  !
23.8.2.9 Symmetric IRB Configuration (Tenant-A)

In symmetric IRB, the host routes are generated by advertising type-2 routes with both the MAC VRF VNI and the routing (or VRF) VNI. On Leaf-11, the MAC VRFs for Tenant-A are left in their default configuration (i.e., redistributing host routes). The example below shows the configuration for the MAC VRF.

MAC VRF Configuration for Tenant-A: Leaf-11

The `redistribute learned` commands below cause type-2 routes to be advertised with two labels: in VLAN 10, 1010 and 1000; in VLAN 11, 1011 and 1000; in VLAN 21, 1021 and 1000.

```bash
vlan 10
 rd 1.1.1.11:1010
 route-target both 1010:1010
 redistribute learned
!
 vlan 11
 rd 1.1.1.11:1011
 route-target both 1011:1011
 redistribute learned
!
 vlan 21
 rd 1.1.1.11:1021
 route-target both 1021:1021
 redistribute learned
!
```

With this configuration, any locally learned MAC-IP binding on a leaf switch will be advertised as a type-2 route with two labels. For example, on switches Leaf-21 and Leaf-22, any MAC-IP binding locally learned on subnets 10.10.10.0/24, 10.10.11.0/24, or 10.10.21.0/24 will be advertised as type-2 routes with two labels (the MAC VRF of 1010,1011, or 1021 and the IP VRF of 1000) and two route targets equal to the relevant MAC VRF for the host and IP VRF for the tenant (1000:1000). The remote leaf switches (Leaf-11 and Leaf-12), will now learn the host route in the IP VRF.

In addition to advertising the type-2 routes with dual labels, the switch will still advertise type-5 routes. This ensures connectivity to the remote subnet even when no host on the subnet has been learned. With both a layer-2 route and layer-3 host route for Server-3 learned on the MAC VRF(1010) and the IP VRF (1000) on Leaf-11, traffic ingressing on Leaf-11 from the local subnet 10.10.10.103 (i.e., VLAN 10) will be VXLAN bridged based on the MAC VRF entry. Traffic ingressing from outside the subnet (i.e., VLAN 11,12,13, or 20) will be routed to the host via the IP VRF host route.

The VLAN-aware bundle VLAN type-2 routes are advertised with the VNI ID within the update.

The type-5 routes are advertised with the IP VRF Route Distinguisher and the VNI label, signifying that the forwarding path for the prefix would be the IP VRF. The imported routes from the eBGP peering with the BGP border router in Leaf-11 and Leaf-12 are imported by both switches respectively and redistributed via type-5 advertisements to Leaf-21 and Leaf-22.

23.8.2.10 Asymmetric IRB Configuration (Tenant-B)

In asymmetric IRB, the host routes are generated by advertising type-2 routes with just the MAC VRF VNI. On leaf 11, the MAC VRFs for Tenant-B are configured with no redistribute host route within the MAC VRF configuration. The example below shows the configuration for the MAC VRF.
MAC VRF Configuration for Tenant-B: Leaf-11

The **no redistribute host-route** commands below cause type-2 routes to be advertised with a single label: in VLAN 210, 1110; in VLAN 211, 1211; in VLAN 220, 1220; and in the VLAN-aware bundle (Tenant-B-VLAN-212-213), 1212 and 1213.

```
vlan 210
  rd 1.1.1.11:1210
  route-target both 1210:1210
  redistribute learned
  no redistribute host-route
!
vlan 211
  rd 1.1.1.11:1211
  route-target both 1211:1211
  redistribute learned
  no redistribute host-route
!
vlan 220
  rd 1.1.1.11:1220
  route-target both 1220:1220
  redistribute learned
  no redistribute host-route
!
```

```
vlan-aware-bundle Tenant-B-VLAN-212-213
  rd 1.1.1.11:21213
  route-target both 212:213
  redistribute learned
  no redistribute host-route
  vlan 212-213
!
```

With this configuration, any locally learned MAC-IP binding on a leaf switch will be advertised as a type-2 route with a single label. For example, on Leaf-11 and Leaf-12, any MAC-IP binding locally learned on subnets 10.10.10.0/24, 10.10.11.0/24, or 10.10.21.0/24 will be advertised as type-2 routes with a single label, the MAC VRF (1210,1211,1220,1212,1213 or 21111). The IP VRF (1001) still advertises the type-5 prefix routes. This ensures connectivity to the remote subnet even when no host on the subnet has been learned.

The VLAN-aware bundle VLAN type-2 routes are advertised with the VNI ID within the update.

### 23.8.3 EVPN MPLS Sample Configuration

This section describes configuring and verifying BGP VPN which has steps similar to the EVPN VXLAN demonstration. Here, we examine BGP EVPN layer 3 VPN over LDP, Segment Routing (ISIS-SR), and BGP-SR transport LSPs. This highlights the difference between the transport and the VPN overlay service.
23.8.3.1 Layer 3 VPN Over ISIS-SR

Figure 23-47 and Figure 23-48 illustrate the overview of combined control and data planes.

Figure 23-47: Control Plane Tenant-A Over ISIS-SR

Figure 23-48: Control Plane Tenant-B over ISIS-SR
The North Edge router has an eBGP peering session out to leaf-11 and leaf-12 in DC1, while the South Edge router has peerings to leaf-11 and leaf-12 in DC2. Tenant-a has few additional local interfaces used for testing.

**Example**

- The `show ip route vrf tenant-a connected` command displays the interfaces assigned to the tenant-a of North Edge router.

```
north-edge#show ip route vrf tenant-a connected
```

**Activating EVPN**

In all scenarios, the EVPN must be activated under BGP and neighbors configured to exchange Layer 2 VPN/EVPN NLRI. The tenant’s VRF (tenant-a and tenant-b) is associated with a dynamically assigned label by BGP.

An activated EVPN provides the following functionalities:

- Enables the multi-agent routing protocol model, which is required for EVPN support.
- Sets the local autonomous system number to 64512 and configures IBGP neighbors that are activated for the Layer 2 VPN/EVPN address family.
- Sets the EVPN encapsulation type to MPLS.
- Specifies that Loopback0 will be used as the next-hop for all advertised EVPN routes. The underlay configuration must provide MPLS LSPs from remote PEs to this loopback interface address.

Example
- The `service routing protocols model multi-agent` command activates EVPN on the north edge router.
  ```
service routing protocols model multi-agent

router bgp 64512
  router-id 1.1.1.111
  maximum-paths 128 ecmp 128

Layer 3 Overlay Configuration
Distribution of layer 3 routes over BGP is enabled by configuring one or more IP VRFs under the router bgp configuration mode. Additionally, IP routing must be enabled in the VRF.

The VRF is assigned a unique Route-Distinguisher (RD). The RD allows the PE to advertise EVPN routes for the same IP prefix that have been exported by different VRFs. The NLRI RouteKey of a route exported from the VRF’s IPv4 table into EVPN consists of both the RD and the original IP prefix.

The Route-Target (RT) extended communities for the VRF. The RTs are associated with all routes exported from the VRF. Received EVPN type-5 routes carrying at least one RT matching the VRFs configuration are imported into the VRF. The route target directives are configured under the IPv4 or IPv6 address family.
Example

The `vrf tenant-a` and `vrf tenant-a` commands define overlay VRFs (tenant-a and tenant-b) on the VTEP of North Edge router and enables IPv4 routing within them.

```
vrf tenant-a
  rd 1.1.1.1:64512
  route-target import evpn 64512:11
  route-target export evpn 64512:11

Verifying BGP EVPN Layer 3 VPN

Show commands are executed in the North Edge router to view routes to the South Edge router. Execute the same commands in the South Edge router to view vice-versa routes.

Examples

- The `show bgp evpn summary` command displays the status of EVPN peers in North Edge router.

```
north-edge#show bgp evpn summary
BGP summary information for VRF default
Router identifier 1.1.1.111, local AS number 64512
Neighbor Status Codes: m - Under maintenance
     Neighbor  V  AS     MsgRcvd  MsgSent  InQ  OutQ  Up/Down State
         PfxRcd PfxAcc
     2.2.2.222  4  64512    195   127    0    0 01:13:31 Estab 78  78
```

- The `show bgp evpn route-type ip-prefix ipv4 next-hop 6.6.6.6` command displays all BGP EVPN ip prefix routes received from the South Edge router (6.6.6.6). Not all are advertised via the RR 2.2.2.222.
Each entry in the table represents a BGP path. The path specific information includes Route-Distinguisher and IP prefix. Paths are either received from EVPN peers or exported from local VRFs.

</tbody>
</table>
```

Note

EVPN routes are received from router 2.2.2.222 C-List (cluster list - basically identifying this route as from a route-reflector) with originating router being 6.6.6.6.
The `show ip route vrf tenant-b` command displays the BGP table for VRF in tenant-b containing imported EVPN routes.

```
north-edge#show ip route vrf tenant-b
```

Note
If we look at the routes in the VRF for tenant-b, we see that the VPN label has now changed, whilst the transport label for NH 6.6.6.6 is the same. The only difference seen in tenant-b, aside from the different VPN label, is that there are no host-routes in tenant-b because within each DC tenant-b is running in asymmetric mode, therefore no host routes are generated-installed in the IP VRF.
23.8.3.2 Layer 3 EVPN Over LDP

Figure 23-50 and Figure 23-51 illustrate an overview of the combines control and data planes.

**Figure 23-50: Control Plane Tenant-A Over LDP**

**Figure 23-51: Control Plane Tenant-B over LDP**
To switch to using the MPLS LDP transport, we simply need to change the next-hop advertised for EVPN routes. As per Figure 23-51, the next hop needs to be set to loopback 200 to use the LDP LSP. This is simply achieved by configuring the next-hop for EVPN routes on both North Edge and South Edge routes. The output again includes the RD and IP prefix identifying the route. As seen in the output, we now have the NH set to 6.6.6.200 for tenant-a and tenant-b.

```
router bgp 64512
  !
  address-family evpn
  neighbor default encapsulation mpls next-hop-self source-interface Loopback200
```

Once this is configured, we can check the BGP updates and the routes in the VRF.

```
north-edge# show bgp evpn route-type ip-prefix 100.10.11.0/24 detail
BGP routing table information for VRF default
Router identifier 1.1.1.111, local AS number 64512
BGP routing table entry for ip-prefix 100.10.11.0/24, Route Distinguisher: 6.6.6.6:64512
Paths: 1 available
  65006 6.6.6.200 from 2.2.2.222 (2.2.2.222)
    Origin IGP, metric -, localpref 100, weight 0, valid, internal, best
    Extended Community: Route-Target-AS:64512:11 TunnelEncap:tunnelTypeMpls
    MPLS label: 958810
BGP routing table entry for ip-prefix 100.10.11.0/24, Route Distinguisher: 6.6.6.6:64513
Paths: 1 available
  65006 6.6.6.200 from 2.2.2.222 (2.2.2.222)
    Origin IGP, metric -, localpref 100, weight 0, valid, internal, best
    Extended Community: Route-Target-AS:64513:11 TunnelEncap:tunnelTypeMpls
    MPLS label: 953372
```

**Note**

Again, we have the same route in tenant-a and tenant-b in DC2. Hence, the two other routes with RD 6.6.6.6:64513 and RT 64513:11. The VPN label has not changed, reinforcing the fact that the BGP VPN label is orthogonal to the transport label.
Finally, let us look at the routes in the VRF tenant-a.

north-edge#show ip route vrf tenant-a

VRF: tenant-a

Codes: C - connected, S - static, K - kernel,
O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,

B I 100.10.103/32  [200/0]  via 6.6.6.200/32, LDP tunnel index 1, label 958810
     via 192.168.58.12, Ethernet1/1, label 904097
     via 192.168.59.12, Ethernet2/1, label 904098

B I 192.168.168.4/30  [200/0]  via 6.6.6.200/32, LDP tunnel index 1, label 958810
     via 192.168.58.12, Ethernet1/1, label 904097
     via 192.168.59.12, Ethernet2/1, label 904098

C 192.168.168.8/30 is directly connected, Ethernet6/3.1

C 192.168.168.12/30 is directly connected, Ethernet6/2.1

B I 223.255.254.248/30  [200/0]  via 6.6.6.200/32, LDP tunnel index 1, label 958810
     via 192.168.58.12, Ethernet1/1, label 904097
     via 192.168.59.12, Ethernet2/1, label 904098

B I 223.255.254.252/30  [200/0]  via 6.6.6.200/32, LDP tunnel index 1, label 958810
     via 192.168.58.12, Ethernet1/1, label 904097
     via 192.168.59.12, Ethernet2/1, label 904098

     via 192.168.168.10, Ethernet6/3.1

B E 223.255.255.252/30  [200/0]  via 192.168.168.14, Ethernet6/2.1
     via 192.168.168.10, Ethernet6/3.1

Note

As can be seen from the highlighted route above the label stack, the route has the same VPN route 958810, but the transport labels are now 904097 and 904098 on top (this is the ECMP label path to reach NH 6.6.6.200).
As a comparison, let us look at the routes for tenant-b.

```
north-edge#show ip route vrf tenant-b
VRF: tenant-b
Codes: C - connected, S - static, K - kernel,
      0 - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
      E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
      N2 - OSPF NSSA external type2, B I - IBGP, B E - eBGP,
      R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
      O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
      NH - NextHop Group Static Route, V - VXLAN Control Service,
      DH - DHCP client installed default route, M - Martian,
      DP - Dynamic Policy Route

Gateway of last resort:

B E  223.255.255.252/30 [200/0] via 192.168.168.22, Ethernet6/2.2
```

**Note**

The only difference apart from the missing host routes (no host-route inject for this tenant), is the VPN label.
23.8.3.3 Layer 3 EVPN Over BGP-SR

Figure 23-53 and Figure 23-54 illustrate an overview of the combined control and data planes.

Figure 23-53: Control Plane Tenant-a Over BGP-SR

Figure 23-54: Control Plane Tenant-b Over BGP-SR
To switch to using the MPLS BGP-SR transport, we simply need to change the next-hop advertised for the EVPN routes. As per Figure 23-54, the next hop needs to be set to loopback 1 for using the BGP-SR LSP. This is achieved by configuring the next-hop for the EVPN routes.

```
router bgp 64512
    address-family evpn
    neighbor default encapsulation mpls next-hop-self source-interface Loopback1
```

Once the next-hop for the EVPN routes are configured, we can check the BGP updates and the routes in the VRF. The output again includes the RD and IP prefix identifying the route. As seen in the output, we now have the NH set to 6.6.6.66 for tenant-a and tenant-b.

```
North Edge.17:52:30#show bgp evpn route-type ip-prefix 100.10.11.0/24 detail

```

### Note
Again, we have the same route in tenant-a and tenant-b in DC2. Hence, the two other routes with RD 6.6.6.6:64513 and RT 64513:11. The VPN label has not changed, reinforcing the fact that the BGP VPN label is orthogonal to the transport label.
Finally, let us look at the routes in the VRF tenant-a.

North Edge.17:55:01#show ip route vrf tenant-a

VRF: tenant-a
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type 2, B I - IBGP, B E - eBGP,
       R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
       O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
       NG - Nexthop Group Static Route, V - VXLAN Control Service,
       DH - DHCP client installed default route, M - Martian,
       DP - Dynamic Policy Route

Gateway of last resort:
  B I  0.0.0.0/0 [200/0] via 6.6.6.66/32, BGP LU tunnel index 8, label 958810
       via 192.168.58.12, Ethernet1/1, label 200066
       via 192.168.59.12, Ethernet2/1, label 200066

  B E  10.10.103/32 [200/0] via 192.168.168.14, Ethernet6/2.1
       via 192.168.168.10, Ethernet6/3.1

  <------OUTPUT OMITTED FROM EXAMPLE------>
  via 192.168.168.10, Ethernet6/3.1

  B I  100.10.103/32 [200/0] via 6.6.6.66/32, BGP LU tunnel index 8, label 958810
       via 192.168.58.12, Ethernet1/1, label 200066
       via 192.168.59.12, Ethernet2/1, label 200066

  <------OUTPUT OMITTED FROM EXAMPLE------>

  B I  192.168.168.4/30 [200/0] via 6.6.6.66/32, BGP LU tunnel index 8, label 958810
       via 192.168.58.12, Ethernet1/1, label 200066
       via 192.168.59.12, Ethernet2/1, label 200066

  C  192.168.168.8/30 is directly connected, Ethernet6/3.1
  C  192.168.168.12/30 is directly connected, Ethernet6/2.1

  B I  223.255.254.248/30 [200/0] via 6.6.6.66/32, BGP LU tunnel index 8, label 958810
       via 192.168.58.12, Ethernet1/1, label 200066
       via 192.168.59.12, Ethernet2/1, label 200066

  B I  223.255.254.252/30 [200/0] via 6.6.6.66/32, BGP LU tunnel index 8, label 958810
       via 192.168.58.12, Ethernet1/1, label 200066
       via 192.168.59.12, Ethernet2/1, label 200066

       via 192.168.168.10, Ethernet6/3.1

  B E  223.255.255.252/30 [200/0] via 192.168.168.14, Ethernet6/2.1
       via 192.168.168.10, Ethernet6/3.1

As can be seen from the highlighted route above the label stack, the route are the transport labels 958810 and 200066 on top (this is the ECMP label path to reach NH 6.6.6.66), with the tenant-a VPN label 958810 next in the stack, identifying the route as belonging to tenant-a.

As a comparison, let us look at the routes for tenant-b. As seen in the output, the VPN label assigned to tenant-b is 953372.

north-edge#show bgp evpn route-type ip-prefix 100.10.11.0/24 detail

  MPLS label: 953372
north-edge#
If we now look at the routes in the VRF for tenant-b, we see that the VPN label has now changed, whilst the transport label (for NH 6.6.6.66 is the same). The only difference seen in tenant-b, aside from the different VPN label, is that there are no host-routes in tenant-b because within each DC tenant-b is running in asymmetric mode, therefore no host routes are generated/installed in the IP VRF.

north-edge#show ip route vrf tenant-b

Activating IP VPN

In all scenarios, the IP VPN must be activated under BGP and neighbors configured to exchange the IP VPN NLRIs. The tenant's VRF (tenant-d) is associated with a dynamically assigned label by BGP.

**North Edge**

```
service routing protocols model multi-agent

router bgp 64512
  router-id 1.1.1.111
  maximum-paths 128 ecmp 128
  neighbor 2.2.2.222 remote-as 64512
  neighbor 2.2.2.222 update-source Loopback0
  neighbor 2.2.2.222 fall-over bfd
  neighbor 2.2.2.222 send-community extended
  neighbor 2.2.2.222 maximum-routes 12000
  !
  address-family vpn-ipv4
    neighbor 2.2.2.222 activate
    neighbor default encapsulation mpls next-hop-self source-interface Loopback0
  !
  address-family vpn-ipv6
    neighbor 2.2.2.222 activate
    neighbor default encapsulation mpls next-hop-self source-interface Loopback0
```

**South Edge**

```
service routing protocols model multi-agent

router bgp 64512
  router-id 6.6.6.6
  maximum-paths 128 ecmp 128
  neighbor 2.2.2.222 remote-as 64512
  neighbor 2.2.2.222 update-source Loopback0
  neighbor 2.2.2.222 fall-over bfd
  neighbor 2.2.2.222 send-community extended
  neighbor 2.2.2.222 maximum-routes 12000
  !
  address-family vpn-ipv4
    neighbor 2.2.2.222 activate
    neighbor default encapsulation mpls next-hop-self source-interface Loopback0
  !
  address-family vpn-ipv6
    neighbor 2.2.2.222 activate
    neighbor default encapsulation mpls next-hop-self source-interface Loopback0
```

The configuration above provides the following.

It enables the multi-agent routing protocol model, which is required for BGP VPN support.

It sets the local autonomous system number to 64512 and configured the route-reflector for both IPv4 VPN and IPv6 VPN capabilities.
It sets the IP VPN encapsulation type to MPLS (default).
It specifies that Loopback0 will be used as the next-hop for all advertised VPN routes. The underlay configuration must provide MPLS LSPs from remote PEs to this loopback interface address.

**Layer 3 Overlay Configuration**

Distribution of Layer 3 routes over BGP is enabled by configuring one or more IP VRFs under the router bgp configuration mode. Additionally, either IPv4 or IPv6 routing must be enabled in the VRF.

- Configure IP VRF in the North Edge router.

```plaintext
vrf definition tenant-d
ip routing vrf tenant-d
ipv6 unicast-routing vrf tenant-d

router bgp 64512
  vrf tenant-d
    rd 1.1.1.1:64514
    route-target import vpn-ipv4 64512:4364
    route-target import vpn-ipv6 64512:4364
    route-target export vpn-ipv4 64512:4364
    route-target export vpn-ipv6 64512:4364
    neighbor 10.255.255.6 remote-as 65011
    neighbor 10.255.255.6 maximum-routes 12000
    neighbor 2010::6 remote-as 65011
    neighbor 2010::6 maximum-routes 12000
    address-family ipv6
      neighbor 2010::6 activate
      redistribute connected
    !
```

- Configure IP VRF in the South Edge router.

```plaintext
vrf definition tenant-d
ip routing vrf tenant-d
ipv6 unicast-routing vrf tenant-d

router bgp 64512
  vrf tenant-d
    rd 6.6.6.6:64514
    route-target import vpn-ipv4 64512:4364
    route-target import vpn-ipv6 64512:4364
    route-target export vpn-ipv4 64512:4364
    route-target export vpn-ipv6 64512:4364
    neighbor 10.255.255.2 remote-as 65010
    neighbor 10.255.255.2 maximum-routes 12000
    neighbor 2010::2 remote-as 65010
    neighbor 2010::2 maximum-routes 12000
    address-family ipv6
      neighbor 2010::2 activate
      redistribute connected
    !
```

These IP VRF configurations provide the following functionalities:

- It defines overlay VRFs (tenant-d) on the PE and enables IP unicast routing.
- The VRF is assigned a unique Route-Distinguisher (RD). The RD allows the PE to advertise VPN routes for the same IP prefix that have been exported by different VRFs. The NLRI RouteKey of a route exported from the VRFs IPv4 table into VPN consists of both the RD and the original IP prefix.
- The Route-Target (RT) extended communities for the VRF. The RTs are associated with all routes exported from the VRF. Received VPN routes carrying at least one RT matching the VRFs configuration are imported into the VRF.
Verifying IP VPNs over ISIS-SR

- The `show bgp vpn-ipv4 summary` command displays the status of the VPN IP peers in the North Edge router with the BGP VPN enabled.

```
north-edge#show bgp vpn-ipv4 summary
BGP summary information for VRF default
Router identifier 1.1.1.111, local AS number 64512
Neighbor Status Codes: m - Under maintenance
  Neighbor  V  AS           MsgRcvd   MsgSent  InQ OutQ  Up/Down  State
  PfxRcd  PfxAcc
  2.2.2.222        4  64512            172        45    0    0 00:17:16  Estab  2  2
```

- The `show bgp vpn-ipv6 summary` command displays routes sent and received through IP VPN.

```
north-edge# sh bgp vpn-ipv6 summary
BGP summary information for VRF default
Router identifier 1.1.1.111, local AS number 64512
Neighbor Status Codes: m - Under maintenance

```

Note: Each entry in the table represents a BGP path. The path specific information includes the Route-Distinguisher and the IP prefix. Paths are either received from VPN peers or exported from local VRFs.
• The `show bgp vpn-ipv4 206.0.0.0/24 detail` and `show bgp vpn-ipv6 2206::/64 detail` commands display detailed view of the IP prefix route for 206.0.0.0/24 and 2206::/64 of the North Edge router.

```plaintext
north-edge#show bgp vpn-ipv4 206.0.0.0/24 detail
BGP routing table information for VRF default
Router identifier 1.1.1.111, local AS number 64512
BGP routing table entry for IPv4 prefix 206.0.0.0/24, Route Distinguisher: 6.6.6.6:64514
Paths: 1 available
65010
  6.6.6.6 from 2.2.2.222 (2.2.2.222)
    Origin IGP, metric -, localpref 100, weight 0, valid, internal, best
    Extended Community: Route-Target-AS:64512:4364
    MPLS label: 967920
```

```plaintext
north-edge#show bgp vpn-ipv6 2206::/64 detail
BGP routing table information for VRF default
Router identifier 1.1.1.111, local AS number 64512
BGP routing table entry for IPv6 prefix 2206::/64, Route Distinguisher: 6.6.6.6:64514
Paths: 1 available
65010
  6.6.6.6 from 2.2.2.222 (2.2.2.222)
    Origin IGP, metric -, localpref 100, weight 0, valid, internal, best
    Extended Community: Route-Target-AS:64512:4364
    MPLS label: 965242
```

**Note**
The output includes the RD and IP prefix identifying the route. As seen in the output, the IPv4 VPN route is received from 2.2.2.222 because it is set-up to be a route-reflector, but the next hop is 6.6.6.6. Both are advertised with tenant VPN label 967920 and 965242 and an RT.

• The `show ip bgp vrf tenant-d` command displays the BGP table for the VRF containing the imported EVPN routes.

```plaintext
north-edge#show ip bgp vrf tenant-d
BGP routing table information for VRF tenant-d
Router identifier 1.1.1.1, local AS number 64512
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e - ECMP
S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast
% - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop
Network Next Hop        Metric LocPref Weight Path
*  ec 10.255.255.0/30  6.6.6.6   -  100   0   65010 i Or-ID: 6.6.6.6 C-LST: 2.2.2.222
*  ec 10.255.255.0/30  6.6.6.6   -  100   0   65010 i Or-ID: 6.6.6.6 C-LST: 2.2.2.222
*  > 10.255.255.4/30  10.255.255.6   -   100   0   65011 i
*  > 201.0.0.0/24  10.255.255.6   -   100   0   65011 i
*  >Ec 206.0.0.0/24  6.6.6.6   -   100   0   65010 i Or-ID: 6.6.6.6 C-LST: 2.2.2.222
*  ec 206.0.0.0/24  6.6.6.6   -   100   0   65010 i Or-ID: 6.6.6.6 C-LST: 2.2.2.222
```

**Note**
Each entry in the table represents a BGP path that is either locally redistributed and received into the VRF or imported from the IPv4 VPN table. VPN routes are received from router 2.2.2.222 C-List (cluster list - basically identifying this route as from a route-reflector) with originating router being 6.6.6.6.
Finally, let us look at the routes in the VRF tenant-d.

VRF: tenant-d

Gateway of last resort is not set

Note

As displayed in the highlighted route above the label stack, the route is the transport label 408006 on top (this is the label to reach NH 6.6.6.6), with the tenant-a VPN label 967920 next in the stack, identifying the route as belonging to tenant-d.

A check of the Tunnel FIB confirms that 408006 is the ISIS-SR LSP.

</table>
23.8.4.2 IP VPNs Over LDP

Figure 23-61, Figure 23-62, and Figure 23-63 illustrate an overview of the combined control and data planes.

Figure 23-61: IPv4 VPN and IPv6 VPN Over LDP MPLS
To switch to using the MPLS LDP transport, we just need to change the next-hop we advertised for the VPN routes. As per Figure 23-62 and Figure 23-63, the next hop needs to be set to loopback 200 for using the LDP LSP.

This is achieved by configuring the next-hop for the EVPN routes on both north and south edge routers.

```
routing bgp 64512
  address-family evpn
    neighbor default encapsulation mpls next-hop-self source-interface Loopback200
```
Once this is configured, we can check the BGP updates and the routes in the VRF. The output again includes the RD and IP prefix identifying the route. We now have the NH set to 6.6.6.200 for tenant-d.

```bash
north-edge#show bgp vpn-ipv4 206.0.0.0/24 detail
BGP routing table information for VRF default
Router identifier 1.1.1.111, local AS number 64512
BGP routing table entry for IPv4 prefix 206.0.0.0/24, Route Distinguisher: 6.6.6.6:64514
Paths: 1 available
  65010
    6.6.6.200 from 2.2.2.222 (2.2.2.222)
      Origin IGP, metric -, localpref 100, valid, internal, best
      Extended Community: Route-Target-AS:64512:4364
      MPLS label: 967920
```

```bash
north-edge# show bgp vpn-ipv6 2206::/64 detail
BGP routing table information for VRF default
Router identifier 1.1.1.111, local AS number 64512
BGP routing table entry for IPv6 prefix 2206::/64, Route Distinguisher: 6.6.6.6:64514
Paths: 1 available
  65010
    6.6.6.200 from 2.2.2.222 (2.2.2.222)
      Origin IGP, metric -, localpref 100, valid, internal, best
      Extended Community: Route-Target-AS:64512:4364
      MPLS label: 965242
```

**Note**
The VPN label has not changed from the ISIS-SR case above (967920 & 965242), reinforcing the fact that the BGP VPN label is orthogonal to the transport label.

```bash
north-edge#show ip route vrf tenant-d
VRF: tenant-d
Codes: C - connected, S - static, K - kernel,
O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
N2 - OSPF NSSA external type 2, B I - iBGP, B E - eBGP,
R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
NG - Nexthop Group Static Route, V - VXLAN Control Service,
DH - DHCP client installed default route, M - Martian,
DP - Dynamic Policy Route
Gateway of last resort is not set
B I    10.255.255.0/30 [200/0] via 6.6.6.200/32, LDP tunnel index 1, label 967920
  via 192.168.58.12, Ethernet1/1, label 904097
C      10.255.255.4/30 is directly connected, Ethernet6/1.120
B E    201.0.0.0/24 [200/0] via 10.255.255.6, Ethernet6/1.120
B I    206.0.0.0/24 [200/0] via 6.6.6.200/32, LDP tunnel index 1, label 967920
  via 192.168.58.12, Ethernet1/1, label 904097
```

**Note**
As seen from the highlighted route above the label stack, the route are the transport label 904097 on top (this is the label path to reach NH 6.6.6.200), with the tenant-d VPN label 967920 next in the stack, and identifying the route as belonging to tenant-a.
A capture of the dataplane on North-Edge matching on the LDP transport label confirms the encapsulated traffic on the wire. 904097:976920:[Source IP Address][Destination IP Address].
23.8.4.3 IP VPNs Over BGP-SR

Figure 23-64, Figure 23-65, and Figure 23-66 illustrate an overview of the combined control and data planes.

Figure 23-64: IPv4 VPN and IPv6 VPN Over BGP-SR MPLS
To switch to using the MPLS BGP-SR transport, we just need to change the next-hop we advertised for the VPN routes. As per Figure 23-65 and Figure 23-66, the next hop needs to be set to loopback 1 for using the BGP-SR LSP.

This is simply achieved by configuring the next-hop for EVPN routes.

```conf
cisco@PE1:~$ router bgp 64512
   address-family evpn
     neighbor default encapsulation mpls next-hop-self source-interface Loopback1
```
Once this is configured, we can check the BGP updates and the routes in the VRF. The output again includes the RD and IP prefix identifying the route. As seen in the output, we now have the NH set to 6.6.6.66 for tenant-d.

```plaintext
north-edge# show bgp vpn-ipv4 206.0.0.0/24 detail
BGP routing table information for VRF default
Router identifier 1.1.1.111, local AS number 64512
BGP routing table entry for IPv4 prefix 206.0.0.0/24, Route Distinguisher: 6.6.6.6:64514
Paths: 1 available
   65010
      6.6.6.66 from 2.2.2.222 (2.2.2.222)
      Origin IGP, metric -, localpref 100, weight 0, valid, internal, best
      Extended Community: Route-Target-AS:64512:4364
      MPLS label: 967920

north-edge#
```

```plaintext
north-edge# show bgp vpn-ipv6 2206::/64 detail
BGP routing table information for VRF default
Router identifier 1.1.1.111, local AS number 64512

23.9 EVPN and VCS Commands

Router BGP Configuration Mode
- next-hop resolution disabled
- redistribute service vxlan
- route-target
- route-target export
- route-target import
- route-target route-map
- vni-aware-bundle

VCS Commands
- redistribute bgp evpn vxlan

Display Commands
- show bgp evpn
- show ip bgp vrf
- show ip route vrf
- show ipv6 bgp vrf
- show ipv6 route vrf
- show service vxlan address-table
- show vrf leak flapping
**next-hop resolution disabled**

The **next-hop resolution disabled** command disables the next-hop resolution in routes received from BGP-EVPN peers.

The **no next-hop resolution disabled** and the **default next-hop resolution disabled** commands enable the next-hop resolution in routes received from BGP-EVPN peers.

**Command Mode**
Router-BGP Address-Family Configuration

**Command Syntax**

```
  next-hop resolution disabled
```

**Example**

This command disables the next-hop resolution in routes received from BGP-EVPN peers.

```
cvx(config)#router bgp 65002
  cvx(config-router-bgp)#address-family evpn
  cvx(config-router-bgp-af)#next-hop resolution disabled
  cvx(config-router-bgp-af)#
```
**redistribute bgp evpn vxlan**

The `redistribute bgp evpn vxlan` command enables BGP-EVPN routes to be redistributed to VCS which in turn advertises them to all VTEPs within the DC.

The `no redistribute bgp evpn vxlan` and the `default redistribute bgp evpn vxlan` commands disable the redistribution of BGP-EVPN routes to VCS.

**Command Mode**

CVX-VXLAN Configuration

**Command Syntax**

```
redistribute bgp evpn vxlan
```

**Example**

This command enables redistribution of BGP-EVPN routes to VCS.

```
cvx(config)#cvx
cvx(config-cvx)#no shutdown
cvx(config-cvx)#service vxlan
cvx(config-cvx-vxlan)#no shutdown
cvx(config-cvx-vxlan)#redistribute bgp evpn vxlan
```
**redistribute service vxlan**

The `redistribute service vxlan` command enables BGP to redistribute the Layer 2 bridging information received from VCS.

The `no redistribute service vxlan` and the `default redistribute service vxlan` commands disable the redistribution of the bridging information received from VCS.

**Command Mode**

Router-BGP VNI Configuration

**Command Syntax**

```
redistribute service vxlan
```

**Example**

This command enables redistribution of the Layer 2 bridging information received from VCS.

```
cvx(config)#router bgp 100
cvx(config-router-bgp)#vni-aware-bundle bundle1
cvx(config-macvrf-bundle1)#redistribute service vxlan
```
router general

The `router general` command configures a route-map to leak routes from one VRF to another VRF using a route-map named “RM1”.

The `no router general` and `default router general` commands disable the router general configuration from the `running-config`.

**Command Mode**
Router General Configuration

**Command Syntax**
- `router general`
- `no router general`
- `default router general`

**Examples**
- These commands configure a route-map to leak routes from “VRF1” to “VRF2” using a route-map “RM1”.
  ```
  switch(config)#router general
  switch(config-router-general)#vrf VRF2
  switch(config-router-general-vrf-VRF2)#leak routes source-vrf VRF1
  subscribe-policy RM1
  ```
- These commands configure a route-map with the prefix 10.0.0.0/8 and the administrative distance to 10 in the destination VRF.
  ```
  switch(config)#ip prefix-list PL1
  switch(config-ip-pfx)#permit 10.0.0.0/8
  switch(config)#ip route-map RM1
  switch(config-route-map-RM1)#match ip address prefix-list PL1
  switch(config-route-map-RM1)#set distance 10
  ```
**route-target**

The `route-target` command configures a well-known extended community that is used by BGP-EVPN to export routes from or import routes into MAC-VRF.

The `no route-target` and `default route-target` commands delete the route-target configuration.

**Command Mode**

Router-BGP VNI Configuration

**Syntax**

```
route-target {export | import | both} rt
no route-target
default route-target
```

**Parameters**

- **export** configures a well-known extended community that is attached to the routes exported by BGP-EVPN.
- **import** configures a well-known extended community that identifies the received routes that need to be imported into the MAC-VRF specified by the VNI bundle.
- **both** configures the same extended community for import and export of routes.
- **rt** route-target extended community.

**Example**

This command configures a well-known extended community for import and export of routes.

```
cvx(config)#router bgp 100
cvx(config-router-bgp)#vni-aware-bundle bundle1
cvx(config-macvrf-bundle1)#route-target both 503:12
cvx(config-macvrf-bundle1)#
```
route-target export

The `route-target export` command allows the user to export routes from a VRF to the local VPN table using the route target extended community list.

The `no route-target export` and `default route-target export` commands remove the routes from the VPN table.

**Command Mode**
Router-BGP VNI Configuration

**Syntax**
```
route-target export [evpn|vpn-ipv4|vpn-ipv6] <RT>
no route-target export
default route-target export
```

**Parameters**
- `evpn` EVPN address family.
- `vpn-ipv4` MPLS L3 VPN IPv4 unicast address family.
- `vpn-ipv6` MPLS L3 VPN IPv6 unicast address family.
- `RT` route-target extended community.

**Examples**
- These commands export routes from `vrf-red` to the VPN table.
  ```
  switch(config)#service routing protocols model multi-agent
  switch(config)#mpls ip
  switch(config)#router bgp 65001
  switch(config-router-bgp)#vrf vrf-red
  switch(config-router-bgp-vrf-vrf-red)#rd 1:1
  switch(config-router-bgp-vrf-vrf-red)#route-target export vpn-ipv4 10:10
  switch(config-router-bgp-vrf-vrf-red)#route-target export vpn-ipv6 10:20
  ```
- These commands export routes from `vrf-red` to the EVPN table.
  ```
  switch(config)#router bgp 65001
  switch(config-router-bgp)#vrf vrf-red
  switch(config-router-bgp-vrf-vrf-red)#rd 1:1
  switch(config-router-bgp-vrf-vrf-red)#route-target export evpn 10:1
  ```
route-target import

The `route-target import` command allows the user to import route target extended community lists from the local VPN table to the target VRF.

The `no route-target import` and `default route-target import` commands remove the routes from the VPN table.

**Command Mode**
Router-BGP VNI Configuration

**Syntax**
```
route-target import [evpn|vpn-ipv4|vpn-ipv6] <RT>
no route-target import
default route-target import
```

**Parameters**
- `evpn` EVPN address family.
- `vpn-ipv4` MPLS L3 VPN IPv4 unicast address family.
- `vpn-ipv6` MPLS L3 VPN IPv6 unicast address family.
- `RT` route-target extended community.

**Examples**
- These commands import routes from the VPN table to `vrf-blue`.

  ```
  switch(config)#service routing protocols model multi-agent
  switch(config)#mpls ip
  switch(config)#router bgp 65001
  switch(config-router-bgp)#vrf vrf-blue
  switch(config-router-bgp-vrf-vrf-blue)#rd 2:2
  switch(config-router-bgp-vrf-vrf-blue)#route-target import vpn-ipv4 10:10
  switch(config-router-bgp-vrf-vrf-blue)#route-target import vpn-ipv6 10:20
  ```

- These commands import routes from the EVPN table to `vrf-blue`.

  ```
  switch(config)#router bgp 65001
  switch(config-router-bgp)#vrf vrf-blue
  switch(config-router-bgp-vrf-vrf-blue)#rd 2:2
  switch(config-router-bgp-vrf-vrf-blue)#route-target import evpn 10:1
  ```
route-target route-map

The `route-target route-map` command allows the user to export and import route target extended community lists from one VRF to another using route maps.

The `no route-target route-map` and `default route-target route-map` commands remove the routes from the VPN table.

**Command Mode**

Router-BGP VNI Configuration

**Syntax**

```
route-target {import|export} [evpn|vpn-ipv4|vpn-ipv6] route-map RM
no route-target route-map
default route-target route-map
```

**Parameters**

- **evpn**  
  EVVPN address family.

- **vpn-ipv4**  
  MPLS L3 VPN IPv4 unicast address family.

- **vpn-ipv6**  
  MPLS L3 VPN IPv6 unicast address family.

- **RM**  
  route-map extended community.

**Examples**

- These commands export routes from `vrf-red` to the VPN table.
  ```
  switch(config)#service routing protocols model multi-agent
  switch(config)#mpls ip
  switch(config)#router bgp 65001
  switch(config-router-bgp)#vrf vrf-red
  switch(config-router-bgp-vrf-vrf-red)#rd 1:1
  switch(config-router-bgp-vrf-vrf-red)#route-target export vpn-ipv4 10:10
  switch(config-router-bgp-vrf-vrf-red)#route-target export vpn-ipv6 10:20
  switch(config-router-bgp-vrf-vrf-red)#route-target export vpn-ipv4 route-map EXPORT_V4_ROUTES_T0_VPN_TABLE
  switch(config-router-bgp-vrf-vrf-red)#route-target export vpn-ipv6 route-map EXPORT_V6_ROUTES_T0_VPN_TABLE
  ```

- These commands export routes from `vrf-red` to the EVVPN table.
  ```
  switch(config)#router bgp 65001
  switch(config-router-bgp)#vrf vrf-red
  switch(config-router-bgp-vrf-vrf-red)#rd 1:1
  switch(config-router-bgp-vrf-vrf-red)#route-target export evpn 10:1
  switch(config-router-bgp-vrf-vrf-red)#route-target export evpn route-map EXPORT ROUTES_T0_EVPN_TABLE
  ```

- These commands import routes from the VPN table to `vrf-blue`.
  ```
  switch(config)#service routing protocols model multi-agent
  switch(config)#mpls ip
  switch(config)#router bgp 65001
  switch(config-router-bgp)#vrf vrf-blue
  switch(config-router-bgp-vrf-vrf-blue)#rd 1:1
  switch(config-router-bgp-vrf-vrf-blue)#route-target import vpn-ipv4 10:10
  switch(config-router-bgp-vrf-vrf-blue)#route-target import vpn-ipv6 10:20
  switch(config-router-bgp-vrf-vrf-blue)#route-target import vpn-ipv4 route-map IMPORT_V4 ROUTES_VPN_TABLE
  switch(config-router-bgp-vrf-vrf-blue)#route-target import vpn-ipv6 route-map IMPORT_V6 ROUTES_VPN_TABLE
  ```
These commands import routes from the EVPN table to `vrf-blue`.

```
switch(config)#router bgp 65001
switch(config-router-bgp)#vrf vrf-blue
switch(config-router-bgp-vrf-vrf-blue)#rd 2:2
switch(config-router-bgp-vrf-vrf-blue)#route-target import evpn 10:1
switch(config-router-bgp-vrf-vrf-blue)#route-target import evpn route-map IMPORT_ROUTES_FROM_EVPN_TABLE
```
show bgp evpn

The `show bgp evpn` command displays information about the BGP-EVPN routes of the switch.

**Command Mode**
Global Configuration

**Command Syntax**
```
show bgp evpn [community | detail | esi esid | extcommunity | host-flap | instance | large-community AS:nn:nn | next-hop | rd admin:local-assignment | route-type | summary | vni vni_num]
```

**Parameters**
- `<no parameters>` displays all routes of the switch.
- `community` displays routes filtered by the specified community. Options include:
  - `GSHUT` well known GSHUT community.
  - `aa:nn` AS and network number, separated by colon. The value ranges from 1 to `4294967295`.
  - `internet` advertises route to the Internet community.
  - `local-as` advertises route only to local peers.
  - `no-advertise` does not advertise the route to any peer.
  - `no-export` advertises route only within the BGP-EVPN AS boundary
  - `comm_num` community number. Values range from 1 to `4294967040`.
- `detail` displays detailed information of routes.
- `esi esid` displays routes filtered by the specified Ethernet Segment Identifier (ESI).
- `extcommunity` displays routes that match with BGP or VPN extended community list. Options include:
  - `esi-label esid` displays routes filtered by the specified value of ESI label. The value ranges from 0 to `16777215`.
  - `mac-mobility` displays routes filtered by the specified MAC mobility.
  - `router-mac H.H.H` displays routes filtered by the specified router MAC address.
  - `rt` displays routes filtered by the specified route target.
  - `tunnel-encap vxlan` displays routes filtered by the VXLAN tunnel encapsulation.
- `host-flap` displays routes that contains MAC addresses that are blacklisted due to duplication.
- `instance` displays routes with EVPN instances.
- `large-community AS:nn:nn` displays routes filtered by the specified large community.
- `next-hop` displays routes filtered by next-hop IPv4 or IPv6 addresses of remote VTEP.
- `rd admin:local-assignment` displays routes filtered by the specified Route Distinguisher (RD).
- `route-type` displays routes filtered by NLRI route type.
- `summary` displays summary of routes.
- `vni vni_num` displays routes filtered by the specified VXLAN Network Identifier (VNI). Value ranges from 1 to `4294967294`. 
**Example**

- **This command displays BGP-EVPN routes filtered by the VNI 3011.**

  cvx(config-router-bgp-af)#show bgp evpn vni 3011

show ip bgp vrf

The `show ip bgp vrf` command displays the type of VPN from the imported route. It shows an indication that the IPv4 route has been leaked and source VRF information is displayed.

**Command Mode**

Global Configuration

**Command Syntax**

```
show ip bgp vrf {vrf_name | all | default}
```

**Parameters**

- `vrf_name` name of the VRF.
- `all` displays summary of all VRFs.
- `default` default virtual routing and forwarding instance.

**Example**

- This command displays the leaked and source VRF information.

```
switch(config)#show ip bgp 13.0.0.0/24 vrf vrf-blue
BGP routing table information for VRF vrf-blue
Router identifier 5.0.0.2, local AS number 65001
BGP routing table entry for 130.110.61.0/24
   4.0.0.3 from 4.0.0.3 (52.0.0.1), imported EVPN route, RD 400:1
      Origin IGP, metric -, localpref 100, weight 0, valid, external,best
      Extended Community: Route-Target-AS:4000:1 TunnelEncap:tunnelTypeVxlan
      EvpnRouterMac:74:83:ef:0b:70:f3
      Leaked from VRF vrf-red
```
show ipv6 bgp vrf

The show ipv6 bgp vrf command displays the type of VPN from the imported route. It shows an indication that the IPv6 route has been leaked and source VRF information is displayed.

**Command Mode**
Global Configuration

**Command Syntax**

```
show ipv6 bgp vrf {vrf_name | all | default}
```

**Parameters**
- `vrf_name` name of the VRF.
- `all` displays summary of all VRFs.
- `default` default virtual routing and forwarding instance.

**Example**
- This command displays the leaked and source VRF information.

```
switch(config)#show ipv6 bgp 2001:10:1:0::102/64 vrf default
BGP routing table information for VRF default
Router identifier 218.218.218.218, local AS number 34
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E
- ECMP head, e - ECMP
    S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast
% - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop

```
**show ip route vrf**

The *show ip route vrf* command displays leaked prefixes with the label "L" in the output that indicates that the IPv4 route has been leaked. It also displays information about the source VRF from which these prefixes have been leaked.

**Command Mode**
Global Configuration

**Command Syntax**

```
show ip route vrf {vrf_name | all}
```

**Parameters**
- *vrf_name*  name of the VRF.
- *all*  displays summary of all VRFs.

**Example**
- These commands display the OSPF or OSPFV3 leaked routes as “redistribute ospf” and “redistribute ospfv3” are configured on the source VRF vrf-red.

```
switch(config)#show ip route vrf vrf-blue
VRF: vrf-blue
Codes: C - connected, S - static, K - kernel,  
O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,  
E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,  
N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,  
R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,  
O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,  
NG - Nexthop Group Static Route, V - VXLAN Control Service,  
DH - DHCP client installed default route, M - Martian,  
DP - Dynamic Policy Route, L - VRF Leaked
Gateway of last resort is not set
C       5.0.0.2/31 is directly connected, Ethernet14
B L  57.0.0.3/32 [200/0] (source VRF vrf-red) via 4.0.0.3, Ethernet11
B L  45.0.0.1/32 [200/0] (source VRF vrf-red) via 4.0.0.3, Ethernet11
B L  52.0.0.1/32 [200/0] (source VRF vrf-red) via 4.0.0.3, Ethernet11
B L  120.0.0.2/24 [200/0] (source VRF vrf-red) via 4.0.0.3, Ethernet11

B L  130.0.2.0/24 [200/0] (source VRF vrf-red) via 4.0.0.3, Ethernet11
B L  130.0.3.0/24 [200/0] (source VRF vrf-red) via 4.0.0.3, Ethernet11
```
show ipv6 route vrf

The `show ipv6 route vrf` command displays leaked prefixes with the label "L" in the output that indicates that the IPv6 route has been leaked. It also displays information about the source VRF from which these prefixes have been leaked.

**Command Mode**

Global Configuration

**Command Syntax**

```
show ipv6 route vrf {vrf_name | all}
```

**Parameters**

- `vrf_name` name of the VRF.
- `all` displays summary of all VRFs.

**Example**

- These commands display the OSPF or OSPFV3 leaked routes as "redistribute ospf" and "redistribute ospfv3" are configured on the source VRF vrf-red.

```
switch(config)#show ipv6 route vrf vrf-blue
VRF: vrf-blue
Displaying 802 of 802 IPv6 routing table entries
Codes: C - connected, S - static, K - kernel, O3 - OSPFv3, B - BGP, R - RIP, A B - BGP Aggregate, I L1 - IS-IS level 1, I L2 - IS-IS level 2, DH - DHCP, NG - Nexthop Group Static Route, M - Martian, DP - Dynamic Policy Route, L - VRF Leaked

B L  18::1/128  [200/0] (source VRF vrf-red)
  via 4::3, Ethernet11

```
show service vxlan address-table

The show service vxlan address-table command displays route entries in the MAC forwarding table that are added through the CVX.

Command Mode
CVX Global Configuration

Command Syntax
```
show service vxlan address-table {advertised | received} [address H.H.H | evpn | hsc | mss | switch [Word | all] | vni vnid | vtep A.B.C.D]
```

Parameters
- **advertised** displays the advertised route entries in the MAC forwarding table.
- **received** displays the received route entries in the MAC forwarding table.
- **address H.H.H** displays route entries that are filtered by the specified MAC addresses.
- **evpn** displays route entries filtered by BGP-EVPN.
- **hsc** displays route entries filtered by Hardware Switch Controller (HSC).
- **mss** displays route entries filtered by Macro Segmentation Service (MSS).
- **switch** displays route entries that are filtered by the specified switch or all switches. Options include:
  - **Word** Hostname, IP address or ID of the switch.
  - **all** all switches
- **vni vnid** displays route entries filtered by the specified VXLAN Network Identifier (VNI). Value ranges from 1 to 4294967294.
- **vtep A.B.C.D** displays route entries filtered by the specified IP address of the remote Virtual Tunnel End Point (VTEP).

Examples
- This command displays the route entries in MAC forwarding table advertised to BGP-EVPN peers.

```
cvx# show service vxlan address-table advertised evpn
Advertised Mac Address Table
----------------------------------------------
VNI    Mac Address   VTEP        Moves
------- -------------------- --------------- -----
1000    02:01:62:01:00:00 10.0.0.1        1
Total Mac Addresses for this criterion: 1

Advertised Flood Table
----------------------------------------------
VNI    Mac Address    VTEP(s)
------- -------------------- --------------------
1000    02:01:62:01:00:00 10.0.0.1 10.0.0.2
Total Mac Addresses for this criterion: 1
cvx#`
```
• This command displays the route entries in MAC forwarding table received from BGP-EVPN peers.

```plaintext
cvx# show service vxlan address-table received evpn
---------------------------------------------------------------------
Source VNI  Mac Address  VTEP  Moves
----------------- ----------- ----------------- --------------- -----
EVPN 1000 02:01:62:02:00:00 10.0.0.3        1
Total Mac Addresses for this criterion: 1
---------------------------------------------------------------------
Source VNI  Mac Address  VTEP
----------------- ----------- ----------------- ---------------------
EVPN 1000 02:01:62:02:00:00 10.0.0.3
EVPN 1000 00:00:00:00:00:00 10.0.0.4
Total Mac Addresses for this criterion: 2
cvx#v
```
show vrf leak flapping

The `show vrf leak flapping` command displays the flapping prefixes of the routes leaked from one VRF to another VRF. Routes that are detected as “flapping” are blocked considering the future leaking policy execution.

**Command Mode**

EXEC

**Command Syntax**

```
show vrf leak flapping
```

**Parameters**

- `destination` displays flapping prefixes destined to a VRF.
- `prefix` displays flapping routes for a prefix.
- `source` displays flapping prefixes sourced from a VRF.
- `vrf` displays flapping prefixes associated with a VRF

**Example**

- This command displays the flapping prefixes of the leaked routes.

```
switch#show vrf leak flapping
Age Source VRF Destination VRF Prefix Created At
-------- ------------- ----------------- ------------- --------------
141 VRF1 VRF2 10.0.2.0/24 3357281.40992
```
vni-aware-bundle

The `vni-aware-bundle` command configures a BGP MAC-VRF containing Layer 2 routes from a group of VXLAN Network Identifiers (VNI).

**Command Mode**
Router BGP Configuration

**Command Syntax**
```
vni-aware-bundle vni_bundle_name
```

**Parameter**

- `vni_bundle_name`  VNI bundle name.

**Example**

This command configures MAC-VRF BGP to support VNI bundle1.

```
cvx(config)#router bgp 100
cvx(config-router-bgp)#vni-aware-bundle bundle1
cvx(config-macvrf-bundle1)#
```
Chapter 24

ACLs and Route Maps

The switch uses rule-based lists to control packet access to ports and to select routes for redistribution to routing domains defined by dynamic routing protocols. This chapter describes the construction of access control lists (ACLs), prefix lists, and route maps.

This chapter includes the following sections:

- Section 24.1: ACL, Service ACL, Route Map, Prefix List, and RACL Divergence Introduction
- Section 24.2: Access Control Lists
- Section 24.3: Service ACLs
- Section 24.4: RACL Sharing on SVIs
- Section 24.5: Route Maps
- Section 24.6: Prefix Lists
- Section 24.7: ACL, Route Map, and Prefix List Commands

24.1 ACL, Service ACL, Route Map, Prefix List, and RACL Divergence Introduction

Access control lists (ACLs), Service ACLs, route maps, and prefix lists are all processed in order, beginning with the first rule and proceeding until a match is encountered.

An access control list (ACL) is a list of rules that control the inbound flow of packets into Ethernet interfaces, subinterfaces, and port channel interfaces or the switch control plane. The switch supports the implementation of a wide variety of filtering criteria including IP and MAC addresses, TCP/UDP ports with include/exclude options without compromising its performance or feature set. Filtering syntax is industry standard.

A Service ACL is an ACL applied by a control-plane process to control connections to, or packets processed by, the agent process.

A route map is a list of rules that control the redistribution of IP routes into a protocol domain on the basis of such criteria as route metrics, access control lists, next hop addresses, and route tags. Route maps can also alter parameters of routes as they are redistributed.

A prefix list is a list of rules that defines route redistribution access for a specified IP address space. Route maps often use prefix lists to filter routes.

The RACL divergence optimizes the usage of hardware resources occupied on each forwarding ASIC by installing ACLs only on the hardware components corresponding to the member interfaces belonging to the SVIs on which ACL is applied. Hence, saving the hardware resources used and enables RACLs to scale-up to a larger configuration. The show commands are used to display the interface mapping, TCAM entries, and TCAM utilization information.
24.2 Access Control Lists

These sections describe access control lists:

- Section 24.2.1: ACL Description
- Section 24.2.2: ACL Configuration
- Section 24.2.3: Applying ACLs

24.2.1 ACL Description

This section describes ACL composition and function. The switch supports the following ACL types:

- IPv4
- IPv6
- Standard IPv4
- Standard IPv6
- MAC

24.2.1.1 ACL Structure

An ACL is an ordered list of rules that defines access restrictions for the entities (the control plane, or an interface) to which it is applied. ACLs are also used by route maps to select routes for redistribution into specified routing domains.

ACL rules specify the data to which packet contents are compared when filtering data:

- The interface forwards packets that match all commands in a permit rule.
- The interface drops packets that match all commands in a deny rule.
- The interface drops packets that do not match at least one rule.

Upon its arrival at an interface, a packet's fields are compared to the first rule of the ACL applied to the interface. Packets that match the rule are forwarded (permit rule) or dropped (deny rule). Packets that do not match the rule are compared to the next rule in the list. This process continues until the packet either matches a rule or the rule list is exhausted. The interface drops packets not matching a rule.

The sequence number designates the rule's placement in the ACL.

24.2.1.2 ACL Rules

ACL rules consist of a command list that is compared to inbound packet fields. When all of a rule's criteria match a packet's contents, the interface performs the action specified by the rule.

The set of available commands depend on the ACL type and the specified protocol within the rule. The following is a list of commands available for supported ACL types

**IPv4 ACL Rule Parameters**

All rules in IPv4 ACLs include the following criteria:

- **Protocol:** The packet's IP protocol. Valid rule inputs include:
  - Protocol name for a limited set of common protocols.
  - Assigned protocol number for all IP protocols.
- **Source Address:** The packet's source IPv4 address. Valid rule inputs include:
  - a subnet address (CIDR or address-mask). Discontiguous masks are supported.
• a host IP address (dotted decimal notation).
• any to denote that the rule matches all source addresses.

• **Destination Address:** The packet’s destination IP address. Valid rule inputs include:
  • a subnet address (CIDR or address-mask). Discontiguous masks are supported.
  • a host IP address (dotted decimal notation).
  • any to denote that the rule matches all destination addresses.

All rules in IPv4 ACLs *may* include the following criteria:

• **Fragment:** Rules filter on the fragment bit.
• **Time-to-live:** Compares the TTL (time-to-live) value in the packet to a specified value. Valid in ACLs applied to the control plane. Validity in ACLs applied to the data plane varies by switch platform. Comparison options include:
  • **Equal:** Packets match if packet value equals statement value.
  • **Greater than:** Packets match if packet value is greater than statement value.
  • **Less than:** Packets match if packet value is less than statement value.
  • **Not equal:** Packets match if packet value does not equal statement value.

The availability of the following optional criteria depends on the specified protocol:

• **Source Ports / Destination Ports:** A rule filters on ports when the specified protocol supports IP address-port combinations. Rules provide one of these port filtering values:
  • any denotes that the rule matches all ports.
  • A list of ports that matches the packet port. Maximum list size is 10 ports.
  • Negative port list. The rule matches any port not in the list. Maximum list size is 10 ports.
  • Integer (lower bound): The rule matches any port with a number larger than the integer.
  • Integer (upper bound): The rule matches any port with a number smaller than the integer.
  • Range integers: The rule matches any port whose number is between the integers.

• **Flag bits:** Rules filter TCP packets on flag bits.
• **Message type:** Rules filter ICMP type or code.
• **Tracked:** Matches packets in existing ICMP, UDP, or TCP connections. Valid in ACLs applied to the control plane. Validity in ACLs applied to the data plane varies by switch platform.

**IPv6 ACL Rule Parameters**

| **Note** | When calculating the size of ACLs, be aware that Arista switches install four rules in every IPv6 ACL so that ICMPv6 neighbor discovery packets bypass the default drop rule. |

All rules in IPv6 ACLs include the following criteria:

• **Protocol:** All rules filter on the packet’s IP protocol field. Rule input options include:
  • Protocol name for a limited set of common protocols.
  • Assigned protocol number for all IP protocols.
• **Source Address:** The packet’s source IPv6 address. Valid rule inputs include:
  • an IPv6 prefix (CIDR). Discontiguous masks are supported.
  • a host IP address (dotted decimal notation).
  • any to denote that the rule matches all addresses.
• **Destination Address**: The packet’s destination IP address. Valid rule inputs include:
  • a subnet address (CIDR or address-mask). Discontiguous masks are supported.
  • a host IP address (dotted decimal notation).
  • `any` to denote that the rule matches all addresses.

All rules in IPv6 ACLs **may** include the following criteria:

• **Fragment**: Rules filter on the fragment bit.

• **Hop**
  Comparing the packet’s hop-limit value to a specified value. Comparison options include:
  • **Equal**: Packets match if packet value equals statement value.

The availability of the following optional criteria depends on the specified protocol:

• **Source Ports / Destination Ports**: A rule filters on ports when the specified protocol supports IP address-port combinations. Rules provide one of these port filtering values:
  • `any` denotes that the rule matches all ports.
  • A list of ports that matches the packet port. Maximum list size is 10 ports.
  • Negative port list. The rule matches any port not in the list. Maximum list size is 10 ports.
  • Integer (lower bound): The rule matches any port with a number larger than the integer.
  • Integer (upper bound): The rule matches any port with a number smaller than the integer.
  • Range integers: The rule matches any port whose number is between the integers.

• **Flag bits**: Rules filter TCP packets on flag bits.

• **Message type**: Rules filter ICMP type or code.

• **Tracked**: Matches packets in existing ICMP, UDP, or TCP connections. Valid in ACLs applied to the control plane. Validity in ACLs applied to the data plane varies by switch platform.

**Standard IPv4 and IPv6 ACL Rule Parameters**

**Note** When calculating the size of ACLs, be aware that Arista switches install four rules in every IPv6 ACL so that ICMPv6 neighbor discovery packets bypass the default drop rule.

Standard ACLs filter only on the source address.

**MAC ACL Rule Parameters**

MAC ACLs filter traffic on a packet’s layer 2 header. Criteria that MAC ACLs use to filter packets include:

• **Source Address** and **Mask**: The packet’s source MAC address. Valid rule inputs include:
  • MAC address range (address-mask in 3x4 dotted hexadecimal notation).
  • `any` to denote that the rule matches all source addresses.

• **Destination Address** and **Mask**: The packet’s destination MAC address. Valid rule inputs include:
  • MAC address range (address-mask in 3x4 dotted hexadecimal notation).
  • `any` to denote that the rule matches all destination addresses.

• **Protocol**: The packet’s protocol as specified by its EtherType field contents. Valid inputs include:
  • Protocol name for a limited set of common protocols.
  • Assigned protocol number for all protocols.
24.2.1.3 Creating and Modifying Lists

The switch provides configuration modes for creating and modifying ACLs. The command that enters an ACL configuration mode specifies the name of the list that the mode modifies. The switch saves the list to the running configuration when the configuration mode is exited.

- ACLs are created and modified in ACL configuration mode.
- Standard ACLs are created and modified in Standard-ACL-configuration mode.
- MAC ACLs are created and modified in MAC-ACL-configuration mode.

Lists that are created in one mode cannot be modified in any other mode.

A sequence number designates the rule’s placement in a list. New rules are inserted into a list according to their sequence numbers. A rule’s sequence number can be referenced when deleting it from a list.

Section 24.2.2 describes procedures for configuring ACLs.

24.2.1.4 Implementing Access Control Lists

An access control list (ACL) is implemented by assigning the list to an Ethernet interface or subinterface, to a port channel interface, or to the control plane. The switch assigns a default ACL to the control plane unless the configuration contains a valid control-plane ACL assignment statement. Ethernet and port channel interfaces are not assigned an ACL by default. Standard ACLs are applied to interfaces in the same manner as other ACLs.

IPv4 and MAC ACLs are separately applied for inbound and outbound packets. An interface or subinterface can be assigned multiple ACLs, with a limit of one ACL per packet direction per ACL type. Egress ACLs are supported on a subset of all available switches. The control-plane does not support egress ACLs.

Section 24.2.3 describes procedures for applying ACLs to interfaces or the control plane.

24.2.1.5 ACL Rule Tracking

ACL rule tracking determines the impact of ACL rules on the traffic accessing interfaces upon which they are applied. ACLs provide two tracking mechanisms:

- ACL logging: A syslog entry is logged when a packet matches specified ACL rules.
- ACL counters: ACL counters increment when a packet matches a rule in specified ACLs.

**ACL Logging**

ACL rules provide a log option that produces a log message when a packet matches the rule. ACL logging creates a syslog entry when a packet matches an ACL rule where logging is enabled. Packets that match a logging-enabled ACL rule are copied to the CPU by the hardware. These packets trigger the creation of a syslog entry. The information provided in the entry depends on the ACL type or the protocol specified by the ACL. Hardware rate limiting is applied to packets written to the CPU, avoiding potential DoS attacks. The rate of logging is also software limited to avoid the creation of syslog lists that are too large for practical use by human operators.

Section 24.2.2.3 describes procedures for configuring and enabling ACL logging.
ACL Counters

An ACL counter is assigned to each ACL rule. The activity of the ACL counters for rules within a list depend on the list’s counter state. When the list is in counting state, the ACL counter of a rule increments when the rule matches a packet. When the list is in non-counting state, the counter does not increment. A list’s counter state applies to all rules in the ACL. The initial state for new ACLs is non-counting.

When an ACL changes from counting state to non-counting state, or when the ACL is no longer applied to any interfaces that increment counters, counters for all rules in the list maintain their values and do not reset. When the ACL returns to counting mode or is applied to an interface that increments counters, the counter operation resumes from its most recent value.

Counters never decrement and are reset only through CLI commands. Section 24.2.2.3 describes procedures for configuring and enabling ACL counters.

24.2.1.6 AlgoMatch

AlgoMatch enables more flexible and scalable solutions for access control, telemetry, and enforcement networking whether the requirements are an on-premises or hybrid cloud model. By combining power-efficient and low-cost general purpose memory technology with advanced software algorithms, AlgoMatch provides greater scale, performance, and efficiency compared to common standard implementations with merchant silicon systems and TCAM.

In a typical TCAM solution, as additional lookup capacity is added, the power increases in-line with the scale. AlgoMatch utilizes power-efficient searching, only checking locations needed, and as a result lowers power draw by as much as half compared to TCAMs.

AlgoMatch utilizes a flexible and efficient packet matching algorithm with variable lookup sizes, rather than a fixed size lookup with TCAM. This enables full flow matching against source and destination criteria, or parts of the mask, and allows for multiple actions to be performed on a single packet or flow, with user defined filters for packet classification and custom actions in a single pass. A policy with multiple actions is not typically possible with a TCAM solution without using recirculation of chained lookups. However, with AlgoMatch, multiple actions can be applied in a single pass (For example, access control, telemetry, and counters) without losing either features or performance.

AlgoMatch Benefits

- Improved power efficiency: 50 percentage lower.
- Efficient Layer 4 rules: allows enhanced security policy.
- Counters: provide better visibility and flow filtering.

Note

AlgoMatch configuration and show commands are no different from security ACLs. For more information on ACL commands refer Section 24.7: ACL, Route Map, and Prefix List Commands

24.2.2 ACL Configuration

Access control lists are created and modified in an ACL-configuration mode. A list can be edited only in the mode where it was created. The switch provides five configuration modes for creating and modifying access control lists:

- **ACL configuration mode** for IPv4 access control lists.
- **IPv6-ACL configuration mode** for IPv6 access control lists.
- **Std-ACL configuration mode** for Standard IPv4 access control lists.
24.2.2.1 Managing ACLs

Creating and Opening a List

To create an ACL, enter one of the following commands, followed by the name of the list:

- `ip access-list` for IPv4 ACLs.
- `ipv6 access-list` for IPv6 ACLs.
- `ip access-list standard` for standard IPv4 ACLs.
- `ipv6 access-list standard` for standard IPv6 ACLs.
- `mac access-list` for MAC ACLs.

The switch enters the appropriate ACL configuration mode for the list. If the command is followed by the name of an existing ACL, subsequent commands edit that list (see Modifying an ACL for additional information).

Examples

- This command places the switch in ACL configuration mode to create an ACL named `test1`.
  ```
  switch(config)#ip access-list test1
  switch(config-acl-test1)#
  ```

- This command places the switch in Standard-ACL-configuration mode to create a Standard ACL named `stest1`.
  ```
  switch(config)#ip access-list standard stest1
  switch(config-std-acl-stest1)#
  ```

- This command places the switch in MAC-ACL configuration mode to create an MAC ACL named `mtest1`.
  ```
  switch(config)#mac access-list mtest1
  switch(config-mac-acl-mtest1)#
  ```

Saving List Modifications

ACL configuration modes are group-change modes. Changes made in a group-change mode are saved by exiting the mode.

**Important!** After exiting ACL mode, the running-config file must be saved to the startup configuration file to preserve an ACL after a system restart.
Example

- The second example in Adding a Rule (page 1301) results in this edited ACL:

```
switch(config-acl-test1)#show
IP Access List test1
  10 permit ip 10.10.10.0/24 any
  20 permit ip 10.30.10.0/24 host 10.20.10.1
  30 deny ip host 10.10.10.1 host 10.20.10.1
  40 permit ip any any
```

Because the changes were not yet saved, the ACL remains empty, as shown by show ip access-lists.

```
switch(config-acl-test1)#show ip access-lists test1
```

To save all current changes to the ACL and exit ACL configuration mode, type exit.

```
switch(config-acl-test1)#exit
```

```
switch(config)#show ip access-lists test1
```

**Discarding List Changes**

The abort command exits ACL configuration mode without saving pending changes.

Example

- Example 2 in Adding a Rule (page 1301) results in this edited ACL:

```
switch(config-acl-test1)#show
IP Access List test1
  10 permit ip 10.10.10.0/24 any
  20 permit ip 10.30.10.0/24 host 10.20.10.1
  30 deny ip host 10.10.10.1 host 10.20.10.1
  40 permit ip any any
```

To discard the changes, enter abort. If the ACL existed before entering ACL-configuration mode, abort restores the version that existed before entering ACL-configuration mode. Otherwise, show ip access-lists shows the ACL was not created.

```
switch(config-acl-test1)#abort
```

```
switch(config)#
```

### 24.2.2.2 Modifying an ACL

An existing ACL, including those currently applied to interfaces, can be modified by entering the appropriate configuration mode for the ACL as described in Creating and Opening a List. By default, while an ACL is being modified all traffic is blocked on any interface to which the ACL has been applied.

**Permit All Traffic During ACL Update**

Because blocking ports during ACL modifications can result in packet loss and can interfere with features such as routing and dynamic NAT, 7050X, 7060X, 7150, 7250X, 7280, 7280R, 7300X, 7320X, and 7500 series switches can be configured instead to permit all traffic on Ethernet and VLAN interfaces while ACLs applied to those interfaces are being modified. This is done with the hardware access-list update default-result permit command.
These commands add deny rules to the appropriate ACL:

- **deny (IPv4 ACL)** adds a deny rule to an IPv4 ACL.
- **deny (IPv6 ACL)** adds a deny rule to an IPv6 ACL.
- **deny (Standard IPv4 ACL)** adds a deny rule to an IPv4 standard ACL.
- **deny (Standard IPv6 ACL)** adds a deny rule to an IPv6 standard ACL.
- **deny (MAC ACL)** adds a deny rule to a MAC ACL.

These commands add permit rules to the appropriate ACL:

- **permit (IPv4 ACL)** adds a permit rule to an IPv4 ACL.
- **permit (IPv6 ACL)** adds a permit rule to an IPv6 ACL.
- **permit (Standard IPv4 ACL)** adds a permit rule to an IPv4 standard ACL.
- **permit (Standard IPv6 ACL)** adds a permit rule to an IPv6 standard ACL.
- **permit (MAC ACL)** adds a permit rule to a MAC ACL.

### Adding a Rule

To append a rule to the end of a list, enter the rule without a sequence number while in ACL configuration mode for the list. The new rule’s sequence number is derived by adding 10 to the last rule’s sequence number.

### Examples

- This command configures the switch to permit all traffic during ACL modifications on interfaces to which the ACL has been applied. The rules in modified ACLs are applied after exiting ACL configuration mode, and after the ACL rules have been populated in hardware.

  ```plaintext
  switch(config)#hardware access-list update default-result permit
  ```

- These commands enter the first three rules into a new ACL.

  ```plaintext
  switch(config-acl-test1)#permit ip 10.10.10.0/24 any
  switch(config-acl-test1)#permit ip any host 10.20.10.1
  switch(config-acl-test1)#deny ip host 10.10.10.1 host 10.20.10.1
  ```

To view the edited list, type **show**.

```plaintext
switch(config-acl-test1)#show
IP Access List test1
  10 permit ip 10.10.10.0/24 any
  20 permit ip any host 10.20.10.1
  30 deny ip host 10.10.10.1 host 10.20.10.1
```

- This command appends a rule to the ACL. The new rule’s sequence number is 40.

  ```plaintext
  switch(config-acl-test1)#permit ip any any
  switch(config-acl-test1)#show
  IP Access List test1
  10 permit ip 10.10.10.0/24 any
  20 permit ip any host 10.20.10.1
  30 deny ip host 10.10.10.1 host 10.20.10.1
  40 permit ip any any
  ```

### Inserting a Rule

To insert a rule into a ACL, enter the rule with a sequence number between the existing rules’ numbers.
Example

- This command inserts a rule between the first two rules by assigning it the sequence number 15.

```
Switch(config-acl-test1)#15 permit ip 10.30.10.0/24 host 10.20.10.1
Switch(config-acl-test1)#show
IP Access List test1
  10 permit ip 10.10.10.0/24 any
  15 permit ip 10.30.10.0/24 host 10.20.10.1
  20 permit ip any host 10.20.10.1
  30 deny ip host 10.10.10.1 host 10.20.10.1
  40 permit ip any any
```

Deleting a Rule

To remove a rule from the current ACL, perform one of these commands:

- Enter `no`, followed by the sequence number of the rule to be deleted.
- Enter `no`, followed by the rule to be deleted.
- Enter `default`, followed by the rule to be deleted.

Example

- These equivalent commands remove rule 20 from the list.

```
switch(config-acl-test1)#no 20

switch(config-acl-test1)#no permit ip any host 10.20.10.1

switch(config-acl-test1)#default permit ip any host 10.20.10.1
```

This ACL results from entering one of the preceding commands.

```
switch(config-acl-test1)#show
ip access list test1
  10 permit ip 10.10.10.0/24 any
  15 permit ip 10.30.10.0/24 host 10.20.10.1
  30 deny ip host 10.10.10.1 host 10.20.10.1
  40 permit ip any any
```

Resequencing Rule Numbers

Sequence numbers determine the order of the rules in an access control list. After a list editing session where existing rules are deleted and new rules are inserted between existing rules, the sequence number distribution may not be uniform. Resequencing rule numbers changes the sequence number of rules to provide a constant difference between adjacent rules. The `resequence (ACLs)` command adjusts the sequence numbers of ACL rules.
Example

- The `resequence` command renumbers rules in the test1 ACL. The sequence number of the first rule is 100; subsequent rules numbers are incremented by 20.

```
switch(config-acl-test1)#show
IP Access List test1
  10 permit ip 10.10.10.0/24 any
  25 permit ip any host 10.20.10.1
  30 deny ip host 10.10.10.1 host 10.20.10.1
  50 permit ip any any
  90 remark end of list
```

```
switch(config-acl-test1)#resequence 100 20
```

```
switch(config-acl-test1)#show
IP Access List test1
  100 permit ip 10.10.10.0/24 any
  120 permit ip any host 10.20.10.1
  140 deny ip host 10.10.10.1 host 10.20.10.1
  160 permit ip any any
  180 remark end of list
```

24.2.2.3 ACL Rule Tracking Configuration

ACL rules provide a log option that produces a syslog message about the packets matching packet. ACL logging creates a syslog entry when a packet matches an ACL rule with logging enabled.

This feature is currently available on Arad switches and on 7100 series switches. On 7100 series switches, matches are logged only on ingress, not on egress.

Example

- This command creates an ACL rule with logging enabled.

```
switch(config-acl-test1)#15 permit ip 10.30.10.0/24 host 10.20.10.1 log
```

The format of the generated syslog message depends on the ACL type and the specified protocol:

- Messages generated by a TCP or UDP packet matching an IP ACL use this format:

  `IPACCESS: list acl intf filter protocol src-ip(src-port) -> dst-ip(dst-port)`

- Messages generated by ICMP packets matching an IP ACL use this format:

  `IPACCESS: list acl intf filter icmp src-ip(src-port) -> dst-ip(dst-port) type=n code=m`

- Messages generated by all other IP packets matching an IP ACL use this format:

  `IPACCESS: list acl intf filter protocol src-ip -> dst-ip`

- Messages generated by packets matching a MAC ACL use this format:

  `MACACCESS: list acl intf filter vlan ether src_mac -> dst_mac`

- Messages generated by a TCP or UDP packet matching a MAC ACL use this format:

  `MACACCESS: list acl intf filter vlan ether ip-prt src-mac src-ip: src-prt -> dst-mac dst-ip: dst-prt`

- Messages generated by any other IP packet matching a MAC ACL use this format:

  `MACACCESS: list acl intf filter vlan ether src_mac src_ip -> dst_mac dst_ip`

Variables in the syslog messages display the following values:

- `acl` Name of ACL.
Access Control Lists

Chapter 24: ACLs and Route Maps

- `intf` Name of interface that received the packet.
- `filter` Action triggered by ACL (denied or permitted).
- `protocol` IP protocol specified by packet.
- `vlan` Number of VLAN receiving packet.
- `ether` EtherType protocol specified by packet.
- `src-ip` and `dst-ip` source and destination IP addresses.
- `src-prt` and `dst-prt` source and destination ports.
- `src-mac` and `dst-mac` source and destination MAC addresses.

ACLs provide a command that configures its counter state (counting or non-counting). The counter state applies to all rules in the ACL. The initial state for new ACLs is non-counting.

The `counters per-entry (ACL configuration modes)` command places the ACL in counting mode.

- This command places the configuration mode ACL in counting mode.

```
switch(config-acl-test1)#counters per-entry
switch(config-acl-test1)#exit
switch(config-acl-test1)#show ip access-list test1
```

<table>
<thead>
<tr>
<th>IP Access List test1</th>
</tr>
</thead>
<tbody>
<tr>
<td>counters per-entry</td>
</tr>
<tr>
<td>10 permit ip 10.10.10.0/24 any</td>
</tr>
<tr>
<td>20 permit ip any host 10.20.10.1</td>
</tr>
<tr>
<td>30 deny ip host 10.10.10.1 host 10.20.10.1</td>
</tr>
<tr>
<td>40 permit ip any any</td>
</tr>
<tr>
<td>50 remark end of list</td>
</tr>
</tbody>
</table>

The `clear ip access-lists counters` and `clear ipv6 access-lists counters` commands set the IP access list counters to zero for the specified IP access list.

- This command clears the ACL counter for the test1 ACL.

```
switch(config)#clear ip access-lists counters test1
```

24.2.2.4 Displaying ACLs

ACLs can be displayed by a `show running-config` command. The `show ip access-lists` also displays ACL rosters and contents, as specified by command parameters.

When editing an ACL, the `show (ACL configuration modes)` command displays the current or pending list, as specified by command parameters.

**Displaying a List of ACLs**

To display the roster of ACLs on the switch, enter `show ip access-lists` with the `summary` option.
Example

- This command lists the available access control lists.

```
switch(config)#show ip access-list summary
IPV4 ACL default-control-plane-acl
    Total rules configured: 12
    Configured on: control-plane
    Active on    : control-plane

IPV4 ACL list2
    Total rules configured: 3

IPV4 ACL test1
    Total rules configured: 6

IPV4 ACL test_1
    Total rules configured: 1

IPV4 ACL test_3
    Total rules configured: 0

switch(config)#
```

Displaying Contents of an ACL

These commands display ACL contents.

- `show ip access-lists`
- `show ipv6 access-lists`
- `show mac access-lists`

Each command can display the contents of one ACL or of all ACLs of the type specified by the command:

- To display the contents of one ACL, enter `show ip access-lists` followed by the name of the ACL.
- To display the contents of all ACLs on the switch, enter the command without any options.

ACLs that are in counting mode display the number of inbound packets each rule in the list matched and the elapsed time since the last match.

Example

- This command displays the rules in the `default-control-plane-acl` ACL.

```
switch#show ip access-lists default-control-plane-acl
IP Access List default-control-plane-acl [readonly]
    counters per-entry
    10 permit icmp any any
    20 permit ip any any tracked [match 1725, 0:00:00 ago]
    30 permit ospf any any
    40 permit tcp any any eq ssh telnet www snmp bgp https
    50 permit udp any any eq bootps bootpc snmp [match 993, 0:00:29 ago]
    60 permit tcp any any eq mlag ttl eq 255
    70 permit udp any any eq mlag ttl eq 255
    80 permit vrrp any any
    90 permit ahp any any [match 1316, 0:00:23 ago]
   100 permit pim any any
   110 permit igmp any any [match 1316, 0:00:23 ago]
   120 permit tcp any any range 5900 5910
```
• This command displays the rules in all ACLs on the switch.

    switch#show ip access-lists
    IP Access List default-control-plane-acl [readonly]
        counters per-entry
        10 permit icmp any any
        20 permit ip any any tracked [match 1371, 0:00:00 ago]
        30 permit ospf any any
        40 permit tcp any any eq ssh telnet www snmp bgp https
        50 permit udp any any eq bootps bootpc snmp
        60 permit tcp any any eq mlag ttl eq 255
        70 permit udp any any eq mlag ttl eq 255
        80 permit vrrp any any
        90 permit ahp any any
        100 permit pim any any
        110 permit igmp any any [match 1316, 0:00:23 ago]
        120 permit tcp any any range 5900 5910
    IP Access List list2
        10 permit ip 10.10.10.0/24 any
        20 permit ip 10.30.10.0/24 host 10.20.10.1
        30 permit ip any host 10.20.10.1
        40 deny ip host 10.10.10.1 host 10.20.10.1
        50 permit ip any any
    IP Access List test1
        <-------OUTPUT OMITTED FROM EXAMPLE-------->

    Switch(config)#

Displaying ACL Modifications

While editing an ACL in ACL-configuration mode, the show (ACL configuration modes) command provides options for displaying ACL contents.

• To display the list, as modified in ACL configuration mode, enter show or show pending.
• To display the list, as stored in running-config, enter show active.
• To display differences between the pending list and the stored list, enter show diff.

Examples

The examples in this section assume these ACL commands were previously entered.

These commands are stored in the configuration:

    10 permit ip 10.10.10.0/24 any
    20 permit ip any host 10.21.10.1
    30 deny ip host 10.10.10.1 host 10.20.10.1
    40 permit ip any any
    50 remark end of list

The current edit session removed this command. This change is not yet stored to running-config:

    20 permit ip any host 10.21.10.1
**Chapter 24: ACLs and Route Maps**

**Access Control Lists**

*The current edit session added these commands ACL. They are not yet stored to running-config:*

```
20 permit ip 10.10.0.0/16 any
25 permit tcp 10.10.20.0/24 any
45 deny pim 239.24.124.0/24 10.5.8.4/30
```

- This command displays the pending ACL, as modified in ACL configuration mode.

```
switch(config-acl-test_1)#show pending
IP Access List test_1
  10 permit ip 10.10.10.0/24 any
  20 permit ip 10.10.0.0/16 any
  25 permit tcp 10.10.20.0/24 any
  30 deny ip host 10.10.10.1 host 10.20.10.1
  40 permit ip any any
  45 deny pim 239.24.124.0/24 10.5.8.4/30
  50 remark end of list
```

- This command displays the ACL, as stored in the configuration.

```
switch(config-acl-test_1)#show active
IP Access List test_1
  10 permit ip 10.10.10.0/24 any
  20 permit ip any host 10.21.10.1
  30 deny ip host 10.10.10.1 host 10.20.10.1
  40 permit ip any any
  50 remark end of list
```

- This command displays the difference between the saved and modified ACLs.
  - Rules added to the pending list are denoted with a plus sign (+).
  - Rules removed from the saved list are denoted with a minus sign (-).

```
switch(config-acl-test_1)#show diff
---
+++ @@ -1,7 +1,9 @@

### 24.2.2.5 Configuring Per-Port Per-VLAN QoS

To configure per-port per-VLAN QoS, first, configure the ACL policing for QoS, and then apply the policy-map on a single Ethernet or port-channel interfaces on a per-port per-VLAN basis. The per port per VLAN QoS allows a class-map to match traffic for a single VLAN or for a range of VLANs separated by commas. Per-port per-VLAN works with QoS-based class-maps only.

**Platform Compatibility**

- DCS-7010T
- DCS-7050X
- DCS-7250X
- DCS-7250X
- DCS-7280E, DCS-7280R
• DCS-7280E, DCS-7280R
• DCS-7300X
• DCS-7320X
• DCS-7500E, DCS-7500R

Note
To configure per-port per-VLAN QoS on DCS-7280(E/R) and DCS-7500(E/R), change the TCAM profile to QoS as shown below.

Step 1 Change the TCAM profile to QoS.

```
switch(config)#hardware tcam profile qos
```

Step 2 Create an ACL and then match the traffic packets based on the VLAN value and the VLAN mask configured in the ACL.

```
switch(config)#ip access-list acl1
switch(config-acl-acl1)#permit vlan 100 0xfff ip any any
switch(config-acl-acl1)#exit
```

Step 3 Similarly, create a class-map and then match the traffic packets based on the range of VLAN values configured in the class-map.

```
switch(config)#class-map match-any class1
switch(config-cmap-qos-class1)#match vlan 20-40, 1000-1250, 2000
switch(config-cmap-qos-class1)#exit
```

Note In ACLs, the VLAN configuration must have a VLAN mask, whereas the class-map allows the VLAN configuration without a VLAN mask, in such cases use 0xFFF as the default VLAN mask.

24.2.2.6 Displaying Per-Port Per-VLAN QoS

The following show commands display the status, traffic hit counts, tcam profile information, and policy-maps configured on an interface.

• The `show policy-map` command displays the policy-map information of the configured policy-map.

Example

```
switch#show policy-map policy1
Service-policy policy1
Class-map: class1 (match-any)
Match: ip access-group name acl1
Police cir 512000 bps bc 96000 bytes
Class-map: class-default (match-any)
```

• The `show policy-map interface` command displays the policy-map configured on an interface.
Example

```bash
switch# show policy-map interface ethernet 1
Service-policy input: p1
Hardware programming status: Successful
Class-map: c2001 (match-any)
Match: vlan 2001 0xfff
set dscp 4
Class-map: c2002 (match-any)
Match: vlan 2002 0xfff
set dscp 8
Class-map: c2003 (match-any)
Match: vlan 2003 0xfff
set dscp 12
```

24.2.2.7 On DCS-7010, DCS-7050X, DCS7250X, DCS-7300X series switches

- The `show policy-map policy-name counters` command displays the policy-map traffic match count for the policy-map configured.

Example

```bash
switch# show policy-map policy1 counters
Service-policy input: policy1
Hardware programming status: Successful
Class-map: class1 (match-any)
Match: vlan 20-40,1000-1250
police rate 100 mbps burst-size 100 kbytes
Interface: Ethernet16/1
Conformed 28621 packets, 7098008 bytes -------------- packet match count

Class-map: class-default (match-any)
Matched Packets: 19 -------------- packet match count
```

- The `show platform trident tcam [detail]` displays the TCAM entries configured for each TCAM group including policy-maps and corresponding hits.
Example

```
switch#show platform trident tcam

== TCAM summary for switch Linecard0/0 ==
TCAM group 9 uses 42 entries and can use up to 1238 more.
Mlag control traffic uses 4 entries.
CVX traffic uses 6 entries.
L3 Control Priority uses 23 entries.
IGMP Snooping Flooding uses 8 entries.
L4 MicroBfd traffic uses 1 entries.
TCAM group 13 uses 99 entries and can use up to 1181 more.
Dotlx MAB traffic uses 1 entries.
ACL Management uses 10 entries.
Vxlan Traffic uses 24 entries.
L2 Control Priority uses 11 entries.
Storm Control Management uses 2 entries.
ARP Inspection uses 2 entries.
L3 Routing uses 49 entries.
TCAM group 14 uses 12 entries and can use up to 2548 more.
Policy QOS uses 12 entries.
TCAM group 16 uses 59 entries and can use up to 1221 more.
PDP Reserved uses 1 entries.
PDP uses 58 entries.
TCAM group 67 uses 12 entries and can use up to 500 more.
PDP Class Reservation uses 12 entries.
```
Example

```bash
switch#show platform trident tcam detail
=== TCAM detail for switch Linecard0/0 ===
TCAM group 9 uses 42 entries and can use up to 1238 more.
MLag control traffic uses 4 entries.
589826   0 hits - MLAG - SrcPort UDP Entry
589827   0 hits - MLAG - DstPort UDP Entry
589828   0 hits - MLAG - SrcPort TCP Entry
589829   0 hits - MLAG - DstPort TCP Entry
CVX traffic reserves 6 entries (0 used).
L3 Control Priority uses 23 entries.
589836   0 hits - URM - SelfIp UDP Entry
589837   0 hits - URM - SelfIp TCP Entry
589838   0 hits - URM - Ttl1 UDP Entry
589839   0 hits - URM - Ttl1 TCP Entry
589840   0 hits - BGP - Dst Port
589841   0 hits - BGP - Src Port
589842   0 hits - VRRP
589843   0 hits - BFD
589844   0 hits - BFD Multihop
589845   0 hits - PIM
589846   0 hits - PIM Null Register
589847   0 hits - PIM Register
589848   0 hits - OSPF - unicast
589849   71196 hits - OSPFV2 - Multicast
589850   0 hits - OSPFV3 - Multicast
589851   0 hits - OSPF Auth ESP - Multicast
589852   0 hits - OSPF Auth ESP - Unicast
589853   0 hits - IP packets with GRE type and ISIS protocol
589854   0 hits - RouterL3 Vlan Priority 6,7 Elevator
589855   0 hits - RouterL3 DSCP 48-63 Elevator
589856   0 hits - RouterL3 Priority Elevator
589857   0 hits - NextHopToCpu, Glean
589858   0 hits - L3MC Cpu OIF
IGMP Snooping Flooding reserves 8 entries (6 used).
589860   0 hits - Drop All IGMP packets
589861   0 hits - Flood link local packets
589862   0 hits - IGMP Snooping Restricted Flooding L2 from local
mlag peer
589863   0 hits - IGMP Snooping Restricted Flooding L2
589864   0 hits - IGMP Snooping Restricted Flooding L3 from local
mlag peer
589865   0 hits - IGMP Snooping Restricted Flooding L3
L4 MicroBfd traffic reserves 1 entries (0 used).
TCAM group 13 uses 99 entries and can use up to 1181 more.
Dot1x MAB traffic uses 1 entries.
851968   0 hits - Dot1xMab Rule
```

<--------OUTPUT OMITTED FROM EXAMPLE-------->

ck338.22:14:38(config-pmap-qos-policy1)#

24.2.2.8 On DCS-7280(E/R), DCS7500(E/R) series switches

- The `show platform fap [fapName] acl tcam hw` command displays the TCAM entries configured for each TCAM bank including policy-maps and corresponding traffic match.
Example

```
switch#show platform fap Arad1 acl tcam hw
```

```
Arad1 Bank 0 Type: dbPdpIp, dbPdpIp6, dbPdpMpls, dbPdpNonIp, dbPdpTunnel
```

**Chapter 24: ACLs and Route Maps**

Access Control Lists
Access Control Lists (ACLs) are configured to permit or deny traffic between source and destination ports on Strata-based platforms. Mirror ACLs are used in mirroring traffic by matching VLAN ID of the configured ACLs. Mirror ACLs are applied for IPv4, IPv6, and MAC ACLs.

**Note**

Mirror ACLs work in receiving direction only.
Platform Compatibility

Mirror ACLs are supported on the following platforms:

- 7050X
- 7050X2
- 7050X3
- 7060X
- 7060X2
- 7060X3
- 7260X
- 7260X3

Examples

- These commands configure ACL to permit VLAN traffic between any source and destination host.

  ```
  switch(config)#ip access-list acl1
  switch(config-acl-acl1)#permit vlan 1234 0x0 ip any any
  ```

- These commands configure monitor session sess1 with Ethernet 1 as source port and Ethernet 2 as destination port for an ingress ip acl_1.

  ```
  switch(config)#monitor session sess1 source ethernet 1 rx ip access-group acl1
  switch(config)#monitor session sess1 destination ethernet 2
  ```

24.2.3 Applying ACLs

Access control lists become active when they are assigned to an interface or subinterface or to the control plane. This section describes the process of adding and removing ACL interface assignments.

Applying an ACL to an Interface

The switch must be in interface configuration mode to assign an ACL to an interface or subinterface.

- The `ip access-group` command applies the specified IP or standard IP ACL to the configuration mode interface or subinterface.

- The `mac access-group` command applies the specified MAC ACL to the configuration mode interface.

IPv4, IPv6, and MAC ACLs are separately applied for inbound and outbound packets. An interface or subinterface can be assigned with multiple ACLs, with a limit of one ACL per packet direction per ACL type. Egress ACLs are supported on a subset of all available switches. IPv6 egress ACLs have limited availability, and IPv6 egress ACLs applied to routed interfaces or subinterfaces across the same chip on the DCS-7500E and the DCS-7280E series can be shared. In addition to that, the DSCP value can match on IPv6 egress ACLs. This result in a more efficient utilization of system resources, and is particularly useful for environments with few, potentially large, IPv6 egress ACLs applied across multiple routed interfaces.
Example

- These commands assign `test1` ACL to Ethernet interface 3, then verify the assignment.

```
switch(config)#interface ethernet 3
switch(config-if-Et3)#ip access-group test1 in
switch(config-if-Et3)#show running-config interfaces ethernet 3
interface Ethernet3
    ip access-group test1 in
switch(config-if-Et3)#
```

- This command enables shared ACLs.

```
switch(config)#hardware access-list resource sharing vlan ipv6 out
switch(config)#
```

- This command disables shared ACLs.

```
switch(config)#no hardware access-list resource sharing vlan ipv6 out
switch(config)#
```

- These commands apply an IPv4 ACL named “test_ACL” to ingress traffic on Ethernet subinterface 5.1.

```
switch(config)#interface ethernet 5.1
switch(config-if-Et5.1)#ipv4 access-group test_ACL in
switch(config-if-Et5.1)#
```

Removing an ACL from an Interface

The `no ip access-group` command removes an IP ACL assignment statement from `running-config` for the configuration mode interface. After an ACL is removed, the interface is not associated with an IP ACL.

The `no mac ip access-group` command removes a MAC ACL assignment statement from `running-config` for the configuration mode interface. After a MAC ACL is removed, the interface is not associated with an MAC ACL.

To remove an ACL from the control plane, enter the `no ip access-group` command in control plane configuration mode. Removing the control plane ACL command from `running-config` reinstates `default-control-plane-acl` as the control plane ACL.

Examples

- These commands remove the assigned IPv4 ACL from Ethernet interface 3.

```
switch(config)#interface ethernet 3
switch(config-if-Et3)#no ip access-group test in
switch(config-if-Et3)#
```

- These commands place the switch in control plane configuration mode and remove the ACL assignment from `running-config`, restoring `default-control-plane-acl` as the Control Place ACL.

```
switch(config)#control-plane
switch(config-cp)#no ip access-group test_cp in
switch(config-cp)#
```
24.3 Service ACLs

These sections describe Service ACLs:

- Section 24.3.1: Service ACL Description
- Section 24.3.2: Configuring Service ACLs and Displaying Status and Counters

24.3.1 Service ACL Description

Service ACL enforcement is a feature added to a control plane service (the SSH server, the SNMP server, routing protocols, etc) that allows the switch administrator to restrict the processing of packets and connections by the control plane processes that implement that service. The control plane program run by the control plane process checks already received packets and connections against a user configurable access control list (ACL), a Service ACL. The Service ACL contains permit and deny rules matching any of the source address, destination address, and TCP or UDP ports of received packets or connections. After receiving a packet or connection, the control plane process evaluates the packet or connection against the rules of the Service ACL configured for the control plane process, and if the received packet or connection matches a deny rule the control plane process drops or closes it without further processing.

Control Plane Process Enforced Access Control enables the system administrator to restrict which systems on the network can access the services provided by the switch. Each service has its own access control list, giving the system administrator fine grained control over access to the switch's control plane services. The CLI for this uses the familiar pattern of access control lists assigned for a specific purpose, in this case for each control plane service.

24.3.2 Configuring Service ACLs and Displaying Status and Counters

24.3.2.1 SSH Server

To apply the SSH server Service ACLs for IPv4 and IPv6 traffic, use the `ip access-group (Service ACLs)` and `ipv6 access-group (Service ACLs)` commands in mgt-ssh configuration mode as shown below.

```
(config)# management ssh
(config-mgmt-ssh)# ip access-group <acl_name> [vrf <vrf_name>] in
(config-mgmt-ssh)# ipv6 access-group <acl_name> [vrf <vrf_name>] in
```

In EOS 4.19.0, all VRFs are required to use the same SSH server Service ACL. The Service ACL assigned without the `vrf` keyword is applied to all VRFs where the SSH server is enabled.

To display the status and counters of the SSH server Service ACLs, use the following commands.

```
(switch)# show management ssh ip access-list
(switch)# show management ssh ipv6 access-list
```

24.3.2.2 SNMP Server

To apply the SNMP server Service ACLs to restrict which hosts can access SNMP services on the switch, use the `snmp-server community` command as shown below.

```
(config)# snmp-server community <community-name> [view <viewname>] [ro | rw] <acl_name>
(config)# snmp-server community <community-name> [view <viewname>] [ro | rw] ipv6 <ipv6_acl_name>
```
Service ACLs

Chapter 24: ACLs and Route Maps

24.3.2.3 EAPI

To apply Service ACLs to the EOS application programming interface (EAPI) server, use the `ip access-group (Service ACLs)` and `ipv6 access-group (Service ACLs)` commands as shown below.

```
(config)#management api http-commands
(config-mgmt-api-http-cmds)#vrf <vrf_name>
(config-mgmt-api-http-cmds-vrf-<vrf>)#ip access-group <acl_name>
(config-mgmt-api-http-cmds-vrf-<vrf>)#ipv6 access-group <ipv6_acl_name>
```

**Note**

To configure a Service ACL for the EAPI server in the default VRF, use the `vrf default` command to enter the per-VRF configuration mode for the default VRF before using the `ip access-group (Service ACLs)` or `ipv6 access-group (Service ACLs)` command.

To display the status and counters of the EAPI server Service ACLs, use the following commands.

```
(switch)> show management api http-commands ip access-list
(switch)> show management api http-commands ipv6 access-list
```

24.3.2.4 BGP

To apply Service ACLs for controlling connections to the BGP routing protocol agent, use the `ip access-group (Service ACLs)` and `ipv6 access-group (Service ACLs)` commands as shown below.

```
(config)#router bgp <asn>
(config-router-bgp)# ip access-group <acl_name>
(config-router-bgp)# ipv6 access-group <ipv6_acl_name>
(config-router-bgp)# vrf <vrf_name>
(config-router-bgp-vrf-<vrf>)# ip access-group <acl_name>
(config-router-bgp-vrf-<vrf>)# ipv6 access-group <ipv6_acl_name>
```

To display the status and counters of the BGP routing protocol Service ACLs, use the following commands.

```
(switch)> show bgp ipv4 access-list
(switch)> show bgp ipv6 access-list
```

24.3.2.5 OSPF

To apply Service ACLs for controlling packets processed by the OSPF routing protocol agent, use the `ip access-group (Service ACLs)` and `ipv6 access-group (Service ACLs)` commands as shown below.

```
(config)#router ospf <id>
(config-router-ospf)# ip access-group <acl_name>
(config-router-ospf)# ipv6 access-group <ipv6_acl_name>
```

When using VRFs, each per-VRF OSPF instance must be assigned its Service ACL explicitly.

To display the status and counters of the OSPF routing protocol Service ACLs, use the following commands.

```
(switch)> show ospf ipv4 access-list
(switch)> show ospf ipv6 access-list
```
24.3.2.6 PIM

To apply Service ACLs for controlling packets processed by the PIM routing protocol agent, use the `access-group` command as shown below.

```
(config)#router pim
(config-router-pim)#ipv4
(config-router-pim-ipv4)#access-group <acl_name>
(config-router-pim-ipv4)#vrf <vrf_name>
(config-router-pim-vrf-<vrf>)#ipv4
(config-router-pim-vrf-<vrf>-ipv4)#access-group <acl_name>
```

To display the status and counters of the PIM routing protocol Service ACLs, use the following commands.

```
(switch)> show ip pim access-list
```

24.3.2.7 IGMP

To apply Service ACLs for controlling packets processed by the IGMP management protocol agent, use the `ip igmp access-group` command as shown below.

```
(config)# router igmp
(config-router-igmp)# ip igmp access-group <acl_name>
(config-router-igmp)# vrf <vrf_name>
(config-router-igmp-vrf-<vrf>)# ip igmp access-group <acl_name>
```

To display the status and counters of the IGMP management protocol Service ACLs, use the following commands.

```
(switch)> show ip igmp access-list
```

24.3.2.8 DHCP Relay

To apply Service ACLs for controlling packets processed by the DHCP relay agent, use the `ip dhcp relay access-group` and `ipv6 dhcp relay access-group` commands as shown below.

```
(config)# ip dhcp relay access-group <acl_name> [vrf <vrf_name>]
(config)# ipv6 dhcp relay access-group <acl_name> [vrf <vrf_name>]
```

To display the status and counters of the DHCP relay agent Service ACLs, use the following commands.

```
(switch)> show ip dhcp relay access-list
(switch)> show ipv6 dhcp relay access-list
```

24.3.2.9 LDP

To apply Service ACLs for controlling packets and connections processed by the LDP MPLS label distribution protocol, use the `ip access-group (Service ACLs)` command as shown below.

```
(config)# mpls ldp
(config-mpls-ldp)# ip access-group <acl_name>
```

To display the status and counters of the LDP Service ACLs, use the following command.

```
(switch)> show mpls ldp access-list
```
24.3.2.10 LANZ

To apply Service ACLs for controlling connections accepted by the LANZ agent, use the ip access-group (Service ACLs) and ipv6 access-group (Service ACLs) commands as shown below.

```
(config)# queue-monitor streaming
(config-qm-streaming)# ip access-group <acl_name>
(config-qm-streaming)# ipv6 access-group <ipv6_acl_name>
```

To display the status and counters of the LDP Service ACLs, use the following command.

```
(switch)> show queue-monitor streaming access-lists
```

24.3.2.11 MPLS Ping and Traceroute

To apply Service ACLs for controlling connections accepted by the MPLS Ping agent, use the ip access-group (Service ACLs) and ipv6 access-group (Service ACLs) commands as shown below.

```
(config)# mpls ping
(config-mpls-ping)# ip access-group <acl_name> [vrf <vrf_name>]
(config-mpls-ping)# ipv6 access-group <ipv6_acl_name> [vrf <vrf_name>]
```

24.3.2.12 Telnet Server

To apply Service ACLs to the Telnet server, use the ip access-group (Service ACLs) and ipv6 access-group (Service ACLs) commands as shown below.

```
(config)# management telnet
(config-mgmt-telnet)# ip access-group <acl_name> [vrf <vrf_name>] in
(config-mgmt-telnet)# ipv6 access-group <ipv6_acl_name> [vrf <vrf_name>] in
```

In EOS 4.19.0, all VRFs are required to use the same Telnet server Service ACL. The Service ACL assigned without the vrf keyword is applied to all VRFs where the Telnet server is enabled.

To display the status and counters of the LDP Service ACLs, use the following commands.

```
(switch)> show management telnet ip access-list
(switch)> show management telnet ipv6 access-list
```
24.4 RACL Sharing on SVIs

24.4.1 IPv4 Ingress Sharing

The IPv4 ingress sharing optimizes the utilization of hardware resources by sharing the hardware resources between different VLAN interfaces when they have same ACL attached.

Larger deployments are benefited with this function, where IPv4 ingress sharing is applied on multiple SVIs with member interfaces on same forwarding ASIC. For example, a trunk port carrying multiple VLANS and an ingress sharing is applied on all VLANS, it occupies lesser hardware resources irrespective of number of VLANS. By default, IPv4 ingress sharing is disabled on the switches.

To enable IPv4 Ingress Sharing use \[\text{no hardware access-list resource sharing vlan in}\] command. Note, enabling or disabling the IPv4 ingress sharing requires the restart of software agents on the switches which is a disruptive process and will impact the traffic forwarding. The \text{no} form of the command disables the IPv4 ingress sharing on the switch. To display the IPv4 ingress sharing information use \text{show platform trident} command on the switch.

24.4.2 IPv4 Egress Sharing

The IPv4 Egress Sharing optimizes the utilization of hardware resources by sharing TCAM entries for a group of SVIs on which IPv4 ACLs shared. The TCAM entries are shared for all the SVIs per chip, hence, saving a lot of hardware resources and enabling ACLs to scale to a larger configurations.

Larger deployments are benefited, where IPv4 Egress Sharing is applied on multiple SVIs with member interfaces on same forwarding ASIC. For example, a trunk port carrying multiple VLANS, and when Egress Sharing is applied on all VLANS it occupies lesser hardware resources irrespective of number of VLANS. By default, IPv4 Egress Sharing is enabled on the switches. However, both IPv4 Egress Sharing and uRPF cannot be enabled at the same time. Disabling IPv4 RACL sharing will allow uRPF configuration and make sure RACL configuration, non-shared mode, is configured at the same time.

To enable unicast Reverse Path Forwarding (uRPF) on the switch, the IPv4 Egress Sharing must me disabled using the \text{no hardware access-list resource sharing vlan ipv4 out} command.

To enable IPv4 Egress Sharing if previously disabled from the default configuration, use \text{hardware access-list resource sharing vlan ipv4 out} command. Note, enabling or disabling the IPv4 Egress Sharing requires the restart of software agents on the switches which is a disruptive process and will impact the traffic forwarding.

The following show commands can be used to verify the IPv4 Egress Sharing information on the switch.

- \text{show ip access-lists}
- \text{show vlan}
- \text{show platform arad acl tcam}
- \text{show ip route}
- \text{show platform arad ip route}

24.4.3 Configuring IPv4 Egress Sharing

Use \text{hardware access-list resource sharing vlan ipv4 out} command to enable the IPv4 Egress Sharing on the switch. By default, IPv4 Egress Sharing is enabled on the switch. The \text{no} form of the command disables the IPv4 Egress Sharing on the switch and user is allowed to configure the uRPF on the switch.
24.4.4 Displaying IPv4 Egress Sharing Information

Examples

- **The show ip access-lists command** displays the list of all the configured IPv4 ACLs.

  ```
  switch#show ip access-lists summary
  IPv4 ACL default-control-plane-acl [readonly]
  Total rules configured: 17
  Configured on Ingress: control-plane(default VRF)
  Active on Ingress: control-plane(default VRF)
  
  IPV4 ACL ipAclLimitTest
  Total rules configured: 0
  Configured on Egress: Vl2148,2700
  Active on Egress: Vl2148,2700
  ```

- **The show vlan command** displays the list of all the member interfaces under each SVI.

  ```
  switch#show vlan
  VLAN  Name                             Status    Ports
  ----- -------------------------------- --------- -------------------------------
  1     default                           active
  2148  VLAN2148                          active    Cpu, Et1, Et26
  2700  VLAN2700                          active    Cpu, Et18
  ```

- **The show platform arad acl tcam command** displays the number of TCAM entries (hardware resources) occupied by the ACL on each forwarding ASIC and the percentage of TCAM utilization per forwarding ASIC.

  ```
  switch#show platform arad acl tcam detail
  ip access-list ipAclLimitTest (Shared RACL, 0 rules, 1 entries, direction out, state success, Acl Label 2)
  Fap: Arad0, Shared: true, Interfaces: Vl2148, Vl2700
  Bank Offset Entries
  0    0     1
  Fap: Arad1, Shared: true, Interfaces: Vl2148
  Bank Offset Entries
  0    0     1
  ```

  ```
  switch#show platform arad acl tcam summary
  The total number of TCAM lines per bank is 1024.
  ==============================================================
  Arad0:
  ==============================================================
  Bank  Used Used % Used By
  0    1    0     IP Egress PACLs/RACLs
  Total Number of TCAM lines used is: 1
  ==============================================================
  Arad1:
  ==============================================================
  Bank  Used Used % Used By
  0    1    0     IP Egress PACLs/RACLs
  Total Number of TCAM lines used is: 1
  ```
The **show ip route** command displays the unicast ip routes installed in the system.

```
switch# show ip route
VRF name: default
Codes: C - connected, S - static, K - kernel,
      O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
      E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
      N2 - OSPF NSSA external type 2, B I - iBGP, B E - eBGP,
      R - RIP, I - ISIS, A B - BGP Aggregate, A O - OSPF Summary,

24.5 Route Maps

A route map is an ordered set of rules that control the redistribution of IP routes into a protocol domain on the basis of such criteria as route metrics, access control lists, next hop addresses, and route tags. Route maps can also alter parameters of routes as they are redistributed.

These sections describe the route map implementation:

- **Section 24.5.1** describes route maps.
- **Section 24.5.2** describes the route map configuration process.
- **Section 24.5.3** describes the usage of route maps.

24.5.1 Route Map Description

Route maps are composed of route map statements, each of which consists of a list of match and set commands.

**Route Map Statements**

Route map statements are categorized by the resolution of routes that the statement filters.

- Permit statements facilitate the redistribution of matched routes.
- Deny statements prevent the redistribution of matched routes.

Route map statement elements include name, sequence number, filter type, match commands, set commands, and continue commands.

- **name** identifies the route map to which the statement belongs.
- **sequence number** designates the statement’s placement within the route map.
- **filter type** specifies the route resolution. Valid types are **permit** and **deny**.
- **match commands** specify criteria that select routes that the statement is evaluating for redistribution.
- **set commands** modify route parameters for redistributed routes.
- **continue commands** prolong the route map evaluation of routes that match a statement.

Statements filter routes for redistribution. Routes that statements pass are redistributed (permit statements) or rejected (deny statements). Routes that statements fail are filtered by the next statement in the route map.

- When a statement does not contain a **match** command, the statement passes all routes.
- When a statement contains a single **match** command that lists a single object, the statement passes routes whose parameters match the object.
- When a statement contains a single **match** command that lists multiple objects, the statements pass routes whose parameters match at least one object.
- When a statement contains multiple **match** commands, the statement passes routes whose parameters match all match commands.

**Set commands** modify parameters for redistributed routes. Set commands are valid in permit statements.
Example

- The following route map statement is named MAP_1 with sequence number 10. The statement matches all routes from BGP Autonomous System 10 and redistributes them with a local preference set to 100. Routes that do not match the statement are evaluated against the next statement in the route map.

  switch#route-map MAP_1 permit 10
  match as 10
  set local-preference 100

Route Maps with Multiple Statements

A route map consists of statements with the same name and different sequence numbers. Statements filter routes in ascending order of their sequence numbers. When a statements passes a route, the redistribution action is performed as specified by the filter type and all subsequent statements are ignored. When the statement fails the route, the statement with the smallest sequence number that is larger than the current one filters the route.

All route maps have an implied final statement that contains a single deny statement with no match command. This denies redistribution to routes that are not passed by any statement.

Example

- The following route map is named MAP_1 with two permit statements. Routes that do not match either statement are denied redistribution into the target protocol domain.

  switch#route-map MAP_1 permit 10
  match as 10
  set local-preference 100

  switch#route-map MAP_1 permit 20
  match metric-type type-1
  match as 100

Section 24.5.2 describes route map configuration procedures.

Route Maps with Multiple Statements and Continue Commands

Route map statements that contain a continue (route map) command support additional route map evaluation of routes whose parameters meet the statement’s match commands. Routes that match a statement containing a continue command are evaluated against the statement specified by the continue command.

When a route matches multiple route map statements, the filter action (deny or permit) is determined by the last statement that the route matches. The set commands in all statements matching the route are applied to the route after the route map evaluation is complete. Multiple set commands are applied in the same order by which the route was evaluated against the statements containing them.
Example

- The following route map is named MAP_1 with a permit statement and a deny statement. The permit statement contains a continue command. Routes that match statement 10 are evaluated against statement 20.

```plaintext
route-map MAP_2 permit 10
  match as 10
  continue 20
  set local-preference 100
!
route-map MAP_2 deny 20
  match metric-type type-1
  match as 100
```

The route is redistributed if it passes statement 10 and is rejected by statement 20. The route is denied redistribution in all other instances. The `continue` command guarantees the evaluation of all routes against both statements.

24.5.2 Route Map Configuration

Route maps are created and modified in route map configuration mode. These sections describe the configuration mode and its commands.

- Section 24.5.2.1: Route Map Creation and Editing
- Section 24.5.2.2: Modifying Route Map Components

24.5.2.1 Route Map Creation and Editing

Creating a Route Map Statement

To create a route map, enter `route-map` followed by the map name and filter type (`deny` or `permit`). The default sequence number is assigned to the statement if the command does not include a number.

Example

- This command places the switch in route map configuration mode to create a route map statement named `map1` with a sequence number of 50.

```plaintext
switch(config)#route-map map1 permit 50
switch(config-route-map-map1)#
```

Editing a Route Map Statement

To edit an existing route map statement, enter `route-map` with the map’s name and statement’s number. The switch enters route map configuration mode for the statement. Subsequent `match (route-map)` and `set (route-map)` commands add the corresponding commands to the statement.

The `show` command displays contents of the existing route map.
Example
- This command places the switch in route map configuration mode to edit an existing route map statement. The `show` command displays contents of all statements in the route map.

  ```
  switch(config)#route-map MAP2
  switch(config-route-map-MAP2)#show
  Match clauses:
  match as 10
  match tag 333
  Set clauses:
  set local-preference 100
  switch(config-route-map-MAP2)#
  ```

Saving Route Map Modifications

Route map configuration mode is a group-change mode. Changes are saved by exiting the mode, either with an explicit `exit` command or by switching directly to another configuration mode. This includes switching to the configuration mode for a different route map.

Example
- The first command creates the `map1` statement with sequence number of 10. The second command is not yet saved to the route map, as displayed by the `show` command.

  ```
  switch(config)#route-map map1 permit
  switch(config-route-map-map1)#match as 100
  switch(config-route-map-map1)#show
  ```

The `exit` command saves the `match` command.

  ```
  switch(config-route-map-map1)#exit
  switch(config)#show route-map map1
  route-map map1 permit 10
  Match clauses:
  match as 100
  Set clauses:
  switch(config)#
  ```

Discarding Route Map Modifications

The `abort` command discards all pending changes and exits route map configuration mode.

Example
- The `abort` command discards the pending `match` command and restores the original route map.

  ```
  switch(config)#route-map map1 permit
  switch(config-route-map-map1)#match as 100
  switch(config-route-map-map1)#abort
  switch(config)#show route-map map1
  ```

24.5.2.2 Modifying Route Map Components

These commands add rules to the configuration mode route map:
- `match (route-map)` adds a match rule to a route map.
- `set (route-map)` adds a set rule to a route map.
Inserting a Statement

To insert a new statement into an existing route map, create a new statement with a sequence number that differs from any existing statement in the map.

Example

- This command adds statement 50 to the Map1 route map, then displays the new route map.

```
switch(config)#route-map Map1 permit 50
switch(config-route-map-Map1)#match as 150
switch(config-route-map-Map1)#exit
switch(config)#show route-map Map1
```

route-map Map1 permit 50
Match clauses:
  match as 10
  match tag 333
Set clauses:
  set local-preference 100

Deleting Route Map Components

To remove a component from a route map, perform one of the following:

- To remove a command from a statement, enter `no`, followed by the command to be removed.
- To remove a statement, enter `no`, followed by the route map with the filter type and the sequence number of the statement to be removed.
- To remove a route map, enter `no` followed by the route map without a sequence number.

24.5.3 Using Route Maps

Protocol redistribution commands include a route map parameter that determines the routes to be redistributed into the specified protocol domain.

Example

- This command uses Map1 route map to select OSPFv2 routes for redistribution into BGP AS1.

```
switch(config)#router bgp 1
switch(config-router-bgp)#redistribute ospf route-map Map1
switch(config-router-bgp)#exit
switch(config)#
```

24.6 Prefix Lists

A prefix list is an ordered set of rules that defines route redistribution access for a specified IP address space. A prefix list rules consists of a filter action (deny or permit), an address space identifier (IPv4 subnet address or IPv6 prefix), and a sequence number.

Prefix lists are referenced by route map match commands when filtering routes for redistribution.

- Section 24.6.1 describes the prefix list configuration process.
- Section 24.6.2 describes the use of prefix lists.
24.6.1 Prefix List Configuration

A prefix list is an ordered set of rules that defines route redistribution access for a specified IP address space. A prefix list rule consists of a filter action (deny or permit), a network address (IPv4 subnet or IPv6 prefix), and a sequence number. A rule may also include an alternate mask size.

The switch supports IPv4 and IPv6 prefix lists. The switch is placed in a Prefix-list configuration mode to create and edit IPv4 or IPv6 prefix lists.

24.6.1.1 IPv4 Prefix Lists

IPv4 prefix lists are created or modified by adding an IPv4 prefix list rule in the Prefix-list configuration mode. Each rule includes the name of a prefix list, in addition to the sequence number, network address, and filter action. A list consists of all rules that have the same prefix list name.

The ip prefix-list command creates a prefix list or adds a rule to an existing list. Route map match commands use prefix lists to filter routes for redistribution into OSPF, RIP, or BGP domains.

Creating an IPv4 Prefix List

To create an IPv4 prefix list, enter the ip prefix-list command, followed by the name of the list. The switch enters IPv4 prefix-list configuration mode for the list. If the command is followed by the name of an existing ACL, subsequent commands edit that list.

Example

- This command places the switch in IPv4 prefix list configuration mode to create an IPv4 prefix list named route-one.
  
  switch(config)#ip prefix-list route-one
  switch(config-ip-pfx)#

- These commands create four different rules for the prefix-list named route-one.
  
  switch(config)#ip prefix-list route-one
  switch(config-ip-pfx)#seq 10 deny 10.1.1.0/24
  switch(config-ip-pfx)#seq 20 deny 10.1.0.0/16
  switch(config-ip-pfx)#seq 30 permit 12.15.4.9/32
  switch(config-ip-pfx)#seq 40 deny 1.1.1.0/24

To view the list, save the rules by exiting the Prefix-list command mode, then re-enter the configuration mode and type show active.

  switch(config-ip-pfx)#exit
  switch(config)#ip prefix-list route-one
  switch(config-ip-pfx)#show active
  ip prefix-list route-one
  seq 10 deny 10.1.1.0/24
  seq 20 deny 10.1.0.0/16
  seq 30 permit 12.15.4.9/32
  seq 40 deny 1.1.1.0/24

  switch(config-ip-pfx)#ip prefix-list route-one

IPv4 prefix lists are referenced in route map match (route-map) commands.

24.6.1.2 IPv6 Prefix Lists

Creating an IPv6 Prefix List

The switch provides IPv6 prefix-list configuration mode for creating and modifying IPv6 prefix lists. A list can be edited only in the mode where it was created.
To create an IP ACL, enter the `ipv6 prefix-list` command, followed by the name of the list. The switch enters IPv6 prefix-list configuration mode for the list. If the command is followed by the name of an existing ACL, subsequent commands edit that list.

**Example**

- This command places the switch in IPv6 prefix list configuration mode to create an IPv6 prefix list named `map1`.

```
switch(config)#ipv6 prefix-list map1
switch(config-ipv6-pfx)#
```

**Adding a Rule**

To append a rule to the end of a list, enter the rule without a sequence number while in Prefix-List configuration mode for the list. The new rule’s sequence number is derived by adding 10 to the last rule’s sequence number.

**Example**

- These commands enter the first two rules into a new prefix list.

```
switch(config-ipv6-pfx)#permit 3:4e96:8ca1:33cf::/64
switch(config-ipv6-pfx)#permit 3:11b1:8fe4:1aac::/64
```

To view the list, save the rules by exiting the prefix-list command mode, then re-enter the configuration mode and type `show active`.

```
switch(config-ipv6-pfx)#exit
switch(config)#ipv6 prefix-list map1
switch(config-ipv6-pfx)#show active
ipv6 prefix-list map1
  seq 10 permit 3:4e96:8ca1:33cf::/64
  seq 20 permit 3:11b1:8fe4:1aac::/64
switch(config-ipv6-pfx)#
```

This command appends a rule to the end of the prefix list. The new rule’s sequence number is 30.

```
switch(config-ipv6-pfx)#permit 3:1bca:1141:ab34::/64
switch(config-ipv6-pfx)#exit
switch(config)#ipv6 prefix-list map1
switch(config-ipv6-pfx)#show active
ipv6 prefix-list map1
  seq 10 permit 3:4e96:8ca1:33cf::/64
  seq 20 permit 3:11b1:8fe4:1aac::/64
  seq 30 permit 3:1bca:1141:ab34::/64
switch(config-ipv6-pfx)#
```

**Inserting a Rule**

To insert a rule into a prefix list, use the `seq (IPv6 Prefix Lists)` command to enter a rule with a sequence number that is between numbers of two existing rules.
Example

- This command inserts a rule between the first two rules by assigning it the sequence number 15.

```
switch(config-ipv6-pfx)#seq 15 deny 3:4400::/64
switch(config-ipv6-pfx)#exit
switch(config)#show ipv6 prefix-list map1
ipv6 prefix-list map1
  seq 10 permit 3:4e96:8ca1:33cf::/64
  seq 15 deny 3:4400::/64
  seq 20 permit 3:11b1:8fe4:1aac::/64
  seq 30 permit 3:1bca:3ff2:634a::/64
switch(config)#
```

Deleting a Rule

To remove a rule from the configuration mode prefix list, enter `no seq` (see `seq (IPv6 Prefix Lists)`), followed by the sequence number of the rule to be removed.

Example

- These commands remove rule 20 from the prefix list, then displays the resultant prefix list.

```
switch(config-ipv6-pfx)#no seq 20
switch(config-ipv6-pfx)#exit
switch(config)#show ipv6 prefix-list map1
ipv6 prefix-list map1
  seq 10 permit 3:4e96:8ca1:33cf::/64
  seq 15 deny 3:4400::/64
  seq 30 permit 3:1bca:3ff2:634a::/64
switch(config)#
```

24.6.2 Using Prefix Lists

Route map match commands include an option that matches a specified prefix list.

Example

- The MAP_1 route map uses a match command that references the PL_1 prefix list.

```
switch(config)#route-map MAP_1 permit
switch(config-route-map-MAP_1)#match ip address prefix-list PL_1
switch(config-route-map-MAP_1)#set community 500
switch(config-route-map-MAP_1)#exit
```
24.7 ACL, Route Map, and Prefix List Commands

This section describes CLI commands that this chapter references.

**ACL Creation and Access Commands**

- `hardware access-list resource sharing vlan in`
- `hardware access-list resource sharing vlan ipv4 out`
- `ip access-list`
- `ip access-list standard`
- `ipv6 access-list`
- `ipv6 access-list standard`
- `mac access-list`
- `system profile`

**ACL Implementation Commands**

- `ip access-group`
- `ipv6 access-group`
- `mac access-group`

**Service ACL Implementation Commands**

- `ip access-group (Service ACLs)`
- `ipv6 access-group (Service ACLs)`

**ACL Edit Commands**

- `counters per-entry (ACL configuration modes)`
- `hardware access-list update default-result permit`
- `no <sequence number> (ACLs)`
- `resequence (ACLs)`
- `show (ACL configuration modes)`

**ACL Rule Commands**

- `deny (IPv4 ACL)`
- `deny (IPv6 ACL)`
- `deny (MAC ACL)`
- `deny (Standard IPv4 ACL)`
- `deny (Standard IPv6 ACL)`
- `permit (IPv4 ACL)`
- `permit (IPv6 ACL)`
- `permit (MAC ACL)`
- `permit (Standard IPv4 ACL)`
- `permit (Standard IPv6 ACL)`
- `remark`

**ACL List Counter Commands**

- `clear ip access-lists counters`
- `clear ipv6 access-lists counters`
- `hardware counter feature acl out`

**ACL Display Commands**

- `show ip access-lists`
- `show ipv6 access-lists`
- `show mac access-lists`
Prefix List Creation and Access Commands
- `ip prefix-list`
- `ipv6 prefix-list`

Prefix List Edit Commands
- `deny (IPv6 Prefix List)`
- `permit (IPv6 Prefix List)`
- `seq (IPv6 Prefix Lists)`

Prefix List Display Commands
- `show ip prefix-list`
- `show ipv6 prefix-list`
- `show platform trident tcam`
- `show platform fap acl`
- `show platform fap acl tcam`
- `show platform arad acl tcam`
- `show platform arad acl tcam summary`
- `show platform arad mapping`
- `show hardware tcam profile`
- `show platform fap acl tcam hw`

Route Map Creation and Access Command
- `route-map`

Route Map Edit Commands
- `continue (route map)`
- `description (route map)`
- `match (route-map)`
- `set (route-map)`
- `set as-path prepend`
- `set as-path match`
- `set community (route-map)`
- `set extcommunity (route-map)`

Route Map Display Commands
- `show route-map`
clear ip access-lists counters

The `clear ip access-lists counters` command sets ACL counters to zero for the specified IPv4 access control list (ACL). The `session` parameter limits ACL counter clearing to the current CLI session.

**Command Mode**
Privileged EXEC

**Command Syntax**
```
clear ip access-lists counters [ACL_NAME] [SCOPE]
```

**Parameters**
- `ACL_NAME` Name of ACL. Options include:
  - `<no parameter>` all ACLs.
  - `access_list` name of ACL.
- `SCOPE` Session affected by command. Options include:
  - `<no parameter>` command affects counters on all CLI sessions.
  - `session` affects only current CLI session.

**Example**
- This command resets all IPv4 ACL counters.
```
switch(config)# clear ip access-lists counters
switch(config)#
```
clear ipv6 access-lists counters

The `clear ipv6 access-lists counters` command sets ACL counters to zero for the specified IPv6 access control list (ACL). The `session` parameter limits ACL counter clearing to the current CLI session.

**Command Mode**

Privileged EXEC

**Command Syntax**

```
clear ipv6 access-lists counters [ACL_NAME] [SCOPE]
```

**Parameters**

- **ACL_NAME** name of ACL. Options include:
  - `<no parameter>` all IPv6 ACLs.
  - `access_list` name of IPv6 ACL.
- **SCOPE** Session affected by command. Options include:
  - `<no parameter>` command affects counters on all CLI sessions.
  - `session` affects only current CLI session.

**Example**

- This command resets all IPv6 ACL counters.
  ```
  switch(config)# clear ipv6 access-lists counters
  switch(config)#
  ```
continue (route map)

The continue command creates a route map statement entry that enables additional route map evaluation of routes whose parameters meet the statement’s matching criteria.

A statement typically contains a match (route-map) and a set (route-map) command. The evaluation of routes whose settings are the same as match command parameters normally ends and the statement’s set commands are applied to the route. Routes that match a statement containing a continue command are evaluated against the statement specified by the continue command.

When a route matches multiple route map commands, the filter action (deny or permit) is determined by the last statement that the route matches. The set commands in all statements matching the route are applied to the route after the route map evaluation is complete. Multiple set commands are applied in the same order by which the route was evaluated against the statement containing them.

The no continue and default continue commands remove the corresponding continue command from the configuration mode route map statement by deleting the corresponding command from running-config.

Command Mode
Route-Map Configuration

Command Syntax
continue NEXT_SEQ
no continue NEXT_SEQ
default continue NEXT_SEQ

Parameters
- NEXT_SEQ specifies next statement for evaluating matching routes. Options include:
  - <no parameter> Next statement in the route map, as determined by sequence number.
  - seq_number Specifies the number of the next statement. Values range from 1 to 16777215.

Restrictions
A continue command cannot specify a sequence number smaller than the sequence number of its route map statement.

Related Commands
- route-map enters route map configuration mode.

Example
- This command creates route map map1, statement 40 with a match command, a set command, and a continue command. Routes that match the statement are subsequently evaluated against statement 100. The set local-preference command is applied to matching routes regardless of subsequent matching operations.

  switch(config)#route-map map1 deny 40
  switch(config-route-map-map1)#match as 15
  switch(config-route-map-map1)#continue 100
  switch(config-route-map-map1)#set local-preference 50
  switch(config-route-map-map1)#
counters per-entry (ACL configuration modes)

The `counters per-entry` command places the ACL in counting mode. An ACL in counting mode displays the number of instances each rule in the list matches an inbound packet and the elapsed time since the last match. The show access list commands display the statistics next to each rule in the ACL.

On the FM6000 platform, this command has no effect when used in an ACL that is part of a PBR class map.

The `no counters per-entry` and `default counters per-entry` command places the ACL in non-counting mode.

**Command Mode**
- ACL Configuration
- IPv6-ACL Configuration
- Std-ACL Configuration
- Std-IPv6-ACL Configuration
- MAC-ACL Configuration

**Command Syntax**

- `counters per-entry`
- `no counters per-entry`
- `default counters per-entry`

**Examples**

- This command places the test1 ACL in counting mode.

  ```
  switch(config)#ip access-list test1
  switch(config-acl-test1)#counters per-entry
  switch(config-acl-test1)#
  ```

- This command displays the ACL, with counter information, for an ACL in counting mode.

  ```
  switch#show ip access-lists
  IP Access List default-control-plane-acl [readonly]
  counters per-entry
  10 permit icmp any any
  20 permit ip any any tracked [match 12041, 0:00:00 ago]
  30 permit ospf any any
  40 permit tcp any any eq ssh telnet www snmp bgp https [match 11, 1:41:07 ago]
  50 permit udp any any eq bootps bootpc snmp rip [match 78, 0:00:27 ago]
  60 permit tcp any any eq mlag ttl eq 255
  70 permit udp any any eq mlag ttl eq 255
  80 permit vrrp any any
  90 permit ahp any any
  100 permit pim any any
  110 permit igmp any any [match 14, 0:23:27 ago]
  120 permit tcp any any range 5900 5910
  130 permit tcp any any range 50000 50100
  140 permit udp any any range 51000 51100
  ```
deny (IPv4 ACL)

The `deny` command adds a deny rule to the configuration mode IPv4 access control list (ACL). Packets filtered by a `deny` rule are dropped by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding 10 to the number of the ACL’s last rule.

The `no deny` and `default deny` commands remove the specified rule from the configuration mode ACL. The `no <sequence number> (ACLs)` command also removes the specified rule from the ACL.

Command Mode

ACL Configuration

Command Syntax

```
[SEQ_NUM] deny PROTOCOL SOURCE_ADDR [SOURCE_PORT] DEST_ADDR [DEST_PORT] [FLAGS] [MESSAGE] [fragments] [tracked] [DSCP_FILTER] [TTL_FILTER] [log]
```

```
no deny PROTOCOL SOURCE_ADDR [SOURCE_PORT] DEST_ADDR [DEST_PORT] [FLAGS] [MESSAGE] [fragments] [tracked] [DSCP_FILTER] [TTL_FILTER] [log]
```

```
default deny PROTOCOL SOURCE_ADDR [SOURCE_PORT] DEST_ADDR [DEST_PORT] [FLAGS] [MESSAGE] [fragments] [tracked] [DSCP_FILTER] [TTL_FILTER] [log]
```

Commands use a subset of the listed fields. Available parameters depend on specified protocol. Use CLI syntax assistance to view options for specific protocols when creating a deny rule.

Parameters

- **SEQ_NUM**: Sequence number assigned to the rule. Options include:
  - `<no parameter>`: Number is derived by adding 10 to the number of the ACL’s last rule.
  - `<1 – 4294967295>`: Number assigned to entry.
- **PROTOCOL**: protocol field filter. Values include:
  - `ahp` Authentication Header Protocol (51).
  - `icmp` Internet Control Message Protocol (1).
  - `igmp` Internet Group Management Protocol (2).
  - `ip` Internet Protocol v4 (4).
  - `ospf` Open Shortest Path First (89).
  - `pim` Protocol Independent Multicast (103).
  - `tcp` Transmission Control Protocol (6).
  - `udp` user datagram protocol (17).
  - `vrrp` Virtual Router Redundancy Protocol (112).
  - `protocol_num` integer corresponding to an IP protocol. Values range from 0 to 255.
- **SOURCE_ADDR** and **DEST_ADDR**: source and destination address filters. Options include:
  - `network_addr` subnet address (CIDR or address-mask).
  - `any` Packets from all addresses are filtered.
  - `host ip_addr` IP address (dotted decimal notation).
    Subnet addresses support discontiguous masks.
- **SOURCE_PORT** and **DEST_PORT**: source and destination port filters. Options include:
• **any**  all ports
• **eq port-1 port-2 ... port-n**  A list of ports. Maximum list size is 10 ports.
• **neq port-1 port-2 ... port-n**  The set of all ports not listed. Maximum list size is 10 ports.
• **gt port**  The set of ports with larger numbers than the listed port.
• **lt port**  The set of ports with smaller numbers than the listed port.
• **range port_1 port_2**  The set of ports whose numbers are between the range.
• **fragments**  filters packets with FO bit set (indicates a non-initial fragment packet).
• **FLAGS**  flag bit filters (TCP packets). Use CLI syntax assistance (?) to display options.
• **MESSAGE**  message type filters (ICMP packets). Use CLI syntax assistance (?) to display options.
• **tracked**  rule filters packets in existing ICMP, UDP, or TCP connections.
  • Valid in ACLs applied to the control plane.
  • Validity in ACLs applied to data plane varies by switch platform.
• **DSCP_FILTER**  rule filters packet by its DSCP value. Values include:
  • <no parameter>  Rule does not use DSCP to filter packets.
  • **dscp dscp_value**  Packets match if DSCP field in packet is equal to dscp_value.
• **TTL_FILTER**  rule filters packet by its TTL (time-to-live) value. Values include:
  • **ttl eq ttl_value**  Packets match if ttl in packet is equal to ttl_value.
  • **ttl gt ttl_value**  Packets match if ttl in packet is greater than ttl_value.
  • **ttl lt ttl_value**  Packets match if ttl in packet is less than ttl_value.
  • **ttl neq ttl_value**  Packets match if ttl in packet is not equal to ttl_value.
  • Valid in ACLs applied to the control plane.
  • Validity in ACLs applied to data plane varies by switch platform.
• **log**  triggers an informational log message to the console about the matching packet.
  • Valid in ACLs applied to the control plane.
  • Validity in ACLs applied to data plane varies by switch platform.

**Examples**

• This command appends a **deny** statement at the end of the ACL. The **deny** statement drops OSPF packets from 10.10.1.1/24 to any host.

```
switch(config)#ip access-list text1
switch(config-acl-text1)#deny ospf 10.1.1.0/24 any
switch(config-acl-text1)#
```

• This command inserts a **deny** statement with the sequence number 65. The **deny** statement drops all PIM packets.

```
switch(config-acl-text1)#65 deny pim any any
switch(config-acl-text1)#
```
deny (IPv6 ACL)

The **deny** command adds a deny rule to the configuration mode IPv6 access control list (ACL). Packets filtered by a **deny** rule are dropped by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding 10 to the number of the ACL’s last rule.

The **no deny** and **default deny** commands remove the specified rule from the configuration mode ACL. The **no <sequence number> (ACLs)** command also removes the specified rule from the ACL.

**Command Mode**

IPv6-ACL Configuration

**Command Syntax**

```
[SEQ_NUM] deny PROT SRC_ADDR [SRC_PT] DEST_ADDR [DEST_PT] [FLAG] [MSG] [HOP] [tracked] [DSCP_FILTER] [log]
```

```
no deny PROT SRC_ADDR [SRC_PT] DEST_ADDR [DEST_PT] [FLAG] [MSG] [HOP] [tracked] [DSCP_FILTER] [log]
```

```
default deny PROT SRC_ADDR [SRC_PT] DEST_ADDR [DEST_PT] [FLAG] [MSG] [HOP] [tracked] [DSCP_FILTER] [log]
```

Commands use a subset of the listed fields. Available parameters depend on specified protocol. Use CLI syntax assistance to view options for specific protocols when creating a deny rule.

**Parameters**

- **SEQ_NUM**  
  Sequence number assigned to the rule. Options include:
  - **<no parameter>**  
    Number is derived by adding 10 to the number of the ACL’s last rule.
  - **<1 – 4294967295>**  
    Number assigned to entry.
  - **PROT**  
    Protocol field filter. Values include:
    - **icmpv6**  
      Internet Control Message Protocol for version 6 (58).
    - **ipv6**  
      Internet Protocol – IPv6 (41).
    - **ospf**  
      Open Shortest Path First (89).
    - **tcp**  
      Transmission Control Protocol (6).
    - **udp**  
      User Datagram Protocol (17).
    - **protocol_num**  
      Integer corresponding to an IP protocol. Values range from 0 to 255.
  - **SRC_ADDR** and **DEST_ADDR**  
    Source and destination address filters. Options include:
    - **ipv6_prefix**  
      IPv6 address with prefix length (CIDR notation).
    - **any**  
      Packets from all addresses are filtered.
    - **host ipv6_addr**  
      IPv6 host address.
  - **SRC_PT** and **DEST_PT**  
    Source and destination port filters. Options include:
    - **any**  
      All ports.
    - **eq port-1 port-2 ... port-n**  
      A list of ports. Maximum list size is 10 ports.
    - **neq port-1 port-2 ... port-n**  
      The set of all ports not listed. Maximum list size is 10 ports.
    - **gt port**  
      The set of ports with larger numbers than the listed port.
    - **lt port**  
      The set of ports with smaller numbers than the listed port.
    - **range port_1 port_2**  
      The set of ports whose numbers are between the range.
• **HOP** filters by packet’s hop-limit value. Options include:
  • *<no parameter>* Rule does not use hop limit to filter packets.
  • **hop-limit** *eq hop_value* Packets match if *hop-limit* value in packet equals *hop_value*.
  • **hop-limit** *gt hop_value* Packets match if *hop-limit* in packet is greater than *hop_value*.
  • **hop-limit** *lt hop_value* Packets match if *hop-limit* in packet is less than *hop_value*.
  • **hop-limit** *neq hop_value* Packets match if *hop-limit* in packet is not equal to *hop_value*.

• **FLAG** flag bit filters (TCP packets). Use CLI syntax assistance (?) to display options.

• **MSG** message type filters (ICMPv6 packets). Use CLI syntax assistance (?) to display options.

• **tracked** rule filters packets in existing ICMP, UDP, or TCP connections.
  • Valid in ACLs applied to the control plane.
  • Validity in ACLs applied to data plane varies by switch platform.

• **DSCP_FILTER** rule filters packet by its DSCP value. Values include:
  • *<no parameter>* Rule does not use DSCP to filter packets.
  • **dscp** *dscp_value* Packets match if DSCP field in packet is equal to *dscp_value*.
  • **log** triggers an informational log message to the console about the matching packet.
  • Valid in ACLs applied to the control plane.
  • Validity in ACLs applied to data plane varies by switch platform.

**Example**
• This command appends a **deny** statement at the end of the ACL. The **deny** statement drops IPv6 packets from 3710:249a:c643:ef11::/64 to any host.

```
switch(config)#ipv6 access-list text1
switch(config-acl-text1)#deny ipv6 3710:249a:c643:ef11::/64 any
switch(config-acl-text1)#
```
deny (IPv6 Prefix List)

The `deny` command adds a rule to the configuration mode IPv6 prefix list. Route map match commands use prefix lists to filter routes for redistribution into OSPF, RIP, or BGP domains. Routes are denied access when they match the prefix that a `deny` statement specifies.

The `no deny` and `default deny` commands remove the specified rule from the configuration mode prefix list. The `no seq (IPv6 Prefix Lists)` command also removes the specified rule from the prefix list.

**Command Mode**

IPv6-pfx Configuration

**Command Syntax**

```
[SEQUENCE] deny ipv6_prefix [MASK]
```

**Parameters**

- **SEQUENCE**  
  Sequence number assigned to the rule. Options include:
  - `<no parameter>`  
    Number is derived by adding 10 to the number of the list's last rule.
  - `seq seq_num`  
    Number is specified by `seq_num`. Value ranges from 0 to 65535.
  - `ipv6_prefix`  
    IPv6 prefix upon which command filters routes (CIDR notation).
  - `MASK`  
    Range of the prefix to be matched.
  - `<no parameter>`  
    Exact match with the subnet mask is required.
  - `eq mask_e`  
    Prefix length is equal to `mask_e`.
  - `ge mask_g`  
    Range is from `mask_g` to 128.
  - `le mask_l`  
    Range is from `subnet` mask length to `mask_l`.
  - `ge mask_l` `le mask_g`  
    Range is from `mask_g` to `mask_l`.

  *When `le` and `ge` are specified, `subnet` mask > `mask_g` > `mask_l`*

**Example**

- This command appends a `deny` statement at the end of the `text1` prefix list. The `deny` statement denies redistribution of routes with the specified prefix.

```
switch(config)#ipv6 prefix-list route-five
switch(config-ipv6-pfx)#deny 3100::/64
switch(config-ipv6-pfx)#
```
deny (MAC ACL)

The `deny` command adds a deny rule to the configuration mode MAC access control list (ACL). Packets filtered by a deny rule are dropped by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding 10 to the number of the ACL’s last rule.

The `no deny` and `default deny` commands remove the specified rule from the configuration mode ACL. The `no <sequence number>` (ACLs) command also removes the specified rule from the ACL.

**Command Mode**

MAC-ACL Configuration

**Command Syntax**

```plaintext
[SEQ_NUM] deny SOURCE_ADDR DEST_ADDR [PROTOCOL] [log]
no deny SOURCE_ADDR DEST_ADDR [PROTOCOL] [log]
default deny SOURCE_ADDR DEST_ADDR [PROTOCOL] [log]
```

**Parameters**

- **SEQ_NUM**  Sequence number assigned to the rule. Options include:
  - `<no parameter>`  Number is derived by adding 10 to the number of the ACL’s last rule.
  - `<1 – 4294967295>`  Number assigned to entry.
  - **SOURCE_ADDR** and **DEST_ADDR**  source and destination address filters. Options include:
    - `mac_address mac_mask`  MAC address and mask
    - `any`  Packets from all addresses are filtered.
    - `mac_address` specifies a MAC address in 3x4 dotted hexadecimal notation (hhhh.hhhh.hhhh)
    - `mac_mask` specifies a MAC address mask in 3x4 dotted hexadecimal notation (hhhh.hhhh.hhhh)
  - 0 bits require an exact match to filter
  - 1 bits filter on any value
  - **PROTOCOL**  protocol field filter. Values include:
    - `aarp`  Appletalk Address Resolution Protocol (0x80f3)
    - `appletalk`  Appletalk (0x809b)
    - `arp`  Address Resolution Protocol (0x806)
    - `ip`  Internet Protocol Version 4 (0x800)
    - `ipx`  Internet Packet Exchange (0x8137)
    - `lldp`  LLDP (0x88cc)
    - `novell`  Novell (0x8138)
    - `rarp`  Reverse Address Resolution Protocol (0x8035)
    - `protocol_num`  integer corresponding to a MAC protocol. Values range from 0 to 65535
  - `log`  triggers an informational log message to the console about the matching packet.
Examples

- This command appends a permit statement at the end of the ACL. The deny statement drops all aarp packets from 10.1000.0000 through 10.1000.FFFF to any host.
  
  ```bash
  switch(config)#mac access-list text1
  switch(config-mac-acl-text1)#deny 10.1000.0000 0.0.FFFF any aarp
  ```

- This command inserts a permit statement with the sequence number 25. The deny statement drops all packets through the interface.
  
  ```bash
  switch(config-mac-acl-text1)#25 deny any any
  ```
deny (Standard IPv4 ACL)

The *deny* command adds a deny rule to the configuration mode standard IPv4 access control list (ACL). Standard ACL rules filter on the source field.

Packets filtered by a *deny* rule are dropped by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding 10 to the number of the ACL’s last rule.

The *no deny* and *default deny* commands remove the specified rule from the configuration mode ACL. The *no <sequence number> (ACLs)* command also removes the specified rule from the ACL.

**Command Mode**

Std-ACL Configuration

**Command Syntax**

```markdown
[SEQ_NUM] deny SOURCE_ADDR [log]
no deny SOURCE_ADDR [log]
default deny SOURCE_ADDR [log]
```

**Parameters**

- **SEQ_NUM**  Sequence number assigned to the rule. Options include:
  - `<no parameter>`  Number is derived by adding 10 to the number of the ACL’s last rule.
  - `<1 – 4294967295>`  Number assigned to entry.
- **SOURCE_ADDR**  source address filter. Options include:
  - *network_addr*  subnet address (CIDR or address-mask).
  - *any*  packets from all addresses are filtered.
  - *host ip_addr*  IP address (dotted decimal notation).
    Subnet addresses support discontiguous masks.
- **log**  triggers an informational log message to the console about the matching packet.
  - Valid in ACLs applied to the control plane.
  - Validity in ACLs applied to data plane varies by switch platform.

**Example**

- This command appends a *deny* statement at the end of the ACL. The *deny* statement drops packets from 10.10.1.1/24.

  ```
  switch(config)#ip access-list standard text1
  switch(config-std-acl-text1)#deny 10.1.1.1/24
  switch(config-std-acl-text1)#
  ```
deny (Standard IPv6 ACL)

The `deny` command adds a deny rule to the configuration mode standard IPv6 access control list (ACL). Standard ACL rules filter on the source field.

Packets filtered by a `deny` rule are dropped by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding 10 to the number of the ACL’s last rule.

The `no deny` and `default deny` commands remove the specified rule from the configuration mode ACL. The `no <sequence number> (ACLs)` command also removes the specified rule from the ACL.

**Command Mode**

Std-IPv6-ACL Configuration

**Command Syntax**

```plaintext
[SEQ_NUM] deny SOURCE_ADDR
no deny SOURCE_ADDR
default deny SOURCE_ADDR
```

**Parameters**

- **SEQ_NUM**  Sequence number assigned to the rule. Options include:
  - `<no parameter>`  Number is derived by adding 10 to the number of the ACL’s last rule.
  - `<1 – 4294967295>`  Number assigned to entry.
- **SOURCE_ADDR**  source address filter. Options include:
  - `ipv6_prefix`  IPv6 address with prefix length (CIDR notation).
  - `any`  Packets from all addresses are filtered.
  - `host ipv6_addr`  IPv6 host address.

**Example**

- This command appends a `deny` statement at the end of the ACL. The `deny` statement drops packets from 2103::/64.

```plaintext
switch(config)#ipv6 access-list standard text1
switch(config-standard-ipv6-acl-text1)#deny 2103::/64
switch(config-standard-ipv6-acl-text1)#
```
**description (route map)**

The `description` command adds a text string to the configuration mode route map. The string has no functional impact on the route map.

The `no description` and `default description` commands remove the text string from the configuration mode route map by deleting the corresponding `description` command from `running-config`.

**Command Mode**
Route-Map Configuration

**Command Syntax**
```
description label_text
no description
default description
```

**Parameters**
- `label_text` character string assigned to the route map configuration.

**Related Commands**
- `route-map`

**Examples**
- These commands add description text to the XYZ-1 route map.
  ```
  switch(config)#route-map XYZ-1
  switch(config-route-map-XYZ-1)#description This is the first map.
  switch(config-route-map-XYZ-1)#exit
  switch(config)#show route-map XYZ-1
  route-map XYZ-1 permit 10
  Description:
  description This is the first map.
  Match clauses:
  Set clauses:
  switch(config)#
  ```
**hardware access-list resource sharing vlan in**

The `hardware access-list resource sharing vlan in` command enables the IPv4 Ingress Sharing of hardware resources on the switch same ACL is applied on different VLANs.

The `no hardware access-list resource sharing vlan in` command disables the IPv4 Ingress Sharing of hardware resources on the switch.

**Command Mode**

Global Configuration

**Command Syntax**

```
hardware access-list resource sharing vlan in
no hardware access-list resource sharing vlan in
```

**Guideline**

- This command is compatible only with the DCS-7010 and DCS-7050x series switches.
- Enabling IPv4 Ingress Sharing requires the restart of software agents on the platform, this is a disruptive process and will impact traffic forwarding.

Use `show platform trident` command to verify the Ingress IPv4 Sharing information.
hardware access-list resource sharing vlan ipv4 out

The `hardware access-list resource sharing vlan ipv4 out` command enables the IPv4 Egress RACL TCAM sharing on the switch.

The `no hardware access-list resource sharing vlan ipv4 out` command disables the IPv4 Egress RACL TCAM sharing on the switch. By default, the IPv4 Egress RACL sharing is enabled on the switch.

**Command Mode**

Global Configuration

**Command Syntax**

```
hardware access-list resource sharing vlan ipv4 out
no hardware access-list resource sharing vlan ipv4 out
```

**Guideline**

- This command is compatible only with the DCS-7280E and DCS-7500E series switches.
- Disabling IPv4 RACL sharing requires the restart of software agents on the platform. This is a disruptive process and will impact traffic forwarding.
- Enabling IPv4 RACL sharing, if previously disabled from the default configuration, requires the restart of software agents on the platform. This is a disruptive process and will impact traffic forwarding. Enabling IPv4 RACL sharing if uRPF is configured will disable uRPF.
- Use `show running-config all | include sharing` command to verify whether or not sharing for egress IPv4 RACLs is enabled.

**Example**

- This command verifies whether IPv4 RACL sharing is enabled or disabled.

```
switch# show running-config all | include sharing
hardware access-list resource sharing vlan ipv4 out ---->
```

It returns the following output if IPv4 RACL sharing is enabled.
hardware access-list update default-result permit

The `hardware access-list update default-result permit` command configures the switch to permit all traffic on Ethernet and VLAN interfaces with ACLs applied to them while those ACLs are being modified. Traffic is permitted when the ACL is available for modification using one of the `ip access-list` commands, and ends when the ACL configuration mode is exited and rules are populated in hardware. This command is disabled by default.

The `no hardware access-list update default-result permit` and `default hardware access-list update default-result permit` commands restore the switch to its default state (blocking traffic during ACL modifications) by removing the corresponding `hardware access-list update default-result permit` command from the `running-config`.

**Command Mode**
- Global Configuration

**Command Syntax**

```
hardware access-list update default-result permit
no hardware access-list update default-result permit
default hardware access-list update default-result permit
```

**Restrictions**

This command is available on the Arista 7050X, 7060X, 7150, 7250X, 7280, 7280R, 7300X, 7320X, and 7500 series switches.

This command does not support egress ACLs.

While this command is enabled, static NAT and ACL-based mirroring are affected during ACL updates.

**Example**

- This command configures a 7150 series switch to permit all traffic on Ethernet and VLAN interfaces with ACLs applied to them while those ACLs are being modified.

  ```sh
  switch(config)#hardware access-list update default-result permit
  switch(config)#
  ```
hardware counter feature acl out

The `hardware counter feature acl out` command enables egress ACL hardware counters for IPv4 or IPv6, which count the number of packets hitting rules associated with egress ACLs applied to various interfaces on a switch.

The `no hardware counter feature acl out` and `default hardware counter feature acl out` commands disable or return the egress ACL hardware counters to the default state.

**Command Mode**
Global Configuration

**Command Syntax**

```
hardware counter feature acl out [OPTIONS]
no hardware counter feature acl out [OPTIONS]
default hardware counter feature acl out [OPTIONS]
```

**Parameters**

- **OPTIONS**  
  ACL hardware counter options include:
  - ipv4  address family IPv4.
  - ipv6  address family IPv6.

**Example**

- This command enables IPv4 egress ACL hardware counters.

  ```
  switch(config)#hardware counter feature acl out ipv4
  switch(config)#
  ```

- This command disables IPv4 egress ACL hardware counters.

  ```
  switch(config)#no hardware counter feature acl out ipv4
  switch(config)#
  ```
ip access-group

The `ip access-group` command applies an IPv4 or standard IPv4 access control list (ACL) to the configuration mode interface or subinterface.

The `no ip access-group` and `default ip access-group` commands remove the corresponding `ip access-group` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `ip access-group list_name DIRECTION`
- `no ip access-group list_name DIRECTION`
- `default ip access-group list_name DIRECTION`

**Parameters**
- `list_name` name of ACL assigned to interface.
- `DIRECTION` transmission direction of packets, relative to interface. Valid options include:
  - `in` inbound packets.
  - `out` outbound packets.

**Restrictions**
Filtering of outbound packets by ACLs is not supported on Petra platform switches.
Filtering of outbound packets by ACLs on FM6000 switches is supported only on physical interfaces (Ethernet and port channels).

ACLs on sub-interfaces are supported on DCS-7280E, DCS-7500E, DCS-7280R, and DCS-7500R.

**Example**
- These commands apply the IPv4 ACL named `test2` to Ethernet interface 3.
  ```
  switch(config)#interface ethernet 3
  switch(config-if-Et3)#ip access-group test2 in
  switch(config-if-Et3)#
  ```
ip access-group (Service ACLs)

The `ip access-group (Service ACLs)` command configures a Service ACL to be applied by a control-plane service. The service is specified by the command mode in which the Service ACL is applied.

The `no ip access-group (Service ACLs)` and `default ip access-group (Service ACLs)` commands remove the corresponding `ip access-group (Service ACLs)` command from `running-config`.

Command Mode

- Mgmt-SSH Configuration
- Mgmt-API Configuration
- Router-BGP Configuration
- Router-OSPF Configuration
- Router-IGMP Configuration
- MPLS-LDP Configuration
- Queue-Monitor-Streaming Configuration
- MPLS-Ping Configuration
- Mgmt-Telnet Configuration

Command Syntax

```plaintext
ip access-group acl_name [vrf vrf_name] [in]
no ip access-group [acl_name] [vrf vrf_name] [in]
default ip access-group acl_name [vrf vrf_name] [in]
```

Parameters

Parameters vary by process.

- `acl_name`     name of the Service ACL assigned to control-plane service.
- `vrf vrf_name` specifies the VRF in which the Service ACL is to be applied.
- `in`          specifies inbound connections or packets only (keyword required for SSH and Telnet services).

Example

- These commands apply the Service ACL `bgpacl` to the BGP routing protocol in VRF `purple`.

  ```plaintext
  (config)# router bgp 5
  (config-router-bgp)# vrf purple
  (config-router-bgp-vrf-purple)# ip access-group bgpacl
  ```

For additional configuration examples, see Section 24.3.2: Configuring Service ACLs and Displaying Status and Counters.
**ip access-list**

The `ip access-list` command places the switch in ACL configuration mode, which is a group change mode that modifies an IPv4 access control list. The command specifies the name of the IPv4 ACL that subsequent commands modify and creates an ACL if it references a nonexistent list. All changes in a group change mode edit session are pending until the end of the session.

The `exit` command saves pending ACL changes to `running-config`, then returns the switch to global configuration mode. ACL changes are also saved by entering a different configuration mode.

The `abort` command discards pending ACL changes, returning the switch to global configuration mode.

The `no ip access-list` and `default ip access-list` commands delete the specified IPv4 ACL.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip access-list  list_name
no ip access-list  list_name
default ip access-list  list_name
```

**Parameters**

- `list_name` Name of ACL.
  Must begin with an alphabetic character. Cannot contain spaces or quotation marks.

**Commands Available in ACL configuration mode:**

- `deny (IPv4 ACL)`
- `no <sequence number> (ACLS)`
- `permit (IPv4 ACL)`
- `remark`
- `resequence (ACLS)`
- `show (ACL configuration modes)`

**Related Commands**

- `ip access-list standard` enters std-acl configuration mode for editing standard IP ACLs.
- `show ip access-lists` displays IP and standard ACLs.

**Examples**

- This command places the switch in ACL configuration mode to modify the *filter1* IPv4 ACL.
  
  ```
  switch(config)#ip access-list filter1
  switch(config-acl-filter1)#
  ```

- This command saves changes to *filter1* ACL, then returns the switch to global configuration mode.

  ```
  switch(config-acl-filter1)#exit
  switch(config)#
  ```

- This command discards changes to *filter1*, then returns the switch to global configuration mode.

  ```
  switch(config-acl-filter1)#abort
  switch(config)#
  ```
**ip access-list standard**

The `ip access-list standard` command places the switch in std-ACL configuration mode, which is a group change mode that modifies a standard IPv4 access control list. The command specifies the name of the standard IPv4 ACL that subsequent commands modify, and creates an ACL if it references a nonexistent list. All group change mode edit session changes are pending until the session ends.

The `exit` command saves pending ACL changes to `running-config`, then returns the switch to global configuration mode. Pending changes are also saved by entering a different configuration mode.

The `abort` command discards pending ACL changes, returning the switch to global configuration mode.

The `no ip access-list standard` and `default ip access-list standard` commands delete the specified ACL.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip access-list standard list_name
no ip access-list standard list_name
default ip access-list standard list_name
```

**Parameters**

- `list_name` Name of standard ACL. Must begin with an alphabetic character. Cannot contain spaces or quotation marks.

**Commands Available in std-ACL configuration mode:**

- `deny` (Standard IPv4 ACL)
- `no <sequence number> (ACLs)
- `permit` (Standard IPv4 ACL)
- `remark`
- `resequence (ACLs)`
- `show (ACL configuration modes)`

**Related Commands**

- `ip access-list` enters ACL configuration mode for editing IPv4 ACLs.
- `show ip access-lists` displays IPv4 and standard IPv4 ACLs.

**Examples**

- This command places the switch in std-ACL configuration mode to modify the `filter2` IPv4 ACL.
  ```
  switch(config)#ip access-list standard filter2
  switch(config-std-acl-filter2)#
  ```

- This command saves changes to `filter2` ACL, then returns the switch to global configuration mode.
  ```
  switch(config-std-acl-filter2)#exit
  switch(config)#
  ```

- This command discards changes to `filter2`, then returns the switch to global configuration mode.
  ```
  switch(config-std-acl-filter2)#abort
  switch(config)#
  ```
ip prefix-list

The `ip prefix-list` command creates a prefix list or adds an entry to an existing list. Route map match commands use prefix lists to filter routes for redistribution into OSPF, RIP, or BGP domains.

A prefix list comprises all prefix list entries with the same label. The sequence numbers of the rules in a prefix list specify the order that the rules are applied to a route that the `match` command is evaluating.

The `no ip prefix-list` and `default ip prefix-list` commands delete the specified prefix list entry by removing the corresponding `ip prefix-list` statement from `running-config`. If the `no` or `default ip prefix-list` command does not list a sequence number, the command deletes all entries of the prefix list.

**Command Mode**

Global Configuration

**Command Syntax**

```plaintext
ip prefix-list list_name [SEQUENCE] FILTER_TYPE network_addr [MASK]
no ip prefix-list list_name [SEQUENCE]
default ip prefix-list list_name [SEQUENCE]
```

**Parameters**

- `list_name` The label that identifies the prefix list.
- `SEQUENCE` Sequence number of the prefix list entry. Options include
  - `<no parameter>` entry's number is ten plus highest sequence number in current list.
  - `seq seq_num` number assigned to entry. Value ranges from 0 to 65535.
- `FILTER_TYPE` specifies route access when it matches IP prefix list. Options include:
  - `permit` routes are permitted access when they match the specified subnet.
  - `deny` routes are denied access when they match the specified subnet.
- `network_addr` Subnet upon which command filters routes. Format is CIDR or address-mask.
- `MASK` range of the prefix to be matched.
  - `<no parameter>` exact match with the subnet mask is required.
  - `eq mask_e` prefix length is equal to `mask_e`.
  - `ge mask_g` range is from `mask_g` to 32.
  - `le mask_l` range is from `subnet` mask length to `mask_l`.
  - `ge mask_l` range is from `mask_g` to `mask_l`.
    ```plaintext
default ip prefix-list list_name [SEQUENCE]
```

**Example**

- This command places the switch in IPv4 prefix list configuration mode to create an IPv4 prefix list named `route-one`.

```
switch(config)#ip prefix-list route-one
switch(config-ip-pfx)#
```
These commands create four different rules for the prefix-list named `route-one`.

```
switch(config)#ip prefix-list route-one
switch(config-ip-pfx)#seq 10 deny 10.1.1.0/24
switch(config-ip-pfx)#seq 20 deny 10.1.0.0/16
switch(config-ip-pfx)#seq 30 permit 12.15.4.9/32
switch(config-ip-pfx)#seq 40 deny 1.1.1.0/24
```
ipv6 access-group

The **ipv6 access-group** command applies an IPv6 or standard IPv6 access control list (ACL) to the configuration mode interface.

The **no ipv6 access-group** and **default ipv6 access-group** commands remove the corresponding **ipv6 access-group** command from **running-config**.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
```
ipv6 access-group list_name DIRECTION
no ipv6 access-group list_name DIRECTION
default ipv6 access-group list_name DIRECTION
```

**Parameters**
- **list_name**    name of ACL assigned to interface.
- **DIRECTION**   transmission direction of packets, relative to interface. Valid options include:
  - **in**  inbound packets.
  - **out** outbound packets.

**Examples**
- These commands assign the IPv6 ACL named **test2** to the Ethernet 3 interface.
  
  ```
  switch(config)#interface ethernet 3
  switch(config-if-Et3)#ipv6 access-group test2 in
  switch(config-if-Et3)#
  ```
ipv6 access-group (Service ACLs)

The `ipv6 access-group (Service ACLs)` command configures an IPv6 or standard IPv6 Service ACL to be applied by a control-plane service. The service is specified by the command mode in which the Service ACL is applied.

The `no ipv6 access-group (Service ACLs)` and `default ipv6 access-group (Service ACLs)` commands remove the corresponding `ipv6 access-group (Service ACLs)` command from `running-config`.

**Command Mode**
- Mgmt-SSH Configuration
- Mgmt-API Configuration
- Router-BGP Configuration
- Router-OSPF Configuration
- MPLS-LDP Configuration
- Queue-Monitor-Streaming Configuration
- MPLS-Ping Configuration
- Mgmt-Telnet Configuration

**Command Syntax**
```
ipv6 access-group ipv6_acl_name [vrf vrf_name] [in]
no ipv6 access-group [ipv6_acl_name] [vrf vrf_name] [in]
default ip access-group ipv6_acl_name [vrf vrf_name] [in]
```

**Parameters**
Parameters vary by process.
- `ipv6_acl_name` name of the IPv6 Service ACL assigned to control-plane service.
- `vrf vrf_name` specifies the VRF in which the Service ACL is to be applied.
- `in` specifies inbound connections or packets only (keyword required for SSH and Telnet services).

**Example**
- These commands apply the IPv6 Service ACL `bgpacl` to the BGP routing protocol in VRF `purple`.
  ```
  (config)# router bgp 5
  (config-router-bgp)# vrf purple
  (config-router-bgp-vrf-purple)# ipv6 access-group bgpacl
  ```

For additional configuration examples, see Section 24.3.2: Configuring Service ACLs and Displaying Status and Counters.
**ipv6 access-list**

The `ipv6 access-list` command places the switch in IPv6-ACL configuration mode, which is a group change mode that modifies an IPv6 access control list. The command specifies the name of the IPv6 ACL that subsequent commands modify and creates an ACL if it references a nonexistent list. All changes in a group change mode edit session are pending until the end of the session.

The `exit` command saves pending ACL changes to `running-config`, then returns the switch to global configuration mode. ACL changes are also saved by entering a different configuration mode.

The `abort` command discards pending ACL changes, returning the switch to global configuration mode.

The `no ipv6 access-list` and `default ipv6 access-list` commands delete the specified IPv6 ACL.

**Command Mode**

Local Configuration

**Command Syntax**

```
ipv6 access-list list_name
no ipv6 access-list list_name
default ipv6 access-list list_name
```

**Parameters**

- `list_name` Name of ACL.
  Must begin with an alphabetic character. Cannot contain spaces or quotation marks.

**Commands Available in IPv6-ACL configuration mode:**

- `deny (IPv6 ACL)`
- `no <sequence number> (ACLs)`
- `permit (IPv6 ACL)`
- `remark`
- `resequence (ACLs)`
- `show (ACL configuration modes)`

**Related Commands**

- `ipv6 access-list standard` enters std-ipv6-acl configuration mode for editing standard IPv6 ACLs.
- `show ipv6 access-lists` displays IPv6 and standard IPv6 ACLs.

**Examples**

- This command places the switch in IPv6-ACL configuration mode to modify the `filter1` IPv6 ACL.
  ```
  switch(config)#ipv6 access-list filter1
  switch(config-ipv6-acl-filter1)%
  ```

- This command saves changes to `filter1` ACL, then returns the switch to global configuration mode.
  ```
  switch(config-ipv6-acl-filter1)#exit
  switch(config)%
  ```

- This command discards changes to `filter1`, then returns the switch to global configuration mode.
  ```
  switch(config-ipv6-acl-filter1)#abort
  switch(config)%
  ```
The `ipv6 access-list standard` command places the switch in std-IPv6-ACL-configuration mode, which is a group change mode that modifies a standard IPv6 access control list. The command specifies the name of the standard IPv6 ACL that subsequent commands modify and creates an ACL if it references a nonexistent list. All group change mode edit session changes are pending until the session ends.

The `exit` command saves pending ACL changes to `running-config`, then returns the switch to global configuration mode. Pending changes are also saved by entering a different configuration mode.

The `abort` command discards pending ACL changes, returning the switch to global configuration mode.

The `no ipv6 access-list standard` and `default ipv6 access-list standard` commands delete the specified ACL.

### Command Mode
Global Configuration

### Command Syntax
```
ipv6 access-list standard list_name
no ipv6 access-list standard list_name
default ipv6 access-list standard list_name
```

### Parameters
- `list_name` Name of ACL.
  Must begin with an alphabetic character. Cannot contain spaces or quotation marks.

### Commands Available in std-IPv6-ACL configuration mode:
- `deny` (Standard IPv6 ACL)
- `no <sequence number>` (ACLs)
- `permit` (Standard IPv6 ACL)
- `remark`
- `resequence` (ACLs)
- `show` (ACL configuration modes)

### Related Commands
- `ipv6 access-list` enters IPv6-ACL configuration mode for editing IPv6 ACLs.
- `show ipv6 access-lists` displays IPv6 and standard IPv6 ACLs.

### Examples
- This command places the switch in Std-IPv6 ACL configuration mode to modify the `filter2` ACL.
  ```
  switch(config)#ipv6 access-list standard filter2
  switch(config-std-ipv6-acl-filter2)#
  ```
- This command saves changes to `filter2` ACL, then returns the switch to global configuration mode.
  ```
  switch(config-std-ipv6-acl-filter2)#exit
  switch(config)#
  ```
- This command discards changes to `filter2`, then returns the switch to global configuration mode.
  ```
  switch(config-std-ipv6-acl-filter2)#abort
  switch(config)#
  ```
ipv6 prefix-list

The `ip prefix-list` command places the switch in IPv6 prefix-list configuration mode, which is a group change mode that modifies an IPv6 prefix list. The command specifies the name of the IPv6 prefix list that subsequent commands modify and creates a prefix list if it references a nonexistent list. All changes in a group change mode edit session are pending until the end of the session.

The `exit` command saves pending prefix list changes to `running-config`, then returns the switch to global configuration mode. ACL changes are also saved by entering a different configuration mode.

The `abort` command discards pending changes, returning the switch to global configuration mode.

The `no ipv6 prefix-list` and `default ipv6 prefix-list` commands delete the specified IPv6 prefix list.

Command Mode

Global Configuration

Command Syntax

```
ipv6 prefix-list list_name
no ipv6 prefix-list list_name
default ipv6 prefix-list list_name
```

Parameters

- `list_name` Name of prefix list.
  Must begin with an alphabetic character. Cannot contain spaces or quotation marks.

Commands Available in IPv6-pfx configuration mode:

- `deny` (IPv6 Prefix List)
- `permit` (IPv6 Prefix List)
- `seq` (IPv6 Prefix Lists)

Examples

- This command places the switch in IPv6 prefix-list configuration mode to modify the `route-five` prefix list.
  ```
  switch(config)#ipv6 prefix-list route-five
  switch(config-ipv6-pfx)#
  ```

- This command saves changes to the prefix list, then returns the switch to global configuration mode.
  ```
  switch(config-ipv6-pfx)#exit
  switch(config)#
  ```

- This command saves changes to the prefix list, then places the switch in interface-Ethernet mode.
  ```
  switch(config-ipv6-pfx)#interface ethernet 3
  switch(config-if-Et3)#
  ```

- This command discards changes to the prefix list, then returns the switch to global configuration mode.
  ```
  switch(config-ipv6-pfx)#abort
  switch(config)#
  ```
**mac access-group**

The **mac access-group** command applies a MAC access control list (MAC ACL) to the configuration mode interface.

The **no mac access-group** and **default mac access-group** commands remove the specified **mac access-group** command from *running-config*.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

**Command Syntax**

```
mac access-group list_name DIRECTION
no mac access-group list_name DIRECTION
default mac access-group list_name DIRECTION
```

**Parameters**

- `list_name` name of MAC ACL.
- `DIRECTION` transmission direction of packets, relative to interface. Valid options include:
  - `in` inbound packets.
  - `out` outbound packets.

**Restrictions**

Filtering of outbound packets by MAC ACLs is supported only on Helix, Trident, and Trident II platform switches.

**Example**

- These commands assign the MAC ACL named *mtest2* to the Ethernet 3 interface to filter inbound packets.

```
switch(config)#interface ethernet 3
switch(config-if-Et3)#mac access-group mtest2 in
switch(config-if-Et3)#
```
**mac access-list**

The `mac access-list` command places the switch in MAC-ACL configuration mode, which is a group change mode that modifies a MAC access control list. The command specifies the name of the MAC ACL that subsequent commands modify and creates an ACL if it references a nonexistent list. All changes in a group change mode edit session are pending until the end of the session.

The `exit` command saves pending ACL changes to `running-config`, then returns the switch to global configuration mode. ACL changes are also saved by entering a different configuration mode.

The `abort` command discards pending ACL changes, returning the switch to global configuration mode.

The `no mac access-list` and `default mac access-list` commands delete the specified list.

**Command Mode**

Global Configuration

**Command Syntax**

```
mac access-list list_name
no mac access-list list_name
default mac access-list list_name
```

**Parameters**

- `list_name` Name of MAC ACL.
  Names must begin with an alphabetic character and cannot contain a space or quotation mark.

**Commands Available in MAC-ACL configuration mode:**

- `deny (MAC ACL)`
- `no <sequence number> (ACLs)`
- `permit (MAC ACL)`
- `remark`  
- `resequence (ACLs)`
- `show (ACL configuration modes)`

**Examples**

- This command places the switch in MAC-ACL configuration mode to modify the `mfilter1` MAC ACL.
  ```
  switch(config)#mac access-list mfilter1
  switch(config-mac-acl-mfilter1)#
  ```

- This command saves changes to `mfilter1` ACL, then returns the switch to global configuration mode.
  ```
  switch(config-mac-acl-mfilter1)#exit
  switch(config)#
  ```

- This command saves changes to `mfilter1` ACL, then places the switch in interface-Ethernet mode.
  ```
  switch(config-mac-acl-mfilter1)#interface ethernet 3
  switch(config-if-Et3)#
  ```

- This command discards changes to `mfilter1`, then returns the switch to global configuration mode.
  ```
  switch(config-mac-acl-mfilter1)#abort
  switch(config)#
  ```
**match (route-map)**

The `match` command creates a route map statement entry that specifies one route filtering command. When a statement contains multiple match commands, the permit or deny filter applies to a route only if its properties are equal to corresponding parameters in each `match` command. When a route's properties do not equal the command parameters, the route is evaluated against the next statement in the route map, as determined by sequence number. If all statements fail to permit or deny the route, the route is denied.

The `no match` and `default match` commands remove the `match` command from the configuration mode route map statement by deleting the corresponding command from *running-config*.

---

**Note**

The route map configuration supports only standard ACL.

---

**Command Mode**

Route-Map Configuration

**Command Syntax**

- `match CONDITION`
- `no match CONDITION`
- `default match CONDITION`

**Parameters**

- **CONDITION** specifies criteria for evaluating a route. Options include:
  - `as <1 to 4294967295>` BGP Autonomous System number.
  - `as-path path_name` BGP Autonomous System path access list.
  - `community NAME` BGP community. Options for `NAME` include:
    - `listname` BGP community.
    - `listname exact-match` BGP community; list must match set that is present.
  - `extcommunity listname` BGP extended community. Options for `NAME` include:
    - `listname` BGP community.
    - `listname exact-match` BGP community; list must match set that is present.
  - `interface INTF_NAME` Specifies an interface. Options for `INTF_NAME` include:
    - `ethernet e_num` Ethernet interface.
    - `loopback l_num` Loopback interface.
    - `port-channel p_num` Port channel interface.
    - `vlan v_num` VLAN interface.
  - `ip address LIST` IPv4 address filtered by an ACL or prefix list. `LIST` options include:
    - `access-list acl_name` IPv4 address filtered by access control list (ACL).
    - `prefix-list plv4_name` IPv4 address filtered by IP prefix list.
  - `ip next-hop prefix-list plv4_name` IPv4 next-hop filtered by IP prefix list.
  - `ip resolved-next-hop prefix-list plv4_name` IPv4 resolved nexthop filtered by IP prefix list.
  - `ipv6 address prefix-list plv6_name` IPv6 address filtered by IPv6 prefix list.
  - `ipv6 next-hop prefix-list plv6_name` IPv6 next-hop filtered by IPv6 prefix list.
  - `ipv6 resolved-next-hop prefix-list plv6_name` IPv6 resolved nexthop filtered by IPv6 prefix list.
Chapter 24: ACLs and Route Maps

- **local-preference <1 to 4294967295>** BGP local preference metric.
- **metric <1 to 4294967295>** route metric.
- **metric-type OSPF_TYPE** OSPF metric type. Options include:
  - **type-1** OSPF type 1 metric.
  - **type-2** OSPF type 2 metric.
- **source-protocol protocol_type** Routing protocol of route’s source. Options include:
  - bgp
  - connected
  - ospf
  - rip
  - static
- **tag <1 to 4294967295>** route tag.

**Related Commands**

- **route-map**

**Example**

- This command creates a route map match rule that filters routes from BGP AS 15.
  
  switch(config)#route-map map1
  switch(config-route-map-map1)#match as 15
  switch(config-route-map-map1)#

---

| 1367 |
no <sequence number> (ACLs)

The `no <sequence number>` command removes the rule with the specified sequence number from the ACL. The `default <sequence number>` command also removes the specified rule.

**Command Mode**
- ACL Configuration
- IPv6-ACL Configuration
- Std-ACL Configuration
- Std-IPv6-ACL Configuration
- MAC-ACL Configuration

**Command Syntax**
```
no line_num
default line_num
```

**Parameters**
- `line_num` sequence number of rule to be deleted. Values range from 1 to 4294967295.

**Example**
- This command removes statement 30 from the list

```
switch(config-acl-test1)#show
IP Access List test1
  10 permit ip 10.10.10.0/24 any
  20 permit ip any host 10.20.10.1
  30 deny ip host 10.10.10.1 host 10.20.10.1
  40 permit ip any any
  50 remark end of list
switch(config-acl-test1)#no 30
switch(config-acl-test1)#show
IP Access List test1
  10 permit ip 10.10.10.0/24 any
  20 permit ip any host 10.20.10.1
  40 permit ip any any
  50 remark end of list
```
permit (IPv4 ACL)

The `permit` command adds a permit rule to the configuration mode IPv4 access control list (ACL). Packets filtered by a permit rule are accepted by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding 10 to the number of the ACL’s last rule.

The `no permit` and `default permit` commands remove the specified rule from the configuration mode ACL. The `no <sequence number> (ACLs)` command also removes a specified rule from the ACL.

**Command Mode**

ACL Configuration

**Command Syntax**

```
[SEQ_NUM] permit PROTOCOL SOURCE_ADDR [SOURCE_PORT] DEST_ADDR [DEST_PORT]
[FLAGS] [MESSAGE] [fragments] [tracked] [DSCP_FILTER] [TTL_FILTER] [log]
```

```
no permit PROTOCOL SOURCE_ADDR [SOURCE_PORT] DEST_ADDR [DEST_PORT]
[FLAGS] [MESSAGE] [fragments] [tracked] [DSCP_FILTER] [TTL_FILTER] [log]
```

```
default permit PROTOCOL SOURCE_ADDR [SOURCE_PORT] DEST_ADDR [DEST_PORT]
[FLAGS] [MESSAGE] [fragments] [tracked] [DSCP_FILTER] [TTL_FILTER] [log]
```

Commands use a subset of the listed fields. Available parameters depend on specified protocol. Use CLI syntax assistance to view options for specific protocols when creating a permit rule.

**Parameters**

- **SEQ_NUM** Sequence number assigned to the rule. Options include:
  - `<no parameter>` Number is derived by adding 10 to the number of the ACL’s last rule.
  - `<1 – 4294967295>` Number assigned to entry.
- **PROTOCOL** protocol field filter. Values include:
  - `ahp` Authentication Header Protocol (51).
  - `gre` Generic Routing Encapsulation.
  - `gtp` GPRS Tunneling Protocol
  - `icmp` Internet Control Message Protocol (1).
  - `igmp` Internet Group Management Protocol (2).
  - `ip` Any Internet Protocol v4 (4).
  - `ospf` Open Shortest Path First (89).
  - `pim` Protocol Independent Multicast (103).
  - `tcp` Transmission Control Protocol (6).
  - `udp` user datagram protocol (17).
  - `vlan` Enter VLAN number. Value ranges from 1 to 4094.
  - `vrrp` Virtual Router Reduncancy Protocol (112).
  - `protocol_num` integer corresponding to an IP protocol. Values range from 0 to 255.
- **SOURCE_ADDR** and **DEST_ADDR** source and destination address filters. Options include:
  - `network_addr` subnet address (CIDR or address-mask).
  - `any` Packets from all addresses are filtered.
  - `host ip_addr` IP address (dotted decimal notation).
Source and destination subnet addresses support discontiguous masks.

- **SOURCE_PORT** and **DEST_PORT** source and destination port filters. Options include:
  - `any` all ports
  - `eq port-1 port-2 ... port-n` A list of ports. Maximum list size is 10 ports.
  - `neq port-1 port-2 ... port-n` The set of all ports not listed. Maximum list size is 10 ports.
  - `gt port` The set of ports with larger numbers than the listed port.
  - `lt port` The set of ports with smaller numbers than the listed port.
  - `range port_1 port_2` The set of ports whose numbers are between the range.
- **fragments** filters packets with FO bit set (indicates a non-initial fragment packet).
- **FLAGS** flag bit filters (TCP packets). Use CLI syntax assistance (?) to display options.
- **MESSAGE** message type filters (ICMP packets). Use CLI syntax assistance (?) to display options.
- **tracked** rule filters packets in existing ICMP, UDP, or TCP connections.
  - Valid in ACLs applied to the control plane.
  - Validity in ACLs applied to data plane varies by switch platform.
- **DSCP_FILTER** rule filters packet by its DSCP value. Values include:
  - `<no parameter>` Rule does not use DSCP to filter packets.
  - `dscp dscp_value` Packets match if DSCP field in packet is equal to `dscp_value`.
- **TTL_FILTER** rule filters packet by its TTL (time-to-live) value. Values include:
  - `ttl eq ttl_value` Packets match if `ttl` in packet is equal to `ttl_value`.
  - `ttl gt ttl_value` Packets match if `ttl` in packet is greater than `ttl_value`.
  - `ttl lt ttl_value` Packets match if `ttl` in packet is less than `ttl_value`.
  - `ttl neq ttl_value` Packets match if `ttl` in packet is not equal to `ttl_value`.
  - Valid in ACLs applied to the control plane.
  - Validity in ACLs applied to data plane varies by switch platform.
- **log** triggers an informational log message to the console about the matching packet.
  - Valid in ACLs applied to the control plane.
  - Validity in ACLs applied to data plane varies by switch platform.

**Examples**

- This command appends a `permit` statement at the end of the ACL. The `permit` statement passes all OSPF packets from 10.10.1.1/24 to any host.

```
switch(config)#ip access-list text1
switch(config-acl-text1)#permit ospf 10.1.1.0/24 any
switch(config-acl-text1)#
```

- This command inserts a `permit` statement with the sequence number 25. The `permit` statement passes all PIM packets through the interface.

```
switch(config-acl-text1)#25 permit pim any any
switch(config-acl-text1)#
```

- These commands configure ACL to permit VLAN traffic between any source and destination host.

```
switch(config)#ip access-list acl1
switch(config-acl-acl1)#permit vlan 1234 0x0 ip any any
```
permit (IPv6 ACL)

The **permit** command adds a permit rule to the configuration mode IPv6 access control list (ACL). Packets filtered by a permit rule are accepted by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding 10 to the number of the ACL’s last rule.

The **no permit** and **default permit** commands remove the specified rule from the configuration mode ACL. The **no <sequence number>** (ACLs) command also removes a specified rule from the ACL.

**Command Mode**
IPv6-ACL Configuration

**Command Syntax**

```
[SEQ_NUM] permit PROT SRC_ADDR [SRC_PT] DEST_ADDR [DEST_PT] [FLAG] [MSG] [HOP]
[tracked] [DSCP_FILTER] [log]
```

```
no permit PROT SRC_ADDR [SRC_PT] DEST_ADDR [DEST_PT] [FLAG] [MSG] [HOP]
[tracked] [DSCP_FILTER] [log]
```

```
default permit PROT SRC_ADDR [SRC_PT] DEST_ADDR [DEST_PT] [FLAG] [MSG] [HOP]
[tracked] [DSCP_FILTER] [log]
```

Commands use a subset of the listed fields. Available parameters depend on specified protocol. Use CLI syntax assistance to view options for specific protocols when creating a permit rule.

**Parameters**

- **SEQ_NUM** Sequence number assigned to the rule. Options include:
  - <no parameter> Number is derived by adding 10 to the number of the ACL’s last rule.
  - <1 – 4294967295> Number assigned to entry.
- **PROT** Protocol field filter. Values include:
  - icmpv6 Internet Control Message Protocol for v6 (58).
  - ipv6 Internet Protocol – IPv6 (41).
  - ospf Open Shortest Path First (89).
  - tcp Transmission Control Protocol (6).
  - udp User Datagram Protocol (17).
  - vlan Enter VLAN number. Value ranges from 1 to 4094.
  - protocol_num integer corresponding to an IP protocol. Values range from 0 to 255.
- **SRC_ADDR** and **DEST_ADDR** Source and destination address filters. Options include:
  - ipv6_prefix IPv6 address with prefix length (CIDR notation).
  - any Packets from all addresses are filtered.
  - host ipv6_addr IPv6 host address.
- **SRC_PT** and **DEST_PT** Source and destination port filters. Options include:
  - any all ports.
  - eq port-1 port-2 ... port-n A list of ports. Maximum list size is 10 ports.
  - neq port-1 port-2 ... port-n The set of all ports not listed. Maximum list size is 10 ports.
  - gt port The set of ports with larger numbers than the listed port.
  - lt port The set of ports with smaller numbers than the listed port.
• **range port_1 port_2**  The set of ports whose numbers are between the range.

• **HOP** filters by packet’s hop-limit value. Options include:
  • `<no parameter>`  Rule does not use hop limit to filter packets.
  • **hop-limit eq hop_value**  Packets match if `hop-limit` value in packet equals `hop_value`.
  • **hop-limit gt hop_value**  Packets match if `hop-limit` in packet is greater than `hop_value`.
  • **hop-limit lt hop_value**  Packets match if `hop-limit` in packet is less than `hop_value`.
  • **hop-limit neq hop_value**  Packets match if `hop-limit` in packet is not equal to `hop_value`.

• **FLAG**  flag bit filters (TCP packets). Use CLI syntax assistance (?) to display options.

• **MSG**  message type filters (ICMPv6 packets). Use CLI syntax assistance (?) to display options.

• **tracked**  rule filters packets in existing ICMP, UDP, or TCP connections.
  • Valid in ACLs applied to the control plane.
  • Validity in ACLs applied to data plane varies by switch platform.

• **DSCP_FILTER**  rule filters packet by its DSCP value. Values include:
  • `<no parameter>`  Rule does not use DSCP to filter packets.
  • **dscp dscp_value**  Packets match if DSCP field in packet is equal to `dscp_value`.
  • **log**  triggers an informational log message to the console about the matching packet.
  • Valid in ACLs applied to the control plane.
  • Validity in ACLs applied to data plane varies by switch platform.

**Example**

• This command appends a **permit** statement at the end of the ACL. The **permit** statement passes all IPv6 packets with the source address 3710:249a:c643:ef11::/64 and with any destination address.

  
  switch(config)#ipv6 access-list text1
  switch(config-acl-text1)#permit ipv6 3710:249a:c643:ef11::/64 any

• These commands configure ACL to permit VLAN traffic between any source and destination host.

  switch(config)#ip access-list acl1
  switch(config-acl-acl1)#permit ipv6 vlan 1234 0x0 ip any any
permit (IPv6 Prefix List)

The **permit** command adds a rule to the configuration mode IPv6 prefix list. Route map match commands use prefix lists to filter routes for redistribution into OSPF, RIP, or BGP domains. Routes are redistributed into the specified domain when they match the prefix that a **permit** statement specifies.

The **no permit** and **default permit** commands remove the specified rule from the configuration mode prefix list. The **no seq (IPv6 Prefix Lists)** command also removes the specified rule from the prefix list.

**Command Mode**

IPv6-pfx Configuration

**Command Syntax**

\[
\text{[SEQUENCE]} \quad \text{deny} \quad \text{ipv6}_\text{prefix} \quad \text{[MASK]}
\]

**Parameters**

- **SEQUENCE**  
  Sequence number assigned to the rule. Options include:
  - *<no parameter>*  
    Number is derived by adding 10 to the number of the list’s last rule.
  - **seq** \text{seq}\_num  
    Number is specified by \text{seq}\_num. Value ranges from 0 to 65535.
  - **ipv6\_prefix**  
    IPv6 prefix upon which command filters routes (CIDR notation).
  - **MASK**  
    Range of the prefix to be matched.
    - *<no parameter>*  
      exact match with the subnet mask is required.
    - **eq** \text{mask}\_e  
      prefix length is equal to \text{mask}\_e.
    - **ge** \text{mask}\_g  
      range is from \text{mask}\_g to 128.
    - **le** \text{mask}\_l  
      range is from \text{subnet} mask length to \text{mask}\_l.
    - **ge** \text{mask}\_l \text{le} \text{mask}\_g  
      range is from \text{mask}\_g to \text{mask}\_l.
  
  When **le** and **ge** are specified, the prefix list size > \text{mask}\_g > \text{mask}\_l

**Example**

- This command appends a **permit** statement at the end of the text1 prefix list. The **permit** statement allows redistribution of routes with the specified prefix.

  ```
  switch(config)#ipv6 prefix-list route-five
  switch(config-ipv6-pfx)#permit 3100::/64
  switch(config-ipv6-pfx)#
  ```
permit (MAC ACL)

The **permit** command adds a permit rule to the configuration mode MAC access control list packets through the interface to which the list is applied. Rule filters include protocol, source, and destination.

The **no permit** and **default permit** commands remove the specified rule from the configuration mode ACL. The **no <sequence number> (ACLs)** command also removes the specified rule from the ACL.

**Command Mode**

MAC-ACL Configuration

**Command Syntax**

```
[SEQ_NUM] permit SOURCE_ADDR DEST_ADDR [PROTOCOL] [log]
no permit SOURCE_ADDR DEST_ADDR [PROTOCOL] [log]
default permit SOURCE_ADDR DEST_ADDR [PROTOCOL] [log]
```

**Parameters**

- **SEQ_NUM**  Sequence number assigned to the rule. Options include:
  - `<no parameter>` Number is derived by adding 10 to the number of the ACL’s last rule.
  - `<1 – 4294967295>` Number assigned to entry.
- **SOURCE_ADDR** and **DEST_ADDR**  source and destination address filters. Options include:
  - *mac_address mac_mask*  MAC address and mask
  - *any*  Packets from all addresses are filtered.
    - *mac_address* specifies a MAC address in 3x4 dotted hexadecimal notation (hhhh.hhhh.hhhh)
    - *mac_mask* specifies a MAC address mask in 3x4 dotted hexadecimal notation (hhhh.hhhh.hhhh)
  - 0 bits require an exact match to filter
  - 1 bits filter on any value
- **PROTOCOL**  protocol field filter. Values include:
  - *aarp*  Appletalk Address Resolution Protocol (0x80f3)
  - *appletalk*  Appletalk (0x809b)
  - *arp*  Address Resolution Protocol (0x806)
  - *ip*  Internet Protocol Version 4 (0x800)
  - *ipx*  Internet Packet Exchange (0x8137)
  - *lldp*  LLDP (0x88cc)
  - *novell*  Novell (0x8138)
  - *rarp*  Reverse Address Resolution Protocol (0x8035)
  - *protocol_num*  integer corresponding to a MAC protocol. Values range from 0 to 65535
- **log**  triggers an informational log message to the console about the matching packet.

**Examples**

- This command appends a **permit** statement at the end of the ACL. The **permit** statement passes all aarp packets from 10.1000.0000 through 10.1000.FFFF to any host.
  
  ```
  switch(config)#mac access-list text1
  switch(config-mac-acl-text1)#permit 10.1000.0000 0.0.FFFF any aarp
  switch(config-mac-acl-text1)#
  ```
• This command inserts a `permit` statement with the sequence number 25. The `permit` statement passes all packets through the interface.

```bash
switch(config-mac-acl-text1)#25 permit any any
switch(config-mac-acl-text1)#
```
permit (Standard IPv4 ACL)

The `permit` command adds a permit rule to the configuration mode standard IPv4 access control list (ACL). Standard ACL rules filter on the source field.

Packets filtered by a permit rule are accepted by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding 10 to the number of the ACL’s last rule.

The `no permit` and `default permit` commands remove the specified rule from the configuration mode ACL. The `no <sequence number> (ACLs)` command also removes the specified rule from the ACL.

**Command Mode**
Std-ACL Configuration

**Command Syntax**

```
[SEQ_NUM] permit SOURCE_ADDR [log]
no permit SOURCE_ADDR [log]
default permit SOURCE_ADDR [log]
```

**Parameters**

- **SEQ_NUM**  
  Sequence number assigned to the rule. Options include:
  - `<no parameter>`  Number is derived by adding 10 to the number of the ACL’s last rule.
  - `<1 – 4294967295>`  Number assigned to entry.

- **SOURCE_ADDR**  
  Source address filter. Options include:
  - `network_addr`  Subnet address (CIDR or address-mask).
  - `any`  Packets from all addresses are filtered.
  - `host ip_addr`  IP address (dotted decimal notation).

  Subnet addresses support discontiguous masks.

- **log**  
  Triggers an informational log message to the console about the matching packet.
  - Valid in ACLs applied to the control plane.
  - Validity in ACLs applied to data plane varies by switch platform.

**Example**

- This command appends a `permit` statement at the end of the ACL. The `permit` statement passes all packets with a source address of 10.10.1.1/24.

  ```
switch(config)#ip access-list standard text1
switch(config-std-acl-text1)#permit 10.1.1.1/24
switch(config-std-acl-text1)#
```
permit (Standard IPv6 ACL)

The **permit** command adds a permit rule to the configuration mode standard IPv6 access control list. Standard ACL rules filter on the source field.

Packets filtered by a permit rule are accepted by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding 10 to the number of the ACL’s last rule.

The **no permit** and **default permit** commands remove the specified rule from the configuration mode ACL. The **no <sequence number> (ACLs)** command also removes the specified rule from the ACL.

**Command Mode**

Std-IPv6-ACL Configuration

**Command Syntax**

```
[SEQ_NUM] permit SOURCE_ADDR
no permit SOURCE_ADDR
default permit SOURCE_ADDR
```

**Parameters**

- **SEQ_NUM**  Sequence number assigned to the rule. Options include:
  - <no parameter>  Number is derived by adding 10 to the number of the ACL’s last rule.
  - <1 – 4294967295>  Number assigned to entry.
- **SOURCE_ADDR**  source address filter. Options include:
  - ipv6_prefix  IPv6 address with prefix length (CIDR notation).
  - any  Packets from all addresses are filtered.
  - host ipv6_addr  IPv6 host address.

**Example**

- This command appends a **permit** statement at the end of the ACL. The **permit** statement drops packets with a source address of 2103::/64.

```
switch(config)#ipv6 access-list standard test1
switch(config-std-acl-ipv6-text1)#permit 2103::/64
switch(config-std-acl-ipv6-text1)#
```
remark

The **remark** command adds a non-executable comment statement into the pending ACL. Remarks entered without a sequence number are appended to the end of the list. Remarks entered with a sequence number are inserted into the list as specified by the sequence number.

The **default remark** command removes the comment statement from the ACL.

The **no remark** command removes the comment statement from the ACL. The command can specify the remark by content or by sequence number.

**Command Mode**
- ACL Configuration
- IPv6-ACL Configuration
- Std-ACL Configuration
- Std-IPv6-ACL Configuration
- MAC-ACL Configuration

**Command Syntax**

```
remark text
line_num remark [text]
no remark text
default remark text
```

**Parameters**

- `text` the comment text.
- `line_num` sequence number assigned to the remark statement. Value ranges from 1 to 4294967295

**Example**

- This command appends a comment to the list.

```
switch(config-acl-test1)#remark end of list
switch(config-acl-test1)#show
IP Access List test1
  10 permit ip 10.10.10.0/24 any
  20 permit ip any host 10.20.10.1
  30 deny ip host 10.10.10.1 host 10.20.10.1
  40 permit ip any any
  50 remark end of list
```
**resequence (ACLs)**

The `resequence` command assigns sequence numbers to rules in the configuration mode ACL. Command parameters specify the number of the first rule and the numeric interval between consecutive rules.

Maximum rule sequence number is 4294967295.

**Command Mode**

- ACL Configuration
- IPv6-ACL Configuration
- Std-ACL Configuration
- Std-IPv6-ACL Configuration
- MAC-ACL Configuration

**Command Syntax**

```
resequence [start_num [inc_num]]
```

**Parameters**

- `start_num` sequence number assigned to the first rule. Default is 10.
- `inc_num` numeric interval between consecutive rules. Default is 10.

**Example**

- The `resequence` command renumbers the list, starting the first command at number 100 and incrementing subsequent lines by 20.

  ```
  switch(config-acl-test1)#show
  IP Access List test1
              10 permit ip 10.10.10.0/24 any
              20 permit ip any host 10.20.10.1
              30 deny ip host 10.10.10.1 host 10.20.10.1
              40 permit ip any any
              50 remark end of list
  switch(config-acl-test1)#resequence 100 20
  switch(config-acl-test1)#show
  IP Access List test1
              100 permit ip 10.10.10.0/24 any
             120 permit ip any host 10.20.10.1
             140 deny ip host 10.10.10.1 host 10.20.10.1
             160 permit ip any any
             180 remark end of list
  ```
route-map

The `route-map` command places the switch in route map configuration mode, which is a group change mode that modifies a route map statement. The command specifies the name and number of the route map statement that subsequent commands modify and creates a route map statement if it references a nonexistent statement. All changes in a group change mode edit session are pending until the end of the session.

Route maps define commands for redistributing routes between routing protocols. A route map statement is identified by a name, filter type (permit or deny), and sequence number. Statements with the same name are components of a single route map; the sequence number determines the order in which the statements are compared to a route.

The `exit` command saves pending route map statement changes to `running-config`, then returns the switch to global configuration mode. ACL changes are also saved by entering a different configuration mode.

The `abort` command discards pending changes, returning the switch to global configuration mode.

The `no route-map` and `default route-map` commands delete the specified route map statement from `running-config`.

Note

The route map configuration supports only standard ACL.

Command Mode

Global Configuration

Command Syntax

```
route-map map_name [FILTER_TYPE] [sequence_number]
no route-map map_name [FILTER_TYPE] [sequence_number]
default route-map map_name [FILTER_TYPE] [sequence_number]
```

Parameters

- `map_name` label assigned to route map. Protocols reference this label to access the route map.
- `FILTER_TYPE` disposition of routes matching commands specified by route map statement.
  - `permit` routes are redistributed when they match route map statement.
  - `deny` routes are not redistributed when they match route map statement.
  - `<No parameter>` assigns `permit` as the `FILTER_TYPE`.

When a route does not match the route map criteria, the next statement within the route map is evaluated to determine the redistribution action for the route.

- `sequence_number` the route map position relative to other statements with the same name.
  - `<no parameter>` sequence number of 10 (default) is assigned to the route map.
  - `<1-16777215>` specifies sequence number assigned to route map.

Commands Available in route map configuration mode:

- `continue (route map)`
- `match (route-map)`
- `set (route-map)`
Examples

- This command creates the route map named *map1* and places the switch in route map configuration mode. The route map is configured as a permit map.
  
  ```
  switch(config)#route-map map1 permit 20
  switch(config)#
  ```

- This command saves changes to *map1* route map, then returns the switch to global configuration mode.
  
  ```
  switch(config-route-map-map1)#exit
  switch(config)#
  ```

- This command saves changes to *map1* route map, then places the switch in interface-Ethernet mode.
  
  ```
  switch(config-route-map-map1)#interface ethernet 3
  switch(config-if-Et3)#
  ```

- This command discards changes to *map1* route map, then returns the switch to global configuration mode.
  
  ```
  switch(config-route-map-map1)#abort
  switch(config)#
  ```
**seq (IPv6 Prefix Lists)**

The `no seq` command removes the rule with the specified sequence number from the ACL. The `default seq` command also removes the specified rule.

The `seq` keyword is a command option used at the beginning of `deny (IPv6 Prefix List)` and `permit (IPv6 Prefix List)` commands that places a new rule between two existing rules.

**Command Mode**
IPv6-pfx Configuration

**Command Syntax**
- `no seq line_num`
- `default seq line_num`

**Parameters**
- `line_num`  sequence number of rule to be deleted. Valid rule numbers range from 0 to 65535.

**Example**
- These commands remove rule 20 from the `map1` prefix list, then displays the resultant list.

```bash
switch(config)#ipv6 prefix-list map1
switch(config-ipv6-pfx)#no seq 20
switch(config-ipv6-pfx)#exit
switch(config)#show ipv6 prefix-list map1
ipv6 prefix-list map1
  seq 10 permit 3:4e96:8ca1:33cf::/64
  seq 15 deny 3:4400::/64
  seq 30 permit 3:1bca:3ff2:634a::/64
  seq 40 permit 3:1bca:1141:ab34::/64
switch(config)#
```
**set (route-map)**

The `set` command specifies modifications to routes that are selected for redistribution by the configuration mode route map.

The `no set` and `default set` commands remove the specified `set` command from the configuration mode route map statement by deleting the corresponding `set` command from `running-config`.

**Command Mode**

Route-Map Configuration

**Command Syntax**

```
set CONDITION
no set CONDITION
default set CONDITION
```

**Parameters**

- `CONDITION` specifies the route modification parameter and value. Options include:
  - `as-path prepend` BGP AS number that is prepended to as-path. For details, see the `set as-path prepend` command.
    - `<1` to `4294967295>` BGP AS number to prepend.
    - `auto` use peer AS number for inbound and local AS for outbound to prepend.
  - `distance <1` to `255` Protocol independent administrative distance.
  - `ip next-hop ipv4_address` next hop IPv4 address.
  - `ip next-hop peer-address` Use BGP peering address as next hop IPv4 address.
  - `ipv6 next-hop ipv6_address` next hop IPv6 address.
  - `ipv6 next-hop peer-address` Use BGP peering address as next hop IPv6 address.
  - `local-preference <1` to `4294967295>` BGP local preference metric.
  - `metric <1` to `4294967295>` route metric.
  - `metric +<1` to `4294967295>` add specified value to current route metric.
  - `metric –<1` to `4294967295>` subtract specified value to current route metric.
  - `metric-type OSPF_TYPE` OSPF metric type. Options include:
    - `type-1` OSPF type 1 metric.
    - `type-2` OSPF type 2 metric.
  - `origin O_TYPE` BGP origin attribute. Options for `O_TYPE` include
    - `egp` exterior BGP route.
    - `igp` interior BGP route.
    - `incomplete` BGP route of unknown origin.
  - `tag <1` to `4294967295>` route tag.
  - `weight <1` to `65535` BGP weight parameter.

**Related Commands**

- `route-map` enters route-map configuration mode.
- `set (route-map)` specifies community modifications for the redistributed routes.
- `set community (route-map)` specifies extended community modifications for the redistributed routes.
Example

- This command creates a route map entry that sets the local preference metric to 100 on redistributed routes.

```
switch(config)#route-map map1
switch(config-route-map-map1)#set local-preference 100
switch(config-route-map-map1)#
```
**set as-path match**

The `set as-path match` command configures the AS_PATH attribute for prefixes that are either received from a BGP neighbor or advertised to a BGP neighbor in the route map configuration mode.

The `no set as-path match` command removes the AS path specified for the BGP prefix.

**Command Mode**
Route-Map Configuration

**Command Syntax**
```
set as-path match all replacement [[none | auto] as_path]
no set as-path match all replacement [[none | auto] as_path]
```

**Parameters**
- **none** replaces the AS-Path of the matching routes with a null or an empty AS-Path.
- **auto** if the specific route map is applied as an inbound policy to a corresponding BGP neighbor statement, then replace the AS_PATH of the prefixes received from this neighbor with the neighbor’s AS number. If this route map is applied as an outbound policy to a corresponding neighbor statement, then replace the AS_PATH of the prefixes advertised to this neighbor with the locally configured AS number.
- **as_path** replaces the AS-Path of the matching routes with an arbitrary AS-Path.
Example

- This command replaces the AS-Path with the “none” option.

```
switch#show ip bgp neighbors 80.80.1.2 advertised-routes

  * > 202.202.1.0/24 80.80.1.1 - - - 200 200 500 600 i

  The AS-Path of matching prefixes are replaced with the locally configured AS – 200 and 500 600.
set as-path prepend

The `set as-path prepend` command adds a set statement to a route map to prepend one or more autonomous system (AS) numbers to the AS_PATH attribute of a BGP route.

The `no set as-path prepend` and `default set as-path prepend` commands remove the specified set statements from the route map and update all corresponding routes.

Command Syntax

```
set as-path prepend {{auto | as_number ... [auto | as_number]} | last-as count}
no set as-path prepend {{auto | as_number ... [auto | as_number]} | last-as count}
default set as-path prepend {{auto | as_number ... [auto | as_number]} | last-as count}
```

Parameters

- **auto** prepends the peer AS number for peer inbound route maps and the local AS number for peer outbound route maps.
- **as_number** prepends the specified AS number. Can be entered in plain notation (values range from 1-4294967295) or in asdot notation as described in RFC 5396. In asdot notation, AS numbers from 1-65535 are entered in plain notation, and AS numbers from 65536 to 4294967295 are entered as two values separated by a dot. The first value is high-order and represents a multiple of 65536; the second value is low-order and represents a decimal integer. For example, AS number 65552 can be entered as either 65552 or 1.16 (i.e., 1*65536+16). However they are entered, AS numbers are stored internally in plain decimal notation and will appear that way in `show` outputs.
- **last-as count** prepends the last AS number in the AS path `count` times. Values range from 1 to 15. This is mutually exclusive with the use of the `auto` keyword or the entry of one or more specified AS numbers, and is not supported in multi-agent mode.

Examples

- These commands create a route-map entry that prepends AS number 64496 and prepends either the peer or local AS number twice.

```
switch(config)#route-map map1
switch(config-route-map-map1)#set as-path prepend 64496 auto auto
switch(config-route-map-map1)#exit
switch(config)#show route-map map1
route-map map1 permit 10  
  Description:  
  Match clauses:  
  SubRouteMap:  
  Set clauses:  
    set as-path prepend 64496 auto auto
```

- The commands create a route-map entry that prepends AS numbers 64496, 64498, and 65552.

```
switch(config)#route-map map2
switch(config-route-map-map2)#set as-path prepend 64496 64498 1.16
switch(config-route-map-map2)#exit
switch(config)#show route-map map2
route-map map2 permit 10
Description:
Match clauses:
SubRouteMap:
Set clauses:
  set as-path prepend 64496 64498 65552
switch(config)#
```

- These commands create a route map entry that prepends the last AS number 12 times.

```
switch(config)#route-map map3
switch(config-route-map-map3)#set as-path prepend last-as 12
switch(config-route-map-map3)#exit
switch(config)#show route-map map3
route-map map3 permit 10
Description:
Match clauses:
SubRouteMap:
Set clauses:
  set as-path prepend last-as 12
switch(config)#
```
set community (route-map)

The *set community* command specifies community attribute modifications to routes that are selected for redistribution by the configuration mode route map. The *set community none* command removes community attributes from the route.

The *no set community* and *default set community* commands remove the specified community from the configuration mode route map statement by deleting the corresponding statement from the running configuration.

**Command Mode**

Route-Map Configuration

**Command Syntax**

```
set community [GSHUT | aa:nn | community-list | internet | local-as | no-advertise | no-export | none | number]
no set community [GSHUT | aa:nn | additive | community-list | delete | internet | local-as | no-advertise | no-export | none | number]
default set community [GSHUT | aa:nn | additive | community-list | delete | internet | local-as | no-advertise | no-export | none | number]
```

**Parameters**

- **GSHUT** configures a graceful shutdown in BGP.
- **aa:nn** configures the community AS and network number, separated by colon. Value ranges from 0:0 to 65535:65535.
- **community-list** A label for community list.
- **internet** advertises route to the Internet community.
- **local-as** advertises route only to local peers.
- **no-advertise** does not advertise route to any peer.
- **no-export** advertises route only within BGP AS boundary.
- **none** does not provide any community attributes.
- **number** configures the community number. Value ranges from 1 to 4294967040.
- **additive** adds specified attributes to the current community.
- **delete** removes specified attributes from the current community.

**Related Commands**

- ip community-list
- route-map
- set (route-map)
- set community (route-map)
Guideline

EOS does not support disabling the process of graceful shutdown community.

Example

- This command advertises routes only to local peers.

```
switch(config-route-map-map1)#show active
route-map map1 permit 10
  match community instances <= 50
  set community 0:456 0:2345
switch(config-route-map-map1)#set community local-as
switch(config-route-map-map1)#ip community-list 345 permit 23
switch(config)#route-map map1
switch(config-route-map-map1)#show active
route-map map1 permit 10
  match community instances <= 50
  set community 0:456 0:2345 local-as
switch(config-route-map-map1)#
```
set extcommunity (route-map)

The `set extcommunity` command specifies extended community attribute modifications to routes that are selected for redistribution by the configuration mode route map. The `set extcommunity none` command removes extended community attributes from the route.

The `no set extcommunity` and `default set extcommunity` commands remove the specified `set extcommunity` command from the configuration mode route map statement by deleting the corresponding statement from `running-config`.

Command Mode
Route-Map Configuration

Command Syntax

```
set extcommunity COND_1 [COND_2] [COND_N] [MOD_TYPE]
set extcommunity none
no set extcommunity COND_1 [COND_2] [COND_N] [MOD_TYPE]
no set extcommunity none
default set extcommunity COND_1 [COND_2] [COND_N] [MOD_TYPE]
default set extcommunity none
```

Parameters
- `COND_X` Specifies extended community route map modification. Command may contain multiple attributes. Options include:
  - `rt ASN:nn` Route target attribute (AS:network number).
  - `rt IP-address:nn` Route target attribute (IP address: network number).
  - `soo ASN:nn` Site of origin attribute (AS:network number).
  - `soo IP-address:nn` Site of origin attribute (IP address: network number).

- `MOD_TYPE` Specifies route map modification method. Options include:
  - `<no parameter>` command replaces existing route map with specified parameters.
  - `additive` command adds specified parameters to existing route map.
  - `delete` command removes specified parameters from existing route map.

Related Commands
- `route-map` enters route map configuration mode.
- `set (route-map)` specifies attribute modifications for the redistributed routes
- `set (route-map)` specifies community modifications for the redistributed routes.

Example
- This command creates a route map entry in map1 that sets the route target extended community attribute.

  ```
  switch(config)#route-map map1
  switch(config-route-map-map1)#set extcommunity rt 10.13.2.4:100
  switch(config-route-map-map1)#
  ```
show (ACL configuration modes)

The `show` command displays the contents of an access control list (ACL).

- **show** or **show pending** – displays the list as modified in ACL configuration mode.
- **show active** – displays the list as stored in `running-config`.
- **show comment** – displays the comment stored with the list.
- **show diff** – displays the modified and stored lists, with flags denoting the modified rules.

Exiting the ACL configuration mode stores all pending ACL changes to `running-config`.

**Command Mode**

- ACL Configuration
- IPv6-ACL Configuration
- Std-ACL Configuration
- Std-IPv6-ACL Configuration
- MAC-ACL Configuration

**Command Syntax**

```plaintext
show
show active
show comment
show diff
show pending
```

**Examples**

The examples in this section assume these ACL commands are entered as specified.

These commands are stored in running-config:

```plaintext
10 permit ip 10.10.10.0/24 any
20 permit ip any host 10.21.10.1
30 deny ip host 10.10.10.1 host 10.20.10.1
40 permit ip any any
50 remark end of list
```

The current edit session removed this command. This change is not yet stored to running-config:

```plaintext
20 permit ip any host 10.21.10.1
```

The current edit session added these commands ACL. They are not yet stored to running-config:

```plaintext
20 permit ip 10.10.0.0/16 any
25 permit tcp 10.10.20.0/24 any
45 deny pim 239.24.124.0/24 10.5.8.4/30
```

- This command displays the ACL, as stored in the configuration.

```plaintext
switch(config-acl-test_1)#show active
IP Access List test_1
  10 permit ip 10.10.10.0/24 any
  20 permit ip any host 10.21.10.1
  30 deny ip host 10.10.10.1 host 10.20.10.1
  40 permit ip any any
  50 remark end of list
```
• This command displays the pending ACL, as modified in ACL configuration mode.

```bash
switch(config-acl-test_1)#show pending
IP Access List test_1
  10 permit ip 10.10.10.0/24 any
  20 permit ip 10.10.0.0/16 any
  25 permit tcp 10.10.20.0/24 any
  30 deny ip host 10.10.10.1 host 10.20.10.1
  40 permit ip any any
  45 deny pim 239.24.124.0/24 10.5.8.4/30
  50 remark end of list
```

• This command displays the difference between the saved and modified ACLs.
  • Rules added to the pending list are denoted with a plus sign (+).
  • Rules removed from the saved list are denoted with a minus sign (-)

```bash
switch(config-acl-test_1)#show diff
---
+++@@ -1,7 +1,9 @@
- 20 permit ip any host 10.21.10.1
+ 20 permit ip 10.10.0.0/16 any

```
show ip access-lists

The `show ip access-list` command displays the contents of IPv4 and standard IPv4 access control lists (ACLs) on the switch. Use the `summary` option to display only the name of the lists and the number of lines in each list.

Command Mode
Privileged EXEC

Command Syntax
`show ip access-list [LIST] [SCOPE]`

Parameters
- **LIST** name of lists to be displayed. Selection options include:
  - `<no parameter>` all IPv4 ACLs are displayed.
  - `list_name` specified IPv4 ACL is displayed.
- **SCOPE** information displayed. Selection options include:
  - `<no parameter>` all rules in the specified lists are displayed.
  - `summary` the number of rules in the specified lists are displayed.

Examples
- This command displays all rules in **test1** IPv4 ACL.

```
switch#show ip access-list list2
IP Access List list2
  10 permit ip 10.10.10.0/24 any
  20 permit ip any host 10.20.10.1
  30 deny ip host 10.10.10.1 host 10.20.10.1
switch#
```

- This command displays the name of, and number of rules in, each list on the switch.

```
switch#show ip access-list summary
IPV4 ACL default-control-plane-acl
  Total rules configured: 12
  Configured on: control-plane
  Active on : control-plane

IPV4 ACL list2
  Total rules configured: 3

IPV4 ACL test1
  Total rules configured: 6

Standard IPV4 ACL test_1
  Total rules configured: 1

IPV4 ACL test_3
  Total rules configured: 0

switch#
```
This command displays the summary and lists all the configured IPv4 ACLs.

```
switch #show ip access-lists summary
IPv4 ACL default-control-plane-acl [readonly]
  Total rules configured: 17
  Configured on Ingress: control-plane(default VRF)
  Active on Ingress: control-plane(default VRF)

IPv4 ACL ipAclLimitTest
  Total rules configured: 0
  Configured on Egress: V12148,2700
  Active on Egress: V12148,2700
```
**show ip prefix-list**

The `show ip prefix-list` command displays all rules for the specified IPv4 prefix list. The command displays all IPv4 prefix list rules if a prefix list name is not specified.

**Command Mode**

EXEC

**Command Syntax**

```
show ip prefix-list [DISPLAY_ITEMS]
```

**Parameters**

- `DISPLAY_ITEMS` specifies the name of prefix lists for which rules are displayed. Options include:
  - `<no parameter>` all IPv4 prefix list rules are displayed.
  - `list_name` specifies the IPv4 prefix list for which rules are displayed.

**Example**

This command displays all rules in the route-one IPv4 prefix list:

```
switch(config-ip-pfx)#show ip prefix-list
ip prefix-list route-one
  seq 10 deny 10.1.1.0/24
  seq 20 deny 10.1.0.0/16
  seq 30 permit 12.15.4.9/32
  seq 40 deny 1.1.1.0/24
switch(config-ip-pfx)#
```
show ipv6 access-lists

The show ipv6 access-list command displays the contents of all IPv6 access control lists (ACLs) on the switch. Use the summary option to display only the name of the lists and the number of lines in each list.

Command Mode
Privileged EXEC

Command Syntax

```
show ipv6 access-list [LIST] [SCOPE]
```

Parameters

- **LIST** name of lists to be displayed. Selection options include:
  - <no parameter> all IPv6 ACLs are displayed.
  - list_name specified IPv6 ACL is displayed.
- **SCOPE** information displayed. Selection options include:
  - <no parameter> all rules in the specified lists are displayed.
  - summary the number of rules in the specified lists are displayed.

Examples

- This command displays all rules in test1 IPv6 ACL.
  ```
  switch#show ipv6 access-list list2
  IP Access List list2
  10 permit ipv6 3891:3c58:6300::/64 any
  20 permit ipv6 any host 2fe1:b468:024a::
  30 deny ipv6 host 3411:91c1:: host 4210:cc23:d2de::
  ```
  switch#

- This command displays the name of, and number of rules in, each list on the switch.
  ```
  switch#show ipv6 access-list summary
  IPV6 ACL list2
  Total rules configured: 3
  
  IPV6 ACL test1
  Total rules configured: 6
  
  IPV6 ACL test_1
  Total rules configured: 1
  
  Standard IPV6 ACL test_3
  Total rules configured: 0
  ```
  switch#
show ipv6 prefix-list

The show ipv6 prefix-list command displays all rules for the specified IPv6 prefix list. The command displays all IPv6 prefix lists if a prefix list name is not specified.

Command Mode
EXEC

Command Syntax
show ipv6 prefix-list [DISPLAY_ITEMS]

Parameters
- **DISPLAY_ITEMS** specifies the name of prefix lists for which rules are displayed. Options include:
  - <no parameter> all IPv6 prefix lists are displayed.
  - list_name specifies the IPv6 prefix list for which rules are displayed.

Examples
- This command displays all rules in the map1 IPv6 prefix list:

  switch>show ipv6 prefix-list map1
  ipv6 prefix-list map1
  seq 10 permit 3:4e96:8ca1:33cf::/64
  seq 15 deny 3:4400::/64
  seq 20 permit 3:11b1:8fe4:1aac::/64
  seq 30 permit 3:1bca:3ff2:634a::/64
  seq 40 permit 3:1bca:1141:ab34::/64
  switch>

- This command displays all prefix lists:

  switch>show ipv6 prefix-list
  ipv6 prefix-list map1
  seq 10 permit 3:4e96:8ca1:33cf::/64
  seq 15 deny 3:4400::/64
  seq 20 permit 3:11b1:8fe4:1aac::/64
  seq 30 permit 3:1bca:3ff2:634a::/64
  seq 40 permit 3:1bca:1141:ab34::/64
  ipv6 prefix-list FREDD
  ipv6 prefix-list route-five
  ipv6 prefix-list map2
  seq 10 deny 10:1:1:1::/64 ge 72 le 80
  seq 20 deny 10:1::/32
  switch>
show mac access-lists

The `show mac access-list` command displays the contents of all MAC access control lists (ACLs) on the switch. Use the summary to display only the name of the lists and the number of lines in each list.

**Command Mode**
Privileged EXEC

**Command Syntax**
```
show mac access-lists [LIST] [SCOPE]
```

**Parameters**
- **LIST** name of lists to be displayed. Selection options include:
  - `<no parameter>` command displays all ACLs.
  - `list_name` command displays ACL specified by parameter.
- **SCOPE** information displayed. Selection options include:
  - `<no parameter>` command displays all rules in specified lists.
  - `summary` command displays the number of rules in specified lists.

**Examples**
- This command displays all rules in `mtest2` MAC ACL.
  ```
  switch#show mac access-list mlist2
  IP Access List mlist2
      10 permit 1024.4510.F125 0.0.0 any aarp
      20 permit any 4100.4500.0000 0.FF.FFFF novell
      30 deny any any
  switch#
  ```
- This command displays the number of rules in each MAC ACL on the switch.
  ```
  switch#show mac access-list summary
  MAC ACL mlist1
      Total rules configured: 6
  MAC ACL mlist2
      Total rules configured: 3
  MAC ACL mlist3
      Total rules configured: 1
  MAC ACL mlist4
      Total rules configured: 0
  switch#
  ```
show route-map

The `show route-map` command displays the contents of configured route maps.

Command Mode

EXEC

Command Syntax

```
show route-map [map_name]
```

Parameters

- `<no parameter>` displays the content of all configured route maps
- `map_name` displays the content of the specified route map

Example

- **This command displays the `map1` route map.**
  
  ```
  switch(config)#show route-map map1
  route-map map1 permit 10
  Description:
  Match clauses:
  SubRouteMap:
  Set clauses:
  set as-path prepend last-as 12
  set as-path prepend auto auto
  ```

- **This command displays the `map` route map.**
  
  ```
  switch>show route-map map
  route-map map permit 5
  Match clauses:
  match as 456
  Set clauses:
  route-map map permit 10
  Match clauses:
  match ip next-hop 2.3.4.5
  match as-path path_2
  Set clauses:
  set local-preference 100
  ```
show platform fap acl

The **show platform fap acl** command displays the ACL information of Sand platform devices.

**Command Mode**
Privileged EXEC

**Command Syntax**

```
show platform fap acl [ipkgv | l4ops | mirroring | opkgv | pmf | tcam | udf | vsicfg]
```

**Parameters**

- **ipkgv** displays the ACL Ingress Interface Specification (IPKGV) information.
- **l4ops** displays the ACL Layer 4 Options (L4OPS) information.
- **mirroring** displays the mirroring ACL information.
- **opkgv** displays the ACL Egress Interface Specification (OPKGV) information.
- **pmf** displays the Pmf.
- **tcam** displays the ACL TCAM information.
- **udf** displays the ACL UDF information.
- **vsicfg** displays the ACL Virtual Switch Instance (VSI) CONFIG information.

**Guidelines**

This command is supported on DCS-7280SE and DCS-7500E series platforms only.

**Examples**

- This command displays the brief information of all installed mirroring ACLs.

```
switch(config)#show platform fap acl mirroring

============================
Aggregate ACLs
============================

(list2:0->2) type=2; version=0
- list2 [ prio 0 ] => session 2

(list1:10->1,list3:20->3) type=0; version=13
- list3 [ prio 20 ] => session 3
- list1 [ prio 10 ] => session 1

============================
Interface-ACL Mapping
============================

Ethernet1 => (list1:10->1,list3:20->3) [ ipv4 ]
Ethernet33 => (list2:0->2) [ mac ]
```
show platform fap acl tcam

The `show platform fap tcam` command displays the number of TCAM entries (hardware resources) occupied by the ACL on each forwarding ASIC of Sand platform devices.

**Command Mode**
Privileged EXEC

**Command Syntax**

```
show platform fap acl tcam [detail | diff | hw | shadow | summary]
```

**Parameter**
- `detail` displays the number of TCAM entries (hardware resources) occupied by the ACL on each forwarding ASIC.
- `diff` displays the difference between hardware and shadow.
- `hw` displays ACL entries from hardware.
- `shadow` displays ACL entries from shadow.
- `summary` displays the percentage of TCAM utilization per forwarding ASIC.

**Example**
- This command displays the number of TCAM entries and other ACL TCAM detail.

```plaintext
switch# show platform fap acl tcam detail
ip access-list ipAc1000 (RACL, 1 rules, 2 entries, direction in, state success)
   Shared: false
   Interface: Vlan0002
   -------------------
   Fap: Arad3/0
   Bank Offset Entries
   1   0   2
   Interface: Vlan0003
   -------------------
   Fap: Arad3/0
   Bank Offset Entries
   1   2   2
   Fap: Arad3/4
   Bank Offset Entries
   1   0   2
```
show platform arad acl tcam

The **show platform arad acl tcam** command displays the number of TCAM entries (hardware resources) occupied by the ACL on each forwarding ASIC.

This command is applicable only on DCS-7500E, DCS-7280E series switches.

**Command Mode**

EXEC

**Command Syntax**

```
show platform arad acl tcam [scope]
```

**Parameters**

- **scope** specifies the information displayed. Options include:
  - detail Displays the ACL TCAM details
  - diff Displays the difference between hardware and shadow
  - hw Displays the ACL entries from hardware
  - shadow Displays the ACL entries from shadow
  - summary Displays the ACL TCAM summary

**Example**

- This command displays the number of TCAM entries used by Arad0 ASIC. In this example, ACL is applied on 2 VLANs (Vl2148 and Vl2700) but number of TCAM entries occupied is only 1.

  ```
  switch# show platform arad acl tcam detail
  ip access-list ipAclLimitTest (Shared RACL, 0 rules, 1 entries, direction out, state success, Acl Label 2)
  Fap: Arad0, Shared: true, Interfaces: Vl2148, Vl2700
  Bank Offset Entries
  0          0       1
  Fap: Arad1, Shared: true, Interfaces: Vl2148
  Bank Offset Entries
  0          0       1
  ```

- This command displays the percentage of TCAM utilization per forwarding ASIC.

  ```
  switch# show platform arad acl tcam summary
  The total number of TCAM lines per bank is 1024.
  =========================================================
  Arad0:
  =========================================================
  Bank   Used                  Used %             Used By
  0      1                       0   IP Egress PACLs/RACLs
  Total Number of TCAM lines used is: 1
  =========================================================
  Arad1:
  =========================================================
  Bank   Used                   Used %            Used By
  0      1                        0   IP Egress PACLs/RACLs
  Total Number of TCAM lines used is: 1
  ```
**show platform arad acl tcam summary**

The **show platform arad acl tcam summary** command displays the percentage of TCAM utilization per forwarding ASIC.

**Command Mode**

EXEC

**Command Syntax**

```
show platform arad acl tcam summary
```

**Parameter**

- `summary` displays the ACL TCAM summary.

**Example**

- This command displays the percentage of TCAM utilization per forwarding ASIC.

```
switch#show platform arad acl tcam summary
The total number of TCAM lines per bank is 1024.

```
show platform arad mapping

The **show platform arad mapping** command displays the mapping between the interfaces and the forwarding ASICs.

**Command Mode**

EXEC

**Command Syntax**

```
show platform arad chip_name mapping
```

**Parameter**

- `chip_name` specifies the Arad chip name.

**Example**

- This command displays the mapping between the interfaces and the forwarding ASICs on arad3/0 chip.

```bash
switch#show platform arad arad3/0 mapping
Arad3/0 Port     SysPhyPort Voq ( Fap,FapPort) Xlge  Serdes
---------------------------------------------------------------
Ethernet3/1/1     34    288        (0, 2)     n/a        (20)
```

```
show platform trident tcam

The show platform trident tcam command displays the TCAM entries configured for each TCAM group including policy maps and corresponding hits.

Command Mode

EXEC

Command Syntax

show platform trident tcam [acl | cpu-bound | detail | entry | mirror | pbr | pipe | qos | shared | summary]

Parameters

- `<no parameters>` displays TCAM entries for each TCAM group.
- `acl` displays the trident ACL information.
- `cpu-bound` displays the trident cpu-bound information.
- `detail` Lists all TCAM entries.
- `entry` displays the TCAM entry information.
- `mirror` displays the trident Mirroring ACL information.
- `pbr` displays the trident PBR ACL information.
- `pipe` allows to specify a pipe for filtering.
- `qos` displays the trident QOS information.
- `shared` displays the ACL Sharing information.
- `summary` displays the TCAM allocation information.

Guidelines

This command is applicable only on DCS-7010, DCS-7050/DCS-7050X, DCS7250X, DCS-7300X series switches.

Examples

- This command displays the trident mirroring ACL information.

  switch(config)#show platform trident tcam mirror
  === Mirroring ACLs on switch Linecard0/0 ===

  Session: mir-sess2

  INGRESS ACL mirAc12* uses 2 entries
  Assigned to ports: Ethernet32/1
This command displays detailed information for the TCAM group.

```
switch#show platform trident tcam detail
=== TCAM detail for switch Linecard0/0 ===
TCAM group 9 uses 42 entries and can use up to 1238 more.
MLag control traffic uses 4 entries.
589826 0 hits - MLAG - SrcPort UDP Entry
589827 0 hits - MLAG - DstPort UDP Entry
589828 0 hits - MLAG - SrcPort TCP Entry
589829 0 hits - MLAG - DstPort TCP Entry
CVX traffic reserves 6 entries (0 used).
L3 Control Priority uses 23 entries.
589836 0 hits - URM - SelfIp UDP Entry
589837 0 hits - URM - SelfIp TCP Entry
589848 0 hits - OSPF - unicast
589849 71196 hits - OSPFv2 - Multicast
589850 0 hits - OSPFv3 - Multicast

```

ck338.22:14:38(config-pmap-qos-policy1)#
show hardware tcam profile

The `show hardware tcam profile` command displays the hardware specific information for the current operational TCAM profile in the running configuration.

This command is applicable only on DCS-7280(E/R), DCS-7500(E/R) series switches.

Command Mode

EXEC

Command Syntax

`show hardware tcam profile`

Parameters

- `tcam` specifies the TCAM information.
- `profile` specifies the TCAM profile information.

Example

- This command displays the current operational TCAM profile details.

```
switch#show hardware tcam profile
Configuration     Status
FixedSystem       default     default
```
show platform fap acl tcam hw

The `show platform fap acl tcam hw` command displays the TCAM entries configured for each TCAM bank including policy-maps and corresponding traffic match.

This command is applicable only on DCS-7280(E/R), DCS-7500(E/R) series switches.

**Command Mode**

EXEC

**Command Syntax**

```plaintext
show platform fap fap_name acl tcam hw
```

**Parameters**

- `fap_name` specifies the switch chip-set name.
- `acl` specifies the Arad ACL information.
- `tcam` specifies the Arad TCAM information.
- `hw` specifies the ACL entries for hardware.

**Example**

This command displays the TCAM entries configured for each TCAM bank including policy maps and corresponding traffic matches.

```
switch#show platform fap Arad1 acl tcam hw
```

<--------OUTPUT OMITTED FROM EXAMPLE-------->
**system profile**

The `system profile` command creates a new Ternary Content-Addressable Memory (TCAM) profile in the running configuration.

The `default system profile` and `no system profile` commands delete non-default TCAM profiles from the running configuration.

**Command Mode**

Hardware TCAM

**Command Syntax**

```
system profile [profile_name | default | mirroring-acl | pbr-match-nexthop-group
| qos | tap-aggregation-default | tap-aggregation-extended | tc-counters]
default system profile
no system profile
```

**Parameters**

- `profile_name` creates a profile with the specified name.
- `default` creates a default profile.
- `mirroring-acl` creates a mirroring-ACL profile.
- `pbr-match-nexthop-group` creates a pbr-match-nexthop-group profile.
- `qos` creates a Quality of Service (QoS) profile.
- `tap-aggregation-default` creates a tap-aggregation-default profile.
- `tap-aggregation-extended` creates a tap-aggregation-extended profile.
- `tc-counters` creates a tc-counters profile.

**Guideline**

These commands are compatible with the DCS-7280SE and DCS-7500E series switches only.

**Examples**

- These commands create a mirroring-ACL profile.

```
switch(config)#hardware tcam
switch(config-hw-tcam)#system profile mirroring-acl
switch(config-hw-tcam)#show hardware tcam profile
          Configuration       Status
FixedSystem     mirroring-acl       mirroring-acl
switch(config-hw-tcam)#
```
• These commands delete non-default TCAM profiles.

switch(config)#hardware tcam
switch(config-hw-tcam)#show hardware tcam profile

switch(config-hw-tcam)#ab
A virtual IP (VIP) address is an IP address that does not directly connect to a specific interface. Inbound packets sent to a Virtual IP address are redirected to a physical network interface. VIPs support connection redundancy by assigning the address to multiple switches. If one device becomes unavailable, packets sent to the address are still serviced by the functioning device.

Arista switches support virtual IP addresses through Virtual Router Redundancy Protocol, version 2 (VRRPv2), Virtual Router Redundancy Protocol, version 3 (VRRPv3), and Virtual-ARP (VARP). This chapter describes the Arista switch support of virtual IP addresses and contains these sections:

- Section 25.1: VRRP and VARP Conceptual Overview
- Section 25.2: VRRP and VARP Implementation Procedures
- Section 25.3: VRRP and VARP Implementation Examples
- Section 25.4: VRRP and VARP Configuration Commands

25.1 VRRP and VARP Conceptual Overview

25.1.1 VRRPv2

A virtual router, also known as a virtual router group, is defined by a virtual router identifier (VRID) and a virtual IP address. A virtual router's mapping of VRID and IP address must be consistent among all switches implementing the virtual router group. A virtual router's scope is restricted to a single LAN.

A LAN may contain multiple virtual routers for distributing traffic. Each virtual router on a LAN is assigned a unique VRID. A switch may be configured with virtual routers among multiple LANs.

VRRP uses priority ratings to assign Master or Backup roles for each VRRP router configured for a virtual router group. The Master router sends periodic VRRP Advertisement messages along the LAN and forwards packets received by the virtual router to their destination. Backup routers are inactive but are available to assume Master router duties when the current Master fails.

A VRRP can be configured to allow VRRP routers with higher priority to take over Master router duties. Alternatively, the group can be configured to prevent a router from preemptively assuming the Master role. A VRRP router is always assigned the Master of any virtual router configured with the address owned by the VRRP router, regardless of the preemption prevention setting.

25.1.2 VRRPv3

RFC 5798 defines version 3 of the Virtual Router Redundancy Protocol (VRRP) for both IPv4 and IPv6. It is based on version 2 of VRRP, as defined in RFC 3768.
25.1.3 VARP

Virtual-ARP (VARP) allows multiple switches to simultaneously route packets from a common IP address in an active-active router configuration. Each switch is configured with the same set of virtual IP addresses on corresponding VLAN interfaces and a common virtual MAC address. In MLAG configurations, VARP is preferred over VRRP because VARP does not require traffic to traverse the peer-link to the master router as VRRP would.

A maximum of 500 virtual IP addresses can be assigned to a VLAN interface. All virtual addresses on all VLAN interfaces resolve to the same virtual MAC address.

VARP functions by having each switch respond to ARP and GARP requests for the configured router IP address with the virtual MAC address. The virtual MAC address is only for inbound packets and never used in the source field of outbound packets.

When `ip routing` is enabled, packets to the virtual MAC address are routed to the next hop destination.

Figure 25-1: VARP Configuration
25.2 VRRP and VARP Implementation Procedures

This section contains the following configuration instructions:

- Section 25.2.1: VRRP Configuration for IPv4
- Section 25.2.2: VRRP Configuration for IPv6
- Section 25.2.3: VARP Configuration

25.2.1 VRRP Configuration for IPv4

To implement a virtual router, it must be configured and enabled. A virtual router is typically configured before it is enabled; this ensures that the VRRP router operates as required before its priority settings immediately make it the master virtual router. Because assigning a primary address to a virtual router enables it, address assignment is normally performed after all other configuration tasks.

The **no vrrp** command removes all VRRP commands for the specified virtual router from **running-config**.

25.2.1.1 Virtual Router Configuration

Most configuration tasks are optional because all mandatory parameters have a default value. The following virtual router parameters are configurable:

- VRRP version (default = version 2)
- Router priority (default = 100)
- Preemption option (default is enabled)
- Advertisement timer (default = one second)
- Description (optional parameter)
- Peer authentication (optional parameter)
- Secondary IP addresses (optional parameter)

**VRRP Version**

The **vrrp ipv4 version** command sets the version of VRRP for the corresponding IPv4 virtual router. IPv6 version is not configurable as it only supports version 3. The version selected in a VRRP group can either be same for all group members or independent of each other. By default, Arista switches use VRRP version 2, which supports only IPv4 environments. VRRP version 3 supports both IPv4 and IPv6 environments.

**Example**

- This command causes VLAN 20 to use VRRP version 3.

  ```
  switch(config)#interface vlan 20
  switch(config-if-vl20)#vrrp 1 ipv4 version 3
  switch(config-if-vl20)#
  ```

**Master and Backup Router**

The VRRP routers within a virtual router group determine the Master router through priority settings. Priority values range from 254 (highest priority) to 1 (lowest priority). Priority is either set by a CLI command or is assigned the default value of 100. A switch specifies priority settings for each of its virtual routers. Once set, VRRP priority level can also be changed by a tracked object. The **vrrp tracked-object** command configures the VRRP client process to track an object created by the **track** command and react if its status changes to **down**.
Preemption mode determines when a VRRP router with a higher priority rating becomes the Master router. If preemption is enabled, the VRRP router with the highest priority immediately becomes the Master router. If preemption is disabled, a VRRP router with a higher priority value does not become the Master router unless the current Master becomes unavailable; this is applicable when a new VRRP router becomes available on the LAN or VRRP router’s priority value changes for the virtual router.

The **vrrp priority-level** command configures the switch’s priority setting for the specified virtual router.

**Example**

- This command sets the priority value of 250 for the virtual router with VRID 15 on VLAN 20.
  ```
  switch(config-if-vl20)#vrrp 15 priority-level 250
  switch(config-if-vl20)#
  ```

The **vrrp preempt** command controls the preempt mode setting of the specified virtual router. By default, preempt mode is enabled.

**Examples**

- This command disables preempt mode for the virtual router 15 on VLAN 20.
  ```
  switch(config-if-vl20)#no vrrp 15 preempt
  switch(config-if-vl20)#
  ```

- This command enables preempt mode for the virtual router 30 on VLAN 20.
  ```
  switch(config-if-vl20)#vrrp 30 preempt
  switch(config-if-vl20)#
  ```

The **vrrp preempt delay** command configures a period between an event that elevates a switch to master VRRP router status and the switch’s assumption of master VRRP router role. Command options configure delays during normal operation and after a switch reboot.

**Advertisement Interval**

The Master router sends periodic VRRP Advertisement messages to other VRRP routers. The **vrrp advertisement interval** command specifies the interval between successive advertisement message transmissions.

The advertisement interval also defines the timeout that determines when the switch assumes the Master router role. This timeout interval is three times the advertisement interval.

**Example**

- This command sets the advertisement interval of 10 seconds for virtual router 35 on VLAN 100.
  ```
  switch(config-if-vl100)#vrrp 35 advertisement interval 10
  switch(config-if-vl100)#
  ```

**Description**

The **vrrp session description** command associates a text string to the specified virtual router. The maximum string length is 80 characters. The string has no functional impact on the virtual router.

**Example**

- This command associates the text string **Laboratory Router** to virtual router 15 on VLAN 20.
  ```
  switch(config-if-vl20)#vrrp 15 session description Laboratory Router
  switch(config-if-vl20)#
  ```
Peer Authentication

VRRP peer authentication validates VRRP advertisement packets that the switch receives from other VRRP routers in a specified virtual router group. When a virtual router uses authentication, all VRRP routers in the group must use the same authentication parameters.

The `vrrp peer authentication` command configures virtual router authentication parameters for the specified virtual router.

Example

- This command implements plain-text authentication, using 12345 as the key, for virtual router 40 on VLAN 100.

```
switch(config-if-vl100)#vrrp 40 peer authentication text 12345
switch(config-if-vl100)#
```

Secondary Addresses

The `vrrp ipv4 secondary` command assigns a secondary IP address to a virtual router. Secondary addresses are optional; a virtual router’s configuration may include more than one secondary address command. The primary and secondary address list must be identical for all switches in a virtual router group.

A primary IP address is assigned to a virtual router with the `vrrp ipv4` command (Section 25.2.1.2).

Example

- This command assigns the IP address of 10.2.4.5 as the secondary IP address for the virtual router 15 on VLAN 20

```
switch(config-if-vl20)#vrrp 15 ipv4 10.2.4.5 secondary
switch(config-if-vl20)#
```

25.2.1.2 Virtual Router Enabling and the Primary IP address

The `vrrp ipv4` command configures the primary IP address of the specified virtual router and enables the virtual router if the primary address is contained within the configuration mode interface’s IP address subnet. A virtual router’s configuration may contain only one primary IP address assignment command; subsequent `vrrp ipv4` commands reassign the virtual router’s primary IP address.

Example

- This command enables virtual router group 15 (VRID) on VLAN 20 and assigns 10.1.1.5 as the virtual router’s primary address.

```
switch(config-if-vl20)#vrrp 15 ipv4 10.1.1.5
switch(config-if-vl20)#
```

25.2.1.3 Disabling VRRP

The `vrrp disabled` command places the switch in stopped state for the specified virtual router. While in stopped state, the switch cannot act as a Master or backup router for the virtual router group. The `no vrrp disabled` command changes the switch’s virtual router state to backup or master if the virtual router is properly configured.

VRRP can also be shut down when the status of a tracked object configured by the `vrrp tracked-object` command changes to down.
Examples

- This command places the switch in stopped mode for virtual router 24 on VLAN 20.
  
  switch(config-if-vl20)#vrrp 24 disabled
  switch(config-if-vl20)#

- This command moves the switch out of stopped mode for virtual router 24 on VLAN 20.
  
  switch(config-if-vl20)#no vrrp 24 disabled
  switch(config-if-vl20)#

- This command configures the switch to enter stopped mode for virtual router 24 on VLAN 20 if the status of tracked object interfaceE6/48 changes to down.
  
  switch(config-if-vl20)#vrrp 24 tracked-object interfaceE6/48 shutdown
  switch(config-if-vl20)#

The no vrrp and no vrrp ipv4 commands delete the specified virtual IP address from the interface. Additionally, the no vrrp command removes all residual VRRP commands for the virtual router.

Examples

- This command removes all VRRP configuration commands for virtual router 10 on VLAN 15.
  
  switch(config-if-vl15)#no vrrp 10
  switch(config-if-vl15)#

- This command disables virtual router 25 on VLAN 20 and removes the primary IP address from its configuration.
  
  switch(config-if-vl20)#no vrrp 25 ipv4 10.1.1.5
  switch(config-if-vl20)#

25.2.2 VRRP Configuration for IPv6

To implement a virtual router, it must be configured and enabled. A virtual router is typically configured before it is enabled; this ensures that the VRRP router operates as required before its priority settings immediately make it the master virtual router. Because assigning a primary address to a virtual router enables it, address assignment is normally performed after all other configuration tasks.

The no vrrp command removes all VRRP commands for the specified virtual router from running-config.

25.2.2.1 Configuring VRRP for IPv6

Specify the VRRP Version

The vrrp ipv4 version command sets the version of VRRP used on an interface. The version selected in a VRRP group must be the same for all group members. By default, Arista switches use VRRP version 2, which is not compatible with IPv6.

Example

- This command causes VLAN 20 to use VRRP version 3.
  
  switch(config)#interface vlan 20
  switch(config-if-vl20)#vrrp 1 ipv4 version 3
  switch(config-if-vl20)#

Create a VRRP Group and Configure a Virtual IPv6 Address

The vrrp ipv6 command assigns an IPv6 address to the interface being configured and creates a VRRP group.
Example
- These commands create VRRP group 3 and configure a virtual IPv6 address for the VRRP group on the VLAN 20 interface.

```plaintext
switch(config)#interface vlan 20
switch(config-if-vl20)#vrrp 3 ipv6 2001:db8:0:1::1
switch(config-if-vl20)#
```

Configure Tracking
The `vrrp tracked-object` command configures the VRRP client process to track an object created by the `track` command and react if its status changes to `down`.

Example
- This command causes interface VLAN 20 to disable VRRP when tracked object ETH8 changes state.

```plaintext
switch(config-if-vl20)#vrrp 1 tracked-object ETH8 shutdown
switch(config-if-vl20)#
```

Configure the Priority Level
The `vrrp priority-level` command configures the switch’s priority setting for the specified virtual router.

Example
- This command sets the priority value of 250 for the virtual router with VRID 15 on VLAN 20.

```plaintext
switch(config-if-vl20)#vrrp 15 priority-level 250
switch(config-if-vl20)#
```

Configure the Preemption Mode
Preemption mode determines when a VRRP router with a higher priority rating becomes the Master router. If preemption is enabled, the VRRP router with the highest priority immediately becomes the Master router. If preemption is disabled, a VRRP router with a higher priority value does not become the Master router unless the current Master becomes unavailable; this is applicable when a new VRRP router becomes available on the LAN or VRRP router’s priority value changes for the virtual router.

The `vrrp preempt` command controls the preempt mode setting of the specified virtual router. By default, preempt mode is enabled.

Example
- This command enables preempt mode for the virtual router 30 on VLAN 20.

```plaintext
switch(config-if-vl20)#vrrp 30 preempt
```

Configure the VRRP Advertisement Interval
The `ip virtual-router mac-address advertisement-interval` command specifies the interval between advertisement packets sent by the master router to the VRRP group members.

Examples
- This command configures a MAC address advertisement interval of one minute (60 seconds).

```plaintext
switch(config)#interface vlan 20
switch(config-if-vl20)#ip virtual-router mac-address advertisement-interval 60
switch(config-if-vl20)#
```
25.2.2.2 Verify VRRP IPv6 Configurations

Use the following commands to display the VRRP configurations and status.

**Show VRRP Group**

The `show vrrp` command displays information about the Virtual Router Redundancy Protocol (VRRP) groups configured on a specified interface.

**Examples**

- This command displays a table of information for VRRP groups on the switch.

  ```
  switch>show vrrp interface vlan 3060 brief
  Interface Id  Ver Pri Time  State   VrIps
  Vlan3060  1   3   100 3609  Master  2001::2
            3609 2001::3
  Vlan3060  2   3   100 3609  Master  2002::2
            3609 2002::3
  switch>
  ```

25.2.3 VARP Configuration

Implementing VARP consists of assigning virtual IP addresses to VLAN interfaces and configuring a virtual MAC address.

**Virtual IP Addresses**

The `ip virtual-router address` command assigns a virtual IP address to the VLAN interface being configured. Unlike VRRP, the virtual IP address does not have to be in the same subnet as the physical interface.

A virtual IPv4 address may optionally be configured with a subnet, but doing so will modify the behavior of ARP requests sent from the router. When the router sends an ARP request for an IPv4 address in a virtual subnet, the ARP request will use the virtual IPv4 address as the source IP address and the virtual MAC address as the source MAC address inside the ARP header. For virtual IP addresses configured without the subnet option, no modifications are made to outgoing ARP requests.

**Examples**

- These commands configure a Switch Virtual Interface (SVI) and a virtual IP address for VLAN 10.

  ```
  switch(config)#interface vlan 10
  switch(config-if-Vl10)#ip address 10.0.0.2/24
  switch(config-if-Vl10)#ip virtual-router address 10.0.0.6
  switch(config-if-Vl10)#ipv6 address 2001::1/64
  switch(config-if-Vl10)#ipv6 virtual-router address 2001::2
  switch(config-if-Vl10)#exit
  switch(config)#
  ```

- These commands configure a Switch Virtual Interface (SVI) and a virtual IPv4 address with a subnet for VLAN 10. A static route is added to indicate that the virtual subnet is reachable through VLAN 10.

  ```
  switch(config)#ip route 192.0.0.0/24 vlan 10
  switch(config)#interface vlan 10
  switch(config-if-Vl10)#ip address 10.0.0.2/24
  switch(config-if-Vl10)#ip virtual-router address 192.0.0.6/24
  switch(config-if-Vl10)#exit
  switch(config)#
  ```
Virtual MAC Address

The `ip virtual-router mac-address` command assigns a virtual MAC address to the switch. The switch maps all virtual router IP addresses to this MAC address. The address is receive-only; the switch never sends packets with this address as the source.

When the destination MAC of a packet destined to a remote network matches the virtual MAC address, the MLAG peer forwards the traffic to the next hop destination. Each MLAG peer must have the same routes available, either through static configuration or learned through a dynamic routing protocol.

Example

- This command configures a virtual MAC address.

```
switch(config)#ip virtual-router mac-address 001c.7300.0099
```

Show Virtual MAC Address

To display the virtual router MAC and IP addresses, enter the `show ip virtual-router` command.

Example

- This command displays the virtual router addresses assigned on the switch.

```
switch>show ip virtual-router
IP virtual router is configured with MAC address: 24cd.5a29.cc31
Interface       IP Address    Virtual IP Address    Status    Protocol
Vlan15          10.1.1.3/24    10.1.1.15           up         up
Vlan15          10.1.1.3/24    10.1.1.16           up         up
Vlan15          10.1.1.3/24    10.1.1.17           up         up
Vlan20          10.12.1.6/24   10.1.1.51           up         up
Vlan20          10.12.1.6/24   10.1.1.53           up         up
Vlan20          10.12.1.6/24   10.1.1.55           up         up
```

Show IPv6 Virtual-Router

The `show ipv6 virtual-router` command displays the virtual MAC address assigned to the switch and all virtual IPv6 addresses assigned to each VLAN interface.

Examples

- This command displays a table of information for IPv6 VRRP groups on the switch.

```
switch>show ipv6 virtual-router
IP virtual router is configured with MAC address: 001c.7300.0099
MAC address advertisement interval: 30 seconds
Interface Vlan4094
  State is up
  Protocol is up
  IPv6 address 2001:b8:2001::1011/64
  Virtual IPv6 address 2001:db8:ac10:fe01:
```

1423
25.3 VRRP and VARP Implementation Examples

This section contains the following example set:

- Section 25.3.1: VRRP Examples
- Section 25.3.2: VARP Example

25.3.1 VRRP Examples

This section provides code that implements three VRRP configurations:

- Example 1 configures two switches in a single virtual router group. This implementation protects the LAN against the failure of one router.
- Example 2 configures two switches into two virtual routers within a single LAN. This implementation protects the LAN against the failure of one router and balances traffic between the routers.
- Example 3 configures three switches to implement virtual routers on two LANs. Each LAN contains two virtual routers. One switch is configured into four virtual routers – two on each LAN.

25.3.1.1 VRRP Example 1: One Virtual Router on One LAN

Figure 25-2 displays the Example 1 network. Two switches are configured as VRRP routers to form one virtual router.

Figure 25-2: VRRP Example 1 Network Diagram

The following code configures the first switch (Router A) as the master router and the second switch (Router B) as a backup router for virtual router 10 on VLAN 50. Router A becomes the Master virtual router by setting its priority at 200; Router B maintains the default priority of 100. The advertisement interval is three seconds on both switches. Priority preemption is enabled by default.

Switch code that implements Router A on the first switch

```
switch-A(config)#interface vlan 50
switch-A(config-if-vl50)#ip address 10.10.4.10/24
switch-A(config-if-vl50)#no vrrp 10
switch-A(config-if-vl50)#vrrp 10 priority 200
switch-A(config-if-vl50)#vrrp 10 advertisement interval 3
switch-A(config-if-vl50)#vrrp 10 ip 10.10.4.10
switch-A(config-if-vl50)#exit
```
Switch code that implements Router B on the second switch

```plaintext
switch-B(config)#interface vlan 50
switch-B(config-if-vl50)#ip address 10.10.4.2/24
switch-B(config-if-vl50)#no vrrp 10
switch-B(config-if-vl50)#vrrp 10 advertisement interval 3
switch-B(config-if-vl50)#vrrp 10 ip 10.10.4.10
switch-B(config-if-vl50)#exit
```

25.3.1.2 VRRP Example 2: Two Virtual Routers on One LAN

Figure 25-3 displays Example 2. Two switches are configured as VRRP routers to form two virtual routers on one LAN. Using two virtual routers distributes the LAN traffic between the switches.

Figure 25-3: VRRP Example 2 Network Diagram

```
<table>
<thead>
<tr>
<th>VRID</th>
<th>IP Address</th>
<th>Master Router</th>
<th>Backup Router</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>10.10.4.10</td>
<td>Router A</td>
<td>Router B</td>
</tr>
<tr>
<td>20</td>
<td>10.10.4.20</td>
<td>Router A</td>
<td>Router B</td>
</tr>
</tbody>
</table>
```

The following code configures two switches as a master and a backup router for two virtual routers on VLAN 50.

- Router A is the master for virtual router 10 and backup for virtual router 20.
- Router B is the master for virtual router 20 and backup for virtual router 10.
- VRRP advertisement interval is 3 seconds on virtual router 10 and 5 seconds on virtual router 20.
- Priority preemption is enabled by default for both virtual routers.

Switch code that implements Router A on the first switch

```plaintext
switch-A(config)#interface vlan 50
switch-A(config-if-vl50)#ip address 10.10.4.1/24
switch-A(config-if-vl50)#no vrrp 10
switch-A(config-if-vl50)#vrrp 10 priority 200
switch-A(config-if-vl50)#vrrp 10 advertisement interval 3
switch-A(config-if-vl50)#vrrp 10 ip 10.10.4.10
switch-A(config-if-vl50)#no vrrp 20
switch-A(config-if-vl50)#vrrp 20 advertisement interval 5
switch-A(config-if-vl50)#vrrp 20 ip 10.10.4.20
switch-A(config-if-vl50)#exit
```
Switch code that implements Router B on the second switch

```
switch-B(config)# interface vlan 50
switch-B(config-if-vl50)# ip address 10.10.4.2/24
switch-B(config-if-vl50)# no vrrp 10
switch-B(config-if-vl50)# vrrp 10 advertisement interval 3
switch-B(config-if-vl50)# vrrp 10 ip 10.10.4.10
switch-B(config-if-vl50)# no vrrp 20
switch-B(config-if-vl50)# vrrp 20 priority 200
switch-B(config-if-vl50)# vrrp 20 advertisement interval 5
switch-B(config-if-vl50)# vrrp 20 ip 10.10.4.20
switch-B(config-if-vl50)# exit
```

25.3.1.3 VRRP Example 3: Two Virtual Routers on Two LANs

Figure 25-4 displays Example 3. Three switches are configured as VRRP routers to form four virtual router groups – two groups on each of two LANs.

Figure 25-4: VRRP Example 3 Network Diagram

The following code configures the three switches as follows:

- Router A is the master for virtual router 10 and backup for virtual router 20 on VLAN 100.
- Router A is the master for virtual router 30 and backup for virtual router 40 on VLAN 150.
- Router B is the master for virtual router 20 and backup for virtual router 10 on VLAN 100.
- Router C is the master for virtual router 40 and backup for virtual router 30 on VLAN 150.
- VRRP advertisement interval is set to one second on all virtual routers.
- Priority preemption is disabled on all virtual routers.
Switch code that implements Router A on the first switch

```
switch-A(config)#interface vlan 100
switch-A(config-if-vl100)#ip address 10.10.4.1/24
switch-A(config-if-vl100)#no vrrp 10
switch-A(config-if-vl100)#vrrp 10 priority 200
switch-A(config-if-vl100)#no vrrp 10 preempt
switch-A(config-if-vl100)#vrrp 10 ip 10.10.4.10
switch-A(config-if-vl100)#vrrp 10 advertisement interval 1
switch-A(config-if-vl100)#no vrrp 20
switch-A(config-if-vl100)#no vrrp 20 preempt
switch-A(config-if-vl100)#vrrp 20 ip 10.10.4.20
switch-A(config-if-vl100)#interface vlan 150
switch-A(config-if-vl150)#ip address 40.10.5.7/24
switch-A(config-if-vl150)#no vrrp 30
switch-A(config-if-vl150)#vrrp 30 priority 200
switch-A(config-if-vl150)#no vrrp 30 preempt
switch-A(config-if-vl150)#vrrp 30 ip 40.10.5.31
switch-A(config-if-vl150)#vrrp 30 advertisement interval 1
switch-A(config-if-vl150)#no vrrp 40
switch-A(config-if-vl150)#no vrrp 40 preempt
switch-A(config-if-vl150)#vrrp 40 ip 40.10.5.32
switch-A(config-if-vl150)#exit
```

Switch code that implements Router B on the second switch

```
switch-B(config)#interface vlan 100
switch-B(config-if-vl100)#ip address 10.10.4.2/24
switch-B(config-if-vl100)#no vrrp 10
switch-B(config-if-vl100)#no vrrp 10 preempt
switch-B(config-if-vl100)#vrrp 10 ip 10.10.4.10
switch-B(config-if-vl100)#no vrrp 20
switch-B(config-if-vl100)#vrrp 20 ip 10.10.4.20
switch-B(config-if-vl100)#interface vlan 150
switch-B(config-if-vl150)#ip address 40.10.5.7/24
switch-B(config-if-vl150)#no vrrp 30
switch-B(config-if-vl150)#vrrp 30 ip 40.10.5.31
switch-B(config-if-vl150)#vrrp 30 advertisement interval 1
switch-B(config-if-vl150)#no vrrp 40
switch-B(config-if-vl150)#no vrrp 40 preempt
switch-B(config-if-vl150)#vrrp 40 ip 40.10.5.32
switch-B(config-if-vl150)#exit
```

Switch code that implements Router C on the third switch

```
switch-C(config)#interface vlan 150
switch-C(config-if-vl150)#ip address 40.10.5.8/24
switch-C(config-if-vl150)#no vrrp 30
switch-C(config-if-vl150)#no vrrp 30 preempt
switch-C(config-if-vl150)#vrrp 30 ip 40.10.5.31
switch-C(config-if-vl150)#no vrrp 40
switch-C(config-if-vl150)#vrrp 40 ip 40.10.5.32
switch-C(config-if-vl150)#exit
```

**25.3.2 VARP Example**

This section provides code that implements a VARP configuration. Figure 25-5 displays the Example 1 network. Two switches in an MLAG domain are configured as VARP routers.

The following code configures 10.10.4.10 as the virtual IP address for VLAN 50, 10.24.4.1 as the virtual IP address for VLAN 70, and 001c.7300.0999 as the virtual MAC address on both switches.
Switch code that implements VARP on the first switch

switch-A(config)#ip virtual-router mac-address 001c.7300.0999
switch-A(config)#interface vlan 50
switch-A(config-if-vl50)#ip address 10.10.4.1/24
switch-A(config-if-vl50)#ip virtual-router address 10.10.4.10
switch-A(config-if-vl50)#interface vlan 70
switch-A(config-if-vl70)#ip address 10.24.4.18/24
switch-A(config-if-vl70)#ip virtual-router address 10.24.4.1
switch-A(config-if-vl70)#exit

Switch code that implements VARP on the second switch

switch-B(config)#ip virtual-router mac-address 001c.7300.0999
switch-B(config)#interface vlan 50
switch-B(config-if-vl50)#ip address 10.10.4.2/24
switch-B(config-if-vl50)#ip virtual-router address 10.10.4.10
switch-B(config-if-vl50)#interface vlan 70
switch-B(config-if-vl70)#ip address 10.24.4.18/24
switch-B(config-if-vl70)#ip virtual-router address 10.24.4.1
switch-B(config-if-vl70)#exit
25.4 VRRP and VARP Configuration Commands

This section contains descriptions of CLI commands that support VRRP and VARP.

Global Configuration Commands

- ip fhrp accept-mode
- ip virtual-router mac-address
- ip virtual-router mac-address advertisement-interval

Interface Configuration Commands – Ethernet, Port Channel, and VLAN Interfaces

- ip virtual-router address
- ipv6 virtual-router address
- no vrrp
- vrrp advertisement interval
- vrrp disabled
- vrrp ipv4
- vrrp ipv4 checksum pseudo-header exclude
- vrrp ipv4 secondary
- vrrp ipv4 version
- vrrp ipv6
- vrrp mac-address advertisement-interval
- vrrp peer authentication
- vrrp preempt
- vrrp preempt delay
- vrrp priority-level
- vrrp session description
- vrrp timers delay reload
- vrrp tracked-object

Privileged EXEC Commands

- show ip virtual-router
- show ipv6 virtual-router
- show vrrp
**ip fhrp accept-mode**

The `ip fhrp accept-mode` command configures the switch to permit SSH access to the VRRP Master and VARP Master router. All routers within a VRRP or VARP group should be configured consistently. By default, SSH access to the VRRP and VARP Master routers is not permitted.

The `no ip fhrp accept-mode` and `default ip fhrp accept-mode` commands restores the default SSH access availability by removing the `ip fhrp accept-mode` command from `running-config`.

**Command Mode**

- Global Configuration

**Command Syntax**

- `ip fhrp accept-mode`
- `no ip fhrp accept-mode`
- `default ip fhrp accept-mode`

**Example**

- This command configures the switch to permit SSH access to the VRRP and VARP Master routers.

  ```
  switch(config)#ip fhrp accept-mode
  switch(config)#show running-config
  
  !
  ip fhrp accept-mode
  !
  
  switch(config)#
  ```
**ip virtual-router address**

The **ip virtual-router address** command assigns a virtual IPv4 address to the VLAN interface being configured. (To assign a virtual IPv6 address to a VLAN interface, use the **ipv6 virtual-router address** command.) Unlike VRRP, the virtual IP address does not have to be in the same subnet as the physical interface.

A virtual IP address may optionally be configured with a subnet, but doing so will modify the behavior of ARP requests sent from the router. When the router sends an ARP request for an IP address in a virtual subnet, the ARP request will use the virtual IP address as the source IP address and the virtual MAC address as the source MAC address inside the ARP header. For virtual IP addresses configured without the subnet option, no modifications are made to outgoing ARP requests.

A maximum of 500 virtual IP addresses can be assigned to a VLAN interface. All virtual addresses on all VLAN interfaces resolve to the same virtual MAC address configured through the **ip virtual-router mac-address** command.

This command is typically used in MLAG configurations to create identical virtual routers on switches connected to the MLAG domain through an MLAG.

The **no ip virtual-router address** and **default ip virtual-router address** commands remove the specified virtual IP address from the configuration mode interface by deleting the corresponding **ip virtual-router address** command from the **running-config**. If the command does not specify an address, all virtual IPv4 addresses are removed from the interface.

**Command Mode**

Interface-VLAN Configuration

**Command Syntax**

- `ip virtual-router address ipv4_addr`
- `no ip virtual-router address [ipv4_addr]`
- `default ip virtual-router address [ipv4_addr]`

**Parameters**

- **ipv4_addr**  IP address of router. Dotted decimal notation.

**Examples**

- These commands configure a Switch Virtual Interface (SVI) and a virtual IP address for VLAN 10.

```
switch(config)#interface vlan 10
switch(config-if-Vl10)#ip address 10.0.0.2/24
switch(config-if-Vl10)#ip virtual-router address 10.0.0.6
switch(config-if-Vl10)#exit
switch(config)#
```

- These commands configure a Switch Virtual Interface (SVI) and a virtual IP address with a subnet for VLAN 10. A static route is added to indicate that the virtual subnet is reachable through VLAN 10.

```
switch(config)#ip route 192.0.0.0/24 vlan 10
switch(config)#interface vlan 10
switch(config-if-Vl10)#ip address 10.0.0.2/24
switch(config-if-Vl10)#ip virtual-router address 192.0.0.6/24
switch(config-if-Vl10)#exit
switch(config)#
```
**ip virtual-router mac-address**

The `ip virtual-router mac-address` command assigns a virtual MAC address to the switch. The switch maps all virtual router IP addresses to this MAC address. The address is receive-only; the switch never sends packets with this address as the source. The virtual router is not configured on the switch until this virtual mac-address is assigned.

This command is typically used in MLAG configurations to create identical virtual routers on switches connected to the MLAG domain through an MLAG. When the destination MAC of a packet destined to a remote network matches the virtual MAC address, the MLAG peer forwards the traffic to the next hop destination. Each MLAG peer must have the same routes available, either through static configuration or learned through a dynamic routing protocol.

The `no ip virtual-router mac-address` command removes a virtual MAC address from the interface by deleting the corresponding `ip virtual-router mac-address` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip virtual-router mac-address mac_addr
no ip virtual-router mac address [mac_addr]
```

**Parameters**

- `mac_addr` MAC IP address (dotted hex notation). Select an address that will not otherwise appear on the switch.

**Examples**

- This command configures a virtual MAC address.
  
  ```
  switch(config)#ip virtual-router mac-address 001c.7300.0099
  switch(config)#
  ```
ip virtual-router mac-address advertisement-interval

The `ip virtual-router mac-address advertisement interval` command specifies the period between the transmission of consecutive gratuitous ARP requests that contain the virtual router mac address for each virtual-router IP address configured on the switch. The default period is 30 seconds.

The `no ip virtual-router mac-address advertisement-interval` command restores the default period of 30 seconds by removing the `ip virtual-router mac-address advertisement-interval` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip virtual-router mac-address advertisement-interval period
no ip virtual-router mac-address advertisement-interval
default ip virtual-router mac-address advertisement-interval
```

**Parameters**

- `period` advertisement interval (seconds). Values range from 0 to 86400. Default is 30.

**Examples**

- This command configures a MAC address advertisement interval of one minute (60 seconds).

```bash
switch(config)#ip virtual-router mac-address advertisement-interval 60
switch(config)#
```
ipv6 virtual-router address

The **ipv6 virtual-router address** command assigns a virtual IPv6 address to the VLAN interface being configured. (To assign a virtual IPv4 address to a VLAN interface, use the **ip virtual-router address** command.) Unlike VRRP, the virtual IP address does not have to be in the same subnet as the physical interface.

A maximum of 500 virtual IP addresses can be assigned to a VLAN interface. All virtual addresses on all VLAN interfaces resolve to the same virtual MAC address configured through the **ip virtual-router mac-address** command.

This command is typically used in MLAG configurations to create identical virtual routers on switches connected to the MLAG domain through an MLAG.

The **no ipv6 virtual-router address** and **default ipv6 virtual-router address** commands remove the specified virtual IPv6 address from the configuration mode interface by deleting the corresponding **ipv6 virtual-router address** command from **running-config**. If the command does not specify an address, all virtual IPv6 addresses are removed from the interface.

**Command Mode**

Interface-VLAN Configuration

**Command Syntax**

```
ipv6 virtual-router address net_addr
no ipv6 virtual-router address [net_addr]
default ipv6 virtual-router address [net_addr]
```

**Parameters**

- **net_addr** network IPv6 address.

**Examples**

- These commands configure a Switch Virtual Interface (SVI) and a virtual IPv6 address for VLAN 10.

```
switch(config)#interface vlan 10
switch(config-if-Vl10)#ipv6 address 2001:0DB8:0:1::1/64
switch(config-if-Vl10)#ipv6 virtual-router address 2001:0DB8:0:1::2
switch(config-if-Vl10)#exit
switch(config)#
```
no vrrp

The no vrrp command removes all VRRP configuration commands for the specified virtual router on the configuration mode interface. The default vrrp command also reverts VRRP configuration parameters to default settings by removing the corresponding vrrp commands.

Commands removed by the no vrrp command include:

- vrrp advertisement interval
- vrrp disabled
- vrrp ipv4
- vrrp ipv4 secondary
- vrrp peer authentication
- vrrp preempt
- vrrp preempt delay
- vrrp priority-level
- vrrp session description

Command Mode

Interface-Ethernet Configuration
Interface-Port-Channel Configuration
Interface-VLAN Configuration

Command Syntax

no vrrp group
default vrrp group

Parameters

- group virtual router identifier (VRID). Values range from 1 to 255.

Examples

- This command removes all VRRP configuration commands for virtual router group 10 on VLAN 15.

  switch(config)#interface vlan 15
  switch(config-if-vl15)#no vrrp 10
  switch(config-if-vl15)#
**show ip virtual-router**

The `show ip virtual-router` command displays the virtual MAC address assigned to the switch and all virtual IP addresses assigned to each VLAN interface.

**Command Mode**

EXEC

**Command Syntax**

`show ip virtual-router`

**Messages**

- **IP virtual router is not configured**  
a virtual MAC address is not assigned to the switch.
- **No interface with virtual IP address**  
no virtual IP addresses are assigned to any VLAN interfaces.

**Examples**

- This command displays a table of information for VRRP groups on the switch.

  ```
  switch>show ip virtual-router
  IP virtual router is configured with MAC address: 24cd.5a29.cc31
  Interface  IP Address        Virtual IP Address   Status            Protocol
  Vlan15     10.1.1.3/24       10.1.1.15            up                up
  Vlan15     10.1.1.3/24       10.1.1.16            up                up
  Vlan15     10.1.1.3/24       10.1.1.17            up                up
  Vlan20     10.12.1.6/24      10.1.1.51            up                up
  Vlan20     10.12.1.6/24      10.1.1.53            up                up
  Vlan20     10.12.1.6/24      10.1.1.55            up                up
  switch>
  ```

- This command generates a response that indicates a virtual MAC address is not assigned to the switch.

  ```
  switch>show ip virtual-router
  IP virtual router is not configured
  switch>
  ```
show ipv6 virtual-router

The `show ipv6 virtual-router` command displays the virtual MAC address assigned to the switch and all virtual IPv6 addresses assigned to each VLAN interface.

**Command Mode**

EXEC

**Command Syntax**

`show ipv6 virtual-router`

**Messages**

- IPv6 virtual router is not configured a virtual MAC address is not assigned to the switch.
- No interface with virtual IPv6 address no virtual IPv6 addresses are assigned to any VLAN interfaces.

**Examples**

- This command displays a table of information for IPv6 VRRP groups on the switch.

```
switch>show ipv6 virtual-router
IP virtual router is configured with MAC address: 001c.7300.0099
MAC address advertisement interval: 30 seconds
Interface Vlan4094
  State is up
  Protocol is up
  IPv6 address
    2001:b8:2001::1011/64
  Virtual IPv6 address
    2001:db8:ac10:fe01::
switch>
```
show vrrp

The `show vrrp` command displays information about the Virtual Router Redundancy Protocol (VRRP) groups configured on a specified interface. Parameter options control the amount and formatting of the displayed information.

**Command Mode**
Privileged EXEC

**Command Syntax**

```
show vrrp [INFO_LEVEL] [STATES]
show vrrp INTF [GROUP_NUM] [INFO_LEVEL] [STATES]
show vrrp GROUP_NUM INTF_GROUP [INFO_LEVEL] [STATES]
```

**Parameters**
- `INTF` specifies the VRRP groups for which the command displays status. When the parameter is omitted or specifies only an interface, the group list is filtered by the `STATES` parameter.
  - `<no parameter>` specified groups on all interfaces.
  - `interface ethernet e_num` specified groups on Ethernet interface.
  - `interface loopback l_num` specified groups on loopback interface.
  - `interface management m_num` specified groups on management interface.
  - `interface port-channel p_num` specified groups on port channel interface.
  - `interface vlan v_num` specified groups on VLAN interface.
  - `interface vxlan vx_num` specified groups on VXLAN interface.
- `GROUP_NUM` the VRRP ID number of the group for which the command displays status.
  - `<no parameter>` all groups on specified interface.
  - `vrid_num` virtual router identifier (VRID). Value ranges from 1 to 255.
- `INFO_LEVEL` Specifies format and amount of displayed information. Options include:
  - `<no parameter>` displays a block of data for each VRRP group.
  - `brief` displays a single table that lists information for all VRRP groups.
- `STATES` Specifies the groups, by VRRP router state, that are displayed. Options include:
  - `<no parameter>` displays data for groups in the `master` or `backup` states.
  - `all` displays all groups, including groups in the `stopped` and `interface down` states.

**Examples**
- This command displays a table of information for VRRP groups on the switch.

```
switch>show vrrp brief
Interface Id  Ver Pri Time  State   VrIps
Vlan1006  3   2   100 3609  Master  127.38.10.2
Vlan1006  4   3   100 3609  Master  127.38.10.10
Vlan1010  1   2   100 3609  Master  128.44.5.3
Vlan1014  2   2   100 3609  Master  127.16.14.2
switch>
```
• This command displays data blocks for all VRRP groups on VLAN 46, regardless of the VRRP state.
  
  switch>show vrrp interface vlan 1006 all
  Vlan1010 - Group 1
  VRRP Version 2
  State is Stopped
  Virtual IPv4 address is 128.44.5.3
  Virtual MAC address is 0000.5e00.0101
  Mac Address Advertisement interval is 30s
  VRRP Advertisement interval is 1s
  Preemption is enabled
  Preemption delay is 0s
  Preemption reload delay is 0s
  Priority is 100
  Master Router is 0.0.0.0
  Master Advertisement interval is 1s
  Skew time is 0.609s
  Master Down interval is 3.609s
  switch>

• This command displays data for all VRRP group 2 on VLAN 1014.
  
  switch>show vrrp interface vlan 1014 group 2
  Vlan1006 - Group 2
  VRRP Version 2
  State is Master
  Virtual IPv4 address is 127.38.10.2
  Virtual MAC address is 0000.5e00.0103
  Mac Address Advertisement interval is 30s
  VRRP Advertisement interval is 1s
  Preemption is enabled
  Preemption delay is 0s
  Preemption reload delay is 0s
  Priority is 100
  Master Router is 127.38.10.1 (local), priority is 100
  Master Advertisement interval is 1s
  Skew time is 0.609s
  Master Down interval is 3.609s
  switch>
vrrp peer authentication

The vrrp peer authentication command configures parameters the switch uses to authenticate virtual router packets it receives from other VRRP routers in the group.

The no vrrp peer authentication and default vrrp peer authentication commands disable VRRP peer authentication of packets from the specified virtual router by removing the corresponding vrrp peer authentication command from running-config. The no vrrp command also removes the vrrp peer authentication command for the specified virtual router.

Command Mode

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

Command Syntax

vrrp group peer authentication AUTH_PARAMETER
no vrrp group peer authentication
default vrrp group peer authentication

Parameters

- **group** virtual router identifier (VRID). Values range from 1 to 255.
- **AUTH_PARAMETER** encryption level and authentication key used by router. Options include:
  - text text_key plain-text authentication, text_key is text.
  - text text_key plain-text authentication, text_key is text.
  - ietf-md5 key-string 0 text_key IP authentication of MD5 key hash, text_key is text.
  - ietf-md5 key-string text_key IP authentication of MD5 key hash, text_key is text.
  - ietf-md5 key-string 7 coded_key IP authentication of MD5 key hash, coded_key is MD5 hash.

Guidelines

This command is applicable to VRRPv2 which supports IPv4 addresses only.

Examples

- This command implements plain-text authentication, using 12345 as the key, for virtual router 40 on VLAN 100.
  
  switch(config)#interface vlan 100
  switch(config-if-v1100)#vrrp 40 peer authentication text 12345
  switch(config-if-v1100)#

- This command implements ietf-md5 authentication, using 12345 as the key.
  
  switch(config-if-v1100)#vrrp 40 peer authentication ietf-md5 key-string 0 12345
  switch(config-if-v1100)#

- This command implements ietf-md5 authentication, using 12345 as the key. The key is entered as the MD5 hash equivalent of the text string.
  
  switch(config-if-v1100)#vrrp 40 peer authentication ietf-md5 key-string 7 EA3TUPxddDFCTuyT8mb+kxw==
  switch(config-if-v1100)#
vrrp timers delay reload

The vrrp timers delay reload command delays the time for VRRP initialization after a system reboot. The no vrrp timers delay reload and default vrrp timers delay reload commands restore the default value of 0 by deleting the vrrp timers delay reload statement from running-config.

Command Mode

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

Command Syntax

vrrp group timers delay reload [INTERVAL]
no vrrp group timers delay reload
default vrrp group timers delay reload

Parameters

- **INTERVAL**  The number of seconds for the delay (seconds). Options include:
  - <no parameter>  Default value of 0 seconds.
  - <0 to 3600>  Ranges between 0 and 60 minutes.

Example

- These commands configure the VRRP reload delay interval to 15 minutes.
  
  switch(config)#interface vlan 100
  switch(config-if-Vl100)#vrrp 2 timers delay reload 900
  switch(config-if-Vl100)#

- These commands removes the VRRP reload delay interval.
  
  switch(config)#interface vlan 100
  switch(config-if-Vl100)#no vrrp 2 timers delay reload
  switch(config-if-Vl100)#
vrrp ipv4

The `vrrp_ipv4` command configures the primary IP address for the specified VRRP virtual router. The command also activates the virtual router if the primary address is contained in the interface’s subnet. A VRRP virtual router’s configuration may contain only one primary IP address assignment command; subsequent `vrrp_ipv4` commands replace the existing primary address assignment.

The `vrrp_ipv4 secondary` command assigns a secondary IP address to the VRRP virtual router.

The `no vrrp_ipv4` and `default vrrp_ipv4` commands disable the VRRP virtual router and deletes the primary IP address by removing the corresponding `vrrp_ipv4` statement from `running-config`. The `no vrrp` command also removes the `vrrp_ipv4` command for the specified virtual router.

Command Mode

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

Command Syntax

```
vrrp group ipv4 ipv4_address
no vrrp group ipv4 ipv4_address
default vrrp group ipv4 ipv4_address
```

Parameters

- `group` virtual router identifier (VRID). Values range from 1 to 255.
- `ipv4_address` IPv4 address of the virtual router.

Related Commands

- `vrrp_ipv4 secondary`

Example

- This command enables virtual router 15 on VLAN 20 and designates 10.1.1.5 as the virtual router’s primary address.

```
switch(config)#interface vlan 20
switch(config-if-vl20)#vrrp 15 ipv4 10.1.1.5
switch(config-if-vl20)#
```
vrrp ipv4 checksum pseudo-header exclude

This command excludes the pseudo-header in IPv4 VRRPv3 checksum calculation on the VRRP group on the configuration mode interface of the switch and supports IPv4 VRRPv3 interoperability.

The no form of the command deletes the vrrp ipv4 checksum pseudo-header exclude configuration from the Ethernet interface on the switch.

The exit command returns the switch to global configuration mode.

Command Mode
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

Command Syntax
- `vrrp group ipv4 checksum pseudo-header exclude`
- `no vrrp group ipv4 checksum pseudo-header exclude`

Parameter
- **group** virtual router identifier (VRID). Values range from 1 to 255.

Example
- This command excludes the pseudo-header in IPv4 VRRPv3 checksum calculation on VRRP group 1 on interface Ethernet 1.

```
switch(config-if-Et1)#vrrp 1 ipv4 checksum pseudo-header exclude
```
vrrp ipv4 version

The vrrp ipv4 version command enables VRRP on the configuration mode interface and configures the VRRP version for the specified VRRP virtual router.

The no vrrp ipv4 version and default vrrp ipv4 version commands restore the default VRRP version to VRRPv2 by removing the corresponding vrrp ipv4 version statement from running-config.

Command Mode
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

Command Syntax
- vrrp group ipv4 version VERSION_NUMBER
- no vrrp group ipv4 version
- default vrrp group ipv4 version

Parameters
- group virtual router identifier (VRID). Values range from 1 to 255.
- VERSION_NUMBER Specifies VRRP version that the switch uses. Default value is 2 (VRRPv2)
  Options include:
  - 2 VRRP v2 supports IPv4 environment.
  - 3 VRRP v3 supports IPv4 and IPv6 environment.

Example
- This command enables VRRPv3 for IPv6 on interface Ethernet 3.
  switch#(config)#interface ethernet 3
  switch#(config-if-Et3)# vrrp 1 ipv4 version 3
  switch#

- This command removes VRRPv3 from interface Ethernet 3 and reverts to the default VRRPv2.
  switch#(config)#interface ethernet 3
  switch#(config-if-Et3)# no vrrp 1 ipv4 version
  switch#(config-if-Et3)#
vrrp ipv4 secondary

The **vrrp ipv4 secondary** command assigns a secondary IP address to the specified virtual router. Secondary IP addresses are an optional virtual router parameter. A virtual router may contain multiple secondary address commands. The IP address list must be identical for all VRRP routers in a virtual router group.

The virtual router is assigned a primary IP address with the **vrrp ipv4** command.

The **no vrrp ipv4 secondary** and **default vrrp ipv4 secondary** commands remove the secondary IP address for the specified VRRP virtual router by deleting the corresponding **vrrp ipv4 secondary** statement from **running-config**. The **no vrrp** command also removes all **vrrp ipv4 secondary** commands for the specified virtual router.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
vrrp group ipv4 ipv4_addr secondary
no vrrp group ipv4 ipv4_addr secondary
default vrrp group ipv4 ipv4_addr secondary
```

**Parameters**

- **group** virtual router identifier (VRID). Values range from 1 to 255.
- **ipv4_addr** secondary IPv4 address of the virtual router.

**Related Commands**

- **vrrp ipv4**

**Example**

- This command assigns the IP address of 10.2.4.5 as the secondary IP address for the virtual router with VRID of 15 on VLAN 20
  
  ```
  switch(config)#interface vlan 20
  switch(config-if-vl20)#vrrp 15 ipv4 10.2.4.5 secondary
  switch(config-if-vl20)#
  ```
**vrrp ipv6**

The **vrrp ipv6** command configures the IPv6 address for the specified VRRP virtual router. The command also activates the virtual router if the primary address is contained in the interface’s subnet.

The **no vrrp ipv6** and **default vrrp ipv6** commands disable the VRRP virtual router and deletes the IPv6 address by removing the corresponding **vrrp ipv6** statement from **running-config**. The **no vrrp** command also removes the **vrrp ipv6** command for the specified virtual router.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```plaintext
vrrp group ip ipv6_address  
go vrrp group ip ipv6_address  
default vrrp group ip ipv6_address
```

**Parameters**

- **group** virtual router identifier (VRID). Values range from 1 to 255.
- **ipv6_address** IPv6 address of the virtual router.

**Example**

- This command enables address 2001:db8:0:1::1 for IPv6 VRRP on VLAN 20.
  
  switch(config)#interface vlan 20  
  switch(config-if-vl20)#vrrp 3 ipv6 2001:db8:0:1::1

- This command disables VRRPv3 on VLAN 20 from virtual router 3.
  
  switch(config)#interface vlan 20  
  switch(config-if-vl20)#no vrrp 3 ipv6 2001:db8:0:1::1
  ```
vrrp mac-address advertisement-interval

The `vrrp mac-address advertisement-interval` command specifies the interval between advertisement packets sent by the master router to the VRRP group members.

The `vrrp mac-address advertisement-interval 0`, `no vrrp mac-address advertisement-interval` and `default vrrp mac-address advertisement-interval` commands disable the feature by removing the `vrrp mac-address advertisement-interval` command from `running-config`.

Command Mode
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

Command Syntax

```
vrrp group mac-address advertisement-interval period
no vrrp group mac-address
default vrrp group mac-address
```

Parameters
- `group` virtual router identifier (VRID). Values range from 1 to 255.
- `period` interval in which the master router sends advertisement packets (seconds). Value ranges from 0 to 3600. Selecting 0 as the interval disables this feature.

Example
- This command specifies the interval between advertisement packets sent to the members of VRRP group 3 on VLAN 20.

```
switch(config)#interface vlan 20
switch(config-if-vl20)#vrrp 3 mac-address advertisement-interval 60
switch(config-if-vl20)#
```
- This command disables the feature on VLAN 20.

```
switch(config)#interface vlan 20
switch(config-if-vl20)#no vrrp 3 mac-address advertisement-interval
switch(config-if-vl20)#
```
vrrp preempt

The vrrp preempt command controls a virtual router’s preempt mode setting. When preempt mode is enabled, if the switch has a higher priority it will preempt the current master virtual router. When preempt mode is disabled, the switch can become the master virtual router only when a master virtual router is not present on the subnet, regardless of VRRP priority level settings. By default, preempt mode is enabled.

The no vrrp preempt and default vrrp preempt commands disable preempt mode for the specified virtual router; the default vrrp preempt command stores a corresponding no vrrp preempt statement in running-config. The vrrp preempt command enables preempt mode by removing the corresponding no vrrp preempt statement from running-config.

The no vrrp command also enables preempt mode by removing the no vrrp preempt command for the specified virtual router.

Command Mode
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

Command Syntax
- vrrp group preempt
- no vrrp group preempt
- default vrrp group preempt

Parameters
- group virtual router identifier (VRID). Values range from 1 to 255.

Related Commands
- vrrp preempt delay

Examples
- This command disables preempt mode for virtual router 20 on VLAN 40.
  switch(config)#interface vlan 40
  switch(config-if-vl40)#no vrrp 20 preempt
  switch(config-if-vl40)#
- This command enables preempt mode for virtual router 20 on VLAN 40.
  switch(config-if-vl40)#vrrp 20 preempt
  switch(config-if-vl40)＃
vrrp preempt delay

The vrrp preempt delay command specifies the interval between a VRRP preemption event and the point when the switch becomes the master VRRP router. A preemption event is any event that results in the switch having the highest virtual router priority setting while preemption is enabled. The vrrp preempt command enables preemption for a specified virtual router.

The command configures two delay periods:

- minimum time delays master VRRP takeover when VRRP is fully implemented.
- reload time delays master VRRP takeover after VRRP is initialized following a switch reload (boot). The switch bypasses the reload time to become the VRRP master immediately if it senses there are no other active switches in the virtual router group.

Running-config maintains separate delay statements for minimum and reload parameters. Commands may list both parameters. Commands that list one parameter do not affect the omitted parameter. Values range from 0 to 3600 seconds (one hour). The default delay is zero seconds for both parameters.

The no vrrp preempt delay and default vrrp preempt delay commands reset the specified delay to the default of zero seconds. Commands that do not list either parameter resets both periods to zero. The no vrrp command also removes all vrrp preempt delay commands for the specified virtual router.

Command Mode

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

Command Syntax

```
vrrp group preempt delay [MINIMUM_INTERVAL] [RELOAD_INTERVAL]
no vrrp group preempt delay [DELAY_TYPE]
default vrrp group preempt delay [DELAY_TYPE]
```

Parameters

- **group** virtual router identifier (VRID). Values range from 1 to 255.
- **MINIMUM_INTERVAL** period between preempt event and takeover of master VRRP router role.
  - <no parameter> minimum delay is not altered by command.
  - minimum min_time delay during normal operation (seconds). Values range from 0 to 3600.
- **RELOAD_INTERVAL** period after reboot-VRRP initialization and takeover of master VRRP router role.
  - <no parameter> reload delay is not altered by command.
  - reload reload_time delay after reboot (seconds). Values range from 0 to 3600.
- **DELAY_TYPE** delay type that is reset to default value.
  - <no parameter> reload and minimum delays are reset to default.
  - minimum minimum delay is reset to default.
  - reload reload delay is reset to default.

- **(DELAY_TYPE parameter is only used in no vrrp preempt delay and default vrrp preempt delay commands).**

Related Commands

- vrrp preempt
Examples

- This command sets the minimum preempt time of 90 seconds for virtual router 20 on VLAN 40.
  ```
  switch(config)#interface vlan 40
  switch(config-if-vl40)#vrrp 20 preempt delay minimum 90
  switch(config-if-vl40)#
  ```

- This command sets the minimum and reload preempt time to zero for virtual router 20 on VLAN 40.
  ```
  switch(config-if-vl40)#no vrrp 20 preempt delay
  switch(config-if-vl40)#
  ```
vrrp priority-level

The `vrrp priority-level` command configures the switch’s priority setting for a VRRP virtual router. Priority values range from 1 to 254. The default value is 100.

The router with the highest VRRP priority level setting for a group becomes the master virtual router for that group. The master virtual router controls the IP address and is responsible for forwarding traffic sent. The `vrrp preempt` command controls the time when a switch can become the master virtual router.

The `no vrrp priority-level` and `default vrrp priority-level` commands restore the default priority of 100 to the virtual router on the configuration mode interface by removing the corresponding `vrrp priority-level` command from `running-config`. The `no vrrp` command also removes the `vrrp priority-level` command for the specified virtual router.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
vrrp group priority-level level
no vrrp group priority-level
default vrrp group priority-level
```

**Parameters**
- `group` virtual router identifier (VRID). Values range from 1 to 255.
- `level` priority setting for the specified virtual router. Values range from 1 to 254.

**Examples**
- This command sets the virtual router priority value of 250 for virtual router group 45 on VLAN 20.
  ```
  switch(config)#interface vlan 20
  switch(config-if-vl20)#vrrp 45 priority-level 250
  switch(config-if-vl20)#
  ```
vrrp session description

The vrrp session description command associates a text string to a VRRP virtual router on the configuration mode interface. The string has no functional impact on the virtual router. The maximum length of the string is 80 characters.

The no vrrp session description and default vrrp session description commands remove the text string association from the VRRP virtual router by deleting the corresponding vrrp session description command from running-config. The no vrrp command also removes the vrrp session description command for the specified virtual router.

Command Mode

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

Command Syntax

vrrp group session description label_text
no vrrp group session description
default vrrp group session description

Parameters

- group  virtual router identifier (VRID). Values range from 1 to 255.
- label_text  text that describes the virtual router. Maximum string length is 80 characters.

Example

- This command associates the text string Laboratory Router to virtual router 15 on VLAN 20.

  switch(config)#interface vlan 20
  switch(config-if-vl20)#vrrp 15 session description Laboratory Router
  switch(config-if-vl20)#
vrrp disabled

The **vrrp disabled** command places the switch in stopped state for the specified virtual router. While in stopped state, the switch cannot act as a Master or backup router for the virtual router group.

The **no vrrp disabled** and **default vrrp disabled** commands remove the corresponding **vrrp disabled** command from **running-config**. This changes the switch's virtual router state to **backup** or **master** if the virtual router is properly configured.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```plaintext
vrrp group disabled
no vrrp group disabled
default vrrp group disabled
```

**Parameters**

- **group** virtual router identifier (VRID). Values range from 1 to 255.

**Example**

- These commands place the switch in stopped mode for virtual router 24 on VLAN 20.

  ```plaintext
  switch(config)#interface vlan 20
  switch(config-if-vl20)#vrrp 24 disabled
  switch(config-if-vl20)#
  ```

- This command moves the switch out of stopped mode for virtual router 24 on VLAN 20.

  ```plaintext
  switch(config-if-vl20)#no vrrp 24 disabled
  switch(config-if-vl20)#
  ```
vrrp advertisement interval

The `vrrp advertisement interval` command configures the interval between successive advertisement messages that the switch sends to VRRP routers in the specified virtual router group. The switch must be the group’s Master virtual router to send advertisement messages. The advertisement interval must be configured identically on all physical routers in the virtual router group.

The advertisement interval also influences the timeout interval that defines when the virtual router becomes the master virtual router. When preemption is enabled, the virtual router becomes the master when three times the advertisement interval elapses after the switch detects master router priority conditions.

The `no vrrp advertisement interval` and `default vrrp advertisement interval` commands restore the default advertisement interval of one second for the specified virtual router by removing the corresponding `vrrp advertisement interval` command from `running-config`. The `no vrrp` command also removes the `vrrp advertisement interval` command for the specified virtual router.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
```
vrrp group advertisement interval adv_time
no vrrp group advertisement interval
default vrrp group advertisement interval
```

**Parameters**
- `group` virtual router identifier (VRID). Values range from 1 to 255.
- `adv_time` advertisement interval (seconds). Values range from 1 to 255. Default value is 1.

**Example**
- This command sets the advertisement interval of five seconds for the virtual router 35 on VLAN 100.
  ```
  switch(config)#interface vlan 100
  switch(config-if-vl100)#vrrp 35 advertisement interval 5
  switch(config-if-vl100)#
  ```
vrrp tracked-object

The `vrrp tracked-object` command configures the VRRP client process on the configuration mode interface to track the specified tracked object and react when its status changes to `down`. The tracked object is created by the `track` command.

The `no vrrp tracked-object` and `default vrrp tracked-object` commands cause the VRRP client process to stop tracking the specified tracked object by removing the corresponding `vrrp tracked-object` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
-vrrp group tracked-object object_name ACTION amount
-no vrrp group tracked-object object_name ACTION
-default vrrp group tracked-object object_name ACTION
```

**Parameters**
- `group` virtual router identifier (VRID). Values range from 1 to 255.
- `object_name` name of tracked object.
- `amount` amount to decrement VRRP priority level. Values range from 1 to 254.
- `ACTION` The action that VRRP is to take when the tracked object’s status changes to `down`. Options include:
  - `decrement` decrease VRRP priority level by `amount`.
  - `shutdown` shut down VRRP on the configuration mode interface.

If both `decrement` and `shutdown` are configured on the same interface for the same VRRP group, then VRRP will be shut down on the interface if the tracked object is down.

**Related Commands**
- `track`

**Example**
- This command causes Ethernet interface 5 to disable VRRP when tracked object ETH8 changes state.

```
switch(config-if-Et5)#vrrp 1 tracked-object ETH8 shutdown
switch(config-if-Et5)#
```
Spanning Tree Protocol

Spanning Tree Protocols prevent bridging loops in Layer 2 Ethernet networks. Arista switches support Rapid Spanning Tree, Multiple Spanning Tree, and Rapid-Per VLAN Spanning Tree protocols. These sections describe the Arista Spanning Tree Protocol implementation.

- Section 26.1: Introduction to Spanning Tree Protocols
- Section 26.2: Spanning Tree Overview
- Section 26.3: Configuring a Spanning Tree
- Section 26.4: STP Commands

26.1 Introduction to Spanning Tree Protocols

Arista Switches support the leading spanning tree protocols: RSTP, MST and Rapid-PVST. This variety of options simplifies integration into existing networks without compromising network reliability, scalability or performance.

26.2 Spanning Tree Overview

An Ethernet network functions properly when only one active path exists between any two stations. A spanning tree is a loop-free subset of a network topology. STP is a L2 network protocol that ensures a loop-free topology for any bridged Ethernet LAN. STP allows a network to include spare links as automatic backup paths that are available when an active link fails without creating loops or requiring manual intervention. The original STP is standardized as IEEE 802.1D.

Several variations to the original STP improve performance and add capacity. Arista switches support these STP versions:
- Rapid Spanning Tree (RSTP)
- Multiple Spanning Tree (MSTP)
- Rapid Per-VLAN Spanning Tree (Rapid-PVST)

The Overview contains the following sections:
- Section 26.2.1: Spanning Tree Protocol Versions
- Section 26.2.2: Structure of a Spanning Tree Instance
- Section 26.2.3: BPDUs

26.2.1 Spanning Tree Protocol Versions

STP versions supported by Arista switches address two limitations of the original Spanning Tree protocol that was standardized as IEEE 802.1D:
Spanning Tree Overview

Chapter 26: Spanning Tree Protocol

- Slow convergence to the new spanning tree topology after a network change
- The entire network is covered by one spanning tree instance.

The following sections describe the supported STP versions, compatibility issues in networks containing switches running different STP versions, and supported alternatives to spanning tree.

26.2.1.1 Rapid Spanning Tree Protocol (RSTP)

RSTP is specified in 802.1w and supersedes STP. RSTP provides rapid convergence after network topology changes. Similar to STP, RSTP provides a single instance of spanning tree for the entire network. Standard 802.1D-2004 incorporates RSTP and obsoletes STP.

The RSTP instance is the base unit of MST and Rapid-PVST spanning trees.

26.2.1.2 Rapid Per-VLAN Spanning Tree Protocol (Rapid-PVST)

Rapid Per-VLAN Spanning Tree (PVST) extends the original STP to support a spanning tree instance on each VLAN in the network. The maximum number of PVST instances that can be created on a switch depends on the hardware platform. In most of the cases, it is 510. PVST can load balance layer-2 traffic without creating a loop because it handles each VLAN as a separate network. However, PVST does not address slow network convergence after a network topology change.

Arista switches support Rapid-PVST, which is a variation of PVST based on RSTP instances. Rapid-PVST provides rapid connectivity recovery after the failure of a bridge, port, or LAN. Rapid-PVST can be enabled or disabled on individual VLANs.

26.2.1.3 Multiple Spanning Tree Protocol (MSTP)

MST extends rapid spanning tree protocol (RSTP) to support multiple spanning tree instances on a network, but is still compatible with RSTP. By default, Arista switches use MSTP.

MST supports multiple spanning tree instances, similar to Rapid PVST. However, MST associates an instance with multiple VLANs. This architecture supports load balancing by providing numerous forwarding paths to data traffic. Network fault tolerance is improved because failures in one instance do not affect other instances.

MST Regions

An MST region is a group of connected switches with identical MST configuration. Each region can support a maximum of 65 spanning-tree instances. MST regions are identified by a version number, name, and VLAN-to-instance map. You must configure identical parameters on all switches in the regions. Only MST region members participate with the MST instances defined in the region. A VLAN can be simultaneously assigned to only one spanning-tree instance. MST does not specify the maximum number of regions that a network can contain.

MST Instances

Each MST instance is identified by an instance number that ranges from 0 to 4094 and is associated with a set of VLANs. An MST region contains two types of spanning tree instances: an Internal Spanning Tree Instance (IST) and Multiple Spanning Tree Instances (MSTI).

- IST is the default spanning tree instance in MST regions; and is always zero. It gives a root switch to the region that contains all VLANs configured across all switches in the region but not assigned to a MST instance.
• **Multiple Spanning Tree instances** (MSTIs) consist of VLANs that are assigned through MST configuration statements. VLANs assigned to an MSTI are removed from the IST instance. VLANs in an MSTI operate as a part of a single Spanning Tree topology. Because each VLAN can belong to only one instance, MST instances (and the IST) are topologically independent.

**MSTP-Rapid PVST+ interoperation**

MSTP-Rapid PVST+ interoperation allows protocol-level interaction between MSTP and Rapid PVST+ by consuming and transmitting PVST BPDUs through MSTP at the border ports. While transmitting from Rapid PVST+ to MSTP or vice-versa, you can deploy MSTP in certain regions and Rapid PVST+ in other regions based on their merits or other factors. MSTP-Rapid PVST+ interoperation allows MSTP to work with any Rapid PVST+ implementation.

MSTP inter-operation can be viewed as bi-directional BPDU conversion occurring at MSTP PVST+ border ports as following:

- The outgoing Common Internal Spanning Tree (CIST) BPDU is projected as Rapid PVST+ BPDUs across various VLANs.
- Incoming PVST+ topology BPDU is mapped to corresponding MSTI based on incoming VLAN.

The following restrictions are enforced based on port role. These are relevant only for border ports with roles ‘designated’ or ‘root’ (for CIST) that can potentially forward.

- **Case (A)**: If the MSTP-Rapid PVST+ border port role is ‘designated’ for CIST, it should not receive any superior PVST BPDU (with respect to CIST). Root of all VLANs in the PVST region should be towards the MSTP region.
- **Case (B)**: If the MSTP-Rapid PVST+ border port role is ‘root’ for CIST, it should not receive any inferior Rapid PVST+ BPDU (with respect to CIST). Root of all VLANs in the Rapid PVST+ region should be within the PVST+ region.

**Note**

If the restrictions are violated, the port enters ‘blocking’ state. The BPDU translation occurs only on MSTP-Rapid PVST+ border ports with the ‘forwarding’ state for CIST.

It is desirable to configure multiple MSTP-Rapid PVST+ border ports confirming to Case(A) for a specified Rapid PVST+ region as it allows VLAN load balancing across the ports. This can be achieved by adjusting the per-VLAN port cost towards the Rapid PVST+ region such that the per-VLAN ‘root’ port is evenly distributed across the border ports.

**26.2.1.4 Version Interoperability**

A network can contain switches running different spanning tree versions. The common spanning tree (CST) is a single forwarding path the switch calculates for STP, RSTP, MSTP, and Rapid-PVST topologies in networks containing multiple spanning tree variations.

In multi-instance topologies, the following instances correspond to the CST:

- **Rapid-PVST**: VLAN 1
- **MST**: IST (instance 0)

RSTP and MSTP are compatible with other spanning tree versions:

- An RSTP bridge sends 802.1D (original STP) BPDUs on ports connected to an STP bridge.
- RSTP bridges operating in 802.1D mode remain in 802.1D mode even after all STP bridges are removed from their links.
- An MST bridge detects a port is at a region boundary when it receives an STP BPDU or an MST BPDU from a different region.
• MST ports assume they are boundary ports when the bridges to which they connect join the same region.

The clear spanning-tree detected-protocols command forces MST ports to renegotiate with their neighbors.

26.2.1.5 Switchport Interface Pairs

Switchport interface pairs associate two interfaces in a primary-backup configuration. When the primary interface is functioning, the backup interface remains dormant in standby mode. When the primary interface stops functioning, the backup interface handles the traffic.

An alternative implementation balances traffic between the primary and backup interfaces. If either interface shuts down, the other handles traffic addressed to the pair.

The following guidelines apply to switchport interface pairs.

• Ethernet and Port Channels can be primary interfaces.
• Ethernet, Port Channel, Management, Loopback, and VLAN interfaces can be backup interfaces.
• The primary and backup interfaces can be different interface types.
• Interface pairs should be similarly configured to ensure consistent behavior.
• An interface can be associated with a maximum of one backup interface.
• An interface can back up a maximum of one interface.
• Any Ethernet interface configured in an interface pair cannot be a port channel member.
• STP is disabled on ports configured as primary or backup interfaces.
• Static MAC addresses should be configured after primary-backup pairs are established.

26.2.1.6 Disabling Spanning Tree

When spanning tree is disabled and switchport interface pairs are not configured, all interfaces forward packets as specified by their configuration. STP packets are not generated and inbound STP packets are forwarded on the VLAN where they are received as normal multicast data packets.

Important! Disabling all Spanning Tree Protocols on the switch is strongly discouraged.

26.2.2 Structure of a Spanning Tree Instance

A layer 2 network consists of bridges and network segments. A loop exists when multiple active paths connect two components. Spanning tree protocols allow only one active path between any two network components. Loops are removed by blocking selected ports that connect bridges to network segments.

Ports are assigned cost values that reflect their transmission speed and any other criteria selected by the administrator. Ports with faster transmission speeds and other desirable characteristics are assigned lower costs. High cost ports are blocked in deference to lower cost ports.

A network topology defines multiple possible spanning trees. Network bridges collectively compute and implement one spanning tree to maintain connectivity between all network components while blocking ports that could result in loops. Administrators improve network performance by adjusting parameter settings to select the most efficient spanning tree.

Spanning tree bridges continuously transmit topology information to notify all other bridges on the network when topology changes are required, such as when a link fails. Bridge Protocol Data Units (BPDUs) are STP information packets that bridges exchange.
Chapter 26: Spanning Tree Protocol

26.2.2.1 Root and Designated Bridges

The root bridge is the center of the STP topology. A spanning tree instance has one root bridge. Spanning tree bases path calculations on each network component’s distance from the root bridge.

All other network bridges calculate paths to the root bridge when selecting spanning tree links. STP calculates the distance to the root bridge to build a loop-free topology that features the shortest distance between devices among all possible paths.

Each switch is assigned a unique bridge ID number for each instance. All network switches collectively elect the root bridge by comparing bridge IDs. The root bridge is the switch with the lowest bridge ID.

The bridge ID contains the following eight bytes, in order of decreasing significance:

- Port priority (four bits)
- Instance number (12 bits): VLAN number (Rapid-PVST); instance number (MST); 0 (RST)
- MAC address of switch (six bytes)

A designated bridge is defined for each network segment as the switch that provides the segment’s shortest path to the root bridge. A designated bridge is selected for each segment after a root bridge is selected; a switch can be a designated bridge for multiple segments.

The following network calculations in Figure 26-1 assume that each path has the same cost:

- Switch B is the root bridge – its bridge ID is lowest because it has the smallest port priority.
- Switch A is the designated bridge for VLAN 11.
- Switch B is the designated bridge for VLAN 10, VLAN 13, VLAN 16, VLAN 18, VLAN 19.
- Switch C is the designated bridge for VLAN 25.
- Switch D is the designated bridge for VLAN 21, VLAN 23.

Figure 26-1: Spanning Tree Network Example
26.2.2.2 Port Roles

Messages from connected devices to the root bridge traverse a least-cost path, which has the smallest cost among all possible paths to the root bridge. The cost of a path is the sum of the costs of all path segments, as defined through port cost settings.

Active ports in a least cost-path fulfill one of two possible roles: root port and designated port. STP blocks all other network ports. STP also defines alternate and backup ports to handle traffic when an active port is inaccessible.

- **Root port (RP) accesses the bridge’s least-cost path to the root bridge.** Each bridge selects its root port after calculating the cost of each possible path to the root bridge.

  The following ports in Figure 26-1 are root ports:
  - **Switch A**: port 2
  - **Switch C**: port 1
  - **Switch D**: port 3

- **Designated port (DP) accesses a network segment’s designated bridge.** Each segment defines one DP. Switches can provide DPs for multiple segments. All ports on the root bridge are DPs.

  The following ports in Figure 26-1 are designated ports:
  - **Switch A**: port 4 (VLAN 11)
  - **Switch B**: port 2 (VLAN 13), port 4 (VLAN 18), port 5 (VLAN 10), port 6 (VLAN 19), port 8 (VLAN 16)
  - **Switch C**: port 2 (VLAN 25)
  - **Switch D**: port 2 (VLAN 23), port 6 (VLAN 21)

- **Alternate ports** provide backup paths from their bridges to the root bridge. An alternate port is blocked until a network change transforms it into a root port.

- **Backup ports** provide alternative paths from VLANs to their designated bridges. A backup port is blocked until a network change transforms it into a designated port.

26.2.2.3 Port Activity States

A port’s activity state defines its current STP activity level. STP monitors BPDUs for network changes that require an activity state transition.

STP defines three port activity states:

- **Forwarding**: The port receives and sends data. Root ports and designated ports are either in, or transitioning to, this state.

- **Discarding**: The port does not receive or send data. Blocked ports receive BPDU packets. All ports except RPs and DPs are blocked, including alternate and backup ports.

- **Learning**: The transitional post-discarding state where the port prepares to forward frames by adding source addresses from inbound data packets to the switching database.

26.2.2.4 Port Types

Port type is a configurable parameter that reflects the type of network segment that is connected to the port. Proper port type configuration results in rapid convergence after network topology changes. RSTP port types include normal, network, and edge ports. **Normal** is the default port type.

- **Normal** ports have an unspecified topology.
• **Network** ports connect only to switches or bridges.
  RSTP immediately transitions network ports to the discarding state.

• **Edge** ports connect directly to end stations.
  Edge ports transition directly to forwarding state because they do not create loops. An edge port becomes a normal port when it receives a BPDU.

### 26.2.2 Link Types

Link type is a configurable parameter that determines candidates for RSTP fast state transition.

- the default link type for full-duplex ports is **point-to-point**.
- the default link type for half-duplex ports is **shared**.

Fast state transitions are allowed on point-to-point links that connect bridges. Fast state transitions are not allowed on shared ports regardless of the duplex setting.

### 26.2.3 BPDUs

Spanning tree rules specify a root bridge, select designated bridges, and assign roles to ports. STP rule implementation requires that network topology information is available to each switch. Switches exchange topology information through bridge protocol data units (BPDUs). Information provided by BPDU packets include bridge IDs and root path costs.

#### 26.2.3.1 BPDU Types

STP defines three BPDU types:

- Configuration BPDU (CBPDU), used for computing the spanning tree.
- Topology Change Notification (TCN) BPDU, announces network topology changes.
- Topology Change Notification Acknowledgment (TCA), acknowledges topology changes.

Bridges enter the following addresses in outbound BPDU frames:

- source address: outbound port’s MAC address.
- destination address: STP multicast address 01:80:C2:00:00:00.

Bridges regularly exchange BPDUs to track network changes that trigger STP recomputations and port activity state transitions. The **hello timer** specifies the period between consecutive BPDU messages; the default is two seconds.

#### 26.2.3.2 Bridge Timers

Bridge timers specify parameter values that the switch includes in BPDU packets that it sends as a root bridge. Bridge timers include:

- **hello-time**: transmission interval between consecutive BPDU packets.
- **forward-time**: the period that ports remain in learning state.
- **max-age**: the period that BPDU data remains valid after it is received.
- **max-hop**: the number of bridges in an MST region that a BPDU can traverse before it is discarded.

The switch recomputes the spanning tree topology if it does not receive another BPDU before the max-age timer expires. When **edge** ports and **point-to-point** links are properly configured, RSTP network convergence does not require forward-delay and max-age timers.
26.2.3.3 MSTP BPDUs

MSTP BPDUs are targeted at a single instance and provide STP information for the entire region. MSTP encodes a standard BPDU for the IST, then adds region information and MST instance messages for all configured instances, where each message conveys spanning tree data for an instance. Frames assigned to VLANs operate in the instance to which the VLAN is assigned. Bridges enter an MD5 digest of the VLAN-to-instance map table in BPDUs to avoid including the entire table in each BPDU. Recipients use this digest and other administratively configured values to identify bridges in the same MST region.

MSTP BPDUs are compatible with RSTP. RSTP bridges view an MST region as a single-hop RSTP bridge regardless of the number of bridges inside the region because:

- RSTP bridges interpret MSTP BPDUs as RSTP BPDUs.
- RSTP bridges increment the message age timer only once while data flows through an MST region; MSTP measures time to live with a remaining hops variable, instead of the message age timer.

Ports at the edge of an MST region connecting to a bridge (RSTP or STP) or to an endpoint are boundary ports.
26.3 Configuring a Spanning Tree

These sections describe the following configuration processes:

- Section 26.3.1: Version Configuration and Instance Creation
- Section 26.3.2: Spanning Tree Instance Configuration
- Section 26.3.3: Port Roles and Rapid Convergence
- Section 26.3.4: Configuring BPDU Transmissions

26.3.1 Version Configuration and Instance Creation

The switch supports three STP versions and switchport backup interface pairs. Disabling spanning tree is also supported but not recommended.

The spanning-tree mode global configuration command specifies the spanning tree version the switch runs. This section describes command options that enable and configure STP versions.

26.3.1.1 Multiple Spanning Tree (MST)

Multiple Spanning Tree is enabled by the spanning-tree mode command with the mstp option. MSTP is the default STP version.

Example

- This command enables Multiple Spanning Tree.

  switch(config)#spanning-tree mode mstp
  switch(config)#

Configuring MST Regions

All switches in an MST region must have the same name, revision, and VLAN-to-instance map. MST configuration mode commands sets the region parameters. MST configuration mode is a group-change mode where changes are saved by exiting the mode.

Example

- The spanning-tree mst configuration command places the switch in MST configuration mode.

  switch(config)#spanning-tree mst configuration
  switch(config-mst)#

The instance command assigns VLANs to MST instances. The name (mst-configuration mode) and revision (mst-configuration mode) commands configure the MST region name and revision.

Examples

- These commands assign VLANs 4-7 and 9 to instance 8 and remove VLAN 6 from instance 10.

  switch(config-mst)#instance 8 vlans 4-7,9
  switch(config-mst)#no instance 10 vlans 6
  switch(config-mst)#

- These commands assign the name (corporate_1) and revision (3) to the switch.

  switch(config-mst)#name corporate_1
  switch(config-mst)#revision 3
  switch(config-mst)#

The exit (mst-configuration mode) command transitions the switch out of MST configuration mode and saves all pending changes. The abort (mst-configuration mode) command exits MST configuration mode without saving the pending changes.
Configuring MST Instances

These STP commands provide an optional MST instance parameter. These commands apply to instance 0 when the optional parameter is not included.

- **spanning-tree priority**
- **spanning-tree root**
- **spanning-tree port-priority**

**Examples**

- This command configures priority for MST instance 4.
  ```
  switch(config)#spanning-tree mst 4 priority 4096
  switch(config)#
  ```

- Each of these commands configure priority for MST instance 0.
  ```
  switch(config)#spanning-tree mst 0 priority 4096
  or
  switch(config)#spanning-tree priority 4096
  ```

26.3.1.2 Rapid Spanning Tree (RST)

Rapid spanning tree is enabled through the **spanning-tree mode** command with the *rstp* option.

**Example**

- This command enables Rapid Spanning Tree.
  ```
  switch(config)#spanning-tree mode rstp
  switch(config)#
  ```

These STP commands, when they do not include an optional MST or VLAN parameter, apply to RSTP. Commands that configure MSTP instance 0 also apply to the RSTP instance.

- **spanning-tree priority**
- **spanning-tree root**
- **spanning-tree port-priority**

**Examples**

- These commands apply to the RST instance.
  ```
  switch(config)#spanning-tree priority 4096
  and
  switch(config)#spanning-tree mst 0 priority 4096
  ```

- These commands do not apply to the RST instance.
  ```
  switch(config)#spanning-tree mst 4 priority 4096
  and
  switch(config)#spanning-tree vlan-id 3 priority 4096
  ```
Show commands (such as show spanning-tree) displays the RSTP instance as MST0 (MST instance 0).

Example
- This command, while the switch is in RST mode, displays RST instance information.
  switch(config)#show spanning-tree
  MST0
  Spanning tree enabled protocol rstp          <--- RSTP mode indicator
  Root ID    Priority    32768
  Address     001c.730c.1867
  This bridge is the root

  Bridge ID  Priority    32768 (priority 32768 sys-id-ext 0)
  Address     001c.730c.1867
  Hello Time  2.000 sec  Max Age 20 sec  Forward Delay 15 sec

  Interface        Role       State      Cost      Prio.Nbr Type
  ---------------- ---------- ---------- --------- -------- --------------------
  Et51             designated forwarding 2000      128.51   P2p

  switch(config)#

26.3.1.3 Rapid Per-VLAN Spanning Tree (Rapid-PVST)
Rapid-PVST mode is enabled by the spanning-tree mode command with the rapid-pvst option.

Example
- This command enables Rapid Per-VLAN Spanning Tree.
  switch(config)#spanning-tree mode rapid-pvst
  switch(config)#

These commands provide an optional VLAN parameter for configuring Rapid-PVST instances.

- spanning-tree priority
- spanning-tree root
- spanning-tree port-priority
- spanning-tree mst pvst border

Examples
- This command configures bridge priority for VLAN 4.
  switch(config)#spanning-tree vlan-id 4 priority 4096
  switch(config)#
- This command enables MSTP PVST+ border ports. The command is effective only if spanning-tree mode is MSTP.
  switch(config)#spanning-tree mst pvst border

26.3.1.4 Switchport Backup Mode
Switchport backup interface pairs are enabled through the spanning-tree mode command with the backup option. Enabling switchport backup disables all spanning-tree modes. For loop avoidance under switchport backup mode, use the Loop Protection feature.
Example

- This command enables switchport backup.

  switch(config)#spanning-tree mode backup
  switch(config)#

The **switchport backup-link** command establishes an interface pair between the command mode interface (primary) and the interface specified by the command (backup).

Examples

- These commands establish Ethernet interface 7 as the backup port for Ethernet interface 1.

  switch(config)#interface ethernet 1
  switch(config-if-Et1)#switchport backup-link ethernet 7
  switch(config-if-Et1)#

  The **prefer** option of the **switchport backup-link** command establishes a peer relationship between the primary and backup interfaces and specifies VLAN traffic that the backup interface normally carries. If either interface goes down, the other interface carries traffic normally handled by both interfaces.

Examples

These steps perform the following:

- configures Ethernet interface 1 as a trunk port that handles VLANs 4 through 9 traffic.
- configures Ethernet interface 2 as the backup interface.
- assigns Ethernet 2 as the preferred interface for VLANs 7 through 9.

**Step 1** Enter configuration mode for the primary interface

  switch(config)#interface ethernet 1

**Step 2** Configure the primary interface as a trunk port that services VLANs 4-9

  switch(config-if-Et1)#switchport mode trunk
  switch(config-if-Et1)#switchport trunk allowed vlan 4-9

**Step 3** Configure the backup interface and specify the VLANs that it normally services.

  switch(config-if-Et1)#switchport backup-link Ethernet 2 prefer vlan 7-9
  switch(config-if-Et1)#
26.3.1.5 Loop Protection

Loop protection is a loop detection and prevention method which is independent of STP and is not disabled when the switch is in switchport backup mode. When loop protection is active on an interface, that interface periodically sends out loop-detection frames; if one is received that originated on the switch, the receiving port is errdisabled until a timeout period has passed or it is manually reset.

Loop protection is configured and enabled per VLAN, but individual ports in a VLAN can be configured to disable loop protection.

### Note

Loop protection cannot be enabled on an MLAG peer link.

This feature is disabled by default. To enable it, use the `monitor loop-protection` command to enter loop-protection configuration mode, then use the `no shutdown (Loop-protection)` command to enable the feature. To enable loop protection on a VLAN, use the `protect vlan` command. To exclude a port from loop protection, use the `no loop-protection` command.

The feature is configured with the following additional commands:

- `transmit-interval`
- `disabled-time`
- `rate-limit`

### Examples

- This command enters loop protection configuration mode.
  ```
  switch(config)#monitor loop-protection
  switch(config-monitor-loop-protect)#
  ```
- These commands enable loop protection on VLANs 1025-2000.
  ```
  switch(config)#monitor loop-protection
  switch(config-monitor-loop-protect)#no shutdown
  switch(config-monitor-loop-protect)#protect vlan 1025-2000
  switch(config-monitor-loop-protect)#
  ```
- These commands exclude Ethernet interface 38 from loop protection.
  ```
  switch(config)#interface ethernet 38
  switch(config-if-Et38)#no loop-protection
  switch(config-if-Et38)#
  ```
- These commands configure loop protection with a transmission interval of 10 seconds, a disabled time of two days, and a maximum rate of 500 loop detection frames per second.
  ```
  switch(config-monitor-loop-protect)#transmit-interval 10
  switch(config-monitor-loop-protect)#disabled-time 172800
  switch(config-monitor-loop-protect)#rate-limit 500
  switch(config-monitor-loop-protect)#
  ```

26.3.1.6 Disabling Spanning Tree

Spanning tree is disabled by the `spanning-tree mode` command with the `none` option. The switch does not generate STP packets. Switchport interfaces forward packets when connected to other ports. The switch forwards inbound STP packets as multicast data packets on the VLAN where they are received.
### Examples

- This command disables all STP functions.
  ```
  switch(config)#spanning-tree mode none
  switch(config)#
  ```

#### 26.3.2 Spanning Tree Instance Configuration

A network performs these steps to set up an STP instance:

**Step 1**  The bridge with the lowest ID is elected root bridge.

**Step 2**  Root ports (RP) are selected on all other bridges.

**Step 3**  Designated bridges are selected for each network segment.

**Step 4**  Designated ports (DP) are selected on each designated bridge.

**Step 5**  Networks begin forwarding data through RPs and DPs. All other ports are blocked.

#### 26.3.2.1 Root Bridge Parameters

STPs use bridge IDs for electing the root bridge. Switches denote a bridge ID for each configured Spanning Tree instance. The bridge ID composition is:

- **Priority** (four bits)
  - Priority is expressed as a multiple of 4096 because it is stored as the four most significant bits of a two-byte number.

- **Protocol Dependent** (twelve bits)
  - Rapid-PVST: VLAN number
  - MST: Instance number
  - RST: 0

- **MAC address of switch** (six bytes)

### Example

- The switch defines bridge IDs for three MST instances:
  - MST 0: 32768 (Priority (32768)+Instance number(0)) and 001c.7301.23de (MAC address)
  - MST101: 32869 (Priority (32768)+Instance number(101)) and 001c.7301.23de (MAC address)
  - MST102: 32870 (Priority (32768)+Instance number(102)) and 001c.7301.23de (MAC address)

This command displays a table of root bridge information.

```
switch>show spanning-tree root

<table>
<thead>
<tr>
<th>Instance</th>
<th>Root ID</th>
<th>MAC addr</th>
<th>Root</th>
<th>Hello</th>
<th>Max</th>
<th>Fwd</th>
</tr>
</thead>
<tbody>
<tr>
<td>MST0</td>
<td>32768</td>
<td>001c.7301.23de</td>
<td>0</td>
<td>2</td>
<td>20</td>
<td>15</td>
</tr>
<tr>
<td>MST101</td>
<td>32869</td>
<td>001c.7301.23de</td>
<td>3998</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>MST102</td>
<td>32870</td>
<td>001c.7301.23de</td>
<td>3998</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>
```

The switch provides two commands that configure the switch priority: `spanning-tree priority` and `spanning-tree root`. The commands differ in the available parameter options:
The default priority value is 32768.

The following examples configure bridge IDs with both commands.

Examples

- These commands configure MST instance bridge priorities with the `root` command:

  ```
  switch(config)#spanning-tree mst 0 root primary
  switch(config)#spanning-tree mst 1 root secondary
  switch>show spanning-tree root
  Instance       Priority    MAC addr   Cost    Time   Age  Dly  Root Port
  ------------   -------------------- --------- -----  ---  ---  ------------
  MST0           8192 001c.7301.6017         0    2    20  15   None
  MST1           16385 001c.7301.6017         0    0     0   0   None
  MST2           32770 001c.7301.6017         0    0     0   0   None
  ```

- Instance 0 root priority is 8192: primary priority plus the instance number of 0.
- Instance 1 root priority is 16385: secondary priority plus the instance number of 1.
- Instance 2 root priority is 32770: default priority plus the instance number of 2.

  These priority settings normally program the switch to be the primary root bridge for instance 0, the secondary root bridge for instance 1, and a normal bridge for instance 2. Primary and secondary root bridge elections also depend on the configuration of other network bridges.

- These priority commands configure Rapid-PVST VLAN bridge priorities:

  ```
  switch(config)#spanning-tree vlan-id 1 priority 8192
  switch(config)#spanning-tree vlan-id 2 priority 16384
  switch(config)#spanning-tree vlan-id 3 priority 8192
  switch(config)#spanning-tree vlan-id 4 priority
  switch(config)#show spanning-tree root
  Instance       Root ID     VLAN      Priority    MAC addr   Cost    Time   Age  Dly  Root Port
  ------------   ----------   --------   -------------------- --------- -----  ---  ---  ------------
  VL1            8193 001c.7301.6017         0    2    20  15   None
  VL2            16386 001c.7301.6017         0    2    20  15   None
  VL3            8195 001c.7301.6017         0    2    20  15   None
  VL4            32788 001c.7301.6017         0    2    20  15   None
  ```

- VLAN 1 root priority is 8193: configured priority plus the VLAN number of 1.
- VLAN 2 root priority is 16386: configured priority plus the VLAN number of 2.
- VLAN 3 root priority is 8195: configured priority plus the VLAN number of 3.
- VLAN 4 root priority is 32788: default priority plus the VLAN number of 4.

  These priority settings normally program the switch to be the primary root bridge for VLANs 1 and 3, the secondary root bridge for VLAN2, and a normal bridge for VLAN 4. Primary and secondary root bridge elections also depend on the configuration of other network bridges.
26.3.2.2 Path Cost

Spanning tree calculates the costs of all possible paths from each component to the root bridge. The path cost is equal to the sum of the cost assigned to each port in the path. Ports are assigned a cost by default or through CLI commands. Cost values range from 1 to 200000000 (200 million).

The default cost is a function of the interface speed:

- 1 gigabit interfaces have a default cost of 20000.
- 10 gigabit interfaces have a default cost of 2000.

The `spanning-tree cost` command configures the path cost of the configuration mode interface. Costs can be specified for Ethernet and port channel interfaces. The command provides a mode parameter for assigning multiple costs to a port for MST instances or Rapid-PVST VLANs.

Examples

- These commands configure a port cost of 25000 to Ethernet interface 5. This cost is valid for RSTP or MSTP instance 0.

  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#spanning-tree cost 25000
  switch(config-if-Et5)#
  ```

- This command configures a path cost of 300000 to Ethernet interface 5 in MST instance 200.

  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#spanning-tree mst 200 cost 300000
  switch(config-if-Et5)#
  ```

- This command configures a path cost of 10000 to Ethernet interface 5 in Rapid-PVST VLAN 200-220.

  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#spanning-tree vlan-id 200-220 cost 10000
  switch(config-if-Et5)#
  ```

26.3.2.3 Port Priority

STP uses the port priority interface parameter to select ports when resolving loops. The port with the lower port priority numerical value is placed in forwarding mode. When multiple ports are assigned equal port priority numbers, the port with the lower interface number is placed in forwarding mode. Valid port-priority numbers are multiples of 16 between 0 and 240; the default is 128.

The `spanning-tree port-priority` command configures the port-priority number for the configuration mode interface. The command provides a mode option for assigning different priority numbers to a port for multiple MST instances or Rapid-PVST VLANs. Port-priority can be specified for Ethernet and port channel interfaces.

Examples

- This command sets the access port priority of 144 for Ethernet 5 interface.

  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#spanning-tree port-priority 144
  switch(config-if-Et5)#
  ```

- This command sets the access port priority of 144 for Ethernet 5 interface in MST instance 10.

  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#spanning-tree mst 10 port-priority 144
  switch(config-if-Et5)#
  ```
26.3.3 Port Roles and Rapid Convergence

Spanning Tree provides the following options for controlling port configuration and operation:
- **PortFast**: Allows ports to skip learning state before entering the forwarding state.
- **Port type** and **link type**: Designates ports for rapid transitions to the forwarding state.
- **Root guard**: Ensures that a port will not become the root port.
- **Loop guard**: Prevents loops resulting from unidirectional failure of links.
- **Bridge assurance**: Prevents loops caused by unidirectional links or a malfunctioning switch.

26.3.3.1 PortFast

PortFast allows devices to gain immediate network access before convergence of the spanning tree. Enabling PortFast on ports connected to another switch can create loops.

A portfast port that receives a BPDU sets its operating state to non-portfast while remaining in portfast configured state. In this state, the port is subject to topology changes and can enter the discarding state.

The `spanning-tree portfast` command programs access ports to immediately enter the forwarding state. PortFast connects devices attached to an access port, such as a single workstation, to the network immediately without waiting for STP convergence. PortFast can also be enabled on trunk ports.

**Example**

- This command unconditionally enables portfast on Ethernet 5 interface.

  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#spanning-tree portfast
  switch(config-if-Et5)#
  ```

26.3.3.2 Port Type and Link Type Configuration

RSTP only achieves rapid transition to forwarding state on edge ports and point-to-point links.

**Port Type**

Edge ports are directly connected to end stations. Because edge ports do not create loops, they transition directly to forwarding state when a link is established.

The `spanning-tree portfast <port type>` command sets the configuration mode interface’s port type. Spanning tree ports can be configured as **edge** ports, **network** ports, or **normal** ports. The default port type is **normal**.

- **Edge ports** connect to a host (end station). Configuring a port that connects to a bridge as an edge port may create a loop. Edge ports that receive a BPDU become a normal spanning tree port.
- **Network ports** connect only to a Layer 2 switch or bridge. Configuring a port connected to a host as a network port transitions the port to the discarding state.
- **Normal ports** have an unspecified topology.

**Example**

- This command configures Ethernet 5 interface as a network port.

  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#spanning-tree portfast network
  switch(config-if-Et5)#
  ```
Auto-edge detection converts ports into edge ports when they do not receive a new BPDU before the current BPDU expires, as measured by the max-age timer. The `spanning-tree portfast auto` command enables auto-edge detection on the configuration mode interface, superseding the `spanning-tree portfast` command. Auto-edge detection is enabled by default.

**Example**

- This command enables auto-edge detection on Ethernet interface 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree portfast auto
```

**Link Type**

The switch derives a port's default link type from its duplex mode:

- full-duplex ports are `point-to-point`.
- half-duplex ports are `shared`.

The `spanning-tree link-type` command specifies the configuration mode interface's link-type. RSTP fast transition is not allowed on `shared link` ports, regardless of their duplex setting. Because the ports are full-duplex by default, the default link-type setting is `point-to-point`.

**Example**

- This command configures Ethernet 5 interface as a shared port.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree link-type shared
```

### 26.3.3.3 Root Guard and Loop Guard

**Root guard** stops a port from becoming a root port, which stops connected switches from becoming root bridges. When a switch detects a new root bridge, its root-guard-enabled ports enter blocked (root-inconsistent) state. When the switch no longer detects a new root, these ports enter learning state.

Root guard is enabled on a per-port basis. The setting applies to all STP instances. Disabling root guard places the port in learning state.

The `spanning-tree guard` command, with the root option, enables root guard on the configuration mode interface.

**Example**

- This command enables root guard on Ethernet 5 interface.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree guard root
```

**Loop guard** prevents loops resulting from unidirectional failure of point-to-point links by verifying that non-designated ports (root, blocked, and alternate) are receiving BPDUs from their designated ports. A loop-guard-enabled root or blocked port that stops receiving BPDUs transitions to the discarding (loop-inconsistent) state. The port recovers from this state when it receives a BPDU.

Loop guard, when enabled globally, applies to all point-to-point ports. Loop guard is configurable on individual ports and applies to all STP instances of an enabled port. Loop-inconsistent ports transition to learning state when loop guard is disabled.
If loop guard is enabled on a root switch, it takes effect only if the switch becomes a nonroot switch.

When using loop guard:

- Do not enable loop guard on portfast-enabled ports.
- Loop guard is not functional on ports not connected to point-to-point links.
- Loop guard has no effect on disabled spanning tree instances.

Loop guard aspects on port channels include:

- BPDUs are sent over the channel’s first operational port. Loop guard blocks the channel if that link becomes unidirectional even when other channel links function properly.
- Creating a new channel destroys state information for its component ports; new channels with loop-guard-enabled ports can enter forwarding state as a DP.
- Disassembling a channel destroys its state information; component ports from a blocked channel can enter the forwarding state as DPs, even if the channel contained unidirectional links.
- If a link on any port of the channel becomes unidirectional, the channel is blocked. Transmission resumes if the port is removed from the channel or the bidirectional communication is restored.

Loop guard configuration commands include:

- `spanning-tree guard loop default` command enables loop guard as a default on all switch ports.
- `spanning-tree guard` control the loop guard setting on the configuration mode interface. This command overrides the default command for the specified interface.

Examples

- This command enables loop guard as the default on all switch ports.
  ```
  switch(config)#spanning-tree guard loop default
  switch(config)#
  ```
- This command enables loop guard on Ethernet 6 interface.
  ```
  switch(config)#interface ethernet 6
  switch(config-if-Et6)#spanning-tree guard loop
  switch(config-if-Et6)#
  ```

26.3.3.4 Bridge Assurance

Bridge assurance protects against unidirectional link failures, other software failures, and devices that continue forwarding data traffic after they quit running spanning tree.

Bridge assurance programs the switch to send BPDUs at each hello time period through all bridge assurance-enabled ports (i.e., network ports). Bridge assurance operates only on network ports with point-to-point links, ideally with bridge assurance enabled on each side of the link. Bridge assurance-enabled ports will not necessarily be blocked when they link to a port where bridge assurance is not enabled.

Ports not receiving a BPDU packet within a hello time period enter inconsistent (blocking) state. In this case, the `show spanning-tree transmit active` command will show a bridge assurance status of “inconsistent” for the port. If the other side of the link has bridge assurance enabled, or if the other switch is the root bridge, it will send periodic BPDUs, preventing an “inconsistent” blocking state.

Bridge assurance is globally enabled by default, but must also be enabled on a per-port basis by designating the port as a network port with the `spanning-tree portfast <port type>` command. The `no spanning-tree transmit active` command disables bridge assurance globally.
Example

- These commands enable bridge assurance on the switch, then enable bridge assurance on Ethernet port 5 by designating it a network port.

```
switch(config)#spanning-tree transmit active
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree portfast network
switch(config-if-Et5)#
```

26.3.4 Configuring BPDU Transmissions

The following sections describe instructions that configure BPDU packet contents and transmissions.

26.3.4.1 Bridge Timers

Bridge timers configure parameter values that the switch includes in BPDU packets that it sends as a root bridge. Bridge timers include:

- **hello-time**: the transmission interval between consecutive outbound BPDU packets.
- **forward-time**: the period that ports are in learning state prior to forwarding packets.
- **max-age**: the period that BPDU data remains valid after it is received. The switch recomputes the spanning tree topology if it does not receive another BPDU packet before the timer expires.
- **max-hop**: the number of bridges in an MST region that a BPDU can traverse before it is discarded.

In standard STP, ports passively wait for `forward_delay` and `max_age` periods before entering the forwarding state. RSTP achieves faster convergence by relying on edge port and link type definitions to start forwarding traffic. When edge ports and link types are properly configured, bridge timers are used in RSTP as backup or when interacting with networks running standard STP.

The `spanning-tree hello-time` command configures the hello time.

Example

- This command configures a hello-time of 1 second (1000 ms).

```
switch(config)#spanning-tree hello-time 1000
switch(config)#
```

The `spanning-tree max-hops` command specifies the max hop setting that the switch inserts into BPDUs that it sends out as the root bridge.

Example

- This command sets the max hop value to 40.

```
switch(config)#spanning-tree max-hops 40
switch(config)#
```

The `spanning-tree forward-time` command configures the forward delay setting that the switch inserts into BPDUs that it sends out as the root bridge.

Example

- This command sets the forward delay timer value to 25 seconds.

```
switch(config)#spanning-tree forward-time 25
switch(config)#
```

The `spanning-tree max-age` command configures the max age setting that the switch inserts into BPDUs that it sends out as the root bridge.
Example
- This command sets the max age timer value to 25 seconds.

```
switch(config)#spanning-tree max-age 25
switch(config)#
```

26.3.4.2 BPDU Transmit Hold-Count

The `spanning-tree bpdu tx hold-count` command specifies the maximum number of BPDUs per second that the switch can send from an interface. Valid settings range from 1 to 10 BPDUs with a default of 6 BPDUs.

Higher hold-count settings can significantly impact CPU utilization, especially in Rapid-PVST mode. Smaller values can slow convergence in some configurations.

Example
- This command configures a transmit hold-count of 8 BPDUs.

```
switch(config)#spanning-tree bpdu tx hold-count 8
switch(config)#
```

26.3.4.3 BPDU Guard

PortFast interfaces do not receive BPDUs in a valid configuration. BPDU Guard provides a secure response to invalid configurations by disabling ports when they receive a BPDU. Disabled ports differ from blocked ports in that they are re-enabled only through manual intervention.

- When configured globally, BPDU Guard is enabled on ports in the operational portfast state.
- When configured on an individual interface, BPDU Guard disables the port when it receives a BPDU, regardless of the port's portfast state.

The `spanning-tree edge-port bpduguard default` global configuration command enables BPDU guard by default on all portfast ports. BPDU guard is disabled on all ports by default.

The `spanning-tree bpduguard` interface configuration command controls BPDU guard on the configuration mode interface. This command takes precedence over the default setting configured by `spanning-tree edge-port bpduguard default`.

- `spanning-tree bpduguard` enables BPDU guard on the configuration mode interface.
- `spanning-tree bpduguard disable` disables BPDU guard on the configuration mode interface.
- `no spanning-tree bpduguard` reverts the configuration mode interface to the default BPDU guard setting.

Example
- These commands enable BPDU guard by default on all portfast ports, then disable BPDU guard on Ethernet 5.

```
switch(config)#spanning-tree edge-port bpduguard default
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree bpduguard disable
switch(config-if-Et5)
```

26.3.4.4 BPDU Filter

BPDU filtering prevents the switch from sending or receiving BPDUs on specified ports. BPDU filtering is configurable on Ethernet and port channel interfaces.
Ports with BPDU filtering enabled do not send BPDUs and drops inbound BPDUs. Enabling BPDU filtering on a port not connected to a host can result in loops as the port continues forwarding data while ignoring inbound BPDU packets.

The `spanning-tree bpdufilter` command controls BPDU filtering on the configuration mode interface. BPDU filtering is disabled by default.

**Example**
- These commands enable BPDU filtering on Ethernet 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree bpdufilter enable
switch(config-if-Et5)#
```

### 26.3.4.5 BPDU Rate Limit
BPDU input rate limiting restricts the number of BPDUs that a port with BPDU guard and BPDU filter disabled, can process during a specified interval. The port discards all BPDUs that it receives in excess of the specified limit. Configuring the rate limiter requires two steps:

- Establishing the rate limit threshold
- Enabling rate limiting

**Establishing the Rate Limit Threshold**
The `spanning-tree bpduguard rate-limit count (interface)` command specifies the BPDU reception rate (quantity per interval) that triggers the discarding of BPDUs. The command is available in global and interface configuration modes.

- The `spanning-tree bpduguard rate-limit count` global command specifies the maximum reception rate for ports that are not covered by interface rate limit count commands. The global command specifies the default limit.

**Note**
Arista Networks recommends to retain the default values of rate limit. In the PVST mode, when the VLAN membership of a port is changed by a significant margin, it is advisable to disable interface BPDU rate limit on both ends of a port. For example, if three VLANs are present on a port initially, the operator must first add 300 more VLANs on one side of the port and then add the same 300 VLANs on the other side of the port. In this case, if the VLANs are increased towards the root bridge first, then the other side can cross the rate-limit threshold.

- The `spanning-tree bpduguard rate-limit count` interface command defines the maximum BPDU reception rate for ports in the configuration mode interface.

**Examples**
- This command configures the global limit of 5000 BPDUs over a four second interval.

```
switch(config)#spanning-tree bpduguard rate-limit count 5000 interval 4
switch(config)#
```

- These commands configure a limit of 7500 BPDUs over an 8 second interval on the Ethernet interface 2.

```
switch(config)#interface ethernet 2
switch(config-if-Et2)#spanning-tree bpduguard rate-limit count 7500 interval 8
switch(config-if-Et2)#
```
Enabling Rate Limiting

BPDU rate limiting is enabled globally or on individual ports:

- `spanning-tree bpduguard rate-limit default` enables rate limiting on all ports that are not covered by the interface rate limiting command. The default setting is `enabled`.
- `spanning-tree bpduguard rate-limit enable / disable` interface command enables or disables BPDU rate limiting on the configuration mode interface. This command has precedence over the global command.

Examples

- This command enables rate limiting on ports that are not covered by interface rate limit commands.
  
  switch(config)#spanning-tree bpduguard rate-limit default
  
  switch(config)#

- These commands enable rate limiting on the Ethernet interface 15.
  
  switch(config)#interface ethernet 15
  
  switch(config-if-Et15)#spanning-tree bpduguard rate-limit enable
  
  switch(config-if-Et15)#
26.4 **STP Commands**

**Spanning Tree Commands: Global Configuration**
- `spanning-tree bpdu tx hold-count`
- `spanning-tree bpduguard rate-limit default`
- `spanning-tree bpduguard rate-limit count (global)`
- `spanning-tree edge-port bpduguard default`
- `spanning-tree forward-time`
- `spanning-tree guard loop default`
- `spanning-tree hello-time`
- `spanning-tree max-age`
- `spanning-tree max-hops`
- `spanning-tree mode`
- `spanning-tree mst configuration`
- `spanning-tree mst pvst border`
- `spanning-tree portchannel guard misconfig`
- `spanning-tree priority`
- `spanning-tree root`
- `spanning-tree transmit active`
- `spanning-tree vlan-id`

**Loop Protection Commands**
- `disabled-time`
- `loop-protection`
- `monitor loop-protection`
- `protect vlan`
- `rate-limit`
- `shutdown (Loop-protection)`
- `transmit-interval`

**Spanning Tree Commands: Interface Configuration Mode**
- `spanning-tree bpdufilter`
- `spanning-tree bpduguard`
- `spanning-tree bpduguard rate-limit count (interface)`
- `spanning-tree bpduguard rate-limit enable / disable`
- `spanning-tree cost`
- `spanning-tree guard`
- `spanning-tree link-type`
- `spanning-tree port-priority`
- `spanning-tree portfast`
- `spanning-tree portfast auto`
- `spanning-tree portfast <port type>`
- `switchport backup-link`

**MST Configuration Commands**
- `abort (mst-configuration mode)`
- `exit (mst-configuration mode)`
- `instance`
- `name (mst-configuration mode)`
- `revision (mst-configuration mode)`
• show (mst-configuration mode)

**Display Commands**
• show spanning-tree
• show spanning-tree bridge detail
• show spanning-tree blockedports
• show spanning-tree counters
• show spanning-tree instance
• show spanning-tree interface
• show spanning-tree mst
• show spanning-tree mst configuration
• show spanning-tree mst interface
• show spanning-tree mst test information
• show spanning-tree root
• show spanning-tree topology status
• show spanning-tree transmit active

**Clear Commands**
• clear spanning-tree counters
• clear spanning-tree counters session
• clear spanning-tree detected-protocols
abort (mst-configuration mode)

The `abort` command, in MST-configuration mode, discards pending changes to the MST region configuration, then returns the switch to global configuration mode.

The `exit (mst-configuration mode)` command saves MST region changes to `running-config` before returning the switch to global configuration mode.

**Command Mode**

MST-configuration

**Command Syntax**

`abort`

**Examples**

- This command discards changes to the MST region, then returns the switch to global configuration mode.

```
switch(config-mst)#abort
switch(config)#
```
clear spanning-tree counters

The clear spanning-tree counters command resets the BPDU counters for the specified interfaces to zero in all CLI sessions.

Command Mode
Privileged EXEC

Command Syntax
```
clear spanning-tree counters [INT_NAME]
```

Parameters
- **INT_NAME** Interface type and number. Options include:
  - `<no parameter>` resets counters for all interfaces.
  - `interface ethernet e_num` Ethernet interface specified by `e_num`.
  - `interface loopback l_num` Loopback interface specified by `l_num`.
  - `interface management m_num` Management interface specified by `m_num`.
  - `interface port-channel p_num` Port-Channel Interface specified by `p_num`.
  - `interface vlan v_num` VLAN interface specified by `v_num`.

Examples
- This command resets the BPDU counters on Ethernet 15 interface.

  ```
  switch#show spanning-tree counters
  Port      Sent       Received       Tagged Error    Other Error
  ------------------------------------------------------------------------
  Ethernet15      32721             0                  0              0
  Port-Channel10       8487             0                  0              0
  switch#clear spanning-tree counters interface ethernet 15
  switch#show spanning-tree counters
  Port      Sent       Received       Tagged Error    Other Error
  ------------------------------------------------------------------------
  Ethernet15        11              0                  0              0
  Port-Channel10         8494 2                  6              0
  ```
clear spanning-tree counters session

The `clear spanning-tree counter session` command resets the BPDU counters to zero on all interfaces in the current CLI session. Counters in other CLI sessions are not affected.

**Command Mode**

Privileged EXEC

**Command Syntax**

`clear spanning-tree counters session`

**Examples**

- This command resets the BPDU counters in the current CLI session.

```
switch# show spanning-tree counters
Port       Sent      Received       Tagged Error    Other Error
----------------------------------------------------------------------------------------------------
  Ethernet15      32721             0                  0              0
  Port-Channel10       8487             0                  0              0

switch# clear spanning-tree counters session

switch# show spanning-tree counters
Port      Sent       Received       Tagged Error    Other Error
----------------------------------------------------------------------------------------------------
  Ethernet15        11              0                  0              0
  Port-Channel10         7              2                  6              0

switch#
```
clear spanning-tree detected-protocols

The clear spanning-tree detected-protocols command restarts the spanning tree protocol (STP) migration state machine on the specified interfaces. The switch is reset to running rapid spanning tree protocol on an interface where it previously detected a bridge running an old version of the protocol.

Command Mode
Privileged EXEC

Command Syntax

```
clear spanning-tree detected-protocols [INT_NAME]
```

Parameters
- **INT_NAME**  Interface type and number. Values include:
  - <no parameter>  all interfaces.
  - ethernet e_num  Ethernet interface specified by e_num.
  - loopback l_num  Loopback interface specified by l_num.
  - management m_num  Management interface specified by m_num.
  - port-channel p_num  Port-Channel Interface specified by p_num.
  - vlan v_num  VLAN interface specified by v_num.

Examples
- This command restarts the STP migration machine on all switch interfaces.
  ```
  switch#clear spanning-tree detected-protocols
  switch#
  ```
disabled-time

The disabled-time command sets the time for which the port remains disabled after a loop is detected by loop protection. The no disabled-time and default disabled-time commands reset the disabled time to the default of 604800 seconds (seven days).

Note

If this value is changed, interfaces that are already disabled by loop protection will remain disabled for the previously configured period.

Command Mode
Loop-protection Configuration

Command Syntax

```
disabled-time  period
no disabled-time  [period]
default disabled-time  [period]
```

Parameters

- **period**  Time in seconds for which the port remains disabled. Values range from 0 to 604800 (seven days). Default is 604800. A value of 0 disables the interface until it is manually reset, even if the disabled time is later set to a non-zero value. To restore the port manually, shut it down and then re-enable it.

Example

- This command configures loop protection to disable a port on which a loop is detected for a period of two days (172800 seconds).

  ```
  switch(config-monitor-loop-protect)#disabled-time 172800
  switch(config-monitor-loop-protect)#
  ```
exit (mst-configuration mode)

The `exit` command, in MST-configuration mode, saves changes to the MST region configuration, then returns the switch to global configuration mode. MST region configuration changes are also saved by entering a different configuration mode.

**Command Mode**
MST-configuration

**Command Syntax**
`exit`

**Examples**
- This command saves changes to the MST region, then returns the switch to global configuration mode.
  ```
  switch(config-mst)#exit
  switch(config)#
  ```
- This command saves changes to the MST region, then places the switch in Interface-Ethernet mode.
  ```
  switch(config-mst)#interface ethernet 3
  switch(config-if-Et3)#
  ```
instance

The `instance` command inserts an entry into the VLAN-to-instance map that associates a set of VLANs to an MST instance. In addition to defining the MST topology, the VLAN-to-instance map is one of three parameters, along with the MST name and revision number, that identifies the switch’s MST region.

The `no instance` command removes specified entries from the VLAN-to-instance map. If the command does not provide a VLAN list, all entries are removed for the specified instance. The `no instance` and `default instance` commands function identically.

Command Mode
MST-Configuration

Command Syntax

```
instance mst_inst vlans v_range
no instance mst_inst [vlans v_range]
no default instance mst_inst [vlans v_range]
```

Parameters

- `mst_inst` MST instance number. Value of `mst_inst` ranges from 0 to 4094.
- `v_range` VLAN list. Formats include a number, number range, or comma-delimited list of numbers and ranges.

Examples

- This command maps VLANs 20-39 to MST instance 2
  ```
  switch(config)#spanning-tree mst configuration
  switch(config-mst)#instance 2 vlans 20-39
  switch(config-mst)#
  ```

- This command removes all VLAN mappings to MST instance 10.
  ```
  switch(config-mst)#no instance 10
  switch(config-mst)#
  ```
loop-protection

The `loop-protection` command enables loop protection on the configuration mode interface. All interfaces in a VLAN under loop protection have loop protection enabled by default. The `no loop-protection` and `default loop-protection` commands disable loop protection on the interface.

When loop protection is disabled (at the VLAN or interface level), the computed state of the interface is forgotten and packets queued to be sent are dropped. If an interface is err-disabled by loop protection, disabling loop protection removes the err-disable.

**Command Mode**
Interface-Ethernet Configuration

**Command Syntax**
- `loop-protection`
- `no loop-protection`
- `default loop-protection`

**Example**
- These commands disable loop protection on Ethernet interface 2/4. If the interface is currently err-disabled by loop protection, the err-disable will be removed.

```
switch(config)#interface ethernet 2/4
switch(config-if-Et2/4)#no loop-protection
switch(config-if-Et2/4)#
```
**monitor loop-protection**

The **monitor loop-protection** command places the switch in loop-protection configuration mode.

**Command Mode**

Global Configuration

**Command Syntax**

```
monitor loop-protection
```

**Commands available in loop-protection configuration mode:**

- `shutdown (Loop-protection)`
- `protect vlan`
- `transmit-interval`
- `disabled-time`
- `rate-limit`

**Example**

- This command places the switch in loop-protection configuration mode.

  ```
  switch(config)#monitor loop-protection
  switch(config-monitor-loop-protect)#
  ```
name (mst-configuration mode)

The name command configures the MST region name. The name is one of three parameters, along with the MST revision number and VLAN-to-instance map, that identifies the switch’s MST region.

The name has up to 32 characters. The default name is an empty string. The name string accepts all characters except the space.

The no name and default name commands restore the default name by removing the name command from running-config.

Command Mode
MST-Configuration

Command Syntax

```
name label_text
no name
default name
```

Parameters

- label_text character string assigned to name attribute. Maximum 32 characters. The space character is not permitted in the name string.

Example

- This command assigns corporate_100 as the MST region name.

```sh
switch(config)#spanning-tree mst configuration
switch(config-mst)#name corporate_100
switch(config-mst)#show pending
```

Active MST configuration

Name     [corporate_100]
Revision 0   Instances configured 1

Instance Vlans mapped
--------
  0  1-4094
```
**protect vlan**

The **protect vlan** command specifies which VLANs will participate in loop protection. The **no protect vlan** and **default protect vlan** commands remove loop protection from the specified VLANs.

**Command Mode**
- Loop-protection Configuration

**Command Syntax**

```
protect vlan vlan-range
```

**Parameters**
- **vlan-range** List of VLANs (number, range, comma-delimited list of numbers and ranges). Numbers range from 1 to 4094.

**Example**
- This command enables loop protection on VLANs 1025-2000.

```
switch(config-monitor-loop-protect)#protect vlan 1025-2000
switch(config-monitor-loop-protect)#
```
rate-limit

The `rate-limit` command sets the maximum number of loop detection frames which can be sent by the switch per second. The `no rate-limit` and `default rate-limit` commands return the rate limit to the default value of 1000.

**Command Mode**
- Loop-protection Configuration

**Command Syntax**

```plaintext
rate-limit frames
no rate-limit [frames]
default rate-limit [frames]
```

**Parameters**
- `frames` Maximum number of frames sent per second. Values range from 0-1000, default is 1000. A value of zero disables throttling.

**Example**
- This command sets the maximum number of loop detection frames to 500 per second.

```plaintext
switch(config-monitor-loop-protect)#rate-limit 500
switch(config-monitor-loop-protect)#
```
**revision (mst-configuration mode)**

The `revision` command configures the MST revision number. The revision number is one of three parameters, along with the MST name and VLAN-to-instance map, that identifies the switch’s MST region. Revision numbers range from 0 to 65535. The default revision number is 0.

The `no revision` and `default revision` commands restore the revision number to its default value by removing the revision command from `running-config`.

**Command Mode**

MST-Configuration

**Command Syntax**

```
revision  rev_number
no revision
default revision
```

**Parameters**

- `rev_number` revision number. Possible ranges from 0 to 65535 with a default of 0.

**Examples**

- This command sets the revision number to 15.

```bash
switch(config)#spanning-tree mst configuration
switch(config-mst)#revision 15
```

**Active MST configuration**

```
Name       []
Revision 15 Instances configured 1

Instance Vlans mapped
--------- ----------------------------------------------------------
0         1-4094
```

*Highlighted in the document*
show (mst-configuration mode)

The show command displays the current and pending MST configuration:
Exiting MST configuration mode stores all pending configuration changes to running-config.

Command Mode
MST-Configuration

Command Syntax
   show [EDIT_VERSION]

Parameters
- **EDIT_VERSION** specifies configuration version that the command displays. Options include:
  - <no parameter> command displays pending MST configuration.
  - active command displays MST configuration stored in running-config.
  - current command displays MST configuration stored in running-config.
  - pending command displays pending MST configuration.
Example

- These commands contrast the difference between the active and pending configuration by adding MST configuration commands, then showing the configurations.

```
switch(config-mst)#show pending
Active MST configuration
Name   []
Revision 0  Instances configured 1

Instance Vlans mapped
--------
0  1-4094

switch(config-mst)#instance 2 vlan 20-29,102
switch(config-mst)#revision 2
switch(config-mst)#name baseline
```
```
switch(config-mst)#show pending
Pending MST configuration
Name   [baseline]
Revision 2  Instances configured 2

Instance Vlans mapped
--------
0  1-19,30-101,103-4094
2  20-29,102

```
```
switch(config-mst)#show active
Active MST configuration
Name   []
Revision 0  Instances configured 1

Instance Vlans mapped
--------
0  1-4094
```
**show loop-protection**

The `show loop-protection` command displays loop protection status.

**Command Syntax**

```
show loop-protection [detail]
```

**Examples**

- This command displays basic loop protection information.

```
switch>show loop-protection
Loop protection is enabled
Transmit interval: 5
Disable Time: 604800 (or Permanent)
Packets Transmitted rate: 12/second (or Unthrottled)
Total: 3 Vlans enabled.
switch>
```

- This command displays detailed information about loop protection.

```
switch>show loop-protection detail
Loop protection is enabled
Transmit interval: 5
Disable Time: 604800
Packets Transmitted rate: 12/second
Total: 3 Vlans enabled.
Destination address: ffff.ffff.ffff
Ethernet type: 0x88b7
Receive action: Interface Disable

```
**show spanning-tree**

The **show spanning-tree command** displays spanning tree protocol (STP) data, organized by instance.

**Command Mode**

EXEC

**Command Syntax**

```plaintext
show spanning-tree [VLAN_ID] [INFO_LEVEL]
```

**Parameters**

- **VLAN_ID** specifies the VLANs for which the command displays information. Formats include:
  - `<no parameter>` displays information for all VLANs.
  - `vlan` displays data for instances containing the first VLAN listed in `running-config`.
  - `vlan v_range` displays data for instances containing a VLAN in the specified range.

- **INFO_LEVEL** specifies level of information detail provided by the command.
  - `<no parameter>` displays table for each instance listing status, configuration, and history.
  - `detail` displays data blocks for each instance and all ports on each instance.

**Display Values**

- **Root ID** Displays information on the ROOT ID (elected spanning tree root bridge ID):
  - **Priority**: Priority of the bridge. Default value is 32768.
  - **Address**: MAC address of the bridge.

- **Bridge ID** bridge status and configuration information for the locally configured bridge:
  - **Priority**: Priority of the bridge. The default priority is 32768.
  - **Address**: MAC address of the bridge.
  - **Hello Time**: Interval (seconds) between bridge protocol data units (BPDUs) transmissions.
  - **Max Age**: Maximum time that a BPDU is saved.
  - **Forward Delay**: Time (in seconds) that is spent in the learning state.

- **Interface** STP configuration participants. Link-down interfaces are not shown.

- **Role** Role of the port as one of the following:
  - **Root**: The best port for a bridge to a root bridge used for forwarding.
  - **Designated**: A forwarding port for a LAN segment.
  - **Alternate**: A port acting as an alternate path to the root bridge.
  - **Backup**: A port acting as a redundant path to another bridge port.

- **State** Displays the interface STP state as one of the following:
  - Learning
  - Discarding
  - Forwarding

- **Cost** STP port path cost value.

- **Prio. Nbr.** STP port priority. Values range from 0 to 240. Default is 128.

- **Type** The link type of the interface (automatically derived from the duplex mode of an interface):
  - **P2p Peer (STP)** Point to point full duplex port running standard STP.
• *shr Peer (STP)*  Shared half duplex port running standard STP.

Examples

• This command displays STP data, including a table of port parameters.

```plaintext
switch>show spanning-tree vlan 1000
MST0

```

<--------OUTPUT OMITTED FROM EXAMPLE-------->

```
switch>
```
show spanning-tree bridge detail

The `show spanning-tree bridge detail` command displays detailed MST information including MSTP-Rapid PVST+ interoperation status.

Command Mode

EXEC

Command Syntax

`show spanning-tree bridge detail`

Example

- This command displays detailed MST information.

```
switch#show spanning-tree bridge detail
Stp Detailed Status:
    Stp agent restartable : True
    MST-PVST interoperation : Enabled
    Stp heartbeat timeout  : 2.0
    Last local heartbeat timeout : 36 days, 19:10:46 ago
    Local heartbeat timeout since reboot : 1

MST0
    Bridge ID  Priority   32768  (priority 32768 sys-id-ext 0)
    Address     001c.7374.8572
    Hello Time  2.000 sec  Max Age 20 sec  Forward Delay 15 sec
```
show spanning-tree blockedports

The show spanning-tree blockedports command displays the list of blocked (discarding) ports.

Command Mode
EXEC

Command Syntax
show spanning-tree blockedports

Example
• This command shows the ports that are in discarding state.

switch>show spanning-tree blockedports
Name       Blocked Interfaces List
----------
---------------------------------------------------------------------
MST0        Po903, Po905, Po907, Po909, Po911, Po913, Po915, Po917, Po919, Po921, 
             Po923
             Po925, Po927, Po929, Po931, Po933, Po935, Po939, Po941, Po943, Po945, 
             Po947

Number of blocked ports (segments) in the system : 22
switch>
**show spanning-tree counters**

The **show spanning-tree counters** command displays the number of BPDU transactions on each interface running spanning tree.

**Command Mode**

EXEC

**Command Syntax**

*show spanning-tree counters*

**Example**

- This command displays the BPDU counter status on each interface running spanning tree.

```
switch>show spanning-tree counters

switch>
show spanning-tree instance

The **show spanning-tree instance** command displays spanning tree protocol bridge configuration settings for each instance on the switch. The display includes Bridge ID, Hello Time, Max Age, and Forward Delay times.

The command also displays the restartability of the STP agent when the **detail** option is selected. A switch can continue support of MLAG operation when its peer is offline and the STP agent is unavailable.

**Command Mode**
EXEC

**Command Syntax**
```plaintext
show spanning-tree instance [INFO_LEVEL]
```

**Parameters**
- **INFO_LEVEL** specifies level of information detail provided by the command.
  - `<no parameter>` command displays information in a data table.
  - **detail** command displays bridge information in data blocks for each instance.

**Examples**
- This command displays a bridge data table.
  ```plaintext
  switch>show spanning-tree instance
  Bridge ID        Priority   MAC addr        Hello  Max  Fwd
  Instance         Priority   MAC addr        Time   Age  Dly
  ---------------  --------   -----------------  -----  ---  ---
  MST0            32768(32768, sys-id 0 ) 001c.7302.2f98    2000    20   15
  MST101          32869(32768, sys-id 101 ) 001c.7302.2f98    2000    20   15
  MST102          32870(32768, sys-id 102 ) 001c.7302.2f98    2000    20   15
  switch>
  ```
- This command displays bridge data blocks.
  ```plaintext
  switch>show spanning-tree instance detail

  switch>
  ```
show spanning-tree interface

The show spanning-tree interface command displays spanning tree protocol information for the specified interface.

Command Mode

EXEC

Command Syntax

show spanning-tree interface INT_NAME [INFO_LEVEL]

Parameters

- **INT_NAME** Interface type and number. Values include:
  - **ethernet e_num** Ethernet interface specified by e_num.
  - **peerethernet e_num** Ethernet interface specified by e_num.
  - **port-channel p_num** Port-Channel Interface specified by p_num.
  - **peerport-channel p_num** Port-Channel Interface specified by p_num.
- **INFO_LEVEL** specifies level of detail provided by the output. Options include:
  - <no parameter> command displays a table of STP data for the specified interface.
  - **detail** command displays a data block for the specified interface.

Examples

- This command displays an STP table for Ethernet interface 5.

  switch>show spanning-tree interface ethernet 5
  Instance Role State Cost Prio.Nbr Type

  switch>
show spanning-tree mst

The **show spanning-tree mst** command displays configuration and state information for Multiple Spanning Tree Protocol (MST) instances.

**Command Mode**

EXEC

**Command Syntax**

```
show spanning-tree mst [INSTANCE] [INFO_LEVEL]
```

**Parameters**

- **INSTANCE** – MST instance for which the command displays information. Options include:
  - `<no parameter>` all MST instances.
  - `mst_inst` MST instance number. Value of `mst_inst` ranges from 0 to 4094.
- **INFO_LEVEL** – type and amount of information in the output. Options include:
  - `<no parameter>` output is interface data in tabular format.
  - `detail` output is a data block for each interface.

**Examples**

- This command displays interface data blocks for MST instance 3.

```
switch>show spanning-tree mst 3 detail
##### MST3 vlans mapped: 3
Bridge address 0011.2233.4402 priority 32771 (32768 sysid 3)
Root address 0011.2233.4401 priority 32771 (32768 sysid 3)
Ethernet1 of MST3 is root forwarding
Port info port id 128.1 priority 128 cost 2000
Designated root address 0011.2233.4401 priority 32768 cost 0
Designated bridge address 0011.2233.4401 priority 32768 port id 128.1

Ethernet2 of MST3 is alternate discarding
Port info port id 128.2 priority 128 cost 2000
Designated root address 0011.2233.4401 priority 32768 cost 0
Designated bridge address 0011.2233.4401 priority 32768 port id 128.2

Ethernet3 of MST3 is designated forwarding
Port info port id 128.3 priority 128 cost 2000
Designated root address 0011.2233.4401 priority 32768 cost 2000
Designated bridge address 0011.2233.4402 priority 32768 port id 128.3
```
This command displays interface tables for all MST instances.

```plaintext
switch>show spanning-tree mst

```
**show spanning-tree mst configuration**

The `show spanning-tree mst configuration` command displays information about the MST region’s VLAN-to-instance mapping. The command provides two display options:

- **default** displays a table that lists the instance to VLAN map.
- **digest** displays the configuration digest.

The configuration digest is a 16-byte hex string calculated from the md5 encoding of the VLAN-to-instance mapping table. Switches with identical mappings have identical digests.

**Command Mode**

EXEC

**Command Syntax**

```
show spanning-tree mst configuration [INFO_LEVEL]
```

**Parameters**

- **INFO_LEVEL** specifies data provided by the output. Options include:
  - `<no parameter>` command displays VLAN-to-instance map.
  - **digest** command displays the MST configuration digest.

**Examples**

- This command displays the MST region’s VLAN-to-instance map.
  ```
  switch>show spanning-tree mst configuration
  Name          []
  Revision 0    Instances configured 3

  Instance  Vlans mapped
  --------  ---------------------------
          0  1,4-4094
          2    2   
          3    3   
  
  switch>
  ```

- This command displays the MST region’s configuration digest.
  ```
  switch>show spanning-tree mst configuration digest
  Name          []
  Revision 0    Instances configured 1
  Digest    0xAC36177F5D283CD4B8821D8AB26DE62
  switch>
  ```
show spanning-tree mst interface

The **show spanning-tree mst interface** command displays Multiple Spanning Tree Protocol (MSTP) information for a specified interface on the specified MST instances.

**Command Mode**

**EXEC**

**Command Syntax**

```
show spanning-tree mst [INSTANCE] interface INT_NAME [INFO_LEVEL]
```

**Parameters**

- **INSTANCE** MST instance for which the command displays information. Options include:
  - <no parameter> all MST instances.
  - mst_inst denotes a single MST instance. Value of mst_inst ranges from 0 to 4094.
- **INT_NAME** Interface type and number. Values include:
  - ethernet e_num Ethernet interface specified by e_num.
  - peerethernet e_num Ethernet interface specified by e_num.
  - port-channel p_num Port-channel interface specified by p_num.
  - peerport-channel p_num Port-channel interface specified by p_num.
- **INFO_LEVEL** specifies level of detail provided by the output. Options include:
  - <no parameter> command displays a table of STP instance data for the specified interface
  - detail command displays a data block for all specified instance-interface combinations.

**Examples**

- This command displays an table of STP instance data for Ethernet 1 interface:

  ```
  switch>show spanning-tree mst interface ethernet 1
  Ethernet1 of MST0 is root forwarding
  Edge port: no bpduguard: disabled
  Link type: point-to-point
  Boundary: Internal
  Bpdus sent 2120, received 2164, taggedErr 0, otherErr 0
  
  Instance Role Sts Cost Prio.Nbr Vlans mapped
  --------- ---- --- ---------- -------- -------------------------------
  0 Root FWD 2000 128.1 1,4-4094
  2 Desg FWD 2000 128.1 2
  3 Root FWD 2000 128.1 3
  ```

- This command displays blocks of STP instance information for Ethernet 1 interface.

  ```
  switch>show spanning-tree mst 3 interface ethernet 1 detail
  Ethernet1 of MST3 is root forwarding
  Port info port id 128.1 priority 128 cost 2000
  Designated root address 0011.2233.4401 priority 32768 cost 0
  Designated bridge address 0011.2233.4401 priority 32768 port id 128.1
  ```
show spanning-tree mst test information

The `show spanning-tree mst test information` displays diagnostic spanning tree protocol information.

**Command Mode**

EXEC

**Command Syntax**

`show spanning-tree mst test information`

**Examples**

- This command displays diagnostic STP information.

```plaintext
switch>show spanning-tree mst test information
bi = MstInfo.BridgeInfo( "dut" )
bi.stpVersion = "rstp"
bi.mstpRegionId = ""
bi.bridgeAddr = "00:1c:73:01:60:17"
si = MstInfo.BridgeStpiInfo( "Mst" )
bi.stpiInfoIs( "Mst", si )
si.cistRoot = Tac.Value( "Stp::BridgeId", priority=32768, systemId=0,
                        address='00:1c:73:01:60:17' )
si.cistPathCost = 0
bmi = MstInfo.BridgeMstiInfo( "Mst0" )
bmi.bridgeId = Tac.Value( "Stp::BridgeId", priority=32768, systemId=0,
                        address='00:1c:73:01:60:17' )
bmi.designatedRoot = Tac.Value( "Stp::BridgeId", priority=32768, systemId=0,
                            address='00:1c:73:01:60:17' )
si.mstiInfoIs( "Mst0", bmi )
bmii = MstInfo.BridgeMstiIntfInfo( "Mst0", "Ethernet15" )

bmii.role = "designated"
bmii.operIntPathCost = 1999
bmii.fdbFlush = 1
bmi.mstiIntfInfoIs( "Port-Channel110", bmii )
bii = MstInfo.BridgeIntfInfo( "Port-Channel110" )
bii.operExtPathCost = 1999
si.intfInfoIs( "Port-Channel110", bii )
switch>
```
**show spanning-tree root**

The `show spanning-tree root` command displays the Bridge-ID, cost to the root bridge, root port, and the root bridge timer settings for all instances.

**Command Mode**

EXEC

**Command Syntax**

`show spanning-tree root [INFO_LEVEL]`

**Parameters**

- **INFO_LEVEL** specifies output format. Options include:
  - `<no parameter>` output displays data in tabular format.
  - **detail** output displays a data block for each instance.

**Examples**

- This command displays a table of root bridge information.

```
switch> show spanning-tree root

<table>
<thead>
<tr>
<th>Instance</th>
<th>Root ID</th>
<th>Priority</th>
<th>MAC addr</th>
<th>Cost</th>
<th>Hello</th>
<th>Max</th>
<th>Fwd</th>
<th>Root Port</th>

```
show spanning-tree topology status

The `show spanning-tree topology status` command displays the forwarding state of ports on the specified VLANs.

**Command Mode**

EXEC

**Command Syntax**

`show spanning-tree topology [VLAN_NAME] status [INFO_LEVEL]`

**Parameters**

- **VLAN_NAME** specifies the VLANs that the output displays. Options include:
  - `<no parameter>` output includes all VLANs.
  - `vlan` output includes all VLANs.
  - `vlan v_num` command includes specified VLAN; `v_num` ranges from 1 to 4094.

- **INFO_LEVEL** specifies information provided by output. Options include:
  - `<no parameter>` output lists forwarding state of interfaces.
  - `detail` output lists forwarding state and change history of interfaces.

**Examples**

- This command displays forwarding state for ports mapped to all VLANs.

  `switch> show spanning-tree topology status`
  
  Topology: Cist
  
  Mapped Vlans: 1-4,666,1000-1001,1004-1005
  
  Cpu: forwarding
  
  Ethernet2: forwarding
  
  Ethernet3: forwarding
  
  Ethernet4: forwarding
  
  Ethernet5: forwarding
  
  Ethernet6: forwarding
  
  Ethernet8: forwarding
  
  Ethernet10: forwarding
  
  Port-Channel1: forwarding
  
  Port-Channel2: forwarding
  
  Port-Channel3: forwarding

  `switch>`

- This command displays forwarding state and history for ports mapped to VLAN 1000.

  `switch> show spanning-tree topology vlan 1000 status detail`
  
  Topology: Cist
  
  Mapped Vlans: 1000
  
  Cpu: forwarding (1 changes, last 23 days, 22:54:43 ago)
  
  Ethernet2: forwarding (3 changes, last 23 days, 22:48:59 ago)
  
  Ethernet4: forwarding (3 changes, last 10 days, 19:54:17 ago)
  
  Ethernet5: forwarding (3 changes, last 23 days, 22:54:38 ago)
  
  Ethernet6: forwarding (3 changes, last 19 days, 15:49:10 ago)
  
  Ethernet10: forwarding (3 changes, last 9 days, 7:37:05 ago)
  
  Port-Channel1: forwarding (3 changes, last 23 days, 22:54:34 ago)
  
  Port-Channel3: forwarding (5 changes, last 21 days, 4:56:41 ago)

  `switch>`
**show spanning-tree transmit active**

The `show spanning-tree transmit active` command displays spanning tree protocol bridge assurance information for network ports or for all ports. Bridge assurance-enabled ports will not necessarily be blocked when they link to a port where bridge assurance is not enabled, but if they do not receive periodic BPDUs from the other side of the link the `show spanning-tree transmit active` command will show a bridge assurance status of “inconsistent” (blocking) for that port.

**Command Mode**

EXEC

**Command Syntax**

`show spanning-tree transmit active INFO_LEVEL`

**Parameters**

- `INFO_LEVEL` specifies level of information detail provided by the command.
  - `<no parameter>` command displays bridge assurance information for network ports.
  - `detail` command displays bridge assurance information for all ports.

**Examples**

- This command displays the bridge assurance status of network ports.

```
switch>show spanning-tree transmit active
Name                  Bridge Assurance Status
--------------------------------------------
VL1            Et5/1             consistent

Number of bridge assurance inconsistent ports in the system : 0
switch>
```
**shutdown (Loop-protection)**

The `shutdown (Loop-protection)` command disables loop protection globally. The feature is disabled by default, and is enabled by using the `no shutdown (Loop-protection)` command.

**Note**

To function, loop protection must also be enabled on a per-VLAN basis using the `protect vlan` command.

**Command Mode**

Loop-protection Configuration

**Command Syntax**

```
shutdown
no shutdown
```

**Example**

- This command enables loop protection globally on the switch.

```
switch(config-monitor-loop-protect)#no shutdown
switch(config-monitor-loop-protect)#
```
spanning-tree bpdu tx hold-count

The `spanning-tree bpdu tx hold-count` command specifies the maximum number of BPDUs per second that the switch can send from an interface. Valid settings range from 1 to 10 BPDUs with a default of 6 BPDUs.

The `no spanning-tree bpdu tx hold-count` and `default spanning-tree bpdu tx hold-count` commands restore the transmit hold count default of 6 BPDUs by removing the `spanning-tree bpdu tx hold-count` command from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**
```
spanning-tree bpdu tx hold-count max_bpdu
no spanning-tree bpdu tx hold-count
default spanning-tree bpdu tx hold-count
```

**Parameters**
- `max_bpdu`  BPDUs. Value ranges from 1 to 10. Default is 6.

**Examples**
- This command configures a transmit hold-count of 8 BPDUs.
```
switch(config)#spanning-tree bpdu tx hold-count 8
switch(config)#
```
spanning-tree bpdufilter

The `spanning-tree bpdufilter` command controls bridge protocol data unit (BPDU) filtering on the configuration mode interface. BPDU filtering is disabled by default.

- `spanning-tree bpdufilter enabled` enables BPDU filtering.
- `spanning-tree bpdufilter disabled` disables BPDU filtering by removing the `spanning-tree bpdufilter` command from `running-config`.

The BPDU filter default setting for portfast ports is configured by the `spanning-tree edge-port bpdufilter default` command; BPDU filter is disabled by default on all non-portfast ports.

The `no spanning-tree bpdufilter` and `default spanning-tree bpdufilter` commands restore the global BPDU filter setting on the configuration mode interface by removing the corresponding `spanning-tree bpdufilter` command from `running-config`.

Command Mode

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

Command Syntax

```
spanning-tree bpdufilter FILTER_STATUS
no spanning-tree bpdufilter
default spanning-tree bpdufilter
```

Parameters

- `FILTER_STATUS` BPDU filtering status. Options include:
  - `enabled` BPDU filter is enabled on the interface.
  - `disabled` BPDU filter is disabled on the interface.

Examples

- This command enables BPDU filtering on Ethernet 5 interface.

```bash
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree bpdufilter enabled
switch(config-if-Et5)#
```
**spanning-tree bpduguard**

The `spanning-tree bpduguard` command controls BPDU guard on the configuration mode interface. A BPDU guard-enabled port is disabled when it receives a BPDU packet.

The BPDU guard default setting for portfast ports is configured by the `spanning-tree edge-port bpduguard default` command; BPDU guard is disabled by default on all non-portfast ports.

The `no spanning-tree bpduguard` and `default spanning-tree bpduguard` commands restore the global BPDU guard setting on the configuration mode interface by removing the corresponding `spanning-tree bpduguard` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

**Command Syntax**
- `spanning-tree bpduguard GUARD_ACTION`
- `no spanning-tree bpduguard`
- `default spanning-tree bpduguard`

**Parameters**
- `GUARD_ACTION` BPDU guard setting. Options include:
  - `disable` Disable bpduguard
  - `enable` Enable bpduguard
  - `rate-limit` BPDU Input Rate Limiter options

**Examples**
- These commands enable BPDU guard on Ethernet interface 5.

```plaintext
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree bpduguard enabled
switch(config-if-Et5)
```
spanning-tree bpduguard rate-limit count (global)

The **spanning-tree bpduguard rate-limit count** command sets the maximum BPDU reception rate (quantity per interval) for ports that are not covered by a **spanning-tree bpduguard rate-limit count (interface)** command.

BPDU rate limiting restricts the number of BPDUs that ports with BPDU guard or BPDU filter disabled can process during a specified interval. Ports discard BPDUs they receive in excess of the specified limit. BPDU rate limiting is enabled or disabled by **spanning-tree bpduguard rate-limit enable / disable** commands.

The **no spanning-tree bpduguard rate-limit count** and **default spanning-tree bpduguard rate-limit count** commands restore the global setting to its default value by removing the **spanning-tree bpduguard rate-limit count** command from **running-config**.

**Command Mode**
Global Configuration

**Command Syntax**

```
spanning-tree bpduguard rate-limit count max_bpdu [interval period]
no spanning-tree bpduguard rate-limit count
default spanning-tree bpduguard rate-limit count
```

**Parameters**
- **max_bpdu** configures the maximum number of BPDUs per timer interval. The value of **BPDU quantity** ranges from 1 to 20000.
- **interval period** configures the timer interval in seconds. The value of **period** ranges from 1 to 15.

**Guidelines**
Arista Networks recommends to retain the default values of rate limit.

In the PVST mode, when the VLAN membership of a port is changed by a significant margin, it is advisable to disable interface BPDU rate limit on both ends of a port. For example, if three VLANs are present on a port initially, the operator must first add 300 more VLANs on one side of the port and then add the same 300 VLANs on the other side of the port. In this case, if the VLANs are increased towards the root bridge first, then the other side can cross the rate-limit threshold.

**Example**
- This command configures the global rate limit as 5000 BPDUs per four second period.

```
switch(config)#spanning-tree bpduguard rate-limit count 5000 interval 4
switch(config)#
```
spanning-tree bpduguard rate-limit count (interface)

The `spanning-tree bpduguard rate-limit count` command configures the maximum BPDU reception rate for the configuration mode interface. The default rate limit is specified by the `spanning-tree bpduguard rate-limit count (global)` command.

BPDU rate limiting restricts the number of BPDUs that ports with BPDU guard or BPDU filter disabled can process during a specified interval. Ports discard BPDUs it receives in excess of the specified limit. BPDU rate limiting is enabled or disabled by `spanning-tree bpduguard rate-limit enable / disable` commands.

The `no spanning-tree bpduguard rate-limit count` and `default spanning-tree bpduguard rate-limit count` commands restore the interface value to the global setting by removing the corresponding `spanning-tree bpduguard rate-limit count` command from `running-config`.

Command Mode
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

Command Syntax
```
spanning-tree bpduguard rate-limit count max_bpdu [TIMER]
no spanning-tree bpduguard rate-limit count
default spanning-tree bpduguard rate-limit count
```

Parameters
- `max_bpdu` BPDU quantity. Value ranges from 1 to 20,000.
- `TIMER` BPDU reception interval (seconds). Options include:
  - `<no parameter>` reception interval defaults to `hello-time`.
  - `interval period` Value of `period` ranges from 1 to 15.

Example
- These commands configure rate limit as 7500 BPDUs per 8 second period on Ethernet 2.

```
switch(config)#interface ethernet 2
switch(config-if-Et2)#spanning-tree bpduguard rate-limit count 7500 interval 8
switch(config-if-Et2)#
```
**spanning-tree bpduguard rate-limit default**

The `spanning-tree bpduguard rate-limit default` command configures the global BPDU rate limit setting. The global BPDU rate limit setting provides the default for individual ports whose configuration does not include a `spanning-tree bpduguard rate-limit enable / disable` command. The default global setting is *enabled*.

BPDU rate limiting restricts the number of BPDUs that ports with BPDU guard or BPDU filter disabled can process during a specified interval. Ports discard BPDUs it receives in excess of the specified limit. BPDU rate limits are established by `spanning-tree bpduguard rate-limit count (global)` commands.

The `no spanning-tree bpduguard rate-limit default` sets the global BPDU rate limit setting to *disabled*. The `spanning-tree bpduguard rate-limit default` and `default spanning-tree bpduguard rate-limit default` commands restore the default global rate limit setting to *enabled* by removing the `no spanning-tree bpduguard rate-limit default` command from *running-config*.

**Command Mode**

Global Configuration

**Command Syntax**

- `spanning-tree bpduguard rate-limit default`
- `no spanning-tree bpduguard rate-limit default`
- `default spanning-tree bpduguard rate-limit default`

**Example**

- This command enables rate limiting on all ports not covered by an interface rate limit command.

  ```bash
  switch(config)#spanning-tree bpduguard rate-limit default
  switch(config)#
  ```
**spanning-tree bpduguard rate-limit enable / disable**

These commands enable and disable BPDU rate limiting on the configuration mode interface:

- `spanning-tree bpduguard rate-limit enable` enables BPDU rate limiting.
- `spanning-tree bpduguard rate-limit disable` disables BPDU rate limiting.

The `spanning-tree bpduguard rate-limit default` command enables BPDU rate limiting on all ports not configured with a `spanning-tree bpduguard rate-limit` command.

BPDU rate limiting restricts the number of BPDUs that ports with BPDU guard or BPDU filter disabled can process during a specified interval. Ports discard BPDUs it receives in excess of the specified limit. BPDU rate limits are established by `spanning-tree bpduguard rate-limit count (interface)` commands.

The `no spanning-tree bpduguard rate-limit` and `default spanning-tree bpduguard rate-limit` commands restore the global rate limit setting on the configuration mode interface by removing the corresponding `spanning-tree bpduguard rate-limit` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

**Command Syntax**

- `spanning-tree bpduguard rate-limit enable`
- `spanning-tree bpduguard rate-limit disable`
- `no spanning-tree bpduguard rate-limit`
- `default spanning-tree bpduguard rate-limit`

**Example**

- These commands enable rate limiting on Ethernet 15.

```bash
switch(config)#interface ethernet 15
switch(config-if-Et15)#spanning-tree bpduguard rate-limit enable
switch(config-if-Et15)#
```
spanning-tree cost

The `spanning-tree cost` command configures the path cost of the configuration mode interface. Cost values range from 1 to 200000000 (200 million). The default cost depends on the interface speed:

- 1 gigabit interface: cost = 20000
- 10 gigabit interface: cost = 2000

The `spanning-tree cost` command provides a mode option:

- RST instance cost is configured by not including a mode.
- MST instance 0 cost is configured by not including a mode or with the `mst` mode option.
- MST instance cost is configured with the `mst` mode option.
- Rapid-PVST VLAN cost is configured with the `vlan` mode option.

The `no spanning-tree cost` and `default spanning-tree cost` commands restore the default cost on the configuration mode interface by removing the corresponding `spanning-tree cost` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

**Command Syntax**

```
spanning-tree MODE cost value
no spanning-tree MODE cost
default spanning-tree MODE cost
```

**Parameters**

- `MODE` specifies the spanning tree instances for which the cost is configured. Values include:
  - `<no parameter>` RST instance, MST instance 0, or all Rapid-PVST instances permitted on the interface.
  - `mst m_range` specified MST instances. `m_range` formats include a number, number range, or comma-delimited list of numbers and ranges. Instance numbers range from 0 to 4094.
  - `vlan v_range` specified Rapid-PVST instances. `v_range` formats include a number, number range, or comma-delimited list of numbers and ranges. VLAN numbers range from 1 to 4094.
- `value` path cost assigned to interface. Values range from 1 to 200000000 (200 million). Default values are 20000 (1 G interfaces) or 2000 (10 G interfaces).

**Examples**

- These commands configure a port cost of 25000 for Ethernet interface 5 when configured as an RST port, as a port in MST instance 0, or all unconfigured Rapid-PVST instances that are not explicitly configured.

  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#spanning tree cost 25000
  ```

- This command configures a port cost of 30000 for Ethernet interface 5 when configured as a port in MST instance 200.

  ```
  switch(config-if-Et5)#spanning tree mst 200 cost 30000
  ```
• This command configures a port cost of 100000 for Ethernet interface 5 when configured as a port in VLANs 200-220.

switch(config-if-Et5)#spanning tree vlan 200-220 cost 100000
switch(config-if-Et5)#
spanning-tree edge-port bpdufilter default

The `spanning-tree edge-port bpdufilter default` command configures the global BPDU filter setting as `enabled`. Ports not covered by a `spanning-tree bpdufilter` command use the global BPDU filter setting.

**Command Mode**
- Global Configuration

**Command Syntax**

```
spanning-tree edge-port bpdufilter default
no spanning-tree edge-port bpdufilter default
default spanning-tree edge-port bpdufilter default
```

**Example**
- This command configures the BPDU filter global setting to `enabled`.

```
switch(config)#spanning-tree edge-port bpdufilter default
switch(config)#
```
**spanning-tree edge-port bpduguard default**

The `spanning-tree edge-port bpduguard default` command sets the global BPDU guard setting as *enabled*. Ports not covered by a `spanning-tree bpduguard` command use the global BPDU guard setting.

**Command Mode**
- Global Configuration

**Command Syntax**
- `spanning-tree edge-port bpduguard default`
- `no spanning-tree edge-port bpduguard default`
- `default spanning-tree edge-port bpduguard default`

**Example**
- This command configures the global BPDU guard setting to *enabled*.

```
switch(config)#spanning-tree edge-port bpduguard default
switch(config)#
```
spanning-tree forward-time

The `spanning-tree forward-time` command configures the forward delay timer. Forward delay is the time that a port is in learning state before it begins forwarding data packets.

The switch inserts the forward delay timer value in BPDU packets it sends as the root bridge. The forward delay value ranges from 4 to 30 seconds with a default of 15 seconds.

The `no spanning-tree forward-time` and `default spanning-tree forward-time` commands restore the forward delay timer default of 15 seconds by removing the `spanning-tree forward-time` command from `running-config`.

**Command Mode**
- Global Configuration

**Command Syntax**
- `spanning-tree forward-time period`
- `no spanning-tree forward-time`
- `default spanning-tree forward-time`

**Parameters**
- `period` forward delay timer (seconds). Value ranges from 4 to 30. Default is 15.

**Examples**
- This command sets the forward delay timer value to 25 seconds.
  ```
  switch(config)#spanning-tree forward-time 25
  switch(config)#
  ```
spanning-tree guard

The **spanning-tree guard** command enables root guard or loop guard on the configuration mode interface. The **spanning-tree guard loop default** command configures the global loop guard setting.

- Root guard prevents a port from becoming a root or blocked port. A root guard port that receives a superior BPDU transitions to the root-inconsistent (blocked) state.
- Loop guard protects against loops resulting from unidirectional link failures on point-to-point links by preventing non-designated ports from becoming designated ports. When loop guard is enabled, a root or blocked port transitions to loop-inconsistent (blocked) state if it stops receiving BPDUs from its designated port. The port returns to its prior state when it receives a BPDU.

The **no spanning-tree guard** and **default spanning-tree guard** commands sets the configuration mode interface to the global loop guard mode by removing the **spanning-tree guard** statement from **running-config**. The **spanning-tree guard none** command disables loop guard and root guard on the interface, overriding the global setting.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

**Command Syntax**

```plaintext
spanning-tree guard PORT_MODE
no spanning-tree guard
default spanning-tree guard
```

**Parameters**

- **PORT_MODE** the port mode. Options include:
  - **loop** enables loop guard on the interface.
  - **root** enables root guard on the interface.
  - **none** disables root guard and loop guard.

**Examples**

- This command enables root guard on Ethernet 5 interface.
  ```plaintext
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#spanning-tree guard root
  switch(config-if-Et5)#
  ```
spanning-tree guard loop default

The `spanning-tree guard loop default` command configures the global loop guard setting as `enabled`. Ports not covered by a `spanning-tree guard` command use the global loop guard setting. Loop guard prevents blocked or root ports from becoming a designated port due to failures resulting in a unidirectional link. The `spanning-tree guard` interface configuration statement overrides the global setting for a specified interface. The default global loop guard setting is `disabled`.

The `no spanning-tree guard loop default` and `default spanning-tree guard loop default` commands restore the global loop guard setting of `disabled` by removing the `spanning-tree guard loop default` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
spanning-tree guard loop default
no spanning-tree guard loop default
default spanning-tree guard loop default
```

**Examples**

- This command enables loop guard as the default on all switch ports.

```
switch(config)# spanning-tree guard loop default
switch(config)#
```
spanning-tree hello-time

The `spanning-tree hello-time` command configures the hello time, which specifies the transmission interval between consecutive bridge protocol data units (BPDU) that the switch sends as a root bridge. The hello time is also inserted in outbound BPDUs.

This hello time ranges from 0.2 seconds to 10 seconds with a default of 2 seconds.

The `no spanning-tree hello-time` and `default spanning-tree hello-time` commands restore the hello time default of 2 seconds by removing the `spanning-tree hello-time` command from `running-config`.

**Command Mode**
- Global Configuration

**Command Syntax**

- `spanning-tree hello-time period`
- `no spanning-tree hello-time`
- `default spanning-tree hello-time`

**Parameters**
- `period` hello-time (milliseconds). Value ranges from 200 to 10000. Default is 2000.

**Examples**
- This command configures a hello-time of one second.
  ```
  switch(config)#spanning-tree hello-time 1000
  switch(config)#
  ```
spanning-tree link-type

The `spanning-tree link-type` command specifies the configuration mode interface's link type, which is normally derived from the port's duplex setting. The default setting depends on a port's duplex mode:

- full-duplex ports are `point-to-point`.
- half-duplex ports are `shared`.

The `no spanning-tree link-type` and `default spanning-tree link-type` commands restore the default link type on the configuration mode interface by removing the corresponding `spanning-tree link-type` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

**Command Syntax**

```
spanning-tree link-type TYPE
no spanning-tree link-type
default spanning-tree link-type
```

**Parameters**

- `TYPE`  
  
  Link type of the configuration mode interface. Options include:
  
  - `point-to-point`
  - `shared`

**Examples**

- This command configures Ethernet 5 interface as a shared port.

  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#spanning-tree link-type shared
  switch(config-if-Et5)#
  ```
**spanning-tree max-age**

The `spanning-tree max-age` command configures the switch's max age timer, which specifies the max age value that the switch inserts in outbound BPDU packets it sends as a root bridge. The max-age time value ranges from 6 to 40 seconds with a default of 20 seconds.

Max age is the interval, specified in the BPDU, that BPDU data remains valid after its reception. The bridge recomputes the spanning tree topology if it does not receive a new BPDU before max age expiry.

The `no spanning-tree max-age` and `default spanning-tree max-age` commands restore the max-age default of 20 seconds by removing the `spanning-tree max-age` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
spanning-tree max-age period
no spanning-tree max-age
default spanning-tree max-age
```

**Parameters**

- `period`  max age period (seconds). Value ranges from 6 to 40. Default is 20.

**Examples**

- This command sets the max age timer value to 25 seconds.
  
  ```text
  switch(config)#spanning-tree max-age 25
  switch(config)#
  ```
**spanning-tree max-hops**

The `spanning-tree max-hops` command specifies the max hop setting that the switch inserts into BPDUs that it sends out as the root bridge. The max hop setting determines the number of bridges in an MST region that a BPDU can traverse before it is discarded. The max-hop value ranges from 1 to 40 with a default of 20.

The `no spanning-tree max-hops` and `default spanning-tree max-hops` commands restore the max-hops setting to its default value of 20 by removing the `spanning-tree max-hops` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

- `spanning-tree max-hops ports`
- `no spanning-tree max-hops`
- `default spanning-tree max-hops`

**Parameters**

- `ports` max hops (bridges). Value ranges from 1 to 40. Default is 20.

**Example**

- This command sets the max hop value to 40.

```
switch(config)#spanning-tree max-hop 40
switch(config)#
```
**spanning-tree mode**

The `spanning-tree mode` command specifies the spanning tree protocol version that the switch runs. The default mode is Multiple Spanning Tree (mstp).

The `no spanning-tree mode` and `default spanning-tree mode` commands restore the default spanning tree protocol version.

---

**Caution**
The `spanning-tree mode` command may disrupt user traffic. When the switch starts a different STP version, all spanning-tree instances are stopped, then restarted in the new mode.

---

### Command Mode
Global Configuration

### Command Syntax

```plaintext
spanning-tree mode VERSION
no spanning-tree mode
default spanning-tree mode
```

### Parameters

- **VERSION**  
  spanning tree version that the switch runs. Options include:
  - `mstp`  
    multiple spanning tree protocol described in the IEEE 802.1Q-2005 specification and originally specified in the IEEE 802.1s specification.
  - `rstp`  
    rapid spanning tree protocol described in the IEEE 802.1D-2004 specification and originally specified in the IEEE 802.1w specification.
  - `rapid-pvst`  
    rapid per-VLAN spanning tree protocol described in the IEEE 802.1D-2004 specification and originally specified in the IEEE 802.1w specification.
  - `backup`  
    disables STP and enables switchport interface pairs configured with the `switchport backup-link` command.
  - `none`  
    disables STP. The switch does not generate STP packets. Each switchport interface forwards data packets to all connected ports and forwards STP packets as multicast data packets on the VLAN where they are received.

### Guidelines
Backup mode is not available on Trident platform switches.

### Example

- This command configures the switch to run multiple spanning tree protocol.
  ```plaintext
  switch(config)#spanning-tree mode mstp
  switch(config)#
  ```
spanning-tree mst configuration

The `spanning-tree mst configuration` command places the switch in MST-configuration mode, which is the group change mode where MST region parameters are configured.

Changes made in a group change mode are saved by leaving the mode through the `exit` command or by entering another configuration mode. To discard changes from the current edit session, leave the mode with the `abort` command.

These commands are available in MST-configuration mode:

- `abort (mst-configuration mode)`
- `exit (mst-configuration mode)`
- `instance`
- `name (mst-configuration mode)`
- `revision (mst-configuration mode)`
- `show (mst-configuration mode)`

The `no spanning-tree mst configuration` and `default spanning-tree mst configuration` commands restore the MST default configuration.

Command Mode

- Global Configuration

Command Syntax

```
spanning-tree mst configuration
no spanning-tree mst configuration
default spanning-tree mst configuration
```

Examples

- This command enters MST configuration mode.
  
  ```
  switch(config)#spanning-tree mst configuration
  switch(config-mst)#
  ```

- This command exits MST configuration mode, saving MST region configuration changes to `running-config`.
  
  ```
  switch(config-mst)#exit
  switch(config)#
  ```

- This command exits MST configuration mode without saving MST region configuration changes to `running-config`.
  
  ```
  switch(config-mst)#abort
  switch(config)#
  ```
spanning-tree mst pvst border

The `spanning-tree mst pvst border` command configures MSTP PVST border feature to automatically detect border ports facing PVST+ regions. By default, spanning-tree mst pvst border is disabled.

The `no spanning-tree mst pvst border` and `default spanning-tree mst pvst border` commands restore the default MST configuration.

Command Mode
  MSTConfiguration

Command Syntax
  - `spanning-tree mst pvst border`
  - `no spanning-tree mst pvst border`
  - `default spanning-tree mst pvst border`

Examples
- This command enters the MST configuration mode.
  
  switch(config)#spanning-tree mst configuration
  switch(config-mst)#spanning-tree mst pvst border
spanning-tree portchannel guard misconfig

The **spanning-tree portchannel guard misconfig** command enables the switch to detect misconfigured port channels that may cause network loops by monitoring inbound BPDUs. When a port channel receives 75 inconsistent BPDUs within 30 seconds, the switch error disables the port. When a port channel receives 5 BPDUs with the same source BPDU during the 30 second measurement interval, the error counter is reset and the port continues normal port channel operation. Misconfigured port channel detection is disabled by default.

The **no spanning-tree portchannel guard misconfig** and **default spanning-tree portchannel guard misconfig** commands disable the detection of misconfigured port channels by removing the **spanning-tree portchannel guard misconfig** statement from *running-config*.

**Command Mode**

Global Configuration

**Command Syntax**

```none
spanning-tree portchannel guard misconfig
no spanning-tree portchannel guard misconfig
default spanning-tree portchannel guard misconfig
```

```none
spanning-tree etherchannel guard misconfig
no spanning-tree etherchannel guard misconfig
default spanning-tree etherchannel guard misconfig
```

**Guidelines**

The **spanning-tree portchannel guard misconfig** and **spanning-tree etherchannel guard misconfig** commands are equivalent.

**Examples**

- This command enables port channel misconfiguration detection on the switch.

  ```
  switch(config)#spanning-tree portchannel guard misconfig
  switch(config)#show running-config
  
  !
  spanning-tree mode mstp
  spanning-tree portchannel guard misconfig
  !
  !
  !
  end
  switch(config)#
  ```

- This command disables port channel misconfiguration detection on the switch.

  ```
  switch(config)#no spanning-tree portchannel guard misconfig
  switch(config)#show running-config
  
  !
  spanning-tree mode mstp
  !
  !
  !
  !
  end
  switch(config)#
  ```
spanning-tree portfast

The `spanning-tree portfast` command programs configuration mode ports to immediately enter forwarding state when they establish a link. PortFast ports are included in spanning tree topology calculations and can enter discarding state. This command overrides the `spanning-tree portfast auto` command.

The `no spanning-tree portfast` and `default spanning-tree portfast` commands remove the corresponding `spanning-tree portfast` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

**Command Syntax**

```
spanning-tree portfast
no spanning-tree portfast
default spanning-tree portfast
```

**Example**

- This command unconditionally enables portfast on Ethernet 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree portfast
switch(config-if-Et5)#
```
spanning-tree portfast auto

The \texttt{spanning-tree portfast auto} command enables auto-edge detection on the configuration mode interface. When auto-edge detection is enabled, the port is configured as an edge port if it does not receive a new BPDU before the current BPDU expires. Auto-edge detection is enabled by default. The \texttt{spanning-tree portfast} command, when configured, has priority over this command.

The \texttt{no spanning-tree portfast auto} command disables auto-edge port detection. This command is removed from \texttt{running-config} with the \texttt{spanning-tree portfast auto} and \texttt{default spanning-tree portfast auto} commands.

\textbf{Command Mode}

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

\textbf{Command Syntax}

\begin{itemize}
  \item \texttt{spanning-tree portfast auto}
  \item \texttt{no spanning-tree portfast auto}
  \item \texttt{default spanning-tree portfast auto}
\end{itemize}

\textbf{Example}

- This command enables auto-edge detection on Ethernet interface 5.

\begin{verbatim}
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree portfast auto
switch(config-if-Et5)#
\end{verbatim}
spanning-tree portfast <port type>

The `spanning-tree portfast <port-type>` command specifies the STP port mode for the configuration mode interface. Default port mode is `normal`.

Port modes include:

- **Edge**: Edge ports connect to hosts and transition to the forwarding state when the link is established. An edge port that receives a BPDU becomes a normal port.
- **Network**: Network ports connect only to switches or bridges and support bridge assurance. Network ports that connect to hosts or other edge devices transition to the discarding state.
- **Normal**: Normal ports function as normal STP ports and can connect to any type of device.

The `no spanning-tree portfast <port-type>` and `default spanning-tree portfast <port-type>` commands restore the default port mode of normal by removing the corresponding `spanning-tree portfast <port-type>` command from `running-config`.

Command Mode

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

Command Syntax

```
spanning-tree portfast PORT_MODE
no spanning-tree portfast PORT_MODE
default spanning-tree portfast PORT_MODE
```

Parameters

- **PORT_MODE**  STP port mode. Options include:
  - edge
  - network
  - normal

  The `normal` option is not available for the `no` and `default` commands.

Related Commands

The `spanning-tree portfast <port-type>` command also affects the `spanning-tree portfast auto` and `spanning-tree portfast` configuration for the configuration mode interface:

- **spanning-tree portfast normal**: `spanning-tree portfast auto` is enabled.
- **spanning-tree portfast edge**: `spanning-tree portfast` is enabled.
- **spanning-tree portfast network**: `spanning-tree portfast auto` is disabled.

Example

- This command configures Ethernet 5 interface as a network port.

  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#spanning-tree portfast network
  switch(config-if-Et5)#
  ```
spanning-tree port-priority

The spanning-tree port-priority command specifies the configuration mode interface’s port-priority number. The switch uses this number to determine which interface it places into forwarding mode when resolving a loop. Valid settings are all multiples of 16 between 0 and 240. Default value is 128. Ports with lower numerical priority values are selected over other ports.

The no spanning-tree port-priority and default spanning-tree port-priority commands restore the default of 128 for the configuration mode interface by removing the spanning-tree port-priority command from running-config.

The spanning-tree port-priority command provides a mode option:

- RST instance port-priority is configured by not including a mode.
- MST instance 0 port-priority is configured by not including a mode or with the mst mode option.
- MST instance port-priority is configured with the mst mode option.
- Rapid-PVST VLAN port-priority is configured with the vlan mode option.

Command Mode

Interface-Ethernet Configuration
Interface-Port-Channel Configuration

Command Syntax

spanning-tree [MODE] port-priority value
no spanning-tree [MODE] port-priority
default spanning-tree [MODE] port-priority

Parameters

- **MODE** specifies the spanning tree instances for which the cost is configured. Values include:
  - <no parameter> RST instance or MST instance 0.
  - mst m_range specified MST instances. m_range formats include a number, number range, or comma-delimited list of numbers and ranges. Instance numbers range from 0 to 4094.
  - vlan v_range specified Rapid-PVST instances. v_range formats include a number, number range, or comma-delimited list of numbers and ranges. VLAN numbers range from 1 to 4094.
- **value** bridge priority number. Values range from 0 to 240 and must be a multiple of 16.

Example

- This command sets the port priority of Ethernet 5 interface to 144.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree port-priority 144
switch(config-if-Et5)#
```
spanning-tree priority

The spanning-tree priority command configures the bridge priority number. The bridge priority is the four most significant digits of the bridge ID, which is used by spanning tree algorithms to select the root bridge and choose among redundant links. Bridge ID numbers range from 0 to 65535 (16 bits); bridges with smaller bridge IDs are elected over other bridges.

Because bridge priority sets the four most significant bits of the bridge ID, valid settings include all multiples of 4096 between 0 and 61440. Default value is 32768.

The spanning-tree priority command provides a mode option:

- RST instance priority is configured by not including a mode.
- MST instance 0 priority is configured by not including a mode or with the mst mode option.
- MST instance priority is configured with the mst mode option.
- Rapid-PVST VLAN priority is configured with the vlan mode option.

The no spanning-tree priority and default spanning-tree priority commands restore the bridge priority default of 32768 for the specified mode by removing the corresponding spanning-tree priority command from running-config.

Another method of adding spanning-tree priority commands to the configuration is through the spanning-tree root command. Similarly, the no spanning-tree root command removes the corresponding spanning-tree priority command from running-config.

**Command Mode**

Global Configuration

**Command Syntax**

```
spanning-tree [MODE] priority level
no spanning-tree [MODE] priority
default spanning-tree [MODE] priority
```

**Parameters**

- **MODE** spanning tree instances for which the command configures priority. Options include:
  - <no parameter> RST instance or MST instance 0.
  - mst m_range specified MST instances. m_range formats include a number, number range, or comma-delimited list of numbers and ranges. Instance numbers range from 0 to 4094.
  - vlan v_range specified Rapid-PVST instances. v_range formats include a number, number range, or comma-delimited list of numbers and ranges. VLAN numbers range from 1 to 4094.
  - level priority number. Values include multiples of 4096 between 0 and 61440. Default is 32768.

**Examples**

- This command configures a bridge priority value of 20480 for Rapid-PVST VLANs 20, 24, 28, and 32.
  ```
  switch(config)#spanning-tree vlan-id 20,24,28,32 priority 20480
  switch(config)#
  ```

- This command configures a bridge priority value of 36864 for the RST instance. When MST is enabled, this command configures a priority of 36864 for MST instance 0.
  ```
  switch(config)#spanning-tree priority 36864
  switch(config)#
  ```
spanning-tree root

The `spanning-tree root` command configures the bridge priority number by adding a `spanning-tree priority` command to the configuration. Parameter settings set the following priority values:

- **primary** sets the bridge priority to 8192.
- **secondary** sets the bridge priority to 16384.

The bridge priority is the four most significant digits of the bridge ID, which is used by spanning tree algorithms to select the root bridge and choose among redundant links. Bridge ID numbers range from 0 to 65535 (16 bits); bridges with smaller bridge IDs are elected over other bridges.

When no other switch in the network is similarly configured, assigning the primary value to the switch facilitates its selection as the root switch. Assigning the secondary value to the switch facilitates its selection as the backup root in a network that contains one switch with a smaller priority number.

The `spanning-tree root` command provides a mode option:

- RST instance priority is configured by not including a mode.
- MST instance 0 priority is configured by not including a mode or with the `mst` mode option.
- MST instance priority is configured with the `mst` mode option.
- Rapid-PVST VLAN priority is configured with the `vlan` mode option.

The `no spanning-tree root` and `default spanning-tree root` commands restore the bridge priority default of 32768 by removing the corresponding `spanning-tree priority` command from `running-config`. The `no spanning-tree root`, `no spanning-tree priority`, `default spanning-tree root` and `default spanning-tree priority` commands perform the same function.

**Command Mode**

Global Configuration

**Command Syntax**

```
spanning-tree [MODE] root TYPE
no spanning-tree [MODE] root
default spanning-tree [MODE] root
```

**Parameters**

- **MODE** specifies the spanning tree instances for which priority is configured. Values include:
  - `<no parameter>` RST instance or MST instance 0.
  - `mst m_range` specified MST instances. `m_range` formats include a number, number range, or comma-delimited list of numbers and ranges. Instance numbers range from 0 to 4094.
  - `vlan v_range` specified Rapid-PVST instances. `v_range` formats include a number, number range, or comma-delimited list of numbers and ranges. VLAN numbers range from 1 to 4094.
- **TYPE** sets the bridge priority number. Values include:
  - `primary` sets the bridge priority to 8192.
  - `secondary` sets the bridge priority to 16384.
Examples

- This command configures a bridge priority value of 8192 for Rapid-PVST VLANs 20-36.
  
  ```
  switch(config)#spanning-tree vlan-id 20-36 root primary
  ```

- This command configures a bridge priority value of 16384 for the RSTP instance and MST instance 0.
  
  ```
  switch(config)#spanning-tree root secondary
  ```
spanning-tree transmit active

The `spanning-tree transmit active` command enables bridge assurance globally, which enables bridge assurance on all ports with a port type of `network`. Bridge assurance protects against unidirectional link failure, other software failure, and devices that quit running a spanning tree algorithm.

Bridge assurance is available only on point-to-point links on spanning tree `network` ports. Both ends of the link should ideally have bridge assurance enabled. Bridge assurance-enabled ports will not necessarily be blocked when they link to a port where bridge assurance is not enabled, but if they do not receive periodic BPDUs from the other side of the link the `show spanning-tree transmit active` command will show a bridge assurance status of “inconsistent” (blocking) for that port.

The `no spanning-tree transmit active` command disables bridge assurance.

The `spanning-tree transmit active` and `default spanning-tree transmit active` commands restore the default behavior by removing the `no spanning-tree transmit active` command from `running-config`.

Command Mode
- Global Configuration

Command Syntax
  - `spanning-tree transmit active`
  - `no spanning-tree transmit active`
  - `default spanning-tree transmit active`

Example
- This command enables bridge assurance on the switch.
  ```
  switch(config)#spanning-tree transmit active
  switch(config)#
  ```
spanning-tree vlan-id

The `spanning-tree vlan-id` command enables Spanning Tree Protocol (STP) on specified VLANs by removing any corresponding `no spanning-tree vlan-id` statements from `running-config`. Spanning-tree is enabled on all VLANs by default.

The `no spanning-tree vlan-id` command disables STP on the specified interfaces. The `default spanning-tree vlan-id` enables STP on the specified interfaces.

**Warning**
Disabling STP is not recommended, even in topologies free of physical loops; STP guards against configuration mistakes and cabling errors. When disabling STP, ensure that there are no physical loops in the VLAN.

**Important!**
When disabling STP on a VLAN, ensure that all switches and bridges in the network disable STP for the same VLAN. Disabling STP on a subset of switches and bridges in a VLAN may have unexpected results because switches and bridges running STP will have incomplete information regarding the network's physical topology.

The following STP global configuration commands provide a `vlan` option for configuring Rapid-PVST VLAN instances:

- `spanning-tree priority`
- `spanning-tree root`

**Command Mode**
Global Configuration

**Command Syntax**

- `spanning-tree vlan-id v_range`
- `no spanning-tree vlan-id v_range`
- `default spanning-tree vlan-id v_range`

**Parameters**
- `v_range` VLAN list. Formats include a number, number range, or comma-delimited list of numbers and ranges. VLAN numbers range from 1 to 4094.

**Examples**
- This command disables STP on VLANs 200-205
  ```
  switch(config)#no spanning-tree vlan-id 200-205
  switch(config)#
  ```
- This command enables STP on VLAN 203
  ```
  switch(config)#spanning-tree vlan-id 203
  switch(config)#
  ```
**switchport backup-link**

The `switchport backup-link` command establishes a primary-backup configuration for forwarding VLAN traffic between the command mode interface and a specified interface. The `show interfaces switchport backup-link` command displays the state of backup interface pairs on the switch:

- the primary interface is the command mode interface.
- the backup interface is the interface specified in the command.

The following guidelines apply to primary and backup interfaces.

- Ethernet and Port Channels can be primary interfaces.
- Ethernet, Port Channel, Management, Loopback, and VLANs can be backup interfaces.
- The primary and backup interfaces can be different interface types.
- Interface pairs should be similarly configured to ensure consistent behavior.
- An interface can be associated with a maximum of one backup interface.
- An interface can back up a maximum of one interface.
- Any Ethernet interface configured in an interface pair cannot be a port channel member.
- The STP mode is backup.
- Static MAC addresses should be configured after primary-backup pairs are established.

When load balancing is not enabled, the primary and backup interfaces cannot simultaneously forward VLAN traffic. When the primary interface is forwarding VLAN traffic, the backup interface drops all traffic. If the primary interface fails, the backup interface forwards VLAN traffic until the primary interface is functional.

The `prefer vlan` option balances the load across the primary and backup interfaces. When the command includes the `prefer vlan` option, each interface is the primary for a subset of the vlans carried by the pair. When both interfaces are up, prefer option vlans are forwarded on the backup interface and all other configured vlans are carried by the primary interface.

The `no switchport backup-link` and `default switchport backup-link` commands remove the primary-backup configuration for the configuration mode interface.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port Channel Configuration

**Command Syntax**

```
switchport backup-link INT_NAME [BALANCE]
no switchport backup-link -
default switchport backup-link
```

**Parameters**

- `INT_NAME` the backup interface. Options include:
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Channel group interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
  - `vxlan vx_num` VXLAN interface specified by `vx_num`.
- `BALANCE` VLANs whose traffic is normally handled on the backup interfaces. Values include:
- `<no parameter>`  backup interface handles no traffic if the primary interface is operating.
- `prefer vlan v_range`  list of VLANs whose traffic is handled by backup interface.

**Examples**

- These commands establish Ethernet interface 7 as the backup port for Ethernet interface 1.
  ```
  switch(config)#interface ethernet 1
  switch(config-if-Et1)#switchport backup-link ethernet 7
  switch(config-if-Et1)#
  ```
- These commands configure the following:
  - Ethernet interface 1 as a trunk port that handles VLAN 4 through 9 traffic.
  - Ethernet interface 2 as its backup interface.
  - Ethernet 2 as the preferred interface for VLANs 7 through 9.
  ```
  switch(config-if-Et1)#switchport mode trunk
  switch(config-if-Et1)#switchport trunk allowed vlan 4-9
  switch(config-if-Et1)#switchport backup-link Ethernet 2 prefer vlan 7-9
  switch(config-if-Et1)#
  ```
**transmit-interval**

The *transmit-interval* command sets the interval at which loop detection packets are transmitted. The *no transmit-interval* and *default transmit-interval* commands restore the transmission interval to the default of 5 seconds.

**Command Mode**
Loop-protection Configuration

**Command Syntax**

```
transmit-interval interval
```

**Parameters**

- *interval* Interval in seconds at which loop-detection packets are transmitted. Values range from 1 to 10; default is 5.

**Example**

- This command sets the loop detection packet transmission interval to 10 seconds.
  
  ```
  switch(config-monitor-loop-protect)#transmit-interval 10
  switch(config-monitor-loop-protect)#
  ```
Quality of Service

This chapter describes Arista’s Quality of Service (QoS) implementation, including configuration instructions and command descriptions. Topics covered by this chapter include:

- Section 27.1: Quality of Service Conceptual Overview
- Section 27.2: QoS Configuration: Platform-Independent Features
- Section 27.3: QoS Configuration: Arad Platform Switches
- Section 27.4: QoS Configuration: Jericho Platform Switches
- Section 27.5: QoS Configuration: FM6000 Platform Switches
- Section 27.6: QoS Configuration: Petra Platform Switches
- Section 27.7: QoS Configuration: Trident and Tomahawk Platform Switches
- Section 27.8: QoS Configuration: Trident II and Helix Platform Switches
- Section 27.9: ACL based QoS Configuration
- Section 27.10: Quality of Service Configuration Commands

27.1 Quality of Service Conceptual Overview

QoS processes apply to traffic that flows through Ethernet ports and control planes. These processes can modify data fields (CoS or DSCP) or assign data streams to traffic classes for prioritized handling. Transmission queues are configurable for individual Ethernet ports to shape traffic based on its traffic class. Many switches also support traffic policies that apply to data that is filtered by access control lists.

The following sections describe QoS features:

- Section 27.1.1: QoS Data Fields and Traffic Classes
- Section 27.1.2: Transmit Queues and Port Shaping
- Section 27.1.3: Explicit Congestion Notification (ECN)
- Section 27.1.4: ACL Policing
- Section 27.1.5: Quality of Service (QoS) Profiles

27.1.1 QoS Data Fields and Traffic Classes

Quality of Service defines a method of differentiating data streams to provide varying levels of service to the different streams. Criteria determining a packet’s priority level include packet field contents and the port where data packets are received. QoS settings are translated into traffic classes, which are then used by switches to manage all traffic flows. Traffic flow management varies with each switch platform.
27.1.1.1 QoS Data Fields

Quality of service decisions are based on the contents of the following packet fields:

- **CoS (three bits)**: Class of service (CoS) is a 3-bit field in Ethernet frame headers using VLAN tagging. The field specifies a priority value between zero and seven. Class of service operates at layer 2.
- **DSCP (six bits)**: Differentiated Service Code Point (DSCP) is a 6-bit field in the Type Of Service (TOS) field of IP packet headers.

27.1.1.2 Port Settings – Trust Mode and Traffic Class

Ethernet and port channel interfaces support three QoS trust modes:

- **CoS Trust**: Ports use inbound packet CoS field contents to derive the traffic class.
- **DSCP Trust**: Ports use inbound packets DSCP field contents to derive the traffic class.
- **Untrusted**: Ports use their default values to derive the traffic class, ignoring packet contents.

The default mode setting is **CoS trust** for switched ports and **DSCP trust** for routed ports.

Ports are associated with default CoS, DSCP, and traffic class settings; defaults vary by platform.

These sections describe procedures for configuring port settings:

- Section 27.3.1: CoS and DSCP Port Settings – Arad Platform Switches
- Section 27.5.1: CoS and DSCP Port Settings – FM6000 Platform Switches
- Section 27.6.1: CoS and DSCP Port Settings – Petra Platform Switches
- Section 27.7.1: CoS and DSCP Port Settings – Trident and Tomahawk Platform Switches
- Section 27.8.1: CoS and DSCP Port Settings – Trident II and Helix Platform Switches

27.1.1.3 Rewriting CoS and DSCP

**CoS Rewrite**

Switches can rewrite the CoS field for outbound tagged packets. The new CoS value is configurable, and is derived from a data stream’s traffic class as specified by the traffic class-to-CoS rewrite map. CoS rewrite is disabled on all the traffic received on CoS trusted ports.

On Arad, Jericho, FM6000, Trident and Tomahawk, Trident II, and Helix platform switches, CoS rewrite can be enabled or disabled on DSCP trusted ports and untrusted ports.

- **CoS rewrite is globally enabled by default for packets received on untrusted ports and DSCP trusted ports if at least one port is explicitly configured in **DSCP trust** or **untrusted** mode.**

- **CoS rewrite is globally disabled by default for packets received on untrusted ports and DSCP trusted ports if there are no ports explicitly configured in **DSCP trust** or **untrusted** mode.**

On Petra platform switches, CoS rewrite is always enabled on DSCP trusted ports and untrusted ports.

**DSCP Rewrite**

Switches can rewrite the DSCP field for outbound IP packets. On FM6000, Trident and Tomahawk, Trident II, and Helix platform switches, DSCP rewrite is disabled by default on all ports and always disabled for traffic received on DSCP trusted ports. On Petra, Arad, and Jericho platform switches, DSCP rewrite is always disabled.
FM6000, Trident and Tomahawk, Trident II, and Helix platform switches provide a command that enables or disables DSCP rewrite for packets received on CoS trusted ports and untrusted ports. The new DSCP value is configurable, based on the data stream's traffic class, as specified by the traffic class-to-DSCP rewrite map.

These sections describe procedures for rewriting CoS and DSCP fields:

- Section 27.3.3: CoS Rewrite – Arad Platform Switches
- Section 27.5.3: CoS and DSCP Rewrite – FM6000 Platform Switches
- Section 27.6.3: CoS Rewrite – Petra Platform Switches
- Section 27.7.3: CoS and DSCP Rewrite – Trident and Tomahawk Platform Switches
- Section 27.8.3: CoS and DSCP Rewrite – Trident II and Helix Platform Switches

### Traffic Classes

Data stream distribution is based on their traffic classes. Data stream management varies by switch platform. Traffic classes are derived from these data stream, inbound port, and switch attributes:

- CoS field contents
- DSCP field contents
- Inbound port trust setting
- CoS default setting (Arad, Jericho, FM6000, Trident and Tomahawk, Trident II, and Helix platform switches)
- DSCP default setting (Arad, Jericho, FM6000, Trident and Tomahawk, and Trident II platform switches)
- Traffic class default setting (Petra platform switches)

When a port is configured to derive a data stream's traffic class from the CoS or DSCP value associated with the stream, the traffic class is determined from a conversion map.

- A CoS-to-traffic class map derives a traffic class from a CoS value.
- A DSCP-to-traffic class map derives a traffic class from a DSCP value.

Map entries are configurable through CLI commands. Default maps determine the traffic class value when CLI map entry commands are not configured. Default maps vary by switch platform.

These sections describe traffic class configuration procedures:

- Section 27.3.2: Traffic Class Derivations – Arad Platform Switches
- Section 27.4.2: Traffic Class Derivations – Jericho Platform Switches
- Section 27.5.2: Traffic Class Derivations – FM6000 Platform Switches
- Section 27.6.2: Traffic Class Derivations – Petra Platform Switches
- Section 27.7.2: Traffic Class Derivations – Trident and Tomahawk Platform Switches
- Section 27.8.2: Traffic Class Derivations – Trident II and Helix Platform Switches

### Transmit Queues and Port Shaping

Transmit queues are logical partitions of an Ethernet port's egress bandwidth. Data streams are assigned to queues based on their traffic class, then sent as scheduled by port and transmit settings. Support varies by switch platform. A queue's label determines its priority: queues with the suffix “0” have the lowest priority.

Parameters that determine transmission schedules include:
• **Traffic class-to-transmit queue mapping** determines the transmit queue for transmitting data streams based on traffic class. The set of available transmit maps vary by switch platforms:
  • Arad, Jericho, FM6000, Trident II, and Helix platforms: one map for all unicast and multicast traffic.
  • Trident and Tomahawk platform: one map for unicast traffic and one map for multicast traffic.
  • Petra platform: one map for unicast traffic. Queue shaping is not available for multicast traffic.

• **Port shaping** specifies a port’s maximum egress bandwidth.

• **Queue shaping** specifies a transmit queue’s maximum egress bandwidth, and implementation varies by platform.
  • Trident and Tomahawk platform: queue shaping is configurable separately for unicast and multicast queues.
  • Trident II platform: queue shaping is configurable for transmit queues. Port shaping and queue shaping are supported only in store-and-forward switching mode.
  • Petra platform: queue shaping is not available for multicast traffic.
  • Helix platform: queue shaping is configurable for transmit queues.
  • FM6000 platform: switches do not support simultaneous port shaping and queue shaping. Enabling port shaping on an FM6000 switch disables queue shaping, regardless of the previous configuration.

• **Guaranteed bandwidth** guarantees the allocation of a specified bandwidth for a transmit queue. Guaranteed bandwidth is supported only on Trident II platforms.

• **Queue priority** specifies the priority at which a transmit queue is serviced. The switch defines two queue priority types:
  • **Strict priority** queues are serviced in the order of their priority rank - subject to each queue’s configured maximum bandwidth. Data is not handled for a queue until all queues with higher priority are emptied or their transmission limit is reached. These queues typically carry low latency real time traffic and require highest available priority.
  • **Round robin** queues are serviced simultaneously subject to assigned bandwidth percentage and configured maximum bandwidth. All round robin queues have lower priority than strict priority queues. Round robin queues can be starved by strict priority queues.

• Queue scheduling determines how packets from different transmit queues are serviced to be sent out on the port.

• **Queue bandwidth allocation** specifies the time slice (percentage) assigned to a round robin queue, relative to all other round robin queues.

These sections describe transmit queue and port shaping configuration procedures:

• Section 27.3.4: Transmit Queues and Port Shaping – Arad Platform Switches
• Section 27.4.4: Transmit Queues and Port Shaping – Jericho Platform Switches
• Section 27.5.4: Transmit Queues and Port Shaping – FM6000 Platform Switches
• Section 27.6.4: Transmit Queues and Port Shaping – Petra Platform Switches
• Section 27.7.4: Transmit Queues and Port Shaping – Trident and Tomahawk Platform Switches
• Section 27.8.4: Transmit Queues and Port Shaping – Trident II and Helix Platform Switches
27.1.3 Explicit Congestion Notification (ECN)

Explicit Congestion Notification (ECN) is an IP and TCP extension that facilitates end-to-end network congestion notification without dropping packets. ECN recognizes early congestion and sets flags that signal affected hosts. Trident and Tomahawk, Trident II, and Helix platform switches extend ECN support to non-TCP packets.

ECN usage requires that it is supported and enabled by both endpoints. Although only unicast flows are modified by ECN markers, the multicast, broadcast, and unmarked unicast flows can affect network congestion and influence the indication of unicast packet congestion.

27.1.3.1 ECN Conceptual Overview

The ECN field in the IP header (bits 6 and 7 in the IPv4 TOS or IPv6 traffic class octet) advertises ECN capabilities:

- 00: Router does not support ECN.
- 10: Router supports ECN.
- 01: Router supports ECN.
- 11: Congestion encountered.

Networks typically signal congestion by dropping packets. After an ECN-capable host negotiates ECN, it signals impending congestion by marking the IP header of packets encountering the congestion instead of dropping the packets. The recipient echoes the congestion indication back to the sender, which reduces its transmission rate as if it had detected a dropped packet.

Switches support ECN for unicast queues through Weighted Random Early Detection (WRED), an active queue management (AQM) algorithm that extends Random Early Detection (RED) to define multiple thresholds for an individual queue. WRED determines congestion by comparing average queue size with queue thresholds. Average queue size depends on the previous average and current queue size:

\[
\text{average queue size} = (\text{old}_\text{avg} \cdot (1-2^{-\text{weight}})) + (\text{current}_\text{queue}_\text{size} \cdot 2^{-\text{weight}})
\]

where weight is the exponential weight factor used for averaging the queue size.

Packets are marked based on WRED as follows:

- If average queue size is below the minimum threshold, packets are queued as in normal operation without ECN.
- If average queue size is greater than the maximum threshold, packets are marked for congestion.
- If average queue size is between minimum and maximum queue threshold, packets are either queued or marked. The proportion of packets that are marked increases linearly from 0% at the minimum threshold to 100% at the maximum threshold.

Treatment of packets marked as not ECN capable varies by platform.

These sections describe ECN configuration procedures:

- Section 27.3.5: ECN Configuration – Arad Platform Switches
- Section 27.7.5: ECN Configuration – Trident and Tomahawk Platform Switches

27.1.4 ACL Policing

ACL policing monitors the ingress data rates for a particular class of traffic and performs the action configured when the traffic exceeds the user configured value. Hence, it allows the user to control ingress bandwidth based on packet classification. The incoming traffic is metered and marked by the policing, and based on the metering results the actions are performed.
ACL policing uses a token bucket shaping algorithm for packet transmission. Packets are eligible for transmission when token count is positive, and when token count is negative the next packet will have to wait until the token count turns positive again. The tokens are renewed at 96ns time interval (Tc). The tokens are collected in the policer bucket up to a max burst size of 16KB, and any traffic beyond this shape rate and burst size is buffered in the shared memory. The packets are dropped if there is a memory overflow.

**Note**

The policer bucket is refilled at a sweeper period of 0.333 millisecond. This is applicable for all the platforms.

For example, let us assume that shaping is not enabled, and the link is at 10Gbps, that is 1.25bytes/nsec. In such case a each refill cycle will add tokens worth 120bytes. For a shape rate of 500Mbps, each refill cycle will add 6 bytes. And for 64 byte worth of tokens we need around 11 refill cycles = 1us. A 64byte packet coming immediately after a jumbo frame will have to wait longer compared to a jumbo frame coming after 64byte packet.

Token size depends on the interface speed, following the last example:

- For 10Gbps, each refill cycle will add tokens worth 120bytes.
- For 1 Gbps, each refill cycle will add tokens worth 12 bytes.

At lower shaping rates (less than 10 Mbps), granularity and rounding errors may alter the actual shaping rate by 20% from the specified rate, and the rounding errors are much less at higher speeds. For example, At 100 Mbps you will see 98.9 Mbps configured in hardware. User can use the `show qos interfaces` command to verify the interface speed.

The policing uses three types of traffic metering and coloring mechanisms.

- **Single Rate Two Color Marker**
  - It meters the packet stream and marks packets based on committed burst size (bc) and excess burst size (be).

- **Single Rate Three Color Marker**
  - It meters the packet stream and marks packets based on single rate committed information rate (cir), and committed burst size (bc) and excess burst size (be). The packets are marked in green if it does not exceed the set burst size, and marked in yellow if it does exceed the burst size but not the excess burst size, and marked red otherwise. The packets are marked in two color modes.
    - **Color-blind Mode**: In color-blind mode the incoming packet color is ignored.
    - **Color-aware Mode**: In color-aware mode it is assumed that incoming packet is colored by preceding entity. And, in color-aware mode, a packet never get better than it was. If the input color of the packet is green, it can be marked as green, yellow, or red. But if the input color is yellow, then it can be marked only yellow or red

- **Two Rate Three Color Marker**
  - It meters the packet stream and marks its packets based on two rates, peak information rate (pir) and committed information rate (cir), and associated burst sizes (bc and be). The packet is marked red if rate exceeds ‘pir’, and yellow if it exceeds ‘cir’ but not ‘pir’ and marked green if rate is lower than ‘cir’. The two rate mode is configured by setting four parameters pir, cir, bc, and be.
The ACL policing is supported on platforms specified in the table below.

**Table 27-1  ACL Policing Support Matrix**

### 27.1.4.1 Configuring ACL Policing

The policer is applied to the class inside the policy map. Policy maps can contain one or more policy map classes, each with different match criteria and policers. The following is the default behavior on conditions and available policing actions:

- Police command creates a per-interface policer. If you attach per-interface policers to multiple ingress ports, each one polices the matched traffic on each ingress port separately. Per interface statistics gathered for conformed/allowed traffic and exceeded/dropped traffic
- If there is no policer configured within a class, all traffic is transmitted without any policing. If there are any actions configured, the configured actions are applied
  - conform-action (green): transmit (default)
  - exceed-action (yellow): drop (default)
  - violate-action (red): drop (default)
- The policer bucket is refilled at a sweeper period of 0.333 milliseconds, and the tokens in the policer bucket are renewed at 96ns time interval (Tc). This is applicable for all the platforms.

**Steps to Configure ACL Policing**

These commands set the CIR, burst size, and creates a class and applies the policing to the policy map:

**Step 1** Create a policy map.

**Step 2** Create a class-map.

**Step 3** Apply the policer to the policy map created.
Example

- These commands configure the ACL policing for a policy map.

```bash
switch(config)#configure terminal
switch(config)#policy-map [type qos] policy-name
switch(config-pmap)#class { class-name }
switch(config-pmap-c)#[no] police cir cir [{bps|kbps|mbps}] bc committed-burst-size [{bytes|kbytes|mbytes}]
```

Example

- These commands configure ACL policing in single-rate, two-color mode.

```bash
switch(config)#class-map type qos match-any class1
switch(config-cmap-class1)#match ip access-group acl1
switch(config-cmap-class1)#exit

switch(config)#policy-map type quality-of-service policy1
switch(config-pmap)#class class1
switch(config-pmap-c)#police cir 512000 bc 96000
switch(config-pmap-c)#exit
switch(config-pmap)#
```

Displaying ACL Policing Information

Examples

- This command shows the contents of all policy maps on the switch.

```bash
switch(config)#show policy-map
Service-policy p

Class-map: c (match-any)
  Match: ip access-group name acl1
    police rate 1000 mbps burst-size 100 bytes
Class-map: class-default (match-any)
Service-policy p
Class-map: c (match-any)
  Match: ip access-group name acl1
    police rate 1000 mbps burst-size 100 bytes
Class-map: class-default (match-any)
```

- This command shows the interface-specific police counters for Ethernet interface 1.

```bash
switch(config)#show policy-map interface Ethernet 1 input counters
Service-policy input: policy1
Hardware programming status: Successful

Class-map: class1 (match-any) Match: ip access-group name acl1
Police cir 512000 bps bc 96000 bytes Conformed 4351 packets, 1857386 bytes
Conformed 2536 packets, 3384260 bytes

Class-map: class-default (match-any) matched packets: 0
```
This command shows the counters associated with the policy map called “p1.”

```
switch(config)#show policy-map type qos p1 input counters
Service-policy input: p1 Class-map: c1 (match-any)
Match: ip access-group name a1
Police cir 512000 bps bc 96000 bytes Interface: Ethernet1
Conformed 4351 packets, 1857386 bytes
Exceeded 2536 packets, 3384260 bytes
Interface: Ethernet2
Conformed 2351 packets, 957386 bytes
Exceeded 1536 packets, 1384260 bytes
Class-map: class-default (match-any)
Matched packets: 3229
```

This command shows the QoS policy map for Ethernet interface 1.

```
switch(config)#show policy-map interface Ethernet 1 input type qos
Interface: Ethernet 1 Service-policy input: policy1
Hardware programming status: Successful Class-map: class1 (match-any)
Match: ip access-group name acl1
Police cir 512000 bps bc 9000 bytes
Class-map: class2 (match-any)
Match: ip access-group name acl2 set dscp 2
Class-map: class3 (match-any) Match: ip access-group name acl3
Police cir 1280000 bps bc 9000 bytes
Class-map: class-default (match-any)
```

### 27.1.5 Quality of Service (QoS) Profiles

Quality of Service (QoS) profiles are sets of QoS configuration instructions defined and applied at the interface level. A QoS profile serves the traffic better by reducing disorder in the running configuration. QoS profiles can modify all interface-level QoS configurations, and are supported on fabric, Ethernet, and port-channel interfaces. Control-plane policies cannot be applied using QoS profiles. Because configuration can be applied through QoS profiles or directly at the interface level, multiple configurations can be applied to the same interface. In such cases, QoS configurations with non-default values, whether configured through the CLI at the interface level or through a QoS profile, are given priority. In the case of multiple non-default values being configured, the interface-level CLI configuration is given priority.

Policy maps incorporating traffic resolution commands can also be applied by a QoS profile. If two policy maps are applied to the same interface (one through a QoS profile and another directly to the CLI), Policy maps cannot be used on fabric interfaces. If a QoS profile which includes a policy map is applied to a fabric interface, a warning message will be displayed and the policy map will not be applied to the interface, but any additional supported configurations in the QoS profile will be applied. On SVIs and subinterfaces, QoS profiles are not supported, so policy maps must be applied directly through the CLI for these interfaces.

#### Note
For tx-queue configuration, conflicts between QoS profiles and configuration entered via the CLI are resolved at the tx-queue level and not at the tx-queue attribute level. If any non-default configuration has been entered for the tx-queue through the CLI, all tx-queue configuration included in the QoS profile is ignored.
27.2  QoS Configuration: Platform-Independent Features

27.2.1  Creating QoS Profiles

QoS profiles are created by using the `qos profile` command. This also places the switch in QoS profile configuration mode, where the QoS parameters applied to interfaces are configured. To delete a QoS profile from the running configuration, use the `no` form of the command.

**Example**

This command creates a QoS profile named “Test-Profile” and places the switch in QoS profile configuration mode for the profile.

```
switch(config)# qos profile Test-Profile
switch(config-qos-profile-Test-Profile)#
```

27.2.2  Configuring QoS Profiles

The parameters that a QoS profile will apply to interfaces are configured in QoS profile configuration mode by issuing the same QoS configuration commands that are available in interface configuration mode. QoS profile configuration mode is a group change mode, and changes made in the mode are not saved until the mode is exited. To abandon all changes made while in the mode, use the `abort` command.

**Example**

- These commands enter QoS profile configuration mode for a QoS profile named “Test Profile,” configure the CoS value and transmit queue, and save the changes to the profile.

```
switch(config)# qos profile Test-Profile
switch(config-qos-profile-Test-Profile)# qos cos 3
switch(config-qos-profile-Test-Profile)# priority-flow-control on
switch(config-qos-profile-Test-Profile)# exit

switch(config)#
```

27.2.3  Attaching Policy-Map to a QoS Profile

The `qos profile` command places the switch in QoS profile configuration mode. The profile applies the QoS configurations to Ethernet and Port-Channel, and even to the Fabric interfaces, if it exists. A profile specifies the policy-map and other QoS supported configurations. The policy-map is then attached to the QoS profile using `service-policy` command.

Profiles are created in QoS-profile configuration mode, then applied to an interface in interface configuration mode.

**Example**

- This command places the switch in QoS profile configuration mode, the policy-map is then attached to the profile using `service-policy` command in this mode.

```
switch(config)# qos profile TP
switch(config-qos-profile-TP)#
```

- This command applies the policy-map to the QoS profile.

```
switch(config-qos-profile-TP)# service-policy type qos input PM-1
```

27.2.4  Applying a QoS profile on an Interface

The `service-profile` command applies a QoS profile to the configuration mode interface.
Example

- This command applies the QoS profile TP to Ethernet interface 13.

  switch(config)#interface ethernet 13
  switch(config-if-Et13)#service-profile TP

27.2.5 Displaying the QoS Profile Information

The `show qos profile` command displays information about the QoS profiles configured and their parameters. To display the attribute of a specific profile, add the name of the profile. To display a list of configured QoS profiles and the interfaces on which they are configured, add the summary keyword.

Examples

- This command displays the configured profiles and their configuration.

  switch#show qos profile
  qos profile p
  qos cos 1
  no priority-flow-control pause watchdog
  priority-flow-control priority 1 no-drop
  priority-flow-control priority 2 no-drop
  qos profile p2
  qos cos 3
  priority-flow-control priority 0 no-drop

- This command displays the contents of a specific profile.

  switch#show qos profile p2
  qos profile p2
  qos cos 3
  priority-flow-control priority 0 no-drop

- This command displays the interfaces on which each profile is applied.

  switch#show qos profile summary
  Qos Profile: p
  Configured on: Et13,7 Fabric Po12
  Qos Profile: p2
  Configured on: Et56
27.3 **QoS Configuration: Arad Platform Switches**

Implementing QoS on an Arad platform switch consists of configuring port trust settings, default port settings, default traffic classes, conversion maps, and transmit queues.

- Section 27.3.1: CoS and DSCP Port Settings – Arad Platform Switches
- Section 27.3.2: Traffic Class Derivations – Arad Platform Switches
- Section 27.3.3: CoS Rewrite – Arad Platform Switches
- Section 27.3.4: Transmit Queues and Port Shaping – Arad Platform Switches
- Section 27.3.5: ECN Configuration – Arad Platform Switches
- Section 27.3.6: ACL Policing – Arad Platform Switches

**Note**

QoS traffic policy is supported on Trident and Tomahawk, Trident II, FM6000, Arad, and Jericho.

27.3.1 **CoS and DSCP Port Settings – Arad Platform Switches**

Section 27.1.1.2 describes port trust and default port CoS and DSCP values.

**Configuring Port Trust Settings**

The `qos trust` command configures the QoS port trust mode for the configuration mode interface. Trust enabled ports use packet CoS or DSCP values to classify traffic. The port-trust default for switched ports is **CoS**. The port-trust default for routed ports is **DSCP**.

- `qos trust cos` specifies **CoS** as the port’s port-trust mode.
- `qos trust dscp` specifies **DSCP** as the port’s port-trust mode.
- `no qos trust` specifies **untrusted** as the port’s port-trust mode.

The `show qos interfaces trust` command displays the trust mode of specified interfaces.

**Example**

- These commands configure and display the following trust modes:
  - Ethernet 3/5/1: dscp
  - Ethernet 3/5/2: untrusted
  - Ethernet 3/5/3: cos
  - Ethernet 3/5/4: default as a switched port
Chapter 27: Quality of Service

27.3.2 Traffic Class Derivations – Arad Platform Switches

Section 27.1.1.4 describes traffic classes.

- Ethernet 3/6/1: default as a routed port

```
switch(config)#interface ethernet 3/5/1
switch(config-if-Et3/5/1)#qos trust dscp
switch(config-if-Et3/5/1)#interface ethernet 3/5/2
switch(config-if-Et3/5/2)#no qos trust
switch(config-if-Et3/5/2)#interface ethernet 3/5/3
switch(config-if-Et3/5/3)#qos trust cos
switch(config-if-Et3/5/3)#interface ethernet 3/5/4
switch(config-if-Et3/5/4)#switchport
switch(config-if-Et3/5/4)#default qos trust
switch(config-if-Et3/5/4)#interface ethernet 3/6/1
switch(config-if-Et3/5/4)#no switchport
switch(config-if-Et3/5/4)#default qos trust
switch(config-if-Et3/5/4)#show qos interface ethernet 3/5/1 - 3/6/1 trust
Port Operational Configured
--------- ----------------- ------------
Ethernet3/5/1 DSCP DSCP
Ethernet3/5/2 UNTRUSTED UNTRUSTED
Ethernet3/5/3 COS COS
Ethernet3/5/4 COS DEFAULT
Ethernet3/6/1 DSCP DEFAULT
```

```
switch(config-if-Et3/6/1)#
```

Configuring Default Port Settings

Default CoS and DSCP values are assigned to each Ethernet and port channel interface. These commands specify the configuration mode interface commands specify the port’s default CoS and DSCP values.

- qos cos configures a port’s default CoS value.
- qos dscp configures a port’s default DSCP value.

Example

These commands configure default CoS (4) and DSCP (44) values on Ethernet interface 3/6/2.
```
switch(config)#interface ethernet 3/6/2
switch(config-if-Et3/6/2)#qos cos 4
switch(config-if-Et3/6/2)#qos dscp 44
switch(config-if-Et3/6/2)#show active
interface Ethernet3/6/2
  qos cos 4
  qos dscp 44
```
```
switch(config-if-Et3/6/2)#show qos interfaces ethernet 3/6/2
Ethernet3/6/2: Trust Mode: COS
  Default COS: 4
  Default DSCP: 44
```
```
<--------OUTPUT OMITTED FROM EXAMPLE-------->
```
```
switch(config-if-Et3/6/2)#
```
Traffic Class Derivation Source

Table 27-2 displays the source for deriving a data stream’s traffic class.

<table>

</tr>
<tr>
<td>Tagged IP</td>
</tr>
</tbody>
</table>

Section 27.3.1 describes the default CoS and DSCP settings for each port.

Mapping CoS to Traffic Class

The `qos map cos` command assigns a traffic class to a list of CoS values. Multiple commands create a complete CoS to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet’s CoS field or the chip upon which it is received.

Example

- This command assigns the traffic class of 5 to the classes of service 1, 3, 5, and 7.

  ```
  switch(config)# qos map cos 1 3 5 7 to traffic-class 5
  switch(config)# show qos maps
  Number of Traffic Classes supported: 8
  <-------OUTPUT OMITTED FROM EXAMPLE-------->
  
  CoS-tc map:
  cos:  0  1  2  3  4  5  6  7
  ---------------------------
  tc:   1  5  2  5  4  5  6  5
  
  <-------OUTPUT OMITTED FROM EXAMPLE-------->
  ```

  ```
  switch(config)#
  
  Table 27-3 displays the default CoS to Traffic Class map on Arad platform switches.

<td><strong>Traffic Class</strong></td>
</tr>
<tr>
<td>Untagged</td>
<td>Derived: use default CoS as inbound</td>
</tr>
</tbody>
</table>

Mapping DSCP to Traffic Class

The `qos map dscp` command assigns a traffic class to a set of DSCP values. Multiple commands create a complete DSCP to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet’s DSCP field or the chip upon which it is received.
Example

- This command assigns the traffic class of 0 to DSCP values of 12, 24, 41, and 44-47.

```
switch(config)# qos map dscp 12 24 41 44 45 46 47 to traffic-class 0
switch(config)# show qos maps
Number of Traffic Classes supported: 8
<-------OUTPUT OMMITTED FROM EXAMPLE-------->
```

```
Dscp-tc map:
d1 : d2  0  1  2  3  4  5  6  7  8  9
--------------------------------------
0 :     1  1  1  1  1  1  0  0
1 :     0  0  0  0  0  0  2  2  2
2 :     2  2  2  2  0  3  3  3  3
3 :     3  3  4  4  4  4  4  4  4
4 :     5  0  5  5  0  0  0  6  6
5 :     6  6  6  6  6  7  7  7  7
6 :     7  7  7  7
<-------OUTPUT OMMITTED FROM EXAMPLE-------->
```

```
switch(config)#
```

27.3.3 CoS Rewrite – Arad Platform Switches

Section 27.1.1.3 describes the CoS rewrite functions.

### Traffic Class to CoS Rewrite Map

The CoS rewrite value is configurable and based on a data stream’s traffic class, as specified by the traffic class-CoS rewrite map. The `qos map traffic-class to cos` command assigns a CoS rewrite value to a list of traffic classes. Multiple commands create the complete traffic class–CoS rewrite map.

Example

- This command assigns the CoS of two to traffic classes 1, 3, and 5.

```
switch(config)# qos map traffic-class 1 3 5 to cos 2
switch(config)# show qos map
Number of Traffic Classes supported: 8
<-------OUTPUT OMMITTED FROM EXAMPLE-------->
```

```
Tc-cos map:
tc:  0 1 2 3 4 5 6 7
--------------------------------------
cos: 1 2 2 2 4 2 6 7
<-------OUTPUT OMMITTED FROM EXAMPLE-------->
```

```
switch(config)#
```
Table 27-5 displays the default Traffic Class to CoS rewrite value map on Arad platform switches.

<table>
<thead>
<tr>
<th>Traffic Class</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
</tr>
</thead>
<tbody>
<tr>

<td>1</td>
<td>0</td>
<td>2</td>
<td>3</td>
<td>4</td>
<td>5</td>
<td>6</td>
<td>7</td>
</tr>
</tbody>
</table>

**Traffic Class to DSCP Rewrite Map**

DSCP rewrite is always disabled on Arad platform switches.

### 27.3.4 Transmit Queues and Port Shaping – Arad Platform Switches

Section 27.1.2 describes transmit queues and port shaping.

Arad platform switches provide 16 physical queues for each egress port: eight unicast and eight multicast queues. Data is scheduled to the physical queues based on transmit queue assignments.

Multicast queue capacity that remains after multicast traffic is serviced is available for unicast traffic of a corresponding priority. Similarly, unicast queue capacity that remains after unicast traffic is serviced is available for overflow multicast traffic. Under conditions of unicast and multicast congestion, egress traffic is evenly split between unicast and multicast traffic.

A data stream's traffic class determines the transmit queue it uses. The switch defines a single traffic class–transmit queue map for unicast and multicast traffic on all Ethernet and port channel interfaces. The `show qos maps` command displays the traffic class–transmit queue map.

Table 27-6 displays the default traffic class to transmit queue map on Arad platform switches.

<table>
<thead>
<tr>
<th>Traffic Class</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transmit Queue</td>
<td>0</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>
<td>5</td>
<td>6</td>
<td>7</td>
</tr>
</tbody>
</table>

Transmit queue parameters are configured in `tx-queue configuration` command mode, which is entered from `interface-ethernet configuration` mode.

**Mapping Traffic Classes to a Transmit Queue**

The `qos map traffic-class to tx-queue` command assigns traffic classes to a transmit queue. Multiple commands complete the traffic class-transmit queue map. Traffic class 7 and transmit queue 7 are always mapped to each other. This association is not editable.
Example

- These commands assign traffic classes of 1, 3, and 5 to transmit queue 1, traffic classes 2, 4, and 6 to transmit queue 2, and traffic class 0 to transmit queue 0, then display the resultant map.

  ```
  switch(config)#qos map traffic-class 1 3 5 to tx-queue 1
  switch(config)#qos map traffic-class 2 4 6 to tx-queue 2
  switch(config)#qos map traffic-class 0 to tx-queue 0
  switch(config)#show qos maps
  Number of Traffic Classes supported: 8
  Number of Transmit Queues supported: 8
  --------OUTPUT OMITTED FROM EXAMPLE--------

  Tc - tx-queue map:
  tc:       0  1  2  3  4  5  6  7
  ---------------
  tx-queue:  0  1  2  1  2  1  2  7
  ```

  switch(config)#

Entering Tx-Queue Configuration Mode

The `tx-queue (Arad/Jericho)` command places the switch in tx-queue configuration mode to configure a transmit queue on the configuration mode interface. Tx-queue 7 is not configurable. The `show qos interfaces` displays the transmit queue configuration for a specified port.

Example

- This command enters Tx-queue configuration mode for transmit queue 4 of Ethernet interface 3/3/3.

  ```
  switch(config)#interface ethernet 3/3/3
  switch(config-if-Et3/3/3)#tx-queue 4
  ```

Configuring the Shape Rate – Port and Transmit Queues

A port’s shape rate specifies its maximum outbound traffic bandwidth. A transmit queue’s shape rate specifies the queue’s maximum outbound bandwidth. Shape rate commands specify data rates in kbps.

- To configure a port’s shape rate, enter `shape rate (Interface – Arad/Jericho)` from the port’s interface configuration mode.
- To configure a transmit queue’s shape rate, enter `shape rate (Tx-queue – Arad/Jericho)` from the queue’s tx-queue configuration mode.
Examples

- This command configures a port shape rate of 5 Gbps on Ethernet interface 3/5/1.

```plaintext
switch(config)#interface ethernet 3/5/1
switch(config-if-Et3/5/1)#shape rate 5000000
switch(config-if-Et3/5/1)#show qos interfaces ethernet 3/5/1
Ethernet3/5/1:
                      Port shaping rate: 5000012 / 5000000 kbps
                      Tx    Bandwidth       Shape Rate        Priority  ECN
                      Queue  (percent)        (units)
                      ------- ------------------ --------------- ----------
                      7      - / -        - / -    (  -  )    SP / SP    D
                      ------- ------------------ --------------- ----------
```

- These commands configure a shape rate of 1 Gbps on transmit queues 3 and 4 of Ethernet interface 3/4/1.

```plaintext
switch(config)#interface ethernet 3/4/1
switch(config-if-Et3/4/1)#tx-queue 4
switch(config-if-Et3/4/1-txq-4)#shape rate 1000000 kbps
switch(config-if-Et3/4/1-txq-4)#tx-queue 3
switch(config-if-Et3/4/1-txq-3)#shape rate 1000000 kbps
switch(config-if-Et3/4/1-txq-3)#show qos interface ethernet 3/4/1
Ethernet3/4/1:
                      Port shaping rate: disabled
                      Tx    Bandwidth       Shape Rate        Priority  ECN
                      Queue  (percent)        (units)
                      ------- ------------------ --------------- ----------
                      7      - / -        - / -    (  -  )    SP / SP    D
                      6      - / -        - / -    (  -  )    SP / SP    D
                      5      - / -        - / -    (  -  )    SP / SP    D
                      4      - / -        - / -    (  -  )    SP / SP    D
                      3      - / -        - / -    (  -  )    SP / SP    D
                      2      - / -        - / -    (  -  )    SP / SP    D
                      1      - / -        - / -    (  -  )    SP / SP    D
                      0      - / -        - / -    (  -  )    SP / SP    D
                      ------- ------------------ --------------- ----------
```

Configuring Queue Priority

The priority (Arad/Jericho) command configures a transmit queue’s priority type:

- The **priority strict** command configures the queue as a strict priority queue.
- The **no priority** command configures the queue as a round robin queue.

A queue’s configuration as **round robin** also applies to all lower priority queues regardless of other configuration statements.

The **bandwidth percent (Arad/Jericho)** command configures a round robin queue’s bandwidth share. The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the cumulative configured bandwidth is greater than 100%, each port’s operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.
Example

- These commands configure queues 0 through 3 (Ethernet interface 3/5/1) as round robin, then allocate bandwidth for three queues at 30% and one queue at 10%.

The **no priority** statement for queue 3 also configures queues 0, 1, and 2 as round robin queues. Removing this statement reverts the other queues to **strict priority** type unless **running-config** contains a **no priority** statement for one of these queues.

```bash
switch(config)#interface ethernet 3/5/1
switch(config-if-Et3/5/1)#tx-queue 3
switch(config-if-Et3/5/1-txq-3)#no priority
switch(config-if-Et3/5/1-txq-3)#bandwidth percent 10
switch(config-if-Et3/5/1-txq-3)#tx-queue 2
switch(config-if-Et3/5/1-txq-2)#bandwidth percent 30
switch(config-if-Et3/5/1-txq-2)#tx-queue 1
switch(config-if-Et3/5/1-txq-1)#bandwidth percent 30
switch(config-if-Et3/5/1-txq-1)#tx-queue 0
switch(config-if-Et3/5/1-txq-0)#bandwidth percent 30
switch(config-if-Et3/5/1-txq-0)#show qos interfaces ethernet 3/5/1
```

```

```

27.3.5 ECN Configuration – Arad Platform Switches

Section 27.1.3 describes Explicit Congestion Notification (ECN).

ECN is independently configurable on all egress queues of each Ethernet interface. ECN settings for Port-Channels are applied on each of the channel’s member Ethernet interfaces. Average queue length is tracked for transmit queues. When it reaches maximum threshold, all subsequent packets are marked.

Although the switch does not limit the number of queues that can be configured for ECN, hardware table limitations restrict the number of queues that can simultaneously implement ECN.

The `random-detect ecn (Arad/Jericho)` command enables ECN marking for the configuration mode unicast transmit queue and specifies threshold queue sizes.

**Example**

- These commands enable ECN marking of unicast packets from unicast transmit queue 4 of Ethernet interface 3/5/1, setting thresholds at 128 kbytes and 1280 kbytes.

```
switch(config)#interface ethernet 3/5/1
switch(config-if-Et3/5/1)#tx-queue 4
switch(config-if-Et3/5/1-txq-4)#random-detect ecn minimum-threshold 128 kbytes
switch(config-if-Et3/5/1-txq-4)#random-detect ecn maximum-threshold 1280 kbyte
switch(config-if-Et3/5/1-txq-4)#show active
interface Ethernet3/5/1
tx-queue 4
  random-detect ecn minimum-threshold 128 kbytes maximum-threshold 1280 kbytes
```

27.3.6 ACL Policing – Arad Platform Switches

Section 27.1.4 describes ACL policing.
Implementing ACL policing consists of configuring the following:

- policy-map settings
- class-name
- committed information rate (CIR) the data speed committed to any given circuit regardless of the number of users
- burst size the maximum burst size in bytes the network commits to moving under normal conditions

The default unit for the metering rate CIR is bits per second; the default unit for the burst size is bytes.

The policer is applied to the class inside the policy map. Policy maps can contain one or more policy map classes, each with different match criteria and policer.

Default behavior and available policing actions are as follows:

- Policy map can be applied on multiple interfaces. Interfaces on the same chip will share the policer. (Applicable for Arad only.)
- If there is no policer configured within a class, all traffic is transmitted without any policing.
- If there are any actions configured, the configured actions are applied:
  - Conform-action (green): transmit (default)
  - Violate-action (red): drop (default)

**Example**

These commands configure ACL policing in single-rate, two-color mode.

```bash
switch(config)#class-map type qos match-any class1
switch(config-cmap-class1)#match ip access-group acl1
switch(config-cmap-class1)#exit
switch(config)#policy-map type quality-of-service policy1
switch(config-policy1)#class class1
switch(config-policy1-class1)#police cir 512000 bc 96000
switch(config-policy1-class1)#exit
switch(config-policy1)#exit
switch(config)#
```

**Displaying ACL Policing Information**

**Examples**

- This command shows the contents of all policy maps on the switch.

```bash
switch(config)#show policy-map
Service-policy policy1
Class-map: class1 (match-any)
Match: ip access-group name acl1
Police cir 512000 bps bc 96000 bytes
```

```bash
Class-map: class-default (match-any)
switch(config)#
```
**This command shows the interface-specific police counters for Ethernet interface 1.**

```
switch(config)#show policy-map interface Ethernet 1 input counters
Service-policy input: policy1
Hardware programming status: Successful

Class-map: class1 (match-any) Match: ip access-group name acl1
Police cir 512000 bps bc 96000 bytes Conformed 4351 packets, 1857386 bytes
Conformed 2536 packets, 3384260 bytes

Class-map: class-default (match-any) matched packets: 0
```

**This command shows the counters associated with the policy map called “p1.”**

```
switch(config)#show policy-map type qos p1 input counters
Service-policy input: p1 Class-map: c1 (match-any)
Match: ip access-group name a1
Police cir 512000 bps bc 96000 bytes Interface: Ethernet1
Conformed 4351 packets, 1857386 bytes
Exceeded 2536 packets, 3384260 bytes
Interface: Ethernet2
Conformed 2351 packets, 957386 bytes
Exceeded 1536 packets, 1384260 bytes
Class-map: class-default (match-any)
Matched packets: 3229
```

**This command shows the QoS policy map for Ethernet interface 1.**

```
switch(config)#show policy-map interface Ethernet 1 input type qos
Interface: Ethernet 1 Service-policy input: policy1
Hardware programming status: Successful Class-map: class1 (match-any)
Match: ip access-group name acl1
Police cir 512000 bps bc 9000 bytes
Class-map: class2 (match-any)
Match: ip access-group name acl2 set dscp 2
Class-map: class3 (match-any) Match: ip access-group name acl3
Police cir 1280000 bps bc 9000 bytes
Class-map: class-default (match-any)
```

switch(config)#
27.4 QoS Configuration: Jericho Platform Switches

Implementing QoS on a Jericho platform switch consists of configuring port trust settings, default port settings, default traffic classes, conversion maps, and transmit queues.

- Section 27.4.1: CoS and DSCP Port Settings – Jericho Platform Switches
- Section 27.4.2: Traffic Class Derivations – Jericho Platform Switches
- Section 27.4.3: CoS Rewrite – Jericho Platform Switches
- Section 27.4.4: Transmit Queues and Port Shaping – Jericho Platform Switches
- Section 27.4.5: ACL Policing – Jericho Platform Switches

Note QoS traffic policy is supported on Trident and Tomahawk, Trident II, FM6000, Arad, and Jericho.

27.4.1 CoS and DSCP Port Settings – Jericho Platform Switches

Section 27.1.1.2 describes port trust and default port CoS and DSCP values.

Configuring Port Trust Settings

The `qos trust` command configures the QoS port trust mode for the configuration mode interface. Trust enabled ports use packet CoS or DSCP values to classify traffic. The port-trust default for switched ports is `CoS`. The port-trust default for routed ports is `DSCP`.

- `qos trust cos` specifies `CoS` as the port’s port-trust mode.
- `qos trust dscp` specifies `DSCP` as the port’s port-trust mode.
- `no qos trust` specifies `untrusted` as the port’s port-trust mode.

The `show qos interfaces trust` command displays the trust mode of specified interfaces.

Example

- These commands configure and display the following trust modes:
  - Ethernet 3/5/1: dscp
  - Ethernet 3/5/2: untrusted
  - Ethernet 3/5/3: cos
  - Ethernet 3/5/4: default as a switched port
• Ethernet 3/6/1: default as a routed port

switch(config)#interface ethernet 3/5/1
switch(config-if-Et3/5/1)#qos trust dscp
switch(config-if-Et3/5/1)#interface ethernet 3/5/2
switch(config-if-Et3/5/2)#no qos trust
switch(config-if-Et3/5/2)#interface ethernet 3/5/3
switch(config-if-Et3/5/3)#qos trust cos
switch(config-if-Et3/5/3)#interface ethernet 3/5/4
switch(config-if-Et3/5/4)#switchport
switch(config-if-Et3/5/4)#default qos trust
switch(config-if-Et3/5/4)#interface ethernet 3/6/1
switch(config-if-Et3/6/1)#no switchport
switch(config-if-Et3/6/1)#default qos trust
switch(config-if-Et3/6/1)#show qos interface ethernet 3/5/1 - 3/6/1 trust
Port Operational Configured
-----------------------------------------------
Ethernet3/5/1 DSCP DSCP
Ethernet3/5/2 UNTRUSTED UNTRUSTED
Ethernet3/5/3 COS COS
Ethernet3/5/4 COS DEFAULT
Ethernet3/6/1 DSCP DEFAULT

switch(config-if-Et3/6/1)#

Configuring Default Port Settings

Default CoS and DSCP values are assigned to each Ethernet and port channel interface. These commands specify the configuration mode interface commands specify the port’s default CoS and DSCP values.

• qos cos configures a port’s default CoS value.
• qos dscp configures a port’s default DSCP value.

Example

These commands configure default CoS (4) and DSCP (44) values on Ethernet interface 3/6/2.
switch(config)#interface ethernet 3/6/2
switch(config-if-Et3/6/2)#qos cos 4
switch(config-if-Et3/6/2)#qos dscp 44
switch(config-if-Et3/6/2)#show active
interface Ethernet3/6/2
    qos cos 4
    qos dscp 44
switch(config-if-Et3/6/2)#show qos interfaces ethernet 3/6/2
Ethernet3/6/2:
    Trust Mode: COS
    Default COS: 4
    Default DSCP: 44

<-------OUTPUT OMITTED FROM EXAMPLE-------->

switch(config-if-Et3/6/2)#

27.4.2 Traffic Class Derivations – Jericho Platform Switches

Section 27.1.1.4 describes traffic classes.
Traffic Class Derivation Source

Table 27-7 displays the source for deriving a data stream’s traffic class on Jericho platform switches.

Table 27-7 Traffic Class Derivation Source: Jericho Platform Switches

<table>
<thead>
<tr>
<th>Traffic Class</th>
<th>Untrusted</th>
<th>CoS Trusted</th>
<th>DSCP Trusted</th>
</tr>
</thead>
<tbody>
<tr>
<td>Untrusted Non-IP</td>
<td>Default CoS (port)</td>
<td>Default CoS (port)</td>
<td>Default DSCP (port)</td>
</tr>
<tr>
<td>Untrusted IP</td>
<td>Default CoS (port)</td>
<td>Default CoS (port)</td>
<td>DSCP (packet)</td>
</tr>
<tr>
<td>Tagged IP</td>
<td>Default CoS (port)</td>
<td>CoS (packet)</td>
<td>DSCP (packet)</td>
</tr>
</tbody>
</table>

Section 27.3.1 describes the default CoS and DSCP settings for each port.

Mapping CoS to Traffic Class

The `qos map cos` command assigns a traffic class to a list of CoS values. Multiple commands create a complete CoS to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet’s CoS field or the chip upon which it is received.

Example

- This command assigns the traffic class of 5 to the classes of service 1, 3, 5, and 7.

```
switch(config)# qos map cos 1 3 5 7 to traffic-class 5
switch(config)# show qos maps
  Number of Traffic Classes supported: 8
  <--------OUTPUT OMITTED FROM EXAMPLE-------->

  Cos-tc map:
  cos:  0  1  2  3  4  5  6  7
  --------------------------
  tc:   1  5  2  5  4  5  6  5
  <--------OUTPUT OMITTED FROM EXAMPLE-------->
```

Table 27-8 displays the default CoS to Traffic Class map on Jericho platform switches.

<th>Inbound CoS</th>
<th>Traffic Class</th>
</tr>
</thead>
<tbody>
<tr>
<td>Untagged</td>
<td>Derived: use default CoS as inbound</td>
</tr>
</tbody>
</table>

Mapping DSCP to Traffic Class

The `qos map dscp` command assigns a traffic class to a set of DSCP values. Multiple commands create a complete DSCP to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet’s DSCP field or the chip upon which it is received.
Example

- This command assigns the traffic class of 0 to DSCP values of 12, 24, 41, and 44-47.

```bash
switch(config)# qos map dscp 12 24 41 44 45 46 47 to traffic-class 0
switch(config)# show qos maps
Number of Traffic Classes supported: 8

Dscp-tc map:
d1 : d2 0 1 2 3 4 5 6 7 8 9
--------------------------------------
0 :   1 1 1 1 1 1 1 1 1 0 0
1 :   0 0 0 0 0 0 2 2 2 2
2 :   2 2 2 2 0 3 3 3 3
3 :   3 3 4 4 4 4 4 4
4 :   5 0 5 5 0 0 0 0 6 6
5 :   6 6 6 6 6 6 7 7 7 7
6 : 7 7 7 7

switch(config)#
```

27.4.3 CoS Rewrite – Jericho Platform Switches

Section 27.1.1.3 describes the CoS rewrite functions.

Traffic Class to CoS Rewrite Map

The CoS rewrite value is configurable and based on a data stream’s traffic class, as specified by the traffic class-CoS rewrite map. The `qos map traffic-class to cos` command assigns a CoS rewrite value to a list of traffic classes. Multiple commands create the complete traffic class–CoS rewrite map.

Example

- This command assigns the CoS of two to traffic classes 1, 3, and 5.

```bash
switch(config)# qos map traffic-class 1 3 5 to cos 2
switch(config)# show qos map
Number of Traffic Classes supported: 8

Tc-cos map:
tc: 0 1 2 3 4 5 6 7
-----------------------
cos: 1 2 2 2 4 2 6 7

switch(config)#
```
Table 27-10 displays the default Traffic Class to CoS rewrite value map on Jericho platform switches.

### Table 27-10 Default Traffic Class to CoS Rewrite Value Map: Jericho Platform Switches

<table>
<thead>
<tr>
<th>Traffic Class</th>

<td>1</td>
<td>0</td>
<td>2</td>
<td>3</td>
<td>4</td>
<td>5</td>
<td>6</td>
<td>7</td>
</tr>
</tbody>
</table>

**Traffic Class to DSCP Rewrite Map**

DSCP rewrite is always disabled on Jericho platform switches.

### 27.4.4 Transmit Queues and Port Shaping – Jericho Platform Switches

Section 27.1.2 describes transmit queues and port shaping.

Jericho platform switches provide 16 physical queues for each egress port: eight unicast and eight multicast queues. Data is scheduled to the physical queues based on transmit queue assignments.

Multicast queue capacity that remains after multicast traffic is serviced is available for unicast traffic of a corresponding priority. Similarly, unicast queue capacity that remains after unicast traffic is serviced is available for overflow multicast traffic. Under conditions of unicast and multicast congestion, egress traffic is evenly split between unicast and multicast traffic.

A data stream's traffic class determines the transmit queue it uses. The switch defines a single traffic class–transmit queue map for unicast and multicast traffic on all Ethernet and port channel interfaces. The `show qos maps` command displays the traffic class–transmit queue map.

Table 27-11 displays the default traffic class to transmit queue map on Jericho platform switches.

### Table 27-11 Default Traffic Class to Transmit Queue Map: Jericho Platform Switches

<table>
<thead>
<tr>
<th>Traffic Class</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transmit Queue</td>
<td>0</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>
<td>5</td>
<td>6</td>
<td>7</td>
</tr>
</tbody>
</table>

Transmit queue parameters are configured in tx-queue configuration command mode, which is entered from interface-ethernet configuration mode.

**Mapping Traffic Classes to a Transmit Queue**

The `qos map traffic-class to tx-queue` command assigns traffic classes to a transmit queue. Multiple commands complete the traffic class-transmit queue map. Traffic class 7 and transmit queue 7 are always mapped to each other. This association is not editable.
Example

- These commands assign traffic classes of 1, 3, and 5 to transmit queue 1, traffic classes 2, 4, and 6 to transmit queue 2, and traffic class 0 to transmit queue 0, then display the resultant map.

```
switch(config)#qos map traffic-class 1 3 5 to tx-queue 1
switch(config)#qos map traffic-class 2 4 6 to tx-queue 2
switch(config)#qos map traffic-class 0 to tx-queue 0
switch(config)#show qos maps
Number of Traffic Classes supported: 8
Number of Transmit Queues supported: 8

<--------OUTPUT OMITTED FROM EXAMPLE-------->

Tc - tx-queue map:
  tc:        0  1  2  3  4  5  6  7
  ---------------
  tx-queue:  0  1  2  1  2  1  2  7
```

Entering Tx-Queue Configuration Mode

The tx-queue (Arad/Jericho) command places the switch in tx-queue configuration mode to configure a transmit queue on the configuration mode interface. Tx-queue 7 is not configurable. The `show qos interfaces` displays the transmit queue configuration for a specified port.

Example

- This command enters Tx-queue configuration mode for transmit queue 4 of Ethernet interface 3/3/3.

```
switch(config)#interface ethernet 3/3/3
switch(config-if-Et3/3/3)#tx-queue 4
```

Configuring the Shape Rate – Port and Transmit Queues

A port’s shape rate specifies its maximum outbound traffic bandwidth. A transmit queue’s shape rate specifies the queue’s maximum outbound bandwidth. Shape rate commands specify data rates in kbps.

- To configure a port’s shape rate, enter `shape rate (Interface – Arad/Jericho)` from the port’s interface configuration mode.
- To configure a transmit queue’s shape rate, enter `shape rate (Tx-queue – Arad/Jericho)` from the queue’s tx-queue configuration mode.
Examples

- This command configures a port shape rate of 5 Gbps on Ethernet interface 3/5/1.

  switch(config)#interface ethernet 3/5/1
  switch(config-if-Et3/5/1)#shape rate 5000000
  switch(config-if-Et3/5/1)#show qos interfaces ethernet 3/5/1

  Ethernet3/5/1:
  
  Port shaping rate: 5000012 / 5000000 kbps

  Tx    Bandwidth       Shape Rate        Priority  ECN
  Queue (percent)        (units)
  -----------------------------------------------------
  7      - / -        - / -    (  -  )    SP / SP    D

- These commands configure a shape rate of 1 Gbps on transmit queues 3 and 4 of Ethernet interface 3/4/1.

  switch(config)#interface ethernet 3/4/1
  switch(config-if-Et3/4/1)#tx-queue 4
  switch(config-if-Et3/4/1-txq-4)#shape rate 1000000 kbps
  switch(config-if-Et3/4/1-txq-4)#tx-queue 3
  switch(config-if-Et3/4/1-txq-3)#shape rate 1000000 kbps
  switch(config-if-Et3/4/1-txq-3)#show qos interface ethernet 3/4/1

  Ethernet3/4/1:

  Port shaping rate: disabled

  Tx    Bandwidth       Shape Rate        Priority  ECN
  Queue (percent)        (units)
  -----------------------------------------------------
  7      - / -        - / -    (  -  )    SP / SP    D
  6      - / -        - / -    (  -  )    SP / SP    D
  5      - / -        - / -    (  -  )    SP / SP    D
  4      - / -      999 / 1000 ( Mbps )   SP / SP    D
  3      - / -      999 / 1000 ( Mbps )   SP / SP    D
  2      - / -        - / -    (  -  )    SP / SP    D
  1      - / -        - / -    (  -  )    SP / SP    D
  0      - / -        - / -    (  -  )    SP / SP    D

Configuring Queue Priority

The priority (Arad/Jericho) command configures a transmit queue’s priority type:

- The priority strict command configures the queue as a strict priority queue.
- The no priority command configures the queue as a round robin queue.

  A queue’s configuration as round robin also applies to all lower priority queues regardless of other configuration statements.

The bandwidth percent (Arad/Jericho) command configures a round robin queue’s bandwidth share. The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the cumulative configured bandwidth is greater than 100%, each port’s operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.
**Example**

- These commands configure queues 0 through 3 (Ethernet interface 3/5/1) as round robin, then allocate bandwidth for three queues at 30% and one queue at 10%.

The **no priority** statement for queue 3 also configures queues 0, 1, and 2 as round robin queues. Removing this statement reverts the other queues to **strict priority** type unless running-config contains a **no priority** statement for one of these queues.

```
switch(config)# interface ethernet 3/5/1
switch(config-if-Et3/5/1)# tx-queue 3
switch(config-if-Et3/5/1-txq-3)# no priority
switch(config-if-Et3/5/1-txq-3)# bandwidth percent 10
switch(config-if-Et3/5/1-txq-3)# tx-queue 2
switch(config-if-Et3/5/1-txq-2)# bandwidth percent 30
switch(config-if-Et3/5/1-txq-2)# tx-queue 1
switch(config-if-Et3/5/1-txq-1)# bandwidth percent 30
switch(config-if-Et3/5/1-txq-1)# tx-queue 0
switch(config-if-Et3/5/1-txq-0)# bandwidth percent 30
switch(config-if-Et3/5/1-txq-0)# show qos interfaces ethernet 3/5/1
```

```
Ethernet3/5/1:
Tx Queue  Bandwidth (percent)  Shape Rate (units)  Priority  ECN
-----------------------------------------------------
 7    - / -    - / -    (  -  )    SP / SP    D
 6    - / -    - / -    (  -  )    SP / SP    D
 5    - / -    - / -    (  -  )    SP / SP    D
 4    - / -    - / -    (  -  )    SP / SP    D
 3    10 / 10   - / -    (  -  )    RR / RR    D
 2    30 / 30   - / -    (  -  )    RR / SP    D
 1    30 / 30   - / -    (  -  )    RR / SP    D
 0    30 / 30   - / -    (  -  )    RR / SP    D

<--------OUTPUT OMITTED FROM EXAMPLE-------->
```

```
Changing the bandwidth percentage for queue 3 to 30 changes the operational bandwidth of each queue to its configured bandwidth divided by 120% (10%+20%+30%+60%).

```
switch(config-if-Et3/5/1-txq-0)#tx-queue 3
switch(config-if-Et3/5/1-txq-3)#bandwidth percent 30

### 27.4.5 ACL Policing – Jericho Platform Switches

Section 27.1.4 describes ACL policing.

Implementing ACL policing consists of configuring the following:

- policy-map settings
- class-name
- committed information rate (CIR) the data speed committed to any given circuit regardless of the number of users
- burst size the maximum burst size in bytes the network commits to moving under normal conditions

The default unit for the metering rate CIR is bits per second; the default unit for the burst size is bytes.

The policer is applied to the class inside the policy map. Policy maps can contain one or more policy map classes, each with different match criteria and policer.

Default behavior and available policing actions are as follows:

- Policy map can be applied on multiple interfaces. Interfaces on the same chip will share the policer. (Applicable for Arad and Jericho only.)
- If there is no policer configured within a class, all traffic is transmitted without any policing.
- If there are any actions configured, the configured actions are applied:
  - Conform-action (green): transmit (default)
  - Violate-action (red): drop (default)
Example

These commands configure ACL policing in single-rate, two-color mode.

```
switch(config)#class-map type qos match-any class1
switch(config-cmap-class1)#match ip access-group acl1
switch(config-cmap-class1)#exit
switch(config)#policy-map type quality-of-service policy1
switch(config-policy1)#class class1
switch(config-policy1-class1)#police cir 512000 bc 96000
switch(config-policy1-class1)#exit
switch(config-policy1)#exit
switch(config)#
```

Displaying ACL Policing Information

Examples

- This command shows the contents of all policy maps on the switch.
  
  ```
  switch(config)#show policy-map
  Service-policy policy1
  
  Class-map: class1 (match-any)
  Match: ip access-group name acl1
  Police cir 512000 bps bc 96000 bytes
  
  Class-map: class-default (match-any)
  switch(config)#
  ```

- This command shows the interface-specific police counters for Ethernet interface 1.
  
  ```
  switch(config)#show policy-map interface Ethernet 1 input counters
  Service-policy input: policy1
  Hardware programming status: Successful
  
  Class-map: class1 (match-any)
  Match: ip access-group name acl1
  Police cir 512000 bps bc 96000 bytes Conformed 4351 packets, 1857386 bytes
  Conformed 2536 packets, 3384260 bytes
  
  Class-map: class-default (match-any) matched packets: 0
  switch(config)#
  ```

- This command shows the counters associated with the policy map called “p1.”
  
  ```
  switch(config)#show policy-map type qos p1 input counters
  Service-policy input: p1 Class-map: cl (match-any)
  Match: ip access-group name a1
  Police cir 512000 bps bc 96000 bytes Interface: Ethernet1
  Conformed 4351 packets, 1857386 bytes
  Exceeded 2536 packets, 3384260 bytes
  Interface: Ethernet2
  Conformed 2351 packets, 957386 bytes
  Exceeded 1536 packets, 1384260 bytes
  Class-map: class-default (match-any)
  Matched packets: 3229
  ```

```
• This command shows the QoS policy map for Ethernet interface 1.

```
switch(config)#show policy-map interface Ethernet 1 input type qos
Interface: Ethernet 1 Service-policy input: policy1
Hardware programming status: Successful Class-map: class1 (match-any)
  Match: ip access-group name acl1
  Police cir 512000 bps bc 9000 bytes
Class-map: class2 (match-any)
  Match: ip access-group name acl2 set dscp 2
Class-map: class3 (match-any) Match: ip access-group name acl3
  Police cir 1280000 bps bc 9000 bytes
Class-map: class-default (match-any)
```

```
switch(config)#
```
27.5 **QoS Configuration: FM6000 Platform Switches**
Implementing QoS on an FM6000 platform switch consists of configuring port trust settings, default port settings, default traffic classes, conversion maps, and transmit queues.

- Section 27.5.1: CoS and DSCP Port Settings – FM6000 Platform Switches
- Section 27.5.2: Traffic Class Derivations – FM6000 Platform Switches
- Section 27.5.3: CoS and DSCP Rewrite – FM6000 Platform Switches
- Section 27.5.4: Transmit Queues and Port Shaping – FM6000 Platform Switches

27.5.1 **CoS and DSCP Port Settings – FM6000 Platform Switches**
Section 27.1.1.2 describes port trust and default port CoS and DSCP values.

**Configuring Port Trust Settings**
The `qos trust` command configures the QoS port trust mode for the configuration mode interface. Trust enabled ports use packet CoS or DSCP values to classify traffic. The port-trust default for switched ports is `cos`. The port-trust default for routed ports is `dscp`.

- `qos trust cos` specifies `cos` as the port's port-trust mode.
- `qos trust dscp` specifies `dscp` as the port's port-trust mode.
- `no qos trust` specifies `untrusted` as the port's port-trust mode.

The `show qos interfaces trust` command displays the trust mode of specified interfaces.

**Example**
- These commands configure and display the following trust modes:
  - Ethernet 15: dscp
  - Ethernet 16: untrusted
  - Ethernet 17: cos
  - Ethernet 18: default as a switched port
• Ethernet 19: default as a routed port

switch(config)#interface ethernet 15
switch(config-if-Et15)#qos trust dscp
switch(config-if-Et15)#interface ethernet 16
switch(config-if-Et16)#no qos trust
switch(config-if-Et16)#interface ethernet 17
switch(config-if-Et17)#qos trust cos
switch(config-if-Et17)#interface ethernet 18
switch(config-if-Et18)#switchport
switch(config-if-Et18)#default qos trust
switch(config-if-Et19)#interface ethernet 19
switch(config-if-Et19)#no switchport
switch(config-if-Et19)#default qos trust
switch(config-if-Et19)#show qos interface ethernet 15 - 19 trust

switch(config-if-Et19)#

Configuring Default Port Settings

Default CoS and DSCP settings are assigned to individual port channel and Ethernet interfaces. These configuration mode interface commands specify the port’s default CoS and DSCP values.

• qos cos configures a port’s default CoS value.
• qos dscp configures a port’s default DSCP value.

Example

• These commands configure default CoS (4) and DSCP (44) settings on Ethernet interface 19.

switch(config)#interface ethernet 19
switch(config-if-Et19)#qos cos 4
switch(config-if-Et19)#qos dscp 44
switch(config-if-Et19)#show active
interface Ethernet19
  qos cos 4
  qos dscp 44
switch(config-if-Et19)#show qos interfaces ethernet 19
Ethernet19:
  Trust Mode: COS
  Default COS: 4
  Default DSCP: 44

</tr>
</tbody>
</table>

Section 27.5.1 describes the default CoS and DSCP settings for each port.

Mapping CoS to Traffic Class

The qos map cos command assigns a traffic class to a list of CoS settings. Multiple commands create a complete CoS to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet’s CoS field or the port upon which it is received.

Example

- This command assigns the traffic class of 5 to the classes of service 1, 3, 5, and 7.

```
switch(config)# qos map cos 1 3 5 7 to traffic-class 5
switch(config)# show qos maps
Number of Traffic Classes supported: 8
Number of Transmit Queues supported: 8

<--------OUTPUT OMITTED FROM EXAMPLE-------->
```

Cos-tc map:
```
cos:  0  1  2  3  4  5  6  7
--------------------
tc:   1  5  2  5  4  5  6  5
```

<--------OUTPUT OMITTED FROM EXAMPLE-------->

```
switch(config)#
```

Table 27-13 displays the default CoS to Traffic Class map on FM6000 platform switches.

</tbody>
</table>

Mapping DSCP to Traffic Class

The qos map dscp command assigns a traffic class to a set of DSCP values. Multiple commands create a complete DSCP to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet’s DSCP field or the chip upon which it is received.
Example

- This command assigns the traffic class of three to the DSCP values of 12, 13, 25, and 37.

```
switch(config)# qos map dscp 12 13 25 37 to traffic-class 3
switch(config)# show qos map
   Number of Traffic Classes supported: 8
   ＜--------OUTPUT OMITTED FROM EXAMPLE--------＞
```

```
Dscp-tc map:
  d1 : d2 0 1 2 3 4 5 6 7 8 9
  -----------------------------
  0 : 1 1 1 1 1 1 1 1 0 0

27.5.3 CoS and DSCP Rewrite – FM6000 Platform Switches

Section 27.1.1.3 describes the CoS and DSCP rewrite functions.

Traffic Class to CoS Rewrite Map

The CoS rewrite value is configurable and based on a data stream’s traffic class, as specified by the traffic class-CoS rewrite map. The `qos map traffic-class to cos` command assigns a CoS rewrite value to a list of traffic classes. Multiple commands create the complete traffic class–CoS rewrite map.

Example

- This command assigns the CoS rewrite value of two to traffic classes 1, 3, and 5.

```
switch(config)# qos map traffic-class 1 3 5 to cos 2
switch(config)# show qos map
   Number of Traffic Classes supported: 8
   ＜--------OUTPUT OMITTED FROM EXAMPLE--------＞
```

```
Tc - tx-queue map:
tc:  0 1 2 3 4 5 6 7
     -----------------------------
tax-queue:  0 1 2 3 4 5 6 7
   ＜--------OUTPUT OMITTED FROM EXAMPLE--------＞
switch(config)#
```
Table 27-15 displays the default traffic class–CoS rewrite map on FM6000 platform switches.

### Table 27-15 Default Traffic Class to CoS Rewrite Map: FM6000 Platform Switches

<table>
<thead>
<tr>

**Traffic Class to DSCP Rewrite Map**

The DSCP rewrite value is configurable and based on a data stream's traffic class, as specified by the traffic class-DSCP rewrite map. The `qos map traffic-class to dscp` command assigns a DSCP rewrite value to a list of traffic classes. Multiple commands create the complete traffic class-DSCP rewrite map.

**Example**

- This command assigns the DSCP rewrite value of 37 to traffic classes 2, 4, and 6.

```bash
switch(config)# qos map traffic-class 2 4 6 to dscp 37
switch(config)# show qos map
```

Eventually output omitted from example.

```
Tc-dscp map:
tc: 0 1 2 3 4 5 6 7
-----------------------------
dscp: 8 0 37 24 37 40 37 56
```

Eventually output omitted from example.

```
switch(config)#
```

Table 27-16 displays the default traffic class–DSCP rewrite map on FM6000 platform switches.

<td>32</td>
<td>40</td>
<td>48</td>
<td>56</td>
</tr>
</tbody>
</table>

27.5.4 Transmit Queues and Port Shaping – FM6000 Platform Switches

Section 27.1.2 describes transmit queues and port shaping.

A data stream's traffic class determines the transmit queue it uses. The switch defines a single traffic class-transmit queue map for all Ethernet and port channel interfaces and is used for unicast and multicast traffic. The `show qos maps` command displays the traffic class to transmit queue map.

Table 27-17 displays the default traffic class to transmit queue map on FM6000 platform switches.

### Table 27-17 Default Traffic Class to Transmit Queue Map: FM6000 Platform Switches

<table>
<thead>
<tr>
<th>Traffic Class</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transmit Queue</td>
<td>0</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>
<td>5</td>
<td>6</td>
<td>7</td>
</tr>
</tbody>
</table>
Example

- These commands assign traffic classes of 1, 3, and 5 to transmit queue 1, traffic classes 2, 4, and 6 to transmit queue 2, and traffic class 0 to transmit queue 0, then display the resultant map.

```
switch(config)# qos map traffic-class 1 3 5 to tx-queue 1
switch(config)# qos map traffic-class 2 4 6 to tx-queue 2
switch(config)# qos map traffic-class 0 to tx-queue 0
switch(config)# show qos maps
Number of Traffic Classes supported: 8
Number of Transmit Queues supported: 8
<-------OUTPUT OMITTED FROM EXAMPLE-------->

Tc - tx-queue map:
 tc: 0 1 2 3 4 5 6 7
 -------------------------------
 tx-queue: 0 1 2 1 2 1 2 7
```

Entering TX-Queue Configuration Mode

Transmit queues are configurable on Ethernet ports and port channels. Queue parameters are configured in tx-queue configuration command mode, which is entered from interface ethernet configuration mode. The tx-queue (FM6000) command places the switch in tx-queue configuration mode. The show qos interfaces displays the transmit queue configuration for a specified port.

Example

- This command enters tx-queue configuration mode for transmit queue 3 of Ethernet interface 5.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# tx-queue 3
```

Configuring the Shape Rate – Port and Transmit Queues

A port’s shape rate specifies its maximum outbound traffic bandwidth. A transmit queue’s shape rate specifies the queue’s maximum outbound bandwidth. Shape rate commands specify data rates in kbps.

Important! Enabling port shaping on an FM6000 interface disables queue shaping internally. Disabling port shaping restores queue shaping as specified in running-config.

- To configure a port’s shape rate, enter shape rate (Interface – FM6000) from the port’s interface configuration mode.
- To configure a transmit queue’s shape rate, enter shape rate (Tx-queue – FM6000) from the queue’s tx-queue configuration mode.

Example

- These commands configure a shape rate of 5 Gbs on Ethernet port 3, then configure the shape rate for the following transmit queues:
  - transmit queues 0, 1, and 2: 500 Mbps
transmit queues 3, 4, and 5: 400 Mbps

switch(config)#interface ethernet 3
switch(config-if-Et3)#shape rate 5000000
switch(config-if-Et3)#tx-queue 0
switch(config-if-Et3-txq-0)#shape rate 500000
switch(config-if-Et3-txq-0)#tx-queue 1
switch(config-if-Et3-txq-1)#shape rate 500000
switch(config-if-Et3-txq-1)#tx-queue 3
switch(config-if-Et3-txq-3)#shape rate 400000
switch(config-if-Et3-txq-3)#tx-queue 4
switch(config-if-Et3-txq-4)#shape rate 400000
switch(config-if-Et3-txq-4)#tx-queue 5
switch(config-if-Et3-txq-5)#shape rate 400000
switch(config-if-Et3-txq-5)#exit
switch(config-if-Et3)#show qos interface ethernet 3

<td>500000</td>
<td>strict</td>
</tr>
<tr>
<td>0</td>
<td>N/A</td>
<td>500000</td>
<td>strict</td>
</tr>
</tbody>
</table>

Configuring Queue Priority

Queue priority rank is denoted by the queue number; transmit queues with higher numbers have higher priority. The priority (FM6000) command configures a transmit queue’s priority type:

- **priority strict** configures the queue as a strict priority queue.
- **no priority** configures the queue as a round robin queue.

A queue’s configuration as *round robin* also applies to all lower priority queues regardless of other configuration statements.

The bandwidth percent (FM6000) command configures a round robin queue’s bandwidth share. The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the cumulative configured bandwidth is greater than 100%, each port’s operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

**Example**

- These commands configure transmit queue 3 (on Ethernet interface 19) as a round robin queue, then allocates 10%, 20%, 30%, and 40% bandwidth to queues 0 through 3.
The **no priority** statement for queue 3 also configures queues 0, 1, and 2 as round robin queues. Removing this statement reverts the other queues to **strict priority** type unless **running-config** contains a **no priority** statement for one of these queues.

```
switch(config)#interface ethernet 19
switch(config-if-Et19)#tx-queue 3
switch(config-if-Et19-txq-3)#no priority
switch(config-if-Et19-txq-3)#bandwidth percent 40
switch(config-if-Et19-txq-3)#tx-queue 2
switch(config-if-Et19-txq-2)#bandwidth percent 30
switch(config-if-Et19-txq-2)#tx-queue 1
switch(config-if-Et19-txq-1)#bandwidth percent 20
switch(config-if-Et19-txq-1)#tx-queue 0
switch(config-if-Et19-txq-0)#bandwidth percent 10
switch(config-if-Et19-txq-0)#show qos interface ethernet 19
```

27.6  QoS Configuration: Petra Platform Switches

Implementing QoS on a Petra platform switch consists of configuring port trust settings, default port settings, default traffic classes, conversion maps, and transmit queues.

- 27.6.1: CoS and DSCP Port Settings – Petra Platform Switches
- 27.6.2: Traffic Class Derivations – Petra Platform Switches
- 27.6.3: CoS Rewrite – Petra Platform Switches
- 27.6.4: Transmit Queues and Port Shaping – Petra Platform Switches

27.6.1  CoS and DSCP Port Settings – Petra Platform Switches

Section 27.1.1.2 describes port trust and default port CoS and DSCP values.

Configuring Port Trust Settings

The qos trust command configures the QoS port trust mode for the configuration mode interface. Trust enabled ports use packet CoS or DSCP values to classify traffic. The port-trust default for switched ports is **cos**. The port-trust default for routed ports is **dscp**.

- **qos trust cos** specifies **cos** as the port's port-trust mode.
- **qos trust dscp** specifies **dscp** as the port's port-trust mode.
- **no qos trust** specifies **untrusted** as the port's port-trust mode.

The show qos interfaces trust command displays the trust mode of specified interfaces.

Example

- These commands configure and display the following trust modes:
  - Ethernet 3/25: dscp
  - Ethernet 3/26: untrusted
  - Ethernet 3/27: cos
  - Ethernet 3/28: default as a switched port
• Ethernet 3/29: default as a routed port

switch(config)#interface ethernet 3/25
switch(config-if-Et3/25)#qos trust dscp
switch(config-if-Et3/25)#interface ethernet 3/26
switch(config-if-Et3/26)#no qos trust
switch(config-if-Et3/26)#interface ethernet 3/27
switch(config-if-Et3/27)#qos trust cos
switch(config-if-Et3/27)#interface ethernet 3/28
switch(config-if-Et3/28)#switchport
switch(config-if-Et3/28)#default qos trust
switch(config-if-Et3/28)#interface ethernet 3/29
switch(config-if-Et3/29)#no switchport
switch(config-if-Et3/29)#default qos trust
switch(config-if-Et3/29)#show qos interface ethernet 3/25 - 3/29 trust

<table>

<td>CoS (packet)</td>
<td>Default TC (chip)</td>
</tr>
<tr>
<td>Default TC (chip)</td>
<td>CoS (packet)</td>
<td>DSCP (packet)</td>
</tr>
</tbody>
</table>

**Configuring Default Traffic Class**

Petra platform switches assign a default traffic class to the set of Ethernet interfaces controlled by individual PetraA chips. Default traffic class values are configurable for each PetraA chip, not individual interfaces.

The platform petraA traffic-class command specifies the default traffic class used by all ports controlled by a specified chip. The show platform petraA traffic-class command displays traffic class assignments.
Example

- This command configures the default traffic class to five for the ports 32-39 on linecard 3 (7500 Series).

  switch(config)#platform petraA petra3/4 traffic-class 5
  switch(config)#show platform petraA module 3 traffic-class
  Petra3/0 traffic-class: 1
  Petra3/1 traffic-class: 1
  Petra3/2 traffic-class: 1
  Petra3/3 traffic-class: 1
  Petra3/4 traffic-class: 5
  Petra3/5 traffic-class: 1
  switch(config)#

- This command configures the default traffic class to three for all ports on linecard 6 (7500 Series).

  switch(config)#platform petraA module 6 traffic-class 6
  switch(config)#show platform petraA module 6 traffic-class
  Petra6/0 traffic-class: 6
  Petra6/1 traffic-class: 6
  Petra6/2 traffic-class: 6
  Petra6/3 traffic-class: 6
  Petra6/4 traffic-class: 6
  Petra6/5 traffic-class: 6
  switch(config)#

Mapping CoS to Traffic Class

The `qos map cos` command assigns a traffic class to a list of CoS settings. Multiple commands create a complete CoS–traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet’s CoS field or the port upon which it is received.

Example

- This command assigns the traffic class of 4 to the classes of service 1, 3, 5, and 7.

  switch(config)#qos map cos 1 3 5 7 to traffic-class 4
  switch(config)#show qos maps
  Number of Traffic Classes supported: 8
  <--------OUTPUT OMITTED FROM EXAMPLE-------->

  Cos-tc map:
  cos:  0  1  2  3  4  5  6  7
  ---------------------------
  tc:   1  4  2  4  4  4  6  4
  <--------OUTPUT OMITTED FROM EXAMPLE-------->

  switch(config)#

Table 27-19 displays the default CoS to traffic class map on Petra platform switches.

<table>

Mapping DSCP to Traffic Class

The `qos map dscp` command assigns a traffic class to a set of DSCP values. Multiple commands create a complete DSCP to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet’s DSCP field or the chip upon which it is received.

Example

- This command assigns the traffic class of three to the DSCP values of 12, 13, 25, and 37.

  ```
  switch(config)# qos map dscp 12 13 14 25 48 to traffic-class 3
  switch(config)# show qos maps
  Number of Traffic Classes supported: 8
  ---------------OUTPUT OMITTED FROM EXAMPLE-------------
  
  Dscp-tc map:
  d1 : d2 0 1 2 3 4 5 6 7 8 9  
  --------------------------------------
  0 :  1 1 1 1 1 1 1 1 0 0
  1 :  0 0 3 3 3 0 2 2 2 2
  2 :  2 2 2 2 3 3 3 3 3 3
  3 :  3 3 4 4 4 4 4 4 4 4
  4 :  5 5 5 5 5 5 5 5 3 6
  5 :  6 6 6 6 6 6 7 7 7 7
  6 :  7 7 7 7
  
  ---------------OUTPUT OMITTED FROM EXAMPLE-------------
  
  switch(config)#
  ```

Table 27-20 displays the default DSCP to Traffic Class map on Petra platform switches.

27.6.3 CoS Rewrite – Petra Platform Switches

Section 27.1.1.3 describes the CoS rewrite function.

Traffic Class to CoS Rewrite Map

The CoS rewrite value is configurable and based on a data stream’s traffic class, as specified by the traffic class-CoS rewrite map. The `qos map traffic-class to cos` command assigns a CoS rewrite value to a list of traffic classes. Multiple commands create the complete traffic class-CoS rewrite map.
Example

- This command assigns the CoS of two to traffic classes 1, 3, and 5.

```
switch(config)# qos map traffic-class 1 3 5 to cos 2
switch(config)# show qos map
   Number of Traffic Classes supported: 8
   <--------OUTPUT OMITTED FROM EXAMPLE-------->

Tc-cos map:
   tc: 0 1 2 3 4 5 6 7
   cos: 1 2 2 2 4 2 6 7
   <--------OUTPUT OMITTED FROM EXAMPLE-------->

switch(config)#
```

Table 27-21 displays the default Traffic Class to CoS rewrite value map on Petra platform switches.

<table>
<thead>
<tr>
<th>Traffic Class</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
</tr>
</thead>
<tbody>
<tr>
<td>CoS Rewrite Value</td>
<td>1</td>
<td>0</td>
<td>2</td>
<td>3</td>
<td>4</td>
<td>5</td>
<td>6</td>
<td>7</td>
</tr>
</tbody>
</table>

Traffic Class to DSCP Rewrite Map

DSCP rewrite is always disabled on Petra platform switches.

27.6.4 Transmit Queues and Port Shaping – Petra Platform Switches

Section 27.1.2 describes transmit queues and port shaping.

Petra platform switches provide four physical queues for each egress port: Unicast High, Unicast Low, Multicast High, and Multicast Low. Data is scheduled for the high or low queue based on its priority as defined by its transmit queue assignment (unicast traffic) or traffic class (multicast traffic), as shown in Table 27-22. A Petra transmit queue is a data structure that defines scheduling of unicast traffic among physical egress queues.

Table 27-22 Traffic Distribution to Egress Port Queues

<table>
<thead>
<tr>
<th>Unicast Traffic</th>
<th>High Priority Queue</th>
<th>Low Priority Queue</th>
</tr>
</thead>
<tbody>
<tr>
<td>Multicast Traffic</td>
<td>Transmit Queues 5 – 7</td>
<td>Traffic Queues 0 – 4</td>
</tr>
<tr>
<td></td>
<td>Traffic Classes 5 – 7</td>
<td>Traffic Classes 0 – 4</td>
</tr>
</tbody>
</table>

Multicast queue capacity that is available after multicast traffic is serviced is used for unicast traffic of a corresponding priority. Similarly, unicast queue capacity that is available after unicast traffic is serviced is used for overflow multicast traffic. Under conditions of unicast and multicast congestion, egress traffic is evenly split between unicast and multicast traffic.

Section 27.6.4.1 describes unicast transmit queues and shaping. Section 27.6.4.2 describes multicast priority and traffic classes.
27.6.4.1 Unicast Transmit Queues and Port Shaping

A data stream’s traffic class determines the transmit queue it uses. The switch defines a single traffic class–transmit queue map for unicast traffic on all Ethernet interfaces. The `show qos maps` command displays the traffic class–transmit queue map. Table 27-23 displays the default traffic class to transmit queue map on Petra platform switches.

### Table 27-23 Default Traffic Class to Transmit Queue Map: Petra Platform Switches

<table>
<thead>
<tr>
<th>Traffic Class</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
</tr>
</thead>

<td>0</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>
<td>5</td>
<td>6</td>
<td>7</td>
</tr>
</tbody>
</table>

Transmit queue parameters are configured in tx-queue configuration command mode.

### Mapping Traffic Classes to a Transmit Queue

The `qos map traffic-class to tx-queue` command assigns traffic classes to a transmit queue. Multiple commands complete the traffic class-transmit queue map. Traffic class 7 and transmit queue 7 are always mapped to each other. This association is not editable.

**Example**

* These commands assign traffic classes of 1, 3, and 5 to transmit queue 1, traffic classes 2, 4, and 6 to transmit queue 2, and traffic class 0 to transmit queue 0, then display the resultant map.

```
switch(config)#qos map traffic-class 1 3 5 to tx-queue 1
switch(config)#qos map traffic-class 2 4 6 to tx-queue 2
switch(config)#qos map traffic-class 0 to tx-queue 0
switch(config)#show qos maps
```

```
Number of Traffic Classes supported: 8
Number of Transmit Queues supported: 8

Tc - tx-queue map:
tc:        0  1  2  3  4  5  6  7
---------------------------------
tx-queue:  0  1  2  1  2  1  2  7
```

```
switch(config)#
```

### Entering Tx-Queue Configuration Mode

The `tx-queue (Petra)` command places the switch in tx-queue configuration mode to configure a transmit queue on the configuration mode interface. Tx-queue 7 is not configurable. The `show qos interfaces` displays the transmit queue configuration for a specified port.

**Example**

* This command enters tx-queue configuration mode for transmit queue 3 of Ethernet interface 3/28

```
switch(config)#interface ethernet 3/28
switch(config-if-Et3/28)#tx-queue 3
```

### Configuring the Shape Rate – Port and Transmit Queues

A port’s shape rate specifies its maximum outbound traffic bandwidth. A transmit queue’s shape rate specifies the queue’s maximum outbound bandwidth. Shape rate commands specify data rates in kbps.

* To configure a port’s shape rate, enter `shape rate (Interface – Petra)` from the port’s interface configuration mode.
To configure a transmit queue’s shape rate, enter `shape rate (Tx-queue – Petra)` from the queue’s tx-queue configuration mode.

**Example**

- These commands configure a shape rate of 5 Gbs on Ethernet port 3, then configure the shape rate for the following transmit queues:
  - transmit queues 0, 1, and 2: 500 Mbps
  - transmit queues 3, 4, and 5: 400 Mbps

```bash
switch(config)#interface ethernet 3/28
switch(config-if-Et3/28)#shape rate 5000000
switch(config-if-Et3/28)#tx-queue 0
switch(config-if-Et3/28-txq-0)#shape rate 500000
switch(config-if-Et3/28-txq-0)#tx-queue 1
switch(config-if-Et3/28-txq-1)#shape rate 500000
switch(config-if-Et3/28-txq-1)#tx-queue 2
switch(config-if-Et3/28-txq-2)#shape rate 500000
switch(config-if-Et3/28-txq-2)#tx-queue 3
switch(config-if-Et3/28-txq-3)#shape rate 400000
switch(config-if-Et3/28-txq-3)#tx-queue 4
switch(config-if-Et3/28-txq-4)#shape rate 400000
switch(config-if-Et3/28-txq-4)#tx-queue 5
switch(config-if-Et3/28-txq-5)#shape rate 400000
switch(config-if-Et3/28-txq-5)#show qos interface ethernet 3/28
```

**Port shaping rate: 5000000Kbps**

<td>500000</td>
<td>strict</td>
</tr>
</tbody>
</table>

```
switch(config-if-Et3/28-txq-5)#
```

**Configuring Queue Priority**

The `priority (Petra)` command configures a transmit queue’s priority type:

- The `priority strict` command configures the queue as a strict priority queue.
- The `no priority` command configures the queue as a round robin queue.

A queue’s configuration as `round robin` also applies to all lower priority queues regardless of other configuration statements.

The `bandwidth percent (Petra)` command configures a round robin queue’s bandwidth share. The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the cumulative configured bandwidth is greater than 100%, each port’s operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.
Example

- These commands configure transmit queue 3 (on Ethernet interface 3/28) as a round robin queue, then allocates 10%, 20%, 30%, and 40% bandwidth to queues 0 through 3.

The **no priority** statement for queue 3 also configures queues 0, 1, and 2 as round robin queues. Removing this statement reverts the other queues to **strict priority** type unless **running-config** contains a **no priority** statement for one of these queues.

```plaintext
switch(config-if-Et3/28)#tx-queue 3
switch(config-if-Et3/28-txq-3)#no priority
switch(config-if-Et3/28-txq-3)#bandwidth percent 40
switch(config-if-Et3/28-txq-3)#tx-queue 2
switch(config-if-Et3/28-txq-2)#bandwidth percent 30
switch(config-if-Et3/28-txq-2)#tx-queue 1
switch(config-if-Et3/28-txq-1)#bandwidth percent 20
switch(config-if-Et3/28-txq-1)#tx-queue 0
switch(config-if-Et3/28-txq-0)#bandwidth percent 10
switch(config-if-Et3/28-txq-0)#show qos interface ethernet 3/28
```

Ethernet3/28:

<--------OUTPUT OMITTED FROM EXAMPLE-------->

Port shaping rate: 5000000Kbps

<table>
<thead>
<tr>
<th>Tx-Queue</th>

switch(config-if-Et3/28-txq-3)#
27.6.4.2 Multicast Egress Scheduling

Multiclass traffic is not affected by traffic class assignment or port shaping statements. Multicast traffic is assigned to port egress queues based on traffic class and uses strict priority to schedule egress between the high and low queues.
27.7 QoS Configuration: Trident and Tomahawk Platform Switches

Implementing QoS on a Trident and Tomahawk platform switch consists of configuring port trust settings, default port settings, default traffic classes, conversion maps, and transmit queues.

- Section 27.7.1: CoS and DSCP Port Settings – Trident and Tomahawk Platform Switches
- Section 27.7.2: Traffic Class Derivations – Trident and Tomahawk Platform Switches
- Section 27.7.3: CoS and DSCP Rewrite – Trident and Tomahawk Platform Switches
- Section 27.7.4: Transmit Queues and Port Shaping – Trident and Tomahawk Platform Switches
- Section 27.7.5: ECN Configuration – Trident and Tomahawk Platform Switches

27.7.1 CoS and DSCP Port Settings – Trident and Tomahawk Platform Switches

Configuring Port Trust Settings

The `qos trust` command configures the QoS port trust mode for the configuration mode interface. Trust-enabled ports use packet CoS or DSCP values to classify traffic. The port-trust default for switched ports is CoS. The port-trust default for routed ports is DSCP.

- `qos trust cos` specifies CoS as the port’s trust mode.
- `qos trust dscp` specifies DSCP as the port’s trust mode.
- `no qos trust` specifies untrusted as the port’s trust mode.

The `show qos interfaces trust` command displays the trust mode of specified interfaces.

Example

- These commands configure and display the following trust modes:
  - Ethernet 15: dscp
  - Ethernet 16: untrusted
  - Ethernet 17: cos
  - Ethernet 18: default as a switched port
Ethernet 19: default as a routed port

```
switch(config)#interface ethernet 15
switch(config-if-Et15)#qos trust dscp
switch(config-if-Et15)#interface ethernet 16
switch(config-if-Et16)#no qos trust
switch(config-if-Et16)#interface ethernet 17
switch(config-if-Et17)#qos trust cos
switch(config-if-Et17)#interface ethernet 18
switch(config-if-Et18)#switchport
default qos trust
switch(config-if-Et18)#interface ethernet 19
no switchport
default qos trust
switch(config-if-Et19)#show qos interface ethernet 15 - 19 trust

</tr>
</tbody>
</table>
```

switch(config-if-Et19)#

### Configuring Default Port Settings

Default CoS and DSCP settings are assigned to individual port channel and Ethernet interfaces. These configuration mode interface commands specify the port's default CoS and DSCP values.

- `qos cos` configures a port's default CoS value.
- `qos dscp` configures a port's default DSCP value.

### Example

These commands configure default CoS (4) and DSCP (44) values on Ethernet interface 7.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#qos cos 4
switch(config-if-Et7)#qos dscp 44
switch(config-if-Et7)#show active
interface Ethernet7
  qos cos 4
  qos dscp 44
show qos interfaces ethernet 7
Ethernet7:
  Trust Mode: COS
  Default COS: 4
  Default DSCP: 44
```

### 27.7.2 Traffic Class Derivations – Trident and Tomahawk Platform Switches

Section 27.1.1.4 describes traffic classes.
Chapter 27: Quality of Service  
QoS Configuration: Trident and Tomahawk Platform Switches

Traffic Class Derivation Source

Table 27-24 displays the source for deriving a data stream’s traffic class.

<table>
<thead>
<tr>
<th>Source</th>
<th>Untrusted</th>
<th>CoS Trusted</th>
<th>DSCP Trusted</th>

<td>Un-tagged IP</td>
<td>Default CoS (port)</td>
<td>Default CoS (port)</td>
<td>DSCP (packet)</td>
</tr>
<tr>
<td>Tagged IP</td>
<td>Default CoS (port)</td>
<td>CoS (packet)</td>
<td>DSCP (packet)</td>
</tr>
</tbody>
</table>

Section 27.7.1 describes the default CoS and DSCP settings for each port.

Mapping CoS to Traffic Class

The `qos map cos` command assigns a traffic class to a list of CoS settings. Multiple commands create a complete CoS to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet’s CoS field or the port upon which it is received.

Example

- This command assigns the traffic class of 5 to the classes of service 1, 3, 5, and 7.

  ```
  switch(config)# qos map cos 1 3 5 7 to traffic-class 5
  switch(config)# show qos maps
  Number of Traffic Classes supported: 8
  <-------OUTPUT OMITTED FROM EXAMPLE--------->
  Cos-tc map:
  cos: 0 1 2 3 4 5 6 7
  -----------------------------
  tc: 1 5 2 5 4 5 6 5
  <-------OUTPUT OMITTED FROM EXAMPLE--------->
  ```

  ```
  switch(config)#
  ```

Table 27-25 displays the default CoS–traffic class map on Trident and Tomahawk platform switches.

Table 27-25 Default CoS to Traffic Class Map: Trident and Tomahawk Platform Switches

<td>1 0 2 3 4 5 6 7</td>
</tr>
</tbody>
</table>

Mapping DSCP to Traffic Class

The `qos map dscp` command assigns a traffic class to a set of DSCP values. Multiple commands create a complete DSCP to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet’s DSCP field or the chip upon which it is received.
Example

- This command assigns the traffic class of 0 to DSCP values of 12, 24, 41, and 44-47.

```
switch(config)# qos map dscp 12 24 41 44 45 46 47 to traffic-class 0
switch(config)# show qos maps
  Number of Traffic Classes supported: 8
  <-------OUTPUT OMITTED FROM EXAMPLE-------->
```

```
Dscp-traffic class map:
  d1: 0 1 2 3 4 5 6 7 8 9
---------------------------------------------
0 : 1 1 1 1 1 1 1 0 0
1 : 0 0 0 0 0 0 2 2 2
2 : 2 2 2 2 0 3 3 3 3
3 : 3 3 4 4 4 4 4 4 4
4 : 5 0 5 5 0 0 0 6 6
5 : 6 6 6 6 6 6 7 7 7
6 : 7 7 7 7
  <-------OUTPUT OMITTED FROM EXAMPLE-------->
```

```
switch(config)#
```

27.7.3 CoS and DSCP Rewrite – Trident and Tomahawk Platform Switches

Section 27.1.1.3 describes the CoS and DSCP rewrite functions.

Traffic Class to CoS Rewrite Map

The CoS rewrite value is configurable and based on a data stream’s traffic class, as specified by the traffic class-CoS rewrite map. The `qos map traffic-class to cos` command assigns a CoS rewrite value to a list of traffic classes. Multiple commands create the complete traffic class–CoS rewrite map.

Example

- This command assigns the CoS of two to traffic classes 1, 3, and 5.

```
switch(config)# qos map traffic-class 1 3 5 to cos 2
switch(config)# show qos map
  Number of Traffic Classes supported: 8

  Tc-cos map:
    tc: 0 1 2 3 4 5 6 7
    -------------------------
    cos: 1 2 2 2 4 2 6 7
  <-------OUTPUT OMITTED FROM EXAMPLE-------->
```

```
switch(config)#
```
Table 27-27 displays the default Traffic Class to CoS rewrite value map on Trident and Tomahawk platform switches.

### Table 27-27 Default Traffic Class to CoS Rewrite Value Map: Trident and Tomahawk Platform Switches

<table>
<thead>
<tr>

<td>2</td>
<td>3</td>
<td>4</td>
<td>5</td>
<td>6</td>
<td>7</td>
</tr>
</tbody>
</table>

### Traffic Class to DSCP Rewrite Map

The DSCP rewrite value is configurable and based on a data stream’s traffic class, as specified by the traffic class-DSCP rewrite map. The `qos map traffic-class to dscp` command assigns a DSCP rewrite value to a list of traffic classes. Multiple commands create the complete traffic class-DSCP rewrite map.

#### Example

- This command assigns the DSCP value of 29 to traffic classes 2, 4, and 6.

  ```
  switch(config)# qos map traffic-class 2 4 6 to dscp 29
  switch(config)# show qos map
  Number of Traffic Classes supported: 8
  Tc-dscp map:
  tc:    0  1  2  3  4  5  6  7
  -----------------------------
  dscp:  8  0 29 24 29 40 29 56
  ``

Table 27-28 displays the default traffic class to DSCP rewrite map on Trident and Tomahawk platform switches.

### Table 27-28 Traffic Class to DSCP Rewrite Value Map: Trident and Tomahawk Platform Switches

<table>

<td>48</td>
<td>56</td>
</tr>
</tbody>
</table>

### 27.7.4 Transmit Queues and Port Shaping – Trident and Tomahawk Platform Switches

Section 27.1.2 describes transmit queues and port shaping.

Trident and Tomahawk platform switches define 12 transmit queues: eight unicast (UC0 – UC7) and four multicast (MC0 – MC03). The traffic class–transmit queue maps are configured globally and apply to all Ethernet interfaces. The `show qos maps` command displays the traffic class–transmit queue maps.

Table 27-29 displays the default traffic class–transmit queue maps.

### Table 27-29 Default Traffic Class to Transmit Queue Map: Trident and Tomahawk Platform Switches

### Mapping Traffic Classes to a Transmit Queue

These commands assign traffic classes to a transmit queue:

- `qos map traffic-class to uc-tx-queue` associates a unicast queue to a traffic class set.
**QoS Configuration: Trident and Tomahawk Platform Switches**

Chapter 27: Quality of Service

- `qos map traffic-class to mc-tx-queue` associates a multicast queue to a traffic class set.

Multiple commands create the complete maps.

**Example**

- These commands assign the following on Ethernet interface 7:
  - traffic classes 1, 3, and 5 to unicast queue 1
  - traffic classes 2, 4, and 6 to unicast queue 5
  - traffic classes 1, 2, and 3 to multicast queue 1
  - traffic classes 4, 5, and 6 to multicast queue 3
  - traffic class 0 to unicast queue 0 and multicast queue 0

```
switch(config)#default interface ethernet 7
switch(config)#qos map traffic-class 1 3 5 to uc-tx-queue 1
switch(config)#qos map traffic-class 2 4 6 to uc-tx-queue 5
switch(config)#qos map traffic-class 1 2 3 to mc-tx-queue 1
switch(config)#qos map traffic-class 4 5 6 to mc-tx-queue 3
switch(config)#qos map traffic-class 0 to uc-tx-queue 0
switch(config)#qos map traffic-class 0 to mc-tx-queue 0
```

```
switch(config)#show qos maps
Number of Traffic Classes supported: 8
Number of Transmit Queues supported: 12
<--------OUTPUT OMITTED FROM EXAMPLE-------->

Tc - uc-tx-queue map:
tc: 0 1 2 3 4 5 6 7
------------------------------------
uc-tx-queue: 0 1 5 1 5 1 5 7

Tc - mc-tx-queue map:
tc: 0 1 2 3 4 5 6 7
------------------------------------
mc-tx-queue: 0 1 1 3 3 3 3 3
```

**Entering a Transmit Queue Configuration Mode**

Transmit queues are configurable on individual Ethernet ports. Parameters for individual transmit queues are configured in one of two transmit queue configuration modes. Transmit queue modes are accessed from an interface-ethernet configuration mode.

- `uc-tx-queue` places the switch in uc-tx-queue mode to configure a unicast transmit queue.
- `mc-tx-queue` places the switch in mc-tx-queue mode to configure a multicast transmit queue.

The `show qos interfaces` displays the transmit queue configuration for a specified port. Examples

**Example**

- This command enters the mode that configures unicast transmit queue 3 of Ethernet interface 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#uc-tx-queue 3
switch(config-if-Et5-uc-txq-3)#
```
• This command enters the mode to configure multicast transmit queue 3 of Ethernet interface 5.
  
  switch(config-if-Et5)#mc-tx-queue 2
  switch(config-if-Et5-mc-txq-2)#

Configuring the Shape Rate – Port and Transmit Queues

A port’s shape rate specifies the port’s maximum outbound traffic bandwidth. A shape rate can also be configured for all transmit queues on each port. All shape rate commands use kbps to specify data rates.

• To configure a port’s shape rate, enter shape rate (Interface – Trident and Tomahawk) from the port’s interface configuration mode.

• To configure a transmit queue’s shape rate, enter shape rate (Tx-queue – Trident and Tomahawk) from the queue’s tx-queue configuration mode.

Example

• These commands configure a shape rate of 5 Gbs on Ethernet port 7, then configure the shape rate for the following transmit queues:
  
  • unicast transmit queues 0 and 1: 500 Mbps
  • unicast transmit queues 3 and 4: 400 Mbps
multicast transmit queues 0 and 2: 300 Mbps

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#shape rate 5000000
switch(config-if-Et7)#uc-tx-queue 0
switch(config-if-Et7-uc-txq-0)#shape rate 500000
switch(config-if-Et7-uc-txq-0)#uc-tx-queue 1
switch(config-if-Et7-uc-txq-1)#shape rate 500000
switch(config-if-Et7-uc-txq-1)#uc-tx-queue 3
switch(config-if-Et7-uc-txq-3)#shape rate 400000
switch(config-if-Et7-uc-txq-3)#uc-tx-queue 5
switch(config-if-Et7-uc-txq-5)#shape rate 400000
switch(config-if-Et7-uc-txq-5)#mc-tx-queue 0
switch(config-if-Et7-uc-txq-0)#shape rate 300000
switch(config-if-Et7-mc-txq-0)#mc-tx-queue 2
switch(config-if-Et7-mc-txq-2)#shape rate 300000
switch(config-if-Et7-mc-txq-2)#exit
switch(config-if-Et7)#show qos interface ethernet 7

**Configuring Queue Priority**

Trident and Tomahawk platform switch queues are categorized into two priority groups. Priority group 1 queues have priority over priority 0 queues. The following lists display the priority group queues in order from higher priority to lower priority.

- **Priority Group 1**: UC7, UC6, MC3
- **Priority Group 0**: UC5, UC4, MC2, UC3, UC2, MC1, UC1, UC0, MC0

The `priority` (Trident and Tomahawk) command configures a transmit queue’s priority type:

- The `priority strict` command configures the queue as a strict priority queue.
- The `no priority` command configures the queue as a round robin queue.

A queue’s configuration as **round robin** also applies to all lower priority queues regardless of other configuration statements.
The `bandwidth percent` (Trident and Tomahawk) command configures a round robin queue’s bandwidth share. The cumulative operational bandwidth of all round robin queues is always 100%. If the cumulative configured bandwidth is greater than 100%, each port’s operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

Priority Group 1 queues (UC7, UC6, MC3) are not configurable as round robin queues. The `bandwidth percent` command is not available for these queues.

**Example**

- These commands configure unicast transmit queue 3 as a round robin queue, then allocates 5%, 15%, 25%, 35%, 8%, and 12% bandwidth to unicast transmit queues 0 through 3 and multicast transmit queues 0 and 1, respectively.

  The `no priority` statement for queue 3 also configures priority for all lower priority queues. Removing the statement reverts the other queues to *strict priority* type unless `running-config` contains a `no priority` statement for one of these queues.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#uc-tx-queue 3
switch(config-if-Et7-uc-txq-3)#no priority
switch(config-if-Et7-uc-txq-3)#bandwidth percent 5
switch(config-if-Et7-uc-txq-3)#uc-tx-queue 2
switch(config-if-Et7-uc-txq-2)#bandwidth percent 15
switch(config-if-Et7-uc-txq-2)#uc-tx-queue 1
switch(config-if-Et7-uc-txq-1)#bandwidth percent 25
switch(config-if-Et7-uc-txq-1)#uc-tx-queue 0
switch(config-if-Et7-uc-txq-0)#bandwidth percent 35
switch(config-if-Et7-uc-txq-0)#mc-tx-queue 1
switch(config-if-Et7-mc-txq-1)#bandwidth percent 12
switch(config-if-Et7-mc-txq-1)#mc-tx-queue 0

27.7.5 ECN Configuration – Trident and Tomahawk Platform Switches

Section 27.1.3 describes Explicit Congestion Notification (ECN).

ECN is independently configurable on all egress queues of each Ethernet interface. ECN settings for Port-Channels are applied on each of the channel's member Ethernet interfaces. ECN is also globally configurable to mark packets from the shared pool used for dynamically allocating memory to the queues. Multicast packets contribute to the globally shared pool and can contribute to global level congestion that result in ECN marking of unicast packets queued after the multicast packets.

Average queue length is tracked for transmit queues and the global pool independently. When either entity reaches its maximum threshold, all subsequent packets are marked.

Although the switch does not limit the number of queues that can be configured for ECN, hardware table limitations restrict the number of queues (including the global shared pool) that can simultaneously implement ECN.

The `qos random-detect ecn global-buffer (Trident and Tomahawk)` command enables ECN marking for globally shared packet memory and specifies minimum and maximum queue threshold sizes.

**Example**

- This command enables ECN marking of unicast packets from the global data pool and sets the minimum and maximum thresholds at 20 and 500 segments.

```
switch(config)#qos random-detect ecn global-buffer minimum-threshold 20 segments
maximum-threshold 500 segments
switch(config)#
```
This command disables ECN marking of unicast packets from the global data pool.

```
switch(config)#no qos random-detect ecn global-buffer
switch(config)#
```

The `random-detect ecn (Trident and Tomahawk)` command enables ECN marking for the configuration mode unicast transmit queue and specifies threshold queue sizes.

**Example**

These commands enable ECN marking of unicast packets from transmit queue 4 of Ethernet interface 15, setting thresholds at 10 and 100 segments.

```
switch(config)#interface ethernet 15
switch(config-if-Et15)#uc-tx-queue 4
switch(config-if-Et15-uc-txq-4)#random-detect ecn minimum-threshold 10 segments
maximum-threshold 100 segments
switch(config-if-Et15-uc-txq-4)#show active
interface Ethernet15
    uc-tx-queue 4
        random-detect ecn minimum-threshold 10 segments maximum-threshold 100
segments
switch(config-if-Et15-uc-txq-4)#exit
switch(config-if-Et15)#
```

This command disables ECN marking of unicast packets from transmit queue 4 of Ethernet interface 15.

```
switch(config-if-Et15-uc-txq-4)#no random-detect ecn
switch(config-if-Et15-uc-txq-4)#show active
interface Ethernet15
switch(config-if-Et15-uc-txq-4)#exit
switch(config-if-Et15)#
```
27.8 QoS Configuration: Trident II and Helix Platform Switches
Implementing QoS on a Trident platform switch consists of configuring port trust settings, default port settings, default traffic classes, conversion maps, and transmit queues.

- Section 27.8.1: CoS and DSCP Port Settings – Trident II and Helix Platform Switches
- Section 27.8.2: Traffic Class Derivations – Trident II and Helix Platform Switches
- Section 27.8.3: CoS and DSCP Rewrite – Trident II and Helix Platform Switches
- Section 27.8.4: Transmit Queues and Port Shaping – Trident II and Helix Platform Switches
- Section 27.8.5: Ingress Policing on LAG
- Section 27.8.6: Fabric QoS -- – Trident II Platform Switches

27.8.1 CoS and DSCP Port Settings – Trident II and Helix Platform Switches

Configuring Port Trust Settings
The `qos trust` command configures the QoS port trust mode for the configuration mode interface. Trust enabled ports use packet CoS or DSCP values to classify traffic. The port-trust default for switched ports is `cos`. The port-trust default for routed ports is `dscp`.

- `qos trust cos` specifies `cos` as the port’s port-trust mode.
- `qos trust dscp` specifies `dscp` as the port’s port-trust mode.
- `no qos trust` specifies `untrusted` as the port’s port-trust mode.

The `show qos interfaces trust` command displays the trust mode of specified interfaces.

Example
- These commands configure and display the following trust modes:
  - Ethernet 7/1: dscp
  - Ethernet 7/2: untrusted
  - Ethernet 7/3: cos
  - Ethernet 7/4: default as a switched port
Chapter 27: Quality of Service

QoS Configuration: Trident II and Helix Platform Switches

- Ethernet 8/1: default as a routed port

```
switch(config)#interface ethernet 7/
switch(config-if-Et7/1)#qos trust dscp
switch(config-if-Et7/1)#interface ethernet 7/2
switch(config-if-Et7/2)#no qos trust
switch(config-if-Et7/2)#interface ethernet 7/3
switch(config-if-Et7/3)#qos trust cos
switch(config-if-Et7/3)#interface ethernet 7/4
switch(config-if-Et7/4)#switchport
switch(config-if-Et7/4)#default qos trust
switch(config-if-Et7/4)#interface ethernet 8/1
switch(config-if-Et8/1)#no switchport
switch(config-if-Et8/1)#default qos trust
switch(config-if-Et8/1)#show qos interface ethernet 7/1 - 8/1 trust
```

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

```
switch(config-if-Et8/1)#
```

Configuring Default Port Settings

Default CoS and DSCP settings are assigned to individual port channel and Ethernet interfaces. These configuration mode interface commands specify the port’s default CoS and DSCP values.

- **qos cos** configures a port’s default CoS value.
- **qos dscp** configures a port’s default DSCP value.

Example

- These commands configure default CoS (4) and DSCP (44) values on Ethernet interface 7/3.

```
switch(config)#interface ethernet 7/3
switch(config-if-Et7/3)#qos cos 4
switch(config-if-Et7/3)#qos dscp 44
switch(config-if-Et7/3)#show active
interface Ethernet7/3
  qos cos 4
  qos dscp 44
switch(config-if-Et7/3)#show qos interfaces ethernet 7/3
Ethernet7/3:
  Trust Mode: COS
  Default COS: 4
  Default DSCP: 44
  <--------OUTPUT OMITTED FROM EXAMPLE-------->
switch(config-if-Et7/3)#
```

27.8.2 Traffic Class Derivations – Trident II and Helix Platform Switches

Section 27.1.1.4 describes traffic classes.

Note

Qos traffic policy is supported on Trident II platform switches.
Traffic Class Derivation Source

Table 27-30 displays the source for deriving a data stream’s traffic class.

Table 27-30  Traffic Class Derivation Source: Trident II Platform Switches

<td>CoS (packet)</td>
<td>DSCP (packet)</td>
</tr>
</tbody>
</table>

Section 27.8.1 describes the default CoS and DSCP settings for each port.

Mapping CoS to Traffic Class

The qos map cos command assigns a traffic class to a list of CoS settings. Multiple commands create a complete CoS to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet’s CoS field or the port upon which it is received.

Example

- This command assigns the traffic class of 5 to the classes of service 1, 3, 5, and 7.

```
switch(config)# qos map cos 1 3 5 7 to traffic-class 5
switch(config)# show qos maps
  Number of Traffic Classes supported: 8
  <--------OUTPUT OMITTED FROM EXAMPLE-------->
  Cos-tc map:
  cos:  0  1  2  3  4  5  6  7
  ---------------
  tc:   1  5  2  5  4  5  6  5
  <--------OUTPUT OMITTED FROM EXAMPLE-------->
```

Mapping DSCP to Traffic Class

The qos map dscp command assigns a traffic class to a set of DSCP values. Multiple commands create a complete DSCP to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet’s DSCP field or the chip upon which it is received.
Example

- This command assigns the traffic class of 0 to DSCP values of 12, 24, 41, and 44-47.

```
switch(config)# qos map dscp 12 24 41 44 45 46 47 to traffic-class 0
switch(config)# show qos maps
Number of Traffic Classes supported: 8

<--------OUTPUT OMITTED FROM EXAMPLE-------->
```

```

27.8.3 CoS and DSCP Rewrite – Trident II and Helix Platform Switches

Section 27.1.1.3 describes the CoS and DSCP rewrite functions.

Traffic Class to CoS Rewrite Map

The CoS rewrite value is configurable and based on a data stream’s traffic class, as specified by the traffic class-CoS rewrite map. The `qos map traffic-class to cos` command assigns a CoS rewrite value to a list of traffic classes. Multiple commands create the complete traffic class–CoS rewrite map.

Example

- This command assigns the CoS of two to traffic classes 1, 3, and 5.

```
switch(config)# qos map traffic-class 1 3 5 to cos 2
switch(config)# show qos map
Number of Traffic Classes supported: 8

<--------OUTPUT OMITTED FROM EXAMPLE-------->
```

```
Tc-cos map:
 tc: 0 1 2 3 4 5 6 7
------------------------
cos: 1 2 2 2 4 2 6 7
```

<--------OUTPUT OMITTED FROM EXAMPLE-------->

switch(config)#

27.8.4 Transmit Queues and Port Shaping – Trident II and Helix Platform Switches

Section 27.1.2 describes transmit queues and port shaping.

A data stream’s traffic class determines the transmit queue it uses. The switch defines a single traffic class-transmit queue map for all Ethernet interfaces and is used for unicast and multicast traffic. The traffic class to transmit queue maps are configured globally and apply to all Ethernet and port channel interfaces. The `show qos maps` command displays the traffic class to transmit queue map.

Trident II platform switches have eight unicast (UC0 – UC7) and eight multicast (MC0 – MC7) queues. Each UCx-MCx queue set is combined into a single queue group (L1.x), which is exposed to the CLI through this command.

Table 27-35 displays the default traffic class to transmit queue maps.

Table 27-35  Default Traffic Class to Transmit Queue Map: Trident II Platform Switches

<table>

</tbody>
</table>

Mapping Traffic Classes to a Transmit Queue

The `qos map traffic-class to tx-queue` command assigns traffic classes to a transmit queue. Multiple commands create the complete map.
Chapter 27: Quality of Service

Quality of Service (QoS) Configuration: Trident II and Helix Platform Switches

Example

- These commands assign traffic classes of 1, 3, and 5 to transmit queue 1, traffic classes 2, 4, and 6 to transmit queue 2, and traffic class 0 to transmit queue 0, then display the resultant map.

```
switch(config)#qos map traffic-class 1 3 5 to tx-queue 1
switch(config)#qos map traffic-class 2 4 6 to tx-queue 2
switch(config)#qos map traffic-class 0 to tx-queue 0
switch(config)#show qos maps
```

- Number of Traffic Classes supported: 8
- Number of Transmit Queues supported: 8

```
<--------OUTPUT OMITTED FROM EXAMPLE-------->
```

```
Tc – tx-queue map:
tc:        0  1  2  3  4  5  6  7
---------------------------------
tx-queue:  0  1  2  1  2  1  2  7
```

```
switch(config)#
```

Entering a Transmit Queue Configuration Mode

Transmit queues are configurable on Ethernet ports and port channels. Queue parameters are configured in tx-queue configuration command mode, which is entered from the appropriate interface configuration mode. The `tx-queue (Trident II)` command places the switch in tx-queue configuration mode. The `show qos interfaces` displays the transmit queue configuration for a specified port.

Example

- This command enters tx-queue configuration mode for transmit queue 3 of Ethernet interface 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#tx-queue 3
switch(config-if-Et5-txq-3)#
```

Configuring the Shape Rate – Port and Transmit Queues

A port’s shape rate specifies the port’s maximum outbound traffic bandwidth. A shape rate can also be configured for all transmit queues on each port. All shape rate commands use kbps to specify data rates.

- To configure a port’s shape rate, enter `shape rate (Interface – Trident II)` from the port’s interface configuration mode.
- To configure a transmit queue’s shape rate, enter `shape rate (Tx-queue – Trident II)` from the queue’s tx-queue configuration mode.

Example

- These commands configure a shape rate of 5 Gbs on Ethernet port 3, then configure the shape rate for the following transmit queues:
  - transmit queues 0, 1, and 2: 500 Mbps
transmit queues 3, 4, and 5: 400 Mbps

```
switch(config)#interface ethernet 17/3
switch(config-if-Et17/3)#shape rate 5000000
switch(config-if-Et17/3)#tx-queue 0
switch(config-if-Et17/3-txq-0)#shape rate 500000
switch(config-if-Et17/3-txq-0)#tx-queue 1
switch(config-if-Et17/3-txq-1)#shape rate 500000
switch(config-if-Et17/3-txq-1)#tx-queue 3
switch(config-if-Et17/3-txq-3)#shape rate 400000
switch(config-if-Et17/3-txq-3)#tx-queue 4
switch(config-if-Et17/3-txq-4)#shape rate 400000
switch(config-if-Et17/3-txq-4)#tx-queue 5
switch(config-if-Et17/3-txq-5)#shape rate 400000
switch(config-if-Et17/3-txq-5)#exit
```

```
switch(config-if-Et17/3)#show qos interface ethernet 17/3

Ethernet17/3:

```

**Configuring Queue Priority**

Queue priority rank is denoted by the queue number; transmit queues with higher numbers have higher priority. Trident II supports strict priority queues; round robin queues are not supported.

The **bandwidth guaranteed (Trident II)** command configures specifies the minimum bandwidth for outbound traffic on the transmit queue.
Example

- These commands configure a minimum egress bandwidth of 1 Mbps for transmit queue 4 of Ethernet interface 17/3.

switch(config-if-Et17/3)#tx-queue 4
switch(config-if-Et17/3-txq-4)#show qos interface ethernet 17/3

<table>
<thead>
<tr>

<td>SP / SP</td>
</tr>
</tbody>
</table>

switch(config-if-Et17/3-txq-4)#

27.8.5 Ingress Policing on LAG

Ingress policing on a port-channel polices the matched traffic from all member interfaces combined, i.e. it provides aggregate policing and statistics (DCS-7050X, DCS-7010T, DCS-7250X, and DCS-7300X series). When a per-interface policer is attached to a port-channel, one set of TCAM entries is created for all member interfaces. The associated interface bitmap is updated, and aggregate policing is performed on all member interfaces.

Example

- These commands configure a service-policy (with policer action) on LAG by creating the service-policy and applying the service-policy on a port-channel.

switch(config)#policy-map policy-1
switch(config-pmap-qos-policy-1)#class class-1
switch(config-pmap-c-qos-policy-1-class-1)#police cir 512000 bps bc 96000
switch(config-pmap-c-qos-policy-1-class-1)#exit
switch(config-pmap-qos-policy-1)#exit
switch(config)#interface Et 4 / 5 / 4
switch(config-if-Et4/5/4)#channel-group 2 mode active
switch(config-if-Et4/5/4)#exit
switch(config)#interface po2
switch(config-if-Po2)#service-policy type qos input policy-1
switch(config-if-Po2)#exit
switch(config)#
These commands configure ACL policing in single-rate, two-color mode.

```
switch(config)#class-map type qos match-any class1
switch(config-cmap-qos-class1)#match ip access-group acl1
switch(config-cmap-qos-class1)#exit
switch(config)#policy-map type quality-of-service policy1
switch(config-pmap-qos-policy1)#class class1
switch(config-pmap-c-qos-policy1-class1)#police cir 512000 bc 96000
switch(config-pmap-c-qos-policy1-class1)#exit
switch(config-pmap-qos-policy1)#exit
switch(config)#show policy-map
Service-policy policy1
Class-map: class1 (match-any)
  Match: ip access-group name acl1
  police rate 512000 bps burst-size 96000 bytes
Class-map: class-default (match-any)
```

**27.8.6 Fabric QoS -- Trident II Platform Switches**

EOS is optimized to support QoS configuration on the Fabric interfaces on 7250x and 7300 series switches. Configuring QoS on the Fabric interfaces in addition to front panel ports allows user to have end-to-end control and helps to manage traffic better over these switches. By default, tx queues are configured as strict priority on 7250X and 7300X series.

The following QoS configuration options are supported on Fabric interfaces on 7250x and 7300 series switches.

- **Guaranteed Bandwidth**: In order to prevent queue starvation on fabric ports EOS supports minimum bandwidth configuration on per queue basis across all fabric ports.
- **Explicit Congestion Notification (ECN)**: EOS supports enabling ECN on a per queue basis across all fabric ports.
- **Priority Flow Control (PFC)**: Queue back-pressure propagates across the backplane such that flow control messages can be generated to the upstream devices. This is done by enabling PFC for the desired backplane traffic-classes.
- **Weight Round Robin (WRR)**: EOS supports configuring Weighted Round Robin (WRR) on a per queue basis across all fabric ports.

**27.8.6.1 Configuring Fabric QoS on 7250X and 7300X Series**

Fabric QoS is configured using a QoS profiles which is then applied on fabric interfaces on 7250x and 7300x series. Following are the steps to configure Fabric QoS.

**Step 1** Use `qos profile` command to create a QoS profile.

**Step 2** Use `tx-queue` (Trident II) command to configure a transmit queue on the configuration mode interface.

**Step 3** Use `bandwidth guaranteed` (Trident II) command to specify the minimum bandwidth for outbound traffic on the transmit queue.

**Step 4** Use `random-detect ecn` (Trident) command to enable the ECN marking for the configuration mode unicast transmit queue and specifies threshold queue sizes.
Step 5  Use **priority-flow-control priority** command to configure the packet resolution setting on the configuration mode interface.

Step 6  Use **interface fabric** command to configure Fabric interface.

Step 7  Use **service-profile** command to apply the QoS profile to the Fabric interface.

**Example**

- These commands create a QoS profile named **fabricProfile** with tx queue, bandwidth, ECN, PFC and DLB values defined in it and then the profile is attached to Fabric interface of the switch.

**Note**  
To support PFC on a particular priority, DLB is disabled for that priority.

```
switch(config)# qos profile fabricProfile
switch(config-qos-profile-fabricProfile)# tx-queue 0
switch(config-qos-profile-fabricProfile-txq-0)# bandwidth guaranteed 10000 kbps
switch(config-qos-profile-fabricProfile-txq-0)# random-detect ecn
switch(config-qos-profile-fabricProfile-txq-0)# minimum-threshold 10 mbytes maximum-threshold 10 mbytes
switch(config-qos-profile-fabricProfile)# priority-flow-control priority 1 no-drop
switch(config-qos-profile-fabricProfile)# priority-flow-control priority 6 no-drop dlb

Applying the QoS profile on ‘interface fabric’ of the switch.

switch# configure terminal
switch(config)# interface fabric
switch(config-if-fabric)# service-profile fabricProfile
```

**27.8.6.2 Displaying Fabric QoS Information**

These show commands display the configured Fabric QoS information on the switch.

- **show qos profile [profile Name]:** Displays the list of QoS profiles configured on the switch.
- **show qos interfaces fabric:** Displays the profile applied on the fabric interface on the switch.

**Examples**

- This command displays the fabricProfile profile information.

  switch# show qos profile fabricProfile
  qos profile fabricProfile
  priority-flow-control priority 1 no-drop
  priority-flow-control priority 6 no-drop dlb
  tx-queue 0
  bandwidth guaranteed 10000 kbps
  random-detect ecn minimum-threshold 10 mbytes maximum-threshold 10 mbytes

- This command displays the profile applied on the fabric interface.

  switch# show qos interfaces fabric
  qos profile fabricProfile
27.9 ACL based QoS Configuration

27.9.1 ACL Based QoS (DCS-7160)

The IPv4 ACL based QoS is enabled on switches through policy-map configuration. The ACL based QoS can be configured on front panel ports, port-channel interfaces on DCS-7160 series switches.

27.9.1.1 ACL based QoS on SVIs

The ACL based QoS policy applied on SVIs modify the QoS parameters for SVI traffic (L3 VLAN) based on ACL classification. The ACL based QoS on Switched Virtual Interface (SVI) ports is supported on DCS-7500E, DCS-7280E, DCS-7010, DCS-7050, DCS-7050X, DCS-7250X, DCS-7300X, DCS-7020TR.

27.9.1.2 ACL Sharing on QoS

The ACLs applied on QoS shares the hardware resources (TCAM) when potentially large QoS policy-maps are applied to multiple SVIs. For ACL based QoS on SVIs in sharing mode we share TCAM for class-maps without policer action and replicate entries for policer class-maps. The following platforms support ACL sharing on QoS - HelixFour, TridentTwo, Tomahawk, TomahawkPlus, TomahawkTwo, Trident3, TridentThreeXThree.

The QoS actions is applicable only to the routed traffic flowing through the members of the corresponding VLAN.

The steps to configure ACL based QoS is as follows:

Step 1 Create a access list using `ip access-list` command.

Step 2 Create a class map and attach it to the access list using `class-map` command.

Step 3 Create a policy and attach the class map to the policy created, using the `policy-map` command.

Step 4 Apply the policy to the interface using the `service-policy input` command.

Examples

- These command configure the access list `acl1`.
  ```
  switch(config)#ip access-list acl1
  switch(config-acl-acl1)#permit ip 10.1.1.1/24 any
  switch(config-acl-acl1)#exit
  ```

- These commands configure the class map `class1`.
  ```
  switch(config)#class-map match-any class1
  switch(config-cmap-qos-class1)#match ip access-group acl1
  switch(config-cmap-qos-class1)#exit
  ```

- These commands configure the policy map `policy1`.
  ```
  switch(config)#policy-map policy1
  switch(config-pmap-qos-policy1)#class class1
  switch(config-pmap-c-qos-policy1-class1)#set dscp 20
  switch(config-pmap-c-qos-policy1-class1)#set traffic-class 2
  switch(config-pmap-c-qos-policy1-class1)#exit
  switch(config-pmap-c-qos-policy1)#exit
  ```
Chapter 27: Quality of Service

ACL based QoS Configuration

- These commands apply the policy1 to the interface Ethernet 1/1.
  ```
  switch(config)#interface Et1/1
  switch(config-if-Et1/1)#service-policy input policy1
  switch(config-if-Et1/1)#exit
  ```

- These commands configure a ACL based QoS on the SVI interface VLAN10.
  ```
  switch(config)#interface vlan 10
  switch(config-if-Vl10)#service-policy [type qos] input policy1
  ```

- This command enables the resource (hardware) sharing when a ACL based QoS is attached to VLAN interface. The no form of the command disables it.
  ```
  switch(config)#hardware access-list qos resource sharing vlan in
  ```

Show Commands

The following show commands display the status of policy-maps programmed on the interface, for more information on these commands refer Section 27.10: Quality of Service Configuration Commands

- `show policy-map [policy-name]`: Displays the policy-map programming status.
- `show policy-map interface interface-id`: Displays the policy-map that is currently programmed on the interface.
- `show policy-map [policy-name] counters`: Displays the policy-map traffic hits.
- `show platform xp qos tcam [hits]`: Displays the TCAM entries programmed for each policy-map as well as the traffic hits. The hits option is used to see the TCAM entries with nonzero traffic hits.
- `show run | grep sharing`: Displays if whether the ACL based QoS is enabled or disabled.
- `show platform trident tcam shared vlan interface-class-id`: Displays what SVIs are currently sharing the QoS policy-map.
- `show platform trident tcam qos detail`: Displays the list of all the SVIs that are sharing the TCAM entries.

27.9.1.3 Limitations

- Maximum number of TCAM entries that can be programmed in hardware for all QoS policy-maps on the box is 1024.
- Layer 4 port ranges are not supported for ACL based QoS. The ranges will be expanded into multiple TCAM rules and programmed in the hardware.
- Configured policer rate should be above 1mbps and recommended burst value is 2000 bytes.
- Policer action can’t be associated with policy-maps applied to Port-Channels.

The following are the limitations specific to DCS-7500E, DCS-7280E and DCS-7020TR:

- User cannot apply more than 31 QoS service policies per chip on L3 interfaces.
- When different QoS service policies are applied to the SVI and its member interfaces, the behavior is indeterministic.
- When QoS service policies are applied on SVIs with partial failures due to limited hardware resources, any event that triggers a forwarding agent restart will lead to indeterministic behavior.
- When QoS service policies are applied on 2 SVIs, any event that triggers the VLAN membership change of a member interface may result in a policy-map programming failure. To change the VLAN membership, remove the interface from the first VLAN and then add it to the other.
- Outgoing COS rewrite is not supported.
- QoS policy-map counters are not supported.

The following are the limitations specific to DCS-7010, DCS-7050, DCS-7050X, DCS-7250X, DCS-7300X:
  
  - TCAM resources won’t be shared for the same policy-map applied to multiple SVIs.
  - Policy-map applied to a SVI will result in TCAM allocation on all chips irrespective of whether the SVI members are present or not.

When QoS service policies are applied to both SVI and its member interfaces and packets hit both policies, the behavior is indeterministic.
27.10 Quality of Service Configuration Commands

QoS Data Field and Traffic Class Configuration Commands
- hardware access-list qos resource sharing vlan in
- platform petraA traffic-class
- qos cos
- qos dscp
- qos map cos
- qos map dscp
- qos map traffic-class to cos
- qos map traffic-class to dscp
- qos map traffic-class to mc-tx-queue
- qos map traffic-class to tx-queue
- qos map traffic-class to uc-tx-queue
- qos profile
- qos rewrite cos
- qos rewrite dscp
- qos trust
- service-policy type qos input
- service-profile

QoS and ECN Display Commands
- show platform petraA traffic-class
- show policy-map
- show policy-map interface
- show qos interfaces
- show qos interfaces trust
- show qos interfaces random-detect ecn
- show qos maps
- show qos profile
- show run|grep sharing
- show platform trident tcam shared vlan interface-class-id
- show platform trident tcam qos detail
- show qos profile summary
- show qos random-detect ecn
- show platform xp qos tcam hit

ECN Configuration Commands
- qos random-detect ecn global-buffer (Helix)
- qos random-detect ecn global-buffer (Trident and Tomahawk)
- random-detect ecn (Arad/Jericho)
- random-detect ecn (Helix)
- random-detect ecn (Trident and Tomahawk)

Transmit Queue and Port Shaping Commands – Arad and Jericho Platforms
- bandwidth percent (Arad/Jericho)
- priority (Arad/Jericho)
- shape rate (Interface – Arad/Jericho)
- shape rate (Tx-queue – Arad/Jericho)
- tx-queue (Arad/Jericho)
Transmit Queue and Port Shaping Commands – FM6000 Platform
- bandwidth percent (FM6000)
- priority (FM6000)
- shape rate (Interface – FM6000)
- shape rate (Tx-queue – FM6000)
- tx-queue (FM6000)

Transmit Queue and Port Shaping Commands – Helix Platform
- bandwidth guaranteed (Helix)
- shape rate (Interface – Helix)
- shape rate (Tx-queue – Helix)
- tx-queue (Helix)

Transmit Queue and Port Shaping Commands – Petra Platform
- bandwidth percent (Petra)
- priority (Petra)
- shape rate (Interface – Petra)
- shape rate (Tx-queue – Petra)
- tx-queue (Petra)

Transmit Queue and Port Shaping Commands – Trident and Tomahawk Platform
- bandwidth percent (Trident and Tomahawk)
- mc-tx-queue
- priority (Trident and Tomahawk)
- shape rate (Interface – Trident and Tomahawk)
- shape rate (Tx-queue – Trident and Tomahawk)
- uc-tx-queue

Transmit Queue and Port Shaping Commands – Trident II Platform
- bandwidth guaranteed (Trident II)
- shape rate (Tx-queue – Trident II)
- shape rate (Interface – Trident II)
- tx-queue (Trident II)
- interface fabric (Trident II)
bandwidth guaranteed (Helix)

The `bandwidth guaranteed` command specifies the minimum bandwidth for outbound traffic on the transmit queue. By default, no bandwidth is guaranteed to any transmit queue.

The `no bandwidth guaranteed` and `default bandwidth guaranteed` commands remove the minimum bandwidth guarantee on the transmit queue by deleting the corresponding `bandwidth guaranteed` command from `running-config`.

**Command Mode**

Tx-Queue Configuration

**Command Syntax**

```
bandwidth guaranteed rate DATA_MIN
no bandwidth guaranteed
default bandwidth guaranteed
```

**Parameters**

- `DATA_MIN` minimum bandwidth. Value range varies with data unit:
  - `<8` to `40000000` 8 to 40,000,000 kbytes per second.
  - `<8` to `40000000-kbps` 8 to 40,000,000 kbytes per second.
  - `<8` to `60000000-pps` 1 to 60,000,000 packets per second.

**Related Commands**

- `tx-queue (Helix)` places the switch in tx-queue configuration mode.

**Example**

- These commands configure a minimum egress bandwidth of 1 Mbps for transmit queue 4 of Ethernet interface 17/3.

```
switch(config)#interface ethernet 17
switch(config-if-Et17)#tx-queue 4
switch(config-if-Et17-txq-4)#bandwidth guaranteed 1000 kbps
switch(config-if-Et17-txq-4)#show qos interfaces ethernet 17
```

```
Ethernet17/3:
Trust Mode: COS
Default COS: 0
Default DSCP: 0
Port shaping rate: disabled

```

```
switch(config-if-Et17-txq-4)#
```
bandwidth guaranteed (Trident II)

The bandwidth guaranteed command specifies the minimum bandwidth for outbound traffic on the transmit queue. By default, no bandwidth is guaranteed to any transmit queue.

The no bandwidth guaranteed and default bandwidth guaranteed commands remove the minimum bandwidth guarantee on the transmit queue by deleting the corresponding bandwidth guaranteed command from running-config.

Command Mode
Tx-Queue Configuration

Command Syntax

```
bandwidth guaranteed rate DATA_MIN
no bandwidth guaranteed
default bandwidth guaranteed
```

Parameters

- **DATA_MIN** minimum bandwidth. Value range varies with data unit:
  - `<8 to 40000000>` 8 to 40,000,000 kbytes per second.
  - `<8 to 40000000-kbps>` 8 to 40,000,000 kbytes per second.
  - `<8 to 60000000-pps>` 1 to 60,000,000 packets per second.

Related Commands

- tx-queue (Trident II) places the switch in tx-queue configuration mode.

Example

- These commands configure a minimum egress bandwidth of 1 Mbps for transmit queue 4 of Ethernet interface 17/3.

```
switch(config)#interface ethernet 17/3
switch(config-if-Et17/3)#tx-queue 4
switch(config-if-Et17/3-txq-4)#bandwidth guaranteed 1000 kbps
switch(config-if-Et17/3-txq-4)#show qos interfaces ethernet 17/3
```

bandwidth percent (Arad/Jericho)

The `bandwidth percent` command configures the bandwidth share of the transmit queue when configured for round robin priority. Bandwidth is allocated to all queues based on the cumulative configured bandwidth of all the port’s round robin queues.

The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the cumulative configured bandwidth is greater than 100%, each port’s operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

The `no bandwidth percent` and `default bandwidth percent` commands restore the default bandwidth share of the transmit queue by removing the corresponding `bandwidth percent` command from running-config.

**Command Mode**

Tx-Queue Configuration

**Command Syntax**

```
bandwidth percent proportion
no bandwidth percent
default bandwidth percent
```

**Parameters**

- `proportion` Bandwidth percentage assigned to queues. Values range from 1 to 100.

**Related Commands**

- `tx-queue (Arad/Jericho)` places the switch in tx-queue configuration mode.

**Example**

- These commands configure queues 0 through 3 (Ethernet interface 3/5/1) as round robin, then allocate bandwidth for three queues at 30% and one queue at 10%.

```
switch(config)#interface ethernet 3/5/1
switch(config-if-Et3/5/1)#tx-queue 3
switch(config-if-Et3/5/1-txq-3)#no priority
switch(config-if-Et3/5/1-txq-3)#bandwidth percent 10

bandwidth percent (FM6000)

The **bandwidth percent** command configures the bandwidth share of the transmit queue when configured for round robin priority. Bandwidth is allocated to all queues based on the cumulative configured bandwidth of all the port’s round robin queues.

The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the cumulative configured bandwidth is greater than 100%, each port’s operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

The **no bandwidth percent** and **default bandwidth percent** commands restore the default bandwidth share of the transmit queue by removing the corresponding **bandwidth percent** command.

**Command Mode**

  Tx-Queue Configuration

**Command Syntax**

- `bandwidth percent proportion`
- `no bandwidth percent`
- `default bandwidth percent`

**Parameters**

- **proportion**  Configured bandwidth percentage. Value ranges from 1 to 100. Default value is 0.

**Related Commands**

- **tx-queue (FM6000)** places the switch in tx-queue configuration mode.
Example

These commands configure queues 0 through 3 (Ethernet interface 19) as round robin, then allocate bandwidth for three queues at 30% and one queue at 10%.

```plaintext
switch(config)#interface Ethernet 19
switch(config-if-Et19)#tx-queue 3

switch(config-if-Et3/28-txq-3)#
bandwidth percent (Trident and Tomahawk)

The bandwidth percent command configures the bandwidth share of the transmit queue when configured for round robin priority. Bandwidth is allocated to all queues based on the cumulative configured bandwidth of all the port’s round robin queues.

The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the cumulative configured bandwidth is greater than 100%, each port’s operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

The no bandwidth percent and default bandwidth percent commands restore the default bandwidth share of the transmit queue by removing the corresponding bandwidth percent command running-config.

Command Mode

Mc-Tx-Queue configuration
Uc-Tx-Queue configuration

Command Syntax

bandwidth percent proportion
no bandwidth percent
default bandwidth percent

Parameters

• proportion Bandwidth percentage assigned to queues. Values range from 1 to 100.

Related Commands

• mc-tx-queue places the switch in mc-tx-queue configuration mode.
• uc-tx-queue places the switch in uc-tx-queue configuration mode.
Example

- These commands configure unicast transmit queue 3 (and all other queues of lower priority) as round robin, then allocate bandwidth for unicast transmit queues 1, 2, and 3 at 30% and multicast transmit queue 1 at 10%.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#uc-tx-queue 3
switch(config-if-Et7-uc-txq-3)#no priority

switch(config-if-Et7-uc-txq-3)#
hardware access-list qos resource sharing vlan in

The **hardware access-list qos resource sharing vlan in** command enables the ACL based QoS resources sharing on a VLAN interface.

The **no hardware access-list qos resource sharing vlan in** disables the ACL based QoS resources sharing on a VLAN interface. By default this function is disabled.

**Command Mode**
Global Configuration

**Command Syntax**

```
hardware access-list qos resource sharing vlan in
no hardware access-list qos resource sharing vlan in
```

**Example**
- This commands enables the ACL based QoS resources sharing on a VLAN interface.
  ```
  switch(config)#hardware access-list qos resource sharing vlan in
  ```
mc-tx-queue

The `mc-tx-queue` command places the switch in mc-tx-queue configuration mode to configure a multicast transmit queue on the configuration mode interface. Mc-tx-queue configuration mode is not a group change mode; `running-config` is changed immediately after commands are executed. The `exit` command does not affect the configuration.

Trident and Tomahawk switches have four multicast queues (MC0 – MC03) and eight unicast queues (UC0 – UC7), categorized into two priority groups. All queues are exposed through the CLI and are user configurable.

- Priority Group 1: UC7, UC6, MC3
- Priority Group 0: UC5, UC4, MC2, UC3, UC2, MC1, UC1, UC0, MC0

The `exit` command returns the switch to the configuration mode for the base Ethernet or port channel interface.

The `no mc-tx-queue` and `default mc-tx-queue` commands remove the configuration for the specified transmit queue by deleting the all corresponding `mc-tx-queue` mode commands from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

**Command Syntax**

```
mc-tx-queue queue_level
```

**Parameters**

- `queue_level` The multicast transmit queue number. Values range from 0 to 3.

**Commands Available in tx-queue Configuration Mode**

- `bandwidth percent` (Trident and Tomahawk)
- `priority` (Trident and Tomahawk)
- `shape rate` (Tx-queue – Trident and Tomahawk)

**Related Commands**

- `uc-tx-queue`: Configures unicast transmit queues on Trident and Tomahawk platform switches.

**Example**

- This command enters mc-tx-queue configuration mode for multicast transmit queue 3 of Ethernet interface 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#mc-tx-queue 3
switch(config-if-Et5-mc-txq-3)#
```
The **platform petraA traffic-class** command configures the default traffic class used by all ports on a specified chip. The default traffic class is implemented by Petra platform switches to replace qos cos and qos dscp commands. Traffic class values range from 0 to 7. The default traffic class is one.

When **platform ?** returns Petra:

- CoS trusted ports: inbound untagged packets are assigned to the default traffic class. Tagged packets are assigned to the traffic class that corresponds to the contents of its CoS field.
- DSCP trusted ports: inbound non-IP packets are assigned to the default traffic class. IP packets are assigned to the traffic class that corresponds to the contents of its DSCP field.
- Untrusted ports: all inbound packets are assigned to the default traffic class.

The **no platform petraA traffic-class** and **default platform petraA traffic-class** commands restore the default traffic class of one for all ports on the specified chips by deleting the corresponding **platform petraA traffic-class** command from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

```
platform petraA [CHIP_NAME] traffic-class tc_value
no platform petraA [CHIP_NAME] traffic-class
default platform petraA [CHIP_NAME] traffic-class
```

**Parameters**

- **CHIP_NAME** trust mode assigned to the specified ports. Port designation options include:
  - `<no parameter>` all ports on the switch.
  - **module cardX** all ports on specified linecard (7500 Series).
  - **petra cardX/chipY** all ports on PetraA chip chipY on linecard cardX (7500 Series).
  - **petra-chipZ** all ports on PetraA chip chipZ (7048 Series)

**7500 Series**

Switches can contain up to eight linecards. **cardX** varies from 3 to 10.

Each linecard contains six PetraA chips. Each chip controls eight ports. **chipY** varies from 0 to 5:

- 0 controls ports 1 through 8
- 1 controls ports 9 through 16
- 2 controls ports 17 through 24
- 3 controls ports 25 through 32
- 4 controls ports 33 through 40
- 5 controls ports 41 through 48

**7048 Series**

Each switch contains two PetraA chips. **chipZ** varies from 0 to 1:

- 0 controls ports 1 through 32
- 1 controls ports 33 through 52

- **tc_value** Traffic class value. Values range from 0 to 7. Default value is 1.
Related Commands

- `show platform petraA traffic-class` displays the traffic class assignment on all specified Petra chips.

Example

- This command configures the default traffic class to six for ports 25-32 on linecard 5.

  ```
  switch(config)#platform petraA petra5/3 traffic-class 6
  switch(config)#
  ```
priority (Arad/Jericho)

The **priority** command specifies the priority of the transmit queue. The switch supports two queue priorities:

- **strict priority**: contents are removed from the queue - subject to maximum bandwidth limits, before data from lower priority queues. The default setting on all queues is strict priority.
- **round robin priority**: contents are removed proportionately from all round robin queues - subject to maximum bandwidth limits assigned to the strict priority queues.

Tx-queue 7 is set to strict priority and is not configurable.

When a queue is configured as a round robin queue, all lower priority queues also function as round robin queues. A queue's numerical label denotes its priority: higher labels denote higher priority. Tx-queue 6 has higher priority than Tx-queue 5, and Tx-queue 0 has the lowest priority.

The **priority strict** and **default priority** commands configure a transmit queue to function as a strict priority queue unless a higher priority queue is configured as a round robin queue.

The **no priority** command configures a transmit queue as a round robin queue. All lower priority queues also function as round robin queues regardless of their configuration.

**Command Mode**

Tx-Queue Configuration

**Command Syntax**

```plaintext
priority strict
no priority
default priority
```

**Related Commands**

- **tx-queue (Arad/Jericho)** places the switch in tx-queue configuration mode.

**Example**

- These commands perform the following on Ethernet interface 3/4/1:
  - Displays the default state of all transmit queues.
  - Configures transmit queue 3 as a round robin queue.
Displays the effect of the **no priority** command on all transmit queues on the interface.

```
switch(config)#interface ethernet 3/4/1
switch(config-if-Et3/4/1)#show qos interfaces ethernet 3/4/1

priority (FM6000)

The priority command specifies the priority of the transmit queue. The switch supports two queue priorities:

- strict priority: contents are removed from the queue - subject to maximum bandwidth limits, before data from lower priority queues. The default setting on all queues is strict priority.
- round robin priority: contents are removed proportionately from all round robin queues - subject to maximum bandwidth limits assigned to the strict priority queues.

When a queue is configured as a round robin queue, all lower priority queues also function as round robin queues. A queue's numerical label denotes its priority: higher labels denote higher priority. Tx-queue 6 has higher priority than Tx-queue 5, and Tx-queue 0 has the lowest priority.

The priority strict and default priority commands configure a transmit queue to function as a strict priority queue unless a higher priority queue is configured as a round robin queue.

The no priority command configures a transmit queue as a round robin queue. All lower priority queues also function as round robin queues regardless of their configuration.

Command Mode

- Tx-Queue Configuration

Command Syntax

- priority strict
- no priority
- default priority

Related Commands

- tx-queue (FM6000) places the switch in tx-queue configuration mode.

Example

- These commands perform the following on Ethernet interface 2:
  - Displays the default state of all transmit queues.
  - Configures transmit queue 3 as a round robin queue.
  - Displays the effect of the no priority command on all transmit queues on the interface.
switch(config)#interface ethernet 19

switch(config-if-Et19-txq-3)#
priority (Petra)

The **priority** command specifies the priority of the transmit queue. The switch supports two queue priorities:

- **strict priority**: contents are removed from the queue - subject to maximum bandwidth limits, before data from lower priority queues. The default setting on all queues is strict priority.
- **round robin priority**: contents are removed proportionately from all round robin queues - subject to maximum bandwidth limits assigned to the strict priority queues.

Tx-queue 7 is set to strict priority and is not configurable.

When a queue is configured as a round robin queue, all lower priority queues also function as round robin queues. A queue's numerical label denotes its priority: higher labels denote higher priority. Tx-queue 6 has higher priority than Tx-queue 5, and Tx-queue 0 has the lowest priority.

The **priority strict** and **default priority** commands configure a transmit queue to function as a strict priority queue unless a higher priority queue is configured as a round robin queue.

The **no priority** command configures a transmit queue as a round robin queue. All lower priority queues also function as round robin queues regardless of their configuration.

**Command Mode**

*Tx-Queue Configuration*

**Command Syntax**

- `priority strict`
- `no priority`
- `default priority`

**Related Commands**

- `tx-queue (Petra)` places the switch in tx-queue configuration mode.

**Example**

- These commands perform the following on Ethernet interface 3/28:
  - Displays the default state of all transmit queues.
  - Configures transmit queue 3 as a round robin queue.
• Displays the effect of the **no priority** command on all transmit queues on the interface.

```plaintext
switch(config)#interface ethernet 3/28
switch(config-if-Et3/28)#show qos interface ethernet 3/28
Ethernet3/28:
   Trust Mode: COS
   <---------OUTPUT OMITTED FROM EXAMPLE-------->

   3          25     disabled   round-robin
   2          25     disabled   round-robin
   1          25     disabled   round-robin
   0          25     disabled   round-robin
switch(config-if-Et3/28-txq-3)#
```
priority (Trident and Tomahawk)

The **priority** command specifies the priority of the transmit queue. The switch supports two queue priorities:

- **strict priority**: contents are removed from the queue - subject to maximum bandwidth limits, before data from lower priority queues. The default setting on all other queues is strict priority.
- **round robin priority**: contents are removed proportionately from all round robin queues - subject to maximum bandwidth limits assigned to the strict priority queues.

Trident and Tomahawk switches have eight unicast queues (UC0 – UC7) and four multicast queues (MC0 – MC03), categorized into two priority groups. Priority group 1 queues have priority over priority 0 queues. The following lists display the priority group queues in order from higher priority to lower priority.

- Priority Group 1: UC7, UC6, MC3
- Priority Group 0: UC5, UC4, MC2, UC3, UC2, MC1, UC1, UC0, MC0

Priority group 1 queues are strict priority queues and are not configurable as round robin. Priority 0 queues are strict priority by default and are configurable as round robin. When a queue is configured as a round robin queue, all lower priority queues automatically function as round robin queues.

The **priority strict** and **default priority** commands configure a transmit queue to function as a strict priority queue unless a higher priority queue is configured as a round robin queue.

The **no priority** command configures a transmit queue as a round robin queue. All lower priority queues also function as round robin queues regardless of their configuration.

**Command Mode**

- Mc-Tx-Queue configuration
- Uc-Tx-Queue configuration

**Command Syntax**

- priority strict
- no priority
- default priority

**Related Commands**

- **mc-tx-queue** places the switch in mc-tx-queue configuration mode.
- **uc-tx-queue**: places the switch in uc-tx-queue configuration mode.

**Example**

- These commands perform the following on Ethernet interface 7:
  - Displays the default state of all transmit queues.
  - Configures transmit queue 3 as a round robin queue.
  - Displays the effect of the **no priority** command on all transmit queues on the interface.
```

```

**qos cos**

The `qos cos` command specifies the default class of service (CoS) value of the configuration mode interface. CoS values range from 0 to 7. Default value is 0.

*Arad, Jericho, fm6000, Trident, Tomahawk*, and *Trident II* platform switches:

- CoS trusted ports: the default CoS value determines the traffic class for inbound untagged packets. Tagged packets are assigned to the traffic class that corresponds to the contents of its CoS field.
- Untrusted ports: the default CoS value determines the traffic class for all inbound packets.

*Petra* platform switches:

- CoS trusted ports: inbound untagged packets are assigned to the default traffic class, as configured by `platform petraA traffic-class`. Tagged packets are assigned to the traffic class that corresponds to the contents of its CoS field.
- Untrusted ports: all inbound packets are assigned to the default traffic class.

The `no qos cos` and `default qos cos` commands restore the port’s default CoS value to zero by deleting the corresponding `qos cos` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

**Command Syntax**

```
qos cos cos_value
no qos cos
default qos cos
```

**Parameters**

- `cos_value` CoS value assigned to port. Value ranges from 0 to 7. Default value is 0.

**Example**

- This command configures the default CoS of four on Ethernet interface 8.

  ```
  switch(config-if-Et8)# qos cos 4
  switch(config-if-Et8)#
  ```
qos dscp

The `qos dscp` command specifies the default Differentiated Services Code Point (DSCP) value of the configuration mode interface. The default DSCP determines the traffic class for non-IP packets that are inbound on DSCP trusted ports. DSCP trusted ports determine the traffic class for inbound packets as follows:

- **Arad, Jericho, fm6000, Trident, Tomahawk**, and **Trident II** platform switches:
  - non-IP packets: default DSCP value specified by `qos dscp` determines the traffic class.
  - IP packets: assigned to the traffic class corresponding to its DSCP field contents.

- **Petra** platform switches:
  - non-IP packets: assigned to default traffic class configured by `platform petraA traffic-class`.
  - IP packets: assigned to the traffic class corresponding to its DSCP field contents.

The `no qos dscp` and `default qos dscp` commands restore the port’s default DSCP value to zero by deleting the corresponding `qos dscp` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

**Command Syntax**

```
qos dscp dscp_value
no qos dscp
default qos dscp
```

**Parameters**

- `dscp_value` DSCP value assigned to the port. Value ranges from 0 to 63. Default value is 0.

**Example**

- This command sets the default DSCP of 44 on Ethernet 7 interface.
  
  ```
  switch(config)#interface ethernet 7
  switch(config-if-Et7)#qos dscp 44
  switch(config-if-Et7)
  ```
qos map cos

The **qos map cos** command associates a traffic class to a list of class of service (CoS) settings. Multiple commands create a complete CoS to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet’s CoS field or the port upon which it is received.

The **no qos map cos** and **default qos map cos** commands restore the specified CoS values to their default traffic class setting by deleting the corresponding **qos map cos** statements from **running-config**.

**Command Mode**

- Global Configuration

**Command Syntax**

```
qos map cos cos_value_1 [cos_value_2 ... cos_value_n] to traffic-class tc_value
no qos map cos cos_value_1 [cos_value_2 ... cos_value_n]
default qos map cos cos_value_1 [cos_value_2 ... cos_value_n]
```

**Parameters**

- **cos_value_x**  
  Class of service (CoS) value. Value ranges from 0 to 7.

- **tc_value**  
  Traffic class value. Value range varies by platform.

Default CoS to traffic class map varies by platform (**Table 27-36**).

**Default Inbound CoS to Traffic Class Map**

**Table 27-36** displays the default CoS to traffic class map for each platform.

**Table 27-36 Default CoS to Traffic Class Map**

<table>
<thead>
<tr>
<th>Inbound CoS</th>
<th>0</th>

</table>

**Related Commands**

- **qos cos** specifies the default CoS
- **platform petraA traffic-class** specifies the default traffic class

**Example**

- This command assigns the traffic class of 5 to the classes of service 1, 3, 5, and 7.

```
switch(config)#qos map cos 1 3 5 7 to traffic-class 5
switch(config)#
```
qos map dscp

The **qos map dscp** command associates a traffic class to a set of Differentiated Services Code Point (DSCP) values. Multiple commands create a complete DSCP to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet’s DSCP field or the chip upon which it is received.

The **no qos map dscp** and **default qos map dscp** commands restore the specified DSCP values to their default traffic class settings by deleting corresponding **qos map dscp** statements from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

```
qos map dscp dscpv_1 [dscpv_2 ... dscpv_n] to traffic-class tc_value
no qos map dscp dscpv_1 [dscpv_2 ... dscpv_n]
default qos map dscp dscpv_1 [dscpv_2 ... dscpv_n]
```

**Parameters**

- **dscpv_x**  Differentiated services code point (DSCP) value. Value ranges from 0 to 63.
- **tc_value**  Traffic class value. Value range varies by platform.

Default map varies by platform (Table 27-37).

**Default Inbound DSCP to Traffic Class Map**

Table 27-37 displays the default DSCP to traffic class map for each platform.

<table>
<thead>
<tr>
<th>Inbound DSCP</th>
<th>0-7</th>
<th>8-15</th>
<th>16-23</th>
<th>24-31</th>
<th>32-39</th>
<th>40-47</th>
<th>48-55</th>
<th>56-63</th>
</tr>
</thead>
<tbody>
<tr>

<td>3</td>
<td>4</td>
<td>5</td>
<td>6</td>
<td>7</td>
</tr>
</tbody>
</table>

**Example**

- This command assigns the traffic class of three to the DSCP values of 12, 13, 25, and 37.
  
  ```
  switch(config)#qos map dscp 12 13 25 37 to traffic-class 3
  switch(config)#
  ```
qos map traffic-class to cos

The `qos map traffic-class to cos` command associates a class of service (CoS) to a list of traffic classes. Multiple commands create a complete traffic class to CoS map. The switch uses this map in CoS rewrite operations to fill the CoS field in outbound packets. This map is applicable to DSCP trusted ports and untrusted ports. CoS rewrite is disabled on CoS trusted ports. The `show qos maps` command displays the CoS to traffic class map.

The `no qos traffic-class to cos` and `default qos traffic-class to cos` commands restore the specified traffic class values to their default CoS settings by removing the corresponding `qos map traffic-class to cos` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to cos cos_value
no qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to cos
default qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to cos
```

**Parameters**

- `tc_num_x` Traffic class value. Value range varies by switch platform.
- `cos_value` Class of service (CoS) value. Value ranges from 0 to 7.

**Default Inbound Traffic Class to CoS Map**

Table 27-38 displays the default traffic class to CoS map for each platform.

<table>
<thead>
<tr>
<th>Traffic Class</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
</tr>

<td>1</td>
<td>0</td>
<td>2</td>
<td>3</td>
<td>4</td>
<td>5</td>
<td>6</td>
<td>7</td>
</tr>
</tbody>
</table>

**Example**

- This command assigns the CoS of two to traffic classes 1, 3, and 5.

```
switch(config)# qos map traffic-class 1 3 5 to cos 2
switch(config)#
```
qos map traffic-class to dscp

The qos map traffic-class to dscp command associates a Differentiated Services Code Point (DSCP) value to a list of traffic classes. Multiple commands create a complete traffic class to DSCP map. The switch uses this map in DSCP rewrite operations to fill the DSCP field in outbound packets. This map is applicable to CoS trusted ports and untrusted ports but disabled by default on these ports. DSCP rewrite is disabled on DSCP trusted ports. The show qos maps command displays the traffic class to DSCP map.

The no qos traffic-class to dscp and default qos traffic-class to dscp commands restore the specified traffic class values to their default DSCP settings by removing the corresponding qos map traffic-class to dscp command from running-config.

Command Mode
Global Configuration

Command Syntax
qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to dscp dscp_value
no qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to dscp
default qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to dscp

Parameters
- tc_num_x Traffic class value. Value range varies by switch platform.
- dscp_value Differentiated services code point (DSCP) value. Value ranges from 0 to 63.

Default Inbound Traffic Class to DSCP Map
Table 27-39 displays the default traffic class to DSCP map for each platform.

<table>
<thead>
<tr>
<th>Traffic Class</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSCP Rewrite Value (FM6000)</td>

<tr>
<td>DSCP Rewrite Value (Trident II)</td>
<td>8</td>
<td>0</td>
<td>16</td>
<td>24</td>
<td>32</td>
<td>40</td>
<td>48</td>
<td>56</td>
</tr>
</tbody>
</table>

Example
- This command assigns the DSCP value of 17 to traffic classes 1, 2, and 4.

switch(config)#qos map traffic-class 1 2 4 to dscp 17
switch(config)#
**qos map traffic-class to mc-tx-queue**

The `qos map traffic-class to mc-tx-queue` command associates a multicast transmit queue to a list of traffic classes. Multiple commands create a complete traffic class to mc-tx-queue map. The switch uses this map to route outbound packets to transmit queues, which in turn schedules their transmission from the switch. The `show qos maps` command displays the traffic class to multicast transmit queue map.

The `no qos traffic-class to mc-tx-queue` and `default qos traffic-class to mc-tx-queue` commands restore the default traffic class to multicast transmit queue map for the specified traffic class values by removing the corresponding `qos map traffic-class to mc-tx-queue` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
quos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to mc-tx-queue mtq_value
no qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to mc-tx-queue
default qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to mc-tx-queue
```

**Parameters**

- `tc_num_x` Traffic class value. Value ranges from 0 to 7.
- `mtq_value` Multicast transmit queue number. Value ranges from 0 to 3.

**Default Inbound Traffic Class to Multicast Transmit Queue Map**

Table 27-40 displays the default traffic class to multicast transmit queue map for Trident and Tomahawk platform switches.

<table>
<thead>
<tr>
<th>Traffic Class</th>
<th>Multicast Transmit Queue (Trident and Tomahawk)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 1 2 3 4 5 6 7</td>
<td>0 0 1 1 2 2 3 3</td>
</tr>
</tbody>
</table>

**Related Commands**

- `qos map traffic-class to uc-tx-queue` (Trident and Tomahawk) associates traffic classes to a multicast transmit queue.
- `qos map traffic-class to tx-queue` (all other platforms) associates traffic classes to a transmit queue.

**Example**

- This command maps traffic classes 0, 4, and 5 to mc-tx-queue 2.
  ```
  switch(config)#qos map traffic-class 0 4 5 to mc-tx-queue 2
  switch(config)#
  ```
**qos map traffic-class to tx-queue**

The `qos map traffic-class to tx-queue` command associates a transmit queue (tx-queue) to a list of traffic classes. Multiple commands create a complete traffic to tx-queue map. The switch uses this map to route outbound packets to transmit queues, which in turn schedules their transmission from the switch. The `show qos maps` command displays the transmit queue to traffic class map.

The `no qos traffic-class to tx-queue` and `default qos traffic-class to tx-queue` commands restore the specified traffic class values to their default transmit queue settings by removing the corresponding `qos map traffic-class to tx-queue` command from `running-config`.

### Command Mode

Global Configuration

### Command Syntax

```
qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to tx-queue txq_value
no qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to tx-queue
default qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to tx-queue
```

### Parameters

- `tc_num_x` Traffic class value. Value range varies by platform.
- `txq_value` Transmit queue value. Value range varies by platform.

### Restrictions

FM6000: When priority flow control (PFC) is enabled, traffic classes are mapped to their corresponding transmit queues, regardless of existing `qos map traffic-class to tx-queue` statements.

Arad, Jericho, and Petra: Traffic class 7 always maps to transmit queue 7. This association is not editable.

### Default Inbound Traffic Class to Transmit Queue Map

Table 27-41 displays the transmit queue to traffic class map.

<table>

### Related Commands

- `qos map traffic-class to mc-tx-queue` (Trident and Tomahawk) associates traffic classes to a unicast transmit queue.
- `qos map traffic-class to uc-tx-queue` (Trident and Tomahawk) associates traffic classes to a multicast transmit queue.

### Example

- This command maps traffic classes 0, 4, and 5 to tx-queue 4.
```
switch(config)#qos map traffic-class 0 4 5 to tx-queue 4
switch(config)#
```
qos map traffic-class to uc-tx-queue

The `qos map traffic-class to uc-tx-queue` command associates a unicast transmit queue to a list of traffic classes. Multiple commands create a complete traffic class to unicast transmit queue map. The switch uses this map to route outbound packets to transmit queues, which in turn schedules their transmission from the switch. The `show qos maps` command displays the traffic class to unicast transmit queue map.

The `no qos traffic-class to uc-tx-queue` and `default qos traffic-class to uc-tx-queue` commands restore the default traffic class to unicast transmit queue map for the specified traffic class values by removing the corresponding `qos map traffic-class to uc-tx-queue` command from `running-config`.

Command Mode
Global Configuration

Command Syntax
```
qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to uc-tx-queue utq_value
no qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to uc-tx-queue
default qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to uc-tx-queue
```

Parameters
- `tc_num_x`  Traffic class value. Value ranges from 0 to 7.
- `utq_value`  Unicast transmit queue number. Value ranges from 0 to 7.

Default Inbound Traffic Class to Unicast Transmit Queue Map
`Table 27-42` displays the default traffic class to Unicast transmit queue map for Trident and Tomahawk platform switches.

`Table 27-42  Default Traffic Class to Unicast Transmit Queue Map`

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Related Commands
- `qos map traffic-class to mc-tx-queue` (Trident and Tomahawk) associates traffic classes to a unicast transmit queue.
- `qos map traffic-class to tx-queue` (all other platforms) associates traffic classes to a transmit queue.

Example
- This command maps traffic classes 0, 4, and 5 to unicast transmit queue 4.
  ```
  switch(config)#qos map traffic-class 0 4 5 to uc-tx-queue 4
  switch(config)#
  ```
**qos profile**

The `qos profile` command places the switch in QoS profile configuration mode and for the specified profile and creates the profile if it does not already exist. QoS profiles are used to apply the same QoS configuration to multiple interfaces.

The `no qos profile` and `default qos profile` command deletes the QoS profile from the running configuration.

The `exit` command returns the switch to global configuration mode.

**Command Mode**
- Global Configuration

**Command Syntax**

```
qos profile profile_name
no qos profile profile_name
default qos profile profile_name
```

**Parameter**
- `profile_name` QoS profile name.

**Note**

Commands use a subset of the listed fields. Available subset depends on the specified parameter. Use CLI syntax assistance to view options for specific parameter when creating a QoS profile.

**Example**

- This command places the switch in QoS profile configuration mode for policy map policy map “TP” and creates the policy map if it does not already exist.

```
switch(config)#qos profile TP
switch(config-qos-profile-TP)#
```

**Related Commands**

- `service-policy type qos input`
qos random-detect ecn global-buffer (Helix)

The `qos random-detect ecn global-buffer` command enables ECN marking for globally shared packet memory and specifies minimum and maximum queue threshold sizes. Hosts can advertise their ECN capabilities in the ToS DiffServ field’s two least significant bits:

- **00** Non ECN Capable transport.
- **10** ECN Capable transport.
- **01** ECN Capable transport.
- **11** Congestion encountered.

Congestion is determined by comparing average queue size with queue thresholds. Average queue size is calculated through a formula based on the previous average and current queue size. Packets are marked based on this average size and the specified thresholds:

- Average queue size below minimum threshold: Packets are queued normally.
- Average queue size above maximum threshold: Packets are marked *congestion encountered*.
- Average queue size between minimum and maximum thresholds. Packets are queued or marked *congestion encountered*. The proportion of marked packets varies linearly with average queue size:
  - 0% are marked when average queue size is less than or equal to minimum threshold.
  - 100% are marked when average queue size is greater than or equal to maximum threshold.

When transmitted packets are marked *Non ECN Capable*, congestion packets are dropped, not marked.

The `no qos random-detect ecn global-buffer` and `default qos random-detect ecn global-buffer` commands disables ECN marking for the shared buffer by removing the `qos random-detect ecn global-buffer` command from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**
```
qos random-detect ecn global-buffer minimum-threshold MIN maximum-threshold MAX
no qos random-detect ecn global-buffer
default qos random-detect ecn global-buffer
```

**Guidelines**
Packet memory is divided into 46080 208-byte cells, whose allocation is managed by the memory management unit (MMU). The MMU tracks the cells that each entity uses and determines the number of cells that can be allocated to an entity.

**Related Commands**
- `random-detect ecn (Helix)` enables ECN marking for a unicast transmit queue.

**Parameters**

- *MIN* and *MAX* parameters must use the same data unit.
- **MIN** Minimum threshold. Options include:
  - `<1 to 19456>` segments 208-byte segments units
  - `<1 to 4>` mbytes Megabyte units
  - `<1 to 4046>` kbytes Kilobyte units
Chapter 27: Quality of Service  Quality of Service Configuration Commands

- `<1 to 4046848> bytes`  Byte units
- **MAX**  Maximum threshold. Options include:
  - `<1 to 46080> segments`  208-byte segments units
  - `<1 to 4> mbytes`  Megabyte units
  - `<1 to 4046> kbytes`  Kilobyte units
  - `<1 to 4046848> bytes`  Byte units

**Examples**

- This command enables ECN marking of unicast packets from the global data pool and sets the minimum and maximum thresholds at 20 and 500 segments.
  
  ```
  switch(config)#qos random-detect ecn global-buffer minimum-threshold 20 segments
  maximum-threshold 500 segments
  switch(config)#
  ```

- This command disables ECN marking of unicast packets from the global data pool
  
  ```
  switch(config)#no qos random-detect ecn global-buffer
  switch(config)#
  ```
qos random-detect ecn global-buffer (Trident and Tomahawk)

The `qos random-detect ecn global-buffer` command enables ECN marking for globally shared packet memory and specifies minimum and maximum queue threshold sizes. Hosts can advertise their ECN capabilities in the ToS DiffServ field’s two least significant bits:

- 00 Non ECN Capable transport.
- 10 ECN Capable transport.
- 01 ECN Capable transport.
- 11 Congestion encountered.

Congestion is determined by comparing average queue size with queue thresholds. Average queue size is calculated through a formula based on the previous average and current queue size. Packets are marked based on this average size and the specified thresholds:

- Average queue size below minimum threshold: Packets are queued normally.
- Average queue size above maximum threshold: Packets are marked `congestion encountered`.
- Average queue size between minimum and maximum thresholds. Packets are queued or marked `congestion encountered`. The proportion of marked packets varies linearly with average queue size:
  - 0% are marked when average queue size is less than or equal to minimum threshold.
  - 100% are marked when average queue size is greater than or equal to maximum threshold.

When transmitted packets are marked `Non ECN Capable`, congestion packets are dropped, not marked.

The `no qos random-detect ecn global-buffer` and `default qos random-detect ecn global-buffer` commands disables ECN marking for the shared buffer by removing the `qos random-detect ecn global-buffer` command from `running-config`.

Command Mode
Global Configuration

Command Syntax
```
qos random-detect ecn global-buffer minimum-threshold MIN maximum-threshold MAX
no qos random-detect ecn global-buffer
default qos random-detect ecn global-buffer
```

Guidelines
Packet memory is divided into 46080 208-byte cells, whose allocation is managed by the memory management unit (MMU). The MMU tracks the cells that each entity uses and determines the number of cells that can be allocated to an entity.

Related Commands
- `random-detect ecn (Trident and Tomahawk)` enables ECN marking for a unicast transmit queue.

Parameters
`MIN` and `MAX` parameters must use the same data unit.

- `MIN` Minimum threshold. Options include:
  - `<1 to 46080> segments` 208-byte segments units
  - `<1 to 9> mbytes` Megabyte units
  - `<1 to 9584> kbytes` Kilobyte units
Chapter 27: Quality of Service

Quality of Service Configuration Commands

- **<1 to 9584640> bytes**  Byte units
- **MAX** Maximum threshold. Options include:
  - **<1 to 46080> segments**  208-byte segments units
  - **<1 to 9> mbytes**  Megabyte units
  - **<1 to 9584> kbytes**  Kilobyte units
  - **<1 to 9584640> bytes**  Byte units

Examples

- This command enables ECN marking of unicast packets from the global data pool and sets the minimum and maximum thresholds at 20 and 500 segments.
  
  switch(config)#qos random-detect ecn global-buffer minimum-threshold 20 segments
  maximum-threshold 500 segments
  switch(config)#

- This command disables ECN marking of unicast packets from the global data pool
  
  switch(config)#no qos random-detect ecn global-buffer
  switch(config)#
qos rewrite cos

The `qos rewrite cos` command enables the rewriting of the CoS field for outbound tagged packets that were received on DSCP trusted ports and untrusted ports. CoS rewrite is always disabled on CoS trusted ports. The CoS value that is written into the packet is based on the data stream’s traffic class. CoS rewriting is active by default.

The `no qos rewrite cos` command disables CoS rewriting on the switch. The default `qos rewrite cos` command restores the default setting of enabling CoS rewriting by removing the `no qos rewrite cos` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
qos rewrite cos
no qos rewrite cos
default qos rewrite cos
```

**Related Commands**

- `qos map traffic-class to cos` configures the traffic class to CoS rewrite map.

**Example**

- This command enables CoS rewrite.
  ```
  switch(config)#qos rewrite cos
  switch(config)#
  ```
**qos rewrite dscp**

The `qos rewrite dscp` command enables the rewriting of the DSCP field for outbound tagged packets that were received on CoS trusted ports and untrusted ports. DSCP rewrite is always disabled on DSCP trusted ports. The DSCP value that is written into the packet is based on the data stream’s traffic class. DSCP rewriting is disabled by default.

The `no qos rewrite dscp` and `default qos rewrite dscp` commands disable DSCP rewriting on the switch by removing the `no qos rewrite dscp` command from `running-config`.

**Command Mode**
- Global Configuration

**Command Syntax**
```
qos rewrite dscp
no qos rewrite dscp
default qos rewrite dscp
```

**Related Commands**
- `qos map traffic-class to dscp` configures the traffic class to DSCP rewrite map.

**Example**
- This command enables DSCP rewrite.
  ```
  switch(config)#qos rewrite dscp
  switch(config)#
  ```
qos trust

The `qos trust` command configures the quality of service port trust mode for the configuration mode interface. Trust-enabled ports classify traffic by examining the traffic's CoS or DSCP value. Port trust mode default setting is `cos` for switched interfaces and `dscp` for routed interfaces.

The `default qos trust` command restores the default trust mode on the configuration mode interface by removing the corresponding `qos trust` or `no qos trust` statement from `running-config`.

The `no qos trust` command performs the following:

- `no qos trust` places the port in `untrusted` mode.
- `no qos trust cos` removes the corresponding `qos trust cos` statement.
- `no qos trust dscp` removes the corresponding `qos trust dscp` statement.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

**Command Syntax**

```
qos trust MODE
no qos trust [MODE]
default qos trust
```

**Parameters**

- **MODE** trust mode assigned to the port. Options include:
  - `cos` enables cos trust mode.
  - `dscp` enables dscp trust mode.

**no qos trust** enables untrusted mode on the port.

**Examples**

- This command configures trust mode of dscp for Ethernet interface 5.

  ```
  switch(config)#interface Ethernet 7
  switch(config-if-Et7)#qos trust dscp
  switch(config-if-Et7)#show active
  interface Ethernet7
  qos trust dscp
  switch(config-if-Et7)#
  ```

- This command configures trust mode of untrusted for Port Channel interface 23.

  ```
  switch(config)#interface port-channel 23
  switch(config-if-Po23)#no qos trust
  switch(config-if-Po23)#show active
  interface Port-Channel23
  no qos trust
  switch(config-if-Po23)#
  ```
random-detect ecn (Arad/Jericho)

The `random-detect ecn` command enables ECN marking for the configuration mode unicast transmit queue and specifies threshold queue sizes. Hosts can advertise their ECN capabilities in the ToS DiffServ field’s two least significant bits:

- 00 Non ECN Capable transport.
- 10 ECN Capable transport.
- 01 ECN Capable transport.
- 11 Congestion encountered.

Congestion is determined by comparing average queue size with queue thresholds. Average queue size is calculated through a formula based on the previous average and current queue size. Packets are marked based on this average size and the specified thresholds:

- Average queue size below minimum threshold: Packets are queued normally.
- Average queue size above maximum threshold: Packets are marked `congestion encountered`.
- Average queue size between minimum and maximum thresholds. Packets are queued or marked `congestion encountered`. The proportion of marked packets varies linearly with average queue size:
  - 0% are marked when average queue size is less than or equal to minimum threshold.
  - 100% are marked when average queue size is greater than or equal to maximum threshold.

When transmitted packets are marked `Non ECN Capable`, congestion packets are dropped, not marked.

The `no random-detect ecn` and `default qos random-detect ecn` commands disables ECN marking for the shared buffer by removing the `qos random-detect ecn` command from `running-config`.

Command Mode

- Tx-Queue configuration

Command Syntax

```
random-detect ecn minimum-threshold MIN maximum-threshold MAX
no random-detect ecn
default random-detect ecn
```

Parameters

`MIN` and `MAX` parameters must use the same data unit.

- **MIN** Minimum threshold. Options include:
  - `<1 to 256>` mbytes Megabyte units
  - `<1 to 256000>` kbytes Kilobyte units
  - `<1 to 256000000>` bytes Byte units

- **MAX** Maximum threshold. Options include:
  - `<1 to 256>` mbytes Megabyte units
  - `<1 to 256000>` kbytes Kilobyte units
  - `<1 to 256000000>` bytes Byte units

Related Commands

- `tx-queue (Arad/Jericho)` places the switch in tx-queue configuration mode.
Examples

- These commands enable ECN marking of unicast packets from unicast transmit queue 4 of Ethernet interface 3/5/1, setting thresholds at 128 kbytes and 1280 kbytes.

```plaintext
switch(config)#interface ethernet 3/5/1
switch(config-if-Et3/5/1)#tx-queue 4
switch(config-if-Et3/5/1-txq-4)#random-detect ecn minimum-threshold 128 kbytes maximum-threshold 1280 kbyte
switch(config-if-Et3/5/1-txq-4)#show active
interface Ethernet3/5/1
  tx-queue 4
    random-detect ecn minimum-threshold 128 kbytes maximum-threshold 1280 kbytes
switch(config-if-Et3/5/1-txq-4)#
```
random-detect ecn (Helix)

The random-detect ecn command enables ECN marking for the configuration mode unicast transmit queue and specifies threshold queue sizes. Hosts can advertise their ECN capabilities in the ToS DiffServ field’s two least significant bits:

- 00 Non ECN Capable transport.
- 10 ECN Capable transport.
- 01 ECN Capable transport.
- 11 Congestion encountered.

Congestion is determined by comparing average queue size with queue thresholds. Average queue size is calculated through a formula based on the previous average and current queue size. Packets are marked based on this average size and the specified thresholds:

- Average queue size below minimum threshold: Packets are queued normally.
- Average queue size above maximum threshold: Packets are marked congestion encountered.
- Average queue size between minimum and maximum thresholds. Packets are queued or marked congestion encountered. The proportion of marked packets varies linearly with average queue size:
  - 0% are marked when average queue size is less than or equal to minimum threshold.
  - 100% are marked when average queue size is greater than or equal to maximum threshold.

When transmitted packets are marked Non ECN Capable, congestion packets are dropped, not marked.

Average queue length is tracked for transmit queues and the global pool independently. When either entity reaches its maximum threshold, all subsequent packets are marked.

The no random-detect ecn and default random-detect ecn commands disable ECN marking on the configuration mode queue, deleting the corresponding random-detect ecn command from running-config.

Command Mode
Tx-Queue configuration

Command Syntax
random-detect ecn minimum-threshold MIN maximum-threshold MAX
no random-detect ecn
default random-detect ecn

Related Commands
- tx-queue (Helix) places the switch in tx-queue configuration mode.
- qos random-detect ecn global-buffer (Helix) enables ECN marking for globally shared packet memory.

Parameters
MIN and MAX parameters must use the same data unit.

- MIN Minimum threshold. Options include:
  - <1 to 46080> segments 208-byte segments units
  - <1 to 9> mbytes Megabyte units
  - <1 to 9584> kbytes Kilobyte units

1671
- **<1 to 9584640> bytes**  Byte units
- **MAX**  Maximum threshold. Options include:
  - **<1 to 46080> segments**  208-byte segments units
  - **<1 to 9> mbytes**  Megabyte units
  - **<1 to 9584> kbytes**  Kilobyte units
  - **<1 to 9584640> bytes**  Byte units

**Examples**

- These commands enable ECN marking of unicast packets from transmit queue 4 of Ethernet interface 15, setting thresholds at 10 and 100 segments.

```plaintext
switch(config)#interface ethernet 15
switch(config-if-Et15)#uc-tx-queue 4
switch(config-if-Et15-txq-4)#random-detect ecn minimum-threshold 10 segments maximum-threshold 100 segments
switch(config-if-Et15-txq-4)#show active
interface Ethernet15
    tx-queue 4
        random-detect ecn minimum-threshold 10 segments maximum-threshold 100 segments
switch(config-if-Et15-txq-4)#exit
switch(config-if-Et15)
```

- This command disables ECN marking of unicast packets from transmit queue 4 of Ethernet interface 15.

```plaintext
switch(config-if-Et15-txq-4)#no random-detect ecn
switch(config-if-Et15-txq-4)#show active
interface Ethernet15
switch(config-if-Et15-txq-4)#exit
switch(config-if-Et15)#
```
random-detect ecn (Trident and Tomahawk)

The `random-detect ecn` command enables ECN marking for the configuration mode unicast transmit queue and specifies threshold queue sizes. Hosts can advertise their ECN capabilities in the ToS DiffServ field’s two least significant bits:

- 00  Non ECN Capable transport.
- 10  ECN Capable transport.
- 01  ECN Capable transport.
- 11  Congestion encountered.

Congestion is determined by comparing average queue size with queue thresholds. Average queue size is calculated through a formula based on the previous average and current queue size. Packets are marked based on this average size and the specified thresholds:

- Average queue size below minimum threshold: Packets are queued normally.
- Average queue size above maximum threshold: Packets are marked **congestion encountered**.
- Average queue size between minimum and maximum thresholds. Packets are queued or marked **congestion encountered**. The proportion of marked packets varies linearly with average queue size:
  - 0% are marked when average queue size is less than or equal to minimum threshold.
  - 100% are marked when average queue size is greater than or equal to maximum threshold.

When transmitted packets are marked **Non ECN Capable**, congestion packets are dropped, not marked.

Average queue length is tracked for transmit queues and the global pool independently. When either entity reaches its maximum threshold, all subsequent packets are marked.

The `no random-detect ecn` and `default random-detect ecn` commands disable ECN marking on the configuration mode queue, deleting the corresponding `random-detect ecn` command from **running-config**.

**Command Mode**

Uc-Tx-Queue configuration

**Command Syntax**

```
random-detect ecn minimum-threshold MIN maximum-threshold MAX
no random-detect ecn
default random-detect ecn
```

**Related Commands**

- `uc-tx-queue` places the switch in uc-tx-queue configuration mode.
- `qos random-detect ecn global-buffer (Trident and Tomahawk)` enables ECN marking for globally shared packet memory.

**Parameters**

- `MIN` and `MAX` parameters must use the same data unit.
- `MIN`  Minimum threshold. Options include:
  - `<1 to 46080>` segments  208-byte segments units
  - `<1 to 9>` mbytes  Megabyte units
  - `<1 to 9584>` kbytes  Kilobyte units
• \(<1 \text{ to } 9584640\) \text{ bytes} \quad \text{Byte units}

• \(\text{MAX}\) Maximum threshold. Options include:
  • \(<1 \text{ to } 46080\) \text{ segments} \quad \text{208-byte segments units}
  • \(<1 \text{ to } 9\) \text{ mbytes} \quad \text{Megabyte units}
  • \(<1 \text{ to } 9584\) \text{ kbytes} \quad \text{Kilobyte units}
  • \(<1 \text{ to } 9584640\) \text{ bytes} \quad \text{Byte units}

**Examples**

• These commands enable ECN marking of unicast packets from unicast transmit queue 4 of Ethernet interface 15, setting thresholds at 10 and 100 segments.

  ```
  switch(config)#interface ethernet 15
  switch(config-if-Et15)#uc-tx-queue 4
  switch(config-if-Et15-uc-txq-4)#random-detect ecn minimum-threshold 10 segments
  maximum-threshold 100 segments
  switch(config-if-Et15-uc-txq-4)#show active
  interface Ethernet15
    uc-tx-queue 4
      random-detect ecn minimum-threshold 10 segments maximum-threshold 100
    segments
  switch(config-if-Et15-uc-txq-4)#exit
  switch(config-if-Et15)#
  ```

• This command disables ECN marking of unicast packets from unicast transmit queue 4 of Ethernet interface 15.

  ```
  switch(config-if-Et15-uc-txq-4)#no random-detect ecn
  switch(config-if-Et15-uc-txq-4)#show active
  interface Ethernet15
  switch(config-if-Et15-uc-txq-4)#exit
  switch(config-if-Et15)#
  ```
service-policy type qos input

The **service-policy type qos input** command applies the specified policy map to a QoS profile. The profile is then applied to an interface in interface configuration mode using the **service-profile** command.

The **no service-policy type qos** and **default service-policy type qos** command deletes the policy map from the profile.

The **exit** command returns the switch to global configuration mode.

**Command Mode**
QoS Profile Configuration

**Command Syntax**
```
service-policy type qos input policy_map_name
no service-policy type qos input policy_map_name
default service-policy type qos input policy_map_name
```

**Parameter**
- **policy_map_name**  QoS policy map name.

**Example**
- This command applies the policy map PM-1 to the QoS profile TP.

```
switch(config-qos-profile-TP)#service-policy type qos input PM-1
```

**Related Commands**
- service-profile
service-profile

The **service-profile** command applies the QoS profile to the configuration mode interface. The **no service-profile** and the **default service-profile** command removes the QoS profile from the interface. The **exit** command returns the switch to global configuration mode.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

**Command Syntax**
- `service-profile profile_name`
- `no service-profile profile_name`
- `default service-profile profile_name`

**Parameter**
- `profile_name` QoS profile name.

**Example**
- This commands applies the QoS profile TP to Ethernet interface 13.
  
  switch(config)#interface ethernet 13
  switch(config-if-Et13)#service-profile TP
shape rate (Interface – Arad/Jericho)

The shape rate command specifies the maximum bandwidth for outbound traffic on the configuration mode interface, also known as queue shaping. The shape rate for individual transmit queues is configured by the shape rate (Tx-queue – Arad/Jericho) command. By default, outbound transmission rate is not bounded by a shape rate.

The no shape rate and default shape rate commands remove the shape rate bandwidth limit on the configuration mode interface by deleting the corresponding shape rate command from running-config.

Command Mode

Interface-Ethernet Configuration
Interface-Port-Channel Configuration

Command Syntax

```
shape rate byte_limit [kbps]
no shape rate
default shape rate
```

Parameters

- `byte_limit` shape rate applied to interface (Kbps). Value ranges from 162 to 10000000.

Example

- This command configures a port shape rate of 5 Gbps on Ethernet interface 3/5/1.

```
switch(config)#interface ethernet 3/5/1
switch(config-if-Et3/5/1)#shape rate 5000000
switch(config-if-Et3/5/1)#show qos interfaces ethernet 3/5/1
```

```
Ethernet3/5/1:

<---OUTPUT OMITTED FROM EXAMPLE-------->

switch(config-if-Et3/5/1)#
```
shape rate (Interface – FM6000)

The **shape rate** command specifies the maximum bandwidth for outbound traffic on the configuration mode interface, also known as queue shaping. The shape rate for individual transmit queues is configured by the **shape rate (Tx-queue – FM6000)** command. By default, outbound transmission rate is not bounded by a shape rate.

The **no shape rate** and **default shape rate** commands remove the shape rate bandwidth limit on the configuration mode interface by deleting the corresponding **shape rate** command from **running-config**.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

**Command Syntax**
- `shape rate byte_limit [kbps]`
- `no shape rate`
- `default shape rate`

**Parameters**
- **byte_limit** shape rate applied to interface (Kbps). Value ranges from 7000 to 10000000.

**Guidelines**
Enabling port shaping on an FM6000 interface disables queue shaping internally. Disabling port shaping restores queue shaping as specified in **running-config**.

**Example**
- This command configures a port shape rate of 5 Gbps on Ethernet interface 5.
  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#shape rate 5000000
  switch(config-if-Et5)#
  ```
shape rate (Interface – Helix)

The shape rate command specifies the maximum bandwidth for outbound traffic on the configuration mode interface, also known as queue shaping. The shape rate for individual transmit queues is configured by the shape rate (Tx-queue – Helix) command. By default, outbound transmission rate is not bounded by a shape rate.

The no shape rate and default shape rate commands remove the shape rate bandwidth limit on the configuration mode interface by deleting the corresponding shape rate command from running-config.

Command Mode

Interface-Ethernet Configuration
Interface-Port-Channel Configuration

Command Syntax

```
shape rate DATA_LIMIT
no shape rate
default shape rate
```

Parameters

- **DATA_LIMIT**  shape rate applied to interface. Value range varies with data unit:
  - `<8 to 40000000>`  8 to 40,000,000 kbytes per second.
  - `<8 to 40000000-kbps`  8 to 40,000,000 kbytes per second.
  - `<8 to 60000000-pps`  8 to 60,000,000 packets per second.

Guidelines

Shaping rates of at least 8 kbps are supported. At shaping rates smaller than 1 Mbps, granularity and rounding errors may skew the actual shaping rate by 20% from the specified rate.

Example

- This command configures a port shape rate of 5 Gbps on Ethernet interface 17.

```
switch(config)#interface ethernet 17
switch(config-if-Et17)#shape rate 5000000 kbps
switch(config-if-Et17)#show qos interface ethernet 17/3
```

```
Ethernet17:
Trust Mode: COS
Default COS: 0
Default DSCP: 0

Port shaping rate: 5000000 / 5000000 kbps

<table>
<thead>
<tr>

<td>- / - ( - )</td>
<td>SP / SP</td>
</tr>
</tbody>
</table>
```

Example output:

```
switch(config-if-Et17) #
```
shape rate (Interface – Petra)

The `shape rate` command specifies the maximum bandwidth for outbound traffic on the configuration mode interface, also known as queue shaping. The shape rate for individual transmit queues is configured by the `shape rate (Tx-queue – Petra)` command. By default, outbound transmission rate is not bounded by a shape rate.

The `no shape rate` and `default shape rate` commands remove the shape rate bandwidth limit on the configuration mode interface by deleting the corresponding `shape rate` command from `running-config`.

Command Mode

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

Command Syntax

```
shape rate data_limit [kbps]
no shape rate
default shape rate
```

Parameters

- `data_limit` shape rate applied to interface (Kbps). Value ranges from 100 to 1000000.

Guidelines

The following port shaping rates are supported:

- 1G ports: above 100 kbps.
- 10G ports: above 7900 kbps.

Commands that specify a smaller shape rate disable port shaping on the interface.

Example

- This command configures a port shape rate of 5 Gbps on Ethernet interface 3/3.

```
switch(config)#interface ethernet 3/3
switch(config-if-Et3/3)#shape rate 5000000
switch(config-if-Et3/3)#show active
interface Ethernet3/3
  shape rate 5000000
switch(config-if-Et3/3)#
```
shape rate (Interface – Trident and Tomahawk)

The `shape rate` command specifies the maximum bandwidth for outbound traffic on the configuration mode interface, also known as queue shaping. The shape rate for individual transmit queues is configured by the `shape rate (Tx-queue – Trident and Tomahawk)` command. By default, outbound transmission rate is not bounded by a shape rate.

The `no shape rate` and `default shape rate` commands remove the shape rate bandwidth limit on the configuration mode interface by deleting the corresponding `shape rate` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

**Command Syntax**

```
shape rate DATA_LIMIT
no shape rate
default shape rate
```

**Parameters**

- `DATA_LIMIT` shape rate applied to interface. Value range varies with data unit:
  - `<8 to 40000000>` 8 to 40,000,000 kbytes per second.
  - `<8 to 40000000>kbps` 8 to 40,000,000 kbytes per second.
  - `<8 to 60000000>pps` 8 to 60,000,000 packets per second.

**Guidelines**

Shaping rates of at least 8 kbps are supported. At shaping rates smaller than 1 Mbps, granularity and rounding errors may skew the actual shaping rate by 20% from the specified rate.

**Example**

- This command configures a port shape rate of 5 Gbps on Ethernet interface 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#shape rate 5000000
switch(config-if-Et5)#
```
shape rate (Interface – Trident II)

The shape rate command specifies the maximum bandwidth for outbound traffic on the configuration mode interface, also known as queue shaping. The shape rate for individual transmit queues is configured by the shape rate (Tx-queue – Trident II) command. By default, outbound transmission rate is not bounded by a shape rate.

The no shape rate and default shape rate commands remove the shape rate bandwidth limit on the configuration mode interface by deleting the corresponding shape rate command from running-config.

Command Mode

Interface-Ethernet Configuration
  Interface-Port-Channel Configuration

Command Syntax

  shape rate DATA_LIMIT
  no shape rate
  default shape rate

Parameters

- **DATA_LIMIT**   shape rate applied to interface. Value range varies with data unit:
  - `<8 to 40000000>`  8 to 40,000,000 kbytes per second.
  - `<8 to 40000000-kbps`  8 to 40,000,000 kbytes per second.
  - `<8 to 60000000-pps`  8 to 60,000,000 packets per second.

Guidelines

Shaping rates of at least 8 kbps are supported. At shaping rates smaller than 1 Mbps, granularity and rounding errors may skew the actual shaping rate by 20% from the specified rate.

Example

- This command configures a port shape rate of 5 Gbps on Ethernet interface 17/3.

  switch(config)#interface ethernet 17/3
  switch(config-if-Et17/3)#shape rate 5000000 kbps
  switch(config-if-Et17/3)#show qos interface ethernet 17/3
  Ethernet17/3:
  Trust Mode: COS
  Default COS: 0
  Default DSCP: 0

shape rate (Tx-queue – FM6000)

The shape rate command specifies the maximum bandwidth for outbound traffic on the transmit queue, also known as queue shaping. The shape rate for interfaces is configured by the shape rate (Interface – FM6000) command. By default, the configured outbound transmission rate is not bounded by a transmit queue shape rate.

Queue shaping on an FM6000 port is supported only when port shaping is not enabled on the interface. Enabling port shaping on a port disables queue shaping internally. Disabling port shaping restores queue shaping as specified by running-config.

Shaping rates greater than 460 kbps are supported. At lower shaping rates (less than 10 Mbps), granularity and rounding errors may skew the actual shaping rate by 20% from the specified rate.

The no shape rate and default shape rate commands remove the shape rate bandwidth limit on the transmit queue by deleting the corresponding shape rate command from running-config.

Command Mode

Tx-Queue Configuration

Command Syntax

```
shape rate byte_limit [kbps]
no shape rate
default shape rate
```

Parameters

- `byte_limit` shape rate applied to interface (Kbps). Value ranges from 464 to 1000000.

Related Commands

- tx-queue (FM6000) places the switch in tx-queue configuration mode
- shape rate (Interface – FM6000) configures the shape rate for a configuration mode interface.

Example

- These commands configure a shape rate of 1 Gbps (1,000,000 Kbps) on transmit queues 3 and 4 of Ethernet interface 19.

```
switch(config)#interface ethernet 19
switch(config-if-Et19)#tx-queue 4
switch(config-if-Et19-txq-4)#shape rate 1000000
switch(config-if-Et19-txq-4)#tx-queue 3
switch(config-if-Et19-txq-4)#shape rate 1000000
switch(config-if-Et19-txq-4)#show qos interface ethernet 19
```

```
shape rate (Tx-queue – Helix)

The **shape rate** command specifies the maximum bandwidth for outbound traffic on the transmit queue, also known as queue shaping. The shape rate for interfaces is configured by the **shape rate (Interface – Helix)** command. By default, the configured outbound transmission rate is not bounded by a transmit queue shape rate.

The **no shape rate** and **default shape rate** commands remove the shape rate bandwidth limit on the configuration mode transmit queue by deleting the corresponding **shape rate** command from **running-config**.

**Command Mode**

Tx-Queue Configuration

**Command Syntax**

```
shape rate byte_limit [kbps]
no shape rate
default shape rate
```

**Parameters**

- **DATA_LIMIT** shape rate applied to the queue. Value range varies with data unit:
  - `<8 to 40000000>` 8 to 40,000,000 kbytes per second.
  - `<8 to 40000000>kbps` 8 to 40,000,000 kbytes per second.
  - `<8 to 60000000>pps` 8 to 60,000,000 packets per second.

**Restrictions**

Queue shaping is not supported in cut-through mode.

**Related Commands**

- **tx-queue (Helix)** places the switch in tx-queue configuration mode.
- **shape rate (Interface – Helix)** configures the shape rate for a configuration mode interface.
Example

- These commands configure a shape rate of 1 Gbps (1,000,000 Kbps) on transmit queues 3 and 4 of Ethernet interface 17/3.

```plaintext
switch(config)#interface ethernet 17/3
switch(config-if-Et17/3)#tx-queue 4
switch(config-if-Et17/3-txq-4)#shape rate 1000000 kbps
switch(config-if-Et17/3-txq-4)#tx-queue 3
switch(config-if-Et17/3-txq-3)#shape rate 1000000 kbps
switch(config-if-Et17/3-txq-3)#show qos interface ethernet 17/3
```

switch(config-if-Et17/3-txq-3)#
```
**shape rate (Tx-queue – Petra)**

The **shape rate** command specifies the maximum bandwidth for outbound traffic on the configuration mode transmit queue, also known as queue shaping. The shape rate for interfaces is configured by the **shape rate (Interface – Petra)** command. By default, the configured outbound transmission rate is not bounded by a transmit queue shape rate.

Queue shaping applies only to unicast traffic. Shaping rates of at least 162 Kbps are supported.

The **no shape rate** and **default shape rate** commands remove the shape rate bandwidth limit on the configuration mode queue by deleting the corresponding **shape rate** command from **running-config**.

**Command Mode**

Tx-Queue Configuration

**Command Syntax**

```
shape rate DATA_LIMIT
no shape rate
default shape rate
```

**Parameters**

- **DATA_LIMIT** shape rate applied to the queue. Value range varies with data unit:
  - `<8 to 40000000>` 8 to 40,000,000 kbytes per second.
  - `<8 to 40000000>kbps` 8 to 40,000,000 kbytes per second.
  - `<8 to 60000000>pps` 8 to 60,000,000 packets per second.

Shaping rates greater than 460 kbps are supported. At lower shaping rates (less than 10 Mbps), granularity and rounding errors may skew the actual shaping rate by 20% from the specified rate.

**Related Commands**

- **tx-queue (Petra)** places the switch in tx-queue configuration mode
- **shape rate (Interface – Petra)** configures the shape rate for a configuration mode interface.
Example

- These commands configure a shape rate of 1 Gbps (1,000,000 Kbps) on transmit queues 3 and 4 of Ethernet interface 3/28.

```bash
switch(config)#interface ethernet 3/28
switch(config-if-Et3/28)#tx-queue 4
switch(config-if-Et3/28-txq-4)#shape rate 1000000
switch(config-if-Et3/28-txq-4)#tx-queue 3
switch(config-if-Et3/28-txq-3)#shape rate 1000000
switch(config-if-Et3/28-txq-3)#show qos interface ethernet 3/28

switch(config-if-Et3/28-txq-3)#
shape rate (Tx-queue – Trident and Tomahawk)

The shape rate command specifies the maximum bandwidth for outbound traffic on the configuration mode transmit queue, also known as queue shaping. The shape rate for interfaces is configured by the shape rate (Interface – Trident and Tomahawk) command. By default, the configured outbound transmission rate is not bounded by a transmit queue shape rate.

The no shape rate and default shape rate commands remove the shape rate limit from the configuration mode transmit queue by deleting the corresponding shape rate command from running-config.

Command Mode
Mc-Tx-Queue configuration
Uc-Tx-Queue configuration

Command Syntax
shape rate \textit{DATA\_LIMIT}
no shape rate
default shape rate

Parameters
- \textit{DATA\_LIMIT} shape rate applied to the queue. Value range varies with data unit:
  - <8 to \textit{40000000}> 8 to 40,000,000 kbytes per second.
  - <8 to \textit{40000000}-kbps> 8 to 40,000,000 kbytes per second.
  - <8 to \textit{60000000}-pps> 8 to 60,000,000 packets per second.

Related Commands
- mc-tx-queue places the switch in mc-tx-queue configuration mode.
- uc-tx-queue places the switch in uc-tx-queue configuration mode.
- shape rate (Interface – Trident and Tomahawk) configures the shape rate for a configuration mode interface.

Guidelines
Shaping rates of at least 8 kbps are supported. At shaping rates smaller than 1 Mbps, granularity and rounding errors may skew the actual shaping rate by 20% from the specified rate.

When two queues source traffic from the same traffic class and the higher priority queue is shaped, that queue consumes all internal buffers, starving the lower priority queue even if bandwidth is available.
Example

- These commands configure a shape rate of 1 Gbps (1,000,000 Kbps) on unicast transmit queues 3 and multicast transmit 4 of Ethernet interface 7.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#uc-tx-queue 3
switch(config-if-Et7-uc-txq-3)#shape rate 1000000
switch(config-if-Et7-uc-txq-3)#mc-tx-queue 2
switch(config-if-Et7-mc-txq-2)#shape rate 1000000
switch(config-if-Et7-mc-txq-2)#show qos interface ethernet 7
```

`switch(config-if-Et17/3-txq-3)#`
show platform petraA traffic-class

The show platform petraA traffic-class command displays the traffic class assignment on all specified Petra chips. Each chip controls eight Ethernet interfaces. The default traffic class of an interface is specified by the traffic class assigned to the chip that controls the interface.

Traffic class assignments are configured with the platform petraA traffic-class command.

Valid command options include:

- show platform petraA traffic-class  traffic class of all chips on all linecard.
- show platform petraA CHIP_NAME traffic-class  traffic class of specified chip.
- show platform petraA MODULE_NAME traffic-class  traffic class of all chips on specified linecard.

Command Mode

EXEC

Command Syntax

show platform petraA traffic-class
show platform petraA CHIP_NAME traffic-class
show platform petraA MODULE_NAME traffic-class

Parameters

- CHIP_NAME Name of Petra chip on linecard that control Ethernet ports. Options include:
  - petracardX/chipY all ports on PetraA chip chipY on linecard cardX (7500 Series).
  - petra-chipZ all ports on PetraA chip chipZ (7048 Series)

7500 Series

Switches can contain up to eight linecards. cardX varies from 3 to 10.

Each linecard contains six PetraA chips. Each chip controls eight ports. chipY varies from 0 to 5:

- 0 controls ports 1 through 8
- 1 controls ports 9 through 16
- 2 controls ports 17 through 24
- 3 controls ports 25 through 32
- 4 controls ports 33 through 40
- 5 controls ports 41 through 48

7048 Series

Each switch contains two PetraA chips. chipZ varies from 0 to 1:

- 0 controls ports 1 through 32
- 1 controls ports 33 through 52

- MODULE_NAME Name and number of linecard (7500 Series). Options include:
  - module linecard mod_num . Linecard number (3 to 10).
  - module mod_num Linecard number (3 to 10).

Related Commands

- platform petraA traffic-class configures the default traffic class used by all ports on a specified chip
Example

- This command displays the traffic class of all chips on linecard 3.

```
switch#show platform petraA module linecard 3 traffic-class
Petra3/0 traffic-class: 1
Petra3/1 traffic-class: 1
Petra3/2 traffic-class: 1
Petra3/3 traffic-class: 1
Petra3/4 traffic-class: 5
Petra3/5 traffic-class: 1
switch#
```
show policy-map

The show policy-map command displays the policy map information for the configured policy map.

Command Mode
EXEC

Command Syntax
show policy-map policy_map_name [counters | interface | summary]

Parameters
- **policy_map_name**  QoS policy map name.
- **counters**  specifies the policy map traffic match count (This parameter is applicable only on DCS-7010, DCS-7050X, DCS7250X, DCS-7300X and DCS-7280(E/R), DCS-7500(E/R) series switches.)
- **interface**  specifies the service policy on an interface.
- **summary**  policy map summary.

Examples
- The **show policy-map** command displays the information for the policy map **policy1**.
  
  switch#show policy-map policy1
  Service-policy policy1
  Class-map: class1 (match-any)
  Match: ip access-group name acl1
  Police cir 512000 bps bc 96000 bytes
  Class-map: class-default (match-any)

- The **show policy-map counters** command displays the policy map traffic match count for the policy map configured.

  switch#show policy-map policy1 counters
  Service-policy input: policy1
  Hardware programming status: Successful
  Class-map: class1 (match-any)
  Match: vlan 20-40,1000-1250
    police rate 100 mbps burst-size 100 kbytes
  Interface: Ethernet16/1
  Conformed 28621 packets, 7098008 bytes -------------- packet match count

  Class-map: class-default (match-any)
  Matched Packets: 19 -------------- packet match count
**show policy-map interface**

The `show policy-map interface` command displays contents of the policy map applied to specified the interface.

**Command Mode**

EXEC

**Command Syntax**

```
show policy-map interface interface_name
```

**Parameters**

- `interface_name` Interface for which command returns data. Options include:
  - `no parameter` returns data for all interfaces.
  - `ethernet e_range` Ethernet interfaces specified by `e_range`.
  - `port-channel p_range` port channel interfaces specified by `p_range`.

**Example**

- This command displays the name and contents of the policy map applied to Ethernet interface 1.

```
switch#show policy-map interface ethernet 1
Service-policy input: p1
    Hardware programming status: Successful

    Class-map: c2001 (match-any)
        Match: vlan 2001 0xfff
            set dscp 4

    Class-map: c2002 (match-any)
        Match: vlan 2002 0xfff
            set dscp 8

    Class-map: c2003 (match-any)
        Match: vlan 2003 0xfff
            set dscp 12
```
show qos interfaces

The `show qos interfaces` command displays the QoS, DSCP, and transmit queue configuration on a specified interface. Information provided by this command includes the ports trust setting, the default CoS value, and the DSCP value.

**Command Mode**

EXEC

**Command Syntax**

```
show qos interfaces INTERFACE_NAME
```

**Parameters**

- `INTERFACE_NAME` Interface For which command returns data. Options include:
  - `<no parameter>` returns data for all interfaces.
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `port-channel p_num` Port-Channel Interface specified by `p_num`.

**Examples**

- This command lists the QoS configuration for Ethernet interface 4.
  
  ```
  switch>show qos interfaces ethernet 4
  Ethernet4:
  Trust Mode: COS
  Default COS: 0
  Default DSCP: 0
  
  Port shaping rate: 5000000Kbps
  
  Tx-Queue  Bandwidth   ShapeRate     Priority
  (percent) (Kbps)
  -------------------------------
  0     50      disabled     round-robin
  1     50      disabled     round-robin
  2     N/A    disabled     strict
  3     N/A    1000000      strict
  4     N/A    1000000      strict
  5     N/A    1500000      strict
  6     N/A    2000000      strict
  ```

  switch>

---

1697
**show qos interfaces random-detect ecn**

The `show qos interfaces random-detect ecn` command displays the Explicit Congestion Notification (ECN) configuration for each transmit queue on the specified interfaces.

**Command Mode**

EXEC

**Command Syntax**

```bash
show qos interfaces [INTERFACE_NAME] random-detect ecn
```

**Parameters**

- **INTERFACE_NAME** Interface for which command returns data. Options include:
  - `<no parameter>` returns data for all interfaces.
  - `ethernet e_range` Ethernet interfaces specified by `e_range`.
  - `port-channel p_range` Port-Channel Interfaces specified by `p_range`.

**Examples**

- This command configures ECN parameters for transmit queues 0 through 3 on Ethernet interface 3/5/1, then displays that configuration.

  ```bash
  switch(config)#interface ethernet 3/5/1
  switch(config-if-Et3/5/1)#tx-queue 0
  switch(config-if-Et3/5/1-txq-0)#random-detect ecn minimum-threshold 2560 kbytes
  maximum-threshold 256000 kbytes
  switch(config-if-Et3/5/1-txq-0)#tx-queue 1
  switch(config-if-Et3/5/1-txq-1)#random-detect ecn minimum-threshold 25600 kbytes
  maximum-threshold 128000 kbytes
  switch(config-if-Et3/5/1-txq-1)#tx-queue 2

  tx-queue: 0 1 2 3 4 5 6 7

switch>
```
show qos profile

The **show qos profile** command displays the contents of the specified QoS profile or of all QoS profiles in the running configuration.

**Command Mode**

EXEC

**Command Syntax**

```
show qos profile profile_name
```

**Parameter**

- `profile_name` QoS profile name.

**Examples**

- This command displays the contents of all QoS profiles configured on the switch.

  ```
  switch(config)#show qos profile
  qos profile p
  qos cos 1
    no priority-flow-control pause watchdog
    priority-flow-control priority 1 no-drop
    priority-flow-control priority 2 no-drop
  qos profile p2
  qos cos 3
  priority-flow-control priority 0 no-drop
  ```

- This command displays the configuration attached and information specific to QoS profile p2.

  ```
  switch#show qos profile p2
  qos profile p2
  qos cos 3
  priority-flow-control priority 0 no-drop
  ```
**show qos profile summary**

The `show qos profile summary` command displays the QoS profile summary of those which are part of the running configuration.

**Command Mode**

EXEC

**Command Syntax**

`show qos profile summary`

**Example**

- This command shows a summary of all QoS profiles configured on the switch.

```
switch(config)#show qos profile summary
Qos Profile: p
    Configured on: Et13,7
    Fabric
    Po12
Qos Profile: p2
    Configured on: Et56
```
show run|grep sharing

The `show run|grep sharing` command displays whether the QoS policy-map sharing on SVIs is enabled or disabled.

**Command Mode**

EXEC

**Command Syntax**

`show run|grep sharing`

**Example**

- This command displays whether the QoS policy-map sharing on SVIs is enabled or disabled.

  ```
  switch# show run|grep sharing
  hardware access-list qos resource sharing vlan in ---- If this message is
  displayed then QoS policy-map sharing on SVIs is enabled.
  ```
show platform trident tcam shared vlan interface-class-id

The `show platform trident tcam shared vlan interface-class-id` command displays what SVIs are currently sharing the QoS policy-map in the below output under QoS PMAP Data.

**Command Mode**

EXEC

**Command Syntax**

`show platform trident tcam shared vlan interface-class-id`

**Example**

- This command displays what SVIs are currently sharing the QoS policy-map in the below output under QoS PMAP Data.

```
switch(config)#show platform trident tcam shared vlan interface-class-id
=== Shared RACL Data on switch Linecard0/0 ===
=== Shared QoS Policy-map Data on switch Linecard0/0 ===
Interface Class Id             VLANs
1                               1 2
```
show platform trident tcam qos detail

The `show platform trident tcam qos detail` command displays the list of all the SVIs that are sharing the TCAM entries.

**Command Mode**

EXEC

**Command Syntax**

`show platform trident tcam qos detail`

**Example**

- This command displays the list of all the SVIs that are sharing the TCAM entries.

```
switch(config)#show platform trident tcam qos detail
=== Policy-map p01 type qos on switch Linecard0/0 ===
Interfaces : Vlan2 Vlan1
=-- Inter face BitMap =--
0x00000000000000001FFFFE
```
**show qos random-detectecn**

The `show qos random-detectecn` command displays the global Explicit Congestion Notification (ECN) configuration.

**Command Mode**

EXEC

**Command Syntax**

`show qos random-detectecn`

**Examples**

- These commands configure global ECN parameters, then displays that configuration.

```
switch(config)#qos random-detectecn global-buffer minimum-threshold 2 mbytes
maximum-threshold 5 mbytes
switch(config)#show qos random-detectecn
Minimum Threshold:  2
Maximum Threshold:  5
Threshold Unit:  mbytes

switch(config)#
```
show platform xp qos tcam hit

The **show platform xp qos tcam hit** command displays the TCAM entries programmed for each policy-map as well as the traffic hits. The **hits** option is used to see the TCAM entries with nonzero traffic hits.

**Command Mode**

EXEC

**Command Syntax**

```plaintext
show platform xp qos tcam hit
```

**Examples**

- This command displays the QoS TCAM hits on Ethernet interface 10/1.

```
switch#show platform xp qos tcam hit
=== Policy-map test type qos on switch 0 ===
Assigned to ports: Ethernet10/1

== Class-map class-default type qos ==

```
tx-queue (Arad/Jericho)

The tx-queue command places the switch in Tx-queue configuration mode to configure a transmit queue on the configuration mode interface. Tx-queue configuration mode is not a group change mode; running-config is changed immediately after commands are executed. The exit command does not affect the configuration.

Arad and Jericho platform switches have eight queues, 0 through 7, and all queues are exposed through the CLI. However, queue 7 is not user-configurable. Queue 7 is always mapped to traffic class 7, which is reserved for control traffic.

The exit command returns the switch to the configuration mode for the base Ethernet or port channel interface.

The no tx-queue and default tx-queue commands remove the configuration for the specified transmit queue by deleting all corresponding tx-queue mode statements from running-config.

Command Mode

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

Command Syntax

```
tx-queue queue_level
```

Parameters

- **queue_level** the transmit queue. Values range from 0 to 6.

Commands Available in tx-queue Configuration Mode

- bandwidth percent (Arad/Jericho)
- priority (Arad/Jericho)
- shape rate (Tx-queue – Arad/Jericho)

Guidelines

Arad and Jericho platform switch queues handle unicast traffic. Queues for multicast traffic are not supported.

Example

- This command enters Tx-queue configuration mode for transmit queue 4 of Ethernet interface 3/3/3.

```
switch(config)#interface ethernet 3/3/3
switch(config-if-Et3/3/3)#tx-queue 4
switch(config-if-Et3/3/3-txq-4)#
```
tx-queue (FM6000)

The tx-queue command places the switch in Tx-queue configuration mode to configure a transmit queue on the configuration mode interface. Tx-queue configuration mode is not a group change mode; running-config is changed immediately after commands are executed. The exit command does not affect the configuration.

FM6000 platform switches have eight queues, 0 through 7. All queues are exposed through the CLI and are user configurable.

The exit command returns the switch to the configuration mode for the base Ethernet or port channel interface.

The no tx-queue and default tx-queue commands remove the configuration for the specified transmit queue by deleting the all corresponding tx-queue mode commands from running-config.

Command Mode
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

Command Syntax
- `tx-queue queue_level`

Parameters
- `queue_level` the transmit queue. Values range from 0 to 7.

Commands Available in tx-queue Configuration Mode
- `bandwidth percent (FM6000)`
- `priority (FM6000)`
- `shape rate (Tx-queue – FM6000)`

Guidelines
FM6000 platform switch queues handle unicast and multicast traffic.

Example
- This command enters Tx-queue configuration mode for transmit queue 3 of Ethernet interface 5.

```bash
switch(config)#interface ethernet 5
switch(config-if-Et5)#tx-queue 3
switch(config-if-Et5-txq-3)#
```
tx-queue (Helix)

The tx-queue command places the switch in Tx-queue configuration mode to configure a transmit queue on the configuration mode interface. Tx-queue configuration mode is not a group change mode; running-config is changed immediately after commands are executed. The exit command does not affect the configuration.

Helix platform switches have eight unicast (UC0 – UC7) and eight multicast (MC0 – MC7) queues. Each UCx-MCx queue set is combined into a single queue group (L1.x), which is exposed to the CLI through this command.

The exit command returns the switch to the configuration mode for the base Ethernet or port channel interface.

The no tx-queue and default tx-queue commands remove the configuration for the specified transmit queue by deleting the all corresponding tx-queue mode commands from running-config.

Command Mode

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

Command Syntax

`tx-queue queue_level`

Parameters

- `queue_level` transmit queue group number. Values range from 0 to 7.

Commands Available in tx-queue Configuration Mode

- bandwidth guaranteed (Helix)
- shape rate (Tx-queue – Helix)

Guidelines

Helix platform switch queues handle unicast and multicast traffic.

Example

- This command enters Tx-queue configuration mode for transmit queue 4 of Ethernet interface 17/3.

```
switch(config)#interface ethernet 17/3
switch(config-if-Et17/3)#tx-queue 4
switch(config-if-Et17/3-txq-4)#
```
tx-queue (Petra)

The tx-queue command places the switch in Tx-queue configuration mode to configure a transmit queue on the configuration mode interface. Tx-queue configuration mode is not a group change mode; running-config is changed immediately after commands are executed. The exit command does not affect the configuration.

Petra platform switches have eight queues, 0 through 7, and all queues are exposed through the CLI. However, queue 7 is not user-configurable. Queue 7 is always mapped to traffic class 7, which is reserved for control traffic.

The exit command returns the switch to the configuration mode for the base Ethernet or port channel interface.

The no tx-queue and default tx-queue commands remove the configuration for the specified transmit queue by deleting the all corresponding tx-queue mode commands from running-config.

Command Mode

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

Command Syntax

```
tx-queue queue_level
```

Parameters

- `queue_level`: the transmit queue. Values range from 0 to 6.

Commands Available in tx-queue Configuration Mode

- bandwidth percent (Petra)
- priority (Petra)
- shape rate (Tx-queue – Petra)

Guidelines

Petra platform switch queues handle unicast traffic. Queues for multicast traffic are not supported.

Example

This command enters Tx-queue configuration mode for transmit queue 3 of Ethernet interface 3/3.

```
switch(config)#interface ethernet 3/3
switch(config-if-Et3/3)#tx-queue 3
switch(config-if-Et3/3-txq-3)#
```
tx-queue (Trident II)

The `tx-queue` command places the switch in Tx-queue configuration mode to configure a transmit queue on the configuration mode interface. Tx-queue configuration mode is not a group change mode; `running-config` is changed immediately after commands are executed. The `exit` command does not affect the configuration.

Trident II platform switches have eight unicast (UC0 – UC7) and eight multicast (MC0 – MC7) queues. Each UCx-MCx queue set is combined into a single queue group (L1.x), which is exposed to the CLI through this command.

The `exit` command returns the switch to the configuration mode for the base Ethernet or port channel interface.

The `no tx-queue` and `default tx-queue` commands remove the configuration for the specified transmit queue by deleting the all corresponding `tx-queue` mode commands from `running-config`.

Command Mode

```
Interface-Ethernet Configuration
Interface-Port-Channel Configuration
```

Command Syntax

```
  tx-queue queue_level
```

Parameters

- `queue_level` transmit queue group number. Values range from 0 to 7.

Commands Available in tx-queue Configuration Mode

- `bandwidth guaranteed (Trident II)`
- `shape rate (Tx-queue – Trident II)`

Guidelines

Trident II platform switch queues handle unicast and multicast traffic.

Example

- This command enters Tx-queue configuration mode for transmit queue 4 of Ethernet interface 17/3.

```bash
switch(config)#interface ethernet 17/3
switch(config-if-Et17/3)#tx-queue 4
switch(config-if-Et17/3-txq-4)#
```
uc-tx-queue

The `uc-tx-queue` command places the switch in uc-tx-queue configuration mode to configure a unicast transmit queue on the configuration mode interface. Uc-tx-queue configuration mode is not a group change mode; `running-config` is changed immediately after commands are executed. The `exit` command does not affect the configuration.

Trident and Tomahawk switches have eight unicast queues (UC0 – UC7) and four multicast queues (MC0 – MC03), categorized into two priority groups. All queues are exposed through the CLI and are user-configurable.

- Priority Group 1: UC7, UC6, MC3
- Priority Group 0: UC5, UC4, MC2, UC3, UC2, MC1, UC1, UC0, MC0

The `exit` command returns the switch to the configuration mode for the base Ethernet or port channel interface.

The `no uc-tx-queue` and `default uc-tx-queue` commands remove the configuration for the specified transmit queue by deleting the all corresponding `uc-tx-queue` mode commands from `running-config`.

Command Mode

| Interface-Ethernet Configuration |
| Interface-Port-Channel Configuration |

Command Syntax

```
uc-tx-queue queue_level
```

Parameters

- `queue_level` The multicast transmit queue number. Values range from `0` to `7`.

Commands Available in uc-tx-queue Configuration Mode

- `bandwidth percent` (Trident and Tomahawk)
- `priority` (Trident and Tomahawk)
- `shape rate` (Tx-queue – Trident and Tomahawk)

Related Commands

- `mc-tx-queue`: Configures multicast transmit queues on Trident and Tomahawk platform switches.

Example

- This command enters mc-tx-queue configuration mode for multicast transmit queue 3 of Ethernet interface 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#uc-tx-queue 4
switch(config-if-Et5-mc-txq-4)#
```
interface fabric (Trident II)

The interface fabric command places the switch in Fabric-interface configuration mode and allows the user to attach the QoS profile to the fabric interface of the switch.

Command Mode
Global Configuration

Command Syntax
interface fabric

Example
• This command places the switch in Fabric-interface configuration mode.
  switch(config)#interface fabric
  switch(config-if-fabric)#
Arista switches support Internet Protocol version 4 (IPv4) and Internet Protocol version 6 (IPv6) for routing packets across network boundaries. This chapter describes Arista’s implementation of IPv4 and includes these sections:

- Section 28.1: IPv4 Addressing
- Section 28.2: IPv4 Routing
- Section 28.3: IPv4 Multicast Counters
- Section 28.4: Route Management
- Section 28.5: IPv4 Route Scale
- Section 28.6: IP Source Guard
- Section 28.7: DHCP Relay Across VRF
- Section 28.8: IP NAT
- Section 28.9: TCP MSS Clamping
- Section 28.10: IPv4 GRE Tunneling
- Section 28.11: IPv4 Commands

### 28.1 IPv4 Addressing

Each IPv4 network device is assigned a 32-bit IP address that identifies its network location. These sections describe IPv4 address formats, data structures, configuration tasks, and display options:

- Section 28.1.1: IPv4 Address Formats
- Section 28.1.2: IPv4 Address Configuration
- Section 28.1.3: Address Resolution Protocol (ARP)
- Section 28.1.4: Displaying ARP Entries

### 28.1.1 IPv4 Address Formats

IPv4 addresses are composed of 32 bits, expressed in dotted decimal notation by four decimal numbers, each ranging from 0 to 255. A subnet is identified by an IP address and an address space defined by a routing prefix. The switch supports the following subnet formats:

- **IP address and subnet mask**: The subnet mask is a 32-bit number (dotted decimal notation) that specifies the subnet address space. The subnet address space is calculated by performing an AND operation between the IP address and subnet mask.
**IP address and wildcard mask:** The wildcard mask is a 32-bit number (dotted decimal notation) that specifies the subnet address space. Wildcard masks differ from subnet masks in that the bits are inverted. Some commands use wildcard masks instead of subnet masks.

**CIDR notation:** CIDR notation specifies the scope of the subnet space by using a decimal number to identify the number of leading ones in the routing prefix. When referring to wildcard notation, CIDR notation specifies the number of leading zeros in the routing prefix.

**Example**

- These subnets (subnet mask and CIDR notation) are calculated identically:
  
  10.24.154.13 255.255.255.0
  10.24.154.13/24

  The defined space includes all addresses between **10.24.154.0** and **10.24.154.255**.

- These subnets (wildcard mask and CIDR notation) are calculated identically:
  
  124.17.3.142 0.0.0.15
  124.17.3.142/28

  The defined space includes all addresses between **124.17.3.128** and **124.17.3.143**.

### 28.1.2 IPv4 Address Configuration

**Assigning an IPv4 Address to an Interface**

The `ip address` command specifies the IPv4 address of an interface and the mask for the subnet to which the interface is connected.

**Example**

- These commands configure an IPv4 address with subnet mask for VLAN 200:
  
  `switch(config)#interface vlan 200`
  `switch(config-if-Vl200)#ip address 10.0.0.1/24`

### 28.1.3 Address Resolution Protocol (ARP)

Address Resolution Protocol (ARP) is a protocol that maps IP addresses to MAC addresses that local network devices recognize. The ARP cache is a table that stores the correlated addresses of the devices for which the router facilitates data transmissions.

After receiving a packet, routers use ARP to find the MAC address of the device assigned to the packet’s destination IP address. If the ARP cache contains both addresses, the router sends the packet to the specified port. If the ARP cache does not contain the addresses, ARP broadcasts a request packet to all devices in the subnet. The device at the requested IP address responds and provides its MAC address. ARP updates the ARP cache with a dynamic entry and forwards the packet to the responding device. Static ARP entries can also be added to the cache through the CLI.

Proxy ARP is an ARP variant. A network device (proxy) responds to ARP requests for network addresses on a different network with its MAC address. Traffic to the destination is directed to the proxy device which then routes the traffic toward the ultimate destination.
### Configuring ARP

The switch uses ARP cache entries to correlate 32-bit IP addresses to 48-bit hardware addresses. The `arp aging timeout` command specifies the duration of dynamic address entries in the Address Resolution Protocol (ARP) cache for addresses learned through the layer 3 interface. The default duration is 14400 seconds (four hours).

Static ARP entries never time out and must be removed from the table manually.

#### Example

- This command specifies an ARP cache duration of 7200 seconds (two hours) for dynamic addresses added to the ARP cache that were learned through VLAN 200.

```plaintext
switch(config)#interface vlan 200
switch(config-if-Vl200)#arp aging timeout 7200
switch(config-if-Vl200)#show active
  interface Vlan200
    arp timeout 7200
switch(config-if-Vl200)#
```

The `arp` command adds a static entry to an Address Resolution Protocol (ARP) cache.

#### Example

- This command adds a static entry to the ARP cache in the default VRF.

```plaintext
switch(config)#arp 172.22.30.52 0025.900e.c63c arpa
switch(config)#
```

#### 28.1.3.1 Gratuitous ARP

Gratuitous ARP packets are broadcast by a device in response to an internal change rather than as a response to an ARP request. The gratuitous ARP packet is a request packet (no reply expected) that supplies an unrequested update of ARP information. In a gratuitous ARP packet, both the source and destination IP addresses are the IP of the sender, and the destination MAC address is the broadcast address (ff:ff:ff:ff:ff:ff).

Gratuitous ARP packets are generated to update ARP tables after an IPv4 address or a MAC address change occurs.

#### Configuring Gratuitous ARP

By default, Arista switch interfaces reject gratuitous ARP request packets. The `arp gratuitous accept` command configures an L3 interface to accept the gratuitous ARP request packets sent from a different device in the network and add their mappings to the ARP table. Gratuitous ARP can be configured on Ethernet interfaces, VLANs/SVI, or L3 port channels, but has no effect on L2 interfaces.

#### Example

- These commands enable gratuitous ARP packet acceptance on Ethernet interface 2/1.

```plaintext
switch (config)# interface ethernet 2/1
switch (config-if-Et2/1)#arp gratuitous accept
```

#### 28.1.4 Displaying ARP Entries

The `show ip arp` command displays ARP cache entries that map an IP address to a corresponding MAC address. The table displays addresses by their host names when the command includes the `resolve` argument.
Example

- This command displays ARP cache entries that map MAC addresses to IPv4 addresses.

```
switch>show ip arp
Address         Age (min)  Hardware Addr   Interface
172.25.0.2              0 004c.6211.021e  Vlan101, Port-Channel2
172.22.0.1              0 004c.6214.3699  Vlan1000, Port-Channel1
172.22.0.2              0 004c.6219.a0f3  Vlan1000, Port-Channel1
172.22.0.3              0 0045.4942.a32c  Vlan1000, Ethernet33
172.22.0.5              0 f012.3118.c09d  Vlan1000, Port-Channel1
172.22.0.6              0 00e1.d11a.aleb  Vlan1000, Ethernet5
172.22.0.7              0 004f.e320.cd23  Vlan1000, Ethernet6
172.22.0.8              0 0032.48da.f9d9  Vlan1000, Ethernet37
172.22.0.9              0 0018.910a.1fc5  Vlan1000, Ethernet29
172.22.0.11             0 0056.cbe9.8510  Vlan1000, Ethernet26
switch>
```

- This command displays ARP cache entries that map MAC addresses to IPv4 addresses. Host names assigned to IP addresses are displayed in place of the address.

```
switch>show ip arp resolve
Address         Age (min)  Hardware Addr   Interface
 green-vl101.new 0 004c.6211.021e  Vlan101, Port-Channel2
172.22.0.1              0 004c.6214.3699  Vlan1000, Port-Channel1
orange-vl1000.n 0 004c.6219.a0f3  Vlan1000, Port-Channel1
172.22.0.3              0 0045.4942.a32c  Vlan1000, Ethernet33
purple.newcompa 0 f012.3118.c09d  Vlan1000, Port-Channel1
pink.newcompany 0 00e1.d11a.aleb  Vlan1000, Ethernet5
yellow.newcompa 0 004f.e320.cd23  Vlan1000, Ethernet6
172.22.0.8              0 0032.48da.f9d9  Vlan1000, Ethernet37
royalblue.newco 0 0018.910a.1fc5  Vlan1000, Ethernet29

switch>
```

28.1.4.1 ARP Inspection

Address Resolution Protocol (ARP) inspection command `ip arp inspection vlan` activates a security feature that protects the network from ARP spoofing. ARP requests and responses on untrusted interfaces are intercepted on specified VLANs, and intercepted packets are verified to have valid IP-MAC address bindings. All invalid ARP packets are dropped. On trusted interfaces, all incoming ARP packets are processed and forwarded without verification.

Enabling and Disabling ARP Inspection

By default, ARP inspection is disabled on all VLANs.

Examples

- This command enables ARP inspection on VLANs 1 through 150.

```
switch(config)#ip arp inspection vlan 1 - 150
switch(config)#
```

- This command disables ARP inspection on VLANs 1 through 150.

```
switch(config)#no ip arp inspection vlan 1 - 150
switch(config)#
```

- This command sets the ARP inspection default to VLANs 1 through 150.

```
switch(config)#default ip arp inspection vlan 1 - 150
switch(config)#
```
These commands enable ARP inspection on multiple VLANs 1 through 150 and 200 through 250.

```
switch(config)#ip arp inspection vlan 1-150,200-250
switch(config)#
```

**Syslog for Invalid ARP Packets Dropped**

When an invalid ARP packet is dropped, the following syslog message appears. The log severity level can be set higher if required.

```
%SECURITY-4-ARP_PACKET_DROPPED: Dropped ARP packet on interface Ethernet28/1 Vlan 2121 because invalid mac and ip binding. Received: 00:0a:00:bc:00:de/1.1.1.1.
```

**Displaying ARP Inspection States**

The command `show ip arp inspection vlan` displays the configuration and operation state of ARP inspection. For a VLAN range specified by `show ip arp inspection vlan` only VLANs with ARP inspection enabled will be displayed. If no VLAN is specified, all VLANs with ARP inspection enabled are displayed. The operation state turns to *Active* when hardware is ready to trap ARP packets for inspection.

**Example**

- This command displays the configuration and operation state of ARP inspection for VLANs 1 through 150.

```
switch(config)#show ip arp inspection vlan 1 - 150
VLAN 1
--------
Configuration : Enabled
Operation State : Active
VLAN 2
--------
Configuration : Enabled
Operation State : Active
{...}
VLAN 150
--------
Configuration : Enabled
Operation State : Active
```

**Displaying ARP Inspection Statistics**

The command `show ip arp inspection statistics` displays the statistics of inspected ARP packets. For a VLAN specified by `show ip arp inspection vlan` only VLANs with ARP inspection enabled will be displayed. If no VLAN is specified, all VLANs with ARP inspection enabled are displayed.

The command `clear arp inspection statistics` clears ARP inspection.
Examples

- This command displays ARP inspection statistics for VLAN 1.

```
switch(config)#show ip arp inspection statistics vlan 2
Vlan : 2
--------
ARP Req Forwarded = 20
ARP Res Forwarded = 20
ARP Req Dropped = 1
ARP Res Dropped = 1

Last invalid ARP:
Time: 10:20:30 ( 5 minutes ago )
Reason: Bad IP/Mac match
Received on: Ethernet 3/1
Packet:
   Source MAC: 00:01:00:01:00:01
   Dest MAC: 00:02:00:02:00:02
   ARP Type: Request
   ARP Sender MAC: 00:01:00:01:00:01
   ARP Sender IP: 1.1.1
```

- This command displays ARP inspection statistics for Ethernet interface 3/1.

```
switch(config)#show ip arp inspection statistics ethernet interface 3/1
Interface : 3/1
--------
ARP Req Forwarded = 10
ARP Res Forwarded = 10
ARP Req Dropped = 1
ARP Res Dropped = 1

Last invalid ARP:
Time: 10:20:30 ( 5 minutes ago )
Reason: Bad IP/Mac match
Received on: VLAN 10
Packet:
   Source MAC: 00:01:00:01:00:01
   Dest MAC: 00:02:00:02:00:02
   ARP Type: Request
   ARP Sender MAC: 00:01:00:01:00:01
   ARP Sender IP: 1.1.1
```

- This command clears ARP inspection statistics.

```
switch(config)#clear arp inspection statistics
```

Configure Trust Interface

By default, all interfaces are untrusted. The command `ip arp inspection trust` configures the trust state of an interface.
Examples

- This command configures the trust state of an interface.
  ```
  switch(config)# ip arp inspection trust
  switch(config)#
  ```

- This command configures the trust state of an interface to untrusted.
  ```
  switch(config)# no ip arp inspection trust
  switch(config)#
  ```

- This command configures the trust state of an interface to its default (untrusted).
  ```
  switch(config)# default ip arp inspection trust
  switch(config)#
  ```

Configure Rate Limit

When ARP inspection is enabled, ARP packets are trapped to the CPU. Two actions can be taken when the incoming ARP rate exceeds expectation. For notification purpose, the command `ip arp inspection logging` will enable logging of the incoming ARP packets. To prevent a denial-of-service attack, the command `ip arp inspection limit` will error-disable interfaces.

Examples

- This command enables logging of incoming ARP packets when its rate exceeds the configured value, and sets the rate to 2048 (which is the upper limit for the number of invalid ARP packets allowed per second), and sets the burst consecutive interval over which the interface is monitored for a high ARP rate to 15 seconds.
  ```
  switch(config)# ip arp inspection logging rate 2048 burst interval 15
  switch(config)#
  ```

- This command configures the rate limit of incoming ARP packets to errdisable the interface when the incoming ARP rate exceeds the configured value, sets the rate to 512 (which is the upper limit for the number of invalid ARP packets allowed per second), and sets the burst consecutive interval over which the interface is monitored for a high ARP rate to 11 seconds.
  ```
  switch(config)# ip arp inspection limit rate 512 burst interval 11
  switch(config)#
  ```

- This command displays verification of the interface specific configuration.
  ```
  switch(config)# interface Ethernet 3 / 1
  switch(config)# show ip arp inspection interfaces
  Interface Trust State Rate (pps) Burst Interval
  Et3/1 Untrusted 20 5
  Et3/3 Trusted None N/A
  ```

Configure Errdisable Caused by ARP Inspection

If the incoming ARP packet rate on an interface exceeds the configured rate limit in burst interval, the interface will be errdisabled (by default). If errdisabled, the interface will stay in this state until you intervene with the command `errdisable detect cause arp-inspection` (e.g., after you perform a `shutdown` or `no shutdown` of the interface) or it automatically recovers after a certain time period. The
The command **errdisable recovery cause arp-inspection** will enable auto recovery. The command **errdisable recovery interval** will enable sharing the auto recovery interval among all errdisable interfaces. (See the chapter “Data Transfer” for information on all errdisable commands.

**Examples**

- This command enables errdisable caused by an ARP inspection violation.
  
  ```
  switch(config)#errdisable detect cause arp-inspection
  switch(config)#
  ```

- This command disables errdisable caused by an ARP inspection violation.
  
  ```
  switch(config)#no errdisable detect cause arp-inspection
  switch(config)#
  ```

- This command enables auto recovery.
  
  ```
  switch(config)#errdisable recovery cause arp-inspection
  switch(config)#
  ```

- This command disables auto recovery.
  
  ```
  switch(config)#no errdisable recovery cause arp-inspection
  switch(config)#
  ```

- This command enables sharing the auto recovery interval of 10 seconds among all errdisable interfaces.
  
  ```
  switch(config)#errdisable recovery interval 10
  switch(config)#
  ```

- This command disables sharing the auto recovery interval of 10 seconds among all errdisable interfaces.
  
  ```
  switch(config)#no errdisable recovery interval 10
  switch(config)#
  ```

- This command displays the reason for a port entering the errdisable state.
  
  ```
  switch(config)#show interfaces status errdisabled
  Port Name Status Reason
  ------------------ ------------------ ------------------
  Et3/2 errdisabled arp-inspection
  ```

**Configure Static IP MAC Binding**

The ARP inspection command **ip source binding** allows users to add static IP-MAC binding. If enabled, ARP inspection verifies incoming ARP packets based on the configured IP-MAC bindings. The static IP-MAC binding entry can only be configured on Layer 2 ports. By default, there is no binding entry on the system.

**Examples**

- This command configures static IP-MAC binding for IP address 127.0.0.1, MAC address 0001.0001.0001, VLAN 1, and Ethernet interface slot 4 and port 1.
  
  ```
  switch(config)#ip source binding 127.0.0.1 0001.0001.0001 vlan 1 interface ethernet 4/1
  switch(config)#
  ```
This command configures static IP-MAC binding for IP address 127.0.0.1, MAC address 0001.0001.0001, VLAN 1, and port-channel interface 20.

```
switch(config)#ip source binding 127.0.0.1 0001.0001.0001 vlan 1 interface port-channel 20
switch(config)#
```

This command displays the configured IP-MAC binding entries. Note that the Lease column is mainly used for displaying dynamic DHCP snooping binding entries. For static binding entries, lease time is shown as infinite.

```
switch(config)#show ip source binding 127.0.0.1 0001.0001.0001 static vlan 1 interface port-channel 20
MacAddress   IpAddress   Lease(sec)   Type   VLAN   Interface
------------- ----------- ----------- ------- ------ -------------------
0001.0001.0001 127.0.0.1 infinite static 1   Port-Channel20
switch(config)#
```
28.2 IPv4 Routing

Internet Protocol version 4 (IPv4) is a communications protocol used for relaying network packets across a set of connected networks using the Internet Protocol suite. Routing transmits network layer data packets over connected independent subnets. Each subnet is assigned an IP address range and each device on the subnet is assigned an IP address from that range. The connected subnets have IP address ranges that do not overlap.

A router is a network device that connects multiple subnets. Routers forward inbound packets to the subnet whose address range includes the packets' destination address. IPv4 and IPv6 are internet layer protocols that define packet-switched internetworking, including source-to-destination datagram transmission across multiple networks.

These sections describe IPv4 routing and route creation options:

- Section 28.2.1: Enabling IPv4 Routing
- Section 28.2.2: Static and Default IPv4 Routes
- Section 28.2.3: Dynamic IPv4 Routes
- Section 28.2.4: Viewing IPv4 Routes and Network Components

28.2.1 Enabling IPv4 Routing

When IPv4 routing is enabled, the switch attempts to deliver inbound packets to destination IPv4 addresses by forwarding them to interfaces or next hop addresses specified by the forwarding table. The ip routing command enables IPv4 routing.

Example

- This command enables IP routing:

  switch(config)#ip routing

  switch(config)#

28.2.2 Static and Default IPv4 Routes

Static routes are entered through the CLI and are typically used when dynamic protocols are unable to establish routes to a specified destination prefix. Static routes are also useful when dynamic routing protocols are not available or appropriate. Creating a static route associates a destination IP address with a local interface. The routing table refers to these routes as connected routes that are available for redistribution into routing domains defined by dynamic routing protocols.

The ip route command creates a static route. The destination is a network segment; the nexthop is either an IP address or a routable interface port. When multiple routes exist to a destination prefix, the route with the lowest administrative distance takes precedence.

By default, the administrative distance assigned to static routes is 1. Assigning a higher administrative distance to a static route configures it to be overridden by dynamic routing data. For example, a static route with a distance value of 200 is overridden by OSPF intra-area routes, which have a default distance of 110.

A route tag is a 32-bit number that is attached to a route. Route maps use tags to filter routes. Static routes have a default tag value of 0.

Example

- This command creates a static route:

  switch(config)#ip route 172.17.252.0/24 vlan 500

  switch(config)#
Creating Default IPv4 Routes

The default route denotes the packet forwarding rule that takes effect when no other route is configured for a specified IPv4 address. All packets with destinations that are not established in the routing table are sent to the destination specified by the default route.

The IPv4 destination prefix is 0.0.0.0/0 and the next-hop is the default gateway.

Example

- This command creates a default route and establishes 192.14.0.4 as the default gateway address:
  ```
  switch(config)#ip route 0.0.0.0/0 192.14.0.4
  switch(config)#
  ```

28.2.3 Dynamic IPv4 Routes

Dynamic routes are established by dynamic routing protocols. These protocols also maintain the routing table and modify routes to adjust for topology or traffic changes. Routing protocols assist the switch in communicating with other devices to exchange network information, maintaining routing tables, and establishing data paths.

The switch supports these dynamic IPv4 routing protocols:

- **Open Shortest Path First – Version 2**
- **Border Gateway Protocol (BGP)**
- **Routing Information Protocol**
- **IS-IS**

28.2.4 Viewing IPv4 Routes and Network Components

Displaying the FIB and Routing Table

The **show ip route** command displays routing table entries that are in the forwarding information base (FIB), including static routes, routes to directly connected networks, and dynamically learned routes. Multiple equal-cost paths to the same prefix are displayed contiguously as a block, with the destination prefix displayed only on the first line.

The **show running-config** command displays configured commands not in the FIB. The **show ip route summary** command displays the number of routes, categorized by source, in the routing table.
Examples

- This command displays IP routes learned through BGP.
  
  ```
  switch>show ip route bgp
  Codes: C - connected, S - static, K - kernel, 
  O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1, 
  E2 - OSPF external type 2, N1 - OSPF NSSA external type 1, 
  N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP, 
  R - RIP, A - Aggregate 
  
  B E    170.44.48.0/23 [20/0] via 170.44.254.78 
  B E    170.44.50.0/23 [20/0] via 170.44.254.78 
  B E    170.44.52.0/23 [20/0] via 170.44.254.78 
  B E    170.44.54.0/23 [20/0] via 170.44.254.78 
  B E    170.44.254.112/30 [20/0] via 170.44.254.78 
  B I    170.53.0.34/32 [1/0] via 170.44.254.78 
  
  switch>
  ```

- This command displays a summary of routing table contents.
  
  ```
  switch>show ip route summary
  Route Source         Number Of Routes 
  ---------------------
  connected                   15 
  static                       0 
  ospf                        74 
  Intra-area: 32 Inter-area:33 External-1:0 External-2:9 
  NSSA External-1:0 NSSA External-2:0 
  bgp                          7 
  External: 6 Internal: 1 
  internal                    45 
  attached                    18 
  aggregate                    0 
  switch>
  ```

Displaying the IP Route Age

The `show ip route age` command displays the time when the route for the specified network was present in the routing table. It does not account for the changes in parameters like metric, next-hop etc.

Example

- This command displays the amount of time since the last update to ip route 172.17.0.0/20.
  
  ```
  switch>show ip route 172.17.0.0/20 age
  Codes: C - connected, S - static, K - kernel, 
  O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1, 
  E2 - OSPF external type 2, N1 - OSPF NSSA external type 1, 
  N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP, 
  R - RIP, I - ISIS, A - Aggregate 
  
  B E    172.17.0.0/20 via 172.25.0.1, age 3d01h
  
  switch>
  ```
Displaying Gateways

A gateway is a router that provides access to another network. The gateway of last resort, also known as the default route, is the route that a packet uses when the route to its destination address is unknown. The IPv4 default route is 0.0.0.0/0.

The `show ip route gateway` command displays IP addresses of all gateways (next hops) used by active routes.

Example

- This command displays next hops used by active routes.

```
switch> show ip route gateway
The following gateways are in use:
  172.25.0.1 Vlan101
  172.17.253.2 Vlan2000
  172.17.254.2 Vlan2201
  172.17.254.11 Vlan2302
  172.17.254.13 Vlan2302
  172.17.254.17 Vlan2303
  172.17.254.20 Vlan2303
  172.17.254.66 Vlan2418
  172.17.254.67 Vlan2418
  172.17.254.68 Vlan2768
  172.17.254.29 Vlan3020
switch>
```

Displaying Host Routes

The `show ip route host` command displays all host routes in the host forwarding table. Host routes are those whose destination prefix is the entire address (mask = 255.255.255.255 or prefix = /32). Each displayed host route is labeled with its purpose:

- F static routes from the FIB.
- R routes defined because the IP address is an interface address.
- B broadcast address.
- A routes to any neighboring host for which the switch has an ARP entry.
Example

- This command displays all host routes in the host forwarding table.

```bash
switch#show ip route host
R - receive B - broadcast F - FIB, A - attached

F  127.0.0.1 to cpu
B  172.17.252.0 to cpu
A  172.17.253.2 on Vlan2000
R  172.17.253.3 to cpu
A  172.17.253.10 on Vlan2000
R  172.17.254.1 to cpu
A  172.17.254.2 on Vlan2901
B  172.17.254.3 to cpu
B  172.17.254.8 to cpu
A  172.17.254.11 on Vlan2902
R  172.17.254.12 to cpu

F  172.26.0.28 via 172.17.254.20 on Vlan3003
   via 172.17.254.67 on Vlan3008
   via 172.17.254.98 on Vlan3492
   via 172.17.254.86 on Vlan3884
   via 172.17.253.2 on Vlan3000
F  172.26.0.29 via 172.25.0.1 on Vlan101
F  172.26.0.30 via 172.17.254.29 on Vlan3910
F  172.26.0.31 via 172.17.254.33 on Vlan3911
F  172.26.0.32 via 172.17.254.105 on Vlan3912
switch#
```
28.3 IPv4 Multicast Counters

IPv4 multicast counters allow association of IPv4 multicast routes with a packet or byte counter.

This chapter contains the following sections.

- Section 28.3.1: Multicast Counters Hardware Overview
- Section 28.3.2: Multicast Counters iBGP and eBGP Configuration
- Section 28.3.3: Configuring IPv4 Multicast Counters

28.3.1 Multicast Counters Hardware Overview

This section describes a hardware overview for multicast counters, and contains the following sections.

- Section 28.3.1.1: Platform Independent Requirements for Counters
- Section 28.3.1.2: Policer Counter Overview
- Section 28.3.1.3: BGP Functions Supported for Arista Switches
- Section 28.3.1.4: Additional Requirements

28.3.1.1 Platform Independent Requirements for Counters

The following platform independent requirements include:

- Enable/Disable counters
- Clear counters
- Show counters
- Configure counter mode for byte (default) or frame mode

28.3.1.2 Policer Counter Overview

The switch hardware has two policer banks, each with 4k entries and each entry has one 32 bit entry1, and one 32 bit entry2, which can be used as either packet counter or byte counter.

In the pipeline, each bank can have one policer index coming from upstream blocks, which means different features cannot update multiple policer entries in the same bank simultaneously. Therefore, different features cannot share entries in the same bank.

In switch hardware routing, each FFU/BST entry points to a corresponding RAM. A policer index is saved in the action ram, so when installing a multicast route into hardware, platform code will get a policer index and saved in the action field. If a policer index is unavailable, a counter is not added to the action field.

Switch hardware can have multiple features competing for the policer banks. It is desirable to have a platform command to reserve policer banks dedicated for a certain feature.

The following command reserves one or two policer banks to be used only by the named feature:

```
[no] platform fm6000 [nat | acl | qos | multicast] policer banks <1|2>
```

Available bank(s) are reserved for the feature. Otherwise the command takes effect at the next reboot or FocalPointV2 agent restart. This reservation guarantees the configured number of bank(s) for this feature. However, the feature can still possibly obtain the other policer bank if it needs more, and the other bank is available.

If a feature has a pending reservation request which is not fulfilled because of availability, and some other feature frees a bank, the bank will be allocated to the pending feature.
28.3.1.3 BGP Functions Supported for Arista Switches

Arista switches support these BGP functions:
- A single BGP instance
- Simultaneous internal (iBGP) and external (eBGP) peering
- Multiprotocol BGP
- BGP Confederations

28.3.1.4 Additional Requirements

On switch hardware, the following additional requirements include:
- Reservation of policer banks
- Notification of policer bank availability when a policer entry is freed by other features

28.3.2 Multicast Counters iBGP and eBGP Configuration

This section describes the commands required to configure an iBGP and an eBGP topology, and contains the following sections.
- Section 28.3.2.1: Policer Usage

28.3.2.1 Policer Usage

There are two types of counters – those created by wildcard creation and by specific creation. When a specific counter is required and the hardware runs out of policer entries, a wildcard counter is forced to give up its policer entry.

If the user configures a specific counter and the starter group (SG) already has a wildcard-created counter for it, then this counter is upgraded to a specific one, with no change in hardware policer index. If the user configures both a wildcard counter and specific counter for this SG, and subsequently deletes the specific counter, the counter for this SG is downgraded to a wildcard, with no change in hardware policer index. However, if another specific counter is pending for a hardware policer index, then this policer entry will be assigned to that counter due to its higher precedence.

Even if a counter is configured by the user, in order to conserve the use of hardware resources, we should not allocate a policer entry until a real route (G, S) is programmed into the frame filtering and forwarding unit (FFU).

28.3.3 Configuring IPv4 Multicast Counters

Perform the following CLI steps to configure IPv4 multicast counters on the FM6000 platform:

**Step 1** Execute the global configuration command:

- `no | default ip multicast count bytes | packets`
  Enables wildcard counters. Also used to change bytes / packets mode. When hardware runs of resources, specific creation has priority to preempt counters from wildcard creation. The **bytes | packets** optional keyword enables the counter to be in either bytes mode or packets mode. This mode applies to all counters. When the counter mode changes, all counter values will be reset to zero.

- `no | default ip multicast count <G> <S>`
  This is only takes affect when ip multicast count is enabled. Either `<G, S>` or **bytes | packets** optional keyword is used. They can not be used concurrently.
No I default Commands: (default is same as no)

- no ip multicast count
  - Deletes all multicast counters, including explicit \(<G> <S>\) routes
- no ip multicast count \(<G> <S>\)
  - Removes the config. Does not delete the counter because the wildcard is still active.
  - If no \(<G, S>\) is specified, all multicast routes will have counters unless the hardware runs out of resources. The creation of counters is referred to as “wildcard creation.”
  - If \(<G, S>\) is specified, only \(<G, S>\) will get a counter (and no other route). The creation of counters is referred to as “specific creation.” By default, all mcast routes will have counters allocated. This \(<G, S>\) configuration is applicable when the hardware runs out of resources. Specific \(<G, S>\) creation has priority to preempt counters from wildcard creation.

The \texttt{byte} | \texttt{frame} optional keyword enables the counter to be in either byte mode or frame mode. This mode applies to all counters. When the counter mode changes, all counter values will be reset to zero.

Either \texttt{<G, S>} or \texttt{byte} | \texttt{frame} optional keywords are used and cannot be used together. All counters are \texttt{byte} | \texttt{frame}. The \texttt{byte} | \texttt{frame} mode is global, and not applicable on a \texttt{<G, S>} basis.

**Step 2** Execute clear command:

- clear ip multicast count \(<G> <S>\)

**Step 3** Execute show command:

- show multicast fib ipv4 \(<G>\) count
  
  This command currently exists but does not show anything.

  This show command is intended to display the following (example):
  
  switch\textgreater show multicast fib ipv4 count
  Activity poll time: 60 seconds
  225.1.1.1 100.0.0.2
  Byte: 123
  Vlan100 (iif)
  Vlan200
  Activity 0:00:47 ago

  Total counts is the sum of counts from all sources in that group.

  The count value can be \texttt{N/A} if a mroute does not have an associated counter.

  If the count value for any source in a \texttt{<G>} is \texttt{N/A}, then the total counts for \texttt{<G>} will be shown as \texttt{N/A}. However, the count values for other sources are still shown.
28.4 Route Management
When routing is enabled, the switch discovers the best route to a packet's destination address by exchanging routing information with other devices. IP routing is disabled by default.

The following sections describe routing features that the switch supports:

- Section 28.4.1: Route Redistribution
- Section 28.4.2: Equal Cost Multipath Routing (ECMP) and Load Sharing
- Section 28.4.3: Unicast Reverse Path Forwarding (uRPF)
- Section 28.4.4: Routing Tables / Virtual Routing and Forwarding (VRF)
- Section 28.4.5: RIB Route Control

28.4.1 Route Redistribution
Route redistribution is the advertisement, into a dynamic routing protocol's routing domain, of connected (static) routes or routes established by other routing protocols. By default, the switch advertises only routes in a routing domain that are established by the protocol that defined the domain.

Route redistribution commands specify the scope of the redistribution action. By default, all routes from a specified protocol (or all static routes) are advertised into the routing domain. Commands can also filter routes by applying a route map, which defines the subset of routes to be advertised.

28.4.2 Equal Cost Multipath Routing (ECMP) and Load Sharing
Equal cost multi-path (ECMP) is a routing strategy where traffic is forwarded over multiple paths that have equal routing metric values.

Configuring ECMP (IPv4)
All ECMP paths are assigned the same tag value; commands that change the tag value of a path also change the tag value of all paths in the ECMP route.

In a network topology using ECMP routing, hash polarization may result when all switches perform identical hash calculations. Hash polarization leads to uneven load distribution among the data paths. Hash polarization is avoided when switches use different hash seeds to perform hash calculations.

The ip load-sharing command provides the hash seed to an algorithm that the switch uses to distribute data streams among multiple equal-cost routes to a specified subnet.

Example
- This command sets the IPv4 load sharing hash seed to 20:

  switch(config)#ip load-sharing fm6000 20
  switch(config)#

Multicast Traffic Over ECMP
The switch attempts to spread outbound unicast and multicast traffic to all ECMP route paths equally. To disable the sending of multicast traffic over ECMP, use the multipath none command or the no multipath deterministic command.

Resilient ECMP
Resilient ECMP is used for those prefixes where it is not desirable for routes to be rehashed due to link flap, typically where ECMP is being used for load balancing. Resilient ECMP configures a fixed number of next-hop entries in the hardware ECMP table for all the routes within a specified IP address prefix.
Implementing fixed table entries for a specified next-hop address allows data flows that are hashed to a valid next-hop number to remain intact even when some of the next hops go down or come back online.

Resilient ECMP is enabled for all routes within a specified prefix using the `ip hardware fib ecmp resilience` command. The command specifies the maximum number of next-hop addresses that the hardware ECMP table can contain for the specified IP prefix, and configures a redundancy factor that facilitates the duplication of next-hop addresses in the table. The fixed table space for the address is the maximum number of next hops multiplied by the redundancy factor. When the table contains the maximum number of next-hop addresses, the redundancy factor specifies the number of times each address is listed in the table. When the table contains fewer than the maximum number of next-hop addresses, the table space entries are filled by additional duplication of the nexthop addresses.

Resilient ECMP is also available for IPv6 IP addresses.

**Example**

- This command configures a hardware ECMP table space of 24 entries for the IP address 10.14.2.2/24. A maximum of six next-hop addresses can be specified for the IP address. When the table contains six next-hop addresses, each appears in the table four times. When the table contains fewer than six next-hop addresses, each is duplicated until the 24 table entries are filled.

```
switch(config)#ip hardware fib ecmp resilience 10.14.2.2/24 capacity 6 redundancy 4
```

### 28.4.3 Unicast Reverse Path Forwarding (uRPF)

Unicast Reverse Path Forwarding (uRPF) verifies the accessibility of source IP addresses in packets that the switch forwards. The switch drops a packet when uRPF determines that the routing table does not contain an entry with a valid path to that packet’s source IP address.

IPv4 and IPv6 uRPF operate independently. uRPF is VRF aware. Commands that do not specify a VRF utilize the default instance. Multicast routing is not affected by uRPF.

uRPF defines two operational modes: strict mode and loose mode.

- **Strict mode:** uRPF also verifies that a packet is received on the interface that its routing table entry will use for its return packet.
- **Loose mode:** uRPF validation does not consider the inbound packet’s ingress interface.

#### 28.4.3.1 uRPF Operation

uRPF is configurable on interfaces. For packets arriving on a uRPF-enabled interfaces, the source IP address is verified by examining the source and destination addresses of unicast routing table entries.

uRPF requires a reconfigured routing table to support IP address verification. When uRPF is enabled for the first time, unicast routing is briefly disabled to facilitate the routing table reconfiguration. Multicast routing is not affected by the initial uRPF enabling.

A packet fails uRPF verification if the table does not contain an entry whose source or destination address matches the packet’s source IP address. In strict mode, the uRPF also fails when the matching entry’s outbound interface does not match the packet’s ingress interface.

uRPF verification is not available for the following packets:

- **DHCP** (Source is 0.0.0.0 – Destination is 255.255.255.255)
- **IPv6 link local** (FE80::/10)
- **Multicast packets**
**ECMP uRPF**

When verifying ECMP routes, strict mode checks all possible paths to determine that a packet is received on the correct interface. Strict mode is supported for ECMP groups with a maximum of eight routing table entries. The switch reverts to loose mode for ECMP groups that exceed eight entries.

**Default Routes**

uRPF strict mode provides an *allow-default* option that accepts default routes. On interfaces that enable allow-default and a default route is defined, uRPF strict mode validates a packet even when the routing table does not contain an entry that matches the packet’s source IP address. When allow-default is not enabled, uRPF does not consider the default route when verifying an inbound packet.

**Null Routes**

NULL0 routes drop traffic destined to a specified prefix. When uRPF is enabled, traffic originating from a null route prefixes is dropped in strict and loose modes.

### 28.4.3.2 uRPF Configuration

Unicast Reverse Path Forwarding (uRPF) is enabled for IPv4 packets ingressing the configuration mode interface through the *ip verify* command.

**Note**

uRPF cannot be enabled on interfaces with ECMP member FECs.

### Example

- This command enables uRPF loose mode on VLAN interface 17.

  ```
  switch(config)#interface vlan 17
  switch(config-if-Vl17)#ip verify unicast source reachable-via any
  switch(config-if-Vl17)#show active
  interface Vlan17
      ip verify unicast source reachable-via any
  switch(config-if-Vl17)#
  ```

- This command enables uRPF strict mode on VLAN interface 18.

  ```
  switch(config)#interface vlan 18
  switch(config-if-Vl18)#ip verify unicast source reachable-via rx
  switch(config-if-Vl18)#show active
  interface Vlan18
      ip verify unicast source reachable-via rx
  switch(config-if-Vl18)#
  ```

### 28.4.4 Routing Tables / Virtual Routing and Forwarding (VRF)

An IP routing table is a data table that lists the routes to network destinations and metrics (distances) associated with those routes. A routing table is also known as a routing information base (RIB).

Virtual Routing and Forwarding (VRF) allows traffic separation by maintaining multiple routing tables. Arista switches support multiple VRF instances: one global or default VRF called “default” and multiple user-defined VRFs; the number of user-defined VRFs supported varies by platform. VRFs can be used as management or data plane VRFs.

- Management VRFs have routing disabled. They are typically used for management-related traffic.
- Dataplane VRFs have routing enabled. They support routing protocols and packet forwarding (hardware and software).
Dataplane VRFs are supported by Trident, FM6000, and Arad platform switches. VRFs support unicast IPv4 and IPv6 traffic and multicast traffic. Loopback, SVI, and routed ports may be added to VRFs. Management ports may be added without any hardware forwarding.

To allow overlap in the sets of IP addresses used by different VRF instances, a route distinguisher (RD) may be prepended to each address. RDs are defined in RFC 4364.

### 28.4.4.1 Default VRF

The default VRF on Arista switches is called “default.” It is created automatically and cannot be renamed or configured. Some configuration options accept “default” as a VRF input.

### 28.4.4.2 User-Defined VRFs

A user-defined VRF is created with the `vrf instance` command. After its creation, a VRF may be assigned a route distinguisher (RD) with the `rd` (Router-BGP VRF and VNI Configuration Modes) command in the VRF submode of Router-BGP Configuration Mode.

**Example**

- These commands create a VRF named “purple,” place the switch in BGP VRF configuration mode for that VRF, and specify a route distinguisher for the VRF identifying the administrator as AS 530 and assigning 12 as its local number.

  ```
  switch(config)#vrf instance purple
  switch(config-vrf-purple)#router bgp 50
  switch(config-router-bgp)#vrf purple
  switch(config-router-bgp-vrf-purple)#rd 530:12
  switch(config-router-bgp-vrf-purple)#
  ```

  To add interfaces to a user-defined VRF, enter configuration mode for the interface and use the `vrf` (Interface mode) command. Loopback, SVI, and routed ports can be added to a VRF.

**Example**

- These commands add VLAN 20 to the VRF named “purple.”

  ```
  switch(config)#interface VLAN 20
  switch(config-if-Vl20)#vrf purple
  switch(config-if-Vl20)#
  ```

The `show vrf` command shows information about user-defined VRFs on the switch.

**Example**

- This command displays information for the VRF named “purple”.

  ```
  switch>show vrf purple
  Vrf    RD       Protocols  State     Interfaces
  purple 64496:237   ipv4     no routing  Vlan42, Vlan43
  ```

### 28.4.4.3 Context-Active VRF

The context-active VRF specifies the default VRF that VRF-context aware commands use when displaying or refreshing routing table data.

VRF-context aware commands include:
- clear arp-cache
- show ip
- show ip arp
- show ip route
- show ip route gateway
- show ip route host

The `cli vrf` command specifies the context-active VRF.

**Example**
- This command specifies `magenta` as the context-active VRF.

```
switch#cli vrf magenta
switch#show routing-context vrf
Current VRF routing-context is magenta
```

The `show routing-context vrf` command displays the context-active VRF.

**Example**
- This command displays the context-active VRF.

```
switch>show routing-context vrf
Current VRF routing-context is magenta
switch>
```

### 28.4.5 RIB Route Control

The routing database (RIB) is composed of the routing information learned by the routing protocols, including static routes. The forwarding database (FIB) is composed of the routes actually used to forward traffic through a router.

Forwarding Information Base (FIB) makes IP destination prefix-based switching decisions. The FIB is similar to a routing table or information base. It maintains the forwarding information for the winning routes from the RIB. When routing or topology changes occur in the network, the IP routing table information is updated, and those changes are reflected in the FIB.

#### 28.4.5.1 Configuring FIB policy

The RIB calculates the best/winning routes to each destination and place these routes in the forwarding table. Based on the FIB policy configured the best routes are advertised.

For example, a FIB policy can be configured to deny the routes for FIB programming, however, it does not prevent these routes from being advertised by a routing protocol, or to be redistributed into another routing domain, or to be used for recursive resolution in the IP RIB. FIB policies control the size and content of the routing tables, and the best route to take to reach a destination.

The `rib ipv4 | ipv6 fib policy` command is used to enable FIB policy for a particular VRF under router general configuration mode.

The following match statements are supported:

- match interface
- match { ip | ipv6 } address prefix-list
- match { ip | ipv6 } resolved-next-hop prefix-list
- match isis level
- match metric
• match source-protocol

**Example**

• The following example enables FIB policy for IPv4 in the default VRF, using the route map, map1.

```
Switch(config)#router general
Switch(config-router-general)#vrf default
Switch(config-router-general-vrf-default)#rib ipv4 fib policy map1
```

### 28.4.5.2 Displaying FIB Information

Use the `show rib route <ipv4 | ipv6> fib policy exclude` command to display the RIB information. The `fib policy exclude` option displays the RIB routes that have been excluded from being programmed into FIB, by FIB policy.

**Example**

• The following example displays the routes filtered by FIB policy using the `fib policy excluded` option of the `show rib route ip|ipv6` command.

```
Switch#show rib route ipv6 fib policy excluded
Switch#show rib route ip bgp fib policy excluded
VRF name: default, VRF ID: 0xfe, Protocol: bgp
Codes: C - Connected, S - Static, P - Route Input
    B - BGP, O - Ospf, O3 - Ospf3, I - Isis
    > - Best Route, * - Unresolved Nexthop
    L - Part of a recursive route resolution loop
>B  10.1.0.0/24 [200/0]
    via 10.2.2.1 [115/20] type tunnel
      via 10.3.5.1, Ethernet1
    via 10.2.0.1 [115/20] type tunnel
      via 10.3.4.1, Ethernet2
      via 10.3.6.1, Ethernet3
>B  10.1.0.0/24 [200/0]
    via 10.2.2.1 [115/20] type tunnel
      via 10.3.5.1, Ethernet1
    via 10.2.0.1 [115/20] type tunnel
      via 10.3.4.1, Ethernet2
      via 10.3.6.1, Ethernet3
```

### 28.4.5.3 Displaying RIB Route Information

Use the `show rib route ip` command to view the IPv4 RIB information.

**Example**

• This command displays IPv4 RIB static routes.

```
switch#show rib route ip static
VRF name: default, VRF ID: 0xfe, Protocol: static
Codes: C - Connected, S - Static, P - Route Input
    B - BGP, O - Ospf, O3 - Ospf3, I - Isis
    > - Best Route, * - Unresolved Nexthop
    L - Part of a recursive route resolution loop
>S  10.80.0.0/12 [1/0]
    via 172.30.149.129 [0/1]
      via Management1, directly connected
```

```
>S  172.16.0.0/12 [1/0]
    via 172.30.149.129 [0/1]
      via Management1, directly connected
```
switch#
28.5 IPv4 Route Scale

IPv4 routes are optimized to achieve route scale when route distribution has a large number of routes of one or two parameters, with each parameter consisting of prefix lengths 12, 16, 20, 24, 28, and 32. If two separate prefix lengths are configured (in any order), one of them must be the prefix length of 32.

The following sections describes IPv4 route scale configuration, show commands, and system log messages:

- Section 28.5.1: Configuring IPv4 Route Scale
- Section 28.5.2: Show Commands
- Section 28.5.3: Syslog

28.5.1 Configuring IPv4 Route Scale

IPv4 route scale is enabled by the `ip hardware fib optimize` command for the configuration mode interface. The platform layer 3 agent is restarted to ensure IPv4 routes are optimized with the `agent SandL3Unicast terminate` command for the configuration mode interface.

**Example**

- This configuration command allows configuring prefix lengths 12 and 32.

  ```
  switch(config)#ip hardware fib optimize exact-match prefix-length 12 32
  ! Please restart layer 3 forwarding agent to ensure IPv4 routes are optimized
  ```

  One of the two prefixes in this command is a prefix-length of 32, which is required in the instance where there are two prefixes. For this command to take effect, the platform layer 3 agent must be restarted.

  This configuration command restarts the platform layer 3 agent to ensure IPv4 routes are optimized.

  ```
  switch(config)#agent SandL3Unicast terminate
  SandL3Unicast was terminated
  ```

  Restarting the platform layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.

  **Example**

  - This configuration command allows configuring prefix lengths 32 and 16.

    ```
    switch(config)#ip hardware fib optimize exact-match prefix-length 32 16
    ! Please restart layer 3 forwarding agent to ensure IPv4 routes are optimized
    ```

    One of the two prefixes in this command is a prefix-length of 32, which is required in the instance where there are two prefixes. For this command to take effect, the platform layer 3 agent must be restarted.

    This configuration command restarts the platform layer 3 agent to ensure IPv4 routes are optimized.

    ```
    switch(config)#agent SandL3Unicast terminate
    SandL3Unicast was terminated
    ```

    Restarting the platform layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.
Example

- This configuration command allows configuring prefix length 24.

  switch(config)#ip hardware fib optimize exact-match prefix-length 24
  ! Please restart layer 3 forwarding agent to ensure IPv4 routes are optimized

  In this instance, there is only one prefix-length, so a prefix-length of 32 is not required. For this command to take effect, the platform layer 3 agent must be restarted.

  This configuration command restarts the platform layer 3 agent to ensure IPv4 routes are optimized.

  switch(config)#agent SandL3Unicast terminate
  SandL3Unicast was terminated

  Restarting the platform layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.

Example

- This configuration command allows configuring prefix length 32.

  switch(config)#ip hardware fib optimize exact-match prefix-length 32
  ! Please restart layer 3 forwarding agent to ensure IPv4 routes are optimized

  For this command to take effect, the platform layer 3 agent must be restarted.

  This configuration command restarts the platform layer 3 agent to ensure IPv4 routes are optimized.

  switch(config)#agent SandL3Unicast terminate
  SandL3Unicast was terminated

  Restarting the platform layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.

Example

- This configuration command disables configuring prefix lengths 12 and 32.

  switch(config)#no ip hardware fib optimize exact-match prefix-length 12 32
  ! Please restart layer 3 forwarding agent to ensure IPv4 routes are not optimized

  One of the two prefixes in this command is a prefix-length of 32, which is required in the instance where there are two prefixes. For this command to take effect, the platform layer 3 agent must be restarted.

  This configuration command restarts the platform layer 3 agent to ensure IPv4 routes are not optimized.

  switch(config)#agent SandL3Unicast terminate
  SandL3Unicast was terminated

  Restarting the platform layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.

Example

- This configuration command attempts to configure prefix length 20 and 28 which triggers an error exception. One of the two prefixes in this command must be a prefix-length of 32, which is required in the instance where there are two prefixes.

  switch(config)#ip hardware fib optimize exact-match prefix-length 20 28
  % One of the prefix lengths must be 32
28.5.2 Show Commands

The IPv4 route scale summary is displayed by the `show platform arad ip route summary` command for the configuration mode interface. Resources for all IPv4 route scale routes are displayed by the `show platform arad ip route` command for the configuration mode interface.

Example

This command shows hardware resource usage of IPv4 routes.

```
switch(config)#show platform arad ip route summary
Total number of VRFs: 1
Total number of routes: 25
Total number of route-paths: 21
Total number of lem-routes: 4
```

Example

This command shows resources for all IPv4 routes in hardware. Routes that use the additional hardware resources will appear with an asterisk.

```
switch(config)#show platform arad ip route
Tunnel Type: M(mpls), G(gre)
* - Routes in LEM

28.5.3 Syslog

When the number of routes exceed additional hardware resources, the `ROUTING_LEMRESOURCE_FULL` syslog message is displayed.
28.6 IP Source Guard

IP Source Guard (IPSG) prevents IP spoofing attacks. It filters inbound IP packets based on their source MAC and IP addresses. IPSG is supported in hardware. IPSG enabled on a Layer 2 port verifies IP packets received on this port. Packets are permitted if each packet source MAC and IP addresses match any of the user-configured IP-MAC binding entries on the receiving VLAN and port. Packets with no match are dropped immediately.

28.6.1 Configuring IPSG

IPSG is applicable only to Layer 2 ports, and is enabled by the `ip verify source` command for the configuration mode interface. When configured on Layer 3 ports, IPSG does not take effect until this interface is converted to Layer 2.

IPSG is supported on Layer 2 Port-Channels, not member ports. The IPSG configuration on port channels supersedes the configuration on the physical member ports. Hence, source IP MAC binding entries should be configured on port channels using the `ip source binding` command. When configured on a port channel member port, IPSG does not take effect until this port is deleted from the port channel configuration.

Example

- These configuration commands exclude VLAN IDs 1 through 3 from IPSG filtering. When enabled on a trunk port, IPSG filters the inbound IP packets on all allowed VLANs. IP packets received on VLANs 4 through 10 on Ethernet 36 will be filtered by IPSG, while those received on VLANs 1 through 3 are permitted.

```
switch(config)#no ip verify source vlan 1-3
switch(config)#interface ethernet 36
switch(config-if-Et36)#switchport mode trunk
switch(config-if-Et36)#switchport trunk allowed vlan 1-10
switch(config-if-Et36)#ip verify source
switch(config-if-Et36)#
```

This configuration command configures source IP-MAC binding entries to IP address 10.1.1.1, MAC address 0000.aaaa.1111, VLAN ID 4094, and Ethernet interface 36.

```
switch(config)#ip source binding 10.1.1.1 0000.aaaa.1111 vlan 4094 interface ethernet 36
switch(config)#
```

28.6.2 Show Commands

The IPSG configuration and operational states and IP-MAC binding entries are displayed by the `show ip verify source` command for the configuration mode interface.

Example

This command verifies the IPSG configuration and operational states.

```
switch(config)#show ip verify source
Interface          Operational State
------------------- -------------------------------
Ethernet1           IP source guard enabled
Ethernet2           IP source guard disabled
```
Example
This command displays all VLANs configured in `no ip verify source vlan`. Hardware programming errors, e.g., VLAN classification failed, are indicated in the operational state. If an error occurs, this VLAN will be considered as enabled for IPSG. Traffic on this VLAN will still be filtered by IPSG.

```plaintext
switch(config)#show ip verify source vlan
IPSG disabled on VLANS: 1-2
VLAN Operational State
--------------- ------------------------
1 IP source guard disabled
2 Error: vlan classification failed
```

Example
This command displays all source IP-MAC binding entries configured for IPSG. A source binding entry is considered active if it is programmed in hardware. IP traffic matching any active binding entry will be permitted. If a source binding entry is configured on an interface or a VLAN whose operational state is IPSG disabled, this entry will not be installed in the hardware, in which case an “IP source guard disabled” state will be shown. If a port channel has no member port configured, binding entries configured for this port channel will not be installed in hardware, and a “Port-Channel down” state will be shown.

```plaintext
switch(config)#show ip verify source detail
Interface IP Address MAC Address VLAN State
--------------- -------- --------- ------ ------------------------
Ethernet1 10.1.1.1 0000.aaaa.1111 5 active
Ethernet1 10.1.1.5 0000.aaaa.5555 1 IP source guard disabled
Port-Channel1 20.1.1.1 0000.bbbb.1111 4 Port-Channel down
```
28.7 DHCP Relay Across VRF

The EOS DHCP relay agent supports forwarding of DHCP requests to DHCP servers located in a different VRF to the DHCP client interface VRF. In order to enable VRF support for the DHCP relay agent, Option 82 (DHCP Relay Agent Information Option) must first be enabled. The DHCP relay agent uses Option 82 to pass client specific information to the DHCP server.

These sections describe DHCP Relay across VRF features:

- **Section 28.7.1: Global Configuration**
- **Section 28.7.2: Show Command**

The DHCP relay agent inserts Option 82 information into the DHCP forwarded request, which requires the DHCP server belongs to a network on an interface, and that interface belongs to a different VRF than the DHCP client interface. Option 82 information includes the following:

- **VPN identifier**: The VRF name for the ingress interface of the DHCP request, inserted as sub-option 151.

```
 SubOpt | Len  | ASCII VRF Identifier 
  151   | 7    | V R F N A M E 
```

Figure 28-1: VPN Identifier

- **Link selection**: The subnet address of the interface that receives the DHCP request, inserted as sub-option 5. When the DHCP smart relay is enabled, the link selection is filled with the subnet of the active address. The relay agent will set the Gateway IP address (gIPaddr) to its own IP address so that DHCP messages can be routed over the network to the DHCP server.

```
 SubOpt | Len   | Subnet IP Address 
  5     | 4 A1 A2 A3 A4 
```

Figure 28-2: Link Selection

- **Server identifier override**: The primary IP address of the interface that receives the DHCP request, inserted as sub-option 11. When the DHCP smart relay is enabled, the server identifier is filled with the active address (one of the primary or secondary addresses chosen by smart relay mechanism).

```
 SubOpt | Len   | Overriding Server Identifier Address 
  11    | 4 B1 B2 B3 B4 
```

Figure 28-3: Link Selection

- **VSS control suboption as suboption 152**: The DHCP server will strip out this suboption when sending the response to the relay, indicating that the DHCP server used VPN information to allocate IP address.

**Note**

The DHCP server must be capable of handling VPN identifier information in option 82.

Direct communication between DHCP client and server may not be possible as they are in separate VRFs. The Server identifier override and Link Selection sub-options set the relay agent to act as the DHCP server, and enable all DHCP communication to flow through the relay agent.

The relay agent adds all the appropriate sub-options, and forwards all (including renew and release) request packets to the DHCP server. When the DHCP server response messages are received by the relay, Option 82 information is removed and the response is forwarded to the DHCP client in the client VRF.
28.7.1 Global Configuration

The DHCP relay agent information option is inserted in DHCP messages relayed to the DHCP server. The `ip helper-address` command enables DHCP relay on an interface; and relays DHCP messages to the specified IPv4 address.

Example

This command enables DHCP relay on the interface Ethernet 1/2; and relays DHCP messages to the server at 1.1.1.1.

```
switch(config)#interface ethernet 1/2
switch(config-if-Et1/2)#ip helper-address 1.1.1.1
```

The commands provided in examples below will turn on the attachment of VRF-related tags in the relay agent information option. If both the DHCP client interface and server interface are on the same VRF (default or non-default), then no VRF-related DHCP relay agent information option is inserted.

Examples

- This command configures the DHCP relay to add option 82 information.
  
  switch(config)#ip dhcp relay information option

- These commands configures two new VRF instances and assign them Route Distinguishers (RDs).

  switch(config)#vrf instance mtxxg-vrf
  switch(config-vrf-mttxg-vrf)#router bgp 50
  switch(config-router-bgp)#vrf mtxxg-vrf
  switch(config-router-bgp-vrf-mttxg-vrf)#rd 5546:5546

  switch(config)#vrf instance qchyh-vrf
  switch(config-vrf-qchyh-vrf)#router bgp 50
  switch(config-router-bgp)#vrf qchyh-vrf
  switch(config-router-bgp-vrf-qchyh-vrf)#rd 218:218

- This command configures an interface connected to DHCP client in vrf mtxxg-vrf and assigns an IP address.

  switch(config)#interface Ethernet 9
  switch(config-if-Et9)#no switchport

- This command configures the DHCP client interface in VRF mttxg-vrf.

  switch(config-if-Et9)#vrf mttxg-vrf
  switch(config-if-Et9)#ip address 10.10.0.1/16

- This command configures the server interface in VRF qchyh-vrf.

  switch(config-if-Et11)#vrf qchyh-vrf
  switch(config-if-Et11)#ip address 10.40.0.1/16

- This command configures a helper address for a DHCP server in VRF qchyh-vrf.

  switch(config-if-Et11)#ip helper-address 10.40.2.3 vrf qchyh-vrf
28.7.2 Show Command

Example

This command displays the VRF specifier for the server:

```
rtr1# show ip dhcp relay
DHCP Relay is active
DHCP Relay Option 82 is enabled
DHCP Smart Relay is disabled
Interface: Ethernet9

28.8 IP NAT

Network address translation (NAT) is a router process that modifies address information of IP packets in transit. NAT is typically used to correlate address spaces between a local network and a remote, often public, network. Static NAT defines a one-to-one map between local and remote IP addresses. Static maps are configured manually through CLI commands. An interface can support multiple NAT commands, but each command must specify a unique local IP address-port location.

NAT is configured on routers that have interfaces connecting to the local networks and interfaces connecting to a remote network.

NAT is available only on FM6000 platform switches (the 7150 series).

Inside and Outside Addresses

In NAT configurations, IP addresses are placed into one of two categories: inside or outside. Inside refers to IP addresses used within the organizational network. Outside refers to addresses on an external network outside the organizational network.

28.8.1 Static IP NAT

Static NAT configurations create a one-to-one mapping and translate a particular address to another address. This type of configuration creates a permanent entry in the NAT table as long as the configuration is present, and it enables both inside and outside hosts to initiate a connection.

Static NAT options include source NAT, destination NAT, and twice NAT.

- Source NAT modifies the source address in the IP header of a packet exiting the interface, and can optionally change the source port referenced in the TCP/UDP headers.
- Destination NAT modifies the destination address in the IP header of a packet entering the interface, and can optionally change the destination port referenced in the TCP/UDP headers.
- Twice NAT modifies both the source and destination address of packets entering and exiting the interface, and can optionally change the L4 port information in the TCP/UDP headers. Twice NAT is generally used when inside network addresses overlap or otherwise conflict with outside network addresses. When a packet exits the interface, local source and destination addresses are translated to global source and destination addresses. When a packet enters the interface, global source and destination addresses are translated to local source and destination addresses.

28.8.1.1 Configuring Static NAT

Configuring Source NAT

Network address translation of a source address (source NAT) is enabled by the `ip nat source static` command for the configuration mode interface. Applying source NAT to interfaces that connect to local hosts shields the IP address of the host when sending IP packets to remote destinations.

This command installs hardware translation entries for forward and reverse unicast traffic. When the rule specifies a multicast group, the command does not install the reverse path in hardware. The command may include an access control list to filter packets for translation.

Note

The switch uses a common NAT table for the entire switch, not a per interface one. For example, if a customer has the same inside local address translated to different inside global addresses depending on which interface it exits. It might be translated to exit interface B’s inside global address even though it exits through interface A. A way to avoid this is to use an access list that differentiates based on the destination IP address.
Chapter 28: IPv4

Example

These commands configure VLAN 201 to translate source address 10.24.1.10 to 168.32.14.15.

```
switch(config)#interface vlan 201
switch(config-if-Vl201)#ip nat source static 10.24.1.10 168.32.14.15
```

The `ip nat source static` command may include an ACL to limit packet translation. Only packets whose source IP address matches the ACL are cleared. ACLs configured for source NAT must specify a source IP address of `any`. Source port or protocol matching is not permitted. The destination may be an IP subnet. Commands referencing nonexistent ACLs are accepted by the CLI but not installed in hardware until the ACL is created. Modifying a referenced ACL causes the corresponding hardware entries to be replaced by entries that match the new command.

Example

These commands configure VLAN 101 to translate the source address 10.24.1.10 to 168.32.14.15 for all packets with IP destination addresses in the 168.10.1.1/32 subnet.

```
switch(config)#ip access-list ACL1
switch(config-acl-ACL1)#permit ip any 168.10.1.0/24
switch(config-acl-ACL1)#exit
switch(config)#interface vlan 101
switch(config-if-Vl101)#ip nat source static 168.32.14.15 access-list ACL1 10.24.1.10
```

Configuring Destination NAT

Network address translation of a destination address (destination NAT) is enabled by the `ip nat destination static` command for the configuration mode interface. Applying destination NAT to interfaces that connect to remote hosts shields the IP address of the recipient host when receiving IP packets from remote destinations.

This command installs hardware translation entries for forward and reverse unicast traffic. When the rule specifies a multicast group, the command does not install the reverse path in hardware. The command may include an access control list to filter packets for translation.
Example

- These commands configure VLAN 201 to translate destination address 168.32.14.15 to 10.24.1.10.

  switch(config)#interface vlan 201
  switch(config-if-Vl201)#ip nat destination static 168.32.14.15 10.24.1.10
  switch(config-if-Vl201)#

The `ip nat destination static` command may include an ACL to limit packet translation. Only packets whose source IP address matches the ACL are cleared. ACLs configured for destination NAT must specify a destination IP address of `any`. Destination port or protocol matching is not permitted. The source may be an IP subnet. Commands referencing nonexistent ACLs are accepted by the CLI but not installed in hardware until the ACL is created. Modifying a referenced ACL causes the corresponding hardware entries to be replaced by entries that match the new command.

Example

- These commands configure VLAN 201 to translate the destination address 168.32.14.15 to 10.24.1.10 for all packets with IP source addresses in the 168.10.1.4/32 subnet.

  switch(config)#ip access-list ACL2
  switch(config-acl-ACL2)#permit ip 168.10.1.4/32 any
  switch(config-acl-ACL2)#exit
  switch(config)#interface vlan 201
  switch(config-if-Vl201)#ip nat destination static 168.32.14.15 access-list ACL2 10.24.1.10
  switch(config-if-Vl201)#

Configuring Twice NAT

Network address translation of both source and destination addresses on the same interface (twice NAT) is enabled by creating one source NAT rule and one destination NAT rule on the same interface and associating them through a NAT group using the `ip nat source static` and `ip nat destination static` commands.

The `ip nat source static` command translates the actual local source address to a source address which can be used outside the local network to reference the source. The `ip nat destination static` command translates an internally used destination address to the actual IP address that is the destination of the packet.
The source and destination NAT rules must reference the same NAT group, and both should either specify only IP addresses or specify both IP addresses and L4 port information. If L4 port information is configured in one rule but not in the other, an error message will be displayed.

Each NAT rule installs hardware translation entries for forward and reverse unicast traffic. When the rule specifies a multicast group, the command does not install the reverse path in hardware. Twice NAT does not support the use of access control lists to filter packets for translation.

Example

- These commands configure Ethernet interface 2 to translate the local source address 10.24.1.10 to the global source address 168.32.14.15, and to translate the local destination address 10.68.104.3 to the global destination address 168.25.10.7 for all packets moving through the interface. The use of NAT group 3 is arbitrary, but must be the same in both rules.

```
switch(config)#interface ethernet 2
switch(config-if-Et2)#ip nat source static 10.24.1.10 168.32.14.15 group 3
switch(config-if-Et2)#ip nat destination static 10.68.104.3 168.25.10.7 group 3
```

28.8.1.2 Static NAT Configuration Considerations

Egress VLAN filter for static NAT

When a static source NAT is configured on an interface, the source IP translation happens only for those packets that is going 'out' of this interface. If a packet is egressing on an interface which does not have NAT configured, then the source IP is not translated.

When there are two interfaces on which static SNAT is configured then the translation specified for one interface can be applied to a packet going out on the other interface.

Example

- In this example, the packets with source IP 20.1.1.1 going out of E1 will still have the source IP translated to 172.1.1.1 even though the rule is configured in E2 and not on E1.

```
switch(config)#interface ethernet 1
switch(config-if-Et1)#ip nat source static 10.1.1.1 171.1.1.1
switch(config)#interface ethernet 2
switch(config-if-Et2)#ip nat source static 20.1.1.1 172.1.1.1
```

To prevent this, use an ACL to filter the traffic that needs NAT on the interfaces.

```
switch(config)#ip access-list acl1
switch(config-acl-acl1)#permit ip any 171.1.1.0/24
switch(config)#ip access-list acl2
switch(config-acl-acl2)#permit ip any 172.1.1.0/24
```

```
switch(config)#interface ethernet 1
switch(config-if-Et1)#ip nat source static 10.1.1.1 access-list acl1 171.1.1.1
switch(config)#interface ethernet 2
switch(config-if-Et2)#ip nat source static 20.1.1.1 access-list acl2 172.1.1.1
```

ACL filtering is not supported when using twice NAT.

28.8.2 Dynamic NAT

Dynamic NAT can be used when fewer addresses are accessible than the number of hosts to be translated. A NAT table entry is created when the host starts a connection and establishes a one-to-one mapping between addresses. The mapping can vary and is dependent upon the registered addresses in the pool at the time of the communication. Dynamic NAT sessions are only allowed to be initiated only from inside networks. NAT should be configured on a Layer 3 interface, either a routed port or
Switch Virtual Interface (SVI). If the host doesn't communicate for a specific period, dynamic NAT entries are removed from the translation table. The address will then returned to the pool for use by another host.

Figure 28-6: Dynamic NAT Scenario

Dynamic NAT options:

- **Many-to-Many NAT**
  Maps local addresses to a global address that is selected from a pool of global addresses. After pool is configured, the first available address from the pool is picked dynamically on receiving the first packet.

- **Many-to-One NAT (PAT)**
  PAT is a form of dynamic NAT where multiple local addresses are mapped to a single global address (many-to-one) using different source ports. This method is also called NAT Overloading, NAPT (Network and Port address translation), and Masquerade. The global address can be the IP address configured on the outside interface.

  Hardware entries that translate packets are created when the CLI command is processed. Entries for forward and reverse traffic are created for unicast traffic. The hardware entry for reverse traffic is not created for multicast traffic.

  Commands may include ACLs to filter packets that are cleared. Source NAT use ACLs to filter packets based on destination IP address. Destination NAT use ACLs to filter packets based on source IP address. Upon using NAT, inside usually refers to a private network while outside usually refers to a public network.

  A switch with NAT configured translates forwarded traffic between inside and outside interfaces, and the flow that matches the criteria specified for translation.

  The same IP address can't be used for the NAT static configuration and in the pool for dynamic NAT configurations. Public IP addresses must be unique. The global addresses used in static translations aren't excluded with dynamic pools containing the same global addresses.

  Hardware entries that translate packets are created when the CLI command is processed. Entries for forward and reverse traffic are created for unicast traffic. The hardware entry for reverse traffic is not created for multicast traffic.
Commands may include ACLs to filter packets that are cleared. Source NAT use ACLs to filter packets based on destination IP address. Destination NAT use ACLs to filter packets based on source IP address. When using NAT, inside usually refers to a private network while outside usually refers to a public network.

A switch with NAT configured translates forwarded traffic between inside and outside interfaces, and the flow that matches the criteria specified for translation.

**Important!** The same IP address can't be used for the NAT static configuration and in the pool for dynamic NAT configurations. Public IP addresses must be unique. The global addresses used in static translations aren’t excluded with dynamic pools containing the same global addresses.

### 28.8.2.1 Configuring Dynamic NAT

**Prerequisites**

- Configure an ACL to specify IP addresses allowed to be translated.
- Determine if you should use an IP address as the translated source address.
- Decide on a public IP address pool for address translation.

**Configure the Address Pool**

The addresses used for translation are configured by issuing the `ip nat pool` command in global configuration mode.

**Example**

- This command configures the pool of addresses using start address, and end address.

  ```
  switch(config)# ip nat pool p1 10.15.15.15 10.15.15.25
  switch(config)#
  ```

**Set the IP Address**

The `ip address` command configures VLAN 201 with an IP address.

**Example**

- This command configures an IPv4 address for VLAN 201.

  ```
  switch(config)# interface vlan 201
  switch(config-if-Vl201)# ip address 10.0.0.1/24
  switch(config-if-Vl201)#
  ```

  - This command configures the dynamic NAT source address and sets the NAT overload for pool P2.

    ```
    switch(config-if-Vl201)# ip nat source dynamic access-list ACL2 pool p2
    switch(config-if-Vl201)#
    ```

**Define the NAT Source Address for Translation**

The `ip nat source dynamic` command specifies a dynamic translation from the source IP address to the pool and to overload the pool address (or addresses).

**Example**

- This command configures the dynamic NAT source address and sets the pool P2 NAT overload.

  ```
  switch(config)# interface ethernet 3/1
  switch(config-if-Et3/1)# ip nat source dynamic access-list ACL2 pool p2
  switch(config-if-Et3/1)#
  ```
Specify the Timeout Values

The `ip nat translation tcp-timeout` or `ip nat translation udp-timeout` commands alter the translation timeout period for NAT translation table entries.

**Example**

- This command globally sets the timeout for TCP to 600 seconds.
  
  ```
  switch(config)# ip nat translation tcp-timeout 600
  switch(config)#
  ```

- This command globally sets the timeout for UDP to 800 seconds.
  
  ```
  switch(config)# ip nat translation udp-timeout 800
  switch(config)#
  ```

28.8.2.2 Verify the NAT Configuration

**Display the Address Pools**

The `show ip nat pool` command displays the configuration of the address pool.

**Example**

- This command displays all the address pools configured on the switch.
  
  ```
  switch# show ip nat pool
  Pool       StartIp        EndIp        Prefix
  p1        10.15.15.15    10.15.15.25  24
  p2        10.10.15.15    10.10.15.25  22
  p3        10.12.15.15    10.12.15.25  12
  switch#
  ```

28.8.2.3 Clearing IP NAT Table Entries

Use the `clear ip nat flow translation` command to remove all or the specified NAT table entries.

**Example**

- This command clears all dynamic entries from the NAT table.
  
  ```
  switch# clear ip nat flow translation
  switch#
  ```

28.8.2.4 Dynamic NAT Configuration Considerations

**Configuring Dynamic NAT Using Pools in a L2 Adjacent Network**

When many-to-one dynamic NAT is configured using a NAT pool, and the next hop router for the NAT device is on the same network (L2 adjacent), then you must configure the IP addresses in the NAT pool as a secondary address on the interface.
Example

- The IP addresses in the NAT pool are configured as the secondary address on the interface.

```plaintext
switch(config)#ip nat pool p1 10.1.1.1 10.1.1.4 prefix-length 24
switch(config)#interface ethernet 1
switch(config-if-Et1)#ip nat source dynamic access-list a1 pool p1
switch(config-if-Et1)#ip address 10.1.1.1/24 secondary
switch(config-if-Et1)#ip address 10.1.1.2/24 secondary
switch(config-if-Et1)#ip address 10.1.1.3/24 secondary
switch(config-if-Et1)#ip address 10.1.1.4/24 secondary
```

Configuring Dynamic NAT Using Pool in a L3 Network

If the next hop of the NAT device is on a different subnet, then you should configure a static Null route for the IP addresses in the NAT pool. Redistribute the static route using BGP/OSPF.

Example

- Outside Interface

```plaintext
switch(config)#interface port-channel 319
switch(config-if-Po319)#ip nat source dynamic access-list dynamic-nat-m2m pool natpl-dynamic-nat-m2m
switch(config)#ip access-list dynamic-nat-m2m
switch(config-acl-dynamic-nat-m2m)#10 permit ip 192.168.93.0/24 any
switch(config)#ip nat pool natpl-dynamic-nat-m2m prefix-length 24
switch(config-natpool-p1)#range 11.3.3.2 11.3.3.10
```

- Static Null Route for Virtual IP

```plaintext
switch(config)#ip route 11.0.0.0/8 Null0
switch(config)#router ospf 1
switch(config-router-ospf)#redistribute static
```

Configuring Dynamic NAT Using Overload with ECMP Routes

Dynamic many-to-one NAT using overload (PAT) should not be configured on interfaces that form an ECMP group. When one interface in the group goes down, the return packet for connections that are already established will continue to go to the IP address of the interface that went down and will not be forwarded to the inside host. For this type of scenario, use Dynamic NAT with pool configurations.

28.8.2.5 Dynamic NAT Peer State Synchronization

The NAT peer state synchronization provides redundancy and resiliency for dynamic NAT across a pair of devices to avoid single NAT device failure. Both devices in redundant pair are active and they track new sessions and create or delete NAT entries dynamically. Essentially, an active NAT entry is maintained on both devices irrespective of who created the NAT entry.

Configuring Dynamic NAT Peer State Synchronization

The following prerequisites should be fulfilled before configuring NAT peer state synchronization on devices in a redundant pair.

- Both devices in redundant pair must be reachable across an IP address within the same subnet.
- NAT version on both devices in redundant pair must be compatible.
- Dynamic NAT configuration must be identical across both devices in redundant pair.
The following configuration output indicates a valid running configuration of the NAT peer state synchronization on one device.

```
  ip nat pool POOL61 prefix-length 24
    range 170.24.0.2 170.24.0.200

  ip access-list NatACL61
    10 permit ip 61.0.0.0/16 any

  interface Port-Channel5
    mtu 9214
    no switchport
    ip address 10.0.0.1/31
    ip nat source dynamic access-list NatACL61 pool POOL61

  ip nat synchronization
    peer-address 11.11.11.1
    local-interface Vlan1111
    port-range 1024 2048
```

The following limitations are applicable during NAT peer state synchronization.

- While configuring dynamic NAT peer state synchronization across peer switches, the port range values of the switches should always be disjoint to avoid virtual IP conflict.
- NAT peer state synchronization does not support asymmetrical TCP setup (SYN - SYNACK - ACK should always be hashed to the same peer.)
- The connection is only synchronized with a peer if the TCP state is established.
TCP MSS Clamping

TCP MSS clamping limits the value of the maximum segment size (MSS) in the TCP header of TCP SYN packets transiting a specified Ethernet or tunnel interface. Setting the MSS ceiling can avoid IP fragmentation in tunnel scenarios by ensuring that the MSS is low enough to account for the extra overhead of GRE and tunnel outer IP headers. TCP MSS clamping can be used when connecting via GRE to cloud providers that require asymmetric routing.

When MSS clamping is configured on an interface, if the TCP MSS value in a SYN packet transiting that interface exceeds the configured ceiling limit it will be overwritten with the configured limit and the TCP checksum will be recomputed and updated.

TCP MSS clamping is handled by default in the software data path, but the process can be supported through hardware configuration to minimize possible packet loss and a reduction in the number of TCP sessions which the switch can establish per second.

28.9.1 Cautions

This feature should be used with caution. When the TCP MSS clamping feature is enabled by issuing the \texttt{tcp mss ceiling} command on any routed interface, all routed IPv4 TCP SYN packets (TCP packets with the “SYN” flag set) are sent by default to the CPU and switched through software, even on interfaces where no TCP MSS ceiling has been configured, as long as TCP MSS clamping is enabled. This limits the number of TCP sessions that can be established through the switch per second, and, because throughput for software forwarding is limited, this feature can also cause packet loss if the rate at which TCP SYN packets are sent to the CPU exceeds the limits configured in the control-plane policy map.

Packet loss and TCP session reductions can be minimized by enabling TCP MSS clamping in hardware, but only SYN packets in which MSS is the first TCP option are clamped in the hardware data path; other TCP SYN packets are still switched through software.

To disable MSS clamping, the MSS ceiling must be removed from every interface on which it has been configured by issuing the \texttt{no tcp mss ceiling} command on each configured interface.

28.9.2 Enabling TCP MSS Clamping

There is no global configuration to enable TCP MSS clamping. It is enabled as soon as an MSS ceiling is configured on at least one interface.

28.9.3 Disabling TCP MSS Clamping

To disable TCP MSS clamping, the MSS ceiling configuration must be removed from every interface by using the \texttt{no} or \texttt{default} form of the \texttt{tcp mss ceiling} command on every interface where a ceiling has been configured.

28.9.4 Configuring the TCP MSS Ceiling on an Interface

The TCP MSS ceiling limit is set on an interface using the \texttt{tcp mss ceiling} command. This also enables TCP MSS clamping on the switch as a whole.

Caution

Configuring a TCP MSS ceiling on any interface enables TCP MSS clamping on the switch as a whole. Without hardware support, clamping routes all TCP SYN packets through software, even on interfaces where no TCP MSS ceiling has been configured. This significantly limits the number of TCP sessions the switch can establish per second, and can potentially cause packet loss if the CPU traffic exceeds control plane policy limits.
On Sand platform switches (Qumran-MX, Qumran-AX, Jericho, Jericho+), the following limitations apply:

- This command works only on egress.
- TCP MSS ceiling is supported on IPv4 unicast packets entering the switch; the configuration has no effect on GRE transit packets.
- The feature is supported only on IPv4 routed interfaces. It is not supported on L2 (switchport) interfaces or IPv6 routed interfaces.
- The feature is not supported for IPv6 packets even if they are going to be tunneled over an IPv4 GRE tunnel.
- The feature is not supported on VXLAN, loopback or management interfaces.
- The feature is only supported on IPv4 unicast packets entering the switch. The configuration has no effect on GRE transit packets or GRE decap, even if the egress interface has a TCP MSS ceiling configured.
- The feature cannot co-exist with Policy Based Routing (PBR) on switches running releases 4.21.5F or older.

**Example**

These commands configure Ethernet interface 5 as a routed port, then specify a maximum MSS ceiling value of 1458 bytes for TCP SYN packets exiting that port.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# no switchport
switch(config-if-Et5)# tcp mss ceiling ipv4 1458 egress
```

### 28.9.5 Configuring Hardware Support for TCP MSS Clamping

TCP MSS clamping can be supported in hardware, but some packets are still routed through the software data path, and an MSS ceiling value must be configured on each interface where clamping is to be applied.

Hardware support for clamping is accomplished through the use of a user-defined TCAM profile. The TCAM profile can be created from scratch or copied from an existing profile, but in either case it must include the `tcp-mss-ceiling ip` feature.

**Guidelines**

- When the system TCAM profile is changed, some agents will restart.
- To ensure that the TCP MSS feature is allocated a TCAM DB, it may be necessary to remove some unused features from the TCAM profile.
- Hardware TCP MSS clamping only works for TCP packets with MSS as the first TCP option. Other TCP SYN packets are still trapped to the CPU for clamping in software.
- Hardware TCP MSS clamping is not supported with host routes when the clamping is applied on a non-tunnel interface. This limitation does not apply to GRE tunnel interfaces.
- The maximum MSS ceiling limit with hardware MSS clamping is 32727 even though the CLI allows configuration of much larger values.
- For more information on the creation of user-defined TCAM profiles, see https://eos.arista.com/eos-4-20-5f/user-defined-pmf-profile/.

To configure hardware support for TCP MSS clamping, create a TCAM profile that includes the `tcp-mss-ceiling ip` feature, then apply it to the system.
Chapter 28: IPv4

TCP MSS Clamping

28.9.5.1 Creating the TCAM Profile

A TCAM profile that supports TCP MSS clamping can be created from scratch, or the feature can be added to a copy of the default TCAM profile. When creating a profile from scratch, care must be taken to ensure that all needed TCAM features are included in the profile.

Modifying a Copy of the Default TCAM Profile

The following commands create a copy of the default TCAM profile, name it “tcp-mss-clamping,” and configure it to enable MSS clamping in hardware, then remove some unused features included in the default profile to ensure that there are sufficient TCAM resources for the clamping feature.

```
switch(config)#hardware tcam
switch(config-hw-tcam)#profile tcp-mss-clamping copy default
switch(config-hw-tcam-profile-tcp-mss-clamping)#feature tcp-mss-ceiling ip copy system-feature-source-profile
switch(config-hw-tcam-profile-tcp-mss-clamping-feature-tcp-mss-ceiling)#key size limit 160
switch(config-hw-tcam-profile-tcp-mss-clamping-feature-tcp-mss-ceiling)#packet ipv4 forwarding routed
switch(config-hw-tcam-profile-tcp-mss-clamping-feature-tcp-mss-ceiling)#exit
switch(config-hw-tcam-profile-tcp-mss-clamping)#exit
```

28.9.5.2 Applying the TCAM Profile to the System

The following commands enter Hardware TCAM Configuration Mode and set the “tcp-mss-clamping” profile as the system profile.

```
switch(config)#hardware tcam
switch(config-hw-tcam)#system profile tcp-mss-clamping
switch(config-hw-tcam)#
```

28.9.5.3 Verifying the TCAM Profile Configuration

The following command displays hardware TCAM profile information to verify that the user-defined TCAM profile has been applied correctly.

```
switch(config)#show hardware tcam profile

Configuration           Status
FixedSystem             tcp-mss-clamping tcp-mss-clamping
```

switch(config)
28.10 IPv4 GRE Tunneling

GRE tunneling supports the forwarding over IPv4 GRE tunnel interfaces. The GRE tunnel interfaces act as a logical interface that performs GRE encapsulation or decapsulation.

The following switches support the IPv4 forwarding of GRE tunnel interface.

- DCS-7020R
- DCS-7280R
- DCS-7500R

**Note**
The forwarding over GRE tunnel interface on DCS-7500R is supported only if all the line cards on the system have Jericho family chip-set.

28.10.1 Configuring GRE Tunneling Interface

**On a local Arista switch**

```bash
switch(config)#ip routing
switch(config)#interface Tunnel 10
switch(config-if-Tu10)#tunnel mode gre
tswitch(config-if-Tu10)#ip address 192.168.1.1/24
tswitch(config-if-Tu10)#tunnel source 10.1.1.1
tswitch(config-if-Tu10)#tunnel destination 10.1.1.2
tswitch(config-if-Tu10)#tunnel path-mtu-discovery
tswitch(config-if-Tu10)#tunnel tos 10
tswitch(config-if-Tu10)#tunnel ttl 10
```

**On a remote Arista switch**

```bash
switch(config)#ip routing
switch(config)#interface Tunnel 10
switch(config-if-Tu10)#tunnel mode gre
tswitch(config-if-Tu10)#ip address 192.168.1.2/24
tswitch(config-if-Tu10)#tunnel source 10.1.1.2
tswitch(config-if-Tu10)#tunnel destination 10.1.1.1
tswitch(config-if-Tu10)#tunnel path-mtu-discovery
tswitch(config-if-Tu10)#tunnel tos 10
tswitch(config-if-Tu10)#tunnel ttl 10
```

**Alternative configuration for tunnel source IPv4 address**

```bash
switch(config)#interface Loopback 10
switch(config-if-Lo10)#ip add 10.1.1.1/32
switch(config-if-Lo10)#exit

switch(config)#conf terminal
switch(config)#interface Tunnel 10
switch(config-if-Tu10)#tunnel source interface Loopback 10
```

**Configuration for adding an IPv4 route over the GRE tunnel interface**

```bash
switch(config)#ip route 192.168.100.0/24 Tunnel 10
```

**Tunnel Mode**

Tunnel Mode needs to be configured as **gre**, for GRE tunnel interface. Default value is **tunnel mode gre**.
IP address

Configures the IP address for the GRE tunnel interface. The IP address can be used for routing over the GRE tunnel interface. The configured subnet is reachable over the GRE tunnel interface and the packets to the subnet are encapsulated in the GRE header.

Tunnel Source

Specifies the source IP address for the outer IPv4 encapsulation header for packets going over the GRE tunnel interface. The tunnel source IPv4 address should be a valid local IPv4 address configured on the Arista Switch. The tunnel source can also be specified as any routed interface on the Arista Switch. The routed interface’s IPv4 address is assigned as the tunnel source IPv4 address.

Tunnel Destination

Specifies the destination IPv4 address for the outer IPv4 encapsulation header for packets going over the GRE tunnel interface. The tunnel destination IPv4 should be reachable from the Arista Switch.

Tunnel Path Mtu Discovery

Specifies if the “Do not Fragment” flag needs to set in the outer IPv4 encapsulation header for packets going over the GRE tunnel interface.

Tunnel TOS

Specifies the Tunnel type of service (ToS) value to be assigned to the outer IPv4 encapsulation header for packets going over the GRE tunnel interface. Default TOS value of 0 will be assigned if tunnel TOS is not configured.

Tunnel TTL

Specifies the TTL value to the assigned to the outer IPv4 encapsulation header for packet going over the GRE tunnel interface. The TTL value is copied from the inner IPv4 header if tunnel TTL is not configured. The tunnel TTL configuration requires the tunnel Path MTU Discovery to be configured.

28.10.2 Displaying GRE tunnel Information

- The following commands display the tunnel configuration.
  
  switch#show interfaces Tunnel 10
  
  Tunnel10 is up, line protocol is up (connected)
  Hardware is Tunnel, address is 0a01.0101.0800
  Internet address is 192.168.1.1/24
  Broadcast address is 255.255.255.255
  Tunnel source 10.1.1.1, destination 10.1.1.2
  Tunnel protocol/transport GRE/IP
  Key disabled, sequencing disabled
  Checksumming of packets disabled
  Tunnel TTL 10, Hardware forwarding enabled
  Tunnel TOS 10
  Path MTU Discovery
  Tunnel transport MTU 1476 bytes
  Up 3 seconds
switch# show gre tunnel static

<table>
<thead>
<tr>
<th>Name</th>
<th>Index</th>
<th>Source</th>
<th>Destination</th>
<th>Nexthop</th>
<th>Interface</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tunnel10</td>
<td>10</td>
<td>10.1.1.1</td>
<td>10.1.1.2</td>
<td>10.6.1.2</td>
<td>Ethernet6/1</td>
</tr>
</tbody>
</table>

switch# show tunnel fib static interface gre 10

Type 'Static Interface', index 10, forwarding Primary
via 10.6.1.2, 'Ethernet6/1'
GRE, destination 10.1.1.2, source 10.1.1.1, ttl 10, tos 0xa

- Use **show platform fap tcam summary** to verify if the TCAM bank is allocated for GRE packet termination lookup.

switch# show platform fap tcam summary

<table>
<thead>
<tr>
<th>Bank</th>
<th>Tcam Allocation (Jericho0)</th>
<th>Used By</th>
<th>Reserved By</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>

28.11 IPv4 Commands

IP Routing and Address Commands
- agent SandL3Unicast terminate
- clear arp inspection statistics
- ip address
- ip arp inspection limit
- ip arp inspection logging
- ip arp inspection trust
- ip arp inspection vlan
- ip hardware fib ecmp resilience
- ip hardware fib optimize
- ip icmp redirect
- ip load-sharing
- ip route
- ip routing
- ip source binding
- ip verify
- ip verify source
- rib fib policy
- show ip
- show ip arp inspection vlan
- show ip arp inspection statistics
- show ip interface
- show ip interface brief
- show ip route
- show ip route age
- show ip route gateway
- show ip route host
- show ip route match tag
- show ip route summary
- show rib route ip
- show rib route <ipv4 | ipv6> fib policy excluded
- show routing-context vrf
- show vrf
- show ip verify source
- show platform arad ip route
- show platform arad ip route summary
- tcp mss ceiling

IPv4 DHCP Relay
- clear ip dhcp relay counters
- ip dhcp relay all-subnets
- ip dhcp relay all-subnets default
- ip dhcp relay always-on
- ip dhcp relay information option (Global)
- ip dhcp relay information option circuit-id
- ip helper-address
- show ip dhcp relay
- show ip dhcp relay counters
IPv4 DHCP Snooping
- clear ip dhcp snooping counters
- ip dhcp snooping
- ip dhcp snooping information option
- ip dhcp snooping vlan
- show ip dhcp snooping
- show ip dhcp snooping counters
- show ip dhcp snooping hardware

IPv4 Multicast Counters
- clear ip multicast count
- ip multicast count

IPv4 NAT
- clear ip nat flow translation
- ip nat destination static
- ip nat pool
- ip nat source dynamic
- ip nat source static
- ip nat translation counters
- ip nat translation low-mark
- ip nat translation max-entries
- ip nat translation tcp-timeout
- ip nat translation udp-timeout
- show ip nat access-list interface
- show ip nat pool
- show ip nat translation
- show ip nat synchronization peer
- show ip nat synchronization advertised-translations
- show ip nat synchronization discovered-translations

ARP Table
- arp
- arp aging timeout
- arp cache persistent
- arp gratuitous accept
- clear arp-cache
- clear arp
- ip local-proxy-arp
- ip proxy-arp
- show arp
- show ip arp

VRF Commands
- cli vrf
- description (VRF)
- rd (VRF configuration mode)
- show routing-context vrf
- show vrf
- vrf (Interface mode)
- vrf instance
**Trident Forwarding Table Commands**
- platform trident forwarding-table partition
- platform trident routing-table partition
- show platform trident forwarding-table partition

**IPv4 GRE Tunneling Commands**
- interface tunnel
- tunnel
- show interface tunnel
- show platform fap eedb ip-tunnel gre interface tunnel
- show tunnel fib static interface gre
- show platform fap tcam summary
agent SandL3Unicast terminate

The *agent SandL3Unicast terminate* command restarts the platform layer 3 agent to ensure IPv4 routes are optimized.

**Command Mode**
- Global Configuration

**Command Syntax**
```
agent SandL3Unicast terminate
```

**Related Commands**
- `ip hardware fib optimize` enables IPv4 route scale.
- `show platform arad ip route` shows resources for all IPv4 routes in hardware. Routes that use the additional hardware resources will appear with an asterisk.
- `show platform arad ip route summary` shows hardware resource usage of IPv4 routes.

**Example**
- This configuration command restarts the platform layer 3 agent to ensure IPv4 routes are optimized.
  ```
  switch(config)#agent SandL3Unicast terminate
  SandL3Unicast was terminated
  ```
  Restarting the platform layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.
arp

The arp command adds a static entry to an Address Resolution Protocol (ARP) cache. The switch uses ARP cache entries to correlate 32-bit IP addresses to 48-bit hardware addresses.

The no arp and default arp commands remove the ARP cache entry with the specified IP address. When multiple VRFs contain ARP cache entries for identical IP addresses, each entry can only be removed individually.

**Command Mode**
Global Configuration

**Command Syntax**

```
arp [VRF_INSTANCE] ipv4_addr mac_addr arpa
no arp [VRF_INSTANCE] ipv4_addr
default arp [VRF_INSTANCE] ipv4_addr
```

**Parameters**

- **VRF_INSTANCE** specifies the VRF instance being modified.
- `<no parameter>` changes are made to the default VRF.
- **vrf vrf_name** changes are made to the specified user-defined VRF.
- **ipv4_addr** IPv4 address of ARP entry.
- **mac_addr** local data-link (hardware) address (48-bit dotted hex notation – H.H.H).

**Examples**

- This command adds a static entry to the ARP cache in the default VRF.
  
  ```
  switch(config)#arp 172.22.30.52 0025.900e.c63c arpa
  switch(config)#
  ```

- This command adds the same static entry to the ARP cache in the VRF named “purple.”
  
  ```
  switch(config)#arp vrf purple 172.22.30.52 0025.900e.c63c arpa
  switch(config)#
  ```
**arp aging timeout**

The **arp aging timeout** command specifies the duration of dynamic address entries in the Address Resolution Protocol (ARP) cache for addresses learned through the configuration mode interface. The default duration is 14400 seconds (four hours).

The **arp aging timeout** and **default arp aging timeout** commands restores the default ARP aging timeout for addresses learned on the configuration mode interface by deleting the corresponding **arp aging timeout** command from **running-config**.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
arp aging timeout arp_time
no arp aging timeout
default arp aging timeout
```

**Parameters**

- **arp_time**  ARP aging timeout period (seconds). Values range from 60 to 65535. Default value is 14400.

**Examples**

- This command specifies an ARP cache duration of 7200 seconds (two hours) for dynamic addresses added to the ARP cache that were learned through VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#arp aging timeout 7200
switch(config-if-Vl200)#show active
interface Vlan200
  arp timeout 7200
switch(config-if-Vl200)#
```
arp cache persistent

The arp cache persistent command restores the dynamic entries in the Address Resolution Protocol (ARP) cache after reboot.

The no arp cache persistent and default arp cache persistent commands remove the ARP cache persistent configuration from the running-config.

Command Mode

Global Configuration

Command Syntax

- arp cache persistent
- no arp cache persistent
- default arp cache persistent

Example

- This command restores the ARP cache after reboot.

  switch(config)#arp cache persistent
  switch(config)#
arp gratuitous accept

The arp gratuitous accept command configures the configuration mode interface to accept gratuitous ARP request packets received on that interface. Accepted gratuitous ARP requests are then learned by the ARP table.

The no and default forms of the command prevent the interface from accepting gratuitous ARP requests. Configuring gratuitous ARP acceptance on an L2 interface has no effect.

Command Mode
  Interface-Ethernet Configuration
  Interface-VLAN Configuration
  Interface Port-channel Configuration

Command Syntax
  arp gratuitous accept
  no arp gratuitous accept
  default arp gratuitous accept

Example
  • These commands configure Ethernet interface 2/1 to accept gratuitous ARP request packets.

    switch (config)# interface ethernet 2/1
    switch (config-if-Et2/1)#arp gratuitous accept
    switch (config-if-Et2/1)#
clear arp-cache

The clear arp-cache command refreshes dynamic entries in the Address Resolution Protocol (ARP) cache. Refreshing the ARP cache updates current ARP table entries and removes expired ARP entries not yet deleted by an internal, timer-driven process.

The command, without arguments, refreshes ARP cache entries for all enabled interfaces. With arguments, the command refreshes cache entries for the specified interface. Executing clear arp-cache for all interfaces can result in extremely high CPU usage while the tables are resolving.

Command Mode
Privileged EXEC

Command Syntax
  clear arp-cache [VRF_INSTANCE][INTERFACE_NAME]

Parameters
- **VRF_INSTANCE** specifies the VRF instance for which arp data is refreshed.
  - <no parameter> specifies the context-active VRF.
  - vrf vrf_name specifies name of VRF instance. System default VRF is specified by default.
- **INTERFACE_NAME** interface upon which ARP cache entries are refreshed. Options include:
  - <no parameter> All ARP cache entries.
  - interface ethernet e_num ARP cache entries of specified Ethernet interface.
  - interface loopback l_num ARP cache entries of specified loopback interface.
  - interface management m_num ARP cache entries of specified management interface.
  - interface port-channel p_num ARP cache entries of specified port-channel Interface.
  - interface vlan v_num ARP cache entries of specified VLAN interface.
  - interface vxlan vx_num VXLAN interface specified by vx_num.

Related Commands
- cli vrf specifies the context-active VRF.

Example
- These commands display the ARP cache before and after ARP cache entries are refreshed.

```
switch#show arp
Address          Age (min)  Hardware Addr   Interface
172.22.30.1      001c.730b.1d15 Management1
172.22.30.118    001c.7301.6015 Management1
switch#clear arp-cache
switch#show arp
Address          Age (min)  Hardware Addr   Interface
172.22.30.1      001c.730b.1d15 Management1
switch#
```
**clear arp**

The `clear arp` command removes the specified dynamic ARP entry for the specified IP address from the Address Resolution Protocol (ARP) table.

**Command Mode**

Privileged EXEC

**Command Syntax**

```
clear arp [VRF_INSTANCE] ipv4_addr
```

**Parameters**

- `VRF_INSTANCE` specifies the VRF instance for which arp data is removed.
- `<no parameter>` specifies the context-active VRF.
- `vrf vrf_name` specifies name of VRF instance. System default VRF is specified by `default`.
- `ipv4_addr` IPv4 address of dynamic ARP entry.

**Related Commands**

- `cli vrf` specifies the context-active VRF.

**Example**

- These commands display the ARP table before and after the removal of dynamic ARP entry for IP address 172.22.30.52.

```
switch# show arp
Address         Age (min)  Hardware Addr   Interface  
172.22.30.1     0  001c.730b.1d15  Management1 
172.22.30.52    0  0025.900e.c468  Management1 
172.22.30.53    0  0025.900e.c63c  Management1 
172.22.30.133   0  001c.7304.3906  Management1
switch# clear arp 172.22.30.52
switch# show arp
Address         Age (min)  Hardware Addr   Interface  
172.22.30.1     0  001c.730b.1d15  Management1 
172.22.30.53    0  0025.900e.c63c  Management1 
172.22.30.133   0  001c.7304.3906  Management1
switch#
```
clear arp inspection statistics

The clear arp inspection statistics command clears ARP inspection statistics.

Command Mode
EXEC

Command Syntax
   clear arp inspection statistics

Related Commands
   - ip arp inspection limit
   - ip arp inspection logging
   - ip arp inspection trust
   - ip arp inspection vlan
   - show ip arp inspection vlan
   - show ip arp inspection statistics

Examples
   - This command clears ARP inspection statistics.
     switch(config)#clear arp inspection statistics
     switch(config)#
clear ip dhcp relay counters

The `clear ip dhcp relay counters` command resets the DHCP relay counters. The configuration mode determines which counters are reset:

- Interface configuration: command clears the counter for the configuration mode interface.

**Command Mode**
Privileged EXEC

**Command Syntax**
```
clear ip dhcp relay counters [INTERFACE_NAME]
```

**Parameters**
- `INTERFACE_NAME` entity for which counters are cleared. Options include:
  - `<no parameter>` clears counters for the switch and for all interfaces.
  - `interface ethernet e_num` clears counters for the specified Ethernet interface.
  - `interface loopback l_num` clears counters for the specified loopback interface.
  - `interface port-channel p_num` clears counters for the specified port-channel Interface.
  - `interface vlan v_num` clears counters for the specified VLAN interface.

**Examples**
- These commands clear the DHCP relay counters for VLAN 1045 and shows the counters before and after the `clear` command.

```
switch# show ip dhcp relay counters

clear ip dhcp snooping counters

The `clear ip dhcp snooping counters` command resets the DHCP snooping packet counters.

**Command Mode**
Privileged EXEC

**Command Syntax**
```
clear ip dhcp snooping counters [COUNTER_TYPE]
```

**Parameters**
- **COUNTER_TYPE** The type of counter that the command resets. Options include:
  - `<no parameter>` counters for each VLAN.
  - `debug` aggregate counters and drop cause counters.

**Example**
- This command clears the DHCP snooping counters for each VLAN.
  ```
  switch# clear ip dhcp snooping counters
  switch# show ip dhcp snooping counters
  | Dhcp Request Pkts | Dhcp Reply Pkts |
  Vlan | Rcvd Fwdd Drop | Rcvd Fwdd Drop | Last Cleared
  -----|---------- -----|---------- -------|-----------------------------
  100 | 0 0 0 | 0 0 0 | 0:00:10 ago
  switch#
  ```
- This command clears the aggregate DHCP snooping counters.
  ```
  switch# clear ip dhcp snooping counters debug
  switch# show ip dhcp snooping counters debug

  Dropped - Snooping disabled 0 0
  Last Cleared: 0:00:08 ago
  switch#```
clear ip multicast count

The clear ip multicast count command clears all counters associated with the multicast traffic.

Command Mode
Global Configuration

Command Syntax

```
clear ip multicast count [group_address [source_address]]
```

Parameters
- `<no parameters>` clears all counts of the multicast route traffic
- `group_address` clears the multicast traffic count of the specified group address
- `source_address` clears the multicast traffic count of the specified group and source addresses

Guidelines
- This command functions only when the ip multicast count command is enabled.

Examples
- This command clears all counters associated with the multicast traffic.
  ```
  switch(config)#clear ip multicast count
  ```
- This command clears the multicast traffic count of the specified group address.
  ```
  switch(config)#clear ip multicast count 16.39.24.233
  ```
clear ip nat flow translation

The **clear ip nat flow translation** command clears all or the specified NAT table entries.

**Command Mode**
Privileged EXEC

**Command Syntax**
```
clear ip nat flow translation [HOST_ADDR [DEST_ADDR]] [INTF] [PROT_TYPE]
```

**Parameters**
- **DEST_ADDR** immediately follows **HOST_ADDR**. All other parameters, including **HOST_ADDR**, may be placed in any order.
  - **HOST_ADDR** Host address to be modified. Options include:
    - <no parameter> All packets with specified destination address are cleared.
    - **address local_ipv4** IPv4 address.
    - **address local_ipv4 local_port** IPv4 address and port (port value ranges from 1 to 65535).
  - **DEST_ADDR** Destination address of translated packet. Destination address can be entered only when the **HOST_ADDR** is specified. Options include:
    - <no parameter> All packets with specified destination address are cleared.
    - **global_ipv4** IPv4 address.
    - **global_ipv4 global_port** IPv4 address and port (port value ranges from 1 to 65535).
  - **INTF** Route source. Options include:
    - <no parameter> All packets with specified destination address are cleared.
    - **interface ethernet e_num** Ethernet interface specified by **e_num**.
    - **interface loopback l_num** Loopback interface specified by **l_num**.
    - **interface management m_num** Management interface specified by **m_num**.
    - **interface port-channel p_num** Port-channel interface specified by **p_num**.
    - **interface vlan v_num** VLAN interface specified by **v_num**.
  - **PROT_TYPE** Filters packets based on protocol type. Options include:
    - <no parameter> All packets with specified destination address are cleared.
    - **tcp** TCP packets with specified destination address are cleared.
    - **udp** UDP packets with specified destination address are cleared.

**Example**
- This command clears all dynamic entries from the NAT translation table
  ```
  switch#clear ip nat flow translation
  switch#
  ```
- This command clears a specific NAT IP address 172.22.30.52.
  ```
  switch#clear ip nat flow translation address 172.22.30.52
  switch#
  ```
- This command clears the inside entry that maps the private address 10.10.10.3 to Internet address 172.22.30.52.
  ```
  switch#clear ip nat flow translation address 172.22.30.52 10.10.10.3
  switch#
  ```
**cli vrf**

The `cli vrf` command specifies the context-active VRF. The context-active VRF determines the default VRF that VRF-context aware commands use when displaying routing table data.

**Command Mode**

Privileged EXEC

**Command Syntax**

```
cli vrf [VRF_ID]
```

**Parameters**

- **VRF_ID** Name of VRF assigned as the current VRF scope. Options include:
  - `vrf_name` Name of user-defined VRF.
  - `default` System-default VRF.

**Guidelines**

VRF-context aware commands include:

- `clear arp-cache`
- `show ip`
- `show ip arp`
- `show ip route`
- `show ip route gateway`
- `show ip route host`

**Related Commands**

- `show routing-context vrf` displays the context-active VRF.

**Example**

- These commands specify *magenta* as the context-active VRF, then display the context-active VRF.

  ```bash
  switch#cli vrf magenta
  switch#show routing-context vrf
  Current VRF routing-context is magenta
  switch#
  ```
description (VRF)

The description command adds a text string to the configuration mode VRF. The string has no functional impact on the VRF.

The no description and default description commands remove the text string from the configuration mode VRF by deleting the corresponding description command from running-config.

Command Mode

VRF Configuration

Command Syntax

description label_text
no description
default description

Parameters

- label_text character string assigned to the VRF configuration.

Related Commands

- vrf instance places the switch in VRF configuration mode.

Examples

- These commands add description text to the magenta VRF.

  switch(config)#vrf instance magenta
  switch(config-vrf-magenta)#description This is the first vrf
  switch(config-vrf-magenta)#show active
    vrf instance magenta
      description This is the first vrf
  switch(config-vrf-magenta)#
**ip address**

The **ip address** command configures the IPv4 address and connected subnet on the configuration mode interface. Each interface can have one primary address and multiple secondary addresses.

The **no ip address** and **default ip address** commands remove the IPv4 address assignment from the configuration mode interface. Entering the command without specifying an address removes the primary and all secondary addresses from the interface. The primary address cannot be deleted until all secondary addresses are removed from the interface.

Removing all IPv4 address assignments from an interface disables IPv4 processing on that port.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ip address ipv4_subnet [PRIORITY]
no ip address [ipv4_subnet] [PRIORITY]
default ip address [ipv4_subnet] [PRIORITY]
```

**Parameters**

- **ipv4_subnet** IPv4 and subnet address (CIDR or address-mask notation). *Running-config* stores the value in CIDR notation.
- **PRIORITY** interface priority. Options include:
  - <no parameter> the address is the primary IPv4 address for the interface.
  - secondary the address is the secondary IPv4 address for the interface.

**Guidelines**

The **ip address** command is supported on routable interfaces.

**Example**

- This command configures an IPv4 address for VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ip address 10.0.0.1/24
switch(config-if-Vl200)#
```
Chapter 28: IPv4

**ip arp inspection limit**

The `ip arp inspection limit` command err-disables the interface if the incoming ARP rate exceeds the configured value rate limit the incoming ARP packets on an interface.

**Command Mode**

EXEC

**Command Syntax**

```
[no | default] ip arp inspection limit [RATE <pps>] [BURST_INTERVAL <sec> | none]
```

**Parameters**

- **RATE** specifies the ARP inspection limit rate in packets per second.
  - `<pps>` ARP inspection limit rate packets per second.
- **BURST_INTERVAL** specifies the ARP inspection limit burst interval.
  - `<sec>` burst interval second.

**Related Commands**

- `ip arp inspection limit`
- `ip arp inspection trust`
- `ip arp inspection vlan`
- `show ip arp inspection vlan`

**Examples**

- This command configures the rate limit of incoming ARP packets to errdisable the interface when the incoming ARP rate exceeds the configured value, sets the rate to 512 (which is the upper limit for the number of invalid ARP packets allowed per second), and sets the burst consecutive interval over which the interface is monitored for a high ARP rate to 11 seconds.

  ```
  switch(config)#ip arp inspection limit rate 512 burst interval 11
  switch(config)#
  ```

- This command displays verification of the interface specific configuration.

  ```
  switch(config)#interface Ethernet 3 / 1
  switch(config)#ip arp inspection limit rate 20 burst interval 5
  switch(config)#interface Ethernet 3 / 3
  switch(config)#ip arp inspection trust
  switch(config)#show ip arp inspection interfaces
  Interface Trust State Rate (pps) Burst Interval
  ------------- ----------- ---------- --------------
  Et3/1 Untrusted 20 5
  Et3/3 Trusted None N/A
  ```

  ```
  switch(config)#
  ```
The `ip arp inspection logging` command enables logging of incoming ARP packets on the interface if the rate exceeds the configured value.

**Command Mode**
EXEC

**Command Syntax**
```
[no | default] ip arp inspection logging [RATE <pps>] [BURST_INTERVAL <sec>] [none]
```

**Parameters**
- `RATE` specifies the ARP inspection limit rate in packets per second.
- `<pps>` ARP inspection limit rate packets per second.
- `BURST_INTERVAL` specifies the ARP inspection limit burst interval.
- `<sec>` burst interval second.

**Related Commands**
- `ip arp inspection limit`
- `ip arp inspection trust`
- `ip arp inspection vlan`
- `show ip arp inspection vlan`

**Example**
- This command enables logging of incoming ARP packets when the incoming ARP rate exceeds the configured value on the interface, sets the rate to 2048 (which is the upper limit for the number of invalid ARP packets allowed per second), and sets the burst consecutive interval over which the interface is monitored for a high ARP rate to 15 seconds.

```
switch(config)#ip arp inspection logging rate 2048 burst interval 15
switch(config)#
```
ip arp inspection trust

The **ip arp inspection trust** command configures the trust state of an interface. By default, all interfaces are untrusted.

**Command Mode**

EXEC

**Command Syntax**

```
[no | default] ip arp inspection trust
```

**Related Commands**

- ip arp inspection limit
- ip arp inspection logging
- ip arp inspection vlan
- show ip arp inspection vlan

**Examples**

- This command configures the trust state of an interface.
  
  ```
  switch(config)#ip arp inspection trust
  switch(config)#
  ```

- This command configures the trust state of an interface to untrusted.
  
  ```
  switch(config)#no ip arp inspection trust
  switch(config)#
  ```

- This command configures the trust state of an interface to its default (untrusted).
  
  ```
  switch(config)#default ip arp inspection trust
  switch(config)#
  ```
**ip arp inspection vlan**

The `ip arp inspection vlan` command enables ARP inspection. ARP requests and responses on untrusted interfaces are intercepted on specified VLANs, and intercepted packets are verified to have valid IP-MAC address bindings. All invalid ARP packets are dropped. On trusted interfaces, all incoming ARP packets are processed and forwarded without verification. By default, ARP inspection is disabled on all VLANs.

**Command Mode**

EXEC

**Command Syntax**

```
ip arp inspection vlan [LIST]
```

**Parameters**

- `LIST` specifies the VLAN interface number.

**Related Commands**

- `ip arp inspection limit`
- `ip arp inspection trust`
- `show ip arp inspection vlan`

**Examples**

- This command enables ARP inspection on VLANs 1 through 150.
  ```
switch(config)#ip arp inspection vlan 1 - 150
  switch(config)#
  ```
- This command disables ARP inspection on VLANs 1 through 150.
  ```
switch(config)#no ip arp inspection vlan 1 - 150
  switch(config)#
  ```
- This command sets the ARP inspection default to VLANs 1 through 150.
  ```
switch(config)#default ip arp inspection vlan 1 - 150
  switch(config)#
  ```
- These commands enable ARP inspection on multiple VLANs 1 through 150 and 200 through 250.
  ```
switch(config)#ip arp inspection vlan 1-150,200-250
  switch(config)#
  ```
ip dhcp relay all-subnets

The **ip dhcp relay all-subnets** command configures the DHCP smart relay status on the configuration mode interface. DHCP smart relay supports forwarding DHCP requests with a client’s secondary IP addresses in the gateway address field. Enabling DHCP smart relay on an interface requires that DHCP relay is also enabled on that interface.

By default, an interface assumes the global DHCP smart relay setting as configured by the **ip dhcp relay all-subnets default** command. The **ip dhcp relay all-subnets** command, when configured, takes precedence over the global smart relay setting.

The **no ip dhcp relay all-subnets** command disables DHCP smart relay on the configuration mode interface. The **default ip dhcp relay all-subnets** command restores the interface’s to the default DHCP smart relay setting, as configured by the **ip dhcp relay all-subnets default** command, by removing the corresponding **ip dhcp relay all-subnets** or **no ip dhcp relay all-subnets** statement from **running-config**.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ip dhcp relay all-subnets
no ip dhcp relay all-subnets
default ip dhcp relay all-subnets
```

**Examples**

- This command enables DHCP smart relay on VLAN interface 100.
  ```
  switch(config)#interface vlan 100
  switch(config-if-Vl100)#ip helper-address 10.4.4.4
  switch(config-if-Vl100)#ip dhcp relay all-subnets
  switch(config-if-Vl100)#show ip dhcp relay
  DHCP Relay is active
  DHCP Relay Option 82 is disabled
  DHCP Smart Relay is enabled
  Interface: Vlan100
  DHCP Smart Relay is enabled
  DHCP servers: 10.4.4.4
  switch(config-if-Vl100)#
  ```

- This command disables DHCP smart relay on VLAN interface 100.
  ```
  switch(config-if-Vl100)#no ip dhcp relay all-subnets
  switch(config-if-Vl100)#show active
  interface Vlan100
  no ip dhcp relay all-subnets
  ip helper-address 10.4.4.4
  switch(config-if-Vl100)#show ip dhcp relay
  DHCP Relay is active
  DHCP Relay Option 82 is disabled
  DHCP Smart Relay is enabled
  Interface: Vlan100
  DHCP Smart Relay is disabled
  DHCP servers: 10.4.4.4
  switch(config-if-Vl100)#
  ```
- This command enables DHCP smart relay globally, configures VLAN interface 100 to use the global setting, then displays the DHCP relay status

```bash
switch(config)#ip dhcp relay all-subnets default
switch(config)#interface vlan 100
switch(config-if-Vl100)#ip helper-address 10.4.4.4
switch(config-if-Vl100)#default ip dhcp relay
switch(config-if-Vl100)#show ip dhcp relay

DHCP Relay is active
DHCP Relay Option 82 is disabled
DHCP Smart Relay is enabled
Interface: Vlan100
  Option 82 Circuit ID: 333
  DHCP Smart Relay is enabled
  DHCP servers: 10.4.4.4
switch(config-if-Vl100)#
```
**ip dhcp relay all-subnets default**

The `ip dhcp relay all-subnets default` command configures the global DHCP smart relay setting. DHCP smart relay supports forwarding DHCP requests with a client’s secondary IP addresses in the gateway address field. The default global DHCP smart relay setting is disabled.

The global DHCP smart relay setting is applied to all interfaces for which an `ip dhcp relay all-subnets` statement is not configured. Enabling DHCP smart relay on an interface requires that DHCP relay is also enabled on that interface.

The `no ip dhcp relay all-subnets default` and `default ip dhcp relay all-subnets default` commands restore the global DHCP smart relay default setting of disabled by removing the `ip dhcp relay all-subnets default` command from `running-config`.

**Command Mode**

  Global Configuration

**Command Syntax**

```
  ip dhcp relay all-subnets default
  no ip dhcp relay all-subnets default
  default ip dhcp relay all-subnets default
```

**Related Commands**

- `ip helper-address` enables the DHCP relay agent on a configuration mode interface.
- `ip dhcp relay all-subnets` enables the DHCP smart relay agent on a configuration mode interface.

**Example**

- This command configures the global DHCP smart relay setting to `enabled`.

```
  switch(config)#ip dhcp relay all-subnets default
  switch(config)#
```
The `ip dhcp relay always-on` command enables the switch DHCP relay agent on the switch regardless of the DHCP relay agent status on any interface. By default, the DHCP relay agent is enabled only if at least one routable interface is configured with an `ip helper-address` statement.

The `no ip dhcp relay always-on` and `default ip dhcp relay always-on` commands remove the `ip dhcp relay always-on` command from `running-config`.

### Command Mode
Global Configuration

### Command Syntax
- `ip dhcp relay always-on`
- `no ip dhcp relay always-on`
- `default ip dhcp relay always-on`

### Related Commands
These commands implement DHCP relay agent.

- `ip helper-address`
- `ip dhcp relay information option (Global)`
- `ip dhcp relay information option circuit-id`

### Example
- This command enables the DHCP relay agent.

  ```
  switch(config)#ip dhcp relay always-on
  switch(config)#
  ```
ip dhcp relay information option (Global)

The **ip dhcp relay information option** command configures the switch to attach tags to DHCP requests before forwarding them to the DHCP servers designated by **ip helper-address** commands. The **ip dhcp relay information option circuit-id** command specifies the tag contents for packets forwarded by the interface that it configures.

The **no ip dhcp relay information option** and **default ip dhcp relay information option** commands restore the switch’s default setting of not attaching tags to DHCP requests by removing the **ip dhcp relay information option** command from **running-config**.

**Command Mode**

- Global Configuration

**Command Syntax**

- `ip dhcp relay information option`
- `no ip dhcp relay information option`
- `default ip dhcp relay information option`

**Related Commands**

These commands implement DHCP relay agent.

- **ip helper-address**
- **ip dhcp relay always-on**
- **ip dhcp relay information option circuit-id**

**Example**

- This command enables the attachment of tags to DHCP requests that are forwarded to DHCP server addresses.

  ```
  switch(config)#ip dhcp relay information option
  switch(config)#
  ```
**ip dhcp relay information option circuit-id**

The `ip dhcp relay information option circuit-id` command specifies the content of tags that the switch attaches to DHCP requests before they are forwarded from the configuration mode interface to DHCP server addresses specified by `ip helper-address` commands. Tags are attached to outbound DHCP requests only if the information option is enabled on the switch (`ip dhcp relay information option circuit-id`). The default value for each interface is the name and number of the interface.

The `no ip dhcp relay information option circuit-id` and `default ip dhcp relay information option circuit-id` commands restore the default content setting for the configuration mode interface by removing the corresponding command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ip dhcp relay information option circuit-id id_label
no ip dhcp relay information option circuit-id
default ip dhcp relay information option circuit-id
```

**Parameters**
- `id_label` Tag content. Format is alphanumeric characters (maximum 15 characters).

**Related Commands**
- `ip helper-address`
- `ip dhcp relay always-on`
- `ip dhcp relay information option (Global)`

**Example**

- This command configures `x-1234` as the tag content for packets send from VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ip dhcp relay information option circuit-id x-1234
switch(config-if-Vl200)#
```
ip dhcp snooping

The **ip dhcp snooping** command enables DHCP snooping globally on the switch. DHCP snooping is a set of layer 2 processes that can be configured on LAN switches and used with DHCP servers to control network access to clients with specific IP/MAC addresses. The switch supports Option-82 insertion, which is a DHCP snooping process that allows relay agents to provide remote-ID and circuit-ID information to DHCP reply and request packets. DHCP servers use this information to determine the originating port of DHCP requests and associate a corresponding IP address to that port. DHCP servers use port information to track host location and IP address usage by authorized physical ports.

DHCP snooping uses the information option (Option-82) to include the switch MAC address (router-ID) along with the physical interface name and VLAN number (circuit-ID) in DHCP packets. After adding the information to the packet, the DHCP relay agent forwards the packet to the DHCP server as specified by the DHCP protocol.

DHCP snooping on a specified VLAN requires all of these conditions to be met:

- DHCP snooping is globally enabled.
- Insertion of option-82 information in DHCP packets is enabled.
- DHCP snooping is enabled on the specified VLAN.
- DHCP relay is enabled on the corresponding VLAN interface.

The **no ip dhcp snooping** and **default ip dhcp snooping** commands disables global DHCP snooping by removing the **ip dhcp snooping** command from **running-config**.

**Command Mode**

- Global Configuration

**Command Syntax**

```
ip dhcp snooping
no ip dhcp snooping
default ip dhcp snooping
```

**Related Commands**

- **ip dhcp snooping information option** enables insertion of option-82 snooping data.
- **ip helper-address** enables the DHCP relay agent on a configuration mode interface.

**Example**

- This command globally enables snooping on the switch, displaying DHCP snooping status prior and after invoking the command.

```
switch(config)#show ip dhcp snooping
DHCP Snooping is disabled
switch(config)#ip dhcp snooping
switch(config)#show ip dhcp snooping
DHCP Snooping is enabled
DHCP Snooping is not operational
DHCP Snooping is configured on following VLANs:
  None
DHCP Snooping is operational on following VLANs:
  None
Insertion of Option-82 is disabled
switch(config)#
```
**ip dhcp snooping information option**

The **ip dhcp snooping information option** command enables the insertion of option-82 DHCP snooping information in DHCP packets on VLANs where DHCP snooping is enabled. DHCP snooping is a layer 2 switch process that allows relay agents to provide remote-ID and circuit-ID information to DHCP reply and request packets. DHCP servers use this information to determine the originating port of DHCP requests and associate a corresponding IP address to that port.

DHCP snooping uses information option (Option-82) to include the switch MAC address (router-ID) along with the physical interface name and VLAN number (circuit-ID) in DHCP packets. After adding the information to the packet, the DHCP relay agent forwards the packet to the DHCP server through DHCP protocol processes.

DHCP snooping on a specified VLAN requires all of these conditions to be met:

- DHCP snooping is globally enabled.
- Insertion of option-82 information in DHCP packets is enabled.
- DHCP snooping is enabled on the specified VLAN.
- DHCP relay is enabled on the corresponding VLAN interface.

When global DHCP snooping is not enabled, the **ip dhcp snooping information option** command persists in *running-config* without any operational effect.

The **no ip dhcp snooping information option** and **default ip dhcp snooping information option** commands disable the insertion of option-82 DHCP snooping information in DHCP packets by removing the **ip dhcp snooping information option** statement from *running-config*.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip dhcp snooping information option
no ip dhcp snooping information option
default ip dhcp snooping information option
```

**Related Commands**

- **ip dhcp snooping** globally enables DHCP snooping.
- **ip helper-address** enables the DHCP relay agent on a configuration mode interface.

**Example**

- These commands enable DHCP snooping on DHCP packets from ports on snooping-enabled VLANs. DHCP snooping was previously enabled on the switch.

```
switch(config)#ip dhcp snooping information option
switch(config)#show ip dhcp snooping
DHCP Snooping is enabled
DHCP Snooping is operational
DHCP Snooping is configured on following VLANs:
  100
DHCP Snooping is operational on following VLANs:
  100
Insertion of Option-82 is enabled
  Circuit-id format: Interface name:Vlan ID
  Remote-id: 00:1c:73:1f:b4:38 (Switch MAC)
switch(config)#
```
ip dhcp snooping vlan

The `ip dhcp snooping vlan` command enables DHCP snooping on specified VLANs. DHCP snooping is a layer 2 process that allows relay agents to provide remote-ID and circuit-ID information in DHCP packets. DHCP servers use this data to determine the originating port of DHCP requests and associate a corresponding IP address to that port. DHCP snooping is configured on a global and VLAN basis.

VLAN snooping on a specified VLAN requires each of these conditions:

- DHCP snooping is globally enabled.
- Insertion of option-82 information in DHCP packets is enabled.
- DHCP snooping is enabled on the specified VLAN.
- DHCP relay is enabled on the corresponding VLAN interface.

When global DHCP snooping is not enabled, the `ip dhcp snooping vlan` command persists in `running-config` without any operational affect.

The `no ip dhcp snooping information option` and `default ip dhcp snooping information option` commands disable DHCP snooping operability by removing the `ip dhcp snooping information option` statement from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip dhcp snooping vlan v_range
no ip dhcp snooping vlan v_range
default ip dhcp snooping vlan v_range
```

**Parameters**

- `v_range` VLANs upon which snooping is enabled. Formats include a number, a number range, or a comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.

**Related Commands**

- `ip dhcp snooping` globally enables DHCP snooping.
- `ip dhcp snooping information option` enables insertion of option-82 snooping data.
- `ip helper-address` enables the DHCP relay agent on a configuration mode interface.
Example

These commands enable DHCP snooping globally, DHCP on VLAN interface 100, and DHCP snooping on VLAN 100.

```
switch(config)#ip dhcp snooping
switch(config)#ip dhcp snooping information option
switch(config)#ip dhcp snooping vlan 100
switch(config)#interface vlan 100
switch(config-if-Vl100)#ip helper-address 10.4.4.4
switch(config-if-Vl100)#show ip dhcp snooping
DHCP Snooping is enabled
DHCP Snooping is operational
DHCP Snooping is configured on following VLANs:
  100
DHCP Snooping is operational on following VLANs:
  100
Insertion of Option-82 is enabled
  Circuit-id format: Interface name:Vlan ID
  Remote-id: 00:1c:73:1f:b4:38 (Switch MAC)
switch(config)#
```
ip hardware fib ecmp resilience

The **ip hardware fib ecmp resilience** command enables resilient ECMP for the specified IP address prefix and configures a fixed number of next hop entries in the hardware ECMP table for that prefix. In addition to specifying the maximum number of next hop addresses that the table can contain for the prefix, the command includes a redundancy factor that allows duplication of each next hop address. The fixed table space for the address is the maximum number of next hops multiplied by the redundancy factor.

Resilient ECMP is useful when it is not desirable for routes to be rehashed due to link flap, as when ECMP is being used for load balancing.

The **no ip hardware fib ecmp resilience** and **default ip hardware fib ecmp resilience** commands restore the default hardware ECMP table management by removing the **ip hardware fib ecmp resilience** command from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip hardware fib ecmp resilience net_addr capacity nhop_max redundancy duplicates
no ip hardware fib ecmp resilience net_addr
default ip hardware fib ecmp resilience net_addr
```

**Parameters**

- **net_addr** IP address prefix managed by command. (CIDR or address-mask).
- **nhop_max** Maximum number of nexthop addresses for specified IP address prefix. Value range varies by platform:
  - Helix: <2 to 64>
  - Trident: <2 to 32>
  - Trident II: <2 to 64>
- **duplicates** Specifies the redundancy factor. Value ranges from 1 to 128.

**Example**

- This command configures a hardware ECMP table space of 24 entries for the IP address 10.14.2.2/24. A maximum of six next-hop addresses can be specified for the IP address. When the table contains six next-hop addresses, each appears in the table four times. When the table contains fewer than six next-hop addresses, each is duplicated until the 24 table entries are filled.

```
switch(config)#ip hardware fib ecmp resilience 10.14.2.2/24 capacity 6 redundancy 4
switch(config)#
```
**ip hardware fib optimize**

The **ip hardware fib optimize** command enables IPv4 route scale. The platform layer 3 agent is restarted to ensure IPv4 routes are optimized with the **agent SandL3Unicast terminate** command for the configuration mode interface.

**Command Mode**
- Global Configuration

**Command Syntax**

```plaintext
ip hardware fib optimize exact-match prefix-length <prefix-length>
<optional: prefix-length>
no ip hardware fib optimize exact-match prefix-length <prefix-length>
<optional: prefix-length>
```

**Parameters**
- **prefix-length** The length of the prefix equal to 12, 16, 20, 24, 28, or 32. One additional prefix-length limited to the prefix-length of 32 is optional.

**Related Commands**
- **agent SandL3Unicast terminate** enables restarting the layer 3 agent to ensure IPv4 routes are optimized.
- **show platform arad ip route** shows resources for all IPv4 routes in hardware. Routes that use the additional hardware resources will appear with an asterisk.
- **show platform arad ip route summary** shows hardware resource usage of IPv4 routes.

**Examples**
- This configuration command allows configuring prefix lengths 12 and 32.

```
switch(config)#ip hardware fib optimize exact-match prefix-length 12 32
! Please restart layer 3 forwarding agent to ensure IPv4 routes are optimized
```

One of the two prefixes in this command is a prefix-length of 32, which is required in the instance where there are two prefixes. For this command to take effect, the platform layer 3 agent must be restarted.

This configuration command restarts the platform layer 3 agent to ensure IPv4 routes are optimized.

```
switch(config)#agent SandL3Unicast terminate
SandL3Unicast was terminated
```

Restarting the platform layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.

- This configuration command allows configuring prefix lengths 32 and 16.

```
switch(config)#ip hardware fib optimize exact-match prefix-length 32 16
! Please restart layer 3 forwarding agent to ensure IPv4 routes are optimized
```

One of the two prefixes in this command is a prefix-length of 32, which is required in the instance where there are two prefixes. For this command to take effect, the platform layer 3 agent must be restarted.

This configuration command restarts the platform layer 3 agent to ensure IPv4 routes are optimized.

```
switch(config)#agent SandL3Unicast terminate
SandL3Unicast was terminated
```
Chapter 28: IPv4 Commands

Restarting the platform layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.

- This configuration command allows configuring prefix length 24.
  
  switch(config)#ip hardware fib optimize exact-match prefix-length 24
  
  ! Please restart layer 3 forwarding agent to ensure IPv4 routes are optimized

  In this instance, there is only one prefix-length, so a prefix-length of 32 is not required. For this command to take effect, the platform layer 3 agent must be restarted.

  This configuration command restarts the platform layer 3 agent to ensure IPv4 routes are optimized.

  switch(config)#agent SandL3Unicast terminate
  SandL3Unicast was terminated

  Restarting the platform layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.

- This configuration command allows configuring prefix length 32.
  
  switch(config)#ip hardware fib optimize exact-match prefix-length 32
  
  ! Please restart layer 3 forwarding agent to ensure IPv4 routes are optimized

  For this command to take effect, the platform layer 3 agent must be restarted.

  This configuration command restarts the platform layer 3 agent to ensure IPv4 routes are optimized.

  switch(config)#agent SandL3Unicast terminate
  SandL3Unicast was terminated

  Restarting the platform layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.

Example

- This configuration command disables configuring prefix lengths 12 and 32.
  
  switch(config)#no ip hardware fib optimize exact-match prefix-length 12 32
  
  ! Please restart layer 3 forwarding agent to ensure IPv4 routes are not optimized

  One of the two prefixes in this command is a prefix-length of 32, which is required in the instance where there are two prefixes. For this command to take effect, the platform layer 3 agent must be restarted.
**ip helper-address**

The **ip helper-address** command enables the DHCP relay agent on the configuration mode interface and specifies a forwarding address for DHCP requests. An interface that is configured with multiple helper-addresses forwards DHCP requests to all specified addresses.

The **no ip helper-address** and **default ip helper-address** commands remove the corresponding **ip helper-address** command from **running-config**. Commands that do not specify an IP helper-address remove all helper-addresses from the interface.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ip helper-address ipv4_addr [vrf vrf_name] [source-address ipv4_addr | source-interface INTERFACES]
o no ip helper-address [ipv4_addr]
default ip helper-address [ipv4_addr]
```

**Parameters**

- **vrf vrf_name** specify the user-defined VRF for DHCP server.
- **ipv4_addr** specify the DHCP server address accessed by interface.
- **source-address ipv4_addr** specify the source IPv4 address to communicate with DHCP server.
- **source-interface INTERFACES** specify the source interface to communicate with DHCP server. Options include:
  - **Ethernet eth_num** specify the Ethernet interface number.
  - **Loopback lpbck_num** specify the loopback interface number. Value ranges from 0 to 1000.
  - **Management mgmt_num** specify the management interface number. Accepted values are 1 and 2.
  - **Port-Channel {int_num | sub_int_num}** specify the port-channel interface or subinterface number. Value of interface ranges from 1 to 2000. Value of sub-interface ranges from 1 to 4094.
  - **Tunnel tnl_num** specify the tunnel interface number. Value ranges from 0 to 255.
  - **VLAN vlan_num** specify the Ethernet interface number. Value ranges from 1 to 4094.

**Related Commands**

- **ip dhcp relay always-on**
- **ip dhcp relay information option (Global)**
- **ip dhcp relay information option circuit-id**

**Guidelines**

If the source-address parameter is specified, then the DHCP client receives an IPv4 address from the subnet of source IP address. The source-address must be one of the configured addresses on the interface.
Examples

- This command enables DHCP relay on the VLAN interface 200; and configure the switch to forward DHCP requests received on this interface to the server at 10.10.41.15.

  switch(config)#interface vlan 200
  switch(config-if-Vl200)#ip helper-address 10.10.41.15
  switch(config-if-Vl200)#show active
  interface Vlan200
    ip helper-address 10.10.41.15
  switch(config-if-Vl200)#

- This command enables DHCP relay on the interface Ethernet 1/2; and configures the switch to use 2.2.2.2 as the source IP address when relaying IPv4 DHCP messages to the server at 1.1.1.1.

  switch(config)#interface ethernet 1/2
  switch(config-if-Et1/2)#ip helper-address 1.1.1.1 source-address 2.2.2.2
  switch(config-if-Et1/2)#
**ip icmp redirect**

The *ip icmp redirect* command enables the transmission of ICMP redirect messages. Routers send ICMP redirect messages to notify data link hosts of the availability of a better route for a specific destination.

The *no ip icmp redirect* disables the switch from sending ICMP redirect messages.

**Command Mode**
- Global Configuration

**Command Syntax**
- ip icmp redirect
- no ip icmp redirect
- default ip icmp redirect

**Example**
- This command disables the redirect messages.

```
switch(config)#no ip icmp redirect
switch(config)#show running-config

! no ip icmp redirect
ip routing
!

switch(config)#
```
ip load-sharing

The `ip load-sharing` command provides the hash seed to an algorithm that the switch uses to distribute data streams among multiple equal-cost routes to an individual IPv4 subnet.

In a network topology using Equal-Cost Multipath routing, all switches performing identical hash calculations may result in hash polarization, leading to uneven load distribution among the data paths. Hash polarization is avoided when switches use different hash seeds to perform different hash calculations.

The `no ip load-sharing` and `default ip load-sharing` commands return the hash seed to the default value of zero by removing the `ip load-sharing` command from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**

```
ip load-sharing HARDWARE seed
no ip load-sharing HARDWARE
default ip load-sharing HARDWARE
```

**Parameters**
- `HARDWARE` The ASIC switching device. The available option depend on the switch platform. Verify available options with the CLI `?` command.
  - `arad`
  - `fm6000`
  - `petraA`
  - `trident`
- `seed` The hash seed. Value range varies by switch platform. The default value on all platforms is 0.
  - when `HARDWARE=arad` `seed` ranges from 0 to 2.
  - when `HARDWARE=fm6000` `seed` ranges from 0 to 39.
  - when `HARDWARE=petraA` `seed` ranges from 0 to 2.
  - when `HARDWARE=trident` `seed` ranges from 0 to 5.

**Example**
- This command sets the IPv4 load sharing hash seed to one on FM6000 platform switches.
  ```
  switch(config)#ip load-sharing fm6000 1
  switch(config)#
  ```
ip local-proxy-arp

The ip local-proxy-arp command enables local proxy ARP (Address Resolution Protocol) on the configuration mode interface. When local proxy ARP is enabled, ARP requests received on the configuration mode interface will return an IP address even when the request comes from within the same subnet.

The no ip local-proxy-arp and default ip local-proxy-arp commands disable local proxy ARP on the configuration mode interface by removing the corresponding ip local-proxy-arp command from running-config.

Command Mode
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

Command Syntax
- ip local-proxy-arp
- no ip local-proxy-arp
- default ip local-proxy-arp

Example
- These commands enable local proxy ARP on VLAN interface 140.
  switch(config)#interface vlan 140
  switch(config-if-Vl140)#ip local-proxy-arp
  switch(config-if-Vl140)#show active
  interface Vlan140
    ip local-proxy-arp
  switch(config-if-Vl140)#
The **ip multicast count** command enables the IPv4 multicast route traffic counter of group and source addresses in either bytes or packets.

The **no ip multicast count** command deletes all multicast counters including the routes of group and source addresses.

The **no ip multicast count** `group_address source_address` command removes the current configuration of the specified group and source addresses. It does not delete the counter because the wildcard is still active.

The **default ip multicast count** command reverts the current counter configuration of multicast route to the default state.

### Command Mode
Global Configuration

### Command Syntax

```
ip multicast count [group_address [source_address] | bytes | packets]
no ip multicast count [group_address [source_address] | bytes | packets]
default ip multicast count [group_address [source_address] | bytes | packets]
```

### Parameters
- **group_address** configures the multicast route traffic count of the specified group address
- **source_address** configures the multicast route traffic count of the specified group and source addresses
- **bytes** configures the multicast route traffic count to bytes
- **packets** configures the multicast route traffic count to packets

### Guidelines
This command is supported on the FM6000 platform only.

### Examples
- This command configures the multicast route traffic count to bytes.
  ```plaintext
  switch(config)#ip multicast count bytes
  ```
- This command configures the multicast route traffic count of the specified group and source addresses.
  ```plaintext
  switch(config)#ip multicast count 10.50.30.23 45.67.89.100
  ```
- This command deletes all multicast counters including the routes of group and source addresses.
  ```plaintext
  switch(config)#no ip multicast count
  ```
- This command reverts the current multicast route configuration to the default state.
  ```plaintext
  switch(config)#default ip multicast count
  ```
### ip nat destination static

The **ip nat destination static** command enables NAT of a specified destination address for the configuration mode interface. This command installs hardware translation entries for forward and reverse unicast traffic. When the rule specifies a multicast group, the command does not install the reverse path in hardware. The command may include an access control list to filter packets for translation.

When configuring twice NAT, an arbitrary NAT group number is used to associate the source NAT and destination NAT rules. This number must be the same in both rules.

The **no ip nat destination static** and **default ip nat destination static** commands disables NAT translation of the specified destination address by removing the corresponding **ip nat destination static** command from **running_config**.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ip nat destination static ORIGINAL [FILTER] TRA NSLATED [PROT_TYPE] [group group_number]
o ip nat destination static ORIGINAL [FILTER] TRA NSLATED [PROT_TYPE] [group group_number]
default ip nat destination static ORIGINAL [FILTER] TRA NSLATED [PROT_TYPE] [group group_number]
```

**Parameters**

- **ORIGINAL**  Destination address to be modified. Options include:
  - `local_ipv4`  IPv4 address.
  - `local_ipv4 local_port`  IPv4 address and port (port value ranges from 1 to 65535).

- **FILTER**  Access control list that filters packets. Options include:
  - `<no parameter>`  All packets with specified destination address are cleared.
  - `access-list list_name`  List that specifies the packets that are cleared. Not supported when configuring twice NAT.

- **TRANSLATED**  Destination address of translated packet. Options include:
  - `global_ipv4`  IPv4 address.
  - `global_ipv4 global_port`  IPv4 address and port (port value ranges from 1 to 65535). When configuring twice NAT, source and destination NAT rules must either both specify a port translation or both not specify a port translation.

- **PROT_TYPE**  Filters packets based on protocol type. Options include:
  - `<no parameter>`  All packets with specified destination address are cleared.
  - `protocol tcp`  TCP packets with specified destination address are cleared.
  - `protocol udp`  UDP packets with specified destination address are cleared.

- **group group_number**  Used only when configuring twice NAT, the NAT group number associates a source NAT rule with a destination NAT rule on the same interface. The group number (values range from 1 to 255) is arbitrary, but must be the same in both rules.
Example

- These commands configure VLAN 201 to translate destination address 10.24.1.10 to
  168.32.14.15.

  ```
  switch(config)#interface vlan 201
  switch(config-if-Vl201)#ip nat destination static 10.24.1.10 168.32.14.15
  switch(config-if-Vl201)#
  ```

- These commands configure VLAN 201 to translate the source address 10.24.1.10 to 168.32.14.15
  for all packets with IP destination addresses in the 168.10.1.1/32 subnet.

  ```
  switch(config)#ip access-list ACL2
  switch(config-acl-ACL2)#permit ip 168.10.1.1/32 any
  switch(config-acl-ACL2)#exit
  switch(config)#interface vlan 201
  switch(config-if-Vl201)#ip nat destination static 10.24.1.10 access-list ACL2
  168.32.14.15
  switch(config-if-Vl201)#
  ```

- These commands configure Ethernet interface 2 to translate the local source address 10.24.1.10
to the global source address 168.32.14.15, and to translate the local destination address
10.68.104.3 to the global destination address 168.25.10.7 for all packets moving through the
interface. The use of NAT group 3 is arbitrary, but must be the same in both rules.

  ```
  switch(config)#interface ethernet 2
  switch(config-if-Et2)#ip nat source static 10.24.1.10 168.32.14.15 group 3
  switch(config-if-Et2)#ip nat destination static 10.68.104.3 168.25.10.7 group 3
  ```
**ip nat pool**

The `ip nat pool` command identifies a pool of addresses using start address, end address, and either netmask or prefix length. If its starting IP address and ending IP address are the same, there is only one address in the address pool.

The `no ip nat pool` removes the `ip nat pool` command from `running_config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip nat pool pool_name [ADDRESS_SPAN] SUBNET_SIZE
no ip nat pool pool_name
default ip nat pool pool_name
```

**Parameters**

- `pool_name` name of the IP address pool.
- `ADDRESS_SPAN` Options include:
  - `start_addr` The first IP address in the address pool (IPv4 addresses in dotted decimal notation).
  - `end_addr` The last IP address in the address pool. (IPv4 addresses in dotted decimal notation).
- `SUBNET_SIZE` this functions as a sanity check to ensure it is not a network or broadcast network. Options include:
  - `netmask ipv4_addr` The netmask of the address pool’s network (dotted decimal notation).
  - `prefix-length <0 to 32>` The number of bits of the netmask (of the address pool’s network) that are ones (how many bits of the address indicate network).

**Examples**

- This command configures the pool of addresses using start address, end address, and prefix length of 24.
  
  ```
  switch(config)#ip nat pool pool 10.15.15.15 10.15.15.25 prefix-length 24
  switch(config)
  ```

- This command removes the pool of addresses.
  
  ```
  switch(config)# no ip nat pool pool 10.15.15.15 10.15.15.25 prefix-length 24
  switch(config)
  ```
ip nat source dynamic

The **ip nat source dynamic** command enables NAT of a specified source address for packets sent and received on the configuration mode interface. This command installs hardware translation entries for forward and reverse traffic. When the rule specifies a multicast group, the command does not install the reverse path in hardware. The command may include an access control list to filter packets for translation.

The **no ip nat source dynamic** and **default ip nat source dynamic** commands disable NAT translation of the specified destination address by removing the corresponding **ip nat source dynamic** command from **running_config**.

**Note**

Ethernet and Port-channel interfaces should be configured as routed ports.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ip nat source dynamic access-list acl_name POOL_TYPE
no ip nat source dynamic access-list acl_name
default ip nat source dynamic access-list acl_name
```

**Parameters**

- **acl_name** Access control list that controls the internal network addresses eligible for NAT.
- **POOL_TYPE** Options include:
  - **overload** Translates multiple local addresses to a single global address. When overloading is enabled, conversations using the same IP address are distinguished by their TCP or UDP port number.
  - **pool pool_name** The name of the IP address pool. The pool is defined using the **ip nat pool** command.

  The pool option is required even if the pool has just one address. NAT uses that one address for all of the translations.
  - **pool_fullcone** Enables full cone NAT where all requests from the same internal IP address and port are mapped to the same external IP address and port.

**Example**

- This command configures the dynamic NAT source address and sets the NAT overload for pool P2.
  ```
  switch(config)#interface ethernet 3/1
  switch(config-if-Et3/1)#ip nat source dynamic access-list ACL2 pool p2
  switch#
  ```

- This command disables the NAT source translation on interface Ethernet 3/1.
  ```
  switch(config)#interface ethernet 3/1
  switch(config-if-Et3/1)# no ip nat source dynamic access-list ACL2
  switch(config-if-Et3/1)#
  ```
**ip nat source static**

The `ip nat source static` command enables NAT of a specified source address for the configuration mode interface. This command installs hardware translation entries for forward and reverse unicast traffic. When the rule specifies a multicast group, the command does not install the reverse path in hardware. The command may include an access control list to filter packets for translation.

When configuring twice NAT, an arbitrary NAT group number is used to associate the source NAT and destination NAT rules. This number must be the same in both rules.

The `no ip nat source static` and `default ip nat source static` commands disables NAT translation of the specified source address by removing the corresponding `ip nat source` command from `running_config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ip nat source static ORIGINAL [FILTER] TRANSLATED [PROT_TYPE] [group group_number]
no ip nat source static ORIGINAL [FILTER] TRANSLATED [PROT_TYPE] [group group_number]
default ip nat source static ORIGINAL [FILTER] TRANSLATED [PROT_TYPE] [group group_number]
```

**Parameters**

- **ORIGINAL**  
  Source address to be modified. Options include:
  - `original_ipv4`  IPv4 address.
  - `original_ipv4 original_port`  IPv4 address and port (port value ranges from 1 to 65535).

- **FILTER**  
  Access control list that filters packets. Options include:
  - `<no parameter>`  All packets with specified source address are cleared.
  - `access-list list_name`  List that specifies the packets that are cleared. Not supported when configuring twice NAT.

- **TRANSLATED**  
  Source address of translated packet. Options include:
  - `translated_ipv4`  IPv4 address.
  - `translated_ipv4 translated_port`  IPv4 address and port (port value ranges from 1 to 65535).
  When configuring twice NAT, source and destination NAT rules must either both specify a port translation or both not specify a port translation.

- **PROT_TYPE**  
  Filters packets based on protocol type. Options include:
  - `<no parameter>`  All packets with specified source address are cleared.
  - `protocol tcp`  TCP packets with specified source address are cleared.
  - `protocol udp`  UDP packets with specified source address are cleared.
  - `group group_number`  Used only when configuring twice NAT, the NAT group number associates a source NAT rule with a destination NAT rule on the same interface. The group number (values range from 1 to 255) is arbitrary, but must be the same in both rules.

**Restrictions**

- If `ORIGINAL` includes a port, `TRANSLATED` must also include a port.
- If `ORIGINAL` does not include a port, `TRANSLATED` cannot include a port.
Example

- These commands configure VLAN 101 to translate source address 10.24.1.10 to 168.32.14.15.

  switch(config)#interface vlan 101
  switch(config-if-Vl101)#ip nat source static 10.24.1.10 168.32.14.15
  switch(config-if-Vl101)#

- These commands configure VLAN 100 to translate the source address 10.24.1.10 to 168.32.14.15 for all packets with IP destination addresses in the 168.10.1.1/32 subnet.

  switch(config)#ip access-list ACL1
  switch(config-acl-ACL1)#permit ip any 168.10.1.1/32
  switch(config-acl-ACL1)#exit
  switch(config)#interface vlan 100
  switch(config-if-Vl100)#ip nat source static 10.24.1.10 access-list ACL1 168.32.141.15
  switch(config-if-Vl100)#

- These commands configure Ethernet interface 2 to translate the local source address 10.24.1.10 to the global source address 168.32.14.15, and to translate the local destination address 10.68.104.3 to the global destination address 168.25.10.7 for all packets moving through the interface. The use of NAT group 3 is arbitrary, but must be the same in both rules.

  switch(config)#interface ethernet 2
  switch(config-if-Et2)#ip nat source static 10.24.1.10 168.32.14.15 group 3
  switch(config-if-Et2)#ip nat destination static 10.68.104.3 168.25.10.7 group 3
ip nat translation counters

The **ip nat translation counters** command enables the feature to count packets that are translated by static and twice NAT rules in hardware. Once this feature is enabled, all current rules in hardware and new rules that are configured after running this command receive policers for counting packets.

The **no ip nat translation counters** and **default ip nat translation counters** commands disable the packet counter feature for static and twice NAT connections.

**Command Mode**
Global Configuration

**Command Syntax**
- `ip nat translation counters`
- `no ip nat translation counters`
- `default ip nat translation counters`

**Guidelines**
The **ip nat translation counters** command is supported on the DCS-7150 series switches only. This command is solely intended to debug static and twice NAT translation failures in hardware. Disable this feature after completing troubleshooting. If this feature remains enabled even when the count of static connections exceed 275, it can cause unpredictable behavior including restart of FocalPointV2 agent. The restart of FocalPointV2 agent results in traffic disruption.

**Example**
- The **ip nat translation counters** command enables the packet counter feature for static and twice NAT connections. Using the **show ip nat translation hardware detail** and **show ip nat translation twice hardware detail** commands, you can verify the packet count.

```
switch(config)#ip nat translation counters
switch(config)#show ip nat translation hardware detail

```

---
**ip nat translation low-mark**

The **ip nat translation low-mark** command configures the minimum threshold that triggers the resumption of programming new NAT translation connections.

The **ip nat translation max-entries** command specifies the maximum number of NAT translation connections that can be stored. When this limit is reached, new connections are dropped instead of being programmed in hardware or software. At this point no new connections will be programmed until the number of stored entries drop below the configured low-mark, expressed as a percentage of the max-entries value. The default low mark value is 90%.

The **no ip nat translation low-mark** and **default ip nat translation low-mark** commands restores the default low-mark value by removing the **ip nat translation low-mark** command from **running_config**.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip nat translation low-mark threshold
no ip nat translation low-mark
default ip nat translation low-mark
```

**Parameters**

- **threshold** Percentage of maximum connection entries. Value ranges from 1 to 99. Default is 90.

**Examples**

- This command globally sets the translation low mark of 93%.

  ```
  switch(config)#ip nat translation low-mark 93
  switch(config)#
  ```
**ip nat translation max-entries**

The `ip nat translation max-entries` command specifies maximum number of NAT translation connections. After this threshold is reached, new connections are dropped until the number of programmed connections is reduced below the level specified by the `ip nat translation low-mark` command.

The `no ip nat translation max-entries` and `default ip nat translation max-entries` commands removes the maximum connection limit and resets the parameter value to zero by removing the `ip nat translation max-entries` command from `running_config`.

**Command Mode**
- Global Configuration

**Command Syntax**
```
ip nat translation max-entries connections
no ip nat translation max-entries
default ip nat translation max-entries
```

**Parameters**
- `connections`  The maximum number of NAT translation connections. Value ranges from 0 to 4294967295. Default value is 0, which removes the connection limit.

**Examples**
- This command limits the number of NAT translation connections the switch can store to 3000.
  ```
switch(config)#ip nat translation max-entries 3000
switch(config)#
```
ip nat translation tcp-timeout

The **ip nat translation tcp-timeout** command specifies the translation timeout period for translation table entries. The timeout period specifies the interval during which the switch will attempt to reuse an existing TCP translation for devices specified by table entries.

The **no ip nat translation tcp-timeout** and **default ip nat translation tcp-timeout** commands reset the timeout to its default by removing the corresponding **ip nat translation tcp-timeout** command from **running_config**.

**Command Mode**
Global Configuration

**Command Syntax**

```
ip nat translation tcp-timeout period
no ip nat translation tcp-timeout
default ip nat translation tcp-timeout
```

**Parameters**

- **period** Time-out period in seconds for port translations. Value ranges from 0 to 4294967295. Default value is 86400 (24 hours).

**Examples**

- This command sets the TCP timeout for translations to 600 seconds.
  
```
switch(config)# ip nat translation tcp-timeout 600
```

- This command removes the TCP translation timeout.
  
```
switch(config)# no ip nat translation tcp-timeout
```

switch(config)#
ip nat translation udp-timeout

The `ip nat translation udp-timeout` command specifies the translation timeout period for translation table entries. The timeout period specifies the interval the switch attempts to establish a UDP connection with devices specified by table entries.

The `no ip nat translation udp-timeout` and `default ip nat translation udp-timeout` commands disables NAT translation of the specified destination address by removing the corresponding `ip nat translation udp-timeout` command from `running_config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip nat translation udp-timeout period
no ip nat translation udp-timeout
default ip nat translation udp-timeout
```

**Parameters**

- `period`  Value ranges from 0 to 4294967295. Default value is 300 (5 minutes).

**Examples**

- This command globally sets the timeout for UDP to 800 seconds.
  
  ```
  switch(config)# ip nat translation udp-timeout 800
  ```

- This command removes the timeout for UDP.
  
  ```
  switch(config)# no ip nat translation udp-timeout
  ```
**ip proxy-arp**

The `ip proxy-arp` command enables proxy ARP on the configuration mode interface. Proxy ARP is disabled by default.

The `no ip proxy-arp` and `default ip proxy-arp` commands disable proxy ARP on the configuration mode interface by removing the corresponding `ip proxy-arp` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

- `ip proxy-arp`
- `no ip proxy-arp`
- `default ip proxy-arp`

**Examples**

- This command enables proxy ARP on Ethernet interface 4.

  ```bash
  switch(config)#interface ethernet 4
  switch(config-if-Et4)#ip proxy-arp
  switch(config-if-Et4)#
  ```
**ip route**

The `ip route` command creates a static route. The destination is a network segment; the nexthop address is either an IPv4 address or a routable port. When multiple routes exist to a destination prefix, the route with the lowest administrative distance takes precedence.

By default, the administrative distance assigned to static routes is 1. Assigning a higher administrative distance to a static route configures it to be overridden by dynamic routing data. For example, a static route with an administrative distance value of 200 is overridden by OSPF intra-area routes, which have a default administrative distance of 110.

Tags are used by route maps to filter routes. The default tag value on static routes is 0.

Multiple routes with the same destination and the same administrative distance comprise an Equal Cost Multi-Path (ECMP) route. The switch attempts to spread outbound traffic equally through all ECMP route paths. All paths comprising an ECMP are assigned identical tag values; commands that change the tag value of a path change the tag value of all paths in the ECMP.

The `no ip route` and `default ip route` commands delete the specified static route by removing the corresponding `ip route` command from `running-config`. Commands that do not list a nexthop address remove all `ip route` statements with the specified destination from `running-config`. If an `ip route` statement exists for the same IP address in multiple VRFs, each must be removed separately. All static routes in a user-defined VRF are deleted when the VRF is deleted.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip route [VRF_INSTANCE] dest_net NEXTHOP [DISTANCE] [TAG_OPTION] [RT_NAME]
no ip route [VRF_INSTANCE] dest_net [NEXTHOP] [DISTANCE]
default ip route [VRF_INSTANCE] dest_net [NEXTHOP] [DISTANCE]
```

**Parameters**

- **VRF_INSTANCE** Specifies the VRF instance being modified.
  - `<no parameter>` Changes are made to the default VRF.
  - `vrf vrf_name` Changes are made to the specified VRF.
- **dest_net** Destination IPv4 subnet (CIDR or address-mask notation).
- **NEXTHOP** Location or access method of next hop device. Options include:
  - `ipv4_addr` An IPv4 address.
  - `null0` Null0 interface.
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-channel interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
  - `vxlan vx_num` VXLAN interface specified by `vx_num`.
- **DISTANCE** Administrative distance assigned to route. Options include:
  - `<no parameter>` Route assigned default administrative distance of one.
  - `<1-255>` The administrative distance assigned to route.
- **TAG_OPTION** static route tag. Options include:
• <no parameter> Assigns default static route tag of 0.
• tag t_value Static route tag value. t_value ranges from 0 to 4294967295.
• RT_NAME Associates descriptive text to the route. Options include:
  • <no parameter> No text is associated with the route.
  • name descriptive_text The specified text is assigned to the route.

Related Commands
• ip route nexthop-group command creates a static route that specifies a Nexthop Group to determine the Nexthop address.

Example
• This command creates a static route in the default VRF.

```
switch(config)#ip route 172.17.252.0/24 VLAN 2000
switch(config)#
```
ip routing

The **ip routing** command enables IPv4 routing. When IPv4 routing is enabled, the switch attempts to deliver inbound packets to destination IPv4 addresses by forwarding them to interfaces or next hop addresses specified by the forwarding table.

The **no ip routing** and **default ip routing** commands disable IPv4 routing by removing the **ip routing** command from *running-config*. When IPv4 routing is disabled, the switch attempts to deliver inbound packets to their destination MAC addresses. When this address matches the switch’s MAC address, the packet is delivered to the CPU. IP packets with IPv4 destinations that differ from the switch’s address are typically discarded. The **delete-static-routes** option removes static entries from the routing table.

IPv4 routing is disabled by default.

**Command Mode**
- Global Configuration

**Command Syntax**
```
  ip routing [VRF_INSTANCE]
  no ip routing [DELETE_ROUTES] [VRF_INSTANCE]
  default ip routing [DELETE_ROUTES] [VRF_INSTANCE]
```

**Parameters**
- **DELETE_ROUTES** Resolves routing table static entries when routing is disabled.
  - <no parameter> Routing table retains static entries.
  - **delete-static-routes** Static entries are removed from the routing table.
- **VRF_INSTANCE** specifies the VRF instance being modified.
  - <no parameter> changes are made to the default VRF.
  - **vrf vrf_name** changes are made to the specified user-defined VRF.

**Example**
- This command enables IPv4 routing.
```
  switch(config)#ip routing
  switch(config)#
```
**ip source binding**

IP source guard (IPSG) is supported on Layer 2 Port-Channels, not member ports. The IPSG configuration on port channels supersedes the configuration on the physical member ports. Hence, source IP MAC binding entries should be configured on port channels. When configured on a port channel member port, IPSG does not take effect until this port is deleted from the port channel configuration.

**Note**

IP source bindings are also used by static ARP inspection.

The **no ip source binding** and **default ip source binding** commands exclude parameters from IPSG filtering, and set the default for **ip source binding**.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

```
ip source binding [IP_ADDRESS] [MAC_ADDRESS] vlan [VLAN_RANGE] interface [INTERFACE]
no ip source binding [IP_ADDRESS] [MAC_ADDRESS] vlan [VLAN_RANGE] interface [INTERFACE]
default ip source binding [IP_ADDRESS] [MAC_ADDRESS] vlan [VLAN_RANGE] interface [INTERFACE]
```

**Parameters**
- **IP_ADDRESS** Specifies the IP ADDRESS.
- **MAC_ADDRESS** Specifies the MAC ADDRESS.
- **VLAN_RANGE** Specifies the VLAN ID range.
- **INTERFACE** Specifies the Ethernet interface.

**Related Commands**
- ip verify source
- show ip verify source

**Example**
- This command configures source IP-MAC binding entries to IP address 10.1.1.1, MAC address 0000.aaaa.1111, VLAN ID 4094, and Ethernet interface 36.

  ```
  switch(config)#ip source binding 10.1.1.1 0000.aaaa.1111 vlan 4094 interface ethernet 36
  switch(config)#
  ```
ip verify

The `ip verify` command configures Unicast Reverse Path Forwarding (uRPF) for inbound IPv4 packets on the configuration mode interface. uRPF verifies the accessibility of source IP addresses in packets that the switch forwards.

uRPF defines two operational modes: strict mode and loose mode.

- **Strict mode**: uRPF verifies that a packet is received on the interface that its routing table entry specifies for its return packet.
- **Loose mode**: uRPF validation does not consider the inbound packet’s ingress interface only that there is a valid return path.

The `no ip verify` and `default ip verify` commands disable uRPF on the configuration mode interface by deleting the corresponding `ip verify` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ip verify unicast source reachable-via RPF_MODE
no ip verify unicast
default ip verify unicast
```

**Parameters**

- **RPF_MODE**  
  Specifies the uRPF mode. Options include:
  - `any`  Loose mode.
  - `rx`  Strict mode.
  - `rx allow-default`  Strict mode. All inbound packets are forwarded if a default route is defined.

**Guidelines**

The first IPv4 uRPF implementation briefly disrupts IPv4 unicast routing. Subsequent `ip verify` commands on any interface do not disrupt IPv4 routing.

**Example**

- This command enables uRPF loose mode on VLAN interface 17.
  ```
  switch(config)#interface vlan 17
  switch(config-if-Vl17)#ip verify unicast source reachable-via any
  switch(config-if-Vl17)#show active
  interface Vlan17
  ip verify unicast source reachable-via any
  switch(config-if-Vl17)#
  ```

- This command enables uRPF strict mode on VLAN interface 18.
  ```
  switch(config)#interface vlan 18
  switch(config-if-Vl18)#ip verify unicast source reachable-via rx
  switch(config-if-Vl18)#show active
  interface Vlan18
  ip verify unicast source reachable-via rx
  switch(config-if-Vl18)#
  ```
**ip verify source**

The **ip verify source** command configures IP source guard (IPSG) applicable only to Layer 2 ports. When configured on Layer 3 ports, IPSG does not take effect until this interface is converted to Layer 2.

IPSG is supported on Layer 2 Port-Channels, not member ports. The IPSG configuration on port channels supersedes the configuration on the physical member ports. Hence, source IP MAC binding entries should be configured on port channels. When configured on a port channel member port, IPSG does not take effect until this port is deleted from the port channel configuration.

The **no ip verify source** and **default ip verify source** commands exclude VLAN IDs from IPSG filtering, and set the default for **ip verify source**.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

```
ip verify source vlan [VLAN_RANGE]
nop ip verify source [VLAN_RANGE]
default ip verify source
```

**Parameters**

- **VLAN_RANGE** Specifies the VLAN ID range.

**Related Commands**

- **ip source binding**
- **show ip verify source**

**Example**

- This command excludes VLAN IDs 1 through 3 from IPSG filtering. When enabled on a trunk port, IPSG filters the inbound IP packets on all allowed VLANs. IP packets received on VLANs 4 through 10 on Ethernet 36 will be filtered by IPSG, while those received on VLANs 1 through 3 are permitted.

  ```
  switch(config)#no ip verify source vlan 1-3
  switch(config)#interface ethernet 36
  switch(config-if-Et36)#switchport mode trunk
  switch(config-if-Et36)#switchport trunk allowed vlan 1-10
  switch(config-if-Et36)#ip verify source
  switch(config-if-Et36)#
  ```
platform trident forwarding-table partition

The **platform trident forwarding-table partition** command provides a shared table memory for L2, L3, and algorithmic LPM entries that can be partitioned in different ways.

Instead of having fixed-size tables for L2 MAC entry tables, L3 IP forwarding tables, and Longest Prefix Match (LPM) routes, the tables can be unified into a single shareable forwarding table.

**Important!** Changing the Unified Forwarding Table mode causes the forwarding agent to restart, briefly disrupting traffic forwarding on all ports.

The **no platform trident forwarding-table partition** and **default platform trident forwarding-table partition** commands remove the **platform trident forwarding-table partition** command from **running-config**.

**Command Mode**
Global Configuration

**Command Syntax**
```plaintext
platform trident forwarding-table partition SIZE
no platform trident forwarding-table partition
default platform trident forwarding-table partition
```

**Parameters**
- **SIZE** Size of partition. Options include:
  - 0  288k L2 entries, 16k host entries, 16k lpm entries
  - 1  224k L2 entries, 80k host entries, 16k lpm entries
  - 2  160k L2 entries, 144k host entries, 16k lpm entries
  - 3  96k L2 entries, 208k host entries, 16k lpm entries

  Default value is **2** (160k L2 entries, 144k host entries, 16k lpm entries).

**Example**
- This command sets the single shareable forwarding table to option 2 that supports 160k L2 entries, 144k host entries, and 16k LPM entries.

  ```plaintext
  switch(config)# platform trident forwarding-table partition 2
  switch(config)
  ```

- This command sets the single shareable forwarding table to option 3 that supports 96k L2 entries, 208k host entries, and 16k LPM entries. Since the switch was previously configured to option 2, you'll see a warning notice before the changes are implemented.

  ```plaintext
  #switch(config)# platform trident forwarding-table partition 3
  Warning: StrataAgent will restart immediately
  ```
**platform trident routing-table partition**

The **platform trident routing-table partition** command manages the partition sizes for the hardware LPM table that stores IPv6 routes of varying sizes.

An IPv6 route of length /64 (or shorter) requires half the hardware resources of an IPv6 route that is longer than /64. The switch installs routes of varying lengths in different table partitions. This command specifies the size of these partitions to optimize table usage.

**Important!** Changing the routing table partition mode causes the forwarding agent to restart, briefly disrupting traffic forwarding on all ports.

The **no platform trident routing-table partition** and **default platform trident routing-table partition** commands restore the default partitions sizes by removing the **platform trident routing-table partition** command from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

- `platform trident routing-table partition SIZE`
- `no platform trident routing-table partition`
- `default platform trident routing-table partition`

**Parameters**

- **SIZE**  Size of partition. Options include:
  - 1 16k IPv4 entries, 6k IPv6 (/64 and smaller) entries, 1k IPv6 (any prefix length)
  - 2 16k IPv4 entries, 4k IPv6 (/64 and smaller) entries, 2k IPv6 (any prefix length)
  - 3 16k IPv4 entries, 2k IPv6 (/64 and smaller) entries, 3k IPv6 (any prefix length)

Default value is 2 (16k IPv4 entries, 4k IPv6 (/64 and smaller) entries, 2k IPv6 (any prefix length).

**Restrictions**

Partition allocation cannot be changed from the default setting when uRPF is enabled for IPv6 traffic.

**Example**

- This command sets the shareable routing table to option 1 that supports 6K prefixes equal to or shorter than /64 and 1K prefixes longer than /64.

  ```config
  switch(config)#platform trident routing-table partition 1
  switch(config)
  ```
**rd (VRF configuration mode)**

The `rd` command issued in VRF Configuration Mode is a legacy command supported for backward compatibility. To configure a route distinguisher (RD) for a VRF, use the `rd (Router-BGP VRF and VNI Configuration Modes)` command.

**Note**

Legacy RDs that were assigned to a VRF in VRF Configuration Mode will still appear in `show vrf` outputs if an RD has not been configured in Router-BGP VRF Configuration Mode, but they no longer have an effect on the system.
**rib fib policy**

The `rib fib policy` command enables FIB policy for a particular VRF under router general configuration mode. The FIB policy can be configured to advertise only specific RIB routes and exclude all other routes.

For example, a FIB policy can be configured that will not place routes associated with a specific origin in the routing table. These routes will not be used to forward data packets and these routes are not advertised by the routing protocol to neighbors.

The `no rib fib policy` and `default rib fib policy` commands restore the switch to its default state by removing the corresponding `rib fib policy` command from `running-config`.

**Command Mode**

Router General Configuration

**Command Syntax**

```
rib <ipv4|ipv6> fib policy <name>
no rib <ipv4|ipv6> fib policy <name>
default rib <ipv4|ipv6> fib policy <name>
```

**Parameters**

- `ipv4`   IPv4 configuration commands.
- `ipv6`   IPv6 configuration commands.
- `name`   Route map name.

**Example**

- The following example enables FIB policy for IPv4 in the default VRF, using the route map, map1.

  ```
  Switch(config)#router general
  Switch(config-router-general)#vrf default
  Switch(config-router-general-vrf-default)#rib ipv4 fib policy map1
  ```
**show arp**

The `show arp` command displays all ARP tables. This command differs from the `show ip arp` command in that it shows MAC bindings for all protocols, whereas `show ip arp` only displays MAC address – IP address bindings. Addresses are displayed as their host name by including the `resolve` argument.

**Command Mode**

EXEC

**Command Syntax**

```
show arp [VRF_INST] [FORMAT] [HOST_ADDR] [HOST_NAME] [INTF] [MAC_ADDR] [DATA]
```

**Parameters**

The `VRF_INST` and `FORMAT` parameters are always listed first and second. The `DATA` parameter is always listed last. All other parameters can be placed in any order.

- **VRF_INST** specifies the VRF instance for which data is displayed.
  - `<no parameter>` context-active VRF.
  - `vrf vrf_name` specifies name of VRF instance. System default VRF is specified by `default`.
- **FORMAT** Display format of host address. Options include:
  - `<no parameter>` entries associate hardware address with an IPv4 address.
  - `resolve` entry associate hardware address with a host name (if it exists).
- **HOST_ADDR** IPv4 address by which routing table entries are filtered. Options include:
  - `<no parameter>` routing table entries are not filtered by host address.
  - `ipv4_addr` table entries matching specified IPv4 address.
- **HOST_NAME** Host name by which routing table entries are filtered. Options include:
  - `<no parameter>` routing table entries are not filtered by host name.
  - `host hostname` entries matching `hostname` (text).
- **INTF** interfaces for which command displays status.
  - `<no parameter>` Routing table entries are not filtered by interface.
  - `interface ethernet e_num` Routed Ethernet interface specified by `e_num`.
  - `interface loopback l_num` Routed loopback interface specified by `l_num`.
  - `interface management m_num` Routed management interface specified by `m_num`.
  - `interface port-channel p_num` Routed port channel Interface specified by `p_num`.
  - `interface vlan v_num` VLAN interface specified by `v_num`.
  - `interface vxlan vx_num` VXLAN interface specified by `vx_num`.
- **MAC_ADDR** MAC address by which routing table entries are filtered. Options include:
  - `<no parameter>` Routing table entries are not filtered by interface MAC address.
  - `mac_address mac_address` entries matching `mac_address` (dotted hex notation – H.H.H).
- **DATA** Detail of information provided by command. Options include:
  - `<no parameter>` Routing table entries.
  - `summary` Summary of ARP table entries.
  - `summary total` Number of ARP table entries.

**Related Commands**

- `cli vrf` specifies the context-active VRF.
Example

- This command displays the ARP table.

switch> `show arp`

<table>
<thead>
<tr>
<th>Address</th>
<th>Age (min)</th>
<th>Hardware Addr</th>
<th>Interface</th>
</tr>
</thead>
<tbody>
<tr>
<td>172.22.30.1</td>
<td>0</td>
<td>001c.730b.1d15</td>
<td>Management1</td>
</tr>
<tr>
<td>172.22.30.133</td>
<td>0</td>
<td>001c.7304.3906</td>
<td>Management1</td>
</tr>
</tbody>
</table>

switch>
**show ip**

The *show ip* command displays IPv4 routing, IPv6 routing, IPv4 multicast routing, and VRRP status on the switch.

**Command Mode**

EXEC

**Command Syntax**

`show ip`

**Example**

- This command displays IPv4 routing status.

```
switch>show ip
IP Routing : Enabled
IP Multicast Routing : Disabled
VRRP: Configured on 0 interfaces

IPv6 Unicast Routing : Enabled
IPv6 ECMP Route support : False
IPv6 ECMP Route nexthop index: 5
IPv6 ECMP Route num prefix bits for nexthop index: 10

switch>
```
show ip arp

The `show ip arp` command displays ARP cache entries that map an IPv4 address to a corresponding MAC address. The table displays addresses by their host names when the command includes the `resolve` argument.

Command Mode
EXEC

Command Syntax
`show ip arp [VRF_INST] [FORMAT] [HOST_ADD] [HOST_NAME] [INTF] [MAC_ADDR] [DATA]`

Parameters
The `VRF_INST` and `FORMAT` parameters are always listed first and second. The `DATA` parameter is always listed last. All other parameters can be placed in any order.

- **VRF_INST** specifies the VRF instance for which data is displayed.
  - <no parameter> context-active VRF.
  - vrf `vrf_name` specifies name of VRF instance. System default VRF is specified by `default`.
- **FORMAT** Display format of host address. Options include:
  - <no parameter> entries associate hardware address with an IPv4 address.
  - resolve entry associate hardware address with a host name (if it exists).
- **HOST_ADDR** IPv4 address by which routing table entries are filtered. Options include:
  - <no parameter> routing table entries are not filtered by host address.
  - ipv4_addr table entries matching specified IPv4 address.
- **HOST_NAME** Host name by which routing table entries are filtered. Options include:
  - <no parameter> routing table entries are not filtered by host name.
  - host `hostname` entries matching `hostname` (text).
- **INTERFACE_NAME** interfaces for which command displays status.
  - <no parameter> Routing table entries are not filtered by interface.
  - interface ethernet `e_num` Routed Ethernet interface specified by `e_num`.
  - interface loopback `l_num` Routed loopback interface specified by `l_num`.
  - interface management `m_num` Routed management interface specified by `m_num`.
  - interface port-channel `p_num` Routed port channel Interface specified by `p_num`.
  - interface vlan `v_num` VLAN interface specified by `v_num`.
  - interface vxlan `vx_num` VXLAN interface specified by `vx_num`.
- **MAC_ADDR** MAC address by which routing table entries are filtered. Options include:
  - <no parameter> Routing table entries are not filtered by interface MAC address.
  - mac_address entries matching `mac_address` (dotted hex notation – H.H.H).
- **DATA** Detail of information provided by command. Options include:
  - <no parameter> Routing table entries.
  - summary Summary of ARP table entries.
  - summary total Number of ARP table entries.

Related Commands
- cli vrf specifies the context-active VRF.
Examples

- This command displays ARP cache entries that map MAC addresses to IPv4 addresses.

```bash
switch>show ip arp
Address     Age (min)  Hardware Addr  Interface
172.25.0.2   0 004c.6211.021e  Vlan101, Port-Channel2
172.22.0.1   0 004c.6214.3699  Vlan1000, Port-Channel1
172.22.0.2   0 004c.6219.a0f3  Vlan1000, Port-Channel1
172.22.0.3   0 0045.4942.a32c  Vlan1000, Ethernet33
172.22.0.5   0 f012.3118.c09d  Vlan1000, Port-Channel1
172.22.0.6   0 00e1.d11a.a1eb  Vlan1000, Ethernet5

172.22.0.11  0 0056.cbe9.8510  Vlan1000, Ethernet26
```

show ip arp inspection vlan

The show ip arp inspection vlan command displays the configuration and operation state of ARP inspection. For a VLAN range specified, only VLANs with ARP inspection enabled will be displayed. If no VLAN is specified, all VLANs with ARP inspection enabled are displayed. The operation state turns to Active when hardware is ready to trap ARP packets for inspection.

Command Mode
EXEC

Command Syntax
   show ip arp inspection vlan [LIST]

Parameters
   • LIST specifies the VLAN interface number.

Related Commands
   • ip arp inspection limit
   • ip arp inspection trust
   • show ip arp inspection statistics

Example
   • This command displays the configuration and operation state of ARP inspection for VLANs 1 through 150.

   switch(config)#show ip arp inspection vlan 1 - 150
   VLAN 1
   ----------
   Configuration : Enabled
   Operation State : Active
   VLAN 2
   ----------
   Configuration : Enabled
   Operation State : Active
   {...}
   VLAN 150
   ----------
   Configuration : Enabled
   Operation State : Active

   switch(config)#
**show ip arp inspection statistics**

The `show ip arp inspection statistics` command displays the statistics of inspected ARP packets. For a VLAN specified, only VLANs with ARP inspection enabled will be displayed. If no VLAN is specified, all VLANs with ARP inspection enabled are displayed.

**Command Mode**

EXEC

**Command Syntax**

```
show ip arp inspection statistics [vlan [VID] | [INTERFACE] interface <intf_slot/intf_port>]
```

**Parameters**

- **VID** specifies the VLAN interface ID.
- **INTERFACE** specifies the interface (e.g., Ethernet).
  - `<intf_slot>` interface slot.
  - `<intf_port>` interface port.
- **INTF** specifies the VLAN interface slot and port.

**Related Commands**

- `ip arp inspection limit`
- `ip arp inspection trust`
- `show ip arp inspection vlan`

**Examples**

- This command display statistics of inspected ARP packets for VLAN 10.

```
switch(config)#show ip arp inspection statistics vlan 10
Vlan : 10
--------
ARP
Req Forwarded = 20
ARP Res Forwarded = 20
ARP Req Dropped = 1
ARP Res Dropped = 1
Last invalid ARP:
  Time: 10:20:30 ( 5 minutes ago )
  Reason: Bad IP/Mac match
  Received on: Ethernet 3/1
  Packet:
    Source MAC: 00:01:00:01:00:01
    Dest MAC: 00:02:00:02:00:02
    ARP Type: Request
    ARP Sender MAC: 00:01:00:01:00:01
    ARP Sender IP: 1.1.1
```

```
switch(config)#
```
• This command displays ARP inspection statistics for Ethernet interface 3/1.

```bash
switch(config)# show ip arp inspection statistics ethernet interface 3/1

Interface : 3/1
--------
ARP Req Forwarded = 10
ARP Res Forwarded = 10
ARP Req Dropped = 1
ARP Res Dropped = 1

Last invalid ARP:
Time: 10:20:30 ( 5 minutes ago )
Reason: Bad IP/Mac match
Received on: VLAN 10
Packet:
    Source MAC: 00:01:00:01:00:01
    Dest MAC: 00:02:00:02:00:02
    ARP Type: Request
    ARP Sender MAC: 00:01:00:01:00:01
    ARP Sender IP: 1.1.1

switch(config)#
```
show ip dhcp relay

The show ip dhcp relay command displays the DHCP relay agent configuration status on the switch.

Command Mode

EXEC

Command Syntax

show ip dhcp relay

Example

• This command displays the DHCP relay agent configuration status.

  switch>show ip dhcp relay
  DHCP Relay is active
  DHCP Relay Option 82 is disabled
  DHCP Smart Relay is enabled
  Interface: Vlan100
    DHCP Smart Relay is disabled
    DHCP servers: 10.4.4.4
  switch>
show ip dhcp relay counters

The **show ip dhcp relay counters** command displays the number of DHCP packets received, forwarded, or dropped on the switch and on all interfaces enabled as DHCP relay agents.

**Command Mode**

EXEC

**Command Syntax**

`show ip dhcp relay counters`

**Example**

- This command displays the IP DHCP relay counter table.

```
switch>show ip dhcp relay counters

<table>
<thead>
<tr>
<th>Dhcp Packets</th>
<th></th>
<th>Last Cleared</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Rcvd Fwdd Drop</td>
<td></td>

<td>4 days, 19:55:12 ago</td>
</tr>
<tr>
<td>All Resp</td>
<td>277 277 0</td>
<td></td>
</tr>
<tr>
<td>Vlan1000</td>
<td>0 0 0</td>
<td>4 days, 19:54:24 ago</td>
</tr>
<tr>
<td>Vlan1036</td>
<td>376 277 0</td>
<td>4 days, 19:54:24 ago</td>
</tr>
</tbody>
</table>

switch>
```
**show ip dhcp snooping**

The *show ip dhcp snooping* command displays the DHCP snooping configuration.

**Command Mode**

EXEC

**Command Syntax**

```plaintext
show ip dhcp snooping
```

**Related Commands**

- `ip dhcp snooping` globally enables DHCP snooping.
- `ip dhcp snooping vlan` enables DHCP snooping on specified VLANs.
- `ip dhcp snooping information option` enables insertion of option-82 snooping data.
- `ip helper-address` enables the DHCP relay agent on a configuration mode interface.

**Example**

- This command displays the switch's DHCP snooping configuration.

```plaintext
switch>show ip dhcp snooping
DHCP Snooping is enabled
DHCP Snooping is operational
DHCP Snooping is configured on following VLANs:
  100
DHCP Snooping is operational on following VLANs:
  100
Insertion of Option-82 is enabled
  Circuit-id format: Interface name:Vlan ID
  Remote-id: 00:1c:73:1f:b4:38 (Switch MAC)
```

switch>
show ip dhcp snooping counters

The show ip dhcp snooping counters command displays counters that track the quantity of DHCP request and reply packets that the switch receives. Data is either presented for each VLAN or aggregated for all VLANs with counters for packets dropped.

Command Mode
EXEC

Command Syntax
show ip dhcp snooping counters [COUNTER_TYPE]

Parameters

- COUNTER_TYPE The type of counter that the command resets. Formats include:
  - <no parameter> command displays counters for each VLAN.
  - debug command displays aggregate counters and drop cause counters.

Example

- This command displays the number of DHCP packets sent and received on each VLAN.

```
switch>show ip dhcp snooping counters

<table>
<thead>
<tr>
<th>Dhcp Request Pkts</th>
<th>Dhcp Reply Pkts</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vlan</td>
<td>Rcvd Fwdd Drop</td>
</tr>
<tr>
<td>------</td>
<td>--------</td>
</tr>
<tr>
<td>100</td>
<td>0</td>
</tr>
</tbody>
</table>

switch>
```

- This command displays the number of DHCP packets sent on the switch.

```
switch>show ip dhcp snooping counters debug

Counter Snooping to Relay Relay to Snooping
----------------------------- ----------------- -----------------
Received                     0                 0
Forwarded                    0                 0
Dropped - Invalid VlanId     0                 0
Dropped - Parse error        0                 0
Dropped - Invalid Dhcp Optype 0                 0
Dropped - Invalid Info Option 0                 0
Dropped - Snooping disabled  0                 0

Last Cleared:  3:37:18 ago
switch>
```
show ip dhcp snooping hardware

The `show ip dhcp snooping hardware` command displays internal hardware DHCP snooping status on the switch.

**Command Mode**

EXEC

**Command Syntax**

`show ip dhcp snooping hardware`

**Example**

- This command DHCP snooping hardware status.

```
switch>show ip dhcp snooping hardware
DHCP Snooping is enabled
DHCP Snooping is enabled on following VLANs:
    None
    Vlans enabled per Slice
        Slice:  FixedSystem
            None
```

switch>
show ip interface

The **show ip interface** command displays the status of specified interfaces that are configured as routed ports. The command provides the following information:

- Interface description
- Internet address
- Broadcast address
- Address configuration method
- Proxy-ARP status
- MTU size

**Command Mode**

EXEC

**Command Syntax**

```
show ip interface [INTERFACE_NAME] [VRF_INST]
```

**Parameters**

- **INTERFACE_NAME**  
  interfaces for which command displays status.
  - <no parameter>  all routed interfaces.
  - ipv4_addr  Neighbor IPv4 address.
  - ethernet e_range  Routed Ethernet interfaces specified by e_range.
  - loopback l_range  Routed loopback interfaces specified by l_range.
  - management m_range  Routed management interfaces specified by m_range.
  - port-channel p_range  Routed port channel Interfaces specified by p_range.
  - vlan v_range  VLAN interfaces specified by v_range.
  - vxlan vx_range  VXLAN interfaces specified by vx_range.

- **VRF_INST**  
  specifies the VRF instance for which data is displayed.
  - <no parameter>  context-active VRF.
  - vrf vrf_name  specifies name of VRF instance. System default VRF is specified by default.

**Example**

- This command displays IP status of configured VLAN interfaces numbered between 900 and 910.

```
switch>show ip interface vlan 900-910
! Some interfaces do not exist
Vlan901 is up, line protocol is up (connected)
  Description: ar.pqt.mlag.peer
  Internet address is 170.23.254.1/30
  Broadcast address is 255.255.255.255
  Address determined by manual configuration
  Proxy-ARP is disabled
  MTU 9212 bytes
Vlan903 is up, line protocol is up (connected)
  Description: ar.pqt.rn.170.23.254.16/29
  Internet address is 170.23.254.19/29
  Broadcast address is 255.255.255.255
  Address determined by manual configuration
  Proxy-ARP is disabled
  MTU 9212 bytes
```
• This command displays the configured TCP maximum segment size (MSS) ceiling value of 1436 bytes for an Ethernet interface 25.

    switch>show ip interface ethernet 25
    Ethernet25 is up, line protocol is up (connected)
    Internet address is 10.1.1.1/24
    Broadcast address is 255.255.255.255
    IPv6 Interface Forwarding: None
    Proxy-ARP is disabled
    Local Proxy-ARP is disabled
    Gratuitous ARP is ignored
    IP MTU 1500 bytes
    IPv4 TCP MSS egress ceiling is 1436 bytes
**show ip interface brief**

Use the `show ip interface brief` command output to display the status summary of the specified interfaces that are configured as routed ports. The command provides the following information for each specified interface:

- IP address
- Operational status
- Line protocol status
- MTU size

**Command Mode**

EXEC

**Command Syntax**

```
show ip interface [INTERFACE_NAME][VRF_INST] brief
```

**Parameters**

- `INTERFACE_NAME` interfaces for which command displays status.
  - `<no parameter>` all routed interfaces.
  - `ipv4_addr` Neighbor IPv4 address.
  - `ethernet e_range` Routed Ethernet interfaces specified by `e_range`.
  - `loopback l_range` Routed loopback interfaces specified by `l_range`.
  - `management m_range` Routed management interfaces specified by `m_range`.
  - `port-channel p_range` Routed port channel interfaces specified by `p_range`.
  - `vlan v_range` VLAN interfaces specified by `v_range`.
  - `vxlan vx_range` VXLAN interface range specified by `vx_range`.
- `VRF_INST` specifies the VRF instance for which data is displayed.
  - `<no parameter>` context-active VRF.
  - `vrf vrf_name` specifies name of VRF instance. System default VRF is specified by `default`.

**Example**

- This command displays the summary status of VLAN interfaces 900-910

```
switch>show ip interface vlan 900-910 brief
! Some interfaces do not exist
    Interface       IP Address     Status  Protocol     MTU
  Vlan901          170.33.254.1/30  up     up          9212
  Vlan902          170.33.254.14/29 up     up          9212
  Vlan905          170.33.254.17/29  up     up          1500
  Vlan907          170.33.254.67/29  up     up          9212
  Vlan910          170.33.254.30/30  up     up          9212
```
**show ip nat access-list interface**

The `show ip nat acl interface` command displays the access control lists (ACLs) that are configured as source NAT or destination NAT filters. The display indicates ACL rules that do not comply with these NAT requirements:

- Source IP address is **any**.
- Destination IP address may use any mask size.
- Source port matching is not allowed.
- Protocol matching is not allowed.

**Command Mode**

EXEC

**Command Syntax**

```
show ip nat access-list [INTF] [LISTS]
```

**Parameters**

- **INTF** Filters NAT statements by interface. Options include:
  - `<no parameter>` includes all statements on all interfaces.
  - `interface ethernet e_num` Statements on specified Ethernet interface.
  - `interface loopback l_num` Statements on specified Loopback interface.
  - `interface management m_num` Statements on specified Management interface.
  - `interface port-channel p_num` Statements on specified Port-Channel Interface.
  - `interface vlan v_num` Statements on specified VLAN interface.
  - `interface vxlan vx_num` Statements on specified VXLAN interface.

- **LISTS** ACLs displayed by command. Options include:
  - `<no parameter>` all ACLs.
  - `acl_name` Specifies individual ACL.

**Example**

- These commands display the NAT command usage of the ACL1 and ACL2 access control lists.

  ```
  switch> show ip nat acl ACL1
  acl ACL1
  (0.0.0.0/0, 168.10.1.1/32)
  Interfaces using this ACL for Nat:
  Vlan100
  
  switch> show ip nat acl ACL2
  acl ACL2
  (168.10.1.1/32, 0.0.0.0/0)
  Interfaces using this ACL for Nat:
  Vlan201
  switch>
  ```
show ip nat pool

The `show ip nat pool` command displays the configuration of the address pool.

**Command Mode**

EXEC

**Command Syntax**

```
show ip nat pool POOL_SET
```

**Parameters**

- `pool_name` The name of the pool.
- `POOL_SET` Options include:
  - `<no parameter>` all configured port channels.
  - `pool_name` The name of the pool.

**Example**

- This command displays all the address pools configured on the switch.

  ```
  switch# show ip nat pool
  Pool     StartIp   EndIp     Prefix
  p1       10.15.15.15 10.15.15.25 24
  p2       10.10.15.15 10.10.15.25 22
  p3       10.12.15.15 10.12.15.25 12
  switch#
  ```

- These commands display specific information for the address pools configured on the switch.

  ```
  switch# show ip nat pool p1
  Pool     StartIp   EndIp     Prefix
  p1       4.1.1.1   4.1.1.2   24
  p1       1.1.1.1   1.1.1.2   24
  p1       3.1.1.1   3.1.1.2   24
  switch# show ip nat pool p2
  Pool     StartIp   EndIp     Prefix
  p2       10.1.1.1  10.1.1.2   16
  switch#
  ```
show ip nat translation

The `show ip nat translation` command displays configured NAT statements in the switch hardware.

**Command Mode**
EXEC

**Command Syntax**
```
show ip nat translation [address | address-only | destination | detail | dynamic | hardware | interface | kernel | max-entries | source | static | summary | twice]
```
Command position of all parameters are interchangeable.

**Parameters**
- `<no parameter>` displays all NAT connections installed in software.
- `address ipv4_addr` displays NAT connections of the specified IPv4 host address.
- `address-only ipv4_addr` displays address-only NAT connections of the specified IPv4 host address.
- `destination` displays destination NAT connections installed in software.
- `detail` displays detailed output of all NAT connections.
- `dynamic` displays dynamic NAT connections.
- `hardware` displays NAT connections installed in hardware.
- `interface` Filters NAT connections by interface. Options include:
  - `interface ethernet e_num` displays NAT connections of the specified ethernet interface.
  - `interface port-channel p_num` displays NAT connections of the specified port-channel interface.
  - `interface vlan v_num` displays NAT connections of the specified VLAN interface.
- `kernel` displays NAT connections installed in kernel.
- `max-entries` displays the configured NAT connection limits of a hardware.
- `source` displays source NAT connections installed in software.
- `static` displays static NAT connections.
- `summary` displays summary of all NAT connections.
- `twice` displays twice NAT connections.

**Example**
- This command displays all configured NAT translations.
  ```
  switch>show ip nat translation
  Source IP            Destination IP        Translated IP         TGT Type Intf
  -------------------------------------------------------------------------------
  192.152.1.10:20342   172.22.22.40:80       172.17.254.161:22222  SRC STAT Vl3945
  switch#
  ```
- This command displays NAT connections of the specified ethernet interface.
  ```
  switch>show ip nat translation dynamic interface Ethernet 26
  Source IP            Destination IP        Translated IP         TGT Type Intf
  ---------------------------------------------------------------------------------
  - 192.168.1.2:8080      10.1.1.5:600       20.1.1.5:8080          SRC DYN Et26
  ```
This command displays the configured NAT connection limits of a hardware.

```
switch>show ip nat translation max-entries
Global connection limit                         100
Global connection limit low mark               90 (90%)
Hosts connection limit                         20
Hosts connection limit low mark                18 (90%)
Total number of connections                    1
Host                  Max-Entries           Low-Mark              Connections
-------------------------------------------------------------------------------
---------------------
10.1.1.1              10                    9 (90%)                0
```
show ip nat synchronization peer

The show ip nat synchronization peer command displays the detailed status of a peer device.

**Command Mode**

EXEC

**Command Syntax**

```
show ip nat synchronization peer
```

**Example**

- This command displays details of a peer device with an IP address of 11.11.11.0 and interface Vlan1111 that is used to connect to the peer device.

  ```
  switch#show ip nat synchronization peer
  Description : Value
  Peer : 11.11.11.0
  Connection Port : 4532
  Connection Source : 0.0.0.0
  Kernel Interface : vlan1111
  Local Interface : Vlan1111
  Established Time : 1969-12-31 16:00:00
  Connection Attempts : 0
  Oldest Supported Version : 1
  Newest Supported Version : 1
  Version Compatible : True
  Connection State : connected
  Shutdown State : False
  Status Mount State : mountMounted
  Version Mount State : mountMounted
  Recover Mount State : mountMounted
  Reboot Mount State : mountMounted
  ```
show ip nat synchronization advertised-translations

The `show ip nat synchronization advertised-translations` command displays the detailed status of devices that are advertised to a peer device.

**Command Mode**

EXEC

**Command Syntax**

`show ip nat synchronization advertised-translations`

**Example**

- This command displays details of devices that are advertised to a peer device.

```
switch#show ip nat synchronization advertised-translations
Source IP    Destination IP     Translated IP              TGT  Type Intf
-------------------------------------------------------------------------------
61.0.0.15:6661    100.0.0.2:80     192.170.230.171:6661    SRC  DYN  Et5
61.0.0.41:2245    100.0.0.2:80     192.170.230.170:2245    SRC  DYN  Et5
61.0.0.48:22626   100.0.0.2:80     192.170.230.169:22626   SRC  DYN  Et5
61.0.0.41:22601   100.0.0.2:80     192.170.230.170:22601   SRC  DYN  Et5
61.0.0.41:16798   100.0.0.2:80     192.170.230.170:16798   SRC  DYN  Et5

```
show ip nat synchronization discovered-translations

The `show ip nat synchronization discovered-translations` command displays details of what has been advertised from a peer device.

**Command Mode**

EXEC

**Command Syntax**

`show ip nat synchronization discovered-translations`

**Example**

- This command displays details of devices that are advertised to a peer device.

```
switch#show ip nat synchronization discovered-translations
Source IP     Destination IP    Translated IP            TGT  Type Intf
--------------------------------------------------------------------------------
61.0.2.229:63  100.0.0.2:63     170.24.86.180:63        SRC  DYN  Et5

61.0.6.68:63   100.0.0.2:63     170.24.110.128:63       SRC  DYN  Et5
61.0.7.163:63  100.0.0.2:63     170.24.104.35:63        SRC  DYN  Et5
```
**show ip route**

The `show ip route` command displays routing table entries that are in the Forwarding Information Base (FIB), including static routes, routes to directly connected networks, and dynamically learned routes. Multiple equal-cost paths to the same prefix are displayed contiguously as a block, with the destination prefix displayed only on the first line.

The `show running-config` command displays configured commands not in the FIB.

**Command Mode**

EXEC

**Command Syntax**

```
show ip route [VRF_INSTANCE] [ADDRESS] [ROUTE_TYPE] [INFO_LEVEL] [PREFIX]
```

**Parameters**

The `VRF_INSTANCE` and `ADDRESS` parameters are always listed first and second, respectively. All other parameters can be placed in any order.

- **VRF_INSTANCE** specifies the VRF instance for which data is displayed.
  - `<no parameter>` context-active VRF.
  - `vrf vrf_name` specifies name of VRF instance. System default VRF is specified by `default`.
- **ADDRESS** filters routes by IPv4 address or subnet.
  - `<no parameter>` all routing table entries.
  - `ipv4_addr` routing table entries matching specified address.
  - `ipv4_subnet` routing table entries matching specified subnet (CIDR or address-mask).
- **ROUTE_TYPE** filters routes by specified protocol or origin. Options include:
  - `<no parameter>` all routing table entries.
  - `aggregate` entries for BGP aggregate routes.
  - `bgp` entries added through BGP protocol.
  - `connected` entries for routes to networks directly connected to the switch.
  - `isis` entries added through ISIS protocol.
  - `kernel` entries appearing in Linux kernel but not added by EOS software.
  - `ospf` entries added through OSPF protocol.
  - `rip` entries added through RIP protocol.
  - `static` entries added through CLI commands.
  - `vrf` displays routes in a VRF.
- **INFO_LEVEL** filters entries by next hop connection. Options include:
  - `<no parameter>` filters routes whose next hops are directly connected.
  - `detail` displays all routes.
- **PREFIX** filters routes by prefix.
  - `<no parameter>` specific route entry that matches the ADDRESS parameter.
  - `longer-prefixes` all subnet route entries in range specified by ADDRESS parameter.

**Related Commands**

- `cli vrf` specifies the context-active VRF.
Example

- This command displays IPv4 routes learned through BGP.

  ```
  switch>show ip route bgp
  Codes: C - connected, S - static, K - kernel,
         O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,

- This command displays the leaked routes from a source VRF.

  ```
  switch#show ip route vrf VRF2 20.0.0.0/8
  ```

  ```
  S L      20.0.0.0/8 [1/0] (source VRF VRF1) via 10.1.2.10, Ethernet1
  ```
**show ip route age**

The **show ip route age** command displays the time when the route for the specified network was present in the routing table. It does not account for the changes in parameters like metric, next-hop etc.

**Command Mode**

`EXEC`

**Command Syntax**

`show ip route ADDRESS age`

**Parameters**

- **ADDRESS**: Filters routes by IPv4 address or subnet.
  - `ipv4_addr`: routing table entries matching specified address.
  - `ipv4_subnet`: routing table entries matching specified subnet (CIDR or address-mask).

**Example**

- This command shows the amount of time since the last update to ip route 172.17.0.0/20.

```
switch> show ip route 172.17.0.0/20 age
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, I - ISIS, A - Aggregate

B E  172.17.0.0/20 via 172.25.0.1, age 3d01h
```

switch>
show ip route gateway

The show ip route gateway command displays IP addresses of all gateways (next hops) used by active routes.

Command Mode

EXEC

Command Syntax

show ip route [VRF_INSTANCE] gateway

Parameters

- **VRF_INSTANCE** specifies the VRF instance for which data is displayed.
  - <no parameter> context-active VRF.
  - vrf vrf_name specifies name of VRF instance. System default VRF is specified by default.

Related Commands

- cli vrf specifies the context-active VRF.

Example

- This command displays next hops used by active routes.

```
switch>show ip route gateway
The following gateways are in use:
  172.25.0.1 Vlan101
  172.17.253.2 Vlan3000
  172.17.254.2 Vlan3901
  172.17.254.11 Vlan3902
  172.17.254.13 Vlan3902
  172.17.254.17 Vlan3903
  172.17.254.20 Vlan3903
  172.17.254.66 Vlan3908
  172.17.254.67 Vlan3908
  172.17.254.68 Vlan3908

  172.17.254.98 Vlan3992
  172.17.254.99 Vlan3992
switch>
```
show ip route host

The `show ip route host` command displays all host routes in the host forwarding table. Host routes are those whose destination prefix is the entire address (mask = 255.255.255.255 or prefix = /32). Each entry includes a code of the route’s purpose:

- **F** static routes from the FIB.
- **R** routes defined because the IP address is an interface address.
- **B** broadcast address.
- **A** routes to any neighboring host for which the switch has an ARP entry.

**Command Mode**

EXEC

**Command Syntax**

```
show ip route [VRF_INSTANCE] host
```

**Parameters**

- **VRF_INSTANCE** specifies the VRF instance for which data is displayed.
  - `<no parameter>` context-active VRF.
  - `vrf vrf_name` specifies name of VRF instance. System default VRF is specified by `default`.

**Related Commands**

- `cli vrf` specifies the context-active VRF.

**Example**

This command displays all host routes in the host forwarding table.

```
switch>show ip route host
R - receive B - broadcast F - FIB, A - attached

F   127.0.0.1 to cpu
B   172.17.252.0 to cpu
A   172.17.253.2 on Vlan2000
R   172.17.253.3 to cpu
A   172.17.253.10 on Vlan2000
B   172.17.253.255 to cpu
B   172.17.254.0 to cpu
R   172.17.254.1 to cpu
B   172.17.254.3 to cpu
B   172.17.254.8 to cpu
A   172.17.254.11 on Vlan2902
R   172.17.254.12 to cpu

F   172.26.0.28 via 172.17.254.20 on Vlan3003
    via 172.17.254.67 on Vlan3008
    via 172.17.254.98 on Vlan3492
    via 172.17.254.2 on Vlan3601
    via 172.17.254.13 on Vlan3602
    via 172.17.253.2 on Vlan3000
F   172.26.0.29 via 172.25.0.1 on Vlan101
F   172.26.0.30 via 172.17.254.29 on Vlan3910
F   172.26.0.32 via 172.17.254.105 on Vlan3912
switch>
```
**show ip route match tag**

The `show ip route match tag` command displays the route tag assigned to the specified IPv4 address or subnet. Route tags are added to static routes for use by route maps.

**Command Mode**

EXEC

**Command Syntax**

```
show ip route [VRF_INSTANCE] ADDRESS match tag
```

**Parameters**

- **VRF_INSTANCE** specifies the VRF instance for which data is displayed.
- `<no parameter>` context-active VRF.
- **vrf vrf_name** specifies name of VRF instance. System default VRF is specified by `default`.
- **ADDRESS** displays routes of specified IPv4 address or subnet.
  - **ipv4_addr** routing table entries matching specified IPv4 address.
  - **ipv4_subnet** routing table entries matching specified IPv4 subnet (CIDR or address-mask).

**Example**

- This command displays the route tag for the specified subnet.

  ```
  switch> show ip route 172.17.50.0/23 match tag
  Codes:  C - connected, S - static, K - kernel,
          O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
          E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
          N2 - OSPF NSSA external type 2, B I - iBGP, B E - eBGP,
          R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
          O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
          NG - Nexthop Group Static Route, V - VXLAN Control Service,
          DH - DHCP client installed default route, M - Martian
  O E2   172.17.50.0/23 tag 0
  
  switch>
  ```
show ip route summary

The show ip route summary command displays the number of routes, categorized by destination prefix, in the routing table.

Command Mode

EXEC

Command Syntax

show ip route [VRF_INSTANCE] summary

Parameters

- **VRF_INSTANCE** specifies the VRF instance for which data is displayed.
  - <no parameter> context-active VRF.
  - vrf vrf_name specifies name of VRF instance. System default VRF is specified by default.

Example

- This command displays a summary of the routing table contents.

```
switch> show ip route summary
Route Source Number Of Routes
-------------------------------------
connected        15
static           0
ospf             74
    Intra-area: 32 Inter-area:33 External-1:0 External-2:9
    NSSA External-1:0 NSSA External-2:0
bgp              7
    External: 6 Internal: 1
internal         45
attached         18
aggregate        0
switch>
```
show ip verify source

The `show ip verify source` command displays the IP source guard (IPSG) configuration, operational states, and IP-MAC binding entries for the configuration mode interface.

**Command Mode**

EXEC

**Command Syntax**

```
show ip verify source [VLAN | DETAIL]
```

**Parameters**

- **VLAN** displays all VLANs configured in `no ip verify source vlan`.
- **DETAIL** displays all source IP-MAC binding entries configured for IPSG.

**Related Commands**

- `ip source binding`
- `ip verify source`

**Example**

This command verifies the IPSG configuration and operational states.

```
switch(config)#show ip verify source
Interface          Operational State
------------------ ------------------------
Ethernet1          IP source guard enabled
Ethernet2          IP source guard disabled
```

**Example**

This command displays all VLANs configured in `no ip verify source vlan`. Hardware programming errors, e.g., VLAN classification failed, are indicated in the operational state. If an error occurs, this VLAN will be considered as enabled for IPSG. Traffic on this VLAN will still be filtered by IPSG.

```
switch(config)#show ip verify source vlan
IPSG disabled on VLANS: 1-2
VLAN              Operational State
------------------ ------------------------
1                  IP source guard disabled
2                  Error: vlan classification failed
```

**Example**

This command displays all source IP-MAC binding entries configured for IPSG. A source binding entry is considered active if it is programmed in hardware. IP traffic matching any active binding entry will be permitted. If a source binding entry is configured on an interface or a VLAN whose operational state is IPSG disabled, this entry will not be installed in the hardware, in which case an “IP source guard disabled” state will be shown. If a port channel has no member port configured, binding entries configured for this port channel will not be installed in hardware, and a “Port-Channel down” state will be shown.

```
switch(config)#show ip verify source detail
Interface     IP Address     MAC Address     VLAN   State
-------------- --------------- --------------- ------ ------------------------
Ethernet1     10.1.1.1      0000.aaaa.1111   5      active
Ethernet1     10.1.1.5      0000.aaaa.5555   1      IP source guard disabled
Port-Channel1 20.1.1.1     0000.bbbb.1111   4      Port-Channel down
```
show platform arad ip route

The show platform arad ip route command shows resources for all IPv4 routes in hardware. Routes that use the additional hardware resources will appear with an asterisk.

Command Mode
EXEC

Command Syntax
show platform arad ip route

Example
- This command displays the platform unicast forwarding routes. In this example, the ACL label field in the following table is 4094 by default for all routes. If an IPv4 egress RACL is applied to an SVI, all routes corresponding to that VLAN will have an ACL label value. In this case, the ACL Label field value is 2.

```
switch# show platform arad ip route
Tunnel Type: M(mpls), G(gre)
```

```

switch(config)#
show platform arad ip route summary

The `show platform arad ip route summary` command shows hardware resource usage of IPv4 routes.

Command Mode

EXEC

Command Syntax

`show platform arad ip route summary`

Related Commands

- `agent SandL3Unicast terminate` enables restarting the layer 3 agent to ensure IPv4 routes are optimized.
- `ip hardware fib optimize` enables IPv4 route scale.
- `show platform arad ip route` shows resources for all IPv4 routes in hardware. Routes that use the additional hardware resources will appear with an asterisk.

Example

- This command shows hardware resource usage of IPv4 routes.

  ```
  switch(config)#show platform arad ip route summary
  Total number of VRFs: 1
  Total number of routes: 25
  Total number of route-paths: 21
  Total number of lem-routes: 4
  
  switch(config)#
  ```
show platform trident forwarding-table partition

The `show platform trident forwarding-table partition` command displays the size of the L2 MAC entry tables, L3 IP forwarding tables, and Longest Prefix Match (LPM) routes.

**Command Mode**

Privileged EXEC

**Command Syntax**

`show platform trident forwarding-table partition`

**Example**

- This command shows the Trident forwarding table information.

  ```
  switch(config)#show platform trident forwarding-table partition
  L2 Table Size: 96k
  L3 Host Table Size: 208k
  LPM Table Size: 16k
  switch(config)#
  ```
show rib route ip

The `show rib route ip` command displays a list of IPv4 Routing Information Base (RIB) routes.

**Command Mode**
EXEC

**Command Syntax**
```
show rib route ip [vrf vrf_name] [PREFIX] [ROUTE TYPE]
```

**Parameters**
- `vrf vrf_name` displays RIB routes from the specified VRF.
- **PREFIX** displays routes filtered by the specified IPv4 information. Options include:
  - `ip_address` displays RIB routes filtered by the specified IPv4 address.
  - `ip_subnet_mask` displays RIB routes filtered by the specified IPv4 address and subnet mask.
  - `ip_prefix` displays RIB routes filtered by the specified IPv4 prefix.
- **ROUTE TYPE** displays routes filtered by the specified route type. Options include:
  - `bgp` displays RIB routes filtered by BGP.
  - `connected` displays RIB routes filtered by connected routes.
  - `dynamicPolicy` displays RIB routes filtered by dynamic policy routes.
  - `host` displays RIB routes filtered by host routes.
  - `isis` displays RIB routes filtered by ISIS routes.
  - `ospf` displays RIB routes filtered by OSPF routes.
  - `ospf3` displays RIB routes filtered by OSPF3 routes.
  - `reserved` displays RIB routes filtered by reserved routes.
  - `route-input` displays RIB routes filtered by route-input routes.
  - `static` displays RIB routes filtered by static routes.
  - `vrf` displays routes in a VRF.
  - `vrf-leak` displays leaked routes in a VRF.

**Examples**
- This command displays IPv4 RIB static routes.
```
switch#show rib route ip static
VRF name: default, VRF ID: 0xFE, Protocol: static
Codes: C - Connected, S - Static, P - Route Input
       B - BGP, O - Ospf, O3 - Ospf3, I - Isis
       > - Best Route, * - Unresolved Nexthop
       L - Part of a recursive route resolution loop
>S  10.80.0.0/12 [1/0]
   via 172.30.149.129 [0/1]
   via Management1, directly connected
>S  172.16.0.0/12 [1/0]
   via 172.30.149.129 [0/1]
   via Management1, directly connected
switch#
```
• This command displays IPv4 RIB connected routes.

switch#show rib route ip connected
VRF name: default, VRF ID: 0xfe, Protocol: connected
Codes: C – Connected, S – Static, P – Route Input
B – BGP, O – Osfp, O3 – Osfp3, I – Isis
> – Best Route, * – Unresolved Nexthop
L – Part of a recursive route resolution loop
>C 10.1.0.0/24 [0/1]
   via 10.1.0.102, Ethernet1
>C 10.2.0.0/24 [0/1]
   via 10.2.0.102, Ethernet2
>C 10.3.0.0/24 [0/1]
   via 10.3.0.102, Ethernet3

switch#

• This command displays routes leaked through VRF leak agent.

switch#show rib route ip vrf VRF2 vrf-leak
VRF: VRF2, Protocol: vrf-leak
...
>VL 20.0.0.0/8 [1/0] source VRF: VRF1
   via 10.1.2.10 [0/0] type ipv4
   via 10.1.2.10, Ethernet1
show rib route <ipv4 | ipv6> fib policy excluded

The `show rib route <ipv4 | ipv6> fib policy excluded` command displays the RIB routes filtered by FIB policy. The `fib policy exclude` option displays the RIB routes that have been excluded from being programmed into FIB, by FIB policy.

**Command Mode**
EXEC

**Command Syntax**

```
show rib route <ipv4 | ipv6> fib policy excluded
```

**Example**

- The following example displays the RIB routes excluded by the FIB policy using the `fib policy excluded` option of the `show rib route <ipv4 | ipv6>` command.

```
Switch# show rib route ipv6 fib policy excluded
Switch# show rib route ip bgp fib policy excluded

VRF name: default, VRF ID: 0xfe, Protocol: bgp
Codes: C - Connected, S - Static, P - Route Input
       B - BGP, O - Ospf, O3 - Ospf3, I - Isis
       > - Best Route, * - Unresolved Nexthop
       L - Part of a recursive route resolution loop

>B 10.1.0.0/24 [200/0]
    via 10.2.2.1 [115/20] type tunnel
    via 10.3.5.1, Ethernet1
    via 10.2.0.1 [115/20] type tunnel
    via 10.3.4.1, Ethernet2
    via 10.3.6.1, Ethernet3

>B 10.1.0.0/24 [200/0]
    via 10.2.2.1 [115/20] type tunnel
    via 10.3.5.1, Ethernet1
    via 10.2.0.1 [115/20] type tunnel
    via 10.3.4.1, Ethernet2
    via 10.3.6.1, Ethernet3
```
show routing-context vrf

The `show routing-context vrf` command displays the context-active VRF. The context-active VRF determines the default VRF that VRF-context aware commands use when displaying routing table data from a specified VRF.

**Command Mode**
EXEC

**Command Syntax**
```
show routing-context vrf
```

**Related Commands**
- `cli vrf` specifies the context-active VRF.

**Example**
- This command displays the context-active VRF.
  
  `switch>show routing-context vrf`
  `Current VRF routing-context is PURPLE`
  `switch>`
**show vrf**

The *show vrf* command displays the VRF name, RD, supported protocols, state and included interfaces for the specified VRF or for all VRFs on the switch.

**Command Mode**

EXEC

**Command Syntax**

```
show vrf [VRF_INSTANCE]
```

**Parameters**

- **VRF_INSTANCE** specifies the VRF instance to display.
- `<no parameter>` information is displayed for all VRFs.
- **vrf vrf_name** information is displayed for the specified user-defined VRF.

**Example**

- This command displays information for the VRF named “purple.”

```
switch>show vrf purple
Vrf     RD             Protocols     State     Interfaces
---     --------        --------       ---------    ------------
purple  64496:237     ipv4         no routing  Vlan42, Vlan43

switch>
```
**tcp mss ceiling**

The **tcp mss ceiling** command configures the maximum segment size (MSS) limit in the TCP header on the configuration mode interface and enables TCP MSS clamping.

The **no tcp mss ceiling** and the **default tcp mss ceiling** commands remove any MSS ceiling limit previously configured on the interface.

**Caution**

Configuring a TCP MSS ceiling on any Ethernet or tunnel interface enables TCP MSS clamping on the switch as a whole. Without hardware support, clamping routes all TCP SYN packets through software, even on interfaces where no TCP MSS ceiling has been configured. This significantly limits the number of TCP sessions the switch can establish per second, and can potentially cause packet loss if the CPU traffic exceeds control plane policy limits.

**Command Mode**

- Interface-Ethernet Configuration
- Subinterface-Ethernet Configuration
- Interface-Port-channel Configuration
- Subinterface-Port-channel Configuration
- Interface-Tunnel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
tcp mss ceiling {ipv4 segment size | ipv6 segment size} {egress | ingress}
no tcp mss ceiling
default tcp mss ceiling
```

**Parameters**

- **ipv4 segment size**  The IPv4 segment size value in bytes. Values range from 64 to 65515.
- **ipv6 segment size**  The IPv6 segment size value in bytes. Values range from 64 to 65495. This option is not supported on Sand platform switches (Qumran-MX, Qumran-AX, Jericho, Jericho+).
- **egress**  The TCP SYN packets that are forwarded from the interface to the network.
- **ingress**  The TCP SYN packets that are received from the network to the interface. Not supported on Sand platform switches.

**Guidelines**

- On Sand platform switches (Qumran-MX, Qumran-AX, Jericho, Jericho+), this command works only for egress, and is supported only on IPv4 unicast packets entering the switch.
- Clamping can only be configured in one direction per interface and works only on egress on Sand platform switches.
- To configure ceilings for both IPv4 and IPv6 packets, both configurations must be included in a single command; re-issuing the command overwrites any previous settings.
- Clamping configuration has no effect on GRE transit packets.

**Example**

- These commands configure Ethernet interface 5 as a routed port, then specify a maximum MSS ceiling value of 1458 bytes in TCP SYN packets exiting that port. This enables TCP MSS clamping on the switch.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#no switchport
switch(config-if-Et5)#tcp mss ceiling ipv4 1458 egress
switch(config-if-Et5)#
```
vrf (Interface mode)

The `vrf` command adds the configuration mode interface to the specified VRF. You must create the VRF first, using the `vrf instance` command.

The `no vrf` and `default vrf` commands remove the configuration mode interface from the specified VRF by deleting the corresponding `vrf` command from `running-config`.

All forms of the `vrf` command remove all IP addresses associated with the configuration mode interface.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
  vrf vrf_name
  no vrf [vrf_name]
  default vrf [vrf_name]
```

**Parameters**

- `vrf_name` name of configured VRF.

**Examples**

- These commands add the configuration mode interface (VLAN 20) to the VRF named “purple”.
  ```
  switch(config)#interface vlan 20
  switch(config-if-Vl20)#vrf purple
  switch(config-if-Vl20)#
  ```

- These commands remove the configuration mode interface from VRF “purple”.
  ```
  switch(config)#interface vlan 20
  switch(config-if-Vl20)#no vrf purple
  switch(config-if-Vl20)#
  ```
**vrf instance**

The **vrf instance** command places the switch in VRF configuration mode for the specified VRF. If the named VRF does not exist, this command creates it. The number of user-defined VRFs supported varies by platform.

To add an interface to the VRF once it is created, use the **vrf (Interface mode)** command.

The **no vrf instance** and **default vrf instance** commands delete the specified VRF instance by removing the corresponding **vrf instance** command from **running-config**. This also removes all IP addresses associated with interfaces that belong to the deleted VRF.

The **exit** command returns the switch to global configuration mode.

**Command Mode**

Global Configuration

**Command Syntax**

```
vrf instance vrf_name
no vrf instance vrf_name
default vrf instance vrf_name
```

**Parameters**

- **vrf_name** Name of VRF being created, deleted or configured. The names “main” and “default” are reserved.

**Example**

- This command creates a VRF named “purple” and places the switch in VRF configuration mode for that VRF.

```
switch(config)#vrf instance purple
switch(config-vrf-purple)#
```
interface tunnel

The interface tunnel command places the switch in interface-tunnel configuration mode. Interface-tunnel configuration mode is not a group change mode; running-config is changed immediately after commands are executed.

The no interface tunnel command deletes the specified interface tunnel configuration.

The exit command returns the switch to the global configuration mode.

Command Mode
- Global Configuration

Command Syntax
- interface tunnel <number>
- no interface tunnel <number>

Parameter
- number Tunnel interface number. Values range from 0 to 255.

Example
- This command places the switch in interface-tunnel configuration mode for tunnel interface 10.
  
```plaintext
switch(config)#interface tunnel 10
switch(config-if-Tu10)#
```
tunnel

The `tunnel` command configures options for protocol-over-protocol tunneling. Because interface-tunnel configuration mode is not a group change mode, `running-config` is changed immediately after commands are executed. The `exit` command does not affect the configuration.

The `no tunnel` command deletes the specified tunnel configuration.

Command Mode

Interface-tunnel Configuration

Command Syntax

```markdown
<table>
<thead>
<tr>
<th>Command</th>
<th>Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tunnel</td>
<td><code>tunnel &lt;options&gt;</code></td>
</tr>
<tr>
<td>No Tunnel</td>
<td><code>no tunnel &lt;options&gt;</code></td>
</tr>
</tbody>
</table>
```

Parameters

- `options`: Specifies the various tunneling options as listed below.
  - `destination`: destination address of the tunnel.
  - `ipsec`: secures the tunnel with the IPsec address.
  - `key`: sets the tunnel key.
  - `mode`: tunnel encapsulation method.
  - `path-mtu-discovery`: enables the Path MTU discovery on tunnel.
  - `source`: source of the tunnel packets.
  - `tos`: sets the IP type of service value.
  - `ttl`: sets time to live value.
  - `underlay`: tunnel underlay.

Example

- These commands place the switch in interface-tunnel configuration mode for tunnel interface 10 and with GRE tunnel configured on the interfaces specified.

  ```bash
  switch(config)#ip routing
  switch(config)#interface Tunnel 10
  switch(config-if-Tu10)#tunnel mode gre
  switch(config-if-Tu10)#ip address 192.168.1.1/24
  switch(config-if-Tu10)#tunnel source 10.1.1.1
  switch(config-if-Tu10)#tunnel destination 10.1.1.2
  switch(config-if-Tu10)#tunnel path-mtu-discovery
  switch(config-if-Tu10)#tunnel tos 10
  switch(config-if-Tu10)#tunnel ttl 10
  ```
show interface tunnel

The `show interface tunnel` command displays the interface tunnel information.

**Command Mode**

EXEC

**Command Syntax**

`show interface tunnel <number>`

**Parameter**

- `number` Specifies the tunnel interface number.

**Example**

- This command displays tunnel interface configuration information for tunnel interface 10.

```
switch# show interface tunnel 10

Tunnel10 is up, line protocol is up (connected)
Hardware is Tunnel, address is 0a01.0101.0800
Internet address is 192.168.1.1/24
Broadcast address is 255.255.255.255
Tunnel source 10.1.1.1, destination 10.1.1.2
Tunnel protocol/transport GRE/IP
  Key disabled, sequencing disabled
  Checksumming of packets disabled
  Tunnel TTL 10, Hardware forwarding enabled
  Tunnel TOS 10
  Path MTU Discovery
  Tunnel transport MTU 1476 bytes
Up 3 seconds
```
show platform fap eedb ip-tunnel gre interface tunnel

The `show platform fap eedb ip-tunnel gre interface tunnel` command verifies the tunnel encapsulation programming for the tunnel interface.

**Command Mode**

EXEC

**Command Syntax**

`show platform fap eedb ip-tunnel gre interface tunnel <number>`

**Parameter**

- `number` Specifies the tunnel interface number.

**Examples**

- These commands verify the tunnel encapsulation programming for the tunnel interface 10.

  ```
  switch#show platform fap eedb ip-tunnel gre interface tunnel 10

show tunnel fib static interface gre

The `show tunnel fib static interface gre` command displays the forwarding information base (FIB) information for a static interface GRE tunnel.

**Command Mode**

EXEC

**Command Syntax**

```
show tunnel fib static interface gre <number>
```

**Parameter**

- `number` Specifies the tunnel index number.

**Example**

- This command display the interface tunnel configuration with GRE configured.

```
switch#show tunnel fib static interface gre 10

Type 'Static Interface', index 10, forwarding Primary
  via 10.6.1.2, 'Ethernet6/1'
    GRE, destination 10.1.1.2, source 10.1.1.1, ttl 10, tos 0xa
```
**show platform fap tcam summary**

The `show platform fap tcam summary` command displays information about the TCAM bank that is allocated for GRE packet termination lookup.

**Command Mode**

EXEC

**Command Syntax**

`show platform fap tcam summary`

**Example**

- This command verifies if the TCAM bank is allocated for GRE packet termination lookup.
  
  ```
  switch#show platform fap tcam summary
  
  Tcam Allocation (Jericho0)
  Bank  Used By     Reserved By
  -------  ------------  -----------
  0       dbGreTunnel  -
  ```
IPv6

Arista switches support Internet Protocol version 4 (IPv4) and Internet Protocol version 6 (IPv6) for routing packets across network boundaries. This chapter describes Arista’s implementation of IPv6 and includes these sections:

- Section 29.1: Introduction
- Section 29.2: IPv6 Description
- Section 29.3: Configuring IPv6
- Section 29.4: IPv6 Commands

29.1 Introduction

Routing transmits network layer data packets over connected independent subnets. Each subnet is assigned an IP address range and each device on the subnet is assigned an IP address from that range.

Connected subnets have IP address ranges that do not overlap. A router is a network device connecting multiple subnets. Routers forward inbound packets to the subnet whose address range includes the packets’ destination address.

IPv4 and IPv6 are Internet layer protocols that define packet-switched inter-networking, including source-to-destination datagram transmission across multiple networks. The switch supports IP Version 4 (IPv4) and IP Version 6 (IPv6).

29.2 IPv6 Description

Internet Protocol Version 6 is a communications protocol used for relaying network packets across a set of connected networks using the Internet Protocol suite. Each network device is assigned a 128 bit IP address that identifies its network location.

IPv6 specifies a packet format that minimizes router processing of packet headers. Since the IPv4 and IPv6 packet headers differ significantly, the protocols are not interoperable. Many transport and application-layer protocols require little or no change to operate over IPv6.

29.2.1 IPv6 Address Format

IPv6 addresses have 128 bits, represented by eight 16-bit hexadecimal numbers separated by colons. IPv6 addresses are abbreviated as follows:

- Leading zeros in each 16-bit number may be omitted.
- One set of consecutive 16-bit numbers that equal zero may be replaced by a double colon.

**Example**

- The following three IPv6 hexadecimal number representations refer to the same address:
  
  - d28e:0:0:0:234:812f:61ed:4419
  - d28e::234:812f:61ed:4419

IPv6 addresses typically denote a 64-bit network prefix and a 64-bit host address.

**Unicast and Anycast Addressing**

Unicast addressing defines a one-to-one association between the destination address and a network endpoint. Each destination address uniquely identifies a single receiver endpoint. Anycast addressing defines a one-to-one-of-many association: packets to a single member of a group of potential receivers identified by the same destination address.

Unicast and anycast addresses are typically composed as follows:

- a 64-bit network prefix that identifies the network segment.
- a 64-bit interface identifier that is based on interface MAC address.

The format of a network address identifies the scope of the address:

- **Global address**: valid in all networks and connect with other addresses with global scope anywhere or to addresses with link-local scope on the directly attached network.
- **Link-local address**: scope extends only to the link to which the interface is directly connected. Link-local addresses are not routable off the link.

Link-local addresses are created by the switch and are not configurable. Figure 29-1 depicts the switch’s link local address derivation method.

**Multicast Addressing**

Multicast addressing defines a one-to-many association: packets are simultaneously routed from a single sender to multiple endpoints in a single transmission. The network replicates packets as required by network links that contain a recipient endpoint. One multicast address is assigned to an interface for each multicast group to which the interface belongs.
A solicited-node multicast address is an IPv6 multicast address whose scope extends only to the link to which the interface is directly connected. All IPv6 hosts have at least one such address per interface. Solicited-node multicast addresses are used by the Neighbor Discovery Protocol to obtain layer 2 link-layer addresses of other nodes.

### 29.2.2 IPv6 DHCP Snooping

DHCP (Dynamic Host Configuration Protocol) snooping is a layer 2 feature that is configured on LAN switches. The Arista EOS switch supports Option-37 insertion that allows relay agents to provide remote-ID information in DHCP request packets. DHCP servers use this information to determine the originating port of DHCP requests and associate a corresponding IP address to that port. DHCP servers use port information to track host location and IP address usage by authorized physical ports.

DHCP snooping uses the information option (Option-37) to include the switch MAC address (router-ID) along with the physical interface name and VLAN number (remote-ID) in DHCP packets. After adding the information to the packet, the DHCP relay agent forwards the packet to the DHCP server as specified by the DHCP protocol.

**Platform Compatibility**

- DCS-7010
- DCS-7050
- DCS-7060
- DCS-7250
- DCS-7260
- DCS-7300

### 29.2.3 Neighbor Discovery Protocol

The Neighbor Discovery Protocol (RFC 4861) operates with IPv6 to facilitate the following tasks for nodes within a specified prefix space:

![Link Local Address Derivation](image)
- autoconfiguring a node's IPv6 address
- sensing other nodes on the link
- discovering the link-local addresses of other nodes on the link
- detecting duplicate addresses
- discovering available routers
- discovering DNS servers
- discovering the link's address prefix
- maintaining path reachability data to other active neighbor nodes

The Neighbor Discovery Protocol protocol defines five different ICMPv6 packet types:

- Router Solicitation
- Router Advertisement
- Neighbor Solicitation
- Neighbor Advertisement
- Redirect
29.3 Configuring IPv6

These sections describe IPv6 configuration tasks:

- Section 29.3.1: Configuring IPv6 on the Switch
- Section 29.3.2: Configuring IPv6 on an Interface
- Section 29.3.3: Configuring IPv6 DHCP Snooping
- Section 29.3.4: Viewing IPv6 Network Components
- Section 29.3.5: DHCP Relay Agent for IPv6

29.3.1 Configuring IPv6 on the Switch

29.3.1.1 Enabling IPv6 Unicast Routing on the Switch

The `ipv6 unicast-routing` command enables the forwarding of IPv6 unicast packets. When routing is enabled, the switch attempts to deliver inbound packets to destination addresses by forwarding them to interfaces or next hop addresses specified by the IPv6 routing table.

**Example**

- This command enables IPv6 unicast-routing.

```
switch(config)#ipv6 unicast-routing
switch(config)#
```

29.3.1.2 Configuring Default and Static IPv6 Routes

The `ipv6 route` command creates an IPv6 static route. The destination is an IPv6 prefix; the source is an IPv6 address or a routable interface port. When multiple routes exist to a destination prefix, the route with the lowest administrative distance takes precedence.

By default, the administrative distance assigned to static routes is 1. Assigning a higher administrative distance to a static route configures it to be overridden by dynamic routing data. For example, a static route with a distance value of 200 is overridden by OSPF intra-area routes, which have a default distance of 110.

**Example**

- This command creates an IPv6 static route.

```
switch(config)#ipv6 route 10:23:31:00:01:32:93/24 vlan 300
switch(config)#
```

The default route denotes the packet forwarding rule that takes effect when no other route is configured for a specified IPv6 address. All packets with destinations that are not established in the routing table are sent to the destination specified by the default route.

The IPv6 default route source is ::/0. The default route destination is referred to as the default gateway.

**Example**

- This command creates a default route and establishes fd7a:629f:52a4:fe61::2 as the default gateway address.

```
switch(config)#ipv6 route ::/0 fd7a:629f:52a4:fe61::2
switch(config)#
```
29.3.1.3 IPv6 ECMP

Multiple routes that are configured to the same destination with the same administrative distance comprise an Equal Cost Multi-Path (ECMP) route. The switch attempts to spread outbound traffic across all ECMP route paths equally. All ECMP paths are assigned the same tag value; commands that change the tag value of any ECMP path change the tag value of all paths in the ECMP.

Resilient ECMP is available for IPv6 routes. Section 28.4.2 describes resilient ECMP. The `ipv6 hardware fib ecmp resilience` command implements IPv6 resilient ECMP.

Example
- This command implements IPv6 resilient ECMP by configuring a hardware ECMP table space of 15 entries for IPv6 address 2001:db8:0::/64. A maximum of five nexthop addresses can be specified for the address. When the table contains five addresses, each appears in the table three times. When the table contains fewer than five addresses, each is duplicated until the 15 table entries are filled.

```
switch(config)#ipv6 hardware fib ecmp resilience 2001:db8:0::/64 capacity 5
             redundancy 3
switch(config)#
```

29.3.2 Configuring IPv6 on an Interface

29.3.2.1 Enabling IPv6 on an Interface

The `ipv6 enable` command enables IPv6 on the configuration mode interface if it does not have a configured IPv6 address. It also configures the interface with an IPv6 address.

The `no ipv6 enable` command disables IPv6 on a configuration mode interface not configured with an IPv6 address. Interfaces configured with an IPv6 address are not disabled by this command.

Example
- This command enables IPv6 on VLAN interface 200.

```
switch(config)#interface vlan 200
switch(config-vl200)#ipv6 enable
switch(config-vl200)#
```

29.3.2.2 Assigning an IPv6 Address to an Interface

The `ipv6 address` command enables IPv6 on the configuration mode interface, assigns a global IPv6 address to the interface, and defines the prefix length. This command is supported on routable interfaces. Multiple global IPv6 addresses can be assigned to an interface.

Example
- These commands configure an IPv6 address with subnet mask for VLAN 200:

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 address 10:23:31::1:32:93/64
switch(config-if-Vl200)#
```

29.3.2.3 IPv6 Neighbor Discovery

The IPv6 Neighbor Discovery protocol defines a method for nodes to perform the following network maintenance tasks:
- determine layer 2 addresses for neighbors known to reside on attached links
IPv6 Neighbor Discovery is defined by RFC 2461. IPv6 Stateless Address Autoconfiguration is described by RFC 2462.

The following sections describe Neighbor Discovery configuration tasks.

Reachable Time
The **ipv6 nd reachable-time** command specifies the time period that the switch includes in the reachable time field of Router Advertisements (RAs) sent from the configuration mode interface. The reachable time defines the period that a remote IPv6 node is considered reachable after a reachability confirmation event.

**Example**
- These commands configure the entry of 25000 (25 seconds) in the reachable time field of RAs sent from VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd reachable-time 25000
```

```
interface Vlan200
  ipv6 address fd7a:4321::1/64
  ipv6 nd reachable-time 25000
switch(config-if-Vl200)#
```

Router Advertisement Interval
The **ipv6 nd ra interval** command configures the interval between IPv6 RA transmissions from the configuration mode interface.

**Example**
- These commands configure a RA transmission interval of 60 seconds on VLAN interface 200, then displays the interface status.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd ra interval 60
```

```
interface Vlan200
  ipv6 nd ra interval 60
switch(config-if-Vl200)#
```

Router Lifetime
The **ipv6 nd ra lifetime** command specifies the value that the switch places in the **router lifetime** field of IPv6 RAs sent from the configuration mode interface.

If the value is set to 0, IPv6 peers connected to the specified interface will remove the switch from their lists of default routers. Values greater than 0 indicate the time in seconds that peers should keep the router on their default router lists without receiving further RAs from the switch. Unless the value is 0, the router lifetime value should be equal to or greater than the interval between unsolicited RAs sent on the interface.
Example
- This command configures the switch to enter 2700 in the router lifetime field of RAs transmitted from VLAN 200.
  
  ```
  switch(config)#interface vlan 200
  switch(config-if-Vl200)#ipv6 nd ra lifetime 2700
  switch(config-if-Vl200)#show active
  interface Vlan200
    ipv6 nd ra lifetime 2700
  switch(config-if-Vl200)#
  ```

Router Advertisement Prefix
The `ipv6 nd prefix` command configures neighbor discovery router advertisement prefix inclusion for RAs sent from the configuration mode interface.

By default, all prefixes configured as IPv6 addresses are advertised in the interface’s RAs. The `ipv6 nd prefix` command with the `no-advertise` option prevents advertising of the specified prefix without affecting the advertising of other prefixes specified as IPv6 addresses. When an interface configuration includes at least one `ipv6 nd prefix` command that enables prefix advertising, RAs advertise only prefixes specified through `ipv6 nd prefix` commands.

Commands enabling prefix advertising also specify the advertised valid and preferred lifetime periods. Default periods are 2,592,000 (valid) and 604,800 (preferred) seconds.

Example
- These commands enable neighbor discovery advertising for IPv6 address 3012:D678::/64, specifying a valid lifetime of 1,296,000 seconds and the default preferred lifetime.
  
  ```
  switch(config)#interface vlan 200
  switch(config-if-Vl200)#ipv6 nd prefix 3012:D678::/64 1296000
  switch(config-if-Vl200)#
  ```

Router Advertisement Suppression
The `ipv6 nd ra disabled` command suppress IPv6 RA transmissions on the configuration mode interface. By default, only unsolicited RAs that are transmitted periodically are suppressed. The `all` option configures the switch to suppress all RAs, including those responding to a router solicitation.

Example
- This command suppresses all RAs on VLAN interface 200.
  
  ```
  switch(config)#interface vlan 200
  switch(config-vl200)#ipv6 nd ra disabled all
  switch(config-vl200)#
  ```

Router Advertisement MTU Suppression
The `ipv6 nd ra mtu suppress` command suppresses the router advertisement MTU option on the configuration mode interface. The MTU option causes an identical MTU value to be advertised by all nodes on a link. By default, the router advertisement MTU option is not suppressed.

Example
- This command suppresses the MTU option on VLAN interface 200.
  
  ```
  switch(config)#interface vlan 200
  switch(config-vl200)#ipv6 nd ra mtu suppress
  switch(config-vl200)#
  ```
Router Advertisement Flag Configuration

The following commands sets the specified configuration flag in IPv6 RAs transmitted from the configuration mode interface:

- The `ipv6 nd managed-config-flag` command sets the `managed address configuration` flag. This bit instructs hosts to use stateful address autoconfiguration.
- The `ipv6 nd other-config-flag` command sets the `other stateful configuration` flag. This bit indicates availability of autoconfiguration information, other than addresses. Hosts should use stateful autoconfiguration when available. The setting of this flag has no effect if the `managed address configuration` flag is set.
- These commands configure the switch to set the `managed address configuration` flag in advertisements sent from VLAN interface 200.

```plaintext
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd managed-config-flag
```

- These commands configure the switch to set the `other stateful configuration` flag in advertisements sent from VLAN interface 200.

```plaintext
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd other-config-flag
```

29.3.2.4 IPv6 Router Preference

The IPv6 Router Preference protocol supports an extension to RA messages for communicating default router preferences and more specific routes from routers to hosts. This provides assistance to hosts when selecting a router. RFC 4191 describes the IPv6 Router Preference Protocol.

The `ipv6 nd router-preference` command specifies the value that the switch enters in the Default Router Preference (DRP) field of RAs that it sends from the configuration mode interface. The default field entry value is `medium`.

Example

- This command configures the switch as a medium preference router on RAs sent from VLAN 200.

```plaintext
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd router-preference medium
```

29.3.2.5 uRPF Configuration

Unicast Reverse Path Forwarding (uRPF) verifies the accessibility of source IP addresses in packets that the switch forwards. Section 28.4.3 describe uRPF. uRPF is enabled for IPv6 packets entering the configuration mode interface through the `ipv6 verify` command.

uRPF defines two operational modes: strict mode and loose mode.

- Strict mode: uRPF verifies that a packet is received on the interface that its routing table entry specifies for its return packet.
- Loose mode: uRPF validation does not consider the inbound packet’s ingress interface only that there is a valid return path.
Example

- This command enables uRPF strict mode on VLAN interface 100. If a default route is configured on the interface, all inbound packets will pass the uRPF check as valid.

```
switch(config)# interface vlan 100
switch(config-if-Vl100)# ipv6 verify unicast source reachable-via rx allow-default
switch(config-if-Vl100)# show active
  interface Vlan100
  ipv6 verify unicast source reachable-via rx allow-default
switch(config-if-Vl100)#
```

29.3.3 Configuring IPv6 DHCP Snooping

29.3.3.1 Enabling IPv6 DHCP Snooping on the switch

The `ipv6 dhcp snooping` command enables DHCP snooping globally on the switch. DHCP snooping is a layer 2 feature that can be configured on LAN switches. The Arista switch supports Option-37 insertion that allows relay agents to provide remote-ID information in DHCP request packets.

Note

DHCPv6 VLAN classification and DHCPv4 VLAN classification share same hardware resource.

Example

- The following configuration enables IPv6 DHCP snooping feature at the global level.
  ```
  switch(config)# ipv6 dhcp snooping
  switch(config)# ipv6 dhcp snooping remote-id option
  switch(config)# ipv6 dhcp snooping vlan <vlan|vlan-range>
  ```

- The following command display IPv6 DHCP snooping state.
  ```
  switch(config)# ipv6 dhcp snooping
  switch(config)# show ipv6 dhcp snooping
  DHCPv6 Snooping is enabled
  DHCPv6 Snooping is operational
  DHCPv6 Snooping is configured on following VLANs:
    2789-2790
  DHCPv6 Snooping is operational on following VLANs:
    2789
  Insertion of Option-37 is enabled
  ```

29.3.4 Viewing IPv6 Network Components

Displaying RIB Route Information

Use the `show rib route ipv6` command view the IPv6 Routing Information Base (RIB) information.

Example
This command displays IPv6 RIB BGP routes.

```
switch# show rib route ipv6 bgp
VRF name: default, VRF ID: 0xfe, Protocol: bgp
Codes: C - Connected, S - Static, P - Route Input
       B - BGP, O - Ospf, O3 - Ospf3, I - Isis
       > - Best Route, * - Unresolved Nexthop
       L - Part of a recursive route resolution loop
B  2001:10:1::/64 [200/42]
   via 2001:10:1::100 [0/1]
   via Ethernet1, directly connected
B  2001:10:100::/64 [200/200]
   via 2001:10:1::100 [0/1]
   via Ethernet1, directly connected
B  2001:10:100:1::/64 [200/0]
   via 2001:10:1::100 [0/1]
   via Ethernet1, directly connected
B  2001:10:100:2::/64 [200/42]
   via 2001:10:1::100 [0/1]
   via Ethernet1, directly connected
```

Displaying the FIB and Routing Table

The `show ipv6 route` command displays routing table entries that are in the Forwarding Information Base (FIB), including static routes, routes to directly connected networks, and dynamically learned routes. Multiple equal cost paths to the same prefix are displayed contiguously as a block, with the destination prefix displayed only on the first line.

**Example**

This command displays a route table entry for a specific IPv6 route.

```
switch> show ipv6 route fd7a:3418:52a4:fe18::/64
IPv6 Routing Table - 77 entries
Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP, R - RIP, A - Aggregate
O  fd7a:3418:52a4:fe18::/64 [10/20]
   via f180::21c:73ff:fe00:1319, Vlan3601
   via f180::21c:73ff:fe00:1319, Vlan3602
   via f180::21c:73ff:fe00:1319, Vlan3608
   via f180::21c:73ff:fe0f:6a80, Vlan3610
   via f180::21c:73ff:fe00:1319, Vlan3611
```

Displaying the Route Age

The `show ipv6 route age` command displays the IPv6 route age to the specified IPv6 address or prefix.
Example

- This command displays the route age for the specified prefix.

```
switch>show ipv6 route 2001::3:0/11 age
IPv6 Routing Table - 74 entries
Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP, R - RIP, A - Aggregate

C 2001::3:0/11 age 00:02:34
switch>
```

Displaying Host Routes

The `show ipv6 route host` command displays all host routes in the IPv6 host forwarding table. Host routes are those whose destination prefix is the entire address (prefix = /128). Each displayed host route is labeled with its purpose:

- **F** static routes from the FIB.
- **R** routes defined because the IP address is an interface address.
- **A** routes to any neighboring host for which the switch has an ARP entry.

Example

- This command displays all IPv6 host routes in the host forwarding table.

```
switch#show ipv6 route host
R - receive F - FIB, A - attached

F ::1 to cpu
A fee7:48a2:0c11:1900:400::1 on Vlan102
R fee7:48a2:0c11:1900:400::2 to cpu
F fee7:48a2:0c11:1a00::b via fe80::21c:73ff:fe0b:a80e on Vlan3902
R fee7:48a2:0c11:1a00::17 to cpu
F fee7:48a2:0c11:1a00::20 via fe80::21c:73ff:fe0b:33e on Vlan3913
F fee7:48a2:0c11:1a00::22 via fe80::21c:73ff:fe01:5fe1 on Vlan3908
    via fe80::21c:73ff:fe01:5fe1 on Vlan3902

switch#
```

Displaying Route Summaries

The `show ipv6 route summary` command displays the current number of routes of the IPv6 routing table in summary format.
Example

- This command displays the route source and the corresponding number of routes in the IPv6 routing table.

```
switch> show ipv6 route summary
Route Source    Number Of Routes
--------------- ----------------
connected                      2
static                         0
ospf                           5
bgp                            7
isis                           0
internal                       1
attached                       0
aggregate                      2
Total Routes                   17
```

29.3.5 DHCP Relay Agent for IPv6

29.3.5.1 Configuring IPv6 DHCP Relay

Configuring the IPv6 DHCP Relay Agent (Global)

The `ipv6 dhcp relay always-on` command enables the switch DHCP relay agent globally regardless of the DHCP relay agent status on any interface. The DHCP relay agent is enabled by default if at least one routable interface is configured with an `ipv6 dhcp relay destination` statement.

Example

- This command enables the DHCP relay agent.

```
switch(config)# ipv6 dhcp relay always-on
switch(config)#
```

Configuring DHCP for IPv6 relay agent

The `ipv6 dhcp relay destination` command enables the DHCPv6 relay agent function and specifies the client message destination address on an interface.

Example

This command enables the DHCPv6 relay agent function and sets the client message destination address to 2001:0db8:0:1::1 on Ethernet interface 4.

```
switch(config)# interface ethernet 4
switch(config-if-Et4)# ipv6 dhcp relay destination 2001:0db8:0:1::1
```

Configuring the Client Link Layer Address for the IPv6 DHCP relay agent

The `ipv6 dhcp relay option link-layer address` command enables the DHCPv6 relay agent to configure the client link layer address option to solicit and request messages. In other words, the command enables the link layer address option (79) in the global configuration mode. The `no ipv6 dhcp relay option link-layer address` command disables the link layer address option (79) in the global configuration mode.
Example
- This command enables the insertion of link layer address option (79) in the global configuration mode.
  
  switch(config)#ipv6 dhcp relay option link-layer address

Clearing IPv6 DHCP Relay Counters
The clear ipv6 dhcp relay counters command resets the DHCP relay counters. The configuration mode determines which counters are reset:
- Global configuration: command clears the counters for the switch and for all interfaces.
- Interface configuration: command clears the counter for the configuration mode interface.

Example
- These commands clear all DHCP relay counters on the switch.
  
  switch(config-if-Et4)#exit
  switch(config)#clear ipv6 dhcp relay counters
  switch(config)#

- These commands clear the DHCP relay counters for Ethernet interface 4.
  
  switch(config)#interface ethernet 4
  switch(config-if-Et4)#clear ipv6 dhcp relay counters
  switch(config)#

29.3.5.2 Viewing IPv6 DHCP Relay Information

IPv6 DHCP Status
The show ip dhcp relay command displays the status of DHCP relay agent parameters on the switch and each interface where at least one feature parameter is listed. The command displays the status for both global and interface configurations.

Example
- This command displays the DHCP Agent Relay parameter status.
  
  switch(config)#interface ethernet 1/2
  switch(config-if-Et1/2)#show ip dhcp relay
  DHCP Relay is active
  DHCP Relay Option 82 is disabled
  DHCPv6 Relay Link-layer Address Option (79) is disabled
  DHCP Smart Relay is disabled
  Interface: Ethernet1/2
  DHCP Smart Relay is disabled
  DHCP servers: 1::1
  2001:db8:0:1::1
  switch(config-if-Et1/2)#

IPv6 DHCP Relay Counters
The show ipv6 dhcp relay counters command displays the number of DHCP packets received, forwarded, or dropped on the switch and on all interfaces enabled as DHCP relay agents.
Example

- This command displays the IP DHCP relay counter table.

```
switch>show ipv6 dhcp relay counters

| DHCP Packets | Rcvd Fwdd Drop | Last Cleared
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>

switch>
```
29.4 IPv6 Commands

Global Configuration Commands
- `ipv6 dhcp relay always-on`
- `ipv6 dhcp relay option link-layer address`
- `ipv6 hardware fib aggregate-address`
- `ipv6 hardware fib ecmp resilience`
- `ipv6 hardware fib nexthop-index`
- `ipv6 neighbor`
- `ipv6 neighbor cache persistent`
- `ipv6 route`
- `ipv6 unicast-routing`

Interface Configuration Commands
- `ipv6 address`
- `ipv6 dhcp relay destination`
- `ipv6 dhcp snooping`
- `ipv6 enable`
- `ipv6 nd managed-config-flag`
- `ipv6 nd managed-config-flag`
- `ipv6 nd ns-interval`
- `ipv6 nd other-config-flag`
- `ipv6 nd prefix`
- `ipv6 nd ra dns-server`
- `ipv6 nd ra dns-servers lifetime`
- `ipv6 nd ra dns-suffix`
- `ipv6 nd ra dns-suffixes lifetime`
- `ipv6 nd ra hop-limit`
- `ipv6 nd ra interval`
- `ipv6 nd ra lifetime`
- `ipv6 nd ra mtu suppress`
- `ipv6 nd ra disabled`
- `ipv6 nd reachable-time`
- `ipv6 nd router-preference`
- `ipv6 verify`

Privileged EXEC Commands
- `clear ipv6 dhcp relay counters`
- `clear ipv6 dhcp snooping counters`
- `clear ipv6 neighbors`

EXEC Commands
- `show ipv6 dhcp relay counters`
- `show ipv6 dhcp snooping`
- `show ipv6 dhcp snooping counters`
- `show ipv6 dhcp snooping hardware`
- `show ipv6 hardware fib aggregate-address`
- `show ipv6 interface`
- `show ipv6 nd ra internal state`
- `show ipv6 neighbors`
- `show ipv6 route`
- show ipv6 route age
- show ipv6 route host
- show ipv6 route interface
- show ipv6 route match tag
- show ipv6 route summary
- show rib route ipv6
clear ipv6 dhcp relay counters

The `clear ipv6 dhcp relay counters` command resets the DHCP relay counters. When no port is specified, the command clears the counters for the switch and for all interfaces. Otherwise, the command clears the counter for the specified interface.

**Command Mode**

Privileged EXEC

**Command Syntax**

```
clear ipv6 dhcp relay counters [PORT]
```

**Parameters**

- **PORT** Interface through which neighbor is accessed. Options include:
  - `<no parameter>` all dynamic entries are removed.
  - `interface ethernet e_num` Ethernet interface specified by `e_num`.
  - `interface loopback l_num` Loopback interface specified by `l_num`.
  - `interface port-channel p_num` Port-channel interface specified by `p_num`.
  - `interface vlan v_num` VLAN interface specified by `v_num`. 
Examples

- These commands clear the DHCP relay counters for Ethernet interface 4 and shows the counters before and after the clear command.

```
switch(config)#show ipv6 dhcp relay counters

<table>
<thead>
<tr>
<th>Dhcp Packets</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
</tr>
<tr>
<td>----------</td>
</tr>
<tr>
<td>All Req</td>
</tr>
<tr>
<td>All Resp</td>
</tr>
<tr>
<td>Ethernet4</td>
</tr>
</tbody>
</table>

switch(config)#interface ethernet 4

switch(config-if-Et4)#clear ipv6 dhcp relay counters

<table>
<thead>
<tr>
<th>Dhcp Packets</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
</tr>
<tr>
<td>----------</td>
</tr>
<tr>
<td>All Req</td>
</tr>
<tr>
<td>All Resp</td>
</tr>
<tr>
<td>Ethernet4</td>
</tr>
</tbody>
</table>

These commands clear all DHCP relay counters on the switch.

switch(config-if-Et4)#exit

switch(config)#clear ipv6 dhcp relay counters

switch(config)#show ipv6 dhcp relay counters

<table>
<thead>
<tr>
<th>Dhcp Packets</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
</tr>
<tr>
<td>----------</td>
</tr>
<tr>
<td>All Req</td>
</tr>
<tr>
<td>All Resp</td>
</tr>
<tr>
<td>Ethernet4</td>
</tr>
</tbody>
</table>

switch(config)#
```
**clear ipv6 dhcp snooping counters**

The `clear ipv6 dhcp snooping counters` command resets the DHCP snooping packet counters.

**Command Mode**

Privileged EXEC

**Command Syntax**

```
clear ipv6 dhcp snooping counters [COUNTER_TYPE]
```

**Parameters**

- **COUNTER_TYPE** The type of counter that the command resets.
- `<no parameter>` command clears the counters for each VLAN.
- `debug` command clears aggregate counters and drop cause counters.

**Examples**

- This command clears the number of DHCP packets sent and received on each VLAN.

  ```
  switch# clear ipv6 dhcp snooping counters
  switch# show ipv6 dhcp snooping counters
  | Dhcpv6 Request Pkts | Dhcpv6 Reply Pkts |
  Vlan | Rcvd | Fwdd | Drop | Rcvd | Fwdd | Drop | Last Cleared |
  -----|------|------|------|------|------|------|-------------|
  2789 | 1    | 1    | 0    | 1    | 1    | 0    | 0:03:09 ago |
  ```

- This command clears the number of DHCP packets sent on the switch.

  ```
  switch# clear ipv6 dhcp snooping counters debug
  switch# show ipv6 dhcp snooping counters debug
  Counter                  Snooping to Relay Relay to Snooping

  Dropped - Snooping disabled 0            0
  Last Cleared: 0:04:29 ago
  ```
clear ipv6 neighbors

The clear ipv6 neighbors command removes the specified dynamic IPv6 neighbor discovery cache entries. Commands that do not specify an IPv6 address remove all dynamic entries for the listed interface. Commands that do not specify an interface remove all dynamic entries.

Command Mode
Privileged EXEC

Command Syntax
   clear ipv6 neighbors [PORT] [DYNAMIC_IPV6]

Parameters
- **PORT** Interface through which neighbor is accessed. Options include:
  - <no parameter> all dynamic entries are removed.
  - ethernet e_num Ethernet interface specified by e_num.
  - loopback l_num Loopback interface specified by l_num.
  - management m_num Management interface specified by m_num.
  - port-channel p_num Port-channel interface specified by p_num.
  - vlan v_num VLAN interface specified by v_num.
  - vxlan vx_num VXLAN interface specified by vx_num.
- **DYNAMIC_IPV6** Address of entry removed by the command. Options include:
  - <no parameter> all dynamic entries for specified interface are removed.
  - ipv6_addr IPv6 address of entry.

Example
- This command removes all dynamic neighbor entries for VLAN interface 200.
  
  switch#clear ipv6 neighbors vlan 200
  
  switch#
**ipv6 address**

The **ipv6 address** command assigns a global IPv6 address to the IPv6 interface, and defines the prefix length. This command is supported on routable interfaces. Multiple global IPv6 addresses can be assigned to an interface.

The **no ipv6 address** and **default ipv6 address** commands remove the IPv6 address assignment from the configuration mode interface by deleting the corresponding **ipv6 address** command from **running-config**. If the command does not include an address, all address assignments are removed from the interface. IPv6 remains enabled on the interface after the removal of all IPv6 addresses only if an **ipv6 enable** command is configured on the interface.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ipv6 address ipv6_prefix
no ipv6 address [ipv6_prefix]
default ipv6 address [ipv6_prefix]
```

**Parameters**

- **ipv6_prefix** address assigned to the interface (CIDR notation).

**Guidelines**

This command is supported on routable interfaces.

**Example**

- These commands configure an IPv6 address and prefix length for VLAN 200:

  ```
  switch(config)#interface vlan 200
  switch(config-if-Vl200)#ipv6 address 10:23:31:00:01:32:93/64
  switch(config-if-Vl200)#
  ```
**ipv6 dhcp relay always-on**

The `ipv6 dhcp relay always-on` command enables the switch DHCP relay agent on the switch regardless of the DHCP relay agent status on any interface. By default, the DHCP relay agent is enabled only if at least one routable interface is configured with an `ipv6 dhcp relay destination` statement.

The `no ipv6 dhcp relay always-on` and `default ipv6 dhcp relay always-on` commands remove the `ipv6 dhcp relay always-on` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

- `ipv6 dhcp relay always-on`
- `no ipv6 dhcp relay always-on`
- `default ipv6 dhcp relay always-on`

**Example**

- This command enables the DHCP relay agent.

```
switch(config)#ipv6 dhcp relay always-on
switch(config)#
```
ipv6 dhcp relay destination

The **ipv6 dhcp relay destination** command enables the DHCPv6 relay agent and sets the destination address on the configuration mode interface.

The **no ipv6 dhcp relay destination** and **default ipv6 dhcp relay destination** commands remove the corresponding **ipv6 dhcp relay destination** command from *running-config*. When the commands do not list an IPv6 address, all **ipv6 dhcp relay destination** commands are removed from *running-config*.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ipv6 dhcp relay destination ipv6_addr [source-address ipv6_addr]
no ipv6 dhcp relay destination [ipv6_addr]
default ipv6 dhcp relay destination [ipv6_addr]
```

**Parameters**
- **ipv6_addr** DCHP Server's IPv6 address.
- **source-address ipv6_addr** specify the source IPv6 address to communicate with DHCP server.

**Guidelines**

If the source-address parameter is specified, then the DHCP client receives an IPv6 address from the subnet of source IP address. The source-address must be one of the configured addresses on the interface.

**Example**

```
This command enables the DHCPv6 relay agent and sets the destination address to 2001:0db8:0:1::1 on Ethernet interface 4.
switch(config)#interface ethernet 4
switch(config-if-Et4)#ipv6 dhcp relay destination 2001:0db8:0:1::1
switch(config-if-Et4)#show ip dhcp relay
DHCP Relay is active
DHCP Relay Option 82 is disabled
DHCPv6 Relay Link-layer Address Option (79) is disabled
DHCP Smart Relay is disabled
Interface: Ethernet4
    DHCP Smart Relay is disabled
    DHCP servers: l:1
                2001:db8:0:1::1
switch(config-if-Et4)#
```
**ipv6 dhcp snooping**

The **ipv6 dhcp snooping** command enables DHCP snooping globally on the switch.

The **no ipv6 dhcp snooping** and **default ipv6 dhcp snooping** commands disable global DHCP snooping by removing the **ipv6 dhcp snooping** command from **running-config**.

**Command Mode**

  Global Configuration

**Command Syntax**

```
ipv6 dhcp snooping [remote-id option | vlan [$ | vlan-range]]
no ipv6 dhcp snooping [remote-id option | vlan [$ | vlan-range]]
default ipv6 dhcp snooping [remote-id option | vlan [$ | vlan-range]]
```

**Parameters**

- **remote-id option** configures the remote ID option.
- **vlan** enables IPv6 DHCP snooping for a specific VLAN. Numbers range from 1 to 4094.
- **$** end of range.
- **vlan-range** VLANs based on the snooping enabled. Formats include a number, a number range, or a comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.

**Platform Compatibility**

- DCS-7010
- DCS-7050
- DCS-7060
- DCS-7250
- DCS-7260
- DCS-7300

**Examples**

- The following configuration enables IPv6 DHCP snooping feature at the global level.

  ```
  switch(config)# ipv6 dhcp snooping
  switch(config)# ipv6 dhcp snooping remote-id option
  switch(config)# ipv6 dhcp snooping vlan <vlan|vlan-range>
  ```

- The following command display IPv6 DHCP snooping state.

  ```
  switch(config)# ipv6 dhcp snooping
  switch(config)# show ipv6 dhcp snooping
  DHCPv6 Snooping is enabled
  DHCPv6 Snooping is operational
  DHCPv6 Snooping is configured on following VLANs:
  2789-2790
  DHCPv6 Snooping is operational on following VLANs:
  2789
  Insertion of Option-37 is enabled
  ```
ipv6 dhcp relay option link-layer address

The `ipv6 dhcp relay option link-layer address` command enables the DHCPv6 relay agent to configure the client link layer address option to solicit and request messages. In other words, the command enables the link layer address option (79) in the global configuration mode.

The `no ipv6 dhcp relay option link-layer address` command disables the link layer address option (79) in the global configuration mode.

**Command Mode**
- Global Configuration

**Command Syntax**

```
ipv6 dhcp relay option link-layer address
no ipv6 dhcp relay option link-layer address
default ipv6 dhcp relay option link-layer address
```

**Example**

- This command enables the insertion of link layer address option (79) in the global configuration mode.

  ```
switch(config)#ipv6 dhcp relay option link-layer address
  ```
ipv6 enable

The `ipv6 enable` command enables IPv6 on the configuration mode interface. Assigning an IPv6 address to an interface also enables IPv6 on the interface.

The `no ipv6 enable` and `default ipv6 enable` command remove the corresponding `ipv6 enable` command from `running-config`. This action disables IPv6 on interfaces that are not configured with an IPv6 address.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `ipv6 enable`
- `no ipv6 enable`
- `default ipv6 enable`

**Example**
- This command enables IPv6 on VLAN interface 200.

```
switch(config)#interface vlan 200
switch(config-vl200)#ipv6 enable
switch(config-vl200)#
```
**ipv6 hardware fib aggregate-address**

The **ipv6 hardware fib aggregate-address** command specifies the routing table repository of specified IPv6 route.

By default, routes that are created statically through the CLI or dynamically through routing protocols are initially stored in software routing tables, then entered in the hardware routing table by the routing agent. This command prevents the entry of the specified route into the hardware routing table. Specified routes that are in the hardware routing table are removed by this command. Specific routes that are encompassed within the specified route prefix are affected by this command.

The **no ipv6 hardware fib aggregate-address** and **default ipv6 hardware fib aggregate-address** commands remove the restriction from the hardware routing table for the specified routes by removing the corresponding **ipv6 hardware fib aggregate-address** command from **running-config**.

**Command Mode**  
Global Configuration

**Command Syntax**

```
ipv6 hardware fib aggregate-address ipv6_prefix summary-only software-forward  
no ipv6 hardware fib aggregate-address ipv6_prefix  
default ipv6 hardware fib aggregate-address ipv6_prefix
```

**Parameters**

- **ipv6_prefix**  IPv6 prefix that is restricted from the hardware routing table (CIDR notation).

**Example**

- These commands configure a hardware routing restriction for an IPv6 prefix, then displays that restriction.

```
switch(config)#ipv6 hardware fib aggregate-address fd77:4890:5313:ffed::/64  
summary-only software-forward  
switch(config)#show ipv6 hardware fib aggregate-address  
Codes: S - Software Forwarded  
S  fd77:4890:5313:ffed::/64
```

switch(config)#
**ipv6 hardware fib ecmp resilience**

The `ipv6 hardware fib ecmp resilience` command configures a fixed number of next hop entries in the hardware ECMP table for the specified IPv6 address prefix. In addition to specifying the maximum number of next hop addresses that the table can contain for the prefix, the command introduces a redundancy factor that allows duplication of each next hop address. The fixed table space for the address is the maximum number of next hops multiplied by the redundancy factor.

The default method of adding or removing next hop entries when required by the active hashing algorithm leads to inefficient management of the ECMP table, which can result in the rerouting of packets to different next hops that breaks TCP packet flows. Implementing fixed table entries for a specified IP address allows data flows that are hashed to a valid next hop number to remain intact. Additionally, traffic is evenly distributed over a new set of next hops.

The `no ipv6 hardware fib ecmp resilience` and `default ipv6 hardware fib ecmp resilience` commands restore the default hardware ECMP table management by removing the `ipv6 hardware fib ecmp resilience` command from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

```
ipv6 hardware fib ecmp resilience net_prfx capacity nhop_max redundancy duplicates
no ipv6 hardware fib ecmp resilience net_addr
default ipv6 hardware fib ecmp resilience net_addr
```

**Parameters**

- `net_prfx` IPv6 address prefix managed by command.
- `nhop_max` Specifies maximum number of nexthop entries for specified IP address prefix. Value range varies by platform:
  - Helix: `<2 to 64>`
  - Trident: `<2 to 32>`
  - Trident II: `<2 to 64>`
- `duplicates` Specifies the redundancy factor. Value ranges from 1 to 128.

**Example**

- This command configures a hardware ECMP table space of 15 entries for the IPv6 address 2001:db8:0:/:64. A maximum of five nexthop addresses can be specified for the address. When the table contains five nexthop addresses, each appears in the table three times. When the table contains fewer than five nexthop addresses, each is duplicated until the 15 table entries are filled.

  switch(config)#ipv6 hardware fib ecmp resilience 2001:db8:0:/:64 capacity 5 redundancy 3
**ipv6 hardware fib nexthop-index**

The `ipv6 hardware fib nexthop-index` command deterministically selects the next hop used for ECMP routes. By default, routes that are created statically through the CLI or dynamically through routing protocols are initially stored in software routing tables, then entered in the hardware routing table by the routing agent. This command specifies the method of creating an index-offset number that points to the next hop from the list of the route’s ECMP next hops.

The index-offset is calculated by adding the next hop index to a prefix offset.

- Next hop index: specified in the command.
- Prefix offset: the least significant bits of the route’s prefix.

The command specifies the number of bits that comprise the prefix offset. The prefix offset is set to the prefix when the command specifies a prefix size larger than the prefix. If the command specifies an prefix size of zero, the prefix-offset is also zero and the index-offset is set to the next hop index.

When the index-offset is greater than the number of next hops in the table, the position of the next hop is the remainder of the division of the index-offset by the number of next hop entries.

The `no ipv6 hardware fib nexthop-index` and `default ipv6 hardware fib nexthop-index` commands remove the specified nexthop used for ECMP routes by removing the `ipv6 hardware fib nexthop-index` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ipv6 hardware fib nexthop nexthop_index [PREFIX]
no ipv6 hardware fib nexthop
default ipv6 hardware fib nexthop
```

**Parameters**

- `nexthop_index` specifies the next hop index. Value ranges from 0 to 32.
- `PREFIX` Number of bits of the route’s prefix to use as the prefix-offset. Value ranges from 0 to 64.
  - `<no parameter>` The prefix offset is set to zero.
  - `prefix-bits <0 to 64>` Specifies the number bits to use as the prefix-offset.

**Example**

- This command specifies the next hop from the list of ECMP next hops for the route.

```
switch(config)#ipv6 hardware fib nexthop-index 5 prefix-bits 10
switch>show ip
IP Routing : Enabled
IP Multicast Routing : Disabled
VRRP: Configured on 0 interfaces

IPv6 Unicast Routing : Enabled
IPv6 ECMP Route support : False
IPv6 ECMP Route nexthop index: 5
IPv6 ECMP Route num prefix bits for nexthop index: 10
switch>
```
**ipv6 nd managed-config-flag**

The `ipv6 nd managed-config-flag` command causes the *managed address configuration* flag to be set in IPv6 RA packets transmitted from the configuration mode interface.

The `no ipv6 nd managed-config-flag` and `default ipv6 nd managed-config-flag` commands restore the default setting where the *managed address configuration* flag is not set in IPv6 RA packets transmitted by the interface by removing the corresponding `ipv6 nd managed-config-flag` command from *running-config*.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ipv6 nd managed-config-flag
no ipv6 nd managed-config-flag
default ipv6 nd managed-config-flag
```

**Example**

- These commands cause the *managed address configuration* flag to be set in IPv6 RA packets sent from VLAN interface 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd managed-config-flag
switch(config-if-Vl200)#
```

---

1907
ipv6 nd ns-interval

The `ipv6 nd ns-interval` command configures the interval between IPv6 neighbor solicitation (NS) transmissions from the configuration mode interface.

The `no ipv6 nd ns-interval` and `default ipv6 nd ns-interval` commands return the IPv6 NS transmission interval for the configuration mode interface to the default value of 1000 milliseconds by removing the corresponding `ipv6 nd ns-interval` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
```
ipv6 nd ns-interval period
no ipv6 nd ns-interval
default ipv6 nd ns-interval
```

**Parameters**
- `period` interval in milliseconds between successive IPv6 neighbor solicitation transmissions. Values range from 1000 to 4294967295. The default period is 1000 milliseconds.

**Example**
- This command configures a neighbor solicitation transmission interval of 30 seconds on VLAN interface 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd ns-interval 30000
switch(config-if-Vl200)#
```
**ipv6 nd other-config-flag**

The `ipv6 nd other-config-flag` command configures the configuration mode interface to send IPv6 RAs with the *other stateful configuration* flag set.

The `no ipv6 nd other-config-flag` and `default ipv6 nd other-config-flag` commands restore the default setting by removing the corresponding `ipv6 nd other-config-flag` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `ipv6 nd other-config-flag`
- `no ipv6 nd other-config-flag`
- `default ipv6 nd other-config-flag`

**Example**
- These commands configure the switch to set the other stateful configuration flag in advertisements sent from VLAN interface 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd other-config-flag
switch(config-if-Vl200)#
```
**ipv6 nd prefix**

The `ipv6 nd prefix` command configures neighbor discovery Router Advertisements (RAs) prefix inclusion for RAs sent from the configuration mode interface.

By default, all prefixes configured as IPv6 addresses (`ipv6 address`) are advertised in the interface’s RAs. The `ipv6 nd prefix` command with the `no-advertise` option prevents advertising of the specified prefix without affecting the advertising of other prefixes specified as IPv6 addresses. When an interface configuration includes at least one `ipv6 nd prefix` command that enables prefix advertising, RAs advertise only prefixes specified through `ipv6 nd prefix` commands.

Commands enabling prefix advertising also specify the advertised valid and preferred lifetime periods. Default periods are 2,592,000 (valid) and 604,800 (preferred) seconds.

The `no ipv6 nd prefix` and `default ipv6 nd prefix` commands remove the corresponding `ipv6 nd prefix` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ipv6 nd prefix ipv6_prefix LIFETIME [FLAGS]
ipv6 nd prefix ipv6_prefix no-advertise
no ipv6 nd prefix ipv6_prefix
default ipv6 nd prefix ipv6_prefix
```

**Parameters**

- `ipv6_prefix` IPv6 prefix (CIDR notation).
- `no-advertise` Prevents advertising of the specified prefix.
- `LIFETIME` Period that the specified IPv6 prefix is advertised (seconds). Options include
  - `valid preferred` Two values that set the `valid` and `preferred` lifetime periods.
  - `valid` One value that sets the `valid` lifetime. The `preferred` lifetime is set to the default value.
  - `<no parameter>` The `valid` and `preferred` lifetime periods are set to their default values.

  Options for `valid`: `<0 to 4294967295>` and `infinite`. Default value is 2592000
  Options for `preferred`: `<0 to 4294967295>` and `infinite`. Default value is 604800
  The maximum value (`4294967295`) and `infinite` are equivalent settings.

- `FLAGS` `on-link` and `autonomous address-configuration` flag values in RAs.
  - `<no parameter>` both flags are set.
  - `no-autoconfig` `autonomous address-configuration` flag is reset.
  - `no-onlink` `on-link` flag is reset.
  - `no-autoconfig no-onlink` both flags are reset.
  - `no-onlink no-autoconfig` both flags are reset.
Example

- These commands enable neighbor discovery advertising for IPv6 address 3012:D678::/64, on VLAN interface 200, specifying a valid lifetime of 1,296,000 seconds and the default preferred lifetime.

  switch(config)#interface vlan 200
  switch(config-if-Vl200)#ipv6 nd prefix 3012:D678::/64 1296000
ipv6 nd ra dns-server

The `ipv6 nd ra dns-server` command configures the IPv6 address of a preferred Recursive DNS Server (RDNSS) for the command mode interface to include in its neighbor-discovery Router Advertisements (RAs). Including RDNSS information in RAs provides DNS server configuration for connected IPv6 hosts without requiring DHCPv6.

Multiple servers can be configured on the interface by using the command repeatedly. A lifetime value for the RDNSS can optionally be specified with this command, and overrides any default value configured for the interface using the `ipv6 nd ra dns-servers lifetime` command.

The `no ipv6 nd ra dns-server` and `default ipv6 nd ra dns-server` commands remove the corresponding `ipv6 nd ra dns-server` command from `running-config`.

Command Mode

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

Command Syntax

```
ipv6 nd ra dns-server ipv6_addr SERVER_LIFE
no ipv6 nd ra dns-server ipv6_addr
default ipv6 nd ra dns-server ipv6_addr
```

Parameters

- `ipv6_addr` RDNSS address to be included in RAs from the command mode interface.
- `SERVER_LIFE` maximum lifetime value for the specified RDNSS entry. This value overrides any default lifetime value. Value should be between the RA interval configured on the interface and two times that interval. Options include:
  - `<no parameter>` lifetime period is the default lifetime period configured on the interface. If no lifetime period is configured on the interface, the default value is 1.5 times the maximum RA interval set by the `ipv6 nd ra interval` command.
  - `lifetime 0` the configured RDNSS is not to be used.
  - `lifetime <1 to 4294967295>` specifies the lifetime period for this RDNSS in seconds.

Example

- This command configures the RDNSS at 2001:0db8:0:1::1 as a preferred RDNSS for VLAN interface 200 to include in its neighbor-discovery route advertisements, and sets its lifetime value to 300 seconds.

  switch(config)#interface vlan 200
  switch(config-if-Vl200)#ipv6 nd ra dns-server 2001:0db8:0:1::1 lifetime 300
  switch(config-if-Vl200)#
**ipv6 nd ra dns-servers lifetime**

The **ipv6 nd ra dns-servers lifetime** command sets the default value that the configuration mode interface uses for the lifetime of any Recursive DNS Server (RDNSS) configured on the interface. A lifetime value set for an individual RDNSS overrides this value. The lifetime value is the maximum amount of time after a route advertisement packet is sent that the RDNSS referenced in the packet may be used for name resolution.

The **no ipv6 nd ra dns-servers lifetime** and **default ipv6 nd ra dns-servers lifetime** commands remove the default lifetime value from the interface by removing the corresponding **ipv6 nd ra dns-servers lifetime** command from **running-config**. When there is no default RDNSS lifetime value configured on the interface, an RDNSS without a custom lifetime value will default to 1.5 times the RA interval configured on the interface. A lifetime of zero seconds means that the RDNSS must not be used for name resolution.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ipv6 nd ra dns-servers lifetime period
no ipv6 nd ra dns-servers lifetime
default ipv6 nd ra dns-servers lifetime
```

**Parameters**
- **period** the RDNSS lifetime value for the configuration mode interface. Options include:
  - `<0>` any RDNSS configured on the command mode interface without a custom lifetime value must not be used.
  - `<1 to 4294967295>` maximum RDNSS lifetime value for the configuration mode interface. This value is overridden by any lifetime value set with the **ipv6 nd ra dns-server** command. Should be between the router advertisement interval configured on the interface and two times that interval.

**Example**
- This command sets the default RDNSS maximum lifetime value for VLAN 200 to 350 seconds.
  ```
  switch(config)#interface vlan 200
  switch(config-if-Vl200)#ipv6 nd ra dns-servers lifetime 350
  switch(config-if-Vl200)#
  ```
ipv6 nd ra dns-suffix

The ipv6 nd ra dns-suffix command creates a DNS Search List (DNSSL) for the command mode interface to include in its neighbor-discovery Router Advertisements as defined in RFC 6106. The DNSSL contains the domain names of DNS suffixes for IPv6 hosts to append to short, unqualified domain names for DNS queries.

Multiple DNS domain names can be added to the DNSSL by using the command repeatedly. A lifetime value for the DNSSL can optionally be specified with this command, and overrides any default value configured for the interface using the ipv6 nd ra dns-suffixes lifetime command.

The no ipv6 nd ra dns-suffix and default ipv6 nd ra dns-suffix commands remove the corresponding ipv6 nd ra dns-suffix command from running-config.

Command Mode

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

Command Syntax

ipv6 nd ra dns-suffix domain SUFFIX_LIFE
no ipv6 nd ra dns-suffix ipv6_addr
default ipv6 nd ra dns-suffix ipv6_addr

Parameters

- *domain* domain suffix for IPv6 hosts to append to short, unqualified domain names for DNS queries. Suffix must contain only alphanumeric characters, "." and "-" and must begin and end with an alphanumeric character.

- *SUFFIX_LIFE* maximum lifetime value for the specified domain suffix. This value overrides any default lifetime value. Value should be between the RA interval configured on the interface and two times that interval. Options include:
  - <no parameter> lifetime period is the default lifetime period configured on the interface. If no lifetime period is configured on the interface, the default value is 1.5 times the maximum RA interval set by the ipv6 nd ra interval command.
  - lifetime 0 the configured domain suffix is not to be used.
  - lifetime <1 to 4294967295> specifies the lifetime period for this domain suffix in seconds.

Example

- These commands create a DNSSL for VLAN interface 200 to include in its neighbor-discovery route advertisements, and set its lifetime value to 300 seconds.

  switch(config)#interface vlan 200
  switch(config-if-Vl200)#ipv6 nd ra dns-suffix test.com lifetime 300
  switch(config-if-Vl200)#
ipv6 nd ra dns-suffixes lifetime

The `ipv6 nd ra dns-suffixes lifetime` command sets the default value that the configuration mode interface uses for the lifetime of any DNS Search List (DNSSL) configured on the interface. A lifetime value set for an individual DNSSL overrides this value. The lifetime value is the maximum amount of time after a route advertisement packet is sent that the DNSSL included in the packet may be used for name resolution.

The `no ipv6 nd ra dns-suffixes lifetime` and `default ipv6 nd ra dns-suffixes lifetime` commands remove the default lifetime value from the interface by removing the corresponding `ipv6 nd ra dns-suffixes lifetime` command from running-config. When there is no default DNSSL lifetime value configured on the interface, a DNSSL without a custom lifetime value will default to 1.5 times the RA interval configured on the interface. A lifetime of zero seconds means that the DNSSL must not be used for name resolution.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
```
ipv6 nd ra dns-suffixes lifetime period
no ipv6 nd ra dns-suffixes lifetime
default ipv6 nd ra dns-suffixes lifetime
```

**Parameters**
- `period` the DNSSL lifetime value for the configuration mode interface. Options include:
  - `<0>` any DNSSL configured on the command mode interface without a custom lifetime value must not be used.
  - `<1 to 4294967295>` maximum DNSSL lifetime value for the configuration mode interface. This value is overridden by any lifetime value set with the `ipv6 nd ra dns-suffix` command. Should be between the RA interval configured on the interface and two times that interval.

**Example**
- This command sets the default DNSSL maximum lifetime value for VLAN 200 to 350 seconds.
```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd ra dns-suffixes lifetime 350
switch(config-if-Vl200)#
```
**ipv6 nd ra hop-limit**

The `ipv6 nd ra hop-limit` command sets a suggested hop-limit value to be included in Router Advertisement (RA) packets. The hop-limit value is to be used by attached hosts in outgoing packets.

The `no ipv6 nd ra hop-limit` and `default ipv6 nd ra hop-limit` commands remove the corresponding `ipv6 nd ra hop-limit` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
```
ipv6 nd ra hop-limit quantity
no ipv6 nd ra hop-limit lifetime
default ipv6 nd ra hop-limit lifetime
```

**Parameters**
- `quantity` the hop-limit value to be included in RA packets sent by the configuration mode interface. Options include:
  - `<0>` indicates that outgoing packets from attached hosts are to be immediately discarded.
  - `<1 to 255>` number of hops. The default value is 64.

**Example**
- These commands include a hop-limit value of 100 in RA packets sent by VLAN 200.
  ```
  switch(config)#interface vlan 200
  switch(config-if-Vl200)#ipv6 nd ra hop-limit
  switch(config-if-Vl200)#
  ```
ipv6 nd ra interval

The `ipv6 nd ra interval` command configures the interval between IPv6 Router Advertisement transmissions from the configuration mode interface.

The `no ipv6 nd ra interval` and `default ipv6 nd ra interval` commands return the IPv6 RA transmission interval for the configuration mode interface to the default value of 200 seconds by removing the corresponding `ipv6 nd ra interval` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ipv6 nd ra interval [SCALE] ra_period [minimum_period]
no ipv6 nd ra interval
default ipv6 nd ra interval
```

**Parameters**

- **SCALE** timescale in which command parameter values are expressed.
  - `<no parameter>` seconds
  - `msec` milliseconds
- **ra_period** maximum interval between successive IPv6 RA transmissions. The default period is 200 seconds.
  - `<4 - 1800>` valid range when `scale` is set to default value (seconds).
  - `<500 - 1800000>` valid range when `scale` is set to `msec`.
- **minimum_period** minimum interval between successive IPv6 RA transmissions. Must be smaller than `ra_period`. By default, a minimum period is not defined.
  - `<no parameter>` Command does not specify a minimum period.
  - `<3 - 1799>` valid range when `scale` is set to default value (seconds).
  - `<375 - 1799999>` valid range when `scale` is set to `msec`.

**Example**

- These commands configure a RA transmission interval of 60 seconds on VLAN interface 200, then displays the interface status.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd ra interval 60
switch(config-if-Vl200)#show active
interface Vlan200
  ipv6 nd ra interval 60
switch(config-if-Vl200)#
```
ipv6 nd ra lifetime

The **ipv6 nd ra lifetime** command specifies the value that the switch places in the *router lifetime* field of IPv6 Router Advertisements sent from the configuration mode interface.

If the value is set to 0, IPv6 peers connected to the specified interface will remove the switch from their lists of default routers. Values greater than 0 indicate the time in seconds that peers should keep the router on their default router lists without receiving further RAs from the switch. Unless the value is 0, the router lifetime value should be equal to or greater than the interval between unsolicited RAs sent on the interface.

The **no ipv6 nd ra lifetime** and **default ipv6 nd ra lifetime** commands return the IPv6 RA lifetime data entry filed for the configuration mode interface to the default value of 1800 seconds by removing the corresponding **ipv6 nd ra lifetime** command from **running-config**.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
```
ipv6 nd ra lifetime ra_lifetime
no ipv6 nd ra lifetime
default ipv6 nd ra lifetime
```

**Parameters**
- **ra_lifetime**  router lifetime period (seconds). Default value is 1800. Options include
  - **<0>**  Router should not be considered as a default router
  - **<1 - 65535>**  Lifetime period advertised in RAs. Should be greater than or equal to the interval between IPv6 RA transmissions from the configuration mode interface as set by the ipv6 nd ra interval command.

**Example**
- This command configures the switch to enter 2700 in the router lifetime field of RAs transmitted from VLAN 200.
  ```
  switch(config)#interface vlan 200
  switch(config-if-Vl200)#ipv6 nd ra lifetime 2700
  switch(config-if-Vl200)#show active
  interface Vlan20
    ipv6 nd ra lifetime 2700
  switch(config-if-Vl200)#
  ```
**ipv6 nd ra mtu suppress**

The `ipv6 nd ra mtu suppress` command suppresses the Router Advertisement (RA) MTU option on the configuration mode interface. The MTU option causes an identical MTU value to be advertised by all nodes on a link. By default, the RA MTU option is not suppressed.

The `no ipv6 nd ra mtu suppress` and `default ipv6 nd ra mtu suppress` commands restores the MTU option setting to enabled by for the configuration mode interface by removing the corresponding `ipv6 nd ra mtu suppress` command from *running-config*.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ipv6 nd ra mtu suppress
no ipv6 nd ra mtu suppress
default ipv6 nd ra mtu suppress
```

**Example**

- This command suppresses the MTU option on VLAN interface 200.

  switch(config)#interface vlan 200
  switch(config-vl200)#ipv6 nd ra mtu suppress
  switch(config-vl200)#
**ipv6 nd ra disabled**

The `ipv6 nd ra disabled` command suppresses IPv6 Router Advertisement (RA) transmissions on the configuration mode interface. By default, only unsolicited RAs that are transmitted periodically are suppressed. The `all` option configures the switch to suppress all RAs, including those responding to a router solicitation.

The `no ipv6 nd ra disabled` and `default ipv6 nd ra disabled` commands restore the transmission of RAs on the configuration mode interface by deleting the corresponding `ipv6 nd ra disabled` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ipv6 nd ra disabled [SCOPE]
no ipv6 nd ra disabled
default ipv6 nd ra disabled
```

**Parameters**

- `SCOPE` specifies the RAs that are suppressed.
  - `<no parameter>` Periodic unsolicited RAs are suppressed.
  - `all` All RAs are suppressed.

**Example**

- This command suppresses all RAs on VLAN interface 200.

```bash
switch(config)#interface vlan 200
switch(config-vl200)#ipv6 nd ra disabled all
switch(config-vl200)#
```
**ipv6 nd reachable-time**

The `ipv6 nd reachable-time` command specifies the time period that the switch includes in the reachable time field of RAs sent from the configuration mode interface. The reachable time defines the period that a remote IPv6 node is considered reachable after a reachability confirmation event.

RAs that advertise zero seconds indicate that the router does not specify a reachable time. The default advertisement value is 0 seconds. The switch reachability default period is 30 seconds.

The `no ipv6 nd reachable-time` and `default ipv6 nd reachable-time` commands restore the entry of the default value (0) in RAs sent from the configuration mode interface by deleting the corresponding `ipv6 nd reachable-time` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ipv6 nd reachable-time period
no ipv6 nd reachable-time
default ipv6 nd reachable-time
```

**Parameters**
- `period` Reachable time value (milliseconds). Value ranges from 0 to 4294967295. Default is 0.

**Example**
- These commands configure the entry of 25000 (25 seconds) in the reachable time field of RAs sent from VLAN 200.

  switch(config)#interface vlan 200
  switch(config-if-Vl200)#ipv6 nd reachable-time 25000
  interface Vlan200
  ipv6 address fd7a:4321::1/64
  ipv6 nd reachable-time 25000
  switch(config-if-Vl200)#
**ipv6 nd router-preference**

The `ipv6 nd router-preference` command specifies the value that the switch enters in the Default Router Preference (DRP) field of Router Advertisements (RAs) that it sends from the configuration mode interface. The default field entry value is `medium`.

The `no ipv6 nd router-preference` and `default ipv6 nd router-preference` commands restore the switch to enter the default DRP field value of `medium` in RAs sent from the configuration mode interface by deleting the corresponding `ipv6 nd router-preference` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ipv6 nd router-preference RANK
no ipv6 nd router-preference
default ipv6 nd router-preference
```

**Parameters**

- **RANK**  Router preference value. Options include:
  - high
  - low
  - medium

**Example**

- This command configures the switch as a medium preference router on RAs sent from VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd router-preference medium
switch(config-if-Vl200)#
```
ipv6 neighbor

The `ipv6 neighbor` command creates an IPv6 neighbor discovery cache static entry. The command converts pre-existing dynamic cache entries for the specified address to static entries.

The `no ipv6 neighbor` and `default ipv6 neighbor` commands remove the specified static entry from the IPv6 neighbor discovery cache and delete the corresponding `ipv6 neighbor` command from `running-config`. These commands do not affect any dynamic entries in the cache.

**Command Mode**

Global Configuration

**Command Syntax**

```
ipv6 neighbor ipv6_addr PORT mac_addr
no ipv6 neighbor ipv6_address PORT
default ipv6 neighbor ipv6_addr PORT
```

**Parameters**

- `ipv6_addr` Neighbor’s IPv6 address.
- `PORT` Interface through which the neighbor is accessed. Options include:
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-channel interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
  - `vxlan vx_num` VXLAN interface specified by `vx_num`.
- `mac_addr` Neighbor’s data-link (hardware) address. (48-bit dotted hex notation – H.H.H).

**Example**

- This command will add a static entry to the neighbor discovery cache for the neighbor located at 3100:4219::3EF2 with hardware address 0100.4EA1.B100 and accessible through VLAN 200.
  ```
  switch(config)#ipv6 neighbor 3100:4219::3EF2 vlan 200 0100.4EA1.B100
  switch(config)#
  ```
ipv6 neighbor cache persistent

The `ipv6 neighbor cache persistent` command restores the IPv6 neighbor cache after reboot.

The `no ipv6 neighbor cache persistent` and `default ipv6 neighbor cache persistent` commands remove the ARP cache persistant configuration from the `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ipv6 neighbor cache persistent
no ipv6 neighbor cache persistent
default ipv6 neighbor cache persistent
```

**Example**

- This command restores the ipv6 neighbor cache after reboot.

```
switch(config)# ipv6 neighbor cache persistent
switch(config)#
```
**ipv6 route**

The `ipv6 route` command creates an IPv6 static route. The destination is a IPv6 prefix; the source is an IPv6 address or a routable interface port. When multiple routes exist to a destination prefix, the route with the lowest administrative distance takes precedence.

By default, the administrative distance assigned to static routes is 1. Assigning a higher administrative distance to a static route configures it to be overridden by dynamic routing data. For example, a static route with a distance value of 200 is overridden by OSPF intra-area routes, which have a default distance of 110.

The command provides these methods of designating the nexthop location:

- **null0**: Traffic to the specified destination is dropped.
- **IPv6 gateway**: Switch identifies egress interface by recursively resolving the next-hop.
- **Egress interface**: Switch assumes destination subnet is directly connected to interface; when routing to any subnet address, the switch sends an ARP request to find the MAC address for the first packet.
- **Combination Egress interface and IPv6 gateway**: Switch does not assume subnet is directly connected to interface; the only ARP traffic is for the nexthop address for the first packet on the subnet. Combination routes are not recursively resolved.

Multiple routes that are configured to the same destination with the same administrative distance comprise an Equal Cost Multi-Path (ECMP) route. The switch attempts to spread outbound traffic across all ECMP route paths equally. All ECMP paths are assigned the same tag value; commands that change the tag value of any ECMP path change the tag value of all paths in the ECMP.

The `no ipv6 route` and `default ipv6 route` commands delete static routes by removing the corresponding `ipv6 route` statements from `running-config`. Commands not including a source delete all statements to the destination. Only statements with parameters that match specified command arguments are deleted. Parameters that are not in the command line are not evaluated.

**Command Mode**
Global Configuration

**Command Syntax**

```
ipv6 route dest_prefix NEXTHOP [DISTANCE] [TAG_OPT] [RT_NAME]
no ipv6 route dest_prefix [nexthop_addr] [DISTANCE]
default ipv6 route dest_prefix [nexthop_addr] [DISTANCE]
```

**Parameters**

- **dest_prefix**  destination IPv6 prefix (CIDR notation).
- **NEXTHOP**  Access method of next hop device. Options include:
  - **null0**  Null0 interface – route is dropped.
  - **nexthop_addr**  IPv6 address of nexthop device.
  - **ethernet e_num**  Ethernet interface specified by `e_num`.
  - **loopback l_num**  Loopback interface specified by `l_num`.
  - **management m_num**  Management interface specified by `m_num`.
  - **port-channel p_num**  Port-channel interface specified by `p_num`.
  - **vlan v_num**  VLAN interface specified by `v_num`.
  - **vxlan vx_num**  VXLAN interface specified by `vx_num`.
  - **ethernet e_num nexthop_addr**  Combination route (Ethernet interface and gateway).
IPv6 Commands

Chapter 29: IPv6

- **loopback** `l_num nexthop_addr` Combination route (loopback interface and gateway).
- **management** `m_num nexthop_addr` Combination route (management interface and gateway).
- **port-channel** `p_num nexthop_addr` Combination route (port channel interface and gateway).
- **vlan** `v_num nexthop_addr` Combination route (VLAN interface and gateway).
- **vxlan** `vx_num nexthop_addr` Combination route (VXLAN interface and gateway)

- **DISTANCE** administrative distance assigned to route. Options include:
  - `<no parameter>` route assigned default administrative distance of one.
  - `<1 to 255>` The administrative distance assigned to route.

- **TAG_OPT** static route tag. Options include:
  - `<no parameter>` assigns default static route tag of 0.
  - `tag <0 to 4294967295>` Static route tag value.

- **RT_NAME** Associates descriptive text to the route. Options include:
  - `<no parameter>` No text is associated with the route.
  - `name descriptive_text` The specified text is assigned to the route.

**Example**

- This command creates an IPv6 static route.

```
switch(config)#ipv6 route 10:23:31:00:01:32:93/24 vlan 300
```
ipv6 unicast-routing

The `ipv6 unicast-routing` command enables the forwarding of IPv6 unicast packets. When routing is enabled, the switch attempts to deliver inbound packets to destination addresses by forwarding them to interfaces or next hop addresses specified by the IPv6 routing table.

The `no ipv6 unicast-routing` and default `ip ipv6 unicast-routing` commands disable IPv6 unicast routing by removing the `ipv6 unicast-routing` command from `running-config`. Dynamic routes added by routing protocols are removed from the routing table. Static routes are preserved by default; the `delete-static-routes` option removes static entries from the routing table.

IPv6 unicast routing is disabled by default.

**Command Mode**
Global Configuration

**Command Syntax**

```
ipv6 unicast-routing
no ipv6 unicast-routing [DELETE_ROUTES]
default ipv6 unicast-routing [DELETE_ROUTES]
```

**Parameters**

- `DELETE_ROUTES` Resolves routing table static entries when routing is disabled.
- `<no parameter>` Routing table retains static entries.
- `delete-static-routes` Static entries are removed from the routing table.

**Example**

- This command enables IPv6 unicast-routing.

  ```
  switch(config)#ipv6 unicast-routing
  switch(config)#
  ```
ipv6 verify

The `ipv6 verify` command configures Unicast Reverse Path Forwarding (uRPF) for inbound IPv6 packets on the configuration mode interface. uRPF verifies the accessibility of source IP addresses in packets that the switch forwards.

uRPF defines two operational modes: strict mode and loose mode.

- **Strict mode**: uRPF also verifies that a packet is received on the interface that its routing table entry specifies for its return packet.
- **Loose mode**: uRPF validation does not consider the inbound packet’s ingress interface.

The `no ipv6 verify` and `default ipv6 verify` commands disable uRPF on the configuration mode interface by deleting the corresponding `ipv6 verify` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ipv6 verify unicast source reachable-via RPF_MODE
no ipv6 verify unicast
default ipv6 verify unicast
```

**Parameters**

- **RPF_MODE**  Specifes the uRPF mode. Options include:
  - **any**  Loose mode.
  - **rx**  Strict mode
  - **rx allow-default**  Strict mode. All inbound packets are forwarded if a default route is defined.

**Guidelines**

The first IPv6 uRPF implementation briefly disables IPv6 unicast routing. Subsequent `ip verify` commands on any interface do not disable IPv6 routing.

**Example**

- This command enables uRPF strict mode on VLAN interface 100. When a default route is configured on the interface, all inbound packets are checked as valid.
  ```
  switch(config)#interface vlan 100
  switch(config-if-Vl100)#ipv6 verify unicast source reachable-via rx allow-default
  switch(config-if-Vl100)#show active
  interface Vlan100
  ipv6 verify unicast source reachable-via rx allow-default
  switch(config-if-Vl100)#
  ```
**pim ipv6 sparse-mode**

The *pim ipv6 sparse-mode* command enables PIM Sparse Mode (PIM-SM) and IGMP (router mode) on the configuration mode interface.

---

**Important!** PIM and multicast border router (MBR) must be mutually exclusive on an interface. If the interface is configured as an MBR, do not enable PIM on the interface.

The *no pim ipv6 sparse-mode* and *default pim ipv6 sparse-mode* commands restore the default PIM and IGMP (router mode) settings of *disabled* on the configuration mode interface by removing the *pim ipv6 sparse-mode* command from *running-config*.

---

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
```
pim ipv6 sparse-mode
no pim ipv6
no pim ipv6 sparse-mode
default pim ipv6
default pim ipv6 sparse-mode
```

**Example**
- This command enables PIM ipv6 sparse mode on VLAN 4 interface.

```
switch(config)#interface vlan 4
switch(config-if-Vl4)#pim ipv6 sparse-mode
switch(config-if-Vl4)#
```
**show ipv6 dhcp relay counters**

The `show ipv6 dhcp relay counters` command displays the number of DHCP packets received, forwarded, or dropped on the switch and on all interfaces enabled as DHCP relay agents.

**Command Mode**

EXEC

**Command Syntax**

`show ipv6 dhcp relay counters`

**Example**

- This command displays the IP DHCP relay counter table.

```plaintext
switch>show ipv6 dhcp relay counters

<table>
<thead>
<tr>
<th>Interface</th>
<th>Rcvd</th>
<th>Fwdd</th>
<th>Drop</th>
<th>Last Cleared</th>
</tr>
</thead>
<tbody>
<tr>
<td>All Req</td>
<td>376</td>
<td>376</td>
<td>0</td>
<td>4 days, 19:55:12 ago</td>
</tr>
<tr>
<td>All Resp</td>
<td>277</td>
<td>277</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>Ethernet4</td>
<td>207</td>
<td>148</td>
<td>0</td>
<td>4 days, 19:54:24 ago</td>
</tr>
</tbody>
</table>

switch>
```
show ipv6 dhcp snooping

The `show ipv6 dhcp snooping` command displays information about the DHCP snooping configuration.

**Command Mode**

EXEC

**Command Syntax**

```text
switch# show ipv6 dhcp snooping
```

**Related Commands**

- `ipv6 dhcp snooping`
- `ipv6 dhcp relay always-on`
- `ipv6 dhcp relay destination`
- `ipv6 dhcp relay option link-layer address`
- `show ipv6 dhcp relay counters`
- `show ipv6 dhcp snooping counters`
- `show ipv6 dhcp snooping hardware`
- `clear ipv6 dhcp snooping counters`

**Example**

This command displays the switch’s DHCP snooping configuration.

```text
switch# show ipv6 dhcp snooping
DHCPv6 Snooping is enabled
DHCPv6 Snooping is operational
DHCPv6 Snooping is configured on following VLANs: 2789-2790
DHCPv6 Snooping is operational on following VLANs: 2789
Insertion of Option-37 is enabled
```
show ipv6 dhcp snooping counters

The `show ipv6 dhcp snooping counters` command displays counters that track the quantity of DHCP request and reply packets that the switch receives. Data is either presented for each VLAN or aggregated for all VLANs with counters for packets dropped.

Command Mode

EXEC

Command Syntax

```
switch# show ipv6 dhcp snooping counters [COUNTER_TYPE]
```

Parameters

- **COUNTER_TYPE** The type of counter that the command displays.
- `<no parameter>` command displays counters for each VLAN.
- `debug` command displays aggregate counters and drop cause counters.

Examples

- This command displays the number of DHCP packets sent and received on each VLAN.
  ```
  switch# show ipv6 dhcp snooping counters
  |
  Vlan | Dhcpv6 Request Pkts | Dhcpv6 Reply Pkts |
  -----|--------- ------ -------|
  2789 |     1      1      0 |     1     1     0 |
  |
  Last Cleared: 0:03:09 ago
  ```

- This command displays the number of DHCP packets sent on the switch.
  ```
  switch# show ipv6 dhcp snooping counters debug
  |
  Vlan | COUNTER | Snooping to Relay Relay to Snooping |
  -----|--------- |----------------- |-----------------|
  2789 | Received | 1                1 |
  2789 | Forwarded| 1                1 |
  2789 | Dropped - Invalid VlanId | 0 | 0 |
  2789 | Dropped - Parse error | 0 | 0 |
  2789 | Dropped - Invalid Dhcp Opty | 0 | 0 |
  2789 | Dropped - Invalid Remote-ID Option | 0 | 0 |
  2789 | Dropped - Snooping disabled | 0 | 0 |
  |
  Last Cleared: 0:04:29 ago
show ipv6 dhcp snooping hardware

The `show ipv6 dhcp snooping hardware` command displays internal hardware DHCP snooping status on the switch.

**Command Mode**

EXEC

**Command Syntax**

`switch# show ipv6 dhcp snooping hardware`

**Example**

This command displays DHCP snooping hardware status.

```
switch# show ipv6 dhcp snooping hardware
DHCPv6 Snooping is enabled
DHCPv6 Snooping is enabled on following VLANs:
  2789
  Vlans enabled per Slice
    Slice: Linecard0-0
        2789
    Slice: Linecard0-1
        2789
    Slice: Linecard0-2
        2789
    Slice: Linecard0-3
        2789
```
show ipv6 hardware fib aggregate-address

The `show ipv6 hardware fib aggregate-address` command displays the IPv6 prefixes that are restricted from entry into the hardware routing table. The `ipv6 hardware fib aggregate-address` command configures IPv6 prefix restrictions.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 address fib aggregate-address [ADDRESS] [RESTRICTION]
```

**Parameters**

- **ROUTE_FILTER** filters by IPv6 address. Options include:
  - `<no parameter>` Displays all routes.
  - `ipv6_addr` Command displays only specified address.
  - `ipv6_prefix` Command displays addresses filtered by specified prefix (CIDR notation).
- **RESTRICTION** filters by route restriction.
  - `<no parameter>` displays routes restricted from the hardware routing table.
  - `software-forward` displays routes restricted from the hardware routing table.

**Example**

- This command displays the routes that are restricted from the hardware routing table.

```
switch>show ipv6 hardware fib aggregate-address
Codes: S - Software Forwarded
S    fd77:4890:5313:aaed::/64
S    fd77:4890:5313:ffed::/64
switch>
```
show ipv6 interface

The `ipv6 interface` command displays the status of specified routed interfaces that are configured for IPv6.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 interface [INTERFACE_NAME] [INFO_LEVEL]
```

**Parameters**

- `INTERFACE_NAME` interfaces for which command displays status.
  - `<no parameter>` all routed interfaces.
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-Channel Interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
  - `vxlan vx_num` VXLAN interface specified by `vx_num`.
- `INFO_LEVEL` amount of information that is displayed. Options include:
  - `<no parameter>` command displays data block for each specified interface.
  - `brief` command displays table that summarizes IPv6 interface data.

**Example**

- This command displays the status of VLAN 903.

```
switch>show ipv6 interface vlan 903
Vlan903 is up, line protocol is up (connected)
  IPv6 is enabled, link-local is fe80::21c:73ff:fe01:21e/64
  Global unicast address(es):
    fd7a:629f:52a4:fe10::3, subnet is fd7a:629f:52a4:fe10::/64
  Joined group address(es):
    ff02::1
    ff02::1:ff01:21e
    ff02::1:ff00:3
    ff01::2
switch>
```
show ipv6 nd ra internal state

The `ipv6 nd ra internal state` command displays the state of the IPv6 Router Advertisement (RA) daemon for the specified routable interface.

**Command Mode**
EXEC

**Command Syntax**
```plaintext
show ipv6 nd ra internal state [INTERFACE_NAME]
```

**Parameters**
- `INTERFACE_NAME` interfaces for which command displays status.
  - `<no parameter>` all routed interfaces.
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-Channel Interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
  - `vxlan vx_num` VXLAN interface specified by `vx_num`.

**Example**
- This command displays the IPv6 RA daemon for VLAN interface 1243.

```
switch>show ipv6 nd ra internal state vlan 1243
INTERFACE: Vlan3908
  ifindex : 0x00000021
  mtu : 9212
  numIpv6Addr : 2
  numPrefixToAdvertise : 0
  numPrefixToSuppress : 0
  RaSuppress : 0
  RsRspSuppress : 0
  raIntervalMaxMsec : 200000
  raIntervalMinMsec : 0
  managedConfigFlag : 0
  otherConfigFlag : 0
  raMtuSuppress : 0
  raLifetimemin : 0
  routerPreference : 0
  lastRaTime : 2012-05-01 09:22:57.020634
  lastRsRspSentTime : 171.474535 (sec)
  raNotSentIntfNotReady : 0
  numRsRcvd : 0
  numRsSuppressed : 0
  numRsRspSent : 219
  numRsDroppedInvalidHopLimit : 0
  numPktDroppedUnexpectedType : 0
  initialized : 1
```

switch>
show ipv6 neighbors

The `show ipv6 neighbors` command displays the IPv6 neighbor discovery cache. The command provides filters to restrict the list to a specified IPv6 address or routable interface.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 neighbors [PORT] [SOURCE] [INFO_LEVEL]
```

**Parameters**

- **PORT** Filters by interface through which neighbor is accessed. Options include:
  - <no parameter> all routed interfaces.
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-channel interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
  - `vxlan vx_num` VXLAN interface specified by `vx_num`.
- **SOURCE** Filters by neighbor IPv6 address. Options include:
  - <no parameter> all IPv6 neighbors.
  - `ipv6_addr` IPv6 address of individual neighbor.
- **INFO_LEVEL** amount of information that is displayed. Options include:
  - <no parameter> command displays the discovery cache for the specified interfaces.
  - `summary` command displays summary information only.

**Example**

- This command displays the IPv6 neighbor discovery cache for IPv6 address `fe80::21c:73ff:fe01:5fe1`.

```
switch> show ipv6 neighbors fe80::21c:73ff:fe01:5fe1
IPv6 Address       Age   Hardware Addr    State  Interface
fe80::21c:73ff:fe01:5fe1  0    001c.d147.8214  REACH  Et12
fe80::21c:73ff:fe01:5fe1  0    001c.d147.8214  REACH  Po999
fe80::21c:73ff:fe01:5fe1  0    001c.d147.8214  REACH  Vl102
fe80::21c:73ff:fe01:5fe1  0    001c.d147.8214  REACH  Vl110
fe80::21c:73ff:fe01:5fe1  0    001c.d147.8214  REACH  Vl120
fe80::21c:73ff:fe01:5fe1  0    001c.d147.8214  REACH  Vl127
fe80::21c:73ff:fe01:5fe1  0    001c.d147.8214  REACH  Vl3901

fe80::21c:73ff:fe01:5fe1  0    001c.d147.8214  REACH  Vl3996
```
**show ipv6 route**

The `show ipv6 route` command displays IPv6 routing table entries that are in the Forwarding Information Base (FIB), including static routes, routes to directly connected networks, and dynamically learned routes. Multiple equal cost paths to the same prefix are displayed contiguously as a block, with the destination prefix displayed only on the first line.

The `show running-config` command displays all configured routes.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 route [ADDRESS] [ROUTE_TYPE] [INFO_LEVEL]
```

**Parameters**

Address, when present, is always listed first. All other parameters can be placed in any order.

- **ADDRESS** filters routes by IPv6 address or prefix.
  - `<no parameter>` all routing table entries.
  - `ipv6_address` routing table entries matching specified IPv6 address.
  - `ipv6_prefix` routing table entries matching specified IPv6 prefix (CIDR notation).
- **ROUTE_TYPE** filters routes by specified protocol or origin.
  - `<no parameter>` all routing table entries.
  - `aggregate` entries for BGP aggregate routes.
  - `bgp` entries added through BGP protocol.
  - `connected` entries for routes to networks directly connected to the switch.
  - `kernel` entries appearing in Linux kernel but not added by EOS software.
  - `isis` entries added through IS-IS protocol.
  - `ospf` entries added through OSPF protocol.
  - `static` entries added through CLI commands.
- **INFO_LEVEL** Filters entries by next hop connection.
  - `<no parameter>` filters routes whose next hops are directly connected.
  - `detail` displays all routes.

**Example**

- This command displays a route table entry for a specific IPv6 route.
  ```
switch>show ipv6 route fd7a:3418:52a4:fe18::/64
IPv6 Routing Table - 77 entries
Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP, R - RIP, A - Aggregate
  O  fd7a:3418:52a4:fe18::/64 [10/20]
      via fe80::21c:73ff:fe00:1319, Vlan3601
      via fe80::21c:73ff:fe00:1319, Vlan3602
      via fe80::21c:73ff:fe00:1319, Vlan3608
      via fe80::21c:73ff:fe0f:6a80, Vlan3610
      via fe80::21c:73ff:fe00:1319, Vlan3611

switch>
```
show ipv6 route age

The `show ipv6 route age` command displays the IPv6 route age to the specified IPv6 address or prefix.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 route ADDRESS age
```

**Parameters**

- `ADDRESS` filters routes by IPv6 address or prefix.

**Example**

- This command displays the route age for the specified prefix.

```
switch> show ipv6 route 2001::3:0/11 age
IPv6 Routing Table - 74 entries
Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP, R - RIP, A - Aggregate

C 2001::3:0/11 age 00:02:34
switch>
```
show ipv6 route host

The show ipv6 route host command displays all host routes in the IPv6 host forwarding table. Host routes are those whose destination prefix is the entire address (prefix = /128). Each displayed host route is labeled with its purpose:

- **F** static routes from the FIB.
- **R** routes defined because the IP address is an interface address.
- **A** routes to any neighboring host for which the switch has an ARP entry.

**Command Mode**

EXEC

**Command Syntax**

`show ipv6 route host`

**Example**

- This command displays all IPv6 host routes in the host forwarding table.

```plaintext
switch>show ipv6 route host
R - receive F - FIB, A - attached

F ::1 to cpu
A fee7:48a2:0c11:1900:400::1 on Vlan102
R fee7:48a2:0c11:1900:400::2 to cpu
F fee7:48a2:0c11:1a00::b via fe80::21c:73ff:fe0b:a80e on Vlan3902
R fee7:48a2:0c11:1a00::17 to cpu
F fee7:48a2:0c11:1a00::20 via fe80::21c:73ff:fe0b:33e on Vlan3913
F fee7:48a2:0c11:1a00::22 via fe80::21c:73ff:fe01:5fe1 on Vlan3908
  via fe80::21c:73ff:fe01:5fe1 on Vlan3902

switch>
```
show ipv6 route interface

The `show ipv6 route interface` command displays routing table entries on a specified routed port.

**Command Mode**

EXEC

**Command Syntax**

`show ipv6 route [ADDRESS] interface PORT_NAME [INFO_LEVEL]`

**Parameters**

- `ADDRESS`, when present, is always listed first. All other parameters can be placed in any order.
  - `ADDRESS` filters routes by IPv6 address or prefix.
    - <no parameter> all routing table entries.
    - `ipv6_address` routing table entries matching specified IPv6 address.
    - `ipv6_prefix` routing table entries matching specified IPv6 prefix (CIDR notation).
  - `PORT_NAME` interfaces for which command displays status.
    - `ethernet e_num` Ethernet interface specified by `e_num`.
    - `loopback l_num` Loopback interface specified by `l_num`.
    - `management m_num` Management interface specified by `m_num`.
    - `port-channel p_num` Port-Channel Interface specified by `p_num`.
    - `vlan v_num` VLAN interface specified by `v_num`.
    - `vxlan vx_num` VXLAN interface specified by `vx_num`.
  - `INFO_LEVEL` filters entries by next hop connection.
    - <no parameter> filters routes whose next hops are directly connected.
    - `detail` displays all routes.

**Example**

- This command displays the IPv6 routes in VLAN interface 661.
  
  `switch>show ipv6 route interface ethernet 8`
  IPv6 Routing Table - 77 entries
  Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP, R - RIP, A - Aggregate

      O  fd7a:629f:63af:1232::/64 [150/11]
        via fe80::823c:73ff:fe00:3640, Ethernet8

      C  fd7a:629f:63af:fe88::/64 [0/1]
        via ::, Ethernet12
      O  fd7a:629f:63af:fe8c::/64 [10/20]
        via fe80::21c:73ff:fe00:3640, Ethernet8
      C  fe80:0:40::/64 [0/1]
        via ::, Ethernet8
**show ipv6 route match tag**

The `show ipv6 route match tag` command displays the route tag assigned to the specified IPv6 address or prefix. Route tags are added to static routes for use by route maps.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 route ADDRESS match tag
```

**Parameters**

- `ADDRESS` filters routes by IPv6 address or prefix.
  - `ipv6_address` routing table entries matching specified address (A:B:C:D:E:F:G:H)

**Example**

- This command displays the route tag for the specified prefix.
  
  ```
  switch>show ipv6 route 2001:0DB8::/64 match tag
  IPv6 Routing Table - 74 entries
  Codes: C - connected, S - static, K - kernel, O3 - OSPFv3, B - BGP, R - RIP, A B - BGP Aggregate, I L1 - IS-IS level 1, I L2 - IS-IS level 2, DH - DHCP, NG - Nexthop Group Static Route, M - Martian, DP - Dynamic Policy Route, L - VRF Leaked
  
  C 2001:0DB8::/64 tag 0
  
  switch>
  ```
show ipv6 route summary

The show ipv6 route summary command displays the information about the IPv6 routing table.

Command Mode
EXEC

Command Syntax
show ipv6 route summary

Example
- This command displays the route source and the corresponding number of routes in the IPv6 routing table.

```plaintext
switch>show ipv6 route summary
Route Source    Number Of Routes
------------------ --------------------
connected         2
static            0
ospf               5
bgp                7
isis              0
internal          1
attached          0
aggregate         2

Total Routes      17
switch>
```
show platform fap mroute ipv6

The show platform fap mroute ipv6 command enables PIM Sparse Mode (PIM-SM) and IGMP (router mode) on the configuration mode interface.

Command Mode

EXEC

Command Syntax

show platform

Example

• This command enables PIM sparse mode on VLAN 4 interface.

```
router# show platform fap mroute ipv6
Jericho0 Multicast Routes:
--------------------------
        Location      GroupId       Group               Source         IIF      McId    OIF
        FLP/TT       FLP/TT     TT               FLP            FLP      FLP     FLP
-----------------------------------------------------------------------------------------------
            4096/2048    1/1     ff33::1:0:0:23/128  101:1::2/128   Vlan1357 21504   Vlan1044(Et7/1) Vlan1123(Et9/1)
                          Vlan1200(Et8/1) Vlan1223(Et2/1) Vlan1226(Et5/1) Vlan1232(Et3/1) Vlan1307(Et6/1) Vlan1337(Et4/1)
```
**show rib route ipv6**

The *show rib route ipv6* command displays a list of IPv6 Routing Information Base (RIB) routes.

**Command Mode**
EXEC

**Command Syntax**
```
show rib route ipv6 [vrf vrf_name] [PREFIX] [ROUTE TYPE]
```

**Parameters**
- `vrf vrf_name` displays RIB routes from the specified VRF.
- `PREFIX` displays routes filtered by the specified IPv6 information. Options include:
  - `ipv6_address` displays RIB routes filtered by the specified IPv6 address.
  - `ipv6_subnet_mask` displays RIB routes filtered by the specified IPv6 address and subnet mask.
  - `ipv6_prefix` displays RIB routes filtered by the specified IPv6 prefix.
- `ROUTE TYPE` displays routes filtered by the specified route type. Options include:
  - `bgp` displays RIB routes filtered by BGP.
  - `connected` displays RIB routes filtered by connected routes.
  - `dynamicPolicy` displays RIB routes filtered by dynamic policy routes.
  - `host` displays RIB routes filtered by host routes.
  - `isis` displays RIB routes filtered by ISIS routes.
  - `ospf` displays RIB routes filtered by OSPF routes.
  - `ospf3` displays RIB routes filtered by OSPF3 routes.
  - `reserved` displays RIB routes filtered by reserved routes.
  - `route-input` displays RIB routes filtered by route-input routes.
  - `static` displays RIB routes filtered by static routes.

**Examples**
- This command displays IPv6 RIB BGP routes.

```
switch# show rib route ipv6 bgp
VRF name: default, VRF ID: 0xfe, Protocol: bgp
Codes: C - Connected, S - Static, P - Route Input
   B - BGP, O - Osfp, O3 - Osfp3, I - Isis
   > - Best Route, * - Unresolved Nexthop
 L - Part of a recursive route resolution loop
B  2001:10:1::/64 [200/42]
   via 2001:10:1::100 [0/1]
      via Ethernet1, directly connected
>B  2001:10:100::/64 [200/200]
   via 2001:10:1::100 [0/1]
      via Ethernet1, directly connected
>B  2001:10:100:1::/64 [200/0]
   via 2001:10:1::100 [0/1]
      via Ethernet1, directly connected
>B  2001:10:100:2::/64 [200/42]
   via 2001:10:1::100 [0/1]
      via Ethernet1, directly connected
switch#
```
• This command displays IPv6 RIB connected routes.

```
switch# show rib route ipv6 connected
VRF name: default, VRF ID: 0xfe, Protocol: connected
Codes: C - Connected, S - Static, P - Route Input
       B - BGP, O - Ospf, O3 - Ospf3, I - Isis
       > - Best Route, * - Unresolved Nexthop
       L - Part of a recursive route resolution loop

>C  2001:10:1::/64 [0/1]
    via 2001:10:1::102, Ethernet1
>C  2001:10:2::/64 [0/1]
    via 2001:10:2::102, Ethernet2
>C  2001:10:3::/64 [0/1]
    via 2001:10:3::102, Ethernet3
```

switch#
Traffic Management

This chapter describes Arista’s Traffic Management, including configuration instructions and command descriptions. Topics covered by this chapter include:

- Section 30.1: Traffic Management Conceptual Overview
- Section 30.2: Traffic Management Configuration – Arad Platform Switches
- Section 30.3: Traffic Management Configuration – FM6000 Platform Switches
- Section 30.4: Traffic Management Configuration – Petra Platform Switches
- Section 30.5: Traffic Management Configuration – Trident Platform Switches
- Section 30.6: Traffic Management Configuration – Trident II Platform Switches
- Section 30.7: Traffic Management Configuration Commands
Traffic Management Conceptual Overview

Traffic is managed through policy maps that apply data shaping methods to specific data streams. A policy map is a data structure that identifies specific data streams and then defines shaping parameters that modify packets within the streams. The switch defines three types of policies:

- **Section 30.1.1: Control Plane Policies**: Control plane policy maps are applied to the control plane.
- **Section 30.1.2: QoS Policies**: QoS policy maps are applied to Ethernet and port channel interfaces.
- **Section 30.1.3: PBR Policies**: PBR policy maps are applied to Ethernet interfaces, port channel interfaces and switch virtual interfaces (SVIs).
- **Section 30.1.4: PDP Policies**: PDP policy maps are assigned to Ethernet interfaces.

**Note**

PDP is available only in EOS versions 4.19.0F and above.

A policy map consists of classes. Each class contains an eponymous class map and traffic resolution commands.

- A class map is a data structure that defines a data stream by specifying characteristics of data packets that comprise that stream. Each class map is typed as either QoS, control plane, PBR, or PDP and is available only to identically typed policy maps.
- Traffic resolution commands specify data handling methods for traffic that matches a class map. Traffic resolution options vary by policy map type.

Data packets that enter an entity to which a policy map is assigned are managed with traffic resolution commands of the first class that matches the packets.
30.1.1 Control Plane Policies

The switch defines one control plane policy map named `copp-system-policy`. The `copp-system-policy` policy map is always applied to the control plane and cannot be removed from the switch. Other control plane policy maps cannot be added. `copp-system-policy` consists of preconfigured classes, each containing a static class map and traffic resolution commands. Preconfigured classes cannot be removed from `copp-system-policy`.

Static class maps are provided by the switch and cannot be modified or deleted. The naming convention of static class maps is `copp-system-name`, where `name` differentiates the class maps. Static class maps have pre-defined internal conditions, are not based on ACLs, and are only listed in `running-config` as components of `copp-system-policy`. The sequence of static class maps in the policy map is not significant. Traffic resolution commands define minimum (bandwidth) and maximum (shape) transmission rates for data streams matching the corresponding class map.

`Copp-system-policy` can be modified through the following steps:

- Add classes consisting of an eponymous dynamic class map and traffic resolution commands. Dynamic class maps are user created, can be edited or deleted, filter traffic with a single IPv4 ACL, and are listed in `running-config`.
- Change traffic resolution commands for a preconfigured class.

These sections describe control plane traffic policy configuration procedures:

- Section 30.2.1: Configuring Control Plane Traffic Policies – Arad Platform Switches
- Section 30.3.1: Configuring Control Plane Traffic Policies – FM6000 Platform Switches
- Section 30.4.1: Configuring Control Plane Traffic Policies – Petra Platform Switches
- Section 30.5.1: Configuring Control Plane Traffic Policies – Trident Platform Switches

30.1.2 QoS Policies

QoS policy maps are user defined. The switch does not provide preconfigured QoS policy maps and in the default configuration, policy maps are not applied to any Ethernet or port channel interface. Policy maps and class maps are created and applied to interfaces through configuration commands.

A QoS policy map is composed of one or more classes. Each class contains an eponymous dynamic class map and traffic resolution commands. Dynamic class maps are user created, can be edited or deleted, filter traffic with a single IPv4 ACL, and are listed in `running-config`.

QoS traffic resolution commands perform one of the following:

- Set the layer 2 CoS field
- Set the DSCP value in the ToS byte
- Specify a traffic class queue

The last class in all QoS policy maps is `class-default`, which is composed as follows:

- The `class-default` class map matches all traffic except IPv4 or IPv6 traffic and is not editable.
- By default, `class-default` class contains no traffic resolution commands. Traffic resolution commands can be added through configuration commands.

Data packets that enter an interface to which a policy map is assigned are managed with traffic resolution commands that correspond to the first class that matches the packet.

These sections describe QoS traffic policy configuration procedures:

- Section 30.2.2: Configuring QoS Traffic Policies – Arad Platform Switches.
30.1.3 PBR Policies

Policy-Based Routing (PBR) allows the operator to specify the next hop for selected incoming packets on an L3 interface, overriding the routing table. Incoming packets are filtered through a policy map referencing one or more ACLs, and matching packets are routed to the next hop specified.

A PBR policy map is composed of one or more classes and can include next-hop information for each class. It can also include single-line raw match statements, which have the appearance and function of a single line from an ACL. Each class contains an eponymous class map. Class maps are user-created, can be edited or deleted, filter traffic using IPv4 ACLs, and are listed in running-config.

These sections describe PBR policy configuration procedures:

- Section 30.2.3: Configuring PBR Policies – Arad Platform Switches
- Section 30.3.3: Configuring PBR Policies – FM6000 Platform Switches
- Section 30.4.3: Configuring PBR Policies – Petra Platform Switches
- Section 30.5.3: Configuring PBR Policies – Trident Platform Switches

30.1.4 PDP Policies

Note

PDP is available only in EOS versions 4.19.0F and above.

Per-port Denial-of-service Protection (PDP) is a new, specialized, port-level packet classification and policing service, similar to the existing port-level QoS policy service, targeted specifically at identifying and rate limiting potential denial of service traffic.

Default policies and shared-policy support vary by platform:

- **Arad and Jericho platforms** only shared policies are supported.
- **FM6000 and XP** only unshared policies are supported
- **Trident II, Tomahawk, and Helix4** both shared and unshared policies are supported.

Creating a PDP policy and assigning it to an interface uses procedures similar to those for QoS, but with the following commands.

- To create an unshared PDP policy, use the `policy-map type pdp` command.
- To create a shared PDP policy, use the `policy-map type pdp` command with the `shared` keyword.
- To assign a policy to an input interface, use the `service-policy type pdp (Interface mode)` command in the configuration mode for the interface.
30.2 Traffic Management Configuration – Arad Platform Switches

Traffic policies are implemented by policy maps, which are applied to the control plane, or to L3 interfaces for Policy-Based Routing (PBR). Policy maps contain classes, which are composed of class maps and traffic resolution commands.

Section 30.1 describes traffic policies.

30.2.1 Configuring Control Plane Traffic Policies – Arad Platform Switches

Default control plane traffic policies are implemented automatically without user intervention. These policies are modified by associating traffic resolution commands with static classes that comprise the control plane policy map.

Static Class Maps

Control plane traffic policies utilize static class maps, which are provided by the switch, are not editable, and cannot be deleted.

Editing the Policy Map

The only control plane policy map is `copp-system-policy`, which cannot be deleted. In its default form, `copp-system-policy` consists of the classes listed in Table 30-1. Although the underlying class map of each class cannot be edited, the traffic resolution commands can be adjusted. The default classes cannot be removed from the policy map and their sequence within the policy map is not editable.

<table>

<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-sflow</td>
<td>2500</td>
<td>250</td>
</tr>
</tbody>
</table>
Policy maps are modified in policy-map configuration mode. The `policy-map type copp` command enters policy-map configuration mode.

**Example**
- This command enters policy-map configuration mode for editing `copp-system-policy`.
  ```
  switch(config)#policy-map type copp copp-system-policy
  switch(config-pmap-copp-system-policy)#
  ```

The `class (policy-map (control-plane) – Arad)` command enters policy-map-class configuration mode, where traffic resolution commands are modified for the configuration mode class.

**Example**
- This command enters policy-map-class configuration mode for the `copp-system-lacp static` class.
  ```
  switch(config-pmap-copp-system-policy)#class copp-system-lacp
  switch(config-pmap-c-copp-system-policy-copp-system-lacp)#
  ```

Two traffic resolution commands determine bandwidth parameters for class traffic:
- `bandwidth (policy-map-class (control-plane) – Arad)` specifies the minimum bandwidth.
- `shape (policy-map-class (control-plane) – Arad)` specifies the maximum bandwidth.

**Example**
- These commands configure a bandwidth range of 2000 to 4000 kilobits per seconds (kbps) for traffic filtered by the `copp-system-lacp class map`:
  ```
  switch(config-pmap-c-c copp-system-policy-copp-system-lacp)#bandwidth kbps 2000
  switch(config-pmap-c-c copp-system-policy-copp-system-lacp)#shape kbps 4000
  ```

Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the `exit` command or discarded with the `abort` command. The `show active` command displays the saved version of policy map. The `show pending` command displays the modified policy map.

**Example**
- These commands exit policy-map-class configuration mode, display the pending policy-map, then exit policy-map configuration mode, which saves the altered policy map to `running-config`.
  ```
  switch(config-pmap-c-c copp-system-policy-copp-system-lacp)#exit
  switch(config-pmap-c copp-system-policy)#show pending
  policy-map type copp copp-system-policy
  class copp-system-bpdu
  class copp-system-11dp
  class copp-system-lacp
  shape kbps 4000
  bandwidth kbps 2000
  class copp-system-13t11
  class copp-system-13slowpath
  ```

```
<----------OUTPUT OMITTED FROM EXAMPLE---------->
```

```
switch(config-pmap-copp-system-policy)#exit
switch(config)#
```
Applying Policy Maps to the Control Plane

The `copp-system-policy` policy map is always applied to the control plane. No commands are available to add or remove this assignment.

Displaying Policy Maps

The `show policy-map interface type qos` command displays the configured values of the policy map’s classes and the number of packets filtered and dropped as a result of the class maps.

Example

- These commands exit policy-map-class configuration mode, display the pending policy-map, then exit policy-map configuration mode, which saves the altered policy map to `running-config`.

```
switch(config)#show policy-map copp copp-system-policy
Service-policy input: copp-system-policy
Hardware programming status:InProgress

Class-map: copp-system-mlag (match-any)
  shape : 10000001 kbps
  bandwidth : 10000001 kbps
Out Packets : 0
Drop Packets : 0

Class-map: copp-system-bpdu (match-any)
  shape : 2604 kbps
  bandwidth : 1302 kbps
Out Packets : 0
Drop Packets : 0

Class-map: copp-system-lacp (match-any)
  shape : 4230 kbps
  bandwidth : 2115 kbps
Out Packets : 0
Drop Packets : 0

<--------OUTPUT OMITTED FROM EXAMPLE-------->
```

```
switch(config)#
```

```
switch(config-pmap-c-copp-system-policy-copp-system-lacp)#exit
```

30.2.2 Configuring QoS Traffic Policies – Arad Platform Switches.

QoS traffic policies are implemented by creating class maps and policy maps, then applying the policy maps to Ethernet and port channel interfaces.

Creating Class Maps

QoS traffic policies utilize dynamic class maps that are created and modified in class-map configuration mode. The `class-map type qos` command enters class-map configuration mode.

Example

- This command enters class-map configuration mode to create QoS class map named Q-CMap_1.

```
switch(config)#class-map type qos match-any Q-CMap_1
switch(config-cmap-Q-CMap_1)#
```
A class map contains one IPv4 access control list (ACL). The `match ip access-group` command assigns an ACL to the class map. Subsequent `match` commands replace the existing `match` command. Class maps filter traffic only on ACL permit rules. Deny ACL rules are disregarded.

**Example**

- This command adds the IPv4 ACL named ACL_1 to the class map.

```
switch(config-cmap-Q-CMap_1)#match ip access-group ACL_1
```

Class-map configuration mode is a group-change mode. Changes made in a group-change mode are saved by exiting the mode. The `show active` command displays the saved version of class map. The `show pending` command displays the unsaved class map.

**Example**

- The `show active` command indicates that the configuration mode class map is not stored in `running-config`. The `show pending` command displays the class map to be stored upon exiting class-map configuration mode.

```
switch(config-cmap-Q-CMap_1)#show active
switch(config-cmap-Q-CMap_1)#show pending
class-map type qos match-any Q-CMap_1
   match ip access-group ACL_1

switch(config-cmap-Q-CMap_1)#
```

The `exit` command returns the switch to global configuration mode and saves pending class map changes. The `abort` command returns the switch to global configuration mode and discards pending changes.

**Example**

- This command exits class-map configuration mode and stores pending changes to `running-config`.

```
switch(config-cmap-CP-CMAP_1)#exit
```

Policy maps are created and modified in policy-map configuration mode. The `policy-map type quality-of-service` command enters policy-map configuration mode.

**Example**

- This command places the switch in policy-map configuration mode and creates a QoS policy map named Q-PMAP_1.

```
switch(config)#policy-map type quality-of-service Q-PMAP_1
switch(config-pmap-Q-PMAP_1)#
```

Policy maps are edited by adding or removing classes. A class automatically contains its eponymous class map; traffic resolution commands are added or edited in policy-map-class configuration mode. The below command adds a class to the configuration mode policy map and places the switch in policy-map-class configuration mode, where traffic resolution commands are added to the class.
Example

- This command adds the Q-CMap_1 class to the Q-PMAP_1 policy map and places the switch in policy-map-class configuration mode.

```
switch(config-pmap-Q-PMAP_1)#class Q-CMap_1
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#
```

The `set cos` commands configure traffic resolution methods for data that passes the class map:

- `set cos` sets the layer 2 CoS field.
- `set dscp` sets the DSCP value in the ToS byte.
- `set traffic class` specifies a traffic class queue.

Example

- These commands configure the policy map to set the CoS field to 7 on packets filtered by the class map, then assigns those packets to traffic class 4.

```
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#set cos 7
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#set traffic-class 4
```

Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the `exit` command or discarded with the `abort` command. The `show active` and `show pending` commands display the saved and modified policy map versions, respectively.

Example

- These commands exit policy-map-class configuration mode, display the pending policy-map, then exit policy-map configuration mode to save the altered policy map to `running-config`.

```
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#exit
switch(config-pmap-Q-PMAP_1)#show pending
policy-map type quality-of-service Q-PMAP_1
class Q-CMap_1
  set cos 7
  set traffic-class 4

class class-default
```

The last class in all QoS policy maps is `class-default`. The `class-default` class map matches all traffic except IPv4 or IPv6 traffic and provides no traffic resolution commands. The `class-default` class map is not editable; traffic resolution commands can be added to the `class-default` class.

To modify traffic resolution commands for the `class-default` class, enter policy-map-class configuration mode for the class, then enter the desired `set` commands.
Example

- These commands enter policy-map-class configuration mode for class-default, configures the stream to enter traffic class 2, and saves the altered policy map to running-config.

  switch(config)#policy-map type quality-of-service Q-PMap_1
  switch(config-pmap-Q-PMap_1)#class class-default
  switch(config-pmap-c-Q-PMap_1-class-default)#set traffic-class 2
  switch(config-pmap-c-Q-PMap_1-class-default)#exit
  switch(config-pmap-Q-PMap_1)#exit
  switch(config)#show policy-map type qos Q-PMap_1

Service-policy Q-PMap_1

Class-map: Q-CMap_1 (match-any)
  Match: ipv6 access-group name ACLv6_1
     set cos 7
     set traffic-class 4

Class-map: class-default (match-any)
  set traffic-class 2

switch(config)#

Applying Policy Maps to an Interface

The service-policy type qos (Interface mode) command applies a specified policy map to the configuration mode interface.

- These commands apply PMAP-1 policy map to Ethernet interface 8.

  switch(config)#interface ethernet 8
  switch(config-if-Et8)#show active
  switch(config-if-Et8)#service-policy input PMAP-1
  switch(config-if-Et8)#show active
  interface Ethernet8
     service-policy type qos input PMAP-1
  switch(config-if-Et8)#

30.2.3 Configuring PBR Policies – Arad Platform Switches

Policy-Based Routing (PBR) is implemented by creating class maps and policy maps, then applying the policy maps to Ethernet interfaces, port channel interfaces or switch virtual interfaces (SVIs).

Creating PBR Class Maps

PBR policies utilize class maps that are created and modified in class-map configuration mode. The class-map type pbr command enters class-map configuration mode.

Example

- This command enters class-map configuration mode to create a PBR class map named CMAP1.

  switch(config)#class-map type pbr match-any CMAP1
  switch(config-cmap-PBR-CMAP1)#

A class map contains one or more access control lists (ACLs). The match (policy-map (pbr)) command assigns an ACL to the class map. Subsequent match commands add additional ACLs to the class map. Class maps filter traffic only on ACL permit rules. Deny ACL rules are disregarded; if a class map includes ACLs with deny rules, the configuration reverts to its previous state.
Example

- This command adds the ACL named ACL1 to the class map.
  
  switch(config-cmap-PBR-CMAP1)#match ip access-group ACL1
  switch(config-cmap-PBR-CMAP1)#

Class-map configuration mode is a group-change mode. Changes made in a group-change mode are saved by exiting the mode. The show active command displays the saved version of class map.

- The show active command indicates that the configuration mode class map is not stored in running-config.
  
  switch(config-cmap-PBR-CMAP1)#show active
  switch(config-cmap-PBR-CMAP1)#

The exit command returns the switch to global configuration mode and saves pending class map changes. The abort command returns the switch to global configuration mode and discards pending changes.

Example

- This command exits class-map configuration mode and stores pending changes to running-config.
  
  switch(config-cmap-PBR-CMAP1)#exit
  switch(config)#show class-map type pbr CMAP1
  class-map type pbr match-any CMAP1
      10 match ip access-group ACL1
  switch(config)#

Creating PBR Policy Maps

Policy maps are created and modified in policy-map configuration mode. The policy-map type pbr command enters policy-map configuration mode.

Example

- This command enters policy-map configuration mode for creating a PBR policy map named PMAP1.
  
  switch(config)#policy-map type pbr PMAP1
  switch(config-pmap-PMAP1)#

Policy map are edited by adding or removing classes. A class automatically contains its eponymous class map; next-hop commands are added or edited in policy-map-class configuration mode. The class (policy-map (pbr)) command adds a class to the configuration mode policy map and places the switch in policy-map-class configuration mode, where next-hop commands are added to the class.

Example

- This command adds the CMAP1 class to the policy map and places the switch in policy-map-class configuration mode.
  
  switch(config-pmap-PMAP1)#class CMAP1
  switch(config-pmap-c-PMAP1-CMAP1)#

The set nexthop (policy-map-class – pbr) command configures the next hop for data that passes the class map.

- This command configures the policy map to set the next hop to 10.12.0.5 on packets filtered by the class map.
  
  switch(config-pmap-c-PMAP1-CMAP1)#set nexthop 10.12.0.5
  switch(config-pmap-c-PMAP1-CMAP1)#
The `set nexthop-group (policy-map-class(pbr) – Arad)` command configures a nexthop group as the next hop for data that passes the class map.

- These commands configure the policy map PMAP1 to set the next hop to a nexthop group named GROUP1 for traffic defined by class map CMAP1.

```
switch(config)#policy-map type pbr PMAP1
switch(config-pmap-PMAP1)#class CMAP1
switch(config-pmap-c-PMAP1-CMAP1)#set nexthop-group GROUP1
switch(config-pmap-c-PMAP1-CMAP1)#
```

Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the `exit` command or discarded with the `abort` command. The `show active` command displays the currently saved map version.

**Example**

- These commands exit policy-map-class configuration mode, then exit policy-map configuration mode to save the altered policy map to `running-config`.

```
switch(config-pmap-c-PMAP1-CMAP1)#exit
switch(config-pmap-PMAP1)#exit
switch(config)#
```

**Applying a PBR Policy Map to an Interface**

The `service-policy type pbr (Interface mode)` command applies the specified PBR policy map to the configuration mode interface. Only one PBR service policy is supported per interface.

- These commands apply the PMAP1 PBR policy map to Ethernet interface 8.

```
switch(config)#interface ethernet 8
switch(config-if-Et8)#service-policy type pbr input PMAP1
switch(config-if-Et8)#
```

**Hardware Decapsulation**

When hardware decapsulation takes place, PBR policy maps on Arad platform switches match on outer packet headers (i.e., they match based on the attributes of the packet before it is decapsulated).
Chapter 30: Traffic Management

30.3 Traffic Management Configuration – FM6000 Platform Switches

Traffic policies are implemented by policy maps, which are applied to the control plane or an interface. Policy maps contain classes, which are composed of class maps and traffic resolution commands. Section 30.1 describes traffic policies.

FM6000 platform switches support the following traffic policies:

- Control plane policies manage control plane traffic.
- QoS traffic policies manage traffic on Ethernet and port channel interfaces.

These sections describe the construction and application of policy maps on FM6000 platform switches:

- Section 30.3.1: Configuring Control Plane Traffic Policies – FM6000 Platform Switches
- Section 30.3.2: Configuring QoS Traffic Policies – FM6000 Platform Switches
- Section 30.3.3: Configuring PBR Policies – FM6000 Platform Switches

30.3.1 Configuring Control Plane Traffic Policies – FM6000 Platform Switches

Default control plane traffic policies are implemented automatically without user intervention. These policies are modified by associating traffic resolution commands with static classes that comprise the control plane policy map.

Static Class Maps

Control plane traffic policies utilize static class maps, which are provided by the switch, are not editable, and cannot be deleted.

Editing the Policy Map

The only control plane policy map is `copp-system-policy`, which cannot be deleted. In its default form, `copp-system-policy` consists of the classes listed in Table 30-2. Although the underlying class map of each class cannot be edited, the traffic resolution commands can be adjusted. The default classes cannot be removed from the policy map and their sequence within the policy map is not editable.

Table 30-2 copp-system-policy default classes: FM6000 Platform Switches

<table>
<thead>
<tr>
<th>Class Name</th>
<th>shape (pps)</th>
<th>bandwidth (pps)</th>
</tr>
</thead>
<tbody>
<tr>
<td>copp-system-arp</td>
<td>10000</td>
<td>100</td>
</tr>
<tr>
<td>copp-system-default</td>
<td>8000</td>
<td>100</td>
</tr>
<tr>
<td>copp-system-ipmcrsvd</td>
<td>10000</td>
<td>100</td>
</tr>
<tr>
<td>copp-system-ipmcmss</td>
<td>10000</td>
<td>100</td>
</tr>
<tr>
<td>copp-system-igmp</td>
<td>10000</td>
<td>100</td>
</tr>
<tr>
<td>copp-system-l2rsvd</td>
<td>10000</td>
<td>10000</td>
</tr>
<tr>
<td>copp-system-l3slowpath</td>

<td>100</td>
</tr>
<tr>
<td>copp-system-selfip</td>
<td>5000</td>
<td>5000</td>
</tr>
<tr>
<td>copp-system-selfip-tc6to7</td>
<td>5000</td>
<td>5000</td>
</tr>
<tr>
<td>copp-system-sflow</td>
<td>25000</td>
<td>1000</td>
</tr>
</tbody>
</table>
Policy maps are modified in policy-map configuration mode. The `policy-map type copp` command enters policy-map configuration mode.

**Example**

- This command enters policy-map configuration mode for editing `copp-system-policy`.
  ```
  switch(config)#policy-map type copp copp-system-policy
  switch(config-pmap-copp-system-policy)#
  ```

The `class (policy-map (control-plane) – FM6000)` command enters policy-map-class configuration mode, where traffic resolution commands are modified for the configuration mode class.

**Example**

- This command enters policy-map-class configuration mode for the copp-system-arp static class.
  ```
  switch(config-pmap-copp-system-policy)#class copp-system-arp
  switch(config-pmap-c-copp-system-policy-copp-system-arp)#
  ```

Two traffic resolution commands determine bandwidth parameters for class traffic:

- `bandwidth (policy-map-class (control-plane) – FM6000)` specifies the minimum bandwidth.
- `shape (policy-map-class (control-plane) – FM6000)` specifies the maximum bandwidth.

**Example**

- These commands configure a bandwidth range of 2000 to 4000 packets per seconds (pps) for traffic filtered by the copp-system-arp class map:
  ```
  switch(config-pmap-c-copp-system-policy-copp-system-arp)#bandwidth pps 2000
  switch(config-pmap-c-copp-system-policy-copp-system-arp)#shape pps 4000
  ```

Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the `exit` command or discarded with the `abort` command. The `show active` command displays the saved version of policy map. The `show pending` command displays the modified policy map.
**Example**

- These commands exit policy-map-class configuration mode, display the pending policy-map, then exit policy-map configuration mode, which saves the altered policy map to `running-config`.

  ```
  switch(config-pmap-c-copp-system-policy-CP-CMAP_1)#exit
  switch(config-pmap-copp-system-policy)#show pending
  policy-map type copp copp-system-policy
  class CP-CMAP_1
    shape pps 4000
    bandwidth pps 2000
  class copp-system-bpdu
  class copp-system-lldp
  class copp-system-lacp
  class copp-system-arp

  <--------OUTPUT OMITTED FROM EXAMPLE-------->
  class copp-system-arpresolver
  class copp-system-default

  switch(config-pmap-copp-system-policy)#exit
  switch(config)#
  ```

**Applying Policy Maps to the Control Plane**

The `copp-system-policy` policy map is always applied to the control plane. No commands are available to add or remove this assignment.

**30.3.2 Configuring QoS Traffic Policies – FM6000 Platform Switches**

QoS traffic policies are implemented by creating class maps and policy maps, then applying the policy maps to Ethernet and port channel interfaces.

**Creating Class Maps**

QoS traffic policies utilize dynamic class maps that are created and modified in class-map configuration mode. The `class-map type qos` command enters class-map configuration mode.

**Example**

- This command enters class-map configuration mode to create QoS class map named Q-CMap_1.

  ```
  switch(config)#class-map type qos match-any Q-CMap_1
  switch(config-cmap-Q-CMap_1)#
  ```

  A class map contains one IPv4 access control list (ACL). The `match (class-map (qos) – FM6000)` command assigns an ACL to the class map. Subsequent `match` commands replace the existing `match` command. Class maps filter traffic only on ACL permit rules. Deny ACL rules are disregarded.

**Example**

- This command adds the IPv4 ACL named ACL_1 to the class map.

  ```
  switch(config-cmap-Q-CMap_1)#match ip access-group ACL_1
  switch(config-cmap-Q-CMap_1)#
  ```
Class-map configuration mode is a group-change mode. Changes made in a group-change mode are saved by exiting the mode. The **show active** command displays the saved version of class map. The **show pending** command displays the unsaved class map.

**Example**
- The **show active** command indicates that the configuration mode class map is not stored in **running-config**. The **show pending** command displays the class map to be stored upon exiting class-map configuration mode.

```bash
switch(config-cmap-Q-CMap_1)#show active
switch(config-cmap-Q-CMap_1)#show pending
class-map type qos match-any Q-CMap_1
  match ip access-group ACL_1

switch(config-cmap-Q-CMap_1)#
```

The **exit** command returns the switch to global configuration mode and saves pending class map changes. The **abort** command returns the switch to global configuration mode and discards pending changes.

**Example**
- This command exits class-map configuration mode and stores pending changes to **running-config**.

```bash
switch(config-cmap-CP-CMAP_1)#exit
switch(config)#show class-map type control-plane CP-CMAP_1
  Class-map: CP-CMAP_1 (match-any)
    Match: ip access-group name ACLv4_1

switch(config)#
```

**Creating Policy Maps**

Policy maps are created and modified in policy-map configuration mode. The **policy-map type quality-of-service** command enters policy-map configuration mode.

**Example**
- This command places the switch in policy-map configuration mode and creates a QoS policy map named Q-PMAP_1.

```bash
switch(config)#policy-map type quality-of-service Q-PMAP_1
switch(config-pmap-Q-PMAP_1)#
```

Policy map are edited by adding or removing classes. A class automatically contains its eponymous class map; traffic resolution commands are added or edited in policy-map-class configuration mode. The **class (policy-map (qos) – FM6000)** command adds a class to the configuration mode policy map and places the switch in policy-map-class configuration mode, where traffic resolution commands are added to the class.

**Example**
- This command adds the Q-CMap_1 class to the Q-PMAP_1 policy map and places the switch in policy-map-class configuration mode.

```bash
switch(config-pmap-Q-PMAP_1)#class Q-CMap_1
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#
```

**set (policy-map-class (qos) – FM6000)** commands configure traffic resolution methods for data that passes the class map:
- **set cos** sets the layer 2 CoS field.
• **set dscp** sets the DSCP value in the ToS byte.
• **set traffic class** specifies a traffic class queue.

**Example**

• These commands configure the policy map to set the CoS field to 7 on packets filtered by the class map, then assigns those packets to traffic class 4.
  
  ```
  switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#set cos 7
  switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#set traffic-class 4
  ```

Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the **exit** command or discarded with the **abort** command. The **show active** and **show pending** commands display the saved and modified policy map versions, respectively.

**Example**

• These commands exit policy-map-class configuration mode, display the pending policy-map, then exit policy-map configuration mode to save the altered policy map to **running-config**.
  
  ```
  switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#exit
  switch(config-pmap-Q-PMAP_1)#show pending
  policy-map type quality-of-service Q-PMAP_1
  class Q-CMap_1
    set cos 7
    set traffic-class 4
  class class-default
  ```

The last class in all QoS policy maps is **class-default**. The **class-default** class map matches all traffic except IPv4 or IPv6 traffic and provides no traffic resolution commands. The **class-default** class map is not editable; traffic resolution commands can be added to the **class-default** class.

To modify traffic resolution commands for the **class-default** class, enter policy-map-class configuration mode for the class, then enter the desired **set** commands.
Example

- These commands enter policy-map-class configuration mode for class-default, configures the stream to enter traffic class 2, and saves the altered policy map to running-config.

```plaintext
switch(config)#policy-map type quality-of-service Q-PMap_1
switch(config-pmap-Q-PMap_1)#class class-default
switch(config-pmap-c-Q-PMap_1-class-default)#set traffic-class 2
switch(config-pmap-c-Q-PMap_1-class-default)#exit
switch(config-pmap-Q-PMap_1)#exit
switch(config)#show policy-map type qos Q-PMap_1
Service-policy Q-PMap_1

Class-map: Q-CMap_1 (match-any)
  Match: ipv6 access-group name ACLv6_1
    set cos 7
    set traffic-class 4

Class-map: class-default (match-any)
  set traffic-class 2
```

Applying Policy Maps to an Interface

The `service-policy type qos (Interface mode)` command applies a specified policy map to the configuration mode interface.

- These commands apply PMAP-1 policy map to Ethernet interface 8.

```plaintext
switch(config)#interface ethernet 8
switch(config-if-Et8)#show active
switch(config-if-Et8)#service-policy input PMAP-1
switch(config-if-Et8)#show active
interface Ethernet8
  service-policy type qos input PMAP-1
switch(config-if-Et8)#
```

30.3.3 Configuring PBR Policies – FM6000 Platform Switches

Policy-Based Routing (PBR) is implemented by creating class maps and policy maps, then applying the policy maps to Ethernet interfaces, port channel interfaces or switch virtual interfaces (SVIs).

Creating PBR Class Maps

PBR policies utilize class maps that are created and modified in class-map configuration mode. The `class-map type pbr` command enters class-map configuration mode.

Example

- This command enters class-map configuration mode to create a PBR class map named CMAP1.

```plaintext
switch(config)#class-map type pbr match-any CMAP1
switch(config-cmap-PBR-CMAP1)#
```

A class map contains one or more IPv4 access control lists (ACLs). The `match (policy-map (pbr))` command assigns an ACL to the class map. Subsequent `match` commands add additional ACLs to the class map. Class maps filter traffic only on ACL permit rules. Deny ACL rules are disregarded; if a class map includes ACLs with deny rules, the configuration reverts to its previous state.

On FM6000 platform switches, counters are not supported, so a `counters per-entry (ACL configuration modes)` command in an ACL is ignored.
Example

- This command adds the IPv4 ACL named ACL1 to the class map.
  
  ```
  switch(config-cmap-PBR-CMAP1)#match ip access-group ACL1
  ```

Class-map configuration mode is a group-change mode. Changes made in a group-change mode are saved by exiting the mode. The `show active` command displays the saved version of class map.

- The `show active` command indicates that the configuration mode class map is not stored in `running-config`.
  
  ```
  switch(config-cmap-PBR-CMAP1)#show active
  ```

  The `exit` command returns the switch to global configuration mode and saves pending class map changes. The `abort` command returns the switch to global configuration mode and discards pending changes.

Example

- This command exits class-map configuration mode and stores pending changes to `running-config`.
  
  ```
  switch(config-cmap-PBR-CMAP1)#exit
  switch(config)#show class-map type pbr CMAP1
  class-map type pbr match-any CMAP1
  10 match ip access-group ACL1
  ```

Creating PBR Policy Maps

Policy maps are created and modified in policy-map configuration mode. The `policy-map type pbr` command enters policy-map configuration mode.

Example

- This command enters policy-map configuration mode for creating a PBR policy map named PMAP1.
  
  ```
  switch(config)#policy-map type pbr PMAP1
  ```

Policy map are edited by adding or removing classes. A class automatically contains its eponymous class map; next-hop commands are added or edited in policy-map-class configuration mode. The `class (policy-map (pbr))` command adds a class to the configuration mode policy map and places the switch in policy-map-class configuration mode, where next-hop commands are added to the class.

Example

- This command adds the CMAP1 class to the policy map and places the switch in policy-map-class configuration mode.
  
  ```
  switch(config-pmap-PMAP1-c#class CMAP1
  ```

  The `set nexthop (policy-map-class – pbr)` command configures the next hop for data that passes the class map.

- This command configures the policy map to set the next hop to 10.12.0.5 on packets filtered by the class map.
  
  ```
  switch(config-pmap-c-PMAP1-CMAP1-c#set nexthop 10.12.0.5
  ```
Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the `exit` command or discarded with the `abort` command. The `show active` command displays the currently saved map version.

**Example**

- These commands exit policy-map-class configuration mode, then exit policy-map configuration mode to save the altered policy map to `running-config`.

  ```
  switch(config-pmap-c-PMAP1-CMAP1)#exit
  switch(config-pmap-PMAP1)#exit
  switch(config)#
  ```

**Applying a PBR Policy Map to an Interface**

The `service-policy type pbr (Interface mode)` command applies the specified PBR policy map to the configuration mode interface. Only one PBR service policy is supported per interface.

- These commands apply the PMAP1 PBR policy map to Ethernet interface 8.

  ```
  switch(config)#interface ethernet 8
  switch(config-if-Et8)#service-policy type pbr input PMAP1
  switch(config-if-Et8)#
  ```

**Hardware Decapsulation**

When hardware decapsulation takes place, PBR policy maps on FM6000 platform switches match on outer packet headers (i.e., they match based on the attributes of the packet before it is decapsulated).
30.4 Traffic Management Configuration – Petra Platform Switches

Traffic policies are implemented by policy maps, which are applied to the control plane. Policy maps contain classes, which are composed of class maps and traffic resolution commands. QoS traffic policies are not supported on 7500 Series switches.

Section 30.1 describes traffic policies.

30.4.1 Configuring Control Plane Traffic Policies – Petra Platform Switches

Default control plane traffic policies are implemented automatically without user intervention. These policies are modified by associating traffic resolution commands with static classes that comprise the control plane policy map.

Static Class Maps

Control plane traffic policies utilize static class maps, which are provided by the switch, are not editable, and cannot be deleted.

Editing the Policy Map

The only control plane policy map is `copp-system-policy`, which cannot be deleted. In its default form, `copp-system-policy` consists of the classes listed in Table 30-3. Although the underlying class map of each class cannot be edited, the traffic resolution commands can be adjusted. The default classes cannot be removed from the policy map and their sequence within the policy map is not editable.

<table>
<thead>
<tr>
<th>Class Name</th>
<th>shape (kbps)</th>
<th>bandwidth (kbps)</th>
</tr>
</thead>
<tbody>
<tr>
<td>copp-system-bpdu</td>
<td>2500</td>
<td>1250</td>
</tr>
<tr>
<td>copp-system-default</td>
<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-igmp</td>
<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-ipbroadcast</td>
<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-ipmc</td>
<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-ipmcmiss</td>
<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-ipmcrsvd</td>
<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-ipunicast</td>
<td>NO LIMIT</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-l3destmiss</td>
<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-l3slowpath</td>
<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-l3ttl0</td>
<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-l3ttl1</td>
<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-lacp</td>
<td>2500</td>
<td>1250</td>
</tr>
<tr>
<td>copp-system-lldp</td>
<td>2500</td>
<td>250</td>
</tr>
<tr>
<td>copp-system-unicast-arp</td>
<td>2500</td>
<td>250</td>
</tr>
</tbody>
</table>

Policy maps are modified in policy-map configuration mode. The `policy-map type copp` command enters policy-map configuration mode.
Example

- This command enters policy-map configuration mode for editing `copp-system-policy`.

  ```
  switch(config)#policy-map type copp copp-system-policy
  switch(config-pmap-copp-system-policy)#
  ```

  The `class (policy-map (control-plane) – Petra)` command enters policy-map-class configuration mode, where traffic resolution commands are modified for the configuration mode class.

Example

- This command enters policy-map-class configuration mode for the copp-system-lldp static class.

  ```
  switch(config-pmap-copp-system-policy)#class copp-system-lldp
  switch(config-pmap-c-copp-system-policy-copp-system-lldp)#
  ```

  Two traffic resolution commands determine bandwidth parameters for class traffic:
  
  - `bandwidth (policy-map-class (control-plane) – Petra)` specifies the minimum bandwidth.
  - `shape (policy-map-class (control-plane) – Petra)` specifies the maximum bandwidth.

Example

- These commands configure a bandwidth range of 2000 to 4000 kilobits per seconds (kbps) for traffic filtered by the copp-system-arp class map:

  ```
  switch(config-pmap-c-copp-system-policy-copp-system-lldp)#bandwidth kbps 2000
  switch(config-pmap-c-copp-system-policy-copp-system-lldp)#shape kbps 4000
  switch(config-pmap-c-copp-system-policy-copp-system-lldp)#
  ```

  Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the `exit` command or discarded with the `abort` command. The `show active` command displays the saved version of policy map. The `show pending` command displays the configured policy map.

Petra platform switches do not support all discrete rate values. When a `bandwidth` or `shape` command specifies a value that is not supported, the switch converts the rate to the next highest discrete value that it supports. The `show policy-map interface type qos` command displays the converted rate and not the user configured rate.

Example

- These commands exit policy-map-class configuration mode, display the pending policy-map, then exit policy-map configuration mode, which saves the altered policy map to `running-config`.

  ```
  switch(config-pmap-c-copp-system-policy-copp-system-lldp)#exit
  switch(config-pmap-c copp-system-policy)#show pending
  policy-map type copp copp-system-policy
  class copp-system-bpdu
   class copp-system-lldp
      shape kbps 4000
      bandwidth kbps 2000
  class copp-system-lacp

  switch(config-pmap-copp-system-policy)#exit
  switch(config)#
  ```

  Changes are saved with the `exit` command or discarded with the `abort` command. The `show active` command displays the saved version of policy map. The `show pending` command displays the modified policy map.
Displaying Policy Maps

The `show policy-map interface type qos` command displays the traffic resolution rates of the policy map’s classes and the number of packets filtered and dropped as a result of the class maps. The shape and bandwidth rates may differ from configured values, because the switch does not support all discrete rate values.

Example

- These commands exit policy-map-class configuration mode, display the pending policy-map, then exit policy-map configuration mode, which saves the altered policy map to `running-config`.

```
switch(config)#show policy-map copp copp-system-policy
Service-policy input: copp-system-policy
Hardware programming status: InProgress

Class-map: copp-system-mlag (match-any)
  shape : 10000001 kbps
  bandwidth : 10000001 kbps
  Out Packets : 0
  Drop Packets : 0

Class-map: copp-system-lacp (match-any)
  shape : 2604 kbps
  bandwidth : 1302 kbps
  Out Packets : 0
  Drop Packets : 0

<-------OUTPUT OMITTED FROM EXAMPLE-------->
```

Applying Policy Maps to the Control Plane

The `copp-system-policy` policy map is always applied to the control plane. No commands are available to add or remove this assignment.

30.4.2 Configuring QoS Traffic Policies – Petra Platform Switches

QoS traffic policies are not supported on Petra platform switches.

30.4.3 Configuring PBR Policies – Petra Platform Switches

PBR policies are not supported on Petra platform switches.
30.5 Traffic Management Configuration – Trident Platform Switches

Traffic policies are implemented by policy maps, which are applied to the control plane or an interface. Policy maps contain classes, which are composed of class maps and traffic resolution commands. Section 30.1 describes traffic policies.

Trident platform switches support the following traffic policies:

- Control plane policies manage control plane traffic.
- QoS traffic policies manage traffic on Ethernet and port channel interfaces.

These sections describe the construction and application of policy maps:

- Section 30.5.1: Configuring Control Plane Traffic Policies – Trident Platform Switches
- Section 30.5.2: Configuring QoS Traffic Policies – Trident Platform Switches
- Section 30.5.3: Configuring PBR Policies – Trident Platform Switches

30.5.1 Configuring Control Plane Traffic Policies – Trident Platform Switches

Default control plane traffic policies are implemented automatically without user intervention. These policies are modified by creating class maps and editing the policy map to include the new class maps.

Creating Class Maps

Control plane traffic policies utilize static and dynamic class maps. Static class maps are provided by the switch, are not editable, and cannot be deleted. Dynamic class maps are created and modified in class-map configuration mode. The `class-map type copp` command enters class-map configuration mode.

Example

- This command enters class-map configuration mode for creating or editing a control plane dynamic class map named CP-CMAP_1.
  
  ```
  switch(config)#class-map type copp match-any CP-CMAP_1
  switch(config-cmap-CP-CMAP_1)#
  ```

Class maps contain one IPv4 or IPv6 access control list (ACL). The `match (class-map (control-plane) – Trident)` command assigns an ACL to the class map. Subsequent `match` commands replace the existing `match` command. Class maps filter traffic only on ACL permit rules. Deny ACL rules are disregarded.

Example

- This command assigns the IPv4 ACL named ACLv4_1 to the class map.
  
  ```
  switch(config-cmap-CP-CMAP_1)#match ip access-group ACLv4_1
  switch(config-cmap-CP-CMAP_1)#
  ```

Class-map configuration mode is a group-change mode. Changes are saved by exiting the mode. The `show active` command displays the saved version of class map. The `show pending` command displays the unsaved class map.
Example

- The `show active` command indicates that the configuration mode class map is not stored in `running-config`. The `show pending` command displays the class map to be stored upon exiting class-map configuration mode.

  ```
  switch(config-cmap-CP-CMAP_1)#show active
  switch(config-cmap-CP-CMAP_1)#show pending
  class-map type copp match-any CP-CMAP_1
      match ip access-group ACLv4_1
  
  switch(config-cmap-CP-CMAP_1)#
  ```

  The `exit` command returns the switch to global configuration mode and saves pending class map changes. The `abort` command returns the switch to global configuration mode and discards pending class map changes.

Example

- This command exits class-map configuration mode and stores pending changes to `running-config`.

  ```
  switch(config-cmap-CP-CMAP_1)#exit
  switch(config)#show class-map type control-plane CP-CMAP_1
  Class-map: CP-CMAP_1 (match-any)
      Match: ip access-group name ACLv4_1
  switch(config)#
  ```

Editing the Policy Map

The only control plane policy map is `copp-system-policy`, which cannot be deleted. In its default form, `copp-system-policy` consists of the classes listed in Table 30-4. Although the underlying class map of each class cannot be edited, the traffic resolution commands can be adjusted. The default classes cannot be removed from the policy map and their sequence within the policy map is not editable.

Table 30-4 `copp-system-policy` default classes: Trident Platform Switches

</tr>
<tr>
<td>copp-system-l3slowpath</td>
<td>10000</td>
<td>1000</td>
</tr>
<tr>
<td>copp-system-l3ttl1</td>
<td>10000</td>
<td>1000</td>
</tr>
</tbody>
</table>
Policy maps are modified in policy-map configuration mode. The `policy-map type copp` command enters policy-map configuration mode.

**Example**

- This command enters policy-map configuration mode for editing `copp-system-policy`.
  
  ```
  switch(config)#policy-map type copp copp-system-policy
  switch(config-pmap-copp-system-policy)#
  ```

Dynamic classes are inserted in front of the static classes. Classes automatically contain their eponymous class map; traffic resolution commands are created or edited in policy-map-class configuration mode. The `class (policy-map (control-plane) – Trident)` command adds a class to the policy map and places the switch in policy-map-class configuration mode, where traffic resolution commands are added to the class.

**Example**

- This command adds the CP-CMAP_1 class to the copp-system-policy policy map and places the switch in policy-map-class configuration mode.

  ```
  switch(config-pmap-copp-system-policy)#class CP-CMAP_1
  switch(config-pmap-c-copp-system-policy-CP-CMAP_1)#
  ```

Two traffic resolution commands determine bandwidth parameters for class traffic:

- `bandwidth (policy-map-class (control-plane) – Trident)` specifies the minimum bandwidth.
- `shape (policy-map-class (control-plane) – Trident)` specifies the maximum bandwidth.

**Example**

- These commands configure a bandwidth range of 2000 to 4000 packets per seconds (pps) for traffic filtered by the CP-CMAP_1 class map:

  ```
  switch(config-pmap-c-copp-system-policy-CP-CMAP_1)#bandwidth pps 2000
  switch(config-pmap-c-copp-system-policy-CP-CMAP_1)#shape pps 4000
  switch(config-pmap-c-copp-system-policy-CP-CMAP_1)#
  ```

Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the `exit` command or discarded with the `abort` command. The `show active` command displays the saved version of policy map. The `show pending` command displays the modified policy map.

---

**Table 30-4  copp-system-policy default classes: Trident Platform Switches**

<table>
<thead>
<tr>
<th>Class Name</th>
<th>shape (pps)</th>
<th>bandwidth (pps)</th>
</tr>
</thead>
<tbody>
<tr>
<td>copp-system-default</td>
<td>8000</td>
<td>1000</td>
</tr>
<tr>
<td>copp-system-aclog</td>
<td>10000</td>
<td>1000</td>
</tr>
<tr>
<td>copp-system-sflow</td>
<td>25000</td>
<td>0</td>
</tr>
</tbody>
</table>
Example

- These commands exit policy-map-class configuration mode, display the pending policy-map, then exit policy-map configuration mode, which saves the altered policy map to `running-config`.

  ```
  switch(config-pmap-c-copp-system-policy-CP-CMAP_1)#exit
  switch(config-pmap-copp-system-policy)#show pending
  policy-map type copp copp-system-policy
  class CP-CMAP_1
  shape pps 4000
  bandwidth pps 2000
  class copp-system-bpdu
  class copp-system-lldp
  class copp-system-lacp
  class copp-system-arp
  class copp-system-arpresolver
  class copp-system-default
  switch(config-pmap-copp-system-policy)#exit
  switch(config)#
  ```

To modify traffic resolution commands for a static class, enter policy-map-class configuration mode for the class, then enter the desired **bandwidth** and **shape** commands.

Example

- These commands enter policy-map-class configuration mode for copp-system-bpdu class, change the bandwidth range for the class, then save the altered policy map to `running-config`.

  ```
  switch(config)#policy-map type copp copp-system-policy
  switch(config-pmap-c copp-system-policy)#class copp-system-bpdu
  switch(config-pmap-c-copp-system-policy-copp-system-bpdu)#shape pps 200
  switch(config-pmap-c-copp-system-policy-copp-system-bpdu)#bandwidth pps 100
  switch(config-pmap-c-copp-system-policy-copp-system-bpdu)#exit
  switch(config-pmap-copp-system-policy)#show pending
  policy-map type copp copp-system-policy
  class CP-CMAP_1
  shape pps 4000
  bandwidth pps 2000
  class copp-system-bpdu
  shape pps 200
  bandwidth pps 100
  class copp-system-lldp
  ```

  <-------OUTPUT OMITTED FROM EXAMPLE--------->

  ```
  switch(config-pmap-copp-system-policy)#exit
  switch(config)#
  ```
Applying Policy Maps to the Control Plane

The `copp-system-policy` policy map is always applied to the control plane. No commands are available to add or remove this assignment.

30.5.2 Configuring QoS Traffic Policies – Trident Platform Switches

QoS traffic policies are implemented by creating class maps and policy maps, then applying the policy maps to Ethernet and port channel interfaces.

Creating Class Maps

QoS traffic policies utilize dynamic class maps that are created and modified in class-map configuration mode. The `class-map type qos` command enters class-map configuration mode.

Example

- This command enters class-map configuration mode to create QoS class map named `Q-CMap_1`.

  switch(config)#class-map type qos match-any Q-CMap_1

  switch(config-cmap-Q-CMap_1)#

A class map contains one IPv4 or IPv6 access control list (ACL). The `match (class-map (qos) – Trident)` command assigns an ACL to the class map. Subsequent `match` commands replace the existing `match` command. Class maps filter traffic only on ACL permit rules. Deny ACL rules are disregarded.

Example

- This command adds the IPv6 ACL named `ACLv6_1` to the class map.

  switch(config-cmap-Q-CMap_1)#match ipv6 access-group ACLv6_1

  switch(config-cmap-Q-CMap_1)#

Class-map configuration mode is a group-change mode. Changes made in a group-change mode are saved by exiting the mode. The `show active` command displays the saved version of class map. The `show pending` command displays the unsaved class map.

Example

- The `show active` command indicates that the configuration mode class map is not stored in `running-config`. The `show pending` command displays the class map to be stored upon exiting class-map configuration mode.

  switch(config-cmap-Q-CMap_1)#show active

  switch(config-cmap-Q-CMap_1)#show pending

  class-map type qos match-any Q-CMap_1

  match ipv6 access-group ACLv6_1

  switch(config-cmap-Q-CMap_1)#

The `exit` command returns the switch to global configuration mode and saves pending class map changes. The `abort` command returns the switch to global configuration mode and discards pending class map changes.
Example

- This command exits class-map configuration mode and stores pending changes to running-config.

  switch(config-cmap-CP-CMAP_1)#exit
  switch(config)#show class-map type control-plane CP-CMAP_1
  Class-map: CP-CMAP_1 (match-any)
  Match: ip access-group name ACLv4_1
  switch(config)#

Creating Policy Maps

Policy maps are created and modified in policy-map configuration mode. The policy-map type quality-of-service command enters policy-map configuration mode.

Example

- This command enters policy-map configuration mode for creating a QoS policy map named Q-PMAP_1.

  switch(config)#policy-map type quality-of-service Q-PMAP_1
  switch(config-pmap-Q-PMAP_1)#

Policy maps are edited by adding or removing classes. A class automatically contains its eponymous class map; traffic resolution commands are added or edited in policy-map-class configuration mode. The class (policy-map (qos) – Trident) command adds a class to the configuration mode policy map and places the switch in policy-map-class configuration mode, where traffic resolution commands are added to the class.

Example

- This command adds the Q-CMap_1 class to the Q-PMAP_1 policy map and places the switch in policy-map-class configuration mode.

  switch(config-pmap-Q-PMAP_1)#class Q-CMap_1
  switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#

The set (policy-map-class (qos) – Trident) command configures traffic resolution methods for data that passes the class map:

- set cos sets the layer 2 CoS field.
- set dscp sets the DSCP value in the ToS byte.
- set traffic class specifies a traffic class queue.

Example

- These commands configure the policy map to set the CoS field to 7 on packets filtered by the class map, then assigns those packets to traffic class 4.

  switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#set cos 7
  switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#set traffic-class 4
  switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#

Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the exit command or discarded with the abort command. The show active and show pending commands display the saved and modified policy map versions, respectively.
Example

- These commands exit policy-map-class configuration mode, display the pending policy-map, then exit policy-map configuration mode to save the altered policy map to `running-config`.

  ```
  switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#exit
  switch(config-pmap-Q-PMAP_1)#show pending
  policy-map type quality-of-service Q-PMAP_1
  class Q-CMap_1
    set cos 7
    set traffic-class 4
  class class-default

  switch(config-pmap-Q-PMAP_1)#exit
  switch(config)#
  ```

The last class in all QoS policy maps is `class-default`. The `class-default` class map matches all traffic except IPv4 or IPv6 traffic and provides no traffic resolution commands. The `class-default` class map is not editable; traffic resolution commands can be added to the `class-default` class.

To modify traffic resolution commands for the `class-default` class, enter policy-map-class configuration mode for the class, then enter the desired `set` commands.

Example

- These commands enter policy-map-class configuration mode for `class-default`, configures the stream to enter traffic class 2, and saves the altered policy map to `running-config`.

  ```
  switch(config)#policy-map type quality-of-service Q-PMap_1
  switch(config-pmap-Q-PMap_1)#class class-default
  switch(config-pmap-c-Q-PMap_1-class-default)#set traffic-class 2
  switch(config-pmap-c-Q-PMap_1-class-default)#exit
  switch(config-pmap-Q-PMap_1)#exit
  switch(config)#show policy-map type qos Q-PMap_1
  Service-policy Q-PMap_1

  Class-map: Q-CMap_1 (match-any)
    Match: ipv6 access-group name ACLv6_1
      set cos 7
      set traffic-class 4

  Class-map: class-default (match-any)
    set traffic-class 2

  switch(config)#
  ```

Applying Policy Maps to an Interface

The `service-policy type qos (Interface mode)` command applies a specified policy map to the configuration mode interface.
Example

- These commands apply PMAP-1 policy map to Ethernet interface 8.

  ```
  switch(config)#interface ethernet 8
  switch(config-if-Et8)#show active
  switch(config-if-Et8)#service-policy input PMAP-1
  switch(config-if-Et8)#show active
  interface Ethernet8
    service-policy type qos input PMAP-1
  switch(config-if-Et8)#
  ```

30.5.3 Configuring PBR Policies – Trident Platform Switches

Policy-Based Routing (PBR) is implemented by creating class maps and policy maps, then applying the policy maps to Ethernet interfaces, port channel interfaces or switch virtual interfaces (SVIs).

Creating PBR Class Maps

PBR policies utilize class maps that are created and modified in class-map configuration mode. The `class-map type pbr` command enters class-map configuration mode.

Example

- This command enters class-map configuration mode to create a PBR class map named CMAP1.

  ```
  switch(config)#class-map type pbr match-any CMAP1
  switch(config-cmap-PBR-CMAP1)#
  ```

A class map contains one or more access control lists (ACLs). The `match (policy-map (pbr))` command assigns an ACL to the class map. Subsequent `match` commands add additional ACLs to the class map. Class maps filter traffic only on ACL permit rules. Deny ACL rules are disregarded; if a class map includes ACLs with deny rules, the configuration reverts to its previous state.

Example

- This command adds the ACL named ACL1 to the class map.

  ```
  switch(config-cmap-PBR-CMAP1)#match ip access-group ACL1
  switch(config-cmap-PBR-CMAP1)#
  ```

Class-map configuration mode is a group-change mode. Changes made in a group-change mode are saved by exiting the mode. The `show active` command displays the saved version of class map.

- The `show active` command indicates that the configuration mode class map is not stored in `running-config`.

  ```
  switch(config-cmap-PBR-CMAP1)#show active
  switch(config-cmap-PBR-CMAP1)#
  ```

The `exit` command returns the switch to global configuration mode and saves pending class map changes. The `abort` command returns the switch to global configuration mode and discards pending changes.

Example

- This command exits class-map configuration mode and stores pending changes to `running-config`.

  ```
  switch(config-cmap-PBR-CMAP1)#exit
  switch(config)#show class-map type pbr CMAP1
  class-map type pbr match-any CMAP1
    10 match ip access-group ACL1
  switch(config)#
  ```
Creating PBR Policy Maps

Policy maps are created and modified in policy-map configuration mode. The `policy-map type pbr` command enters policy-map configuration mode.

Example

- This command enters policy-map configuration mode for creating a PBR policy map named PMAP1.

```
switch(config)#policy-map type pbr PMAP1
switch(config-pmap-PMAP1)#
```

Policy maps are edited by adding or removing classes. A class automatically contains its eponymous class map; next-hop commands are added or edited in policy-map-class configuration mode. The `class (policy-map (pbr))` command adds a class to the configuration mode policy map and places the switch in policy-map-class configuration mode, where next-hop commands are added to the class.

Example

- This command adds the CMAP1 class to the policy map and places the switch in policy-map-class configuration mode.

```
switch(config-pmap-PMAP1)#class CMAP1
switch(config-pmap-c-PMAP1-CMAP1)#
```

The `set nexthop (policy-map-class – pbr)` command configures the next hop for data that passes the class map.

- This command configures the policy map to set the next hop to 10.12.0.5 on packets filtered by the class map.

```
switch(config-pmap-c-PMAP1-CMAP1)#set nexthop 10.12.0.5
switch(config-pmap-c-PMAP1-CMAP1)#
```

Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the `exit` command or discarded with the `abort` command. The `show active` command displays the currently saved map version.

Example

- These commands exit policy-map-class configuration mode, then exit policy-map configuration mode to save the altered policy map to `running-config`.

```
switch(config-pmap-c-PMAP1-CMAP1)#exit
switch(config-pmap-PMAP1)#exit
switch(config)#
```

Applying a PBR Policy Map to an Interface

The `service-policy type pbr (Interface mode)` command applies the specified PBR policy map to the configuration mode interface. Only one PBR service policy is supported per interface.

- These commands apply the PMAP1 PBR policy map to Ethernet interface 8.

```
switch(config)#interface ethernet 8
switch(config-if-Et8)#service-policy type pbr input PMAP1
switch(config-if-Et8)#
```

Hardware Decapsulation

When hardware decapsulation takes place, PBR policy maps on Trident platform switches match on inner packet headers (i.e., they match based on the attributes of the decapsulated packet).
30.6 Traffic Management Configuration – Trident II Platform Switches

Traffic policies are implemented by policy maps, which are applied to the control plane or an interface. Policy maps contain classes, which are composed of class maps and traffic resolution commands. Section 30.1 describes traffic policies.

Trident platform switches support the following traffic policies

- Control plane policies manage control plane traffic.
- QoS traffic policies manage traffic on Ethernet and port channel interfaces.

30.6.1 Configuring Control Plane Traffic Policies – Trident II Platform Switches

Default control plane traffic policies are implemented automatically without user intervention. These policies are modified by associating traffic resolution commands with static classes that comprise the control plane policy map.

Static Class Maps

Control plane traffic policies utilize static class maps, which are provided by the switch, are not editable, and cannot be deleted.

Editing the Policy Map

The only control plane policy map is `copp-system-policy`, which cannot be deleted. In its default form, `copp-system-policy` consists of the classes listed in Table 30-5. Although the underlying class map of each class cannot be edited, the traffic resolution commands can be adjusted. The default classes cannot be removed from the policy map and their sequence within the policy map is not editable.

Table 30-5 `copp-system-policy` default classes: Trident II Platform Switches

<table>
<thead>
<tr>
<th>Class Name</th>
<th>shape (pps)</th>
<th>bandwidth (pps)</th>
</tr>
</thead>
<tbody>
<tr>
<td>copp-system-acllog</td>
<td>1000</td>
<td>10000</td>
</tr>
<tr>
<td>copp-system-arp</td>
<td>1000</td>
<td>10000</td>
</tr>
<tr>
<td>copp-system-arpsolver</td>
<td>1000</td>
<td>10000</td>
</tr>
<tr>
<td>copp-system-bfd</td>
<td>5000</td>
<td>10000</td>
</tr>
<tr>
<td>copp-system-bgp</td>
<td>5000</td>
<td>5000</td>
</tr>
<tr>
<td>copp-system-bpdu</td>
<td>5000</td>
<td>5000</td>
</tr>
<tr>
<td>copp-system-default</td>
<td>1000</td>
<td>8000</td>
</tr>
<tr>
<td>copp-system-glean</td>
<td>1000</td>
<td>10000</td>
</tr>
<tr>
<td>copp-system-igmp</td>
<td>1000</td>
<td>10000</td>
</tr>
<tr>
<td>copp-system-ipmcmisss</td>
<td>1000</td>
<td>10000</td>
</tr>
<tr>
<td>copp-system-ipmcrsvd</td>
<td>1000</td>
<td>10000</td>
</tr>
<tr>
<td>copp-system-l3destdmiss</td>
<td>1000</td>
<td>10000</td>
</tr>
<tr>
<td>copp-system-l3slowpath</td>
<td>1000</td>
<td>10000</td>
</tr>
<tr>
<td>copp-system-l3tttl1</td>
<td>1000</td>
<td>10000</td>
</tr>
<tr>
<td>copp-system-lacp</td>

<td>5000</td>
<td>5000</td>
</tr>
<tr>
<td>copp-system-selfip</td>
<td>5000</td>
<td>5000</td>
</tr>
</tbody>
</table>
Policy maps are modified in policy-map configuration mode. The `policy-map type copp` command enters policy-map configuration mode.

**Example**
- This command enters policy-map configuration mode for editing `copp-system-policy`.
  
  ```
  switch(config)#policy-map type copp copp-system-policy
  switch(config-pmap-copp-system-policy)#
  ```

The `class (policy-map (control-plane) – Trident II)` command enters policy-map-class configuration mode, where traffic resolution commands are modified for the configuration mode class.

**Example**
- This command enters policy-map-class configuration mode for the `copp-system-lacp static` class.
  
  ```
  switch(config-pmap-c-copp-system-policy-copp-system-lacp)#
  ```

Two traffic resolution commands determine bandwidth parameters for class traffic:
- `bandwidth (policy-map-class (control-plane) – Trident II)` specifies the minimum bandwidth.
- `shape (policy-map-class (control-plane) – Trident II)` specifies the maximum bandwidth.

**Example**
- These commands configure a bandwidth range of 2000 to 4000 packets per seconds (pps) for traffic filtered by the `copp-system-lacp` class map:
  
  ```
  switch(config-pmap-c-copp-system-policy-copp-system-lacp)#bandwidth pps 2000
  switch(config-pmap-c-copp-system-policy-copp-system-lacp)#shape pps 4000
  ```

Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the `exit` command or discarded with the `abort` command. The `show active` command displays the saved version of policy map. The `show pending` command displays the modified policy map.

### Table 30-5: copp-system-policy default classes: Trident II Platform Switches

```
switch(config-pmap-copp-system-policy)#exit
switch(config)#
```

Applying Policy Maps to the Control Plane

The copp-system-policy policy map is always applied to the control plane. No commands are available to add or remove this assignment.
30.7 Traffic Management Configuration Commands

Traffic Policy (Control Plane) Configuration Commands

- bandwidth (policy-map-class (control-plane) – Arad)
- bandwidth (policy-map-class (control-plane) – FM6000)
- bandwidth (policy-map-class (control-plane) – Helix)
- bandwidth (policy-map-class (control-plane) – Petra)
- bandwidth (policy-map-class (control-plane) – Trident)
- bandwidth (policy-map-class (control-plane) – Trident II)
- class-map type copp
- class (policy-map (control-plane) – Arad)
- class (policy-map (control-plane) – FM6000)
- class (policy-map (control-plane) – Helix)
- class (policy-map (control-plane) – Trident)
- class (policy-map (control-plane) – Trident II)
- match (class-map (control-plane) – Helix)
- match (class-map (control-plane) – Trident)
- match (class-map (control-plane) – Trident II)
- policy-map type copp
- shape (policy-map-class (control-plane) – Arad)
- shape (policy-map-class (control-plane) – FM6000)
- shape (policy-map-class (control-plane) – Helix)
- shape (policy-map-class (control-plane) – Petra)
- shape (policy-map-class (control-plane) – Trident)
- shape (policy-map-class (control-plane) – Trident II)

Traffic Policy (PBR) Configuration Commands

- class (policy-map (pbr))
- class-map type pbr
- match (class-map (pbr))
- match (policy-map (pbr))
- platform arad tcam counters feature
- policy-map type pbr
- resequence (class-map (pbr))
- resequence (policy-map (pbr))
- service-policy type pbr (Interface mode)
- set nexthop (policy-map-class – pbr)

Traffic Policy (PDP) Configuration Commands

- policy-map type pdp
- service-policy type pdp (Interface mode)

CPU Traffic Policy Command

- feature traffic-policy cpu (ipv4 | ipv6)

Traffic Policy (QoS) Configuration Commands

- class-map type qos
- class (policy-map (qos) – FM6000)
- class (policy-map (qos) – Helix)
- class (policy-map (qos) – Trident)
- class (policy-map (qos) – Trident II)
- match (class-map qos – FM6000)
- match (class-map qos – Helix)
- match (class-map qos – Trident)
- match (class-map qos – Trident II)
- policy-map type quality-of-service
- service-policy type qos (Interface mode)
- set (policy-map-class qos – FM6000)
- set (policy-map-class qos – Helix)
- set (policy-map-class qos – Trident)
- set (policy-map-class qos – Trident II)

**Traffic Policy Display and Utility Commands**

- clear policy-map counters
- show class-map type control-plane
- show class-map type pbr
- show class-map type qos
- show policy-map type copp
- show policy-map type pbr
- show policy-map type qos
- show policy-map type qos counters
- show policy-map copp
- show policy-map interface type qos
- show policy-map interface type qos counters
bandwidth (policy-map-class (control-plane) – Arad)

The bandwidth command specifies the minimum bandwidth for traffic filtered by the configuration mode policy map class.

The no bandwidth and default bandwidth commands remove the minimum bandwidth guarantee for the configuration mode class by deleting the corresponding bandwidth command from running-config.

Command Mode
Policy-map-class (control plane) configuration
accessed through class (policy-map (control-plane) – Arad)

Command Syntax
bandwidth kbps kilobits
no bandwidth
default bandwidth

Parameters
- **kilobits** Minimum data rate in kilobits per second. Value ranges from 1 to 1000000.

Related Commands
- class (policy-map (control-plane) – Arad) places the switch in policy-map-class (control plane) configuration mode.
- shape (policy-map-class (control-plane) – Arad) specifies the maximum bandwidth for traffic defined by the associated class map in its configuration mode policy map class.

Static Classes Default Bandwidth
Arad platform switches define these default bandwidths for control plane static classes:

- copp-system-bgp250
- copp-system-bpdu1250
- copp-system-default250
- copp-system-ipbroadcast250
- copp-system-ipmc250
- copp-system-l2broadcast250
- copp-system-l2unicast250
- copp-system-l3destmiss250
- copp-system-l3dlmi250
- copp-system-l3ipbroadcast250
- copp-system-l3lpmoverflow250
- copp-system-l3slowpath250
- copp-system-l3ttl1250
- copp-system-lacp1250
- copp-system-ldp250
- copp-system-lldp250
- copp-system-multicastsnoop250
- copp-system-mlag250
- copp-system-ospfIsis250
- copp-system-sflow250
Example

- These commands configure the minimum bandwidth of 500 kbps for data traffic specified by the class map copp-system-lldp of the default control-plane policy map.

```
switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#bandwidth kbps 500

```

switch(config)#
bandwidth (policy-map-class (control-plane) – FM6000)

The `bandwidth` command specifies the minimum bandwidth for traffic filtered by the configuration mode policy map class.

The `no bandwidth` and `default bandwidth` commands remove the minimum bandwidth guarantee for the configuration mode class by deleting the corresponding `bandwidth` command from `running-config`.

**Command Mode**

Policy-map-class (control plane) configuration
accessed through `class (policy-map (control-plane) – FM6000)`

**Command Syntax**

```
bandwidth pps packets
no bandwidth
default bandwidth
```

**Parameters**

- `packets` Minimum data rate in packets per second. Value ranges from 1 to 100000.

**Related Commands**

- `class (policy-map (control-plane) – FM6000)` places the switch in policy-map-class (control plane) configuration mode.
- `shape (policy-map-class (control-plane) – FM6000)` specifies the maximum bandwidth for traffic defined by the associated class map in its configuration mode policy map class.

**Static Classes Default Bandwidth**

FM6000 platform switches define these default bandwidths for control plane static classes:

- copp-system-arp1000
- copp-system-l3slowpath1000
- copp-system-default1000
- copp-system-pim-ptp1000
- copp-system-ipmcrsvd1000
- copp-system-ospf-isis1000
- copp-system-ipmcmmiss1000
- copp-system-selfip5000
- copp-system-igmp1000
- copp-system-selfip-tc6to75000
- copp-system-l2rsvd10000
- copp-system-sflow1000

**Example**

- These commands configure the minimum bandwidth of 1000 packets per second for data traffic specified by the class map PMAP-1 in the policy map named copp-system-policy.

```
switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#class PMAP-1
switch(config-pmap-c-copp-system-policy-PMAP-1)#bandwidth pps 1000
```

1986
bandwidth (policy-map-class (control-plane) – Helix)

The **bandwidth** command specifies the minimum bandwidth for traffic filtered by the configuration mode policy map class.

The **no bandwidth** and **default bandwidth** commands remove the minimum bandwidth guarantee for the configuration mode class by deleting the corresponding **bandwidth** command from **running-config**.

**Command Mode**

Policy-map-class (control plane) configuration
accessed through **class (policy-map (control-plane) – Helix)**

**Command Syntax**

```
bandwidth pps packets
no bandwidth
default bandwidth
```

**Parameters**

- **packets** Minimum data rate in packets per second. Value ranges from 1 to 100000.

**Related Commands**

- **class (policy-map (control-plane) – Helix)** places the switch in policy-map-class (control plane) configuration mode.
- **shape (policy-map-class (control-plane) – Helix)** specifies the maximum bandwidth for traffic defined by the associated class map in its configuration mode policy map class.

**Static Classes Default Bandwidth**

Helix platform switches define these default bandwidths for control plane static classes:

- copp-system-accllog1000•copp-system-l3ttl11000
- copp-system-arp1000•copp-system-lacp5000
- copp-system-arpresolver1000•copp-system-lldp1000
- copp-system-bfd5000•copp-system-mlag5000
- copp-system-bgp5000•copp-system-Ospfsis5000
- copp-system-bpdu5000•copp-system-selfip5000
- copp-system-default1000•copp-system-selfip-tc6to75000
- copp-system-glean1000•copp-system-sflow0
- copp-system-igmp1000•copp-system-tc3to51000
- copp-system-ipmcmiss1000•copp-system-tc6to71000
- copp-system-ipmcrsvd1000•copp-system-urm1000
- copp-system-l3destmiss1000•copp-system-vrrp1000
- copp-system-l3slowpath1000
Example

- These commands configure the minimum bandwidth of 500 packets per second for data traffic specified by the class map copp-system-lldp.

```
switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#bandwidth pps 500
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#exit
switch(config-pmap-c copp-system-policy)#exit
switch(config)#show policy-map interface control-plan copp-system-policy
Service-policy input: copp-system-policy
  Number of units programmed: 4
  Hardware programming status: Successful
  <-------OUTPUT OMITTED FROM EXAMPLE--------->
  Class-map: copp-system-lldp (match-any)
    shape : 10000 pps
    bandwidth : 500 pps
    Out Packets : 304996
    Drop Packets : 0
  <-------OUTPUT OMITTED FROM EXAMPLE--------->
```

switch(config)#
bandwidth (policy-map-class (control-plane) – Petra)

The **bandwidth** command specifies the minimum bandwidth for traffic filtered by the configuration mode policy map class.

The **no bandwidth** and **default bandwidth** commands remove the minimum bandwidth guarantee for the configuration mode class by deleting the corresponding **bandwidth** command from **running-config**.

**Command Mode**

Policy-map-class (control plane) configuration accessed through **class (policy-map (control-plane) – Petra)**

**Command Syntax**

```
bandwidth kbps kilobits
no bandwidth
default bandwidth
```

**Parameters**

- **kbits** Minimum data rate in kilobits per second. Value ranges from 1 to 1000000.

**Related Commands**

- **class (policy-map (control-plane) – Petra)** places the switch in policy-map-class (control plane) configuration mode.
- **shape (policy-map-class (control-plane) – Petra)** specifies the maximum bandwidth for traffic defined by the associated class map in its configuration mode policy map class.

**Static Classes Default Bandwidth**

Petra platform switches define these default bandwidths for control plane static classes:

- copp-system-bpdu1250•copp-system-l3destmiss250
- copp-system-default250•copp-system-l3slowpath250
- copp-system-igmp250•copp-system-l3ttl0250
- copp-system-ipbroadcast250•copp-system-l3ttl1250
- copp-system-ipmc250•copp-system-lacp1250
- copp-system-ipmcmiss250•copp-system-lldp250
- copp-system-ipmcrsvd250•copp-system-unicast-arp250
- copp-system-ipunicast250

**Guidelines**

Petra does not support all discrete rate values. When a specified discrete value is not supported, the switch converts the rate to the next highest discrete value that it supports. The **show** command displays the converted rate and not the user-configured rate.
Example

- These commands configure a minimum bandwidth of 500 kbps for data traffic specified by the class map copp-system-lldp of the default control-plane policy map. Because the switch does not support the discrete value of 500 kbps, it converts the bandwidth up to 651 kbps.

switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#bandwidth kbps 500
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#exit
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#exit
switch(config)#show policy-map copp copp-system-policy
Service-policy input: copp-system-policy
Hardware programming status: InProgress

Class-map: copp-system-lldp (match-any)
  shape : 2766 kbps
  bandwidth : 651 kbps
  Out Packets : 0
  Drop Packets : 0

<-------OUTPUT OMITTED FROM EXAMPLE--------->

switch(config)#
**bandwidth (policy-map-class (control-plane) – Trident)**

The `bandwidth` command specifies the minimum bandwidth for traffic filtered by the configuration mode policy map class.

The `no bandwidth` and `default bandwidth` commands remove the minimum bandwidth guarantee for the configuration mode class by deleting the corresponding `bandwidth` command from `running-config`.

**Command Mode**

Policy-map-class (control plane) configuration accessed through `class (policy-map (control-plane) – Trident)`

**Command Syntax**

```
bandwidth pps packets
no bandwidth
default bandwidth
```

**Parameters**

- `packets` Minimum data rate in packets per second. Value ranges from 1 to 100000.

**Related Commands**

- `class (policy-map (control-plane) – Trident)` places the switch in policy-map-class (control plane) configuration mode.
- `shape (policy-map-class (control-plane) – Trident)` specifies the maximum bandwidth for traffic defined by the associated class map in its configuration mode policy map class.

**Static Classes Default Bandwidth**

Trident platform switches define these default bandwidths for control plane static classes:

- copp-system-arp1000•copp-system-lldp1000
- copp-system-arpresolver1000•copp-system-l3destmiss1000
- copp-system-bpdu5000•copp-system-l3slowpath1000
- copp-system-default1000•copp-system-l3ttl11000
- copp-system-glean1000•copp-system-selfip5000
- copp-system-igmp1000•copp-system-selfip-tc6to75000
- copp-system-ipmcm1000•copp-system-sflow0
- copp-system-ipmcrsvd1000•copp-system-tc6to71000
- copp-system-lacp5000•copp-system-tc3to51000

**Example**

- These commands configure the minimum bandwidth of 1000 packets per second for data traffic specified by the class map PMAP-1 in the policy map named copp-system-policy.

```
switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#class PMAP-1
switch(config-pmap-c-copp-system-policy-PMAP-1)#bandwidth pps 1000
switch(config-pmap-c-copp-system-policy-PMAP-1)#
```
**bandwidth (policy-map-class (control-plane) – Trident II)**

The `bandwidth` command specifies the minimum bandwidth for traffic filtered by the configuration mode policy map class.

The `no bandwidth` and `default bandwidth` commands remove the minimum bandwidth guarantee for the configuration mode class by deleting the corresponding `bandwidth` command from `running-config`.

**Command Mode**

Policy-map-class (control plane) configuration accessed through `class (policy-map (control-plane) – Trident II)`

**Command Syntax**

```
bandwidth pps packets
no bandwidth
default bandwidth
```

**Parameters**

- `packets` Minimum data rate in packets per second. Value ranges from 1 to 100000.

**Related Commands**

- `class (policy-map (control-plane) – Trident II)` places the switch in policy-map-class (control plane) configuration mode.
- `shape (policy-map-class (control-plane) – Trident II)` specifies the maximum bandwidth for traffic defined by the associated class map in its configuration mode policy map class.

**Static Classes Default Bandwidth**

Trident II platform switches define these default bandwidths for control plane static classes:

- copp-system-aclog1000•copp-system-l3slowpath1000
- copp-system-arp1000•copp-system-l3t111000
- copp-system-arpresolver1000•copp-system-lacp5000
- copp-system-bfd5000•copp-system-lldp1000
- copp-system-bgp5000•copp-system-mlag5000
- copp-system-bpdu5000•copp-system-selfip5000
- copp-system-default1000•copp-system-selfip-tc6to75000
- copp-system-glean1000•copp-system-sflow0
- copp-system-igmp1000•copp-system-tc3to51000
- copp-system-ipmcmis1000•copp-system-tc6to71000
- copp-system-ipmcrsvd1000•copp-system-urm1000
- copp-system-l3destmiss1000
Example

- These commands configure the minimum bandwidth of 500 packets per second for data traffic specified by the class map copp-system-lldp.

```shell
switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#bandwidth pps 500
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#exit
switch(config-pmap-copp-system-policy)#exit
switch(config)#show policy-map interface control-plan copp-system-policy
  Service-policy input: copp-system-policy
  Number of units programmed: 4
  Hardware programming status: Successful
  <-------OUTPUT OMITTED FROM EXAMPLE------->
Class-map: copp-system-lldp (match-any)
  shape : 10000 pps
  bandwidth : 500 pps
  Out Packets : 304996
  Drop Packets : 0
  <-------OUTPUT OMITTED FROM EXAMPLE------->
switch(config)#
```
**class (policy-map (control-plane) – Arad)**

The `class` command places the switch in policy-map-class (control plane) configuration mode, which is a group change mode for changing bandwidth and shape parameters associated with a specified class. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. The control plane policy map contains 20 static classes. Each class contains an eponymous class map and may contain `bandwidth` and `shape` commands.

- The class map identifies a data stream.
- **Bandwidth** command defines the stream’s minimum transmission rate through the control plane.
- **Shape** command defines the stream’s maximum transmission rate through the control plane.

Static class maps identify a data stream by definition. Each data packet is managed by commands of the first class whose map matches the packet’s content. Dynamic classes are not supported for control plane policing on Arad platform switches.

Each class corresponds to a transmission queue. Queue scheduling is round-robin until `bandwidth` rate for a queue is exceeded. Scheduling becomes strict-priority with CPU queue number determining priority until the `shape` rate is reached. Packets are dropped after the shape rate is exceeded.

The `exit` command returns the switch to policy-map configuration mode. Saving policy-map-class changes also require an exit from policy-map mode, which saves pending policy-map-class and policy-map changes to `running-config` and returns the switch to global configuration mode. The `abort` command discards pending changes, returning the switch to global configuration mode.

The `no class` and `default class` commands remove policy-map-class commands for the specified class assignment from the policy map.

**Command Mode**

Policy-Map (control plane) configuration accessed through `policy-map type copp` command

**Command Syntax**

```
class class_name
no class class_name
default class class_name
```

**Parameters**

- `class_name` name of the class.

**Static Classes**

Arad platform switches provide the following static control plane classes:

- `copp-system-bgp`
- `copp-system-l2broadcast`
- `copp-system-linklocal`
- `copp-system-bpdu`
- `copp-system-l2unicast`
- `copp-system-lldp`
- `copp-system-default`
- `copp-system-l3destmiss`
- `copp-system-mlag`
- `copp-system-ipbroadcast`
- `copp-system-l3lpmoveflow`
- `copp-system-multicastsnoop`
- `copp-system-ipmc`
- `copp-system-l3slowpath`
- `copp-system-OspfIsis`
- `copp-system-ipmcmsshow`
- `copp-system-l3ttt1`
- `copp-system-sflow`
- `copp-system-ipunicast`
- `copp-system-lacp`

**Commands Available in Policy-map-class (control plane) Configuration Mode**

- `bandwidth (policy-map-class (control-plane) – Arad)`
- `shape (policy-map-class (control-plane) – Arad)`
**Chapter 30: Traffic Management**

**Traffic Management Configuration Commands**

- **exit** saves pending class map changes, then returns the switch to global configuration mode.
- **abort** discards pending class map changes, then returns the switch to global configuration mode.

**Related Commands**

- **policy-map type copp** places switch in policy-map (control plane) configuration mode.

**Example**

- These commands enters policy-map-class configuration mode to modify the shape, bandwidth parameters associated with the static class named **copp-system-lldp**.

```
switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#
```

---

1995
class (policy-map (control-plane) – FM6000)

The class command places the switch in policy-map-class (control plane) configuration mode, which is a group change mode for changing bandwidth and shape parameters associated with a specified class. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. The control plane policy map contains 12 static classes. Each class contains an eponymous class map and may contain bandwidth and shape commands.

- The class map identifies a data stream.
- Bandwidth command defines the stream’s minimum transmission rate through the control plane.
- Shape command defines the stream’s maximum transmission rate through the control plane.

Static class maps identify a data stream by definition. Each data packet is managed by commands of the first class whose map matches the packet’s content. Dynamic classes are not supported for control plane policing on FM6000 platform switches.

Each class corresponds to a transmission queue. Queue scheduling is round-robin until bandwidth rate for a queue is exceeded. Scheduling becomes strict-priority with CPU queue number determining priority until the shape rate is reached. Packets are dropped after the shape rate is exceeded.

The exit command returns the switch to policy-map configuration mode. Saving policy-map-class changes also require an exit from policy-map mode, which saves pending policy-map-class and policy-map changes to running-config and returns the switch to global configuration mode. The abort command discards pending changes, returning the switch to global configuration mode.

The no class and default class commands remove policy-map-class commands for the specified class assignment from the policy map. The class is removed from the policy map if it is a dynamic class.

Command Mode
Policy-Map (control plane) configuration
accessed through policy-map type copp command

Command Syntax
  class class_name
  no class class_name
  default class class_name

Parameters
- class_name name of the class.

Static Classes
FM6000 platform switches provide the following static control plane classes:
- copp-system-arp
- copp-system-igmp
- copp-system-PimPtp
- copp-system-default
- copp-system-12rsvd
- copp-system-selfip
- copp-system-ipmcmi
- copp-system-l3slowpath
- copp-system-selfip-tc6to7
- copp-system-ipmcrsvd
- copp-system-OspfIsis
- copp-system-sflow

Commands Available in Policy-map-class (control plane) Configuration Mode
- bandwidth (policy-map-class (control-plane) – FM6000)
- shape (policy-map-class (control-plane) – FM6000)
- exit saves pending class map changes, then returns the switch to global configuration mode.
- abort discards pending class map changes, then returns the switch to global configuration mode.
Related Commands
• policy-map type copp places switch in policy-map (control plane) configuration mode.

Example
• These commands enters policy-map-class configuration mode to modify the shape, bandwidth parameters associated with the static class named copp-system-arp.

switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#class copp-system-arp
switch(config-pmap-c-copp-system-policy-copp-system-arp)#
The `class` command places the switch in policy-map-class (control plane) configuration mode, which is a group change mode for changing bandwidth and shape parameters associated with a specified class. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. The control plane policy map contains 23 static classes. Each class contains an eponymous class map and may contain `bandwidth` and `shape` commands.

- The class map identifies a data stream.
- **Bandwidth** command defines the stream's minimum transmission rate through the control plane.
- **Shape** command defines the stream's maximum transmission rate through the control plane.

Static class maps identify a data stream by definition. Each data packet is managed by commands of the first class whose map matches the packet's content. Dynamic classes are not supported for control plane policing on Helix platform switches.

Each class corresponds to a transmission queue. Queue scheduling is strict-priority; CPU queue number determines priority until the `shape` rate is reached. Packets are dropped after the shape rate is exceeded.

The `exit` command returns the switch to policy-map configuration mode. Saving policy-map-class changes also require an exit from policy-map mode, which saves pending policy-map-class and policy-map changes to `running-config` and returns the switch to global configuration mode. The `abort` command discards pending changes, returning the switch to global configuration mode.

The `no class` and `default class` commands remove policy-map-class commands for the specified class assignment from the policy map.

### Command Mode
Policy-Map (control plane) configuration
accessed through `policy-map type copp` command

### Command Syntax
```
class class_name
no class class_name
default class class_name
```

### Parameters
- `class_name` name of the class.

### Static Classes
Helix platform switches provide the following static control plane classes:

- copp-system-acllog
- copp-system-ipmcmisss
- copp-system-Ospf
- copp-system-arp
- copp-system-ipmcrsvd
- copp-system-selfip
- copp-system-arpresolver
- copp-system-l3destmiss
- copp-system-selfip-tc6to7
- copp-system-bfd
- copp-system-l3slowpath
- copp-system-sflow
- copp-system-bgp
- copp-system-l3tll1
- copp-system-tc3to5
- copp-system-bpdu
- copp-system-lacp
- copp-system-tc6to7
- copp-system-default
- copp-system-ldp
- copp-system-urm
- copp-system-glean
- copp-system-ldp
- copp-system-rr
- copp-system-igmp
- copp-system-ldp
Commands Available in Policy-map-class (control plane) Configuration Mode

- **bandwidth (policy-map-class (control-plane) – Helix)**
- **shape (policy-map-class (control-plane) – Helix)**
- **exit** saves pending class map changes, then returns the switch to global configuration mode.
- **abort** discards pending class map changes, then returns the switch to global configuration mode.

Related Commands

- **policy-map type copp** places switch in policy-map (control plane) configuration mode.

Example

- These commands enters policy-map-class configuration mode to modify the shape, bandwidth parameters associated with the static class named **copp-system-arp**.

  ```
  switch(config)#policy-map
  switch(config)#policy-map type copp copp-system-policy
  switch(config-pmap-copp-system-policy)#class copp-system-lddp
  switch(config-pmap-c-copp-system-policy-copp-system-lddp)#
  ```
class (policy-map (control-plane) – Petra)

The **class** command places the switch in policy-map-class (control plane) configuration mode, which is a group change mode for changing bandwidth and shape parameters associated with a specified class. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. The control plane policy map contains 15 static classes. Each class contains an eponymous class map and may contain **bandwidth** and **shape** commands.

- The class map identifies a data stream.
- **Bandwidth** command defines the stream’s minimum transmission rate through the control plane.
- **Shape** command defines the stream’s maximum transmission rate through the control plane.

Static class maps identify a data stream by definition. Each data packet is managed by commands of the first class whose map matches the packet’s content. Dynamic classes are not supported for control plane policing on Petra platform switches.

Each class corresponds to a transmission queue. Queue scheduling is round-robin until **bandwidth** rate for a queue is exceeded. Scheduling becomes strict-priority with CPU queue number determining priority until the **shape** rate is reached. Packets are dropped after the shape rate is exceeded.

The **exit** command returns the switch to policy-map configuration mode. Saving policy-map-class changes also require an exit from policy-map mode, which saves pending policy-map-class and policy-map changes to **running-config** and returns the switch to global configuration mode. The **abort** command discards pending changes, returning the switch to global configuration mode.

The **no class** and **default class** commands remove policy-map-class commands for the specified class assignment from the policy map.

**Command Mode**

Policy-Map (control plane) configuration accessed through **policy-map type copp** command

**Command Syntax**

```
class class_name
no class class_name
default class class_name
```

**Parameters**

- **class_name** name of the class.

**Static Classes**

Petra platform switches provide the following static control plane classes:

- copp-system-bpdu
- copp-system-ipmcmiss
- copp-system-l3ttl0
- copp-system-default
- copp-system-ipmcrsvd
- copp-system-l3ttl1
- copp-system-igmp
- copp-system-ipunicast
- copp-system-lacp
- copp-system-ipbroadcast
- copp-system-l3destmiss
- copp-system-lldp
- copp-system-ipmc
- copp-system-l3slowpath
- copp-system-unicast-arp

**Commands Available in Policy-map-class (control plane) Configuration Mode**

- **bandwidth** (policy-map-class (control-plane) – Petra)
- **shape** (policy-map-class (control-plane) – Petra)
- **exit** saves pending class map changes, then returns the switch to global configuration mode.
- **abort** discards pending class map changes, then returns the switch to global configuration mode.
Related Commands

- `policy-map type copp` places switch in policy-map (control plane) configuration mode.

Example

- These commands enters policy-map-class configuration mode to modify the shape, bandwidth parameters associated with the static class named `copp-system-lldp`.

```
switch(config)#policy-map
switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#
```
class (policy-map (control-plane) – Trident)

The **class** command places the switch in policy-map-class (control plane) configuration mode, which is a group change mode for changing bandwidth and shape parameters associated with a specified class. The command adds the specified class to the policy map if it was not previously included. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. The control plane policy map contains 18 static classes and up to 30 dynamic classes. Dynamic classes contain an eponymous class map. All classes may contain **bandwidth** and **shape** commands.

- The class map identifies a data stream.
- **Bandwidth** command defines the stream's minimum transmission rate through the control plane.
- **Shape** command defines the stream's maximum transmission rate through the control plane.

Dynamic class maps identify a data stream with an ACL assigned by **match (class-map (control-plane) – Trident)**. Static class maps identify a data stream by definition. Each data packet is managed by commands of the first class whose map matches the packet's content.

Static classes are provided with the switch and cannot be removed from the policy map or modified by the **class** command. Dynamic classes are user defined and added to the policy map by this command. Dynamic classes are always placed in front of the static classes. Bandwidth and shape parameters are editable for all classes.

Each class corresponds to a transmission queue. Queue scheduling is round-robin until **bandwidth** rate for a queue is exceeded. Scheduling becomes strict-priority with CPU queue number determining priority until the **shape** rate is reached. Packets are dropped after the shape rate is exceeded.

The **exit** command returns the switch to policy-map configuration mode. Saving policy-map-class changes also require an exit from policy-map mode, which saves pending policy-map-class and policy-map changes to **running-config** and returns the switch to global configuration mode. The **abort** command discards pending changes, returning the switch to global configuration mode.

The **no class** and **default class** commands remove policy-map-class commands for the specified class assignment from the policy map. The class is removed from the policy map if it is a dynamic class.

**Command Mode**

Policy-Map (control plane) configuration
accessed through **policy-map type copp** command

**Command Syntax**

```
class class_name [PLACEMENT]
no class class_name [PLACEMENT]
default class class_name [PLACEMENT]
```

**Parameters**

- **class_name** name of the class.
- **PLACEMENT** Specifies the class’s map placement. Configurable only for dynamic classes.
  - <no parameter> New classes are placed between the dynamic and static classes. Previously defined classes retain their current policy map placement.
  - **insert-before** dynamic_class Class is inserted in front of the specified dynamic class.

**Static Classes**

Trident switches provide the following static control plane classes:

- copp-system-acllog•copp-system-ipmcmiss•copp-system-lldp
• copp-system-arp
• copp-system-ipmcrsvd
• copp-system-selfip
• copp-system-arpresolver
• copp-system-l3destmiss
• copp-system-selfip-tc6to7
• copp-system-bpdu
• copp-system-l3slowpath
• copp-system-sflow
• copp-system-glean
• copp-system-l3ttl1
• copp-system-tc3to5
• copp-system-igmp
• copp-system-lacp
• copp-system-tc6to7

Commands Available in Policy-map-class (control plane) Configuration Mode
• bandwidth (policy-map-class (control-plane) – Trident)
• shape (policy-map-class (control-plane) – Trident)
• exit saves pending class map changes, then returns the switch to global configuration mode.
• abort discards pending class map changes, then returns the switch to global configuration mode.

Related Commands
• class-map type copp places switch in class-map (control-plane) configuration mode.
• policy-map type copp places switch in policy-map (control plane) configuration mode.

Example
• These commands add CM-1 class to the copp-system-policy policy map.

switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#class CM-1
switch(config-pmap-c-copp-system-policy-CM-1)#
class (policy-map (control-plane) – Trident II)

The class command places the switch in policy-map-class (control plane) configuration mode, which is a group change mode for changing bandwidth and shape parameters associated with a specified class. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. The control plane policy map contains 23 static classes. Each class contains an eponymous class map and may contain bandwidth and shape commands.

- The class map identifies a data stream.
- Bandwidth command defines the stream’s minimum transmission rate through the control plane.
- Shape command defines the stream’s maximum transmission rate through the control plane.

Static class maps identify a data stream by definition. Each data packet is managed by commands of the first class whose map matches the packet’s content. Dynamic classes are not supported for control plane policing on Trident II platform switches.

Each class corresponds to a transmission queue. Queue scheduling is strict-priority; CPU queue number determines priority until the shape rate is reached. Packets are dropped after the shape rate is exceeded.

The exit command returns the switch to policy-map configuration mode. Saving policy-map-class changes also require an exit from policy-map mode, which saves pending policy-map-class and policy-map changes to running-config and returns the switch to global configuration mode. The abort command discards pending changes, returning the switch to global configuration mode.

The no class and default class commands remove policy-map-class commands for the specified class assignment from the policy map.

Command Mode

Policy-Map (control plane) configuration
accessed through policy-map type copp command

Command Syntax

class class_name
no class class_name
default class class_name

Parameters

- class_name name of the class.

Static Classes

Trident II platform switches provide the following static control plane classes:

- copp-system-acllog
- copp-system-igmp
- copp-system-mlag
- copp-system-arp
- copp-system-ipmcmiss
- copp-system-selfip
- copp-system-arpresolver
- copp-system-ipmcrsvd
- copp-system-selfip-tc6to7
- copp-system-bfd
- copp-system-l3destmiss
- copp-system-sflow
- copp-system-bgp
- copp-system-l3slowpath
- copp-system-tc3to5
- copp-system-bpdu
- copp-system-l3ttl1
- copp-system-tc6to7
- copp-system-default
- copp-system-lacp
- copp-system-urm
- copp-system-glean
- copp-system-lldp

Commands Available in Policy-map-class (control plane) Configuration Mode

- bandwidth (policy-map-class (control-plane) – Trident II)
• shape (policy-map-class (control-plane) – Trident II)
• exit saves pending class map changes, then returns the switch to global configuration mode.
• abort discards pending class map changes, then returns the switch to global configuration mode.

Related Commands
• policy-map type copp places switch in policy-map (control plane) configuration mode.

Example
• These commands enters policy-map-class configuration mode to modify the shape, bandwidth parameters associated with the static class named copp-system-arp.

    switch(config)#policy-map
    switch(config)#policy-map type copp copp-system-policy
    switch(config-pmap-copp-system-policy)#class copp-system-lldp
    switch(config-pmap-c-copp-system-policy-copp-system-lldp)#
class (policy-map (pbr))

The class (policy-map (pbr)) command places the switch in policy-map-class (pbr) configuration mode, which is a group change mode that modifies the specified class of the configuration mode Policy-Based Routing (PBR) policy map. The command adds the class to the policy map if it was not previously included in the policy map. All changes in a group change mode edit session are pending until the mode is exited, and can be canceled by using the abort command.

A PBR policy map is an ordered list of classes. Each class contains an eponymous class map and can contain set commands to specify next hop. Classes without set commands translate to no action being performed on that class of packets.

- The class map identifies a data stream through ACLs. Class maps are configured in class-map (pbr) configuration mode.
- Set commands can be used to specify the next hop for a given class. Set commands are configured in policy-map-class (pbr) configuration mode.

PBR policy maps can also contain one or more raw match statements which filter incoming traffic without using ACLs. Data packets are managed by commands of the first class or raw match statement matching the packet’s contents.

The exit command returns the switch to policy-map (pbr) configuration mode. However, saving policy-map-class changes also requires an exit from policy-map (pbr) configuration mode. This saves all pending policy map and policy-map-class changes to running-config and returns the switch to global configuration mode. The abort command discards pending changes, returning the switch to global configuration mode.

The no class and default class commands remove the class assignment from the configuration mode policy map by deleting the corresponding class configuration from running-config.

Command Mode
Policy-Map (pbr) Configuration
accessed through policy-map type pbr

Command Syntax

[sequence_number] class class_name
no [sequence_number] class class_name
default [sequence_number] class class_name
no sequence_number
default sequence_number

Parameters
- sequence_number Sequence number (1 to 4294967295) assigned to the rule. If no number is entered, the number is derived by adding 10 to the number of the policy map’s last numbered line. To increase the distance between existing entries, use the resequence command.
- class_name name of the class.

Commands Available in Policy-map-class (pbr) Configuration Mode
- set nexthop (policy-map-class – pbr) sets next hop for the class.
- exit saves pending class changes and returns switch to policy-map (pbr) configuration mode.
- abort discards pending class changes and returns switch to policy-map (pbr) configuration mode.

Related Commands
- class-map type pbr places switch in class-map (pbr) configuration mode.
- policy-map type pbr places switch in policy-map (pbr) configuration mode.
Examples

- These commands add the CMAP1 class map to the PMAP1 policy map, then place the switch in policy-map-class configuration mode where the next hops can be assigned to the class. Changes will not take effect until both modes are exited.

```console
switch(config)#policy-map type pbr PMAP1
switch(config-pmap-PMAP1)#class CMAP1
switch(config-pmap-c-PMAP1-CMAP1)#
```
class (policy-map (qos) – FM6000)

The class command places the switch in policy-map-class (qos) configuration mode, which is a group change mode that modifies the specified class of the configuration mode policy map. The command adds the class to the policy map if it was not previously included in the policy map. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. Each class contains an eponymous class map and at least one set command:

- The class map identifies a data stream through an ACL. Class maps are configured in class-map (qos) configuration mode.
- Set commands either modify a packet’s content (CoS or DSCP fields) or assigns it to a traffic class queue. Set commands are configured in policy-map-class (qos) configuration mode.

Data packets are managed by commands of the first class whose map matches the packet’s content.

The exit command returns the switch to policy-map configuration mode. However, saving policy-map-class changes also require an exit from policy-map mode. This saves all pending policy map and policy-map-class changes to running-config and returns the switch to global configuration mode. The abort command discards pending changes, returning the switch to global configuration mode.

The no class and default class commands remove the class assignment from the configuration mode policy map by deleting the corresponding class configuration from running-config.

Command Mode
Policy-Map (qos) Configuration
accessed through policy-map type quality-of-service

Command Syntax

```
class class_name [PLACEMENT]
no class class_name [PLACEMENT]
default class class_name [PLACEMENT]
```

Parameters

- **class_name** name of the class.
- **PLACEMENT** Specifies the map placement within the list of class maps.
  - <no parameter> Class is placed at the top of the list.
  - insert-before existing_class Class is inserted in front of the specified class.

Commands Available in Policy-map-class (qos) Configuration Mode

- set (policy-map-class (qos) – FM6000)
- exit saves pending class changes and returns switch to policy-map (qos) configuration mode.
- abort discards pending class changes and returns switch to policy-map (qos) configuration mode.

Related Commands

- class-map type qos places switch in class-map (qos) configuration mode.
- policy-map type quality-of-service places switch in policy-map (qos) configuration mode
Example

- These commands add the **CMAP_1** class map to the **PMAP_1** policy map, then places the switch in policy-map-class configuration mode.

  ```
  switch(config)#policy-map type quality-of-service PMAP-1
  switch(config-pmap-PMAP-1)#class CMAP-1
  switch(config-pmap-c-PMAP-1-CMAP-1)#
  ```
class (policy-map (qos) – Helix)

The **class** command places the switch in policy-map-class (qos) configuration mode, which is a group change mode that modifies the specified class of the configuration mode policy map. The command adds the class to the policy map if it was not previously included in the policy map. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. Each class contains an eponymous class map and at least one set command:

- The class map identifies a data stream through an ACL. Class maps are configured in class-map (qos) configuration mode.
- **Set** commands either modify a packet’s content (CoS or DSCP fields) or assigns it to a traffic class queue. **Set** commands are configured in policy-map-class (qos) configuration mode.

  Data packets are managed by commands of the first class whose map matches the packet’s content.

The **exit** command returns the switch to policy-map configuration mode. However, saving policy-map-class changes also require an exit from policy-map mode. This saves all pending policy map and policy-map-class changes to **running-config** and returns the switch to global configuration mode. The **abort** command discards pending changes, returning the switch to global configuration mode.

The **no class** and **default class** commands remove the class assignment from the configuration mode policy map by deleting the corresponding **class** configuration from **running-config**.

### Command Mode

**Policy-Map (qos) Configuration**

accessed through **policy-map type quality-of-service** command

### Command Syntax

```
class class_name [PLACEMENT]
no class class_name [PLACEMENT]
default class class_name [PLACEMENT]
```

### Parameters

- **class_name**  
  name of the class.

- **PLACEMENT**  
  Specifies the map placement within the list of class maps.
  - <no parameter>  
    Class is placed at the top of the list.
  - **insert-before existing_class**  
    Class is inserted in front of the specified class.

### Commands Available in Policy-map-class (qos) Configuration Mode

- **set (policy-map-class (qos) – Helix)**

### Related Commands

- **class-map type qos** places switch in class-map (qos) configuration mode.
- **policy-map type quality-of-service** places switch in policy-map (qos) configuration mode
Example

- These commands add the `CMAP_1` class map to the `PMAP_1` policy map, then places the switch in policy-map-class configuration mode.

  ```bash
  switch(config)#policy-map type quality-of-service PMAP-1
  switch(config-pmap-PMAP-1)#class CMAP-1
  switch(config-pmap-c-PMAP-1-CMAP-1)#
  ```
class (policy-map (qos) – Trident)

The `class` command places the switch in policy-map-class (qos) configuration mode, which is a group change mode that modifies the specified class of the configuration mode policy map. The command adds the class to the policy map if it was not previously included in the policy map. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. Each class contains an eponymous class map and at least one set command:

- The class map identifies a data stream through an ACL. Class maps are configured in class-map (qos) configuration mode.
- `Set` commands either modify a packet’s content (CoS or DSCP fields) or assigns it to a traffic class queue. `Set` commands are configured in policy-map-class (qos) configuration mode.
  
  Data packets are managed by commands of the first class whose map matches the packet’s content.

The `exit` command returns the switch to policy-map configuration mode. However, saving policy-map-class changes also require an exit from policy-map mode. This saves all pending policy map and policy-map-class changes to `running-config` and returns the switch to global configuration mode. The `abort` command discards pending changes, returning the switch to global configuration mode.

The `no class` and `default class` commands remove the class assignment from the configuration mode policy map by deleting the corresponding class configuration from `running-config`.

Command Mode
Policy-Map (qos) Configuration
accessed through `policy-map type quality-of-service` command

Command Syntax
```
class class_name [PLACEMENT]
no class class_name [PLACEMENT]
default class class_name [PLACEMENT]
```

Parameters
- `class_name` name of the class.
- `PLACEMENT` Specifies the map placement within the list of class maps.
  - `<no parameter>` Class is placed at the top of the list.
  - `insert-before existing_class` Class is inserted in front of the specified class.

Commands Available in Policy-map-class (qos) Configuration Mode
- `set (policy-map-class (qos) – Trident)`
- `exit` saves pending class changes and returns switch to policy-map (qos) configuration mode.
- `abort` discards pending class changes and returns switch to policy-map (qos) configuration mode.

Related Commands
- `class-map type qos` places switch in class-map (qos) configuration mode.
- `policy-map type quality-of-service` places switch in policy-map (qos) configuration mode
Example

- These commands add the `CMAP_1` class map to the `PMAP_1` policy map, then places the switch in policy-map-class configuration mode.

```
switch(config)#policy-map type quality-of-service PMAP-1
switch(config-pmap-PMAP-1)#class CMAP-1
switch(config-pmap-c-PMAP-1-CMAP-1)#
```
class (policy-map (qos) – Trident II)

The **class** command places the switch in policy-map-class (qos) configuration mode, which is a group change mode that modifies the specified class of the configuration mode policy map. The command adds the class to the policy map if it was not previously included in the policy map. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. Each class contains an eponymous class map and at least one set command:

- The class map identifies a data stream through an ACL. Class maps are configured in class-map (qos) configuration mode.
- **Set** commands either modify a packet’s content (CoS or DSCP fields) or assigns it to a traffic class queue. **Set** commands are configured in policy-map-class (qos) configuration mode.

Data packets are managed by commands of the first class whose map matches the packet’s content.

The **exit** command returns the switch to policy-map configuration mode. However, saving policy-map-class changes also require an exit from policy-map mode. This saves all pending policy map and policy-map-class changes to **running-config** and returns the switch to global configuration mode. The **abort** command discards pending changes, returning the switch to global configuration mode.

The **no class** and **default class** commands remove the class assignment from the configuration mode policy map by deleting the corresponding **class** configuration from **running-config**.

**Command Mode**

Policy-Map (qos) Configuration
accessed through **policy-map type quality-of-service** command

**Command Syntax**

```plaintext
class class_name [PLACEMENT]
no class class_name [PLACEMENT]
default class class_name [PLACEMENT]
```

**Parameters**

- **class_name** name of the class.
- **PLACEMENT** Specifies the map placement within the list of class maps.
  - <no parameter> Class is placed at the top of the list.
  - **insert-before existing_class** Class is inserted in front of the specified class.

**Commands Available in Policy-map-class (qos) Configuration Mode**

- **set** (policy-map-class (qos) – Trident II)
- **exit** saves pending class changes and returns switch to policy-map (qos) configuration mode.
- **abort** discards pending class changes and returns switch to policy-map (qos) configuration mode.

**Related Commands**

- **class-map type qos** places switch in class-map (qos) configuration mode.
- **policy-map type quality-of-service** places switch in policy-map (qos) configuration mode
Example

- These commands add the `CMAP_1` class map to the `PMAP_1` policy map, then places the switch in policy-map-class configuration mode.

  ```
  switch(config)#policy-map type quality-of-service PMAP-1
  switch(config-pmap-PMAP-1)#class CMAP-1
  switch(config-pmap-c-PMAP-1-CMAP-1)#
  ```
**class-map type copp**

The **class-map type copp** command places the switch in Class-Map (control plane) configuration mode, which is a group change mode that modifies a control-plane dynamic class map. A dynamic class map is a data structure that uses access control lists (ACLs) to define a data stream by specifying characteristics of data packets that comprise that stream. Control-plane policy maps use class maps to specify which control plane traffic is controlled by policy map criteria.

The **exit** command saves pending class map changes to **running-config** and returns the switch to global configuration mode. Class map changes are also saved by entering a different configuration mode. The **abort** command discards pending changes and returns the switch to global configuration mode.

The **no class-map type copp** and **default class-map type copp** commands delete the specified class map by removing the corresponding **class-map type copp** command and its associated configuration.

**Command Mode**

Global Configuration

**Command Syntax**

```
class-map type copp match-any class_name
no class-map type copp [match-any] class_name
default class-map type copp [match-any] class_name
```

**Parameters**

- **class_name**  Name of class map.

**Commands Available in Class-Map (Control Plane) Configuration Mode**

- **match (class-map (control-plane) – Trident)**

**Related Commands**

- **policy-map type copp**
- **class (policy-map (control-plane) – Trident)**
- **class-map type qos**

**Example**

- This command creates the control plane class map named CP-MAP-1 and places the switch in class-map configuration mode.

```
switch(config)#class-map type copp match-any CP-CMAP-1
switch(config-cmap-CP-CMAP-1)#
```
class-map type pbr

The class-map type pbr command places the switch in class-map (pbr) configuration mode for the specified class map, and creates the class map if one does not already exist. Class-map (pbr) configuration mode is a group change mode that modifies a class map for Policy-Based Routing (PBR). PBR class maps contain one or more match statements which filter incoming traffic using ACLs. PBRs can then use these class maps to set next-hop IP addresses for the traffic that matches them. (Classes without set commands translate to no action being performed on that class of packets.)

The exit command saves pending class map changes to running-config, then returns the switch to global configuration mode. Class map changes are also saved by directly entering a different configuration mode. The abort command discards pending changes and returns the switch to global configuration mode.

The no class-map type pbr and default class-map type pbr commands delete the specified class map by removing the corresponding class-map type pbr command and its associated configuration.

Command Mode
Global Configuration

Command Syntax

```
class-map type pbr match-any map_name
no class-map type pbr match-any map_name
default class-map type pbr match-any map_name
```

Parameters
- `map_name` Name of class map.

Commands Available in Class-Map (PBR) configuration mode
- match (class-map (pbr))
- resequence (class-map (pbr))

Related Commands
- policy-map type pbr
- class (policy-map (pbr))

Example
- This command creates the PBR class map named MAP1 and places the switch in class-map (pbr) configuration mode where match criteria can be configured for the class.

```
switch(config)#class-map type pbr match-any MAP1
switch(config-cmap-MAP1)#
```
**class-map type qos**

The `class-map type qos` command places the switch in Class-Map (qos) configuration mode, which is a group change mode that modifies a QoS dynamic class map. A dynamic class map is a data structure that uses access control lists (ACLs) to define a data stream by specifying characteristics of data packets that comprise that stream. QoS policy maps use class maps to specify the traffic (to which the policy map is assigned) that is transformed by policy map criteria.

The `exit` command saves pending class map changes to `running-config`, then returns the switch to global configuration mode. Class map changes are also saved by entering a different configuration mode. The `abort` command discards pending changes and returns the switch to global configuration mode.

The `no class-map type qos` and `default class-map type qos` commands delete the specified class map by removing the corresponding `class-map type qos` command and its associated configuration. The `class-map` and `class-map type qos` commands are equivalent.

**Command Mode**

Global Configuration

**Command Syntax**

```
class-map [type qos] match-any class_name
no class-map [type qos] [match-any] class_name
default class-map [type qos] [match-any] class_name
```

`class-map map_name` and `class-map type qos map_name` are identical commands.

**Parameters**

- `class_name` Name of class map.

**Commands Available in Class-Map (QoS) Configuration Mode**

- `match (class-map (qos) – FM6000)`
- `match (class-map (qos) – Trident)`

**Related Commands**

- `policy-map type quality-of-service`
- `class (policy-map (qos) – FM6000)`
- `class (policy-map (qos) – Trident)`

**Example**

- This command creates the QoS class map named MAP-1 and places the switch in class-map configuration mode.

  ```
  switch(config)#class-map type qos match-any MAP-1
  switch(config-cmap-MAP-1)#
  ```
clear policy-map counters

The clear policy-map command resets the specified policy map counters to zero. Policy map counters record the quantity of packets that are filtered by the ACLs that comprise a specified policy map.

Command Mode
Privileged EXEC

Command Syntax

```
clear policy-map INTERFACE_NAME counters MAP_NAME
```

Parameters

- **INTERFACE_NAME** Interface for which command clears table counters. Options include:
  - `interface control-plane` Control plane.
- **MAP_NAME** Policy map for which command clears counters. Options include:
  - `copp-system-policy` Name of only policy map supported for the control plane.
match (class-map (control-plane) – Helix)

The match command assigns an ACL to the configuration mode class map. A class map can contain only one ACL. Class maps only use permit rules to filter data; deny rules are ignored. The command accepts IPv4 and IPv4 standard ACLs.

A class map is assigned to a policy map by the class (policy-map (control-plane) – Helix) command.

Class map (control plane) configuration mode is a group change mode. Match statements are not saved to running-config until the edit session is completed by exiting the mode.

The no match and default match commands remove the match statement from the configuration mode class map by deleting the corresponding command from running-config.

Command Mode

Class-Map (control plane) configuration
accessed through class-map type copp command

Command Syntax

match ip access-group list_name
no match ip access-group list_name
default match ip access-group list_name

Parameters

- list_name name of ACL assigned to class map.

Related Commands

- class-map type copp places the switch in Class-Map configuration mode.
- exit saves pending class map changes, then returns the switch to global configuration mode.
- abort discards pending class map changes, then returns the switch to global configuration mode.
- class (policy-map (control-plane) – Helix) assigns a class map to a policy map.

Guidelines

Static class maps cannot be modified by this command.

Match statements are saved to running-config only upon exiting Class-Map (control plane) configuration mode.

Example

- These commands add the IP ACL list_1 to the map_1 class map, then saves the command by exiting class-map mode.

  switch(config)#class-map type copp map_1
  switch(config-cmap-map_1)#match ip access-group list_1
  switch(config-cmap-map_1)#exit
  switch(config)#
match (class-map (control-plane) – Trident)

The `match` command assigns an ACL to the configuration mode class map. A class map can contain only one ACL. Class maps only use permit rules to filter data; deny rules are ignored. The command accepts IPv4, IPv6, IPv4 standard, and IPv6 standard ACLs.

A class map is assigned to a policy map by the `class (policy-map (control-plane) – Trident)` command. Class map (control plane) configuration mode is a group change mode. Match statements are not saved to `running-config` until the edit session is completed by exiting the mode.

The `no match` and `default match` commands remove the `match` statement from the configuration mode class map by deleting the corresponding command from `running-config`.

Command Mode

Class-Map (control plane) configuration
accessed through `class-map type copp` command

Command Syntax

```
machine IP_VERSION access-group list_name
no match IP_VERSION access-group list_name
default match IP_VERSION access-group list_name
```

Parameters

- `IP_VERSION` IP version of the specified ACL. Options include:
  - `ip` IPv4.
  - `ipv6` IPv6.
- `list_name` name of ACL assigned to class map.

Related Commands

- `class-map type copp` places the switch in Class-Map configuration mode.
- `exit` saves pending class map changes, then returns the switch to global configuration mode.
- `abort` discards pending class map changes, then returns the switch to global configuration mode.
- `class (policy-map (control-plane) – Trident)` assigns a class map to a policy map.

Guidelines

Static class maps cannot be modified by this command.

Match statements are saved to `running-config` only upon exiting Class-Map (control plane) configuration mode.

Example

- These commands add the IPv4 ACL names `list_1` to the `map_1` class map, then saves the command by exiting class-map mode.

  ```
  switch(config)#class-map type copp map_1
  switch(config-cmap-map_1)#match ip access-group list_1
  switch(config-cmap-map_1)#exit
  switch(config)#
  ```
**match (class-map (control-plane) – Trident II)**

The `match` command assigns an ACL to the configuration mode class map. A class map can contain only one ACL. Class maps only use permit rules to filter data; deny rules are ignored. The command accepts IPv4 and IPv4 standard ACLs.

A class map is assigned to a policy map by the `class (policy-map (control-plane) – Trident II)` command. Class map (control plane) configuration mode is a group change mode. Match statements are not saved to `running-config` until the edit session is completed by exiting the mode.

The `no match` and `default match` commands remove the `match` statement from the configuration mode class map by deleting the corresponding command from `running-config`.

**Command Mode**

   Class-Map (control plane) configuration
   accessed through `class-map type copp` command

**Command Syntax**

   - `match ip access-group list_name`
   - `no match ip access-group list_name`
   - `default match ip access-group list_name`

**Parameters**

- `list_name` name of ACL assigned to class map.

**Related Commands**

- `class-map type copp` places the switch in Class-Map configuration mode.
- `exit` saves pending class map changes, then returns the switch to global configuration mode.
- `abort` discards pending class map changes, then returns the switch to global configuration mode.
- `class (policy-map (control-plane) – Trident II)` assigns a class map to a policy map.

**Guidelines**

Static class maps cannot be modified by this command.

**Match** statements are saved to `running-config` only upon exiting Class-Map (control plane) configuration mode.

**Example**

- These commands add the IP ACL `list_1` to the `map_1` class map, then saves the command by exiting class-map mode.

```
switch(config)#class-map type copp map_1
switch(config-cmap-map_1)#match ip access-group list_1
switch(config-cmap-map_1)#exit
switch(config)#
```
match (class-map (pbr))

The match command assigns ACLs to the configuration mode Policy-Based Routing (PBR) class map. The command accepts IPv4, IPv4 standard, IPv6 and IPv6 standard ACLs.

Class map (pbr) configuration mode is a group change mode. Match statements are not saved to running-config until the edit session is completed by exiting the mode.

The no match and default match commands remove the match statement from the configuration mode class map by deleting the corresponding command from running-config.

Important! PBR ACLs use only permit rules to filter data; if there are deny rules in an ACL used by PBR, the configuration will be reverted.

Command Mode
Class-map (pbr) configuration
accessed through class-map type pbr command

Command Syntax

```
[sequence_number] match \{ip|ipv6\} access-group list_name
no [sequence_number] match \{ip|ipv6\} access-group list_name
default [sequence_number] match \{ip|ipv6\} access-group list_name
no sequence_number
default sequence_number
```

Parameters

- `sequence_number`  Sequence number (1 to 4294967295) assigned to the rule. If no number is entered, the number is derived by adding 10 to the number of the class map’s last numbered line. To increase the distance between existing entries, use the resequence command.

- `list_name`  name of ACL assigned to class map.

Related Commands

- class-map type pbr places the switch in class-map configuration mode.
- exit saves pending class map changes, then returns the switch to global configuration mode.
- abort discards pending class map changes, then returns the switch to global configuration mode.
- class (policy-map (pbr)) assigns a class map to a policy map.

Example

- These commands add the IPv4 ACL named list1 to the map1 class map, then save the change by exiting class-map mode.

  ```
switch(config)#class-map type pbr map1
switch(config-cmap-map1)#match ip access-group list1
switch(config-cmap-map1)#exit
switch(config)#
```
match (class-map (qos) – FM6000)

The **match** command assigns an ACL to the configuration mode class map. A class map can contain only one ACL. Class maps only use permit rules to filter data; deny rules are ignored. The command accepts IPv4 and IPv4 standard ACLs.

Class map (qos) configuration mode is a group change mode. **Match** statements are not saved to **running-config** until the edit session is completed by exiting the mode.

The **no match** and **default match** commands remove the **match** statement from the configuration mode class map by deleting the corresponding command from **running-config**.

**Command Mode**

Class-map (qos) configuration
accessed through **class-map type qos** command

**Command Syntax**

```
match IP_VERSION access-group list_name
no match IP_VERSION access-group list_name
default match IP_VERSION access-group list_name
```

**Parameters**

- **IP_VERSION**  IP version of the specified ACL. Options include:
  - **ip**  IPv4.
- **list_name**  name of ACL assigned to class map.

**Related Commands**

- **class-map type qos** places the switch in Class-Map configuration mode.
- **exit**  saves pending class map changes, then returns the switch to global configuration mode.
- **abort**  discards pending class map changes, then returns the switch to global configuration mode.
- **class (policy-map (qos) – FM6000)**  assigns a class map to a policy map.

**Example**

- These commands add the IPv4 ACL named **list_1** to the **map_1** class map, then saves the command by exiting class-map mode.

```
switch(config)#class-map type qos map_1
switch(config-cmap-map_1)#match ip access-group list_1
switch(config-cmap-map_1)#exit
switch(config)#
```
**match (class-map (qos) – Helix)**

The **match** command assigns an ACL to the configuration mode class map. A class map can contain only one ACL. Class maps only use permit rules to filter data; deny rules are ignored. The command accepts IPv4, IPv4 standard, IPv6, and IPv6 standard ACLs.

Class map (qos) configuration mode is a group change mode. **Match** statements are not saved to **running-config** until the edit session is completed by exiting the mode.

The **no match** and **default match** commands remove the **match** statement from the configuration mode class map by deleting the corresponding command from **running-config**.

**Command Mode**

Class-Map (qos) configuration accessed through **class-map type qos** command

**Command Syntax**

```
match IP_VERSION access-group list_name
no match IP_VERSION access-group list_name
default match IP_VERSION access-group list_name
```

**Parameters**

- **IP_VERSION** IP version of the specified ACL. Options include:
  - ip IPv4.
  - ipv6 IPv6.
- **list_name** name of ACL assigned to class map.

**Related Commands**

- **class-map type qos** places the switch in Class-Map configuration mode.
- **exit** saves pending class map changes, then returns the switch to global configuration mode.
- **abort** discards pending class map changes, then returns the switch to global configuration mode.
- **class (policy-map (qos) – Helix)** assigns a class map to a policy map.

**Example**

- These commands add the IPv4 ACL named **list_1** to the **map_1** class map, then saves the command by exiting class-map mode.

```
switch(config)#class-map type qos map_1
switch(config-cmap-map_1)#match ip access-group list_1
switch(config-cmap-map_1)#exit
switch(config)#
```
match (class-map (qos) – Trident)

The `match` command assigns an ACL to the configuration mode class map. A class map can contain only one ACL. Class maps only use permit rules to filter data; deny rules are ignored. The command accepts IPv4, IPv4 standard, IPv6, and IPv6 standard ACLs.

Class map (qos) configuration mode is a group change mode. Match statements are not saved to `running-config` until the edit session is completed by exiting the mode.

The `no match` and `default match` commands remove the `match` statement from the configuration mode class map by deleting the corresponding command from `running-config`.

Command Mode

Class-Map (qos) configuration accessed through `class-map type qos` command

Command Syntax

```
match IP_VERSION access-group list_name
no match IP_VERSION access-group list_name
default match IP_VERSION access-group list_name
```

Parameters

- `IP_VERSION`  IP version of the specified ACL. Options include:
  - `ip`  IPv4.
  - `ipv6`  IPv6.
- `list_name`  name of ACL assigned to class map.

Related Commands

- `class-map type qos` places the switch in Class-Map configuration mode.
- `exit` saves pending class map changes, then returns the switch to global configuration mode.
- `abort` discards pending class map changes, then returns the switch to global configuration mode.
- `class (policy-map (qos) – Trident)` assigns a class map to a policy map.

Example

- These commands add the IPv4 ACL named `list_1` to the `map_1` class map, then saves the command by exiting class-map mode.

```
switch(config)#class-map type qos map_1
switch(config-cmap-map_1)#match ip access-group list_1
switch(config-cmap-map_1)#exit
switch(config)#
```
match (class-map (qos) – Trident II)

The `match` command assigns an ACL to the configuration mode class map. A class map can contain only one ACL. Class maps only use permit rules to filter data; deny rules are ignored. The command accepts IPv4, IPv4 standard, IPv6, and IPv6 standard ACLs.

Class map (qos) configuration mode is a group change mode. Match statements are not saved to `running-config` until the edit session is completed by exiting the mode.

The `no match` and `default match` commands remove the `match` statement from the configuration mode class map by deleting the corresponding command from `running-config`.

Command Mode

Class-Map (qos) configuration accessed through `class-map type qos` command

Command Syntax

```plaintext
match IP_VERSION access-group list_name
no match IP_VERSION access-group list_name
default match IP_VERSION access-group list_name
```

Parameters

- **IP_VERSION**  IP version of the specified ACL. Options include:
  - `ip`  IPv4.
  - `ipv6`  IPv6.
- **list_name**  name of ACL assigned to class map.

Related Commands

- `class-map type qos` places the switch in Class-Map configuration mode.
- `exit` saves pending class map changes, then returns the switch to global configuration mode.
- `abort` discards pending class map changes, then returns the switch to global configuration mode.
- `class (policy-map (qos) – Trident)` assigns a class map to a policy map.

Example

- These commands add the IPv4 ACL named `list_1` to the `map_1` class map, then saves the command by exiting class-map mode.

  ```plaintext
  switch(config)#class-map type qos map_1
  switch(config-cmap-map_1)#match ip access-group list_1
  switch(config-cmap-map_1)#exit
  switch(config)#
  ```
match (policy-map (pbr))

The **match** command creates a policy map clause entry that specifies one filtering condition. When a packet matches the filtering criteria, its next hop is set as specified. When a packet’s properties do not equal the statement parameters, the packet is evaluated against the next clause or class map in the policy map, as determined by sequence number. If all clauses fail to set a next hop for the packet, the packet is routed according to the FIB.

The **no match** and **default match** commands remove the **match** statement from the configuration mode policy map by deleting the corresponding command from running-config.

**Command Mode**

Policy-Map (pbr) Configuration
accessed through **policy-map type pbr** command

**Command Syntax**

```
[sequence_number] match ip SOURCE_ADDR DEST_ADDR [set nexthop [recursive]]
NH-addr_1 [NH-addr_2] ... [NH-addr_n]
```

```
no match ip SOURCE_ADDR DEST_ADDR [set nexthop [recursive]]
NH-addr_1 [NH-addr_2] ... [NH-addr_n]]
```

```
no SEQ_NUM
```

```
default match match ip SOURCE_ADDR DEST_ADDR [set nexthop [recursive]]
NH-addr_1 [[NH-addr_2] ... [NH-addr_n]]
```

```
default SEQ_NUM
```

**Parameters**

- **sequence_number**  Sequence number assigned to the rule. If no number is entered, the number is derived by adding 10 to the number of the policy map’s last numbered line. To increase the distance between existing entries, use the **resequence** command.

- **SOURCE_ADDR** and **DEST_ADDR**  source and destination address filters. Options include:
  - **network_addr**  subnet address (CIDR or address-mask).
  - **any**  packets from or to all addresses are matched.
  - **host ip_addr**  IP address (dotted decimal notation).

  Source and destination subnet addresses support discontiguous masks.

- **recursive**  enables recursive next hop resolution.

- **NH_addr**  IP address of next hop. If multiple addresses are entered, they are treated as an ECMP group.

**Related Commands**

- **policy-map type pbr** enters policy-map (PBR) configuration mode.

**Example**

These commands create a match rule in policy map “PMAP1” which sets the next hop to 192.168.3.5 for packets received from 172.16.0.0/12 regardless of their destination, then exit the mode to save the changes.

```
switch(config)#policy-map type pbr PMAP1
switch(config-pmap-PMAP1)#match ip 172.16.0.0/12 any set nexthop 192.163.3.5
switch(config-pmap-PMAP1)#exit
switch(config)#
```
platform arad tcam counters feature

The platform arad tcam counters feature command enables incrementing PBR hardware counters corresponding to ACL. If counters for PBR are enabled, then counters for ACL will be automatically disabled in all cases. If counters for ACL are enabled, then counters for PBR will be automatically disabled in all cases.

The no platform arad tcam counters feature command disables PBR/ACL counters selection. The default platform arad tcam counters feature commands resets the default behavior.

Command Mode
Global Configuration

Command Syntax
platform arad tcam counters feature [OPTIONS]
no platform arad tcam counters feature [OPTIONS]
default platform arad tcam counters feature [OPTIONS]

Parameters
- OPTIONS Assign the TCAM counters feature. Options include:
  - pbr assign the TCAM counters feature PBR hardware counters.
  - acl assign the TCAM counters feature ACL hardware counters.

Example
- This command enables incrementing ACL hardware counters selection.
  switch(config)#platform arad tcam counters feature acl
  switch(config)#
- This command disables incrementing ACL hardware counters selection.
  switch(config)#no platform arad tcam counters feature acl
  switch(config)#
policy-map type copp

The **policy-map type copp** command places the switch in Policy-Map (control plane) configuration mode, which is a group change mode that modifies a control-plane policy map. A policy map is a data structure that consists of class maps that identify a specific data stream and specify bandwidth and shaping parameters that controls its transmission. Control plane policy maps are applied to the control plane to manage traffic.

The **copp-system-policy** policy map is supplied with the switch and is always applied to the control plane. **Copp-system-policy** is the only valid control plane policy map.

The **exit** command saves pending policy map changes to **running-config** and returns the switch to global configuration mode. Policy map changes are also saved by entering a different configuration mode. The **abort** command discards pending changes, returning the switch to global configuration mode.

The **no policy-map type copp** and **default policy-map type copp** commands delete the specified policy map by removing the corresponding **policy-map type copp** command and its associated configuration.

**Command Mode**  
Global Configuration

**Command Syntax**

```plaintext
policy-map type copp copp-system-policy
no policy-map type copp copp-system-policy
default policy-map type copp copp-system-policy
```

copp-system-policy is supplied with the switch and is the only valid control plane policy map.

**Commands Available in Policy-Map Configuration Mode**

- **class (policy-map (control-plane) – FM6000)**
- **class (policy-map (control-plane) – Trident)**

**Related Commands**

- **class-map type copp** enters control-plane class-map configuration mode for modifying a control-plane dynamic class map.

  Only Helix and Trident platform switches support dynamic classes for control plane policing.

**Example**

- This command places the switch in policy-map configuration mode to edit the copp-system-policy policy map.

  ```plaintext
  switch(config)#policy-map type copp copp-system-policy
  switch(config-pmap-copp-system-policy)#
  ```
**policy-map type pbr**

The `policy-map type pbr` command places the switch in policy-map (pbr) configuration mode, which is a group change mode that modifies a Policy-Based Routing (PBR) policy map. The command also creates the specified policy map if it does not already exist. A PBR policy map is a data structure that consists of class maps that identify specific packets and the next hops for those packets. Policy maps are applied to Ethernet or port channel interfaces to manage traffic.

The `exit` command saves pending policy map changes to `running-config` and returns the switch to global configuration mode. Policy map changes are also saved by entering a different configuration mode. The `abort` command discards pending changes, returning the switch to global configuration mode.

The `no policy-map type pbr` and `default policy-map type pbr` commands delete the specified policy map by removing the corresponding `policy-map type pbr` command and its associated configuration.

**Command Mode**
- Global Configuration

**Command Syntax**

```
policy-map type pbr map_name
no policy-map type pbr map_name
default policy-map type pbr map_name
```

**Parameters**
- `map_name` Name of policy map.

**Commands Available in Policy-Map configuration mode**
- `class (policy-map (pbr))`
- `match (policy-map (pbr))`

**Related Commands**
- `class-map type pbr`
- `service-policy type pbr (Interface mode)`

**Example**
- This command creates the PBR policy map named PMAP1 and places the switch in policy-map configuration mode.

  ```
  switch(config)#policy-map type pbr PMAP1
  switch(config-pmap-PMAP1)#
  ```
policy-map type pdp

The `policy-map type pdp` command places the switch in policy-map (pdp) configuration mode, which is a group change mode that modifies a Per-port Denial-of-service Protection (PDP) policy map. The command also creates the specified policy map if it does not already exist.

The `exit` command saves pending policy map changes to `running-config` and returns the switch to global configuration mode. Policy map changes are also saved by entering a different configuration mode. The `abort` command discards pending changes, returning the switch to global configuration mode.

The `no policy-map type pdp` and `default policy-map type pdp` commands delete the specified policy map by removing the corresponding `policy-map type pdp` command and its associated configuration.

Note: PDP is available only in EOS versions 4.19.0F and above.

Command Mode
Global Configuration

Command Syntax

```
policy-map type pdp [shared] map_name
no policy-map type pdp [shared] map_name
default policy-map type pdp [shared] map_name
```

Parameters

- `shared` optional keyword designating a shared policy map.
- `map_name` name of policy map.

Example

- This command creates the unshared PDP policy map named PMAP1 and places the switch in policy-map configuration mode.

```
switch(config)#policy-map type pdp PMAP1
switch(config-pmap-PMAP1)#
```
**policy-map type quality-of-service**

The **policy-map type quality-of-service** command places the switch in Policy-Map (qos) configuration mode, which is a group change mode that modifies a QoS policy map. A policy map is a data structure that consists of class maps that identify a specific data stream and shaping parameters that controls its transmission. Policy maps are applied to Ethernet or port channel interfaces to manage traffic.

The **exit** command saves pending policy map changes to **running-config** and returns the switch to global configuration mode. Policy map changes are also saved by entering a different configuration mode. The **abort** command discards pending changes, returning the switch to global configuration mode.

The **no policy-map type quality-of-service** and **default policy-map type quality-of-service** commands delete the specified policy map by removing the corresponding **policy-map type quality-of-service** command and its associated configuration. The **policy-map** and **policy-map type quality-of-service** commands are equivalent.

**Command Mode**

Global Configuration

**Command Syntax**

```
policy-map type quality-of-service map_name
no policy-map type quality-of-service map_name
default policy-map type quality-of-service map_name

policy-map map_name and policy-map type quality-of-service map_name are identical commands.
```

**Parameters**

- **map_name** Name of policy map.

**Commands Available in Policy-Map Configuration Mode**

- **class (policy-map (qos) – FM6000)**
- **class (policy-map (qos) – Trident)**

**Related Commands**

- **class-map type qos**
- **service-policy type qos (Interface mode)**

**Example**

- This command creates the QoS policy map named PMAP-1 and places the switch in policy-map configuration mode.

  switch(config)#policy-map PMAP-1
  switch(config-pmap-PMAP-1)#
resequence (class-map (pbr))

The resequence command assigns sequence numbers to rules in the configuration mode class map. Command parameters specify the number of the first rule and the numeric interval between consecutive rules. Once changed, rule numbers persist unless changed again using the resequence command, but the interval used for numbering new rules reverts to 10 on exiting class-map (pbr) configuration mode.

Maximum rule sequence number is 4294967295.

Command Mode

Class-Map (PBR) Configuration
accessed through class-map type pbr command

Command Syntax

resequence [start_num [inc_num]]

Parameters

- start_num sequence number assigned to the first rule. Default is 10.
- inc_num numeric interval between consecutive rules. Default is 10.

Example

- The resequence command renumbers the rules in CMAP1, starting the first command at number 100 and incrementing subsequent lines by 20.

```
switch(config)#class-map type pbr match-any CMAP1
switch(config-cmap-CMAP1)#show active
class-map type pbr match-any CMAP1
  10 match ip access-group group1
  20 match ip access-group group2
  30 match ip access-group group3
switch(config-cmap-CMAP1)#resequence 100 20
switch(config-cmap-CMAP1)#exit
switch(config)#class-map type pbr match-any CMAP1
switch(config-cmap-CMAP1)#show active
class-map type pbr match-any CMAP1
  100 match ip access-group group1
  120 match ip access-group group2
  140 match ip access-group group3
```
resequence (policy-map (pbr))

The `resequence` command assigns sequence numbers to rules in the configuration mode policy map. Command parameters specify the number of the first rule and the numeric interval between consecutive rules. Once changed, rule numbers persist unless changed again using the `resequence` command, but the interval used for numbering new rules reverts to 10 on exiting policy-map (pbr) configuration mode.

Maximum rule sequence number is 4294967295.

Command Mode

Policy-Map (PBR) Configuration
accessed through `policy-map type pbr` command

Command Syntax

```
resequence [start_num [inc_num]]
```

Parameters

- `start_num` sequence number assigned to the first rule. Default is 10.
- `inc_num` numeric interval between consecutive rules. Default is 10.

Example

- The `resequence` command renumbers the rules in PMAP1, starting the first command at number 100 and incrementing subsequent lines by 20.

```
switch(config)#policy-map type pbr PMAP1
switch(config-pmap-PMAP1)#show active
policy-map type pbr PMAP1
  10 class CMAP1
    set nexthop 172.16.1.1
  20 class CMAP2
    set nexthop 172.16.2.2
  30 class CMAP3
    set nexthop 172.16.3.3
switch(config-pmap-PMAP1)#resequence 100 20
switch(config-pmap-PMAP1)#exit
switch(config)#policy-map type pbr PMAP1
switch(config-pmap-PMAP1)#show active
class-map type pbr PMAP1
  100 class CMAP1
    set nexthop 172.16.1.1
  120 class CMAP2
    set nexthop 172.16.2.2
  140 class CMAP3
    set nexthop 172.16.3.3
switch(config-pmap-PMAP1)#
```
service-policy type pbr (Interface mode)

The `service-policy pbr` command applies the specified Policy-Based Routing (PBR) policy map to the configuration mode interface. A PBR policy map is a data structure that consists of class maps that identify specific packets and the next hops for those packets. Policy maps are applied to Ethernet or port channel interfaces to manage traffic. Only one service policy is supported per interface.

The `no service-policy pbr` and `default service-policy pbr` commands remove the service policy assignment from the configuration mode interface by deleting the corresponding `service-policy pbr` command from `running-config`.

Command Mode
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

Command Syntax
```
service-policy type pbr TRAFFIC_DIRECTION map_name
no service-policy pbr TRAFFIC_DIRECTION map_name
default service-policy pbr TRAFFIC_DIRECTION map_name
```

Parameters
- `TRAFFIC_DIRECTION` IP address or peer group name. Values include:
  - `input` Policy map applies to inbound packet streams.
- `map_name` Name of policy map.

Guidelines
A policy map that is attached to a port channel interface takes precedence for member interfaces of the port channel over their individual Ethernet interface configuration. Members that are removed from a port channel revert to the policy map implementation specified by its Ethernet interface configuration.

Related Commands
- `policy-map type pbr`

Example
- This command applies the PBR policy map “PMAP1” to Ethernet interface 8.
```
switch#config
switch(config)#interface ethernet 8
switch(config-if-Et8)#service-policy type pbr input PMAP1
switch(config-if-Et8)#
```
service-policy type pdp (Interface mode)

The `service-policy pdp` command assigns the specified Per-port Denial-of-service (PDP) policy map to the configuration mode interface.

The `no service-policy pdp` and `default service-policy pdp` commands remove the service policy assignment from the configuration mode interface by deleting the corresponding `service-policy pdp` command from `running-config`.

Note

PDP is available only in EOS versions 4.19.0F and above.

Command Mode

Interface-Ethernet Configuration

Command Syntax

```
service-policy type pdp input map_name
no service-policy pdp input [map_name]
default service-policy pdp input [map_name]
```

Parameters

- `map_name` name of policy map.

Example

- This command assigns the PDP policy map “PMAP1” to Ethernet interface 8.
  ```
  switch#config
  switch(config)#interface ethernet 8
  switch(config-if-Et8)#service-policy type pdp input PMAP1
  switch(config-if-Et8)#
  ```
service-policy type qos (Interface mode)

The `service-policy` command applies a specified policy map to the configuration mode interface. A policy map is a data structure that identifies data traffic through class maps, then specifies actions to classify the traffic (by setting the traffic class), mark the traffic (by setting the cos and dscp values), and police the traffic (by setting the police rate) through data packet field modifications.

The `no service-policy` and `default service-policy` commands remove the service policy assignment from the configuration mode interface by deleting the corresponding `service-policy` command from `running-config`.

Command Mode
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

Command Syntax
```
service-policy [type qos] TRAFFIC_DIRECTION map_name
no service-policy [type qos] TRAFFIC_DIRECTION map_name
default service-policy [type qos] TRAFFIC_DIRECTION map_name
```

Parameters
- `type qos` Parameter has no functional effect.
- `TRAFFIC_DIRECTION` Direction of data stream to which command applies. Options include:
  - `input` Policy map applies to inbound packet streams.
- `map_name` Name of policy map.

Guidelines
A policy map that is attached to a port channel interface takes precedence for member interfaces of the port channel over their individual Ethernet interface configuration. Members that are removed from a port channel revert to the policy map implementation specified by its Ethernet interface configuration.

DCS-7500E and DCS-7280E limitations:
- A maximum of 31 QoS service policies per chip may be applied on L3 interfaces.
- Applying different QoS service policies to an SVI and its member interfaces causes unpredictable behavior.
- When an SVI on which QoS service policies are applied experiences partial failure due to limited hardware resources, a forwarding agent restart will cause unpredictable behavior.
- Policy-map programming may fail when QoS service policies are applied on two SVIs if an event causes a member interface to switch membership from one to the other. To change the VLAN membership of an interface in this case, remove the interface from one VLAN before adding it to the other.
- Outgoing COS rewrite is not supported.
- QoS policy-map counters are not supported.

DCS-7010, DCS-7050, DCS-7050X, DCS-7250X, and DCS-7300X limitations:
- When the same policy map is applied to multiple SVIs, TCAM resources are not shared.
- A policy map applied to an SVI will result in TCAM allocation on all chips whether SVI members are present or not.
- Applying different QoS service policies to an SVI and its member interfaces causes unpredictable behavior.
Related Commands

- `policy-map type quality-of-service`

Example

- This command applies the PMAP-1 policy map to Ethernet interface 8.

```plaintext
switch#config
switch(config)#interface ethernet 8
switch(config-if-Et8)#show active
switch(config-if-Et8)#service-policy input PMAP-1
switch(config-if-Et8)#show active
interface Ethernet8
  service-policy type qos input PMAP-1
switch(config-if-Et8)#
```
set (policy-map-class (qos) – FM6000)

The `set` command specifies traffic resolution methods for traffic defined by its associated class map in its configuration mode policy map class. Three set statements are available for each class:

- **cos**: Sets the layer 2 class of service field.
- **dscp**: Sets the differentiated services code point value in the type of service (ToS) byte.
- **traffic-class**: Sets the traffic class queue for data packets.

Each type of set command can be assigned to a class, allowing for the simultaneous modification of both (cos, dscp) fields and assignment to a traffic class.

The `no set` and `default set` commands remove the specified data action from the class map by deleting the associated `set` command from `running-config`.

**Command Mode**

Policy-map-class (qos) configuration accessed through `class (policy-map (qos) – FM6000)` command

**Command Syntax**

```
set QOS_TYPE value
no set QOS_TYPE
default set QOS_TYPE
```

**Parameters**

- **QOS_TYPE**: Specifies the data stream resolution method. Valid options include:
  - **cos**: Layer 2 class of service field of outbound packet is modified.
  - **dscp**: Differentiated services code point value in the ToS byte is modified.
  - **traffic-class**: Data stream is assigned to a traffic class queue.
- **value**: Specifies the data field value or traffic class queue. Valid data range depends on `QOS_TYPE`.
  - If `QOS_TYPE` is `cos` Value ranges from 0 to 7.
  - If `QOS_TYPE` is `dscp` Value ranges from 0 to 63.
  - If `QOS_TYPE` is `traffic-class` Value ranges from 0 to 7.

**Related Commands**

- `policy-map type quality-of-service`
- `class (policy-map (qos) – FM6000)`

**Example**

These commands configure the policy map to set the CoS field to 7 to data traffic specified by the class map CMAP-1, then assigns that data to traffic class queue 4.

```
switch(config)#policy-map type quality-of-service PMAP-1
switch(config-pmap-PMAP-1)#class CMAP-1
switch(config-pmap-c-PMAP-1-CMAP-1)#set cos 7
switch(config-pmap-c-PMAP-1-CMAP-1)#set traffic-class 4
switch(config-pmap-c-PMAP-1-CMAP-1)#
```
set (policy-map-class (qos) – Helix)

The set command specifies traffic resolution methods for traffic defined by its associated class map in its configuration mode policy map class. Three set statements are available for each class:

- **cos**  Sets the layer 2 class of service field.
- **dscp** Sets the differentiated services code point value in the type of service (ToS) byte.
- **traffic-class**  Sets the traffic class queue for data packets.

Each type of set command can be assigned to a class, allowing for the simultaneous modification of both (cos, dscp) fields and assignment to a traffic class.

The no set and default set commands remove the specified data action from the class map by deleting the associated set command from running-config.

Command Mode

Policy-map-class (qos) configuration accessed through class (policy-map (qos) – Helix) command

Command Syntax

```
set QOS_TYPE value
no set QOS_TYPE
default set QOS_TYPE
```

Parameters

- **QOS_TYPE**  Specifies the data stream resolution method. Valid options include:
  - **cos**  Layer 2 class of service field of outbound packet is modified.
  - **dscp** Differentiated services code point value in the ToS byte is modified.
  - **traffic-class**  Data stream is assigned to a traffic class queue.
- **value**  Specifies the data field value or traffic class queue. Valid data range depends on QOS type.
  - **QOS_TYPE is cos**  Value ranges from 0 to 7.
  - **QOS_TYPE is dscp**  Value ranges from 0 to 63.
  - **QOS_TYPE is traffic-class**  Value ranges from 0 to 7.

Related Commands

- policy-map type quality-of-service
- class (policy-map (qos) – Helix)

Example

- These commands configure the policy map to set the CoS field to 7 to data traffic specified by the class map CMAP-1, then assigns that data to traffic class queue 4.

  ```
  switch(config)#policy-map type quality-of-service PMAP-1
  switch(config-pmap-PMAP-1)#class CMAP-1
  switch(config-pmap-c-PMAP-1-CMAP-1)#set cos 7
  switch(config-pmap-c-PMAP-1-CMAP-1)#set traffic-class 4
  ```
**set (policy-map-class (qos) – Trident)**

The `set` command specifies traffic resolution methods for traffic defined by its associated class map in its configuration mode policy map class. Three set statements are available for each class:

- **cos**  Sets the layer 2 class of service field.
- **dscp** Sets the differentiated services code point value in the type of service (ToS) byte.
- **traffic-class** Sets the traffic class queue for data packets.

Each type of set command can be assigned to a class, allowing for the simultaneous modification of both (cos, dscp) fields and assignment to a traffic class.

The `no set` and `default set` commands remove the specified data action from the class map by deleting the associated `set` command from `running-config`.

**Command Mode**

Policy-map-class (qos) configuration
accessed through `class (policy-map (qos) – Trident)` command

**Command Syntax**

```
set QOS_TYPE value
no set QOS_TYPE
default set QOS_TYPE
```

**Parameters**

- **QOS_TYPE** Specifies the data stream resolution method. Valid options include:
  - **cos** Layer 2 class of service field of outbound packet is modified.
  - **dscp** Differentiated services code point value in the ToS byte is modified.
  - **traffic-class** Data stream is assigned to a traffic class queue.

- **value** Specifies the data field value or traffic class queue. Valid data range depends on QOS type.
  - **QOS_TYPE is cos** Value ranges from 0 to 7.
  - **QOS_TYPE is dscp** Value ranges from 0 to 63.
  - **QOS_TYPE is traffic-class** Value ranges from 0 to 7.

**Related Commands**

- `policy-map type quality-of-service`
- `class (policy-map (qos) – Trident)`

**Example**

These commands configure the policy map to set the CoS field to 7 to data traffic specified by the class map CMAP-1, then assigns that data to traffic class queue 4.

```
switch(config)#policy-map type quality-of-service PMAP-1
switch(config-pmap-PMAP-1)#class CMAP-1
switch(config-pmap-c-PMAP-1-CMAP-1)#set cos 7
switch(config-pmap-c-PMAP-1-CMAP-1)#set traffic-class 4
switch(config-pmap-c-PMAP-1-CMAP-1)#
```
set (policy-map-class (qos) – Trident II)

The `set` command specifies traffic resolution methods for traffic defined by its associated class map in its configuration mode policy map class. Three set statements are available for each class:

- **cos**  Sets the layer 2 class of service field.
- **dscp**  Sets the differentiated services code point value in the type of service (ToS) byte.
- **traffic-class**  Sets the traffic class queue for data packets.

Each type of set command can be assigned to a class, allowing for the simultaneous modification of both (cos, dscp) fields and assignment to a traffic class.

The `no set` and `default set` commands remove the specified data action from the class map by deleting the associated `set` command from `running-config`.

**Command Mode**

Policy-map-class (qos) configuration
accessed through `class (policy-map (qos) – Trident)` command

**Command Syntax**

```
set QOS_TYPE value
no set QOS_TYPE
default set QOS_TYPE
```

**Parameters**

- **QOS_TYPE**  Specifies the data stream resolution method. Valid options include:
  - **cos**  Layer 2 class of service field of outbound packet is modified.
  - **dscp**  Differentiated services code point value in the ToS byte is modified.
  - **traffic-class**  Data stream is assigned to a traffic class queue.
- **value**  Specifies the data field value or traffic class queue. Valid data range depends on QOS type.
  - **QOS_TYPE is cos**  Value ranges from 0 to 7.
  - **QOS_TYPE is dscp**  Value ranges from 0 to 63.
  - **QOS_TYPE is traffic-class**  Value ranges from 0 to 7.

**Related Commands**

- `policy-map type quality-of-service`
- `class (policy-map (qos) – Trident)`

**Example**

- These commands configure the policy map to set the CoS field to 7 to data traffic specified by the class map CMAP-1, then assigns that data to traffic class queue 4.

```
switch(config)#policy-map type quality-of-service PMAP-1
switch(config-pmap-PMAP-1)#class CMAP-1
switch(config-pmap-c-PMAP-1-CMAP-1)#set cos 7
switch(config-pmap-c-PMAP-1-CMAP-1)#set traffic-class 4
switch(config-pmap-c-PMAP-1-CMAP-1)#
```
set nexthop (policy-map-class – pbr)

The set nexthop command specifies the next hop for traffic defined by its associated class map in its configuration mode policy map class.

The no set nexthop and default set nexthop commands remove the specified action from the class map by deleting the associated set nexthop command from running-config.

Command Mode

Policy-map-class (pbr) configuration accessed through class (policy-map (pbr)) command

Command Syntax

set nexthop [recursive] NH-addr_1 [NH-addr_2] ... [NH-addr_n]
no set nexthop [recursive]
default set nexthop [recursive]

Parameters

• recursive enables recursive next hop resolution.
• NH_addr IP address of next hop. If multiple addresses are entered, they are treated as an ECMP group.

Related Commands

• policy-map type pbr
• class (policy-map (pbr))

Example

• These commands configure the policy map PMAP1 to set the next hop to 192.168.5.3 for traffic defined by class map CMAP1.

switch(config)#policy-map type pbr PMAP1
switch(config-pmap-PMAP1)#class CMAP1
switch(config-pmap-c-PMAP1-CMAP1)#set nexthop 192.168.5.3
switch(config-pmap-c-PMAP1-CMAP1)#
set nexthop-group (policy-map-class(pbr) – Arad)

The set nexthop-group command specifies a nexthop group as the next hop for traffic defined by its associated class map in its configuration mode policy map class.

The no set nexthop-group and default set nexthop-group commands remove the specified action from the class map by deleting the associated set nexthop-group command from running-config.

Command Mode
Policy-map-class (pbr) configuration
accessed through class (policy-map (pbr)) command

Command Syntax
set nexthop-group group_name
no set nexthop-group
default set nexthop-group

Parameters
- group_name name of ECMP group to use as next hop.

Related Commands
- policy-map type pbr
- class (policy-map (pbr))

Example
- These commands configure the policy map PMAP1 to set the next hop to a nexthop group named GROUP1 for traffic defined by class map CMAP1.
  
  switch(config)#policy-map type pbr PMAP1
  switch(config-pmap-PMAP1)#class CMAP1
  switch(config-pmap-c-PMAP1-CMAP1)#set nexthop-group GROUP1
  switch(config-pmap-c-PMAP1-CMAP1)#

shape (policy-map-class (control-plane) – Arad)

The shape command specifies the maximum bandwidth for traffic filtered by the configuration mode policy map class.

The no shape and default shape commands remove the maximum bandwidth restriction for the configuration mode class by deleting the corresponding bandwidth command from running-config.

Command Mode
Policy-map-class (control plane) configuration accessed through class (policy-map (control-plane) – Arad)

Command Syntax

```
shape kbps kilobits
no shape
default shape
```

Parameters
- **kilobits** Maximum data rate in kilobits per second. Value ranges from 1 to 10000000.

Related Commands
- class (policy-map (control-plane) – Arad) places the switch in policy-map-class (control plane) configuration mode.
- bandwidth (policy-map-class (control-plane) – Arad) specifies the minimum bandwidth for traffic defined by its associated class map in its configuration mode policy map class.

Static Classes Default Shape
Arad platform switches define these default shapes for static classes:

- copp-system-bgp2500
- copp-system-bpdu2500
- copp-system-default2500
- copp-system-ipbroadcast2500
- copp-system-ipmc2500
- copp-system-ipmcmiss2500
- copp-system-ipunicast
- copp-system-l2broadcast2500
- copp-system-l2unicast
- copp-system-l3destmiss2500
- copp-system-l3dp
- copp-system-l3ipmoverflow2500
- copp-system-l3slowpath2500
- copp-system-l3ttl12500
- copp-system-lacp2500
- copp-system-linklocal2500
- copp-system-lldp2500
- copp-system-mlag2500
- copp-system-multicastsnoop2500
- copp-system-ospfisis2500
- copp-system-sflow2500
Example

- These commands configure the maximum bandwidth of 2000 kbps for data traffic specified by the class map copp-system-lldp of the default control-plane policy map.

```
switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#shape kbps 2000
switch(config-pmap-c-c copp-system-policy-copp-system-lldp)#exit
switch(config-pmap-copp-system-policy)#exit
switch(config)#show policy-map copp copp-system-policy
Service-policy input: copp-system-policy

<-------OUTPUT OMITTED FROM EXAMPLE--------->

Class-map: copp-system-lldp (match-any)
    shape : 2000 kbps
    bandwidth : 250 kbps
    Out Packets : 0
    Drop Packets : 0

<-------OUTPUT OMITTED FROM EXAMPLE--------->

switch(config)#
```
shape (policy-map-class (control-plane) – FM6000)

The shape command specifies the maximum bandwidth for traffic filtered by the configuration mode policy map class.

The no shape and default shape commands remove the maximum bandwidth restriction for the configuration mode class by deleting the corresponding bandwidth command from running-config.

Command Mode

Policy-map-class (control plane) configuration accessed through class (policy-map (control-plane) – FM6000)

Command Syntax

```
shape pps packets
no shape
default shape
```

Parameters

- **packets**: Maximum data rate in packets per second. Value ranges from 1 to 100000.

Related Commands

- class (policy-map (control-plane) – FM6000) places the switch in policy-map-class (control plane) configuration mode.
- bandwidth (policy-map-class (control-plane) – FM6000) specifies the minimum bandwidth for traffic defined by its associated class map in its configuration mode policy map class.

Static Classes Default Shape

FM6000 platform switches define these default shapes for static classes:

- copp-system-arp10000
- copp-system-l3slowpath10000
- copp-system-default8000
- copp-system-pim-ptp10000
- copp-system-ipmcrsvd10000
- copp-system-ospf-isis10000
- copp-system-ipmcmiss10000
- copp-system-selfip-tc6to75000
- copp-system-l2rsvd10000
- copp-system-sflow25000

Example

- These commands configure a maximum bandwidth of 5000 packets per second for data traffic specified by the class map PMAP-1 in the policy map named copp-system-policy.

```
switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#class PMAP-1
switch(config-pmap-c-copp-system-policy-PMAP-1)#shape pps 5000
switch(config-pmap-c-copp-system-policy-PMAP-1)#
```
shape (policy-map-class (control-plane) – Helix)

The `shape` command specifies the maximum bandwidth for traffic filtered by the configuration mode policy map class.

The `no shape` and `default shape` commands remove the maximum bandwidth restriction for the configuration mode class by deleting the corresponding `bandwidth` command from `running-config`.

Command Mode

Policy-map-class (control plane) configuration
accessed through `class (policy-map (control-plane) – Helix)`

Command Syntax

```plaintext
shape pps packets
no shape
default shape
```

Parameters

- `packets` Maximum data rate in packets per second. Value ranges from 1 to 100000.

Static Classes Default Shape

Trident platform switches define these default shapes for static classes:

- `copp-system-aclog10000•copp-system-l3ttl110000`
- `copp-system-arp10000•copp-system-lacp5000`
- `copp-system-apresolver10000•copp-system-lldp10000`
- `copp-system-bfd10000•copp-system-mlag5000`
- `copp-system-bgp5000•copp-system-OspfIsis10000`
- `copp-system-bpdu5000•copp-system-selfip5000`
- `copp-system-default8000•copp-system-selfip-tc6to75000`
- `copp-system-glean10000•copp-system-sflow25024`
- `copp-system-igmp10000•copp-system-tc3to510000`
- `copp-system-ipmcmmiss10000•copp-system-tc6to710000`
- `copp-system-ipmcrsvd10000•copp-system-urm10000`
- `copp-system-l3destmiss10000•copp-system-rrp5000`
- `copp-system-l3slowpath10000`

Related Commands

- `class (policy-map (control-plane) – Helix)` places the switch in policy-map-class (control plane) configuration mode.
- `bandwidth (policy-map-class (control-plane) – Helix)` specifies the minimum bandwidth for traffic defined by its associated class map in its configuration mode policy map class.
Example

- These commands configure a maximum bandwidth of 5000 packets per second for data traffic specified by the copp-system-lldp of the default control-plane policy map

```bash
switch(config)#policy-map type control-plan copp-system-policy
switch(config-pmap-copp-system-policy)#class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#shape pps 5000
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#exit
switch(config-pmap-copp-system-policy)#exit
switch(config)#show policy-map copp copp-system-policy
Service-policy input: copp-system-policy
  Class-map: copp-system-lldp (match-any)
    shape : 5000 pps
    bandwidth : 500 pps
    Out Packets : 305961
    Drop Packets : 0
```

```bash
<-------OUTPUT OMMITTED FROM EXAMPLE-------->
```

```bash
switch(config)#
```
shape (policy-map-class (control-plane) – Petra)

The *shape* command specifies the maximum bandwidth for traffic filtered by the configuration mode policy map class.

The *no shape* and *default shape* commands remove the maximum bandwidth restriction for the configuration mode class by deleting the corresponding *bandwidth* command from *running-config*.

**Command Mode**

Policy-map-class (control plane) configuration
accessed through *class (policy-map (control-plane) – Petra)*

**Command Syntax**

```
shape kbps kilobits
no shape
default shape
```

**Parameters**

- *kilobits* Maximum data rate in kilobits per second. Value ranges from 1 to 1000000.

**Related Commands**

- *class (policy-map (control-plane) – Petra)* places the switch in policy-map-class (control plane) configuration mode.
- *bandwidth (policy-map-class (control-plane) – Petra)* specifies the minimum bandwidth for traffic defined by its associated class map in its configuration mode policy map class.

**Static Classes Default Shape**

Petra platform switches define these default shapes for static classes:

- copp-system-bpdu2500
copp-system-l3destmiss2500
- copp-system-default2500
copp-system-l3slowpath2500
- copp-system-igmp2500
copp-system-l3ttl02500
- copp-system-ipbroadcast2500
copp-system-l3ttl12500
- copp-system-ipmc2500
copp-system-lacp2500
- copp-system-ipmcmrs2500
copp-system-lldp2500
- copp-system-ipmcmiss2500
copp-system-unicast-arp2500
- copp-system-ipunicastNo Limit

**Guidelines**

Petra does not support all discrete rate values. When a specified discrete value is not supported, the switch converts the rate to the next highest discrete value that it supports. The *show* command displays the converted rate and not the user-configured rate.
Example

- These commands configure the maximum bandwidth of 2000 kbps for data traffic specified by the class map copp-system-lldp of the default control-plane policy map. Because the switch does not support the discrete value of 2000 kbps, it converts the bandwidth up to 2115 kbps.

```
switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#shape kbps 2000
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#exit
switch(config-pmap-copp-system-policy)#exit
switch(config)#show policy-map copp copp-system-policy
Service-policy input: copp-system-policy

<--------OUTPUT OMITTED FROM EXAMPLE-------->

Class-map: copp-system-lldp (match-any)
    shape : 2115 kbps
    bandwidth : 325 kbps
    Out Packets : 0
    Drop Packets : 0

<--------OUTPUT OMITTED FROM EXAMPLE-------->
```

```
switch(config)#
```
shape (policy-map-class (control-plane) – Trident)

The shape command specifies the maximum bandwidth for traffic filtered by the configuration mode policy map class.

The no shape and default shape commands remove the maximum bandwidth restriction for the configuration mode class by deleting the corresponding bandwidth command from running-config.

Command Mode

Policy-map-class (control plane) configuration accessed through class (policy-map (control-plane) – Trident)

Command Syntax

```
shape pps packets
no shape
default shape
```

Parameters

- packets Maximum data rate in packets per second. Value ranges from 1 to 100000.

Static Classes Default Shape

Trident platform switches define these default shapes for static classes:

- copp-system-arp10000
- copp-system-lldp10000
- copp-system-arpsolver10000
- copp-system-l3destmiss10000
- copp-system-bpdu5000
- copp-system-l3slowpath10000
- copp-system-default8000
- copp-system-l3ttl110000
- copp-system-glean10000
- copp-system-selfip5000
- copp-system-igmp10000
- copp-system-selfip-tc6to75000
- copp-system-ipmcmiss10000
- copp-system-sflow25000
- copp-system-ipmcrsvd10000
- copp-system-tc3to510000
- copp-system-lacp5000
- copp-system-tc6to710000

Related Commands

- class (policy-map (control-plane) – Trident) places the switch in policy-map-class (control plane) configuration mode.
- bandwidth (policy-map-class (control-plane) – Trident) specifies the minimum bandwidth for traffic defined by its associated class map in its configuration mode policy map class.

Example

- These commands configure a maximum bandwidth of 5000 packets per second for data traffic specified by the class map PMAP-1 in the policy map named copp-system-policy.

```
switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#class PMAP-1
switch(config-pmap-c-copp-system-policy-PMAP-1)#shape pps 5000
switch(config-pmap-c-copp-system-policy-PMAP-1)#
```
shape (policy-map-class (control-plane) – Trident II)

The `shape` command specifies the maximum bandwidth for traffic filtered by the configuration mode policy map class.

The `no shape` and `default shape` commands remove the maximum bandwidth restriction for the configuration mode class by deleting the corresponding `bandwidth` command from `running-config`.

Command Mode
- Policy-map-class (control plane) configuration
  accessed through `class (policy-map (control-plane) – Trident II)`

Command Syntax
- `shape pps packets`
- `no shape`
- `default shape`

Parameters
- `packets` Maximum data rate in packets per second. Value ranges from 1 to 100000.

Static Classes Default Shape
Trident II platform switches define these default shapes for static classes:
- `copp-system-aclog10000`
- `copp-system-l3slowpath10000`
- `copp-system-arp10000`
- `copp-system-l3ttl110000`
- `copp-system-arpresolver10000`
- `copp-system-lacp5000`
- `copp-system-bfd10000`
- `copp-system-lldp10000`
- `copp-system-bgp5000`
- `copp-system-mlag5000`
- `copp-system-bpdu5000`
- `copp-system-selfip5000`
- `copp-system-default8000`
- `copp-system-selfip-tc6to75000`
- `copp-system-glean10000`
- `copp-system-sflow25024`
- `copp-system-igmp10000`
- `copp-system-tc3to510000`
- `copp-system-ipmcmmiss10000`
- `copp-system-tc6to710000`
- `copp-system-ipmcrsvd10000`
- `copp-system-urm10000`
- `copp-system-l3destmiss10000`

Related Commands
- `class (policy-map (control-plane) – Trident II)` places the switch in policy-map-class (control plane) configuration mode.
- `bandwidth (policy-map-class (control-plane) – Trident II)` specifies the minimum bandwidth for traffic defined by its associated class map in its configuration mode policy map class.
Example

- These commands configure a maximum bandwidth of 5000 packets per second for data traffic specified by the copp-system-lldp of the default control-plane policy map

```bash
switch(config)#policy-map type control-plan copp-system-policy
switch(config-pmap-copp-system-policy)#class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#shape pps 5000
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#exit
switch(config-pmap-c copp-system-policy)#exit
switch(config)#show policy-map copp copp-system-policy
Service-policy input: copp-system-policy

 Class-map: copp-system-lldp (match-any)
  shape : 5000 pps
  bandwidth : 500 pps
  Out Packets : 305961
  Drop Packets : 0

<-------OUTPUT OMITTED FROM EXAMPLE-------->
```

```bash
switch(config)#
```
**feature traffic-policy cpu (ipv4 | ipv6)**

The `feature traffic-policy cpu` command configures the CPU traffic policy features for the IPv4 and IPv6 traffic in user-defined TCAM profile.

The `no feature traffic-policy cpu` and `default feature traffic-policy cpu` commands remove the CPU policy configurations from `running-config`.

**Command Mode**

Hardware TCAM

**Command Syntax**

```plaintext
feature traffic-policy cpu <ipv4 | ipv6>
no feature traffic-policy cpu <ipv4 | ipv6>
default feature traffic-policy cpu <ipv4 | ipv6>
```

**Parameters**

- `ipv4`  CPU traffic policy for IPv4 traffic.
- `ipv6`  CPU traffic policy for IPv6 traffic.

**Example**

- These commands places the switch in the hardware TCAM profile mode and configures the CPU traffic policy features for IPv4 traffic in the TCAM profile “test”.

  ```plaintext
  switch(config)#hardware tcam
  switch(config-hw-tcam)#profile test
  switch(config-hw-tcam-profile-test)#feature traffic-policy cpu ipv4
  ```
**show class-map type control-plane**

The `show class-map` command displays contents of available control-plane class maps. Control-plane class maps can be added to the copp-system-policy policy map. Control-plane class maps can be static class maps defined by the system or dynamic maps created in class-map-configuration mode.

Dynamic class maps are composed of statements that match IPv4 access control lists. Static class maps are defined by the switch and cannot be altered.

**Command Mode**

EXEC

**Command Syntax**

`show class-map type control-plane [MAP_NAME]`

**Parameters**

- **MAP_NAME** Name of class map displayed by the command. Options include:
  - <no parameter> Command displays all control plane class maps.
  - `name_text` Command displays specified control-plane class maps.

**Related Commands**

- `show class-map type qos` displays control plane class maps.

**Example**

- This command displays all control plane class maps.
- This command displays the available control plane class maps.

```
switch>show class-map type control-plane
Class-map: CM-CP1 (match-any)
  Match: ip access-group name LIST-CP1
Class-map: copp-system-acloog (match-any)
Class-map: copp-system-arp (match-any)
Class-map: copp-system-arpresolver (match-any)
Class-map: copp-system-bpdu (match-any)
Class-map: copp-system-glean (match-any)
Class-map: copp-system-igmp (match-any)
Class-map: copp-system-ipmcmiss (match-any)
Class-map: copp-system-ipmcrsvd (match-any)
Class-map: copp-system-l3destmiss (match-any)
Class-map: copp-system-l3slowpath (match-any)
Class-map: copp-system-l3tttl1 (match-any)
Class-map: copp-system-lacp (match-any)
Class-map: copp-system-lldp (match-any)
Class-map: copp-system-selfip (match-any)
Class-map: copp-system-selfip-tc6to7 (match-any)
Class-map: copp-system-sflow (match-any)
Class-map: copp-system-tc3to5 (match-any)
Class-map: copp-system-tc6to7 (match-any)
switch>
```
show class-map type pbr

The show class-map command displays contents of all available Policy-Based Routing (PBR) class maps, or of a specified PBR class map. PBR class maps are used by PBR policy maps. PBR class maps are dynamic maps that are created in class-map-configuration mode. Dynamic class maps are composed of statements that match IPv4 or IPv6 access control lists.

Command Mode
EXEC

Command Syntax
show class-map type pbr [map_name]

Parameters
• map_name Name of class map displayed by the command. If no parameter is entered, command show all available PBR class maps.

Related Commands
• show policy-map type pbr displays PBR policy maps.

Example
• This command displays the contents of the PBR class map CMAP1.

switch>show class-map type pbr CMAP1
Class-map: CMAP1 (match-any)
  Match: 10 ip access-group PBRgroup1
  Match: 20 ip access-group PBRgroup2
  Match: 30 ip access-group PBRgroup3
switch>
The `show class-map` command displays contents of all available QoS class maps. QoS class maps are used by QoS policy maps. QoS class maps are dynamic maps that are created in class-map-configuration mode. Dynamic class maps are composed of statements that match IPv4 or IPv6 access control lists.

**Command Mode**

EXEC

**Command Syntax**

`show class-map [type qos] [MAP_NAME]`

**Parameters**

- **MAP_NAME** Name of class map displayed by the command.
- **<no parameter>** Command displays all QoS class maps.
- **name_text** Command displays specified QoS class maps.

`show class-map` and `show class-map type qos` are identical commands.

**Related Commands**

- `show class-map type control-plane` displays control plane class maps.

**Example**

This command displays the available QoS class maps.

```
switch>show class-map type qos
Class-map: CM-Q1 (match-any)
    Match: ipv6 access-group name LIST-1
Class-map: CM-Q2 (match-any)
    Match: ip access-group name LIST-2
switch>
```
show policy-map type copp

The `show policy-map type copp` command displays contents of control plane policy maps. Control-plane policy maps are applied to the control plane; copp-system-policy is the only supported policy map.

Command options filter the output to display contents of all policy maps, contents of a specified policy map, or contents of a single class map within a specified policy map.

**Command Mode**

EXEC

**Command Syntax**

```
show policy-map type copp copp-system-policy [CMAP_NAME]
```

**Parameters**

- `CMAP_NAME` Name of class map displayed by the command.
- `<no parameter>` Command displays all class maps in specified policy map.
- `class_name` Command displays specified class map.

**Example**

- This command displays the contents of the copp-system-bpdu class map in the copp-system-policy policy maps.
  ```
  switch>show policy-map type copp copp-system-policy class copp-system-bpdu
  Class-map: copp-system-bpdu (match-any)
    shape : 5000 pps
    bandwidth : 5000 pps
  ```
  ```
  switch>
  ```
show policy-map type pbr

The `show policy-map pbr` command displays contents of Policy-Based Routing (PBR) policy maps. PBR policy maps are applied to Ethernet interfaces, port channel interfaces or switch virtual interfaces (SVIs).

Command options filter the output to either display contents of all policy maps, contents of a specified policy map, or summary contents of all or a specified policy map.

**Command Mode**
EXEC

**Command Syntax**
```
show policy-map type pbr [PMAP_NAME] [DATA_LEVEL]
```

**Parameters**
- `PMAP_NAME` Name of policy map displayed by the command.
  - <no parameter> Command displays all policy maps.
  - `policy_map` Command displays specified policy map.
- `DATA_LEVEL` Type of information the command displays. Values include:
  - <no parameter> Command displays all class maps in specified policy map.
  - `summary` Command displays summary data for the specified policy map.

**Example**
- This command displays the contents of all PBR policy maps in `running-config`.

```
switch#show policy-map type pbr
Service policy PMAP1
  Configured on:
  Applied on:
  10: Class-map: CMAP1 (match-any)
      Match: 10 ip access-group PBRgroup1
      Match: 20 ip access-group PBRgroup2
      Match: 30 ip access-group PBRgroup3
      Configured actions: set nexthop 172.16.10.12
  20: Class-map: CMAP2 (match-any)
      Match: 10 ip access-group PBRgroup1
      Match: 10 ip access-group PBRgroup4
      Match: 20 ip access-group PBRgroup5
      Configured actions: set nexthop 192.168.15.15
switch#
```
show policy-map type qos

The **show policy-map qos** command displays contents of QoS policy maps. QoS policy maps are applied to Ethernet or port channel interfaces.

Command options filter the output to either display contents of all policy maps, contents of a specified policy map, or contents of a single class map within a specified policy map.

**Command Mode**

EXEC

**Command Syntax**

```
show policy-map [type qos] [PMAP_NAME [CMAP_NAME]]
```

**Parameters**

- **PMAP_NAME** Name of policy map displayed by the command.
  - <no parameter> Command displays all policy maps.
  - **policy_map** Command displays specified policy map.
- **CMAP_NAME** Name of class map displayed by the command. This option is available only when the command includes a policy map name.
  - <no parameter> Command displays all class maps in specified policy map.
  - **class_name** Command displays specified class map.

**Example**

- This command displays the contents of all QoS policy maps in **running-config**.

```
switch#show policy-map type qos
Service-policy input: PMAP-1
   Hardware programming status: Successful

   Class-map: xeter (match-any)
       Match: ip access-group name LIST-1
              set cos 6

   Class-map: class-default (match-any)

Service-policy PMAP-2

   Class-map: class-default (match-any)

switch#
```
show policy-map type qos counters

The `show policy-map counters` command displays the quantity of packets that are filtered by the ACLs that comprise a specified QoS policy map.

**Command Mode**

EXEC

**Command Syntax**

```
show policy-map [type qos] pmap_name [TRAFFIC] counters [INFO_LEVEL]
```

**Parameters**

- `pmap_name` Name of policy map displayed by the command.
- `TRAFFIC` Filters policy maps by the traffic they manage. Options include:
  - `<no parameter>` Policy maps that manage interface’s ingress traffic (same as `input` option).
  - `input` Policy maps that manage interface’s ingress traffic.
- `INFO_LEVEL` amount of information that is displayed. Options include:
  - `<no parameter>` displays summarized information about the policy map.
  - `detail` displays detailed policy map information.
show policy-map copp

The `show policy-map copp` command displays contents of the control-plane policy map. Control-plane policy maps are applied to the control plane, and copp-system-policy is the only supported policy map.

**Command Mode**

EXEC

**Command Syntax**

```
show policy-map copp copp-system-policy
```

**Example**

- This command displays the contents and throughput of the policy map applied to the control plane.

```
switch>show policy-map copp copp-system-policy
Service-policy input: copp-system-policy
   Number of units programmed: 1
   Hardware programming status: Successful

Class-map: copp-system-bpdu (match-any)
   shape : 5000 pps
   bandwidth : 5000 pps
   Out Packets : 2
   Drop Packets : 0

Class-map: copp-system-lacp (match-any)
   shape : 5000 pps
   bandwidth : 5000 pps
   Out Packets : 0
   Drop Packets : 0

<i>----------OUTPUT OMITTED FROM EXAMPLE----------</i>

switch>
```
show policy-map interface type qos

The `show policy-map interface` command displays contents of the policy maps applied to specified interfaces or to the control plane.

**Command Mode**

EXEC

**Command Syntax**

```
show policy-map interface INTERFACE_NAME [type qos] [TRAFFIC]
```

**Parameters**

- `INTERFACE_NAME` Filters policy map list by interfaces. Options include:
  - `ethernet e_range` Ethernet ports for which command displays policy maps.
  - `port-channel p_range` Port channels for which command displays policy maps.
- `TRAFFIC` Filters policy maps by the traffic they manage. Options include:
  - `<no parameter>` Policy maps that manage interface’s ingress traffic (same as `input` option).
  - `input` Policy maps that manage interface’s ingress traffic.

**Example**

- This command displays the policy maps applied to Ethernet interfaces 7 and 8.

  ```
  switch#show policy-map interface ethernet 7-8
  Service-policy input: PMAP-1
  Hardware programming status: Successful
  
  Class-map: cmap-1 (match-any)
  Match: ip access-group name LIST-2
  set cos 6
  
  Class-map: class-default (match-any)
  
  Service-policy input: PMAP-2
  Hardware programming status: Successful
  
  Class-map: cmap-2 (match-any)
  Match: ip access-group name LIST-2
  set dscp 10
  
  Class-map: class-default (match-any)
  
  switch#
  ```
show policy-map interface type qos counters

The `show policy-map interface` command displays the quantity of packets that are filtered by ACLs applied to a interface.

**Command Mode**
EXEC

**Command Syntax**
```
show policy-map [INTERFACE_NAME] [type qos] [TRAFFIC] counters
```

**Parameters**
- **INTERFACE_NAME** Filters policy map list by interfaces. Options include:
  - `<no parameter>` Displays data for all configured interfaces.
  - `interface ethernet e_range` Ethernet ports for which command displays policy maps.
  - `interface port-channel p_range` Port channels for which command displays policy maps.
- **TRAFFIC** Filters policy maps by the traffic they manage. Options include:
  - `<no parameter>` Policy maps that manage interface’s ingress traffic (same as `input` option).
  - `input` Policy maps that manage interface’s ingress traffic.

**Example**
- This command displays the policy maps applied to Ethernet interfaces 7 and 8.

  ```
  switch#show policy-map interface ethernet 7-8
  Service-policy input: PMAP-1
  Hardware programming status: Successful
  
  Class-map: cmap-1 (match-any)
  Match: ip access-group name LIST-2
  set cos 6
  
  Class-map: class-default (match-any)
  
  Service-policy input: PMAP-2
  Hardware programming status: Successful
  
  Class-map: cmap-2 (match-any)
  Match: ip access-group name LIST-2
  set dscp 10
  
  Class-map: class-default (match-any)
  ```

switch#
Open Shortest Path First (OSPF) is a link-state routing protocol that operates within a single autonomous system. OSPF version 2 is defined by RFC 2328.

This chapter contains the following sections:

- Section 31.1: OSPFv2 Introduction
- Section 31.2: OSPFv2 Conceptual Overview
- Section 31.3: Configuring OSPFv2
- Section 31.4: OSPFv2 Configuration Examples
- Section 31.5: OSPFv2 Commands

### 31.1 OSPFv2 Introduction

#### 31.1.1 Supported Features

Arista switches support the following OSPFv2 functions:

- A single OSPFv2 instance
- Intra- and inter-area routing
- Type 1 and 2 external routing
- Broadcast and P2P interfaces
- Stub areas
- Not so stubby areas (NSSA) (RFC 3101)
- MD5 Authentication
- Redistribution of static, IP, and BGP routes into OSPFv2 with route map filtering
- Opaque LSAs (RFC 2370)
- Graceful restart (RFC 3623)

#### 31.1.2 Features Not Supported

The following OSPFv2 functions are not supported in the current version:

- NBMA, demand circuit, and P2MP interfaces
- OSPFv2 MIB support
31.2 **OSPFv2 Conceptual Overview**

31.2.1 **Storing Link States**

OSPFv2 is a dynamic, link-state routing protocol, where links represent interfaces or routable paths. Dynamic routing protocols calculate the most efficient path between locations based on bandwidth and device status.

A link state advertisement (LSA) is an OSPFv2 packet that communicates a router's topology to other routers. The link state database (LSDB) stores an area’s topology database and is composed of LSAs received from other routers. Routers update the LSDB by storing LSAs from other routers.

31.2.2 **Topology**

An autonomous system (AS) is the IP domain within which a dynamic protocol controls the routing of traffic. In OSPFv2, an AS is composed of areas, which define the LSDB computation boundaries. All routers in an area store identical LSDBs. Routers in different areas exchange updates without storing the entire database, reducing information maintenance on large, dynamic networks.

An AS shares internal routing information from its areas and external routing information from other processes to inform routers outside the AS about routes the network can access. Routers that advertise routes on other ASs commit to carry data to the IP space on the route.

OSPFv2 defines these routers:

- Internal router (IR) – a router whose interfaces are contained in a single area. All IRs in an area maintain identical LSDBs.
- Area border router (ABR) – a router that has interfaces in multiple areas. ABRs maintain one LSDB for each connected area.
- Autonomous system boundary router (ASBR) – a gateway router connecting the OSPFv2 domain to external routes, including static routes and routes from other autonomous systems.

Figure 31-1 displays the OSPFv2 router types.

**Figure 31-1: OSPFv2 Router Types**

```plaintext
Area 0

ASBR – Autonomous System Boundary Router: Router B

Area 1

IR – Internal Router: Router C

ABR – Area Border Router: Router A

OSPF Autonomous System

Router A  Router B  Router C
```

2068
OSPFv2 areas are assigned a number between 0 and 4,294,967,295 ($2^{32} - 1$). Area numbers are often expressed in dotted decimal notation, similar to IP addresses.

Each AS has a backbone area, designated as area 0, that connects to all other areas. The backbone receives routing information from all areas, then distributes it to the other areas as required.

OSPFv2 area types include:

- Normal area – accepts intra-area, inter-area, and external routes. The backbone is a normal area.
- Stub area – does not receive router advertisements external to the AS. Stub area routing is based on a default route.
- Not-so-stubby-area (NSSA) – may import external routes from an ASBR, does not receive external routes from the backbone, and does not propagate external routes to other areas.

### 31.2.3 Link Updates

Routers periodically send hello packets to advertise status and establish neighbors. A router's hello packet includes IP addresses of other routers from which it received a hello packet within the time specified by the router dead interval. Routers become neighbors when they detect each other in their hello packets if they:

- share a common network segment.
- are in the same area.
- have the same hello interval, dead interval, and authentication parameters.

Neighbors form adjacencies to exchange LSDB information. A neighbor group uses hello packets to elect a Designated Router (DR) and Backup Designated Router (BDR). The DR and BDR become adjacent to all other neighbors, including each other. Only adjacent neighbors share database information.

Figure 31-2 illustrates OSPFv2 neighbors.
The DR is the central contact for database exchanges. Switches send database information to their DR, which relays the information to the other neighbors. All routers in an area maintain identical LSDBs. Switches also send database information to their BDR, which stores this data without distributing it. If the DR fails, the BDR distributes LSDB information to its neighbors.

OSPFv2 routers distribute LSAs by sending them on all of their active interfaces. The router will generate an LSA for a network defined and active on a passive interface but will not transmit this LSA on the passive interface as no adjacencies are formed.

When a router’s LSDB is changed by an LSA, it sends the changes to the DR and BDR for distribution to the other neighbors. Routing information is updated only when the topology changes.

Routers use Dijkstra’s algorithm to calculate the shortest path to all known destinations, based on cumulative route cost. The cost of an interface indicates the transmission overhead and is usually inversely proportional to its bandwidth.
31.3 Configuring OSPFv2

These sections describe basic OSPFv2 configuration steps:

- Section 31.3.1: Configuring the OSPFv2 Instance
- Section 31.3.2: Configuring OSPFv2 Areas
- Section 31.3.3: Configuring Interfaces for OSPFv2
- Section 31.3.4: Enabling OSPFv2
- Section 31.3.5: Displaying OSPFv2 Status

31.3.1 Configuring the OSPFv2 Instance

31.3.1.1 Entering OSPFv2 Configuration Mode

The `router ospf` command places the switch in router-ospf configuration mode and creates an OSPFv2 instance if one was not previously created. The switch only supports one OSPFv2 instance and all OSPFv2 configuration commands apply to this instance.

When an OSPFv2 instance is already configured, the command must specify its process ID. Any attempt to define additional instances will fail and generate errors.

The process ID is local to the router and is used to identify the running OSPFv2 process. Neighbor OSPFv2 routers can have different process ID's.

Example

- This command places the switch in router-ospf configuration mode and, if not previously created, creates an OSPFv2 instance with a process ID of 100.

  switch(config)#router ospf 100
  switch(config-router-ospf)#

31.3.1.2 Defining the Router ID

The router ID is a 32-bit number assigned to a router running OSPFv2. This number uniquely labels the router within an Autonomous System. Status commands identify the switch through the router ID.

The switch sets the router ID to the first available alternative in the following list:

1. The `router-id` command.
2. The loopback IP address, if a loopback interface is active on the switch.
3. The highest IP address on the router.

Important!

When configuring VXLAN on an MLAG, always manually configure the OSPFv2 router ID to prevent the switch from using the common VTEP IP address as the router ID.

The `router-id (OSPFv2)` command configures the router ID for an OSPFv2 instance.

Example

- This command assigns 10.1.1.1 as the OSPFv2 router ID.

  switch(config-router-ospf)#router-id 10.1.1.1
  switch(config-router-ospf)#

31.3.1.3 Global OSPFv2 Parameters

These router-ospf configuration mode commands define OSPFv2 behavior.
LSA Overload

The `max-lsa (OSPFv2)` command specifies the maximum number of LSAs allowed in an LSDB database and configures the switch behavior when the limit is approached or exceeded. An LSA overload condition triggers these actions:

- **Warning**: The switch logs OSPF MAXLSAWARNING if the LSDB contains a specified percentage of the LSA maximum.
- **Temporary shutdown**: When the LSDB exceeds the LSA maximum, OSPFv2 is disabled and does not accept or acknowledge new LSAs. The switch re-starts OSPFv2 after a specified period.
- **Permanent shutdown**: The switch permanently disables OSPFv2 after performing a specified number of temporary shutdowns. This state usually indicates the need to resolve a network condition that consistently generates excessive LSA packets.

OSPFv2 is re-enabled with a `router ospf` command.

The LSDB size restriction is removed by setting the LSA limit to zero.

**Example**

- This command configures the OSPFv2 maximum LSA count to 20,000 and triggers these actions:
  - The switch logs an OSPF MAXLSAWARNING if the LSDB has 8,000 LSAs (40% of 20,000).
  - The switch temporarily disables OSPFv2 for 10 minutes if the LSDB contains 20,000 LSAs.
  - The switch permanently disables OSPFv2 after four temporary OSPFv2 shutdowns.
  - The shutdown counter resets if the LSDB contains less than 20,000 LSAs for 20 minutes.

  ```bash
  switch(config-router-ospf)##max-lsa 20000 40 ignore-time 10 ignore-count 4 reset-time 20
  switch(config-router-ospf)##
  ```

Logging Adjacency Changes

The `log-adjacency-changes (OSPFv2)` command configures the switch to log OSPFv2 link-state changes and transitions of OSPFv2 neighbors into the up or down state.

**Examples**

- This command configures the switch to log transitions of OSPFv2 neighbors into the up or down state.
  ```bash
  switch(config-router-ospf)##log-adjacency-changes
  switch(config-router-ospf)##
  ```

- This command configures the switch to log all OSPFv2 link-state changes.
  ```bash
  switch(config-router-ospf)##log-adjacency-changes detail
  switch(config-router-ospf)##
  ```

OSPF RFC Compatibility

RFC 2328 and RFC 1583 specify different methods for calculating summary route metrics. The `compatible (OSPFv2)` command allows the selective disabling of compatibility with RFC 2328.

**Example**

- This command sets the OSPF compatibility list with RFC 1583.
  ```bash
  switch(config)##router ospf 6
  switch(config-router-ospf)##compatible rfc1583
  switch(config-router-ospf)##
  ```
Intra-Area Distance

The `distance ospf (OSPFv2)` command configures the administrative distance for routes contained in a single OSPFv2 area. Administrative distances compare dynamic routes configured by different protocols. The default administrative distance for intra-area routes is 110.

Example

- This command configures an administrative distance of 95 for OSPFv2 intra-area routes.

  ```
  switch(config-router-ospf)#distance ospf intra-area 95
  switch(config-router-ospf)#
  ```

Passive Interfaces

The `passive-interface <interface> (OSPFv2)` command prevents the transmission of hello packets on the specified interface. Passive interfaces drop all adjacencies and do not form new adjacencies. Passive interfaces send LSAs but do not receive them. The router does not send or process OSPFv2 packets received on passive interfaces. The router advertises the passive interface in the router LSA.

The `no passive-interface` command re-enables OSPFv2 processing on the specified interface.

Examples

- This command configures VLAN 2 as a passive interface.

  ```
  switch(config-router-ospf)#passive-interface vlan 2
  switch(config-router-ospf)#
  ```

- This command configures VLAN 2 as an active interface.

  ```
  switch(config-router-ospf)#no passive-interface vlan 2
  switch(config-router-ospf)#
  ```

Redistributing Connected Routes

Redistributing connected routes causes the OSPFv2 instance to advertise all connected routes on the switch as external OSPFv2 routes. Connected routes are routes that are established when IPv4 is enabled on an interface.

Example

- The `redistribute (OSPFv2) connected` command converts connected routes to OSPFv2 external routes.

  ```
  switch(config-router-ospf)#redistribute connected
  switch(config-router-ospf)#
  ```

Redistributing Static Routes

Redistributing static routes causes the OSPFv2 instance to advertise all static routes on the switch as external OSPFv2 routes. The switch does not support redistributing individual static routes.

Example

- The `redistribute (OSPFv2) static` static command converts the static routes to OSPFv2 external routes.

  ```
  switch(config-router-ospf)#redistribute static
  switch(config-router-ospf)#
  ```

- The `no redistribute (OSPFv2)` command stops the advertising of the static routes as OSPFv2 external routes.

  ```
  switch(config-router-ospf)#no redistribute static
  switch(config-router-ospf)#
  ```
Filtering Routes with Distribute Lists

An OSPF distribute list uses a route map or prefix list to filter specific routes from incoming OSPF LSAs; this filtering occurs after SPF calculation. The filtered routes are not installed on the switch, but are still included in LSAs sent by the switch. An OSPF router instance can have one distribute list configured.

If a prefix list is used, destination prefixes that do not match the prefix list will not be installed. If a route map is used, routes may be filtered based on address, next hop, or metric. OSPF external routes may also be filtered by metric type or tag.

The **distribute-list in** command specifies the filter to be used and applies it to the OSPF instance.

**Example**

- These commands configure a prefix-list named “dist_list1” in OSPF instance 5 to filter certain routes from incoming OSPF LSAs.

  ```
  switch(config)#router ospf 5
  switch(config-router-ospf)#distribute-list prefix-list dist_list1 in
  ```

31.3.2 Configuring OSPFv2 Areas

OSPFv2 areas are configured through area commands. The switch must be in router-ospf configuration mode, as described in Section 31.3.1.1: Entering OSPFv2 Configuration Mode, to run area commands.

Areas are assigned a 32-bit number that is expressed in decimal or dotted-decimal notation. When an OSPFv2 instance configuration contains multiple areas, the switch only configures areas associated with its interfaces.

31.3.2.1 Configuring the Area Type

The **area (OSPFv2)** command specifies the area type. The switch supports three area types:

- Normal area: Area that accepts intra-area, inter-area, and external routes. The backbone area (area 0) is a normal area.
- Stub area: Area that does not advertise external routes. External routes are reached through a default summary route (0.0.0.0). Networks with no external routes do not require stub areas.
- NSSA (Not So Stubby Area): ASBRs advertise external LSAs directly connected to the area. External routes from other areas are not advertised and are reached through a default summary route.

The default area type is normal.

**Examples**

- This command configures area 45 as a stub area.

  ```
  switch(config-router-ospf)#area 45 stub
  ```

- This command configures area 10.92.148.17 as an NSSA.

  ```
  switch(config-router-ospf)#area 10.92.148.17 NSSA
  ```
31.3.2.2 Blocking All Summary Routes from Flooding the NSSA

The `area nssa no-summary (OSPFv2)` command configures the router to not import type-3 summary LSAs into the not-so-stubby area (NSSA) and injects a default summary route (0.0.0.0/0) into the NSSA to reach the inter-area prefixes.

**Example**

- This command directs the device not to import type-3 summary LSAs into the NSSA area and injects a default summary route (0.0.0.0/0) into the NSSA area.

  ```
  switch(config)# router ospf 6
  switch(config-router-ospf)# area 1.1.1.1 nssa no-summary
  switch(config-router-ospf)#
  ```

31.3.2.3 Assigning Network Segments to the Area

**Assigning Routes to an Area**

The `network area (OSPFv2)` command assigns the specified network segment to an OSPFv2 area. The network can be entered in CIDR notation or by an address and wildcard mask.

The switch zeroes the host portion of the specified network address e.g. 1.2.3.4/24 converts to 1.2.3.0/24 and 1.2.3.4/16 converts to 1.2.0.0/16

**Example**

- Each of these equivalent commands assign the network segment 10.1.10.0/24 to area 0.

  ```
  switch(config-router-ospf)#network 10.1.10.0 0.0.0.255 area 0
  switch(config-router-ospf)#
  ```

  ```
  switch(config-router-ospf)#network 10.1.10.0/24 area 0
  switch(config-router-ospf)#
  ```

  In each case, running-config stores the command in CIDR (prefix) notation.

**Summarizing Routes**

By default, ABRs create a summary LSA for each route in an area and advertise them to adjacent routers. The `area range (OSPFv2)` command aggregates routing information, allowing the ABR to advertise multiple routes with one LSA. The `area range` command can be used to suppress route advertisements.

**Examples**

- Two `network area` commands assign subnets to an area. The `area range` command summarizes the addresses, which the ABR advertises in a single LSA.

  ```
  switch(config-router-ospf)#network 10.1.25.80 0.0.0.240 area 5
  switch(config-router-ospf)#
  ```

  ```
  switch(config-router-ospf)#network 10.1.25.112 0.0.0.240 area 5
  switch(config-router-ospf)#
  ```

  ```
  switch(config-router-ospf)#area 5 range 10.1.25.64 0.0.0.192
  switch(config-router-ospf)#
  ```

- The `network area` command assigns a subnet to an area, followed by an `area range` command that suppresses the advertisement of that subnet.

  ```
  switch(config-router-ospf)#network 10.12.31.0 0.0.0.255 area 5
  switch(config-router-ospf)#
  ```

  ```
  switch(config-router-ospf)#area 5 range 10.12.31.0 0.0.0.255 not-advertise
  switch(config-router-ospf)#
  ```
### 31.3.2.4 Configuring Area Parameters

These router-ospf configuration mode commands define OSPFv2 behavior in a specified area.

#### Default Summary Route Cost

The `area default-cost (OSPFv2)` command specifies the cost of the default summary route that ABRs send into a stub area or NSSA. Summary routes, also called inter-area routes, originate in areas different than their destination.

**Example**

- This command configures a cost of 15 for the default summary route in area 23.

```
switch(config-router-ospf)#area 23 default-cost 15
switch(config-router-ospf)#
```

#### Filtering Type 3 LSAs

The `area filter (OSPFv2)` command prevents an area from receiving Type 3 (Summary) LSAs from a specified subnet. Type 3 LSAs are sent by ABRs and contain information about one of its connected areas.

**Example**

- This command prevents the switch from entering Type 3 LSAs originating from the 10.1.1.2/24 subnet into its area 2 LSDB.

```
switch(config-router-ospf)#area 2 filter 10.1.1.2/24
switch(config-router-ospf)#
```

### 31.3.3 Configuring Interfaces for OSPFv2

OSPFv2 interface configuration commands specify transmission parameters for routed ports and SVIs that handle OSPFv2 packets.

#### 31.3.3.1 Configuring Authentication

OSPFv2 authenticates packets through passwords configured on VLAN interfaces. Interfaces connecting to the same area can authenticate packets if they have the same key. By default, OSPFv2 does not authenticate packets.

OSPFv2 supports simple password and message digest authentication:

- **Simple password authentication:** A password is assigned to an area. Interfaces connected to the area can authenticate packets by enabling authentication and specifying the area password.

- **Message digest authentication:** Each interface is configured with a key (password) and key-id pair. When transmitting a packet, the interface generates a string, using the MD5 algorithm, based on the OSPFv2 packet, key, and key ID, then appends that string to the packet.

  Message digest authentication supports uninterrupted transmissions during key changes by allowing each interface to have two keys with different key IDs. When a new key is configured on an interface, the router transmits OSPFv2 packets for both keys. Once the router detects that all neighbors are using the new key, it stops sending the old one.

Implementing authentication on an interface is a two step process:

1. **Enabling authentication.**
2. **Configuring a key (password).**
To configure simple authentication on a VLAN interface:

**Step 1**  Enable simple authentication with the `ip ospf authentication` command.
```
switch(config-if-vl12)# ip ospf authentication
```

**Step 2**  Configure the password with the `ip ospf authentication-key` command.
```
switch(config-if-vl12)# ip ospf authentication-key 0 code123
```

*Running-config* stores the password as an encrypted string, using a proprietary algorithm.

To configure Message-Digest authentication on a VLAN interface:

**Step 1**  Enable Message-Digest authentication with the `ip ospf authentication` command.
```
switch(config-if-vl12)# ip ospf authentication message-digest
```

**Step 2**  Configure the key ID and password with the `ip ospf message-digest-key` command.
```
switch(config-if-vl12)# ip ospf message-digest-key 23 md5 0 code123
```

*Running-config* stores the password as an encrypted string, using a proprietary algorithm. The key ID (23) is between keywords `message-digest-key` and `md5`.

### 31.3.3.2 Configuring Intervals

Interval configuration commands determine OSPFv2 packet transmission characteristics for the specified VLAN interface and are entered in interface-vlan configuration mode.

#### Hello Interval

The hello interval specifies the period between consecutive hello packet transmissions from an interface. Each OSPFv2 neighbor should specify the same hello interval, which should not be longer than any neighbor’s dead interval.

The `ip ospf hello-interval` command configures the hello interval for the configuration mode interface.

The default is 10 seconds.

**Example**

- This command configures a hello interval of 30 seconds for VLAN 2.
```
switch(config-if-Vl2)# ip ospf hello-interval 30
```

#### Dead Interval

The dead interval specifies the period that an interface waits for an OSPFv2 packet from a neighbor before it disables the adjacency under the assumption that the neighbor is down. The dead interval should be configured identically on all OSPFv2 neighbors and be longer than the hello interval of any neighbor.

The `ip ospf dead-interval` command configures the dead interval for the configuration mode interface.

The default is 40 seconds.

**Example**

- This command configures a dead interval of 120 seconds for VLAN 4.
```
switch(config-if-Vl4)# ip ospf dead-interval 120
```

```
Retransmit Interval

Routers that send OSPFv2 advertisements to an adjacent router expect to receive an acknowledgment from that neighbor. Routers that do not receive an acknowledgment will retransmit the advertisement. The retransmit interval specifies the period between retransmissions.

The `ip ospf retransmit-interval` command configures the LSA retransmission interval for the configuration mode interface. The default retransmit interval is 5 seconds.

Example

- This command configures a retransmit interval of 15 seconds for VLAN 3.

  ```
  switch(config-if-Vl3)#ip ospf retransmit-interval 15
  switch(config-if-Vl3)#
  ```

Transmission Delay

The transmission delay is an estimate of the time that an interface requires to transmit a link-state update packet. OSPFv2 adds this delay to the age of outbound packets to more accurately reflect the age of the LSA when received by a neighbor. The default transmission delay is one second.

The `ip ospf transmit-delay` command configures the transmission delay for the configuration mode interface.

Example

- This command configures a transmission delay of 5 seconds for VLAN 6.

  ```
  switch(config-if-Vl6)#ip ospf transmit-delay 5
  switch(config-if-Vl6)#
  ```

31.3.3.3 Configuring Interface Parameters

Interface Cost

The OSPFv2 interface cost (or metric) reflects the overhead of sending packets across the interface. The cost is typically inversely proportional to the bandwidth of the interface. The default cost is 10.

The `ip ospf cost` command configures the OSPFv2 cost for the configuration mode interface.

Example

- This command configures a cost of 15 for VLAN 2.

  ```
  switch(config-if-Vl2)#ip ospf cost 15
  switch(config-if-Vl2)#
  ```

Router Priority

Router priority determines preference during designated router (DR) and backup designated router (BDR) elections. Routers with higher priority numbers have preference over other routers. Routers with a priority of zero cannot be elected as a DR or BDR.

The `ip ospf priority` command configures router priority for the configuration mode interface. The default priority is 1.

Examples

- This command configures a router priority of 15 for VLAN 8.

  ```
  switch(config-if-Vl8)#ip ospf priority 15
  switch(config-if-Vl8)#
  ```
• This command restores the router priority of 1 for VLAN 7.
  switch(config-if-Vl7)#no ip ospf priority
  switch(config-if-Vl7)#

31.3.4 Enabling OSPFv2

31.3.4.1 IPv4 Routing

OSPFv2 requires that IPv4 routing is enabled on the switch. When IP routing is not enabled, entering OSPFv2 configuration mode generates a message.

Example

• This message is displayed if, when entering router-ospf configuration mode, IP routing is not enabled.
  switch(config)#router ospf 100
  ! IP routing not enabled
  switch(config-router-ospf)#

• This command enables IP routing on the switch.
  switch(config)#ip routing
  switch(config)#

31.3.4.2 Disabling OSPFv2

The switch can disable OSPFv2 operations without disrupting the OSPFv2 configuration.

• **shutdown (OSPFv2)** disables all OSPFv2 activity.
• **ip ospf disabled** disables OSPFv2 activity on a VLAN interface.

The no **shutdown** and no **ip ospf disabled** commands resume OSPFv2 activity.

Examples

• This command disables OSPFv2 activity on the switch.
  switch(config-router-ospf)#shutdown
  switch(config-router-ospf)#

• This command resumes OSPFv2 activity on the switch.
  switch(config-router-ospf)#no shutdown
  switch(config-router-ospf)#

• This command disables OSPFv2 activity on VLAN 5.
  switch(config-if-Vl5)#ip ospf disabled
  switch(config-if-Vl5)#

31.3.5 Displaying OSPFv2 Status

This section describes OSPFv2 **show** commands that display OSPFv2 status. General switch methods that provide OSPFv2 information include pinging routes, viewing route status (**show ip route** command), and viewing the configuration (**show running-config** command).

31.3.5.1 OSPFv2 Summary

The **show ip ospf** command displays general OSPFv2 configuration information and operational statistics.
Example

- This command displays general OSPFv2 information.

```bash
switch#show ip ospf
Routing Process "ospf 1" with ID 10.168.103.1
Supports opaque LSA
Maximum number of LSA allowed 12000
  Threshold for warning message 75%
  Ignore-time 5 minutes, reset-time 5 minutes
  Ignore-count allowed 5, current 0
  It is an area border router
  Hold time between two consecutive SPF's 5000 msecs
  SPF algorithm last executed 00:00:09 ago
  Minimum LSA interval 5 secs
  Minimum LSA arrival 1000 msecs
  Number of external LSA 0. Checksum Sum 0x000000
  Number of opaque AS LSA 0. Checksum Sum 0x000000
  Number of LSA 27.
  Number of areas in this router is 3. 3 normal 0 stub 0 nssa
  Area BACKBONE(0.0.0.0)
    Number of interfaces in this area is 2
    It is a normal area
    Area has no authentication
    SPF algorithm executed 153 times
    Number of LSA 8. Checksum Sum 0x03e13a
    Number of opaque link LSA 0. Checksum Sum 0x000000
  Area 0.0.0.2
    Number of interfaces in this area is 1
    It is a normal area
    Area has no authentication
    SPF algorithm executed 153 times
    Number of LSA 11. Checksum Sum 0x054e57
    Number of opaque link LSA 0. Checksum Sum 0x000000
  Area 0.0.0.3
    Number of interfaces in this area is 1
    It is a normal area
    Area has no authentication
    SPF algorithm executed 5 times
    Number of LSA 6. Checksum Sum 0x02a401
    Number of opaque link LSA 0. Checksum Sum 0x000000
```

The output lists configuration parameters and operational statistics and status for the OSPFv2 instance, followed by a brief description of the areas located on the switch.

31.3.5.2 Viewing OSPFv2 on the Interfaces

The `show ip ospf interface` command displays OSPFv2 information for switch interfaces configured for OSPFv2. Different command options allow the display of either all interfaces or a specified interface. The command can also be configured to display complete information or a brief summary.
Example

- This command displays complete OSPFv2 information for VLAN 1.

```plaintext
switch# show ip ospf interface vlan 1
Vlan1 is up, line protocol is up (connected)
  Internet Address 10.168.0.1/24, Area 0.0.0.0
  Process ID 1, Router ID 10.168.103.1, Network Type BROADCAST, Cost: 10
  Transmit Delay is 1 sec, State BDR, Priority 1
  Designated Router is 10.168.104.2
  Backup Designated router is 10.168.103.1
  Timer intervals configured, Hello 10, Dead 40, Retransmit 5
  Neighbor Count is 1
  MTU is 1500
switch#
```

The display indicates the switch is an ABR by displaying a neighbor count, the Designated Router, and Backup Designated Router.

- This command displays a summary of interface information for the switch.

```plaintext
switch# show ip ospf interface brief
  Interface    PID    Area      IP Address     Cost  State  Nbrs
Loopback0 1 0.0.0.0 10.168.103.1/24 10  DR     0
Vlan1 1 0.0.0.1 10.168.0.1/24 10  BDR    1
Vlan2 1 0.0.0.2 10.168.2.1/24 10  BDR    1
Vlan3 1 0.0.0.3 10.168.3.1/24 10  DR     0
switch#
```

Configuration information includes the Process ID (PID), area, IP address, and cost. OSPFv2 operational information includes the Designated Router status and number of neighbors.

### 31.3.5.3 Viewing the OSPFv2 Database

The `show ip ospf database <link state list>` command displays the LSAs in the LSDB for the specified area. If no area is listed, the command displays the contents of the database for each area on the switch. The database command provides options to display subsets of the LSDB database, a summary of database contents, and the link states that comprise the database.
Examples

- This command displays LSDB contents for area 2.

  ```
  switch#show ip ospf 1 2 database
  OSPF Router with ID(10.168.103.1) (Process ID 1)
  
  Router Link States (Area 0.0.0.2)

```

### Viewing OSPFv2 Neighbors

The `show ip ospf neighbor` command displays information about the routers that are neighbors to the switch. Command options allow the display of summary or detailed information about the neighbors for all areas and interfaces on the switch. The command also allows the display of neighbors for individual interfaces or areas. The `adjacency-changes` option displays the interface’s adjacency changes.

#### Example

This command displays the switch’s neighbors.

```
switch#show ip ospf neighbor
Neighbor ID Pri State Dead Time Address Interface
10.168.104.2  1  FULL/DR  00:00:35  10.168.0.2  Vlan1
10.168.104.2  8  FULL/BDR  00:00:31  10.168.2.2  Vlan2
```
- This command displays details about the neighbors to VLAN 2.
  ```
  switch# show ip ospf neighbor vlan 2 detail
  Neighbor 10.168.104.2, interface address 10.168.2.2
  In the area 0.0.0.2 via interface Vlan2
  Neighbor priority is 8, State is FULL, 13 state changes
  Adjacency was established 00:01:25:48 ago
  DR is 10.168.2.1 BDR is 10.168.2.2
  Options is E
  Dead timer due in 00:00:34
  switch#
  ```
- This command displays the adjacency changes to VLAN 2.
  ```
  switch# show ip ospf neighbor vlan 2 adjacency-changes
  [08-04 09:58:58] 10.168.104.2, interface Vlan2 adjacency established
  [08-04 09:59:34] 10.168.104.2, interface Vlan2 adjacency dropped: interface went down
  [08-04 09:59:42] 10.168.104.2, interface Vlan2 adjacency established
  [08-04 10:01:40] 10.168.104.2, interface Vlan2 adjacency dropped: nbr did not list our router ID
  [08-04 10:01:46] 10.168.104.2, interface Vlan2 adjacency established
  switch#
  ```

The `show ip ospf neighbor state` command displays the state information for OSPF neighbors on a per-interface basis.

**Examples**

- This command displays OSPF information for neighboring routers that are fully adjacent.
  ```
  switch> show ip ospf neighbor state full
  Neighbor ID  VRF  Pri  State     Dead Time  Address          Interface
  Test1        default  1  FULL/BDR  00:00:35  10.17.254.105  Vlan3912
  Test2        default  1  FULL/BDR  00:00:36  10.17.254.29   Vlan3910
  Test3        default  1  FULL/DR   00:00:35  10.25.0.1      Vlan101
  Test4        default  1  FULL/DROTHER 00:00:36  10.17.254.67   Vlan3908
  Test5        default  1  FULL/DROTHER 00:00:36  10.17.254.68   Vlan3908
  Test6        default  1  FULL/DR   00:00:32  10.17.254.66   Vlan3908
  Test7        default  1  FULL/DROTHER 00:00:34  10.17.36.4     Vlan3036
  Test8        default  1  FULL/DR   00:00:35  10.17.36.3     Vlan3036
  Test9        default  1  FULL/DROTHER 00:00:31  10.17.254.13   Vlan3902

  switch>
  ```

The `show ip ospf neighbor summary` command displays a single line of summary information for each OSPFv2 neighbor.
Example

- This command displays the summary information for the OSPFv2 neighbors.

  switch>show ip ospf neighbor summary
  OSPF Router with (Process ID 1) (VRF default)
  0 neighbors are in state DOWN
  0 neighbors are in state GRACEFUL RESTART
  2 neighbors are in state INIT
  0 neighbors are in state LOADING
  0 neighbors are in state ATTEMPT
  18 neighbors are in state FULL
  0 neighbors are in state EXCHANGE
  0 neighbors are in state 2 WAYS
  0 neighbors are in state EXCH START
  switch>

31.3.5.5 Viewing OSPFv2 Routes

The `show ip routes` command provides an OSPFv2 option.

Examples

- This command displays all of a switch’s routes.

  switch#show ip route
  Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP

  Gateway of last resort:
  S  0.0.0.0/0 [1/0] via 10.255.255.1
  C  10.255.255.0/24 is directly connected, Management1
  C  10.168.0.0/24 is directly connected, Vlan1
  C  10.168.2.0/24 is directly connected, Vlan2
  O  10.168.3.0/24 [110/20] via 10.168.0.1
  O  10.168.103.0/24 [110/20] via 10.168.0.1
  C  10.168.104.0/24 is directly connected, Loopback0
  switch#

- This command displays the switch’s OSPFv2 routes.

  switch#show ip route ospf
  Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP

  O  10.168.3.0/24 [110/20] via 10.168.0.1
  O  10.168.103.0/24 [110/20] via 10.168.0.1
  switch#

Use the `ping` command to determine the accessibility of a route.
Example

- This command pings an OSPFv2 route.

  ```
  switch# ping 10.168.0.1
  PING 10.168.0.1 (10.168.0.1) 72(100) bytes of data.
  80 bytes from 10.168.0.1: icmp_seq=1 ttl=64 time=0.148 ms
  80 bytes from 10.168.0.1: icmp_seq=2 ttl=64 time=0.132 ms
  80 bytes from 10.168.0.1: icmp_seq=3 ttl=64 time=0.136 ms
  80 bytes from 10.168.0.1: icmp_seq=4 ttl=64 time=0.137 ms
  80 bytes from 10.168.0.1: icmp_seq=5 ttl=64 time=0.136 ms
  --- 10.168.0.1 ping statistics ---
  5 packets transmitted, 5 received, 0% packet loss, time 7999ms
  rtt min/avg/max/mdev = 0.132/0.137/0.148/0.015 ms
  switch#
  ```

31.3.5.6 Viewing OSPFv2 SPF Logs

The `show ip ospf spf-log` command displays when and how long the switch took to run a full SPF calculation for OSPF.

Examples

- This command displays the SPF information for OSPF.

  ```
  switch> show ip ospf spf-log
  OSPF Process 172.26.0.22
  When  Duration(msec)
  13:01:34  1.482
  13:01:29  1.547
  13:01:24  1.693
  13:00:50  1.459
  13:00:45  1.473
  13:00:40  2.603
  11:00:49  1.561
  11:00:40  1.463
  11:00:35  1.467
  11:00:30  1.434
  11:00:54  1.456
  11:00:49  1.472
  11:00:44  1.582
  15:01:49  1.575
  15:01:44  1.470
  15:01:39  1.679
  15:01:34  1.601
  15:00:57  1.454
  15:00:52  1.446
  15:00:47  1.603
  switch>
  ```
31.4 OSPFv2 Configuration Examples

This section describes the commands required to configure three OSPFv2 topologies.

31.4.1 OSPFv2 Configuration Example 1

The OSPF Autonomous System in example 1 contains two areas that are connected through two routers. The backbone area also contains an internal router that connects two subnets.

31.4.1.1 Example 1 Topology

Figure 31-3 displays the Example 1 topology. Two ABRs connect area 0 and area 1 – Router A and Router B. Router C is an internal router that connects two subnets in area 0.

Figure 31-3: OSPFv2 Example 1

Area 1 Configuration

Area 1 contains one subnet that is accessed by Router A and Router B.

- Router A: The subnet 10.10.1.0/24 is accessed through VLAN 1.
- Router B: The subnet 10.10.1.0/24 is accessed through VLAN 1.
- Each router uses simple authentication, with password abcdefgh.
- Designated Router (DR): Router A.
- Backup Designated Router (BDR): Router B.
- Each router defines an interface cost of 10.
- Router priority is not specified for either router on area 1.

Area 0 ABR Configuration

Area 0 contains one subnet that is accessed by ABRs Router A and Router B.

- Router A: The subnet 10.10.2.0/24 is accessed through VLAN 2.
- Router B: The subnet 10.10.2.0/24 is accessed through VLAN 2.
- Designated Router (DR): Router B.
• Backup Designated Router (BDR): Router A.
• Each router uses simple authentication, with password ijklmnop.
• Each router defines an interface cost of 20.
• Each router defines a retransmit-interval of 10.
• Each router defines a transmit-delay of 2.
• Router priority is specified such that Router B will be elected as the Designated Router.

Area 0 IR Configuration

Area 0 contains one internal router that connects two subnets.
• Router C: The subnet 10.10.2.0/24 is accessed through VLAN 2.
• Router C: The subnet 10.10.3.0/24 is accessed through VLAN 3.
• The subnet 10.10.2.0/24 link is configured as follows:
  • Interface cost of 20.
  • Retransmit-interval of 10.
  • Transmit-delay of 2.
• The subnet 10.10.3.0/24 link is configured as follows:
  • Interface cost of 20.
  • Dead interval of 80 seconds.

31.4.1.2 Example 1 Code

This code configures the OSPFv2 instances on the three switches.

Step 1  Configure the interface addresses.

  a  Router A interfaces:
    switch-A(config)#interface vlan 1
    switch-A(config-if-vl1)#ip address 10.10.1.1/24
    switch-A(config-if-vl1)#interface vlan 2
    switch-A(config-if-vl2)#ip address 10.10.2.1/24

  b  Router B interfaces:
    switch-B(config)#interface vlan 1
    switch-B(config-if-vl1)#ip address 10.10.1.2/24
    switch-B(config-if-vl1)#interface vlan 2
    switch-B(config-if-vl2)#ip address 10.10.2.2/24

  c  Router C interfaces:
    switch-C(config)#interface vlan 2
    switch-C(config-if-vl2)#ip address 10.10.2.3/24
    switch-C(config-if-vl2)#interface vlan 3
    switch-C(config-if-vl3)#ip address 10.10.3.3/24
Step 2 Configure the interface OSPFv2 parameters.

a Router A interfaces:

switch-A(config-if-vl2)#interface vlan 1
switch-A(config-if-vl1)#ip ospf authentication-key abcd
switch-A(config-if-vl1)#ip ospf cost 10
switch-A(config-if-vl1)#ip ospf priority 6
switch-A(config-if-vl2)#interface vlan 2
switch-A(config-if-vl2)#ip ospf authentication-key ijk
switch-A(config-if-vl2)#ip ospf cost 20
switch-A(config-if-vl2)#ip ospf retransmit-interval 10
switch-A(config-if-vl2)#ip ospf transmit-delay 2
switch-A(config-if-vl2)#ip ospf priority 4

b Router B interfaces:

switch-B(config-if-vl2)#interface vlan 1
switch-B(config-if-vl1)#ip ospf authentication-key abcd
switch-B(config-if-vl1)#ip ospf cost 10
switch-B(config-if-vl1)#ip ospf priority 4
switch-B(config-if-vl2)#interface vlan 2
switch-B(config-if-vl2)#ip ospf authentication-key ijk
switch-B(config-if-vl2)#ip ospf cost 20
switch-B(config-if-vl2)#ip ospf retransmit-interval 10
switch-B(config-if-vl2)#ip ospf transmit-delay 2
switch-B(config-if-vl2)#ip ospf priority 6

c Router C interfaces:

switch-C(config-if-vl3)#interface vlan 2
switch-C(config-if-vl2)#ip ospf cost 20
switch-C(config-if-vl2)#ip ospf retransmit-interval 10
switch-C(config-if-vl2)#ip ospf transmit-delay 2
switch-C(config-if-vl2)#interface vlan 3
switch-C(config-if-vl3)#ip ospf cost 20
switch-C(config-if-vl3)#ip ospf dead-interval 80

Step 3 Attach the network segments to the areas.

a Router A interfaces:

switch-A(config-if-vl2)#router ospf 1
switch-A(config-router-ospf)#router-id 169.10.0.1
switch-A(config-router-ospf)#network 10.10.1.0/24 area 1
switch-A(config-router-ospf)#network 10.10.2.0/24 area 0

b Router B interfaces:

switch-B(config-if-vl2)#router ospf 1
switch-B(config-router-ospf)#router-id 169.10.0.2
switch-B(config-router-ospf)#network 10.10.1.0/24 area 1
switch-B(config-router-ospf)#network 10.10.2.0/24 area 0

c Router C interfaces:

switch-C(config-if-vl3)#router ospf 1
switch-C(config-router-ospf)#router-id 169.10.0.3
switch-C(config-router-ospf)#network 10.10.2.0/24 area 0
switch-C(config-router-ospf)#network 10.10.3.0/24 area 0

31.4.2 OSPFv2 Configuration Example 2

The AS in example 2 contains three areas. Area 0 connects to the other areas through different routers. The backbone area contains an internal router that connects two subnets. Area 0 is normal; the other areas are stub areas.
31.4.2.1 Example 2 Topology

Figure 31-4 displays the Example 2 topology. One ABR (Router B) connects area 0 and area 10.42.110.0; another ABR (router C) connects area 0 and area 36.56.0.0. Router A is an internal router that connects two subnets in area 0.

Figure 31-4: OSPFv2 Example 2

Area 10.42.110.0 Configuration

Area 10.42.110.0 contains one subnet that is accessed by Router B.
- Router B: The subnet 10.42.110.0 is accessed through VLAN 15.
- Router B uses simple authentication, with password abcdefgh.
- Each router defines a interface cost of 10.

Area 10.56.0.0 Configuration

Area 10.56.0.0 contains one subnet that is accessed by Router C.
- Router C: The subnet 10.56.0.0 is accessed through VLAN 21.
- Router C uses simple authentication, with password ijklmnop.
- Each router defines a interface cost of 20.

Area 0 ABR Configuration

Area 0 contains two subnets. ABR Router B connects one subnet to area 10.42.110.0. ABR Router C connects the other subnet to area 10.56.0.0.
- Router B: The subnet 10.119.254.0/24 is accessed through VLAN 16.
- Router C: The subnet 10.119.251.0/24 is accessed through VLAN 20.
• Designated Router (DR): Router B.
• Backup Designated Router (BDR): Router C.
• Each ABR uses simple authentication, with password iklmnop
• Each router defines an interface cost of 20.
• Each router defines a retransmit-interval of 10.
• Each router defines a transmit-delay of 2.

Area 0 IR Configuration
Area 0 contains two subnets connected by an internal router.
• Router A: The subnet 10.119.254.0/24 is accessed through VLAN 16.
• Router A: The subnet 10.119.251.0/24 is accessed through VLAN 20.
• The subnet 10.42.110.0 is configured as follows:
  • Interface cost of 10.
• The subnet 10.56.0.0/24 is configured as follows:
  • Interface cost of 20.
  • Retransmit-interval of 10.
  • Transmit-delay of 2.

31.4.2.2 Example 2 Code
Step 1 Configure the interface addresses.
  a  Router A interfaces:
      switch-A(config)#interface vlan 16
      switch-A(config-if-vl16)#ip address 10.119.254.2/24
      switch-A(config-if-vl16)#interface vlan 20
      switch-A(config-if-vl20)#ip address 10.119.251.1/24
  b  Router B interfaces:
      switch-B(config)#interface vlan 15
      switch-B(config-if-vl15)#ip address 10.42.110.1/24
      switch-B(config-if-vl15)#interface vlan 16
      switch-B(config-if-vl16)#ip address 10.119.254.1/24
  c  Router C interfaces:
      switch-C(config)#interface vlan 20
      switch-C(config-if-vl20)#ip address 10.119.251.2/24
      switch-C(config-if-vl20)#interface vlan 21
      switch-C(config-if-vl21)#ip address 10.56.0.1/24

Step 2 Configure the interface OSPFv2 parameters.
  a  Router A interfaces:
      switch-A(config-if-vl20)#interface vlan 16
      switch-A(config-if-vl16)#ip ospf cost 10
      switch-A(config-if-vl16)#interface vlan 20
      switch-A(config-if-vl20)#ip ospf cost 20
      switch-A(config-if-vl20)#ip ospf retransmit-interval 10
      switch-A(config-if-vl20)#ip ospf transmit-delay 2
b Router B interfaces:

```
switch-B(config-if-vl16)#interface vlan 15
switch-B(config-if-vl15)#ip ospf authentication-key abcdefgh
switch-B(config-if-vl15)#ip ospf cost 10
switch-B(config-if-vl16)#interface vlan 16
switch-B(config-if-vl16)#ip ospf authentication-key ijklnnop
switch-B(config-if-vl16)#ip ospf cost 20
switch-B(config-if-vl16)#ip ospf retransmit-interval 10
switch-B(config-if-vl16)#ip ospf transmit-delay 2
switch-B(config-if-vl16)#ip ospf priority 6
```

c Router C interfaces:

```
switch-C(config-if-vl21)#interface vlan 20
switch-C(config-if-vl20)#ip ospf authentication-key ijklnnop
switch-C(config-if-vl20)#ip ospf cost 20
switch-C(config-if-vl20)#ip ospf retransmit-interval 10
switch-C(config-if-vl20)#ip ospf transmit-delay 2
switch-C(config-if-vl20)#ip ospf priority 4
switch-C(config-if-vl20)#interface vlan 21
switch-C(config-if-vl21)#ip ospf authentication-key ijklnnop
switch-C(config-if-vl21)#ip ospf cost 20
switch-C(config-if-vl21)#ip ospf dead-interval 80
```

Step 3  Attach the network segments to the areas.

a Router A interfaces:

```
switch-A(config-if-vl20)#router ospf 1
switch-A(config-router-ospf)#router-id 10.24.1.1
switch-A(config-router-ospf)#network 10.119.254.0/24 area 0
switch-A(config-router-ospf)#network 10.119.251.0/24 area 0
switch-A(config-router-ospf)#area 0 range 10.119.251.0 0.0.7.255
```

b Router B interfaces:

```
switch-B(config-if-vl16)#router ospf 1
switch-B(config-router-ospf)#router-id 10.24.1.2
switch-B(config-router-ospf)#area 10.42.110.0 stub
switch-B(config-router-ospf)#network 10.42.110.0/24 area 10.42.110.0
switch-B(config-router-ospf)#network 10.119.254.0/24 area 0
```

c Router C interfaces:

```
switch-C(config-if-vl21)#router ospf 1
switch-C(config-router-ospf)#router-id 10.24.1.3
switch-C(config-router-ospf)#area 10.56.0.0 stub 0
switch-C(config-router-ospf)#network 10.119.251.0/24 area 0
switch-C(config-router-ospf)#network 10.56.0.0/24 area 36.56.0.0
```

31.4.3 OSPFv2 Configuration Example 3

The AS in example 3 contains two areas that connect through one ABR.
- Area 0: Backbone area contains two internal routers that connect three subnets, one ASBR, and one ABR that connects to Area 1.
- Area 1: NSSA contains one internal router, one ASBR, and one ABR that connects to the backbone.
### Example 3 Topology

**Figure 31-5** displays the Example 3 topology. One ABR connects area 0 and area 1. Router C is an ABR that connects the areas. Router A is an internal router that connects two subnets in area 1. Router D and Router E are internal routers that connect subnets in area 0. Router B and Router F are ASBRs that connect static routes outside the AS to area 1 and area 0, respectively.

**Figure 31-5: OSPFv2 Example 3**

#### Area 0 ABR Configuration
ABR Router C connects one area 0 subnet to an area 1 subnet.
- Router C: The subnet 10.10.2.0/24 is accessed through VLAN 11.
- Authentication is not configured on the interfaces.
- All interface OSPFv2 parameters are set to their default values.

#### Area 0 IR Configuration
Area 0 contains two internal routers, each of which connects two of the three subnets in the area.
- Router D: The subnet 10.10.2.0/24 is accessed through VLAN 11.
- Router D: The subnet 10.10.3.0/24 is accessed through VLAN 12.
- Router E: The subnet 10.10.3.0/24 is accessed through VLAN 12.
- Router E: The subnet 10.10.4.0/24 is accessed through VLAN 12.
- All interface OSPFv2 parameters are set to their default values.

#### Area 0 ASBR Configuration
ASBR Router F connects one area 0 subnet to an external subnet.
• Router F: The subnet 10.10.4.0/24 is accessed through VLAN 13.
• Router F: The subnet 12.15.1.0/24 is accessed through VLAN 14.
• All interface OSPFv2 parameters are set to their default values.

Area 1 ABR Configuration
ABR Router C connects one area 0 subnet to area 1.
• Router C: The subnet 10.10.1.0/24 is accessed through VLAN 10.
• Authentication is not configured on the interface.
• All interface OSPFv2 parameters are set to their default values.

Area 1 IR Configuration
Area 1 contains one internal router that connects two subnets in the area.
• Router A: The subnet 10.10.1.0/24 is accessed through VLAN 10.
• Router A: The subnet 10.10.5.0/24 is accessed through VLAN 9.
• All interface OSPFv2 parameters are set to their default values.

Area 1 ASBR Configuration
ASBR Router B connects one area 1 subnet to an external subnet.
• Router B: The subnet 10.10.1.0/24 is accessed through VLAN 10.
• Router B: The subnet 16.29.1.0/24 is accessed through VLAN 15.
• All interface OSPFv2 parameters are set to their default values.

31.4.3.2 Example 3 Code

Step 1 Configure the interfaces.
  a Router A interfaces:
    switch-A(config)#interface vlan 10
    switch-A(config-if-vl10)#ip address 10.10.1.1/24
    switch-A(config-if-vl10)#interface vlan 9
    switch-A(config-if-vl11)#ip address 10.10.5.1/24
  b Router B interfaces:
    switch-B(config)#interface vlan 10
    switch-B(config-if-vl10)#ip address 10.10.1.2/24
    switch-B(config-if-vl10)#interface vlan 15
    switch-B(config-if-vl18)#ip address 16.29.1.1/24
  c Router C interfaces:
    switch-C(config)#interface vlan 10
    switch-C(config-if-vl10)#ip address 10.10.1.3/24
    switch-C(config-if-vl10)#interface vlan 11
    switch-C(config-if-vl11)#ip address 10.10.2.2/24
  d Router D interfaces:
    switch-D(config)#interface vlan 11
    switch-D(config-if-vl11)#ip address 10.10.2.1/24
    switch-D(config)#interface vlan 12
    switch-D(config-if-vl12)#ip address 10.10.3.1/24
e  Router E interfaces:
   switch-E(config)#interface vlan 12
   switch-E(config-if-vl12)#ip address 10.10.3.2/24
   switch-E(config)#interface vlan 13
   switch-E(config-if-vl13)#ip address 10.10.4.1/24

f  Router F interfaces:
   switch-F(config)#interface vlan 13
   switch-F(config-if-vl13)#ip address 10.10.4.2/24
   switch-F(config)#interface vlan 14
   switch-F(config-if-vl14)#ip address 12.15.1.1/24

Step 2  Attach the network segments to the areas.
   a  Router A interfaces:
      switch-A(config-if-vl10)#router ospf 1
      switch-A(config-router-ospf)#router-id 170.21.0.1
      switch-A(config-router-ospf)#area 1 nssa
      switch-A(config-router-ospf)#network 10.10.1.0/24 area 1

   b  Router B interfaces:
      switch-B(config-if-vl10)#router ospf 1
      switch-B(config-router-ospf)#router-id 170.21.0.2
      switch-B(config-router-ospf)#area 1 nssa
      switch-B(config-router-ospf)#network 10.10.1.0/24 area 1

   c  Router C interfaces:
      switch-C(config-if-vl11)#router ospf 1
      switch-C(config-router-ospf)#router-id 170.21.0.3
      switch-C(config-router-ospf)#area 1 nssa
      switch-C(config-router-ospf)#network 10.10.1.0/24 area 1

- timers lsa tx delay initial (OSPFv2)
• timers spf delay initial (OSPFv2)

**Display and Clear Commands**

• clear ip ospf neighbor
• show ip ospf
• show ip ospf border-routers
• show ip ospf database database-summary
• show ip ospf database <link state list>
• show ip ospf database <link-state details>
• show ip ospf interface
• show ip ospf interface brief
• show ip ospf lsa-log
• show ip ospf neighbor
• show ip ospf neighbor adjacency-changes
• show ip ospf neighbor state
• show ip ospf neighbor summary
• show ip ospf request queue
• show ip ospf retransmission queue
• show ip ospf spf-log
adjacency exchange-start threshold (OSPFv2)

The adjacency exchange-start threshold command sets the exchange-start options for an OSPF instance.

The no adjacency exchange-start threshold and default adjacency exchange-start threshold command resets the default by removing the corresponding adjacency exchange-start threshold command from running-config.

Command Mode
Router-OSPF Configuration

Command Syntax
adjacency exchange-start threshold peers
no adjacency exchange-start threshold
default adjacency exchange-start threshold

Parameters
- **peers**  Value ranges from 1 4294967295. Default value is 10.

Example
- This command sets the adjacency exchange start threshold to 20045623.

switch(config)#router ospf 6
switch(config-router-ospf)#adjacency exchange-start threshold 20045623
switch(config-router-ospf)#
area default-cost (OSPFv2)

The area default-cost command specifies the cost for the default summary routes sent into a specified area. The default-cost is set to 10.

The no area default-cost and default area default-cost command resets the default-cost value of the specified area to 10 by removing the corresponding area default-cost command from running-config. The no area (OSPFv2) command removes all area commands for the specified area from running-config, including the area default-cost command.

Command Mode
   Router-OSPF Configuration

Command Syntax
   area area_id default-cost def_cost
   no area area_id default-cost
   default area area_id default-cost

Parameters
   - area_id  area number. <0 to 4294967295> or <0.0.0.0 to 255.255.255.255> running-config stores value in dotted decimal notation.
   - def_cost  Value ranges from 1 to 65535. Default value is 10.

Example
   - This command configures a cost of 15 for default summary routes that an ABR sends into area 23.
     switch(config)#router ospf 6
     switch(config-router-ospf)#area 23 default-cost 15
     switch(config-router-ospf)#
area filter (OSPFv2)

The **area filter** command prevents an area from receiving Type 3 Summary LSAs from a specified subnet.

The **no area filter** and **default area filter** commands remove the specified **area filter** command from **running-config**. The **no area** command (see **no area (OSPFv2)**) removes all area commands for the specified area from **running-config**, including **area filter** commands.

**Command Mode**
- Router-OSPF Configuration

**Command Syntax**

```
area area_id filter net_addr
no area area_id filter net_addr
default area area_id filter net_addr
```

**Parameters**
- **area_id** area number. `<0 to 4294967295>` or `<0.0.0.0 to 255.255.255.255>`
  - **running-config** stores value in dotted decimal notation.
- **net_addr** network IP address. Entry formats include address-prefix (CIDR) and address-mask.
  - **running-config** stores value in CIDR notation.

**Example**
- This command prevents the switch from entering Type 3 LSAs originating from the 10.1.1.0/24 subnet into its area 2 LSDB.

 switch(config)#router ospf 6
 switch(config-router-ospf)#area 2 filter 10.1.1.0/24
 switch(config-router-ospf)#
area nssa (OSPFv2)

The **area nssa** command configures an OSPFv2 area as a not-so-stubby area (NSSA). All routers in an AS must specify the same area type for identically numbered areas.

NSSA ASBRs advertise external LSAs that are part of the area, but do not advertise external LSAs from other areas.

Areas are **normal** by default; area type configuration is required only for stub NSSA areas. Area 0 is always a normal area and cannot be configured through this command.

The **no area nssa** command configures the specified area as a normal area by removing the specified **area nssa** command from **running-config**.

**Command Mode**

- **Router-OSPF Configuration**

**Command Syntax**

```
area area_id nssa [TYPE]
no area area_id nssa [TYPE]
default area area_id nssa [TYPE]
```

All parameters except **area_id** can be placed in any order.

**Parameters**

- **area_id**
  - Valid formats: integer < 1 to 4294967295> or dotted decimal < 0.0.0.1 to 255.255.255.255>
  - Area 0 (or 0.0.0.0) is not configurable; it is always **normal**.
  - **running-config** stores value in dotted decimal notation.
- **TYPE** area type. Values include:
  - <no parameter>
  - nssa-only

**Example**

- This command configures area 3 as a NSSA area.

```
switch(config-router-ospf)#area 3 nssa nssa-only
switch(config-router-ospf)#
```
area nssa default-information-originate (OSPFv2)

The `default area nssa default-information-originate` command sets default route origination for the NSSA, allowing the redistribute policy to advertise a default route if one is present. The resulting OSPF behavior depends on the presence of an installed static default route and on whether static routes are redistributed in OSPF (using the `redistribute (OSPFv2)` command). The `no area nssa default-information-originate` command disables advertisement of the default route for the NSSA regardless of the redistribute policy. See Table 31-1 for details.

Areas are normal by default; area type configuration is required only for stub and NSSA areas. Area 0 is always a normal area and cannot be configured through this command.

Default route origination is configured differently for different area types and supports three area types:

- Normal areas: advertisement of the default route is configured for all normal areas using the `default-information originate (OSPFv2)` command.
- Stub areas: the default route is automatically advertised in stub areas and cannot be configured.
- Not So Stubby Areas (NSSAs): advertisement of the default route is configured per area using the `area nssa default-information-originate (OSPFv2)` or `area nssa no-summary (OSPFv2)` command.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```
area area_id nssa default-information-originate [VALUE] [TYPE] [EXCL]
no area area_id nssa default-information-originate
default area area_id nssa default-information-originate
```

All parameters except `area_id` can be placed in any order.

**Parameters**

- `area_id`
  - Valid formats: integer `<1` to `4294967295>` or dotted decimal `<0.0.0.1` to `255.255.255.255>`
  - Area 0 (or `0.0.0.0`) is not configurable; it is always normal.
  - `running-config` stores value in dotted decimal notation.
• **VALUE**  Values include:
  • <no parameter>  Default value of 1.
  • **metric** <1-65535>

• **TYPE**  Values include:
  • <no parameter>
  • **metric-type** <1-2>

• **EXCL**  Values include:
  • <no parameter>
  • **nssa-only**

**Example**
• This command configures area 3 as an NSSA and generates a type 7 default LSA within the NSSA.

```
switch(config-router-ospf)#area 3 nssa default-information-originate nssa-only
switch(config-router-ospf)#
```
area nssa no-summary (OSPFv2)

The **area nssa no-summary** command configures the switch to stop importing type-3 summary LSAs into the not-so-stubby area and sets the default summary route into the NSSA in order to reach the inter-area prefixes.

The **no area nssa no-summary** and **default area nssa no-summary** commands allow type-3 summary LSAs into the NSSA area.

The **no area nssa** and **default area nssa** commands configure the specified area as a normal area.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```
area area_id nssa no-summary
no area area_id nssa no-summary
default area area_id nssa no-summary
```

**Parameters**

- **area_id** area number.
  - Valid formats: integer <1 to 4294967295> or dotted decimal <0.0.0.1 to 255.255.255.255>.
  - Area 0 (or 0.0.0.0) is not configurable; it is always **normal**.
  - **running-config** stores value in dotted decimal notation.

**Example**

- This command directs the device not to import type-3 summary LSAs into the NSSA area.
  ```
  switch(config)# router ospf 6
  switch(config-router-ospf)# area 1.1.1.1 nssa no-summary
  switch(config-router-ospf)#
  ```

- This command directs the device to import type-3 summary LSAs into the NSSA area.
  ```
  switch(config)# router ospf 6
  switch(config-router-ospf)# no area 1.1.1.1 nssa no-summary
  switch(config-router-ospf)#
  ```
area not-so-stubby lsa type-7 convert type-5 (OSPFv2)

The area not-so-stubby lsa type-7 convert type-5 command configures the switch to always translate Type-7 link-state advertisement (LSAs) to Type-5 LSAs.

The no area not-so-stubby lsa type-7 convert type-5 and no area not-so-stubby lsa type-7 convert type-5 commands allow LSAs to be translated dynamically by removing the no area not-so-stubby lsa type-7 convert type-5 command from running-config.

Command Mode

Router-OSPF Configuration

Command Syntax

area area_id not-so-stubby lsa type-7 convert type-5
no area_id not-so-stubby lsa type-7 convert type-5
default area_id not-so-stubby lsa type-7 convert type-5

Parameters

- area_id  area number.
  - Valid formats: integer <1 to 4294967295> or dotted decimal <0.0.0.1 to 255.255.255.255>
  - Area 0 (or 0.0.0.0) is not configurable; it is always normal.
  - running-config stores value in dotted decimal notation.

Example

- This command configures the switch to always translate Type-7 link-state advertisement (LSAs) to Type-5 LSAs.

  switch(config-router-ospf)#area 3 not-so-stubby lsa type-7 convert type-5
  switch(config-router-ospf)#
area range (OSPFv2)

The area range command configures OSPF area border routers (ABRs) to consolidate or summarize routes, to set the cost setting routes, and to suppress summary route advertisements.

The no area (OSPFv2) command removes all area commands for the specified area from running-config.

Command Mode
Router-OSPF Configuration

Command Syntax

```
area area_id range net_addr [ADVERTISE_SETTING] [COST_SETTING]
no area area_id range net_addr [ADVERTISE_SETTING] [COST_SETTING]
default area area_id range net_addr [ADVERTISE_SETTING] [COST_SETTING]
```

Parameters

- **area_id** area number. <0 to 4294967295> or <0.0.0.0 to 255.255.255.255> running-config stores value in dotted decimal notation.
- **net_addr**
- **ADVERTISE_SETTING** Values include
  - <no parameter>
  - advertise
  - not-advertise
- **COST_SETTING** Values include
  - <no parameter>
  - cost range_cost Value ranges from 1 to 65535.

Examples

- The network area commands assign two subnets to an area. The area range command summarizes the addresses, which the ABR advertises in a single LSA.

```
switch(config)#router ospf 6
switch(config-router-ospf)#network 10.1.25.80 0.0.0.240 area 5
switch(config-router-ospf)#network 10.1.25.112 0.0.0.240 area 5
switch(config-router-ospf)#area 5 range 10.1.25.64 0.0.0.192
switch(config-router-ospf)#
```

- The network area command assigns a subnet to an area, followed by an area range command that suppresses the advertisement of that subnet.

```
switch(config-router-ospf)#network 10.12.31.0/24 area 5
switch(config-router-ospf)#area 5 range 10.12.31.0/24 not-advertise
switch(config-router-ospf)#
```
area stub (OSPFv2)

The area stub command sets the area type of an OSPF area to stub. All devices in an AS must specify the same area type for identically numbered areas.

The no area stub command remove the specified stub area from the OSPFv2 instance by deleting all area stub commands from running-config for the specified area.

The no area stub command configure the specified area as a normal area.

Command Mode

Router-OSPF Configuration

Command Syntax

```
area area_id stub [summarize]
no area area_id stub [summarize]
default area area_id stub [summarize]
```

Parameters

- `area_id` area number.
  - Valid formats: integer <1 to 4294967295> or dotted decimal <0.0.0.1 to 255.255.255.255>
  - Area 0 (or 0.0.0.0) is not configurable; it is always normal.
  - running-config stores value in dotted decimal notation.
- `SUMMARIZE` area type. Values include:
  - <no parameter>
  - no-summary

Examples

- These commands configure area 45 as a stub area.
  ```
  switch(config)#router ospf 3
  switch(config-router-ospf)#area 45 stub
  switch(config-router-ospf)#
  ```

- This command configures area 10.92.148.17 as a stub area.
  ```
  switch(config-router-ospf)#area 10.92.148.17 stub
  switch(config-router-ospf)#
  ```
auto-cost reference-bandwidth (OSPFv2)

The auto-cost reference-bandwidth command is a factor in the formula that calculates the default OSPFv2 cost for Ethernet interfaces.

\[
\text{OSPFv2-cost} = \frac{(\text{auto-cost value} \times 1 \text{ Mbps})}{\text{interface bandwidth}}
\]

The switch uses a minimum OSPFv2-cost of one. The switch rounds down all non-integer results.

On a 10G Ethernet interface:
- if auto-cost = 100, then OSPFv2-cost = 100 Mbps / 10 Gbps = 0.01, and the default cost is set to 1.
- if auto-cost = 59000, then OSPFv2-cost = 59000 Mbps / 10 Gbps = 5.9, and the default cost is set to 5.

The no auto-cost reference-bandwidth and default auto-cost reference-bandwidth command removes the auto-cost reference-bandwidth command from running-config. When this parameter is not set, the default cost for Ethernet interfaces is the default ip ospf cost value of 10.

Command Mode
Router-OSPF Configuration

Command Syntax
- auto-cost reference-bandwidth rate
- no auto-cost reference-bandwidth
- default auto-cost reference-bandwidth

Parameters
- rate Values range from 1 to 4294967. Default is 100.

Example
To configure a default cost of 20 on 10G Ethernet interfaces:

Step 1 calculate the required auto-cost value:

\[
\text{auto-cost} = \frac{(\text{OSPFv2-cost} \times \text{interface bandwidth})}{1 \text{ Mbps}} = \frac{(20 \times 10000 \text{ Mbps})}{1 \text{ Mbps}} = 200000
\]

Step 2 Configure this value as the auto-cost reference-bandwidth.

```
switch(config)#router ospf 6
switch(config-router-ospf)#auto-cost reference-bandwidth 200000
switch(config-router-ospf)#
```
**clear ip ospf neighbor**

The `clear ip ospf` command clears the neighbors statistics per interface.

**Command Mode**
Privileged EXEC

**Command Syntax**
```
clear ip ospf [PROCESS_ID] neighbor [LOCATION] [VRF_INSTANCE]
```

**Parameters**
- **PROCESS_ID**  OSPFv2 process ID. Values include:
  - `<no parameter>`
  - `<1 to 65535>`
- **LOCATION**  IP address or interface peer group name. Values include:
  - `*`  clears all OSPF IPv4 neighbors.
  - `ipv4_addr`
  - `ethernet e_num`
  - `loopback l_num`
  - `port-channel p_num`
  - `vlan v_num`
- **VRF_INSTANCE**  specifies the VRF instance.
  - `vrf vrf_name`  configures the vrf_name instance.

**Examples**
- This command resets all OSPF neighbor statistics.
  ```
  switch# clear ip ospf neighbor *
  switch#
  ```
- This command resets the OSPF neighbor statistics for the specified Ethernet 3 interface.
  ```
  switch# clear ip ospf neighbor ethernet 3
  switch##
  ```
compatible (OSPFv2)

The **compatible** command allows the selective disabling of compatibility with RFC 2328.

The **no compatible** and **default compatible** commands reverts OSPF to RFC 2328 compatible and removes the **compatible** statement from **running-config**.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

- `compatible rfc1583`
- `no compatible rfc1583`
- `default compatible rfc1583`

**Example**

- This command sets the OSPF compatibility list with RFC 1583.
  
  switch(config)#router ospf 6
  switch(config-router-ospf)#compatible rfc1583
  switch(config-router-ospf)#

- This command disables RFC 1583 compatibility.
  
  switch(config)#router ospf 6
  switch(config-router-ospf)# no compatible rfc1583
  switch(config-router-ospf)#
default-information originate (OSPFv2)

The `default-information originate` command enables default route origination for normal areas. The user may configure the metric value and metric type used in LSAs. The `always` option will cause the ASBR to create and advertise a default route whether or not one is configured.

The `no default-information originate` command prevents the advertisement of the default route. The `default default-information originate` command enables default route origination with default values (metric type 2, metric=1).

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```
default-information originate [FORCE] [VALUE] [TYPE] [MAP]
```

`no default-information originate`

`default default-information originate`

All parameters can be placed in any order.

**Parameters**

- **FORCE** advertisement forcing option. Values include:
  - <no parameter>
  - always
- **VALUE** Values include:
  - <no parameter>
  - metric <1-65535>
- **TYPE** Values include:
  - <no parameter>
  - metric-type <1-2>
- **MAP** sets attributes in the LSA based on a route map. Values include:
  - <no parameter>
  - route-map `map_name`.

**Examples**

- These commands will always advertise the OSPFv2 default route regardless of whether the switch has a default route configured.
  ```
  switch(config)#router ospf 1
  switch((config-router-ospf)#default-information originate always
  switch(config-router-ospf)#show active
  router ospf 1
   default-information originate always
  ```
- These commands advertise a default route with a metric of 100 and an external metric type of 1 if a default route is configured.
  ```
  switch(config)#router ospf 1
  switch((config-router-ospf)#default-information originate metric 100 metric-type 1
  ```
distance ospf (OSPFv2)

The `distance ospf intra-area` command specifies the administrative distance for routes in a single OSPFv2 area. The default administrative distance for intra-area, inter-area and external routes is 110.

The `no distance ospf intra-area` and `default distance ospf intra-area` commands remove the `distance ospf intra-area` command from `running-config`, returning the OSPFv2 administrative distance settings to the default value of 110.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```plaintext
distance ospf AREA_TYPE distance
no distance ospf AREA_TYPE
default distance ospf AREA_TYPE
```

**Parameters**

- `AREA_TYPE` specifies routes for which administrative distance is to be set. Values include:
  - `external`.
  - `inter-area`.
  - `intra-area`
- `distance` Values range from 1 to 255. Default value is 110 for all types.

**Example**

- This command configures a distance of 85 for all OSPFv2 intra-area routes on the switch.

  ```plaintext
  switch(config)#router ospf 6
  switch(config-router-ospf)#distance ospf intra-area 85
  switch(config-router-ospf)#
  ```
**dn-bit-ignore (OSPFv2)**

The `dn-bit-ignore` command results in the DN bit in Type 3 Summary LSAs to be ignored during the shortest path first (SPF) calculations.

The `no dn-bit-ignore` and `default dn-bit-ignore` commands result in the DN bit in Type 3 Summary LSAs to not be ignored during SPF calculations.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```
dn-bit-ignore
no dn-bit-ignore
default dn-bit-ignore
```

**Examples**

- This command ignores the DN bit.
  ```
  switch(config)#router ospf 6
  switch(config-router-ospf)#dn-bit-ignore
  switch(config-router-ospf)#
  ```

- This command causes the DN bit not to be ignored.
  ```
  switch(config)#router ospf 6
  switch(config-router-ospf)#no dn-bit-ignore
  switch(config-router-ospf)#
  ```
**distribute-list in**

A distribute list uses a route map or prefix list to filter specific routes from incoming OSPF LSAs. Filtering occurs after SPF calculation. The filtered routes are not installed on the switch, but are still included in LSAs sent by the switch. The `distribute-list in` command creates a distribute list in the configuration mode OSPF instance.

If a prefix list is used, destination prefixes that do not match the prefix list will not be installed. If a route map is used, routes may be filtered based on address, next hop, or metric. OSPF external routes may also be filtered by metric type or tag.

The `no distribute-list in` and `default distribute-list in` commands remove the `distribute-list in` command from `running-config`.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```
distribute-list {prefix-list|route-map} list_name in
no distribute-list {prefix-list|route-map}
default distribute-list {prefix-list|route-map}
```

**Parameters**

- `prefix-list` specifies a prefix-list as the filter.
- `route-map` specifies a route-map as the filter.
- `list_name` the name of the prefix-list or route-map used to filter routes from incoming LSAs.

**Related Commands**

- `area filter (OSPFv2)`
- `redistribute (OSPFv2)`

**Example**

- These commands configure a prefix list named “dist_list1” in OSPF instance 5 to filter certain routes from incoming OSPF LSAs.

```
switch(config)#router ospf 5
switch(config-router-ospf)#distribute-list prefix-list dist_list1 in
switch(config-router-ospf)#
```
ip ospf area

The `ip ospf area` command enables OSPFv2 on an interface and associates the area to the interface. The `no ip ospf area` and `default ip ospf area` commands disable OSPFv2 on the configuration mode interface and remove the configured area from the system.

**Note**
The per interface configuration has precedence over the OSPF Configuration mode. In other words, the area configured by the `ip ospf area` command has precedence over the area configured by the `network area` command.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
```
ip ospf area area_id
no ip ospf [area area_id]
default ip ospf [area area_id]
```

**Parameters**
- `area_id` the area ID. The valid values are 0 to 4294967295 or a decimal range between 0.0.0.0 and 255.255.255.255.

**Example**
- These commands enable OSPFv2 on the “et2” interface and associates area identifier 1.1.1.1 to the interface.

```
switch(config)# Interface ethernet 2
switch(config-if-Et2)# ip address 1.0.0.1/24
switch(config-if-Et2)# ip ospf area 1.1.1.1
router ospf 1
```
ip ospf authentication

The **ip ospf authentication** command enables OSPFv2 authentication for the configuration mode interface..

The **no ip ospf authentication** and **default ip ospf authentication** commands disable OSPFv2 authentication on the configuration mode interface by removing the corresponding **ip ospf authentication** command from **running-config**.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ip ospf authentication [METHOD]
no ip ospf authentication
default ip ospf authentication
```

**Parameters**

- **METHOD** OSPFv2 authentication method. Options include:
  - <no parameter>
  - message-digest

**Examples**

- This command enables simple authentication on VLAN 12.
  ```
  switch(config)#interface vlan 12
  switch(config-if-vl12)#ip ospf authentication
  switch(config-if-vl12)#
  ```

- This command enables message-digest authentication on VLAN 12.
  ```
  switch(config-if-vl12)#ip ospf authentication message-digest
  switch(config-if-vl12)#
  ```
**ip ospf authentication-key**

The `ip ospf authentication-key` command configures the OSPFv2 authentication password for the configuration mode interface.

The `no ip ospf authentication-key` and `default ip ospf authentication-key` commands removes the OSPFv2 authentication password from the configuration mode interface by removing the corresponding `ip ospf authentication-key` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
  ip ospf authentication-key [ENCRYPT_TYPE] key_text
  no ip ospf authentication-key
  default ip ospf authentication-key
```

**Parameters**

- `ENCRYPT_TYPE` encryption level of the `key_text` parameter. Values include:
  - `<no parameter>` the `key_text` is in clear text.
  - `0` `key_text` is in clear text. Equivalent to `<no parameter>`.
  - `7` `key_text` is MD5 encrypted.
- `key_text` the authentication-key password.

**Example**

- This command specifies a password in clear text.

  ```bash
  switch(config)#interface vlan 12
  switch(config-if-V12)#ip ospf authentication-key 0 code123
  switch(config-if-V112)#show active
  interface Vlan12
      ip ospf authentication-key 7 baY11FzVbcx4yHqlIhmMdw==
  switch(config-if-V112)#
  ```

*Running-config* stores the password as an encrypted string.
**ip ospf cost**

The `ip ospf cost` command configures the OSPFv2 cost for the configuration mode interface. The default cost depends on the interface type:

- Ethernet: determined by the `auto-cost reference-bandwidth (OSPFv2)` command.
- Port channel: 10.
- VLAN: 10.

The `no ip ospf cost` and `default ip ospf cost` commands restore the default OSPFv2 cost for the configuration mode interface by removing the corresponding `ip ospf cost` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
```
ip ospf cost interface_cost
no ip ospf cost
default ip ospf cost
```

**Parameters**
- `interface_cost` Value ranges from 1 to 65535; default is 10.

**Examples**
- This command configures a cost of 15 for VLAN 2.
```
switch(config)#interface vlan 2
switch(config-if-Vl2)#ip ospf cost 15
switch(config-if-Vl2)#
```
**ip ospf dead-interval**

The `ip ospf dead-interval` command configures the dead interval for the configuration mode interface. The `no ip ospf dead-interval` and `default ip ospf dead-interval` commands restore the default dead interval of 40 seconds on the configuration mode interface by removing the corresponding `ip ospf dead-interval` command from `running-config`.

**Command Mode**

  - Interface-Ethernet Configuration
  - Interface-Port-Channel Configuration
  - Interface-VLAN Configuration

**Command Syntax**

  - `ip ospf dead-interval time`
  - `no ip ospf dead-interval`
  - `default ip ospf dead-interval`

**Parameters**

- `time`  Value ranges from 1 to 8192; default is 40.

**Example**

- This command configures a dead interval of 120 seconds for VLAN 4.
  
  switch(config)#interface vlan 4
  switch(config-if-Vl4)#ip ospf dead-interval 120
  switch(config-if-Vl4)#
**ip ospf disabled**

The `ip ospf disabled` command disables OSPFv2 on the configuration mode interface without disrupting the OSPFv2 configuration. When OSPFv2 is enabled on the switch, the it is also enabled by default on all interfaces.

The OSPFv2 instance is disabled on the entire switch with the `shutdown (OSPFv2)` command.

The `no ip ospf disabled` and `default ip ospf disabled` commands enable OSPFv2 on the configuration mode interface by removing the corresponding `ip ospf disabled` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `ip ospf disabled`
- `no ip ospf disabled`
- `default ip ospf disabled`

**Examples**
- This command shuts down OSPFv2 activity on VLAN 5.
  ```
  switch(config)#interface vlan 5
  switch(config-if-Vl5)#ip ospf disabled
  switch(config-if-Vl5)#
  ```
- This command resumes OSPFv2 activity on VLAN 5.
  ```
  switch(config-if-Vl5)#no ip ospf disabled
  switch(config-if-Vl5)#
  ```
ip ospf hello-interval

The `ip ospf hello-interval` command configures the OSPFv2 hello interval for the configuration mode interface.

The same hello interval should be specified for each OSPFv2 neighbor, and should not be longer than any neighbor's dead interval.

The `no ip ospf hello-interval` and `default ip ospf hello-interval` commands restore the default hello interval of 10 seconds on the configuration mode interface by removing the `ip ospf hello-interval` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ip ospf hello-interval time
no ip ospf hello-interval
default ip ospf hello-interval
```

**Parameters**

- `time` hello interval (seconds). Values range from 1 to 8192; default is 10.

**Example**

- This command configures a hello interval of 30 seconds for VLAN 2.

  ```
  switch(config)#interface vlan 2
  switch(config-if-Vl2)#ip ospf hello-interval 30
  switch(config-if-Vl2)#
  ```
**ip ospf message-digest-key**

The `ip ospf message-digest-key` command configures a message digest authentication key for the configuration mode interface.

The `no ip ospf message-digest-key` and `default ip ospf message-digest-key` commands remove the message digest authentication key for the specified key ID on the configuration mode interface by deleting the corresponding `ip ospf message-digest-key` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
```
ip ospf message-digest-key key_id md5 ENCRYPT_TYPE key_text
no ip ospf message-digest-key key_id
default ip ospf message-digest-key key_id
```

**Parameters**
- `key_id`  key ID number. Value ranges from 1 to 255.
- `ENCRIPT_TYPE`  encryption level of the `key_text` parameters. Values include:
  - `<no parameter>`
  - `0`  `key_text`
  - `7`  `key_text`
- `key_text`  message key (password).

**Example**
- This command configures `code123` as the MD5 key with a corresponding key ID of 23.
  ```
  switch(config)#interface vlan 12
  switch(config-if-vl12)#ip ospf message-digest-key 23 md5 0 code123
  switch(config-if-vl12)#
  ```

  `Running-config` stores the password as an encrypted string.
**ip ospf router-id output-format hostnames**

The `ip ospf router-id output-format hostnames` command causes the switch to display DNS names in place of numeric OSPFv2 router IDs in all OSPFv2 show commands, including:

- `show ip ospf`
- `show ip ospf border-routers`
- `show ip ospf database <link state list>`
- `show ip ospf database database-summary`
- `show ip ospf database <link-state details>`
- `show ip ospf interface`
- `show ip ospf neighbor`
- `show ip ospf request queue`
- `show ip ospf retransmission queue`

The `no ip ospf router-id output-format hostnames` and `default ip ospf router-id output-format hostnames` commands remove the `ip ospf router-id output-format hostnames` command from `running-config`, restoring the default behavior of displaying OSPFv2 router IDs by their numeric value.

**Command Mode**
- Global Configuration

**Command Syntax**

```
ip ospf router-id output-format hostnames
no ip ospf router-id output-format hostnames
default ip ospf router-id output-format hostnames
```

**Example**

- This command programs the switch to display OSPFv2 router IDs by the corresponding DNS name in subsequent show commands.

```
switch(config)#ip ospf router-id output-format hostnames
switch(config)#
```
ip ospf network point-to-point

The `ip ospf network point-to-point` command sets the configuration mode interface as a point-to-point link. By default, interfaces are configured as broadcast links.

The `no ip ospf network` and `default ip ospf network` commands set the configuration mode interface as a broadcast link by removing the corresponding `ip ospf network` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `ip ospf network point-to-point`
- `no ip ospf network`
- `default ip ospf network`

**Examples**
- These commands configure Ethernet interface 10 as a point-to-point link.
  ```
  switch(config)#interface ethernet 10
  switch(config-if-Et10)#ip ospf network point-to-point
  switch(config-if-Et10)#
  ```
- This command restores Ethernet interface 10 as a broadcast link.
  ```
  switch(config-if-Et10)#no ip ospf network
  switch(config-if-Et10)#
  ```
ip ospf priority

The **ip ospf priority** command configures OSPFv2 router priority for the configuration mode interface.

The **no ip ospf priority** and **default ip ospf priority** commands restore the default priority (1) on the configuration mode interface by removing the corresponding **ip ospf priority** command from **running-config**.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ip ospf priority priority_level
no ip ospf priority
default ip ospf priority
```

**Parameters**
- `priority_level` priority level. Value ranges from 0 to 255. Default value is 1.

**Examples**
- This command configures a router priority of 15 for VLAN 8.
  ```
  switch(config)#interface vlan 8
  switch(config-if-V18)#ip ospf priority 15
  switch(config-if-V18)#
  ```
- This command restores the router priority of 1 for VLAN 7.
  ```
  switch(config)#interface vlan 7
  switch(config-if-V17)#no ip ospf priority
  switch(config-if-V17)#
  ```
ip ospf retransmit-interval

The `ip ospf retransmit-interval` command configures the link state advertisement retransmission interval for the interface.

The `no ip ospf retransmit-interval` and `default ip ospf retransmit-interval` commands restore the default retransmission interval of 5 seconds on the configuration mode interface by removing the corresponding `ip ospf retransmit-interval` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `ip ospf retransmit-interval period`
- `no ip ospf retransmit-interval`
- `default ip ospf retransmit-interval`

**Parameters**
- `period` retransmission interval (seconds). Value ranges from 1 to 8192; default is 5.

**Example**
- This command configures a retransmission interval of 15 seconds for VLAN 3.

```
switch(config)#interface vlan 3
switch(config-if-Vl3)#ip ospf retransmit-interval 15
switch(config-if-Vl3)#
```
ip ospf transmit-delay

The `ip ospf transmit-delay` command configures the transmission delay for OSPFv2 packets over the configuration mode interface.

The `no ip ospf transmit-delay` and `default ip ospf transmit-delay` commands restore the default transmission delay (one second) on the configuration mode interface by removing the corresponding `ip ospf transmit-delay` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ip ospf transmit-delay trans
no ip ospf transmit-delay
default ip ospf transmit-delay
```

**Parameters**
- `trans` LSA transmission delay (seconds). Value ranges from 1 to 8192; default is 1.

**Example**
- This command configures a transmission delay of 5 seconds for VLAN 6.
  ```
switch(config)#interface vlan 6
switch(config-if-Vl6)#ip ospf transmit-delay 5
switch(config-if-Vl6)#
```
log-adjacency-changes (OSPFv2)

The log-adjacency-changes command enables syslog messages to be sent when it detects OSPFv2 link state changes or when it detects that a neighbor has gone up or down. Log message sending is enabled by default.

The default log-adjacency-changes command restores the default state by removing the log-adjacency-changes statement from running-config.

The default option (sending a message only when a neighbor goes up or down) is active when running-config does not contain any form of the command. Entering the command in any form replaces the previous command state in running-config.

The no log-adjacency-changes command disables link state change syslog reporting.

The default log-adjacency-changes command restores the default state by removing the log-adjacency-changes detail or no log-adjacency-changes statement from running-config.

Command Mode
Router-OSPF Configuration

Command Syntax
log-adjacency-changes
log-adjacency-changes detail
no log-adjacency-changes
default log-adjacency-changes

Examples
• This command configures the switch to send a syslog message when a neighbor goes up or down.
  
  switch(config)#router ospf 6
  switch(config-router-ospf)#log-adjacency-changes
  switch(config-router-ospf)#

  After entering the command, show active does not display a log-adjacency-changes statement.

  switch(config-router-ospf)#show active
  router ospf 1
  switch(config-router-ospf)#

• This command configures the switch to send a syslog message when it detects any link state change.

  switch(config-router-ospf)#log-adjacency-changes detail
  switch(config-router-ospf)#

  After entering the command, show active displays a log-adjacency-changes detail command.

  switch(config-router-ospf)#show active
  router ospf 1
    log-adjacency-changes detail
  switch(config-router-ospf)#
max-lsa (OSPFv2)

The `max-lsa` command specifies the number of LSAs allowed in the LSDB. Setting the limit to zero removes the LSDB restriction and disables LSA overload actions. Actions triggered by LSDB overload conditions include:

- Warning
- Temporary shutdown
- Permanent shutdown

The `no max-lsa` and `default max-lsa` commands restore all LSA overload parameters to their default settings by placing the `max-lsa 12000` statement in `running-config`.

Command Mode

Router-OSPF Configuration

Command Syntax

```
max-lsa lsa_num [WARNING] [IGNORE_TIME] [IGNORE_COUNT] [RESET]
no max-lsa
default max-lsa
```

Parameters

- `lsa_num` maximum number of LSAs. Value ranges from 0 to 100,000.
  - 0 disables overload protection
  - 1 to 100000 Default value is 12,000.
- `WARNING` warning threshold, as a percentage of the maximum number of LSAs (% of `lsa_num`).
  - <no parameter> Default of 75%.
  - `percent` Ranges from 25 to 99.
- `IGNORE_TIME` temporary shutdown period (minutes). Options include:
  - <no parameter> Default value of 5 minutes.
  - `ignore-time period` Value ranges from 1 to 60.
- `IGNORE_COUNT` number of temporary shutdowns required to trigger a permanent shutdown.
  - <no parameter> Default value of 5.
  - `ignore-count episodes` Ranges from 1 to 20.
- `RESET` period of not exceeding LSA limit required to reset temporary shutdown counter to zero.
  - <no parameter> Default value of 5 minutes
  - `reset-time r_period` Ranges from 1 to 60.

Example

- This command defines an LSA limit of 8,000 and other parameters.

```
switch(config-router-ospf)#max-lsa 8000 40 ignore-time 6 ignore-count 3
reset-time 20
```
max-metric router-lsa (OSPFv2)

The **max-metric router-lsa** command configures OSPF to include the maximum value in LSA metric fields to keep other network devices from using the switch as a preferred intermediate SPF hop.

The **no max-metric router-lsa** and **default max-metric router-lsa** commands disable the advertisement of a maximum metric.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```plaintext
max-metric router-lsa [EXTERNAL][STUB][STARTUP][SUMMARY]
no max-metric router-lsa [EXTERNAL][STUB][STARTUP][SUMMARY]
default max-metric router-lsa [EXTERNAL][STUB][STARTUP][SUMMARY]
```

All parameters can be placed in any order.

**Parameters**

- **EXTERNAL**  advertised metric value. Values include:
  - <no parameter>  Default value of 1.
  - external-lsa
  - external-lsa <1 to 16777215>  Default value is 0xFF0000.
- **STUB**  advertised metric type. Values include:
  - <no parameter>  Default value of 2.
  - include-stub
- **STARTUP**  limit scope of LSAs. Values include:
  - <no parameter>
  - on-startup
  - on-startup wait-for-bgp
  - on-startup <5 to 86400>
    - wait-for-bgp or an on-start time value is not included in no and default commands.
- **SUMMARY**  advertised metric value. Values include:
  - <no parameter>
  - summary-lsa
  - summary-lsa <1 to 16777215>

**Example**

- This command configures OSPF to include the maximum value in LSA metric fields until BGP has converged:

```
switch(config-router-ospf)#max-metric router-lsa on-startup wait-for-bgp
switch(config-router-ospf)#
```
maximum-paths (OSPFv2)

The maximum-paths command controls the number of parallel routes that OSPFv2 supports. The default maximum is 16 paths.

The no maximum-paths and default maximum-paths commands restore the maximum number of parallel routes that OSPFv2 supports on the switch to the default value of 16 by placing the maximum-paths 16 statement in running-config.

Command Mode

Router-OSPF Configuration

Command Syntax

maximum-paths paths
no maximum-paths
default maximum-paths

Parameters

- paths maximum number of parallel routes.

  Value ranges from 1 to the number of interfaces available per ECMP group, which is platform dependent.
  - Arad: Value ranges from 1 to 128. Default value is 128.
  - FM6000: Value ranges from 1 to 32. Default value is 32.
  - PetraA: Value ranges from 1 to 16. Default value is 16.
  - Trident: Value ranges from 1 to 32. Default value is 32.
  - Trident II: Value ranges from 1 to 128. Default value is 128.

Example

- This command configures the maximum number of OSPFv2 parallel paths to 12.

  switch(config)#router ospf 6
  switch(config-router-ospf)#maximum-paths 12
  switch(config-router-ospf)#
network area (OSPFv2)

The `network area` command assigns the specified IPv4 subnet to an OSPFv2 area.
The `no network area` and `default network area` commands delete the specified network area assignment by removing the corresponding `network area` command from `running-config`.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```
network ipv4_subnet area area_id
no network ipv4_subnet area area_id
default network ipv4_subnet area area_id
```

**Parameters**

- `ipv4_subnet` IPv4 subnet. Entry formats include address-prefix (CIDR) or address-wildcard mask.
  
  `running-config` stores value in CIDR notation.

- `area_id` area number. `<0 to 4294967295>` or `<0.0.0.0 to 255.255.255.255>
  
  `Running-config` stores value in dotted decimal notation.

**Example**

- These equivalent commands each assign the subnet 10.1.0.0/24 to area 0.

  ```
  switch(config-router-ospf)#network 10.1.10.0 0.0.0.255 area 0
  switch(config-router-ospf)##
  ```

  ```
  switch(config-router-ospf)#network 10.1.10.0/24 area 0
  switch(config-router-ospf)##
  ```
no area (OSPFv2)

The no area <type> command removes the corresponding area <type> command from running-config:

- no/default area not-so-stubby lsa type-7 convert type-5 commands remove the translate type7 always parameter without changing the area type.
- no/default area nssa , no/default area stub, and no/default area stub no-summary commands restore the area’s type to normal. Section 31.5: OSPFv2 Commands
- no/default area default-information-originate command removes all area commands for the specified area from running-config
- no/default area command removes all area commands for the specified area from running-config
- no/default area command removes all area commands for the specified area from running-config.

Command Mode
Router-OSPF Configuration

Command Syntax
no area area_id [TYPE]
default area area_id [TYPE]

Parameters
- area_id area number.
  - Valid formats: integer <1 to 4294967295> or dotted decimal <0.0.0.1 to 255.255.255.255>
  - Area 0 (or 0.0.0.0) is not configurable; it is always normal.
  - Running-config stores value in dotted decimal notation.
- TYPE area type. Values include:
  - nssa
  - nssa translate type7 always
  - stub
  - stub no-summary

Examples
- These commands remove area 1 from the running configuration.
  switch(config)#router ospf 6
  switch(config-router-ospf)# no area 1
  switch(config-router-ospf)#
- These commands remove area 10.92.148.17 as an NSSA.
  switch(config-router-ospf)#no area 10.92.148.17 nssa
  switch(config-router-ospf)#
passive-interface default (OSPFv2)

The `passive-interface default` command configures all interfaces as OSPFv2 passive by default. The switch advertises the passive interface as part of the router LSA.

The `passive-interface <interface> (OSPFv2)` configures the OSPFv2 active-passive status for a specific interface:

- When `passive-interface default` is not set, all interfaces are OSPFv2 active by default and passive interfaces are denoted by `passive-interface <interface>` statements in `running-config`.
- When `passive-interface default` is set, all interfaces are OSPFv2 passive by default and active interfaces are denoted by `no passive-interface <interface>` statements in `running-config`.

The `no passive-interface` and `default passive-interface` commands configures all interfaces as OSPFv2 active by default by removing the `passive-interface default` statement from `running-config`.

Command Mode

Router-OSPF Configuration

Command Syntax

```
passive-interface default
no passive-interface default
default passive-interface default
```

Examples

- This command configures the default interface setting as OSPFv2 passive. This command also removes all `passive-interface <interface>` statements from `running-config`.

  switch(config)#router ospf 6
  switch(config-router-ospf)#passive-interface default
  switch(config-router-ospf)#

- This command configures the default interface setting as OSPFv2 active. This command also removes all `no passive-interface <interface>` statements from `running-config`.

  switch(config-router-ospf)#no passive-interface default
  switch(config-router-ospf)#
**passive-interface **<interface> **(OSPFv2)**

The **passive-interface** command disables OSPFv2 on an interface range. The switch advertises the passive interface as part of the LSA.

The default OSPFv2 interface activity is configured by the **passive-interface default (OSPFv2)** command:

- When **passive-interface default** is not set, all interfaces are OSPFv2 active by default and passive interfaces are denoted by **passive-interface <interface>** statements in **running-config**.
- When **passive-interface default** is set, all interfaces are OSPFv2 passive by default and active interfaces are denoted by **no passive-interface <interface>** statements in **running-config**.

The **no passive-interface** command enables OSPFv2 on the specified interface range. The **default passive-interface** command sets the interface to the default interface activity setting by removing the corresponding **passive-interface** or **no passive-interface** statement from **running-config**.

**Command Mode**
- Router-OSPF Configuration

**Command Syntax**

```
passive-interface INTERFACE_NAME
no passive-interface INTERFACE_NAME
default passive-interface INTERFACE_NAME
```

**Parameters**

- **INTERFACE_NAME** interface to be configured. Options include:
  - ethernet e_range
  - port-channel p_range
  - vlan v_range
  - vxlan vx_range

**Examples**

- These commands configure Ethernet interfaces 2 through 5 as passive interfaces.
  ```
  switch(config)#router ospf 6
  switch(config-router-ospf)#passive-interface ethernet 2-5
  switch(config-router-ospf)#
  ```
- This command configures VLAN interfaces 50-54, 61, 68, and 102-120 as passive interfaces.
  ```
  switch(config-router-ospf)#passive-interface vlan 50-54,61,68,102-120
  switch(config-router-ospf)#
  ```
- This command configures VLAN 2 as an active interface.
  ```
  switch(config-router-ospf)#no passive-interface vlan 2
  switch(config-router-ospf)#
  ```
point-to-point routes (OSPFv2)

The point-to-point routes command enables the switch to maintain a local routing information base (RIB) to store information it learns from its neighbors.

The **point-to-point routes** and **default point-to-point routes** commands program the switch to include point-to-point links in its RIB by removing the **no point-to-point routes** command from **running-config**.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```
point-to-point routes
no point-to-point routes
default point-to-point routes
```

**Examples**

- This command configures the switch to optimize the local RIB by not including point-to-point routes.
  ```
  switch(config)#router ospf 6
  switch(config-router-ospf)#no point-to-point routes
  switch(config-router-ospf)#
  ```

- This command configures the switch to include point-to-point routes.
  ```
  switch(config-router-ospf)#point-to-point routes
  switch(config-router-ospf)#
  ```
**redistribute (OSPFv2)**

The `redistribute` command enables the advertising of all specified routes on the switch into the OSPFv2 domain as external routes.

The `no redistribute` and `default redistribute` commands remove the corresponding `redistribute` command from `running-config`, disabling route redistribution for the specified route type.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```
redistribute ROUTE_TYPE [ROUTE_MAP]
no redistribute ROUTE_TYPE
default redistribute ROUTE_TYPE
```

**Parameters**

- **ROUTE_TYPE** source from which routes are redistributed. Options include:
  - `connected` routes that are established when IPv4 is enabled on an interface.
  - `BGP` routes from a BGP domain.
  - `RIP` routes from a RIP domain.
  - `static` IP static routes.
- **ROUTE_MAP** route map that determines the routes that are redistributed. Options include:
  - `<no parameter>`
  - `route-map map_name`

**Examples**

- The `redistribute static` command starts the advertising of static routes as OSPFv2 external routes.
  ```
  switch(config)#router ospf 6
  switch(config-router-ospf)#redistribute static
  switch(config-router-ospf)#
  ```

- The `no redistribute bgp` command stops the advertising of BGP routes as OSPFv2 external routes.
  ```
  switch(config-router-ospf)#no redistribute bgp
  switch(config-router-ospf)#
  ```
router-id (OSPFv2)

The `router-id` command assigns a router ID for an OSPFv2 instance. This number uniquely identifies the router within an Autonomous System. Status commands use the router ID to identify the switch.

The switch sets the router ID to the first available alternative in the following list:

1. The `router-id` command.
2. The loopback IP address, if a loopback interface is configured on the switch.
3. The highest IP address present on the router.

**Important!** When configuring VXLAN on an MLAG, always manually configure the OSPFv2 router ID to prevent the switch from using the common VTEP IP address as the router ID.

The `no router-id` and `default router-id` commands remove the router ID command from `running-config`, the switch uses the loopback or highest address as the router ID.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```
router-id identifier
no router-id [identifier]
default router-id [identifier]
```

**Parameters**

- `identifier` Value ranges from 0.0.0.0 to 255.255.255.255.

**Example**

- This command assigns 10.5.4.2 as the router ID for the OSPFv2 instance.

```bash
switch(config)#router ospf 6
switch(config-router-ospf)#router-id 10.5.4.2
switch(config-router-ospf)#
```
**router ospf**

The `router ospf` command places the switch in router-ospf configuration mode. The switch will create a process ID for the new instance if one does not already exist. The `exit` command returns the switch to global configuration mode.

The `show ip ospf` command displays the process ID of the OSPFv2 instances configured on the switch.

The `no router ospf` and `default router ospf` commands delete the specified OSPFv2 instance.

Router-ospf configuration mode is not a group change mode; `running-config` is changed immediately upon entering commands. Exiting router-ospf configuration mode does not affect `running-config`. The `exit` command returns the switch to global configuration mode.

Refer to **Router-OSPFv2 Configuration Mode (page 2096)** for a list of commands available in router-ospf configuration mode.

**Command Mode**

Global Configuration

**Command Syntax**

```
router ospf process_id [VRF_INSTANCE]
no router ospf process_id [VRF_INSTANCE]
default router ospf process_id [VRF_INSTANCE]
```

**Parameters**

- `process_id` OSPFv2 process ID. Values range from 1 to 65535.
- `VRF_INSTANCE`
  - `<no parameter>` configures the default VRF instance.
  - `vrf vrf_name` configures the `vrf_name` instance.

**Examples**

- This command creates an OSPFv2 instance with process ID 145 in the main VRF.
  ```
  switch(config)#router ospf 145
  switch(config-router-ospf)#
  ```

- This command deletes the specified OSPFv2 instance.
  ```
  switch(config)#no router ospf 145
  switch(config)#
  ```
**show ip ospf**

The **show ip ospf** command displays OSPFv2 routing information.

**Command Mode**

EXEC

**Command Syntax**

```
show ip ospf [PROCESS_ID] [VRF_INSTANCE]
```

**Parameters**

- **PROCESS_ID**  OSPFv2 process ID. Values include:
  - <no parameter>
  - <1 to 65535>

- **VRF_INSTANCE** specifies the VRF instance.
  - <no parameter>   configures the default VRF instance.
  - `vrf vrf_name`   configures the vrf_name instance.
Example

- This command displays configuration parameters, operational statistics, status of the OSPFv2 instance, and a brief description of the areas on the switch.

```
switch>show ip ospf
Routing Process "ospf 1" with ID 10.168.103.1 VRF default
  Support opaque LSA
  Maximum number of LSA allowed 12000
  Threshold for warning message 75%
  Ignore-time 5 minutes, reset-time 5 minutes
  Ignore-count allowed 5, current 0
  It is an area border router
  Hold time between two consecutive SPF's 5000 msecs
  SPF algorithm last executed 00:00:09 ago
  Minimum LSA interval 5 secs
  Minimum LSA arrival 1000 msecs
  Number of external LSA 0. Checksum Sum 0x000000
  Number of opaque AS LSA 0. Checksum Sum 0x000000
  Number of LSA 27.
  Number of areas in this router is 3. 3 normal 0 stub 0 nssa
  Area BACKBONE(0.0.0.0)
    Number of interfaces in this area is 2
    It is a normal area
    Area has no authentication
    SPF algorithm executed 153 times
    Number of LSA 8. Checksum Sum 0x03e13a
    Number of opaque link LSA 0. Checksum Sum 0x000000
  Area 0.0.0.2
    Number of interfaces in this area is 1
    It is a normal area
    Area has no authentication
    SPF algorithm executed 153 times
    Number of LSA 11. Checksum Sum 0x054e57
    Number of opaque link LSA 0. Checksum Sum 0x000000
  Area 0.0.0.3
    Number of interfaces in this area is 1
    It is a normal area
    Area has no authentication
    SPF algorithm executed 5 times
    Number of LSA 6. Checksum Sum 0x02a401
    Number of opaque link LSA 0. Checksum Sum 0x000000
```
show ip ospf border-routers

The `show ip ospf border-routers` command displays the internal OSPFv2 routing table entries to area border routers (ABRs) and autonomous system boundary routers (ASBRs) for each of the OSPFv2 areas.

**Command Mode**

EXEC

**Command Syntax**

```
show ip ospf border-routers [VRF_INSTANCE]
```

**Parameters**

- `VRF_INSTANCE` specifies the VRF instance.
- `<no parameter>` displays information from all VRFs, or from context-active VRF if set.
- `vrf vrf_name` displays information from the specified VRF.

**Example**

- This command displays the ABRs and ASBRs

```
switch>show ip ospf border-routers
OSPF Process 10.17.0.42, VRF default

<table>
<thead>
<tr>
<th>Router ID</th>
<th>Area</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>10.17.0.1</td>
<td>0.0.0.0</td>
<td>ASBR</td>
</tr>
</tbody>
</table>

switch>
```
show ip ospf database database-summary

The `show ip ospf database database-summary` command displays the number of link state advertisements in the OSPFv2 database.

**Command Mode**

EXEC

**Command Syntax**

```
show ip ospf [AREA] database database-summary [VRF_INSTANCE]
```

**Parameters**

- **VRF_INSTANCE** specifies the VRF instance.
  - <no parameter> displays information from all VRFs, or from context-active VRF if set.
  - `vrf vrf_name` displays information from the specified VRF.
- **AREA** areas for which command displays data. Specifying an individual area requires entering the process ID where the area is located. Options include:
  - <no parameter>
  - `process_id`
  - `process_id area_id`
  - `process_id` input range: <1 to 65535>
  - `area_id` input range: <0 to 4294967295> or <0.0.0.0 to 255.255.255.255>

**Example**

- This command displays the LSDB content summary for area 0.

```
switch>show ip ospf 1 0 database database-summary

LSA Type     Count
Router       18
Network      21
Summary Net  59
Summary ASBR 4
Type-7 Ext   0
Opaque Area  0
Type-5 Ext   4238
Opaque AS    0
Total        4340
```

switch>
show ip ospf database <link state list>

The `show ip ospf database <link state list>` command displays the OSPFv2 link state advertisements that originate on a specified switch.

**Command Mode**

EXEC

**Command Syntax**

```
show ip ospf [AREA] database [ROUTER] [VRF_INSTANCE]
```

**Parameters**

- **AREA** areas for which command displays data. Specifying an individual area requires entering the process ID where the area is located. Options include:
  - <no parameter>
  - process_id
  - process_id area_id
  - process_id value ranges from 1 to 65535.
  - area_id is entered in decimal or dotted decimal notation.

- **ROUTER** router or switch for which the command provides data. Options include:
  - <no parameter>
  - adv-router [a.b.c.d]
  - self originate

- **VRF_INSTANCE** specifies the VRF instance.
  - <no parameter> displays information from all VRFs, or from context-active VRF if set.
  - vrf vrf_name displays information from the specified VRF.

**Example**

- This command displays OSPFv2 LSAs that originate at the router with a router ID of 10.26.0.31.

```
switch>show ip ospf database adv-router 10.26.0.31
```

```
OSPF Router with ID(10.26.0.23) (Process ID 1) (VRF default)

<--------OUTPUT OMITTED FROM EXAMPLE-------->

Type 11 Opaque LSDB

```
switch>
```
**show ip ospf database <link-state details>**

The `show ip ospf database <link-state details>` command displays details of the specified link state advertisements.

**Command Mode**
EXEC

**Command Syntax**
```
show ip ospf [AREA] database LINKSTATE_TYPE linkstate_id [ROUTER] [VRF_INSTANCE]
```

**Parameters**
- **AREA** areas for which command displays data. Specifying an individual area requires entering the process ID where the area is located. Options include:
  - `<no parameter>`
  - `process_id`
  - `process_id area_id`
  - `process_id` input range: <1 to 65535>
  - `area_id` input range: <0 to 4294967295> or <0.0.0.0 to 255.255.255.255>

- **LINKSTATE_TYPE** link state types. Parameter options include:
  - `detail` Displays all link states.
  - `router`
  - `network`
  - `summary`
  - `asbr-summary`
  - `external`
  - `nssa-external`
  - `opaque-link`
  - `opaque-area`
  - `opaque-as`

- `linkstate_id` Network segment described by the LSA (dotted decimal notation). Value depends on the LSA type.

- **ROUTER** router or switch for which the command provides data. Options include:
  - `<no parameter>`
  - `adv-router [a.b.c.d]`
  - `self-originate`

- **VRF_INSTANCE** parameter has no effect; this command displays information about the specified process and area regardless of VRF.
  - `<no parameter>` displays information from all VRFs, or from context-active VRF if set.
  - `vrf vrf_name` displays information from the specified VRF.
Examples

- This command displays the router link states contained in the area 2 LSDB.

  switch>**show ip ospf 1 2 database router**

```

switch>
**show ip ospf interface**

The **show ip ospf interface** command displays interface information that is related to OSPFv2.

**Command Mode**

EXEC

**Command Syntax**

```
show ip ospf [PROCESS_ID] interface [INTERFACE_NAME] [VRF_INSTANCE]
```

**Parameters**

- **PROCESS_ID**  OSPFv2 process ID. Values include:
  - <no parameter>
  - <1 to 65535>
- **INTERFACE_NAME**  Interface type and number. Values include
  - <no parameter>
  - ethernet e_num
  - loopback l_num
  - port-channel p_num
  - vlan v_num
- **VRF_INSTANCE**  specifies the VRF instance.
  - <no parameter>  displays information from all VRFs, or from context-active VRF if set.
  - vrf vrf_name  displays information from the specified VRF.

**Related Command**

- **show ip ospf interface brief**

**Example**

- This command displays complete OSPFv2 information for VLAN 1.

  ```
  switch>show ip ospf interface vlan 1
  Vlan1 is up, line protocol is up (connected)
  Internet Address 10.168.0.1/24, VRF default, Area 0.0.0.0
  Process ID 1, Router ID 10.168.103.1, Network Type BROADCAST, Cost: 10
  Transmit Delay is 1 sec, State BDR, Priority 1
  Designated Router is 10.168.104.2
  Backup Designated router is 10.168.103.1
  Timer intervals configured, Hello 10, Dead 40, Retransmit 5
  Neighbor Count is 1
  MTU is 1500
  switch>
  ```
show ip ospf interface brief

The `show ip ospf interface brief` command displays a summary of OSPFv2 information.

Command Mode
EXEC

Command Syntax
```
show ip ospf [PROCESS_ID] interface brief [VRF_INSTANCE]
```

Parameters
- **PROCESS_ID** OSPFv2 process ID. Values include:
  - `<no parameter>`
  - `<1 to 65535>`
- **VRF_INSTANCE** specifies the VRF instance.
  - `<no parameter>` displays information from all VRFs, or from context-active VRF if set.
  - `vrf vrf_name` displays information from the specified VRF.

Related Commands
- `show ip ospf interface`

Example
- This command displays a summary of interface information for the switch.

```
switch>show ip ospf interface brief
  Interface     PID  Area    IP Address     Cost  State  Nbrs
  Loopback0    1    0.0.0.0 10.168.103.1/24 10  DR     0
  Vlan1        1    0.0.0.0 10.168.0.1/24 10  BDR    1
  Vlan2        1    0.0.0.2 10.168.2.1/24 10  BDR    1
  Vlan3        1    0.0.0.3 10.168.3.1/24 10  DR     0
switch>
```
show ip ospf lsa-log

The **show ip ospf lsa-log** command displays log entries when LSA update messages are sent or received for OSPF.

**Command Mode**
EXEC

**Command Syntax**
```
show ip ospf [PROCESS_ID] ospf-log
```

**Parameters**
- **PROCESS_ID**  
  OSPFv2 process ID. Values include:
  - <no parameter>
  - <1 to 65535>

**Examples**
- This command displays log entries when LSA update messages are sent or received for OSPF.

```
switch>show ip ospf lsa-log
OSPF Process 3.3.3.3, LSA Throttling Log:
(04:21:09] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 2000 msecs
(04:21:08] type 1: 3.3.3.3/32 [3.3.3.3], event 2, backoff restarted, new hold value 900 msecs

(04:20:42] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 32000 msecs
(04:20:10] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 32000 msecs
(04:19:46] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 8000 msecs
(04:19:42] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 4000 msecs
(04:19:40] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 2000 msecs
(04:19:39] type 1: 3.3.3.3/32 [3.3.3.3], event 2, backoff restarted, new hold value 900 msecs
(04:19:22] type 1: 4.4.4.4/32 [4.4.4.4], event 3, discarded, was early by 995 msecs
(04:19:22] type 1: 3.3.3.3/32 [3.3.3.3], event 0, backoff started, new hold value 1000 msecs
```

*switch*>
**show ip ospf neighbor**

The **show ip ospf neighbor** command displays OSPFv2 neighbor information for specified interfaces.

**Command Mode**

EXEC

**Command Syntax**

```
show ip ospf [PROCESS_ID] neighbor
  [INTERFACE_NAME] [NEIGHBOR] [DATA] [VRF_INSTANCE]
```

**Parameters**

- **PROCESS_ID**  OSPFv2 process ID. Values include:
  - <no parameter>
  - <1 to 65535>
- **INTERFACE_NAME**  Interface type and number. Values include:
  - <no parameter>
  - ethernet e_num
  - loopback l_num
  - port-channel p_num
  - vlan v_num
- **NEIGHBOR**  OSPFv2 neighbor. Options include:
  - <no parameter>
  - ipv4_addr
- **DATA**  Type of information the command displays. Values include:
  - <no parameter>
  - detail
- **VRF_INSTANCE**  specifies the VRF instance.
  - <no parameter>  displays information from all VRFs, or from context-active VRF if set.
  - vrf vrf_name  displays information from the specified VRF.

**Examples**

- This command displays the switch’s neighbors.

  ```
  switch>show ip ospf neighbor
  Neighbor ID  VRF  Pri  State   Dead Time  Address   Interface
  10.168.104.2  default  1  FULL/DR  00:00:35  10.168.0.2  Vlan1
  10.168.104.2  default  8  FULL/BDR  00:00:31  10.168.2.2  Vlan2
  switch>
  ```

- This command displays details about the neighbors to VLAN 2.

  ```
  switch>show ip ospf neighbor vlan 2 detail
  Neighbor 10.168.104.2, VRF default, interface address 10.168.2.2
  In the area 0.0.0.2 via interface Vlan2
  Neighbor priority is 8, State is FULL, 13 state changes
  Adjacency was established 000:01:25:48 ago
  DR is 10.168.2.1 BDR is 10.168.2.2

  switch>
  ```
show ip ospf neighbor adjacency-changes

The `show ip ospf neighbor adjacency-changes` command displays the OSPFv2 neighbor adjacency change log for specified interfaces.

**Command Mode**

EXEC

**Command Syntax**

```
show ip ospf neighbor [INTERFACE_NAME] [NEIGHBOR] adjacency-changes [VRF_INSTANCE]
```

**Parameters**

- **INTERFACE_NAME** Interface type and number. Values include:
  - <no parameter>
  - ethernet e_num
  - loopback l_num
  - port-channel p_num
  - vlan v_num
- **NEIGHBOR** OSPFv2 neighbor. Options include:
  - <no parameter>
  - ipv4_addr
  - host_name
- **VRF_INSTANCE** specifies the VRF instance.
  - <no parameter> displays information from all VRFs, or from context-active VRF if set.
  - `vrf vrf_name` displays information from the specified VRF.

**Examples**

- This command displays the adjacency changes to VLAN 2.
  ```
  switch>show ip ospf neighbor vlan 2 adjacency-changes
  [08-04  09:58:58] 10.168.104.2, interface Vlan2 adjacency established
  [08-04  09:59:34] 10.168.104.2, interface Vlan2 adjacency dropped: interface went down
  [08-04  09:59:42] 10.168.104.2, interface Vlan2 adjacency established
  [08-04 10:01:40] 10.168.104.2, interface Vlan2 adjacency dropped: nbr did not list our router ID
  [08-04 10:01:46] 10.168.104.2, interface Vlan2 adjacency established
  switch>
  ```
show ip ospf neighbor state

The `show ip ospf neighbor state` command displays the state information on OSPF neighbors on a per-interface basis.

**Command Mode**

EXEC

**Command Syntax**

```
show ip ospf neighbor state STATE_NAME [VRF_INSTANCE]
```

**Parameters**

- `STATE_NAME` Output filtered by the devices OSPF state. Options include valid OSPF states:
  - 2-ways
  - attempt
  - down
  - exch-start
  - exchange
  - full
  - graceful-restart
  - init
  - loading
- `VRF_INSTANCE` specifies the VRF instance.
  - `<no parameter>` displays information from all VRFs, or from context-active VRF if set.
  - `vrf vrf_name` displays information from the specified VRF.

**Examples**

- This command displays OSPF information for neighboring routers that are fully adjacent.

  ```
  switch>show ip ospf neighbor state full
  Neighbor ID  VRF  Pri  State            Dead Time   Address       Interface
  Test1        default 1 FULL/BDR     00:00:35    10.17.254.105 Vlan3912
  Test2        default 1 FULL/BDR     00:00:36    10.17.254.29  Vlan3910

  Test13       default 1 FULL/DROTHER 00:00:31    10.17.254.154 Vlan3923
  Test14       default 1 FULL/BDR     00:00:39    10.17.254.156 Vlan3923
  Test15       default 1 FULL/DROTHER 00:00:33    10.17.254.35  Vlan3911
  Test16       default 1 FULL/DR      00:00:34    10.17.254.33  Vlan3911
  Test17       default 1 FULL/DR      00:00:36    10.17.254.138 Ethernet12
  Test18       default 1 FULL/DR      00:00:37    10.17.254.2    Vlan3901
  ```
show ip ospf neighbor summary

The show ip ospf neighbor summary command displays a single line of summary information for each OSPFv2 neighbor.

Command Mode

EXEC

Command Syntax

    show ip ospf [PROCESS_ID] neighbor summary [VRF_INSTANCE]

Parameters

•  **PROCESS_ID**  OSPFv2 process ID. Values include:
  •  <no parameter>
  •  <1 to 65535>

•  **VRF_INSTANCE**  specifies the VRF instance.
  •  <no parameter>  displays information from all VRFs, or from context-active VRF if set.
  •  *vrf vrf_name*  displays information from the specified VRF.

Examples

•  This command displays the summary information for the OSPFv2 neighbors.

    switch>show ip ospf neighbor summary
    OSPF Router with (Process ID 1) (VRF default)
    0 neighbors are in state DOWN
    0 neighbors are in state GRACEFUL RESTART
    2 neighbors are in state INIT
    0 neighbors are in state LOADING
    0 neighbors are in state ATTEMPT
    18 neighbors are in state FULL
    0 neighbors are in state EXCHANGE
    0 neighbors are in state 2 WAYS
    0 neighbors are in state EXCH START
    switch>
show ip ospf request queue

The `show ip ospf request queue` command displays a list of all OSPFv2 link state advertisements (LSAs) requested by a router.

**Command Mode**
- EXEC

**Command Syntax**

```
show ip ospf request queue [VRF_INSTANCE]
```

**Parameters**
- `VRF_INSTANCE` specifies the VRF instance.
- `<no parameter>` displays information from all VRFs, or from context-active VRF if set.
- `vrf vrf_name` displays information from the specified VRF.

**Example**
- This command displays an LSA request list.

```
switch>show ip ospf request queue
Neighbor 10.168.104.2 vrf default interface: 10.168.0.2 address vlan1
  Type LS ID ADV RTR Seq No Age Checksum
Neighbor 10.168.104.2 vrf default interface: 10.168.2.2 address vlan2
  Type LS ID ADV RTR Seq No Age Checksum
switch>
```
show ip ospf retransmission queue

The `show ip ospf retransmission queue` command displays a list of all OSPFv2 link state advertisements (LSAs) waiting to be re-sent.

**Command Mode**

EXEC

**Command Syntax**

`show ip ospf retransmission queue [VRF_INSTANCE]`

**Parameters**

- `VRF_INSTANCE` specifies the VRF instance.
- `<no parameter>` displays information from all VRFs, or from context-active VRF if set.
- `vrf vrf_name` displays information from the specified VRF.

**Example**

- This command displays an empty retransmission list.

```
switch>show ip ospf retransmission queue
Neighbor 10.168.104.2 vrf default interface vlan1 address 10.168.0.2
LSA retransmission not currently scheduled. Queue length is 0

Type Link ID ADV Router Age Seg# Checksum
Neighbor 10.168.104.2 vrf default interface vlan2 address 10.168.2.2
LSA retransmission not currently scheduled. Queue length is 0

Type Link ID ADV Router Age Seg# Checksum
switch>
```
show ip ospf spf-log

The `show ip ospf spf-log` command displays when and how long the switch took to run a full SPF calculation for OSPF.

**Command Mode**

EXEC

**Command Syntax**

`show ip ospf [PROCESS_ID] ospf-log`

**Parameters**

- `PROCESS_ID` OSPFv2 process ID. Values include:
  - `<no parameter>`
  - `<1 to 65535>`

**Examples**

- This command displays the SPF information for OSPF.

```
switch>show ip ospf spf-log
OSPF Process 172.26.0.22
When  Duration(msec)
13:01:34  1.482
13:01:29  1.547
13:01:24  1.893
13:00:50  1.459
13:00:45  1.473
13:00:40  2.603
11:01:49  1.561
11:01:40  1.463
11:01:35  1.467
11:01:30  1.434
11:00:54  1.456
11:00:49  1.472
11:00:44  1.582
15:01:49  1.575
15:01:44  1.470
15:01:39  1.679
15:01:34  1.601
15:00:57  1.454
15:00:52  1.446
15:00:47  1.603
```

switch>
**shutdown (OSPFv2)**

The `shutdown` command disables OSPFv2 on the switch. OSPFv2 is disabled on individual interfaces with the `shutdown` (OSPFv2) command.

The `no shutdown` and `default shutdown` commands enable the OSPFv2 instance by removing the `shutdown` statement from the OSPF block in `running-config`.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```
shutdown
no shutdown
default shutdown
```

**Examples**

- This command disables OSPFv2 activity on the switch.
  ```
  switch(config)#router ospf 6
  switch(config-router-ospf)#shutdown
  switch(config-router-ospf)#
  ```

- This command resumes OSPFv2 activity on the switch.
  ```
  switch(config-router-ospf)#no shutdown
  switch(config-router-ospf)#
  ```
summary-address

The summary-address command allows aggregation of external routes advertised by an OSPF ASBR. It is used to aggregate AS External and NSSA External LSAs.

The default summary-address and no summary-address commands delete the current summary-address configurations.

Command Mode
Router Configuration Mode

Command Syntax
summary-address {ip_address subnet_mask | ip_prefix} [attribute_map WORD | not_advertise | tag]
default summary-address {ip_address summary_mask | ip_prefix}
no summary-address {ip_address summary_mask | ip_prefix}

Parameters
- ip_address subnet_mask IPv4 subnet in dotted decimal notation.
- ip_prefix IPv4 subnet in CIDR notation.
- attribute_map WORD allows using a route-map to set the attributes to be advertised in the LSA. Options include:
  - set metric
  - set metric-type
  - set tag
- not_advertise suppresses the advertisement of contributing external prefixes by the router
- tag allows setting the tag in the advertised external LSA. The tag value ranges from 0 to 4294967295. The default value is zero.

Guidelines
This feature reduces the size of External LSDB in OSPF, does not impact inter area and intra area LSAs. This command installs a Null0 route in FIB when at least one contributor is present.

Restriction
Only OSPF redistributed routes are aggregated.

Examples
- This command advertises an external LSA for 50.0.0.0/16 prefix if at least one BGP contributing route is present which falls in the subnet 50.0.0.0/16.
The `show` commands display aggregation of BGP prefixes 50.0.0.0/24 and 50.0.1.0/24 into one OSPF AS External LSA for 50.0.0.0/16 prefix. A route-map is to set metric and tag for the advertised LSA.

```
switch(config)# router ospf 5
switch(config-router-ospf)# redistribute bgp
switch(config-router-ospf)# summary-address 50.0.0.0/16 attribute-map BGP_AGGR
switch(config-router-ospf)# exit
switch(config)# show ip route bgp

timers lsad rx min interval (OSPFv2)

The *timers lsad rx min interval* command sets the minimum interval for acceptance of identical link-state advertisements (LSAs) from OSPFv2 neighbors.

The *no timers lsad rx min interval* and *default timers lsad rx min interval* commands restore the minimum interval to the default of one second by removing the *timers lsad rx min interval* command from *running-config*.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```
timers lsad rx min interval lsa_time
no timers lsad rx min interval
default timers lsad rx min interval
```

**Parameters**

- *lsa_time* minimum time (in milliseconds) after which the switch will accept an identical LSA from OSPFv2 neighbors. Default is 1000 (1 second).

**Example**

- This command sets the minimum LSA arrival interval to ten milliseconds.

  ```
  switch(config)#router ospf 6
  switch(config-router-ospf)#timers lsad rx min interval 10
  switch(config-router-ospf)#
  ```
timers lsa tx delay initial (OSPFv2)

The `timers lsa tx delay initial` command sets the rate-limiting values for OSPF link-state advertisement generation.

The `no timers lsa tx delay initial` and `default timers throttle lsa all` commands restore the defaults by removing the `timers lsa tx delay initial` command from `running-config`.

**Command Mode**
- Router-OSPF Configuration

**Command Syntax**

```
timers lsa tx delay initial initial_delay min_hold max_wait
no timers lsa tx delay initial
default timers lsa tx delay initial
```

**Parameters**
- `initial_delay` Value ranges from 0 to 600000 (ms). Default is 1000.
- `min_hold` Value ranges from 0 to 600000 (ms). Default is 5000.
- `max_wait` Value ranges from 0 to 600000 (ms). Default is 5000.

**Example**
- This command sets the rate-limiting values for OSPF link-state advertisement to 10 milliseconds.

```
switch(config)#router ospf 6
switch(config-router-ospf)#timers lsa tx delay initial 10
switch(config-router-ospf)#
```
timers spf delay initial (OSPFv2)

The purpose of SPF throttling is to delay shortest path first (SPF) calculations when network topology is changing rapidly. The timers spf delay initial command controls the intervals at which the switch will perform SPF calculations. The command sets three values:

- **Initial delay**: how long the switch waits to perform an SPF calculation after a topology change in a network that has been stable throughout the hold interval. Because a topology change often causes several link state updates to be sent, the initial delay is configured to allow the network to settle before the switch performs an SPF calculation. If an additional topology change occurs during the initial interval, the SPF calculation still takes place after the expiration of the initial delay period and no other change is made to the throttle timers.

- **Hold interval**: this is an additional wait timer which scales to slow SPF calculations during periods of network instability. If a network change occurs during the hold period, an SPF calculation is scheduled to occur at the expiration of the hold interval. Subsequent hold intervals are doubled if further topology changes occur during a hold interval until either the hold interval reaches its configured maximum or no topology change occurs during the interval. If the next topology change occurs after the expiration of the hold interval, the hold interval is reset to its configured value and the SPF calculation is scheduled to take place after the initial delay.

- **Maximum interval**: the maximum time the switch will wait after a topology change before performing an SPF calculation.

The no timers spf delay initial and default timers spf delay initial commands restore the default OSPFv2 SPF calculation intervals by removing the timers spf delay initial command from running-config.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```
timers spf delay initial initial_delay hold_interval max_interval
no timers spf
default timers spf
```

**Parameters**

- **initial_delay** Initial delay between a topology change and SPF calculation. Value ranges from 0 to 65535000 (ms). Default is 0 (ms).

- **hold_interval** Additional wait time after SPF calculation to allow the network to settle. If a topology change occurs during the hold interval, another SPF calculation is scheduled to occur after the hold interval expires. The next hold interval is doubled if topology changes occur during the hold interval. If doubling exceeds the maximum value, the maximum value is used instead. Value ranges from 0 to 65535000 (ms). Default is 5000 (ms).

- **max_interval** Maximum hold interval before the switch will perform an SPF calculation. Value ranges from 0 to 65535000 (ms). Default is 5000 (ms).

**Example**

- These commands set the SPF timers on the switch.

```
switch(config)#router ospf 6
switch(config-router-ospf)#timers spf 5 100 20000
switch(config-router-ospf)#
```
Open Shortest Path First (OSPF) is a link-state routing protocol that operates within a single autonomous system. OSPF version 3 is defined by RFC 5340.

This chapter contains the following sections.

- Section 32.1: OSPFv3 Introduction
- Section 32.2: OSPFv3 Conceptual Overview
- Section 32.3: Configuring OSPFv3
- Section 32.4: OSPFv3 Configuration Examples
- Section 32.5: OSPFv3 Commands

32.1 OSPFv3 Introduction

OSPFv3 is based on OSPF version 2 and includes enhancements that utilize IPv6 features. However, OSPFv3 is configured and operates independently of any implementation of OSPFv2 on the switch. OSPFv2 features that OSPFv3 implements include:

- Packet types
- Neighbor discovery and adjacency formation mechanisms
- LSA aging and flooding
- SPF calculations
- DR election procedure
- Multiple area support
- Router-ID (32 bits)
The following list describes the OSPFv3 differences and enhancements from OSPFv2:

- IPv6 128-bit addresses
- Use of link-local addresses
- OSPFv3 runs over links instead of subnets
- Support flood pacing

Arista switches support the following OSPFv3 functions:

- A single OSPFv3 instance for each VRF
- Intra- and inter-area routing
- Type 1 and 2 external routing
- Broadcast and P2P interfaces
- Stub areas
- Redistribution of static and connected routes into OSPFv3

## 32.2 OSPFv3 Conceptual Overview

### 32.2.1 Storing Link States

OSPFv3 is a dynamic, link-state routing protocol, where links represent routable paths. Dynamic routing protocols calculate the most efficient path between locations based on bandwidth and device status.

A link state advertisement (LSA) is an OSPFv3 packet that communicates a router's topology to other routers. The link state database (LSDB) stores an area's topology database and is composed of LSAs received from other routers. Routers update the LSDB by storing LSAs from other routers.

### 32.2.2 Topology

An autonomous system (AS) is the IP domain within which a dynamic protocol controls the routing of traffic. In OSPFv3, an AS is composed of areas, which define the LSDB computation boundaries. All routers in an area store identical LSDBs. Routers in different areas exchange updates without storing the entire database, reducing information maintenance on large, dynamic networks.

An AS shares internal routing information from its areas and external routing information from other processes to inform routers outside the AS about routes the network can access. Routers that advertise routes on other ASs commit to carry data to the IP space on the route.

OSPFv3 defines these routers:

- **Internal router (IR)** – a router whose interfaces are contained in a single area. All IRs in an area maintain identical LSDBs.
- **Area border router (ABR)** – a router that has interfaces in multiple areas. ABRs maintain one LSDB for each connected area.
- **Autonomous system boundary router (ASBR)** – a gateway router connecting the OSPFv3 domain to external routes, including static routes and routes from other autonomous systems.
Chapter 32: Open Shortest Path First – Version 3

Chapter 32: Open Shortest Path First – Version 3

Figure 32-1 displays the OSPFv3 router types.

Figure 32-1: OSPFv3 Router Types

OSPFv3 areas are assigned a number between 0 and 4,294,967,295. Area numbers are often expressed in dotted decimal notation, similar to IP addresses.

Each AS has a backbone area, designated as area 0, that connects to all other areas. The backbone receives routing information from all areas, then distributes it to the other areas as required.

OSPFv3 area types include:

- Normal area – accepts intra-area, inter-area, and external routes. The backbone is a normal area.
- Stub area – does not receive router advertisements external to the AS. Stub area routing is based on a default route.

32.2.3 Link Updates

Routers periodically send hello packets to advertise status and establish neighbors. A router’s hello packet includes IP addresses of other routers from which it received a hello packet within the time specified by the router dead interval. Routers become neighbors when they detect each other in their hello packets if they:

- share a common network segment.
- are in the same area.
- have the same hello interval, dead interval, and authentication parameters.

Neighbors form adjacencies to exchange LSDB information. A neighbor group uses hello packets to elect a Designated Router (DR) and Backup Designated Router (BDR). The DR and BDR become adjacent to all other neighbors, including each other. Only adjacent neighbors share database information.
The DR is the central contact for database exchanges. Switches send database information to their DR, which relays the information to the other neighbors. All routers in an area maintain identical LSDBs. Switches also send database information to their BDR, which stores this data without distributing it. If the DR fails, the BDR distributes LSDB information to its neighbors.

OSPFv3 routers distribute LSAs by sending them on all of their active interfaces. The router does not send hello packets from passive interfaces preventing adjacencies. The router does not process any OSPFv2 packets received on a passive interface.

When a router’s LSDB is changed by an LSA, it sends the changes to the BDR and DR for distribution to the other neighbors. Routing information is updated only when the topology changes.

Routing devices use Dijkstra’s algorithm to calculate the shortest path to all known destinations, based on cumulative route cost. The cost of an interface indicates the transmission overhead and is usually inversely proportional to its bandwidth.

### 32.2.4 OSPFv3 Security

The OSPFv3 protocol relies on the IPsec Authentication Header (AH) and Encapsulating Security Payload (ESP) header to provide data integrity, authentication and confidentiality. Transport mode provides IPsec to OSPFv3 packets.

The IPsec SA has Security Policy Index (SPI), HMAC algorithm, and a secret key as parameters. These parameters are used to compute Integrity Check Value (ICV), that is used to authenticate peers. When authentication is enabled, all corresponding peers must use same SA parameters to clear OSPFv3 ICV verification. SA can be configured at both area and interface levels.

#### Note
On the same area or interface, EOS allows security configuration with either AH or ESP but not both. We can have one area or interface configured with AH and another with ESP.
32.2.4.1 OSPFv3 Authentication

While sending OSPFv3 packets, the HMAC-MD5 or SHA algorithm hash is inserted in the IPsec header and the packet is sent over the wire for peer authentication. While receiving OSPFv3 packets, the computed hash is verified with the one present in the IPsec header. If it fails, OSPFv3 packets are discarded.

32.2.4.2 OSPFv3 Encryption

ESP provides confidentiality to OSPFv3 packets. When confidentiality is enabled, ESP encrypts the sent data and decrypts the received data. OSPFv3 packets that are not encapsulated with security payload are discarded.

OSPFv3 encryption uses algorithms of Triple Data Encryption Standard (3DES) and Advanced Encryption Standard (AES). 3DES uses a 192 bit key, whereas the AES key length varies by 128, 192 and 256 bits.

32.2.5 Flood Pacing

OSPFv3 flood pacing allows configuring the minimum interval between the transmission of consecutive Link State (LS) update packets in a network. Flood pacing provides the following benefits:

- Prevents the rapid drain of flood queue by sending consecutive LSU packets with a delay
- Helps mitigate high CPU or socket buffer utilization issues that occur when a switch instantly floods a large number of LSAs
- When LSDB is updated frequently, an incremented flood pacing interval scales down LSA flooding

Note

A high flood pacing interval may lead to convergence delays in large OSPF LSDBs.
32.3 Configuring OSPFv3

These sections describe basic OSPFv3 configuration steps:

- Section 32.3.1: Configuring an OSPFv3 Instance
- Section 32.3.2: Configuring OSPFv3 Areas
- Section 32.3.3: Configuring Interfaces for OSPFv3
- Section 32.3.4: Enabling OSPFv3

- Section 32.3.6: Configuring OSPFv3 Flood Pacing
- Section 32.3.7: Displaying OSPFv3 Status

32.3.1 Configuring an OSPFv3 Instance

32.3.1.1 Entering OSPFv3 Configuration Mode

OSPFv3 configuration commands apply to the specified OSPFv3 instance. To perform OSPFv3 configuration commands, the switch must be in router-OSPFv3 configuration mode. The `ipv6 router ospf` command places the switch in router-OSPFv3 configuration mode, creating an OSPFv3 instance if OSPFv3 was not previously instantiated on the switch. If no VRF is specified, the OSPFv3 instance is in the default VRF. To instantiate or configure OSPFv3 on a non-default VRF, specify that VRF when using the `ipv6 router ospf` command.

The process ID identifies the OSPFv3 instance and is local to the router. Neighbor OSPFv3 routers can have different process IDs. OSPFv3 instances configured in different VRFs on the switch must have different process IDs.

The switch supports one OSPFv3 instance for each VRF. When an OSPFv3 instance already exists, the `ipv6 router ospf` command must specify its process ID (and VRF, if it is not configured in the default VRF). Attempts to define additional instances in the same VRF will generate errors. The `show ipv6 ospf` command displays information about OSPFv3 instances, including their process IDs.

Example

- This command places the switch in router-OSPFv3 configuration mode for the default VRF. If OSPFv3 was not previously instantiated in the default VRF, the command creates an OSPFv3 instance in the default VRF with a process ID of 9.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#show active
ipv6 router ospf 9
switch(config-router-ospf3)#
```

32.3.1.2 Defining the Router ID

The router ID is a 32-bit number assigned to a router running OSPFv3. This number uniquely labels the router within an Autonomous System. Status commands identify the switch through the router ID. When configuring OSPFv3 instances in multiple VRFs, each should have a different router ID.

Note

A router ID is required to run OSPF, and Arista recommends setting the router ID manually for the following reasons: 1) If there are no IPv4 addresses configured on the switch, a manually configured router ID is required. 2) The router ID also does not change if the interface status or IP address changes, which can cause confusion if the ID has been selected automatically.
The switch sets the router ID to the first available alternative in the following list:

1. The `router-id` command.
2. The loopback IPv6 address, if a loopback interface is active on the switch.
3. The highest IPv6 address on the router.

Important! When configuring VXLAN on an MLAG, always manually configure the OSPFv3 router ID to prevent the switch from using the common VTEP IP address as the router ID.

The `router-id` (OSPFv3) command configures the router ID for an OSPFv3 instance.

Example

- This command assigns 15.1.1.1 as the OSPFv3 router ID.
  ```
  switch(config-router-ospf3)#router-id 15.21.4.9
  switch(config-router-ospf3)#show active
  ipv6 router ospf 9
  router-id 15.21.4.9
  switch(config-router-ospf3)#
  ```

32.3.1.3 Global OSPFv3 Parameters

These router-OSPFv3 configuration mode commands define OSPFv3 behavior for the OSPFv3 instance under which they are used.

**Logging Adjacency Changes**

The `log-adjacency-changes` (OSPFv3) command configures the switch to log OSPFv3 link-state changes and transitions of OSPFv3 neighbors into the up or down state.

Examples

- This command configures the switch to log transitions of OSPFv3 neighbors into the up or down state.
  ```
  switch(config-router-ospf3)#log-adjacency-changes
  switch(config-router-ospf3)#
  ```
- This command configures the switch to log all OSPFv3 link-state changes.
  ```
  switch(config-router-ospf3)#log-adjacency-changes detail
  switch(config-router-ospf3)#
  ```

**Intra-Area Distance**

The `distance ospf intra-area` (OSPFv3) command configures the administrative distance for routes contained in a single OSPFv3 area. Administrative distances compare dynamic routes configured by different protocols. The default administrative distance for intra-area routes is 10.

Example

- This command configures an administrative distance of 90 for OSPFv3 intra-area routes.
  ```
  switch(config-router-ospf3)#distance ospf intra-area 90
  switch(config-router-ospf3)#show active
  ipv6 router ospf 9
  distance ospf intra-area 90
  switch(config-router-ospf3)#
  ```
Passive Interfaces

The passive-interface (OSPFv3) command prevents the transmission of hello packets on the specified interface. Passive interfaces drop all adjacencies and do not form new adjacencies. Although passive interfaces do not send or receive LSAs, other interfaces may generate LSAs for the network segment. The router does not send OSPFv3 packets from a passive interface or process OSPFv3 packets received on a passive interface. The router advertises the passive interface in the router LSA.

The no passive-interface command re-enables OSPFv3 processing on the specified interface.

Examples

- This command configures VLAN 200 as a passive interface.

  switch(config-router-ospf3)#passive-interface vlan 200
  switch(config-router-ospf3)#show active
  ipv6 router ospf 9
      passive-interface Vlan200
  switch(config-router-ospf3)#

- This command configures VLAN 200 as an active interface.

  switch(config-router-ospf3)#no passive-interface vlan 200
  switch(config-router-ospf3)#show active
  ipv6 router ospf 9
  switch(config-router-ospf3)#

Redistributing Connected Routes

Redistributing connected routes causes the OSPFv3 instance to advertise all connected routes on the switch as external OSPFv3 routes. Connected routes are routes that are established when IPv6 is enabled on an interface.

Example

- The redistribute (OSPFv3) connected command converts connected routes to OSPFv3 external routes.

  switch(config-router-ospf3)#redistribute connected
  switch(config-router-ospf3)#show active
  ipv6 router ospf 9
      redistribute connected
  switch(config-router-ospf3)#

Redistributing Static Routes

Redistributing static routes causes the OSPFv3 instance to advertise all static routes on the switch as external OSPFv3 routes. The switch does not support redistributing individual static routes.

Example

- The redistribute (OSPFv3) static command converts static routes to OSPFv3 external routes.

  switch(config-router-ospf3)#redistribute static
  switch(config-router-ospf3)#show active
  ipv6 router ospf 9
      redistribute static
  switch(config-router-ospf3)#
32.3.2 Configuring OSPFv3 Areas

OSPFv3 areas are configured through area commands. The switch must be in router-OSPFv3 configuration mode, as described in Section 32.3.1.1: Entering OSPFv3 Configuration Mode, to run area commands.

Areas are assigned a 32-bit number that is expressed in decimal or dotted-decimal notation. When an OSPFv3 instance configuration contains multiple areas, the switch only configures areas associated with its interfaces.

32.3.2.1 Configuring the Area Type

The no area (OSPFv3) command specifies the area type. The switch supports three area types:

- Normal area: Area that accepts intra-area, inter-area, and external routes. The backbone area (area 0) is a normal area.
- Stub area: Area where external routes are not advertised. External routes are reached through a default summary route (0.0.0.0) inserted into stub areas. Networks with no external routes do not require stub areas.

The default area type is normal.

Example

- These commands configures area 200 as a NSSA area and 300 as a stub area.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#area 200 nssa
switch(config-router-ospf3)#area 300 stub
switch(config-router-ospf3)#show active
ipv6 router ospf 9
  area 0.0.0.200
  area 0.0.1.44 stub
switch(config-router-ospf3)#
```

32.3.2.2 Configuring Area Parameters

These router-OSPFv3 configuration mode commands define OSPFv3 behavior in a specified area.

Default Summary Route Cost

The area default-cost (OSPFv3) command specifies the cost of the default summary route that ABRs send into a stub area or NSSA. Summary routes, also called inter-area routes, originate in areas different than their destination. When the area default-cost command is not configured for an area, the default-cost of that area is set to 10.

Example

- This command configures a cost of 25 for the default summary route in area 0.0.1.194 (450).

```
switch(config-router-ospf3)#area 450 default-cost 25
switch(config-router-ospf3)#show active
ipv6 router ospf 9
  area 0.0.1.194 default-cost 25
switch(config-router-ospf3)#
```

Area Stub

The area stub (OSPFv3) command configures the area type of an OSPFv3 area. All routers in an AS must specify the same area type for identically numbered areas.
Stub areas are areas in which external routes are not advertised. To reach these external routes, the stub area uses a default summary route (0.0.0.0). Networks without external routes do not require stub areas.

Areas are **normal** by default; area type configuration is required only for stub NSSA areas. Area 0 is always a normal area and cannot be configured through this command.

**Examples**

- This command configures area 45 as a stub area.

```
switch(config)#ipv6 router ospf 3
switch(config-router-ospf3)#area 45 stub
switch(config-router-ospf3)#
```

- This command configures area 10.92.148.17 as a stub area.

```
switch(config-router-ospf3)#area 10.92.148.17 stub
switch(config-router-ospf3)#
```

**Area Range**

The **area range (OSPFv3)** command is used by OSPFv3 area border routers (ABRs) to consolidate or summarize routes, to configure a cost setting for those routes, and to suppress summary route advertisements.

By default, an ABR creates a summary LSA for each route in an area and advertises that LSA to adjacent areas. The **area range (OSPFv3)** command aggregates routing information on area boundaries, allowing the ABR to use one summary LSA to advertise multiple routes.

**Examples**

- These commands consolidate and summarize routes at an area boundary 1.

```
switch(config)#ipv6 router ospf 1
switch(config-router-ospf3)#area 1 range 2001:0DB8:0:1::/64
switch(config-router-ospf3)#
```

- These commands change the address range status to DoNotAdvertise. Neither one of the individual intra-area routes falling under range or the ranged prefix is advertised as summary LSA.

```
switch(config)#ipv6 router ospf 1
switch(config-router-ospf3)#area 1 range 2001:0DB8:0:1::/64 not-advertise
switch(config-router-ospf3)#
```

### 32.3.3 Configuring Interfaces for OSPFv3

OSPFv3 interface configuration commands enable OSPFv3 on an interface, assign the interface to an area, and specify transmission parameters for routed ports and SVIs that handle OSPFv3 packets.

#### 32.3.3.1 Assigning an Interface to an Area

The **ipv6 ospf area** command enables OSPFv3 on the configuration mode interface and associates the specified area to the interface. Each routed interface can be associated with one OSPFv3 area; subsequent **ipv6 ospf area** commands that designate a different area on an interface replace any existing command for the interface.
32.3.3.2 Configuring Intervals

Interval configuration commands determine OSPFv3 packet transmission characteristics for a specified VLAN interface. Interval configuration commands are entered in vlan-interface configuration mode.

Hello Interval

The hello interval specifies the period between consecutive hello packet transmissions from an interface. Each OSPFv3 neighbor should specify the same hello interval, which should not be longer than any neighbor’s dead interval.

The `ospfv3 hello-interval` command configures the hello interval for the configuration mode interface. The default is 10 seconds.

Example

- These commands configure a hello interval of 45 seconds for VLAN 200.

```plaintext
switch(config)#interface vlan 200
switch(config-if-Vl200)#ospfv3 hello-interval 45
switch(config-if-Vl200)#show active
interface Vlan200
   ospfv3 hello-interval 45
switch(config-if-Vl200)#
```

Dead Interval

The dead interval specifies the period that an interface waits for an OSPFv3 packet from a neighbor before it disables the adjacency under the assumption that the neighbor is down. The dead interval should be configured identically on all OSPFv3 neighbors and be longer than the hello interval of any neighbor.

The `ospfv3 dead-interval` command configures the dead interval for the configuration mode interface. The default is 40 seconds.

Example

- This command configures a dead interval of 75 seconds for VLAN 200.

```plaintext
switch(config)#interface vlan 200
switch(config-if-Vl200)#ospfv3 dead-interval 75
switch(config-if-Vl200)#show active
interface Vlan200
   ospfv3 dead-interval 75
switch(config-if-Vl200)#
```
### Retransmission Interval

Routers that send OSPFv3 advertisements to an adjacent router expect to receive an acknowledgment from that neighbor. Routers that do not receive an acknowledgment will retransmit the advertisement. The retransmission interval specifies the period between retransmissions.

The `ospfv3 ipv6 retransmit-interval` command configures the LSA retransmission interval for the configuration mode interface. The default retransmission interval is 5 seconds.

#### Example

- This command configures a retransmission interval of 25 seconds for VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ospfv3 ipv6 retransmit-interval 25
```

### Transmission Delay

The transmission delay is an estimate of the time that an interface requires to transmit a link-state update packet. OSPFv3 adds this delay to the age of outbound packets to more accurately reflect the age of the LSA when received by a neighbor.

The `ospfv3 transmit-delay` command configures the transmission delay for the configuration mode interface. The default transmission delay is one second.

#### Example

- This command configures a transmission delay of 10 seconds for VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ospfv3 transmit-delay 10
```

### Configuring Interface Parameters

#### Interface Cost

The OSPFv3 interface cost reflects the overhead of sending packets across the interface. The cost is typically assigned to be inversely proportional to the bandwidth of the interface. The `ospfv3 cost` command configures the OSPFv3 cost for the configuration mode interface. The default cost is 10.

#### Example

- This command configures a cost of 50 for VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ospfv3 cost 50
```
Router Priority

Router priority determines preference during designated router (DR) and backup designated router (BDR) elections. Routers with higher priority numbers have preference over other routers. Routers with a priority of zero cannot be elected as a DR or BDR.

The `ospfv3 priority` command configures router priority for the configuration mode interface. The default priority is 1.

Example

- This command configures a router priority of 128 for VLAN 200.
  
  ```
  switch(config)#interface vlan 200
  switch(config-if-Vl200)#ospfv3 priority 128
  interface Vlan200
  ospfv3 priority 128
  switch(config-if-Vl200)#
  ```

32.3.4 Enabling OSPFv3

32.3.4.1 IP Routing

OSPFv3 requires that IPv6 unicast routing is enabled on the switch. When IP routing is not enabled, entering OSPFv3 configuration mode generates a message.

Examples

- This message is displayed if, when entering router-OSPFv3 configuration mode, IPv6 unicast routing is not enabled.
  
  ```
  switch(config)#ipv6 router ospf 9
  ! IPv6 routing not enabled
  switch(config-router-ospf3)#
  ```

- This command enables IP routing on the switch.
  
  ```
  switch(config)#ipv6 unicast-routing
  ```

32.3.4.2 Disabling OSPFv3

The `shutdown (OSPFv3)` disables OSPFv3 operations on the switch without disrupting the OSPFv3 configuration. To disable OSPFv3 on an interface, remove the `ipv6 ospf area` statement for the corresponding interface.

The `no shutdown` command resumes OSPFv3 activity.

Examples

- This command disables OSPFv3 activity on the switch.
  
  ```
  switch(config)#ipv6 router ospf 9
  switch(config-router-ospf3)#shutdown
  switch(config-router-ospf3)#show active
  ipv6 router ospf 9
  shutdown
  switch(config-router-ospf3)#
  ```
• This command resumes OSPFv3 activity on the switch.
  switch(config-router-ospf3)#no shutdown
  switch(config-router-ospf3)#show active
  ipv6 router ospf 9
  switch(config-router-ospf3)#

### 32.3.5 Configuring OSPFv3 Security

You can configure OSPFv3 security for either an area or an interface, or both, using either an Authentication Header (AH) or an Encapsulating Security Payload (ESP). When OSPFv3 security is configured on an area, the configured settings apply to all interfaces in that area. Interface-specific configuration overrides configuration on the area to which the interface belongs.

#### 32.3.5.1 Configuring OSPFv3 Authentication

**Configuring OSPFv3 Authentication for Areas**

The `area authentication ipsec spi` command configures OSPFv3 authentication on an area.

**Example**

This command configures OSPFv3 authentication on an area with MD5 hash algorithm.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#area 0.0.0.0 authentication ipsec spi 34 md5 0 8FD6158BFE81ADD96124169D411
switch(config-router-ospf3)#show active
ipv6 router ospf 9
area 0.0.0.0 authentication ipsec spi 34 md5 7 $1$cnpcrQ11czqdvKATyVr6l7+R3niuWouDKYCFNs4/XOWG/Tap5Q==
switch(config-router-ospf3)#
```

**Configuring OSPFv3 Authentication for Interfaces**

The `ospfv3 authentication ipsec spi` command configures OSPFv3 authentication on an interface.

**Example**

This command configures OSPFv3 authentication on an interface with MD5 hash algorithm.

```
switch(config-if-Et9)#ospfv3 authentication ipsec spi 3456 md5 0 8FD6158BFE81ADD96124169D411
switch(config-if-Et9)#show active
interface Ethernet9
  no switchport
  ospfv3 authentication ipsec spi 3456 md5 7 $1$xtmcMSPzEn+Njp8Lb4qryVVOJkczrYuv6dx10+nSwWQdaiRt2RPTQ==
switch(config-if-Et9)#
```

#### 32.3.5.2 Configuring OSPFv3 Encryption

**Configuring OSPFv3 Encryption for Areas**

The `area encryption ipsec spi` command configures OSPFv3 security on an area.

**Example**

This command configures OSPFv3 security on an area with 3DES-CBC encryption and MD5 hash algorithm.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#area 0.0.0.0 encryption ipsec spi 5678 esp 3des-cbc md5 passphrase 0 8FD6158BFE81ADD96124169D411
switch(config-router-ospf3)#show active
ipv6 router ospf 9
  area 0.0.0.0 encryption ipsec spi 5678 esp 3des-cbc md5 passphrase 7 $1$cnpcrQ11czqdvKATyVr6l7+R3niuWouDKYCFNs4/XOWG/Tap5Q==
switch(config-router-ospf3)#
```
Configuring OSPFv3 Encryption for Interfaces

The `ospfv3 encryption ipsec spi` command configures OSPFv3 security on an interface.

**Example**

This command configures OSPFv3 security on an interface with 3DES-CBC encryption and SHA1 algorithm.

```
switch(config)#interface ethernet 9
switch(config-if-Et9)#ospfv3 encryption ipsec spi 345 esp 3des-cbc sha1 passphrase 0 2fd4e1c67a2d28fced849ee1bb76e7391b93eb12
switch(config-if-Et9)#show active
interface Ethernet9
no switchport
ospfv3 encryption ipsec spi 345 esp 3des-cbc sha1 passphrase 7 $1$VmUkWk6IL2S343bR3BbH0RhgywHw8pfvB4VXMKQ5FC7JHBP5VXTFsBQy4CWU
switch(config-if-Et9)#
```

### 32.3.6 Configuring OSPFv3 Flood Pacing

Flood pacing can be configured for global OSPFv3 instances and address families. The `timers pacing flood` command configures OSPFV3 flood pacing.

**Examples**

- This command configures OSPFv3 flood pacing timer to 50 ms in the global OSPFv3 instance.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#timers pacing flood 50
switch(config-router-ospf3)#show ipv6 ospf
Routing Process "ospfv3 9" with ID 13.13.13.13 and Instance 0 VRF default
FIPS mode disabled
It is not an autonomous system boundary router and is not an area border router
Minimum LSA arrival interval 1000 msecs
Initial LSA throttle delay 1000 msecs
Minimum hold time for LSA throttle 5000 msecs
Maximum wait time for LSA throttle 5000 msecs
Interface flood pacing timer 50 msecs
It has 0 fully adjacent neighbors
Number of areas in this router is 1. 1 normal, 0 stub, 0 nssa
Number of LSAs 1
Initial SPF schedule delay 0 msecs
Maximum hold time between two consecutive SPF's 5000 msecs
Current hold time between two consecutive SPF's 5000 msecs
Maximum wait time between two consecutive SPF's 5000 msecs
SPF algorithm last executed 21d19h ago
No scheduled SPF
Adjacency exchange-start threshold is 20
Maximum number of next-hops supported in ECMP is 32
Number of backbone neighbors is 0
Graceful-restart is not configured
Graceful-restart-helper mode is enabled
Area 0.0.0.0
Number of interface in this area is 0
It is a normal area
SPF algorithm executed 2 times
```
• This command configures OSPFv3 flood pacing timer to 50 ms for ipv4 address family.

```
switch(config)#router ospfv3
switch(config-router-ospfv3)#address-family ipv4
switch(config-router-ospfv3-af)#timers pacing flood 50
switch(config-router-ospfv3-af)#show ospfv3
```

OSPFv3 address-family ipv4
Routing Process "ospfv3" with ID 11.1.11.1 and Instance 64 VRF default
FIPS mode disabled
It is not an autonomous system boundary router and is not an area border router
Minimum LSA arrival interval 1000 msecs
Initial LSA throttle delay 1000 msecs
Minimum hold time for LSA throttle 5000 msecs
Maximum wait time for LSA throttle 5000 msecs
Interface flood pacing timer 50 msecs
It has 0 fully adjacent neighbors
Number of areas in this router is 1. 1 normal, 0 stub, 0 nssa
Number of LSAs 1
Initial SPF schedule delay 0 msecs
Minimum hold time between two consecutive SPFss 5000 msecs
Current hold time between two consecutive SPFss 5000 msecs
Maximum wait time between two consecutive SPFss 5000 msecs
SPF algorithm last executed 00:01:05 ago
No scheduled SPF
Adjacency exchange-start threshold is 20
Maximum number of next-hops supported in ECMP is 32
Number of backbone neighbors is 0
Graceful-restart is not configured
Graceful-restart-helper mode is enabled
Area 0.0.0.0
  Number of interface in this area is 0
  It is a normal area
  SPF algorithm executed 2 times

<-------OUTPUT OMITTED FROM EXAMPLE-------->

32.3.7 Displaying OSPFv3 Status

This section describes OSPFv3 show commands that display OSPFv3 status. General switch methods that provide OSPFv3 information include pinging routes, viewing route status (show ip route command), and viewing the configuration (show running-config command).

32.3.7.1 OSPFv3 Summary

The show ipv6 ospf command displays general OSPFv3 configuration information, operational statistics and status for the OSPFv3 instance, followed by a brief description of the areas configured on the switch.

Example

• This command displays OSPFv3 routing process information.
This command displays OSPFv3 routing process information.

```
switch(config-router-ospf3)#show ipv6 ospf
Routing Process "ospfv3 1" with ID 1.1.1.1 and Instance 0 VRF default
It is not an autonomous system boundary router and is not an area border router
Minimum LSA arrival interval 1000 msecs
Initial LSA throttle delay 1000 msecs
Minimum hold time for LSA throttle 5000 msecs
Maximum wait time for LSA throttle 5000 msecs
Interface flood pacing timer 50 msecs
It has 0 fully adjacent neighbors
...
Graceful-restart is not configured
Graceful-restart-helper mode is enabled
```

### 32.3.7.2 Viewing OSPFv3 on the Interfaces

The `show ipv6 ospf interface` command displays OSPFv3 information for switch interfaces configured for OSPFv3. Different command options allow the display of either all interfaces or a specified interface. The command can also be configured to display complete information or a brief summary.

**Example**

This command displays OSPFv3 information for interfaces where OSPFv3 is enabled.

```
switch#show ipv6 ospf interface
Ethernet17 is up  
  Interface Address fe80::48c:73ff:fe00:1319%Ethernet12, Area 0.0.0.0
  Network Type Broadcast, Cost 10
  Transmit Delay is 1 sec, State Backup DR, Priority 1
  Designated Router is 10.37.0.37
  Backup Designated Router is 10.37.0.23
  Timer intervals configured, Hello 10, Dead 40, Retransmit 5
  Neighbor Count is 1
Vlan31 is up  
  Interface Address fe80::48c:73ff:fe00:1319%Vlan31, Area 0.0.0.0
  Network Type Broadcast, Cost 10
  Transmit Delay is 1 sec, State Backup DR, Priority 1
  Designated Router is 10.37.0.22
  Backup Designated Router is 10.37.0.23
  Timer intervals configured, Hello 10, Dead 40, Retransmit 5
  Neighbor Count is 1
Vlan32 is up  
  Interface Address fe80::48c:73ff:fe00:1319%Vlan32, Area 0.0.0.0
  Network Type Broadcast, Cost 10
  Transmit Delay is 1 sec, State DR Other, Priority 1
  Designated Router is 10.37.0.11
  Backup Designated Router is 10.37.0.22
  Timer intervals configured, Hello 10, Dead 40, Retransmit 5
  Neighbor Count is 2
switch#
```

### 32.3.7.3 Viewing the OSPFv3 Database

The `show ipv6 ospf database <link state list>` command displays the LSAs in the LSDB for the specified area. If no area is listed, the command displays the contents of the database for each area on the switch. The database command provides options to display subsets of the LSDB database, a summary of database contents, and the link states that comprise the database.
Example

- This command displays the OSPFv3 database of link state advertisements (LSAs).

```bash
switch# show ipv6 ospf database
Routing Process "ospf 9":

    AS Scope LSDB
    Type Link ID ADV Router Age Seq# Checksum
    AEX 0.0.0.5 10.37.0.37 15 0x80000005 0x00be82
    AEX 0.0.0.9 10.37.0.22 1747 0x8000002b 0x00df56
    AEX 0.0.0.3 10.37.0.46 599 0x8000002d 0x00651d

    Area 0.0.0.0 LSDB
    Type Link ID ADV Router Age Seq# Checksum
    RTR 0.0.0.0 10.37.0.32 234 0x80000031 0x00585a

switch#
```

### 32.3.7.4 Viewing OSPFv3 Neighbors

The `show ipv6 ospf neighbor` command displays information about the routers that are neighbors to the switch. Command options allow the display of summary or detailed information about the neighbors to all areas and interfaces on the switch. The command also allows for the display of neighbors to individual interfaces or areas. The `adjacency-changes` option displays the interface’s adjacency changes.
Example

- This command displays the switch’s neighbors.

```bash
switch# show ipv6 ospf neighbor
Routing Process "ospf 9":
Neighbor 10.37.0.37 priority is 1, state is Full
   In area 0.0.0.0 interface et12
   DR is 10.37.0.37 BDR is 10.37.0.23
   Options is 0
   Dead timer is due in 37 seconds
Neighbor 10.37.0.22 priority is 1, state is Full
   In area 0.0.0.0 interface vlan3911
   DR is 10.37.0.22 BDR is 10.37.0.23
   Options is 0
   Dead timer is due in 31 seconds
Neighbor 10.37.0.22 priority is 1, state is Full
   In area 0.0.0.0 interface vlan3902
   DR is 10.37.0.11 BDR is 10.37.0.22
   Options is 0
   Dead timer is due in 31 seconds
Neighbor 10.37.0.22 priority is 1, state is Full
   In area 0.0.0.0 interface vlan3908
   DR is 10.37.0.22 BDR is 10.37.0.21
   Options is 0
   Dead timer is due in 39 seconds
```

```bash
switch#
```

32.3.7.5 Viewing OSPFv3 Routes

The `show ipv6 routes` command provides an OSPFv3 option.

Example

- This command displays the switch’s OSPFv3 routes.

```bash
switch# show ipv6 route ospf
IPv6 Routing Table - 43 entries
Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP, R - RIP, A - Aggregate

O   fd7a:3279:81a4:1112::/64 [150/11]
    via fe80::21c:41ff:fe00:d120, Ethernet12
O   fd7a:3279:81a4:1114::/64 [150/11]
    via fe80::21c:41ff:fe00:d120, Ethernet12
O   fd7a:3279:81a4:1124::/64 [10/20]
    via fe80::21c:41ff:fe01:5fe1, Vlan3901
    via fe80::21c:41ff:fe01:5fe1, Vlan3902
    via fe80::21c:41ff:fe01:5fe1, Vlan3908
O   fd7a:3279:81a4:1a00::25/128 [150/11]
    via fe80::21c:41ff:fe00:d120, Ethernet12
O   fd7a:3279:81a4:1a00::28/128 [150/11]
    via fd7a:3279:81a4:fe00::5, Vlan3908
```
32.4 OSPFv3 Configuration Examples

This section describes the commands required to configure three OSPFv3 topologies.

32.4.1 OSPFv3 Configuration Example 1

The AS in Example 1 contains two areas that are connected through two routers. The backbone area also contains an internal router that connects two links.

32.4.1.1 Example 1 Topology

Figure 32-3 displays the Example 1 topology. Two ABRs connect area 0 and area 1 – Router A and Router B. Router C is an internal router that connects two links in area 0. Area 0 is normal; area 1 is stub.

Figure 32-3: OSPFv3 Example 1

---

**Area 1 Configuration**

Area 1 contains links to ABRs Router A and Router B.

- Router A is accessed through VLAN 301.
- Router B is accessed through VLAN 401.
- Designated Router (DR): Router A.
- Backup Designated Router (BDR): Router B.
- Each router defines an interface cost of 10.
- Router priority is not specified for either router on area 1.

**Area 0 ABR Configuration**

Area 0 contains links to ABRs Router A and Router B.

- Router A is accessed through VLAN 302.
- Router B is accessed through VLAN 402.
- Designated Router (DR): Router B.
- Backup Designated Router (BDR): Router A.
- Each router defines an interface cost of 20.
- Each router defines a retransmit-interval of 10.
- Each router defines a transmit-delay of 2.
Route priority is specified such that Router B will be elected as the Designated Router.

**Area 0 IR Configuration**

Area 0 contains two links to an internal router.

- Router C is accessed through VLAN 501 and VLAN 502.
- VLAN 501 is configured as follows:
  - Interface cost of 20.
  - Retransmit-interval of 10.
  - Transmit-delay of 2.
- VLAN 502 is configured as follows:
  - Interface cost of 20.
  - Dead interval of 80 seconds.

### 32.4.1.2 Example 1 Code

This code configures the OSPFv3 instances on the three switches.

**Step 1** Configure the areas and router IDs.

**a** Router A OSPFv3 instance configuration:

```plaintext
switch-A(config)#ipv6 router ospf 100
switch-A(config-router-ospfv3)#area 1 stub
switch-A(config-router-ospfv3)#router-id 10.17.0.1
```

**b** Router B OSPFv3 instance configuration:

```plaintext
switch-B(config)#ipv6 router ospf 100
switch-B(config-router-ospfv3)#area 1 stub
switch-B(config-router-ospfv3)#router-id 10.17.0.2
```

**c** Router C OSPFv3 instance configuration: interfaces:

```plaintext
switch-C(config)#ipv6 router ospf 100
switch-C(config-router-ospfv3)#router-id 10.17.0.3
```

**Step 2** Configure the interface OSPFv3 area and transmission parameters.

**a** Router A interfaces:

```plaintext
switch-A(config)#interface vlan 301
switch-A(config-if-Vl301)#ipv6 ospf 100 area 1
switch-A(config-if-Vl301)#ospfv3 cost 10
switch-A(config-if-Vl301)#ospfv3 priority 6
switch-A(config-if-Vl301)#exit
switch-A(config)#interface vlan 302
switch-A(config-if-Vl302)#ipv6 ospf 100 area 0
switch-A(config-if-Vl302)#ospfv3 cost 20
switch-A(config-if-Vl302)#ospfv3 ipv6 retransmit-interval 10
switch-A(config-if-Vl302)#ospfv3 transmit-delay 2
switch-A(config-if-Vl302)#ospfv3 priority 4
```
b Router B interfaces:

```bash
switch-B(config)#interface vlan 401
switch-B(config-if-Vl401)#ipv6 ospf 100 area 1
switch-B(config-if-Vl401)#ospfv3 cost 10
switch-B(config-if-Vl401)#ospfv3 priority 4
switch-B(config-if-Vl401)#exit

switch-B(config)#interface vlan 402
switch-B(config-if-Vl402)#ipv6 ospf 100 area 0
switch-B(config-if-Vl402)#ospfv3 cost 20
switch-B(config-if-Vl402)#ospfv3 ipv6 retransmit-interval 10
switch-B(config-if-Vl402)#ospfv3 transmit-delay 2
switch-B(config-if-Vl402)#ospfv3 priority 6
```

c Router C interfaces:

```bash
switch-C(config)#interface vlan 501
switch-C(config-if-Vl501)#ipv6 ospf 100 area 0
switch-C(config-if-Vl501)#ospfv3 cost 20
switch-C(config-if-Vl501)#ospfv3 ipv6 retransmit-interval 10
switch-C(config-if-Vl501)#ospfv3 transmit-delay 2
switch-C(config-if-Vl501)#exit

switch-C(config)#interface vlan 502
switch-C(config-if-Vl502)#ipv6 ospf 100 area 0
switch-C(config-if-Vl502)#ospfv3 cost 20
switch-C(config-if-Vl502)#ospfv3 dead-interval 80
```

32.4.2 OSPFv3 Configuration Example 2

The AS in Example 2 contains three areas. Area 0 connects to the other areas through different routers and contains an internal router connecting two links. Area 0 is normal; the other areas are stub areas.
32.4.2.1 Example 2 Topology

Figure 32-4 displays the Example 2 topology. One ABR (Router B) connects area 0 and area 1; another ABR (router C) connects area 0 and area 2. Router A is an internal router that connects two links in area 0.

Figure 32-4: OSPFv3 Example 2

Area 1 Configuration
Area 1 contains one link that is accessed by Router B.
- Router B is accessed through VLAN 601.
- The router defines a interface cost of 10.

Area 2 Configuration
Area 2 contains one link that is accessed by Router C.
- Router C is accessed through VLAN 802.
- The router defines a interface cost of 20.

Area 0 ABR Configuration
One ABR Router B link connects area 1 to area 0. One ABR Router C link connects area 0 to area 2.
- Router B is accessed through VLAN 602.
• Router C is accessed through VLAN 801.
• Designated Router (DR): Router B.
• Backup Designated Router (BDR): Router C.
• Each router defines an interface cost of 20.
• Each router defines a retransmit-interval of 10.
• Each router defines a transmit-delay of 2.

**Area 0 IR Configuration**

Area 0 contains links connected by an internal router.

• Router A is accessed through VLAN 701 and 702.
• The VLAN 701 link is configured as follows:
  • Interface cost of 10.
• The VLAN 702 link is configured as follows:
  • Interface cost of 20.
  • Retransmit-interval of 10.
  • Transmit-delay of 2.

32.4.2.2 Example 2 Code

**Step 1** Configure the areas and router IDs.

a  Router A OSPFv3 instance configuration:

```plaintext
switch-A(config)#ipv6 router ospf 200
switch-A(config-router-ospfv3)#router-id 10.24.1.10
```

b  Router B OSPFv3 instance configuration:

```plaintext
switch-B(config)#ipv6 router ospf 200
switch-B(config-router-ospfv3)#area 1 stub
switch-B(config-router-ospfv3)#router-id 10.24.2.10
```

c  Router C OSPFv3 instance configuration:

```plaintext
switch-C(config)#ipv6 router ospf 200
switch-C(config-router-ospfv3)#area 1 stub
switch-C(config-router-ospfv3)#router-id 10.25.2.12
```

**Step 2** Configure the interface OSPFv3 area and transmission parameters.

a  Router A interfaces:

```plaintext
switch-A(config)#interface vlan 701
switch-A(config-if-Vl701)#ipv6 ospf 200 area 0
switch-A(config-if-Vl701)#ospfv3 cost 10
switch-A(config-if-Vl701)#exit
switch-A(config)#interface vlan 702
switch-A(config-if-Vl702)#ipv6 ospf 200 area 0
switch-A(config-if-Vl702)#ospfv3 cost 20
switch-A(config-if-Vl702)#ospfv3 ipv6 retransmit-interval 10
switch-A(config-if-Vl702)#ospfv3 transmit-delay 2
```
b  Router B interfaces:

switch-B(config)#interface vlan 601
switch-B(config-if-Vl601)#ospfv3 200 area 1
switch-B(config-if-Vl601)#ospfv3 cost 10
switch-B(config-if-Vl601)#exit
switch-B(config)#interface vlan 602
switch-B(config-if-Vl602)#ospfv3 200 area 0
switch-B(config-if-Vl602)#ospfv3 cost 20
switch-B(config-if-Vl602)#ospfv3 ipv6 retransmit-interval 10
switch-B(config-if-Vl602)#ospfv3 transmit-delay 2
switch-B(config-if-Vl602)#ospfv3 priority 6

c  Router C interfaces:

switch-C(config)#interface vlan 801
switch-C(config-if-Vl801)#ospfv3 200 area 0
switch-C(config-if-Vl801)#ospfv3 cost 20
switch-C(config-if-Vl801)#ospfv3 ipv6 retransmit-interval 10
switch-C(config-if-Vl801)#ospfv3 transmit-delay 2
switch-C(config-if-Vl801)#exit
switch-C(config)#interface vlan 802
switch-C(config-if-Vl802)#ospfv3 200 area 2
switch-C(config-if-Vl802)#ospfv3 cost 20
switch-C(config-if-Vl802)#ospfv3 dead-interval 80

32.4.3 OSPFv3 Configuration Example 3

The AS in Example 3 contains two areas that connect through one ABR. Each area also contains an ASBR that connects static routes to the AS.
32.4.3.1 Example 3 Topology

Figure 32-5 displays the Example 3 topology. One ABR connects area 0 and area 1. Router C is an ABR that connects the areas. Router A is an internal router that connects two links in area 1. Router D and Router E are internal routers that connect links in area 0. Router B and Router F are ASBRs that connect static routes outside the AS to area 1 and area 0, respectively.

Figure 32-5: OSPFv3 Example 3

---

**Area 0 ABR Configuration**

ABR Router C connects one area 0 link to an area 1 link.

- Router C is accessed through VLAN 1302.
- All interface OSPFv3 parameters are set to their default values.

**Area 0 IR Configuration**

Area 0 contains two internal routers, each of which connects two of the three links in the area.

- Router D is accessed through VLAN 1401 and VLAN 1402.
- Router E is accessed through VLAN 1501 and VLAN 1502.
- All interface OSPFv3 parameters are set to their default values.

**Area 0 ASBR Configuration**

ASBR Router F connects one area 0 link to an external link.

- Router F is accessed through VLAN 1601.
- Router F connects to the external AS through VLAN 1602.
- All interface OSPFv3 parameters are set to their default values.
Area 1 ABR Configuration
ABR Router C connects one area 0 link to an area 1 link.
- Router C is accessed by area 1 through VLAN 1301.
- Router C is accessed by area 0 through VLAN 1302.
- All interface OSPFv3 parameters are set to their default values.

Area 1 IR Configuration
Area 1 contains one internal router that connects two links in the area.
- Router A is accessed through VLAN 1101 and VLAN 1102.
- All interface OSPFv3 parameters are set to their default values.

Area 1 ASBR Configuration
ASBR Router B connects one area 1 link to an external link.
- Router B is access through VLAN 1201.
- Router B connects to the external AS through VLAN 1202.
- All interface OSPFv3 parameters are set to their default values.

32.4.3.2 Example 3 Code

Step 1 Configure the areas and router IDs.

a  Router A OSPFv3 instance configuration:
   switch-A(config)#ipv6 router ospf 300
   switch-A(config-router-ospfv3)#router-id 10.12.15.10
   switch-A(config-router-ospfv3)#area 1 stub

b  Router B OSPFv3 instance configuration:
   switch-B(config)#ipv6 router ospf 300
   switch-B(config-router-ospfv3)#router-id 10.12.15.12
   switch-B(config-router-ospfv3)#area 1 stub

c  Router OSPFv3 instance configuration:
   switch-C(config)#ipv6 router ospf 300
   switch-C(config-router-ospfv3)#router-id 10.12.15.13
   switch-C(config-router-ospfv3)#area 1 stub

d  Router D OSPFv3 instance configuration:
   switch-D(config)#ipv6 router ospf 300
   switch-D(config-router-ospfv3)#router-id 10.12.15.14

e  Router E OSPFv3 instance configuration:
   switch-E(config)#ipv6 router ospf 300
   switch-E(config-router-ospfv3)#router-id 10.12.15.15

f  Router F OSPFv3 instance configuration:
   switch-F(config)#ipv6 router ospf 300
   switch-F(config-router-ospfv3)#router-id 10.12.15.31
Step 2  Configure the interfaces.

a  Router A interfaces:

switch-A(config)#interface vlan 1101
switch-A(config-if-Vl1101)#ospfv3 300 area 1
switch-A(config-if-Vl1101)#exit
switch-A(config)#interface vlan 1102
switch-A(config-if-Vl1102)#ospfv3 300 area 1

b  Router B interfaces:

switch-B(config)#interface vlan 1201
switch-B(config-if-Vl1201)#ospfv3 300 area 1
switch-B(config-if-Vl1201)#exit

c  Router C interfaces:

switch-C(config)#interface vlan 1301
switch-C(config-if-Vl1301)#ospfv3 300 area 1
switch-C(config-if-Vl1301)#exit
switch-C(config)#interface vlan 1302
switch-C(config-if-Vl1302)#ospfv3 300 area 0

d  Router D interfaces:

switch-D(config)#interface vlan 1401
switch-D(config-if-Vl1401)#ospfv3 300 area 0
switch-D(config-if-Vl1401)#exit
switch-D(config)#interface vlan 1402
switch-D(config-if-Vl1402)#ospfv3 300 area 0

e  Router E interfaces:

switch-E(config)#interface vlan 1501
switch-E(config-if-Vl1501)#ospfv3 300 area 0
switch-E(config-if-Vl1501)#exit
switch-E(config)#interface vlan 1502
switch-E(config-if-Vl1502)#ospfv3 300 area 0

f  Router F interfaces:

switch-F(config)#interface vlan 1601
switch-F(config-if-Vl1601)#ospfv3 300 area 0
switch-F(config-if-Vl1601)#exit
32.5 OSPFv3 Commands

Global Configuration Mode
- clear ospfv3 ipv6 force-spf
- ipv6 router ospf

Interface Configuration Mode
- ipv6 ospf area
- ospfv3 authentication ipsec spi
- ospfv3 cost
- ospfv3 dead-interval
- ospfv3 encryption ipsec spi
- ospfv3 hello-interval
- ospfv3 ipv6 retransmit-interval
- ospfv3 network
- ospfv3 priority
- ospfv3 transmit-delay

Router-OSPFv3 Configuration Mode
- adjacency exchange-start threshold (OSPFv3)
- area authentication ipsec spi
- area default-cost (OSPFv3)
- area encryption ipsec spi
- area nssa (OSPFv3)
- area nssa default-information-originate (OSPFv3)
- area not-so-stubby lsa type-7 convert type-5 (OSPFv3)
- area range (OSPFv3)
- area stub (OSPFv3)
- default-information originate (OSPFv3)
- default-metric (OSPFv3)
- distance ospf intra-area (OSPFv3)
- log-adjacency-changes (OSPFv3)
- max-metric router-lsa (OSPFv3)
- maximum-paths (OSPFv3)
- no area (OSPFv3)
- passive-interface (OSPFv3)
- redistribute (OSPFv3)
- router-id (OSPFv3)
- shutdown (OSPFv3)
- timers
- timers lsa rx min interval (OSPFv3)
- timers lsa tx delay initial (OSPFv3)
- timers spf delay initial (OSPFv3)

Display Commands
- show ipv6 ospf
- show ipv6 ospf border-routers
- show ipv6 ospf database
- show ipv6 ospf database<link-state details>
- show ipv6 ospf database <link state list>
- show ipv6 ospf database link
- show ipv6 ospf database link if-name
- show ipv6 ospf database link if-type
- show ipv6 ospf interface
- show ipv6 ospf ls-a-log
- show ipv6 ospf neighbor
- show ipv6 ospf neighbor state
- show ipv6 ospf neighbor summary
- show ipv6 ospf spf-log
- show ospfv3
adjacency exchange-start threshold (OSPFv3)

The `adjacency exchange-start threshold` command sets the exchange-start options for an OSPF instance.

The `no adjacency exchange-start threshold` and `default adjacency exchange-start threshold` command resets the default by removing the corresponding `adjacency exchange-start threshold` command from `running-config`.

**Command Mode**

Router-OSPFv3 Configuration

**Command Syntax**

```
adjacency exchange-start threshold peers
no adjacency exchange-start threshold
default adjacency exchange-start threshold
```

**Parameters**

- `peers`  Value ranges from 1 4294967295. Default value is 10.

**Example**

- This command sets the adjacency exchange start threshold to 156923.

```
switch(config)#ipv6 router ospf 3
switch(config-router-ospf3)#adjacency exchange-start threshold 156923
switch(config-router-ospf3)#
```
area authentication ipsec spi

The `area authentication ipsec spi` command configures OSPFv3 authentication on an area. The `default area authentication` and `no area authentication` commands delete the OSPFv3 authentication on an area.

**Command Mode**

Router-OSPFv3 Configuration

**Command Syntax**

```plaintext
area area_id authentication ipsec spi spi_value {md5 | sha1} {0 unencrypted_key
| 7 hidden_key | KEY}

area area_id authentication ipsec spi spi_value {md5 | sha1} passphrase {0
unencrypted_key | 7 hidden_key | LINE}

default area area_id authentication

no area area_id authentication
```

**Parameters**

- `area area_id` configures OSPF area ID in either IP address or decimal formats. The value for decimal format ranges from 0 to 4294967295.
- `spi spi_value` configures the IPsec Security Parameter Index. The value ranges from 0 to 4294967295.
- `md5` configures HMAC-MD5 hash algorithm.
- `sha1` configures HMAC-SHA1 algorithm.
- `0 unencrypted_key` configures either a 192 bit 3DES key or 128/192/256 bit AES key in an unencrypted format.
- `7 encrypted_key` configures either a 192 bit 3DES key or 128/192/256 bit AES key in an encrypted format.
- `KEY` configures either a 128 bit MD5 key or a 140 bit SHA1 key.
- `passphrase` configures passphrase for authentication and encryption. Options include:
  - `0 unencrypted_passphrase` configures an unencrypted key.
  - `7 encrypted_passphrase` configures an encrypted key.
  - `LINE` uses passphrase string to derive keys for authentication and encryption.

**Related Commands**

- `ospfv3 authentication ipsec spi`
- `area encryption ipsec spi`

**Guidelines**

Passphrase and key value are exclusive. MD5 and SHA1 keys are derived from the configured passphrase.

**Restriction**

On the same area, EOS allows security configuration with either AH or ESP but not both. We can have one area configured with AH and another with ESP.
Examples

- This command configures OSPFv3 authentication on an area with MD5 hash algorithm.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#area 0.0.0.0 authentication ipsec spi 34 md5 0 8FD6158BFE81ADD961241D8E4169D411
switch(config-router-ospf3)#show active
ipv6 router ospf 9
area 0.0.0.0 authentication ipsec spi 34 md5 7 $1$cNpcrQl1czqdvKAzKLtYVr6i7+R3niuWouDKKYCFN4s4/XOWG/1ap5Q==
```

- This command configures OSPFv3 authentication on an area with SHA1 algorithm.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#area 0.0.0.0 authentication ipsec spi 5789 sha1 passphrase 7
$1$Ab754G0OHbGllIKqlCl7lyUKscUlpPTpvcQxQ1hjJm1OUzGJDh4bLWxs6KHvW4Mo6
switch(config-router-ospf3)#show active
ipv6 router ospf 9
area 0.0.0.0 authentication ipsec spi 5789 sha1 passphrase 7
Ab754G0OHbGllIKqlCl7lyUKscUlpPTpvcQxQ1hjJm1OUzGJDh4bLWxs6KHvW4Mo6
```

- This command deletes the OSPFv3 authentication on an area.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#show active
ipv6 router ospf 9
  area 1.1.1.1 authentication ipsec spi 2437 md5 7 cNpcrQl1czqdvKAzKLtYVr6i7+R3niuWouDKKYCFN4s4/XOWG/1ap5Q==
  area 0.0.0.0 authentication ipsec spi 5789 sha1 passphrase 7

```

2197
area default-cost (OSPFv3)

The area default-cost command sets the cost for the default summary routes sent into an area. When the area default-cost command is not configured for an area, the default-cost of that area is set to 10.

The no area default-cost and default area default-cost command resets the default-cost value of the specified area to 10 by removing the corresponding area default-cost command from running-config. The no area (OSPFv3) command removes all area commands for the specified area from running-config, including the area default-cost command.

Command Mode
Router-OSPFv3 Configuration

Command Syntax
area area_id default-cost def_cost
no area area_id default-cost
default area area_id default-cost

Parameters
- area_id area number. <0 to 4294967295> or <0.0.0.0 to 255.255.255.255>
  Running-config stores value in dotted decimal notation.
- def_cost Values range from 1 to 65535.

Example
- These commands configure a cost of 15 for default summary routes that an ABR sends into area 100.

  switch(config)#ipv6 router ospf 9
  switch(config-router-ospf3)#area 100 default 15
  switch(config-router-ospf3)#show active
  ipv6 router ospf 9
    area 0.0.0.100 default-cost 15
  switch(config-router-ospf3)#
area encryption ipsec spi

The `area encryption ipsec spi` command configures OSPFv3 security on an area.

The `default area area_id encryption` and `no area area_id encryption` commands delete the OSPFv3 security on an area.

**Command Mode**

Router-OSPFv3 Configuration

**Command Syntax**

```plaintext
area area_id encryption ipsec spi spi_value esp {3des-cbc | aes-128-cbc | aes-192-cbc | aes-256-cbc} {0 unencrypted_key | 7 encrypted_key} {md5 | sha1} {0 unencrypted_key | 7 encrypted_key | KEY}

area area_id encryption ipsec spi spi_value esp null {md5 | sha1} {0 unencrypted_key | 7 encrypted_key | KEY}

area area_id encryption ipsec spi spi_value esp {3des-cbc | aes-128-cbc | aes-192-cbc | aes-256-cbc | null} {md5 | sha1} passphrase {0 unencrypted_passphrase | 7 encrypted_passphrase | LINE}

default area area_id encryption

no area area_id encryption
```

**Parameters**

- `area area_id` configures OSPF area ID in either IP address or decimal formats. The value for decimal format ranges from 0 to 4294967295.
- `spi spi_value` configures the value for IPsec Security Parameter Index. The value ranges from 0 to 4294967295.
- `3des-cbc` configures ESP with 3DES-CBC encryption.
- `aes-128-cbc` configures ESP with AES-128-CBC encryption.
- `aes-192-cbc` configures ESP with AES-192-CBC encryption.
- `aes-256-cbc` configures ESP with AES-256-CBC encryption.
- `null` configures ESP with null encryption.
- `0 unencrypted_key` configures either a 192 bit 3DES key or 128/192/256 bit AES key in an unencrypted format.
- `7 encrypted_key` configures either a 192 bit 3DES key or 128/192/256 bit AES key in an encrypted format.
- `KEY` configures either a 128 bit MD5 key or a 140 bit SHA1 key.
- `md5` configures HMAC-MD5 hash algorithm.
- `sha1` configures HMAC-SHA1 algorithm.
- `passphrase` configures passphrase for authentication and encryption. Options include:
  - `0 unencrypted_passphrase` configures an unencrypted key.
  - `7 encrypted_passphrase` configures an encrypted key.
  - `LINE` uses passphrase string to derive keys for authentication and encryption.

**Related Commands**

- `area authentication ipsec spi`
• ospfv3 encryption ipsec spi

Guidelines
Passphrase and key value are exclusive. MD5 and SHA1 keys are derived from the configured passphrase.

Restriction
On the same area, EOS allows security configuration with either AH or ESP but not both. We can have one area configured with AH and another with ESP.

Examples
• This command configures OSPFv3 security on an area with 3DES-CBC encryption and MD5 hash algorithm.

switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#area 0.0.0.0 encryption ipsec spi 5678 esp 3des-cbc md5 passphrase 0 8FD6158BBFE81ADD961241DBE4169D411
switch(config-router-ospf3)#show active
ipv6 router ospf 9
  area 0.0.0.0 encryption ipsec spi 5678 esp 3des-cbc md5 passphrase 7 $1$cNpcrQl1czqdvKAzKLtYVr6I7+R3niuWouDRKYGCFN4s7/XOWG/Iap5Q==
switch (config-router-ospf3)#

• This command deletes the OSPFv3 security on an area.

switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#show active
ipv6 router ospf 9
  area 0.0.0.0 encryption ipsec spi 5678 esp 3des-cbc md5 passphrase 7 $1$cNpcrQl1czqdvKAzKLtYVr6I7+R3niuWouDRKYGCFN4s7/XOWG/Iap5Q==
switch(config-router-ospf3)#no area 0.0.0.0 encryption
switch(config-router-ospf3)#show active
ipv6 router ospf 9
switch(config-router-ospf3)#
area nssa (OSPFv3)

The area nssa command configures an OSPFv3 area as a not-so-stubby area (NSSA). All routers in an AS must specify the same area type for identically numbered areas.

NSSA ASBRs advertise external LSAs that are part of the area, but do not advertise external LSAs from other areas.

Areas are normal by default; area type configuration is required only for stub NSSA areas. Area 0 is always a normal area and cannot be configured through this command.

The no area nssa command configures the specified area as a normal area by removing the specified area nssa command from running-config.

Command Mode
   Router-OSPFv3 Configuration

Command Syntax
   area area_id nssa [TYPE]
   no area area_id nssa [TYPE]
   default area area_id nssa [TYPE]

Parameters
   - area_id
     - Valid formats: integer <1 to 4294967295> or dotted decimal <0.0.0.1 to 255.255.255.255>
     - Area 0 (or 0.0.0.0) is not configurable; it is always normal.
     - Running-config stores value in dotted decimal notation.
   - TYPE
     - Values include:
       - <no parameter>
       - nssa-only

Example
   - This command configures area 3 as a NSSA area.
     switch(config)#ipv6 router ospf 1
     switch(config-router-ospf3)#area 3 nssa nssa-only
     switch(config-router-ospf3)#
area nssa default-information-originate (OSPFv3)

The `area nssa default-information-originate` command sets an area as an NSSA and the generation of a type 7 default LSAs is created if a default route exists in the routing table.

The switch supports three area types:

Areas are `normal` by default; area type configuration is required only for stub NSSA areas. Area 0 is always a normal area and cannot be configured through this command.

The `no area` and `default area` commands remove the specified area from the OSPFv3 instance by deleting all area commands from `running-config` for the specified area, including the `area default-cost (OSPFv3)` command.

The `no area stub` and `default area stub` commands configure the specified area as a normal area.

**Command Mode**

Router-OSPFv3 Configuration

**Command Syntax**

```
area area_id nssa default-information-originate [VALUE] [TYPE] [EXCL]
no area area_id nssa default-information-originate [VALUE] [TYPE] [EXCL]
default area area_id nssa default-information-originate [VALUE] [TYPE] [EXCL]
```

All parameters except `area_id` can be placed in any order.

**Parameters**

- `area_id`
  - Valid formats: integer <1 to 4294967295> or dotted decimal <0.0.0.1 to 255.255.255.255>
  - Area 0 (or 0.0.0.0) is not configurable; it is always `normal`.
  - `Running-config` stores value in dotted decimal notation.
- `VALUE`
  - Values include:
    - <no parameter>
    - `metric <1-65535>`
- `TYPE`
  - Values include:
    - <no parameter>
    - `metric-type <1-2>`
- `EXCL`
  - Values include:
    - <no parameter>
    - `nssa-only`

**Example**

- These commands sets area 1 as NSSA only and generates a type 7 default LSA if a default route exists in the routing table.
  ```
  switch(config-router-ospf3)# area 3 nssa default-information-originate nssa-only
  switch(config-router-ospf3)#
  ```
- These commands generates a type 7 default route.
  ```
  switch(config-router-ospf3)# area 3 nssa default-information-originate
  switch(config-router-ospf3)#
  ```
area not-so-stubby lsa type-7 convert type-5 (OSPFv3)

The area not-so-stubby lsa type-7 convert type-5 command configures the switch to always translate Type-7 link-state advertisement (LSAs) to Type-5 LSAs.

The no area not-so-stubby lsa type-7 convert type-5 and no area not-so-stubby lsa type-7 convert type-5 commands allow LSAs to be translated dynamically by removing the no area not-so-stubby lsa type-7 convert type-5 command from running-config.

Command Mode
Router-OSPFv3 Configuration

Command Syntax

area area_id not-so-stubby lsa type-7 convert type-5
no area_id not-so-stubby lsa type-7 convert type-5
default area_id not-so-stubby lsa type-7 convert type-5

Parameters

- area_id
  - Valid formats: integer <1 to 4294967295> or dotted decimal <0.0.0.1 to 255.255.255.255>
  - Area 0 (or 0.0.0.0) is not configurable; it is always normal.
  - Running-config stores value in dotted decimal notation.

Example

- These commands configure the switch to always translate Type-7 link-state advertisement (LSAs) to Type-5 LSAs.

  switch(config)#ipv6 router ospf 3
  switch(config-router-ospf)#area 3 not-so-stubby lsa type-7 convert type-5
  switch(config-router-ospf)#
area range (OSPFv3)

The **area range** command is used by OSPFv3 area border routers to summarize routes.

The **no area range** and **default area range** commands remove the area-range by deleting the corresponding **area range** command from **running-config**.

**Command Mode**

Router-OSPFv3 Configuration

**Command Syntax**

```
area area_id range net_addr [ADVERTISE_SETTING] [COST_SETTING]
no area area_id range net_addr [ADVERTISE_SETTING] [COST_SETTING]
default area area_id range net_addr [ADVERTISE_SETTING] [COST_SETTING]
```

**Parameters**

- **area_id** <0 to 4294967295> or <0.0.0.0 to 255.255.255.255>
- **net_addr**
- **ADVERTISE_SETTING** specifies the LSA advertising activity. Values include
  - <no parameter>
  - advertise
  - not-advertise
- **COST_SETTING** Values include
  - <no parameter>
  - cost range_cost Value ranges from 1 to 65535.

**Examples**

- These commands summarize routes at an area boundary 1.
  ```bash
  switch(config)#ipv6 router ospf 1
  switch(config-router-ospf3)#area 1 range 2001:0DB8:0:1::/64
  switch(config-router-ospf3)#
  ```

- These commands modify the address range status to DoNotAdvertise.
  ```bash
  switch(config)#ipv6 router ospf 1
  switch(config-ospf6-router)#area 1 range 2001:0DB8:0:1::/64 not-advertise
  switch(config-ospf6-router)#
  ```
area stub (OSPFv3)

The `area stub` command configures the area type of an OSPFv3 area. Areas are *normal* by default.

The `no area stub` command configures the specified area as a normal area.

**Command Mode**

Router-OSPFv3 Configuration

**Command Syntax**

```
area area_id stub
no area area_id stub
default area area_id stub
```

**Parameters**

- `area_id`
  - Valid formats: integer <1 to 4294967295> or dotted decimal <0.0.0.1 to 255.255.255.255>
  - Area 0 (or 0.0.0.0) is not configurable; it is always *normal*.
  - *Running-config* stores value in dotted decimal notation.

**Examples**

- This command configures area 45 as a stub area.
  
  switch(config)#ipv6 router ospf 3  
  switch(config-router-ospf3)#area 45 stub

- This command configures area 10.92.148.17 as a stub area.
  
  switch(config-router-ospf3)#area 10.92.148.17 stub
clear ospfv3 ipv6 force-spf

The clear ospfv3 ipv6 force-spf command starts the SPF algorithm without clearing the OSPF database.

**Command Mode**

Privileged EXEC

**Command Syntax**

```
clear ospfv3 ipv6 force-spf [VRF_INSTANCE]
```

**Parameters**

- **VRF_INSTANCE** Values include:
  - `<no parameter>` Action is performed in the default VRF.
  - `vrf vrf_name` Action is performed in the specified VRF.

**Example**

- This command restarts the SPF algorithm in the default VRF without first clearing the OSPFv3 database.

```
switch(config)#clear ospfv3 ipv6 force-spf
switch(config)#
```
default-information originate (OSPFv3)

The **default-information originate** command generates a default external route into an OSPF domain.

The **no default-information originate** and **default default-information originate** command removes the configuration from the *running-config*.

**Command Mode**

Router-OSPFv3 Configuration

**Command Syntax**

```
default-information originate [DURATION] [VALUE] [TYPE] [MAP]
no default-information originate
default default-information originate
```

All parameters can be placed in any order.

**Parameters**

- **DURATION** Values include:
  - <no parameter>
  - always
- **VALUE** Values include:
  - <no parameter>
  - metric <1-65535>
- **TYPE** Values include:
  - <no parameter>
  - metric-type <1-2>
- **MAP** Values include:
  - <no parameter>
  - route-map *map_name*

**Examples**

- These commands will advertise the OSPFv3 default route regardless of whether the switch has a default route configured.

  ```
  switch(config)#ipv6 router ospf 1
  switch(config-router-ospf3)#default-information originate always
  switch(config-router-ospf3)#show active
  ipv6 router ospf 1
  default-information originate always
  ```

- These commands configures OSPF area 1 as metric of 100 for the default route with an external metric type of Type 1.

  ```
  switch(config)#ipv6 router ospf 1
  switch(config-router-ospf3)#default-information originate metric 100 metric-type 1
  switch(config-router-ospf3)#show active
  ipv6 router ospf 1
  default-information originate metric 100 metric-type 1
  ```
default-metric (OSPFv3)

The **default-metric** command sets default metric value for routes redistributed into the OSPFv3 domain.

The **no default-metric** and **default default-metric** commands restores the default metric to its default value of 10 by removing the **default-metric** command from **running-config**.

**Command Mode**

Router-OSPFv3 Configuration

**Command Syntax**

```
default-metric  def_metric
no default-metric
default default-metric
```

**Parameters**

- **def_metric** Values range from 1 to 65535. Default value is 10.

**Example**

- These commands configure a default metric of 30 for routes redistributed into OSPFv3.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#default-metric 30
switch(config-router-ospf3)#show active
ipv6 router ospf 9
  default-metric 30
switch(config-router-ospf3)#
```
**distance ospf intra-area (OSPFv3)**

The `distance ospf intra-area` command sets the administrative distance for routes in a single OSPFv3 area. The default is 110.

The `no distance ospf intra-area` and `default distance ospf intra-area` commands remove the `distance ospf intra-area` command from `running-config`, returning the OSPFv3 intra-area distance setting to the default value of 110.

**Command Mode**

Router-OSPFv3 Configuration

**Command Syntax**

```
distance ospf intra-area distance
no distance ospf intra-area
default distance ospf intra-area
```

**Parameters**

- `distance`  Values range from 1 to 255. Default is 110.

**Example**

- This command configures a distance of 90 for all OSPFv3 intra-area routes on the switch.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#distance ospf intra-area 90
switch(config-router-ospf3)#show active
ipv6 router ospf 9
distance ospf intra-area 90
switch(config-router-ospf3)#
```
**ipv6 ospf area**

The `ipv6 ospf area` command enables OSPFv3 on the interface and associates the area to the interface.

OSPFv3 areas are configured in by `no area (OSPFv3)` commands in router-OSPFv3 configuration mode.

The `no ipv6 ospf area` and `default ipv6 ospf area` commands disable OSPFv3 on the configuration mode interface by removing the corresponding `ipv6 ospf area` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```plaintext
ipv6 ospf process_id area area_id
no ipv6 ospf process_id [area area_id]
default ipv6 ospf process_id [area area_id]
```

**Parameters**

- `process_id`  Values range from 1 to 65535.
- `area_id`
  - Valid formats: integer `<0 to 4294967295>` or dotted decimal `<0.0.0.0 to 255.255.255.255>`
  - `Running-config` stores value in dotted decimal notation.

**Example**

- These commands enable OSPFv3 on VLAN interface 200 and associates area 0 to the interface.

```plaintext
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 ospf 9 area 0
switch(config-if-Vl200)#show active
interface Vlan200
  ipv6 ospf 9 area 0.0.0.0
switch(config-if-Vl200)#
```
ospfv3 authentication ipsec spi

The `ospfv3 authentication ipsec spi` command configures OSPFv3 authentication on an interface. The `default ospfv3 authentication` and `no ospfv3 authentication` commands delete the OSPFv3 authentication on an interface.

**Command Mode**
Interface-Ethernet Configuration

**Command Syntax**
```
ospfv3 authentication ipsec spi spi_value {md5 | sha1} {0 unencrypted_key | 7 hidden_key | KEY}
```
```
ospfv3 authentication ipsec spi spi_value {md5 | sha1} passphrase {0 unencrypted_passphrase | 7 encrypted_passphrase | LINE}
```
```
default ospfv3 authentication
```
```
no ospfv3 authentication
```

**Parameters**
- `spi spi_value` configures IPsec Security Parameter Index. The value ranges from 0 to 4294967295.
- `md5` configures HMAC-MD5 hash algorithm.
- `sha1` configures HMAC-SHA1 algorithm.
- `0 unencrypted_key` configures either a 192 bit 3DES key or 128/192/256 bit AES key in an unencrypted format.
- `7 encrypted_key` configures either a 192 bit 3DES key or 128/192/256 bit AES key in an encrypted format.
- `KEY` configures either a 128 bit MD5 key or a 140 bit SHA1 key.
- `passphrase` configures passphrase for authentication and encryption. Options include:
  - `0 unencrypted_passphrase` configures an unencrypted passphrase.
  - `7 encrypted_passphrase` configures an encrypted passphrase.
  - `LINE` uses passphrase string to derive keys for authentication and encryption.

**Related Commands**
- `area authentication ipsec spi`
- `ospfv3 encryption ipsec spi`

**Guidelines**
Passphrase and key value are exclusive. MD5 and SHA1 keys are derived from the configured passphrase.

Arista devices also support the legacy `ipv6 ospf authentication ipsec spi` command in certain software releases of the EOS.

**Restriction**
On the same interface, EOS allows security configuration with either AH or ESP but not both. We can have one interface configured with AH and another with ESP.
Examples

• This command configures OSPFv3 authentication on an interface with MD5 hash algorithm.

```bash
switch(config)#interface ethernet 9
switch(config-if-Et9)#ospfv3 authentication ipsec spi 3456 md5 0 8FD6158BFE81ADD961241D8E4169D411
switch(config-if-Et9)#show active
interface Ethernet9
  no switchport
ospfv3 authentication ipsec spi 3456 md5 7 $1$xtmcMSPzEn+Njp8Lb4qryVVOjKcsrYuv6dx10+nSwKQdaIrt2RPTQ==
switch(config-if-Et9)#
```

• This command configures OSPFv3 authentication on an interface with SHA1 algorithm.

```bash
switch(config)#interface ethernet 9
switch(config-if-Et9)#ospfv3 authentication ipsec spi 987 sha1 7 $1$VmUkWk6IL2S343bR3BbH0RhgVxHhwBpfvB4VXK00QGF7HJBp5VvBfBaYygCkWU
switch(config-if-Et9)#show active
interface Ethernet9
  no switchport
ospfv3 authentication ipsec spi 987 sha1 7 $1$VmUkWk6IL2S343bR3BbH0RhgVxHhwBpfvB4VXK00QGF7HJBp5VvBfBaYygCkWU
switch(config-if-Et9)#
```

• This command deletes the OSPFv3 authentication on an interface.

```bash
switch(config)#interface ethernet 9
switch(config-if-Et9)#show active
interface Ethernet9
  no switchport
ospfv3 authentication ipsec spi 3456 md5 7 $1$xtmcMSPzEn+Njp8Lb4qryVVOjKcsrYuv6dx10+nSwKQdaIrt2RPTQ==
switch(config-if-Et9)#no ospfv3 authentication
switch(config-if-Et9)#show active
interface Ethernet9
  no switchport
switch(config-if-Et9)#
```
ospfv3 cost

The `ospfv3 cost` command sets the OSPFv3 cost for the interface. The default OSPFv3 cost is 10.

The `no ospfv3 cost` and `default ospfv3 cost` commands restore the default cost of 10 for the configuration mode interface by removing the corresponding `ospfv3 cost` command from `running-config`.

Command Mode
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

Command Syntax
- `ospfv3 cost interface_cost`
- `no ospfv3 cost`
- `default ospfv3 cost`

Parameters
- `interface_cost` Value ranges from 1 to 65535; default is 10.

Guideline
Arista devices also support the legacy `ipv6 ospf cost` command in certain software releases of the EOS.

Example
- This command configures a cost of 50 for VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ospfv3 cost 50
switch(config-if-Vl200)#show active
interface Vlan200
  ospfv3 cost 50
switch(config-if-Vl200)#
```
**ospfv3 dead-interval**

The `ospfv3 dead-interval` command sets the OSPFv3 dead interval.

The `no ospfv3 dead-interval` and `default ospfv3 dead-interval` commands restore the default dead interval of 40 seconds on the configuration mode interface by removing the corresponding `ospfv3 dead-interval` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

- `ospfv3 dead-interval time`
- `no ospfv3 dead-interval`
- `default ospfv3 dead-interval`

**Parameters**

- `time` Value ranges from 1 to 65535; default is 40.

**Guideline**

Arista devices also support the legacy `ipv6 ospf dead-interval` command in certain software releases of the EOS.

**Example**

- This command configures a dead interval of 75 seconds for VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ospfv3 dead-interval 75
switch(config-if-Vl200)#show active
interface Vlan200
  ospfv3 dead-interval 75
switch(config-if-Vl200)#
```
ospfv3 encryption ipsec spi

The `ospfv3 encryption ipsec spi` command configures OSPFv3 security on an interface.

The `default ospfv3 encryption` and `no ospfv3 encryption` commands delete the OSPFv3 security on an interface.

Command Mode

   Interface-Ethernet Configuration

Command Syntax

```
ospfv3 encryption ipsec spi spi_value esp {3des-cbc | aes-128-cbc | aes-128-cbc | aes-192-cbc} {0 unencrypted_key | 7 encrypted_key} {md5 | sha1} {0 unencrypted_key | 7 encrypted_key | KEY}

ospfv3 encryption ipsec spi spi_value esp {3des-cbc | aes-128-cbc | aes-128-cbc | aes-192-cbc} [md5 | sha1] passphrase {0 unencrypted_passphrase | 7 encrypted_passphrase | LINE}

ospfv3 encryption ipsec spi spi_value esp null {md5 | sha1} {0 unencrypted_key | 7 encrypted_key | KEY}

ospfv3 encryption ipsec spi spi_value esp null {md5 | sha1} passphrase {0 unencrypted_passphrase | 7 encrypted_passphrase | LINE}

default ospfv3 encryption

no ospfv3 encryption
```

Parameters

- `spi spi_value` configures the value for IPsec Security Parameter Index. The value ranges from 0 to 4294967295.
- `3des-cbc` configures ESP with 3DES-CBC encryption.
- `aes-128-cbc` configures ESP with AES-128-CBC encryption.
- `aes-192-cbc` configures ESP with AES-192-CBC encryption.
- `aes-256-cbc` configures ESP with AES-256-CBC encryption.
- `null` configures ESP with null encryption.
- `0 unencrypted_key` configures either a 192 bit 3DES key or 128/192/256 bit AES key in an unencrypted format.
- `7 encrypted_key` configures either a 192 bit 3DES key or 128/192/256 bit AES key in an encrypted format.
- `md5` configures HMAC-MD5 hash algorithm.
- `sha1` configures HMAC-SHA1 algorithm.
- `KEY` configures either a 128 bit MD5 key or a 140 bit SHA1 key.
- `passphrase` configures passphrase for authentication and encryption. Options include:
  - `0 unencrypted_passphrase` configures an unencrypted passphrase.
  - `7 encrypted_passphrase` configures an encrypted passphrase.
  - `LINE` uses passphrase string to derive keys for authentication and encryption.

Related Commands

- `area encryption ipsec spi`
• **ospfv3 authentication ipsec spi**

**Guidelines**
Passphrase and key value are exclusive. MD5 and SHA1 keys are derived from the configured passphrase.

Arista devices also support the legacy `ipv6 ospf encryption ipsec spi` command in certain software releases of the EOS.

**Restrictions**
On the same interface, EOS allows security configuration with either AH or ESP but not both. We can have one interface configured with AH and another with ESP.

**Examples**
• This command configures OSPFv3 security on an interface with 3DES-CBC encryption and SHA1 algorithm.

```bash
switch(config)#interface ethernet 9
switch(config-if-Et9)#ospfv3 encryption ipsec spi 345 esp 3des-cbc sha1 passphrase 0
2fd4e1c67a2d2faced849ee1bb76e7391b93eb12
switch(config-if-Et9)#show active
    interface Ethernet9
        no switchport
        ospfv3 encryption ipsec spi 345 esp 3des-cbc sha1 passphrase 7
            $1$VmUkWk6IL2S343bR3bbc80RkvxdWdpfvi4VXXNOOOGQ7HJ8p5VvXTfBASyvbCgKwU
        switch(config-if-Et9)#
```

• This command configures OSPFv3 security on an interface with 3DES-CBC encryption and MD5 hash algorithm.

```bash
switch(config)#interface ethernet 9
switch(config-if-Et9)#ospfv3 encryption ipsec spi 345 esp 3des-cbc md5 passphrase 7
2fd4e1c67a2d2faced849ee1bb76e7391b93eb12
switch(config-if-Et9)#show active
    interface Ethernet9
        no switchport
        ospfv3 encryption ipsec spi 345 esp 3des-cbc md5 passphrase 7
            $1$VmUkWk6IL2S343bR3bbc80RkvxdWdpfvi4VXXNOOOGQ7HJ8p5VvXTfBASyvbCgKwU
        switch(config-if-Et9)#
```

• This command deletes the OSPFv3 security on an interface.

```bash
switch(config)#interface ethernet 9
switch(config-if-Et9)#show active
    interface Ethernet9
        no switchport
        ospfv3 encryption ipsec spi 3456 md5 7 $1$xtmcMSPzEn+Njp8Lb4qryyVOjKcjysrYuv6dxIO+nSwQdaiRt2PcTQ==
        switch(config-if-Et9)#no ospfv3 encryption
        switch(config-if-Et9)#show active
        interface Ethernet9
            no switchport
        switch(config-if-Et9)#
```
**ospfv3 hello-interval**

The `ospfv3 hello-interval` command sets the OSPFv3 hello interval. The hello interval is the period between the transmission of consecutive hello packets.

Each OSPFv3 neighbor should be the same hello interval and should not be longer than any neighbor’s dead interval.

The `no ospfv3 hello-interval` and `default ospfv3 hello-interval` commands restore the default hello interval of 10 seconds on the configuration mode interface by removing the `ospfv3 hello-interval` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ospfv3 hello-interval time
no ospfv3 hello-interval
default ospfv3 hello-interval
```

**Parameters**
- `time` Values range from 1 to 65535; default is 10.

**Guideline**
Arista devices also support the legacy `ipv6 ospf hello-interval` command in certain software releases of the EOS.

**Example**
- This command configures a hello interval of 45 seconds for VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ospfv3 hello-interval 45
switch(config-if-Vl200)#show active
interface Vlan200
  ospfv3 hello-interval 45
switch(config-if-Vl200)#
```
ospfv3 ipv6 retransmit-interval

The `ospfv3 ipv6 retransmit-interval` command configures the link state advertisement retransmission interval.

The `no ospfv3 ipv6 retransmit-interval` and `default ospfv3 ipv6 retransmit-interval` commands restore the default retransmission interval of 5 seconds on the configuration mode interface by removing the corresponding `ospfv3 ipv6 retransmit-interval` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `ospfv3 ipv6 retransmit-interval period`
- `no ospfv3 ipv6 retransmit-interval`
- `default ospfv3 ipv6 retransmit-interval`

**Parameters**
- `period` Value ranges from 1 to 65535; default is 5.

**Example**
- This command configures a retransmission interval of 25 seconds for VLAN 200.
  ```
  switch(config)# interface vlan 200
  switch(config-if-Vl200)# ospfv3 ipv6 retransmit-interval 25
  switch(config-if-Vl200)# show active
  interface Vlan200
    ospfv3 ipv6 retransmit-interval 25
  switch(config-if-Vl200)#
  ```
ospfv3 network

The `ospfv3 network` command sets the configuration mode interface as a point-to-point link. By default, interfaces are set as broadcast links.

The `no ospfv3 network` and `default ospfv3 network` commands set the configuration mode interface as a broadcast link by removing the corresponding `ospfv3 network` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ospfv3 network point-to-point
no ospfv3 network
default ospfv3 network
```

**Guideline**

Arista devices also support the legacy `ipv6 ospf network` command in certain software releases of the EOS.

**Examples**

- This command configures VLAN interface 200 as a point-to-point link.
  ```
  switch(config)#interface vlan 200
  switch(config-if-Vl200)#ospfv3 network point-to-point
  switch(config-if-Vl200)#show active
  interface Vlan200
      ospfv3 network point-to-point
  switch(config-if-Vl200)#
  ```

- This command restores Ethernet interface 10 as a broadcast link.
  ```
  switch(config)#interface vlan 200
  switch(config-if-Vl200)#no ospfv3 network
  switch(config-if-Vl200)#show active
  interface Vlan200
  switch(config-if-Vl200)#
  ```
**ospfv3 priority**

The `ospfv3 priority` command configures the OSPFv3 router priority.

The `no ospfv3 priority` and `default ospfv3 priority` commands restore the default priority (1) on the interface by removing the corresponding `ospfv3 priority` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ospfv3 priority priority_level
no ospfv3 priority
default ospfv3 priority
```

**Parameters**

- `priority_level` Settings range from 0 to 255.

**Guideline**

Arista devices also support the legacy `ipv6 ospf priority` command in certain software releases of the EOS.

**Example**

- This command configures a router priority of 128 for VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ospfv3 priority 128
switch(config-if-Vl200)#show active
interface Vlan200
    ospfv3 priority 128
switch(config-if-Vl200)#
```
**ospfv3 transmit-delay**

The `ospfv3 transmit-delay` command configures the transmission delay for OSPFv3 packets.

The `no ospfv3 transmit-delay` and `default ospfv3 transmit-delay` commands restore the default transmission delay of one second on the configuration mode interface by removing the corresponding `ospfv3 transmit-delay` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
```
ospfv3 transmit-delay trans
no ospfv3 transmit-delay
default ospfv3 transmit-delay
```

**Parameters**
- `trans` Value ranges from 1 to 65535; default is 1.

**Guideline**
Arista devices also support the legacy `ipv6 ospf transmit-delay` command in certain software releases of the EOS.

**Example**
- This command configures a transmission delay of 10 seconds for VLAN 200.
  ```
  switch(config)#interface vlan 200
  switch(config-if-Vl200)#ospfv3 transmit-delay 10
  switch(config-if-Vl200)#show active
  interface Vlan200
   ospfv3 transmit-delay 10
  switch(config-if-Vl200)#
  ```
**ipv6 router ospf**

The `ipv6 router ospf` command places the switch in router-OSPFv3 configuration mode and creates and OSPFv3 instance if one does not already exist. Note that each OSPFv3 instance on the switch must have a unique process ID. A router ID for the new instance will be created if one does not already exist.

The `show ipv6 ospf` command displays the router ID of each OSPFv3 instance configured on the switch.

The `no ipv6 router ospf` and `default ipv6 router ospf` command deletes the OSPFv3 instance.

Refer to the *Router-OSPFv3 Configuration Mode* command for a list of commands available in router-OSPFv3 configuration mode.

**Command Mode**

Global Configuration

**Command Syntax**

```
ipv6 router ospf  process_id [VRF_INSTANCE]
no ipv6 router ospf process_id [VRF_INSTANCE]
default ipv6 router ospf  process_id [VRF_INSTANCE]
```

**Parameters**

- `process_id`  Values range from 1 to 65535.
- `VRF_INSTANCE` Values include:
  - `<no parameter>` OSPF instance is in the default VRF.
  - `vrf vrf_name` OSPF instance is the specified VRF.

**Examples**

- This command creates an OSPFv3 instance in the default VRF with process ID 9.
  ```
  switch(config)#ipv6 router ospf 9
  switch(config-router-ospf3)#show active
  ipv6 router ospf 9
  switch(config-router-ospf3)#
  ```

- This command deletes the OSPFv3 instance.
  ```
  switch(config)#no ipv6 router ospf 9
  switch(config)#
  ```
log-adjacency-changes (OSPFv3)

The log-adjacency-changes command enables syslog messages to be sent when it detects OSPFv3 link state changes or when it detects that a neighbor has gone up or down. Log message sending is enabled by default.

The default log-adjacency-changes command restores the default state by removing the log-adjacency-changes statement from running-config.

The default option (sending a message only when a neighbor goes up or down) is active when running-config does not contain any form of the command. Entering the command in any form replaces the previous command state in running-config.

The no log-adjacency-changes command disables link state change syslog reporting.

The default log-adjacency-changes command restores the default state by removing the log-adjacency-changes detail or no log-adjacency-changes statement from running-config.

Command Mode
Router-OSPFv3 Configuration

Command Syntax
log-adjacency-changes [INFO_LEVEL]
no log-adjacency-changes
default log-adjacency-changes

Parameters
• INFO_LEVEL Options include
  • <no parameter> Sends messages when a neighbor goes up or down.
  • detail Sends messages for all neighbor state changes.

Example
• This command configures the switch to send a syslog message when a neighbor state changes.

```bash
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#log-adjacency-changes
switch(config-router-ospf3)#show active
ipv6 router ospf 9
  log-adjacency-changes
switch(config-router-ospf3)#
```
max-metric router-lsa (OSPFv3)

The max-metric router-lsa command configures OSPF to include the maximum value in LSA metric fields to keep other network devices from using the switch as a preferred intermediate SPF hop.

The no max-metric router-lsa and default max-metric router-lsa commands disable the advertisement of a maximum metric.

Command Mode
Router-OSPFv3 Configuration

Command Syntax
max-metric router-lsa \[EXTERNAL\] \[STUB\] \[STARTUP\] \[SUMMARY\]
no max-metric router-lsa \[EXTERNAL\] \[STUB\] \[STARTUP\] \[SUMMARY\]
default max-metric router-lsa \[EXTERNAL\] \[STUB\] \[STARTUP\] \[SUMMARY\]

All parameters can be placed in any order.

Parameters
- \textit{EXTERNAL} Values include:
  - <no parameter> Default value of 1.
  - external-lsa
  - external-lsa <1 to 16777215> The default value is 0xFF0000.
- \textit{STUB} Values include:
  - <no parameter> Default value of 2.
  - include-stub
- \textit{STARTUP} Values include:
  - <no parameter>
  - on-startup
  - on-startup wait-for-bgp
  - on-startup <5 to 86400>
    wait-for-bgp or an on-start time value is not included in no and default commands.
- \textit{SUMMARY} Values include:
  - <no parameter> Metric is set to the default value of 1.
  - summary-lsa
  - summary-lsa <1 to 16777215>

Example
- This command configures OSPFv3 to include the maximum value in LSA metric fields until BGP has converged:

  switch(config-router-ospf3)#max-metric router-lsa on-startup wait-for-bgp
  switch(config-router-ospf3)#
maximum-paths (OSPFv3)

The `maximum-paths` command sets the maximum number of parallel routes that OSPFv3 supports on the switch.

The `no maximum-paths` command restores the maximum number of parallel routes that OSPFv3 supports on the switch to the default value of 16 by removing the maximum-paths command from `running-config`.

Command Mode

Router-OSPFv3 Configuration

Command Syntax

```
maximum-paths paths
no maximum-paths
default maximum-paths
```

Parameters

- `paths` Value range is platform dependent:
  - Arad: Value ranges from 1 to 128. Default value is 128.
  - FM6000: Value ranges from 1 to 32. Default value is 32.
  - PetraA: Value ranges from 1 to 16. Default value is 16.
  - Trident: Value ranges from 1 to 32. Default value is 32.
  - Trident II: Value ranges from 1 to 128. Default value is 128.

Example

- This command configures the maximum number of OSPFv3 parallel paths to 12.
  ```
  switch(config)#ipv6 router ospf 9
  switch(config-router-ospf3)#maximum-paths 12
  switch(config-router-ospf3)#
  ```
no area (OSPFv3)

The `no area` command removes all area configuration commands for the specified OSPFv3 area. Commands removed by the `no area` command include:

- area
- nssa
- range
- stub

Area settings can be removed individually; refer to the command description page of the desired command for details.

**Command Mode**

Router-OSPFv3 Configuration

**Command Syntax**

```
no area area_id [TYPE]
default area area_id [TYPE]
```

**Parameters**

- `area_id` area number.
  - Valid formats: integer `<1` to `4294967295>` or dotted decimal `<0.0.0.1` to `255.255.255.255>`
  - Area 0 (or `0.0.0.0`) is not configurable; it is always `normal`.
  - *Running-config* stores value in dotted decimal notation.
- `TYPE` area type. Values include:
  - `nssa`
  - `nssa translate type7 always`
  - `stub`
  - `stub no-summary`

**Example**

- This command remove the area 1 stub configuration.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)# no area 1 stub
switch(config-router-ospf3)#
```
**passive-interface (OSPFv3)**

The `passive-interface` command disables OSPF on an interface range. All interfaces are active by default.

The `no passive-interface` and `default passive-interface` commands enable OSPFv3 on the specified interface range by removing the corresponding `passive-interface` statements from `running-config`.

**Command Mode**
- Router-OSPFv3 Configuration

**Command Syntax**

```
passive-interface INTERFACE_NAME
no passive-interface INTERFACE_NAME
default passive-interface INTERFACE_NAME
```

**Parameters**

- `INTERFACE_NAME` Options include:
  - ethernet `e_range`
  - loopback `l_range`
  - management `m_range`
  - port-channel `p_range`
  - vlan `v_range`
  - vxlan `vx_range`
  - default

Valid `e_range`, `l_range`, `m_range`, `p_range`, `v_range`, and `vx_range` formats include number, range, or comma-delimited list of numbers and ranges.

**Example**

- This command configures VLAN interfaces 101 through 103 as passive interfaces.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#passive-interface vlan 101-103
switch(config-router-ospf3)#show active
ipv6 router ospf 9
  passive-interface Vlan101
  passive-interface Vlan102
  passive-interface Vlan103
switch(config-router-ospf3)#
```
The redistribute command enables the advertising of all specified routes into the OSPFv3 domain as external routes.

The no redistribute and default redistribute commands remove the corresponding redistribute command from running-config, disabling route redistribution for the specified route type.

**Command Mode**
Router-OSPFv3 Configuration

**Command Syntax**
```
redistribute ROUTE_TYPE [ROUTE_MAP]
no redistribute ROUTE_TYPE
default redistribute ROUTE_TYPE
```

**Parameters**

- **ROUTE_TYPE** Options include:
  - BGP
  - connected
  - static

- **ROUTE_MAP** Options include:
  - route-map map_name

**Example**
- The redistribute static command starts the advertising of static routes as OSPFv3 external routes.

  switch(config)#ipv6 router ospf 9
  switch(config-router-ospf3)#redistribute static
  switch(config-router-ospf3)#show active
  ipv6 router ospf 9
     redistribute connected
     redistribute static
  switch(config-router-ospf3)#
router-id (OSPFv3)

The `router-id` command assigns the router ID for an OSPFv3 instance. The switch sets the router ID to the first available alternative in the following list:

1. The `router-id` command
2. The loopback IP address
3. The highest IP address present on the device

**Important!** When configuring VXLAN on an MLAG, always manually configure the OSPFv3 router ID to prevent the switch from using the common VTEP IP address as the router ID.

The `no router-id` and `default router-id` commands remove the router ID command from `running-config`.

**Command Mode**

Router-OSPFv3 Configuration

**Command Syntax**

```
router-id identifier
no router-id
default router-id
```

**Parameters**

- `identifier` Value ranges from 0.0.0.0 to 255.255.255.255 (dotted decimal notation).

**Example**

- This command assigns 10.10.1.4 as the router ID for the OSPFv3 instance.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#router-id 10.10.1.4
switch(config-router-ospf3)#show active
ipv6 router ospf 9
  router-id 15.10.1.4
switch(config-router-ospf3)#
```
show ipv6 ospf

The show ipv6 ospf command displays information about OSPFv3 routing.

Command Mode
EXEC

Command Syntax

show ipv6 ospf [access-list | border-routers | database | interface | lsa-log | neighbor | request-list | retransmission-list | spf-log | vrf | Process ID]

Parameters
- `<no parameters>` displays the complete configuration of OSPFv3 address family and routing process.
- `access-list` displays the information of configured OSPFv3 access-list. Options include:
  - `<no parameters>` displays the information of all configured OSPFv3 access lists.
  - `WORD` displays the information of the specified access list.
  - `summary` displays the summary of all configured access lists.
- `border-routers` displays the information of configured OSPFv3 border and boundary routers. Options include:
  - `<no parameters>` displays the information of all configured OSPFv3 borders and boundary routers.
  - `vrf` displays the OSPFv3 borders and boundary routers information of the specified Virtual Routing and Forwarding (VRF).
- `database` displays the summary of database. Options include:
  - `<no parameters>` displays the complete summary of database.
  - `ipv4` displays the database information of link state ID.
  - `adv-router` displays the database information of advertising router link states.
  - `area` displays the database information filtered by area scope LSAs.
  - `as` displays the database information filtered by AS scope LSAs.
  - `database-summary` displays the count of LSAs in OSPFv3 database.
  - `detail` displays the detailed information of LSA.
  - `link` displays the database information filtered by link scoped LSAs.
  - `self-originated` displays the database information of self-originated link states.
  - `vrf` displays the VRF information in OSPFV3 database.
- `interface` displays the information of OSPFv3 interfaces. Options include
  - `<no parameters>` displays the information of all OSPFv3 interfaces.
  - `Ethernet eth_num` displays the information of the specified Ethernet interface. The value ranges from 1 to 24.
  - `Loopback lb_num` displays the information of the specified loop back interface. The value ranges from 0 to 1000.
  - `Port-Channel pc_num` displays the interface or sub-interface information of the specified port channel. The interface and sub-interface values of port channel ranges from `<1-1000>` and `<1-2000>,<1-4094>` respectively.
  - `Tunnel t_num` displays the information of the specified tunnel. The value ranges from 0 to 255.
• **Vlan vlan_num** displays the information of the specified VLAN interface. The value ranges from 1 to 4094.
• **vrf vrf_name** displays the information of the specified VRF.
• **lsa-log** displays the log entries of OSPFv3 LSA updates.
• **neighbor** displays the list of OSPFv3 neighbors.
• **request-list** displays the list of all OSPFv3 LSAs requested by a router.
• **retransmission-list** displays the list of all OSPFv3 LSAs waiting to be re-sent.
• **spf-log** displays the start-time, duration of completion, and reason of delay to calculate the OSPFv3 Sender Policy Framework (SPF).
• **vrf vrf_name** displays the information of specified VRF.
• **Process ID** displays the OSPFv3 configuration of the specified process ID. The value ranges from 1 to 65535.

**Example**

• This command displays OSPFv3 routing information for all VRFs.
  ```
  switch>show ipv6 ospf
  Routing Process "ospfv3 0" with ID 11.1.11.1 and Instance 0 VRF default
  FIPS mode disabled
  It is not an autonomous system boundary router and is not an area border router
  Minimum LSA arrival interval 1000 msecs
  Initial LSA throttle delay 1000 msecs
  Minimum hold time for LSA throttle 5000 msecs
  Maximum wait time for LSA throttle 5000 msecs
  It has 0 fully adjacent neighbors
  Number of areas in this router is 0. 0 normal, 0 stub, 0 nssa
  Number of LSAs 0
  Initial SPF schedule delay 0 msecs
  Minimum hold time between two consecutive SPF 5000 msecs
  Current hold time between two consecutive SPF 5000 msecs
  Maximum wait time between two consecutive SPF 5000 msecs
  SPF algorithm last executed 00:07:13 ago
  No scheduled SPF
  Adjacency exchange-start threshold is 20
  Maximum number of next-hops supported in ECMP is 32
  Number of backbone neighbors is 0
  Graceful-restart is not configured
  Graceful-restart-helper mode is enabled
  ```
This command displays the log entries of OSPFv3 LSA updates.

```
switch>show ipv6 ospf lsa-log
   [22:11:02] type RTR: 0.0.0.0 [13.13.13.13], event 2, backoff restarted, new hold value 1000 msecs

```
show ipv6 ospf border-routers

The `show ipv6 ospf border-routers` command displays the OSPF routing table entries.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 ospf border-routers [VRF_INSTANCE]
```

**Parameters**

- **VRF_INSTANCE**  Values include:
  - `<no parameter>`  Displays information for all VRFs.
  - `vrf vrf_name`  Displays information for the specified VRF.

**Example**

- This command displays the ABRs and ASBRs configured in the switch in all VRFs.

```
switch>show ipv6 ospf border-routers
Routing Process "ospf 9", VRF default
  Router 10.37.0.32 area 0.0.0.0 ASBR
  Router 10.37.0.18 area 0.0.0.0 ASBR
  Router 10.37.0.22 area 0.0.0.0 ASBR ABR
  Router 10.37.0.31 area 0.0.0.0 ASBR ABR
  Router 10.37.0.58 area 0.0.0.0 ASBR
  Router 10.37.0.37 area 0.0.0.0 ASBR
  Router 10.37.0.22 area 0.0.0.2 ASBR ABR
  Router 10.37.0.31 area 0.0.0.2 ASBR ABR
switch>
```
show ipv6 ospf database

The `show ipv6 ospf database` command displays data from the OSPF database. The switch can return link state data for a single VRF or for all VRFs on the switch.

Command Mode

EXEC

Command Syntax

```
show ipv6 ospf database [VRF_INSTANCE]
```

Parameters

- **VRF_INSTANCE** Values include:
  - `<no parameter>` Displays information for all VRFs.
  - `vrf vrf_name` Displays information for the specified VRF.

Example

- This command displays OSPF database information for VRF blue.

```
switch>show ipv6 ospf database vrf blue
Codes: AEX - AS External, GRC - Grace, IAP - Inter Area Prefix, IAR - Inter Area Router, LNK - Link, NAP - Intra Area Prefix, NSA - Not So Stubby Area, NTW - Network, RTR - Router
Routing Process "ospf 9", VRF blue
AS Scope LSDB
switch>
```
show ipv6 ospf database <link-state details>

The `show ipv6 ospf database <link-state details>` command displays detailed information about the specified link state advertisements. The switch can return link state data about a single area or for all areas on the switch.

**Command Mode**
EXEC

**Command Syntax**
```
show ipv6 ospf database [FILTER] LINK_TYPE [LINKSTATE_ID] [ROUTER] [DATA_LEVEL]
```

**Parameters**
- **FILTER** filters the output of the command by specifying areas. Options include:
  - *area* `A.B.C.D`
  - *area* backbone
- **LINK_TYPE** Parameter options include:
  - router
  - network
  - inter-area-prefix
  - inter-area-router
  - intra-area-prefix
  - nssa
- **LINKSTATE_ID** Options include:
  - `<no parameter>`
  - `A.B.C.D`
- **ROUTER** Options include:
  - `<no parameter>`
  - `adv-router a.b.c.d`
  - `self-originate`
- **DATA_LEVEL** Options include:
  - `<no parameter>`
  - `detail`
Example

- This command displays the OSPF database summary.

```
switch>show ipv6 ospf database detail
Codes:  AEX - AS External, GRC - Grace,
       IAP - Inter Area Prefix, IAR - Inter Area Router,
       LNK - Link, NAP - Intra Area Prefix,
       NSA - Not So Stubby Area, NTW - Network,
       RTR - Router

switch>
```
show ipv6 ospf database link

The `show ipv6 ospf database link` command displays details of the specified link state advertisements. The switch can return link state data about a single area or for all areas on the switch.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 ospf database link [LINKSTATE_ID] [ROUTER] [DATA_LEVEL]
```

**Parameters**

- **LINKSTATE_ID** Options include:
  - <no parameter>
  - <A.B.C.D>
- **ROUTER** Options include:
  - <no parameter>
  - adv-router [a.b.c.d]
  - self-originate
- **DATA_LEVEL** Options include:
  - <no parameter>
  - detail

**Example**

- This command displays information about the Open Shortest Path First (OSPF).

  switch> show ipv6 ospf database link
  Codes: AEX - AS External, GRC - Grace,
  IAP - Inter Area Prefix, IAR - Inter Area Router,
  LNK - Link, NAP - Intra Area Prefix,
  NSA - Not So Stubby Area, NTW - Network,
  RTR - Router

  Routing Process "ospf 9":

  switch>
**show ipv6 ospf database link if-name**

The **show ipv6 ospf database link** command displays link state advertisement details. The switch can return link state data about a single area or for all areas on the switch.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 ospf database link if-name [INTF_ID] [LS_ID] [ROUTER] [DATA_LEVEL]
```

**Parameters**

- **INTF_ID**  Options include:
  - `ethernet e_range`  Ethernet interface list.
  - `loopback l_range`  Loopback interface list.
  - `management m_range`  Management interface list.
  - `port-channel p_range`  Channel group interface list.
  - `vlan v_range`  VLAN interface list.
  - `vxlan vx_range`  VXLAN interface list.

Valid *range* formats include number, range, or comma-delimited list of numbers and ranges.

- **LS_ID**  Options include:
  - `<no parameter>`
  - `<A.B.C.D>`

- **ROUTER**  Options include:
  - `<no parameter>`
  - `adv-router [a.b.c.d]`
  - `self-originate`

- **DATA_LEVEL**  Options include:
  - `<no parameter>`
  - `detail`

**Example**

- This command displays information for Ethernet 4/1 link state advertisements.

  ```
  switch>show ipv6 ospf database link if-name ethernet 4/1
  Codes: AEX - AS External, GRC - Grace,
  IAP - Inter Area Prefix, IAR - Inter Area Router,

switch>
```
**show ipv6 ospf neighbor state**

The `show ipv6 ospf neighbor state` command displays the state information on OSPF neighbors on a per-interface basis.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 ospf neighbor state STATE_NAME [VRF_INSTANCE]
```

**Parameters**

- **STATE_NAME** Values include:
  - 2-ways
  - attempt
  - down
  - exch-start
  - exchange
  - full
  - restart
  - init
  - loading

- **VRF_INSTANCE** Values include:
  - <no parameter> Displays information for all VRFs.
  - `vrf vrf_name` Displays information for the specified VRF.

**Examples**

- This command displays OSPF information for neighboring devices that are adjacent.
  ```
  switch>show ipv6 ospf neighbor state full
  Routing Process "ospf 3":
  switch>
  ```
**show ipv6 ospf neighbor summary**

The `show ipv6 ospf neighbor summary` command displays a single line of state information for each OSPFv3 neighbor.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 ospf neighbor summary [VRF_INSTANCE]
```

**Parameters**

- **VRF_INSTANCE** Values include:
  - `<no parameter>` Displays information for all VRFs.
  - `vrf vrf_name` Displays information for the specified VRF.

**Examples**

- This command shows the summary information for the OSPFv3 neighbors.

```
switch>show ipv6 ospf neighbor summary
Routing Process "ospf 1":
  3 neighbors are in state Down
  3 neighbors are in state Full
  5 neighbors are in state Init
  0 neighbors are in state Loading
  0 neighbors are in state Attempt
  3 neighbors are in state Restarting
  0 neighbors are in state Exchange
  3 neighbors are in state 2 Ways
  0 neighbors are in state Exch Start
switch>
```
**show ipv6 ospf spf-log**

The `show ipv6 ospf spf-log` command displays when and how long the switch took to run a full SPF calculation for OSPFv3.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 ospf [PROCESS_ID] spf-log [VRF_INSTANCE]
```

**Parameters**

- **PROCESS_ID**  OSPFv3 process ID. Values include:
  - `<no parameter>`  Displays information for all process IDs.
  - `<1 to 65535>`  Displays information for the specified process ID.
- **VRF_INSTANCE**  Values include:
  - `<no parameter>`  Displays information for all VRFs.
  - `vrf vrf_name`  Displays information for the specified VRF.

**Examples**

- This command displays the SPF information for OSPFv3 in all VRFs.

```plaintext
switch>show ipv6 ospf spf-log
OSPF3 Process 172.26.0.22, VRF default
TIME          EVENT                    REASON
04:54:52.070  SPF ran for 0.70 ms
04:54:52.070  Scheduled after 0 ms     Router LSA generation
04:54:39.151  SPF ran for 0.71 ms
04:54:39.151  Scheduled after 0 ms     Router LSA generation
04:54:12.071  SPF ran for 0.56 ms
04:54:12.070  Scheduled after 0 ms     Router LSA generation
04:54:04.153  SPF ran for 0.29 ms
04:53:59.153  Scheduled after 4999 ms  Router LSA generation
04:53:59.153  SPF ran for 0.25 ms
04:53:59.151  Scheduled after 0 ms     Router LSA generation
04:53:33.081  SPF ran for 0.3 ms
04:53:33.081  Scheduled after 0 ms     ECMP max nexthop cfg change
```

switch>
**show ospfv3**

The `show ospfv3` command displays the OSPFv3 configuration of OSPFv3 address family and routing process.

**Command Mode**

EXEC

**Command Syntax**

```
show ospfv3 [access-list | border-routers | database | interface | ipv4 | ipv6 | lsa-log | neighbor | request-list | retransmission-list | spf-log | vrf]
```

**Parameters**

- `<no parameters>` displays the complete configuration of OSPFv3 address family and routing process.
- `access-list` displays the information of configured OSPFv3 access-list. Options include:
  - `<no parameters>` displays the information of all configured OSPFv3 access lists.
  - `WORD` displays the information of the specified access list.
  - `summary` displays the summary of all configured access lists.
- `border-routers` displays the information of configured OSPFv3 border and boundary routers. Options include:
  - `<no parameters>` displays the information of all configured OSPFv3 borders and boundary routers.
  - `vrf` displays the OSPFv3 borders and boundary routers information of the specified Virtual Routing and Forwarding (VRF).
- `database` displays the summary of database. Options include:
  - `<no parameters>` displays the complete summary of database.
  - `ipv4` displays the database information of link state ID.
  - `adv-router` displays the database information of advertising router link states.
  - `area` displays the database information filtered by area scope LSAs.
  - `as` displays the database information filtered by AS scope LSAs.
  - `database-summary` displays the count of LSAs in OSPFv3 database.
  - `detail` displays the detailed information of LSA.
  - `link` displays the database information filtered by link scoped LSAs.
  - `self originate` displays the database information of self-originated link states.
  - `vrf` displays the VRF information in OSPFV3 database.
- `interface` displays the information of OSPFv3 interfaces. Options include:
  - `<no parameters>` displays the information of all OSPFv3 interfaces.
  - `Ethernet eth_num` displays the information of the specified Ethernet interface. The value ranges from 1 to 24.
  - `Loopback lb_num` displays the information of the specified loop back interface. The value ranges from 0 to 1000.
  - `Port-Channel pc_num` displays the interface or sub-interface information of the specified port channel. The interface and sub-interface values of port channel ranges from `<1-1000>` and `<1-2000/> <1-4094>` respectively.
• **Tunnel** `t_num`  displays the information of the specified tunnel. The value ranges from 0 to 255.

• **Vlan** `vlan_num`  displays the information of the specified VLAN interface. The value ranges from 1 to 4094.

• **vrf** `vrf_name`  displays the information of the specified VRF.

• **ipv4**  displays the IPv4 address family information.

• **ipv6**  displays the IPv6 address family information.

• **lsa-log**  displays the log entries of OSPFv3 LSA updates.

• **neighbor**  displays the list of OSPFv3 neighbors.

• **request-list**  displays the list of all OSPFv3 LSAs requested by a router.

• **retransmission-list**  displays the list of all OSPFv3 LSAs waiting to be re-sent.

• **spf-log**  displays the start-time, duration of completion, and reason of delay to calculate the OSPFv3 Sender Policy Framework (SPF).

• **vrf** `vrf_name`  displays the information of specified VRF.

**Examples**

• This command displays the complete configuration of OSPFv3 address family and routing process.

  
  switch#show ospfv3

ro301.02:05:02(config-router-ospfv3-af)#
shutdown (OSPFv3)

The `shutdown` command disables OSPFv3 on the switch. OSPFv3 is disabled by default on individual interfaces and enabled through `ipv6 ospf area` commands. The `no shutdown` and `default shutdown` commands enable the OSPFv3 instance by removing the `shutdown` statement from the OSPFv3 block in `running-config`.

**Command Mode**

Router-OSPFv3 Configuration

**Command Syntax**

- `shutdown`
- `no shutdown`
- `default shutdown`

**Example**

- This command disables OSPFv3 activity on the switch.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#shutdown
switch(config-router-ospf3)#show active
ipv6 router ospf 9
  shutdown
switch(config-router-ospf3)#
```
timers

The *timers* command configures the minimum interval between the transmission of consecutive LS update packets in a network.

The *no timers* and *default timers* commands set the configured timer value to its default.

**Command Mode**

Router-OSPFv3 Configuration

**Command Syntax**

```
timers {lsa | out-delay | pacing | throttle}
default timers {lsa | out-delay | pacing | throttle}
no timers {lsa | out-delay | pacing | throttle}
```

**Parameters**

- **lsa** configures threshold for the retransmission of LSA. Option includes:
  - **arrival** configures the OSPF LSA arrival timer.
- **out-delay** configures the delay to flood router LSA in milliseconds. Option includes:
  - **out-delay_time** minimum interval in milliseconds between accepting the same LSAs. The value ranges from 0 to 65000 milliseconds. The default value is zero.
- **pacing** configures the OSPF packet pacing. Option includes:
  - **flood** configures the OSPF flood pacing.
- **throttle** configures ospf throttle timers. Options include:
  - **lsa** configures threshold for the retransmission of LSA.
  - **spf** configures the time between SPF calculations.
Examples

- This command configures OSPFv3 flood pacing timer to 50 ms in the global OSPFv3 instance.

  switch(config)#ipv6 router ospf 9
  switch(config-router-ospf3)#timers pacing flood 50
  switch(config-router-ospf3)#show ospfv3

  Routing Process "ospfv3 9" with ID 13.13.13.13 and Instance 0 VRF default
  - FIPS mode disabled
  - It is not an autonomous system boundary router and is not an area border router
  - Minimum LSA arrival interval 1000 msecs
  - Initial LSA throttle delay 1000 msecs
  - Minimum hold time for LSA throttle 5000 msecs
  - Maximum wait time for LSA throttle 5000 msecs
  - Interface flood pacing timer 50 msecs
  - It has 0 fully adjacent neighbors
  - Number of areas in this router is 1. 1 normal, 0 stub, 0 nssa
  - Number of LSAs 1
  - Initial SPF schedule delay 0 msecs
  - Minimum hold time between two consecutive SPFs 5000 msecs
  - Current hold time between two consecutive SPFs 5000 msecs
  - Maximum wait time between two consecutive SPFs 5000 msecs
  - SPF algorithm last executed 21d19h ago
  - No scheduled SPF
  - Adjacency exchange-start threshold is 20
  - Maximum number of next-hops supported in ECMP is 32
  - Number of backbone neighbors is 0
  - Graceful-restart is not configured
  - Graceful-restart-helper mode is enabled
  - Area 0.0.0.0
    - Number of interface in this area is 0
    - It is a normal area
    - SPF algorithm executed 2 times

  <--------OUTPUT OMITTED FROM EXAMPLE-------->
This command configures the OSPFv3 flood pacing timer to 50 ms in IPv4 address family.

```
switch(config)#router ospfv3
switch(config-router-ospfv3)#address-family ipv4
switch(config-router-ospfv3-af)#timers pacing flood 50
switch(config-router-ospfv3-af)#show ospfv3
```

<--------OUTPUT OMITTED FROM EXAMPLE-------->
timers lsa rx min interval (OSPFv3)

The `timers lsa rx min interval` command sets the minimum interval for accepting identical link-state advertisements (LSAs) from OSPFv3 neighbors.

The `no timers lsa rx min interval` and `default timers lsa rx min interval` commands restore the minimum interval to the default value of one second by removing the `timers lsa rx min interval` command from `running-config`.

**Command Mode**
- Router-OSPFv3 Configuration
- Router-OSPFv3 Address-Family IPv4/IPv6 Configuration

**Command Syntax**

```
timers lsa rx min interval lsa_time
no timers lsa rx min interval
default timers lsa rx min interval
```

**Parameters**

- `lsa_time` minimum time (in milliseconds) after which the switch accepts an identical LSA from OSPFv3 neighbors. Value ranges from 0 to 600000 (ms). Default value is 1000 milliseconds (1 second).

**Example**

This command sets the minimum LSA arrival interval to ten milliseconds.

```
switch(config)#router ospfv3
switch(config-router-ospfv3)#timers lsa rx min interval 10
switch(config-router-ospfv3)#
```
**timers lsa tx delay initial (OSPFv3)**

The `timers lsa tx delay initial` command sets the rate-limiting values for OSPFv3 Link-State Advertisement (LSA) generation.

The `no timers lsa tx delay initial` and `default timers lsa tx delay initial` commands restore the default LSA rate-limiting values by removing the `timers lsa tx delay initial` command from `running-config`.

**Command Mode**

- Router-OSPFv3 Configuration
- Router-OSPFv3 Address-Family IPv4/IPv6 Configuration

**Command Syntax**

```plaintext
timers lsa tx delay initial initial_delay min_hold max_wait
no timers lsa tx delay initial
default timers lsa tx delay initial
```

**Parameters**

- `initial_delay` Initial delay in milliseconds to generate the first instance of LSAs. Value ranges from 0 to 600000 (ms). The default value is 1000 ms.
- `min_hold` Minimum hold interval availed in milliseconds between the generation of same LSA. Value ranges from 1 to 600000 (ms). The default interval is 5000 ms.
- `max_wait` Maximum hold interval availed in milliseconds between the generation of same LSA. Value ranges from 1 to 600000 (ms). The default interval is 5000 ms.

**Example**

These commands set the LSA transmission timers on the switch.

```plaintext
switch(config)#router ospfv3
switch(config-router-ospfv3)#
switch(config-router-ospfv3)#timers lsa tx delay initial 5 100 20000
switch(config-router-ospfv3)#
```
timers spf delay initial (OSPFv3)

The purpose of SPF throttling is to delay Shortest Path First (SPF) calculations when network topology is changing rapidly. The `timers spf delay initial` command controls the intervals of SPF calculations in a switch. The command sets three values:

- **Initial delay:** Initial wait by a switch to calculate SPF after a topology change in a network that has been stable throughout the hold interval. Because a topology change often requires several link state updates to be sent, the initial delay is configured to allow the network to settle before the switch calculates SPF. If an additional topology change occurs during the initial interval, the SPF calculation still takes place after the initial delay period has expired and no other change is made to the throttle timers.

- **Hold interval:** This is an additional wait timer that reduces the frequency of SPF calculations during periods of network instability. If a network change occurs during the hold period, an SPF calculation is scheduled to occur when the hold interval expires. Subsequent hold intervals are doubled if further topology changes occur during a hold interval until either the hold interval reaches its configured maximum or no topology change occurs during the interval. If the next topology change occurs after the hold interval expires, the hold interval is reset to its configured value and the SPF calculation is scheduled to take place after the initial delay.

- **Maximum interval:** The maximum wait time of a switch after a topology change before performing an SPF calculation.

The `no timers spf delay initial` and `default timers spf delay initial` commands restore the default OSPFv3 SPF calculation intervals by removing the `timers spf delay initial` command from `running-config`.

**Command Mode**
- Router-OSPFv3 Configuration
- Router-OSPFv3 Address-Family IPv4/IPv6 Configuration

**Command Syntax**
```
timers spf delay initial     initial_delay hold_interval max_interval
no timers spf
default timers spf
```

**Parameters**
- **initial_delay** Initial delay between a topology change and SPF calculation. Value ranges from 0 to 65535000 (ms). The default value is 0 ms.
- **hold_interval** Additional wait time after SPF calculation to allow the network to settle. If a topology change occurs during the hold interval, another SPF calculation is scheduled to occur after the hold interval expires. The next hold interval is doubled if topology changes occur during the hold interval. If doubling exceeds the maximum value, the maximum value is used instead. Value ranges from 0 to 65535000 (ms). The default value is 5000 ms.
- **max_interval** The maximum hold interval before a switch calculates SPF. Value ranges from 0 to 65535000 (ms). The default value is 5000 ms.

**Example**
These commands set the SPF timers on the switch.
```
switch(config)#router ospfv3
switch(config-router-ospfv3)#
switch(config-router-ospfv3)#timers spf delay initial 5 100 20000
switch(config-router-ospfv3)#
```
Border Gateway Protocol (BGP)

Border Gateway Protocol (BGP) exchanges routing information among neighboring routers in different Autonomous Systems (AS). Arista switches use BGP version 4+, incorporating the multiprotocol extensions defined by RFC 4760 so that BGP can carry both IPv4 and IPv6 routes simultaneously over a single BGP peering.

This chapter contains the following sections.

- **Section 33.1: BGP Conceptual Overview**
- **Section 33.2: Configuring BGP**
- **Section 33.3: BGP Examples**
- **Section 33.4: BGP Commands**

Arista switches support these BGP functions:

- A single BGP instance
- Simultaneous internal (iBGP) and external (eBGP) peering
- Multiprotocol BGP
- BGP confederations
33.1 BGP Conceptual Overview

BGP is a protocol that exchanges routing information among neighboring routers in different autonomous systems through TCP sessions.

BGP neighbors (peers) communicate through a TCP session on port 179. They are established by manual configuration commands (static peers) or by creating a peer group listen range and accepting incoming peering requests in that range (dynamic peers). Internal BGP (iBGP) peers operate within a single autonomous system (AS). External BGP (eBGP) peers operate between autonomous systems. Border routers are on AS boundaries and exchange information with other autonomous systems; the primary function of border routers is distributing routes. Internal routers do not distribute route updates that they receive.

BGP defines a state machine for establishing connections. BGP routers maintain a state variable for each peer-to-peer session to track connection status. The state machine consists of these states:

- **Idle**: The router initializes BGP resources, refuses inbound BGP connection attempts, initiates a TCP connection to the peer, then transitions to the **Connect** state.
- **Connect**: The router waits for the TCP connection to complete, then sends an OPEN message to the peer and transitions to the **OpenSent** state if successful. If unsuccessful, it sets the **ConnectRetry** timer and transitions to the **Active** state upon expiry.
- **Active**: The router sets the **ConnectRetry** timer to zero and returns to the **Connect** state.
- **OpenSent**: The router waits for an OPEN message from the peer. After receiving a valid message, it transitions to the **OpenConfirm** state.
- **OpenConfirm**: The router waits for a keepalive message from its peer. If the message is received prior to a timeout expiry, the router transitions to the **Established** state. If the timeout expires or an error condition exists, the router transitions to the **Idle** state.
- **Established**: Peers exchange UPDATE messages about routes they advertise. If an UPDATE message contains an error, the router sends a NOTIFICATION message and transitions to the **Idle** state.

During established BGP sessions, routers exchange UPDATE messages about the destinations to which they offer connectivity. The route description includes the destination prefix, prefix length, autonomous systems in the path, the next hop, and information that affects the acceptance policy of the receiving router. UPDATE messages also list destinations to which the router no longer offers connectivity.

BGP detects and eliminates routing loops while making routing policy decisions by using the network topology as defined by AS paths and path attributes.

33.1.1 Multiprotocol BGP

Multiprotocol BGP facilitates the advertisement of network routes and switch capabilities to neighbors from multiple address families over a single BGP peering. The switch supports IPv4 unicast and IPv6 unicast address families.

Neighbors negotiate to select an address family when establishing a connection. The peer session is based on this address family, which identifies the following:

- The set of network layer protocols to which the address carried in the Next Hop field must belong.
- The encoding format of the next hop address.
- The semantics of Network Layer Reachability Information (NLRI).
33.1.2 BGP Confederations

BGP confederations divide an autonomous system (AS) into subsystems (sub-ASs), each identified by a unique sub-AS number, while still appearing externally as a single AS.

33.1.3 QoS Control of Neighbor Discovery and ARP Packets

To help prevent BGP sessions from being affected by dropped neighbor discovery and ARP packets, some Arista switches assign those packets to a higher priority output queue when they are being software forwarded. This helps minimize hardware drops from competition with data plane packets traffic congestion.

The switch platforms which use this feature are:

- DCS-7500E
- DCS-7250X
- DCS-7300X
- DCS-7010X
- DCS-7050X

33.1.4 Best-Path Selection

Routing information received via the BGP protocol often contains more than one route to the same destination: the BGP best-path selection algorithm determines which of these routes will be installed in the routing table. The following criteria are evaluated in order; at each step, if there is a tie for best path the next criterion is applied. If there is still a tie at the end of the process, BGP installs the route received from the peer with the lowest address. When equal cost multi path (ECMP) routing is enabled, multiple paths to a single destination may be installed in the IP routing table.

Route preferences can be shaped through configuration choices as described in Configuring Best-path Selection. The steps in Arista’s best-path selection process are described below.

**Step 1** Select the route that has the highest weight value. The weight of paths learned from a specific neighbor can be adjusted using the `neighbor weight` or `neighbor route-map (BGP)` command. Weight is only significant locally, and is not communicated in update messages.

**Step 2** Select the route that has the highest LOCAL_PREF value.

**Step 3** If `bgp bestpath as-path ignore` is disabled (the default), select the route that has the shortest AS path, excluding confederation segments; otherwise skip ahead to the next step.

**Step 4** Select the route that has the lower ORIGIN value. The lowest ORIGIN value is IGP (Interior Gateway Protocol), which is better than EGP (Exterior Gateway Protocol), which is better than INCOMPLETE.

**Note** Exterior Gateway Protocol (EGP), as described in RFC 904, is the predecessor of BGP and is included in the selection algorithm for legacy reasons. It is rarely if ever used, and should not be confused with eBGP (see step 6 below).

**Step 5** Select the route that has the lower MED value. The MED values are comparable if `bgp always-compare-med` is enabled or if the routes have the same neighbor AS. The neighbor AS of a path is determined as follows:

a. If the router is in a confederation: if `bgp bestpath med confed` is configured, the confederation ID is used for the neighbor AS. Otherwise, the MED values of the routes are not comparable.
b If the router is not in a confederation: the first AS number in the first AS_SEQUENCE segment is used as the neighbor AS. If such a segment does not exist, the local router AS number is used.

Step 6 Prefer routes received from external peers (eBGP routes) over those received from internal peers (iBGP routes).

Step 7 Select the route that has the lowest IGP cost to the BGP NEXT_HOP. The IGP cost is determined using the metric of the resolving route for the BGP nexthop.

Step 8 If bgp bestpath as-path multipath-relax is enabled (default), then skip ahead to the next step; otherwise the AS_PATH path lengths are compared. The path length is determined by adding the total number of AS and segment types in the AS_PATH field. Prefer the route with the shorter path length. If path lengths are equal, then prefer the route with the first smaller non-matching AS, and then prefer the route with the first smaller non-matching segment type (sub-AS).

Step 9 If the selection process reaches this stage, then the routes being considered are eligible for multipath task.

a If multipath routes are being evaluated and bgp bestpath ecmp-fast is enabled (default) and none of the bgp bestpath tie-break configurations is enabled (default), then there is no preferred route in the multipath group and routes are not evaluated further. The effective ordering of routes in the multipath group is implementation-dependent and routes that were added to the multipath group first are preferred over routes that are added to the multipath group later. The path selection process ends here.

b If multipath routes are being evaluated and bgp bestpath ecmp-fast is not enabled, continue to step 10.

Step 10 If the routes are eligible for multipath task and none of the bgp bestpath tie-break configurations is enabled (default), skip ahead to step 11. Otherwise, continue as follows:

a If bgp bestpath tie-break router-id is enabled, prefer the route with the lowest ROUTER_ID. If the route is a reflected route (that is if it contains route reflector attributes), use the ORIGINATOR_ID as the ROUTER_ID for comparison.

b If bgp bestpath tie-break cluster-list-length is enabled, prefer the route with the shortest CLUSTER_LIST length. The cluster list length is assumed to be 0 if the route doesn’t carry a CLUSTER_LIST attribute.

c If there isn’t a preferred route yet, go to step 13.

Step 11 Prefer the route with the lowest ROUTER_ID. If the route is a reflected route (i.e., if it contains route reflector attributes), use the ORIGINATOR_ID as the ROUTER_ID for comparison.

Step 12 Prefer the route with the shortest CLUSTER_LIST length. The cluster list length is assumed to be 0 if the route doesn’t carry a CLUSTER_LIST attribute.

Step 13 Prefer the route received from the lowest peer address.

Step 14 If the peer address is the same for routes under comparison and bgp additional-path receive is enabled (the default), then the routes should differ in the received path IDs. Prefer the route with the lower received path ID. The path selection process ends here.

33.1.5 BGP Convergence

BGP supports convergence where it waits for all peers to join and receive all the routes from other peers. Before declaring convergence, BGP also waits for IGP protocols to converge so that all IBGP sessions are established, and routes that were learned over IBGP sessions, are resolved via the IGP routes. BGP declares convergence when it has received route updates from all its peers and EOR.
(End-Of-RIB) markers from all the expected peers and IGP protocols have converged. Using BGP convergence, you can avoid hardware updates or route advertisement churn during a switch reload or a BGP instance start.

### 33.1.6 BGP Communities

A BGP community is a group of subnet address prefixes that share a common identifying attribute. Communities simplify routing policies by consolidating IP network spaces into logical entities that BGP speakers can address to accept, prefer, and distribute routing information. BGP communities are defined by setting the community value within route maps. Community lists then reference one or more communities as follows:

- **Standard** community lists refer to communities by name or number.
- **Expanded** community lists reference communities using regular expressions.

### 33.1.7 BGP Graceful Shutdown Community

Autonomous System Boundary Routers (ASBRs) do not update all paths received from external BGP sessions and routers. They hide inefficient alternate paths and update only best paths in the routing table. BGP route policies are applied to all internal BGP sessions of ASBRs that support the graceful shutdown procedure.

As a part of maintenance mode, these route policies perform the following functionalities on routing advertisements:

- Match the graceful shutdown community with route map rules.
- Set the local preference attribute value of the paths that are tagged with the graceful shutdown community as zero.

Refer to [Chapter 10: Maintenance Mode](#) for the detailed information on maintenance mode.

### 33.1.8 BGP Labeled-Unicast (LU) path Next-hop resolution over Tunnel RIB Entries

BGP Labeled-Unicast protocol (BGP LU) path next-hop is enhanced to allow BGP in “ribd” mode to support resolution of BGP LU path next-hop over entries in the Tunnel RIB and fall-back to resolving over connected route when there is no entry in Tunnel RIB that provides a direct match for the BGP LU path next-hop. Previously, BGP in “ribd” mode allowed resolution of BGP Labeled-Unicast protocol (BGP LU) path next-hop over only connected routes, resolution of the next-hop over IGP or static routes was not allowed since the next-hop router may not be in the MPLS forwarding path in which case the traffic will get dropped by the next-hop router (per IGP).

**Note**

There are no new CLIs or show commands added with this enhancement.

The following two use cases explain how BGP LU path next-hop resolution over tunnels would help in achieving desired or efficient traffic forwarding.

- **Egress Peer Engineering (EPE)**
- **Inter-AS Option C**

**Egress Peer Engineering (EPE)**

Egress Peer Engineering is a source-routing paradigm that provides ability to select an egress node/interface through which traffic goes out of an Autonomous System (AS). As shown in Figure 1 below R1, R2, ASBR1 & ASBR2 are in AS 1 and E1, E2, E3 & E4 are in different Ases. R1, R2, ASBR1 & ASBR2 could be connected each other directly or reachable to each other over an IGP (OSPF/ISIS)
or MPLS tunnel. Let’s assume reachability of loop-back addresses 1.1.1.1, 2.2.2.2, 3.3.3.3 & 4.4.4.4 through LDP or Segment Routing (SR). There exists an iBGP Full Mesh between R1, R2, ASBR1 & ASBR2. eBGP session is present between ASBR1 & E1, ASBR1 & E2, ASBR2 & E3 and ASBR2 & E4. Consider following BGP updates are received on ASBR1:

Prefix 50.0.0.0/8 next-hop 10.0.0.2 as-path 2 100 from E1
Prefix 50.0.0.0/8 next-hop 11.0.0.2 as-path 3 200 300 from E2

BGP path from E1 will be selected as best path due to shorter AS path length. ASBR1 advertises this prefix to both R1 & R2. Any traffic destined to prefix 50.0.0.0/8 from R1 will always be tunneled to ASBR1 and then it will always be sent on an interface connected to E1. Traditional Destination based routing enforced by BGP policy and best path selection on the ASBRs may route traffic to a single AS as exit when a case can be made that for some prefixes an exit via some other AS may be preferable. BGP LU can be used here to perform traffic engineering or selecting Egress peer through which traffic should be forwarded.

A Centralized EPE Controller can be used to establish iBGP session with R1 & R2. Let’s assume Controller advertises BGP LU routes for E2, i.e., 11.0.0.2/32, with next-hop set to loop-back IP address of ASBR1, that is, 1.1.1.1 and a label 111 to R1 & R2.

```
Switch# show ip bgp 11.0.0.2/32
BGP routing table information for VRF default
Router identifier 3.3.3.3, local AS number 1
BGP routing table entry for 11.0.0.2/32
Paths: 1 available
Local
  1.1.1.1 labels [111] from 100.100.100.1 (100.100.100.1)
  Origin IGP, metric 0, localpref 100, IGP metric 40, weight 0, received
  21:07:07 ago, valid, external, not installed
  Rx SAFI: Labels
  Tunnel RIB eligible
```
BGP LU path next-hop will get resolved over an ISIS SR tunnel present on R1 & R2 to reach 1.1.1.1, loop-back IP address of ASBR1.

   ago, valid, internal
   Rx SAFI: Unicast

This results in pushing 2 labels on R1, top label is the label corresponding to ISIS SR tunnel to reach ASBR1 and bottom label is the label that corresponds to egress interface. Similarly LU route for 12.0.0.0.2 or 13.0.0.2 can be advertised from controller to select egress peer between E3 & E4. This approach provides Egress peer selection on an ingress router R1/R2.

Inter-AS Option C

Inter-AS Option C is an efficient and scalable MPLS IP VPN solution to provide connectivity between two sites of a customer connected to Provider Edge (PE) routers in different ASes. Following diagram shows a typical topology.
PE1 & ASBR1 and PE2 & ASBR2 distribute loop-back addresses using an IBGP Labeled Unicast (LU) session. ASBR2 advertises system addresses in AS200 to ASBR1 with next-hop as itself over EBGP LU session between them and installing Label swap entry of label sent to ASBR1 (L2) to label received from PE2 (L1) in MPLS forwarding table. ASBR1 further propagates system addresses in AS200 learned from ASBR2 into AS100 or to PE1 using IBGP LU session with itself as next-hop and installing Label swap entry with label advertised to PE1 (L3) to Label received from ASBR2 (L2) in MPLS forwarding table. Similarly ASBR1 sends system addresses in AS100 to ASBR2 over EBGP LU session, ASBR2 forwards them into AS200 or to PE2 using IBGP LU session with itself as next-hop and this would trigger installing appropriate label swap actions into MPLS forwarding table. These advertisements results in the creation of a label switched path from PE1 to PE2.

PE1 & PE2 exchange VPN routes between each other using a Multi hop EBGP session with next-hop being their own loop-back/system addresses. This method eliminates the requirement of storing or sending/receiving VPN routes at ASBR routers. When PE & ASBR routers are non-adjacent, but in the same AS, then LDP or ISIS-SR can be used as a transport label signaling protocol and this would need resolving BGP LU path next-hop over LDP or ISIS-SR tunnel. An IP packet destined to an address in CE1 site 2 is received on PE1 from CE1 site 1 PE1 would need to push 3 labels onto it. Bottom label corresponds to packet destination address in a particular VRF of CE1 site 2 advertised by PE2 to PE1 over Multi hop EBGP session, Middle label belongs to PE2 system address sent by ASBR1 and top label corresponding to ASBR1 system address assigned by transport label signaling protocol.
33.2 Configuring BGP

These sections describe basic BGP configuration steps:

- Section 33.2.1: Configuring BGP Instances
- Section 33.2.2: Configuring BGP Neighbors
- Section 33.2.3: Configuring GTSM for BGP
- Section 33.2.4: Configuring Routes
- Section 33.2.5: Configuring Address Families
- Section 33.2.6: Configuring Best-path Selection
- Section 33.2.7: Configuring BGP Convergence
- Section 33.2.8: Configuring BGP Graceful Shutdown Community
- Section 33.2.9: BGP Confederations
- Section 33.2.10: BGP Operational Commands

33.2.1 Configuring BGP Instances

33.2.1.1 Creating an Instance and Entering BGP Configuration Mode

The switch supports one BGP instance, which is associated with a specified autonomous system (AS). To other BGP peers, the AS number uniquely identifies the network to which the switch belongs. Arista switches support four-byte AS numbers as described in RFC 4893. Four-byte AS number capability is communicated to BGP peers in OPEN messages. When communicating with a BGP peer which does not support four-byte AS numbers, the switch will replace AS numbers greater than 65535 with the well-known two-byte AS number 23456 (also called AS_TRANS), and encode the actual four-byte AS numbers using the AS4_PATH attribute.

The switch must be in router-BGP configuration mode to run BGP configuration commands. The `router bgp` command places the switch in router-BGP configuration mode for creating a BGP instance if one was not previously created. BGP configuration commands apply globally to the BGP instance.

Example

- This command places the switch in router-BGP configuration mode. It also creates a BGP instance in AS 50 if an instance was not previously created.

  switch(config)#router bgp 50
  switch(config-router-bgp)#

When a BGP instance exists, the `router bgp` command must include its autonomous system. Any attempt to create a second instance results in an error message.

Example

- This command attempts to open a BGP instance with a different AS number from that of the existing instance. The switch displays an error and stays in global configuration mode.

  switch(config)#router bgp 100
  % BGP is already running with AS number 50
  switch(config)#
33.2.1.2 Configuring BGP in a VRF

IPv6 VRF support in EOS allows application of a BGP configuration to a single VRF instance, overriding global commands. To apply VRF-specific BGP configuration, use the vrf command within router-BGP configuration mode to enter BGP VRF configuration mode. IPv6 BGP VRF configuration is performed in the VRF submode of the router-BGP configuration mode. This submode is also where a route distinguisher (RD) is configured for a VRF on switches running Ethernet VPN (EVPN): use the rd (Router-BGP VRF and VNI Configuration Modes) command to configure an RD for a VRF.

Examples

- These commands place the switch in BGP VRF configuration mode for VRF “purple.” Commands issued in this mode will override global BGP configuration for the specified VRF instance.
  
  switch(config)#router bgp 1
  switch(config-router-bgp)#vrf purple

- These commands activate IPv6 address-family support for the IPv6 neighbor 2001:0DB8:8c01::1 in VRF “purple.”
  
  switch(config-router-bgp-vrf-purple)#router-id 1.1.1.1
  switch(config-router-bgp-vrf-purple)#neighbor 2001:0DB8:8c01::1 remote-as 16
  switch(config-router-bgp-vrf-purple)#address-family ipv6
  switch(config-router-bgp-vrf-purple-af)#neighbor 2001:0DB8:8c01::1 activate

- This command configures a route distinguisher for VRF “purple.”
  
  switch(config-router-bgp-vrf-purple)#rd 530:12

33.2.2 Configuring BGP Neighbors

33.2.2.1 Establishing BGP Neighbors

BGP neighbors, or peers, are established by configuration commands that initiate a TCP connection. BGP supports two types of neighbors:

- Internal neighbors are in the same autonomous system.
- External neighbors are in different autonomous systems.

BGP neighbors can be either static or dynamic:

- Static neighbors are established by manually configuring the connection.
- Dynamic neighbors are established by creating a listen range and accepting incoming connections from neighbors in that address range.

Static neighbors may belong to a static peer group, allowing them to be configured as a group. Configuration applied to an individual member of a static peer group overrides the group configuration for that peer. Dynamic neighbors must belong to a dynamic peer group, and can only be configured as a group.

Static BGP Neighbors

The neighbor remote-as command connects the switch with a peer, establishing a static neighbor.

Once established, a static neighbor may be added to an existing peer group. Any configuration applied to the peer group then is inherited by the neighbor, unless a conflicting configuration has been entered for that peer. Settings applied to a member of the peer group override group settings.
To establish a BGP session, there must be an IPv4 router ID configured in the same VRF or at least one L3 interface with an IPv4 address in the same VRF. If the VRF contains no L3 interfaces with IPv4 addresses (for example, in an IPv6-only environment), configure an appropriate router ID using the `router-id (BGP)` command.

**Example**

- These commands establish an internal BGP connection with the peer at 10.1.1.14.
  ```
  switch(config)#router bgp 50
  switch(config-router-bgp)#neighbor 10.1.1.14 remote-as 50
  ```

- These commands establish an external BGP connection with the peer at 192.168.2.5.
  ```
  switch(config)#router bgp 50
  switch(config-router-bgp)#neighbor 192.168.2.5 remote-as 100
  ```

**Dynamic BGP Neighbors**

The `bgp listen range` command specifies a range of IPv4 addresses from which the switch will accept incoming dynamic BGP peering requests, and creates the named dynamic peer group to which those peers belong. Dynamic BGP neighbors are peers which have not been manually established, but are accepted into a dynamic peer group when the switch receives a peering request from them.

Dynamic peers cannot be configured individually, but inherit any configuration that is applied to the peer group to which they belong. Peering relationships with dynamic peers are terminated if the peer group is deleted.

**Example**

- These commands create a peer group called “brazil” which accepts dynamic peering requests from the 192.168.2.0/24 subnet.
  ```
  switch(config)#router bgp 50
  switch(config-router-bgp)#bgp listen range 192.168.2.0/24 peer-group brazil remote-as 50
  ```

**Displaying Neighbor Connections**

The `show ip bgp summary` and `show ip bgp neighbors` commands display neighbor connection status.

**Example**

- This command indicates the connection state with the peer at 192.168.2.5 is *Estab* (established). The peer is an external neighbor because it is in AS 100 and the local server is in AS 50.
  ```
  switch>show ip bgp summary
  BGP summary information for VRF default
  BGP router identifier 192.168.104.2, local AS number 50
  Neighbor Status Codes: m - Under maintenance
  Neighbor V AS MsgRcvd MsgSent InQ OutQ Up/Down State PfxRcd PfxAcc
  192.168.2.5 4 100 198 281 0 0 03:11:31 Estab 12 12
  ```
Static BGP Peer Groups

A static BGP peer group is a collection of BGP neighbors which can be configured as a group. Once a static peer group is created, the group name can be used as a parameter in neighbor configuration commands, and the configuration will be applied to all members of the group. Neighbors added to the group will inherit any settings already created for the group. Static peer group members may also be configured individually, and the settings of an individual neighbor in the peer group override group settings for that neighbor.

When the default form of a BGP configuration command is entered for a member of a static peer group, the peer inherits that configuration from the peer group.

A static peer group is created with the neighbor peer group (create) command, or by using the bgp listen range command to accept dynamic peering requests. Once a static peer group has been created, static neighbors can be manually added to the group by using the neighbor peer-group (neighbor assignment) command. The no neighbor peer-group (neighbor assignment) command removes a neighbor from a static peer group.

The no neighbor peer group (create) command will delete a static peer group. When a peer group is deleted, the members of that group revert to their individual configurations, or to the system default for any attributes that have not been specifically configured for that peer.

Examples

- These commands create a peer group named “akron.”
  ```
  switch(config)#router bgp 50
  switch(config-router-bgp)#neighbor akron peer-group
  switch(config-router-bgp)#
  ```
- This command adds the neighbors at 1.1.1.1 and 2.2.2.2 to peer group akron.
  ```
  switch(config-router-bgp)#neighbor 1.1.1.1 peer-group akron
  switch(config-router-bgp)#neighbor 2.2.2.2 peer-group akron
  switch(config-router-bgp)#
  ```
- These commands configure the members of peer group akron, but cause the neighbor at 1.1.1.1 to use the system default value for out-delay.
  ```
  switch(config-router-bgp)#neighbor akron remote-as 109
  switch(config-router-bgp)#neighbor akron out-delay 101
  switch(config-router-bgp)#neighbor akron maximum-routes 12000
  switch(config-router-bgp)#no neighbor 1.1.1.1 out-delay
  switch(config-router-bgp)#
  ```

Dynamic BGP Peer Groups

A dynamic BGP peer group is a collection of BGP neighbors in a specified address range which makes a peer request to the switch. Members of dynamic peer group are configured in groups and not as individuals. A dynamic peer group name is used as a parameter to apply the configuration across all the members in the group. Neighbors joining the group inherit any settings already created for the group.

The bgp listen range command is used to create a dynamic peer group. This command identifies the BGP peering request from a range of IP address, and names the dynamic peer group to which those peers belong to. The bgp listen range command can be configured to accept a peering request from a single AS number or to accept peer request from the range of AS numbers. To accept the request from the range of AS numbers use the peer filter option in the command as shown. If the peer filter referred by the bgp listen range command does not exist, or if the filter exists but has no match commands, it will accept any AS number.
Note

When a listen range command is modified, any existing dynamic neighbor that is already established will get reset.

To delete a dynamic peer group, use the no or default form of the `bgp listen range` command. All peering relationships with group members are terminated when the dynamic peer group is deleted.

Example

- These commands create a dynamic peer group called “brazil” in a single AS, which accepts peering requests from the 192.0.2.0/24 subnet the single AS is 5.

```
switch(config)#router bgp 1
switch(config-router-bgp)#bgp listen range 192.0.2.0/24 peer-group brazil
remote-as 5
```

- These commands create a dynamic peer group called “brazil” in a range of ASNs, which accepts peering requests from the 192.0.2.0/24 subnet. The range of AS numbers is defined by peer filter option.

```
switch(config)#router bgp 1
switch(config-router-bgp)#bgp listen range 192.0.2.0/24 peer-group brazil
peer-filter group-1
```

The `show ip bgp peer-group` command displays the source of a listen range’s remote AS number definition as shown.

```
switch(config-router-bgp)#show ip bgp peer-group
BGP peer-group is brazil
BGP version 4
Listen-range subnets:
  VRF default:
    192.0.2.0/24, remote AS 5
    192.0.2.0/24, peer filter group1
```

33.2.2.2 Peer Filter

A peer filter defines a set of rules which decides whether to accept or reject the incoming peer request, based on the specific peer attributes. The peer filter is defined using a sequence number and a match statement, today it does support one new match statement for matching against a range of BGP AS numbers. A peer filter is defined using a peer filter configuration mode as shown. The peer filter command supports only matching AS ranges. Unlike route maps, peer filter do not support sets, continues or subroutines.

To delete a peer filter, use the no or default form of the peer filter command.

Example

- These commands define a peer filter that accepts any AS number.

```
switch(config)#peer-filter group1
switch(config-peer-filter-group1)#10 match as-range 1-4294967295 result accept
```

- These commands define a peer filter that accepts any AS number within 65000 and 65100 (inclusive) except 65008 and 65009.

```
switch(config)#peer-filter group2
switch(config-peer-filter-group2)#10 match as-range 65008-65009 result reject
switch(config-peer-filter-group2)#20 match as-range 65000-651000 result accept
```
These commands define a peer filter that accepts 3 specific remote AS numbers.

```
switch(config)#peer-filter group3
switch(config-peer-filter-group3)#10 match as-range 65003 result accept
switch(config-peer-filter-group3)#20 match as-range 65007 result accept
switch(config-peer-filter-group3)#30 match as-range 65009 result accept
```

The `show peer-filter` command displays the peer filter definition.

```
switch(config)#show ip bgp peer-group3
peer-filter group3
  10 match as-range 65003 result accept
  20 match as-range 65007 result accept
  30 match as-range 65009 result accept
```

### 33.2.2.3 Special Considerations for IPv6

BGP predates the use of IPv6, and BGP configuration assumes IPv4 connections by default. The following additional steps are used to configure IPv6 BGP neighbors.

**Note**

To establish a BGP session, there must be an IPv4 router ID configured in the same VRF or at least one L3 interface with an IPv4 address in the same VRF. If the VRF contains no L3 interfaces with IPv4 addresses (e.g., in an IPv6-only environment), configure an appropriate router ID using the `router-id` (BGP) command.

#### Activating IPv6 Neighbors

By default, the switch does not negotiate or advertise IPv6 BGP routes. In order to establish a session with an IPv6 neighbor, it must be made active in the IPv6 address family. The `bgp default ipv6-unicast` command causes the switch to send IPv6 capability messages and all network advertisements with IPv6 prefixes to all BGP neighbors. The `neighbor activate` command issued in IPv6 address family configuration mode does the same for a single BGP neighbor.

**Examples**

- These commands make all BGP neighbors active in the IPv6 address family.
  ```
  switch(config)#router bgp 11
  switch(config)#address-family ipv6
  switch(config-router-bgp-af)#bgp default ipv6-unicast
  switch(config-router-bgp-af)#exit
  switch(config-router-bgp)#
  ```

- These commands make the BGP neighbor at 2001:0DB8:8c01::1 active in the IPv6 address family.
  ```
  switch(config)#router bgp 11
  switch(config)#address-family ipv6
  switch(config-router-bgp-af)#neighbor 2001:0DB8:8c01::1 activate
  switch(config-router-bgp-af)#exit
  switch(config-router-bgp)#
  ```

**Sending IPv4 NLRI over IPv6 Connections**

The switch supports the exchange of IPv4 NLRI with IPv6 neighbors. To enable this feature for all IPv6 neighbors, use the command `bgp default ipv4-unicast transport ipv6` in IPv4 address family configuration mode. To enable it for a single IPv6 neighbor, use the `neighbor activate` command for that neighbor in IPv4 address family configuration mode.
To send IPv4 NLRIs to IPv6 neighbors, the IPv4 next-hop address must also be communicated. To explicitly configure an IPv4 next hop to send to a specific IPv6 neighbor, use the `neighbor local-v4-addr` command. In some network configurations, the switch can also be configured to automatically determine the best IPv4 next-hop address for an individual IPv6 neighbor or for all neighbors in the VRF using the `neighbor auto-local-addr` command.

**Examples**

- These commands permit IPv4 NLRI transport over all IPv6 connections by making the IPv4 address family active on IPv6 BGP neighbors, then configure the switch to automatically select a local IPv4 address to be sent in NLRIs to the IPv6 neighbors in a peer group called “indianapolis”.

```
switch(config)#router bgp 11
switch(config-router-bgp)#address-family ipv4
switch(config-router-bgp-af)#bgp default ipv4-unicast transport ipv6
switch(config-router-bgp-af)#exit
switch(config-router-bgp)#neighbor indianapolis auto-local-addr
switch(config-router-bgp)#
```

- These commands permit IPv4 NLRI transport with the IPv6 neighbor at 2001:0DB8:8c01::1 using a local IPv4 address of 10.7.5.11.

```
switch(config)#router bgp 11
switch(config-router-bgp)#address-family ipv4
switch(config-router-bgp-af)#neighbor 2001:0DB8:8c01::1 activate
switch(config-router-bgp-af)#exit
switch(config-router-bgp)#neighbor 2001:0DB8:8c01::1 local-v4-addr 10.7.5.11
switch(config-router-bgp)#
```

### 33.2.2.4 Maintaining Neighbor Connections

BGP neighbors maintain connections by exchanging keepalive, UPDATE, and NOTIFICATION messages. Neighbors that do not receive a message from a peer within a specified period (hold time) close the BGP session with that peer. Hold time is typically three times the period between scheduled keepalive messages. The default keepalive period is 60 seconds; default hold time is 180 seconds.

The `timers bgp` command configures the hold time and keepalive period. A peer retains its BGP connections indefinitely when its hold time is zero.

**Example**

- This command sets the keepalive period to 15 seconds and the hold time to 45 seconds.

```
switch(config-router-bgp)#timers bgp 15 45
switch(config-router-bgp)#
```

The `show ip bgp neighbors` command displays the hold time.
Example

- This command indicates the BGP hold time is 45 seconds.

  switch>show ip bgp neighbors 10.100.100.2
  BGP neighbor is 10.100.100.2, remote AS 100
  BGP version 4, remote router ID 192.168.100.13, VRF default
  Negotiated BGP version 4
  Last read 00:00:05, last write 00:00:05
  Hold time is 45, keepalive interval is 15 seconds
  Configured hold time is 45, keepalive interval is 15 seconds
  Connect timer is inactive
  Idle-restart timer is inactive
  BGP state is Established, up for 04:44:05
  Number of transitions to established: 11
  Last state was OpenConfirm
  Last event was RecvKeepAlive
  Last sent notification:Cease/administrative reset, Last time 04:44:09
  Last rcvd notification:Cease/peer de-configured, Last time 2d02h, First time 7d08h, Repeats 1
  Neighbor Capabilities:
  Multiprotocol IPv4 Unicast: advertised and received and negotiated
  Four Octet ASN: advertised and received

  switch> <--------OUTPUT OMITTED FROM EXAMPLE-------->

33.2.2.5 Neighbor – Route Configuration

Maximum Routes

The `neighbor maximum-routes` command determines the number of BGP routes the switch accepts from a specified neighbor. The switch disables peering with the neighbor when this number is exceeded.

Example

- This command configures the switch to accept 15,000 routes from the peer at 192.168.18.24.

  switch(config-router-bgp)#neighbor 192.168.18.24 maximum-routes 15000
  switch(config-router-bgp)#

Route Reflection

Participating BGP routers within an AS communicate eBGP-learned routes to all of their peers; they do not re-advertise iBGP-learned routes within the AS to prevent routing loops. Although a fully meshed network topology ensures that all AS members share routing information, this topology can result in high volumes of iBGP messages when scaled. Alternatively, one or more routers are configured as route reflectors in larger networks.

A route reflector re-advertises routes learned through iBGP to a group of BGP neighbors within the AS, replacing the function of a fully meshed topology. The `neighbor route-reflector-client` command configures the switch to act as a route reflector and configures the specified neighbor as a client. The `bgp client-to-client reflection` command enables client-to-client reflection.

When using route reflectors, an AS is divided into clusters. A cluster contains at least one route reflector and a group of clients to which they re-advertise route information. A cluster may contain multiple route reflectors to provide redundancy protection. Each reflector has a cluster ID. When the cluster has a single route reflector, the cluster ID is its router ID. When a cluster has multiple route
reflectors, a 4-byte cluster ID is assigned to all route reflectors in the cluster, allowing them to recognize updates from other cluster reflectors. The `bgp cluster-id` command configures the cluster ID in a cluster with multiple route reflectors.

**Example**

- These commands configure the switch as a route reflector and the neighbor at 172.72.14.5 as one of its clients, and set the cluster ID to 172.22.30.101.

  ```
  switch(config-router-bgp)\# neighbor 172.72.14.5 route-reflector-client
  switch(config-router-bgp)\# bgp cluster-id 172.22.30.101
  switch(config-router-bgp)\#
  ```

Usually the clients of a route reflector are not interconnected, and any routes learned by a client are mirrored to other clients and re-advertised within the AS by the route reflector. If the clients of a route reflector are fully meshed, routes received from a client do not need to be mirrored to other clients. In this case, client-to-client reflection should be disabled (`no bgp client-to-client reflection`).

**Route Preference**

The primary function of external peers is to distribute routes they learn from their peers. Internal peers receive route updates without distributing them. External peers receive route updates, then distribute them to internal and external peers.

*Local preference* is a metric that iBGP sessions use to select an external route. Preferred routes have the highest local preference value. UPDATE packets include this metric in the LOCAL_PREF field.

The `neighbor export-localpref` command specifies the LOCAL_PREF that the switch sends to an internal peer. The command overrides previously assigned preferences and has no effect on external peers.

**Example**

- This command configures the switch to enter 200 in the LOCAL_PREF field of UPDATE packets it sends to the peer at 10.1.1.45.

  ```
  switch(config-router-bgp)\# neighbor 10.1.1.45 export-localpref 200
  switch(config-router-bgp)\#
  ```

The `neighbor import-localpref` command assigns a local preference to routes received through UPDATE packets from an external peer. This command has no effect when the neighbor is an internal peer.

**Example**

- This command configures the switch to assign the local preference of 50 for routes advertised from the peer at 172.16.5.2.

  ```
  switch(config-router-bgp)\# neighbor 172.16.5.2 import-localpref 50
  switch(config-router-bgp)\#
  ```

The `show ip bgp` command displays the LOCAL_PREF value for all listed routes.
Example

- This command indicates the route to network 10.10.20.0/24 has a local preference of 400.

```
switch#show ip bgp
BGP routing table information for VRF default
Router identifier 192.168.100.23, local AS number 64512
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e - ECMP
S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop

Network   Next Hop     Metric  LocPref  Weight  Path
* >Ec     10.10.20.0/24 192.168.31.3 0       400     0 64521 i
```

Graceful Restart

Graceful BGP restart allows a BGP speaker with separate control plane and data plane processing to continue forwarding traffic during a BGP restart. Its neighbors (receiving speakers) may retain routing information from the restarting speaker while a BGP session with it is being re-established, reducing route flapping.

Arista switches can act as helpers (receiving speakers) for graceful BGP restart with neighbors that advertise graceful restart capability.

Graceful restart helper mode is enabled by default, but can be turned off globally with the `no graceful-restart-helper` command. Per-peer configuration takes precedence over the global configuration.

Example

- This command disables graceful restart helper mode for all BGP peers.

```
switch(config-router-bgp)#no graceful-restart-helper
switch(config-router-bgp)#
```

- This command disables graceful restart helper mode for the neighbor at 192.168.32.5 regardless of global configuration.

```
switch(config-router-bgp)#no neighbor 192.168.32.5 graceful-restart-helper
switch(config-router-bgp)#
```

Peers with graceful restart capability advertise a restart time value as an estimate of the time it will take them to restart a BGP session. When a BGP session with a restarting speaker goes down, the switch (receiving speaker) marks routes from that peer as stale and starts the restart timer. If the session with the peer is not re-established before the restart time runs out, the switch deletes the stale routes from that peer. If the session is re-established within that time, the stale path timer is started. If the stale paths are not updated by the restarting speaker before the stale path time runs out, they are deleted. The maximum time these stale paths will be retained after the BGP session is re-established is 300 seconds by default, but can be configured using the `graceful-restart stalepath-time` command.

Example

- This command configures BGP to discard stale paths from a restarting peer 500 seconds after the BGP session with that peer is re-established.

```
switch(config-router-bgp)#graceful-restart stalepath-time 500
switch(config-router-bgp)#
```
Filtering Routes

Filtering with Route Maps

Route maps are used in BGP to directly filter IPv4 unicast routes. The neighbor route-map (BGP) command applies a route map to inbound or outbound BGP routes. To display the route maps associated with a specific BGP neighbor, use the show ip bgp neighbors command.

Filtering with BGP Communities

Community values are assigned to a set of subnet prefixes through route map set commands. Route map match commands subsequently use community values to filter routes. The switch uses the following ip community-list commands to filter community routes into a BGP domain:

- **ip community-list** creates a community list by explicitly referencing one or more communities by name or number.
- **ip community-list regexp** creates a community list by referencing one or more communities by regular expression.
- **ip extcommunity-list** creates an extended community list to identify routes for VRFs or for link bandwidth (LBW) by explicitly referencing extended communities by prefix and number.
- **ip extcommunity-list regexp** creates an extended community list to identify routes for VRFs or for link bandwidth (LBW) by regular expression.

The BGP community attribute is a 32 bit value formatted as follows:

- an integer between 0 and 4294967040.
- **AA:NN**, where AA is 65535 and NN specifies the community number (0-65535) within the AS.

These four community attribute values, and the associated BGP speaker actions, are predefined:

- **no-export**: speaker does not advertise the routes beyond the BGP domain.
- **no-advertise**: speaker does not advertise the routes to any BGP peers.
- **local-as**: speaker does not advertise route to any external peers.
- **internet**: speaker advertises the route to the Internet community. By default, this includes all prefixes.

Example

- These commands assign two network subnets to a prefix list, assign a community number to the prefix list members, then utilize that community in an ip community-list command to permit the routes into the BGP domain.

**Step 1** Compose the IP prefix list.

```
switch(config)#ip prefix-list PL_1 permit 10.1.2.5/24
switch(config)#ip prefix-list PL_1 permit 10.2.5.1/28
```

**Step 2** Create a route map that matches the IP prefix list and sets the community value.

```
switch(config)#route-map MAP_1 permit
switch(config-route-map-MAP_1)#match ip address prefix-list PL_1
switch(config-route-map-MAP_1)#set community 500
switch(config-route-map-MAP_1)#exit
```

**Step 3** Create a community list that references the community.

```
switch(config)#ip community-list CL_1 permit 500
switch(config)#
```
BGP extended communities identify routes for VRFs or for link bandwidth (LBW). Extended community clauses utilize route target (rt) and site of origin options (soo):

- **route targets** identify sites that may receive appropriately tagged routes.
- **site of origin** identifies the site where the router learned the route.

### Filtering with AS Path Access Lists

An AS path access list is a named list of permit and deny statements which use regular expressions to filter BGP routes based on their AS path attribute. AS path access lists are created using the `ip as-path access-list` command, and are applied using a route map `match` clause with the name of the access list as a parameter.

**Example**

- These commands create an AS path access list identifying routes which pass through AS 3, create a route map which references the access list, assign the routes it filters to community 300, and apply the route map to the neighbor at 192.68.14.5 to assign a community value of 300 to inbound routes received from that neighbor.

**Step 1**  Create the AS path access list.

```plaintext
switch(config)#ip as-path access-list as_list3 permit _3_
```

**Step 2**  Create a route map that matches the AS path access list and sets the community value.

```plaintext
switch(config)#route-map MAP_3 permit
switch(config-route-map-MAP_3)#match as-path as_list3
switch(config-route-map-MAP_3)#set community 300
switch(config-route-map-MAP_3)#exit
```

**Step 3**  Apply the route map to the neighbor.

```plaintext
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 192.68.14.5 route-map MAP_3 in
```

### Configuring GTSM for BGP

The Generalized TTL Security Mechanism (GTSM) uses a packet's Time to Live (TTL) (IPv4) or Hop Limit (IPv6) to protect BGP peering sessions from denial-of-service (DoS) attacks based on forged protocol packets.

An IP packet received from a BGP peer is discarded when its current TTL value is less than \((255-n)\) where \(n\) is the configured maximum number of hops to the peer. Use the `neighbor ttl maximum-hops` command to configure the maximum hop count.

**Note**  IP packets to GTSM enabled BGP peers are sent with the configured TTL value of 255.

### Configuring Routes

#### Advertising Routes

A BGP neighbor advertises routes it can reach through UPDATE packets. The `network (BGP)` command specifies a prefix that the switch advertises as a route originating from its AS.

The configuration clears the host portion of addresses entered in `network` commands. For example, 192.0.2.4/24 is stored as 192.0.2.0/24.
Example

- This command configures the switch to advertise the 10.5.8.0/24 network.
  
  ```
  switch(config-router-bgp)#network 10.5.8.0/24
  switch(config-router-bgp)#
  ```

By default, BGP will advertise only those routes that are active in the switch's RIB. This can contribute to dropped traffic. If a preferred route is available through another protocol (like OSPF), the BGP route will become inactive and not be advertised; if the preferred route is lost, there is no available route to the affected peers. Advertising inactive BGP routes minimizes traffic loss by providing alternative routes.

The `bgp advertise-inactive` command causes BGP to advertise inactive routes to BGP neighbors. Inactive route advertisement is configured globally, but the global setting can be overridden on a per-VRF basis.

Examples

- This command configures the switch to advertise routes learned through BGP even if they are not active on the switch.
  
  ```
  switch(config-router-bgp)#bgp advertise-inactive
  switch(config-router-bgp)#
  ```

- This command overrides inactive route advertisement for VRF “purple.”
  
  ```
  switch(config-router-bgp)#vrf purple
  switch(config-router-bgp-vrf-purple)#no bgp advertise-inactive
  switch(config-router-bgp-vrf-purple)#
  ```

33.2.4.2 Advertising ISIS Routes into BGP Network

The `redistribute isis route-map isis-to-bgp` command advertises the routes learned through IS-IS routes into BGP network. It also allows to selectively advertise some routes and modify route attributes before advertising using route-maps.

The command is available in both address-family mode and router BGP mode, however, the command is rejected if configured in both address-family mode and router mode at the same time.

While redistributing IS-IS routes into BGP, Level-1|Level-2 keyword can be used to selectively redistribute Level-1 routes or Level-2 routes into BGP. The level-1|level-2 keyword is optional and it defaults to level-2 when not configured.

Use `show ipv6 bgp <detail>` command to verify that routes are advertised with correct attributes.

Note

If the command is configured in router-af mode, it only redistributes routes with matching address family. If it is configured in router mode, it applies to all enabled address-families.

Examples

- In this example the `redistribute isis route-map isis-to-bgp` command redistributes the IS-IS routes into BGP, in `address-family` mode.
  
  ```
  Switch(config)#router bgp 1
  Switch(config-router-bgp)#address-family ipv4
  Switch(config-router-bgp-af)#redistribute isis level-1 route-map isis-to-bgp-v4
  ```

- In this example the `redistribute isis route-map isis-to-bgp` command redistributes the IS-IS routes into BGP, in `router bgp` mode.
  
  ```
  Switch(config)#router bgp 1
  Switch(config-router-bgp)#redistribute isis level-1 route-map isis-to-bgp
  ```
33.2.4.3 BGP Route Aggregation

Aggregation combines the characteristics of multiple routes into a single route for advertisement by the BGP speaker. Aggregation can reduce the amount of information that a BGP speaker is required to store and transmit when advertising routes to other BGP speakers. Aggregation options affect the attributes associated with the aggregated route, the advertisement of the contributor routes that comprise the aggregate, and which contributor routes are included.

Aggregate routes are created with the aggregate-address command, which takes an IP subnet as an argument; any routes configured on the switch that lie within that subnet then become contributors to the aggregate. Note that on Arista switches the BGP aggregate route will become active if there are any available contributor routes on the switch, regardless of the originating protocol. This includes routes configured statically.

BGP speakers display aggregate routes that they create as null routes (with one exception: if all the contributors to the aggregate have the same BGP path attributes, then the BGP aggregate copies those attributes and is no longer a null route). Aggregate routes are advertised into the BGP autonomous system and redistributed automatically, and their redistribution cannot be disabled. BGP neighbors display inbound aggregate routes as normal BGP routes. Null routes are displayed with the show ip route command; normal BGP routes (and null aggregate routes) are displayed with the show ip bgp and show ip route commands.

Aggregation Options

The aggregate-address command provides the following aggregate route options:

- AS_PATH attribute inclusion: the as-set option controls the aggregate route’s AS_PATH and ATOMIC_AGGREGATE attribute contents. AS_PATH identifies the autonomous systems through which UPDATE message routing information passes. ATOMIC_AGGREGATE indicates that the route is an aggregate or summary of more specific routes.

  When the command includes as-set, the aggregate route’s AS_SET attribute contains the AS numbers of contributor routes. This can help BGP neighbors to prevent loops by rejecting aggregate routes that include their AS number in the AS_SET.

  When the command does not include as-set, the aggregate route’s ATOMIC_AGGREGATE attribute is set and the AS_PATH attribute does not include AS numbers of contributing routes.

- Attribute assignment: The attribute-map option assigns attributes contained in set commands in a specified route map’s lowest sequence with any set command to the aggregated route, overriding the automatic determination of the aggregate route’s attributes by the switch.

- Route suppression: The summary-only option suppresses the advertisement of the contributor routes that comprise the aggregate.

- Contributor filtering: The match-map option uses a route map to filter out contributor routes that would otherwise be included in the aggregate.

Example

- These commands create an aggregate route (10.16.48.0/20) from four contributor routes (10.16.48.0/23, 10.16.50.0/23, 10.16.52.0/23, and 10.16.54.0/23). The aggregate route includes the AS_PATH information from the contributor routes.

  switch(config)#router bgp 1
  switch(config-router-bgp)#aggregate-address 10.16.48.0/20 as-set
  switch(config-router-bgp)#exit
  switch(config)#
Configuring BGP

Chapter 33: Border Gateway Protocol (BGP)

- These commands create an aggregate route and use a route map to add a local-preference attribute to the route.

  switch(config)#route-map map1 permit 10
  switch(config-route-map-map1)#set local-preference 40
  switch(config-route-map-map1)#exit
  switch(config)#router bgp 1
  switch(config-router-bgp)#aggregate-address 10.16.48.0/20 attribute-map map1
  switch(config-router-bgp)#exit

- These commands create an aggregate route and use a route map to allow only those contributors which match a specified prefix list to be included in the aggregate route.

  switch(config)#route-map matchmap permit 10
  switch(config-route-map-matchmap)#match ip address prefix-list agglist
  switch(config-route-map-matchmap)#exit
  switch(config)#router bgp 1
  switch(config-router-bgp)#aggregate-address 1.1.0.0/16 match-map matchmap

33.2.4.4 Customizing the BGP AS-Path Attribute

The BGP Replace AS-Path feature enables customizing the AS_PATH attribute for prefixes that are either received from a BGP neighbor or advertised to a BGP neighbor. To configure the BGP Replace AS-Path feature, use the set as-path match and set as-path prepend commands.

To replace the AS_PATH attribute of routes received from a BGP neighbor, configure a route map and attach the policy to the corresponding BGP neighbor statement in the inbound direction.

To replace the AS_PATH attribute of routes that are advertised to a neighbor, configure a route map and attach the policy to the corresponding BGP neighbor statement in the outbound direction.

The Replace AS-Path feature works in conjunction with the AS-Path Prepend feature which is also used to modify the AS_PATH attribute. However, if both features are configured within the same route map, then the replace AS-Path feature takes precedence over the AS-Path Prepend.

Note

The BGP Replace AS-Path feature supports both eBGP and iBGP neighbors. The locally configured AS number is always prefixed to the AS-Path of routes advertised to the eBGP neighbors. This RFC behavior is retained in Arista’s implementation of the Replace AS-Path feature as well.

BGP Replace AS-Path has the following limitations:

- Replacing the AS-Path should be used cautiously since it may impact BGP loop prevention.
- A few duplicated routes may be advertised and installed on a router after the original AS-Path of those routes are replaced. To fix this issue, it is always suggested to filter out such routes by prefix with BGP Community.
**Example**

- This command replaces the AS-Path with the “none” option.

```plaintext
switch#show ip bgp neighbors 80.80.1.2 advertised-routes
BGP routing table information for VRF default
Router identifier 202.202.1.1, local AS number 200
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e - ECMP
S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast, q - Queued for advertisement
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop

Network Next Hop Metric LocPref Weight Path
* > 101.101.1.0/24 80.80.1.1 - - - 200 i
* > 102.102.1.0/24 80.80.1.1 - - - 200 i
* > 103.103.1.0/24 80.80.1.1 - - - 200 302 i
* > 202.202.1.0/24 80.80.1.1 - - - 200 i
```

```plaintext
switch#configuration terminal
switch(config)#route-map foo permit 10
switch(config-route-map-foo)#set as-path match all replacement none
switch(config-route-map-foo)#exit
switch(config)#router bgp 200
switch(config-router-bgp)#neighbor 80.80.1.2 route-map foo out
switch(config-router-bgp)#end

switch#show ip bgp neighbors 80.80.1.2 advertised-routes
BGP routing table information for VRF default
Router identifier 202.202.1.1, local AS number 200
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e - ECMP
S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast, q - Queued for advertisement
Origin codes: i - IGP, e - EGP, ? - incomplete

Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop

Network Next Hop Metric LocPref Weight Path
* > 101.101.1.0/24 80.80.1.1 - - - 200 200 i
* > 102.102.1.0/24 80.80.1.1 - - - 200 200 i
* > 103.103.1.0/24 80.80.1.1 - - - 200 200 i
* > 202.202.1.0/24 80.80.1.1 - - - 200 200 i

The AS-Path of matching prefixes are replaced with the locally configured AS – 200.

33.2.4.5 AS-path Modifications for Split ASes

By default, BGP rejects routes that contain the local autonomous system number (ASN). Sometimes a single autonomous system is divided geographically or otherwise with one or more provider ASes in between. In these cases, a valid route can sometimes be dropped by a customer edge router because the local ASN appears in the AS-path of route advertisements that have traveled through one or more provider networks. To ensure that these routes are not dropped, the provider edge router can be configured to replace the customer AS with its own, or the customer edge router can be configured to ignore its local AS number in received routes.

Replacing Remote ASN in Outbound Route Announcements

To replace a remote ASN with the local ASN in BGP route announcements sent to a specified router, use the neighbor as-path remote-as replace out command.

Example

- These commands configure the switch to substitute its local ASN for the ASN of the BGP neighbor at 192.168.2.15 in BGP routes advertised to that neighbor.

switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 192.168.2.15 as-path remote-as replace out
switch(config-router-bgp)#

Ignoring Local ASN in Incoming Route Announcements

To accept BGP routes that include the local ASN in their AS-path attribute, use the neighbor allowas-in command.

Example

- These commands configure the switch to accept routes from the BGP neighbor at 192.168.1.30 which contain the switch’s ASN in their AS paths as many as 3 times.

switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 192.168.1.30 allowas-in
switch(config-router-bgp)#
33.2.5 Configuring Address Families

The switch determines the network prefixes that peering sessions advertise and the BGP neighbor addresses that receive advertisements through address family activity configuration.

An address family is a data structure that defines route advertising status to BGP neighbor addresses. Each BGP neighbor address is assigned an activity level for each address family on the switch. The switch sends capability and network prefix advertisements to neighbor addresses that are active within specified address families:

- IPv4 address family: switch advertises IPv4 capability and network commands with IPv4 prefixes to neighbor addresses configured as *IPv4 address family active*.
- IPv6 address family: switch advertises IPv6 capability and network commands with IPv6 prefixes to neighbor addresses configured as *IPv6 address family active*.

33.2.5.1 Neighbor Address Family Configuration

Address family activity levels for neighbor addresses are configured through *bgp default* and *neighbor activate* commands.

- The *bgp default* command specifies the default activity level of BGP neighbor addresses for a specified address family.
- The *neighbor activate* command specifies deviations from default address family activity level for a specified BGP neighbor address.

Default neighbor activation

The *bgp default* command configures the default address family activity level of all configured BGP neighbor addresses. The switch advertises the following to *address family active* addresses:

- IPv4 address family active: IPv4 capability and all network advertisements with IPv4 prefixes.
- IPv6 address family active: IPv6 capability and all network advertisements with IPv6 prefixes.

These commands configure default address family activity levels for configured BGP neighbor addresses:

- *bgp default ipv4-unicast*  
  all BGP neighbor addresses are IPv4 address family active (this is the switch default).
- *no bgp default ipv4-unicast*  
  no BGP neighbor addresses are IPv4 address family active.
- *bgp default ipv6-unicast*  
  all BGP neighbor addresses are IPv6 address family active.
- *no bgp default ipv6-unicast*  
  no BGP neighbor addresses are IPv6 address family active (this is the switch default).
- *bgp default ipv4-unicast transport ipv6*  
  all BGP neighbor addresses are IPv4 address family active and IPv6 neighbors can receive IPv4 NLRIs.

Note

If it is necessary to exchange IPv4 NLRIs over an IPv6 connection, the IPv4 address family must be activated on the IPv6 neighbor. To do this for all IPv6 neighbors, use the command *bgp default ipv4-unicast transport ipv6*. For an individual neighbor, use the *neighbor activate* command for the IPv6 neighbor in the IPv4 address-family configuration mode as described below.

Activating Individual Neighbor Addresses

The *address-family* command places the switch in address family mode to configure the address family activity level of individual BGP neighbor addresses. The switch supports these address families:
• ipv4-unicast
• ipv6-unicast

Running-config displays address family commands in sub-blocks of the BGP configuration. The neighbor activate command is available in each address family configuration mode and defines the configuration mode address family activity level of a specified configured BGP neighbor address. Addresses are assigned one of the following states by the activate command:

• **neighbor activate** configures the address as active in the configuration mode address family.
• **no neighbor activate** configures the address as not active in the configuration mode address family.

The switch sends the following announcements to addresses that are active in an address family:

• IPv4 address family: IPv4 capability and all network routes with IPv4 prefixes.
• IPv6 address family: IPv6 capability and all network routes with IPv6 prefixes.

The neighbor route-map (BGP) command applies a route map to inbound or outbound BGP routes. In address-family mode, the route map is applied to routes corresponding to the configuration mode address family. When a route map is applied to outbound routes, the switch advertises only routes matching at least one section of the route map. One outbound and one inbound route map can be applied to a neighbor for each address family. Applying a route map to a route replaces the previous corresponding route map assignment.

Network Route Advertising in Address Families

The network (BGP) command specifies a network for advertisement through UPDATE packets to BGP peers. The command is available in Router-BGP and Router-BGP-Address-Family configuration modes; the mode in which the command is issued does not affect the command’s execution.

• Commands with an IPv4 address are advertised to peers that are IPv4 address family-active.
• Commands with an IPv6 address are advertised to peers that are IPv6 address family-active.

Examples

• These commands instantiate BGP, configure three neighbors, and configure 2 network routes.

The default activity level for IPv4 and IPv6 address families is set to the default; all neighbor addresses are IPv4 address family active and IPv6 address family not active. IPv4 capability and network routes with IPv4 prefixes are advertised to all neighbor IPv4 addresses.

```bash
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor 172.21.14.8 remote-as 15
switch(config-router-bgp)#neighbor 172.23.18.6 remote-as 16
switch(config-router-bgp)#neighbor 2001:0DB8:8c01::1 remote-as 16
switch(config-router-bgp)#network 172.18.23.9/24
switch(config-router-bgp)#network 2001:0DB8:de29::/64
```

• These commands instantiate BGP on the switch, set IPv4 default activity level (**not active**), set IPv6 default activity level (**active**), and configure three neighbor addresses and two network route prefixes.
IPv6 capability and network routes with IPv6 prefixes are advertised to all neighbor addresses.

```
switch(config)#router bgp 10
switch(config-router-bgp)#bgp default ipv6-unicast
switch(config-router-bgp)#no bgp default ipv4-unicast
switch(config-router-bgp)#neighbor 172.21.14.8 remote-as 15
switch(config-router-bgp)#neighbor 172.23.18.6 remote-as 16
switch(config-router-bgp)#neighbor 2001:0DB8:8c01::1 remote-as 16
switch(config-router-bgp)#network 172.18.23.9/24
switch(config-router-bgp)#network 2001:0DB8:de29::/64
```

• These commands configure three neighbors, two network routes, and the default activity level for each address family (not active), and specify neighbor addresses for each address family that is active.

```
switch(config)#router bgp 11
switch(config-router-bgp)#neighbor 172.21.14.8 remote-as 15
switch(config-router-bgp)#neighbor 172.23.18.6 remote-as 16
switch(config-router-bgp)#neighbor 2001:0DB8:8c01::1 remote-as 16
switch(config-router-bgp)#network 172.18.23.9/24
switch(config-router-bgp)#network 2001:0DB8:de29::/64
switch(config-router-bgp)#no bgp default ipv4-unicast
switch(config-router-bgp)#no bgp default ipv6-unicast
switch(config-router-bgp)#address-family ipv4
switch(config-router-bgp-af)#neighbor 172.21.14.8 activate
switch(config-router-bgp-af)#neighbor 172.23.18.6 activate
switch(config-router-bgp-af)#exit
switch(config-router-bgp)#address-family ipv6
switch(config-router-bgp-af)#neighbor 2001:0DB8:8c01::1 activate
switch(config-router-bgp-af)#exit
```

• These commands permit IPv4 NLRI transport over all IPv6 connections by making the IPv4 address family active on IPv6 BGP neighbors.

```
switch(config)#router bgp 11
switch(config)#address-family ipv4
switch(config-router-bgp-af)#bgp default ipv4-unicast transport ipv6
switch(config-router-bgp-af)#exit
```

### 33.2.6 Configuring Best-path Selection

The best-path selection algorithm (described under Best-Path Selection) determines which of multiple paths to the same destination received by BGP will be added to the IP routing table. To shape route preferences and influence best-path selection, use the following commands in router-BGP configuration mode.

• **bgp always-compare-med** configures the switch to always consider the multi-exit discriminator (MED) value when comparing paths (disabled by default).

• **bgp bestpath as-path ignore** configures the switch to ignore the length of the autonomous system (AS) path when comparing routes (disabled by default).

• **bgp bestpath as-path multipath-relax** used in equal-cost multi path (ECMP configuration) and enabled by default; the **no** form of the command configures the switch to consider paths unequal if their AS paths have different contents.

• **bgp bestpath ecmp-fast** the **no** form of this command causes the switch to ignore order of arrival in evaluating paths within an ECMP group.
• **bgp bestpath med confed** causes comparison of multi-exit discriminator (MED) values in routes originating within the same confederation as the switch and received from confederation peers (disabled by default).

• **bgp bestpath med missing-as-worst** configures the switch to treat a missing MED as having the highest (least preferred) value (disabled by default). This command overrides the **missing-as-worst** setting of the **bgp bestpath med confed** command.

• **bgp bestpath tie-break cluster-list-length** configures the switch to prefer the multipath route with the shortest CLUSTER_LIST length in case of a tie in step 10 of the selection process (disabled by default).

• **bgp bestpath tie-break router-id** configures the switch to prefer the multipath route with the lowest ROUTER_ID in case of a tie in step 10 (disabled by default).

### 33.2.6.1 Displaying Reasons for Best-path Selection

To see the reasons why certain routes were excluded by the best-path selection process, use the **detail** option of the **show ip bgp** command. Enter the prefix to which BGP has selected a best path, and the output will display all learned paths. Paths which were not selected as best will display the reason they were not selected after the label **not best**.

The reason will be listed as one of the following:

- Path weight
- Local preference
- AS path length
- Origin
- Path MED
- eBGP path preferred
- IGP cost
- AS path details
- ECMP-Fast configured
- Router ID
- Originator ID
- Router ID tie-break configured
- Cluster list length
- Cluster list length tie-break configured
- Peer IP address
- Path ID
- Redistributed route exists
- Unknown
- Another route from the same AS is a better BGP route
- Peer not ready
- Usable
Example

- This command displays the reasons why three routes to 172.16.0.0/24 were rejected by the best-path algorithm. The reason for rejection is preceded by the label **Not best**:

  ```
  switch>##show ip bgp 172.16.0.0/24 detail
  BGP routing table information for VRF default
  Router identifier 192.168.100.18, local AS number 64524
  Route status: [a.b.c.d] - Route is queued for advertisement to peer.
  BGP routing table entry for 204.1.47.220/30
  Paths: 4 available
  64512 64550 65100
    Origin IGP, metric 0, localpref 100, weight 0, received 19:15:29 ago, valid,
    external, ECMP head, ECMP, best, ECMP contributor
    Rx SAFI: Unicast
  64512 64550 65100
  192.168.24.2 from 192.168.24.2 (192.168.100.22)
    Origin IGP, metric 0, localpref 100, weight 0, received 19:15:29 ago, valid,
    external, ECMP, ECMP contributor
    Rx SAFI: Unicast
    Not best: ECMP-Fast configured
  64512 64550 65100
  192.168.34.2 from 192.168.34.2 (192.168.100.23)
    Origin IGP, metric 0, localpref 100, weight 0, received 19:15:29 ago, valid,
    external, ECMP, ECMP contributor
    Rx SAFI: Unicast
    Not best: Redistributed route exists
  64512 64550 65100
  192.168.44.2 from 192.168.44.2 (192.168.100.24)
    Origin IGP, metric 0, localpref 100, weight 0, received 19:15:29 ago, valid,
    external, ECMP, ECMP contributor
    Rx SAFI: Unicast
    Not best: eBGP path preferred
  Not advertised to any peer
  switch>
  ```

### 33.2.7 Configuring BGP Convergence

To avoid hardware updates and route advertisement churn during switch reload or BGP instance start, BGP enters into the convergence state where it waits for all peers to join and receive all routes from all the peers.

**BGP Convergence** is bound by an upper value of convergence time (default value is 5 minutes) and BGP declares convergence on expiry of convergence timer. At the end of convergence, BGP updates the routes in FIB and advertises to all the peers.

To configure BGP convergence and the different timeout features, use the following commands in the router-BGP configuration mode.

- `update wait-for-convergence` enables the BGP convergence feature.
- `bgp convergence slow-peer time` configures the BGP convergence idle peer timeout value. The default timeout value is 90 seconds.
- `bgp convergence time` configures the BGP convergence timeout value. The default timeout value is 300 seconds.

**Different cases for convergence with default timeout configuration**
• Convergence Time < 90 seconds after the first peer has joined: This is the best case when all the configured peers have joined and EORs have been received from all peers in less than 90 seconds after the first peer has joined.

• Convergence Time = 90 seconds after the first peer has joined: This is the case when one or more BGP peers have joined within 90 seconds and EORs have been received from all peers within 90 seconds, but there are still some configured peers which have not joined yet. In this case, the convergence is declared after slow-peer timeout is reached.

• Convergence Time > 90 seconds after the first peer has joined: This is the case when one or more BGP peers have joined after 90 seconds, but EORs have not been received from all peers. As soon as EORs are received from all peers which have joined during the first 90 seconds, the convergence is declared.

• Convergence Time = 300 seconds after the first peer has joined: This is the case when EOR is not received till 300 seconds from some of the peers that have joined during 90 seconds after the first peer has joined.

33.2.7.1 Displaying BGP Convergence Status

Use the `show bgp convergence` command to view information about the BGP convergence status, and to know if the convergence timer has started or not.

No peers have joined

• This command displays the output when no peers have joined before convergence.

```
switch(config-router-bgp)#show bgp convergence
BGP Convergence information for VRF: default
Configured convergence timeout: 00:02:30
Configured convergence slow peer timeout: 00:00:55
Convergence based update synchronization is enabled
Last Bgp convergence event : None
Bgp convergence state : Not Initiated (Waiting for the first peer to join)
  Convergence timer is not running
  Convergence timeout in use: 00:02:30
  Convergence slow peer timeout in use: 00:00:55
  First peer is not up yet
  All the expected peers are up: no
  All IGP protocols have converged: yes
  Outstanding EORs: 0, Outstanding Keepalives: 0
Pending Peers: 2
Total Peers: 2
Established Peers: 0
Disabled Peers: 0
Peers that have not converged yet:
IPv4 peers:
  201.1.1.1 (Session : Connect)
  202.1.1.1 (Session : Connect)
IPv6 peers:
  None
```
First peer has joined

- This command displays the output when the first peer has joined before convergence.

```
switch#show bgp convergence
BGP Convergence information for VRF: default
Configured convergence timeout: 00:02:30
Configured convergence slow peer timeout: 00:00:55
Convergence based update synchronization is enabled
Last Bgp convergence event 00:00:40 ago
Bgp convergence state : Pending (Waiting for EORs/Keepalives from peer(s) and IGP convergence)
  Convergence timer running, will expire in 00:01:50
  Convergence timeout in use: 00:02:30
  Convergence slow peer timeout in use: 00:00:55
  First peer came up 00:00:13 ago
  All the expected peers are up: no
  All IGP protocols have converged: yes
  Outstanding EORs: 0, Outstanding Keepalives: 0
  Pending Peers: 1
  Total Peers: 2
  Established Peers: 1
  Disabled Peers: 0
  Peers that have not converged yet:
    IPv4 peers:
      201.1.1.1 (Session : Active)
    IPv6 peers:
      None
```

Convergence timeout reached

- This command displays the output when the convergence timeout value is reached.

```
switch(config-router-bgp)#show bgp convergence
BGP Convergence information for VRF: default
Configured convergence timeout: 00:02:30
Configured convergence slow peer timeout: 00:00:55
Convergence based update synchronization is enabled
Last Bgp convergence event 00:02:44 ago
Bgp convergence state : Timeout reached
  Time taken to converge 00:02:30
  Pending Peers: 1
  Total Peers: 2
  Established Peers: 1
  Disabled Peers: 0
  Peers that did not converge before local bgp convergence:
    IPv4 peers:
    201.1.1.1 (Session : Active)
    202.1.1.1 (Session : Established)
    IPv6 peers:
    None
```
### Converged state

- This command displays the output during the converged state.

```bash
switch(config-router-bgp)#show bgp convergence
BGP Convergence information for VRF: default
Configured convergence timeout: 00:05:00
Configured convergence slow peer timeout: 00:01:30
Convergence based update synchronization is enabled
Last Bgp convergence event 00:00:05 ago
Bgp convergence state : Converged
Time taken to converge 00:00:02
First peer came up 00:00:05 ago
Pending Peers: 0
Total Peers: 3
Established Peers: 3
Disabled Peers: 0
Peers that did not converge before local bgp convergence:
  IPv4 peers:
    None
  IPv6 peers:
    None
```

### 33.2.8 Configuring BGP Graceful Shutdown Community

#### 33.2.8.1 Creating a Route-Map Entry that Sets the Community for Graceful Shutdown

The `set community (route-map)` command specifies community attribute modifications to BGP routes.

**Example**

```bash
switch(config)#route-map map1
switch(config-route-map-map1)#set community GSHUT
switch(config)#exit
```

#### 33.2.8.2 Creating a Route-Map Entry with Matching Preferences on Graceful Shutdown Community

The `ip community-list` command creates and configures a BGP access list that is based on BGP communities.

The `match (route-map)` command creates a route map clause entry that specifies one route filtering condition.

**Example**

```bash
switch(config)#ip community-list gshut_list permit GSHUT
switch(config)#route-map map1
switch(config-route-map-map1)#match community gshut_list
switch(config-route-map-map1)#exit
switch(config)#
```

#### 33.2.8.3 Validating the Route-Map

The `show route-map` command displays the contents of the specified route maps.
33.2.9 BGP Confederations

BGP confederations allow you to break an autonomous system (AS) into multiple sub-ASs, and then to group the sub-ASs as a confederation.

The sub-ASs exchange iBGP routing information (next-hop, local-preference and MED), but communicate via eBGP.

Configure a BGP confederation by completing the following tasks on each BGP device in the confederation:

- Configuring the local AS number: The local AS number is the membership number in a sub-AS. BGP devices with the same local AS number are identified as members of the same sub-AS. BGP devices always use the local AS number when communicating with other BGP4 devices in the confederation.

- Configuring the confederation ID: The confederation ID is the AS number for those BGP devices that are outside of the confederation. A BGP device outside the confederation is not aware that BGP devices are in multiple sub-ASs. The confederation ID must differ from the sub-AS numbers.

- Configuring the list of sub-AS numbers that are confederation members. Devices in a sub-AS exchange information via iBGP, while devices in different sub-ASs use eBGP.

**Example**

- The `router bgp` command enables BGP and configures the router in sub-autonomous system 65050. The `bgp confederation identifier` command specifies confederation 65050 belongs to autonomous system 100.

  
  switch(config)#router bgp 65050
  switch(config-router-bgp)#bgp confederation identifier 100

  The neighbors from other autonomous systems within the confederation are treated as special eBGP peers when using the `bgp confederation peers` command.

  switch(config-router-bgp)#bgp confederation peers 65060

  - The Arista EOS will group the maximum ranges together. In this example, peers 65032 and 65036 are not included in BGP confederation 100.

  switch(config-router-bgp)#no bgp confederation peers 65032, 65036

33.2.10 BGP Operational Commands

33.2.10.1 Shutdown

The `shutdown (BGP)` command disables BGP operations without disrupting the BGP configuration. The `no router bgp` command disables BGP and removes the BGP configuration.
The **no shutdown** command resumes BGP activity.

**Example**

- This command disables BGP activity on the switch.
  
  ```
  switch(config-router-bgp)#shutdown
  switch(config-router-bgp)#
  ```

- This command resumes BGP activity on the switch.
  
  ```
  switch(config-router-bgp)#no shutdown
  switch(config-router-bgp)#
  ```

**33.2.10.2 Clearing the Routing Table and Resetting BGP Sessions**

When entered without parameters, the **clear ip bgp** command clears all BGP learned routes from the routing table, reads routes from designated peers, and sends routes required by those peers. Routes that are read or sent are processed through any modified route map or AS-path access list.

Followed by an asterisk (*), it clears the BGP sessions with all BGP peers. To reset the session with a specific peer, enter the peer’s IP address at the end of the command.

**Example**

- This command removes all BGP learned routes from the routing table.
  
  ```
  switch#clear ip bgp
  switch#
  ```
33.3 **BGP Examples**

This section describes the commands required to configure an iBGP and an eBGP topology.

33.3.1 **Example 1**

Example 1 features an internal BGP link that connects peers in AS 100.

33.3.1.1 **Diagram**

*Figure 33-2* displays BGP Example 1. The BGP link establishes iBGP neighbors in AS 100. Each switch advertises two subnets. In UPDATE packets sent by Switch A, the LOCAL_PREF field is 150. In UPDATE packets sent by Switch B, the LOCAL_PREF field is 75.

*Figure 33-2: BGP Example 1*

![BGP Example 1 Diagram](image)

33.3.1.2 **Code**

This code configures the Example 1 BGP instance on both switches.

**Step 1** Configure the neighbor addresses.

a Specify the neighbor to Switch A.

```
switchA(config-router-bgp) neighbor 10.100.100.2 remote-as 100
```

b Specify the neighbor to Switch B.

```
switchB(config-router-bgp) neighbor 10.100.100.1 remote-as 100
```

**Step 2** Configure the routes to be advertised.

a Advertise Switch A’s routes.

```
switchA(config-router-bgp) network 10.10.1.0/24
switchA(config-router-bgp) network 10.10.2.0/24
```

b Advertise Switch B’s routes.

```
switchB(config-router-bgp) network 10.10.3.0/24
switchB(config-router-bgp) network 10.10.4.0/24
```
Step 3 Configure the LOCAL_PREF.

```
switchA(config-router-bgp)#neighbor 10.100.100.2 export-localpref 150
switchB(config-router-bgp)#neighbor 10.100.100.1 export-localpref 75
```

Step 4 Modify the hold time and keepalive interval.

```
switchA(config-router-bgp)#timer bgp 30 90
switchB(config-router-bgp)#timer bgp 30 90
```

33.3.2 Example 2

Example 2 creates an external BGP link that connects routers in AS 100 and AS 200.

33.3.2.1 Diagram

Figure 33-3 displays BGP Example 2. The BGP link connects a switch in AS 100 to a switch in AS 200. Each switch advertises two subnets.

Switch A assigns a local preference of 150 to networks advertised by Switch B. Switch B assigns a local preference of 75 to networks advertised by Switch A.

**Figure 33-3: BGP Example 2**

33.3.2.2 Code

This code configures the Example 2 BGP instance on both switches.

**Step 1** Configure the neighbor addresses.

- **a** Specify the neighbor to Switch A.
  
  ```
  switchA(config)#router bgp 100
  switchA(config-router-bgp)#neighbor 10.100.100.2 remote-as 200
  ```

- **b** Specify the neighbor to Switch B.
  
  ```
  switchB(config)#router bgp 200
  switchB(config-router-bgp)#neighbor 10.100.100.1 remote-as 100
  ```
Step 2  Configure the routes to be advertised.
   a  Advertise Switch A’s routes.
      switchA(config-router-bgp)#network 10.10.1.0/24
      switchA(config-router-bgp)#network 10.10.2.0/24
   b  Advertise Switch B’s routes.
      switchB(config-router-bgp)#network 10.10.3.0/24
      switchB(config-router-bgp)#network 10.10.4.0/24

Step 3  Assign local preference values to routes received from their respective peers.
      switchA(config-router-bgp)#neighbor 10.100.100.2 import-localpref 150
      switchB(config-router-bgp)#neighbor 10.100.100.2 import-localpref 75

Step 4  Modify the hold timer and keepalive interval.
      switchA(config-router-bgp)#timer bgp 30 90
      switchB(config-router-bgp)#timer bgp 30 90

address-family

The address-family command places the switch in address-family configuration mode to configure the address family setting of addresses configured as BGP neighbors. Address-family configuration mode is not a group change mode; running-config is changed immediately after commands are executed. The exit command does not affect the configuration.

The switch supports these address families:

- ipv4-unicast
- ipv6-unicast

Running-config displays address family commands in sub-blocks of the BGP configuration. The following commands are available in address family configuration mode:

- neighbor activate configures the address as active in the configuration mode address family.
- no neighbor activate configures the address as not active in the configuration mode address family.
- neighbor default-originate advertises a default route to the specified BGP neighbor.
- neighbor route-map (BGP) applies a route map to the specified BGP route.
- network (BGP) specifies a network for advertisement through UPDATE packets to BGP peers.

The no address-family and default address-family commands delete the specified address-family from running-config by removing all commands previously configured in the corresponding address-family mode.

The exit command returns the switch to router-BGP configuration mode.

Command Mode

Router-BGP Configuration

Command Syntax

```
bgp ADDRESS_TYPE
no bgp ADDRESS_TYPE
default bgp ADDRESS_TYPE
```

Parameters

- ADDRESS_FAMILY Address family affected by subsequent commands. Options include:
  - ipv4 IPv4 unicast
  - ipv6 IPv6 unicast

Example

- These commands enter address family mode for IPv6-unicast, insert a command, then exit the mode:

  ```
switch(config)#router bgp 1
switch(config-router-bgp)#address-family ipv6
switch(config-router-bgp-af)#neighbor 172.10.1.1 activate
switch(config-router-bgp-af)#exit
switch(config-router-bgp-af)#
```
aggregate-address

The **aggregate-address** command creates an aggregate route in the Border Gateway Protocol (BGP) database. Aggregate routes combine the characteristics of multiple routes into a single route that the switch advertises. Aggregation can reduce the amount of information that a BGP speaker is required to store and transmit when advertising routes to other BGP speakers. Aggregate routes are advertised only after they are redistributed.

The advertised address of the aggregate is entered as an IP subnet; any routes configured on the switch that lie within that subnet then become contributors to the aggregate. Note that on Arista switches the BGP aggregate route will become active if there are any available contributor routes on the switch, regardless of the originating protocol. This includes routes configured statically.

**Important!** Aggregate routes are redistributed automatically, and their redistribution cannot be disabled.

Command options affect the attributes associated with the aggregated route, the advertisement of the contributor routes that comprise the aggregate, and which contributor routes are included.

Command options affect the following aggregate routing attributes:

- **AS_PATH attribute inclusion**: the *as-set* option controls the aggregate route’s AS_PATH and ATOMIC_AGGREGATE attribute contents. AS_PATH identifies the autonomous systems through which UPDATE message routing information passes. ATOMIC_AGGREGATE indicates that the route is an aggregate or summary of more specific routes.

  When the command includes *as-set*, the aggregate route’s AS_SET attribute contains the AS numbers of contributor routes. This can help BGP neighbors to prevent loops by rejecting aggregate routes that include their AS number in the AS_SET.

  When the command does not include *as-set*, the aggregate route’s ATOMIC_AGGREGATE attribute is set and the aggregate route AS_PATH will include the longest leading PATH_SEQ of the AS_PATH which is common to all contributor routes. For example, for the aggregate 1.0.0.0/16 with two contributors present, the AS_PATH for the aggregate is “100 200” as shown.

  Aggregate
  1.0.0.0/16 as-path ??
  Contributors
  1.0.1.0/24 as-path “100 200 400 500”
  1.0.2.0/24 as-path “100 200 300”

- **Attribute assignment**: The *attribute-map* option assigns attributes contained in set commands in a specified route map’s lowest sequence with any set command to the aggregated route, overriding the automatic determination of the aggregate route’s attributes by the switch.

- **Route suppression**: The *summary-only* option suppresses the advertisement of the contributor routes that comprise the aggregate.

- **Contributor filtering**: The *match-map* option uses a route map to filter out contributor routes that would otherwise be included in the aggregate.

The **no aggregate-address** and **default aggregate-address** commands remove the corresponding aggregate-address command from `running-config`.

**Command Mode**

Router-BGP Configuration
Command Syntax

aggregate-address AGGREGATE_NET [AS_SET] [SUMMARY] [ATTRIBUTE_MAP] [MATCH_MAP]
no aggregate-address AGGREGATE_NET
default aggregate-address AGGREGATE_NET

Parameters

• **AGGREGATE_NET** aggregate route IP address. Options include:
  • `netv4_addr` IPv4 subnet address (CIDR or address-mask notation).
  • `netv6_addr` IPv6 subnet address (CIDR notation).
• **AS_SET** controls AS_PATH attribute values associated with aggregate route. Options include:
  • `as-set` ATOMIC_AGGREGATE attribute is set. Route contains no AS_PATH data.
  • `as-set` route includes AS_PATH information from contributor routes as AS_SET attributes.
• **SUMMARY** controls advertisement of contributor routes. Options include:
  • `summary-only` contributor routes are not advertised.
• **ATTRIBUTE_MAP** controls attribute assignments to the aggregate route. Options include:
  • `attribute-map map_name` assigns attribute values in set commands of the map’s permit clauses. Deny clauses and match commands in permit clauses are ignored.
  • `attribute-map map_name` assigns attribute values in set commands of the map’s permit clauses. Deny clauses and match commands in permit clauses are ignored.
• **MATCH_MAP** filters contributors to the aggregate route. Options include:
  • `match-map map_name` filters contributor routes using the named match-map.

Examples

• These commands create an aggregate route (10.16.48.0/20) from the contributor routes 10.16.48.0/23, 10.16.50.0/23, 10.16.52.0/23, and 10.16.54.0/23. The aggregate route includes the AS_PATH information from the contributor routes.

  ```
  switch(config)#router bgp 1
  switch(config-router-bgp)#aggregate-address 10.16.48.0/20 as-set
  switch(config-router-bgp)#exit
  switch(config)#
  ```

• These commands create an aggregate route and use a route map to add a local-preference attribute to the route.

  ```
  switch(config)#route-map map1 permit 10
  switch(config-route-map-map1)#set community 45
  switch(config-route-map-map1)#exit
  switch(config)#router bgp 1
  switch(config-router-bgp)#aggregate-address 10.16.48.0/20 attribute-map map1
  switch(config-router-bgp)#exit
  switch(config)#
  ```

• These commands create an aggregate route and use a route map to allow only those contributors which match a specified prefix list to be included in the aggregate route.

  ```
  switch(config)#route-map matchmap permit 10
  switch(config-route-map-matchmap)#match ip address prefix-list agglist
  switch(config-route-map-matchmap)#exit
  switch(config)#router bgp 1
  switch(config-router-bgp)#aggregate-address 1.1.0.0/16 match-map matchmap
  ```
bcp advertise-inactive

By default, BGP will advertise only those routes that are active in the switch’s RIB. This can contribute to dropped traffic. If a preferred route is available through another protocol (like OSPF), the BGP route will become inactive and not be advertised; if the preferred route is lost, there is no available route to the affected peers. Advertising inactive BGP routes minimizes traffic loss by providing alternative routes.

The `bcp advertise-inactive` command configures BGP to advertise inactive routes to BGP neighbors. Inactive route advertisement is configured globally, but the global setting can be overridden on a per-VRF basis.

The `no bcp advertise-inactive` and `default bcp advertise-inactive` commands restore the default BGP behavior (advertising only active routes) by removing the corresponding `bcp advertise-inactive` command from `running-config`.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
bcp advertise-inactive
no bcp advertise-inactive
default bcp advertise-inactive
```

**Example**

- These commands configure BGP to advertise inactive routes.

```
switch(config)#router bcp 64500
switch(config-router-bgp)#bcp advertise-inactive
switch(config-router-bgp)#
```
**bgp always-compare-med**

The `bgp always-compare-med` command configures the switch to always consider multi-exit discriminator (MED) values (also known as “metric”) in best-path selection. By default, this function is disabled, and MED values are compared only if two paths have the same neighbor AS.

When there are two or more links between autonomous systems, MED values may be set by a router in the originating AS to give preferences to certain routes. In comparing MED values, the lower value is preferred.

The `no bgp always-compare-med` and `default bgp always-compare-med` commands restore the default behavior of comparing MED values only on paths with the same neighbor AS.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

- `bgp always-compare-med`
- `no bgp always-compare-med`
- `default bgp always-compare-med`

**Related Commands**

- `bgp bestpath as-path ignore`
- `bgp bestpath as-path multipath-relax`
- `bgp bestpath ecmp-fast`
- `bgp bestpath med confed`
- `bgp bestpath med missing-as-worst`
- `bgp bestpath tie-break cluster-list-length`
- `bgp bestpath tie-break router-id`

**Example**

- These commands configure BGP to always consider MED values in best-path comparisons.

```bash
switch(config)#router bgp 64500
switch(config-router-bgp)#bgp always-compare-med
switch(config-router-bgp)#
```
**bgp bestpath as-path ignore**

The `bgp bestpath as-path ignore` command configures BGP to ignore the length of the autonomous system (AS) path when comparing routes. This behavior is disabled by default. Normally, the switch compares AS paths as the third step in the best-path selection process (see Best-Path Selection), preferring the route with the shorter AS path.

The `no bgp bestpath as-path ignore` and `default bgp bestpath as-path ignore` commands restore the default behavior of considering AS path length in route comparisons.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
bgp bestpath as-path ignore
no bgp bestpath as-path ignore
default bgp bestpath as-path ignore
```

**Related Commands**

- `bgp always-compare-med`
- `bgp bestpath as-path multipath-relax`
- `bgp bestpath ecmp-fast`
- `bgp bestpath med confed`
- `bgp bestpath med missing-as-worst`
- `bgp bestpath tie-break cluster-list-length`
- `bgp bestpath tie-break router-id`

**Example**

```
switch(config)#router bgp 64500
switch(config-router-bgp)#bgp bestpath as-path ignore
switch(config-router-bgp)#
```
bgp bestpath as-path multipath-relax

The **bgp bestpath as-path multipath-relax** command allows multiple eBGP routes to a destination to be considered equal in ECMP if their AS paths are the same length despite having different autonomous systems in those paths. The **no bgp bestpath as-path multipath-relax** command configures best-path selection to consider two paths *unequal* if their AS path contents are different, and prefers the first path received.

Multipath-relax is enabled by default. The **bgp bestpath as-path multipath-relax** and **default bgp bestpath as-path multipath-relax** commands restore the default behavior by removing the corresponding **no bgp bestpath as-path multipath-relax** command from **running-config**.

For BGP to support equal cost multipath (ECMP) routing, the **maximum paths (BGP)** command must be issued in router-BGP configuration mode.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
bgp bestpath as-path multipath-relax
no bgp bestpath as-path multipath-relax
default bgp bestpath as-path multipath-relax
```

**Related Commands**

- **bgp always-compare-med**
- **bgp bestpath as-path ignore**
- **bgp bestpath ecmp-fast**
- **bgp bestpath med confed**
- **bgp bestpath med missing-as-worst**
- **bgp bestpath tie-break cluster-list-length**
- **bgp bestpath tie-break router-id**

**Example**

- These commands configure BGP best-path selection to consider routes unequal if the contents of their AS paths differ.

  ```
  switch(config)#router bgp 64500
  switch(config-router-bgp)#no bgp bestpath as-path multipath-relax
  switch(config-router-bgp)#
  ```
bgp bestpath ecmp-fast

By default, within an ECMP group the BGP best-path selection process prefers the active path (the first path received by the switch) unless a relevant tie-breaker is enabled. The `no bgp bestpath ecmp-fast` command causes the best-path selection process to ignore order of arrival and continue evaluating paths on other criteria.

The `bgp bestpath ecmp-fast` and `default bgp bestpath ecmp-fast` commands restore the default behavior by removing the corresponding `no bgp bestpath ecmp-fast` command from `running-config`.

**Command Mode**
- Router-BGP Configuration

**Command Syntax**
- `bgp bestpath ecmp-fast`
- `no bgp bestpath ecmp-fast`
- `default bgp bestpath ecmp-fast`

**Related Commands**
- `bgp always-compare-med`
- `bgp bestpath as-path ignore`
- `bgp bestpath as-path multipath-relax`
- `bgp bestpath med confed`
- `bgp bestpath med missing-as-worst`
- `bgp bestpath tie-break cluster-list-length`
- `bgp bestpath tie-break router-id`

**Example**
- These commands configure BGP to ignore order of arrival in best-path comparisons of paths within an ECMP group.

```bash
switch(config)#router bgp 64500
switch(config-router-bgp)#no bgp bestpath ecmp-fast
switch(config-router-bgp)#
```
bgp bestpath med confed

By default, paths originating within the same confederation as the switch and received from confederation peers do not have their multi-exit discriminator (MED) values compared as part of the best-path selection process. The **bgp bestpath med confed** command causes comparison of MED values in such routes. To ensure that MED values are considered in the best-path selection process for all routes received, use the **bgp always-compare-med** command.

The **no bgp bestpath med confed** and **default bgp bestpath med confed** commands restore the default behavior by removing the corresponding **bgp bestpath ecmp-fast** command from **running-config**.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
bgp bestpath med confed [missing-as-worst]
no bgp bestpath med confed [missing-as-worst]
default bgp bestpath med confed [missing-as-worst]
```

**Related Commands**

- **bgp always-compare-med**
- **bgp bestpath as-path ignore**
- **bgp bestpath as-path multipath-relax**
- **bgp bestpath ecmp-fast**
- **bgp bestpath med missing-as-worst**
- **bgp bestpath tie-break cluster-list-length**
- **bgp bestpath tie-break router-id**

**Parameters**

**missing-as-worst**  By default, best-path selection considers a missing MED value to be 0, so paths with missing MED values will be preferred. This option reverses the behavior in comparisons of routes originating within the same confederation as the switch, treating a missing MED as having the highest (least preferred) value.

**Note**

The **bgp bestpath med missing-as-worst** command controls how best-path selection treats missing MED values for all routes received, and, if configured, overrides the **missing-as-worst** option of this command.

**Example**

```
These commands configure the BGP best-path selection process to consider MED values in comparisons between routes originating within the same confederation as the switch.
```

```
switch(config)#router bgp 64500
switch(config-router-bgp)#bgp bestpath med confed
switch(config-router-bgp)#
```
**bgp bestpath med missing-as-worst**

By default, BGP best-path selection considers a missing MED value to be 0, so paths with missing MED values will be preferred. The `bgp bestpath med missing-as-worst` command reverses the behavior, treating a missing MED as having the highest (least preferred) value.

The `no bgp bestpath med missing-as-worst` and `default bgp bestpath med missing-as-worst` commands restore the default behavior (giving preference to missing MED values) by removing the corresponding `bgp bestpath med missing-as-worst` command from `running-config`.

**Note**

This command overrides the `missing-as-worst` setting of the `bgp bestpath med confed` command.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
bgp bestpath med missing-as-worst
no bgp bestpath med missing-as-worst
default bgp bestpath med missing-as-worst
```

**Related Commands**

- `bgp always-compare-med`
- `bgp bestpath as-path ignore`
- `bgp bestpath as-path multipath-relax`
- `bgp bestpath ecmp-fast`
- `bgp bestpath med confed`
- `bgp bestpath tie-break cluster-list-length`
- `bgp bestpath tie-break router-id`

**Example**

- These commands configure the BGP best-path selection process to consider a missing MED value to be considered highest (least preferred) in MED comparisons for all routes received.

```
switch(config)#router bgp 64500
switch(config-router-bgp)#bgp bestpath med missing-as-worst
switch(config-router-bgp)#
```
bgp bestpath tie-break cluster-list-length

The `bgp bestpath tie-break cluster-list-length` command causes the best-path selection process to prefer the multipath route with the shortest CLUSTER_LIST length in case of a tie in step 10. The cluster list length is assumed to be 0 if the route doesn’t carry a CLUSTER_LIST attribute.

The `no bgp bestpath tie-break cluster-list-length` and `default bgp bestpath tie-break cluster-list-length` commands restore the default behavior by removing the associated `bgp bestpath tie-break cluster-list-length` command from `running-config`.

**Command Mode**

- Router-BGP Configuration

**Command Syntax**

```
bgp bestpath tie-break cluster-list-length
no bgp bestpath tie-break cluster-list-length
default bgp bestpath tie-break cluster-list-length
```

**Related Commands**

- `bgp always-compare-med`
- `bgp bestpath as-path ignore`
- `bgp bestpath as-path multipath-relax`
- `bgp bestpath ecmp-fast`
- `bgp bestpath med confed`
- `bgp bestpath med missing-as-worst`
  - `bgp bestpath tie-break router-id`

**Example**

- These commands configure the BGP selection process to prefer the multipath route with the shortest CLUSTER_LIST length in case of a tie.

```
switch(config)#router bgp 64500
switch(config-router-bgp)#bgp bestpath tie-break cluster-list-length
switch(config-router-bgp)#
```
bgp bestpath tie-break router-id

The `bgp bestpath tie-break router-id` command causes the best-path selection process to prefer the multipath route with the lowest ROUTER_ID in case of a tie in step 10. If the route is a reflected route (i.e., if it contains route reflector attributes), the process will use the ORIGINATOR_ID as the ROUTER_ID for comparison. This behavior is disabled by default.

The `no bgp bestpath tie-break router-id` and `default bgp bestpath tie-break router-id` commands restore the default behavior by removing the associated `bgp bestpath tie-break router-id` command from `running-config`.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

- `bgp bestpath tie-break router-id`
- `no bgp bestpath tie-break router-id`
- `default bgp bestpath tie-break router-id`

**Related Commands**

- `bgp always-compare-med`
- `bgp bestpath as-path ignore`
- `bgp bestpath as-path multipath-relax`
- `bgp bestpath ecmp-fast`
- `bgp bestpath med confed`
- `bgp bestpath med missing-as-worst`
- `bgp bestpath tie-break cluster-list-length`

**Example**

- These commands configure the best-path selection process to prefer the multipath route with the lowest ROUTER_ID in case of a tie.

  ```
  switch(config)#router bgp 64500
  switch(config-router-bgp)#bgp bestpath tie-break router-id
  switch(config-router-bgp)#
  ```
bgp client-to-client reflection

By default, routes received from a route reflector client and selected as best routes are propagated to all BGP peers, including other route reflector clients. If the clients are fully meshed, however, routes received from a client do not need to be mirrored to other clients. In this case, client-to-client reflection should be disabled.

The no bgp client-to-client reflection command disables client-to-client reflection.

The bgp client-to-client reflection and default bgp client-to-client reflection commands restore the default behavior by removing the no bgp client-to-client reflection command from running-config.

Command Mode

Router-BGP Configuration

Command Syntax

bgp client-to-client reflection
no bgp client-to-client reflection
default bgp client-to-client reflection

default bgp client-to-client reflection

default bgp client-to-client reflection

Example

• This command disables client-to-client reflection on the switch.

switch(config)#router bgp 1
switch(config-router-bgp)#no bgp client-to-client reflection
switch(config-router-bgp)#
bgp cluster-id

When using route reflectors, an AS is divided into clusters. A cluster consists of one or more route reflectors and a group of clients to which they re-advertise route information, and for redundancy a single cluster may contain multiple route reflectors. Each route reflector has a cluster ID. If the cluster has only one route reflector the cluster ID is its router ID, but if a cluster has multiple route reflectors a 4-byte cluster ID must be assigned to all route reflectors in the cluster. All must be configured with the same cluster ID to allow them to identify updates from the cluster’s other route reflectors.

The bgp cluster-id command configures the cluster ID in a cluster with multiple route reflectors.

The no bgp cluster-id and default bgp cluster-id commands remove the cluster ID by removing the corresponding bgp cluster-id command from running-config. Do not remove the cluster ID if there are multiple route reflectors in the cluster.

Command Mode

Router-BGP Configuration

Command Syntax

bgp cluster-id ID_NUM
no bgp cluster-id
default bgp cluster-id

Parameters

- **ID_NUM** cluster ID shared by all route reflectors in the cluster (32-bit dotted-decimal notation).
  
  Options include:
  
  - 0.0.0.1 to 255.255.255.255 valid cluster ID number.
  - 0.0.0.0 removes the cluster-ID from the switch. Equivalent to no bgp cluster-id command.

Example

- This command sets the cluster ID for the switch to 172.22.30.101.

  switch(config)#router bgp 1
  switch(config-router-bgp)#bgp cluster-id 172.22.30.101
  switch(config-router-bgp)#
**bgp confederation identifier**

The **bgp confederation identifier** command configures the confederation identifier. Confederation can reduce the number of iBGP connections in a large AS domain. The AS domain is divided into several smaller sub-ASs, and each sub-AS remains fully connected. Devices in a sub-AS exchange information via iBGP, while devices in different sub-ASs use eBGP.

The **no bgp confederation identifier** and **default bgp confederation identifier** commands remove the **bgp confederation identifier** command from **running-config**.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

- `bgp confederation identifier as_number`
- `no bgp confederation identifier`
- `default bgp confederation identifier`

**Parameters**

- `as_number` the ID of BGP AS confederation. Value ranges from 1 to 4294967295.

**Example**

- This command sets the BGP confederation identifier to 9.
  
  ```
  switch(config)#router bgp 1  
  switch(config-router-bgp)#bgp confederation identifier 9  
  switch(config-router-bgp)#
  ```
**bgp confederation peers**

The `bgp confederation peers` command configures a confederation consisting of sub-ASs.

Before this command is executed, the confederation ID should be configured by the `bgp confederation identifier` command. Otherwise this configuration is invalid. The configured ASs in this command are inside the confederation and each AS uses a fully meshed network. The confederation appears as a single AS to the devices outside it.

The `no bgp confederation peers` and `default bgp confederation peers` commands delete the specified sub-AS from the confederation by removing the corresponding `bgp confederation peers` command from `running-config`.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
bgp confederation peers as_range
no bgp confederation peers as_range
default bgp confederation peers as_range
```

**Parameters**

- `as_range` the Sub-AS number.

  `as_range` formats include number (from 1 to 4294967295), number range, or comma-delimited list of numbers and ranges.

**Example**

- This command configures the confederation that contains AS 1000 and 1002.

  ```
  switch(config)#router bgp 1
  switch(config-router-bgp)#bgp confederation peers 1000 1002
  switch(config-router-bgp)#
  ```
**bgp convergence slow-peer time**

The `bgp convergence slow-peer time` command configures the idle peer time to wait for the slow peers to establish a session in a BGP convergence state.

The `no bgp convergence slow-peer time` command disables the inheritance of the configuration from the global BGP configuration mode. The `default bgp convergence slow-peer time` command sets the timeout value to the default value.

**Command Mode**

- Router-BGP Configuration

**Command Syntax**

```
bgp convergence slow-peer time timeout_range
no bgp convergence slow-peer time
default bgp convergence slow-peer time
```

**Parameters**

- `time timeout_range`  
  The maximum time to wait for the slow peers to establish a session connection. The time ranges from 1 to 3600 seconds. The default value is 90 seconds.

**Example**

- This command configures an idle peer timeout of 40 seconds to wait before establishing a session.

  ```bash
  switch(config)#router bgp 1
  switch(config-router-bgp)#bgp convergence slow-peer time 40
  switch(config-router-bgp)#
  ```
**bgp convergence time**

The `bgp convergence time` command configures the time to wait before the BGP convergence starts in a session.

The `no bgp convergence time` command removes the configured convergence time to wait. The `default bgp convergence time` command sets the timeout value to the default value.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
bgp convergence time timeout_range
no bgp convergence time
default bgp convergence time
```

**Parameters**

- `time timeout_range` The maximum time to wait for the BGP convergence. The time ranges from 1 to 3600 seconds. The default value is 300 seconds.

**Example**

- This command configures a convergence time of 200 seconds to wait before establishing a session.

  ```
  switch(config)#router bgp 1
  switch(config-router-bgp)#bgp convergence time 200
  switch(config-router-bgp)#
  ```
The `bgp default` command configures the default address family activation level of all addresses configured as BGP neighbors. The switch sends the following announcements to addresses active in an address family:

- IPv4 address family: IPv4 capability and all network advertisements with IPv4 prefixes.
- IPv6 address family: IPv6 capability and all network advertisements with IPv6 prefixes.

The following commands configure default address family activation levels for addresses configured as BGP neighbors:

- `bgp default ipv4-unicast` all addresses are IPv4 address family active.
- `no bgp default ipv4-unicast` all addresses are not IPv4 address family active.
- `bgp default ipv6-unicast` all addresses are IPv6 address family active.
- `no bgp default ipv6-unicast` all addresses are not IPv6 address family active.
- `bgp default ipv4-unicast transport ipv6` all BGP neighbor addresses are IPv4 address family active and IPv6 neighbors can receive IPv4 NLRIs.

**Note**

If it is necessary to exchange IPv4 NLRIs over an IPv6 connection, the IPv4 address family must be activated on the IPv6 neighbor. To do this for all IPv6 neighbors, use the command `bgp default ipv4-unicast transport ipv6`. For an individual neighbor, use the `neighbor activate` command for the IPv6 neighbor in the IPv4 address-family configuration mode as described below.

The activation state of an individual BGP neighbor address is configured by the `neighbor activate` commands. The `neighbor activate` command overrides the address’s default activation state for the address family configuration mode in which the command is issued:

- `neighbor activate`: the specified address is active.
- `no neighbor activate`: the specified address is not active.

The `default-default address family` activation state defines address family activation level of all addresses configured as BGP neighbors when `running-config` does not contain any `bgp default` commands. The default state of the BGP default activation level varies by address family.

- IPv4 address family all BGP addresses are IPv4 address family active.
- IPv6 address family all BGP addresses are not IPv6 address family active.

The `default bgp default` command restores the default-default activation setting for BGP neighbor addresses in the specified address family:

- `default bgp ipv4-unicast` is equivalent to `bgp ipv4-unicast`
- `default bgp ipv6-unicast` is equivalent to `no bgp ipv6-unicast`

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
bgp default ADDRESS_FAMILY
no bgp default ADDRESS_FAMILY
default bgp default ADDRESS_FAMILY
```

**Parameters**

- `ADDRESS_FAMILY` BGP address family. Options include:
• **ipv4-unicast** IPv4-unicast peering sessions.
• **ipv6-unicast** IPv6-unicast peering sessions.

**Example**

These commands configure the switch to configure all BGP neighbor addresses as IPv4 address family active and IPv6 address family active.

```
switch(config)#router bgp 1
switch(config-router-bgp)#bgp default ipv4-unicast
switch(config-router-bgp)#bgp default ipv6-unicast
switch(config-router-bgp)#show active
router bgp 65533
  bgp log-neighbor-changes
  distance bgp 20 200 200
  neighbor 172.23.254.2 remote-as 65533
  neighbor 172.41.254.78 remote-as 65534
  neighbor 2001:0DB8:52a4:fe01::2 remote-as 65533
  neighbor 2001:0DB8:52a4:fe4c::1 out-delay 10
switch(config-router-bgp)#
```

The `show active` command does not display the **bgp default ipv4-unicast** command because it is the default setting for IPv4 peering sessions.
**bgp enforce-first-as**

The `bgp enforce-first-as` command causes a forced comparison of the first autonomous system (AS) in the AS path of eBGP routes received from BGP neighbors to the configured remote external peer autonomous system number (ASN). Updates from eBGP peers that do not include that ASN as the first item in the AS path (in the AS_PATH attribute) are discarded.

This behavior is enabled by default upon BGP configuration, and disabled globally by the `no` form of this command. To configure enforce-first-as for an individual neighbor or peer group, use the `neighbor enforce-first-as` command.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
bgp enforce-first-as
default bgp enforce-first-as
no bgp enforce-first-as
```

**Example**

- This command configures BGP to enforce the first AS globally.

  ```
switch(config-router-bgp)#bgp enforce-first-as
  switch(config-router-bgp)#
  ```
**bgp listen range**

The **bgp listen range** command identifies the BGP peering request from a range of IPv4 or IPv6 address, and names the dynamic peer group to which those peers belong to. To create a static peer group, use the neighbor peer group (create) command.

The request can be from a single AS number or from a range of AS numbers configured. To accept the peering request from single ASN use the **remote-as** option, and to accept request from multiple ASNs use the **peer-filter** option.

Members of dynamic peer group are configured in groups and not as individuals. Once a new peer group is created with a group name, the group name is then used as a parameter by the following **neighbor** commands:

- neighbor ebgp-multihop
- neighbor import-localpref
- neighbor maximum-routes
- neighbor route-map (BGP)
- neighbor timers
- neighbor update-source.

The **no bgp listen range** and **default bgp listen range** commands remove the dynamic peer group by deleting the corresponding command from **running-config**. To remove a static peer group, use the **no neighbor** command. All peering relationships with group members are terminated when the dynamic peer group is deleted.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
bgp listen range NET_ADDRESS peer-group group_name [remote-as as_number | peer-filter filter_name]

no bgp listen range NET_ADDRESS peer-group group_name

default bgp listen range NET_ADDRESS peer-group group_name
```

**Parameters**

- **NET_ADDRESS** IP address range. Entry options include:
  - IPv4 subnet IPv4 subnet (CIDR notation).
  - IPv4_address mask subnet IPv4 subnet (dotted decimal notation).
  - IPv6_prefix IPv6 subnet (dotted decimal notation).
- **group_name** name of the peer group.
- **as_number** the autonomous system number, ranges from 1 to 4294967295.
- **filter_name** name of the peer filter.

**Example**

- These commands create a dynamic peer group called “brazil” in AS 5 which accepts peering requests from the 192.168.6.0/24 subnet.

```
switch(config)#router bgp 1
switch(config-router-bgp)#bgp listen range 192.168.6.0/24 peer-group brazil remote-as 5
```
These commands create a dynamic peer group called “brazil” in a range of ASNs, which accepts peering requests from the 192.0.2.0/24 subnet. The range of AS numbers is defined by `peer filter` option.

```
switch(config)#router bgp 1
switch(config-router-bgp)#bgp listen range 192.0.2.0/24 peer-group brazil peer-filter group-1
```
**bgp log-neighbor-changes**

The `bgp log-neighbor-changes` command configures the switch to generate a log message when a BGP peer enters or exits the Established state. This is the default behavior.

The `no bgp log-neighbor-changes` command disables the generation of these log messages. The `default bgp log-neighbor-changes` command enables the generation of these log messages.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
bgp log-neighbor-changes
no bgp log-neighbor-changes
default bgp log-neighbor-changes
```

**Example**

- These commands configure the switch to generate a message when a BGP peer enters or exits the *established* state.

```bash
switch(config)#router bgp 1
switch(config-router-bgp)#bgp log-neighbor-changes
switch(config-router-bgp)#
```
bgp redistribute-internal (BGP)

The `bgp redistribute-internal` command enables the redistribution of iBGP routes into an interior gateway protocol (IGP).

The `no bgp redistribute-internal` and `default bgp redistribute-internal` commands disable route redistribution from the specified domain by removing the corresponding `bgp redistribute-internal` command from `running-config`.

**Command Mode**
- Router-BGP Configuration
- Router-BGP Address-Family Configuration

**Command Syntax**

- `bgp redistribute internal`
- `no bgp redistribute internal`
- `default bgp redistribute internal`

**Example**

- This command redistributes internal BGP routes.
  ```
  switch(config)# router bgp 9
  switch(config-router-bgp)# bgp redistribute-internal
  switch(config-router-bgp)#
  ```
clear ip bgp

The clear ip bgp command removes learned BGP routes from the routing table, reads all routes from designated peers, and sends routes to those peers as required. This command can also clear the switch’s BGP sessions with its peers.

Routes that are read or sent are processed through modified route maps or AS-path access lists. The command can also clear the switch’s BGP sessions with its peers.

Command Mode
Privileged EXEC

Command Syntax
```
clear ip bgp [PEERS] [RESET_TYPE] [DATA_FLOW] [VRF_INSTANCE]
```

Parameters
- **PEERS** specifies targeted BGP peers. Options include:
  - <no parameters> all IPv4 and IPv6 peers.
  - * all IPv4 and IPv6 peers.
  - ipv4_addr the IPv4 peer with the specified IPv4 address.
  - ipv6_addr the IPv6 peer with the specified IPv6 address.
  - intrf_ipv6_addr the peer using the specified IPv6 link-local address.
  - peer-group peer.grp_name the peers using the specified BGP peer group.
- **RESET_TYPE** specifies the method used to reset routes. Options include:
  - <no parameters> performs a hard reset that terminates current BGP sessions and recreates the local routing information base.
  - soft performs a soft reset that maintains current BGP sessions and reconfigures the local routing information base using stored routes.
- **DATA_FLOW** restricts soft reset to inbound or outbound routes. Hard reset is bidirectional. Options include:
  - <no parameters> resets inbound and outbound routes.
  - in resets inbound peer routes.
  - out resets outbound peer routes.
- **VRF_INSTANCES** specifies the VRF(s) examined for BGP peers. Options include:
  - <no parameters> resets matching peers in the context-active VRF.
  - vrf_name resets matching peers in the specified VRF.
  - all resets matching peers in all VRFs.
  - default resets matching peers in the default VRF.

Related Commands
- clear ip bgp counters
- clear ip bgp errors
- clear ip bgp neighbor *

Guidelines
Use the clear ip bgp command after changing any of the following BGP attributes:
- Weights
• Distribution lists
• Timers
• Administrative distance

**Examples**
• This command performs a hard reset of all IPv4 and IPv6 peers in the context-active VRF.
  
  ```
  switch#clear ip bgp
  switch#
  ```

  This command has the same behavior as in `clear ip bgp` command.
  
  ```
  switch#clear ip bgp *
  switch#
  ```
clear ip bgp counters

The clear ip bgp counters command resets general statistics of peers. It primarily consists of message related counts.

Command Mode
Privileged EXEC

Command Syntax
   clear ip bgp [PEERS] counters [VRF_INSTANCES]

Parameters
   • **PEERS** specifies targeted BGP peers. Options include:
     • <no parameters> all IPv4 and IPv6 peers.
     • * all IPv4 and IPv6 peers.
     • ipv4_addr the IPv4 peer with the specified IPv4 address.
     • ipv6_addr the IPv6 peer with the specified IPv6 address.
     • intrf_ipv6_addr the peer using the specified IPv6 link-local address.
     • peer-group peer_grp_name the peers using the specified BGP peer group.
   • **VRF_INSTANCES** specifies the VRF(s) examined for BGP peers. Options include:
     • <no parameters> resets matching peers in the context-active VRF.
     • vrf_name resets matching peers in the specified VRF.
     • all resets matching peers in all VRFs.
     • default resets matching peers in the default VRF.

Related Commands
   • clear ip bgp
   • clear ip bgp errors
   • clear ipv6 bgp counters

Example
   • This command resets general statistics of all IPv4 and IPv6 peers in the context-active VRF.
     switch#clear ip bgp counters
     ! Clearing all IPv4 and IPv6 peering sessions
     switch#
clear ip bgp errors

The clear ip bgp errors command resets the error statistics and history of peers. Peer general statistics primarily consists of notification errors, socket errors, and update errors.

Command Mode
Privileged EXEC

Command Syntax
```
clear ip bgp [PEERS] errors [VRF_INSTANCES]
```

Parameters
- **PEERS** specifies targeted BGP peers. Options include:
  - <no parameters> all IPv4 and IPv6 peers.
  - * all IPv4 and IPv6 peers.
  - ipv4_addr the IPv4 peer with the specified IPv4 address.
  - ipv6_addr the IPv6 peer with the specified IPv6 address.
  - intrf_ipv6_addr the peer using the specified IPv6 link-local address.
  - peer-group peer_grp_name the peers using the specified BGP peer group.
- **VRF_INSTANCES** specifies the VRF(s) examined for BGP peers. Options include:
  - <no parameters> resets matching peers in the context-active VRF.
  - vrf_name resets matching peers in the specified VRF.
  - all resets matching peers in all VRFs.
  - default resets matching peers in the default VRF.

Related Commands
- clear ip bgp
- clear ip bgp counters
- clear ipv6 bgp errors

Example
- This command resets the error statistics of all IPv4 and IPv6 peers in the context-active VRF.
  ```
  switch#clear ip bgp errors
  ! Clearing all IPv4 and IPv6 peering sessions
  switch#
  ```
clear ip bgp neighbor *

The `clear ip bgp neighbor *` command clears BGP neighbors belonging to the IPv4 transport address family. To clear BGP neighbors in the IPv6 transport address family, use the `clear ipv6 bgp neighbor *` command.

**Command Mode**

Privileged EXEC

**Command Syntax**

```
clear ip bgp neighbor * [VRF_INSTANCE]
```

**Parameters**

- `VRF_INSTANCE` specifies VRF instance for which IPv4 transport address family BGP neighbors will be cleared. Options include:
  - `<no parameter>` clears IPv4 BGP neighbors in the context-active VRF.
  - `vrf vrf_name` clears IPv4 BGP neighbors in the specified VRF.
  - `vrf all` clears IPv4 BGP neighbors in the all VRFs.
  - `vrf default` clears IPv4 BGP neighbors in the default VRF.

**Related Commands**

- `clear ip bgp`
- `clear ip bgp counters`
- `clear ip bgp errors`

**Examples**

- This command clears all IPv4 BGP neighbors in the context-active VRF.
  ```
switch#clear ip bgp neighbor *
switch#
```

- This command clears all IPv4 BGP neighbors in VRF “purple.”
  ```
switch#clear ip bgp neighbor * vrf purple
switch#
```
**clear ipv6 bgp**

The `clear ipv6 bgp` command removes learned BGP routes from the routing table, reads all routes from designated peers, and sends routes to those peers as required. This command can also clear the switch’s BGP sessions with its peers.

Routes that are read or sent are processed through modified route maps or AS-path access lists. The command can also clear the switch’s BGP sessions with its peers.

**Command Mode**

Privileged EXEC

**Command Syntax**

```
clear ipv6 bgp [PEERS] [RESET_TYPE] [DATA_FLOW] [VRF_INSTANCE]
```

**Parameters**

- **PEERS** specifies targeted BGP peers. Options include:
  - `<no parameters>` all IPv4 and IPv6 peers.
  - `*` all IPv4 and IPv6 peers.
  - `ipv4_addr` the IPv4 peer with the specified IPv4 address.
  - `ipv6_addr` the IPv6 peer with the specified IPv6 address.
  - `intrf_ipv6_addr` the peer using the specified IPv6 link-local address.
  - `peer-group peer_grp_name` the peers using the specified BGP peer group.

- **RESET_TYPE** specifies the method used to reset routes. Options include:
  - `<no parameters>` performs a hard reset that terminates current BGP sessions and recreates the local routing information base.
  - `soft` performs a soft reset that maintains current BGP sessions and reconfigures the local routing information base using stored routes.

- **DATA_FLOW** restricts soft reset to inbound or outbound routes. Hard reset is bidirectional. Options include:
  - `<no parameters>` resets inbound and outbound routes.
  - `in` resets inbound peer routes.
  - `out` resets outbound peer routes.

- **VRF_INSTANCES** specifies the VRF(s) examined for BGP peers. Options include:
  - `<no parameters>` resets matching peers in the context-active VRF.
  - `vrf_name` resets matching peers in the specified VRF.
  - `all` resets matching peers in all VRFs.
  - `default` resets matching peers in the default VRF.

**Related Commands**

- `clear ipv6 bgp counters`
- `clear ipv6 bgp errors`
- `clear ipv6 bgp neighbor *`

**Guidelines**

Use the `clear ipv6 bgp` command after changing any of the following BGP attributes:

- Weights
• Distribution lists
• Timers
• Administrative distance

Examples
• This command performs a hard reset of all IPv4 and IPv6 peers in the context-active VRF.
  switch#clear ipv6 bgp
  switch#

• This command has the same behavior as in clear ipv6 bgp command.
  switch#clear ipv6 bgp *
  switch#
clear ipv6 bgp counters

The `clear ipv6 bgp counters` command resets general statistics of peers. Peer general statistics primarily consists of message related counts.

**Command Mode**
Privileged EXEC

**Command Syntax**
```
clear ipv6 bgp [PEERS] counters [VRF_INSTANCES]
```

**Parameters**

- **PEERS** specifies targeted BGP peers. Options include:
  - `<no parameters>` all IPv4 and IPv6 peers.
  - `*` all IPv4 and IPv6 peers.
  - `ipv4_addr` the IPv4 peer with the specified IPv4 address.
  - `ipv6_addr` the IPv6 peer with the specified IPv6 address.
  - `intrf_ipv6_addr` the peer using the specified IPv6 link-local address.
  - `peer-group peer_grp_name` the peers using the specified BGP peer group.

- **VRF_INSTANCES** specifies the VRF(s) examined for BGP peers. Options include:
  - `<no parameters>` resets matching peers in the context-active VRF.
  - `vrf_name` resets matching peers in the specified VRF.
  - `all` resets matching peers in all VRFs.
  - `default` resets matching peers in the default VRF.

**Related Commands**

- `clear ip bgp counters`
- `clear ipv6 bgp`
- `clear ipv6 bgp errors`

**Example**

- This command resets general statistics of all IPv4 and IPv6 peers in the context-active VRF.

  ```
switch#clear ipv6 bgp counters
  ! Clearing all IPv4 and IPv6 peering sessions
  switch#  
  ```
clear ipv6 bgp errors

The clear ipv6 bgp errors command resets the error statistics and history of peers. Peer error statistics primarily consists of notification errors, socket errors, and update errors.

**Command Mode**
Privileged EXEC

**Command Syntax**
clear ipv6 bgp [PEERS] errors [VRF_INSTANCES]

**Parameters**
- **PEERS** specifies targeted BGP peers. Options include:
  - <no parameters> all IPv4 and IPv6 peers.
  - * all IPv4 and IPv6 peers.
  - ipv4_addr the IPv4 peer with the specified IPv4 address.
  - ipv6_addr the IPv6 peer with the specified IPv6 address.
  - intrf_ipv6_addr the peer using the specified IPv6 link-local address.
  - peer-group peer_grp_name the peers using the specified BGP peer group.
- **VRF_INSTANCES** specifies the VRF(s) examined for BGP peers. Options include:
  - <no parameters> resets matching peers in the context-active VRF.
  - vrf_name resets matching peers in the specified VRF.
  - all resets matching peers in all VRFs.
  - default resets matching peers in the default VRF.

**Related Commands**
- clear ip bgp errors
- clear ipv6 bgp
- clear ipv6 bgp counters

**Example**
- This command resets the error statistics of all IPv4 and IPv6 peers in the context-active VRF.
  
  switch#clear ipv6 bgp errors
  ! Clearing all IPv4 and IPv6 peering sessions
  switch#
clear ipv6 bgp neighbor *

The `clear ipv6 bgp neighbor *` command clears BGP neighbors belonging to the IPv6 transport address family. To clear BGP neighbors in the IPv4 transport address family, use the `clear ip bgp neighbor *` command.

**Command Mode**

Privileged EXEC

**Command Syntax**

```
clear ipv6 bgp neighbor * [VRF_INSTANCE]
```

**Parameters**

- `VRF_INSTANCE` specifies VRF instance for which IPv6 transport address family BGP neighbors will be cleared. Options include:
  - `<no parameter>` clears IPv6 BGP neighbors in the context-active VRF.
  - `vrf vrf_name` clears IPv6 BGP neighbors in the specified VRF.
  - `vrf all` clears IPv6 BGP neighbors in the all VRFs.
  - `vrf default` clears IPv6 BGP neighbors in the default VRF.

**Examples**

- This command clears all IPv6 BGP neighbors in the context-active VRF.
  
  ```
  switch#clear ipv6 bgp neighbor *
  switch#
  ```

- This command clears all IPv6 BGP neighbors in VRF “purple.”
  
  ```
  switch#clear ipv6 bgp neighbor * vrf purple
  switch#
  ```
**distance bgp**

The **distance bgp** command assigns an administrative distance to routes that the switch learns through BGP. Routers use administrative distances to select a route when two protocols provide routing information to the same destination. Distance values range from 1 to 255; lower distance values correspond to higher reliability. BGP routing tables do not include routes with a distance of 255.

The distance command assigns distance values to external, internal, and local BGP routes:

- **external**: Best-path routes learned from a neighbor external to the autonomous system. Default distance is 200.
- **internal**: Internal routes are routes learned from a BGP entity within the same autonomous system. Default distance is 200.
- **local**: Local routes are networks listed with a network router configuration command for that router or for networks that are redistributed from another process. Default distance is 200.

The no distance bgp and default distance bgp commands restore the default administrative distances by removing the distance bgp command from running-config.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
distance bgp  external_dist  [INTERNAL_LOCAL]
no  distance bgp
default distance bgp
```

**Parameters**

- **external_dist**  distance assigned to external routes. Values range from 1 to 255.
- **INTERNAL_LOCAL**  distance assigned to internal and local routes. Values for both routes range from 1 to 255. Options include:
  - <no parameter>  **external_dist** value is assigned to internal and local routes.
  - **internal_dist**  **local_dist**  values assigned to internal (**internal_dist**) and local (**local_dist**) routes.

**Example**

- This command assigns an administrative distance of 150 to external routes, 200 to internal, and 150 to local routes.
  ```
  switch(config)#router bgp 1  
  switch(config-router-bgp)#distance bgp 150 200 150  
  switch(config-router-bgp)##
  ```
**dynamic peer max**

The *dynamic peer max* command limits the number of dynamic BGP peers allowed on the switch. The *no dynamic peer max* and *default dynamic peer max* commands restore the default limit of dynamic BGP peers by removing the *dynamic peer max* command from *running-config*.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
dynamic peer max maximum
no dynamic peer max
default dynamic peer max
```

**Parameters**

- *maximum* the maximum number of dynamic BGP peers to be allowed on the switch. Values range from 1 to 1000; default value is 100.

**Example**

- This command sets the maximum number of dynamic BGP peers allowed on the switch to 200.

```
switch(config)#router bgp 1
switch(config-router-bgp)#dynamic peer max 200
switch(config-router-bgp)#
```
graceful-restart stalepath-time

The **graceful-restart stalepath-time** command specifies the maximum time that stale routes from a restarting BGP neighbor will be retained after a BGP session is re-established with that peer.

The **no graceful-restart stalepath-time** and **default graceful-restart stalepath-time** commands restore the default value of 300 seconds by deleting the **graceful-restart stalepath-time** statement from **running-config**.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
graceful-restart stalepath-time interval
no graceful-restart stalepath-time
default graceful-restart stalepath-time
```

**Parameters**

- **interval** Maximum period (in seconds) that stale routes from a restarting BGP neighbor will be retained after the BGP session is re-established. Value ranges from 1 to 3600 (60 minutes). Default is 300.

**Example**

- These commands configure the stale path retention interval to 15 minutes.

```
switch(config)#router bgp 1
switch(config-router-bgp)#graceful-restart stalepath-time 900
switch(config-router-bgp)#
```
graceful-restart-helper

The **graceful-restart helper** command enables BGP graceful restart helper mode on the switch for all BGP neighbors. When graceful restart helper mode is enabled, the switch will retain routes from neighbors which are capable of graceful restart while those neighbors are restarting BGP. Graceful restart is enabled by default. To configure graceful restart helper mode for a specific neighbor or peer group, use the **neighbor graceful-restart-helper** command. Individual neighbor configuration takes precedence over the global configuration.

The **no graceful-restart helper** command disables graceful restart helper mode on the switch. The **default graceful-restart helper** command enables graceful restart helper mode by removing the corresponding **no graceful-restart helper** command from **running-config**.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
graceful-restart helper
no graceful-restart helper
default graceful-restart helper
```

**Example**

- These commands disable graceful restart helper mode on the switch.

```
switch(config)#router bgp 1
switch(config-router-bgp)#no graceful-restart-helper
switch(config-router-bgp)#
```
**ip as-path access-list**

The `ip as-path access-list` command creates an access list to filter BGP route updates. If access list `list_name` does not exist, this command creates it. If it already exists, this command appends statements to the list.

The `no ip as-path access-list` and `default ip as-path access-list` commands delete the named access list.

**Command Mode**
Global Configuration

**Command Syntax**

```
ip as-path access-list list_name FILTER_TYPE regex ORIGIN
no ip as-path access-list list_name
default ip as-path access-list list_name
```

**Parameters**
- `list_name` the name of the AS path access list.
- **FILTER_TYPE** access resolution of the specified AS path. Options include:
  - `permit` access is permitted.
  - `deny` access is denied.
- `regex` a regular expression describing the AS path being filtered. Regular expressions are pattern matching strings that are composed of text characters and operators.
- **ORIGIN** the origin of the path information. Values include:
  - `<no parameter>` sets the origin to `any`.
  - `any` any BGP origin.
  - `egp` EGP origin.
  - `igp` IGP origin.
  - `incomplete` incomplete origin.

**Example**
- These commands create an AS path access list named “list1” which allows all BGP routes except those originating in AS 3.
  ```
  switch(config)#ip as-path access-list list1 deny _3$
  switch(config)#ip as-path access-list list1 permit .*
  switch(config)#
  ```
ip as-path regex-mode

The **ip as-path regex-mode** command specifies how the switch will evaluate regular expressions describing AS paths in ACLs. When the regex mode is set to **asn**, AS numbers in the ACL are interpreted as AS numbers; only complete AS number matches in the AS path return a match. When it is set to **string**, AS numbers in the ACL are interpreted as strings; both complete AS number matches and longer AS numbers that include the target string return a match. The default mode is **asn**.

For example, **asn** mode will return “false” and **string** mode will return “true” when searching for “10” in an AS path of “100 200”.

The **no ip as-path regex-mode** and **default ip as-path regex-mode** commands restore the regex mode to **asn** by removing the **ip as-path regex-mode** command from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

- ip as-path regex-mode **MODE_SETTING**
- no ip as-path regex-mode
- default ip as-path regex-mode

**Parameters**

- **MODE_SETTING** Specifies how regular expressions describing AS paths in AS path ACLs will be evaluated. Options include:
  - **asn** AS numbers in the ACL are interpreted as AS numbers; only complete AS number matches in the AS path return a match.
  - **string** AS numbers in the ACL are interpreted as strings; both complete AS number matches and longer AS numbers that include the target string return a match.

**Example**

- This command sets the regex mode to **string**.

```
switch(config)#ip as-path regex-mode string
switch(config)#
```
**ip community-list**

The `ip community-list` command creates and configures a BGP access list based on BGP communities.

The `no ip community-list` and `default ip community-list` commands delete the specified community list by removing the corresponding `ip community-list` command from the running configuration.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip community-list listname [permit | deny] [GSHUT | aa:nn | internet | local-as | no-advertise | no-export | number]
no ip community-list listname
default ip community-list listname
```

**Parameters**

- `listname` name of the community list. Valid input is text.
- `permit` permits access to the specified community.
- `deny` denies access to the specified community.
- `GSHUT` well-known graceful shutdown community.
- `aa:nn` AA is 65535 and NN specifies the community number (0-65535) within the AS.
- `internet` advertises route to the Internet community.
- `local-as` advertises route only to local peers.
- `no-advertise` does not advertise route to any peer.
- `no-export` advertises route only within BGP AS boundary.
- `number` community number. Value ranges from 0 to 4294967040.

**Related Commands**

- `route-map`
- `match (route-map)`
- `show ip community-list`
- `show ip extcommunity-list`

**Guideline**

EOS does not support disabling the process of graceful shutdown community.

---

**Note**

The `ip community-list listname permit internet` command permits access to all routes associated with any community.

---

**Examples**

- This command creates a BGP community list (named list_9) that does not match members of route maps configured as AS-network number 100:250.

  ```
  switch(config)#ip community-list list_9 deny 100:250
  switch(config)#
  ```
• This command creates a BGP community list that permits the graceful shutdown community, and uses it in a route map to permit routes with that community.

```
switch(config)#ip community-list gshut_list permit GSHUT
switch(config)#route-map map1
switch(config-route-map-map1)#match community gshut_list
switch(config-route-map-map1)#exit
switch(config)#show route-map map1
route-map map1 permit 10
Description:
   Match clauses:
      match community gshut_list
SubRouteMap:
   Set clauses:
      switch(config)#
```

• This command permits access to all routes associated with the BGP community list (CLIST1).

```
switch(config)#ip community-list CLIST1 permit internet
switch(config)#
```
**ip community-list regexp**

The `ip community-list regexp` command creates and configures a BGP access list based on BGP communities. A BGP community access list filters prefixes based on their BGP communities. The command uses regular expressions to identify the communities specified by the list. To create a community list by explicitly specifying one or more communities, use the `ip community-list` command.

The `no ip community-list regexp` and `default ip community-list regexp` commands delete the specified community list. To delete a specific community-list entry, specify the entry in the `no ip community-list regexp` command.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip community-list regexp listname FILTER_TYPE R_EXP
no ip community-list regexp listname FILTER_TYPE R_EXP
default ip community-list regexp listname
```

**Parameters**

- `listname` name of the community list. Valid input is text.
- `FILTER_TYPE` access resolution of the specified community. Options include:
  - `permit` access is permitted.
  - `deny` access is denied.
- `R_EXP` list of communities, formatted as a regular expression. Regular expressions are pattern matching strings that are composed of text characters and operators.
- `entry` specifies a single entry to be removed from the list and leaves the rest of the list intact. Valid input is text. If no entry is specified, the `no` form of the command removes the entire list.

**Related Commands**

- `route-map`
- `match (route-map)`
- `show ip community-list`
- `show ip extcommunity-list`

**Guideline**

The `ip community-list regexp listname permit internet` command permits access to only those routes that carry the community value of 0.

**Example**

- This command creates a BGP community list that permits routes from networks 20-24 and 30-34 in autonomous system 10.
  ```
  switch(config)#ip community-list regexp list_2 permit 10:[2-3][0-4]_
  switch(config)#
  ```
- This command removes the above statement from the community list named “list_2,” leaving any other statements in the list intact.
  ```
  switch(config)#no ip community-list regexp list_2 permit 10:[2-3][0-4]_
  switch(config)#
  ```
- This command deletes the community list named “list_2” entirely.
  ```
  switch(config)#no ip community-list regexp list_2
  switch(config)#
  ```
• This command permits access to all routes associated with the BGP community list (CLIST1) that carry the community value 0.

```bash
switch(config)# ip community-list regexp CLIST1 permit internet
switch(config)#
```
**ip extcommunity-list**

The `ip extcommunity-list` command creates an extended community list to filter VRF routes or for link bandwidth (LBW) advertisement.

The following extcommunity-list types are supported:

- **Route Target (rt)** identifies sites that may receive appropriately tagged routes.
- **Site of Origin (soo)** identifies sites where the switch learned the route.
- **Link Bandwidth (lbw)** advertises BGP link bandwidth.

The `no ip extcommunity-list` and `default ip extcommunity-list` commands delete the specified extended community list by removing the corresponding `ip extcommunity-list` statement from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip extcommunity-list listname FILTER_TYPE COMM_1 [COMM_2...COMM_n]
oip extcommunity-list listname
default ip extcommunity-list listname
```

**Parameters**

- `listname` name of the extended community list. Valid input is text.
- `FILTER_TYPE` access resolution of the specified extended community list. Options include:
  - `permit` access is permitted.
  - `deny` access is denied.
- `COMM_x` extended community attribute. Options include:
  - `rt aa:nn` route target, as specified by autonomous system:network number
  - `rt ip_addr:nn` route target, as specified by ip address:network number
  - `soo aa:nn` Site of Origin, as specified by autonomous system:network number
  - `soo ip_addr:nn` site of origin, as specified by ip address:network number
  - `lbw` link bandwidth in bits per second

**Related Commands**

- `route-map`
- `match (route-map)`
- `show ip community-list`
- `show ip extcommunity-list`

**Example**

- This command creates a BGP extended community list that denies routes from route target 100:250.

```
switch(config)#ip extcommunity-list list_9 deny rt 100:250
switch(config)#
```
**ip extcommunity-list regexp**

The `ip extcommunity-list regexp` command creates an extended community list to filter VRF routes or for link bandwidth (LBW) advertisement. The command uses regular expressions to define the extended communities specified by the list. To specify particular values, use the `ip extcommunity-list` command.

The following extcommunity-list types are supported:

- **Route Target (rt)** identifies sites that may receive appropriately tagged routes.
- **Site of Origin (soo)** identifies sites where the switch learned the route.
- **Link Bandwidth (lbw)** advertises BGP link bandwidth.

The `no ip extcommunity-list regexp` and `default ip extcommunity-list regexp` commands delete the specified extended community list by removing the corresponding `ip extcommunity-list regexp` statement from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip extcommunity-list regexp listname FILTER_TYPE R_EXP
no ip extcommunity-list regexp listname FILTER_TYPE R_EXP
default ip extcommunity-list regexp listname
```

**Parameters**

- **listname** name of the extended community list. Valid input is text.
- **FILTER_TYPE** access resolution of the specified extended community list. Options include:
  - **permit** access is permitted.
  - **deny** access is denied.
- **R_EXP** list of communities, formatted as a regular expression. Regular expressions are pattern matching strings that are composed of text characters and operators.
  - Expressions beginning with **RT**: match the *route target* extended community attribute option.
  - Expressions beginning with **SoO**: match the *site of origin* extended community attribute option.

  **RT**: and **SoO**: are case sensitive.

**Related Commands**

- `route-map`
- `match (route-map)`
- `show ip community-list`
- `show ip extcommunity-list`

**Example**

- This command creates a BGP extended community list that denies routes from route target networks 20-24 and 30-34 in autonomous system 10.

  ```
  switch(config)#ip extcommunity-list regexp list_1 deny RT:10:[2-3][0-4]_
  switch(config)#
  ```
ip large-community-list regexp

The `ip large-community-list regexp` command creates and configures a BGP access list based on BGP large communities. A BGP large-community access list filters prefixes based on their BGP large community values. The command uses regular expressions to match large communities. Multiple large-community lists with the same name may be specified. To create a large-community list by explicitly specifying one or more communities, use the `ip large-community-list` command.

Large-communities are represented as follows: [ASN]:local-part1:local-part2.

The `no ip large-community-list regexp` and `default ip large-community-list regexp` commands delete the specified large community list. To delete a specific community-list entry, specify the entry in the `no ip large-community-list regexp` command.

**Command Mode**
- Global Configuration

**Command Syntax**
```
ip large-community-list regexp listname {deny | permit} R_EXP
no ip large-community-list regexp listname {deny | permit} R_EXP
default ip large-community-list regexp listname {deny | permit}
```

**Parameters**
- `listname` name of the community list. Valid input is text.
- `deny` access is denied
- `permit` access is permitted
- `R_EXP` list of communities that are formatted as a regular expression. Regular expressions are pattern matching strings that are composed of text characters and operators.

**Example**
- This command creates a BGP large community list that permits routes from autonomous system 10 with local-part1 value of 20-24 or 30-34.
  ```
  switch(config)#ip large-community-list regexp list_2 permit 10:[2-3][0-4]:_
  switch(config)#
  ```
- This command removes the above statement from the large community list named “list_2,” leaving any other statements in the list intact.
  ```
  switch(config)#no ip large-community-list regexp list_2 permit 10:[2-3]:[0-4]_
  switch(config)#
  ```
- This command deletes the large community list named “list_2” entirely.
  ```
  switch(config)#no ip large-community-list regexp list_2
  switch(config)#
  ```
**maximum paths (BGP)**

The `maximum-paths` command controls the maximum number of parallel eBGP routes that the switch supports. The default maximum is one route. The command provides an ECMP (equal cost multiple paths) parameter that controls the number of equal-cost paths that the switch stores in the routing table for each route.

For paths to be considered equal, they must have the same weight, local preference, AS-path length, and origin. To require that they also have the same multi-exit discriminator (MED) value, use the `bgp always-compare-med` command. To require that their AS paths have the same contents, use the `no bgp bestpath as-path multipath-relax` command.

The `no maximum-paths` and `default maximum-paths` commands restore the default values of the maximum number of parallel routes and the maximum number of ECMP paths by removing the corresponding command from `running-config`.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
maximum-paths paths [ecmp ecmp_paths]
no maximum-paths
default maximum-paths
```

**Parameters**

- `paths` maximum number of parallel routes. Default value is 1. Value must be less than or equal to the maximum number of ECMP paths.
- `ecmp_paths` maximum number of ECMP paths for each route. Default is maximum value.

Value for each parameter ranges from 1 to the number of interfaces available per ECMP group, which is platform dependent.

- Arad: Value ranges from 1 to 128. Default value is 128.
- FM6000: Value ranges from 1 to 32. Default value is 32.
- PetraA: Value ranges from 1 to 16. Default value is 16.
- Trident: Value ranges from 1 to 32. Default value is 32.
- Trident II: Value ranges from 1 to 128. Default value is 128.

**Examples**

- This command configures the maximum number of BGP parallel paths to 12 without changing the default ECMP value.
  ```
  switch(config)#router bgp 1
  switch(config-router-bgp)#maximum-paths 12
  switch(config-router-bgp)#
  ```

- This command configures the maximum number of eBGP parallel routes to 2, with a maximum of 4 equal cost (ECMP) paths for each route.
  ```
  switch(config)#router bgp 1
  switch(config-router-bgp)#maximum-paths 2 ecmp 4
  switch(config-router-bgp)#
  ```
**match as-range**

The **match as-range** command defines the match statement for the peer-filter, based on the match statement the peer-filter accept or reject the incoming peer request. The match statement includes a sequence number, AS number range and a match condition to accept or reject a peer by comparing its remote AS number to the specified range. A peer filter can consist of a single match statement or multiple match statements. The match statement for the peer filter is configured under peer-filter configuration mode.

The **no match as-range** or **default match as-range** command deletes the peer-filter condition from the group from the running configuration.

**Command Mode**

Peer-Filter Configuration

**Command Syntax**

```
[sequence_number] match as-range [as_number1] [- as_number2] result {accept | reject} group_name
no [sequence_number] match as-range [ASN1] [- ASN2] result {accept | reject} group_name
default [sequence_number] match as-range [ASN1] [- ASN2] result {accept | reject} group_name
```

**Parameters**

- **sequence_number** number ranges from 0 to 65535.
- **group_name** name of the peer filter group.
- **as_number** the autonomous system number, ranges from 1 to 4294967295.

**Example**

- These commands define a peer filter that accepts any AS number.
  
  ```
  switch(config)#peer-filter group1
  switch(config-peer-filter-group1)#10 match as-range 1-4294967295 result accept
  ```

- These commands define a peer filter that accepts any AS number within 65000 and 65100 (inclusive) except 65008 and 65009.
  
  ```
  switch(config)#peer-filter group2
  switch(config-peer-filter-group2)#10 match as-range 65008-65009 result reject
  switch(config-peer-filter-group2)#20 match as-range 65000-65009 result accept
  ```

- These commands define a peer filter that accepts 3 specific remote AS numbers.
  
  ```
  switch(config)#peer-filter group3
  switch(config-peer-filter-group3)#10 match as-range 65003 result accept
  switch(config-peer-filter-group3)#20 match as-range 65007 result accept
  switch(config-peer-filter-group3)#30 match as-range 65009 result accept
  ```
neighbor activate

The **neighbor activate** command defines the configuration mode address family activation state of a specified address that is configured as a BGP neighbor. The switch sends the following announcements to addresses active in an address family:

- IPv4 address family: IPv4 capability and all network advertisements with IPv4 prefixes.
- IPv6 address family: IPv6 capability and all network advertisements with IPv6 prefixes.

The **bgp default** command configures the default address family activation state of addresses configured as BGP neighbors. The **neighbor activate** and **no neighbor activate** commands override the neighbor's default activation state within the configuration mode address family.

- **neighbor activate**: the specified address is active in the address family.
- **no neighbor activate**: the specified address is not active in the address family.

The **default neighbor activate** command removes the corresponding **neighbor activate** or **no neighbor activate** command from **running-config**, restoring the default address family activation state for the specified neighbor address.

**Command Mode**

Router-BGP Address-Family Configuration

**Command Syntax**

```
neighbor neighbor_ID activate
no neighbor neighbor_ID activate
default neighbor neighbor_ID activate
```

**Parameters**

- **neighbor_ID** neighbor's IPv4 or IPv6 address or peer group name

**Limitations**

The switch supports the advertisement of networks with IPv6 prefixes to IPv4 transport neighbors. The switch does not support the advertisement of networks with IPv4 prefixes to IPv6 transport neighbors.

**Example**

- The two neighbor activation commands activate the advertising of specified neighbors during IPv4 peering sessions. The **show active** command displays the result of the previous commands.

```
switch(config)#router bgp 1
switch(config-router-bgp)#no address-family ipv4
switch(config-router-bgp-af)#neighbor 172.41.18.15 activate
switch(config-router-bgp-af)#neighbor 172.49.22.6 activate
switch(config-router-bgp-af)#no neighbor 172.15.21.18 activate
switch(config-router-bgp-af)#show active
   address-family ipv4
      no neighbor 172.15.21.18 activate
      neighbor 172.49.22.6 activate
      neighbor 172.41.18.15 activate
switch(config-router-bgp-af)#exit
switch(config-router-bgp)#
```
**neighbor allowas-in**

By default, BGP drops received routes if their autonomous system (AS) paths contain the AS number (ASN) of the switch. The **neighbor allowas-in** command configures the switch to accept routes from the specified BGP neighbor even if their AS paths contain the ASN of the switch itself. Optionally, the command can also configure the maximum number of times that the switch’s ASN can appear in a route before it is dropped.

The **no neighbor allowas-in** command configures the default behavior (dropping BGP routes that contain the ASN of the switch).

The **default neighbor allowas-in** command applies the system default configuration for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the BGP neighbor at the specified address.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID allowas-in [asn_quantity]
no neighbor neighbor_ID allowas-in
default neighbor neighbor_ID allowas-in
```

**Parameters**

- **neighbor_ID** neighbor’s IPv4 or IPv6 address or peer group name
- **asn_quantity** number of repetitions of the switch’s ASN allowed in the AS path of routes received from the specified BGP neighbor. Values range from 1 to 10. Default is 3.

**Related Commands**

This command is used on a customer edge router that is part of a split AS; to address the problem at the provider end, use the **neighbor as-path remote-as replace out** command.

**Example**

- These commands configure the switch to accept routes from the BGP neighbor at 192.168.1.30 which contain the switch’s ASN in their AS paths as many as 3 times.

  switch(config)#router bgp 1
  switch(config-router-bgp)#neighbor 192.168.1.30 allowas-in
  switch(config-router-bgp)#
neighbor as-path remote-as replace out

By default, BGP drops received routes if their autonomous system (AS) paths contain the AS number (ASN) of the switch. In a split AS sharing route advertisements through a provider network, this can result in valid routes being dropped. The `neighbor as-path remote-as replace out` command configures a provider edge switch to replace the customer’s AS with its own in route advertisements sent to neighbors in that AS.

The `no neighbor as-path remote-as replace out` command configures the default behavior (leaving the customer’s AS in the AS path attribute of routes advertised to the specified neighbor).

The `default neighbor as-path remote-as replace out` command applies the system default configuration for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

The `no neighbor` command removes all configuration commands for the BGP neighbor at the specified address.

**Command Mode**
- Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID as-path remote-as replace out
no neighbor neighbor_ID as-path remote-as replace out
default neighbor neighbor_ID as-path remote-as replace out
```

**Parameters**
- `neighbor_ID` neighbor’s IPv4 or IPv6 address or peer group name.

**Related Commands**
This command is used on a provider edge router forwarding BGP routes to a customer in a split AS; to address the problem at the customer end, use the `neighbor allowas-in` command.

**Example**
- This command configures the switch to substitute its local ASN for the ASN of the BGP neighbor at 192.168.2.15 in BGP routes advertised to that neighbor.

```
switch(config)#router bgp 1 
switch(config-router-bgp)#neighbor 192.168.2.15 as-path remote-as replace out 
switch(config-router-bgp)#
```
neighbor auto-local-addr

The `neighbor auto-local-addr` command configures the switch to automatically determine the local address to be used for the non-transport address family in NLRIs sent to the specified neighbor or peer group. This allows IPv4 NLRIs to be carried over IPv6 transport, or IPv6 NLRIs to be carried over IPv4 transport.

The `no neighbor auto-local-addr` command applies the system default configuration.

The `default neighbor auto-local-addr` command applies the system default configuration for individual neighbors, and applies the peer group’s setting for neighbors that are members of a peer group.

Note

While this feature works well in eBGP deployments in which the pairing routers are directly connected and have matching IP address configurations, multi-hop eBGP or iBGP deployments may require manual local address configuration.

To explicitly configure a local address for the non-transport address family for a specific neighbor or peer group, use the `neighbor local-v4-addr` command for IPv6 neighbors, or the `neighbor local-v6-addr` for IPv4 neighbors.

Command Mode

Router-BGP Configuration

Command Syntax

```
neighbor neighbor_ID auto-local-addr
no neighbor neighbor_ID auto-local-addr
default neighbor neighbor_ID auto-local-addr
```

Parameters

- `neighbor_ID` neighbor’s IPv4 or IPv6 address or peer group name

Example

- For the IPv6 neighbor at 2001:0DB8:c2a4:1761::2, these commands configure the switch to automatically determine the IPv4 NLRI value to be sent during peering sessions.

```
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 2001:0DB8:c2a4:1761::2 auto-local-addr
switch(config-router-bgp)#
```
neighbor default-originate

The `neighbor default-originate` command advertises a default route to a BGP neighbor or peer group. This default route overrides the default route advertised by any other means to the specified neighbor or peer group. However, the update generated by `neighbor default-originate` is not processed by neighbor route map out policies.

If a route map is specified in this command, its set clauses are used to modify attributes of the exported default route, but its match clauses are not used to conditionally advertise the route. The default route is always advertised to the specified neighbor.

The `no neighbor default-originate` command applies the system default configuration.

The `default neighbor default-originate` command applies the system default configuration for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

The `no neighbor` command removes all configuration commands for the neighbor at the specified address.

**Command Mode**
- Router-BGP Configuration
- Router-BGP Address-Family Configuration

**Command Syntax**

`neighbor neighbor_ID default-originate [MAP]`

`no neighbor neighbor_ID default-originate`

`default neighbor neighbor_ID default-originate`

**Parameters**

- `neighbor_ID` neighbor's IPv4 or IPv6 address or peer group name
- `MAP` specifies route map that modifies attributes of the exported default route. Options include:
  - `<no parameter>` attributes are not modified by a route map.
  - `route-map map_name` attributes set by specified route map are assigned to the exported default route.

**Example**

- These commands advertise a default route to the BGP neighbor at 192.168.14.5.

```
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor 192.168.14.5 default-originate
switch(config-router-bgp)#
```
neighbor description

The **neighbor description** command associates descriptive text with the specified peer or peer group.

The **no neighbor description** command removes the text association from the specified peer or peer group.

The **default neighbor description** command removes the text association from the specified peer for individual neighbors, and applies the peer group’s description to neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address or for the specified peer group.

**Command Mode**

- Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID description description_string
no neighbor neighbor_ID description
default neighbor neighbor_ID description
```

**Parameters**

- `neighbor_ID` neighbor’s IPv4 or IPv6 address or peer group name
- `description_string` text string to be associated with the neighbor or peer group.

**Example**

- This command associates the string PEER_1 with the peer located at 192.168.1.30.

```
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 192.168.1.30 description PEER_1
switch(config-router-bgp)#
```
neighbor ebgp-multihop

The `neighbor ebgp-multihop` command programs the switch to accept and attempt BGP connections to the external peers residing on networks not directly connected to the switch. The command does not establish the multihop if the only route to the peer is the default route (0.0.0.0).

The `no neighbor ebgp-multihop` command applies the system default configuration.

The `default neighbor ebgp-multihop` command applies the system default configuration for individual neighbors, and applies the peer group’s setting for neighbors that are members of a peer group.

The `no neighbor` command removes all configuration commands for the neighbor at the specified address.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID ebgp-multihop [hop_number]
no neighbor neighbor_ID ebgp-multihop
default neighbor neighbor_ID ebgp-multihop
```

**Parameters**

- **neighbor_ID** neighbor’s IPv4 or IPv6 address or peer group name
- **hop_number** time-to-live (hops). Values range from 1 to 255. Default value is 255.

**Example**

- These commands configure the switch to accept and attempt BGP connections to the external peer located at 192.168.1.30, setting the hop limit to 32.

```
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 192.168.1.30 ebgp-multihop 32
switch(config-router-bgp)#
```
neighbor enforce-first-as

The `neighbor enforce-first-as` command causes a forced comparison of the first autonomous system (AS) in the AS path of eBGP routes received from a specified BGP peer or peer group to the configured remote external peer autonomous system number (ASN). Updates from the specified eBGP peers that do not include an ASN as first AS path (in the AS_PATH attribute) are discarded.

This behavior is enabled globally by default upon BGP configuration, and disabled for the specified neighbor or peer group by the `no` form of the command. To configure enforce-first-as globally, use the `bgp enforce-first-as` command.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID enforce-first-as
default neighbor neighbor_ID enforce-first-as
no neighbor neighbor_ID enforce-first-as
```

**Parameters**

- `neighbor_ID` neighbor’s IPv4 or IPv6 address or peer group name

**Example**

- This command disables BGP enforce-first-as for the neighbors in peer group “region-3”.

```
switch(config-router-bgp)# no neighbor region-3 enforce-first-as
switch(config-router-bgp)#
```
neighbor export-localpref

The **neighbor export-localpref** command determines the LOCAL_PREF value that is sent in BGP UPDATE packets to the specified peer or peer group. This command has no effect on external peers.

The **no neighbor export-localpref** command resets the LOCAL_PREF value to the system default of 100 in packets sent to the specified peer or peer group.

The **default neighbor export-localpref** command resets the LOCAL_PREF value to the system default of 100 for individual neighbors, and applies the peer group’s setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address or the specified peer group.

**Command Mode**

   Router-BGP Configuration

**Command Syntax**

   neighbor neighbor_ID export-localpref preference
   no neighbor neighbor_ID export-localpref
   default neighbor neighbor_ID export-localpref

**Parameters**

- **neighbor_ID**  neighbor’s IPv4 or IPv6 address or peer group name
- **preference**  preference value. Values range from 0 to 4294967295.

**Example**

- This command configures the switch to fill the LOCAL_PREF field with 200 in UPDATE packets that it sends to the peer located at 10.1.1.45.

```
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 10.1.1.45 export-localpref 200
switch(config-router-bgp)#
```
neighbor graceful-restart

The `neighbor graceful-restart` command enables the BGP graceful restart mode for a specified BGP neighbor or peer group. When graceful restart mode is enabled, the switch retains routes from neighbors that are capable of graceful restart. By default, graceful restart is enabled for all BGP neighbors. Individual neighbor configuration takes precedence over the global configuration.

The `no neighbor graceful-restart` and `default neighbor graceful-restart` commands disable graceful restart mode for the specified BGP neighbor or peer group by removing the corresponding `no neighbor graceful-restart` command from `running-config`.

Command Mode
Router-BGP Configuration

Command Syntax
```
neighbor neighbor_ID graceful-restart
no neighbor neighbor_ID graceful-restart
default neighbor neighbor_ID graceful-restart
```

Parameters
• `neighbor_ID` neighbor's IPv4 or IPv6 address or peer group name

Example
• This command enables graceful restart mode for the neighbor with the IP address 192.168.12.1.
```
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 192.168.12.1 graceful-restart
switch(config-router-bgp)#
```
neighbor graceful-restart-helper

The `neighbor graceful-restart helper` command enables BGP graceful restart helper mode for the specified BGP neighbor or peer group. When graceful restart helper mode is enabled, the switch will retain routes from neighbors which are capable of graceful restart while those neighbors are restarting BGP. Graceful restart is enabled by default for all BGP neighbors. To configure graceful restart helper mode for all BGP neighbors, use the `graceful-restart-helper` command. Individual neighbor configuration takes precedence over the global configuration.

The `no neighbor graceful-restart helper` command disables graceful restart helper mode for the specified BGP neighbor or peer group. The `default neighbor graceful-restart helper` command enables graceful restart helper mode for the specified BGP neighbor or peer group by removing the corresponding `no neighbor graceful-restart helper` command from `running-config`.

**Command Mode**

- Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID graceful-restart helper
no neighbor neighbor_ID graceful-restart helper
default neighbor neighbor_ID graceful-restart helper
```

**Parameters**

- `neighbor_ID` neighbor’s IPv4 or IPv6 address or peer group name

**Example**

- These commands disable graceful restart helper mode for the neighbor at 192.168.12.1.

```
switch(config)#router bgp 1
switch(config-router-bgp)#no neighbor 192.168.12.1 graceful-restart-helper
switch(config-router-bgp)#
```
**neighbor import-localpref**

The **neighbor import-localpref** command determines the local preference assigned to routes received from the specified external peer or peer group. This command has no effect on routes received from internal peers.

The **no neighbor import-localpref** command resets the local preference to the default of 100 for routes received from the specified peer or peer group.

The **default neighbor import-localpref** command resets the local preference to the default of 100 for individual neighbors, and applies the peer group’s setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID import-localpref preference
no neighbor neighbor_ID import-localpref
default neighbor neighbor_ID import-localpref
```

**Parameters**

- **neighbor_ID** neighbor’s IPv4 or IPv6 address or peer group name
- **preference** preference value. Values range from 0 to 4294967295.

**Example**

- This command configures the switch to assign a local preference of 50 to routes received from the peer located at 192.168.1.30.

  ```
  switch(config)#router bgp 1
  switch(config-router-bgp)#neighbor 192.168.1.30 import-localpref 50
  switch(config-router-bgp)#
  ```
**neighbor local-as**

The `neighbor local-as` command enables AS_PATH attribute modification for received eBGP routes, allowing the switch to appear as a member of a different AS to external peers. Arista switches do not prepend the local AS number to routes received from the eBGP neighbor; currently, we implement the command only as `neighbor local-as no-prepend replace-as`.

The `no neighbor local-as` command disables AS_PATH modification for the specified peer or peer group. The `default neighbor local-as` command disables AS_PATH modification for individual neighbors, and applies the peer group's setting for neighbors that are members of a peer group.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID local-as as_id no-prepend replace-as
no neighbor neighbor_ID local-as
default neighbor neighbor_ID local-as
```

**Parameters**

- `neighbor_ID` neighbor's IPv4 or IPv6 address or peer group name
- `as_id` AS number that is sent in outbound routing updates in place of the actual AS of the switch. Values range from 1 to 4294967295.

This parameter cannot be set to the switch’s AS number or to any AS number in the peer’s network.

**Example**

- For the neighbor at 10.13.64.1, this command removes AS 300 from outbound routing updates and replaces it with AS 600.

  ```
  switch(config)#router bgp 300
  switch(config-router-bgp)#neighbor 10.13.64.1 local-as 600 no-prepend replace-as
  switch(config-router-bgp)#
  ```
neighbor local-v4-addr

The **neighbor local-v4-addr** command specifies the next-hop value that the switch sends as the IPv4 NLRI value to neighbors with whom IPv6 transport peering is established.

The **no neighbor local-v4-addr** command applies the system default configuration.

The **default neighbor local-v4-addr** command applies the system default configuration for individual neighbors, and applies the peer group’s setting for neighbors that are members of a peer group.

To configure the switch to automatically determine the IPv4 address to be sent as the next-hop in IPv4 NLRIs to an IPv6 neighbor, use the **neighbor auto-local-addr** command.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID local-v4-addr ipv4_local
no neighbor neighbor_ID local-v4-addr
default neighbor neighbor_ID local-v4-addr
```

**Parameters**

- **neighbor_ID** neighbor’s IPv6 address or peer group name
- **ipv4_local** Next hop address.

**Example**

- For the neighbor at 2001:0DB8:c2a4:1761::2, these commands specify an IPv4 NLRI value of 10.7.5.11 to be sent during IPv6 transport peering sessions.

  ```
  switch(config)#router bgp 1
  switch(config-router-bgp)#neighbor 2001:0DB8:c2a4:1761::2 local-v4-addr 10.7.5.11
  switch(config-router-bgp)#
  ```
**neighbor local-v6-addr**

The `neighbor local-v6-addr` command specifies the next-hop value that the switch sends as the IPv6 NLRI value to neighbors with whom IPv4 transport peering is established.

In IPv6 peering sessions, the switch sends the global IPv6 address of the interface that is used to transmit BGP updates.

The `no neighbor local-v6-addr` command applies the system default configuration.

The `default neighbor local-v6-addr` command applies the system default configuration for individual neighbors, and applies the peer group's setting for neighbors that are members of a peer group.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID local-v6-addr ipv6_local
no neighbor neighbor_ID local-v6-addr
default neighbor neighbor_ID local-v6-addr
```

**Parameters**

- `neighbor_ID` neighbor's IPv4 address or peer group name

**Example**

- For the neighbor at 10.7.5.11, these commands specify an IPv6 NLRI value that is sent during IPv4 transport peering sessions.

  ```
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 10.7.5.11 local-v6-addr 2001:0DB8:c2a4:1761::2
switch(config-router-bgp)#show active
router bgp 1
  bgp log-neighbor-changes
default ipv6-unicast
  neighbor 10.7.5.11 local-v6-addr 2001:0DB8:c2a4:1761::2
switch(config-router-bgp)#
```
neighbor maximum-routes

The neighbor maximum-routes command determines the number of BGP routes the switch accepts from a specified neighbor and defines an action when the limit is exceeded. The default value is 12,000. To remove the maximum routes limit, select a limit of zero.

When the number of routes received from a peer exceeds the limit, the switch generates an error message. This command can also configure the switch to disable peering with the neighbor. In this case, the neighbor state is reset only through a clear ip bgp command.

The no neighbor maximum-routes command applies the system default maximum-routes value of 12,000 for the specified peer.

The default neighbor maximum-routes command applies the system default value for individual neighbors, and applies the peer group’s setting for neighbors that are members of a peer group.

The no neighbor command removes all configuration commands for the neighbor at the specified address.

Command Mode
Router-BGP Configuration

Command Syntax
neighbor neighbor_ID maximum-routes quantity [ACTION]  
no neighbor neighbor_ID maximum-routes  
default neighbor neighbor_ID maximum-routes

Parameters
- **neighbor_ID** neighbor’s IPv4 or IPv6 address or peer group name
- **quantity** maximum number of routes. Values include:
  - 0 the switch does not define a route limit.
  - 1 to 4294967294 maximum number of routes.
- **ACTION** switch action when the route limit is exceeded. Values include:
  - <no parameter> peering is disabled and an error message is generated.
  - warning-only peering is not disabled, but an error message is generated.

Example
- This command configures the switch to accept 15000 routes for the neighbor at 10.3.16.210. If the neighbor exceeds 15000 routes, the switch disables peering with the neighbor.

  switch(config)#router bgp 1
  switch(config-router-bgp)#neighbor 110.3.16.210 maximum-routes 15000

  switch(config-router-bgp)#
neighbor next-hop-peer

The `neighbor next-hop-peer` command configures the switch to list the peer address as the next hop in routes that it receives from the specified peer BGP-speaking neighbor or members of the specified peer group. This command overrides the next hop for all routes received from this neighbor or peer group.

The `no neighbor next-hop-peer` command applies the system default (no next-hop override) for the specified peer.

The `default neighbor next-hop-peer` command applies the system default for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

The `no neighbor` command removes all configuration commands for the neighbor at the specified address or the specified peer group.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID next-hop-peer
no neighbor neighbor_ID next-hop-peer
default neighbor neighbor_ID next-hop-peer
```

**Parameters**

- `neighbor_ID` neighbor’s IPv4 or IPv6 address or peer group name

**Example**

- This command configures the peer address of 10.3.2.24 as the next hop for routes advertised to the switch from the peer BGP neighbor.

```
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor 10.3.2.24 next-hop-peer
switch(config-router-bgp)#
```
neighbor next-hop-self

The `neighbor next-hop-self` command configures the switch to list its address as the next hop in routes that it advertises to the specified BGP-speaking neighbor or neighbors in the specified peer group. This is used in networks where BGP neighbors do not directly access all other neighbors on the same subnet.

The `no neighbor next-hop-self` command applies the system default (no next-hop override) for the specified peer.

The `default neighbor next-hop-self` command applies the system default for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

The `no neighbor` command removes all configuration commands for the neighbor at the specified address or for the specified peer group.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID next-hop-self
no neighbor neighbor_ID next-hop-self
default neighbor neighbor_ID next-hop-self
```

**Parameters**

- `neighbor_ID` neighbor's IPv4 or IPv6 address or peer group name

**Example**

- This command configures the switch as the next hop for the peer at 10.4.1.30.

```
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 10.4.1.30 next-hop-self
switch(config-router-bgp)#
```
**neighbor out-delay**

The **neighbor out-delay** command sets the period of time that a route update for the specified neighbor must be in the routing table before the switch exports it to BGP. The out delay interval is used for bundling routing updates.

The **no neighbor out-delay** command applies the system default (out-delay value of zero) for the specified peer.

The **default neighbor out-delay** command applies the system default for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the specified neighbor.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID out-delay delay_time
no neighbor neighbor_ID out-delay
default neighbor neighbor_ID out-delay
```

**Parameters**

- **neighbor_ID** neighbor’s IPv4 or IPv6 address or peer group name
- **delay_time** the out delay period (seconds). Values range from 0 to 600. Default value is 0.

**Example**

- These commands set the out delay period to 5 seconds for the connection with the peer at 10.24.15.9.

```
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 10.24.15.9 out-delay 5
switch(config-router-bgp)#
```
neighbor passive

The `neighbor passive` command sets the TCP connection for the specified BGP neighbor or peer group to passive mode. When the peer’s transport connection mode is set to passive, it accepts TCP connections for BGP but does not initiate them.

The `no neighbor passive` command sets the specified BGP neighbor or peer group to active connection mode. BGP peers in active mode can both accept and initiate TCP connections for BGP. This is the default behavior.

The `default neighbor passive` command restores the default connection mode. The default mode is “active” for individual BGP peers, or the mode inherited from the peer group for peer group members.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID passive
no neighbor neighbor_ID passive
default neighbor neighbor_ID passive
```

**Parameters**

- `neighbor_ID` neighbor’s IPv4 or IPv6 address or peer group name

**Example**

- These commands configure the neighbor at IP address 10.2.2.14 to not initiate TCP connections for BGP peering.

```
switch(config)#router bgp 300
switch(config-router-bgp)#neighbor 10.2.2.14 passive
switch(config-router-bgp)#
```
neighbor password

The neighbor password command enables authentication on a TCP connection with a BGP peer. The plain-text version of the password is a string, up to 8 bytes in length. Peers must use the same password to ensure proper communication.

Running-config displays the encrypted version of the password. The encryption scheme is not strong by cryptographic standards; encrypted passwords should be treated in the same manner as plain-text passwords.

The no neighbor password command applies the system default for the specified peer, removing the neighbor password from the configuration and disabling authentication with the specified peer.

The default neighbor password command applies the system default for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

The no neighbor password and default neighbor password commands remove the neighbor password from the configuration, disabling authentication with the specified peer.

The no neighbor command removes all configuration commands for the neighbor at the specified address.

Command Mode
Router-BGP Configuration

Command Syntax

neighbor neighbor_ID password [ENCRYPT_LEVEL] key_text
no neighbor neighbor_ID password
default neighbor neighbor_ID password

Parameters

• neighbor_ID neighbor’s IPv4 or IPv6 address or peer group name
• ENCRYPT_LEVEL the encryption level of the key_text parameter. Values include:
  • <no parameter> indicates the key_text is in clear text.
  • 0 indicates key_text is in clear text. Equivalent to the <no parameter> case.
  • 7 indicates key_text is md5 encrypted.
• key_text the password.

Example

• This command specifies a password in clear text.

  switch(config)#router bgp 1
  switch(config-router-bgp)#neighbor 10.25.25.13 password 0 code123
  switch(config-router-bgp)#

Running-config stores the password as an encrypted string.
neighbor peer group (create)

Peer groups allow the user to apply settings to a group of BGP neighbors simultaneously. Once a peer group is created, the group name can be used as a parameter in neighbor configuration commands, and the configuration will be applied to all members of the group. Settings applied to an individual neighbor in the peer group override group settings.

The `neighbor peer group (create)` command is used to create static BGP peer groups. Static peer groups are peer groups whose members are added manually. To assign BGP neighbors to a static peer group, use the `neighbor peer-group (neighbor assignment)` command. To create a dynamic peer group, use the `bgp listen range` command.

The `no neighbor peer group (create)` and `default neighbor peer group (create)` commands remove the specified static peer group from `running-config`. When a static peer group is deleted, the neighbors that were members of that peer group lose any configuration that was inherited from the peer group. The `no bgp listen range` command removes a dynamic peer group.

The `no neighbor` command removes all configuration commands for the specified neighbor.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor group_name peer group
no neighbor group_name peer group
default neighbor group_name peer group
```

**Parameters**

- `group_name` peer group name.

**Examples**

- These commands create a BGP peer group called bgpgroup1, assign several neighbors to the group, apply a route map and adjust the configuration for one group member.

  ```
  switch(config)#router bgp 9
  switch(config-router-bgp)#neighbor bgpgroup1 peer group
  switch(config-router-bgp)#neighbor 10.1.1.1 peer group bgpgroup1
  switch(config-router-bgp)#neighbor 10.2.2.2 peer group bgpgroup1
  switch(config-router-bgp)#neighbor 10.3.3.3 peer group bgpgroup1
  switch(config-router-bgp)#neighbor bgpgroup1 route-map corporate in
  switch(config-router-bgp)#neighbor bgpgroup1 maximum-routes 12000
  switch(config-router-bgp)#neighbor 10.1.1.1 peer-group bgpgroup1
  switch(config-router-bgp)#neighbor 10.2.2.2 peer-group bgpgroup1
  switch(config-router-bgp)#neighbor 10.3.3.3 peer-group bgpgroup1
  switch(config-router-bgp)#neighbor 10.3.3.3 maximum-routes 5000
  switch(config-router-bgp)#show active
  router bgp 9
  bgp log-neighbor-changes
  neighbor bgpgroup1 peer-group
  neighbor bgpgroup1 route-map corporate in
  neighbor bgpgroup1 maximum-routes 12000
  neighbor 10.1.1.1 peer-group bgpgroup1
  neighbor 10.2.2.2 peer-group bgpgroup1
  neighbor 10.3.3.3 peer-group bgpgroup1
  neighbor 10.3.3.3 maximum-routes 5000
  switch(config-router-bgp)#
  ```
This command removes peer group “bgpgroup1” from *running-config*. The group members remain, but all settings that group members inherited from the peer group are removed.

```
switch(config-router-bgp)#no neighbor bgpgroup1 peer-group
switch(config-router-bgp)#show active
router bgp 9
  bgp log-neighbor-changes
    neighbor 10.1.1.1 maximum-routes 12000
    neighbor 10.2.2.2 maximum-routes 12000
    neighbor 10.3.3.3 maximum-routes 5000
switch(config-router-bgp)#
```
neighbor peer-group (neighbor assignment)

Peer groups allow the user to apply settings to a group of BGP neighbors simultaneously. Once a peer group is created, the group name can be used as a parameter in neighbor configuration commands, and the configuration will be applied to all members of the group. Settings applied to an individual neighbor in the peer group override group settings.

The **neighbor peer-group (neighbor assignment)** command is used to assign BGP neighbors to an existing static peer group. To create a static peer group, use the **neighbor peer group (create)** command. A neighbor can only belong to one peer group, so issuing this command for a neighbor that is already a member of another group will remove it from that group.

The **no neighbor peer-group** and **default neighbor peer-group** commands remove the specified neighbor from all peer groups. When a neighbor is removed from a peer group, the neighbor retains the configuration inherited from the peer group.

The **no neighbor** command removes all configuration commands for the specified neighbor.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor NEIGHBOR_ADDR peer-group group_name
no neighbor NEIGHBOR_ADDR peer-group
default neighbor NEIGHBOR_ADDR peer-group
```

**Parameters**

- **NEIGHBOR_ADDR** Address of a neighbor being added to peer group. Values include:
  - **ipv4_addr** neighbor’s IPv4 address.
  - **ipv6_addr** neighbor’s IPv6 address.
  - **group_name** peer group name.

**Examples**

- These commands create a BGP peer group called bgpgroup1, assign several neighbors to the group, and apply a route map.
  ```
  switch(config)#router bgp 9
  switch(config-router-bgp)#neighbor bgpgroup1 peer-group
  switch(config-router-bgp)#neighbor 10.1.1.1 peer-group bgpgroup1
  switch(config-router-bgp)#neighbor 10.2.2.2 peer-group bgpgroup1
  switch(config-router-bgp)#neighbor 10.3.3.3 peer-group bgpgroup1
  switch(config-router-bgp)#neighbor bgpgroup1 route-map corporate in
  switch(config-router-bgp)#
  ```

- This command removes the neighbor at 1.1.1.1 from the peer group. All settings that neighbor 10.1.1.1 inherited from the peer group are maintained.
  ```
  switch(config-router-bgp)#no neighbor 10.1.1.1 peer-group
  switch(config-router-bgp)#
  ```
neighbor remote-as

The neighbor remote-as command configures the expected AS number for a neighbor (peer). This configuration is required to establish a neighbor connection. Internal neighbors have the same AS number; external neighbors have different AS numbers.

**Note**

To establish a BGP session, there must be an IPv4 router ID configured in the same VRF or at least one L3 interface with an IPv4 address in the same VRF. If the VRF contains no L3 interfaces with IPv4 addresses (e.g., in an IPv6-only environment), configure an appropriate router ID using the `router-id (BGP)` command.

The no neighbor remote-as command applies the system default for the specified peer or peer group. The default neighbor remote-as command applies the system default for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group. The no neighbor command removes all configuration commands for the neighbor at the specified address.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID remote-as as_id
no neighbor neighbor_ID remote-as
default neighbor neighbor_ID remote-as
```

**Parameters**

- `neighbor_ID`  neighbor’s IPv4 or IPv6 address or peer group name
- `as_id`  Autonomous system (AS) of the peer. Values range from 1 to 4294967295.

**Example**

- This command establishes a BGP connection with the router at 10.4.3.10 in AS 300.
  
  ```
  switch(config)#router bgp 9
  switch(config-router-bgp)#neighbor 10.4.3.10 remote-as 300
  switch(config-router-bgp)#
  ```
neighbor remove-private-as

The `neighbor remove-private-as` command removes private autonomous system numbers from outbound routing updates for external BGP (eBGP) neighbors. When the autonomous system path includes only private autonomous system numbers, the `REMOVAL` parameter specifies how the private autonomous system number is removed.

The `no neighbor remove-private-as` command applies the system default (preserves private AS numbers) for the specified peer.

The `default neighbor remove-private-as` command applies the system default for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

The `no neighbor` command removes all configuration commands for the neighbor at the specified address.

**Command Mode**
Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID remove-private-as [REMOVAL]
no neighbor neighbor_ID remove-private-as
default neighbor neighbor_ID remove-private-as
```

**Parameters**
- `neighbor_ID` neighbor’s IPv4 or IPv6 address or peer group name
- `REMOVAL` Specifies removal of all private AS numbers when the AS path contains only private AS numbers. Values include:
  - `all` removes all private AS numbers from AS path in outbound updates.
  - `all replace-as` all private AS numbers in AS path are replaced with router’s local AS number.

**Note**
This command does not support a mix of public and private AS numbers.

**Example**
- These commands program the switch to remove all private AS numbers from outbound routing updates for the eBGP neighbor at 10.5.2.11 only if the AS path does not contain any public AS number.
  
  ```
  switch(config)#router bgp 9
  switch(config-router-bgp)#neighbor 10.5.2.11 remove-private-as
  switch(config-router-bgp)#
  ```

- This command replaces all private AS numbers in the AS path with the switch’s local AS number.
  
  ```
  switch(config)#router bgp 9
  switch(config-router-bgp)#neighbor 10.5.2.11 remove-private-as all replace-as
  switch(config-router-bgp)#
  ```
neighbor rib-in pre-policy retain

By default, inbound BGP routes that are filtered out by the import policy are still stored on the switch. Because all routes are retained, this allows policies to be changed without resetting BGP sessions. It also allows the switch to display all advertised routes when the `show ip bgp neighbor advertised-routes` command is issued.

The `no neighbor rib-in pre-policy retain` command configures the switch to discard information about routes received from the specified neighbor or group that fail the import policy.

The `neighbor rib-in pre-policy retain` command restores the system default behavior (retaining routes from the specified neighbor or group regardless of import policy).

The `default neighbor rib-in pre-policy retain` command applies the system default (retaining all routes) for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID rib-in pre-policy retain inbound [SCOPE]
no neighbor neighbor_ID rib-in pre-policy retain inbound
default neighbor neighbor_ID rib-in pre-policy retain inbound
```

**Parameters**

- `neighbor_ID` neighbor's IPv4 or IPv6 address or peer group name
- `SCOPE` determines how routes including the switch’s AS number are handled. Values include:
  - `<no parameter>` routes including the switch’s AS number are discarded.
  - `all` routes including the switch’s AS number are retained.

**Example**

- This command configures the switch to discard information about routes from the neighbor at 10.5.2.23 which are filtered out by the switch’s import policies.

  ```
  switch(config)#router bgp 9
  switch(config-router-bgp)#no neighbor 10.5.2.23 rib-in pre-policy retain inbound
  switch(config-router-bgp)#
  ```
neighbor route-map (BGP)

The **neighbor route-map** command applies a route map to inbound or outbound BGP routes. When a route map is applied to outbound routes, the switch will advertise only routes matching at least one section of the route map. Only one outbound route map and one inbound route map can be applied to a given neighbor. A new route map applied to a neighbor will replace the previous route map.

The command is available in Router-BGP and Router-BGP-Address-Family configuration modes. The mode in which the command is executed determines the scope of the command:

- In Router-BGP mode, the route map is applied to specified neighbor in all peering sessions where it is advertised.
- In Router-BGP-Address-Family mode, the route map is applied to the neighbors only in peering sessions corresponding to the configuration mode address family.

The **no neighbor route-map** command discontinues the application of the specified route map for the specified neighbor and direction. Removing a route map from one direction does not remove it from the other if it has been applied to both.

The **default neighbor route-map** command applies the system default (no route map) for individual neighbors, and applies the peer group's setting for neighbors that are members of a peer group.

**Command Mode**
- Router-BGP Configuration
- Router-BGP Address-Family Configuration

**Command Syntax**

```
neighbor neighbor_ID route-map map_name DIRECTION
no neighbor neighbor_ID route-map map_name DIRECTION
default neighbor neighbor_ID route-map map_name DIRECTION
```

**Parameters**

- `neighbor_ID` neighbor's IPv4 or IPv6 address or peer group name
- `map_name` name of a route map.
- `DIRECTION` routes to which the route map is applied. Options include:
  - `in` route map is applied to inbound routes.
  - `out` route map is applied to outbound routes.

**Example**

- This command applies a route map named **inner-map** to a BGP inbound route from 10.5.2.11
  ```
  switch(config)#router bgp 9
  switch(config-router-bgp)#neighbor 10.5.2.11 route-map inner-map in
  switch(config-router-bgp)#
  ```
neighbor route-reflector-client

Participating BGP routers within an AS communicate eBGP-learned routes to all of their peers, but to prevent routing loops they must not re-advertise iBGP-learned routes within the AS. To ensure that all members of the AS share the same routing information, a fully meshed network topology (in which each member router of the AS is connected to every other member) can be used, but this topology can result in high volumes of iBGP messages when it is scaled. Instead, in larger networks one or more routers can be configured as route reflectors.

A route reflector is configured to re-advertise routes learned through iBGP to a group of BGP neighbors within the AS (its clients), eliminating the need for a fully meshed topology.

The neighbor route-reflector-client command configures the switch to act as a route reflector and configures the specified neighbor as one of its clients. Additional clients are specified by re-issuing the command.

The no neighbor route-reflector-client and default neighbor route-reflector-client commands disable route reflection by deleting the neighbor route-reflector-client command from running-config.

Command Mode
Router-BGP Configuration

Command Syntax
neighbor neighbor_ID route-reflector-client
no neighbor neighbor_ID route-reflector-client
default neighbor neighbor_ID route-reflector-client

Parameters
- neighbor_ID neighbor’s IPv4 or IPv6 address or peer group name

Related Commands
- bgp client-to-client reflection

Example
- This command configures the switch as a route reflector and the neighbor at 10.5.2.1 as one of its clients.
  switch(config)#router bgp 9
  switch(config-router-bgp)#neighbor 10.5.2.11 route-reflector-client
  switch(config-router-bgp)#
**neighbor route-to-peer**

The **neighbor route-to-peer** command allows BGP to establish a connection to reach the specified peer using kernel routing table information. By default, route-to-peer configuration is enabled for a peer or a peer group.

The **no neighbor route-to-peer** command prevents BGP from using kernel routing table information to establish a BGP connection to reach a peer and the **default neighbor route-to-peer** command enables route-to-peer configuration for a peer or a peer group by removing the corresponding no neighbor route-to-peer command from the running-config.

If the peer is directly connected, BGP instead uses ARP table or neighbor table information to establish a BGP connection to reach the peer.

**Command Mode**
- Router-BGP Configuration

**Command Syntax**
```
neighbor neighbor_ID route-to-peer
no neighbor neighbor_ID route-to-peer
default neighbor neighbor_ID route-to-peer
```

**Parameters**
- `neighbor_ID` neighbor's IPv4 or IPv6 address or the peer group name.

**Example**
- These commands establish a connection between the switch and the BGP peer located at IP address 172.16.1.1, and prevents BGP from using kernel routing table information to establish a route to that peer.

```
switch(config)#router bgp 64496
switch(config-router-bgp)#no neighbor 172.16.1.1 route-to-peer
switch(config-router-bgp)#neighbor 172.16.1.1 remote-as 100
switch(config-router-bgp)
```
neighbor send-community

The neighbor send-community command configures the switch to include community path attributes for routes in the UPDATE messages advertised to the specified BGP neighbor. By default, the command enables the switch to send all community attributes: standard, extended, large, and link-bandwidth. To advertise only a subset of community attributes, use the keyword(s) for the community attribute(s) to be included. To add additional community attributes in a separate command, or to remove specific community attributes from advertised routes, use the neighbor send-community add / remove command.

The no neighbor send-community command applies the system default (not sending community attributes in BGP UPDATE messages) for the specified peer.

The default neighbor send-community command applies the system default for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

Command Mode
 Router-BGP Configuration

Command Syntax

```
neighbor neighbor_ID send-community [extended] [large] [standard]
no neighbor neighbor_ID send-community
default neighbor neighbor_ID send-community
```

Parameters
- `neighbor_ID` neighbor's IPv4 or IPv6 address or peer group name
- `extended` includes extended community attributes
- `large` includes large community attributes
- `standard` includes standard community attributes

Examples
- These commands configure the switch to send all community attributes to the neighbor at address 10.5.2.23.
  ```
  switch(config)#router bgp 9
  switch(config-router-bgp)#neighbor 10.5.2.23 send-community
  switch(config-router-bgp)#
  ```
- These commands configure the switch to include only large community attributes in the routes sent to the neighbor at address 10.5.2.24.
  ```
  switch(config)#router bgp 9
  switch(config-router-bgp)#neighbor 10.5.2.24 send-community large
  switch(config-router-bgp)#
  ```
- These commands configure the switch to send only standard and large community attributes to the neighbor at address 10.5.2.25.
  ```
  switch(config)#router bgp 9
  switch(config-router-bgp)#neighbor 10.5.2.25 send-community standard large
  switch(config-router-bgp)#
  ```
neighbor send-community add / remove

The `neighbor send-community add / remove` command modifies the types of community path attributes included for routes in the UPDATE messages advertised to the specified BGP neighbor without having to issue the `no neighbor send-community` command.

**Command Mode**
Router-BGP Configuration

**Command Syntax**
```
neighbor neighbor_ID send-community {add | remove} {extended | large | standard}
```

**Parameters**
- `neighbor_ID` neighbor’s IPv4 or IPv6 address or peer group name
- `add` appends the specified community path attribute type to the list of community path attribute types sent to the specified neighbor
- `extended` enables (or disables) sending of the extended community path attribute to the specified neighbor
- `large` enables (or disables) sending of the large community path attribute to the specified neighbor
- `remove` removes the specified community path attribute type from the list of community path attribute types sent to the specified neighbor
- `standard` enables (or disables) sending of the standard community path attribute to the specified neighbor

**Guidelines**
- If the `neighbor send-community` command has been issued for the neighbor without specifying any community types, that neighbor will receive all community attributes in the routes advertised to it. Using the `neighbor send-community add` command then to add an attribute will cause the switch to send only the specified community types in advertised routes. This will result in the other community path attributes no longer being advertised to that BGP peer.
- If all community types are removed using the `neighbor send-community remove` command, the switch will then send routes with all community types. (This behavior is maintained for backward compatibility.) To remove all community path attributes from routes sent to the specified neighbor, use the `no neighbor send-community` command.
- After using this command, issue the `show active` command in Router-BGP Configuration Mode to ensure that the intended attributes are being sent to the specified neighbor.

**Examples**
- These commands configure the switch to send large community attributes in the routes sent to the neighbor at address 10.5.2.24, then add extended community attributes as well.
  
  ```
  switch(config)#router bgp 9
  switch(config-router-bgp)#neighbor 10.5.2.24 send-community large
  switch(config-router-bgp)#neighbor 10.5.2.24 send-community add extended
  switch(config-router-bgp)#show active
  switch(config-router-bgp)#neighbor 10.5.2.24 send-community add extended
  switch(config-router-bgp)#show active
  router bgp 9
  neighbor 10.5.2.24 send-community extended large
  neighbor 10.5.2.24 maximum-routes 12000
  switch(config-router-bgp)#
  ```
These commands configure the switch to include large and link-bandwidth community attributes in the routes sent to the neighbor at address 10.5.2.27, then remove the large attribute from the list of community types to be included.

```
switch (config) router bgp 9
switch (config-router-bgp) neighbor 10.5.2.27 send-community extended large
link-bandwidth divide equal
switch (config-router-bgp) neighbor 10.5.2.27 send-community remove large
switch (config-router-bgp) show active
router bgp 600
  neighbor 10.5.2.27 send-community extended link-bandwidth divide equal
  neighbor 10.5.2.27 maximum-routes 12000
switch (config-router-bgp) #
```

**Note**

The following examples illustrate potentially unexpected behaviors.

- These commands attempt to configure the switch to remove large community attributes from routes sent to the neighbor at address 10.5.2.28, but send all others. However, because the original command did not specify a list of attributes, the `remove` command has no effect, and all community path attributes are still included.

```
switch (config) router bgp 9
switch (config-router-bgp) neighbor 10.5.2.28 send-community
switch (config-router-bgp) neighbor 10.5.2.28 send-community remove large
switch (config-router-bgp) show active
router bgp 600
  neighbor 10.5.2.28 send-community
  neighbor 10.5.2.28 maximum-routes 12000
switch (config-router-bgp) #
```

- These commands configure the switch to send only large community attributes in routes sent to the neighbor at address 10.5.2.29, then attempt to remove the large attribute from sent routes. However, because this removes the last specified attribute, all community path attributes (including large) will now be included.

```
switch (config) router bgp 9
switch (config-router-bgp) neighbor 10.5.2.29 send-community large
switch (config-router-bgp) neighbor 10.5.2.28 send-community remove large
switch (config-router-bgp) show active
router bgp 600
  neighbor 10.5.2.29 send-community
  neighbor 10.5.2.29 maximum-routes 12000
switch (config-router-bgp) #
```
neighbor shutdown

The neighbor shutdown command disables the specified neighbor. Disabling a neighbor also terminates all of its active sessions and removes associated routing information.

The no neighbor shutdown command enables the specified peer.

The default neighbor shutdown command enables individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

Command Mode

Router-BGP Configuration

Command Syntax

neighbor neighbor_ID shutdown
no neighbor neighbor_ID shutdown
default neighbor neighbor_ID shutdown

Parameters

• neighbor_ID neighbor's IPv4 or IPv6 address or peer group name

Example

• This command disables the neighbor at 10.5.2.23.

  switch(config)#router bgp 9
  switch(config-router-bgp)#neighbor 10.5.2.23 shutdown
  switch(config-router-bgp)#
neighbor timers

The `neighbor timers` command configures the BGP keepalive and hold times for a specified peer connection. The `timers bgp` command configures the times on all peer connections for which an individual command is not specified.

- Keepalive time is the period between the transmission of consecutive keepalive messages.
- Hold time is the period the switch waits for a KEEPALIVE or UPDATE message before it disables peering.

The hold time must be at least 3 seconds and should be three times longer than the keepalive setting.

The `no neighbor timers` command applies the system default for the specified peer or group (the timers specified by the `timers bgp` command).

The default neighbor timers command applies the system default for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

The `no neighbor` command removes all configuration commands for the neighbor at the specified address.

Command Mode
Router-BGP Configuration

Command Syntax
```
neighbor neighbor_ID timers keep_alive hold_time
no neighbor neighbor_ID timers
default neighbor neighbor_ID timers
```

Parameters
- `neighbor_ID` neighbor’s IPv4 or IPv6 address or peer group name
- `keep_alive` keepalive period, in seconds. Values include
  - 0 keepalive messages are not sent
  - 1 to 3600 keepalive time (seconds).
- `hold_time` hold time. Values include
  - 0 peering is not disabled by timeout expiry; keepalive packets are not sent.
  - 3 to 7200 hold time (seconds).

Example
- This command sets the keepalive time to 30 seconds and the hold time to 90 seconds for the connection with the peer at 10.24.15.9.
  
  switch(config)#router bgp 9
  switch(config-router-bgp)#neighbor 10.24.15.9 timers 30 90
  switch(config-router-bgp)#
**neighbor ttl maximum-hops**

The `neighbor ttl maximum-hops` command configures the Generalized TTL Security Mechanism (GTSM) for the specified neighbor(s).

The `no neighbor ttl maximum-hops` command disables the GTSM configuration in the specified neighbor.

The `default neighbor ttl maximum-hops` command applies the system default configuration for individual neighbors; and applies the peer group’s setting for neighbors that are members of a peer group.

**Command-Mode**

Router-BGP Configuration

**Command Syntax**

```text
neighbor neighbor_ID ttl maximum-hops n
default neighbor neighbor_ID ttl maximum-hops
no neighbor neighbor_ID ttl maximum-hops
```

**Parameters**

- **neighbor_ID** neighbor’s IPv4 or IPv6 address or peer group name
- **n** Maximum count of hops from a BGP peer. The value ranges from 0 to 254.

**Example**

- This command configures the TTL security for 10.20.20.30 with a maximum of 4 hops.
  ```text
  switch(config)#router bgp 9
  switch(config-router-bgp)#neighbor 10.20.20.30 ttl maximum-hops 4
  switch(config-router-bgp)#
  ```
neighbor update-source

The `neighbor update-source` command specifies the interface that BGP sessions use for TCP connections. By default, BGP sessions use the neighbor’s closest interface (also known as the best local address).

The `no neighbor update-source` command applies the system default (using best local address for TCP connections) for the specified peer or group.

The default neighbor update-source command applies the system default for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

The `no neighbor` command removes all configuration commands for the neighbor at the specified address.

**Command Mode**  
Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID update-source INTERFACE  
no neighbor neighbor_ID update-source  
default neighbor neighbor_ID update-source
```

**Parameters**

- `neighbor_ID` neighbor’s IPv4 or IPv6 address or peer group name
- `INTERFACE` Interface type and number. Options include:
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` loopback interface specified by `l_num`.
  - `management m_num` management interface specified by `m_num`.
  - `port-channel p_num` port channel interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.

**Example**

- This command configures the switch to use Ethernet interface 10 for TCP connections for the neighbor at 10.2.2.14.
  
```
switch(config)#router bgp 9  
switch(config-router-bgp)#neighbor 10.2.2.14 update-source ethernet 10  
switch(config-router-bgp)#
```
neighbor weight

The `neighbor weight` command assigns a weight attribute value to paths from the specified neighbor. Weight is the first parameter that the BGP best-path selection algorithm considers. When multiple paths to a destination prefix exist, the best-path selection algorithm prefers the path with the highest weight. Other attributes are used only when all paths to the prefix have the same weight.

Weight values range from 0 to 65535 and are not propagated to other switches through route updates. The default weight for paths that the router originates is 32768; the default weight for routes received through BGP is 0.

A path’s BGP weight is also configurable through route maps. Weight values set through route map commands have precedence over neighbor weight command values.

The `no neighbor weight` command applies the system default (32768 for router-originated paths, 0 for routes received through BGP) for the specified peer or group.

The `default neighbor weight` command applies the system default for individual neighbors, and applies the peer group’s setting for neighbors that are members of a peer group.

The `no neighbor` command removes all configuration commands for the neighbor at the specified address.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID weight weight_value
no neighbor neighbor_ID weight
default neighbor neighbor_ID weight
```

**Parameters**

- `neighbor_ID`  neighbor’s IPv4 or IPv6 address or peer group name
- `weight_value`  weight value. Values range from 1 to 65535.

**Example**

- This command specifies a weight of 4000 for all paths from the neighbor at 10.1.2.5

```
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor 10.1.2.5 weight 4000
switch(config-router-bgp)#
```
network (BGP)

The network command specifies a network for advertisement through UPDATE packets to BGP peers. The configuration zeros the host portion of the specified network address; for example, 192.0.2.4/24 is stored as 192.0.2.0/24. A route map option is available for assigning attributes to the network.

The command is available in Router-BGP and Router-BGP-Address-Family configuration modes. The mode in which the command is issued does not affect the command. The scope of the command depends on the specified network address:

- Commands with an IPv4 address are advertised to peers activated in the IPv4 address family.
- Commands with an IPv6 address are advertised to peers activated in the IPv6 address family.

The no network and default network commands remove the network from the routing table, preventing its advertisement.

Command Mode
- Router-BGP Configuration
- Router-BGP Address-Family Configuration

Command Syntax
```
network NET_ADDRESS [ROUTE_MAP]
no network NET_ADDRESS
default network NET_ADDRESS
```

Parameters
- **NET_ADDRESS** IP address range. Entry options include:
  - *ipv4_subnet* IPv4 subnet (CIDR notation).
  - *ipv4_addr_mask subnet* IPv4 subnet (address-mask notation).
  - *ipv6_prefix* neighbor’s IPv6 prefix (CIDR notation).
- **ROUTE_MAP** specifies route map that assigns attribute values to the network. Options include:
  - *<no parameter>* attributes are not assigned through a route map.
  - *route-map map_name* attributes listed by specified route map are assigned to the network.

Example
- This command enables BGP advertising for the network located at 10.1.2.5. The configuration stores the network as 10.1.2.5.

```bash
switch(config)#router bgp 9
switch(config-router-bgp)#network 10.1.2.5/24
switch(config-router-bgp)#
```
**no neighbor**

The `no neighbor` command removes all neighbor configuration commands for the specified neighbor. Commands removed by the `no neighbor` command include:

- `neighbor description`
- `neighbor ebgp-multihop`
- `neighbor export-localpref`
- `neighbor import-localpref`
- `neighbor local-as`
- `neighbor maximum-routes`
- `neighbor next-hop-peer`
- `neighbor next-hop-self`
- `neighbor out-delay`
- `neighbor password`
- `neighbor peer group (create)`
- `neighbor peer-group (neighbor assignment)`
- `neighbor remote-as`
- `neighbor remove-private-as`
- `neighbor route-map (BGP)`
- `neighbor route-reflector-client`
- `neighbor send-community`
- `neighbor timers`
- `neighbor update-source`

Neighbor settings can be removed individually; refer to the command description page of the desired command for details. Neighbor settings for a peer group must be removed individually.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
no neighbor neighbor_ID
default neighbor neighbor_ID
```

**Parameters**

- `neighbor_ID` neighbor's IPv4 or IPv6 address

**Example**

- This command removes all neighbor configuration commands for the neighbor at 10.1.1.1.

  switch(config)#router bgp 9
  switch(config-router-bgp)#no neighbor 10.1.1.1
  switch(config-router-bgp)#
peer-filter

The `peer-filter` command places the switch in the peer-filter configuration mode and allows to create a peer-filter group. The peer-filter group parameters are defined using the `match as-range` command.

The `no peer-filter` or `default peer-filter` command removes the `peer-filter group` from the running configuration.

**Command Mode**
- Router-BGP Configuration
- Peer-Filter Configuration

**Command Syntax**

```
peer-filter filter_name
```

**Parameters**
- `filter_name` name of the peer filter.

**Example**
- This command places the switch in the peer-filter configuration mode and creates a peer-filter "group1".

```
switch(config-router-bgp)#peer-filter group1
switch(config-peer-filter-group1)#
```
**rd (Router-BGP VRF and VNI Configuration Modes)**

The `rd` command adds a route distinguisher (RD) to VRF and VNI configuration modes. RDs internally identify routes belonging to a VRF or VNI to distinguish overlapping or duplicate IP address ranges. This allows the creation of distinct routes to the same IP address for different VPNs. The RD is a 64-bit number made up of an AS number or IPv4 address followed by a user-selected ID number.

If the switch is not running EVPN, an RD is not required for a VRF or VNI to function. Use `no` or `default` command forms to remove an RD from a VRF or VNI.

---

**Note**

Legacy RDs that were assigned in VRF Configuration Mode appear in `show vrf` outputs if an RD has not been configured using this command, but they no longer have an effect on the system. RDs assigned in the VNI Configuration Mode are displayed in the output of `show bgp evpn` command.

---

**Command Modes**

- Router-BGP VRF Configuration
- Router-BGP VNI Configuration

**Command Syntax**

```
rd admin_ID:local_assignment
no rd
default rd
```

**Parameters**

- `admin_ID` An AS number or globally assigned IPv4 address identifying the entity assigning the RD. This should be an IANA-assigned identifying number.
- `local_assignment` A locally assigned number distinguishing the VRF. Values range from 0-65535 if the `admin_ID` is an IPv4 address, or from 0-4,294,967,295 if the `admin_ID` is an AS number. If the `admin_ID` is an AS number, the `local_assignment` can also be entered in the form of an IPv4 address.

**Examples**

- These commands identify the administrator of the VRF called “purple” as AS 530 and assign 12 as its local number.
  ```
  switch(config)#router bgp 50
  switch(config-router-bgp)#vrf purple
  switch(config-router-bgp-vrf-purple)#rd 530:12
  switch(config-router-bgp-vrf-purple)#
  ```

- These commands identify the administrator of the MAC-VRF called “bundle1” as AS 530 and assign 12 as its local number.
  ```
  cvx(config)#router bgp 100
  cvx(config-router-bgp)#vni-aware-bundle bundle1
  cvx(config-macvrf-bundle1)#rd 530:12
  cvx(config-macvrf-bundle1)#
  ```
redistribute (BGP)

The **redistribute** command enables the redistribution of specified routes to the BGP domain.

The **no redistribute** and **default redistribute** commands disable route redistribution from the specified domain by removing the corresponding **redistribute** command from **running-config**.

**Important!** Aggregate routes are redistributed automatically, and their redistribution cannot be disabled.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
redistribute ROUTE_TYPE [ROUTE_MAP]
no redistribute ROUTE_TYPE
default redistribute ROUTE_TYPE
```

**Parameters**

- **ROUTE_TYPE** source from which routes are redistributed. Options include:
  - **connected** routes that are established when IP is enabled on an interface.
  - **match nssa-external** all OSPF NSSA external routes.
  - **match nssa-external 1** type 1 OSPF NSSA external routes.
  - **match nssa-external 2** type 2 OSPF NSSA external routes.
  - **ospf** routes from an OSPF domain.
  - **ospf match external** routes external to the AS, but imported from OSPF.
  - **ospf match internal** OSPF routes that are internal to the AS.
  - **ospf match nssa-external** all OSPF NSSA external routes.
  - **ospf match nssa-external 1** type 1 OSPF NSSA external routes.
  - **ospf match nssa-external 2** type 2 OSPF NSSA external routes.
  - **ospf3** routes from an OSPFv3 domain.
  - **ospf3 match external** routes external to the AS, but imported from OSPFv3.
  - **ospf3 match internal** OSPFv3 routes that are internal to the AS.
  - **rip** routes from a RIP domain.
  - **static** IP static routes.
  - **isis** IS-IS routes. Sub-options include.
    - **level-1** Redistribute IS-IS level-1 routes
    - **level-1-2** Redistribute IS-IS level-1 and level-2 routes
    - **level-2** Redistribute IS-IS level-2 routes
    - **route-map** Route map reference

**Important!** While redistributing IS-IS routes into BGP, Level-1 or Level-2 keyword can be used to selectively redistribute Level-1 routes or Level-2 routes into BGP. The Level-1 or Level-2 keyword is optional and it defaults to Level-2 when not configured.

- **ROUTE_MAP** route map that determines the routes that are redistributed. Options include:
  - **<no parameter>** all routes are redistributed.
• route-map map_name only routes in the specified route map are redistributed.

Example
• This command redistributes OSPF routes into the BGP domain.
  switch(config)#router bgp 9
  switch(config-router-bgp)#redistribute OSPF
  switch(config-router-bgp)#

• These commands redistributes ISIS routes into BGP domain in address-family mode.
  Switch(config)#router bgp 1
  Switch(config-router-bgp)#address-family ipv4
  Switch(config-router-bgp-af)#redistribute isis level-1 route-map isis-to-bgp-v4

• These commands redistributes ISIS routes into BGP domain in router-bgp mode.
  Switch(config)#router bgp 1
  Switch(config-router-bgp)#redistribute isis level-1 route-map isis-to-bgp
router-id (BGP)

The `router-id` command sets the local router BGP router ID. When no ID has been specified, the local router ID is set to the following:

- The loopback IP address when a single loopback interface is configured.
- The loopback with the highest IP address when multiple loopback interfaces are configured.
- The highest IP address on a physical interface when no loopback interfaces are configured.

**Important!** The router-id must be specified if the switch has no IPv4 addresses configured.

The `no router-id` and `default router-id` commands remove the `router-id` command from `running-config`.

**Command Mode**
Router-BGP Configuration

**Command Syntax**

```
router-id id_num
no router-id [id_num]
default router-id [id_num]
```

**Parameters**

- `id_num` router ID number (32-bit dotted decimal notation).

**Example**

- This command configures the fixed router ID address of 10.10.4.11

  switch(config)#router bgp 9
  switch(config-router-bgp)#router-id 10.10.4.11
  switch(config-router-bgp)#
**router bgp**

The `router bgp` command places the switch in router-BGP configuration mode. If BGP was not previously instantiated, this command creates a BGP instance with the specified AS number. Router-BGP configuration mode is not a group change mode; `running-config` is changed immediately after commands are executed. The `exit` command does not affect the configuration.

When a BGP instance exists, the command must include the AS number of the existing BGP instance. Running this command with a different AS number generates an error message.

The `no router bgp` and `default router bgp` commands delete the BGP instance.

Refer to [Router-BGP Configuration Mode (Includes Address-Family Mode)](#) for a list of commands available in router-BGP configuration mode.

The `exit` command returns the switch to global configuration mode.

**Command Mode**

Global Configuration

**Command Syntax**

```
router bgp  as_id
no router bgp
default router bgp
```

**Parameters**

- `as_id` Autonomous system (AS) number. Values range from 1 to 4294967295.

**Examples**

- This command creates a BGP instance with AS number 64500.

  ```
  switch(config)#router bgp 64500
  switch(config-router-bgp)#
  ```

- This command attempts to open a BGP instance with a different AS number from that of the existing instance. The switch displays an error and stays in global configuration mode.

  ```
  switch(config)#router bgp 64501
  % BGP is already running with AS number 64500
  switch(config)#
  ```

- This command exits BGP configuration mode.

  ```
  switch(config-router-bgp)#exit
  switch(config)#
  ```

- This command deletes the BGP instance.

  ```
  switch(config)#no router bgp
  switch(config)#
  ```
**show bgp convergence**

The `show bgp convergence` command displays information about the Border Gateway Protocol (BGP) convergence state and other statistics about the BGP instance in the specified VRF or in all VRFs.

**Command Mode**

EXEC

**Command Syntax**

```
show bgp convergence [VRF_INSTANCE]
```

**Parameters**

- `VRF_INSTANCE` specifies VRF instances.
  - `<no parameter>` displays BGP information for the context-active VRF.
  - `vrf vrf_name` displays BGP information for the specified VRF.
  - `vrf all` displays BGP information for all VRFs.
  - `vrf default` displays BGP information for the default VRF.

**Examples**

- This command displays the output when no peers have joined before convergence.

  ```
  switch(config-router-bgp)#show bgp convergence
  BGP Convergence information for VRF: default
  Configured convergence timeout: 00:02:30
  Configured convergence slow peer timeout: 00:00:55
  Convergence based update synchronization is enabled
  Last Bgp convergence event : None
  Bgp convergence state : Not Initiated (Waiting for the first peer to join)
  Convergence timer is not running
  Convergence timeout in use: 00:02:30
  Convergence slow peer timeout in use: 00:00:55
  First peer is not up yet
  All the expected peers are up: no
  All IGP protocols have converged: yes
  Outstanding EORs: 0, Outstanding Keepalives: 0
  Pending Peers: 2
  Total Peers: 2
  Established Peers: 0
  Disabled Peers: 0
  Peers that have not converged yet:
  IPv4 peers:
  201.1.1.1 (Session : Connect)
  202.1.1.1 (Session : Connect)
  IPv6 peers:
  None
  ```
• This command displays the output when the first peer has joined before convergence.

switch#show bgp convergence
BGP Convergence information for VRF: default
Configured convergence timeout: 00:02:30
Configured convergence slow peer timeout: 00:00:55
Convergence based update synchronization is enabled
Last Bgp convergence event 00:00:40 ago
Bgp convergence state : Pending (Waiting for EORs/Keepalives from peer(s) and IGP convergence)
  Convergence timer running, will expire in 00:01:50
  Convergence timeout in use: 00:02:30
  Convergence slow peer timeout in use: 00:00:55
First peer came up 00:00:13 ago
All the expected peers are up: no
All IGP protocols have converged: yes
Outstanding EORs: 0, Outstanding Keepalives: 0
Pending Peers: 1
Total Peers: 2
Established Peers: 1
Disabled Peers: 0
Peers that have not converged yet:
IPv4 peers:
  201.1.1.1 (Session : Active)
IPv6 peers:
  None

• This command displays the output when the convergence timeout value is reached.

switch(config-router-bgp)#show bgp convergence
BGP Convergence information for VRF: default
Configured convergence timeout: 00:02:30
Configured convergence slow peer timeout: 00:00:55
Convergence based update synchronization is enabled
Last Bgp convergence event 00:02:44 ago
Bgp convergence state : Timeout reached
  Time taken to converge 00:02:30
Pending Peers: 1
Total Peers: 2
Established Peers: 1
Disabled Peers: 0
Peers that did not converge before local bgp convergence:
IPv4 peers:
  201.1.1.1 (Session : Active)
IPv6 peers:
  None
This command displays the output during the converged state.

```
switch(config-router-bgp)#show bgp convergence
BGP Convergence information for VRF: default
Configured convergence timeout: 00:05:00
Configured convergence slow peer timeout: 00:01:30
Convergence based update synchronization is enabled
Last Bgp convergence event 00:00:05 ago
Bgp convergence state : Converged
  Time taken to converge 00:00:02
  First peer came up 00:00:05 ago
  Pending Peers: 0
  Total Peers: 3
  Established Peers: 3
  Disabled Peers: 0
Peers that did not converge before local bgp convergence:
  IPv4 peers:
    None
  IPv6 peers:
    None
```
**show bgp instance**

The *show bgp instance* command displays summary Border Gateway Protocol (BGP) information about the BGP instance in the specified VRF or in all VRFs.

**Command Mode**

EXEC

**Command Syntax**

```
show bgp instance [VRF_INSTANCE]
```

**Parameters**

- **VRF_INSTANCE** specifies VRF instances.
  - <no parameter> displays BGP information for the context-active VRF.
  - `vrf vrf_name` displays BGP information for the specified VRF.
  - `vrf all` displays BGP information for all VRFs.
  - `vrf default` displays BGP information for the default VRF.

**Examples**

- This command displays information about the BGP instance in the context-active VRF.
  ```
  switch>show bgp instance
  BGP instance information for VRF purple
  BGP Local AS:  64497, Router ID: 1.2.3.5
  Total peers:  5
  Configured peers:  3
  UnConfigured peers:  2
  Disabled peers:  0
  Established peers:  3
  Graceful restart helper mode enabled
  End of rib timer timeout: 00:05:00
  BGP Convergence timer is inactive
  BGP Convergence information:
  BGP has converged: no
  Outstanding EORs: 0, Outstanding Keepalives: 0
  Convergence timeout: 00:10:00
  switch>
  ```

- This command displays information about the BGP instance in the default VRF.
  ```
  switch>show bgp instance vrf default
  BGP instance information for VRF default
  BGP Local AS:  64503, Router ID: 1.2.3.5
  Total peers:  1
  Configured peers:  1
  UnConfigured peers:  0
  Disabled peers:  0
  Established peers:  0
  Graceful restart helper mode enabled
  End of rib timer timeout: 00:05:00
  BGP Convergence timer is inactive
  BGP Convergence information:
  BGP has converged: no
  Outstanding EORs: 0, Outstanding Keepalives: 0
  Convergence timeout: 00:10:00
  switch>
  ```
show bgp labeled-unicast tunnel

The `show bgp labeled-unicast tunnel` command displays the contents of the BGP labeled-unicast (LU) tunnel table. The user can optionally specify a tunnel index parameter to view the specific single tunnel information.

**Command Mode**

EXEC

**Command Syntax**

`show bgp labeled-unicast tunnel tunnel_index`

**Parameters**

- `tunnel_index` specify tunnel index to view single tunnel information.

**Example**

- This command displays the BGP LU tunnel table.

```
switch#show bgp labeled-unicast tunnel
Index Endpoint   Nexthop  Interface   Labels          Contributing Metric Metric 2 Pref Pref 2
----- ---------- -------- ----------- --------------- ------------ ------ -------- ---- ------
5     2.0.0.0/24 10.1.1.2 'Ethernet3' [ 123 899 900 ] Yes          0      100      200  0
6     2.0.1.0/24 10.1.1.2 'Ethernet3' [ 400 500 600 ] Yes          0      100      200  0
7     2.0.2.0/24 10.1.1.2 'Ethernet3' [ 400 500 600 ] Yes          0      100      200  0
```

- This command displays the BGP LU tunnel table for tunnel index 4.

```
switch#show bgp labeled-unicast tunnel 4
Index    Endpoint          Nexthop/Tunnel Index     Interface           Labels     Contributing     Metric Metric 2     Pref Pref 2
-------- ----------------- ----------------------- ------------------- ---------- ----------------
---------- ------------ -------- ------
4        10.253.0.10/32    10.1.0.0                 Port-Channel111     [ 3 ]      Yes              0
```

**show ip as-path access-list**

The `show ip as-path access-list` command displays BGP filters on the switch. Specifying an access list displays the statements from that access list. Entering the command without parameters displays the statements from all access lists on the switch.

**Command Mode**

EXEC

**Command Syntax**

```
show ip as-path access-list [list_name]
```

**Parameters**

- `list_name` the name of an AS path access list.

**Example**

- This command displays the contents of the AS path access list named “list1.”

```
switch>show ip as-path access-list list1
ip as-path access-list list1 deny _3$
ip as-path access-list list1 permit .*
switch>
```
show ip bgp

The `show ip bgp` command displays Border Gateway Protocol (BGP) IPv4 routing table entries. The output format depends on the command parameters:

- Data block format displays comprehensive information for each specified BGP routing table entry.
- Tabular format displays routing table entries for the specified IPv4 addresses.

**Command Mode**

EXEC

**Command Syntax**

```
show ip bgp [FILTER] [VRF_INSTANCE]
```

**Parameters**

- `FILTER` routing table entries that the command displays. Options include:
  - `<no parameter>` displays all routing table entries in tabular format.
  - `detail` displays all routing table entries in data block format.
  - `ipv4_addr` displays IPv4 host address in data block format.
  - `ipv4_prefix` displays the route information of specified IPv4 prefix in data block format. Options include:
    - `detail` displays the detailed route information of specified IPv4 prefix in data block format.
    - `longer-prefixes` displays the route information of IPv4 prefix in tabular block format.
    - `longer-prefixes detail` displays the detailed route information of specified IPv4 prefix in data block format.
  - `community-list cmnty_list_name` displays BGP routes filtered by the specified community list.
  - `installed` displays the information of installed BGP routes.
  - `labeled-unicast` displays the information of labeled-unicast BGP routes only.
  - `not-installed` displays the information of BGP routes that are not installed.
- `VRF_INSTANCE` specifies VRF instances.
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Guidelines**

You must provide the IPv4 prefix in CIDR notation.
Examples

- This command displays the BGP routing table with prefix ‘L’ flag for all BGP LU route entries.

  ```
  switch# show ip bgp
  BGP routing table information for VRF default
  Router identifier 0.0.0.1, local AS number 100
  Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e - ECMP
  S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast
  Origin codes: i - IGP, e - EGP, ? - incomplete
  AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop

        10.3.0.103
switch#
```
show ip bgp community

The show ip bgp community command displays Border Gateway Protocol (BGP) routing table entries, filtered by community.

**Command Mode**

EXEC

**Command Syntax**

```
show ip bgp community COMM_1 [COMM_2... COMM_n] [MATCH_TYPE] [DATA_OPTION] [VRF_INSTANCE]
```

**Parameters**

- **COMM_x**  community number or name, as specified in the route map that sets the community list number.
  - GSHUT  well-known graceful shutdown community.
  - aa:nn  AS and network number, separated by colon. Each value ranges from 1 to 4294967295.
  - comm_num  community number. Values range from 1 to 4294967040.
  - internet  advertises route to Internet community.
  - local-as  advertises route only to local peers.
  - no-advertise  does not advertise the route to any peer.
  - no-export  advertises route only within BGP AS boundary.
- **MATCH_TYPE**  routes are filtered based on their communities.
  - <no parameter>  routes must match at least one community in the list
  - exact  route must match all communities and include no other communities.
  - regex  display routes matching the regular expression of communities.
- **DATA_OPTION**  type of information the command displays. Values include:
  - <no parameter>  displays table of the routing entry line items.
  - detail  displays data block for each routing table entry.
- **VRF_INSTANCE**  specifies VRF instances.
  - <no parameter>  displays routing table for context-active VRF.
  - vrf vrf_name  displays routing table for the specified VRF.
  - vrf all  displays routing table for all VRFs.
  - vrf default  displays routing table for default VRF.

**Guidelines**

The interpretation of regular expressions is always based on string mode but not on the ACL configuration.
Example

- This command displays the BGP routing table entries with the community 64496:1000.

```
switch# show ip bgp community 64496:1000 detail
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
BGP routing table entry for 10.100.1.0/24
Paths: 1 available
  64496 64497 65536
  10.1.0.100 from 10.1.0.100 (10.0.0.100)
    Origin IGP, metric 0, localpref 100, IGP metric 1, weight 0, received 00:03:16 ago, valid, external, best
    Community: 65512390 64496:1000
    Rx SAFI: Unicast
switch#
```
**show ip bgp neighbors**

The `show ip bgp neighbors` command displays Border Gateway Protocol (BGP) and TCP session data for a specified IPv4 BGP neighbor, or for all IPv4 BGP neighbors if an address is not included.

**Command Mode**

`EXEC`

**Command Syntax**

```
show ip bgp neighbors [NEIGHBOR_ADDR][VRF_INSTANCE]
```

**Parameters**

- `NEIGHBOR_ADDR` location of the neighbors. Options include:
  - `<no parameter>` command displays information for all IPv4 BGP neighbors.
  - `ipv4_addr` command displays information for specified neighbor.
- `VRF_INSTANCE` specifies VRF instances.
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Related Command**

- `show ip bgp neighbors (route type)`
- `show ip bgp neighbors (route-type) community`
Example

- This command displays information of the neighbor at 10.1.0.100.

```
switch(config)#show ip bgp neighbors 10.1.0.100
BGP neighbor is 10.1.0.100, remote AS 64496, external link

**show ip bgp neighbors (route type)**

The `show ip bgp neighbors (route type)` command displays information for next hop routes to a specified IPv4 neighbor. The `show ip bgp neighbors (route-type) community` command displays the same information for routes filtered by communities.

The output format depends on the selected **FILTER** parameter:

- Data block format displays comprehensive information for each specified route.
- Tabular format displays routing table entries in tabular format for the specified IP addresses.

Commands that do not include a route type revert to the `show ip bgp neighbors` command.

**Command Mode**

**EXEC**

**Command Syntax**

```
show ip bgp neighbors neighbor_addr [HOPDIRECT [FILTER] [VRF_INSTANCE]]
show ip bgp neighbors neighbor_addr [ROUTE_TYPE] HOPDIRECT
show ip bgp neighbors neighbor_addr [ROUTE_TYPE] HOPDIRECT detail
```

**Related Command**

- `show ip bgp neighbors`
- `show ip bgp neighbors (route-type) community`

**Parameters**

- `neighbor_addr` location of the neighbor.
- **ROUTE TYPE** filters route on route type. Options include:
  - `ipv4 unicast` displays IPv4 unicast routes.
  - `ipv6 unicast` displays IPv6 unicast routes.
- **HOPDIRECT** filters route on the basis of direction from neighbor. Options include:
  - `advertised-routes` displays routes advertised to the specified neighbor.
  - `received-routes` displays routes received from the specified neighbor (accepted and rejected).
  - `routes` displays routes received and accepted from specified neighbor.
- **FILTER** routing table entries that the command displays. Values include:
  - `<no parameter>` displays all routing table entries. Tabular format.
  - `detail` displays all routing table entries. Data block format.
  - `ipv4_addr` displays IPv4 host address in data block format.
  - `ipv4_prefix` displays the route information of specified IPv4 prefix in data block format.
  - Option includes:
    - `longer-prefixes` displays the route information of IPv4 prefix in tabular block format.
- **VRF_INSTANCE** specifies VRF instances.
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.
Example

- This command displays information for routes advertised to the neighbor at 10.3.0.103.

```
switch# show ip bgp neighbors 10.3.0.103 advertised-routes
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e - ECMP
S - Stale, c - Contributing to ECMP, b - backup, I - labeled-unicast
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop
 Network                Next Hop            Metric  LocPref Weight  Path
* >     10.1.0.0/24            10.3.0.102            -       100     -       i
* >     10.2.0.0/24            10.3.0.102            -       100     -       i

* >     10.100.0.0/24          10.1.0.100            200     100     -       64496 i
* >     10.100.1.0/24          10.1.0.100            -       100     -       64496 64497 65536 i
* >     10.100.2.0/24          10.1.0.100            42      100     -       64496 ?
* >     10.101.0.0/24          10.2.0.101            -       100     -       64510 i
* >     10.101.1.0/24          10.2.0.101            -       100     -       64510 i
* >     10.101.2.0/24          10.2.0.101            -       100     -       64510 i
switch#
```
show ip bgp neighbors (route-type) community

The `show ip bgp neighbors (route type) community` command displays information for next hop routes to a specified neighbor. Routes are filtered by community.

The `show ip bgp neighbors (route type)` command displays the same information for routes filtered by IP addresses and subnets.

**Command Mode**

EXEC

**Command Syntax**

```
show ip bgp neighbors addr RTE community CM_1 [CM_2...CM_n] [MATCH] [INFO] [VRF_INST]
```

**Related Command**

- `show ip bgp neighbors`
- `show ip bgp neighbors (route type)`

**Parameters**

- **addr**  location of the neighbor.
- **RTE**  type of route that the command displays. Options include:
  - **advertised-routes**  displays routes advertised to the specified neighbor.
  - **received-routes**  displays routes received from the specified neighbor (accepted and rejected).
  - **routes**  displays routes received and accepted from specified neighbor.
- **CM_x**  community number or name, as specified in the route map that sets the community list number. The command must list at least one of the following community identifiers:
  - **GSHUT**  well-known graceful shutdown community.
  - **aa:nn**  AS and network number, separated by colon. Each value ranges from 1 to 4294967295.
  - **comm_num**  community number. Values range from 1 to 4294967040.
  - **internet**  advertises route to Internet community.
  - **local-as**  advertises route only to local peers.
  - **no-advertise**  does not advertise route to any peer.
  - **no-export**  advertises route only within BGP AS boundary.
- **MATCH**  Routes are filtered based on their communities.
  - `<no parameter>`  routes must match at least one community in the list
  - **exact**  route must match all communities and include no other communities.
- **INFO**  Type of information the command displays. Values include:
  - `<no parameter>`  Displays table of routing entry line items.
  - **detail**  Displays data block for each routing table entry.
- **VRF_INST**  specifies VRF instances.
  - `<no parameter>`  displays routing table for context-active VRF.
  - `vrf vrf_name`  displays routing table for the specified VRF.
  - `vrf all`  displays routing table for all VRFs.
• **vrf default** displays routing table for default VRF.

**Example**

This command lists the routes advertised to the neighbor at 10.3.0.103 with community 655:23590.

```
switch#show ip bgp neighbors 10.3.0.103 advertised-routes community 655:23590
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e - ECMP
S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop

<table>

</tr>
</tbody>
</table>
```

switch#
show ip bgp neighbors regexp

The `show ip bgp neighbors regexp` command displays information for next hop routes to a specified IPv4 neighbor that match the AS path attributes specified in the given regular expression.

**Command Mode**
EXEC

**Command Syntax**
```
show ip bgp neighbors addr RTE regexp as_paths [VRF_INST]
```

**Related Command**
- `show ip bgp neighbors`
- `show ip bgp neighbors (route type)`

**Parameters**
- `addr` location of the neighbor.
- `RTE` type of route that the command displays. Options include:
  - `advertised-routes` displays routes advertised to the specified neighbor.
  - `received-routes` displays routes received from the specified neighbor (accepted and rejected).
  - `routes` displays routes received and accepted from specified neighbor.
- `as_paths` list of AS paths, formatted as a regular expression. Regular expressions are pattern matching strings that are composed of text characters and operators.
- `VRF_INST` specifies VRF instances.
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Example**
- This command lists the routes advertised to the neighbor at 10.3.0.103 where the AS path is 64496.

```
switch#show ip bgp neighbors 10.3.0.103 advertised-routes regex ^64496$
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e - ECMP
  S - Stale, c - Contributing to ECMP, b - backup, L = labeled-unicast
  % - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST -Cluster List, LL Nexthop - Link Local Nexthop

<table>
<thead>
<tr>

</table>
```

switch#
**show ip bgp paths**

The *show ip bgp paths* command displays all BGP AS paths in the database.

**Command Mode**

EXEC

**Command Syntax**

```
show ip bgp paths [VRF_INSTANCE]
```

**Parameters**

- `VRF_INSTANCE` specifies VRF instances.
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Display Values**

- **Refcount**: Number of routes using a listed path.
- **Metric**: The path’s Multi Exit Discriminator (MED).
- **Path**: The route’s AS path and its origin code.

The MED (the path’s external metric) provides information to external neighbors about the preferred path into an AS that has multiple entry points. Lower MED values are preferred.

**Example**

- This command displays all BGP AS paths in the switch’s database.

```
switch#show ip bgp paths
Refcount Metric     Path
6        0          64510 64505 64506 64507 i (HashID 9)
6        0          64510 ? (HashID 8)
12       0          65530 65531 65532 e (HashID 5)
12       0          i (HashID 6)
6        0          64100 64200 i (HashID 4)
28       0          i (HashID 1)
7        0          ? (HashID 2)
40       0          64510 i (HashID 10)
19       0          64510 i (HashID 7)
2        0          i (HashID 3)
switch#
```
show ip bgp peer-group

The *show ip bgp peer-group* command displays the BGP version, address family and group members for all BGP peer groups defined on the switch.

**Command Mode**

EXEC

**Command Syntax**

```
show ip bgp peer-group [GROUP][VRF_INSTANCE]
```

**Parameters**

- **GROUP** peer group for which command displays information. Options include:
  - *<no parameter>* command displays information for all peer groups.
  - *group_name* name of peer group for which command displays information.
- **VRF_INSTANCE** specifies VRF instances.
  - *<no parameter>* displays routing table for context-active VRF.
  - *vrf vrf_name* displays routing table for the specified VRF.
  - *vrf all* displays routing table for all VRFs.
  - *vrf default* displays routing table for default VRF.

**Example**

- This command displays BGP peer group information for all peer groups on the switch.

```
switch#show ip bgp peer-group
BGP peer-group is EXTERNAL
BGP version 4
Static peer-group members:
  VRF default:
    10.1.0.100, state: Connect
      Negotiated MP Capabilities:
        IPv4 Unicast: No
        IPv6 Unicast: No
        IPv4 SR-TE: No
        IPv6 SR-TE: No
    10.2.0.101, state: Connect
      Negotiated MP Capabilities:
        IPv4 Unicast: No
        IPv6 Unicast: No
        IPv4 SR-TE: No
        IPv6 SR-TE: No
BGP peer-group is INTERNAL
BGP version 4
Listen-range subnets:
  VRF default:
    10.3.0.0/24, remote AS 64500
Dynamic peer-group members:
  VRF default:
switch#
```
show ip bgp regexp

The `show ip bgp regexp` command displays Border Gateway Protocol (BGP) IPv4 routing table entries that match the AS path attributes specified in the given regular expression.

**Command Mode**
EXEC

**Command Syntax**
```
show ip bgp regexp as_paths [VRF_INSTANCE]
```

**Parameters**
- `as_paths` list of AS paths, formatted as a regular expression. Regular expressions are pattern matching strings that are composed of text characters and operators.
- `VRF_INSTANCE` specifies the VRF instance of the BGP routing table to be displayed.
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Example**
- This command displays information about the BGP IPv4 routes in the context-active VRF where the AS path is 64510.

```
switch#show ip bgp regex ^64510$
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e - ECMP
S - Stale, c - Contributing to ECMP, b - backup, L = labeled-unicast
% - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST -Cluster List, LL Nexthop - Link Local Nexthop

<table>

</tbody>
</table>
switch#
```
show ip bgp summary

The **show ip bgp summary** command displays the summary of all IPv4 and IPv6 BGP neighbors based on exchanged Address Family Identifiers (AFI) and Subsequent Address Family Identifiers (SAFI) negotiations where AFI is ‘IP’ and SAFI is ‘unicast’ information.

**Command Mode**

EXEC

**Command Syntax**

```
show ip bgp summary [VRF_INSTANCE]
```

**Parameters**

- **VRF_INSTANCE** specifies VRF instances.
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Display Values**

**Header Row**

- **BGP router identifier**: The router identifier – loopback address or highest IP address.
- **Local AS Number**: AS number assigned to switch

**Neighbor Table Columns**

- **(First) Neighbor**: Neighbor’s IP address.
- **(Second) V**: BGP version number.
- **(Third) AS**: Neighbor’s AS number.
- **(Fourth) MsgRcvd**: Messages received from the neighbor.
- **(Fifth) MsgSent**: Messages sent to neighbor.
- **(Sixth) InQ**: Messages queued from neighbor.
- **(Seventh) OutQ**: Messages queued to send neighbor.
- **(Eighth) Up/Down**: Period the BGP session has been Established, or its current status.
- **(Ninth) State**: State of the BGP session and the number of routes received from a neighbor.

After the maximum number of routes are received, the ninth field displays **PfxRcd**, and the connection becomes Idle. Maximum number of routes is set using the **maximum paths (BGP)** command.

**Related Commands**

- `show ipv6 bgp summary`

**Example**

- This command displays the status of the switch’s BGP connections.

```
switch#show ip bgp summary
BGP summary information for VRF default
Router identifier 10.0.0.102, local AS number 64500
Neighbor Status Codes: m - Under maintenance
Neighbor V AS MsgRcvd MsgSent InQ OutQ Up/Down State PfxRcd PfxAcc
10.1.0.100 4 64496 1075 1083 0 0 00:04:04 Connect 0 0
10.2.0.101 4 64510 1079 1080 0 0 00:04:14 Connect 0 0
switch#
```
show ip community-list

The `show ip community-list` command displays the BGP community lists configured on the switch.

**Command Mode**

EXEC

**Command Syntax**

```
show ip community-list [COMMUNITY_LIST]
```

**Parameters**

- `COMMUNITY_LIST` community list for which command displays information.
- `<no parameter>` command displays information for all community lists.
- `listname` name of the community list (text string).

**Example**

- This command displays the BGP paths in the switch’s database.

  ```
  switch>show ip community-list hs-comm-list
  ip community-list hs-comm-list permit 0:10
  switch>
  ```
show ip extcommunity-list

The `show ip extcommunity-list` command displays the BGP extended community lists configured on the switch.

**Command Mode**
- EXEC

**Command Syntax**

```
show ip extcommunity-list [COMMUNITY_LIST]
```

**Parameters**
- `COMMUNITY_LIST` extended community list for which command displays information.
- `<no parameter>` command displays information for all extended community lists.
- `listname` name of the extended community list (text string).

**Example**

- This command displays the extended extcommunity lists on the switch.

  ```
  switch>show ip extcommunity-list
  ip extcommunity-list hs-extcomm-list permit rt 3050:20
  ip extcommunity-list hs-extcomm-list permit soo 172.17.52.2:30
  ip extcommunity-list hs-extcomm-list permit rt 3050:70000
  switch>
  ```
**show ipv6 bgp**

The `show ipv6 bgp` command displays IPv6 Border Gateway Protocol (BGP) routing table entries. The output format depends on the command parameters:

- Data block format displays comprehensive information for each specified BGP routing table entry.
- Tabular format displays routing table entries for specified IPv6 addresses.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 bgp [FILTER][VRF_INSTANCE]
```

**Parameters**

- `FILTER` routing table entries that the command displays. Options include:
  - `<no parameter>` displays all routing table entries in tabular format.
  - `detail` displays all routing table entries in data block format.
  - `ipv6_addr` displays IPv6 host address in data block format.
  - `ipv6_prefix` displays the route information of specified IPv6 prefix address in data block format. Options include:
    - `detail` displays the detailed route information of specified IPv6 prefix address in data block format.
    - `longer-prefixes` displays the route information of IPv6 prefix in tabular block format.
    - `longer-prefixes detail` displays the detailed route information of specified IPv6 prefix in data block format.
  - `community-list cmnty_list_name` displays BGP routes filtered by the specified community list.
  - `installed` displays the information of installed BGP routes.
  - `labeled-unicast` displays the information of labeled-unicast BGP routes only.
  - `not-installed` displays the information of BGP routes that are not installed.
- `VRF_INSTANCE` specifies VRF instances. Options include:
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Guidelines**

You must provide the IPv6 prefix in CIDR notation.

**Related Command**

- `show ip bgp`
Examples

- This command displays the route information of 2001:10:1::102/64 in data block format.

```bash
switch#show ipv6 bgp 2001:10:1::102/64
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
BGP routing table entry for 2001:10:1::/64
Paths: 2 available
  Local
    - from - (10.0.0.102)
      Origin IGP, metric 1, localpref 0, IGP metric -, weight -, received 00:16:27 ago, valid, local, best, redistributed (Connected)
      Rx SAFI: Unicast
      64496
    2001:10:1::100 from 2001:10:1::100 (10.0.0.100)
      Origin INCOMPLETE, metric 42, localpref 100, IGP metric 1, weight 0, received 00:10:09 ago, valid, external
      Rx SAFI: Unicast
switch#
```
show ipv6 bgp match community

The `show ipv6 bgp match community` command displays IPv6 Border Gateway Protocol (BGP) routing table entries, filtered by community.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 bgp match community [COMM_1 ... COMM_n][MATCH_TYPE][INFO][VRF_INSTANCE]
```

**Parameters**

- **COMM_x** community number or name, as specified in the route map that sets the community list number. Options include:
  - `aa:nn` AS and network number, separated by colon. Each value ranges from 1 to 4294967295.
  - `comm_num` community number. Values range from 1 to 4294967040.
  - `internet` advertises route to Internet community.
  - `local-as` advertises route only to local peers.
  - `no-advertise` does not advertise route to any peer.
  - `no-export` advertises route only within BGP AS boundary.

- **MATCH_TYPE** routes are filtered based on their communities. Options include:
  - `<no parameter>` routes must match at least one community in the list.
  - `exact` route must match all communities and include no other communities.

- **INFO** type of information the command displays. Values include:
  - `<no parameter>` displays table of the routing entry line items.
  - `detail` displays data block for each routing table entry.

- **VRF_INSTANCE** specifies VRF instances. Options include:
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Example**

This command displays data block for each routing table entry with community 655:23590.

```
switch(config)# show ipv6 bgp match community 655:23590 detail
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
BGP routing table entry for 2001:10:100:1::/64
Paths: 1 available
  64496 64497 65536
  2001:10:1::100 from 2001:10:1::100 (10.0.0.100)
  Origin IGP, metric 0, localpref 100, IGP metric 1, weight 0, received 01:09:29 ago, valid, external, best
  Community: 655:23590 64496:1000
  Rx SAFI: Unicast
```

switch(config)#
show ipv6 bgp peers

The `show ipv6 bgp peers` command displays IPv6 Border Gateway Protocol (BGP) and TCP session data for a specified neighbor. Command displays data for all neighbors if an address is not included.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 bgp peers [NEIGHBOR_ADDR][VRF_INSTANCE]
```

**Parameters**

- `NEIGHBOR_ADDR` location of the neighbors. Options include:
  - `<no parameter>` command displays information for all neighbors.
  - `ipv6_addr` command displays information for specified neighbor.
- `VRF_INSTANCE` specifies VRF instances. Options include:
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Related Commands**

- `show ip bgp peer-group`
Example

- This command displays information of the neighbor at 2001:10:1:0::100.

```bash
switch>show ipv6 bgp peers 2001:10:1:0::100
BGP neighbor is 2001:10:1::100, remote AS 64496, external link
BGP version 4, remote router ID 10.0.0.100, VRF default
Inherits configuration from and member of peer-group EXTERNAL
Negotiated BGP version 4
Member of update group 3
Last read 00:00:01, last write 00:00:01
Hold time is 180, keepalive interval is 60 seconds
Configured hold time is 180, keepalive interval is 60 seconds
Connect timer is inactive
Idle-restart timer is inactive
BGP state is Established, up for 00:12:01
Number of transitions to established: 1
Last state was OpenConfirm
Last event was RecvKeepAlive
Neighbor Capabilities:
  Multiprotocol IPv6 Unicast: advertised and received and negotiated
  Four Octet ASN: advertised and received and negotiated
  Route Refresh: advertised and received and negotiated
  Send End-of-RIB messages: advertised and received and negotiated
Additional-paths recv capability:
  IPv6 Unicast: advertised
Additional-paths send capability:
  IPv6 Unicast: received
Restart timer is inactive
End of rib timer is inactive
Message Statistics:
  InQ depth is 0
  OutQ depth is 0

switch>
show ipv6 bgp peers (route type)

The **show ipv6 bgp peers (route type)** command displays information about the routes either advertised to or received from a specified IPv6 BGP neighbor. The **show ipv6 bgp peers (route type) community** command displays the same information for routes filtered by communities. Commands that do not include a route type revert to the **show ipv6 bgp peers** command.

The output format depends on the selected **FILTER** parameter:
- Data block format displays comprehensive information for each specified route.
- Tabular format displays routing table entries in tabular format for the specified IP addresses.

Output produced by the **longer-prefixes** option includes the specified route and all more specific routes.

**Command Mode**
EXEC

**Command Syntax**
```
show ipv6 bgp peers neighbor_addr HOPDIRECT [FILTER] [VRF_INSTANCE]
show ipv6 bgp peers neighbor_addr [ROUTE_TYPE] HOPDIRECT
show ipv6 bgp peers neighbor_addr [ROUTE_TYPE] HOPDIRECT detail
```

**Parameters**
- **neighbor_addr** location of the neighbor.
- **ROUTE_TYPE** filters route on route type. Options include:
  - **ipv4 unicast** displays IPv4 unicast routes.
  - **ipv6 unicast** displays IPv6 unicast routes.
- **HOPDIRECT** filters route on the basis of direction from neighbor. Options include:
  - **advertised-routes** displays routes advertised to the specified neighbor.
  - **received-routes** displays routes received from the specified neighbor (accepted and rejected).
  - **routes** displays routes received and accepted from specified neighbor.
- **FILTER** routing table entries that the command displays. Values include:
  - **<no parameter>** displays all routing table entries. Tabular format.
  - **detail** displays all routing table entries. Data block format.
  - **ipv6_addr** displays the IPv6 host address in data block format.
  - **ipv6_prefix** displays the route information of specified IPv6 prefix in data block format. Option includes:
    - **longer-prefixes** displays the route information of IPv4 prefix in tabular block format.
- **VRF_INSTANCE** specifies VRF instances. Options include:
  - **<no parameter>** displays routing table for context-active VRF.
  - **vrf vrf_name** displays routing table for the specified VRF.
  - **vrf all** displays routing table for all VRFs.
  - **vrf default** displays routing table for default VRF.

**Related Commands**
- **show ipv6 bgp peers (route type) community**
Example

- This command displays information of all routes advertised to the neighbor at 2001:10:1:0::100.

switch# show ipv6 bgp peers 2001:10:1:0::100 advertised-routes
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e - ECMP
S - Stale, c - Contributing to ECMP, b - backup, l - labeled-unicast
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop

switch#
**show ipv6 bgp peers (route type) community**

The `show ipv6 bgp peers (route type) community` command displays information about the routes either advertised to or received from a specified IPv6 BGP neighbor. The routes are filtered by community.

The `show ipv6 bgp peers (route type)` command displays the same information for routes filtered by IP addresses and prefixes.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 bgp peers adr RTE community CM_1 [CM_2..CM_n][MATCH][INFO][VRF_INST]
```

**Parameters**

- `adr` Neighbor location (IPv6 address).
- `RTE` type of route that the command displays. Options include:
  - `advertised-routes` displays routes advertised to the specified neighbor.
  - `received-routes` displays routes received from the specified neighbor (accepted and rejected).
  - `routes` displays routes received and accepted from specified neighbor.
- `CM_x` community number or name, as specified in the route map that sets the community list number. The command must list at least one of the following community identifiers:
  - `GSHUT` well-known graceful shutdown community.
  - `aa:nn` AS and network number, separated by colon. Each value ranges from 1 to 4294967295.
  - `comm_num` community number. Values range from 1 to 4294967040.
  - `internet` advertises route to Internet community.
  - `local-as` advertises route only to local peers.
  - `no-advertise` does not advertise route to any peer.
  - `no-export` advertises route only within BGP AS boundary.
- `MATCH` Routes are filtered based on their communities. Options include:
  - `<no parameter>` routes must match at least one community in the list
  - `exact` route must match all communities and include no other communities.
- `INFO` Type of information the command displays. Values include:
  - `<no parameter>` Displays table of the routing entry line items.
  - `detail` Displays data block for each routing table entry.
- `VRF_INST` specifies VRF instances. Options include:
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Related Commands**

- `show ipv6 bgp peers`
Example

- This command lists the routes advertised to the neighbor at 2001:10:1:0::102 with the community 64496:1000.

```bash
switch>show ipv6 bgp peers 2001:10:1:0:102 advertised-routes community 64496:1000

BGP routing table information for VRF default
Router identifier 10.0.0.100, local AS number 64496
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e - ECMP
S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop

Network                Next Hop            Metric  LocPref Weight  Path
* >     2001:10:100:1::/64     2001:10:1::100        -       -       -       64496 64497 65536 i
```

switch>
show ipv6 bgp peers regexp

The `show ipv6 bgp peers regexp` command displays information about routes (advertised or received) from a specified IPv6 neighbor that match the AS path attributes specified in the given regular expression.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 bgp peers addr RTE regexp as_paths [VRF_INST]
```

**Parameters**

- **addr** Neighbor location (IPv6 address).
- **RTE** type of route that the command displays. Options include:
  - **advertised-routes** displays routes advertised to the specified neighbor.
  - **received-routes** displays routes received from the specified neighbor (accepted and rejected).
  - **routes** displays routes received and accepted from specified neighbor.
- **as_paths** list of AS paths, formatted as a regular expression. Regular expressions are pattern matching strings that are composed of text characters and operators.
- **VRF_INST** specifies VRF instances. Options include:
  - `<no parameter>` displays routing table for context-active VRF.
  - **vrf vrf_name** displays routing table for the specified VRF.
  - **vrf all** displays routing table for all VRFs.
  - **vrf default** displays routing table for default VRF.

**Related Command**

- `show ip bgp regexp`
- `show ipv6 bgp peers`

**Examples**

- This command displays information of routes received from the neighbor at 2001:10:1:0::100 which include AS number 64496 in their AS paths.

```
switch>show ipv6 bgp peers 2001:10:1::100 received-routes regex 64496
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e - ECMP S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop

```

switch>
**show ipv6 bgp regexp**

The `show ipv6 bgp regexp` command displays Border Gateway Protocol (BGP) IPv6 routing table entries that match the AS path attributes specified in the given regular expression.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 bgp regexp as_paths [VRF_INSTANCE]
```

**Parameters**

- `as_paths` list of AS paths, formatted as a regular expression. Regular expressions are pattern matching strings that are composed of text characters and operators.
- `VRF_INSTANCE` specifies the VRF instance of the BGP routing table to be displayed. Options include:
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Related Command**

- `show ip bgp regexp`

**Examples**

- This command displays information about the BGP IPv6 routes in the context-active VRF that pass through AS 64496.

```
switch>show ipv6 bgp regexp _64496_
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e - ECMP
S - Stale, c - Contributing to ECMP, b - backup, L = labeled-unicast
% - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST -Cluster List, LL Nexthop - Link Local Nexthop

</tr>
</tbody>
</table>
```

switch>
show ipv6 bgp summary

The `show ipv6 bgp summary` command displays the summary of all IPv4 and IPv6 BGP neighbors based on exchanged Address Family Identifiers (AFI) and Subsequent Address Family Identifiers (SAFI) negotiations where AFI is ‘IPv6’ and SAFI is ‘Unicast’ information.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 bgp summary [VRF_INSTANCE]
```

**Parameters**

- `VRF_INSTANCE` specifies VRF instances. Options include:
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Display Values**

**Header Row**

- **BGP router identifier**: The router identifier - loopback address or highest IP address.
- **Local AS Number**: AS number assigned to switch.

**Neighbor Table Columns**

- **(First) Neighbor**: Neighbor's IP address.
- **(Second) V**: BGP version number.
- **(Third) AS**: Neighbor's AS number.
- **(Fourth) MsgRcvd**: Messages received from the neighbor.
- **(Fifth) MsgSent**: Messages sent to neighbor.
- **(Sixth) InQ**: Messages queued from neighbor.
- **(Seventh) OutQ**: Messages queued to send neighbor.
- **(Eighth) Up/Down**: Period the BGP session has been Established, or its current status.
- **(Ninth) State**: State of the BGP session and the number of routes received from a neighbor.
- **(Tenth) PfxRcd**: The count of prefixes received by BGP per neighbor.
- **(Eleventh) PfxAcc**: The count of prefixes added to the BGP RIB among all received prefixes.

**Related Commands**

- `show ip bgp summary`

**Example**

```
switch>show ipv6 bgp summary
BGP summary information for VRF default
Router identifier 10.0.0.102, local AS number 64500
Neighbor Status Codes: m - Under maintenance
Neighbor        V  AS    MsgRcvd  MsgSent  InQ  OutQ  Up/Down State  PfxRcd  PfxAcc
2001:10:1::100  4  64496  37      36      0    0    00:29:33 Estab    4     4
2001:10:1::101  4  64510  35      38      0    0    00:29:37 Estab    4     4
switch>
```
show peer-filter

The `show peer-filter` command displays the definition of a peer filter.

**Command Mode**

  EXEC

**Command Syntax**

  `show peer-filter filter_name`

**Parameters**

- `filter_name` name of the peer filter group.

**Example**

- This command displays the peer-filter group information.

```
switch#show peer-filter group3
peer-filter group3
  10 match as-range 65003 result accept
  20 match as-range 65007 result accept
  30 match as-range 65009 result accept
```
show tunnel rib brief

The `show tunnel rib brief` command display the preferred tunnels for various IP endpoints, optionally filtered by endpoint. Each tunnel RIB entry in the output displays the type of the tunnel (such as BGP LU) and a numerical index uniquely identifying that tunnel within the type-specific tunnel table.

**Command Mode**

EXEC

**Command Syntax**

```
show bgp tunnel rib brief
```

**Example**

- This command displays the tunnel type and the index value.

```
Arista#show tunnel rib brief
Endpoint          Tunnel Type       Indexes
----------------- ----------------- -------
10.1.1.0/32       BGP LU            2
11.1.1.0/32       BGP LU            1, 3
```
shutdown (BGP)

The `shutdown` command disables BGP on the switch without modifying the BGP configuration. The `no shutdown` and `default shutdown` commands enable the BGP instance by removing the `shutdown` command from `running-config`.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```plaintext
shutdown
no shutdown
default shutdown
```

**Examples**

- This command disables BGP on the switch.
  ```
  switch(config)#router bgp 9
  switch(config-router-bgp)#shutdown
  switch(config-router-bgp)#
  ```

- This command enables BGP on the switch.
  ```
  switch(config)#router bgp 9
  switch(config-router-bgp)#no shutdown
  switch(config-router-bgp)#
  ```
**timers bgp**

The `timers bgp` command configures the BGP keepalive and hold times. Timer settings apply to each peer connection. The `neighbor timers` command configures the times on a specified peer connection.

- Keepalive time: period between the transmission of consecutive keepalive messages.
- Hold time: period the switch waits for a keepalive or UPDATE message before it disables peering.

The hold time must be at least 3 seconds and should be three times longer than the keepalive setting.

The `no timers bgp` and `default timers bgp` commands return the time settings to their default values by removing the `timers bgp` command from `running-config`.

- keepalive: 60 seconds
- hold time: 180 seconds

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
timers bgp keep_alive hold_time
no timers bgp
default timers bgp
```

**Parameters**

- `keep_alive` keepalive period, in seconds. Values include
  - 0 keepalive messages are not sent
  - 1 to 3600 keepalive time (seconds).
- `hold_time` hold time. Values include
  - 0 peering is not disabled by timeout expiry; keepalive packets are not sent.
  - 3 to 7200 hold time (seconds).

**Example**

- This command sets the keepalive time to 30 seconds and the hold time to 90 seconds.

```
switch(config)#router bgp 9
switch(config-router-bgp)#timers bgp 30 90
switch(config-router-bgp)#
```
update wait-for-convergence

The **update wait-for-convergence** command disables FIB update and route advertisement when the BGP instance is initiated until the BGP convergence state is reached.

The **no update wait-for-convergence** command allows FIB update and route advertisement irrespective of the BGP convergence state.

**Command Mode**
- Router-BGP Configuration

**Command Syntax**
- update wait-for-convergence
- no update wait-for-convergence
- default update wait-for-convergence

**Related Commands**
- `clear ip bgp` removes learned BGP routes from the routing table, reads all routes from designated peers, and sends routes to those peers as required.
- `bgp convergence slow-peer time` configures the BGP convergence idle peer timeout value.
- `bgp convergence time` configures the BGP convergence timeout value.
- `show bgp convergence` displays information about the BGP convergence state; and other statistics about the BGP instance in either the specified VRF or all VRFs.

**Guidelines**

The initiation of BGP instance includes the following scenarios:

- The BGP instance starts for the first time after a switch is reloaded
- The BGP instance restarts
- All sessions are cleared by using the `clear ip bgp *` command

Configuration changes made by using this command are effective from the next initiation of BGP instance.

**Example**

- This command disables FIB update and route advertisement when the BGP instance is initiated until the BGP convergence state is reached.

  ```
  switch(config)#router bgp 9
  switch(config-router-bgp)#update wait-for-convergence
  switch(config-router-bgp)#
  ```
**vrf**

The `vrf` command places the switch in BGP VRF configuration mode for the specified VRF. Commands issued in this mode will override global BGP configuration for the specified VRF.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
vrf vrf_instance
```

**Parameters**

- `vrf_instance` VRF to be configured.

**Example**

- These commands place the switch in BGP VRF configuration mode for VRF “purple.”

```
switch(config)#router bgp 9
switch(config-router-bgp)#vrf purple
switch(config-router-bgp-vrf-purple)#
```
Routing Information Protocol

This chapter contains the following sections.

- Section 34.1: RIP Conceptual Overview
- Section 34.2: Running RIP on the Switch
- Section 34.3: Configuring RIP on Multiple VRFs
- Section 34.4: RIP Commands

34.1 RIP Conceptual Overview

Routing Information Protocol (RIP) is a routing protocol typically used as an interior gateway protocol (IGP). RIP uses hop counts only to determine the shortest path to a destination. To avoid loops, RIP limits its paths to a maximum of 15 hops, making it an ineffective protocol for large networks. RIP Version 2 supports Classless Inter-Domain Routing (CIDR) and uses IP multicast at address 224.0.0.9 to share the routing table with adjacent routers.

RIP sends updates whenever there is a change in the network topology and periodic updates when there are no changes. Receiving switches update their routing table whenever the update includes topology changes. Because RIP transmits the entire routing table every 30 seconds, RIP updates can generate heavy traffic loads in large or complicated networks.

Each switch also sends a list of distance-vectors to each of its neighbors periodically. The distance-vector is the metric RIP uses to express the cost of a route, and it describes the number of hops required to reach a destination. Each hop is typically assigned a hop count value of 1, and the router adds 1 to the metric when it receives a routing update and adds the network to its routing table.

To remove dead routes from its routing table, RIP marks a route for deletion if the router does not receive an advertisement for it within the expiration interval, then removes it from the routing table after the deletion interval.
34.2 Running RIP on the Switch

34.2.1 Accessing RIP Configuration Mode and Enabling RIP

34.2.1.1 RIP Configuration Mode

The `router rip` command places the switch in router-RIP configuration mode to configure the Routing Information Protocol (RIP) routing.

**Example**

- This command places the switch in router-rip configuration mode.

  ```
  switch(config)#router rip
  switch(config-router-rip)#
  ```

Using the `router rip` command puts the switch in router-RIP configuration mode, but does not enable RIP on the switch.

34.2.1.2 Enabling RIP

Routing Information Protocol (RIP) is disabled on the switch by default. The `no shutdown (RIP)` command in router-RIP configuration mode will enable RIP.

**Example**

- This command enables RIP on the switch.

  ```
  switch(config-router-rip)#no shutdown
  switch(config-router-rip)#
  ```

Issuing this command enables RIP, but to send and receive RIP route updates and to route packets via RIP you must also specify interfaces on which RIP will run by using the `network (RIP)` command.

34.2.1.3 Disabling RIP

You can disable RIP in two ways. The `shutdown (RIP)` command disables RIP on the switch but maintains all user-entered router-RIP configuration statements in the `running-config`. The `no router rip` command disables RIP and removes all user-entered router-RIP configuration statements from the `running-config`.

**Examples**

- This command disables RIP on the switch and removes all user-entered router-RIP configuration.

  ```
  switch(config)#no router rip
  switch(config)#
  ```

- This command disables RIP on the switch, but preserves all user-entered router-RIP configuration.

  ```
  switch(config-router-rip)#shutdown
  switch(config-router-rip)#
  ```

34.2.2 Configuring RIP

Issuing the `no shutdown (RIP)` command in router-RIP configuration mode enables RIP, but to run RIP on an interface you must specify a RIP network by using the `network (RIP)` command.

You can also configure the redistribution of routes learned from other protocols, set the default metric and administrative distance for redistributed routes, configure the timing of various RIP events, and configure specific interfaces to send RIP update packets by broadcast instead of multicast.
34.2.2.1 Specifying RIP Networks

The `network (RIP)` command identifies networks on which RIP will run and also specifies which routes RIP will accept into its routing table. You can issue the `network (RIP)` command multiple times to build up a list of RIP networks. No RIP networks are configured by default, so in order to route packets and send and receive RIP updates you must specify one or more RIP networks.

To disable RIP on a specific network, use the `no network (RIP)` command.

**Examples**

- This command enables RIP on 10.168.1.1/24
  
  ```
  switch(config-router-rip)#network 10.168.1.1/24
  switch(config-router-rip)#
  ```

- This command disables RIP on 10.168.1.1/24
  
  ```
  switch(config-router-rip)#no network 10.168.1.1/24
  switch(config-router-rip)#
  ```

34.2.2.2 Redistributing Routes Learned from Other Protocols into RIP

To enable route import from a specified protocol into RIP, use the `redistribute (RIP)` command. Additionally, you can apply a route map to the incoming routes to filter which routes are added to the RIP routing table. All connected routes are redistributed into RIP by default.

**Example**

- This command redistributes all routes learned from OSPF into RIP.
  
  ```
  switch(config-router-rip)#redistribute OSPF
  switch(config-router-rip)#
  ```

34.2.2.3 Configuring RIP Timers

When RIP is running on the switch, it sends unsolicited route updates and deletes expired routes at regular intervals. To configure the timing of those events, use the `timers (RIP)` command. The command takes three parameters: the update interval, the route expiration time, and the route deletion time.

The update interval is the amount of time in seconds that the switch waits between sending unsolicited RIP route updates to its neighbors. The route expiration time is how long the switch waits before marking an unadvertised route for deletion (the counter resets whenever an advertisement for the route is received). And the route deletion time is how long the switch waits between marking a route for deletion and removing it from the routing table. During the deletion interval, the switch continues to forward packets on the route.

**Example**

- This command sets the update interval to 60 seconds, expiration time to 90 seconds, and deletion time to 150 seconds.
  
  ```
  switch(config-router-rip)#timers 60 90 150
  switch(config-router-rip)#
  ```

34.2.2.4 Configuring an Interface to Transmit Broadcast RIP Updates

By default, the switch uses RIP version 2 and multicasts RIP update packets from all participating interfaces. To reconfigure a specific interface to send updates as broadcast packets, use the `rip v2 multicast disable` command in the configuration mode for the interface.
Example

- The following commands configure RIP version 2 broadcasting on interface Ethernet 5.

  ```
  switch(config)#interface ethernet5
  switch(config-if-Et5)#rip v2 multicast disable
  switch(config-if-Et5)#exit
  switch(config)#
  ```

34.2.3 Displaying RIP Information

34.2.3.1 Displaying RIP Routes

To see a listing of the RIP routes in the switch’s routing table, use the `show ip rip database` command. (You can also display similar information using the RIP option in the `show ip route` command)

Examples

- This command displays all active rip routes.

  ```
  switch>show ip rip database
  10.168.11.0/24 directly connected, Et4
  10.168.13.0/24
  [1] via 10.168.14.2, 00:00:25, Et4
  [2] via 10.168.15.2, 00:00:20, Et1
  10.168.13.0/24
  [1] via 10.168.14.2, 00:00:25, Et3
  ```

- This command submits a query for RIP route information for a network.

  ```
  switch>show ip rip database 10.168.13.0/16
  10.168.13.0/24
  [1] via 10.168.14.2, 00:00:25, Et4
  [2] via 10.168.15.2, 00:00:20, Et1
  ```

34.2.3.2 Displaying RIP Route Gateways

To see information about the switch’s RIP route gateways, use the `show ip rip neighbors` command. The output displays the IPv4 address, the last heard time of the gateway, and characteristic flags applying to the gateway.

Example

- This command displays information about all the gateways of RIP routes.

  ```
  switch>show ip rip neighbors
  Gateway     Last-Heard     Bad-Packets Bad-Routes Flags
  10.2.12.33   00:00:15 SRC, TRSTED, ACCEPTED, RJCTED, Q_RBCTED, AUTHFAIL
  ```
Chapter 34: Routing Information Protocol

34.3 Configuring RIP on Multiple VRFs

VRF support for Routing Information Protocol (RIP) allows instances of RIP on multiple non-default VRFs on the same router. By default, all interfaces belong to the default VRF until VRF forwarding is executed.

The `vrf instance` and `vrf (Interface mode)` commands configure a non-default VRF, enable routing in it, and configure the network command under the configuration router RIP for the prefix to which the interface belongs.

The `router rip vrf` command places the switch in router-RIP configuration mode to configure a RIP routing instance in a non-default VRF.

**Examples**

- These commands configure a non-default VRF and enable unicast routing in it.

  switch(config)#vrf instance test
  switch(config-vrf-test)#exit
  switch(config)#ip routing vrf test
  switch(config)#

- This command configures a RIP instance in a non-default VRF.

  switch(config)#router rip vrf test
  switch(config-router-rip-router-rip-vrf-test)#no shutdown
  switch(config-router-rip-router-rip-vrf-test)#exit
  switch(config)#

- This command configures an interface as part of a non-default VRF by configuring the network command under the configuration router RIP for the prefix to which the interface belongs.

  switch(config)#interface Ethernet 3 / 1
  switch(config-if-Et3/1)#no switchport
  switch(config-if-Et3/1)#ip address 1.0.0.1/24
  switch(config-if-Et3/1)#vrf test
  switch(config-if-Et3/1)#network 1.0.0.1
  switch(config-if-Et3/1)#exit
  switch(config)#
34.4 RIP Commands

Global Configuration Commands
- `router rip`
- `router rip vrf`

Interface Configuration Commands
- `rip v2 multicast disable`

Router-RIP Configuration Mode
- `distance (RIP)`
- `distribute-list (RIP)`
- `metric default`
- `network (RIP)`
- `redistribute (RIP)`
- `shutdown (RIP)`
- `timers (RIP)`

Display Commands – EXEC Mode
- `show ip rip database`
- `show ip rip neighbors`
distance (RIP)

The `distance` command assigns an administrative distance to routes that the switch learns through RIP. Routers use administrative distances to select a route when two protocols provide routing information to the same destination. Distance values range from 1 to 255; lower distance values correspond to higher reliability. The default RIP distance value is 120.

The `no distance` and `default distance` commands restore the administrative distance default value of 120 by removing the `distance` command from `running-config`.

**Command Mode**

Router-RIP Configuration

**Command Syntax**

```
distance distance_value
no distance
default distance
```

**Parameters**

- `distance_value` distance assigned to RIP routes. Values range from 1 to 255.

**Examples**

- These commands assign an administrative distance of 75 to RIP routes.

```
switch(config)#router rip
switch(config-router-rip)#distance 75
switch(config-router-rip)#
```

distribute-list (RIP)

The distribute-list command allows users to filter out routes that are received or sent out. The distribute-list command influences which routes the router installs into its routing table and advertises to its neighbors.

Configuration Notes:

- Only one inbound distribute-list is allowed per interface.
- Only one outbound distribute-list is allowed per interface.
- Only one globally-defined inbound distribute-list is allowed.
- Only one globally-defined outbound distribute-list is allowed.
- Not all match clauses in a route-map are supported using RIP routes filtering. These match clauses for distribute-lists are supported:
  - match ip address access-list
  - match ip address prefix-list
- The distribute-list command does not enforce the specified route-map to contain only supported match clauses.
- Permit or deny can be specified in both prefix/access list and route-map configurations. The following rules apply when filtering routes:
  - Routes permitted by the prefix/access lists are treated as matched.
  - Matched routes are filtered based on the permit or deny option configured for the route-map clause.
  - Unmatched routes are further evaluated by the next route-map clause.
  - If a route does not match any clause in a route-map, it is denied.
  - If the route-map given in the distribute-list command is not configured, then all routes are permitted.
  - When multiple inbound (or outbound) distribute-lists are configured, only the most specific one is applied.

The no distribute-list and default distribute-list commands remove the corresponding distribute-list command from running-config.

Command Mode

Router-RIP Configuration

Command Syntax

distribute-list DIRECTION MAP [INTF]
no distribute-list DIRECTION MAP [INTF]
default distribute-list DIRECTION MAP [INTF]

Parameters

- **DIRECTION**  
  direction specifies if distribute-list is applied on inbound or outbound traffic. Valid options include:
  - in  specifies inbound as the direction the distribute-list is applied.
  - out specifies outbound as the direction the distribute-list is applied.
- **MAP**  
  specifies route map that assigns attribute values to the network. Options include:
  - <no parameter> attributes are not assigned through a route map.
  - route-map map_name attributes listed by specified route map are assigned to the network.
• **INTF**  interface to be configured. Options include:
  • **ethernet e_num**  Ethernet interface.
  • **loopback l_num**  Loopback interface.
  • **port-channel p_num**  Port channel interface.
  • **vlan v_num**  VLAN interface.

**Example**

• The following commands demonstrate that an access-list or prefix-list can be used within a route-map for use in a distribute-list.

```
switch(config)#ip prefix-list 8to24 seq 5 permit 0.0.0.0/0 ge 8 le 24
switch(config)#route-map myRouteMap permit 10
switch(config-route-map-myRouteMap)#match ip address prefix-list 8to24
switch(config-route-map-myRouteMap)#exit
switch(config)#router rip
switch(config-router-rip)#distribute-list in route-map myRouteMap
```

• These commands suppress routes advertised on a particular interface.

```
switch(config)#ip prefix-list 2 seq 10 deny 30.1.1.0/24
switch(config)#route-map myRmOut permit 10
switch(config-route-map-myRmOut)#match ip address prefix-list 2
switch(config-route-map-myRouteMap)#exit
switch(config)#router rip
switch(config-router-rip)# distribute-list out route-map myRmOut
```
**metric default**

The `metric default` command specifies the metric value assigned to RIP routes learned from other protocols. All routes imported into RIP receive the default metric unless a matching route-map exists for the route. The route metric of 0 is assigned to redistributed connected and static routes. The default metric values range from 0 to 16 with a default value of 1.

The `no metric default` and `default metric default` commands remove the `metric default` command from `running-config` and returns the metric value to its default value of 1.

**Command Mode**
Router-RIP Configuration

**Command Syntax**

```
metric default metric_value
no metric default
default metric default
```

**Parameters**
- `metric_value`  default metric value assigned. Values range from 0 to 16; default is 1.

**Example**
- This command sets the default metric value to five.
  ```
  switch(config)#router rip
  switch(config-router-rip)#metric default 5
  switch(config-router-rip)#
  ```
network (RIP)

The `network` command specifies which network the switch runs Routing Information Protocol (RIP), and also specifies which routes will be accepted into the RIP routing table. Multiple network commands can be issued to create a network list on which RIP runs.

The switch enables RIP on all interfaces in the specified network.

The `no network` and `default network` commands disable RIP on the specified network by removing the corresponding `network` command from `running-config`.

**Command Mode**
Router-RIP Configuration

**Command Syntax**

```
network NETWORK_ADDRESS
no network NETWORK_ADDRESS
default network NETWORK_ADDRESS
```

**Parameters**

- `NETWORK_ADDRESS` network IP address. Entry formats include the following:
  - `ipv4_subnet` IPv4 subnet (CIDR notation).
  - `ipv4_addr mask wildcard_mask` IP address and wildcard-mask.

**Examples**

- This command enables RIP on 10.168.1.1/24
  
  ```
  switch(config)# router rip
  switch(config-router-rip)# network 10.168.1.1/24
  switch(config-router-rip)#
  ```

- This command also enables RIP on 10.168.1.1/24
  
  ```
  switch(config-router-rip)# network 10.168.1.1 mask 0.0.0.255
  switch(config-router-rip)#
  ```
**redistribute (RIP)**

The `redistribute` command enables the importing of routes from a specified routing domain to RIP.

- **connected** by default, RIP redistributes all connected routes that are established when IP is enabled on an interface. The route-map parameter facilitates the exclusion of connected routes from redistribution by specifying a route map that denies the excluded routes.

- **BGP, OSPF, and IP static routes** by default, routes are not redistributed. The redistribution command without the route-map parameter facilitates the redistribution of all routes from the specified source.

The `no redistribute` and `default redistribute` commands reset the default route redistribution setting by removing the `redistribute` statement from `running-config`.

**Command Mode**

Router-RIP Configuration

**Command Syntax**

```
redistribute connected ROUTE_MAP
redistribute ROUTE_TYPE [ROUTE_MAP]
no redistribute connected ROUTE_MAP
no redistribute ROUTE_TYPE
default redistribute connected ROUTE_MAP
default redistribute ROUTE_TYPE
```

**Parameters**

- **ROUTE_TYPE** source from which routes are redistributed. Options include:
  - **BGP** routes from a BGP domain.
  - **OSPF** routes from an OSPF domain.
  - **OSPF match external** Routes external to RIP, but imported from OSPF.
  - **OSPF match internal** OSPF routes that are internal to the AS.
  - **static** IP static routes.

- **ROUTE_MAP** route map that determines the routes that are redistributed. Options include:
  - `<no parameter>` all routes are redistributed.
  - `route-map map_name` only routes in the specified route map are redistributed.

**Example**

- These commands redistribute OSPF routes into RIP.

  ```
  switch(config)#router rip
  switch(config-router-rip)#redistribute OSPF
  switch(config-router-rip)#
  ```
**rip v2 multicast disable**

The `rip v2 multicast disable` command specifies the transmission of Routing Information Protocol (RIP) Version 2 update packets from the configuration mode interface as broadcast to 255.255.255.255.

The `no rip v2 multicast disable` and `default rip v2 multicast disable` commands specify the transmission of update packets as multicast to 224.0.0.9 if the configuration mode interface is multicast capable. Updates are broadcast if the interface is not multicast capable.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `rip v2 multicast disable`
- `no rip v2 multicast disable`
- `default rip v2 multicast disable`

**Example**
- The following example configures version 2 broadcasting on interface Ethernet 5.

```bash
switch(config)#interface ethernet 5
switch(config-if-Et5)#rip v2 multicast disable
switch(config-if-Et5)#exit
switch(config)#
```
**router rip**

The `router rip` command places the switch in router-rip configuration mode to configure the Routing Information Protocol (RIP) routing process. Router-rip configuration mode is not a group change mode; `running-config` is changed immediately upon command entry. The `exit` command does not affect `running-config`.

The `no router rip` and `default router rip` commands disable RIP and remove all user-entered `router-rip` configuration statements from `running-config`. To disable RIP without removing configuration statements, use the `shutdown (RIP)` command.

The `exit` command returns the switch to global configuration mode.

**Command Mode**

Global Configuration

**Command Syntax**

```
router rip
no router rip
default router rip
```

**Commands Available in router-rip Configuration Mode**

- `distance (RIP)`
- `distance (RIP)`
- `network (RIP)`
- `redistribute (RIP)`
- `shutdown (RIP)`
- `timers (RIP)`

**Example**

- This command places the switch in router-rip configuration mode.

```
switch(config)#router rip
switch(config-router-rip)#
```
router rip vrf

The `router rip` command places the switch in router-RIP configuration mode to configure an RIP routing instance in the non-default VRF.

The `no router rip vrf` and `default router rip vrf` commands disable an RIP routing instance in the non-default VRF, and remove all user-entered `router-rip` configuration statements from `running-config`. To disable RIP without removing configuration statements, use the `shutdown (RIP)` command.

The `exit` command returns the switch to global configuration mode.

**Command Mode**

- Global Configuration

**Command Syntax**

```
router rip vrf [RIP_INSTANCE]
no router rip vrf [RIP_INSTANCE]
default router rip vrf [RIP_INSTANCE]
```

**Parameters**

- `RIP_INSTANCE` configure a RIP VRF instance in the non-default VRF:

**Example**

- This command configures a RIP instance in the non-default VRF.

  ```
  switch(config)#router rip vrf test
  switch(config-router-rip-router-rip-vrf-test)#no shutdown
  switch(config-router-rip)#exit
  switch(config)#
  ```

- This command disables a RIP instance in the non-default VRF.

  ```
  switch(config)#no router rip vrf test
  switch(config)#
  ```
show ip rip database

The `show ip rip database` command displays information about routes in the Routing Information Base. The default command displays active routes and learned routes not used in deference to higher priority routes from other protocols.

This command has the following forms:

- default (no arguments): information about all RIP routes.
- IPv4 address and mask: information about the referenced addresses
- `active`: information about routes not superseded by routes from other protocols.

**Command Mode**

EXEC

**Command Syntax**

```
show ip rip database [FILTER]
```

**Parameters**

- **FILTER** routing table entries that the command displays. Values include:
  - `<no parameter>` displays all routing table entries
  - `active` displays all active routing table entries.
  - `net_addr` subnet address (CIDR or address-mask). Command displays entries in this subnet.

**Examples**

- This command displays all active rip routes.
  ```
switch>show ip rip database active
  10.168.11.0/24 directly connected, Et4
  10.168.13.0/24
  [1] via 10.168.14.2, 00:00:25, Et4
  [2] via 10.168.15.2, 00:00:20, Et1
  10.168.13.0/24
  [1] via 10.168.14.2, 00:00:25, Et3
  ```

- This command submits a query for RIP route information for a network.
  ```
switch>show ip rip database 10.168.13.0/16
  10.168.13.0/24
  [1] via 10.168.14.2, 00:00:25, Et4
  [2] via 10.168.15.2, 00:00:20, Et1
  ```

- This command returns information for all RIP routes.
  ```
switch>show ip rip database
  10.1.0.0/255.255.255.0
  [1] via 10.8.31.15, 00:00:21, Et2, holddown
  10.2.0.0/255.255.255.0
  [1] via 10.8.31.15, 00:00:21, Et2, holddown
  10.3.0.0/255.255.255.0
  [1] via 10.8.31.15, 00:00:21, Et2, inactive
  10.212.0.0/255.255.255.0
  [1] via 10.8.31.15, 00:00:21, Et2, active
  10.214.0.0/255.255.255.0
  [1] via 10.8.12.17, 00:00:30, Et4, active
  ```
show ip rip neighbors

The `show ip rip neighbors` command displays information about all RIP route gateways. The output displays the IPv4 address, the last heard time of the gateway, and characteristic flags applying to the gateway.

Command Mode

EXEC

Command Syntax

`show ip rip neighbors`

Example

- The `show ip rip neighbors` command displays information about all gateways of RIP routes.

```
switch>show ip rip neighbors
Gateway     Last-Heard      Bad-Packets     Bad-Routes     Flags
10.2.12.33  00:00:15 SRC, TRSTED, ACCPTED, RJCTED, Q_RJCTED, AUTHFAIL
```
**shutdown (RIP)**

The `shutdown` command disables RIP on the switch without modifying the RIP configuration. RIP is disabled by default.

The `no shutdown` command enables RIP. The `default shutdown` command disables RIP.

**Command Mode**

- **Router-RIP Configuration**

**Command Syntax**

```
shutdown
no shutdown
default shutdown
```

**Examples**

- This command disables RIP on the switch.
  
  ```
  switch(config)#router rip
  switch(config-router-rip)#shutdown
  switch(config-router-rip)#
  ```

- This command enables RIP on the switch.
  
  ```
  switch(config-router-rip)#no shutdown
  switch(config-router-rip)#
  ```
timers (RIP)

The `timers` command configures the update interval, the expiration time, and the deletion time for routes received and sent through RIP. The command requires value declaration of all values.

- The update time is the interval between unsolicited route responses.
- The expiration time is initialized when a route is established and any time an update is received for the route.
- The deletion time is initialized when the expiration time elapses and the route is invalid. It is retained in the routing table until deletion time expiry.

The `no timers` and `default timers` commands return the timer values to their default values by removing the `timers` command from `running-config`.

**Command Mode**

Router-RIP Configuration

**Command Syntax**

```
timers  update_time  expire_time  deletion_time
no timers
default timers
```

**Parameters**

- `update_time` Default is 30 seconds
- `expire_time` Default is 180 seconds.
- `deletion_time` Default is 120 seconds.

Parameter values are in seconds and range from 5 to 2147483647.

**Example**

- This command sets the update (60 seconds), expiration (90 seconds), and deletion (150 seconds) times.

  ```
  switch(config)#router rip
  switch(config-router-rip)#timers 60 90 150
  switch(config-router-rip)#
  ```
IS-IS

Intermediate System-to-Intermediate System (IS-IS) intra-domain routing information exchange protocol is designed by the International Organization for Standardization to support connectionless networking. This protocol is a dynamic routing protocol.

This chapter contains the following sections.

- Section 35.1: IS-IS Introduction
- Section 35.2: IS-IS
- Section 35.3: IS-IS Segment Routing
- Section 35.4: IS-IS Graceful Restart
- Section 35.5: IS-IS Commands

35.1 IS-IS Introduction

IS-IS is a link-state protocol, which uses the shortest path first (SPF) algorithm. IS-IS and the OSPF protocol are similar in many aspects. As an interior gateway protocol (IGP), IS-IS runs inside an AS. To enable IS-IS, you must instantiate an IS-IS routing instance and assign it to an interface.

35.2 IS-IS

These sections describe IS-IS configuration tasks:

- Section 35.2.1: Enabling IS-IS
- Section 35.2.2: IS-IS Optional Global Parameters
- Section 35.2.3: IS-IS Interface Optional Parameters
- Section 35.2.4: Disabling IS-IS
- Section 35.2.5: Verifying IS-IS
35.2.1 Enabling IS-IS

For the normal operation of the IS-IS protocol, the `router isis` command must be used to enable the IS-IS instance. Then the `net` command is used to set a Network Entity Title (NET) for the device. Next, you must configure at least one `address-family`. Lastly, the `isis enable` command is used to enable IS-IS on the desired interface. The IS-IS protocol is enabled upon the completion of these configurations.

To enable IS-IS, the following tasks must be performed.

- **Section 35.2.1.1: Enable IS-IS Globally and Specify an IS-IS Instance**
- **Section 35.2.1.2: Configure the Network Entity Title (NET)**
- **Section 35.2.1.3: Set the Address Family Configuration**
- **Section 35.2.1.4: Enable IS-IS on a Specified Interface**

35.2.1.1 Enable IS-IS Globally and Specify an IS-IS Instance

The switch supports only one IS-IS routing instance per VRF. The routing instance uniquely identifies the switch to other devices. IS-IS configuration commands apply globally to the IS-IS instance.

The switch must be in router IS-IS configuration mode to run IS-IS configuration commands. The `router isis` command places the switch in router IS-IS configuration mode.

**Example**

- These commands place the switch in IS-IS configuration mode. It also creates an IS-IS routing instance named Osiris.

```plaintext
switch(config)#router isis Osiris
switch(config-router-isis)#
```

35.2.1.2 Configure the Network Entity Title (NET)

After creating an IS-IS routing instance, you should also configure the Network Entity Title (NET) with the `net` command. The NET defines the current IS-IS area address and the system ID of the device.

**Example**

- These commands define the current IS-IS area address and the system ID of the device.

```plaintext
switch(config)#router isis Osiris
switch(config-router-isis)# net 49.0001.1010.1040.1030.00
```

35.2.1.3 Set the Address Family Configuration

The `address-family` command allows you to enable the address families that IS-IS will route and also enter a configuration sub-mode to configure settings that are distinct to that address family. The address families supported are IPv4 unicast and IPv6 unicast.

**Example**

- These commands enable and enter the address family mode for IPv4 unicast.

```plaintext
switch(config)#router isis Osiris
switch(config-router-isis)#address-family ipv4 unicast
switch(config-router-isis-af)#
```
35.2.1.4 Enable IS-IS on a Specified Interface

After enabling IS-IS, you need to specify on which interface IS-IS will be run with the `isis enable` command.

Example
- These commands enable IS-IS on the specified interface Ethernet 4.

```plaintext
switch(config-router-isis)#interface ethernet 4
switch(config-if-Eth4)#isis enable Osiris
```

35.2.2 IS-IS Optional Global Parameters

After globally enabling IS-IS, the following global parameters can be configured.

- Section 35.2.2.1: Set the Router Type
- Section 35.2.2.2: Configuring Redistribution of Connected or Static non-ISIS Routes
