config)#show maintenance interface`
Flags:
 v - Violating traffic threshold
 s - Shutdown for maintenance

<table>
<thead>
<tr>
<th>Interface</th>
<th>Status</th>
<th>Rate (Mbps)</th>
<th>Flags</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ethernet1</td>
<td>Under Maintenance</td>
<td>0.4</td>
<td>0.0</td>
</tr>
<tr>
<td>Ethernet2</td>
<td>Under Maintenance</td>
<td>0.0</td>
<td>0.0</td>
</tr>
<tr>
<td>Ethernet3</td>
<td>Not Under Maintenance</td>
<td>-</td>
<td>-</td>
</tr>
<tr>
<td>Ethernet4</td>
<td>Under Maintenance</td>
<td>0.0</td>
<td>0.0</td>
</tr>
<tr>
<td>Ethernet5</td>
<td>Not Under Maintenance</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

`switch(config)#`

10.4.11.6 show maintenance interface status quiesced

This example of the `show maintenance interface status quiesced` command displays maintenance mode interface status details for quiesced interfaces.
Example

```
switch(config)#show maintenance interface status quiesced
Flags:
  v - Violating traffic threshold
  s - Shutdown for maintenance

<table>
<thead>
<tr>
<th>Interface</th>
<th>Status</th>
<th>In</th>
<th>Out</th>
<th>Flags</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ethernet1</td>
<td>Under Maintenance</td>
<td>0.3</td>
<td>0.0</td>
<td>v</td>
</tr>
<tr>
<td>Ethernet2</td>
<td>Under Maintenance</td>
<td>0.0</td>
<td>0.0</td>
<td></td>
</tr>
<tr>
<td>Ethernet4</td>
<td>Under Maintenance</td>
<td>0.0</td>
<td>0.0</td>
<td></td>
</tr>
</tbody>
</table>

switch(config)#
```

10.4.11.7 show maintenance groups

This example of the `shutdown max-delay` command displays maintenance mode group details.

Example

```
switch(config)#show maintenance groups
Interface Group: IG1
  Interfaces:
    Et4-6
  Profiles:
    Interface Profile: IP1
    Units: newEt
  Bgp Group: BG
  Neighbors:
    IPv4 Peers: 4.4.4.2, 1.1.1.2, 3.3.3.2
    IPv6 Peers: 3::3
  Bgp Profile: prepend
    Units: newBG

switch(config)#
```

10.4.11.8 show maintenance profiles

This example of the `command displays maintenance mode profile details.

Example

```
switch(config)#show maintenance profiles
Interface Profile: INTFPROFILE
  Rate Monitoring:
    load-interval: 444 seconds
    threshold (in/out): 4000 Kbps
  shutdown:
    enabled: yes
    max-delay: 399 seconds
  Bgp Profile: BGPPROFILE
    Initiator route-map:
      name: rm
  Unit Profile: UNITPROFILE
    On-boot:
      enabled: yes
      duration: 340 seconds

switch(config)#
```
Chapter 10: Maintenance Mode

10.4.11.9 show interface status

This example of the `show interface <intf_name> status` command displays maintenance mode information for interfaces.

**Example**

```
switch(config)# show interface status

Port   Name  Status  Vlan  Duplex  Speed   Type      Flags
Et1    connected  1   full  10G    EbraTestPhyP  mv
Et2    connected  1   full  10G    EbraTestPhyP  m
Et3    maint-down  1   full  10G    EbraTestPhyP  m
Et4    maint-down  1   full  10G    EbraTestPhyP  m
Et5    connected  1   full  10G    EbraTestPhyP
Et6    connected  1   full  10G    EbraTestPhyP

switch(config)#
```

10.4.11.10 show interface ethernet

This example of the `show interface ethernet` command displays maintenance mode information for an ethernet interface.

**Example**

```
switch(config)# show interface ethernet 4

Ethernet4 is down, line protocol is down (maint-down)
Hardware is Ethernet, address is 0000.0101.0004 (bia 0000.0101.0004)
Ethernet MTU 9214 bytes, BW 10000000 kbit
Full-duplex, 10Gb/s, auto negotiation: off, uni-link: unknown
Down 18 minutes, 39 seconds
Under maintenance for 18 minutes, 42 seconds
2 link status changes since last clear
Last clearing of "show interface" counters never
5 minutes input rate 0 bps (0.0% with framing overhead), 0 packets/sec
5 minutes output rate 0 bps (0.0% with framing overhead), 0 packets/sec
0 packets input, 0 bytes
Received 0 broadcasts, 0 multicast
0 runts, 0 giants
0 input errors, 0 CRC, 0 alignment, 0 symbol, 0 input discards
0 PAUSE input
94 packets output, 11562 bytes
Sent 0 broadcasts, 94 multicast
0 output errors, 0 collisions
0 late collision, 0 deferred, 0 output discards
0 PAUSE output

switch(config)#
```

10.4.11.11 show ip bgp neighbors

This example of the `show ip bgp neighbors` command displays IP BGP neighbors maintenance mode details.
Example

```
switch(config)#show ip bgp neighbors 1.1.1.2
BGP neighbor is 1.1.1.2, remote AS 1, external link...
Prefix statistics:
IPv4 prefixes: 0 0
IPv6 prefixes: 0 0
Inbound route map is foo
Outbound route map is foo
Session is under maintenance
Maintenance-mode:
  Inbound and Outbound policy
  Route map is SystemGenerated
```

```
switch(config)#
```

10.4.11.12 show ip bgp summary

This example of the `show ip bgp summary` command displays maintenance mode information for IP BGP.

Example

```
switch(config)#show ip bgp summary
BGP summary information for VRF default
Router identifier 192.168.201.13, local AS number 100
Neighbor Status Codes: m - Under maintenance
Neighbor V AS MsgRcvd MsgSent InQ OutQ Up/Down State PfxRcd PfxAcc
m 1.0.0.1 4 300 983 988 0 0 16:16:03 Estab 1 1
  1.0.1.1 4 300 983 983 0 0 16:15:58 Estab 1 1
```

```
switch(config)#
```

10.4.11.13 show maintenance stages

These examples of the `show maintenance stages` command display maintenance mode stages details.

Example

```
switch(config)#show maintenance stages
Maintenance Enter Stage Sequence
 No. Stage Description
--------- ------------- --------------------------
 1 bgp BGP Maintenance processing
 2 ratemon Interface Rate Monitoring

Maintenance Exit Stage Sequence
 No. Stage Description
--------- ------------- --------------------------
 1 ratemon Interface Rate Monitoring
 2 bgp BGP Maintenance processing
```

```
switch(config)#
```
Example

```bash
switch(config)#show maintenance bgp receiver route-map
route-map SystemGenerated permit 10
  Description:
    description System generated receiver route-map
  Match clauses:
    match community GSHUT-LIST
route-map SystemGenerated permit 50
  Description:
    description System generated receiver route-map
  Match clauses:
route-map SystemGenerated permit 50
  Description:
    description System generated receiver route-map
  Match clauses:
route-map SystemGenerated permit 50
  Description:
    description System generated receiver route-map
  Match clauses:
route-map SystemGenerated permit 50
  Description:
    description System generated receiver route-map
  Match clauses:
```

Example

```bash
tg232(s1)(config)#show maintenance profiles interface
tg232(s1)(config)#show maintenance profiles bgp
tg232(s1)(config)#show maintenance profiles unit
tg232(s1)(config)#show maintenance profiles unit default
Unit Profile: Default
  On-boot:
    enabled: no
    duration: 300 seconds

switch(config)#
```

Example

```bash
switch(config)#show maintenance profiles interface default
Interface Profile: Default
  Rate Monitoring:
    load-interval: 60 seconds
    threshold (in/out): 100 Kbps
  shutdown:
    enabled: no
    max-delay: 300 seconds

switch(config)#
```

Example

```bash
switch(config)#show maintenance profiles bgp default
Bgp Profile: Default
  Initiator route-map: SystemGenerated
  route-map SystemGenerated permit 10
    Description:
      description System generated initiator route-map
    Match clauses:
    SubRouteMap:
    Set clauses:
      set local-preference 0
      set community GSHUT additive

switch(config)#
```
Example

```
switch(config)# show maintenance profiles unit default
Unit Profile: Default
   On-boot:
      enabled: no
      duration: 300 seconds
switch(config)#
```

10.4.12 Syslog Messages

Maintenance mode syslog messages are as follows:

- MaintenanceMode: %MMODE-4-MAINT_OP_WARNING: Unit config is deleted for unit foo. The unit is still undergoing maintenance operation.
- MaintenanceMode: %ETH-6-MAINTENANCE_DOWN: Interface Et1 has been shutdown for maintenance.
- MaintenanceMode: %MMODE-5-INTF PROFILE_CHANGE: For interface Et1 interface profile changed to IP1.
- Rib: %BGP-6-MAINTENANCE-MODE: peer 1.1.1.1 is placed under maintenance.
- Rib: %BGP-6-MAINTENANCE-MODE: peer 1.1.1.1 is taken out of maintenance.
10.5 Maintenance Mode Commands

Global Configuration Commands
- group bgp
- group interface
- maintenance

Group Configuration Commands
- interface
- maintenance profile bgp
- maintenance profile interface
- neighbor
- vrf

Maintenance Configuration Commands
- bgp <peer> [vrf <vrf_name>]
- interface
- profile bgp
- profile unit <profile_name> default
- profile interface
- profile interface <profile_name> default
- profile unit
- profile unit <profile_name> default
- unit

Unit Configuration Commands
- group bgp <group_name>
- group interface <group_name>
- profile unit
- quiesce

Interface Profile Configuration Commands
- rate-monitoring load-interval
- rate-monitoring threshold
- shutdown max-delay

BGP Profile Configuration Commands
- initiator route-map <route-map-name> inout

Unit Profile Configuration Commands
- on-boot duration

EventMgr Configuration Commands
- trigger on-maintenance

Display Commands
- show maintenance
- show maintenance bgp
- show maintenance bgp receiver route-map
- show maintenance debug
- show maintenance groups
- show maintenance interface
- show maintenance interface status
- show maintenance profiles
- show maintenance stages
- show maintenance summary
- show maintenance units

**Enhanced Commands to show Maintenance Status**

- show interface
- show interface <intf_name> status
- show ip | ipv6 bgp
- show ip | ipv6 bgp summary [ vrf <vrf_name>]
Chapter 10: Maintenance Mode

Maintenance Mode Commands

**bgp <peer> [vrf <vrf_name>]**

The `bgp <peer> [vrf <vrf-name>]` command places the switch in maintenance dynamic BGP unit configuration mode. If no VRF is specified, the BGP peer is considered to be in the DEFAULT VRF, otherwise, in the specified VRF.

The command creates the dynamic BGP unit if the specified dynamic BGP unit does not exist prior to issuing the command.

The `no bgp <peer> [vrf <vrf_name>]` and `default bgp <peer> [vrf <vrf_name>]` removes the dynamic BGP unit from `running-config`.

**Command Mode**

Maintenance Configuration

**Command Syntax**

```
bgp ipv4_addr [vrf <vrf_name>]
bgp ipv6_addr [vrf <vrf_name>]
bgp peer_group_name [vrf <vrf_name>]
<no | default> bgp ipv4_addr|ipv6_addr|peer_group_name [vrf <vrf_name>]
```

**Parameters**

- `ipv4_addr`  BGP neighbor IPv4 address
- `ipv6_addr`  BGP neighbor IPv6 address
- `peer_group_name`  BGP peer group name
- `vrf_name`  name of the VRF to which the BGP peer belongs

**Commands available in maintenance dynamic interface unit configuration mode:**

- `quiesce`

**Example**

- This command creates dynamic BGP unit for IPv4 addr 1.0.1.1, IPv6 addr 1::1 with quiesce and peer-group PG in VRF VRF1 under maintenance configuration.

```
switch(config)#maintenance
switch(config-maintenance)#bgp 1.0.1.1
switch(config-maint-bgp-1.0.1.1)#exit
switch(config-maintenance)#bgp 1::1
switch(config-maint-bgp-1::1)#quiesce
switch(config-maint-bgp-1::1)#exit
switch(config-maintenance)#bgp PG vrf VRF1
switch(config-maint-bgp-PG)#exit
switch(config-maint-bgp-PG)#show active
maintenance
  bgp 1.0.1.1
  |
  bgp 1::1
  |
  quiesce
  !
  bgp PG vrf VRF1
switch(config-maintenance)#
```
**group bgp**

The `group bgp <group_name>` command places the switch in group-BGP configuration mode for configuring the members of a BGP group in a particular VRF and associating a BGP maintenance profile for these members.

The command creates the group if the specified group does not exist prior to issuing the command. The `no group bgp <group_name>` and `default group bgp <group_name>` removes the BGP group.

**Command Mode**

Global Configuration

**Command Syntax**

```
    group bgp group_name
    no group bgp group_name
    default group bgp group_name
```

**Parameters**

- `group_name` name of the BGP group

**Commands available in group-BGP configuration mode:**

- neighbor (ipv4 address | ipv6 address | peer-group)
- vrf (vrf-name)
- maintenance profile bgp

**Note**

Built-in BGP groups like `AllBgpNeighborVrf-default` and `AllBgpNeighborVrf-<vrf_name>` do not allow neighbor configuration. Only BGP maintenance profile can be associated to them.

**Example**

- This command creates a BGP group BG1 and enters into group BGP BG1 configuration mode.
  ```
  switch(config)#group bgp BG1
  switch(config-group-bgp-BG1)# show active
  group bgp BG1
  exit
  switch(config-group-bgp-BG1)#
  ```

- This command enters into BGP built-in configuration mode for `AllBgpNeighborVrf-default`.
  ```
  switch(config)#group bgp AllBgpNeighborVrf-default
  switch(config-builtin-group-bgp-AllBgpNeighborVrf-default)#show active
  group bgp AllBgpNeighborVrf-default
  exit
  switch(config-builtin-group-bgp-AllBgpNeighborVrf-default)#exit
  switch(config)#show maintenance groups bgp AllBgpNeighborVrf-default
  BGP Group: AllBgpNeighborVrf-default
  Origin: Built-in
  Neighbors:
   Ipv4 Peers: 1.0.0.1, 1.0.1.2
  Bgp Profile: Default
  Vrf: default
  Units: System
  switch(config)#
  ```
**group bgp <group_name>**

The `group bgp <group_name>` command adds a BGP group to a unit.

The `no group bgp <group_name>` and `default group bgp <group_name>` removes the BGP group from a unit.

**Command Mode**

Maintenance Unit Configuration

**Command Syntax**

```
group bgp group_name
no group bgp group_name
default group bgp group_name
```

**Parameters**

- `group_name` name of the BGP group

**Example**

- This command adds a BGP group BG1 to unit UNIT1.

```
switch(config)#maintenance
switch(config-maintenance)# unit UNIT1
switch(config-unit-UNIT1)# group bgp BG1
switch(config-unit-UNIT1)# show active
maintenance
    unit UNIT1
    group bgp BG1
switch(config-unit-UNIT1)
```
**group interface**

The *group interface* command places the switch in group-intf configuration mode for configuring the members of interface group and associating a BGP/interface maintenance profile for these members. The command creates the group if the specified group does not exist prior to issuing the command.

The *no group interface <group_name>* and *default group interface <group_name>* removes the interface group.

**Command Mode**

Global Configuration

**Command Syntax**

```
group interface group_name
no group interface group_name
default group interface group_name
```

**Parameters**

- *group_name* name of the interface group

**Commands available in group-BGP configuration mode:**

- interface
- maintenance profile bgp
- maintenance profile interface

**Note**

Built-in Interface groups like *AllEthernetInterface, Linecard3, Linecard4*, etc. do not allow interface configurations. Only BGP/interface maintenance profiles can be associated to them.

**Example**

- This command creates an interface group IG1 and enters into group interface IG1 configuration mode.
  
  ```
  switch(config)#group interface IG1
  switch(config-group-if-IG1)# show active
  group interface IG1
  exit
  switch(config-group-if-IG1)#
  ```

- This command enters into built-in interface group *AllEthernetInterface*.
  
  ```
  switch(config)#group interface AllEthernetInterface
  switch(config-built-in-group-if-AllEthernetInterface)#show active
  group interface AllEthernetInterface
  exit
  switch(config-built-in-group-if-AllEthernetInterface)#exit
  switch(config)# show maintenance groups interface AllEthernetInterface
  Interface Group: AllEthernetInterface
  Origin: Built-in
  Interfaces:
  Et1, Et2, Et3, Et4, Et5/1, ... Et34, Et35, Et36
  Profiles:
  Interface Profile: Default
  Bgp Profile: Default
  Units: System#
  ```
**group interface <group_name>**

The `group interface <group_name>` command adds an interface to a unit.

The `no group interface <group_name>` and `default group interface <group_name>` removes the interface group from a unit.

**Command Mode**

Maintainence Unit Configuration

**Command Syntax**

```
group interface group_name
no group interface group_name
default group interface group_name
```

**Parameters**

- `group_name` name of the interface group

**Example**

- This command adds an interface group IG1 to unit UNIT1.

```
switch(config)#maintenance
switch(config-maintenance)# unit UNIT1
switch(config-unit-UNIT1)# group interface IG1
switch(config-unit-UNIT1)# show active
maintenance
  unit UNIT1
    group interface IG1
switch(config-unit-UNIT1)
```
**initiator route-map <route-map-name> inout**

The *initiator route-map <route-map-name> inout* command is a maintenance BGP profile configuration option for assigning the initiator route-map, which will be applied to inout (inbound and outbound).

The *no initiator route-map <route-map-name> inout* and *default initiator route-map <route-map-name> inout* removes this configuration from the BGP profile.

**Command Mode**

Maintenance-Profile-BGP Configuration

**Command Syntax**

```
initiator route-map route-map-name inout
no initiator route-map
default initiator route-map
```

**Parameters**

- *route-map-name* initiator route-map name

**Example**

- This command configures initiator route-map RM1 within a BGP profile BP1.

```
switch(config)#maintenance
switch(config-maintenance)#profile bgp BP1
switch(config-profile-bgp-BP1)#initiator route-map RM1 inout
switch(config-profile-bgp-BP1)#show active
maintenance
    profile bgp BP1
        initiator route-map RM1 inout

switch(config-profile-bgp-BP1)#
```
interface

The `interface` command adds interfaces to interface group.

The `no interface <intf-name>` and `default interface <intf-name>` removes the interface from the group.

**Command Mode**
Group-Interface Configuration

**Command Syntax**
```
interface interface-name
no interface interface-name
default interface interface-name
```

**Parameters**
- `interface-name` name of the interface
  - `ethernet e_range` Ethernet interfaces specified by e_range
  - `port-channel p_range` port channel interfaces specified by p_range
  - `vlan v_range` vlans specified by v_range.

Valid `e_range`, `p_range` and `v_range` formats include number, range, or comma-delimited list of numbers and ranges. Valid Ethernet numbers depend on the Ethernet interfaces available on the switch.

**Example**
- This command adds `Ethernet8`, `Ethernet9`, and `port-channel10` to the interface group IG1.

```
switch(config)#group interface IG1
switch(config-group-if-IG1)#interface Ethernet8-9
switch(config-group-if-IG1)#interface port-channel10
switch(config-group-if-IG1)#show active
group interface IG1
  interface Et8-9
  interface Po10
switch(config-group-if-IG1)#exit
switch(config)#
```
**interface**

The `interface <intf-name>` command places the switch in maintenance dynamic interface unit configuration mode.

The command creates the dynamic interface unit if the specified dynamic interface unit does not exist prior to issuing the command.

The `no interface <intf-name>` and `default interface <intf-name>` removes the dynamic interface unit from `running-config`.

**Command Mode**

Maintenance Configuration

**Command Syntax**

```
interface interface-name
no interface interface-name
default interface interface-name
```

**Parameters**

- `interface-name`  name of the interface
- `ethernet e_range`  Ethernet interfaces specified by `e_range`
- `port-channel p_range`  port channel interfaces specified by `p_range`
- `vlan v_range`  vlans specified by `v_range`.

Valid `e_range`, `p_range` and `v_range` formats include number, range, or comma-delimited list of numbers and ranges.

**Note**

Different dynamic interface units are created for each interface in the range.

**Commands available in maintenance dynamic interface unit configuration mode:**

- `quiesce`

**Example**

- This command creates two dynamic interface units for interfaces Ethernet1-2 under maintenance configuration.

  ```
  switch(config)#maintenance
  switch(config-maintenance)#interface Ethernet1-2
  switch(config-maint-if-Et1-2)#exit
  switch(config-maintenance)#show active maintenance
  interface Ethernet1
  !
  interface Ethernet2
  switch(config-maintenance)#
  ```
**maintenance**

The `maintenance` command allows you to enter maintenance configuration mode and specify maintenance configuration options.

The `no maintenance` and `default maintenance` command removes the maintenance configuration from the `running-config`.

**Command Mode**
- Global Configuration

**Command Syntax**

```
maintenance
no maintenance
default maintenance
```

**Commands available in maintenance configuration mode:**
- `unit`
- `bgp`
- `interface`
- `profile bgp`
- `profile interface`
- `profile unit`
- `profile interface <profile-name> default`
- `profile bgp <profile-name> default`
- `profile unit <profile-name> default`

**Examples**
- This example shows the commands to enter maintenance configuration mode and configure maintenance related parameters.

```
switch(config)#maintenance
switch(config-maintenance)#profile unit foo
switch(config-profile-unit-foo)#on-boot duration 300
switch(config-profile-unit-foo)#exit
switch(config-maintenance)#unit U1
switch(config-unit-U1)#group interface IG1
switch(config-unit-U1)#group bgp BG1
switch(config-unit-U1)#profile unit foo
switch(config-unit-U1)#exit
switch(config-maintenance)#show active
maintenance
    profile unit foo
        on-boot duration 300
    unit U1
        group interface IG1
        group bgp BG1
        profile unit foo
switch(config-maintenance)#
```
maintenance profile bgp

The `maintenance profile bgp <profile-name>` command associates a BGP maintenance profile to an interface/BGP group. A BGP profile can be associated to both the interface and BGP group.

The `no maintenance profile bgp <profile-name>` and `default maintenance profile bgp <profile-name>` removes the profile from the interface/BGP group.

**Command Mode**
- Group-Interface Configuration
- Group-BGP Configuration
- Built-in-Group-Interface Configuration
- Built-in-Group-BGP Configuration

**Command Syntax**

```
maintenance profile bgp profile-name
no maintenance profile bgp profile-name
default maintenance profile profile-name
```

**Parameters**

- `profile name` name of the BGP profile

**Example**

- This command adds BGP profile BP1 to a BGP group BG1.

```
switch(config)#group bgp BG1
switch(config-group-bgp-BG1)#neighbor 1.0.1.1
switch(config-group-bgp-BG1)#neighbor 1::1
switch(config-group-bgp-BG1)#neighbor PG
switch(config-group-bgp-BG1)#maintenance profile bgp BP1
switch(config-group-bgp-BG1)#show active
  group bgp BG1
    neighbor 1.0.1.1
    neighbor 1::1
    neighbor PG
    maintenance profile bgp BP1
switch(config-group-bgp-BG1)#exit
switch(config)#
```

- This command adds BGP profile BP1 to interface group IG1.

```
switch(config)#group interface IG1
switch(config-group-if-IG1)#interface Ethernet8-9
switch(config-group-if-IG1)#maintenance profile bgp BP1
switch(config-group-if-IG1)#show active
  group interface IG1
    interface Et8-9
    maintenance profile bgp BP1
switch(config-group-if-IG1)#exit
switch(config)#
```

- This command adds BGP profile BP1 to built-in interface group AllEthernetInterface.

```
switch(config)#group interface AllEthernetInterface
switch(config-group-if-AllEthernetInterface)#maintenance profile bgp BP1
switch(config-group-if-AllEthernetInterface)#show active
  group interface AllEthernetInterface
    maintenance profile bgp BP1
switch(config-group-if-AllEthernetInterface)#
```
maintenance profile interface

The `maintenance profile interface <profile-name>` command associates interface profile to interface group.

The `no maintenance profile interface <profile-name>` and `default maintenance profile interface <profile-name>` removes the interface profile from interface group.

Command Mode

Group-Interface Configuration
Built-in-Group-Interface Configuration

Command Syntax

```
maintenance profile interface profile-name
no maintenance profile interface profile-name
default maintenance profile interface profile-name
```

Parameters

- `<profile-name>` name of the interface profile

Example

- This command adds interface profile IP1 to interface group IG1.

  switch(config)#group interface IG1
  switch(config-group-if-IG1)#interface Ethernet8-9
  switch(config-group-if-IG1)#maintenance profile interface IP1
  switch(config-group-if-IG1)#show active
  group interface IG1
  interface Et8-9
  maintenance profile interface IP1

  switch(config-group-if-IG1)#

- This command adds interface profile IP1 to built-in interface group AllEthernetInterface.

  switch(config)#group interface AllEthernetInterface
  switch(config-builtin-group-if-AllEthernetInterface)#maintenance profile interface IP1
  switch(config-builtin-group-if-AllEthernetInterface)#show active
  group interface AllEthernetInterface
  maintenance profile interface IP1

  switch(config-builtin-group-if-AllEthernetInterface)#
neighbor

The `neighbor` command adds BGP peer(s) to a BGP group. The neighbors can be IPv4, IPv6 or a peer-group. The `no neighbor <peer>` and `default neighbor <peer>` removes the BGP peer from the group.

**Command Mode**

Group-BGP Configuration

**Command Syntax**

```
neighbor ipv4_addr
no neighbor ipv4_addr
default neighbor ipv4_addr
neighbor ipv6_addr
no neighbor ipv6_addr
default neighbor ipv6_addr
neighbor peer-group-name
no neighbor peer-group-name
default neighbor peer-group-name
```

**Parameters**

- `ipv4_addr`   BGP neighbor ipv4 address
- `ipv6_addr`   BGP neighbor ipv6 address
- `peer-group-name`   BGP peer group name

**Example**

- This command adds ipv4 peer 1.0.1.1, ipv6 peer 1::1 and peer-group PG to the BGP group BG1.

```
switch(config)#group bgp BG1
switch(config-group-bgp-BG1)#neighbor 1.0.1.1
switch(config-group-bgp-BG1)#neighbor 1::1
switch(config-group-bgp-BG1)#neighbor PG
switch(config-group-bgp-BG1)#group bgp BG1
switch(config-group-bgp-BG1)#neighbor 1.0.1.1
switch(config-group-bgp-BG1)#neighbor 1::1
switch(config-group-bgp-BG1)#neighbor PG
switch(config-group-bgp-BG1)#exit
switch(config)#
```
on-boot duration

The on-boot duration command is a maintenance unit profile configuration option for specifying the duration after which the associated unit will be brought out of maintenance after reboot. The on-boot property in the maintenance unit profile specifies that the unit will be placed into maintenance mode as part of boot-up, and remain so for the specified duration.

The no on-boot and default on-boot removes this configuration from the unit profile.

Command Mode
   Maintenance-Profile-Unit Configuration

Command Syntax
   on-boot duration duration
   no on-boot
   default on-boot

Parameters
   • duration number of seconds for which unit will remain under maintenance after reboot (from 300 to 3600 seconds)

Example
   • This command configures on-boot duration of 1000 seconds in profile unit UP1.
     switch(config)#maintenance
     switch(config-maintenance)#profile unit UP1
     switch(config-profile-unit-UP1)#on-boot duration 1000
     switch(config-profile-unit-UP1)#show active
     maintenance
         profile unit UP1
         on-boot duration 1000

     switch(config-profile-unit-UP1)#
profile bgp

The **profile bgp** command places the switch in maintenance profile BGP configuration mode for configuring initiator route-map.

The command creates the profile if the specified BGP profile does not exist prior to issuing the command.

The **no profile bgp** `<profile-name>` and **default profile bgp** `<profile-name>` removes the profile from **running-config**.

**Command Mode**
  Maintenance Configuration

**Command Syntax**
  
  ```
  profile bgp profile-name
  no profile bgp profile-name
  default profile bgp profile-name
  ```

**Parameters**
  
  • **profile-name**  name of the BGP profile

**Commands available in maintenance profile BGP configuration mode:**
  
  • **initiator route-map** (route-map name) **inout**

**Example**
  
  • This command creates BGP profile BP1.
    ```
    switch(config)#maintenance
    switch(config-maintenance)#profile bgp BP1
    switch(config-profile-bgp-BP1)#show active
    maintenance
        profile bgp BP1
    ```

```
switch(config-profile-bgp-BP1)#
```
profile bgp <profile_name> default

The profile bgp <profile_name> default command configures a user-configured BGP profile as default BGP profile.

The no profile bgp <profile_name> default and default profile bgp <profile_name> default removes the user-configured BGP profile as default BGP profile.

Command Mode
   Maintenance Configuration

Command Syntax
   profile bgp profile_name default
   no profile bgp profile_name default
   default profile bgp profile_name default

Parameters
   • profile_name  name of the BGP profile

Example
   • This command configures user configured BGP profile BP1 as default BGP profile.

```
switch(config)#maintenance
switch(config-maintenance)#profile bgp BP1
switch(config-profile-bgp-BP1)#initiator route-map RM1 inout
switch(config-profile-bgp-BP1)#exit
switch(config-maintenance)#
switch(config-maintenance)#show maintenance profile bgp default
Bgp Profile: Default
    Initiator route-map: SystemGenerated
    route-map SystemGenerated permit 10
    Description:
        description System generated initiator route-map
    Match clauses:
    Set clauses:
        set community GSHUT additive
        set local-preference 0

switch(config-maintenance)#
switch(config-maintenance)#profile bgp BP1 default
switch(config-maintenance)#show maintenance profile bgp default
Bgp Profile: BP1
    Initiator route-map: RM1

switch(config-maintenance)#
switch(config-maintenance)#show active maintenance
profile bgp BP1
    initiator route-map RM1 inout
profile bgp BP1 default

switch(config-maintenance)#
```
profile interface

The **profile interface** command places the switch in maintenance profile interface configuration mode for configuring rate-monitoring threshold, load-interval, and shutdown max-delay.

The command creates the profile if the specified interface profile does not exist prior to issuing the command.

The **no profile interface** `<profile-name>` and **default profile interface** `<profile-name>` removes the profile from running-config.

**Command Mode**
- Maintenance Configuration

**Command Syntax**
- `profile interface profile-name`
- `no profile interface profile-name`
- `default profile interface profile-name`

**Parameters**
- `profile-name` name of the interface profile

**Commands available in maintenance profile interface configuration mode:**
- rate-monitoring load-interval
- rate-monitoring threshold
- shutdown max-delay

**Example**
- This command creates interface profile IP1.
  ```
  switch(config)#maintenance
  switch(config-maintenance)#profile interface IP1
  switch(config-profile-intf-IP1)#show active maintenance
  profile interface IP1
  
  switch(config-profile-intf-IP1)#
  ```
profile interface <profile_name> default

The `profile interface <profile_name> default` command configures a user-configured interface profile as default interface profile.

The `no profile interface <profile_name> default` and `default profile interface <profile_name> default` removes the user-configured interface profile as default interface profile.

**Command Mode**

- Maintenance Configuration

**Command Syntax**

- `profile interface profile_name default`
- `no profile interface profile_name default`
- `default profile interface profile_name default`

**Parameters**

- `profile_name`  name of the interface profile

**Example**

- This command configures user configured interface profile IP1 as default interface profile.

```
switch(config)#maintenance
switch(config-maintenance)#profile interface IP1
switch(config-profile-intf-IP1)#rate-monitoring load-interval 100
switch(config-profile-intf-IP1)#rate-monitoring threshold 500
switch(config-profile-intf-IP1)#shutdown max-delay 100
switch(config-profile-intf-IP1)#exit
switch(config-maintenance)#
switch(config-maintenance)#show maintenance profile interface default
Interface Profile: Default
  Rate Monitoring:
    load-interval: 60 seconds
    threshold (in/out): 100 kbps
  shutdown:
    enabled: no
    max-delay: 300 seconds

switch(config-maintenance)#
switch(config-maintenance)#profile interface IP1 default
switch(config-maintenance)#show maintenance profile interface default
Interface Profile: IP1
  Rate Monitoring:
    load-interval: 100 seconds
    threshold (in/out): 500 kbps
  shutdown:
    enabled: yes
    max-delay: 100 seconds
switch(config-maintenance)#
switch(config-maintenance)#show active maintenance
  profile interface IP1 default
  profile interface IP1
    rate-monitoring load-interval 100
    rate-monitoring threshold 500
    shutdown max-delay 100

switch(config-maintenance)#
```
**profile unit**

The `profile unit` command places the switch in maintenance profile unit configuration mode for configuring on-boot duration.

The command creates the profile if the specified BGP profile does not exist prior to issuing the command.

The `no profile unit <profile-name>` and `default profile unit <profile-name>` removes the profile from `running-config`.

**Command Mode**

Maintenance Configuration

**Command Syntax**

```
profile unit profile-name
no profile unit profile-name
default profile unit profile-name
```

**Parameters**

- `profile-name`  name of the unit profile

**Commands available in maintenance profile unit configuration mode:**

- `on-boot duration`

**Example**

- This command creates unit profile UP1.

```
switch(config)#maintenance
switch(config-maintenance)#profile unit UP1
switch(config-profile-unit-UP1)#show active
maintenance
profile unit UP1

switch(config-profile-unit-UP1)#
```
profile unit <profile_name>

The `profile unit <profile_name>` command associates unit profile to a particular unit.

The `no profile unit <profile_name>` and `default profile unit <profile_name>` removes the unit profile from a unit.

**Command Mode**

- Maintenance-Unit Configuration
- Maintenance-Built-in-Unit Configuration

**Command Syntax**

```
profile unit profile-name
no profile unit
default profile unit
```

**Parameters**

- `profile-name` name of the unit profile

**Examples**

- This command adds unit profile UP1 to UNIT1.

```
switch(config)#maintenance
switch(config-maintenance)#unit UNIT1
switch(config-unit-UNIT1)#group interface IG1
switch(config-unit-UNIT1)#exit
switch(config-maintenance)#show maintenance units UNIT1
Unit Name: UNIT1
 Origin: User Configured
 Status: Not Under Maintenance
 Unit Profile: Default
 Time Since Last State Change: never
 Interface Groups:
   IG1

switch(config-maintenance)#unit UNIT1
switch(config-unit-UNIT1)#profile unit UP1
switch(config-unit-UNIT1)#show maintenance units UNIT1
Unit Name: UNIT1
 Origin: User Configured
 Status: Not Under Maintenance
 Unit Profile: UP1
 Time Since Last State Change: never
 Interface Groups:
   IG1

switch(config-unit-UNIT1)#show active maintenance
unit UNIT1
   group interface IG1
   profile unit UP1

switch(config-unit-UNIT1)#
```
• This command adds unit profile UP2 to built-in unit System.

    switch (config)#maintenance
    switch (config-maintenance)#profile unit UP2
    switch (config-profile-unit-UP2)#on-boot duration 600
    switch (config-profile-unit-UP2)#exit
    switch (config-maintenance)#
    switch (config-maintenance)#unit System
    switch (config-builtin-unit-System)#show active maintenance
        unit System
    switch (config-builtin-unit-System)#exit
    switch (config-maintenance)#show maintenance units System
    Unit Name: System
        Origin: Built-in
        Status: Not Under Maintenance
        Unit Profile: Default
        Time Since Last State Change: never
    Interface Groups:
        AllEthernetInterface
    switch (config-maintenance)#
    switch (config-maintenance)#unit System
    switch (config-builtin-unit-System)#profile unit UP2
    switch (config-builtin-unit-System)#show active maintenance
        unit System
        profile unit UP2
    switch (config-builtin-unit-System)#exit
    switch (config-maintenance)#show maintenance units System
    Unit Name: System
        Origin: Built-in
        Status: Not Under Maintenance
        Unit Profile: UP2
        Time Since Last State Change: never
    Interface Groups:
        AllEthernetInterface
    switch (config-maintenance)#
profile unit <profile_name> default

The `profile unit <profile_name> default` command configures a user-configured unit profile as default unit profile.

The `no profile unit <profile_name> default` and `default profile unit <profile_name> default` removes the user-configured unit profile as default unit profile.

**Command Mode**
- Maintenance Configuration

**Command Syntax**

```
profile unit profile_name default
no profile unit profile_name default
default profile unit profile_name default
```

**Parameters**

- `profile_name` name of the interface profile

**Example**

- This command configures user-configured unit profile UP1 as the default unit profile.

  ```
  switch(config)#maintenance
  switch(config-maintenance)#profile unit UP1
  switch(config-profile-unit-UP1)#on-boot duration 1000
  switch(config-profile-unit-UP1)#exit
  switch(config-maintenance)#
  switch(config-maintenance)#show maintenance profiles unit default
  Unit Profile: Default
  On-boot:
  enabled: no
  duration: 300 seconds
  
  switch(config-maintenance)#profile unit UP1 default
  switch(config-maintenance)#show maintenance profile unit default
  Unit Profile: UP1
  On-boot:
  enabled: yes
  duration: 1000 seconds
  switch(config-maintenance)#
  switch(config-maintenance)#show active maintenance
  profile unit UP1 default
  profile unit UP1
  on-boot duration 1000
  
  switch(config-maintenance)#
  ```
quiesce

The `quiesce` command places a unit or dynamic interface/BGP unit into maintenance mode, gracefully transitioning traffic away from it.

The `no quiesce` and `default quiesce` exits the unit from maintenance.

**Command Mode**
- Maintenance-Unit Configuration
- Maintenance-Built-in-Unit Configuration
- Maintenance Dynamic-Interface Unit Configuration
- Maintenance Dynamic-Bgp Unit Configuration

**Command Syntax**

```
quiesce
no quiesce
default quiesce
```
Examples

- This command places unit UNIT1, interface Et1, BGP peer 1.0.1.1 in VRF default, BGP peer 1::1 in VRF VRF1 into maintenance.

```plaintext
switch(config)#group interface IG1
switch(config-group-if-IG1)#interface Ethernet3-6
switch(config-group-if-IG1)#maintenance profile interface IP1
switch(config-group-if-IG1)#exit
switch(config)#maintenance
switch(config-maintenance)#unit UNIT1
switch(config-unit-UNIT1)#group interface IG1
switch(config-unit-UNIT1)#quiesce
switch(config-unit-UNIT1)#exit
switch(config-maintenance)#interface Ethernet1
switch(config-maint-if-Et1)#quiesce
switch(config-maint-if-Et1)#exit
switch(config-maintenance)#bgp 1.0.1.1
switch(config-maint-bgp-1.0.1.1)#quiesce
switch(config-maint-bgp-1.0.1.1)#exit
switch(config-maintenance)#bgp 1::1 vrf VRF1
switch(config-maint-bgp-1::1)#quiesce
switch(config-maint-bgp-1::1)#exit
```

```
switch(config-maintenance)#show active maintenance
bgp 1.0.1.1
   quiesce
bgp 1::1 vrf VRF1
   quiesce
```

```
interface Et1
   quiesce
   unit UNIT1
   quiesce
```

```
switch(config-maintenance)#show maintenance
Flags:
o - On-boot maintenance
v - Violating traffic threshold

switch(config-maintenance)#
```
rate-monitoring load-interval

The **rate-monitoring load-interval** command is a maintenance interface profile configuration option for configuring the interface’s rate monitoring load interval with a load interval value between 5 and 600 seconds.

**Command Mode**

Maintenance-Profile-Interface Configuration

**Command Syntax**

```
rate-monitoring load-interval load_interval
no rate-monitoring load-interval
default rate-monitoring load-interval
```

**Parameters**

- `load_interval` load interval value between 5 and 600 seconds

**Example**

- This command configures the rate monitoring load interval for the profile interface **IP1** to a load interval of 10 seconds.

```
switch(config)#maintenance
switch(config-maintenance)#profile interface IP1
switch(config-profile-intf-IP1)#rate-monitoring load-interval 10
switch(config-profile-intf-IP1)#show active
maintenance
    profile interface IP1
        rate-monitoring load-interval 10

switch(config-profile-intf-IP1)#
```
rate-monitoring threshold

The `rate-monitoring threshold` command is a maintenance interface profile configuration option for configuring the interface's rate monitoring threshold with a threshold value between 1 and 4294967295 kilobytes.

The `no rate-monitoring threshold` and `default rate-monitoring threshold` removes this configuration from the interface profile.

**Command Mode**

Maintenance-Profile-Interface Configuration

**Command Syntax**

```
rate-monitoring threshold threshold_in_kbps
no rate-monitoring threshold
default rate-monitoring threshold
```

**Parameters**

- `threshold_in_kbps` threshold in kilobytes per second (kbps) between 1 and 4294967295 kilobytes

**Example**

- This command configures the rate monitoring threshold for the profile interface IP1 to a threshold of 1000 kilobytes per second (kbps).

```
switch(config)#maintenance
switch(config-maintenance)#profile interface IP1
switch(config-profile-intf-IP1)#rate-monitoring threshold 1000
switch(config-profile-intf-IP1)# show active maintenance
    profile interface IP1
        rate-monitoring threshold 1000

switch(config-profile-intf-IP1)#
```
**show interface**

The `show interface` command displays detailed information about the interface. It displays an extra line that reads: “Under maintenance for time in hours and minutes”.

**Command Mode**

EXEC

**Command Syntax**

```
show interface intf_name
```

**Parameters**

- `intf_name` name of the interface
- `ethernet e_range` Ethernet interfaces specified by e_range
- `port-channel p_range` port channel interfaces specified by p_range
- `vlan v_range` vlans specified by v_range

**Note**

Valid `e_range`, `p_range` and `v_range` formats include number, range, or comma-delimited list of numbers and ranges. Valid Ethernet numbers depend on the Ethernet interfaces available on the switch.

**Example**

- This command displays detailed information about Ethernet 16/1 interface.

```
switch# show interface ethernet 16/1
Ethernet16/1 is up, line protocol is up (connected)
  Hardware is Ethernet, address is 001c.7373.efc7
  Internet address is 1.0.1.1/24
  Broadcast address is 255.255.255.255
  Address determined by manual configuration
  IP MTU 1500 bytes, BW 40000000 kbit
  Full-duplex, 40Gb/s, auto negotiation: off, uni-link: n/a
  Up 4 hours, 44 minutes, 36 seconds
  Under maintenance for 4 hours, 22 minutes, 26 seconds
  Loopback Mode : None
  2 link status changes since last clear
  Last clearing of "show interface" counters 4:45:12 ago
  5 minutes input rate 20 bps (0.0% with framing overhead), 0 packets/sec
  5 minutes output rate 20 bps (0.0% with framing overhead), 0 packets/sec
  580 packets input, 46286 bytes
  Received 1 broadcasts, 0 multicast
  0 runts, 0 giants
  0 input errors, 0 CRC, 0 alignment, 0 symbol, 0 input discards
  0 PAUSE input
  601 packets output, 48954 bytes
  Sent 7 broadcasts, 15 multicast
  0 output errors, 0 collisions
  0 late collision, 0 deferred, 0 output discards
  0 PAUSE output

switch#
```
**show interface <intf_name> status**

The `show interface <intf_name> status` command displays an 'm' flag if the interface is undergoing maintenance operation.

**Command Mode**

EXEC

**Command Syntax**

```
show interface [ intf_name ] status
```

**Parameters**

- `intf_name` name of the interface
- `ethernet e_range` Ethernet interfaces specified by e_range
- `port-channel p_range` port channel interfaces specified by p_range
- `vlan v_range` vlans specified by v_range

**Note**

Valid `e_range`, `p_range` and `v_range` formats include number, range, or comma-delimited list of numbers and ranges. Valid Ethernet numbers depend on the Ethernet interfaces available on the switch.

**Example**

- This command display tabular output and shows 'm' flag for Ethernet16/1 status.

```
switch#show interface Ethernet16/1 status
Port Name Status Vlan Duplex Speed Type Flags
Et1 disabled 1 auto auto 1000BASE-T
... Et14/1 connected 2 full 40G 40GBASE-CR4
Et15/1 connected 2 full 40G 40GBASE-CR4
Et16/1 connected routed full 40G 40GBASE-CR4 m
Et17/1 notconnect 1 full 10G Not Present
... switch#
```
show ip | ipv6 bgp

The **show ip | ipv6 bgp** command displays maintenance related information when relevant.

**Command Mode**

EXEC

**Command Syntax**

```
show ip bgp neighbors <peer_addr> [vrf <vrf_name>]
show ipv6 bgp peers <peer_addr> [vrf <vrf_name>]
```

**Parameters**

- `peer_addr` name of the peer
- `ipv4_addr` BGP neighbor IPv4 address
- `ipv6_addr` BGP neighbor IPv6 address
- `peer-group-name` BGP peer group name
- `vrf_name` name of the VRF
Example

- This command displays the ‘m’ flag in `show ip bgp summary` output for peer 1.0.1.2 which is in maintenance mode.

```
switch#show ip bgp neighbors 1.0.1.2
BGP neighbor is 1.0.1.2, remote AS 300, external link

switch#
show ip | ipv6 bgp summary [ vrf <vrf_name>]

The `show ip | ipv6 bgp summary [ vrf <vrf_name>]` command displays the ‘m’ flag if the BGP IPv4 or IPv6 peer is undergoing maintenance operation.

**Command Mode**

`EXEC`

**Command Syntax**

- `show ip bgp summary [ vrf <vrf_name>]`
- `show ipv6 bgp summary [ vrf <vrf_name>]`

**Parameters**

- `vrf_name` name of the VRF

**Example**

- This command displays the ‘m’ flag in `show ip bgp summary` output for peer 1.0.1.2 which is in maintenance mode.

```
switch#show ip bgp summary
BGP summary information for VRF default
Router identifier 0.0.1.1, local AS number 200
Neighbor Status Codes: m - Under maintenance
Neighbor  V  AS  MsgRcvd  MsgSent  InQ  OutQ  Up/Down  State  PfxRcd  PfxAcc
       1.0.0.1 4  100  292   296   0   0  04:47:44  Estab 1  1
   m 1.0.1.2 4  300  292   296   0   0  04:47:44  Estab 1  1
switch#
```
show maintenance

The **show maintenance** command provides brief information about all units/dynamic interface unit/dynamic bgp unit and status.

'0' - flag displays that unit is undergoing or has undergone a maintenance operation because of on-boot.

'v' - flag displays that one/some of the interfaces are violating traffic, i.e. traffic for those interfaces is above threshold.

**Command Mode**

EXEC

**Command Syntax**

```
show maintenance
```

**Examples**

- This command displays maintenance mode details.

```
switch# show maintenance
Flags:
o - On-boot maintenance
v - Violating traffic threshold

<table>
<thead>
<tr>
<th>Unit Name</th>
<th>Status</th>
<th>Time since last change</th>
<th>Flags</th>
</tr>
</thead>
<tbody>
<tr>
<td>System</td>
<td>Not Under Maintenance</td>
<td>never</td>
<td></td>

<tr>
<td>1.0.0.2</td>
<td>Not Under Maintenance</td>
<td>never</td>
<td></td>
</tr>
<tr>
<td>2.0.1.2</td>
<td>Under Maintenance</td>
<td>0:00:16 ago</td>
<td></td>
</tr>
</tbody>
</table>

switch#
```
**show maintenance bgp**

The `show maintenance bgp` command displays detailed maintenance information about BGP peers.

**Command Mode**

EXEC

**Command Syntax**

```
show maintenance bgp <ipv4_addr> [vrf <vrf_name>] | <ipv6_addr> [vrf <vrf_name>] | <peer_group> [vrf <vrf_name>] | ip all [vrf <vrf_name>] | vrf all | ipv6 all [vrf <vrf_name> | vrf all]
```

**Parameters**

- `ipv4_addr` BGP neighbor ipv4 address
- `ipv6_addr` BGP neighbor ipv6 address
- `peer_group` BGP peer group name
- `vrf_name` name of the VRF to which peer belongs
- `ip all vrf vrf_name` all ipv4 peers in specified VRF
- `ipv6 all vrf vrf_name` all ipv6 peers in specified VRF
- `ip all vrf all` all ipv4 peers in all the VRFs
- `ipv6 all vrf all` all ipv6 peers in all the VRFs

**Example**

- This command displays maintenance information about BGP peers 1.0.0.1 and 1.0.1.1 and maintenance route-map applied.

```
switch#show maintenance bgp ip all vrf all
BGP peer maintenance information for VRF default
Router identifier 0.0.1.1, local AS number 200
Neighbor: 1.0.0.1
  Maintenance state: Under Maintenance
  Maintenance route-map: SystemGenerated
Neighbor: 1.0.1.2
  Maintenance state: Under Maintenance
  Maintenance route-map: SystemGenerated

switch#
```
show maintenance bgp receiver route-map

The `show maintenance bgp receiver route-map` command displays receiver route-map which is applied during maintenance operation.

**Command Mode**

EXEC

**Command Syntax**

```
show maintenance bgp receiver route-map
```

**Example**

- This command displays receiver route-map contents.

```
switch#show maintenance bgp receiver route-map
route-map SystemGenerated permit 10
  Description:
  description System generated receiver route-map
  Match clauses:
  match community GSHUT-LIST
  SubRouteMap:
  Set clauses:
route-map SystemGenerated permit 50
  Description:
  description System generated receiver route-map
  Match clauses:
  SubRouteMap:
  Set clauses:switch#
```
show maintenance debug

The `show maintenance debug` command displays the history of various maintenance operations on a unit/interface/BGP peer.

**Command Mode**

EXEC

**Command Syntax**

```
show maintenance debug  bgp [peer_name] | interface [intf_name] | units [unit_name]
```

**Parameters**

- `bgp` display history of all dynamic BGP units which have undergone maintenance operation
- `interface` display history of all dynamic interface units which have undergone maintenance operation
- `units` display history of all units which have undergone maintenance operation
- `peer_name` name of the peer
  - `ipv4_addr` BGP neighbor IPv4 address
  - `ipv6_addr` BGP neighbor IPv6 address
  - `peer-group-name` BGP peer group name
- `intf_name` name of the interface
  - `ethernet e_range` Ethernet interfaces specified by `e_range`
  - `port-channel p_range` port channel interfaces specified by `p_range`
  - `vlan v_range` vlans specified by `v_range`

**Note**

Valid `e_range`, `p_range` and `v_range` formats include number, range, or comma-delimited list of numbers and ranges. Valid Ethernet numbers depend on the Ethernet interfaces available on the switch.

- `unit_name` name of the unit
Example

- This command displays history of maintenance operation on Ethernet 16/1.

```
switch#show maintenance debug interface Ethernet 16/1-4
Interface Ethernet16/1

```
show maintenance groups

The `show maintenance groups` command displays all the interface/BGP groups along with their members and associated profiles.

**Command Mode**

EXEC

**Command Syntax**

```
show maintenance groups interface | bgp <group_name>
```

**Parameters**

- `interface` display only interface groups
- `bgp` display only BGP groups
- `group_name` name of the group

**Example**

- This command displays group details for built-in interface group `AllEthernetInterface` and built-in BGP group `AllBgpNeighborVrf-default` and user-configured interface group `IG1`.

```
switch#show maintenance groups
Interface Group: AllEthernetInterface
  Origin: Built-in
  Interfaces:
    Et1, Et2, Et3, Et4, Et5/1, Et5/2, Et5/3, Et5/4, Et6/1, Et6/2, Et6/3, Et6/4, Et7/1, Et7/2, Et7/3, Et7/4, Et8/1, Et8/2, Et8/3, Et8/4, Et9/1, Et9/2, Et9/3, Et9/4, Et10/1, Et10/2, Et10/3, Et10/4, Et11/1, Et11/2, Et11/3, Et11/4, Et12/1, Et12/2, Et12/3, Et12/4, Et13/1, Et13/2, Et13/3, Et13/4, Et14/1, Et14/2, Et14/3, Et14/4, Et15/1, Et15/2, Et15/3, Et15/4, Et16/1, Et16/2, Et16/3, Et16/4, Et17/1, Et17/2, Et17/3, Et17/4, Et18/1, Et18/2, Et18/3, Et18/4, Et19/1, Et19/2, Et19/3, Et19/4, Et20/1, Et20/2, Et20/3, Et20/4, Et21/1, Et21/2, Et21/3, Et21/4, Et22/1, Et22/2, Et22/3, Et22/4, Et23/1, Et23/2, Et23/3, Et23/4, Et24/1, Et24/2, Et24/3, Et24/4, Et25/1, Et25/2, Et25/3, Et25/4, Et26/1, Et26/2, Et26/3, Et26/4, Et27/1, Et27/2, Et27/3, Et27/4, Et28/1, Et28/2, Et28/3, Et28/4, Et29, Et30, Et31, Et32, Et33, Et34, Et35, Et36

switch#
```
**show maintenance interface**

The **show maintenance interface** command displays detailed information about interfaces and their maintenance status with traffic rates.

**Command Mode**

**EXEC**

**Command Syntax**

```
show maintenance interface [intf_name [detail] | detail]
```

**Parameters**

- **intf_name**  
  name of the interface or sub-interface. Options include:
  - ethernet **e_range**  
    Ethernet interfaces specified by e_range
  - port-channel **p_range**  
    port channel interfaces specified by p_range
  - vlan **v_range**  
    vlans specified by v_range
- **detail**  
  provides the detailed rate-monitoring information

**Guidelines**

Valid **e_range**, **p_range** and **v_range** formats include number, range, or comma-delimited list of numbers and ranges.

**Example**

- This command displays interface status and traffic rates.

```
switch#show maintenance interface
Flags:
v - Violating traffic threshold
s - Shutdown for maintenance

<table>
<thead>
<tr>
<th>Interface</th>
<th>Status</th>
<th>Rate (Mbps)</th>

    switch#
**show maintenance interface status**

The **show maintenance interface status** command displays maintenance status and rates for interfaces.

**Command Mode**
EXEC

**Command Syntax**

```
show maintenance interface status active | entering | exiting | quiesced
```

**Parameters**
- **active** interfaces which are active
- **entering** interface which are entering maintenance
- **exiting** interface which are exiting maintenance
- **quiesced** interface which are under maintenance

**Example**

```
This command displays interface status and traffic rates of interfaces which are quiesced.
```

```
switch#show maintenance interface status quiesced
Flags: v - Violating traffic threshold
       s - Shutdown for maintenance
Rate (Mbps)

switch#
```
**show maintenance profiles**

The **show maintenance profiles** command displays all the interface/BGP/unit profiles configuration.

**Command Mode**
EXEC

**Command Syntax**

```
show maintenance profiles interface | bgp | unit <profile_name>
```

**Parameters**
- `interface` display only interface profiles
- `bgp` display only BGP profiles
- `unit` display only unit profiles
- `profile_name` name of the profile

**Example**
- This command displays profile configuration details for interface profile **IP1**, unit profile **UP1** and BGP profile **BP1**.

```plaintext
switch #show maintenance profiles
Interface Profile: IP1
  Rate Monitoring:
    load-interval: 444 seconds
    threshold (in/out): 4000 Kbps
  shutdown:
    enabled: yes
    max-delay: 399 seconds
Bgp Profile: BP1
  Initiator route-map:
    name: RM1
Unit Profile: UP1
  On-boot:
    enabled: yes
    duration: 340 seconds

switch #
```
show maintenance stages

The `show maintenance stages` command displays stages of maintenance operation while entering/exiting maintenance.

**Command Mode**

EXEC

**Command Syntax**

```
show maintenance stages [enter | exit]
```

**Parameters**

- `enter`  display maintenance stages during maintenance enter operation
- `exit`  display maintenance stages during maintenance exit operation

**Example**

- This command displays maintenance mode stages details.

```
switch # show maintenance stages

<table>
<thead>
<tr>
<th>No.</th>
<th>Stage</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>bgp</td>
<td>BGP Maintenance processing</td>
</tr>
<tr>
<td>2</td>
<td>ratemon</td>
<td>Interface Rate Monitoring</td>
</tr>
</tbody>
</table>

Maintenance Exit Stage Sequence

<table>
<thead>
<tr>

<td>Interface Rate Monitoring</td>
</tr>
<tr>
<td>2</td>
<td>bgp</td>
<td>BGP Maintenance processing</td>
</tr>
</tbody>
</table>
```

switch 

- This command displays maintenance mode stage details during entry.

```
switch # show maintenance stages enter

<table>
<thead>
<tr>
<th>No.</th>
<th>Stage</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>bgp</td>
<td>BGP Maintenance processing</td>
</tr>
<tr>
<td>2</td>
<td>ratemon</td>
<td>Interface Rate Monitoring</td>
</tr>
</tbody>
</table>
```

switch#

show maintenance summary

The `show maintenance summary` command displays summarized information about the maintenance mode operations such as number of units configured, number of units Entering/Exiting maintenance etc.

**Command Mode**

EXEC

**Command Syntax**

`show maintenance summary`

**Example**

- This command displays summary of maintenance mode operations.

```
switch#show maintenance summary
Number of Units Configured: 0
Number of Units Exiting Maintenance: 0
Number of Units Entering Maintenance: 0
Number of Units Not Under Maintenance: 1
Number of Units Under Maintenance: 0
Directly Put Under Maintenance:
  Number of interfaces Entering Maintenance: 0
  Number of interfaces Under Maintenance: 1
  Number of bgp peers Entering Maintenance: 0
  Number of bgp peers Under Maintenance: 1
Rate Monitoring:
  Number of interfaces Entering Maintenance: 0
  Number of interfaces Under Maintenance: 1
  Number of interfaces Under Maintenance with threshold violation: 0
  Number of interfaces shutdown for maintenance: 0

switch#
```
**show maintenance units**

The *show maintenance units* command displays detailed information about the particular unit.

**Command Mode**

EXEC

**Command Syntax**

```
show maintenance units [unit_name]
```

**Parameters**

- `unit_name` name of unit

**Example**

- This command displays maintenance units details.

```
switch# show maintenance units
Unit Name: System
 Origin: Built-in
 Status: Not Under Maintenance
 Unit Profile: Default
 Time Since Last State Change: never
 Bgp Groups:
   AllBgpNeighborVrf-default
 Interface Groups:
   AllEthernetInterface

Unit Name: UNIT1
 Origin: User Configured
 Status: Under Maintenance
 Unit Profile: UP1
 Time Since Last State Change: 0:00:08 ago
 Bgp Groups:
   BG1
 Interface Groups:
   IG1
 History:
   2016-08-29 23:05:30  old state: 'maintenanceModeEnter' to new state: 'underMaintenance' 0:00:08 ago
   2016-08-29 23:05:30  old state: 'active' to new state: 'maintenanceModeEnter' 0:00:08 ago

switch#
```
**shutdown max-delay**

The `shutdown max-delay` command is a maintenance interface profile configuration option for configuring the maximum duration after which the interface is shutdown with a value between 1 and 4294967295 seconds.

The `no shutdown` and `default shutdown` removes this configuration from the interface profile.

**Command Mode**
- Maintenance-Profile-Interface Configuration

**Command Syntax**

```
shutdown max-delay delay
no shutdown max-delay delay
default shutdown max-delay delay
```

**Parameters**
- `delay` maximum shutdown delay between 1 and 4294967295 seconds

**Example**
- This command configures the shutdown max-delay for the profile interface IP1 to 500 seconds or one hour.

```
switch(config)#maintenance
switch(config-maintenance)#profile interface IP1
switch(config-profile-intf-IP1)#shutdown max-delay 500
switch(config-profile-intf-IP1)#show active
maintenance
    profile interface IP1
        shutdown max-delay 500

switch(config-profile-intf-IP1)#
```
**trigger on-maintenance**

The `trigger on-maintenance` command is an event handler configuration for triggering actions during the maintenance operation of a unit, interface and BGP peer at specified stages.

The event-handler configuration takes effect only after exiting the event-handler configuration mode.

**Command Mode**

Event-handler Configuration

**Command Syntax**

```
trigger on-maintenance <enter | exit> <unit <unit_name> | bgp <ipv4_addr|ipv6_addr| peer_group> [vrf <vrf_name>] | interface <intf_name>> <begin | end | all |<before | after> stage <stage_name>>
```

**Parameters**

- `enter` trigger on-maintenance event-handler on maintenance enter operation
- `exit` trigger on-maintenance event-handler on maintenance exit operation
- `bgp` trigger event-handler on dynamic BGP unit maintenance operation
  - `ipv4_addr` BGP neighbor ipv4 address
  - `ipv6_addr` BGP neighbor ipv6 address
  - `peer_group` BGP peer group name
  - `vrf vrf_name` name of the VRF to which BGP peer belongs
- `interface` trigger event-handler on dynamic interface unit maintenance operation
  - `intf_name` name of the interface
    - `ethernet` trigger event-handler on specified Ethernet interface
    - `port-channel` trigger event-handler on specified port channel interface
    - `vlan` trigger event-handler on specified vlan

**Note**

Comma-delimited list, ranges are not supported.

- `unit` trigger event-handler on maintenance operation of unit
- `begin` action is triggered in the beginning of maintenance operation
- `end` action is triggered at the end of maintenance operation
- `stage_name` action is triggered at specified stage
  - `bgp` and `ratemon` are the two stages
- `all` action is triggered at all the stages
- `before` action is triggered before the specified stage
- `after` action is triggered after the specified stage
Examples

- This command configures event-handler E1, which triggers on maintenance an enter operation of unit UNIT1 at all the stages.

  ```
  switch(config)#event-handler E1
  switch(config-handler-E1)#trigger on-maintenance enter unit UNIT1 all
  switch(config-handler-E1)#action bash FastCli -c "show maintenance"
  switch(config-handler-E1)# exit
  switch(config)# show event-handler E1
  Event-handler E1
  Trigger: Asynchronous on-maintenance enter unit UNIT1 all delay 0 seconds
  Threshold Time Window: 0 Seconds, Event Count: 1 times
  Action: FastCli -c "show maintenance"
  Action expected to finish in less than 10 seconds
  Last Trigger Detection Time: Never
  Total Trigger Detections: 0
  Last Trigger Activation Time: Never
  Total Trigger Activations: 0
  Last Action Time: Never
  Total Actions: 0
  ```

- This command configures event-handler E2, which triggers on maintenance an exit operation of dynamic interface unit Ethernet1 before stage bgp.

  ```
  switch(config)#event-handler E2
  switch(config-handler-E2)#trigger on-maintenance exit interface Ethernet1 before stage bgp
  switch(config-handler-E2)#action bash FastCli -c "show maintenance summary"
  switch(config-handler-E2)# exit
  switch(config)# show event-handler E2
  Event-handler E2
  Trigger: Asynchronous on-maintenance exit interface Ethernet1 before stage bgp delay 0 seconds
  Threshold Time Window: 0 Seconds, Event Count: 1 times
  Action: FastCli -c "show maintenance summary"
  Action expected to finish in less than 10 seconds
  Last Trigger Detection Time: Never
  Total Trigger Detections: 0
  Last Trigger Activation Time: Never
  Total Trigger Activations: 0
  Last Action Time: Never
  Total Actions: 0
  ```
• This command configures event-handler E3, which triggers on maintenance an enter operation of dynamic BGP unit 1::1 in VRF VRF1 at the last stage end.

```
switch(config)#event-handler E3
switch(config-handler-E3)#trigger on-maintenance enter bgp 1::1 vrf VRF1 end
switch(config-handler-E3)#action bash FastCli -c "show maintenance bgp ip all vrf all"
switch(config-handler-E3)# exit
switch(config)# show event-handler E3
Event-handler E3
  Trigger: Asynchronous on-maintenance enter bgp 1::1 vrf VRF1 end delay 0 seconds
  Threshold Time Window: 0 Seconds, Event Count: 1 times
  Action: FastCli -c "show maintenance bgp ip all vrf all"
  Action expected to finish in less than 10 seconds
  Last Trigger Detection Time: Never
  Total Trigger Detections: 0
  Last Trigger Activation Time: Never
  Total Trigger Activations: 0
  Last Action Time: Never
  Total Actions: 0

switch(config)#
```

**unit**

The `unit <unit_name>` command places the switch in maintenance unit configuration mode for configuring BGP/interface groups in the unit.

The command creates the unit if the specified unit profile does not exist prior to issuing the command. The `no unit <unit-name>` and `default unit <unit-name>` removes the unit from `running-config`.

**Command Mode**

Maintenance Configuration

**Command Syntax**

```
unit linecard l_range | unit_name
no unit linecard l_range | unit_name
default unit linecard l_range | unit_name
```

**Parameters**

- `Linecard l_range` name of the Linecard built-in unit
- `0 l_range` linecards available on the switch
- `unit_name` name of the user-configured unit

**Commands available in maintenance unit configuration mode:**

- `group interface`
- `group bgp`
- `profile unit`
- `quiesce`

**Note**

Built-in units like `System`, `Linecard3`, `Linecard4`, etc. do not allow group configuration but unit profile can be associated to these units.

**Examples**

- This command creates maintenance unit UNIT1.
  ```
  switch(config)#maintenance
  switch(config-maintenance)#unit UNIT1
  switch(config-unit-UNIT1)#show active maintenance
  unit UNIT1
  switch(config-unit-UNIT1)#
  ```

- This command enters the built-in `Linecard1` unit configuration mode.
  ```
  switch(config)#maintenance
  switch(config-maintenance)#unit Linecard1
  switch(config-builtin-unit-Linecard1)#show active maintenance
  unit Linecard1
  switch(config-builtin-unit-Linecard1)#
  ```
vrf

The vrf command specifies the VRF for BGP group. All the neighbors configured in the BGP group are considered to be members of the BGP group in the particular VRF context.

The no vrf <vrf-name> and default vrf <vrf-name> removes the VRF configuration from the BGP group and sets the VRF context to “default”.

Command Mode

Group-BGP Configuration

Command Syntax

  vrf vrf_name
  no vrf vrf_name
  default vrf vrf_name

Parameters

- vrf_name  name of the VRF in a group belonging to neighbors in that group

Example

- This command specifies VRF VRF1 for the neighbors in the BGP group BGP1.

```
switch(config)#group bgp BGP1
switch(config-group-bgp-BG1)#neighbor 1.0.1.1
switch(config-group-bgp-BG1)#neighbor 1::1
switch(config-group-bgp-BG1)#neighbor PG
switch(config-group-bgp-BG1)#vrf VRF1
switch(config-group-bgp-BG1)#show active
group bgp BGP1
   neighbor 1.0.1.1
   neighbor 1::1
   neighbor PG
   vrf VRF1
switch(config-group-bgp-BG1)#exit
switch(config)#
```
This chapter describes Ethernet ports supported by Arista switches. Sections covered in this chapter include:

- Section 11.1: Ethernet Ports Introduction
- Section 11.2: Ethernet Standards
- Section 11.3: Ethernet Physical Layer
- Section 11.4: Interfaces
- Section 11.5: Ethernet Configuration Procedures
- Section 11.6: Ethernet Configuration Commands

### 11.1 Ethernet Ports Introduction

Arista switches support a variety of Ethernet network interfaces. This chapter describes the configuration and monitoring options available in Arista switching platforms.

### 11.2 Ethernet Standards

Ethernet, standardized in IEEE 802.3, is a group of technologies used for communication over local area networks. Ethernet communication divides data streams into frames containing addresses (source and destination), payload, and cyclical redundancy check (CRC) information.

IEEE 802.3 also describes two types of optical fiber: single-mode fiber (SMF) and multi-mode fiber (MMF).

- SMF is more expensive, but can be used over longer distances (over 300 meters).
- MMF is less expensive, but can only be used over distances of less than 300 meters.

#### 11.2.1 100 Gigabit Ethernet

The 100 Gigabit Ethernet (100GbE) standard defines an Ethernet implementation with a nominal data rate of 100 billion bits per second over multiple 10 gigabit lanes. 100 Gigabit Ethernet implements full duplex point to point links connected by network switches. Arista switches support 100GBASE-10SR through MXP ports.
11.2.2 40 Gigabit Ethernet

The 40 Gigabit Ethernet (40GbE) standard defines an Ethernet implementation with a nominal data rate of 40 billion bits per second over multiple 10 gigabit lanes. 40 Gigabit Ethernet implements full duplex point to point links connected by network switches. 40 gigabit Ethernet standards are named 40GBASE-xyz, as interpreted by Table 11-1.

<table>
<thead>
<tr>

</tbody>
</table>

11.2.3 10 Gigabit Ethernet

The 10 Gigabit Ethernet (10GbE) standard defines an Ethernet implementation with a nominal data rate of 10 billion bits per second. 10 Gigabit Ethernet implements full duplex point to point links connected by network switches. Half duplex operation, hubs and CSMA/CD do not exist in 10GbE. The standard encompasses several PHY standards; a networking device may support different PHY types through pluggable PHY modules. 10GbE standards are named 10GBASE-xyz, as interpreted by Table 11-2.

11.2.4 Gigabit Ethernet

The Gigabit Ethernet (GbE), defined by IEEE 802.3-2008, describes an Ethernet version with a nominal data rate of one billion bits per second. GbE cables and equipment are similar to those used in previous standards. While full-duplex links in switches is the typical implementation, the specification permits half-duplex links connected through hubs.

Gigabit Ethernet physical layer standards that Arista switches support include 1000BASE-X (optical fiber), 1000BASE-T (twisted pair cable), and 1000BASE-CX (balanced copper cable).

- 1000BASE-SX is a fiber optic standard that utilizes multi-mode fiber supporting 770 to 860 nm, near infrared (NIR) light wavelength to transmit data over distances ranging from 220 to 550 meters. 1000BASE-SX is typically used for intra-building links in large office buildings, co-location facilities and carrier neutral Internet exchanges.
- 1000BASE-LX is a fiber standard that utilizes a long wavelength laser (1,270–1,355 nm), with a RMS spectral width of 4 nm to transmit data up to 5 km. 1000BASE-LX can run on all common types of multi-mode fiber with a maximum segment length of 550 m.
• 1000BASE-T is a standard for gigabit Ethernet over copper wiring. Each 1000BASE-T network segment can be a maximum length of 100 meters.

11.2.5 10/100/1000 BASE-T
Arista switches provide 10/100/1000 BASE-T Mbps Ethernet out of band management ports. Auto-negotiation is enabled on these interfaces. Speed (10/100/1000), duplex (half/full), and flow control settings are available using the appropriate speed forced and flowcontrol commands.

11.2.6 Power over Ethernet (PoE)
Selected Arista switches provide power over Ethernet (PoE) to power connected devices. Arista’s PoE implementation is compliant with IEEE standards 802.3af and 802.3at, and includes partial support for 802.3bt. When a standards-compliant powered device (PD) is connected to a PoE-enabled Ethernet port, it is recognized by a specific resistor signature, and its power class is determined by hardware negotiation; more granular power adjustments can then be managed by Link Layer Discovery Protocol (LLDP).

11.2.7 Link Fault Signaling
Link Fault Signaling (LFS) is a mechanism by which remote link faults are transmitted to the peer over the link that is experiencing problems by configuring specific actions. LFS operates between the remote Reconciliation Sublayer (remote RS) and the local Reconciliation Sublayer (local RS). Faults that are detected between the remote RS and the local RS are treated by the local RS as Local Faults.

LFS enables monitoring FCS and Symbol errors on an interface and if they exceed a configured threshold, one of the following three actions are enabled.
• Disable the error on the interface
• Generate system log messages
• Generate a link fault
11.3 Ethernet Physical Layer

The Ethernet physical layer (PHY) includes hardware components connecting a switch’s MAC layer to the transceiver, cable, and ultimately a peer link partner. Data exist in digital form at the MAC layer. On the line side of the PHY, data exist as analog signals: light blips on optical fiber or voltage pulses on copper cable. Signals may be distorted while in transit and recovery may require signal processing.

Ethernet physical layer components include a PHY and a transceiver.

11.3.1 PHYs

The PHY provides translation services between the MAC layer and transceiver. It also helps to establish links between the local MAC layer and peer devices by detecting and signaling fault conditions. The PHY line-side interface receives Ethernet frames from the link partner as analog waveforms. The PHY uses signal processing to recover the encoded bits, then sends them to the MAC layer.

PHY line-side interface components and their functions include:

- Physical Medium Attachment (PMA): Framing, octet synchronization, scrambling / descrambling.
- Physical Medium Dependent (PMD): Consists of the transceiver.
- Physical Coding Sublayer (PCS): Performs auto-negotiation and coding (8B/10B or 64B/66B).

The MAC sublayer of the PHY provides a logical connection between the MAC layer and the peer device by initializing, controlling, and managing the connection with the peer.

Ethernet frames transmitted by the switch are received by the PHY system-side interface as a sequence of digital bits. The PHY encodes them into a media-specific waveform for transmission through the line-side interface and transceiver to the link peer. This encoding may include signal processing, such as signal pre-distortion and forward error correction.

PHY system-side interface components and their functions include:

- 10 Gigabit Attachment Unit Interface (XAUI): Connects an Ethernet MAC to a 10 G PHY.
- Serial Gigabit Media Independent Attachment (SGMII): Connects an Ethernet MAC to a 1G PHY.

11.3.2 Transceivers

A transceiver connects the PHY to an external cable (optical fiber or twisted-pair copper) and through a physical connector (LC jack for fiber or RJ-45 jack for copper).

- Optical transceivers convert the PHY signal into light pulses that are sent through optical fiber.
- Copper transceivers connect the PHY to twisted-pair copper cabling.

Arista Small Form-Factor Pluggable (SFP+) and Quad Small Form Factor Pluggable (QSFP+) modules and cables provide high-density, low-power Ethernet connectivity over fiber and copper media. Arista offers transceivers that span data rates, media types, and transmission distances.

**Arista 10 Gigabit Ethernet SFP+ Modules:**

- 10GBASE-SR (Short Reach)
  - Link length maximum 300 meters over multi-mode fiber.
  - Optical interoperability with 10GBASE-SRL.
- 10GBASE-SRL (Short Reach Lite)
  - Link length maximum 100 meters over multi-mode fiber.
  - Optical interoperability with 10GBASE-SR.
**10GBASE-LRL (Long Reach Lite)**
- Link length maximum 1 km over single-mode fiber.
- Optical interoperability with 10GBASE-LR (1 km maximum).

**10GBASE-LR (Long Reach)**
- Link length maximum 10 km over single-mode fiber.
- Optical interoperability with 10GBASE-LRL (1 km maximum).

**10GBASE-LRM (Long Reach Multimode)**
- Link length maximum 220 meters over multi-mode fiber (50 um and 62.5 um).

**10GBASE-ER (Extended Reach)**
- Link length maximum 40 km over single-mode fiber.

**10GBASE-ZR (Ultra-Extended Reach)**
- Link length maximum 80 km over single-mode fiber.

**10GBASE-DWDM (Dense Wavelength Division Multiplexing)**
- Link length maximum 80 km over single-mode fiber (40 color options).
- Tunable SFP+ Optics Module, Full C-Band 50 GHz ITU Grid, up to 80km over duplex SMF.

**Arista 10 Gigabit Ethernet CR Cable Modules:**
- **10GBASE-CR SFP+ to SFP+ Cables**
  - Link lengths of 0.5, 1, 1.5, 2, 2.5, 3, 5 and 7 meters over twinax copper cable
  - Includes SFP+ connectors on both ends
- **4 x 10GbE QSFP+ to 4 x SFP+ twinax copper cables**
  - Link lengths of 0.5, 1, 2, 3, and 5 meters over twinax copper cable

**Arista 25 Gigabit Ethernet Modules:**
- **25GBASE-CR SFP28 Cable**
  - Capable of 10G/25G with link length of 1 to 5 meters
- **AOC-S-S-25G SFP28 to SFP28 25GbE Active Optical Cable**
  - Link length of 3 to 30 meters
- **SFP-25G-SR SFP28 Optics Module**
  - Link length up to 70m over OM3 MMF or 100m over OM4 MMF
- **SFP-25G-LR SFP28 Optics Module**
  - Link length up to 10 kilometers over duplex SMF

**Arista 40 Gigabit Ethernet QSFP+ Cables and Optics:**
- **40GBASE-SR4 QSFP+ Transceiver**
  - Link length maximum 100 meters over parallel OM3 or 150 meters over OM4 MMF
  - Optical interoperability with 40GBASE-XSR4 (100/150 meter maximum)
- **40GBASE-XSR4 QSFP+ Transceiver**
  - Link length maximum 300 meters over parallel OM3 or 450 meters over OM4 MMF
  - Optical interoperability with 40GBASE-SR4 (100/150 meter maximum)
- **40GBASE-LR4 QSFP+**
  - Link length maximum 10 km over duplex single-mode fiber
- 40GBASE-CR4 QSFP+ to QSFP+ twinax copper cables
  - Link lengths of 1, 2, 3, 5 and 7 meters over twinax copper cable
- 40G-SRBD Bidirectional QSFP+ Optic
  - Link length maximum up to 100 meters over parallel OM3 or 150 meters over OM4 MMF
- 40G Univ QSFP+ Optic
  - Link length maximum up to 150 meters over duplex OM3/OM4 and 500 meters over duplex SMF
- 40GBASE-LRL QSFP+ Optic
  - Link length maximum up to 1 kilometer over duplex SMF
- 40GBASE-PLRL4 QSFP+ Optic
  - Link length maximum up to 1 kilometer over parallel SMF (4x10G LR up to 1 km)
- 40GBASE-PLR4 QSFP+ Optic
  - Link length maximum up to 1 kilometer over parallel SMF (4x10G LR up to 1 km)
- 40GBASE-ER QSFP+ Optic
  - Link length maximum up to 40 kilometers duplex SMF

**Arista Gigabit Ethernet SFP Options:**
- 1000BASE-SX (Short Haul)
  - Multi-mode fiber
  - Link length maximum 550 meter
- 1000BASE-LX (Long Haul)
  - Single-mode fiber
  - Link length maximum 10 km (single mode)
- 1000BASE-T (RJ-45 Copper)
  - Category 5 cabling
  - Full duplex 1000Mbps connectivity

**Arista 100 Gigabit Ethernet QSFP Modules:**
- 100GBASE-SR4 QSFP transceiver
  - Link length up to 70 meters over parallel OM3 or 100 meters over OM4 multi-mode fiber.
- 100GBASE-SWDM4 QSFP transceiver
  - Link length up to 70 meters over OM3 or 100 meters over OM4 duplex multi-mode fiber.
- 100GBASE-SRBD BIDI QSFP transceiver
  - Link length up to 70 meters over OM3 or 100 meters over OM4 duplex multi-mode fiber.
- 100GBASE-PSM4 40G/100G dual speed QSFP Optics Module
  - Link length up to 500 meters over parallel single-mode fiber.
- 100GBASE-CWDM4 40G/100G dual speed QSFP Optics Module
  - Link length up to 2 km over duplex single-mode fiber.
- 100GBASE-LRL4 QSFP Optics Module
  - Link length up to 2 km over duplex single-mode fiber.
- 100GBASE-LR4 QSFP Optics Module
  - Link length up to 10 km over duplex single-mode fiber.
• 100GBASE-ERL4 QSFP Optics Module
  • Link length up to 40 km over duplex single-mode fiber.
• 100G DWDM QSFP transceiver
  • Link length up to 80 km over single-mode fiber.
• 100GBASE-CR4 QSFP to QSFP Twinax Copper Cable
  • Link length of 1 to 5 meters
• 100GBASE-CR4 QSFP to 4 x 25GbE SFP Twinax Copper Cable
  • Link length of 1 to 5 meters

Internal ports
Several Arista switches include internal ports that connect directly to an external cable through an RJ-45 jack. Internal ports available on Arista switches include:
• 100/1000BASE-T (7048T-A)
• 100/1000/10GBASE-T (7050-T)

AOC cables
• AOC-Q-Q-100G QSFP 100GbE Active Optical Cable
  • Link length of 3 to 30 meters
• AOC-Q-Q-40G QSFP+ to QSFP+ 40GbE Active Optical Cable
  • Link length of 3 to 100 meters
• AOC-S-S-25G SFP28 to SFP28 25GbE Active Optical Cable
  • Link length of 3 to 30 meters

11.3.3 MXP Ports
MXP ports provide embedded optics that operate in one of three modes: 10GbE (12 ports), 40GbE (3 ports), and 100GbE (1 port). Each mode requires a specified cable is implemented through configuration commands. MXP ports utilize multi-mode fiber to provide support over 150 meters.
• 100GbE mode requires an MTP-24 to MTP-24 cable, which uses 20 of 24 fibers to carry 100Gbe across 10 send and 10 receive channels. When connecting two 100GbE MXP ports, the TX lanes must be crossed with the RX lanes.
• 40GbE mode requires an MTP cable that provides a split into three MTP-12 ends. The cable splits the MXP port into three MTP-12 ends, each compatible with standards based 40GBASE-SR4 ports over OM3 or OM4 fiber up to 100m or 150m.
• 10GbE mode requires an MTP cable that provides a split into 12x10G with LC connectors to adapt the MXP port into 12x10GbE. The cable splits the MXP port into twelve LC ends for using SR or SRL optics over multimode OM3/OM4 cables.
11.4 Interfaces

Arista switches provide two physical interface types that receive, process, and transmit Ethernet frames: Ethernet interfaces and Management interfaces.

Each Ethernet interface is assigned a 48-bit MAC address and communicates with other interfaces by exchanging data packets. Each packet contains the MAC address of its source and destination interface. Ethernet interfaces establish link level connections by exchanging packets. Interfaces do not typically accept packets with a destination address of a different interface.

Ethernet data packets are frames. A frame begins with preamble and start fields, followed by an Ethernet header that includes source and destination MAC addresses. The middle section contains payload data, including headers for other protocols carried in the frame. The frame ends with a 32-bit cyclic redundancy check (CRC) field that interfaces use to detect data corrupted during transmission.

11.4.1 Ethernet Interfaces

Ethernet speed and duplex configuration options depend on the media type of the interface:

- **40G QSFP+**: Default operation is as four 10G ports. **Speed forced** command options support configuration as a single 40G port.
- **10GBASE-T**: Mode is **autonegotiate** by default, offering 10G and 1G full duplex and 100M. Default setting is 10G. Half duplex and 10M are not supported. Adjustments may be made using **speed forced** commands.
- **10GBASE (SFP+)**: Port operates as a single 10G port. **Speed forced** commands do not affect configuration.
- **1000BASE-T (copper)**: Mode is **autonegotiate** by default, offering 1G full and 100M; default setting is 1G full. Autonegotiation that offers only 100M is available through **speed auto 100full** command. Half duplex and 10M are not supported.
- **100G CFP**: Default operation is 100G. It cannot be split, and its speed cannot be changed.
- **100G MXP**: Default operation is as a single 100G port on the 7500 and 7280 platforms, and as three 40G ports on the 7050 platform. On the 7500 and 7280 platforms, available speed/duplex settings are a single 100G port, three 40G ports, or twelve 10G ports. On the 7050 platform, available speed/duplex settings are three 40G ports or twelve 10G ports. Adjustments are made with **speed forced** commands.
- **100G QSFP100**: Available speeds are transceiver-dependent. The QSFP100 transceiver supports a single 100G port, four 25G ports, or two 50G ports; the QSFP+ transceiver supports one 40G port or four 10G ports; the CWDM transceiver supports all five configurations. Adjustments are made using **speed forced** commands. **Note**: 7500 and 7280 families do not currently support 25G or 50G speeds.
- The **SFP-1G-T** transceivers advertise one speed at a time only. Hence, the desired speed and negotiation must be configured explicitly using the following commands:
  - **speed auto**: auto-negotiated 1Gbps (this is because no speed is specified and we are defaulting to advertise 1G).
  - **speed auto 1G full**/ **speed 1G**: auto-negotiated 1Gbps (note that per BASE-T standard, 1G must be negotiated)
  - **speed auto 100full**: auto-negotiated 100Mbps
  - **speed 100full**: non-negotiated/true-forced 100Mbps

For information relating to transceivers, please see Transceivers.
11.4.2 Subinterfaces

Subinterfaces divide a single ethernet or port channel interface into multiple logical L3 interfaces based on the 802.1q tag (VLAN ID) of incoming traffic. Subinterfaces are commonly used in the L2/L3 boundary device, but they can also be used to isolate traffic with 802.1q tags between L3 peers by assigning each subinterface to a different VRF.

While subinterfaces can be configured on a port channel interface (the virtual interface associated with a port channel), the following restrictions apply:

- An L3 interface with subinterfaces configured on it should not be made a member of a port channel.
- An interface that is a member of a port channel should not have subinterfaces configured on it.
- A subinterface cannot be made a member of a port channel.

Subinterfaces on multiple ports can be assigned the same VLAN ID, but there is no bridging between subinterfaces (or between subinterfaces and SVIs), and each subinterface is considered to be in a separate bridge domain.

The following features are supported on subinterfaces:

- Unicast and multicast routing
- BGP, OSPF, ISIS, PIM
- ACL
- VRF
- VRRP
- SNMP
- Subinterface counters (on some platforms)
- VXLAN (on some platforms)
- MPLS (on some platforms)
- GRE (on some platforms)
- PBR (on some platforms)
- QoS (on some platforms)
- Inheriting QoS settings (trust mode and default DSCP) from the parent interface
- Inheriting MTU setting from parent interface

The following are **not** supported on subinterfaces:

- Per-subinterface MTU setting
- Per-subinterface SFLOW settings
- Per-subinterface mirroring settings

11.4.3 Agile Ports

Agile Ports are a feature of the 7150S Series that allows the user to configure adjacent blocks of 4 x SFP+ interfaces as a single 40G link. The set of interfaces that can be combined to form a higher speed port is restricted by the hardware configuration. Only interfaces that pass through a common PHY component can be combined. One interface within a combinable set is designated as the primary port. When the primary interface is configured as a higher speed port, all configuration statements are performed on that interface. All other interfaces in the set are subsumed and not individually configurable when the primary interface is configured as the higher speed port. This feature allows the 7150S-24 to behave as a 4x40G switch (using 16 SFP+) and the remaining SFP+ provide 8 x 10G
ports. On the 7150S-52 this allows up to 13x 40G (all 52 ports grouped as 40G) and on the 7150S-64 Agile Ports allows the switch to be deployed with up to 16 native 40G interfaces - 4 are QSFP+ and the remaining 12 as 4xSFP+ groups.

Section 11.5.11 describes the configuration of agile ports.

11.4.4 Management Interfaces

The management interface is a layer 3 host port that is typically connected to a PC for performing out of band switch management tasks. Each switch has one or two management interfaces. Only one port is needed to manage the switch; the second port, when available, provides redundancy.

Management interfaces are 10/100/1000 BASE-T interfaces. By default, auto-negotiation is enabled on management interfaces. All combinations of speed 10/100/1000 and full or half duplex is enforceable on these interfaces through `speed` commands.

Management ports are enabled by default. The switch cannot route packets between management ports and network (Ethernet interface) ports because they are in separate routing domains. When the PC is multiple hops from the management port, packet exchanges through layer 3 devices between the management port and PC may require the enabling of routing protocols.

The Ethernet management ports are accessed remotely over a common network or locally through a directly connected PC. An IP address and static route to the default gateway must be configured to access the switch through a remote connection.

11.4.5 Tunable SFP

Tuning of DWDM 10G SFP+ transceivers (10GBASE-DWDM) includes:

- Tuning transceiver wavelength/frequency by channel number
- Showing wavelengths/frequencies for specified channels supported by the transceiver
- Showing current wavelength/frequency settings of the transceiver interface

For information relating to tuning the transceiver wavelength/frequency by channel number, refer to the command `transceiver channel`. To show the current wavelength/frequency settings for specified channels, refer to the command `show interfaces transceiver channels`. To show the current wavelength/frequency settings of an interface, refer to the command `show interfaces transceiver hardware`. 
11.5 Ethernet Configuration Procedures

These sections describe Ethernet and Management interface configuration procedures:

- Section 11.5.1: Physical Interface Configuration Modes
- Section 11.5.2: Assigning a MAC Address to an Interface
- Section 11.5.3: Port Groups (QSFP+ and SFP+ Interface Selection)
- Section 11.5.4: Referencing Modular Ports
- Section 11.5.5: Referencing Multi-lane Ports
- Section 11.5.6: QSFP+ Ethernet Port Configuration
- Section 11.5.7: QSFP100 Ethernet Port Configuration
- Section 11.5.8: CFP2 Ethernet Port Configuration
- Section 11.5.9: MXP Ethernet Port Configuration
- Section 11.5.10: Port Speed Capabilities
- Section 11.5.11: Agile Ports
- Section 11.5.12: Subinterface Configuration
- Section 11.5.13: Autonegotiated Settings
- Section 11.5.14: Displaying Ethernet Port Properties
- Section 11.5.15: Ingress Counters
- Section 11.5.16: Configuring Ingress Traffic-Class Counters
- Section 11.5.17: Configuring Power over Ethernet (PoE)
- Section 11.5.18: Configuring Link Fault Signaling
- Section 11.5.19: Configuring Hardware TCAM

11.5.1 Physical Interface Configuration Modes

The switch provides two configuration modes for modifying Ethernet parameters:

- Interface-Ethernet mode configures parameters for specified Ethernet interfaces.
- Interface-Management mode configures parameters for specified management Ethernet interfaces.

Physical interfaces cannot be created or removed.

Multiple interfaces can be simultaneously configured. Commands are available for configuring Ethernet specific, layer 2, layer 3, and application layer parameters. Commands that modify protocol specific settings in Ethernet configuration mode are listed in the protocol chapters.

- The `interface ethernet` command places the switch in Ethernet-interface configuration mode.
- The `interface management` command places the switch in management configuration mode.

**Examples**

- This command places the switch in Ethernet-interface mode for Ethernet interfaces 5-7 and 10.
  
  ```
  switch(config)#interface ethernet 5-7,10
  switch(config-if-Et5-7,10)#
  ```

- This command places the switch in management-interface mode for management interface 1.

  ```
  switch(config)#interface management 1
  switch(config-if-Ma1)#
  ```
11.5.2 Assigning a MAC Address to an Interface

Ethernet and Management interfaces are assigned a MAC address when manufactured. This address is the burn-in address. The mac-address command assigns a MAC address to the configuration mode interface in place of the burn-in address. The no mac-address command reverts the interface’s current MAC address to its burn-in address.

Examples

- This command assigns the MAC address of 001c.2804.17e1 to Ethernet interface 7.
  
  ```
  switch(config-if-Et7)#mac-address 001c.2804.17e1
  ```

- This command displays the MAC address of Ethernet interface 7. The active MAC address is 001c.2804.17e1. The burn-in address is 001c.7312.02e2.
  
  ```
  switch(config-if-Et7)#show interface ethernet 7
  Ethernet7 is up, line protocol is up (connected)
  Hardware is Ethernet, address is 001c.2804.17e1 (bia 001c.7312.02e2)
  Description: b.e45
  <--------OUTPUT OMITTED FROM EXAMPLE-------->
  ```

11.5.3 Port Groups (QSFP+ and SFP+ Interface Selection)

Several of Arista’s fixed switches limit the number of 10G data lanes in operation through the use of port groups. A port group is a set of interfaces that can be configured as four SFP+ interfaces or a single QSFP+ interface. When configured in SFP+ mode, the port group enables 4 standalone 10GbE interfaces using SFP+ optics. When configured in QSFP+ mode, the port group enables a single QSFP+ interface (in addition to the dedicated QSFP+ ports), which can operate as a single 40GbE port, or as four 10GbE ports with the appropriate breakout cabling.

Hardware port groups are used on the following systems:

- DCS-7050Q-16
- DCS-7050QX-32S

Use the hardware port-group command to select the interface mode for the specified port group.

**Important!** The hardware port-group command restarts the forwarding agent, which disrupts traffic on all switch ports.

Example

- These commands configure the DCS-7050-Q16 switch to enable four SFP+ interfaces and one extra QSFP+ interface by enabling the SFP+ interfaces in port group 1 and the QSFP+ interface in port group 2.

  ```
  switch(config)#hardware port-group 1 select Et17-20
  switch(config)#hardware port-group 2 select Et16/1-4
  ```

The show hardware port-group command displays the status of ports in the port groups.
Example

- This command displays the status of the flexible ports within the two port groups on a DCS-7050Q-16 switch.

```
switch#show hardware port-group
```

<table>
<thead>
<tr>

11.5.3.1 DCS-7050Q-16

The DCS-7050Q-16 has 14 dedicated QSFP+ ports, plus two port groups. The port groups support either two additional QSFP+ ports or eight SFP+ ports as shown in Table 11-3.

**Table 11-3 DCS-7050Q-16 Port Groups**

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

11.5.3.2 DCS-7050QX-32S

The DCS-7050QX-32S has 31 dedicated QSFP+ ports, plus one port group. The port group supports either one additional QSFP+ port or four SFP+ ports as shown in Table 11-4.
11.5.4 Referencing Modular Ports

Arista modular switches provide port access through installed line cards. The maximum number of line cards on a modular switch varies with the switch series and model.

Several CLI commands modify modular parameters for all ports on a specified line card or controlled by a specified chip. This manual uses these conventions to reference modular components:

- `card_x` refers to a line card.
- `module_y` refers to a QSFP+ module.
- `port_z` refers to a line card or module port.

Commands that display Ethernet port status use the following conventions:

- SFP ports: `card_x/port_z` to label the line card-port location of modular ports
- QSFP ports: `card_x/module_y/port_z` to label the line card-port location of modular ports

Section 11.5.6 describe QSFP+ module usage.

Example

- This command displays the status of interfaces 1 to 9 on line card 4:

  ```
  switch>show interface ethernet 4/1-9 status
  Port      Name              Status       Vlan        Duplex  Speed Type
  Et4/1                       connected    1             full    10G Not Present
  Et4/2                       connected    1             full    10G Not Present
  Et4/3                       connected    1             full    10G Not Present
  Et4/4                       connected    1             full    10G Not Present
  Et4/5                       connected    1             full    10G Not Present
  Et4/6                       connected    1             full    10G Not Present
  Et4/7                       connected    1             full    10G Not Present
  Et4/8                       connected    1             full    10G Not Present
  Et4/9                       connected    1             full    10G Not Present
  switch>
  ```

11.5.5 Referencing Multi-lane Ports

EOS supports two types of Ethernet ports:

- single-lane (also called fixed-lane)
- multi-lane (also called flexible-lane)

Single-lane (or "fixed-lane") ports are always modeled as a single interface within EOS. While the speed of the interface may be configurable, the physical port can never be broken out into multiple lower-speed interfaces. Single-lane ports use the following naming scheme:

- Ethernet <port #> (for fixed switches)
- Ethernet <module #>/<port #> (for modular switches)
Multi-lane (or “flexible lane”) ports are made up of multiple parallel lanes, each served by its own laser. Multi-lane ports can be configured to combine the lanes and operate as a single native high-speed interface (a 40GbE or 100GbE interface), or to operate each lower-speed interface independently (four 10GbE or 25GbE interfaces). Multi-lane ports use the following naming scheme:

- Ethernet <port #>/<lane #> (for fixed switches)
- Ethernet <module #>/<port #>/<lane #> (for modular switches)

The operational state displayed for each lane of a multi-lane port is determined by the configuration applied to the primary lane(s), as shown in Table 11-5. When broken out into multiple lower-speed interfaces, all lanes will be active in parallel, and each will display its operational state as connected or not connected. In high-speed mode, only the primary lane(s) will be displayed as active, with the remaining lanes showing as errdisabled. The exception is the CFP2 module: when it is configured as a single 100GbE port, the primary lane is displayed as active in the CLI while the other lanes are hidden.

<table>
<thead>
<tr>
<th>Parent Port Configured Mode</th>
<th>Primary Lane(s)</th>
<th>Secondary Lanes</th>
</tr>
</thead>
<tbody>
<tr>
<td>single high-speed interface</td>
<td>active (connected/not connected)</td>
<td>inactive (errdisabled)</td>
</tr>
<tr>
<td>multi-interface</td>
<td>active (connected/not connected)</td>
<td>active</td>
</tr>
</tbody>
</table>

A multi-lane port is configured as a single high-speed interface or multiple breakout interfaces by using the speed command on the primary lane(s) of the port. For specific configuration instructions and details regarding the primary lane(s) of a specific interface, refer to the configuration section for the appropriate interface type:

- QSFP+ Ethernet Port Configuration
- QSFP100 Ethernet Port Configuration
- CFP2 Ethernet Port Configuration
- MXP Ethernet Port Configuration

Important! Use of the speed command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280SE, 7300X, 7320X and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which will result in traffic disruption. On 7160 series platforms, use of the speed command is hitless, but if the command changes the number of port lanes, packets may be dropped on unrelated ports.

11.5.6 QSFP+ Ethernet Port Configuration

Each QSFP+ module contains four data lanes which can be used individually or combined to form a single, higher-speed interface. This allows a QSFP+ Ethernet port to be configured as a single 40GbE interface or as four 10GbE interfaces.

When the four lanes are combined to form a 40GbE interface, display commands will show lane /1 as connected or not connected, and will show lanes /2 through /4 as errdisabled.

The following sections describe the configuration of QSFP+ ports.
11.5.6.1 Configuring a QSFP+ Module as a Single 40GbE Interface

To configure the port as a single 40GbE interface, combine the module’s four data lanes by using the `speed` command (`speed forced 40g full`) on the port’s /1 lane (the primary lane).

**Important!** Use of the `speed` command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280SE, 7300X, 7320X and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which will result in traffic disruption. On 7160 series platforms, use of the `speed` command is hitless, but if the command changes the number of port lanes, packets may be dropped on unrelated ports.

**Step 1** Enter interface Ethernet configuration mode for lane /1 of the QSFP+ Ethernet interface.

```
switch(config)#interface ethernet 5/1/1
```

**Step 2** Enter the `speed forced 40g full` command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for 60 seconds or more.

```
switch(config-if-Et5/1/1)#speed forced 40g full
```

**Step 3** Use the `show interfaces status` command to confirm the change in configuration.

```
switch(config-if-Et5/1/1)#show interfaces status

<table>
<thead>
<tr>

</tbody>
</table>
```

11.5.6.2 Configuring a QSFP+ Module as Four 10GbE Interfaces

To configure the port as four 10GbE interfaces, use the `speed` command (`speed forced 10000full`) on the port’s /1 lane (the primary lane).

**Important!** Use of the `speed` command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280SE, 7300X, 7320X and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which will result in traffic disruption. On 7160 series platforms, use of the `speed` command is hitless, but if the command changes the number of port lanes, packets may be dropped on unrelated ports.

**Step 1** Enter interface Ethernet configuration mode for lane /1 of the QSFP+ Ethernet interface.

```
switch(config)#interface ethernet 5/1/1
```

**Step 2** Enter the `speed forced 10000full` command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for 60 seconds or more.

```
switch(config-if-Et5/1/1)#speed forced 10000full
```
Step 3 Use the `show interfaces status` command to confirm the change in configuration.

```
switch(config-if-Et5/1/1)#show interfaces status
Port Name Status Vlan Duplex Speed Type Flags
Et1 connected 2 full 1G 10GBASE-T
Et5/1/1 connected 1 full 10G 40GBASE-SR4
Et5/1/2 connected 1 full 10G 40GBASE-SR4
Et5/1/3 connected 1 full 10G 40GBASE-SR4
Et5/1/4 connected 1 full 10G 40GBASE-SR4
```

11.5.7 QSFP100 Ethernet Port Configuration

Each QSFP100 module contains four data lanes which can be used individually or combined to form a single, higher-speed interface. This allows a QSFP100 Ethernet port to be configured as a single 100GbE interface, a single 40GbE interface, or four 10GbE interfaces. The default mode is a single 100GbE interface.

The 7060X, 7260X and 7320X platforms also allow a QSFP100 port to be configured as two 50GbE interfaces or four 25GbE interfaces.

When the lanes are combined to form a higher-speed interface, display commands will show the primary lane(s) as `connected` or `not connected`, and will show the other lanes as `errdisabled`.

The following sections describe the configuration of QSFP+ ports.

11.5.7.1 Configuring a QSFP100 Module as a Single 100GbE Interface

By default, the QSFP100 module operates as a single 100GbE interface; using the `default speed` or `no speed` command on the primary lane restores the default behavior.

To explicitly configure the port as a single 100GbE interface, combine the module’s four data lanes by using the `speed` command (`speed forced 100gfull`) on the port’s /1 lane (the primary lane).

**Important!** Use of the `speed` command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280SE, 7300X, 7320X and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which will result in traffic disruption. On 7160 series platforms, use of the `speed` command is hitless, but if the command changes the number of port lanes, packets may be dropped on unrelated ports.

Step 1 Enter interface Ethernet configuration mode for lane /1 of the QSFP100 Ethernet interface.

```
switch(config)#interface ethernet 5/1/1
```

Step 2 Enter the `speed forced 100gfull` command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for 60 seconds or more.

```
switch(config-if-Et5/1/1)#speed forced 100gfull
```

Step 3 Use the `show interfaces status` command to confirm the change in configuration.

```
switch(config-if-Et5/1/1)#show interfaces status
Port Name Status Vlan Duplex Speed Type Flags
Et1 connected 2 full 1G 10GBASE-T
Et5/1/1 connected 1 full 100G 100GBASE-SR4
Et5/1/2 errdisabled 1 unconf unconf 100GBASE-SR4
Et5/1/3 errdisabled 1 unconf unconf 100GBASE-SR4
Et5/1/4 errdisabled 1 unconf unconf 100GBASE-SR4
```
11.5.7.2 Configuring a QSFP100 Module as Two 50GbE Interfaces

To configure the port as a two 50GbE interfaces, configure the module’s four data lanes by using the `speed` command (`speed forced 50gfull`) on the port’s /1 and /3 lanes. This configuration is available on 7060X, 7260X and 7320X platforms.

**Important!** Use of the `speed` command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280SE, 7300X, 7320X and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which will result in traffic disruption. On 7160 series platforms, use of the `speed` command is hitless, but if the command changes the number of port lanes, packets may be dropped on unrelated ports.

**Step 1** Enter interface Ethernet configuration mode for lane /1 of the QSFP100 Ethernet interface.

```bash
switch(config)#interface ethernet 5/1/1
```

**Step 2** Enter the `speed forced 50gfull` command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for 60 seconds or more.

```bash
switch(config-if-Et5/1/1)#speed forced 50gfull
```

**Step 3** Repeat the above steps for lane /3.

```bash
switch(config-if-Et5/1/1)#interface ethernet 5/1/3

switch(config-if-Et5/1/3)#speed forced 50gfull
```

**Step 4** Use the `show interfaces status` command to confirm the change in configuration.

```bash
switch(config-if-Et5/1/1)#show interfaces status
```

</tbody>
</table>

**Step 4** Use the `show interfaces status` command to confirm the change in configuration.

11.5.7.3 Configuring a QSFP100 Module as a Single 40GbE Interface

To configure the port as a single 40GbE interface, combine the module’s four data lanes by using the `speed` command (`speed forced 40gfull`) on the port’s /1 lane (the primary lane).

**Important!** Use of the `speed` command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280SE, 7300X, 7320X and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which will result in traffic disruption. On 7160 series platforms, use of the `speed` command is hitless, but if the command changes the number of port lanes, packets may be dropped on unrelated ports.

**Step 1** Enter interface Ethernet configuration mode for lane /1 of the QSFP100 Ethernet interface.

```bash
switch(config)#interface ethernet 5/1/1
```

**Step 2** Enter the `speed forced 40gfull` command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for 60 seconds or more.

```bash
switch(config-if-Et5/1/1)#speed forced 40gfull
```
Step 3  Use the show interfaces status command to confirm the change in configuration.

```
switch(config-if-Et5/1/1)#show interfaces status
Port  Name Status  Vlan Duplex Speed Type Flags
Et1   connected  2 full 1G  10GBASE-T
Et5/1/1 connected  1 full 40G 100GBASE-SR4
Et5/1/2 errdisabled 1 unconf unconf 100GBASE-SR4
Et5/1/3 errdisabled 1 unconf unconf 100GBASE-SR4
Et5/1/4 errdisabled 1 unconf unconf 100GBASE-SR4
```

11.5.7.4 Configuring a QSFP100 Module as Four 25GbE Interfaces

To configure the port as four 25GbE interfaces, use the speed command (speed forced 25gfull) on the port’s /1 lane (the primary lane). This configuration is available on 7060X, 7260X and 7320X platforms.

**Important!** Use of the speed command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280SE, 7300X, 7320X and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which will result in traffic disruption. On 7160 series platforms, use of the speed command is hitless, but if the command changes the number of port lanes, packets may be dropped on unrelated ports.

**Step 1**  Enter interface Ethernet configuration mode for lane /1 of the QSFP100 Ethernet interface.
```
switch(config)#interface ethernet 5/1/1
```

**Step 2**  Enter the speed forced 25gfull command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for 60 seconds or more.
```
switch(config-if-Et5/1/1)#speed forced 25gfull
```

**Step 3**  Use the show interfaces status command to confirm the change in configuration.
```
switch(config-if-Et5/1/1)#show interfaces status
Port  Name Status  Vlan Duplex Speed Type Flags
Et1   connected  2 full 1G  10GBASE-T
Et5/1/1 connected  1 full 25G 100GBASE-SR4
Et5/1/2 errdisabled 1 unconf unconf 100GBASE-SR4
Et5/1/3 errdisabled 1 unconf unconf 100GBASE-SR4
Et5/1/4 errdisabled 1 unconf unconf 100GBASE-SR4
```

11.5.7.5 Configuring a QSFP100 Module as Four 10GbE Interfaces

To configure the port as four 10GbE interfaces, use the speed command (speed forced 10000full) on the port’s /1 lane (the primary lane).

**Important!** Use of the speed command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280SE, 7300X, 7320X and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which will result in traffic disruption. On 7160 series platforms, use of the speed command is hitless, but if the command changes the number of port lanes, packets may be dropped on unrelated ports.

**Step 1**  Enter interface Ethernet configuration mode for lane /1 of the QSFP100 Ethernet interface.
```
switch(config)#interface ethernet 5/1/1
```
Step 2  Enter the speed forced 10000full command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for 60 seconds or more.

switch(config-if-Et5/1/1)# speed forced 10000full

Step 3  Use the show interfaces status command to confirm the change in configuration.

switch(config-if-Et5/1/1)# show interfaces status

<table>

11.5.8  CFP2 Ethernet Port Configuration

Each CFP2 module contains ten data lanes. The configuration options available on the port depend on the optic inserted:

- CFP2-100G-LR4 optics operate only in 100GbE mode.
- CFP2-100G-ER4 optics operate only 100GbE mode.
- CFP2-100G-XSR10 optics can be configured as a single 100GbE interface or as ten 10GbE interfaces.

When the port is configured as ten 10GbE interface, each lane is active and visible in CLI display commands. When the lanes are combined to form a single 100GbE interface, display commands will show the primary lane as connected or not connected; all other lanes will be hidden.

The following sections describe the configuration of CFP2 ports.

11.5.8.1  Configuring a CFP2 Module a as a Single100GbE Interface

To configure the port as a single 100GbE interface (the default configuration), combine the module’s ten data lanes by using the speed command (speed forced 100gfull) on the port’s /1 lane (the primary lane).

This configuration is available for all pluggable optics.

**Important!** Use of the speed command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280SE, 7300X, 7320X and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which will result in traffic disruption. On 7160 series platforms, use of the speed command is hitless, but if the command changes the number of port lanes, packets may be dropped on unrelated ports.

Step 1  Enter interface Ethernet configuration mode for lane /1 of the CFP2 Ethernet interface.

switch(config)# interface ethernet 5/1/1

Step 2  Enter the speed forced 100gfull command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for 60 seconds or more.

switch(config-if-Et5/1/1)# speed forced 100gfull
Step 3 Use the `show interfaces status` command to confirm the change in configuration.

```
   switch(config-if-Et5/1/1)#show interfaces status
   Port   Name      Status  Vlan  Duplex  Speed  Type    Flags
   Et1    connected 2  full  1G  10GBASE-T
   Et5/1/1 connected 1  full  10G 100GBASE-SR1
   Et5/2/1 connected 1  full  10G 100GBASE-SR1
```

11.5.8.2 Configuring a CFP2 Module as Ten 10GbE Interfaces

To configure the port as four 10GbE interfaces, use the `speed` command (`speed forced 10000full`) on the port’s /1 lane (the primary lane).

This configuration is available only for CFP2-100G-XSR10 optics.

**Important!** Use of the `speed` command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280SE, 7300X, 7320X and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which will result in traffic disruption. On 7160 series platforms, use of the `speed` command is hitless, but if the command changes the number of port lanes, packets may be dropped on unrelated ports.

Step 1 Enter interface Ethernet configuration mode for lane /1 of the CFP2 Ethernet interface.

```
   switch(config)#interface ethernet 5/1/1
```

Step 2 Enter the `speed forced 10000full` command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for 60 seconds or more.

```
   switch(config-if-Et5/1/1)#speed forced 10000full
```

Step 3 Use the `show interfaces status` command to confirm the change in configuration.

```
   switch(config-if-Et5/1/1)#show interfaces status
   Port   Name      Status  Vlan  Duplex  Speed  Type    Flags
   Et1    connected 2  full  1G  10GBASE-T
   Et5/1/1 connected 1  full  10G 100GBASE-SR1
   Et5/1/2 connected 1  full  10G 100GBASE-SR1
   Et5/1/3 connected 1  full  10G 100GBASE-SR1
   Et5/1/4 connected 1  full  10G 100GBASE-SR1
   Et5/1/5 connected 1  full  10G 100GBASE-SR1
   Et5/1/6 connected 1  full  10G 100GBASE-SR1
   Et5/1/7 connected 1  full  10G 100GBASE-SR1
   Et5/1/8 connected 1  full  10G 100GBASE-SR1
   Et5/1/9 connected 1  full  10G 100GBASE-SR1
   Et5/1/10 connected 1  full  10G 100GBASE-SR1
```

11.5.9 MXP Ethernet Port Configuration

Each MXP module contains twelve data lanes which can be used individually or combined to form one or more higher-speed interfaces. This allows an MXP Ethernet port to be configured as a single 100GbE interface, up to twelve 10GbE interfaces, or a mixture of 40GbE and 10GbE ports.

MXP ports do not use pluggable optics: instead, an MTP-24 ribbon is inserted directly into the port. The remote end of the MTP 24 ribbon must then be broken out using a splitter cable or cartridge based on the operational mode and speed of the MXP port.
When four lanes of an MXP interface are combined to form a 40GbE port, CLI commands will show the primary lane of that group as **connected or not connected** and the other three lanes as **errdisabled**.

The following sections describe the configuration of MXP interfaces.

### 11.5.9.1 Configuring an MXP Module as a Single 100GbE Interface

To configure the port as a single 100GbE interface (the default configuration), enter the `speed` command (**speed forced 100gfull**) on the port's /1 lane (the primary lane). This combines lanes 1-10 and disables lanes 11 and 12.

Under this configuration, CLI display commands will show lane /1 as **connected or not connected**, and show lanes /2-/12 as **errdisabled**.

**Important!** Use of the `speed` command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280SE, 7300X, 7320X and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which will result in traffic disruption. On 7160 series platforms, use of the `speed` command is hitless, but if the command changes the number of port lanes, packets may be dropped on unrelated ports.

**Step 1** Enter interface Ethernet configuration mode for lane /1 of the MXP Ethernet interface.

```
switch(config)#interface ethernet 5/49/1
```

**Step 2** Enter the `speed forced 100gfull` command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for 60 seconds or more.

```
switch(config-if-Et5/49/1)#speed forced 100gfull
```

**Step 3** Use the `show interfaces status` command to confirm the change in configuration.

```
switch(config-if-Et5/49/1)#show interfaces status

</table>
```

### 11.5.9.2 Configuring an MXP Module With 40GbE Interfaces

Each set of four lanes on the MXP module is independently configurable as a single 40GbE interface or four 10GbE interfaces. To configure four lanes as a single 40GbE interface, enter the `speed` command (**speed forced 40gfull**) on the group's primary lane (/1, /5, or /9). To revert a group of four lanes to functioning as four independent 10GbE interfaces, enter the `speed forced 10000full` command on the primary lane of the group.
When four lanes of an MXP interface are combined to form a 40GbE port, CLI commands will show the primary lane of that group as **connected** or **not connected** and the other three lanes as **errdisabled**. In groups of four lanes which are configured as four independent 10GbE interfaces, each lane will be displayed in the CLI as **connected** or **not connected**.

Note that a **speed forced 100gfull** command entered on the /1 lane takes precedence over **speed forced 40gfull** commands on the /5 and /9 lanes.

**Important!** Use of the **speed** command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280SE, 7300X, 7320X and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which will result in traffic disruption. On 7160 series platforms, use of the **speed** command is hitless, but if the command changes the number of port lanes, packets may be dropped on unrelated ports.

The example below shows the steps for configuring an MXP module as three 40GbE interfaces.

**Step 1** Enter interface Ethernet configuration mode for lane /1 of the MXP Ethernet interface.

```
switch(config)#interface ethernet 5/49/1
```

**Step 2** Enter the **speed forced 40gfull** command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for 60 seconds or more.

```
switch(config-if-Et5/49/1)#speed forced 40gfull
```

**Step 3** Repeat the above steps for lanes /5 and /9.

```
switch(config-if-Et5/49/1)#interface ethernet 5/49/5
switch(config-if-Et5/49/5)#speed forced 40gfull
switch(config-if-Et5/49/5)#interface ethernet 5/49/9
switch(config-if-Et5/49/9)#speed forced 40gfull
```

**Step 4** Use the **show interfaces status** command to confirm the change in configuration.

```
switch(config-if-Et5/49/9)#show interfaces status
```

11.5.9.3 Configuring an MXP Module as Twelve 10GbE Interfaces

Each lane of an MXP port functions as a 10GbE interface when it is not included in a higher-speed interface configuration (either actively or as an **errdisabled** port).

To explicitly configure the port as twelve 10GbE interfaces, use the **speed** command (**speed forced 10000full**) on all twelve lanes of the port.

When each lane is configured as an independent 10GbE interface, CLI display commands show each lane as **connected** or **not connected**.
Use of the `speed` command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280SE, 7300X, 7320X and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which will result in traffic disruption. On 7160 series platforms, use of the `speed` command is hitless, but if the command changes the number of port lanes, packets may be dropped on unrelated ports.

**Step 1** Enter interface Ethernet configuration mode for all twelve lanes of the MXP Ethernet interface.

```bash
switch(config)#interface ethernet 5/49/1-12
```

**Step 2** Enter the `speed forced 10000full` command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for 60 seconds or more.

```bash
switch(config-if-Et5/49/1-12)#speed forced 10000full
```

**Step 3** Use the `show interfaces status` command to confirm the change in configuration.

```bash
switch(config-if-Et5/49/1-12)#show interfaces status
```

---

### 11.5.10 Port Speed Capabilities

The supported speeds supported on each Arista platform per interface type are described in Table 11-6.

11.5.11 Agile Ports

An agile port is an interface that can function as a 10G port or can subsume a predefined set of 10G interfaces to form an interface with higher speed capabilities.

The set of interfaces that can be combined to form a higher speed port is restricted by the hardware configuration. Only interfaces that pass through a common PHY component can be combined. One interface within a combinable set is designated as the primary port.

- To view the set of available agile ports and the subsumable interfaces that comprise them, enter `show platform fm6000 agileport map`.
- To configure the primary port as a higher speed port, enter `speed forced 40gfull` or `speed auto 40gfull`.
- To revert the primary port and its subsumed ports to 10G interfaces, enter `no speed`.

### Table 11-6 Supported Speeds (GbE)

</table>
Example

- These commands displays the agile port map for the switch, then configures ethernet interface 13 as a 40G port.

```
switch#show platform fm6000 agileport map

-----------------------------------------------------------------
| Agile Ports | Interfaces subsumed in 40G link |
-----------------------------------------------------------------
| Ethernet1   | Ethernet3 Ethernet5 Ethernet7 |
| Ethernet2   | Ethernet4 Ethernet6 Ethernet8 |
| Ethernet13  | Ethernet15 Ethernet17 Ethernet19 |
| Ethernet14  | Ethernet16 Ethernet18 Ethernet20 |
```

```
switch#config
switch(config)#interface ethernet 13
switch(config-if-Et13)#speed forced 40gfull

WARNING! Executing this command will cause the forwarding agent to be restarted. All interfaces will briefly drop links and forwarding on all interfaces will momentarily stop.

Do you wish to proceed with this command? [y/N]

Ethernet17 configured for 40G.
Ethernet15, Ethernet17 and Ethernet19 are now subsumed.
```

```
switch(config-if-Et13)#
This command reverts the agile 40G port to a 10G port and frees its subsumed ports as individual 10G ports.
```

```
switch(config-if-Et13)#no speed

WARNING! Executing this command will cause the forwarding agent to be restarted. All interfaces will briefly drop links and forwarding on all interfaces will momentarily stop.

Do you wish to proceed with this command? [y/N]

Ethernet13 no longer configured for 40G.
Ethernet15, Ethernet17 and Ethernet19 are now free.
```

```
switch(config-if-Et13)#
```

11.5.12 Subinterface Configuration

For a subinterface to be operational on an Ethernet or port channel interface, the parent interface must be configured as a routed port and be administratively up, and a VLAN must be configured on the subinterface. If the parent interface goes down, all subinterfaces automatically go down as well, but will come back up with the same configuration once the parent interface is up.

Note that a port channel should not contain Ethernet interfaces with subinterfaces configured on them, and that subinterfaces cannot be members of a port channel.

Subinterfaces are named by adding a period followed by a unique subinterface number to the name of the parent interface. Note that the subinterface number has no relation to the ID of the VLAN corresponding to the subinterface.

Subinterfaces are available on the following platforms:
- DCS-7050X
11.5.12.1 Creating a Subinterface

To create a subinterface on an Ethernet or port channel interface:

**Step 1** Bring up the parent interface and ensure that it is configured as a routed port.

```
switch(config)#interface Ethernet1/1
switch(config-if-Et1/1)#no switchport
switch(config-if-Et1/1)#no shutdown
```

**Step 2** Configure a VLAN on the subinterface. The `encapsulation dot1q vlan` command is also used for VLAN translation, but in this context it associates a VLAN with the subinterface.

```
switch(config-if-Et1/1)#interface Ethernet1/1.1
switch(config-if-Et1/1.1)#encapsulation dot1q vlan 100
```

**Step 3** Configure an IP address on the subinterface (optional) and ensure that it is up.

```
switch(config-if-Et1/1)#ip address 10.0.0.1/24
switch(config-if-Et1/1)#no shutdown
switch(config-if-Et1/1)#
```

11.5.12.2 Creating a Range of Subinterfaces

A range of subinterfaces can also be configured simultaneously. The following example configures subinterfaces 1 to 100 on Ethernet interface 1/1, and assigns VLANs 501 through 600 to them. Note that the range of interfaces must be the same size as the range of VLAN IDs.

**Example**

```
switch(config)#interface eth1/1.1-100
switch(config-if-Et1/1.1-100)#no shutdown
switch(config-if-Et1/1.1-100)#encapsulation dot1q vlan {501,600}
switch(config-if-Et1/1.1-100)#exit
switch(config)#
```

11.5.12.3 Parent Interface Configuration

For subinterfaces to function, the parent interface must be administratively up and configured as a routed port.

Some settings are inherited by subinterfaces from the parent interface. These include QoS (trust mode and default DSCP) and MTU.

Additionally, on the DCS-7050X, DCS-7250X, and DCS-7300X platforms, the parent interface may be configured with an IP address. In this case, untagged packets are treated as incoming traffic on the parent interface.
11.5.12.4 Configuring Routing Features on a Subinterface

Once a subinterface is created, the following features can be configured on it:

- Unicast and multicast routing
- BGP, OSPF, ISIS, PIM
- VRF
- VRRP
- SNMP
- Inheritance of QoS (trust mode and default DSCP) and MTU settings from the parent interface

Additionally, these features can be configured on subinterfaces on Arad (DCS-7500E and DCS-7280E) platforms:

- Subinterface counters on ingress
- VXLAN
- MPLS
- GRE
- PBR
- QoS

11.5.12.5 Displaying Subinterface Information

Subinterface information is displayed using the same show commands as for other interfaces.

Examples

This command displays summary information for all IP interfaces on the switch, including subinterfaces.

```
switch>show ip interfaces brief
Interface    IP Address     Status    Protocol    MTU
Ethernet1/1  10.1.1.1/24 up        up          1500
Ethernet1/1.1 10.0.0.1/24 up        up          1500
Ethernet1/2  unassigned up        up          1500
```

This command displays information for subinterface Ethernet 1/1.1.

```
switch>show interface ethernet 1/1.1
Ethernet1/1.1 is down, line protocol is lowerlayerdown (notconnect)
     Hardware is Subinterface, address is 001c.735d.65dc
     Internet address is 10.0.0.1/24
     Broadcast address is 255.255.255.255
     Address determined by manual configuration
     IP MTU 1500 bytes, BW 10000000 kbit
     Down 59 seconds
```

This command displays status information for all subinterfaces configured on the switch.

```
switch>show interfaces status sub-interfaces
Port    Name    Status    Vlan    Duplex    Speed    Type                Flags
Et1.1   connect 101    full    10G     dot1q-encapsulation
Et1.2   connect 102    full    10G     dot1q-encapsulation
Et1.3   connect 103    full    10G     dot1q-encapsulation
Et1.4   connect 103    full    10G     dot1q-encapsulation
```

switch>
11.5.13 Autonegotiated Settings

In autonegotiation, the transmission speed, duplex setting, and flow control parameters used for Ethernet-based communication can be automatically negotiated between connected devices to establish optimized common settings.

11.5.13.1 Speed and Duplex

The speed command affects the transmission speed and duplex setting for the configuration mode interface. When a speed forced command is in effect on an interface, autonegotiation of speed and duplex settings is disabled for the interface; to enable autonegotiation, use the speed auto command.

The scope and effect of the speed command depends on the interface type; see Ethernet Interfaces and Ethernet Configuration Procedures for detailed information on the speed settings for different interfaces.

11.5.13.2 Flow Control

Flow control is a data transmission option that temporarily stops a device from sending data because of a peer data overflow condition. If a device sends data faster than the receiver can accept it, the receiver's buffer can overflow. The receiving device then sends a PAUSE frame, instructing the sending device to halt transmission for a specified period.

Flow control commands configure administrative settings for flow control packets.

- The flowcontrol receive command configures the port's ability to receive flow control pause frames.
  - off: port does not process pause frames that it receives.
  - on: port processes pause frames that it receives.
  - desired: port autonegotiates; processes pause frames if peer is set to send or desired.

- The flowcontrol send command configures the port's ability to transmit flow control pause frames.
  - off: port does not send pause frames.
  - on: port sends pause frames.
  - desired: port autonegotiates; sends pause frames if peer is set to receive or desired.

**Desired** is not an available parameter option. Ethernet data ports cannot be set to desired. Management ports are set to desired by default and with the no flowcontrol receive command.

The port linking process includes flow control negotiation. Ports must have compatible flow control settings to create a link. Table 11-7 lists the compatible flow control settings.

<table>
<thead>
<tr>
<th>local port</th>
<th>peer port</th>
</tr>
</thead>
<tbody>
<tr>
<td>receive on</td>
<td>send on or send desired</td>
</tr>
<tr>
<td>receive off</td>
<td>send off or send desired</td>
</tr>
<tr>
<td>receive desired</td>
<td>send on, send off, or send desired</td>
</tr>
<tr>
<td>send on</td>
<td>receive on or receive desired</td>
</tr>
<tr>
<td>send off</td>
<td>receive off or receive desired</td>
</tr>
<tr>
<td>send desired</td>
<td>receive on, receive off, or receive desired</td>
</tr>
</tbody>
</table>
Example

- These commands set the flow control receive and send to on on Ethernet interface 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#flowcontrol receive on
switch(config-if-Et5)#flowcontrol send on
switch(config-if-Et5)#
```

11.5.14 Displaying Ethernet Port Properties

Show commands are available to display various Ethernet configuration and operational status on each interface. Ethernet settings that are viewable include:

- Port Type
- PHY Status
- Negotiated Settings
- Flow Control
- Capabilities

Port Type

The port type is viewable from the output of `show interfaces status`, `show interfaces hardware`, and `show interfaces transceiver properties` commands.

Example

- This `show interfaces status` command displays the status of Ethernet interfaces 1-5.

```
switch>show interfaces status
Port  Name       Status  Vlan  Duplex  Speed Type
Et1   connected  1       full  10G  10GBASE-SRL
Et2   connected  1       full  10G  10GBASE-SRL
Et3   connected  1       full  10G  10GBASE-SRL
Et4   connected  1       full  10G  10GBASE-SRL
Et5   notconnect  1      full  10G  Not Present
switch>
```

- This `show interfaces hardware` command displays the speed, duplex, and flow control capabilities of Ethernet interfaces 2 and 18.

```
switch>show interfaces ethernet 2,18 hardware
Ethernet2
  Model: DCS-7150S-64-CL
  Type: 10GBASE-CR
  Speed/Duplex: 10G/full,40G/full,auto
  Flowcontrol: rx-(off,on,desired),tx-(off,on,desired)
Ethernet18
  Model: DCS-7150S-64-CL
  Type: 10GBASE-SR
  Speed/Duplex: 10G/full
  Flowcontrol: rx-(off,on),tx-(off,on)
switch>
```
Chapter 11: Ethernet Ports

Ethernet Configuration Procedures

- This command displays the media type, speed, and duplex properties for Ethernet interfaces 1.

  switch>show interfaces ethernet 1 transceiver properties
  Name : Et1
  Administrative Speed: 10G
  Administrative Duplex: full
  Operational Speed: 10G (forced)
  Operational Duplex: full (forced)
  Media Type: 10GBASE-SRL

PHY

PHY information for each Ethernet interface is viewed by entering the show interfaces phy command.

Example

- This command summarizes PHY information for Ethernet interfaces 1-3.

  switch>show interfaces ethernet 1-3 phy
  Key:
  U = Link up
  D = Link down
  R = RX Fault
  T = TX Fault
  B = High BER
  L = No Block Lock
  A = No XAUI Lane Alignment
  0123 = No XAUI lane sync in lane N

<table>
<thead>
<tr>
<th>Port</th>
<th>PHY state</th>
<th>State</th>
<th>Reset</th>
<th>Changes</th>
<th>Count</th>
<th>PMA/PMD</th>
<th>PCS</th>
<th>XAUI</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ethernet1</td>

<td>U..</td>
<td>U....</td>
<td>U.......</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Ethernet2</td>
<td>linkUp</td>
<td>13944</td>
<td>1704</td>
<td>U..</td>
<td>U....</td>
<td>U.......</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Ethernet3</td>
<td>detectingXcvr</td>
<td>3</td>
<td>1</td>
<td>D..A0123</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Negotiated Settings

Speed, duplex, and flow control settings are displayed through the show interfaces hardware, PHY information for each Ethernet interface is viewed by entering the show interfaces hardware, show interfaces flow-control, and show interfaces status commands.

Example

- This command displays speed/duplex and flow control settings for Ethernet interface 1.

  switch>show interfaces ethernet 1 hardware
  Ethernet1
  Model:          DCS-7150S-64-CL
  Type:           10GBASE-SR
  Speed/Duplex:   10G/full
  Flowcontrol:    rx-(off,on),tx-(off,on)
• This command shows the flow control settings for Ethernet interfaces 1-2.

```
switch>show flow-control interface ethernet 1-2
Port      Send FlowControl  Receive FlowControl  RxPause   TxPause
---------  -------- -------- -------- --------    ------------- -------------
Et1        off      off      off      off         0             0
Et2        off      off      off      off         0             0
```

• This command displays the speed type and duplex settings for management interfaces 1-2.

```
switch>show interfaces management 1-2 status
Port      Name              Status       Vlan        Duplex  Speed Type
Ma1                         connected    routed      a-full a-100M 10/100/1000
Ma2                         connected    routed      a-full   a-1G 10/100/1000
```

11.5.15 Ingress Counters
The Ingress counters enables the switch to count the ingress traffic on the Layer 3 ports of the switch. Any ingress traffic on Layer 3 sub-interfaces and VLAN interface with IPv4 and IPv6 addresses are accounted irrespective of the routing decision. The VLAN counters are supported on DCS-7050x, DCS-7250x, and DCS-7300x series switches and not supported on any routed ports.

11.5.15.1 Configuring Ingress Counters
The `hardware counter feature in` command enables the switch to count the ingress traffic on the Layer 3 port of the switch. Any traffic on Layer 3 sub-interfaces and VLAN interface with IPv4 and IPv6 addresses are accounted irrespective of the routing decision.

• This command configures the ingress traffic count on the sub-interfaces. The `no` form of the command disable the counter configuration from the switch ports.

```
switch#hardware counter feature subinterface in
```

• This command configures the ingress traffic count on the VLAN interface. The `no` form of the command disable the counter configuration from the VLAN configured switch ports.

```
switch#hardware counter feature vlan-interface in
```

11.5.15.2 Displaying the Ingress Counter Information
The `show interface counters` command displays the Layer 3 ingress traffic count information. Run this command to view the traffic counts on a sub-interface or VLAN interface of the switch. The `clear counters` command resets the counters to zero.

• This command displays the ingress traffic count on a VLAN interface vl12.

```
switch#show interface vl12 counters incoming
L3 Interface InOctets InUcastPkts InMcastPkts
VL12       3136          47           2
```

11.5.16 Configuring Ingress Traffic-Class Counters
Ingress traffic class counter support is enabled in order to display per traffic-class counters on ingress interfaces, and supported on routed-ports and subinterfaces. Both packet and octet counts are displayed.
Example

- This command enables traffic-class counter support.
  ```
  switch(config)#hardware counter feature traffic-class in
  switch(config)#
  ```

- This command enables TCAM profile ‘tc-counters’ if this profile is configured.
  ```
  switch(config)#hardware tcam profile tc-counters
  switch(config)#
  ```

11.5.17 Configuring Power over Ethernet (PoE)

Power over Ethernet (PoE) is enabled by default on all Ethernet ports of PoE-capable switches, and the switch will detect IEEE-compliant powered devices (PDs) when they are plugged into a port and supply power appropriately.

Limitations

- Ethernet ports will not detect non IEEE-compliant devices by default, and may not be able to detect or power them even if configured to do so.
- If attached PDs overload the switch, it will power off. This can occur when an attached PD increases its power demand via LLDP, when too many PDs are connected to the switch, or when a power supply fails on a heavily loaded dual-supply switch.
- Power-cycling the switch will cause temporary loss of power to attached PDs.
- PoE is not available on management interfaces.

Disabling PoE on an Interface

On switches which support PoE, it is enabled by default on all Ethernet ports but can be disabled per-port with the `poe disabled` command.

Example

- These commands disable PoE on Ethernet interface 5.
  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#poe disabled
  switch(config-if-Et5)#
  ```

PoE Power Settings

When an IEEE-compliant powered device (PD) is connected to a PoE-enabled Ethernet port, it is recognized by a specific resistor signature, and its initial power needs are determined by hardware negotiation, after which further negotiation is managed through the Link Layer Discovery Protocol (LLDP). For details, see Configuring LLDP for Power over Ethernet.

PoE power output can be limited on a port using the `poe limit` command. The power limit represents the power output at the Ethernet port; actual power delivered to the PD will be lower due to power loss along the Ethernet cable.

Note

LLDP uses Power Via MDI type-length-value elements (TLVs) to allow the switch to dynamically negotiate power needs with PDs. LLDP will not include Power Via MDI TLVs for the interface if a power limit has been configured on it.
Example

- These commands limit nominal PoE power output on Ethernet interface 5 to 10 W.
  
  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#poe limit 10 watts
  ```

- These commands limit nominal PoE power output on Ethernet interface 7 to 4 W.

  ```
  switch(config)#interface ethernet 7
  switch(config-if-Et7)#poe limit class 1
  ```

Detecting Legacy PDs

IEEE-compliant powered devices (PDs) are recognized by a specific resistance signature to a test signal sent by the switch, but non-compliant (legacy or proprietary) PDs may use a capacitive signature instead. By default, legacy PD detection is disabled, and legacy devices are not powered.

To configure an interface to use hardware detection for these non-compliant PoE devices and attempt to power them, use the `poe legacy detect` command.

Note

Non IEEE-compliant PDs are not officially supported. Arista cannot guarantee compatibility with such devices, and they may not be detected even when legacy detection is enabled on the port they are connected to.

Example

- These commands configure Ethernet interface 5 to attempt to detect and power non-compliant PDs.

  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#poe legacy detect
  ```

Displaying PoE Information

To display PoE information for a specific interface range or for all Ethernet interfaces, use the `show poe` command.

Example

- This command displays PoE information for Ethernet interface 46.

  ```
  switch(config)#show poe interface ethernet 46
  ```

11.5.18 Configuring Link Fault Signaling

As part of the Link Fault Signaling (LFS) configuration, a new configuration mode called the EOAM (Ethernet operations administration & management) mode is introduced. The EOAM profile has a link-error sub-mode wherein the threshold, action, and the period is configured for both FCS and Symbol errors. The period can be in seconds or in number of frames. The default values are – threshold 0, action syslog, and period 0 seconds. If the errors exceed the threshold within the given period, the configured action is executed. The recovery time configures the recovery timeout value for link fault signaling. Only one EOAM profile is associated with a port.
The following steps enable configuring the LFS parameters:

**Step 1** Enable the EOAM mode.

```
switch(config)#monitor ethernet oam
```

**Step 2** Create an EOAM profile named as `profile1`.

```
switch(config-eoam)#profile profile1
```

**Step 3** Enter the EOAM link-error sub-mode.

```
switch(config-eoam-profile-profile1)#link-error
```

**Step 4** Enter the commands in the profile link-error submode to configure a specific LFS parameter.

```
switch(config-eoam-profile-profile1-link-error)#symbol action errdisable
switch(config-eoam-profile-profile1-link-error)#symbol period 300 frames
switch(config-eoam-profile-profile1-link-error)#symbol threshold 20
switch(config-eoam-profile-profile1-link-error)#recovery-time 40
```

**Step 5** Apply the EOAM profile `profile1` to the Ethernet interface 1/1.

```
switch(config)#interface ethernet 1/1
switch(config-if-Et1/1)#monitor ethernet oam profile profile1
```

**Platform Compatibility**

LFS parameter configuration is supported on the following platforms:

- DCS-7020
- DCS-7050X
- DCS-7060X
- DCS-7250X
- DCS-7260X
- DCS-7280R
- DCS-7300
- DCS-7320
- DCS-7500R

**Note**

The link fault action is not supported on the DCS-7050X, DCS-7250X, DCS-7060X, DCS-7260X, DCS-7300, DCS-7320 platforms.

### 11.5.19 Configuring Hardware TCAM

TCAM (ternary content-addressable memory) is a specialized type of high-speed memory that increase the speed of route look-up, packet classification, packet forwarding and access control list-based commands. The `hardware tcam` command is used to configure and place the switch in the TCAM mode. In this mode the user can configure few TCAM related commands such as feature, profile and system.

In the TCAM mode the `feature` command is used to configure the reservation of TCAM banks for the features like ACL, IPsec, flow-spec, l2-protocol, PBR, QoS, TCP-MSS-ceiling, traffic-policy. The `profile` command configures a new TCAM profile, or just copy the TCAM profile which is already created using the hardware tcam profile command such as default, mirroring-acl, pbr-match-nexthop-group, qos, tap-aggregation-default, tap-aggregation-extended, tc-counters, test, vxlan-routing. Similarly, the `system` command configures the system-wide TCAM profiles.
Examples

- This command places the switch in Hardware TCAM configuration mode.

  
  ```
  switch(config)#hardware tcam
  switch(config-hw-tcam)#
  ```

These are the commands allowed to configure in Hardware TCAM mode.

- This commands allow the switch to configure the TCAM feature.

  ```
  switch(config)#hardware tcam
  switch(config-hw-tcam)#feature
  ```

- This commands allow the switch to configure TCAM profile.

  ```
  switch(config)#hardware tcam
  switch(config-hw-tcam)#profile
  ```

- This commands allow the switch to configure TCAM system profile.

  ```
  switch(config)#hardware tcam
  switch(config-hw-tcam)#system
  ```
11.6 **Ethernet Configuration Commands**

**Global Configuration Commands**
- hardware port-group
- hardware tcam
- hardware counter feature in (DCS-7050x, 7350x, 7300x)
- interface ethernet
- interface ethernet create
- interface management
- monitor ethernet oam
- transceiver qsfp default-mode
- transceiver channel

**Hardware TCAM Commands**
- feature
- profile
- system

**Interface Configuration Commands – Ethernet and Management Interfaces**
- flowcontrol receive
- flowcontrol send
- link-debounce
- mac-address
- poe disabled
- poe legacy detect
- poe limit
- speed

**EOAM Configuration Commands**
- link-error
- monitor ethernet oam profile
- profile

**Link-error Configuration Commands**
- action
- period
- recovery-time
- threshold

**Interface Display Commands**
- show hardware counter
- show hardware port-group
- show interfaces counters
- show interfaces counters bins
- show interfaces counters errors
- show interfaces counters queue
- show interfaces counters rates
- show interfaces flow-control
- show interfaces hardware
- show interfaces hardware default
- show interfaces negotiation
• show interfaces phy
• show interfaces status
• show interfaces status errdisabled
• show interfaces transceiver
• show interfaces transceiver channels
• show interfaces transceiver hardware
• show interfaces transceiver properties
• show monitor ethernet oam profile
• show platform fm6000 agileport map
• show poe
**action**

The `action` command configures the link monitoring action that is specified for the link fault signaling event.

The `no action` command removes the action type specified for the chosen link fault signaling. The `default action` command configures the link monitoring action as system log type.

**Command Mode**
- Link-error Configuration

**Command Syntax**

```
{fcs | symbol} action [linkfault | errdisable | log]
no {fcs | symbol} action [linkfault | errdisable | log]
default {fcs | symbol} action [linkfault | errdisable | log]
```

**Parameters**

- `fcs` Inbound packets with frame check sequence (FCS) error.
- `symbol` Inbound packets with symbol error.
- `linkfault` The link fault action type.
- `errdisable` The errdisable action type.
- `log` The system log action type.

**Related Commands**

- `period`
- `threshold`

**Example**

- These commands set the `errdisable` action type for the profile `profile1` in the Link-error configuration mode for symbol errors.
  ```
  switch(config)#monitor ethernet oam
  switch(config-eoam)#profile profile1
  switch(config-eoam-profile-profile1)#link-error
  switch(config-eoam-profile-profile1-link-error)#symbol action errdisable
  ```
The `feature` command allows the user to reserve the number of TCAM banks for the following features such as ACL, flow-spec, IPsec, l2-protocol, PBR, QoS, TCP-MSS-ceiling, traffic-policy.

The `exit` command returns the switch to global configuration mode.

**Command Mode**

Hardware TCAM

**Command Syntax**

`feature`

**Example**

- These commands allow the switch to configure the TCAM flow-spec feature for IPv4 ports.

```
switch(config-hw-tcam)#feature flow-spec port ipv4 bank maximum count 12
```

**Commands Available**

- `hardware tcam`
flowcontrol receive

The `flowcontrol receive` command configures administrative settings for inbound flow control packets. Ethernet ports use flow control to delay packet transmission when port buffers run out of space. Ports transmit a pause frame when their buffers are full, signaling their peer ports to delay sending packets for a specified period.

The `flowcontrol receive` command configures the configuration mode port's ability to receive flow control pause frames.

- **off**: port does not process pause frames that it receives.
- **on**: port processes pause frames that it receives.
- **desired**: port autonegotiates flow control; processes pause frames if the peer is set to `send desired`.

Desired is not an available parameter option. Ethernet data ports cannot be set to desired. Management ports are set to desired by default and with the `no flowcontrol receive` command.

The port linking process includes flow control negotiation. Ports must have compatible flow control settings to create a link. Table 11-8 lists the compatible flow control settings.

### Table 11-8 Compatible Settings for Flow Control Negotiation – Local Port Receiving

<table>
<thead>
<tr>
<th>local port</th>
<th>peer port</th>
</tr>
</thead>
<tbody>
<tr>
<td>receive on</td>
<td>send on or send desired</td>
</tr>
<tr>
<td>receive off</td>
<td>send off or send desired</td>
</tr>
<tr>
<td>receive desired</td>
<td>send on, send off, or send desired</td>
</tr>
</tbody>
</table>

The `no flowcontrol receive` and `default flowcontrol receive` commands restore the default flow control setting for the configuration mode interface by removing the corresponding `flowcontrol receive` command from `running-config`. The default setting is **off** for Ethernet data ports and **desired** for Management ports.

### Command Mode

- Interface-Ethernet Configuration
- Interface-Management Configuration

### Command Syntax

- `flowcontrol receive STATE`
- `no flowcontrol receive`
- `default flowcontrol receive`

### Parameters

- **STATE** flow control pause frame processing setting. Options include:
  - on
  - off

### Examples

- These commands set the flow control received on Ethernet interface 5.

```bash
switch(config)#interface ethernet 5
switch(config-if-Et5)#flowcontrol receive on
switch(config-if-Et5)#
```
flowcontrol send

The `flowcontrol send` command configures administrative settings for outbound flow control packets. Ethernet ports use flow control to delay packet transmission when port buffers run out of space. Ports transmit a pause frame when their buffers are full, signaling their peer ports to delay sending packets for a specified period.

The `flowcontrol send` command configures the configuration mode port's ability to transmit flow control pause frames.

- **off**: port does not send pause frames.
- **on**: port sends pause frames.
- **desired**: port autonegotiates flow control; sends pause frames if the peer is set to `receive desired`.

*Desired* is not an available parameter option. Ethernet data ports cannot be set to *desired*. Management ports are set to *desired* by default and with the `no flowcontrol send` command.

The port linking process includes flow control negotiation. Ports must have compatible flow control settings to create a link. Table 11-9 lists the compatible flow control settings.

Table 11-9  Compatible Settings for Flow Control Negotiation – Local Port Transmitting

<table>
<thead>
<tr>
<th>local port</th>
<th>peer port</th>
</tr>
</thead>
<tbody>
<tr>
<td>send on</td>
<td>receive on or receive desired</td>
</tr>
<tr>
<td>send off</td>
<td>receive off or receive desired</td>
</tr>
<tr>
<td>send desired</td>
<td>receive on, receive off, or receive desired</td>
</tr>
</tbody>
</table>

The `no flowcontrol send` and `default flowcontrol send` commands restore the default flow control setting for the configuration mode interface by removing the corresponding `flowcontrol send` command from `running-config`. The default setting is **off** for Ethernet data ports and **desired** for Management ports.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Management Configuration

**Command Syntax**

```
flowcontrol send STATE
no flowcontrol send
default flowcontrol send
```

**Parameters**

- **STATE**  flow control send setting. Options include
  - on
  - off

**Examples**

- These commands set the flow control sent on Ethernet interface 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#flowcontrol send on
switch(config-if-Et5)#
```
hardware counter feature in (DCS-7050x, 7350x, 7300x)

The hardware counter feature in command enables the switch to count the ingress traffic on the Layer 3 port of the switch. Any traffic on Layer 3 sub-interfaces and VLAN interface with IPv4 and IPv6 addresses are accounted irrespective of the routing decision.

The no hardware counter feature in command disable the counter configuration from the switch ports. By default the ingress counter is disabled on the switch.

Command Mode
  Global Configuration

Command Syntax
  hardware counter feature [INTERFACE] in
  no hardware counter feature [INTERFACE] in

Parameters
  • INTERFACE  Layer 3 interface on the switch.
  • subinterface Displays the subinterface traffic count.
  • vlan-interface Displays the VLAN-interface traffic count.

Examples
  • This command configures the ingress traffic count on the sub-interfaces.
    switch#hardware counter feature subinterface in
  • This command configures the ingress traffic count on the VLAN interface.
    switch#hardware counter feature vlan-interface in
Example

- These commands enable the QSFP+ interface in port group 1 and SFP+ interfaces in port group 2 on a DCS-7050Q-16 switch, display the port group status, and display interface status.

```plaintext
switch(config)#hardware port-group 1 select Et15/1-4
switch(config)#hardware port-group 2 select Et21-24
switch(config)#show hardware port-group

Portgroup: 1    Active Ports: Et17-20
Port            State
-----------------------------
Ethernet17      ErrDisabled
Ethernet18      ErrDisabled
Ethernet19      ErrDisabled
Ethernet20      ErrDisabled
Ethernet15/1    Active
Ethernet15/2    Active
Ethernet15/3    Active
Ethernet15/4    Active

Portgroup: 2    Active Ports: Et16/1-4
Port            State
-----------------------------
Ethernet16/1    Active
Ethernet16/2    Active
Ethernet16/3    Active
Ethernet16/4    Active
Ethernet21      ErrDisabled
Ethernet22      ErrDisabled
Ethernet23      ErrDisabled
Ethernet24      ErrDisabled

switch(config)#show interfaces status

Port      Name              Status       Vlan        Duplex  Speed Type
Et1/1                       connected    in Po621      full    40G 40GBASE-CR4
Et1/2                       errdisabled  inactive    unconf unconf 40GBASE-CR4
Et15/1                      errdisabled  inactive    unconf unconf Not Present
Et15/2                      errdisabled  inactive    unconf unconf Not Present
Et15/3                      errdisabled  inactive    unconf unconf Not Present
Et15/4                      errdisabled  inactive    unconf unconf Not Present
Et16/1                      errdisabled  inactive    unconf unconf Not Present
Et16/2                      errdisabled  inactive    unconf unconf Not Present
Et16/3                      errdisabled  inactive    unconf unconf Not Present
Et16/4                      errdisabled  inactive    unconf unconf Not Present
Et17                        errdisabled  inactive    unconf unconf Not Present
Et18                        errdisabled  inactive    unconf unconf Not Present
Et19                        errdisabled  inactive    unconf unconf Not Present
Et20                        errdisabled  inactive    unconf unconf Not Present
Et21                        connected    425           full    10G 10GBASE-SRL
Et22                        connected    611           full    10G 10GBASE-SRL
Et23                        connected    in Po998      full    10G 10GBASE-SLR
Et24                        connected    in Po998      full    10G 10GBASE-SLR

switch(config)#
```
**hardware port-group**

The **hardware port-group** command configures a port group to activate a 40GBASE (QSFP+) interface or four 10GBASE (SFP+) interfaces, affecting QSFP+ and SFP+ availability.

The **no hardware port-group** and **default hardware port-group** commands restore a port group’s default setting by removing the corresponding **hardware port-group** command from **running-config**. The QSFP+ interface is active by default in each port group.

The **hardware port-group** command is available on DCS-7050Q-16 and DCS-7050QX-32S switches, and has different parameters on each platform.

**Command Mode**

Global Configuration

**Command Syntax**

```
hardware port-group group_number select PORT_LIST
no hardware port-group group_number
default hardware port-group group_number
```

**Parameters**

- **group_number** label of the port group. Valid options are 1 and 2 on the 7050Q-16; only 1 is available on the 7050QX-32S.

- **PORT_LIST** ports activated by command. Options vary by platform and depend on **group_number** value.

**DCS-7050Q-16**

- **Et15/1-4** activates QSFP+ port on port group 1. Available when **group_number** is 1.
- **Et16/1-4** activates QSFP+ port on port group 2. Available when **group_number** is 2.
- **Et17-20** activates SFP+ ports on port group 1. Available when **group_number** is 1.
- **Et21-23** activates SFP+ ports on port group 2. Available when **group_number** is 2.

**DCS-7050QX-32S**

- **Et1-4** activates SFP+ ports on port group 1. Available when **group_number** is 1.
- **Et5/1-4** activates QSFP+ port on port group 1. Available when **group_number** is 1.
**hardware tcam**

The `hardware tcam` command places the switch in Hardware TCAM configuration mode. The `exit` command returns the switch to global configuration mode.

**Command Mode**

Global Configuration

**Command Syntax**

```
hardware tcam
```

**Example**

- This command places the switch in Hardware TCAM configuration mode.

```
switch(config)#hardware tcam
switch(config-hw-tcam)#
```

**Commands Available**

- `profile`
- `profile`
- `interface ethernet`
**interface ethernet**

The **interface ethernet** command places the switch in Ethernet-interface configuration mode for the specified interfaces. The command can specify a single interface or multiple interfaces.

Ethernet interfaces are physical interfaces and are not created or removed.

Interface management commands include:

- **description**
- **exit**
- **load-interval**
- **mtu**
- **shutdown** (Interfaces)

Ethernet management commands include:

- **flowcontrol**
- **mac-address**
- **speed**

Chapters describing supported protocols and other features list additional configuration commands available from Ethernet interface configuration mode.

**Command Mode**

Global Configuration

**Command Syntax**

```plaintext
interface ethernet e_range
```

**Parameters**

- **e_range** Ethernet interfaces (number, range, or comma-delimited list of numbers and ranges).

Valid Ethernet numbers depend on the switch’s available Ethernet interfaces.

**Example**

- This command enters interface configuration mode for Ethernet interfaces 1 and 2:

  ```plaintext
  switch(config)#interface ethernet 1-2
  switch(config-if-Et1-2)#
  ```

- This command enters interface configuration mode for Ethernet interface 1:

  ```plaintext
  switch(config)#interface ethernet 1
  switch(config-if-Et1)#
  ```
interface ethernet create

The `interface ethernet create` command is used to configure a range of Ethernet subinterfaces. The command places the switch in Ethernet-interface configuration mode for the specified range of subinterfaces.

**Command Mode**
- Global Configuration

**Command Syntax**

```
interface ethernet create sub_range
```

**Parameters**
- `sub_range` range of subinterfaces to be configured. Subinterfaces are named by adding a period followed by a unique subinterface number to the name of the parent interface.

**Example**
- This command enters interface configuration mode for Ethernet subinterfaces 1/1.1-100:

```
switch(config)#interface ethernet create 1/1.100
switch(config-if-Et1/1.1-100)#
```
interface management

The *interface management* command places the switch in management-interface configuration mode for the specified interfaces. The list can specify a single interface or multiple interfaces if the switch contains more than one management interface.

Management interfaces are physical interfaces and are not created or removed.

Interface management commands include:

- description
- exit
- load-interval
- mtu
- shutdown (Interfaces)

Ethernet management commands include:

- flowcontrol
- mac-address
- speed

Chapters describing supported protocols and other features list additional configuration commands available from management-interface configuration mode.

**Command Mode**

Global Configuration

**Command Syntax**

```
interface management m_range
```

**Parameters**

- `m_range` Management interfaces (number, range, or comma-delimited list of numbers and ranges).

  Valid management numbers depend on the switch’s available management interfaces. A value of 0, where available, configures the virtual management interface on a dual-supervisor modular switch. Management interface 0 accesses management port 1 on the active supervisor of a dual-supervisor modular switch.

**Examples**

- This command enters interface configuration mode for management interfaces 1 and 2.
  
  `switch(config)#interface management 1-2`
  
  `switch(config-if-Ma1-2)#`

- This command enters interface configuration mode for management interface 1:
  
  `switch(config)#interface management 1`
  
  `switch(config-if-Ma1)#`
link-debounce

The link-debounce command configures the link debounce time for the configuration mode interface. Link debounce time is the time that advertisements for new link states are delayed after the link state is established. By default, debounce time is set to zero, disabling link debounce.

Debounce times for link-up and link-down transitions can be independently configured.

- Link-up debounce time: the delay before an interface advertises link down to link up transitions.
- Link-down debounce time: the delay before an interface advertises link up to link down transitions.

The no link-debounce and default link-debounce commands restore the default debounce setting for the configuration mode interface by removing the corresponding link-debounce command from running-config.

**Command Mode**

Interface-Ethernet Configuration
Interface-Management Configuration

**Command Syntax**

```
link-debounce time WAIT_TIME
no link-debounce
default link-debounce
```

**Parameters**

- **WAIT_TIME**  link debounce period (milliseconds). Options include
  - `<0 - 30000>`  One debounce value assigned as both link up and link down.
  - `<0 - 30000> <0 - 30000>`  Two debounce values: link up is first, link down is second.

  All debounce values range from 0 (disabled) to 30000 (30 seconds).

**Examples**

- These commands set the link-up and link-down debounce period to 10 seconds on Ethernet interface 5.
  
  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#link-debounce time 10000
  ```

- These commands set the link-up debounce to 10 seconds and the link-down debounce period to zero on Ethernet interface 5.
  
  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#link-debounce time 10000 0
  ```

- These commands set the link-up debounce to zero and the link-down debounce period to 12.5 seconds on Ethernet interface 5.
  
  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#link-debounce time 0 12500
  ```
**link-error**

The `link-error` command places the Ethernet operations, administration, and management (EOAM) profile in the EOAM link-error sub-mode.

The `no link-error` and `default link-error` commands exit from the EOAM link-error sub-mode.

**Command Mode**

EOAM Configuration

**Command Syntax**

```
link-error
no link-error
default link-error
```

**Related Commands**

- `monitor ethernet oam profile`
- `show monitor ethernet oam profile`

**Example**

- These commands place the EOAM profile `profile1` in the link-error sub-mode.

```
switch(config)#monitor ethernet oam
switch(config-eoam)#profile profile1
switch(config-eoam-profile-profile1)#link-error
switch(config-eoam-profile-profile1-link-error)#
```
mac-address

The **mac-address** command assigns a MAC address to the configuration mode interface. An interface’s default MAC address is its burn-in address.

The **no mac-address** and **default mac-address** commands revert the interface to its default MAC address by removing the corresponding **mac-address** command from **running-config**.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Management Configuration

**Command Syntax**
- `mac-address address`
- `no mac-address`
- `default mac-address`

**Parameters**
- **address**  MAC address assigned to the interface. Format is dotted hex notation (H.H.H). Disallowed addresses are 0.0.0 and FFFF.FFFF.FFFF.

**Example**
- This command assigns the MAC address of 001c.2804.17e1 to Ethernet interface 7, then displays interface parameters, including the assigned address.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#mac-address 001c.2804.17e1
switch(config-if-Et7)#show interface ethernet 7
Ethernet3 is up, line protocol is up (connected)
Hardware is Ethernet, address is 001c.2804.17e1 (bia 001c.7312.02e2)
Description: b.e45
MTU 9212 bytes, BW 10000000 Kbit
Full-duplex, 10Gb/s, auto negotiation: off
Last clearing of "show interface" counters never
5 seconds input rate 7.84 kbps (0.0% with framing), 10 packets/sec
5 seconds output rate 270 kbps (0.0% with framing), 24 packets/sec
1363799 packets input, 222736140 bytes
Received 0 broadcasts, 290904 multicast
0 runts, 0 giants
0 input errors, 0 CRC, 0 alignment, 0 symbol
0 PAUSE input
2264927 packets output, 2348747214 bytes
Sent 0 broadcasts, 28573 multicast
0 output errors, 0 collisions
0 late collision, 0 deferred
0 PAUSE output
switch(config-if-Et7)#
```
monitor ethernet oam

The `monitor ethernet oam` command places the switch in the Ethernet operations, administration, and management (EOAM) configuration mode.

The `no monitor ethernet oam` and `default monitor ethernet oam` commands exit from the EOAM configuration mode.

**Command Mode**

Global Configuration

**Command Syntax**

```
monitor ethernet oam
no monitor ethernet oam
default monitor ethernet oam
```

**Example**

- This command places the switch in the EOAM configuration mode.

```
switch(config)#monitor ethernet oam
switch(config-eoam)#
```
**monitor ethernet oam profile**

The `monitor ethernet oam profile` command applies the EOAM profile to the specific interface in interface configuration mode.

The `no monitor ethernet oam profile` and `default monitor ethernet oam profile` commands remove the EOAM profile from the interface.

**Command Mode**

Interface Configuration

**Command Syntax**

```
monitor ethernet oam profile name
no monitor ethernet oam profile
default monitor ethernet oam profile
```

**Parameters**

- `name`  The EOAM profile name. An EOAM profile cannot be named as `summary`.

**Related Commands**

- `link-error`
- `show monitor ethernet oam profile`

**Example**

- These commands apply the EOAM profile `profile1` to the Ethernet interface 1/1.

```
switch(config)#interface ethernet 1/1
switch(config-if-Et1/1)#monitor ethernet oam profile profile1
```
**period**

The `period` command configures the link monitoring period that is specified for a link error in terms of number of frames or seconds.

The `no period` command removes the period type specified on the chosen link error. The `default period` command configures the link monitoring period as zero seconds.

**Command Mode**

Link-error Configuration

**Command Syntax**

```
{fcs | symbol} period num {seconds | frames}
no {fcs | symbol} period num {seconds | frames}
default {fcs | symbol} period num {seconds | frames}
```

**Parameters**

- `fcs`  Inbound packets with frame check sequence (FCS) error.
- `symbol`  Inbound packets with symbol error.
- `num`  The link monitoring period in frames or seconds. The frames' value ranges from 1 to 4000000000. The seconds' value ranges from 2 to 200 seconds. The default value is 2 seconds.
- `seconds`  The monitor errors per `num` seconds.
- `frames`  The monitor errors per `num` frames.

**Related Commands**

- `action`
- `threshold`

**Example**

- These commands set the `frames` period type for the profile `profile1` in the Link-error configuration mode for 300 frames.

  ```
  switch(config)#monitor ethernet oam
  switch(config-eoam)#profile profile1
  switch(config-eoam-profile-profile1)#link-error
  switch(config-eoam-profile-profile1-link-error)#symbol period 300 frames
  ```
**poe disabled**

Power over Ethernet (PoE) is enabled on all Ethernet ports by default on switches that support PoE. The `poe disabled` command disables PoE on the configuration-mode interface.

The `no poe disabled` and `default poe disabled` commands restore PoE on the interface by removing the corresponding `poe disabled` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration

**Command Syntax**
- `poe disabled`
- `no poe disabled`
- `default poe disabled`

**Example**
- These commands disable PoE on Ethernet interface 7.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#poe disabled
switch(config-if-Et7)#
```
**poe legacy detect**

IEEE-compliant powered devices (PDs) are recognized by a specific resistance signature to a test signal sent by the switch, but non-compliant (legacy or proprietary) PDs may use a capacitive signature instead. The `poe legacy detect` command causes the configuration-mode interface to attempt to use hardware detection for these non-compliant PoE devices and power them. By default, legacy PD detection is disabled, and legacy devices are not powered.

**Note**

Non IEEE-compliant PDs are not officially supported. Arista cannot guarantee compatibility with such devices, and they may not be detected even when legacy detection is enabled on the port they are connected to.

The `no poe legacy detect` and `default poe legacy detect` commands restore the default behavior by removing the corresponding `poe legacy detect` command from `running-config`.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

- `poe legacy detect`
- `no poe legacy detect`
- `default poe legacy detect`

**Example**

- These commands configure Ethernet interface 7 to attempt to detect and power capacitive PDs.
  
  ```
  switch(config)#interface ethernet 7
  switch(config-if-Et7)#poe legacy detect
  switch(config-if-Et7)#
  ```
poe limit

Power over Ethernet (PoE) power output is limited by the hardware-negotiated power level and by the total power capacity of the switch. The poe limit command sets an additional maximum power output for the configuration-mode interface. The power limit represents the power output at the Ethernet port; actual power delivered to the PD will be lower due to power loss along the Ethernet cable.

**Note**
If a power limit is set by this command, Power Via MDI TLVs will not be sent from the interface. See Configuring LLDP for Power over Ethernet for details.

The no poe limit and default poe limit commands restore the default power limitation by removing the corresponding poe limit command from running-config.

**Command Mode**
Interface-Ethernet Configuration

**Command Syntax**
```
poe limit {class class_num | watt_num watts}
no poe limit
default poe limit
```

**Parameters**
- **class_num** specifies the power output limit by power class. Values range from 0-6 as follows:
  - Class 0 = 15.4 W
  - Class 1 = 4 W
  - Class 2 = 7 W
  - Class 3 = 15.4 W
  - Class 4 = 30 W
  - Class 5 = 45 W
  - Class 6 = 60 W
- **watt_num** specifies the power output limit in watts. Values range from 0-60. A value of 0 watts will prevent the port from providing PoE power.

**Example**
- These commands limit nominal PoE power output on Ethernet interface 7 to 10 W.
  ```
  switch(config)#interface ethernet 7
  switch(config-if-Et7)#poe limit 10 watts
  switch(config-if-Et7)#
  ```
- These commands limit nominal PoE power output on Ethernet interface 7 to 4 W.
  ```
  switch(config)#interface ethernet 7
  switch(config-if-Et7)#poe limit class 1
  switch(config-if-Et7)#
  ```
profile

The `profile` command allows the user to configure a new TCAM profile, or just copy the TCAM profile which is already created using the `hardware tcam profile` command such as default, mirroring-acl, pbr-match-nexthop-group, qos, tap-aggregation-default, tap-aggregation-extended, tc-counters, test, vxlan-routing.

The `exit` command returns the switch to global configuration mode.

**Command Mode**
- Hardware TCAM

**Command Syntax**

```
profile <name>
```

**Parameter**

- `name` TCAM profile name.

**Example**

- This commands allow the switch to configure the TCAM profile “test”.

```
switch(config-hw-tcam)#profile test
```

**Commands Available**

- `hardware tcam`
**profile**

The `profile` command creates an Ethernet operations, administration, and management (EOAM) profile in the EOAM configuration mode.

The `no profile` and `default profile` commands exit from the EOAM configuration mode.

**Command Mode**

EOAM Configuration

**Command Syntax**

```
profile profile_name
no profile profile_name
default profile profile_name
```

**Parameters**

- `profile_name` the profile name that is specified.

**Related Commands**

- `monitor ethernet oam profile`
- `show monitor ethernet oam profile`

**Guidelines**

Run the `shutdown` or `no shutdown` command to bring the port back to the normal state.

**Example**

- These commands create an EOAM profile `profile1` in the EOAM configuration mode.

```
switch(config)#monitor ethernet oam
switch(config-eoam)#profile profile1
switch(config-eoam-profile-profile1)#
```
recovery-time

The recovery-time command configures the recovery timeout value for link fault signaling.

The no recovery-time command and the default recovery-time command removes the recovery timeout value specified for the chosen link error.

**Command Mode**

Link-error Configuration

**Command Syntax**

```
recovery-time value
no recovery-time value
default recovery-time value
```

**Parameters**

- **value**  Specifies the recovery timeout value for LFS. The value ranges from 20 to 200.

**Related Commands**

- action
- period
- threshold

**Example**

- These commands set the recovery time value of 40 for the profile profile1 in the Link-error configuration mode.

  switch(config)#monitor ethernet oam
  switch(config-eoam)#profile profile1
  switch(config-eoam-profile-profile1)#link-error
  switch(config-eoam-profile-profile1-link-error)#recovery-time 40
show hardware counter

The `show hardware counter` command displays counter events across time intervals.

**Command Mode**

EXEC

**Command Syntax**

```
show hardware counter
```

**Example**

- This command displays counter events across all time intervals, which are currently more than one standard deviation apart from a given time interval.

```
switch(config-handler-eventHandler1-counters)#show hardware counter events
-----------------------------------------------------------------------------------------
<table>
<thead>
<tr>
<th>Interval</th>

</tr>
</tbody>
</table>
-----------------------------------------------------------------------------------------
switch(config-handler-eventHandler1-counters)#
```
**show hardware port-group**

The *show hardware port-group* command displays the status of DCS-7050Q-16 port-groups. Port groups contain one QSFP+ interface and a set of four SFP+ interfaces. In each port group, either the QSFP+ interface or the SFP+ interface set is enabled. The port groups are configured independent of each other.

- Port group 1 contains interface 15 (QSFP+) and interfaces 17-20 (SFP+).
- Port group 2 contains interface 16 (QSFP+) and interfaces 21-24 (SFP+).

**Command Mode**

EXEC

**Command Syntax**

```none
show hardware port-group
```

**Guidelines**

The *hardware port-group* command is available on on DCS-7050Q-16 switches.

**Example**

- This command displays the status of ports in the two port groups on a DCS-7050Q-16 switch.

```
switch>show hardware port-group

Portgroup: 1    Active Ports: Et15/1-4
Port            State
------------------------------------------
Ethernet17      ErrDisabled
Ethernet18      ErrDisabled
Ethernet19      ErrDisabled
Ethernet20      ErrDisabled
Ethernet15/1    Active
Ethernet15/2    Active
Ethernet15/3    Active
Ethernet15/4    Active

Portgroup: 2    Active Ports: Et16/1-4
Port            State
------------------------------------------
Ethernet16/1    Active
Ethernet16/2    Active
Ethernet16/3    Active
Ethernet16/4    Active
Ethernet21      ErrDisabled
Ethernet22      ErrDisabled
Ethernet23      ErrDisabled
Ethernet24      ErrDisabled
switch>
```
show interfaces counters

The **show interface counters** command displays the Layer 3 ingress traffic count information. Run this command to view the traffic counts on a sub-interface or VLAN interface. The **clear counters** command resets the counters to zero. Counters displayed by the command include:

- inbound bytes
- inbound unicast packets
- inbound multicast packets
- inbound broadcast packets
- outbound bytes
- outbound unicast packets
- outbound multicast packets
- outbound broadcast packets

**Command Mode**

EXEC

**Command Syntax**

```
show interfaces [INTERFACE] counters [incoming]
```

**Parameters**

- **INTERFACE** Interface type and numbers. Options include:
  - <no parameter> all interfaces.
  - **ethernet** e_range Ethernet interface range specified by e_range.
  - **management** m_range Management interface range specified by m_range.
  - **port-channel** p_range Port-Channel Interface range specified by p_range.
  - **subinterface** Displays the subinterface traffic counts.
  - **vlan-interface** Displays the VLAN-interface traffic counts.
  - **incoming** Displays the traffic count for the ingress port.

**Note**

When no interface is specified, the output will start with ingress and egress counters section for regular interfaces, followed by section for the ingress L3 Interface counters.

**Related Commands**

- **show interfaces counters bins**
- **show interfaces counters errors**
- **show interfaces counters queue**
- **show interfaces counters rates**
Examples

- This command displays byte and packet counters for Ethernet interfaces 1 and 2.

  switch> show interfaces ethernet 1-2 counters
  Port      | InOctets | InUcastPkts | InMcastPkts | InBcastPkts |
  Et1       | 99002845169 | 79116358 | 75557 | 2275 |
  Et2       | 81289180585 | 76278345 | 86422 | 11 |

  Port      | OutOctets | OutUcastPkts | OutMcastPkts | OutBcastPkts |
  Et1       | 4347928323 | 6085482 | 356173 | 2276 |
  Et2       | 4512762190 | 5791718 | 110498 | 15 |

- This command displays the ingress traffic count on a VLAN interface vl12.

  switch> show interface vl12 counters incoming
  L3 Interface | InOctets | InUcastPkts | InMcastPkts |
  Vl12         | 3136 | 47 | 2
**show interfaces counters bins**

The **show interfaces counters bins** command displays packet counters, categorized by packet length, for the specified interfaces. Packet length counters that the command displays include:

- 64 bytes
- 65-127 bytes
- 128-255 bytes
- 256-511 bytes
- 512-1023 bytes
- 1024-1522 bytes
- larger than 1522 bytes

**Command Mode**

EXEC

**Command Syntax**

```
show interfaces [INTERFACE] counters bins
```

**Parameters**

- **INTERFACE** Interface type and numbers. Options include:
  - <no parameter> all interfaces.
  - ethernet e_range Ethernet interface range specified by `e_range`.
  - management m_range Management interface range specified by `m_range`.
  - port-channel p_range Port-Channel Interface range specified by `p_range`.

**Related Commands**

- `show interfaces counters`
- `show interfaces counters errors`
- `show interfaces counters queue`
- `show interfaces counters rates`

**Examples**

This command displays packet counter results for Ethernet interfaces 1 and 2.

```
switch>show interfaces ethernet 1-2 counters bins
```

```

```

```
switch>
```
**show interfaces counters errors**

The `show interfaces counters errors` command displays the error counters for the specified interfaces.

**Command Mode**

EXEC

**Command Syntax**

```
show interfaces [INTERFACE] counters errors
```

**Parameters**

- `INTERFACE` Interface type and numbers. Options include:
  - `<no parameter>` all interfaces.
  - `ethernet e_range` Ethernet interface range specified by `e_range`.
  - `management m_range` Management interface range specified by `m_range`.
  - `port-channel p_range` Port-Channel Interface range specified by `p_range`.

**Display Values**

The table displays the following counters for each listed interface:

- FCS: Inbound packets with CRC error and proper size.
- Align: Inbound packets with improper size (undersized or oversized).
- Symbol: Inbound packets with symbol error and proper size.
- Rx: Total inbound error packets.
- Runts: Outbound packets that terminated early or dropped because of underflow.
- Giants: Outbound packets that overflowed the receiver and were dropped.
- Tx: Total outbound error packets.

**Related Commands**

- `show interfaces counters`
- `show interfaces counters bins`
- `show interfaces counters queue`
- `show interfaces counters rates`

**Examples**

- This command displays the error packet counters on Ethernet interfaces 1-2.

```
switch>show interfaces ethernet 1-2 counters errors
Port       FCS  Align Symbol  Rx  Runts  Giants  Tx
Et1        0    0      0       0  0      0      0
Et2        0    0      0       0  0      0      0
switch>
```
show interfaces counters queue

The **show interfaces counters queue** command displays the queue drop counters for the specified interfaces.

**Command Mode**

EXEC

**Command Syntax**

```
show interfaces [INTERFACE] counters queue
```

**Parameters**

- **INTERFACE** Interface type and numbers. Options include:
  - `<no parameter>` all interfaces.
  - `ethernet e_range` Ethernet interface range specified by `e_range`.
  - `management m_range` Management interface range specified by `m_range`.
  - `port-channel p_range` Port-Channel Interface range specified by `p_range`.

**Related Commands**

- `show interfaces counters`
- `show interfaces counters bins`
- `show interfaces counters errors`
- `show interfaces counters rates`

**Example**

- This command displays the queue drop counters for Ethernet interfaces 1 and 2.

```
switch>show interfaces ethernet 1-2 counters queue
Port  InDrops
Et1   180
Et2   169
switch>
```
show interfaces counters rates

The `show interfaces counters rates` command displays the received and transmitted packet rate counters for the specified interfaces. Counter rates provided include megabits per second (Mbps), kilopackets per second (Kpps) and utilization percentage.

All port rates are approximately calculated. Note that, when displaying the rate information of a port channel, the rate value of the port channel will likely differ from the sum of the rates for the member ports. The discrepancy is likely to be larger for port channels with fewer ports except for port channels with single ports. The rate values of individual member ports are less inaccurate than the rate values of the port channel as a whole.

**Command Mode**

EXEC

**Command Syntax**

```
show interfaces [INTERFACE] counters rates
```

**Parameters**

- **INTERFACE** Interface type and numbers. Options include:
  - `<no parameter>` all interfaces.
  - `ethernet e_range` Ethernet interface range specified by `e_range`.
  - `management m_range` Management interface range specified by `m_range`.
  - `port-channel p_range` Port-Channel Interface range specified by `p_range`.

**Related Commands**

- `show interfaces counters`
- `show interfaces counters bins`
- `show interfaces counters errors`
- `show interfaces counters queue`

**Example**

- This command displays rate counters for Ethernet interfaces 1 and 2.

```
switch> show interfaces ethernet 1-2 counters rates
Port  Intvl  In Mbps   %  In Kpps  Out Mbps   % Out Kpps
Et1   0:05   53.3  0.5%    5   31.2  0.3%    2
Et2   0:05   43.3  0.4%    4   0.1   0.0%    0
switch>
```
show interfaces flow-control

The `show interfaces flow-control` command displays administrative and operational flow control data for the specified interfaces. Administrative data is the parameter settings stored in `running-config` for the specified interface; the switch uses these settings to negotiate flow control with the peer switch. Operational data is the resolved flow control setting that controls the port’s behavior.

**Command Mode**

**EXEC**

**Command Syntax**

```
show flow-control [INTERFACE]
show [INTERFACE] flow-control
```

**Parameters**

- `INTERFACE` Interface type and number for which flow control data is displayed.
  - `<no parameter>` all interfaces.
  - `ethernet e_range` Ethernet interfaces in the specified range.
  - `management m_range` Management interfaces in the specified range.

Valid `e_range` and `m_range` formats include number, number range, or comma-delimited list of numbers and ranges.

**Example**

- This command shows the settings for Ethernet interfaces 1-10.

```
switch>show flow-control interface ethernet 1-10
Port  Send FlowControl  Receive FlowControl  RxPause  TxPause
       admin  oper  admin  oper            -------------  -------------
Et1    off      off      off      off         0             0
Et2    off      off      off      off         0             0
Et3    off      off      off      off         0             0
Et4    off      off      off      off         0             0
Et5    off      off      off      off         0             0
Et6    off      off      off      off         0             0
Et7    off      off      off      off         0             0
Et8    off      off      off      off         0             0
Et9    off      off      off      off         0             0
Et10   off      off      off      off         0             0
switch>
```
show interfaces hardware

The `show interfaces hardware` command displays the model number, interface type, duplex mode, and flow control settings of the specified interfaces. The capabilities command is available on Ethernet and management interfaces.

**Command Mode**
EXEC

**Command Syntax**
`show interfaces [INTERFACE] hardware`

**Parameters**
- `INTERFACE` Interface type and numbers. Options include:
  - `<no parameter>` all interfaces.
  - `ethernet e_range` Ethernet interface range specified by `e_range`.
  - `management m_range` Management interface range specified by `m_range`.

Valid `e_range` and `m_range` formats include number, number range, or comma-delimited list of numbers and ranges.

**Examples**
- This command displays the model number, interface type, duplex mode and flow control settings for Ethernet interfaces 2 and 18.

```
switch>show interfaces ethernet 2,18 hardware
Ethernet2
  Model: DCS-7150S-64-CL
  Type: 10GBASE-CR
  Speed/Duplex: 10G/full,40G/full,auto
  Flowcontrol: rx-(off,on,desired),tx-(off,on,desired)

Ethernet18
  Model: DCS-7150S-64-CL
  Type: 10GBASE-SR
  Speed/Duplex: 10G/full
  Flowcontrol: rx-(off,on),tx-(off,on)
switch>
```
show interfaces hardware default

The `show interfaces hardware default` command displays the static interface capability information of the specified interfaces. This command displays information related to the speed, auto-negotiation, error correction, and modulation capabilities (when applicable) of a system’s ports. The command also provides information displayed by the `show interfaces hardware` command, such as model number, interface type, duplex mode, and flow control settings of the specific interface. Compared to the `show interfaces hardware` command, this command accounts for the capabilities of the system architecture only, and does not consider the capabilities of a transceiver.

**Command Mode**

EXEC

**Command Syntax**

```
show interfaces [INTERFACE] hardware default
```

**Parameters**

- `INTERFACE` Interface type and numbers. Options include:
  - `<no parameter>` all interfaces.
  - `ethernet e_range` Ethernet interface range specified by `e_range`.
  - `management m_range` Management interface range specified by `m_range`.

Valid `e_range` and `m_range` formats include number, number range, or comma-delimited list of numbers and ranges.

**Examples**

- This command displays the static interface capability information at the default level.
  
  switch>show interfaces hardware default
  
  Ethernet1
  
  Model: DCS-7020TR-48
  Type: 1000BASE-T
  Speed/Duplex: 100M/full, 1G/full
  Flowcontrol: rx-(off, on, desired), tx-(off)
  Autoneg CL28: 100M/full, 1G/full
  Autoneg CL37: 1G/full
  ...
  ...
  switch>

- This command displays the static interface capability information for Ethernet interface 4/1/1.
  
  switch>show interfaces ethernet 4/1/1 hardware default
  
  Ethernet4/1/1
  
  Model: 7500R2AK-36CQ-LC
  Type: 40GBASE-CR4
  Speed/Duplex: 1G/full, 10G/full, 25G/full, 40G/full, 50G/full, 100G/full
  Flowcontrol: rx-(off, on, desired), tx-(off)
  Autoneg CL28: 1G/full, 10G/full
  Autoneg CL73:
    IEEE: 25G/full, 40G/full, 100G/full
    Consortium: 25G/full, 50G/full
  Error Correction:
    Reed-Solomon: 25G, 50G, 100G
    Fire-code: 25G, 50G
show interfaces negotiation

The show interfaces negotiation command displays the speed, duplex, and flow control auto-negotiation status for the specified interfaces.

**Command Mode**

EXEC

**Command Syntax**

```
show interfaces [INTERFACE] negotiation [INFO_LEVEL]
```

**Parameters**

- **INTERFACE** Interface type and numbers. Options include:
  - <no parameter> Display information for all interfaces.
  - **ethernet e_range** Ethernet interface range specified by `e_range`.
  - **management m_range** Management interface range specified by `m_range`.

  Valid `e_range` and `m_range` formats include number, number range, or comma-delimited list of numbers and ranges.

- **INFO_LEVEL** amount of information that is displayed. Options include:
  - <no parameter> displays status and negotiated setting of local ports.
  - **detail** displays status and negotiated settings of local ports and their peers.

**Examples**

- This command displays the negotiated status of management 1 and 2 interfaces

```
switch> show interface management 1-2 negotiation
Port  Autoneg    Negotiated Settings
      Status  Speed  Duplex  Rx Pause  Tx Pause
---------  -------  --------  --------  --------  --------
Ma1  success  100M    full    off  off
Ma2  success  auto  auto    off  off
```

- This command displays the negotiated status of management 1 interface and its peer interface.

```
switch> show interface management 1 negotiation detail
Management1 :

Auto-Negotiation Mode  10/100/1000 BASE-T (IEEE Clause 28)
Auto-Negotiation Status Success

Advertisements  Speed  Duplex  Pause
-----------------  --------  -------  --------
Local  10M/100M/1G  half/full Disabled
Link Partner  None    None    None

Resolution  100Mb/s  full  Rx=off,Tx=off
```

switch>
show interfaces phy

The show interfaces phy command displays physical layer characteristics for the specified interfaces.

Command Mode
EXEC

Command Syntax
show interfaces [INTERFACE] phy [INFO_LEVEL]

Parameters
- **INTERFACE** Interface type and numbers. Options include:
  - <no parameter> All interfaces.
  - ethernet e_range Ethernet interfaces in specified range.
    Valid e_range formats include number, number range, or comma-delimited list of numbers and ranges.
- **INFO_LEVEL** amount of information that is displayed. Options include:
  - <no parameter> command displays table that summarizes PHY data.
  - detail command displays data block for each specified interface.

Examples
- This command summarizes PHY information for Ethernet interfaces 1-5.
  
```
  switch>show interfaces ethernet 1-5 phy
  Key:

switch>
```
**show interfaces status**

The **show interfaces status** command displays the interface name, link status, vlan, duplex, speed, and type of the specified interfaces. When the command includes a link status, the results are filtered to display only interfaces whose link status match the specified type.

**Command Mode**

EXEC

**Command Syntax**

```
show interfaces [INTERFACE] status [STATUS_TYPE]
```

**Parameters**

- **INTERFACE** Interface type and numbers. Options include:
  - `<no parameter>` All existing interfaces.
  - `ethernet e_range` Ethernet interfaces in the specified range.
  - `management m_range` Management interfaces in the specified range.
  - `port-channel p_range` All existing port-channel interfaces in the specified range.

  Valid `e_range`, `m_range`, and `p_range` formats include number, number range, or comma-delimited list of numbers and ranges.

- **STATUS_TYPE** Interface status upon which the command filters output. Options include:
  - `<no parameter>` command does not filter on interface status.
  - `connected` interfaces connected to another port.
  - `notconnect` unconnected interfaces that are capable of connecting to another port.
  - `disabled` interfaces that have been powered down or disabled.
  - `sub-interfaces` L3 subinterfaces configured on the switch.

  Command may include multiple status types (*connected* *notconnect* *disabled*), which can be placed in any order.

**Example**

- This command displays the status of Ethernet interfaces 1-5.

  ```
  switch> show interfaces ethernet 1-5 status
  Port   Name              Status       Vlan        Duplex  Speed Type
  Et1     connected    1             full    10G  10GBASE-SRL
  Et2     connected    1             full    10G  10GBASE-SRL
  Et3     connected    1             full    10G  10GBASE-SRL
  Et4     connected    1             full    10G  10GBASE-SRL
  Et5     notconnect   1             full    10G Not Present
  switch>
  ```

- This command displays status information for all subinterfaces configured on the switch.

  ```
  switch> show interfaces status sub-interfaces
  Port   Name   Status  Vlan  Duplex  Speed  Flags
  Et1.1   connect     101  full  10G  dot1q-encapsulation
  Et1.2   connect     102  full  10G  dot1q-encapsulation
  Et1.3   connect     103  full  10G  dot1q-encapsulation
  Et1.4   connect     103  full  10G  dot1q-encapsulation
  switch>
  ```
show interfaces status errdisabled

The `show interfaces status errdisabled` command displays interfaces that are in errdisabled state, including their link status and errdisable cause.

**Command Mode**

EXEC

**Command Syntax**

```
show interfaces [INTERFACE] status errdisabled
```

**Parameters**

- **INTERFACE** Interface type and numbers. Options include:
  - `<no parameter>` Display information for all interfaces.
  - `ethernet e_range` Ethernet interface range specified by `e_range`.
  - `management m_range` Management interface range specified by `m_range`.
  - `port-channel p_range` Port-Channel Interface range specified by `p_range`.

Valid `e_range` and `m_range` formats include number, number range, or comma-delimited list of numbers and ranges.

**Examples**

- This command displays the error-disabled ports.

```
switch>show interfaces status errdisabled
+---------------+---------------+------------+------------------+
<table>
<thead>
<tr>
<th>Port</th>
<th>Name</th>
<th>Status</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>

<td></td>
</tr>
<tr>
<td>Et49/3</td>
<td>multi-lane-intf</td>
<td>errdisabled</td>
<td></td>
</tr>
<tr>
<td>Et49/4</td>
<td>multi-lane-intf</td>
<td>errdisabled</td>
<td></td>
</tr>
</tbody>
</table>
switch>
```
show interfaces transceiver

The `show interfaces transceiver` command displays operational transceiver data for the specified interfaces.

**Command Mode**

EXEC

**Command Syntax**

```
show interfaces [INTERFACE] transceiver [DATA_FORMAT]
```

**Parameters**

- `INTERFACE` Interface type and numbers. Options include:
  - `<no parameter>` all interfaces.
  - `ethernet e_range` Ethernet interface range specified by `e_range`.
  - `management m_range` Management interface range specified by `m_range`.

Valid `e_range`, and `m_range` formats include number, number range, or comma-delimited list of numbers and ranges.

- `DATA_FORMAT` format used to display the data. Options include:
  - `<no parameter>` table entries separated by tabs.
  - `csv` table entries separated by commas.

**Related Commands**

- `show interfaces transceiver properties`

**Examples**

- This command displays transceiver data on Ethernet interfaces 1 through 4.

```
switch>show interfaces ethernet 1-4 transceiver
If device is externally calibrated, only calibrated values are printed. 
N/A: not applicable, Tx: transmit, Rx: receive. 
mA: milliamperes, dBm: decibels (milliwatts).

switch>
```
**show interfaces transceiver channels**

The `show interfaces transceiver channels` command displays current wavelength/frequency settings for the specified channels.

**Command Mode**

EXEC

**Command Syntax**

```
show interfaces [INTERFACE e_range] transceiver channels
```

**Parameters**

- **INTERFACE** Interface type and port numbers.
- **eternet e_range** Ethernet interface range specified by `e_range`.

**Related Commands**

- `transceiver channel`
- `show interfaces transceiver hardware`

**Examples**

- This command displays the supported wavelengths/frequencies and their corresponding channel numbers on Ethernet interface 4 to slot 3 through 4.

```
switch(config-as-if-Et4/1/3)#show interfaces ethernet 4 / 3 / 4 transceiver channels
Name: Et4/3/4
100GHz- 50GHz-
Wavelength Frequency spacing spacing (nm) (GHz) Channel Channel
---------- --------- ------- -------
1567.95  191,200 1  1
1567.54  191,250 2
1567.13  191,300 2  3
1566.72  191,350 4
....
1529.16  196,050 98
1528.77  196,100 50  99
1528.38  196,150 100
```

switch(config-as-if-Et4/1/3)#
show interfaces transceiver hardware

The **show interfaces transceiver hardware** command displays current wavelength/frequency settings for the specified transceiver interfaces.

**Command Mode**

EXEC

**Command Syntax**

```
show interfaces [INTERFACE e_range] transceiver hardware
```

**Parameters**

- **INTERFACE**  Interface type and port numbers.
  - **ethernet e_range**  Ethernet interface range specified by `e_range`.

**Related Commands**

- `transceiver channel`
- `show interfaces transceiver channels`

**Examples**

- This command displays the current wavelength/frequency settings on Ethernet interface 4 to slot 3 through 4.

  ```
  switch(config-as-if-Et4/1/3)#show interfaces ethernet 4 / 3 / 4 transceiver hardware
  Name: Et4/3/4
  Media Type: 10GBASE-DWDM
  Configured Channel : 39
  Configured Grid (GHz) : 50
  Computed Frequency (GHz) : 193,100
  Computed Wavelength (nm) : 1552.52
  Operational Channel : 39 (Default)
  Operational Grid (GHz) : 50 (Default)
  Operational Frequency (GHz): 193,100
  Operational Wavelength (nm): 1552.52
  switch(config-as-if-Et4/1/3)#
  ```
show interfaces transceiver properties

The `show interfaces transceiver properties` command displays configuration information for the specified interfaces. Information provided by the command includes the media type, interface speed-duplex settings, speed-duplex operating state.

**Command Mode**

EXEC

**Command Syntax**

```
show interfaces [INTERFACE] transceiver properties
```

**Parameters**

- `INTERFACE` Interface type and numbers. Options include:
  - `<no parameter>` Display information for all interfaces.
  - `ethernet e_range` Ethernet interface range specified by `e_range`.
  - `management m_range` Management interface range specified by `m_range`.

Valid `e_range` and `m_range` formats include number, number range, or comma-delimited list of numbers and ranges.

**Related Commands**

- `show interfaces transceiver`

**Examples**

- This command displays the media type, speed, and duplex properties for Ethernet interfaces 1-3.

```
switch>show interfaces ethernet 1-3 transceiver properties
Name : Et1
Administrative Speed: 10G
Administrative Duplex: full
Operational Speed: 10G (forced)
Operational Duplex: full (forced)
Media Type: 10GBASE-SRL

Name : Et2
Administrative Speed: 10G
Administrative Duplex: full
Operational Speed: 10G (forced)
Operational Duplex: full (forced)
Media Type: 10GBASE-SRL

Name : Et3
Administrative Speed: 10G
Administrative Duplex: full
Operational Speed: 10G (forced)
Operational Duplex: full (forced)
Media Type: 10GBASE-SRL

switch>
```
**show monitor ethernet oam profile**

The `show monitor ethernet oam profile` command displays configuration information for the specified ethernet OAM profile name or the summary information of all configured profile names.

**Command Mode**

EXEC

**Command Syntax**

```
show monitor ethernet oam profile {name | summary}
```

**Parameters**

- `name` The EOAM profile name.
- `summary` The EOAM summary of all profiles that are configured.

**Related Commands**

- `link-error`
- `monitor ethernet oam profile`

**Examples**

- This command displays the OAM profile configuration information for the specific profile name.

  ```
  switch#show monitor ethernet oam profile [ <name> ]
  ```

  Ethernet OAM Profile : p

  Error Type : symbol

  Threshold : 20 frames
  Action : log
  Period : 20 seconds

  Error Type : fcs

  Threshold : 10 frames
  Action : linkfault
  Period : 100 frame

  Recovery Timeout : 20

- This command displays the OAM profile configuration summary for all profiles configured.

  ```
  switch>show monitor ethernet oam profile [ <name> ] summary
  ```

  Eoam Profile : p

  Configured on: Et3/1-4,5
show platform fm6000 agileport map

The `show platform fm6000 agileport map` command displays the list of Ethernet interfaces that are combinable to form a higher speed port.

**Command Mode**
Privileged EXEC

**Command Syntax**
```
show platform fm6000 agileport map
```

**Example**
- These commands displays the agile port map for the switch, then configures Ethernet interface 13 as a 40G port, subsuming Ethernet interfaces 15, 17 and 19.

```
switch#show platform fm6000 agileport map

<table>
<thead>
<tr>
<th>Agile Ports</th>
<th>Interfaces subsumed in 40G link</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ethernet1</td>
<td>Ethernet3  Ethernet5  Ethernet7</td>
</tr>
<tr>
<td>Ethernet2</td>
<td>Ethernet4  Ethernet6  Ethernet8</td>
</tr>
<tr>
<td>Ethernet13</td>
<td>Ethernet15  Ethernet17  Ethernet19</td>
</tr>
<tr>
<td>Ethernet14</td>
<td>Ethernet16  Ethernet18  Ethernet20</td>
</tr>
</tbody>
</table>

switch#config
switch(config)#interface ethernet 13
switch(config-if-Et13)#speed forced 40gfull

WARNING! Executing this command will cause the forwarding agent to be restarted. All interfaces will briefly drop links and forwarding on all interfaces will momentarily stop.

Do you wish to proceed with this command? [y/N]

Ethernet13 configured for 40G.
Ethernet15, Ethernet17 and Ethernet19 are now subsumed.
switch(config-if-Et13)#
**show poe**

The `show poe` command displays PoE information for a specified port range or for all ports.

**Command Mode**

Privileged EXEC

**Command Syntax**

```
show poe [INTERFACE]
```

**Parameters**

- `INTERFACE` Interface type and numbers. Options include:
  - `<no parameter>` Display information for all interfaces.
  - `ethernet e_range` Ethernet interface range specified by `e_range`.

**Example**

- This command displays PoE information for Ethernet interface 46.

```
switch(config)# show poe interface ethernet 46
show poe interface ethernet 46

PSE  LLDP  Power Granted  Port
Port  Enabled  Enabled  Limit  Power  State  Class  Power  Current  Voltage  Temperature
-----  -------  -------  ------  -----  -----  -----  ------  -------  -------  -----------
46    True    True    15.40W    15.40W    powered    class0    1.40W    27.00mA    55.04V    41.25C
switch(config-if-Et7)#
```
The `speed` command configures the transmission speed and duplex setting for the configuration mode interface. The scope and effect of this command depends on the interface type. Interface types include:

- **40GBASE (QSFP+):** Default is 4x10G-full. **Speed forced 40gfull** and **Speed auto 40gfull** configure interface as a 40G port.
- **10GBASE-T:** Default is 10G-full. **Speed** command affects interface.
- **10GBASE (SFP+):** Default is 10G-full. **Speed** command does not affect interface.
- **1000BASE (copper):** Default is 1G-full. **Speed auto 100full** affects interface.
- **1000BASE (fiber):** Default is 1G-full. **Speed** command does not affect interface.
- **10/100/1000:** Default is **auto-negotiation. Speed** command (10/100/1000 options) affects interface.

The **speed forced 40gfull** and **auto 40gfull** commands configure a QSFP+ Ethernet interface as a 40G port. The **no speed** and **no auto 40gfull** commands configure a QSFP+ Ethernet interface as four 10G ports. These commands must be applied to the /1 port. These commands are hitless on the 7050X, 7060X, 7250X, 7260X, 7280SE, 7300X, 7320X and 7500E series platforms. On all other platforms, these commands restart the forwarding agent, which will result in traffic disruption.

The **no speed** and **default speed** commands restore the default setting for the configuration mode interface by removing the corresponding **speed** command from **running-config**.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Management Configuration

**Command Syntax**
```
speed MODE
no speed
default speed
```

**Parameters**
- **MODE** transmission speed and duplex setting. Options include:
  - **speed auto** auto negotiation mode. (For SFP-1G-T, auto-negotiates 1Gbps, this is because no speed is specified, and we are defaulting to advertise 1G)
  - **speed auto 40gfull** auto negotiation mode with clause 73 auto negotiation.
  - **speed auto 1G full/ speed 1G** auto-negotiated 1Gbps (note that per BASE-T standard, 1G must be negotiated)
  - **speed auto 100full** auto-negotiated 100Mbps.
  - **speed 100full** non-negotiated and true-forced 100Mbps.

**Important!** Interfaces using clause 73 auto negotiation must connect to a device that runs clause 73 auto negotiation.

- **sfp-1000baset auto** auto-negotiation mode (1000BASE-T interfaces only).
- **forced 10000full** 10G full duplex.
- **forced 1000full** 1G full duplex.
- **forced 1000half** 1G half duplex.
- **forced 100full** 100M full duplex.
- **forced 100gfull** 100G full duplex.
- **forced 100half** 100M half duplex.
- **forced 10full** 10M full duplex.
- **forced 10half** 10M half duplex.
- **forced 40gfull** 40G full duplex.

On 40GBASE and 100GBASE interfaces, options that change the SFP+ and MXP interfaces (the **auto 40gfull**, the **forced 40gfull**, and the **no speed** options) may restart the forwarding agent on some switch platforms, disrupting traffic on all ports for more than a minute.

### Guidelines

**Note** The **SFP-1G-T** transceivers advertise one speed at a time only. Hence, the desired speed and negotiation must be configured explicitly using the **speed auto**, **speed auto 1G full**/ **speed 1G**, **speed auto 100full**, and **speed 100full** commands.

### Examples

- **This command configures a 40GBASE interface as a 40G port.**

```
switch(config)#interface ethernet 49/1
switch(config-if-Et49/1)#speed forced 40gfull
switch(config-if-Et49/1)#show interface ethernet 49/1 - 49/4 status
```

<table>

```
switch(config-if-Et49/1)#
```
system

The system command allows the user to configure the system-wide TCAM profiles such as default, mirroring-acl, mpls-evpn, pbr-match-next-hop-group, qos, tap-aggregation-default, tap-aggregation-extended, tc-counters, test, vxlan-routing.

The exit command returns the switch to global configuration mode.

Command Mode
   Hardware TCAM

Command Syntax
   system profile <name>

Parameter
   • name TCAM profile name.

Example
   • This commands allow the switch to configure the TCAM profile “qos”.
     switch(config-hw-tcam)#system profile qos

Commands Available
   • hardware tcam
threshold

The `threshold` command configures the link monitoring threshold value that is specified for a link error. The `no threshold` and the `default threshold` commands remove the threshold value specified for the chosen link error.

**Command Mode**
Link-error Configuration

**Command Syntax**
```
{fcs | symbol} threshold threshold_value
no {fcs | symbol} threshold threshold_value
default {fcs | symbol} threshold threshold_value
```

**Parameters**
- `fcs` Inbound packets with frame check sequence (FCS) error.
- `symbol` Inbound packets with symbol error.
- `threshold_value` Specifies the threshold value in number of errors. The value ranges from 1 to 100.

**Related Commands**
- `action`
- `period`

**Example**
- These commands set the `threshold` value of 20 for the profile `profile1` in the Link-error configuration mode.

```
switch(config)#monitor ethernet oam
switch(config-eoam)#profile profile1
switch(config-eoam-profile-profile1)#link-error
switch(config-eoam-profile-profile1-link-error)#symbol threshold 20
```
transceiver channel

The transceiver channel command displays transceiver wavelength/frequency by channel number. The channel numbering depends on the selected grid-spacing mode. The default grid-spacing mode is 50GHz-spacing.

- If the startup configuration does not specify the channel number for the interface, the transceiver will automatically tune to the default channel (i.e. channel-39 of 50GHz-spacing grid) when it is inserted.
- If the configured wavelength/frequency is not supported by the transceiver, the transceiver will be tuned to the default channel (i.e. channel-39 of 50GHz-spacing grid).

The interface is shutdown before the channel number is configured.

Command Mode
Global Configuration

Command Syntax

```
transceiver channel CHANNEL_NUMBER grid-spacing <SPACING_GRID>
no transceiver channel CHANNEL_NUMBER [GRID_SPACING <SPACING_GRID>]
default transceiver channel CHANNEL_NUMBER [GRID_SPACING <SPACING_GRID>]
```

Parameters

- **CHANNEL-NUMBER** The default channel is 39 (50GHz-spacing grid) which corresponds to a frequency of 193,100 GHz and a wavelength of 1552.52 nm.
- **GRID_SPACING** Grid-spacing mode (optional) depends on the selected grid-spacing mode. The default grid-spacing mode is 50GHz-spacing. For example, channel 39 of 50GHz-spacing grid is equivalent to channel 20 of 100GHz-spacing grid, which corresponds to a frequency of 193,100 GHz and a wavelength of 1552.52 nm.
- `<SPACING_GRID>` default grid-spacing mode in GHz.

Related Commands

- show interfaces transceiver channels
- show interfaces transceiver hardware

Example

- This command tunes the transceiver on slot number 4 to slot 1 through 3 of 50GHz-spacing grid.
```
switch(config-as)#interface ethernet 4 / 1 / 3
switch(config-if-Et4/1/3)#transceiver channel 1 grid-spacing 50
switch(config-if-Et4/1/3)#
```
**transceiver qsfp default-mode**

The `transceiver qsfp default-mode` command specifies the transmission mode of all QSFP transceiver modules that are not explicitly configured.

Each QSFP+ module Ethernet interface is configurable as a single 40G port or as four 10G ports. The switch displays four ports for each interface. Each port's status depends on the interface configuration:

- The /1 port is active (*connected* or *not connected*), regardless of the interface configuration.
- The /2, /3, and /4 ports are *error-disabled* when the interface is configured as a single 40G port.
- All ports are active (*connected* or *not connected*), when the interface is configured as four 10G ports.

The only available default-mode value is 4x10G; QSFP modules that are not configured through a `speed` command are operated as four 10G ports.

The `no transceiver qsfp default-mode` and `default transceiver qsfp default-mode` commands restore the default-mode transceiver setting to its default value of 4x10G.

**Command Mode**

Global Configuration

**Command Syntax**

```
transceiver qsfp default-mode 4x10G
no transceiver qsfp default-mode
default transceiver qsfp default-mode
```

**Guidelines**

The `transceiver qsfp default-mode 4x10g` statement is always in `running-config` and cannot be modified or removed in the current release.
Port Channels and LACP

This chapter describes channel groups, port channels, port channel interfaces, and the Link Aggregation Control Protocol (LACP). This chapter contains the following sections:

- Section 12.1: Port Channel Introduction
- Section 12.2: Port Channel Conceptual Overview
- Section 12.3: Port Channel Configuration Procedures
- Section 12.4: Load Balancing Hash Algorithms
- Section 12.5: Port Channel and LACP Configuration Commands

12.1 Port Channel Introduction

Arista’s switching platforms support industry-standard link aggregation protocols. Arista switches optimize traffic throughput by using MAC addressing, IP addressing, and services fields to effectively load share traffic across aggregated links. Managers can configure multiple ports into a logical port channel, either statically or dynamically through the IEEE Link Aggregation Control Protocol (LACP). Various negotiation modes are supported to accommodate different configurations and peripheral requirements, including LACP fallback to support devices that need simple network connectivity to retrieve images or configurations prior to engaging port channel aggregation modes.

Arista’s Multi-chassis Link Aggregation protocol (MLAG) supports LAGs across paired Arista switches to provide both link aggregation and active/active redundancy.

12.2 Port Channel Conceptual Overview

12.2.1 Channel Groups and Port Channels

A port channel is a communication link between two switches supported by matching channel group interfaces on each switch. A port channel is also referred to as a link aggregation group (LAG). Port channels combine the bandwidth of multiple Ethernet ports into a single logical link.

A channel group is a collection of Ethernet interfaces on a single switch. A port channel interface is a virtual interface that serves a corresponding channel group and connects to a compatible interface on another switch to form a port channel. Port channel interfaces can be configured and used in a manner similar to Ethernet interfaces. Port channel interfaces are configurable as layer 2 interfaces, layer 3 (routable) interfaces, and VLAN members. Most Ethernet interface configuration options are also available to port channel interfaces.
12.2.2 Port Channel Subinterfaces

Port channel subinterfaces divide a single port channel interface into multiple logical L3 interfaces based on the 802.1q tag (VLAN ID) of incoming traffic. Subinterfaces are commonly used in the L2/L3 boundary device, but they can also be used to isolate traffic with 802.1q tags between L3 peers by assigning each subinterface to a different VRF.

For further details about subinterfaces, see Subinterfaces.

12.2.3 Link Aggregation Control Protocol (LACP)

The Link Aggregation Control Protocol (LACP), described by IEEE 802.3ad, defines a method for two switches to automatically establish and maintain link aggregation groups (LAGs, also called channel groups or port channels). Using LACP, a switch can configure LACP-compatible ports into a dynamic LAG. The ports try to complete LACP negotiation automatically with the linked ports (also configured as a dynamic LAG) on the partner switch. The maximum number of ports per LAG varies by platform; numbers for each platform in the latest EOS release are available here: https://www.arista.com/en/support/product-documentation/supported-features.

Static LAGs

In static mode (with the channel-group mode configured as on on the member interfaces), the switch aggregates links without an awareness of LAGs on the partner switch and without LACP negotiation. The member ports do not send LACP packets or process inbound LACP packets on static LAGs. Packets may drop when static LAG configurations differ between switches.

Dynamic LAGs

Dynamic LAGs are aware of their partners’ port-channel states. Interfaces configured as dynamic LAGs are designated as active or passive.

- **Active interfaces** send LACP Protocol Data Units (LACP PDUs) at a rate of one per second when forming a channel with an interface on the peer switch. An aggregate forms if the peer runs LACP in active or passive mode.

- **Passive interfaces** only send LACP PDUs in response to PDUs received from the partner. The partner switch must be in active mode and initiates negotiation by sending a LACP packet. The passive mode switch receives and responds to the packet to form a LAG.

An active interface can form port channels with passive or active partner interfaces, but port channels are not formed when the interface on each switch is passive.

Table 12-1 summarizes the effect of different LACP mode combinations:

<table>
<thead>
<tr>
<th>Switch 1</th>
<th>Switch 2</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>active</td>
<td>active</td>
<td>Links aggregate when LACP negotiation is successful.</td>
</tr>
<tr>
<td>active</td>
<td>passive</td>
<td>Links aggregate when LACP negotiation is successful.</td>
</tr>
<tr>
<td>passive</td>
<td>passive</td>
<td>Links do not aggregate because LACP negotiation is not initiated.</td>
</tr>
<tr>
<td>on (static)</td>
<td>on (static)</td>
<td>Links aggregate without LACP.</td>
</tr>
<tr>
<td>on (static)</td>
<td>active or passive</td>
<td>Links aggregate on the static switch without LACP; links do not aggregate on the other switch, and no port-channel connection is established with the partner.</td>
</tr>
</tbody>
</table>
During synchronization, interfaces in dynamic LAGs transmit one LACP PDU per second. After synchronization is complete, interfaces exchange one PDU every thirty seconds, facilitated by a default timeout of 30 seconds and a failure tolerance of three. Under these parameters, when the switch does not receive a LACP PDU for an interface during a ninety-second period, it records the partner interface as **failed** and removes the interface from the port channel.

**Fallback Mode**

An active interface that is not in fallback mode does not form a LAG until it receives PDUs from, and negotiates with its peer. Fallback mode allows an active LACP interface to maintain a LAG without receiving PDUs from its peer. The fallback timer specifies the period the LAG waits to receive a peer PDU. Upon timer expiry, the port channel reverts to its configured fallback mode if one is configured.

**Static fallback**: the port channel maintains one active port while in fallback mode; all its other member ports are in standby mode until a LACP PDU is received by the port channel. All member ports send (and can receive) LACP PDUs, but only the active port sends or receives data.

**Individual fallback**: all member ports act as individual switch ports while in fallback mode. Individual port configuration (rather than port channel configuration) is active while the port channel is in fallback mode, with the exception of ACLs. This includes VLAN membership. All member ports send and receive data, and continue to send LACP PDUs. As soon as a LACP PDU is received by a member of the port channel, all ports revert to normal port-channel operation.

The switch uses a link aggregation hash algorithm to determine the forwarding path within a link aggregation group. The IP and MAC header fields can be selected as components of the hash algorithm.
12.3 Port Channel Configuration Procedures

These sections describe channel group and port channel configuration procedures:

- Section 12.3.1: Configuring a Channel Group
- Section 12.3.2: Configuring a Port Channel Interface
- Section 12.3.3: Configuring Port Channel Subinterfaces
- Section 12.3.4: Configuring LACP
- Section 12.3.5: Displaying Port Channel Information

12.3.1 Configuring a Channel Group

Creating a Channel Group

The `channel-group` command assigns the configuration-mode Ethernet interfaces to a channel group, creates the channel group if it does not already exist, and specifies LACP attributes for the channel.

Channel groups are associated with a port channel interface immediately upon their creation. A command that creates a new channel group also creates a port channel with a matching ID. The port channel is configured in port-channel configuration mode. Configuration changes to a port channel interface propagate to all Ethernet interfaces in the corresponding channel group.

LACP is enabled on the member interfaces by setting the channel-group mode to `active` or `passive`. Setting the mode to `on` disabled LACP on the member interfaces and creates a static channel group.

Example

- These commands assign Ethernet interfaces 1 and 2 to channel group 10 (creating the channel group if it does not already exist), enable LACP on those interfaces, and place the channel group in a negotiating state.
  
  ```
  switch(config)#interface ethernet 1-2
  switch(config-if-Et1-2)#channel-group 10 mode active
  switch(config-if-Et1-2)#
  ```

Adding an Interface to a Channel Group

The `channel-group` command is also used to add the configuration mode interface to an existing channel group. When adding channels to a previously created channel group, the channel-group mode for the new channel must match the mode for the existing group.

Example

- These commands add Ethernet interfaces 7 through 10 to previously created channel group 10, using the channel-group mode (`active`) under which it was created.
  
  ```
  switch(config)#interface ethernet 7-10
  switch(config-if-Et7-10)#channel-group 10 mode active
  switch(config-if-Et7-10)#
  ```

Removing an Interface from a Channel Group

The `no channel-group` command removes the configuration mode interface from the specified channel group. Deleting all members of a channel group does not remove the associated port channel interface from `running-config`. 
Example

- These commands remove Ethernet interface 8 from previously created channel group 10.

```
switch(config)#interface ethernet 8
switch(config-if-Et8)#no channel-group
switch(config-if-Et8)#
```

Deleting a Channel Group

A channel group is deleted by removing all Ethernet interfaces from the channel group. A channel group's LACP mode can be changed only by deleting the channel group and then creating an equivalent group with a different LACP mode. Deleting a channel group by removing all Ethernet interfaces from the group preserves the port channel interface and its configuration settings.

View `running-config` to verify the deletion of all Ethernet interfaces from a channel group.

12.3.2 Configuring a Port Channel Interface

Creating a Port Channel Interface

The switch provides two methods for creating port channel interfaces:

- creating a channel group simultaneously creates an associated port channel.
- the `interface port-channel` command creates a port channel without assigning Ethernet channels to the new interface.

The `interface port-channel` command places the switch in interface-port channel configuration mode.

Example

- This command creates port channel interface 8 and places the switch in port channel interface configuration mode.

```
switch(config)#interface port-channel 8
switch(config-if-Po8)#
```

Deleting a Port Channel Interface

The `no interface port-channel` command deletes the configuration mode port channel interface and removes the channel group assignment for each Ethernet interface assigned to the group associated with the port channel interface. Removing all Ethernet interfaces from a channel group does not remove the associated port channel interface from `running-config`.

12.3.3 Configuring Port Channel Subinterfaces

When configuring subinterfaces on a port channel interface (the virtual interface associated with a port channel), the following restrictions apply:

- An L3 interface with subinterfaces configured on it should not be made a member of a port channel.
- An interface that is a member of a port channel should not have subinterfaces configured on it.
- A subinterface cannot be made a member of a port channel.

Port channel subinterfaces are otherwise configured similarly to Ethernet subinterfaces. For additional information, see `Subinterfaces`. 
12.3.4 Configuring LACP

Configuring the Channel-group Mode

The channel-group mode is configured when a channel group is created using the `channel-group` command. A channel group’s mode cannot be modified without deleting the entire channel group, but it can be modified without deleting the port channel interface associated with the channel group. The mode setting defines whether the port channel is static or dynamic, and whether a dynamic port channel is active or passive.

Examples

- These commands create a dynamic channel group and place it in LACP active mode.

```
switch(config)#interface ethernet 1-2
switch(config-if-Et1-2)#channel-group 10 mode active
```

- These commands create a static channel group.

```
switch(config)#interface ethernet 4-5
switch(config-if-Et4-5)#channel-group 11 mode on
```

Configuring the System Priority

Each switch is assigned a globally unique system identifier by concatenating the system priority (16 bits) to the MAC address of one of its physical ports (48 bits). The system identifier is used by peer devices when forming an aggregation to verify that all links are from the same switch. The system identifier is also used when dynamically changing aggregation capabilities in response to LACP information; the system with the numerically lower system identifier is permitted to dynamically change advertised aggregation capabilities.

The `lacp system-priority` command configures the switch’s LACP system priority.

Example

- This command assigns the system priority of 8192 to the switch.

```
switch(config)#lacp system-priority 8192
```

Configuring Port Priority

LACP port priority determines the port that is active in a LAG in fallback mode. Numerically lower values have higher priority. Port priority is supported on port channels that are enabled with LACP physical interfaces.

The `lacp port-priority` command sets the aggregating port priority for the configuration mode interface.

Example

- This command assigns the port priority of 4096 to Ethernet interface 1.

```
switch(config-if-Et1)#lacp port-priority 4096
```

Configuring the LACP Packet Reception Rate

The `lacp timer` command sets the reception rate of LACP packets on the local device for the interface being configured. This command supports the following reception rates:

- **normal**: LACP packets are received at the following rates:
• 30 seconds for synchronized interfaces.
• One second for interfaces that are being synchronized.
• fast: LACP packets are received every second.

Example
• This command sets the LACP reception rate to one second on the Ethernet interface 4.

```
switch(config-if-Et4)##lacp timer fast
switch(config-if-Et4)##
```

Configuring LACP Fallback

Fallback mode (static or individual) is configured on a port channel interface with the `port-channel lacp fallback` command. The fallback timeout interval is configured with the `port-channel lacp fallback timeout` command. Fallback timeout settings persist in `running-config` without taking effect for interfaces that are not configured into fallback mode. The default fallback timeout period is 90 seconds.

Examples
• These commands enable LACP static fallback mode, then configure an LACP fallback timeout of 100 seconds on port channel interface 13. If LACP negotiation fails, only the member port with the lowest LACP priority will remain active until an LACP PDU is received by one of the member ports.

```
switch(config)#interface port-channel 13
switch(config-if-Po13)#port-channel lacp fallback static
switch(config-if-Po13)#port-channel lacp fallback timeout 100
switch(config-if-Po13)#show active
interface Port-Channel13
    port-channel lacp fallback static
    port-channel lacp fallback timeout 100
switch(config-if-Po13)##
```

• These commands enable LACP individual fallback mode, then configure an LACP fallback timeout of 50 seconds on port channel interface 17. If LACP negotiation fails, all member ports will act as individual switch ports, using port-specific configuration, until a LACP PDU is received by one of the member ports.

```
switch(config)#interface port-channel 17
switch(config-if-Po17)#port-channel lacp fallback individual
switch(config-if-Po17)#port-channel lacp fallback timeout 50
switch(config-if-Po17)#show active
interface Port-Channel17
    port-channel lacp fallback individual
    port-channel lacp fallback timeout 50
switch(config-if-Po17)##
```

Configuring Minimum Links

The `port-channel min-links` command specifies the minimum number of interfaces that the configuration mode LAG requires to be active. If there are fewer ports than specified by this command, the port channel interface does not become active.
In static LAGs, the min-links value must be met for the LAG to be active. The LAG will not become active until it has at least the min-links number of functioning links in the channel group. If failed links cause the number to drop below the minimum, the LAG will go down and administrator action will be required to bring it back up.

In dynamic LAGs, the LACP protocol must determine that at least min-links physical ports are aggregable (they are physically compatible and have the same keys both remotely and locally) before it begins negotiating to make any ports active members of the port-channel. However, once negotiation begins, an error on the partner’s side or an error in programming of member interfaces can cause the LAG to become active with fewer than the minimum number of links.

EOS evaluates min-links after min-links-review-timeout (linearly proportional to configured min-links) when LACP protocol collecting and/or distributing state changes. If the number of active member interfaces in a port-channel is less than configured min-links, it brings the corresponding port-channel Link Down and syslogs LAG-4-MINLINK_INTF_INSUFFICIENT message.

If additional interfaces get programmed as collecting and distributing, EOS re-evaluates min-links on the port-channel. If sufficient number of interfaces are available to be a part of port-channel, then all interfaces of the corresponding port-channel are re-enabled for LACP negotiation and the port-channel becomes Link Up. LAG-4-MINLINK_INTF_NORMAL is syslogged after min-links-review-timeout if the min-links condition is satisfied; otherwise LAG-4-MINLINK_INTF_INSUFFICIENT is syslogged and the port-channel goes Link Down.

If an interface remains in collecting state but not in distributing state for min-links-review-timeout, it is moved out of collecting state. It is periodically re-enabled after min-links-retry-timeout (which is 200 seconds) till it progresses to collecting and distributing. Meanwhile, if a port-channel becomes Link Up because sufficient number of interfaces progressed to collecting and distributing states, then this interface is enabled for LACP negotiation.

Example

This command sets four as the minimum number of ports required for port channel 5 to become active.

```
switch(config-if-Po5)#port-channel min-links 4
switch(config-if-Po5)#
```

Configuring Minimum Links Review Interval

The `port-channel min-links review interval` command enables or disables timer based min-links review feature for all port-channels. The timer based min-links feature is enabled when all of the following conditions are true. It is disabled otherwise:

- The min-links configured is greater than 1.
- LACP fallback is disabled.
- The number of interfaces configured in the port-channel is more than min-links.
- The number of active member interfaces in the port-channel is less than min-links.
- The default timer values are:
  - min-links-review-timeout = min-links-timeout-base + f (configured min-links)
  - min-links-timeout-base = 180 seconds
  - min-links-retry-timeout = 360 seconds
12.3.5 Displaying Port Channel Information

Port channel information is accessed using some of the `show` commands listed under Interface Display Commands. Ensure that while using the `show interfaces counters rates` command to view the rate information of a port channel, rate values for the individual member ports are less inaccurate than rate values of the port channel.

Both the port channel rate and the individual port rates are calculated approximations; the rate value of a port channel might vary from the total of the rates for the member ports. The discrepancy is likely to be larger for port channels with fewer ports, and will be most obvious in single-port port channels.
12.4 Load Balancing Hash Algorithms

The switch balances packet load across multiple links in a port channel by calculating a hash value based on packet header fields. The hash value determines the active member link through which the packet is transmitted. This method, in addition to balancing the load in the LAG, ensures that all packets in a data stream follow the same network path.

In network topologies that include MLAGs or multiple paths with equal cost (ECMP), programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links. This uneven distribution is avoided by performing different hash calculations on each switch routing the paths.

The `port-channel load-balance` command specifies the seed for hashing algorithms that balance the load across ports comprising a port channel. Available seed values vary by switch platform.

**Example**

- This command configures the hash seed of 10 on 7150 Series (FM6000 platform) switches.

  ```
  switch(config)# port-channel load-balance fm6000 10
  switch(config)#
  ```

Hashing algorithm inputs varies by switch platform. These sections describe hashing algorithm inputs for each platform.

- **Section 12.4.1: Load Balance Hash Algorithms on 7048 and 7500 Series Switches**
- **Section 12.4.2: Load Balance Hash Algorithms on 7500E Series Switches**
- **Section 12.4.3: Load Balance Hash Algorithms on 7050 Series Switches**
- **Section 12.4.4: Load Balance Hash Algorithms on 7150 Series Switches**

12.4.1 Load Balance Hash Algorithms on 7048 and 7500 Series Switches

One command configures the load balance hash algorithm on 7048 and 7500 Series switches:

- `port-channel load-balance petraA fields ip`: controls the hash algorithm for IP packets by specifying the algorithm’s use of IP and MAC header fields. Fields that the command can specify include source and destination IP addresses, source and destination port fields (for TCP and UDP packets), and the entire MAC address header.

The hash algorithm for non-IP packets is not configurable and always includes the entire MAC header.

**Example**

- These commands configure the load balance algorithm for IP packets by using the entire MAC header.

  ```
  switch(config)# port-channel load-balance petraA fields ip mac-header
  switch(config)#
  ```

12.4.2 Load Balance Hash Algorithms on 7500E Series Switches

One command configures the load balance hash algorithm on 7500E Series switches:

- `port-channel load-balance arad fields ip`: controls the hash algorithm for IP packets by specifying the algorithm’s use of IP and MAC header fields. Fields that the command can specify include source and destination IP addresses, source and destination port fields (for TCP and UDP packets), and the entire MAC address header.

The hash algorithm for non-IP packets is not configurable and always includes the entire MAC header.
Example

- These commands configure the load balance algorithm for IP packets by using the entire MAC header.

  switch(config)#port-channel load-balance arad fields ip mac-header
  switch(config)#

12.4.2.1 Dynamic and Symmetric LAG Hashing

Dynamic LAG hashing enables high link utilization and highly even distribution among LAG members by employing a randomized hashing algorithm. Symmetric LAG hashing allows the two flows of a bidirectional communication link, even when the two flows enter the switch on different ingress ports, to be hashed to the same member of a LAG on egress.

Dynamic and symmetric LAG hashing policies are enabled via named port-channel load-balancing profiles. LAG load-balancing policies can be provisioned on per line-card basis using these profiles. Load-balancing profiles can be used to provision all LAG load-balance attributes, including hash polynomials, hash seeds, and hash fields.

When no specific LAG hashing profile is assigned to a line card, then a global LAG hashing profile can be defined and applied to all the line cards with no LAG hashing defined on them.

Note, if no profile is selected as global profile then the default profile takes the precedence and set as a global profile. The default profile is reserved and if it is set as a global profile it cannot be deleted, if the profile is deleted then the following warning message is displayed.

Examples

- These commands configure a load balance profile for symmetric hashing.

  switch(config)#load-balance policies
  switch(config-load-balance-policies)#load-balance arad profile symmetric-profile-1
  switch(config-sand-load-balance-profile-symmetric-profile-1)#hash symmetric
  switch(config-sand-load-balance-profile-symmetric-profile-1)#show active
  load-balance policies
  load-balance arad profile symmetric-profile-1
  hash symmetric

- These commands configure a load balance profile for dynamic hashing.

  switch(config)#load-balance policies
  switch(config-load-balance-policies)#load-balance arad profile dynamic-hash-profile-1
  switch(config-sand-load-balance-profile-dynamic-hash-profile-1)#distribution clock
  switch(config-sand-load-balance-profile-dynamic-hash-profile-1)#show active
  load-balance policies
  load-balance arad profile dynamic-hash-profile-1
  distribution clock

- This command assigns a named load-balancing profile to a linecard.

  switch(config)#port-channel load-balance module 3-7 sand profile Linecard5
  switch(config)#
12.4.3 Load Balance Hash Algorithms on 7050 Series Switches

Three commands configure the load balance hash algorithm on 7050 Series switches:

- `port-channel load-balance trident fields ip` controls the hash algorithm for IP packets by specifying the algorithm’s use of IP and MAC header fields. Fields that the command can specify include source and destination IP addresses, source and destination port fields (for TCP and UDP packets), and fields specified by the `port-channel load-balance trident fields mac` command.

- `port-channel load-balance trident fields ipv6` controls the hash algorithm for IPv6 packets by specifying the algorithm’s use of IP and MAC header fields. Fields that the command can specify include source and destination IP addresses, source and destination port fields (for TCP and UDP packets), and fields specified by the `port-channel load-balance trident fields mac` command.

- `port-channel load-balance trident fields mac` controls the hash algorithm for non-IP packets by specifying the algorithm’s use of MAC header fields. Fields that the command can specify include the MAC source address, MAC destination address, and Ethernet type fields.

Example

- These commands configure the switch’s port channel load balance for non IP packets by using the MAC destination and Ethernet type fields in the hashing algorithm.

  `switch(config)#port-channel load-balance trident fields mac dst-mac eth-type
switch(config)#`
12.4.4 Load Balance Hash Algorithms on 7150 Series Switches

Load balance profiles specify parameters used by hashing algorithms that distribute traffic across ports comprising a port channel or among component ECMP routes. The switch supports 16 load balance profiles, including the default profile. The default load balance profile is configured through `port-channel load-balance fm6000 fields ip` and `port-channel load-balance fm6000 fields mac` commands.

12.4.4.1 Load Balance Profiles

Load balance profiles are managed in load-balance-policies configuration mode. Load-balance-policies mode provides commands that display the contents of all configured profiles and place the switch in load-balance-profile command. Load balance profiles are created by entering load-balance-profile mode and edited while in that mode.

The `load-balance policies` command places the switch in load-balance-policies configuration mode. Load balance profiles specify the inputs used by the hashing algorithms that distribute traffic across ports comprising a port channel or among ECMP routes.

**Example**

- This command places the switch in load-balance-policies configuration mode.

  ```
  switch(config)#load-balance policies
  switch(config-load-balance-policies)#
  ```

- This command displays the contents of the four load balance profiles configured on the switch.

  ```
  switch(config-load-balance-policies)#show active
  load-balance policies
  load-balance fm6000 profile F-01
  port-channel hash-seed 22
  fields ip dscp
  distribution random port-channel
  !
  load-balance fm6000 profile F-02
  fields ip protocol dst-ip
  distribution random port-channel
  !
  load-balance fm6000 profile F-03
  fields ip protocol dst-ip
  fields mac dst-mac eth-type
  distribution random ecmp port-channel
  !
  load-balance fm6000 profile F-04
  switch(config-load-balance-policies)#
  ```

**Creating a Load Balance Profile**

The `load-balance fm6000 profile` command places the switch in load-balance-profile configuration mode to configure a specified load balance profile. The command specifies the name of the profile that subsequent commands modify. It creates a profile if the profile it references does not exist.
Example

- These commands enter load-balance-profile configuration mode, creates the LB-5 profile, and lists the default settings for the profile.

switch(config)#load-balance policies
switch(config-load-balance-policies)#load-balance fm6000 profile LB-5
switch(config-load-balance-profile-LB-5)#show active all
load-balance policies
  load-balance fm6000 profile LB-5
  port-channel hash-seed 0
  fields mac dst-mac src-mac eth-type vlan-priority vlan-id
  fields ip protocol dst-ip dst-port src-ip src-port dscp
  no distribution symmetric-hash
  no distribution random
switch(config-load-balance-profile-LB-5)#

Configuring a Load Balance Profile

These commands are available in load-balance-profile configuration mode to specify the parameters that comprise a profile.

- The **fields ip** command specifies the L3/L4 data fields used by the hash algorithm defined by the configuration mode load balance profile.
- The **fields mac** command specifies the L2 data fields used by the hash algorithm defined by the configuration mode load balance profile.
- The **distribution symmetric-hash** command enforces traffic symmetry on data distributed by the hash algorithm defined by the configuration mode load balance profile. Symmetric traffic is the flow of both directions of a data stream across the same physical link.
- The **distribution random** command specifies the random distribution of data packets handled by the hash algorithm defined by the configuration mode load balance profile.

Example

- These commands configure the following components of the hash algorithm defined by the LB-7 load balance profile:
  - L2 header fields: MAC destination address, VLAN priority
  - L3/L4 header fields: Source IP address, protocol field
  - Symmetric hash distribution of IP and non-IP packets.

switch(config)#load-balance policies
switch(config-load-balance-policies)#load-balance fm6000 profile LB-7
switch(config-load-balance-profile-LB-7)#fields ip src-ip protocol
switch(config-load-balance-profile-LB-7)#fields mac dst-mac vlan-priority
switch(config-load-balance-profile-LB-7)#distribution symmetric-hash mac-ip
switch(config-load-balance-profile-LB-7)#show active
load-balance policies
  load-balance fm6000 profile LB-7
  fields mac dst-mac vlan-priority
  fields ip protocol src-ip
  distribution symmetric-hash mac-ip
switch(config-load-balance-profile-LB-7)#exit
switch(config)#exit
switch(config)#exit
Assigning a Load Balance Profile to an Interface

The **ingress load-balance profile** command applies a specified load-balance profile to the configuration mode interface. Load balance profiles specify parameters used by hashing algorithms that distribute traffic across ports comprising a port channel or among ECMP routes. The switch supports 16 load balance profiles, including the default profile.

**Example**

- This command applies the **LB-1** load balance profile to port channel interface 100.
  
  ```
  switch(config)#interface port-channel 100
  switch(config-if-Po100)#ingress load-balance profile LB-1
  switch(config-if-Po100)#show active
  interface Port-Channel100
   ingress load-balance profile LB-1
  switch(config-if-Po100)#
  ```

12.4.4.2 Default Load Balance Profile

Two commands configure the load balance default profile on 7150 Series switches:

- **port-channel load-balance fm6000 fields ip** controls the hash algorithm for IP packets by specifying the algorithm’s use of IP and MAC header fields. Fields that the command can specify include source and destination IP addresses, source and destination port fields (for TCP and UDP packets).

- **port-channel load-balance fm6000 fields mac** controls the hash algorithm for non-IP packets by specifying the algorithm’s use of MAC header fields. Fields that the command can specify include the MAC source address, MAC destination address, and Ethernet type, VLAN-ID, and VLAN-priority fields.

**Example**

- These commands configure the load balance default profile for IP packets by using source and destination IP address fields, along with source and destination port fields for TCP, and UDP packets.
  
  ```
  switch(config)#port-channel load-balance fm6000 fields ip ip-tcp-udp-header
  switch(config)#
  ```

- This command applies the default load balance profile to port channel interface 100.
  
  ```
  switch(config)#interface port-channel 100
  switch(config-if-Po100)#no ingress load-balance profile
  switch(config-if-Po100)#show active
  interface Port-Channel100
  switch(config-if-Po100)#
  ```
12.5 Port Channel and LACP Configuration Commands

Global Port Channel and LACP Configuration Commands

- interface port-channel
- lacp system-priority

Interface Configuration Commands – Ethernet Interface

- channel-group
- lacp port-priority
- lacp timer
- port-channel lacp fallback
- port-channel lacp fallback timeout
- port-channel min-links
- port-channel min-links review interval

Load Balance (Default) Commands

- port-channel load-balance
- port-channel load-balance arad fields ip
- port-channel load-balance fm6000 fields ip
- port-channel load-balance fm6000 fields mac
- port-channel load-balance sand profile (7500E/7500R)
- port-channel load-balance module

EXEC Commands

- show lacp aggregates
- show lacp counters
- show lacp interface
- show lacp internal
- show lacp peer
- show lacp sys-id
- show load-balance profile
- show port-channel
- show port-channel dense
- show port-channel limits
- show port-channel load-balance
• `show port-channel load-balance fields`
channel-group

The channel-group command assigns the configuration mode Ethernet interfaces to a channel group, creates the group if it does not already exist, and sets the port-channel mode for the group. When adding interfaces to a previously created channel group, the port-channel mode for the newly added interfaces must match the mode for the existing group.

Channel groups are associated with a port channel interface immediately upon their creation. A command that creates a new channel group also creates a port channel with a matching ID. The port channel is configured in Port-channel Configuration Mode. Configuration changes to a port channel interface propagate to all Ethernet interfaces in the corresponding channel group. The interface port-channel command places the switch in Interface-port-channel Configuration Mode.

The no channel-group and default channel group commands remove the configuration-mode interface from the specified channel group.

Command Mode

Interface-Ethernet Configuration

Command Syntax

```
channel-group  number  mode  group_mode
no channel-group
default channel-group
```

Parameters

- `number` specifies a channel group ID. Values range from 1 through 2000.
- `group_mode` specifies the channel-group mode for the channel group. Values include:
  - `on` port channel is static and LACP is disabled on member interfaces. Port neither verifies nor negotiates port channel membership.
  - `active` port channel is dynamic and member interfaces are active LACP ports that transmit and receive LACP negotiation packets.
  - `passive` port channel is dynamic and member interfaces are passive LACP ports that respond to LACP negotiation packets but do not generate them.

Guidelines: Port Channels

You can configure a port channel to contain many ports, but only a subset may be active at a time. All active ports in a port channel must be compatible. Compatibility includes many factors and is platform-specific. For example, compatibility may require identical operating parameters such as speed and maximum transmission unit (MTU). Compatibility may only be possible between specific ports because of the internal organization of the switch.

Guidelines: MLAG Configurations

Static LAG is not recommended in MLAG configurations. However, these considerations apply when the channel group mode is `on` while configuring static MLAG:

- When configuring multiple interfaces on the same static port channel:
  - all interfaces must physically connect to the same neighboring switch.
  - the neighboring switch must configure all interfaces into the same port channel.

The switches are misconfigured when these conditions are not met.

- Disable the static port channel membership before moving any cables connected to these interfaces or changing a static port channel membership on the remote switch.
Examples

- These commands assign Ethernet interfaces 8 and 9 to channel group 10, and enable LACP in negotiating mode.

```
switch(config)#interface ethernet 8-9
switch(config-if-Et8-9)#channel-group 10 mode active
switch(config-if-Et8-9)#show active
```

interface Ethernet8
  channel-group 10 mode active
interface Ethernet9
  channel-group 10 mode active

- These commands assign Ethernet interfaces 12 and 13 to static channel group 11. LACP is disabled on these interfaces.

```
switch(config)#interface ethernet 12-13
switch(config-if-Et12-13)#channel-group 11 mode on
switch(config-if-Et12-13)#show active
```

interface Ethernet12
  channel-group 11 mode on
interface Ethernet13
  channel-group 11 mode on

switch(config-if-Et12-13)#
distribution random

The **distribution random** command specifies the random distribution of data packets handled by the hash algorithm defined by the configuration mode load balance profile. All data fields and hash seeds that are configured for the profile are used as seeds for the random number generator that defines the distribution of individual packets.

Command options allow for the random distribution of traffic across port channel links and ECMP routes. Random distribution can be enabled for either, both, or neither.

The **no distribution random** and **default distribution random** commands remove random distribution on the configuration mode load balance profile by deleting the corresponding **distribution random** command from the configuration.

**Command Mode**

Load-balance-profile Configuration

**Command Syntax**

```
distribution random BALANCE_TYPE
no distribution random
default distribution random
```

**Parameters**

- **SCOPE** Specifies use of random distribution for port channels and ECMP routes. Options include:
  - `<no parameter>` Random distribution is enabled for ECMP routes and port channel links.
  - `ecmp` Random distribution is enabled for ECMP routes.
  - `port-channel` Random distribution is enabled for port channel links.
  - `ecmp port-channel` Random distribution is enabled for ECMP routes and port channel links.
  - `port-channel ecmp` Random distribution is enabled for ECMP routes and port channel links.

**Guidelines**

The **distribution random** command takes precedence over the **distribution symmetric-hash** command when both methods are simultaneously enabled.

**Related Commands**

- **load-balance fm6000 profile** places the switch in load-balance-profile configuration mode.

**Example**

- These commands configure symmetric hashing on all traffic distributed through the algorithm defined by the LB-1 load balance profile.

```
switch(config)#load-balance policies
switch(config-load-balance-policies)#load-balance fm6000 profile LB-1
switch(config-load-balance-profile-LB-1)#distribution random ecmp port-channel
switch(config-load-balance-profile-LB-1)#show active
load-balance policies
  load-balance fm6000 profile LB-1
distribution random ecmp port-channel
switch(config-load-balance-profile-LB-1)#
```
distribution symmetric-hash

The **distribution symmetric-hash** command enforces traffic symmetry on data distributed by the hash algorithm defined by the configuration mode load balance profile. Symmetric traffic is the flow of both directions of a data stream across the same physical link.

Two symmetric-hash options specify the traffic upon which symmetry is enforced:

- **distribution symmetric-hash mac** specifies that only non-IP traffic is hashed symmetrically. IP traffic is hashed normally without regard to symmetry.
- **distribution symmetric-hash mac-ip** specifies that all traffic is hashed symmetrically.

The **no distribution symmetric-hash** and **default distribution symmetric-hash** commands remove the specified hashing symmetry restriction on the configuration mode load balance profile by deleting the corresponding **distribution symmetric-hash** command from **running-config**.

**Command Mode**

Load-balance-profile Configuration

**Command Syntax**

```
distribution symmetric-hash FIELD_TYPE
no distribution symmetric-hash
default distribution symmetric-hash
```

**Parameters**

- **FIELD_TYPE** fields the hashing algorithm uses for layer 3 routing. Options include:
  - **mac** non-IP traffic is hashed symmetrically.
  - **mac-ip** all traffic is hashed symmetrically.

**Guidelines**

The **distribution random** command takes precedence over the **distribution symmetric-hash** command when both methods are simultaneously enabled.

**Related Commands**

- **load-balance fm6000 profile** places the switch in load-balance-profile configuration mode.

**Example**

- These commands configure symmetric hashing on all traffic distributed through the algorithm defined by the LB-1 load balance profile.

```
switch(config)#load-balance policies
switch(config-load-balance-policies)#load-balance fm6000 profile LB-1
switch(config-load-balance-profile-LB-1)#distribution symmetric-hash mac-ip
switch(config-load-balance-profile-LB-1)#show active
load-balance policies
  load-balance fm6000 profile LB-1
    distribution symmetric-hash mac-ip
switch(config-load-balance-profile-LB-1)#
```
fields ip

The fields ip command specifies the L3/L4 data fields used by the hash algorithm defined by the configuration mode load balance profile. When a load balance profile is assigned to a port channel or Ethernet interface, its associated hash algorithm determines the distribution of packets that ingress the interface. Profile algorithms can load balance packets across port channel links or ECMP routes.

The switch calculates a hash value by using the packet header fields to balance packets across links. The hash value determines the link through which the packet is transmitted. This method also ensures that all packets in a flow follow the same network path. Packet flow is modified by changing the inputs to the port channel hash algorithm.

In network topologies that include MLAGs, programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links in MLAG switches. This problem is avoided by performing different hash calculations between the MLAG switch, and a non-peer switch connected to it.

The no fields ip configures the algorithm not to use L3/L4 data fields. The default fields ip command restores the default data L3/L4 fields to the load balancing algorithm defined by the configuration mode profile by removing the corresponding fields ip or no fields ip command from running-config.

Command Mode
  Load-balance-profile Configuration

Command Syntax
  fields ip IP_FIELD
  no fields ip
  default fields ip

Parameters
  • IP_FIELD specifies the L3/L4 fields the hashing algorithm uses. Options include:
    • dscp algorithm uses dscp field.
    • dst-ip algorithm uses destination IP address field.
    • dst-port algorithm uses destination TCP/UDP port field.
    • protocol algorithm uses protocol field.
    • src-ip algorithm uses source IP address field.
    • src-port algorithm uses source TCP/UDP port field.

  Command may include from one to six fields, in any combination and listed in any order. The default setting is the selection of all fields.

Related Commands
  • load-balance fm6000 profile places the switch in load-balance-profile configuration mode.
Example

- These commands specify the IP source and protocol fields as components of the hash algorithm defined by the LB-1 load balance profile.

```
switch(config)#load-balance policies
switch(config-load-balance-policies)#load-balance fm6000 profile LB-1
switch(config-load-balance-profile-LB-1)#fields ip src-ip protocol
switch(config-load-balance-profile-LB-1)#show active
load-balance policies
   load-balance fm6000 profile LB-1
      fields ip protocol src-ip
switch(config-load-balance-profile-LB-1)#
```
fields mac

The fields mac command specifies the L2 data fields used by the hash algorithm defined by the configuration mode load balance profile. When a load balance profile is assigned to a port channel or Ethernet interface, its associated hash algorithm determines the distribution of packets that ingress the interface. Profile algorithms can load balance packets across port channel links or ECMP routes.

The switch calculates a hash value using the packet header fields to balance packets across links. The hash value determines the link through which the packet is transmitted. This method also ensures that all packets in a flow follow the same network path. Packet flow is modified by changing the inputs to the port channel hash algorithm.

In network topologies that include MLAGs, programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links in MLAG switches. This problem is avoided by performing different hash calculations between the MLAG switch, and a non-peer switch connected to it.

The no fields mac configures the algorithm not to use L2 data fields. The default fields mac command restores the default data L2 fields to the load balancing algorithm defined by the configuration mode profile by removing the corresponding fields mac or no fields mac command from running-config.

Command Mode
Load-balance-profile Configuration

Command Syntax
fields mac MAC_FIELD
no fields mac
default fields mac

Parameters
- MAC_FIELD specifies the L2 fields the hashing algorithm uses. Options include:
  - dst-mac algorithm uses MAC destination field.
  - eth-type algorithm uses MAC destination field.
  - src-mac algorithm uses MAC source field.
  - vlan-id algorithm uses VLAN ID field.
  - vlan-priority algorithm uses VLAN priority field.

Related Commands
- load-balance fm6000 profile places the switch in load-balance-profile configuration mode.

Example
- These commands specify the MAC destination and VLAN priority fields as components of the hash algorithm defined by the LB-1 load balance profile.

```
switch(config)#load-balance policies
switch(config-load-balance-policies)#load-balance fm6000 profile LB-1
switch(config-load-balance-profile-LB-1)#fields mac dst-mac vlan-priority
switch(config-load-balance-profile-LB-1)#show active
load-balance policies
  load-balance fm6000 profile LB-1
    fields mac dst-mac vlan-priority
switch(config-load-balance-profile-LB-1)#
```
**ingress load-balance profile**

The **ingress load-balance profile** command applies the specified load-balance profile to the configuration mode interface. Load balance profiles specify parameters used by hashing algorithms that distribute traffic across ports comprising a port channel or among ECMP routes. The switch supports 16 load balance profiles, including the default profile.

Load balance profiles can be assigned to Ethernet and port channel interfaces. Profiles define the distribution method of traffic that ingresses the interface among the ports comprising a port channel or routes comprising an ECMP.

The default load balance profile is configured through **port-channel load-balance fm6000 fields ip** and **port-channel load-balance fm6000 fields mac** commands.

The **no ingress load-balance profile** and **default ingress load-balance profile** commands restore the default load balance profile for the configuration mode interface by removing the corresponding **ingress load-balance profile** command from **running-config**.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

**Command Syntax**

```
ingress load-balance profile profile_name
no ingress load-balance profile
default ingress load-balance profile
```

**Parameters**

- **profile_name** name of profile assigned to interface.

**Example**

- This command applies the **LB-1** load balance profile to port channel interface 100.

```
switch(config)#interface port-channel 100
switch(config-if-Po100)#show active
interface Port-Channel100
switch(config-if-Po100)#ingress load-balance profile LB-1
switch(config-if-Po100)#show active
interface Port-Channel100
  ingress load-balance profile LB-1
switch(config-if-Po100)#
```
interface port-channel

The `interface port-channel` command places the switch in port-channel interface configuration mode for modifying parameters of specified link aggregation (LAG) interfaces. When entering configuration mode to modify existing port channel interfaces, the command can specify multiple interfaces.

The command creates a port channel interface if the specified interface does not exist prior to issuing the command. When creating an interface, the command can only specify a single interface.

The `no interface port-channel` and `default interface port-channel` commands delete the specified LAG interfaces from running-config.

**Command Mode**
- Global Configuration

**Command Syntax**
- `interface port-channel p_range`
- `no interface port-channel p_range`
- `default interface port-channel p_range`

**Parameter**
- `p_range` port channel interfaces (number, range, or comma-delimited list of numbers and ranges).

Port channel numbers range from 1 to 2000.

**Guidelines**
When configuring a port channel, you do not need to issue the `interface port-channel` command before assigning a port to the port channel (see the `channel-group` command). The port channel number is implicitly created when a port is added to the specified port channel with the `channel-group` command.

To display ports that are members of a port channel, enter `show port-channel`. To view information about hardware limitations for a port channel, enter `show port-channel limits`.

All active ports in a port channel must be compatible. Compatibility comprises many factors and is specific to a given platform. For example, compatibility may require identical operating parameters such as speed and/or maximum transmission unit (MTU). Compatibility may only be possible between specific ports because of internal organization of the switch.

You can configure a port channel with a set of ports such that more than one subset of the member ports are mutually compatible. Port channels in EOS are designed to activate the compatible subset of ports with the largest aggregate capacity. A subset with two 40 Gbps ports (aggregate capacity 80 Gbps) has preference to a subset with five active 10 Gbps ports (aggregate capacity 50 Gbps).

**Example**
- This example creates port channel interface 3:
  ```
  switch(config)#interface port-channel 3
  switch(config-if-Po3)#
  ```
**IACP port-priority**

The **lacp port-priority** command sets the aggregating port priority for the configuration mode interface. Priority is supported on port channels with LACP-enabled physical interfaces. LACP port priority determines the port that is active in a LAG in fallback mode. Numerically lower values have higher priority.

Each port in an aggregation is assigned a 32-bit port identifier by prepending the port priority (16 bits) to the port number (16 bits). Port priority determines the ports that are placed in standby mode when hardware limitations prevent a single aggregation of all compatible ports.

Priority numbers range from 0 to 65535. The default is 32768. Interfaces with higher priority numbers are placed in standby mode before interfaces with lower priority numbers.

The **no lacp port-priority** and **default lacp port-priority** commands restore the default port-priority to the configuration mode interface by removing the corresponding **lacp port-priority** command from **running-config**.

**Command Mode**

- Interface-Ethernet Configuration

**Command Syntax**

```
lacp port-priority priority_value
no lacp port-priority
default lacp port-priority
```

**Parameters**

- **priority_level** port priority. Values range from 0 to 65535. Default is 32768

**Example**

- These commands assign the port priority of 4096 to Ethernet interface 8.

```
switch(config)#interface ethernet 8
switch(config-if-Et8)#lacp port-priority 4096
switch(config-if-Et8)#show active
interface Ethernet8
    lacp port-priority 4096
switch(config-if-Et8)##
```
**lacp timer**

The `lacp timer` command configures the LACP reception interval on the configuration mode interface. The LACP timeout specifies the reception rate of LACP packets at interfaces supporting LACP. Supported rates include:

- **normal**: 30 seconds with synchronized interfaces; one second while interfaces are synchronizing.
- **fast**: one second.

This command is supported on LACP-enabled interfaces. The default value is **normal**.

The `no lacp timer` and `default lacp timer` commands restore the default value of **normal** on the configuration mode interface by deleting the corresponding `lacp timer` command from `running-config`.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

```
lacp timer RATE_LEVEL
no lacp timer
default lacp timer
```

**Parameters**

- **RATE_LEVEL**  
  LACP reception interval. Options include:
  - **fast**: one second.
  - **normal**: 30 seconds for synchronized interfaces; one second while interfaces synchronize.

**Examples**

- This command sets the LACP timer to one second on Ethernet interface 4.

  ```
  Switch(config-if-Et4)#lacp timer fast
  Switch(config-if-Et4)#
  ```
**IACP System-Priority**

The `IACP system-priority` command configures the switch's LACP system priority. Values range between 0 and 65535. Default value is 32768.

Each switch is assigned a globally unique 64-bit system identifier by prepending the system priority (16 bits) to the MAC address of one of its physical ports (48 bits). Peer devices use the system identifier when forming an aggregation to verify that all links are from the same switch. The system identifier is also used when dynamically changing aggregation capabilities resulting from LACP data; the system with the numerically lower system identifier can dynamically change advertised aggregation parameters.

The `no IACP system-priority` and `default IACP system-priority` commands restore the default system priority by removing the `IACP system-priority` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
lACP system-priority priority_value
no lACP system-priority
default lACP system-priority
```

**Parameters**

- `priority_value` system priority number. Values range from 0 to 65535. Default is 32768.

**Example**

- This command assigns the system priority of 8192 to the switch.

```
switch(config)#IACP system-priority 8192
switch(config)#
```
load-balance fm6000 profile

The `load-balance fm6000 profile` command places the switch in load-balance-profile configuration mode to configure a specified load balance profile. The command specifies the name of the profile that subsequent commands modify. It creates a profile if the profile it references does not exist.

Load balance profiles specify parameters used by hashing algorithms that distribute traffic across ports comprising a port channel or among component ECMP routes. The switch supports 16 load balance profiles, including the default profile. The default load balance profile is configured through `port-channel load-balance fm6000 fields ip` and `port-channel load-balance fm6000 fields mac` commands.

The load balance profile name is referenced when it is applied to an interface. The default profile is not associated with a name and is applied to an interface in the absence of a named profile assignment.

The `no load-balance fm6000 profile` and `default load-balance fm6000 profile` commands delete the specified load balance profile from `running-config`. Profiles that are assigned to an interface cannot be deleted. Attempts to delete an assigned profile generate a `profile in use` error messages.

The `load-balance fm6000 profile` command is accessible from load-balance-policies configuration mode. Load-balance-profile configuration mode is not a group change mode; `running-config` is changed immediately upon entering commands. Exiting load-balance-policies configuration mode does not affect the configuration. The `exit` command returns the switch to load-balance-policies configuration mode.

**Command Mode**

- Load-balance-policies Configuration

**Command Syntax**

```
load-balance fm6000 profile profile_name
no load-balance fm6000 profile profile_name
default load-balance fm6000 profile profile_name
```

**Parameters**

- `profile_name` name of the load-balance profile.

**Commands Available in Load-balance-profile Configuration Mode**

- `fields ip`
- `fields mac`
- `distribution random`
- `distribution symmetric-hash`
- `port-channel hash-seed`
- `show active` displays the contents of the configuration mode profile.

**Related Commands**

- `load-balance policies` places the switch in load-balance-policies configuration mode.
- `ingress load-balance profile` applies a load-balance profile to an Ethernet or port channel interface.
- `show load-balance profile` displays the contents of load balance profiles.
Example

These commands enter load-balance-profile configuration mode, creates the LB-1 profile, and lists the default settings for the profile.

```
switch(config)#load-balance policies
switch(config-load-balance-policies)#load-balance fm6000 profile LB-1
switch(config-load-balance-profile-LB-1)#show active all
load-balance policies
   load-balance fm6000 profile LB-1
   port-channel hash-seed 0
   fields mac dst-mac src-mac eth-type vlan-priority vlan-id
   fields ip protocol dst-ip dst-port src-ip src-port dscp
   no distribution symmetric-hash
   no distribution random
switch(config-load-balance-profile-LB-1)#
```
hash-seed

The **hash-seed** command specifies the seed used by the hash algorithm defined by the configuration mode load balance profile. Profile algorithms can load balance packets across port channel links or ECMP routes.

The **no hash-seed** and **default hash-seed** commands restore the default hash seed value of 0 to the load balancing algorithm defined by the configuration mode profile by removing the corresponding **hash-seed** command from **running-config**.

**Command Mode**
Load-balance-profile Configuration

**Command Syntax**

```
hash-seed number
no hash-seed number
default hash-seed number
```

**Parameters**

- **number** specifies the value of the hash seed. Value ranges from 0 to 39.

**Example**

- These commands configure the hash seed 20 in a profile and assign it as the global profile.

```
switch(config)#load-balance policies
switch(config-load-balance-policies)#load-balance sand profile myGlobalProfile
switch(config-sand-load-balance-profile-myGlobalProfile)#hash-seed 20
switch(config)#port-channel load-balance sand profile myGlobalProfile
```
load-balance sand profile (7500E/7500R)

The **load-balance sand profile** command configures a load-balance profile on a sand module switch. A default profile is designated as a global profile when no other profile is set as global profile. Note, a warning message is displayed when a profile is entered or deleted.

If **no load-balance sand profile** command is executed when the profile set is default then the following warning message is displayed:"! profile default is a reserved profile and cannot be deleted".

**Command Mode**

Global Configuration

**Command Syntax**

```
load-balance sand profile profile_name
no load-balance sand profile profile_name
```

**Parameter**

`profile_name` name of the profile assigned to the selected module.

**Examples**

- These commands designate a default profile as a global profile on sand module platform switch. Note, a warning message is displayed when a profile is entered or deleted.

  ```
  switch(config)#load-balance policies
  switch(config-load-balance-policies)#load-balance sand profile default
  ! profile default is a reserved profile
  ! profile default is the current global profile
  ```

- When **no** form of the command is executed it displays the following warning message.

  ```
  switch(config)#load-balance policies
  switch(config-load-balance-policies)#no load-balance sand profile default
  ! profile default is a reserved profile and cannot be deleted
  ```
load-balance policies

The load-balance policies command places the switch in load-balance-policies configuration mode. Load-balance-policies configuration mode provides commands for managing load-balance profiles. Load balance profiles specify the inputs used by the hashing algorithms that distribute traffic across ports comprising a port channel or among ECMP routes.

The no load-balance policies and default load-balance policies commands delete all load balance profiles from running-config. The command generates an error message when at least one profile is assigned to an interface.

Load-balance-policies configuration mode is not a group change mode; running-config is changed immediately upon entering commands. Exiting load-balance-policies configuration mode does not affect running-config. The exit command returns the switch to global configuration mode.

Command Mode
Global Configuration

Command Syntax
load-balance policies
no load-balance policies
default load-balance policies

Commands Available in Load-balance-policies Configuration Mode
- load-balance fm6000 profile places the switch in load-balance-profile configuration mode.
- show active displays contents of all load balance profiles.

Related Commands
- ingress load-balance profile applies a load-balance profile to an Ethernet or port channel interface.
- show load-balance profile displays the contents of load balance profiles.

Example
- This command places the switch in load-balance-policies configuration mode.
  switch(config)#load-balance policies
  switch(config-load-balance-policies)#
- This command displays the contents of the three configured load balance profiles.
  switch(config-load-balance-policies)#show active
  load-balance policies
  load-balance fm6000 profile F-01
  port-channel hash-seed 22
  fields ip dscp
  distribution random port-channel
  !
  load-balance fm6000 profile F-02
  fields ip protocol dst-ip
  fields mac dst-mac eth-type
  distribution random ecmp port-channel
  !
  load-balance fm6000 profile F-03
  switch(config-load-balance-policies)#
**port-channel hash-seed**

The `port-channel hash-seed` command specifies the seed used by the hash algorithm defined by the configuration mode load balance profile when distributing the load across ports comprising a port channel. When a load balance profile is assigned to a port channel or Ethernet interface, its associated hash algorithm determines the distribution of packets that ingress the interface. Profile algorithms can load balance packets across port channel links or ECMP routes.

The hash seed that the algorithm uses to select port channel links or ECMP routes is configured by the `ip load-sharing` command.

The `no port-channel hash-seed` and `default port-channel hash-seed` commands restore the default hash seed value of 0 to the load balancing algorithm defined by the configuration mode profile by removing the corresponding `port-channel hash-seed` command from `running-config`.

**Command Mode**
Load-balance-profile Configuration

**Command Syntax**

```
port-channel hash-seed number
no port-channel hash-seed
default port-channel hash-seed
```

**Parameters**

- `number` The hash seed. Value ranges from 0 to 39.

**Related Commands**
- `load-balance fm6000 profile` places the switch in load-balance-profile configuration mode.

**Example**

- These commands configure the port-channel hash seed of 22 for the hash algorithm defined by the LB-1 load balance profile.

```
switch(config)#load-balance policies
switch(config-load-balance-policies)#load-balance fm6000 profile LB-1
switch(config-load-balance-profile-LB-1)#port-channel hash-seed 22
switch(config-load-balance-profile-LB-1)#show active
load-balance policies
  load-balance fm6000 profile LB-1
    port-channel hash-seed 22
switch(config-load-balance-profile-LB-1)#
```
port-channel lacp fallback

The `port-channel lacp fallback` command enables the LACP fallback mode on the interface.

LACP fallback is unconfigured and disabled by default. An LACP interface without fallback enabled does not form a LAG until it receives PDUs from its peer.

LACP fallback can be configured on an interface in static or individual mode:

- **static mode** the port channel member with the lowest LACP port priority is active and maintains contact with the peer (sending and receiving data) while other port channel members remain in standby mode until a LACP PDU is received. All members continue to send (and can receive) LACP PDUs.

- **individual mode** all port channel members act as individual ports, reverting to their port-specific configuration while the channel is in fallback mode, and continue to send and receive data. All members continue to send LACP PDUs until a LACP PDU is received by one of the member ports.

The `no port-channel lacp fallback` and `default port-channel lacp fallback` commands disable LACP fallback mode on the configuration mode interface by removing the corresponding `port-channel lacp fallback` command from `running-config`.

**Command Mode**

Interface-Port-Channel Configuration

**Command Syntax**

```
port-channel lacp fallback [MODE]
no port-channel lacp fallback
default port-channel lacp fallback
```

**Parameters**

- **MODE** LACP fallback mode. Options include:
  - `<no parameter>` enables static LACP fallback mode.
  - `static` enables static LACP fallback mode.
  - `individual` enables individual LACP fallback mode.

**Related Commands**

`port-channel lacp fallback timeout` configures the fallback timeout period for a port channel interface. The default LACP fallback timeout period is 90 seconds.

`lacp port-priority` configures the port priority for an individual interface.

**Examples**

- These commands enable LACP static fallback mode, then configure an LACP fallback timeout of 100 seconds on port channel interface 13. If LACP negotiation fails, only the member port with the lowest LACP priority will remain active until an LACP PDU is received by one of the member ports.

  ```
  switch(config)#interface port-channel 13
  switch(config-if-Po13)#port-channel lacp fallback static
  switch(config-if-Po13)#port-channel lacp fallback timeout 100
  switch(config-if-Po13)#show active
  interface Port-Channel13
    port-channel lacp fallback static
    port-channel lacp fallback timeout 100
  ```
These commands enable LACP individual fallback mode, then configure an LACP fallback timeout of 50 seconds on port channel interface 17. If LACP negotiation fails, all member ports will act as individual switch ports, using port-specific configuration, until a LACP PDU is received by one of the member ports.

```
switch(config)#interface port-channel 17
switch(config-if-Po17)#port-channel lacp fallback individual
switch(config-if-Po17)#port-channel lacp fallback timeout 50
switch(config-if-Po17)#show active
  interface Port-Channel17
    port-channel lacp fallback individual
    port-channel lacp fallback timeout 50
switch(config-if-Po17)#
```
port-channel lacp fallback timeout

The `port-channel lacp fallback timeout` command specifies the fallback timeout period for the configuration mode interface.

Fallback timeout settings persist in `running-config` without taking effect for interfaces that are not configured into fallback mode. The default fallback timeout period is 90 seconds.

The `no port-channel lacp fallback timeout` and `default port-channel lacp fallback timeout` commands restore the default fallback timeout of 90 seconds for the configuration mode interface by removing the corresponding `port-channel lacp fallback timeout` command from `running-config`.

**Command Mode**

Interface-Port-Channel Configuration

**Command Syntax**

```
port-channel lacp fallback timeout period
no port-channel lacp fallback timeout
default port-channel lacp fallback timeout
```

**Parameters**

- `period` maximum interval between receipt of LACP PDU packets (seconds). Value ranges from 1 to 300 seconds. Default value is 90.

**Related Commands**

- `port-channel lacp fallback` configures fallback mode for a port channel interface.

**Guidelines**

The fallback timeout period should not be shorter than the LACP reception interval (`lacp timer`). The default LACP reception interval is 30 seconds.

**Example**

- This command enables LACP fallback mode, then configures an LACP fallback timeout of 100 seconds on port channel interface 13.

```
switch(config)#interface port-channel 13
switch(config-if-Po13)#port-channel lacp fallback
switch(config-if-Po13)#port-channel lacp fallback timeout 100
switch(config-if-Po13)#show active
interface Port-Channel13
  port-channel lacp fallback
  port-channel lacp fallback timeout 100
switch(config-if-Po13)#
```
port-channel load-balance

The **port-channel load-balance** command specifies the seed in the hashing algorithm that balances the load across ports comprising a port channel. Available seed values vary by switch platform.

The **no port-channel load-balance** and **default port-channel load-balance** commands remove the **port-channel load-balance** command from **running-config**, restoring the default hash seed value of 0.

**Command Mode**

Global Configuration

**Command Syntax**

```plaintext
port-channel load-balance platform { hash_seed | fields ip fields | hash hash_function }
no port-channel load-balance platform [hash_seed]
default port-channel load-balance platform [hash_seed]
```

**Parameters**

**Important!** Parameter options vary by switch model. Verify available options with the ? command.

- **platform**  ASIC switching device. Value depends on the switch model.
- **hash_seed**  The numerical seed for the hash function. Value range varies by switch platform:
  - **arad**  0 to 65535.
  - **fm6000**  0 to 39.
  - **petraA**  uses field inputs only.
  - **trident**  0 to 47.

  For trident platform switches, algorithms using hash seeds between 0 and 15 typically result in more effective distribution of data streams across the port channels.

- **fields**  Which fields will be used as inputs to the port channel hash.
  - **gre**  Configure which GRE fields are inputs to the hash.
  - **ip**  Configure which fields are inputs to the hash for IPv4 packets.
  - **ipv6**  Configure which fields are inputs to the hash for IPv6 packets.
  - **mac**  Configure which MAC fields are inputs to the hash.
  - **mac-in-mac**  Configure which MAC-in-MAC fields are inputs to the hash.
  - **mpls**  Configure which MPLS fields are inputs to the hash.
  - **destination-ip**  Use the layer 3 IP destination address in the hash.
  - **destination-port**  Use the layer 4 TCP/UDP destination port in the hash.
  - **dst-ip**  Use the destination IP address in the hash.
  - **dst-mac**  Use the destination Payload MAC in the hash (or the destination MAC address in the MAC hash).
  - **eth-type**  Use the Ethernet type in the MAC hash.
  - **ip-in-ip**  Use the outer IP header in the hash for IPv4 over IPv4 GRE tunnel.
  - **ip-in-ipv6**  Use the outer IP header in the hash for IPv4 over IPv6 GRE tunnel.
  - **ipv6-in-ip**  Use the outer IP header in the hash for IPv6 over IPv4 GRE tunnel.
  - **ipv6-in-ipv6**  Use the outer IP header in the hash for IPv6 over IPv6 GRE tunnel.
- `ip-tcp-udp-header` Use the layer 3 and layer 4 hashes.
- `isid` Use the MAC-in-MAC ISID in the hash.
- `label` Use the MPLS label in the hash.
- `mac-header` Use the MAC hash.
- `outer-mac` Use the outer MAC of source and destination in the hash.
- `source-ip` Use the layer 3 IP source address in the hash.
- `src-ip` Use the source IP address in the hash.
- `source-port` Use layer 4 TCP/UDP source port in the hash.
- `src-mac` Use the source payload MAC in the hash (or the source MAC address in the MAC hash).
- `hash_function` Specifies the hash polynomial function. Values range from 0-2.

**Example**
- This command configures a hash seed of 10 on an FM6000 platform switch.

```
switch(config)#port-channel load-balance fm6000 10
switch(config)#
```
port-channel load-balance sand profile (7500E/7500R)

The **port-channel load-balance sand profile** command configures a global LAG hashing profile on the port channel interface. A default profile is set as a global profile when no other profile is set as global.

The **no port-channel load-balance sand profile** command removes the active profile from the **port-channel load-balance** command from **running-config**, restoring the default profile.

**Command Mode**

Global Configuration

**Command Syntax**

```
port-channel load-balance sand profile profile_name
no port-channel load-balance sand profile profile_name
```

**Parameter**

*profile_name*  name of the profile assigned to the selected module.

**Example**

- This command configures a global LAG hashing profile on 7500 series platform switch.

  ```
  switch(config)#port-channel load-balance sand profile myGlobalProfile
  switch(config)#
  ```
port-channel load-balance arad fields ip

The `port-channel load-balance arad fields ip` command specifies the data fields that the port channel load balance hash algorithm uses for distributing IP packets on Arad platform switches. The hashing algorithm fields used for IP packets differ from the fields used for non-IP packets.

The switch calculates a hash value using the packet header fields to load balance packets across links in a port channel. The hash value determines the link through which the packet is transmitted. This method also ensures that all packets in a flow follow the same network path. Packet flow is modified by changing the inputs to the port channel hash algorithm.

In network topologies that include MLAGs, programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links in MLAG switches. This problem is avoided by performing different hash calculations between the MLAG switch, and a non-peer switch connected to it.

The `no port-channel load-balance arad fields ip` and `default port-channel load-balance arad fields ip` commands restore the default data fields for the IP packet load balancing algorithm by removing the `port-channel load-balance arad A fields ip` command from running-config.

Command Mode
Global Configuration

Command Syntax
```
port-channel load-balance arad fields ip IP_FIELD_NAME
no port-channel load-balance arad fields ip
default port-channel load-balance arad fields ip
```

Parameters
- `IP_FIELD_NAME` fields the hashing algorithm uses for layer 3 routing. Options include:
  - `ip-tcp-udp-header` algorithm uses source and destination IP address fields. Source and destination port fields are included for TCP and UDP packets.
  - `mac-header` algorithm uses entire MAC header.

A command can only specify one option. The default setting is `ip-tcp-udp-header`.

Guidelines
The port channel hash algorithm for non-IP packets is not configurable and always includes the entire MAC header.

Related Commands
- `port-channel load-balance` configures the hash seed for the algorithm.

Example
- These commands configure the switch’s port channel load balance hash algorithm for IP packets to use source and destination IP address (and port) fields.
```
switch(config)#port-channel load-balance fm6000 fields ip ip-tcp-udp-header
switch(config)#
```
The `port-channel load-balance fm6000 fields ip` command specifies the data fields that the port channel load balance hash algorithm uses for distributing IP packets on FM6000 platform switches. The hashing algorithm fields used for IP packets differ from the fields used for non-IP packets.

The switch calculates a hash value using the packet header fields to load balance packets across links in a port channel. The hash value determines the link through which the packet is transmitted. This method also ensures that all packets in a flow follow the same network path. Packet flow is modified by changing the inputs to the port channel hash algorithm.

In network topologies that include MLAGs, programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links in MLAG switches. This problem is avoided by performing different hash calculations between the MLAG switch, and a non-peer switch connected to it.

The `no port-channel load-balance fm6000 fields ip` and `default port-channel load-balance fm6000 fields ip` commands restore the default data fields for the IP packet load balancing algorithm by removing the `port-channel load-balance fm6000 fields ip` command from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**
```
port-channel load-balance fm6000 fields ip IP_FIELD_NAME
no port-channel load-balance fm6000 fields ip
default port-channel load-balance fm6000 fields ip
```

**Parameters**
- `IP_FIELD_NAME` specifies fields the hashing algorithm uses for layer 3 routing. Options include:
  - `ip-tcp-udp-header` algorithm uses source and destination IP address fields. Source and destination port fields are included for TCP and UDP packets.

  A command can only specify one option. The default setting is `ip-tcp-udp-header`.

**Related Commands**
- `port-channel load-balance` configures the hash seed for the algorithm.
- `port-channel load-balance fm6000 fields mac` controls the hash algorithm for non-IP packets

**Example**
- These commands configure the switch's port channel load balance for IP packets by source and destination IP address and port fields.

```
switch(config)#port-channel load-balance fm6000 fields ip ip-tcp-udp-header
switch(config)#
```
port-channel load-balance fm6000 fields mac

The **port-channel load-balance fm6000 fields mac** command specifies data fields that configure the port channel load balance hash algorithm for non-IP packets on FM6000 platform switches. The hashing algorithm fields used for balancing non-IP packets differ from the fields used for IP packets.

The switch calculates a hash value using the packet header fields to load balance packets across links in a port channel. The hash value determines the link through which the packet is transmitted. This method also ensures that all packets in a flow follow the same network path. Packet flow is modified by changing the inputs to the port channel hash algorithm.

In network topologies that include MLAGs, programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links in MLAG switches. This problem is avoided by performing different hash calculations between the MLAG switch, and a non-peer switch connected to it.

The **no port-channel load-balance fm6000 fields mac** and **default port-channel load-balance fm6000 fields mac** commands restore the default data fields for the non-IP packet load balancing algorithm by removing the **port-channel load-balance fm6000 fields mac** command from running-config.

**Command Mode**

Global Configuration

**Command Syntax**

- `port-channel load-balance fm6000 fields mac MAC_FIELD_NAME`
- `no port-channel load-balance fm6000 fields mac`
- `default port-channel load-balance fm6000 fields mac`

**Parameters**

- **MAC_FIELD_NAME** fields the hashing algorithm uses for layer 2 routing. Options include
  - **dst-mac** MAC destination field
  - **eth-type** EtherType field
  - **src-mac** MAC source field
  - **vlan-id** VLAN ID field
  - **vlan-priority** VLAN priority field

  Command may include from one to five fields, in any combination and listed in any order. The default setting is the selection of all fields.

**Related Commands**

- **port-channel load-balance** configures the hash seed for the algorithm.
- **port-channel load-balance fm6000 fields ip** controls the hash algorithm for IP packets

**Example**

- These commands configure the switch’s port channel load balance for non-IP packets by using the MAC destination and Ethernet type fields in the hashing algorithm.

  ```
  switch(config)#port-channel load-balance fm6000 fields mac dst-mac eth-type
  switch(config)#
  ```
**port-channel load-balance module**

The **port-channel load-balance module** command assigns a named load-balancing profile to a linecard.

**Note**

Available on the 7500E platform.

The **no port-channel load-balance module** and **default port-channel load-balance module** commands unassigns the load balancing module, or restores the default data fields for the load balancing module.

**Command Mode**

Global Configuration

**Command Syntax**

```
port-channel load-balance module LINECARD_RANGE sand profile PROFILE_NAME
no port-channel load-balance module LINECARD_RANGE sand profile PROFILE_NAME
default port-channel load-balance module LINECARD_RANGE sand profile PROFILE_NAME
```

**Parameters**

- **LINECARD_RANGE**  linecard number range includes
- **<3-10>**  linecard number range
- **PROFILE_NAME**  load-balancing profile name

**Examples**

- This command assigns a named load-balancing profile to a linecard.
  ```
  switch(config)#port-channel load-balance module 3-7 sand profile Linecard5
  switch(config)#
  ```

- This command unassigns a named load-balancing profile to a linecard.
  ```
  switch(config)#no port-channel load-balance module 3-7 sand profile Linecard5
  switch(config)#
  ```
port-channel load-balance petraA fields ip

The port-channel load-balance petraA fields ip command specifies the data fields that the port channel load balance hash algorithm uses for distributing IP packets on Petra platform switches. The hashing algorithm fields used for IP packets differ from the fields used for non-IP packets.

The switch calculates a hash value using the packet header fields to load balance packets across links in a port channel. The hash value determines the link through which the packet is transmitted. This method also ensures that all packets in a flow follow the same network path. Packet flow is modified by changing the inputs to the port channel hash algorithm.

In network topologies that include MLAGs, programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links in MLAG switches. This problem is avoided by performing different hash calculations between the MLAG switch, and a non-peer switch connected to it.

The no port-channel load-balance petraA fields ip and default port-channel load-balance petraA fields ip commands restore the default data fields for the IP packet load balancing algorithm by removing the port-channel load-balance petraA fields ip command from running-config.

Command Mode
Global Configuration

Command Syntax

port-channel load-balance petraA fields ip IP_FIELD_NAME
no port-channel load-balance petraA fields ip
default port-channel load-balance petraA fields ip

Parameters

- **IP_FIELD_NAME** fields the hashing algorithm uses for layer 3 routing. Options include:
  - ip-tcp-udp-header algorithm uses source and destination IP address fields. Source and destination port fields are included for TCP and UDP packets.
  - mac-header algorithm uses entire MAC header.

A command can only specify one option. The default setting is **ip-tcp-udp-header**.

Guidelines

The port channel hash algorithm for non-IP packets is not configurable and always includes the entire MAC header.

Related Commands

- port-channel load-balance configures the hash seed for the algorithm.

Example

- These commands configure the switch’s port channel load balance hash algorithm for IP packets to use source and destination IP address (and port) fields.

```
switch(config)#port-channel load-balance fm6000 fields ip ip-tcp-udp-header
switch(config)#
```
**port-channel load-balance trident fields ip**

The **port-channel load-balance trident fields ip** command specifies the data fields that the port channel load balance hash algorithm uses for distributing IP packets on Trident platform switches. The hashing algorithm fields used for IP packets differ from the fields used for non-IP packets.

The switch calculates a hash value using the packet header fields to load balance packets across links in a port channel. The hash value determines the link through which the packet is transmitted. This method also ensures that all packets in a flow follow the same network path. Packet flow is modified by changing the inputs to the port channel hash algorithm.

In network topologies that include MLAGs, programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links in MLAG switches. This problem is avoided by performing different hash calculations between the MLAG switch, and a non-peer switch connected to it.

The **no port-channel load-balance trident fields ip** and **default port-channel load-balance trident fields ip** commands restore the default data fields for the IP packet load balancing algorithm by removing the **port-channel load-balance trident fields ip** command from **running-config**.

**Command Mode**
Global Configuration

**Command Syntax**

```
port-channel load-balance trident fields ip IP_FIELD_NAME
no port-channel load-balance trident fields ip
default port-channel load-balance trident fields ip
```

**Parameters**

- **IP_FIELD_NAME** specifies fields the hashing algorithm uses for layer 3 routing. Options include:
  - **destination-ip** algorithm uses destination IP address field.
  - **source-ip** algorithm uses source IP address field.
  - **destination-port** algorithm uses destination TCP/UDP port field.
  - **source-port** algorithm uses source TCP/UDP port field.
  - **ip-tcp-udp-header** algorithm uses source and destination IP address fields. Source and destination port fields are included for TCP and UDP packets. *This option can't be used in combination with any other option.*
  - **mac-header** algorithm uses fields specified by **port-channel load-balance trident fields mac**. *This option can't be used in combination with any other option.*

Default setting is **ip-tcp-udp-header**

**Related Commands**

- **port-channel load-balance** configures the hash seed for the algorithm.
- **port-channel load-balance trident fields ipv6** controls the hash algorithm for IPv6 packets
- **port-channel load-balance trident fields mac** controls the hash algorithm for non-IP/IPv6 packets
Example

- These commands configure the switch’s port channel load balance for IP packets by using the IPv6 destination field in the hashing algorithm.

```
switch(config)#port-channel load-balance trident fields ip destination-ip
switch(config)#
```
port-channel load-balance trident fields ipv6

The `port-channel load-balance trident fields ipv6` command specifies the data fields that the port channel load balance hash algorithm uses for distributing IPv6 packets on Trident platform switches. The hashing algorithm fields used for IPv6 packets differ from the fields used for non-IPv6 packets.

The switch calculates a hash value using the packet header fields to load balance packets across links in a port channel. The hash value determines the link through which the packet is transmitted. This method also ensures that all packets in a flow follow the same network path. Packet flow is modified by changing the inputs to the port channel hash algorithm.

In network topologies that include MLAGs, programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links in MLAG switches. This problem is avoided by performing different hash calculations between the MLAG switch, and a non-peer switch connected to it.

The `no port-channel load-balance trident fields ipv6` and `default port-channel load-balance trident fields ipv6` commands restore the default data fields for the IPv6 packet load balancing algorithm by removing the `port-channel load-balance trident fields ipv6` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
port-channel load-balance trident fields ipv6 IP_FIELD_NAME
no port-channel load-balance trident fields ipv6
default port-channel load-balance trident fields ipv6
```

**Parameters**

- `IP_FIELD_NAME` specifies fields the hashing algorithm uses for layer 3 routing. Options include:
  - *destination-ip* algorithm uses destination IPv6 address field.
  - *source-ip* algorithm uses source IPv6 address field.
  - *destination-port* algorithm uses destination TCP/UDP port field.
  - *source-port* algorithm uses source TCP/UDP port field.
  - *ip-tcp-udp-header* algorithm uses source and destination IPv6 address fields. Source and destination port fields are included for TCP and UDP packets. *This option can't be used in combination with any other option.*
  - *mac-header* algorithm uses fields specified by `port-channel load-balance trident fields mac`. *This option can't be used in combination with any other option.*

Default setting is `ip-tcp-udp-header`

**Related Commands**

- `port-channel load-balance` configures the hash seed for the algorithm.
- `port-channel load-balance trident fields ipv6` controls the hash algorithm for non-IP packets
- `port-channel load-balance trident fields mac` controls the hash algorithm for non-IP packets
Example

- These commands configure the switch’s port channel load balance for IP packets by using the IPv6 source field in the hashing algorithm.

  ```bash
  switch(config)#port-channel load-balance trident fields ipv6 source-ip
  switch(config)#
  ```
port-channel load-balance trident fields mac

The `port-channel load-balance trident fields mac` command specifies data fields that the port channel load balance hash algorithm uses for distributing non-IP packets on Trident platform switches. The hashing algorithm fields used for non-IP packets differ from the fields used for IP packets.

The switch calculates a hash value using the packet header fields to load balance packets across links in a port channel. The hash value determines the link through which the packet is transmitted. This method also ensures that all packets in a flow follow the same network path. Packet flow is modified by changing the inputs to the port channel hash algorithm.

In network topologies that include MLAGs, programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links in MLAG switches. This problem is avoided by performing different hash calculations between the MLAG switch, and a non-peer switch connected to it.

The `no port-channel load-balance trident fields mac` and `default port-channel load-balance trident fields mac` commands restore the default data fields for the non-IP packet load balancing algorithm by removing the `port-channel load-balance trident fields mac` command from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**
```
port-channel load-balance trident fields mac MAC_FIELD_NAME
no port-channel load-balance trident fields mac
default port-channel load-balance trident fields mac
```

**Parameters**
- `MAC_FIELD_NAME` fields the hashing algorithm uses for layer 2 routing. Options include
  - `dst-mac` MAC destination field
  - `eth-type` EtherType field
  - `src-mac` MAC source field

  Command may include from one to three fields, in any combination and listed in any order. The default setting is the selection of all fields.

**Related Commands**
- `port-channel load-balance` configures the hash seed for the algorithm.
- `port-channel load-balance trident fields ip` controls the hash algorithm for IP packets
- `port-channel load-balance trident fields ipv6` controls the hash algorithm for IP packets

**Example**
- These commands configure the switch’s port channel load balance for non-IP packets by using the MAC destination and Ethernet type fields in the hashing algorithm.

```
switch(config)#port-channel load-balance trident fields mac dst-mac eth-type
switch(config)#
```
**port-channel min-links**

The **port-channel min-links** command specifies the minimum number of interfaces that the configuration mode LAG requires to become active. If there are fewer ports than specified by this command, the port channel interface does not become active. The default min-links value is 0.

The **no port-channel min-links** and **default port-channel min-links** commands restore the default min-links setting for the configuration mode LAG by removing the corresponding **port-channel min-links** command from the configuration.

**Note**

In static LAGs, the min-links value must be met for the LAG to be active. The LAG will not become active until it has at least the min-links number of functioning links in the channel group. If failed links cause the number to drop below the minimum, the LAG will go down and administrator action will be required to bring it back up.

In dynamic LAGs, the LACP protocol must determine that at least min-links physical ports are aggregable (they are physically compatible and have the same keys both remotely and locally) before it begins negotiating to make any ports active members of the port-channel. However once negotiation begins, an error on the partner’s side or an error in programming of member interfaces can cause the LAG to become active with fewer than the minimum number of links.

EOS evaluates min-links after min-links-review-timeout (linearly proportional to configured min-links) when LACP protocol collecting and/or distributing state changes. If the number of active member interfaces in a port-channel is less than configured min-links, it brings the corresponding port-channel Link Down and syslogs LAG-4-MINLINK_INTF_INSUFFICIENT message.

If additional interfaces get programmed as collecting and distributing, EOS re-evaluates min-links on the port-channel. If sufficient number of interfaces are available to be a part of port-channel, then all interfaces of the corresponding port-channel are re-enabled for LACP negotiation and the port-channel becomes Link Up. LAG-4-MINLINK_INTF_NORMAL is syslogged after min-links-review-timeout if the min-links condition is satisfied; otherwise LAG-4-MINLINK_INTF_INSUFFICIENT is syslogged and the port-channel goes Link Down.

If an interface remains in collecting state but not in distributing state for min-links-review-timeout, it is moved out of collecting state. It is periodically re-enabled after min-links-retry-timeout (which is 200 seconds) till it progresses to collecting and distributing. Meanwhile, if a port-channel becomes Link Up because sufficient number of interfaces progressed to collecting and distributing states, then this interface is enabled for LACP negotiation.

**Command Mode**

Interface-Port-Channel Configuration

**Command Syntax**

```
port-channel min-links quantity
no port-channel min-links
default port-channel min-links
```

**Parameters**

- **quantity** minimum number of interfaces. Value range varies by platform. Default value is 0.
Example

- These commands set four as the minimum number of ports required for port channel 13 to become active.

```bash
switch(config)#interface port-channel 13
switch(config-if-Po13)#port-channel min-links 4
switch(config-if-Po13)#show active
interface Port-Channel13
   port-channel min-links 4
switch(config-if-Po13)#
```
port-channel min-links review interval

The `port-channel min-links review interval` command enables or disables timer based min-links review feature for all port-channels.

The `no port-channel min-links review interval` and `default port-channel min-links review interval` commands restore the default min-links-timeout-base to 180 seconds by removing the corresponding `port-channel min-links review interval` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
port-channel min-links review interval timeout(seconds)
no port-channel min-links review interval
default port-channel min-links review interval
```

**Guidelines**

The min-links-timeout-base interval for port-channels can be set within the range of 0 to 600 seconds. When setting the review interval to zero, the command will have the following effect:

- Disables the timer-based min-links review feature for all port-channels.
- For LACP port-channels, it prevents the port-channel from bringing link up (even after one or more member ports were negotiated to collect or distribute (rx or tx)) until there are sufficient member interfaces ready to join the port-channel. Meanwhile, the partner can enable the port-channel link with fewer than required member interfaces. This configuration does not impact port-channels without min-links configuration.

**Related Commands**

- `port-channel min-links`

**Example**

- This command sets the port-channel min-links interval to 200 seconds.

```
switch(config)#port-channel min-links review interval 200
```
show lacp aggregates

The show lacp aggregates command displays aggregate IDs and the list of bundled ports for all specified port channels.

Command Mode

EXEC

Command Syntax

show lacp [PORT_LIST] aggregates [PORT_LEVEL] [INFO_LEVEL]

PORT_LEVEL and INFO_LEVEL parameters can be placed in any order.

Parameters

- **PORT_LIST** port channels for which aggregate information is displayed. Options include:
  - <no parameter> all configured port channels.
  - c_range channel list (number, range, or comma-delimited list of numbers and ranges).
- **PORT_LEVEL** ports displayed, in terms of aggregation status. Options include:
  - <no parameter> ports bundled by LACP into the port channel.
  - all-ports all channel group ports, including channel group members not bundled into the port channel interface.
- **INFO_LEVEL** amount of information that is displayed. Options include:
  - <no parameter> aggregate ID and bundled ports for each channel.
  - brief aggregate ID and bundled ports for each channel.
  - detailed aggregate ID and bundled ports for each channel.
Examples

- This command lists aggregate information for all configured port channels.

```
switch>show lacp aggregates
Port Channel Port-Channel1:
   Aggregate ID:
   [(8000,00-1c-73-04-36-d7,0001,0000,0000), (8000,00-1c-73-09-a0-f3,0001,0000,0000)]
   Bundled Ports: Ethernet43 Ethernet44 Ethernet45 Ethernet46
Port Channel Port-Channel2:

   Bundled Ports: Ethernet41
switch>
```
show lacp counters

The show lacp counters command displays LACP traffic statistics.

Command Mode
EXEC

Command Syntax

```plaintext
show lacp [PORT_LIST] counters [PORT_LEVEL] [INFO_LEVEL]
```

**PORT_LEVEL** and **INFO_LEVEL** parameters can be placed in any order.

Parameters

- **PORT_LIST** ports for which port information is displayed. Options include:
  - <no parameter> all configured port channels
  - **c_range** ports in specified channel list (number, number range, or list of numbers and ranges).
  - **interface** ports on all interfaces.
  - **interface ethernet e_num** port on Ethernet interface specified by **e_num**.
  - **interface port-channel p_num** port on port channel interface specified by **p_num**.

- **PORT_LEVEL** ports displayed, in terms of aggregation status. Options include:
  - <no parameter> only ports bundled by LACP into an aggregate.
  - **all-ports** all ports, including LACP candidates that are not bundled.

- **INFO_LEVEL** amount of information that is displayed. Options include:
  - <no parameter> displays packet transmission (TX and RX) statistics.
  - **brief** displays packet transmission (TX and RX) statistics.
  - **detailed** displays packet transmission (TX and RX) statistics and actor-partner statistics.

Example

- This command displays transmission statistics for all configured port channels.

  ```plaintext
  switch>show lacp counters brief
  LACPDUs         Markers     Marker Response
  Port   Status        RX         TX   RX    TX      RX        TX     Illegal
  Port Channel Port-Channel1:
  Et43   Bundled   396979     396959    0     0       0         0           0
  Et44   Bundled   396979     396959    0     0       0         0           0
  Et45   Bundled   396979     396959    0     0       0         0           0
  Et46   Bundled   396979     396959    0     0       0         0           0
  Port Channel Port-Channel2:
  Et47   Bundled   396836     396883    0     0       0         0           0
  Et48   Bundled   396838     396883    0     0       0         0           0
  switch>
  ```
**show lacp interface**

The `show lacp interface` command displays port status for all port channels that include the specified interfaces. Within the displays for each listed port channel, the output displays sys-id, partner port, state, actor port, and port priority for each interface in the channel.

**Command Mode**

EXEC

**Command Syntax**

```
show lacp interface [INTERFACE_PORT] [PORT_LEVEL] [INFO_LEVEL]
```

*INTERFACE_PORT* is listed first when present. Other parameters can be listed in any order.

**Parameters**

- **INTERFACE_PORT** interfaces for which information is displayed. Options include:
  - <no parameter> all interfaces in channel groups.
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `port-channel p_num` port channel interface specified by `p_num`.

- **PORT_LEVEL** ports displayed, in terms of aggregation status. Options include:
  - <no parameter> command lists data for ports bundled by LACP into the aggregate.
  - `all-ports` command lists data for all ports, including LACP candidates that are not bundled.

- **INFO_LEVEL** amount of information that is displayed. Options include:
  - <no parameter> displays same information as `brief` option.
  - `brief` displays LACP configuration data, including sys-id, actor, priorities, and keys.
  - `detailed` includes `brief` option information plus state machine data.
**Example**

- This command displays LACP configuration information for all ethernet interfaces.

```plaintext
switch>show lacp interface

State: A = Active, P = Passive; S=ShortTimeout, L=LongTimeout;
G = Aggregateable, I = Individual; s+=InSync, s-=OutOfSync;
C = Collecting, X = state machine expired,
D = Distributing, d = default neighbor state

switch>
```
show lACP internal

The `show lACP internal` command displays the local LACP state for all specified channels. Local state data includes the state machines and LACP protocol information.

**Command Mode**

EXEC

**Command Syntax**

```
show lACP [PORT_LIST] internal [PORT_LEVEL] [INFO_LEVEL]
```

**Parameters**

- **PORT_LIST** interface for which port information is displayed. Options include:
  - `<no parameter>` all configured port channels
  - `c_range` ports in specified channel list (number, number range, or list of numbers and ranges).
  - `interface` ports on all interfaces.
  - `interface ethernet e_num` Ethernet interface specified by `e_num`.
  - `interface port-channel p_num` port channel interface specified by `p_num`.

- **PORT_LEVEL** ports displayed, in terms of aggregation status. Options include:
  - `<no parameter>` command lists data for ports bundled by LACP into an aggregate.
  - `all-ports` command lists data for all ports, including LACP candidates that are not bundled.

- **INFO_LEVEL** amount of information that is displayed. Options include:
  - `<no parameter>` displays same information as `brief` option.
  - `brief` displays LACP configuration data, including sys-id, actor, priorities, and keys.
  - `detailed` includes `brief` option information plus state machine data.

**PORT_LEVEL** and **INFO_LEVEL** parameters can be placed in any order.

**Example**

- This command displays internal data for all configured port channels.

```
switch>show lACP internal
LACP System-identifier: 8000,00-1c-73-04-36-d7
State: A = Active, P = Passive; S=ShortTimeout, L=LongTimeout;
       G = Aggregable, I = Individual; s+=InSync, s-=OutOfSync;

show lacp peer

The show lacp peer command displays the LACP protocol state of the remote neighbor for all specified port channels.

**Command Mode**

EXEC

**Command Syntax**

```
show lacp [PORT_LIST] peer [PORT_LEVEL] [INFO_LEVEL]
```

*PORT_LEVEL* and *INFO_LEVEL* parameters can be placed in any order.

**Parameters**

- **PORT_LIST** interface for which port information is displayed. Options include:
  - <no parameter> displays information for all configured port channels
  - `c_range` ports in specified channel list (number, number range, or list of numbers and ranges).
  - `interface` ports on all interfaces.
  - `interface ethernet e_num` Ethernet interface specified by `e_num`.
  - `interface port-channel p_num` port channel interface specified by `p_num`.

- **PORT_LEVEL** ports displayed, in terms of aggregation status. Options include:
  - <no parameter> command lists data for ports bundled by LACP into an aggregate.
  - `all-ports` command lists data for all ports, including LACP candidates that are not bundled.

- **INFO_LEVEL** amount of information that is displayed. Options include:
  - <no parameter> displays same information as `brief` option.
  - `brief` displays LACP configuration data, including sys-id, actor, priorities, and keys.
  - `detailed` includes `brief` option information plus state machine data.
Example

- This command displays the LACP protocol state of the remote neighbor for all port channels.

```
switch>show lacp peer
State: A = Active, P = Passive; S=ShortTimeout, L=LongTimeout;
G = Aggregable, I = Individual; s+=InSync, s-=OutOfSync;
C = Collecting, X = state machine expired,

* - Only local interfaces for MLAGs are displayed. Connect to the peer to see the state for peer interfaces.
```

switch>
show lACP sys-id

The `show lACP sys-id` command displays the System Identifier the switch uses when negotiating remote LACP implementations.

**Command Mode**

EXEC

**Command Syntax**

```
show lACP sys-id [INFO_LEVEL]
```

**Parameters**

- `INFO_LEVEL` amount of information that is displayed. Options include:
  - `<no parameter>` displays system identifier
  - `brief` displays system identifier.
  - `detailed` displays system identifier and system priority, including the MAC address.

**Examples**

- This command displays the system identifier.
  ```
  switch>show lACP sys-id brief
  8000,00-1c-73-04-36-d7
  ```

- This command displays the system identifier and system priority.
  ```
  switch>show lACP sys-id detailed
  System Identifier used by LACP:
  System priority: 32768  Switch MAC Address: 00:1c:73:04:36:d7
  802.11.43 representation: 8000,00-1c-73-04-36-d7
  ```
**show load-balance profile**

The **show load-balance profile** command displays the contents of the specified load balance profiles. Load balance profiles specify parameters used by hashing algorithms that distribute traffic across ports comprising a port channel or among component ECMP routes.

**Command Mode**

EXEC

**Command Syntax**

```plaintext
show load-balance profile [PROFILES]
```

**Parameters**

- **PROFILES**  Load balance profiles for which command displays contents. Options include:
  - `<no parameter>`  displays all load balance profiles.
  - `profile_name`  displays specified profile.

**Related Commands**

- **load-balance policies**  places the switch in load-balance-policies configuration mode.
- **ingress load-balance profile**  applies a load-balance profile to an Ethernet or port channel interface.

**Example**

- This command displays the contents of the LB-1 load balance profile.

  ```plaintext
  switch>show load-balance profile LB-1
  ---------- LB-1 ----------
  Source MAC address hashing               ON
  Destination MAC address hashing          ON
  Ethernet type hashing                    ON
  VLAN ID hashing                          ON
  IP protocol field hashing                ON
  DSCP field hashing is                    ON
  Symmetric hashing for non-IP packets     OFF
  Symmetric hashing for IP packets         OFF
  Random distribution for port-channel     ON
  Random distribution for ecmp             ON
  
  Profile LB-1 is applied on the following
  Port-Channel100
  
  ---------- myGlobalProfile (global) ----------
  L3 hashing is ON
  Symmetric hashing is OFF
  Hashing mode is flow-based
  Hash polynomial is 3
  Hash seed is 0
  Profile myGlobalProfile (global) is applied on the following
  Linecard3
  Linecard4
  Linecard5
  Linecard6
  
  switch>
  ```
show port-channel

The `show port-channel` command displays information about members the specified port channels.

**Command Mode**

EXEC

**Command Syntax**

```
show port-channel [MEMBERS] [PORT_LIST] [INFO_LEVEL]
```

**Parameters**

- `MEMBERS` list of port channels for which information is displayed. Options include:
  - `<no parameter>` all configured port channels.
  - `p_range` ports in specified channel list (number, number range, or list of numbers and ranges).
- `PORT_LEVEL` ports displayed, in terms of aggregation status. Options include:
  - `<no parameter>` Displays information on ports that are active members of the LAG.
  - `active-ports` Displays information on ports that are active members of the LAG.
  - `all-ports` Displays information on all ports (active or inactive) configured for LAG.
- `INFO_LEVEL` amount of information that is displayed. Options include:
  - `<no parameter>` Displays information at the brief level.
  - `brief` Displays information at the brief level.
  - `detailed` Displays information at the detail level.

**Display Values**

- **Port Channel** Type and name of the port channel.
- **Time became active** Time when the port channel came up.
- **Protocol** Protocol operating on the port channel.
- **Mode** Status of the Ethernet interface on the port. The status value is Active or Inactive.
- **No active ports** Number of active ports on the port channel.
- **Configured but inactive ports** Ports configured but that are not actively up.
- **Reason unconfigured** Reason why the port is not part of the LAG.

**Guidelines**

You can configure a port channel to contain many ports, but only a subset may be active at a time. All active ports in a port channel must be compatible. Compatibility includes many factors and is platform specific. For example, compatibility may require identical operating parameters such as speed and maximum transmission unit (MTU). Compatibility may only be possible between specific ports because of the internal organization of the switch.

**Examples**

- This command displays output from the `show port-channel` command:

```
switch>show port-channel 3
Port Channel Port-Channel3:
  Active Ports:
  +-----------------+-----------------+----------------+--------------+
  | Port            | Time became active | Protocol | Mode |
  +-----------------+-----------------+----------------+--------------+
  | Ethernet3       | 15:33:41         | LACP        | Active      |
  | PeerEthernet3   | 15:33:41         | LACP        | Active      |
```
- This command displays output from the `show port-channel active-ports` command:
  ```
  switch>show port-channel active-ports
  Port Channel Port-Channel3:
  No Active Ports
  Port Channel Port-Channel11:
  No Active Ports
  switch>
  ```

- This command displays output from the `show port-channel all-ports` command:
  ```
  switch>show port-channel all-ports
  Port Channel Port-Channel3:
  No Active Ports
  Configured, but inactive ports:
  Port          Time became inactive   Reason unconfigured
  -----------------------------------------------
  Ethernet3     Always                  not compatible with aggregate
  -----------------------------------------------

  Port Channel Port-Channel11:
  No Active Ports
  Configured, but inactive ports:
  Port          Time became inactive   Reason unconfigured
  -----------------------------------------------
  Ethernet25    Always                  not compatible with aggregate
  Ethernet26    Always                  not compatible with aggregate
  ```
**show port-channel dense**

The `show port-channel dense` command displays the port-channels on the switch and lists their component interfaces, LACP status, and set flags.

**Command Mode**
EXEC

**Command Syntax**

`show port-channel dense`

**Examples**

- This command displays `show port-channel dense` output:

```
switch>show port-channel dense

Flags
-----------------------------------------------------------------------------
a - LACP Active p - LACP Passive
U - In Use D - Down
+ - In-Sync - - Out-of-Sync i - incompatible with agg
P - bundled in Po s - suspended G - Aggregable
I - Individual S - ShortTimeout w - wait for agg

Number of channels in use: 2
Number of aggregators:2

</tbody>
</table>
show port-channel limits

The `show port-channel limits` command displays groups of ports that are compatible and may be joined into port channels. Each group of compatible ports is called a LAG group. For each LAG group, the command also displays *Max interfaces* and *Max ports per interface*.

- *Max interfaces* defines the maximum number of active port channels that may be formed out of these ports.
- *Max ports per interface* defines the maximum number of active ports allowed in a port channel from the compatibility group.

All active ports in a port channel must be compatible. Compatibility comprises many factors and is specific to a given platform. For example, compatibility may require identical operating parameters such as speed and/or maximum transmission unit (MTU). Compatibility may only be possible between specific ports because of internal organization of the switch.

**Command Mode**

EXEC

**Command Syntax**

`show port-channel limits`

**Example**

- This command displays `show port-channel list` output:

```
switch>show port-channel limits
LAG Group: focalpoint
--------------------------------------------------------------------------
Max port-channels per group: 24, Max ports per port-channel: 16
24 compatible ports: Ethernet1 Ethernet2 Ethernet3 Ethernet4
                       Ethernet5 Ethernet6 Ethernet7 Ethernet8
                       Ethernet9 Ethernet10 Ethernet11 Ethernet12
                       Ethernet13 Ethernet14 Ethernet15 Ethernet16
                       Ethernet17 Ethernet18 Ethernet19 Ethernet20

--------------------------------------------------------------------------
```
show port-channel load-balance

The **show port-channel load-balance** command displays the traffic distribution between the member ports of the specified port channels. The command displays distribution for unicast, multicast, and broadcast streams.

- The distribution values displayed are based on the total interface counters which start from zero at boot time or when the counters are cleared. For more current traffic distribution values, clear the interface counters of the member interfaces using the **clear counters** command.

**Command Mode**

**EXEC**

**Command Syntax**

```
show port-channel load-balance [MEMBERS]
```

**Parameters**

- **MEMBERS**
  - list of port channels for which information is displayed. Options include:
    - `<no parameter>` all configured port channels.
    - `c_range` ports in specified channel list (number, number range, or list of numbers and ranges).

**Examples**

- This command displays traffic distribution for all configured port channels.

```
switch>show port-channel load-balance
ChanId  Port  Rx-Ucst  Tx-Ucst  Rx-Mcst  Tx-Mcst  Rx-Bcst  Tx-Bcst
-------  ------  --------  --------  --------  --------  --------  --------
     8  Et10  100.00%  100.00%  100.00%  100.00%  0.00%  100.00%
     1  Et1  13.97%  42.37%  47.71%  30.94%  0.43%  99.84%
     1  Et2  86.03%  57.63%  52.29%  69.06%  99.57%  0.16%
     2  Et23  48.27%  50.71%  26.79%  73.22%  0.00%  100.00%
     2  Et24  51.73%  49.29%  73.21%  26.78%  0.00%  0.00%
     4  Et3  55.97%  63.29%  51.32%  73.49%  0.00%  0.00%
     4  Et4  44.03%  36.71%  48.68%  26.51%  0.00%  0.00%
     5  Et19  39.64%  37.71%  50.00%  90.71%  0.00%  0.00%
     5  Et20  60.36%  62.29%  50.00%  9.29%  0.00%  100.00%
     6  Et6   100.00% 100.00% 100.00% 100.00%  0.00%  100.00%

switch>
```
show port-channel load-balance fields

The `show port-channel load-balance fields` command displays the fields that the hashing algorithm uses to distribute traffic across the interfaces that comprise the port channels.

**Command Mode**

EXEC

**Command Syntax**

```
show port-channel load-balance HARDWARE fields
```

**Parameters**

- `HARDWARE`  ASIC switching device. Selection options depend on the switch model and include:
  - arad
  - fm6000
  - petraA
  - trident

**Examples**

- This command displays the hashing fields used for balancing port channel traffic.

  switch>show port-channel load-balance fm6000 fields
  Source MAC address hashing for non-IP packets is ON
  Destination MAC address hashing for non-IP packets is ON
  Ethernet type hashing for non-IP packets is ON
  VLAN ID hashing for non-IP packets is ON
  VLAN priority hashing for non-IP packets is ON
  Source MAC address hashing for IP packets is ON
  Destination MAC address hashing for IP packets is ON
  Ethernet type hashing for IP packets is ON
  VLAN ID hashing for IP packets is ON
  VLAN priority hashing for IP packets is ON
  IP source address hashing is ON
  IP destination address hashing is ON
  IP protocol field hashing is ON
  TCP/UDP source port hashing is ON
  TCP/UDP destination port hashing is ON
  switch>
Multi-Chassis Link Aggregation

Arista switches support Multi-Chassis Link Aggregation (MLAG) to logically aggregate ports across two switches. For example, two 10-gigabit Ethernet ports, one each from two MLAG configured switches, can connect to two 10-gigabit ports on a host, switch, or network device to create a link that appears as a single 20-gigabit port. MLAG-configured ports provide Layer 2 multipathing, increased bandwidth, higher availability, and other improvements on traditional active-passive or Spanning Tree governed infrastructures.

The Multi-Chassis Link Aggregation chapter contains these sections:

- Section 13.1: MLAG Introduction
- Section 13.2: MLAG Conceptual Overview
- Section 13.3: MLAG Maintenance
- Section 13.4: Configuring MLAG
- Section 13.5: MLAG Implementation Example
- Section 13.6: MLAG Commands

13.1 MLAG Introduction

High availability data center topologies typically provide redundancy protection at the expense of oversubscription by connecting top-of-rack (TOR) switches and servers to dual aggregation switches. In these topologies, Spanning Tree Protocol prevents network loops by blocking half of the links to the aggregation switches. This reduces the available bandwidth by 50%.

Deploying MLAG removes oversubscription by configuring an MLAG link between two aggregation switches to create a single logical switching instance that utilizes all connections to the switches. Interfaces on both devices participate in a distributed port channel, enabling all active paths to carry data traffic while maintaining the integrity of the Spanning Tree topology.

MLAG provides these benefits:

- Aggregates multiple Ethernet ports across two switches.
- Provides higher bandwidth links as network traffic increases.
- Utilizes bandwidth more efficiently with fewer links blocked by STP.
- Connects to other switches and servers by static LAG or LACP without other proprietary protocols.
- Supports normal STP operation to prevent loops.
- Supports active-active Layer-2 redundancy.

Note

PTP (precision timing protocol) is not supported with MLAG.
The global STP configuration is derived from the primary peer device while the secondary device parameters are ignored. When STP is disabled on the primary device, the secondary device will not contain any STP configuration information from the primary device. As a result, the secondary device will not be able to decide on the port roles or states, and will remain in the default state which is the discarding state. This is an expected behavior.
13.2 MLAG Conceptual Overview

13.2.1 MLAG Operation Process

A multi-chassis link aggregation group (MLAG) is a pair of links that terminate on two cooperating switches and appear as an ordinary link aggregation group (LAG). The cooperating switches are MLAG peer switches and communicate through an interface called a peer link. While the peer link’s primary purpose is exchanging MLAG control information between peer switches, it also carries data traffic from devices that are attached to only one MLAG peer and have no alternative path. An MLAG domain consists of the peer switches and the control links that connect the switches.

In Figure 13-1, Switch A and Switch B are peer switches in the MLAG domain and connect to each other through the peer link. Each peer switch uses the peer address to form and maintain the peer link.

The MLAG domain ID is a text string configured in each peer switch. MLAG switches use this string to identify their peers. The MLAG System ID (MSI) is the MLAG domain’s MAC address. The MSI is automatically derived when the MLAG forms and does not match the bridge MAC address of either peer. Each peer uses the MSI in STP and LACP PDUs.

The topology in Figure 13-1 contains four MLAGs: one MLAG connects each device to the MLAG domain. Each peer switch connects to the four servers through MLAG link interfaces.

In a conventional topology, with dually-attaching devices to multiple switches for redundancy, Spanning Tree Protocol (STP) blocks half of the switch-device links. In the MLAG topology, STP does not block any portion because it views the MLAG Domain as a single switch and each MLAG as a single port. The MLAG protocol facilitates the balancing of device traffic between the peer switches.

Figure 13-1: MLAG Domain Topology

When MLAG is disabled, peer switches revert to their independent state. MLAG is disabled by any of the following:
MLAG configuration changes.
- The TCP connection breaks.
- The peer-link or local-interface goes down.
- A switch does not receive a response to a keep alive message from its peer within a specified period.

13.2.2 MLAG Interoperability with Other Features
The following sections describe MLAG interaction with other switch features.

13.2.2.1 VLANs
VLAN parameters must be configured identically on each peer for the LAGs comprising the peer link and MLAGs. These parameters include the switchport access VLAN, switchport mode, trunk-allowed VLANs, the trunk native VLAN, and switchport trunk groups. Configuration discrepancies may result in traffic loss in certain failure scenarios. Port-specific bridging configuration originates on the switch where the port is physically located.

13.2.2.2 LACP
Link Aggregation Control Protocol (LACP) should be used on all MLAG interfaces, including the peer-link. LACP control packets reference the MLAG system ID.

13.2.2.3 Static MAC Addresses
A static MAC address configured on an MLAG interface is automatically configured on the peer’s corresponding interface. Configuring static MAC addresses on both peers prevents undesired flooding if an MLAG peer relationship fails.

If the MLAG peering relationship is disabled, the static MAC previously learned from peer is removed.

13.2.2.4 STP
When implementing MLAG in a spanning tree network, spanning tree must be configured globally and on port-channels configured with an MLAG ID. Port specific spanning tree configuration comes from the switch where the port physically resides. This includes spanning-tree PortFast BPDU Guard and BPDU filter.

13.2.2.5 Port Mirroring
A port channel which is a member of an MLAG must not be used as the destination port for a port mirroring (port monitoring) session.

13.2.3 IPv6 Flow Label Hashing
Arista switches use the hashing algorithm to load-balance traffic among LAG members and Layer 3 ECMP (equal cost multipath) paths. For IP and IPv6 traffic, the hashing algorithm includes (if so configured for LAG) the IP packet fields such as source and destination IP addresses as well as source and destination ports for UDP and TCP traffic.

To improve traffic distribution for IPv6 traffic, IPv6 Flow Label field has been added to the hashing algorithm for both LAG and ECMP.
Note
IPv6 Flow Label is included in the LAG hashing algorithm only when the MAC header hashing is not enabled for IPv6 traffic.
13.3 MLAG Maintenance

These sections describe tasks required for MLAG to operate on the switch:

- Section 13.3.1: Ensuring Control Plane ACL Compatibility
- Section 13.3.2: MLAG Availability through a Single Functional Peer
- Section 13.3.3: Upgrading MLAG Peers

13.3.1 Ensuring Control Plane ACL Compatibility

The control plane access control list (ACL) on any interface participating in the MLAG must be configured to allow only the peer link neighbor to generate MLAG control traffic. The required rules are included in the default control plane ACL for Ethernet ports.

Any custom control plane ACL applied to a participating port must include these three rules:

```
permit tcp any any eq mlag ttl eq 255
permit udp any any eq mlag ttl eq 255
permit tcp any eq mlag any ttl eq 255
```

MLAG peers that function as routers must each have routing enabled.

13.3.2 MLAG Availability through a Single Functional Peer

MLAG high availability advantages are fully realized when all devices that connect to one MLAG switch also connect to the peer switch. A switch can continue supporting MLAG when its peer is offline if the STP agent is restartable. When one peer is offline, data traffic flows from the devices through the MLAG component link that connects to the functioning switch. When a switch is offline, its interfaces and ports do not appear in `show mlag` and `show spanning tree protocol` commands of the functioning peer.

To view the restartability status of the STP agent, use the `detail` option of the `show spanning-tree instance` command:

```
switch-1#show spanning-tree instance detail | grep agent
Stp agent restartable : True
```

STP agent restartability requires consistent configuration between the peers of STP, LACP, MLAG, and switchport parameters. Events triggering an STP state machine change may also briefly prevent the STP agent from being restartable.

13.3.2.1 Reload Delay

If an MLAG peer reboots, all ports except those in the peer-link port-channel remain in `errdisabled` state for a specified time, called the reload-delay period. This period allows all topology states to stabilize before the switch begins forwarding traffic. Each Arista switch defaults to the recommended reload-delay value, which varies by switch platform:

- **Fixed configuration switches**: 300 seconds
- **Trident II modular switches**: 1200 seconds
  - 7304
  - 7308
  - 7316
  - 7300X series
- **Sand platform fixed configuration switches**: 600 seconds
• 7280 series
• **Sand platform modular switches**: 1800 seconds
  • 7504
  • 7508
  • 7500E series
  • 7548S

In those cases where network topology requires additional time to stabilize or where a shorter delay can be tolerated, the reload-delay period can be configured using the `reload-delay mlag` command.

Severing the physical connection (cable) that establishes the peer-link between MLAG peers may result in a **split brain** state where each peer independently enters spanning tree state to prevent topology loops. Sessions established through one interface of a dual attached device may fail if its path is disrupted by the STP reconvergence, possibly resulting in temporarily lost connectivity. Sessions can be reestablished if permitted by the resulting topology.

### 13.3.3 Upgrading MLAG Peers

MLAG ISSU (In-Service Software Upgrade) upgrades EOS software on one MLAG peer with minimal traffic disruptions on active MLAG interfaces and without changing the network topology.

#### 13.3.3.1 Verifying Configuration Compatibility

A seamless EOS upgrade on an MLAG peer requires that the following features are configured consistently on each switch:

- VLANs
- Switchport configuration on port channel interfaces that are configured with an MLAG ID
- STP configuration (global)

#### 13.3.3.2 Version Compatibility

A switch running MLAG can be upgraded without disrupting MLAG traffic when the upgrade EOS version is compatible with the version on the peer switch. Refer to the Release Notes for a list of compatible EOS versions.

#### 13.3.3.3 Reload Warning Conditions

Entering an EOS reload command while MLAG is active generates warning messages if conditions that can result in packet loss during the upgrade are present. All warnings should be resolved before confirming the reload request. Table 13-1 displays the reload conditions and a common resolution method for each condition..

<table>
<thead>
<tr>
<th>Reload Condition</th>
<th>Resolution Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compatibility check</td>
<td>Refer to the Release Notes to verify that the new version is compatible with the currently installed version</td>
</tr>
<tr>
<td>Active-partial MLAG warning</td>
<td>Bring up the remote port-channel. If the MLAG is not actively used, then this warning can be ignored.</td>
</tr>
<tr>
<td>STP is not restartable</td>
<td>Wait for STP to be restartable: typically 30 seconds, up to 120 seconds for a newly started STP agent. Refer to Section 13.3.2 for information on checking restartability.</td>
</tr>
</tbody>
</table>
Example

- The following `reload` command generates MLAG warning conditions that should be addressed before confirming the `proceed with reload` prompt.

```
switch(config)#reload
```

If you are performing an upgrade, and the Release Notes for the new version of EOS indicate that MLAG is not backwards-compatible with the currently installed version (4.9.2), the upgrade will result in packet loss.

The following MLAGs are not in Active mode. Traffic to or from these ports will be lost during the upgrade process.

<table>
<thead>
<tr>
<th>Local/Remote</th>
<th>State</th>
<th>Local</th>
<th>Remote</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>14</td>
<td>active-partial</td>
<td>Po14</td>
<td>Po14</td>
<td>up/down</td>
</tr>
<tr>
<td>15</td>
<td>active-partial</td>
<td>Po15</td>
<td>Po15</td>
<td>up/down</td>
</tr>
</tbody>
</table>

Stp is not restartable. Topology changes will occur during the upgrade process.

The configured reload delay of 100 seconds is below the default value of 300 seconds. A longer reload delay allows more time to rollback an unsuccessful upgrade due to incompatibility.

The other MLAG peer has error-disabled interfaces. Traffic loss will occur during the upgrade process.

Proceed with reload? [confirm]

### 13.3.3.4 Performing an MLAG ISSU Upgrade

The following procedure performs an MLAG ISSU upgrade:

**Step 1** Very configuration consistency on each peer ([Section 13.3.3.1](#)).

**Step 2** Verify version compatibility between the new and existing images ([Section 13.3.3.2](#)).

**Step 3** Configure `reload-delay mlag` ([Section 13.3.2](#)) if needed. Recommended delay period varies by switch type, and each switch defaults to its recommended delay period.

**Step 4** Install the new image onto one of the peers:

a. Upload the new image to the switch.

b. Set the boot path to the new image.

c. Enter the `reload` command.

**Step 5** Resolve all reload warnings.

**Step 6** Confirm the reload.
Step 7  Wait for MLAG peers to renegotiate to the active state and reload-delay expiry on rebooted peer; until reload-delay period has expired, ports on the rebooted peer (except the peer-link) will be in errdisabled state with err-disabled reason being mlag-issu.

Avoid configuration changes on both peers until after this step.

Step 8  Repeat the upgrade process for the other peer.

When upgrading modular switches with dual supervisors, upgrade the standby supervisors first, then upgrade the active supervisors.
13.4 Configuring MLAG

These sections describe the basic MLAG configuration steps:

- Section 13.4.1: Configuring the MLAG Peers
- Section 13.4.2: Configuring MLAG Services

13.4.1 Configuring the MLAG Peers

Connecting two switches as MLAG peers requires the establishment of the peer link and an SVI that defines local and peer IP addresses on each switch.

The peer link is composed of a LAG between the switches. When all devices that connect to the MLAG domain are dually connected to the switches through an MLAG, a peer link of two Ethernet interfaces is sufficient to handle MLAG control data and provide N+1 redundancy. When the domain connects to devices through only one MLAG peer, the peer link may require additional Ethernet interfaces to manage data traffic.

Disruptions to peer link connectivity due to forwarding agent restarts may cause an extended MLAG outage. Forwarding agent restart event include some configuration changes, such as port speed change or UFT mode change). The following precautions can reduce the risk of losing peer-link connectivity:

- all switches: constructing peer-links from port-channels in preference to a single Ethernet interface.
- modular systems: peer-link port-channel members should span multiple line cards.
- multi-chip systems: peer-link port-channel member should span multiple chips.

Section 3.6 describes modular systems.

The steps that configure two switches as MLAG peers include:

- Configuring the Port Channels, VLAN Interfaces, and IP addresses
- Configure Peer Parameters
- Configuring MLAG Peer Gateway

13.4.1.1 Configuring the Port Channels, VLAN Interfaces, and IP addresses

The peer link is a normal port channel. The local address is the SVI that maps to the peer link port channel. The port channel and SVI must be configured on each peer switch. The port channel should be an active LACP port. The local and peer addresses must be located on the same IP address subnet. Autostate should be disabled on the SVI configured as the local interface.

Examples

- These commands create an active mode LACP port channel interface from two Ethernet interfaces and configure it as part of a trunk group on each switch.

  The `switchport mode trunk` command permits all VLANs on the interface by default, so all VLANs are permitted on port channel 10 in the following example. The configuration of a trunk group for a VLAN restricts only that specific VLAN to the associated ports: VLAN 4094 is only permitted on port channel 10, and not on any other ports on the switch. It is important to remember that all VLANs must be permitted between the peers on the peer link for correct operation.
Switch 1

switch1#config
switch1(config)#vlan 4094
switch1(config-vlan-4094)#trunk group mlpeer
switch1#config
switch1(config)#interface ethernet 1-2
switch1(config-if-et1-2)#channel-group 10 mode active
switch1(config-if-et1-2)#interface port-channel 10
switch1(config-if-po10)#switchport mode trunk
switch1(config-if-po10)#switchport trunk group mlpeer
switch1(config-if-po10)#exit
switch1(config)#

Switch 2

switch2#config
switch2(config)#vlan 4094
switch2(config-vlan-4094)#trunk group mlpeer
switch2(config-vlan-4094)#exit
switch2(config)#interface ethernet 1-2
switch2(config-if-et1-2)#channel-group 10 mode active
switch2(config-if-et1-2)#interface port-channel 10
switch2(config-if-po10)#switchport mode trunk
switch2(config-if-po10)#switchport trunk group mlpeer
switch2(config-if-po10)#exit
switch2(config)#

- These commands create an SVI for the local interface and associate it to the trunk group assigned to the peer link port channel.

The SVI creates a Layer 3 endpoint in the switch and enables MLAG processes to communicate via TCP. The IP address can be any unicast address that does not conflict with other SVIs. STP is disabled for the peer link VLAN 4094 to prevent any potential STP disruption of inter peer communications. Recall that the VLAN has been restricted to port-channel 10 by the earlier trunk group configuration thus preventing potential Layer 2 loop conditions within VLAN 4094.

Switch 1

switch1#config
switch1(config)#interface vlan 4094
switch1(config-if-vl4094)#ip address 10.0.0.1/30
switch1(config-if-vl4094)#no autostate
switch1(config-if-vl4094)#exit
switch1(config)#no spanning-tree vlan-id 4094
switch1(config)#

Switch 2

switch2#config
switch2(config)#interface vlan 4094
switch2(config-if-vl4094)#ip address 10.0.0.2/30
switch2(config-if-vl4094)#no autostate
switch2(config-if-vl4094)#exit
switch2(config)#no spanning-tree vlan-id 4094
switch2(config)#

13.4.1.2 Configure Peer Parameters

Peer connection parameters configure the connection between the MLAG peer switches. This section describes the following peer configuration parameters.

- MLAG Configuration Mode
• Local VLAN Interface
• Peer Address
• Peer Link
• Domain ID
• Heartbeat Interval and Timeout
• Reload Delay Period

MLAG Configuration Mode
Peer connection parameters are configured in MLAG-configuration mode. The `mlag configuration` (global configuration) command places the switch in MLAG configuration mode.

Example
• This command places the switch in MLAG configuration mode.
  ```
  switch(config)#mlag configuration
  switch(config-mlag)#
  ```

Local VLAN Interface
The local interface specifies the SVI upon which the switch sends MLAG control traffic. The local IP address is specified within the definition of the VLAN associated with the local interface. The Peer Address configures the control traffic destination on the peer switch.

The `local-interface` command specifies a VLAN interface as the peer link SVI.

Example
• This command configures VLAN 4094 as the local interface.
  ```
  switch(config-mlag)#local-interface vlan 4094
  switch(config-mlag)#
  ```

Peer Address
The peer address is the destination address on the peer switch for MLAG control traffic. If the peer IP address is unreachable, MLAG peering fails and both peer switches revert to their independent state.

The `peer-address` command specifies the peer address.

Example
• This command configures a peer address of 10.0.0.2.
  ```
  switch(config-mlag)#peer-address 10.0.0.2
  switch(config-mlag)#
  ```

Peer Link
An MLAG is formed by connecting two switches through an interface called a peer link. The peer link carries MLAG advertisements, keepalive messages, and data traffic between the switches. This information keeps the two switches working together as one. While interfaces comprising the peer links on each switch must be compatible, they need not use the same interface number. Ethernet and Port-channel interfaces can be configured as peer links.

The `peer-link` command specifies the interface the switch uses to communicates MLAG control traffic.
Chapter 13: Multi-Chassis Link Aggregation  Configuring MLAG

Example

- This command configures port-channel 10 as the peer link.
  
  ```
  switch(config-mlag)#peer-link port-channel 10
  switch(config-mlag)#
  ```

Domain ID

The MLAG domain ID is a unique identifier for an MLAG domain. The MLAG domain ID must be the identical on each switch to facilitate MLAG communication.

The `domain-id` command configures the MLAG domain ID.

Example

- This command configures `mlagDomain` as the domain ID:
  
  ```
  switch(config-mlag)#domain-id mlagDomain
  switch(config-mlag)#
  ```

Heartbeat Interval and Timeout

The heartbeat interval specifies the period between the transmission of successive keepalive messages. Each MLAG switch transmits keepalive messages and monitors message reception from its peer. The heartbeat timeout is reset when the switch receives a keepalive message. If the heartbeat timeout expires, the switch disables MLAG under the premise that the peer switch is not functioning.

The `heartbeat-interval (MLAG)` command configures the heartbeat interval between 1 and 30 seconds, with a default value of 2 seconds. The heartbeat timeout expiry is 30 seconds.

**Important!** On 7500 and 7500E Series Switches, Arista recommends setting the heartbeat interval to 10 seconds.

Example

- This command configures the heartbeat interval as 2.5 seconds (2500 ms).
  
  ```
  switch(config-mlag)#heartbeat-interval 2500
  switch(config-mlag)#
  ```

Reload Delay Period

The reload delay period specifies the interval that non-peer links are disabled after an MLAG peer reboots. This interval allows non-peer links to learn multicast and OSPF states and synchronize ARP caches before the ports start handling traffic. Each Arista switch defaults to the recommended reload-delay value, which varies by switch platform

- Fixed configuration switches: 300 seconds (five minutes)
- Trident II platform modular switches: 1200 seconds (twenty minutes)
- Sand platform fixed configuration switches (7280 series): 600 seconds (ten minutes)
- Sand platform modular switches: 1800 seconds (thirty minutes)

In those cases where network topology requires additional time to stabilize or where a shorter delay can be tolerated, the reload-delay period can be configured using the `reload-delay mlag` command.

Example

- This command configures the reload delay interval as 2.5 minutes (150 seconds).
  
  ```
  switch(config-mlag)#reload-delay 150
  switch(config-mlag)#
  ```
### Shutdown

The **shutdown (MLAG)** command disables MLAG operations without disrupting the MLAG configuration. The **no mlag configuration** command (global configuration mode) disables MLAG and removes the MLAG configuration. The **no shutdown** command resumes MLAG activity.

#### Examples

- This command disables MLAG activity on the switch.
  
  ```
  switch(config-mlag)##shutdown
  switch(config-mlag)##
  ```

- This command resumes MLAG activity on the switch.
  
  ```
  switch(config-mlag)##no shutdown
  switch(config-mlag)##
  ```

### 13.4.1.3 Configuring MLAG Peer Gateway

In an MLAG setup, routing on a MLAG peer switch is possible using its own bridge system MAC, VARP MAC, or VRRP MAC. On a peer receiving an IP packet with destination MAC set to one of these MACs, a packet gets routed if its hardware has enough information to route the packet. Configuring sending traffic to a cached MAC involves routing the session table and MLAG peer traffic if packets are received with the MAC peer.

#### Examples

- This command enables the MLAG peer gateway.
  
  ```
  switch(config)#ip virtual-router mac-address mlag-peer
  switch1(config)#
  ```

- This command disables the MLAG peer gateway.
  
  ```
  switch(config)#no ip virtual-router mac-address mlag-peer
  switch1(config)#
  ```
13.4.1.4 Configuring Ingress Replication to LAGs

Hardware support for ingress replication to LAGs is enabled by default when the user configures ingress replication. When multicast traffic is sent over the LAG, the hardware uses its built-in algorithm, based on the L2/L3/L4 headers, to load balance traffic over ports in the LAG. When a port goes down in a LAG, the hardware quickly hashes the multicast traffic over the remaining ports in the LAG, resulting in fewer drops than software based LAG support.

**Examples**

- This command enables ingress replication.
  ```
  switch(config)#platform sand multicast replication default ingress
  switch(config)#
  ```

- This command configures the maximum members (within a range of 1 through 64) for ingress only replication in a multicast group.
  ```
  switch(config)#platform sand multicast replication ingress maximum 32
  switch(config)#
  ```

13.4.2 Configuring MLAG Services

An MLAG is a pair of links that originate on a network attached device and terminate on the two MLAG peer switches. The MLAG switches coordinate traffic to the device through a common `mlag (port-channel interface configuration)` command on the interfaces that connect to the device.

The MLAG ID differs from the MLAG domain ID. The MLAG domain ID is assigned globally per switch in MLAG configuration mode, and the same MLAG domain ID must be on both switches.

It is not recommended that MLAGs are used with static LAGs. Configure the downstream switch or router connected to the MLAG peers to negotiate a LAG with LACP. For Arista Networks switches, this is in respect to a configuration such as `channel-group group-number mode on`.

Port channels configured as an MLAG must have identical port channel numbers. Although the MLAG ID is a distinct parameter from the port channel number, best practices recommend assigning the MLAG ID to match the port channel number.

The following example does not follow this convention to emphasize the parameters that are distinct. The example in Section 13.5 follows the best practices convention.

**Examples**

- These Switch1 commands bundle Ethernet interfaces 3 and 4 in port channel 20, then associate that port channel with MLAG 12.
  ```
  switch1(config)#interface ethernet 3-4
  switch1(config-if-et3-4)#channel-group 20 mode active
  switch1(config-if-et3-4)#interface port-channel 20
  switch1(config-if-po20)#mlag 12
  switch1(config-if-po20)#exit
  switch1(config)#
  ```

- These Switch2 commands bundle Ethernet interfaces 9 and 10 in port channel 20, then associate that port channel with MLAG 12.
  ```
  switch2(config)#interface ethernet 9-10
  switch2(config-if-et9-10)#channel-group 20 mode active
  switch2(config-if-et9-10)#interface port-channel 20
  switch2(config-if-po20)#mlag 12
  switch2(config-if-po20)#exit
  switch2(config)#
  ```
These commands configure the port channels that attach to the MLAG on network attached device:

```
NAD(config)#interface ethernet 1-4
NAD(config-if-Et1-4)#channel-group 1 mode active
NAD(config-if-Et1-4)#exit
NAD(config)#
```

Figure 13-2 displays the result of the interface MLAG configuration.

Figure 13-2: MLAG Interface Configuration
### 13.5 MLAG Implementation Example

This example creates an MLAG Domain, then configures MLAG connections between the peer switches and four Network Attached Devices (NADs). The MLAG switches connect through a LAG and communicate with the NADs through MLAGs. Although the NADs can be any device that supports LACP LAGs, the devices in this example are Arista switches.

#### 13.5.1 Topology

Figure 13-3 displays the MLAG topology. Switch 1 and Switch 2 are MLAG peers that logically represent a single Layer 2 switch. The peer link between the switches contains the following interfaces:

- **Switch 1**: Ethernet 47, Ethernet 48  
- **Switch 2**: Ethernet 23, Ethernet 24

The example configures MLAGs from the MLAG Domain to four network attached devices (NAD-1, NAD-2, NAD-3, NAD-4).

#### 13.5.2 Configuring the Peer Switch Connections

To configure the switches in the described topology, perform the tasks in these sections:

- **Section 13.5.2.1: Configuring the Peer Switch Port Channels**
- **Section 13.5.2.2: Configuring the Peer Switch SVIs**
- **Section 13.5.2.3: Configuring the Peer Links**

#### 13.5.2.1 Configuring the Peer Switch Port Channels

These commands create the port channels the switches use to establish the peer link.
These commands create port channels on Switch1

```bash
switch1(config)#interface ethernet 47-48
switch1(config-if-et47-48)#channel-group 101 mode active
switch1(config-if-et47-48)#interface port-channel 101
switch1(config-if-po101)#switchport mode trunk
switch1(config-if-po101)#switchport trunk group peertrunk
switch1(config-if-po101)#exit
switch1(config)#
```

These commands create port channels on Switch2

```bash
switch2(config)#interface ethernet 23-24
switch2(config-if-et23-24)#channel-group 201 mode active
switch2(config-if-et23-24)#interface port-channel 201
switch2(config-if-po201)#switchport mode trunk
switch2(config-if-po201)#switchport trunk group trunkpeer
switch2(config-if-po201)#exit
switch2(config)#
```

13.5.2.2 Configuring the Peer Switch SVIs

For each peer switch, these commands create an SVI and associate it to the trunk group assigned to the peer link port channel. STP is disabled on the VLAN.

These commands configure the SVI on Switch1

```bash
switch1(config)#vlan 4094
switch1(config-vlan-4094)#trunk group peertrunk
switch1(config-vlan-4094)#interface vlan 4094
switch1(config-if-vl4094)#ip address 172.17.0.1/30
switch1(config-if-vl4094)#no autostate
switch1(config-if-vl4094)#exit
switch1(config)#no spanning-tree vlan-id 4094
switch1(config)#
```

These commands configure the SVI on Switch2

```bash
switch2(config)#vlan 4094
switch2(config-vlan-4094)#trunk group trunkpeer
switch2(config-vlan-4094)#interface vlan 4094
switch2(config-if-vl4094)#ip address 172.17.0.2/30
switch2(config-if-vl4094)#no autostate
switch2(config-if-vl4094)#exit
switch2(config)#no spanning-tree vlan-id 4094
switch2(config)#
```

13.5.2.3 Configuring the Peer Links

These commands create the peer links on each MLAG switch.
Chapter 13: Multi-Chassis Link Aggregation MLAG Implementation Example

These commands create peer links on Switch1

switch1(config)#mlag configuration
switch1(config-mlag)#local-interface vlan 4094
switch1(config-mlag)#peer-address 172.17.0.2
switch1(config-mlag)#peer-link port-channel 101
switch1(config-mlag)#domain-id mlag_01
switch1(config-mlag)#heartbeat-interval 2500
switch1(config-mlag)#reload-delay 150
switch1(config-mlag)#exit

switch2(config)#

These commands create peer links on Switch2

switch2(config)#mlag configuration
switch2(config-mlag)#local-interface vlan 4094
switch2(config-mlag)#peer-address 172.17.0.1
switch2(config-mlag)#peer-link port-channel 201
switch2(config-mlag)#domain-id mlag_01
switch2(config-mlag)#heartbeat-interval 2500
switch2(config-mlag)#reload-delay 150
switch2(config-mlag)#exit
switch2(config)#

13.5.3 Configuring Peer Switch MLAGs

These commands create the MLAGs that connect the MLAG domain to the network attached devices.

These commands configure MLAG 1 on Switch1

switch1(config)#interface ethernet 17-18
switch1(config-if-et17-18)#channel-group 1 mode active
switch1(config-if-et17-18)#interface port-channel 1
switch1(config-if-po1)#mlag 1
switch1(config-if-po1)#

These commands configure MLAG 1 on Switch2

switch2(config)#interface ethernet 1-2
switch2(config-if-et1-2)#channel-group 1 mode active
switch2(config-if-et1-2)#interface port-channel 1
switch2(config-if-po1)#mlag 1
switch2(config-if-po1)#

These commands configure MLAG 2 on Switch1

switch1(config)#interface ethernet 19-20
switch1(config-if-et19-20)#channel-group 2 mode active
switch1(config-if-et19-20)#interface port-channel 2
switch1(config-if-po2)#mlag 2
switch1(config-if-po2)#

switch1(config)#
These commands configure MLAG 2 on Switch2

```
switch2(config)#interface ethernet 3-4
switch2(config-if-et3-4)#channel-group 2 mode active
switch2(config-if-et3-4)#interface port-channel 2
switch2(config-if-po2)#mlag 2
switch2(config-if-po2)#exit
switch2(config)#
```

These commands configure MLAG 3 on Switch1

```
switch1(config)#interface ethernet 23
switch1(config-if-et23)#channel-group 3 mode active
switch1(config-if-et23)#interface port-channel 3
switch1(config-if-po3)#mlag 3
switch1(config-if-po3)#exit
switch1(config)#
```

These commands configure MLAG 3 on Switch2

```
switch2(config)#interface ethernet 7
switch2(config-if-et7)#channel-group 3 mode active
switch2(config-if-et7)#interface port-channel 3
switch2(config-if-po3)#mlag 3
switch2(config-if-po3)#exit
switch2(config)#
```

These commands configure MLAG 4 on Switch1

```
switch1(config)#interface ethernet 25
switch1(config-if-et25)#channel-group 4 mode active
switch1(config-if-et25)#interface port-channel 4
switch1(config-if-po4)#mlag 4
switch1(config-if-po4)#exit
switch1(config)#
```

These commands configure MLAG 4 on Switch2

```
switch2(config)#interface ethernet 9
switch2(config-if-et9)#channel-group 4 mode active
switch2(config-if-et9)#interface port-channel 4
switch2(config-if-po4)#mlag 4
switch2(config-if-po4)#exit
switch2(config)#
```

13.5.4 Configuring the Network Attached Devices

These commands create the LAGs on the Network Attached Devices that connect to the MLAG domain.

These commands configure the port channels on NAD-1

```
NAD-1(config)#interface ethernet 7-10
NAD-1(config-if-Et7-10)#channel-group 1 mode active
NAD-1(config-if-Et7-10)#exit
NAD-1(config)#
```
These commands configure the port channels on NAD-2

NAD-2(config)#interface ethernet 25-28
NAD-2(config-if-Et25-28)#channel-group 7 mode active
NAD-2(config-if-Et25-28)#exit
NAD-2(config)#

These commands configure the port channels on NAD-3

NAD-3(config)#interface ethernet 3-4
NAD-3(config-if-Et3-4)#channel-group 5 mode active
NAD-3(config-if-Et3-4)#exit
NAD-3(config)#

These commands configure the port channels on NAD-4

NAD-4(config)#interface ethernet 1-2
NAD-4(config-if-Et1-2)#channel-group 2 mode active
NAD-4(config-if-Et1-2)#exit
NAD-4(config)#
13.5.5 Verification

The following tasks verify the MLAG peer and connection configuration:

- Section 13.5.5.1: Verify the Peer Switch Connection
- Section 13.5.5.2: Verify the MLAGs
- Section 13.5.5.3: Verify Spanning Tree Protocol (STP)
- Section 13.5.5.4: Verify the MLAG Port Channel
- Section 13.5.5.5: Verify the VLAN Membership

13.5.5.1 Verify the Peer Switch Connection

To display the MLAG configuration and the MLAG status on Switch 1, use the `show mlag` command:

```
Switch1# show mlag
MLAG Configuration:
domain-id : mlag_01
local-interface : Vlan4094
peer-address : 172.17.0.2
peer-link : Port-Channel101

MLAG Status:
state : Active
peer-link status : Up
local-int status : Up
system-id : 02:1c:FF:00:15:38

MLAG Ports:
Disabled : 0
Configured : 0
Inactive : 0
Active-partial : 0
Active-full : 4
```

To display the MLAG configuration and the MLAG status on Switch 2, use the `show mlag` command:

```
Switch2# show mlag
MLAG Configuration:
domain-id : mlag_01
local-interface : Vlan4094
peer-address : 172.17.0.1
peer-link : Port-Channel1102

MLAG Status:
state : Active
peer-link status : Up
local-int status : Up
system-id : 02:1c:FF:00:15:41

MLAG Ports:
Disabled : 0
Configured : 0
Inactive : 0
Active-partial : 0
Active-full : 4
```
13.5.5.2 Verify the MLAGs

The `show mlag interfaces` command displays MLAG connections between the MLAG switches and the Network Attached Devices.

- This `show mlag interfaces` command displays MLAG connections between the MLAG peer Switch 1 and the network attached devices:

```
Switch1# show mlag interfaces
mlag desc state local remote status
----------------------------------------------------------------------------
1 sw1.po1 active-full Po1 Po1 up/up
2 sw1.po2 active-full Po2 Po2 up/up
3 sw1.po3 active-full Po3 Po3 up/up
4 sw1.po4 active-full Po4 Po4 up/up
```

- The following `show mlag interfaces` command, with the `detail` option, displays MLAG connections between the MLAG peer Switch 1 and the network attached devices:

```
Switch2# show mlag interfaces detail
mlag state local remote oper config last change changes
----------------------------------------------------------------------------
1 active-full Po1 Po1 up/up ena/ena 6 days, 2:08:28 ago 5
2 active-full Po2 Po2 up/up ena/ena 6 days, 2:08:30 ago 5
3 active-full Po3 Po3 up/up ena/ena 6 days, 2:08:33 ago 5
4 active-full Po4 Po4 up/up ena/ena 6 days, 2:08:41 ago 5
```

13.5.5.3 Verify Spanning Tree Protocol (STP)

STP functions can be displayed from each peer switch. MLAG interfaces are displayed as a single entry. Configured interfaces on each switch that are not included in an MLAG are displayed. Local interfaces have the normal notation; remote interfaces are preceded by `P` or `Peer`.

**VLAN Output 1: Assume VLAN 3903 includes MLAG 1**

```
Switch1# show spanning-tree vlan 3903
Spanning tree instance for vlan 3903
VL3903
  Spanning tree enabled protocol rapid-pvst
  Root ID  Priority  36671
  Address  001c.730c.3009
  Cost     1999 (Ext)  0 (Int)
  Port     105 (Port-Channel5)
  Hello Time 2.000 sec Max Age 20 sec Forward Delay 15 sec
  Bridge ID Priority  36671 (priority 32768 sys-id-ext 3903)
  Address  021c.7300.1319
  Hello Time 2.000 sec Max Age 20 sec Forward Delay 15 sec

Interface Role State Cost Prio.Nbr Type
----------------- ---------- ------- ---------- ------------------
Po1 root forwarding 1999 128.105 P2p
```

The output displays MLAG 1 under its local interface name (Po1). A peer interface is not displayed because spanning tree considers the local and remote Port Channels as a single MLAG interface.
VLAN Output 2: Assume VLAN 3908 does not include any MLAGs

Switch1# show spanning-tree vlan 3908
Spanning tree instance for vlan 3908 VL3908
Spanning tree enabled protocol rapid-pvst
Root ID Priority 36676
Address 021c.7300.1319
This bridge is the root

Bridge ID Priority 36676 (priority 32768 sys-id-ext 3908)
Address 021c.7300.1319
Hello Time 2.000 sec Max Age 20 sec Forward Delay 15 sec

<table>
<thead>
<tr>
<th>Interface</th>
<th>Role</th>
<th>State</th>
<th>Cost</th>
<th>Prio.Nbr</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Et17</td>
<td>designated</td>
<td>forwarding</td>
<td>2000</td>
<td>128.217</td>
<td>P2p</td>
</tr>
<tr>
<td>Et18</td>
<td>designated</td>
<td>forwarding</td>
<td>2000</td>
<td>128.218</td>
<td>P2p</td>
</tr>
<tr>
<td>PEt17</td>
<td>designated</td>
<td>forwarding</td>
<td>2000</td>
<td>128.17</td>
<td>P2p</td>
</tr>
<tr>
<td>PEt18</td>
<td>designated</td>
<td>forwarding</td>
<td>2000</td>
<td>128.18</td>
<td>P2p</td>
</tr>
</tbody>
</table>

The output displays all interfaces from both switches. Each interface is explicitly displayed because they are individual units that STP must consider when selecting ports to block.

- Et17 and Et18 are located on the switch where the show spanning-tree command is issued.
- PEt17 and PEt18 are located on the remote switch from where the command was issued

An identical command issued on the peer switch displays similar information.

Verify the MLAG does not create topology loops (show spanning-tree blocked)

Switch1# show spanning-tree blocked

<table>
<thead>
<tr>
<th>Name</th>
<th>Blocked Interfaces List</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Number of blocked ports (segments) in the system: 0

Switch1#

13.5.5.4 Verify the MLAG Port Channel

Issue the command show port-channel for channels 1-4 from Switch 1:

Switch1# show port-channel 1-4
Port Channel Port-Channel1:
Active Ports: Ethernet17 Ethernet18 PeerEthernet1 PeerEthernet2
Port Channel Port-Channel2:
Active Ports: Ethernet19 Ethernet20 Ethernet21 Ethernet22 PeerEthernet3 PeerEthernet4 PeerEthernet5 PeerEthernet6
Port Channel Port-Channel3:
Active Ports: Ethernet23 Ethernet24 PeerEthernet7 PeerEthernet8
Port Channel Port-Channel4:
Active Ports: Ethernet25 Ethernet26 PeerEthernet9 PeerEthernet10
Issue the command `show port-channel load-balance fields detailed` command for channel 1 from Switch 2:

```
Switch# show port-channel 1 detailed
Port Channel Port-Channel1:
   Active Ports:  
       Port     Time became active     Protocol    Mode
        Ethernet17  7/7/11 15:27:36    LACP        Active
        Ethernet18  7/7/11 15:27:36    LACP        Active
        PeerEthernet1 7/7/11 15:27:36    LACP        Active
        PeerEthernet2 7/7/11 15:27:36   LACP        Active
```

13.5.5.5 Verify the VLAN Membership

The `show vlan` command displays VLAN member ports, including MLAG ports and ports on each peer not bundled in an MLAG.

```
Switch1# show vlan 3903, 3908
VLAN Name                  Status    Ports
----- ----------------------- --------- -------------------------------
  3903 ar.mg.rn.172.17.254.16/29 active  Cpu, Po1
  3908 po.ra.ar.mg.172.17.254.64/29 active  Cpu, Et17, Et18, PEt17, PEt18
```
13.6 MLAG Commands

MLAG and Port Channel Commands – Global Configuration Mode
- `mlag configuration (global configuration)`

Interface Configuration Commands – Interface Configuration Mode
- `mlag (port-channel interface configuration)`

MLAG Configuration Commands
- `domain-id`
- `heartbeat-interval (MLAG)`
- `local-interface`
- `peer-address`
- `peer-link`
- `reload-delay mlag`
- `reload-delay mode`
- `reload-delay non-mlag`
- `shutdown (MLAG)`

Display Commands
- `show mlag`
- `show mlag interfaces`
- `show mlag interfaces members`
- `show mlag interfaces states`
- `show mlag issu warnings`
domain-id

The domain-id command specifies a name for the multi-chassis link aggregation (MLAG) domain. The no domain-id and default domain-id commands remove the MLAG domain name by deleting the domain-id statement from running-config.

Command Mode
- MLAG Configuration

Command Syntax
- domain-id identifier
- no domain-id
- default domain-id

Parameters
- identifier alphanumeric string that names the MLAG domain.

Examples
- This command names the MLAG domain mlag1.
  
    switch(config)#mlag
    switch(config-mlag)#domain-id mlag1
    switch(config-mlag)#
heartbeat-interval (MLAG)

The heartbeat-interval command configures the interval at which heartbeat messages are issued in a multi-chassis link aggregation (MLAG) configuration.

The no heartbeat-interval and default heartbeat-interval commands revert the heartbeat interval to the default setting by removing the heartbeat-interval command from running-config.

Command Mode
MLAG Configuration

Command Syntax

```
 heartbeat-interval  period
 no heartbeat-interval
 default heartbeat-interval
```

Parameters

- **period** Interval duration (ms). Value ranges from 1000 through 30000 milliseconds. Default interval is 2000 milliseconds.

Guidelines

Heartbeat messages flow independently in both directions between the MLAG peers. If a peer stops receiving heartbeat messages within the expected time frame (30 seconds), the other peer can assume it no longer functions and without intervention or repair, the MLAG becomes disabled. Both switches revert to their independent state.

**Important!** On 7500 and 7500E Series Switches, Arista recommends setting the heartbeat interval to 10 seconds.

Examples

- This command configures the heartbeat interval to 15000 milliseconds:

```
 switch(config)#mlag
 switch(config-mlag)#heartbeat-interval 15000
 switch(config-mlag)#
```
local-interface

The local-interface command assigns a VLAN interface for use in multi-chassis link aggregation (MLAG) configurations. The VLAN interface is used for both directions of communication between the MLAG peers.

The no local-interface and default local-interface commands delete the VLAN interface assignment by removing the local-interface command from running-config.

**Command Mode**

MLAG Configuration

**Command Syntax**

```
local-interface vlan vlan_number
no local-interface
default local-interface
```

**Parameters**

- `vlan_number` VLAN number, in the range from 1 through 4094.

**Guidelines**

When configuring the local interface, the VLAN interface must exist already. To configure a VLAN interface, issue the command interface vlan.

**Example**

- This command assigns VLAN 4094 as the local interface.

```
switch(config)#mlag
switch(config-mlag)#local-interface vlan 4094
switch(config-mlag)#
```
mlag (port-channel interface configuration)

The `mlag` command assigns an MLAG ID to a port-channel. MLAG peer switches form an MLAG when each switch configures the same MLAG ID to a port-channel interface. Only one MLAG ID can be assigned to an interface. An individual MLAG number cannot be assigned to more than one interface.

The `no mlag` and `default mlag` commands remove the MLAG ID assignment from the configuration mode interface by deleting the corresponding `mlag` command from `running-config`.

**Command Mode**
- Interface-Port Channel Configuration

**Command Syntax**

```
mlag number
no mlag
default mlag
```

**Parameters**
- `number` Number used as MLAG ID. Value ranges from 1 to 2000.

**Example**

- These commands configures a port channel and assigns it MLAG 4.

```
switch(config)#interface ethernet 5-10
switch(config-if-Et5-10)#channel-group 1 mode active
switch(config-if-Et5-10)#interface port-channel 4
switch(config-if-Po4)#switchport trunk group group4
switch(config-if-Po4)#mlag 4
switch(config-if-Po4)#exit
switch(config)#
```
mlag configuration (global configuration)

The `mlag configuration` command enters MLAG configuration mode to configure multi-chassis link aggregation (MLAG) features. MLAG configuration mode is not a group change mode; `running-config` is changed immediately after commands are executed. The `exit` command does not affect the configuration.

The `no mlag configuration` and `default mlag configuration` commands remove all MLAG configuration commands from `running-config`.

The `exit` command returns the switch to global configuration mode.

Command Mode

- **Global Configuration**

Command Syntax

```plaintext
mlag [configuration]
no mlag configuration
default mlag configuration
```

`mlag` and `mlag configuration` are identical commands.

Guidelines

An MLAG is formed by connecting two switches through an interface called a peer link. The peer link carries control and data traffic between the switches, including advertisements and keepalive messages. This information coordinates the switches. Functioning peers are in the `active` state.

Each peer switch uses IP-level connectivity between their local addresses and the MLAG peer IP address to form and maintain the peer link.

Commands Available in MLAG Configuration Mode

- `domain-id`
- `heartbeat-interval (MLAG)`
- `local-interface`
- `peer-address`
- `peer-link`
- `reload-delay mlag`
- `shutdown (MLAG)`

Example

- These commands enter MLAG configuration mode and configure MLAG parameters:

```
switch(config)#mlag
switch(config-mlag)#local-interface vlan 4094
switch(config-mlag)#peer-address 10.0.0.2
switch(config-mlag)#peer-link port-channel 10
switch(config-mlag)#domain-id mlagDomain
switch(config-mlag)#heartbeat-interval 2500
switch(config-mlag)#reload-delay 2000
switch(config-mlag)#exit
switch(config)#
```
peer-address

The peer-address command specifies the peer IPv4 address for a multi-chassis link aggregation (MLAG) domain. MLAG control traffic, including keepalive messages, is sent to the peer IPv4 address. If the peer IPv4 address is unreachable, then MLAG peering fails and both peer switches revert to their independent state.

The no peer-address and default peer-address commands remove the MLAG peer’s IPv4 address assignment by deleting the peer-address command from running-config.

Command Mode
MLAG Configuration

Command Syntax
peer-address ipv4_addr
no peer-address
default peer-address

Parameters
- ipv4_addr MLAG peer IPv4 address.

Example
- These commands configure the MLAG peer address.
  switch(config)#mlag
  switch(config-mlag)#peer-address 10.0.0.2
  switch(config-mlag)#
peer-link

The **peer-link** command specifies the interface that connects multi-chassis link aggregation (MLAG) peers. To form an MLAG, two switches are connected through an interface called a peer link. The peer link carries control and data traffic between the two switches. Control traffic includes MLAG-related advertisements and keepalive messages. This information keeps the two switches working as one.

The **no peer-link** and **default peer-link** command remove the peer link by deleting the **peer-link** command from **running-config**.

**Command Mode**

MLAG Configuration

**Command Syntax**

```
peer-link INT_NAME
no peer-link
default peer-link
```

**Parameters**

- **INT_NAME** denotes the interface type and number of the interface. Values include:
  - `ethernet e_num` Ethernet interface range specified by `e_num`.
  - `port-channel p_num` Channel group interface range specified by `p_num`.

**Example**

- These commands creates a peer link.

```
switch(config)#mlag configuration
switch(config-mlag)#peer-link port-channel 10
switch(config-mlag)
```
**reload-delay mlag**

The `reload-delay mlag` command configures the reload delay period for MLAG links. The command also specifies the reload delay period for non-MLAG links when the `reload-delay non-mlag` command is not configured.

Each Arista switch defaults to the recommended reload-delay value, which varies by switch platform:

- **Fixed configuration switches**: 300 seconds
- **Trident II modular switches**: 1200 seconds
  - 7304
  - 7308
  - 7316
  - 7300X series
- **Sand platform fixed configuration switches**: 600 seconds
  - 7280 series
- **Sand platform modular switches**: 1800 seconds
  - 7504
  - 7508
  - 7500E series
  - 7548S

The `no reload-delay mlag` and `default reload-delay mlag` commands restore the default value by deleting the `reload-delay mlag` statement from `running-config`.

**Command Mode**

MLAG Configuration

**Command Syntax**

```
reload-delay [mlag] PERIOD
no reload-delay [mlag]
default reload-delay [mlag]
```

**Parameters**

- **PERIOD**  
  Period that non-peer links are disabled after an MLAG peer reboots. Options include:
  - `infinity`: link is not enabled after reboot.
  - `<0 to 86400>`: disabled link interval (seconds). Default varies by switch platform as described above.

**Guidelines**

The `reload-delay` and `reload-delay mlag` commands are equivalent.

**Example**

- These commands configure the reload-delay interval to 15 minutes.

  ```
  switch(config)#mlag configuration
  switch(config-mlag)#reload-delay mlag 900
  switch(config-mlag)#
  ```
**reload-delay mode**

The `reload-delay mode` command specifies the state of LACP LAG ports during the MLAG reload delay period. By default, MLAG ports remain in the errdisabled state during reload delay. This command configures MLAG ports to come up to standby mode before the expiration of the reload delay period.

The `no reload-delay mode` and `default reload-delay mode` commands restore the default behavior of MLAG ports by deleting the `reload-delay mode` statement from `running-config`. The default behavior is for the MLAG ports to remain in the errdisabled state until the expiration of the reload delay period.

**Command Mode**

MLAG Configuration

**Command Syntax**

- `reload-delay mode lacp standby`
- `no reload-delay mode`
- `default reload-delay mode`

**Related Commands**

- `reload-delay mlag` configures the MLAG reload delay period.

**Example**

- These commands configure the MLAG port to come up to standby state before the end of the reload delay period.

```bash
switch(config)#mlag configuration
switch(config-mlag)#reload-delay mode lacp standby
switch(config-mlag)#
```
**reload-delay non-mlag**

The `reload-delay non-mlag` command specifies the period that non-MLAG links are disabled after an MLAG peer reboots. This interval allows non peer links to learn multicast and OSPF states before the ports start handling traffic. The recommended minimum value required to ensure the forwarding hardware is initialized with the topology state depends on the switch platform:

- Fixed configuration switches: 300 seconds (five minutes)
- Sand platform fixed configuration switches (7280 series): 600 seconds (ten minutes)
- Modular switches: 1200 seconds (twenty minutes)

When the `reload-delay non-mlag` command is not configured, the `reload-delay mlag` command specifies the reload delay time for non-MLAG and MLAG links.

The `no reload-delay non-mlag` and `default reload-delay non-mlag` command restores the default behavior by deleting the `reload-delay non-mlag` statement from `running-config`.

**Command Mode**

MLAG Configuration

**Command Syntax**

```
reload-delay non-mlag PERIOD
no reload-delay non-mlag
default reload-delay non-mlag
```

**Parameters**

- **PERIOD** Period that non-MLAG links are disabled after an MLAG peer reboots. Options include:
  - `infinity` links are not enabled after reboot.
  - `<0 to 86400>` disabled link interval (seconds). Values range from 0 to 86400 (24 hours).

**Example**

- These commands configure the reload-delay interval of non-MLAG links to 20 minutes.

  ```
  switch(config)#mlag configuration
  switch(config-mlag)#reload-delay non-mlag 1200
  switch(config-mlag)#
  ```
show mlag

The **show mlag** command displays information about the multi-chassis link aggregation (MLAG) configuration on bridged Ethernet interfaces.

**Command Mode**

EXEC

**Command Syntax**

```
show mlag [INFO_LEVEL]
```

**Parameters**

- **INFO_LEVEL** specifies information displayed by command. Options include:
  - `<no parameter>` command displays MLAG configuration, status, and ports.
  - `detail` command displays MLAG configuration, status, ports, and detailed status.

**Example**

- This command displays output from the **show mlag** command:

```
switch>show mlag
MLAG Configuration:
domain-id : ar.mg.mlag
local-interface : Vlan3901
peer-address : 172.17.254.2
peer-link : Port-Channel1

MLAG Status:
state : Active
peer-link status : Up
local-int status : Up
system-id : 02:1c:73:00:13:19

MLAG Ports:
Disabled : 0
Configured : 0
Inactive : 0
Active-partial : 0
Active-full : 5
switch>
```
show mlag interfaces

The `show mlag interfaces` command displays information about the multi-chassis link aggregation (MLAG) configuration on bridged Ethernet interfaces.

**Command Mode**
EXEC

**Command Syntax**
```
show mlag interfaces [MLAGS] [INFO_LEVEL]
```

**Parameters**
- **MLAGS** MLAG channels for which command displays data. Options include:
  - `<no parameter>` command displays data for all MLAGs.
  - `mlag_id` specifies MLAG for which command displays data. Value ranges from 1 to 2000.
- **INFO_LEVEL** specifies information displayed by command. Options include:
  - `<no parameter>` command displays basic MLAG interface parameters
  - `detail` command displays detailed MLAG interface parameters.

**Example**
- This command displays output from the `show mlag interfaces detail` command:
  ```
  switch>show mlag interfaces detail
  local/remote  mlag  state local remote oper config  last change  changes
  ------------  ------  ------  ------  ------  ------  -------------  -----  ----------
  4 active-full Po4 Po4  up/up  ena/ena  6 days, 1:19:26 ago  5
  5 active-full Po5 Po5  up/up  ena/ena  6 days, 1:19:24 ago  5
  6 active-full Po6 Po6  up/up  ena/ena  6 days, 1:19:23 ago  5
  7 active-full Po7 Po7  up/up  ena/ena  6 days, 1:19:23 ago  5
  ```
show mlag interfaces members

The `show mlag interfaces members` command displays information about the multi-chassis link aggregation (MLAG) members on bridged Ethernet interfaces.

**Command Mode**

EXEC

**Command Syntax**

`show mlag interfaces members`

**Example**

- This command displays the MLAG interface members.

```
switch#show mlag interfaces members
Mlag4 is Port-Channel4
  Active Ports: Ethernet3 PeerEthernet3
Mlag5 is Port-Channel5
  Active Ports: Ethernet14
Mlag7 is Port-Channel7
  Active Ports: Ethernet5 PeerEthernet5
Mlag8 is Port-Channel8
  Active Ports: Ethernet10 PeerEthernet10
Mlag9 is Port-Channel9
  Active Ports: Ethernet15 Ethernet21 PeerEthernet19 PeerEthernet20 PeerEthernet22
Mlag10 is Port-Channel10
  Active Ports: Ethernet19 Ethernet20 PeerEthernet21 PeerEthernet22
switch#
```
show mlag interfaces states

The `show mlag interfaces states` command displays information about the multi-chassis link aggregation (MLAG) states on bridged Ethernet interfaces.

**Command Mode**

EXEC

**Command Syntax**

```
show mlag interfaces [MLAGS] states [STATE_NAMES] [INFO_LEVEL]
```

**Parameters**

- **MLAGS** MLAG channels for which command displays data. Options include:
  - `<no parameter>` command displays data for all MLAGs.
  - `mlag_id` specifies MLAG for which command displays data. Value ranges from 1 to 2000.

- **STATE_NAMES** MLAG channels for which command displays data. Parameter may specify more than one name, which can be listed in any order. Valid state names include:
  - `active-full` includes active-full interfaces.
  - `active-partial` includes active-partial interfaces.
  - `configured` includes configured interfaces.
  - `disabled` includes disabled interfaces.
  - `inactive` includes inactive interfaces.

- **INFO_LEVEL** specifies information displayed by command. Options include:
  - `<no parameter>` command displays basic MLAG interface parameters
  - `detail` command displays detailed MLAG interface state parameters.

**Example**

- This command displays the MLAG interface states that are active-full.

```
switch# show mlag interfaces states active-full

  mlag  desc                  state       local  remote       local/remote
       ----  ------------------ --------- ------- ---------------
        4   b.po1                active-full Po4    Po4           up/up
        7   ar.mg.au.po1         active-full Po7    Po7           up/up
        8   co.po1               active-full Po8    Po8           up/up
        9   k.po5                active-full Po9    Po9           up/up
       10   ar.mg.pt.ir.po10     active-full Po10   Po10          up/up

switch#
```
show mlag issu warnings

The `show mlag issu warnings` command displays a warning message regarding the backward-compatibility of this feature before you upgrade.

Command Mode

EXEC

Command Syntax

- `show mlag issu warnings`

Example

- This command displays the MLAG backward-compatibility warning message. Refer to the latest version of the release notes for additional information before you upgrade.

```
switch##show mlag issu warnings
```

If you are performing an upgrade, and the Release Notes for the new version of EOS indicate that MLAG is not backwards-compatible with the currently installed version, the upgrade will result in packet loss.

```
Stp is not restartable. Topology changes will occur during the upgrade process.
```

switch#
**shutdown (MLAG)**

The `shutdown` command disables MLAG on the switch without modifying the MLAG configuration.

The `no shutdown` and `default shutdown` commands re-enable MLAG by removing the `shutdown` command from `running-config`.

**Command Mode**
- MLAG Configuration

**Command Syntax**
- `shutdown`
- `no shutdown`
- `default shutdown`

**Example**
- These commands disable MLAG on the switch.

```
switch(config)#mlag configuration
switch(config-mlag)#shutdown
switch(config-mlag)#
```
802.1X Port Security

This section explains the basic concepts behind 802.1X port security, including switch roles, how the switches communicate, and the procedure used for authenticating clients.

- Section 14.1: 802.1X Port Security Introduction
- Section 14.2: 802.1X Port Security Description
- Section 14.3: Configuring 802.1X Port Security
- Section 14.4: Displaying 802.1X Information
- Section 14.5: 802.1X Configuration Commands

14.1 802.1X Port Security Introduction

802.1X is an IEEE standard protocol that prevents unauthorized devices from gaining access to the network.

802.1X defines three device roles,

- Supplicant (client),
- Authenticator (switch)
- Authentication server (RADIUS)

Before authentication can succeed, switchport is in unauthorized mode and blocks all traffic but, after authentication has succeeded, normal data can then flow through the switchport.

Port security control who can send or receive traffic from an individual switch port. An end node is not allowed to send or receive traffic through a port until the node is authenticated by a RADIUS server.

This prevents unauthorized individuals from connecting to a switch port to access your network. Only designated valid users on a RADIUS server will be allowed to use the switch to access the network.
14.2 **802.1X Port Security Description**

802.1X port security controls can send traffic through and receive traffic from the individual switch ports. A supplicant must authenticate itself using EAPoL packets with the switch before it can gain full access to the port. Arista switches act as an authenticator, passing the messages from 802.1X supplicants through to the RADIUS server and vice versa. 802.1X can operate in two different modes:

**Single Host Mode:** Once the 802.1X supplicant is authenticated on the port, only the traffic coming from the supplicant's MAC is allowed through the port.

**Multi-Host Mode:** Once the 802.1X supplicant is authenticated on the port, traffic coming from any source MAC is allowed through the port.

Both these modes allow only one 802.1X supplicant to be authenticated for one port. Once it is successfully authenticated, no other 802.1X supplicant can be authenticated, unless the current one logs off.

Apart from 802.1X authentication, Arista switches also support MAC-Based Authentication (MBA), which allows devices not speaking 802.1X to have access to the network. The authenticator uses the MAC address of such devices as username/password in its RADIUS request packets. Depending on the MAC-Based Authentication configuration on the RADIUS server, it decides whether to authenticate the supplicant or not. Unlike 802.1X supplicants, multiple MBA supplicants are allowed on a single port. The MBA configuration is independent of the 802.1X host modes. MBA supplicants will not be considered to allow or reject unauthenticated traffic, based on the host mode.

Arista switches also support Dynamic VLAN assignment, which allows the RADIUS server to indicate the desired VLAN for the supplicant, using the tunnel attributes with the Access-Accept message. Both 802.1X and MBA supplicants can be assigned a VLAN via the RADIUS server. Note that only one VLAN per port is supported. When the first host authenticates, the authenticator port is put in the respective VLAN (via dynamic VLAN assignment) and subsequently, all other hosts must belong to that VLAN as well.

802.1X features are now supported on 802.1Q trunk ports allowing the user to have Port-Based Network Access Control (PNAC) on such a port. With this feature, traffic coming into an 802.1X enabled port with a VLAN tag can also be authenticated via both 802.1X or MBA.

By default, traffic from any unauthenticated device on an 802.1X enabled port is dropped. By configuring Authentication Failure VLAN on the authenticator switch, 802.1X or MBA supplicants’ traffic can be put into a specific VLAN, if the supplicant fails to authenticate via the RADIUS server.

---

**Note**

Only one configurable VLAN for failure is supported. That is, failure due to server timeout, server unreachable, server AUTH-FAIL, or Quarantine.

---

14.2.1 **Switch Roles for 802.1X Configurations**

The 802.1X standard specifies the roles of **Supplicant (client)**, **Authenticator**, and **Authentication Server** in a network. Figure 14-1 illustrates these roles.

**Authentication server** – The switch that validates the client and specifies whether or not the client may access services on the switch. The switch supports Authentication Servers running RADIUS.

**Authenticator** – The switch that controls access to the network. In an 802.1X configuration, the switch serves as the Authenticator. As the Authenticator, it moves messages between the client and the Authentication Server. The Authenticator either grants or does not grant network access to the client based on the identity data provided by the client, and the authentication data provided by the Authentication Server.
Supplicant/Client – The client provides a username or password data to the Authenticator. The Authenticator sends this data to the Authentication Server. Based on the supplicant’s information, the Authentication Server determines whether the supplicant can use services given by the Authenticator. The Authentication Server gives this data to the Authenticator, which then provides services to the client, based on the authentication result.

14.2.2 Authentication Process

The authentication that occurs between a supplicant, authenticator, and authentication server include the following processes.

- Either the authenticator (a switch port) or the supplicant starts an authentication message exchange. The switch starts an exchange when it detects a change in the status of a port, or if it gets a packet on the port with a source MAC address that is not included in the MAC address table.
- An authenticator starts the negotiation by sending an EAP-Request/Identity packet. A supplicant starts the negotiation with an EAPOL-Start packet, to which the authenticator answers with an EAP-Request/Identity packet.
- The supplicant answers with an EAP-Response/Identity packet to the authentication server via the authenticator.
- The authentication server responds with an EAP-Request packet to the supplicant via the authenticator.
- The supplicant responds with an EAP-Response.
- The authentication server transmits either an EAP-Success packet or EAP-Reject packet to the supplicant.
- If an EAP-Reject is received, the supplicant will receive an EAP-Reject message and their traffic will not be forwarded.
14.2.3 Communication Between the Switches

For communication between the switches, 802.1X port security uses the Extensible Authentication Protocol (EAP), defined in RFC 2284 and the RADIUS authentication protocol.

The 802.1X standard defines a method for encapsulating EAP messages so they can be sent over a LAN. This encapsulated kind of EAP is known as EAP over LAN (EAPOL). The standard also specifies a means of transferring the EAPOL information between the client or Supplicant, Authenticator, and Authentication Server.

EAPOL messages are passed between the Supplicant’s and Authenticator’s Port Access Entity (PAE). Figure 14-2 shows the relationship between the Authenticator PAE and the Supplicant PAE.

![Diagram of Authenticator PAE and Supplicant PAE]

**Authenticator PAE**: The Authenticator PAE communicates with the Supplicant PAE to receive the Supplicant’s identifying information. Behaving as a RADIUS client, the Authenticator PAE passes the Supplicant’s information to the Authentication Server, which decides whether to grant the Supplicant access. If the Supplicant passes authentication, the Authenticator PAE allows it access to the port.

**Supplicant PAE** – The Supplicant PAE provides information about the client to the Authenticator PAE and replies to requests from the Authenticator PAE. The Supplicant PAE may initiate the authentication procedure with the Authenticator PAE, as well as send logoff messages.

14.2.4 Enable 802.1X Port Control

To enable 802.1X port authentication on the switch, global command configuration is required:

```
switch (config)#dot1x system-auth-control
```
Port mode can be set to access/trunk port and 802.1X port access entity is set to authenticator:

```
switch(config-if-Et1)#switchport mode access
switch(config-if-Et1)#dot1x pae authenticator
```

14.2.5 Controlled and Uncontrolled Ports

A physical port on the switch used with 802.1X has two virtual access points that include a controlled port and an uncontrolled port. The controlled port grants full access to the network. The uncontrolled port only gives access for EAPOL traffic between the client and the Authentication Server. When a client is authenticated successfully, the controlled port is opened to the client.

**Figure 14-3: Ports before and after client authentication**

14.2.5.1 Control Port State

Before the port is authenticated, the port is in an unauthorized state. In this state, only EAPOL packets are processed by 802.1X agent and all other packets are dropped. After the port is successfully authenticated, the port is in the authorized state and all packets are allowed to pass. The state transition is controlled by authentication exchange between supplicant and authentication server. However, the user can control the state by using any one of the following commands:

```
switch(config-if-Et1)#dot1x port-control force-authorized
switch(config-if-Et1)#dot1x port-control force-unauthorized
switch(config-if-Et1)#dot1x port-control auto
```

- **force-authorized** disables 802.1X authentication and directly puts the port to the authorized state. This is the default setting.

- **force-unauthorized** also disables 802.1X authentication and directly puts the port to unauthorized state, ignoring all attempts by the client to authenticate.

- **auto** enables 802.1X authentication and puts the port to unauthorized state first. The port state remains in an unauthorized state or transit to authorized state according to authentication result and configuration.

14.2.5.2 Uncontrolled Port State

The uncontrolled port on the Authenticator is the only one open before a client is authenticated. The uncontrolled port permits only EAPOL frames to be swapped between the client and the Authentication Server. No traffic is allowed to pass through the controlled port in the unauthorized state.

During authentication, EAPOL messages are swapped between the Supplicant PAE and the Authenticator PAE, and RADIUS messages are swapped between the Authenticator PAE and the Authentication Server. If the client is successfully authenticated, the controlled port becomes authorized, and traffic from the client can flow through the port normally.

All controlled ports on the switch are placed in the authorized state, allowing all traffic, by default. When authentication is initiated, the controlled port on the interface is initially set in the unauthorized state. If a client connected to the port is authenticated successfully, the controlled port is set in the authorized state.

14.2.6 Message Exchange During Authentication

Figure 14-4 illustrates an exchange of messages between an 802.1X-enabled client, a switch operating as Authenticator, and a RADIUS server operating as an Authentication Server.

Arista switches support MD5-challenge TLS and any other EAP-encapsulated authentication types in EAP Request or Response messages. In other words, the switches are transparent to the authentication scheme used.

14.2.7 Authenticating Multiple Clients Connected to the Same Port

Arista switches support 802.1X authentication for ports with more than one client connected to them. Figure 14-5 illustrates a sample configuration where multiple clients are connected to a single 802.1X port. 802.1X authentication may use multi-host mode, or (on selected switches) single-host mode. In both modes, the port authenticates the packets received from any one client, and the packets received from other clients are dropped, until the connected client is authenticated by the RADIUS server.

14.2.7.1 Multi-host Mode

In multi-host mode, once the 802.1X client has been authenticated by the RADIUS server, the port is open to accept all packets from any connected client, and these packets do not require any authentication.

14.2.7.2 Single-host Mode

In single-host mode, once the 802.1X client has been authenticated by the RADIUS server further authentication is not required, but the port accepts packets only from the MAC address of the authenticated client.
14.2.8 802.1X MAC-Based Authentication

The 802.1X MAC-based authentication allows a set of MAC addresses to be programmed into the RADIUS server. These MAC addresses (MAC-based authentication supplicants) do not connect to 802.1X profiles but are still allowed access to the network. The authenticator identifies devices that do not support 802.1X and uses the MAC address of these devices as username and password in its RADIUS request packets.

In a MAC-based authentication, every supplicant trying to gain access to the authenticator port is individually authenticated as opposed to authenticating just one supplicant on a given VLAN or port with 802.1X. The behavior is different for MAC-based authentication supplicants when we have a 802.1.x supplicant authenticated in single host and multi-host 802.1X modes.

To enable Mac-based authentication, use the following command:

```
switch(config-if-Et1/1)#dot1x mac based authentication
```

Note

This command is added to the existing 802.1X configuration on the port, so a typical 802.1X interface configuration with MAC-Based Authentication enabled may look something like this:

```
switch(config-if-Et1/1)#show active
  speed forced 1000full
dot1x pae authenticator
dot1x port-control auto
dot1x mac based authentication
```
Figure 14-5: Multiple clients connected to a 802.1X-enabled port

- RADIUS Server (Authentication Server)
- Arista Switch (Authenticator)
- Hub
- Clients/Supplicants running 802.1X-compliant client software
14.3 Configuring 802.1X Port Security

Basic steps to implementing 802.1X Port-based Network Access Control and RADIUS accounting on the switch:

**Step 1** A RADIUS server is required on one or more of your network servers or management stations. 802.1X is not supported with the TACACS+ authentication protocol.

**Step 2** You must create supplicant accounts on the RADIUS server:
- The account for a supplicant connected to an authenticator port must have a username and password combination when set to the 802.1X authentication mode.
- An account for the supplicant connected to an authenticator port and placed in the MAC address-based authentication mode needs use the MAC address of the node as both the username and password.
- Connected clients to an 802.1X authenticator port will require 802.1X client software.

**Step 3** The RADIUS client must be configured by entering the IP addresses and encryption keys of the authentication servers on your network.

**Step 4** The port access control settings must be configured on the switch. This includes the following:
- Specifying the port roles.
- Configuring 802.1X port parameters.
- Enabling 802.1X Port-based Network Access Control.

**Guidelines**
- Do not set a port that is connected to a RADIUS authentication server to the authenticator role as an authentication server cannot authenticate itself.
- A supplicant connected to an authenticator port set to the 802.1X username and password authentication method must have 802.1X client software.
- To prevent unauthorized individuals from accessing the network through unattended network workstations, end users of 802.1X port-based network access control should always log off when they are finished with a work session.
- The RADIUS client should be configured on the switch before activating port-based access control.

### 14.3.1 Configuring 802.1X Authentication Methods

IEEE 802.1X port security relies on external client-authentication methods, which must be configured for use. The method currently supported on Arista switches is RADIUS authentication. To configure the switch to use a RADIUS server for client authentication, use the `aaa authentication dot1x` command.

**Example**
- This command configures the switch to use RADIUS authentication.
  
```
switch(config)# aaa authentication dot1x default group radius
switch(config)#
```

### 14.3.2 Globally Enable IEEE 802.1X

To enable IEEE 802.1X port authentication globally on the switch, use the `dot1x system-auth-control` command.
14.3.3 Designating Authenticator Ports

To set the port access entity (PAE) type of an Ethernet or management interface to the authenticator, use the `dot1x pae authenticator` command.

**Example**

- These commands configure the PAE type to authenticator on the Ethernet interface 1 to enable IEEE 802.1X on the port.

```bash
switch(config)#interface ethernet 1
switch(config-if-Et1)#dot1x pae authenticator
switch(config-if-Et1)#
```

For ports to act as authenticator ports to connected supplicants, those ports must be designated using the `dot1x port-control` command.

The `auto` option of the `dot1x port-control` command designates an authenticator port for immediate use, blocking all traffic that is not authenticated by the AAA server.

**Example**

- This command configures Ethernet 1 to immediately begin functioning as an authenticator port.

```bash
switch(config)#interface ethernet 1
switch(config-if-Et1)#dot1x port-control auto
switch(config-if-Et1)#
```

The `force-authorized` option of the `dot1x port-control` command sets the state of the port to authorized without authentication, allowing traffic to continue uninterrupted.

**Example**

- These commands designate Ethernet 1 as an authenticator port that will forward packets without authentication.

```bash
switch(config)#interface ethernet 1
switch(config-if-Et1)#dot1x port-control force-authorized
switch(config-if-Et1)#
```

To designate a port as an authenticator but prevent it from authorizing any traffic, use the `force-unauthorized` option of the `dot1x port-control` command.

**Example**

- The `force-unauthorized` option of the `dot1x port-control` command places the specified port in the unauthorized state, which will deny any access requests from users of the ports.

```bash
switch(config)#interface ethernet 1
switch(config-if-Et1)#dot1x port-control force-unauthorized
switch(config-if-Et1)#
```

14.3.4 Specifying the Authentication Mode for Multiple Clients

By default, Arista switches authenticate in multi-host mode, allowing packets from any source MAC address once 802.1X authentication has taken place. To configure the switch for single-host mode (allowing traffic only from the authenticated client’s MAC address), use the `dot1x host-mode` command.
Example

- These commands configure Ethernet interface 1 to use single-host mode for 802.1X authentication.

```
switch(config)#interface Ethernet 1
switch(config-if-Et1)#dot1x host-mode single-host
switch(config-if-Et1)#
```

14.3.5 Configuring Re-authentication

The `dot1x reauthentication` command enables re-authentication of authenticator ports with the default values.

The `dot1x timeout reauth-period` command allows to customize the re-authentication period of authenticator ports.

Example

- These commands configures the configuration mode interface to require re-authentication from clients at regular intervals.

```
switch(config)#interface Ethernet 1
switch(config-if-Eth)#dot1x reauthentication
```

- These commands configure the Ethernet interface 1 authenticator to require re-authentication from clients every 6 hours (21600 seconds).

```
switch(config)#interface Ethernet 1
switch(config-if-Et1)#dot1x reauthentication
switch(config-if-Et1)#dot1x timeout reauth-period 21600
switch(config-if-Et1)#
```

- These commands deactivate re-authentication on Ethernet interface 1.

```
switch(config)#interface Ethernet 1
switch(config-if-Et1)#no dot1x reauthentication
switch(config-if-Et1)#
```

14.3.6 Setting the EAP Request Maximum

The `dot1x reauthorization request limit` command configures the number of times the switch retransmits an 802.1X Extensible Authentication Protocol (EAP) request packet before ending the conversation and restarting authentication.

Example

- These commands set the number of times the authenticator sends an EAP request packet to the client before restarting authentication.

```
switch(config)#interface ethernet 1
switch(config-if-Et1)#dot1x reauthorization request limit 4
switch(config-if-Et1)#
```

The default value is 2.

14.3.7 Disabling Authentication on a Port

To disable authentication on an authenticator port, use the `no dot1x port-control` command.
Example

- These commands disable authentication on Ethernet interface 1.
  
  switch(config)#interface ethernet 1
  switch(config-if-Et1)#no dot1x port-control
  switch(config-if-Et1)#

14.3.8 Setting the Quiet Period

If the switch fails to immediately authenticate the client, the time the switch waits before trying again is specified by the `dot1x timeout quiet-period` command. This timer also indicates how long a client that failed authentication is blocked.

Example

- These commands set the 802.1X quiet period for Ethernet interface 1 to 30 seconds.
  
  switch(config)#interface ethernet 1
  switch(config-if-Et1)#dot1x timeout quiet-period 30
  The default value is 60 seconds.

14.3.9 Setting the Dot1x Timeout Reauth-period

The `dot1x timeout reauth-period` command specifies the time period in seconds that the configuration mode interface waits before requiring re-authentication from clients.

- These commands configure the timeout reauth-period to 21600 seconds.
  
  switch(config)#interface Ethernet 1
  switch(config-if-Et1)#dot1x reauthentication
  switch(config-if-Et1)#dot1x timeout reauth-period 21600
  The default value is 3600 seconds.

14.3.10 Setting the Transmission Timeout

Authentication and re-authentication are accomplished by the authenticator sending an Extensible Authentication Protocol (EAP) request to the supplicant and the supplicant sending a reply which the authenticator forwards to an authentication server. If the authenticator doesn’t receive a reply to the EAP request, it waits a specified period of time before retransmitting. To configure that wait time, use the `dot1x timeout tx-period` command.

Example

- These commands configure Ethernet interface 1 to wait 30 seconds before retransmitting EAP requests to the supplicant.
  
  switch(config)#interface Ethernet 1
  switch(config-if-Et1)#dot1x timeout tx-period 30
  switch(config-if-Et1)#
  The default value is 5 seconds.

14.3.11 Enable Authentication Failure VLAN

Configure Authentication Failure VLAN on a dot1x-enabled port using the following CLI command under the `interface-config` mode. The CLI command to set VLAN10 as authentication failure VLAN is as follows:

  switch(config-if-Et1/1)#dot1x authentication failure action traffic allow vlan 10
When no authentication failure VLAN is configured on a dot1x-enabled port, the default action is to drop any unauthorized traffic on the port. This behavior can also be specified using the following command:

**Example**

```
switch(config-if-Et1/1)#dot1x authentication failure action traffic drop
```

### 14.3.12 Clearing 802.1X Statistics

The **clear dot1x statistics** command resets the 802.1X counters.

**Example**

- This command clears the 802.1X counters on all interfaces.
  
  ```
  switch#clear dot1x statistics all
  switch#
  ```

- This command clears the 802.1X counters on Ethernet interface 1.
  
  ```
  switch#clear dot1x statistics interface ethernet 1
  switch#
  ```

### 14.4 Displaying 802.1X Information

You can display information about 802.1X on the switch and on individual ports.

#### 14.4.1 Displaying Port Security Configuration Information

The **show dot1x** command shows information about the 802.1X configuration on the specified port or ports.

**Example**

- This commands displays IEEE 802.1X configuration information for Ethernet interface 5.
  
  ```
  switch#show dot1x interface ethernet 5
  Dot1X Information for Ethernet5
  --------------------------------------------------------------
  PortControl             : auto
  QuietPeriod             : 60 seconds
  TxPeriod                : 5 seconds
  ReauthPeriod            : 3600 seconds
  MaxReauthReq            : 2
  switch#
  ```

#### 14.4.2 Displaying 802.1X information

Use the **show dot1x all brief** command to display IEEE 802.1X status for all ports.

**Example**

- The following commands display a summary of IEEE 802.1X status.
  
  ```
  switch#show dot1x all brief
  Interface       Client    Status
  ---------------------------------------
  Ethernet5       None       Unauthorized
  switch#
  ```
14.4.3 Displaying 802.1X statistics

Use the `show dot1x statistics` command to display 802.1X statistics for the specified port or ports.

**Example**
- This command displays IEEE 802.1X statistics for Ethernet interface 5.

  ```
  switch#show dot1x interface ethernet 5 statistics
  Dot1X Authenticator Port Statistics for Ethernet5
  --------------------------------------------
  RxStart = 0      RxLogoff = 0    RxRespId = 0
  RxResp = 0       RxInvalid = 0   RxTotal = 0
  TxReqId = 0      TxReq = 0       TxTotal = 0
  RxVersion = 0    LastRxSrcMAC = 0000.0000.0000
  switch#
  ```

14.4.4 Displaying 802.1X supplicant information

Use the `show dot1x hosts` command to display information for all the supplicants.

**Example**
- This command displays 802.1X supplicant information.

  ```
  switch#show dot1x hosts
  Interface: Ethernet1/1
  Supplicant MAC          Auth Method         State                   VLAN Id
  --------------          -----------         -----                   -----
  e2:29:cb:11:2f:4a       EAPOL               SUCCESS                 300
  e2:29:cb:11:2f:4b       MAC-BASED-AUTH      SUCCESS                 300
  ```

14.4.5 Displaying VLANS

Use the `show vlan` command to display if a VLAN has been dynamically assigned to the port.

**Example**

  ```
  switch#show vlan
  VLAN  Name          Status    Ports
  ----- ------------- --------- ----------------------------------
  1     default       active    Et7, Et17, Et18, Et41
  2     VLAN0002      active    Et1/1, Et6, Et19, Et20, Et29
  300*  VLAN0300      active    Et30, Et31, Et32, Et42, Et43, Et44
  ```

* indicates a Dynamic VLAN

14.4.6 Displaying Mac-address Tables

Use the `show mac address-table` command to display the MAC address of the supplicants allowed to pass the traffic through the port.
Example

```bash
switch#show mac address-table
Mac Address Table
---------------------------------------------------------------
Vlan  Mac Address          Type    Ports  Moves   Last Move
----  -----------          ----    -----  -----   ---------
 300   e229.cb11.2f4a    STATIC  Et1/1
 300   e229.cb11.2f4b    STATIC  Et1/1
Total Mac Addresses for this criterion: 2
```

14.4.7 Displaying the Status of the 802.1X Attributes for each Port.

Use the `show dot1x interface interface-id` command to display the status of the 802x1 attributes for each port.

Example

```bash
switch(config-if-Et1/1)#show dot1x interface ethernet1/1
Dot1X Information for Ethernet1
--------------------------------------------
PortControl             : force-authorized
HostMode                : multi-host
QuietPeriod             : 60 seconds
TxPeriod                : 5 seconds
ReauthPeriod            : 0 seconds
MaxReauthReq            : 2
ReauthTimeoutIgnore     : No
AuthFailVlan            : 10
```
14.5  **802.1X Configuration Commands**

**Global Configuration Commands**
- `dot1x system-auth-control`

**Interface Configuration Commands – Ethernet Interface**
- `dot1x host-mode`
- `dot1x mac based authentication`
- `dot1x pae authenticator`
- `dot1x port-control`
- `dot1x reauthentication`
- `dot1x reauthorization request limit`
- `dot1x timeout quiet-period`
- `dot1x timeout reauth-period`
- `dot1x timeout tx-period`

**Privileged EXEC Commands**
- `clear dot1x statistics`
- `show dot1x`
- `show dot1x all brief`
- `show dot1x hosts`
- `show dot1x statistics`
clear dot1x statistics

The clear dot1x statistics command resets the 802.1X counters on the specified interface or all interfaces.

Command Mode
Privileged EXEC

Command Syntax
   clear dot1x statistics INTERFACE_NAME

Parameters
- INTERFACE_NAME Interface type and number. Options include:
  - all Display information for all interfaces.
  - interface ethernet e_num Ethernet interface specified by e_num.
  - interface loopback l_num Loopback interface specified by l_num.
  - interface management m_num Management interface specified by m_num.
  - interface port-channel p_num Port-Channel Interface specified by p_num.
  - interface vlan v_num VLAN interface specified by v_num.

Example
- This command resets the 802.1X counters on all interfaces.
  switch#clear dot1x statistics all
  switch#
**dot1x host-mode**

When multiple clients are connected to an Ethernet interface providing 802.1X authentication, the port can either accept packets from all MAC addresses once the supplicant has been authenticated (multi-host mode), or it can accept only those packets originating from the MAC address of the authenticated client (single-host mode). The *dot1x host-mode* command specifies the host mode for authentication of multiple clients on the configuration mode interface.

The **no dot1x host-mode** and **default dot1x host-mode** commands restore the switch default (multi-host mode) by removing the corresponding *dot1x host-mode* command for the configuration mode interface.

**Command Mode**  
Interface-Ethernet Configuration

**Command Syntax**
- `dot1x host-mode [multi-host | single-host]`
- `no dot1x host-mode`
- `default dot1x host-mode`

**Parameters**
- **multi-host** configures the interface to use multi-host mode (the default)
- **single-host** configures the interface to use single-host mode

**Example**
- These commands configure Ethernet interface 1 to use single-host mode for 802.1X authentication.
  
  ```
  switch(config)#interface ethernet 1
  switch(config-if-Et1)#dot1x host-mode single-host
  switch(config-if-Et1)#
  ```
**dot1x mac based authentication**

The **dot1x mac based authentication** command enables MAC-based authentication on the existing 802.1X authenticator port.

The **no dot1x mac based authentication** and the **default dot1x mac based authentication** commands restore the switch default by disabling the corresponding **dot1x mac based authentication** command for the specific 802.1X authenticator port.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

- `dot1x mac based authentication`
- `no dot1x mac based authentication`
- `default dot1x mac based authentication`

**Related Commands**

- `show dot1x hosts`

**Example**

- These commands configure MAC-based authentication on Ethernet interface 1.

```console
switch(config)#interface ethernet 1
switch(config-if-Et1)#dot1x mac based authentication
switch(config-if-Et1)#
```
**dot1x system-auth-control**

The `dot1x system-auth-control` command enables 802.1X authentication on the switch.

The `no dot1x system-auth-control` and `default dot1x system-auth-control` commands disables 802.1X authentication by removing the `dot1x system-auth-control` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
dot1x system-auth-control
no dot1x system-auth-control
default dot1x system-auth-control
```

**Example**

- This command enables 802.1X authentication on the switch.

  ```
  switch(config)#dot1x system-auth-control
  switch(config)#
  ```

- This command disables 802.1X authentication on the switch.

  ```
  switch(config)#no dot1x system-auth-control
  switch(config)#
  ```
dot1x pae authenticator

The `dot1x pae authenticator` command sets the port access entity (PAE) type of the configuration mode interface to `authenticator`, which enables IEEE 802.1X on the port. IEEE 802.1X is disabled on all ports by default.

The `no dot1x pae authenticator` and `default dot1x pae authenticator` commands restore the switch default by deleting the corresponding `dot1x pae authenticator` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Management Configuration

**Command Syntax**
- `dot1x pae authenticator`
- `no dot1x pae authenticator`
- `default dot1x pae authenticator`

**Example**
- These commands configure Ethernet interface 2 as a port access entity (PAE) authenticator, enabling IEEE 802.1X on the port.
  ```
  switch(config-if-Et1)#interface ethernet 2
  switch(config-if-Et1)#dot1x pae authenticator
  switch(config-if-Et1)#
  ```
- These commands disable IEEE 802.1X authentication on Ethernet interface 2.
  ```
  switch(config-if-Et1)#interface ethernet 2
  switch(config-if-Et1)#no dot1x pae authenticator
  switch(config-if-Et1)#
  ```
**dot1x port-control**

The `dot1x port-control` command configures the configuration mode interface as an authenticator port and specifies whether it will authenticate traffic.

The `no dot1x port-control` and `default dot1x port-control` commands configure the port to pass traffic without authorization by removing the corresponding `dot1x port-control` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Management Configuration

**Command Syntax**

```
dot1x port-control STATE
no dot1x port-control
default dot1x port-control
```

**Parameters**

- `STATE` specifies whether the interface will authenticate traffic. The default value is `force-authorized`. Options include:
  - `auto` configures the port to authenticate traffic using Extensible Authentication Protocol messages.
  - `force-authorized` configures the port to pass traffic without authentication.
  - `force-unauthorized` configures the port to block all traffic regardless of authentication.

**Examples**

- These commands configure Ethernet interface 1 to pass traffic without authentication. This is the default setting.
  ```
  switch(config)#interface Ethernet 1
  switch(config-if-Et1)#dot1x port-control force-authorized
  switch(config-if-Et1)#
  ```

- These commands configure Ethernet interface 1 to block all traffic.
  ```
  switch(config)#interface Ethernet 1
  switch(config-if-Et1)#dot1x port-control force-unauthorized
  switch(config-if-Et1)#
  ```

- These commands configure Ethernet interface 1 to authenticate traffic using EAP messages.
  ```
  switch(config)#interface Ethernet 1
  switch(config-if-Et1)#dot1x port-control auto
  switch(config-if-Et1)#
  ```
dot1x reauthentication

The dot1x reauthentication command configures the configuration mode interface to require re-authentication from clients at regular intervals. The interval is set by the dot1x timeout reauth-period command.

The no dot1x reauthentication and default dot1x reauthentication commands restore the default setting by deleting the corresponding dot1x reauthentication command from running-config.

Command Mode

- Interface-Ethernet Configuration
- Interface-Management Configuration

Command Syntax

dot1x reauthentication
no dot1x reauthentication
default dot1x reauthentication

Example

- These commands configure the Ethernet interface 1 authenticator to require periodic re-authentication from clients.

```
switch(config)#interface Ethernet 1
switch(config-if-Et1)#dot1x reauthentication
switch(config-if-Et1)#
```
**dot1x reauthorization request limit**

The `dot1x reauthorization request limit` command configures how many times the switch retransmits an 802.1X Extensible Authentication Protocol (EAP) request packet before ending the conversation and restarting authentication.

The `no dot1x reauthorization request limit` and `default dot1x reauthorization request limit` commands restore the default value of 2 by deleting the corresponding `dot1x reauthorization request limit` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Management Configuration

**Command Syntax**

```
  dot1x reauthorization request limit attempts
  no dot1x reauthorization request limit
  default dot1x reauthorization request limit
```

**Parameters**

- `attempts` maximum number of attempts. Values range from 1 to 10; default value is 2.

**Examples**

- This command sets the 802.1X EAP-request retransmit limit to 6.
  ```
  switch(config)#interface ethernet 1
  switch(config-if-Et1)#dot1x reauthorization request limit 6
  switch(config-if-Et1)#
  ```

- This command restores the default request repetition value of 2.
  ```
  switch(config)#interface ethernet 1
  switch(config-if-Et1)#no dot1x reauthorization request limit
  switch(config-if-Et1)#
  ```
**dot1x timeout quiet-period**

If the switch fails to immediately authenticate the client, the time the switch waits before trying again is specified by the `dot1x timeout quiet-period` command. This timer also indicates how long a client that failed authentication is blocked.

The `no dot1x timeout quiet-period` and `default dot1x timeout quiet-period` commands restore the default quiet period of 60 seconds by removing the corresponding `dot1x timeout quiet-period` command from *running-config*.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Management Configuration

**Command Syntax**
- `dot1x timeout quiet-period` *quiet_time*
- `no dot1x timeout quiet-period`
- `default dot1x timeout quiet-period`

**Parameters**
- `quiet_time` interval in seconds. Values range from 1 to 65535. Default value is 60.

**Example**
- These commands set the 802.1X quiet period for Ethernet interface 1 to 30 seconds.
  - `switch(config)#interface Ethernet 1`
  - `switch(config-if-Et1)#dot1x timeout quiet-period 30`
  - `switch(config-if-Et1)#`
**dot1x timeout reauth-period**

The *dot1x timeout reauth-period* command specifies the time period that the configuration mode interface waits before requiring re-authentication from clients.

The *no dot1x timeout reauth-period* and *default dot1x timeout reauth-period* commands restore the default period of 60 minutes by removing the corresponding *dot1x timeout reauth-period* command from *running-config*.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Management Configuration

**Command Syntax**

```plaintext
  dot1x timeout reauth-period reauth_time
  no dot1x timeout reauth-period
  default dot1x timeout reauth-period
```

**Parameters**

- *reauth_time* the number of seconds the interface passes traffic before requiring re-authentication. Values range from 1 to 65535. Default value is 3600.

**Example**

- These commands configure the Ethernet interface 1 authenticator to require re-authentication from clients every 6 hours (21600 seconds).

  ```plaintext
  switch(config)#interface Ethernet 1
  switch(config-if-Et1)#dot1x reauthentication
  switch(config-if-Et1)#dot1x timeout reauth-period 21600
  switch(config-if-Et1)#
  ```
dot1x timeout tx-period

Authentication and re-authentication are accomplished by the authenticator sending an Extensible Authentication Protocol (EAP) request to the supplicant and the supplicant sending a reply which the authenticator forwards to an authentication server. If the authenticator does not get a reply to the EAP request, it waits a specified period of time before retransmitting. The dot1x timeout tx-period command configures that wait time.

The no dot1x timeout tx-period and default dot1x timeout tx-period commands restore the default wait time by removing the corresponding dot1x timeout tx-period command from running-config.

Command Mode
- Interface-Ethernet Configuration
- Interface-Management Configuration

Command Syntax
- dot1x timeout tx-period tx_time
- no dot1x timeout tx-period
- default dot1x timeout tx-period

Parameters
- tx_time Values range from 1 to 65535. Default value is 5.

Example
- These commands configure Ethernet interface 1 to wait 30 seconds before retransmitting EAP requests to the supplicant.

```
switch(config)#interface Ethernet 1
switch(config-if-Et1)#dot1x timeout tx-period 30
switch(config-if-Et1)#
```
show dot1x

The `show dot1x` command displays 802.1X information for the specified interface.

**Command Mode**
EXEC

**Command Syntax**
```
show dot1x INTERFACE_NAME INFO
```

**Parameters**
- **INTERFACE_NAME**  Interface type and number. Options include:
  - **all**  Display information for all interfaces.
  - **ethernet e_num**  Ethernet interface specified by `e_num`.
  - **loopback l_num**  Loopback interface specified by `l_num`.
  - **management m_num**  Management interface specified by `m_num`.
  - **port-channel p_num**  Port-Channel Interface specified by `p_num`.
  - **vlan v_num**  VLAN interface specified by `v_num`.
- **INFO**  Type of information the command displays. Values include:
  - `<no parameter>`  displays summary of the specified interface.
  - **detail**  displays all 802.1X information for the specified interface.

**Example**
- This command displays 802.1X summary information for Ethernet interface 5.
  ```
  switch#show dot1x interface ethernet 5
  Dot1X Information for Ethernet5
  --------------------------------------------
  PortControl             : auto
  QuietPeriod             : 60 seconds
  TxPeriod                : 5 seconds
  ReauthPeriod            : 3600 seconds
  MaxReauthReq            : 2
  switch#
  ```
- This command displays detailed 802.1X information for Ethernet interface 5.
  ```
  switch#show dot1x interface ethernet 5 detail
  Dot1X Information for Ethernet5
  --------------------------------------------
  PortControl             : auto
  QuietPeriod             : 60 seconds
  TxPeriod                : 5 seconds
  ReauthPeriod            : 3600 seconds
  MaxReauthReq            : 2
  Dot1X Authenticator Client
  Port Status             : Unauthorized
  switch#
  ```
show dot1x all brief

The **show dot1x all brief** command displays the IEEE 802.1X status for all ports.

**Command Mode**

EXEC

**Command Syntax**

```
show dot1x all brief
```

**Example**

- This command displays the IEEE 802.1X status.

```
switch#show dot1x all brief

+-------------+---------+-----------+
<table>
<thead>
<tr>
<th>Interface</th>
<th>Client</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ethernet5</td>
<td>None</td>
<td>Unauthorized</td>
</tr>
</tbody>
</table>

switch#
```
show dot1x hosts

The **show dot1x hosts** command displays 802.1X information for all the supplicants.

**Command Mode**

EXEC

**Command Syntax**

```shell
show dot1x hosts [ethernet]
```

**Parameters**

- `ethernet e_num` Ethernet interface specified by `e_num`.

**Related Commands**

- `dot1x mac based authentication`

**Example**

- This command displays 802.1X information for all the supplicants.

```shell
switch#show dot1x hosts
Interface: Ethernet1/1
Supplicant MAC          Auth Method         State                   VLAN Id
--------------          -----------         -----                   -------
               e2:29:cb:11:2f:4a       MAC-BASED-AUTH      SUCCESS                 300
```
show dot1x statistics

The **show dot1x statistics** command displays 802.1X statistics for the specified port or ports.

**Command Mode**
EXEC

**Command Syntax**
```
show dot1x INTERFACE_NAME statistics
```

**Parameters**
- **INTERFACE_NAME** Interface type and number. Options include:
  - **all** Display information for all interfaces.
  - **ethernet e_num** Ethernet interface specified by e_num.
  - **loopback l_num** Loopback interface specified by l_num.
  - **management m_num** Management interface specified by m_num.
  - **port-channel p_num** Port-Channel Interface specified by p_num.
  - **vlan v_num** VLAN interface specified by v_num.

**Output Fields**
- **RxStart** Number of EAPOL-Start frames received on the port.
- **TxReqId** Number of EAP-Request/Identity frames transmitted on the port.
- **RxVersion** Version number of the last EAPOL frame received on the port.
- **RxLogoff** Number of EAPOL-Logoff frames received on the port.
- **RxInvalid** Number of invalid EAPOL frames received on the port.
- **TxReq** Number of transmitted EAP-Request frames that were not EAP-Request/Identity.
- **LastRxSrcMAC** The source MAC address in the last EAPOL frame received on the port.
- **RxRespId** The number of EAP-Response/Identity frames received on the port.
- **RxTotal** The total number of EAPOL frames transmitted on the port.
- **TxTotal** The total number of EAPOL frames transmitted on the port.

**Example**
- This command displays the 802.1X statistics for ethernet 5

```
switch#show dot1x interface ethernet 5 statistics
Dot1X Authenticator Port Statistics for Ethernet5
-------------------------------------------------
RxStart = 0  RxLogoff = 0  RxRespId = 0
RxStart= 0  RxInvalid = 0  RxTotal = 0
TxReqId = 0  TxReq = 0  TxTotal = 0
RxVersion = 0  LastRxSrcMAC = 0000.0000.0000
switch#
```
Chapter 15

Media Access Control Security

This section explains the basic concepts about Media Access Control Security (MACsec) including overview, configuration, and the different MACsec commands that are used.

- Section 15.1: MACsec Overview
- Section 15.2: Configuring MACsec
- Section 15.3: Displaying MACsec Information
- Section 15.4: MACsec Key Retirement Immediate
- Section 15.5: MACsec EAP-FAST Support
- Section 15.6: MACsec Proxy For VXLAN
- Section 15.7: MACsec Fallback to Unprotected Traffic
- Section 15.8: MACsec Commands
15.1 MACsec Overview

Media Access Control Security (MACsec) is an industry standard encryption mechanism that protects all traffic flowing on the Ethernet links. MACsec is based on IEEE 802.1X and IEEE 802.1AE standards.

The major benefits of MACsec are:

- MACsec supports packet authentication by providing integrity checking so that packet data is not altered during a packet flow.
- MACsec provides secure encryption at Layer 2 level by ensuring complete data confidentiality.
- A high density MACsec solution for Cloud Data Centers is integrated with 7500R for highest density and performance in a modular platform.
- Cost and performance is optimized for Data Center Interconnect to transport massive volumes of traffic through metro or long haul networks.
- Secure transport of data over distance with MACsec encryption eliminating additional intermediate devices.

15.1.1 MACsec Terminology

**MACsec Key Agreement Protocol (MKA)** – It is the key agreement protocol for discovering MACsec peers and negotiating keys between MACsec peers (IEEE 802.1X-REV).

**Connectivity Association Key (CAK)** – Endpoints that share CAK are part of the same secure Connectivity Association (CA). This key can either be a static pre-shared key or dynamically derived when 802.1X authentication is used. CAK is a master key that is used to generate all other keys that are used for MACsec.

**Connectivity Associations (CA)** – CA is a security relationship between MACsec-capable devices. Endpoints that share CAK are part of the same CA. There can be more than two endpoints in a secure CA. Arista implementation is limited to 2 endpoints.

**Primary Key** – It is ideally the CAK for the MKA session in progress.

**Fallback Key** – In case the primary configured key does not establish its connection, the fallback key is used, so as to ensure no loss of traffic.

**Secure Association Key (SAK)** – The SAK is derived from the CAK and is the key used by the network device ports to encrypt traffic for a given session.

**Key Server** – One of the MACsec peers in the CA becomes the Key Server. The main role of the Key Server is to create and distribute Secure Association Keys (SAKs), which are used in actual data encryption.

15.1.2 MACsec Limitations

The limitations of MACsec are:

- MACsec is supported only on point-to-point links.
- When MACsec is enabled on an interface for the first time, interface flapping occurs for MACsec to take effect.
- Until MKA protocol converges and negotiates encryption keys, the port does not forward any traffic. This occurs initially when MACsec is configured on a port.

15.1.3 Supported Devices

MACsec is supported on the following devices:
15.4 MACsec Licensing

MACsec encryption is a EOS licensed feature. A valid MACsec license must be configured on a switch. MACsec licenses are tied to a switch serial number and the licensee. Every switch running MACsec requires a separate license of its own.

Please contact your system engineer to acquire the required license codes before attempting to configure MACsec.

15.5 MACsec in FIPS mode

Federal Information Processing Standards (FIPS) are a set of standards defined by the United States federal government related to the processing of data in computer systems by non-military government agencies and government contractors. These standards define specific requirements for various purposes such as ensuring computer security and interoperability within and across the computer networking industry.

Arista devices are compliant with FIPS 140-2 Level 1. This set of standards govern the processing of data for cryptographic modules. FIPS is enabled using the CLI configuration.
15.2 Configuring MACsec

Basic steps to configuring MACsec on the switch:

**Step 1** Enable MACsec on the switch using the `mac security` command.

```
switch(config)#mac security
```

**Step 2** Configure a valid MACsec license on the switch using the `license` command.

MACsec licenses are tied to a switch. Every switch running MACsec requires a separate license of its own. Contact your system engineer to acquire the required license codes before attempting to configure MACsec.

```
switch(config-mac-security)#license
```

**Step 3** Create a MACsec profile using the `profile` command. Profiles are mandatory for MACsec to be provisioned.

```
switch(config-mac-security)#profile <profile-name>
```

**Step 4** Configure a valid MACsec cipher authentication on the switch using the `cipher` command.

```
switch(config-mac-security-profile-test)#cipher
```

**Step 5** Configure the primary key so that the MACsec profile is made active using the `key` command.

```
switch(config-mac-security-profile-sampleProfile)#key 0abcd1 0 1234abcd
```

Optionally a fallback CAK can also be configured on a profile. This CAK is picked up by MACsec to negotiate keys if the primary CAK fails. A CAK can be configured as a backup key using the `fallback` keyword with the `key` command.

```
switch(config-mac-security-profile-sampleProfile)#key 1234 0 abcd fallback
```

**Step 6** Configure a key server among the MACsec peers. The key server is responsible for generating and distributing encryption keys. The election of the key server can be influenced by configuring a key-server priority into a profile using the following command:

```
switch(config-mac-security-profile-sampleProfile)#mka key-server priority <value>
```

A lower value indicates higher priority. If the MACsec peers have identical priority, the peer with the lower MAC address is elected as the key server. The default key server priority is 16.

**Step 7** Configure the period at which the SAK is refreshed. Since MACsec uses a Session Association Key (SAK) for encrypting data traffic, the SAK is derived from the CAK.

```
switch(config-mac-security-profile-sampleProfile)#mka session rekey-period <period in seconds>
```

The default session rekey-period is 0. The SAK is not refreshed periodically in the absence of the above configuration.

**Step 8** Generate the cryptographic keys to strengthen the random number generator used by MACsec.

```
switch(config-mgmt-security)#entropy source hardware
```
Example

mac security
    license productTest db7cf232
    !
    profile macsec-test
cipher aes256-gcm-xpn
    key 0abc1234 7 06070E234E4D0A48544540585F507E
    key 0def5678 7 09484A0C1C0311475E5A527D7C7C70 fallback
    mka session rekey-period 30
    !

interface Ethernet5/3/1
    mac security profile macsec-test
    !
    management security
    entropy source hardware

15.2.1 Configuring the FIPS mode

To configure the FIPS mode on the MACsec protocol, use the FIPS command.

- This command configures the FIPS mode on the MACsec protocol.

    switch(config)#mac security
    switch(config-mac-security)fips restrictions
15.3 Displaying MACsec Information

The following sections provide information about MACsec on a switch.

15.3.1 Displaying MACsec information

The `show mac security interface` command shows information about the MACsec on the interface.

Example

```
switch#show mac security interface

Interface    SCI                       Controlled Port      Key in Use
Ethernet4/1/1 28:99:3a:82:6f:82::605    True            9d5bc0d3076ea4a08b99b9d9:1
Ethernet4/3/1 28:99:3a:82:6f:85::613    True            9d5bc0d3076ea4a08b99b9d9:1
```

15.3.2 Displaying MACsec detailed information

Use the `show mac security interface detail` command to display detailed information about MACsec.

Example

```
switch#show mac security interface detail

Interface: Ethernet4/1/1
SCI: 28:99:3a:82:6f:82::605
SSCI: 00000002
Controlled port: True
Key server priority: 16
Session rekey period: 0
Traffic: Protected
Key in use: 9d5bc0d3076ea4a08b99b9d9:1
Latest key: None
Old key: 9d5bc0d3076ea4a08b99b9d9:1(RT)

Interface: Ethernet4/3/1
SCI: 28:99:3a:82:6f:85::613
SSCI: 00000001
Controlled port: True
Key server priority: 16
Session rekey period: 0
Traffic: Protected
Key in use: 9d5bc0d3076ea4a08b99b9d9:1
Latest key: None
Old key: 9d5bc0d3076ea4a08b99b9d9:1(RT)
```

In the above output:

- **Interface**: Name of the interface.
- **Secure Channel Identifier (SCI)**: Combination of MAC address and port number. Used to uniquely identify a Mac Security port.
- **Controlled Port**: Indicates if Mac Security is enabled on the port. A value of True indicates that encryption is enabled on the port.
- **Key In Use**: The SAK identifier currently in use. Combination of Key Server’s message identifier (see below) and key number.
- **Key Server priority**: Configured key server priority.
- **Session Rekey Period**: Configured session rekey period.
- **Latest Key**: Latest SAK being negotiated by Mac Security Key Agreement Protocol (MKA)
Chapter 15: Media Access Control Security

Displaying MACsec Information

Old Key: The last SAK negotiated by Mac Security Key Agreement Protocol (MKA)

Note

Latest and Old key are MKA protocol specific terminology and are used to refer to the last two keys in use. For all practical purposes, “Key In Use” field is used to identify the current key.

15.3.3 Displaying MACsec participants

Use the `show mac security participants` command to display information about the MACsec participants.

Example

```
switch#show mac security participants
Interface: Ethernet4/1/1
  CKN: abcd
  Message ID: 9d5bc0d3076ea4a08b99b9d9
  Elected self: True
  Success: True
  Principal: True
  Default: False

  CKN: dead
  Message ID: 4ef4cf009161bd551b5e7434
  Elected self: True
  Success: True
  Principal: False
  Default: True

Interface: Ethernet4/3/1
  CKN: abcd
  Message ID: c79ad8882c2dd3a8e838a691
  Elected self: False
  Success: True
  Principal: True
  Default: False

  CKN: dead
  Message ID: 3dfd4486b5f68a81014a37ec
  Elected self: False
  Success: True
  Principal: False
  Default: True
```

15.3.4 Displaying MACsec participants' detailed information

Use the `show mac security participants detail` command to display detailed information about the MACsec participants.
Example

```
switch#show mac security participants detail
Interface: Ethernet4/1/1
  CKN: abcd
    Message ID: 9d5bc0d3076ea4a08b99b9d9
    Elected self: True
    Success: True
    Principal: True
    Default: False
    KeyServer SCI: 28:99:3a:82:6f:82::605
    SAK transmit: True
    LLPN exhaustion: 0
    Distributed key identifier: 9d5bc0d3076ea4a08b99b9d9:1
    Live peer list: ['c79ad8882c2dd3a8e838a691']
    Potential peer list: []

CKN: dead
    Message ID: 4ef4cf009161bd551b5e7434
    Elected self: True
    Success: True
    Principal: False
    Default: True
    KeyServer SCI: 28:99:3a:82:6f:82::605
    SAK transmit: False
    LLPN exhaustion: 0
    Distributed key identifier: None
    Live peer list: ['3dfd4486b5f68a81014a37ec']
    Potential peer list: []

Interface: Ethernet4/3/1
  CKN: abcd
    Message ID: c79ad8882c2dd3a8e838a691
    Elected self: False
    Success: True
    Principal: True
    Default: False
    KeyServer SCI: 28:99:3a:82:6f:82::605
    SAK transmit: True
    LLPN exhaustion: 0
    Distributed key identifier: 9d5bc0d3076ea4a08b99b9d9:1
    Live peer list: ['9d5bc0d3076ea4a08b99b9d9']
    Potential peer list: []

CKN: dead
    Message ID: 3dfd4486b5f68a81014a37ec
    Elected self: False
    Success: True
    Principal: False
    Default: True
    KeyServer SCI: 28:99:3a:82:6f:82::605
    SAK transmit: False
    LLPN exhaustion: 0
    Distributed key identifier: None
    Live peer list: ['4ef4cf009161bd551b5e7434']
    Potential peer list: []
```

In the above output:

Connectivity Association Key Name (CKN): Configured name of the key in use.
Message ID: A random 92 bit string used as an identifier for an MKA participant.
Elected Self: True if this participant is the elected key server.

Success: True if this participant is live and has at least one live peer.

Principal: True if this participant is the principal participant elected to distribute SAKs or if participant receives SAKs from key server.

Default: True if this participant is a fallback/backup participant (spawned when a fallback key is configured in a Mac Security profile).

Key Server SCI: The SCI of the key server.

SAK Transmit: True if the participant is ready to use the negotiated key for transmit.

LLPN Exhaustion: Increments if the number of data packets sent using the current key exceeds a certain threshold.

Distributed Key Identifier: Message ID + key number of the most recently generated SAK.

Live Peer List: Message IDs of all the live peers of the participant.

Potential Peer List: Message IDs of all the potential peers of the participant. These are peers which haven’t yet established mutual liveness but have sent out at least one control packet.

### 15.3.5 Displaying MACsec MKA Counters

Use the `show mac security mka counters` command to display information about the MACsec MKA counters.

#### Example

```
switch#show mac security mka counters

<table>
<thead>
<tr>
<th>Interface</th>
<th>Rx Success</th>
<th>Rx Failure</th>
<th>Tx Success</th>
<th>Tx Failure</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ethernet4/1/1</td>
<td>287</td>
<td>0</td>
<td>288</td>
<td>0</td>
</tr>
<tr>
<td>Ethernet4/3/1</td>
<td>288</td>
<td>0</td>
<td>287</td>
<td>0</td>
</tr>
</tbody>
</table>
```

### 15.3.6 Displaying MACsec MKA Counters detailed information

Use the `show mac security mka counters detail` command to display detailed information about the MACsec MKA counters.
Example

switch#show mac security mka counters detail
  Interface: Ethernet4/1/1
  Tx packet success: 290
  Tx packet failure: 0
  Tx invalid: 0
  Rx packet success: 289
  Rx packet failure: 0
  Rx invalid: 0
  Rx eapol error: 0
  Rx basic parameter set error: 0
  Rx unrecognized CKN error: 0
  Rx ICV validation error: 0
  Rx live peer list error: 0
  Rx potential peer list error: 0
  Rx SAK use set error: 0
  Rx distributed SAK set error: 0
  Rx distributed CAK set error: 0
  Rx ICV Indicator error: 0
  Rx unrecognized parameter set error: 0

Interface: Ethernet4/3/1
  Tx packet success: 289
  Tx packet failure: 0
  Tx invalid: 0
  Rx packet success: 290
  Rx packet failure: 0
  Rx invalid: 0
  Rx eapol error: 0
  Rx basic parameter set error: 0
  Rx unrecognized CKN error: 0
  Rx ICV validation error: 0
  Rx live peer list error: 0
  Rx potential peer list error: 0
  Rx SAK use set error: 0
  Rx distributed SAK set error: 0
  Rx distributed CAK set error: 0
  Rx ICV Indicator error: 0
  Rx unrecognized parameter set error: 0

15.3.7 Displaying MACsec Security Counters

Use the `show mac security counters` command to display information about the MACsec security counters.

Example

switch#show mac security counters
<table>
<thead>
<tr>
<th>Port</th>
<th>InPacketsDecrypted</th>
<th>InOctetsDecrypted</th>
<th>OutPacketsEncrypted</th>
<th>OutOctetsEncrypted</th>
</tr>
</thead>
<tbody>
<tr>
<td>Et4/1/1</td>
<td>2</td>
<td>214</td>
<td>109</td>
<td>11663</td>
</tr>
<tr>
<td>Et4/3/1</td>
<td>109</td>
<td>11663</td>
<td>2</td>
<td>214</td>
</tr>
</tbody>
</table>

15.3.8 Displaying MACsec Security Counters Detailed Information

Use the `show mac security counters detail` command to display detailed information about the MACsec security counters.
Example

```plaintext
switch#show mac security counters detail
Ethernet4/1/1  Counter Name        Count
-------------------------------------------------------
outPktsEncrypted    112
outOctetsEncrypted  11984
outPktsUntagged    0
outPktsTooLong     0
outPktCtrl         224
inPktsDecrypted    2
inOctetsDecrypted  214
inPktsUnchecked    0
inPktsOK           2
inPktsNotValid     0
inPktsNotUsingSA   0
inPktsCtrl         223
inPktsNoTag         8
inPktsTagged       0
inPktsBadTag       0
inPktsNoSCI        0
inPktsLate         0

Ethernet4/3/1  Counter Name        Count
-------------------------------------------------------
outPktsEncrypted    2
outOctetsEncrypted  214
outPktsUntagged    0
outPktsTooLong     0
outPktCtrl         223
inPktsDecrypted    111
inOctetsDecrypted  11877
inPktsUnchecked    0
inPktsOK           111
inPktsNotValid     0
inPktsNotUsingSA   0
inPktsCtrl         224
inPktsNoTag         9
inPktsTagged       0
inPktsBadTag       0
inPktsNoSCI        0
inPktsLate         0
```

15.3.9 Displaying MACsec FIPS Status

Use the `show mac sec status` command to display information about the MACsec FIPS status.

Example

```plaintext
switch(config)#mac security
switch(config-mac-security)#show mac sec status
Active Profiles:    1
FIPS Mode:           Yes
Secured Interfaces:  2
```
15.4 MACsec Key Retirement Immediate

The MACsec uses the concept of configuring two keys for MKA negotiation: Primary and Fallback (as a backup). Given a mac security profile configured on an interface, there is an actor created per key which is responsible for MKA negotiation with the other peer. When a new primary key is configured, old primary key’s actor is retained in the system till the time MKA session becomes successful with the configured new primary key. Same holds good for fallback key as well. When key retirement immediate command is used it removes the actor corresponding to old key, be it primary or fallback, from the system immediately.

MACsec Key Retirement Immediate Operations

- If a new primary key is configured in a mac security profile, old primary key’s actor is deleted from the system immediately.
- If a new fallback key is configured in a mac security profile, old fallback key’s actor is deleted from the system immediately.
- Removing the feature configuration from mac security profile will just prevent cleaning up of old keys immediately when new keys are configured. It will not create old actor again.

Note

The key retirement immediate command only deletes the actor corresponding to old key. It does not clean up the SAK programmed in the hardware until a new SAK is available to be programmed. However, as a side effect of deletion of actor, a new principal actor will be chosen (if an eligible actor is available) over which a new SAK will be distributed subsequently.

MACsec Key Retirement Immediate Feature Interactions

MACsec EAP-FAST Support

If Dynamic MAC Security keys is used with key retirement immediate, then on every new primary key derived from 802.1X, old primary key’s actor will be deleted from the system. This will usually happen based on the reauth time interval configuration for 802.1X.

MACsec Fallback to Unprotected Traffic Support

The key retirement immediate is configured with “Fallback to Unprotected Traffic” feature, transition between unprotected traffic and protected traffic may become more frequent. This is because with “Key Retirement Immediate” feature, whenever a new key is configured, existing successful MKA session corresponding to the old key are not maintained, which might bring down the number of successful MKA sessions to zero, which eventually moves the interface to unprotected traffic state as per “Fallback to Unprotected Traffic” feature functionality.

15.4.1 MACsec Key Retirement Immediate Configuration

The show dot1x supplicant command is configured in mac security profile mode, the configuration needs to be present on both key server and non key server peers. Since key server decides the principal actor for SAK distribution, it is recommended that this configuration is present in key server for triggering the re-election of principal actor immediately.

If key retirement immediate is configured only on key server, non key server will still try to negotiate MKA over old primary key unnecessarily utilizing some system resources and some time even when not required.

If key retirement immediate is configured only on non key server, it will take 6 seconds (MKA Lifetime) for triggering any re-election on key server as a result of session failure.

switch(config-mac-security-profile-sampleProfile)# [no] key retirement immediate
Configuration Scenarios

**When both Primary Key and Fallback Key configured:** without configuring key retirement immediate, when a new primary is configured, the actor corresponding to the old actor will stay active till MKA session on the new primary becomes successful. With key retirement immediate, the actor corresponding to the old primary is deleted immediately. Since fallback is also configured, key server will choose it as the new principal actor, if eligible. Once a new principal actor is chosen, new SAK is distributed which will eventually get programmed and used for encryption & decryption.

**When only Primary Key is configured:** the behavior is same as above except the fact that no other actor will become principal until the new primary becomes successful. Till then hardware will continue to use SAK generated with old primary.

**When Fallback is Principal actor:** without key retirement immediate, when a new fallback key is configured, old fallback will stay in the system till the time new fallback becomes active or primary becomes active. With key retirement immediate, old fallback actor is deleted immediately. Till the time a new principal actor is elected, hardware will continue to use SAK generated with old fallback.

The `show mac security participants` command shows all the participants present in the system.

When key retirement immediate is configured, the actor corresponding to old keys will no longer list up in the output of the above show command.
15.5 MACsec EAP-FAST Support

The Media Access Control Security (MACsec) with static keys feature brings support for dynamic Mac Security keys. To derive Mac Security keys dynamically, both peers must be configured for 802.1X authentication. One peer must be configured to be the ‘Authenticator’ and the other peer to be the ‘Supplicant’. Upon a successful 802.1X authentication sequence between the peers, keying material is generated by both the authenticator and the supplicant. This keying material is then used to derive Mac Security keys to establish a MACsec Key Agreement (MKA) protocol session. This feature brings in support for Arista devices to act as the supplicant to derive Mac Security keys in a bidirectional fashion.

The following diagram illustrates a typical Mac Security + 802.1X topology:

15.5.1 Platform Compatibility

Mac Security dynamic key derivation is supported on all MACsec capable switches. This includes 7500E-6CFPX-LC, 7500R-8CFPX-LC, 7500RM-36CQ-LC, 7500R2M-36CQ-LC, 7280SRAM-48C6, 7280SRM-40CX2, and 7280CR2M-30.

15.5.2 Configuring MAC Security Dynamic Key Derivation

15.5.2.1 802.1X Authenticator Configuration

A new option is added to 802.1X authenticator configuration to make the authenticator more strong to unreliable authentication servers. By default, when an authentication server is unreachable, the authenticator blocks all traffic on the port and keeps the port as “Unauthorized” until it gets replies from the authentication server. The following option changes the behavior and maintains the port in its current state if the authentication server is not reachable:

Example

```
switch(config-if-Et1)#dot1x timeout reauth-timeout-ignore always
```

15.5.2.2 802.1X Supplicant Configuration

The 802.1X supplicant configurations are done through MACsec profiles. MACsec profile contain all the credentials necessary for 802.1X authentication to succeed.

Following are the steps to configure an 802.1X supplicant profile:

Step 1 Use `dot1x` command to enter the dot1x mode to configure a supplicant profile.

```
switch(config)#dot1x
switch(config-dot1x)#
```

Step 2 Use `supplicant profile` command to configure a 802.1X supplicant profile.

```
switch(config)#supplicant profile <profileName>
```
Chapter 15: Media Access Control Security

MACsec EAP-FAST Support

The following mandatory commands must be configured for a supplicant profile to be operational:

a) An Extensible Authentication Protocol (EAP) method must be configured for the profile. The only method supported by Arista supplicants is EAP-FAST.

```
switch(config-dot1x-supp-profile-test)#eap-method fast
```

b) Configure EAP Identity which is used to authenticate the supplicant with the Radius server:

```
switch(config-dot1x-supp-profile-test)#identity <user-identity>
```

c) Configure EAP pass-phrase the password used to authenticate the supplicant with the Radius server:

```
switch(config-dot1x-supp-profile-test)#passphrase <options>
```

Example

- This is a sample 802.1X supplicant profile:

```
switch(config-dot1x-supp-profile-test)#show active
dot1x
  supplicant profile test
    identity arista
    passphrase 7 070E334D5D1D0B04
```

Note

The pass-phrase is never displayed in clear text.

Step 3  Apply the supplicant profile by enabling it on the Mac Security interface:

```
switch(config-if-Et6/1)#dot1x pae supplicant test
```

Mac Security

Mac Security configuration remains the same as described in the configuration guide with a single important difference. Instead of configuring manual keys, a Mac security profile must instead be configured to use dynamic keys:

```
switch(config-mac-security-profile-test)#key source dot1x
```

Note

A static fallback key can be configured in conjunction with a dynamic primary key. However, if 802.1X puts the port in unauthorized state, fallback key will not become active and traffic will be impacted.

15.5.3  Displaying 802.1X Supplicant Status

- The `show dot1x supplicant` command displays the 802.1X supplicant status.

```
switch#show dot1x supplicant

Interface: Ethernet6/1
  Identity: arastra
  EAP method: fast
  Status: success
  Supplicant MAC: 44:4c:a8:34:bf:20
  Authenticator MAC: 00:1c:73:e0:d3:76
```

About the Output

- **Interface**: The port on which the supplicant is running.
**Identity**: Configured supplicant identity.

**EAP method**: Configured EAP method (Currently just EAP-FAST)

**Status**: Supplicant Status. Can be one of the following:
- Success – Authentication has been successful.
- Down – Authentication sequence has not begun.
- Failed – Authentication has failed.
-Connecting – Authentication is in progress.
- Unused – Supplicant is uninitialized.

**S supplicant MAC**: MAC address of the supplicant.

**Authenticator MAC**: MAC address of the authenticator (peer).

Existing Mac Security show commands can be used to look at Mac Security status.
15.6 MACsec Proxy For VXLAN

The MACsec Proxy for VXLAN feature enables the MACsec service over VXLAN. MACsec over VXLAN is provided by mapping a Visual Networking Index (VNI), Remote VXLAN tunnel endpoint (VTEP) IP to a MACsec proxy sub interface. Any packets routed to the MACsec proxy sub interface is encrypted and tunneled to the remote VTEP. On the receiving path the packets are decrypted, then decapsulated and forwarded. MKA negotiates and renews the encryption keys, for this purpose a MACsec capable front panel port has to be dedicated and cannot be plugged in as it will be used to recycle packets being encrypted and decrypted.

15.6.1 Configuring MACsec Proxy For VXLAN

The switch platforms which use this feature are:

- 7280SRAM-48C6
- 7280CR2M-30
- 7500R2M-36CQ-LC

The mandatory steps to configure a MACsec proxy sub-interface on an Arista switch are:

**Step 1** Configure the parent interface to be a routed port.

**Step 2** Create a L3 sub-interface on the parent interface. This is the MACsec proxy sub-interface.

**Step 3** Create a L2 sub-interface on the parent interface. This is the MACsec patch sub-interface.

**Step 4** Configure and enable the MACsec proxy port on a sub-interface.

**Step 5** Configure the VXLAN tunnel.

**Step 6** Assign the forwarding VLAN ID for the MACsec patch sub-interface and VXLAN tunnel.

**Example Configurations**

**Step 1** Configure a 100g MACsec interface as a routed port.

```
switch(config)#interface et49/1
switch(config-if-Et49/1)#no switchport
```

**Step 2** Create a new L3 sub-interface - et49/1.1

```
switch(config-if-Et49/1)#interface et49/1.1
```

**Step 3** Create a new L2 sub-interface - et49/1.2

```
switch(config-if-Et49/1)#interface et49/1.2
```

**Step 4** Configure the MACsec proxy port, and enable MACsec on the proxy port.

```
switch(config)#interface et49/1.1
switch(config-if-Et49/1.1)#mac security proxy patch Ethernet49/1.2
switch(config-if-Et49/1.1)#mac security profile test1
switch(config-if-Et49/1.1)#ip address 2.2.2.1/24
```

**Step 5** Configure the VXLAN tunnel. The remote VTEP is provided as the flood VTEP.

```
switch(config)#interface vxlan 1
switch(config-if-Vx1)#vxlan source-interface Loopback0
switch(config-if-Vx1)#vxlan udp-port 4789
switch(config-if-Vx1)#vxlan vlan 20 vni 20
switch(config-if-Vx1)#vxlan vlan 20 flood vtep 100.100.100.2
```
**Step 6** Configure the L2 MACsec patch interface to be in the same VLAN as VXLAN.

```
switch(config)#interface et49/1.2
switch(config-if-Et49/1.2)#vlan id 20
```

### 15.6.2 Displaying MACsec Proxy For VXLAN Information

- Use `show mac security interface` command to display the proxy sub-interface information.

#### Example

```
switch(config)#show mac security interface

<table>
<thead>
<tr>
<th>Interface</th>
<th>SCI</th>
<th>Controlled Port</th>
<th>Key in Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ethernet4/1/1</td>
<td>28:99:3a:82:6f:82::605</td>
<td>True</td>
<td>9d5bc0d3076ea4a08b99b9d9:1</td>
</tr>
<tr>
<td>Ethernet4/3/1</td>
<td>28:99:3a:82:6f:85::613</td>
<td>True</td>
<td>9d5bc0d3076ea4a08b99b9d9:1</td>
</tr>
</tbody>
</table>
```

- Use `show mac security mka counters` command to display the MACsec counters and detailed values.

#### Example

```
switch(config)#show mac security mka counters

<table>
<thead>
<tr>
<th>Interface</th>
<th>Rx Success</th>
<th>Rx Failure</th>
<th>Tx Success</th>
<th>Tx Failure</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ethernet4/1/1</td>
<td>287</td>
<td>0</td>
<td>288</td>
<td>0</td>
</tr>
<tr>
<td>Ethernet4/3/1</td>
<td>288</td>
<td>0</td>
<td>287</td>
<td>0</td>
</tr>
</tbody>
</table>
```

```
switch(config)#show mac security mka counters ethernet 49/1.1 detail

Interface: Ethernet49/1.1
Tx packet success: 84
Tx packet failure: 0
Tx invalid: 0
Rx packet success: 82
Rx packet failure: 0
Rx invalid: 0
Rx eapol error: 0
Rx basic parameter set error: 0
Rx unrecognized CKN error: 0
Rx ICV validation error: 0
Rx live peer list error: 0
Rx potential peer list error: 0
Rx SAK use set error: 0
Rx distributed SAK set error: 0
Rx distributed CAK set error: 0
Rx ICV Indicator error: 0
Rx unrecognized parameter set error: 0
```

### 15.6.3 Limitations

- Not supported in systems with Arad linecards.
- Learning cannot be disabled on VLAN bridging between MACsec patch interface and VXLAN tunnel.
- Not supported on LAG sub interfaces.
- MACsec proxy sub interfaces cannot be in non default VRF.
- Replay protection has to be disabled since the encrypted packets are load balanced on the underlay.
- L2 and L3 sub interface has to be belong to the same parent interface.
- The VLAN should have only the patch interface and VXLAN VNI mapped.
- No configuration except for “no switchport” should be done on the parent 100g port.
15.7 MACsec Fallback to Unprotected Traffic

When MACsec is enabled on an interface, it tries to establish MACsec Key Agreement (MKA) session(s) with its peer. If no MKA sessions is successfully established, then the interface can continue to protect the traffic with the last known negotiated key, and if such a key does not exist then it blocks the traffic. The MACsec Fallback to Unprotected Traffic feature introduces an optional configuration which, if provided, allows unprotected traffic whenever there is no successful MKA session with the peer in the following scenarios:

- If MACsec is enabled on an interface with this feature configured, then the interface allows unprotected traffic immediately without waiting for MKA session establishment.
- If a MACsec enabled interface was blocking traffic as no MKA sessions were established and its corresponding MACsec profile is changed to enable this feature, the interface will start allowing unprotected traffic immediately.
- If a MACsec enabled interface was allowing unprotected traffic and its corresponding MACsec profile is changed to disable this feature, the interface will block traffic immediately.
- While an interface is allowing unprotected traffic, it will stop doing so when a new Secure Association Key (SAK) is generated (if this interface is key server) or when a SAK is received from the key-server (if this interface is not the key server).
- If MACsec Fallback to Unprotected Traffic is configured and all MKA sessions between the peers fail, the peers will switch to unprotected traffic. If not configured, protected traffic could have continued with last known negotiated key.

To protect traffic between pairs, primary MKA session derived keys are given priority over Fallback MKA session. With this feature enabled, the priority order of traffic between peers is:

1. Protected using derived keys from primary MKA sessions
2. Protected using derived keys from Fallback MKA sessions
3. Unprotected traffic

**Note**

Arista allows a primary and a Fallback Connectivity Association Key (CAK) and Connectivity Association Key Name (CKN) pair to be configured on an interface. And interfaces tries to establish a MKA session with its peer corresponding to each CAK/CKN pair.

15.7.1 MACsec Fallback to Unprotected Traffic Feature Interaction

This feature interacts with other related features in following way:

- **MACsec EAP-FAST Support** - If dynamic MAC Security keys (derived from 802.1X authentication) are used, then the feature configuration has no effect.
- **MACsec Proxy Interfaces** - This feature does not work with MACsec proxy sub interfaces.
- **Key Retirement Immediate** - If this feature is configured with “Key Retirement Immediate” feature on an interface, transition between unprotected traffic and protected traffic may become more frequent. This is because with “Key Retirement Immediate” feature, whenever a new key is configured, existing successful MKA session corresponding to the old key is not maintained.

15.7.2 Limitations

When this feature is in use, following limitations can be noticed:

- An interface while moving from allowing unprotected traffic to allowing only protected traffic can experience a traffic disruption of up to 4 seconds.
- If the key server interface manages to establish a MKA session with its old credentials (CKN/CAK pair) while unprotected traffic was allowed, then traffic disruption for a duration of up to 6 seconds can be noticed in addition to the duration mentioned in the above point.

15.7.3 Configuring MACsec Fallback to Unprotected Traffic

This feature is supported on all MACsec capable cards except for **7500E-6CFPX-LC**.

The MACsec Fallback to Unprotected Traffic feature is configured under MACsec profile mode using the `[no] traffic unprotected allow` command. The `no` form of the command removes the configuration from the switch. This configuration must be present in both the peers for the unprotected traffic to flow between them successfully.

**Example**

```
switch(config-mac-security-profile-sampleProfile)#[no] traffic unprotected allow
```

15.7.4 Displaying MACsec Fallback to Unprotected Traffic Information

The `show mac security interface detail` command can be used to verify if the interface is currently allowing unprotected traffic.

```
switch# show mac security interface Ethernet 6/1/1 detail
Interface: Ethernet4/1/1
 SCI: 28:99:3a:82:6f:82::605
 SSCI: 00000002
 Controlled port: True
 Key server priority: 16
 Session rekey period: 0
 Traffic: Unprotected
 Key in use: 9d5bc0d3076ea4a08b99b9d9:1
 Latest key: None
 Old key: 9d5bc0d3076ea4a08b99b9d9:1(RT)

Interface: Ethernet4/3/1
 SCI: 28:99:3a:82:6f:85::613
 SSCI: 00000001
 Controlled port: True
 Key server priority: 16
 Session rekey period: 0
 Traffic: Protected
 Key in use: 9d5bc0d3076ea4a08b99b9d9:1
 Latest key: None
 Old key: 9d5bc0d3076ea4a08b99b9d9:1(RT)
```
15.8 MACsec Commands

MACsec Configuration Commands
- cipher
- entropy source hardware
- key (MACsec)
- license
- mac security
- mka key-server
- mka session
- profile

MACsec Key Retirement Immediate Commands
- key retirement immediate

MACsec Show Commands
- show mac security counters
- show mac security counters detail
- show mac security interface
- show mac security interface detail
- show mac security mka counters
- show mac security participants
- show mac security participants detail
- show mac security status

MACsec EAP FAST Support Commands
- dot1x
- dot1x pae supplicant
- dot1x timeout reauth-timeout-ignore always
- show dot1x supplicant
- supplicant profile

MACsec Fallback to Unprotected Traffic
- traffic unprotected allow
cipher

The cipher command configures the cipher authentication for MAC security on the switch.

Command Mode
MACsec Profile

Command Syntax
cipher <options>

Parameters
- options  The cipher authentication options.
  - aes128-gcm-xpn  Advanced Encryption Standard (128 bit, Galois/Counter mode, Extended Packet Numbering)
  - aes256-gcm-xpn  Advanced Encryption Standard (256 bit, Galois/Counter mode, Extended Packet Numbering)

Example
- The following command configures the cipher aes128-gcm-xpn for MAC security on the switch for the MACsec profile called test.
  switch(config-mac-security-profile-test)#cipher aes128-gcm-xpn
**dot1x**

The `dot1x` command places the switch in the dot1x mode. In this mode user is allowed to configure various MACsec configurations.

**Command Mode**
- Global Configuration

**Command Syntax**

```
dot1x
```

**Example**
- The following command places the switch in the dot1x mode.

```
switch(config)#dot1x
switch(config-dot1x)#
```
dot1x pae supplicant

The **dot1x pae supplicant** command applies the supplicant profile by enabling it on the Mac Security interface.

**Command Mode**
- Interface Configuration

**Command Syntax**
- `dot1x pae supplicant`

**Example**
- The following command applies the supplicant profile **test** on the MACsec interface 6/1.

```
switch(config-if-Et6/1)#dot1x pae supplicant test
```
**dot1x timeout reauth-timeout-ignore always**

The **dot1x timeout reauth-timeout-ignore always** command retains the current port state without blocking it irrespective of when the authentication server is unreachable or in-case of supplicant time outs.

**Command Mode**

Interface Configuration

**Command Syntax**

`dot1x timeout reauth-timeout-ignore always`

**Examples**

- The following command retains the current port status of interface Ethernet 6/1 when there is authentication server timeout.

  ```bash
  switch(config-if-Et6/1)#dot1x timeout reauth-timeout-ignore always
  ```
entropy source hardware

The **entropy source hardware** command generates the cryptographic keys to strengthen the random number generator used by MACsec.

**Command Mode**
- Management Configuration

**Command Syntax**

```plaintext
entropy source hardware
```

**Example**
- The following command configures the **entropy source hardware** and generates the cryptographic keys.

```
Switch(config)#management security
Switch(config-mgmt-security)#entropy source hardware
```
key (MACsec)

The `key` command configures the primary key so that the MACsec profile is activated.

**Note**  
Optionally a fallback CAK can also be configured on a profile. This CAK is picked up by MACsec to negotiate keys if the primary CAK fails. A CAK can be configured as a backup key using the `fallback` keyword with the `key` command.

**Command Mode**  
MACsec Profile Configuration

**Command Syntax**  
`key <options>`

**Parameter**

- **CKN** Connectivity association key name in hex octets. Options include.
  - `0` Specifies that an UNENCRYPTED key will follow
  - `7` Specifies that an HIDDEN key will follow
- **CAK** Connectivity association key in hex octets
- **fallback** Configure the key as a fallback
- **retirement** Retire the key. Options include.
  - `immediate` Retire the key immediately
- **source** List of sources to derive MAC security keys. Options include.
  - `dot1x` Derive MAC security keys from IEEE 802.1X based port authentication
  - `group-cak` Derive MAC security keys from Group CAK Distribution

**Examples**

- The following example configures the primary key for the profile called "sample" profile for MAC security on the switch.
  
  ```
  Switch(config)#mac security
  Switch(config-mac-security)#profile sample_Profile
  Switch(config-mac-security-profile-sample_Profile)#key 0abcd1 0 1234abcd
  ```

- The following example configures the fallback CAK on a profile.
  
  ```
  Switch(config)#mac security
  Switch(config-mac-security)#profile sample_Profile
  Switch(config-mac-security-profile-sample_Profile)#key 0abcd1 0 1234abcd fallback
  ```
key retirement immediate

The **key retirement immediate** command configures the key retirement feature on the key server and assists the key server to decide the principal actor for SAK distribution by triggering the re-election of principal actor immediately. It is recommended that the key retirement is configured on both key server and non key server peers.

The **no key retirement immediate** command disable the key retirement function by removing the **key retirement immediate** command from *running-config*.

**Command Mode**
- MACsec Profile

**Command Syntax**
- `key retirement immediate`

**Example**
- The following commands configures the **key retirement immediate** feature on a switch for a MACsec profile called **sample**.

```plaintext
Switch(config)#mac security
Switch(config-mac-security)#profile sample
Switch(config-mac-security-profile-sample)#key retirement immediate
```
license

The `license` command configures the license for MAC security on the switch. MACsec licenses are tied to a switch. Every switch running MACsec requires a separate license of its own.

**Important!** Contact your system engineer to acquire the required license codes before attempting to configure MACsec.

**Command Mode**
MACsec Profile

**Command Syntax**

```
license <options>
```

**Parameters**
- `options` The options through which the license is configured.
  - `WORD Licensee name`
  - `import` Import license from a URL. Options include.
    - `8-digit hex number` Key to authorize Mac security
    - `alert-base:` Path to license file
    - `certificate:` Path to license file
    - `checkpoint:` Path to license file
    - `extension:` Path to license file
    - `file:` Path to license file
    - `flash:` Path to license file
    - `ftp:` Path to license file
    - `http:` Path to license file
    - `https:` Path to license file
    - `scp:` Path to license file
    - `sftp:` Path to license file
    - `system:` Path to license file
    - `terminal:` Path to license file
    - `tftp:` Path to license file
  - `update` Trigger a check for license. Option include.
    - `8-digit hex number` Key to authorize Mac security

**Example**
- The following example configures the license for MAC security on the switch.

  ```
  Switch(config)#mac security
  Switch(config-mac-security)#
  Switch(config-mac-security-profile-test)# license ABC RRGGBBAA
  ```
mac security

The **mac security** command enables MAC security provision on the switch.

The **no mac security** and **default mac security** commands restore the switch to its default state by removing the corresponding **mac security** command from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

```plaintext
mac security
no mac security
default mac security
```

**Example**

- The following command will place the switch in **MAC security mode**.

  ```plaintext
  switch(config)#mac security
  switch(config-mac-security)#
  ```
mka key-server

The `mka key-server` command configures key server among the MACsec peers.

**Command Mode**

MACsec Profile Configuration

**Command Syntax**

```
mka key-server priority <value>
```

**Parameter**

- **priority**  MKA key server priority.
- **value**  Key server priority value. Value ranges from 0 to 255.

**Example**

- The following example configures the key server value of 10 among the MACsec peers.

```sh
Switch(config)#mac security
Switch(config-mac-security)#profile sample_Profile
Switch(config-mac-security-sample_Profile)#mka key-server priority 10
```
mka session

The **mka session** command configures period at which the SAK is refreshed.

**Command Mode**

MACsec Profile Configuration

**Command Syntax**

```
    mka session rekey-period <value>
```

**Parameter**

- **rekey-period**  Sets MKA session re-key period.
- **value**  Session re-key period in seconds. Value ranges from 30 to 100000.

**Example**

- The following example configures the mka session rekey-period time of 10 seconds at which the SAK is refreshed.

```
  Switch(config)#mac security
  Switch(config-mac-security)#profile sample_Profile
  Switch(config-mac-security-sample_Profile)#mka session rekey-period 10
```
profile

The `profile` command configures the MACsec profile for MAC security on the switch. Profiles are mandatory for MACsec to be provisioned.

**Command Mode**
MACsec Configuration

**Command Syntax**
```
profile <profile-name>
```

**Parameter**
- `profile-name` Name of the MACsec profile.

**Example**
- The following example configures the MACsec profile called “sample” profile for MAC security on the switch.
  ```
  Switch(config)#mac security
  Switch(config-mac-security)#profile sample_Profile
  ```
**show dot1x supplicant**

The `show dot1x supplicant` command displays the 802.1X supplicant status.

**Command Mode**

EXEC

**Command Syntax**

```
show dot1x supplicant
```

**Example**

- The following example displays information about 802.1X supplicant status.

  ```
  switch# show dot1x supplicant
  Interface: Ethernet6/1
  Identity: arastra
  EAP method: fast
  Status: success
  Supplicant MAC: 44:4c:a8:34:bf:20
  Authenticator MAC: 00:1c:73:e0:d3:76
  ```

**About the Output**

- **Interface**: The port on which the supplicant is running.
- **Identity**: Configured supplicant identity.
- **EAP method**: Configured EAP method (Currently just EAP-FAST)
- **Status**: Supplicant Status. Can be one of the following:
  - Success – Authentication has been successful.
  - Down – Authentication sequence has not begun.
  - Failed – Authentication has failed.
  - Connecting – Authentication is in progress.
  - Unused – Supplicant is uninitialized.
- **Supplicant MAC**: MAC address of the supplicant.
- **Authenticator MAC**: MAC address of the authenticator (peer).

Existing Mac Security show commands can be used to look at Mac Security status.
show mac security counters

The **show mac security counters** command displays information about the MACsec security counters.

**Command Mode**

EXEC

**Command Syntax**

```
show mac security counters
```

**Example**

- The following example displays information about MACsec security counters.

```
switch# show mac security counters
Port InPktsDecrypted InOctetsDecrypted OutPktsEncrypted OutOctetsEncrypted
Et4/1/1 2 214 109 11663
Et4/3/1 109 11663 2 214
```
show mac security counters detail

The `show mac security counters detail` command to displays the detail information about the MACsec security counters.

**Command Mode**

EXEC

**Command Syntax**

`show mac security counters detail`

**Example**

- The following example displays detail information about MACsec security counters.

```plaintext
switch#show mac security counters detail

Ethernet4/1/1  Counter Name        Count
-------------------------------------------------------
outPktsEncrypted    112
outOctetsEncrypted  11984
outPktsUntagged     0
outPktsTooLong      0
outPktCtrl          224
inPktsDecrypted     2
inOctetsDecrypted   214
inPktsUnchecked     0
inPktsOK            2
inPktsNotValid      0
inPktsNotUsingSA    0
inPktsCtrl          223
inPktsNoTag         8
inPktsTagged        0
inPktsBadTag        0
inPktsNoSCI         0
inPktsLate          0

Ethernet4/3/1  Counter Name        Count
-------------------------------------------------------
outPktsEncrypted    2
outOctetsEncrypted  214
outPktsUntagged     0
outPktsTooLong      0
outPktCtrl          223
inPktsDecrypted     111
inOctetsDecrypted   11877
inPktsUnchecked     0
inPktsOK            111
inPktsNotValid      0
inPktsNotUsingSA    0
inPktsCtrl          224
inPktsNoTag         9
inPktsTagged        0
inPktsBadTag        0
inPktsNoSCI         0
inPktsLate          0
```
show mac security interface

The **show mac security** interface command shows information about the MACsec on the interface.

**Command Mode**

EXEC

**Command Syntax**

```
show mac security interface
```

**Example**

- The following example displays information about MACsec on the interface.

```
Switch#show mac security interface
Interface   SCI             Controlled Port      Key in Use
Ethernet4/1/1 28:99:3a:82:6f:82::605    True            9d5bc0d3076ea4a08b99b9d9:1
Ethernet4/3/1 28:99:3a:82:6f:85::613    True            9d5bc0d3076ea4a08b99b9d9:1
```
show mac security interface detail

The **show mac security interface detail** interface command displays the detail information about the MACsec on the interface.

**Command Mode**

EXEC

**Command Syntax**

```
show mac security interface detail
```

**Example**

- The following example displays detail information about MACsec on the interface.

```
Switch#show mac security interface detail

Interface: Ethernet4/1/1
  SCI: 28:99:3a:82:6f:82::605
  SSCI: 00000002
  Controlled port: True
  Key server priority: 16
  Session rekey period: 0
  Traffic: Protected
  Key in use: 9d5bc0d3076ea4a08b99b9d9:1
  Latest key: None
  Old key: 9d5bc0d3076ea4a08b99b9d9:1(RT)

Interface: Ethernet4/3/1
  SCI: 28:99:3a:82:6f:85::613
  SSCI: 00000001
  Controlled port: True
  Key server priority: 16
  Session rekey period: 0
  Traffic: Protected
  Key in use: 9d5bc0d3076ea4a08b99b9d9:1
  Latest key: None
  Old key: 9d5bc0d3076ea4a08b99b9d9:1(RT)
```

**About the Output**

- Interface: Name of the interface.
- Secure Channel Identifier (SCI): Combination of MAC address and port number. Used to uniquely identify a Mac Security port.
- Controlled Port: Indicates if Mac Security is enabled on the port. A value of True indicates that encryption is enabled on the port.
- Key In Use: The SAK identifier currently in use. Combination of Key Server’s message identifier (see below) and key number.
- Key Server priority: Configured key server priority.
- Session Rekey Period: Configured session rekey period.
- Latest Key: Latest SAK being negotiated by Mac Security Key Agreement Protocol (MKA)
- Old Key: The last SAK negotiated by Mac Security Key Agreement Protocol (MKA)

**Note**

Latest and Old key are MKA protocol specific terminology and are used to refer to the last two keys in use. For all practical purposes, “Key In Use” field is used to identify the current key.
show mac security mka counters

The **show mac security mka counters** command to display information about the MACsec MKA counters.

**Command Mode**

EXEC

**Command Syntax**

```
show mac security mka counters
```

**Example**

- The following example displays information about MACsec MKA counters.

```
switch# show mac security mka counters
   Interface       Rx Success      Rx Failure      Tx Success      Tx Failure
Ethernet4/1/1   287             0               288             0
Ethernet4/3/1   288             0               287             0
```
show mac security participants

The **show mac security participants** interface command displays information about the MACsec participants.

**Command Mode**

EXEC

**Command Syntax**

```
show mac security interface
```

**Example**

- The following example displays information about MACsec participants.

  switch#show mac security participants
  Interface: Ethernet4/1/1
  CKN: abcd
  Message ID: 9d5bc0d3076ea4a08b99b9d9
  Elected self: True
  Success: True
  Principal: True
  Default: False

  CKN: dead
  Message ID: 4ef4cf009161bd551b5e7434
  Elected self: True
  Success: True
  Principal: False
  Default: True

  Interface: Ethernet4/3/1
  CKN: abcd
  Message ID: c79ad8882c2dd3a8e838a691
  Elected self: False
  Success: True
  Principal: True
  Default: False

  CKN: dead
  Message ID: 3dfd4486b5f68a81014a37ec
  Elected self: False
  Success: True
  Principal: False
  Default: True
show mac security participants detail

The `show mac security participants detail` command displays detail information about the MACsec participants.

**Command Mode**

EXEC

**Command Syntax**

`show mac security participants detail`
Example

- The following example displays information about MACsec participants details.

```
switch# show mac security participants detail
  Interface: Ethernet4/1/1
  CKN: abcd
  Message ID: 9d5bc0d3076ea4a08b99b9d9
  Elected self: True
  Success: True
  Principal: True
  Default: False
  KeyServer SCI: 28:99:3a:82:6f:82::605
  SAK transmit: True
  LLPN exhaustion: 0
  Distributed key identifier: 9d5bc0d3076ea4a08b99b9d9:1

```

About the Output

- Connectivity Association Key Name (CKN): Configured name of the key in use.
• Message ID: A random 92 bit string used as an identifier for an MKA participant.
• Elected Self: True if this participant is the elected key server.
• Success: True if this participant is live and has at least one live peer.
• Principal: True if this participant is the principal participant elected to distribute SAKs.
• Default: True if this participant is a fallback/backup participant (spawned when a fallback key is configured in a Mac Security profile).
• Key Server SCI: The SCI of the key server.
• SAK Transmit: True if the participant is ready to use the negotiated key for transmit.
• LLPN Exhaustion: Increments if the number of data packets sent using the current key exceeds a certain threshold. Because we use a 64 bit packet number cipher suite, this should never increment.
• Distributed Key Identifier: Message ID + key number of the most recently generated SAK.
**show mac security status**

The `show mac security status` command displays the MACsec status information on a switch.

**Command Mode**

EXEC

**Command Syntax**

`show mac security status`

**Example**

- The following command displays the MACsec status information.

```
switch#show mac security status
  Active Profiles: 1
  Data Delay Protection: No
  FIPS Mode: No
  Secured Interfaces: 2
  License: Enabled
```
supplicant profile

The **supplicant profile** command configures the supplicant profile containing all the credentials necessary for 802.1X authentication to succeed.

**Command Mode**

dot1x Configuration

**Command Syntax**

```
supplicant profile <profile_name> <options>
```

**Parameters**

- **profile_name** Name of the supplicant profile.
- The following parameters can be included after entering the profile mode.
  - **eap-method** Extensible Authentication Protocol (EAP) method. Option include.
    - **fast** EAP Flexible Authentication via Secure Tunneling (FAST)
  - **identity** Extensible Authentication Protocol (EAP) user identity. Option include.
    - **WORD** User identity name.
  - **passphrase** Extensible Authentication Protocol (EAP) password. Options include.
    - **0** Specifies that an UNENCRYPTED key will follow.
    - **7** Specifies that an HIDDEN key will follow.
    - **LINE** The UNENCRYPTED (clear-text) shared key.

**Examples**

- The following commands place the switch in the supplicant profile mode.
  ```
  Switch(config)#dot1x
  Switch(config-dot1x)#supplicant profile test
  Switch(config-dot1x-supp-profile-test)#
  ```

- The following commands configures the **EAP FAST** method for the supplicant profile called “test” profile for **MAC security** on the switch.
  ```
  Switch(config)#dot1x
  Switch(config-dot1x)#supplicant profile test
  Switch(config-dot1x-supp-profile-test)#eap-method fast
  ```

- The following commands configures the **Identity** for the supplicant profile called “test” profile for **MAC security** on the switch.
  ```
  Switch(config)#dot1x
  Switch(config-dot1x)#supplicant profile test
  Switch(config-dot1x-supp-profile-test)#identity New_User
  ```

- The following commands configures the **passphrase** for the supplicant profile called “test” profile for **MAC security** on the switch.
  ```
  Switch(config)#dot1x
  Switch(config-dot1x)#supplicant profile test
  Switch(config-dot1x-supp-profile-test)#passphrase 7 070E334D5D1D0B04
  ```
traffic unprotected allow

The traffic unprotected allow command configures the switch to allow the unprotected traffic whenever there is no successful MKA session established with the peer.

The no traffic unprotected allow command disable the MACsec Fallback to Unprotected Traffic function by removing the traffic unprotected allow command from running-config.

Command Mode
MACsec Profile

Command Syntax
[no] traffic unprotected allow

Example
- The following commands configures the MACsec Fallback traffic unprotected allow feature on a switch for a MACsec profile called sample.

  Switch(config)#mac security
  Switch(config-mac-security)#profile sample
  Switch(config-mac-security-profile-sample)#no traffic unprotected allow
Internet Protocol Security (IPsec)

This chapter describes Arista’s IPsec implementation. Sections in this chapter include:

- Section 16.1: IPsec Introduction
- Section 16.2: IPsec Overview
- Section 16.3: Configuring IPsec
- Section 16.4: IPsec Commands
16.1 **IPsec Introduction**

Internet Protocol Security (IPsec) is a protocol suite for securing Internet Protocol (IP) communications by authenticating and encrypting each IP packet of a communication session. IPsec includes protocols for establishing mutual authentication between agents periodically during the session and negotiation of cryptographic keys to be used during the session. IPsec supports network-level peer authentication, data origin authentication, data integrity, data confidentiality (encryption), and replay protection.

IPsec is used to protect data traffic between sites for example between Branch, HQ and Data center sites in an enterprise.

IPsec uses the following protocols to perform various functions:

- **Authentication Headers (AH):** provides the connectionless integrity and data origin authentication for IP datagrams and provides protection against replay attacks.
- **Encapsulating Security Payloads (ESP):** provides the confidentiality, data-origin authentication, connectionless integrity and an anti-replay service (a form of partial sequence integrity).
- **Internet Key Exchange (IKE):** is a key management protocol which provides security for virtual private networks’ (VPNs) negotiations and network access to random hosts. It is also described as a method for exchanging keys for encryption and authentication over an unsecured medium, such as the Internet.
16.2 IPsec Overview

16.2.1 Security Associations

Security Associations (SA) provide the bundle of algorithms and data that provide the parameters necessary for AH and/or ESP operations. The Internet Security Association and Key Management Protocol (ISAKMP) provides a framework for authentication and key exchange, with actual authenticated keying material provided either by manual configuration with pre-shared keys, Internet Key Exchange (IKE and IKEv2) and other mechanisms. In order to decide what protection is to be provided for an outgoing packet, IPsec uses the Security Parameter Index (SPI), an index to the security association database (SADB), along with the destination address in a packet header, which together uniquely identify a security association for that packet. A similar procedure is performed for an incoming packet, where IPsec gathers decryption and verification keys from the security association database.

Full bidirectional communication requires at least two SAs, one for each direction. SA is defined by the following parameters:

- Security Algorithms (AH) or Encapsulating Security Payloads (ESP) and keys
- Mode: Tunnel or Transport
- Key Management Method: Manual or IKE
- Lifetime: Expressed in hours.

16.2.2 Mode of Operation

IPsec on Arista switches operates in tunnel mode. In tunnel mode, the entire IP packet is encrypted and/or authenticated. It is then encapsulated into a new IP packet with a new IP header. Tunnel mode is used to create virtual private networks for network-to-network communications (for example, between routers to link sites). Tunnel mode is used for most network-to-network IPsec.

16.2.3 Key Management

Key management on Arista switches uses the Internet Key Exchange (IKE) method. Internet Key Exchange (IKE) supports automated generation and renegotiation of SAs (includes keys) between the devices at a configured interval so it is much more scalable and secure.

IPsec needs SAs to define the algorithms and keys to use for protecting traffic. IKE establishes the SA so IPsec can protect traffic.

There are two IKE versions, IKEv1 and IKEv2. IKEv2 builds on IKEv1 but both are still widely used today.

16.2.3.1 IKEv1

IKEv1 has two phases.

- IKEv1 Phase 1
- IKEv1 Phase 2

**IKEv1 Phase 1**

- Uses main or aggressive mode exchange
- Negotiates IKE SA
- Used for control plane
- Peer authentication
IKEv1 Phase 2
- Uses quick mode exchange
- Negotiates IPsec SAs

Note that there are two different SAs that are established. The IKE SA protects only the IKE key management session using the IKE policy defined. The policy should include the following parameters:
- Encryption algorithm
- Hash MAC (HMAC) algorithm
- Peer authentication procedure
- Diffie-Hellman group for initial key exchange
- SA lifetime

IKE initially performs a Diffie-Hellman (DH) exchange at the start of the IKE session. A Diffie-Hellman (DH) exchange allows participants to produce a shared secret value. The strength of the technique is that it allows participants to create the secret value over an unsecured medium without passing the secret value through the wire. From that exchange, peers get shared keying material, which is then used for IKE encryption and integrity functions. The strength of that keying material can be used for faster performance, by choosing lower key sizes for Diffie-Hellman exchanges. The key length (strength) of Diffie-Hellman exchanges can be changed with the use of different DH groups.

When an IKE session's lifetime expires, a new Diffie-Hellman exchange is performed between peers and the IKE SA is re-established.

The IPsec protection policy resulting in IPsec SAs, defines the protection of network traffic. These IPsec SAs are usually negotiated over IKE sessions. The parameters that define the IPsec protection policy are:
- Encryption Algorithm
- Hash MAC (HMAC) Algorithm

Note that the key material for IPsec SA (also called Child SA) is derived from keying material from IKEv1 phase 1.

There are two different modes for phase 1:
- Main Mode
  - 6 packet exchange
  - Full identity protection and better anti-DoS protection
- Aggressive Mode
  - 3 packet faster session establishment
  - Identities are exchanged in clear
  - Weak DoS protection

Authentication
- **Pre-Shared Keys (PSK)** As the name suggests, a shared secret is distributed out-of-band to the peers. The peers use this information and nonce parameters to create a hash that is used to authenticate messages.
- **PKI Certificates** Here, certificates of the peers are exchanged and hashes are calculated over these certificates to authenticate each other.
16.2.3.2 IKEv2

IKEv2 differs from IKEv1 in the following ways:
- Faster setup because of reduced number of messages
- More secure
  - ESP is reused for all IKEv2 messages
  - Suite-B support
- There is no aggressive mode, so IKEv2 always provides identity protection
- Additional authentication methods
  - Local and remote can use different authentication methods and use different pre-shared keys
  - Authentication is done unidirectionally in IKEv2

16.2.4 Certificate Management

There are many protocols and standards available now that ease the process of certificate enrollment, certificate request, and certificate status checking. Some popular ones are RSA Labs’ PKCS #7, PKCS #10, Cisco's Simple Certificate Enrollment Protocol (SCEP), and Online Certificate Status Protocol (OCSP).

16.2.4.1 Certificate Enrollment

There are two methods for certificate enrollment:
- **SCEP** Simple Certificate Enrollment Protocol. In this mode, EOS will automatically enroll the certificate with the CA.
- **Manual** This is used if the CA does not support SCEP or there is no network access from the device to the CA. The steps are as follows:
  a. Generate a Certificate Signing Request (CSR) and display on the terminal. CSR is represented as a Base64 encoded PKCS#10. The admin has to cut and paste the request into the CA to generate the certificate. The admin will have to specify the router FQDN and IP address.
  b. Import the certificate into EOS.

16.2.4.2 Certificate Validation

To verify the validity of certificates, Arista switches use two mechanisms:
- **CRL** Certificate Revocation List (CRL) is a list of certificates (or more specifically, a list of serial numbers for certificates) that have been revoked. Entities presenting those (revoked) certificates should no longer be trusted. CRLs can be obtained through Simple Certificate Enrollment Protocol (SCEP).
- **OCSP** The Online Certificate Status Protocol (OCSP) is an Internet protocol used for obtaining the revocation status of an X.509 digital certificate. Since it is an online protocol it is accessed in real time and avoids the caching-related security problems CRLs pose. OCSP also reduces the load on all devices since they don’t have to be updated on the entire CRL. However, the devices need to have access to the OCSP server.
16.2.5 Route-based VPN

A route-based VPN employs routed tunnel interfaces as the endpoints of the virtual network. All traffic passing through a tunnel interface is placed into the VPN. Rather than relying on an explicit policy to dictate which traffic enters the VPN, static and/or dynamic IP routes are formed to direct the desired traffic through the VPN tunnel interface.

Since route-based VPNs support dynamic routing information through VPN tunnels. EOS supports only route based VPN for dynamic routing support and for easier configuration and management.

In route-based VPN, features like NAT, ACL, QoS is applied to packets before they are encrypted by applying these features to tunnel interface and can be applied to encrypted packets to applying these features on the physical interface carrying the tunnel traffic.

Virtual Template Interface (VTI)

A new tunnel interface type “vti” is introduced to represent the VPN tunnel. This tunnel interface will participate in the routing and any packets forwarded to it will be encrypted and forwarded to the other end of the tunnel. Note, that this does not add a new header to the packet.
16.3 Configuring IPsec

Complete the following steps to configure IPsec tunnels over the switch.

This configuration will use the default IKE version 2 procedure.

**Step 1** Use this command to enter IP security mode.

```
switch(config)#ip security
```

**Step 2** To use IKE version 1, complete the following before completing the default IKE version the steps below.

```
switch(config)#ip security
switch(config-ipsec)#ike policy ike-peerRtr
switch(config-ipsec-ike)#version 1
```

**Step 3** Create an IKE Policy to be used to communicate with the peer to establish IKE. You have the option of configuring multiple IKE policies.

The default IKE Policy values are:

- Encryption- AES256 / AES128
- Integrity - SHA256 / SHA128
- DH group - Group 14
- IKE lifetime - 8 hours

Example:

```
switch(config-ipsec)#ike policy ike-router
switch(config-ipsec-ike)#encryption aes256
switch(config-ipsec-ike)#integrity sha256
switch(config-ipsec-ike)#dh-group 24
switch(config-ipsec-ike)#version 2
```

**Step 4** If the router is behind a NAT, configure the local-id with the local public IP address. The public IP corresponds to the underlying interface over which the IKE communications are done with the peer.

Example:

```
switch(config-ipsec-ike)#local-id <public ip address>
```

**Step 5** Create an IPsec Security Association policy to be used in the data path for encryption and integrity. Use the option of enabling Perfect Forward Secrecy by configuring a DH group to the SA. In this example, AES256 is used for encryption, SHA 256 is used for integrity, and Perfect Forward Secrecy is enabled (the DH group is 14).

```
switch(config-ipsec)#sa policy sa-vrouter
switch(config-ipsec-sa)#esp encryption aes256
switch(config-ipsec-sa)#esp integrity sha256
switch(config-ipsec-sa)#pfs dh-group 14
switch(config-ipsec-sa)#sa lifetime 2
```

**Step 6** Bind or associate the IKE and SA policies together using an IPsec profile. Provide a shared-key, which must be common on both peers. The default profile assigns default values for all parameters that are not explicitly configured in the other profiles. In this example, the
IKE Policy ike-peerRtr and SA Policy sa-peerRtr are applied to profile peer-Rtr. Dead Peer Detection is enabled and configured to delete the connection when the peer is down for more than 50 seconds. The peer peer-Rtr is set to be the responder.

```
switch(config-ipsec)#profile default
switch(config-ipsec-profile)#ike-policy ikedefault
switch(config-ipsec-profile)#sa-policy sadefault
switch(config-ipsec-profile)#shared-key arista
switch(config-ipsec-profile)#connection start
switch(config-ipsec)#profile vrouter
switch(config-ipsec-profile)#ike-policy ike-vrouter
switch(config-ipsec-profile)#sa-policy sa-vrouter
switch(config-ipsec-profile)#dpd 10 50 clear
switch(config-ipsec-profile)#connection add
```

**Step 7** Configure the WAN interface to be the underlying interface for the tunnel. You must specify an L3 address for the tunnel. If you do not, the switch cannot route packets using the tunnel.

Example:

```
switch(config)#interface E1
switch(config-if-E1)#no switchport
switch(config-if-E1)#ip address 1.0.0.1/24
switch(config-if-E1)#mtu 1500
```

**Step 8** Apply the IPsec profile to a new tunnel interface. You create the new tunnel interface as part of this step. You can configure the tunnel as a VTI IPsec tunnel. In this example, the new tunnel interface is Tunnel0. The new tunnel interface is configured to use IPsec. The other end of the tunnel also needs to be configured as a GRE-over-IPsec tunnel.

```
switch(config)#interface tunnel0
switch(config-if-Tu0)#ip address 1.0.3.1/24
switch(config-if-Tu0)#mtu 1394
switch(config-if-Tu0)#tunnel source 1.0.0.1
switch(config-if-Tu0)#tunnel destination 1.0.0.2
switch(config-if-Tu0)#tunnel ipsec profile vrouter
```
Example Configuration

```
ip security
ike policy ikebranch1
integrity sha256
dh-group 15
!
sa policy sabranch1
sa lifetime 2
pfs dh-group 14
!
profile hq
mode tunnel
ike-policy ikebranch1
sa-policy sabranch1
connection add
shared-key keyAristaHq
dpd 10 50 clear
!
interface Tunnel1
mtu 1404
ip address 1.0.3.1/24
tunnel source 1.0.0.1
tunnel destination 1.0.0.2
tunnel ipsec profile hq
!
interface Ethernet1
no switchport
ip address 1.0.0.1/24
```

### 16.3.1 Displaying IPsec Information

- **Use the `show ip security policy` command to display the IPsec policy information.**

  ```
  switch# show ip security policy
  Policy Name                  Authentication   Encryption       Integrity        Lifetime
  Rekey  DH Group
  ike-policy                   Pre-shared       256-bit AES      256bit Hash      8
  hours   False  3072 bit
  ```

- **Use the `show ip security policy` command to display the IP security profile information.**

  ```
  switch# show ip security profile
  Profile name     IKE Policy Name     SA
  ipsec-profile    ike-policy          sa-policy
  ```
16.4 **IPsec Commands**

- ike policy
- interface tunnel (IPsec)
- ip security
- profile (IPsec)
- sa policy
- show ip security applied-profile
- show ip security connection
- show ip security policy
- show ip security profile
- show ip security security-association
ike policy

The *ike policy* command configures the *Internet Security Association and Key Mgmt Protocol* on the switch and related policies. The IKE policy is configured in IP security configuration mode.

The *no ike policy* command deletes the IKE policy configuration from the switch.

The *exit* command returns the switch to the global configuration mode.

**Command Mode**

IP Security Configuration

**Command Syntax**

```
ike policy <policy-name>
noike policy <policy-name>
```

**Parameter**

- *policy-name* specifies the IKE policy name.

The following parameters are allowed to configure when the switch is placed in IKE policy configuration mode:

- *authentication* specifies the authentication type.
- *dh-group* specifies Diffie-Hellman Group value.
- *encryption* specifies the encryption type.
- *ike-lifetime* sets the ikeLifetime for ISAKMP security association. Expressed in hours.
- *integrity* specifies the Integrity algorithm.
- *local-id* specifies the local IKE identification.
- *remote-id* remote peer IKE identification.
- *version* specifies the IKE version.

**Example**

- This command configures the *IKE policy test* for IP security configuration.

  switch(config)#ike policy test
  switch(config-ipsec-ike)#
**interface tunnel (IPsec)**

The `interface tunnel` command places the switch in the interface tunnel configuration mode. Interface tunnel configuration mode is not a group change mode; `running-config` is changed immediately after commands are executed.

The `no interface tunnel` command deletes the interface tunnel configuration. The `exit` command returns the switch to the global configuration mode.

**Command Mode**
- Global Configuration

**Command Syntax**

```plaintext
interface tunnel <value>
no interface tunnel <value>
```

**Parameter**
- `value` Tunnel interface number. The value ranges from 0 to 255.

**Example**
- This command places the switch in interface tunnel configuration mode with a tunnel value 10.

```
switch(config)#interface tunnel 10
switch(config-if-Tu10)#
```
ip security

The ip security command places the switch in the IP security configuration mode.

IP security configuration mode is not a group change mode; running-config is changed immediately after commands are executed.

The no ip security command deletes the IP security configuration.

The exit command returns the switch to the global configuration mode.

Command Mode
- Global Configuration

Command Syntax
- ip security
- no ip security

Example
- This command places the switch in IP security configuration mode.

```
switch(config)#ip security
switch(config-ipsec)#ike policy IKE1
switch(config-ipsec-IKE1)#exit
switch(config-ipsec-IKE1)#exit
switch(config-ipsec)#sa policy SA1
switch(config-SA1)#
```
**profile (IPsec)**

The `profile` command configures the **IP security profile** on the switch. The profile is configured in IP security configuration mode.

The `no profile` command deletes the IP security profile configuration from the switch.

The `exit` command returns the switch to the global configuration mode.

**Command Mode**

IP Security Configuration

**Command Syntax**

```
profile <profile-name>
no profile <profile-name>
```

**Parameter**

- `profile-name` specifies the IP security profile name.

The following parameters can be configured in SA policy configuration mode:

- `connection` IPsec Connection (Initiator/Responder/Dynamic).
- `dpd` Dead Peer Detection.
- `flow` sets the flow.
- `ike-policy` ISAKMP policy.
- `mode` IP security mode type.
- `sa-policy` security association name.
- `shared-key` specifies key value.

**Example**

- This command configures the IP security profile **test** for IP security configuration.

```
switch(config)#profile test
switch(config-ipsec-profile)#
```
sa policy

The `sa policy` command specifies a Security Association (SA) policy to be used for IPsec configuration, and enters IP security SA policy configuration mode to configure the named policy.

The `no sa policy` command deletes the specified SA policy configuration from the switch.

The `exit` command returns the switch to the global configuration mode.

**Note**

Arista EOS 4.22.0F release supports two combinations of encapsulations only: "esp encryption aes128" with "esp integrity sha1" and "esp encryption aes256" with "esp integrity sha256".

**Command Mode**

IP Security Configuration

**Command Syntax**

```plaintext
sa policy <policy_name>
no sa policy <policy_name>
```

**Parameter**

- `policy_name` specifies the SA policy name.

The following parameters are configured in IP security SA policy configuration mode:

- `anti-replay` IPsec duplicate IP datagram detection
- `esp` Encapsulation Security Payload
- `pfs` Perfect Forward Secrecy
- `sa` Security Association

**Example**

- This command applies the SA policy called “test” for IP security and enters IP security SA policy configuration mode for the “test” policy.

```plaintext
switch(config)#sa policy test
switch(config-ipsec-sa)#
```
**show ip security applied-profile**

The **show ip security applied-profile** command displays the IP security profile names and the interfaces on which they are applied.

**Command Mode**

EXEC

**Command Syntax**

```
show ip security applied-profile
```

**Example**

- This command displays the IP security profile-1 and the interfaces on which it is applied.

```
switch# show ip sec applied-profile
Profile Name     Interface
ipsec-profile-1  Tunnel1, Tunnel2, Tunnel3, Tunnel4, Tunnel5, Tunnel6, Tunnel7, Tunnel8, Tunnel9, Tunnel10, Tunnel11, Tunnel12, Tunnel13, Tunnel14, Tunnel15, Tunnel16, Tunnel17, Tunnel18, Tunnel19, Tunnel20, Tunnel21, Tunnel22, Tunnel23, Tunnel24, Tunnel25, Tunnel26,
```
show ip security connection

The **show ip security connection** command displays the IP security connection status information.

**Command Mode**

EXEC

**Command Syntax**

```
show ip security connection
```

**Example**

- These commands display the IP security connection status information.

```
switch#show ip sec conn tunnel 1
Tunnel     Source           Dest             Status       Uptime     Input
Output     Rekey Time

hours   False   3072 bit
```
show ip security profile

The `show ip security profile` command displays the IP security profile information.

**Command Mode**

EXEC

**Command Syntax**

`show ip security profile`

**Example**

This command displays IP security profile configuration information.

```
switch#show ip security profile
Profile name       IKE Policy Name      SA
ipsec-profile     ike-policy           sa-policy
```
show ip security security-association

The show ip security security-association command displays the IP security SA information.

**Command Mode**

EXEC

**Command Syntax**

```
show ip security security-association
```

**Example**

- This command displays the IP security SA information.

  switch#show ip sec security-association
  SA Name             ESP Encryption  ESP Integrity  Lifetime  PFS Group
  sa-policy-1         256-bit AES     256bit Hash    24 hours  2k bit
This chapter describes Data Center Bridging Capability Exchange (DCBX) configuration tasks. Sections in this chapter include:

- Section 17.1: Introduction
- Section 17.2: Overview
- Section 17.3: DCBX Configuration and Verification
- Section 17.4: Configuring Priority-Flow-Control (PFC)
- Section 17.5: Configuring PFC Watchdog
- Section 17.6: DCBX and Flow Control Commands

17.1 Introduction

EOS implements Link Layer Discovery Protocol (LLDP) and the Data Center Bridging Capability Exchange (DCBX) protocol to help automate the configuration of Data Center Bridging (DCB) parameters, including the Priority-Based Flow Control (PFC) standard, which allows an end-to-end flow-control feature.

This feature enables a switch to recognize when it is connected to an iSCSI device and automatically configure the switch link parameters (such as priority flow control) to provide optimal support for that device. DCBX can be used to prioritize the handling of iSCSI traffic to help ensure that packets are not dropped or delayed. DCBX is off by default.
17.2 Overview

17.2.1 Data Center Bridging Capability Exchange (DCBX)

DCBX works with LLDP to allow switches to exchange information about their data center bridging (DCB) capabilities and configuration and automatically negotiate common Priority-Based Flow Control (PFC) parameters. Data is exchanged in type-length-value (TLV) format. For DCBX to function on an interface LLDP must be enabled on that interface as well.

17.2.2 Priority-Based Flow Control (PFC)

PFC uses a new control packet defined in IEEE 802.1Qbb and is not compatible with 802.3x flow control (FC). An interface that is configured for PFC will be disabled for FC. When PFC is disabled on an interface, the FC configuration for the interface becomes active. Any FC frames received on a PFC configured interface are ignored.

Each priority is configured as either drop or no-drop. If a priority that is designated as no-drop is congested, the priority is paused. Drop priorities do not participate in pause.

When PFC is disabled, the interface defaults to the IEEE 802.3x flow control setting for the interface. PFC is disabled by default.

17.2.3 PFC Watchdog

The PFC watchdog identifies the egress queues that are unable to transmit packets for a long time due to receiving continuous PFC pause frames. On identifying such stuck tx-queue PFC watchdog error-disables the respective port with a error-disable reason of stuck-queue. When there is an error reported on a port the traffic is re-routed through a different port to the destination.

The PFC watchdog supports the following PFC watchdog configurations:

- PFC watchdog forced recovery of queues
- PFC watchdog polling interval configuration
- PFC Watchdog non-disruptive priorities configuration
- Displaying stuck queue and recovery counters
17.3 DCBX Configuration and Verification

17.3.1 Set the Priority Rank to the Traffic Class

The `dcbx application priority` command assigns a priority rank to the specified traffic class in the application priority table. This table is transmitted on each DCBX-enabled interface.

**Examples**

- These commands tell the DCBX peer that iSCSI frames (TCP ports 860 and 3260) should be assigned the given priority of 5.
  
  ```
  switch(config)#dcbx application tcp-sctp 860 priority 5
  switch(config)#dcbx application tcp-sctp 3260 priority 5
  ```

- These commands specify a different priority for the two iSCSI traffic ports.
  
  ```
  switch(config)# dcbx application tcp-sctp 860 priority 3
  switch(config)# dcbx application tcp-sctp 3260 priority 4
  ```

- This command is equivalent to the `dcbx application tcp-sctp` command. The DCBX peer that iSCSI frames are assigned are the given the priority 5.
  
  ```
  switch(config)#dcbx application iscsi priority 5
  switch(config)#
  ```

- These commands prevent the peers from sending anything about the iSCSI frames.
  
  ```
  switch(config)#no dcbx application tcp-sctp 860 priority 5
  switch(config)#no dcbx application tcp-sctp 3260 priority 5
  ```

17.3.2 Configuring CEE DCBX Priority Group

The `priority-flow-control priority` command configures the enhanced transmission selection (ETS) to the specified QoS group, and sets the traffic class priority and the bandwidth percentage for the packets in the traffic class.

**Examples**

- This command configures the ETS to the QoS group map and assigns the CoS map value as 7 and sets traffic class priority to 5.
  
  ```
  switch(config)#dcbx ets qos map cos 7 traffic-class 5
  ```

- This command configures the ETS to the traffic class and sets the traffic class priority as 7 and bandwidth value to 70 percent.
  
  ```
  switch(config)#dcbx ets traffic-class 7 bandwidth 70
  ```

17.3.3 DCBX Verification

To display the DCBX status and the interfaces on which DCBX is enabled, use the `show dcbx` command.

**Examples**

- This command displays the DCBX status for Ethernet 50.
  
  ```
  switch#show dcbx Ethernet 50
  Ethernet50:
  IEEE DCBX is enabled and active
  Last LLDPU received on Thu Feb 14 12:06:01 2013
  No priority flow control configuration TLV received
  No application priority configuration TLV received
  ```
17.4 Configuring Priority-Flow-Control (PFC)

17.4.1 Enable Priority-Flow-Control (PFC)

The `priority-flow-control` command enables Priority-Flow-Control (PFC) on an individual port.

**Examples**

- The `priority-flow-control` command in DCBX mode enables PFC on an interface.

  ```
  switch(config)#interface ethernet 2
  switch(config-if-Et2)#priority-flow-control on
  ```

17.4.2 Set the Priority Flow Control Priority

The `priority-flow-control priority` command in DCBX mode creates a priority group that pauses priority. Each priority is configured as either drop or no-drop. If a priority that is designated as no-drop is congested, the priority is paused. Drop priorities do not participate in pause.

**Examples**

- The `priority-flow-control priority` command in DCBX mode creates a priority group that pauses priority 5 on Ethernet 2.

  ```
  switch(config)#interface ethernet 2
  switch(config-if-Et2)#priority-flow-control on
  switch(config-if-Et2)# priority-flow-control priority 5 no-drop
  ```

- To enable lossy behavior, use the drop option of the `priority-flow-control priority` command.

  ```
  switch(config)#interface ethernet 2
  switch(config-if-Et2)#priority-flow-control on
  switch(config-if-Et2)#priority-flow-control priority 5 drop
  ```

17.4.3 Disable Priority-Flow-Control (PFC)

To disable priority flow control (PFC) on the configuration mode interface and restore the default packet drop setting on the interface, use the `priority-flow-control priority` command.

**Example**

- To disable PFC, use the `no priority-flow-control` command.

  ```
  switch (config)#interface ethernet 2
  switch(config-if-Et2)#no priority-flow-control
  ```
17.5 Configuring PFC Watchdog

17.5.1 Enabling PFC Watchdog

The `priority-flow-control pause watchdog default timeout` command starts monitoring all the egress queues which have guaranteed bandwidth enabled and for the priorities on which PFC is enabled.

Note

To enable PFC watchdog, user is required to configure guaranteed bandwidth on the tx-queue to be monitored. Also, PFC must be enabled on the port for the traffic flowing into the queue that is being monitored.

Example

- These commands enable the PFC watchdog monitoring on tx-queue 3 of Ethernet 1/1, and configures a PFC congestion timeout of 10 seconds which will error-disable the port if the queue is stuck.

```
switch# config
switch(config)# interface Ethernet1/1
switch(config-if-Et1/1)# priority-flow-control on
switch(config-if-Et1/1)# priority-flow-control priority 3 no-drop
switch(config-if-Et1/1)# tx-queue 3
switch(config-if-Et1/1-txq-3)# bandwidth guaranteed 100
switch(config-if-Et1/1-txq-3)# exit
switch(config-if-Et1/1)# exit
switch(config)# priority-flow-control pause watchdog default timeout 10
```

17.5.2 Enabling PFC Watchdog Queue Recovery

The `priority-flow-control pause watchdog default recovery-time forced` command recovers a stuck queue after the PFC storm ceases. PFC watchdog supports the following two recovery methods.

- Auto Recovery – recover queue(s) after the PFC storm ceases.
- Forced Recovery – recover queue(s) after a fixed duration, irrespective of PFC storm being received.

Note

The default recovery mode is “auto”.

Example

- This command recovers a stuck queue after a fixed duration of 10 seconds.

```
switch(config)# priority-flow-control pause watchdog default recovery-time 10 forced
```

17.5.3 Configuring PFC Watchdog Polling Interval

The `priority-flow-control pause watchdog default polling-interval` command configures the frequency at which queues should be checked for stuck or recovery detection. By default, polling interval is calculated internally or it considers the value configured through CLI.

Note

Configuring a very low polling interval may increase load on the CPU.
Example
- This command configures a polling interval of 10 seconds on the switch.

```
switch(config)# priority-flow-control pause watchdog default polling-interval 10
```

## 17.5.4 Displaying Stuck Queue and Recovery Counters

The `show priority-flow-control counters watchdog` command displays the value of number of times a queue is identified as stuck and recovered. These counters are maintained only for those queues that have PFC watchdog functionality enabled. These counters are cleared when either PFC or PFC watchdog configuration is disabled. Alternatively, `show interfaces priority-flow-control counters watchdog` command can be used to display the counters.

Example
- This command displays the value of number of times the queue was stuck and recovered for all the interfaces.

```
switch#show priority-flow-control counters watchdog
Port  TxQ  Total times stuck  Total times recovered
-------  ----  --------------  ----------------
Et1/1    UC2      2              2
Et1/1    UC3      3              3
Et2/1    UC2     12             12
Et2/1    UC3     31             30
```

- This command displays the value of number of times the queue was stuck and recovered for a specific interface. In this case it is Et1/1.

```
switch#show priority-flow-control interfaces Ethernet 1/1 counters watchdog
Port  TxQ  Total times stuck  Total times recovered
-------  ----  --------------  ----------------
Et1/1    UC2      2              2
Et1/1    UC3      3              3
```

## 17.5.5 PFC Watchdog Non-disruptive Priorities

The PFC Watchdog acts to drop the traffic entering or leaving the port at the stuck PFC priority. Later when the queue recovers, this action is reversed. While applying these actions, some traffic (for all priorities) is dropped on that port. In such case, the `priority-flow-control pause watchdog hardware non-disruptive priority` command can be used to avoid the traffic drop on ports at stuck queues.

This traffic drop can be avoided by configuring specific PFC priorities as non-disruptive. When queues corresponding to these priorities are stuck/recovered, the traffic for other priorities are not impacted.

Example
- This command configures the specific PFC priorities as non-disruptive, and the priority is set to 3.

```
switch(config)#priority-flow-control pause watchdog hardware non-disruptive priority 3
```

- This command configures all the ports, having a subset of non-disruptive priorities as a part of their no-drop priorities, start in non-disruptive mode.

```
switch(config)#priority-flow-control pause watchdog hardware port non-disruptive-only
```
17.5.6 Displaying PFC Watchdog Information

The `show priority-flow-control` command displays the PFC watchdog status information. Note, if the PFC watchdog default timeout value is non-zero then PFC watchdog is active on the switch.

**Example**
- This command displays the PFC watchdog default timeout value, in this show example the timeout value is 3.0 which means the PFC watchdog is active.

```
switch# show priority-flow-control
The hardware supports PFC on priorities 0 1 2 3 4 5 6 7
The PFC watchdog default timeout is 3.0

Port Enabled Priorities Active Note
Et1/1 Yes 34 Yes DCBX disabled
Et1/2 Yes 34 Yes DCBX disabled
Et1/3 Yes 34 Yes DCBX disabled
Et1/4 Yes 34 Yes DCBX disabled
```

The `show interface status errdisabled` command displays the port which is error-disabled due to stuck-queue condition.

**Example**
- This command displays the interface Ethernet Eth1/1 status as errdisabled and the reason.

```
switch# show interface Eth1/1 status errdisabled
Port Name Status Reason
---------- ----------------- ---------
Et1/1 errdisabled stuck-queue
```

The `show priority-flow-control status` command displays the current PFC watchdog details.

**Example**
- This command displays the PFC watchdog configuration details at global and interface level.

```
switch #show priority-flow-control status
The hardware supports PFC on priorities 0 1 2 3 4 5 6 7
The PFC watchdog timeout is 1.0 second(s)
The PFC watchdog recovery-time is 2.0 second(s) (auto)
The PFC watchdog polling-interval is 0.1 second(s)
The PFC watchdog non-disruptive priorities are 3 4
The PFC watchdog port non-disruptive-only is False

E: PFC Enabled, D: PFC Disabled, A: PFC Active, W: PFC Watchdog Enabled

17.6 DCBX and Flow Control Commands

Configuration Commands
- `dcbx application priority`
- `dcbx ets`
- `dcbx mode`
- `no priority-flow-control`
- `platform fm6000 pfc-wm`
- `priority-flow-control`
- `priority-flow-control pause watchdog action`
- `priority-flow-control pause watchdog default`
- `priority-flow-control pause watchdog hardware`
- `priority-flow-control priority`

Show Commands
- `show dcbx`
- `show dcbx application-priority-configuration`
- `show dcbx priority-flow-control-configuration`
- `show dcbx status`
- `show interfaces priority-flow-control`
- `show platform fm6000 pfc-wm`
- `show priority-flow-control`
dcbx application priority

The *dcbx application priority* command assigns a priority rank to the specified traffic class in the application priority table. This table is transmitted on each DCBX-enabled interface.

The *no dcbx application priority* and *default dcbx application priority* commands remove the specified DCBX traffic class – priority assignment by deleting the corresponding *dcbx application priority* command from *running-config*. When the command does not specify a traffic class, all DCBX traffic class priority assignments are removed.

**Command Mode**

Global Configuration

**Command Syntax**

```
dcbx application APPLICATION_TYPE priority rank
no dcbx application [APPLICATION_TYPE priority]
debug dcbx application [APPLICATION_TYPE priority]
```

**Parameters**

- **APPLICATION_TYPE**  traffic class receiving the priority assignment. Options include:
  - *ether ethertype_number*  Ethernet traffic. *Ethertype_number* varies from 1536 to 65535.
  - *iscsi*  iSCSI traffic. Maps to TCP/SCTP ports 860 and 3260.
  - *tcp-sctp port_number*  TCP/SCTP traffic. Port number varies from 1 to 65535.
  - *tcp-sctp-udp port_number*  TCP/SCTP/UDP traffic. Port number varies from 1 to 65535.
  - *udp port_number*  UDP traffic. Port number varies from 1 to 65535.
  - *rank*  priority assigned to traffic class. Values range from 0 to 7.

**Examples**

- These commands tell the DCBX peer that iSCSI frames (TCP ports 860 and 3260) should be assigned the given priority of 5.

```
switch(config)#dcbx application tcp-sctp 860 priority 5
switch(config)#dcbx application tcp-sctp 3260 priority 5
```

- These commands specify a different priority for the two iSCSI traffic ports.

```
switch(config)# dcbx application tcp-sctp 860 priority 3
switch(config)# dcbx application tcp-sctp 3260 priority 4
```

- This command is equivalent to the *dcbx application tcp-sctp* command. The DCBX peer that iSCSI frames are assigned to is given priority 5.

```
switch(config)#dcbx application iscsi priority 5
switch(config)#
```

- These commands prevent the peers from sending anything about the iSCSI frames.

```
switch(config)#no dcbx application tcp-sctp 860 priority
switch(config)#no dcbx application tcp-sctp 3260 priority
```
dcnx ets

The `dcnx ets` command configures the enhanced transmission selection (ETS) to the specified QoS group, and sets the traffic class priority and the bandwidth percentage for the packets in the traffic class.

The `no dcbx ets` and `default ets` commands remove the specified DCBX traffic class – priority assignment by deleting the corresponding `dcnx ets` command from the running-config.

**Command Mode**

Global Configuration

**Command Syntax**

```
dcbx ets [qos map cos <value> traffic-class <value> | traffic-class <value> bandwidth <value>]
no dcbx ets [qos map cos <value> traffic-class <value> | traffic-class <value> bandwidth <value>]
default dcbx ets [qos map cos <value> traffic-class <value> | traffic-class <value> bandwidth <value>]
```

**Parameters**

- `qos` QoS to configure.(The sub options include)
  - `map` QoS map to configure.
  - `cos` CoS value assigned to port. Value ranges from 0 to 7. Default value is 0.
  - `traffic-class` Assigns the traffic-class priority to the QoS map. The value ranges from 0 to 7.
- `traffic-class` Assigns the traffic class priority. The value ranges from 0 to 7. (The sub options include)
  - `bandwidth` The percentage of bandwidth assigned to the packets received from traffic class. The value ranges from 0 to 100 in percentage. The default value is 0.

**Examples**

- This command configures the ETS to the QoS group map and assigns the CoS map value as 7 and sets the traffic class priority to 5.
  ```
  switch(config)#dcbx ets qos map cos 7 traffic-class 5
  ```

- This command configures the ETS to the traffic class and sets the traffic class priority value to 7 and sets the bandwidth value to 70 percent.
  ```
  switch(config)#dcbx ets traffic-class 7 bandwidth 70
  ```
**dcbx mode**

The `dcbx mode` command enables DCBX mode on the configuration mode interface. The switch supports IEEE P802.1Qaz. When DCBX is enabled, two TLVs are added to outgoing LLDPDUs, which instruct the peer on the interface to configure PFC (priority flow control) and the application priority table in the same way as the switch.

The `no dcbx mode`, `default dcbx mode`, and `dcbx mode none` commands disable DCBX on the configuration mode interface by removing the corresponding `dcbx mode` command from `running-config`.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

- `dcbx mode MODE_NAME`
- `no dcbx mode`
- `default dcbx mode`

**Parameters**

- `MODE_NAME` Specifies the DCBX version. Options include:
  - `ieee` IEEE version.
  - `cee` Converged Enhanced Ethernet version.
  - `none` DCBX is disabled.

**Examples**

- These commands enable interface Ethernet 2 to use IEEE DCBX.
  ```
  switch(config)#interface ethernet 2
  switch(config-if-Et2)#dcbx mode ieee
  switch(config-if-Et2)#
  ```

- These commands disable DCBX on interface Ethernet 5.
  ```
  switch(config)#interface ethernet 2
  switch(config-if-Et2)#dcbx mode none
  switch(config-if-Et2)
  ```
no priority-flow-control

The `no priority-flow-control` and `default priority-flow-control` commands disable the priority flow control (PFC) on the configuration mode interface and restore the default packet drop setting on the interface, which takes effect when PFC is re-enabled. The commands delete all corresponding `priority-flow-control` commands from `running-config`.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

```plaintext
no priority-flow-control
default priority-flow-control
```

**Examples**

- These commands disable priority flow control (PFC) on Ethernet interface 3.

  ```plaintext
  switch(config)#interface Ethernet 3
  switch(config-if-Et3)#no priority-flow-control
  switch(config-if-Et3)#
  ```
platform fm6000 pfc-wm

The platform fm6000 pfc-wm command configures the hardware buffer space allocated to the PFC (Priority Flow Control) RX-Private buffer. The command provides options to configure the buffer size and specify when PFC frames are sent to request that a neighbor stop sending traffic. The default values are as follows:

- RX-Private: 18400 bytes
- on (watermark): 9280 bytes
- off (watermark): 1600 bytes

Values that are entered in the command are rounded up to the closest multiple of 16. The RX-Private value must be greater than the off value, which must be larger than the on value.

The no platform fm6000 pfc-wm and default platform fm6000 pfc-wm commands restore the default settings by removing the platform fm6000 pfc-wm command from running-config.

Command Mode
Global Configuration

Command Syntax

```
platform fm6000 pfc-wm [RX-PRIVATE_SIZE] [PFC-ON_WM] [PFC-OFF_WM]
no platform fm6000 pfc-wm
default platform fm6000 pfc-wm
```

The platform fm6000 pfc-wm command must explicitly configure at least one parameter.

Parameters

- **RX-PRIVATE_SIZE** Specifies size of rx-private buffer. Options include:
  - <no parameter> rx-private buffer retains previously configured size.
  - rx-private <18268 to 102400> Size of rx-private buffer (bytes).

- **PFC-ON_WM** Buffer capacity that triggers the switch to send PFC frames. Options include:
  - <no parameter> Parameter retains previously configured value.
  - on <9134 to 102400> Buffer capacity that triggers PFC frames (bytes).

- **PFC-OFF_WM** Buffer capacity that triggers the switch to stop PFC frame transmissions. Options include:
  - <no parameter> Parameter retains previously configured value.
  - off <1536 to 102400> Buffer capacity that turns off PFC frames.

Related Commands
- show platform fm6000 pfc-wm displays the PFC RX-Private buffer memory allocations

Example
- This command configures the rx-private hardware buffer.
  switch(config)#platform fm6000 pfc-wm rx-private 24800 on 16000 off 3200
  switch(config)#
priority-flow-control

The **priority-flow-control** command enables priority flow control (PFC) on the configuration mode interface to pause selected traffic classes.

The **no priority-flow-control** and **default priority-flow-control** commands disable PFC on the configuration mode interface by deleting the corresponding **priority-flow-control** command from **running-config**. The **priority-flow-control priority** command also disables PFC on the configuration mode interface.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

- `priority-flow-control on`
- `no priority-flow-control [on]`
- `default priority-flow-control [on]`

**Example**

- These commands enable PFC on Ethernet interface 3.

```
switch(config)# interface Ethernet 3
switch(config-if-Et3)#priority-flow-control on
```

- These commands disable PFC on Ethernet interface 3.

```
switch(config)# interface Ethernet 3
switch(config-if-Et3)# no priority-flow-control
switch(config-if-Et3)#
```
priority-flow-control pause watchdog action

The **priority-flow-control pause watchdog action** command either drops the traffic on a stuck queue, or error disables the port which has a stuck queue, or notifies if there is no action on the stuck queue. The following actions are performed based on the queue status.

The **no priority-flow-control pause watchdog action** command removes the specified priority-flow-control pause watchdog action configuration by deleting the corresponding **priority-flow-control pause watchdog action** command from **running-config**.

**Command Mode**

  Global Configuration

**Command Syntax**

  ```
  priority-flow-control pause watchdog action
  no priority-flow-control pause watchdog action
  ```

**Parameters**

- **action** PFC watchdog action for stuck transmit queues. Options include.
  - **drop**  Drop traffic on the stuck queue.
  - **errdisable**  Error disable port which has the stuck transmit queue.
  - **notify-only**  No action on the stuck queue.

**Guidelines**

Before enabling the PFC watchdog configuration, configure the guaranteed bandwidth on the tx-queue to be monitored. Also, enable the PFC on the port for the PFC priorities for the traffic flowing into the queue that is being monitored.

**Example**

- These commands enables the **pfc-watchdog monitoring** on tx-queue 3 of Ethernet 1/1, and configures a PFC watchdog action drop and drops the traffic if the queue is a stuck queue.

  ```
  switch# config
  switch(config)# interface Ethernet1/1
  switch(config-if-Et1/1)# priority-flow-control on
  switch(config-if-Et1/1)# priority-flow-control priority 3 no-drop
  switch(config-if-Et1/1)# tx-queue 3
  switch(config-if-Et1/1-txq-3)# bandwidth guaranteed 100
  switch(config-if-Et1/1-txq-3)# exit
  switch(config-if-Et1/1)# exit
  switch(config)# priority-flow-control pause watchdog action drop
  ```
priority-flow-control pause watchdog default

The `priority-flow-control pause watchdog default` command monitors all the egress queues which have guaranteed bandwidth enabled and for the priorities on which PFC is enabled. Guaranteed bandwidth is needed to ensure starvation due to higher priority traffic is not wrongly flagged as a stuck-queue due to congestion. The stuck duration after which the port needs to be error disabled is also configurable.

The `no priority-flow-control pause watchdog default` command removes the specified priority-flow-control pause watchdog configuration by deleting the corresponding `priority-flow-control pause watchdog` command from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**
```
priority-flow-control pause watchdog default
no priority-flow-control pause watchdog default
```

**Parameters**
- `default` Specifies the default value. Options include.
  - `polling-interval` Configures the interval at which the watchdog should poll the queues. The polling interval value ranges from 0.005 to 30 seconds.
  - `recovery-time` Configures recovery-time after which stuck queue should recover and start forwarding. The recovery-time value ranges from 0.01 to 60 seconds.
  - `forced` Force recover any stuck queue(s) after the recovery-time interval, irrespective of whether PFC frames are being received or not.
  - `timeout` Configures timeout after which port should be errdisabled or should start dropping on congested priorities. The timeout value ranges from 0.01 to 60 seconds.

**Guidelines**
Before enabling the PFC watchdog configuration, configure the guaranteed bandwidth on the tx-queue to be monitored. Also, enable the PFC on the port for the PFC priorities for the traffic flowing into the queue that is being monitored.

- **Polling Interval Discrepancy**
  For user configured polling-interval to be valid, it must satisfy the following conditions
  
  When the recovery-mode is auto and timeout, recovery-time, and polling-interval are non-default, polling-interval <= min (timeout, recovery-time) / 2,
  
  When recovery-mode is forced or recovery-time is not configured, polling-interval <= (timeout / 2)
  
  For better functioning of PFC Watchdog, when user configured polling interval is too large compared to either timeout or recovery time values, Watchdog will use auto calculated value instead of user configured value until the discrepancy is resolved. Also, CLI warning and syslog messages are generated to inform user of the discrepancy.

- **CLI Warnings**
  When there is discrepancy between timeout and polling-interval, the format of the message is as shown below
  
  `! User configured polling interval <user-cfgd polling-interval> second(s) is greater than half of timeout <user-cfgd timeout> second(s). Setting polling-interval to <to-be-used polling-interval> second(s)`
When there is discrepancy between recovery-time and polling-interval, the format of the message is as shown below

! User configured polling interval <user-cfgd polling-interval> second(s) is greater than half of recovery-time <user-cfgd recovery-time> second(s). Setting polling-interval to <to-be-used polling-interval> second(s)

Examples

- These commands enables the **pfc-watchdog monitoring** on tx-queue 3 of Ethernet 1/1, and configures a PFC congestion timeout of 10 seconds which will error-disable the port if the queue is stuck.

```bash
switch# config
switch(config)# interface Ethernet1/1
switch(config-if-Et1/1)# priority-flow-control on
switch(config-if-Et1/1)# priority-flow-control priority 3 no-drop
switch(config-if-Et1/1)# tx-queue 3
switch(config-if-Et1/1-txq-3)# bandwidth guaranteed 100
switch(config-if-Et1/1-txq-3)# exit
switch(config-if-Et1/1)# exit
switch(config)# priority-flow-control pause watchdog default timeout 10
```

- These commands enables the **pfc-watchdog monitoring** on tx-queue 3 of Ethernet 1/1, and configures a PFC forced recovery-time interval of 30 seconds after which the stuck queue(s) are recovered, irrespective of whether PFC frames are being received or not.

```bash
switch# config
switch(config)# interface Ethernet1/1
switch(config-if-Et1/1)# priority-flow-control on
switch(config-if-Et1/1)# priority-flow-control priority 3 no-drop
switch(config-if-Et1/1)# tx-queue 3
switch(config-if-Et1/1-txq-3)# bandwidth guaranteed 100
switch(config-if-Et1/1-txq-3)# exit
switch(config-if-Et1/1)# exit
switch(config)# priority-flow-control pause watchdog default recovery-time 30 forced
```

- These commands enables the **pfc-watchdog monitoring** on tx-queue 3 of Ethernet 1/1, and configures a PFC polling-interval of 20 seconds after which queue is polled.

```bash
switch# config
switch(config)# interface Ethernet1/1
switch(config-if-Et1/1)# priority-flow-control on
switch(config-if-Et1/1)# priority-flow-control priority 3 no-drop
switch(config-if-Et1/1)# tx-queue 3
switch(config-if-Et1/1-txq-3)# bandwidth guaranteed 100
switch(config-if-Et1/1-txq-3)# exit
switch(config-if-Et1/1)# exit
switch(config)# priority-flow-control pause watchdog default polling-interval 20
```
priority-flow-control pause watchdog hardware

The `priority-flow-control pause watchdog hardware` command configures specific PFC priorities as non-disruptive. This will avoid traffic drop on queues corresponding to these priorities are stuck/recovered, the traffic for other priorities are not impacted.

The `no priority-flow-control pause watchdog hardware` command removes the specified priority-flow-control pause watchdog non-disruptive configuration by deleting the corresponding `priority-flow-control pause watchdog hardware` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
priority-flow-control pause watchdog hardware
no priority-flow-control pause watchdog hardware
```

**Parameters**

- `hardware` Configure PFC priority through hardware. Options include.
  - `non-disruptive` PFC watchdog non-disruptive configuration. The priority value ranges from 0 to 7.

**Guidelines**

Before enabling the PFC watchdog configuration, configure the guaranteed bandwidth on the tx-queue to be monitored. Also, enable the PFC on the port for the PFC priorities for the traffic flowing into the queue that is being monitored.

**Example**

- These commands enables the `pfc-watchdog monitoring` on tx-queue 3 of Ethernet 1/1, and configures PFC priorities as non-disruptive on PFC priorities 3 and 4.

```
switch# config
switch(config)# interface Ethernet1/1
switch(config-if-Et1/1)# priority-flow-control on
switch(config-if-Et1/1)# priority-flow-control priority 3 no-drop
switch(config-if-Et1/1)# tx-queue 3
switch(config-if-Et1/1-txq-3)# bandwidth guaranteed 100
switch(config-if-Et1/1-txq-3)# exit
switch(config-if-Et1/1)# exit
switch(config)# priority-flow-control pause watchdog hardware non-disruptive priority 3 4
```
priority-flow-control priority

The **priority-flow-control priority** command configures the packet resolution setting on the configuration mode interface. This setting determines if packets are dropped when priority flow control (PFC) is enabled on the interface. Packets are dropped by default.

The **no priority-flow-control priority** and **default priority-flow-control priority** commands restore the default packet drop setting on the configuration mode interface by deleting the corresponding **priority-flow-control priority** command from **running-config**. The **priority-flow-control priority** command also restores the default setting on the configuration mode interface.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

```
priority-flow-control priority pack-drop
no priority-flow-control priority
default priority-flow-control priority
```

**Parameters**

- **pack-drop** denotes the interfaces. Options include:
  - **drop**  Packets are dropped. Default setting.
  - **no drop**  Packets are not dropped.

**Examples**

- These commands in DCBX mode create a priority group that pauses dot1p priority 5 on Ethernet 2.
  ```
  switch(config)#interface ethernet 2
  switch(config-if-Et2)#priority-flow-control on
  switch(config-if-Et2)# priority-flow-control priority 5 no-drop
  ```

- These commands enable lossy behavior.
  ```
  switch(config)#interface ethernet 2
  switch(config-if-Et2)#priority-flow-control on
  switch(config-if-Et2)#priority-flow-control priority 5 drop
  ```

- These commands remove the priority group that pauses dot1p priority 5 on Ethernet 2.
  ```
  switch(config)#interface ethernet 2
  switch(config-if-Et2)# priority-flow-control on
  switch(config-if-Et2)# no priority-flow-control priority
  ```
show dcbx

The show dcbx command list DCBX status and the interfaces on which DCBX is enabled.

Command Mode
EXEC

Command Syntax
show dcbx [INTERFACE]

Parameters
- INTERFACE Interface type and number. Options include:
  - <no parameter> all configured DCBX interfaces.
  - ethernet e-num Ethernet interface specified by e-num.

Examples
- This command displays the DCBX status for Ethernet 50.
  switch#show dcbx Ethernet 50
  Ethernet50:
    IEEE DCBX is enabled and active
    Last LLDPDU received on Thu Feb 14 12:06:01 2013
    No priority flow control configuration TLV received
    No application priority configuration TLV received
  switch#
- This command displays the DCBX status for Ethernet 50 when Priority Flow Control (PFC) is not enabled.
  switch#show dcbx Ethernet 50
  Ethernet50:
    IEEE DCBX is enabled and active
    Last LLDPDU received on Thu Feb 14 12:08:29 2013
    - PFC configuration: willing
    - not capable of bypassing MACsec
    - supports PFC on up to 4 traffic classes
    - PFC enabled on priorities: 5 7
    - WARNING: peer PFC configuration does not match the local PFC configuration
    - Application priority configuration:
      - 2 application priorities configured:
        tcp-sctp 860 priority 5
        tcp-sctp 3260 priority 5
  switch#
show dcbx application-priority-configuration

The show dcbx application-priority-configuration command displays the DCBX peer application priority configuration.

**Command Mode**

EXEC

**Command Syntax**

```plaintext
show dcbx [INTERFACE] application-priority-configuration
```

**Parameters**

- **INTERFACE** Interface type and number. Options include:
  - <no parameter> All configured DCBX interfaces.
  - ethernet e-num Ethernet interface specified by e-num.

**Guidelines**

This command and the show priority-flow-control command function identically.

**Examples**

- This command displays the DCBX peer application priority configuration for all DCBX-enabled interfaces.

```
switch# show dcbx application-priority-configuration
Ethernet1:
  Last LLDPDU received on Thu Feb 14 10:52:20 2013
  No application priority configuration TLV received
Ethernet2:
  Last LLDPDU received on Thu Feb 14 10:52:20 2013
  No application priority configuration TLV received
...
Ethernet50:
  Last LLDPDU received on Thu Feb 14 12:08:29 2013
  - Application priority configuration:
    2 application priorities configured:
    tcp-sctp 860 priority 5
    tcp-sctp 3260 priority 5
switch#
```
show dcbx priority-flow-control-configuration

The `show dcbx priority-flow-control-configuration` command displays the IEEE DCBX peer priority flow control configurations.

**Command Mode**
- EXEC

**Command Syntax**
```
show dcbx [INTERFACE] priority-flow-control-configuration
```

**Parameters**
- `INTERFACE` Interface type and number. Options include:
  - `<no parameter>` all configured DCBX interfaces.
  - `ethernet e-num` Ethernet interface specified by `e-num`.

**Examples**
- This command displays the DCBX peer priority flow control configuration for the DCBX-enabled interfaces on the device.

  ```
  switch#show dcbx priority-flow-control-configuration
  Ethernet1:
  Last LLDPDU received on Thu Feb 14 10:52:20 2013
  No priority flow control configuration TLV received
  Ethernet2:
  Last LLDPDU received on Thu Feb 14 10:52:20 2013
  No priority flow control configuration TLV received
  ...
  Ethernet50:
  Last LLDPDU received on Thu Feb 14 12:11:29 2013
  - PFC configuration: willing
    not capable of bypassing MACsec
    supports PFC on up to 4 traffic classes
    PFC enabled on priorities: 5 7
  WARNING: peer PFC configuration does not match the local PFC configuration
  switch#
  ```
show dcbx status

The `show dcbx status` command displays the DCBX status on the interfaces on which DCBX is enabled.

**Command Mode**

`EXEC`

**Command Syntax**

`show dcbx [INTERFACE] status`

**Parameters**

- `INTERFACE` Interface type and number. Options include:
  - `<no parameter>` all configured DCBX interfaces.
  - `ethernet e-num` Ethernet interface specified by `e-num`.

**Examples**

- This command displays the DCBX status for the DCBX-enabled interfaces.

```
switch# show dcbx status
Ethernet1:
  Last LLDPDU received on Thu Feb 14 10:52:20 2013
Ethernet2:
  Last LLDPDU received on Thu Feb 14 10:52:20 2013
Ethernet50:
  IEEE DCBX is enabled and active
  Last LLDPDU received on Thu Feb 14 12:11:54 2013
switch#
```
show interfaces priority-flow-control

The show interfaces priority-flow-control command displays the status of PFC on all interfaces.

Command Mode
EXEC

Command Syntax
show interfaces [INTERFACE] priority-flow-control [INFO_LEVEL]

Parameters
- **INTERFACE** Interface type and numbers. Options include:
  - <no parameter> Display information for all interfaces.
  - ethernet e_range Ethernet interface range specified by e_range.
  - loopback l_range Loopback interface specified by l_range.
  - management m_range Management interface range specified by m_range.
  - port-channel p_range Port-Channel interface range specified by p_range.
  - vlan v_range VLAN interface range specified by v_range.
  - vxlan vx_range VXLAN interface range specified by vx_range.

Valid range formats include number, number range, or comma-delimited list of numbers and ranges.

- **INFO_LEVEL** specifies the type of information displayed. Options include:
  - <no parameter> Displays information about all DCBX neighbor interfaces.
  - status Displays the DCBX status.
  - counters Displays the DCBX counters.

Guidelines
This command and the show priority-flow-control command function identically.

Examples
- This command displays the PFC for all interfaces.

```
switch#show interfaces priority-flow-control
The hardware supports PFC on priorities 0 1 2 3 4 5 6 7

<table>

switch#
```
show platform fm6000 pfc-wm

The `show platform fm6000 pfc-wm` command displays the buffer space allocated to the RX-Private buffer and buffer levels that trigger PFC frame transmission activities.

**Command Mode**

Privileged EXEC

**Command Syntax**

`show platform fm6000 pfc-wm`

**Related Commands**

- `priority-flow-control priority` specifies the PFC RX-Private buffer memory allocation.

**Example**

- This command displays the rx-private hardware buffer memory allocation.

```
switch# show platform fm6000 pfc-wm
Pfc_Rx_Private_WM: 24800 Bytes
Pfc_On_WM: 16000 Bytes
Pfc_Off_WM: 3200 Bytes
switch#
```
show priority-flow-control

The `show priority-flow-control` command displays the status and other PFC and PFC watchdog information on all interfaces if no specific interface is specified.

**Command Mode**

EXEC

**Command Syntax**

```
show priority-flow-control [status | counters | interfaces]
```

**Parameters**

- `Interfaces` specifies the interface for which the information is displayed. Options include:
  - `Ethernet` hardware Ethernet interface
  - `Loopback` Loopback interface
  - `Management` Management interface
  - `Port-Channel` Lag interface
  - `Recirc-Channel` Recirculation interface
  - `Tunnel` Tunnel interface
  - `Vlan` VLAN interface
  - `Vxlan` Vxlan Tunnel Interface
- `status` displays the interface PFC status.
- `counters` displays the interface PFC counters. Options include:
  - `detail` displays the DCBX counters for each priority class. This option is available only on Trident switches.
  - `watchdog` displays the PFC watchdog counters.

**Examples**

- This command displays the PFC status on all interfaces.
  
  ```
  switch# show priority-flow-control
  The hardware supports PFC on priorities 0 1 2 3 4 5 6 7
  Port   Enabled Priorities Active Note
  Et1    No               No
  Et2    No               No
  ...
  Et50   Yes             5   Yes
  ...
  Port   RxPfc   TxPfc
  Et1    0       0
  Et2    0       0
  ...
  Et50   0       0
  ```

This command displays the PFC watchdog status. If PFC watchdog default timeout is non-zero (in this case it’s 3.0) then PFC watchdog is actively running on the switch.

```
switch# show priority-flow-control
The hardware supports PFC on priorities 0 1 2 3 4 5 6 7
The PFC watchdog default timeout is 3.0

Port   Enabled Priorities Active Note
Et1/1   Yes       34      Yes    DCBX disabled
Et1/2   Yes       34      Yes    DCBX disabled
Et1/3   Yes       34      Yes    DCBX disabled
Et1/4   Yes       34      Yes    DCBX disabled
...
```

This command displays the current value of these counters for all the interfaces being monitored by PFC watchdog. Alternatively, `show interfaces priority-flow-control counters watchdog` command can be used for the same.

```
switch # show priority-flow-control counters watchdog
Port       TxQ   Total times stuck   Total times recovered
----------   ----   --------------   --------------
Et1/1      UC2             2             2
Et1/1      UC3             3             3
Et2/1      UC2            12            12
Et2/1      UC3            31            30
```

This command displays the current value of these counters for a specific subset of interfaces. Alternatively, `show interfaces <name> priority-flow-control counters watchdog` command can be used for the same.

```
switch # show priority-flow-control interfaces Ethernet 1/1 counters watchdog
Port       TxQ   Total times stuck   Total times recovered
----------   ----   --------------   --------------
Et1/1      UC2             2             2
Et1/1      UC3             3             3
```

This command displays the configuration details of PFC watchdog at global and interface level.

```
switch # show priority-flow-control status
The hardware supports PFC on priorities 0 1 2 3 4 5 6 7
The PFC watchdog timeout is 1.0 second(s)
The PFC watchdog recovery-time is 2.0 second(s) (auto)
The PFC watchdog polling-interval is 0.1 second(s)
The PFC watchdog non-disruptive priorities are 3 4
The PFC watchdog port non-disruptive-only is False

E: PFC Enabled, D: PFC Disabled, A: PFC Active, W: PFC Watchdog Enabled

Chapter 18

LLDP

This chapter describes Link Layer Discovery Protocol (LLDP) configuration tasks. Refer to the command descriptions for information about commands used in this chapter.

Sections in this chapter include:

- Section 18.1: LLDP Introduction
- Section 18.2: LLDP Overview
- Section 18.3: LLDP Configuration Procedures
- Section 18.4: LLDP Configuration Commands

18.1 LLDP Introduction

Link Layer Discovery Protocol (LLDP) lets Ethernet network devices to advertise details about themselves, such as capabilities, identification, and device configurations to directly connected devices on the network that are also using LLDP.

18.2 LLDP Overview

LLDP is a discovery protocol that allows devices to advertise information about themselves to peer devices that are on the same physical LAN and store information about the network. LLDP allows a device to learn higher layer management reachability and connection endpoint information from adjacent devices.

Each switch with an active LLDP agent sends and receives messages on all physical interfaces enabled for LLDP transmission. These messages are sent periodically and are typically configured for short time intervals to ensure that accurate information is always available. These messages are then stored for a configurable period of time, and contained within the received packet. The message information expires and is discarded when the configured value is met. The only other time an advertisement is sent is when a relevant change takes place in the switch. If information changes for any reason, the LLDP agent is notified and will send out and update the new values.
18.2.1 LLDP Data Units

A single LLDP Data Unit (LLDPDU) is transmitted in a single 802.3 Ethernet frame. The basic LLDPDU includes a header and a series of type-length-value elements (TLVs). Each TLV advertises different types of information, such as its device ID, type, or management addresses.

LLDP advertises the following TLVs by default:

- port-description
- system-capabilities
- system-description
- system-name
- management-address
- port-vlan

18.2.2 Transmission and Reception

Every device that uses LLDP has its own LLDP agent. The LLDP agent is responsible for the reception, transmission, and management of LLDP. When LLDP is enabled on a port, transmission and reception of LLDPDUs are both enabled by default, but the agent can be configured to only transmit or only receive.

**Transmission**

When LLDP transmission is enabled, the LLDP agent advertises information about the switch to neighbors at regular intervals. Each transmitted LLDPDU contains the mandatory TLVs, and any enabled optional TLVs.

**Reception**

When LLDP reception is enabled, the LLDP agent receives and stores advertised information from neighboring devices.

18.2.3 Storing LLDP Information

Whenever the switch receives a valid and current LLDP advertisement from a neighbor, it stores the information in a Simple Network Management Protocol (SNMP) management information base (MIB).

18.2.4 Guidelines and Limitations

LLDP has the following configuration limitations:

- LLDP must be enabled globally before it can be enabled on an interface.
- LLDP is not supported on virtual interfaces.
- LLDP can discover only one device per port.
18.3 LLDP Configuration Procedures

These sections describe the following configuration processes:

- Section 18.3.1: Enabling LLDP Globally
- Section 18.3.2: Enabling LLDP on an Interface
- Section 18.3.3: Optional LLDP Parameters
- Section 18.3.4: Clearing LLDP Statistics
- Section 18.3.5: Displaying LLDP Information

18.3.1 Enabling LLDP Globally

The `lldp run` command globally enables LLDP on the Arista switch. Once LLDP is enabled, the switch will transmit advertisements from the ports that are configured to send TLVs. The neighbor information table is populated as advertisements from the neighbors arrive on the ports.

Example

- This command enables LLDP globally on the Arista switch.

  ```
  switch(config)# lldp run
  switch(config)#
  ```

18.3.2 Enabling LLDP on an Interface

When enabling LLDP, it is enabled on all interfaces by default. By using the `lldp transmit` and `lldp receive` commands, LLDP can be enabled or disabled on individual interfaces or configured to only send or only receive LLDP packets.

Examples

- These commands enable Ethernet port 3/1 to transmit LLDP packets.

  ```
  switch(config)# interface ethernet 3/1
  switch(config-if-Et3/1)# lldp transmit
  switch(config-if-Et3/1)#
  ```

- These commands enable Ethernet port 3/1 to receive LLDP packets.

  ```
  switch(config)# interface ethernet 3/1
  switch(config-if-Et3/1)# lldp receive
  switch(config-if-Et3/1)#
  ```

18.3.3 Optional LLDP Parameters

The following sections describe these tasks:

- Section 18.3.3.1: Setting the LLDP Timer
- Section 18.3.3.2: Setting the LLDP Hold Time
- Section 18.3.3.3: Setting the LLDP Re-initialization Timer
- Section 18.3.3.4: Setting the IP Management Address to be used in the TLV
- Section 18.3.3.5: Selecting the LLDP TLVs
- Section 18.3.3.6: Configuring LLDP for Power over Ethernet

18.3.3.1 Setting the LLDP Timer

The `lldp timer` command specifies the time in seconds between LLDP updates sent by the switch.
Examples

- This command specifies that the LLDP updates should be sent every 120 seconds.
  
  switch(config)# lldp timer 120
  switch(config)#

- This command reverts the LLDP timer to its default value of 30 seconds.
  
  switch(config)# no lldp timer 120
  switch(config)#

18.3.3.2 Setting the LLDP Hold Time

The `lldp hold-time` command sets the amount of time a receiving device should retain the information sent by the device.

Examples

- This command specifies that the receiving device should retain the information for 180 seconds before discarding it.
  
  switch(config)# lldp hold-time 180
  switch(config)#

- This command reverts the LLDP hold time and to the default value of 120 seconds.
  
  switch(config)# no lldp hold-time 180
  switch(config)#

18.3.3.3 Setting the LLDP Re-initialization Timer

The `lldp run` command specifies the amount in time in seconds to delay the re-initialization attempt by the switch.

Example

- This command specifies that the switch waits 10 seconds before attempting to re-initialize.
  
  switch(config)# lldp timer reinitialization 10
  switch(config)#

18.3.3.4 Setting the IP Management Address to be used in the TLV

The `lldp management-address` command specifies the IP management address or the IP address of the VRF interface in LLDP type-length-value (TLV) triplets.

Example

- This command specifies the IP management address to be used in the TLV.
  
  switch(config)# lldp management-address ethernet 3/1
  switch(config)#

18.3.3.5 Selecting the LLDP TLVs

The `lldp tlv transmit` command specifies which type, length, and value elements (TLVs) are to be included in LLDP packets. The `no lldp tlv transmit` command removes the TLV configuration.

Example

- This command enables the system descriptions to be included in the TLVs.
  
  switch(config)# lldp tlv transmit system-description
  switch(config)#
18.3.3.6 Configuring LLDP for Power over Ethernet

Initial power over Ethernet (PoE) power-level negotiation with a powered device (PD) takes place in hardware (see Configuring Power over Ethernet (PoE)). Once hardware negotiation has taken place, IEEE 802.3at Power Via MDI type-length-value elements (TLVs) are included by default in LLDP packets sent to connected PDs to allow LLDP to further negotiate power needs. LLDP allows the switch to deal with more granular power requests from PDs, and also allows dynamic power-level setting. TLVs received from connected power-sourcing equipment (PSE) are ignored.

Note

Power Via MDI TLVs are not sent (even when enabled) under the following circumstances: 1) there is a user-configured power limit on the port, or 2) hardware negotiation sets the power to higher than class 4 because IEEE 802.3bt, which increases the maximum power output for PoE, is not yet supported by LLDP.

To disable Power Via MDI TLVs globally, use the `no lldp tlv transmit` command and specify the Power Via MDI TLV. Hardware negotiation and manual power limits will remain in effect.

Example

- This command disables the sending of Power Via MDI TLVs globally.
  ```
  switch(config)# no lldp tlv transmit power-via-mdi
  switch(config)#
  ```

To disable Power Via MDI TLVs on an individual interface, use the `poe negotiation lldp disabled` command. Hardware negotiation and manual power limits will remain in effect.

Example

- These commands disable the sending of Power Via MDI TLVs on Ethernet interface 5.
  ```
  switch(config)# interface ethernet 5
  switch(config-if-Et5)# poe negotiation lldp disabled
  switch(config-if-Et5)#
  ```

New LLDP Fields Defined by IEEE 802.3at-2009

Arista switches do not support the following new LLDP/SNMP fields defined in IEEE standard 802.3at-2009:
  - **Power type** \( aLdpXdot3RemPowerType \)
  - **Power source** \( aLdpXdot3RemPowerSource \)
  - **Power priority** \( aLdpXdot3RemPowerPriority \)
  - **PD requested power value** \( aLdpXdot3RemPDRequestedPowerValue \)
  - **PSE allocated power value** \( aLdpXdot3RemPSEAllocatedPowerValue \)

18.3.4 Clearing LLDP Statistics

- Section 18.3.4.1: Clear LLDP Counters
- Section 18.3.4.2: Clear LLDP Table

18.3.4.1 Clear LLDP Counters

The `clear lldp counters` command resets the LLDP traffic counters to zero.
Example

- This command resets the traffic counters to zero.

```
switch# clear lldp counters
switch#
```

18.3.4.2 Clear LLDP Table

The `clear lldp table` command clears neighbor information from the LLDP table.

Example

- This command clears neighbor information from the LLDP table.

```
switch# clear lldp table
switch#
```

18.3.5 Displaying LLDP Information

- Section 18.3.5.1: Viewing LLDP Global Information
- Section 18.3.5.2: Viewing LLDP Local Information
- Section 18.3.5.3: Viewing LLDP Neighbors
- Section 18.3.5.4: Viewing LLDP Traffic

18.3.5.1 Viewing LLDP Global Information

The `show lldp` command displays LLDP information.

Examples

- This command displays global information about LLDP.

```
switch# show lldp
LLDP transmit interval : 60 seconds
LLDP transmit holdtime : 120 seconds
LLDP reinitialization delay : 2 seconds
LLDP Management Address VRF : default

Enabled optional TLVs:
  Port Description
  System Name
  System Description
  System Capabilities
  Management Address (Management0)
  IEEE802.1 Port VLAN ID
  IEEE802.3 Link Aggregation
  IEEE802.3 Maximum Frame Size

  Port    Tx Enabled  Rx Enabled
  Et3/1   Yes         Yes

<-------OUTPUT OMITTED FROM EXAMPLE-------->

switch#
```
Chapter 18: LLDP

LLDP Configuration Procedures

- This command displays LLDP information.
  ```
  switch# show lldp ethernet interface 3/1
  LLDP transmit interval : 30 seconds
  LLDP transmit holdtime : 120 seconds
  LLDP reinitialization delay : 2 seconds
  LLDP Management Address VRF : default
  ```
  
  Enabled optional TLVs:
  - Port Description
  - System Name
  - System Description
  - System Capabilities

- **18.3.5.2 Viewing LLDP Local Information**

  The `show lldp local-info` command displays the information contained in the LLDP TLVs to be sent about the local system.

  **Example**

  - This command displays information contained in the TLVS about the local systems.
    ```
    switch# show lldp local-info management 1
    Local System:
    - Chassis ID type: MAC address (4)
      Chassis ID : 001c.730f.11a8
    - System Name: "switch.aristanetworks.com"
    - System Description: "Arista Networks EOS version 4.13.2F running on an Arista Networks DCS-7150S-64-CL"
    - System Capabilities : Bridge, Router
      Enabled Capabilities: Bridge
    Interface Management1:
    - Port ID type: Interface name (5)
      Port ID : "Management1"
    - Port Description: ""
    - Management Address Subtype: IPv4 (1)
      Management Address : 172.22.30.154
      Interface Number Subtype : ifIndex (2)
      Interface Number : 999001
      OID String : 
      - IEEE802.1 Port VLAN ID: 0
      - IEEE802.1/IEEE802.3 Link Aggregation
        Link Aggregation Status: Not Capable (0x00)
        Port ID : 0
      - IEEE802.3 Maximum Frame Size: 1518 bytes
    ```

- **18.3.5.3 Viewing LLDP Neighbors**

  The `show lldp neighbors` command displays information about LLDP neighbors.
Example

- This command shows information about LLDP neighbors.

```
switch# show lldp neighbor
Last table change time  : 0:12:33 ago
Number of table inserts  : 33
Number of table deletes  : 0
Number of table drops    : 0
Number of table age-outs : 0

Port   Neighbor Device ID             Neighbor Port ID           TTL
Et3/1   tgl04.sjc.aristanetworks.com   Ethernet3/2                120

Ma1/1   dcl-rack11-tor1.sjc           1/1                         120
```

Example

- This command displays detailed information about the neighbor Ethernet 3/1.

```
switch# show lldp neighbor ethernet 3/1
Last table change time  : 0:16:24 ago
Number of table inserts  : 33
Number of table deletes  : 0
Number of table drops    : 0
Number of table age-outs : 0

Port   Neighbor Device ID             Neighbor Port ID           TTL
Et3/1   tgl04.sjc.aristanetworks.com   Ethernet3/2                120
```

18.3.5.4 Viewing LLDP Traffic

The `show lldp counters` command displays the LLDP traffic information for the switch.

Example

- This command displays the LLDP counters on the switch.

```
switch# show lldp counters
Port   Tx Frames Tx Length Exceeded
Et20    69485                  0
Et21    69394                  0
Et22    69203                  0
Et23    57546                  0
Et24                  0             0
Ma1     69665                  0

Port   Rx Frames Rx Errors Rx Discard TLVs Discard TLVs Unknown
Et20    69470             0             0             0             0
Et21    69383             0             0             0             0
Et22    69143             0             0             0             0
Et23    55370             0             0             0             0
Et24                  0             0             0             0
Ma1     69078         69078             0         69078             0
```

switch#
18.4 LLDP Configuration Commands

Global Configuration Commands
- lldp hold-time
- lldp management-address
- lldp management-address vrf
- lldp run
- lldp timer
- lldp timer reinitialization
- lldp tlv transmit

Interface Configuration Commands – Ethernet Interface
- lldp receive
- lldp transmit
- poe negotiation lldp disabled

Privileged EXEC Commands
- clear lldp counters
- clear lldp table

EXEC Commands
- show lldp
- show lldp counters
- show lldp local-info
- show lldp neighbors
**clear lldp counters**

The **clear lldp counters** command resets the LLDP counters to zero.

**Command Mode**

Privileged EXEC

**Command Syntax**

```
clear lldp counters [SCOPE]
```

**Parameters**

- **SCOPE**  Session affected by command. Options include:
  - `<no parameter>` command affects counters on all CLI sessions.
  - `session` clears LLDP counters for the current CLI session only.

**Examples**

- This command resets all the LLDP counters to zero.
  ```
  switch(config)# clear lldp counters
  switch(config)#
  ```

- This command resets only the LLDP counters for the current CLI session.
  ```
  switch(config)# clear lldp counters session
  switch(config)#
  ```
clear lldp table

The `clear lldp table` command clears neighbor information from the LLDP table.

**Command Mode**
Privileged EXEC

**Command Syntax**
```
clear lldp table
```

**Example**
- This command clears neighbor information from the LLDP table.
  ```
  switch(config)# clear lldp table
  switch(config)#
  ```
**lldp hold-time**

The **lldp hold-time** command specifies the amount of time a receiving device should maintain the information sent by the device before discarding it.

**Command Mode**
- Global Configuration

**Command Syntax**

```
lldp hold-time period
no lldp hold-time
default lldp hold-time
```

**Parameters**

- **period**  The amount of time a receiving device should hold LLDPDU information before discarding it. Value ranges from 10 to 65535 second; default value is 120 seconds.

**Examples**

- This command sets the amount of time before the receiving device discards LLDPDU information to 180 seconds.

  ```
  switch(config)# lldp hold-time 180
  switch(config)#
  ```

- This command restores the hold-time to its default value of 120 seconds.

  ```
  switch(config)# no lldp hold-time 180
  switch(config)#
  ```
lldp management-address

The `lldp management-address` command enables the user to add the IP management address used for LLDP type-length-value (TLV).

**Command Mode**

Global Configuration

**Command Syntax**

```
lldp management-address INTERFACE
no lldp management-address [INTERFACE]
default lldp management-address [INTERFACE]
```

**Parameters**

- `INTERFACE` Interface type and number. Options include:
  - `all` all interfaces.
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-Channel Interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.

**Examples**

- This command specifies the IP management address to be used in the TLV.
  ```
  switch(config)# lldp management-address ethernet 3/1
  switch(config)#
  ```

- This command removes the IP management address used in the TLV.
  ```
  switch(config)# no lldp management-address ethernet 3/1
  switch(config)#
  ```

- This command specifies that VLAN 200 is used in the TLV.
  ```
  switch(config)# lldp management-address vlan 200
  switch(config)#
  ```

- This command removes the VLAN ID used in the TLV.
  ```
  switch(config)# no lldp management-address vlan 200
  switch(config)#
  ```
**Ildp management-address vrf**

The **Ildp management-address vrf** command enables the user to add the IP address of the VRF interface used in LLDP type-length-value (TLV).

**Command Mode**

Global Configuration

**Command Syntax**

```
Ildp management-address vrf VRF_INSTANCE
no Ildp management-address vrf VRF_INSTANCE
default Ildp management-address vrf VRF_INSTANCE
```

**Parameters**

- **VRF_INSTANCE** specifies the VRF instance.

**Examples**

- This command specifies the management address VRF to be used in the TLV.
  ```
  switch(config)# Ildp management-address vrf test 1
  switch(config)#
  ```

- This command removes the management VRF used in the TLV.
  ```
  switch(config)# no Ildp management-address vrf test 1
  switch(config)#
  ```
**lldp receive**

The `lldp receive` command enables LLDP packets on an interface. The `no lldp receive` command disables the acceptance of LLDP packets.

**Command Mode**
- Interface-Ethernet configuration
- Interface-Management configuration

**Command Syntax**
- `lldp receive`
- `no lldp receive`
- `default lldp receive`

**Examples**
- These commands enable the reception of LLDP packets on Ethernet interface 4/1.
  ```
  switch(config)#interface ethernet 4/1
  switch(config-if-Et4/1)#lldp receive
  switch(config-if-Et4/1)#
  ```
- These commands disable LLDP the reception of LLDP packets on Ethernet interface 4/1.
  ```
  switch(config)#interface ethernet 4/1
  switch(config-if-Et4/1)# no lldp receive
  switch(config-if-Et4/1)#
  ```
**lldp run**

The *lldp run* command enables LLDP on the Arista switch.

**Command Mode**
Global Configuration

**Command Syntax**
- `lldp run`
- `no lldp run`
- `default lldp run`

**Examples**
- This command enables LLDP globally on the Arista switch.
  
  switch(config)# lldp run
  switch(config)#

- This command disables LLDP globally on the Arista switch.
  
  switch(config)# no lldp run
  switch(config)#
**lldp timer**

The `lldp timer` command specifies the amount of time a receiving device should maintain the information sent by the device before discarding it. The `no lldp timer` command removes the configured LLDP timer.

**Command Mode**
- Global Configuration

**Command Syntax**
```
lla dp timer transmission_time
no lldp timer
default lldp timer
```

**Parameters**
- `transmission_time` the period of time at which LLDPDUs are transmitted. Values range from 5 to 32768 seconds; the default is 30 seconds.

**Examples**
- This command configures a period of 80 seconds at which the LLDPDUs are transmitted.
  ```
  switch(config)# lldp timer 180
  switch(config)#
  ```
- This command removes the configured period of time at which the LLDPDUs are transmitted.
  ```
  switch(config)# no lldp timer 180
  switch(config)#
  ```
**lldp timer reinitialization**

The **lldp timer reinitialization** command sets the time delay in seconds for LLDP to initialize.

**Command Mode**
- Global Configuration

**Command Syntax**

```plaintext
lldp timer reinitialization delay
no lldp timer reinitialization
default lldp timer reinitialization
```

**Parameters**
- `delay` the amount of time the device should wait before re-initialization is attempted. Value ranges from 1 to 20 seconds; default value is 2 seconds.

**Examples**
- This command specifies that the switch should wait 10 seconds before attempting to re-initialize.
  ```plaintext
  switch(config)# lldp timer reinitialization 10
  switch(config)#
  ```
- This command restores the default initialization delay of 2 seconds.
  ```plaintext
  switch(config)# no lldp timer reinitialization 10
  switch(config)#
  ```
lldp tlv transmit

The lldp tlv transmit command allows the user to specify the type-length-values (TLVs) to include in LLDP packets.

Command Mode

Global Configuration

Command Syntax

```
lldp tlv transmit TLV_NAME
no lldp tlv transmit TLV_NAME
default lldp tlv transmit TLV_NAME
```

Parameters

- **TLV_NAME** Options include:
  - link-aggregation specifies the link aggregation TLV.
  - management-address specifies the management address TLV.
  - max-frame-size specifies the Frame size TLV.
  - port-description specifies the port description TLV.
  - port-vlan specifies the port VLAN ID TLV.
  - power-via-mdi specifies the power over Ethernet TLV.
  - system-capabilities specifies the system capabilities TLV.
  - system-description specifies the system description TLV.
  - system-name specifies the system name TLV.

Example

- This command enables the system description TLV:
  ```
  switch(config)# lldp tlv transmit system-description
  switch(config)#
  ```
- This command disables the system description TLV:
  ```
  switch(config)# no lldp tlv transmit system-description
  switch(config)#
  ```
- This command enables the max-frame-size TLV:
  ```
  switch(config)# lldp tlv transmit max-frame-size
  switch(config)#
  ```
- This command disables the max-frame-size TLV:
  ```
  switch(config)# no lldp tlv transmit max-frame-size
  switch(config)#
  ```
**lldp transmit**

The `lldp transmit` command enables the transit of LLDP packets on an interface.

**Command Mode**
- Interface-Ethernet configuration
- Interface-Management configuration

**Command Syntax**
- `lldp transmit`
- `no lldp transmit`
- `default lldp transmit`

**Examples**
- These commands enable the transmission of LLDP packets.
  
  ```
  switch(config)#interface ethernet 4/1
  switch(config-if-Et4/1)#lldp transmit
  switch(config-if-Et4/1)#
  ```

- These commands disable the transmission of LLDP packets.
  
  ```
  switch(config)#interface ethernet 4/1
  switch(config-if-Et4/1)#no lldp transmit
  switch(config-if-Et4/1)#
  ```
poe negotiation lldp disabled

Power Via MDI TLVs are included by default in LLDP packets sent to power over Ethernet (PoE) powered devices (PDs) to allow dynamic negotiation of power levels. The `poe negotiation lldp disabled` command disables the sending of Power Via MDI TLVs from the configuration-mode interface.

The `no poe negotiation lldp disabled` and `default poe negotiation lldp disabled` commands restore the default behavior (sending Power Via MDI TLVs) by removing the corresponding `poe negotiation lldp disabled` command from `running-config`.

To disable Power Via MDI TLVs globally, use the `no lldp tlv transmit` command and specify the Power Via MDI TLV.

**Command Mode**

Interface-Ethernet configuration

**Command Syntax**

- `poe negotiation lldp disabled`
- `no poe negotiation lldp disabled`
- `default poe negotiation lldp disabled`

**Example**

- These commands disable the sending of Power Via MDI TLVs on Ethernet interface 5.

  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#poe negotiation lldp disabled
  switch(config-if-Et5)#
  ```
show lldp

The `show lldp` command displays LLDP information.

**Command Mode**

EXEC

**Command Syntax**

```
show lldp [INTERFACE]
```

**Parameters**

- **INTERFACE** Interface type and numbers. Options include:
  - `<no parameter>` Display information for all interfaces.
  - `ethernet e_range` Ethernet interface range specified by `e_range`.
  - `management m_range` Management interface range specified by `m_range`.

Valid `e_range` and `m_range` formats include number, number range, or comma-delimited list of numbers and ranges.

**Examples**

- This command displays all LLDP information.
  ```
  switch# show lldp
  LLDP transmit interval : 60 seconds
  LLDP transmit holdtime : 120 seconds
  LLDP reinitialization delay : 2 seconds
  LLDP Management Address VRF : test
  
  Enabled optional TLVs:
  Port Description
  System Name
  System Description
  System Capabilities
  Management Address (Management0)
  IEEE802.1 Port VLAN ID
  IEEE802.3 Link Aggregation
  IEEE802.3 Maximum Frame Size
  
  Port       Tx Enabled  Rx Enabled
  Et3/1      Yes         Yes
  
  <--------OUTPUT OMITTED FROM EXAMPLE-------->
  
  switch#
  ```

- This command displays specific information about LLDP for Ethernet interface 3/1.
  ```
  switch# show lldp ethernet 3/1
  LLDP transmit interval : 30 seconds
  LLDP transmit holdtime : 120 seconds
  LLDP reinitialization delay : 2 seconds
  LLDP Management Address VRF : default
  
  Enabled optional TLVs:
  Port Description
  System Name
  System Description
  System Capabilities
  switch#
  ```
This command displays specific information about LLDP for management interface 1/1.

```
switch# show lldp management 1/1
LLDP transmit interval : 60 seconds
LLDP transmit holdtime : 120 seconds
LLDP reinitialization delay : 2 seconds
LLDP Management Address VRF : default

Enabled optional TLVs:
  Port Description
  System Name
  System Description

  IEEE802.3 Link Aggregation
  IEEE802.3 Maximum Frame Size

  Port       Tx Enabled  Rx Enabled
  Ma1/1      Yes         Yes
```

switch#
show lldp counters

The **show lldp counters** command displays LLDP traffic information for the switch.

**Command Mode**

EXEC

**Command Syntax**

```
show lldp counters [INTERFACE]
```

**Parameters**

- **INTERFACE**  Interface type and numbers. Options include:
  - <no parameter> Display information for all interfaces.
  - ethernet e_range Ethernet interface range specified by e_range.
  - management m_range Management interface range specified by m_range.

Valid e_range and m_range formats include number, number range, or comma-delimited list of numbers and ranges.

**Example**

- This command displays the LLDP counters on the switch.

  ```
  switch# show lldp counters
  Port   Tx Frames  Tx Length Exceeded
  <-------OUTPUT OMITTED FROM EXAMPLE-------->
  Et20  69485      0

  Ma1   69078      69078      0          69078      0
  ```
show lldp local-info

The `show lldp local-info` command displays LLDP errors and overflows.

**Command Mode**

EXEC

**Command Syntax**

```
show lldp local-info [INTERFACE]
```

**Parameters**

- **INTERFACE** Interface type and numbers. Options include:
  - `<no parameter>` Display information for all interfaces.
  - `ethernet e_range` Ethernet interface range specified by `e_range`.
  - `management m_range` Management interface range specified by `m_range`.

  Valid `e_range` and `m_range` formats include number, number range, or comma-delimited list of numbers and ranges.

**Example**

- This command displays the specific LLDP errors and overflows on management interface 1.

  ```
  switch# show lldp local-info management 1
  Local System:
  - Chassis ID type: MAC address (4)
    Chassis ID : 001c.730f.11a8qqq
  - System Name: "switch.aristanetworks.com"
  - System Description: "Arista Networks EOS version 4.13.2F running on an Arista Networks DCS-7150S-64-CL"
  - System Capabilities : Bridge, Router
    Enabled Capabilities: Bridge
  Interface Management1:
  - Port ID type: Interface name (5)
    Port ID : "Management1"
  - Port Description: ""
  - Management Address Subtype: IPv4 (1)
    Management Address : 172.22.30.154
  - Interface Number Subtype : ifIndex (2)
    Interface Number : 999001
    OID String : 
  - IEEE802.1 Port VLAN ID: 0
  - IEEE802.1/IEEE802.3 Link Aggregation
    Link Aggregation Status: Not Capable (0x00)
  - Port ID : 0
  - IEEE802.3 Maximum Frame Size: 1518 bytes
  ```
  
  se505.16:01:44#

switch#
**show llpd neighbors**

The `show llpd neighbors` command displays information about the switch’s LLDP neighbors.

**Command Mode**

EXEC

**Command Syntax**

```
show llpd neighbors [INTERFACE] [INFO_LEVEL]
```

**Parameters**

- **INTERFACE** Interface type and numbers. Options include:
  - `<no parameter>` displays information for all interfaces.
  - `ethernet e_range` Ethernet interface range specified by `e_range`.
  - `management m_range` Management interface range specified by `m_range`.

  Valid `e_range` and `m_range` formats include number, number range, or comma-delimited list of numbers and ranges.

- **INFO_LEVEL** amount of information that is displayed. Options include:
  - `<no parameter>` Displays information for all interfaces.
  - `detailed` LLDP information for all the adjacent LLDP devices.

**Examples**

- This command displays the neighbor’s information about LLDP.

  ```
  switch(config)# show llpd neighbors
  Last table change time : 0:12:33 ago
  Number of table inserts : 33
  Number of table deletes  : 0
  Number of table drops   : 0
  Number of table age-outs: 0
  
  Port      Neighbor Device ID             Neighbor Port ID    TTL

- Port Description: "Ethernet6/25"
- IEEE802.3 Power Via MDI
  Port Class               : PD
  PSE MDI Power Support    : Not Supported
  PSE MDI Power State      : Disabled
- System Name: "Leaf-Switch1.aristanetworks.com"
- System Description: "Arista Networks EOS version 4.10.1-SSO running on an
  Arista Networks DCS-7504"
  System Capabilities : Bridge, Router
  Enabled Capabilities: Bridge
  Management Address Subtype: IPv4 (1)
  Management Address     : 172.22.30.116
  Interface Number Subtype : ifIndex (2)
  Interface Number       : 999999
  OID String             :
- IEEE802.1 Port VLAN ID: 1
- IEEE802.1/IEEE802.3 Link Aggregation
  Link Aggregation Status: Capable, Disabled (0x01)
  Port ID                : 0
- IEEE802.3 Maximum Frame Size: 9236 bytes

switch#
```
Arista switches support the transfer of packets (network layer) and frames (data link layer). This chapter describes concepts and processes that are referenced by routing and switching protocols that Arista switches support.

Sections in this chapter include:

- Section 19.1: Data Transfer Introduction
- Section 19.2: Data Transfer Methods
- Section 19.3: MAC Address Table
- Section 19.4: Configuring Ports
- Section 19.5: Monitoring Links
- Section 19.6: Data Transfer Commands

19.1 Data Transfer Introduction

Arista switches transfer data through switching, routing, and layer 3 switching. This chapter provides an introduction to these transfer methods.

Data structures and processes that support data transfer methods and referenced in specific protocol chapters are also described, including:

- routed ports
- switched ports
- MAC address table
- port mirroring
- storm control
- loopback interfaces
- route redistribution
- null0 interfaces
- MTUs
19.2 Data Transfer Methods

This section describes these data transfer methods:

- Section 19.2.1: Switching and Bridging
- Section 19.2.2: Routing
- Section 19.2.3: Layer 3 Switching

19.2.1 Switching and Bridging

Switching and bridging operations transmit data link layer frames between devices within a single subnet. Each port is assigned a 48-bit Media Access Control (MAC) address. Frames arriving at a hub are bridged, or sent to all other ports on the subnet. Switches can associate ports with their MAC addresses, obviating the need to flood the subnet when sending a frame.

Subnets in the switch are defined by VLANs. A virtual local area network (VLAN) is a group of devices that are configured to communicate as if they are attached to the same network regardless of their physical location. VLANs describes VLANs.

Four MAC address types identify the scope of LAN interfaces that an address represents:

- unicast: represents a single interface.
- broadcast: represents all interfaces.
- multicast: represents a subset of all interfaces.
- reserved: assigned to nodes that have no configured MAC address.

The Individual/Group (I/G) bit distinguishes unicast MAC addresses from multicast addresses. As shown in Figure 19-1, the I/G bit is the least significant bit of the most significant byte in a MAC address.

19.2.1.1 MAC Address Format

- Unicast address: the I/G bit is 0: 1234.1111.1111 is a unicast MAC address (the most significant byte is an even number).
- Reserved address: all bits set to 0 (0000.0000.0000).
- Multicast address: the I/G bit is 1: 1134.1111.1111 is a multicast MAC address (the most significant byte is an odd number).
- Broadcast address: all bits set to 1 (FFFF.FFFF.FFFF).
Example

- The following are unicast MAC addresses:
  0200.0000.0000
  1400.0000.0000
- The following are multicast MAC addresses:
  0300.0000.0000
  2500.0000.0000

The following sections describe MAC address functions and data structures:

- Assigning a MAC Address to an Interface
- MAC Address Table

19.2.2 Routing

Routing transmits network layer packets over connected independent subnets. Each subnet is assigned an IP address range and each device on the subnet is assigned an IP address from that range. Connected subnets have IP address ranges that do not overlap. A router connects multiple subnets. Routers forward inbound packets to the subnet whose address range includes the packets’ destination address.

IPv4 and IPv6 are internet layer protocols that facilitate packet-switched networking, including transmissions across multiple networks.

These chapters describe available IP features:

- IPv4
- IPv6

19.2.2.1 Static Routing

Static routes are entered through the CLI and are typically used when dynamic protocols are unable to establish routes to a specified destination prefix. Static routes are also useful when dynamic routing protocols are not available or appropriate.

Creating a static route associates a destination IP address with a local interface. The routing table refers to these routes as connected routes that are available for redistribution into routing domains defined by dynamic routing protocols.

These sections describe static route configuration commands:

- IPv4 Address Configuration
- Configuring Default and Static IPv6 Routes

19.2.2.2 Dynamic Routing

Dynamic routes are established by dynamic routing protocols. These protocols also maintain the routing table and modify routes to adjust for topology or traffic changes. Routing protocols assist the switch in communicating with other devices to exchange network information, maintaining routing tables, and establishing data paths.

The switch supports these dynamic routing protocols:

- Open Shortest Path First – Version 2
- Open Shortest Path First – Version 3
- Border Gateway Protocol (BGP)
19.2.3 Layer 3 Switching

Layer 3 switches establish data paths through routing processes (Layer 3) and transfer data as a switch (Layer 2) through speed-optimized hardware. Layer 3 switches use a control plane (routing) and data plane (switching) to manage these processes.

19.2.3.1 Control plane

The control plane builds and maintains the IP routing table, which identifies IP packet routes in terms of destination addresses. The routing table defines a route by its next hop address and the egress interface that accesses the next hop.

The control plane derives routing information from three sources:

- Status of physical and virtual interfaces on the switch.
- Static routes entered through the CLI.
- Routes established through dynamic routing protocols.

Applying an ACL to the Control Plane

The control plane supports routing and management functions, handling packets that are addressed to the switch without regard to any switch interface.

To apply an IP ACL to the control plane, enter `ip access-group (Control Plane mode)` in control-plane mode. The `system control-plane` command places the switch in control-plane mode.

ACLs and Route Maps describes access control lists.

Example

- These commands place the switch in control-plane mode and assigns `CP-Test1` to the control plane.

```
switch(config)#system control-plane
switch(config-system-cp)#ip access-group CP-Test1 in
```

19.2.3.2 Data plane

The data plane routes IP packets based on information derived by the control plane. Each packet’s path includes Layer 2 addresses that reach its next hop destination. The data plane also performs other operations required by IP routing, such as recalculating IP header checksums and decrementing the time-to-live (TTL) field.

Arista data planes support these packet forwarding modes:

- Store and forward: the switch accumulates entire packets before forwarding them.
- Cut through: the switch begins forwarding frames before their reception is complete.

Cut through mode reduces switch latency at the risk of decreased reliability. Packet transmissions can begin immediately after the destination address is processed. Corrupted frames may be forwarded because packet transmissions begin before CRC bytes are received.

Packet forwarding mode availability varies by switch platform:

- Arad: store and forward mode only
• FM6000: both modes are available.
• Petra: store and forward mode only
• Trident: both modes are available.
• Trident II: both modes are available.

The data plane is also referred to as the forwarding plane.

Data Plane Forwarding Mode Configuration

The `switch forwarding-mode` command specifies the forwarding mode of the switch's data plane. This command is available on Trident, Trident II, and FM6000 platform switches. The forwarding mode is `store-and-forward` on Arad and Petra platform switches.

Example

• This command changes the forwarding mode to `store-and-forward`.
  
  switch(config)#switch forwarding-mode store-and-forward
  switch(config)#

The `show switch forwarding-mode` command displays the switch’s forwarding mode.

Example

• This command displays the switch’s forwarding mode.
  
  switch(config)#show switch forwarding-mode
  Current switching mode: store and forward
  Available switching modes: cut through, store and forward
19.3 MAC Address Table

The switch maintains a MAC address table for switching frames efficiently between ports. The MAC address table contains static and dynamic MAC addresses.

- Static MAC addresses are entered into the table through a CLI command.
- Dynamic MAC addresses are entered into the table when the switch receives a frame whose source address is not listed in the MAC address table. The switch builds the table dynamically by referencing the source address of frames it receives.

19.3.1 MAC Address Table Configuration

These sections describe MAC address table configuration tasks.

- Section 19.3.1.1: Static MAC Address Table Entries
- Section 19.3.1.2: Dynamic MAC Address Table Entries

19.3.1.1 Static MAC Address Table Entries

The MAC address table accepts static MAC addresses, including multicast entries. Each table entry references a MAC address, a VLAN, and a list of layer 2 (Ethernet or port channel) ports. The table supports three entry types: unicast drop, unicast, and multicast.

- A drop entry does not include a port.
- A unicast entry includes one port.
- A multicast entry includes at least one port.

Packets with a MAC address (source or destination) and VLAN specified by a drop entry are dropped. Drop entries are valid for only unicast MAC addresses.

The `mac address-table static` command adds a static entry to the MAC address table.

**Example**

- This command adds a static entry for unicast MAC address 0012.3694.03ec to the MAC address table.

```
switch(config)#mac address-table static 0012.3694.03ec vlan 3 interface Ethernet 7
switch(config)#show mac address-table static
Mac Address Table
------------------------------------------------------------------
Vlan    Mac Address       Type        Ports      Moves   Last Move
----    -----------       ----        -----      -----   ---------
 3 0012.3694.03ec STATIC      Et7
------------------------------------------------------------------
Total Mac Addresses for this criterion: 1
```

Multicast Mac Address Table

```
------------------------------------------------------------------
Vlan    Mac Address       Type        Ports
----    -----------       ----        ----- 
------------------------------------------------------------------
Total Mac Addresses for this criterion: 0
```

switch(config)#
• This command adds the static entry for the multicast MAC address 0112.3057.8423 to the MAC address table.

```yaml
switch(config)#mac address-table static 0112.3057.8423 vlan 4 interface port-channel 10 port-channel 12
switch(config)#show mac address-table
```

### Multicast Mac Address Table

<td>STATIC</td>
<td>Po10 Po12</td>
<td></td>
</tr>
</tbody>
</table>

Total Mac Addresses for this criterion: 1

19.3.1.2 Dynamic MAC Address Table Entries

**Learning Mode**

The switch maintains a MAC address table for switching frames efficiently between VLAN ports. When the switch receives a frame, it associates the MAC address of the transmitting interface with the recipient VLAN and port. When MAC address learning is enabled for the recipient port, the entry is added to the MAC address table. When MAC address learning is not enabled, the entry is not added to the table.

The `switchport mac address learning` command enables MAC address learning for the configuration mode interface. MAC address learning is enabled by default on all Ethernet and port channel interfaces.

**Example**

• These commands disables MAC address learning for Ethernet interface 8, then displays the active configuration for the interface.

```yaml
switch(config)#interface ethernet 8
switch(config-if-Et8)#no switchport mac address learning
switch(config-if-Et8)#show active
```

**Aging Time**

Aging time defines the period an entry is in the table, as measured from the most recent reception of a frame on the entry’s VLAN from the specified MAC address. The switch removes entries when their presence in the MAC address table exceeds the aging time.

Aging time ranges from 10 to 1,000,000 seconds with a default of 300 seconds (five minutes).
Example

- This command sets the MAC address table aging time to two minutes (120 seconds).

  switch(config)#mac address-table aging-time 120
  switch(config)#

The `mac address-table aging-time` command configures the aging time for MAC address table dynamic entries. Aging time defines the period an entry is in the table, as measured from the most recent reception of a frame on the entry’s VLAN from the specified MAC address. The switch removes entries when their presence in the MAC address table exceeds the aging time.

Clearing Dynamic Addresses

The `clear mac address-table dynamic` command removes specified dynamic entries from the MAC address table. Entries are identified by their VLAN and layer 2 (Ethernet or port channel) interface.

Example

- This command clears all dynamic mac address table entries for port channel 5 on VLAN 34.

  switch(config)#clear mac address-table dynamic vlan 34 interface port-channel 5

19.3.2 Displaying the MAC Address Table

The `show mac address-table` command displays the specified MAC address table entries.

Example

- This command displays the MAC address table.

  switch#show mac address-table

19.3.3 MAC Address Learning Per-VLAN

MAC address learning per-VLAN enables or disables MAC address learning per-VLAN instead of per-port. When MAC address learning is enabled for the recipient port, the entry is added to the MAC address table. When MAC address learning is disabled, the entry is not added to the table.

19.3.3.1 Platform Compatibility

- DCS-7500E
- DCS-7280

19.3.3.2 MAC Address Learning Configuration

The `mac address learning` command enables MAC address learning on a VLAN interface. By default, MAC address learning on a VLAN is enabled.

The switch maintains a MAC address table for switching frames between VLAN ports. When the switch receives a frame, it associates the MAC address of the transmitting interface with the recipient VLAN and port. When MAC address learning is enabled for the recipient port, the entry is added to the MAC address table. When MAC address learning is not enabled, the entry is not added to the table.

To disable MAC learning on a particular VLAN, use `no mac address learning` command on a VLAN configuration.

Examples

- These commands enable MAC address learning on VLAN 10 configuration.
  ```
  switch(config)#vlan 10
  switch(config-vlan-10)#mac address learning
  ```

- These commands disable MAC address learning on VLAN 10 configuration.
  ```
  switch(config)#vlan 10
  switch(config-vlan-10)#no mac address learning
  ```
19.4 Configuring Ports

This section describes these port properties:

- Section 19.4.1: Port Mirroring
- Section 19.4.2: Storm Control
- Section 19.4.3: Switched and Routed Ports
- Section 19.4.4: Loopback Ports
- Section 19.4.5: MAC Security
- Section 19.4.6: Null0 Interface
- Section 19.4.7: Maximum Transmission Units (MTU)

19.4.1 Port Mirroring

Port mirroring, also known as port monitoring, is the duplication of traffic from a collection of source ports to a destination port. A mirror session correlates a set of source ports to a destination port.

Valid mirror sources are Ethernet or port channel interfaces, including port channels which are part of an MLAG. Mirror destination ports are usually Ethernet interfaces; port channel destination ports are also supported on some platforms.

**Note**

On platforms which support the use of port channels as mirror destinations, a port channel must not be used as a mirror destination if it is a member of an MLAG.

Layer 2 control protocols do not run on destination ports. An interface cannot be in more than one mirror session and cannot simultaneously be a source and destination. By default, mirror sessions duplicate ingress and egress traffic but are configurable to mirror traffic from only one direction.

- **Ingress Mirroring:** Packets received by a source port are duplicated, including all valid data frames and L2 control PDUs. Ports mirror data before forwarding logic is applied. Packets subsequently dropped because of forwarding decisions are mirrored.
- **Egress Mirroring:** Packets transmitted by a source port are duplicated, with these exceptions:
  - Flooded/Multicast Packets: Packets sent to multiple mirror ports generate one copy, except in multi-chip devices when the mirror source and destination ports are on different chips; in this case, an extra copy is generated.
  - Dropped Packets: Packets dropped by forwarding decisions (such as output STP state checks) on egress sources are not duplicated. Packets dropped because of congestion may be duplicated.
- **Filtered Mirroring:** Specific packets are selected for mirroring based on PERMIT and DENY configurations.
- **Mirroring to GRE Tunnel:** Mirrored packets are encapsulated with GRE protocols for transiting Layer 3 network.

VLAN tags on duplicate packets from an egress source are identical to tags on inbound source packets. When a packet’s path through the switch includes multiple mirror source ports in different mirror sessions, the traffic is duplicated once and sent to the destination of the highest numbered session.

19.4.1.1 Port Mirroring Capacity

Port mirroring capacity varies by platform. This section describes session limits for each platform.
Chapter 19: Data Transfer

Configuring Ports

FM6000 Platform Switches
- **Maximum Number of Sessions:** 4
- **Session Sources:** Ethernet interfaces (any number), Port channel interfaces (any number)
- **Session Destinations:** Ethernet interfaces (any number), Port channel interfaces (any number), CPU
- Egress IP ACL on destination port is not supported
  - Sessions can mirror Rx, Tx, or both ways without impacting the number of available sessions.
  - Implementing any of the following reduces the number available sessions by one: ACL Logging, MLAG Peer Link, sFlow, VTEP Learning (VXLAN), LANZ Sampling

Arad Platform Switches
- **Maximum Number of Sessions:** 14
- **Session Sources:** Ethernet interfaces (any number), Port channel interfaces (any number)
- **Session Destinations:** Ethernet interfaces (one)
- Egress IP ACL on destination port is not supported
  - Sessions can mirror Rx, Tx, or both ways without impacting number of available sessions.
  - Although the number of configured source interfaces is unlimited, the number of interfaces that can be effectively mirrored is restricted by the destination port speed.

Petra Platform Switches
- **Maximum Number of Sessions:** 16
- **Session Sources:** Ethernet interfaces (eight for Rx or Tx sessions; four for both ways)
- **Session Destinations:** Ethernet interfaces (eight for Rx or Tx sessions; four for both ways)
- Egress IP ACL on destination port is not supported
  - Sessions can mirror Rx, Tx, or both ways without impacting number of available sessions.

Trident Platform Switches
- **Maximum Number of Sessions:** 4
- **Session Sources:** Ethernet interfaces (any number), Port channel interfaces (any number)
- **Session Destinations:** Ethernet interfaces (one)
- Egress IP ACL on destination port is supported
  - Mirroring Rx or Tx requires one session. Mirroring both ways requires two sessions.

Trident II Platform Switches
- **Maximum Number of Sessions:** 4 per chip
- **Session Sources:** Ethernet interfaces (any number), Port channel interfaces (any number)
- **Session Destinations:** Ethernet interfaces (one)
- Egress IP ACL on Destination Port is supported
  - Mirroring Rx or Tx requires one session. Mirroring both ways requires two sessions.
19.4.1.2 Configuring Mirror Ports

Mirror sessions associate a set of source ports to a destination port using the `monitor session source` and `monitor session destination` commands. An interface cannot be used in more than one mirror session and cannot be simultaneously a source and a destination. By default, mirror sessions duplicate ingress and egress traffic but are configurable to mirror traffic from one direction. On Trident and Trident II platform switches (DCS-7050, DCS-7050X, DCS-7250X, and DCS-7300X series), all frames mirrored on egress are prefixed with an 802.1Q VLAN tag, even when the egress port is configured as an access port. If the capture device cannot process VLAN tags properly, mirroring should be configured exclusively for ingress traffic by specifying `rx` in the `monitor session source` command.

Filtering on TX traffic in a mirror session is not supported.

**Example**

- These commands configure Ethernet interface 7 as the source port and Ethernet interface 8 as the destination port for the `redirect_1` mirroring session. The session mirrors ingress and egress traffic.
  
  switch(config)#monitor session redirect_1 source ethernet 7
  switch(config)#monitor session redirect_1 destination ethernet 8

The `show monitor session` command displays the configuration of the specified port mirroring session.

**Example**

- This command shows the configuration of the `redirect_1` mirroring session.
  
  switch(config)#show monitor session

  Session redirect_1

  Source Ports

  Both:          Et7

  Destination Port: Et8

  switch(config)#

The `monitor session ip access-group` command configures an ACL to filter the traffic being mirrored to the destination port.

**Example**

- These commands create an ACL and apply it to filter the traffic mirrored to the destination port by session “redirect_1.”
  
  switch(config)#ip access-list allow-host
  switch(config-acl-allow-host)#10 permit ip host 192.168.11.24 host 10.0.215.23
  switch(config-acl-allow-host)#20 deny ip any any
  switch(config-acl-allow-host)#exit
  switch(config)#monitor session redirect_1 ip access-group allow-host
  switch(config)#

19.4.1.3 Configuring Filtered Mirroring

Filtered mirroring allows for configuring IPv4, IPv6, and MAC access lists and then updating a monitor session with corresponding configuration changes. EOS mirrors the packets that match permit statements. EOS does not select those packets for mirroring that match deny statements.
Note EOS supports all standard IPv4, IPv6, and MAC qualifiers.

On Strata series platforms, packets from a single monitor source can be mirrored in multiple sessions that use the same access-list. You can attach multiple monitor sources with various access-lists to a monitor session. Each monitor session should contain one access-list type only. Hence, IPv4, IPv6, and MAC access-lists from the same monitor source must appear in different monitor sessions.

When multiple IPv6 monitor sessions share the same monitor source, only one of the monitor sessions remains active and others are automatically inactivated. When the active monitor session is removed from the monitor source, the system automatically activates the inactive monitor sessions.

Packets matching both IP and MAC access lists behave differently on various platforms.

Table 19-1 Behavior of Filtered Mirroring in Different Platforms

<table>
<thead>
<tr>
<th>Platform Series</th>
<th>Behavior of Filtered Mirroring</th>
</tr>
</thead>
<tbody>
<tr>
<td>DCS-7050/7050X, DCS-7250X, and DCS-7300X</td>
<td>When entry packets match both IPv4 and MAC access-lists, mirrored copies are created for both IPv4 and MAC access-lists; and forwarded to configured destinations.</td>
</tr>
<tr>
<td>DCS-7280SE and DCS-7500E</td>
<td>When entry packets match both IPv4 and MAC access-lists, a mirrored copy is created only for IPv4 access-list. The behavior of filtered mirroring varies in the following ways when a packet matches an entry in both access-list types:</td>
</tr>
<tr>
<td></td>
<td>• Mirroring is permitted when a packet contradicts with permit and deny configurations.</td>
</tr>
<tr>
<td></td>
<td>• Mirroring is denied when an entry packet matches deny configurations in both.</td>
</tr>
<tr>
<td></td>
<td>• IP access-list is prioritized over MAC access-list when an entry packet matches permit configurations in both.</td>
</tr>
</tbody>
</table>

Note User-Defined Field (UDF) qualifiers in filtered mirroring access-lists allow matching packets using arbitrary user-defined patterns.

Use the system profile command to enable the Mirroring ACL profile that supports matching on IPv6, MAC and UDFs.

Table 19-2 provides the matching types supported in default and Mirroring ACL profiles.

Table 19-2 Supported Matching Types

<table>
<thead>
<tr>
<th>Profiles</th>
<th>IPv4</th>
<th>IPv6</th>
<th>MAC</th>
<th>UDF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Mirroring ACL</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Note MAC mirroring-ACLs do not accept routed IPv4/IPv6 packets and bridged IPv6 packets.
Examples

- These commands create an IPv4 access-list and then attach the access-list to monitor sessions.

```
switch(config)#ip access-list acl1
switch(config-acl-acl1)#10 permit tcp any any rst
switch(config-acl-acl1)#20 permit tcp any any syn
switch(config-acl-acl1)#30 permit tcp any any ack

switch(config)#monitor session 1 source Ethernet1 rx ip access-group acl1
switch(config)#monitor session 1 source Ethernet2 rx ip access-group acl1
switch(config)#monitor session 1 destination <destination>
```

- These commands create an IPv6 access-list and then attach the access-list to monitor sessions.

```
Arista(config)#ipv6 access-list acl2
Arista(config-ipv6-acl-acl2)#10 permit ipv6 any any

Arista(config)#monitor session 2 source Ethernet4 rx ipv6 access-group acl2
Arista(config)#monitor session 2 destination Ethernet5
```

- These commands configure the same monitor source in multiple monitor sessions.

```
switch(config)#monitor session 1 source Ethernet1 rx ip access-group acl1
switch(config)#monitor session 1 destination <destination 1>

switch(config)#monitor session 2 source Ethernet1 rx ip access-group acl2
switch(config)#monitor session 2 destination <destination 2>
```

- This command configures access-list priorities for dictating the matching order across multiple access-lists that are attached to the same monitor source.

```
switch(config)#monitor session 1 source Ethernet1 rx ip access-group acl1 priority 1
switch(config)#monitor session 1 destination <destination 1>

switch(config)#monitor session 2 source Ethernet1 rx ip access-group acl2 priority 2
switch(config)#monitor session 2 destination <destination 2>
```

- This command enables the Mirroring ACL profile.

```
switch(config)#hardware tcam
switch(config-hw-tcam)#system profile mirroring-acl
switch(config-hw-tcam)#show hardware tcam profile

<table>

19.4.1.4 Filtered Mirroring to CPU

Filtered mirroring to CPU adds a special destination to port mirroring that allows mirrored traffic to be sent to the switch supervisor. The traffic can then be monitored and analyzed locally without the need of a remote port analyzer. Filtered mirroring to CPU can also be used for debugging and troubleshooting configured to mirror RX traffic, TX traffic or both, with up to 14 mirroring profiles used simultaneously. In addition, mirroring to CPU uses control plane protection to limit the rate of the traffic sent to the CPU.

Examples

- These commands configure the source for normal mirroring and the destination to CPU.

```
switch(config)#monitor session mySession source ethernet 3/1 both
switch(config)#monitor session mySession destination cpu
```

Chapter 19: Data Transfer

Configuring Ports

- These commands configure reserved bandwidth and shape rate of mirrored traffic.
  ```
  switch(config)#policy-map type copp copp-system-policy
  switch(config-pmap-control-plane-copp-system-policy)#class copp-system-mirroring
  switch(config-pmap-c-copp-system-policy-copp-system-mirroring)#bandwidth kbps 2000
  switch(config-pmap-c-copp-system-policy-copp-system-mirroring)#shape kbps 4000
  ```
- These commands show the current status of mirroring to CPU from the CLI, and display the control plane protection configuration for mirroring to CPU.
  ```
  switch(config)#show monitor session
  Session mySession
  ---------------
  Source Ports:
  Both : Et3/1
  Destination Ports:
  Cpu : active (mirror0)
  switch(config)#
  ```

19.4.1.5 Configuring Filtered Mirroring to GRE Tunnel

The `monitor session source` and `monitor session destination` commands configure source and destination ports to the specified port mirroring session in a GRE tunnel.

DCS-7050/7050X, DCS-7250X, and 7300X devices support forwarding-drop destination, a special GRE tunnel destination for mirroring ingress packets that are dropped during ASIC forwarding. The `monitor session forwarding-drop` command configures forwarding-drop sessions.

**Note**
Forwarding-drop sessions are the sessions corresponding to forwarding-drop destinations.

**Examples**
- These commands configure ingress filtered mirroring to a GRE tunnel.
  ```
  switch(config)#monitor session abc source Ethernet1 rx ip access-group acl1
  switch(config)#monitor session abc destination tunnel mode gre source 1.1.1.1 destination 2.2.2.2 ttl 128 dscp 0 protocol 0x88be
  ```
- This command configures forwarding-drop sessions.
  ```
  switch(config)#monitor session 1 forwarding-drop destination tunnel mode gre source 1.1.1.1 destination 2.2.2.2
  ```

19.4.2 Storm Control

A traffic storm is a flood of packets entering a network, resulting in excessive traffic and degraded performance. Storm control prevents network disruptions by limiting traffic beyond specified thresholds on individual physical LAN interfaces.
Storm control monitors inbound traffic levels over one-second intervals and compares the traffic level with a specified benchmark.

Storm control has three modes:

- **Storm control all**: When inbound traffic exceeds the specified threshold within a one-second control interval, all traffic is dropped until the end of the interval.
- **Storm control broadcast**: When inbound broadcast traffic exceeds the specified threshold within a one-second control interval, broadcast traffic is dropped until the end of the interval.
- **Storm control multicast**: When inbound multicast traffic exceeds the specified threshold within a one-second control interval, multicast traffic is dropped until the end of the interval.

Broadcast and multicast storm control are independent features and can be enabled simultaneously. The *storm control all* threshold overrides broadcast and multicast thresholds.

**Storm Control Configuration**

The *storm-control* command configures and enables broadcast or multicast storm control on the configuration mode interface. The command provides three mode options:

- **storm-control all** unicast, multicast, and broadcast inbound packet control.
- **storm-control broadcast** broadcast inbound packet control.
- **storm-control multicast** multicast inbound packet control.

An interface configuration can contain three storm-control statements, one with each mode setting. The *storm-control all* threshold overrides broadcast and multicast thresholds.

When storm control is enabled, the switch monitors inbound traffic levels over one second intervals and compares the traffic level with a specified threshold. The threshold is a percentage of the total available port bandwidth and is configurable on each interface for each transmission mode.

**Example**

- These commands enable multicast storm control on Ethernet interfaces 2 through 4 and set a threshold of 65%. During each one second interval, the interface drops inbound multicast traffic in excess of 65% of capacity.

```
switch(config)#interface ethernet 2 / 3 / 4
switch(config-if-Et4/4/4)#storm-control multicast level 65
```

**Example**

- These commands clear multicast storm control on Ethernet interfaces 2 through 4.

```
switch(config)#interface ethernet 2 / 3 / 4
switch(config-if-Et2/3/4)#no storm-control multicast
```

**Example**

- These commands enable broadcast storm control on Ethernet interfaces 2 through 4 and set broadcast traffic to 50%. During each one second interval, the interface drops inbound multicast traffic in excess of 50% of capacity.

```
switch(config)#interface ethernet 2 / 3 / 4
switch(config-if-Et2/3/4)#storm-control broadcast level 50
```
Example

- These commands enable broadcast storm control on Ethernet interfaces 2 through 4 and set a threshold of 5000 packets per second (pps).

```bash
switch(config)#interface ethernet 2 / 3 / 4
switch(config-if-Et2/3/4)#storm-control broadcast level pps 5000
```

Example

- These commands clear broadcast storm control on Ethernet interfaces 2 through 4.

```bash
switch(config)#interface ethernet 2 / 3 / 4
switch(config-if-Et2/3/4)#no storm-control broadcast
```

The show storm-control command displays the storm-control level and interface inbound packet capacity for the specified interface.

Example

- This command displays the storm control configuration for Ethernet ports 2 through 4.

```bash
switch(config-if-Et2/3/4)#show storm-control
```

19.4.3 Switched and Routed Ports

A switched port is an Ethernet or port channel interface that is configured as a layer 2 interface. Switched ports bridge frames and are assigned to at least one VLAN. Switched ports are not associated with any IP addresses. By default, Ethernet and port channel interfaces are in switched port mode.

A routed port is an Ethernet or port channel interface that is configured as a layer 3 interface. Routed ports do not bridge frames and are not members of any VLANs. Routed ports can have IP addresses assigned to them and packets are routed directly to and from the port.

Configuring an interface as a routed port is similar to creating a VLAN with spanning-tree disabled, making the port the only member of that VLAN and configuring the IP address on the switch virtual interface (SVI) associated with the VLAN.

All IP-level interface configuration commands, except autostate and ip virtual-router, can be used to configure a routed interface. If the interface is reverted to switched port mode, running-config maintains IP level interface configuration statements. These changes become active again if the interface is configured back to routed port mode.

A LAG that is created with the channel-group command inherits the mode of the member port. A LAG created from a routed port becomes a routed LAG. IP-level configuration is not propagated to the LAG from its component members.

The broadcast queue towards the CPU is shared among all interfaces of the forwarding chip. Broadcast storm on a single port adversely impacts other interfaces of the same chip by potentially dropping even low rate broadcast frames. Routed port storm control attempts to mitigate this effect by performing storm control on the broadcast frames for routed ports.
Routed Port Configuration

The switching-routing configuration of Ethernet and port channel interfaces is specified by the `switchport` and `no switchport` commands. These commands only toggle the interface between switched and routed modes. They have no effect on other configuration states.

The `no switchport` command places the configuration mode interface in *routed port* mode. Routed ports behave as Layer 3 interfaces. They do not bridge packets and are not VLAN members. An IP address can be assigned to a routed port for the direct routing of packets to and from the interface.

When an interface is configured as a routed port, the switch transparently allocates an internal VLAN whose only member is the routed interface. Internal VLANs are created in the range from 1006 to 4094. VLANs that are allocated internally for a routed interface cannot be directly created or configured. [Allocating Internal VLANs](#) describes VLAN allocation configuration procedures.

**Example**

- This command places Ethernet interface 5 in routed port mode.

  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#no switchport
  ```

Switched Port Configuration

The `switchport` command places the configuration mode interface in *switched port* (Layer 2) mode. Switched ports are configurable as members of one or more VLANs through other switchport commands. Switched ports ignore all IP level configuration commands, including IP address assignments. By default, Ethernet and port channel interfaces are switched ports.

**Example**

- This command places Ethernet interface 5 in switched port mode.

  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#switchport
  ```

The `switchport default mode routed` command places the configuration mode interface for a switch with all ports in *switched port* (Layer 3) routed mode, changing the switch with all ports from `switchport default mode access`.

**Examples**

- This command places a switch with all ports in routed mode.

  ```
  switch(config)#switchport default mode routed
  ```

- This command places a switch with all ports in access mode.

  ```
  switch(config)#switchport default mode access
  ```

19.4.4 Loopback Ports

A loopback interface is a virtual network interface implemented in software and does not connect to any hardware. Traffic sent to the loopback interface is immediately received on the sending interface. The switch provides loopback configuration mode for creating loopback interfaces and modifying their operating parameters.

Internet protocols reserve specific addresses for loopback network segments:

- **IPv4** designates 127/8 as loopback subnet, which includes 127.0.0.0 through 127.255.255.255.
- **IPv6** designates ::1/128 as the loopback address, which includes 0:0:0:0:0:0:0:1 (also written as ::1).
Arista switches support the configuration of 1001 loopback interfaces, numbered from 0 to 1000.

**Loopback Interface Configuration**

Loopback ports are instantiated by entering loopback interface mode for the desired port number. Loopback interface mode also provides access to loopback configuration commands. Previously instantiated ports are edited by entering loopback interface mode for the specified port.

The `interface loopback` command places the switch in interface-loopback configuration mode for the specified interfaces, creating loopback interfaces for each specified port not previously created.

**Example**

- These commands instantiate loopback interface 2 and assigns it IP address 10.1.1.42/24.

```
switch(config)#interface loopback 2
switch(config-if-Lo2)#ip address 10.1.1.42
switch(config-if-Lo2)#show active
interface Loopback2
ip address 10.1.1.42/24
switch(config-if-Lo2)#
```

### 19.4.5 MAC Security

MAC security restricts input to a switched port by limiting the number of MAC addresses that can access the port. Ports with MAC security enabled restrict traffic to a limited number of hosts, as determined by their MAC addresses. When the limit is exceeded, the port becomes errdisabled.

**Port Security Configuration**

MAC address security is enabled by `switchport port-security`. The default MAC address limit on an interface where port security is enabled is one; to change that default limit, use the `switchport port-security mac-address maximum` command.
Example

- These commands enable MAC security on Ethernet interface 7, set the maximum number of assigned MAC addresses to 2, assign two static MAC addresses to the interface, and clear the dynamic MAC addresses for the interface.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#switchport port-security
switch(config-if-Et7)#switchport port-security mac-address maximum 2
switch(config-if-Et7)#exit
switch(config)#mac address-table static 0034.24c2.8f11 vlan 10 interface ethernet 7
switch(config)#mac address-table static 4464.842d.17ce vlan 10 interface ethernet 7
switch(config)#clear mac address-table dynamic interface ethernet 7
switch(config)#show port-security
  Secure Port      MaxSecureAddr  CurrentAddr  SecurityViolation  Security Action  
  (Count)        (Count)      (Count)            (Count)

  Total Mac Addresses for this criterion: 2
```

19.4.6 Null0 Interface

The null0 interface is a virtual interface that drops all inbound packets. A null0 route is a network route whose destination is **null0 interface**. Inbound packets to a null0 interface are not forwarded to any valid address. Many interface configuration commands provide **null0** as an interface option.

19.4.7 Maximum Transmission Units (MTU)

The MTU of a communications protocol refers to the size in bytes of the largest frame (Ethernet) or packet (IP) that can be sent on the network. Different protocols support a variety of MTU sizes. Most IP over Ethernet implementations use the Ethernet V2 frame format, which specifies an MTU of 1500 bytes. Jumbo frames are Ethernet frames containing more than 1500 bytes.

19.4.7.1 Switching interface MTU size

On Arista devices, layer two interfaces (either trunk or access ports) are set with a default ethernet MTU of 9236 bytes. This value cannot be changed and is derived as follows: 9214 + 6 (source MAC ) + 6 (dst MAC) + 4 (VLAN tag) + 2 (ether type) + 4 (crc) totals 9236 bytes.

The output of a **show interface** command for a layer two interface displays the following:
Trunk

Ethernet1 is up, line protocol is up (connected)
Hardware is Ethernet, address is 001c.731c.5073 (bia 001c.731c.5073)
Ethernet MTU 9214 bytes, BW 1000000 kbit

Access

Ethernet3 is up, line protocol is up (connected)
Hardware is Ethernet, address is 001c.731c.5075 (bia 001c.731c.5075)
Ethernet MTU 9214 bytes, BW 1000000 kbit

Important! The value 9214 displayed here is NOT the maximum frame size but rather the maximum size of the IP packet that can be encapsulated within a frame leaving the interface.

19.4.7.2 Routing Interface MTU Size

The MTU size on layer 3 interfaces varies between a minimum of 68 to the maximum 9214 bytes. The default size is 1500 bytes. The show interface output for a layer three interface displays the following:

VLAN routed interface

Vlan100 is up, line protocol is up (connected)
Hardware is Vlan, address is 001c.731c.5072 (bia 001c.731c.5072)
Internet address is 10.1.1.2/24
Broadcast address is 255.255.255.255
Address determined by manual configuration
IP MTU 9214 bytes

Physical routed interface

Ethernet4 is down, line protocol is down (connect)
Hardware is Ethernet, address is 001c.731c.5072
Internet address is 10.10.10.10/24
Broadcast address is 255.255.255.255
Address determined by manual configuration
IP MTU 9214 bytes

Important! The value 9214 in these outputs is the maximum IP packet size that the interface can transmit or receive.

Important! Some protocols, such as OSPF, may require that neighbor interfaces on physically disparate systems are configured with the same IP MTU.

A routed interface fragments packets that exceed the configured IP MTU on the interface. For example, if a 2000 byte packet is received on routed interface 1 and is forwarded from routed interface 2 then routed interface 2 fragments the packet into a 1500 byte packet plus an additional packet containing the remaining data. This fragmentation should be avoided by configuring a consistent IP MTU across all systems within the operational domain.

The IP MTU set on a routed interface is valid for both IPv4 and IPv6 packets.

MTU Configuration

The mtu command configures the IPv4 and IPv6 Maximum Transmission Unit (MTU) size for the configuration mode interface. An interface's MTU value is displayed with the show interface command. The command is valid for all routable interfaces.
Example

- This command sets the MTU size of 1492 bytes on VLAN interface 20.

  switch(config-if-Vl20)#mtu 1492
  switch(config-if-Vl20)#

- This command displays status for a routed interface.

  switch(config-if-Et3)#show interface e3
  Ethernet3 is up, line protocol is up (connected)
  Hardware is Ethernet, address is 001c.731c.5072
  Internet address is 10.1.1.2/24
  Broadcast address is 255.255.255.255
  Address determined by manual configuration
  IP MTU 1500 bytes, BW 1000000 kbit
  Full-duplex, 1Gb/s, auto negotiation: on, uni-link: unknown
  Up 22 days, 7 hours, 47 minutes, 58 seconds
  switch(config)#

- Using ping on a Linux host, you can test the maximum transmission through the interface.

  [user@linux ~]$ ping -M do -s 1472 10.1.1.2
  PING 10.1.1.2 (10.1.1.2) 1472(1500) bytes of data.
  1480 bytes from 10.1.1.2: icmp_seq=1 ttl=64 time=0.206 ms
  1480 bytes from 10.1.1.2: icmp_seq=2 ttl=64 time=0.191 ms
  --- 10.1.1.2 ping statistics ---
  2 packets transmitted, 2 received, 0% packet loss, time 999ms
  rtt min/avg/max/mdev = 0.191/0.198/0.206/0.015 ms

  The size 1472 has 8 bytes of ICMP information added and 20 bytes of IP headers added, generating a total packet size of 1500 bytes.

  - The option `-M do` specifies that fragmentation is prohibited for this test.
  - The option `-s` specifies the size of the packet being generated.
  - A capture of the frame displays total length of 1514 bytes on the wire which includes the Ethernet headers and type field.
19.5 Monitoring Links

These section describes link monitoring and object tracking processes:

- Section 19.5.1: Object Tracking
- Section 19.5.2: Errdisabled Ports
- Section 19.5.3: Link Flap Monitoring
- Section 19.5.4: Fabric Link Monitoring
- Section 19.5.5: Rapid Automated Indication of Link-Loss

19.5.1 Object Tracking

Object tracking makes it possible for the switch to take action in response to changes in specific switch properties by creating an object to track those properties. When the tracked property changes, the object then changes state, allowing configured agents to react accordingly.

Object Tracking Configuration

The `track` command creates an object that changes state to reflect changes in a specific switch property. Agents configured to track that object are then able to react to the change.

Example

- These commands create an object that tracks the line protocol state on Ethernet interface 8, then configures Ethernet interface 5 to disable VRRP when that tracked object changes state to `down`.

```console
switch(config)#track ETH8 interface ethernet 8 line-protocol
switch(config)#interface ethernet 5
switch(config-if-Et5)#vrrp 1 tracked-object ETH8 shutdown
switch(config-if-Et5)#
```

These commands use object tracking:

- `link tracking group`
- `vrrp tracked-object`

19.5.2 Errdisabled Ports

The switch places an Ethernet or management interface in `error-disabled` state when it detects an error on the interface. `Error-disabled` is an operational state that is similar to link-down state. Conditions that error-disable an interface include:

- `bpduguard`
- `link-flap`
- `no-internal-vlan`
- `portchannelguard`
- `portsec`
- `tapagg`
- `uplink-failure-detection`
- `xcvr_unsupported`

Most conditions are programmed by the configuration of other features, such as Spanning Tree protocol (`bpduguard`). Link flap error-disabling is configured through errdisable commands or link flap monitor commands (Section 19.5.3).
Error-disabled interfaces are recovered either through manual or automated methods.

To manually recover an interface, enter its configuration mode and execute `shutdown` and `no shutdown` commands.

**Example**

- These commands manually recover Ethernet interface 30 from the errdisable state.

  ```
  switch(config)#interface ethernet 30
  switch(config-if-Et30)#shutdown
  switch(config-if-Et30)#no shutdown
  switch(config-if-Et30)#
  ```

Automated recovery of Ethernet interfaces that are error-disabled by a specified condition is enabled by `errdisable recovery cause`. The `errdisable recovery interval` specifies the period that an interface remains disabled until it is enabled and begins operating normally. When the disabling condition persists, recovered interfaces eventually return to the error-disabled state.

**Example**

- These commands configure automated recovery for all interfaces that are error-disabled from link flap and bpduguard conditions. Automated recovery begins five minutes after the port is disabled.

  ```
  switch(config)#errdisable recovery cause link-flap
  switch(config)#errdisable recovery cause bpduguard
  switch(config)#errdisable recovery interval 300
  switch(config)#
  ```

### 19.5.3 Link Flap Monitoring

Link flap frequency is the quantity of link flaps (connection state changes) over a specified period. Excessive link flaps result in network stability issues, including spanning tree and routing recalculations. Link flaps are often caused by layer 1 issues, such as a bad cable or duplex mismatch. Link flap monitoring specifies link flap thresholds and disables a port when a threshold is exceeded.

Link flap monitoring can be enabled on all interfaces through `errdisable link flap` commands or on individual interfaces with the link flap monitor.

#### 19.5.3.1 Global Link Flap Monitor

Global link flap detection is configured through two global configuration mode commands:

- `errdisable flap-setting cause link-flap` configures the link-flap frequency that defines link-flap errors on an Ethernet interface.
- `errdisable detect cause link-change` enables the error-disabling of Ethernet interfaces that exceed the threshold link flap frequency.

Link-flap detection is enabled by default.

**Example**

- These commands sets the link flap error criteria of 15 connection state changes over a 30 second period, then enables error detection on all interfaces.

  ```
  switch(config)#errdisable flap-setting cause link-flap max-flaps 15 time 30
  switch(config)#errdisable detect cause link-change
  switch(config)#
  ```
19.5.3.2 Interface Link Flap Monitor

An interface is monitored for link flap errors with link flap profiles. A link flap profile specifies conditions that define a link-flap error. Profiles are assigned to Ethernet interfaces. Multiple profiles can be assigned to an interface to monitor a set of error conditions.

The global link flap monitor is used by interfaces that are not individually monitored for link flap errors.

Configuring Link Flap Profiles

Link flap profiles are configuration statements that define a link flap error in terms of these criteria:

- **flaps** Threshold number of interface state changes.
- **period** Interval when link flaps accumulate to trigger an error condition.
- **violations** Number of link flap errors (threshold exceeded over specified period).
- **intervals** Quantity of periods.

The `monitor link-flap policy` command places the switch in link-flap configuration mode for configuring link flap profiles and compiling a default-profile set. The `profile max-flaps (Link Flap Configuration)` command configures link flap profiles.

The default-profile set is a list of link-flap profiles that define error-disable criteria for interfaces where link flap monitoring is enabled but link-flap profiles are not assigned. The default-profile set may contain zero, one, or multiple profiles. When the default-profile set is empty, `errdisable flap-setting cause link-flap` specifies default error-disable criteria. When the default-profile set contains multiple profiles, the criteria is satisfied when conditions match any profile.

Example

These commands enter link flap configuration mode and create four link flap profiles.

```
switch(config)#monitor link-flap policy
switch(config-link-flap)#profile LF01 max-flaps 15 time 60
switch(config-link-flap)#profile LF02 max-flaps 10 time 30 violations 5 intervals 10
switch(config-link-flap)#profile LF03 max-flaps 20 time 75 violations 2 intervals 6
switch(config-link-flap)#profile LF04 max-flaps 30 time 100 violations 4 intervals 7
switch(config-link-flap)#show active
    monitor link-flap policy
    profile LF01 max-flaps 15 time 60 violations 1 intervals 1
    profile LF02 max-flaps 10 time 30 violations 5 intervals 10
    profile LF02 max-flaps 20 time 75 violations 2 intervals 6
    profile LF04 max-flaps 30 time 100 violations 4 intervals 7
switch(config-link-flap)#
```

The `default-profiles` command specifies the set of link-flap profiles that define error-disable criteria for interfaces where link flap monitoring is enabled without a link flap profile assignment. Entering a `default-profile` command replaces the current default-profile statement in `running-config`.

The default-profile set may contain zero, one, or multiple profiles. When the default-profile set is empty, `errdisable flap-setting cause link-flap` specifies default error-disable criteria. When the default-profile set contains multiple profiles, error-disable criteria is satisfied when conditions match any profile. Multiple profiles are assigned to the default-profile set through a single `default-profiles` command.
Example

- This command assigns configures LF01 and LF02 as the default-profile set.

```bash
switch(config)#monitor link-flap policy
switch(config-link-flap)#default-profiles LF01 LF02
switch(config-link-flap)#show active
```

```bash
monitor link-flap policy
    profile LF01 max-flaps 15 time 60 violations 1 intervals 1
    profile LF02 max-flaps 10 time 30 violations 5 intervals 10
    profile LF02 max-flaps 20 time 75 violations 2 intervals 6
    profile LF02 max-flaps 30 time 100 violations 4 intervals 7
    default-profiles LF01 LF02
switch(config-link-flap)#
```

Interface Link Flap Profile Assignments

Link flap monitoring is enabled on individual Ethernet interfaces and can optionally specify one or more profiles to define link-flap error-disabling criteria. When link flap monitoring is enabled on an interface, the link-flap conditions determine when the interface is error-disabled. Multiple profiles can be assigned to an interface to monitor a set of error conditions; a port is disabled when conditions match any of the profiles assigned to an interface.

The `monitor link-flap profiles` command controls link-flap monitoring on a configuration mode interface. The command provides these link flap detection options:

- **monitor link-flap (no profiles listed):** Interface detects link flaps using default-profile set criteria.
- **monitor link-flap (at least one profile listed):** Interface detects link flaps using listed profile criteria.
- **default monitor link-flap:** The interface uses global link flap monitor commands (Section 19.5.3.1).
- **no monitor link-flap:** The interface does not detect link flaps.

Examples

- This command assigns LF03 and LF04 link flap profiles to Ethernet interface 33.

  ```bash
  switch(config)#interface ethernet 33
  switch(config-if-Et33)#monitor link-flap profiles LF03 LF04
  switch(config-if-Et33)#show active
  interface Ethernet33
      monitor link-flap profiles LF04 LF03
  switch(config-if-Et33)#
  ``

- This command disables link-flap monitoring on Ethernet interface 34.

  ```bash
  switch(config)#interface ethernet 34
  switch(config-if-Et34)#no monitor link-flap
  switch(config-if-Et34)#show active
  interface Ethernet34
      no monitor link-flap
  switch(config-if-Et34)#
  ``

- This command assigns the default-profile set to Ethernet interface 35.

  ```bash
  switch(config)#interface ethernet 35
  switch(config-if-Et35)#monitor link-flap
  switch(config-if-Et35)#show active
  interface Ethernet35
      monitor link-flap
  switch(config-if-Et35)#
  ```
• This command configures Ethernet interface 36 to use the global link flap monitoring commands

```bash
switch(config)#interface ethernet 36
switch(config-if-Et36)#default monitor link-flap
switch(config-if-Et36)#show active
interface Ethernet36
switch(config-if-Et36)#
```

19.5.4 Fabric Link Monitoring

Fabric link monitoring enables EOS to monitor low error rate errors on all fabric links for long durations, and automatically isolates fabric links on consistent error detection over an extended time interval. Isolated fabric links are restored when the error rate drops below a configured threshold.

The error rate over each configurable polling interval is derived by comparing the number of cells with CRC errors against the total number of received cells. Links are automatically isolated when the error rate is above the configured threshold for the configured consecutive number of polling intervals.

On an isolated fabric link, control cells (but not data cells) are sent. Once the error rate drops below a set threshold for the configured consecutive number of polling intervals, EOS revives the fabric link to continue sending data traffic.

19.5.4.1 Configuring Fabric Link Monitoring

Configuration mode commands globally enable and disable fabric link monitoring and syslog messages for the settings described below.

The `no platform sand monitor` command disables fabric link monitoring.

**Generate Serdes Error Syslog**

The `platform sand monitor serdes error log` command generates syslog fabric link monitoring for serdes error logging.

**Example**

• This command enables the serdes error log for fabric link monitoring.

```bash
switch(config)#platform sand monitor serdes error log
switch(config)#
```

The following syslog messages are not enabled by default. Fabric link monitoring syslog is enabled by configuring the `platform sand monitor serdes error log` command.

**Examples**

• The following syslog message is generated when a fabric link for serdes is automatically withdrawn:

  `%SAND-4-SERDES_WITHDRAWN_FROM_FABRIC: Serdes withdrawn from the switch fabric.`

• Here is another instance where a syslog message is generated when a fabric link is automatically withdrawn:

  `%SAND-4-SERDES_WITHDRAWN_FROM_FABRIC: Serdes Arad10/5-FabricSerdes-11 withdrawn from the switch fabric.`

• The following syslog message is generated when a fabric link is restored:

  `%SAND-4-SERDES_RESTORED_TO_FABRIC: Serdes restored to the switch fabric.`

• Here is another instance where a syslog message is generated when a fabric link is restored:

  `%SAND-4-SERDES_RESTORED_TO_FABRIC: Serdes Arad10/5-FabricSerdes-11 restored to the switch fabric.`
Generate Serdes Error Threshold
The `platform sand monitor serdes error threshold` command generates a fabric link monitoring serdes error threshold.

Example
- This command monitors serdes error thresholds over the specified number of received cells, resulting in the isolation of a fabric link between 200 and 30,000 received cells.
  ```
  switch(config)#platform sand monitor serdes error threshold 200 30000
  switch(config)#
  ```

Enable Serdes Poll Period
The `platform sand monitor serdes poll period` command sets the serdes poll period.

Example
- This command changes the serdes polling period for fabric link monitoring to 6 seconds.
  ```
  switch(config)#platform sand monitor serdes poll period 6
  switch(config)#
  ```

Monitor Serdes Poll Threshold Isolation
The `platform sand monitor serdes poll threshold isolation` command sets and enables fabric link monitoring for serdes poll threshold isolation.

Example
- This command changes the number of consecutive polls in which the threshold needs to be detected to isolate a link. In this case the number is 5 consecutive polls.
  ```
  switch(config)#platform sand monitor serdes poll threshold isolation 5
  switch(config)#
  ```

Monitor Serdes Poll Threshold Recovery
The `platform sand monitor serdes poll threshold recovery` command sets and enables fabric link monitoring for serdes poll threshold recovery.

Example
- This command changes the number of consecutive serdes polls used for threshold recovery to 6 seconds.
  ```
  switch(config)#platform sand monitor serdes poll threshold recovery 6
  switch(config)#
  ```

Show Fabric Monitoring Health
The `show fabric monitoring health` command displays the fabric monitoring connected state status with isolated links.
Example

- When fabric links are isolated, their connected state status is shown with isolated links.

\[\text{switch(config)\#show platform san health}\]
Fabric serdes isolated by fabric monitoring: (36 total)

Arad5/0 serdes [0-1, 10-19, 2, 20-29, 3, 30-35, 4-9]

Top fabric serdes list by number of times isolated by monitoring:
Arad5/0 serdes 0: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 1: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 10: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 11: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 12: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 13: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 14: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 15: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 16: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 17: 1 (last occurred: 0:01:04 ago)

\[\text{switch(config)\#}\]

19.5.5 Rapid Automated Indication of Link-Loss

Rapid Automated Indication of Link-Loss (RAIL) is a software feature that reduces the wait time of applications on hosts that are blocked due to a failed link. When a link goes down because of link-flapping or the unavailability of a directly connected server, the switch drops all traffic to servers whose next-hop destination was learned on the port connected to the link. Applications that drive the traffic (clients on source hosts) are blocked because of the dropped edge-switch traffic. Connection timeout varies by application and is usually measured in seconds or minutes.

RAIL is functional on a switch if it is routing-enabled and available for servers that set the switch as the default router.

19.5.5.1 RAIL Method

When a link monitored by RAIL goes down, the switch performs these steps for servers that the switch proxies:

Step 1 IP addresses of servers on the failed link are extracted from ARP cache. The interface that accesses the server is determined by searching for the MAC address in the hardware MAC address tables.

Step 2 Upon link shutdown, a dynamic MAC entry is added in the MAC address table for each server that was learned on the failed interface. Each new entry lists its interface as CPU.

Figure 19-1 depicts three switch-server scenarios: link is up, link is down with RAIL disabled, and link is down with RAIL enabled. A failed link with RAIL enabled results in these behaviors:

Step 1 All ingress packets whose destination MAC address matches an address added to the MAC address table are sent to the CPU.

Step 2 For packets scheduled to be forwarded to the source address, the switch sends one of the following, based on the type of received segment:

- TCP: TCP RST segment to the source IP address and port.
- UDP: ICMP unreachable segment to the source IP address and port.
Step 3  The client closes the socket associated with the transmitted segment and notifies the application. The application reacts immediately instead of maintaining the block until connection timeout expiry.

Figure 19-1: RAIL Scenarios

19.5.5.2 RAIL Implementation

RAIL defines a state machine that manages the RAIL activity level relative to a specified server. The state machine consists of four states:

- **Up**: Transitions to this state from *Inactive* when ARP and MAC entries are added for the server.
- **Proxying**: Transitions to this state from *Up* when Link Down is detected and RAIL proxying is enabled. The switch is a proxy for messages to the server.
- **Down**: Transitions to this state from *Up* when Link Down is detected and RAIL proxying is not enabled. Messages from the client remain unanswered and the application recovers only after timeout expiry.
- **Inactive**: Transitions to this state upon any of the following conditions:
  - Server’s MAC address or ARP entry is deleted (from any state).
  - Proxy timeout expiry (from *Proxying* state)
  - Link down timeout expiry (from *Down* state).

19.5.5.3 RAIL Configuration

Server-failure configuration mode commands globally enable RAIL and configure RAIL parameters. RAIL is functional on individual interfaces only when it is globally enabled and enabled on the interface. RAIL monitors an interface for link errors when RAIL is globally enabled and enabled on the interface.

**Entering Server-failure Configuration Mode**

The `monitor server-failure` command places the switch in server-failure configuration mode. The `exit` command returns the switch to global configuration mode. Server-failure mode is not a group change mode; `running-config` is changed when commands are entered and not affected by exiting the mode.

The `no monitor server-failure` deletes all server-failure mode commands from `running-config`.

**Examples**

- These commands place the switch in server-failure configuration mode.

  ```
  switch(config)#monitor server-failure
  switch(config-server-failure)#
  ```
This command deletes all server-failure configuration mode commands from *running-config*.

```
switch(config)#no monitor server-failure
switch(config)#
```

### Enabling RAIL on the Switch

RAIL is disabled by default and is enabled by `no shutdown` (*server-failure configuration mode*). The `shutdown` command disables RAIL without removing RAIL commands from *running-config*.

### Examples

- These commands enable RAIL globally.

```
switch(config)#monitor server
switch(config-server-failure)#no shutdown
switch(config-server-failure)#show active
monitor server-failure
  no shutdown
switch(config-server-failure)#
```

- This command disables RAIL globally.

```
switch(config-server-failure)#shutdown
switch(config-server-failure)#
```

### Enabling Proxy Mode

The `proxy` (*server-failure configuration mode*) command sets the RAIL proxy setting to `enabled` and specifies the interval that RAIL responds to messages sent to servers on failed links. The proxy timeout is measured individually for each server whose link has failed. The switch enters RAIL proxy state only when the proxy setting is enabled.

When RAIL is enabled but the proxy setting is disabled, the switch maintains a list of unavailable servers without responding to messages sent to the servers. The RAIL proxy setting is `disabled` by default. When RAIL proxy is enabled, the default period is three minutes.

The `no proxy` and `default proxy` commands return the RAIL proxy setting to `disabled`. The `no proxy lifetime` and `default proxy lifetime` commands set the proxy timeout to its default of three minutes if the RAIL proxy setting is `enabled`. The lifetime commands have no effect if RAIL proxy is `disabled`.

### Examples

- These commands enable the RAIL proxy and sets the proxy timeout period of 10 minutes.

```
switch(config)#monitor server
switch(config-server-failure)#proxy lifetime 10
switch(config-server-failure)#show active
monitor server-failure
  proxy lifetime 10
switch(config-server-failure)#
```

- This command sets the proxy timeout period to its default value of 3 minutes.

```
switch(config-server-failure)#no proxy lifetime
switch(config-server-failure)#show active
monitor server-failure
  proxy
switch(config-server-failure)#
```

- This command disables the RAIL proxy.

```
switch(config-server-failure)#no proxy
switch(config-server-failure)#show active
switch(config-server-failure)#
```
Selecting Networks to Monitor

The `network (server-failure configuration mode)` command specifies the IPv4 network space that Rapid Automated Indication of Link-Loss (RAIL) monitors for failed links to connected servers. `Running-config` can contain multiple `network` statements, allowing RAIL to monitor multiple disjoint network spaces.

When a server on the specified network is blocked because of a failed Ethernet or port channel link, the switch becomes a proxy for the unavailable server and responds with `TCP RST` or `ICMP Unreachable` segments to devices sending packets to the unavailable server.

Example

- These commands specify two IPv4 network spaces that RAIL monitors for server failures.

```
switch(config)#monitor server
switch(config-server-failure)#network 10.1.1.0/24
switch(config-server-failure)#network 10.2.1.96/28
switch(config-server-failure)#show active
monitor server-failure
   network 10.2.1.96/28
   network 10.1.1.0/24
switch(config-server-failure)#
```

Enabling RAIL on an Interface

RAIL monitors an interface for link errors only when RAIL is globally enabled and enabled for the interface. The `monitor server-failure link` command enables RAIL on the configuration mode interface. Configuration settings are effective for all Ethernet and port channel interfaces that enable RAIL.

Example

- These commands enable RAIL on port channel interface 100.

```
switch(config)#interface port-channel 100
switch(config-if-Po100)#monitor server-failure link
switch(config-if-Po100)#show active
interface Port-Channel100
   monitor server-failure link
switch(config-if-Po100)#
```

19.5.5.4 Displaying RAIL Status

The switch provides commands to display RAIL configuration and status information:

Displaying RAIL Configuration settings

The `show monitor server-failure` command displays Rapid Automated Indication of Link-Loss (RAIL) configuration settings and the number of servers on each monitored network.
Example

- This command displays RAIL configuration status and lists the number of servers that are on each monitored network.

  switch>show monitor server-failure
  Server-failure monitor is enabled
  Proxy service: disabled
  Networks being monitored: 3
  10.2.1.96/28          : 0 servers
  10.1.1.0/24           : 0 servers
  10.3.0.0/16           : 3 servers
  switch>

Displaying RAIL History for All Connected Servers

The *show monitor server-failure history* command displays the time of all link failures detected by Rapid Automated Indication of Link-Loss (RAIL) and includes the interface name for each failure.

**Example**

- This command displays the link failure history from the time RAIL is instantiated on the switch.

  switch>show monitor server-failure history
  Total server failures: 4

<table>
<thead>
<tr>
<th>Server IP</th>
<th>Server MAC</th>
<th>Interface</th>
<th>Last Failed</th>
</tr>
</thead>
<tbody>
<tr>
<td>44.11.11.7</td>
<td>ad:3e:5f:dd:64:cf</td>
<td>Ethernet23</td>
<td>2013-02-10 00:07:56</td>
</tr>
<tr>
<td>10.1.8.13</td>
<td>01:33:df:ee:39:91</td>
<td>Port-Channel15</td>
<td>2013-02-10 00:03:39</td>
</tr>
</tbody>
</table>
  switch>

Displaying Server Configuration and Status

The *show monitor server-failure servers* command displays status and configuration data about each server that RAIL monitors. The display format depends on the parameter specified by the command:

**Example**

- This command displays RAIL information for the server at IP address 10.11.11.7

  switch>show monitor server-failure servers 10.11.11.7
  Server information:
  Server Ip Address: 10.11.11.7
  MAC Address: ad:3e:5f:dd:64:cf
  Current state: down
  Interface: Ethernet23
  Last Discovered: 2013-01-06 06:47:39
  Last Failed: 2013-02-10 00:07:56
  Last Proxied: 2013-02-10 00:08:33
  Last Inactive: 2013-02-09 23:52:21
  Number of times failed: 3
  Number of times proxied: 1
  Number of times inactive: 18
  switch>
This command displays RAIL information for the all servers on configured interfaces.

```
switch>show monitor server-failure servers all
Total servers monitored: 5

<table>
<thead>
<tr>
<th>Server IP</th>

switch>
19.6 **Data Transfer Commands**

**Control Plane and Data Plane Commands**
- ip access-group (Control Plane mode)
- switch forwarding-mode
- show switch forwarding-mode
- system control-plane

**Errdisable Commands**
- errdisable detect cause link-change
- errdisable flap-setting cause link-flap
- errdisable recovery cause
- errdisable recovery interval

**Fabric Link Monitoring Commands**
- platform sand monitor serdes error log
- platform sand monitor serdes error threshold
- platform sand monitor serdes poll period
- platform sand monitor serdes poll threshold isolation
- platform sand monitor serdes poll threshold recovery
- show fabric monitoring health
- show platform trident mirroring

**RAIL Commands**
- clear server-failure servers inactive
- monitor server-failure
- monitor server-failure link
- network (server-failure configuration mode)
- proxy (server-failure configuration mode)
- show monitor server-failure
- show monitor server-failure history
- show monitor server-failure servers
- shutdown (server-failure configuration mode)

**Link Flap Monitor Commands**
- default-profiles
- monitor link-flap policy
- monitor link-flap profiles
- profile max-flaps (Link Flap Configuration)

**MAC Address Table Commands**
- clear mac address-table dynamic
- mac address-table aging-time
- mac address-table static
- show bridge mac-address-table aging timeout
- show mac address-table
- show mac address-table count
- show mac address-table mlag-peer
- show mac address-table multicast
- show mac address-table multicast brief
- switchport mac address learning
Port Configuration Commands
- clear counters
- description
- interface loopback
- load interval
- switchport
- mtu
- show interfaces
- show interfaces description
- switchport default mode access
- switchport default mode routed

Port Mirroring Commands
- monitor session destination
- monitor session destination cpu
- monitor session forwarding-drop
- monitor session ip access-group
- monitor session source
- monitor session source ip access-group
- monitor session truncate
- no monitor session
- show monitor session

Port Security Commands
- switchport port-security
- switchport port-security mac-address maximum
- switchport port-security violation
- show port-security
- show port-security interface
- show port-security mac-address

Storm Control Commands
- storm-control
- show storm-control

Tracking Commands
- interface loopback
- links minimum
- link tracking group (interface)
- link tracking group
- show link tracking group
- show track
- track
- traffic-loopback
clear counters

The `clear counters` command resets the counters to zero for the specified interfaces. The command provides the following options:

- No parameter: When no option is selected, the counters are reset on the switch.
- Session parameter: The command resets the counters in software for the current CLI session, establishing a baseline upon which subsequent `show interfaces` or `show interfaces counters` commands are relative. Counters are not affected for other CLI sessions.

**Command Mode**

Privileged EXEC

**Command Syntax**

```
clear counters [INTERFACE] [SCOPE]
```

**Parameters**

- **INTERFACE** Interface type and number. Options include:
  - <no parameter> Display information for all interfaces.
  - ethernet `e_range` Ethernet interface range specified by `e_range`.
  - loopback `l_range` Loopback interface specified by `l_range`.
  - management `m_range` Management interface range specified by `m_range`.
  - port-channel `p_range` Port-Channel Interface range specified by `p_range`.
  - vlan `v_range` VLAN interface range specified by `v_range`.
  - vxlan `vx_range` VXLAN interface range specified by `vx_range`.

  Valid `e_range`, `l_range`, `m_range`, `p_range`, `v_range`, and `vx_range` formats include number, number range, or comma-delimited list of numbers and ranges.

- **SCOPE** Duration of the reset results. Options include:
  - <no parameter> counters are cleared on the switch.
  - session counters are reset only for the current session.
Examples

- These commands display interface counters, clear the counters, then display the counters again.

```
switch#show interfaces ethernet 1

```
switch#
```
clear mac address-table dynamic

The clear mac address-table dynamic command removes specified dynamic entries from the MAC address table. Entries are identified by their VLAN and layer 2 (Ethernet or port channel) interface.

- To remove a specific entry, include its VLAN and interface in the command.
- To remove all dynamic entries for a VLAN, do not specify an interface.
- To remove all dynamic entries for an interface, do not specify a VLAN.
- To remove all dynamic entries, do not specify a VLAN or an interface.

Command Mode
Privileged EXEC

Command Syntax

```plaintext
clear mac address-table dynamic [VLANS] [INTERFACE]
```

Parameters
- **VLANS** Table entries are cleared for specified VLANs. Options include:
  - <no parameter> all VLANs.
  - `vlan v_num` VLAN specified by `v_num`.
- **INTERFACE** Table entries are cleared for specified interfaces. Options include:
  - <no parameter> all Ethernet and port channel interfaces.
  - `interface ethernet e_range` Ethernet interfaces specified by `e_range`.
  - `interface port-channel p_range` port channel interfaces specified by `p_range`.
  - `vxlan vx_range` VXLAN interfaces specified by `vx_range`.

Valid range formats include number, range, or comma-delimited list of numbers and ranges.

Example
- This command clears all dynamic mac address table entries for port channel 5 on VLAN 34.

```plaintext
switch#clear mac address-table dynamic vlan 34 interface port-channel 5
switch#
```
clear server-failure servers inactive

The clear server-failure servers inactive command removes all inactive server entries from the server failed history list. The switch maintains this list, even after a server’s ARP entry is removed, to maintain a list of servers that are connected to the switch and log the most recent time of the failure of the link that connects the switch to the server.

Command Mode
Privileged EXEC

Command Syntax
   clear server-failure servers inactive

Related Commands
• show monitor server-failure history

Example
• This command clears the inactive servers from the server failed history list.
  switch#clear server-failure servers inactive
  switch#
default-profiles

The `default-profiles` command specifies the set of link-flap profiles that define error-disable criteria for interfaces where link flap monitoring is enabled without a link flap profile assignment. Entering a `default-profile` command replaces the current default-profile statement in `running-config`.

The default-profile set may contain zero, one, or multiple profiles. When the default-profile set is empty, `errdisable flap-setting cause link-flap` specifies default error-disable criteria. When the default-profile set contains multiple profiles, error-disable criteria is satisfied when conditions match any profile. Multiple profiles are assigned to the default-profile set through a single `default-profiles` command.

The `no default-profiles` and `default default-profiles` commands restore the empty default-profile set by deleting the `default-profiles` command from `running-config`.

**Command Mode**

Link-flap Configuration

**Command Syntax**

```
default-profiles [LF_PROFILES]
no default-profiles
default default-profiles
```

**Parameters**

- `LF_PROFILES` Name of link-flap profiles assigned to default profile set. Parameter may contain zero, one, or multiple link-flap profile names:
  - `<no parameter>` default-profile set is empty.
  - `profile` name of single link-flap profile.
  - `profile_1 profile_2 ... profile_N` list of link-flap profile names.

**Related Commands**

- `monitor link-flap policy` places the switch in link-flap-profiles configuration mode.
- `profile max-flaps (Link Flap Configuration)` configures link flap profiles.

**Guidelines**

The `errdisable flap-setting cause link-flap` statement is also configurable through the `profile max-flaps (Link Flap Configuration)` command.

**Example**

- This command assigns configures LF01 and LF02 as the default-profile set.
  ```
  switch(config)#monitor link-flap policy
  switch(config-link-flap)#default-profiles LF01 LF02
  switch(config-link-flap)#show active
  monitor link-flap policy
  profile LF01 max-flaps 15 time 60 violations 1 intervals 1
  profile LF02 max-flaps 10 time 30 violations 5 intervals 10
  profile LF03 max-flaps 25 time 100 violations 2 intervals 12
  profile LF04 max-flaps 5 time 15 violations 1 intervals 3
  default-profiles LF01 LF02
  switch(config-link-flap)#
  ```
description

The **description** command adds comment text for the configuration mode interface. The text provides information about the interface and has no effect on interface functions. The **show interfaces description** command displays interface description text.

The **no description** command removes the description text for the configuration mode interface from **running-config**.

**Command Mode**

Interface-Ethernet Configuration  
Interface-Loopback Configuration  
Interface-Management Configuration  
Interface-Port-channel Configuration  
Interface-VLAN Configuration  
Interface-VXLAN Configuration

**Command Syntax**

```
  description  label_text  
  no description  
  default description
```

**Parameters**

- **label_text** character string assigned to description attribute.

**Examples**

- These commands add description text to Ethernet interface 23, then displays the text through a **show interfaces description** command.

```
  switch(config)#interface ethernet 23  
  switch(config-if-Et23)#description external line  
  switch(config-if-Et23)#show interfaces ethernet 23 description
```

<table>

errdisable detect cause link-change

The `errdisable detect cause link-change` command enables the error-disabling of Ethernet interfaces when the switch detects a link flap error on the interface. The `errdisable flap-setting cause link-flap` command defines a link flap error in terms of the frequency of connection state changes.

The switch places an interface in `error-disabled` state when it detects an error on the interface. `Error-disabled` is an operational state that is similar to `link-down` state. To re-enable an error-disabled interface, enter `shutdown` and `no shutdown` command in the configuration mode for the interface.

By default, link flap detection is enabled. The `no errdisable detect cause link-change` command disables the triggering of error-disable actions. The `errdisable detect cause link-change` and `default errdisable detect cause link-change` commands enable the triggering of error-disable actions by removing the `no errdisable detect cause link-change` command from `running-config`.

**Command Mode**
- Global Configuration

**Command Syntax**
```
errdisable detect cause link-change
no errdisable detect cause link-change
default errdisable detect cause link-change
```

**Examples**
- This command disables error detection on the switch.
  
  ```
  switch(config)#no errdisable detect cause link-change
  switch(config)#
  ```

- These commands sets the link flap error criteria of 15 connection state changes over a 30 second period, then enables error detection on the switch.
  
  ```
  switch(config)#errdisable flap-setting cause link-flap max-flaps 15 time 30
  switch(config)#errdisable detect cause link-change
  switch(config)#
  ```
errdisable flap-setting cause link-flap

The `errdisable flap-setting cause link-flap` command configures the link-flap frequency that defines an link-flap error on an Ethernet interface. The `errdisable detect cause link-change` command uses this criteria to trigger an error-disable action.

The link-flap frequency is defined by the quantity of link flaps (connection state changes) over a specified period. The default settings are five link flaps and ten seconds.

The `no errdisable flap-setting cause link-flap` and `default errdisable flap-setting cause link-flap` commands restore the default link flap cause settings by removing the `errdisable flap-setting cause link-flap` command from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**
```
errdisable flap-setting cause link-flap max-flaps quantity time period
no errdisable flap-setting cause link-flap
default errdisable flap-setting cause link-flap
```

**Parameters**
- `quantity`  Number of link flaps. Value ranges from 1 to 100. Default value is 5.
- `period`  Interval over which link flaps accumulate to trigger an error condition (seconds). Value ranges from 1 to 1800. Default value is 10.

**Examples**
- This command sets the link flap error criteria of 15 connection state changes over 30 second periods.

```
switch(config)#errdisable flap-setting cause link-flap max-flaps 15 time 30
switch(config)#
```
errdisable recovery cause

The `errdisable recovery cause` command enables the automated recovery of error-disabled Ethernet interfaces. An interface that is disabled as a result of a specified condition attempts normal operation after a specified interval. When the disabling condition persists, recovered interfaces eventually return to the error-disabled state.

When automated recovery is not enabled, interfaces are recovered manually by entering `shutdown` and `no shutdown` from the interface's configuration mode.

`Running-config` can simultaneously store `errdisable recovery cause` statements for each error-disable condition. By default, error-disable recovery is disabled for all conditions.

The `no errdisable recovery cause` and `default errdisable recovery cause` commands disable automated recovery for interfaces disabled by the specified condition by removing the corresponding `errdisable recovery cause` command from `running-config`.

Command Mode
Global Configuration

Command Syntax
```
errdisable recovery cause CONDITION
no errdisable recovery cause CONDITION
default errdisable recovery cause CONDITION
```

Parameters
- `CONDITION` Disabling condition for which command automates recovery. Options include:
  - `arp-inspection`
  - `bpdu-guard`
  - `link-flap`
  - `no-internal-vlan`
  - `port-channel-guard`
  - `portsec`
  - `tapagg`
  - `uplink-failure-detection`
  - `xcvr_unsupported`

Related Commands
- `errdisable recovery interval` configures the period that an ethernet interface remains disabled before automated recovery begins.
Examples

- This command enables error-disable recovery for interfaces that are disabled by link-flap and bpduguard conditions and sets the errdisable recovery period at 10 minutes.

```
switch(config)#errdisable recovery cause bpduguard
switch(config)#errdisable recovery cause link-flap
switch(config)#errdisable recovery interval 600
switch(config)#show running-config
! Command: show running-config
<-------OUTPUT OMITTED FROM EXAMPLE-------->
errdisable recovery cause bpduguard
erdisable recovery cause link-flap
erdisable recovery interval 600
!
<-------OUTPUT OMITTED FROM EXAMPLE-------->
switch(config)#
```
errdisable recovery interval

The **errdisable recovery interval** command specifies the period that an error-disabled Ethernet interface remains disabled before automated errdisable recovery begins. This command affects only interfaces whose automated recovery is enabled for the disabling condition (**errdisable recovery cause**). When automated recovery is not enabled, interfaces are recovered manually by entering **shutdown** and **no shutdown** from the interface's configuration mode.

The **no errdisable recovery interval** and **default errdisable recovery interval** commands restore the default error recovery period of 300 seconds by removing the **errdisable recovery interval** command from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

```
errdisable recovery interval period
no errdisable recovery interval
default errdisable recovery interval
```

**Parameters**

- **period**  Error disable recovery period (seconds). Value ranges from 30 to 86400. Default value is 300

**Related Commands**

- **errdisable recovery cause** enables the automated recovery of error-disabled Ethernet interfaces.

**Examples**

- This command enables error-disable recovery for interfaces that are disabled by link-flap conditions and sets the errdisable recovery period at 10 minutes.

```
switch(config)#errdisable recovery cause link-flap
switch(config)#errdisable recovery interval 600
switch(config)#show running-config
! Command: show running-config
<!-------OUTPUT OMITTED FROM EXAMPLE-------->
!
errdisable recovery cause link-flap
errdisable recovery interval 600
!
<!-------OUTPUT OMITTED FROM EXAMPLE-------->
!
! switch(config)#
```
interface loopback

The `interface loopback` command places the switch in loopback-interface configuration mode for the specified interfaces. The command creates loopback interfaces for previously unconfigured interfaces.

The command can specify a single interface or multiple interfaces:

- Single interface: Command creates an interface if it specifies one that was not previously created.
- Multiple interfaces: Command is valid only if all specified interfaces were previously created.

The `no interface loopback` command removes the specified interfaces from `running-config`, including all interface configuration statements. The `default interface loopback` command removes all configuration statements for the specified loopback interface without deleting the loopback interface from `running-config`.

The following commands are available in loopback configuration mode:

- `description`
- `exit`
- `ip address`
- `ip proxy-arp`
- `ipv6 address`
- `ipv6 enable`
- `load interval`
- `logging event`
- `mtu`
- `shutdown (Interfaces)`
- `snmp trap`

**Command Mode**

Global Configuration

**Command Syntax**

```
interface loopback l_range
no interface loopback l_range
default interface loopback l_range
```

**Parameters**

- `l_range` Loopback interfaces (number, range, or comma-delimited list of numbers and ranges). Loopback number ranges from 0 to 1000.

**Examples**

- This command enters interface configuration mode for loopback interfaces 1 through 5.
  
  ```
  switch(config)#interface loopback 1-5
  switch(config-if-Lo1-5)#
  ```

- This command creates interface 23 and enters interface configuration mode:
  
  ```
  switch(config)#interface loopback 23
  switch(config-if-Lo23)#
  ```

- This command removes loopback interfaces 5 through 7 from `running-config`.
  
  ```
  switch(config)#no interface loopback 5-7
  switch(config)#
  ```
ip access-group (Control Plane mode)

The `ip access-group` command applies an IPv4 or standard IPv4 access control list (ACL) to the control plane.

The no `ip access-group` and default `ip access-group` commands remove the corresponding `ip access-group` command from `running-config`.

**Command Mode**
Control-plane Configuration

**Command Syntax**
```
ip access-group list_name [VRF_INSTANCE] DIRECTION
no ip access-group [list_name] [VRF_INSTANCE] DIRECTION
default ip access-group [list_name] [VRF_INSTANCE] DIRECTION
```

**Parameters**
- `list_name` name of ACL assigned to interface.
- `VRF_INSTANCE` specifies the VRF instance being modified.
  - <no parameter> changes are made to the default VRF.
  - `vrf vrf_name` changes are made to the specified user-defined VRF.
- `DIRECTION` transmission direction of packets, relative to interface. Valid options include:
  - `in` inbound packets.

**Example**
- These commands apply the IPv4 ACL named `test2` to the control plane.
  ```
switch(config)#system control-plane
switch(config-system-cp)#ip access-group test2 in
switch(config-system-cp)#
```
**links minimum**

The *links minimum* command specifies the minimum number of links the configuration mode link-state group requires.

The *no links minimum* and *default links minimum* commands restore the default minimum value of 1 by deleting the corresponding *links minimum* statement from *running-config*.

**Command Mode**

- Link-State Configuration

**Command Syntax**

```
links minimum quantity
no links minimum
default links minimum
```

**Parameters**

- *quantity* Minimum number of links. Value ranges from 1 to 100000. Default value is 1.

**Related Commands**

- *link tracking group* creates and enables a link-state group and places the switch in link-state configuration mode.
- *link tracking group (interface)* adds the configuration mode interface to the specified link-state group.

**Examples**

- These commands configure link-state tracking group *link-a* to have at least 60 links.

```
switch(config)#link tracking group link-a
switch(config-link-state-link-a)links minimum 60
switch(config-link-state-link-a)
```
link tracking group (interface)

The `link tracking group` command adds the configuration mode interface to a link-state group and specifies whether it is upstream or downstream.

The `no link tracking group` and `default link tracking group` commands remove the specified link-state group assignment for the configuration mode interface.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration
- Interface-VXLAN Configuration

**Command Syntax**

```
link tracking group group_name DIRECTION
no link tracking group [group_name]
default link tracking group [group_name]
```

**Parameters**

- `group_name`  link tracking group name.
- `DIRECTION`  position of the interface in the link-state group. Valid options include:
  - `upstream`
  - `downstream`

**Example**

- These commands create link-state group “xyz” and add VLAN interface 100 to the group as an upstream interface.

```
switch(config)#link tracking group xyz
switch(config-link-state-xyz)#show active
link tracking group xyz
switch(config-link-state-xyz)#exit
switch(config)#interface vlan 100
switch(config-if-Vl100)#link tracking group xyz upstream
switch(config-if-Vl100)#show active
  interface Vlan100
    link state group xyz upstream
switch(config-if-Vl100)#
```
link tracking group

The link tracking group command creates and enables a link-state group and places the switch in link-state-group configuration mode. A link-state group consists of “upstream” interfaces (connections to servers) and “downstream” interfaces (connections to switches and clients). In the event of a failure of all upstream interfaces in the link-state group, the downstream interfaces are shut down.

The no link tracking group and default link tracking group commands delete the link tracking group from running-config.

Command Mode
Global Configuration

Command Syntax

  link tracking group  group_name
  no link tracking group  group_name
  default link tracking group  group_name

Parameters
  •  group_name  link-state group name.

Commands available in link-state Configuration Mode
  •  links minimum  configures the minimum number of links that the link-state group requires.

Example
  •  This command creates and enables link-state group 1.

    switch(config)#link tracking group 1
    switch(config-link-state-1)#
load interval

The `load-interval` command changes the load interval for the configuration mode interface. Load interval is the time period over which data is used to compute interface rate counters. Interface rates are exponentially weighted moving averages; recent data samples have greater influence than older samples. Statistics calculated with shorter load intervals are usually more sensitive to short traffic bursts.

The `no load-interval` and `default load-interval` commands restore the default value of 300 seconds by removing the corresponding `load-interval` statement from `running-config`.

Command Mode
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration
- Interface-VXLAN Configuration

Command Syntax
- `load-interval delay`
- `no load-interval`
- `default load-interval`

Parameters
- `delay` Load interval delay. Values range from 5 to 600 (seconds). Default value is 300 (five minutes).

Example
- These commands set the load interval for Ethernet interface 7 at 60 seconds.
  
  ```
  switch(config)#interface ethernet 7
  switch(config-if-Et7)#load-interval 60
  switch(config-if-Et7)#
  ```
mac address learning

The mac address learning command enables MAC address learning on a VLAN configuration mode. By default, MAC address learning is enabled by on a VLAN.

The no mac address learning command disables MAC address learning for the VLAN configuration mode. The mac address learning and default mac address learning commands enable MAC address learning for the VLAN configuration mode by deleting the corresponding no mac address learning command from the running-config.

Command Mode
   Interface-VLAN Configuration

Command Syntax
   mac address learning
   no mac address learning
   default mac address learning

Examples
- These commands enable MAC address learning on VLAN 10 configuration.
  switch(config)#vlan 10
  switch(config-vlan-10)#mac address learning

- These commands disable MAC address learning on VLAN 10 configuration.
  switch(config)#vlan 10
  switch(config-vlan-10)#no mac address learning
**mac address-table aging-time**

The **mac address-table aging-time** command configures the aging time for MAC address table dynamic entries. Aging time defines the period an entry is in the table, as measured from the most recent reception of a frame on the entry’s VLAN from the specified MAC address. The switch removes entries when their presence in the MAC address table exceeds the aging time.

Aging time ranges from 10 to 1,000,000 seconds with a default of 300 seconds (five minutes).

The **no mac address-table aging-time** and **default mac address-table aging-time** commands reset the aging time to its default by removing the **mac address-table aging-time** command from **running-config**.

**Command Mode**
- Global Configuration

**Command Syntax**

```
mac-address-table aging-time period
no mac-address-table aging-time
default mac-address-table aging-time
```

**Parameters**
- **period** MAC address table aging time. Default is 300 seconds. Options include:
  - 0 disables deletion of table entries on the basis of aging time.
  - 10 through 1000000 (one million) aging period (seconds).

**Example**
- This command sets the MAC address table aging time to two minutes (120 seconds).

```
switch(config)#mac address-table aging-time 120
switch(config)#
```
mac address-table static

The `mac address-table static` command adds a static entry to the MAC address table. Each table entry references a MAC address, a VLAN, and a list of layer 2 (Ethernet or port channel) ports. The table supports three entry types: unicast drop, unicast, and multicast.

- A drop entry does not include a port.
- A unicast entry includes one port.
- A multicast entry includes at least one port.

Packets with a MAC address (source or destination) and VLAN specified by a drop entry are dropped. Drop entries are valid for only unicast MAC addresses.

The command replaces existing dynamic or static table entries with the same VLAN-MAC address. Static entries are not removed by aging (`mac address-table aging-time`). Static MAC entries for mirror destinations or LAG members are typically avoided.

The most important byte of a MAC address distinguishes it as a unicast or multicast address:

- Unicast: most significant byte is an even number. Examples: 0200.0000.0000 1400.0000.0000
- Multicast: most significant byte is an odd number. Examples: 0300.0000.0000 2500.0000.0000

The `no mac address-table static` and `default mac address-table static` commands remove corresponding `mac address-table static` commands from `running-config` and MAC address table entries.

**Command Mode**

Global Configuration

**Command Syntax**

```
mac address-table static mac_address vlan v_num DESTINATION
no mac address-table static mac_address vlan v_num [DESTINATION]
default mac address-table static mac_address vlan v_num [DESTINATION]
```

**Parameters**

- `mac_address` Table entry’s MAC address (dotted hex notation – H.H.H).
- `v_num` Table entry’s VLAN.
- `DESTINATION` Table entry’s port list.

For multicast MAC address entries, the command may contain multiple ports, listed in any order. The CLI accepts only one interface for unicast entries.

- `drop` creates drop entry in table. Valid only for unicast addresses.
- `interface ethernet e_range` Ethernet interfaces specified by `e_range`.
- `interface port-channel p_range` Port channel interfaces specified by `p_range`.
- `<no parameter>` Valid for `no` and `default` commands that remove multiple table entries.

`e_range` and `p_range` formats include number, range, comma-delimited list of numbers and ranges.
Example

- This command adds a static entry for unicast MAC address 0012.3694.03ec to the MAC address table.

  switch(config)#mac address-table static 0012.3694.03ec vlan 3 interface Ethernet 7
  switch(config)#show mac address-table static
  Mac Address Table
  -------------------------------
  Vlan    Mac Address       Type        Ports      Moves   Last Move
  ----    -----------       ----        -----      -----   --------
  3 0012.3694.03ec STATIC   Et7          
  Total Mac Addresses for this criterion: 1

  Multicast Mac Address Table
  -----------------------------------
  Vlan    Mac Address       Type        Ports
  ----    -----------       ----        ----- 
  Total Mac Addresses for this criterion: 0

switch(config)#

- These commands adds a static drop entry for MAC address 0012.3694.03ec to the MAC address table, then displays the entry in the MAC address table.

  switch(config)#mac address-table static 0012.3694.03ec vlan 3 drop
  switch(config)#show mac address-table static
  Mac Address Table
  -----------------------------------
  Vlan    Mac Address       Type        Ports      Moves   Last Move
  ----    -----------       ----        -----      -----   --------

Total Mac Addresses for this criterion: 1
```

switch(config)#
monitor link-flap policy

The monitor link-flap policy command places the switch in link-flap configuration mode for configuring link flap profiles and compiling a default-profile set. Link-flap configuration mode is not a group change mode; running-config is changed immediately after commands are executed. The exit command does not affect the configuration.

Link flap profiles are assigned to Ethernet interfaces and specify conditions that define a link-flap error. When link flap monitoring is enabled on an interface, the link-flap conditions determine when the interface is error-disabled. Multiple profiles can be assigned to an interface to monitor a set of error conditions.

Command Mode
Global Configuration

Command Syntax

monitor link-flap policy

Commands Available in link-flap Configuration Mode

- default-profiles configures the set of profiles that define the default-profile set.
- profile max-flaps (Link Flap Configuration) configures a link-flap profile

Example

- These commands place the switch in link-flap configuration mode.

  switch(config)#monitor link-flap policy
  switch(config-link-flap)#

- This command returns the switch to global configuration mode.

  switch(config-link-flap)#exit
  switch(config)#
monitor link-flap profiles

The **monitor link-flap profiles** command enables link-flap monitoring on the configuration mode interface and specifies the error-disable criteria for the interface. Entering a **monitor link-flap profiles** command replaces the corresponding statement in **running-config**.

The command enables the following link flap detection options:

- **monitor link-flap (no profiles listed)**: The interface detects link flaps using the criteria defined by the default-profile set (**default-profiles**).
- **monitor link-flap profiles (at least one profile listed)**: The interface detects link flaps using the criteria of the listed profiles. Error-disable criteria require conditions that match at least one profile.
- **default monitor link-flap**: The interface detects link flaps using the **errdisable flap-setting cause link-flap** and **errdisable recovery cause** commands.
- **no monitor link-flap**: The interface does not detect link flaps.

Default monitor link flap is the default setting.

**Command Mode**

  Interface-Ethernet Configuration  
  Interface-Management Configuration

**Command Syntax**

```plaintext
monitor link-flap [LF_PROFILES]  
no monitor link-flap  
default monitor link-flap
```

**Parameters**

- **LF_PROFILES**  
  Name of link-flap profiles assigned to interface. Parameter may contain zero, one, or multiple link-flap profile names:
  - <no parameter>  
    Link flap criteria determined by default-profile set.
  - **profiles** profile_name  
    Name of single link-flap profile.
  - **profiles** profile_name_1 profile_name_2 ... profile_name_N  
    List of link-flap profile names.

**Example**

- This command applies the LF03 and LF04 link flap profiles to Ethernet interface 33.
  ```plaintext
  switch(config)#interface ethernet 33  
  switch(config-if-Et33)#monitor link-flap profiles LF03 LF04  
  switch(config-if-Et33)#show active  
  interface Ethernet33  
  monitor link-flap profiles LF04 LF03  
  switch(config-if-Et33)#
  ```

- This command disables link-flap monitoring on Ethernet interface 34.
  ```plaintext
  switch(config)#interface ethernet 34  
  switch(config-if-Et34)#no monitor link-flap  
  switch(config-if-Et34)#show active  
  interface Ethernet34  
  no monitor link-flap  
  switch(config-if-Et34)#
  ```
**monitor server-failure**

The `monitor server-failure` command places the switch in server-failure configuration mode. Rapid Automated Indication of Link-Loss (RAIL) settings are configured in server-failure configuration mode. RAIL is disabled by default and is enabled by the `no shutdown` command in server-failure configuration mode.

The `no monitor server-failure` and `default monitor server-failure` commands disable RAIL and restore all settings to their default state by removing all server-failure configuration mode statements from `running-config`.

Server-failure configuration mode is not a group change mode; `running-config` is changed immediately upon entering commands. Exiting server-failure configuration mode does not affect `running-config`. The `exit` command returns the switch to global configuration mode.

**Command Mode**

Global Configuration

**Command Syntax**

```
monitor server-failure
no monitor server-failure
default monitor server-failure
```

**Commands Available in server-failure Configuration Mode**

- `network (server-failure configuration mode)`
- `proxy (server-failure configuration mode)`
- `shutdown (server-failure configuration mode)`

**Example**

- These commands place the switch in server-failure configuration mode and enables RAIL.
  
  ```
  switch(config)#monitor server-failure
  switch(config-server-failure)#show active
  switch(config-server-failure)#no shutdown
  switch(config-server-failure)#show active
  monitor server-failure
  no shutdown
  switch(config-server-failure)#
  ```

- This command deletes all server-failure configuration mode commands from `running-config`.
  
  ```
  switch(config)#no monitor server-failure
  switch(config)#
  ```
monitor server-failure link

The **monitor server-failure link** command enables Rapid Automated Indication of Link-Loss (RAIL) on the configuration mode interface. RAIL must be properly configured globally or this command has no effect on switch operation.

When an interface monitored by RAIL goes down, the switch performs these steps for servers that the switch accesses from the interface:

**Step 1** IP addresses of the servers are removed from ARP cache.

**Step 2** A dynamic MAC entry is added to the MAC address table for each server. The port for each entry is listed as **CPU**.

The **no monitor server-failure link** and **default monitor server-failure link** commands disable RAIL on the configuration mode interface by deleting the corresponding **monitor server-failure link** command from **running-config**.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

**Command Syntax**

```
monitor server-failure link
no monitor server-failure link
default monitor server-failure link
```

**Related Commands**

- **monitor server-failure** places the switch in server-failure configuration mode for configuring RAIL.

**Example**

- These commands enable RAIL on port channel interface 100.

  ```
  switch(config)#interface port-channel 100
  switch(config-if-Po100)#monitor server-failure link
  switch(config-if-Po100)#show active
  interface Port-Channel100
    monitor server-failure link
  switch(config-if-Po100)#
  ```
monitor session destination

The **monitor session destination** command configures an interface as the destination port of a specified port mirroring session. The destination is usually an Ethernet interface, but other options are available on certain platforms (see **Guidelines**). The **monitor session source** command configures the source port of the mirroring session.

An interface cannot be used in more than one mirror session and cannot be simultaneously used as both source and destination. By default, mirror sessions duplicate ingress and egress traffic but are configurable to mirror traffic only from one direction.

**Note**
On platforms which support the use of port channels as mirror destinations, a port channel **must not** be used as a mirror destination if it is a member of an MLAG.

The **no monitor session destination** and **default monitor session destination** commands remove the mirroring session destination assignment by deleting the corresponding **monitor session destination** command from **running-config**. The **no monitor session** removes the entire mirroring session.

**Command Mode**
Global Configuration

**Command Syntax**
```
monitor session session_name destination {cpu | ethernet e_range | port-channel p_range | tunnel mode}
no monitor session session_name destination
default monitor session session_name destination
```

**Parameters**
- `session_name` label assigned to the port mirroring session.
- `cpu` configures a CPU as the destination interface.
- `ethernet e_range` configures Ethernet interfaces specified by `e_range` as the destination interface. The ethernet interface value ranges from 1 to 50.
- `port-channel p_range` configures port channel interfaces specified by `p_range` as the destination interface. The port-channel value ranges from 1 to 2000.
- `tunnel mode` configures a tunnel as the destination interface. Option includes:
  - `gre` configures GRE-tunnel as the destination interface.

**Guidelines**
The tunnel mode is supported on DCS-7280SE, DCS-7500E, DCS-7050/7050X, DCS-7250X, and DCS-7300X devices only.

Port mirroring capacity varies by platforms. The session destination capacity of switches on each platform is listed below:
- **Arad Platform**: Ethernet interfaces (one)
- **FM6000 Platform**: Ethernet interfaces (any count), Port channel interfaces (any count), CPU
- **Petra Platform**: Ethernet interfaces (eight for Rx or Tx sessions; four for both ways)
- **Trident Platform**: Ethernet interfaces (one)
- **Trident II Platform**: Ethernet interfaces (one)
When there are multiple transmit (Tx) sources in a monitor session, mirrored frames use Tx properties of the lowest numbered Tx mirror source configured. Packets are modified based on properties.

**Example**

Allowed VLANs on the ethernet8 source interface are 10, 20 and 30. Allowed VLANs on ethernet9 source interface are 30, 40, and 50. The frames going out of ethernet9 tagged with 10, 20, and 30 appears at the mirrored destination as tagged frames. The tagged frames with 40 or 50 on ethernet9 appears at the mirrored destination as untagged frames. Since ethernet8 is the lowest numbered source interface, all Tx frames on ethernet8 are tagged in the mirrored destination.

**Examples**

- This command configures Ethernet interface 8 as the destination port for the `redirect_1` mirroring session.
  
  ```
  switch(config)#monitor session redirect_1 destination ethernet 2
  switch(config)#show monitor session
  Session redirect_1
  ------------------------
  Source Ports:
  
  Destination Ports:
  
  Et2 : active
  ```

- This command configures a GRE tunnel with source and destination addresses as 1.1.1.1 and 2.2.2.2 respectively as the destination interface for the `redirect_2` mirroring.
  
  ```
  switch(config)#monitor session redirect_2 destination tunnel mode gre source 1.1.1.1 destination 2.2.2.2
  switch(config)#show monitor session
  Session redirect_2
  ------------------------
  Source Ports:
  
  Destination Ports:
  
  status source dest TTL DSCP proto VRF fwd-drop
  Gre1 : active 1.1.1.1 2.2.2.2 128 0x88be default no
  ```

switch(config)#
**monitor session destination cpu**

The `monitor session destination cpu` command configures the CPU as the destination port of a specified port mirroring session. The `monitor session source` command configures the source port of the mirroring session. By default, mirror sessions duplicate ingress and egress traffic but are configurable to mirror traffic from one direction.

The CPU can only be configured as a destination for a mirroring session, not as a source. However, the CPU can serve as the destination for multiple mirroring sessions. Traffic mirrored to the CPU can be viewed using `tcpdump`.

The no `monitor session destination cpu` and default `monitor session destination cpu` commands remove the mirror session destination assignment by deleting the corresponding `monitor session destination cpu` command from `running-config`. The no `monitor session` command removes the entire mirror session.

**Command Mode**
- Global Configuration

**Command Syntax**

```
monitor session session_name destination cpu
no monitor session session_name destination cpu
default monitor session session_name destination cpu
```

**Parameters**
- `session_name` Label assigned to port mirroring session.

**Guidelines**

To view the traffic mirrored to the CPU from a source port, use `tcpdump` from the Bash shell, with the source interface as an argument. This causes `tcpdump` to capture packets from the kernel interface of the source port.

**Examples**
- These commands configure Ethernet interface 35 as the source and the CPU as the destination port for the `redirect_1` mirroring session, then display the mirror interface.

```
switch(config)#monitor session redirect_1 destination cpu
switch(config)#monitor session redirect_1 source ethernet 35
switch(config)#show monitor session
```

Session redirect_1
------------------------

Source Ports:

Both: Et35

Destination Ports:

    Cpu : active (mirror0)

switch(config)#
This command uses tcpdump to view the traffic mirrored by the redirect_1 mirroring session. The CPU mirror interface specified in the previous output must be used in the tcpdump expression (in this case, mirror0).

```
switch# bash tcpdump -i mirror0
tcpdump: WARNING: mirror0: no IPv4 address assigned
tcpdump: verbose output suppressed, use -v or -vv for full protocol decode
listening on mirror0, link-type EN10MB (Ethernet), capture size 65535 bytes

switch#
```
**monitor session forwarding-drop**

The `monitor session forwarding-drop` command configures a forwarding-drop session for mirroring ingress packets that are dropped during ASIC forwarding.

The `no monitor session forwarding-drop` and `default monitor session forwarding-drop` commands delete the current forwarding-drop configuration.

**Command Mode**

Global Configuration

**Command Syntax**

```
monitor session session_name forwarding-drop destination tunnel mode
no monitor session session_name forwarding-drop destination tunnel mode
default monitor session session_name forwarding-drop destination tunnel mode
```

**Parameters**

- `destination` specifies to mirror packets at destination
- `tunnel mode` specifies to mirror packets that pass through a tunnel. Options include:
  - `gre` configures GRE-tunnel as the destination interface.

**Related Commands**

- `monitor session destination`
- `monitor session destination cpu`
- `show monitor session`

**Guidelines**

The forwarding-drop configuration is supported on DCS-7050/7050X, DCS-7250X, and 7300X devices only.

**Examples**

- This command configures a forwarding-drop session to 1.1.1.1 as the destination.

```
switch(config)#monitor session 1 forwarding-drop destination tunnel mode gre source 1.1.1.1 destination 2.2.2.2
switch(config)#show monitor session
Session 1
------------------------
Programmed in HW: No

<td>default</td>
<td>yes</td>
</tr>
</tbody>
</table>
```

```
switch(config)#
```
**monitor session ip access-group**

The **monitor session ip access-group** command configures an ACL to filter the traffic being mirrored to the destination port. ACLs applied to a source port affect the RX side of the interface, and do not impact the TX side of the interface. TX mirrored packets cannot be filtered, and will continue to be sent to the mirror destination.

The **no monitor session ip access-group** and **default monitor session ip access-group** commands remove the filter from the specified mirror session by deleting the corresponding **monitor session ip access-group** command from **running-config**. The **no monitor session** command removes the entire mirror session.

**Command Mode**

  Global Configuration

**Command Syntax**

```
monitor session session_name ip access-group acl_name
no monitor session session_name ip access-group
default monitor session session_name ip access-group
```

**Parameters**

- **session_name**  Label assigned to port mirroring session.
- **acl_name**  The ACL to be applied to filter traffic for the specified session.

**Examples**

- These commands create an ACL and apply it to filter the traffic mirrored to the destination port by session “redirect_1.”
  ```
  switch(config)#ip access-list allow-host
  switch(config-acl-allow-host)#10 permit ip host 192.168.11.24 host 10.0.215.23
  switch(config-acl-allow-host)#20 deny ip any any
  switch(config-acl-allow-host)#exit
  switch(config)#
  switch(config)#monitor session redirect_1 ip access-group allow-host
  switch(config)#
  ```

- Use the **show monitor session** command to verify the configuration.
  ```
  switch#show monitor session
  Session redirect_1
  ------------------------
  Source Ports:
  Both: Et35(Acl:allow-host)
  Destination Ports:
  Cpu : active (mirror0)
  ip access-group: allow-host
  switch#
  ```
monitor session source

The monitor session source command configures the source port of a specified port mirroring session. The monitor session destination or monitor session destination cpu command configures the destination port of the mirroring session.

An interface cannot be used in more than one mirror session and cannot be simultaneously a source and a destination. An interface which is part of a port channel cannot be used as a source, but a port channel which is a member of an MLAG can be used. By default, mirror sessions duplicate ingress and egress traffic but are configurable to mirror traffic from only one direction.

The no monitor session source and default monitor session source commands remove the mirroring session source assignment by deleting the corresponding monitor session source command from running-config. The no monitor session removes entire the mirroring session.

Command Mode
Global Configuration

Command Syntax

monitor session session_name source INT_NAME DIRECTION
no monitor session session_name source INT_NAME DIRECTION
default monitor session session_name source INT_NAME DIRECTION

Parameters

- **session_name** Label assigned to port mirroring session.
- **INT_NAME** Source interface for the mirroring session.
  - ethernet e_range Ethernet interfaces specified by e_range.
  - port-channel p_range Port channel interfaces specified by p_range.
- **DIRECTION** transmission direction of traffic to be mirrored.
  - <no parameter> mirrors transmitted and received traffic.
  - both mirrors transmitted and received traffic.
  - rx mirrors received traffic only.
  - tx mirrors transmitted traffic only.

Guidelines

On DCS-7050, DCS-7050X, DCS-7250X, and DCS-7300X series, due to limitations of the switch ASIC, all frames mirrored on egress are prefixed with an 802.1Q VLAN tag, even when the egress port is configured as an access port. If the capture device is unable to process VLAN tags in a desirable manner mirroring should be configured exclusively for ingress traffic by specifying rx.

Restrictions

Port mirroring capacity varies by platform. Session source capacity for each platform is listed below:

- **FM6000 Platform**: Ethernet interfaces (any number), port channel interfaces (any number)
- **Arad Platform**: Ethernet interfaces (any number), port channel interfaces (any number).
- **Petra Platform**: Ethernet interfaces (eight for Rx or Tx sessions; four for both ways)
- **Trident Platform**: Ethernet interfaces (any number), port channel interfaces (any number)
- **Trident II Platform**: Ethernet interfaces (any number), port channel interfaces (any number)

The number of interfaces that can be effectively mirrored is restricted by the destination port speed.
Example

- This command configures Ethernet interface 7 as the source port for `redirect_1` mirroring session.

  ```
  switch(config)#monitor session redirect_1 source ethernet 7
  switch(config)#
  ```
monitor session source ip access-group

The **monitor session source ip access-group** command configures an ACL to filter the traffic being mirrored from a specific source port. This enables the ability to filter traffic using a different ACL on each source port and have the combined matched traffic sent to the destination port.

The **no monitor session source ip access-group** and **default monitor session source ip access-group** commands remove the filter from the specified mirror session by deleting the corresponding **monitor session source ip access-group** command from **running-config**. The **no monitor session** command removes the entire mirror session.

**Command Mode**
Global Configuration

**Command Syntax**

```
monitor session s_name source INT_NAME [DIRECT] ip access-group acl_name
go monitor session s_name source INT_NAME [DIRECT] ip access-group acl_name
default monitor session s_name source INT_NAME [DIRECT] ip access-group acl_name
```

**Parameters**

- **s_name**  Label assigned to port mirroring session.
- **INT_NAME**  Source interface for the mirroring session.
  - **ethernet e_range**  Ethernet interfaces specified by `e_range`.
  - **port-channel p_range**  Port channel interfaces specified by `p_range`.
- **DIRECT**  transmission direction of traffic to be mirrored. Options include:
  - `<no parameter>` mirrors received traffic only.
  - **rx** mirrors received traffic only.
- **acl_name**  The ACL to be applied to filter traffic for the specified session.

**Examples**

- These commands create ACLs and apply them to filter the traffic mirrored from two source ports by session “redir_1.”

```
switch(config)#ip access-list allow-host-x
switch(config-acl-allow-host-x)#10 permit ip host 192.168.11.24 host 10.0.215.23
switch(config-acl-allow-host-x)#20 deny ip any any
switch(config-acl-allow-host-x)#exit
switch(config)#ip access-list allow-host-y
switch(config-acl-allow-host-y)#10 permit ip host 172.16.233.80 host 10.0.215.23
switch(config-acl-allow-host-y)#20 deny ip any any
switch(config-acl-allow-host-y)#exit
switch(config)#monitor session redir_1 source ethernet 5,9 rx
switch(config)#monitor session redir_1 source ethernet 5 ip access-group allow-host-x
switch(config)#monitor session redir_1 source ethernet 9 ip access-group allow-host-y
switch(config)#
```
monitor session truncate

The `monitor session truncate` command configures a port mirroring session to truncate mirrored packets, retaining only the first 160 bytes. Packet truncation can be used to prevent oversubscription of the session’s destination port.

Packet truncation applies to the mirroring session as a whole, and cannot be applied to individual source ports.

The `no monitor session truncate` and `default monitor session truncate` commands restores mirroring of full packets by deleting the corresponding `monitor session truncate` command from `running-config`. The `no monitor session` removes the entire mirroring session.

Command Mode
Global Configuration

Command Syntax
```
monitor session session_name truncate
no monitor session session_name truncate
default monitor session session_name truncate
```

Parameters
- `session_name` Label assigned to port mirroring session.

Examples
- This command configures mirroring session `redirect_1` to truncate mirrored packets.
  ```
  switch(config)#monitor session redirect_1 truncate
  switch(config)#
  ```
**mtu**

The `mtu` command configures the IPv4 and IPv6 Maximum Transmission Unit (MTU) size for the configuration mode interface. The switch fragments IP packets that are larger than the MTU value for the outbound interface. An interface's MTU value is displayed with the `show interfaces` command.

MTU is independently configurable on all routable interfaces. The switch supports MTU sizes ranging from 68 to 9214 bytes. The default MTU size is 1500 bytes.

The `no mtu` and `default mtu` commands restore the interface's MTU to the default value by removing the corresponding `mtu` command from running-config.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
```
mtu bytes
no mtu
default mtu
```

**Parameters**
- `bytes` MTU size (bytes). Values range from 68 to 9214.

**Examples**
- This command sets the MTU size of 1492 bytes on VLAN interface 20.
  ```
  switch(config)#interface vlan 20
  switch(config-if-Vl20)#mtu 1492
  switch(config-if-Vl20)#
  ```
network (server-failure configuration mode)

The `network` command specifies the IPv4 network space that Rapid Automated Indication of Link-Loss (RAIL) monitors for failed links to connected servers. RAIL reduces the wait time for applications on directly connected servers that are blocked due to a failed link. **Running-config** supports simultaneous network command, allowing RAIL to monitor multiple disjoint network spaces.

When a server on the specified network is blocked because of a failed Ethernet or port channel link, the switch becomes a proxy for the unavailable server and responds with **TCP RST** or **ICMP Unreachable** segments to devices sending packets to the unavailable server.

The `no network` and `default network` commands terminate the RAIL monitoring of the specified IPv4 address space by deleting the corresponding `network` command from **running-config**.

**Command Mode**
- Server-failure Configuration

**Command Syntax**
- `network netv4_address`
- `no network netv4_address`
- `default network netv4_address`

**Parameters**
- `netv4_addr` IPv4 subnet address to be monitored (CIDR or address-mask notation).

**Related Commands**
- `monitor server-failure` places the switch in server-failure configuration mode.

**Example**
- This command specifies two IPv4 network spaces that RAIL monitors for server failures.

```bash
switch(config)#monitor server
switch(config-server-failure)#network 10.1.1.0/24
switch(config-server-failure)#network 10.2.1.96/28
switch(config-server-failure)#show active
monitor server-failure
  network 10.2.1.96/28
  network 10.1.1.0/24
switch(config-server-failure)#
```
no monitor session

The no monitor session and default monitor session commands remove the specified monitor session from the switch by deleting all corresponding monitor commands from running-config. Commands that remove or alter individual commands within a session configuration are described in the monitor session destination and monitor session source commands.

Command Mode
- Global Configuration

Command Syntax
- no monitor session session_name
- default monitor session session_name

Parameters
- **session_name**  Label assigned to port mirroring session.

Example
- This command displays the configuration of the **redirect_1** mirroring session, deletes the session, then confirms that the session was removed.
  
  switch(config)#show monitor session redirect_1
  
  Session redirect_1
  ------------------------
  Source Ports
  
  Both: Et7
  
  Destination Port: Et8
  
  switch(config)#no monitor session redirect_1
  
  switch(config)#show monitor session redirect_1
  
  Session not created
  
  switch(config)#
platform\s+sand\s+monitor\s+serdes\s+error\s+log

The platform\s+sand\s+monitor\s+serdes\s+error\s+log\s+command\s+is\s+used\s+for\s+enabling\s+the\s+serdes\s+error\s+log\s+for\n\+fabric\s+link\s+monitoring.

Command\s+Mode
  Global\s+Configuration

Command\s+Syntax
  \texttt{platform\sand\monitor\serdes\error\log}

Example
  \begin{itemize}
    \item This\s+command\s+enables\s+the\s+serdes\s+error\s+log\s+for\s+fabric\s+link\s+monitoring.
      \begin{verbatim}
      switch(config)#platform\sand\monitor\serdes\error\log
      switch(config)#
      \end{verbatim}
  \end{itemize}
platform sand monitor serdes error threshold

The `platform sand monitor serdes error threshold` command is used for generating a fabric link monitoring serdes error threshold.

**Command Mode**
- Global Configuration

**Command Syntax**

```
platform sand monitor serdes error threshold
```

**Example**

- This command monitors serdes error thresholds over the specified number of received cells, resulting in the isolation of a fabric link between 200 and 30,000 received cells.

```
switch(config)#platform sand monitor serdes error threshold 200 30000
switch(config)#
```
platform sand monitor serdes poll period

The platform sand monitor serdes poll period command is used to enable the serdes poll period.

**Command Mode**
- Global Configuration

**Command Syntax**

```
platform sand monitor serdes poll period
```

**Example**
- This command changes the serdes polling period for fabric link monitoring to 6 seconds.
  ```
  switch(config)#platform sand monitor serdes poll period 6
  switch(config)#
  ```
**platform sand monitor serdes poll threshold isolation**

The `platform sand monitor serdes poll threshold isolation` command is used to set and enables fabric link monitoring for serdes poll threshold isolation.

**Command Mode**

Global Configuration

**Command Syntax**

```
platform sand monitor serdes poll threshold isolation
```

**Example**

- This command changes the number of consecutive polls in which the threshold needs to be detected to isolate a link. In this case the number is 5 consecutive polls.

  ```
  switch(config)#platform sand monitor serdes poll threshold isolation 5
  switch(config)#
  ```
**platform sand monitor serdes poll threshold recovery**

The **platform sand monitor serdes poll threshold recovery** command is used to set and enable fabric link monitoring for serdes poll threshold recovery.

**Command Mode**
- Global Configuration

**Command Syntax**
- `platform sand monitor serdes poll threshold recovery`

**Example**
- This command changes the number of consecutive serdes polls used for threshold recovery to 6 seconds.
  ```bash
  switch(config)#platform sand monitor serdes poll threshold recovery 6
  switch(config)#
  ```
profile max-flaps (Link Flap Configuration)

The profile max-flaps command creates a link flap profile that, when assigned to an Ethernet interface, specifies the conditions that result in an error-disable action. Link flap profile parameters include:

- **flaps** Threshold number of interface state changes.
- **period** Interval when link flaps accumulate to trigger an error condition.
- **violations** Number of link flap errors (threshold exceeded over specified period).
- **intervals** Quantity of periods.

By default, violations and intervals are each set to one, resulting in a profile that triggers a link-flap error when the specified frequency is exceeded once. By configuring violations and intervals, link-flap errors are defined when the frequency is exceeded multiple times over a specified set of intervals.

Default is a reserved profile name that modifies the errdisable flap-setting cause link-flap statement in running-config. When configuring the default profile, violations and intervals are disregarded.

The no profile max-flaps command removes the specified profile by deleting the corresponding profile max-flaps command from running-config. The no profile max-flaps default command restores default errdisable flap-setting cause link-flap values by removing that command from running-config.

Command Mode

Link-flap Configuration

Command Syntax

```
profile PROFILE_NAME max-flaps flap_max time period [EXTENSIONS]
no profile LFPROFILE
```

Parameters

- **PROFILE_NAME** Name of link flap profile. Options include:
  - default command modifies default values (errdisable flap-setting cause link-flap).
  - profile_name command modifies specified link-flap profile.
- **flap_max** Threshold number of interface state changes. Value ranges from 1 to 100.
- **period** Interval when flaps accumulate toward threshold (seconds). Value ranges from 1 to 1800.
- **EXTENSIONS** Configures multi-flap triggers. Options include:
  - <no parameter> Sets errors and episodes to default values (one).
  - violations errors intervals episodes Link flap errors (errors) and number of periods (episodes).
    - Errors range is 1 to 1000. Default value is one.
    - Episodes range is 1 to 1000. Default value is one.

Related Commands

- monitor link-flap policy places the switch in link-flap configuration mode.
Example

- These commands create two link flap profiles with various trigger settings.

```plaintext
switch(config)#monitor link-flap policy
switch(config-link-flap)#profile LF01 max-flaps 15 time 60
switch(config-link-flap)#profile LF02 max-flaps 10 time 30 violations 5 intervals 10
switch(config-link-flap)#show active
monitor link-flap policy
    profile LF01 max-flaps 15 time 60 violations 1 intervals 1
    profile LF02 max-flaps 10 time 30 violations 5 intervals 10
switch(config-link-flap)#
```
proxy (server-failure configuration mode)

The `proxy` command enables the Rapid Automated Indication of Link-Loss (RAIL) proxy setting and specifies the interval that RAIL responds to messages sent to servers on failed links, starting from when the switch detects the failed link. The RAIL state machine is in the proxying state during the timeout interval this command specifies. When RAIL proxy is not enabled, the switch maintains a list of unavailable servers without responding to messages sent the servers. The switch can enter RAIL proxy state only when this command is enabled.

The RAIL proxy setting is `disabled` by default. When RAIL proxy is enabled, the default period is three minutes.

The `no proxy` and `default proxy` commands return the RAIL proxy setting to disabled by removing the proxy statement from `running-config`.

The `no proxy lifetime` and `default proxy lifetime` command sets the proxy time setting to its default value of three minutes if the RAIL proxy setting is `enabled`. These commands have no effect if the RAIL proxy setting is `disabled`.

Command Mode
Server-failure Configuration

Command Syntax
```
proxy [lifetime time_span]
no proxy
no proxy [lifetime]
default proxy
default proxy [lifetime]
```

Parameters
- `timespan`  proxy timeout period (minutes). Value ranges from 1 to 10080. Default value is 3.

Related Commands
- `monitor server-failure` places the switch in server-failure configuration mode.

Example
- These commands enable the RAIL proxy and sets the proxy timeout period of 10 minutes.
  
  ```
  switch(config)#monitor server
  switch(config-server-failure)#proxy lifetime 10
  switch(config-server-failure)#show active
  monitor server-failure
    proxy lifetime 10
  switch(config-server-failure)#
  ```

- This command sets the proxy timeout period to its default value of 3 minutes.
  
  ```
  switch(config-server-failure)#no proxy lifetime
  switch(config-server-failure)#show active
  monitor server-failure
    proxy
  switch(config-server-failure)#
  ```

- This command disables the RAIL proxy.
  
  ```
  switch(config-server-failure)#no proxy
  switch(config-server-failure)#show active
  monitor server-failure
  switch(config-server-failure)#
  ```
show bridge mac-address-table aging timeout

The `show bridge mac-address-table aging timeout` command displays the aging time for MAC address table dynamic entries. Aging time defines the period an entry is in the table, as measured from the most recent reception of a frame on the entry’s VLAN from the specified MAC address. The switch removes entries that exceed the aging time.

Aging time ranges from 10 seconds to 1,000,000 seconds with a default of 300 seconds (five minutes).

**Command Mode**

EXEC

**Command Syntax**

```
show bridge mac-address-table aging timeout
```

**Examples**

- This command shows the MAC address table aging time
  ```
  switch>show bridge mac-address-table aging timeout
  Global Aging Time: 120
  switch>
  ```
show fabric monitoring health

The platform sand monitor health command is used to display the fabric monitoring connected state status with isolated links.

Command Mode
Global Configuration

Command Syntax
platform sand monitor health

Example
• This command displays the connected state status with isolated links.

    switch(config)#show platform sand health
    Fabric serdes isolated by fabric monitoring: (36 total)
    Arad5/0 serdes [0-1, 10-19, 2, 20-29, 3, 30-35, 4-9]
    Top fabric serdes list by number of times isolated by monitoring:
    Arad5/0 serdes 0: 1 (last occurred: 0:01:04 ago)
    Arad5/0 serdes 1: 1 (last occurred: 0:01:04 ago)
    Arad5/0 serdes 10: 1 (last occurred: 0:01:04 ago)
    Arad5/0 serdes 11: 1 (last occurred: 0:01:04 ago)
    Arad5/0 serdes 12: 1 (last occurred: 0:01:04 ago)
    Arad5/0 serdes 13: 1 (last occurred: 0:01:04 ago)
    Arad5/0 serdes 14: 1 (last occurred: 0:01:04 ago)
    Arad5/0 serdes 15: 1 (last occurred: 0:01:04 ago)
    Arad5/0 serdes 16: 1 (last occurred: 0:01:04 ago)
    Arad5/0 serdes 17: 1 (last occurred: 0:01:04 ago)

    switch(config)#
show interfaces

The `show interfaces` command displays operational status and configuration information of specified interfaces. The output includes speed, duplex, flow control information and basic interface statistics.

The input and output bit rates, as displayed, do not include framing bits that are part of the Ethernet standard, the inter-frame gap and preamble that total 20 bytes per packet. The percentage number includes those framing bits to provide a better link utilization estimate.

**Command Mode**

EXEC

**Command Syntax**

```
show interfaces [INT_NAME]
```

**Parameters**

- `INT_NAME` Interface type and numbers. Options include:
  - `<no parameter>` all interfaces.
  - `ethernet e_range` Ethernet interface range specified by `e_range`.
  - `loopback l_range` Loopback interface specified by `l_range`.
  - `management m_range` Management interface range specified by `m_range`.
  - `port-channel p_range` Port-Channel Interface range specified by `p_range`.
  - `vlan v_range` VLAN interface range specified by `v_range`.
  - `vxlan vx_range` VXLAN interface range specified by `vx_range`.

Valid range formats include number, number range, or comma-delimited list of numbers and ranges.
Example

- This command display configuration and status information for Ethernet interface 1 and 2.

```bash
switch>show interfaces ethernet 1-2
Ethernet1 is up, line protocol is up (connected)
  Hardware is Ethernet, address is 001c.2481.7647 (bia 001c.2481.7647)
  Description: mkt.1
  MTU 9212 bytes, BW 10000000 Kbit
  Full-duplex, 10Gb/s, auto negotiation: off
  Last clearing of "show interface" counters never
  5 seconds input rate 33.5 Mbps (0.3% with framing), 846 packets/sec
  5 seconds output rate 180 kbps (0.0% with framing), 55 packets/sec
  76437268 packets input, 94280286608 bytes
  Received 2208 broadcasts, 73358 multicast
  0 runts, 0 giants
  0 input errors, 0 CRC, 0 alignment, 0 symbol
  0 PAUSE input
  6184281 packets output, 4071319140 bytes
  Sent 2209 broadcasts, 345754 multicast
  0 output errors, 0 collisions
  0 late collision, 0 deferred
  0 PAUSE output
Ethernet2 is up, line protocol is up (connected)
  Hardware is Ethernet, address is 001c.2481.7648 (bia 001c.2481.7648)
  Description: mkt.2
  MTU 9212 bytes, BW 10000000 Kbit
  Full-duplex, 10Gb/s, auto negotiation: off
  Last clearing of "show interface" counters never
  5 seconds input rate 711 kbps (0.0% with framing), 271 packets/sec
  5 seconds output rate 239 kbps (0.0% with framing), 65 packets/sec
  73746370 packets input, 78455101010 bytes
  Received 11 broadcasts, 83914 multicast
  0 runts, 0 giants
  0 input errors, 0 CRC, 0 alignment, 0 symbol
  0 PAUSE input
  5687714 packets output, 4325064454 bytes
  Sent 15 broadcasts, 107279 multicast
  0 output errors, 0 collisions
  0 late collision, 0 deferred
  0 PAUSE output
switch>
```
show interfaces description

The `show interfaces description` command displays the status and description text of the specified interfaces. The `description` command configures an interface’s description parameter.

**Command Mode**

EXEC

**Command Syntax**

```
show interfaces [INT_NAME] description
```

**Parameters**

- **INT_NAME** Interface type and labels. Options include:
  - `<no parameter>` all interfaces.
  - `ethernet e_range` Ethernet interface range specified by `e_range`.
  - `loopback l_range` Loopback interface specified by `l_range`.
  - `management m_range` Management interface range specified by `m_range`.
  - `port-channel p_range` Port-Channel Interface range specified by `p_range`.
  - `vlan v_range` VLAN interface range specified by `v_range`.
  - `vxlan vx_range` VXLAN interface range specified by `vx_range`.

  Range formats include number, number range, or comma-delimited list of numbers and ranges.

**Example**

- This command displays description text and status of ethernet interfaces 1-10.

  ```
  switch>show interfaces ethernet 1-10 description
  Interface                      Status         Protocol Description
  Et1                            up             up       ctar_01
  Et2                            up             up       ctar_02
  Et3                            up             up       ctar_03
  Et4                            up             up       fobd_01
  Et5                            up             up       fobd_02
  Et6                            up             up       yzrq_01
  Et7                            up             up       yzrq_02
  Et8                            down           down     yzrq_03
  Et9                            up             up       yzrq_04
  Et10                           up             up       yzrq_05
  switch>
  ```
show link tracking group

The **show link tracking group** command displays information about a specified link-state group or about all groups.

**Command Mode**

EXEC

**Command Syntax**

```
show link tracking group [DATA_LEVEL] [GROUPS]
```

**Parameters**

- **DATA_LEVEL** device for which the command provides data. Options include:
  - <no parameter> information about all groups in group list.
  - **detail** detailed information about all groups in group list.

- **GROUPS**
  - <no parameter> all link-state groups.
  - **group_name** link-state group name.

**Example**

- This command displays all the link-state group information.

```
switch# show link tracking group detail
Link State Group: 1 Status: up
Upstream Interfaces : Vlan100
Downstream Interfaces : Vlan200
Number of times disabled : 2
Last disabled 0:10:29 ago

Link State Group: group3 Status: down
Upstream Interfaces : Ethernet24
Downstream Interfaces : Ethernet8
Number of times disabled : 2
Last disabled 0:30:35 ago

Link State Group: 2 Status: up
Upstream Interfaces : Ethernet2 Ethernet5
Downstream Interfaces : Ethernet12
Number of times disabled : 0
Last disabled never
```

switch#
show mac address-table

The show mac-address-table command displays the specified MAC address table entries.

Command Mode
EXEC

Command Syntax
show mac address-table [ENTRY_TYPE] [MAC_ADDR] [INTF_1 ... INTF_N] [VLANS]

Parameters
- **ENTRY_TYPE** command filters display by entry type. Entry types include mlag-peer, dynamic, static, unicast, multicast entries, and configured.
  - <no parameter> all table entries.
  - configured static entries; includes unconfigured VLAN entries.
  - dynamic entries learned by the switch.
  - static entries entered by CLI commands and include a configured VLAN.
  - unicast entries with unicast MAC address.
- **MAC_ADDR** command uses MAC address to filter displayed entries.
  - <no parameter> all MAC addresses table entries.
  - address mac_address displays entries with specified address (dotted hex notation – H.H.H).
- **INTF_X** command filters display by port list. When parameter lists multiple interfaces, command displays all entries containing at least one listed interface.
  - <no parameter> all Ethernet and port channel interfaces.
  - ethernet e_range Ethernet interfaces specified by e_range.
  - port-channel p_range Port channel interfaces specified by p_range.
- **VLANS** command filters display by VLAN.
  - <no parameter> all VLANs.
  - vlan v_num VLANs specified by v_num.

Related Commands
- show mac address-table mlag-peer
- show mac address-table multicast
**Example**

- This command displays the MAC address table.

```
switch>show mac address-table

show mac address-table count

The `show mac-address-table count` command displays the number of entries in the MAC address table for the specified VLAN or for all VLANs.

**Command Mode**

EXEC

**Command Syntax**

`show mac address-table count [VLANS]`

**Parameters**

- **VLANS**  The VLANs for which the command displays the entry count.
  - <no parameter>  all configured VLANs.
  - `vlan v_num`  VLAN interface specified by `v_num`.

**Examples**

- This command displays the number of entries on VLAN 39
  
  `switch>show mac address-table count vlan 39`

  Mac Entries for Vlan 39:
  ---------------------------
  Dynamic Address Count : 1
  Unicast Static Address Count : 1
  Multicast Static Address Count : 0
  Total Mac Addresses : 2

  switch>
show mac address-table mlag-peer

The `show mac-address-table mlag-peer` command displays the specified MAC address table entries learned from the MLAG peer switch.

**Command Mode**

EXEC

**Command Syntax**

```
show mac address-table mlag-peer [ENTRY_TYPE][MAC_ADDR][INTF_1 ... INTF_N][VLANS]
```

**Parameters**

- **ENTRY_TYPE** command filters display by entry type. Entry types include mlag-peer, dynamic, static, unicast, multicast entries, and configured.
  - `<no parameter>` all MLAG peer entries.
  - `configured` static entries on MLAG peer; includes unconfigured VLAN entries.
  - `dynamic` entries learned on MLAG peer.
  - `static` MLAG entries entered by CLI commands and include a configured VLAN.
  - `unicast` MLAG entries with unicast MAC address.
- **MAC_ADDR** command uses MAC address to filter displayed entries.
  - `<no parameter>` all MAC addresses table entries.
  - `address mac_address` displays entries with specified address (dotted hex notation – H.H.H).
- **INTF_X** command filters display by port list. When parameter lists multiple interfaces, command displays all entries containing at least one listed interface.
  - `<no parameter>` all Ethernet and port channel interfaces.
  - `ethernet e_range` Ethernet interfaces specified by `e_range`.
  - `port-channel p_range` Port channel interfaces specified by `p_range`.
- **VLANS** command filters display by VLAN.
  - `<no parameter>` all VLANs.
  - `vlan v_num` VLANs specified by `v_num`.

**Related Commands**

- `show mac address-table`
- `show mac address-table multicast`
**show mac address-table multicast**

The **show mac-address-table** command displays the specified multicast MAC address table entries.

**Command Mode**

EXEC

**Command Syntax**

```
show mac address-table multicast [MAC_ADDR] [INTF] [VLANS]
```

**Parameters**

- **MAC_ADDR** command uses MAC address to filter displayed entries.
  - <no parameter> all MAC addresses table entries.
  - `address mac_address` displays entries with specified address (dotted hex notation – H.H.H).
- **INTF** command filters display by port list. When parameter lists multiple interfaces, command displays all entries containing at least one listed interface.
  - <no parameter> all Ethernet and port channel interfaces.
  - `ethernet e_range` Ethernet interfaces specified by `e_range`.
  - `port-channel p_range` Port channel interfaces specified by `p_range`.
- **VLANS** command filters display by VLAN.
  - <no parameter> all VLANs.
  - `vlan v_num` VLANs specified by `v_num`.

**Related Commands**

- **show mac address-table**
- **show mac address-table multicast brief**
show mac address-table multicast brief

The show mac-address-table command displays a summary of multicast MAC address table entries.

Command Mode
EXEC

Command Syntax
  show mac address-table multicast [VLANS] brief

Parameters
•  VLANS  command filters display by VLAN.
  •  <no parameter>  all VLANs.
  •  vlan v_num   VLANs specified by v_num.

Related Commands
•  show mac address-table multicast
show monitor server-failure

The `show monitor server-failure` command displays Rapid Automated Indication of Link-Loss (RAIL) configuration settings and the number of servers on each monitored network.

**Command Mode**

EXEC

**Command Syntax**

   show monitor server-failure

**Example**

- This command displays RAIL configuration status and lists the number of servers that are on each monitored network.

```
switch>show monitor server-failure
Server-failure monitor is enabled
Proxy service: disabled
Networks being monitored: 3
  10.2.1.96/28 : 0 servers
  10.1.1.0/24  : 0 servers
  10.3.0.0/16  : 3 servers
switch>
```
**show monitor server-failure history**

The `show monitor server-failure history` command displays the time of all link failures detected by Rapid Automated Indication of Link-Loss (RAIL) and includes the interface name for each failure. The history is cleared by removing RAIL from the switch (`no monitor server-failure`).

**Command Mode**

EXEC

**Command Syntax**

`show monitor server-failure history`

**Related Commands**

- `clear server-failure servers inactive`

**Example**

This command displays the Fast Server Failure link failure history from the time RAIL is instantiated on the switch.

```
switch>show monitor server-failure history
Total server failures: 4

<table>
<thead>
<tr>
<th>Server IP</th>
<th>Server MAC</th>
<th>Interface</th>
<th>Last Failed</th>
</tr>
</thead>
<tbody>
<tr>
<td>44.11.11.7</td>

<td>2013-02-10 00:03:39</td>
</tr>
</tbody>
</table>

switch>
```
show monitor server-failure servers

The `show monitor server-failure servers` command displays status and configuration information about each server that RAIL is monitoring. The display format depends on the parameter specified by the command:

- **single IP address:** command displays information about the server at the specified address, including IP address, MAC address, RAIL state, the time of most recent entry of all RAIL states, and the number of failed, proxied, and inactive state entries.
- **no parameter, key specifying a server list:** command displays a table. Each row corresponds to a monitored server. Information that the command displays includes **IP address, MAC address, RAIL state, the time of most recent link failure.**

**Command Mode**

EXEC

**Command Syntax**

```
show monitor server-failure servers [SERVER_LIST]
```

**Parameters**

- **SERVER_LIST** Servers for which command displays information. Valid options include:
  - `<no parameter>` all servers in up, down, and proxying states.
  - `ipv4_addr` individual server; command displays detailed information.
  - `all` all servers on monitored networks.
  - `inactive` all servers in inactive state.
  - `proxying` all servers in proxying state.

**Example**

- This command displays RAIL information for the server at IP address 10.11.11.7.
  ```
  switch>show monitor server-failure servers 10.11.11.7
  Server information:
  Server Ip Address : 10.11.11.7
  MAC Address : ad:3e:5f:dd:64:cf
  Current state : down
  Interface : Ethernet23
  Last Discovered : 2013-01-06 06:47:39
  Last Failed : 2013-02-10 00:07:56
  Last Proxied : 2013-02-10 00:08:33
  Last Inactive : 2013-02-09 23:52:21
  Number of times failed : 3
  Number of times proxied : 1
  Number of times inactive : 18
  ```

- This command displays RAIL data for all servers in monitored networks that are in inactive state.
  ```
  switch>show monitor server-failure servers inactive
  Inactive servers: 1
  Server IP Server MAC Interface State Last Failed
  ---------- --------------- --------- ------- ------------
  10.1.67.92 01:22:ab:cd:ee:ff Ethernet17 inactive 7 days, 12:48:06 ago
  ```

switch>
This command displays RAIL information for all servers in monitored networks that are in up, down, and proxying states.

```
switch> show monitor server-failure servers
Active servers: 4
```

```
switch>
```
show monitor session

The show monitor session command displays the configuration of the specified port mirroring session. The command displays the configuration of all mirroring sessions on the switch when the session name parameter is omitted.

Command Mode
EXEC

Command Syntax
show monitor session SESSION_NAME

Parameters
- **SESSION_NAME**  Port mirroring session identifier. Options include:
  - <no parameter>  displays configuration for all sessions.
  - label  command displays configuration of the specified session.

Example
- This command displays the mirroring configuration of the specified monitor session.

```
switch>show monitor session redirect_1

Session redirect_1
------------------------
Source Ports

  Both:        Et7

Destination Port: Et8
```

switch(config)>

show platform trident mirroring

The `show platform trident mirroring` command displays current parameters of all configured mirroring sessions in Trident series platforms.

**Command Mode**
- Privileged EXEC

**Command Syntax**
```
show platform trident mirroring [detail | session]
```

**Parameters**
- `detail` displays the detailed information of all configured mirroring sessions.
- `session session_name` displays the information of specified mirroring session.

**Guidelines**
This command is supported on DCS-7050/7050X, DCS-7250X, and DCS-7300X devices only.

**Example**
- This command displays the detailed information of all configured mirroring sessions.

```
switch(config)#show platform trident mirroring detail

Session : 123
==================================
srcIntf(rx): Ethernet12/3
Hw Mirror Id: 0x1
IM_MTP_INDEX
----------
count: 1
Dest: Et15/1

**show port-security**

The `show port-security` command displays a summary of MAC address port security configuration and status on each interface where switchport port security is enabled.

**Command Mode**

EXEC

**Command Syntax**

`show port-security`

**Display Values**

Each column corresponds to one physical interface. The table displays interfaces with port security enabled.

- Secure Port: Interface with switchport port-security enabled.
- MaxSecureAddr: Maximum quantity of MAC addresses that the specified port can process.
- CurrentAddr: Static MAC addresses assigned to the interface.
- SecurityViolation: Number of frames with unsecured addresses received by port.
- Security Action: Action triggered by a security violation.

**Examples**

- This command displays switchport port security configuration and status data.

```
switch>show port-security
Secure Port  MaxSecureAddr  CurrentAddr  SecurityViolation  Security Action
            (Count)        (Count)        (Count)                      
Et7          5             3            0            Shutdown
Et10         1             0            0            Shutdown

Total Addresses in System: 3

switch>
```
show port-security interface

The `show port-security interface` command displays the switchport port-security status of all specified interfaces.

**Command Mode**
EXEC

**Command Syntax**
```
show port-security interface [INT_NAME]
```

**Parameters**
- `INT_NAME` Interface type and numbers. Options include:
  - `<no parameter>` Display information for all interfaces.
  - `ethernet e_range` Ethernet interface range specified by `e_range`.
  - `loopback l_range` Loopback interface specified by `l_range`.
  - `management m_range` Management interface range specified by `m_range`.
  - `port-channel p_range` Port-Channel Interface range specified by `p_range`.
  - `vlan v_range` VLAN interface range specified by `v_range`.
  - `vxlan vx_range` VXLAN interface range specified by `vx_range`.

Valid `range` formats include number, number range, or comma-delimited list of numbers and ranges.

**Examples**
- This command display port-security configuration and status for the specified interfaces.

```
switch>show port-security interface ethernet 7-8
Interface                  : Ethernet7
Port Security              : Enabled
Port Status                : Secure-down
Violation Mode             : Shutdown
Maximum MAC Addresses      : 5
Aging Time                 : 5 mins
Aging Type                 : Inactivity
SecureStatic Address Aging : Disabled
Total MAC Addresses        : 3
Configured MAC Addresses   : 3

SecureStatic Address Aging : Disabled
switch>
```
show port-security mac-address

The `show port-security mac-address` command displays static unicast MAC addresses assigned to interfaces where switchport port security is enabled.

**Command Mode**

EXEC

**Command Syntax**

`show port-security mac-address`

**Example**

- This command displays MAC addresses assigned to port-security protected interfaces.

```
switch>show port-security mac-address
Secure Mac Address Table
-----------------------------------------------
Vlan | Mac Address       | Type               | Ports | Remaining Age (mins)
---- | ----------------- |--------------------| ----- |---------------------
 10  | 164f.29ae.4e14    | SecureConfigured   | Et7   | N/A
 10  | 164f.29ae.4f11    | SecureConfigured   | Et7   | N/A
 10  | 164f.320a.3a11    | SecureConfigured   | Et7   | N/A
-----------------------------------------------
Total Mac Addresses for this criterion: 3
switch>
```
show storm-control

The `show storm-control` command displays the storm-control level and interface inbound packet capacity for the specified interface.

The configured value (storm-control) differs from the programmed threshold in that the hardware accounts for Interframe Gaps (IFG) based on the minimum packet size. This command displays the broadcast or multicast rate after this adjustment.

**Command Mode**

Privileged EXEC

**Command Syntax**

```
show storm-control [INT_NAME]
```

**Parameters**

- `<no parameter>` Command returns data for all interfaces configured for storm control.
- `INT_NAME` interface type and port range. Settings include:
  - `ethernet e_range` Ethernet interfaces that `e_range` denotes.
  - `port-channel p_range` Port channel interfaces that `p_range` denotes.

When storm control commands exist for a port-channel and an Ethernet port that is a member of the port channel, the command for the port-channel takes precedence.

Valid range formats include number, number range, or comma-delimited list of numbers and ranges.

**Example**

- This command displays the storm control configuration for Ethernet ports 1 through 5.

```
switch#show storm-control
Port          Type  Level Rate(Mbps)   Status      Drops Reason
Et10/2         all     75       7500   active          0
Et10/3   multicast     55       5500   active          0
Et10/4   broadcast     50       5000   active          0
switch#
```
show switch forwarding-mode

The `show switch forwarding-mode` command displays the switch's current and available forwarding plane hardware modes.

**Command Mode**

EXEC

**Command Syntax**

```
show switch forwarding-mode
```

**Related Commands**

- `switch forwarding-mode` configures the switch's forwarding mode setting.

**Example**

- This command changes the switch's forward mode to `store-and-forward`, then displays the forwarding mode.

```
switch(config)# switch forwarding-mode store-and-forward
switch(config)# show switch forwarding-mode
Current switching mode: store and forward
Available switching modes: cut through, store and forward
```
show track

The `show track` command displays information about tracked objects configured on the switch.

**Command Mode**

EXEC

**Command Syntax**

```
show track [OBJECT] [INFO_LEVEL]
```

**Parameters**

- **OBJECT** tracked object for which information is displayed. Options include:
  - `<no parameter>` displays information for all tracked objects configured on the switch.
  - `object_name` displays information for the specified object.
- **INFO_LEVEL** amount of information that is displayed. Options include:
  - `<no parameter>` displays complete information including object status, number of status changes, time since last change, and client process tracking the object (if any).
  - `brief` displays brief list of all tracked objects and their current status.

**Examples**

- This command displays all information for tracked object ETH8.
  ```
  switch#show track ETH8
  Tracked object ETH8 is up
  Interface Ethernet8 line-protocol
  4 change, last change time was 0:36:12 ago
  Tracked by:
  Ethernet5/1 vrrp instance 50
  switch#
  ```

- This command displays summary information for all tracked objects.
  ```
  switch#show track brief
  Tracked object ETH2 is up
  Tracked object ETH4 is down
  Tracked object ETH6 is up
  Tracked object ETH8 is up
  switch#
  ```
**shutdown (server-failure configuration mode)**

The `shutdown` command disables Rapid Automated Indication of Link-Loss (RAIL). By default, RAIL is disabled.

After entering server-failure configuration mode, a `no shutdown` command is required to enable RAIL.

The `no shutdown` command enables RAIL on the switch. The `shutdown` and `default shutdown` commands disable RAIL by removing the shutdown command from `running-config`.

**Command Mode**

Server-failure Configuration

**Command Syntax**

```
shutdown
no shutdown
default shutdown
```

**Examples**

- This command enables RAIL on the switch.

  ```
  switch(config)#monitor server
  switch(config-server-failure)#no shutdown
  switch(config-server-failure)#show active
  monitor server-failure
    no shutdown
  switch(config-server-failure)#
  ```

- This command disables RAIL on the switch.

  ```
  switch(config-server-failure)#shutdown
  switch(config-server-failure)#show active
  monitor server-failure
  switch(config-server-failure)#
  ```
storm-control

The **storm-control** command configures and enables storm control on the configuration mode physical interface. The command provides three mode options:

- **storm-control all** unicast, multicast, and broadcast inbound packet control.
- **storm-control broadcast** broadcast inbound packet control.
- **storm-control multicast** multicast inbound packet control.

An interface configuration can contain three storm-control statements, one with each mode setting. The **storm-control all** threshold overrides broadcast and multicast thresholds.

The threshold is a percentage of the available port bandwidth and is configurable on each interface for each transmission mode.

The **no storm-control** and **default storm-control** commands remove the corresponding **storm-control** statement from **running-config**, disabling storm control for the specified transmission type on the configuration mode interface.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

**Command Syntax**

```
storm-control MODE level threshold
no storm-control mode
default storm-control mode
```

**Parameters**

- **MODE** packet transmission type. Options include:
  - all
  - broadcast
  - multicast
- **threshold** Inbound packet level that triggers storm control, as a percentage of port capacity. Value ranges from 0.01 to 100. Storm control is suppressed by a level of 100.

The configured value differs from the programmed threshold in that the hardware accounts for Interframe Gaps (IFG) based on the minimum packet size. The **show storm-control** command displays the broadcast or multicast rate after this adjustment.

**Restrictions**

The **storm-control all** option is not available on Arad platform switches.

**Example**

- These commands enable multicast and broadcast storm control on Ethernet port 20 and sets thresholds of 65% (multicast) and 50% (broadcast). During each one second interval, the interface drops inbound multicast traffic and broadcast traffic in excess of the specified thresholds.

```
switch(config)#interface ethernet 20
switch(config-if-Et20)#storm-control multicast level 65
switch(config-if-Et20)#storm-control broadcast level 50
switch(config-if-Et20)#show active
interface Ethernet20
   storm-control broadcast level 50
   storm-control multicast level 65
switch(config-if-Et20)#
```
switch forwarding-mode

The `switch forwarding-mode` command specifies the mode of the switch's forwarding plane hardware. The default forwarding mode is *cut through*.

The `no switch forwarding-mode` and `default switch forwarding-mode` commands restore the default forwarding mode by removing the `switch forwarding-mode` command from *running-config*.

**Command Mode**
- Global Configuration

**Command Syntax**
- `switch forwarding-mode MODE_SETTING`
- `no switch forwarding-mode`
- `default switch forwarding-mode`

**Parameters**
- `MODE_SETTING` Specifies the switch's forwarding plane hardware mode. Options include:
  - `cut-through` the switch begins forwarding frames before their reception is complete.
  - `store-and-forward` the switch accumulates entire packets before forwarding them.

**Guidelines**
The forwarding plane mode is *store-and-forward* on Petra and Arad platform switches.

**Related Commands**
- `show switch forwarding-mode` displays the current forwarding mode.

**Examples**
- This command changes the forwarding mode to *store-and-forward*.
  ```
  switch(config)# switch forwarding-mode store-and-forward
  switch(config)#
  ```
**switchport**

The `switchport` command places the configuration mode interface in **switched port** (Layer 2) mode. Switched ports are configurable as members of one or more VLANs through other switchport commands. Switched ports ignore all IP level configuration commands, including IP address assignments.

The `no switchport` command places the configuration mode interface in **routed port** (Layer 3) mode. Routed ports are not members of any VLANs and do not switch or bridge packets. All IP level configuration commands, including IP address assignments, apply directly to the routed port interface.

By default, Ethernet and Port Channel interfaces are in switched port mode. The **default switchport** command also places the configuration mode interface in switched port mode by removing the corresponding `no switchport` command from **running-config**.

These commands only toggle the interface between switched and routed modes. They have no effect on other configuration states.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port Channel Configuration

**Command Syntax**

- `switchport`
- `no switchport`
- `default switchport`

**Guidelines**

When an interface is configured as a routed port, the switch transparently allocates an internal VLAN whose only member is the routed interface. Internal VLANs are created in the range from 1006 to 4094. VLANs that are allocated internally for a routed interface cannot be directly created or configured. The `vlan internal order` command specifies the method that VLANs are allocated.

All IP-level configuration commands, except `autostate` and `ip virtual-router`, can be used to configure a routed interface. Any IP-level configuration changes made to a routed interface are maintained when the interface is toggled to switched port mode.

A LAG that is created with the `channel-group` command inherits the mode of the member port. A LAG created from a routed port becomes a routed LAG. IP-level configuration statements are not propagated to the LAG from its component members.

**Examples**

- These commands put Ethernet interface 5 in routed port mode.
  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#no switchport
  switch(config-if-Et5)#
  ```

- These commands returns Ethernet interface 5 to switched port mode.
  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#switchport
  switch(config-if-Et5)#
  ```
**switchport default mode access**

The `switchport default mode access` command places the configuration mode interface in *switched port default access* (Layer 3) mode. Switched ports are configurable as members of one or more VLANs through other switchport commands. Switched ports ignore all IP level configuration commands, including IP address assignments.

**Command Mode**
- Global Configuration

**Command Syntax**
- `switchport default mode access`

**Related Commands**
- `switchport default mode routed` puts a switch with all ports in routed port mode.

**Examples**
- This command puts a switch with all ports in access port mode.
  ```
  switch(config)#switchport default mode access
  ```
**switchport default mode routed**

The `switchport default mode routed` command places the configuration mode interface in *switched port default routed* (Layer 3) mode. Switched ports are configurable as members of one or more VLANs through other switchport commands. Switched ports ignore all IP level configuration commands, including IP address assignments.

By default, on a switch with default startup config or no config, all ports come up in access mode. By adding the CLI command `switchport default mode routed` to kickstart config, all ports will come up in routed mode after boot up. On boot up, Zero Touch Provisioning (ZTP) is enabled by default if the startup config (/mnt/flash/startupconfig) is deleted. ZTP can be disabled by setting DISABLE=True in ZTP config (/mnt/flash/zerotouchconfig). Kickstart config (/mnt/flash/kickstart-config) is used when startup config is missing and ZTP is disabled.

**Command Mode**
- Global Configuration

**Command Syntax**
```
switchport default mode routed
```

**Related Commands**
- `switchport default mode access` puts a switch with all ports in access port mode.

**Examples**
- This command puts a switch with all ports in routed port mode.
  ```
  switch(config)#switchport default mode routed
  ```
**switchport mac address learning**

The `switchport mac address learning` command enables MAC address learning for the configuration mode interface. MAC address learning is enabled by default on all Ethernet and port channel interfaces.

The switch maintains a MAC address table for switching frames between VLAN ports. When the switch receives a frame, it associates the MAC address of the transmitting interface with the recipient VLAN and port. When MAC address learning is enabled for the recipient port, the entry is added to the MAC address table. When MAC address learning is not enabled, the entry is not added to the table.

The `no switchport mac address learning` command disables MAC address learning for the configuration mode interface. The `switchport mac address learning` and `default switchport mac address learning` commands enable MAC address learning for the configuration mode interface by deleting the corresponding `no switchport mac address learning` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port Channel Configuration

**Command Syntax**

- `switchport mac address learning`
- `no switchport mac address learning`
- `default switchport mac address learning`

**Example**

- These commands disable MAC address learning for Ethernet interface 8, then displays the active configuration for the interface.

```
switch(config)#interface ethernet 8
switch(config-if-Et8)#no switchport mac address learning
switch(config-if-Et8)#show active
interface Ethernet8
    no switchport mac address learning
switch(config-if-Et8)#
```
switchport port-security

The `switchport port-security` command enables MAC address port security on the configuration mode interface. Ports with port security enabled restrict traffic to a limited number of hosts, as determined by their MAC addresses. The `switchport port-security mac-address maximum` command specifies the maximum number of MAC addresses. The `switchport port-security violation` command enables port security in protect mode.

The `no switchport port-security` and `default switchport port-security` commands disable port security on the configuration mode interface by removing the corresponding `switchport port-security` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port Channel Configuration

**Command Syntax**
- `switchport port-security`
- `no switchport port-security`
- `default switchport port-security`

**Examples**
- These commands enable port security on ethernet interface 7.
  ```
  switch(config)#interface ethernet 7
  switch(config-if-Et7)#switchport port-security
  switch(config-if-Et7)#
  ```
switchport port-security mac-address maximum

The switchport port-security mac-address maximum command specifies the maximum MAC address limit for the configuration mode interface when configured as a secure port. When port security is enabled, the port accepts traffic and adds source addresses to the ARP table until the maximum is reached. Once the maximum is reached, if any traffic arrives from a source not already in the ARP table for the secure port, the port becomes errdisabled. The switchport port-security command configures an interface as a secure port.

The no switchport port-security mac-address maximum and default switchport port-security mac-address maximum commands restore the maximum MAC address limit of one on the configuration mode interface by removing the corresponding switchport port-security mac-address maximum command from running-config.

Command Mode
   Interface-Ethernet Configuration
   Interface-Port Channel Configuration

Command Syntax
   switchport port-security mac-address maximum max_addr
   no switchport port-security mac-address maximum
   default switchport port-security mac-address maximum

Parameters
   • max_addr   maximum number of MAC addresses. Value ranges from 1 to 1000. Default value is 1.

Examples
   • These commands configure a maximum of five incoming addresses for secure port channel interface 14.

        switch(config)#interface port-channel 14
        switch(config-if-Po14)#switchport port-security mac-address maximum 5
        switch(config-if-Po14)#
**switchport port-security violation**

The **switchport port-security violation** command configures port security in protect mode (with the option of enabling logging) or the shutdown mode.

The **no switchport port-security** and **no switchport port-security violation protect log** commands disable port security protect mode and port security protect mode logging on the configuration mode interface.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port Channel Configuration

**Command Syntax**

```
switchport port-security violation {protect [log]| shutdown}
no switchport port-security violation protect log
default switchport port-security violation protect log
```

**Parameters**

- **protect** configures the port security in the protect mode.
- **shutdown** configures the port security in the shutdown mode.
- **log** the log of new addresses seen after limit is reached in the protect mode.

**Guidelines**

When port security is enabled, the port accepts traffic and adds source addresses to the ARP table until the maximum is reached. The **switchport port-security** command configures an interface as a secure port.

In the protect mode, the ACLs are dynamically created to block incoming MAC addresses when the configured maximum MAC value is reached.

In the shutdown mode, once the maximum is reached, if any traffic arrives from a source not already in the ARP table for the secure port, the port is set to be **errdisabled**.

**Examples**

- These commands configure port security violation protect mode for secure port channel interface 14.
  
  switch(config)#interface port-channel 14
  switch(config-if-Po14)#switchport port-security violation protect
  
- These commands configure port security violation protect logging mode for secure port channel interface 14.
  
  switch(config)#interface port-channel 14
  switch(config-if-Po14)#switchport port-security violation protect log
  
- These commands configure port security violation shutdown mode for secure port channel interface 15.
  
  switch(config)#interface port-channel 15
  switch(config-if-Po15)#switchport port-security violation shutdown
system control-plane

The `system control-plane` command places the switch in control-plane configuration mode. Control-plane mode is used for assigning an ACL (access control list) to the control plane.

Control-plane configuration mode is not a group change mode; `running-config` is changed immediately after commands are executed. Exiting control-plane configuration mode does not affect the configuration.

The `exit` command returns the switch to global configuration mode.

**Command Mode**
Global Configuration

**Command Syntax**
```
system control-plane
```

**Commands Available in control-plane Configuration Mode**
- `ip access-group (Control Plane mode)`

**Examples**
- This command places the switch in control plane mode.
  ```
  switch(config)#system control-plane
  switch(config-system-cp)
  ```
- This command assigns the `control-plane-2` ACL to the control plane.
  ```
  switch(config-system-cp)#ip access-group control-plane-2
  switch(config-system-cp)
  ```
- This command exits control plane mode.
  ```
  switch(config-system-cp)#exit
  switch(config)
  ```
**track**

The `track` command creates an object whose state changes to provide information to a client process. The client process must be separately configured for object tracking to have an effect on the switch.

The `no track` and `default track` commands remove the specified tracked object by removing the corresponding `track` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
track object_name interface INTERFACE_NAME PROPERTY
no track object_name
default track object_name
```

**Parameters**

- `object_name` User-created name for the tracked object.
- `INTERFACE_NAME` Interface associated with the tracked object. Options include:
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-channel interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
  - `vxlan vx_num` VXLAN interface specified by `vx_num`.
- `PROPERTY` Tracked property. Options include:
  - `line-protocol` Object changes when the state of the associated interface changes.

**Example**

- This command creates a tracked object which tracks the state of the line protocol on Ethernet interface 8.

  switch(config)#track ETH8 interface ethernet 8 line-protocol
  switch(config)#
**traffic-loopback**

The `traffic-loopback` command verifies the functionality of interfaces and link partners.

The `traffic-loopback source network device phy` command configures the loopback device and implements loopback in physical layer for the traffic sent from a peer host. This command loops back the data packets that are sent from the link partner towards the link partner again, as a part of link partner troubleshooting.

The `traffic-loopback source system device` command configures the loopback device for the traffic sent from a local host. This command loops back the packets that are sent from the system, back to the same system.

The `no traffic-loopback` command deletes the loopback configuration from MAC and physical layers.

**Command Mode**

Interface Configuration

**Command Syntax**

```
traffic-loopback source network device phy
traffic-loopback source system device {mac | phy}
no traffic-loopback
```

**Parameters**

- `mac` implements loopback in the MAC layer
- `phy` implements loopback in the physical layer

**Guidelines**

This command is not supported on the Jericho platform.

**Examples**

- **The `traffic-loopback source network device phy` command** configures the loopback device and implements loopback in the physical layer for the traffic sent from a peer host.

  ```
  switch(config)#interface ethernet 1
  switch(config-if-Et1)#traffic-loopback source network device phy
  switch(config-if-Et1)#show active
  interface Ethernet1
  traffic-loopback source network device phy
  switch(config-if-Et1)#
  ```

- **The `traffic-loopback source system device mac` command** configures the loopback device and implements loopback in the MAC layer for the traffic sent from a local host.

  ```
  switch(config)#interface ethernet 1
  switch(config-if-Et1)#show active
  interface Ethernet1
  switch(config-if-Et1)#traffic-loopback source system device mac
  switch(config-if-Et1)#show active
  interface Ethernet1
  traffic-loopback source system device mac
  switch(config-if-Et1)#
  ```
• The **traffic-loopback source system device phy** command configures the loopback device and implements loopback in the physical layer for the traffic sent from a local host.

```
switch(config)#interface ethernet 1
switch(config-if-Et1)#show active
interface Ethernet1
  traffic-loopback source system device mac
switch(config-if-Et1)#traffic-loopback source system device phy
switch(config-if-Et1)#show act
interface Ethernet1
  traffic-loopback source system device phy
```

• The **no traffic-loopback** command deletes the loopback configuration from MAC and physical layers.

```
switch(config)#interface ethernet 1
switch(config-if-Et1)#show active
interface Ethernet1
  traffic-loopback source network device phy
switch(config-if-Et1)#no traffic-loopback
switch(config-if-Et1)#show active
interface Ethernet1
switch(config-if-Et1)#
```
Chapter 20

Tap Aggregation

This chapter describes tap aggregation and the data structures that it requires. Sections in this chapter include:

- Section 20.1: Tap Aggregation Introduction
- Section 20.2: Tap Aggregation Description
- Section 20.3: Tap Aggregation Configuration
- Section 20.4: Tap Aggregation Traffic Steering
- Section 20.5: Tap Aggregation GUI
- Section 20.6: Keyframe and Timestamp Configuration
- Section 20.7: Tap Aggregation Commands

Port mirroring is described in Port Mirroring.

20.1 Tap Aggregation Introduction

Ethernet based switches are commonly deployed in dedicated networks to support tap and mirror port traffic towards one or more analysis applications. Ports configured to mirror data can simultaneously switch traffic to its primary destination while directing a copy of that traffic to analysis or test devices. Tap ports are typically part of a dedicated environment that allows for the aggregation of data streams from multiple sources that can be directed to multiple destinations.

Arista switches support port mirroring and tap aggregation and the data structures required by these functions.
20.2 Tap Aggregation Description
These sections describe tap aggregation, timestamps, and keyframes:

- Section 20.2.1: Tap Aggregation
- Section 20.2.2: Timestamps and Keyframes

20.2.1 Tap Aggregation
Tap aggregation is the accumulation of data streams and subsequent dispersal of these streams to devices and applications that analyze, test, verify, parse, detect, or store data. Tap aggregation requires an environment free from switching operations. Arista switches operate in one of two device modes:

- Switching mode: The switch performs normal switching and routing operations. Data mirroring is supported in switching mode. Tap aggregation is not available in switching mode.
- Tap aggregation mode: The switch is a data monitoring device and does not provide normal switching and routing services. Data mirroring is not available in tap aggregation mode.

Access control lists, port channels, LAGs, QoS, and VLANs function normally in both modes.

Ethernet and port channel interfaces are configured as tap and tool ports to support tap aggregation.

- Tap ports: A tap port is an interface that receives a data stream that two network ports exchange. Tap ports prohibit egress traffic. MAC learning is disabled. All control plane interaction is prevented. Traps for inbound traffic are disabled. Tap ports are in STP forwarding mode.
- Tool ports: A tool port is an interface that replicates data streams received by one or more tap ports. Tool ports connect to devices that process the monitored data streams. Tool ports prohibit ingress traffic. MAC learning is disabled. All control plane interaction is prevented. Tool ports are in STP forwarding mode.

Tap and tool ports are configured with the switchport mode command. These ports are active when the switch is in tap aggregation mode and error-disabled when the switch is in switching mode.

Tap aggregation groups are data structures that map a set of tap ports to a set of tool ports. Both tap and tool ports may belong to multiple tap aggregation groups, and a tap aggregation group may contain multiple tap and tool ports.

Tap and tool ports are designated through switchport mode commands and act similar to trunk ports, in that they can allow access to VLANs specified through allowed-VLAN lists. Tap ports also specify a native VLAN for handling untagged frames.

- Access, trunk, and dot1q-tunnel mode ports are active when the switch is in switching mode and error-disabled when the switch is in tap aggregation mode.
- Tap and tool mode ports are active when the switch is in tap aggregation mode and error-disabled when the switch is in switching mode.

20.2.2 Timestamps and Keyframes
FM6000 platform switches support packet timestamping of packets sent from any port at line rate. Timestamps are used to correlate network events and in performance analysis. Keyframes provide information to assist in the interpretation of timestamps.

The switch contains two 64-bit counters to maintain ASIC time and UTC time. ASIC time is based on an internal 350 MHz counter. UTC is absolute time that is maintained by a precision oscillator and synchronized through PTP.
Timestamps are derived from the least significant 31 bits of ASIC time. Based on the 350 MHz counter period and 31-bit resolution, timestamp values repeat every 6.135 seconds.

Keyframes are periodically inserted into the data stream to provide context for interpreting timestamps. Keyframes contain the 64-bit value of the ASIC time counter, the corresponding 64-bit value of the UTC time counter, and the elapsed time since the last PTP synchronization of the UTC counter. Inserting one keyframe every second into the data stream assures that the timestamp value in each egress packet can be associated with values of the complete 64-bit ASIC time counter and the corresponding UTC counter.

20.2.2.1 Timestamps

Timestamps are based on a frame’s ingress time and applied to frames sent on egress ports, ensuring that timestamps on monitored traffic reflect ingress timing of the original frames. Timestamping is configured on the egress port where the timestamp is applied to the frame.

A timestamp consists of the least significant 31 bits of the ASIC time counter. The most significant bit of the least significant byte is a 0 pad, resulting in a 32 bit timestamp with 31 bits of data. The keyframe mechanism provides recovery of the most significant 33 bits of the ASIC counters and a map to UTC time. Applications use this mechanism to determine the absolute time of the frame timestamp.

The switch supports three timestamp modes, which are configurable on individual Ethernet ports. The modes differ in the management of the egress frame’s 32-bit frame check sequence (FCS):

- **Disabled**: Timestamping is disabled.
- **FCS Replacement Mode**: The original FCS is discarded, the ingress timestamp is appended to frame data, followed by a new FCS that is based on the appended timestamp. The result is a valid Ethernet frame, but the headers of all nested protocols are not updated to reflect the timestamp.
- **FCS Appending Mode**: The original FCS is discarded and replaced by the ingress timestamp. The size of the original frame is maintained without any latency impact, but the FCS is not valid.

20.2.2.2 Keyframes

Keyframes contain routable IP packets that provide information to relate timestamps with the complete ASIC counter and absolute UTC time. Keyframes have valid L2 and L3 headers. Keyframes contain these header fields:

- **MAC fields (12 bytes):**
  - Source MAC address is the address of the egress interface transmitting the keyframe.
  - Destination MAC address is configured through a CLI command.

- **IP Header (20 bytes):**
  - Source IP address is configured through CLI; default is management interface IP address.
  - Destination IP address is configured through a CLI command.
  - TTL is set to 64.
  - TOS is set to 0.
  - Protocol field is set to 253.
  - IP header’s ID field is set to 0.

Keyframes contain these payload fields:

- **ASIC time**: (64 bits) ASIC time counter. (2.857 ns resolution).
- **UTC time**: (64 bits) Unix time that corresponds to ASIC time (ns).
- **Last sync time**: (64 bits) ASIC time of most recent PTP synchronization.
• Keyframe time: (64 bits) ASIC time of the keyframe’s egress (ns).
• Egress interface drops: (64 bits) Number of dropped frames on keyframe’s egress interface.
• Device ID: (16 bits) device ID (user defined).
• Egress interface: (16 bits) Keyframe’s egress switchport.
• FCS type (8 bits): Timestamping mode configured on keyframe’s egress port.
  • 0: timestamping disabled.
  • 1: timestamp is appended to payload; new FCS is added to the frame.
  • 2: timestamp overwrites the existing FCS.
• Reserved (8 bits): Reserved for future use.
• Skew numerator/skew denominator: Form a ratio indicating the ASIC clock skew. If the ratio is
greater than 1, the clock is skewed fast; if the ratio is less than 1, the clock is skewed slow.

Last sync time equals 0 when there was no previous synchronization or the time since the last
synchronization is greater than 8 hours.

The 31-bit frame timestamp provides high-resolution timing, rolling over about every 6.135
seconds (31 bits at 2.857ns per tick). To obtain the full ASIC time and to correlate the timestamp
to an absolute UTC time, the switch sends keyframes. Each keyframe contains the current ASIC
time and UTC time; hence an application can compute the high order bits of the ASIC time (for
precise, relative timing) from the ASIC to UTC time mapping, and then determine absolute time.

ASIC to UTC time conversion is not quite immediate, so the UTC time in the frame will not be the
‘current’ time. A keyframe timestamp is provided for this purpose. The frame also includes the
timestamping mode (FCS type) so applications can dynamically determine the timestamp’s byte
offset. Each field is described in the following table.
Figure 20-1: Key frame payload

<table>

20.3 Tap Aggregation Configuration

These sections describe tap aggregation configuration tasks:

- Section 20.3.1: Enabling Tap Aggregation Mode
- Section 20.3.2: Tap Aggregation Mixed Mode
- Section 20.3.3: Tap Port Configuration
- Section 20.3.4: Tool Port Configuration
- Section 20.3.5: Per-linecard TCAM Profile Configuration
- Section 20.3.6: Two-Way Ports for Tap Aggregation
- Section 20.3.7: Tap Aggregation QoS Handling on Tap Ports
- Section 20.3.8: Identity VLAN Tagging
- Section 20.3.9: Tap Aggregation Group Configuration

20.3.1 Enabling Tap Aggregation Mode

The switch supports switching mode and tap aggregation mode. In switching mode, normal switching and routing functions are supported while tap aggregation functions are disabled. In tap aggregation mode, tap aggregation functions are enabled while normal switching and routing functions are disabled. By default, the switch is in switching mode.

A port’s switchport status depends on its switchport mode and the switch’s tap aggregation mode.

- Tap aggregation mode enabled: Tap and tool ports are enabled. Switching ports are errdisabled.
- Tap aggregation mode disabled: Tap and tool ports are errdisabled. Switching ports are enabled.

To enable the switch to carry out tap aggregation, first enter tap aggregation configuration mode and then set the mode.

Example

- These commands enter tap-agg configuration mode, then place the switch in tap aggregation mode.

  switch(config)#tap aggregation
  switch(config-tap-agg)#mode exclusive
  switch(config-tap-agg)#show active
  tap aggregation
  mode exclusive
  switch(config-tap-agg)#

To return the switch to switching mode, remove the mode command from running-config.

Examples

- These commands enter tap-agg configuration mode, then place the switch in switching mode.

  switch(config)#tap aggregation
  switch(config-tap-agg)#no mode
  switch(config-tap-agg)#show active
  switch(config-tap-agg)#

- These commands enter switching mode and remove all tap-agg configuration mode statements.

  switch(config)#no tap aggregation
  switch(config)#
20.3.2 Tap Aggregation Mixed Mode

On a modular switch, the user can configure Tap Aggregation on some linecards and leave other linecards to operate normally. Refer to this feature as Tap Aggregation Mixed Mode.

- Platform Compatibility
- Configurations

20.3.2.1 Platform Compatibility

The following platforms support Tap Aggregation Mixed Mode.

- DCS-7500R
- DCS-7500R2

20.3.2.2 Configurations

Complete the following steps to configure Linecard 3 as Tap Aggregation Linecard in Mixed Mode.

**Step 1** Enable the switch for configuration.

```
switch>configure terminal
```

**Step 2** Enable tap aggregation

```
switch(config)#tap aggregation
```

**Step 3** Enable tap aggregation mixed mode, selecting the targeted linecard module using the tap aggregation default.

```
switch(config-tap-agg)#mode mixed module linecard 3 tap-aggregation-default
```

**Note** Changing modes may affect available functionality. Unsupported configuration elements will be ignored.

The profile selection in mixed mode is the same as in exclusive mode. The user can configure multiple linecards for Tap Aggregation in Mixed Mode.

The user can check Tap Aggregation Mixed Mode status by executing the following show commands:

```
switch(config)#show running-config section tap
tap aggregation
   mode mixed module linecard 3 profile tap-aggregation-default
switch(config)#show hardware tcam profile

+-----------------+-----------------+
| Configuration   | Status          |
|-----------------+-----------------|
| Linecard4       | default         |
| Linecard3       | default         |
| Linecard6       | default         |
| Linecard3       | tap-aggregation-default |
| Linecard6       | default         |
```

In the Tap Aggregation Mixed Mode, linecards which are not configured for Tap Aggregation support both bridging and routing features as usual.

20.3.3 Tap Port Configuration

Tap ports function when the switch is in tap aggregation mode. Tap ports receive traffic for replication to one or more tool ports. In tap aggregation mode, tap ports are in STP forwarding state and prohibit egress traffic. MAC learning, control plane interaction and traps for inbound traffic are disabled.
Tap mode ports are configured through switchport mode commands. Tap mode command settings persist in `running-config` without taking effect when the switch is not in tap aggregation mode or the interface is not in tap aggregation mode.

This section describes the following tap port configuration steps.

- Configuring an interface as a Tap Mode Port
- Tap Port Allowed VLAN List Configuration
- Tap Port Native VLAN
- Tap Port Packet Truncation

**Configuring an interface as a Tap Mode Port**

Ethernet and port channel interfaces are configured as tap ports with the `switchport mode` command.

**Example**

- These commands configure ethernet interfaces 41 through 43 as tap mode ports.

```plaintext
switch(config)#interface ethernet 41-43
switch(config-if-Et41-43)#switchport mode tap
switch(config-if-Et41-43)#show interface ethernet 41-43 tap
```

<table>
<thead>
<tr>
<th>Port</th>
<th>Mode</th>
<th>Configured</th>
<th>Status</th>
<th>Native Vlan</th>
<th>Id</th>
<th>Truncation</th>
<th>Default Group</th>
</tr>
</thead>
<tbody>
<tr>
<td>Et41</td>
<td>tap</td>
<td>tap</td>
<td>tap</td>
<td>1</td>
<td>1</td>
<td>0</td>
<td>---</td>
</tr>
<tr>
<td>Et42</td>
<td>tap</td>
<td>tap</td>
<td>tap</td>
<td>1</td>
<td>1</td>
<td>0</td>
<td>---</td>
</tr>
<tr>
<td>Et43</td>
<td>tap</td>
<td>tap</td>
<td>tap</td>
<td>1</td>
<td>1</td>
<td>0</td>
<td>---</td>
</tr>
</tbody>
</table>

**Tap Port Allowed VLAN List Configuration**

By default, tap mode interfaces handle tagged traffic for all VLANs. The `switchport tap allowed vlan` command creates or modifies the set of VLANs for which a tap port handles tagged traffic.

**Example**

- These commands create tap mode allowed VLAN lists for Ethernet interface 41 through 43.

```plaintext
switch(config)#interface ethernet 41
switch(config-if-Et41)#switchport tap allowed vlan 401-410
switch(config-if-Et41)#interface ethernet 42
switch(config-if-Et42)#switchport tap allowed vlan 411-420
switch(config-if-Et41)#interface ethernet 41-42
switch(config-if-Et41-42)#show active
interface Ethernet41
  switchport mode tap
  switchport tap allowed vlan 401-410
interface Ethernet42
  switchport mode tap
  switchport tap allowed vlan 411-420
switch(config-if-Et41-42)#
```

**Tap Port Native VLAN**

Tap mode Interfaces associate untagged frames with the tap mode native VLAN. The `switchport tap native vlan` command specifies the tap mode native VLAN for the configuration mode interface. The default tap mode native VLAN for all interfaces is VLAN 1.

**Example**

- These commands set the tap mode native VLAN for Ethernet interface 41 through 43.

```plaintext
switch(config)#interface ethernet 41
switch(config-if-Et41)#switchport tap native vlan 1
switch(config-if-Et41)#interface ethernet 42
switch(config-if-Et42)#switchport tap native vlan 1
```

**Tap Port Packet Truncation**

When a tap mode port terminates an untagged frame, the switch may drop the frame. The `switchport tap packet truncation` command specifies whether the switch should drop the frame. By default, the tap port packet truncation is disabled.
Example

- These commands assign VLAN 400 as the tap mode native VLAN for Ethernet interface 41.

```
switch(config)#interface ethernet 41
switch(config-if-Et41)#switchport tap native vlan 400
switch(config-if-Et41)#show interface ethernet 41-43 tap
```

<table>
<thead>
<tr>
<th>Port</th>
<th>Configured</th>
<th>Status</th>
<th>Native</th>
<th>Id</th>
<th>Truncation</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Et41</td>
<td>tap</td>
<td>tap</td>
<td>400</td>
<td>1</td>
<td>0</td>
<td>---</td>
</tr>
<tr>
<td>Et42</td>
<td>tap</td>
<td>tap</td>
<td>1</td>
<td>1</td>
<td>0</td>
<td>---</td>
</tr>
<tr>
<td>Et43</td>
<td>tap</td>
<td>tap</td>
<td>1</td>
<td>1</td>
<td>0</td>
<td>---</td>
</tr>
</tbody>
</table>

```
switch(config-if-Et41)#
```

Tap Port Packet Truncation

Tap ports can be configured to truncate inbound packets. The `switchport tap truncation` command configures the configuration mode interface, as a tap port, to truncate inbound packets to the specified packet size. By default, tap ports do not truncate packets.

Example

- These commands configure ethernet interface 41 to truncate packets to 150 bytes.

```
switch(config)#interface ethernet 41
switch(config-if-Et41)#switchport tap truncation 150
switch(config-if-Et41)#show interface ethernet 41-43 tap
```

<table>
<thead>
<tr>
<th>Port</th>
<th>Configured</th>
<th>Status</th>
<th>Native</th>
<th>Id</th>
<th>Truncation</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Et41</td>
<td>tap</td>
<td>tap</td>
<td>400</td>
<td>1</td>
<td>150</td>
<td>---</td>
</tr>
<tr>
<td>Et42</td>
<td>tap</td>
<td>tap</td>
<td>1</td>
<td>1</td>
<td>0</td>
<td>---</td>
</tr>
<tr>
<td>Et43</td>
<td>tap</td>
<td>tap</td>
<td>1</td>
<td>1</td>
<td>0</td>
<td>---</td>
</tr>
</tbody>
</table>

```
switch(config-if-Et41)#
```

- These commands configure ethernet interface 41 to send complete packets for replication.

```
switch(config-if-Et41)#no switchport tap truncation
switch(config-if-Et41)#show interface ethernet 41 tap
```

```
<table>
<thead>
<tr>
<th>Port</th>
<th>Configured</th>
<th>Status</th>
<th>Native</th>
<th>Id</th>
<th>Truncation</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Et41</td>
<td>tap</td>
<td>tap</td>
<td>400</td>
<td>1</td>
<td>0</td>
<td>---</td>
</tr>
</tbody>
</table>
```

```
switch(config-if-Et41)#
```

20.3.4 Tool Port Configuration

Tool ports replicate traffic received by tap ports. Tool ports are mapped to the tap ports through tap aggregation groups. A tool port may belong to multiple aggregation groups and an aggregation group may contain multiple tool ports.

Tool ports function when the switch is in tap aggregation mode. In this switch mode, tool ports are in STP forwarding state and ingress traffic is prohibited. MAC learning, control plane interaction and traps for inbound traffic are disabled. All control plane interaction is prevented and L2 agents do not send PDUs to tool mode interfaces. When the switch is in switching mode, tool ports are error-disabled.

Tool mode ports are configured through switchport commands. Tool mode command settings persist in `running-config` without taking effect when the switch is not in tap aggregation mode or the interface is not in tap aggregation mode.

This section describes the following tool port configuration steps.
• Configuring an interface as a Tool Mode Port

Configuring an interface as a Tool Mode Port

Ethernet and port channel interfaces are configured as tool ports with the `switchport mode` command.

Example

• These commands configure port channel interfaces 101 through 103 as tool mode ports.

```
switch(config)#interface port-channel 101-103
switch(config-if-Po101-103)#switchport mode tool
switch(config-if-Po101-103)#show interface port-channel 101-103 tool
```

<table>
<thead>
<tr>
<th>Port</th>
<th>Configured</th>
<th>Status</th>
<th>Allowed Vlans</th>
<th>Tag Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>Po101</td>
<td>tool</td>
<td>tool</td>
<td>All</td>
<td>Off</td>
</tr>
<tr>
<td>Po102</td>
<td>tool</td>
<td>tool</td>
<td>All</td>
<td>Off</td>
</tr>
<tr>
<td>Po103</td>
<td>tool</td>
<td>tool</td>
<td>All</td>
<td>Off</td>
</tr>
</tbody>
</table>

```
switch(config-if-Po101-103)#
```

Tool Port Allowed VLAN List Configuration

By default, tool mode interfaces handle tagged traffic for all VLANs. The `switchport tool allowed vlan` command creates or modifies the set of VLANs for which a tool port handles tagged traffic.

Example

• These commands create tool mode allowed VLAN lists for port channel interfaces 101 through 103.

```
switch(config)#interface port-channel 101-103
switch(config-if-Po101-103)#switchport tool allowed vlan 1010-1020
switch(config-if-Po101-103)#interface port-channel 101
switch(config-if-Po101-103)#switchport tool allowed vlan add 1001-1009
switch(config-if-Po101-103)#interface port-channel 102
switch(config-if-Po101-103)#switchport tool allowed vlan remove 1016-1020
switch(config-if-Po101-103)#interface port-channel 103
switch(config-if-Po101-103)#switchport tool allowed vlan add 1021-1030
switch(config-if-Po101-103)#show interface port-channel 101-103 tool
```

<table>
<thead>
<tr>
<th>Port</th>
<th>Configured</th>
<th>Status</th>
<th>Allowed Vlans</th>
<th>Id</th>
<th>Timestamp</th>
</tr>
</thead>
<tbody>
<tr>
<td>Po101</td>
<td>tool</td>
<td>tool</td>
<td>1001-1020</td>
<td>Off</td>
<td>---</td>
</tr>
<tr>
<td>Po102</td>
<td>tool</td>
<td>tool</td>
<td>1010-1015</td>
<td>Off</td>
<td>---</td>
</tr>
<tr>
<td>Po103</td>
<td>tool</td>
<td>tool</td>
<td>1010-1030</td>
<td>Off</td>
<td>---</td>
</tr>
</tbody>
</table>

```
switch(config-if-Po101-103)#
```

Tool Port Packet Truncation

Tool ports can be configured to truncate outbound packets. The `switchport tool truncation` command configures the configuration mode interface, as a tool port, to truncate outbound packets to 160 bytes. By default, tool ports do not truncate packets.

Tool port packet truncation is supported only on the 7150 series platform.
Examples

- These commands configure ethernet interface 41, as a tool port, to truncate packets on egress to 160 bytes.
  
  ```
  switch(config)#interface ethernet 41
  switch(config-if-Et41)#switchport mode tool
  switch(config-if-Et41)#switchport tool truncation 160
  switch(config-if-Et41)#
  ```

- These commands configure ethernet interface 41 to send complete packets.
  
  ```
  switch(config-if-Et41)#no switchport tool truncation
  switch(config-if-Et41)#
  ```

20.3.5 Per-linecard TCAM Profile Configuration

This feature gives the ability to specify different profiles for different linecards in Mixed Mode. The following platforms support per-linecard TCAM profile configuration:

- DCS-7500
- DCS-7500R
- DCS-7500R2

To enable the TapAgg mode and configure a TCAM profile for a linecard set, complete the following steps.

**Step 1** Enable the switch for configuration.

```
switch>configure terminal
```

**Step 2** Enable Tap Aggregation mode.

```
switch(config)#tap aggregation
```

**Step 3** Configure the TCAM profile for a linecard set.

```
switch(config-tap-agg)#mode mixed module linecard_list [profile <profile>]
```

**Example:**

```
switch>configure terminal
switch(config)#tap aggregation
switch(config-tap-agg)#mode mixed module <Linecard list>[profile <profile>]
```

To disable the Tap Aggregation mode and configure a TCAM profile for a linecard set, complete the following steps.

**Step 1** Enable the switch for configuration.

```
switch>configure terminal
```

**Step 2** Enable Tap Aggregation mode.

```
switch(config)#tap aggregation
```

**Step 3** Disable TapAgg mode for a linecard set.

```
switch(config)#no mode mixed module <Linecard list>
```

or

```
switch(config)#default mode mixed module <Linecard list>
```
Example:
```
switch>configure terminal
switch(config)#tap-agg
switch(config)#no mode mixed module <Linecard list>
```

An incremental configuration is supported. Multiple configuration commands can be used to configure a TCAM profile for different Linecard set.

```
switch.configure terminal
switch(config)# tap aggregation
switch(config-tap-agg)#mode mixed module linecard 3 profile
tap-aggregation-default
switch(config-tap-agg)#mode mixed module linecard 4 profile
tap-aggregation-default
switch(config-tap-agg)#mode mixed module linecard 5,6 profile
tap-aggregation-extended
```

The examples above result in the following configuration.
```
!
tap aggregation
  mode mixed module linecard 3,4 profile tap-aggregation-default
  mode mixed module linecard 5,6 profile tap-aggregation-extended
!
```

Note
For a tap that is a port-channel, it requires that its members come from linecards that are using the same profile.

20.3.6 Two-Way Ports for Tap Aggregation

While in tap aggregation mode, there is support for traffic only in one direction through either tap ports, that receive packets from mirroring or Span ports and optical Tap or Tool ports, that send out packets to customer devices. Two-way ports for tap aggregation allows bidirectional tx and rx capability on a single port in Tap Aggregation mode. Using the tap-tool switchport mode enables both tap and tool configurations simultaneously on an interface.

- **Platform Compatibility**
- **Configurations**

20.3.6.1 Platform Compatibility

The following platforms support two-way ports for tap aggregation.

- DCS-7280R
- DCS-7280R2
- DCS-7500R
- DCS-7500R2
20.3.6.2 Configurations

To configure the interface to allow traffic in both directions, complete the following steps using the `switchport` command.

**Step 1** Enable the switch for configuration.

```
switch>configure terminal
```

**Step 2** Enable an Ethernet interface. In the example, Ethernet Interface 4/1 is selected.

```
switch(config)# Ethernet interface 4/1
```

**Step 3** Enable the `switchport` command.

```
switch(config-if-Et4/1)#switchport mode tap-tool
```

The configurations for the tap and tool functionality on the interface remain the same. This means that once the user enables the tap-tool switchport mode on the interface, they can use the existing tap and tool mode commands to enable their respective configurations.

It is recommended to use this feature in conjunction with unidirectional send-receive enabled on the interface. By using **unidirectional send-receive** the receiver and transceiver for the interface have independent fates. That means that if one goes down, the other remains active. To use **unidirectional send-receive**, complete the following steps.

**Step 1** Enable the switch for configuration.

```
switch>configure terminal
```

**Step 2** Enable an Ethernet interface. In the example, Ethernet Interface 4/1 is selected.

```
switch(config)# Ethernet interface 4/1
```

**Step 3** Enable the **unidirectional send-receive** parameter.

```
switch(config-if-Et4/1)#unidirectional send-receive
```

To view the tap aggregation groups, use the `show tap aggregation groups` command.

**Example:**

```
(config-if-Et4/1)#show tap aggregation groups

Group Name    Tool Members              Tap Members
-------------- ------------------------- -------------------
    group1      None                      Et4/1
    group2      Et4/1                      None
```

20.3.6.3

20.3.7 Tap Aggregation QoS Handling on Tap Ports

Before EOS 4.20.5F, QoS behavior was not enforced for tap aggregation ports, meaning that QoS behavior for packets passing through the device was not changed.

- **Platform Compatibility**
- **Configurations**
- **Status**
20.3.7.1 Platform Compatibility

The following platforms support Tap Aggregation QoS handling on tap ports.

- DCS-7280E
- DCS-7280R
- DCS-7500E
- DCS-7500R
- DCS-7280R2

Note

QoS is not available on Tap aggregation ports on the DCS-7150.

20.3.7.2 Configurations

Trust Mode of Tap Ports

Tap ports are in no qos trust mode by default. This means that the QoS marking of an incoming packet is not trusted when determining the QoS attributes of the packet. Therefore, the default QoS handling takes place. Consider the default CoS to traffic class mapping in the following example.

```
switch(config)#show qos maps
[...]
Cos-tc map:
    cos:  0  1  2  3  4  5  6  7
    --------------
tc:    1  0  2  3  4  5  6  7
[...]
```

The Class of Service (CoS) field of incoming packets is ignored and is assumed to be zero. In this example, all packets are assigned to traffic class 1 when using the above mapping.

Tap ports can override the default trust mode behavior using the qos trust command, as shown in the following example:

```
switch(config-if-Et1)#qos trust cos
```

Overriding the no qos trust default trust mode behavior results in the traffic now being placed into the marked class.

Class of Service Rewrite of Tap Ports

Tap ports do not override the existing Class of Service (CoS) field of incoming packets. In other words, the QoS marking of steered packets is not changed in any way.
However, the CoS field of added tags may change according to the traffic class to CoS mapping. For example, the identity tag added by tap ports may have the CoS value from the global traffic class to CoS mapping. Consider the following mapping:

```
switch(config)#show qos maps
[...]
Tc-cos map:
  tc:  0  1  2  3  4  5  6  7
  ------------------------
  cos:  1  7  2  3  4  5  6  0
[...]
```

Using this mapping, the added tag CoS field of packets assigned to traffic class 1 may be set to 7.

20.3.7.3 Status

**Show Commands**

- Use the command `show qos maps` to see the active QoS mappings.

Use the command `show interfaces <interface> counters queue` to see the interface traffic class queues counters.

20.3.8 Identity VLAN Tagging

By default, tool port output packets are identical to the replicated packets they receive from the tap ports to which they are associated. Identity tagging modifies packets sent by tool ports by adding a dot1q VLAN tag that identifies the originating tap port. Each tap port is associated with an identity number. Tool ports that are configured to add an identity tag append the originating tap port’s identity number in the outer layer (or s-VLAN) tag.

These procedures describe commands that support identity VLAN tagging

- Tap Port Identity Value Configuration
- Tool Port Identity Tag Configuration

**Tap Port Identity Value Configuration**

The `switchport tap identity` command configures the tap port identity value for the configuration mode interface. The default identity value for all tap ports is 1.

**Example**

- These commands configure 1042 as the identity value for Ethernet interface 42.

```
switch(config)#interface ethernet 42
switch(config-if-Et42)#switchport tap identity 1042
switch(config-if-Et42)#show interface ethernet 41-43 tap
Port      Configured     Status         Native   Id   Truncation Default
Mode                          Vlan     Vlan            Group
-----------------------------------------------------------------------
Et41      tap            tap            400      1    0          ---
Et42      tap            tap            1        1042 0          ---
Et43      tap            tap            1        1    0          ---
switch(config-if-Et42)#
```
Tool Port Identity Tag Configuration

The switchport tool identity command configures the configuration mode interface to include a tier 1 VLAN tag (dot1q) to packets it transmits. The VLAN number on the dot1q tag is specified by identity value configured for the tap port that supplies the packets. By default, tool ports do not encapsulate packets with the tier 1 VLAN tag.

Example

- These commands configure port channel 102 to include the identity tag in packets it transmits.

```
switch(config)#interface port-channel 102
switch(config-if-Po102)#switchport tool identity dot1q
switch(config-if-Po102)#show interface port-channel 101-103 tool
```

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

20.3.9 Tap Aggregation Group Configuration

Tap aggregation groups associate a set of tap ports with a set of tool ports. Tool port replicates packets it receives from tap ports that are in the aggregation groups to which it belongs. A tap port can be configured to send data to multiple tap aggregation groups. Tool ports may belong to multiple tap aggregation groups. Tap aggregation groups may contain multiple tap ports and multiple tool ports.

These procedures describe commands that configure tap aggregation groups:

- Assigning a Tool Port to Tap Aggregation Groups
- Assigning Tap Ports to a Tap Aggregation Group
- Viewing Tap Aggregation Groups Assignments
- LAGs in Tool Groups

Assigning a Tool Port to Tap Aggregation Groups

Tool ports are assigned to tap aggregation group through the switchport tool group command. Each command either creates a list or alters the existing list of groups to which a tool port belongs.

Example

- These commands create the list of tap aggregation groups for port channel interface 101.

```
switch(config)#interface port-channel 101
switch(config-if-Po101)#switchport tool group set analyze1 analyze2 analyze3
switch(config-if-Po101)#show active
interface Port-Channel101
  switchport mode tool
  switchport tap identity 2101
  switchport tool allowed vlan 1001-1020
  switchport tap default group tag-9
  switchport tool group set analyze3 analyze1 analyze2
switch(config-if-Po101)#
```
Chapter 20: Tap Aggregation

Tap Aggregation Configuration

- These commands remove analyze-1 from port channel 101’s tap aggregation group list.

```
switch(config-if-Po101)#switchport tool group remove analyze1
switch(config-if-Po101)#show active
interface Port-Channel101
   switchport mode tool
   switchport tap identity 2101
   switchport tool allowed vlan 1001-1020
   switchport tap default group tag-9
   switchport tool group set analyze3 analyze2
switch(config-if-Po101)#
```

Assigning Tap Ports to a Tap Aggregation Group

Tap ports are assigned to a tap aggregation group through the `switchport tap default group` command. Multiple ports are added to a group by entering interface configuration mode for all interfaces.

Example

- These commands assign Ethernet interface 41 through 43 to tap aggregation groups analyze2 (41 and 42) and analyze3 (43).

```
switch(config)#interface ethernet 41-42
switch(config-if-Et41-42)#switchport tap default group analyze2
switch(config-if-Et41-42)#interface ethernet 43
switch(config-if-Et43)#switchport tap default group analyze3
switch(config-if-Et43)#show interface ethernet 41-43 tap
<table>
<thead>
<tr>
<th>Port</th>
<th>Configured</th>
<th>Status</th>
<th>Native Vlan</th>
<th>Id</th>
<th>Truncation</th>
<th>Default Group</th>
</tr>
</thead>
<tbody>
<tr>
<td>Et41</td>
<td>tap</td>
<td>tap</td>
<td>400</td>
<td>1</td>
<td>0</td>
<td>analyze2</td>
</tr>
<tr>
<td>Et42</td>
<td>tap</td>
<td>tap</td>
<td>1</td>
<td>1042</td>
<td>0</td>
<td>analyze2</td>
</tr>
<tr>
<td>Et43</td>
<td>tap</td>
<td>tap</td>
<td>1</td>
<td>1</td>
<td>0</td>
<td>analyze3</td>
</tr>
</tbody>
</table>
switch(config-if-Et43)#
```

Viewing Tap Aggregation Groups Assignments

Tap aggregation group membership is displayed by `show tap aggregation groups`. Options facilitate the display of individual groups or all configured groups. The command displays active tool and tap ports by default and provides an option to display configured ports that are not active.

Example

- This command displays the contents of all configured tap aggregation groups.

```
switch>show tap aggregation groups
<table>
<thead>
<tr>
<th>Group Name</th>
<th>Tool Members</th>
</tr>
</thead>
<tbody>
<tr>
<td>analyze2</td>
<td>Po101, Po102</td>
</tr>
<tr>
<td>analyze3</td>
<td>Po101, Po103</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Group Name</th>
<th>Tap Members</th>
</tr>
</thead>
<tbody>
<tr>
<td>analyze2</td>
<td>Et41, Et42</td>
</tr>
<tr>
<td>analyze3</td>
<td>Et43</td>
</tr>
</tbody>
</table>

switch>
```
LAGs in Tool Groups

Link Aggregation Groups (LAGs) can be included in tool groups for load balancing. A tool group can contain both LAGs and regular ports. Each member of a tool group receives one copy of the traffic destined to the group. Traffic is replicated to tool group members using multicast replication. The traffic replicated to LAGs is then load-balanced to their members as per load-balance policies configured on the system.

If a tool group has no more than 60 members with at least one hardware LAG, then the replication mode of the tool group is set to “ingress-only”. Otherwise, the replication mode of the tool group is set to the configured system default multicast replication mode. See platform sand multicast replication default for more information on configuration of the system default replication mode.

This command changes the system-wide default multicast replication mode to ingress mode.

    switch(config)#platform sand multicast replication default ingress
20.4 Tap Aggregation Traffic Steering

Traffic steering is a tap aggregation process that uses class maps and policy maps to direct data streams at tool ports that are not otherwise associated to the ingress tap port. A policy map is a data structure that filters data streams upon which identity VLAN tagging or tap aggregation group assignment is implemented.

Tapagg class maps and policy maps are similar to QoS and control plane maps. However, policy maps and their components are not interchangeable among function types.

20.4.1 Tapagg Policies

A policy map filters data packets by using classes and match rules. Each class contains an eponymous class map and a traffic resolution command. Each match rule contains packet content descriptors and a traffic resolution parameter.

- A class map uses ACLs that identify packets that comprise a specified data stream
- Packet content descriptors specify packet field values that are compared to inbound packets.
- A traffic resolution command or parameter specifies data handling methods for filtered traffic.

Each data packet entering an entity to which a policy map is assigned is managed as defined by the traffic resolution command of the highest priority class or rule that matches the packet. Class maps are user created and can be edited or deleted. They filter traffic with IPv4 ACLs and are listed in running-config. Tapagg traffic resolution commands perform one of the following:

- specify a tap aggregation group to direct the packet
- specify a VLAN number for identity tagging the packet.

Tap Aggregation policy maps do not define an implicit deny statement. Packets that do not match a policy map class or rule are replicated and sent out tool ports specified by the default aggregation group assigned to the ingress tap port. If no default group is selected, these packets are dropped.

20.4.2 Configuring Tapagg Traffic Policies

Tapagg traffic policies are implemented by creating class maps and policy maps, then applying the policy maps to Ethernet and port channel interfaces.

Creating Class Maps

A class map is an ordered list of IPv4 access control lists (ACLs). Each ACL is assigned a sequence number that specifies its priority in the class map. Tapagg class maps utilize ACL permit rules to pass packets and deny rules to drop packets.

Class maps are created and modified in class-map configuration mode, which is entered through class-map type tapagg. The match (class-map (tapagg)) command inserts a specified ACL into the class map, assigning it a sequence number that denotes its placement.

Class-map configuration mode is a group-change mode. Changes made in a group-change mode are saved by exiting the mode. The show active command displays the saved version of class map. The exit command returns the switch to global configuration mode and saves pending class map changes. The abort command returns the switch to global configuration mode and discards pending changes.
Examples

- This command creates a tapagg class map named \texttt{t-class\_1} and places the switch in class-map configuration mode.
  
  \begin{verbatim}
  switch(config)#class-map type tapagg match-any t-class_1
  switch(config-cmap-t-class_1)#
  \end{verbatim}

- These commands add two IPv4 ACLs (\texttt{tacl-1}, \texttt{tacl-2}) to the \texttt{t-class\_1} class map. The commands use the default method of assigning sequence numbers to the ACLs.
  
  \begin{verbatim}
  switch(config-cmap-t-class_1)#match ip access-group tacl-1
  switch(config-cmap-t-class_1)#match ip access-group tacl-2
  switch(config-cmap-t-class_1)#
  \end{verbatim}

- These commands exit class-map configuration mode, stores pending changes to \texttt{running-config}, then displays the class map.
  
  \begin{verbatim}
  switch(config-cmap-t-class_1)#exit
  switch(config)#class-map type tapagg match-any t-class_1
  switch(config-cmap-t-class_1)#show active
  class-map type tapagg match-any t-class_1
  10 match ip access-group tacl-1
  20 match ip access-group tacl-2
  switch(config-cmap-t-class_1)#
  \end{verbatim}

Creating Policy Maps

Policy maps are created and modified in policy-map configuration mode. A policy map is an ordered list of classes and match rules. Policy maps are edited by adding or removing map elements. Data packets are managed by commands of the highest priority class or rule that matches the packet.

Classes: Each class contains a class map, a set command, and a sequence number:

- The class map identifies a data stream by using an ordered list of ACLs. Class maps are configured in class-map (tapagg) configuration mode.
- The Set command specifies the replication method for filtered data packets, either through an associated aggregation group or identity VLAN tagging.
- Sequence number specifies the class’s priority within the policy map. Lower sequence numbers denote higher priority.

Matching rules: Each rule contains a filter list, an action, and a sequence number:

- The filter list identifies a data stream by using a set of packet field values.
- The action, (\texttt{SET_VALUE} parameter) specifies the replication method of filtered data packets, either through an associated aggregation group or identity VLAN tagging.
- Sequence number specifies the rule’s priority within the policy map. Lower sequence numbers denote higher priority.

Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the \texttt{exit} command or discarded with the \texttt{abort} command. The \texttt{show active} and \texttt{show pending} commands display the saved and modified policy map versions, respectively.

The \texttt{class (policy-map (tapagg))} command enters policy-map configuration mode.

Example

- This command creates the tapagg policy map named \texttt{t-policy\_1} and places the switch in policy-map configuration mode.
  
  \begin{verbatim}
  switch(config)#policy-map type tapagg t-policy_1
  switch(config-pmap-t-policy_1)#
  \end{verbatim}
The **class (policy-map (tapagg))** command adds a class to the configuration mode policy map and places the switch in policy-map-class configuration mode for adding a traffic resolution command to the class. The **set (policy-map-class (tapagg))** command specifies the data replication method for traffic filtered by the associated class map in the configuration mode policy map. The **set** command specifies one of these replication actions for filtered data packets.

- specifies an aggregation group
- specifies a VLAN identity tag for replicated packets.
- specifies an aggregation group and a VLAN identity tag.

**Example**

- These commands add the **t-class_1** class map to the **t-policy_1** policy map, associate a set statement with class, then saves the policy map by exiting the modes. Packets filtered by the class map are identity tagged with VLAN 444 and replicated as specified by the **t-grp** aggregation group.

  ```
  switch(config-pmap-t-policy_1)#class t-class_1
  switch(config-pmap-c-t-policy_1-t-class_1)#set aggregation-group t-grp id-tag 444
  switch(config-pmap-c-t-policy_1-t-class_1)#exit
  switch(config-pmap-t-policy_1)#exit
  switch(config)#policy-map type tapagg t-policy_1
  switch(config-pmap-t-policy_1)#show active
  policy-map type tapagg t-policy_1
  10 class t-class_1
    set aggregation-group t-group id-tag 444
  switch(config-pmap-t-policy_1)#
  ```

The **match (policy-map (tapagg))** command adds a match rule to the configuration mode tapagg policy map.

**Example**

- This command enters policy-map configuration mode for **t-policy_1**, then creates a match rule for the policy map that filters OSPF packets and replicates them as specified by **t-grp** tap aggregation group.

  ```
  switch(config-pmap-t-policy_1)#match ip ospf any any set aggregation-group t-grp
  switch(config-pmap-t-policy_1)#
  ```

**Applying Policy Maps to an Interface**

The **service-policy type tapagg (Interface mode)** command applies a specified policy map to the configuration mode interface.

**Example**

- These commands applies the **t-policy_1** policy map to Ethernet interface 17.

  ```
  switch(config)#interface ethernet 17
  switch(config-if-Et17)#service-policy type tapagg input t-policy_1
  switch(config-if-Et17)#
  ```
20.5 Tap Aggregation GUI

The switch provides a graphical user interface (GUI) for creating and viewing a tap aggregation configuration and displaying LANZ traffic statistics.

All commands available on the GUI are accessible through the CLI. The tap aggregation configuration created through either the CLI or the GUI can be viewed and modified through either medium.

This section provides a brief description of the tap aggregation GUI.

20.5.1 Accessing the GUI

The URL for the tap-agg GUI is

https://<hostname>/apps/TapAgg/index.html

where <hostname> is the switch’s configured hostname. Figure 20-2 displays the initial tap-agg panel for the switch with the hostname ro402.

The tap-agg panel contains two sections:

- The configuration section displays the tap-agg configuration, including the tap interfaces, tool interfaces, and aggregation groups. Links are displayed to indicate interface group membership.
- The component section displays information and control buttons for the active configuration entity. When an entity is not selected, the section displays information for the switch (device).

The configuration section displays tap-agg components only when the switch is in tap aggregation mode. To enter tap aggregation mode, click the Tap Aggregation icon in the component section for the device. The icon is a toggle mechanism; clicking it again disables tag aggregation mode.

Figure 20-2: Tag-Agg GUI Initial Panel
20.5.2 Viewing Tap Aggregation Component Details

Figure 20-3 displays the tap-agg panel when the switch is in tap aggregation mode. The configuration section indicates that the tap aggregation configuration consists of three tool interfaces, one tap interface, and four aggregation groups. Ethernet 10 is the active component; configuration control and traffic information for this interface is available in the component section.

The active component is changed by clicking on the desired component in the configuration section. To display device (switch) information, click on any configuration section outside of any component.

20.5.3 Modifying a Tap Aggregation Configuration

The tap aggregation configuration can be modified only when the switch is in tap-agg mode, (Section 20.5.1). The following is a partial list of configuration tasks that are available from the GUI:

- To add a tap or tool interface: Begin typing the interface name in the desired add interface data entry area to access a drop-down list of available interfaces. Select the desired interface and press the Add button.
- Removing an interface from the configuration: Select the desired interface in the configuration section and click the deconfigure button in that interface’s component section.
- To add an aggregation group: Type the desired name of the new group in the data entry area and press the Add button. The tap aggregation group name can consist of alphanumeric characters and specific special characters (- _ [ ] { } :) only.
- To add an interface to an aggregation group: Select the desired interface in the configuration section, then press the icon of the group in the group membership area of the interface’s component section.

Group icons are toggle buttons; clicking the icon of a group to which the interface belongs removes that interface from the group.

Figure 20-3: Tag-Agg GUI Panel – Tap aggregation mode enabled
20.6 Keyframe and Timestamp Configuration

20.6.1 Keyframe Generation

Keyframes contain routable IP packets that provide information to relate timestamps with the complete ASIC counter and absolute UTC time. The switch supports a maximum of ten keyframes, which are distinguished by their name label. Each keyframe can egress from every Ethernet port.

Keyframe generation is enabled by the `platform fm6000 keyframe` command. Command options specify ports that transmit keyframes along with the destination MAC address and IP address in the keyframe's header. Other keyframe commands specify the transmission rate and the frame's source:

- The `platform fm6000 keyframe rate` command configures the keyframe's transmission rate.
- The `platform fm6000 keyframe source` command configures the source IP address that is placed in each keyframe's header. The management interface IP address is the default source address.
- The source MAC address is the MAC address of the egress interface transmitting the keyframe.
- The `platform fm6000 keyframe device` command configures the 16-bit number that keyframes list as the device ID in their payload.
- The `platform fm6000 keyframe fields skew` command enables the inclusion of clock skew fields in the keyframe.
- The `show platform fm6000 keyframe` command displays keyframe configuration information.

Examples

- This command enables the generation of a keyframe named key-1. This keyframe egresses from Ethernet interfaces 11 through 15, specifies a source IP address of 10.21.1.4 and a MAC address of 10.4E21.9F11.
  ```
  switch(config)#platform fm6000 keyframe key-1 interface ethernet 11-15 10.21.1.4 10.4E21.9F11
  switch(config)#
  ```
- This command configures the generation rate for the keyframe of 10 frames per second on each of the five interfaces that it is configured to egress.
  ```
  switch(config)#platform fm6000 keyframe key-1 rate 10
  switch(config)#
  ```
- These commands enable the generation of a keyframe named key-1, then configures 100 as the value that is placed in the keyframe's device ID field.
  ```
  switch(config)#platform fm6000 keyframe key-1 device 100
  switch(config)#
  ```
- This command enables the inclusion of clock skew fields in the keyframe named “key-1”.
  ```
  switch(config)#platform fm6000 keyframe key-1 fields skew
  switch(config)#
  ```
Chapter 20: Tap Aggregation

Keyframe and Timestamp Configuration

- This command displays key-1 configuration information.

  switch(config)# show platform fm6000 keyframe

  Keyframe key-1
  ------------------------
  Egress Interface(s): Ethernet11, Ethernet12, Ethernet13, Ethernet14, Ethernet15
  Source IP: 172.22.30.142
  Destination IP: 10.21.1.4
  Destination MAC: 00:10:4e:21:9f:11
  Device ID: 100
  Rate: 10 packet(s) per second

  switch(config)#

20.6.2 Enabling Timestamp Insertion on an Interface

Timestamps are based on a frame's ingress time and applied to frames sent on egress ports, ensuring that timestamps on monitored traffic reflect ingress timing of the original frames. Time-stamping is configured on the egress port where the timestamp is applied to the frame.

When timestamping is enabled on an egress interface, packets leave the interface with timestamps that were applied in hardware upon arriving at the switch. This is facilitated by applying a hardware timestamp to all frames arriving on all interfaces when timestamping is enabled on any interface, then removing timestamps on packets egressing interfaces where timestamping is not enabled.

The `mac timestamp` command enables time-stamping on the configuration mode interface. The switch supports two timestamp modes, which differ in managing the egress frame’s 32-bit frame check sequence (FCS):

- before-fcs: the switch discards the original FCS, appends the ingress timestamp at the end of the frame data, recalculates a new FCS based on the appended timestamp, then appends the new FCS to the end of the frame. This creates a valid Ethernet frame but does not update headers of any nested protocols.
- replace-fcs: the switch replaces the original FCS with the timestamp. This mode maintains the size of the original frame without any latency impact, but the FCS is not valid.

Examples

- These commands enable timestamping in before-fcs mode on Ethernet interface 44.

  switch(config)# interface ethernet 44
  switch(config-if-Et44)# mac timestamp before-fcs
  switch(config-if-Et44)# show active
  interface Ethernet44
     mac timestamp before-fcs
  switch(config-if-Et44)#

- These commands disable timestamping on Ethernet interface 44.

  switch(config-if-Et44)# no mac timestamp
  switch(config-if-Et44)# show active
  interface Ethernet44
  switch(config-if-Et44)#
20.7 Tap Aggregation Commands

Global Configuration Commands
- platform fm6000 keyframe
- platform fm6000 keyframe device
- platform fm6000 keyframe fields skew
- platform fm6000 keyframe rate
- platform fm6000 keyframe source
- platform sand multicast replication default
- platform sand multicast replication ingress maximum
- tap aggregation

Interface Configuration Commands
- mac timestamp
- switchport tap allowed vlan
- switchport tap default group
- switchport tap identity
- switchport tap native vlan
- switchport tap truncation
- switchport tool allowed vlan
- switchport tool group
- switchport tool identity

Tap Aggregation Configuration Mode
- mode (tap-agg configuration mode)
- mode exclusive no-errdisable (tap-agg configuration mode)

Tap Aggregation Traffic Steering
- class-map type tapagg
- match (class-map (tapagg))
- match (policy-map (tapagg))
- resequence (class-map (tapagg))
- resequence (policy-map (tapagg))
- service-policy type tapagg (Interface mode)
- set (policy-map-class (tapagg))

Display Commands – EXEC Mode
- show interfaces tap
- show interfaces tool
- show platform fm6000 keyframe
- show platform sand mcast capacity
- show tap aggregation groups
**class (policy-map (tapagg))**

The `class` command places the switch in policy-map-class (tapagg) configuration mode, which is a group change mode that defines a tapagg class by associating the class’s eponymous class-map to a `set` statement. Upon exiting the policy-map-class mode, the class is placed in the policy-map as specified by an assigned sequence number.

A policy map is an ordered list of classes and match rules. Each class contains a class map, a set command, and a sequence number:

- The class map identifies a data stream by using an ordered list of ACLs. Class maps are configured in class-map (tapagg) configuration mode. Data packets are managed by commands of the highest priority class or rule that matches the packet.
- **Set** commands specify the replication method of filtered data packets, either through an associated aggregation group or identity VLAN tagging.
- **Sequence number** specifies the class’s priority within the policy map. Lower sequence numbers denote higher priority.

The `exit` command returns the switch to policy-map configuration mode. However, saving policy-map-class changes also require an exit from policy-map mode. This saves all pending policy map and policy-map-class changes to `running-config` and returns the switch to global configuration mode. The `abort` command discards pending changes, and returns the switch to global configuration mode.

The `no class` and `default class` commands remove the class assignment from the configuration mode policy map by deleting the corresponding `class` configuration from `running-config`.

**Command Mode**

Policy-Map (tapagg) Configuration

accessed through `class (policy-map (tapagg))`

**Command Syntax**

```
[SEQ_NUM] class class_name
no [SEQ_NUM] class class_name
default [SEQ_NUM] class class_name
```

**Parameters**

- **SEQ_NUM** Priority of the class within the policy map. Lower numbers denote higher priority.
  - `<no parameter>` Number is derived by adding 10 to number of the map’s last class or rule.
  - `<1 to 4294967295>` Number assigned to class.
- **class_name** name of the class.

**Guidelines**

When a class is not associated with a `set (policy-map-class (tapagg))` command, the filtered traffic is managed as specified by the tap port’s default aggregation group.

**Commands Available in Policy-map-class (tapagg) Configuration Mode**

- **set (policy-map-class (tapagg))** assigns VLAN identity tag or tap aggregation group to class.
- **exit** returns the switch to parent policy map configuration mode.
- **abort** discards pending class map changes, then returns the switch to global configuration mode.

**Related Commands**

- **class (policy-map (tapagg))** places the switch in policy-map (tapagg) configuration mode.
• **match (policy-map (tapagg))** assigns a match rule to a tapagg policy map.

**Example**

- These commands place the switch in policy-map-class and add the *t-class_1* class map to the *t-policy_1* policy map. Packets filtered by the class map are identity tagged with VLAN 444.

```plaintext
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#class t-class_1
switch(config-pmap-c-t-policy_1-t-class_1)#set id-tag 444
switch(config-pmap-c-t-policy_1-t-class_1)#exit
switch(config-pmap-t-policy_1)#exit
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#show active
  policy-map type tapagg t-policy_1
    10 class t-class_1
      set id-tag 444
switch(config-pmap-t-policy_1)#
```
class-map type tapagg

The **class-map type tapagg** command places the switch in class-map (tapagg) configuration mode, which is a group change mode that modifies a tapagg class map. A tapagg class map is a data structure that uses access control lists (ACLs) to define a data stream by specifying characteristics of data packets that comprise the stream. Tapagg policy maps use class maps to specify traffic that is managed by policy map criteria.

The **exit** command saves pending class map changes to **running-config**, then returns the switch to global configuration mode. Class map changes are also saved by entering a different configuration mode. The **abort** command discards pending changes and returns the switch to global configuration mode.

The **no class-map type tapagg** and **default class-map type tapagg** commands delete the specified class map by removing the corresponding **class-map type qos** command and its associated configuration.

**Command Mode**

Global Configuration

**Command Syntax**

```
class-map type tapagg match-any class_name
no class-map type tapagg match-any class_name
default class-map type tapagg match-any class_name
```

**Parameters**

- **class_name** Name of class map.

**Commands Available in Class-Map (tapagg) configuration mode**

- **match (class-map (tapagg))**
- **resequence (class-map (tapagg))**

**Related Commands**

- **class (policy-map (tapagg))**

**Example**

- This command creates a tapagg class map named **t-class_1** and places the switch in class-map configuration mode.

```
switch(config)#class-map type tapagg match-any t-class_1
switch(config-cmap-t-class_1)#
```
**mac timestamp**

The `mac timestamp` command enables timestamping on the configuration mode interface.

When timestamping is enabled on an egress interface, packets leave the interface with timestamps that were applied in hardware upon arriving at the switch. This is facilitated by applying a hardware timestamp to all frames arriving on all interfaces when timestamping is enabled on any interface, then removing timestamps on packets egressing interfaces where timestamping is not enabled.

The switch supports two timestamp modes, which differ in managing the egress frame’s 32-bit frame check sequence (FCS):

- **before-fcs**: the switch discards the original FCS, appends the ingress timestamp at the end of the frame data, recalculates a new FCS based on the appended timestamp, then appends the new FCS to the end of the frame. This creates a valid Ethernet frame but does not update headers of any nested protocols.
- **replace-fcs**: the switch replaces the original FCS with the timestamp. This mode maintains the size of the original frame without any latency impact, but the FCS is not valid.

The `no mac timestamp` and `default mac timestamp` commands restore the default behavior of disabling timestamping on the configuration mode interface by removing the corresponding `mac timestamp` command from `running-config`.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

```
mac timestamp TS_PROPERTY
no mac timestamp
default mac timestamp
```

**Parameters**

- **TS_PROPERTY** Specifies the timestamp insertion mode. Options include:
  - **before-fcs** The ingress timestamp is appended to the frame and the FCS is recalculated.
  - **replace-fcs** The ingress timestamp replaces the original FCS.

**Example**

- These commands enable timestamping in before-fcs mode on Ethernet interface 44.
  ```
  switch(config)#interface ethernet 44
  switch(config-if-Et44)#mac timestamp before-fcs
  switch(config-if-Et44)#show active
  interface Ethernet44
      mac timestamp before-fcs
  switch(config-if-Et44)#
  ```

- These commands disable timestamping on Ethernet interface 44.
  ```
  switch(config-if-Et44)#no mac timestamp
  switch(config-if-Et44)#show active
  interface Ethernet44
  switch(config-if-Et44)#
  ```
match (class-map (tapagg))

The **match** command adds an ACL to the configuration mode class map and associates a sequence number to the ACL. A class map is an ordered list of ACLs that define a data stream; the sequence number specifies an ACL’s priority within the list. A class map is used by policy maps to filter data packets. Tapagg class maps utilize ACL permit rules to pass packets and deny rules to drop packets.

Class map (tapagg) configuration mode is a group change mode. **Match** statements are not saved to **running-config** until the edit session is completed by exiting the mode.

The **no match** and **default match** commands remove the specified **match** statement from the configuration mode class map by deleting the corresponding command from **running-config**.

**Command Mode**

Class-map (tagagg) configuration
accessed through **class-map type tapagg** command

**Command Syntax**

```
[SEQ_NUM] match ip access-group list_name
no [SEQ_NUM] match ip access-group list_name
default [SEQ_NUM] match ip access-group list_name
```

**Parameters**

- **SEQ_NUM**  Sequence number assigned to the ACL. Options include:
  - `<no parameter>`  Number is derived by adding 10 to the number of the map’s last ACL.
  - `<1 to 4294967295>`  Number assigned to ACL.
  - **list_name**  name of ACL assigned to class map.

**Guidelines**

**Match** statements accept IPv4 ACLs.

**Related Commands**

- **class-map type tapagg** places the switch in Class-Map configuration mode.
- **exit** saves pending class map changes, then returns the switch to global configuration mode.
- **abort** discards pending class map changes, then returns the switch to global configuration mode.
- **class (policy-map (tapagg))** assigns a class map to a policy map.

**Example**

- These commands add two IPv4 ACLs (**tacl-1**, **tacl-2**) to the **t-class_1** class map, saves the command by exiting class-map mode, then re-enters the mode to display the added ACLs.

```
switch(config)#class-map type tapagg match-any t-class_1
switch(config-cmap-t-class_1)#match ip access-group tacl-1
switch(config-cmap-t-class_1)#match ip access-group tacl-2
switch(config-cmap-t-class_1)#exit
switch(config)#class-map type tapagg match-any t-class_1
switch(config-cmap-t-class_1)#show active
    class-map type tapagg match-any t-class_1
        10 match ip access-group tacl-1
        20 match ip access-group tacl-2
switch(config-cmap-t-class_1)#
```
match (policy-map (tapagg))

The `match` command adds a rule to the configuration mode tapagg policy map. A policy map is an ordered list of classes and rules. Each rule contains a filter list, an action, and a sequence number:

- The filter list identifies a data stream through a set of packet field values.
- The action, (set_value parameter) specifies the replication method of filtered data packets, either through an associated aggregation group or identity VLAN tagging.
- Sequence number specifies the rule’s priority with the policy map.

The `no match` and `default match` commands remove the `match` rule from the configuration mode policy by deleting the corresponding statement from `running-config`.

Command Mode
Policy-Map (tapagg) Configuration
accessed through `class (policy-map (tapagg))`

Command Syntax

```
[SEQ_NUM] match [VLAN_TAG] ip SOURCE_ADDR [SOURCE_PORT] DEST_ADDR [DEST_PORT] [PROTOCOL] [FLAGS] [MESSAGE] [fragments] [tracked] [DSCP_FILTER] [TTL_FILTER] [log] set_value
```

```
no match [VLAN_TAG] ip SOURCE_ADDR [SOURCE_PORT] DEST_ADDR [DEST_PORT] [PROTOCOL] [FLAGS] [MESSAGE] [fragments] [tracked] [DSCP_FILTER] [TTL_FILTER] [log] set_value
```

```
no SEQ_NUM
```

```
default match [VLAN_TAG] ip SOURCE_ADDR [SOURCE_PORT] DEST_ADDR [DEST_PORT] [PROTOCOL] [FLAGS] [MESSAGE] [fragments] [tracked] [DSCP_FILTER] [TTL_FILTER] [log] set_value
```

```
default SEQ_NUM
```

Commands use a subset of the listed fields. Available parameters depend on specified protocol. Use CLI syntax assistance to view options for specific protocols when creating a permit rule.

Parameters

- **SEQ_NUM**  Priority of the rule within the policy map. Lower numbers denote higher priority.
  - `<no parameter>` Number derived by adding 10 to number of the map’s last class or rule.
  - `<1 to 4294967295>` Number assigned to class.

- **VLAN_TAG**  VLAN field filter. Options include:
  - `<no parameter>` packets are not filtered by VLAN field.
  - `vlan <1 to 4094> <0 to 4095>` VLAN ID and mask.
  - `vlan inner <1 to 4094> <0 to 4095>` VLAN ID and mask.

- **PROTOCOL**  protocol field filter. Values include:
  - `<no parameter>` packets are not filtered by host name.
  - `ahp` authentication header protocol (51).
  - `icmp` internet control message protocol (1).
  - `igmp` internet group management protocol (2).
- ospf  open shortest path first (89).
- pim  protocol independent multicast (103).
- tcp  transmission control protocol (6).
- udp  user datagram protocol (17).
- vrrp  virtual router redundancy protocol (112).
- protocol_num  integer corresponding to an IP protocol. Values range from 0 to 255.
- SOURCE_ADDR and DEST_ADDR  source and destination address filters. Options include:
  - network_addr  subnet address (CIDR or address-mask).
  - any  Packets from all addresses are filtered.
  - host ip_addr  IP address (dotted decimal notation).
  Source and destination subnet addresses support discontiguous masks.
- SOURCE_PORT and DEST_PORT  source and destination port filters. Options include:
  - any  all ports
  - eq port-1 port-2 ... port-n  A list of ports. Maximum list size is 10 ports.
  - neq port-1 port-2 ... port-n  The set of all ports not listed. Maximum list size is 10 ports.
  - gt port  The set of ports with larger numbers than the listed port.
  - lt port  The set of ports with smaller numbers than the listed port.
  - range port_1 port_2  The set of ports whose numbers are between the range.
- fragments  filters packets with FO bit set (indicates a non-initial fragment packet).
- FLAGS  flag bit filters (TCP packets). Use CLI syntax assistance (?) to display options.
- MESSAGE  message type filters (ICMP packets). Use CLI syntax assistance (?) to display options.
- tracked  rule filters packets in existing ICMP, UDP, or TCP connections.
  - Valid in ACLs applied to the control plane.
  - Validity in ACLs applied to data plane varies by switch platform.
- DSCP_FILTER  rule filters packet by its DSCP value. Values include:
  - <no parameter>  Rule does not use DSCP to filter packets.
  - dscp dscp_value  Packets match if DSCP field in packet is equal to dscp_value.
- TTL_FILTER  rule filters packet by its TTL (time-to-live) value. Values include:
  - <no parameter>  Rule does not use TTL field to filter packets.
  - ttl eq ttl_value  Packets match if ttl in packet is equal to ttl_value.
  - ttl gt ttl_value  Packets match if ttl in packet is greater than ttl_value.
  - ttl lt ttl_value  Packets match if ttl in packet is less than ttl_value.
  - ttl neq ttl_value  Packets match if ttl in packet is not equal to ttl_value.
- log  triggers an informational log message to the console about the matching packet.
  - Valid in ACLs applied to the control plane.
  - Validity in ACLs applied to data plane varies by switch platform.
- SET_VALUE  specifies the replication method for filtered packets.
  - set aggregation group agg_group  Replication specified by aggregation group.
• **set id-tag <1 to 4094>**  Packet is identity tagged with specified VLAN number.
• **set aggregation group agg_group id-tag <1 to 4094>**  Assigns agg group and identity tag.

### Related Commands
- **class (policy-map (tapagg))** places the switch in policy-map (tapagg) configuration mode.
- **class (policy-map (tapagg))** assigns a class to the configuration mode policy-map.

### Example
- This command creates a match rule for the `t-policy_1` policy map that filters OSPF packets and replicates them as specified by the `t-group` tap aggregation group.

```
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#match ip ospf any any set aggregation-group t-group
switch(config-pmap-t-policy_1)#exit
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#show active
  policy-map type tapagg t-policy_1
    10 match ip ospf any any set aggregation-group t-group
switch(config-pmap-t-policy_1)#
```
mode (tap-agg configuration mode)

The `mode` command configures the switch’s tap aggregation mode. The switch supports these `mode` command options:

- **exclusive**: Tap aggregation mode is enabled. Switching mode is disabled.
  Tap and tool ports are enabled. Switching ports are errdisabled.
- `<not configured>`: Tap aggregation mode is disabled. Switching mode is enabled.
  Tap and tool ports are errdisabled. Switching mode ports are enabled.

The default setting enables switching mode and disables tap aggregation mode.

The `no mode` and `default mode` commands disables tap aggregation mode and enables switching mode by removing the mode command from `running-config`.

**Command Mode**
Tap-agg Configuration

**Command Syntax**
```
mode TAP_MODE
no mode TAP_MODE
default mode TAP_MODE
```

**Parameters**
- **TAP_MODE** specifies the switch’s switch’s tap aggregation mode.
  - exclusive tap aggregation is enabled.

**Related Commands**
- `tap aggregation` places the switch in tap-aggregation configuration mode.

**Example**
- These commands place the switch in tap-agg configuration mode and enable tap aggregation mode.

  ```
  switch(config)#tap aggregation
  switch(config-tap-agg)#mode exclusive
  switch(config-tap-agg)#show active
  tap aggregation
  mode exclusive
  switch(config-tap-agg)#
  ```

- These commands disable tap aggregation mode by removing the mode command from `running-config`.

  ```
  switch(config-tap-agg)#no mode
  switch(config-tap-agg)#show active
  switch(config-tap-agg)#
  ```
**mode exclusive no-errdisable (tap-agg configuration mode)**

The `mode exclusive no-errdisable` command configures the specified interface to remain enabled regardless of its switchport mode, when tap aggregation is enabled. This command is used primarily to configure a port to support PTP functions while the switch operates as a tap aggregator.

Each command configures one Ethernet or port channel interface. Subsequent mode exclusive no-errdisable commands add to the list of ports that remain enabled when tap aggregation is enabled.

The `no mode exclusive no-errdisable` and `default mode exclusive no-errdisable` commands configure the specified interface to be error-disabled when programmed in access, trunk, or dot1q-tunnel switching mode when tap aggregation is enabled by removing the corresponding `mode exclusive no-errdisable` command from *running-config*.

**Command Mode**
Tap-agg Configuration

**Command Syntax**

```
mode exclusive no-errdisable  INT_NAME
no mode exclusive no-errdisable  INT_NAME
default mode exclusive no-errdisable  INT_NAME
```

**Parameters**

- **INT_NAME** Interface type and numbers. Options include:
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `port-channel p_num` Port-Channel Interface specified by `p_num`.

**Related Commands**

- `tap aggregation` places the switch in tap-aggregation configuration mode.
- `mode (tap-agg configuration mode)` configures the switch’s tap-aggregation mode.

**Guidelines**

In order for a Tapagg switch to receive PTP traffic, the upstream device to which it is connected should be set to statically send PTP multicast traffic to the connected port on the switch.

Since IGMP snooping is disabled on Tapagg switches and with no configuration to support sending upstream join messages in such a state, the messages are transmitted statically from the upstream device. Once the upstream messages are received, the port will move to the slave state and follow the standard PTP mechanism.

**Example**

- These commands places the switch in tap-agg configuration mode and places Ethernet interface 21/3 in no-errdisable mode.

```bash
switch(config)#tap aggregation
switch(config-tap-agg)#mode exclusive
switch(config-tap-agg)#mode exclusive no-errdisable ethernet 21/4
switch(config-tap-agg)#
```
platform fm6000 keyframe

The platform fm6000 keyframe command enables keyframe generation for data streams transmitted from specified ethernet interfaces. Keyframes are routable IP packets that the switch inserts into a data stream to provide contextual information that correlate timestamps inserted into data packets with absolute UTC time and the switch’s complete ASIC time counter.

The switch supports a maximum of ten keyframes. The keyframe name is the label that distinguishes different keyframes. Each keyframe can egress from every ethernet port. Command options specify the destination MAC address and IP address in the keyframe’s header. Other keyframe commands specify the transmission rate and the frame’s source.

The no platform fm6000 keyframe and default platform fm6000 keyframe commands disable generation of the specified keyframe by deleting the corresponding platform fm6000 keyframe command from running-config. These command also remove all supporting platform fm6000 keyframe commands for the specified keyframe.

Command Mode
Global Configuration

Command Syntax

platform fm6000 keyframe kf_name interface ethernet e_range ipv4_addr mac_addr
no platform fm6000 keyframe kf_name
default platform fm6000 keyframe kf_name

Parameters

- kf_name The keyframe’s name.
- e_range Ethernet interface range over which the keyframe egresses. Valid formats include number, range, or comma-delimited list of numbers and ranges.
- ipv4_addr Destination IPv4 address inserted into keyframes. (Dotted decimal notation)
- mac_addr Destination MAC address inserted into keyframes. (48-bit dotted hex notation).

Guidelines
Subsequent issuance of this command for a specified keyframe replaces the existing command in running-config. Ethernet interfaces are inserted into an existing keyframe only by issuing the complete command that identifies all interfaces through which the keyframe is transmitted.

Examples

- This command enables the generation of a keyframe named key-1. This keyframe egresses from Ethernet interfaces 11 through 15, specifies a source IP address of 10.21.1.4 and a MAC address of 10.4E21.9F11.

```
switch(config)#platform fm6000 keyframe key-1 interface ethernet 11-15 10.21.1.4 10.4E21.9F11
```

switch(config)#
The `platform fm6000 keyframe device` command configures the 16-bit number that the specified keyframe lists as the device ID in its payload. By default, the default device value placed in the specified keyframes is 0.

The `no platform fm6000 keyframe device` and `default platform fm6000 keyframe device` commands restore the default device ID insertion value of 0 for the specified keyframe by removing the corresponding `platform fm6000 keyframe device` command from running-config. The `no platform fm6000 keyframe` and `default platform fm6000 keyframe` commands also remove the corresponding `platform fm6000 keyframe device` command from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**
```
platform fm6000 keyframe kf_name device device_id
no platform fm6000 keyframe kf_name device
default platform fm6000 keyframe kf_name device
```

**Parameters**
- `kf_name` Keyframe name.
- `device_id` Value inserted in keyframe’s device ID field. Value ranges from 0 to 65535. Default is 0.

**Examples**
- These commands enable the generation of a keyframe named key-1, then configures 100 as the value that is placed in the keyframe’s device ID field.
  ```
  switch(config)#platform fm6000 keyframe key-1 interface ethernet 11-15 10.21.1.4 10.4E21.9F11
  switch(config)#platform fm6000 keyframe key-1 device 100
  switch(config)#
  ```
platform fm6000 keyframe fields skew

Keyframes may optionally include skew numerator and skew denominator fields. These skew fields form a ratio indicating the ASIC clock skew. If the ratio is greater than 1, the clock is skewed fast; if the ratio is less than 1, the clock is skewed slow. Clock skew fields are omitted by default.

The **platform fm6000 keyframe fields skew** command enables the inclusion of clock skew fields in the keyframe.

The **no platform fm6000 keyframe fields skew** and **default platform fm6000 keyframe fields skew** remove the clock skew fields from the keyframe.

**Command Mode**
- Global Configuration

**Command Syntax**

```
platform fm6000 keyframe kf_name fields skew
no platform fm6000 keyframe kf_name fields skew
default platform fm6000 keyframe kf_name fields skew
```

**Parameters**
- `kf_name` Keyframe name.

**Examples**
- This command enables the inclusion of clock skew fields in the keyframe named “key-1”.

  ```
  switch(config)#platform fm6000 keyframe key-1 fields skew
  switch(config)#
  ```
**platform fm6000 keyframe rate**

The **platform fm6000 keyframe rate** command specifies the transmission rate for the specified keyframe from each interface from which it is configured to egress. By default, one keyframe is sent per second.

The **no platform fm6000 keyframe rate** and **default platform fm6000 keyframe rate** commands restore the default transmission rate for the specified keyframe of one per second by removing the corresponding **platform fm6000 keyframe rate** command from running-config. The **no platform fm6000 keyframe** and **default platform fm6000 keyframe** commands also remove the corresponding **platform fm6000 keyframe rate** command from **running-config**.

**Command Mode**

- Global Configuration

**Command Syntax**

```plaintext
platform fm6000 keyframe kf_name rate tx_rate
no platform fm6000 keyframe kf_name rate
default platform fm6000 keyframe kf_name rate
```

**Parameters**

- `kf_name` The keyframe’s name.
- `tx_rate` Keyframe transmission rate (frames per second). Value ranges from 1 to 100. Default value is 1.

**Examples**

- These commands enable the generation of a keyframe named key-1, then configures the generation rate for the keyframe of 10 frames per second on each of the five interfaces that it is configured to egress.

  ```plaintext
  switch(config)#platform fm6000 keyframe key-1 interface ethernet 11-15 10.21.1.4 10.4E21.9F11
  switch(config)#platform fm6000 keyframe key-1 rate 10
  switch(config)#
  ```
platform fm6000 keyframe source

The `platform fm6000 keyframe source` command configures the source IP address that the specified keyframe lists in its IP header. By default, keyframes use the IP address of the management interface as their source address.

The `no platform fm6000 keyframe source` and `default platform fm6000 keyframe source` commands restore the management interface IP address as the specified keyframe’s source IP address by removing the corresponding `platform fm6000 keyframe source` command from running-config. The `no platform fm6000 keyframe and default platform fm6000 keyframe` commands also remove the corresponding `platform fm6000 keyframe source` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
platform fm6000 keyframe kf_name source ip ipv4_addr
no platform fm6000 keyframe kf_name source ip
default platform fm6000 keyframe kf_name source ip
```

**Parameters**

- `kf_name`  Keyframe’s name.
- `ipv4_addr`  Keyframe’s source IPv4 address. (Dotted decimal notation – A.B.C.D)

**Examples**

- These commands enable the generation of a keyframe named key-1, then configures the IP address of keyframes as 10.1.1.101.

```
switch(config)#platform fm6000 keyframe key-1 interface ethernet 11-15 10.21.1.4 10.4E21.9F11
switch(config)#platform fm6000 keyframe key-1 source 10.1.1.101
switch(config)#
```
platform sand multicast replication default

The `platform sand multicast replication default` command configures Sand platform with the default replication mode. The global default replication mode differs in various scenarios as follows:

- The default replication mode on switches with fabric is fabric-egress mode.
- The default replication mode on switches with single Fabric Access Processor (FAP) systems is ingress mode.
- The default replication mode on switches without fabric barring single FAP systems is ingress-egress mode.
- If a tool group with less than 60 LAGs has at least one hardware LAG, then the default replication mode of the tool group is ingress-only mode. Else the default replication mode of the tool group is the one configured across all LAGs in the tool group.

The `default platform sand multicast replication default` and `no platform sand multicast replication default` commands revert the current state to the global default behaviour.

**Command Mode**

Global Configuration

**Command Syntax**

```
platform sand multicast replication default [fabric-egress | ingress]
default platform sand multicast replication default
no platform sand multicast replication default
```

**Parameters**

- `fabric-egress` configures the replication mode to use fabric-egress VoQ buffers
- `ingress` configures the replication mode to use ingress VoQ buffers

**Guidelines**

This command is supported on Sand platforms only.

**Related Commands**

- `platform sand multicast replication ingress maximum`
- `show platform sand mcast capacity`

**Example**

- This command configures the default replication mode to ingress.

```
switch(config)#platform sand multicast replication default ingress
2018-05-18 19:38:56.928370  3267 SandMcast            0
AgentSm::handleReplicationMode() default: replicationFabricEgress current: replicationIngressOnly cli: replicationIngressOnly haveFabric: 0
```
platform sand multicast replication ingress maximum

The `platform sand multicast replication ingress maximum` command configures maximum members for an ingress only replication.

The `default platform sand multicast replication ingress maximum` command reverts the maximum members for ingress only replication to the default value.

The `no platform sand multicast replication ingress maximum` command deletes the maximum members for ingress only replication.

**Command Mode**
Global Configuration

**Command Syntax**
```
platform sand multicast replication ingress maximum maximum
no platform sand multicast replication ingress maximum
default platform sand multicast replication ingress maximum
```

**Parameters**
- `maximum` configures maximum members for ingress only replication. The value ranges from either 1 to 64. The default value is 64.

**Note**
The value of maximum members for ingress only replication for a single FAP Jericho system ranges from 1 to 4096.

**Guidelines**
This command is supported on Sand platforms only.

**Related Commands**
- `platform sand multicast replication default`
- `show platform sand mcast capacity`

**Example**
- This command configures maximum members for ingress only replication as 63.

```
switch(config)#platform sand multicast replication ingress maximum 63
```

policy-map type tapagg

The `policy-map type tapagg` command places the switch in policy-map (tapagg) configuration mode, which is a group change mode that modifies a tapagg policy map. A tapagg policy map is a data structure that consists of class maps and match statements that filter a specific data stream. Packets in that data stream are either managed as specified by a tap aggregation group or modified to add a VLAN identity tag. Policy maps manage traffic when applied to an Ethernet or port channel interface.

The `exit` command saves pending policy map changes to `running-config` and returns the switch to global configuration mode. Policy map changes are also saved by entering a different configuration mode. The `abort` command discards pending changes, returning the switch to global configuration mode.

The `no policy-map type tapagg` and `default policy-map type tapagg` commands delete the specified policy map by removing the corresponding `policy-map type tapagg` command and the associated policy map statements.

Command Mode
Global Configuration

Command Syntax

```
policy-map type tapagg map_name
no policy-map type tapagg map_name
default policy-map type tapagg map_name
```

Parameters
- `map_name` Name of policy map.

Commands Available in Policy-Map configuration mode
- `class (policy-map (tapagg))`
- `match (policy-map (tapagg))`

Related Commands
- `class-map type tapaggs`
- `service-policy type tapagg (interface mode)`

Example
- This command creates the tapagg policy map named `t-policy_1` and places the switch in policy-map configuration mode.

```
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#
```
**resequence (class-map (tapagg))**

The `resequence` command assigns sequence numbers to access control lists (ACLs) in the configuration mode `tapagg` class map. Sequence numbers denote an ACL’s priority within the class map. Command parameters specify the number of the first ACL and the numeric interval between consecutive ACLs.

Maximum rule sequence number is 4294967295.

**Command Mode**

Class-map (tagagg) configuration
accessed through `class-map type tapagg` command

**Command Syntax**

```
resequence [start_num [inc_num]]
```

**Parameters**

- `start_num` sequence number assigned to the first rule. Default is 10.
- `inc_num` numeric interval between consecutive rules. Default is 10.

**Example**

These commands display a policy map whose entities were entered with default sequence numbers, then renumber the contents.

```
switch(config-pmap-t-policy_1)#show active
policy-map type tapagg t-policy_1
  10 match ip ospf any any set aggregation-group t-group
  20 class fred
    set aggregation-group t-group id-tag 444
  30 class t-class_2
    set id-tag 500
  40 class t-class_3
    set id-tag 600
  50 class t-class_4
    set id-tag 700
switch(config-pmap-t-policy_1)#resequence 100 20
switch(config-pmap-t-policy_1)#exit
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#show active
policy-map type tapagg t-policy_1
  100 match ip ospf any any set aggregation-group t-group
  120 class fred
    set aggregation-group t-group id-tag 444
  140 class t-class_2
    set id-tag 500
  160 class t-class_3
    set id-tag 600
  180 class t-class_4
    set id-tag 700
switch(config-pmap-t-policy_1)#
```
**resequence (policy-map (tapagg))**

The `resequence` command assigns sequence numbers to classes and rules in the configuration mode tapagg policy map. Sequence numbers denote a class or rule’s priority within the policy map. Command parameters specify the number of the first policy map entity and the numeric interval between consecutive entities.

Maximum rule sequence number is 4294967295.

**Command Mode**

Policy-Map (tapagg) Configuration

accessed through `class (policy-map (tapagg))` command

**Command Syntax**

```
resequence [start_num [inc_num]]
```

**Parameters**

- `start_num` sequence number assigned to the first rule. Default is 10.
- `inc_num` numeric interval between consecutive rules. Default is 10.

**Example**

- These commands display a policy map whose entities were entered with default sequence numbers, then use the `resequence` command to renumber the contents.

```
switch(config-pmap-t-policy_1)#show active
policy-map type tapagg t-policy_1
  10 match ip ospf any any set aggregation-group t-group
  20 class fred
    set aggregation-group t-group id-tag 444
  30 class t-class_2
    set id-tag 500
  40 class t-class_3
    set id-tag 600
  50 class t-class_4
    set id-tag 700
switch(config-pmap-t-policy_1)#resequence 100 20
switch(config-pmap-t-policy_1)#exit
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#show active
policy-map type tapagg t-policy_1
  100 match ip ospf any any set aggregation-group t-group
  120 class fred
    set aggregation-group t-group id-tag 444
  140 class t-class_2
    set id-tag 500
  160 class t-class_3
    set id-tag 600
  180 class t-class_4
    set id-tag 700
```

switch(config-pmap-t-policy_1)#
service-policy type tapagg (Interface mode)

The `service-policy type tapagg` command applies a specified tapagg policy map to the configuration mode interface. A policy map is a data structure that identifies data traffic through class maps and match rules, then specifies the method of replicating the traffic. This command is active only when tap aggregation mode is enabled on the switch.

The `no service-policy type tapagg` and `service-policy type tapagg` commands remove the policy map assignment from the configuration mode interface by deleting the corresponding `service-policy tapagg` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

**Command Syntax**

```
service-policy type tapagg TRAFFIC_DIRECTION policymap_name
no service-policy tapagg TRAFFIC_DIRECTION
default service-policy tapagg TRAFFIC_DIRECTION
```

**Parameters**

- `TRAFFIC_DIRECTION` IP address or peer group name. Values include:
  - `input` Policy map applies to inbound packet streams.
  - `map_name` Name of policy map.

**Guidelines**

A policy map that is attached to a port channel interface takes precedence for member interfaces of the port channel over their individual Ethernet interface configuration. Members that are removed from a port channel revert to the policy map implementation specified by its Ethernet interface configuration.

**Related Commands**

- `class (policy-map (tapagg))` places the switch in policy-map configuration mode to create a policy map.

**Example**

- These commands apply the `t-policy_1` policy map to Ethernet interface 17.

  ```
  switch(config)#interface ethernet 17
  switch(config-if-Et17)#service-policy type tapagg input t-policy_1
  switch(config-if-Et17)#
  ```
set (policy-map-class (tapagg))

The `set` command specifies the data replication method for traffic filtered by the associated class map in the configuration mode policy map. The `set` command specifies one of these replication actions for filtered data packets.

- specifies an aggregation group
- specifies a VLAN identity tag for replicated packets.
- specifies an aggregation group and a VLAN identity tag.

The `no set` and `default set` commands remove the specified set command data action from the configuration mode class by deleting the associated `set` command from `running-config`.

**Command Mode**

Policy-map-class (tapagg) configuration

accessed through `class (policy-map (tapagg))` command

**Command Syntax**

```
set SET_VALUE
no set SET_VALUE
default set SET_VALUE
```

**Parameters**

- `SET_VALUE` specifies the replication method for filtered packets.
  - aggregation group `agg_group` Replication specified by aggregation group.
  - id-tag `<1 to 4094>` Packet is identity tagged with specified VLAN number.
  - aggregation group `agg_group id-tag `<1 to 4094>` Assigns agg group and identity tag.

**Related Commands**

- `class (policy-map (tapagg))` places the switch in policy-map (tapagg) configuration mode.
- `class (policy-map (tapagg))` assigns a class to the policy-map configuration mode.
- `match (policy-map (tapagg))` assigns a rule to the policy-map configuration mode.

**Guidelines**

When a class is not associated with a `set` command, the filtered traffic is managed as specified by the tap port's default aggregation group.

**Example**

These commands place the switch in policy-map-class to add the `t-class_1` class map to the `t-policy_1` policy map. Packets filtered by the class map are identity tagged with VLAN 444 and replicated as specified through the `t-group` aggregation group.

```
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#class t-class_1
switch(config-pmap-c-t-policy_1-t-class_1)#set aggregation-group t-group id-tag 444
switch(config-pmap-c-t-policy_1-t-class_1)#exit
switch(config-pmap-t-policy_1)#exit
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#show active
policy-map type tapagg t-policy_1
  10 class t-class_1
    set aggregation-group t-group id-tag 444
switch(config-pmap-t-policy_1)#
```
show interfaces tap

The show interfaces tap command displays tap port configuration information for the specified interfaces.

Command Mode

EXEC

Command Syntax

show interfaces [INTERFACE] tap [INFO_LEVEL]

Parameters

- **INTERFACE** Interface type and numbers. Options include:
  - <no parameter> all interfaces.
  - ethernet e_range Ethernet interface range specified by e_range.
  - management m_range Management interface range specified by m_range.
  - port-channel p_range Port-Channel Interface range specified by p_range.

Valid e_range, m_range, and p_range formats include number, number range, or comma-delimited list of numbers and ranges.

- **INFO_LEVEL** amount of information that is displayed. Options include:
  - <no parameter> command displays table that summarizes tap data.
  - detail command tap data summary table and a list of ACLS applied to tap ports.

Example

- This command displays tap port configuration information for ethernet interfaces 36 through 40.

  switch>show interface ethernet 31-35 tap
  Port  Configured  Status  Native  Id  Truncation  Default
  Mode       Vlan        Vlan              Group
  -------------------------------
  Et31      tap    tap    301    31    0    tag_1
  Et32      tap    tap    1    132    0    tag_1
  Et33      tap    tap    303    233    0    tag_1
  Et34      tap    tap    1    334    0    tag_3
  Et35      tap    tap    1    345    0    tag_3
  switch>

- This command displays detailed tap port configuration information for ethernet interface 31.

  switch>show interface ethernet 31 tap detail
  Port  Configured  Status  Native  Id  Truncation  Default
  Mode       Vlan        Vlan              Group
  -------------------------------
  Et31      tap    tap    301    31    0    tag_1
  Port      ACLs Applied
  --------------------------------------------
  switch>
show interfaces tool

The show interfaces tool command displays tool port configuration information for the specified interfaces.

Command Mode
EXEC

Command Syntax
show interfaces [INTERFACE] tool

Parameters
- INTERFACE Interface type and numbers. Options include:
  - <no parameter> all interfaces.
  - ethernet e_range Ethernet interface range specified by e_range.
  - management m_range Management interface range specified by m_range.
  - port-channel p_range Port-Channel Interface range specified by p_range.

Valid e_range, m_range, and p_range formats include number, number range, or comma-delimited list of numbers and ranges.

Example
This command displays tool port configuration information for ethernet interfaces 36 through 40.

```
switch>show interface ethernet 36-40 tool
Port  Configured Status Allowed Id   Timestamp Mode         Vlans Tag  Mode
-----------------------------------------------------------------------
Et36  tool    tool    tool           201-205   Off  None
Et37  tool    tool    tool           201-205   Off  None
Et38  tool    tool    tool           201-205   Off  None
Et39  access  errdisabled All             Off  None
Et40  tool    tool    All             On   None
switch>
```
show platform fm6000 keyframe

The show platform fm6000 keyframe command displays configured information for the specified keyframes. Keyframes are routable IP packets that the switch inserts into a data stream to provide contextual information that correlate timestamps inserted into data packets with the absolute UTC time and the switch’s complete ASIC time counter.

Command Mode
Privileged EXEC

Command Syntax
show platform fm6000 keyframe [KEYFRAME_ID]

Parameters

- **KEYFRAME_ID**  Specifies keyframes that the command displays. Options include:
  - <no parameter>  Command displays all configured keyframes.
  - *kf_name*  Name of single keyframe that the command displays.

Examples

- This command displays information concerning the three keyframes that the switch sends.

```
switch#show platform fm6000 keyframe

Keyframe key-2
-------------
Egress Interface(s): Ethernet17, Ethernet18, Ethernet19, Ethernet20, Ethernet21
Source IP: 10.22.30.144
Destination IP: 10.21.1.14
Destination MAC: 00:09:00:09:00:09
Device ID: 0
Rate: 5 packet(s) per second

Keyframe key-1
-------------
Egress Interface(s): Ethernet11, Ethernet12, Ethernet13, Ethernet14, Ethernet15
Source IP: 10.22.30.146
Destination IP: 10.21.1.4
Destination MAC: 00:10:4e:21:9f:11
Device ID: 0
Rate: 2 packet(s) per second

switch#
```
show platform sand mcast capacity

The **show platform sand mcast capacity** command displays the usage details of hardware resources in the Sand platform.

**Command Mode**

EXEC

**Command Syntax**

`show platform sand mcast capacity [threshold threshold_value]`

**Parameters**

- **threshold threshold_value**  displays the list of resources whose usage percentage is greater than or equal to the specified threshold value. The value range is from 0 to 100. The default value is 100.

**Guidelines**

This command is supported on Sand platforms only.

**Examples**

- This command displays the usage details of hardware resources in the Sand platform.

```bash
switch#show platform sand mcast capacity

Multicast Resources

```
show tap aggregation groups

The `show tap aggregation groups` command displays the tap and tool port members of the specified tap aggregation groups.

Command Mode
EXEC

Command Syntax
`show tap aggregation groups [INFO_LEVEL] [GROUP_NAMES]`

Parameters
- **INFO_LEVEL**  Port information that is displayed.
  - `<no parameter>`  command displays active tap and tool ports.
  - `detail`  command displays all configured tap and tool ports, including inactive ports.
- **GROUP_NAMES**  Tap aggregation groups. Options include:
  - `<no parameter>`  All tap aggregation groups
  - `group_list`  Tap aggregation group list.

Valid `group_list` format is a space-delimited list of one or more tap aggregation group names.

Example
- This command displays the contents of all configured tap aggregation groups.

```
switch> show tap aggregation groups
Group Name                Tool Members
---------------------------------------------------------
analyze2                  Po101, Po102
analyze3                  Po101, Po103

Group Name                Tap Members
---------------------------------------------------------
analyze2                  Et41, Et42
analyze3                  Et43
switch>
```
**switchport tap allowed vlan**

The `switchport tap allowed vlan` command creates or modifies the list of VLANs for which the configuration mode interface, in tap mode, handles tagged traffic. By default, interfaces handle tagged traffic for all VLANs. Command settings persist in `running-config` without taking effect when the switch is not in tap aggregation mode or the interface is not in tap aggregation mode.

The `no switchport tap allowed vlan` and `default switchport tap allowed vlan` commands restore the tap mode default allowed VLAN setting of `all` by removing the corresponding `switchport tap allowed vlan` statement from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port Channel Configuration

**Command Syntax**

```
switchport tap allowed vlan EDIT_ACTION
no switchport tap allowed vlan
default switchport tap allowed vlan
```

**Parameters**

- `EDIT_ACTION` modifications to the VLAN list.
  - `v_range` Creates VLAN list from `v_range`.
  - `add v_range` Adds specified VLANs to current list.
  - `all` VLAN list contains all VLANs.
  - `except v_range` VLAN list contains all VLANs except those specified.
  - `none` VLAN list is empty (no VLANs).
  - `remove v_range` Removes specified VLANs from current list.

Valid `v_range` formats include number (1 to 4094), range, or comma-delimited list of numbers and ranges.

**Example**

- These commands create the tap mode allowed VLAN list of 26-30 for Ethernet interface 20.
  ```
  switch(config)#interface ethernet 20
  switch(config-if-Et20)#switchport tap allowed vlan 26-30
  switch(config-if-Et20)#show active
  interface Ethernet20
      switchport mode tap
      switchport tap allowed vlan 26-30
  switch(config-if-Et20)#
  ```
switchport tap default group

The `switchport tap default group` command assigns the configuration mode interface as a tap port member to the specified tool group. Tap aggregation groups associate a set of tap ports with a set of tool ports. Both tap ports and tool ports may belong to multiple tap aggregation groups.

The `no switchport tap default group` and `default switchport tap default group` commands remove the configuration mode interface from the tap aggregation group to which it is assigned by deleting the corresponding statement from `running-config`.

Command Mode
- Interface-Ethernet Configuration
- Interface-Port Channel Configuration

Command Syntax
```
switchport tap default group group_name
no switchport tap default group
default switchport tap default group
```

Parameters
- `group_name` tool group name.

Restriction
This command is only available on FM6000 platform switches.

Example
- These commands assign port channel 101 to tap aggregation group `tag-1`.
```
switch(config)#interface port-channel 101
switch(config-if-Po101)#switchport tap default group tag-1
switch(config-if-Po101)#show interfaces port-channel 101 tap
Port     Configured     Status         Native   Id   Truncation Default Group
Mode                          Vlan     Vlan            Group
-----------------------------------------------------------------------
Po101     access         notconnect     1        1    0          tag-1
switch(config)#
```
switchport tap identity

The `switchport tap identity` command associates a VLAN number to the configuration mode tap interface. Tool ports that are configured to encapsulate packets with an dot1q-style tag enter the number specified by this command as the s-VLAN (tier 1) for packets received from this tap port. The default identity value is 1.

The `no switchport tap identity` and `default switchport tap identity` commands restore VLAN 1 as the configuration mode port’s identity vlan by removing the corresponding switchport tap identity command from `running-config`.

Command Mode

- Interface-Ethernet Configuration
- Interface-Port Channel Configuration

Command Syntax

```
switchport tap identity port_id
no switchport tap identity
default switchport tap identity
```

Parameters

- `port_id` port’s identity VLAN. Value ranges from 1 to 4094. Default is 1.

Related Commands

- `switchport tool identity` configures a tool port to encapsulate packets received from tap ports.

Restriction

This command is available on FM6000 platform switches.

Example

- These commands 171 as the identity value for ethernet interface 17.

```
switch(config)#interface ethernet 17
switch(config-if-Et17)#switchport tap identity 171
switch(config-if-Et17)#show active
interface Ethernet17
  switchport tap identity 171
Switch(config-if-Et17)#show interfaces ethernet 17 tap
<table>
<thead>
<tr>
<th>Port</th>
<th>Configured</th>
<th>Status</th>
<th>Native Id</th>
<th>Truncation</th>
<th>Default Group</th>
</tr>
</thead>
<tbody>
<tr>
<td>Et17</td>
<td>access</td>
<td>connected</td>
<td>1</td>
<td>171</td>
<td>0</td>
</tr>
</tbody>
</table>
switch(config-if-Et17)#
```
switchport tap native vlan

The **switchport tap native vlan** command specifies the tap mode native VLAN for the configuration mode interface. Interfaces in tap mode associate untagged frames with the native VLAN. The default native VLAN for all interfaces is VLAN 1. Command settings persist in `running-config` without taking effect when the switch is not in tap aggregation mode or the interface is not in tap mode.

The **no switchport tap native vlan** and **default switchport tap native vlan** commands restore VLAN 1 as the tap mode native VLAN to the configuration mode interface by removing the corresponding switchport tap native vlan command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port Channel Configuration

**Command Syntax**

```
switchport tap native vlan v_num
no switchport tap native vlan
default switchport tap native vlan
```

**Parameters**
- **v_num**  tap mode native VLAN ID. Value ranges from 1 to 4094. Default is 1.

**Restriction**
This command is available on FM6000 platform switches.

**Example**
- These commands assign VLAN 25 as the tap mode native VLAN for Ethernet interface 7.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#switchport tap native vlan 25
switch(config-if-Et7)#show interface ethernet 7 tap
```

```
Port      Configured     Status         Native   Id   Truncation Default
Mode                          Vlan     Vlan            Group
-----------------------------------------------------------------------
Et7       tool           connected      25       1    0          ---
```

switch(config-if-Et7)#
switchport tap truncation

The `switchport tap truncation` command configures the configuration mode interface, as a tap port, to truncate inbound packets to the specified packet size. This command is in effect when the port is in tap mode and the switch is in tap aggregation mode. Command settings persist in `running-config` without taking effect when the switch is not in tap aggregation mode or the interface is not in tap mode. By default, tap ports do not truncate inbound packets.

The no `switchport tap truncation` and default `switchport tap truncation` commands restore the default behavior of not truncating packets received by the configuration mode interface by removing the corresponding `switchport tap truncation` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port Channel Configuration

**Command Syntax**

```
switchport tap truncation packet_size
no switchport tap truncation
default switchport tap truncation
```

**Parameters**

- `packet_size` Size of truncated packets (bytes). Value ranges from 100 to 9236. Default value of 0 corresponds to not truncating packets.

**Restriction**

This command is available on FM6000 platform switches.

**Examples**

- These commands configure ethernet interface 38 to truncate packets to 150 bytes.
  ```
  switch(config)#interface ethernet 38
  switch(config-if-Et38)#switchport tap truncation 150
  switch(config-if-Et38)#show interface ethernet 38 tap
  Port  Configured  Status         Native   Id   Truncation Default
        Mode             Vlan   Vlan            Group
  ------- ------------------- ------ ------ -------------- -------
  Et38   access         notconnect     1       1    150        ---
  switch(config-if-Et38)#
  ```

- These commands configure ethernet interface 38 to send complete packets to tool ports in its tap aggregation group.
  ```
  switch(config-if-Et38)#no switchport tap truncation
  switch(config-if-Et38)#show interface ethernet 38 tap
  Port  Configured  Status         Native   Id   Truncation Default
        Mode             Vlan   Vlan            Group
  ------- ------------------- ------ ------ -------------- -------
  Et38   access         notconnect     1       1    0          ---
  switch(config-if-Et38)#
  ```

**switchport tool allowed vlan**

The `switchport tool allowed vlan` command creates or modifies the list of VLANs for which the configuration mode interface, in tool mode, handles tagged traffic. By default, interfaces handle tagged traffic for all VLANs. Command settings persist in `running-config` without taking effect when the switch is not in tap aggregation mode or the interface is not in tap aggregation mode.

The `no switchport tool allowed vlan` and `default switchport tool allowed vlan` commands restore the tool mode default allowed VLAN setting of `all` by removing the corresponding `switchport tool allowed vlan` statement from `running-config`.

**Command Mode**

Interface-Ethernet Configuration  
Interface-Port Channel Configuration

**Command Syntax**

```
switchport tool allowed vlan EDIT_ACTION  
no switchport tool allowed vlan  
default switchport tool allowed vlan
```

**Parameters**

- `EDIT_ACTION` modifications to the VLAN list.  
  - `v_range` Creates VLAN list from `v_range`.  
  - `add v_range` Adds specified VLANs to current list.  
  - `all` VLAN list contains all VLANs.  
  - `except v_range` VLAN list contains all VLANs except those specified.  
  - `none` VLAN list is empty (no VLANs).  
  - `remove v_range` Removes specified VLANs from current list.

Valid `v_range` formats include number, range, or comma-delimited list of numbers and ranges.

**Example**

- These commands create the tool mode allowed VLAN list of 16-20 for Ethernet interface 38.

```
switch(config)#interface ethernet 38  
switch(config-if-Et38)#switchport tool allowed vlan 16-20  
switch(config-if-Et38)#show interfaces ethernet 38 tool
```

<table>
<thead>
<tr>
<th>Port</th>
<th>Configured</th>
<th>Status</th>
<th>Allowed Vlans</th>
<th>Id</th>
<th>Timestamp</th>
</tr>
</thead>
<tbody>
<tr>
<td>Et38</td>
<td>access</td>
<td>notconnect</td>
<td>16-20</td>
<td>Off</td>
<td>None</td>
</tr>
</tbody>
</table>

switch(config-if-Et38)#
**switchport tool group**

The **switchport tool group** command modifies the configuration mode interface’s tool port membership in the specified tap aggregation groups. Tool ports may belong to multiple tap aggregation groups. Command options for configuring a port’s tap aggregation group membership include:

- specify the groups to which the port belongs (supersedes the port’s previous group memberships).
- add to the list of groups to which the port is a member.
- delete from the list of groups to which the port is a member.

Tap aggregation groups associate a set of tap ports with a set of tool ports. A tap port can belong to a maximum of one default tap aggregation group.

The **no switchport tool default group** and **default switchport tool default group** commands remove the configuration mode interface from all tap aggregation groups to which it is assigned as a tool port by modifying the corresponding statements in **running-config**.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port Channel Configuration

**Command Syntax**

```plaintext
switchport tool group EDIT_ACTION
no switchport tool group
default switchport tool group
```

**Parameters**

- **EDIT_ACTION** specifies changes to the list of groups to which interface is a member.
  - **add group_list** Specifies additional groups to which port belongs.
  - **remove group_list** Removes interface as a tool port member from specified groups.
  - **set group_list** Specifies groups to which interface belongs as a tool port.

Valid **group_list** format is a space-delimited list of one or more tap aggregation group names.

**Restriction**

This command is available on FM6000 platform switches.

**Example**

- These commands associate interface ethernet 40 with three tap aggregation groups.
  
  ```plaintext
  switch(config)#interface ethernet 40
  switch(config-if-Et40)#switchport tool group set tag-1 tag-2 tag-3
  switch(config-if-Et40)#show active
  interface Ethernet40
    switchport tool group set tag-3 tag-2 tag-1
  switch(config-if-Et40)#
  ```

- These commands add tag-7 to the tap aggregation groups of which ethernet interface 40 belongs.
  
  ```plaintext
  switch(config-if-Et40)#switchport tool group add tag-7
  switch(config-if-Et40)#show active
  interface Ethernet40
    switchport tool group set tag-3 tag-7 tag-2 tag-1
  switch(config-if-Et40)#
  ```
These commands specify tag-9 as the only group of which ethernet interface 40 is a member.

```
switch(config-if-Et40)#switchport tool group set tag-9
switch(config-if-Et40)#show active
interface Ethernet40
  switchport tool group set tag-9
switch(config-if-Et40)#
```
switchport tool identity

The **switchport tool identity** command configures the configuration mode interface to include a tier 1 VLAN tag (dot1q) to packets it receives from tap ports. The VLAN number on the dot1q tag is specified by the **switchport tap identity** command configured for the tap port that supplies the packets. By default, tool ports do not encapsulate packets with the tier 1 VLAN tag.

The **no switchport tool identity** and **default switchport tool identity** commands restore the default VLAN handling method for the configuration mode interface by removing the corresponding **switchport tool identity** statement from **running-config**.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port Channel Configuration

**Command Syntax**
- `switchport tool identity dot1q`
- `no switchport tool identity`
- `default switchport tool identity`

**Restriction**
This command is available on FM6000 platform switches.

**Example**
- These commands configure ethernet interface 40 to include a dot1q tag on egress packets.

```bash
switch(config)#interface ethernet 40
switch(config-if-Et40)#switchport tool identity dot1q
switch(config-if-Et40)#show active
interface Ethernet40
    switchport mode tool
    switchport tool identity dot1q
    switchport tool group set tag-9
switch(config-if-Et40)#
```
**switchport tool truncation**

The `switchport tool truncation` command configures the configuration mode interface, as a tool port, to truncate outbound packets to 160 bytes. This command is in effect when the port is in tool mode and the switch is in tap aggregation mode. Command settings persist in `running-config` without taking effect when the switch is not in tap aggregation mode or the interface is not in tool mode. By default, tool ports do not truncate outbound packets.

The `no switchport tool truncation` and `default switchport tool truncation` commands restore the default behavior (not truncating packets that exit the configuration mode interface) by removing the corresponding `switchport tool truncation` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port Channel Configuration

**Command Syntax**
- `switchport tool truncation packet_size`
- `no switchport tool truncation`
- `default switchport tool truncation`

**Parameters**
- `packet_size` Size of truncated packets in bytes. The only permitted value is 160.

**Examples**
- These commands configure ethernet interface 38, as a tool port, to truncate packets on egress to 160 bytes.
  ```
  switch(config)#interface ethernet 38
  switch(config-if-Et38)#switchport mode tool
  switch(config-if-Et38)#switchport tool truncation 160
  switch(config-if-Et38)#
  ```

- These commands configure ethernet interface 38 to send complete packets.
  ```
  switch(config-if-Et38)#no switchport tool truncation
  switch(config-if-Et38)#
  ```
tap aggregation

The tap aggregation command places the switch in tap-agg configuration mode. The switch’s tap aggregation mode is enabled or disabled by the mode command in tap-agg configuration mode.

When tap aggregation mode is enabled, normal switching and routing operations are disabled. A port’s switchport status depends on the switch’s tap aggregation mode and the port’s switchport mode:

- tap aggregation mode enabled: tap and tool ports are enabled. Switching ports are errdisabled.
- tap aggregation mode disabled: tap and tool ports are errdisabled. Switching ports are enabled.

The no tap aggregation and default tap aggregation commands disable tap aggregation mode on the switch by removing all tap-agg configuration mode commands from running-config.

Tap-agg configuration mode is not a group change mode; running-config is changed immediately upon entering commands. Exiting tap-agg configuration mode does not affect running-config. The exit command returns the switch to global configuration mode.

Command Mode
   Global Configuration

Command Syntax
   tap aggregation
   no tap aggregation
   default tap aggregation

Commands Available in Tap Aggregation Configuration Mode
   • mode (tap-agg configuration mode)
   • switchport mode

Related Commands
   • switchport mode

Example
   • These commands place the switch in tap-agg configuration mode and enables tap aggregation mode.

```
switch(config)#tap aggregation
switch(config-tap-agg)#mode exclusive
switch(config-tap-agg)#show active
tap aggregation
   mode exclusive
switch(config-tap-agg)#
```

• These commands disables tap aggregation mode by removing all tap-agg configuration mode commands from running-config.

```
switch(config)#no tap aggregation
switch(config)#
```
VLANs

This chapter describes Arista’s VLAN implementation and MAC address tables.

Sections in this chapter include:

- Section 21.1: VLAN Introduction
- Section 21.2: VLAN Conceptual Overview
- Section 21.3: VLAN Configuration Procedures
- Section 21.4: VLAN Configuration Commands

21.1 VLAN Introduction

Arista switches support industry standard 802.1q VLANs. Arista EOS provides tools to manage and extend VLANs throughout the data center network.

21.2 VLAN Conceptual Overview

21.2.1 VLAN Definition

A virtual local area network (VLAN) allows a group of devices to communicate as if they were in the same network regardless of their physical location. VLANs are layer 2 structures based on the 802.1Q standard.

These parameters are associated with a VLAN:

- VLAN number (1-4094): VLAN numbers uniquely identify the VLAN within a network. VLAN 1 exists by default; all other VLANs only exist after they are configured.
- VLAN name (optional): The VLAN name is a text string that describes the VLAN.
- VLAN state (active or suspended): The state specifies the VLAN transmission status within the switch. In the suspended state, VLAN traffic is blocked on all switch ports. The default state is active.

VLANs define layer 2 broadcast domains in a layer 2 network, in which each device can receive broadcast frames sent by any other within the domain. Switches accommodating multiple broadcast domains serve as multi-port bridges where each broadcast domain is a distinct virtual bridge. Traffic does not pass directly between different VLANs within a switch or between two switches.

21.2.2 VLAN Switching

Ethernet and port channel interfaces are configured as switched ports by default. Switched ports are configurable as members of one or more VLANs. Switched ports ignore all IP-level configuration commands, including IP address assignments.
21.2.2.1 VLAN Trunking and Trunk Groups

Trunking extends multiple VLANs beyond the switch through a common interface or port channel.

A trunk group is the set of physical interfaces that comprise the trunk and the collection of VLANs whose traffic is carried on the trunk. The traffic of a VLAN that belongs to one or more trunk groups is carried only on ports that are members of trunk groups to which the VLAN belongs, i.e., VLANs configured in a trunk group are pruned of all ports that are not associated with the trunk group. See the Trunk Ports example section for further details.

Important! Be cautious when using allowed VLAN lists or trunk groups to ensure that the VLAN topology is consistent with any Layer-2 control protocol topology, or unpredictable results can occur.

VLAN traffic is carried through Ethernet or LAG ports. A port’s switchport mode defines the number of VLANs for which the port can carry traffic.

- Access ports carry traffic for one VLAN – the access VLAN. Access ports associate untagged frames with the access VLAN. Access ports drop tagged frames that are not tagged with the access VLAN.
- Trunk ports carry traffic for multiple VLANs. Tag frames specify the VLAN for which trunk ports process packets.

21.2.2.2 Q-in-Q Trunking

A Q-in-Q network is a multi-tier layer 2 VLAN network. A typical Q-in-Q network is composed of a service provider network (tier 1) where each node connects to a customer network (tier 2).

802.1ad is a networking standard that supports Q-in-Q networks by allowing multiple 802.1Q tags in an Ethernet frame.

Each interface in a customer network is assigned to a customer-VLAN (c-VLAN). Packets in c-VLANs contain 802.1q tags that switch traffic within the network. c-VLANs access the service provider VLAN (s-VLAN) through a provider switch. Customer switch ports connect to an s-VLAN through provider switch edge ports, which are configured as dot1q ports and operate as follows:

- Inbound traffic (from customer switches): adds an s-VLAN tag, then forwards packets to the provider network.
- Outbound traffic (to customer switches): removes the s-VLAN tag, then forwards packets to the customer network.

21.2.2.3 TPID (Configurable Ethertypes)

By default, VLAN-tagged packets carry a tag protocol identifier (TPID) of 0x8100. On some Arista platforms, however, the TPID of a switchport can be modified in accordance with IEEE 802.1ad to allow for the use of 802.1q TPIDs other than 0x8100. Well known and standard tags include:

- 0x8100 customer VLAN
- 0x88a8 service VLAN tag used in provider bridging
- 0x9100 service VLAN tag used in provider bridging (common, but not standardized)

Other non-standard TPID values may also be configured for interoperability with legacy equipment or non-standard systems. Values range from 0x600 (1536) through 0xFFFF (65535).

Non-default TPID values are most commonly used for provider bridging on a network-to-network interface.
21.2.3 VLAN Routing

Each VLAN can be associated with a switch virtual interface (SVI), also called a VLAN interface. The VLAN interface functions in a routed network (layer 3) with an assigned IP subnet address. Connecting different VLANs requires layer 3 networking.

21.2.3.1 VLAN Interfaces

A switched virtual interface (SVI) connects to the VLAN segment on the switch to provide layer 3 processing for packets from the VLAN. An SVI can be activated only after it is connected to a VLAN. SVIs are typically configured for a VLAN to a default gateway for a subnet to facilitate traffic routing with other subnets.

In a layer 3 network, each VLAN SVI is associated with an IP subnet, with all stations in the subnet members of the VLAN. Traffic between different VLANs is routed when IP routing is enabled.

21.2.3.2 Internal VLANs

A routed port is an Ethernet or port channel interface that functions as a layer 3 interface. Routed ports do not bridge frames nor switch VLAN traffic. Routed ports have IP addresses assigned to them and packets are routed directly to and from the port.

The switch allocates an internal VLAN for an interface when it is configured as a routed port. The internal VLAN is assigned a previously unused VLAN ID. The switch prohibits the subsequent configuration of VLANs and VLAN interfaces with IDs corresponding to allocated internal VLANs.

21.2.3.3 VLAN Mapping

VLAN mapping allows you to map packets from one VLAN to another on the switch.

21.2.3.4 VLAN Translation

VLAN translation allows you to map packets from one VLAN to another.
21.3 VLAN Configuration Procedures

These sections describe basic VLAN configuration tasks.

- Section 21.3.1: Creating and Configuring VLANs
- Section 21.3.2: Configuring VLAN Switching
- Section 21.3.3: Creating and Configuring VLAN Interfaces
- Section 21.3.4: Allocating Internal VLANs
- Section 21.3.5: VLAN Mapping
- Section 21.3.6: VLAN Translation

21.3.1 Creating and Configuring VLANs

The CLI provides two methods of creating VLANs.

- Explicitly through the `vlan` command.
- Implicitly through the `switchport access vlan` command.

The `switchport access vlan` command generates a warning message when it creates a VLAN.

To create a VLAN, use the `vlan` command in global configuration mode. Valid VLAN numbers range between 1 and 4094. To create multiple VLANs, specify a range of VLAN numbers.

To edit an existing VLAN, enter the `vlan` command with the number of the existing VLAN.

Example

- This command creates VLAN 45 and enters VLAN configuration mode for the new VLAN.

```
switch(config)#vlan 45
switch(config-vlan-45)#
```

Use the `name (VLAN configuration mode)` command to assign a name to a VLAN.

Example

- These commands assign the name Marketing to VLAN 45.

```
switch(config)#vlan 45
switch(config-vlan-45)#name Marketing
switch(config-vlan-45)#show vlan 45
```

```
VLAN Name      Status  Ports
---- -----------------------------------------
45  Marketing active Et1
```

```
switch(config-vlan-45)#
```

To change a VLAN's state, use the `state` command in VLAN configuration mode.

Examples

- These commands suspend VLAN 45. VLAN traffic is blocked on all switch ports.

```
switch(config)#vlan 45
switch(config-vlan-45)#state suspend
switch(config-vlan-45)#show vlan 45
```

```
VLAN Name      Status  Ports
---- -----------------------------------------
45  Marketing suspended
```

```
switch(config-vlan-45)#
```
These commands activate VLAN 45.

```
switch(config)#vlan 45
switch(config-vlan-45)#state active
switch(config-vlan-45)#show vlan 45

VLAN Name                             Status    Ports
---- -------------------------------- --------- ------------------------
45   Marketing                        active    Et1
```

21.3.1.1 VLAN Policy

The VLAN policy configuration command enables a switch to configure a VLAN policy when it receives a packet with unknown destination MAC address on a VLAN. The `mac address forwarding` command provides three options to configure a VLAN policy:

- Flood the Layer 2 miss packets on the VLAN
- Drop the Layer 2 miss packets
- Log the Layer 2 miss packets to the CPU (while still flooding them on the VLAN)

The default behavior is to flood the L2 miss packets on all ports of the VLAN.

VLAN policy configuration is supported on the Arista 7010, 7050 (excluding 7050SX3-48YC12, 7050CX3-32S, 7050QX2-32S, 7050SX2-72Q, 7050SX2-128, 7050TX2-128), 7060, 7250, and the 7300 series platforms.

VLAN policy is not supported in the following cases:

- STP, LLDP, and LACP packets
- VLAN policy configurations on VXLAN-enabled VLAN
- On a VLAN if IGMP snooping is configured with Multicast miss action is set to drop, then all multicast packets received on that VLAN are dropped.

Examples

- These commands create a VLAN 333 and then set the unicast policy to ‘drop’ and the multicast policy to ‘log’ for the specific VLAN 333.

  ```
  switch(config)#vlan 333
  switch(config-vlan-333)#mac address forwarding unicast miss action drop
  switch(config-vlan-333)#
  switch(config-vlan-333)#mac address forwarding multicast miss action log
  ```

- These commands display the VLAN policy that was defined when VLAN 333 is created.

  ```
  switch(config)# show vlan 333 mac address forwarding
  
  VLAN  UcMissAction  McMissAction
  ----  ------------  ------------
  333   flood         flood
  ```
VLAN Configuration Procedures

These commands display the VLAN policy type that was defined when VLAN 333 is configured with the ‘drop’ unicast policy and the ‘log’ multicast policy.

```
switch(config)#show vlan 333 mac address forwarding
VLAN  UcMissAction  McMissAction
----  ------------  ------------
333  drop          log
```

```
switch(config)#show vlan mac address forwarding
VLAN  UcMissAction  McMissAction
----  ------------  ------------
1    flood         flood
333  drop          log
```

21.3.2 Configuring VLAN Switching

The following describe the configuration of VLAN ports.

21.3.2.1 Access Ports

Access ports carry traffic for one VLAN, as designated by a `switchport access vlan` command. Access ports associate untagged frames with the access VLAN. Tagged frames received by the interface are dropped unless they are tagged with the access VLAN.

To configure an interface group as an access port, use the `switchport mode` command.

**Example**

- These commands configure Ethernet interface 1 as an access port.

```
switch(config)#interface ethernet 1
switch(config-if-Et1)#switchport mode access
switch(config-if-Et1)#
```

To specify the port’s access VLAN, use the `switchport access vlan` command.

**Examples**

- These commands configure VLAN 15 as the access VLAN for Ethernet interface 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#switchport access vlan 15
switch(config-if-Et5)#
```

- These commands configure Ethernet interface 1 through 3 as access ports that process untagged frames as VLAN 5 traffic.

```
switch(config)#interface Ethernet 1-3
switch(config-if-Et1-3)#switchport mode access
switch(config-if-Et1-3)#switchport access vlan 5
switch(config-if-Et1-3)#show interfaces ethernet 1-3 vlans
Port       Untagged Tagged
Et1        None     23,25
Et2        18       -
Et3        None     14
switch(config-if-Et1-3)#
```
21.3.2.2 Trunk Ports

Trunk ports carry traffic for multiple VLANs. Messages use tagged frames to specify the VLAN for which trunk ports process traffic.

- The **vlan trunk list** specifies the VLANs for which the port handles tagged frames. The port drops any packets tagged for VLANs not in the VLAN list.
- The **native vlan** is the VLAN where the port switches untagged frames.

To configure an interface group as a trunk port, use the `switchport mode` command.

**Example**

- These commands configure Ethernet interface 8 as a trunk port.

```
switch(config)#interface ethernet 8
switch(config-if-Et8)#switchport mode trunk
switch(config-if-Et8)#
```

By default all VLANs are permitted on a port configured with `switchport mode trunk`. To limit the port’s VLAN trunk list, use the `switchport trunk allowed vlan` command. Only VLANs in the allowed list will be permitted.

**Examples**

- These commands configure VLAN 15, 20, 21, 22, 40, and 75 as the explicitly permitted VLAN trunk list for Ethernet interface 12-16.

```
switch(config)#interface ethernet 12-16
switch(config-if-Et12-16)#switchport trunk allowed vlan 15,20-22,40,75
switch(config-if-Et12-16)#
```

- These commands explicitly permit VLAN 100 through 120 to the VLAN trunk list for Ethernet interface 14.

```
switch(config)#interface ethernet 14
switch(config-if-Et14)#switchport trunk allowed vlan add 100-120
switch(config-if-Et14)#
```

To specify the port’s native VLAN, use the `switchport trunk native vlan` command.

**Example**

- These commands configure VLAN 12 as the native VLAN trunk for Ethernet interface 10.

```
switch(config)#interface ethernet 10
switch(config-if-Et10)#switchport trunk native vlan 12
switch(config-if-Et10)#
```

By default, ports send native VLAN traffic with untagged frames. The `switchport trunk native vlan` command can also configure the port to send native VLAN traffic with tag frames.

**Examples**

- These commands configure Ethernet interface 10 to send native VLAN traffic as tagged.

```
switch(config)#interface ethernet 10
switch(config-if-Et10)#switchport trunk native vlan tag
switch(config-if-Et10)#
```
- These commands configure Ethernet interface 12 as a trunk with VLAN 15 as the native VLAN. The port's trunk list includes all VLANs except 201-300.

```
switch(config)#interface ethernet 12
switch(config-if-Et12)#switchport mode trunk
switch(config-if-Et12)#switchport trunk native vlan 15
switch(config-if-Et12)#switchport trunk allowed vlan except 201-300
switch(config-if-Et12)#
```

**Example**

- Assume that all ports on the switch are configured with switchport mode trunk similar to ethernet 1 and 2 shown below:

```plaintext
! interface ethernet 1
  switchport mode trunk
!
interface ethernet 2
  switchport mode trunk
!
```

Further assume that VLAN 30 is **not** configured as part of a trunk group

```
switch#show vlan
VLAN Name                  Status    Ports
----- ------------------------ --------- -------------------------------
 1   default                  active    Et1, Et2
30   vlan30                  active    Et1, Et2
```

Now configure VLAN 30 as part of trunk group 30:

```
switch(config)#vlan 30
switch(config-vlan-30)#trunk group 30
```

This updates the VLAN membership for VLAN 30.

```
switch#show vlan
VLAN Name                  Status    Ports
----- ------------------------ --------- -------------------------------
 1   default                  active    Et1, Et2
30   vlan30                  active
```

**Note:** Vlan 30 is no longer on Et1, Et2 i.e. it has been 'pruned' due to the trunk group command in the vlan configuration.

To permit VLAN 30 on Et1 you need to associate the interface with the trunk group as follows:

```
switch(config-if-Et1)#switchport trunk group 30
```

Now we see Et1 included in the vlan 30 list

```
switch#show vlan
VLAN Name                  Status    Ports
----- ------------------------ --------- -------------------------------
 1   default                  active    Et1, Et2
30   vlan30                  active    Et1
```
Chapter 21: VLANs

VLAN Configuration Procedures

The trunk group command is not additive to the allowed vlan command

```plaintext
interface ethernet 1
  switchport mode trunk
  switchport trunk allowed vlan 10
  switchport trunk group trunk30

Vlan 30 will not be permitted on the interface as it is not listed in the allowed vlan list.
```

21.3.2.3 Dot1q Tunnel Ports

Dot1q (802.1Q) is a tunneling protocol that encapsulates traffic from multiple customer (c-tag) VLANs in an additional single outer service provider (s-tag) VLAN for transit across a larger network structure that includes traffic from all customers. Tunneling eliminates the service provider requirement that every VLAN be configured from multiple customers, avoiding overlapping address space issues.

Tunneling preserves the inner VLANs through the tunneled network; these inner VLANs are ignored by intermediate devices that make forwarding decisions based only on the outermost VLAN tag (S-Tag).

A dot1q-tunnel port sits at the edge of the tunneled network. Unlike regular access ports, a dot1q-tunnel port does not drop traffic that arrives with 802.1Q tags in place; it ignores existing 802.1Q information and associates arriving traffic (with or without 802.1Q headers) with a new tunnel VLAN ID.

Packets arriving at a tunnel port are encapsulated with an additional 802.1Q tag that can be trunked between multiple devices like any traditional VLAN. When exiting a dot1-tunnel port, the S-Tag is removed to revert the customer traffic to its original tagged or untagged state.

To configure an interface group as a dot1q tunnel port, use the `switchport mode` command.

**Example**

- These commands configure Ethernet interface 12 as a dot1q tunnel port.

  ```plaintext
  switch(config)#interface ethernet 12
  switch(config-if-Et12)#switchport mode dot1q-tunnel
  switch(config-if-Et12)#
  ```

  To specify the dot1q-tunnel port's access VLAN, use the `switchport access vlan` command. The port then handles all inbound traffic as untagged VLAN traffic.

  **Example**

  - These commands configure VLAN 60 as the access VLAN for Ethernet interface 12.

    ```plaintext
    switch(config)#interface ethernet 12
    switch(config-if-Et12)#switchport access vlan 60
    switch(config-if-Et12)#
    ```

21.3.2.4 TPID Configuration

The default tag protocol identifier (TPID, also called dot1q ethertype) on all switch ports is 0x8100. To configure a different TPID on a port, use the `switchport dot1q ethertype` command. This feature is available only on 7280E and 7500E platforms.

**Important!** If dot1q tunneling is enabled on the interface, a TPID configured on the interface becomes irrelevant.
Example

- In this provider bridging example, Ethernet interface 1 is the user network interface and Ethernet interface 2 is the network-to-network interface. These commands configure dot1q tunneling on Ethernet interface 1 and set the TPID of Ethernet interface 2 to 0x9100.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# switchport mode dot1q-tunnel
switch(config-if-Et1)# interface ethernet 2
switch(config-if-Et2)# switchport mode trunk
switch(config-if-Et2)# switchport dot1q ethertype 0x9100
```

In the above configuration, packets from Et1 to Et2 will undergo dot1q-tunneling (stacking of an additional dot1q tag), with an outer TPID of 0x9100 at egress, while packets with outer TPID 0x9100 going from Et2 to Et1 will have the outer tag removed at egress.

21.3.2.5 Layer 2 802.1Q Encapsulation

Layer 2 traffic encapsulation is enabled on the configuration mode interface for a specified VLAN through `l2-protocol encapsulation dot1q vlan`.

Example

- These commands enable traffic encapsulation for VLAN 200 traffic passing through Ethernet interface 2/5.

```
switch(config)# interface ethernet 5/2
switch(config-if-Et5/2)# l2-protocol encapsulation dot1q vlan 200
```

21.3.2.6 Port VLAN Scaling on DCS-7160

Port VLAN scaling allows the user to configure a subset of ports in the scale mode. The `switchport vlan forwarding` command forwards packets between the ports belonging to VLAN in the interface configuration mode. Port-VLAN table is used for storing the configuration on a per-port/VLAN combination. The scaling configuration is applicable on a per-port basis and supports a maximum of 128 ports.

Note

The configuration is applicable to trunk ports only.

Example

- This command enables VLAN scaling on a port with an Ethernet interface 2.

```
switch# config terminal
switch(config)# interface Ethernet 2
switch(config-if-Et2)# switchport vlan forwarding accept all
```

- This command disables VLAN scaling on a port.

```
switch# config
switch(config)# interface Ethernet 2
switch(config-if-Et2)# no switchport vlan forwarding accept all
```

21.3.3 Creating and Configuring VLAN Interfaces

The `interface vlan` command places the switch in VLAN-interface configuration mode for modifying an SVI. An SVI provides a management address point and Layer 3 processing for packets from all VLAN ports.
Example

- This command enters VLAN-interface configuration mode for VLAN 12. The command also creates VLAN 12 interface if it was not previously created.

  switch#config t
  switch(config)#interface vlan 12
  switch(config-if-Vl12)#

21.3.4 Allocating Internal VLANs

The vlan internal order command specifies the VLANs that the switch allocates as internal VLANs when configuring routed ports and the order of their allocation. By default, the switch allocates VLANs in ascending order. The default allocation range is between VLAN 1006 and VLAN 4094.

The no switchport command converts an Ethernet or port channel interface into a routed port, disabling layer 2 switching for the interface.

Examples

- This command configures the switch to allocate internal VLANs in ascending order starting with 1006.

  switch(config)#vlan internal order ascending
  switch(config)#

- This command configures the switch to allocate internal VLANs in descending order starting with 4094.

  switch(config)#vlan internal order descending
  switch(config)#

- This command configures the switch to allocate internal VLANs in descending order from 4094 through 4000.

  switch(config)#vlan internal order descending range 4000 4094
  switch(config)#

21.3.5 VLAN Mapping

VLAN mapping allows you to map packets from one VLAN to another. The switchport vlan mapping command maps an arbitrary incoming VLAN tag to a particular bridging VLAN on the switch. VLAN mapping is configured on packets having a dot1q header (tagged frames) only. The mapping is applied on a trunk port and multiple mappings can exist under each trunk port.

To use VLAN mapping on a switched port, the port must be configured as a trunk port using the switchport mode command.

Platform Compatibility

- DCS-7500E
- DCS-7280E

Examples

- These commands map ingress packets on an Ethernet interface 3.

  switch(config)#interface Ethernet 3
  switch(config-if-Et3)#switchport vlan mapping in 11 200

- These commands map egress packets on an Ethernet interface 5.

  switch(config)#interface Ethernet 5
  switch(config-if-Et5)#switchport vlan mapping out 300 12
• These commands map multiple packets under a trunk port on an Ethernet interface 3.

  switch(config)#interface Ethernet 3
  switch(config-if-Et3)#switchport mode trunk
  switch(config-if-Et3)#switchport vlan mapping 10 100
  switch(config-if-Et3)#switchport vlan mapping in 11 200
  switch(config-if-Et3)#switchport vlan mapping out 300 12

21.3.5.1 Dual Tag VLAN Mapping

Dual tag VLAN mapping allows mapping between outer or inner VID of double tagged packet and a bridging VLAN. At ingress, a pair of VLAN IDs are mapped to a bridging VLAN and at egress, the bridging VLAN is mapped to a pair of VLAN IDs.

Examples

• These commands map a pair of VLAN IDs on an Ethernet interface 3/1.

  switch(config)#interface Ethernet 3/1
  switch(config-if-Et3/1)#switchport vlan mapping 1000 inner 100 200

21.3.6 VLAN Translation

VLAN translation allows you to map packets from one VLAN to another. This can be carried out only on packets having a dot1q header (tagged frames). The translation rewrites the VID field (VLAN ID) in dot1q headers on packets passing through a switched port without changing any other fields.

VLAN translation also supports the ability to translate packets with a dot1q header to the internal VLAN for a routed port. The VLAN in the incoming packets is mapped to the internal VLAN of the routed port and packets egressing the routed port are encapsulated with a dot1q header for the specified VLAN. For egress packets, no priority information is added to the dot1q header and the priority from the incoming encapsulation will be retained.

When configuring the VLAN translation mode, consider the following:

• VLAN translation is only supported for tagged packets.
• BPDUs from STP, LLDP and other protocols are not affected by this mapping.
• VLAN translation is not applicable for access ports.
• Untagged packets entering the switch on the trunk native VLAN are not mapped.
• TPID and VLAN priority does not get re-written during the translation.

21.3.6.1 Per-port VLAN Translation on Switched Ports

The switchport vlan translation command allows translation of the VLAN tag of traffic entering or exiting a switched port.

To use VLAN translation on a switched port, the port must be configured as a trunk port using the switchport mode command.

Example

• This command configures Ethernet interface 5 as a trunk port.

  switch(config)#interface ethernet 5
  switch(config-if-Et5)#switchport mode trunk
  switch(config-if-Et5)#
By default, the translation is bidirectional: packets ingressing an interface through VLAN A are internally mapped to VLAN B; VLAN B packets egressing the same interface are mapped to VLAN A.

**Examples**

- These commands map Ethernet interface 5 traffic with dot1q tag 50 to bridging VLAN 60.
  
  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)# switchport vlan translation 50 60
  switch(config-if-Et5)#
  ```

- These commands provides multiple 1:1 VLAN mappings under an interface.
  
  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)# switchport vlan translation 50 60
  switch(config-if-Et5)# switchport vlan translation 61 71
  switch(config-if-Et5)# switchport vlan translation 62 72
  switch(config-if-Et5)#
  ```

- These commands translate only incoming packets.
  
  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)# switchport vlan translation in 50 60
  switch(config-if-Et5)#
  ```

- These commands translate only egress packets.
  
  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)# switchport vlan translation out 60 50
  switch(config-if-Et5)#
  ```

### 21.3.6.2 Per-port VLAN Translation on Routed Ports

On routed ports, the `encapsulation dot1q vlan` command (permitted only on routed ports) configures the VLAN on the interface to act as the native VLAN. This command will map packets ingressing with the specified VLAN ID to the internal VLAN ID of the routed port. All traffic egressing out of the routed port will be tagged with the VLAN ID specified in the command.

**Examples**

- These commands translate between VLAN 50 and the internal VLAN for Ethernet interface 5 (a routed port).
  
  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)# no switchport
  switch(config-if-Et5)# encapsulation dot1q vlan 50
  switch(config-if-Et5)#
  ```
21.4 VLAN Configuration Commands

Global VLAN Configuration Commands
- interface vlan
- vlan
- vlan internal order

VLAN Configuration Mode Commands
- mac address forwarding
- name (VLAN configuration mode)
- state
- trunk group

Layer 2 Interface (Ethernet and Port Channel) Configuration Commands
- switchport access vlan
- switchport mode
- switchport trunk allowed vlan
- switchport trunk group
- switchport trunk native vlan
- switchport vlan forwarding
- switchport vlan mapping
- switchport vlan translation

VLAN Interface Configuration Mode Commands
- autostate
- encapsulation dot1q vlan
- l2-protocol encapsulation dot1q vlan
- name (VLAN configuration mode)
- pvlan mapping

Show Commands
- show dot1q-tunnel
- show interfaces switchport
- show interfaces switchport backup-link
- show interfaces switchport vlan mapping
- show interfaces trunk
- show interfaces vlans
- show pvlan mapping interfaces
- show vlan
- show vlan brief count
- show vlan dynamic
- show vlan internal allocation policy
- show vlan internal usage
- show vlan trunk group
**autostate**

When autostate is *enabled*, the VLAN interface will be up when:

- the corresponding VLAN exists and is in the active state.
- one or more layer 2 ports in the VLAN are up and in spanning-tree forwarding state.
- the VLAN interface exists and is not in a *shutdown* state.

Autostate is *enabled* by default. When autostate is *disabled*, the VLAN interface is forced to be active.

- The **no autostate** command disables autostate on the configuration mode interface. The **no autostate** command is stored to *running-config*.
- The **autostate** command enables the autostate function on the configuration mode VLAN SVI by removing the corresponding **no autostate** statement from *running-config*.
- The **default autostate** command restores the autostate default state of *enabled* by removing the corresponding **no autostate** statement from *running-config*.

**Command Mode**

Interface-VLAN Configuration

**Command Syntax**

```
autostate
no autostate
default autostate
```

**Guidelines**

Autostate should be disabled on SVIs configured as an MLAG local interface.

**Examples**

- These commands disable autostate on VLAN 100.
  ```
  switch(config)#interface vlan 100
  switch(config-if-Vl100)#no autostate
  switch(config-if-Vl100)#
  ```

- These commands enable autostate on VLAN 100.
  ```
  switch(config)#interface vlan 100
  switch(config-if-Vl100)#autostate
  switch(config-if-Vl100)#
  ```
encapsulation dot1q vlan

Routed Port VLAN Translation

In the configuration mode for an Ethernet or port channel interface, the `encapsulation dot1q vlan` translates packets with a dot1q header to the internal VLAN for a routed port. The VLAN in the incoming packets is mapped to the internal VLAN of the routed port, and packets egressing the routed port are encapsulated with a dot1q header for the specified VLAN. For egress packets, no priority information is added to the dot1q header and the priority from the incoming encapsulation will be retained.

Subinterface VLAN Assignment

When used in the configuration mode for an Ethernet or port channel subinterface, however, the `encapsulation dot1q vlan` command assigns a dot1q tag to the subinterface. Traffic ingressing on the parent interface with that dot1q tag will then be sent to the configured subinterface. See Subinterfaces and Subinterface Configuration for details.

The `no encapsulation dot1q vlan` and `default encapsulation dot1q vlan` commands restore the default VLAN to the configuration mode interface by removing the corresponding `encapsulation dot1q vlan` command from `running-config`.

Command Mode

- Interface-Ethernet Configuration
- Interface-port-channel Configuration
- Subinterface-Ethernet Configuration
- Subinterface-port-channel Configuration

Command Syntax

```
encapsulation dot1q vlan vlan_id
no encapsulation dot1q vlan
default encapsulation dot1q vlan
```

Parameters

- `vlan_id` For VLAN translation, the ID of the external VLAN to be translated; for subinterface configuration, the VLAN of the subinterface. Values range from 1 to 4094.

Example

- These commands translate between VLAN 50 and the internal VLAN for Ethernet interface 5 (a routed port).

  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)# no switchport
  switch(config-if-Et5)# encapsulation dot1q vlan 50
  switch(config-if-Et5)#
  ```

- These commands assign packets ingressing on Ethernet interface 1/1 with VLAN ID 100 to Ethernet subinterface 1/1.1.

  ```
  switch(config)#interface ethernet1/1.1
  switch(config-if-Et1/1.1)# no switchport
  switch(config-if-Et1/1.1)# encapsulation dot1q vlan 100
  switch(config-if-Et1/1.1)#
  ```
interface vlan

The `interface vlan` command places the switch in VLAN-interface configuration mode for modifying parameters of the switch virtual interface (SVI). An SVI provides Layer 3 processing for packets from all ports associated with the VLAN. There is no physical interface for the VLAN.

When entering configuration mode to modify existing SVIs, the command can specify multiple interfaces. The command creates an SVI if the specified interface does not exist prior to issuing the command. When creating an SVI, the command can only specify a single interface.

The `no interface vlan` command deletes the specified SVI interfaces from `running-config`. The `default interface vlan` commands remove all configuration statements for the specified SVI interfaces from `running-config` without deleting the interfaces.

**Command Mode**
Global Configuration

**Command Syntax**
```
interface vlan v_range
no interface vlan v_range
default interface vlan v_range
```

**Parameter**
- `v_range` VLAN interfaces (number, range, or comma-delimited list of numbers and ranges).
  
  VLAN number ranges from 1 to 4094.

**Restrictions**
Internal VLANs: A VLAN interface cannot be created or configured for internal VLAN IDs. The switch rejects any `interface vlan` command that specifies an internal VLAN ID.

**Example**
- This example creates an SVI for VLAN 12:
  ```
  switch#config
  switch(config)#interface vlan 12
  switch(config-if-Vl12)#
  ```
**l2-protocol encapsulation dot1q vlan**

The `l2-protocol encapsulation dot1q vlan` command enables Layer 2 802.1Q traffic encapsulation on the configuration mode interface for a specified VLAN. The default VLAN for all interfaces is VLAN 1.

The `no l2-protocol encapsulation dot1q vlan` and `default l2-protocol encapsulation dot1q vlan` commands disable the specified encapsulation on the configuration mode interface by removing the corresponding `l2-protocol encapsulation dot1q vlan` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-channel Configuration

**Command Syntax**

```
l2-protocol encapsulation dot1q vlan vlan_id
no l2-protocol encapsulation dot1q vlan
default l2-protocol encapsulation dot1q vlan
```

**Parameters**

- `vlan_id` the ID of the native VLAN. Values range from 1 to 4094.

**Example**

- These commands enable 802.1Q encapsulation of traffic on VLAN 200.

  ```
  switch(config)#interface ethernet 5/2
  switch(config-if-Et5/2)#l2-protocol encapsulation dot1q vlan 200
  switch(s1)(config-if-Et5/2)#show active
  interface Ethernet5/2
  l2-protocol encapsulation dot1q vlan 200
  switch(config-if-Et5/2)#
  ```
mac address forwarding

The **mac address forwarding** command enables a switch to configure a VLAN policy when it receives a packet with an unknown destination MAC address on a VLAN. The command provides three options to configure a VLAN policy:

- Flood the Layer 2 miss packets on the VLAN
- Drop the Layer 2 miss packets
- Log the Layer 2 miss packets to the CPU (while still flooding them on the VLAN)

The default state is to flood the L2 miss packets on all ports of the VLAN.

The **show vlan** command displays information about the VLAN policy that is being configured.

The **no** form and the **default** form of the command removes the previously configured VLAN policy on the VLAN.

**Command Mode**

VLAN Configuration

**Command Syntax**

```plaintext
mac address forwarding {unicast | multicast} miss action {drop | flood | log}
no mac address forwarding {unicast | multicast} miss action {drop | flood | log}
default mac address forwarding {unicast | multicast} miss action {drop | flood | log}
```

**Parameters**

- **unicast** the unicast type of transmission.
- **multicast** the multicast type of transmission.
- **drop** the selected packets are dropped.
- **flood** the selected packets are flooded in the specific VLAN.
- **log** the selected packets are sent to the CPU for logging purpose.

**Guidelines**

VLAN policy configuration is supported on the Arista 7010, 7050 (excluding 7050SX3-48YC12, 7050CX3-32S, 7050QX2-32S, 7050SX2-72Q, 7050SX2-128, 7050TX2-128), 7060, 7250, and the 7300 series platforms.

VLAN policy is not supported in the following cases:

- STP, LLDP, and LACP packets
- VLAN policy configurations on VXLAN-enabled VLAN
- On a VLAN if IGMP snooping is configured with Multicast miss action is set to drop, then all multicast packets received on that VLAN are dropped.

**Examples**

- These commands create a VLAN 333 and then set the unicast policy to ‘drop’ and the multicast policy to ‘log’ for the specific VLAN 333.

  ```plaintext
  switch(config)#vlan 333
  switch(config-vlan-333)#mac address forwarding unicast miss action drop
  switch(config-vlan-333)#
  switch(config-vlan-333)#mac address forwarding multicast miss action log
  ```
• These commands display the VLAN policy that was defined when VLAN 333 is created.
  switch(config)# show vlan 333 mac address forwarding

  VLAN  UcMissAction  McMissAction
  ----  ------------  ------------
  333   flood         flood

• These commands display the VLAN policy type that was defined when VLAN 333 is configured with the 'drop' unicast policy and the 'log' multicast policy.
  switch(config)#show vlan 333 mac address forwarding

  VLAN  UcMissAction  McMissAction
  ----  ------------  ------------
  333   drop          log

  switch(config)#show vlan mac address forwarding

  VLAN  UcMissAction  McMissAction
  ----  ------------  ------------
  1     flood         flood
  333   drop          log
name (VLAN configuration mode)

The `name` command configures the VLAN name. The name can have up to 32 characters. The default name for VLAN 1 is `default`. The default name for all other VLANs is VLANxxxx, where xxxx is the VLAN number. The default name for VLAN 55 is VLAN0055. The `show vlan` command displays the VLAN name.

The `name` command accepts all characters except the space.

The `no name` and `default name` commands restore the default name by removing the `name` command from `running-config`.

**Command Mode**

VLAN Configuration

**Command Syntax**

```
name label_text
no name
default name
```

**Parameters**

- `label_text` character string assigned to name attribute. Maximum length is 32 characters. The space character is not permitted in the name string.

**Examples**

- These commands assign corporate_100 as the name for VLAN 25, then displays the VLAN name.

  ```
  switch(config)#vlan 25
  switch(config-vlan-25)#name corporate_100
  switch(config-vlan-25)#show vlan 25
  VLAN  Name                             Status    Ports
  ----- -------------------------------- --------- -------------------------------
  25    corporate_100                    active
  
  switch(config-vlan-25)#
  ```
**pvlan mapping**

The `pvlan mapping` command maps a switch virtual interface (SVI) available in the primary VLAN to the secondary VLAN or VLANs in the VLAN configuration mode. The `show pvlan mapping interfaces` command displays the list of mapped VLANs.

The `no pvlan mapping` and `default pvlan mapping` commands restore the default state of the private VLAN mapping.

**Command Mode**

VLAN Configuration

**Command Syntax**

- `pvlan mapping {add | remove | vlan ID}`
- `no pvlan mapping {add | remove | vlan ID}`
- `default pvlan mapping {add | remove | vlan ID}`

**Parameters**

- `add` adding VLANs to the PVLAN mapping of the current VLAN interface.
- `remove` removing VLANs from the PVLAN mapping of the current VLAN interface.
- `vlan ID` The secondary VLAN IDs of the private VLAN mapping. The IDs range from 1 to 4094.

**Related Commands**

- `show pvlan mapping interfaces`

**Examples**

- These commands assign a secondary VLAN ID of 50 to the primary VLAN.

```
switch(config)#vlan 25
switch(config-vlan-25)#pvlan mapping 50
switch(config-vlan-25)#
```
show dot1q-tunnel

The `show dot1q-tunnel` command displays the ports that are configured in dot1q-tunnel switching mode. The `switchport mode` command configures the switching mode for the configuration mode interface.

**Command Mode**
EXEC

**Command Syntax**
`show dot1q-tunnel [INTERFACE]`

**Parameters**
- **INTERFACE** Interface type and numbers. Options include:
  - `<no parameter>` Display information for all interfaces.
  - `ethernet e_range` Ethernet interface range specified by `e_range`.
  - `loopback l_range` Loopback interface specified by `l_range`.
  - `management m_range` Management interface range specified by `m_range`.
  - `port-channel p_range` Port-Channel Interface range specified by `p_range`.
  - `vlan v_range` VLAN interface range specified by `v_range`.
  - `vxlan vx_range` VXLAN interface range specified by `vx_range`.

Valid `range` formats include number, number range, or comma-delimited list of numbers and ranges.

**Example**
- This command displays the ports that are configured in dot1q-tunnel switching mode.

  switch> `show dot1q-tunnel`
  dot1q-tunnel mode LAN Port(s)
  ------------------------------
  Po4
  Po21
  Po22
  switch>
show interfaces switchport

The `show interfaces switchport` command displays the switching configuration and operational status of the specified ports.

**Command Mode**

EXEC

**Command Syntax**

```
show interfaces [INTERFACE] switchport
```

**Parameters**

- **INTERFACE** Interface type and numbers. Options include:
  - `<no parameter>` Display the switching status for all interfaces.
  - `ethernet e_range` Ethernet interface range specified by `e_range`.
  - `loopback l_range` Loopback interface specified by `l_range`.
  - `management m_range` Management interface range specified by `m_range`.
  - `port-channel p_range` Port-Channel Interface range specified by `p_range`.
  - `vlan v_range` VLAN interface range specified by `v_range`.

Valid `e_range`, `l_range`, `m_range`, `p_range`, and `v_range` formats include number, number range, or comma-delimited list of numbers and ranges.

**Example**

- This command displays the switching status for all interfaces.

```
switch(config)#show interface switchport
Default switchport mode: access

Name: Et5/1
Switchport: Enabled
Administrative Mode: static access
Operational Mode: static access
MAC Address Learning: enabled

```

switch>
show interfaces switchport backup-link

The show interfaces switchport backup-link command displays interfaces that are configured as switchport backup pairs and the operational status of each interface. For each pair, the command displays the names, roles, status, and VLAN traffic of each interface.

Command Mode
EXEC

Command Syntax
show interfaces [INTERFACE] switchport backup-link
show interfaces switchport backup-link [module {Fabric f_num | Linecard lc_num | Supervisor svr_num | Switchcard | <1-2> | <3-6>}]}

Parameters
- INTERFACE Interface type and numbers. Options include:
  - <no parameter> Display information for all interfaces.
  - ethernet e_range Ethernet interface range specified by e_range.
  - loopback l_range Loopback interface specified by l_range.
  - management m_range Management interface range specified by m_range.
  - port-channel p_range Port-Channel Interface range specified by p_range.
  - vlan v_range VLAN interface range specified by v_range.
  Valid e_range, l_range, m_range, p_range, and v_range formats include number, number range, or comma-delimited list of numbers and ranges.
- module Displays interfaces of the specified module. Options include:
  - Fabric f_num Displays interfaces of the specified fabric module. Value ranges from 1 to 6.
  - Linecard lc_num Displays interfaces of the specified linecard module. Value ranges from 3 to 6.
  - Supervisor svr_num Displays interfaces of the specified supervisor module. Accepted values are 1 and 2.
  - Switchcard Displays interfaces of switchcard modules.
  - <1-2> Displays interfaces of the specified supervisor module.
  - <3-6> Displays interfaces of the specified linecard module.

Display Values
- State Operational status of the interface. Values include:
  - Up Spanning tree mode is backup, interface status is up.
  - Down Spanning tree mode is backup, interface status is down.
  - Inactive Configuration The spanning tree mode is not backup.
  - Forwarding vlans VLANs forwarded by the interface. Depends on interface operation status and prefer option specified by the switchport backup command.
Example

- This command displays the configured switchport primary-backup pairs.

  ```
  switch>show interfaces switchport backup-link
  Switch backup interface pair: Ethernet3/17, Ethernet3/8
  Primary Interface: Ethernet3/17  State:  Inactive Configuration
  Backup Interface: Ethernet3/8    State:  Inactive Configuration
  Preemption delay: 0 milliseconds
  Mac move burst size: 0
  Mac move burst interval: 20 milliseconds
  Mac move destination: ff:ff:ff:ff:ff:ff
  ```

- This command displays interfaces of the module for linecard 4.

  ```
  switch(config)#show int switchport backup-link module Linecard 4
  Switch backup interface pair: Ethernet4/19/1, Ethernet4/19/2
  Primary Interface: Ethernet4/19/1  State:  Inactive Configuration
  Backup Interface: Ethernet4/19/2  State:  Inactive Configuration
  Preemption delay: 0 milliseconds
  Mac move burst size: 0
  Mac move burst interval: 20 milliseconds
  Mac move destination: ff:ff:ff:ff:ff:ff
  ```
**show interfaces switchport vlan mapping**

The **show interfaces switchport vlan mapping** command displays mapping information of the configured VLANs in an interface mode.

**Command Mode**
EXEC

**Command Syntax**

```
show interfaces switchport vlan mapping
```

**Example**

- This command displays mapping information of the configured VLAN IDs.

```
switch#show interfaces switchport vlan mapping
-------------------
Ethernet3
Original Vlan  New Vlan  Status  Configured  Active
------------- --------- --------- ----------- -----------
10             100       Active    In/Out      In/Out
11             200       Active    In          In
300            12        Active    Out         Out
```

- This command displays dual tag mapping information of the configured VLAN IDs.

```
switch(config)#show interfaces switchport vlan mapping
-------------------
Ethernet3/1
Direction | Direction
Outer Tag  | Inner Tag
----------- | -----------
1000       | 100         |
1001       | 101         |
1002       | 102         |
```

- This command displays dual tag mapping information of the configured VLAN IDs.

```
switch(config)#show interfaces switchport vlan mapping
-------------------
Ethernet1/1
Outer Tag  Inner Tag  VLAN ID  Status  Configured  Active
----------- ----------- --------- --------- ----------- -----------
70         -           300      Active    In/Out      In/Out
10         50          100      Active    In/Out      In/Out
20         60          100      Active    In          In
30         40          200      Active    Out         Out
```
show interfaces trunk

The `show interfaces trunk` command displays configuration and status information for interfaces configured in switchport trunk mode.

**Command Mode**

EXEC

**Command Syntax**

```
show interfaces [INTERFACE] trunk
```

**Parameters**

- `INTERFACE` Interface type and numbers. Options include:
  - `<no parameter>` Display information for all interfaces.
  - `ethernet e_range` Ethernet interface range specified by `e_range`.
  - `management m_range` Management interface range specified by `m_range`.
  - `port-channel p_range` Port-Channel Interface range specified by `p_range`.

Valid `e_range`, `m_range`, and `p_range` formats include number, number range, or comma-delimited list of numbers and ranges.

**Example**

- This command displays the trunk status for all interfaces configured in switchport trunk mode.

```plaintext
switch>show interfaces trunk
Port            Mode            Status          Native vlan
Po1             trunk           trunking        1
Po2             trunk           trunking        1

Port            Vlans allowed
Po1             1-15
Po2             16-30

Port            Vlans allowed and active in management domain
Po1             1-10
Po2             21-30

switch>
```
**show interfaces vlans**

The `show interfaces vlans` command displays a table that lists the VLANs that are carried by the specified interfaces. Interfaces that do not carry VLANs are not listed in the table. The table lists the untagged (native or access) and tagged VLANs for each interface.

**Command Mode**

EXEC

**Command Syntax**

```
show interfaces [INT_NAME] vlans
```

**Parameters**

- `INT_NAME` Interface type and number. Values include
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-Channel Interface specified by `p_num`.

**Example**

- This command displays the VLANs carried by all L2 ports.

```
switch>show interfaces vlans
   Port   Untagged Tagged
   Et9    3910     -
   Et11   3912     -
   Et16   500      -
   Et17   3908     -
   Et18   3908     -
   Po1    1        101-102,500,721,3000,
   Po2    101      -
   Po4    3902     -
   Po5    3903     -
   Po6    3992     -
   Po7    661      -
   Po8    3911     -
```
**show pvlan mapping interfaces**

The **show pvlan mapping interfaces** command displays information about the private VLAN mapping interfaces.

**Command Mode**

EXEC

**Command Syntax**

```
show pvlan mapping interfaces
```

**Example**

- This command displays information about the private VLAN mapping interfaces.

```
switch(config)#int vlan 50
switch(config-if-Vl50)#pvlan mapping 70
switch(config-if-Vl50)#show pvlan mapping interfaces
Interface     Secondary Vlans
-------------- ---------------
Vlan50         70
```
show vlan

The `show vlan` command displays the VLAN ID, name, status, and member ports of all configured VLANs. The command only displays active ports by default; by specifying `configured-ports`, the command displays all ports that are members of a configured VLAN regardless of their activity status, including Ethernet ports that are members of a port channel.

**Command Mode**

EXEC

**Command Syntax**

```
show vlan [VLAN_LIST] [PORT_ACTIVITY]
```

**Parameters**

- **VLAN_LIST** List of VLANs displayed by command. Options include:
  - `<no parameter>` all VLANs.
  - `v_range` VLANs specified by `v_range`.
  - `id v_range` VLANs specified by `v_range`.
  - `name v_name` VLANs specified by the VLAN name `v_name`.

  `v_range` formats include number, number range, or comma-delimited list of numbers and ranges.

- **PORT_ACTIVITY** Ports listed in table. Options include:
  - `<no parameter>` table displays only active ports (same as `active-configuration` option).
  - `active-configuration` table displays only active ports.
  - `configured-ports` table displays all configured ports.

**Display Values**

- **VLAN** The VLAN ID.
- **Name** The name of the VLAN.
- **Status** The status of the VLAN.
- **Ports** The ports that are members of the VLAN.

**Example**

- This command displays status and ports of VLANs 1-1000.
  ```
  switch>show vlan 1-1000
  VLAN Name-------------------------------- Status Ports
  ----- ------------------------------- --------- -------------------------------
  1 default --------------------------- active Po1
  184 fet.arca                        active Cpu, Po1, Po2
  262 mgq.net                         active Pf02, Po1
  512 sant.test                       active Cpu, Et16, Po1
  821 ipv6.net                        active Cpu, Po1, Po7
  ```

- This command displays the list of all the member interfaces under each SVI.
  ```
  switch# show vlan
  VLAN Name-------------------------------- Status Ports
  ----- ------------------------------- --------- -------------------------------
  1 default --------------------------- active
  2148 VLAN2148                        active Cpu, Et1, Et26
  2700 VLAN2700                        active Cpu, Et18
  ```
**show vlan brief count**

The **show vlan brief count** command displays the number of VLANs that are configured on the switch.

**Command Mode**

EXEC

**Command Syntax**

```
show vlan brief count
```

**Example**

- This command displays the number of VLANs on the switch.

```
switch>show vlan brief count
Number of existing VLANs : 18

switch>
```
show vlan dynamic

The `show vlan dynamic` command displays the source and quantity of dynamic VLANs on the switch. Dynamic VLANs support VM Tracer monitoring sessions.

**Command Mode**

EXEC

**Command Syntax**

`show vlan dynamic`

**Example**

- This command displays the source and quantity of dynamic VLANs on the switch.

```
switch>show vlan dynamic
Dynamic VLAN source       VLANS
vmtracer-poc              88
switch>
```
show vlan internal allocation policy

The `show vlan internal allocation policy` command displays the method the switch uses to allocate VLANs to routed ports. The `vlan internal order` command configures the allocation method.

The allocation method consists of two configurable components:

- range: the list of VLANs that are allocated to routed ports.
- direction: the direction by which VLANs are allocated (ascending or descending).

**Command Mode**

EXEC

**Command Syntax**

```
show vlan internal allocation policy
```

**Example**

- This command displays the internal allocation policy.

```
switch>show vlan internal allocation policy
Internal VLAN Allocation Policy: ascending
Internal VLAN Allocation Range: 1006-4094
switch>
```
**show vlan internal usage**

The **show vlan internal usage** command shows the VLANs that are allocated as internal VLANs for routed ports.

A routed port is an Ethernet or port channel interface that is configured as a layer 3 interface. Routed ports do not bridge frames and are not members of any VLANs. Routed ports can have IP addresses assigned to them and packets are routed directly to and from the port.

When an interface is configured as a routed port, the switch allocates an SVI with a previously unused VLAN ID. The switch prohibits the configuration of VLANs with numbers corresponding to internal VLAN interfaces allocated to a routed port. VLAN interfaces corresponding to SVIs allocated to a routed port cannot be configured by VLAN interface configuration mode commands.

**Command Mode**

EXEC

**Command Syntax**

`show vlan internal usage`

**Example**

- This command displays the VLANs that are allocated to routed ports.

```
switch>show vlan internal usage
1006 Ethernet3
1007 Ethernet4
switch>
```
show vlan trunk group

The **show vlan trunk group** command displays the trunk group membership of the specified VLANs.

**Command Mode**

EXEC

**Command Syntax**

```
show vlan [VLAN_LIST] trunk group
```

**Parameters**

- **VLAN_LIST** VLAN list. Options include:
  - `<no parameter>` all VLANs.
  - `v_range` VLANs specified by `v_range`.
  - `id v_range` VLANs specified by `v_range`.
  - `name v_name` VLANs specified by the VLAN name `v_name`.

**Display Values**

- **VLAN** VLAN ID.
- **Trunk Groups** Trunk groups associated with the listed VLANs.

**Example**

- This command displays the trunk group membership of all configured VLANs.

```
switch>show vlan trunk group
VLAN    Trunk Groups
----    --------------------------------------------------------------
 5  
10     first_group
12
40     second_group
100    third_group
101    middle_group
102
200

switch>
```
The `state` command configures the VLAN transmission state of the configuration mode VLAN.

- **Active** state: Ports forward VLAN traffic.
- **Suspend** state: Ports block VLAN traffic.

The default transmission status is `active`.

The `no state` command restores the default VLAN transmission state to the configuration mode VLAN by removing the corresponding `state` command from `running-config`.

**Command Mode**

VLAN Configuration

**Command Syntax**

```
state OPERATION_STATE
no state
default state
```

**Parameters**

- **OPERATION_STATE** VLAN transmission state. Options include:
  - **active** VLAN traffic is forwarded
  - **suspend** LAN traffic is blocked.

**Example**

- These commands suspend VLAN traffic on VLANs 100-102.
  ```
  switch(config)#vlan 100-102
  switch(config-vlan-100-102)#state suspend
  ```
switchport dot1q ethertype

The `switchport dot1q ethertype` command configures the tag protocol identifier (TPID, also known as a dot1q ethertype), of the configuration mode interface. By default, all switch ports use the standard TPID of 0x8100.

The `no switchport dot1q ethertype` and `default switchport dot1q ethertype` commands restore the TPID to 0x8100 by removing the corresponding `switchport dot1q ethertype` statement from `running-config`.

Command Mode

Interface-Ethernet Configuration

Command Syntax

```
switchport dot1q ethertype ethertype
no switchport dot1q ethertype
default switchport dot1q ethertype
```

Parameters

- `ethertype` ethertype number (TPID). Value ranges from 0x600 (1536) through 0xFFFF (65535), and can be entered in decimal or hexadecimal notation. Value is stored and displayed in hexadecimal form; the default value is 0x8100.

Example

- These commands configure 0x9100 as the TPID of Ethernet interface 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#switchport dot1q ethertype 0x9100
switch(config-if-Et5)#
```
**switchport access vlan**

The `switchport access vlan` command specifies the access VLAN of the configuration mode interface. Ethernet or port channel interfaces that are in access mode are members of only the access VLAN. Untagged frames that the interface receives are associated with the access VLAN. Frames tagged with the access VLAN are also associated with the access VLAN. The interface drops all other tagged frames that it receives. By default, VLAN 1 is the access VLAN of all Ethernet and port channel interfaces.

An interface's access mode is effective only when the interface is in access mode or dot1q-tunnel mode, as specified by the switchport mode command. Interfaces in dot1q-tunnel mode handle inbound traffic as untagged traffic and associate all traffic with the access VLAN. Interfaces configured to switchport trunk mode maintain and ignore existing switchport access commands.

The `no switchport access vlan` and `default switchport access vlan` commands restore VLAN 1 as the access VLAN of the configuration mode interface by removing the corresponding `switchport access vlan` statement from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-channel Configuration

**Command Syntax**
- `switchport access vlan v_num`
- `no switchport access vlan`
- `default switchport access vlan`

**Parameters**
- `v_num` number of access VLAN. Value ranges from 1 to 4094. Default is 1.

**Example**
- These commands assign VLAN 100 as the access VLAN to Ethernet interface 5.
  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#switchport access vlan 100
  switch(config-if-Et5)#
  ```
switchport mode

The switchport mode command specifies the switching mode of the configuration mode interface. The switch supports five switching modes: access, trunk, dot1q-tunnel, tap, and tool.

- **Access switching mode**: The interface is a member of one VLAN, called the access VLAN, as specified by the switchport access vlan command. Tagged frames received on the interface are dropped unless they are tagged with the access VLAN. Frames transmitted from the interface are always untagged.

- **Trunk switching mode**: The interface may be a member of multiple VLANs, as configured by the switchport trunk allowed vlan command. Untagged traffic is associated with the interface’s native VLAN, as configured with the switchport trunk native vlan command.

- **Dot1q-tunnel switching mode**: The interface treats all inbound packets as untagged traffic and handles them as traffic of its access VLAN, as specified by the switchport access vlan command.

- **Tap mode**: The interface operates as a tap port. Tap ports receive traffic for replication on one or more tool ports. The interface may be a member of multiple VLANs, as configured by the switchport tap allowed vlan command. Untagged traffic is associated with the interface’s native VLAN, as configured with the switchport tap native vlan command.

  Tap ports are in STP forwarding state and prohibit egress traffic. MAC learning, control plane interaction and traps for inbound traffic are disabled.

- **Tool mode**: The interface operates as a tool port. Tool ports replicate traffic received by tap ports. The interface may be a member of multiple VLANs, as configured by the switchport tool allowed vlan command. MAC learning, control plane interaction and traps for inbound traffic are disabled.

  Tool ports are in STP forwarding state and prohibit ingress traffic that uses port settings.

The status of switchport configured ports depends on the switch’s tap aggregation mode (which can be viewed by using the mode (tap-agg configuration mode) command):

- tap aggregation mode enabled: tap and tool ports are enabled. Switching ports are errdisabled.
- tap aggregation mode disabled: tap and tool ports are errdisabled. Switching ports are enabled.

The no switchport mode and default switchport mode commands return the configuration mode interface to its default setting as an access port by deleting the corresponding switchport mode command from running-config.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-channel Configuration

**Command Syntax**

```
switchport mode MODE_TYPE
no switchport mode
default switchport mode
```

**Parameters**

- **MODE_TYPE** switching mode of the configuration mode interfaces. Options include:
  - access access switching mode.
  - dot1q-tunnel dot1q-tunnel switching mode.
  - tap tap switching mode.
  - tool tool switching mode.
  - trunk trunk switching mode.
Restrictions
Dot1q-tunnel switching mode is not available on Petra platform switches.
Tap aggregation (tap and tool modes) is available on FM6000 and Arad platform switches.

Example
- These commands configure Ethernet 4 interface as a trunk port.

  switch(config)#interface ethernet 4
  switch(config-if-Et4)#switchport mode trunk
  switch(config-if-Et4)#
switchport trunk allowed vlan

The `switchport trunk allowed vlan` command creates or modifies the list of VLANs for which the configuration mode interface, in trunk mode, handles tagged traffic. By default, interfaces handle tagged traffic for all VLANs. Command settings persist in `running-config` without taking effect when the switch is in tap aggregation mode or the interface is not in trunk mode.

The `no switchport trunk allowed vlan` and `default switchport trunk allowed vlan` commands restore the trunk mode default allowed VLAN setting of `all` by removing the corresponding `switchport trunk allowed vlan` statement from `running-config`.

Command Mode
- Interface-Ethernet Configuration
- Interface-Port-channel Configuration

Command Syntax
```plaintext
switchport trunk allowed vlan EDIT_ACTION
no switchport trunk allowed vlan
default switchport trunk allowed vlan
```

Parameters
- `EDIT_ACTION` modifications to the VLAN list.
  - `v_range` Creates VLAN list from `v_range`.
  - `add v_range` Adds specified VLANs to current list.
  - `all` VLAN list contains all VLANs.
  - `except v_range` VLAN list contains all VLANs except those specified.
  - `none` VLAN list is empty (no VLANs).
  - `remove v_range` Removes specified VLANs from current list.

Valid `v_range` formats include number, range, or comma-delimited list of numbers and ranges.

Example
- These commands create the trunk mode allowed VLAN list of 6-10 for Ethernet interface 14, then verifies the VLAN list.
  ```plaintext
  switch(config)#interface ethernet 14
  switch(config-if-Et14)#switchport trunk allowed vlan 6-10
  switch(config-if-Et14)#show interfaces ethernet 14 switchport
  Name: Et14
  Switchport: Enabled
  Administrative Mode: trunk
  Operational Mode: trunk
  Access Mode VLAN: 1 (inactive)
  Trunking Native Mode VLAN: 1 (inactive)
  Administrative Native VLAN tagging: disabled
  Trunking VLANs Enabled: 6-10
  Trunk Groups:
  
  switch(config-if-Et14)#
  ```
**switchport trunk group**

The `switchport trunk group` command assigns the configuration mode interface to the specified trunk group. Trunk group ports handle traffic of the VLANs assigned to the group.

The `no switchport trunk group` and `default switchport trunk group` commands remove the configuration mode interface from the specified trunk group by deleting the corresponding statement from `running-config`. If the command does not specify a trunk group, the interface is removed from all trunk groups to which it is assigned.

---

**Note**

On platforms which support the use of port channels as mirror destinations, a port channel which is being used as a mirror destination must not be assigned to an MLAG.

---

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-channel Configuration

**Command Syntax**

```
switchport trunk group group_name
no switchport trunk group [group_name]
default switchport trunk group [group_name]
```

**Parameters**

- `group_name` trunk group name.

**Example**

- These commands assign port channel 4 to trunk group `fe-1`.
  
  ```
  switch(config)#interface port-channel 4
  switch(config-if-Po4)#switchport trunk group fe-1
  switch(config-if-Po4)#
  ```
**switchport trunk native vlan**

The `switchport trunk native vlan` command specifies the trunk mode native VLAN for the configuration mode interface. Interfaces in trunk mode associate untagged frames with the native VLAN. Trunk mode interfaces can also be configured to drop untagged frames. The default native VLAN for all interfaces is VLAN 1.

The `no switchport trunk native vlan` and `default switchport trunk native vlan` commands restore VLAN 1 as the trunk mode native VLAN to the configuration mode interface by removing the corresponding `switchport trunk native vlan` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-channel Configuration

**Command Syntax**

```
switchport trunk native vlan VLAN_ID
no switchport trunk native vlan
default switchport trunk native vlan
```

**Parameters**
- **VLAN_ID** the ID of the native VLAN. Options include
  - `v_num` VLAN number. Value ranges from 1 to 4094
  - `tag` interface drops all untagged frames.

**Example**
- These commands configure VLAN 100 as the native VLAN for port channel 21.
  
  ```
  switch(config)#interface port-channel 21
  switch(config-if-Po21)#switchport trunk native vlan 100
  switch(config-if-Po21)#
  ```
**switchport vlan forwarding**

The `switchport vlan forwarding` command forwards packets between the ports belonging to VLAN in the interface configuration mode. The scaling configuration is applicable on a per-port basis. In the 7160 platform, the hardware uses a Port-VLAN table for storing the configuration on a per port/VLAN combination and supports a maximum of 128 ports.

| Note | The configuration is applicable to trunk ports only. |

**Command Mode**

- Interface-Ethernet Configuration

**Command Syntax**

```
switchport vlan forwarding accept all
```

**Parameters**

- `accept` accepts packets for VLAN
- `all` all VLANs

**Example**

- This command forwards and accepts all the packets of VLAN of ethernet interface 2.

```
switch(config)#interface ethernet 2
switch(config-if-Et2)#switchport vlan forwarding accept all
switch(config-if-Et2)#
```
**switchport vlan mapping**

The `switchport vlan mapping` command allows you to map an arbitrary incoming VLAN tag to a particular bridging VLAN on the switch. The mapping is applied on a trunk port and multiple mappings can exist under each trunk port.

The `no switchport vlan mapping` and `default switchport vlan mapping` commands remove VLAN mapping by removing the corresponding `switchport vlan mapping` command from the `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-channel Configuration

**Command Syntax**

```
switchport vlan mapping [in | out] incoming_vlanid destination_vlanid
no switchport vlan mapping [in | out] incoming_vlanid destination_vlanid
default switchport vlan mapping [in | out] incoming_vlanid destination_vlanid
```

**Parameters**
- `in` maps the specified VLAN ID for received traffic only.
- `out` maps the specified VLAN ID for transmitted traffic only.
- `incoming_vlanid` specifies the VLAN ID to be mapped. Value ranges from 1 to 4094.
- `destination_vlanid` specifies the destination VLAN ID. Value ranges from 1 to 4094.

**Examples**
- These commands map ingress packets of VLAN tag 11 with VLAN 200 on an Ethernet interface 3.
  ```
  switch(config)#interface Ethernet 3
  switch(config-if-Et3)#switchport mode trunk
  switch(config-if-Et3)#switchport vlan mapping in 11 200
  ```
- These commands map egress packets of VLAN 300 with VLAN tag 12 on an Ethernet interface 5.
  ```
  switch(config)#interface Ethernet 5
  switch(config-if-Et5)#switchport mode trunk
  switch(config-if-Et5)#switchport vlan mapping out 300 12
  ```
- These commands map inner and outer VLAN IDs on an Ethernet interface 1.
  ```
  switch(config)#interface Ethernet 1
  switch(config-if-Et1)#switchport vlan mapping 10 inner 50 100
  switch(config-if-Et1)#switchport vlan mapping in 20 inner 60 100
  switch(config-if-Et1)#switchport vlan mapping out 200 30 inner 40
  switch(config-if-Et1)#switchport vlan mapping 70 300
  ```
**switchport vlan translation**

The **switchport vlan translation** command allows you to map packets from one VLAN to another using VLAN translation. This can be carried out only on packets having a dot1q header (tagged frames). The translation rewrites the VID field (VLAN ID) in dot1q headers on packets passing through a switched port without changing any other fields.

By default, the translation is bidirectional. The packets ingressing an interface through VLAN A are internally mapped to VLAN B; VLAN B packets egressing the same interface are mapped to VLAN A.

To use VLAN translation on a switched port, the port must be configured as a trunk port using the **switchport mode** command.

VLAN translation on routed ports is accomplished through the **encapsulation dot1q vlan** command.

The **no switchport vlan translation** and **default switchport vlan translation** commands remove VLAN mapping by removing the switchport vlan translation command from **running-config**.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-channel Configuration

**Command Syntax**

```
switchport vlan translation [DIRECTION] incoming_vlanid new_vlanid
no switchport vlan translation incoming_vlanid new_vlanid
no switchport vlan translation DIRECTION incoming_vlanid
default switchport vlan translation incoming_vlanid new_vlanid
default switchport vlan translation DIRECTION incoming_vlanid
```

**Parameters**

- **DIRECTION**  
  - <no parameter> translates the specified VLAN IDs for transmitted and received traffic.
  - in translates the specified VLAN IDs for received traffic only.
  - out translates the specified VLAN IDs for transmitted traffic only.
  - incoming_vlanid Enter the VLAN ID to be translated. Value ranges from 1 to 4094.
  - new_vlanid The new VLAN ID or bridging VLAN ID that will be used internally. Value ranges from 1 to 4094.

**Example**

- These commands translate only incoming packets, changing the VLAN ID to 2008 in the dot1q header of packets ingressing on VLAN 201.
  ```
  switch(config)# interface ethernet 5
  switch(config-if-Et5)# switchport vlan translation in 201 2008
  ```

- These commands translate multiple VLAN mappings on an Ethernet interface 5.
  ```
  switch(config)# interface ethernet 5
  switch(config-if-Et5)# switchport vlan translation 50 60
  switch(config-if-Et5)# switchport vlan translation 61 71
  switch(config-if-Et5)# switchport vlan translation 62 72
  ```
**trunk group**

The **trunk group** command assigns the configuration mode VLAN to a specified trunk group.

A trunk group is the set of physical interfaces that comprise the trunk and the collection of VLANs whose traffic is carried on the trunk. The traffic of a VLAN that belongs to one or more trunk groups is carried only on ports that are members of trunk groups to which the VLAN belongs. Switchport commands specify the physical interfaces that carry trunk group traffic.

The **no trunk group** and **default trunk group** commands remove the configuration mode VLAN from the specified trunk group by removing the corresponding **trunk group** statement from **running-config**. If a trunk group is not specified, the commands remove the configuration mode VLAN from all trunk groups.

**Command Mode**

VLAN Configuration

**Command Syntax**

```
trunk group name
no trunk group [name]
default trunk group [name]
```

**Parameters**

- **name** - a name representing the trunk group.

**Example**

- These commands assigns VLAN 49 to the trunk group **mlagpeer**.

  ```
  switch(config)#vlan 49
  switch(config-vlan-49)#trunk group mlagpeer
  switch(config-vlan-49)#
  ```
**vlan**

The *vlan* command places the switch in VLAN configuration mode to configure a set of virtual LANs. The command creates the specified VLANs if they do not exist prior to issuing the command. A VLAN that is in use as an internal VLAN may not be created or configured. The switch rejects any *vlan* command that specifies an internal VLAN ID.

The *default vlan* and *no vlan* commands removes the VLAN statements from *running-config* for the specified VLANs.

The *exit* command returns the switch to global configuration mode.

**Command Mode**

Global Configuration

**Command Syntax**

```
vlan vlan_range
no vlan vlan_range
default vlan vlan_range
```

**Parameters**

- `vlan_range`  VLAN list.
  Formats include a name, number, number range, or comma-delimited list of numbers and ranges.

**Commands Available in VLAN configuration mode**

- `name (VLAN configuration mode)`
- `state`
- `trunk group`

**Guidelines**

In MLAG configurations, VLANs operate as follows:

- The VLAN must be configured identically on both MLAG peer switches.
- The port-specific bridging configuration originates on the switch where the port is physically located. This configuration includes the switchport access VLAN, switchport mode (trunk or access), trunk-allowed VLANs, the trunk native VLAN, and the switchport trunk groups.

**Example**

- This command creates VLAN 49 and enters VLAN configuration mode for the new VLAN:

  ```
  switch(config)#vlan 49
  switch(config-vlan-49)#
  ```
**vlan internal order**

The `vlan internal order` command specifies the range that the switch can allocate as internal VLANs when configuring routed ports and the order of their allocation. By default, the switch allocates VLANs in ascending order from VLAN 1006 to VLAN 4094.

The `no vlan internal order` and `default vlan internal order` commands revert the policy to its default.

**Command Mode**

Global Configuration

**Command Syntax**

```
vlan internal order DIRECTION [RANGE_VLAN]
no vlan internal order
default vlan internal order
```

**Parameters**

- **DIRECTION** VLAN allocation number direction. Options include:
  - `ascending` allocates internal VLANs from lower VLAN bound to upper VLAN bound.
  - `descending` allocates internal VLAN from upper VLAN bound to lower VLAN bound.
- **RANGE_VLAN** allocation range. Options include:
  - `<no parameter>` 1006 (lower bound) to 4094 (upper bound).
  - `range lower upper` specifies lower bound (lower) and upper bound (upper).

**Examples**

- This command configures the switch to allocate internal VLANs from 3000 through 3999.
  ```
  switch(config)#vlan internal order ascending range 3000 3999
  switch(config)#
  ```

- This command configures the switch to allocate internal VLANs from 4094 through 1006.
  ```
  switch(config)#vlan internal order descending
  switch(config)#
  ```

- This command configures the switch to allocate internal VLANs from 4094 down through 4000.
  ```
  switch(config)#vlan internal order descending range 4000 4094
  switch(config)#
  ```

- This command reverts the allocation policy to its default (**ascending**, between **1006** and **4094**).
  ```
  switch(config)#no vlan internal order
  switch(config)#
  ```
This chapter describes Arista’s VXLAN implementation. Sections in this chapter include:

- Section 22.1: VXLAN Introduction
- Section 22.2: VXLAN Description
- Section 22.3: VXLAN Configuration
- Section 22.4: VXLAN Command Descriptions

### 22.1 VXLAN Introduction

Virtual Extensible LAN (VXLAN) is a networking technology that encapsulates MAC-based Layer 2 Ethernet frames within Layer 3 UDP packets to aggregate and tunnel multiple layer 2 networks across a Layer 3 infrastructure. VXLAN scales up to 16 million logical networks and supports layer 2 adjacency across IP networks. Multicast transmission architecture is used for broadcast, multicast, and unknown unicast traffic.

For a list of VXLAN feature support in a specific EOS release, consult the appropriate release notes here: [https://www.arista.com/en/support/software-download](https://www.arista.com/en/support/software-download).

For a list of VXLAN feature support by platform in the latest EOS release, see [https://www.arista.com/en/support/product-documentation/supported-features](https://www.arista.com/en/support/product-documentation/supported-features)

**Note**

VXLAN and NAT cannot co-exist.
22.2 VXLAN Description

These sections describe VXLAN architecture, the data objects that comprise a VXLAN network, and process of bridging packets through a VXLAN network.

- Section 22.2.1: VXLAN Architecture
- Section 22.2.2: VXLAN Processes
- Section 22.2.3: Multicast and Broadcast over VXLAN
- Section 22.2.4: VXLAN Gateway
- Section 22.2.5: VXLAN and MLAG
- Section 22.2.6: Data Structures

22.2.1 VXLAN Architecture

The VXLAN architecture extends an L2 network by connecting VLANs from multiple hosts through UDP tunnels called VXLAN segments. VXLAN segments are identified by a 24-bit virtual network identifier (VNI). Within a host, each VLAN whose network is extended to other hosts is associated with a VNI. An extended L2 network comprises the devices attached to VLANs from all hosts that are on VLANs that are associated with the same VNI.

Figure 22-1 displays the data objects that comprise a VXLAN implementation on a local host.

Figure 22-1: VXLAN Architecture

- **VXLAN Tunnel End Point (VTEP):** a host with at least one VXLAN Tunnel Interface (VTI).
- **VXLAN Tunnel Interface (VTI):** a switchport linked to a UDP socket that is shared with VLANs on various hosts. Packets bridged from a VLAN to the VTI are sent out the UDP socket with a VXLAN header. Packets arriving on the VTI through the UDP socket are demuxed to VLANs for bridging.
- **Virtual Network Identifier (VNI):** a 24-bit number that distinguishes between the VLANs carried on a VTI. It facilitates the multiplexing of several VLANs over a single VTI.

VNIs can be expressed in digital or dotted decimal formats. VNI values range from 1 to 16777215 or from 0.0.1 to 255.255.255.
The network in Figure 22-1 has the following assignments:

- VTEP IP address of 10.10.1.1
- UDP port of 4789
- One VTI that supports three VXLAN segments (UDP tunnels): VNI 200, VNI 2000, and VNI 20000
- Five VLANs, of which three VLANs can communicate with remote devices over Layer 2.

### 22.2.2 VXLAN Processes

When a packet enters a VLAN from a member (ingress) port, the VLAN learns the source address by adding an entry to the MAC address table that associates the source to the ingress-port. The VLAN then searches the table for destination address. If the MAC address table lists the address, the packet is sent out the corresponding port. If the MAC address table does not lists the address, the packet is flooded to all ports except the ingress port.

VXLANs extend VLANs through the addition of a VXLAN address table that correlates remote MAC addresses to their port and resident host IP address. Packets that are destined to a remote device are sent to the VXLAN tunnel interface (VTI), which is the switchport that is linked to the UDP socket. The packet is encapsulated with a VXLAN header which includes the VNI associated with the VLAN and the IP mapping of the destination host. The packet is sent through a UDP socket to the destination VTEP IP. The VTI on the remote host extracts the original packet and bridges it to the VLAN associated with the VNI on the remote host.

UDP port 4789 is recognized as the VXLAN socket and listed as the destination port on the UDP packets. The UDP source port field is filled with a hash of the inner header to facilitate load balancing.

Figure 22-2 displays a configuration that includes three VTEPs. The VXLAN defines three inter-host L2 networks. The VLANs that comprise the networks include:

- VNI 200: VTEP 10.20.2.2: VLAN 1200 and VTEP 10.30.3.3: VLAN 200
- VNI 2000: VTEP 10.10.1.1: VLAN 300, VTEP 10.20.2.2: VLAN 1400, and VTEP 10.30.3.3: VLAN 300
- VNI 20000: VTEP 10.10.1.1: VLAN 200, and VTEP 10.20.2.2: VLAN 1600
VXLAN Routing
VXLAN routing is enabled by creating a VLAN interface on the VXLAN-enabled VLAN and assigning an IP address to the VLAN interface. The IP address serves as VXLAN gateway for devices that are accessible from the VXLAN-enabled VLAN.

22.2.3 Multicast and Broadcast over VXLAN
These sections describe multicast and broadcast over VXLANs. Multicast packet flooding describes broadcast and multicast transmission by associating a multicast group to a VTI through a configuration command. Head-end Replication (HER) optimizes flooding of inter VTEP broadcast, unknown unicast and broadcast (BUM) traffic by using hardware and flood lists to perform replication on the supported platform.

22.2.3.1 Multicast Packet Flooding
Multicast packet flooding is supported with VXLAN bridging without MLAG. A VTI is associated with a multicast group through a configuration command.

VXLAN and Broadcast
When a VLAN receives or sends a broadcast packet the VTI is treated as a bridging domain L2 interface. The packet is sent from this interface on the multicast group associated with the VTI. The VTIs on remote VTEPs that receive this packet extract the original packet, which is then handled by the VLAN associated with the packet's VNI. The VLAN floods the packet, excluding the VTI. When the broadcast results in a response, the resulting packet can be unicast back to the originating VTEP because the VXLAN address table obtained the host MAC to VTEP association from the broadcast packet.

VXLAN and Multicast
A VTI is treated as an L2 interface in the VLAN for handling multicast traffic, which is mapped from the VLAN to the multicast group associated with the VTI. All VTEPs join the configured multicast group for inter-VTEP communication within a VXLAN segment; this multicast group is independent of any other multicast groups that the hosts in the VLAN join.

The IP address space for the inter-host VXLAN communication may be sourced from a different VRF than the address space of the hosts in the VLAN. The multicast group for inter-VTEP transmissions must not be used for other purposes by any device in the VXLAN segment space.

22.2.3.2 Head-end Replication
Head-end replication uses a flood list to support broadcast, unknown unicast, and multicast (BUM) traffic over VXLAN. The flood list specifies a list of remote VTEPs. The switch replicates BUM data locally for bridging across the remote VTEPs specified by the flood list. This data flooding facilitates remote MAC address learning by forwarding data with unknown MAC addresses.

Head-end replication is required for VXLAN routing and to support VXLANs over MLAG.

22.2.4 VXLAN Gateway
A VXLAN gateway is a service that exchanges VXLAN data and packets with devices connected to different network segments. VXLAN traffic must pass through a VXLAN gateway to access services on physical devices in a distant network.

A VXLAN gateway requires the following information:
- An IP address that is designated as the VXLAN interface source.
Chapter 22: VXLAN

VXLAN Description

- VLAN to VNI mapping.
- VTEP list for each VNI.
- A method for handling broadcast, unknown unicast, and multicast (BUM) packets.

Arista switches manually perform VXLAN gateway services. The switch connects to VXLAN gateways that serve other network segments. MAC address learning is performed in hardware from inbound VXLAN packets. BUM packets are supported though one of the methods specified in Section 22.2.3.

22.2.5 VXLAN and MLAG

VXLAN over MLAG provides redundancy in hardware VTEPs. VTI configuration must be identical on each MLAG peer for them to act as a single VTEP. This also prevents the remote MAC from flapping between the remote VTEPs by ensuring that the rest of the network sees a host that is connected to the MLAG interface as residing behind a single VTEP.

Differences between VXLAN bridging and routing implementations over MLAG are applicable for the DCS-7050X series platform.

- VXLAN routing recirculates a packet twice, with the first iteration performing the routing action involving an L2 header rewrite, and the second recirculation performing VXLAN encap and decap operations. Recirculation is achieved by MAC loopback on dedicated loopback interfaces.
- The configuration for VXLAN routing on an MLAG VTEP includes separate Recirc-Channel configuration on both peers. The virtual IP, virtual MAC, and virtual VARP VTEP IP addresses are identical on both peers.

The following VTI elements must be configured identically on both MLAG peers:

- VLAN-VNI mappings
- VTEP IP address of the source loopback interface
- Flood VTEP list used for head-end replication

If OSPF is also in use, configure the OSPF router ID manually to prevent the switch from using the common VTEP IP address as the router ID.

The following rules are observed by MLAG switches so that they behave as a single VXLAN VTEP:

- Only the MLAG peer that receives a packet performs VXLAN encapsulation on it.
- Packets are not VXLAN encapsulated if they are received from the peer link.
- If a packet is decapsulated and sent over the peer link, it should not be flooded to active MLAG interfaces.
- If a packet is sent over the peer link to the CPU, it is not head-end replicated to other remote VTEPs.
- If a packet's destination is the VTEP IP address, it is terminated by the MLAG peer that receives it.
Example

- These commands complete the configuration required for a VXLAN routing deployment.

```plaintext
switch(config)#interface Vxlan1
switch(config-if-Vx1)#vxlan source-interface Loopback0
switch(config-if-Vx1)#vxlan udp-port 4789
switch(config-if-Vx1)#vxlan vlan 2417 vni 8358534
switch(config-if-Vx1)#vxlan flood vtep 1.0.1.1 1.0.2.1
switch(config-if-Vx1)#interface Vlan2417
switch(config-if-Vl2417)#ip address 1.0.4.1/24
switch(config-if-Vl2417)#interface Loopback0
switch(config-if-Lo0)#ip address 1.0.1.1/32
switch(config-if-Lo0)#ip routing
switch(config)#interface Recirc-Channel627
switch(config-if-Re627)#switchport recirculation features vxlan
switch(config-if-Re627)#interface Ethernet 1
switch(config-if-Et1)#traffic-loopback source system device mac
switch(config-if-Et1)#channel-group recirculation 627
switch(config-if-Et1)#exit
switch(config)#interface Ethernet 2
switch(config-if-Et2)#traffic-loopback source system device mac
switch(config-if-Et2)#channel-group recirculation 627
```

Configuring Unconnected Ethernet Interfaces for Recirculation

On systems where bandwidth is not fully used by the front panel ports, unused bandwidth is used for recirculation.

The following example is applicable to the DCS-7050X series platform.

Example

- These commands expose unconnected Ethernet interfaces which are used for recirculation, in order to use them to replace or use along with front panel Ethernet interfaces.

```plaintext
switch(config)#service interface unconnected expose
switch(config)#interface UnconnectedEthernet 2
switch(config-if-Ue2)#traffic-loopback source system device mac
switch(config-if-Ue2)#channel-group recirculation 627
```

22.2.6 Data Structures

VXLAN implementation requires two VXLAN tables and a MAC address table accommodation.

22.2.6.1 MAC Address Table VXLAN Support

MAC address table entries correlate MAC addresses with the port upon which packets arrive. In addition to Ethernet and port channels, the port column may specify a VTI for packets that arrive on a VLAN from a remote port through the VXLAN segment.

22.2.6.2 VTEP-MAC Address Table

VTEP-MAC address table entries correlate MAC address with the IP address of the VTEP from where packets bearing the MAC address arrive. The VTI uses this table to determine the destination address for packets that are sent to remote hosts.
22.2.6.3 VNI-VLAN Map

The VNI-VLAN map displays the one-to-one correspondence between the VNIs assigned on the switch and the VLANs to which they are assigned. Each VNI can be assigned to only one VLAN; each VLAN can be assigned a maximum of one VNI. Each VNI-VLAN assignment constitutes a VXLAN segment.
22.3 VXLAN Configuration

These sections describe VXLAN configuration tasks:

- Section 22.3.1: Configuring the VTI
- Section 22.3.2: Head End Replication Configuration
- Section 22.3.3: VXLAN Routing Configuration
- Section 22.3.4: Configuring VXLAN Routing with Overlay VRFs
- Section 22.3.5: Configuring VXLAN over MLAG
- Section 22.3.6: Configuring VXLAN Control Service
- Section 22.3.7: Configuring VXLAN Multicast Decapsulation
- Section 22.3.8: VXLAN Rules Support for Mirror ACLs Configuration
- Section 22.3.9: Displaying VXLAN Configuration

22.3.1 Configuring the VTI

Configuring the VTI enables VXLAN bridging and is a requirement for VXLAN Routing. The following sections describe the steps required to enabling VXLAN bridging by bringing up the VXLAN line protocol. Section 22.3.3 describes the additional steps required to enable VXLAN routing.

Instantiating the VTI and VXLAN Configuration Mode

The `interface vxlan` command places the switch in VXLAN-interface configuration mode for modifying the specified VXLAN tunnel interface (VTI). The command also instantiates the interface if it was not previously created.

VXLAN interface configuration mode is not a group change mode; `running-config` is changed immediately after commands are executed. The `exit` command does not affect the configuration.

Example

- These commands create VXLAN tunnel interface 1, place the switch in VXLAN-interface configuration mode, and display parameters of the new VTI.

  ```
  switch(config)#interface vxlan 1
  switch(config-if-Vx1)#show active
  interface Vxlan1
    vxlan udp-port 4789
  switch(config-if-Vx1)#
  ```

Assigning an IP address to the VTEP

The `vxlan source-interface` command specifies the loopback interface from which the VTEP derives the source address (IP) that it uses when exchanging VXLAN frames. This address is used by UDP headers to specify source and destination addresses of hosts that send or receive VXLAN encapsulated packets.

There is no default source interface assignment. A valid VXLAN configuration requires the assignment of a loopback interface to the VTEP and the assignment of a valid IP address to the specified interface.
Example

- These commands configure VTI 1 to use IP address 10.25.25.3 (loopback interface 15) as the source interface in the encapsulation fields of outbound VXLAN frames.

```plaintext
switch(config)#interface loopback 15
switch(config-if-Lo15)#ip address 10.25.25.3/24
switch(config-if-Lo15)#exit
switch(config)#interface vxlan 1
switch(config-if-Vx1)#vxlan source-interface loopback 15
switch(config-if-Vx1)#exit

switch(config)#interface Vxlan1
vxlan source-interface Loopback15
vxlan udp-port 4789
switch(config-if-Vx1)#
```

Assigning a UDP Port to the VTEP

Packets bridged to the VTI from a VLAN are encapsulated with a VXLAN header, then sent through a pre-configured UDP port. Packets that arrive through this port are assumed to be VXLAN encapsulated and sent to the bridging domain of the recipient VLAN as determined by the VNI in the VXLAN header and the VNI-VLAN map.

The `vxlan udp-port` command associates a UDP port with the configuration mode VXLAN interface (VTI). By default, UDP port 4789 is associated with the VTI.

**Important!** UDP port 4789 is reserved by convention for VXLAN usage. Under most typical applications, this parameter should be set to the default value.

Example

- This command associates UDP port 5500 with VXLAN interface 1.

```plaintext
switch(config)#interface vxlan 1
switch(config-if-Vx1)#vxlan udp-port 5500
switch(config-if-Vx1)#show active
interface Vxlan1
  vxlan udp-port 5500
switch(config-if-Vx1)#
```

- This command resets the VXLAN interface 1 UDP port association of 4789.

```plaintext
switch(config-if-Vx1)#no vxlan udp-port
switch(config-if-Vx1)#show active
interface Vxlan1
  vxlan udp-port 4789
switch(config-if-Vx1)#
```

Assigning a VNI to a VLAN

When a VLAN bridges a packet to the VTI, the packet is encapsulated with a VXLAN header that includes the VNI associated with the VLAN. Packets that arrive on the VTI’s UDP socket are bridged to the VLAN that is associated with the VNI specified by the VXLAN header that encapsulates the packet.

The VTI requires a one-to-one correspondence between specified VLANs and VNI values. Commands that assign a new VNI to a previously configured VLAN replace existing VLAN assignment statements in `running-config`. Commands that attempt to assign a VNI value to a second VLAN generate a CLI error.

The `vxlan vlan vni` command associates a VLAN ID with a virtual network identifier (VNI).
Example

- These commands associate VLAN 100 to VNI 100 and VLAN 200 to VNI 10.10.200.

```
switch(config)#interface vxlan 1
switch(config-if-Vx1)#vxlan vlan 100 vni 100
switch(config-if-Vx1)#vxlan vlan 200 vni 10.10.200
switch(config-if-Vx1)#show active
interface Vxlan1
  vxlan udp-port 4789
  vxlan vlan 200 vni 658120
  vxlan vlan 100 vni 100
switch(config-if-Vx1)#vxlan vni notation dotted
switch(config-if-Vx1)#show active
interface Vxlan1
  vxlan udp-port 4789
  vxlan vlan 100 vni 0.0.100
  vxlan vlan 200 vni 10.10.200
switch(config-if-Vx1)#
```

Assigning a Multicast Group to the VTI

The VTI maps multicast traffic from its associated VLANS to a specified multicast group. Inter-VTEP multicast communications include all VTEPs that are associated with the specified multicast group, which is independent of any other multicast groups that VLAN hosts may join.

The `vxlan multicast-group` command associates a specified multicast group with the configuration mode VXLAN interface (VTI), which handles multicast and broadcast traffic as a layer 2 interface in a bridging domain.

Example

- This command associates the multicast address of 227.10.1.1 with VTI 1.

```
switch(config)#interface vxlan 1
switch(config-if-Vx1)#vxlan multicast-group 227.10.1.1
switch(config-if-Vx1)#show active
interface Vxlan1
  vxlan multicast-group 227.10.1.1
  vxlan udp-port 4789
switch(config-if-Vx1)#
```

Verifying the VXLAN Configuration

The `show interface vxlan 1` displays the configuration and connection status of the VXLAN

Example

- This command indicates that the VXLAN line protocol status is up.

```
switch(config-if-Vx1)#show interface vxlan 1
Vxlan1 is up, line protocol is up (connected)
  Hardware is Vxlan
  Source interface is Loopback15 and is active with 10.25.25.3
  Static vlan to vni mapping is
    [100, 0.0.100]  [200, 10.10.200]
  Multicast group address is 227.1.1.1
switch(config-if-Vx1)#
```
22.3.2 Head End Replication Configuration

Head-end replication is a data distribution method that supports broadcast, unknown unicast, and multicast (BUM) traffic over VXLANs by replicating BUM data locally for transmission to the set of remote VTEPs specified by a flood list. This data flooding facilitates remote MAC address learning through the forwarding of data with unknown MAC addresses.

Each `vxlan flood vtep` statement in `running-config` associates a set of VTEP addresses to an access VNI. A default flood list is also configurable that applies to all VNIs for which a flood list is not configured.

The VTEP flood list is created and modified through the `vxlan flood vtep` command. When configuring VXLAN bridging, the flood list can replace `vxlan multicast-group`.

Example

- These commands create a default VXLAN head-end replication flood list.
  ```
  switch(config)#interface vxlan 1
  switch(config-if-Vx1)#vxlan flood vtep 10.1.1.1 10.1.1.2
  switch(config-if-Vx1)#show active
  interface Vxlan1
  vxlan flood vtep 10.1.1.1 10.1.1.2
  vxlan udp-port 4789
  switch(config-if-Vx1)#
  ```

- These commands create VXLAN head-end replication flood lists for the VNIs accessed through VLANs 101 and 102.
  ```
  switch(config-if-Vx1)#vxlan vlan 101-102 flood vtep 11.1.1.1 11.1.1.2 11.1.1.3
  switch(config-if-Vx1)#show active
  interface Vxlan1
  vxlan flood vtep 10.1.1.1 10.1.1.2
  vxlan vlan 101 flood vtep 11.1.1.1 11.1.1.2 11.1.1.3
  vxlan vlan 102 flood vtep 11.1.1.1 11.1.1.2 11.1.1.3
  vxlan udp-port 4789
  switch(config-if-Vx1)#
  ```

22.3.3 VXLAN Routing Configuration

22.3.3.1 Implementing VXLAN Routing

VXLAN routing is enabled by creating a VLAN interface (SVI) on a VLAN that is associated to a VNI. In Figure 22-3, VXLAN routing is enabled on Switch A by configuring a VLAN interface with an IP address of 10.10.10.1. Packets from Devices A-1 and B-2 that have destinations other than 10.10.10.0/28 are VXLAN-bridged to the default gateway (10.10.10.1), then routed from Switch A.
These commands configure Switch A to perform VXLAN routing. The example includes OSPF routing that is used for underlay routing.

```
switch-A(config)#route-map vxlanvlan permit 10
switch-A(config-route-map-vxlanvlan)#match interface loopb5
switch-A(config-route-map-vxlanvlan)#exit
switch-A(config)#route-map vxlanvlan permit 20
switch-A(config-route-map-vxlanvlan)#match interface vlan 100
switch-A(config-route-map-vxlanvlan)#exit
switch-A(config)#router ospf 1
switch-A(config-router-ospf)#redistribute connected route-map vxlanvlan
switch-A(config-router-ospf)#exit
switch-A(config)#interface loopback 5
switch-A(config-if-Lo5)#ip address 10.25.25.3/24
switch-A(config-if-Lo5)#exit
switch-A(config)#interface vxlan 1
switch-A(config-if-Vx1)#vxlan source-interface loopback 5
switch-A(config-if-Vx1)#vxlan vlan 100 vni 10000
switch-A(config)#interface vlan 100
switch-A(config-if-Vl100)#ip address 10.10.10.28
switch-A(config-if-Vl100)#exit
```
22.3.3.2 Configuring Direct VXLAN Routing

In Figure 22-3, VXLAN routing is enabled on Switch A only; Switch B supports VXLAN bridging. Traffic from Switch B devices to the external routes must go through the core route twice: once as they are bridged to is VXLAN gateway and once when routed to its next hop device.

Direct VXLAN routing with VXLAN enabled addresses this issue by configuring each VTEP with all VLANs. This allows packets to be VXLAN-bridged to a local VTEP and routed to remote VTEPs. Indirect routing scales well but is complex to engineer efficiently, and naked routing provides the same scalability to indirect routing. Direct routing leads to the most efficient traffic flows, with the number of virtual subnets or virtual machines increasing at scale, and is thereby optimal from a data plane viewpoint.

The following sections describe conventions required to implement Direct VXLAN Routing, then presents a direct VXLAN routing implementation.

Configuring VARP addresses

For direct routing, an anycast IP address is used as the gateway address on the SVI for a VLAN on all hardware VTEPs associated with that VLAN.

Examples

- These commands configure an IP virtual-router and virtual MAC address.

  switch(config)#interface Vlan2417
  switch(config-if-Vl2417)#ip address 1.0.4.50/24
  switch(config-if-Vl2417)#ip virtual-router address 1.0.4.1
  switch(config-if-Vl2417)#ip virtual-router mac-address 00:00:11:11:22:22
  switch(config)#

- These commands configure an IP virtual address (instead of IP virtual-router address) for the VLAN SVI, and a secondary address on the loopback interface for the virtual VTEP IP. The virtual VTEP IP is the logical VTEP hosting the virtual MAC address.

  switch(config)#interface Vlan2417
  switch(config-if-Vl2417)#ip address virtual 1.0.4.1/24
  switch(config-if-Vl2417)#exit
  switch(config)#interface Loopback0
  switch(config-if-Lo0)#ip address 1.0.1.1/32
  switch(config-if-Lo0)#ip address 1.0.1.2/32 secondary
  switch(config-if-Lo0)#ip virtual-router mac-address 00:00:11:11:22:22
  switch(config)#

Virtual IP and MAC Addresses

Virtual-router IP addresses can be configured on VLAN interfaces in addition to a primary address. All VTEPs in a direct VXLAN network can be configured with the same virtual router address. This allows devices to use a common IP address as their VXLAN gateway.

The \texttt{ip address virtual} command configures a specified address as the primary IPv4 address and as a virtual IP address for the configuration mode VLAN interface. This results in the virtual MAC address \texttt{(ip virtual-router mac-address)} assignment to the VLAN interface. In large VXLAN networks, using distinct primary IP addresses for each VTEP limits the number addresses on its subnet for connected hosts. Defining a common virtual IP address for all VTEPs and using that their primary addresses conserves subnet addresses.
Example

- These commands specify a virtual router address of 00:00:00:00:00:48 for the switch and, for VLAN 100, a primary address of 10.10.10.10/28 and a virtual IP address of 10.10.10.10.

```console
switch(config)#ip virtual-router mac-address 00:00:00:00:00:48
switch(config)#interface vlan 100
switch(config-if-Vl100)#ip address virtual 10.10.10.10/28
switch(config-if-Vl100)#show active
  interface Vlan100
    ip address virtual 10.10.10.10/28
switch(config-if-Vl100)#
```

Virtual VTEP Configuration

A virtual VTEP address is specified by configuring a secondary address on the loopback interface designated as the VXLAN’s source interface. All VTEPs in the direct routing topology share the same virtual VTEP address.

You must also configure the secondary VTEP IP on the flood-list of the downstream VXLAN VTEPS as shown below.

Example

- These commands specify a primary (10.1.1.1) and virtual VTEP address (10.2.2.2).

```console
Switch1
switch(config)#interface loopback 5
switch(config-if-Lo5)#ip address 10.1.1.1/24
switch(config-if-Lo5)#ip address 10.2.2.2/24 secondary
switch(config-if-Lo5)#show active
  interface Loopback5
    ip address 10.1.1.1/24
    ip address 10.2.2.2/24 secondary
switch(config-if-Lo5)#exit
switch(config)#interface vxlan 1
switch(config-if-Vx1)#vxlan source-interface loopback 5
switch(config-if-Vx1)#show active
  interface Vxlan1
    vxlan source-interface Loopback5
    vxlan udp-port 4789
    vxlan vlan 100 vni 10000
switch(config-if-Vx1)#
```

Switch2

```console
switch(config)#interface vxlan1
switch(config-if-Vx1)#vxlan flood vtep 10.1.1.1
switch(config-if-Vx1)#vxlan flood vtep 10.2.2.2
```

Direct VXLAN Topology

Figure 22-4 displays a direct VXLAN topology, where each VTEP is configured with the same set of VNIs, VLAN interfaces, and virtual VTEP address.
Chapter 22: VXLAN

VXLAN Configuration

Figure 22-4: Direct VXLAN Routing

Example

- These commands configure VXLAN parameters for Switch-A in Figure 22-4.

```plaintext
switch-A(config)#route-map vxlanvlan permit 10
switch-A(config-route-map-vxlanvlan)#match interface loopb5
switch-A(config-route-map-vxlanvlan)#exit
switch-A(config)#route-map vxlanvlan permit 20
switch-A(config-route-map-vxlanvlan)#match interface vlan 100
switch-A(config-route-map-vxlanvlan)#exit
switch-A(config)#router ospf 1
switch-A(config-router-ospf)#redistribute connected route-map vxlanvlan
switch-A(config-router-ospf)#exit
switch-A(config)#ip virtual-router mac-address 00:00:00:00:00:48
switch-A(config)#interface loopback 5
switch-A(config-if-Lo5)#ip address 10.1.1.3/24
switch-A(config-if-Lo5)#ip address 10.1.1.10/24 secondary
switch-A(config-if-Lo5)#exit
switch-A(config)#interface vlan 1
switch-A(config-if-Vl100)#vxlan source-interface interface loopback 5
switch-A(config-if-Vl100)#vxlan vlan 100 vni 10000
switch-A(config)#interface vlan 100
switch-A(config-if-Vl100)#ip address virtual 10.10.10.10/28
switch-A(config-if-Vl100)#exit
```

22.3.3.3 Configuring VXLAN VTEP counters

The switch platforms which use this feature are:

- DCS-7050X
- DCS-7250X
- DCS-7300X

The VXLAN VTEP counters feature enables a device to count VXLAN packets received and sent by the device on a per VTEP basis. Specifically, it enables the device to count bytes and packets that are getting encapsulated and decapsulated as they are passing through.
The counters are logically split up in the two VXLAN directions. Encapsulated on the device and directed to the core, “encap” counters count packets coming from the edge. Decapsulated on the device and heading towards the edge, “decap” counters count packets coming from the core.

To be able to count VXLAN packets the device has to support VXLAN and have a VXLAN interface correctly configured.

**Examples**

- This command configures the enabling of VXLAN VTEP counters for encap.
  ```
  switch(config)#hardware counter feature vtep encap
  switch(config)#
  ```

- This command configures the disabling of VXLAN VTEP counters for encap.
  ```
  switch(config)#no hardware counter feature vtep encap
  switch(config)#
  ```

- This commands configures the enabling of VXLAN VTEP counters for decap.
  ```
  switch(config)#hardware counter feature vtep decap
  switch(config)#
  ```

- This commands configures the disab ling of VXLAN VTEP counters for decap.
  ```
  switch(config)#no hardware counter feature vtep decap
  switch(config)#
  ```

### 22.3.4 Configuring VXLAN Routing with Overlay VRFs

The switch platforms which use this feature are:

- DCS-7050X
- DCS-7250X
- DCS-7300X

VXLAN SVIs configured in non-default VRFs are supported with VXLAN routing using overlay VRFs. Overlay SVIs are configured in non-default VRFs but underlay SVIs, which provide IP connectivity between VTEPs, must remain in the default VRF. VXLAN routing is deployable by allowing users to configure separate overlay routing domains using VRFs per tenant, thereby allowing support for overlapping IP addresses in the overlay. This provides separation between overlay and underlay traffic, including simpler and cleaner protocol configuration, without using complicated route-maps to control distribution of prefixes to peers in the overlay VRFs and underlay SVIs. IPv4 based VXLAN routing is currently supported.

### 22.3.5 Configuring VXLAN over MLAG

VTI configuration must be identical on each MLAG peer for them to act as a single VTEP.

The following VTI elements must be configured identically on both MLAG peers:

**VLAN-VNI Mappings**

Configure identical VLAN to VNI mappings on both MLAG peers using the `vxlan vlan vni` command.

**Example**

- These commands associate VLAN 100 to VNI 100 and VLAN 200 to VNI 10.10.200.
  ```
  switch(config)#interface vxlan 1
  switch(config-if-Vx1)#vxlan vlan 100 vni 100
  switch(config-if-Vx1)#vxlan vlan 200 vni 10.10.200
  ```
VXLAN Configuration

Chapter 22: VXLAN

VTEP IP Address of the Source Loopback Interface

Configure the same VTEP IP address for the source loopback interface on both MLAG peers using the `vxlan source-interface` command.

**Example**

- These commands configure a primary VTEP address.

```
switch(config)#interface loopback 5
switch(config-if-Lo5)#ip address 10.1.1.1/24
switch(config-if-Lo5)#exit
switch(config)#interface vxlan 1
switch(config-if-Vx1)#vxlan source-interface loopback 5
```

Flood VTEP List

Configure the same VTEP flood list on both MLAG peers using the `vxlan flood vtep` command.

**Example**

- These commands create a default VXLAN head-end replication flood list.

```
switch(config)#interface vxlan 1
switch(config-if-Vx1)#vxlan flood vtep 10.1.1.1 10.1.1.2
```

OSPF Configuration

If OSPF is in use, configure the OSPF router ID using the `router-id (OSPFv2)` command to prevent the switch from using the common VTEP IP address as the router ID.

**Example**

- These commands assign 10.0.0.1 as the OSPFv2 router ID.

```
switch(config)#router ospf 100
switch(config-router-ospf)#router-id 10.0.0.1
```

22.3.6 Configuring VXLAN Control Service

The VXLAN Control Service (VCS) provides a mechanism by which hardware VTEPs share states between each other in order to establish VXLAN tunnels, without the need for a multicast control plane. This feature enables the use of a VCS client.

**Examples**

- These commands connect a switch to the VCS running on CVX. The server host IP address is the management IP address of the CVX controller or the IP address that CVX is listening on for client connections.

```
switch(config)#management cvx
switch(config-mgmt-cvx)#server host 172.27.6.248
switch(config-mgmt-cvx)#no shutdown
```

- These commands configure the VXLAN interface, except for the multicast group configuration, in order to learn from the controller.

```
switch(config)#interface vxlan 1
switch(config-if-Vx1)#vxlan controller-client
```

---

1139
22.3.7 Configuring VXLAN Multicast Decapsulation

The switch platforms which use this feature are:
- DCS-7050X
- DCS-7250X
- DCS-7300X

VXLAN multicast decapsulation enables VTEPs that support Head End Replication (HER). Multicast encapsulated Broadcast/Unknown/Multicast (BUM) packets terminate VTEPs from remote VTEPs that do not support HER.

Examples
- These commands enable VXLAN multicast decapsulation.
  ```
  switch(config)#interface vxlan 1
  switch(config-config-if-Vx1)#vxlan multicast-group decap 230.1.1.1
  switch(config-config-if-Vx1)#
  ```
- These commands disable VXLAN multicast decapsulation.
  ```
  switch(config)#interface vxlan 1
  switch(config-config-if-Vx1)#no vxlan multicast-group decap 230.1.1.1
  switch(config-config-if-Vx1)#
  ```

22.3.8 VXLAN Rules Support for Mirror ACLs Configuration

The switch platforms which use this feature are:
- DCS-7150S

VXLAN rules support for mirror ACLs configuration permit VXLAN deep inspection rules to be specified in the mirroring ACLs when the switch is operating in normal mode.

Examples
The following are examples of VXLAN rules specified in mirroring ACLs.
- These commands permit all VXLAN traffic (udp protocol and destination port 4789).
  ```
  switch(config)#ip access-list miracl
  switch(config-acl-miracl)#permit vxlan any any
  switch(config-acl-miracl)#
  ```
- These commands permit VXLAN traffic with vni 1001 only.
  ```
  switch(config)#ip access-list miracl
  switch(config-acl-miracl)#permit vxlan any any vni 1001 0x000000
  switch(config-acl-miracl)#
  ```
- These commands deny VXLAN traffic with vni 0x1000 through 0x100f.
  ```
  switch(config)#ip access-list miracl
  switch(config-acl-miracl)#permit vxlan any any vni 0x1000 0x100f
  switch(config-acl-miracl)#
  ```
22.3.9 Displaying VXLAN Configuration

The following section describes the commands that control the display format of VNIs and the commands that list VXLAN configuration and transmission information.

Configuring VNI Display Format

The `vxlan vni notation dotted` command configures the switch to display VNIs in dotted decimal notation. VNI values range from 1 to 16777215 in decimal notation and from 0.0.1 to 255.255.255 in dotted decimal notation.

The command affects the VNI number display in all `show` commands, including `show running-config`. Commands that include VNI as a parameter may use decimal or dotted decimal notion regardless of the setting of this command. By default, show commands display VNI number in decimal notation.

Examples

- These commands configure the switch to display vni numbers in dotted decimal notation, then displays a configuration that includes a VNI setting.

  ```
  switch(config)#vxlan vni notation dotted
  switch(config)#interface vxlan 1
  switch(config-if-Vx1)#show active
  interface Vxlan1
  vxlan udp-port 4789
  vxlan vlan 333 vni 3.4.5
  switch(config-if-Vx1)#
  ```

- These commands configure the switch to display vni numbers in decimal notation, then displays a configuration that includes a VNI setting.

  ```
  switch(config)#no vxlan vni notation dotted
  switch(config)#interface vxlan 1
  switch(config-if-Vx1)#show active
  interface Vxlan1
  vxlan udp-port 4789
  vxlan vlan 333 vni 197637
  switch(config-if-Vx1)#
  ```

MAC Address Table

The MAC address table indicates a MAC address from a device on a remote host by indicating Vx interface as the port that corresponds to the address.
Example
- This command displays a MAC address table that includes entries of devices from remote hosts by specifying Vx1 as the corresponding port.

```bash
switch> show mac address-table
Mac Address Table

<table>
<thead>
<tr>
<th>Vlan</th>
<th>Mac Address</th>
<th>Type</th>
<th>Ports</th>
<th>Moves</th>
<th>Last Move</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>0050.5682.6725</td>
<td>DYNAMIC</td>
<td>Et16</td>
<td>1</td>
<td>0:02:01 ago</td>
</tr>
<tr>
<td>1</td>
<td>0050.568e.58e9</td>
<td>DYNAMIC</td>
<td>Et23</td>
<td>2</td>
<td>0:08:53 ago</td>
</tr>
<tr>
<td>1</td>
<td>0050.56a0.474a</td>

<tr>
<td>51</td>
<td>0000.0051.0102</td>
<td>DYNAMIC</td>
<td>Vx1</td>
<td>1</td>
<td>12 days, 0:17:30 ago</td>
</tr>
<tr>
<td>61</td>
<td>0000.0061.0005</td>
<td>DYNAMIC</td>
<td>Et5</td>
<td>1</td>
<td>12 days, 1:02:44 ago</td>
</tr>
</tbody>
</table>

Total Mac Addresses for this criterion: 8
```

Multicast Mac Address Table

```bash
Vlan | Mac Address | Type | Ports |
---- | ----------- | ---- | -----|

Total Mac Addresses for this criterion: 0

switch>
```

VXLAN MAC Address Table

VXLAN MAC address table entries correlate MAC addresses accessible through remote VTEPs with the local VLAN and the IP address of the VTEP through which the addressed device is accessed. The VTI uses this table when constructing the VXLAN encapsulation to specify the destination IP address of the recipient VTEP and the VNI segment through which the device’s remote VLAN is accessed.

The `show vxlan address-table` command displays the VXLAN MAC address table.

Example
- This command displays the VXLAN address table.

```bash
switch> show vxlan address-table
Vxlan Mac Address Table

<table>
<thead>
<tr>
<th>Vlan</th>
<th>Mac Address</th>
<th>Type</th>
<th>Prt</th>
<th>Vtep</th>
<th>Moves</th>
<th>Last Move</th>
</tr>
</thead>
<tbody>
<tr>
<td>51</td>
<td>0000.0051.0101</td>
<td>DYNAMIC</td>
<td>Vx1</td>
<td>10.25.2.12</td>
<td>1</td>
<td>4 days, 0:37:14 ago</td>
</tr>
<tr>
<td>51</td>
<td>0000.0051.0102</td>
<td>DYNAMIC</td>
<td>Vx1</td>
<td>10.25.2.12</td>
<td>1</td>
<td>4 days, 0:37:14 ago</td>
</tr>
<tr>
<td>51</td>
<td>0000.0051.0103</td>
<td>DYNAMIC</td>
<td>Vx1</td>
<td>10.25.2.12</td>
<td>1</td>
<td>4 days, 0:37:14 ago</td>
</tr>
<tr>
<td>51</td>
<td>0000.0051.0104</td>
<td>DYNAMIC</td>
<td>Vx1</td>
<td>10.25.2.12</td>
<td>1</td>
<td>4 days, 0:37:14 ago</td>
</tr>
<tr>
<td>51</td>
<td>0000.0051.0105</td>
<td>DYNAMIC</td>
<td>Vx1</td>
<td>10.25.2.12</td>
<td>1</td>
<td>4 days, 0:37:14 ago</td>
</tr>
<tr>
<td>61</td>
<td>0000.0061.0103</td>
<td>DYNAMIC</td>
<td>Vx1</td>
<td>10.25.2.12</td>
<td>1</td>
<td>4 days, 0:37:14 ago</td>
</tr>
<tr>
<td>61</td>
<td>0000.0061.0104</td>
<td>DYNAMIC</td>
<td>Vx1</td>
<td>10.25.2.12</td>
<td>1</td>
<td>4 days, 0:37:14 ago</td>
</tr>
<tr>
<td>61</td>
<td>0000.0061.0105</td>
<td>DYNAMIC</td>
<td>Vx1</td>
<td>10.25.2.12</td>
<td>1</td>
<td>4 days, 0:37:14 ago</td>
</tr>
</tbody>
</table>

switch>
```
VXLAN MAC Address Table

The `show vxlan vtep` command displays information about remote VTEPs that the configured VTI has discovered and with whom it has exchanged packets.

Example

- These commands display the VTEPs that have exchanged data with the configured VTI.

  ```
  switch>show vxlan vtep
  Remote vteps for Vxlan1:
  10.52.2.12
  Total number of remote vteps: 1
  switch>
  ```

VXLAN Counters

The `clear vxlan counters` command resets the VXLAN counters. The `show vxlan counters` command displays the VXLAN counters.

Example

- This command displays the VXLAN counters

  ```
  switch>show vxlan counters software
  encap_bytes:3452284
  encap_pkts:27841
  encap_read_err:1
  encap_discard_runt:0
  encap_discard_vlan_range:0
  encap_discard_vlan_map:0
  encap_send_err:0
  encap_timeout:1427
  decap_bytes_total:382412426
  decap_pkts_total:2259858
  decap_bytes:0
  decap_pkts:0
  decap_runt:0
  decap_pkt_filter:45128
  decap_bytes_filter:5908326
  decap_discard_vxhdr:0
  decap_discard_vlan_map:2214730
  decap_timeout:0
  decap_sock_err:1
  switch>
  ```
22.4 VXLAN Command Descriptions

VXLAN Global Configuration Commands
- interface vxlan
- ip address virtual
- vxlan vni notation dotted

VXLAN Interface Configuration Commands
- vxlan flood vtep
- vxlan multicast-group
- vxlan multicast-group decap
- vxlan source-interface
- vxlan udp-port
- vxlan vlan vni

VXLAN Display and Clear Commands
- clear vxlan counters
- show service vxlan
- show vxlan address-table
- show vxlan counters
- show vxlan flood vtep
- show vxlan vtep
clear vxlan counters

The clear vxlan counters command resets the VXLAN counters.

**Command Mode**
Privileged EXEC

**Command Syntax**

```
clear vxlan counters ROUTE_TYPE
```

**Parameters**
- **ROUTE_TYPE** Specifies the type of VXLAN counter reset by the command.
  - **software** Command resets software counters.
  - **varp** Command resets virtual-ARP counters.

**Related Commands**
- **show vxlan counters** displays the VXLAN counters.

**Example**
- This command resets the VXLAN counters
  ```
  switch#clear vxlan counters software
  switch#show vxlan counters software
  encap_bytes:0
  encap_pkts:0
  encap_read_err:0
  encap_discard_runt:0
  encap_discard_vlan_range:0
  encap_discard_vlan_map:0
  encap_send_err:0
  encap_timeout:0
  decap_bytes_total:0
  decap_pkts_total:0
  decap_bytes:0
  decap_pkts:0
  decap_runt:0
  decap_pkt_filter:0
  decap_bytes_filter:0
  decap_discard_vxhdr:0
  decap_discard_vlan_map:0
  decap_timeout:0
  decap_sock_err:0
  switch#
  ```
interface vxlan

The `interface vxlan` command places the switch in VXLAN-interface configuration mode for modifying the specified VXLAN tunnel interface (VTI). The command also instantiates the interface if it was not previously created.

VXLAN interface configuration mode is not a group change mode; `running-config` is changed immediately after commands are executed. The `exit` command does not affect the configuration.

The `no interface vxlan` deletes the specified VTI interface, including its configuration statements, from `running-config`. The `default interface vxlan` command removes all configuration statements for the specified VTI from `running-config` without deleting the interfaces.

Command Mode
Global Configuration

Command Syntax

```
interface vxlan vx_range
no interface vxlan vx_range
default interface vxlan vx_range
```

Parameter
- `vx_range` VXLAN interface number. The only permitted value is 1.

Commands Available in link-flap Configuration Mode
- `vxlan multicast-group`
- `vxlan source-interface`
- `vxlan udp-port`
- `vxlan vlan vni`

Example
- These commands create VXLAN tunnel interface 1, place the switch in VXLAN-interface configuration mode, then display parameters of the new VTI.

```
switch(config)#interface vxlan 1
switch(config-if-Vx1)#show active
interface Vxlan1
  vxlan udp-port 4789
switch(config-if-Vx1)#
```

- This command exits VXLAN-interface configuration mode, placing the switch in global configuration mode.

```
switch(config-if-Vx1)#exit
switch(config)#
**ip address virtual**

The `ip address virtual` command configures a specified address as the primary IPv4 address and as a virtual IP address for the configuration mode VLAN interface. The address resolves to the virtual MAC address configured through the `ip virtual-router mac-address` command. The command includes a subnet designation that is required in primary IP address assignments.

This command is typically used in VXLAN routing configurations as an alternative to assigning a unique IP address to each VTEP. All existing IPv4 addresses must be removed from the interface before executing this command.

The `no ip address virtual` and `default ip address virtual` commands remove the IPv4 address and virtual IP assignment from the configuration mode interface by deleting the `ip address virtual` command from `running-config`.

Removing the IPv4 address assignments from an interface disables IPv4 processing on that port.

**Command Mode**

Interface-VLAN Configuration

**Command Syntax**

- `ip address virtual ipv4_subnet`
- `no ip address virtual`
- `default ip address virtual`

**Parameters**

- `ipv4_subnet` IPv4 and subnet address (CIDR or address-mask notation).

**Related Commands**

- `ip address`
- `ip address virtual`
- `ip virtual-router mac-address`

**Example**

- This command configures 10.10.10.1 as the IPv4 address and virtual address for VLAN 100.

```
switch(config-if-Vl100)#show active
interface Vlan100
    ip address virtual 10.10.10.1/28
switch(config-if-Vl100)#
```
**show service vxlan**

The `show service vxlan` command displays the status of the Vxlan Control Service (VCS) and the received (from all connected VTEPs) and advertised (to all connected VTEPs) MAC address reachability information.

**Command Mode**

EXEC

**Command Syntax**

```
show service vxlan [status | switch [SWITCH_TYPE] | vni [VNI_INFO]]
```

**Parameters**

- **SWITCH_TYPE** displayed by switch type. Options include:
  - `hostname` hostname, IP address, or ID of the switch.
  - `all` all switches.
- **VNI_INFO** displayed with VNI information. Options include:
  - `advertised` advertised MAC addresses.
  - `received` received MAC addresses.

**Example**

- This command displays the status of the VCS.

  ```
  switch(config)#show service vxlan status
  Vxlan Controller Service is : stopped
  Mac learning : Control plane
  Resync period : 300 seconds
  Resync in progress : No
  Capability : VXLAN v4 overlay routing
               VXLAN v4 overlay indirect routing
  fm319(config-if-Vx1)#show service vxlan status
  Vxlan Controller Service is : stopped
  Mac learning : Control plane
  Resync period : 300 seconds
  Resync in progress : No
  Capability : VXLAN v4 overlay routing
               VXLAN v4 overlay indirect routing
  ```

  ```
  switch(config)#
  ```
show vxlan address-table

The `show vxlan address-table` command displays the VXLAN address table. Entries are created by extracting information from packets received from remote VTEPs.

The VXLAN address table correlates MAC addresses that are accessible through remote VTEPs with the local VLAN and the IP address of the VTP through which the addressed device is accessible. The VTI uses this table when constructing the VXLAN encapsulation fields to specify the destination IP address of the recipient VTEP and the VNI segment through which the device’s remote VLAN is accessed.

**Command Mode**
EXEC

**Command Syntax**
```
show vxlan address-table [ENTRY_TYPE][MAC_ADDR][VLANS][REMOTE_VTEP]
```

**Parameters**
- `ENTRY_TYPE` command filters display by entry type. Options include:
  - `<no parameter>` all table entries.
  - `configured` static entries; includes unconfigured VLAN entries.
  - `dynamic` entries learned through packet receipts.
  - `static` entries entered by CLI commands.
  - `unicast` entries with unicast MAC address.
- `MAC_ADDR` command uses MAC address to filter displayed entries.
  - `<no parameter>` all MAC addresses table entries.
  - `address mac_address` displays entries with specified address (dotted hex notation – H.H.H).
- `VLANS` command filters display by VLAN.
  - `<no parameter>` all VLANS.
  - `vlan v_num` VLAN specified by `v_num`.
- `REMOTE_VTEP` Filters entries by IP address of the remote VTEPs. Options include:
  - `<no parameter>` all items.
  - `vtep ipaddr_1 [ipaddr_2...ipaddr_n]` Identifies VTEPs by their IP address.
Example

- This command displays the VXLAN address table.

```
switch> show vxlan address-table
Vxlan Mac Address Table

switch>
```
show vxlan counters

The **show vxlan counters** command displays the VXLAN counters.

**Command Mode**

EXEC

**Command Syntax**

```
show vxlan counters ROUTE_TYPE
```

**Parameters**

- **ROUTE_TYPE**  
  Specifies the type of VXLAN counter displayed by the command.
  - **software** Command displays software routers.
  - **varp** Command displays virtual-ARP counters.
  - **vtep** Command displays counters for VTEPs which are identified by their IP address. An optional keyword allows the user to view a single direction of the counters:
    - **encap** “encap” counters count packets coming from the edge, encapsulated on the device and directed to the core.
    - **decap** “decap” counters count packets coming from the core, decapsulated on the device and heading towards the edge.

**Related Commands**

- **clear vxlan counters** resets the VXLAN counters.

**Example**

- This command displays the VXLAN counters for software routers.

```
switch>show vxlan counters software
encap_bytes:3452284
encap_pkts:27841
encap_read_err:1
encap_discard_runt:0
encap_discard_vlan_range:0
encap_discard_vlan_map:0

switch>
show vxlan flood vtep

The show vxlan flood vtep command displays the flood list that the switch is using to perform head-end replication. Head-end replication is a data distribution method that supports broadcast, unknown unicast, and multicast (BUM) traffic over VXLANs by replicating BUM data locally for transmission to the set of remote VTEPs that a flood list specifies. The command displays the VLAN ID that references the configured VNIs (vxlan vlan vni).

The flood list is determined by the vxlan flood vtep command.

Command Mode
EXEC

Command Syntax
show vxlan flood vtep [VLANS]

Parameters
- **VLANS** command filters display by the reference VLAN.
  - <no parameter> all VLANs.
  - vlan v_range VLANs specified by v_range.

Valid v_range formats include number, range, or comma-delimited list of numbers and ranges.

Guidelines
The command displays flood list contents only when the VLAN line protocol status is up.

Related Commands
- vxlan flood vtep configures the flood list.

Example
Would you like to see an example of the command? If yes, I can provide one. If not, I can skip it.
**show vxlan vtep**

The `show vxlan vtep` command displays information about remote VTEPs that the configured VTI has discovered and with whom it has exchanged packets.

**Command Mode**

EXEC

**Command Syntax**

`show vxlan vtep`

**Example**

- These commands display the VTEPs that have exchanged data with the configured VTI.

```
switch>show vxlan vtep
Remote vteps for Vxlan1:
10.52.2.12
Total number of remote vteps: 1
switch>
```
The **vxlan flood vtep** command supports VXLAN head-end replication by creating or modifying a list that specifies remote VTEPs to which the switch bridges replicated traffic. Head-end replication is a data distribution method that supports broadcast, unknown unicast, and multicast (BUM) traffic over VXLANs by replicating BUM data locally for transmission to the set of remote VTEPs that a flood list specifies. This data flooding facilitates remote MAC address learning through the forwarding of data with unknown MACs.

Each **vxlan flood vtep** statement in **running-config** associates a set of VTEP addresses to an access VNI. A default flood list is also configurable that applies to all VNIs for which a flood list is not configured. The **vxlan flood vtep** command is available in the following formats to create or modify corresponding **running-config** statements:

- **vxlan flood vtep** creates a statement for a specified VNI and replaces existing statements for that VNI.
- **vxlan flood vtep add** modifies an existing flood statement by adding the specified VTEPs. This statement creates a list if it references a VNI that has no flood statement.
- **vxlan flood vtep remove** modifies an existing flood statement by deleting the specified VTEPs. This statement has no effect if it references a VNI that has no flood statement.

The **vxlan flood vtep** command specifies a VNI by referencing its associated VLAN ID (**vxlan vlan vni**). The command provides these options for specifying the reference VLANs:

- **a single VLAN**: creates or modifies a single statement referenced by the command.
- **a range of VLANs**: creates or modifies all statements referenced by the VLAN range.
- **no VLAN**: creates or modifies the default list

The **no vxlan flood vtep** and **default vxlan flood vtep** commands remove the specified flood list by deleting the corresponding **vxlan flood vtep** statements from **running-config**. Commands that specify a VLAN range remove all corresponding statements.

**Command Mode**

Interface-VXLAN Configuration

**Command Syntax**

```
vxlan [ACCESS_VNI] flood vtep [MODIFY] VTEP_1 [VTEP_2] ... [VTEP_N]
no vxlan [ACCESS_VNI] flood vtep
default vxlan [ACCESS_VNI] flood vtep
```

**Parameters**

- **ACCESS_VNI** VLAN ID associated to the flood list’s target VNI. Value ranges from 1 to 4094.
  - **<no parameter >** default list.
  - **vlan vlan_range** List of VLANs. (Number, range, comma-delimited list of numbers and ranges). Numbers range from 1 to 4094.
- **MODIFY** Statement modification method. Options include:
  - **<no parameter >** creates new list for specified VLANs. Current list is overwritten.
  - **add** specified VTEPs are added to existing list.
  - **remove** specified VTEPs are deleted from existing list.
- **VTEP_X** IPv4 address of VTEPs that are added or removed from the list.
Example

- These commands create a default VXLAN head-end replication flood list.
  
  switch(config)#interface vxlan 1
  switch(config-if-Vx1)#vxlan flood vtep 10.1.1.1 10.1.1.2
  switch(config-if-Vx1)#show active
  
  interface Vxlan1
  vxlan flood vtep 10.1.1.1 10.1.1.2
  vxlan udp-port 4789

- These commands create VXLAN head-end replication flood lists for the VNIs accessed through VLANs 101 and 102.
  
  switch(config-if-Vx1)#vxlan vlan 101-102 flood vtep 11.1.1.1 11.1.1.2 11.1.1.3
  switch(config-if-Vx1)#show active
  
  interface Vxlan1
  vxlan flood vtep 10.1.1.1 10.1.1.2
  vxlan vlan 101 flood vtep 11.1.1.1 11.1.1.2 11.1.1.3
  vxlan vlan 102 flood vtep 11.1.1.1 11.1.1.2 11.1.1.3
  vxlan udp-port 4789

- These commands add two VTEPs for the VNI access through VLAN 102.
  
  switch(config-if-Vx1)#vxlan vlan 102 flood vtep add 12.1.1.1
  switch(config-if-Vx1)#show active
  
  interface Vxlan1
  vxlan flood vtep 10.1.1.1 10.1.1.2
  vxlan vlan 101 flood vtep 11.1.1.1 11.1.1.2 11.1.1.3
  vxlan vlan 102 flood vtep 11.1.1.1 11.1.1.2 11.1.1.3 12.1.1.1
  vxlan udp-port 4789
  switch(config-if-Vx1)#
**vxlan multicast-group**

The `vxlan multicast-group` command associates a specified multicast group with the configuration mode VXLAN interface (VTI), which handles multicast and broadcast traffic as a layer 2 interface in a bridging domain.

The VTI maps multicast traffic from its associated VLANs to the specified multicast group. Inter-VTEP multicast communications include all VTEPs that are associated with the specified multicast group, which is independent of any other multicast groups that VLAN hosts may join.

A VTI can be associated with one multicast group. By default, a VTI is not associated with any multicast group.

The `no vxlan multicast-group` and `default vxlan multicast-group` commands removes the multicast group – VTI association by removing the `vxlan multicast-group` command from *running-config*.

**Command Mode**

Interface-VXLAN Configuration

**Command Syntax**

```
vxlan multicast-group  group_addr
no vxlan multicast-group
default vxlan multicast-group
```

**Parameters**

- `group_addr` IPv4 address of multicast group. Dotted decimal notation of a valid multicast address.

**Related Commands**

- `interface vxlan` places the switch in VXLAN interface configuration mode.

**Examples**

- This command associates the multicast address of 227.10.1.1 with VTI 1.

```
switch(config)#interface vxlan 1
switch(config-if-Vx1)#vxlan multicast-group 227.10.1.1
switch(config-if-Vx1)#show active
interface Vxlan1
  vxlan multicast-group 227.10.1.1
  vxlan udp-port 4789
switch(config-if-Vx1)#
```

- This command changes VTI 1’s multicast group association.

```
switch(config-if-Vx1)#vxlan multicast-group 227.10.5.5
switch(config-if-Vx1)#show active
interface Vxlan1
  vxlan multicast-group 227.10.5.5
  vxlan udp-port 4789
switch(config-if-Vx1)#
```

- This command removes the multicast group association from VTI 1.

```
switch(config-if-Vx1)#no vxlan multicast-group
switch(config-if-Vx1)#show active
interface Vxlan1
  vxlan udp-port 4789
switch(config-if-Vx1)#
```
vxlan multicast-group decap

The `vxlan multicast-group decap` command enables VXLAN multicast decapsulation.

VTEPs are enabled by VXLAN multicast decapsulation, supporting Head End Replication (HER). Multicast encapsulated Broadcast/Unknown/Multicast (BUM) packets terminate VTEPs from remote VTEPs that do not support HER.

The `no vxlan multicast-group decap` and `default vxlan multicast-group decap` commands disable VXLAN multicast decapsulation.

**Command Mode**
Interface-VXLAN Configuration

**Command Syntax**

```
 vxlan multicast-group decap  group_addr
 no vxlan multicast-group decap
 default vxlan multicast-group decap
```

**Parameters**

- `group_addr` IPv4 address of multicast group. Dotted decimal notation of a valid multicast address.

**Examples**

- This command enables VXLAN multicast decapsulation.
  ```
  switch(config)#interface vxlan 1
  switch(config-if-Vx1)#vxlan multicast-group decap 230.1.1.1
  switch(config-if-Vx1)#
  ```

- This command disables VXLAN multicast decapsulation.
  ```
  switch(config)#interface vxlan 1
  switch(config-if-Vx1)#no vxlan multicast-group decap 230.1.1.1
  switch(config-if-Vx1)#
  ```
**vxlan source-interface**

The `vxlan source-interface` command specifies the interface from which the configuration mode VXLAN interface (VTI) derives the source address (IP) that it uses when exchanging VXLAN frames. There is no default source interface assignment.

The `no vxlan source-interface` and `default vxlan source-interface` commands remove the source interface assignment from the configuration mode VXLAN interface by deleting the corresponding `ip vxlan source-interface` command from *running-config*.

**Command Mode**

Interface-VXLAN Configuration

**Command Syntax**

```
vxlan source-interface INT_NAME
no vxlan source-interface
default vxlan source-interface
```

**Parameters**

- `INT_NAME` Interface type and number. Options include:
  - `loopback l_num` Loopback interface specified by `l_num`.

**Guidelines**

A VXLAN interface is inoperable without the source-interface assignment.

**Related Commands**

- `interface vxlan` places the switch in VXLAN interface configuration mode.

**Example**

- These commands configure VTI 1 to use the IP address 10.25.25.3 as the source address of outbound VXLAN frames.
  
  ```
  switch(config)#interface loopback 15
  switch(config-if-Lo15)#ip address 10.25.25.3/24
  switch(config-if-Lo15)#exit
  switch(config)#interface vxlan 1
  switch(config-if-Vx1)#vxlan source-interface loopback 15
  switch(config-if-Vx1)#show active
  interface Vxlan1
  vxlan source-interface Loopback15
  vxlan udp-port 4789
  switch(config-if-Vx1)#
  ```
**vxlan udp-port**

The **vxlan udp-port** command associates a UDP port with the configuration mode VXLAN interface (VTI). By default, UDP port 4789 is associated with the VTI.

Packets bridged to the VTI from a VLAN are encapsulated with a VXLAN header that includes the VNI associated with the VLAN and the IP address of the VTEP that connects to the recipient, then sent through the UDP port. Packets that arrive through the UDP port are sent to the bridging domain of the recipient VLAN as determined by the VNI number in the VXLAN header and the interface’s VNI-VLAN map.

The **no vxlan udp-port** and **default vxlan udp-port** command restores the default UDP port association (4789) on the configuration mode interface by deleting the corresponding **vxlan udp-port** command from **running-config**.

**Command Mode**

Interface-VXLAN Configuration

**Command Syntax**

```
vxlan udp-port port_id
no vxlan udp-port
default vxlan udp-port
```

**Parameters**

- **port_id**  
  UDP port number. Value ranges from 1024 to 65535.

**Guidelines**

UDP port 4789 is reserved by convention for VXLAN usage. Under most typical applications, this parameter should be set to the default value.

**Related Commands**

- **interface vxlan** places the switch in VXLAN interface configuration mode.

**Example**

- This command associates UDP port 5500 with VXLAN interface 1.
  
  ```
  switch(config)#interface vxlan 1
  switch(config-if-Vx1)#vxlan udp-port 5500
  switch(config-if-Vx1)#show active
  interface Vxlan1
  vxlan udp-port 5500
  switch(config-if-Vx1)#
  ```

- This command resets the VXLAN interface 1 UDP port association of 4789.
  
  ```
  switch(config-if-Vx1)#no vxlan udp-port
  switch(config-if-Vx1)#show active
  interface Vxlan1
  vxlan udp-port 4789
  switch(config-if-Vx1)#
  ```
vxlan vlan vni

The `vxlan vlan vni` command associates a VLAN ID with a virtual network identifier (VNI). A VNI is a 24-bit number that is assigned to a VLAN to distinguish it from other VLANs that are on a VXLAN tunnel interface (VTI). VNI values range from 1 to 16777215 in decimal notation and from 0.0.1 to 255.255.255 in dotted decimal notation.

When a VLAN bridges a packet to the VTI, the packet is encapsulated with a VXLAN header that includes the VNI that is associated with the VLAN. Packets that arrive on the VTI's UDP socket are bridged to the VLAN that is associated with the VNI specified by the VXLAN header that encapsulates the packet.

The VTI requires a one-to-one correspondence between specified VLANs and VNI values. Commands that assign a new VNI to a previously configured VLAN replace the existing VLAN assignment statement in `running-config`. Commands that attempt to assign a VNI value to a second VLAN generate a CLI error.

The `no vxlan vlan vni` and `default vxlan vlan vni` commands remove the specified VLAN-VNI association from the configuration mode interface by deleting the corresponding `vxlan vlan` command from `running-config`.

Command Mode
Interface-VXLAN Configuration

Command Syntax
```
vxlan vlan vlan_id vni vni_id
no vxlan vlan vlan_id vni [vni_id]
default vxlan vlan vlan_id vni [vni_id]
```

Parameters
- `vlan_id` number of access VLAN. Value ranges from 1 to 4094.
- `vni_id` VNI number. Valid formats: decimal `<1 to 16777215>` or dotted decimal `<0.0.1 to 255.255.255>`.

Example
- These commands associate VLAN 100 to VNI 100 and VLAN 200 to VNI 10.10.200.

```plaintext
switch(config)#interface vxlan 1
switch(config-if-Vx1)#vxlan vlan 100 vni 100
switch(config-if-Vx1)#vxlan vlan 200 vni 10.10.200
switch(config-if-Vx1)#show active
interface Vxlan1
  vxlan udp-port 4789
  vxlan vlan 200 vni 658120
  vxlan vlan 100 vni 100
switch(config-if-Vx1)#vxlan vni notation dotted
switch(config-if-Vx1)#show active
interface Vxlan1
  vxlan udp-port 4789
  vxlan vlan 200 vni 10.10.200
  vxlan vlan 100 vni 0.0.100
switch(config-if-Vx1)#
```
vxlan vni notation dotted

The **vxlan vni notation dotted** command configures the switch to display VNIs in dotted decimal notation. A virtual network identifier (VNI) is a 24-bit number that is assigned to a VLAN to distinguish it from other VLANs that are on a VXLAN tunnel interface. VNI values range from 1 to 16777215 in decimal notation and from 0.0.1 to 255.255.255 in dotted decimal notation.

The command affects the VNI number display in all **show** commands, including **show running-config**. Commands that include VNI as a parameter may use decimal or dotted decimal notation regardless of the setting of this command. By default, show commands display VNI number in decimal notation.

The **no vxlan vni notation dotted** and **default vxlan vni notation dotted** commands restore the default setting of displaying vni numbers in decimal notation by deleting the **vxlan vni notation dotted** command from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

- `vxlan vni notation dotted`
- `no vxlan vni notation dotted`
- `default vxlan vni notation dotted`

**Examples**

- These commands configure the switch to display vni numbers in dotted decimal notation, then displays a configuration that includes a vni setting.

  ```
  switch(config)#vxlan vni notation dotted
  switch(config)#interface vxlan 1
  switch(config-if-Vx1)#show active
  interface Vxlan1
  vxlan udp-port 4789
  vxlan vlan 333 vni 3.4.5
  switch(config-if-Vx1)#
  ```

- These commands configure the switch to display vni numbers in decimal notation, then displays a configuration that includes a vni setting.

  ```
  switch(config)#no vxlan vni notation dotted
  switch(config)#interface vxlan 1
  switch(config-if-Vx1)#show active
  interface Vxlan1
  vxlan udp-port 4789
  vxlan vlan 333 vni 197637
  switch(config-if-Vx1)#
  ```
This chapter describes Arista’s EVPN implementation. Sections in this chapter include:

- Section 23.1: EVPN Overview
- Section 23.2: EVPN Layer 3 Core Operations
- Section 23.3: Integrated Routing and Bridging
- Section 23.4: VPN MPLS Transport Options
- Section 23.5: EVPN Type-5 Routes: IP Prefix Advertisement
- Section 23.6: Inter-VRF Local Route Leaking
- Section 23.7: Configuring EVPN
- Section 23.8: Sample Configurations
- Section 23.9: EVPN and VCS Commands
23.1 **EVPN Overview**

Ethernet VPN (EVPN) is a standards-based BGP control plane to advertise MAC addresses, MAC and IP bindings and IP Prefixes. This document focuses on EVPN and its operation with a VXLAN data plane for building overlay networks in the data center.

A number of control planes exist today for VXLAN, based on specific use cases, whether it be a requirement to integrate with an SDN overlay controller, or operate in a standards based flood and learn control plane model.

Current flood and learn models operate either with a multicast control plane, or ingress replication, where the operator manually configures the remote VTEPs in the flood list. Both of these are data-plane driven, that is, MAC’s are learned via flooding. In the IP multicast model MAC’s are learned in the underlay via flooding to an IP multicast group, while ingress replication (HER) floods to configured VTEP endpoints and no IP Multicast is required in the underlay.

The controller based solution with cloud vision exchange (CVX), locally learned MAC’s are published to a centralized controller and these MAC’s are then programmed to all participating VTEPs.

![Figure 23-1: Different VXLAN Control Planes](image)

A controller-less BGP EVPN MAC learning is a standards-based control-plane (MP-BGP) is used to discover remote VTEPs and advertise MAC address and MAC/IP bindings in the VXLAN overlay, thus eliminating the flood and learn paradigms of the previously mentioned (multicast or HER) controller-less approaches. As a standards-based approach, the discovery and therefore the advertisement of the EVPN service models can inter-operate amongst multiple vendors.

This highlights an important and powerful advantage of BGP EVPN; that being, it is a single control plane for multiple data-plane encapsulations and defines both Layer 2 and layer 3 VPN services. As network operators drive toward simplicity and automation, having one control plane protocol and address family for all data-planes and VPN services will prove extremely powerful.

![Figure 23-2: VXLAN Control Plane and Data-plane Definitions](image)
The initial EVPN standard is RFC 7432 defined the BGP EVPN control plane and specifies an MPLS data-plane. The control plane with an MPLS data plane was extended to consider additional data plane encapsulations models including VXLAN, NVGRE and MPLS over GRE.

23.1.1 EVPN Terminology

The EVPN standard in the context of an NVO environment, defines the functionality for delivering multi-tenant Layer 2/3 VPN services using either VXLAN, NVGRE or MPLS over GRE encapsulation, across a common physical IP infrastructure. The standard introduces new terminology specific to a NVO environment, which are summarized below in relation to VXLAN encapsulation.

- **Network Virtualization Overlay (NVO):** The overlay network used to deliver the Layer 2 and Layer 3 VPN services. For VXLAN encapsulation, this would define a VXLAN domain, which would include one or more VNIs, for the transportation of tenant traffic over a common IP underlay infrastructure.

- **Network Virtualization End-Point (NVE):** The provider edge node within the NVO environment responsible for the encapsulation of tenant traffic into the overlay network. For a VXLAN data plane, this defines the Virtual Tunnel End-Point (VTEP).

- **Virtual Network Identifier (VNI):** The label identifier within the VXLAN encapsulated frame, defining a Layer 2 domain in the overlay network.

- **EVPN instance (EVI):** A logical switch within the EVPN domain which spans and interconnects multiple VTEPs to provide tenant Layer 2 and layer 3 connectivity.

- **MAC-VRF:** A Virtual Routing and Forwarding table for storing Media Access Control (MAC) addresses on a VTEP for a specific tenant.

Figure 23-3: EVPN Terminology for a VXLAN Data Plane

The new EVPN Network Layer Reachability Information (NLRI) is carried in BGP using Multi-protocol BGP Extensions with a newly defined Address Family Identifier (AFI) and Subsequent Address Family Identifier (SAFI).

To provide multi-tenancy, the standard uses the above traditional VPN methods to control the import and export of routes and provide support for overlapping IP address between tenants.
- **Multi-protocol BGP for EVPN:** A new AFI and SAFI have been defined for EVPN. These are AFI=25 (Layer 2 VPN) and SAFI = 70 (EVPN)

- **EVPN Layer 2/Layer 3 tenant segmentation:** Similar to standard MPLS VPN configurations Route Distinguisher’s (RD’s) and Route Targets (RT’s) are defined for the VPN.

- **Route Target (RT):** To control the import and export of routes across VRFs, EVPN routes are advertised with Route-Target (RT) (BGP extended communities). The RT can be auto derived to simplify the rule configuration, typically this is based on the AS number and the VNI of the MAC-VRF.

- **Route Distinguisher (RD):** Unique number prepended to the advertised address within the VRF, ensuring support for overlapping IPs and MACs across different tenants.

The format of the MP_REACH_NLRI/MP_UNREACH_NLRI attribute, holding the new EVPN NLRI is illustrated below, where the next-hop address within the NLRI is the IP address of the VTEP advertising the EVPN route.

**Figure 23-4: EVPN NLRI Route Format**

![Figure 23-4: EVPN NLRI Route Format](image)

As illustrated in Figure 23-4, the original MPLS RFC (7348) and subsequent IP prefix draft (draft-ietf-bess-evpn-prefix-advertisement-04), introduce five unique EVPN route types.

**Type-1 Route: Ethernet A-D route**

Ethernet A-D route per ESI route, announces the reachability of a multi-homed Ethernet Segment. The route type is used for fast convergence (ie: ‘mass withdraw’) functions, as well as split horizon filtering used for active-active multi-homing.

Ethernet A-D route per EVI route, is used to implement the Aliasing and Backup Path features of EVPN associated with active-active multi-homing.

**Type-2 Route: Host advertisement Route**

Used to advertise the reachability of a MAC address, or optionally a MAC and IP binding as learned by a specific EVI. With the advertisement of the optional IP address of the host, EVPN provides the ability for VTEPs to perform ARP suppression and ARP proxy to reduce flooding within the Layer 2 VPN.
Type-3 Route: Inclusive Multicast route

The type-3 route is used to advertise the membership of a specific Layer 2 domain (VNI within the VXLAN domain), allowing the dynamic discovery of remote VTEPs in a specific VNI and the population of a VTEP ingress flood list for the forwarding of Broadcast Unknown unicast and Multicast (BUM) traffic.

Type-4 Route: Ethernet Segment Route

The type-4 route is specific to VTEPs supporting the EVPN multi-homing model, for active-active and active-standby forwarding. The route is used to discover VTEPs which are attached to the same shared Ethernet Segment. Additionally, this route type is used in the Designated Forwarder (DF) election process.

Type-5 Route: IP-prefix route advertisement

The type-5 route is used to advertise IP prefixes rather the MAC and IP hosts addresses of the type-2 route. This advertisement of prefixes into the EVPN domain provides the ability to build classic layer 3 VPN topologies.

A detailed understanding of the function of each of these route types in the operation of EVPN to provide multi-tenant Layer 2 and 3 VPN services, is defined in Section 4 of this document.

While this guide focuses on EVPN with VXLAN data-plane encapsulation, it’s important to note that, in addition to the new routes type, a BGP encapsulated extended community is included in all advertisements to determine the data-plane encapsulation.

The Encapsulation extended community is defined in RFC 5512. The different IANA registered tunnel types for an NVO environment are summarized in the table below.

23.1.2 EVPN Service Models

An EVPN instance (EVI), can contain, one or more Layer 2 broadcast domains (VLANs). The association of a VLAN-IDs to a specific EVI instance and how a VLAN tag can be transported within the EVI if required, is defined by three EVPN service models: VLAN based, VLAN Bundle, and VLAN aware bundle.

VLAN Based Service Interface

In the VLAN based service there is a one-to-one mapping between the VLAN-ID and the MAC-VRF of the EVI instance. With the MAC-VRF mapping directly to the associated VLAN, there will be a single bridge table within the MAC-VRF. The VLAN tag is not carried in any route update and the VNI label in the route advertisement is used to uniquely identify the bridge domain of the MAC-VRF in the VXLAN forwarding plane.

Figure 23-5: VLAN Based Service Interface

With a one-to-one mapping between the VLAN-ID and the MAC-VRF of EVI instance, the EVI will represent an individual tenant subnet/VLAN in the overlay. The one-to-one mapping also means the route-target associated with the MAC-VRF, uniquely identifies the tenant’s subnet/VLAN, providing granular importing of MAC routes on a per VLAN basis on each VTEP.

In this service, the associated MAC-VRF table is identified by the Route-Target in the control plane and by the VNI in the data plane and the MAC-VRF table corresponds to a single VLAN bridge domain.

VLAN Bundle Service Interface

In the VLAN bundle service, there is a many-to-one mapping between the VLAN-IDs and the MAC-VRF of the EVPN instance. The MAC-VRF however only contains a single Layer 2 bridge table and VNI label, thus MAC addresses must be unique across all associated VLANs.
With the MAC-VRF containing a single Layer 2 bridge table and a single VNI, the original VLAN tag has no significance in the control plane and is not carried in any EVPN route update. The original Ethernet tag and the VNI label are carried in the VXLAN data plane, to allow forwarding to the correct tenant VLAN.

**Figure 23-6: VLAN Bundle Service Interface**

In this service, the Route-Target associated with the MAC-VRF identifies the tenant rather than an individual subnet/VLAN of a tenant. This means all MAC routes for the tenant will be imported on the VTEP regardless of whether or not the specific tenant VLAN exists. The MAC-VRF table is identified by the Route-Target in the control plane and forwarding to the appropriate tenant VLAN is achieved via a combination of the VNI and Ethernet tag in the VXLAN data plane.

**VLAN Aware Bundle Service Interface**

In the VLAN aware bundle service, there is a many-to-one mapping between the VLAN-IDs and the MAC-VRF of the EVPN instance. However, the MAC-VRF contains a unique Layer 2 bridge table for each associated VLAN-ID and a unique VNI label for each bridge domain.
With the MAC-VRF containing multiple Layer 2 bridge tables, the VLAN tag is carried in any EVPN route update to allow mapping to the correct tenant bridge table within the MAC-VRF. Only the unique VNI label is carried in the VXLAN data plane, to allow forwarding to the correct VLAN with the MAC-VRF.

**Figure 23-7: VLAN Aware Bundle Service**
In this service, the MAC-VRF of the EVI instance represents multiple subnet/VLANs of the tenant. The Layer 2 bridge table of the MAC-VRF is identified by a combination of the Route-Target and the Ethernet tag in the control plane and by the unique VNI and in the VXLAN data plane.

This service type is a common DCI/WAN deployment, where a tenant’s VLANs are bundled into single EVI instance, while VLAN “awareness” can be retained in the EVPN service as the VNI tag is advertised in the MAC-IP route (which now identifies the VLAN within the EVI). Bundling into a service like this reduces the number of EVI’s that need to be configured, reducing complexity and the control-plane signaling between PE’s.

23.1.3 VCS and EVPN in DCI

When VXLAN Control Services (VCS) is enabled on a CloudVision eXchange (CVX) of a Data Center (DC), each VXLAN Tunnel End Point (VTEP) connects to the corresponding CVX for sharing the Layer 2 bridging information of it’s attached hosts. In turn, CVX advertises this information to all VTEPs within the DC.

In a topology consisting of multiple DCs where each DC runs its own CVX instance as shown in Figure 23-8, a federation of CVXs can be created by using BGP-EVPN. In such Data Center Interconnect (DCI) topologies, CVX in each DC performs the following functions to advertise the Layer 2 bridging information (MAC-VTEP bindings) to all VTEPs in different DCs:

- Receives the local Layer 2 bridging information in CVX control plane format from all VTEPs within the DC; and advertises it to remote CVXs in the BGP-EVPN NLRI format.
- Receives the Layer 2 bridging information in BGP-EVPN NLRI format from remote CVXs; and advertises it to local VTEPs in the CVX control plane format.

**Note**

The distribution of Layer 2 bridging information as described above allows a Layer 2 overlay network to be stretched across multiple DCs without additional VTEP configurations.

*Figure 23-8* illustrates the federation of CVX across multiple DCs.

*Figure 23-8: CVX Connected from Multiple DCs*
23.1.4 EVPN MPLS LAYER 3 VPN (Type-5 Route)

Ethernet VPN (EVPN) is an extension of the BGP protocol introducing a new address family: Layer 2 VPN (address family number 25) / EVPN (subsequent address family number 70). It is used to exchange overlay MAC and IP address reachability information between BGP peers using type-2 routes. Additionally, EVPN supports the exchange of layer 3 IP overlay routes through the extensions described in (type 5 EVPN routes).

An IP VRF is used on a PE router for each layer 3 overlay. VRF IP routes are exported into the EVPN BGP table and advertised to remote VTEPs as type 5 routes. The exported EVPN routes carry the Route-Target (RT) extended communities that are configured as export route-targets on the IP VRF from which they were exported.

The RTs carried by the EVPN type 5 routes received by a PE are matched against the VRF import route-target configuration. When a received route carries an RT that is configured as an import route-target on an IP VRF, the route is imported into the IP table for that VRF.

PE routers allocate per-VRF and address family Labels that are advertised as part of the layer 3 (type 5) EVPN route NLRI. Forwarding of overlay packets between PEs across the underlay requires underlay MPLS connectivity provided by an IP backbone.

The type-5 routes provide the ability to decouple the advertisement of an IP prefix from any specific MAC address, providing the ability to support floating IP addresses, optimized the mechanism for advertising external IP prefixes, and reduce the churn when withdrawing IP prefixes.

The format of the new type-5 IP-prefix route is illustrated in the figure below. Unlike when VXLAN is used as a transport, BGP route update for MPLS does not specify the router-mac extended community and sets the tunnel encapsulation to MPLS. Unlike with VXLAN encapsulation, which uses the VNI as the overlay index, the MPLS Type-5 route uses the MPLS label.

Figure 23-9: EVPN Route Type-5, for Advertisement of IP-Prefixes over MPLS
Figure 23-10 offers a more detailed view of the route as displayed on a PE router.

Figure 23-10: EVPN Route Type-5 as Shown on PE

As shown in Figure 23-10, the route contains the VPN route (prefix and RD), the next-hop for the route and the advertising router ID, along with the extended communities of tunnel type (MPLS), MPLS Label value and route-target.

Note
You require 4.21.1F release and later versions with Jericho/Jericho+ platforms.

23.2 EVPN Layer 3 Core Operations

The EVPN standard defines a number of operations and functionality to allow the dynamic learning of MAC and IP bindings, management of MAC moves (VM/host mobility), ARP suppression, automated discovery of remote VTEPs and multi-homing to support active-active topologies.

23.2.1 MAC Address Learning.

Figure 23-11 refers to MAC address learning on the local interface of a VTEP is still flow-based learning, however once the MAC’s are learned locally they are advertised to BGP peers within the EVI via an EVPN route update. The next hop of the update is set to IP of the advertising VTEP. In the case of EVPN VXLAN the label advertised in the update is the VNI, which identifies the MAC-VRF in the case of a VLAN Based service, or the EVI for a VLAN aware bundle service.

Figure 23-11: EVPN Type 2 Route Announcement
The route advertisements are EVPN type-2 routes, which can advertise just the MAC address of the host, or optionally the MAC and IP address of the host. The format of the type-2 route is illustrated in the figure below, along with the mandatory and optional extended community attached to the route.

**Figure 23-12: EVPN Type 2 MAC and IP Route Format**

- Multi-protocol Reachable NLRI (MP_REACH_NLRI) attribute of the route is used to carry the next-hop hop for the advertised route. In the context of a VXLAN forwarding plane, this will be the source address (VTI) of the advertising VTEP.
- Route Distinguisher of the advertising node’s MAC-VRF.
- Ethernet Segment Identifier (ESI), this field is populated when the VTEP participating in a multi-homed topology. This is discussed in the following sections.
- Ethernet tag ID that will be 0 for VLAN-based service, and the customer VLAN ID in a VLAN-aware bundle service.
- IP address of the host which is associated with advertised MAC address. The advertisement of the Host’s IP address is optional.
- Label in the context of a VXLAN forwarding plane is the VNI associated with the MAC-VRF/Layer 2 domain the advertised MAC address has been learned on.
- Route Target associated with the MAC-VRF advertised with route to allow the control of the import and export of routes.

The MAC mobility extended community, as discussed in the following section is used during MAC moves to update all VTEPs of the new location of the host.

### 23.2.2 ARP Suppression

Providing the option to advertise the MAC and IP binding in the type-2 route, ARP suppression can be supported on the remote VTEPs. The MAC to IP binding can be learned locally, via ARP snooping or DHCP traffic on the VTEP. Once the MAC and IP binding has been learned, it is advertised to the remote VTEPs as a type-2 route. This allows remote VTEPs to respond to any ARP requests for the host locally, thus reducing the amount of ARP traffic across the EVI.

Importantly, the optional MAC and IP route can be advertised separately from the MAC only type-2 route. This is done so that if the MAC and IP route is cleared, i.e. ARP flushed, or the ARP timeout is set to less than the MAC timeout, then the MAC only route will still exist.
23.2.3 MAC Mobility

A common scenario in a data center environment is virtual machines (VMs) moving between physical servers, for maintenance or performance reasons, this will result in the MAC of the VM being learned and advertised by a new VTEP.

To cater for this situation a sequence number is attached to the new MAC advertisement ensuring an EVI wide refresh of the MAC table, with VTEPs updating their forwarding tables to point to the advertising VTEP as the new next-hop for MAC address.

Figure 23-13: EVPN type-2 MAC Mobility Behavior

When a MAC address is learned and advertised for the first time, it is advertised without a sequence number and the receiving VTEP assume the sequence to be zero. On detection of a MAC move, i.e. a MAC is learned locally when the same MAC route is active via a type-2 advertisement, then the sequence number is incremented by one, and the MAC route is advertised to the remote peers. The original advertising VTEP, receives the MAC route with a now higher sequence number and withdraws its own local MAC route. All other VTEPs flush the original MAC route, and update their tables with the new higher sequence number route.

23.2.4 MAC Address Damping

In addition to MAC mobility, EVPN defines a protection mechanism to detect and prevent MAC routes flapping between VTEPs, which can occur during network instability or when hosts have been mis-configured with the same (duplicate) MAC address.

On advertising a locally learned MAC, the VTEP will start a M second counter (default is 180s), if the VTEP detects N MAC moves (default is 5) for the route within the M second window, it will generate a syslog message and stop sending and processing any further updates for the route.
23.2.5 Broadcast and Multicast Traffic

Broadcast, unknown unicast and Multicast (BUM) traffic is handled within the EVPN forwarding model using ingress replication. Where the BUM frame is replicated on the ingress VTEP to each of the remote VTEPs in the associated EVI/VNI. The VTEP replication list for the EVI, is dynamically populated based on Type-3 route advertisements (Inclusive Multicast Ethernet Tag Route), where VTEPs advertise type-3 routes for each EVI they are members.

Figure 23-14: EVPN type-3 IMET Route Behavior for Ingress Replication

The format of the type-3 route is illustrated in Figure 23-15.

Figure 23-15: EVPN Type-3 IMET Route Format

Figure 23-15 notable fields of the type-3 route:

- Multi-protocol Reachable NLRI (MP_REACH_NLRI) attribute of the route is used to carry the next-hop hop for the advertised route. In the context of a VXLAN forwarding plane, this will be the source address (VTI) of the advertising VTEP.
- Route Distinguisher of the advertising node’s MAC-VRF.
- Ethernet tag that will be 0 for VLAN-based service, and the MAC-VRF VNI for a VLAN-aware bundle service.
- IP address of the VTEP advertising the type 3 route.
- Route Target associated with the MAC-VRF or the EVI in a VLAN-aware bundle service.
• PMSI Tunnel Attribute, to advertise the replication model the VTEP is supporting. The supported options defined within the standard are ingress replication and IP multicast.
23.3 Integrated Routing and Bridging

In the traditional data center design, inter-subnet forwarding is provided by a centralized router, where traffic traverse across the network to a centralized routing node and back again to its final destination. In a large multi-tenant data center environment this operational model can lead to inefficient use of bandwidth and sub-optimal forwarding.

To provide a more optimal forwarding model and avoid traffic tromboning, the EVPN inter-subnet draft ([draft-sajassi-l2vpn-evpn-inter-subnet-forwarding]) proposes integrating the routing and bridging (IRB) functionality directly onto the VTEP, thereby allowing the routing operation to occur as close to the end host as possible. The draft proposes two forwarding models for the IRB functionality, which are termed asymmetric IRB and symmetric IRB, these two models are described in the following sections.

In the asymmetric IRB model, the inter-subnet routing functionality is performed by the ingress VTEP, with the packet after the routing action being VXLAN bridged to the destination VTEP. The egress VTEP only then needs to remove the VXLAN header and forward the packet onto the local Layer 2 domain based on the VNI to VLAN mapping. In the return path, the routing functionality is reversed with the destination VTEP now performing the ingress routing and VXLAN bridging operation, hence the term asymmetric IRB.

![Figure 23-16: EVPN Asymmetric IRB](image)

To provide inter-subnet routing on all VTEPs for all subnets, an anycast IP address is utilized for each subnet and configured on each VTEP. The anycast IP acts as the default gateway for the hosts, therefore regardless of where the host resides the directly attached VTEPs can act as the host’s default gateway. The host MAC and MAC to IP bindings are learned by each VTEP based on a combination of local learning/ARP snooping and type-2 route advertisement from remote VTEPs.

In a typical implementation, the optional MAC and IP, type-2 route is advertised separately from the MAC only type-2 route. This is done so that if the MAC and IP route is cleared, for example the ARP flushed, or the ARP timeout is set to less than the MAC timeout, then the MAC only route will still exist.
The format of the two advertised type-2 routes for Server-1 are illustrated below, where the RD IP-A:1010 and route-target 1010:1010 are used to distinguish the uniqueness of the route and allow the route to be imported into the correct remote MAC-VRF based on the route-target import policy of the VTEP.

*Figure 23-17: EVPN Comparison of MAC & MAC+IP Type 2 Route in Asymmetric IRB*
For the traffic flow between Server-1 in subnet-10 and Server-4 in subnet-11, the ingress VTEP (VTEP-1) locally routes the packet into subnet-11/VNI 1011 and then VXLAN bridges the frame, inserting the VNI 1011 into the VXLAN header with an inner DMAC equal to the destination host, Server-4. This requires the receiving VTEP, (VTEP-4) to only perform a local Layer 2 lookup, based on the VNI to VLAN mapping, for the DMAC of Server-4.

Figure 23-18: EVPN Asymmetric IRB VxLAN Data-plane Forwarding Detail

For the asymmetric model to operate the sending VTEP needs the information for all the tenant’s hosts (MAC and MAC to IP binding), to route and bridge the packet. This means the VTEP needs to be member of all the tenant’s subnets/VNI and have an associated SVI with anycast IP for all the subnets, and this will be required on all VTEPs participating in the routing functionality for the tenant. This introduces scaling issues on multiple fronts:

- **VNI Scaling**: The number of VNIs supported on a hardware VTEP will be finite, so not all VNIs can reside on all VTEPs. This is especially true in data-center deployments, where the TOR's have traditionally been more resource constrained than chassis-based edge systems.
- **Forwarding memory scaling**: The VTEPs needs to store all host MACs and ARP entries for all subnets in the network, on leaf switch this is hardware resource which again will be a finite resource defined by the specific hardware platform deployed at the leaf.

**Symmetric IRB**

To address the scale issues of the asymmetric model, in the symmetric model the VTEP is only configured with the subnets that are present on the directly attached hosts. Connectivity to non-local subnets on a remote VTEP is achieved through an intermediate IP-VRF. The subsequent forwarding model for symmetric IRB is illustrated in the figure below, for traffic between Server-1 on subnet-10 (Green) and Server-4 on the remote subnet-11 (Blue). In this model, the ingress VTEP routes the traffic
between the local subnet-10) and the IP-VRF, which both VTEPs are a member of, the egress VTEP then routes the frame from the IP-VRF to the destination subnet. The forwarding model results in both VTEPs performing a routing function, hence the term symmetric IRB.

Figure 23-19: EVPN Symmetric IRB

To provide the inter-subnet routing, when the subnet is stretched across multiple VTEPs, an anycast IP address is utilized for each subnet, but only configured on the VTEP’s where the subnet exists. The host MAC and MAC to IP bindings are learned by each VTEP based on a combination of local learning/ARP snooping and type-2 route advertisements.

For the symmetric IRB model the type-2 (MAC and IP) route is advertised with two labels and two route-targets corresponding to the MAC-VRF the MAC address is learned on and the IP-VRF. Remote VTEP’s receiving the route, import the IP host route into the corresponding IP-VRF based on the IP-VRF route-target and if the corresponding MAC-VRF exists on the VTEP the MAC address is imported into the local MAC-VRF based on the MAC-VRF’s Route-Target. The import behavior for the type-2 route is illustrated in the diagrams below for the host Server-1.

If the MAC-VRF exists locally on the receiving router, both the IP host route will be installed in the IP-VRF, and the MAC address will be installed in the MAC-VRF. As shown in Figure 30. With both a MAC route in the MAC-VRF and an IP host route in the IP-VRF, the VNI used in the data-path will depend on whether the traffic is being VXLAN bridged between hosts in the same VNI (1010) or VXLAN routed (VNI 2000).
Figure 23-20: EVPN Type 2 Route in Symmetric IRB - MAC-VRF on Both VTEPs

- Path Attribute: IP_REACH_NLRI, NextHop: 17 for the prefix = VTEP1
- Type 2 Route
  - Route Distinguisher = IP-A:1010
  - Ethernet Tag ID = 0 (VLAN-based service)
- MAC address length = 48 bits
- Host MAC address (MAC-1)
- Host IP address length = 128
- Host IP address (IP)
- MAC-VRF VNI Label (1210)
- IP-VRF VNI Label (2000)
- Extended Community/Route Target (MAC-VRF Route target) (1010:1010)
- Route MACs extended community (Optional)
- (System MAC-A address)
- Extended Community MAC mobility (For the Host MAC-1)
- Tunnel encapsulation extended community (VALMAI)

- Type 2 route imported into VTEP-1 IP-VRF based on IP-VRF RT
  - MAC-VRF MAC-1 VTEP1 label 1310
  - IP-VRF: IP-VRF MAC-A:1 VTEP1 label 1310

- Type 2 route imported into VTEP-4 MAC-VRF based on MAC-VRF RT (if MAC-VRF 1010 exists)
  - MAC-VRF MAC-1 VTEP4 label 1310
  - VTEP-1 System MAC = A
  - VTEP-4 System MAC = B

- Bridged traffic
  - VTEP-4 VNI: 2000, VNI: 3000
  - VTEP-1 VNI: 2000, Subnet 10
  - Server-1 IP: 10.10.10.10, MAC: 00:00:00:00:00:01
  - Server-4 IP: 10.10.10.10, MAC: 00:00:00:00:00:02

- Routed traffic
  - VNI: 2000, VNI: 3000
  - Subnet 10, Subnet 11
  - IP: 10.10.10.10, MAC: 00:00:00:00:00:01
  - IP: 10.10.10.10, MAC: 00:00:00:00:00:02
Compare this to Figure 4.17, where the MAC-VRF does not exist on the receiving VTEP (VTEP-2). In this case the MAC route is not installed and ignored, as there is no corresponding Route Target on the VTEP. In this scenario, only the IP-VRF host route is installed on VTEP-2. Traffic from VTEP-2 destined to hosts on subnet-10, are therefore always VXLAN routed via the IP-VRF, VNI 2000.

**Figure 23-21: EVPN Type 2 Route in Symmetric IRB - MAC-VRF Only Exists on Sending VTEP**

The symmetric IRB type-2 route contains a number of additional extended community attributes over the asymmetric IRB type-2 route, the salient fields of the route are summarized below.

- **Multi-protocol Reachable NLRI (MP_REACH_NLRI) attribute** is used to carry the next-hop hop for the advertised route. In the context of a VXLAN forwarding plane, this will be the source address of the advertising VTEP.
- **Route Distinguisher** of the advertising node’s MAC-VRF. For Server-1 in the example above this would be IPA:1010.
- **MAC address** field contains the 48-bit MAC address of the host being advertised. For Server-1 in the example above this would be MAC-1.
- **IP address and length** field contain the IP address and 32-bit mask for the host being advertised. For Server-1 in the example above this would be IP-1.
- **MAC-VRF label**, this contains the VNI number (label) corresponding to the local Layer 2 domain/MAC-VRF the host MAC was learned on. For Server-1 in the example above this would be VNI 1010.
- **IP-VRF label**, this contains the VNI number (label) corresponding to the MAC-VRF’s associated IP-VRF. For MAC-VRF 10 in the example above this would be IP-VRF 2000.
- **Extended community Route Target** for the IP-VRF. This contains the route-target of the IP-VRF associated with the learned MAC address.
- **Extended community Router MAC**. This field advertises the system MAC of the advertising VTEP and is used as the DMAC for any packet sent to the VTEP via the IP-VRF.
• Extended community Route Target for the MAC-VRF. This contains the route-target of the MAC-VRF associated with the learned MAC address.

23.3.1 IP VPN

RFC 4364 allows Service Providers and Enterprises to use their backbone infrastructure to provide the services to multiple customers, or internal departments; while performing the following functions:

• Maintaining privacy
• Allowing for IP address overlap amongst customers
• Constraining route distribution - so that only the service provider routers which need the routes have them.

This is achieved through the usage of VRFs, Route Distinguishers and Route-Targets

The IPv4/IPv6 VPN Standard RFC 4364 does the following:

• Specifies an BGP IPv4 VPN control plane with a MPLS data plane
• BGP control plane, new address family to advertise IP VPN prefixes.
• This RFC obsoleted the original RFC 2547
• MPLS data-plane defined in multiple RFCs and drafts.

The RED circle in Figure 23-22 highlights the main Drafts and RFCs in use today for an MPLS data-plane.

Figure 23-22: MPLS data-plane

IPv4 VPN and IPv6 VPN are an extensions of the BGP protocol introducing new address families: IPv4 (address family number 1), IPv6 (address family number 2), and a subsequent address family number 128: MPLS Layer 3 VPN unicast. It is used to exchange overlay IP prefix reachability information between MP-BGP peers.

Figure 23-23: IPv4 VPN and IPv6 VPN

IPv4 VPN defines two route types:

• Update
Withdrawal
Each route type has its own NLRI prefix format and each route type advertises its own set of prefixes to update/withdraw.

The format of the IPv4 VPN prefix update route is illustrated in Figure 23-24. As detailed, the update route contains the VPN route (prefix and RD), the next-hop for the route and the advertising router ID, along with the MPLS Label, along with a number of path attributes (where the RT extended communities are defined), which are associated with these IPv4 NLRIs.

Figure 23-24: IPv4 and IPv6 VPN Update Route Detail

The output in Figure 23-25 and Figure 23-26 offer a more detailed view of the route as displayed on a PE router.

Figure 23-27 illustrates a basic MPLS Layer 3 VPN topology.

Figure 23-27: MPLS Layer 3 VPN Topology

An IP VRF is used on a PE router for each customer (Layer 3 overlay). VRF IP routes are exported into the MP-BGP table and advertised to remote PEs as VPN routes. The exported VPN routes carry the Route-Target (RT) extended communities that are configured as export route-targets on the IP VRF from which they were exported.

The RTs carried by the VPN routes received by a PE are matched against the VRF import route-target configuration. When a received route carries an RT that is configured as an import route-target on an IP VRF, the route is imported into the IPv4 or IPv6 table for that VRF.

PE routers allocate per-VRF and address family Labels that are advertised as part of the VPN route NLRI. Forwarding of overlay packets between PEs across the underlay requires underlay MPLS connectivity provided by a backbone.

**Note**

You require 4.21.1F release and later versions with Jericho/Jericho+ platforms.
23.4 VPN MPLS Transport Options

EVPN-MPLS and IP-VPN sample topologies illustrate co-existing LDP, BGP-SR, and ISIS-SR on the core.

Figure 23-28: Physical Topology For ISIS-SR, LDP and BGP-SR Transport

LDP, ISIS-SR, and BGP-LU (BGP-SR) demonstrates the corresponding Label Switched Paths (LSPs) as the MPLS transport LSPs for Layer3 EVPN and IP VPN services.
EVPN Sample Topology

In Figure 23-29 and Figure 23-30, the prefixes from each DC are transported over the WAN/DCI domain, maintaining the Layer 3 multi-tenancy in tenant-a and tenant-b.

Figure 23-29: Tenant-A DCI

To provide external connectivity from the DC into the MPLS domain, leaf-11 and leaf-12 are eBGP peering via the tenants VRFs with the border routers. Both core routers are advertising external prefixes for Internet and any remote site connectivity (default route and ip-prefixes from the other DC for the tenant). To provide connectivity within the EVPN domain, the leaf switches (leaf-21 and leaf-2) re-advertise the prefixes into the tenant’s VRF via a type-5 route advertisement, with a next-hop equal to the advertising PE.
Let us review the concepts of transport labels, advertised to provide the label switched path, or LSP, across the back-bone and the VPN, or tenant label, used by the provider edge (PE) routers to identify a particular tenant.

EVPN MPLS Sample Configuration displays BGP route updates and how the tenant VRF is transported over these transport LSPs.

IP VPN Sample Topology
Let us review the concepts of transport labels, advertised to provide the label switched path, or LSP, across the back-bone and the VPN, or tenant label, used by the Provider Edge (PE) routers in Figure 23-31 to identify a particular tenant.

Figure 23-31: IPv4 & IPv6 VPN Sample Topology
In Figure 23-32 and Figure 23-33, the prefixes for VRF tenant-d are transported over the MPLS WAN between North Edge and South Edge routers.

**Figure 23-32: Tenant-D IPv4 VPN**

**Figure 23-33: Tenant-D IPv6 VPN**
23.4.1 LDP

Figure 23-34 illustrates how LDP neighbor relationships are built. First each router sends a discovery to a destination multicast address (TTL=1) 224.0.0.2 on port 646. This discovery contains the router-id and the transport IPv4 address the router wants to use. The second stage is building the TCP peering session using the transport IP addresses specified. This is normally loopback to loopback.

Figure 23-34: LDP Peering Establishment

Examples
- The `show mpls ldp neighbor` command on the North Edge router displays more detail on TCP session establishment, and the local addresses of the LDP neighbor for which it is binding a label.

Note
- All connected interfaces are advertised as bound. However, EOS currently advertised labels for /32 addresses, and FEC filter is configured to install only x.x.x.200/32 prefixes.

North Edge.17:51:17#show mpls ldp neighbor
Peer LDP ID: 2.2.2.200:0; Local LDP ID: 1.1.1.200:0
TCP Connection: 2.2.2.200:38395 - 1.1.1.200:646
State: oper; Msgs sent/rcvd: 46/46; downstream unsolicited
Uptime: 0:06:17
KeepAlive expires in: 20.27 sec
LDP discovery sources:
  Ethernet1/1
Addresses bound to peer:
  2.2.2.200  2.2.2.2  192.168.1.177  192.168.62.11
  192.168.1.181  192.168.58.12  192.168.60.11  192.168.61.11
Peer LDP ID: 3.3.3.200:0; Local LDP ID: 1.1.1.200:0
TCP Connection: 3.3.3.200:38510 - 1.1.1.200:646
State: oper; Msgs sent/rcvd: 42/42; downstream unsolicited
Uptime: 0:05:51
KeepAlive expires in: 20.02 sec
LDP discovery sources:
  Ethernet2/1
Addresses bound to peer:

192.168.65.11       192.168.59.12       3.3.3.200       192.168.60.12
192.168.63.11       3.3.3.3             192.168.64.11

- The `show mpls lfib route 116384` command on the North Edge router displays the label POP and swap operations for any traffic traversing North Edge. As can be seen if traffic came in with label 116384 it would be swapped to the labels seen in the tunnel table.

```bash
North Edge.23:38:28(config)#show mpls lfib route 116384
MPLS forwarding table (Label [metric] Vias) - 1 routes
MPLS next-hop resolution allow default route: False

23.4.2 ISIS-SR

Figure 23-35 illustrates how ISIS-SR distributes the SID index information in the ISIS TLVs and sub-TLVs.

Figure 23-35: ISIS Neighbor Adj and TLVs

The Prefix SID index, SRGB, and ADJ SID values are populated in the sub-TLVs in the ISIS neighbor updates. Each router then builds its own database of Node (Prefix) segments (Labels) and locally assigned ADJ labels.
Examples

- **The show isis neighbors detail** command on the North Edge router displays the detailed information of all ISIS neighbors.

```
north-edge#show isis neighbors detail

23.4.3 BGP-LU (BGP-SR)

Figure 23-36 illustrates how BGP-LU distributes the label information in BGP.

Figure 23-36: BGP-LU Label Distribution

Figure 23-37 illustrates how BGP-LU distributes the Label SRGB and SID index information in BGP. This is known as BGP-SR.

Figure 23-37: BGP-SR Index and SRGB Distribution
The Prefix SID index, and SRGB values are populated in the TLVs in the BGP neighbor updates. Each router then builds its own database of Node (Prefix) segments (Labels).

**Examples**

- The `show bgp neighbor` command displays BGP-SR neighbors.

```plaintext
north-edge#show bgp neighbor | include BGP neighbor|Multiprotocol IPv4 MplsLabel

BGP neighbor is 192.168.2.10, remote AS 64512, internal link
  Multiprotocol IPv4 MplsLabel: received
BGP neighbor is 192.168.3.9, remote AS 64512, internal link
  Multiprotocol IPv4 MplsLabel: advertised and received and negotiated
BGP neighbor is 192.168.3.10, remote AS 64512, internal link
  Multiprotocol IPv4 MplsLabel: advertised
BGP neighbor is 192.168.58.12, remote AS 2, external link
  Multiprotocol IPv4 MplsLabel: advertised and received and negotiated
BGP neighbor is 192.168.59.12, remote AS 3, external link
```

- The `show ip bgp labeled-unicast 6.6.6.66/32 detail` command displays the detailed information of BGP labeled routes unicast with 6.6.6.66/32.

```plaintext
north-edge(config-if-Et2/1)#show ip bgp labeled-unicast 6.6.6.66/32 detail

23.5 EVPN Type-5 Routes: IP Prefix Advertisement

The EVPN type 2 routes can be used to advertise IP prefixes by making use of the optional IP address and IP address length fields in the route, however they are explicitly linked to the MAC address advertised within the route. The EVPN type-5 route defined within the draft https://tools.ietf.org/html/draft-ietf-bess-evpn-prefix-advertisement-04, provides the ability to decouple the advertisement of an IP prefix from any specific MAC address, providing the ability to support floating IP address, optimize the mechanism for advertising external IP prefixes, and reduce the churn when withdrawing IP prefixes.

Figure 23-38 displays the format of the new type-5 IP-prefix route.

Figure 23-38: EVPN Route Type-5, for Advertisement of IP Prefixes

The IP prefix draft defines a number of specific use cases for the type-5 route, which consequently affect the format and content of the fields within the route. The different deployment scenarios and use cases defined within the draft are summarized below.

- Advertising of IP prefixes behind an appliance, when the appliance is not running a routing protocol and only supporting static routes. This could be the typical use case for a Virtual Firewall with a number of local subnets directly attached, but the firewall is only supporting static routes into the associated EVI.

- Support for active-standby deployment of appliances using a shared floating IP model. This is an extension of the previous case where there is now a virtual IP (or VIP) for clustering the appliances, rather than a dedicated physical IP address on the appliance.

- Support for Layer 2 appliances, acting as a “bump in the wire” with no physical IP addresses configured, where instead of the appliances having an IP next-hop there is only a MAC next-hop.

- IP-VRF to IP-VRF model, which is similar to inter-subnet forwarding for host routes (detailed in the symmetric/asymmetric section), except only Type-5 routes and IP prefixes are advertised, allowing announcement of IP prefixes into a tenant’s EVI domain for external connectivity outside the domain.
### Interface-less

In interface-less mode, the IP prefixes within the type-5 route, whether they are local or learned from a connected router are advertised to remote peers via the shared IP-VRF, as illustrated in the figure below. The IP-VRF to IP-VRF model, is further divided in the draft into three distinct use cases.

**Figure 23-39: EVPN Route Type-5, Interface-less Update**

As illustrated in **Figure 23-39**, the IP prefix (subnet-A) residing behind the router (Rtr-1) is learned via an IGP in EVI-1 on VTEP-1. The prefix is announced and learned by the remote VTEPs residing in the same EVI, via the type-5 route announcement. The type-5 route, is advertised along with the prefix, with a route-target (2000:2000) and a VNI label (2000) equal to the IP-VRF which interconnects the VTEPs in the EVI, the router-mac extended community of the route is used to define the inner DMAC (equal to system MAC of VTEP-1) for any VXLAN frame destined to advertised IP prefix.

From a forwarding perspective, host residing on subnet-B communicating with a host on subnet-A, will send traffic to their default gateway which is the IRB interface on VTEP-2 in VLAN 11/VNI 1011. VTEP-2 performs a route lookup for the destination subnet-A), which has been learned in the IP-VRF with a next-hop of VTEP-1 and VNI label of 2000. The packet is thus VXLAN encapsulated with VNI label of 2000 an inner DMAC of A (VTEP-1 system/router MAC), and routed to VTEP-1, which is the next-hop for the prefix. Receiving the frame, VTEP-1 de-encapsulates the packet, with an inner DMAC of the VTEPs router MAC, it performs a local route lookup for the destination subnet-A), which has been
learned with a next-hop of rtr-1. The frame is forwarded directly to rtr-1, which subsequently routes the packet to the local host on subnet-A. The format of the type-5 route in interface-less mode is illustrated in figure below.

**Figure 23-40: EVPN Type-5 Route Format for Interface-less Mode**

In this model, the VTEPs forming the EVI are interconnected via an IP-VRF, meaning there is no IRB interface (MAC and IP) created for the interconnection on each of the VTEPs, hence the term “interface-less”. With no IRB interface the gateway IP address within the type-5 route is set to zero, traffic is routed to the prefix based on the next-hop of the route (VTEP IP) as well as MAC address conveyed within the Router MAC extended community, which represents the inner destination MAC of the VXLAN encapsulated frame.
23.6 Inter-VRF Local Route Leaking

Inter-VRF local route leaking allows the leaking of routes from one VRF (the source VRF) to another VRF (the destination VRF) on the same router. Inter-VRF routes can exist in any VRF (including the default VRF) on the system. Routes can be leaked using the following methods:

- Inter-VRF local route leaking using BGP VPN
- Inter-VRF local route leaking using VRF-leak agent

23.6.1 Inter-VRF Local Route Leaking using BGP VPN

Inter-VRF local route leaking allows the user to export and import routes from one VRF to another on the same device. This is implemented by exporting routes from a VRF to the local VPN table using route target extended community list and then importing the same route target extended community lists from the local VPN table into the target VRF. VRF route leaking is supported on VPN-IPv4, VPN-IPv6, and EVPN types.

Figure 23-41: Inter-VRF Local Route Leaking using Local VPN Table

Accessing Shared Resources Across VPNs

To access shared resources across VPNs, all the routes from the shared services VRF must be leaked into each of the VPN VRFs and customer routes must be leaked into the shared services VRF for return traffic. Accessing shared resources allows one to export the route target of the shared services VRF into all customer VRFs, and allows the shared services VRF to import route targets from customers A and B. Figure 23-42 shows how to provide customers, corresponding to multiple VPN domains, access to services like DHCP available in the shared VRF.

Route leaking across the VRFs is supported on VPN-IPv4, VPN-IPv6, and EVPN.

Figure 23-42: Accessing Shared Resources Across VPNs
23.6.1.1 Configuring Inter-VRF Local Route Leaking

Inter-VRF local route leaking is configured using VPN-IPv4, VPN-IPv6, and EVPN. Prefixes can be exported and imported using any of the configured VPN types. Ensure that the same VPN type that is exported is used while importing.

Leaking unicast IPv4 or IPv6 prefixes is supported and achieved by exporting prefixes locally to the VPN table and importing locally from the VPN table into the target VRF on the same device as shown in Figure 23-41 using the route-target command.

Exporting or importing the routes to or from the EVPN table is accomplished with the following two methods:

- Using VXLAN for encapsulation
- Using MPLS for encapsulation

Using VXLAN for Encapsulation

To use VXLAN encapsulation type, ensure that VRF to VNI mapping is present and the interface status for the VXLAN interface is up. This is the default encapsulation type for EVPN.

Example:

- The configuration for VXLAN encapsulation type is as follows:

  ```
  switch(config)#router bgp 65001
  switch(config-router-bgp)#address-family evpn
  switch(config-router-bgp-af)#neighbor default encapsulation vxlan next-hop-self
  source-interface Loopback0

  switch(config)#hardware tcam
  switch(config-hw-tcam)#system profile vxlan-routing
  switch(config-hw-tcam)#interface Vxlan1
  switch(config-hw-tcam-if-Vx1)#vxlan source-interface Loopback0
  switch(config-hw-tcam-if-Vx1)#vxlan udp-port 4789
  switch(config-hw-tcam-if-Vx1)#vxlan vrf vrf-blue vni 20001
  switch(config-hw-tcam-if-Vx1)#vxlan vrf vrf-red vni 10001
  ```
Using MPLS for Encapsulation
To use MPLS encapsulation type to export to the EVPN table, MPLS needs to be enabled globally on
the device and the encapsulation method needs to be changed from default type, that is VXLAN to
MPLS under the EVPN address-family sub-mode.

Example:

```
switch(config)#router bgp 65001
switch(config-router-bgp)#address-family evpn
switch(config-router-bgp-af)#neighbor default encapsulation mpls next-hop-self
source-interface Loopback0
```

23.6.1.2 Route-Distinguisher
Route-Distinguisher (RD) is used to uniquely identify routes from a particular VRF. Route distinguisher
is configured for every VRF from which routes are exported from or imported into.

The following commands are used to configure route distinguisher for a vrf.

```
Switch(config-router-bgp)#vrf vrf-services
Switch(config-router-bgp-vrf-vrf-services)#rd 1.0.0.1:1

Switch(config-router-bgp)#vrf vrf-blue
Switch(config-router-bgp-vrf-vrf-blue)#rd 2.0.0.1:2
```

23.6.1.3 Exporting Routes from a VRF
Use the route-target export command to export routes from a VRF to the local VPN or EVPN table
using the route target extended community list.

Examples

- These commands export routes from vrf-red to the local VPN table.

```
switch(config)#service routing protocols model multi-agent
switch(config)#mpls ip
switch(config)#router bgp 65001
switch(config-router-bgp)#vrf vrf-red
switch(config-router-bgp-vrf-vrf-red)#rd 1:1
switch(config-router-bgp-vrf-vrf-red)#route-target export vpn-ipv4 10:10
switch(config-router-bgp-vrf-vrf-red)#route-target export vpn-ipv6 10:20
```

- These commands export routes from vrf-red to the EVPN table.

```
switch(config)#router bgp 65001
switch(config-router-bgp)#vrf vrf-red
switch(config-router-bgp-vrf-vrf-red)#rd 1:1
switch(config-router-bgp-vrf-vrf-red)#route-target export evpn 10:1
```

23.6.1.4 Importing Routes into a VRF
Use the route-target import command to import the exported routes from the local VPN or EVPN table
to the target VRF using the route target extended community list.
Examples

- These commands import routes from the VPN table to vrf-blue.

```plaintext
switch(config)#service routing protocols model multi-agent
switch(config)#mpls ip
switch(config)#router bgp 65001
switch(config-router-bgp)#vrf vrf-blue
switch(config-router-bgp-vrf-vrf-blue)#rd 2:2
switch(config-router-bgp-vrf-vrf-blue)#route-target import vpn-ipv4 10:10
switch(config-router-bgp-vrf-vrf-blue)#route-target import vpn-ipv6 10:20
```

- These commands import routes from the EVPN table to vrf-blue.

```plaintext
switch(config)#router bgp 65001
switch(config-router-bgp)#vrf vrf-blue
switch(config-router-bgp-vrf-vrf-blue)#rd 2:2
switch(config-router-bgp-vrf-vrf-blue)#route-target import evpn 10:1
```

23.6.1.5 Exporting and Importing Routes using Route Map

To manage VRF route leaking, control the prefixes that are exported and imported with route-map export or import commands. The route map is effective only if the VRF paths or the VPN paths are already candidates for export or import. It is mandatory to have the route-target export or import command configured first. Setting BGP attributes using route maps is effective only on the export end.

**Note**

Prefixes that are leaked are not re-exported to the VPN table from the target VRF.

Examples

- These commands export routes from vrf-red to the local VPN table.

```plaintext
switch(config)#service routing protocols model multi-agent
switch(config)#mpls ip
switch(config)#router bgp 65001
switch(config-router-bgp)#vrf vrf-red
switch(config-router-bgp-vrf-vrf-red)#rd 1:1
switch(config-router-bgp-vrf-vrf-red)#route-target export vpn-ipv4 10:10
switch(config-router-bgp-vrf-vrf-red)#route-target export vpn-ipv6 10:20
```

- These commands export routes to from vrf-red to the EVPN table.

```plaintext
switch(config-router-bgp-vrf-vrf-red)#route-target export evpn 10:1
```

- These commands export routes to from vrf-red to the VPN table.

```plaintext
switch(config-router-bgp-vrf-vrf-red)#route-target export evpn route-map EXPORT_V4_ROUTES_T0_VPN_TABLE
switch(config-router-bgp-vrf-vrf-red)#route-target export evpn route-map EXPORT_V6_ROUTES_T0_VPN_TABLE
```

- These commands export routes to from vrf-red to the EVPN table.

```plaintext
switch(config-router-bgp-vrf-vrf-red)#route-target export evpn 10:1
switch(config-router-bgp-vrf-vrf-red)#route-target export evpn route-map EXPORT_ROUTES_T0_EVPN_TABLE
```
Inter-VRF Local Route Leaking

These commands import routes from the VPN table to vrf-blue.

```
switch(config)#service routing protocols model multi-agent
switch(config)#mpls ip
switch(config)#router bgp 65001
switch(config-router-bgp)#vrf vrf-blue
switch(config-router-bgp-vrf-vrf-blue)#rd 1:1
switch(config-router-bgp-vrf-vrf-blue)#route-target import vpn-ipv4 10:10
switch(config-router-bgp-vrf-vrf-blue)#route-target import vpn-ipv6 10:20
switch(config-router-bgp-vrf-vrf-blue)#route-target import vpn-ipv4 route-map IMPORT_V4/routes/vpn_table
switch(config-router-bgp-vrf-vrf-blue)#route-target import vpn-ipv6 route-map IMPORT_V6/routes/vpn_table
```

These commands import routes from the EVPN table to vrf-blue.

```
switch(config)#router bgp 65001
switch(config-router-bgp)#vrf vrf-blue
switch(config-router-bgp-vrf-vrf-blue)#rd 2:2
switch(config-router-bgp-vrf-vrf-blue)#route-target import evpn 10:1
switch(config-router-bgp-vrf-vrf-blue)#route-target import evpn route-map IMPORT/routes/from/evpn_table
```

23.6.2 Inter-VRF Local Route Leaking using VRF-leak Agent

Inter-VRF local route leaking allows the leaking of routes from one VRF to another using route map as a VRF-leak agent. VRFs are leaked based on the preferences assigned to each VRF.

23.6.2.1 Configuring Route Maps

Use router general command to configure route maps to leak routes from one VRF to another. Routes in VRF “VRF1” that match the policy “RM1” are considered for leaking into VRF “VRF2”. If two or more policies specify leaking the same prefix to the same destination VRF, then the route with a higher (post-set-clause) distance and preference is chosen.

Example

```
These commands configure a route-map to leak routes from “VRF1” to “VRF2” using a route-map “RM1”.

switch(config)#router general
switch(config-router-general)#vrf VRF2
switch(config-router-general-vrf-VRF2)#leak routes source-vrf VRF1 subscribe-policy RM1
```
Chapter 23: EVPN

23.7 Configuring EVPN

23.7.1 Configuring BGP-EVPN and VCS on CVX

23.7.1.1 Configuring BGP-EVPN

Configuring VNI Bundle

A vni-aware-bundle represents a MAC-VRF that contains Layer 2 route entries from all VXLAN Network Identifiers (VNI) available across multiple DCs. Use the vni-aware-bundle command available on CVX to create a MAC-VRF.

Note

This command is not available on switches.

Example

```plaintext
cvx(config)#router bgp 100
  cvx(config-router-bgp)#vni-aware-bundle bundle1
  cvx(config-macvrf-bundle1)#
```

Configuring RD and RT in VNI Bundle

Use the rd (Router-BGP VRF and VNI Configuration Modes) command to add a Route Distinguisher (RD) for uniquely identifying Layer 2 routes for the VNI bundle. Use the route-target command to configure a well-known extended community that is attached to the routes exported by BGP-EVPN; and to import routes with the specified well-known extended community into the MAC-VRF that corresponds to the VNI bundle.

Example

```plaintext
cvx(config)#router bgp 100
  cvx(config-router-bgp)#vni-aware-bundle bundle1
  cvx(config-macvrf-bundle1)# rd 530:12
  cvx(config-macvrf-bundle1)# route-target both 530:12
```

Enabling Redistribution of Bridging Information

After the VNI aware bundle is created, use the redistribute service vxlan command to redistribute the Layer 2 bridging information received from VCS.

Example

```plaintext
cvx(config)#router bgp 100
  cvx(config-router-bgp)#vni-aware-bundle bundle1
  cvx(config-macvrf-bundle1)#redistribute service vxlan
```

Disabling Next-Hop Resolution in BGP-EVPN

When BGP-EVPN module receives a route from its BGP peer, it generally tries to resolve the next-hop indicated in the route. However, in the DCI topology, the routes coming from a CVX in another DC contains next-hops (VTEP addresses) that may not be reachable from the CVX receiving the route. Use the next-hop resolution disabled command to disable the next-hop resolution on routes received from BGP-EVPN peers.

Note

CVX is a part of the control plane and it is only connected to the VTEPs in its own DC. It does not have IP connectivity to the VTEPs in a different DC.
Example

```bash
cvx(config)#router bgp 100
cvx(config-router-bgp)#address-family evpn
cvx(config-router-bgp-af)#next-hop resolution disabled
```

23.7.1.2 Configuring VCS

**Enabling Redistribution of BGP-EVPN Routes**

Use the `redistribute bgp evpn vxlan` command to redistribute BGP-EVPN routes to VCS, which, in turn advertises them to all VTEPs within the DC.

**Example**

```bash
cvx(config)#cvx
cvx(config-cvx)#no shutdown
cvx(config-cvx)#service vxlan
cvx(config-cvx-vxlan)#no shutdown
cvx(config-cvx-vxlan)#redistribute bgp evpn vxlan
```
23.8 Sample Configurations

23.8.1 EVPN VXLAN IRB Sample Configuration

In the topology below, we are connecting a Layer 2 site with a layer 3 site using layer 3 EVPN (type-5 route). Right side leaves are MLAG leaves and have SVI 10 in VRF-Blue. A number of directly connected hosts are simulated behind the right side leaf. The left side leaves are individual leaves that connect with a remote switch in vrf VRF-Blue to learn layer 3 routes using BGP. The left side leaves are configured as 2 independent layer 3 only VTEPs.

Figure 23-43: Layer 3 EVPN Configuration

To provide VXLAN routing and bridging between the two MLAG domains, each leaf switch is EVPN peering with the four spine switches via a loopback interface.
eBGP Underlay Configuration: Leaf-11

Underlay configuration is straightforward and all neighbors are eBGP. Since all leaves share the same AS number, the `allowas-in` command was added in the leaf.

```plaintext
interface Ethernet1
    description Spine-1-et1/1
    mtu 9214
    no switchport
    ip address 172.168.1.1/31

interface Ethernet8/1
    description ck428-et8/1
    speed forced 40gfull
    no switchport
    ip address 172.168.1.10/31

interface Loopback0
    ip address 1.1.1.11/32

ip prefix-list loopback
    seq 10 permit 1.1.1.0/24 ge 24
!
route-map loopback permit 10
    match ip address prefix-list loopback

router bgp 65004
neighbor SPINE peer-group
    neighbor SPINE remote-as 65001
    neighbor SPINE allowas-in 1
    neighbor SPINE soft-reconfiguration inbound all
    neighbor SPINE send-community
    neighbor 172.168.1.0 peer-group SPINE
    neighbor 172.168.1.11 remote-as 65003
    redistribute connected route-map loopback
```

eBGP Underlay Configuration: Spine-1

```plaintext
interface Ethernet1/1
    description Leaf-11-et1
    mtu 9214
    no switchport
    ip address 172.168.1.0/31

interface Loopback0
    ip address 1.1.1.1/32
!
ip prefix-list loopback
    seq 10 permit 1.1.1.0/24 ge 24
!
route-map loopback permit 10
    match ip address prefix-list loopback
!
router bgp 65001
    neighbor 172.168.1.1 remote-as 65004
    redistribute connected route-map loopback
```
VRF Configuration: Leaf-11
VRF-Blue is configured on all the left leaves. The left leaves have pure layer 3 interfaces and the right side has SVI 10.

```
vrf instance VRF-Blue
ip routing vrf VRF-Blue

interface Ethernet36
  no switchport
  vrf VRF-Blue
  ip address 172.168.1.9/31

router bgp 65004
  vrf VRF-Blue
    neighbor 172.168.1.8 remote-as 65005
```

VRF Configuration: Leaf-21

```
vlan 10

vrf instance VRF-Blue
ip routing vrf VRF-Blue

interface Vlan10
  vrf VRF-Blue
  ip address virtual 10.10.10.1/24

  ip virtual-router mac-address 00:aa:aa:aa:aa:aa

interface Port-Channel3
  switchport mode trunk
  mlag 3
```

VXLAN Configuration: Leaf-11
Make sure all VTEPs have unique loopback0 addresses to represent unique VTEP identifiers. For every VNI that EVPN receives, a dynamic VLAN is allocated, so it is a good practice to keep the same VNI.

```
interface Vxlan1
  vxlan source-interface Loopback0
  vxlan udp-port 4789
  vxlan vrf VRF-Blue vni 10001
```

VXLAN Configuration: Leaf-21

```
interface Vxlan1
  vxlan source-interface Loopback0
  vxlan udp-port 4789
  vxlan vrf VRF-Blue vni 10001
```
EVPN Configuration: Leaf-11

Leaf establishes the EVPN neighborship with all 4 spines for redundancy. EVPN neighborship is on the loopback address and the `multihop` keyword is used. Make sure to disable the IPv4 address family for EVPN neighbors.

Since the spine is acting like a route-reflector for EVPN routes, make sure to configure the next-hop-unchanged.

```
router bgp 65004
 neighbor SPINE_EVPN peer-group
 neighbor SPINE_EVPN remote-as 65001
 neighbor SPINE_EVPN update-source Loopback0
 neighbor SPINE_EVPN ebgp-multihop 3
 neighbor SPINE_EVPN send-community extended
 neighbor SPINE_EVPN maximum-routes 12000
 neighbor 1.1.1.1 peer-group SPINE_EVPN

 !
 address-family evpn
   neighbor SPINE_EVPN activate
 !
 address-family ipv4
   no neighbor SPINE_EVPN activate
```

EVPN Configuration: Leaf-21

```
router bgp 65002
 neighbor SPINE_EVPN peer-group
 neighbor SPINE_EVPN remote-as 65001
 neighbor SPINE_EVPN update-source Loopback0
 neighbor SPINE_EVPN allowas-in 1
 neighbor SPINE_EVPN ebgp-multihop 3
 neighbor SPINE_EVPN send-community extended
 neighbor SPINE_EVPN maximum-routes 12000
 neighbor 1.1.1.1 peer-group SPINE_EVPN

 !
 address-family evpn
   neighbor SPINE_EVPN activate
 !
 address-family ipv4
   no neighbor SPINE_EVPN activate
```

EVPN Configuration: Spine-1

```
router bgp 65004
 neighbor SPINE_EVPN peer-group
 neighbor SPINE_EVPN remote-as 65001
 neighbor SPINE_EVPN update-source Loopback0
 neighbor SPINE_EVPN ebgp-multihop 3
 neighbor SPINE_EVPN send-community extended
 neighbor SPINE_EVPN maximum-routes 12000
 neighbor 1.1.1.1 peer-group SPINE_EVPN

 !
 address-family evpn
   neighbor SPINE_EVPN activate
 !
 address-family ipv4
   no neighbor SPINE_EVPN activate
```
Advertise VRF Routes in EVPN: Leaf-11

By configuring VRF under router-bgp, you are advertising routes from that VRF into EVPN using the RD/RT. The remote end can install the route by importing the RT.

Leaf-11 has routes in VRF-Blue learned through eBGP with the neighbor down south. Since the routes are already in BGP VRF table, we don't to configure the redistribute command.

```
router bgp 65004
    neighbor SPINE_EVPN peer-group
    neighbor SPINE_EVPN remote-as 65001
    neighbor SPINE_EVPN update-source Loopback0
    neighbor SPINE_EVPN ebgp-multihop 3
    neighbor SPINE_EVPN send-community extended
    neighbor SPINE_EVPN maximum-routes 12000
    neighbor 1.1.1.1 peer-group SPINE_EVPN
!
address-family evpn
    neighbor SPINE_EVPN activate
!
address-family ipv4
    no neighbor SPINE_EVPN activate
```

Advertise VRF Routes in EVPN: Leaf-21

On the other hand Leaf-21 wants to export the connected SVI into EVPN and hence require redistribute connected command.

```
router bgp 65002
    neighbor SPINE_EVPN peer-group
    neighbor SPINE_EVPN remote-as 65001
    neighbor SPINE_EVPN update-source Loopback0
    neighbor SPINE_EVPN allowas-in 1
    neighbor SPINE_EVPN ebgp-multihop 3
    neighbor SPINE_EVPN send-community extended
    neighbor SPINE_EVPN maximum-routes 12000
    neighbor 1.1.1.1 peer-group SPINE_EVPN
!
address-family evpn
    neighbor SPINE_EVPN activate
!
address-family ipv4
    no neighbor SPINE_EVPN activate
```
23.8.2 Multi-Tenant EVPN VXLAN IRB Sample Configuration

The following configuration example shows a deployment using both symmetric and asymmetric IRB with VLAN-based and VLAN-aware bundle services; and eBGP overlay and underlay.

Figure 23-44: Tenant-A: Symmetric IRB
In the symmetric and asymmetric IRB configurations illustrated in the figures above, for Tenant-A, four subnets are stretched across the two MLAG domains with two subnets (VLAN 10, 10.10.10.0/24 and VLAN 11, 10.10.11.0/24) configured as a VLAN-based service, and two other subnets (VLAN 12, 10.10.12.0/24 and VLAN 13, 10.10.13.0/24) as a VLAN-aware bundle service.

For Tenant-B, four subnets are stretched across the two MLAG domains with two subnets (VLAN 210, 10.10.10.0/24 and VLAN 211, 10.10.11.0/24) configured as a VLAN-based service, and two other subnets (VLAN 212, 10.10.12.0/24 and VLAN 213, 10.10.13.0/24) as a VLAN-aware bundle service.

In addition each MLAG domain has a single local subnet (Rack-1 subnet 10.10.20.0/24 and Rack-2 subnet 10.10.21.0/24) for the tenant. To provide direct distributed routing, each leaf switch is configured with the same virtual IP address for the four stretched subnets. For the local-only subnets, the virtual IP address is configured in both physical leaf switches of the relevant MLAG domain.

For each MLAG domain, a logical VTEP is created with the same shared loopback address. For Rack-1, the logical VTEP IP is 2.2.2.1 and for the Rack-2, the logical VTEP IP is 2.2.2.2. Directly connected to each leaf switch is a host, which is a member of one of the two IP subnets. To provide Layer 2 connectivity across the racks, VXLAN bridging is enabled by mapping VLAN to VNIs as detailed in the diagram.

To provide IP connectivity across all subnets both stretched and directly connected, an IP-VRF is shared between the two MLAG domains for the tenant. This is used as a transit network for announcing and forwarding the locally connected subnets. Each leaf switch is EVPN peering with the four spine switches via a loopback interface on the leaf and again on the spine switches. To provide external connectivity, Leaf-11 and Leaf-12 are eBGP peering via the tenants’ VRFs with the border routers. Both core routers are advertising external prefixes for Internet and any remote site connectivity (default route and IP prefixes from the other DC for the tenant). To provide connectivity within the EVPN domain, the leaf switches (Leaf-21 and Leaf-22) re-advertise the prefixes into the tenant’s VRF via a type-5 route advertisement, with a next-hop equal to the advertising VTEP.

**23.8.2.3 VLAN and Distributed IP Address Configuration: Leaf-11 and Leaf-21**

VLAN and interface configuration for VLAN 10 (virtual IP address 10.10.10.254) and VLAN 11 (virtual IP address 10.10.11.254), along with SVIs 12, 13 and 20, are similarly configured. To provide multi-tenancy, the two tenant VLANs are placed in a dedicated VRF, named “Tenant-A.” A further five tenant VLANs are configured and assigned to VRF “Tenant-B.”

The other VLANs are for peering, MLAG, and a unique VLAN SVI. These VLANs do not use virtual IP addresses.

The tenants' stretched subnets (Tenant-A: VLANs 10, 11, 12 and 13; Tenant-B: VLANs 210, 211, 211, 212 and 213) are mapped to unique overlay VXLAN VNIs. The tenants’ IP-VRF (Tenant-A and Tenant-B) is associated with a VNI using the `vxlan vrf` command under the VXLAN interface. In the forwarding model for symmetric IRB, this VNI will be used as the transit VNI for routing to subnets which are not locally configured on the VTEP.

As a standard MLAG configuration, both leaf switches in each MLAG domain share the same logical VTEP IP address. Thus MLAG domain, Rack-1 (Leaf-11 + Leaf-12) has a shared logical VTEP IP of 2.2.2.1 and Rack-2 (Leaf-21 + Leaf-22) has a shared logical VTEP IP of 2.2.2.2

23.8.2.4 VXLAN Interface Configuration: Leaf-11 and Leaf-21

The tenants' VLANs are mapped to unique overlay VXLAN VNIs. VLAN 10 is mapped to VNI 1010 on both MLAG domains, and VLAN 11 is mapped to VNI 1011. As standard MLAG configuration, both leaf switches in each MLAG domain share the same logical VTEP IP address. Thus MLAG domain Rack-1 (Leaf-11 + Leaf-12) has a shared logical VTEP IP of 2.2.2.1 and Rack-2 (Leaf-21 + Leaf-22) has a shared logical VTEP IP of 2.2.2.2. Also configured is the VRF-to-VXLAN mapping for Tenant-A.

Leaf-11 VXLAN Interface Configuration

! interface Loopback1
  ip address 2.2.2.1/32
!
interface Vxlan1
  vxlan source-interface Loopback1
  vxlan udp-port 4789
  vxlan vlan 10 vni 1010
  vxlan vlan 11 vni 1011
  vxlan vlan 12 vni 1012
  vxlan vlan 13 vni 1013
  vxlan vlan 20 vni 1020
  vxlan vlan 210 vni 1210
  vxlan vlan 211 vni 1211
  vxlan vlan 212 vni 1212
  vxlan vlan 213 vni 1213
  vxlan vlan 220 vni 1220
  vxlan vrf tenant-a vni 1000
  vxlan vrf tenant-b vni 1001
Leaf-21 VXLAN Interface Configuration

```
interface Loopback1
  ip address 2.2.2.2/32
!
interface Vxlan1
  vxlan source-interface Loopback1
  vxlan udp-port 4789
  vxlan vlan 10 vni 1010
  vxlan vlan 11 vni 1011
  vxlan vlan 12 vni 1012
  vxlan vlan 13 vni 1013
  vxlan vlan 21 vni 1021
  vxlan vlan 210 vni 1210
  vxlan vlan 211 vni 1211
  vxlan vlan 212 vni 1212
  vxlan vlan 213 vni 1213
  vxlan vlan 221 vni 1221
  vxlan vrf tenant-a vni 1000
  vxlan vrf tenant-b vni 1001
```

Note

This configuration uses VXLAN routing. For single-chip T2 and TH platforms, recirculation must be enabled. For R-Series platforms, the following configuration commands must be added:

- `hardware tcam`
- `system profile vxlan-routing`

Refer to diagrams for VLAN and SVI assignment to tenant; Leaf-11 also has peering out to the border router in addition to the connected SVIs.

23.8.2.5 eBGP Underlay Configuration on the Leaf Switches

The leaf switches for the underlay network peer with each spine on the physical interface. For EVPN route advertisement, the BGP EVPN session is between loopback addresses.

In this case, the underlay is all eBGP, and peering is on the physical interfaces. The MLAG leaves also peer with each other in the underlay to retain BGP EVPN connectivity (loopback reachability) in the very unlikely case that all spine links are down. This is a failover configuration that can be implemented if there is ever the chance a leaf could be “core isolated.” The configuration can be viewed on each leaf using the command `show running-configuration section bgp`.

The examples below show the underlay configuration on all four leaf switches, and also on two of the spine switches as an example of the underlay configuration on the spine.

The configuration uses the following peer groups:

- **SPINE** configuration inherited for underlay (eBGP) peering to the spines
**SPINE_EVPN**  overlay eBGP peering between spine and leaf, using loopbacks

**Figure 23-46: Physical Underlay Topology**
**eBGP Underlay Configuration: Leaf-11**

```conf
ebGP Underlay Configuration: Leaf-11
route-map loopback permit 10
   match ip address prefix-list loopback
!
route-map dont_advertise_loopbacks deny 10
   match ip address prefix-list loopback
!
route-map dont_advertise_loopbacks permit 20
!
ip prefix-list loopback

Chapter 23: EVPN

Sample Configurations

23.8.2.6 EVPN BGP Configuration on the Spine Switches

The EVPN BGP configuration on two of the spine switches is summarized below. Note that only the EVPN BGP sessions are listed for the two spine switches: the BGP underlay configuration is not included.
EVPN BGP Configuration: Spine-1

route-map loopback permit 10
   match ip address prefix-list loopback
!
ip prefix-list loopback
   seq 10 permit 1.1.1.11/32
   seq 20 permit 1.1.1.12/32
   seq 30 permit 1.1.1.22/32
   seq 40 permit 1.1.1.21/32
   seq 50 permit 2.2.2.1/32
   seq 60 permit 2.2.2.2/32
!
router bgp 65001
   router-id 1.1.1.1
   distance bgp 20 200 200
   maximum-paths 8 ecmp 16
   neighbor LEAF peer-group
   neighbor LEAF remote-as 65002
   neighbor LEAF maximum-routes 20000
   neighbor 172.168.1.2 peer-group LEAF
   neighbor 172.168.2.2 peer-group LEAF
   neighbor 172.168.3.2 peer-group LEAF
   neighbor 172.168.4.2 peer-group LEAF
   redistribute connected route-map loopback

EVPN BGP Configuration: Spine-2

route-map loopback permit 10
   match ip address prefix-list loopback
!
ip prefix-list loopback
   seq 10 permit 1.1.1.11/32
   seq 20 permit 1.1.1.12/32
   seq 30 permit 1.1.1.22/32
   seq 40 permit 1.1.1.21/32
   seq 50 permit 2.2.2.1/32
   seq 60 permit 2.2.2.2/32
!
router bgp 65001
   router-id 1.1.1.2
   distance bgp 20 200 200
   maximum-paths 8 ecmp 16
   neighbor LEAF peer-group
   neighbor LEAF remote-as 65002
   neighbor LEAF maximum-routes 20000

   neighbor 172.168.2.2 peer-group LEAF
   neighbor 172.168.3.2 peer-group LEAF
   neighbor 172.168.4.2 peer-group LEAF
   redistribute connected route-map loopback

23.8.2.7 eBGP Overlay on Leaf Switches

The MAC VRFs and IP VRF for the tenants’ subnets are created in the BGP router context with unique Route-Distinguishers (RD) and Route-Targets (RT) attached to each MAC-VRF and IP-VRF. The RDs provide support for overlapping MAC and IP addresses across tenants, while the RTs allow control of the routes imported and exported between MAC VRFs.
To ensure all routes are correctly imported between VTEPs sharing the same Layer-2 domain, the import and export RTs are equal across the two MLAG domains. The `redistribute learned` statement under each MAC VRF ensures any locally learned MACs in the VLAN are automatically announced as type-2 routes.

The IP VRF (Tenant-A) is created on all leaf switches which have subnets attached to the tenant’s VRF with the same route target ensuring that routes are correctly imported and exported between VTEPs in the VRF. On Leaf-21 and Leaf-22, to import the external routes an eBGP session with the BGP peering router is created under the IP VRF (Tenant-A) context, and a peering from each to the other is created on the overlay.

**Note**

All MAC VRFs are unique, and each has its own RT, matched by the other leaves in the DC. The “tenants” as such are defined at layer 3 by assigning SVIs to the appropriate VRF. To view this assignment, use the `show ip route vrf <tenant> connected` command. Note below that VLANs 12-13 and 212-213 (shown in bold) are configured as a bundle-aware EVPN service. Also note the peering from Leaf-11 to the BGP border router in each tenant VRF.
**EVPN BGP Overlay Configuration for the Tenants’ MAC VRFs and IP VRF: Leaf-11**

```conf
route-map loopback permit 10
    match ip address prefix-list loopback

route-map dont_advertise_loopbacks deny 10
    match ip address prefix-list loopback

route-map dont_advertise_loopbacks permit 20

ip prefix-list loopback
    seq 10 permit 1.1.1.11/32
    seq 20 permit 1.1.1.12/32
    seq 30 permit 1.1.1.22/32
    seq 40 permit 1.1.1.21/32
    seq 50 permit 2.2.2.1/32
    seq 60 permit 2.2.2.2/32
