- Section 35.2.2.3: Configuring Redistribution of Connected or Static non-ISIS Routes into Level-1
- Section 35.2.2.4: Configuring Redistribution of BGP Routes into ISIS Network
- Section 35.2.2.5: Set the Overload Bit
- Section 35.2.2.6: Configure IS-IS MD5 Authentication
- Section 35.2.2.7: Set the SPF Interval
- Section 35.2.2.8: Configuring IS-IS Segment Routing Global Adjacency-SID
- Section 35.2.2.9: Enable Logging for Peer Changes
- Section 35.2.2.10: Set the IS-IS hostname
- Section 35.2.2.11: Configuring IS-IS Multi-Topology

35.2.2.1 Set the Router Type

The `is-type` command sets the routing level for an IS-IS instance.

Example
- These commands specify level-2 for the IS-IS instance.

```plaintext
switch(config)#router isis Osiris
switch(config-router-isis)#is-type level-2
```

35.2.2.2 Configuring Redistribution of Connected or Static non-ISIS Routes

The `redistribute (IS-IS)` command configures redistribution of connected or static non-ISIS routes.

Example
- These commands redistribute connected routes into the IS-IS domain.

```plaintext
switch(config)#router isis Osiris
switch(config-router-isis)#redistribute connected
```

35.2.2.3 Configuring Redistribution of Connected or Static non-ISIS Routes into Level-1

The non-ISIS routes can be exported into Level-1, Level-2 or both by using route map’s set condition. By default, the routes are exported only to Level-2. The Level-1 or Level-2 routes can also be filtered using the route map’s match statement. The route map is then used when redistributing routes in ISIS.

The following example shows the steps to configure route redistribution into Level-1 or Level-2:

**Example**

**Step 1**  Place the switch in route-map mode and use `set isis level` command to configure a route map to set the IS-IS level.

```sh
Switch(config-route-map-rm)#set isis level [level-1|level-2|level-1-2]
```

**Step 2**  The configured route map is then used while redistributing routes in ISIS using the `redistribute (IS-IS)` command.

```
Switch(config-router-isis)#redistribute [connected|static] route-map <route-map name>
```

Output of `show isis database detail` is used to make sure that the route shows up in the exported level.

35.2.2.4 Configuring Redistribution of BGP Routes into ISIS Network

The `redistribute bgp route-map` command advertises the routes learned through BGP routes into the IS-IS network. It also allows the user to selectively advertise some routes and modify route attributes before advertising using route-maps.

The command is available in both address-family mode and router IS-IS mode, however, the command is rejected if configured in both address-family mode and router mode at the same time.

**Note**  If the command is configured in router address family mode, it only redistributes routes with matching address family. If it is configured in router mode, it applies to all enabled address-families.

Use `show isis database detail` command to verify that routes are advertised with correct attributes.

**Examples**

- In this example the `redistribute bgp route-map` command redistributes the BGP routes into ISIS domain, in `address-family` mode.

  ```sh
  Switch(config)#router isis 1
  Switch(config-router-isis)#address-family ipv4
  Switch(config-router-isis-af)#redistribute bgp route-map bgp-to-isis-v4
  ```

- In this example the `redistribute bgp route-map` command redistributes the BGP routes into ISIS, in `router isis` mode.

  ```sh
  Switch(config)#router isis 1
  Switch(config-router-isis)#redistribute bgp route-map bgp-to-isis
  ```

35.2.2.5 Set the Overload Bit

The `set-overload-bit` command used without the on-startup option, informs other devices not to use the local router to forward transit traffic. When used with the on-startup option, the overload bit is set for the interval specified after startup.
In scenarios when Border Gateway Protocol (BGP) routes are resolved using an Interior Gateway Protocol (IGP), if the transit router reboots and becomes available again, the IGP will consider the transit router as an optimal path again. After rebooting, the transit router will blackhole traffic until the transit router learns the external destination reachability information via BGP.

Examples

These commands configure the switch and sets the overload bit to 120 seconds after startup.

```
switch(config)#router isis Osiris
switch(config-router-isis)#set-overload-bit on-startup 120
```

- These commands configure the overload bit until BGP converges. If BGP fails to converge within the set timeout default period, then the overload bit gets cleared.

```
switch(config)#router isis Osiris
switch(config-router-isis)#set-overload-bit on-startup wait-for-bgp
switch(config-router-isis)#set-overload-bit on-startup wait-for-bgp timeout 750
```

35.2.2.6 Configure IS-IS MD5 Authentication

To configure authentication for the IS-IS instance causing LSPs, CSNPs and PSNPs to be authenticated, use the `authentication mode` and `authentication key` commands. To configure authentication on the interface, causing IS-IS Hellos to be authenticated, use the `isis authentication mode` and `isis authentication key` commands on the interface.

Two forms of authentication are supported by the IS-IS routing protocol: Clear-text authentication and MD5 authentication. The difference between the two forms of authentication is in the level of security provided. In the case of clear-text authentication, the password is specified as text in the authentication TLV, making it possible for an attacker to break authentication by sniffing and capturing IS-IS PDUs on the network. Arista recommends using the MD5 authentication.

HMAC MD5 authentication provides much stronger authentication by computing the message digest (on the IS-IS PDU contents) using the secret key to produce a hashed message authentication code (HMAC). Different modes of authentication can be specified on the interface, which authenticates IIH PDUs (IS-IS hello PDUs), and globally in the router IS-IS mode, in which the LSPs, CSNPs and PSNPs are authenticated. Area-wide and domain-wide authentication can be specified for L1 and L2 routers respectively.

Example

- These commands configure authentication for the IS-IS instance causing LSPs, CSNPs and PSNPs to be authenticated.

```
switch(config)#router isis 1
switch(config-router-isis)#authentication mode md5
switch(config-router-isis)#authentication key secret
```

- These commands configure authentication on the interface causing IS-IS Hellos to be authenticated.

```
switch(config)#interface Ethernet 3/6
switch(config-if-Et3/6)#isis authentication mode text
switch(config-if-Et3/6)#isis authentication key 7 cAm28+9a/xPi04o7hjd8Jw==
```

To maximize interoperability, Arista recommends using the same key in both interface mode and in router isis mode.
### 35.2.2.7 Set the SPF Interval

The SPF timer interval defines the maximum interval between two successive SPF calculations. IS-IS runs SPF calculations following a change in the network topology or the link-state database. The `spf-interval` command defines the following intervals:

- **Maximum wait interval**: The maximum time a switch will wait before running an SPF after a topology change.
- **Initial wait interval**: In a network that has been stable throughout the hold interval, this interval defines the initial wait time of a switch for performing an SPF calculation after a topology change. As several link-state updates must be sent after a topology change, the initial wait interval allows the network to settle before a switch computes an SPF. If the topology changes during an initial wait interval, an SPF is calculated after the initial wait interval expires and no further changes are made to throttle timers.
- **Hold time**: This interval delays SPF calculations during network instability. If the topology changes during a hold time, an SPF is computed when the hold time expires. Subsequent hold intervals are doubled up to the configured maximum wait interval for continuous topology changes. If the next topology change occurs after the hold interval expires, the hold interval is reset to its configured value and the SPF is computed after the initial wait interval.

#### Note
EOS does not support configuring topology-specific SPF timers in multi-topology deployments and IS-IS level-specific SPF timers.

#### Example
This command configures maximum wait interval, initial wait interval, and hold time to 10 seconds, 2000 ms, and 1000 ms respectively.

```
switch(config)#router isis inst1
switch(config-router-isis)#spf-interval 10 2000 1000
```

### 35.2.2.8 Configuring IS-IS Segment Routing Global Adjacency-SID

IS-IS Segment Routing (SR) now supports global adjacency SIDs for point-to-point interfaces. The adjacency SID is configured as an index using the `adjacency-segment` command.

Global adjacency segments are represented using an index instead of actual MPLS labels. The index is an offset into the Segment Routing Global Block (SRGB) advertised by a router, resulting in an MPLS label. The default value of SRGB in EOS is **Base: 900000** and **Size: 65536**.

The same index may be used to configure multiple interfaces so that MPLS forms an ECMP group, and the same index may be applied to IPv4 and IPv6 adjacencies.

#### Example
- In this example, the global adjacency is configured on a point-to-point interface Ethernet Et1, with an index value 10.

```
Arista(config-if-Et1)#adjacency-segment ipv4 p2p index 10 global
```

#### Displaying Adjacency SID Information
The command `show isis segment-routing adjacency-segments` displays the global adjacency SID value and other related information.
Examples

- In this example an interface is configured as follows:

```cpp
interface Ethernet1
ip address 1.1.1.1/24
ipv6 address 1000::1/64
isis enable isis1
isis network point-to-point
adjacency-segment ipv4 p2p index 1 global
adjacency-segment ipv6 p2p index 2 global
```

- The show output for the above interface configuration:

```text
Switch# show isis segment-routing adjacency-segments
System ID: 1000.0000.0002                       Instance: isis1
SR supported Data-plane: MPLS                   SR Router ID: 1.1.1.4
Adj-SID allocation mode: SR-adjacencies
Adj-SID allocation pool: Base: 100000     Size: 16384
Adjacency Segment Count: 2
Flag Descriptions: F: ipv6 address family, B: Backup, V: Value
L: Local, S: Set

Segment Status codes: L1 - Level-1 adjacency, L2 - Level-2 adjacency, P2P - Point-to-Point adjacency, LAN - Broadcast adjacency

Locally Originated Adjacency Segments
Adj IP Address     Local Intf    SID      SID Source    Flags                Type
----------------  ----------    ------  -------------  ---------------     -------
1.1.1.2         Et1         1        Configured   F:0 B:0 V:0 L:0 S:0  P2P L1
fe80::1:ff:fe65:0    Et1         2        Configured   F:1 B:0 V:0 L:0 S:0  P2P L1
```

Received Global Adjacency Segments

<table>
<thead>
<tr>
<th>SID</th>
<th>Originator</th>
<th>Neighbor</th>
<th>Flags</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>rtrmpls1</td>
<td>1000.0000.0002</td>
<td>F:0</td>
</tr>
</tbody>
</table>

35.2.2.9 Enable Logging for Peer Changes

The `log-adjacency-changes (IS-IS)` command configures the switch to send syslog messages when it detects IS-IS neighbor adjacency state changes.

Example

- These commands configure the switch to send a syslog message when a neighbor goes up or down.

```text
switch(config)#router isis Osiris
switch(config-router-isis)#log-adjacency-changes
```

35.2.2.10 Set the IS-IS hostname

The `is-hostname` command configures the use of a human-readable string to represent the symbolic name of an IS-IS router. It also changes the output of IS-IS show commands, to show the IS-IS hostname in place of system IDs if the corresponding IS-IS hostname is known. However, syslogs still use IS-IS system IDs and not the IS-IS hostname.
By default if there’s a hostname configured on the switch, it is used as the IS-IS hostname. It is also possible to un-configure an assigned hostname for IS-IS using the `no is-hostname` command. When the IS-IS hostname is removed, the switch goes back to using the switch’s hostname as the IS-IS hostname.

**Examples**

- These commands configure the IS-IS hostname to the symbolic name “ishost1” for the IS-IS router.
  ```
  switch(config)#router isis inst1
  switch(config-router-isis)#is-hostname ishost1
  switch(config-router-isis)#
  ```

- These commands unconfigure the IS-IS hostname of the symbolic name “ishost1” for the IS-IS router.
  ```
  switch(config)#router isis inst1
  switch(config-router-isis)#no is-hostname ishost1
  switch(config-router-isis)#
  ```

### 35.2.2.11 Configuring IS-IS Multi-Topology

The **multi-topology** command configures IS-IS Multi-Topology (MT) support (disabled by default), enabling an IS-IS router to compute a separate topology for IPv4 and IPv6 links in the network. With MT configured, not all the links in a network need to support both IPv4 and IPv6. Some can support IPv4 or IPv6 individually. The IPv4 SPF will install IPv4 routes using the IPv4 topology, and similarly, the IPv6 SPF will install IPv6 routes using the IPv6 topology. Without MT support, all links in an IS-IS network need to support the same set of address families.

When MT is enabled, and each link has a separate IPv4 metric and IPv6 metric.

The **isis ipv6 metric** command configures the IPv6 metric.

The **isis multi-topology** command configures the IPv4 or IPv6 address family individually on an interface with both IPv4 and IPv6 addresses.

The address families that are enabled on an interface are based on the global address families enabled in router IS-IS configuration mode, and the addresses configured on the interface. To enable a particular address family on an interface, it needs to have an address configured in that address family. In the case where both IPv4 and IPv6 address families are enabled in router IS-IS configuration mode, then if an interface has IPv4 and IPv6 addresses, both IPv4 and IPv6 address families are enabled on that interface. In the case of an interface with only an IPv4 address family, the IPv4 address family is enabled on that interface. Where an interface only has an IPv6 address family, the IPv6 address family is enabled on that interface. Finally, where only the IPv6 address family is enabled in router IS-IS config mode and MT is enabled, then the IPv6 address family is enabled on all interfaces which have an IPv6 address configured.

**Examples**

- These commands configure MT for the IS-IS router.
  ```
  switch(config)#router isis 1
  switch(config-router-isis)#address-family ipv6 unicast
  switch(config-router-isis-af)#multi-topology
  switch(config-router-isis-af)#
  ```

- These commands unconfigure MT for the IS-IS router.
  ```
  switch(config)#router isis 1
  switch(config-router-isis)#address-family ipv6 unicast
  switch(config-router-isis-af)#no multi-topology
  switch(config-router-isis-af)#
  ```
These commands configure the IPv6 metric.

```
switch(config)#interface Ethernet 5/6
switch(config-if-Et5/6)#isis ipv6 metric 30
```

These commands configure the IPv4 address family on an interface with both IPv4 and IPv6 addresses.

```
switch(config)#interface Ethernet1
switch(config-if-Et1)#isis multi-topology address-family ipv4 unicast
```

These commands configure the IPv6 address family on an interface with both IPv4 and IPv6 addresses.

```
switch(config)#interface Ethernet1
switch(config-if-Et1)#isis multi-topology address-family ipv6 unicast
```

These commands configure both the IPv4 and IPv6 address families on an interface.

```
switch(config)#interface Ethernet1
switch(config-if-Et1)#no isis multi-topology address-family unicast
```

### 35.2.3 IS-IS Interface Optional Parameters

After globally enabling IS-IS, the following parameters can be configured on individual interfaces.

- Section 35.2.3.1: Set the Hello Packet Interval
- Section 35.2.3.2: Configure the Hello Multiplier for the Interface
- Section 35.2.3.3: Configure the IS-IS Metric
- Section 35.2.3.4: Set the LSP Transmission Interval
- Section 35.2.3.5: Set the IS-IS Priority
- Section 35.2.3.6: Configure an Interface as Passive
- Section 35.2.3.7: Configure BFD support for IS-IS for IPv4

#### 35.2.3.1 Set the Hello Packet Interval

The `isis hello-interval` command sets the time interval between the hello packets that maintain an IS-IS adjacency.

**Example**

- These commands configure a hello interval of 60 seconds for Ethernet 4.

```
switch(config)#interface ethernet 4
switch(config-if-Et4)#isis hello-interval 60
```

#### 35.2.3.2 Configure the Hello Multiplier for the Interface

The switch maintains the adjacency by sending/receiving hello packets. When receiving no hello packets from the peer within a time interval, the local switch considers the neighbors invalid.

The `isis hello-multiplier` command calculates the hold time announced in hello packets by multiplying this number with the configured `isis hello-interval`.
Example

- These commands configure a hello multiplier of 5 for Ethernet 4.

```config
switch(config)#interface ethernet 4
switch(config-if-Et4)#isis hello-interval 60
switch(config-if-Et4)#isis hello-multiplier 5
```

35.2.3.3 Configure the IS-IS Metric

The `isis metric` command sets the cost for sending information over a specific interface. At present only wide metrics are supported.

Example

- These commands configure a metric cost of 30 for sending information over Ethernet 5.

```config
switch(config)#interface ethernet 5
switch(config-if-Et5)#isis metric 30
```

35.2.3.4 Set the LSP Transmission Interval

The `isis lsp tx interval` command configures the minimum interval between successive LSP transmissions on an interface.

Example

- This command sets the LSP transmission interval on interface Ethernet 5 to 50 milliseconds.

```config
switch(config)#interface ethernet 5
switch(config-if-Et5)#isis lsp tx interval 50
```

35.2.3.5 Set the IS-IS Priority

The `isis priority` command determines which device will be the Designated Intermediate System (DIS). The device with the highest priority on the LAN will become the DIS.

Example

- These commands configure a device priority of 60 on interface Ethernet 5.

```config
switch(config)#interface ethernet 5
switch(config-if-Et5)#isis priority 60
```

35.2.3.6 Configure an Interface as Passive

The `isis passive` and `passive (IS-IS)` commands configure IS-IS interfaces as passive to interfaces where adjacencies are wanted. The interface does not send or receive IS-IS packets when configured as passive.

Examples

- These commands configure Ethernet interface 10 as a passive interface.

```config
switch(config)#interface ethernet 10
switch(config-if-Et10)#isis passive
```
• These commands configure Ethernet interface 10 as a passive interface in the router IS-IS mode.

```bash
switch(config)#router isis Osiris
switch(config-router-isis)#passive interface ethernet 10
switch(config-router-isis)#
```

### 35.2.3.7 Configure BFD support for IS-IS for IPv4

The `isis bfd` and `bfd all-interfaces` commands configure Bidirectional Forwarding Detection (BFD). BFD is supported for both IS-IS IPv4 and IPv6 routes.

**Examples**

• These commands enable BFD (for the IPv4 address family) for all the interfaces on which IS-IS is enabled. By default, BFD is disabled on all interfaces.

```bash
switch(config)#router isis 1
switch(config-router-isis)#address-family ipv4
switch(config-router-af)#bfd all-interfaces
switch(config-router-af)#
```

• These commands enable BFD on an IS-IS interface.

```bash
switch(config)#interface Ethernet 5/6
switch(config-if-Et5/6)#isis bfd
switch(config-if-Et5/6)#
```

### 35.2.4 Disabling IS-IS

An IS-IS instance can be shut down globally or can be disabled on individual interfaces.

The `shutdown (IS-IS)` command shuts down an IS-IS instance globally.

**Example**

• These commands disable IS-IS globally without modifying the IS-IS configuration.

```bash
switch(config)#router isis Osiris
switch(config-router-isis)#shutdown
switch(config-router-isis)#
```

The `no isis enable` command disables IS-IS on an interface.

**Example**

• These commands disable IS-IS on interface Ethernet 4.

```bash
switch(config-router-isis)#interface ethernet 4
switch(config-if-Eth4)#no isis enable
```

### 35.2.5 Verifying IS-IS

The following tasks verify the IS-IS peer and connection configuration:

- **Section 35.2.5.1**: Verify the Link State Database
- **Section 35.2.5.2**: Verify the Interface Information for the IS-IS Instance
- **Section 35.2.5.3**: Verify the IS-IS Neighbor Information
- **Section 35.2.5.4**: Verify IS-IS Instance Information
35.2.5.1 Verify the Link State Database

To display the link state database of IS-IS, use the `show isis database` command.

**Example**

- This command displays the IS-IS link state database.

  ```
  switch>show isis database
  
  ISIS Instance: Osiris
  ISIS Level 2 Link State Database
  LSPID                 Seq Num   Cksum  Life  IS Flags
  1212.1212.1212.00-00  4         714    1064  L2 <>
  1212.1212.1212.0a-00  1         57417  1064  L2 <>
  2222.2222.2222.00-00  6         15323  1116  L2 <>
  2727.2727.2727.00-00 10        15596  1050  L2 <>
  3030.3030.3030.00-00 12        62023  1104  L2 <>
  3030.3030.3030.c7-00  4         53510  1104  L2 <>
  
  switch>
  ```

35.2.5.2 Verify the Interface Information for the IS-IS Instance

To display interface information related to the IS-IS instance, use the `show isis interface` command.

**Example**

- This command displays IS-IS interface information.

  ```
  switch>show isis interface
  
  ISIS Instance: Osiris
  Interface Vlan20:
  Index: 59 SNPA: 0:1c:73:c:5:7f
  MTU: 1497 Type: broadcast
  Level 2:
  Metric: 10, Number of adjacencies: 2
  LAN-ID: 1212.1212.1212, Priority: 64
  DIS: 1212.1212.1212, DIS Priority: 64
  
  Interface Ethernet30:
  Index: 36 SNPA: 0:1c:73:c:5:7f
  MTU: 1497 Type: broadcast
  Level 2:
  Metric: 10, Number of adjacencies: 1
  LAN-ID: 3030.3030.3030, Priority: 64
  DIS: 3030.3030.3030, DIS Priority: 64
  
  switch>
  ```

35.2.5.3 Verify the IS-IS Neighbor Information

To display general information for IS-IS neighbors that the device sees, use `show isis neighbors`. 
Example

- This command displays information for IS-IS neighbors that the device sees.

```
switch>show isis neighbor
```

<table>
<thead>
<tr>
<th>Inst Id</th>
<th>System Id</th>
<th>Type</th>
<th>Interface</th>
<th>SNPA</th>
<th>State</th>
<th>Hold time</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>2222.2222.2222</td>
<td>L2</td>
<td>Vlan20</td>
<td>2:1:0:c:0:0</td>
<td>UP</td>
<td>30</td>
</tr>
<tr>
<td>10</td>
<td>1212.1212.1212</td>
<td>L2</td>
<td>Vlan20</td>
<td>2:1:0:d:0:0</td>
<td>UP</td>
<td>9</td>
</tr>
<tr>
<td>10</td>
<td>3030.3030.3030</td>
<td>L2</td>
<td>Ethernet30</td>
<td>2:1:0:b:0:0</td>
<td>UP</td>
<td>9</td>
</tr>
</tbody>
</table>

```
switch>
```

35.2.5.4 Verify IS-IS Instance Information

To display the system ID, Type, Interface, IP address, State and Hold information for IS-IS instances, use the `show isis summary` command. The command is also used to verify the configured maximum wait interval, initial wait interval, and hold time of SPF timers in IS-IS instances. This command also displays values of the current SPF interval, last level-1 SPF run, and last level-2 SPF run.

Example

- This command displays general information about IS-IS instances.

```
switch>show isis summary
ISIS Instance: Osiris
    System ID: 1010.1040.1030, administratively enabled, attached
    Internal Preference: Level 1: 115, Level 2: 115
    External Preference: Level 1: 115, Level 2: 115
    IS-Type: Level 2, Number active interfaces: 1
    Routes IPv4 only
    Last Level 2 SPF run 2:32 minutes ago
    Area Addresses:
        10.0001
            level 2: number dis interfaces: 1, LSDB size: 1

switch>
```

- This command displays the SPF interval information about IS-IS instances.

```
switch(config-router-isis-af)#show isis summary
ISIS Instance: 1 VRF: default
    System ID: 0000.0000.0001, administratively enabled
    Multi Topology disabled, not attached
    IPv4 Preference: Level 1: 115, Level 2: 115
    IPv6 Preference: Level 1: 115, Level 2: 115
    IS-Type: Level 1 and 2, Number active interfaces: 0
    Routes both IPv4 and IPv6
          Max wait(s) Initial wait(ms) Hold interval(ms)
    LSP Generation Interval:     5        50      50
    SPF Interval:                2      1000   1000
    Current SPF hold interval(ms): Level 1: 1000, Level 2: 1000
    Last Level 1 SPF run 1 seconds ago
    Last Level 2 SPF run 1 seconds ago
    Authentication mode: Level 1: None, Level 2: None
    Graceful Restart: Disabled, Graceful Restart Helper: Enabled
    Area Addresses:
        49.0001
            level 1: number dis interfaces: 0, LSDB size: 1
            level 2: number dis interfaces: 0, LSDB size: 1
```
35.3 IS-IS Segment Routing

Segment Routing (SR) provides a mechanism to simplify the definition of end-to-end paths within IGP topologies by encoding paths as sequences of topological sub-paths, called “segments”. The IS-IS protocol advertises these segments in four different ways: node segments, prefix segments, proxy-node segments, and Adjacency segments.

Node segments represent a node in an IGP topology. Proxy segments are generally associated with an IP(v6) address received from a router that does not support IS-IS SR. Prefix segments represent an ECMP-aware shortest path to a prefix (or a node), as per the state of the IGP topology. Adjacency segments represent a hop over a specific adjacency between two nodes in IGP.

35.3.1 Platform compatibility

The MPLS dataplane is supported on these platforms:

- 7500E and 7280E series
- 7500R and 7280R series
- 7050X series

35.3.2 Configuring IS-IS Segment Routing

Global IS-IS SR commands are accessed in Segment-Routing MPLS mode, under the router IS-IS configuration mode. Interface-specific IS-IS SR commands are accessed in interface configuration mode.

35.3.2.1 Starting the MPLS Agent

The routing information base (RIB) agent provides IS-IS segment routing, but the actual installation of LFIB entries pertaining to SR information provided by IS-IS is handled by the MPLS agent in EOS, which is disabled by default. To enable the MPLS agent, use the following commands.

Note: IP(v6) routing must be enabled as a prerequisite.

Example

- The following commands enable IP routing and the MPLS agent on the switch.

```
switch(config)#ip routing
switch(config)#mpls ip
switch(config)#
```

35.3.2.2 Enabling Segment Routing in IS-IS

By default IS-IS SR is disabled. Hence, you need to enable it explicitly from the segment-routing MPLS configuration mode.

By issuing `shutdown` command under segment-routing MPLS configuration mode IS-IS SR could be administratively disabled, and by issuing `no segment-routing mpls` command under router ISIS configuration mode all the IS-IS SR configuration can be deleted.
Example

- The following commands explicitly enables the IS-IS SR in the MPLS dataplane.

```plaintext
switch(config)#router isis instance1
switch(config-router-isis)#segment-routing mpls
switch(config-router-isis-sr-mpls)#no shutdown
```

35.3.2.3 SRGB (Segment Routing Global Range)

The global segments such as Prefix-SID, Node-SID, Proxy-node-SID are represented using indices of actual MPLS labels. These indices are offset on the SRGB advertised by a router to derive the respective MPLS label. The default value of SRGB in EOS is Base: 900000, Size: 65536. In other words, the labels that any global segment could represent is between 900000-965535.

The MPLS label range is categorized and reserved into pools based on the applications using these labels. The default values of label ranges in these pools are:

- Dynamic Global Range--(100000) (262144)
- IS-IS SR Global Range -- (900000) (65536)
- Static Global Range -- (16) (99984)

Note

SRGB can be configured to fit in different MPLS ranges as long as it does not fall under an MPLS range already assigned for usage by other applications.

Example

- The following command configures an IS-IS SR global range with a value of (900000)-- starting label range, (65536)--Numbers of labels to reserve.

```plaintext
switch(config)#mpls label range isis-sr 900000 65536
```

35.3.2.4 Configuring Node-SID

Node segments are indices's associated with routers within an IS-IS SR domain. This is done by associating node-segments with prefix mask length /32 (IPV4) or /128 (IPV6) addresses. Node segments are carried as sub-TLVs(type-length-value) in IP reachability TLVs for the prefixes with which these segments are associated. Node segments is configured on IS-IS enabled Loop-back interface(s) as shown in the example below.

Examples

- The following commands are used to associate a node-segment with an IPv4 address.

```plaintext
switch(config)#int loopback 1
switch(config-if-Lo1)#ip address 21.1.1.1/32
switch(config-if-Lo1)#node-segment ipv4 index 5
```

- The following commands are used to associate a node-segment with an IPv6 address.

```plaintext
switch(config)#int loopback 1
switch(config-if-Lo1)#ipv6 add 2000::24/128
switch(config-if-Lo1)#node-segment ipv6 index 5
```

- The following example shows a warning thrown at the CLI when a /32 or /128 address is not configured on the interface.

```plaintext
switch(config)#int loopback 1
switch(config-if-Lo1)#ip address 21.1.1.1/24
switch(config-if-Lo1)#node-segment ipv4 index 1
! /32 IPv4 address is not configured on the interface
```
35.3.2.5 Configuring Prefix-SIDs

Prefix segments are associated with any IS-IS prefix a router is originating an IP Reachability TLV for. These segments are carried as sub-TLVs in IP Reachability TLVs of the prefixes with which these segments are associated. Prefix segments are configured under segment-routing MPLS configuration mode in IS-IS.

Note
The configured prefix segment is effective, only if, the prefix for which a prefix-SID configured becomes a part of IS-IS by enabling IS-IS on interfaces, or by redistribution from other protocols etc.

Example
- The following commands are used to associate a prefix segment with an IPv4 address with index value of 50.

```
switch(config)#router isis instance1
switch(config-router-isis)#segment-routing mpls
switch(config-router-isis-sr-mpls)#prefix-segment 1.1.1.0/24 index 50
```

35.3.2.6 Configuring Proxy-Node SIDs

Node segments represent a device (node) by attaching a segment (index) with a /32, /128 prefix which generally is configured on a Loop-back interface. There are routers which do not support segment routing, and there might be a situation where it is required to assign node identifiers on such routers. To overcome this shortfall, a router that supports IS-IS SR is made to proxy by configuring a proxy-node-SID for a IS-IS prefix originating from the router that does not support IS-IS SR.

Example
- A proxy-node-sid associates a /32 or a /128 route with an SID as shown below.

```
switch(config)#router isis instance1
switch(config-router-isis)#segment-routing mpls
switch(config-router-isis-sr-mpls)#proxy-node-segment 1.1.1.0/32 index 50
```

Note
The CLI throws an error message if the prefixes assigned does not match /32 or /128 mask length.

Although the general use case is to configure a proxy node segment on a router that is not originating the prefix with which we want to associate the proxy-node SID, it is not prohibited to configure one for self-originated prefixes.

Configuring proxy-node-SIDs enables a router to send out a Binding-SID TLV with details pertaining to the prefix and SID.

Note
A Binding-SID can carry a range of prefixes and an associated range of SIDs, but at present the EOS does not support to configure such ranges with one binding segment TLV in IS-IS SR. However, we do process ranges of prefixes and SIDs if received from devices that support such configurations.

35.3.2.7 Configuring Anycast-SID

An Anycast-SID is a prefix segment that identifies a set of routers and not a specific router. It enforces the ECMP-aware shortest-path forwarding towards the closest node of the anycast set.
An example of such an anycast group could be a set of routers A1, A2, A3 and A4 where at least one router of A1, A2, A3 and A4 advertises the prefix SID corresponding to the anycast address (which can be a prefix originating on all of A1, A2, A3 and A4 – a loop-back address, maybe).

In general use case, all the routers of the anycast group would have the same prefix-SID configured for the anycast IP address present on them.

**Note**
That for Anycast-SID to work as expected, the SRGB on the members of the anycast group should be same.

### 35.3.2.8 Configuring router-ID

A router that support IS-IS SR need to advertise its SR data-plane capability and the range of MPLS label values it uses for segment routing, this is advertised by inserting SR-Capability sub-TLV in the Router Capabilities TLV.

A Router Capability TLV is now sent in IS-IS LSPs when Segment routing is enabled and it is necessary for a Router Capability TLV to carry a router-ID. This router-ID could be configured in EOS under the segment routing MPLS configuration mode. If no router-ID is configured, the router automatically picks up the highest IPv4 address configured on the router for an router-ID.

### 35.3.2.9 Configuring IS-IS Static Adjacency SID

Adjacency segments for IS-IS adjacencies are statically configured on the switch, so that these values are preserved even when the switch restarts. Static adjacency segments are configured per address family on any interface (including Port-Channel, VLANs and SVIs). They are configured and advertised as labels.

These are the few points to be considered while configuring the static adjacency SIDs:

- The same label can be configured on multiple interfaces so that MPLS can form ECMP, the same value can be applied to IPv4 and IPv6 adjacency.
- Static adjacency SID is applied only to p2p interface, and has local scope. When interface type changes to LAN, then dynamic adjacency SID is assigned.
- When Static adjacency SIDs are configured, then simply replace dynamic adjacency SIDs which are advertised to other routers and installed in the local LFIB.
- Static adjacency SID is applied regardless of Adjacency Segment Allocation Mode.
- When Static adjacency SID is disabled, then normal rules for dynamic adjacency SID is applied (it automatically applies a value based on Adjacency Segment Allocation Mode as described in IS-IS Segment Routing TOI document).

**Example**

```
switch(config-if-Et1)#adjacency-segment ipv4 p2p index 50 global
```

They can be a label (local) or index (global) and we can assign multiple adjacency segments per link.
Where label-value must be within the SR Local Block (SRLB) that can be found in the output of `show mpls label range` command as shown.

### 35.3.2.10 Configuring Adjacency Segment Label Range

Adjacency Segments are MPLS labels assigned to IS-IS adjacencies. These labels are shared with other routers in the domain by adding them in adjacency-SID sub-TLVs which are inserted in neighbor Reachability TLVs in IS-IS.

The MPLS labels (adjacency segments) are incrementally allocated to adjacencies, as the transition to Up state, from a adjacent set of MPLS labels pre-allocated by MPLS agent. This label range extends from 100000 to 116383 (base: 100000, size: 16384) by default. This could be changed by the following configuration:

**Example**
```
switch(config)#mpls label range dynamic 200000 131072
```

The “dynamic” label pool is shared between LDP and IS-IS SR Adjacency Segments.

### 35.3.2.11 Configuring Adjacency Segment Allocation Mode

Adjacency Segments are allocated to all IS-IS adjacencies based on the IS-IS routers that have advertised IS-IS SR capability or to none of the adjacencies. The command `adjacency-segment allocation` is used to configure this under the segment-routing MPLS configuration mode.

The default behavior is to allocate adjacency segments to adjacencies of SR supporting devices.

**Example**
```
switch(config-router-isis-sr-mpls)#adjacency-segment allocation sr-peer
```

### 35.3.2.12 Adjacency Segment Persistence across Link Flaps

Adjacency segments are allocated to IS-IS adjacencies based on configured adjacency segment allocation mode mentioned above. If an adjacency that has been allocated label L goes down, L is reserved for this adjacency for a duration of 3600 seconds from the time of the adjacency down event. Only the adjacency that owned this label before going down could reclaim label L in this duration.

### 35.3.3 Displaying IS-IS Segment Routing Information

**show isis database detail**

The `show isis database detail` command provides a view of LSPDB of different devices in the IS-IS domain. The output displays the TLVs and sub-TLVs that are being self-originated or the ones that have been received from other routers.
Example

```bash
switch# show isis database detail

ISIS Instance: inst1 VRF: default
ISIS Level 2 Link State Database

```

**show isis segment-routing**

The `show isis segment-routing` command displays the summary information on IS-IS SR status.

Example

```bash
switch(config)# show isis segment-routing
System ID: 1111.1111.1002 Instance: inst1
SR supported Data-plane: MPLS SR Router ID: 252.252.2.252
SR Global Block( SRGB ): Base: 900000 Size: 65536
Adj-SID allocation mode: SR-adjacencies
Adj-SID allocation pool: Base: 100000 Size: 16384
All Prefix Segments have : P:0 E:0 V:0 L:0
All Adjacency Segments have : P:0 B:0 V:1 L:1 S:0
ISIS Reachability Algorithm : SPF (0)
Number of ISIS segment routing capable peers: 3
Self-Originated Segment Statistics:
Node-Segments : 2
Prefix-Segments : 2
Proxy-Node-Segments : 0
Adjacency Segments :
About the Output

The first line of the output shows the IS-IS system ID of this device and the name of the instance with which IS-IS is configured.

The supported dataplane is shown against the SR supported Data-plane field whereas the Router ID being advertised in the Router Capability is mentioned in the SR Router ID Field.

The SRGB in use and the MPLS label pool being used for adjacency segment allocation are mentioned in this output. The current adjacency allocation mode which refers to whether we are allocating adjacency segments to all IS-IS adjacencies or only those adjacencies which support SR or None of the adjacencies is shown in the Adj-SID allocation mode field.

Flag contents of All Prefix Segments originated on this router, Flag contents of All Adjacency Segments originated on this router and supported IS-IS Reachability Algorithm have been provided through this command output and they carry the meaning as per the IS-IS SR IETF draft.

This show command provides a statistics related to IS-IS SR in terms of various counters ranging from number of IS-IS SR enabled peers, number of Node-SIDs, prefix-SIDs, proxy-node-segments and adjacency segments being originated on this router in IS-IS.

The `show isis segment-routing` command also provides information if segment routing has been administratively disabled as shown.

```
switch(config-router-isis-sr-mpls)#sh isis segment-routing
! IS-IS (Instance: inst1) Segment Routing has been administratively shutdown
```

**show isis segment-routing global-blocks**

The `show isis segment-routing global-blocks` command lists the SRGBs in use by all SR supporting devices in IS-IS domain including the SRGB in use by IS-IS SR on this device.

**Example**

```
switch#sh isis segment-routing global-blocks
System ID: 1111.1111.1002              Instance: inst1
SR supported Data-plane: MPLS          SR Router ID: 252.252.2.252
SR Global Block( SRGB ): Base: 900000  Size: 65536
Number of ISIS segment routing capable peers: 3
  SystemId   Base     Size
  -------------------------- -----
  1111.1111.1002           900000   65536
  1111.1111.1001           900000   65536
```

**show isis segment-routing prefix-segments**

The `show isis segment-routing prefix-segments` command provides the details of all prefix segments being originated as well the segments received from IS-IS SR speakers in the domain.
### Example

```
switch#sh isis segment-routing prefix-segments
System ID: 1111.1111.11002     Instance: inst1
SR supported Data-plane: MPLS   SR Router ID: 252.252.2.252
Node: 2 Proxy-Node: 2 Prefix: 2 Total Segments: 6
Flag Descriptions: R: Re-advertised, N: Node Segment, P: no-PHP
E: Explicit-NULL, V: Value, L: Local
Segment status codes: * - Self originated Prefix, L1 - level 1, L2 - level 2

```

### About the Output

After the usual output header that represents the system ID, instance name, etc and parameters of a router, there is a line depicting prefix segment counters. Each field in this line relates to the number of segments that are present in this router's IS-IS instance. For example, the above example shows that this device has 2 Node Segments (Self originated as well as the ones received from other IS-IS SR devices).

The main section of this show command’s output is the section that lists all the prefix segments and related information like prefix, SID, type of segment (Prefix, Node, Proxy-Node), the flag values being carried in the sub-TLVs of these prefix segments and the system ID of the originating router. The Type field will be useful on a IS type level-1-2 router. It shows whether the installed prefix segment is from a level-1 prefix or a level-2 prefix.

### show isis segment-routing prefix-segments self-originated

The `show isis segment-routing prefix-segments self-originated` command output is identical to `show isis segment-routing prefix-segments` except, the fact that the former lists only self-originated prefix segments.

### show isis segment-routing adjacency-segments

The `show isis segment-routing adjacency-segments` displays list of all the adjacency segments that are being originated by IS-IS SR on a router.

### Example

```
switch#show isis segment-routing adjacency-segments
System ID: 1111.1111.11002     Instance: inst1
SR supported Data-plane: MPLS   SR Router ID: 252.252.2.252
Adj-SID allocation mode: SR-adjacencies
Adj-SID allocation pool: Base: 100000 Size: 16384
Adjacency Segment Count: 4
Adj IP-address  Local Intf  Label  SID Source  Flags  Type
-----------------  ----------  ------  -----  --------  ------  ------
1.0.0.1           Vlan2472   100000 Dynamic F:0 B:0 V:1 L:1 S:0 LAN L2
1.0.1.2           Vlan2579   100001 Dynamic F:0 B:0 V:1 L:1 S:0 P2P L2
fe80::1:ff:fe01:0 Vlan2472   100002 Dynamic F:0 B:0 V:1 L:1 S:0 LAN L2
fe80::1:ff:fe02:0 Vlan2579   100003 Dynamic F:0 B:0 V:1 L:1 S:0 P2P L2
```
About the Output

It consists allocation mode, MPLS label pool from which labels would be allocated to adjacencies, total count of adjacency segments allocated so far and the default flag values carried in all adj-SID sub-TLVs originating from this device.

The main section of the output lists all the adjacency segments allocated so far in six columns each pertaining to Adjacency IP address, local interface name, MPLS label value, SID source, flags in the sub-TLV and the type of adj-SID respectively. The type of the adjacency segments depends on the IS-IS type of adjacency and the IS level.

show mpls label ranges

The show mpls label ranges command displays the MPLS label range available on a router is categorized into different pools which cater to different applications running on the router.

The IS-IS SR refers to the SRGB use-case in IS-IS and IS-IS (dynamic) refers to the label pool that is used for dynamic allocation of adjacency segments in IS-IS.

Example

```
switch#show mpls label ranges
Start    End      Size     Usage
-----------------------------------------
  0        15       16       reserved
 16       99999    99984    static mpls
100000   116383   16384    isis (dynamic)
116384   362143   245760   free (dynamic)
362144   899999   537856   unassigned
900000   965535   65536    isis-sr
```

show mpls segment-routing bindings

The show mpls segment-routing bindings command displays the local label bindings and label bindings on the peer routers for each prefix that has a segment advertised. Peer ID here represents the IS-IS system ID of the peer.

Example

```
switch#show mpls segment-routing bindings
1.0.7.1/32
  Local binding: Label: 900002
  Remote binding: Peer ID: 1111.1111.1001, Label: imp-null
  Remote binding: Peer ID: 1111.1111.1003, Label: 900002
1.0.8.1/32
  Local binding: imp-null
  Remote binding: Peer ID: 1111.1111.1001, Label: 900004
  Remote binding: Peer ID: 1111.1111.1003, Label: 900004
1.0.9.1/32
  Local binding: Label: 900006
  Remote binding: Peer ID: 1111.1111.1001, Label: 900006
  Remote binding: Peer ID: 1111.1111.1003, Label: imp-null
```

show mpls lfib route

The show mpls lfib route command displays the LFIB. Each LFIB entry has In-Label, Out-Label, metric, payload type, nexthop information, etc. fields. The source column depicts the MPLS control plane protocol that is responsible for the label binding that resulted in this LFIB route.
### Example

```text
switch#show mpls lfib route
MPLS forwarding table (Label [metric] Vias) - 7 routes
MPLS next-hop resolution allow default route: False

Via Type Codes:
- M - Mpls Via
- P - Pseudowire Via
- I - IP Lookup Via
- V - Vlan Via
- VA - EVPN Vlan Aware Via
- ES - EVPN Ethernet Segment Via
- VF - EVPN Vlan Flood Via
- AF - EVPN Vlan Aware Flood Via
- NG - Nexthop Group Via

Source Codes:
- S - Static MPLS Route
- B2 - BGP L2 EVPN
- B3 - BGP L3 VPN
- R - RSVP
- P - Pseudowire
- L - LDP
- IP - IS-IS SR Prefix Segment

- ST - SR TE Policy
- DE - Debug LFIB

IA 100000 [1]
- via M, 1.0.1.2, pop
- payload autoDecide, ttlMode uniform, apply egress-acl
- interface Vlan2930

IA 100001 [1]
- via M, fe80::200:eff:fe02:0, pop
- payload autoDecide, ttlMode uniform, apply egress-acl
- interface Vlan2930

IP 900008 [1]
- via M, 1.0.1.2, swap 900008
- payload autoDecide, ttlMode uniform, apply egress-acl
- interface Vlan2930

IP 900009 [1]
- via M, fe80::200:eff:fe02:0, swap 900009
- payload autoDecide, ttlMode uniform, apply egress-acl
- interface Vlan2930
```

**show mpls lfib route <label value>**

The `show mpls lfib route <label value>` command provides information relevant to just the label value passed as an extension to the show command.
Example

```
switch#show mpls lfib route 900008
MPLS forwarding table (Label [metric] Vias) - 7 routes
MPLS next-hop resolution allow default route: False
Via Type Codes:
   M - Mpls Via, P - Pseudowire Via,
   I - IP Lookup Via, V - Vlan Via,
   VA - EVPN Vlan Aware Via, ES - EVPN Ethernet Segment Via,

```
For a given prefix, if both a proxy-node segment and prefix-SID are received, the prefix-SID advertised is preferred while the proxy-node segment is ignored.

The `show tech-support ribd` displays detail information about IS-IS SR’s internal state, and more information on conflicts and chosen active segments could be found under the SR Book Keeper section of `show tech-support ribd`. command as shown.

**35.4 IS-IS Graceful Restart**

IS-IS Graceful Restart (GR) is a mechanism to prevent routing protocol re-convergence during a processor switchover or device downtime. Normally, when a router restarts, all the neighboring routers associated with that router detect the device has gone down and routes from that neighbor are removed. Upon the restart of the router, the session is re-established and data transfer continues. During the restart, the removal and re-insertion of routes will result in data loss. This can be prevented by configuring graceful restart on the device.

When IS-IS is used as the interior gateway protocol (IGP), the following EOS features require nonstop forwarding (NSF) and support for the graceful restart from IS-IS:

- ASU2 – Software upgrades.
- SSO – Planned SSO initiated by an operator for maintenance or Unplanned SSO due to failures on the active supervisor.
- RIB agent restart due to software failures.

With IS-IS Graceful Restart (GR) configured, a redundancy switchover from active to standby supervisor, or ASU2, or restart of the IS-IS software (the RIB Agent) should be a hitless event if the GR completes successfully. Neighboring routers will continue to forward traffic to the restarting router and traffic forwarding through the restarting router continues without loss. If GR is successful, the failure of a router should be completely transparent to network applications.

ISIS Graceful Restart (GR) is compatible with the following platforms:

- IS-IS GR with unplanned software restart is supported on all platforms.
- IS-IS GR with SSO is supported on modular dual-supervisor platforms.
- IS-IS GR with ASU2 is supported on platforms that support ASU2.

### 35.4.1 Configuring IS-IS Graceful Restart (GR)

By default, IS-IS graceful restart is disabled. Use the `graceful-restart` command to configure graceful restart on an IS-IS router. By default IS-IS `graceful-restart-helper` functionality is enabled, and to disable it use `no graceful-restart-helper` command.

**Examples**

- In this example IS-IS graceful restart is configured with t2 wait time of 30 seconds for level-1 routes.
  
  ```
  switch(config)# router isis 1
  switch(config-router-isis)# graceful-restart t2 level-1 30
  ```

  t2 is the maximum wait time for the LSP database to synchronize (SPF computation is not done while t2 is running). t2 can be configured for either level-1 or level-2 through the CLI. The default value is 30 seconds, and the allowed configuration range is 5 to 300 seconds.

- In this example an ISIS graceful restart is configured with restart-hold-time of 50 seconds.
  
  ```
  switch(config)# router isis 1
  switch(config-router-isis)# graceful-restart restart-hold-time 50
  ```

  In case of a planned restart, the hold time advertised by the IS-IS router prior to restart should be greater than the time for which the router is expected to be offline. Otherwise, neighboring routers will bring down the adjacency before the restarting router has a chance to send a restart request in its hello packet, which may result in traffic loss.

  In case of ASU2, the IS-IS router instance will advertise a hello hold time of `<restart-hold-time>` on those interfaces for which the configured hold time is less than restart-hold-time. This is done just before the router restarts.
Note

Once the router has restarted, the router’s advertised hello hold time will depend on the “hello-interval” and “hello-multiplier” configuration on each interface as before. By default, the restart-hold-time is disabled.

Important!

For Graceful Restart to be successful, the hold time advertised by the router should be greater than the time it takes for Graceful Restart to complete. If the restarting router is DIS, hold time advertised is 1/3rd of the configured value (default is 9s). We recommend increasing the hold time for the DIS to a higher value before a planned restart; otherwise, it may result in traffic loss.

35.4.2 Displaying IS-IS Graceful Restart (GR) Information

GR State can be one of the following:

- Last Start/Restart was completed successfully.
- Last Start/Restart exited after t2 (level-1/level-2) expiry.
- Last Restart exited after t3 expiry.
- Start/Restart in progress.
- Graceful Restart was disabled during startup.

The following show commands are used to display the IS-IS graceful restart information.

- The `show isis graceful-restart vrf [vrf-name]` command displays the GR configuration and graceful-restart related state of the IS-IS instance as well as its neighbors.

Example

```
switch#show isis graceful-restart vrf default
IS-IS Instance: 1 VRF: default
System ID: 0000.0000.0001
Graceful Restart: Enabled, Graceful Restart Helper: Enabled
State: Last Start exited after T2 (level-1) expiry
T1 : 3s
T2 (level-1) : 30s/20s remaining
T2 (level-2) : 30s/not running
T3 : not running

System ID       Type   Interface     Restart Capable  Status
is-hostname-1   L1L2   Ethernet1     Yes              Running
is-hostname-2   L1     Ethernet2     Yes              Restarting
```

- The `show isis summary vrf [vrf-name]` command displays the graceful restart state and helper configuration.

Example

```
switch#show isis summary vrf default
IS-IS Instance: 1 VRF: default
System ID: 0000.0000.0001, administratively enabled

Graceful Restart: Enabled, Graceful Restart Helper: Enabled
```

- The `show isis neighbors detail vrf [vrf-name]` command displays the helper’s view of a restarting router.

Example

```
.....
Graceful Restart: Enabled, Graceful Restart Helper: Enabled
```

```
Example

switch#show isis neighbors detail vrf default
Instance VRF System Id Type Interface SNPA State Hold time Circuit Id
1 default OT1 L1 Ethernet1 2:1:0:b4:0:00 UP 29839 OT3.05
Area Address(es): 49.0001
SNPA: 2:1:0:b4:0:0
....
Graceful Restart: Supported, Status: Restarting (RR rcvd, RA sent, CSNP sent)

- The `show isis interface detail vrf [vrf-name]` command displays the graceful restart related stats for that interface.

Example

switch#show isis interface detail vrf default
ISIS Instance: ISISQ VRF: default
Interface Ethernet1:
Index: 2 SNPA: P2P
...
Level 1:
Graceful Restart Status: RR sent, SA sent, RA rcvd, CSNP rcvd
35.5 **IS-IS Commands**

**Global Configuration Commands**
- `clear isis neighbor`
- `router isis`

**Interface Configuration Commands**
- `adjacency-segment`
- `authentication key`
- `authentication mode`
- `bfd all-interfaces`
- `isis authentication key`
- `isis authentication mode`
- `isis bfd`
- `isis enable`
- `isis hello-interval`
- `isis hello-multiplier`
- `isis ipv6 metric`
- `isis lsp tx interval`
- `isis metric`
- `isis multi-topology`
- `isis network`
- `isis passive`
- `isis priority`

**Router IS-IS Configuration Mode (Includes Address-Family Mode)**
- `address-family`
- `graceful-restart (IS-IS)`
- `is-hostname`
- `is-type`
- `log-adjacency-changes (IS-IS)`
- `match isis level`
- `multi-topology`
- `net`
- `passive (IS-IS)`
- `redistribute (IS-IS)`
- `set isis level`
- `set-overload-bit`
- `shutdown (IS-IS)`
- `spf-interval`

**IS-IS Segment Routing Commands**
- `adjacency-segment`
- `adjacency-segment (static)`
- `mpls label range`
- `node-segment`
- `prefix-segment`
- `proxy-node-segment`
- `segment-routing`
- `show isis database detail`
- `show isis segment-routing`
• show isis segment-routing global-blocks
• show isis segment-routing prefix-segments
• show mpls label ranges
• show mpls lfib route
• show mpls lfib route <label value>
• show mpls segment-routing bindings

Display Commands – EXEC Mode
• show isis database
• show isis graceful-restart vrf
• show isis hostname
• show isis interface
• show isis neighbors
• show isis network topology
• show isis segment-routing adjacency-segments
• show isis summary
address-family

The `address-family` command places the switch in address-family configuration mode.

Address-family configuration mode is not a group change mode; `running-config` is changed immediately after commands are executed. The `exit` command does not affect the configuration.

The switch supports these address families:

- ipv4-unicast
- ipv6-unicast

The `no address-family` and `default address-family` commands delete the specified address-family from `running-config` by removing all commands previously configured in the corresponding address-family mode.

The `exit` command returns the switch to IS-IS configuration mode.

Command Mode
Router-IS-IS Configuration

Command Syntax

```
ADDRESS_FAMILY [ipv4 | ipv6] [MODE]
no ADDRESS_FAMILY [ipv4 | ipv6]
default ADDRESS_FAMILY [ipv4 | ipv6]
```

Parameters

- `ADDRESS_FAMILY` Options include:
  - `ipv4` IPv4 unicast
  - `ipv6` IPv6 unicast
- `MODE` Options include:
  - `<no parameter>` Defaults to unicast.
  - `unicast` All IPv4 or IPv6 addresses are active.

Example

- These commands enter the address family mode for IPv4 unicast.
  
  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#address-family ipv4 unicast
  switch(config-router-isis-af)#
  ```

- To exit from the IPv4 IS-IS unicast address family configuration mode, enter the following command.
  
  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#address-family ipv4 unicast
  switch(config-router-isis-af)#exit
  switch(config-router-isis)#
  ```
adjacency-segment

The **adjacency-segment** command configures the local or global adjacency-SID for a point-to-point interface for IS-IS adjacencies. The **no adjacency-segment** and **default adjacency-segment** commands restore the switch to its default state by removing the corresponding **adjacency-segment** command from **running-config**.

**Command Mode**
- Interface Configuration

**Command Syntax**

```
adjacency-segment <ipv4|ipv6> p2p <index|label> global
no adjacency-segment <ipv4|ipv6> p2p <index|label> global
default adjacency-segment <ipv4|ipv6> p2p <index|label> global
```

**Parameters**
- ipv4 IS-IS SR adjacency segment IPv4 interface configuration.
- ipv6 IS-IS SR adjacency segment IPv6 interface configuration.
- index Index to be assigned as Adj-SID for adjacency on this interface. The value ranges from 0 to 65535.
- label Label value to be assigned as Adj-SID for adjacency on this interface. The value ranges from 16 to 1048575.
- global global adjacency SID.

**Example**
- In this example, the global adjacency is configured on a point-to-point interface Ethernet Et1, with an index value 10.

```
Switch(config-if-Et1)#adjacency-segment ipv4 p2p index 10 global
```
**authentication key**

The *authentication key* command configures the authentication key for the IS-IS instance causing LSPs, CSNPs and PSNPs to be authenticated.

The *no authentication key* and *default authentication key* commands disables the authentication key for the IS-IS instance.

**Command Mode**

ISIS-Router Configuration

**Command Syntax**

```
authentication key [0 | 7] [LAYER_VALUE]
no authentication key [0 | 7] [LAYER_VALUE]
default authentication key [0 | 7] [LAYER_VALUE]
```

**Parameters**

- **LAYER_VALUE** layer value; options include:
  - level-1
  - level-2

**Examples**

- These commands configure authentication for the IS-IS instance causing LSPs, CSNPs and PSNPs to be authenticated.

  ```
  switch(config)#router isis 1
  switch(config-router-isis)#authentication key secret
  switch(config-router-isis)#
  ```
authentication mode

The **authentication mode** command configures authentication for the IS-IS instance causing LSPs, CSNPs and PSNPs to be authenticated.

The **no authentication mode** and **default authentication mode** commands disables authentication for the IS-IS instance.

**Command Mode**

ISIS-Router Configuration

**Command Syntax**

```plaintext
authentication mode <md5 | text> [LAYER_VALUE]
no authentication mode <md5 | text> [LAYER_VALUE]
default authentication mode <md5 | text> [LAYER_VALUE]
```

**Parameters**

- **LAYER_VALUE** layer value; options include:
  - level-1
  - level-2

**Examples**

- These commands configure authentication for the IS-IS instance causing LSPs, CSNPs and PSNPs to be authenticated.

  ```plaintext
  switch(config)#router isis 1
  switch(config-router-isis)#authentication mode md5
  switch(config-router-isis)#
  ```
**bfd all-interaces**

The `bfd all-interaces` command enables Bidirectional Forwarding Detection (BFD) for all IS-IS-enabled interfaces in the IPv4 or IPv6 address family.

Use the `isis bfd` command to configure BFD on a specific interface.

**Command Mode**

Router-Address-Family Configuration

**Command Syntax**

`bfd all-interaces`

**Example**

- These commands enable BFD for all the interfaces on which IS-IS is enabled. By default, BFD is disabled on all the interfaces.

```
switch(config)#router isis 1
switch(config-router-isis)#address-family ipv4
switch(config-router-af)#bfd all-interaces
switch(config-router-af)#
```
clear isis neighbor

The `clear isis neighbor` command clears IS-IS adjacencies that exist on an interface, or at a specific level, or the adjacencies formed with a given neighbor (either with a system ID or a hostname).

**Command Mode**
Privileged EXEC

**Command Syntax**
```
clear isis neighbor {Neighbor-ID | all | interface} [level-1 | level-2 | level-1-2]
```

**Parameters**
- **Neighbor-ID** clears adjacencies based on the system ID or the hostname of a neighbor.
- **all** clears all adjacencies.
- **interface** clears adjacencies for a specific interface.
- **level-1** level 1 only.
- **level-1-2** level 1-2 point-to-point only.
- **level-2** level 2 only.

**Examples**
- This command clears IS-IS adjacencies with a neighbor af86.3032.1a0f.
  
  switch#clear isis neighbor af86.3032.1a0f
  
  2 neighbors cleared on instance 1
  
  switch#

- This command clears all IS-IS adjacencies on an interface et1.
  
  switch#clear isis neighbor interface et1
  
  4 neighbors cleared on instance 1
  
  switch#

- This command clears IS-IS adjacencies with a neighbor af86.3032.1a0f and on interface et1.
  
  switch#clear isis neighbor af86.3032.1a0f interface et1
  
  2 neighbors cleared on instance 1
  
  switch#

- This command clears all IS-IS adjacencies at Level 1 and on interface et1.
  
  switch#clear isis neighbor interface et1 level-1
  
  2 neighbors cleared on instance 1
  
  switch#

- This command clears Level 1-2 point-to-point adjacencies only.
  
  switch#clear isis neighbor all level-1-2
  
  0 neighbors cleared on instance 1
  
  switch#
**graceful-restart (IS-IS)**

The `graceful-restart` command configures IS-IS graceful-restart. The command provides options to configure the \texttt{t2} time or the \texttt{restart-hold-time}.

\texttt{t2} is the maximum wait time for the LSP database to synchronize (SPF computation is not done while \texttt{t2} is running). \texttt{t2} can be configured for either level-1 or level-2 routes.

\texttt{restart-hold-time} is the hold time advertised by the router to its neighbors before undergoing ASU2 fast reboot.

The no `graceful-restart` and default `graceful-restart` commands disables the IS-IS graceful-restart configuration from \textit{running-config}.

**Command Mode**

Router-IS-IS Configuration

**Command Syntax**

```
graceful-restart \texttt{<t2\ |\ restart-hold-time>} \texttt{<value>}
no graceful-restart \texttt{<t2\ |\ restart-hold-time>} \texttt{<value>}
default graceful-restart \texttt{<t2\ |\ restart-hold-time>} \texttt{<value>}
```

**Parameters**

- \texttt{value} The time in seconds. Value ranges from 5 to 300 seconds.
- \texttt{restart-hold-time} Sets the hold time when restarting.
- \texttt{t2} Sets the LSP database sync wait time. Options include.

**Examples**

- In this example an ISIS graceful restart is configured with \texttt{t2} wait time of 30 seconds for level-1 routes.

```
switch(config)# router isis 1
switch(config-router-isis)# graceful-restart \texttt{t2\ level-1\ 30}
```

- In this example an ISIS graceful restart is configured with \texttt{restart-hold-time} of 50 seconds.

```
switch(config)# router isis 1
switch(config-router-isis)# graceful-restart \texttt{restart-hold-time\ 50}
```
### is-hostname

The `is-hostname` command configures the use of a human-readable string to represent the symbolic name of an IS-IS router. It also changes the output of IS-IS show commands, to show the IS-IS hostname in place of system IDs if the corresponding IS-IS hostname is known. However, syslogs still use IS-IS system IDs and not the IS-IS hostname.

By default, if a hostname is configured on the switch, it is used as the IS-IS hostname. It is also possible to unconfigure an assigned hostname for IS-IS using the `no is-hostname` command. When the IS-IS hostname is removed, the switch goes back to using the switch’s hostname as the IS-IS hostname.

#### Command Mode
Router-IS-IS Configuration

#### Command Syntax

```
is-hostname <string>
no is-hostname
```

#### Example
- These commands configure the IS-IS hostname to the symbolic name ishost1 for the IS-IS router.

```bash
switch(config)#router isis inst1
switch(config-router-isis)#is-hostname ishost1
switch(config-router-isis)#
```

- These commands unconfigure the IS-IS hostname of the symbolic name ishost1 for the IS-IS router.

```bash
switch(config)#router isis inst1
switch(config-router-isis)#no is-hostname ishost1
switch(config-router-isis)#
```
is-type

The is-type command configures the routing level for an IS-IS instance.

An IS-IS router can be configured as Level-1-2 which can form adjacencies and exchange routing information with both Level-1 and Level-2 routers. A Level-1-2 router can be configured to transfer routing information from Level-1 to Level-2 areas and vice versa (via route leaking). By default, all routes from Level-1 area are always leaked into Level-2 network.

Command Mode

Router-IS-IS Configuration

Command Syntax

    is-type LAYER_VALUE

Parameters

- \textit{LAYER\_VALUE}  \text{layer value options include:}
  - level-1
  - level-1-2
  - level-2

Example

- These commands configure Level 1-2 routing.
  
  switch(config)#router isis Osiris
  switch(config-router-isis)#is-type level-1-2
  switch(config-router-isis)#

- These commands configure Level 2 routing.
  
  switch(config)#router isis Osiris
  switch(config-router-isis)#is-type level-2
  switch(config-router-isis)#
isis authentication key

The `isis authentication key` command configures the authentication key on the interface causing IS-IS Hellos to be authenticated.

The `no isis authentication mode` and `default isis authentication mode` commands disables the authentication key for the IS-IS instance.

Command Mode
- Interface-Ethernet Configuration

Command Syntax

```
isis authentication key [0 | 7] [LAYER_VALUE]
no isis authentication key [0 | 7] [LAYER_VALUE]
default isis authentication key [0 | 7] [LAYER_VALUE]
```

Parameters
- `LAYER_VALUE` layer value; options include:
  - level-1
  - level-2

Examples
- These commands configure authentication on the interface causing IS-IS Hellos to be authenticated.

```
switch(config)#interface Ethernet 3/6
switch(config-if-Et3/6)#isis authentication mode text
switch(config-if-Et3/6)#isis authentication key 7 cAm28+9a/xPi04o7hjd8Jw==
switch(config-if-Et3/6)#
```
**isis authentication mode**

The `isis authentication mode` command configures authentication on the interface causing IS-IS Hellos to be authenticated.

The `no isis authentication mode` and `default isis authentication mode` commands disables authentication for the IS-IS instance.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

```plaintext
isis authentication mode <md5 | text> [LAYER_VALUE]
no isis authentication mode <md5 | text> [LAYER_VALUE]
default isis authentication mode <md5 | text> [LAYER_VALUE]
```

**Parameters**

- `LAYER_VALUE` layer value; options include:
  - `level-1`
  - `level-2`

**Examples**

- These commands configure authentication on the interface causing IS-IS Hellos to be authenticated.

```plaintext
switch(config)#interface Ethernet 3/6
switch(config-if-Et3/6)#isis authentication mode text
default isis authentication mode text
switch(config-if-Et3/6)#isis authentication key 7 cAm28+9a/xPi04o7jHe8Jw==
switch(config-if-Et3/6)#
```
**isis bfd**

The **isis bfd** command activates the corresponding IS-IS routing instance on the configuration mode interface. By default, the IS-IS routing instance is not enabled on an interface.

The **no isis enable** and **default isis enable** commands disable IS-IS on the configuration mode interface by removing the corresponding **isis enable** command from **running-config**.

**Command Mode**

- Interface-Ethernet Configuration

**Command Syntax**

```plaintext
isis bfd
no isis bfd
default isis bfd
```

**Examples**

- These commands enable BFD on IS-IS interfaces.

```plaintext
switch(config)#interface Ethernet 5/6
switch(config-if-Et5/6)#isis bfd
switch(config-if-Et5/6)#
```
isis enable

The **isis enable** command activates the corresponding IS-IS routing instance on the configuration mode interface. By default, the IS-IS routing instance is not enabled on an interface.

The **no isis enable** and **default isis enable** commands disable IS-IS on the configuration mode interface by removing the corresponding **isis enable** command from **running-config**.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

- `isis enable instance_id`
- `no isis enable`
- `default isis enable`

**Parameters**

- `instance_id` IS-IS instance name.

**Examples**

- These commands enable the IS-IS protocol on the interface Ethernet 4.

  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)# net 49.0001.1010.1040.1030.00
  switch(config-router-isis)#interface ethernet 4
  switch(config-if-Eth4)#isis enable Osiris
  ```

- These commands disable the IS-IS protocol on the interface Ethernet 4.

  ```
  switch(config)#interface ethernet 4
  switch(config-if-Eth4)# no isis enable
  ```
**isis hello-interval**

The `isis hello-interval` command sends Hello packets from applicable interfaces to maintain the adjacency through the transmitting and receiving of Hello packets. The Hello packet interval can be modified.

The `no isis hello-interval` and `default isis hello-interval` commands restore the default hello interval of 10 seconds on the configuration mode interface by removing the `isis hello-interval` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
```
isis hello-interval time
no isis hello-interval
default isis hello-interval
```

**Parameters**
- `time` Values range from 1 to 300; default is 10.

**Examples**
- These commands configure a hello interval of 45 seconds for VLAN 200.
  ```
  switch(config)#interface vlan 200
  switch(config-if-Vl200)#isis hello-interval 45
  switch(config-if-Vl200)#
  ```
- These commands remove the configured hello interval of 45 seconds from VLAN 200.
  ```
  switch(config)#interface vlan 200
  switch(config-if-Vl200)#no isis hello-interval
  switch(config-if-Vl200)#
  ```
- These commands configure a hello interval of 60 seconds for Ethernet 5.
  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#isis hello-interval 60
  switch(config-if-Et5)#
  ```
- These commands remove the configured hello interval of 60 seconds from Ethernet 5.
  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#no isis hello-interval
  switch(config-if-Et5)#
  ```
isis hello-multiplier

The isis hello-multiplier command specifies the number of IS-IS hello packets missed by a neighbor before the the adjacency is considered down.

The no isis hello-multiplier and default isis hello-multiplier commands restore the default hello interval of 3 on the configuration mode interface by removing the isis hello-multiplier command from running-config.

Command Mode

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

Command Syntax

```plaintext
isis hello-multiplier factor
no isis hello-multiplier
default isis hello-multiplier
```

Parameters

- **factor**  Values range from 3 to 100; default is 3

Examples

- These commands configure a hello multiplier of 4 for VLAN 200.
  ```plaintext
  switch(config)#interface vlan 200
  switch(config-if-Vl200)#isis hello-multiplier 4
  switch(config-if-Vl200)#
  ```

- These commands remove the configured hello multiplier of 4 from VLAN 200.
  ```plaintext
  switch(config)#interface vlan 200
  switch(config-if-Vl200)# no isis hello-multiplier
  switch(config-if-Vl200)#
  ```

- These commands configure a hello multiplier of 45 for Ethernet 5.
  ```plaintext
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#isis hello-multiplier 45
  switch(config-if-Et5)#
  ```

- These commands remove the configured hello multiplier of 45 from Ethernet 5.
  ```plaintext
  switch(config)#interface ethernet 5
  switch(config-if-Et5)# no isis hello-multiplier
  switch(config-if-Et5)#
  ```
**isis ipv6 metric**

The `isis ipv6 metric` command configures the IPv6 metric. The `no isis ipv6 metric` and `default isis ipv6 metric` commands restore the default metric of 10 on the configuration mode interface.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

```plaintext
isis ipv6 metric metric_value
no isis ipv6 metric
default isis ipv6 metric
```

**Parameters**

- `metric_value` Values range from 1 to 16777214; default is 10.

**Examples**

- These commands configure the IPv6 metric.

```plaintext
switch(config)#interface Ethernet 5/6
switch(config-if-Et5/6)#isis ipv6 metric 30
switch(config-if-Et5/6)#
```
isis lsp tx interval

The **isis lsp tx interval** command sets the interval at which IS-IS sends link-state information on the interface.

The **no isis lsp tx interval** and **default isis lsp tx interval** commands restores the default setting of 33 ms. by removing the **isis lsp tx interval** command from **running-config**.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```plaintext
isis lsp tx interval period
no isis lsp tx interval
default isis lsp tx interval
```

**Parameters**

- **period** Value ranges from 1 through 3000. Default interval is 33 ms.

**Examples**

- This command sets the LSP interval on interface Ethernet 5 to 600 milliseconds.
  ```plaintext
  switch(config)#interface ethernet 5
  switch(config-if-Et5)# isis lsp tx interval 600
  switch(config-if-Et5)#
  ```

- This command removes the LSP interval on interface Ethernet 5.
  ```plaintext
  switch(config)#interface ethernet 5
  switch(config-if-Et5)# no isis lsp tx interval
  switch(config-if-Et5)#
  ```
isis metric

The **isis metric** command sets cost for sending information over an interface.

The **no isis metric** and **default isis metric** commands restore the metric to its default value of 10 by removing the isis metric command from **running-config**.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```markdown
isis metric metric_cost
no isis metric
default isis metric
```

**Parameters**

- `metric_cost` Values range from 1 to 1677214. Default value is 10.

**Examples**

- These commands configure a metric cost of 30 for sending information over Ethernet 5.
  ```bash
  switch(config)#router isis Osiris
  switch(config-router-isis)#interface ethernet 5
  switch(config-if-Et5)#isis metric 30
  switch(config-if-Et5)#
  ```

- These commands remove the configured metric cost of 30 from Ethernet 5.
  ```bash
  switch(config)#router isis Osiris
  switch(config-router-isis)#interface ethernet 5
  switch(config-if-Et5)#no isis metric
  switch(config-if-Et5)#
  ```
**isis multi-topology**

The `isis multi-topology` command configures the IPv4 or IPv6 address family individually on an interface with both IPv4 and IPv6 addresses.

The `no isis multi-topology` and `default isis multi-topology` commands restores the default interface to both IPv4 and IPv6 address families.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

- `isis multi-topology address-family ipv4 unicast`
- `no isis multi-topology address-family ipv4 unicast`
- `default isis multi-topology address-family ipv4 unicast`

**Examples**

- These commands configure the IPv4 address family on an interface with both IPv4 and IPv6 addresses.
  ```
  switch(config)#interface Ethernet 5/6
  switch(config-if-Et5/6)#isis multi-topology address-family ipv4 unicast
  switch(config-if-Et5/6)#
  ```

- These commands configure the IPv6 address family on an interface with both IPv4 and IPv6 addresses.
  ```
  switch(config)#interface Ethernet 5/6
  switch(config-if-Et5/6)#isis multi-topology address-family ipv6 unicast
  switch(config-if-Et5/6)#
  ```

- These commands configure both the IPv4 and IPv6 address families on an interface.
  ```
  switch(config)#interface Ethernet 5/6
  switch(config-if-Et5/6)#no isis multi-topology address-family unicast
  switch(config-if-Et5/6)#
  ```
**isis network**

The *isis network* command sets the configuration mode interface as a point-to-point link. By default, interfaces are configured as broadcast links.

The *no isis network* and *default isis network* commands set the configuration mode interface as a broadcast link by removing the corresponding *isis network* command from *running-config*.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `isis network point-to-point`
- `no isis network`
- `default isis network`

**Examples**
- These commands configure Ethernet interface 10 as a point-to-point link.
  ```
  switch(config)#interface ethernet 10
  switch(config-if-Et10)# isis network point-to-point
  ```
- This command restores Ethernet interface 10 as a broadcast link.
  ```
  switch(config-if-Et10)#no isis network
  ```
**isis passive**

The `isis passive` command disables IS-IS on an interface configured as passive. The switch won't send or process IS-IS packets received on passive interfaces. The switch will continue to advertise the IP address in the LSP.

The `no isis passive` command enables IS-IS on the interface. The `default isis passive` command sets the interface to the default interface activity setting by removing the corresponding `isis passive` or `no isis passive` statement from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
isis passive
no isis passive
default isis passive
```

**Examples**

- These commands configure Ethernet interface 10 as a passive interface.

  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#interface ethernet 10
  switch(config-if-Et10)# isis passive
  switch(config-if-Et10)#
  ```

- This command enables IS-IS on Ethernet interface 10.

  ```
  switch(config-if-Et10)#no isis passive
  switch(config-if-Et10)#
  ```
**isis priority**

The `isis priority` command sets the IS-IS priority for the interface.

The default priority is 64. The network device with the highest priority will be elected as the designated intermediate router to send link-state advertisements for that network.

The `no isis priority` and `default isis priority` commands restore the default priority (64) on the configuration mode interface.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
isis priority  priority_level
no isis priority
default isis priority
```

**Parameters**

- `priority_level` Value ranges from 0 to 127. Default value is 64.

**Examples**

- These commands configure a IS-IS priority of 60 on interface Ethernet 5.

  
  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#interface ethernet 5
  switch(config-if-Et5)#isis priority 60
  switch(config-if-Et5)#
  ```

- These commands restores the default IS-IS priority of 64 from interface Ethernet 5.

  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#interface ethernet 5
  switch(config-if-Et5)#no isis priority
  switch(config-if-Et5)#
  ```

- These commands configure the switch with a priority of 64 for VLAN 7.

  ```
  switch(config)#interface vlan 7
  switch(config-if-Vl7)#isis priority 64
  switch(config-if-Vl7)#
  ```

- These command restores the default IS-IS priority of 64 for VLAN 7.

  ```
  switch(config)#interface vlan 7
  switch(config-if-Vl7)#no isis priority
  switch(config-if-Vl7)#
  ```
log-adjacency-changes (IS-IS)

The **log-adjacency-changes** command sets the switch to send syslog messages when it detects link state changes or when it detects that a neighbor state has changed.

The default option is active when **running-config** does not contain any form of the command. Entering the command in any form replaces the previous command state in **running-config**.

**Command Mode**

Router-IS-IS Configuration

**Command Syntax**

```
log-adjacency-changes
no log-adjacency-changes
default log-adjacency-changes
```

**Examples**

- These commands configure the switch to send a syslog message when a neighbor state changes.

  switch(config)#**router isis Osiris**
  switch(config-router-isis)#**log-adjacency-changes**
  switch(config-router-isis)#

- These commands configure not to log the peer changes.

  switch(config)#**router isis Osiris**
  switch(config-router-isis)#**no log-adjacency-changes**
  switch(config-router-isis)#
**match isis level**

The `match isis level` command configures a route map to match on ISIS level. It filters the Level-1 or Level-2 routes by using route map's match statement.

The `no match isis level` and `default match isis level` commands disables the match ISIS level configuration from `running-config`.

**Command Mode**

Route-map Configuration

**Command Syntax**

```
match isis level [level-1|level-2]
no match isis level [level-1|level-2]
default set isis level [level-1|level-2]
```

**Parameters**

- **level-1**  IS-IS level 1
- **level-2**  IS-IS level 2

**Example**

- These commands place the switch in route-map mode, and configures a route map to match isis level to level-1.

```
switch(config)#route-map Test
switch(config-route-map-test)# match isis level level-1
```
multi-topology

The `multi-topology` command configures IS-IS Multi-Topology (MT) support (disabled by default), enabling an IS-IS router to compute a separate topology for IPv4 and IPv6 links in the network. With MT configured, not all the links in a network need to support both IPv4 and IPv6. Some can support IPv4 or IPv6 individually. The IPv4 SPF will install IPv4 routes using the IPv4 topology, and similarly the IPv6 SPF will install IPv6 routes using the IPv6 topology. Without MT support, all links in an IS-IS network need to support the same set of address families. When MT is enabled, and each link has a separate IPv4 metric and IPv6 metric.

The `no multi-topology` and `default multi-topology` commands restores the default interface to both IPv4 and IPv6 address families.

**Command Mode**
- Router IS-IS Address Family Configuration

**Command Syntax**
- `multi-topology`
- `no multi-topology`
- `default multi-topology`

**Examples**
- These commands configure MT for the IS-IS router.
  ```
  switch(config)#router isis 1
  switch(config-router-isis)#address-family ipv6 unicast
  switch(config-router-isis-af)#multi-topology
  ```
- These commands unconfigure MT for the IS-IS router.
  ```
  switch(config)#router isis 1
  switch(config-router-isis)#address-family ipv6 unicast
  switch(config-router-isis-af)#no multi-topology
  ```
**net**

The `net` command configures the Network Entity Title of the IS-IS instance. By default, no NET is defined.

The `no net` and `default net` commands removes the NET from *running-config*.

**Command Mode**

Router-IS-IS Configuration

**Command Syntax**

- `net mask_hex`
- `no net`
- `default net`

**Parameters**

- `mask_hex` mask value. Format is hh.hhhh.hhhh.hhhh.hhhh.hhhh.hhhh.hhhh.hhhh.00.

**Examples**

- These commands specify the NET as 49.0001.1010.1040.1030.00, in which the system ID is 1010.1040.1030, area ID is 49.0001.

  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)# net 49.0001.1010.1040.1030.00
  switch(config-router-isis)#
  ```
  
- These commands remove NET 49.0001.1010.1040.1030.00 from *running-config*.

  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)# no net 49.0001.1010.1040.1030.00
  switch(config-router-isis)#
  ```
passive (IS-IS)

The `passive` command disables IS-IS on a passive interface. The switch will continue to advertise the IP address in the LSP.

The `no passive` command enables IS-IS on the interface. The `default passive` command sets the interface to the default interface activity setting by removing the corresponding `passive` or `no passive` statement from `running-config`.

Command Mode

Router-IS-IS Configuration

Command Syntax

```
passive INTERFACE_NAME
no passive INTERFACE_NAME
default passive INTERFACE_NAME
```

Parameters

- `INTERFACE_NAME` Options include:
  - `ethernet e_range` Ethernet interface list.
  - `loopback l_range` Loopback interface list.
  - `port-channel p_range` Channel group interface list.
  - `vlan v_range` VLAN interface list.

Valid `e_range`, `l_range`, `p_range`, and `v_range` formats include number, range, or comma-delimited list of numbers and ranges.

Examples

- These commands configure Ethernet interface 10 as a passive interface.
  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)# passive interface ethernet 10
  ```

- This command restores Ethernet interface 10 as an active interface.
  ```
  switch(config-if-Et10)#no passive
  switch(config-if-Et10)#
  ```
redistribute (IS-IS)

The `redistribute` command redistributes the specified types of routes into IS-IS.

The `no redistribute` and `default redistribute` commands disable route redistribution from the specified domain by removing the corresponding `redistribute` statement from `running-config`.

Command Mode
   Router-IS-IS Configuration

Command Syntax
   ```
   redistribute ROUTE_TYPE
   no redistribute ROUTE_TYPE
   default redistribute ROUTE_TYPE
   ```

Parameters
   - `ROUTE_TYPE` The route type for which routes are redistributed. These are the option to include.
     - `bgp` Redistribution of BGP routes.
     - `connected` Redistribution of connected routes.
     - `ospf` Redistribution of OSPF routes.
     - `ospfv3` Redistribution of OSPFv3 routes.
     - `static` Redistribution of static routes.

Examples
   - These commands redistribute connected routes into the IS-IS domain.
     ```
     switch(config)#router isis Test
     switch(config-router-isis)#redistribute connected
     ```
   - These commands redistribute static routes into the IS-IS domain.
     ```
     switch(config)#router isis Test
     switch(config-router-isis)#redistribute static
     ```
   - These commands redistribute the BGP routes into ISIS domain in `address-family` mode.
     ```
     Switch(config)#router isis 1
     Switch(config-router-isis)#address-family ipv4
     Switch(config-router-isis-af)#redistribute bgp route-map bgp-to-isis-v4
     ```
   - These commands redistribute the BGP routes into ISIS domain in `router-isis` mode.
     ```
     Switch(config)#router isis 1
     Switch(config-router-isis)#redistribute bgp route-map bgp-to-isis
     ```
### router isis

The `router isis` command places the switch in router ISIS configuration mode.

Router ISIS configuration mode is not a group change mode; `running-config` is changed immediately after commands are executed. The `exit` command does not affect the configuration.

The `no router isis` command deletes the IS-IS instance.

The `exit` command returns the switch to global configuration mode.

#### Command Mode

- **Global Configuration**

#### Command Syntax

```
router isis instance_name [VRF_INSTANCE]
no router isis instance_name
default router isis instance_name
```

#### Parameters

- **instance_name** routing instance.
- **VRF_INSTANCE**
  - `<no parameter>`
  - `vrf vrf_name`

#### Examples

- These commands places the switch in router IS-IS mode and creates an IS-IS routing instance named Osiris.
  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#
  ```
- This command attempts to open an instance with a different routing instance name from that of the existing instance. The switch displays an error and stays in global configuration mode.
  ```
  switch(config)#router isis Osiris
  % More than 1 ISIS instance is not supported
  switch(config)#
  ```
- This command deletes the IS-IS instance.
  ```
  switch(config)#no router isis Osiris
  switch(config)#
  ```
set isis level

The `set isis level` command configures a route map to set ISIS level.

The `no set isis level` and `default set isis level` commands disables the set ISIS level configuration from `running-config`.

**Command Mode**
Route-map Configuration

**Command Syntax**

```
set isis level [level-1|level-2|level-1-2]
no set isis level [level-1|level-2|level-1-2]
default set isis level [level-1|level-2|level-1-2]
```

**Parameters**

- **level-1**  IS-IS level 1
- **level-2**  IS-IS level 2
- **level-1-2**  IS-IS level 1 and level 2

**Example**

- These commands place the switch in route-map mode, and configures a route map to set isis level to level-1.

```
switch(config)#route-map Test
switch(config-route-map-test)# set isis level level-1
```
set-overload-bit

The `set-overload-bit` command used without the on-startup option will inform other devices not to use this switch in SPF computation. When used with the on-startup parameter, the overload bit is set for the interval after startup.

The `no set-overload-bit` and `default set-overload-bit` commands removes the corresponding `set-overload-bit` command from `running-config`.

**Command Mode**

Router-IS-IS Configuration

**Command Syntax**

```
set-overload-bit TIMING
no set-overload-bit
default set-overload-bit
```

**Parameters**

- **TIMING**
  - Options include:
    - `<no parameter>`
    - `on-startup <1 to 3600>`

**Example**

- These commands configure the switch to set the overload bit to 120 seconds after startup.
  
  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#set-overload-bit on-startup 120
  switch(config-router-isis)#
  ```

- These commands remove the configured overload bit of 120 seconds from the `running-config`.
  
  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#no set-overload-bit on-startup
  switch(config-router-isis)#
  ```
show isis database

The `show isis database` command displays the link state database of IS-IS. The default command displays active routes and learned routes.

**Command Mode**

EXEC

**Command Syntax**

```
show isis database [INSTANCES] [INFO_LEVEL]
show isis database [INFO_LEVEL] VRF_INSTANCE
```

**Parameters**

- **INSTANCES** Options include:
  - <no parameter>
  - instance_name
- **INFO_LEVEL** Options include:
  - <no parameter>
  - detail
- **VRF_INSTANCE** specifies the VRF instance.
  - <no parameter>
  - vrf vrf_name

**Display Values**

- ISIS Instance
- LSPID
- Seq Num
- Cksum
- Life
- IS

**Examples**

- This command displays general information about the link state database of IS-IS.

```
switch>show isis database

ISIS Instance: Osiris
ISIS Level 2 Link State Database

LSPID    Seq Num  Cksum  Life  IS Flags
1212.1212.1212.00-00  4         714    1064  L2 <>
1212.1212.1212.0a-00  1         57417  1064  L2 <>
2222.2222.2222.00-00  6         15323  1116  L2 <>
2727.2727.2727.00-00 10        15596  1050  L2 <>

switch>
**show isis graceful-restart vrf**

The `show isis graceful-restart vrf` command displays the GR configuration and graceful-restart related state of the IS-IS instance as well as its neighbors.

**Command Mode**

EXEC

**Command Syntax**

`show isis graceful-restart vrf <vrf-name>`

**Example**

- In this example the `show isis graceful-restart` command displays the output for the default vrf instance.

  ```
  switch#show isis graceful-restart vrf default
  IS-IS Instance: 1 VRF: default
  System ID: 0000.0000.0001
  Graceful Restart: Enabled, Graceful Restart Helper: Enabled
  State: Last Start exited after T2 (level-1) expiry
  T1 : 3s
  T2 (level-1) : 30s/20s remaining
  T2 (level-2) : 30s/not running
  T3 : not running

  System ID       Type   Interface     Restart Capable  Status
  is-hostname-1   L1L2   Ethernet1     Yes              Running
  is-hostname-2   L1     Ethernet2     Yes              Restarting
  ```
**show isis hostname**

The **show isis hostname** command displays mapping between the System ID and IS-IS hostname.

**Command Mode**

EXEC

**Command Syntax**

```
show isis hostname
```

**Examples**

- This command mapping between the System ID and IS-IS hostnames host1 and host2.

```
switch>show isis hostname
ISIS Instance: 1 VRF: default
Level System ID Hostname
L1 1111.1111.1001 host1
L1 1111.1111.1002 host2
```
show isis interface

The show isis interface command displays interface information for the IS-IS instance.

Command Mode
EXEC

Command Syntax
show isis interface [INSTANCES] [INTERFACE_NAME] [INFO_LEVEL]
show isis interface [INTERFACE_NAME] [INFO_LEVEL] VRF_INSTANCE

Parameters
- **INSTANCES** Options include:
  - <no parameter>
  - instance_name
- **INTERFACE_NAME** Values include
  - <no parameter> all interfaces.
  - ethernet e_num Ethernet interface specified by e_num.
  - loopback l_num Loopback interface specified by l_num.
  - management m_num Management interface specified by m_num.
  - port-channel p_num Port channel interface specified by p_num.
  - vlan v_num VLAN interface specified by v_num.
  - vxlan vx_num VXLAN interface specified by vx_num.
- **INFO_LEVEL** Options include:
  - <no parameter>
  - detail
- **VRF_INSTANCE** specifies the VRF instance.
  - <no parameter>
  - vrf vrf_name

Display Values
- ISIS Instance
- System ID
- Index
- MTU
- Metric
- LAN-ID
- DIS
- Type
- Interface
- SNPA
- State
- Hold time
Examples

- This command displays general IS-IS information for instance Osiris.

```
switch>show isis interface

ISIS Instance: Osiris
  Interface Vlan20:
    Index: 59 SNPA: 0:1c:73:c:5:7f
    MTU: 1497 Type: broadcast
    Level 2:
      Metric: 10, Number of adjacencies: 2
      LAN-ID: 1212.1212.1212, Priority: 64
      DIS: 1212.1212.1212, DIS Priority: 64
  Interface Ethernet30:
    Index: 36 SNPA: 0:1c:73:c:5:7f
    MTU: 1497 Type: broadcast
    Level 2:
      Metric: 10, Number of adjacencies: 1
      LAN-ID: 3030.3030.3030, Priority: 64
      DIS: 3030.3030.3030, DIS Priority: 64
```
This command displays detailed IS-IS information for instance Osiris.

```
switch>show isis interface detail
```

**ISIS Instance: Osiris**

**Interface Vlan20:**
- Index: 59 SNPA: 0:1c:73:c:5:7f
- MTU: 1497 Type: broadcast
- Level 2:
  - Metric: 10, Number of adjacencies: 2
  - LAN-ID: 1212.1212.1212, Priority: 64
  - DIS: 1212.1212.1212, DIS Priority: 64
- Adjacency 2222.2222.2222:
  - State: UP, Level: 2 Type: Level 2 IS
  - Hold Time: 30, Supported Protocols: ipv4, ipv6
  - SNPA: 2:1:0:c:0:0, Priority: 64
  - IPv4 Interface Address: 10.1.1.3
  - IPv6 Interface Address: fe80::1:ff:fe0c:0
  - Areas: 49.0001
- Adjacency 1212.1212.1212:
  - State: UP, Level: 2 Type: Level 2 IS
  - Hold Time: 9, Supported Protocols: ipv4, ipv6
  - SNPA: 2:1:0:d:0:0, Priority: 64
  - IPv4 Interface Address: 10.1.1.2
  - IPv6 Interface Address: fe80::1:ff:fe0d:0
  - Areas: 49.0001

**Interface Ethernet30:**
- Index: 36 SNPA: 0:1c:73:c:5:7f
- MTU: 1497 Type: broadcast
- Level 2:
  - Metric: 10, Number of adjacencies: 1
  - LAN-ID: 3030.3030.3030, Priority: 64
  - DIS: 3030.3030.3030, DIS Priority: 64
- Adjacency 3030.3030.3030:
  - State: UP, Level: 2 Type: Level 2 IS
  - Hold Time: 9, Supported Protocols: ipv4, ipv6
  - SNPA: 2:1:0:b:0:0, Priority: 64
  - IPv4 Interface Address: 30.1.1.2
  - IPv6 Interface Address: fe80::1:ff:fe0b:0
  - Areas: 49.0001
show isis neighbors

The show isis neighbors command displays IS-IS neighbor information.

Command Mode
EXEC

Command Syntax
show isis neighbors [INSTANCES] [INFO_LEVEL]
show isis neighbors [INFO_LEVEL] VRF_INSTANCE

Parameters
• INSTANCES  Options include:
  • <no parameter>
  • instance_name

• INFO_LEVEL  Options include:
  • <no parameter>
  • detail

• VRF_INSTANCE  specifies the VRF instance.
  • <no parameter>
  • vrf vrf_name

Display Values
• Inst. ID
• System ID
• Type
• Interface
• SNPA
• State
• Hold time
• Area Address

Examples
• This command displays general information about the IS-IS neighbors.

  switch(config)#show isis neighbors
  Inst Id   System Id            Type Interface       SNPA              State Hold time
  10        2222.2222.2222       L2   Vlan20          2:1:0:c:0:0       UP    30
  10        1212.1212.1212       L2   Vlan20          2:1:0:d:0:0       UP    9
  10        3030.3030.3030       L2   Ethernet30      2:1:0:b:0:0       UP    9

  switch(config)#
show isis network topology

The show isis network topology command displays a list of all connected devices in all areas.

Command Mode
EXEC

Command Syntax
   show isis network topology
   show isis INSTANCES topology
   show isis network topology VRF_INSTANCE

Parameters
• INSTANCES  Options include:
  • <no parameter>
  • instance_name
• VRF_INSTANCE specifies the VRF instance.
  • <no parameter>
  • vrf vrf_name

Display Values
• System Id
• Metric
• Next-Hop
• Interface
• SNPA

Examples
• This command displays forwarding state for ports mapped to all VLANs.

   switch>show isis network topology

   ISIS Instance: Osiris VRF: default
   ISIS IP paths to level-2 routers
   System Id    Metric  Next-Hop            Interface  SNPA
   00e0.52b5.7800   20   10.110.2.1      1/7       00e0.22b5.5843

   switch>
This command displays detailed information about the IS-IS neighbors.

```
switch(config)# show isis neighbors detail

switch(config)#
```
**show isis segment-routing adjacency-segments**

The **show isis segment-routing adjacency-segments** command displays the global adjacency SID value and other related information.

**Command Mode**

EXEC

**Command Syntax**

`show isis segment-routing adjacency-segments`

**Examples**

- In this example the **show isis segment-routing adjacency-segments** command displays the output for the interface configured like this:

  ```
  interface Ethernet1
  ip address 1.1.1.1/24
  ipv6 address 1000::1/64
  isis enable isis1
  isis network point-to-point
  adjacency-segment ipv4 p2p index 1 global
  adjacency-segment ipv6 p2p index 2 global
  ```

  The show output for the above interface configuration:

  ```
  Switch# show isis segment-routing adjacency-segments
  System ID: 1000.0000.0002                       Instance: isis1
  SR supported Data-plane: MPLS                   SR Router ID: 1.1.1.4
  Adjacency Segment Count: 2                     Adjacency Segment Count: 2
  Flag Descriptions: F: Ipv6 address family, B: Backup, V: Value
                     L: Local, S: Set
  Segment Status codes: L1 - Level-1 adjacency, L2 - Level-2 adjacency, P2P - Point-to-Point adjacency, LAN - Broadcast adjacency
  Locally Originated Adjacency Segments
  Adj IP Address  Local Intf  SID  SID Source  Flags              Type

```
show isis summary

The **show isis summary** command displays information about the configured IS-IS instances.

**Command Mode**

EXEC

**Command Syntax**

```
show isis summary
show isis \[INSTANCES\] summary
show isis summary VRF_INSTANCE
```

**Parameters**

- **INSTANCES** Options include:
  - <no parameter>
  - `instance_name`
- **VRF_INSTANCE** specifies the VRF instance.
  - <no parameter>
  - `vrf vrf_name`

**Display Values**

- System ID
- IPv4 Preference
- IPv6 Preference
- IS-Types
- LSP Generation interval
- SPF Interval
- Current SPF Hold Interval
- IS-Types Run Time
- Area Addresses
- Designated Intermediate Systems (DIS) Interfaces
- Link State Database (LSDB) size

**Display Status**

- Multi Topology
- Authentication Mode
- Graceful Restart
- Graceful Restart Helper
Example

- This command displays general information about the configured IS-IS instances.

    switch(config-router-isis-af)#show isis summary

    IS-IS Instance: 1 VRF: default
    System ID: 0000.0000.0001, administratively enabled
    Multi Topology disabled, not attached
    IPv4 Preference: Level 1: 115, Level 2: 115
    IPv6 Preference: Level 1: 115, Level 2: 115
    IS-Type: Level 1 and 2, Number active interfaces: 0
    Routes both IPv4 and IPv6

    Max wait(s) Initial wait(ms) Hold interval(ms)
    LSP Generation Interval: 5 50 50
    SPF Interval: 2 1000 1000
    Current SPF hold interval(ms): Level 1: 1000, Level 2: 1000
    Last Level 1 SPF run 1 seconds ago
    Last Level 2 SPF run 1 seconds ago
    Authentication mode: Level 1: None, Level 2: None
    Graceful Restart: Disabled, Graceful Restart Helper: Enabled

    Area Addresses:
    49.0001
    level 1: number dis interfaces: 0, LSDB size: 1
    level 2: number dis interfaces: 0, LSDB size: 1
**shutdown (IS-IS)**

The `shutdown` command disables IS-IS on the switch without modifying the IS-IS configuration. The `no shutdown` and `default shutdown` commands enable the IS-IS instance by removing the `shutdown` command from `running-config`.

**Command Mode**
- Router-IS-IS Configuration

**Command Syntax**

```
shutdown
no shutdown
default shutdown
```

**Examples**

- These commands disable IS-IS on the switch.
  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#shutdown
  switch(config-router-isis)#
  ```

- This command enables IS-IS on the switch.
  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#no shutdown
  switch(config-router-isis)#
  ```
The `spf-interval` command sets the Shortest Path First (SPF) timer that defines the interval between IS-IS path calculations. The default value is two seconds.

This command also configures the maximum wait interval between any two SPF runs, initial wait interval before executing the first SPF computation, and the hold time between the first and second SPF runs.

The `no spf-interval` and `default spf-interval` commands restore the default maximum IS-IS path calculation interval to two seconds by removing the `spf-interval` command from `running-config`.

For information about viewing SPF interval values, see `Verify IS-IS Instance Information`.

**Command Mode**
- Router-IS-IS Configuration

**Command Syntax**
```
spf-interval max-wait [initial-wait | hold-time]
default spf-interval
no spf-interval
```

**Parameters**
- `max-wait` Value ranges from 1 through 300 seconds. Default maximum wait interval is two seconds.
- `initial-wait` Value ranges from 1 through 300000 ms. Default initial wait interval is 1000 ms.
- `hold-time` Value ranges from 1 through 300000 ms. Default hold interval is 1000 ms.

**Guidelines**
EOS does not support configuring topology-specific SPF timers in multi-topology deployments and IS-IS level-specific SPF timers.

**Examples**
- This command configures the SPF maximum wait interval to 50 seconds.
  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#spf-interval 50
  ```
- This command configures maximum wait interval, initial wait interval, and hold time to 20 seconds, 10000 ms, and 5000 ms respectively.
  ```
  switch(config)#router isis inst1
  switch(config-router-isis)#spf-interval 20 10000 5000
  ```
- This command reverts the SPF interval configuration to its default value.
  ```
  switch(config)#router isis Osiris
  switch(config-router-isis)#no spf-interval
  ```
**segment-routing**

The `segment-routing` command places the switch in the `segment-routing mpls sub-config` mode. By default IS-IS SR is shutdown.

The `no segment-routing` command deletes all the IS-IS SR configuration.

The `exit` command returns the switch to the global configuration mode.

**Command Mode**

Router IS-IS Configuration

**Command Syntax**

```
segment-routing mpls
no segment-routing mpls
```

**Parameter**

- `mpls` Specifies segment routing in MPLS dataplane.

**Example**

- The following commands explicitly enables the IS-IS SR in the MPLS dataplane.

```
switch(config)#router isis instance1
switch(config-router-isis)#segment-routing mpls
switch(config-router-isis-sr-mpls)#no shutdown
```
**mpls label range**

The `mpls label range` command derives the indices of the actual MPLS label on the SRGB advertised by the router. The default value of SRGB in EOS is Base: 900000, Size: 65536. In other words, the labels that any global segment could represent is between 900000-965535.

**Command Mode**
Global Configuration

**Command Syntax**
```
mpls label range <value>
```

**Parameters**
- `value` Specifies the Segment Routing global range.
  - `dynamic` Specifies labels reserved for dynamic assignment. Default value is (100000) (262144).
  - `IS-IS-sr` Specifies labels reserved for IS-IS SR global segment identifiers (SIDs). Default value is (900000) (65536).
  - `static` Specifies labels reserved for static MPLS routes. Default value is (16) (99984).

**Example**
- The following command configures an IS-IS SR global range with a value of (900000)-- starting label range, (65536)--Numbers of labels to reserve.
  ```
  switch(config)#mpls label range isis-sr 900000 65536
  ```
node-segment

The `node-segment` command associates the node-segments with prefix mask length /32 (IPv4) or /128 (IPv6) addresses. Node-segment is configured on IS-IS enabled loop-back interface(s).

Command Mode
Loop-back Interface Configuration

Command Syntax
```
node-segment [ipv4 | ipv6] index <value>
```

Parameters
- `ipv4` Specifies the IPv4 node configuration.
- `ipv6` Specifies the IPv6 node configuration.
- `index` Node segment identifier.
- `value` Index to be mapped with IP prefix. Value ranges from 0-65535.

Examples
- The following commands are used to associate a node-segment with an IPv4 address.
  ```
  switch(config)#int loopback 1
  switch(config-if-Lo1)#ip address 21.1.1.1/32
  switch(config-if-Lo1)#node-segment ipv4 index 5
  ```
- The following commands are used to associate a node-segment with an IPv6 address.
  ```
  switch(config)#int loopback 1
  switch(config-if-Lo1)#ipv6 add 2000::24/128
  switch(config-if-Lo1)#node-segment ipv6 index 5
  ```
- The following example shows a warning thrown at the CLI when a /32 or /128 address is not configured on the interface.
  ```
  switch(config)#int loopback 1
  switch(config-if-Lo1)#ip address 21.1.1.1/24
  switch(config-if-Lo1)#node-segment ipv4 index 1
  ! /32 IPv4 address is not configured on the interface
  ```
- The following command removes the node-segment from IS-IS SR from an interface.
  ```
  switch(config-if-Lo1)#no node-segment ipv4 index 1
  ```
**prefix-segment**

The `prefix-segment` command associates prefix segments with any IS-IS prefix a router is originating an IP Reachability TLV for.

**Command Mode**  
Segment-Routing MPLS Configuration

**Command Syntax**  
`prefix-segment ip-address index <value>`

**Parameters**
- `ip-address` It can be IP address, or IP address with prefix, or an IPv6 address prefix.
- `index` Node segment identifier.
- `value` Index to be mapped with IP prefix. Value ranges from 0-65535.

**Example**
- The following commands are used to associate a prefix segment with an IPv4 address with index value of 50.

```plaintext
switch(config)#router isis instance1  
switch(config-router-isis)#segment-routing mpls  
switch(config-router-isis-sr-mpls)#prefix-segment 1.1.0/24 index 50
```
proxy-node-segment

The *proxy-node-segment* command configures a proxy-node-SID for an IS-IS prefix originating from the router that does not support IS-IS SR.

**Command Mode**
Segment-Routing MPLS Configuration

**Command Syntax**
```
proxy-node-segment ip-address index <value>
```

**Parameters**
- *ip-address* It can be IP address, or IP address with prefix, or an IPv6 address prefix.
- *index* Node segment identifier.
- *value* Index to be mapped with IP prefix. Value ranges from 0-65535.

**Example**
- A proxy-node-segment associates a /32 or a /128 route with an SID as shown below.

```
switch(config)#router isis instance1
switch(config-router-isis)#segment-routing mpls
switch(config-router-isis-sr-mpls)#proxy-node-segment 1.1.1.0/32 index 50
```
adjacency-segment

The *adjacency-segment* command allocates adjacency segments to all IS-IS adjacencies, or only those adjacencies which are to IS-IS routers that have advertised IS-IS SR capability, or to none of the adjacencies.

**Command Mode**

Segment-Routing MPLS Configuration

**Command Syntax**

```
adjacency-segment allocation [all-interface | none | sr-peers]
```

**Parameters**

- *allocation*  Allocation of Adjacency Segments.
- *all-interfaces*  Allocates adjacency segments to all IS-IS adjacencies.
- *none*  Disable automatic adjacency segment allocation.
- *sr-peers*  Allocate adjacency segments to IS-IS adjacencies with SR peers.

**Example**

- This command allocates the adjacency segment to an sr-peer.

```
switch(config-router-isis-sr-mpls)#adjacency-segment allocation sr-peer
```
adjacency-segment (static)

The adjacency-segment command configures IS-IS adjacencies statically on the switch, so that these values are preserved even when the switch restarts. The no and the default form of the command places the switch back to the global configuration mode.

Command Mode

Interface Ethernet Configuration

Command Syntax

adjacency-segment <ipv4|ipv6> p2p [[[label <label-value>]] | [index <index-value> global]]

Parameters

- ipv4  IS-IS SR adjacency segment IPv4 interface configuration.
- ipv6  IS-IS SR adjacency segment IPv6 interface configuration.
- label  Label value to be assigned as Adj-SID for adjacency on this interface. Value ranges from 16 to 1048575.
- index  Index to be assigned as Adj-SID for adjacency on this interface. Value ranges from 0 to 65535.
- global  global adjacency SID.

Example

- This command allocates the adjacency segment to an IPv4 p2p interface with a index value 50.

  switch(config-if-Et1)#adjacency-segment ipv4 p2p index 50 global
show isis database detail

The **show isis database detail** command displays a view of LSPDB of different devices in the IS-IS domain.

**Command Mode**

EXEC

**Command Syntax**

`show isis database detail`

**Example**

- The command output displays the TLVs and sub-TLVs that are being self-originated or the ones that have been received from other routers.

```
switch#show isis database detail

show isis segment-routing

The **show isis segment-routing** command displays the summary information on IS-IS SR status.

**Command Mode**

EXEC

**Command Syntax**

```
show isis segment-routing
```

**Example**

- The command output displays the summary information on IS-IS SR status.

```
switch(config)#show isis segment-routing
System ID: 1111.1111.1002   Instance: inst1
SR supported Data-plane: MPLS   SR Router ID: 252.252.2.252
SR Global Block( SRGB ): Base: 900000 Size: 65536

```

**About the Output**

The first line of the output shows the IS-IS system ID of this device and the name of the instance with which IS-IS is configured.

The supported dataplane is shown against the SR supported Data-plane field whereas the Router ID being advertised in the Router Capability is mentioned in the SR Router ID Field.

The SRGB in use and the MPLS label pool being used for adjacency segment allocation are mentioned in this output. The current adjacency allocation mode which refers to whether we are allocating adjacency segments to all IS-IS adjacencies or only those adjacencies which support SR or None of the adjacencies is shown in the Adj-SID allocation mode field.

Flag contents of All Prefix Segments originated on this router, Flag contents of All Adjacency Segments originated on this router and supported IS-IS Reachability Algorithm have been provided through this command output and they carry the meaning as per the IS-IS SR IETF draft.

This show command provides a statistics related to IS-IS SR in terms of various counters ranging from number of IS-IS SR enabled peers, number of Node-SIDs, prefix-SIDs, proxy-node-segments and adjacency segments being originated on this router in IS-IS.

The **show isis segment-routing** command also provides information if segment routing has been administratively disabled as shown.

```
switch(config-router-isis-sr-mpls)#sh isis segment-routing
! IS-IS (Instance: inst1) Segment Routing has been administratively shutdown
```
show isis segment-routing global-blocks

The `show isis segment-routing global-blocks` command lists the SRGBs in use by all SR supporting devices in IS-IS domain including the SRGB in use by IS-IS SR on this device.

**Command Mode**

EXEC

**Command Syntax**

`show isis segment-routing global-blocks`

**Example**

```
switch#sh isis segment-routing global-blocks
System ID: 1111.1111.1002           Instance: inst1
SR supported Data-plane: MPLS       SR Router ID: 252.252.2.252
SR Global Block( SRGB ): Base: 900000  Size: 65536
Number of ISIS segment routing capable peers: 3
                  SystemId           Base     Size
-------------------- ------------ -----  
1111.1111.1002           900000   65536
1111.1111.1001           900000   65536
```
show isis segment-routing prefix-segments

The `show isis segment-routing prefix-segments` command provides the details of all prefix segments being originated as well the segments received from IS-IS SR speakers in the domain.

**Command Mode**

EXEC

**Command Syntax**

```
show isis segment-routing global-blocks
```

**Example**

```
switch# show isis segment-routing prefix-segments
System ID: 1111.1111.1002  Instance: inst1
SR supported Data-plane: MPLS  SR Router ID: 252.252.2.252
Node: 2  Proxy-Node: 2  Prefix: 2  Total Segments: 6
Flag Descriptions: R: Re-advertised, N: Node Segment, P: no-PHP
                   E: Explicit-NULL, V: Value, L: Local
Segment status codes: * - Self originated Prefix, L1 - level 1, L2 - level 2

  1.0.15.1/32    18     Proxy-Node  R:0 N:0 P:0 E:0 V:0 L:0     1111.1111.1001      L2
  1.0.16.1/32    20     Proxy-Node  R:0 N:0 P:0 E:0 V:0 L:0     1111.1111.1003      L2
```

**About the Output**

After the usual output header that represents the system ID, instance name, etc and parameters of a router, there is a line depicting prefix segment counters. Each field in this line relates to the number of segments that are present in this router’s IS-IS instance. For example, the above example shows that this device has 2 Node Segments (Self originated as well as the ones received from other IS-IS SR devices).

The main section of this show command’s output is the section that lists all the prefix segments and related information like prefix, SID, type of segment (Prefix, Node, Proxy-Node), the flag values being carried in the sub-TLVs of these prefix segments and the system ID of the originating router. The Type field will be useful on a IS type level-1-2 router. It shows whether the installed prefix segment is from a level-1 prefix or a level-2 prefix.
show mpls label ranges

The **show mpls label ranges** command displays the MPLS label range available on a router is categorized into different pools which cater to different applications running on the router.

**Command Mode**

EXEC

**Command Syntax**

`show mpls label ranges`

**Example**

```
switch#show mpls label ranges
Start    End      Size     Usage
-----------------------------------------
0        15       16       reserved
16       99999    99984    static mpls
100000   116383   16384    isis (dynamic)
116384   362143   245760   free (dynamic)
362144   899999   537856   unassigned
900000   965535   65536    isis-sr
```
show mpls segment-routing bindings

The `show mpls segment-routing bindings` command displays the local label bindings and label bindings on the peer routers for each prefix that has a segment advertised. Peer ID here represents the IS-IS system ID of the peer.

**Command Mode**

EXEC

**Command Syntax**

`show mpls segment-routing bindings`

**Example**

```
switch#show mpls segment-routing bindings
1.0.7.1/32
  Local binding: Label: 900002
  Remote binding: Peer ID: 1111.1111.1001, Label: imp-null
  Remote binding: Peer ID: 1111.1111.1003, Label: 900002
1.0.8.1/32
  Local binding: Label: imp-null
  Remote binding: Peer ID: 1111.1111.1001, Label: 900004
  Remote binding: Peer ID: 1111.1111.1003, Label: 900004
1.0.9.1/32
  Local binding: Label: 900006
  Remote binding: Peer ID: 1111.1111.1001, Label: 900006
  Remote binding: Peer ID: 1111.1111.1003, Label: imp-null
```
show mpls lfib route

The `show mpls lfib route` command displays the LFIB. Each LFIB entry has In-Label, Out-Label, metric, payload type, nexthop information, etc. fields. The source column depicts the MPLS control plane protocol that is responsible for the label binding that resulted in this LFIB route.

**Command Mode**

EXEC

**Command Syntax**

`show mpls lfib route`

**Example**

```
switch# show mpls lfib route
MPLS forwarding table (Label [metric] Vias) - 7 routes
MPLS next-hop resolution allow default route: False
Via Type Codes:

   payload autoDecide, ttlMode uniform, apply egress-acl
   interface Vlan2930
```
**show mpls lfib route <label value>**

The `show mpls lfib route <label value>` command provides information relevant to just the label value passed as an extension to the show command.

**Command Mode**

**EXEC**

**Command Syntax**

```
show mpls lfib route <label value>
```

**Example**

```
switch# show mpls lfib route 900008
MPLS forwarding table (Label [metric] Vias) - 7 routes
MPLS next-hop resolution allow default route: False

```
Chapter 36

Multiprotocol Label Switching (MPLS)

Tunneling protocols encapsulate packets of a different protocol as the payload of a larger frame for delivery within networks utilizing the encapsulating protocol. Tunneling facilitates the delivery of payload over an incompatible delivery network and creates a secure path through an untrusted network. Protocols that this chapter describes include MPLS, Decap Groups, and Nexthop Groups.

Sections in this chapter include:

- Section 36.1: MPLS
- Section 36.2: BGP/MPLS L3 VPN
- Section 36.3: Decap Groups
- Section 36.4: Nexthop Groups
- Section 36.5: MPLS Commands

36.1 MPLS

These sections describe the Arista MPLS implementation:

- Section 36.1.1: MPLS Description
- Section 36.1.2: MPLS Configuration

36.1.1 MPLS Description

36.1.1.1 MPLS Overview

Multiprotocol Label Switching (MPLS) is a networking process that replaces complete network addresses with short path labels for directing data packets to network nodes. The labels identify virtual links (paths) between distant nodes rather than endpoints. MPLS is scalable and protocol-independent. Data packets are assigned labels, which are used to determine packet forwarding destinations without examining the packet.

Arista switches utilize MPLS to improve efficiency and control from servers through data centers and to the WAN. The MPLS implementation supports static MPLS tunneling that is manually configured on each switch or established over a network by an SDN controller. The configuration is specified by a set of rules that filter packets based on matching criteria. Each rule applies MPLS-related actions to packets that match the rule's criteria. Each rule includes a metric that the switch uses to select an action when multiple rules match a packet.
36.1.1.2 MPLS Implementation

MPLS static rule parameters contain the following:

- A 20-bit value that is compared to the top header label of each MPLS packet. Other rule parameters may be applied to packets whose top label match this value.
- A nexthop location that specifies the packet’s next destination (IPv4 or IPv6) and the interface through which the switch forwards the packet.
- An MPLS label stack management action that is performed on filtered packets:
  - pop-payload: removes the top label from stack; this terminates an LSP (label-switched path).
  - swap-label: replaces top label with a specified new label; this passes a packet along an LSP.
- A rule metric that the switch uses to select a rule when multiple rules match an MPLS packet.

Packets that do not match any MPLS rules are dropped.

36.1.1.3 MPLSoGRE Filtered Mirroring

In MPLS over Generic Routing Encapsulation (MPLSoGRE) filtered mirroring, IPv4 over MPLS over GRE (IPv4oMPLSoGRE) and IPv6 over MPLS over GRE (IPv6oMPLSoGRE) packets that enter a GRE tunnel endpoint on which MPLS lookup is performed, are selected for mirroring based on the destination IP address field in the inner IPv4 or IPv6 header.

Note

These packets are not selected for mirroring if they are forwarded based on either the L2 or outer L3 header destination address.

Figure 36-1 shows the header format of the packets that are selected for mirroring.

Figure 36-1: Header Format of Packets

<table>
<thead>
<tr>
<th>Ethernet</th>
<th>Outer IPv4</th>
<th>GRE</th>
<th>MPLS</th>
<th>Inner IPv4</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ethernet</td>
<td>Outer IPv4</td>
<td>GRE</td>
<td>MPLS</td>
<td>Inner IPv6</td>
</tr>
</tbody>
</table>

When mirroring to a GRE tunnel, the payload of the outgoing GRE packet contains the payload of the incoming source packet starting from the MPLS header. L2 and outer L3 headers are stripped from the mirror copy. When the MPLS lookup fails, the packet is still eligible for mirroring based on the selection criteria defined in the ACL.

36.1.2 MPLS Configuration

MPLS routing is enabled through the `mpls ip` command.

- This command enables MPLS routing.

```bash
switch(config)#mpls ip
switch(config)#show running-config
```
Example

mpls ip
!

disable
switch(config)#

MPLS rules are created by the **mpls static** command. MPLS static rules identify a set of MPLS packets by a common top label and defines the method of handling these packets.

**Examples**

- These commands create an MPLS rule that matches packets with a top label value of 3400 and causes the removal of the top label from the header stack. The next-hop destination of the IPv4 payload is IP address 10.14.4.4 through Ethernet interface 3/3/3. This rule has a metric value of 100.

```plaintext
switch(config)#mpls static top-label 3400 ethernet 3/3/3 10.14.4.4 pop payload-type ipv4
switch(config)#show running-config

! mpls static top-label 3400 Ethernet3/3/3 10.14.4.4 pop payload-type ipv4
!

disable
switch(config)#
```

- These commands create a backup rule that forwards the packet through Ethernet interface 4/3. This rule's metric value of 150 assigns it backup status prior to the first rule.

```plaintext
switch(config)#mpls static top-label 3400 ethernet 4/3 10.14.4.4 pop payload-type ipv4 metric 150
switch(config)#show running-config

! mpls static top-label 3400 Ethernet4/3 10.14.4.4 pop payload-type ipv4 metric 150
mpls static top-label 3400 Ethernet3/3/3 10.14.4.4 pop payload-type ipv4
!

disable
switch(config)#
```

- These commands create an MPLS rule that forwards the packet to the next-hop address through any interface.

```plaintext
switch(config)#mpls static top-label 4400 10.15.46.45 pop payload-type ipv4
switch(config)#show running-config

! mpls static top-label 4400 10.15.46.45 pop payload-type ipv4 metric 150
mpls static top-label 3400 Ethernet4/3 10.14.4.4 pop payload-type ipv4 metric 150
mpls static top-label 3400 Ethernet3/3/3 10.14.4.4 pop payload-type ipv4
mpls static top-label 4400 10.15.46.45 pop payload-type ipv4
!

disable
switch(config)#
```
This command configures a static tunnel for the tunnel endpoint 64.0.0.1 and pushes a label 11111 to it.

```
switch(config)#mpls static STATIC 64.0.0.1/32 54.0.0.1 Port-Channel7 label-stack 11111
```

The switch’s MPLS static rule configuration for specified routes and rules is displayed by `show mpls route`.

**Example**

- This command displays the MPLS rule configuration.

```
switch>show mpls config route
In-Label  Out-Label  Metric  Payload  NextHop
3400      pop        100     ipv4     10.14.4.4,Et3/3/3
3400      pop        150     ipv4     10.14.4.4,Et4/3
switch>
```

Statistics about the configuration and implementation of MPLS rules are displayed by the `show mpls route summary` command.

**Example**

- This command displays a summary of MPLS rule implementation.

```
switch>show mpls route summary
Number of Labels: 1 (1 unprogrammed)
Number of adjacencies in hardware: 0
Number of backup adjacencies: 2
switch>
```

**36.1.2.1 Egress IPv4/IPv6 over MPLS ACLs**

IPv4/IPv6 over MPLS packets are now eligible for ACLs at the egress stage by default, applicable only to IPv4/IPv6 over MPLS packets that are MPLS label popped (i.e. if the label is at the bottom of stack). The user can override this behavior if required, thereby disabling egress ACLs for certain MPLS labels by configuration. No special configuration is required to enable egress ACLs on IPv4/IPv6 over MPLS packets.

**Example**

- This command disables egress ACLs for MPLS top-label 12000 on the egress interface 120.1.1.1 nexthop address.

```
switch(config)#no mpls static top-label 12000 120.1.1.1 pop payload-type ipv6
```

- This command enables egress ACLs for MPLS top-label 12000 on the egress interface 120.1.1.1 nexthop address.

```
switch(config)#mpls static top-label 12000 120.1.1.1 pop payload-type ipv6
```

**36.1.2.2 Configuring MPLSoGRE Filtered Mirroring**

The filtered mirroring of terminated MPLSoGRE packets is configured by creating an IPv4 access-list, and then attaching the IPv4 access-list to a monitor session source where a tunnel decap group has been configured. This IPv4 access-list has rules that match to either inner IPv4 or IPv6 destination addresses.
Enabling the TC-Counters TCAM Profile

The following limitations are applicable to MPLS over GRE filtered mirroring in tc-counters TCAM profile:

- Security ACLs are not enforced on IPv4/MPLSoGRE and IPv6/MPLSoGRE terminated packets.
- The rules of a mirroring-ACL are set to match either inner IPv4 or inner IPv6 header fields, but not both.

The ACLs containing rules to match both inner IPv4 and inner IPv6 header fields are not applicable to a single source interface in multiple mirroring sessions. In other words, all ACLs applied to a shared source interface must contain either inner IPv4 rules or inner IPv6 rules.

The commands below switch to the tc-counters TCAM profile in the running configuration.

Example

```
switch(config)#hardware tcam
switch(config-hw-tcam)#system profile tc-counters
switch(config-hw-tcam)#exit
```

Defining Two IPv4 Access-Lists

The `ip access-list` command places the switch in ACL configuration mode, which is a group change mode that modifies an IPv4 access control list. The command specifies the name of the IPv4 ACL that subsequent commands modify and creates an ACL if it references a nonexistent list. All changes in a group change mode edit session are pending till the end of the session.

The `permit (Role)` command configures one access-list to match the inner IPv4 address, and the other access-list to match the inner IPv6 address.

Example

```
switch(config)# ip access-list dIPv4
switch(config)# 10 permit ip any any inner ip any host 5.5.5.5
switch(config)# exit
switch(config)# ip access-list dIPv6
switch(config)# 10 permit ip any any inner ipv6 any host 55::55
switch(config)# exit
```

Attaching Access-Lists

The `monitor session source` and `monitor session destination` commands allow to attach two access-lists to two different monitor session sources.
Example

```
switch(config)# monitor session sess1 source et1 rx ip access-group dIPv4
switch(config)# monitor session sess1 destination tunnel mode gre source 1.1.1.1
destination 2.2.2.2
switch(config)# monitor session sess2 source et2 rx ip access-group dIPv6
switch(config)# monitor session sess2 destination tunnel mode gre source 3.3.3.3
destination 4.4.4.4
switch(config)# show monitor session

Session sess1
----------------------------
Source Ports:
  Rx Only:     Et1(IP ACL: dIPv4)

Destination Ports:

  status          source            dest TTL DSCP  proto        VRF fwd-drop
  Gre1 :  active         1.1.1.1         2.2.2.2 128    0 0x88be    default       no

Session sess2
----------------------------
Source Ports:
  Rx Only:     Et2(IP ACL: dIPv6), Et5(IP ACL: dIPv6)

Destination Ports:

  status          source            dest TTL DSCP  proto        VRF fwd-drop
  Gre2 :  active         3.3.3.3         4.4.4.4 128    0 0x88be    default       no
```

switch(config)#
36.2 BGP/MPLS L3 VPN

Border Gateway Protocol/ Multiprotocol Label Switching (BGP/MPLS) L3 Virtual Private Network (VPN) allows a Service Provider (SP) or an Enterprise to provide the service of interconnecting geographically dispersed customer sites. This type of service can be provided to multiple customers over the common network backbone infrastructure of the Service Provider, while:

- Maintaining privacy of each customer
- Allowing for overlapping IP addresses among customers
- Having constrained route distribution – such as, only those routers in the Service Provider’s network that need the customer routes, have them.

Achieve the above through the extensions to BGP as defined in RFC 4364 for IPv4 and RFC 4659 for IPv6, and the use of VPN Routing and Forwarding Tables (VRFs), Route Distinguishers (RDs), and Route Targets (RTs).

BGP/MPLS L3 VPN is available when configuring BGP in the multi-agent routing protocol model.

- Section 36.2.1: Platform Compatibility
- Section 36.2.2: Operation
- Section 36.2.3: Configuration
- Section 36.2.4: Show Commands
- Section 36.2.5: Syslog Messages
- Section 36.2.6: Limitations

36.2.1 Platform Compatibility

The following platforms support BGP/MPLS L3 VPN.

- 7280R
- 7500R

36.2.2 Operation

A Virtual Private Network, or VPN, is a set of geographically dispersed sites attached to the Service Provider’s (SP) backbone, with IP interconnectivity amongst the sites. Using this scenario, the customer can obtain “VPN service” from the SP. The SP will provide a VPN service to multiple customers, using this common backbone network infrastructure. The sample VPN topology diagram below illustrates three sites where a customer is being interconnected over the SP backbone network.

At each site, the Customer Edge router (CE) attaches to the Provider’s Edge router (PE). The CE can attach to more than one PE, and in these cases the CE is said to be “multi-homed”. The routers in the SP core network, those which do not attach to any CE, are referred to as “P” routers. The “P” routers do not need to know about the customer routes.

The CE attaches to PE in a VRF. The routes learned from the CE are programmed in the corresponding VRF and the PE then distributes the routes to other PEs as “VPN routes” using MP-BGP. This is done by using two new BGP address families, VPN-IPv4 (AFI=1, SAFI=128) and VPN-IPv6 (AFI=2, SAFI=128).

On the PEs, corresponding to the VPN, VRFs configure with the RD and one or more import and export RTs. The RD attaches to the customer route to create a VPN route. By picking a unique RD for each VRF and attaching it to the customer route, the VPN route is unique. This allows for customers with overlapping IP addresses to be managed by the Service Provider. This unique VPN route is advertised to other PEs along with the configured export RT and the VPN label. The PE router allocates a VPN label per VRF and address family. The PE router programs its Label FIB (LFIB) with this label...
information. When the PE router receives an incoming MPLS packet with the VPN label as the topmost label, it pops the label and does an IP lookup in the associated VRF. The PE router also maintains a mapping of import RTs to the corresponding VRFs. This mapping is used later when deciding into which VRFs a received VPN route should be imported into.

The PE learns customer routes from the CE through the PE-CE routing protocol, which could be Static routing, EBGP, OSPF, or ISIS. The PE will install those customer routes in the associated VRF, with the CE as the nexthop. The customer routes in the VRF are exported into the BGP VPN table as VPN routes, along with the VPN label and the configured export RTs as BGP path attributes. These VPN routes are then advertised to other PEs which have been activated for the VPN address-families (VPN-IPv4/VPN-IPv6). The PE then sets itself as the nexthop while advertising the VPN routes. The PE which receives those VPN routes strips out the RD and imports them as IPv4 or IPv6 routes into the VRFs. The list of VRFs into which the route is imported is determined based on the mapping of import RTs to VRFs. These routes will be programmed into the FIB along with the VPN label and the remote PE as the nexthop. Once these routes are installed in the VRF, the CE connected to that VRF will learn those routes (based on the PE-CE routing protocol) and make it available in the customer network that it is attached to. This way the geographically dispersed customer sites learn of each other’s networks and IP reachability is established between the them.

36.2.2.1 Forwarding

In the Service Provider’s core network there should be MPLS LSPs between the PEs. That is, the connection to the VPN next-hop should be over an MPLS tunnel. The MPLS LSPs in the core could be setup using RSVP-TE or LDP in conjunction with OSPF/ISIS or ISIS-SR.

When the PE receives an IP packet from the CE destined to the remote site, it does an IP lookup in the VRF to which the CE is connected. This lookup provides the VPN label to be used and the nexthop, which would be the remote-PE. The VPN label is imposed on the IP packet and the resulting MPLS packet is then tunnelled through the MPLS LSP to the remote PE. As result of penultimate hop popping, the MPLS packet arrives at the remote PE with the VPN label as the topmost label. The label lookup results in the VPN label being popped and an IP lookup will be done in the associated VRF. Note that the PE would have programmed this label action when it allocated the label to start with. That IP lookup will result in the IP packet being forwarded out to the CE.

36.2.3 Configuration

Configuring BGP/MPLS L3 VPN involves enabling the SP core for MPLS and then configuring the PEs with the required BGP configuration.
It is assumed that the SP core network is enabled for MPLS. This involves configuring an IGP (OSPF/ISIS) followed by a label distribution protocol such as LDP, RSVP-TE or ISIS-SR. Typically, loopback interfaces are configured on all the PE and the P routers and the IGPs exchange reachability to those loopback interfaces. And then the MPLS Label Distribution Protocol will set up MPLS LSPs/tunnels between all those loopbacks.

Enabling MPLS and LDP on the PE involves the following steps:

**Step 1** Configure terminal.

switch#configure terminal

**Step 2** Enter the Loopback0 interface config mode

switch(config)#interface Loopback0

**Step 3** Enter destination IP address

switch(config)#ip address 11.0.0.1/32

**Step 4** Enable MPLS routing.

switch(config)#mpls ip

**Step 5** Configure MPLS LDP.

switch(config)#mpls ldp

**Step 6** Configure the router ID interface.

switch(config-mpls-ldp)#router-id interface Loopback0

**Step 7** Configure for no shutdown.

switch(config-mpls-ldp)#no shutdown

Example:

```
switch#configure terminal
switch(config)#interface Loopback0
switch(config-if)#ip address 11.0.0.1/32
switch(config)#mpls ip
switch(config)#mpls ldp
switch(config-mpls-ldp)#router-id interface Loopback0
switch(config-mpls-ldp)#no shutdown
```

Configuring BGP on the PE involves the following steps.

**Step 1** Configure terminal.

switch#configure terminal
**Step 2** Configure the BGP router. In this scenario, the BGP router is configured AS 64512.

```
switch(config)#router bgp 64512
```

**Step 3** Configure the neighbor IPv4 address, then the neighbor’s autonomous system. In this example, the IPv4 address is 10.0.0.2 and the neighbor’s autonomous system is AS 64512.

```
switch(config-router-bgp)#neighbor 10.0.0.2 remote-as 64512
```

**Step 4** Enable extended send communities attributes.

```
switch(config-router-bgp)#neighbor 10.0.0.2 send-community extended
```

**Step 5** Enable MPLS L3 VPN IP-v4 unicast address family.

```
switch(config-router-bgp)#address-family vpn-ipv4
```

**Step 6** Activate the neighbor for the VPN address family on neighbor 10.0.0.2.

```
switch(config-router-bgp-af)#neighbor 10.0.0.2 activate
```

**Step 7** Optionally, configure the interface from which the system will pick the nexthop while advertising the VPN routes.

```
switch(config-router-bgp-af)#neighbor default encapsulation mpls next-hop-self source-interface Loopback0
```

**Step 8** Enable MPLS L3 VPN IP-v6 unicast address family.

```
switch(config-router-bgp)#address-family vpn-ipv6
```

**Step 9** Configure MPLS L3 VPN IP-v6 unicast address family on neighbor 10.0.0.2.

```
switch(config-router-bgp-af)#neighbor 10.0.0.2 activate
```

**Step 10** Configure MPLS encapsulation next hop on the Loopback0 interface.

```
switch(config-router-bgp-af)#neighbor default encapsulation mpls next-hop-self source-interface Loopback0
```

**Step 11** Configure VRF. In the example, vrf1 is selected.

```
switch(config-router-bgp)#vrf vrf1
```

**Step 12** Configure the BGP router distinguisher. In this example, 11.0.0.1:0 is selected.

```
switch(config-router-bgp-vrf-vrf1)#rd 11.0.0.1:0
```

**Step 13** Configure the import route targets. In this example, the route import targets for the VPN IPv4 and VPN IPv6 are 300:0.

```
switch(config-router-bgp-vrf-vrf1)#route-target import vpn-ipv6 300:0
switch(config-router-bgp-vrf-vrf1)#route-target import vpn-ipv4 300:0
```
Step 14 Configure the export route targets. In this example, the route export targets for the VPN IPv4 and VPN IPv6 are 300:0.

```
switch(config-router-bgp-vrf-vrf1)#route-target export vpn-ipv6 300:0
switch(config-router-bgp-vrf-vrf1)#route-target export vpn-ipv4 300:0
```

Step 15 Connect the interface routes.

```
switch(config-router-bgp-vrf-vrf1)#redistribute connected
```

Step 16 Redistribute static routes into BGP.

```
switch(config-router-bgp-vrf-vrf1)#redistribute static
```

Example:

```
switch#configure terminal
switch(config)#router bgp 64512
switch(config-router-bgp)#neighbor 10.0.0.2 remote-as 64512
switch(config-router-bgp)#neighbor 10.0.0.2 send-community extended
switch(config-router-bgp)#address-family vpn-ipv4

switch(config-router-bgp-af)#neighbor 10.0.0.2 activate
switch(config-router-bgp-af)#neighbor default encapsulation mpls next-hop-self source-interface Loopback0
switch(config-router-bgp)#address-family vpn-ipv6
switch(config-router-bgp-af)#neighbor 10.0.0.2 activate
switch(config-router-bgp-af)#neighbor default encapsulation mpls next-hop-self source-interface Loopback0

switch(config-router-bgp)#vrf vrf1
switch(config-router-bgp-vrf-vrf1)#rd 11.0.0.1:0
switch(config-router-bgp-vrf-vrf1)#route-target import vpn-ipv6 64512:0
switch(config-router-bgp-vrf-vrf1)#route-target import vpn-ipv4 64512:0
switch(config-router-bgp-vrf-vrf1)#route-target export vpn-ipv6 64512:0
switch(config-router-bgp-vrf-vrf1)#route-target export vpn-ipv4 64512:0
switch(config-router-bgp-vrf-vrf1)#redistribute connected
switch(config-router-bgp-vrf-vrf1)#redistribute static
```

36.2.3.1 Enabling BGP to Exchange the Routing Tables with the Peer

- Enabling the send-community extended knob on the neighbor. This essentially enables BGP to exchange the RTs with the peer.
- Activating the peer (the remote PE) under the address-family VPN-IPv4 and address-family VPN-IPv6 modes enables BGP to negotiate the MPLS L3 VPN address families.
- Specify the address for the VPN next-hop using the command, `neighbor default encapsulation mpls next-hop-self source-interface Loopback0`.

In the above configuration example, the system uses the address 11.0.0.1 from interface Loopback0 as the nexthop in the VPN route advertisements.
36.2.3.2 Configuring the VRF Information

First, the VRF must be configured in the global mode and IPv4 and IPv6 routing must be enabled in the VRF. After that, under the router bgp mode, we need to configure the VRF and provide the information related to RD and import and export RTs.

**Step 1** Configure terminal.

```
switch#configure terminal
```

**Step 2** Enable IP routing.

```
switch(config)#ip routing
```

**Step 3** Enable IP routing for the VRF.

```
switch(config)#ip routing vrf vrf1
```

**Step 4** Enable IPv6 routing for the VRF.

```
switch(config)#ipv6 unicast-routing vrf vrf1
```

**Example:**

```
switch#configure terminal
switch(config)#ip routing
switch(config)# ip routing vrf vrf1
switch(config)#ipv6 unicast-routing vrf vrf1
```

The VRF configuration under router BGP mode is shown below.

```
switch(config-router-bgp-vrf-vrf1)#show active
router bgp 300
  vrf vrf1
    rd 11.0.0.1:0
    route-target import vpn-ipv6 300:0
    route-target import vpn-ipv4 300:0
    route-target export vpn-ipv6 300:0
    route-target export vpn-ipv4 300:0
    redistribute connected
    redistribute static
switch(config-router-bgp-vrf-vrf1)#
```

36.2.3.3 Configuring the Route Distinguisher

The Route Distinguisher (RD) is structured such that it can be easily configured and managed. It is configured by specifying two fields separated by a colon, as in administrative-subfield: assigned-number-subfield. The administrative subfield could contain either an IP address, as shown in the example (the PEs loopback address), or the AS number. The assigned-number-subfield can be any number which is determined by the SP. The primary requirement of the RD is that it must be unique per VRF. It is possible to have overlapping address space between VRFs, the intent of the RD is to ensure that a VPN route can be uniquely identified as it is received by a remote PE. However, the identification of which VRF(s) the received VPN route should be imported into is handled by the import RTs configured on the remote PE.
36.2.3.4 Configuring Route Targets

Next is the import and export Route Target configuration. The RTs are structured similar to the RDs. They too are made up of administrative-subfield: assigned-number-subfield. In the example shown, the AS number has been used as the administrative subfield. And the value 0 has been used for the assigned number subfield. It is the RT that plays an important role in identifying the VPN.

- Received VPN routes with the import RT as path attributes will be imported into the VRF will have RTs has extended-community BGP path attributes. They will be imported into VRFs which import RT configuration for RTs in the received VPN route.
- And while advertising the routes from the VRF as VPN routes, the export RT will be attached to the route as an extended-community BGP attribute.
  a In the example shown, the connected and static routes in the VRF are redistributed into BGP. And these routes will be exported as VPN routes.
  b It is also possible to have a BGP session with the CE. In that case, routes received over that session are exported as VPN routes. And imported routes are advertised to the CE.

36.2.3.5 Configuring Import / Export Route-maps

The routes that are imported into a VRF can be further controlled by applying an import route-map. And the routes that are exported from the VRF can be controlled by applying an export route-map.

Complete the following steps:

**Step 1** Configure terminal.

```
switch#configure terminal
```

**Step 2** Configure BGP. In this example, BGP is configured AS 4274781899.

```
switch(config)#router bgp 4274781899
```

**Step 3** Configure the VRF under router bgp mode

```
switch(config-router-bgp)#vrf vrf1
```

**Step 4** Select the BGP route distinguisher. In this example, 36351:268450419 is selected.

```
switch(config-router-bgp-vrf-vrf1)#rd 36351:268450419
```

**Step 5** Configure the import route-target VPN-IPv4, unicast address family. In this example, 36351:1001 is selected.

```
switch(config-router-bgp-vrf-vrf1)#route-target import vpn-ipv4 36351:1001
```

**Step 6** Configure another import route-target for VPN-IPv4 unicast address family. In this example, 36351:268450419 is selected.

```
switch(config-router-bgp-vrf-vrf1)#route-target import vpn-ipv4 36351:268450419
```

**Step 7** Configure the export route-target for VPN-IPv4 unicast address family. In this example, 36351:268450419 is selected.

```
switch(config-router-bgp-vrf-vrf1)#route-target export vpn-ipv4 36351:268450419
```

**Step 8** Configure the import route-map. In this example, the import route-map name is BGP-IMPORT-VRF-SERVICES.

```
switch(config-router-bgp-vrf-vrf1)#route-target import vpn-ipv4 route-map BGP-IMPORT-VRF-SERVICES
```
**Step 9** Configure the export route-map. In this example, the export route-map name is `BGP-EXPORT-VRF-VRF1`.

```
switch(config-router-bgp-vrf-vrf1)#route-target export vpn-ipv4 route-map BGP-EXPORT-VRF-VRF1
```

**Step 10** Optionally, redistribute connected routes in the VRF into BGP, with the associated route-map `BGP-ANNOUNCE-CONNECTED`.

```
switch(config-router-bgp-vrf-vrf1)#redistribute connected route-map BGP-ANNOUNCE-CONNECTED
```

**Step 11** Optionally, redistribute static routes in the vrf into BGP, with associated route-map `BGP-ANNOUNCE-STATIC`.

```
switch(config-router-bgp-vrf-vrf1)#redistribute static route-map BGP-ANNOUNCE-STATIC
```

**Step 12** The import and export route-maps should be separately configured. The configuration snippet below shows the configuration of the same route-map `BGP-IMPORT-VRF-SERVICES`.

```
switch(config-router-bgp-vrf-vrf1)#route-map BGP-IMPORT-VRF-SERVICES permit 10
switch(config-route-map-BGP-IMPORT-VRF-SERVICES)#match extcommunity SERVICES
switch(config-route-map-BGP-IMPORT-VRF-SERVICES)#match ip address prefix-list SERVICES
```

**Example:**

```
switch#configure terminal
switch(config)#router bgp 4274781899
switch(config-router-bgp)#vrf vrf1
switch(config-router-bgp-vrf-vrf1)#rd 36351:268450419
switch(config-router-bgp-vrf-vrf1)#route-target import vpn-ipv4 36351:1001
switch(config-router-bgp-vrf-vrf1)#route-target import vpn-ipv4 36351:268450419
switch(config-router-bgp-vrf-vrf1)#route-target export vpn-ipv4 36351:268450419
switch(config-router-bgp-vrf-vrf1)#route-target import vpn-ipv4 route-map BGP-IMPORT-VRF-SERVICES
switch(config-router-bgp-vrf-vrf1)#route-target export vpn-ipv4 route-map BGP-EXPORT-VRF-VRF1
switch(config-router-bgp-vrf-vrf1)#redistribute connected route-map BGP-ANNOUNCE-CONNECTED
switch(config-router-bgp-vrf-vrf1)#redistribute static route-map BGP-ANNOUNCE-STATIC

switch(config-router-bgp-vrf-vrf1)#route-map BGP-IMPORT-VRF-SERVICES permit 10
switch(config-route-map-BGP-IMPORT-VRF-SERVICES)#match extcommunity SERVICES
switch(config-route-map-BGP-IMPORT-VRF-SERVICES)#match ip address prefix-list SERVICES
```
36.2.3.6 VPN Next-hop

By default, the system uses the source address of the BGP session as the next-hop in the VPN advertisements. This source address is determined by the system while establishing the TCP session between the PEs. If the SP want to use a different address as the VPN next-hop, then an interface with that address must be specified under the BGP address-family VPN-IPv4 or address-family VPN-IPv6 configuration modes. For example,

```bash
switch(config-router-bgp)#address-family vpn-ipv4
switch(config-router-bgp-af)#neighbor 10.0.0.2 activate
switch(config-router-bgp-af)#neighbor default encapsulation mpls next-hop-self source-interface Loopback0

switch(config-router-bgp)#address-family vpn-ipv6
switch(config-router-bgp-af)#neighbor 10.0.0.2 activate
switch(config-router-bgp-af)#neighbor default encapsulation mpls next-hop-self source-interface Loopback0
```

**Note**
Configuring the next-hop-self source interface described above results in the BGP session being reset.

In the previous example, the interface *Loopback 0* has been specified. The system picks the VPN next-hop address from the interface based on the following rules:

- For VPN-IPv4, the IPv4 address from the interface is picked.
- For VPN-IPv6,
  - For an IPv4 peer,
    - Pick the IPv4 address from the interface.
    - If the interface does not have a IPv4 address, pick the IPv6 address.
  - For an IPv6 peer,
    - Pick the IPv6 address from the interface.
    - If the interface does not have an IPv6 address, pick the IPv4 address.

For VPN-IPv6, when an IPv4 address is picked as the next-hop, it is encoded as a IPv4-mapped IPv6 address in the VPN route advertisement. This is as per RFC 4659.
36.2.4 Show Commands

Use the `show bgp instance vrf vrf1` command to show the BGP instance status for a specific VRF to verify the route-targets and import/export route-maps being used. The command also displays the locally allocated MPLS label that the system has allocated for IPv4 and IPv6.

```
switch#show bgp instance vrf vrf1
BGP instance information for VRF vrf1
BGP Local AS: 4274781899, Router ID: 169.254.156.10
Total peers: 0
  Static peers: 0
  Dynamic peers: 0
  Disabled peers: 0
  Established peers: 0
Four Octet ASN mode enabled
Graceful restart helper mode disabled
Graceful restart mode disabled
Graceful restart timer timeout: 00:05:00
End of rib timer timeout: 00:05:00
Attributes of the reflected routes are not preserved
UCMP mode: disabled
Peer mac resolution timeout: 00:00:00
BGP IPv4 Listen Port Status: listening on port 179
BGP IPv6 Listen Port Status: listening on port 179
BGP Convergence information:
  BGP has converged: yes, Time taken to converge: 00:00:31
  Outstanding EORs: 0, Outstanding Keepalives: 0
  Convergence timeout: 00:05:00
BGP Convergence timer is inactive
BGP Convergence based update synchronization is disabled
BGP Convergence slow-peer timeout: 00:01:30
Address-family IPv4 Unicast:

  Nexthop matches local IP address: 0
Local AS is 300, local router ID 0.0.0.1
Local TCP address is 10.0.0.1, local port is 179
Remote TCP address is 10.0.0.2, remote port is 47400
```
Use the `show bgp vpn-ipv4 summary` command to show the status of VPN-IPv4 peers. While the examples below are with respect to VPN-IPv4, the same set of commands are applicable to VPN-IPv6.

```
switch# show bgp vpn-ipv4 summary
BGP summary information for VRF default
Router identifier 0.0.0.1, local AS number 300
Neighbor Status Codes: m - Under maintenance
        Neighbor   V  AS  MsgRcvd   MsgSent  InQ OutQ  Up/Down State  PfxRcd PfxAcc
          10.0.0.2   4  300    3379        60    0    0    1d23h Estab  1    1
```

Use the `show bgp vpn-ipv4` command to show how the VPN-IPv4 routes sent and received.

```
switch# show bgp vpn-ipv4
BGP routing table information for VRF default
Router identifier 0.0.0.1, local AS number 300
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e - ECMP
        S - Stale, c - Contributing to ECMP, b - backup
        % - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link
Local Nexthop
           Network             Next Hop         Metric  LocPref Weight Path
* >     RD: 11.0.0.1:0 IPv4 prefix 20.0.0.0/24
        -                -       -       0       i
* >     RD: 11.0.1.1:0 IPv4 prefix 20.0.1.0/24
             11.0.1.1       100     0       i
```

Each entry in the output represent a VPN path in the VPN table. For each VPN path, the RD and actual prefix along with the nexthop information is shown. Paths in the VPN table are either received from other VPN-IPv4 peers (other PEs) or exported from local VRFs.

In the above output, 20.0.0.0/24 is a local route that has been exported. Notice that it has been prepended with the RD `11.0.0.1:0` to make it a VPN-IPv4 route. And the prefix of 20.0.1.0/24 has been received from another PE. It has the RD of `11.0.1.1:0` with a nexthop of `11.0.1.1`. Looking at each of those prefixes in detail:

**20.0.0.0/24** is a local route from one of the VRFs that has been exported. Notice that along with the prefix, the RD, the export RT and the MPLS label information is displayed. In this case, the MPLS label is a locally allocated label.

```
switch# show bgp vpn-ipv4 20.0.1.0/24
BGP routing table information for VRF default
Router identifier 0.0.0.1, local AS number 300
BGP routing table entry for IPv4 prefix 20.0.1.0/24, Route Distinguisher: 11.0.1.1:0
Paths: 1 available
Local
       11.0.1.1 from 10.0.0.2 (10.0.1.1)
           Origin IGP, metric -, localpref 100, weight 0, valid, internal, best
           Extended Community: Route-Target-AS:300:0
           MPLS label: 100123
```

**20.0.1.0/24** is a prefix that has been received from the VPN-IPv4 peer, 10.0.0.2. The next-hop in this case is `11.0.1.1`. This VPN route is imported into a VRF based on the import RT configuration matching the RT received in the VPN route (300:0).
Note

Route-Distinguishers for the non-default VRFs must be configured under the `router bgp` mode. Route-Distinguisher configured under the VRF definition mode are ignored.

The route is installed in the VRF only when the VPN next-hop is reachable through an MPLS tunnel. The presence of such an MPLS tunnel can be verified using the `show tunnel fib` command. The output below shows that there is an MPLS tunnel setup by LDP to the VPN nexthop 11.0.1.1.

```
switch# show tunnel fib
Type 'LDP', index 1, endpoint 11.0.1.1/32, forwarding None
   via 10.0.0.2, 'Ethernet6'
   label stack 3
```

Use the `show ip bgp vrf vrf1` command to show the BGP table for the VRF which contains the imported VPN-IPv4 route.

```
switch# show ip bgp vrf vrf1
BGP routing table information for VRF vrf1
Router identifier 11.0.0.1, local AS number 300
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e - ECMP
   S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast
   % - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link
Local Nexthop

<table>
<thead>
<tr>
<th>Network</th>
<th>Next Hop</th>
<th>Metric</th>
<th>LocPref</th>
<th>Weight</th>
<th>Path</th>
</tr>
</thead>
<tbody>
<tr>
<td>* &gt; 20.0.0.0/24</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>0</td>
<td>i</td>
</tr>
<tr>
<td>* &gt; 20.0.1.0/24</td>
<td>11.0.1.1</td>
<td>-</td>
<td>100</td>
<td>0</td>
<td>i</td>
</tr>
</tbody>
</table>
```

Each entry in the table represents a path either locally redistributed/received into the VRF (from a BGP peer) or imported from the VPN table.

Use the `show ip bgp 20.0.1.0/24 vrf vrf1` command for a more detailed view of the imported IP prefix 20.0.1.0/24:

```
switch# show ip bgp 20.0.1.0/24 vrf vrf1
BGP routing table information for VRF vrf1
Router identifier 11.0.0.1, local AS number 300
BGP routing table entry for 20.0.1.0/24
Paths: 1 available
Local 11.0.1.1 from 10.0.0.2 (0.0.1.1), imported VPN-IPv4 route, RD 11.0.1.1:0
Origin IGP, metric -, localpref 100, weight 0, valid, internal, best
Extended Community: Route-Target-AS:300:0
Remote MPLS label: 100123
```
Use the `show ip route vrf vrf1` command to view the prefix installed in route table of the VRF:

```
switch#show ip route vrf vrf1
VRF: vrf1
Gateway of last resort is not set
C 20.0.0.0/24 is directly connected, Ethernet5
B I 20.0.1.0/24 [200/0] via 11.0.1.1/32, LDP tunnel index 1, label 100123 via 10.0.0.2, Ethernet3, label imp-null(3)
```

The output displays both the VPN label, as well as the underlay tunnel (LDP) information.

### 36.2.5 Syslog Messages

While transmitting an update, if there is no valid next-hop that could be sent, then the `%BGP-3-VPN-DROP_TXUPDATE` Syslog is generated. In the case of MPLS L3 VPN, it can occur in the following scenarios:

- When BGP is attempting to advertise a received VPN route to an eBGP and next-hop-unchanged is not configured for that peer. The resolution is to configure next-hop-unchanged for that eBGP peer.
- When next-hop-self is configured on the Route-Reflector and the RR is trying to reflect the received.

### 36.2.6 Limitations

- While configuring a BGP Route-Reflector for the VPN-IPv4/VPN-IPv6 address families, the route-reflector must have transport MPLS LSPs to reach the PE nexthop addresses. Even though the route-reflector may not be in the data path and does not use the transport LSPs to forward traffic, the LSPs are required in order for the BGP nexthops to be considered as reachable valid candidates in the bestpath computation.
- When configuring eBGP peers, which receive routes over an eBGP session and re-advertise the same to a different eBGP peer, next-hop-unchanged knob must be configured, so that the original nexthop is retained.
- With iBGP route-reflector topology, next-hop-self knob must not be configured.
- Even with directly connected PEs, the VPN nexthops should be the loopback on the directly connected PEs with an MPLS tunnel between them.
  - For a VPN route to be installed in the VRF, the VPN nexthop must resolve over a MPLS tunnel.
- With OSPF as the PE-CE protocol, RFC 4576, setting of the DN bit in the LSA, is not supported.
- Internal BGP (iBGP) as the PE-CE protocol, RFC 6368, is not supported.
Chapter 36: Multiprotocol Label Switching (MPLS)

36.3 Decap Groups

These sections describe the Decap groups:

- Section 36.3.1: Decap Groups Description
- Section 36.3.2: Decap Groups Configuration

36.3.1 Decap Groups Description

The decap group is a data structure that receives encapsulated packets and extracts the payload. The switch then processes or forwards the extracted payload as required. Although packets cannot be transmitted through decap groups, nexthop groups can be used to create a packet's reverse path. Decap groups support payload extraction of packets received from GRE and IP-in-IP tunnels.

Decap groups have these limitations:

- Tunnels are terminated using destination IP address; source IP address has no influence.
- Packets matching a decap group are not processed through their ingress interface and VLAN.
- During a tunnel termination, ingress ACL filter each decap group packet's inner header.
- Packet counters are not available.
- VRF is not supported.

Decap groups are defined by their tunnel type and decap IP address:

- **Tunnel type** specifies the tunnel protocol that the switch uses to extract payload.
- **Decap IP address** specifies the IP address where the switch receives decap group packets.

Decap groups support Generic Routing Encapsulation (GRE) and IP-in-IP tunnels.

36.3.2 Decap Groups Configuration

Decap groups are configured in decap-group configuration mode. Decap-group configuration mode is not a group change mode; **running-config** is changed immediately upon entering commands. Exiting decap-group configuration mode does not affect **running-config**. The **exit** command returns the switch to global configuration mode.

- The static CLI entry for the incoming label is specified by the **mpls static** command.
- The tunnel type is specified by the **tunnel type (Decap Group)** command.
- The Decap IP address is specified by the **tunnel decap-ip (Decap Group)** command.
- The locally configured IP addresses are added to the Layer 3 interfaces using the **tunnel decap-interface (Decap Group)** command for a specified decap group.

Decap groups do not define a default destination address or tunnel type and is not functional until both parameters are configured. A decap group can contain multiple tunnel decap-ip statements.

**Example**

- This command defines a static CLI entry for the incoming-label.

  ```
  switch(config)# mpls static top-label 3400 ethernet 3/3/3 10.14.4.4 pop
  payload-type ipv4
  ```

---

2577
• This command creates a decap group named DC-1 and configures the group to terminate packets from GRE tunnel packets with the destination IP address of 10.14.3.2

```
switch(config)#ip decap-group DC-1
switch(config-dg-DC-1)#tunnel type gre
switch(config-dg-DC-1)#tunnel decap-ip 10.14.3.2
switch(config-dg-DC-1)#show active
 ip decap-group DC-1
    tunnel type gre
    tunnel decap-ip 10.14.3.2
switch(config-dg-DC-1)#end
switch(config)#
```

### 36.4 Nexthop Groups

#### 36.4.1 Nexthop Group Description

Each routing table entry provides the next hop address to its specified destination. A nexthop address is the address of the next device on the path to the entry’s specified destination.

A nexthop group is a data structure that defines a list of nexthop addresses and a tunnel type for packets routed to the specified address. When an IP route statement specifies a nexthop group as the nexthop address, the switch configures a static route with a nexthop group member as the nexthop address and encapsulates packets forwarded to that address as required by the group’s tunnel type.

The nexthop group size is a configurable parameter that specifies the number of entries that the group contains. Group entries that are not explicitly configured are filled with drop routes. The switch uses ECMP hashing to select the address within the nexthop group when forwarding packets. When a packet’s hash selects a drop route, the packet is dropped.

Nexthop groups are supported on Trident platform switches and subject to the following restrictions:

- Each switch can support 512 IPv4 or IPv6 Tunnels
- Nexthop groups can contain 256 nexthops.
- The switch supports 1024 nexthop groups.
- Multiple routes can share a tunnel.
- Tunnels do not support IP multicast packets.

Nexthop groups support IP-in-IP tunnels. The entry IP address family within a particular nexthop group cannot be mixed, i.e. either they are all IPv4 or they are all IPv6 entries.

#### 36.4.2 Nexthop Group Configuration

Nexthop groups are configured and modified in nexthop-group configuration mode. After a group is created, it is associated to a static route through an `ip route nexthop-group` statement.

These tasks are required to configure a nexthop group and apply it to a static route.

- Creating and Editing Nexthop Groups
- Configuring a Group’s Encapsulation Parameters
- Configuring the Group’s Size
- Creating Nexthop Group Entries
- Displaying Nexthop Groups
- Applying a Nexthop Group to a Static Route
Creating and Editing Nexthop Groups

Nexthop groups are created by a `nexthop-group` command that specifies a group that isn't already configured. The switch enters nexthop-group configuration mode for the new group. Nexthop-group mode is also accessible for modifying existing groups. When in nexthop-group configuration mode, the `show active` command displays the group's configuration.

Example

- This command creates a nexthop group named NH-1.

```
switch(config)#nexthop-group NH-1
switch(config-nexthop-group-NH-1)#
```

- These commands enter nexthop-group configuration mode for the group named NH3, then displays the previously configured group parameters.

```
switch(config)#nexthop-group NH3
switch(config-nexthop-group-NH3)#show active
nexthop-group NH3
  size 4
  ttl 10
  entry 0 tunnel-destination 10.14.21.3
  entry 1 tunnel-destination 10.14.21.5
  entry 2 tunnel-destination 10.14.22.5
  entry 3 tunnel-destination 10.14.22.6
switch(config-nexthop-group-NH3)#
```

Configuring a Group's Encapsulation Parameters

Packets in static routes that are associated with the nexthop group are encapsulated to support the group’s tunnel type. Nexthop groups support IP-in-IP tunnels. The group also defines the source IP address and TTL field contents that are included in the packet encapsulation.

Example

- This command configures the TTL setting to 32 for nexthop group NH-1 encapsulation packets.

```
switch(config)#nexthop-group NH-1
switch(config-nexthop-group-NH-1)#ttl 32
switch(config-nexthop-group-NH-1)#show active
nexthop-group NH-1
  size 128
  ttl 32
switch(config-nexthop-group-NH-1)#
```

The address is inserted in the encapsulation source IP fields is specified by `tunnel-source (Nexthop Group)`.
Example

- These commands create loopback interface 100, assign an IP address to the interface, then specifies that address as the tunnel source for packets designated by nexthop-group NH-1.

```bash
switch(config)#interface loopback 100
switch(config-if-Lo100)#ip address 10.1.1.1/32
switch(config-if-Lo100)#exit
switch(config)#nexthop-group NH-1
switch(config-nexthop-group-NH-1)#tunnel-source intf loopback 100
switch(config-nexthop-group-NH-1)#show active
nexthop-group NH-1
size 256
 ttl 32
 tunnel-source intf Loopback100
switch(config-nexthop-group-NH-1)#
```

Configuring IP-in-IP Encapsulation

Through IP-in-IP encapsulation, IP packets matching a static Nexthop-Group route are encapsulated within an IP-in-IP tunnel and forwarded.

Example

- This command configures a static Nexthop-Group route and an IP-in-IP Nexthop-Group for IP-in-IP encapsulation.

```bash
switch(config)#ip route 124.0.0.1/32 nexthop-group abc
switch(config)#nexthop-group abc type ip-in-ip
switch(config-nexthop-group-abc)#size 512
switch(config-nexthop-group-abc)#tunnel-source 1.1.1.1
switch(config-nexthop-group-abc)#entry 0 tunnel-destination 1.1.1.2
switch(config-nexthop-group-abc)#entry 1 tunnel-destination 10.1.1.1
switch(config-nexthop-group-abc)#ttl 64
switch(config-nexthop-group-abc)#
```

Configuring the Group’s Size

The group’s size specifies the number of entries in the group. A group can contain up to 256 entries, which is the default size. The group’s size is specified by `size (Nexthop Group)`.

Example

- This command configures the nexthop group NH-1 to contain 128 entries.

```bash
switch(config)#nexthop-group NH-1
switch(config-nexthop-group-NH-1)#size 128
switch(config-nexthop-group-NH-1)#show active
nexthop-group NH-1
size 128
 ttl 64
switch(config-nexthop-group-NH-1)#
```

Creating Nexthop Group Entries

Each entry specifies a nexthop address that is used to forward packets. A nexthop group contains one entry statement for each nexthop address. The group’s size specifies the number of entry statements the group may contain. Each entry statement is assigned an index number to distinguish it from other entries within the group; entry index numbers range from zero to the group size minus one.

Nexthop group entries are configured by `entry (Nexthop Group)`.
Example

- These commands set the nexthop group size at four entries, then create three entries. Packets that are hashed to the fourth entry are dropped.

```
switch(config)#nexthop-group NH-1
switch(config-nexthop-group-NH-1)#size 4
switch(config-nexthop-group-NH-1)#entry 0 tunnel-destination 10.13.4.4
switch(config-nexthop-group-NH-1)#entry 1 tunnel-destination 10.15.4.22
switch(config-nexthop-group-NH-1)#entry 2 tunnel-destination 10.15.5.37
```

- These commands configure a nexthop group with three IPv6 nexthop entries.

```
switch(config)#nexthop-group nhg-v6-mpls type ip
switch(config-nhg-v6-mpls)#size 3
switch(config-nhg-v6-mpls)#entry 0 nexthop 2002::6401:1
switch(config-nhg-v6-mpls)#entry 1 nexthop 2002::6404:1
switch(config-nhg-v6-mpls)#entry 2 nexthop 2002::6404:2
```

- These commands configure an IPv4 route to point to the nexthop group nhg-v6-mpls. (Both IPv4 routes and IPv6 routes can point to this nexthop group.)

```
switch#ip route 100.5.0.0/16 Nexthop-Group nhg-v6-mplsp
```

Displaying Nexthop Groups

The `show nexthop-group` command displays a group's configured parameters.

Example

- This command displays the properties of the nexthop group named NH-1.

```
switch>show nexthop-group NH-1
Name     Id   type    size   ttl  sourceIp
NH-1     4    ipInIp 256    64  0.0.0.0
```

Applying a Nexthop Group to a Static Route

The `ip route nexthop-group` associates a nexthop group with a specified destination address and configures the encapsulation method for packets tunneled to that address.

Example

- This command creates a static route in the default VRF, using the nexthop group of NH-1 to determine the next hop address.

```
switch(config)#ip route 10.17.252.0/24 nexthop-group NH-1
```

The `show ip route` command displays the routing table for a specified VRF. Routes that utilize a nexthop group entry are noted with a route type code of NG.
Example

- This command displays a routing table that contains a static route with its nexthop specified by a
  nexthop group.

```
switch>show ip route
Codes: C - connected, S - static, K - kernel,

36.4.3 MPLS Tunnel Support for Traceroute and PMTU Discovery

IP traceroute and path MTU (PMTU) discovery function only when the routers send ICMP reply messages to the host that invokes each network function. When the route to the destination host traverses an MPLS label-switched path (LSP), the label switching routers (LSRs) also need to send ICMP reply messages to the originating host.

The MPLS ICMP tunneling feature enables these LSRs to generate ICMP reply messages and deliver them to the originating host using the same LSP on which the frame was received.

Once the frame exits the LSP, it assumes that the ICMP reply can be routed or label switched back to the originating host.

PMTU discovery requires MPLS tunneling of MTU exceeded ICMP replies (fragmentation needed, packet too big). Traceroute requires MPLS tunneling of TTL exceeded ICMP replies.

The following sections provide further information on MPLS tunnel support for Traceroute and PMTU discovery:

- Platform Compatibility
- MPLS Tunnel Support for Traceroute and PMTU Discovery Configuration
- Troubleshooting
- Limitations
36.4.3.1 Platform Compatibility

MPLS tunnel support for traceroute and PMTU discovery is available on the following platforms:

Figure 36-2:

36.4.3.2 MPLS Tunnel Support for Traceroute and PMTU Discovery Configuration

To enable traceroute and PMTU discovery, complete the following steps:

Step 1 Enable the device for configuration.

```
switch>configure terminal
switch(config)#
```

Step 2 Enable MPLS ICMP fragmentation.

```
switch(config)# mpls icmp fragmentation-needed tunneling
```

Step 3 Enable MPLS ICMP TTL.

```
switch(config)# mpls icmp ttl-exceeded tunneling
```

To disable traceroute and PMTU discovery, use the no form of the commands stated above.

Step 1 Enable the device for configuration.

```
switch>configure terminal
switch(config)#
```

Step 2 Disable MPLS ICMP fragmentation.

```
switch(config)# no mpls icmp fragmentation-needed tunneling
```

Step 3 Disable MPLS ICMP TTL.

```
switch(config)# no mpls icmp ttl-exceeded tunneling
```
36.4.3.3 Troubleshooting

- If the IP address of the interface through which an offending packet was received could not be retrieved, the source IP address of the ICMP reply has a default value of 240.0.0.0 in the case of IPv4, and 2001::1 in the case of IPv6. In the case of traceroute, this IP address appears in the output and could potentially indicate a misconfiguration at this node.

- If a specific node does not tunnel ICMP replies, it is possible to run `tcpdump` on a local interface called `fwd0`. If the replies do not appear on this interface, the tunneling agent is likely to be at fault. If the replies do appear on this interface, the tunneling agent is most likely not at fault, and the issue might be happening in the platform.

36.4.3.4 Limitations

Traceroute using ICMP tunneling requires that the ingress and egress of the tunnel process the TTL using the uniform mode (as described in RFC3443 section 3.1).
36.5 **MPLS Commands**

**MPLS Commands**
- mpls ip
- mpls static
- show mpls route
- show mpls route summary

**Decap Group Commands**
- ip decap-group
- show ip decap-group
- tunnel decap-interface (Decap Group)
- tunnel decap-ip (Decap Group)
- tunnel type (Decap Group)

**Nexthop Group Commands**
- entry (Nexthop Group)
- ip route nexthop-group
- nexthop-group
- show nexthop-group
- size (Nexthop Group)
- ttl (Nexthop Group)
- tunnel-source (Nexthop Group)
**entry (Nexthop Group)**

The `entry` command defines a nexthop entry in the configuration mode nexthop group. Each nexthop entry specifies a nexthop IP address for static routes to which the nexthop group is assigned. The group size (size (Nexthop Group)) specifies the quantity of entries a group contains. Each entry is created by an individual command. Entries within a group are distinguished by an index number.

The `no entry` and `default entry` commands delete the specified nexthop group entry, as referenced by index number, by removing the corresponding `entry` statement from `running-config`.

**Command Mode**

Nexthop-group Configuration

**Command Syntax**

```
entry index tunnel-destination ipv4_address
no entry index
default entry index
```

**Parameters**

- `index` Entry index. Values range from **0** to **group-size – 1**.
- `ipv4_address` Nexthop IPv4 address.

`group-size` is the group’s entry capacity, as specified by the `size (Nexthop Group)` command.

**Example**

- These commands sets the nexthop group size at 4 entries, then creates three nexthop entries. Packets that are hashed to the fourth entry are dropped.

```
switch(config)#nexthop-group NH-1
switch(config-nexthop-group-NH-1)#size 4
switch(config-nexthop-group-NH-1)#entry 0 tunnel-destination 10.13.4.4
switch(config-nexthop-group-NH-1)#entry 1 tunnel-destination 10.15.4.22
switch(config-nexthop-group-NH-1)#entry 2 tunnel-destination 10.15.5.37
switch(config-nexthop-group-NH-1)#show active
nexthop-group NH-1
  size 4
  ttl 64
  entry 0 tunnel-destination 10.13.4.4
  entry 1 tunnel-destination 10.15.4.22
  entry 2 tunnel-destination 10.15.5.37
switch(config-nexthop-group-NH-1)#
```
**ip decap-group**

The `ip decap-group` command places the switch in decap-group configuration mode, through which decap groups are created or modified. A decap group is a data structure that defines a method of extracting the payload from an encapsulated packet that the switch receives on a specified IP address.

Decap groups do not specify a default IP address group or tunnel type. These parameters must be explicitly configured before a decap group can function.

Decap-group configuration mode is not a group change mode; `running-config` is changed immediately upon entering commands. Exiting decap-group configuration mode does not affect `running-config`. The `exit` command returns the switch to global configuration mode.

The `no ip decap-group` and `default ip decap-group` commands delete previously configured commands in the specified `decap-group` mode.

**Command Mode**
- **Global Configuration**

**Command Syntax**

```
ip decap-group group_name
no ip decap-group group_name
default ip decap-group group_name
```

**Parameters**
- `group_name` Decap group name.

**Commands Available in Decap-group Configuration Mode**
- `tunnel decap-ip (Decap Group)` specifies the IP address of packets handled by the decap group.
- `tunnel type (Decap Group)` specifies the tunnel protocol for extracting payload.
- `show ip decap-group`

**Examples**
- This command creates a decap group named DC-1.
  ```
  switch(config)#ip decap-group DC-1
  switch(config-dg-DC-1)#
  ```
- This command exits decap-group mode for the DC-1 decap group.
  ```
  switch(config-dg-DC-1)#exit
  switch(config)#
  ```
- This command delete the decap group named DC-1.
  ```
  switch(config)#no ip decap-group DC-1
  switch(config)#
  ```
ip route nexthop-group

The `ip route nexthop-group` command creates a static route. The destination is a network segment. The nexthop address is one of the IP addresses that comprise the specified nexthop group. Packets forwarded as a result of this command are encapsulated as specified by the tunnel-type parameter of the specified nexthop group.

When multiple routes exist to a destination prefix, the route with the lowest administrative distance takes precedence. When a route created through this command has the same administrative distance as another static route (ECMP), the route that was created earliest has preference; `running-config` stores static routes in the order that they are created.

By default, the administrative distance assigned to static routes is 1. Assigning a higher administrative distance to a static route configures it to be overridden by dynamic routing data. For example, a static route with a distance value of 200 is overridden by OSPF intra-area routes, which have a default distance of 110.

The `no ip route nexthop-group` and `default ip route nexthop-group` commands delete the specified route by removing the corresponding `ip route nexthop-group` command from `running-config`. Ip route nexthop-group statements for an IP address in multiple VRFs must be removed separately.

A `no ip route` or `default ip route` command without a nexthop parameter deletes all corresponding `ip route nexthop-group` statements. Deleting a user-defined VRF also deletes its static routes.

Command Mode

Global Configuration

Command Syntax

```
ip route [VRF_INST] dest_net nexthop-group nhgp_name [dist] [TAG_OPTION] [RT_NAME]
no ip route [VRF_INST] dest_net [nexthop-group nhgroup_name] [distance]
default ip route [VRF_INST] dest_net [nexthop-group nhgroup_name] [distance]
```

Parameters

- **VRF_INST** Specifies the VRF instance being modified.
  - <no parameter> Changes are made to the default VRF.
  - `vrf vrf_name` Changes are made to the specified VRF.
- **dest_net** Destination IPv4 subnet (CIDR or address-mask notation).
- **nhgp_name** Name of nexthop group.
- **dist** Administrative distance assigned to route. Options include:
  - <no parameter> Route assigned default administrative distance of one.
  - <1-255> The administrative distance assigned to route.
- **TAG_OPTION** static route tag. Options include:
  - <no parameter> Assigns default static route tag of 0.
  - `tag t_value` Static route tag value. `t_value` ranges from 0 to 4294967295.
- **RT_NAME** Associates descriptive text to the route. Options include:
  - <no parameter> No text is associated with the route.
  - `name descriptive_text` The specified text is assigned to the route.

Related Commands

- `ip route` creates a static route that specifies the nexthop address without using nexthop groups.
Example

- This command creates a static route in the default VRF, using the nexthop group of NH-1 to determine the next hop address.

```
switch(config)#ip route 10.17.252.0/24 nexthop-group NH-1
switch(config)#
```
mpls ip

The `mpls ip` command enables MPLS routing. Multiprotocol Label Switching (MPLS) is a networking process that avoids complex lookups in a routing table by replacing complete network addresses with short path labels for directing data packets to network nodes. MPLS data paths are serviced through a tunnel encapsulation data structure that adds four-byte label headers to packets.

The `no mpls ip` and `default mpls ip` commands disable MPLS routing by removing the `mpls ip` command from `running-config`. When MPLS routing is disabled, routed MPLS packets are dropped and all MPLS routes and adjacencies are removed. MPLS routing is disabled by default.

**Command Mode**

Global Configuration

**Command Syntax**

```
mpls ip
no mpls ip
default mpls ip
```

**Example**

- This command enables MPLS routing. Previous commands enabled IP routing and configured MPLS static routes.

  ```
  switch(config)#mpls ip
  switch(config)#show running-config
  ! Command: show running-config

  !
  ip routing
 !
  mpls ip
 !
  mpls static top-label 3400 10.14.4.4 pop payload-type ipv4
  mpls static top-label 4400 10.15.46.45 pop payload-type ipv4
  !

  !
  end
  switch(config)#
  ```

- This command disables MPLS routing.

  ```
  switch(config)#no mpls ip
  switch(config)#show running-config
  ! Command: show running-config

  !
  ip routing
 !
  mpls static top-label 3400 10.14.4.4 pop payload-type ipv4
  mpls static top-label 4400 10.15.46.45 pop payload-type ipv4
  !

  !
  end
  switch(config)#
  ```
mpls static

The **mpls static** command creates an MPLS rule that specifies the method of handling of inbound MPLS traffic. Multiprotocol Label Switching (MPLS) is a networking process that replaces complete network addresses with short path labels for directing data packets to network nodes.

Static rules specify these parameters:

- **MPLS filter**: The top-label parameter specifies the 20-bit value that the MPLS packet’s top header label must match to be handled by the rule.
- **Nexthop location**: Specifies the destination nexthop address (IPv4 or IPv6) and the interface through which the switch forwards the packet.
- **MPLS action**: Specifies the MPLS label stack management action performed on the packet:
  - `pop-payload`: removes the top label from stack; this terminates an LSP (label-switched path).
  - `swap-label`: replaces top label with a specified new label; this passes a packet along an LSP.
- **Rule priority**: Specifies the rule to be used when an MPLS packet matches multiple rules.

The **no mpls static** and **default mpls static** commands delete the specified MPLS rule from **running-config**.

- Commands that include only a top label tag remove all MPLS rules with the matching top label.
- Commands with no **PRIORITY** parameter remove all matching routes of every metric value.

**Command Mode**
Global Configuration

**Command Syntax**

```
mpls static top-label top_tag [DEST_INTF] NEXTHOP_ADDR ACTION [PRIORITY]
no mpls static top-label top_tag
no mpls static top-label top_tag [DEST_INTF] NEXTHOP_ADDR ACTION [PRIORITY]
default mpls static top-label top_tag
default mpls static top-label top_tag [DEST_INTF] NEXTHOP_ADDR ACTION [PRIORITY]
```

**Parameters**

- **top_tag**  Top header’s label field contents. Value ranges from 0 to 1048575 (20 bits).
- **DEST_INTF**  Specifies interface through which **NEXTHOP_ADDR** is accessed. Options include:
  - <no parameter>  Any interface.
  - `ethernet e_num`  Ethernet interface specified by `e_num`.
  - `loopback l_num`  Loopback interface specified by `l_num`.
  - `management m_num`  Management interface specified by `m_num`.
  - `port-channel p_num`  Port-channel interface specified by `p_num`.
  - `vlan v_num`  VLAN interface specified by `v_num`.
  - `vxlan vx_num`  VXLAN interface specified by `vx_num`.
- **NEXTHOP_ADDR**  Nexthop address for MPLS for filtered MPLS packets. Options include:
  - `ipv4_addr`  IPv4 address.
  - `ipv6_addr`  IPv6 address.
- **ACTION**  MPLS header stack management action performed on packet. Options include:
  - `pop payload-type ipv4`  Removes top layer from stack. Payload is handled as IPv4 packet.
  - `pop payload-type ipv6`  Removes top layer from stack. Payload is handled as IPv6 packet.
- **swap-label**: Replaces header label with specified label value (20 bits).

- **PRIORITY**: Specifies rule priority when multiple rules match a packet. Options include:
  - `<no parameter>`: Assigns a metric value of 100 to the rule.
  - **metric**: Lower values denote higher priority. Value ranges from 1 to 255.

**Parameters**

The `mpls static` command does not support push label actions.

**Example**

- These commands create an MPLS rule that matches packets with a top label value of 3400 and causes the removal of the top label from the header stack. The next-hop destination of the IPv4 payload is IP address 10.14.4.4 through Ethernet interface 3/3/3. This rule has a metric value of 100.

```plaintext
switch(config)# mpls static top-label 3400 ethernet 3/3/3 10.14.4.4 pop
payload-type ipv4
switch(config)# show running-config

! mpls static top-label 3400 Ethernet3/3/3 10.14.4.4 pop payload-type ipv4
!

end
switch(config)#
```

- These commands create a backup rule that forwards the packet through Ethernet interface 4/3. This rule's metric value of 150 assigns it backup status prior to the first rule.

```plaintext
switch(config)# mpls static top-label 3400 ethernet 4/3 10.14.4.4 pop payload-type ipv4 metric 150
switch(config)# show running-config

! mpls static top-label 3400 Ethernet4/3 10.14.4.4 pop payload-type ipv4 metric 150
mpls static top-label 3400 Ethernet3/3/3 10.14.4.4 pop payload-type ipv4
!

<-------OUTPUT OMITTED FROM EXAMPLE------->

end
switch(config)#
```

- These commands create an MPLS rule that forwards the packet to the next-hop address through any interface.

```plaintext
switch(config)# mpls static top-label 4400 10.15.46.45 pop payload-type ipv4
switch(config)# show running-config

! mpls static top-label 4400 10.15.46.45 pop payload-type ipv4
!

<-------OUTPUT OMITTED FROM EXAMPLE------->

end
switch(config)#
```
nexthop-group

The `nexthop-group` command places the switch in nexthop-group configuration mode, through which nexthop groups are created or modified. The command also specifies the tunnel protocol for extracting payload from encapsulated packets that arrive through an IP address upon which the group is applied.

A nexthop group is a data structure that defines a list of nexthop addresses and the encapsulation process for packets routed to the specified address. The command either accesses an existing nexthop group configuration or creates a new group if it specifies a non-existent group. Supported tunnel protocols include IP ECMP and IP-in-IP.

Next-hop-group configuration mode is not a group change mode; `running-config` is changed immediately upon entering commands. Exiting nexthop-group configuration mode does not affect `running-config`. The `exit` command returns the switch to global configuration mode.

The `no nexthop-group` and `default nexthop-group` commands delete previously configured commands in the specified `nexthop-group` mode. When the command does not specify a group, it removes all nexthop-groups. When the command specifies a tunnel type without naming a group, it removes all nexthop-groups of the specified type.

Command Mode

Global Configuration

Command Syntax

```
nexthop-group group_name type TUNNEL_TYPE
no nexthop-group [group_name] [type TUNNEL_TYPE]
default nexthop-group [group_name] [type TUNNEL_TYPE]
```

Parameters

- `group_name` Nexthop group name.
- `TUNNEL_TYPE` Tunnel protocol of the nexthop-group. Options include:
  - `ip` ECMP nexthop.
  - `ip-in-ip` IP in IP tunnel.
  - `gre` Encapsulates the Layer 3 protocols overs IP networks.
  - `mpls-over-gre` Tunnels MPLS over a non-MPLS network.

Commands Available in Nexthop-group Configuration Mode

- `entry (Nexthop Group)`
- `size (Nexthop Group)`
- `ttl (Nexthop Group)`
- `tunnel-source (Nexthop Group)`

Restrictions

Tunnel type availability varies by switch platform.

Examples

- This command creates a nexthop group named NH-1 that specifies ECMP nexthops.
  ```
  switch(config)#nexthop-group NH-1 type ip
  switch(config-nexthop-group-NH-1)#
  ```
- This command exits nexthop-group mode for the NH-1 nexthop group.
  ```
  switch(config-nexthop-group-NH-1)#exit
  switch(config)#
  ```
**show ip decap-group**

The `show ip decap-group` command displays the IP decap groups that are available in the switch.

**Command Mode**

Global Configuration

**Command Syntax**

`show ip decap-group [decap-group name | dynamic]`

**Parameters**

- `decap-group name`  The decap group name.
- `dynamic`          Displays the dynamic entries only.

**Related Commands**

- `ip decap-group`
- `tunnel decap-ip (Decap Group)`
- `tunnel type (Decap Group)`

**Example**

- This command displays the IP decap groups that are available in a switch.

```
switch(config)#show ip decap-group
```

**Note**

GRE type decap groups are supported in Sand platform only.
show mpls route

The **show mpls config route** command displays the switch’s MPLS static rule configuration for the specified routes and rules.

**Command Mode**

EXEC

**Command Syntax**

```
show mpls [INFO_LEVEL] route [header_label]
```

**Parameters**

- **INFO_LEVEL** Specifies the filters that are used to select the routes to display. Options include:
  - `<no parameter>` displays routes published by the forwarding agent.
  - `config` displays all configured routes.
  - `lfib` displays routes stored to the Label Forwarding Information Base (LFIB)
- **header_label** Filters routes by MPLS top header label. Options include:
  - `<no parameter>` Displays routes for all header values.
  - `<0 to 1048575>` Specifies header for which command displays information.

**Example**

- This command displays the MPLS rule configuration.
  
```
switch>show mpls config route
In-Label  Out-Label  Metric  Payload  NextHop
3400      pop        100     ipv4     10.14.4.4,Et3/3/3
3400      pop        150     ipv4     10.14.4.4,Et4/3
3400      pop        150     ipv4     10.14.4.4,Et4/3
switch>
```
show mpls route summary

The `show mpls route summary` command displays statistics about the configuration and implementation of MPLS rules.

**Command Mode**

EXEC

**Command Syntax**

`show mpls route summary`

**Example**

- This command displays a summary of MPLS rule implementation.

  switch>**show mpls route summary**
  Number of Labels: 1 (1 unprogrammed)
  Number of adjacencies in hardware: 0
  Number of backup adjacencies: 2
  switch>
show nexthop-group

The `show nexthop-group` command displays properties of the specified nexthop group.

**Command Mode**
EXEC

**Command Syntax**
```
show nhgroup_name [VRF_INST]
```

**Parameters**
- `nhgroup_name` Name of the group displayed by command.
- `VRF_INST` specifies the VRF instance for which data is displayed.
  - `<no parameter>` context-active VRF.
  - `vrf vrf_name` specifies name of VRF instance. System default VRF is specified by `default`.

**Related Commands**
- `nexthop-group` places the switch in nexthop-group configuration mode to create a new group or modify an existing group.

**Example**
- This command displays the properties of the nexthop group named NH-1.
```
switch>show nexthop-group NH-1
Name             Id       type     size   ttl    sourceIp
NH-1             4        ipInIp   256    64     0.0.0.0
switch>
```
size (Nexthop Group)

The `size` command configures the quantity of nexthop entries in the configuration mode nexthop group. Each entry specifies a nexthop IP address for static routes to which the group is assigned. Entries are configured with the `entry (Nexthop Group)` command. The default size is 256 entries.

The `no size` and `default size` commands restore the size of the configuration mode nexthop group to its default of 256 by removing the corresponding `size` command from `running-config`.

**Command Mode**

Nexthop-group Configuration

**Command Syntax**

```plaintext
size entry_size
no size entry_size
default size entry_size
```

**Parameters**

- `entry_size` Group size (entries). Value ranges from 1 to 255. Default value is 256.

**Example**

- This command configures the nexthop group NH-1 to contain 128 entries.

```
switch(config)#next-hop-group NH-1
switch(config-next-hop-group-NH-1)#size 128
switch(config-next-hop-group-NH-1)#show active
next-hop-group NH-1
  size 128
ttl 64
switch(config-next-hop-group-NH-1)#
```
ttl (Nexthop Group)

The `ttl` command specifies the number entered into the TTL (time to live) encapsulation field of packets that are transmitted to the address designated by the configuration mode nexthop group. The default TTL value is 64.

The `no ttl` and `default ttl` commands restore the default TTL value written into TTL fields for the configuration mode nexthop group by deleting the corresponding `ttl` command from `running-config`.

**Command Mode**

Nexthop-group Configuration

**Command Syntax**

```
ttl hop_expiry
no ttl hop_expiry
default ttl hop_expiry
```

**Parameters**
- `hop_expiry` Period that the packet remains valid (seconds or hops) Value ranges from 1 to 64.

**Restrictions**
This command is available only to Nexthop groups for tunnels of type `IP-in-IP`, `GRE`, `MPLS`, and `MPLS over GRE`.

**Related Commands**
- `nexthop-group` places the switch in Nexthop-group configuration mode.

**Example**
- This command configures the ttl setting to 32 for nexthop group NH-1 packets.
  ```
  switch(config)#nexthop-group NH-1
  switch(config-nexthop-group-NH-1)#ttl 32
  switch(config-nexthop-group-NH-1)#show active
  nexthop-group NH-1
  size 128
  ttl 32
  switch(config-nexthop-group-NH-1)#
  ```
- This command restores the default ttl setting for nexthop group NH-1 packets.
  ```
  switch(config-nexthop-group-NH-1)#no ttl
  switch(config-nexthop-group-NH-1)#show active
  nexthop-group NH-1
  size 128
  ttl 64
  switch(config-nexthop-group-NH-1)#
  ```
tunnel decap-interface (Decap Group)

The **tunnel decap-interface** command adds all locally configured IP addresses to the specific Layer 3 interface per decap group.

The **no tunnel decap-interface** command and the **default tunnel decap-interface** command restores the default state by removing the locally added IP addresses from the decap group.

**Command Mode**
Decap-Group Configuration

**Command Syntax**

```
tunnel decap-interface {Ethernet | Loopback | Management | Port-Channel | Tunnel | Vlan | Vxlan | all}
no tunnel decap-interface {Ethernet | Loopback | Management | Port-Channel | Tunnel | Vlan | Vxlan | all}
default tunnel decap-interface {Ethernet | Loopback | Management | Port-Channel | Tunnel | Vlan | Vxlan | all}
```

**Parameters**

- **Ethernet e_num** Ethernet interface specified by `e_num`. The Ethernet port number ranges from 1 to 36.
- **Loopback l_num** Loopback interface specified by `l_num`. The loopback interface number ranges from 0 to 1000.
- **Management m_num** Management interface specified by `m_num`. The management port number ranges from 1 to 1.
- **Port-channel p_num** Port-channel interface specified by `p_num`. Options include:
  - **Port-channel interface number** The port-channel interface number ranges from 1 to 2000.
  - **Port-channel sub interface number** The port-channel sub interface number `<1-2000>,<1-4094>`.
- **Tunnel t_num** Tunnel interface specified by `t_num`. The tunnel interface number ranges from 0 to 255.
- **vlan v_num** VLAN interface specified by `v_num`. The VLAN interface number ranges from 1 to 4094.
- **vxlan vx_num** VXLAN interface specified by `vx_num`. The VXLAN tunnel interface number ranges from 1 to 1.
- **all address-family** This parameter configures all L3 interfaces as a decap interface.

**Related Commands**

- **ip decap-group**
- **tunnel type (Decap Group)**
- **show ip decap-group**
Example

- These commands add locally configured IP addresses to the Ethernet interface 1/1 for the dg1 decap group.

```
switch(config)#ip decap-group dg1
switch(config-dg-dg1)#tunnel decap-interface Ethernet1/1

switch(config-dg-dg1)#show active
ip decap-group dg1
    tunnel type ipip
    tunnel decap-interface Ethernet1/1
    tunnel decap-interface all address-family ipv6 address all
```
tunnel decap-ip (Decap Group)

The tunnel decap-ip command specifies the IP address of packets that are handled by the configuration mode decap group. A decap group is a data structure that defines a method of extracting the payload from an encapsulated packet that the switch receives on a specified IP address.

Decap groups do not define a default decap-ip address. A decap group is not functional until an IP address is specified. Decap groups can contain only one tunnel decap-ip statement; subsequent commands replace any previously configured statements.

Command Mode

Decap-Group Configuration

Command Syntax

```
tunnel decap-ip ipv4_address
```

Parameters

- `ipv4_addr` An IPv4 address.

Related Commands

- `ip decap-group` places the switch in decap-group configuration mode.
- `tunnel type (Decap Group)` specifies the tunnel protocol for extracting payload.
- `show ip decap-group`

Guidelines

A decap group does not specify a default IP address group or tunnel type. These parameters must be explicitly configured before a decap group can function.

Example

- These commands configure 10.14.3.2 as the decap-IP address for the DC-1 decap group.

  ```
  switch(config)#ip decap-group DC-1
  switch(config-dg-DC-1)#tunnel decap-ip 10.14.3.2
  switch(config-dg-DC-1)#show active
  ip decap-group DC-1
    tunnel decap-ip 10.14.3.2
  switch(config-dg-DC-1)#
  ```
tunnel-source (Nexthop Group)

The `tunnel-source` command specifies the address that is entered into the source IP address encapsulation field of packets that are transmitted as designated by the configuration mode nexthop group. The command may directly specify an IP address or specify an interface from which an IP address is derived. The default source address IP address is 0.0.0.0.

The `no tunnel-source` and `default tunnel-source` commands remove the source IP address setting from the configuration mode nexthop group by deleting the `tunnel-source` command from `running-config`.

Command Mode

Nexthop-group Configuration

Command Syntax

```
tunnel-source SOURCE
no tunnel-source SOURCE
default tunnel-source SOURCE
```

Parameters

- **SOURCE** IP address or derivation interface. Options include:
  - `ipv4_addr` An IPv4 address.
  - `intf ethernet e_num` Ethernet interface specified by `e_num`.
  - `intf loopback l_num` Loopback interface specified by `l_num`.
  - `intf management m_num` Management interface specified by `m_num`.
  - `intf port-channel p_num` Port-channel interface specified by `p_num`.
  - `intf vlan v_num` VLAN interface specified by `v_num`.

Restrictions

This command is available only to Nexthop groups for tunnels of type `ip-in-ip`.

Related Commands

- `nexthop-group` places the switch in Nexthop-group configuration mode.

Example

- These commands create loopback interface 100, assign an IP address to the interface, then specifies that address as the tunnel source for packets designated by nexthop-group NH-1.

  ```
  switch(config)#interface loopback 100
  switch(config-if-Lo100)#ip address 10.1.1.1/32
  switch(config-if-Lo100)#exit
  switch(config)#nexthop-group NH-1
  switch(config-nexthop-group-NH-1)#tunnel-source intf loopback 100
  switch(config-nexthop-group-NH-1)#show active
  nexthop-group NH-1
  size 256
  ttl 64
  tunnel-source intf Loopback100
  switch(config-nexthop-group-NH-1)#show nexthop-group NH-1
  Name  Id  type  size   ttl  sourceIp
  NH-1   2  ipInIp 256  64  10.1.1.1
  switch(config-nexthop-group-NH-1)#
  ```
tunnel type (Decap Group)

The tunnel type command specifies the tunnel protocol for extracting payload from encapsulated packets that arrive on the IP address specified for the configuration mode decap group. Supported tunnel protocols include GRE (General Routing Encapsulation) and IP-in-IP.

Decap groups do not define a default tunnel type. A decap group is not functional until an IP address is specified. Decap groups can contain only one tunnel decap-ip statement; subsequent commands replace any previously configured statements.

Command Mode
Decap-group Configuration

Command Syntax
  tunnel type gre

Related Commands
  • ip decap-group places the switch in decap-group configuration mode.
  • tunnel decap-ip (Decap Group) specifies the IP address of packets handled by the decap group.
  • show ip decap-group

Guidelines
A decap group does not specify a default IP address group or tunnel type. These parameters must be explicitly configured before a decap group can function.

Example
• This command configures decap group DC-1 to terminate packets from GRE tunnel packets.
  switch(config)#ip decap-group DC-1
  switch(config-dg-DC-1)#tunnel type gre
  switch(config-dg-DC-1)#show active
    ip decap-group DC-1
tunnel type gre
  switch(config-dg-DC-1)#
Chapter 37

Bidirectional Forwarding Detection

This chapter describes Bidirectional Forwarding Detection (BFD) and how it is configured in relation to various protocols. Sections in this chapter include:

- Section 37.1: Introduction
- Section 37.2: BFD Configuration
- Section 37.3: BFD Commands

37.1 Introduction

In networks without data link signaling, connection failures are usually detected by the hello mechanisms of routing protocols. Detection can take over a second, and reducing detection time by increasing the rate at which hello packets are exchanged can create an excessive burden on the participating CPUs.

BFD is a low-overhead, protocol-independent mechanism which adjacent systems can use instead for faster detection of faults in the path between them. BFD is strictly a failure-detection mechanism, and does not discover neighbors or reroute traffic.

BFD is a simple mechanism which detects the liveness of a connection between adjacent systems, allowing it to quickly detect failure of any element in the connection. It does not operate independently, but only as an adjunct to routing protocols. The routing protocols are responsible for neighbor detection, and create BFD sessions with neighbors by requesting failure monitoring from BFD.

Once a BFD session is established with a neighbor, BFD exchanges control packets to verify connectivity and informs the requesting protocol of failure if a specified number of successive packets are not received. The requesting protocol is then responsible for responding to the loss of connectivity.

Routing protocols using BFD for failure detection continue to operate normally when BFD is enabled, including the exchange of hello packets.

The basic behavior of BFD is defined in RFC 5880.

37.1.1 BFD Modes

BFD functions in asynchronous or demand mode, and also offers an echo function. EOS supports asynchronous mode and the echo function.
37.1.1.1 Asynchronous Mode

In asynchronous mode, BFD control packets are exchanged by neighboring systems at regular intervals. If a specified number of sequential packets are not received, BFD declares the session to be down.

37.1.1.2 Demand Mode

In demand mode, once the BFD session is established, the participating systems can request that BFD packets not be sent, then request an exchange of packets only when needed to verify connectivity. EOS does not support demand mode.

37.1.2 Echo Function

When the echo function is in use, echo packets are looped back through the hardware forwarding path of the neighbor system without involving the CPU. Failure is detected by an interruption in the stream of echoed packets. The minimum reception rate for BFD control packets from the neighbor is also changed automatically when the echo function is operational, because liveness detection is supplied by the echo packets.

While BFD control messages are transmitted to port 3784, BFD echo messages use UDP port 3785 for both source and destination.
37.1.3 BFD on Port Channels

On port channels, the BFD per-link feature can be used to add resiliency to the port channel’s BFD sessions. When BFD per-link is enabled, BFD considers the port channel “up” as long as any link in the port channel is functioning properly.

BFD per-link can be configured in full compliance with RFC 7130, causing member ports to be removed from the port channel when their BFD micro sessions are down, or in legacy mode, which relies on the LAG itself to detect and remove unresponsive member ports. By default, BFD per-link operates in legacy mode, which allows the switch to inter-operate more effectively with older equipment, but which may drop traffic if downed links are not detected by other means. RFC7130 mode allows for faster detection and removal of downed links within the port channel and can be used in situations where LACP is not supported. For the BFD session to come up, both peers must be configured in the same way.
37.2  BFD Configuration

To use BFD as the failure detection mechanism for a routing protocol, it must be enabled for each participating protocol.

These sections describe BFD configuration tasks:

- Section 37.2.1: Configuring BFD on an Interface
- Section 37.2.2: Configuring BFD on a Port Channel
- Section 37.2.3: Configuring the Echo Function
- Section 37.2.4: Configuring BFD for PIM
- Section 37.2.5: Configuring BFD for BGP
- Section 37.2.6: Configuring BFD for VRRP
- Section 37.2.7: Configuring BFD for OSPF
- Section 37.2.8: Configuring BFD for IS-IS
- Section 37.2.9: Displaying BFD Neighbor Information

37.2.1 Configuring BFD on an Interface

The transmission rate for BFD control packets, the minimum rate at which control packets are expected from the peer, and the multiplier (the number of packets that must be missed in succession before BFD declares the session to be down) can all be configured per interface. The values configured apply to all BFD sessions that pass through the interface.

The default values for these parameters are:

- transmission rate  300 milliseconds
- minimum receive rate  300 milliseconds
- multiplier  3

To configure different values for these parameters on an interface, use the bfd interval command.

For BFD to function as a failure detection mechanism, it must be enabled for each participating protocol.

Example

- These commands set the transmit and receive intervals to 200 milliseconds and the multiplier to 2 for all BFD sessions passing through Ethernet interface 3/20.

  switch(config)#interface ethernet 3/20
  switch(config-if-Et3/20)#bfd interval 200 min_rx 200 multiplier 2
  switch(config-if-Et3/20)#
### 37.2.2 Configuring BFD on a Port Channel

Basic BFD parameters are configured on a port channel as described in Configuring BFD on an Interface above.

Additionally, BFD can be configured in per-link mode on a port channel so that the port channel will be considered up as long as any link in the channel is up. BFD per-link can be configured in compliance with RFC 7130 (causing member ports to be removed from the port channel when their BFD micro session is down), or in legacy mode for interoperability with older equipment. For the BFD session to come up, both peers must be configured in the same way (either RFC-7130 or legacy mode).

---

**Note**

In RFC 7130 mode, if multiple IP addresses are configured for a member of a port channel (e.g., one IPv4 address and one IPv6 address), the member will be removed from the port channel if the micro session associated with either IP address goes down.

---

#### 37.2.2.1 Enabling BFD Per-link

To enable BFD per-link on a port channel, use the `bfd per-link` command.

**Example**

- These commands enabled BFD per-link on port channel 5.

```bash
switch(config)#interface port-channel 5
switch(config-if-Po5)#bfd per-link
```

#### 37.2.2.2 Configuring BFD Per-link in RFC 7130 Mode

By default, BFD per-link operates in legacy mode. To enable RFC 7130 mode (in which a member port is removed from the port channel when its BFD micro session is down), configure the switch as follows.

**Step 1** If you are configuring an L2 interface, specify a local L3 BFD address for the switch using the `bfd local-address` command. This is not necessary when configuring an L3 interface with an IP address configured on the port channel.

**Step 2** Enable BFD per-link on the port channel using the `bfd per-link` command.

**Step 3** Specify the L3 address of the port channel’s BFD neighbor using the `bfd neighbor` command. For an L2 port channel, the address is the globally configured BFD local address on the peer switch. For an L3 port channel, the address is the IP address configured on the peer port channel.

**Examples**

- These commands configure BFD per-link in RFC 7130 mode over an L2 port channel.

  **Switch 1 configuration:**

  ```bash
  switch1(config)#bfd local-address 10.0.0.5
  switch1(config)#interface port-channel 5
  switch1(config-if-Po5)#bfd per-link rfc-7130
  switch1(config-if-Po5)#bfd neighbor 10.0.0.4
  ```
Switch 2 configuration:

switch2(config)#bfd local-address 10.0.0.4
switch2(config)#interface port-channel 5
switch2(config-if-Po5)#bfd per-link rfc-7130
switch2(config-if-Po5)#bfd neighbor 10.0.0.5

These commands configure BFD per-link in RFC 7130 mode over an L3 port channel.

Switch 1 configuration:

switch1(config)#interface port-channel 5
switch1(config-if-Po5)#no switchport
switch1(config-if-Po5)#bfd per-link rfc-7130
switch1(config-if-Po5)#ip address 10.0.0.5/24
switch1(config-if-Po5)#bfd neighbor 10.0.0.4

Switch 2 configuration:

switch2(config)#interface port-channel 5
switch2(config-if-Po5)#no switchport
switch2(config-if-Po5)#bfd per-link rfc-7130
switch2(config-if-Po5)#ip address 10.0.0.4/24
switch2(config-if-Po5)#bfd neighbor 10.0.0.5
37.2.3 Configuring the Echo Function

The echo function is disabled by default, and is enabled on an interface using the `bfd echo` command.

When the BFD echo function is enabled, a “slow-timer” value replaces the minimum receive interval value in BFD packets sent from the switch. The default value is 2000 milliseconds. To configure a different value for the slow-timer, use the `bfd slow-timer` command.

**Examples**

- These commands enable the BFD echo function on Ethernet interface 5. If a slow-timer value has been configured on the switch, the minimum receive rate expected from the BFD neighbor will be reset to that value; otherwise, the minimum receive rate will be set to 2000 milliseconds.

  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#bfd echo
  switch(config-if-Et5)#
  ```

- This command configures BFD to expect control packets from the peer every 10000 milliseconds when the BFD echo function is enabled.

  ```
  switch(config)#bfd slow-timer 10000
  switch(config)#
  ```

37.2.4 Configuring BFD for PIM

The `bfd (Router-PIM Sparse-mode)` command enables or disables Bidirectional Forwarding Detection (BFD) globally for all protocol-independent multicast (PIM) neighbors.

To enable or disable PIM BFD on a specific interface, use the `pim ipv4 bfd` command. The interface-level configuration supersedes the global setting.

**Example**

- These commands enable PIM BFD globally on the switch in the default VRF, enabling it on all PIM-SM interfaces where it is not explicitly disabled.

  ```
  switch(config)#router pim sparse-mode
  switch(config-router-pim-sparse)#ipv4
  switch(config-router-pim-sparse-ipv4)#bfd
  switch(config-router-pim-sparse-ipv4)#
  ```

- These commands configure VLAN interface 200 to use BFD for PIM-SM connection failure detection regardless of the global PIM BFD configuration.

  ```
  switch(config)#interface vlan 200
  switch(config-if-VL200)#pim ipv4 bfd
  switch(config-if-VL200)#
  ```

37.2.5 Configuring BFD for BGP

To enable or disable Bidirectional Forwarding Detection (BFD) for border gateway protocol (BGP) connections with a BGP neighbor or peer group, use the `neighbor bfd` command.

**Example**

- These commands enable BFD failure detection for BGP connections with the neighbor at 10.13.64.1.

  ```
  switch(config)#router bgp 300
  switch(config-router-bgp)#neighbor 10.13.64.1 bfd
  switch(config-router-bgp)#
  ```
37.2.6 Configuring BFD for VRRP

To enable or disable Bidirectional Forwarding Detection (BFD) for virtual router redundancy protocol (VRRP), use the `vrrp bfd ip` command.

When enabled, BFD provides failure detection for a 2-router VRRP system. When the master is configured with the physical IP address of the backup router, and the backup is configured with the address of the master, a BFD session is established between them. If the BFD session goes down, the backup router immediately assumes the master role.

VRRP master advertisement packets are still sent even when the BFD session is established to accommodate VRRP systems involving more than two routers.

**Example**

- These commands enable BFD on Ethernet interface 3/20 for VRRP ID 15 with a connection to a router at IP address 192.168.2.1.

```sh
switch(config)#interface ethernet 3/20
switch(config-if-Et3/20)#vrrp 15 bfd ip 192.168.2.1
```

37.2.7 Configuring BFD for OSPF

To enable or disable BFD globally for all OSPF neighbors, use the `bfd default (OSPF)` command in OSPF configuration mode.

To enable or disable BFD for OSPF on a specific interface, use the `ip ospf neighbor bfd` command. The interface-level configuration supersedes the global setting.

**Example**

- These commands enable BFD in OSPF instance 100 for all OSPF neighbors on BFD-enabled interfaces except those connected to interfaces on which OSPF BFD has been explicitly disabled.

```sh
switch(config)#router ospf 100
switch(config-router-ospf)#bfd default
```

- This command enables OSPF BFD on Ethernet interface 3/21.

```sh
switch(config)#interface ethernet 3/21
switch(config-if-Et3/21)#ip ospf neighbor bfd
```

37.2.8 Configure BFD for IS-IS

The `isis bfd` and `isis bfd` commands configure Bidirectional Forwarding Detection (BFD), a low overhead protocol designed to provide rapid detection of failures at any protocol layer in the path between adjacent forwarding engines over any media. BFD is supported for IS-IS IPv4 routes.

**Examples**

- These commands enable BFD for all the interfaces on which IS-IS is enabled. By default BFD is disabled on all the interfaces.

```sh
switch(config)#router isis 1
switch(config-router-isis)#address-family ipv4
switch(config-router-af)#bfd default
```

2612
Chapter 37: Bidirectional Forwarding Detection

37.2.9 Displaying BFD Neighbor Information

Use the `show bfd peers` command to display information about Bidirectional Forwarding Detection (BFD) neighbors.

Example

- **This command displays general information about BFD neighbors.**

```plaintext
switch>show bfd peers
DstAddr  MyDisc  YoDisc  If    LUp   LDown  Ldiag      Stat
10.168.1.56  16    13     et52_1(81)  17151450 0  No Diagnostic Up
10.168.1.58  17    14     et52_2(65)  17151883 0  No Diagnostic Up
10.168.1.24  18    15     et51_1(73)  17152175 0  No Diagnostic Up

<-------OUTPUT OMITTED FROM EXAMPLE------->
```

- **This command displays detailed information about BFD neighbors.**

```plaintext
switch>show bfd peers detail
Peer Addr 10.168.1.56, Intf Ethernet52/1, State Up
VRF default, LAddr 10.168.1.57, LD/RD 16/13
Last Up 17151450
Last Down 0
Last Diag: No Diagnostic
TxInt: 300, RxInt: 300, Multiplier: 3
Received RxInt: 300, Received Multiplier: 3
Rx Count: 433987, Tx Count: 433829
Detect Time: 900
Registered protocols: bgp

Peer Addr 10.168.1.58, Intf Ethernet52/2, State Up
VRF default, LAddr 10.168.1.59, LD/RD 17/14
Last Up 17151883
Last Down 0
Last Diag: No Diagnostic
TxInt: 300, RxInt: 300, Multiplier: 3
Received RxInt: 300, Received Multiplier: 3
Rx Count: 434235, Tx Count: 434050
Detect Time: 900
Registered protocols: bgp
```
37.3 BFD Commands

BFD Configuration Command
- bfd echo
- bfd interval
- bfd local-address
- bfd neighbor
- bfd per-link
- bfd slow-timer

BFD Display Commands
- show bfd peers

PIM-BFD Configuration Commands
- bfd (Router-PIM Sparse-mode)
- pim ipv4 bfd

BGP-BFD Configuration Commands
- neighbor bfd

VRRP-BFD Configuration Commands
- vrrp bfd ip

OSPF-BFD Configuration Commands
- bfd default (OSPF)
- ip ospf neighbor bfd

ISIS-BFD Configuration Commands
- isis bfd
- bfd default (ISIS)
 bfd (Router-PIM Sparse-mode)

The \texttt{bfd (Router-PIM Sparse-mode)} command enables Bidirectional Forwarding Detection (BFD) globally for use as a failure-detection mechanism for Protocol-Independent Multicast Sparse-Mode (PIM-SM) on the switch. To override the global configuration for a specific interface, use the \texttt{pim \texttt{ipv4 bfd}} command. All PIM-SM interfaces will use the global setting if they are not individually configured.

When PIM BFD is enabled, a BFD session is created for each PIM-SM neighbor and used to detect a loss of connectivity with the neighbor. PIM hello packets are still exchanged with PIM-SM neighbors when BFD is enabled.

The \texttt{no bfd} and \texttt{default bfd} commands disable PIM BFD globally by deleting the \texttt{bfd} statement from \texttt{running-config}. When this is done, only interfaces with PIM BFD explicitly enabled will use PIM BFD.

\textbf{Command Mode}

- Router-PIM Sparse-mode IPv4 Configuration
- Router-PIM Sparse-mode VRF IPv4 Configuration

\textbf{Command Syntax}

\begin{verbatim}
  bfd
  no bfd
  default bfd
\end{verbatim}

\textbf{Example}

- These commands enable PIM BFD globally on the switch in the default VRF, enabling it on all PIM-SM interfaces where it is not explicitly disabled.

\begin{verbatim}
  switch(config)#router pim sparse-mode
  switch(config-router-pim-sparse)#ipv4
  switch(config-router-pim-sparse-ipv4)#bfd
  switch(config-router-pim-sparse-ipv4)#
\end{verbatim}
b.fd default (ISIS)

The `bfd default` command places the switch in address-family configuration mode.

The `bfd default` and `isis bfd` commands configure Bidirectional Forwarding Detection (BFD), a low overhead protocol designed to provide rapid detection of failures at any protocol layer in the path between adjacent forwarding engines over any media. BFD is supported for IS-IS IPv4 routes.

**Command Mode**
- Router-Address-Family Configuration

**Command Syntax**

```
bfd default
```

**Example**

- These commands enable BFD for all the interfaces on which IS-IS is enabled. By default BFD is disabled on all the interfaces.

```bash
switch(config)#router isis 1
switch(config-router-isis)#address-family ipv4
switch(config-router-af)#bfd default
switch(config-router-af)#
```
**bfd default (OSPF)**

The `bfd default` command globally configures OSPF to use Bidirectional Forwarding Detection (BFD). When this command is issued, BFD sessions will be established with all OSPF neighbors connected to BFD-enabled interfaces unless OSPF BFD has been disabled on a participating interface using the `ip ospf neighbor bfd` command. BFD is globally disabled in OSPF by default.

For OSPF BFD to function on an interface, BFD must also be enabled and configured on that interface using the `bfd interval` command.

The `no bfd default` and `default bfd default` commands disable OSPF BFD on all interfaces except those where it has been explicitly enabled using the `ip ospf neighbor bfd` command.

**Command Mode**

Router-OSPF Configuration

**Command Syntax**

```
bfd default
no bfd default
default bfd default
```

**Examples**

These commands enable BFD for OSPF instance 100 on all interfaces except those on which OSPF BFD has been explicitly disabled.

```
switch(config)#router ospf 100
switch(config-router-ospf)#bfd default
switch(config-router-ospf)#
```
**bfd echo**

The `bfd echo` command enables the BFD echo function on the configuration mode interface.

The `no bfd echo` and `default bfd echo` commands disable the BFD echo function by removing the corresponding `bfd echo` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `bfd echo`
- `no bfd echo`
- `default bfd echo`

**Example**
- These commands enable the BFD echo function on Ethernet interface 5. If a slow-timer value has been configured on the switch, the minimum receive rate expected from the BFD neighbor will be reset to that value; otherwise, the minimum receive rate will be set to 2000 milliseconds.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#bfd echo
switch(config-if-Et5)#
```
bdf interval

The `bdf interval` command configures the BFD control packet transmission rate, minimum control packet receive rate, and the number of missed packets that will signal that the session is down. These parameters can be configured globally for the switch or for the configuration mode interface. If a parameter is configured both globally and on the interface, the value configured on the interface takes precedence.

**Important!**
For a BFD session to be established, BFD must be enabled for any routing protocol using BFD for failure detection.

The `no bfd interval` and `default bfd interval` commands return the BFD parameters on the configuration mode interface to default values by removing the corresponding `bdf interval` command from `running-config`.

**Command Mode**
- Global Configuration
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
bfd interval transmit_rate min_rx receive_minimum multiplier factor
no bfd interval
default bfd interval
```

**Parameters**
- `transmit_rate` rate in milliseconds at which control packets will be sent. Values range from 50 to 60000; the default value is 300.
- `receive_minimum` rate in milliseconds at which control packets will be expected. Values range from 50 to 60000.
- `factor` number of consecutive missed BFD control packets after which BFD will declare the session as down. Values range from 3 to 50.

**Examples**
- These commands configure BFD on Ethernet interface 5 to expect packets from the peer every 200 milliseconds and declare the session down after failing to receive 5 consecutive packets. This configuration overrides any values configured globally.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#bfd interval 200 min_rx 200 multiplier 5
switch(config-if-Et5)#
```
**bfd local-address**

The `bfd local-address` command specifies the local L3 address for use in Bidirectional Forwarding Detection (BFD). When configuring an L2 interface, specification of a local L3 address is required in order to run BFD per-link in RFC 7130 mode. (This is not necessary when configuring an L3 interface with an IP address configured on the port channel.)

The `no bfd local-address` and `default bfd local-address` commands remove the local L3 address by removing the corresponding `bfd local-address` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
bfd local-address address
no bfd local-address [address]
default bfd local-address [address]
```

**Parameters**

- `address` local IPv4 or IPv6 address for BFD.

**Example**

- This command specifies the local L3 address for BFD.

  ```
  switch(config)#bfd local-address 10.0.0.4
  switch(config#)
  ```
**bfd neighbor**

The **bfd neighbor** command specifies the L3 address of the BFD neighbor of the port channel being configured. This is required to run BFD per-link in RFC 7130 mode. For an L2 port channel, this address should be the BFD per-link "local address" globally configured on the peer switch. For an L3 port channel, this address should be the IP address configured on the peer port channel.

The **no bfd neighbor** and **default bfd neighbor** commands remove the BFD neighbor address by removing the corresponding **bfd neighbor** command from *running-config*.

**Command Mode**

Interface-Port-channel Configuration

**Command Syntax**

```
  bfd neighbor address
  no bfd neighbor [address]
  default bfd neighbor [address]
```

**Parameters**

  *address*  IPv4 or IPv6 address of the port channel’s BFD neighbor.

**Example**

- These commands specify the L3 address of the port channel’s BFD neighbor.

  ```
  switch(config)#interface port-channel 5
  switch(config-if-Po5)#bfd neighbor 10.0.0.5
  switch(config-if-Po5)#
  ```
**bfd per-link**

The **bfd per-link** command enables the BFD per-link function on the port channel being configured. When BFD per-link is enabled, BFD sub-sessions are run on each link of the port channel; BFD considers the port-channel to be “up” as long as any one of the links is live.

BFD per-link runs by default in legacy mode, which allows downed links to remain members of the port channel and relies on LACP or other means to prune the dead links. Legacy mode is provided for interoperability with older switches.

RFC 7130 mode runs BFD per-link in full compliance with RFC 7130, and automatically removes links in down state from the port-channel, then adds them back again when they come up. Use the **rfc-7130** keyword to enable per-link in RFC 7130 mode. You must also configure an L3 BFD neighbor address for each port-channel running RFC 7130 per-link using the **bfd neighbor** command. When configuring an L2 interface, you must also globally configure a local L3 BFD address on the switch using the **bfd local-address** command.

For the BFD session to come up, both peers must be configured in the same way (either RFC-7130 or legacy mode).

The **no bfd per-link** and **default bfd per-link** commands disable the BFD per-link function by removing the corresponding **bfd per-link** command from **running-config**.

**Command Mode**

**Interface-Port-channel Configuration**

**Command Syntax**

```
bfd per-link [rfc-7130]
no bfd per-link [rfc-7130]
default bfd per-link [rfc-7130]
```

**Example**

- These commands enable the BFD per-link function in legacy mode on port channel 5.

  ```sh
  switch(config)#interface port-channel 5
  switch(config-if-Po5)#bfd per-link
  switch(config-if-Po5)#
  ```

- These commands globally specify a local L3 BFD address for the switch, enable the BFD per-link function in RFC 7130 mode on port channel 5, and specify the L3 address of the port channel’s BFD neighbor.

  ```sh
  switch(config)#bfd local-address 10.0.0.5
  switch(config)#interface port-channel 5
  switch(config-if-Po5)#bfd per-link rfc-7130
  switch(config-if-Po5)#bfd neighbor 10.0.0.4
  switch(config-if-Po5)#
  ```
**bfd slow-timer**

The `bfd slow-timer` command configures the minimum reception rate for BFD control packets which will be used if the BFD echo function is enabled. The default value is 2000 milliseconds.

**Important!** For a BFD session to be established, BFD must be enabled for any routing protocol using BFD for failure detection.

The `no bfd slow-timer` and `default bfd slow-timer` commands return the BFD slow-timer to the default value of 2000 milliseconds by removing the corresponding `bfd interval` command from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**

```
bfd slow-timer receive_minimum
no bfd slow-timer
default bfd slow-timer
```

**Parameters**
- `receive_minimum` rate in milliseconds at which control packets will be expected when the BFD echo function is enabled. Values range from 2000 to 60000; default value is 2000.

**Examples**
- This command configures BFD to expect control packets from the peer every 10000 milliseconds when the BFD echo function is enabled.

```
switch(config)#bfd slow-timer 10000
switch(config)#
```
ip ospf neighbor bfd

The **ip ospf neighbor bfd** command enables Bidirectional Forwarding Detection (BFD) for the open shortest path first protocol (OSPF) on the configuration mode interface regardless of the global settings for the OSPF instance. All OSPF neighbors associated with the interface become BFD peers, and OSPF uses BFD for failure detection.

For OSPF BFD to function on an interface, BFD must also be enabled and configured on that interface using the **bfd interval** command.

The **no ip ospf neighbor bfd** command disables OSPF BFD on the interface and terminates all BFD sessions with the interface’s OSPF peers. The **default ip ospf neighbor bfd** command causes the interface to follow global OSPF BFD settings configured by the **bfd default (OSPF)** command.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

- ip ospf neighbor bfd
- no ip ospf neighbor bfd
- default ip ospf neighbor bfd

**Example**

- These commands enable BFD on Ethernet interface 3/20.

  switch(config)#interface ethernet 3/20
  switch(config-if-Et3/20)#ip ospf neighbor bfd
  switch(config-if-Et3/20)#

- These commands cause Ethernet interface 3/20 to follow the global OSPF BFD configuration.

  switch(config)#interface ethernet 3/20
  switch(config-if-Et3/20)#default ip ospf neighbor bfd
  switch(config-if-Et3/20)#
isis bfd

The `isis bfd` command activates the corresponding IS-IS routing instance on the configuration mode interface. By default, the IS-IS routing instance is not enabled on an interface.

The `no isis enable` and `default isis enable` commands disable IS-IS on the configuration mode interface by removing the corresponding `isis enable` command from `running-config`.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

- `isis bfd`
- `no isis bfd`
- `default isis bfd`

**Examples**

- These commands enable BFD on IS-IS interfaces.

```
switch(config)#interface Ethernet 5/6
switch(config-if-Et5/6)#isis bfd
switch(config-if-Et5/6)#
```
neighbor bfd

The `neighbor bfd` command enables Bidirectional Forwarding Detection (BFD) for use as a failure detection mechanism for border gateway protocol (BGP) connections to the specified BGP neighbor or peer group.

Once a BFD session is established with a BGP neighbor, if the BFD session goes down the status of the BGP session is changed to "down" as well.

The `no neighbor bfd` and `default neighbor bfd` commands disable BFD for BGP connections to the specified neighbor or peer group by removing the corresponding `neighbor bfd` command from `running-config`.

**Command Mode**
- Router-BGP Configuration

**Command Syntax**

```
neighbor NEIGHBOR_ID bfd
no neighbor NEIGHBOR_ID bfd
default neighbor NEIGHBOR_ID bfd
```

**Parameters**

- `NEIGHBOR_ID`  IP address or peer group name. Values include:
  - `ipv4_addr` neighbor's IPv4 address.
  - `ipv6_addr` neighbor's IPv6 address.
  - `group_name` peer group name.

**Example**

- These commands enable BFD failure detection for BGP connections with the neighbor at 10.13.64.1.
  
  ```
  switch(config)#router bgp 300
  switch(config-router-bgp)#neighbor 10.13.64.1 bfd
  switch(config-router-bgp)#
  ```
**pim ipv4 bfd**

The `pim ipv4 bfd` command enables Bidirectional Forwarding Detection (BFD) on the configuration mode interface as a failure detection mechanism for Protocol-Independent Multicast Sparse-Mode (PIM-SM). To enable PIM BFD globally on the switch, use the `bfd (Router-PIM Sparse-mode)` command. Interface-level settings override the global setting.

When PIM BFD is enabled, a BFD session is created for each PIM-SM neighbor and used to detect a loss of connectivity with the neighbor. PIM-SM hello packets are still exchanged with PIM-SM neighbors when BFD is enabled.

The `no pim ipv4 bfd` disables PIM BFD on the configuration mode interface regardless of global settings. The `default pim ipv4 bfd` command causes the configuration mode interface to follow the global setting for PIM BFD by removing the corresponding `pim ipv4 bfd` statement from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `pim ipv4 bfd`
- `no pim ipv4 bfd`
- `default pim ipv4 bfd`

**Example**
- These commands configure VLAN interface 200 to use BFD for PIM-SM connection failure detection regardless of the global PIM BFD configuration.

```plaintext
switch(config)#interface vlan 200
switch(config-if-VL200)#pim ipv4 bfd
switch(config-if-VL200)#
```
show bfd peers

The `show bfd peers` command displays information about the neighbors with which the switch currently has a Bidirectional Forwarding Detection (BFD) session.

**Command Mode**

EXEC

**Command Syntax**

```
show bfd peers [INFO_LEVEL]
```

**Parameters**

- `INFO_LEVEL` amount of information that is displayed. Options include:
  - `<no parameter>` command displays data block for each specified interface.
  - `detail` command displays table that summarizes interface data.

**Display Values**

- `DstAddr` IP address of the BFD neighbor.
- `MyDisc` Local discriminator value of the BFD session.
- `YoDisc` Neighbor’s discriminator value for the BFD session.
- `If` Interface to which the neighbor is connected.
- `LUp` Last up.
- `LDown` Last down.
- `Ldiag` Diagnostic for the last change in session state.
- `State` State of the BFD session.
- `TxInt` Transmit interval of the local interface.
- `RxInt` Minimum receive interval set on the local interface.
- `Multiplier` Local multiplier (number of packets that must be missed to declare session down).
- `Received RxInt` Minimum receive interval set on the neighbor interface.
- `Received Multiplier` Neighbor’s multiplier (number of packets that must be missed to declare session down).
- `Rx Count` BFD control packets transmitted.
- `Tx Count` BFD control packets received.
- `Detect Time` Total time in milliseconds it takes for BFD to detect connection failure.
- `Registered Protocols` Protocols using BFD with this neighbor.
Examples

- This command displays general information about BFD neighbors.

  switch>show bfd peers

  Detect Time: 900
  Registered protocols: bgp

switch>
vrrp bfd ip

The `vrrp bfd ip` command enables and configures Bidirectional Forwarding Detection (BFD) for virtual router redundancy protocol (VRRP) on the configuration mode interface.

When enabled, BFD provides failure detection for a 2-router VRRP system. When the master is configured with the physical IP address of the backup router, and the backup is configured with the address of the master, a BFD session is established between them. If the BFD session goes down, the backup router immediately assumes the master role.

VRRP master advertisement packets are still sent even when the BFD session is established to accommodate VRRP systems involving more than two routers.

The `no vrrp bfd ip` and `default vrrp bfd ip` commands disable BFD for VRRP on the configuration mode interface by removing the corresponding `vrrp bfd ip` statement from `running-config`. The `no vrrp` command also removes the `vrrp bfd ip` command for the specified virtual router.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

- `vrrp group bfd ip ipv4_address`
- `no vrrp group bfd ip`
- `default vrrp group bfd ip`

**Parameters**

- `group` virtual router identifier (VRID). Values range from 1 to 255.
- `ipv4_address` IPv4 address of the other VRRP router. On the master router, enter the physical IP address of the backup; on the backup, enter the physical IP address of the master.

**Example**

- These commands enable BFD on Ethernet interface 3/20 for VRRP ID 15 with a connection to a router at IP address 192.168.2.1.

```
switch(config)# interface ethernet 3/20
switch(config-if-Et3/20)# vrrp 15 bfd ip 192.168.2.1
switch(config-if-Et3/20)#
```
Multicast Architecture

IP multicast is the transmission of data packets to multiple hosts through a common IP address. Arista switches support multicast transmissions through IGMP, IGMP Snooping, and PIM-SM. These sections describe the Arista multicast architecture.

- Section 38.1: Overview
- Section 38.2: Multicast Architecture Description
- Section 38.3: Multicast Listener Discovery (MLD)
- Section 38.4: Static IP Mroute
- Section 38.5: Static Multicast
- Section 38.6: Multicast Configuration
- Section 38.7: Multicast Commands

38.1 Overview

Arista switches provide layer 2 multicast filtering and layer 3 routing features for applications requiring IP multicast services. The switches support over a thousand separate routed multicast sessions at wire speed without compromising other layer 2/3 switching features. Arista switches support IGMP, IGMP snooping, PIM-SM, and MSDP to simplify and scale data center multicast deployments.

Supported Features

Feature support varies by platform; please consult the release notes for multicast support information by platform.

Multicast and unicast use the same routing table. Unicast routes use TCAM resources, which may also impact the maximum number of multicast routes.

Features Not Supported

The multicast functions not supported by Arista switches include (*,*,G) forwarding or boundary routers, multicast MIBs, and router applications joining multicast groups.
38.2 Multicast Architecture Description

IP multicast is data transmission to a subset of all hosts through a single multicast group address. Multicast packets are delivered using best-effort reliability, similar to unicast packets. Senders use the multicast address as the destination address. Any host, regardless of group membership, can send to a group. However, only group members receive messages sent to a group address.

IP multicast addresses range from 224.0.0.0 to 239.255.255.255. Multicast routing protocol control traffic reserves the address range 224.0.0.0 to 224.0.0.255. The address 224.0.0.0 is never assigned to any group.

Multicast group membership is dynamic; a group’s activity level and membership can vary over time. A host can also simultaneously belong to multiple multicast groups.

Figure 38-1 depicts the components that comprise the multicast architecture. The remainder of this section describes the multicast components depicted in the figure.

Figure 38-1: Multicast Architecture

38.2.1 Multicast Control Plane

The multicast control plane builds and maintains multicast distribution trees. It communicates changes in the multicast routing table to the MFIB for multicast forwarding.

- Protocol Independent Multicast (PIM) builds and maintains multicast routing trees using reverse path forwarding (RPF) on a unicast routing table.
- Internet Group Management Protocol (IGMP) identifies multicast group members on subnets directly connected to the switch. Hosts manage multicast group membership with IGMP messages.
- The switch maintains an mroute (multicast routing) table when running PIM to provide forwarding tables used to deliver multicast packets.

The mroute table stores the states of inbound and outbound interfaces for each source/group pair (S,G). The switch discards and forwards packets on the basis of this state information. Each table entry, referred to as an mroute, corresponds to a unique (S,G) and contains:

- the multicast group address
- the multicast source address (or * for all sources)
38.2.2 Multicast Routing Information Base (MRIB)

The MRIB is the channel between multicast control plane clients and the multicast forwarding plane. The `show ip mroute` command displays MRIB entries as (*, G), (S, G), and (*, G/m) multicast entries. MRIB entries are based on source, group, and group masks. The entries are associated with a list of interfaces whose forwarding state is described with flags. MRIB communication is based on the state change of entry and interface flags. Flags are significant to MRIB clients but are not interpreted by the MRIB.

38.2.3 Multicast Forwarding Plane

The multicast forwarding plane consists of the multicast forwarding information base (MFIB), a forwarding engine that is independent of multicast routing protocols.

MFIB formats PIM and IGMP multicast routes for protocol-independent hardware packet forwarding and adds them to the hardware multicast expansion table (MET) and the hardware FIB.

MFIB uses a core forwarding engine for interrupt-level (fast switching) and process-level (process switching) forwarding. MFIB fast-switches inbound multicast packets that match an MFIB forwarding entry and process-switches packets requiring a forwarding entry if a matching entry does not exist.

38.2.4 Hardware Dependent Forwarding and Fast Drop

In IP multicast protocols, each (S,G) and (*,G) route corresponds to an inbound reverse path forwarding (RPF) interface. Packets arriving on non-RPF interfaces may require PIM processing, as performed by the CPU subsystem software.

By default, hardware sends all packets arriving on non-RPF interfaces to the CPU subsystem software. However, the CPU can be overwhelmed by non-RPF packets that do not require software processing. The CPU subsystem software prevents CPU overload by creating a fast-drop entry in hardware for inbound non-RPF packets not requiring PIM processing. Packets matching a fast-drop entry are bridged in the ingress VLAN but not sent to the software, avoiding CPU subsystem software overload. Fast-drop entry usage is critical in topologies with persistent RPF failures.

Protocol events, such as links going down or unicast routing table changes, can change the set of packets that can be fast dropped. Packets that were correctly fast dropped before a topology change may require forwarding to the CPU subsystem software after the change. The CPU subsystem software handles fast-drop entries that respond to protocol events so that PIM can process all necessary non-RPF packets.
38.3 Multicast Listener Discovery (MLD)

Networks use Multicast Listener Discovery (MLD) to control the flow of layer 3 IPv6 multicast traffic. Hosts request and maintain multicast group membership through MLD messages. Multicast routers use MLD to maintain a membership list of active multicast groups for each attached network.

With respect to each of its attached networks, a multicast router is either a querier or non-querier. Each physical network contains only one querier. A network with more than one multicast router designates the router with the lowest IP address as its querier.

In an MLD Report or Done message, the multicast address field holds a specific IPv6 multicast address to which the message sender is listening or is ceasing to listen, respectively.

38.3.1 Platform Compatibility

- 7280R
- 7500R

38.3.2 Configuring Multicast Listener Discovery

38.3.2.1 Enabling MLD

Use `mld` command to enable MLD on an interface. When the switch fills the multicast routing table, it only adds interfaces when the interface receives join messages from downstream devices or when the interface is directly connected to a member of the MLD group. By default, MLD is disabled on an interface.

**Examples**

- This command enables MLD on the Ethernet interface 1.
  
  ```
  switch(config)#interface Ethernet 1
  switch(config-if-Et1)#mld
  ```

- This command disables MLD on the Ethernet interface 1.
  
  ```
  switch(config)#interface Ethernet1
  switch(config-if-Et1)#no mld
  ```

38.3.2.2 Configuring MLD

An interface that runs MLD uses default protocol settings unless otherwise configured. The switch provides commands that alter startup query, last member query, and normal query settings.

**MLD**

The switch supports MLD versions 1 through 2. The `mld` command configures multicast routers on the configuration mode interface. Version 2 is the default MLD version.

**Example**

- This command enables MLD on the Ethernet interface 1.
  
  ```
  switch(config)#interface Ethernet 1
  switch(config-if-Et1)#mld
  ```
Chapter 38: Multicast Architecture

Multicast Listener Discovery (MLD)

Startup Query

Membership queries are sent at an increased frequency immediately after an interface starts up to quickly establish the group state. Query count and query interval commands adjust the period between membership queries for a specified number of messages.

The `mld startup-query-interval` command specifies the interval between membership queries that an interface sends immediately after it starts up. The `mld startup-query-count` command specifies the number of queries that the switches sends from the interface at the startup interval rate.

Examples

- This command configures the startup query count of 4 on an Ethernet interface 1.
  ```
  switch(config)#interface Ethernet1
  switch(config-if-Et1)#mld startup-query-count 4
  ```

- This command configures the startup query interval of 100 seconds on an Ethernet interface 1.
  ```
  switch(config)#interface Ethernet1
  switch(config-if-Et1)#mld startup-query-interval 100
  ```

Membership Queries

The router with the lowest IP address on a subnet sends membership queries as the MLD querier. When a membership query is received from a source with a lower IP address, the router resets its query response timer. Upon timer expiry, the router begins sending membership queries. If the router subsequently receives a membership query originating from a lower IP address, it stops sending membership queries and resets the query response timer.

The `mld query-interval` command configures the frequency at which the active interface, as an MLD querier, sends membership query messages.

The `mld query-response-interval` command configures the time that a host has to respond to a membership query.

Examples

- This command configures the query interval of 30 seconds on an Ethernet interface 1.
  ```
  switch(config)#interface Ethernet1
  switch(config-if-Et1)#mld query-interval 30
  ```

- This command configures the query response interval of 30 seconds on an Ethernet interface 1.
  ```
  switch(config)#interface Ethernet1
  switch(config-if-Et1)#mld query-response-interval 30
  ```

Last Member Query

When the querier receives an MLD leave message, it verifies the group has no remaining hosts by sending a set of group-specific queries at a specified interval. If the querier does not receive a response to the queries, it removes the group state and discontinues multicast transmissions.

The `mld last-listener-query-count` command specifies the number of query messages the router sends in response to a group-specific or group-source-specific leave message.

The `mld last-listener-query-interval` command configures the transmission interval for sending group-specific or group-source-specific query messages to the active interface.
Examples

- This command configures the last listener query count to 3 on an Ethernet interface 1.
  
  ```
  switch(config)#interface Ethernet 1  
  switch(config-if-Et1)#mld last-listener-query-count 3 
  ```

- This command configures the last listener query interval to 2 seconds on an Ethernet interface 1.
  
  ```
  switch(config)#interface Ethernet1  
  switch(config-if-Et1)#mld last-listener-query-interval 2 
  ```

Static Groups

The `mld static-group` command configures the configuration mode interface as a static member of the multicast group at the specified address. The router forwards multicast group packets through the interface without otherwise appearing or acting as a group member. No interface is a static member of a multicast group by default.

Example

- This command configures static groups on an interface Ethernet 1.

  ```
  switch(config)#interface Ethernet1  
  switch(config-if-Et1)#mld static-group ff30::1 a::1 
  ```
38.4 Static IP Mroute

The Static IP Multicast route (or Static Mroute) interface overrides the interface that is ordinarily selected from the matching route in the unicast routing table, providing a means for breaking dependency on the unicast topology for the multicast topology. Let us assume that, PIM routers in a multicast network sends PIM joins towards a source to receive traffic from that source. The interface on which to send a PIM join is determined by looking up the unicast routing table for the source address. This interface is the “upstream” or “RPF” interface for that source. When traffic is received from that source, it is ensured it is received on the RPF interface for that source. This mechanism causes multicast traffic to take the same path through a network as unicast traffic would. In some cases, it is desirable to have the multicast traffic take a different path than the unicast traffic. For example, to avoid a slow firewall required for unicast traffic but not for multicast traffic or to receive multicast across a low latency, low bandwidth microwave link while unicast traverses a higher latency, higher bandwidth fiber path.

To overcome this situation, a static IP multicast route (or static mroute) command \texttt{ip mroute} command is introduced. The \texttt{ip mroute} command specifies a candidate for the RPF interface of any (S,G) multicast route where the source falls within the given source/mask. This interface potentially overrides the interface that would ordinarily have been selected from the matching route in the unicast routing table. This command, therefore, provides a means of breaking the dependence of the multicast topology on the unicast topology. The method of selecting the RPF interface for an (S,G) route is described next.

\textbf{Example}

- This command configures a Static IP mroute for a source 1.1.1.1/32 with an administrative distance 20 on a Ethernet interface 2/1.

  \texttt{switch(config)#ip mroute 1.1.1.1/32 ethernet 2/1 20}

38.4.1 Selecting Static Mroute

The Static Mroute is selected based the following parameters:

- Longest Match
- Administrative Distance
- Interface Status

\textbf{Longest Match}

When a given source matches multiple static Mroutes in the MRIB, the longest match will be selected. The order in which the static Mroutes were configured will not be a factor.

\textbf{Example}

- If the following static mroutes were configured in order:

  \texttt{ip mroute 0.0.0.0/0 Ethernet1}
  \texttt{ip mroute 192.168.0.0/16 Ethernet2}
  \texttt{ip mroute 192.168.1.0/24 Ethernet3}

For an (S,G) route where S = 192.168.1.1, the third static mroute listed above would be selected since it is the most specific route to the source. The RPF interface would therefore be Ethernet 3. The table below shows the selected RPF interface for 3 different sources based on the configuration above:
Administrative Distance

User is allowed to specify an administrative distance with each static Mroute. While selecting a Static Mroute for a source, if multiple Static Mroute exist in the MRIB with the same source/mask, then, the one with the lowest Admin distance is selected. The default administrative distance for a Static Mroute is 1.

Interface Status

For a Static Mroute to be considered for selection, the specified interface must be UP and PIM must be enabled on it.

38.4.2 Selecting RPF interface

Static Mroutes are BGP IP Multicast (SAFI 2) learned routes. These routes are stored in the multicast routing information base (MRIB), a separate routing table. The RPF interface is selected for a source as follows:

Initially, a source route is looked up in the MRIB. If the MRIB lookup yields a route, that route is used for selecting the RPF interface. Therefore, any configured Static Mroutes matching the source wins the selection process over a 'Connected' route to the source. For a static mroute to be considered for selection, the specified interface must be up and PIM must be enabled on it. By default, Static Mroute have an Admin distance of 1. If multiple Static Mroutes exist with equal longest prefix match, the mroute with the lowest Admin distance will win. Admin distance is not be used to compare selection between unicast RIB and MRIB routes. Successful Static Mroute looked up in the MRIB are always chosen over unicast RIB lookups.

If MRIB lookup does not yield a route, then the unicast RIB is looked up for a route to select the RPF interface. If the selected route has ECMP, one of the corresponding paths is selected as RPF neighbor.

Note

The path to choose RPF neighbor is selected based on the hashing scheme; and protocols specified for valid paths, multi-path configuration, directly connected sources, and assert winners.

Example

- Let us assume that the Static Mroute is configured, and for this example let us consider that the default Admin distance for connected routes is 0, 1 for static routes, and 110 for OSPF routes.

  ```
ip mroute 172.16.0.0/16 Ethernet1
ip mroute 192.168.0.0/16 Ethernet2
ip mroute 192.168.1.0/24 Ethernet3
ip mroute 192.168.1.0/24 Ethernet4 255
ip mroute 192.168.1.3/32 Ethernet5 255
ip mroute 200.10.0.0/16 Ethernet5
ip mroute 200.11.0.32/16 Ethernet5
```

- So the MRIB table contains the following:
And let us assume the unicast RIB table contains the following:

<table>
<thead>
<tr>
<th>Prefix</th>
<th>Interface</th>
<th>Admin Distance</th>
</tr>
</thead>
<tbody>
<tr>
<td>172.16.0.0/16</td>
<td>Ethernet 1</td>
<td>1</td>
</tr>
<tr>
<td>192.168.0.0/16</td>
<td>Ethernet 2</td>
<td>1</td>
</tr>
<tr>
<td>192.168.1.0/24</td>
<td>Ethernet 3</td>
<td>1</td>
</tr>
<tr>
<td>192.168.1.0/24</td>
<td>Ethernet 4</td>
<td>255</td>
</tr>
<tr>
<td>192.168.1.3/32</td>
<td>Ethernet 5</td>
<td>255</td>
</tr>
<tr>
<td>200.10.0.0/16</td>
<td>Ethernet 5</td>
<td>1</td>
</tr>
<tr>
<td>200.11.0.1/32</td>
<td>Ethernet 5</td>
<td>1</td>
</tr>
</tbody>
</table>

The table below shows the RPF interface selections for a set of sources along with which Static Mroute was chosen, which unicast RIB route was chosen, which was the eventual winner, and the reasoning behind the selection.

<table>
<thead>
<tr>
<th>Source</th>
<th>Static Mroute</th>
<th>Unicast Route</th>
<th>Winner</th>
<th>RPF Interface</th>
<th>Reasoning</th>
</tr>
</thead>
<tbody>
<tr>
<td>10.0.0.1</td>
<td>-</td>
<td>1</td>
<td>Unicast</td>
<td>Ethernet 6</td>
<td>• Only the unicast Rib yields a route to the source so it wins</td>
</tr>
<tr>
<td>200.11.0.1</td>
<td>7</td>
<td>-</td>
<td>Static</td>
<td>Ethernet 5</td>
<td>• Only the MRIB yields a route to the source so it wins</td>
</tr>
<tr>
<td>Source</td>
<td>Static Mroute</td>
<td>Unicast Route</td>
<td>Winner</td>
<td>RPF Interface</td>
<td>Reasoning</td>
</tr>
<tr>
<td>---------</td>
<td>---------------</td>
<td>---------------</td>
<td>--------</td>
<td>---------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| 192.168.1.3 | 5             | 5             | Unicast Route | Ethernet 10 | - In the MRIB (5) is the longest match  
- While comparing the static mroute and the unicast route, the unicast route is the winner because it has a lower Admin distance |
| 192.168.2.1 | 2             | 3             | Static Mroute | Ethernet 2   | - In the MRIB (2) is the longest match  
- While comparing the static mroute and the unicast route, the static mroute is the winner because it has a lower Admin distance |
| 192.168.1.1 | 3             | 4             | Static Mroute | Ethernet 3   | - In the MRIB both (3) and (4) are the longest match but (3) has the lower Admin distance  
- While comparing the static mroute and the unicast route, the static mroute is the winner even though both have the same distance |
### 38.5 Static Multicast

Static Multicast feature allows to configure multicast routes statically on any Arista switches. This feature co-exists with PIM-SM and PIM-BIDIR protocols which are dynamic variants of programming multicast routes. However, the selection method for routes are to be kept in mind before programming static routes in order to get predictable results.

Static multicast routes competes with the routes provided by PIM-SM and PIM-BIDIR mainly because this static variant, allows the operator to configure a PIM-SM like or PIM-BIDIR like routes among other routes. The route chosen depends upon setting up the priority on the route. Currently, PIM-SM/PIM-BIDIR installs routes with a priority value of 0 (zero) while static route installs route with a priority of 255, by default. The priorities of PIM-SM and PIM-BIDIR are subject to future change. Higher priority wins in case of conflicts while programming the hardware. Conflicts here imply the same route present as static multicast route and in PIM-SM/PIM-BIDIR. This implies that, by default, static multicast routes will always be the winner.

This feature allows user to configure static multicast routes at a per VRF granularity. However, static multicast routes do not, at this point, perform any VRF validation for the interfaces involved in the route, which can cause some possibility of route leakage.

#### 38.5.1 Platform Compatibility

This feature is supported across all platforms.

#### 38.5.2 Configuring Static Multicast

- Static Multicast configuration involves two steps:

  **Step 1** Adding all the interfaces for which static multicast routing is enabled. Note, all the interfaces involved in the static multicast route must have this configuration for the route to work as expected.

  **Step 2** Configuring the Static Multicast route.

The following example shows how Static Multicast for an interface is configured in interface configuration mode.

**Example**

```
switch(config)#interface ethernet 1/2
switch(config-if-Et1/2)#no switchport
switch(config-if-Et1/2)#ip address 1.1.1.1/24
switch(config-if-Et1/2)#ip multicast static
```

- Configuring Static Multicast routes for a specific VRF:

The static multicast route is configured in multicast mode followed by a VRF configuration in VRF mode, when a static multicast route is being configured within a specific VRF.

Note, static multicast commands belong in the router multicast mode. To maintain backward compatibility for default VRF, static multicast commands for default VRF can be entered without changing to router multicast mode.

In the following example we are configuring static multicast route for a specific VRF.

**Example**

```
switch(config)#router multicast
switch(config-router-multicast)#ip route multicast
```
Source address can be optionally entered. When no source address is entered, it is assumed to be 0.0.0.0

```
switch(config-router-multicast)# ip route multicast 1.1.1.1 10.1.1.1
switch(config-router-multicast)# ip route multicast 1.1.1.1 10.1.1.1 iif
```

Note, the IIF must belong to the same VRF for which the command is being executed for the configuration to take effect.

```
switch(config-router-multicast)# ip route multicast 1.1.1.1 10.1.1.1 iif ethernet
switch(config-router-multicast)# ip route multicast 1.1.1.1 10.1.1.1 iif ethernet 30
switch(config-router-multicast)# ip route multicast 1.1.1.1 10.1.1.1 iif ethernet 30 oif
```

Multiple interfaces can be entered following the OIF. However, OIF is also optional. When there are no OIFs, then traffic for the S,G on the incoming interface is dropped.

```
switch(config-router-multicast)# ip route multicast 1.1.1.1 10.1.1.1 iif ethernet 30 oif ethernet
switch(config-router-multicast)# ip route multicast 1.1.1.1 10.1.1.1 iif ethernet 30 oif ethernet 30 ethernet 32
switch(config-router-multicast)# ip route multicast 1.1.1.1 10.1.1.1 iif ethernet 30 oif ethernet 30 ethernet 32 cpu priority
```

CPU option is optional. It can be used when we desire to have CPU in the OIF set.

```
switch(config-router-multicast)# ip route multicast 1.1.1.1 10.1.1.1 iif ethernet 30 oif ethernet 30 ethernet 32 cpu priority 40
```

Priority is an optional and the value ranges from 1 to 255. By default the value is 255.

### 38.5.3 Displaying Static Multicast Information

- The **show multicast fib ipv4** command is used to check the status of the configured interfaces.

```
switch#show multicast fib ipv4
Activity poll time: 60 seconds
225.1.1.1 10.1.1.1
   Ethernet1 (iif)
   Ethernet2
   Cpu
```
38.6 Multicast Configuration

This section describes the following configuration tasks:

- Section 38.6.1: Multicast Configuration
- Section 38.6.2: Configuring MFIB
- Section 38.6.3: Displaying and Clearing the Mroute Table

38.6.1 Multicast Configuration

38.6.1.1 Enabling IPv4 Multicast Routing

Enabling IPv4 multicast routing allows the switch to forward multicast packets. The `routing` command enables multicast routing. When multicast routing is enabled, `running-config` contains a `routing` statement.

**Example**

These commands enable IPv4 multicast routing on the switch.

```plaintext
switch(config)#router multicast
switch(config-router-multicast)#ipv4
switch(config-router-multicast-ipv4)#routing
```

38.6.1.2 Enabling IPv6 Multicast Routing

Enabling IPv6 Multicast routing allows the switch to distribute IPv6 datagrams to one or more recipients. IPv6 PIM builds and maintains Multicast routing using reverse path forwarding (RPF) based on unicast routing table. IPv6 PIM is protocol-independent and can use routing tables consisting of OSPFv3, IPv6 BGP or static routes, for RPF lookup. MLD is used to discover Multicast hosts and maintain group membership on directly attached link. This feature is supported on 7280R and 7500R. Source-specific multicast (SSM) is currently supported on L3 routed port.

**PIM Sparse Mode**

In PIM-SM, each host (sender and/or receiver) is associated with a designated router (DR) which acts for all directly connected hosts in PIM-SM transactions. Upon receiving of MLD report from host or PIM join from downstream PIM neighbor, (S,G) route is created or programmed and router sends a PIM join to upstream PIM neighbor with shortest path to the source.

**Configuring IPv6 Multicast Routing**

The following steps are to configure IPv6 multicast routing on the switch.

**Step 1** Enabling IPv6 multicast-routing

By default, multicast-routing is disabled on switch. The following commands are used to enable IPv6 multicast-routing.

**Example**

```plaintext
switch(config)#router multicast
switch(config-router-multicast)#ipv6
switch(config-router-multicast-ipv6)#routing
```

**Step 2** Enabling IPv6 PIM Sparse Mode

By default, IPv6 PIM is disabled on an interface. The `pim ipv6 sparse-mode` command enables an interface to participate in IPv6 multicast-routing domain.
Example
switch(config)#interface ethernet 15/1
switch(config-if-Et15/1)#pim ipv6 sparse-mode

Note
SVI is not supported.

Step 3 Enabling MLD
By default, MLD is disabled on an interface. Enabling MLD is needed only on the interface that is connected to the MLD host which would like to receive IPv6 multicast traffic.

Example
switch(config)#interface ethernet 15/1
switch(config-if-Et15/1)#mld

38.6.1.3 Multicast-Routing Configuration Example
router multicast
   ipv6
      Routing
      interface Ethernet15/1
         no switchport
         ipv6 enable
         ipv6 address 40:1::3/64
         mld
         pim ipv6 sparse-mode

Displaying IPv6 Multicast Routing Information
• The show mld multicast routing command displays the MLD group membership table as shown.

switch#show mld membership
                   Interface          Group             Source
                   Filter Mode

Vlan1226(Et5/1) Vlan1232(Et3/1)
Vlan1307(Et6/1) Vlan1337(Et4/1)
```

38.6.1.4 Multicast Boundary Configuration

The multicast boundary specifies subnets where source traffic entering an interface is filtered to prevent the creation of mroute states on the interface. The interface is not included in the outgoing interface list (OIL). Multicast PIM, IGMP and other multicast data cannot cross the boundary, facilitating the use of a multicast group address in multiple administrative domains.

The `ip multicast boundary` command configures the multicast boundary. The multicast boundary can be specified through multiple IPv4 subnets or one standard IPv4 ACL.

In an ACL method, the multicast subnets are allowed only from the permit entries of the ACL and rest is either denied or filtered. Whereas, in a non-ACL method the statements configure subnets that are only denied or filtered.

Examples

- These commands configure the multicast address of 229.43.23.0/24 as a multicast boundary where source traffic is restricted from VLAN interface 300.

```
switch(config)#interface vlan 300
switch(config-if-vl300)#ip multicast boundary 229.43.23.0/24
```

- These commands create a standard ACL, then implement the ACL in an `ip multicast boundary` command to allow multicast for subnet (224.0.0.0/4) and create a multicast boundary for all remaining subnets by denying them.

```
switch(config)#ip access-list standard mbac1
switch(config-standard-acl-mbac1)#10 deny 225.123.0.0/16
switch(config-standard-acl-mbac1)#20 deny 239.120.10.0/24
switch(config-standard-acl-mbac1)#30 permit 224.0.0.0/4
switch(config-standard-acl-mbac1)#exit
```

38.6.2 Configuring MFIB

MFIB formats PIM and IGMP multicast routes for protocol-independent hardware packet forwarding and adds them to the hardware multicast expansion table (MET) and the hardware FIB.
MFIB Polling Interval

The switch records activity levels for multicast routes in the MFIB after polling the corresponding hardware activity bits. The activity polling-interval command specifies the frequency at which the switch polls the hardware activity bits for the multicast routes.

Example

- These commands set the MFIB activity polling period to 15 seconds.

```
switch(config)#router multicast
switch(config-router-multicast)#ipv4
switch(config-router-multicast-ipv4)#activity polling-interval 15
switch(config-router-multicast-ipv4)#
```

MFIB Fast Drops

In IP multicast protocols, every (S,G) or (*,G) route is associated with an inbound RPF (reverse path forwarding) interface. Packets arriving on an interface not associated with the route may need CPU-dependent PIM processing, so packets received by non-RPF interfaces are sent to the CPU by default, causing heavy CPU processing loads.

Multicast routing protocols often do not require non-RPF packets; these packets do not require software processing. The CPU therefore updates the hardware MFIB with a fast-drop entry when it receives a non-RPF interface packet that PIM does not require. Additional packets that match the fast-drop entry are not sent to the system software.

Fast drop is enabled on all interfaces by default. The no ip mfib fastdrop command disables MFIB fast drop for the configuration mode interface.

Example

- This command disables MFIB fast drop for the VLAN interface 120.

```
switch(config)#interface vlan 120
switch(config-if-Vl120)#no ip mfib fastdrop
switch(config-if-Vl120)#
```

The ip mfib max-fastdrops command limits the number of fast-drop routes that the switch’s MFIB table can contain. The default fast-drop route limit is 1024.

Example

- This command sets the maximum number of fast-drop routes to 2000.

```
switch(config)#ip mfib max-fastdrops 2000
switch(config)#
```

The clear ip mfib fastdrop command, in global configuration mode, removes all MFIB fast-drop entries on all interfaces.

Example

- This command removes all fast-drop entries from the MFIB table.

```
switch#clear ip mfib fastdrop
switch#
```

The show multicast fib ipv4 command displays information about the routes and interfaces in the IPv4 MFIB.

- show multicast fib ipv4 displays MFIB information for hardware-forwarded routes.
- show multicast fib ipv4 software displays MFIB information for software-forwarded routes.
Example

- This command displays MFIB information for hardware-forwarded routes.

```
switch>show multicast fib ipv4
Activity poll time: 60 seconds
  239.255.255.250 172.17.26.25

    Vlan2028
    Cpu
      Activity 0:03:37 ago
switch>
```

**MFIB Unresolved Cache-entries Max**

The `unresolved cache-entries max` command configures the maximum number of unresolved (S,G) routes that the switch can cache packets. All packets belonging to (S,G) routes exceeding the limit are dropped. The default buffer size is 4000 routes. See `ip multicast boundary` to limit the number of cached packets per S,G.

Example

- This command sets the maximum MFIB unresolved cache-entry buffer size to 6000 routes in the default VRF.

```
switch(config)#router multicast
switch(config-router-multicast)#ipv4
switch(config-router-multicast-ipv4)#unresolved cache-entries max 6000
switch(config-router-multicast-ipv4)#
```

**MFIB Unresolved Packet-buffers Max**

The `ip multicast boundary` command specifies the number of packets per unresolved route that are queued while the route is being resolved by the switch. The limit for `ip multicast boundary` is for an individual route, packets that exceed this limit are dropped. By default, the switch processes 3 unresolved packets for an individual route. See unresolved cache-entries max to limit the number of unresolved routes that are cached.

Example

- This command configures the switch in the default VRF to cache up to thirty multicast packets from any route before that route is resolved.

```
switch(config)#router multicast
switch(config-router-multicast)#ipv4
switch(config-router-multicast-ipv4)#unresolved packet-buffers max 30
switch(config-router-multicast-ipv4)#
```
38.6.3 Displaying and Clearing the Mroute Table

The mroute table stores the states of inbound and outbound interfaces for each source/group pair (S,G). The switch discards and forwards packets on the basis of this state information. Each table entry, referred to as an mroute, corresponds to a unique (S,G) and contains:

- the multicast group address
- the multicast source address (or * for all sources)
- the inbound interface
- a list of outbound interfaces

Clearing mroute Entries

The `clear ip mroute` command removes route entries from the mroute table:

- `clear ip mroute *` all entries from the mroute table.
- `clear ip mroute gp_ipv4` all entries for the specified multicast group.
- `clear ip mroute gp_ipv4 src_ipv4` all entries for the specified source sending to a specified group.

Examples

- This command removes all route entries from the mroute table.
  ```
  switch#clear ip mroute *
  switch#
  ```
- This command removes entries for source 228.3.10.1 sending to multicast group 224.2.205.42.
  ```
  switch#clear ip mroute 224.2.205.42 228.3.10.1
  switch#
  ```

Displaying the mroute Table

The `show ip mroute count` command displays IP multicast routing table statistics.

Example

- This command displays IP multicast routing table statistics.
  ```
  switch>show ip mroute count
  IP Multicast Statistics
  1 groups and 1 sources
  Multicast routes: 1 (*,G), 1 (S,G)
  Average of 1.00 sources per group
  Maximum of 1 sources per group:
      228.24.12.1
  switch>
  ```

The `show ip mroute` command displays information from the IP multicast routing table.

- `show ip mroute` displays information for all routes in the table.
- `show ip mroute gp_addr` displays information for the specified multicast group.
Example

- This command displays the IP multicast routing table for the multicast group 225.1.1.1.

  switch>show ip mroute 225.1.1.1
  PIM Sparse Mode Multicast Routing Table
  Flags: E - Entry forwarding on the RPT, J - Joining to the SPT
  R - RPT bit is set, S - SPT bit is set
  W - Wildcard entry, X - External component interest
  I - SG Include Join alert rcvd, P - Ex-Prune alert rcvd
  H - Joining SPT due to policy, D - Joining SPT due to protocol
  Z - Entry marked for deletion
  A - Learned via Anycast RP Router

  225.1.1.1
  172.28.1.100, 5d04h, flags: S
  Incoming interface: Vlan281
  Outgoing interface list:
    Port-Channel1999

  switch>
38.7 Multicast Commands

Multicast Configuration Commands (Global)
- activity polling-interval
- ip mfib max-fastdrops
- ip mroute
- ip multicast boundary
- ip multicast static
- multipath deterministic
- multipath none
- route
- router multicast
- routing
- unresolved cache-entries max

Multicast Configuration Commands (Interface)
- ip mfib fastdrop
- ip multicast boundary

Multicast Clear Commands
- clear ip mfib fastdrop
- clear ip mroute

Multicast Display Commands
- show ip mroute
- show ip mroute count
- show ip multicast boundary
- show mld membership
- show multicast fib ipv4
- show multicast fib ipv4 software
- show multicast fib ipv6
- show pim ipv6 sparse-mode route
- show platform fap mroute ipv6
activity polling-interval

The switch records activity levels for multicast routes in the mfib after polling the corresponding hardware activity bits. The activity polling-interval command specifies the frequency at which the switch polls the hardware activity bits for the multicast routes.

The no activity polling-interval and default activity polling-interval commands restore the default interval of 60 seconds by removing the activity polling-interval command from running-config.

Command Mode

Router Multicast IPv4 Configuration

Command Syntax

activity polling-interval period
no activity polling-interval
default activity polling-interval

Parameters

- **period**  interval (seconds) between polls. Values range from 1 to 60. Default is 60.

Example

- These commands set the MFIB activity polling period to 15 seconds.

  switch(config)#router multicast
  switch(config-router-multicast)#ipv4
  switch(config-router-multicast-ipv4)#activity polling-interval 15
  switch(config-router-multicast-ipv4)#
clear ip mfib fastdrop

The clear ip mfib fastdrop command removes all fast-drop entries from the MFIB table.

**Command Mode**

Privileged EXEC

**Command Syntax**

```
clear ip mfib fastdrop
```

**Example**

- This command removes all fast-drop entries from the MFIB table.
  ```
  switch#clear ip mfib fastdrop
  switch#
  ```
clear ip mroute

The clear ip mroute command removes route entries from the mroute table, as follows:

- **clear ip mroute** * removes all entries from the mroute table.
- **clear ip mroute** gp_ipv4 removes all entries for the specified multicast group.
- **clear ip mroute** gp_ipv4 src_ipv4 removes all entries for the specified source sending to the specified group.

Command Mode
- Privileged EXEC

Command Syntax
- `clear ip mroute ENTRY_LIST`

Parameters

- **ENTRY_LIST** entries that the command removes from the mroute table. Options include:
  - * all route entries
  - gp_ipv4 all entries for multicast group gp_ipv4 (dotted decimal notation)
  - gp_ipv4 src_ipv4 all entries for source (src_ipv4) sending to group (gp_ipv4)

Examples

- This command removes all route entries from the mroute table.
  
  ```
  switch#clear ip mroute *
  switch#
  ```

- This command removes entries for the source 228.3.10.1 sending to multicast group 224.2.205.42.
  
  ```
  switch#clear ip mroute 224.2.205.42 228.3.10.1 switch#
  ```
**ip mfib fastdrop**

In IP multicast protocols, every (S,G) or (*,G) route is associated with an inbound RPF (reverse path forwarding) interface. Packets arriving on an interface not associated with the route may need CPU-dependent PIM processing, so packets received by non-RPF interfaces are sent to the CPU by default, causing heavy CPU processing loads.

Multicast routing protocols often do not require non-RPF packets; these packets do not require software processing. The CPU therefore updates the hardware MFIB with a fast-drop entry when it receives a non-RPF interface packet that PIM does not require. Additional packets that match the fast-drop entry are not sent to the system software.

Fast drop is enabled on all interfaces by default. The **no ip mfib fastdrop** command disables MFIB fast drop for the configuration mode interface.

The **ip mfib fastdrop** and **default ip mfib fastdrop** commands enable MFIB fast drop for the configuration mode interface by removing the corresponding **no ip mfib fastdrop** command from **running-config**.

The **clear ip mfib fastdrop** command, in global configuration mode, removes all MFIB fast-drop entries on all interfaces.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
 ip mfib fastdrop
 no ip mfib fastdrop
 default ip mfib fastdrop
```

**Examples**

- This command disables MFIB fast drop for VLAN interface 120.

```
switch(config)#interface vlan 120
switch(config-if-Vl120)#no ip mfib fastdrop
switch(config-if-Vl120)#
```
ip mfib max-fastdrops

The **ip mfib max-fastdrops** command limits the number of fast-drop routes that the switch’s MFIB table can contain.

The **no ip mfib max-fastdrops** and **default ip mfib max-fastdrops** commands restore the default fast-drop route limit of 1024 by removing the **ip mfib max-fastdrops** command from **running-config**.

**Command Mode**
Global Configuration

**Command Syntax**
- `ip mfib max-fastdrops quantity`
- `no ip mfib max-fastdrops`
- `default ip mfib max-fastdrops`

**Parameters**
- **quantity** maximum number of fast-drop routes. Value ranges from 0 to 1000000 (one million). Default is 1024.

**Example**
- This command sets the maximum number of fast-drop routes to 2000.

```
switch(config)#ip mfib max-fastdrops 2000
switch(config)#
```
ip multicast boundary

The `ip multicast boundary` command specifies subnets where source traffic entering the configuration mode interface is dropped, preventing the creation of mroute states on the interface. The interface is not included in the outgoing interface list (OIL). The multicast boundary can be specified through multiple IPv4 subnets or one standard IPv4 ACL.

In an ACL method, the multicast subnets are allowed only from the permit entries of the ACL and rest is either denied or filtered. Whereas, in a non-ACL method the statements configure subnets that are only denied or filtered.

Multicast PIM, IGMP and other multicast data cannot cross the boundary, facilitating the use of a multicast group address in multiple administrative domains.

The `no ip multicast boundary` and `default ip multicast boundary` commands delete the specified subnet restriction by removing the corresponding `ip multicast boundary` command from `running-config`. When these commands do not specify a subnet address, all `ip multicast boundary` statements for the configuration mode interface are removed.

Command Mode
- Interface-Ethernet Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration

Command Syntax
```
ip multicast boundary SUBNET [TCAM]
no ip multicast boundary [SUBNET]
default ip multicast boundary [SUBNET]
```

Parameters
- `SUBNET` the subnet address configured as the multicast boundary. Options include:
  - `net_addr` multicast subnet address (CIDR or address mask).
  - `acl_name` standard access control list (ACL) that specifies the multicast group addresses.
- `TCAM` specifies address inclusion in the routing table. Options include:
  - `<no parameter>` boundaries ((S,G) entries) are added to routing table.
  - `out` boundaries are not added to routing table.

Guidelines
When `out` is selected, the first inbound data packet corresponding to the `SUBNET` may be sent to the CPU. In response, the packet is dropped and the boundary prefix is added to the hardware table. In this scenario, the mroute entry is added only when data traffic is received.

Restrictions
Only one command that specifies an ACL can be assigned to an interface. Commands that specify an ACL and a subnet cannot be simultaneously assigned to an interface.

Examples
- This command configures the multicast address of 229.43.23.0/24 as a multicast boundary where source traffic is restricted from VLAN interface 300.
  ```
  switch(config)#interface vlan 300
  switch(config-if-vl300)#ip multicast boundary 229.43.23.0/24
  switch(config-if-vl300)#
  ```
These commands create a standard ACL, then implement the ACL in an **ip multicast boundary** command to allow multicast for subnet (224.0.0.0/4) and create a multicast boundary for all remaining subnets by denying them.

```console
switch(config)#ip access-list standard mbac1
switch(config-std-acl-mbac1)#10 deny 225.123.0.0/16
switch(config-std-acl-mbac1)#20 deny 239.120.10.0/24
switch(config-std-acl-mbac1)#30 permit 224.0.0.0/4
switch(config-std-acl-mbac1)#exit
switch(config)#interface vlan 200
switch(config-if-Vl200)#ip multicast boundary mbac1
switch(config-if-Vl200)#exit
switch(config)#
```
mld

The mld command enables multicast listener discovery on an interface which controls the flow of layer 3 IPv6 multicast traffic. Hosts request and maintain multicast group membership through MLD messages. Multicast routers use MLD to maintain a membership list of active multicast groups for each attached network.

The no mld and default mld commands restore the default behavior by removing the corresponding mld command from the running-config.

Note

It is possible to change the values of the querier parameters used by MLD.

Command Syntax

```
mld [last-listener-query-count | last-listener-query-interval | query-interval | query-response-interval | robustness | startup-query-count | startup-query-interval | static-group]
no mld
default mld
```

Command Mode

Interface-Ethernet Configuration

Parameters

- `last-listener-query-count` the number of group-specific or group-source-specific queries to send before the router assumes there are no more listeners.
- `last-listener-query-interval` the interval between the last listener queries.
- `query-interval` the interval between the general queries regularly sent by a querier.
- `query-response-interval` the interval that the host has to respond to a general query.
- `robustness` the number of general queries to send before the router assumes there are no more listeners.
- `startup-query-count` the number of queries a router sends at startup.
- `startup-query-interval` the interval between the general queries sent by a querier at startup.
- `static-group` the number of static groups or sources of MLD messages.

Examples

- This command enables MLD on the Ethernet interface 1.

```
switch(config)#interface Ethernet1
switch(config-if-Et1)#mld
```

Note

It is possible to change the values of the querier parameters used by MLD.
mld last-listener-query-count

The `mld last-listener-query-count` command specifies the number of query messages the switch sends in response to a group-specific or group-source-specific leave message.

After receiving a message from a host leaving a group, the switch sends query messages at intervals specified by `mld last-listener-query-interval`. If the switch does not receive a response to the queries after sending the number of messages specified by this parameter, it stops forwarding messages to the host.

The `no mld last-listener-query-count` and `default mld last-listener-query-count` commands reset the last-listener-query-count to the default value by removing the corresponding `mld last-listener-query-count` command from the `running-config`. Default value is 2.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

```
mld last-listener-query-count number
no mld last-listener-query-count
default mld last-listener-query-count
```

**Parameters**

- `number` the last listener query count. Values range from 0 to 100. Default value is 2.

**Example**

- This command configures the last listener query count to 3 on an Ethernet interface 1.

```
switch(config)#interface Ethernet 1
switch(config-if-Et1)#mld last-listener-query-count 3
```
mld last-listener-query-interval

The **mld last-listener-query-interval** command configures the switch’s transmission interval for sending group-specific or group-source-specific query messages from the configuration mode interface.

When a switch receives a message from a host that is leaving a group, it sends query messages at intervals set by this command. The **mld last-listener-query-count** specifies the number of messages that are sent before the switch stops forwarding packets to the host.

If the switch does not receive a response after this period, it stops forwarding traffic to the host on behalf of the group, source, or channel.

The **no mld last-listener-query-interval** and **default mld last-listener-query-interval** commands reset the last-listener-query-interval to the default value by removing the corresponding **mld last-listener-query-interval** command from the **running-config**. Default value is one second.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

- `mld last-listener-query-interval period`
- `no mld last-listener-query-interval`
- `default mld last-listener-query-interval`

**Parameters**

- **period**: the last listener query interval in seconds. Values range from 1 to 3175.

**Example**

- This command configures the last listener query interval to 2 seconds on an Ethernet interface 1.

```
switch(config)#interface Ethernet1
switch(config-if-Et1)#mld last-listener-query-interval 2
```
**mld query-interval**

The `mld query-interval` command configures the frequency at which the configuration mode interface, as an MLD querier, sends host-query messages.

An MLD querier sends host-query messages to discover the multicast groups that have members on networks attached to the interface. The switch implements a default query interval of 125 seconds.

The `no mld query-interval` and `default mld query-interval` commands reset the query interval to the default value by removing the corresponding `mld query-interval` command from the `running-config`.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

```
mld query-interval period
no mld query-interval
default mld query-interval
```

**Parameters**

- `period` the interval between query messages in seconds. Values range from 1 to 3175.

**Example**

- This command configures the query interval of 30 seconds on an Ethernet interface 1.

```
switch(config)#interface Ethernet1
switch(config-if-Et1)#mld query-interval 30
```
**mld query-response-interval**

The `mld query-response-interval` command configures the maximum response time that the recipient can wait before responding with a membership report on receipt of a general query.

The `no mld query-response-interval` and `default mld query-response-interval` commands reset the query interval to the default value by removing the corresponding `mld query-response-interval` command from the `running-config`.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

```
mld query-interval period
no mld query-interval
default mld query-interval
```

**Parameters**

- `period` the query response interval in seconds. Values range from 1 to 3175.

**Example**

- This command configures the query response interval of 30 seconds on an Ethernet interface 1.

  ```
  switch(config)#interface Ethernet1
  switch(config-if-Et1)#mld query-response-interval 30
  ```
mld robustness

The mld robustness command configures the number of general queries to be sent before the router assumes there are no more listeners.

The no mld robustness and default mld robustness commands reset the robustness to the default value by removing the corresponding mld robustness command from the running-config.

Command Mode
Interface-Ethernet Configuration

Command Syntax

mld robustness robust_value
no mld robustness
default mld robustness

Parameters

- robust_value the robustness count. Values range from 1 to 100.

Example

- This command configures the robustness value to 2 on an Ethernet interface 1.

  switch(config)#interface Ethernet1
  switch(config-if-Et1)#mld robustness 2
**mld startup-query-count**

The `mld startup-query-count` command specifies the number of query messages that an interface sends during the startup query interval.

When an interface starts running MLD, it can establish the group state more quickly by sending query messages at a higher frequency. The `mld startup-query-interval` and `mld startup-query-count` commands define the startup period and the query message transmission frequency during that period.

The `no mld startup-query-count` and `default mld startup-query-count` commands restore the default startup-query-count value by removing the corresponding `mld startup-query-count` command from the `running-config`.

**Command Mode**
Interface-Ethernet Configuration

**Command Syntax**
```
  mld startup-query-count  number
  no mld startup-query-count
  default mld startup-query-count
```

**Parameters**
- `number` the startup query count. Values range from 1 to 100.

**Example**
- This command configures the startup query count of 4 on an Ethernet interface 1.
  ```
  switch(config)#interface Ethernet1
  switch(config-if-Et1)#mld startup-query-count 4
  ```
**mld startup-query-interval**

The `mld startup-query-interval` command specifies the interval between the general queries sent by a querier on startup.

When an interface starts running MLD, it can establish the group state quicker by sending query messages at a higher frequency. The `mld startup-query-interval` and `mld startup-query-count` commands define the startup period and the query message transmission frequency during that period.

The `no mld startup-query-count` and `default mld startup-query-interval` commands restore the default startup-query-interval value by removing the corresponding `mld startup-query-interval` command from the *running-config*.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

```
mld startup-query-interval period
no mld startup-query-interval
default mld startup-query-interval
```

**Parameters**

- `period` the startup query interval in seconds. Values range from 1 to 3175.

**Example**

- This command configures the startup query interval of 100 seconds on an Ethernet interface 1.

```
switch(config)#interface Ethernet1
switch(config-if-Et1)#mld startup-query-interval 100
```
**mld static-group**

The `mld static-group` command configures the configuration mode interface as a static member of a specified multicast group. This allows the router to forward multicast group packets through the interface without otherwise appearing or acting as a group member. By default, static group memberships are not configured on any interfaces.

If the command includes a source address, only multicast group messages received from the specified host address are fast-switched. Otherwise, all multicast traffic of the specified group is fast-switched.

The `no mld static-group` and `default mld static-group` commands remove the configuration mode interface’s group membership by removing the corresponding `mld startup-group` command from the `running-config`.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

```
mld static-group source_address [group_address | access-list acl_name]
no mld static-group source_address [group_address | access-list acl_name]
default mld static-group source_address [group_address | access-list acl_name]
```

**Parameters**

- `source_address`  IP address of the host that originates multicast data packets.
- `group_address`  IPv6 address of a multicast group.
- `access-list`  IPv6 access list to use as a static group list.
- `acl_name`  specifies access-list name

**Examples**

- This command configures static groups on an interface Ethernet 1.

```
switch(config)#interface Ethernet1
switch(config-if-Et1)#mld static-group ff30::1 a::1
```

- This command configures multiple static groups using an access list on an interface Ethernet 1.

```
switch(config)#interface Ethernet1
switch(config-if-Et1)#mld static-group access-list testAccessList
```
**multipath deterministic**

By default, multicast traffic is load balanced by distributing packets over all ECMP links. The **no multipath deterministic** command routes multicast ECMP traffic to the neighbor with the highest IPv4 address.

The **multipath deterministic** and **default multipath deterministic** commands restore the default behavior of randomly distributing multicast traffic over all ECMP links.

**Command Mode**

Router Multicast IPv4 Configuration

**Command Syntax**

```
multipath deterministic
no multipath deterministic
default multipath deterministic
```

**Related Commands**

- **multipath none** performs the same function as **no multipath deterministic**

**Example**

- These commands configure the switch to route multicast traffic through the ECMP link to the neighbor with the highest IP address.

  ```
switch(config)#router multicast
switch(config-router-multicast)#ipv4
switch(config-router-multicast-ipv4)#no multipath deterministic
switch(config-router-multicast-ipv4)#
  ```

- These commands configure the switch to load balance multicast traffic by distributing packets over all ECMP links.

  ```
switch(config)#router multicast
switch(config-router-multicast)#ipv4
switch(config-router-multicast-ipv4)#multipath deterministic
switch(config-router-multicast-ipv4)#
  ```
**multipath none**

By default, multicast traffic is load balanced by distributing packets over all ECMP links. The `multipath none` command routes multicast ECMP traffic to the neighbor with the highest IPv4 address.

The `no multipath none` and `default multipath none` commands restore the default behavior of randomly distributing multicast traffic over all ECMP links by removing the `multipath none` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

- `multipath none`
- `no multipath none`
- `default multipath none`

**Related Commands**

- `multipath deterministic` performs the same function as `no multipath none`

**Example**

- These commands configure the switch to route multicast traffic through the ECMP link to the neighbor with the highest IP address.
  ```
  switch(config)#router multicast
  switch(config-router-multicast)#ipv4
  switch(config-router-multicast-ipv4)#multipath none
  switch(config-router-multicast-ipv4)#
  ```

- These commands configure the switch to load balance multicast traffic by distributing packets over all ECMP links.
  ```
  switch(config)#router multicast
  switch(config-router-multicast)#ipv4
  switch(config-router-multicast-ipv4)#no multipath none
  switch(config-router-multicast-ipv4)#
  ```
route

The `route` command configures a static multicast route for the specified source, destination group, and incoming interface on the router.

The `no route` and `default route` commands remove the specified static multicast route by removing the corresponding `route` command from `running-config`.

Command Mode

Router Multicast IPv4 Configuration
Router Multicast VRF IPv4 Configuration

Command Syntax

```
route group_address [source_address] iif interface [oif interface] [cpu] [iifFrr interface] [priority priority_num]

no route group_address
default route group_address
```

Parameters

- **group_address** the multicast group address
- **source_address** the optional source address for multicast traffic
- **iif interface** specifies an incoming interface for the static route
- **cpu** optionally mirrors multicast packets to the CPU
- **oif interface** specifies an optional outgoing interface for the static route
- **iifFrr interface** specifies an optional interface for multicast-only fast reroute
- **interface** options include:
  - **Ethernet ethernet_port** Ethernet interface
  - **Null0** drops all traffic
  - **Port-Channel lag_no** port-channel interface or sub-interface; values range from 1-2000 or 1-2000.1-4094
  - **Register0** drops all incoming traffic
  - **Vlan vlan_no** VLAN interface
- **priority priority_num** specifies an optional priority for the multicast route. If the same route is present in several multicast routing tables, the priority number is used to select the best available route. Values range from 0 to 255; PIM routes by default have a priority of 0, while static multicast routes by default have a priority of 255.

Examples

- These commands create a static multicast route in the default VRF. The static route has a group address of 225.3.3.3 and source address of 1.1.1.1. It uses VLAN 100 as its incoming interface, VLANs 200 and 300 as its outgoing interfaces, and Ethernet interface 2 as its multicast-only fast reroute interface.
  ```
  switch(config)#router multicast
  switch (config-router-multicast)#ipv4
  switch(config-router-multicast-ipv4)#route 225.3.3.3 1.1.1.1 iif Vlan100 oif Vlan200 Vlan300 iifFrr Ethernet2
  switch(config-router-multicast-ipv4)#
  ```
**ip mroute**

The `ip mroute` command configures the Static Mroute on the switch.

The `no ip mroute` and `default ip mroute` commands remove the specified static mroute from `running-config`.

**Command Mode**
- Global Configuration

**Command Syntax**

```
ip mroute [<source-prefix>|<source-address> <mask>]
    [<rpf-interface>|<rpf-neighbor>]
    [admin distance]
```

**Example**

- This command configures a Static IP mroute for a source 1.1.1.1/32 with an administrative distance 20 on a Ethernet interface 2/1.

  ```
  switch(config)#ip mroute 1.1.1.1/32 ethernet 2/1 20
  ```
route

The **routing** command allows the switch to forward multicast packets. Multicast routing is disabled by default.

The **no routing** and **default routing** commands disable multicast routing by removing the **routing** command from **running-config**.

**Command Mode**

- Router Multicast IPv4 Configuration
- Router Multicast VRF IPv4 Configuration

**Command Syntax**

```
routing
no routing
default routing
```

**Example**

- These commands enable multicast routing on the switch.

  ```
switch(config)#router multicast
switch(config-router-multicast)#ipv4
switch(config-router-multicast-ipv4)#routing
```
router multicast

The `router multicast` command enable router-multicast on the switch and allows the user to configure IPv4 and IPv6 router multicast traffic.

**Command Mode**

Global Configuration

**Command Syntax**

`router multicast`

**Example**

- The following commands enable router-multicast on the switch.

  ```
  switch(config)#router multicast
  switch(config-router-multicast)#ipv6
  switch(config-router-multicast-ipv6)#routing
  ```
rpf route

The **rpf route** command specifies a candidate for the multicast reverse path forwarding (RPF) interface of any (S,G) multicast route (mroute), where the source falls within the given network prefix. Static mroutes are stored in a separate routing table, the multicast routing information base (MRIB).

**Command Mode**
- Router Multicast IPv4 Configuration
- Router Multicast VRF IPv4 Configuration

**Command Syntax**
```
rpf route{<source_prefix>|<source_address> <mask>} {<rpf_interface>|<rpf_neighbor>} [admin_distance]
no rpf route {<source_prefix>|<source_address> <mask>} {<rpf_interface>|<rpf_neighbor>}
default rpf route {<source_prefix>|<source_address> <mask>} {<rpf_interface>|<rpf_neighbor>}
```

**Parameters**
- **source_prefix** specifies the source prefix.
- **source_address** specifies the source address.
- **mask** specifies the address mask.
- **rpf_interface** specifies the multicast RPF interface.
- **rpf_neighbor** specifies the multicast RPF neighbor.
- **admin_distance** specifies the administrative distance (optional). Values range from 1 to 255.

**Examples**
- These commands select the longest match when a source matches multiple static mroutes in the MRIB.

```
switch(config)#router multicast
switch(config-router-multicast)#ipv4
switch(config-router-multicast-ipv4)#rpf route 10.0.0.0/16 Ethernet 4
switch(config-router-multicast-ipv4)#rpf route 11.10.1.0/24 Ethernet 5
switch(config-router-multicast-ipv4)#rpf route 11.10.1.2/32 Ethernet 6
switch(config-router-multicast-ipv4)##
```

- These commands include an administrative distance of 255 on Ethernet interface 5 with static mroute.

```
switch(config)#router multicast
switch(config-router-multicast)#ipv4
switch(config-router-multicast-ipv4)#rpf route 10.0.0.0/16 Ethernet 4
switch(config-router-multicast-ipv4)#rpf route 11.10.1.0/24 Ethernet 5 255
switch(config-router-multicast-ipv4)#rpf route 11.10.1.2/32 Ethernet 6
switch(config-router-multicast-ipv4)#
```
**show ip mroute**

The `show ip mroute` command displays information from the IP multicast routing table.

- `show ip mroute` displays information for all routes in the table.
- `show ip mroute gp_addr` displays information for the specified multicast group.

**Command Mode**

EXEC

**Command Syntax**

```
show ip mroute
show ip mroute gp_addr
```

**Parameters**

- `gp_addr` group IP address (dotted decimal notation).

**Example**

- This command displays the IP multicast routing table entry for the multicast group 225.1.1.11

```
switch> show ip mroute 225.1.1.1
PIM Sparse Mode Multicast Routing Table
Flags: E - Entry forwarding on the RPT, J - Joining to the SPT
R - RPT bit is set, S - SPT bit is set
W - Wildcard entry, X - External component interest
I - SG Include Join alert rcvd, P - Ex-Prune alert rcvd
H - Joining SPT due to policy, D - Joining SPT due to protocol
Z - Entry marked for deletion
A - Learned via Anycast RP Router
225.1.1.1
172.28.1.100, 5d04h, flags: S
Incoming interface: Vlan281
Outgoing interface list:
Port-Channel999
switch>
```
**show ip mroute count**

The *show ip mroute count* command displays IP multicast routing table statistics.

The *show ip mroute* command displays information from the IP multicast routing table.

**Command Mode**

EXEC

**Command Syntax**

```
show ip mroute count
```

**Example**

- This command displays IP multicast routing table statistics.

```
switch>show ip mroute count
IP Multicast Statistics
1 groups and 1 sources
Multicast routes: 1 (*,G), 1 (S,G)
Average of 1.00 sources per group
Maximum of 1 sources per group:
  228.24.12.1
switch>
```
show ip multicast boundary

The **show ip multicast boundary** command displays the summary of all IP multicast boundaries across all interfaces.

**Command Mode**

EXEC

**Command Syntax**

```
show ip multicast boundary [group_prefix | group_prefix/length [out] | interface
{ethernet e_num | loopback l_num | management m_num | port-channel p_num | vlan
v_num} | out]
```

**Parameters**

- <no parameters> displays the summary of all IP multicast boundaries across all interfaces
- `group_prefix` displays the list of IP multicast boundaries matching the specified group address with subnet mask.
- `group_prefix/length` displays the list of IP multicast boundaries matching the specified group address with CIDR notation. Option includes:
  - `out` displays the specified group address’s IP multicast boundaries whose control plane filtering is enabled
- `interface` displays IP multicast boundary of the specified interface. Options include:
  - `ethernet e_num` displays IP multicast boundaries of the specified Ethernet interface
  - `loopback l_num` displays IP multicast boundaries of the specified Loopback interface
  - `management m_num` displays IP multicast boundaries of the specified management interface
  - `port-channel p_num` displays IP multicast boundaries of the specified port channel interface
  - `vlan v_num` displays IP multicast boundaries of the specified VLAN interface
- `out` displays all IP multicast boundaries whose only control plane filtering is enabled

**Examples**

- This command displays the summary of all IP multicast boundaries across all interfaces.
  ```
  switch(config-if-Et24)show ip multicast boundary
  Interface Denied Prefix Data Plane Filtered
  Ethernet1 224.5.5.0/24 Yes
  Ethernet1 224.6.6.0/24 Yes
  Ethernet2 224.4.4.0/24 Yes
  Ethernet3 224.5.5.0/24 No
  ```
- This command displays all IP multicast boundaries matching 224.5.5.0 255.255.255.255.
  ```
  switch(config-if-Et24)#show ip multicast boundary 224.5.5.0 255.255.255.255
  Interface Denied Prefix Data Plane Filtered
  Ethernet1 224.5.5.0 255.255.255.255
  Ethernet3 224.5.5.0 255.255.255.255 No
  ```
- This command displays all IP multicast boundaries matching 224.5.5.0/24.
  ```
  switch(config-if-Et24)#show ip multicast boundary 224.5.5.0/24
  Interface Denied Prefix Data Plane Filtered
  Ethernet1 224.5.5.0/24
  Ethernet3 224.5.5.0/24 No
  ```
- This command displays all IP multicast boundaries of the Ethernet1 interface.

```
switch(config-if-Et24)# show ip multicast boundary interface Ethernet1
Interface Denied Prefix Data Plane Filtered
Ethernet1 224.5.5.0/24
Ethernet1 224.6.6.0/24 No
```

- This command displays the list of IP multicast boundaries whose only control plane filtering is enabled.

```
switch(config-if-Et24)#show ip multicast boundary out
Interface Denied Prefix Data Plane Filtered
Ethernet1 224.5.5.0/24 No
Ethernet3 224.5.5.0/24 No
```
show mld membership

The **show mld membership** command displays MLD group and source membership information on a specific interface.

**Command Mode**

EXEC

**Command Syntax**

```
show mld membership [dynamic | group | interface | static]
```

**Parameters**

- **dynamic** displays MLD information for a dynamic group.
- **group** displays MLD information for a specified multicast group address.
- **interface** displays MLD information for the specified interface.
- **static** displays MLD information for statically configured group.

**Example**

- This command displays MLD group and source information on the Ethernet interface 3 and 6.

```
switch#show mld membership
Interface          Group        Source      Filter Mode
-----------------  ----------  ----------  ------------
Ethernet3          ff30::1    a::2        include
Ethernet3          ff30::1    a::1        include
Ethernet6          ff30::2    a::2        include
```
**show mld statistics**

The `show mld statistics` command displays total statistics information of incoming and outgoing MLD messages on a specific interface.

**Command Mode**

EXEC

**Command Syntax**

`show mld statistics version value`

**Parameters**

- `version` specifies MLD version.
- `value` specifies the MLD version number. Accepted version values are 1 and 2.

**Example**

- This command displays total MLD statistics on the Ethernet interface Et3 and Et6.

```
switch#show mld statistics
MLD Total (Version1 + Version2) Statistics
<table>
<thead>
<tr>
<th>Received</th>
<th>Sent</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Queries</td>
</tr>
<tr>
<td>Et3</td>
<td>0</td>
</tr>
<tr>
<td>Et6</td>
<td>0</td>
</tr>
</tbody>
</table>
```
show mld querier

The show mld querier command displays information about the MLD querier and querier parameters.

**Command Mode**

EXEC

**Command Syntax**

```
show mld querier [interface | parameters]
```

**Parameters**

- `interface` displays MLD querier information.
- `parameters` displays MLD querier parameters.

**Example**

- This command displays MLD querier on the Ethernet interface Et3 and Et6.

```
Switch#show mld querier
Interface    Querier                                  General    Other      Version
Query      Querier                                  Expiry     Expiry
---------    -------                                  ---------- ---------  -------
Et3          fe80::1:ff:fe01:0                        0:01:14    N/A        2
Et6          fe80::1:ff:fe01:0                        0:01:14    N/A        2
```

- This command displays MLD querier parameters on the Ethernet interface Et3 and Et6.

```
Switch#show mld querier parameters
Interface    Robustness Query      Query      Startup      Startup      Last       Last
Interval   Response   Query      Query      Listener     Query     Listener     Query
---------     ---------- --------   ---------  ---------  -------    ---------
Et3           2          125        10         31.25      2          1          2
Et6           2          125        10         31.25      2          1          2
```
**show mld summary**

The `show mld summary` command displays MLD summary information.

**Command Mode**

EXEC

**Command Syntax**

`show mld summary`

**Parameters**

- `interface` displays MLD summary on a specified interface.

**Example**

- This command displays MLD summary on the Ethernet interface 3 and 6.

```
Arista# show mld summary
Interface    IPv6 link-local address      Group Count Querier State
------------ ------------------------------ ----------- ---------------
Ethernet3    fe80::1:ff:fe01:0            2           querier
Ethernet6    fe80::1:ff:fe01:0            2           querier

Number of MLD interfaces: 2
Number of total groups joined across all MLD interfaces: 4
```
show multicast fib ipv4

The show multicast fib ipv4 command displays information about interfaces and the hardware-forwarded routes included in the IPv4 Multicast Forwarding Information Base (MFIB).

Command Mode
EXEC

Command Syntax
show multicast fib ipv4 [group_address [source_address] | bidirectional | count | counter | df | rpa | software | sparse-mode | static | summary | vrf]

Parameters
- <no parameters> displays information for all hardware-forwarded routes in the MFIB
- group_address displays the information of the specified multicast group address. Options include:
  - source_address displays the information of the specified multicast group and source addresses
  - count displays the multicast routes count of the specified group address
  - counters displays the multicast route traffic count of the specified group address
  - bidirectional displays the information of bidirectional routes
  - count displays the count of multicast routes
  - counter displays the count of multicast route traffic in either bytes or packets
  - df displays the bidirectional Protocol Independent Multicast (PIM) Designated Forwarder (DF) bitmap
  - rpa displays the bidirectional PIM Rendezvous Point Address (RPA) index
  - software displays the software multicast FIB
  - sparse-mode displays the sparse-mode information
  - static displays the static multicast information
  - summary displays the multicast FIB summary
  - vrf vrf_name displays information of the corresponding VRF

Guidelines
The counter is not available (N/A) if a multicast route does not have an associated counter. If the counter value for any source in a group address is N/A, then the sum of counters for the group address is N/A. However, the counter values for other sources are still displayed.

Examples
- This command displays the bidirectional PIM RPA index.
  switch>show multicast fib ipv4 rpa
  Prefix                      Rpa Index
  225.0.0.0/8                 1
  226.0.0.0/8                 1
- This command displays the static multicast route information.
  switch>show multicast fib ipv4 static count
  (S,G) routes: 34
  (*,G) routes: 31
  Fastdrop routes: 0
  Prefix routes: 12
- This command displays the multicast routes' count of the specified group and source addresses.

```
switch>show multicast fib ipv4 229.0.0.0 10.1.5.101 count
Activity poll time: 60 seconds
(S,G) routes: 1
Fastdrop routes: 0
```

- This command displays the multicast route traffic count of the specified group and source addresses.

```
switch>show multicast fib ipv4 229.0.0.0 10.1.5.101 counters
Activity poll time: 60 seconds
229.0.0.0 10.1.5.101
  Byte: 46128
  Packet: 93
  Port-Channel100 (iif)
  Activity 0:53:52 ago
```

- This command displays the multicast FIB summary.

```
switch>show multicast fib ipv4 summary
Number of multicast routes: 12
  Number of fastdrop routes : 45
```
show multicast fib ipv4 software

The **show multicast fib ipv4 software** command displays information about the interfaces and the software-forwarded routes included in the IPv4 multicast forwarding information base (MFIB). Use the **show multicast fib ipv4** command for hardware-forwarded routes.

Parameter options are available to filter output by group address or group and source address.

**Command Mode**
EXEC

**Command Syntax**
```
show multicast fib ipv4 software [INFO_LEVEL][ROUTE]
```

**Parameters**
- **INFO_LEVEL** specifies the type of information displayed. Options include
  - <no parameter> displays packet reception counters.
  - **detail** displays packet reception counters and packet queued/dropped counters.
- **ROUTE** routes displayed, filtered by multicast group and source IP addresses:
  - <no parameter> shows information for all software-forwarded routes in the MFIB.
  - **group_addr** shows information only for the specified multicast group.
  - **group_addr source address** shows information only for the specified group and source.

**Example**
- This command displays MFIB information for all software-forwarded routes in the MFIB.
  ```
  switch>show multicast fib ipv4 software
  239.255.255.250 172.17.41.150
  Vlan3040 (iif)
  Packets Received : 18
  Bytes Received : 9147
  RPF Failures : 0
  239.255.255.250 172.17.41.120
  Vlan3040 (iif)
  Packets Received : 6
  Bytes Received : 966
  RPF Failures : 0
  switch>
  ```
- This command displays detailed MFIB information for all software-forwarded routes in the MFIB.
  ```
  switch>show multicast fib ipv4 software detail
  239.255.255.250 172.17.41.150
  Vlan3040 (iif)
  Packets Received : 18
  Bytes Received : 9147
  RPF Failures : 0
  Packets Queued/Dropped : 0 / 0
  239.255.255.250 172.17.41.120
  Vlan3040 (iif)
  Packets Received : 6
  Bytes Received : 966
  RPF Failures : 0
  Packets Queued/Dropped : 0 / 0
  switch>
  ```
**unresolved cache-entries max**

The **unresolved cache-entries max** command configures the maximum number of unresolved (S,G) routes that the switch can cache packets. The default buffer size is 4000 (S,G) routes.

The **no unresolved cache-entries max** and **default unresolved cache-entries max** commands restore the default unresolved cache-entries buffer size of 4000 (S,G) routes by removing the **unresolved cache-entries max** command from *running-config*. See **ip multicast boundary** to limit the number of cached packets per S,G.

**Command Mode**
- Router Multicast IPv4 Configuration
- Router Multicast VRF IPv4 Configuration

**Command Syntax**

```
unresolved cache-entries max quantity_entries
no unresolved cache-entries max
default unresolved cache-entries max
```

**Parameters**
- **quantity_entries** maximum buffer size (routes). Value ranges from 10 to 10000000. Default is 4000.

**Example**
- This command sets the maximum MFIB unresolved cache-entry buffer size to 6000 routes in the default VRF.

```
switch(config)#router multicast
switch(config-router-multicast)#ipv4
switch(config-router-multicast-ipv4)#unresolved cache-entries max 6000
switch(config-router-multicast-ipv4)#
```
The **unresolved packet-buffers max** command specifies the number of (S,G) multicast packets for an individual route that the switch can process before the (S,G) entry is entered into cache. Packets that are received in excess of this limit before the route is programmed into the cache are dropped. By default, the switch processes 3 unresolved packets for an individual route.

The **no unresolved packet-buffers max** and **default unresolved packet-buffers max** commands restore the number of unresolved packets that the switch processes to the default value of 3 packets by removing the **unresolved packet-buffers max** command from **running-config**. See **unresolved cache-entries max** to limit the number of unresolved routes that are cached.

### Command Mode
- Router Multicast IPv4 Configuration
- Router Multicast VRF IPv4 Configuration

### Command Syntax

```
unresolved packet-buffers max quantity_packets
no unresolved packet-buffers max
default unresolved packet-buffers max
```

### Parameters
- **quantity_packets** packets per unresolved route that the switch processes. Values range from 3 to 10000000. Default is 3.

### Example
- This command programs the switch in the default VRF to process thirty multicast packets from any route regardless of its entry’s presence in the multicast routing cache.

```
switch(config)#router multicast
switch(config-router-multicast)#ipv4
switch(config-router-multicast-ipv4)#unresolved packet-buffers max 30
switch(config-router-multicast-ipv4)#
```
show mld membership

The **show mld membership** command displays the MLD group membership table.

**Command Mode**

EXEC

**Command Syntax**

```
show mld membership
```

**Example**

- The command output displays the MLD group membership table as shown.

```
switch#show mld membership

```
show pim ipv6 sparse-mode route

The `show pim ipv6 sparse-mode route` command displays the PIM Sparse Mode Multicast Routing table.

Command Mode

EXEC

Command Syntax

`show pim ipv6 sparse-mode route`

Example

- The command output displays the PIM Sparse Mode Multicast Routing table as shown.

```
switch# show pim ipv6 sparse-mode route
PIM Sparse Mode Multicast Routing Table
Flags: E - Entry forwarding on the RPT, J - Joining to the SPT
      R - RPT bit is set, S - SPT bit is set, L - Source is attached
      W - Wildcard entry, X - External component interest
      I - SG Include Join alert rcvd, F - (*,G) Programmed in hardware
      H - Joining SPT due to policy, D - Joining SPT due to protocol
      Z - Entry marked for deletion, C - Learned from a DR via a register
      A - Learned via Anycast RP Router, M - Learned via MSDP
      N - May notify MSDP, K - Keepalive timer not running
      T - Switching Incoming Interface, B - Learned via Border Router

    Ethernet9/1.1
    Ethernet8/1.1
    Ethernet2/1.1
    Ethernet5/1.1
    Ethernet3/1.1
```
show multicast fib ipv6

The `show multicast fib ipv6` command displays the Multicast Forwarding Information Base (MFIB) table.

**Command Mode**

EXEC

**Command Syntax**

`show multicast fib ipv6`

**Example**

- The command output displays the Multicast Forwarding Information Base (MFIB) table as shown.

```plaintext
switch#show multicast fib ipv6
Activity poll time: 60 seconds
  ff33::1:0:0:1 101:1::2
    Ethernet11/1 (iif)
    Ethernet9/1.1
    Ethernet2/1.1
    Ethernet3/1.1
    Ethernet6/1.1
    Ethernet5/1.1
    Ethernet8/1.1
    Ethernet7/1.1
    Ethernet4/1.1
Activity 0:00:35 ago
```
show platform fap mroute ipv6

The show platform fap mroute ipv6 command displays the Platform Hardware Forwarding table.

Command Mode
EXEC

Command Syntax
show platform fap mroute ipv6

Example
- The command output displays the Platform Hardware Forwarding table as shown

```
switch#show platform fap mroute ipv6
Jericho0 Multicast Routes:
--------------------------
Location    GroupId    Group          Source
IIF          McId       OIF
  FLP/TT      FLP/TT     TT              FLP
  FLP         FLP         FLP
-------------------------------------------------------------------------------

                Vlan1200(Et8/1)  Vlan1223(Et2/1)
                Vlan1226(Et5/1)  Vlan1232(Et3/1)
```
**ip multicast static**

The `ip multicast static` command enables the static multicast routing on the switch. The `exit` command returns the switch to the global configuration mode.

**Command Mode**
- Interface Ethernet Configuration

**Command Syntax**

`ip multicast static`

**Example**

- The following commands configure the Static IP Multicast on the switch.

```
switch(config)#interface ethernet 1/2
switch(config-if-Et1/2)#no switchport
switch(config-if-Et1/2)#ip address 1.1.1.1/24
switch(config-if-Et1/2)#ip multicast static
```
ip route multicast

The `ip route multicast` command places the switch in VRF mode, when a static multicast route is being configured within a specific VRF. In this mode the switch allows to configure various route attributes such as VLAN, port-channel, Ethernet interface, Null0, Register0.

The `exit` command returns the switch to the global configuration mode.

**Command Mode**

Router Multicast Configuration

**Command Syntax**

```
ip route multicast group [source] iif interface-name [oif interface-name1, interface-name2...] [cpu] [priority]
```

**Parameters**

- `group` Specifies the group address.
- `source` Specifies the source address.
- `iif` Incoming interface.
- `oif` Outgoing interface.
- `interface-name` Ethernet port number. Value ranges from 1 to 32.
- `cpu` Copy to CPU.
- `priority` Route priority. Value ranges from 1 to 255.

**Example**

- The following commands places the switch in IP route multicast VRF mode and a VLAN 20 is configured in this example.

```plaintext
switch(config)#router multicast
switch(config-router-multicast)#vrf test
switch(config-router-multicast-vrf-test)#ip route multicast 1.1.1.1 10.1.1.1 iif vlan 20 cpu priority 30
```
IGMP and IGMP Snooping

IP multicast is the transmission of data packets to multiple hosts through a common IP address. Networks use Internet Group Management Protocol (IGMP) to control the flow of layer 3 multicast traffic. Hosts request and maintain multicast group membership through IGMP messages. IGMP snooping is a layer 2 optimization for the layer 3 IGMP protocol that extracts lists of hosts receiving multicast group traffic by monitoring IGMP network packets.

These sections describe the Arista IGMP and IGMP snooping implementation.

- Section 39.1: Introduction
- Section 39.2: IGMP Protocols
- Section 39.3: Configuring IGMP
- Section 39.4: Configuring IGMP Snooping
- Section 39.5: IGMP Host Proxy
- Section 39.6: IGMP and IGMP Snooping Commands

39.1 Introduction

39.1.1 Supported Features

For a list of the IGMP features that each Arista switch platform supports, refer to the supported features table here: https://www.arista.com/en/support/product-documentation/supported-features.
39.2 IGMP Protocols

39.2.1 IGMP

Networks use Internet Group Management Protocol (IGMP) to control the flow of layer 3 multicast traffic. Hosts request and maintain multicast group membership through IGMP messages. Multicast routers use IGMP to maintain a membership list of active multicast groups for each attached network.

- IGMP version 1 is defined in RFC 1112. Hosts can join multicast groups without a method to leave a group. Routers use a timeout-based process to determine when hosts lose interest in a group.
- IGMP version 2 is defined in RFC 2236. Version 2 adds leave messages that hosts use to terminate group membership.
- IGMP version 3 is defined in RFC 4604. Version 3 allows hosts to specify IP addresses within a group from where they receive traffic. Traffic from all other group addresses is blocked from the host.

With respect to each of its attached networks, a multicast router is either a querier or non-querier. Each physical network contains only one querier. A network with more than one multicast router designates the router with the lowest IP address as its querier.

Queriers solicit group membership information by periodically sending General Query messages. Queriers also receive unsolicited messages from hosts joining or leaving a multicast group. When a querier receives a message from a host, it updates its membership list for the group referenced in the message and the network where the message originated.

Queriers forward multicasts from remote sources only to networks as specified by its membership list. If a querier does not receive a report from a network host for a specific group, it removes the corresponding entry from the table and discontinues forwarding multicasts for that group on the network. Queriers also send group-specific queries after receiving a leave request from a host to determine if the network still contains active multicast group members. If it does not receive a membership report during the period defined by the \textit{last member query response interval}, the querier removes the group-network entry from the membership list.

When a host receives a General Query, it responds with Membership Report messages for each of its multicast groups within the interval specified by the Max Response Time field in the query. IGMP suppresses multiple messages from different hosts on a network for the same group. Hosts send unsolicited Membership reports to join a multicast group and send leave messages to exit a group.

39.2.2 IGMP Snooping

IGMP snooping is a layer 2 switch process that extracts lists of hosts receiving multicast group traffic by monitoring IGMP network packets. The switch uses these lists to avoid flooding hosts with extraneous multicast traffic by sending group packets only to group members. Besides preventing local hosts from receiving traffic for groups they did not join, snooping prunes multicast traffic from links that do not contain IGMP clients.

When snooping is enabled, a switch examines IGMP packets sent between hosts connected to network switches and multicast routers (mrouter). When a switch finds an IGMP report from a multicast group recipient, it adds the recipient’s port to the group multicast list. When the switch receives an IGMP leave, it removes the recipient’s port from the list. Groups are removed upon the group timer expiry. When the switch finds an IGMP query packet or PIM hello packet from a multicast router, it adds the router’s port to the port list for all multicast groups.
Snooping Querier

Snooping requires an IGMP querier in the network to create multicast group tables. An IGMP snooping querier performs the multicast router (mrouter) role when the network does not have a router. When the snooping querier is enabled on a VLAN, the switch periodically broadcasts IGMP queries and listens for IGMP Reports that indicate host group memberships.

Networks that contain multiple snooping queriers elect one as the querier, based on IP address. When IGMP snooping querier is enabled on a VLAN, the switch performs as a querier only when it is elected or it is the only snooping querier on the network.

L2 Report Flooding

L2 report flooding is an IGMP snooping feature that forwards membership report messages to specified ports. Relying on a single switch to maintain and send report messages can degrade performance. L2 report flooding addresses this by facilitating report message forwarding through any network port. This allows switches to bypass the querier when forwarding multicast traffic to its interested ports.

IGMP Snooping Proxy

IGMP snooping proxy is an enhancement over IGMP snooping. When snooping proxy is enabled, the switch starts sending proxy queries periodically to the downstream hosts and collects the IGMP reports and updates the local state. Later, when the switch receives an IGMP query from an upstream router, the switch immediately responds with a report based on its local state.

When IGMP snooping proxy is disabled, the IGMP queries in VLAN, and the reports from hosts are flooded. Enabling IGMP snooping proxy prevents a sudden burst in IGMP report traffic in response to every query. It also reduces the number of reports that the IGMP Querier needs to process in the VLAN. However, it introduces a latency in the propagation of the IGMP state through the VLAN.
39.3 Configuring IGMP

This section describes the following configuration tasks:

- Section 39.3.1: Enabling IGMP
- Section 39.3.2: Configuring IGMP Settings

39.3.1 Enabling IGMP

Enabling PIM also enables IGMP on that interface. When the switch fills the multicast routing table, it only adds interfaces when the interface receives join messages from downstream devices or when the interface is directly connected to a member of the IGMP group.

By default, PIM and IGMP are disabled on an interface. Use the `pim ipv4 sparse-mode` or `pim ipv4 bidirectional` command to enable PIM and IGMP on the configuration mode interface.

Example

- This command enables PIM and IGMP on VLAN interface 8.
  ```
  switch(config)#interface vlan 8
  switch(config-if-Vl8)#pim ipv4 sparse-mode
  switch(config-if-Vl8)#
  ```

In the unlikely event that the IGMP agent needs to run on an interface without PIM being enabled, use the `ip igmp` command.

Example

- This command enables IGMP on VLAN interface 8 without enabling PIM.
  ```
  switch(config)#interface vlan 8
  switch(config-if-Vl8)#ip igmp
  switch(config-if-Vl8)#
  ```

39.3.2 Configuring IGMP Settings

An interface that runs IGMP uses default protocol settings unless otherwise configured. The switch provides commands that alter startup query, last member query, and normal query settings.

IGMP Version

The switch supports IGMP versions 1 through 3. The `ip igmp version` command configures the IGMP version on the configuration mode interface. Version 3 is the default IGMP version.

Example

- This command configures IGMP version 3 on VLAN interface 4
  ```
  switch(config)#interface vlan 4
  switch(config-if-Vl4)#ip igmp version 3
  switch(config-if-Vl4)#
  ```

Startup Query

Membership queries are sent at an increased frequency immediately after an interface starts up to quickly establish the group state. Query count and query interval commands adjust the period between membership queries for a specified number of messages.

The `ip igmp startup-query-interval` command specifies the interval between membership queries that an interface sends immediately after it starts up. The `ip igmp startup-query-count` command specifies the number of queries that the switches sends from the interface at the startup interval rate.
Example

- These commands define a startup interval of 15 seconds for the first 10 membership queries sent from VLAN interface 12.

```
switch(config)#interface vlan 12
switch(config-if-Vl12)#ip igmp startup-query-interval 150
switch(config-if-Vl12)#ip igmp startup-query-count 10
switch(config-if-Vl12)#
```

Membership Queries

The router with the lowest IP address on a subnet sends membership queries as the IGMP querier. When a membership query is received from a source with a lower IP address, the router resets its query response timer. Upon timer expiry, the router begins sending membership queries. If the router subsequently receives a membership query originating from a lower IP address, it stops sending membership queries and resets the query response timer.

The `ip igmp query-interval` command configures the frequency at which the active interface, as an IGMP querier, sends membership query messages.

The `igmp query-max-response-time` command configures the time that a host has to respond to a membership query.

Example

- These commands define a membership query interval of 75 seconds and a query response timer reset value of 45 seconds for queries sent from VLAN interface 15.

```
switch(config)#interface vlan 15
switch(config-if-Vl15)#ip igmp query-interval 75
switch(config-if-Vl15)#igmp query-max-response-time 450
switch(config-if-Vl15)#
```

Last Member Query

When the querier receives an IGMP leave message, it verifies the group has no remaining hosts by sending a set of group-specific queries at a specified interval. If the querier does not receive a response to the queries, it removes the group state and discontinues multicast transmissions.

The `ip igmp last-member-query-count` (LMQC) command specifies the number of query messages the router sends in response to a group-specific or group-source-specific leave message.

The `ip igmp last-member-query-interval` command configures the transmission interval for sending group-specific or group-source-specific query messages to the active interface.

Example

- These commands program the switch to send 3 query messages, one every 25 seconds, when VLAN interface 15 receives an IGMP leave message.

```
switch(config)#interface vlan 15
switch(config-if-Vl15)#ip igmp last-member-query-interval 250
switch(config-if-Vl15)#ip igmp last-member-query-count 3
switch(config-if-Vl15)#
```

Static Groups

The `ip igmp static-group` command configures the configuration mode interface as a static member of the multicast group at the specified address. The router forwards multicast group packets through the interface without otherwise appearing or acting as a group member. No interface is a static member of a multicast group by default.
Note

To become a static member of a multicast group, the switch must be the PIM designated router (DR) for the network. If it is not, you can use the `pim ipv4 dr-priority` command to make it the DR by configuring its PIM DR value to be the highest on the network.

Example

- These commands configure VLAN interface 15 as the PIM designated router, then configure it as a static member of the multicast group at address 231.1.1.15 for multicast data packets that originate at 10.1.1.1.

```bash
switch(config)#interface vlan 15
switch(config-if-Vl15)#pim ipv4 dr-priority 5000
switch(config-if-Vl15)#ip igmp static-group 231.1.1.15 10.1.1.1
switch(config-if-Vl15)#
```
39.4 Configuring IGMP Snooping

This section describes the following configuration tasks:

- Section 39.4.1: Enabling Snooping
- Section 39.4.2: Configuring Snooping Parameters
- Section 39.4.3: Snooping Querier
- Section 39.4.4: IGMP Snooping L2 Report Flooding
- Section 39.4.5: IGMP Snooping Filters
- Section 39.4.6: Configuring IGMP Snooping Proxy

39.4.1 Enabling Snooping

The switch provides two control settings for snooping IGMP packets:

- Global settings control the availability of IGMP snooping on the switch. Snooping is globally enabled by default.
- Per-VLAN settings control IGMP on individual VLANs. If snooping is enabled on the VLAN, it follows the global snooping state.

The `ip igmp snooping` command controls the global snooping setting. The `ip igmp snooping vlan` command configures snooping on individual VLANs.

**Examples**

- This command globally enables snooping on the switch.
  
  ```
  switch(config)#ip igmp snooping
  switch(config)#
  ```

- This command disables snooping on VLANs 2 through 4.
  
  ```
  switch(config)#no ip igmp snooping vlan 2-4
  switch(config)#
  ```

39.4.2 Configuring Snooping Parameters

**Specifying a Static Multicast Router Connection**

The `ip igmp snooping vlan multicast-router` command statically configures a port that connects to a multicast router to join all multicast groups. The port to the router must be in the specified VLAN range.

Snooping may not always be able to locate the IGMP querier. This command is for IGMP queriers that are known to connect through the network to a port on the switch.

**Example**

- This command configurations the static connection to a multicast router through Ethernet port 3.
  
  ```
  switch(config)#ip igmp snooping vlan 2 mrouter interface ethernet 3
  switch(config)#
  ```

**Adding a Port to a Multicast Group**

The `ip igmp snooping vlan member` command adds an a port to a multicast group. The IP address must be an unreserved IPv4 multicast address. The interface to the port must be in the specified VLAN range.
Example

- This command configures the static connection to a multicast group at 237.2.1.4 through Ethernet port 3.

  switch(config)#ip igmp snooping vlan 7 static 237.2.1.4 interface ethernet 3

  switch(config)#

Robustness Variable

The robustness variable specifies the number of unacknowledged snooping queries that a switch sends before removing the recipient from the group list.

The `ip igmp snooping robustness-variable` command configures the robustness variable for all snooping packets sent from the switch. The default value is 2.

Example

- This command sets the robustness-variable value to 3.

  switch(config)#ip igmp snooping robustness-variable 3

  switch(config)#

Configuring Interface Startup Initial Query Times

The `ip igmp snooping interface-restart-query` command configures the interface startup initial query times in milliseconds. If nothing is configured, a default value of 2000 milliseconds is used. Issuing the command replaces any values already configured. Multiple values may be input in a single command; this makes the mechanism more resilient in the case of dropped packets.

Examples

- This command configures interfaces to send IGMP queries at 1000, 2000, and 4000 milliseconds (i.e., 1 second, 2 seconds, and 4 seconds) after an interface restart or spanning tree change.

  switch(config)#ip igmp snooping interface-restart-query 1000 2000 4000

  switch(config)#

Example

- This command configures interfaces to send a single IGMP query of 5000 milliseconds (5 seconds) after an interface restart or spanning tree change.

  switch(config)#ip igmp snooping interface-restart-query 5000

  switch(config)#

39.4.3 Snooping Querier

The IGMP snooping querier supports snooping by sending layer 2 membership queries to hosts attached to the switch. Note that if IGMP snooping is enabled, QoS will not apply to IGMP packets.

39.4.3.1 Enabling the Snooping Querier

Enabling the snooping querier on an interface requires the explicit configuration of a global querier address or a local querier address for the interface. See Section 39.4.3.2.

The switch provides two control settings for controlling the snooping querier:

- The global setting controls the querier on VLANs for which there is no snooping querier command.
- VLAN querier settings take precedence over the global querier setting.

The `ip igmp snooping querier` command controls the global querier setting. When enabled globally, the querier is controlled on individual VLANs through the `ip igmp snooping vlan querier` command.
The `ip igmp snooping vlan querier` command controls the querier for the specified VLANs. VLANs follow the global querier setting unless overridden by one of these commands:

- **ip igmp snooping vlan querier** enables the querier on specified VLANs.
- **no ip igmp snooping vlan querier** disables the querier on specified VLANs.

**Example**

- These commands globally enables the snooping querier on the switch, explicitly disables snooping on VLANs 1-4, and explicitly enables snooping on VLANs 5-8.

```
switch(config)#ip igmp snooping querier
switch(config)#no ip igmp snooping vlan 1-4 querier
switch(config)#ip igmp snooping vlan 5-8 querier
```

- This command removes the querier setting for VLANs 3-6:

```
switch(config)#default ip igmp snooping vlan 3-6 querier
```

**Globally Set the Snooping Querier Version**

The `ip igmp snooping querier version` command configures the IGMP snooping querier version. Version 2 is the default IGMP snooping version.

**Example**

- This command globally configures IGMP snooping querier version 2.

```
switch(config)#ip igmp snooping querier version 2
```

The `ip igmp snooping vlan querier version` command configures IGMP globally on the VLAN. Version 2 is the default IGMP snooping version.

**Example**

- This command configures IGMP snooping vlan querier version VLAN 5.

```
switch(config)#ip igmp snooping vlan 5 querier version 2
```

### 39.4.3.2 Configuring Snooping Querier Parameters

**Querier Address**

The switch provides two IP addresses for setting the querier source:

- The global address is used by VLANs for which there is no querier address command.
- VLAN querier address settings take precedence over the global querier address.

The snooping querier address specifies the source IP address for IGMP snooping query packets that the switch transmits. The source address is also used to elect a snooping querier when the subnet contains multiple snooping queriers.

The default global querier address is not defined. When the configuration includes a snooping querier, a querier address must be defined globally or for each interface that enables a querier.

The `ip igmp snooping querier address` command sets the global querier source IP address for the switch. VLANs use the global address unless overwritten with the `ip igmp snooping vlan querier address` command. The default global address is not defined.
The **ip igmp snooping vlan querier address** command sets the source IP address for query packets transmitted from the specified VLAN. This command overrides the **ip igmp snooping querier address** for the specified VLAN.

**Examples**

- This command sets the source IP address for query packets that the switch transmits to 10.1.1.41.
  ```
  switch(config)#ip igmp snooping querier address 10.1.1.41
  switch(config)#
  ```

- This command sets the source IP address for query packets that VLAN 2 transmits to 10.14.1.1.
  ```
  switch(config)#ip igmp snooping vlan 2 querier address 10.14.1.1
  switch(config)#
  ```

**Membership Query Interval**

The query interval is the period (seconds), between IGMP Membership Query message transmissions. The interval ranges from 5 to 3600 seconds.

The **ip igmp snooping querier query-interval** command specifies the global query interval for packets the switch sends as a snooper querier. The default global setting is 125 seconds.

The **ip igmp snooping vlan querier query-interval** command specifies the query interval for packets sent from the snooping querier to the specified VLAN, overriding the global setting. VLANs that do not specify a query interval use the global setting.

**Examples**

- This command sets a query interval of 150 seconds for queries transmitted from VLANs for which a query interval is not configured.
  ```
  switch(config)#ip igmp snooping querier query-interval 150
  switch(config)#
  ```

- This command sets the query interval of 240 seconds for queries transmitted from VLAN 2.
  ```
  switch(config)#ip igmp snooping vlan 2 querier query-interval 240
  switch(config)#
  ```

**Membership Query Response Interval**

The Max Response Time field, in Membership Query messages, specifies the longest time a host can wait before responding with a Membership Report message. In all other messages, the sender sets the field to zero and the receiver ignores it. The switch provides two values for setting this field:

- The global value is used by VLANs for which there is no Max Response Time command.
- VLAN values take precedence over the global value for the specified VLAN.

The **ip igmp snooping querier max-response-time** command specifies the global Max Response Time value used in snooping query packets transmitted from the switch. Values range from 1 to 25 seconds with a default of 10 seconds. VLANs use the global setting unless overwritten with the **ip igmp snooping vlan querier max-response-time** command.

The **ip igmp snooping vlan querier max-response-time** command configures the Max Response Time field contents for packets transmitted from the specified VLAN, overriding the global setting.
Examples

- This command sets the maximum response time of 15 seconds for queries transmitted from VLANs for which a maximum response time is not configured.
  
  ```
  switch(config)# ip igmp snooping querier max-response-time 15
  switch(config)#
  ```

- This command sets a maximum response time of 5 seconds for queries that VLAN 2 transmits.
  
  ```
  switch(config)# ip igmp snooping vlan 2 querier max-response-time 5
  switch(config)#
  ```

Last Member Query

When the querier receives an IGMP leave message, it verifies the group has no remaining hosts by sending a set of group-specific queries at a specified interval. If the querier does not receive a response to the queries, it removes the group state and discontinues multicast transmissions.

The switch provides two values for setting this field:

- The global value is used by VLANs for which there is no last-member-query-interval defined.
- VLAN values take precedence over the global value for the specified VLAN.

The `ip igmp snooping querier last-member-query-interval` command specifies the global last-member-query-interval used in snooping query packets transmitted from the switch. This value is used for VLANs that do not have a value specified. Values range from 1 to 25 seconds with a global default of one second.

The `ip igmp snooping vlan querier last-member-query-interval` command configures the last-member-query-interval field contents for packets transmitted from the specified VLAN, overriding the global setting.

Example

- This command sets the global snooping querier last-member-query-interval to five seconds and the VLAN 10 last-member-query-interval to 12 seconds.
  
  ```
  switch(config)# ip igmp snooping querier last-member-query-interval 5
  switch(config)# ip igmp snooping vlan 10 querier last-member-query-interval 12
  switch(config)#
  ```

Interface Restart Query Spoofing

When the port status (link status or spanning tree status) changes, an IGMP general query is spoofed based on the information of the last known IGMP querier. This facilitates faster network convergence time.

By default, interfaces wait 2000 milliseconds before sending the spoofed IGMP query. To configure the delay before the spoofed query is sent, use the `ip igmp snooping interface-restart-query` command. This setting is applied to all ports.

Example

- This command configures the switch to send general IGMP queries at 100 milliseconds, 200 milliseconds, and 300 milliseconds after interface restart or spanning tree status change.
  
  ```
  switch(config)# ip igmp snooping interface-restart-query 100 200 300
  ```
39.4.4 IGMP Snooping L2 Report Flooding

L2 report flooding is an IGMP snooping feature that forwards membership report messages to specified ports. Report flooding is disabled by default and must be enabled globally before it can be enabled on individual interfaces.

The list of ports that can forward membership report messages must be explicitly configured. Commands are available to define lists of ports that are valid for all VLANs and port lists that are valid for specified VLAN ranges. Ports can forward membership reports only if they are configured to handle VLAN traffic, regardless of any report flooding configuration settings.

Enabling L2 Report Flooding

These commands enable L2 report flooding:

- `ip igmp snooping report-flooding` enables report flooding globally.
- `ip igmp snooping vlan report-flooding` enables report flooding on a specified VLAN range.

Example

- These commands enable L2 report flooding globally, and on VLANs 201-205.

```
switch(config)#ip igmp snooping report-flooding
switch(config)#ip igmp snooping vlan 201-205 report-flooding
switch(config)#
```

Configuring Forwarding Ports

These commands specify the ports that forward membership report messages:

- `ip igmp snooping report-flooding switch-port` configures ports globally.
- `ip igmp snooping vlan report-flooding switch-port` configures ports for a specified VLAN range.

Example

- These commands enable Ethernet ports 5-9 to forward reports on all VLANs and ports 12-15 on VLANs 201-205.

```
switch(config)#ip igmp snooping report-flooding switch-port ethernet 5-9
switch(config)#ip igmp snooping vlan 201-205 report-flooding switch-port ethernet 12-15
switch(config)#
```

39.4.5 IGMP Snooping Filters

IGMP snooping filters assigns IGMP profiles only to Layer 2 interfaces, and for Layer 3 interfaces use multicast boundary filters to control the multicast groups that the interfaces can join. An IGMP profile specifies a filter type and a list of address ranges. The address ranges comprise the multicast groups covered by the profile. The filter type determines an interface’s accessibility to the multicast groups:

- Permit filters define the multicast groups the interface can join.
- Deny filters define the multicast groups the interface cannot join.

Profiles are created in IGMP-profile configuration mode, then applied to an interface in interface configuration mode.

The `ip igmp profile` command places the switch in IGMP profile configuration mode. The `permit` / `deny` and `range` commands specify the profile’s filter type and address range. A profile may contain multiple range statements to define a discontiguous address range.
Example

- These commands create an IGMP profile named list_1 by entering IGMP-profile configuration mode, configure the profile to permit multicast groups 231.22.24.0 through 231.22.24.127, and return the switch to global configuration mode.

```plaintext
switch(config)#ip igmp profile list_1
switch(config-igmp-profile-list_1)#permit
switch(config-igmp-profile-list_1)#range 231.22.24.0 231.22.24.127
switch(config-igmp-profile-list_1)#exit
switch(config)#
```

The `ip igmp snooping filter` command applies an IGMP profile to the configuration mode interface.

Example

- These commands apply the `list_1` snooping profile to Ethernet interface 7.

```plaintext
switch(config)#interface ethernet 7
switch(config-if-Et7)#ip igmp snooping filter list_1
switch(config-if-Et7)#
```

39.4.5.1 Verifying IGMP Snooping

Show commands are available to display various configurations and IGMP snooping status. IGMP snooping that are viewable include:

- show ip igmp snooping
- show ip igmp snooping counters
- show igmp snooping querier
- show igmp snooping querier counters
- show igmp snooping querier membership

IGMP Snooping Status

The `show ip igmp snooping` command displays the switch's IGMP snooping configuration.

Example

- This command displays the switch's IGMP snooping configuration.

```plaintext
switch>show ip igmp snooping
  Global IGMP Snooping configuration:
  -------------------------------
  IGMP snooping : Enabled
  Robustness variable : 2

  Vlan 1 :
  -------
  IGMP snooping : Enabled
  Multicast router learning mode : pim-dvmrp

  Vlan 20 :
  -------
  IGMP snooping : Enabled
  Multicast router learning mode : pim-dvmrp

  Vlan 2028 :

  switch>
```
**IGMP Snooping Counters**

The `show ip igmp snooping counters` command displays the number of IGMP messages sent and received through each switch port. The display table sorts the messages by type.

**Example**

- This command displays the number of messages received on each port.

```plaintext
switch>show ip igmp snooping counters

**IGMP Snooping Querier**

The `show igmp snooping querier` command displays snooping querier configuration and status information. Command provides options to only include specific VLANs.

**Example**

- This command displays the querier IP address, version, and port servicing each VLAN.

```plaintext
switch>show igmp snooping querier

<table>
<thead>
<tr>
<th>Vlan</th>
<th>IP Address</th>
<th>Version</th>
<th>Port</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>172.17.0.37</td>
<td>v2</td>
<td>Po1</td>
</tr>
<tr>
<td>20</td>
<td>172.17.20.1</td>
<td>v2</td>
<td>Po1</td>
</tr>
<tr>
<td>26</td>
<td>172.17.26.1</td>
<td>v2</td>
<td>Cpu</td>
</tr>
<tr>
<td>2028</td>
<td>172.17.255.29</td>
<td>v2</td>
<td>Po1</td>
</tr>
</tbody>
</table>
switch>
```
IGMP Snooping Querier Counters

The `show igmp snooping querier counters` command displays the counters from the querier, as learned through Internet Group Management Protocol (IGMP).

Example

- This command displays the counters from the querier.

```plaintext
switch>show igmp snooping querier counters
-----------------------------------------------
Vlan: 1   IP Addr: 100.0.0.1   Op State: Querier   Version: v3
v1 General Queries Sent        :0
v1 Queries Received            :0
v1 Reports Received            :0
v2 General Queries Sent        :1
v2 Queries Received            :0
v2 Reports Received            :25
v2 Leaves Received             :0
v3 General Queries Sent        :655
v3 GSQ Queries Sent            :0
v3 GSSQ Queries Sent           :8
v3 Queries Received            :654
v3 Reports Received            :2385
Error Packets                  :0
Other Packets                  :0
switch>
```

IGMP Snooping Querier Membership

The `show igmp snooping querier membership` command displays the membership from the querier, as learned through Internet Group Management Protocol (IGMP).

Example

- This command displays the membership from the querier fro VLAN 1.

```plaintext
switch>show igmp snooping querier membership
-----------------------------------------------
Vlan: 1   Elected: 100.0.0.1   QQI: 125   QRV: 2   QRI: 10   GMI: 260
Groups           Mode  Ver  Num of Sources
-----------------------------------------------
10.0.0.2        EX    v3   0  []
10.0.0.3        IN    v3   2  [ 3.3.3.3, 3.3.3.4 ]
10.0.0.4        EX    v3   0  []
10.0.0.13       EX    v3   0  []
10.0.0.22       EX    v3   0  []
10.0.0.1        IN    v3   3  [ 5.6.7.9, 5.6.7.8, ... ]
switch>
```

39.4.6 Configuring IGMP Snooping Proxy

Use the `ip igmp snooping proxy` command to enable IGMP snooping proxy globally. Enabling IGMP snooping proxy enables it for all VLANs where IGMP snooping is enabled. IGMP snooping proxy is globally disabled by default.

Use the `ip igmp snooping proxy` command to enable IGMP snooping proxy globally. Use the `no ip igmp snooping vlan` proxy command to disable IGMP snooping proxy on specified VLANs.
Examples

- This command globally enables IGMP snooping proxy on the switch.
  
  ```
  switch(config)#ip igmp snooping proxy
  switch(config)#
  ```

- This command disables IGMP snooping proxy on VLANs 2 through 4.
  
  ```
  switch(config)#no ip igmp snooping proxy vlan 2-4 proxy
  switch(config)#
  ```

39.4.6.1 Configuring Snooping Proxy Querier

To configure the IGMP snooping proxy querier use the existing `ip igmp snooping querier` commands. For more information on these commands, please refer to section 35.4.3 from the document.

Note

The proxy querier by default uses 0.0.0.0 IP address.

Example

In this example, IGMP snooping proxy is enabled using the `ip igmp snooping proxy` command and the snooping proxy is set to reports for all the VLANs except VLANs 100 through 110 using the `ip igmp snooping vlan` command. The proxy querier operates in version 3 and sends queries at a 15-second interval and hosts can take up to 5 seconds to respond.

```
switch(config)#ip igmp snooping proxy
switch(config)#no ip igmp snooping vlan 100-110 proxy
switch(config)#ip igmp snooping querier query-interval 15
switch(config)#ip igmp snooping querier max-response-time 5
switch(config)#ip igmp snooping querier version 3
switch(config)#ip igmp snooping querier
  switch(config)#
```
39.5 IGMP Host Proxy

Interfaces on the switch can be configured to serve as IGMP host proxies. An IGMP host proxy exchanges IGMP reports (joins/leaves) between networks whose connection does not support PIM along network boundaries.

39.5.1 IGMP Host Proxy Description

Figure 39-1 displays a typical IGMP host-proxy implementation. The customer network connects to the sender network through the edge switch’s Ethernet 1 interface, which is configured as an IGMP host proxy. PIM is enabled within the sender and customer networks but not on the connection between the networks.

The IGMP proxy agent sends unsolicited IGMP joins when a (S,G) or (*.G) entry arrives in the multicast routing table (mroute table). Subsequently, IGMP reports are sent when queries or group-specific queries arrive on the host proxy interface. When the customer network is void of active listeners, the connection eventually expires and the senders stop transmitting to the network.

IGMP host proxy requires the following:

- PIM multicast border router (MBR) must be enabled on the interface.
- IP IGMP and IP multicast must be enabled.
- The switch must be an RP or in each host’s RP path.
- Fast-drop entries are required when there are no interested listeners for the group.

IGMP host proxy is configurable to filter for specific multicast groups and sources.

39.5.2 IGMP Host Proxy Configuration

**Enabling IGMP Host Proxy**

Enable PIM MBR on the interface using the `pim ipv4 border-router` command. The IGMP host proxy service is then configured on the interface using the `ip igmp host-proxy` command. When the host proxy is configured, it sends reports for (S,G) entries in the multicast routing (mroute) table if these are the only routes there; if there are any (*.G) entries, it sends reports only for these. To send reports for a specific group even when there is no (*.G) entry in the mroute table for that group, include the group address in the `ip igmp host-proxy` command. Multiple `ip igmp host-proxy` statements are required to specify multiple groups. The interval between IGMP reports is configured by `ip igmp host-proxy report-interval`.

![Figure 39-1: IP IGMP Host Proxy Implementation](image)
Host Proxy IGMP Version and Source Filtering

IGMP host proxies can be configured with IGMP versions 1, 2, or 3, and use version 3 by default. When the host-proxy IGMP version is set to 3, the proxy can explicitly include or exclude source addresses. Otherwise, include/exclude configuration for source addresses is ignored. The IGMP version of unsolicited reports is specified with the `ip igmp host-proxy version` command. Reports that are triggered by IGMP queries, however, are sent in the same IGMP version as the received query. (An interface may also have a different IGMP version configured on it for other purposes using the `ip igmp version` command.)

Using ACLs

IGMP host proxy can also be enabled for the addresses defined by an ACL; if one or more groups are configured in addition to ACLs, the groups are processed first. Implicit deny in the ACL is ignored, but if the ACL includes an explicit deny rule, then the interface sends joins only to groups configured directly on the interface or included in a permit ACL. Deny rules take precedence over permit rules. If a group is configured with no filters and a host-proxy is configured with an ACL with rules having filters for the group, or configured with groups and source filters, then the filters are applied to the group.

Disabling Host Proxy or Removing an Individual Group or Source

The `no igmp host-proxy` command can be entered with group or source parameters to remove the specified group or source from the list. Entering the `no igmp host-proxy` command without specifying group or source disables the forwarding of all IGMP reports on the interface.

Examples

- These commands enable IGMP host proxy on Ethernet interface 17 for all multicast group addresses.
  ```
  switch(config)#interface ethernet 17
  switch(config-if-Et17)#pim ipv4 border-router
  switch(config-if-Et17)#ip igmp host-proxy
  switch(config-if-Et17)#
  ```

- These commands enable IGMP host proxy on Ethernet interface 18 for the multicast group at 231.10.10.1. The list of source addresses is not restricted.
  ```
  switch(config)#interface ethernet 18
  switch(config-if-Et18)#pim ipv4 border-router
  switch(config-if-Et18)#ip igmp host-proxy 231.10.10.1
  switch(config-if-Et18)#
  ```

- These commands enable IGMP host proxy on Ethernet interface 19 for the multicast group at 231.10.10.2. The list of source addresses only excludes 10.4.4.1 and 10.4.5.2.
  ```
  switch(config)#interface ethernet 19
  switch(config-if-Et19)#pim ipv4 border-router
  switch(config-if-Et19)#ip igmp host-proxy 231.10.10.2 exclude 10.4.4.1
  switch(config-if-Et19)#ip igmp host-proxy 231.10.10.2 exclude 10.4.5.2
  switch(config-if-Et19)#
  ```

- These commands enable IGMP host proxy on Ethernet interface 16 for the multicast group at 231.10.10.3. The list of source address for this group only includes 10.5.5.1 and 10.5.5.2
  ```
  switch(config)#interface ethernet 16
  switch(config-if-Et16)#pim ipv4 border-router
  switch(config-if-Et16)#ip igmp host-proxy 231.10.10.3 include 10.5.5.1
  switch(config-if-Et16)#ip igmp host-proxy 231.10.10.3 include 10.5.5.2
  switch(config-if-Et16)#
  ```
Chapter 39: IGMP and IGMP Snooping

- These commands configure an IGMP host proxy interval of five seconds on port channel 100.
  switch(config)#interface port-channel 100
  switch(config-if-Po100)#ip igmp host-proxy report-interval 5
  switch(config-if-Po100)#

- These commands enable IGMP host proxy on Ethernet interface 17 for the group address(es) specified in ACL “acl1.”
  switch(config)#interface ethernet 17
  switch(config-if-Et17)#pim ipv4 border-router
  switch(config-if-Et17)#ip igmp host-proxy access-list acl1
  switch(config-if-Et17)#
39.6 IGMP and IGMP Snooping Commands

IGMP Configuration Commands (Interface Configuration Mode)

- `igmp query-max-response-time`
- `ip igmp last-member-query-count`
- `ip igmp last-member-query-interval`
- `ip igmp query-interval`
- `ip igmp router-alert`
- `ip igmp startup-query-count`
- `ip igmp startup-query-interval`
- `ip igmp static-group`
- `ip igmp static-group acl`
- `ip igmp static-group range`
- `ip igmp version`

IGMP Clear Commands

- `clear ip igmp group`
- `clear ip igmp statistics`

IGMP Display Commands

- `show ip igmp groups`
- `show ip igmp groups count`
- `show ip igmp interface`
- `show ip igmp static-groups`
- `show ip igmp static-groups acl`
- `show ip igmp static-groups group`
- `show ip igmp statistics`

IGMP Snooping Configuration Commands (Global Configuration Mode)

- `ip igmp`
- `ip igmp profile`
- `ip igmp snooping`
- `ip igmp snooping proxy`
- `ip igmp snooping querier`
- `ip igmp snooping querier address`
- `ip igmp snooping querier last-member-query-count`
- `ip igmp snooping querier last-member-query-interval`
- `ip igmp snooping querier max-response-time`
- `ip igmp snooping querier query-interval`
- `ip igmp snooping querier startup-query-count`
- `ip igmp snooping querier startup-query-interval`
- `ip igmp snooping querier version`
- `ip igmp snooping report-flooding`
- `ip igmp snooping report-flooding switch-port`
- `ip igmp snooping restart query-interval`
- `ip igmp snooping robustness-variable`
- `ip igmp snooping vlan`
- `ip igmp snooping vlan fast-leave`
- `ip igmp snooping vlan max-groups`
- `ip igmp snooping vlan member`
- `ip igmp snooping vlan multicast-router`
- ip igmp snooping vlan proxy
- ip igmp snooping vlan querier
- ip igmp snooping vlan querier address
- ip igmp snooping vlan querier last-member-query-count
- ip igmp snooping vlan querier last-member-query-interval
- ip igmp snooping vlan querier max-response-time
- ip igmp snooping vlan querier query-interval
- ip igmp snooping vlan querier startup-query-count
- ip igmp snooping vlan querier startup-query-interval
- ip igmp snooping vlan querier version
- ip igmp snooping vlan report-flooding
- ip igmp snooping vlan report-flooding switch-port

**IGMP Configuration Commands (Interface Configuration Mode)**
- ip igmp snooping filter

**IGMP Snooping Clear Commands**
- clear ip igmp snooping counters

**IGMP Snooping Display Commands**
- show igmp snooping querier
- show igmp snooping querier counters
- show igmp snooping querier membership
- show ip igmp profile
- show ip igmp snooping
- show ip igmp snooping counters
- show ip igmp snooping counters ethdev-pams
- show ip igmp snooping groups
- show ip igmp snooping groups count
- show ip igmp snooping mrouter
- show ip igmp snooping report-flooding

**IGMP Profile Configuration Mode Commands**
- permit / deny
- range

**IGMP Host Proxy Commands**
- ip igmp host-proxy
- ip igmp host-proxy report-interval
- ip igmp host-proxy version
- show ip igmp host-proxy config-sanity
- show ip igmp host-proxy interface
clear ip igmp group

The clear ip igmp group command deletes IGMP cache entries as follows:

- clear ip igmp group all entries from the IGMP cache.
- clear ip igmp group gp_addr all entries for a specified multicast group.
- clear ip igmp group interface int_id all entries that include a specified interface.
- clear ip igmp group gp_addr interface int_id all entries for a specified interface in a specified group.

Command Mode
Privileged EXEC

Command Syntax
```
clear ip igmp group [gp_addr] [interface INT_ID]
```

Parameters
- gp_addr multicast group IP address (dotted decimal notation).
- INT_ID interface name. Options include:
  - ethernet e_num Ethernet interface specified by e_num.
  - loopback l_num Loopback interface specified by l_num.
  - management m_num Management interface specified by m_num.
  - port-channel p_num Port-channel interface specified by p_num.
  - vlan v_num VLAN interface specified by v_num.
  - vxlan vx_num VXLAN interface specified by vx_num.

Examples
- This command deletes all IGMP cache entries for the multicast group 231.23.23.14.
  ```
  switch#clear ip igmp group 231.23.23.14
  switch#
  ```
- This command deletes IGMP cache entries for Ethernet interface 16 in multicast group 226.45.10.45.
  ```
  switch#clear ip igmp group 226.45.10.45 interface ethernet 16
  switch#
  ```
**clear ip igmp snooping counters**

The `clear ip igmp snooping counters` command resets the snooping message counters for the specified interface. The snooping counters for all interfaces are reset if the command does not include an interface name.

The `show ip igmp snooping counters` command displays the counter contents. See the `show ip igmp snooping counters` command description for a list of available snooping counters.

**Command Mode**

Privileged EXEC

**Command Syntax**

```
clear ip igmp snooping counters [INT_NAME]
```

**Parameters**

- **INT_NAME** interface name. Formats include:
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `port-channel p_num` Port-channel interface specified by `p_num`.
  - `switch` virtual interface to an L2 querier.

**Example**

- This command clears the snooping counters for messages received on Ethernet interface 15.

```
switch(config)#clear ip igmp snooping counters ethernet 15
switch(config)#
```
clear ip igmp statistics

The **clear ip igmp statistics** command resets IGMP transmission statistic counters for the specified interface.

**Command Mode**
Privileged EXEC

**Command Syntax**
clear ip igmp statistics [INTF_ID]

**Parameters**
- **INTF_ID** interface name. Options include:
  - <no parameter> all interfaces.
  - interface ethernet e_num Ethernet interface specified by e_num.
  - interface loopback l_num Loopback interface specified by l_num.
  - interface management m_num Management interface specified by m_num.
  - interface port-channel p_num Port-channel interface specified by p_num.
  - interface vlan v_num VLAN interface specified by v_num.
  - interface xlan vx_num VXLAN interface specified by vx_num.

**Examples**
- This command resets IGMP transmission statistic counters on Ethernet 1 interface.

  switch# clear ip igmp statistics interface ethernet 1
  switch#
**igmp query-max-response-time**

The `igmp query-max-response-time` command configures the `query-max-response-time` variable for the configuration mode interface. This variable is used to set the Max Response Time field in outbound Membership Query messages. Max Response Time specifies the maximum period a recipient can wait before responding with a Membership Report.

The router with the lowest IP address on a subnet sends membership queries as the IGMP querier. When a membership query is received from a source with a lower IP address, the router resets its query response timer. Upon timer expiry, the router begins sending membership queries. If the router subsequently receives a membership query originating from a lower IP address, it stops sending membership queries and resets the query response timer.

The `no igmp query-max-response-time` and `default igmp query-max-response-time` commands restore the default query-max-response-time of 10 seconds for the configuration mode interface by removing the corresponding `igmp query max-response-time` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration
- Router-IGMP Configuration

**Command Syntax**

```
igmp query-max-response-time period
no igmp query-max-response-time
default igmp query-max-response-time
```

Router-IGMP Configuration mode

```
query-max-response-time period
no query-max-response-time
default query-max-response-time
```

**Parameters**

- `period` maximum response time (deciseconds). Values range from 1 to 31744 (52 minutes, 54 seconds). Default is 100 (ten seconds).

**Example**

- This command configures the query-max-response-time of 18 seconds for VLAN interface 4.

```
switch(config)#interface vlan 4
switch(config-if-Vl4)# igmp query-max-response-time 180
switch(config-if-Vl4)#
```
ip igmp host-proxy

The `ip igmp host-proxy` command enables the IGMP host proxy service on the configuration mode interface. The IGMP host proxy performs IGMP joins and leaves between networks that are directly connected by an exchange that does not support PIM on the network boundary.

**Note**

For an interface to serve as an IGMP host proxy, PIM MBR must also be enabled on that interface using the `pim ipv4 border-router` command.

The IGMP host proxy sends unsolicited IGMP join reports when an (S,G) or (*,G) entry arrives in the multicast routing (mroute) table. Reports are subsequently sent upon the arrival of queries on the interface. The interval between IGMP reports is configured through `ip igmp host-proxy report-interval`.

The `ip igmp host-proxy` command can also specify a group address; this ensures that reports are generated for the specified group even if there is no (*,G) entry in the mroute table for that group. Multiple `ip igmp host-proxy` statements are required to specify multiple groups.

When the host proxy IGMP version is set to 3 using the `ip igmp host-proxy version` command, the `ip igmp host-proxy` command can also include or exclude source addresses. These options are ignored when the interface runs host proxy IGMP version 1 or 2. Note that the IGMP version set using the `ip igmp version` command does not affect host proxy behavior.

An ACL can also be used in place of a group address by using the `access-list` option. If one or more groups are configured in addition to ACLs, the groups are processed first. Implicit deny in the ACL is ignored, but if the ACL includes an explicit deny rule, then the interface sends joins only to groups configured directly on the interface or included in a permit ACL. Deny rules take precedence over permit rules. If a group is configured with no filters and a host-proxy is configured with an ACL with rules having filters for the group, or configured with groups and source filters, then the filters are applied to the group.

The `no ip igmp host-proxy` and `default ip igmp host-proxy` commands remove the corresponding `ip igmp host-proxy` command from running-config. When these commands do not include a group address, all `ip igmp host-proxy` statements are deleted. When inclusion or exclusion parameters are not specified, all statements with the specified group address are deleted.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ip igmp host-proxy [GROUP_ADDRESS [SOURCE_ADDRESS]] [access-list acl]
no ip igmp host-proxy [GROUP_ADDRESS [SOURCE_ADDRESS]]
default ip igmp host-proxy [GROUP_ADDRESS [SOURCE_ADDRESS]]
```

**Parameters**

- **GROUP_ADDRESS** IPv4 address of group address for which host proxy sends reports.
- **<no parameter>** only groups for which there is a (*,G) entry in the mroute table.
- **ipv4_address** IP address of multicast group (dotted decimal notation). This ensures that reports are generated for this group even if it does not have a (*,G) entry in the mroute table.
- **SOURCE_ADDRESS** IP address of a host that originates multicast data packets.
- **<no parameter>** Proxy sends report for all received or configured groups regardless of source address.
- **exclude ipv4_address** Proxy does not send reports for specified source address.
• include *ipv4_address*  
Proxy always sends reports for specified source address.

Commands that list at least one parameter must specify a group address.
Parameters may be listed in any order.
When a command specifies include and exclude parameters, the exclude parameter is ignored.

• access-list *acl*  
specifies an access control list (ACL); a join is sent for all groups and/or sources obtained by processing the rules from all configured ACLs.

• version *version*  
specifies the IGMP version on IGMP host-proxy interface. The value ranges from 1 to 3. Default value is 3.

Guidelines

Multiple statements for a group address may be configured. The effect of entering a command depends on previously entered commands. The following describes command combination:

• ip igmp host-proxy: IGMP host proxy is enabled for all multicast groups and their source addresses. When enabled for all group addresses, the source address list cannot be restricted.

• ip igmp host-proxy *group_ipv4*: IGMP host proxy is enabled for a specified multicast group. The list of source addresses for this group is not restricted. Enabling host proxy for another group address requires another *ip igmp host-proxy* command.

• ip igmp host-proxy *group_ipv4 exclude source_ipv4*: IGMP host proxy is enabled for the specified multicast group. Sources for this group include all addresses not in an exclude statement. Multiple source addresses for the group are excluded by multiple statements.

• ip igmp host-proxy *group_ipv4 include source_ipv4*: IGMP host proxy is enabled for the specified group address for only the specified source address. Additional statements are required to include other source addresses for the group. The presence of one include parameter invalidates all exclude statements for the specified multicast group.

• ip igmp host-proxy access-list *acl*: IGMP host proxy is enabled for the addresses defined by the specified ACL. If one or more groups are configured in addition to ACLs, the groups are processed first. If the ACL has a “deny all” rule for a group, then this filter takes precedence over configurations with include/exclude keywords or permit/deny rules for that group. If a group is configured with no filters and a host-proxy is configured with an ACL with rules having filters for the group, or configured with groups and source filters, then the filters are applied to the group.

Example

• These commands enable IGMP host proxy on Ethernet interface 17 for all multicast group addresses.

```
switch(config)#interface ethernet 17
switch(config-if-Et17)#pim ipv4 border-router
switch(config-if-Et17)#ip igmp host-proxy
switch(config-if-Et17)#
```

• These commands enable IGMP host proxy on Ethernet interface 17 for the multicast group at 231.10.10.1. The list of source addresses is not restricted.

```
switch(config)#interface ethernet 17
switch(config-if-Et17)#pim ipv4 border-router
switch(config-if-Et17)#ip igmp host-proxy 231.10.10.1
switch(config-if-Et17)#
```
• These commands enable IGMP host proxy on Ethernet interface 17 for the multicast group at 231.10.10.2. The list of source addresses only excludes 10.4.4.1 and 10.4.5.2.

```
switch(config)#interface ethernet 17
switch(config-if-Et17)#pim ipv4 border-router
switch(config-if-Et17)#ip igmp host-proxy 231.10.10.2 exclude 10.4.4.1
switch(config-if-Et17)#ip igmp host-proxy 231.10.10.2 exclude 10.4.5.2
switch(config-if-Et17)#
```

• These commands enable IGMP host proxy on Ethernet interface 17 for the multicast group at 231.10.10.3. The list of source address for this group only includes 10.5.5.1 and 10.5.5.2.

```
switch(config)#interface ethernet 17
switch(config-if-Et17)#pim ipv4 border-router
switch(config-if-Et17)#ip igmp host-proxy 231.10.10.3 include 10.5.5.1
switch(config-if-Et17)#ip igmp host-proxy 231.10.10.3 include 10.5.5.2
switch(config-if-Et17)#
```

• These commands enable IGMP host proxy on Ethernet interface 17 for the group address(es) specified in ACL "acl1"

```
switch(config)#interface ethernet 17
switch(config-if-Et17)#pim ipv4 border-router
switch(config-if-Et17)#ip igmp host-proxy access-list acl1
switch(config-if-Et17)#
```
ip igmp host-proxy report-interval

The ip igmp host-proxy report-interval command configures the period between unsolicited join reports that the switch sends as an IGMP host proxy from the configuration mode interface to a sender network after a (S,G) or (*.G) entry arrives in the multicast route (mroute) table. When the interface receives a query in response, this interval is set to the ip igmp last-member-query-interval. This command also enables the host proxy on the configuration mode interface if it was not previously enabled.

The no ip igmp host-proxy report-interval and default ip igmp host-proxy report-interval commands reset the query interval to the default value of one second by removing the corresponding ip igmp host-proxy report-interval command from running-config. The no ip igmp host-proxy and default ip igmp host-proxy commands also remove the corresponding report-interval command.

Command Mode
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

Command Syntax
- ip igmp host-proxy report-interval period
- no ip igmp host-proxy report-interval
- default ip igmp host-proxy report-interval

Parameters
- period transmission interval (seconds) between consecutive reports.
  Value range: 1 (one second) to 31744 (8 hours, 49 minutes, 4 seconds). Default is 1 (one second).

Example
- These commands configures a IGMP host proxy interval of five seconds on port channel 100.
  switch(config)#interface port-channel 100
  switch(config-if-Po100)#ip igmp host-proxy report-interval 5
  switch(config-if-Po100)#
The `ip igmp host-proxy version` command configures the version number to be used in unsolicited reports when the interface is serving as an IGMP host proxy. To configure the IGMP version used by the interface for other purposes, use the `ip igmp version` command instead.

The `no ip igmp host-proxy version` and `default ip igmp host-proxy version` commands reset the version to the default value of 3.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `ip igmp host-proxy version version_number`
- `no ip igmp host-proxy version`
- `default ip igmp host-proxy version`

**Parameters**
- `version_number` values range from 1-3; default value is 3.

**Example**
- These commands configure the IGMP host proxy version on port channel interface 100 to 2.
  ```
  switch(config)#interface port-channel 100
  switch(config-if-Po100)#ip igmp host-proxy version 2
  switch(config-if-Po100)#
  ```
The `ip igmp last-member-query-count` command specifies the number of query messages the switch sends in response to a group-specific or group-source-specific leave message.

After receiving a message from a host leaving a group, the switch sends query messages at intervals specified by `ip igmp last-member-query-interval`. If the switch does not receive a response to the queries after sending the number of messages specified by this parameter, it stops forwarding messages to the host.

Setting the last member query count (LMQC) to 1 causes the loss of a single packet to stop traffic forwarding. While the switch can start forwarding traffic again after receiving a response to the next general query, the host may not receive that query for a period defined by `ip igmp query-interval`.

The `no ip igmp last-member-query-count` and `default ip igmp last-member-query-count` commands reset the LMQC to the default value by removing the corresponding `ip igmp last-member-query-count` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `ip igmp last-member-query-count number`
- `no ip igmp last-member-query-count`
- `default ip igmp last-member-query-count`

**Parameters**
- `number` query message quantity. Values range from 0 to 3. Default is 2.

**Example**
- This command configures the last-member-query-count to 3 on VLAN interface 4.

```bash
switch(config)#interface vlan 4
switch(config-if-Vl4)#ip igmp last-member-query-count 3
switch(config-if-Vl4)#
```
ip igmp last-member-query-interval

The `ip igmp last-member-query-interval` command configures the switch’s transmission interval for sending group-specific or group-source-specific query messages from the configuration mode interface.

When a switch receives a message from a host that is leaving a group it sends query messages at intervals set by this command. The `ip igmp startup-query-count` specifies the number of messages that are sent before the switch stops forwarding packets to the host.

If the switch does not receive a response after this period, it stops forwarding traffic to the host on behalf of the group, source, or channel.

The `no ip igmp last-member-query-interval` and `default ip igmp last-member-query-interval` commands reset the query interval to the default value of one second by removing the `ip igmp last-member-query-interval` command from `running-config`.

Command Mode
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

Command Syntax

```
ip igmp last-member-query-interval period
no ip igmp last-member-query-interval
default ip igmp last-member-query-interval
```

Parameters
- `period` transmission interval (deciseconds) between consecutive group-specific query messages.
  
  Value range: 10 (one second) to 317440 (8 hours, 49 minutes, 4 seconds). Default is 10 (one second).

Example
- This command configures the last member query interval of 6 seconds for VLAN interface 4.

```
switch(config)#interface vlan 4
switch(config-if-Vl4)#ip igmp last-member-query-interval 60
switch(config-if-Vl4)#
```
**ip igmp**

The `ip igmp` command enables IGMP on a routed interface or on SVI (VLAN interface) without enabling PIM.

The `no igmp` command removes the corresponding `ip igmp` command from `running-config`.

**Command Mode**

- Interface Configuration

**Command Syntax**

```
  ip igmp
  no ip igmp
```

**Example**

- This command enables IGMP on Ethernet interface 5/2.

```
  switch(config)#interface ethernet 5/2
  switch(config-if-Et5/2)#ip igmp
  switch(config-if-Et5/2)#
```
**ip igmp profile**

The `ip igmp profile` command places the switch in IGMP-profile configuration mode to configure an IGMP profile. IGMP profiles control the multicast groups that an interface can join.

Profiles consist of the filter type and an address range:

- Filter types specify accessibility to the listed address range:
  - Permit filters define the multicast groups the interface can join.
  - Deny filters define the multicast groups the interface cannot join.

Profiles are deny filters by default.

- Address ranges specify a list of addresses and ranges:
  - In permit filters, permitted groups are specified by the address range.
  - In deny filters, all groups are permitted except those specified by the address range.

Implementing IGMP filtering affects IGMP report forwarding as follows:

- **IGMPv2:** Report is forwarded to mrouters for permitted groups and dropped for disallowed groups.
- **IGMPv3:** There may be multiple group records in a report.
  - No groups are allowed: The report is dropped.
  - All groups are allowed: The report is forwarded to mrouter ports as normal.
  - Some groups are allowed: A revised report is forwarded to mrouter ports.

  The revised report includes records for the allowed group addresses with the same source MAC and IP addresses.

The `no ip igmp profile` and `default ip igmp profile` commands delete the specified IGMP profile from `running-config`.

IGMP-profile configuration mode is not a group change mode; `running-config` is changed immediately upon entering commands. Exiting IGMP-profile configuration mode does not affect the configuration. The `exit` command returns the switch to global configuration mode.

**Command Mode**

- Global Configuration

**Command Syntax**

```plaintext
ip igmp profile profile_name
no ip igmp profile profile_name
default ip igmp profile profile_name
```

**Parameters**

- `profile_name` name of the IGMP profile.

**Commands Available in igmp-profile Configuration Mode**

- `permit / deny`
- `range`

**Related Commands**

- `ip igmp snooping filter` applies an IGMP snooping filter to a configuration mode interface.
Example

- These commands enter IGMP-profile configuration mode and configure the profile as a permit list.

```
switch(config)#ip igmp profile list_1
switch(config-igmp-profile-list_1)#permit
switch(config-igmp-profile-list_1)#
```
**ip igmp query-interval**

The `ip igmp query-interval` command configures the frequency at which the configuration mode interface, as an IGMP querier, sends host-query messages.

An IGMP querier sends host-query messages to discover the multicast groups that have members on networks attached to the interface. The switch implements a default query interval of 125 seconds.

The `no ip igmp query-interval` and `default ip igmp query-interval` commands reset the IGMP query interval to the default value of 125 seconds by removing the `ip igmp query-interval` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `ip igmp query-interval period`
- `no ip igmp query-interval`
- `default ip igmp query-interval`

**Parameters**
- `period` interval (seconds) between IGMP query messages. Values range from 1 to 3175 (52 minutes, 55 seconds). Default is 125.

**Example**
- This command configures the query-interval of 2 minutes, 30 seconds for VLAN interface 4.

```
switch(config)#interface vlan 4
switch(config-if-Vl4)#ip igmp query-interval 150
switch(config-if-Vl4)#
```
**ip igmp router-alert**

The `ip igmp router-alert` command configures the switch disposition of inbound IGMP packets to the configuration mode interface based on the presence of the router-alert option in the IP header. By default, the port accepts all IGMP packets that arrive on the local subnet and rejects all other packets that arrive without the router-alert option.

The command provides three IGMP packet disposition options:

- **mandatory**: packets are accepted only when router-alert is present.
- **optional**: packets are accepted regardless of router-alert presence.
- **optional connected**: packets are accepted from the same subnet; other packets require router-alert.

The `no ip igmp router-alert` and `default ip igmp router-alert` commands reset the default setting of `optional connected` on the configuration mode interface by removing the corresponding `ip igmp router-alert` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```plaintext
ip igmp router-alert DISPOSITION
no ip igmp router-alert
default ip igmp router-alert
```

**Parameters**

- **DISPOSITION**  
  IGMP packet disposition method. Options include:
  - **mandatory**  
    Rejects packets if router-alert is not present.
  - **optional**  
    Accepts packets regardless of router-alert presence.
  - **optional connected**  
    Accepts packets from same subnet. Other packets require router-alert.

**Example**

- This command configures the switch to accept IGMP packets on Ethernet interface 8 only if the IP header contains router alert.

```
switch(config)#interface ethernet 8
switch(config-if-Et8)#ip igmp router-alert mandatory
switch(config-if-Et8)#
```
**ip igmp snooping**

The **`ip igmp snooping`** command enables snooping globally. By default, global snooping is enabled. When global snooping is enabled, **`ip igmp snooping vlan`** enables or disables snooping on individual VLANs. When global snooping is disabled, snooping cannot be enabled on individual VLANs.

QoS cannot be used for IGMP packets when IGMP snooping is enabled.

The **`no ip igmp snooping`** command disables global snooping. The **`default ip igmp snooping`** command restores the global snooping default setting of enabled by removing the **`ip igmp snooping`** command from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

- **`ip igmp snooping`**
- **`no ip igmp snooping`**
- **`default ip igmp snooping`**

**Example**

- This command globally enables snooping on the switch.

```
switch(config)#ip igmp snooping
switch(config)#
```
Chapter 39: IGMP and IGMP Snooping

IGMP and IGMP Snooping Commands

ip igmp snooping proxy

The `ip igmp snooping proxy` command enables snooping proxy globally. By default, IGMP snooping proxy is disabled globally.

When the snooping proxy is enabled globally, it enables IGMP snooping proxy on an individual VLANs and when the IGMP snooping proxy is globally disabled the snooping proxy is disabled on individual VLANs.

The **no and default** form of `ip igmp snooping proxy` command disables snooping proxy globally and on individual VLANs by removing the `ip igmp snooping proxy` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

`ip igmp snooping proxy`

`no ip igmp snooping proxy`

`default ip igmp snooping proxy`

**Examples**

- This command globally enables snooping proxy on the switch.
  ```
  switch(config)#ip igmp snooping proxy
  switch(config)#
  ```

- This command explicitly disables IGMP snooping proxy on VLAN 20.
  ```
  switch(config)#no ip igmp snooping vlan 20 proxy
  switch(config)#
  ```
ip igmp snooping filter

The `ip igmp snooping filter` command applies the specified IGMP snooping profile to the configuration mode interface. An IGMP snooping profile specifies the multicast groups that an interface may join. Profiles consist of the filter type and an address range:

- **Filter type**: Specifies accessibility to the listed address range:
  - Permit filters define the multicast groups the interface can join.
  - Deny filters define the multicast groups the interface cannot join.
- **Address range**: Specifies a list of addresses and ranges.
  - In permit filters, the permitted groups are specified by the address range.
  - In deny filters, all groups are permitted except those specified by the address range.

An interface without a snooping profile assignment may join any multicast group.

Snooping profiles are configured in IGMP-profile configuration mode (`ip igmp profile`).

The `no ip igmp snooping filter` and `default ip igmp snooping filter` commands restore the default setting of allowing an interface to join any multicast group by deleting the corresponding `ip igmp snooping filter` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

**Command Syntax**
```
ip igmp snooping filter profile_name
no ip igmp snooping filter [profile_name]
default ip igmp snooping filter [profile_name]
```

**Parameters**
- `profile_name` name of profile assigned to interface.

**Example**
- This command applies the `list_1` snooping profile to Ethernet interface 7.
  ```
  switch(config)#interface ethernet 7
  switch(config-if-Et7)#ip igmp snooping filter list_1
  switch(config-if-Et7)#
  ```
ip igmp snooping interface-restart-query

The `ip igmp snooping interface-restart-query` command configures the interface startup initial query time used for IGMP query spoofing. When an interface restarts or there is a change to the spanning tree, the interface will send general IGMP queries after this interval. The query is based on the information of the last known IGMP querier, and serves to facilitate faster network convergence times.

Multiple values can be configured with a single command; issuing the command again replaces any previously configured value(s).

The `no ip igmp snooping interface-restart-query` and `default ip igmp snooping interface-restart-query` commands restore the default setting of 2000 milliseconds by deleting the corresponding `ip igmp snooping interface-restart-query` command from `running-config`.

**Command Mode**
General Configuration

**Command Syntax**
```
ip igmp snooping interface-restart-query query_time
no ip igmp snooping interface-restart-query
default ip igmp snooping interface-restart-query
```

**Parameters**
- `query_time` interval (in milliseconds) after an interface restart or spanning tree change at which the interface will send general IGMP queries. Values range from 100 to 50000 milliseconds; default is 2000.

**Example**
- This command configures interfaces to send IGMP queries at 100, 200, and 300 milliseconds after an interface restart or spanning tree change.

```
switch(config)#ip igmp snooping interface-restart-query 100 200 300
switch(config)#
```
ip igmp snooping querier

The `ip igmp snooping querier` command enables the snooping querier globally, which controls the querier for VLANs that are not configured with a snooping querier command. The `ip igmp snooping vlan querier` command controls the querier on individual VLANs.

The IGMP snooping querier supports snooping by sending layer 2 membership queries to hosts attached to the switch. The snooping querier is functional on VLANs where hosts receive IP multicast traffic without access to a network IP multicast router. A snooping querier avoids flooding multicast packets in the VLAN by querying for hosts and routers.

The IGMP snooping querier is functional on VLANs that meet these criteria:

- Snooping is enabled.
- The corresponding SVI (VLAN interface) is active.
- The VLAN’s querier IP address or the global querier IP address is configured.

The `no ip igmp snooping querier` and `default ip igmp snooping querier` commands disable the snooping querier globally by removing the `ip igmp snooping querier` statement from `running-config`. The snooping querier is globally disabled by default.

**Command Mode**

Global Configuration

**Command Syntax**

- `ip igmp snooping querier`
- `no ip igmp snooping querier`
- `default ip igmp snooping querier`

**Guidelines**

- Enabling a querier after it was disabled is equivalent to establishing a new querier.
- Changing the querier’s IP address is equivalent to establishing a new querier.

**Example**

- This command globally enables the snooping querier on the switch.

  ```
  switch(config)#ip igmp snooping querier
  switch(config)#
  ```
**ip igmp snooping querier address**

The *ip igmp snooping querier address* command sets the global querier source IP address, which specifies the source address for packets transmitted from VLANs for which a querier address (*ip igmp snooping vlan querier address*) is not configured. To use a snooping querier, an address must be explicitly configured globally or for the VLAN.

The switch does not define a default global querier address.

The *no ip igmp snooping querier address* and *default ip igmp snooping querier address* commands remove the global querier address command from *running-config*.

**Command Mode**

- Global Configuration

**Command Syntax**

```
ip igmp snooping querier address ipv4_address
no ip igmp snooping querier address
default ip igmp snooping querier address
```

**Parameters**

- *ipv4_address*  source IPv4 address.

**Example**

- This command sets the source IP address to 10.1.1.41 for query packets transmitted from the switch.

  ```
  switch(config)#ip igmp snooping querier address 10.1.1.41
  switch(config)#
  ```
ip igmp snooping querier last-member-query-count

The `ip igmp snooping querier last-member-query-count` command configures the global IGMP snooping querier last member query count (LMQC) value. LMQC specifies the number of query messages the switch sends in response to group-specific or group-source-specific leave messages it receives from a host; the transmission frequency is specified by `IGMP snooping querier last member query interval`. The switch stops forwarding messages to the host if it does not receive a response to these query messages.

Setting LMQC to 1 causes the loss of one packet to stop traffic forwarding. While the switch can start forwarding traffic again after receiving a response to the next general query, the host may not receive that query for a period defined by `ip igmp snooping querier query-interval`.

VLANs use the global value when they are not assigned a value (`ip igmp snooping vlan querier last-member-query-count`). VLAN commands take precedence over the global value. The default global value is specified by the robustness variable (`ip igmp snooping robustness-variable`).

The `no igmp snooping querier last-member-query-count` and `default igmp snooping querier last-member-query-count` commands reset the LMQC to the default value by removing the corresponding `ip igmp snooping querier last-member-query-count` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip igmp snooping querier last-member-query-count number
no ip igmp snooping querier last-member-query-count
default ip igmp snooping querier last-member-query-count
```

**Parameters**

- `number` query message quantity. Value ranges from 1 to 3. Default is set by robustness-variable.

**Example**

- This command configures the global last-member-query-count to 3.

```
switch(config)#ip igmp snooping querier last-member-query-count 3
switch(config)#show igmp snooping querier status
```

```
Global IGMP Querier status

switch(config)#
```
ip igmp snooping querier last-member-query-interval

The ip igmp snooping querier last-member-query-interval command sets the global IGMP snooping last member query interval. The default interval is one second.

A multicast host sends an IGMP leave report when it leaves a group. To determine if the host was the last group member, the leave message recipient sends an IGMP query. The last-member-query-interval determines when the group record is deleted if no subsequent reports are received.

VLANs not assigned a last member query interval value (ip igmp snooping vlan querier last-member-query-interval) use the global value. VLAN commands take precedence over the global value.

The no ip igmp snooping querier last-member-query-interval and default ip igmp snooping querier last-member-query-interval commands reset the last-member-query-interval value the default interval of one second by removing the ip igmp snooping querier last-member-query-interval statement from running-config.

Command Mode
Global Configuration

Command Syntax
ip igmp snooping querier last-member-query-interval period
no ip igmp snooping querier last-member-query-interval
default ip igmp snooping querier last-member-query-interval

Parameters
• period  last member query interval (seconds). Value ranges from 1 to 25. Default is one second.

Related Commands
• ip igmp snooping vlan querier last-member-query-interval assign a last member query interval value to the specified VLANs.

Example
• This command sets the IGMP snooping querier last-member-query-interval to five seconds.
switch(config)#ip igmp snooping querier last-member-query-interval 5
switch(config)#
ip igmp snooping querier max-response-time

The `ip igmp snooping querier max-response-time` command specifies the global `max-response-time` value. The switch uses `max-response-time` to set the Max Response Time field in outbound Membership Query messages. Max Response Time specifies the maximum period a recipient can wait before responding with a Membership Report.

VLANs not assigned a `max-response-time` value (ip igmp snooping vlan querier max-response-time) use the global value. VLAN commands take precedence over the global value.

Values range from 1 to 25 seconds. The default global value is 10 seconds.

The `no ip igmp snooping querier max-response-time` and `default ip igmp snooping querier max-response-time` commands restore the global `max-response-time` default value by removing the `ip igmp snooping querier max-response-time` statement from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip igmp snooping querier max-response-time resp_sec
no ip igmp snooping querier max-response-time
default ip igmp snooping querier max-response-time
```

**Parameters**

- `resp_sec` `max-response-time` value (seconds). Values range from 1 to 25. Default (global) is 10.

**Example**

- This command sets the global max-response-time to 15 seconds.

  ```
switch(config)#ip igmp snooping querier max-response-time 15
switch(config)#
```
**ip igmp snooping querier query-interval**

The `ip igmp snooping querier query-interval` command sets the global query interval. This command also sets the query-interval of IGMP Snooping when using IGMP version 2. Values range from 5 to 3600 seconds. The default global value is 125 seconds. The query interval is the period between IGMP Membership Query messages sent from the querier. The global value specifies the query interval for VLANs with no query-interval command.

VLANs not assigned a `query interval` value (`ip igmp snooping vlan querier query-interval`) use the global value. VLAN commands take precedence over the global value.

The `no ip igmp snooping querier query-interval` and `default ip igmp snooping querier query-interval` commands reset the global query-interval value to 125 seconds by removing the `ip igmp snooping querier query-interval` statement from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**
```
ip igmp snooping querier query-interval query_sec
no ip igmp snooping querier query-interval
default ip igmp snooping querier query-interval
```

**Parameters**
- `query_sec` query interval (seconds). Values range from 5 to 3600. Default (global) is 125.

**Example**
- This command sets the global query interval to 150 seconds.
```
switch(config)#ip igmp snooping querier query-interval 150
switch(config)#
```
ip igmp snooping querier startup-query-count

The `ip igmp snooping querier startup-query-count` command configures the global *startup query count* value. The *startup query count* specifies the number of query messages that the querier sends on a VLAN during the *startup query interval* (`ip igmp snooping querier startup-query-interval`).

When snooping is enabled, the group state is more quickly established by sending query messages at a higher frequency. The *startup-query-interval* and *startup-query-count* parameters define the startup period by defining the number of queries to be sent and transmission frequency for these messages.

VLANs use the global *startup query count* value when they are not assigned a value (`ip igmp snooping vlan querier startup-query-count`). VLAN commands take precedence over the global value. The default global value is specified by the robustness variable (`ip igmp snooping robustness-variable`).

The `no ip igmp snooping querier startup-query-count` and `default ip igmp snooping querier startup-query-count` commands restore the default *startup-query-count* value by removing the corresponding `ip igmp snooping querier startup-query-count` command from *running-config*.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip igmp snooping querier startup-query-count number
no ip igmp snooping querier startup-query-count
default ip igmp snooping querier startup-query-count
```

**Parameters**

- `number` global startup query count. Value ranges from 1 to 3.

**Example**

- These commands configure the global startup query count value of 2, then displays the status of the snooping querier.

```
switch(config)#ip igmp snooping querier startup-query-count 2
switch(config)#show igmp snooping querier status

Global IGMP Querier status
-------------------------------------------------------
admin state                      : Disabled

switch(config)#
```
ip igmp snooping querier startup-query-interval

The `ip igmp snooping querier startup-query-interval` command configures the global startup query interval value. The `startup query interval` specifies the period between query messages that the querier sends upon startup.

When snooping is enabled, the group state is more quickly established by sending query messages at a higher frequency. The `startup-query-interval` and `startup-query-count` parameters define the startup period by defining the number of queries to be sent and transmission frequency for these messages.

VLANs use the global `startup query interval` value when they are not assigned a value (`ip igmp snooping vlan querier startup-query-interval`). VLAN commands take precedence over the global value. The default global value equals the query interval divided by four. (`ip igmp snooping querier query-interval`).

The `no ip igmp snooping querier startup-query-interval` and `default ip igmp snooping querier startup-query-interval` commands restore the default method of specifying the startup query interval by removing the corresponding `ip igmp snooping querier startup-query-interval` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip igmp snooping querier startup-query-interval period
no ip igmp snooping querier startup-query-interval
default ip igmp snooping querier startup-query-interval
```

**Parameters**

- `period` startup query interval (seconds). Value ranges from 1 to 3600 (1 hour).

**Example**

- This command configures the startup query count of one minute for VLAN interface 4.

  switch(config)#ip igmp snooping querier startup-query-interval 40
  switch(config)#show igmp snooping querier status
  
  Global IGMP Querier status
  _________________________________________________________________

  switch(config)#
ip igmp snooping querier version

The *ip igmp snooping querier version* command configures the Internet Group Management Protocol (IGMP) snooping querier version on the configuration mode interfaces. Version 3 is the default IGMP version.

IGMP is enabled by the *pim ipv4 sparse-mode* or *pim ipv4 bidirectional* command. The *ig igmp snooping querier version* command does not affect the IGMP enabled status.

The *no ip igmp snooping querier version* and *default ip igmp snooping querier version* commands restore the configuration mode to IGMP version 3 by removing the *ip igmp snooping querier version* statement from *running-config*.

Command Mode
Global Configuration

Command Syntax

```
ip igmp snooping querier version version_number
no ip igmp snooping querier version
default ip igmp snooping querier version
```

Parameters

- `version_number`: IGMP version number. Value ranges from 1 to 3. Default value is 3.

Example

- This command configures IGMP snooping querier version 2.
  ```
  switch(config)#ip igmp snooping querier version 2
  switch(config)#
  ```

- This command restores the IGMP snooping querier to version 3.
  ```
  switch(config)# no ip igmp snooping querier version
  switch(config)#
  ```
ip igmp snooping report-flooding

The ip igmp snooping report-flooding command globally enables L2 report flooding on the switch. When report flooding is globally enabled, the ip igmp snooping vlan report-flooding configures a VLAN range to forward membership report messages to specified ports. When report flooding is not globally enabled, L2 report flooding cannot be enabled on individual VLANs.

L2 report flooding is an IGMP snooping feature that forwards membership report messages to specified ports. Relying on a single switch to maintain and send report messages can result in performance issues. L2 report flooding addresses this by facilitating report message transmissions through any network port. This allows switches to bypass the querier when forwarding multicast traffic to its interested ports.

The no ip igmp snooping report-flooding and default ip igmp snooping report-flooding commands disable global L2 report flooding by removing ip igmp report flooding from running-config. L2 report flooding is disabled by default.

Command Mode

  Global Configuration

Command Syntax

  ip igmp snooping report-flooding
  no ip igmp snooping report-flooding
  default ip igmp snooping report-flooding

Related Commands

  • ip igmp snooping vlan report-flooding enables L2 report flooding on a specified VLAN range.

Example

  • This command globally enables the snooping L2 report-flooding.

    switch(config)#ip igmp snooping report-flooding
    switch(config)#
**ip igmp snooping report-flooding switch-port**

The **ip igmp snooping report-flooding switch-port** command specifies Ethernet ports or port channels that can forward IGMP membership report messages for all VLANs where L2 report flooding is enabled. Ports that are connected to multicast routers or queriers continue to forward traffic as previously specified and are not affected by L2 report flooding commands.

L2 report flooding is an IGMP snooping feature that forwards membership report messages to specified ports. The **ip igmp snooping vlan report-flooding switch-port** command configures a list of forwarding ports for a specified VLAN range.

The **no ip igmp snooping report-flooding switch-port** and **default ip igmp snooping report-flooding switch-port** commands remove the specified ports from the global report flooding port list by deleting the corresponding **ip igmp snooping report-flooding switch-port** command from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip igmp snooping report-flooding switch-port INTERFACE
no ip igmp snooping report-flooding switch-port INTERFACE
default ip igmp snooping report-flooding switch-port INTERFACE
```

**Parameters**

- **INTERFACE**  
  Membership report message forwarding is enabled on these ports:
  - **ethernet e_range**  where **e_range** is the number, range, or list of ethernet ports
  - **port-channel p_range**  where **p_range** is the number, range, or list of channel ports

**Related Commands**

- **ip igmp snooping report-flooding** globally enables L2 report flooding.
- **ip igmp snooping vlan report-flooding switch-port** specifies a port list for a VLAN range.

**Example**

- This command configures Ethernet ports 7-9 for report message forwarding for any VLAN where L2 report flooding is enabled.

```
switch(config)#ip igmp snooping report-flooding switch-port ethernet 7-9
switch(config)#
```
ip igmp snooping restart query-interval

The `ip igmp snooping restart query-interval` command sets the query interval for all VLANs during an IGMP snooping restart. By default, the query interval during an IGMP snooping restart is a VLAN’s configured query interval divided by five. This accelerates the transmission of robustness queries to establish the IGMP snooping state more quickly. However, some large scale configurations may not be able to process all of the queries at this query interval rate. The restart query interval, when configured, is valid for all VLANs.

The `no ip igmp snooping restart query-interval` and `default ip igmp snooping restart query-interval` commands removes the global restart query interval by deleting the `ip igmp snooping restart query-interval` statement from `running-config`.

Command Mode
Global Configuration

Command Syntax

- `ip igmp snooping restart query-interval query_sec`
- `no ip igmp snooping restart query-interval`
- `default ip igmp snooping restart query-interval`

Parameters

- `query_sec` query interval (seconds). Values range from 2 to 400. Default (global) is 125.

Example

- This command sets the global query interval to 35 seconds.
  
  ```
  switch(config)#ip igmp snooping restart query-interval 35
  switch(config)#
  ```
ip igmp snooping robustness-variable

The `ip igmp snooping robustness-variable` command configures the robustness variable for snooping packets sent from any VLAN. Values range from 1 to 3 with a default of 2.

The robustness variable specifies the number of unacknowledged snooping queries that a switch sends before removing the recipient from the group list.

The `no ip igmp snooping robustness-variable` and `default ip igmp snooping robustness-variable` commands reset the robustness variable to 2 by removing the `ip igmp snooping robustness-variable` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip igmp snooping robustness-variable robust_value
no ip igmp snooping robustness-variable
default ip igmp snooping robustness-variable
```

**Parameters**

- `robust_value` robustness variable. Values range from 1 to 3. Default is 2.

**Example**

- This command sets the robustness-variable value to 3.
  
  ```
  switch(config)#ip igmp snooping robustness-variable 3
  switch(config)#
  ```
ip igmp snooping vlan

The **ip igmp snooping vlan** command enables snooping on the specified VLANs if snooping is globally enabled. IGMP snooping is globally enabled by default. The **ip igmp snooping** command enables snooping globally.

Note that if IGMP snooping is enabled, QoS will not apply to IGMP packets.

The **no ip igmp snooping vlan** command disables snooping on the specified VLANs.

The **default ip igmp snooping vlan** command returns the snooping setting for the specified VLANs to enabled by removing the corresponding **ip igmp snooping vlan** command from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip igmp snooping vlan v_range
no ip igmp snooping vlan v_range
default ip igmp snooping vlan v_range
```

**Parameters**

- **v_range** VLANs upon which snooping is enabled. Formats include a number, a number range, or a comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.

**Example**

- This command disables snooping on VLANs 2 through 4.

```
switch(config)#no ip igmp snooping vlan 2-4
switch(config)#
```
**ip igmp snooping vlan fast-leave**

The `ip igmp snooping vlan fast-leave` command enables fast-leave processing on specified VLANs. When fast-leave processing is enabled, the removal of a VLAN interface's multicast group entry from the IGMP table is not preceded by an IGMP group-specific query to the interface. The switch removes an interface from the forwarding table when it detects an IGMP leave message on the interface. IGMP fast-leave processing is enabled on all VLANs by default.

The `no ip igmp snooping vlan fast-leave` command disables fast-leave processing on the specified VLANs. The `default ip igmp snooping vlan fast-leave` command restores fast-leave processing on the specified VLANs by removing the corresponding `no ip igmp snooping vlan fast-leave` statement from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**
```plaintext
ip igmp snooping vlan v_range fast-leave
no ip igmp snooping vlan v_range fast-leave
default ip igmp snooping vlan v_range fast-leave
```

**Parameters**
- `v_range` VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.

**Example**
- This command enables IGMP fast-leave processing on VLAN 10.

```plaintext
switch(config)#ip igmp snooping vlan 10 fast-leave
switch(config)#
```
ip igmp snooping vlan max-groups

The `ip igmp snooping vlan max-groups` command configures the quantity of multicast groups that the specified VLAN’s forwarding table can contain. After the limit is reached, attempts to join new groups are ignored. There is no default limit.

The `no ip igmp snooping vlan max-groups` and `default ip igmp snooping vlan max-groups` removes the maximum group limit by deleting the `ip igmp snooping vlan max-groups` statement from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip igmp snooping vlan v_range max-groups quantity
no ip igmp snooping vlan v_range max-groups
default ip igmp snooping vlan v_range max-groups
```

**Parameters**

- `v_range` VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- `quantity` maximum number of groups that can access the VLAN. Value ranges from 0 to 65534.

**Examples**

- This command limits the number of multicast groups that hosts on VLAN 6 can simultaneously access to 25.
  ```
  switch(config)#ip igmp snooping vlan 6 max-groups 25
  switch(config)#
  ```
- This command allows each VLAN between 8 and 15 to receive multicast packets from 30 groups.
  ```
  switch(config)#ip igmp snooping vlan 8-15 max-groups 30
  switch(config)#
  ```
- This command removes the maximum group restriction from all VLAN interfaces between 1 and 50.
  ```
  switch(config)#no ip igmp snooping vlan 1-50 max-groups
  switch(config)#
  ```
The `ip igmp snooping vlan member` command adds ports as static members to a multicast group. The ports must be in the specified VLAN range.

The `no ip igmp snooping vlan member` and `default ip igmp snooping vlan member` commands remove the specified ports from the multicast group by deleting the corresponding `ip igmp snooping member` statements from `running-config`.

### Command Mode
Global Configuration

### Command Syntax
```
ip igmp snooping vlan v_num member ipv4_addr interface STATIC_INT
no ip igmp snooping vlan v_num member ipv4_addr interface STATIC_INT
default ip igmp snooping vlan v_num member ipv4_addr interface STATIC_INT
```

### Parameters
- `v_num` VLAN number. Value ranges from 1 to 4094.
- `ipv4_addr` multicast group IPv4 address.
- `STATIC_INT` interface the command configures as the static group member. Options include:
  - `ethernet e_range`, where `e_range` is the number, range, or list of Ethernet ports
  - `port-channel p_range`, where `p_range` is the number, range, or list of channel ports

### Example
- This command configures the static connection to a multicast group at 237.2.1.4 through Ethernet port 3.
  ```
  switch(config)#ip igmp snooping vlan 7 member 237.2.1.4 interface ethernet 3
  switch(config)#
  ```
**ip igmp snooping vlan multicast-router**

The `ip igmp snooping vlan multicast-router` command adds a multicast router as a static port to the specified VLANs. The router port must be in the specified VLAN range.

Snooping may not always be able to locate the IGMP querier. This command should specify IGMP queriers that are known to connect to the network through a port on the switch.

The `no ip igmp snooping vlan multicast-router` and `default ip igmp snooping vlan multicast-router` commands remove the specified static port configuration by deleting the corresponding `ip igmp snooping vlan multicast-router` command from `running-config`.

**Command Mode**  
Global Configuration

**Command Syntax**

```
ip igmp snooping vlan v_range multicast-router interface STATIC_INT
no ip igmp snooping vlan v_range multicast-router interface STATIC_INT
default ip igmp snooping vlan v_range multicast-router interface STATIC_INT
```

**Parameters**

- `v_range` VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- `STATIC_INT` interface the command configures as a static port. Selection options include:
  - `ethernet e_range` where `e_range` is the number, range, or list of ethernet ports
  - `port-channel p_range` where `p_range` is the number, range, or list of channel ports

The `STATIC_INT` interface must route traffic through a VLAN specified within `v_range`.

**Example**

- This command configures the static connection to a multicast router through Ethernet port 3.

```
switch(config)#ip igmp snooping vlan 2 multicast-router interface ethernet 3
switch(config)#
```
**ip igmp snooping vlan proxy**

The `ip igmp snooping vlan proxy` command enables snooping proxy on individual VLAN, and to enable or disable IGMP snooping vlan proxy globally, use `ip igmp snooping proxy` command.

---

**Note**

The `ip igmp snooping proxy` command enables snooping proxy on all VLANs only where IGMP snooping is enabled.

The no and default form of `ip igmp snooping vlan proxy` command disables snooping proxy globally and on individual VLANs by removing the `ip igmp snooping vlan proxy` command from running-config.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip igmp snooping vlan [ID | range] proxy
no ip igmp snooping vlan [ID | range] proxy
default ip igmp snooping vlan [ID | range] proxy
```

**Parameters**

- `v_range` specifies the range of VLAN IDs. Numbers range from 1 to 4094.
- `v_ID` specifies a individual VLAN ID. Numbers range from 1 to 4094.

**Examples**

- This command globally enables IGMP snooping proxy on the switch and on all VLANs where IGMP snooping is enabled.

  ```
  switch(config)#ip igmp snooping proxy
  switch(config)#
  ```

- This command enables IGMP snooping proxy on VLAN 20.

  ```
  switch(config)#ip igmp snooping vlan 20 proxy
  switch(config)#
  ```

- This command disables IGMP snooping proxy on VLAN 20.

  ```
  switch(config)#no ip igmp snooping vlan 20 proxy
  switch(config)#
  ```
**ip igmp snooping vlan querier**

The **ip igmp snooping vlan querier** command controls the querier for the specified VLANs. VLANs follow the global querier setting unless overridden by one of these commands:

- **ip igmp snooping vlan querier** enables the querier on specified VLANs.
- **no ip igmp snooping vlan querier** disables the querier on specified VLANs.

VLAN querier commands take precedence over the global querier setting. The **ip igmp snooping querier** controls the querier for VLANs with no snooping querier command.

The IGMP snooping querier supports snooping by sending layer 2 membership queries to hosts attached to the switch. The snooping querier is functional on VLANs where hosts receive IP multicast traffic without access to a network IP multicast router. A snooping querier avoids flooding multicast packets in the VLAN by querying for hosts and routers.

The IGMP snooping querier is functional on VLANs that meet these criteria:

- Snooping is enabled.
- The corresponding SVI (VLAN interface) is active.
- The VLAN’s querier IP address or the global querier IP address is configured.

The default **ip igmp snooping vlan querier** command restores the usage of the global setting for the specified VLAN by removing the corresponding **ip igmp snooping vlan querier** or **no ip igmp snooping vlan querier** command from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

```
  ip igmp snooping vlan v_range querier
no ip igmp snooping vlan v_range querier
default ip igmp snooping vlan v_range querier
```

**Parameters**

- **v_range** VLAN IDs. Formats include a number, a number range, or a comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.

**Examples**

- These commands globally enable the snooping querier on the switch, explicitly disable snooping on VLANs 1-3, and explicitly enable snooping on VLANs 4-6.

  ```
  switch(config)#ip igmp snooping querier
  switch(config)#no ip igmp snooping vlan 1-3 querier
  switch(config)#ip igmp snooping vlan 4-6 querier
  ```

  After running these commands, the running-config file contains these lines, which indicate that the snooping querier is enabled on VLANs 4-6.

  ```
  switch(config)#show running-config
  <-------OUTPUT OMITTED FROM EXAMPLE--------->
  no ip igmp snooping vlan 1 querier
  no ip igmp snooping vlan 2 querier
  no ip igmp snooping vlan 3 querier
  ip igmp snooping vlan 4 querier
  ip igmp snooping vlan 5 querier
  ip igmp snooping vlan 6 querier
  ip igmp snooping querier
  <-------OUTPUT OMITTED FROM EXAMPLE--------->
  ```
This command removes the querier setting for VLANs 2-5:

```plaintext
switch(config)#default ip igmp snooping vlan 2-5 querier
```

When executed after the previous commands, the snooping querier is disabled explicitly on VLANs 1-2, enabled implicitly on VLANs 3-6, and enabled explicitly on VLANs 7-8, as shown by `running-config`:

```
no ip igmp snooping vlan 1 querier
ip igmp snooping vlan 6 querier
ip igmp snooping querier
```

This command sets the global snooping querier to disabled by removing the global querier setting from `running-config`:

```plaintext
switch(config)#no ip igmp snooping querier
```

When executed after the previous commands, the snooping querier is disabled explicitly on VLANs 1-2, disabled implicitly on VLANs 3-6 and enabled explicitly on VLANs 7-8, as shown by `running-config`:

```
no ip igmp snooping vlan 1 querier
ip igmp snooping vlan 6 querier
```
**ip igmp snooping vlan querier address**

The **ip igmp snooping vlan querier address** command sets the source address for query packets sent from specified VLANs. VLANs not assigned an address use the global address (**ip igmp snooping querier address**). VLAN querier address commands take precedence over the global address.

To use a snooping querier, an address must be explicitly configured globally or for the querier’s VLAN.

The **no ip igmp vlan snooping querier address** and **default ip igmp snooping vlan querier address** commands reset the specified VLAN to use the global address by removing the corresponding **ip igmp snooping vlan querier address** command from **running-config**.

**Command Mode**
- Global Configuration

**Command Syntax**
- `ip igmp snooping vlan v_range querier address ipv4_address`
- `no ip igmp snooping vlan v_range querier address`
- `default ip igmp snooping vlan v_range querier address`

**Parameters**
- **v_range** VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- **ipv4_address** source IPv4 address.

**Example**
- This command sets the source IPv4 address of 10.14.1.1 for query packets transmitted from VLAN 2.

```
switch(config)#ip igmp snooping vlan 2 querier address 10.14.1.1
switch(config)#
```
ip igmp snooping vlan querier last-member-query-count

The `ip igmp snooping vlan querier last-member-query-count` command specifies an IGMP snooping querier last member query count (LMQC) value for the specified VLANs. LMQC specifies the number of query messages the switch sends in response to group-specific or group-source-specific leave messages it receives from a host; the transmission frequency is specified by `IGMP snooping querier last member query interval`. The switch stops forwarding messages to the host if it does not receive a response to these query messages.

VLANs not assigned an LMQC value use the global value (`ip igmp snooping querier last-member-query-count`). VLAN commands take precedence over the global command.

Setting the last member query count (LMQC) to 1 causes the loss of a single packet to stop traffic forwarding. While the switch can start forwarding traffic again after receiving a response to the next general query, the host may not receive that query for a period defined by `ip igmp snooping querier query-interval`.

The `no igmp snooping vlan querier last-member-query-count` and `default igmp snooping vlan querier last-member-query-count` commands reset the specified VLAN to use the global LMQC by removing the corresponding `ip igmp snooping vlan querier last-member-query-count` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip igmp snooping vlan v_range querier last-member-query-count number
no ip igmp snooping vlan v_range querier last-member-query-count
default ip igmp snooping vlan v_range querier last-member-query-count
```

**Parameters**

- `v_range` VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- `number` query message quantity. Value ranges from 1 to 3.

**Example**

- This command configures the last-member-query-count to 1 on VLAN interface 3.

  `switch(config)#ip igmp snooping vlan 3 querier last-member-query-count 1
  switch(config)#`
**ip igmp snooping vlan querier last-member-query-interval**

The `ip igmp snooping vlan querier last-member-query-interval` command configures `last-member-query-interval` for packets sent from the specified VLANs. VLANs not assigned a value use the global setting (`ip igmp snooping querier last-member-query-interval`). VLAN commands take precedence over the global value. The global default is one second.

A multicast host sends an IGMP leave report when it leaves a group. To determine if the host was the last group member, the leave message recipient sends an IGMP query. The `last-member-query-interval` determines when the group record is deleted if no subsequent reports are received.

The `no ip igmp snooping vlan querier last-member-query-interval` and `default ip igmp snooping vlan querier last-member-query-interval` commands reset the specified VLAN to use the global `last-member-query-interval` by removing the corresponding `ip igmp snooping vlan querier last-member-query-interval` command from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**
```
ip igmp snooping vlan v_range querier last-member-query-interval period
no ip igmp snooping vlan v_range querier last-member-query-interval
default ip igmp snooping vlan v_range querier last-member-query-interval
```

**Parameters**
- `v_range` VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- `period` last member query interval (seconds). Value ranges from 1 to 25.

**Example**
- This command sets the last-member-query-interval for VLAN 10 to 12 seconds.

```
switch(config)#ip igmp snooping vlan 10 querier last-member-query-interval 12
switch(config)#
```
ip igmp snooping vlan querier max-response-time

The `ip igmp snooping vlan querier max-response-time` command configures `max-response-time` for packets sent from the specified VLANs. VLANs not assigned a value use the global setting (`ip igmp snooping querier max-response-time`). VLAN commands take precedence over the global value. The global default is 10 seconds.

Switches use `max-response-time` to set the Max Response Time field in outbound Membership Query messages. Max Response Time specifies the maximum period a recipient can wait before responding with a Membership Report.

The `no ip igmp snooping vlan querier max-response-time` and `default ip igmp snooping vlan querier max-response-time` commands reset the specified VLAN to use the global `max-response-time` by removing the corresponding `ip igmp snooping vlan querier max-response-time` command from `running-config`.

Command Mode
Global Configuration

Command Syntax

```
ip igmp snooping vlan v_range querier max-response-time resp_sec
no ip igmp snooping vlan v_range querier max-response-time
default ip igmp snooping vlan v_range querier max-response-time
```

Parameters

- **v_range** VLAN ID. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- **resp_sec** `max-response-time` value (seconds). Values range from 1 to 25.

Example

- This command sets the max-response-time for VLAN 2 to 5 seconds.

  ```
  switch(config)#ip igmp snooping vlan 2 querier max-response-time 5
  switch(config)#
  ```
ip igmp snooping vlan querier query-interval

The `ip igmp snooping vlan querier query-interval` command sets the query interval for the specified VLAN. VLANs not assigned a value use the global value (`ip igmp snooping querier query-interval`). VLAN commands have precedence over the global value. The query interval is the period between IGMP Membership Query messages sent from the querier.

The `no ip igmp snooping vlan querier query-interval` and `default ip igmp snooping vlan querier query-interval` commands reset the specified VLAN to use the global value by removing the corresponding `ip igmp snooping vlan querier query-interval` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip igmp snooping vlan v_range querier query-interval query_sec
no ip igmp snooping vlan v_range querier query-interval
default ip igmp snooping vlan v_range querier query-interval
```

**Parameters**

- `v_range` VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- `query_sec` query interval (seconds). Values range from 5 to 3600. Default (global) is 125.

**Example**

- This command sets the query interval for VLAN 10 to 240 seconds.

```
switch(config)#ip igmp snooping vlan 10 querier query-interval 240
switch(config)#
```
ip igmp snooping vlan querier startup-query-count

The `ip igmp snooping vlan querier startup-query-count` command specifies the startup query count value for the specified VLANs. The `startup query count` specifies the number of query messages that the querier sends on a VLAN during the `startup query interval`.

When an interface starts running IGMP, it can establish the group state more quickly by sending query messages at a higher frequency. The `startup-query-interval` and `startup-query-count` parameters define the startup period and the query message transmission frequency during that period.

VLANs not assigned a `startup query count` value use the global value (`ip igmp snooping querier startup-query-count`). VLAN commands take precedence over the global command.

The `no ip igmp snooping vlan querier startup-query-count` and `default ip igmp snooping vlan querier startup-query-count` commands restore the default condition of using the global `startup query count` value by removing the corresponding `ip igmp snooping vlan querier startup-query-count` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip igmp snooping vlan v_range querier startup-query-count number
no ip igmp snooping vlan v_range querier startup-query-count
default ip igmp snooping vlan v_range querier startup-query-count
```

**Parameters**

- `v_range` VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- `number` startup query count. Value ranges from 1 to 3.

**Example**

- This command configures the startup query count of 3 for VLAN 100.

  switch(config)#ip igmp snooping vlan 100 querier startup-query-count 3
  switch(config)#
ip igmp snooping vlan querier startup-query-interval

The `ip igmp snooping vlan querier startup-query-interval` command specifies the `startup query interval` value for the specified VLANs. The `startup query interval` specifies the period between query messages that the querier sends upon startup.

When snooping is enabled, the group state is more quickly established by sending query messages at a higher frequency. The `startup-query-interval` and `startup-query-count` parameters define the startup period by defining the number of queries to be sent and transmission frequency for these messages.

VLANs not assigned a `startup query interval` value use the global value (`ip igmp snooping querier startup-query-count`). VLAN commands take precedence over the global command.

The `no ip igmp snooping vlan querier startup-query-interval` and `default ip igmp snooping vlan querier startup-query-interval` commands restore the default condition of using the global `startup query interval` value by removing the corresponding `ip igmp snooping vlan querier startup-query-interval` command from `running-config`.

Command Mode

- Global Configuration

Command Syntax

- `ip igmp snooping vlan v_range querier startup-query-interval period`
- `no ip igmp snooping vlan v_range querier startup-query-interval`
- `default ip igmp snooping vlan v_range querier startup-query-interval`

Parameters

- `v_range` VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- `period` startup query interval (seconds). Value ranges from 1 to 3600 (1 hour). Default is 31.

Example

- This command configures the startup query count of one minute for VLAN interface 100.

  ```
  switch(config)#ip igmp snooping vlan 100 querier startup-query-interval 60
  switch(config)#
  ```
**ip igmp snooping vlan querier version**

The `ip igmp snooping vlan querier version` command configures the Internet Group Management Protocol (IGMP) snooping querier function on the VLAN. Version 3 is the default IGMP snooping version.

IGMP is enabled by the `pim ipv4 sparse-mode` or `pim ipv4 bidirectional` command. The `ip igmp snooping vlan querier version` command does not affect the IGMP enabled status.

The `no ip igmp snooping vlan querier version` and `default ip igmp snooping vlan querier version` commands restore the configuration mode interface to IGMP snooping VLAN querier version 3 by removing the `ip igmp snooping vlan querier version` statement from `running-config`.

**Command Mode**
- Global Configuration

**Command Syntax**
- `ip igmp snooping vlan v_range querier version version_number`
- `no ip igmp snooping vlan v_range querier version`
- `default ip igmp snooping vlan v_range querier version`

**Parameters**
- `v_range` VLAN ID. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- `version_number` IGMP version number. Value ranges from 1 to 3. Default value is 3.

**Example**
- The example sets the querier version to 2 on vlan 5.
  ```
  switch(config)#ip igmp snooping vlan 5 querier version 2
  switch(config)#
  ```
- This command restores IGMP snooping querier version 3 to VLAN 5.
  ```
  switch(config)# no ip igmp snooping vlan 5 querier version
  switch(config)#
  ```
**ip igmp snooping vlan report-flooding**

The `ip igmp snooping vlan report-flooding` command enables L2 report flooding on the specified VLANs if report flooding is globally enabled. When L2 report flooding is not globally enabled, this command has no effect. The `ip igmp snooping report-flooding` command globally enables L2 report flooding.

L2 report flooding is an IGMP snooping feature that forwards membership report messages to specified ports. Relying on a single switch to maintain and send report messages can degrade performance. L2 report flooding addresses this by facilitating report message forwarding through any network port. This allows switches to bypass the querier when forwarding multicast traffic to its interested ports.

Two commands specify the ports that forward reports:

- `ip igmp snooping vlan report-flooding switch-port` for a VLAN range.
- `ip igmp snooping report-flooding switch-port` for all VLANs where report flooding is enabled.

The `no ip igmp snooping vlan report-flooding` and `default ip igmp snooping vlan report-flooding` commands disable L2 report flooding for the specified VLAN by removing the corresponding `ip igmp snooping vlan report-flooding` statement from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip igmp snooping vlan v_range report-flooding
no ip igmp snooping vlan v_range report-flooding
default ip igmp snooping vlan v_range report-flooding
```

**Parameters**

- `v_range` VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.

**Related Commands**

- `ip igmp snooping report-flooding` globally enables L2 report flooding.

**Example**

- These commands enable L2 report flooding globally and on VLANs 201 through 205.

```
switch(config)#ip igmp snooping report-flooding
switch(config)#ip igmp snooping vlan 201-205 report-flooding
switch(config)#
```
ip igmp snooping vlan report-flooding switch-port

The `ip igmp snooping vlan report-flooding switch-port` command configures Ethernet ports or port channels to forward IGMP membership report messages for a specified VLAN range where L2 report flooding is enabled. Ports that are connected to multicast routers or queriers continue to forward traffic as previously specified and are not affected by L2 report flooding commands.

L2 report flooding is an IGMP snooping feature that forwards membership report messages to specified ports. The `ip igmp snooping report-flooding switch-port` command configures a list of forwarding ports for all VLANs where L2 report flooding is enabled.

The `no ip igmp snooping vlan report-flooding switch-port` and `default ip igmp snooping vlan report-flooding switch-port` commands remove the listed ports from the specified report flooding port list by deleting the corresponding `ip igmp snooping vlan report-flooding switch-port` statements from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**

```
ip igmp snooping vlan v_range report-flooding switch-port INTERFACE
no ip igmp snooping vlan v_range report-flooding switch-port INTERFACE
default ip igmp snooping vlan v_range report-flooding switch-port INTERFACE
```

**Parameters**

- `v_range`  VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- `INTERFACE` Membership report message forwarding is enabled on these ports:
  - `ethernet e_range`  where `e_range` is the number, range, or list of ethernet ports
  - `port-channel p_range`  where `p_range` is the number, range, or list of channel ports

**Related Commands**

- `ip igmp snooping report-flooding` globally enables L2 report flooding.
- `ip igmp snooping vlan report-flooding switch-port` specifies a port list for a VLAN range.
- `ip igmp snooping report-flooding switch-port` specifies a port list for all VLANs.

**Example**

These commands globally enable L2 report flooding, enable flooding on VLANs 201 through 205, and specify Ethernet ports 8-10 as the report flooding port list for VLANS 201-205.

```
switch(config)#ip igmp snooping report-flooding
switch(config)#ip igmp snooping vlan 201-205 report-flooding
switch(config)#ip igmp snooping vlan 201-205 report-flooding switch-port ethernet 8-10
switch(config)#
```
The `ip igmp startup-query-count` command specifies the number of query messages that an interface sends during the startup interval defined by `ip igmp startup-query-interval`.

When an interface starts running IGMP, it can establish the group state more quickly by sending query messages at a higher frequency. The `startup-query-interval` and `startup-query-count` parameters define the startup period and the query message transmission frequency during that period.

The `no ip igmp startup-query-count` and `default ip igmp startup-query-count` commands restore the default `startup-query-count` value of 2 for the configuration mode interface by removing the corresponding `ip igmp startup-query-count` command from `running-config`.

### Command Mode
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

### Command Syntax
```
ip igmp startup-query-count number
no ip igmp startup-query-count
default ip igmp startup-query-count
```

### Parameters
- `number` quantity of queries. Values range from 1 to 65535. Default is 2.

### Example
- This command configures the startup query count of 10 for VLAN interface 4.
```
switch(config)#interface vlan 4
switch(config-if-Vl4)#ip igmp startup-query-count 10
switch(config-if-Vl4)#
```
ip igmp startup-query-interval

The `ip igmp startup-query-interval` command specifies the configuration mode interface’s IGMP startup period, during which query messages are sent at an accelerated rate.

When an interface starts running IGMP, it can establish the group state quicker by sending query messages at a higher frequency. The `startup-query-interval` and `startup-query-count` parameters define the startup period and the query message transmission frequency during that period.

The `no ip igmp startup-query-interval` and `default ip igmp startup-query-interval` commands restore the configuration mode interface’s default IGMP `startup-query-interval` of 31 seconds by removing the corresponding `ip igmp startup-query-interval` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ip igmp startup-query-interval period
no ip igmp startup-query-interval
default ip igmp startup-query-interval
```

**Parameters**
- `period` startup query interval, in deciseconds. Value ranges from 10 (one second) to 317440 (8 hours, 49 minutes, 4 seconds). Default is 31 seconds.

**Example**
- This command configures the startup query count of one minute for VLAN interface 4.

```
switch(config)#interface vlan 4
switch(config-if-Vl4)#ip igmp startup-query-interval 600
switch(config-if-Vl4)#
```
ip igmp static-group

The **ip igmp static-group** command configures the configuration mode interface as a static member of a specified multicast group. This allows the router to forward multicast group packets through the interface without otherwise appearing or acting as a group member. By default, static group memberships are not configured on any interfaces.

If the command includes a source address, only multicast group messages received from the specified host address are fast-switched. Otherwise, all multicast messages of the specified group are fast-switched.

**Note**

To become a static member of a multicast group, the switch must be the PIM designated router (DR) for the network. If it is not, you can use the **pim ipv4 dr-priority** command to make it the DR by configuring its PIM DR value to be the highest on the network.

The **no ip igmp static-group** and **default ip igmp static-group** commands remove the configuration mode interface’s group membership by removing the corresponding **ip igmp static-group** command from **running-config**.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```plaintext
ip igmp static-group  group_address  [SOURCE_ADDRESS]
no ip igmp static-group  group_address  [SOURCE_ADDRESS]
default ip igmp static-group  group_address  [SOURCE_ADDRESS]
```

**Parameters**

- **group_address** IPv4 address of multicast group for which the interface fast-switches packets.
- **SOURCE_ADDRESS** IP address of host that originates multicast data packets.
  - <no parameter> all multicast messages of the specified group are fast-switched.
  - **ipv4_address** source IP address (dotted decimal notation).

**Related Commands**

- **ip igmp static-group acl** configures the configuration mode interface as a static member of the multicast groups specified by an IP access control list (ACL).
- **ip igmp static-group range** configures the configuration mode interface as a static member of multicast groups specified by an address range.

One **ip igmp static-group range** command is equivalent to multiple **ip igmp static-group** commands.

**Example**

- These commands configure VLAN interface 15 as the PIM designated router, then configure it as a static member of the multicast group at address 231.1.1.15 for multicast data packets that originate at 10.1.1.1.

```plaintext
switch(config)#interface vlan 15
switch(config-if-Vl15)#pim ipv4 dr-priority 5000
switch(config-if-Vl15)#ip igmp static-group 231.1.1.15 10.1.1.1
switch(config-if-Vl15)#
```
ip igmp static-group acl

The `ip igmp static-group acl` command configures the configuration mode interface as a static member of the multicast groups specified by an IP access control list (ACL). This command is a variant of the `ip igmp static-group` command that uses ACL rules to specify a set of source-multicast group address pairs instead of specifying a single pair. Multiple static-group ACLs can be assigned to an interface. Static groups can be assigned manually and through ACLs simultaneously.

Access control lists that this command references must contain rules of the following format:

- `permit <protocol><source><destination>`, where
  - `<protocol>` has no effect on the static group.
  - `<source>` address of host originating multicast data packets. Must be a host address.
  - `<destination>` multicast group IP address or subnet. Must be a valid multicast address.

An ACL can contain multiple rules. An ACL can be applied to an interface only when all of its rules comply to the specified restrictions. The `show ip igmp static-groups acl` displays the source-multicast group pairs that the specified list configures and lists issues with illegal rules.

The `no ip igmp static-group acl` and `default ip igmp static-group acl` commands remove the specified static group ACL command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
```
ip igmp static-group acl list_name
no ip igmp static-group acl list_name
default ip igmp static-group acl list_name
```

**Parameters**
- `list_name` ACL that specifies multicast group addresses for which interface fast-switches packets.

**Example**
- This command configures VLAN interface 4 as a static member of the multicast group specified by the ACL named `LIST_1`.  
  ```
switch(config)#interface vlan 4
switch(config-if-Vl4)#ip igmp static-group acl LIST_1
switch(config-if-Vl4)#
```
ip igmp static-group range

The **ip igmp static-group range** command configures the configuration mode interface as a static member of multicast groups specified by an address range. This allows the router to forward multicast group packets through the interface without otherwise appearing or acting as a group member. By default, no static group memberships are configured on interfaces.

This command is a variant of the **ip igmp static-group** command that allows the assignment of a subnet range of source addresses or a subnet range of multicast groups. A single **ip igmp static-group range** command is the equivalent of multiple **ip igmp static-group** commands, each of which can only assign a single multigroup-source pair to an interface. Running-config converts the range command to the equivalent list of **ip igmp static-group** commands.

If the command includes a source address range, only multicast group messages received from the range are fast-switched. Otherwise, all multicast messages of the specified group are fast-switched.

The **no ip igmp static-group range** and **default ip igmp static-group range** commands remove the specified range of static group statements from *running-config*. The **no ip igmp static-group** and **default ip igmp static-group** commands can remove an individual static-group command that was initially added to *running-config* by an **ip igmp static-group range** command.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ip igmp static-group range GROUP_ADDR [SOURCE_ADDR]
no ip igmp static-group range GROUP_ADDR [SOURCE_ADDR]
default ip igmp static-group range GROUP_ADDR [SOURCE_ADDR]
```

**Parameters**

- **GROUP_ADDR**  address of multicast group for which the interface fast-switches packets.
- **gp_ipv4_addr**  multicast group IPv4 address.
- **gp_ipv4_subnet**  IPv4 subnet address of multicast groups (CIDR or address-mask).
- **SOURCE_ADDR**  IP address of a host range that originates multicast data packets.
- **<no parameter>**  all multicast messages of the specified range are fast-switched.
- **source sr_ipv4_address**  source IPv4 address (dotted decimal notation).
- **source sr_ipv4_subnet**  IPv4 subnet address of source hosts (CIDR or address-mask).

**Warning**  A command cannot specify a subnet address for both multicast group and source.

**Examples**

- This command configures VLAN interface 4 as a static member of the multicast group range 241.1.4.1/24 for data packets that originate at 10.1.1.1.

```
switch(config)#interface vlan 4
switch(config-if-Vl4)#ip igmp static-group range 239.1.4.1/24 source 10.1.1.1
switch(config-if-Vl4)#
```
This command attempts to configure VLAN interface 4 as a static member of the multicast group range 241.1.4.1/24 for data packets that originate at the 10.1.1.1/29 subnet. Because the range and source cannot both be subnets, this command generates an error message.

```
switch(config-if-Vl4)#ip igmp static-group range 239.1.1.1/29 source 16.1.1.1/29
% Error: cannot specify source range with group range
switch(config-if-Vl4)#
```
ip igmp version

The `ip igmp version` command configures the Internet Group Management Protocol (IGMP) version on the configuration mode interface. Version 3 is the default IGMP version.

IGMP is enabled by the `pim ipv4 sparse-mode` or `pim ipv4 bidirectional` command. The `ig igmp version` command does not affect the IGMP enabled status.

The `no ip igmp version` and `default ip igmp version` commands restore the configuration mode interface to IGMP version 3 by removing the `ip igmp version` statement from `running-config`.

Command Mode
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

Command Syntax
```
ip igmp version version_number
no ip igmp version
default ip igmp version
```

Parameters
- `version_number` IGMP version number. Value ranges from 1 to 3.

Example
- This command configures IGMP version 3 on VLAN interface 4.
  
  ```
  switch(config)#interface vlan 4
  switch(config-if-Vl4)#ip igmp version 3
  switch(config-if-Vl4)#
  ```
permit / deny

The permit command configures the configuration mode IGMP profile as a permit list. Applying a permit list to an interface restricts that interface from joining any multicast group not included in the list.

IGMP profiles are deny lists by default. When applied to an interface, a deny list allows the interface to join any multicast group that is not included in the list.

The deny command restores the IGMP list to its default type by removing the corresponding permit statement from running-config.

The range command adds and removes address ranges from the configuration mode profile.

Command Mode
IGMP-profile Configuration

Command Syntax
- permit
- deny

Related Commands
- ip igmp profile places the switch in IGMP-profile configuration mode.

Example
- These commands enter IGMP profile configuration mode and configure the profile as a permit list.

```
switch(config)#ip igmp profile list_1
switch(config-igmp-profile-list_1)#permit
switch(config-igmp-profile-list_1)#
```
range

The **range** command specifies an address range for the configuration mode IGMP profile. A permit range specifies the groups that an interface is permitted to join. A deny range specifies the groups that an interface is not permitted to join. The **permit / deny** command specifies the range type.

A profile may contain multiple range statements to define a discontiguous address range.

The **no range** and **default range** commands remove the specified address range from a previous specified list.

**Command Mode**
- IGMP-profile Configuration

**Command Syntax**

```
range init_address [UPPER_RANGE]
no range init_address [UPPER_RANGE]
default range init_address [UPPER_RANGE]
```

**Parameters**
- **init_address**  IP address of lower boundary of the address range (dotted decimal notation).
- **UPPER_RANGE**  sets the upper boundary of the address range. Options include
  - <no parameter>  upper boundary is equal to lower boundary: range consists of one address.
  - **range_address**  IP address of upper boundary.

All addresses must be multicast addresses (10.0.0.0 to 239.255.255.255).

**Related Commands**
- **ip igmp profile** places the switch in IGMP-profile configuration mode.

**Example**
- These commands enter IGMP profile configuration mode, configure the profile as a permit list, and define the permit address list of 232.1.1.0 to 232.1.1.255 and 233.1.1.10.

```
switch(config)#ip igmp profile list_1
switch(config-igmp-profile-list_1)#permit
switch(config-igmp-profile-list_1)#232.1.1.0 232.1.1.255
switch(config-igmp-profile-list_1)#233.1.1.10
switch(config-igmp-profile-list_1)#ip igmp profile
```
show igmp snooping querier

The **show igmp snooping querier** command displays snooping querier configuration and status information. Command provides options to only include specific VLANs.

**Command Mode**

EXEC

**Command Syntax**

```
show igmp snooping querier [STATUS][VLAN_ID][DATA]
```

**Parameters**

- **STATUS** specifies the type of information displayed. Options include:
  - `<no parameter>` querier IP address, port, and IGMP version.
  - `status` querier configuration parameters.
- **VLAN_ID** specifies VLANs for which command displays information. Options include:
  - `<no parameter>` all VLANs.
  - `vlan v_num` specified VLAN.
- **DATA** specifies the type of information displayed. Options include:
  - `<no parameter>` displays VLAN number and port-list for each group.
  - `detail` displays port-specific data for each group; includes transmission times and expiration.

**Example**

- This command displays the querier IP address, version, and port servicing each VLAN.

```
switch>show igmp snooping querier
Vlan  IP Address       Version  Port
----------------------------------------
 1     172.17.0.37      v2       Po1
 20    172.17.20.1      v2       Po1
 26    172.17.26.1      v2       Cpu
 2028  172.17.255.29    v2       Po1
switch>
```

- This command displays the querier configuration parameters for each VLAN.

```
switch>show igmp snooping querier status
  Global IGMP Querier status
  ------------------------------------
  admin state              : Enabled
  source IP address        : 0.0.0.0
  query-interval (sec)     : 125.0
  max-response-time (sec)  : 10.0
  querier timeout (sec)    : 130.0
  ------------------------------------

  Vlan Admin  IP          Query  Response  Querier Operational
     State    Interval Time  Timeout State
  ----------------------------------------
  1    Enabled  0.0.0.0    125.0    10.0  130.0  Non-Querier
  4    Enabled  0.0.0.0    125.0    10.0  130.0  Non-Querier
  20   Enabled  0.0.0.0    125.0    10.0  130.0  Non-Querier
  22   Enabled  0.0.0.0    125.0    10.0  130.0  Non-Querier
  28   Enabled  0.0.0.0    125.0    10.0  130.0  Non-Querier
```
**show igmp snooping querier counters**

The `show igmp snooping querier counters` command displays the counters from the querier, as learned through Internet Group Management Protocol (IGMP).

**Command Mode**

**EXEC**

**Command Syntax**

`show igmp snooping querier counters [VLAN_ID]`

**Parameters**

- **VLAN_ID** specifies VLANs for which command displays information. Options include:
  - <no parameter> displays information for all VLANs.
  - `vlan v_num` displays information for specified VLAN.

**Example**

- This command displays the counters from the querier.

```
switch>show igmp snooping querier counters
-----------------------------------------------------------------------
Vlan: 1   IP Addr: 100.0.0.1   Op State: Querier   Version: v3

v1 Queries Received       :0
v1 Reports Received       :0
v2 General Queries Sent   :1
v2 Queries Received       :0
v2 Reports Received       :25
v2 Leaves Received        :0
v3 General Queries Sent   :655
v3 GSQ Queries Sent       :0
v3 GSSQ Queries Sent      :8
v3 Queries Received       :654
v3 Reports Received       :2385
Error Packets             :0
Other Packets             :0
switch>
```
show igmp snooping querier membership

The show igmp snooping querier membership command displays the membership from the querier, as learned through Internet Group Management Protocol (IGMP).

Command Mode

EXEC

Command Syntax

show igmp snooping querier membership [VLAN_ID [GROUP_LIST]]

Parameters

- **VLAN_ID** specifies VLANs for which the command displays information. Options include:
  - <no parameter> displays information for all VLANs.
  - vlan v_num displays information for specified VLAN.
- **GROUP_LIST** list of groups for which the command displays information. Options include:
  - <no parameter> all multicast groups within specified VLAN.
  - group ipv4_addr single multicast group address (dotted decimal notation).

Example

- This command displays the membership from the querier for VLAN 1.
  
  ```
  switch>show igmp snooping querier membership
  Vlan: 1 Elected: 10.0.0.1 QQI: 125 QRV: 2 QRI: 10 GMI: 260
  Groups Mode Ver Num of Sources
  10.0.0.2 EX v3 0 []
  10.0.0.3 IN v3 2 [ 3.3.3.3, 3.3.3.4 ]
  10.0.0.4 EX v3 0 []
  10.0.0.13 EX v3 0 []
  10.0.0.22 EX v3 0 []
  10.0.0.1 IN v3 3 [ 5.6.7.9, 5.6.7.8, ... ]
  switch>
  ```
**show ip igmp groups**

The *show ip igmp groups* command displays multicast groups that have receivers directly connected to the switch, as learned through Internet Group Management Protocol (IGMP).

- **show ip igmp groups** all multicast groups.
- **show ip igmp groups group_addr** listed multicast group.
- **show ip igmp groups interface int_name** all multicast groups on specified interfaces
- **show ip igmp groups group_addr interface int_name** listed multicast group on specified interface.

**Command Mode**

EXEC

**Command Syntax**

```
show ip igmp groups GROUP_LIST [DATA]
```

**Parameters**

- **GROUP_LIST** list of groups for which the command displays information. Options include:
  - <no parameter> all multicast groups.
  - group_addr single multicast group address (dotted decimal notation).
  - interface ethernet e_num all multicast groups on specified Ethernet interface.
  - interface loopback l_num all multicast groups on specified Loopback interface.
  - interface management m_num all multicast groups on specified Management interface.
  - interface port-channel p_num all multicast groups on specified Port-Channel Interface.
  - interface vlan v_num all multicast groups on specified VLAN interface.
  - interface vxlan vx_num all multicast groups on specified VXLAN interface.
- **DATA** specifies the type of information displayed. Options include:
  - <no parameter> provides uptime, expiration, and address of reporter.
  - detail also include group mode and group source list.

**Example**

- This command displays multicast groups with receivers directly connected to the switch.

```
switch> show ip igmp groups
NOTE: static-group information not shown below. Use the 'show ip igmp static-groups' command.
IGMP Connected Group Membership
Group Address  Interface       Uptime    Expires    Last Reporter
10.12.1.1      Vlan162        11d01h    00:02:57  172.17.2.110
10.12.1.2      Vlan162        11d01h    00:02:57  172.17.2.110

switch>
```
show ip igmp groups count

The `show ip igmp groups count` command displays the number of multicast groups that are joined across the specified interfaces.

**Command Mode**

EXEC

**Command Syntax**

`show ip igmp groups [GROUP_LIST] count`

**Parameters**

- `INTERF` Specifies the interface for which the command displays information. Options include:
  - `<no parameter>` all IGMP interfaces.
  - `interface ethernet e_num` Ethernet interface.
  - `interface loopback l_num` Loopback interface.
  - `interface management m_num` Management interface.
  - `interface port-channel p_num` Port-Channel Interface.
  - `interface vlan v_num` VLAN interface.
  - `interface vxlan vx_num` VXLAN interface.

**Example**

- This command displays the number of multicast groups joined across all interfaces.
  ```
  switch>show ip igmp groups count
  Number of total groups joined across all IGMP interfaces: 5
  switch>
  ```

- This command displays the number of multicast groups joined on Ethernet 3/4 interface.
  ```
  switch>show ip igmp groups interface ethernet 3/4 count
  Number of groups joined on Ethernet3/4: 2
  switch>
  ```
**show ip igmp host-proxy config-sanity**

The `show ip igmp host-proxy config-sanity` command displays diagnostic information about an IGMP host proxy configuration.

**Command Mode**

EXEC

**Command Syntax**

`show ip igmp host-proxy config-sanity`

**Example**

- This command displays IGMP host proxy configuration diagnostic information.

```
switch>show ip igmp host-proxy config-sanity
Below are hints of potential IGMP Host-Proxy misconfigurations
IGMP host-proxy configured on interface Test3:
Access-lists having "deny ip any any" rule:
acl1
acl2
Groups with overlapping permit and deny configurations:
  192.168.1.1/32
  192.168.2.2/32
  192.168.4.4/32
Groups with source filters configured with IGMP Host-Proxy set to version 2:
  192.168.2.2/32
  192.168.3.0/24
  192.168.3.3/32
  192.168.8.8/32
switch>
```
show ip igmp host-proxy interface

The `show ip igmp host-proxy interface` command displays per-interface IGMP host-proxy configuration information, including the IGMP groups joined on the interface. Command filters allow the list to display only data for a specified interface and to include packet counter statistics in the display.

Command Mode
EXEC

Command Syntax
`show ip igmp host-proxy interface [interface] [detail]`

Parameters
- `interface` optional parameter to limit the display to a single interface. Omitting the parameter displays host-proxy configuration information for all interfaces on which IGMP host-proxy is configured. Options include:
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `port-channel p_num` port-channel Interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
- `detail` use this optional keyword to include packet counter statistics in the display.

Examples
- This command displays host-proxy information for all switch interfaces on which IGMP host-proxy is configured.

```
switch>show ip igmp host-proxy interface
IGMP host-proxy configured on: Test2
IGMP host-proxy version: 3
Unsolicited-report interval: 1.0
Device name: Test2
Interface   Group Address   IncludeSrc   ExcludeSrc
Test2       172.16.89.0     
Test2       172.16.0.0      20.0.0.0    
Test2       172.16.0.0      10.0.0.0    
Test2       192.168.110.0   20.0.0.0    
```
This command displays host-proxy information for all switch interfaces on which IGMP host-proxy is configured, plus host-proxy statistics.

switch>show ip igmp host-proxy interface detail
IGMP host-proxy configured on: Test2
IGMP host-proxy version: 3
Unsolicited-report interval: 1.0
Device name: Test2

show ip igmp interface

The `show ip igmp interface` command displays multicast information about the specified interface.

Command Mode
EXEC

Command Syntax
`show ip igmp interface [INT_NAME]`

Parameters
- `INT_NAME` Interface type and number. Values include
  - `<no parameter>` Displays information for all interfaces.
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-Channel Interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
  - `vxlan vx_num` VXLAN interface specified by `vx_num`.

Example
- This command displays multicast related information about VLAN 26.

```
switch>show ip igmp interface vlan 26
Vlan26 is up
  Interface address: 172.17.26.1/23
  IGMP on this interface: enabled
  Multicast routing on this interface: enabled
  Multicast TTL threshold: 1
  Current IGMP router version: 2
  IGMP query interval: 125 seconds
  IGMP max query response time: 100 deciseconds
  Last member query response interval: 10 deciseconds
  Last member query response count: 2
  IGMP querier: 172.17.26.1
  Robustness: 2
  Require router alert: enabled
  Startup query interval: 312 deciseconds
  Startup query count: 2
  General query timer expiry: 00:00:22
  Multicast groups joined:
    239.255.255.250

switch>
```
**show ip igmp profile**

The `show ip igmp profile` command displays the contents of the specified IGMP profile. IGMP snooping filters use an IGMP profile to control the multicast groups that an interface can join.

**Command Mode**  
EXEC

**Command Syntax**  
`show ip igmp profile [PROFILES]`

**Parameters**
- **PROFILES**  
  IGMP profiles for which command displays contents. Options include:
  - `<no parameter>`  
    displays all IGMP profiles.
  - `profile_name`  
    displays specified profile.

**Example**
- This command displays the IGMP profiles configured on the switch.

```
switch>show ip igmp profile  
IGMP Profile list_1
  permit
    range 229.1.24.0 229.1.25.255
IGMP Profile list_2
  deny
    range 234.1.1.0 234.1.255.255
switch>
```
**show ip igmp snooping**

The **show ip igmp snooping** command displays the switch’s IGMP snooping configuration.

**Command Mode**

EXEC

**Command Syntax**

```plaintext
  show ip igmp snooping [VLAN_ID]
```

**Parameters**

- **VLAN_ID** specifies VLANs for which command displays information. Options include:
  - `<no parameter>` displays information for all VLANs.
  - `vlan v_num` displays information for specified VLAN.

**Example**

- This command displays the switch’s IGMP snooping configuration.

```plaintext
switch>show ip igmp snooping
  Global IGMP Snooping configuration:
  -------------------------------------------
  IGMP snooping                  : Enabled
  Robustness variable            : 2

  Vlan 1 :
  -------
  IGMP snooping                  : Enabled
  Multicast router learning mode : pim-dvmrp

  Vlan 20 :
  -------
  IGMP snooping                  : Enabled
  Multicast router learning mode : pim-dvmrp

  Vlan 26 :
  -------
  IGMP snooping                  : Enabled
  Multicast router learning mode : pim-dvmrp

  Vlan 2028 :
  -------
  IGMP snooping                  : Enabled
  Multicast router learning mode : pim-dvmrp

switch>
```
**show ip igmp snooping counters**

The `show ip igmp snooping counters` command displays the number of IGMP messages sent and received through each switch port. The display table sorts the messages by type.

**Command Mode**

EXEC

**Command Syntax**

```
show ip igmp snooping counters [DATA_TYPE][DATA_LEVEL]
```

**Parameters**

- **DATA_TYPE** Information displayed by the command. Options include:
  - `<no parameter>` displays transmission counters.
  - `errors` displays error counters.
- **DATA_LEVEL** specifies the type of information displayed. Options include:
  - `<no parameter>` number of packets on physical ports.
  - `detail` number of packets on physical ports.

**Example**

This command displays the number of messages received on each port.

```
switch>show ip igmp snooping counters
```

switch>
show ip igmp snooping groups

The `show ip igmp snooping groups` command displays IGMP snooping statistics. Available information includes the physical ports that send and receive information, the time when multicast data was originally and most recently heard on the ports, and the version number of the IGMP messages. Command provides options that restrict the output to specific VLANs, ports, and groups.

**Command Mode**

EXEC

**Command Syntax**

```
show ip igmp snooping groups proxy [VLAN_ID] [PORT_INT] [GROUPS] [DATA]
```

**Parameters**

- **VLAN_ID** specifies VLAN for which command displays information. Options include:
  - `<no parameter>` displays information for all VLANs.
  - `vlan v_num` displays information for VLAN `v_num` (1 to 4094).
- **PORT_INT** specifies physical ports for which command displays information. Options include:
  - `<no parameter>` displays information for all physical ports.
  - `interface ethernet e_range`, where `e_range` is the number, range, or list of Ethernet ports.
  - `interface port-channel p_range`, where `p_range` is the number, range, or list of channel ports.
- **GROUPS** specifies the multicast groups. Options include:
  - `<no parameter>` all multicast groups on all specified ports.
  - `mgroup_address` multicast group specified by IPv4 address (dotted decimal notation).
  - `dynamic` multicast groups learned through IGMP.
  - `user` multicast groups manually added.
- **DATA** specifies the type of information displayed. Options include:
  - `<no parameter>` VLAN number and port-list for each group.
  - `detail` port-specific information for each group, including transmission times and expiration.
  - `proxy` displays IGMP snooping proxy information.

**Examples**

- This command displays the port lists for all multicast groups.

```
switch>show ip igmp snooping groups
Vlan  Group            Type     Version             Port-List
-------------------------------------------------------------------------------
-       -              -        -                   -
 1 239.255.255.250  -        -                   Po1, Po2
26 239.255.255.250  -        -                   Cpu, Et3, Et4, Et10, Et23, Et27
switch>
```
This command displays detailed port information of all multicast groups.

```plaintext
switch> show ip igmp snooping groups detail
Vlan Group       IP              First     Last    Expire    Ver Filter Port

```
show ip igmp snooping groups count

The `show ip igmp snooping groups count` command displays the number of multicast groups on the switch. Command provides options to only include specific VLANs and ports.

**Command Mode**

EXEC

**Command Syntax**

```
show ip igmp snooping groups [VLAN_ID][PORT_INT] count [DATA]
```

**Parameters**

- **VLAN_ID** specifies VLAN for which command displays information. Options include:
  - `<no parameter>` all VLANs.
  - `vlan v_num` specified VLAN.
- **PORT_INT** specifies physical ports for which command displays information. Options include:
  - `<no parameter>` all physical ports.
  - `interface ethernet e_range` specified Ethernet ports.
  - `interface port-channel p_range` specified port channels.

Valid `e_range` and `p_range` formats include number, number range, or comma-delimited list of numbers and ranges.

- **DATA** specifies the type of information displayed. Options include:
  - `<no parameter>` number of multicast group on specified VLAN and ports.
  - `detail` number of multicast group on specified VLAN and ports.

**Example**

- This command displays the number of multicast groups on the switch.

```
switch>show ip igmp snooping groups count
Total number of multicast groups: 2
switch>
```
show ip igmp snooping mrouter

The show ip igmp snooping mrouter command displays the status of dynamic and static multicast router ports. Command provides options to include only specific VLANs.

**Command Mode**
EXEC

**Command Syntax**
```
show ip igmp snooping mrouter [VLAN_ID] [DATA]
```

**Parameters**
- **VLAN_ID** specifies VLAN for which command displays information. Options include:
  - <no parameter> all VLANs.
  - `vlan v_num` specified VLAN.
- **DATA** specifies the type of information displayed. Options include:
  - <no parameter> displays VLAN number and port-list for each group.
  - `detail` displays port-specific data for each group; includes transmission times and expiration.

**Examples**
- This command displays port information of each multicast router on all VLANs.
  ```
  switch>show ip igmp snooping mrouter
  Vlan   Interface-ports
  ------------------------------------------------------------
  1      Po1(dynamic)
  20     Po1(dynamic)
  26     Cpu(dynamic)
  2028   Cpu(dynamic), Po1(dynamic)
  switch>
  ```
- This command displays multicast router information for each port.
  ```
  switch>show ip igmp snooping mrouter detail
  Vlan   Intf      Address           FirstHeard LastHeard  Expires  Type
  ---------------------------------------------------------------------------
  1      Po1       172.17.0.37       31549:12   0:12    1:33    pim
  20     Po1       172.17.20.1       7066:51    0:19    1:26    pim
  26     Cpu       172.17.26.1       31549:16   0:28    1:17    pim
  2028   Po1       172.17.255.29     31549:10   0:18    1:27    pim
  2028   Cpu       172.17.255.30     31549:14   0:28    1:17    pim
  switch>
  ```
The `show ip igmp snooping report-flooding` command displays IGMP snooping L2 report flooding configuration and status information. Command provides options to only include specific VLANs.

**Command Mode**

EXEC

**Command Syntax**

```
show ip igmp snooping report-flooding [VLAN_ID][DATA]
```

**Parameters**

- **VLAN_ID** specifies VLANs for which command displays information. Options include:
  - `<no parameter>` all VLANs.
  - `vlan v_num` specified VLAN.
- **DATA** specifies the type of information displayed. Options include:
  - `<no parameter>` displays VLAN number and port-list for each group.
  - `detail` displays port-specific data for each group; includes transmission times and expiration.
**show ip igmp static-groups**

The `show ip igmp static-groups` command displays information about all configured IGMP multicast static groups. IGMP multicast static groups are assigned with the `ip igmp static-group` command.

**Command Mode**

EXEC

**Command Syntax**

`show ip igmp static-groups [INFO_LEVEL] [interface INT_NAME]`

**Parameters**

- **INFO_LEVEL** specifies the type of information displayed. Options include
  - `<no parameter>` VLAN number and port-list for each group.
  - `detail` port-specific information for each group, including transmission times and expiration.
- **INT_NAME** Interface type and number. Values include
  - `<no parameter>` static groups on all interfaces.
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-Channel Interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
  - `vxlan vx_num` VXLAN interface specified by `vx_num`.

**Related Commands**

- `show ip igmp static-groups acl`
- `show ip igmp static-groups group`

**Examples**

- This command displays information about all multicast static groups.
  ```
  switch>show ip igmp static-groups
  Interface Vlan281:
  Manually configured groups:
  Interface Port-Channel999:
  Manually configured groups:
  switch>
  ```
- This command displays information about the multicast static groups on VLAN interface 21.
  ```
  switch>show ip igmp static-groups interface vlan 21
  Interface Vlan281:
  Manually configured groups:
  switch>
  ```
**show ip igmp static-groups acl**

The `show ip igmp static-groups acl` command displays information about the IGMP multicast static groups that are configured by the specified access control list (ACL). The command also displays problems with an ACL that prevent its assignment to an interface.

**Command Mode**

EXEC

**Command Syntax**

`show ip igmp static-groups acl`

**Example**

The following `show ip igmp static-group acl` command example references these ACLs:

```plaintext
ip access-list 1
  10 permit igmp host 10.1.1.1 10.1.1.0/29
  20 permit igmp host 10.1.1.2 10.1.1.0/29

ip access-list 2
  10 permit igmp 10.1.1.0/29 host 10.1.1.1

ip access-list 3
  10 deny igmp host 10.1.1.1 255.1.1.0/29

ip access-list 4
  10 permit igmp host 10.1.1.1 10.1.1.0/29
  20 permit igmp 10.1.1.0/29 host 10.1.1.1
```

- This command displays static group configuration data about the various ACLs.

```plaintext
switch>show ip igmp static-group acl 1
acl 1
  ( 10.1.1.1, 10.1.1.0/29 )
  ( 10.1.1.2, 10.1.1.0/29 )
Interfaces using this ACL for static groups:
  Ethernet12
switch>show ip igmp static-group acl 2
acl 2
  Seq no 30: source address must be a single host or *, not a range
Interfaces using this ACL for static groups:
  Ethernet8
switch>show ip igmp static-group acl 3
acl 3
  Seq no 10: action must be 'permit'
Interfaces using this ACL for static groups:
  none
switch>show ip igmp static-group acl 4
acl 4
  Seq no 20: source address must be a single host or *, not a range
Interfaces using this ACL for static groups:
  none
switch>
```
The `show ip igmp static-groups group` command displays information about all specified IGMP multicast static groups. IGMP multicast static groups are assigned with the `ip igmp static-group` command.

**Command Mode**

EXEC

**Command Syntax**

```
show ip igmp static-groups group [GROUP_LIST]
```

**Parameters**

- **GROUP LIST** Groups for which command displays information
  - `<no parameter>` all multicast groups.
  - `group_address` single multicast group address (dotted decimal notation).

**Related Commands**

- `show ip igmp static-groups`
**show ip igmp statistics**

The **show ip igmp statistics** command displays IGMP transmission statistics for the specified interface.

**Command Mode**

EXEC

**Command Syntax**

`show ip igmp statistics [INTERFACE_ID]`

**Parameters**

- **INTERFACE_ID** Specifies interface for which command returns data. Options include:
  - `<no parameter>` all interfaces.
  - `interface ethernet e_num` Ethernet interface specified by `e_num`.
  - `interface loopback l_num` Loopback interface specified by `l_num`.
  - `interface management m_num` Management interface specified by `m_num`.
  - `interface port-channel p_num` Port-Channel Interface specified by `p_num`.
  - `interface vlan v_num` VLAN interface specified by `v_num`.
  - `interface vxlan vx_num` VXLAN interface specified by `vx_num`.

**Example**

- This command displays IGMP transmission statistics for ethernet 1 interface.

  `switch>show ip igmp statistics interface ethernet 1`
  IGMP counters for Ethernet1:

Protocol Independent Multicast

Protocol Independent Multicast (PIM) distributes multicast data using routes gathered by other protocols. Arista switches support two types of PIM: PIM Sparse Mode (PIM-SM) and Bidirectional PIM (Bidir-PIM).

These sections describe the Arista PIM implementation:

- Section 40.1: Introduction
- Section 40.2: Overview
- Section 40.3: Configuring PIM
- Section 40.4: Multicast Example
- Section 40.5: PIM Commands

40.1 Introduction

Protocol Independent Multicast (PIM) distributes multicast data using routes gathered by other protocols. PIM Sparse Mode (PIM-SM), defined in RFC 4601, is a multicast routing protocol intended for networks where multicast group recipients are sparsely distributed, including wide-area and inter-domain networks. Bidirectional PIM (Bidir-PIM), defined in RFC 5015, is a variant of PIM-SM designed for cases in which the receivers of multicast traffic are also sources and where scalability could affect optimization.

Arista switches support both PIM Sparse-Mode (PIM-SM) and Bidirectional PIM (Bidir-PIM).
40.2 Overview

PIM builds and maintains multicast routing trees using reverse path forwarding (RPF) on a unicast routing table. PIM is protocol-independent, and can use routing tables consisting of OSPF, BGP, RIP, and static routes. All sources send traffic to multicast groups through shared trees that have a common root node called the rendezvous point (RP).

PIM uses a multicast routing information base (MRIB) that is populated from the unicast table. The MRIB provides the next-hop router for each multicast destination subnet. This determines the next-hop neighbor for sending PIM join or prune messages.

40.2.1 PIM Sparse Mode

In PIM-SM, each host (sender or receiver) is associated with a designated router (DR) that acts for all directly connected hosts in PIM-SM transactions, and trees are unidirectional. Once sufficient traffic is flowing on a route it usually does not pass through the RP.

PIM-SM establishes multicast routes through three phases:

- Establishing the RP Tree
- Eliminating Encapsulation
- Establishing the Shortest Path Tree (SPT)

40.2.1.1 Establishing the RP Tree (Phase 1)

The RP tree is a distribution network that all sources share to deliver multicast data. The root of the RP tree is the Rendezvous Point.

The process starts when a receiver requests multicast data from a group (G). The receiver’s DR sends a PIM (*,G) Join message toward the multicast group’s RP. As the message travels towards the RP, it instantiates the multicast (*,G) state in each router on the path. Join messages converge on the RP to form the RP tree.

The DR resends Join messages periodically, while it has a receiver in the group, to prevent state timeout expiry in the routers along the path. When all receivers on a DR’s subnet leave a group, the DR sends a (*,G) Prune message towards the RP to remove the state from the routers.

A multicast sender transmits multicast data to the RP through its DR. The DR encapsulates the multicast packets and sends them as unicast packets. The RP extracts the native multicast packet and sends it to the RP tree towards the group members.

40.2.1.2 Eliminating Multicast Encapsulation (Phase 2)

Data encapsulation, while initially required before the multicast path is established, is inefficient because it requires the transmission of data that is extraneous to multicast. Phase 2 establishes states in the routers that support the transmission of native multicast packets.

When the RP receives an encapsulated packet from source S on group G, it sends an (S,G) join message toward the source. As the message travels towards S, it instantiates the (S,G) state on each router in the path which is used to forward packets from source S destined for group G. Data packets on the (S,G) path are also routed into the RP tree when they encounter an (*,G) router.

When the RP starts receiving native packets from the sources, it sends a Register-Stop message to the source’s DR, halting packet encapsulation. At this time, traffic flows natively from the source along a source-specific tree to the RP, then along the shared RP tree to the receivers.
40.2.1.3 Establishing the Shortest Path Tree (Phase 3)

The third phase establishes the shortest path from the multicast source to all receivers. When a multicast packet arrives at the receiver, its router (typically the DR) sends a Join message towards the source to instantiate the (S,G) state in all routers along its path. The message eventually reaches either the source's subnet or a router that already has an (S,G) state. This causes data to flow from the source to the receiver following the (S,G) path. At this time, the receiver is receiving data from the shortest path tree (SPT) and the RP tree (RPT).

The DR (or upstream router) eliminates the data transmission along the RPT by sending a prune message \((S,G,rpt)\) towards the RP. The message instantiates the state on each router in the path, continuing until it reaches the RP or a router that needs traffic from the same source for other receivers.

40.2.2 Bidirectional PIM

Bidirectional PIM (Bidir-PIM) builds shared trees, rooted at the rendezvous point (RP), for each multicast group. Because the trees are based only on \((*,G)\) routes, they can accommodate a much larger number of sources without overfilling the MFIB.

In Bidir-PIM, there is no multicast encapsulation or SPT establishment. All packets are natively forwarded toward the RP along shared, bidirectional trees. There are also no designated routers. Instead, a single designated forwarder (DF) is elected on each link to each RP, usually during the RP discovery process. The DF is the router with the shortest route to the RP based on the unicast routing table. It is responsible for forwarding upstream traffic to the RP and forwarding downstream traffic toward the groups on its link. All routes pass through the RP, and multicast packets are sent from sources toward the RP and to receivers at each hop along the route.

Bidir-PIM elects DFs when a new RP is discovered, when the DF fails, or when there is a change that affects the topology of the link.

40.2.3 Rendezvous Points (RP)

In PIM-SM, an RP is a router that is configured as the root of multicast group’s distribution tree. These distribution trees are not source-specific. The RP is the destination for both join messages from receivers and data from senders, allowing receivers discover sender identity and begin receiving group traffic. In PIM-SM, paths through RP routers are temporary; when traffic volume reaches a sufficient level, the receiver joins a source-specific tree and the path through the RP is dropped. In Bidir-PIM, all paths pass through the RP, and all packets destined for a given multicast group are forwarded to the RP for that group.

RP addresses in Bidir-PIM must be routable from all sources in the domain, but do not have to correspond to any specific physical interface. Multiple groups can use the same RP for distribution.

The switch supports two methods of mapping RPs to multicast groups:

- **Static**: RPs are statically configured through a CLI statement.
- **Dynamic**: RPs are dynamically selected by a bootstrap router from a set of candidate RPs.

While dynamic RP mappings have priority over static maps by default, a static RP can be configured to override dynamic mappings.

Section 40.3.5 describes the configuration of rendezvous points.
40.3 Configuring PIM

This section describes the following configuration tasks:

- Section 40.3.1: Enabling PIM IPv4 Sparse Mode
- Section 40.3.2: Enabling PIM IPv6 Sparse Mode
- Section 40.3.3: Enabling the S, G Expiry Timer Interval
- Section 40.3.4: Enabling PIM Bidirectional
- Section 40.3.5: Rendezvous Points (RPs)
- Section 40.3.6: Hello Messages
- Section 40.3.7: Hello Hold Time
- Section 40.3.8: Designated Router Election
- Section 40.3.9: Designated Forwarder Election
- Section 40.3.10: Join-Prune Messages
- Section 40.3.11: Legacy PIM Configuration in Global Configuration Mode
- Section 40.3.12: Configuring PIM in a Non-default VRF

40.3.1 Enabling PIM IPv4 Sparse Mode

By default, IPv4 PIM is disabled on an interface. The `pim ipv4 sparse-mode` command enables PIM IPv4 Sparse Mode (PIM-SM) on the configuration mode interface. Enabling PIM on an interface enables IGMP on the interface as well.

**Example**

- This command enables IPv4 PIM-SM and IGMP on VLAN interface 8.

  ```
  switch(config)#interface vlan 8
  switch(config-if-Vl8)#pim ipv4 sparse-mode
  switch(config-if-Vl8)#
  ```

40.3.2 Enabling PIM IPv6 Sparse Mode

By default, IPv6 PIM is disabled on an interface. The `pim ipv6 sparse-mode` command enables PIM IPv6 Sparse Mode (PIM-SM) on the configuration mode interface.

**Example**

- This command enables IPv6 PIM-SM on Ethernet interface 15.

  ```
  switch(config)#interface ethernet 15
  switch(config-if-Et15)#pim ipv6 sparse-mode
  switch(config-if-Et15)#
  ```

40.3.3 Enabling the S, G Expiry Timer Interval

The `sg-expiry-timer` command enables expiry timer interval for the PIM-SM multicast routes. By default, the `sg-expiry-timer` command applies to the default VRF when the command is issued in the Router-Multicast Configuration mode. During the time of interval, there is no multicast traffic activity on the route.
40.3.4 Enabling PIM Bidirectional

By default, PIM is disabled on an interface. The `pim ipv4 bidirectional` command enables Bidirectional PIM (Bidir-PIM) on the configuration mode interface. Enabling PIM on an interface also enables IGMP on that interface.

Example

- These commands enable Bidir-PIM and IGMP on VLAN interface 9.

```
switch(config)#interface vlan 9
switch(config-if-Vl9)#pim ipv4 bidirectional
```

40.3.5 Rendezvous Points (RPs)

The switch supports dynamic RPs, static RPs, and anycast RPs.

Configuring Static RPs

The `rp address` command configures a static RP, providing an option to override dynamic RPs.

Examples

- This command creates a static RP at 10.17.255.83 in the default VRF that maps to all multicast groups (224/4) and overrides dynamic RPs.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#rp address 10.17.255.83 override
```

- This command creates a static RP at 10.21.18.23 in the default VRF that maps to the multicast groups at 238.1.12.0/24.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#rp address 238.1.12.0/24 override
```

Configuring Dynamic RPs

Dynamic RP selection is implemented through a bootstrap router (BSR), which is a PIM router within the PIM domain that selects RPs from a list of candidates. A subset of PIM routers within the domain are configured as candidate bootstrap routers (C-BSRs). Through the exchange of bootstrap messages (BSMs), the C-BSRs elect the BSR, which then uses BSMs to inform all domain routers of its status.

The BSR holdtime defines the timeout period that an elected BSR remains valid after the receipt of a BSM and is also used in dynamic RP configuration. Holdtime is designated by the BSR router and communicated to other routers through BSMs.
Another subset of domain PIM routers are configured as candidate RPs (C-RPs). The BSR creates a set of qualifying RPs from the list of C-RPs, then distributes the group-to RP mapping set to all domain routers through BSMs. Each PIM router, after receiving this set, uses a standard algorithm defined in RFC 6226 to select one RP per multicast group.

The *candidate* command configures the switch as a candidate BSR router (C-BSR). Command parameters specify the switch’s BSR address, the interval between BSM transmissions, and the switch’s BSR priority rating. Priority ratings range from 0 to 255 with a default of 64. Higher numbers denote higher priority during BSR elections.

**Example**

- These commands configure the switch as a BSR candidate in the default VRF, using the IP address assigned to VLAN interface 24 as its BSR address. The BSM transmission interval is set to 30 seconds and the priority is set to 192.

```
switch(config)#router pim bsr
switch(config-router-pim-bsr)#ipv4
switch(config-router-pim-bsr-ipv4)#candidate vlan 24 priority 192 interval 30
switch(config-router-pim-bsr-ipv4)#
```

The *holdtime* command specifies the value the switch inserts in the **holdtime** field of bootstrap messages (BSMs) that it sends. This value becomes the holdtime for the PIM domain if the switch is elected as the BSR.

**Example**

- These commands specify 75 seconds as the value that the switch inserts into BSM holdtime fields in the default VRF.

```
switch(config)#router pim bsr
switch(config-router-pim-bsr)#ipv4
switch(config-router-pim-bsr-ipv4)#holdtime 75
switch(config-router-pim-bsr-ipv4)#
```

The *rp candidate* command configures the switch as a candidate rendezvous point (C-RP). The BSR selects a multicast group’s dynamic RP set from the list of C-RPs. Command parameters specify the switch’s RP address, C-RP advertisement interval, and priority rating. The priority rating is used by the BSR when selecting RPs. The C-RP advertisement interval specifies the period between successive C-RP advertisement message transmissions to the BSR.

*Running-config* may contain multiple *rp candidate* statements to support multiple multicast groups:

- All commands must specify the same interface. Issuing a command with an interface that differs from existing commands removes all existing commands from *running-config*.

- *Running-config* stores the **interval** setting in a separate statement that applies to all *rp candidate* statements. Commands that specify an interval that differs from the previously configured value place the new value in *running-config*. This new value applies to all *rp candidate* statements.

**Example**

- These commands configure a switch as a candidate RP for the multicast group 235.1.1.0/24, with a priority of 48 and a RP advertisement interval of 45 seconds, in the default VRF.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#rp candidate vlan 24 235.1.1.0/24 priority 48 interval 45
switch(config-router-pim-sparse-ipv4)#
```
By default, the switch transmits bootstrap router messages (BSMs) over all PIM-enabled interfaces. The `pim bsr ipv4 border` command prevents the switch from transmitting BSMs over the configuration mode interface.

**Example**

- This command prevents the switch from sending BSMs from VLAN interface 10

```bash
switch(config)#interface vlan 10
switch(config-if-Vl10)#pim bsr ipv4 border
switch(config-if-Vl10)#
```

**Anycast Rendezvous Points**

A PIM anycast rendezvous point (anycast RP) defines a single RP address that exists on multiple devices. An anycast-RP set consists of the routers configured with the same anycast-RP address. An anycast RP provides redundancy protection and load balancing. The anycast-RP set supports all multicast groups.

The `anycast-rp` command configures the switch as a member of an anycast-RP set and establishes a communication link with another member of the set.

**Example**

- These commands configure a switch (IP address 10.1.1.14) into an anycast-RP set with an RP address of 10.17.255.2 in the default VRF. The anycast-RP set contains three other routers, located at 10.1.2.14, 10.1.3.14, and 10.1.4.14. It sets the number of unacknowledged register messages it sends to each router at 15.

```bash
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#anycast-rp 10.17.255.2 10.1.1.14 register-count 15
switch(config-router-pim-sparse-ipv4)#anycast-rp 10.17.255.2 10.1.2.14 register-count 15
switch(config-router-pim-sparse-ipv4)#anycast-rp 10.17.255.2 10.1.3.14 register-count 15
switch(config-router-pim-sparse-ipv4)#anycast-rp 10.17.255.2 10.1.4.14 register-count 15
switch(config-router-pim-sparse-ipv4)#
```

**40.3.6 Hello Messages**

PIM-SM multicast routers send PIM router query messages (hello messages) to elect a designated router (DR) for each subnet. The DR then sends registration messages to the RP.

The `pim ipv4 hello interval` command specifies the transmission interval between PIM hello messages originating from the specified VLAN interface.

**Example**

- This command configures 45 second intervals between hello messages originating from VLAN interface 4.

```bash
switch(config)#interface vlan 4
switch(config-if-Vl4)#pim ipv4 hello interval 45
switch(config-if-Vl4)#
```
40.3.7 Hello Hold Time

A PIM interface maintains a hold timer for each of its neighbors. The timer is reset whenever a hello message is received from the neighbor. When the timer expires, the neighbor is considered DOWN. The PIM interface can advertise its neighbor to use a higher hold time by modifying the hello interval, or by setting a higher hello count using the `pim ipv4 hello count` command. The hello count specifies how many hello messages can be missed before the neighbor is considered down; the hold time is therefore the hello interval multiplied by the hello count.

**Example**

- This command configures the PIM hold time on VLAN 2925 to 225 seconds (7.5 times the 30-second hello interval).

  ```
  switch(config)#interface vlan2925
  switch(config-if-Vl2925)#ip pim query-count 7.5
  ```

- This command displays the hold time on VLAN 2925.

  ```
  switch#show ip pim interface vlan2925 details
  Interface Vlan2925 address is 1.0.1.1
  Vif number is 0
  PIM: enabled
  PIM version: 2, mode: sparse
  PIM neighbor count: 0
  PIM Effective DR: 1.0.1.1 (this system)
  PIM Effective DR Priority: 1
  PIM Effective Propagation Delay: 500 milliseconds
  PIM Effective Override Interval: 2500 milliseconds
  PIM Effective Tracking Support: disabled
  PIM Hello Interval: 30 seconds
  PIM Hello Hold Time: 225 seconds <= New Hold Time ( = 7.5 * 30 )
  PIM Hello Priority: 1 seconds
  PIM Hello Lan Delay: 500 milliseconds
  PIM Assert Override Interval: 3 seconds
  ```

40.3.8 Designated Router Election

PIM-SM uses these criteria for electing a designated router (DR):

- If at least one router does not advertise a DR priority value, then PIM-SM elects the router with the highest IP address as the DR.
- If all routers advertise a DR priority value, then PIM-SM elects the router with the highest DR priority value as the DR.

The `group-expiry-timer` command sets the DR priority value that the switch advertises. If `running-config` does not contain a `pim ipv4 dr-priority` statement, the switch does not advertise a DR priority value.

**Examples**

- This command configures a DR priority value of 15 on VLAN interface 4.

  ```
  switch(config-if-Vl4)#pim ipv4 dr-priority 15
  ```

- This command removes the DR priority from VLAN interface 4.

  ```
  switch(config-if-Vl4)#no pim ipv4 dr-priority
  ```
40.3.9 Designated Forwarder Election

Designated forwarders (DFs) are elected based on route metrics in the unicast routing table; there are no configuration options that affect the selection of DFs.

40.3.10 Join-Prune Messages

Join/prune messages are sent by the PIM-SM designated router (DR) or the Bidir-PIM designated forwarder (DF) toward the rendezvous point (RP). These messages inform other PIM routers about clients that want to become receivers (join) or stop being receivers (prune) for the groups.

The `pim ipv4 join-prune interval` command specifies the period between join/prune messages that the switch originates from the specified VLAN interface and sends to the upstream RPF neighbor.

**Example**

- This command configures 75 second intervals between join/prune messages originating from VLAN interface 4.

  ```
  switch(config-if-Vl4)#pim ipv4 join-prune interval 75
  switch(config-if-Vl4)#
  ```

40.3.11 Legacy PIM Configuration in Global Configuration Mode

Earlier versions of the EOS managed all non-interface-specific PIM configuration from Global Configuration Mode. Legacy configurations retain these global commands in `running-config` after upgrading to a newer version of the EOS, and the configurations are applied unchanged to the default VRF. PIM configuration commands entered in Global Configuration Mode which can be applied to either PIM-SM or Bidir-PIM will be applied to PIM-SM. If any commands are added to `running-config` using the new configuration modes, all legacy commands will be converted to the new modal commands and applied in the default VRF.

**Note**

Multicast configuration commands issued in Global Configuration Mode are now deprecated, and Arista recommends configuring all multicast parameters in the appropriate configuration mode (i.e., Router-Multicast Configuration, Router-PIM Sparse-mode Configuration, Router-PIM Bidirectional Configuration, Router-PIM BSR Configuration, or Router-MSDP Configuration).

40.3.12 Configuring PIM in a Non-default VRF

For PIM to function in a non-default VRF, the VRF must be created and configured for multicast traffic, and routed ports must be added to the VRF. Once this is accomplished, configure VRF-global PIM parameters by using the `vrf` command within a PIM configuration mode to place the switch in a PIM VRF configuration submode.

Interface-specific PIM parameters are configured in the interface-configuration mode for VRF-member interface.

Legacy multicast routing commands issued in Global Configuration Mode are applied to the default VRF, but are now deprecated and are available only for backward compatibility. If any PIM commands are issued in the new format, all legacy commands remaining in `running-config` will be replaced with their updated equivalents and applied to the default VRF.
40.3.12.1 Preparing the VRF for PIM Configuration

The following steps prepare a non-default VRF to use PIM:

**Step 1** Enable unicast routing in the default VRF.

```
switch(config)#ip routing vrf default
```

**Step 2** Create the non-default VRF if not already created.

```
switch(config)#vrf instance purple
```

**Step 3** Enable enable unicast routing on the new VRF.

```
switch(config-vrf-purple)#exit
switch(config)#ip routing vrf purple
```

**Step 4** Add participating routed ports to the new VRF.

```
switch(config)#interface ethernet 9/2-9/4
switch(config-if-Et9/2-4)#no switchport
switch(config-if-Et9/2-4)#vrf purple
switch(config-if-Et9/2-4)#exit
```

**Step 5** Enable multicast routing on the new VRF.

```
switch(config)#router multicast
switch(config-router-multicast)#vrf purple
switch(config-router-multicast-vrf-purple)#ip multicast routing
```

40.3.12.2 Configuring Global PIM Parameters in a Non-default VRF

Global PIM parameters for non-default VRFs are configured in the VRF submode of the appropriate PIM configuration mode.

**Examples**

- These commands configure a switch as a candidate RP for the multicast group 235.1.1.0/24, with a priority of 48 and a RP advertisement interval of 45 seconds, in VRF “purple.”

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#vrf purple
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-vrf-purple-ipv4)#rp candidate vlan 24 235.1.1.0/24 priority 48 interval 45
switch(config-router-pim-sparse-vrf-purple-ipv4)#
```

40.3.12.3 Configuring Interface-specific PIM Parameters in a Non-default VRF

Interface-specific PIM parameters for member interfaces of a non-default VRF are configured just as they are for the default VRF: in the interface-configuration mode for the interface.
40.4 Multicast Example

This section provides an example network that implements multicast (PIM-SM) in the default VRF and includes the required commands.

40.4.1 Diagram

Figure 40-1 displays the multicast network example. The network contains four routers. Multicast routing (PIM-SM) is enabled on two switches. One switch has its IGMP Snooping Querier enabled.

The example multicast network implements these multicast parameters:

**Rendezvous Point Address**: 10.25.10.15

**Switch Clara**
- IGMP Snooping: disabled
- Subnet Summary:
  - 10.40.10.0/24: VLAN 11
  - 10.15.10.0/24: VLAN 12
  - 10.15.11.0/24: VLAN 13
  - 10.15.12.0/24: VLAN 14
  - 10.5.1.0/20: VLAN 10

**Switch Mateo**
- IGMP Snooping: disabled
- Subnet Summary:
  - 10.20.13.0/24: VLAN 18
  - 10.20.10.0/24: VLAN 15
  - 10.20.11.0/24: VLAN 16

Figure 40-1: Multicast Example
- 10.20.12.0/24: VLAN 17
- 10.15.10.0/24: VLAN 12
- 10.15.11.0/24: VLAN 13
- 10.15.12.0/24: VLAN 14
- 10.25.10.12/30: VLAN 19
- 10.5.1.0/20: VLAN 10

Switch Allie
- IGMP Snooping: enabled
- Multicast Routing: enabled
- Querier: enabled
- Rendezvous Point Address: 10.25.10.15
- MFIB activity polling interval: 5 second
- Subnet Summary:
  - 10.30.13.0/24: VLAN 23
  - 10.30.10.0/24: VLAN 20 – PIM-SM enabled
  - 10.30.11.0/24: VLAN 21 – PIM-SM enabled
  - 10.30.12.0/24: VLAN 22
  - 10.25.10.12/30: VLAN 19
  - 10.35.10.0/30: VLAN 24 – PIM-SM enabled
  - 10.5.1.0/20: VLAN 10 – PIM-SM enabled

Switch Francis
- IGMP Snooping: enabled
- Multicast Routing: enabled
- Subnet Summary:
  - 10.40.10.0/24: VLAN 25 – PIM-SM enabled
  - 10.35.10.0/30: VLAN 24 – PIM-SM enabled
  - 10.5.1.0/20: VLAN 10
40.4.2 Example

This example configures PIM-SM.

**Step 1** Configure the interface addresses

a **Router Clara interfaces**

Clara(config)#interface vlan 11
Clara(config-if-vl11)#ip address 10.40.10.1/24
Clara(config-if-vl11)#interface vlan 12
Clara(config-if-vl12)#ip address 10.15.10.42/24
Clara(config-if-vl12)#interface vlan 13
Clara(config-if-vl13)#ip address 10.15.11.21/24
Clara(config-if-vl13)#interface vlan 14
Clara(config-if-vl14)#ip address 10.15.12.50/24
Clara(config-if-vl14)#interface vlan 10
Clara(config-if-vl10)#ip address 10.5.1.33/20
Clara(config-if-vl10)#router ospf 1
Clara(config-router-ospf)#redistribute static

b **Router Mateo interfaces**

Mateo(config)#interface vlan 18
Mateo(config-if-vl18)#ip address 10.20.13.1/24
Mateo(config-if-vl18)#interface vlan 15
Mateo(config-if-vl15)#ip address 10.20.10.1/24
Mateo(config-if-vl15)#interface vlan 16
Mateo(config-if-vl16)#ip address 10.20.11.1/24
Mateo(config-if-vl16)#interface vlan 17
Mateo(config-if-vl17)#ip address 10.20.12.16/24
Mateo(config-if-vl17)#interface vlan 12
Mateo(config-if-vl12)#ip address 10.15.10.41/24
Mateo(config-if-vl12)#interface vlan 13
Mateo(config-if-vl13)#ip address 10.15.11.17/24
Mateo(config-if-vl13)#interface vlan 14
Mateo(config-if-vl14)#ip address 10.15.12.49/24
Mateo(config-if-vl14)#interface vlan 19
Mateo(config-if-vl19)#ip address 10.25.10.13/30
Mateo(config-if-vl19)#interface vlan 10
Mateo(config-if-vl10)#ip address 10.5.1.1/20
Mateo(config-if-vl10)#router ospf 1
Mateo(config-router-ospf)#redistribute static

c **Router Allie interfaces**

Allie(config)#interface vlan 23
Allie(config-if-vl23)#ip address 10.30.13.34/24
Allie(config-if-vl23)#interface vlan 20
Allie(config-if-vl20)#ip address 10.30.10.1/24
Allie(config-if-vl20)#interface vlan 21
Allie(config-if-vl21)#ip address 10.30.11.25/24
Allie(config-if-vl21)#interface vlan 22
Allie(config-if-vl22)#ip address 10.30.12.254/24
Allie(config-if-vl22)#interface vlan 19
Allie(config-if-vl19)#ip address 10.25.10.14/30
Allie(config-if-vl19)#interface vlan 24
Allie(config-if-vl24)#ip address 10.35.10.29/30
Allie(config-if-vl24)#interface vlan 10
Allie(config-if-vl10)#ip address 10.5.1.1/20
Allie(config-if-vl10)#router ospf 1
Allie(config-router-ospf)#redistribute static
d Route Francis interfaces

```
Francis(config)#interface vlan 25
Francis(config-if-vl25)#ip address 10.40.10.1/24
Francis(config-if-vl25)#interface vlan 24
Francis(config-if-vl24)#ip address 10.35.10.30/24
Francis(config-if-vl24)#interface vlan 10
Francis(config-if-vl10)#ip address 10.5.1.35/24
Francis(config-if-vl10)#router ospf 1
Francis(config-router-ospf)#redistribute static
```

Step 2 Configure the interface multicast parameters

a Route Allie interfaces

```
Allie(config-router-ospf)#interface vlan 20
Allie(config-if-vl20)#pim ipv4 sparse-mode
Allie(config-if-vl20)#interface vlan 21
Allie(config-if-vl21)#pimipv4 sparse-mode
Allie(config-if-vl21)#interface vlan 24
Allie(config-if-vl24)#pim ipv4 sparse-mode
Allie(config-if-vl24)#interface vlan 10
Allie(config-if-vl10)#pim ipv4 sparse-mode
```

b Route Francis interfaces

```
Francis(config-router-ospf)#interface vlan 25
Francis(config-if-vl25)#pim ipv4 sparse-mode
Francis(config-if-vl25)#interface vlan 24
Francis(config-if-vl24)#pim ipv4 sparse-mode
```

Step 3 Configure the router multicast parameters

a Route Clara parameters

```
Clara(config-router-ospf)#exit
Clara(config)#no ip igmp snooping
```

b Route Mateo router

```
Mateo(config-router-ospf)#exit
Mateo(config)#no ip igmp snooping
```

c Route Allie router

```
Allie(config-if-vl10)#exit
Allie(config)#router multicast
Allie(config-router-multicast)#ipv4
Allie(config-router-multicast-ipv4)#routing
Allie(config-router-multicast-ipv4)#activity polling-interval 5
Allie(config-router-multicast-ipv4)#router pim sparse-mode
Allie(config-router-pim-sparse)#ipv4
Allie(config-router-pim-sparse-ipv4)#rp address 10.25.10.15
```

d Route Francis router

```
Francis(config-if-vl24)#exit
Francis(config)#router multicast
Francis(config-router-multicast)#ipv4
Francis(config-router-multicast-ipv4)#routing
Francis(config-router-multicast-ipv4)#router pim sparse-mode
Francis(config-router-pim-sparse)#ipv4
Francis(config-router-pim-sparse-ipv4)#rp address 10.25.10.15
```
40.5 PIM Commands

**PIM Configuration Commands (Global)**
- anycast-rp
- candidate
- fast-reroute
- group-expiry-timer
- holdtime
- ip pim dr-notify-delay
- log neighbors
- register local-interface
- router pim bidirectional
- router pim bsr
- router pim sparse-mode
- rp address
- rp allow
- rp candidate
- rp-candidate advertisement-filter
- rp hash algorithm modulo
- sg-expiry-timer
- spt threshold
- ssm range

**PIM Configuration Commands (Interface)**
- ipv4
- pim bsr ipv4 border
- pim ipv4 bidirectional
- pim ipv4 border-router
- pim ipv4 dr-priority
- pim ipv4 hello count
- pim ipv4 hello interval
- pim ipv4 join-prune count
- pim ipv4 join-prune interval
- pim ipv4 neighbor-filter
- pim ipv4 sparse-mode
- pim ipv6 sparse-mode

**PIM Display Commands**
- show ip pim bsr
- show ip pim config-sanity
- show ip pim interface

anycast-rp

The `anycast-rp` command configures the switch as a member of an anycast-RP set and establishes a communication link with another member of the set.

When the command is issued in Router-Multicast IPv4 Configuration Mode it applies to the default VRF; to use this command in a non-default VRF, issue it in Router-Multicast VRF IPv4 Configuration Mode.

The `no anycast-rp` and `default anycast-rp` commands remove the corresponding `anycast-rp` command from `running-config`. When the `no` and `default` commands do not include a peer address, all commands for the specified RP address are removed.

**Command Mode**
- Router-Multicast IPv4 Configuration
- Router-Multicast VRF IPv4 Configuration

**Command Syntax**
```
anycast-rp rp_addr peer_addr [REGISTER]
no anycast-rp rp_addr [peer_addr]
default anycast-rp rp_addr [peer_addr]
```

**Parameters**
- `rp_addr`  Rendezvous point IP address (dotted decimal notation).
- `peer_addr`  IP address of another anycast-RP set member (dotted decimal notation).
- `REGISTER`  Number of unacknowledged register messages the switch sends to the peer router.
  - `<no parameter>`  register count is set to default value of 10.
  - `register-count r_num`  where `r_num` is an integer that ranges from 1 to 4294967295.
- `register-count infinity`  

**Example**
- These commands configure a switch (IP address 10.1.1.14) into an anycast-RP set with an RP address of 10.17.255.2 in the default VRF. The anycast-RP set contains three other routers, located at 10.1.2.14, 10.1.3.14, and 10.1.4.14. It sets the number of unacknowledged register messages it sends to each router at 15.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#anycast-rp 10.17.255.2 10.1.1.14 register-count 15
switch(config-router-pim-sparse-ipv4)#anycast-rp 10.17.255.2 10.1.2.14 register-count 15
switch(config-router-pim-sparse-ipv4)#anycast-rp 10.17.255.2 10.1.3.14 register-count 15
switch(config-router-pim-sparse-ipv4)#anycast-rp 10.17.255.2 10.1.4.14 register-count 15
switch(config-router-pim-sparse-ipv4)#
```
### pim ipv4 bidirectional

The `pim ipv4 bidirectional` command enables PIM bidirectional and IGMP (router mode) on the configuration mode interface.

**Important!** PIM and multicast border router (MBR) must be mutually exclusive on an interface. If the interface is configured as an MBR, do not enable PIM on the interface.

The `no pim ipv4 bidirectional`, `no pim ipv4`, `default pim ipv4 bidirectional`, and `default pim ipv4` commands restore the default PIM and IGMP (router mode) settings of `disabled` on the configuration mode interface by removing the `pim ipv4 bidirectional` statement from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `pim ipv4 bidirectional`
- `no pim ipv4`
- `no pim ipv4 bidirectional`
- `default pim ipv4`
- `default pim ipv4 bidirectional`

**Example**
- This command enables PIM bidirectional on VLAN 4 interface.

```
switch(config)#interface vlan 4
switch(config-if-Vl4)#pim ipv4 bidirectional
switch(config-if-Vl4)#
```
**pim ipv4 border-router**

The **pim ipv4 border-router** command configures the configuration mode interface as a PIM multicast border router (MBR). A PIM MBR interface allows multicast traffic from sources that are outside of the PIM domain.

This command does not control the transmission or reception of PIM protocol packets by the interface. Sources learned through an MBR interface are treated as local sources (directly connected to the switch). The border-bit is set in all PIM register messages sent for these sources.

---

**Important!** Configuration as an MBR and configuration in PIM sparse mode must be mutually exclusive. Ensure that PIM sparse mode is not configured by issuing the `no pim ipv4 sparse-mode` command on the interface before issuing this command.

---

The **no pim ipv4 border-router** and **default pim ipv4 border-router** commands removes the PIM MBR configuration for the configuration mode interface by removing the corresponding **pim ipv4 border-router** statement from **running-config**.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

- `pim ipv4 border-router`
- `no pim ipv4 border-router`
- `default pim ipv4 border-router`

**Example**

- These commands configure VLAN interface 200 as a PIM MBR, then display its status.

  ```
  switch(config)#interface vlan 200
  switch(config-if-VL200)#ip address 10.44.2.1/24
  switch(config-if-VL200)#no pim ipv4 sparse-mode
  switch(config-if-VL200)#pim ipv4 border-router
  switch(config-if-VL200)#show active
  interface Vlan200
  ip address 10.44.2.1/24
  pim ipv4 border-router
  switch(config-if-VL200)#exit
  switch(config)#show ip pim interface
  Address       Interface     Mode    Neighbor   Hello   DR    DR Intvl       Pri
  PktsQed       PktsDropped  Count
  10.44.2.1     Vlan200      mbr     0         30      1     10.44.2.1   0      0
  switch(config)#
  ```

---
pim bsr ipv4 border

The `pim bsr ipv4 border` command prevents the switch from sending bootstrap router messages (BSMs) over the configuration mode interface. By default, BSMs are transmitted over all PIM-enabled interfaces.

The `no pim bsr ipv4 border` and `default pim bsr ipv4 border` commands restore the transmission of BSMs over the configuration mode interface by removing the corresponding `pim bsr ipv4 border` statement from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `pim bsr ipv4 border`
- `no pim bsr ipv4 border`
- `default pim bsr ipv4 border`

**Example**
- This command prevents the switch from sending BSMs from VLAN interface 10.

```
switch(config)#interface vlan 10
switch(config-if-Vl10)#pim bsr ipv4 border
switch(config-if-Vl10)#
```
candidate

The candidate command configures the switch as a candidate BSR router (C-BSR). A BSR is a PIM router within the PIM domain through which dynamic RP selection is implemented. The BSR selects RPs from a list of candidate RPs and exchange bootstrap messages (BSM) with all routers in the domain. The BSR is elected from one of the C-BSRs through an exchange of BSMs.

A subset of PIM routers within the domain are configured as candidate bootstrap routers (C-BSRs). Through the exchange of bootstrap messages (BSMs), the C-BSRs elect the BSR, which then uses BSMs to inform all domain routers of its status.

Command parameters specify the switch’s BSR address, the interval between BSM transmissions, the length of the hash mask, and the priority assigned to the switch when electing a BSR.

Entering an candidate command replaces any previously configured candidate command. If the new command does not specify a priority, hash mask length, or interval, the previously configured values persist in running-config.

When the command is issued in Router-PIM BSR IPv4 Configuration Mode it applies to the default VRF; to use this command in a non-default VRF, issue it in Router-PIM BSR VRF IPv4 Configuration Mode for the appropriate VRF.

The no candidate and default candidate commands remove the corresponding candidate commands from running-config. The no and default commands restore the priority, hash mask length, and interval parameters to their default values.

Command Mode
- Router-PIM BSR IPv4 Configuration
- Router-PIM BSR VRF IPv4 Configuration

Command Syntax
```
candidate INTERFACE [HASHMASK_LENGTH] [INTERVAL_PERIOD] [PRIORITY_NUM]
no candidate [priority] [interval]
default candidate [priority] [interval]
```

Parameters
- **INTERFACE** Switch uses IP address of specified interface as its BSR address. Options include:
  - ethernet e_num Ethernet interface specified by e_num.
  - loopback l_num Loopback interface specified by l_num.
  - management m_num Management interface specified by m_num.
  - port-channel p_num Port-Channel Interface specified by p_num.
  - vlan v_num VLAN interface specified by v_num.
- **HASHMASK_LENGTH** Length (in bits) of the hash mask.
  - <no parameter> hash mask remains unchanged from previous setting.
  - hashmask <0 - 32> hash mask length (in bits). Default value is 30.
- **INTERVAL_PERIOD** Period between the transmission of BSMs (seconds). Default value is 60.
  - <no parameter> interval remains unchanged from previous setting.
  - interval <10 - 536870906> transmission interval in seconds.
- **PRIORITY_NUM** BSR election priority rating. Larger numbers denote higher priority. Default value is 64.
  - <no parameter> priority remains unchanged from previous setting.
  - priority <0 - 255> priority rating.
Example

- These commands configure the switch as a BSR candidate in the default VRF, using the IP address assigned to VLAN interface 24 as its BSR address. The BSM transmission interval is set to 30 seconds and the priority is set to 192.

```bash
switch(config)#router pim bsr
switch(config-router-pim-bsr)#ipv4
switch(config-router-pim-bsr-ipv4)#candidate vlan 24 priority 192 interval 30
switch(config-router-pim-bsr-ipv4)#
```
fast-reroute

The fast-reroute command enables Multicast only Fast Re-Route (MoFRR) to minimize traffic loss in a network when a link or node failure occurs. Traffic loss is minimized by allowing the traffic to flow from the secondary path upon the failure of the primary path.

The no fast-reroute and default fast-reroute commands disable MoFRR by removing the corresponding fast-reroute command from running-config.

Command Mode

Router-PIM BSR IPv4 Configuration
Router-PIM BSR VRF IPv4 Configuration

Command Syntax

```
fast-reroute acl_name
no fast-reroute acl_name
default fast-reroute acl_name
```

Parameters

- `acl_name` standard access list name

Examples

- These commands enable fast reroute for ACL “acl2” in the default VRF under the IPv4 configuration.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#fast-reroute acl2
switch(config-router-pim-sparse-ipv4)#
```

- These commands enable fast reroute for ACL “acl2” in VRF “red” under the IPv4 configuration.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#vrf red
switch(config-router-pim-sparse-vrf-red)#ipv4
switch(config-router-pim-sparse-vrf-red-ipv4)#fast-reroute acl2
switch(config-router-pim-sparse-vrf-red-ipv4)#
```
**holdtime**

The `holdtime` command specifies the value the switch inserts in the *holdtime* parameter field in bootstrap messages (BSM) that it sends. The BSR holdtime defines the timeout period that an elected BSR remains valid after the receipt of a BSM and is also used in dynamic RP configuration. BSR holdtime is designated by the BSR router and communicated to other routers through BSMs.

When the command is issued in Router-PIM BSR IPv4 Configuration Mode it applies to the default VRF; to use this command in a non-default VRF, issue it in Router-PIM BSR VRF IPv4 Configuration Mode for the appropriate VRF.

The `no holdtime` and `default holdtime` commands restore the default holdtime parameter field insertion value of 130 seconds by removing the `holdtime` statement from *running-config*.

**Command Mode**
- Router-PIM BSR IPv4 Configuration
- Router-PIM BSR VRF IPv4 Configuration

**Command Syntax**

```
holdtime period
no holdtime
default holdtime
```

**Parameters**
- `period` BSR holdtime (seconds). Value ranges from 12 to 1073741823 (1.073 billion seconds, approximately 34 years). Default is 130.

**Example**
- These commands specify 75 seconds as the value that the switch inserts into BSM holdtime fields in the default VRF.

```
switch(config)#router pim bsr
switch(config-router-pim-bsr)#ipv4
switch(config-router-pim-bsr-ipv4)#holdtime 75
switch(config-router-pim-bsr-ipv4)#
```
**ip pim dr-notify-delay**

The *ip pim dr-notify-delay* command configures the designated router’s (DR) notification delay time. The command is more effective when all PIM routers on the LAN segment have PIM DR priority that is greater than 1.

When the command is issued in Router-Multicast Configuration Mode it applies to the default VRF; to use this command in a non-default VRF, issue it in Router-Multicast VRF Configuration Mode.

The *no ip pim dr-notify-delay* command removes the previously configured DR notification delay time.

**Command Mode**
- Router-Multicast Configuration
- Router-Multicast VRF Configuration

**Command Syntax**

```
ip pim dr-notify-delay notify_delay_time
no ip pim dr-notify-delay
```

**Parameters**

- *notify_delay_time* the PIM-designated router notify delay time in seconds. The value ranges from -32767 to 32768.

**Guidelines**

The notification delay time is configured with a positive or negative value. The timer influences DR election timing when a router with the highest DR priority on a LAN segment is reloaded. In an MLAG configuration, the notification delay time begins shortly after the MLAG reload delay expires (before which the PIM hello messages are sent with a priority of 1). In a non-MLAG configuration, the notification delay time begins as soon as the PIM is configured first on the interface.

Positive values for notify delay time cause the device to send PIM hello messages with a priority of 1 until the time the notify delay time expires. During this time, DR responsibilities of the device will continue according to configured DR priority. Negative values configured for the notification delay time will not modify the priority sent in PIM hello messages, but the device will not perform any DR responsibility until the notify delay time expires. Positive values are used to avoid loss of multicast packets, but they may create a few duplicate packets from multiple PIM routers forwarding traffic for the same S,G. Negative values are used to avoid duplicate packets, but they may cause packet loss when there are no PIM routers forwarding traffic for an S,G.

**Example**

- These commands configure a DR notification delay time of 2 seconds.

```
switch(config)#router multicast
switch(config-router-multicast)#ip pim dr-notify-delay 2
switch(config-router-multicast)#
```
**pim ipv4 dr-priority**

PIM-SM uses these criteria for electing a designated router (DR):

- If at least one router does not advertise a DR priority value, then PIM-SM elects the router with the highest IP address as the DR.
- If all routers advertise a DR priority value, then PIM-SM elects the router with the highest DR priority value as the DR.

The `pim ipv4 dr-priority` command sets the DR priority value that the configuration mode interface advertises. By default, the interface does not advertise a DR priority value.

The `no pim ipv4 dr-priority` and `default pim ipv4 dr-priority` commands force the use of IP addresses to elect the designated router by removing the corresponding `pim ipv4 dr-priority` statement from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
pim ipv4 dr-priority level
no pim ipv4 dr-priority [level]
default pim ipv4 dr-priority [level]
```

**Parameters**

- `level` DR selection priority rating. Value ranges from 0 to 4294967295.

**Examples**

- This command configures the dr-priority value of 15 on VLAN interface 4.
  ```
  switch(config)#interface vlan 4
  switch(config-if-Vl4)#pim ipv4 dr-priority 15
  switch(config-if-Vl4)#
  ```

- This command force the use of IP addresses to elect the designated router.
  ```
  switch(config-if-Vl4)#no pim ipv4 dr-priority
  switch(config-if-Vl4)#
  ```
**group-expiry-timer**

The `group-expiry-timer` command sets the group-expiry-timer in seconds after which a group with no activity gets deleted from the PIM rendezvous point (RP) tree.

When the command is configured in Global Configuration Mode, the configuration is applied globally on the switch. To apply the configuration only in Bidir-PIM mode, the command is configured in Router-PIM Bidirectional Configuration Mode. To apply the configuration for a specific VRF, the command is configured in the VRF sub-mode of the Router-PIM Bidirectional Configuration Mode. Use the `router pim bidirectional` command to enter Router-PIM Bidirectional Configuration Mode.

The `no group-expiry-timer` and `default group-expiry-timer` applies the system default configuration and removes the corresponding `group-expiry-timer` command from `running-config`.

**Command Mode**
- Router-PIM Bidirectional IPv4 Configuration
- Router-PIM Bidirectional VRF IPv4 Configuration

**Command Syntax**
```
group-expiry-timer value
no group-expiry-timer value
default group-expiry-timer value
```

**Parameter**
- `value` specifies the time in seconds after which a group with no activity expires from the PIM RP. Values range from 1 to 210. There is no default value.

**Examples**
- This command configures PIM expiry-timer of 40 seconds in PIM-bidirectional sub-mode.
  ```
  switch(config)#router pim bidirectional
  switch(config-router-pim-bidir)#ipv4
  switch(config-router-pim-bidir-ipv4)#group-expiry-timer 40
  ```
- This command configures PIM expiry-timer of 120 seconds for VRF v1.
  ```
  switch(config)#router pim bidirectional
  switch(config-router-pim-bidir)#vrf v1
  switch(config-router-pim-bidir-vrf-v1)#ipv4
  switch(config-router-pim-bidir-vrf-v1-ipv4)#group-expiry-timer 120
  ```
pim ipv4 join-prune count

The `pim ipv4 join-prune count` command configures the number of times a join or prune messages can be missed before the upstream neighbor time expires.

The join-prune interval multiplied by the count is considered as join or prune hold time (specified in seconds), which is used in the join or prune messages. It is recommended to use the default configuration for "pim ipv4 join-prune interval", and modify the "pim ipv4 join-prune count" to increase the join or prune holdtime. Increasing the join-prune hold time delays the deletion of an S,G route on the upstream neighbor when join-prune messages are not sent to the neighbor. The maximum possible value for join or prune hold-time is 65535.

The `no pim ipv4 join-prune count` and `default pim ipv4 join-prune count` commands restore the default join or prune count for the configuration mode interface by removing the corresponding `pim ipv4 join-prune count` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-VLAN Configuration

**Command Syntax**
```
pim ipv4 join-prune count count_value
no pim ipv4 join-prune count count_value
default pim ipv4 join-prune count count_value
```

**Parameters**
- `count_value` The number of missed join or prune after which the route expires. Value ranges from 1.5 to 65535.

**Example**
- This command indicates the number of times a join or prune messages can be missed.
  ```
  switch(config)# interface Ethernet 1/1
  switch(config-if-Et1/1)# pim ipv4 join-prune count 5
  ```
pim ipv4 join-prune interval

The `pim ipv4 join-prune interval` command specifies the period between join or prune messages that the configuration mode interface originates and sends to the upstream RPF neighbor.

The `no pim ipv4 join-prune interval` and `default pim ipv4 join-prune interval` commands restores the default join or prune interval to 60 seconds for the configuration mode interface by removing the corresponding `pim ipv4 join-prune interval` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
pim ipv4 join-prune interval [period]
no pim ipv4 join-prune interval [period]
default pim ipv4 join-prune interval [period]
```

**Parameters**

- `period` join or prune interval (seconds). Value ranges from 1 to 18724. Default is 60.

**Example**

- This command configures 75-second intervals between join or prune messages originating from VLAN interface 4.

  ```
  switch(config)#interface vlan 4
  switch(config-if-Vl4)#pim ipv4 join-prune interval 75
  switch(config-if-Vl4)#
  ```
**pim ipv4 hello count**

The *pim ipv4 hello count* command sets the PIM hello count for the interface being configured. PIM hold time is calculated by multiplying the configured hello interval by the hello count, ensuring that the PIM neighbor stays up for the specified time after which the neighbor expires.

The *no pim ipv4 hello count* command removes the corresponding *pim ipv4 hello count* command from *running-config*.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
pim ipv4 hello count multiple
no pim ipv4 hello count [multiple]
```

**Parameters**

- *multiple* hello count multiplier. Value ranges from 1.5 to 65535. The hello hold time is the configured hello interval multiplied by the hello count.

**Examples**

- This command configures a hold time interval of 225 seconds on VLAN interface 2925 by multiplying the default 30-second hello interval by a hello count of 7.5.

  ```
  switch(config)#interface vlan2925
  switch(config-if-Vl2925)#pim ipv4 hello count 7.5
  switch(config-if-Vl2925)#
  ```

- This show command displays the hold time and other configuration details on VLAN 2925.

  ```
  switch#show ip pim interface vlan2925 details
  Interface Vlan2925 address is 1.0.1.1
  Vif number is 0
  PIM: enabled
  PIM version: 2, mode: sparse
  PIM neighbor count: 0
  PIM Effective DR: 1.0.1.1 (this system)
  PIM Effective DR Priority: 1
  PIM Effective Propagation Delay: 500 milliseconds
  PIM Effective Override Interval: 2500 milliseconds
  PIM Effective Tracking Support: disabled
  PIM Hello Interval: 30 seconds
  PIM Hello Hold Time: 225 seconds <= New Hold Time (= 7.5 * 30)
  PIM Hello Priority: 1 seconds
  PIM Hello Lan Delay: 500 milliseconds
  PIM Assert Override Interval: 3 seconds
  mrtr1#
  ```
pim ipv4 sparse-mode

The `pim ipv4 sparse-mode` command enables PIM IPv4 Sparse Mode (PIM-SM) and IGMP (router mode) on the configuration mode interface.

**Important!** PIM and multicast border router (MBR) must be mutually exclusive on an interface. If the interface is configured as an MBR, do not enable PIM on the interface.

The `no pim ipv4 sparse-mode`, `no pim ipv4`, `default pim ipv4 sparse-mode`, and `default pim ipv4` commands restore the default PIM and IGMP (router mode) settings of `disabled` on the configuration mode interface by removing the `pim ipv4 sparse-mode` statement from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `pim ipv4 sparse-mode`
- `no pim ipv4`
- `no pim ipv4 sparse-mode`
- `default pim ipv4`
- `default pim ipv4 sparse-mode`

**Example**
- This command enables PIM sparse mode on VLAN 4 interface.
  
  ```
  switch(config)#interface vlan 4
  switch(config-if-Vl4)#pim ipv4 sparse-mode
  switch(config-if-Vl4)#
  ```
**pim ipv6 sparse-mode**

The `pim ipv6 sparse-mode` command enables PIM IPv6 Sparse Mode (PIM-SM) on the configuration mode interface.

**Important!** PIM and multicast border router (MBR) must be mutually exclusive on an interface. If the interface is configured as an MBR, do not enable PIM on the interface.

The `no pim ipv6 sparse-mode`, `no pim ipv6`, `default pim ipv6 sparse-mode`, and `default pim ipv6` commands restore the default PIM settings of `disabled` on the configuration mode interface by removing the `pim ipv6 sparse-mode` command from the `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

- `pim ipv6 sparse-mode`
- `no pim ipv6`
- `no pim ipv6 sparse-mode`
- `default pim ipv6`
- `default pim ipv6 sparse-mode`

**Example**

- This command enables IPv6 PIM sparse mode on VLAN 8 interface.

```
switch(config)#interface vlan 8
switch(config-if-Vl8)#pim ipv6 sparse-mode
```

**rp address**

The **rp address** command configures the address of a Protocol Independent Multicast (PIM) static rendezvous point (RP) for a specified multicast subnet. If the command does not specify a subnet, the static RP maps to all multicast groups (224/4). Dynamic RPs override static RPs unless the static RP is given priority by using the **override** option of this command.

Multicast groups use RPs to connect sources and receivers. A PIM domain requires that all routers have consistently configured RP addresses.

The switch uses multiple **rp address** commands to configure multiple RPs or to assign multiple subnets to an RP. When the address of a multicast group falls within multicast subnets configured by multiple **rp address** commands, the group’s RP address is selected by comparing the commands’ multicast subnet size.

- Different size subnets: group uses command with the largest subnet.
- Same size subnets: group uses command as determined by hash algorithm.

When the command is issued in Router-Multicast Configuration Mode it applies to the default VRF; to use this command in a non-default VRF, issue it in Router-Multicast VRF Configuration Mode.

The **no rp address** and **default rp address** commands remove the corresponding **rp address** command from **running-config**.

**Command Mode**

- Router-PIM Sparse-mode IPv4 Configuration
- Router-PIM Sparse-mode VRF IPv4 Configuration

**Command Syntax**

```plaintext
rp address rp_addr [MULTICAST_SUBNET] [HASHMASK_LENGTH] [BSR_OVERRIDE] [PRIORITY_NUM]
no rp address rp_addr [MULTICAST_SUBNET]
default rp address rp_addr [MULTICAST_SUBNET]
```

**Parameters**

- **rp_addr**  Rendezvous point IP address (dotted decimal notation).
- **MULTICAST_SUBNET**  Multicast IP address space (CIDR or address-mask).
  - <no parameter>  Default multicast group IP address of 224/4.
  - **gp_addr**  Multicast group IP address (CIDR or address-mask).
  - **access-list acl_name**  Standard access control list that specifies the multicast group address.
  - **acl_name**  Standard access control list that specifies the multicast group address.
- **HASHMASK_LENGTH**  Length (in bits) of the hash mask.
  - <no parameter>  hash mask remains unchanged from previous setting.
  - **hashmask <0 - 32>**  hash mask length (in bits). Default value is 30.
- **BSR_OVERRIDE**  Configures priority relative to dynamic RPs selected by BSR.
  - <no parameter>  Dynamic RPs have priority over specified RP.
  - **override**  RP has priority over dynamic RPs.
- **PRIORITY_NUM**  BSR election priority rating. Larger numbers denote higher priority. Default value is 0.
  - <no parameter>  priority remains unchanged from previous setting.
  - **priority <0 - 255>**  priority rating.
Example

- These commands configure 10.17.255.2 as a static RP for all multicast groups in the default VRF.

```bash
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#rp address 10.17.255.2
switch(config-router-pim-sparse-ipv4)#
```
**rp allow**

The **rp allow** command accepts and allows PIM (*,G) join message with an RP address that is different from the configured RPs for that particular (*,G).

The **no rp allow** and **default rp allow** commands disable this behavior by removing the corresponding **rp allow** command from **running-config**.

**Command Mode**

- Router-PIM Sparse-mode IPv4 Configuration
- Router-PIM Sparse-mode VRF IPv4 Configuration

**Command Syntax**

- `rp allow`
- `no rp allow`
- `default rp allow`

**Example**

- These commands configure the switch to accept PIM (*,G) join messages in the default VRF that include RP addresses not configured on the switch for that (*,G) route.

  ```
  switch(config-router-pim-sparse)# ipv4
  switch(config-router-pim-sparse-ipv4)# rp allow
  ```

- These commands configure the switch to accept PIM (*,G) join messages in VRF “blue” that include RP addresses not configured on the switch for that (*,G) route.

  ```
  switch(config-router-pim-sparse)# vrf blue
  switch(config-router-pim-sparse-vrf-blue)# ipv4
  switch(config-router-pim-sparse-vrf-blue-ipv4)# rp allow
  ```
**rp candidate**

The `rp candidate` command configures the switch as a candidate rendezvous point (C-RP). The BSR selects a multicast group's dynamic RP set from the list of C-RPs in the PIM domain. The command specifies the interface (used to derive the RP address), C-RP advertisement interval, and priority rating. The BSR selects the RP set by comparing C-RP priority ratings. The C-RP advertisement interval specifies the period between successive C-RP advertisement message transmissions to the BSR.

**Running-config** supports multiple multicast groups through multiple `rp candidate` statements:

- All commands must specify the same interface. Issuing a command with an interface that differs from existing commands removes all existing commands from `running-config`.
- **Running-config** stores the `interval` setting in a separate statement that applies to all `rp candidate` statements. When a command specifies an interval that differs from the previously configured value, the new value replaces the old value and applies to all configured `rp candidate` statements. The default `interval` value is 60 seconds.

When the command is issued in Router-Multicast Configuration Mode it applies to the default VRF; to use this command in a non-default VRF, issue it in Router-Multicast VRF Configuration Mode.

The `no rp candidate` and `default rp candidate` commands remove `rp candidate` from `running-config` for the specified group. When these commands do not specify a multicast group, all `rp candidate` statements are removed from `running-config`.

The `no rp candidate interval` and `default rp candidate interval` commands restore the interval setting to the default value of 60 seconds. The `no rp candidate priority` and `default rp candidate priority` commands restore the priority setting to the default value of 0.

**Command Mode**

- Router-PIM Sparse-mode IPv4 Configuration
- Router-PIM Sparse-mode VRF IPv4 Configuration
- Router-PIM Bidirectional IPv4 Configuration
- Router-PIM Bidirectional VRF IPv4 Configuration

**Command Syntax**

The `INTERFACE` parameter is always listed first. All other parameters can be placed in any order.

```plaintext
rp candidate INTERFACE [GROUP_ADDR] [PRIORITY_NUM] [INTERVAL_PERIOD]
no rp candidate [INTERFACE] [GROUP_ADDR]
no rp candidate [INTERFACE] interval
no rp candidate [INTERFACE] priority
default rp candidate [INTERFACE] [GROUP_ADDR]
default rp candidate [INTERFACE] interval
default rp candidate [INTERFACE] priority
```

**Parameters**

- **INTERFACE** Switch uses IP address of specified interface as its C-RP address. Options include:
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-Channel Interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
  - `vxlan vx_num` VXLAN interface specified by `vx_num`.
- **GROUP_ADDR** address of multicast group for which candidate is configured. Options include:
- **<no parameter>** default multicast group (224.0.0.0/4).
- **net_addr** multicast IPv4 subnet address (CIDR or address mask).
- **access-list acl_name** standard access control list that specifies the multicast group address.
- **PRIORITY_NUM** RP selection priority rating. Smaller numbers denote higher priority.
  - **<no parameter>** priority rating is set to the default value of 0.
  - **priority <0 - 255>** priority rating.
- **INTERVAL_NUM** Period between consecutive RP-advertisement message transmissions (seconds). Value also applies to previously configured rp candidate statements.
  - **<no parameter>** interval remains unchanged from previous setting.
  - **interval <10 - 16383>** transmission interval.

**Example**
- These commands configure a switch as a candidate RP for the multicast group 235.1.1.0/24 with a priority of 48 and an RP advertisement interval of 45 seconds in the default VRF. The switch advertises the IP address assigned to VLAN 24 as its RP address.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#rp candidate vlan 24 235.1.1.0/24 priority 48 interval 45
switch(config-router-pim-sparse-ipv4)#
```
**rp-candidate advertisement-filter**

The `rp-candidate advertisement-filter` command filters the RP candidate advertisements from certain IP addresses. When `rp-candidate advertisement-filter` command is configured, PIM BSR filters RP candidate messages from ip-addresses matching the prefix list from the access-list that is configured.

The `no rp-candidate advertisement-filter` and `default rp-candidate advertisement-filter` commands removes `rp-candidate advertisement-filter` from `running-config` for the specified group.

**Command Mode**

- Router-PIM BSR IPv4 Configuration
- Router-PIM BSR VRF IPv4 Configuration

**Command Syntax**

```
 rp-candidate advertisement-filter access-list access-list_name
 no rp-candidate advertisement-filter access-list access-list_name
 default rp-candidate advertisement-filter access-list access-list_name
```

**Parameters**

- `access-list_name` Standard access control list that specifies the multicast group address.

**Example**

- These commands configure the switch as a candidate RP advertisement filter for the multicast group in the non-default VRF.

```
 switch(config-router-pim-bsr)# ipv4
 switch(config-router-pim-bsr-ipv4)# rp-candidate advertisement-filter access-list test1
 switch(config-router-pim-bsr-vrf-red-ipv4)# rp-candidate advertisement-filter access-list test2
```
**rp hash algorithm modulo**

The **rp hash algorithm modulo** command configures the load-balancing scheme across available rendezvous points (RP).

The configuration results in a round robin-based load balancing across available RPs, achieved by module operation of the destination group address with the number of RPs available.

The **no rp hash algorithm modulo** and **default rp hash algorithm modulo** commands result in the default load-balancing scheme which is to use a hash function to get a group-RP mapping.

**Command Mode**
- Router-PIM Sparse-mode IPv4 Configuration
- Router-PIM Sparse-mode VRF IPv4 Configuration
- Router-PIM Sparse-mode IPv6 Configuration
- Router-PIM Sparse-mode VRF IPv6 Configuration
- Router-PIM Bidirectional VRF IPv4 Configuration

**Command Syntax**
- `rp hash algorithm modulo`
- `no rp hash algorithm modulo`
- `default rp hash algorithm modulo`

**Example**

- These commands configures the hash algorithm module for a VRF named *blue* in the Router-PIM sparse-mode IPv4 configuration mode.
  ```bash
  switch(config)#router pim sparse-mode
  switch(config-router-pim-sparse)#ipv4
  switch(config-router-pim-sparse-ipv4)#vrf red
  switch(config-router-pim-sparse-vrf-red-ipv4)#rp hash algorithm modulo
  ```

- These commands configures the hash algorithm module for a VRF named *blue* in the Router-PIM bidirectional-mode VRF IPv4 configuration mode.
  ```bash
  switch(config)#router pim bidirectional
  switch(config-router-pim-bidir)#ipv4
  switch(config-router-pim-bidir-ipv4)#vrf red
  switch(config-router-pim-bidir-vrf-red-ipv4)#rp hash algorithm modulo
  ```
**sg-expiry-timer**

The `sg-expiry-timer` command configures the (S, G) expiry timer interval for PIM-SM (S, G) multicast routes. The command does not apply to (*, G) mroutes.

When the command is issued in Router-Multicast Configuration mode it applies to the default VRF; to use this command in a non-default VRF, issue it in Router-Multicast VRF Configuration mode.

The `no sg-expiry-timer` and `default sg-expiry-timer` commands restore the default setting of 210 seconds by removing the `sg-expiry-timer` statement from `running-config`.

**Command Mode**

- Router-PIM Sparse-mode IPv4 Configuration
- Router-PIM Sparse-mode VRF IPv4 Configuration

**Command Syntax**

- `sg-expiry-timer period`
- `no sg-expiry-timer`
- `default sg-expiry-timer`

**Parameters**

- `period` expiry timer interval (seconds). Value ranges from 120 to 65535 seconds. The default value is 210 seconds.

**Example**

- These commands configure 150 seconds as the (S,G) expiry timer interval is in the default VRF.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#sg-expiry-timer 150
switch(config-router-pim-sparse-ipv4)#
```
ipv4

The `ipv4` command places the switch in the IPv4 submode for the PIM configuration mode in which it is entered.

**Command Mode**
- Router Multicast Configuration
- Router-PIM Bidirectional Configuration
- Router-PIM BSR Configuration
- Router-PIM Sparse-mode Configuration

**Command Syntax**

```
ipv4
```

**Examples**

- These commands place the switch in Router Multicast IPv4 Configuration Mode.
  ```
  switch(config)#router multicast
  switch(config-router-multicast)#ipv4
  switch(config-router-multicast-ipv4)#
  ```

- These commands place the switch in Router-PIM Bidirectional IPv4 Configuration Mode.
  ```
  switch(config)#router pim bidirectional
  switch(config-router-pim-bidir)#ipv4
  switch(config-router-pim-bidir-ipv4)#
  ```

- These commands place the switch in Router-PIM BSR IPv4 Configuration Mode.
  ```
  switch(config)#router pim bsr
  switch(config-router-pim-bsr)#ipv4
  switch(config-router-pim-bsr-ipv4)#
  ```

- These commands place the switch in Router-PIM Sparse-mode IPv4 Configuration Mode.
  ```
  switch(config)#router pim sparse-mode
  switch(config-router-pim-sparse)#ipv4
  switch(config-router-pim-sparse-ipv4)#
  ```
log neighbors

The log neighbors command configures the switch to generate a log message when a neighbor entry is added or removed from the PIM Neighbor table. This function is enabled by default.

The no log neighbors command disables log message generation based on changes to the PIM Neighbor table; this command is stored in the running-config. The log neighbors and default log neighbors commands restore the default setting of generating log messages by deleting the no log neighbors statement from running-config.

Command Mode
- Router-PIM Sparse-mode IPv4 Configuration
- Router-PIM Sparse-mode VRF IPv4 Configuration
- Router-PIM Bidirectional IPv4 Configuration
- Router-PIM Bidirectional VRF IPv4 Configuration

Command Syntax
- `log neighbors`
- `no log neighbors`
- `default log neighbors`

Examples
- These commands configure the switch to stop generating log messages based on PIM Neighbor table changes in the default VRF.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#no log neighbors
switch(config-router-pim-sparse-ipv4)#
```

- These commands configure the switch to generate log messages when a neighbor entry is added or removed from the PIM Neighbor table in the default VRF.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#log neighbors
switch(config-router-pim-sparse-ipv4)#
```
pim ipv4 hello interval

The `pim ipv4 hello interval` command specifies the transmission interval between PIM hello messages originating from the configuration mode interface.

The `no pim ipv4 hello interval` and `default pim ipv4 hello interval` commands restore the default query interval of 30 seconds for the configuration mode interface by removing the corresponding `pim ipv4 hello interval` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `pim ipv4 hello interval period`
- `no pim ipv4 hello interval [period]`
- `default pim ipv4 hello interval [period]`

**Parameters**
- `period` query interval (seconds). Value ranges from 1 to 1000000 (1 million). Default is 30.

**Example**
- This command configures 45 second intervals between hello messages originating from VLAN interface 4.

```
switch(config)#interface vlan 4
switch(config-if-Vl4)#pim ipv4 hello interval 45
switch(config-if-Vl4)#
```
pim ipv4 neighbor-filter

The `pim ipv4 neighbor-filter` command configures the configuration mode interface to filter PIM control packets on the basis of neighbor addresses listed in a specified standard access list.

The `no pim ipv4 neighbor-filter` and `default pim ipv4 neighbor-filter` commands disable the configuration mode interface from filtering PIM control packets by removing the corresponding `ip pim ipv4 neighbor-filter` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**
- `pim ipv4 neighbor-filter access_list`
- `no pim ipv4 neighbor-filter`
- `default pim ipv4 neighbor-filter`

**Parameters**
- `access_list` name of the standard IP access list.

**Example**
- This command configures the IP access list named filter_1 to filter neighbor PIM control messages for VLAN 4.
  ```
  switch(config)#ip access-list standard filter_1
  switch(config-standard-acl-filter_1)#permit 10.13.24.9/24
  switch(config-standard-acl-filter_1)#exit
  switch(config)#interface vlan 4
  switch(config-if-Vl4)#pim ipv4 neighbor-filter filter_1
  switch(config-if-Vl4)#
  ```
**register local-interface**

The `register local-interface` command programs the switch to fill the source field in all outbound PIM SM register packets with the IP address of a specified interface or the incoming interface of the group specified by the message. By default, the source field is filled with the IP address from the interface associated with the best route to the RP.

When the command is issued in Router-PIM Sparse-mode IPv4 ConfigurationMode, it applies to the default VRF; to use this command in a non-default VRF, issue it in Router-PIM Sparse-mode VRF IPv4 Configuration.

The `no register local-interface` and `default register local-interface` commands restore the default method of filling the register packet source field by removing the `ip register local-interface` statement from `running-config`.

**Command Mode**

- Router-PIM Sparse-mode IPv4 Configuration
- Router-PIM Sparse-mode VRF IPv4 Configuration

**Command Syntax**

```
register local-interface INT_NAME
no register local-interface
default register local-interface
```

**Parameters**

- `INT_NAME` Interface type and number. Values include:
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port channel interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.

**Example**

- These commands program the switch to fill the source field of outbound PIM SM register packets in the default VRF with the IPv4 address of loopback interface 2.

  ```
  switch(config)#router pim sparse-mode
  switch(config-router-pim-sparse)#ipv4
  switch(config-router-pim-sparse-ipv4)#register local-interface loopback 2
  switch(config-router-pim-sparse-ipv4)#
  ```
**router pim bidirectional**

The **router pim bidirectional** command places the switch in Router-PIM Bidirectional Configuration Mode.

**Command Mode**
Global Configuration

**Command Syntax**

```
router pim bidirectional
```

**Example**
- This command places the switch in Router-PIM Bidirectional Configuration Mode.

```
switch(config)#router pim bidirectional
switch(config-router-pim-bidir)#
```
**router pim bsr**

The `router pim bsr` command places the switch in Router-PIM BSR Configuration Mode.

**Command Mode**

Global Configuration

**Command Syntax**

```
router pim bsr
```

**Example**

- This command places the switch in Router-PIM BSR Configuration Mode.
  
  switch(config)#**router pim bsr**
  
  switch(config-router-pim-bsr)#
**router pim sparse-mode**

The `router pim sparse-mode` command places the switch in Router-PIM Sparse-Mode Configuration Mode.

**Command Mode**
- Global Configuration

**Command Syntax**
- `router pim sparse-mode`

**Example**
- This command places the switch in Router-PIM Sparse-Mode Configuration Mode.
  ```
  switch(config)#router pim sparse-mode
  switch(config-router-pim-sparse)#
  ```
**show ip pim bsr**

The `show ip pim bsr` command displays the switch’s bootstrap router (BSR) information.

**Command Mode**

EXEC

**Command Syntax**

```
show ip pim bsr [GROUP_FILTER]
```

**Parameters**

- `GROUP_FILTER` specifies groups for which command displays information.
  - `<no parameter>` Displays data for all groups.
  - `net_addr` Displays message for specified group address. (CIDR or address mask).

**Example**

- This command configures the switch’s BSR information.

  switch> `show ip pim bsr`

  PIMv2 Bootstrap information
  This system is the Bootstrap Router (BSR)
  BSR address: 10.1.1.1
  Uptime: 00:14:42, BSR Priority: 0, Hash mask length: 30
  Next bootstrap message in 00:00:05
show ip pim config-sanity

The `show ip pim config-sanity` command displays diagnostic information about the switch's PIM configuration.

**Command Mode**

EXEC

**Command Syntax**

`show ip pim config-sanity`

**Example**

- This command displays PIM configuration diagnostic information.

  ```
  switch>show ip pim config-sanity
  DISCLAIMER: Below are only hints of potential PIM misconfiguration. They do not necessary imply that there is a real problem.
  
  The interfaces with PIM which are down: Vl4
  
  switch>
  ```
show ip pim interface

The `show ip pim interface` command displays information about interfaces configured for PIM.

**Command Mode**
EXEC

**Command Syntax**
`show ip pim interface [INT_NAME] [INFO_LEVEL]`

**Parameters**
- **INT_NAME** Interface type and number. Values include
  - `<no parameter>` displays information for all interfaces.
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `port-channel p_num` Port-Channel Interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
  - `vxlan vx_num` VXLAN interface specified by `vx_num`.
- **INFO_LEVEL** specifies level of information detail provided by the command.
  - `<no parameter>` table of basic configuration information.
  - `detail` list of complete configuration information.

**Examples**
- This command displays information about all interfaces on which PIM is enabled.

```plaintext
switch>show ip pim interface
Address Interface Mode Neighbor Hello DR DR Address PktsQed PktsDropped Count Intvl Pri
10.17.254.30 Vlan3910 sparse 1 30 1 10.17.254.30 0

```

switch>
show ip pim neighbor

The `show ip pim neighbor` command displays information about Protocol Independent Multicast (PIM) neighbors discovered by hello messages.

**Command Mode**

EXEC

**Command Syntax**

```
show ip pim neighbor [INT_NAME] [BFD_DATA]
```

**Parameters**

- **INT_NAME**   Interface type and number. Values include
  - `<no parameter>`   displays information for all interfaces.
  - `ethernet e_num`   Ethernet interface specified by `e_num`.
  - `loopback l_num`   Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-Channel Interface specified by `p_num`.
  - `vlan v_num`   VLAN interface specified by `v_num`.
  - `vxlan vx_num`   VXLAN interface specified by `vx_num`.
- **BFD_DATA**   Specifies inclusion of BFD data.
  - `<no parameter>`   BFD data is not displayed.
  - `bfd`   BFD data is displayed.

**Example**

- This command displays information about neighbor PIM routers.

  ```
  switch>show ip pim neighbor
  PIM Neighbor Table
  Neighbor Address   Interface       Uptime     Expires    Mode
  10.17.255.2        Vlan2028        21d22h     00:01:31   sparse
  switch>
  ```

- This command displays information about neighbor PIM routers and the status of BFD.

  ```
  switch>show ip pim neighbor bfd
  PIM Neighbor Table
  Flags: U - BFD is enabled and is UP
         I - BFD is enabled and is INIT
         D - BFD is enabled and is DOWN
         N - Not running BFD
  Neighbor Address   Interface       Uptime     Expires    Mode   Flags
  10.17.255.2        Vlan2028        21d22h     00:01:31   sparse   U
  switch>
  ```
show ip pim protocol counters

The `show ip pim protocol` command displays statistics about Protocol Independent Multicast (PIM) control messages sent and received by the switch.

**Command Mode**

EXEC

**Command Syntax**

```
show ip pim protocol counters [INT_NAME]
```

**Parameters**

- `INT_NAME` Interface type and number. Values include
  - `<no parameter>` displays information for all interfaces.
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-Channel Interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
  - `vxlan vx_num` VXLAN interface specified by `vx_num`.

**Example**

- This command displays statistics about inbound and outbound PIM control messages.

```
switch>show ip pim protocol counters
PIM Control Counters

  Received  Sent  Invalid
Assert       0    37     0
Bootstrap Router   0    0     0

Prune           0     0     0
Register        0   13643   0
Register Stop  11839     0     0
State Refresh   0     0     0

switch>
```
show ip pim register-source

The `show ip pim register-source` command displays the name of the interface from where the switch derives the IP address that it uses to fill the source field in all outbound PIM SM register packets. The `register local-interface` command specifies this interface.

By default, the source field is filled with the IP address from the interface associated with the best route to the RP. The `show ip pim register-source` command does not return a value when the source field is filled with the default value.

**Command Mode**

EXEC

**Command Syntax**

```
show ip pim register-source
```

**Example**

- This command displays the register-source interface.

```
switch>show ip pim register-source
Ethernet22
switch>
```
show ip pim rp

The show ip pim rp command displays the status and multicast group of each cached rendezvous point (RP).

Command Mode

EXEC

Command Syntax

show ip pim rp

Example

• This command displays the cached RPs.

```
switch>show ip pim rp
show ip pim rp
The PIM RP Set
Group: 224.0.0.0/4
 RP: 10.1.2.3
  Uptime: 00:05:12, Expires: never, Priority: 1 Override: 1
```
**show ip pim rp-candidate**

The *show ip pim rp-candidate* command displays the rendezvous point (RP) that is used for a specified multicast group.

**Command Mode**

EXEC

**Command Syntax**

`show ip pim rp-candidate`

**Example**

- This command displays the switch’s candidate-RP information.

```
switch>show ip pim rp-candidate
Candidate RP information
    Candidate RP Address: 10.0.12.2
    CRP Holdtime: 150 seconds
        Group 224.2.0.0/16 Priority 2
```
show ip pim rp-hash

The `show ip pim rp-hash` displays the group to RP-hash mapping for the specified group and the list of qualifying candidate RPs.

**Command Mode**
EXEC

**Command Syntax**
```
show ip pim rp-hash ipv4_addr [INFO_LEVEL]
```

**Parameters**
- `ipv4_addr` multicast group IPv4 address.
- `INFO_LEVEL` specifies level of information detail provided by the command.
  - `<no parameter>` RP-hash map and list of candidate RPs.
  - `detail` includes data about the selected RP.

**Example**
- This command displays the RP that the switch uses for multicast group 224.1.0.0.

```
switch>show ip pim rp-hash 224.1.0.0
RP 10.1.2.3
```
**show ip pim upstream joins**

The `show ip pim upstream joins` command displays the join messages that the switch is scheduled to send.

**Command Mode**

EXEC

**Command Syntax**

`show ip pim upstream joins [JOIN_ADDRESSES] [NEIGHBOR_FILTER]`

**Parameters**

- **JOIN_ADDRESSES**
  - Filters messages by source and group addresses.
  - `<no parameter>` displays all join messages.
  - `source_addr` displays all join messages for specified source group IPv4 address.
  - `group_addr` displays all join messages for specified multicast IPv4 address.
  - `source_addr group_addr` displays join message with specified source and group addresses.
  - `group_addr source_addr` displays join message with specified group and source addresses.

  `group_addr` must be a valid multicast IPv4 address.

- **NEIGHBOR_FILTER**
  - Specifies neighbors for which command provides data.
  - `<no parameter>` Displays messages for all neighbors.
  - `neighbor neighbor_addr` Displays message for specified neighbor address.

**Example**

- This command displays the list of join messages the switch is scheduled to send. The example only displays the first two messages.

```
switch>show ip pim upstream joins

------------- show ip pim upstream joins -------------

Neighbor address: 10.1.1.1
Via interface: 10.1.1.2
Next message in 1 seconds
Group: 10.10.10.3
Joins:
    10.25.1.1/32 SPT
Prunes:
    No prunes included
Neighbor address: 10.1.1.6
Via interface: 10.1.1.5
Next message in 1 seconds
Group: 10.14.1.69
Joins:
    10.105.14.3/32 SPT
Prunes:
    No prunes included
switch>
```
**ssm range**

The `ssm range` command defines the source specific multicast (SSM) range of IP multicast addresses. SSM is a multicast packet delivery method where only packets originating from a specific source address requested by a receiver are routed to that receiver. SSM explicitly excludes the use of (",G) join for applicable multicast groups. Source-specific multicast differs from any-source multicast (ASM), where a receiver expresses interest in traffic to a multicast address, then receives traffic from all multicast sources sending to that address.

When the command is issued in Router-PIM Sparse-mode IPv4 Configuration Mode it applies to the default VRF; to use this command in a non-default VRF, issue it in Router-PIM Sparse-mode VRF IPv4 Configuration Mode.

The `no ssm range` and `default ssm range` commands remove the SSM IP multicast address range by deleting the `ssm range` statement from `running-config`.

**Command Mode**
- Router-PIM Sparse-mode IPv4 Configuration
- Router-PIM Sparse-mode VRF IPv4 Configuration

**Command Syntax**

```
ssm range {acl_name | standard}
no ssm range
default ssm range
```

**Parameters**

- `acl_name` sets the SSM range to address set specified by the standard ACL.
- `standard` sets the SSM range to 232/8.

**Examples**

- These commands configure the SSM address range to 232/8 in the default VRF.

  ```
  switch(config)#router pim sparse-mode
  switch(config-router-pim-sparse)#ipv4
  switch(config-router-pim-sparse-ipv4)#ssm range standard
  switch(config-router-pim-sparse-ipv4)#
  ```

- These commands configure the SSM address range to those permitted by the LIST_1 standard ACL in the default VRF. The ACL permits the subnet address range 233.0.0.0/24.

  ```
  switch(config)#ip access-list standard LIST_1
  switch(config-std-acl-LIST_1)#permit 233.0.0.0/24
  switch(config-std-acl-LIST_1)#exit
  switch(config)#router pim sparse-mode
  switch(config-router-pim-sparse)#ipv4
  switch(config-router-pim-sparse-ipv4)#ssm range LIST_1
  switch(config-router-pim-sparse-ipv4)#
  ```
spt threshold

The **spt threshold** command configures shortest path tree (SPT) threshold actions for IPv4 multicast groups. To specify the threshold action for multicast groups that match a specified access control list (ACL), use the **match list** option. When the command is issued without this option, it is applied throughout the configuration-mode VRF. Any ACL-based configuration overrides global configuration.

- When **running-config** does not list this command, the switch joins the SPT immediately after receiving the first PIM packet from a new source. The switch joins the SPT by sending PIM join message toward the source.
- When **running-config** lists this command with a value of infinity, the switch never joins the SPT.

The **no spt threshold** and **default spt threshold** commands remove the corresponding **spt threshold** command from **running-config**.

**Command Mode**

Router-PIM Sparse-mode IPv4 Configuration  
Router-PIM Sparse-mode VRF IPv4 Configuration

**Command Syntax**

```
spt threshold {0 | infinity} [match list acl_name]
no spt threshold {0 | infinity} [match list acl_name]
default spt threshold {0 | infinity} [match list acl_name]
```

**Parameters**

- **0**  The switch immediately joins the SPT. This is the default value.
- **infinity**  The switch never joins the SPT.
- **acl_name**  name of access control list. If no ACL is supplied, the configuration is applied to all multicast groups within the VRF which are not configured by an ACL.

**Examples**

- This command configures the switch in the default VRF to immediately join the SPT for multicast groups matched by the ACL “group-1.”

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#spt threshold 0 match list group-1
switch(config-router-pim-sparse-ipv4)#
```
**sztimeout**

The `sztimeout` command configures the maximum span of active scope-zone. The no `sztimeout` and default `sztimeout` commands delete the current scope zoned timeout configuration.

**Command Modes**

Router-PIM BSR IPv4 Configuration

Router-PIM BSR VRF IPv4 Configuration

**Syntax**

```
sztimeout timeout
no sztimeout
default sztimeout
```

**Parameter**

`timeout` Maximum span of active scope-zone in seconds. The value ranges from 120 to 4294967295. The default value is 1300.

**Guideline**

The scope zoned timeout must contain a minimum value of 10 times of configured holdtime; else the system displays a warning message.

**Examples**

- This command configures 600 seconds as the maximum of active scope-zone in router-pim bsr ipv4 configuration mode.

```
switch(config)#router pim bsr
switch(config-router-pim-bsr)#ipv4
switch(config-router-pim-bsr-ipv4)#sztimeout 600
```

- This command configures 2200 seconds as the maximum of active scope-zone in router-pim bsr vrf ipv4 configuration mode.

```
switch0(config)#router pim bsr
switch(config-router-pim-bsr)#vrf vrf01
switch(config-router-pim-bsr-vrf-vrf01)#ipv4
switch(config-router-pim-bsr-vrf-vrf01-ipv4)#sztimeout 2200
```
Multicast Source Discovery Protocol (MSDP) describes a topology that connects multiple IPv4 Protocol Independent Multicast Sparse-Mode (PIM-SM) domains. Each PIM-SM domain uses its independent Rendezvous Point (RP) without depending on RPs in other domains.

These sections describe the Arista MSDP implementation.

- Section 41.1: MSDP Introduction
- Section 41.2: MSDP Description
- Section 41.3: MSDP Configuration
- Section 41.4: MSDP Commands

41.1 MSDP Introduction

Arista switches support these MSDP features:

- Basic MSDP speaker functions.
- MSDP peer configuration: description, connect-source interface, keepalive time, and hold time.
- ACL filtering of inbound and outbound Source-Active (SA) messages.
- Mesh groups.
- Display of peer status.
- Display of filtered SA messages received from MSDP peers.

These MSDP features are not supported:

- MSDP is not supported with Anycast-RP (RFC4610).
- IP packet encapsulation.
41.2 MSDP Description

The Multicast Source Discovery Protocol (MSDP) defines a topology connecting Protocol Independent Multicast sparse mode (PIM-SM) domains. MSDP provides inter-domain access to multicast sources in all domains by enabling all rendezvous points (RPs) to discover multicast sources outside of their domains. RPs also use MSDP to announce sources that are sending to a multicast group.

41.2.1 MSDP Speakers

An MSDP speaker is a router in a PIM-SM domain that has MSDP peering sessions with MSDP peers in other domains. An MSDP peering session is a TCP connection through which peers exchange MSDP control information. An MSDP peer is a router that is connected to the speaker through a peering session.

PIM uses MSDP to register a local source with remote domain RPs through Source Active (SA) messages, which originate at the local domain’s RP. Receivers in remote PIM-SM domains depend only on RPs in their domains to learn of multicast data sources in other domains. Multicast data is subsequently delivered from a source to receivers in different domains through a PIM-SM source tree. Section 41.3.1: MSDP Speaker Configuration describes the process of configuring MSDP speakers.

41.2.2 Network Configuration

The TCP connections between RPs are defined either through an underlying unicast routing table or by configuring a default MSDP peer. A typical MSDP configuration utilizes a BGP specified routing table. SA messages are MSDP control messages that peers exchange during peering sessions.

41.2.2.1 Source Active Messages

A Source Active (SA) message is a message that an RP creates and sends to MSDP peers when it learns of a new multicast source through a PIM register message. RPs that intend to originate or receive SA messages must establish MSDP peering with other RPs, either directly or through intermediate MSDP peers. An RP that is not a DR on a shared network should only originate SAs in response to register messages it receives from the DR. It does not originate SA’s for directly connected sources in its domain.

SA messages contain the following fields:

- Source address of the data source.
- Group address that receives data sent by the source.
- IP address of the RP.

The SA Cache is the repository of SA messages received by the MSDP speaker. The switch always stores received SA messages. Section 41.3.4: Managing the SA Cache describes procedures that limit the size of the SA cache and options for displaying the cache.

41.2.2.2 Reverse Path Forwarding

Reverse path forwarding (RPF) is a multicast packet transport technique that ensures loop-free packet forwarding by using a router’s unicast routing table. Traffic forwarding is based on source addresses instead of destination addresses. RPF is implemented as defined in RFC 3618.

Packet forwarding is based on the packet’s unicast reverse path. An RPF router prevents network loops by only forwarding a packet when it enters through the interface holding its source routing entry.
When a multicast packet enters a router's interface, the router checks the reverse path of the packet by examining the list of networks that are reachable through the input interface. If the list contains a matching routing entry for the multicast packet's source IP address, the packet is forwarded to all other interfaces that are participants in the multicast group. Otherwise, the packet is dropped.

RPF requires that the unicast routing table is correct and converged. It also assumes that the use of symmetric forward and reverse paths between router and sender. RPF fails on uni-directional links. 

Section 41.3.3.1: Displaying RPF Peers describes commands that display RPF peers.

**41.2.2.3 Default MSDP Peers**

The default peer is the MSDP peer from which the MSDP speaker accepts SA messages. If there is only one MSDP peer, all of its SA messages will be accepted. When multiple default peers are configured the switch uses the first default peer to appear in *running-config*. Default MSDP peers invalidate the use of RPF over unicast routing tables.

Each default peer may be associated with a prefix list. The prefix list specifies the RPs from where the speaker accepts SA messages. When *running-config* contains multiple default peers with prefix lists, an SA is accepted from the first default peer in *running-config* whose prefix list contains the RP in the SA. The speaker accepts all remaining SAs from the first default peer that is not associated with a prefix list.

Section 41.3.3.2: Configuring the Default Peer describes commands that configure default peers.

**41.2.3 MSDP Exchange Processes**

**41.2.3.1 Control Information Exchange**

An RP originates an SA message when a source registers with the RP to send data to a multicast group. RPs periodically originate SA messages while its registered sources send data to maintain messages in SA caches of its MSDP peers. RPs that have no registered sources periodically send keepalive messages to maintain TCP connections with its peers.

MSDP defines the following timers that specify the transmission frequency of control messages:

- **SA Advertisement Time**: Duration of SA Advertisement intervals. An RP sends periodic SA messages to reference each registered source once per interval. SA advertisement time is 60 seconds.
- **Keepalive Time**: Period between the transmission of consecutive keepalive messages. Default keepalive time is 60 seconds. Minimum keepalive time is one second.
- **Hold Timer**: Period an MSDP speaker maintains a peer TCP connection after receiving an SA or keepalive message from the peer. Default time is 75 seconds. Minimum hold time is three seconds.

**41.2.3.2 MSDP Data Exchange**

This sequence describes the exchange of multicast data across PIM domains through MSDP:

**Step 1**  
When a source's first data packet is registered by the first hop router, the RP extracts the data from the packet and forwards it down the shared tree in the PIM domain.

**Step 2**  
The RP informs MSDP peers of the new source by sending a Source-Active (SA) message that identifies the source, the recipient group, and the RP's address or originator ID.

**Step 3**  
Upon receiving the SA message, an MSDP peer which is the RP for a multicast tree that includes members interested in the multicast sends a PIM join message (S,G) toward the data source.
Step 4  The PIM designated router (DR) sends subsequent data encapsulated in PIM register messages directly to the remote domain’s RP when the source becomes active.

Step 5  If the source times out, this process repeats when the source goes active again.
41.3 MSDP Configuration

These sections describe the configuration of the switch as an MSDP speaker and the establishment of MSDP peering sessions.

- Section 41.3.1: MSDP Speaker Configuration
- Section 41.3.2: Establishing MSDP Peers
- Section 41.3.3: MSDP Network Configuration
- Section 41.3.4: Managing the SA Cache
- Section 41.3.5: Configuring MSDP in a non-default VRF

MSDP requires that TCP port 639 (MSDP) is open on the control plane. The default control-plane ACL includes a permit rule that allows TCP packets access through the MSDP port.

41.3.1 MSDP Speaker Configuration

The switch is configured as an MSDP speaker when MSDP is enabled. MSDP is enabled by configuring an MSDP peer. Section 41.3.2.1 describes the process of configuring an MSDP peer.

Source-Address (SA) messages that an MSDP speaker originates contain the speaker’s rendezvous point (RP) address, as configured through PIM statements and processes. MSDP provides a method of assigning an originator ID address, which the speaker uses in place of its RP address when advertising SA messages. The `originator-id local-interface` command configures the switch to set the RP address to the specified interface’s IP address in SA messages that it originates as an MSDP speaker.

Only RPs originate SA messages and only for its registered sources. RPs do not originate periodic SA messages for sources in other PIM domains. MSDP speakers that are not RPs do not originate periodic SA messages. Intermediate MSDP speakers forward SA messages received from other domains.

Intermediate speakers are not required to be RPs.

Example

- This command configures the switch to use the IP address assigned to loopback interface 100 as the RP address in SA messages that it originates.

  ```
  switch(config)#originator-id local-interface loopback 100
  switch(config)#
  ```

41.3.2 Establishing MSDP Peers

These sections describe MSDP Peer configuration tasks.

- Section 41.3.2.1: Configuring an MSDP Peer
- Section 41.3.2.2: Mesh Groups
- Section 41.3.2.3: Filtering SA Messages
- Section 41.3.2.4: Keep-alive, Hold Time, and Reset Time Configuration
- Section 41.3.2.5: Displaying Peer Information

41.3.2.1 Configuring an MSDP Peer

The switch attempts to establish MSDP peering sessions through IP addresses configured as MSDP peers. The `peer` command configures a specified address as an MSDP peer and enables the switch as an MSDP speaker if no other peers are configured. The peering session with the device at the
specified network is established over a TCP connection. The `local-interface` command can be used to specify an interface through which the switch establishes the TCP session. When no interface is specified, the connection is established through an interface determined by existing routing algorithms.

To display MSDP peer information, enter `show ip msdp peer`.

**Example**

- These commands assign an IP address to loopback interface 100, then configure 10.4.4.12 as an MSDP peer and establish the TCP peer session through the loopback.

```plaintext
switch(config)#router msdp
switch(config-router-msdp)#interface loopback 100
switch(config-if-Lo100)#ip address 10.6.8.6/24
switch(config-if-Lo100)#exit
switch(config)#router msdp
switch(config-router-msdp)#peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)#local-interface loopback 100
switch(config-router-msdp-peer-10.4.4.12)#show ip msdp peer
MSDP Peer 10.4.4.12
Connection status:
  State: Connect
  Resets: 0
  Connection Source: Loopback100 ( 10.6.8.6 )
SAs accepted:
switch(config-router-msdp-peer-10.4.4.12)#
```

To associate descriptive text with the specified MSDP peer, use the `description (MSDP)` command.

**Example**

- These commands associate the string `NORTH` with the MSDP peer located at 10.4.4.12.

```plaintext
switch(config)#router msdp
switch(config-router-msdp)#peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)#description NORTH
switch(config-router-msdp-peer-10.4.4.12)#show ip msdp peer
MSDP Peer 10.4.4.12
Description: NORTH
Connection status:
  State: Connect
  Resets: 0
  Connection Source: Loopback100 ( 10.6.8.6 )
SAs accepted:
switch(config-router-msdp-peer-10.4.4.12)#
```

To close the peering session with the specified MSDP peer, use the `disabled (MSDP)` command. This terminates the TCP connection between the switch and the peer. The peer remains configured and the peer session can be resumed by removing the `disabled` command from `running-config`.

```plaintext
switch(config-router-msdp-peer-10.4.4.12)#
```
Examples

- This command closes the peering session with the MSDP peer at 10.4.4.12.

```plaintext
switch(config)#router msdp
switch(config-router-msdp)#peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)#disabled
switch(config-router-msdp-peer-10.4.4.12)#show ip msdp peer
MSDP Peer 10.4.4.12
Description: NORTH
Connection status:
  State: Disabled
  Resets: 0
  Connection Source: Loopback100 ( 10.6.8.6 )
SAs accepted:
```

- This command reopens the peering session with the peer at 10.4.4.12.

```plaintext
switch(config)#router msdp
switch(config-router-msdp)#peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)#no disabled
switch(config-router-msdp-peer-10.4.4.12)#show ip msdp peer
MSDP Peer 10.4.4.12
Description: NORTH
Connection status:
  State: Connect
  Resets: 0
  Connection Source: Loopback100 ( 10.6.8.6 )
SAs accepted:
```

41.3.2.2 Mesh Groups

Each node in a fully meshed network is directly connected to every other node in the network. Each peer in a fully meshed MSDP speaker network can be configured as a member of a mesh group. SA messages received from a mesh group peer are not forwarded to other members of the mesh group.

To configure an MSDP peer connection as an MSDP mesh group member, use the `mesh-group` command. An MSDP peer can be assigned to multiple mesh groups. Multiple peer connections can be assigned to the same mesh group.

**Note**

Peer-specific mesh-group configuration is performed in Router MSDP Peer Configuration or Router MSDP Peer VRF Configuration Mode. To remove all configured connections from a mesh group, use the `no mesh-group` command in Router MSDP Configuration Mode.

To display the mesh group membership of configured MSDP peers, enter `show msdp mesh-group`. 
Example

- These commands configure the MSDP peer connection to 10.1.1.14 as a member of the AREA-1 mesh group, then displays members of mesh groups to which configured MSDP peers belong.

```bash
switch(config)#router msdp
switch(config-router-msdp)#peer 10.1.1.14
switch(config-router-msdp-peer-10.1.1.14)#mesh-group AREA-1
switch(config-router-msdp-peer-10.1.1.14)#show msdp mesh-group
Mesh Group: AREA-1
  10.1.1.14
Mesh Group: tier_01
  10.24.18.13
Mesh Group: tier_02
  10.26.101.18
```

41.3.2.3 Filtering SA Messages

The switch can filter Source-Active (SA) messages that it sends and receives with access control lists (ACLs). The commands accept standard and extended ACLs. The address field in standard ACLs filter an SA message on its group address.

The `sa-filter in` command assigns an ACL to filter inbound SA messages from the MSDP peer connection being configured. The switch only accepts SA messages from the peer that pass the ACL. The switch accepts all SA messages from peers that are not assigned an input ACL. A peer can be assigned only one input filter ACL. Subsequent `sa-filter in` commands for a peer replace the existing command.

The `sa-filter out` command assigns an ACL as a filter for outbound SA messages to the MSDP peer connection being configured. The switch only sends SA messages to the peer that pass the ACL. The switch sends all specified SA messages to peers not assigned an output filter ACL. A peer can be assigned only one output ACL. Subsequent `sa-filter out` commands for a peer replace the existing command.

Example

- These commands assign the IP ACLs named LIST-IN as the inbound SA message filter and LIST-OUT as the outbound SA message filter for the MSDP peer connection to 10.4.4.12.

```bash
switch(config)#router msdp
switch(config-router-msdp)#peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)#sa-filter in list LIST-IN
switch(config-router-msdp-peer-10.4.4.12)#sa-filter out list LIST-OUT
switch(config-router-msdp-peer-10.4.4.12)#show ip msdp peer
MSDP Peer 10.4.4.12
  Connection status:
    State: Listen
    Connection Source: Loopback100 (10.6.8.6)
  SA Filtering:
    Input Filter: LIST-IN
    Output Filter: LIST-OUT
```

41.3.2.4 Keep-alive, Hold Time, and Reset Time Configuration

To configure the MSDP keep-alive and hold time intervals for a specified MSDP peer connection, use the `keepalive (MSDP)` command.
Keep-alive time interval is the period between the transmission of consecutive keep-alive messages. The default keep-alive time interval is 60 seconds.

Hold time interval is the period the switch waits for a KEEPALIVE or UPDATE message before it disables peering. The default hold time interval is 75 seconds.

The hold time interval must be longer than or equal to the keep-alive time interval.

Example

- This command sets the keep-alive time to 45 seconds and the hold time to 80 seconds for the MSDP peer connection to 10.4.4.12.

```
switch(config)#router msdp
switch(config-router-msdp)#peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)#keepalive 45 80
```

To specify the period that the switch waits after an MSDP peering session is reset before attempting to reestablish the session, enter `connection retry interval`. The default period is 30 seconds.

Example

- This command configures the switch to wait 45 seconds after an MSDP peering session is reset before attempting to reestablish the session.

```
switch(config)#router msdp
switch(config-router-msdp)#connection retry interval 45
```

41.3.2.5 Displaying Peer Information

To display the MSDP peers, enter `show ip msdp summary`. The command also displays the operational status of each peer and the number of messages from the peers in the SA cache.

Example

- This command displays the configured peers, the status of the peers, and the number of SA messages received from those peers.

```
switch(config)#show ip msdp summary
MSDP Peer Status Summary
Peer Address  State  SA Count
192.168.3.18  Up     0
192.168.3.16  Up     0
192.168.3.37  Listen 0
192.168.3.46  Up     0
192.168.3.47  Up     0
```

41.3.3 MSDP Network Configuration

41.3.3.1 Displaying RPF Peers

The switch uses the unicast routing table to define TCP connections between RPs by selecting the next hop peer toward the originating RP of an SA message as the reverse path forwarding (RPF) peer. The switch forwards SA messages that it receives from the RPF peer to all other MSDP peers. The switch rejects SA messages that it receives from non-RPF peers.

To display MSDP information for the peer from which the switch accepts SA messages for a specified rendezvous point (RP), enter `show msdp rpf-peer`. 
Example
- This command displays MSDP information for the peer from which the switch accepts SA messages for the RP at 10.5.29.4.

```
switch(config)#show msdp rpf-peer 10.5.29.4
Rpf Peer is 10.5.29.4 for RP 10.5.29.4
```

41.3.3.2 Configuring the Default Peer

The default peer is the MSDP peer from which the MSDP speaker is configured to accept all SA messages. A default peer may be associated with a prefix list. The prefix list specifies the RPs from where the speaker accepts SA messages.

The switch can designate multiple default peers:

- Switch defines one peer: A default peer statement is not required; the switch accepts SA traffic from the configured peer.
- Switch defines one default peer (no prefix list): The switch accepts all SA messages from only the default peer.
- Switch defines multiple default peers (no prefix lists): The switch accepts all SA messages from only the first default peer listed in `running-config`. Other listed default peers take effect only if the peer named in the first default-peer statement is not accessible.
- First default-peer statement includes a prefix list: The switch accepts all SA messages from the default peer whose originating RP is covered in the prefix list. The disposition of SA messages originating from other RPs is determined by subsequent `default-peer` statements.

To configure the specified MSDP peer connection as a default peer on the switch, use the `default-peer` command. The default peer address must be a previously configured MSDP peer (configured using the `peer` command).

Example
- These commands configure an MSDP default peer.

```
switch(config)#router msdp
switch(config-router-msdp)#peer 10.5.2.2
switch(config-router-msdp-peer-10.5.2.2)#default-peer
```

41.3.4 Managing the SA Cache

The switch stores Source Active (SA) messages after forwarding the information. This allows new group members to learn about the source before the next SA message is received. The caching action is not configurable and cannot be disabled.

SA messages have an expiration period of 90 seconds and remain in the SA cache until they expire. A peer’s SA limit defines the number of SA messages the switch stores from the peer. The switch does not store SA messages from a peer whose SA limit is reached until its cached messages start expiring.

41.3.4.1 Limiting SA Cache Contents

To configure the maximum number of SA messages from a specified MSDP peer that the switch stores in the SA cache, use the `sa-limit` command. The default limit of SA messages that the switch can store from a specified peer is 40000.
Example

- This command sets the SA limit of 500 for the MSDP peer at 10.1.1.5.

```
switch(config)#router msdp
switch(config-router-msdp)#peer 10.1.1.5
switch(config-router-msdp-peer-10.1.1.5)#sa-limit 500
switch(config-router-msdp-peer-10.1.1.5)#
```

The maximum number of SA messages that the switch can store in the SA cache for a specified multicast group address is configured by the `group-limit` command. The default limit of SA messages that the switch can store from a specified group is 40000.

Example

- This command sets the maximum number of 1000 SAs for multicast group 225.13.15.8/29

```
switch(config)#router msdp
switch(config-router-msdp)#group-limit 1000 source 225.13.15.8/29
```

The maximum number of rejected SA messages that the switch can store in the SA cache is configured by the `ip msdp rejected-limit` command. The default limit of rejected SA messages that the switch can store is 40000.

Example

- This command sets 5000 as the maximum number of rejected SAs that the SA cache can contain.

```
switch(config)#router msdp
switch(config-router-msdp)#ip msdp rejected-limit 5000
```

Contents of the SA message cache are removed by the `clear ip msdp sa-cache` command. The command provides options for removing all cache contents or only contents of a specific multicast group.

Example

- This command deletes all SA message cache contents.

```
switch(config)#router msdp
switch(config-router-msdp)#clear ip msdp sa-cache
```

41.3.4.2 Displaying SA Cache Contents

SA message cache contents are displayed by the `show ip msdp sa-cache` command. Filter options provided by the command for displaying partial cache contents include:

- multicast group address: multicast group
- source address and group address

The command can also display unexpired SAs rejected by ACL filters or cache limit exceeded conditions.
Example

- This command displays the contents of the SA message cache.

```
switch(config)#show ip msdp sa-cache
MSDP Source Active Cache
(10.61.71.29, 234.1.4.2), RP 10.5.29.4, heard from 10.5.29.4
(10.51.71.23, 234.1.4.1), RP 10.5.29.4, heard from 10.5.29.4
(10.53.71.27, 234.1.4.2), RP 10.3.25.4, heard from 10.3.25.4
(10.10.101.24, 234.1.4.1), RP 10.2.44.4, heard from 10.2.44.4
(10.10.151.22, 234.1.4.1), RP 10.1.12.4, heard from 10.1.12.4
```

Information about specified MSDP peers, including SAs accepted from the peer is displayed by the `show ip msdp peer` command.

Example

- This command displays data for the peer at 10.2.42.4, including SAs accepted from the peer.

```
switch(config)#show ip msdp peer 10.2.42.4 accepted-sas
MSDP Peer 10.2.42.4
Connection status:
  State: Up
  Connection Source: Loopback4 (10.2.43.4)
SA Filtering:
  Input Filter: allow-multicast-for-msdp
  Output Filter: allow-multicast-for-msdp
SAs accepted:
  (10.62.79.30, 234.1.4.2), RP 10.2.42.4
  (10.61.79.29, 234.1.4.1), RP 10.2.42.4
  (10.62.79.30, 234.1.4.1), RP 10.2.42.4
```

The SA cache for the local PIM domain is displayed by the `show ip msdp pim sa-cache` command.

Example

- This command displays the SA cache for the local PIM domain.

```
switch(config)#show ip msdp pim sa-cache
MSDP Source Active Messages for local Pim RP
  (10.51.71.23, 234.1.4.1), RP 10.2.43.4
  (10.20.91.26, 234.1.4.1), RP 10.2.43.4
  (10.20.91.26, 234.1.4.2), RP 10.2.43.4
  (10.20.91.24, 234.1.4.1), RP 10.2.43.4
```

41.3.4.3 Verifying Consistency Between the SA Cache and the Routing Table

To check the consistency between the multicast routing table and the MSDP Source-Address (SA) caches, enter `show ip msdp sanity`. When the command detects inconsistencies, it displays the cache entries that are not in the table.
Example

- This command displays a sanity check that detects inconsistencies between the SA cache and the multicast routing table.

```
switch(config)#show ip msdp sanity
PIM SA cache entries not in the MRT
Msdp-learnt MRT entries not in the SA cache
SA cache entries not in the MRT
(192.168.3.8, 224.1.154.1)
(192.168.3.35, 224.1.167.1)
(192.168.3.16, 224.1.226.1)
(192.168.3.12, 224.1.182.1)
(192.168.3.33, 224.1.150.1)
May-Notify-MSDP entries not in the PIM SA cache
(need not be an error condition)
4.1), RP 10.2.42.4
```

41.3.5 Configuring MSDP in a non-default VRF

The MSDP can also be configured in a non-default VRF, when the default VRF used does not have a name. The following commands configure MSDP in a non-default VRF.

Example

- These commands configure MSDP peer 1.1.1.1 in a non-default VRF blue.

```
switch(config)#router msdp
switch(config-router-msdp)#vrf blue
switch(config-router-msdp-vrf-blue)#peer 1.1.1.1
```
41.4 MSDP Commands

MSDP Configuration Commands (Global)
- connection retry interval
- group-limit
- ip msdp rejected-limit
- originator-id local-interface
- peer
- router msdp

MSDP Peer Configuration Commands
- default-peer
- description (MSDP)
- disabled (MSDP)
- keepalive (MSDP)
- local-interface
- mesh-group
- sa-filter in
- sa-filter out
- sa-limit

MSDP SA Cache Commands
- clear ip msdp sa-cache

MSDP Display Commands
- show ip msdp peer
- show ip msdp pim sa-cache
- show ip msdp sa-cache
- show ip msdp sanity
- show ip msdp summary
- show msdp mesh-group
- show msdp rpf-peer
clear ip msdp sa-cache

The `clear ip msdp sa-cache` command removes contents of the Source-Active (SA) message cache. The command provides these filter options for removing partial cache contents:

- contents of a multicast group by specifying its group address
- all cache contents

**Command Mode**
- Router MSDP Configuration
- Router MSDP VRF Configuration

**Command Syntax**

```
clear ip msdp sa-cache [ADDRESS_FILTER]
```

**Parameters**

- `ADDRESS_FILTER` IPv4 address used to select table entries for removal.
  - `<no parameter>` All SA messages
  - `grp_addr` Multicast group address (IPv4 address). The `grp_addr` must be a valid multicast address.

**Example**

- This command deletes all SA message cache contents.

```
switch(config)#router msdp
switch(config-router-msdp)#clear ip msdp sa-cache
```
**connection retry interval**

The **connection retry interval** command specifies the period that the switch waits after an MSDP peering session is reset before trying to reestablish the session. The default period is 30 seconds.

The **no connection retry interval** and **default connection retry interval** commands reset the timer interval to the default period of 30 seconds by removing the **connection retry interval** command from **running-config**.

**Command Mode**
- Router MSDP Configuration
- Router MSDP VRF Configuration

**Command Syntax**

- `connection retry interval connect_retry`
- `no connection retry interval connect_retry`
- `default connection retry interval connect_retry`

**Parameter**
- **connect_retry** Reconnect period (seconds). Value ranges from 1 to 65535. Default is 30.

**Example**
- This command configures the switch to wait 45 seconds after an MSDP peering session is reset before attempting to reestablish the session.

```plaintext
switch(config)#router msdp
switch(config-router-msdp)#connection retry interval 45
```
default-peer

The **default-peer** command configures the specified MSDP peer connection as a default peer on the switch. The default peer configuration defines the peers from which the switch accepts Source-Active (SA) messages. When the command includes a *prefix list* parameter, the specified peer is the default peer for only SA messages originating from rendezvous points (RPs) covered by prefix list entries. The default peer address must be a previously configured MSDP peer (configured using the *peer* command).

Default peers provide an alternative to reverse packet forwarding (RPF) typically used by MSDP to specify the peers from which a switch accepts SA messages. However, RPF requires a unicast routing table that is correct and converged. RPF also assumes symmetric forward and reverse paths between router and sender. RPF fails on uni-directional links. Default MSDP peers invalidate the use of RPF over unicast routing tables.

The switch can designate multiple default peers:

- Switch defines one peer: A default peer statement is not required; the switch accepts SA traffic from the configured peer.
- Switch defines one default peer (no prefix list): The switch accepts all SA messages from only the default peer.
- Switch defines multiple default peers (no prefix lists): The switch accepts all SA messages from only the first default peer listed in *running-config*. Other listed default peers are used only when peers listed before them in *running-config* are not accessible.
- First default-peer statement includes a prefix list: The switch accepts all SA messages from the default peer whose originating RP is covered in the prefix list. The disposition of SA messages originating from other RPs is determined by subsequent *default-peer* statements.

The **no default-peer** and **default default-peer** commands remove the corresponding *default-peer* command from *running-config*.

**Command Mode**

Router MSDP Peer Configuration
Router MSDP Peer VRF Configuration

**Command Syntax**

```
default-peer [PREFIX]
no default-peer
default default-peer
```

**Parameters**

- **PREFIX** List of RPs from the SA messages originate for which the default peer is valid.
- <no parameter> default peer is valid for SAs from all originating RPs.
- **prefix-list list_name** name of the prefix list that defines affected originating RP prefixes.
Example

- These commands configure two MSDP peers and configure the peer at 10.5.2.2 as the default peer.

```
switch(config)#router msdp
switch(config-router-msdp)#peer 10.6.2.2
switch(config-router-msdp-peer-10.6.2.2)#exit
switch(config-router-msdp)#peer 10.5.2.2
switch(config-router-msdp-peer-10.5.2.2)#default-peer
switch(config-router-msdp-peer-10.5.2.2)#
```
description (MSDP)

The `description` command associates descriptive text with the configuration-mode MSDP peer. The `no description` and `default description` commands remove the text association from the specified peer.

**Command Mode**
- Router MSDP Peer Configuration
- Router MSDP Peer VRF Configuration

**Command Syntax**

```
description description_string
no description
default description
```

**Parameters**
- `description_string` text string that is associated with the peer.

**Example**
- These commands associate the string NORTH with the MSDP peer located at 10.4.4.12.

```
switch(config)#router msdp
switch(config-router-msdp)#peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)#description NORTH
switch(config-router-msdp-peer-10.4.4.12)#show ip msdp peer
MSDP Peer 10.4.4.12
Description: NORTH
Connection status:
  State: Connect
  Resets: 0
  Connection Source: Loopback100 (10.6.8.6)
SAs accepted:
switch(config-router-msdp-peer-10.4.4.12)#
```
disabled (MSDP)

The `disabled` command closes the peering session with the specified MSDP peer by terminating the TCP connection between the switch and the peer. The connection is not resumed until the shutdown command is removed from `running-config`.

The `no disabled` and `default disabled` commands establish an MSDP peering session with the specified peer by removing the corresponding `disabled` command from `running-config`.

**Command Mode**

- Router MSDP Peer Configuration
- Router MSDP Peer VRF Configuration

**Command Syntax**

```plaintext
disabled
no disabled
default disabled
```

**Examples**

- This command closes the peering session with the MSDP peer at 10.4.4.12.
  ```plaintext
  switch(config)#router msdp
  switch(config-router-msdp)#peer 10.4.4.12
  switch(config-router-msdp-peer-10.4.4.12)#disabled
  switch(config-router-msdp-peer-10.4.4.12)#show ip msdp peer
  MSDP Peer 10.4.4.12
  Description: NORTH
  Connection status:
  State: Disabled
  Resets: 0
  Connection Source: Loopback100 ( 10.6.8.6 )
  SAs accepted:
  switch(config-router-msdp-peer-10.4.4.12)#
  ```

- This command reopens the peering session with the peer at 10.4.4.12.
  ```plaintext
  switch(config)#router msdp
  switch(config-router-msdp)#peer 10.4.4.12
  switch(config-router-msdp-peer-10.4.4.12)#no disabled
  switch(config-router-msdp-peer-10.4.4.12)#show ip msdp peer
  MSDP Peer 10.4.4.12
  Description: NORTH
  Connection status:
  State: Connect
  Resets: 0
  Connection Source: Loopback100 ( 10.6.8.6 )
  SAs accepted:
  switch(config-router-msdp-peer-10.4.4.12)#
  ```
group-limit

The `group-limit` command specifies the maximum number of Source-Active (SA) messages that the switch allows in the SA cache for a specified multicast group address.

SA messages have an expiration period of 90 seconds and remain in the SA cache until they expire. The switch does not accept SA messages for a group whose cache limit is reached until its cached messages start expiring.

The `no group-limit` and `default group-limit` command removes the maximum group limit for the specified prefix by removing the corresponding `group-limit` statement from `running-config`.

**Command Mode**
- Router MSDP Configuration
- Router MSDP VRF Configuration

**Command Syntax**
```
group-limit quantity source src_subnet
no group-limit quantity source src_subnet
default group-limit quantity source src_subnet
```

**Parameters**
- `quantity` maximum number of groups that can access the interface. Value ranges from 1 to 40000.
- `src_subnet` Source IPv4 subnet (CIDR or address-mask notation).

**Example**
- This command sets the maximum number of 1000 SAs for multicast group 10.13.15.8/29.
  ```
  switch(config-router-msdp)#group-limit 1000 source 10.13.15.8/29
  ```
ip msdp rejected-limit

The `ip msdp rejected-limit` command specifies the maximum number of rejected Source-Active messages that the switch allows in the SA cache.

SA messages have an expiration period of 90 seconds. They remain in the SA cache during this time. The default limit of rejected SA messages that the switch can store is 40000.

The `no ip msdp rejected-limit` and `default ip msdp rejected-limit` commands restore the rejected SA limit of 40000 by removing the `ip msdp rejected-limit` statement from `running-config`.

**Command Mode**
- Router MSDP Configuration
- Router MSDP VRF Configuration

**Command Syntax**
- `ip msdp rejected-limit quantity`
- `no ip msdp rejected-limit`
- `default ip msdp rejected-limit`

**Parameter**
- `quantity` maximum rejected SA messages the SA cache can store. Value ranges from 0 to 40000.

**Example**
- This command sets 5000 as the maximum number of rejected SAs that the SA cache can contain.

```
switch(config)#router msdp
switch(config-router-msdp)#ip msdp rejected-limit 5000
```
Keepalive (MSDP)

The `keepalive` command configures the MSDP keep-alive and hold time intervals for a specified MSDP peer connection.

- Keep-alive time interval is the period between the transmission of consecutive keep-alive messages. The default keep-alive time interval is 60 seconds.
- Hold time interval is the period the switch waits for a KEEPALIVE or UPDATE message before it disables peering. The default hold time interval is 75 seconds.

The `no keepalive` and `default keepalive` commands restore the default keep-alive and hold time intervals for the specified MSDP peer connection by removing the corresponding `keepalive` command from `running-config`.

Command Mode

Router MSDP Peer Configuration
Router MSDP Peer VRF Configuration

Command Syntax

```
keepalive keep_alive hold_time
no keepalive
default keepalive
```

Parameters

- `keep_alive` keep-alive period in seconds. Value ranges from 1 to 65535. Default value is 60.
- `hold_time` hold time in seconds. Value ranges from 1 to 65535. Default value is 75.

Note
The hold time interval must be longer than or equal to the keep-alive time interval.

Example

- This command sets the keep-alive time to 45 seconds and the hold time to 80 seconds for the connection with the MSDP peer at 10.4.4.12.

```
switch(config)#router msdp
switch(config-router-msdp)#peer 10.4.4.12
switch(config-router-msdp)#peer 10.4.4.12 keepalive 45 80
switch(config-router-msdp)#
```
local-interface

MSDP peering sessions are established over a TCP connection. The local-interface command specifies the interface through which the TCP connection is established with the configuration-mode MSDP peer. When the local-interface command is not used to specify an interface, the connection is established through an interface determined by existing routing algorithms.

The no local-interface and default local-interface commands remove the corresponding local-interface command from running-config, returning selection of the connecting interface to the routing algorithm.

Command Mode
- Router MSDP Peer Configuration
- Router MSDP VRF Peer Configuration

Command Syntax

```
local-interface interface
no local-interface
default local-interface
```

Parameters
- **interface** local interface through which the TCP connection is established. Options include:
  - **ethernet e_num** Ethernet interface.
  - **loopback l_num** Loopback interface.
  - **management m_num** Management interface.
  - **port-channel p_num** Port-Channel Interface.
  - **vlan v_num** VLAN interface.
  - **vxlan vx_num** VXLAN interface.

Example
- These commands assign an IP address to loopback interface 100, then establish the TCP peer session to the MSDP peer at 10.4.4.12 through the loopback in the default VRF.

```
switch(config)#interface loopback 100
switch(config-if-Lo100)#ip address 10.6.8.6/24
switch(config-if-Lo100)#exit
switch(config)#router msdp
switch(config-router-msdp)#peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)#local-interface loopback 100
switch(config-router-msdp-peer-10.4.4.12)#show ip msdp peer

MSDP Peer 10.4.4.12
Connection status:
  State: Connect
  Resets: 0
  Connection Source: Loopback100 (10.6.8.6)
SAs accepted:
switch(config-router-msdp-peer-10.4.4.12)#
```
mesh-group

The `mesh-group` command configures the configuration-mode MSDP peer connection as an MSDP mesh group member. A peer can be assigned to multiple mesh groups. Multiple MSDP peers can be assigned to a common mesh group.

An MSDP mesh group is a network of MSDP speakers where each speaker directly connects to every other speaker. The switch does not forward Source-Active (SA) messages that it receives from a mesh group peer to other peers of the same group.

The `no mesh-group` and `default mesh-group` commands delete the configuration-mode peer connection from a mesh group by removing the corresponding `mesh-group` command from `running-config` when issued in Router MSDP Peer Configuration or Router MSDP Peer VRF Configuration Mode.

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>To delete all configured connections from a specified mesh group, use the <code>no mesh-group</code> command in Router MSDP Configuration mode.</td>
</tr>
</tbody>
</table>

**Command Mode**
- Router MSDP Configuration
- Router MSDP Peer Configuration
- Router MSDP Peer VRF Configuration

**Command Syntax**
```
mesh-group  group_name
no mesh-group  group_name
default mesh-group  group_name
```

**Parameters**
- `group_name` name of mesh group.

**Related Command**
- `show msdp mesh-group`

**Example**
- These commands configure the MSDP peer connection to 10.1.1.14 as a member of the AREA-1 mesh group, then display members of mesh groups to which configured MSDP peers belong.

```
switch(config)#router msdp
switch(config-router-msdp)#peer 10.1.1.14
switch(config-router-msdp-peer-10.1.1.14)#mesh-group AREA-1
switch(config-router-msdp-peer-10.1.1.14)#show msdp mesh-group
Mesh Group: AREA-1
  10.1.1.14
Mesh Group: tier_01
  10.24.18.13
Mesh Group: tier_02
  10.26.101.18
switch(config-router-msdp-peer-10.1.1.14)#
```
- These commands delete all configured connections from the AREA-1 mesh group.

```
switch(config)#router msdp
switch(config-router-msdp)#no mesh-group AREA-1
switch(config-router-msdp)#
```
originator-id local-interface

The `originator-id local-interface` command configures an originator ID to replace the rendezvous point (RP) address in source-address (SA) messages that it originates as an MSDP speaker.

SA messages that an MSDP speaker originates contain the speaker’s rendezvous point (RP) address, as configured through PIM statements and processes. An originator ID is an alternative IPv4 address that a speaker uses in place of its RP address when advertising SA messages. This command configures the switch to use the specified interface’s IP address as the RP address in SA messages that it originates.

The `no originator-id local-interface` and `default originator-id local-interface` commands configure the switch to use its RP address in SA messages that it sends by removing the `originator-id local-interface` command from `running-config`.

Command Mode
- Router MSDP Configuration
- Router MSDP VRF Configuration

Command Syntax
```
originator-id local-interface INTERFACE
no originator-id local-interface INTERFACE
default originator-id local-interface INTERFACE
```

Parameters
- `INTERFACE` Specifies the interface from which the IP address is derived. Options include:
  - `ethernet e_num` Ethernet interface.
  - `loopback l_num` Loopback interface.
  - `management m_num` Management interface.
  - `port-channel p_num` Port-Channel Interface.
  - `vlan v_num` VLAN interface.
  - `vxlan vx_num` VXLAN interface.

Example
- This command configures the switch to use the IP address assigned to loopback 100 as the RP address in SA messages that it originates.
  ```bash
  switch(config)#router msdp
  switch(config-router-mdsp)#originator-id local-interface loopback 100
  ```
peer

The peer command configures the specified address as an MSDP peer, enables MSDP on the switch if it was not previously enabled, and places the switch in Router MSDP Peer Configuration Mode for the specified peer.

The peering session with the device at the specified network is established over a TCP connection. The local-interface command can specify an interface through which the TCP connection is established. When the local-interface command is not used to specify an interface, the connection is established through an interface determined by existing routing algorithms.

The no peer and default peer commands remove the specified MSDP peer configuration by deleting the corresponding peer command from running-config. MSDP is disabled when the last peer command is removed.

Command Mode
Router MSDP Configuration

Command Syntax
```
peer ip_address
```

Parameters
- **ip_address** IP address of the MSDP peer to be configured.

Commands Available in Router MSDP Peer Configuration Mode
- default-peer
- description (MSDP)
- disabled (MSDP)
- keepalive (MSDP)
- local-interface
- mesh-group
- sa-filter in
- sa-filter out
- sa-limit

Example
- These commands establish an MSDP peer relationship with the peer at 192.168.3.17 and place the switch in the Router MSDP Peer Configuration Mode for that peer.

```
switch(config)#router msdp
switch(config-router-msdp)#peer 192.168.3.17
switch(config-router-msdp-peer-192.168.3.17)#
```
**router msdp**

The **router msdp** command places the switch in the router MSDP configuration mode, and allows to configure the global IP configuration commands and VRF commands in this mode.

The **no router msdp** and **default router msdp** commands removes the corresponding **router msdp** command from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

```
router msdp
no router msdp
default router msdp
```

**Example**

- This command places the switch in the router MSDP configuration mode.

```
switch(config)#router msdp
switch(config-router-msdp)#
```

**Related Commands**

- connection retry interval
- default-peer
- description (MSDP)
- disabled (MSDP)
- group-limit
- ip msdp rejected-limit
- keepalive (MSDP)
- mesh-group
- originator-id local-interface
- peer
- sa-filter in
- sa-filter out
- sa-limit
**sa-filter in**

The **sa-filter in** command assigns an IP access control list (ACL) as a filter for inbound Source-Active (SA) messages from the configuration-mode MSDP peer connection. The switch only accepts SA messages from the peer that are accepted by the assigned ACL. The switch accepts all SA messages from the peer when an ACL is not assigned as an inbound filter.

Only one ACL can be assigned as an inbound filter to an MSDP peer. Any subsequent **sa-filter in** commands for the peer replace the existing command.

The **no sa-filter in** and **default sa-filter in** commands remove the ACL assignment as an inbound filter by removing the corresponding **sa-filter in** command from **running-config**.

**Command Mode**
- Router MSDP Peer Configuration
- Router MSDP Peer VRF Configuration

**Command Syntax**

```plaintext
sa-filter in list list_name
no sa-filter in
default sa-filter in
```

**Parameters**
- **peer_id** MSDP peer address (IPv4 address).
- **list_name** name of ACL that filters SA messages.

**Related Command**
- **sa-filter out**

**Guideline**
- The command accepts standard and extended ACLs. The address field in a standard ACL filters an SA message on its group address.

**Example**
- These commands create an IP ACL named LIST-IN as the inbound SA message filter for the MSDP peer connection to 10.4.4.12. The ACL permits SAs from the multicast group 239.14.4.2/28.

```
switch(config)#ip access-list LIST-IN
switch(config-acl-LIST-IN)#permit ip any 239.14.4.2/28
switch(config-acl-LIST-IN)#exit
switch(config)#router msdp
switch(config-router-msdp)#peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)#sa-filter in list LIST-IN
switch(config-router-msdp-peer-10.4.4.12)#show ip msdp peer
  MSDP Peer 10.4.4.12
  Connection status:
    State: Listen
    Connection Source: Loopback100 (10.6.8.6)
  SA Filtering:
    Input Filter: LIST-IN
```
**sa-filter out**

The `sa-filter out` command assigns an IP access control list (ACL) as a filter for outbound Source-Active (SA) messages to the configuration-mode MSDP peer connection, after which the switch only sends SA messages to the peer that are accepted by the assigned ACL. The switch sends all SA messages to the peer when an ACL is not assigned as an output filter to the peer.

Only one ACL can be assigned as an outbound filter to an MSDP peer. Any subsequent `sa-filter out` commands for the peer replace the existing command.

The `no sa-filter out` and `default sa-filter out` commands remove the ACL assignment as an outbound filter by removing the corresponding `sa-filter out` command from `running-config`.

**Command Mode**

- Router MSDP Peer Configuration
- Router MSDP Peer VRF Configuration

**Command Syntax**

```
   sa-filter out list list_name
   no sa-filter out
   default sa-filter out
```

**Parameters**

- `peer_id` MSDP peer address (IPv4 address).
- `list_name` name of ACL that filters SA messages.

**Related Commands**

- `sa-filter in` assigns an IP ACL to filter inbound SA messages from the MSDP peer being configured.

**Guidelines**

The command accepts standard and extended ACLs. The address field in a standard ACLs filters an SA message on its group address.

**Example**

- These commands assign the IP ACL named LIST-OUT as the outbound SA message filter for the MSDP peer connection to 10.4.4.12.

```
switch(config)#router msdp
switch(config-router-msdp)#ip access-list LIST-OUT
switch(config-acl-LINE-OUT)#permit ip any 239.14.4.2/28
switch(config-acl-LINE-OUT)#exit
switch(config)#router msdp
switch(config-router-msdp)#peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)#sa-filter out list LIST-OUT
switch(config-router-msdp-peer-10.4.4.12)#show ip msdp peer
```

MSDP Peer 10.4.4.12
Connection status:
  State: Listen
  Connection Source: Loopback100 ( 10.6.8.6 )
SA Filtering:
  Output Filter: LIST-OUT
switch(config-router-msdp-peer-10.4.4.12)#
**sa-limit**

The **sa-limit** command specifies the maximum number of Source-Active messages from a specified MSDP peer that the switch allows in the SA cache. SA messages have an expiration period of 90 seconds, during which time they remain in the SA cache. The switch does not accept SA messages from a peer after the peer’s SA limit is reached. By default, the limit to the number of SA messages that the switch can store from a specified peer is 40000, by default.

The **no sa-limit** and **default sa-limit** commands restore the SA limit of 40000 for the specified MSDP peer by removing the corresponding **sa-limit** statement from **running-config**.

**Command Mode**
- Router MSDP Peer Configuration
- Router MSDP Peer VRF Configuration

**Command Syntax**

```
  sa-limit quantity
  no sa-limit
  default sa-limit
```

**Parameters**
- **peer_id** MSDP peer (IPv4 address).
- **quantity** maximum number of SA messages that the switch can store. Value ranges from 0 to 40000.

**Example**
- This command sets the SA limit of 500 for the MSDP peer at 10.1.1.5

```
switch(config)#router msdp
switch(config-router-msdp)#peer 10.1.1.5
switch(config-router-msdp-peer-10.1.1.5)#sa-limit 500
switch(config-router-msdp-peer-10.1.1.5)#
```
show ip msdp peer

The `show ip msdp peer` command displays information about specified MSDP peers. The command includes an optional parameter for displaying SAs accepted from the peer.

**Command Mode**

EXEC

**Command Syntax**

```
show ip msdp peer [PEER_ADDR] [SA_ACCEPT]
```

**Parameters**

- **PEER_ADDR** Peers for which command displays information.
  - `<no parameter>` All peers configured on the switch.
  - `ipv4_addr` Address of specified MSDP peer.
- **SA_ACCEPT** Command displays SAs accepted from the specified peers.
  - `<no parameter>` Accepted SAs are not displayed.
  - `accepted-sas` Accepted SAs are displayed.

**Example**

- This command displays MSDP information concerning the peer located at 10.2.42.4, including SAs that the switch accepted from this peer.

```
switch(config)#show ip msdp peer 10.2.42.4 accepted-sas
MSDP Peer 10.2.42.4
 Connection status:
    State: Up
    Connection Source: Loopback4 ( 10.2.43.4 )
SA Filtering:
Input Filter: allow-multicast-for-msdp
Output Filter: allow-multicast-for-msdp
SAs accepted:
 (10.62.79.30, 234.1.4.2), RP 10.2.42.4
 (10.61.79.29, 234.1.4.1), RP 10.2.42.4
 (10.62.79.30, 234.1.4.1), RP 10.2.42.4
```
**show ip msdp pim sa-cache**

The **show ip msdp pim sa-cache** command displays the SA cache for the local PIM domain configured on the switch. An SA cache is a table of Source-Active messages that are generated or accepted by the PIM domain.

**Command Mode**

EXEC

**Command Syntax**

```
show ip msdp pim sa-cache
```

**Example**

- This command displays the SA cache for the local PIM domain.

```
switch(config)#show ip msdp pim sa-cache
MSDP Source Active Messages for local Pim RP
(10.51.71.23, 234.1.4.1), RP 10.2.43.4
(10.20.91.26, 234.1.4.1), RP 10.2.43.4
(10.51.71.23, 234.1.4.2), RP 10.2.43.4
(10.20.91.21, 234.1.4.1), RP 10.2.43.4
(10.51.79.23, 234.1.4.1), RP 10.2.43.4
(10.20.91.24, 234.1.4.2), RP 10.2.43.4
(10.51.79.23, 234.1.4.2), RP 10.2.43.4
(10.20.91.24, 234.1.4.1), RP 10.2.43.4
(10.20.91.26, 234.1.4.2), RP 10.2.43.4
(10.20.91.21, 234.1.4.2), RP 10.2.43.4
(10.20.91.24, 234.1.4.1), RP 10.2.43.4
```
show ip msdp sa-cache

The `show ip msdp sa-cache` command displays contents of the Source-Active (SA) message cache. The command provides these filter options for displaying partial cache contents:

- multicast group address: multicast group
- source address and group address

The command can also display unexpired SAs that were rejected by ACL filters or cache limit exceeded conditions.

**Command Mode**
EXEC

**Command Syntax**
```
show ip msdp sa-cache [ADDRESS_FILTER] [CONTENTS]
```

**Parameters**

- **ADDRESS_FILTER**  
  IPv4 address used to filter SA messages.
  - <no parameter>  
    All SA messages.
  - `grp_addr`  
    Multicast group address (IPv4 address).
  - `src_addr grp_addr`  
    Source and multicast group addresses (two IPv4 addresses).
    `grp_addr` must be a valid multicast address.

- **CONTENTS**  
  type of SAs that the command displays.
  - <no parameter>  
    Displays contents of SA Cache.
  - `rejected`  
    Displays rejected SAs in addition to the SA cache contents.

**Example**

- This command displays the contents of the SA message cache.

```
switch(config)#show ip msdp sa-cache
MSDP Source Active Cache
(10.61.71.29, 234.1.4.2), RP 10.5.29.4, heard from 10.5.29.4

```

2894
show ip msdp sanity

The `show ip msdp sanity` command performs a consistency check between the multicast routing table and the MSDP Source-Address (SA) caches. When the command detects inconsistencies, it displays the cache entries that are not in the table.

**Command Mode**

EXEC

**Command Syntax**

`show ip msdp sanity`

**Examples**

- This command displays a sanity check that detects no inconsistencies between the SA cache and the multicast routing table.

```
switch(config)#show ip msdp sanity
PIM SA cache entries not in the MRT
Msdp-learnt MRT entries not in the SA cache
SA cache entries not in the MRT
May-Notify-MSDP entries not in the PIM SA cache
(need not be an error condition)
```

- This command displays inconsistencies between the SA cache and the multicast routing table.

```
switch(config)#show ip msdp sanity
PIM SA cache entries not in the MRT
Msdp-learnt MRT entries not in the SA cache
SA cache entries not in the MRT
(192.168.3.8, 224.1.154.1)
(192.168.3.35, 224.1.167.1)
(192.168.3.16, 224.1.226.1)
(192.168.3.19, 224.1.246.1)
(192.168.3.17, 224.1.204.1)
(192.168.3.12, 224.1.182.1)
(192.168.3.33, 224.1.150.1)
(192.168.3.26, 224.1.198.1)
(192.168.3.33, 224.1.195.1)
(192.168.3.4, 224.1.246.1)
(192.168.3.37, 224.1.188.1)
(192.168.3.12, 224.1.245.1)
(192.168.3.31, 224.1.206.1)
(192.168.3.35, 224.1.178.1)
(192.168.3.6, 224.1.155.1)
May-Notify-MSDP entries not in the PIM SA cache
(need not be an error condition)
4.1), RP 10.2.42.4
**show ip msdp summary**

The `show ip msdp summary` command displays a list of peer addresses, the operational status of the peer, and the number of Source-Active messages in the SA cache from that peer.

**Command Mode**

EXEC

**Command Syntax**

`show ip msdp summary`

**Example**

- This command displays the configured peers, the status of the peers, and the number of SA message received from those peers.

```
switch(config)#show ip msdp summary
MSDP Peer Status Summary
Peer Address      State   SA Count
192.168.3.18      Up      0
192.168.3.16      Up      0
192.168.3.37      Listen 0
192.168.3.46      Up      0
192.168.3.47      Up      0
```
show msdp mesh-group

The **show msdp mesh-group** command displays the mesh group membership of MSDP peers that are configured on the switch. An MSDP mesh group is a network of MSDP speakers where each speaker is directly connected to every other speaker. The switch does not forward Source-Active (SA) messages that it receives from a mesh group peer to other peers of the same group.

**Command Mode**

EXEC

**Command Syntax**

```
show msdp mesh-group
```

**Related Command**

- **mesh-group** configures the MSDP peer connection as an MSDP mesh group member.

**Example**

- This command displays the mesh group membership of configured MSDP peers.

```
switch(config)#show msdp mesh-group
  Mesh Group: tier_01
  10.24.18.13
  Mesh Group: tier_02
  10.26.101.18
```
show msdp rpf-peer

The `show msdp rpf-peer` command displays MSDP information for the peer from which the switch accepts SA messages for a specified rendezvous point (RP).

The switch examines the BGP routing table to determine the next hop peer toward the originating RP of an SA message. This next hop peer is the reverse path forwarding (RPF) peer. Because the switch receives SA messages from the RPF peer, it forwards the message to all other MSDP peers. The switch rejects identical SA messages that it receives from a non-RPF peer.

**Command Mode**

EXEC

**Command Syntax**

```
show msdp rpf-peer rp_addr
```

**Parameter**

- `rp_addr` PIM RP IPv4 address.

**Example**

- This command displays MSDP information for the peer from which the switch accepts SA messages for the RP at 10.5.29.4.

```
switch(config)#show msdp rpf-peer 10.5.29.4
  Rpf Peer is 10.5.29.4 for RP 10.5.29.4
```
Audio Video Bridging (AVB)

Arista switches support Audio Video Bridging (AVB) and the associated protocols. This chapter describes AVB concepts and the implementation of associated protocols.

Sections in this chapter include:
- Section 42.1: AVB Overview
- Section 42.2: AVB Protocols
- Section 42.3: AVB Configuration
- Section 42.4: AVB Command Descriptions

42.1 AVB Overview

Audio Video Bridging (AVB) is a protocol set that provides precision time synchronization, admission control, queuing reservation, and guaranteed bandwidth of professional grade quality audio and video across an IP network.

Supported AVB protocols include:
- Generalized Precision Time Protocol (gPTP)
- Multiple Stream Reservation Protocol (MSRP)
- Multiple VLAN Registration Protocol (MVRP)

These AVB features are supported on Arista 7280, 7150 Series, and 7500E Series switches:
- gPTP with hardware time stamping
- gPTP Grandmaster function
- MSRP protocol on Ethernet interfaces: stream admission control and propagation
- Control plane protection for PTP and MSRP control frames
- MVRP
- Traffic classes 2 and 3 for AVB traffic
- Traffic shaping on egress ports
These AVB features are not available on Arista switches:

- MSRP protocol on LAGs
- MSRP co-ordination with gPTP; streams are allowed even when gPTP is not in sync
- MMRP
- Signaling message support in gPTP
- Running peer delay mechanism on STP blocked ports
- Grandmaster-specific state machines (gPTP)

### 42.2 AVB Protocols

This section describes supported AVB protocols:

- Section 42.2.1: gPTP
- Section 42.2.2: MVRP
- Section 42.2.3: MSRP
- Section 42.2.4: MRP

#### 42.2.1 gPTP

Generalized Precision Time Protocol (gPTP) is a network time synchronization standard for bridged Local Area Networks based on the IEEE 1588v2 Precision Time Protocol and supports the AVB protocol standards. Time synchronization in a gPTP domain is conducted the same way as in a PTP 1588 domain. A grandmaster is selected through the best grand master clock algorithm and distributes timing synchronization information to all directly attached peers. This information is propagated across the network to provide a common time reference to all Audio and Video end stations.

#### 42.2.2 MVRP

Multiple VLAN Registration Protocol (MVRP) is an application of Multiple Registration Protocol used by AVB endpoints to dynamically register and unregister VLANs on an interface.

When an interface wishes to join a VLAN advertised by an MSRP talker (to receive a stream), MVRP sends a Join message. On receiving the Join message, the interface is added to the VLAN. If the VLAN does not already exist, MVRP dynamically creates the VLAN and propagates it through the network.

MVRP events post Syslog messages, with the severity level of INFO for each message.

- **MVRP_VLAN_JOIN**
  
  MVRP VLAN Join received/transmitted on an interface.

- **MVRP_VLAN_LV**
  
  MVRP VLAN Leave received/transmitted on an interface.

- **MVRP_ERROR**
  
  MVRP Join was discarded due to an error.
42.2.3 MSRP

Multiple Stream Registration Protocol (MSRP) is a signaling protocol that allows end stations (nodes) to reserve network resources and ensure QoS for communicating with other end stations.

MSRP nodes are specified as talkers or listeners:

- Talker nodes transmit multimedia streams to other nodes in the AVB network.
- Listener nodes receive multimedia streams from the AVB talker nodes.

MSRP is implemented by the switch on individual interfaces. MSRP is active when it is enabled on at least one interface, and stopped when it is disabled on all interfaces. MSRP uses Multiple Registration Protocol (MRP) to facilitate attribute registrations and distribution across connected end points in a LAN environment.

MSRP events post Syslog messages, with the severity level of INFO for each message.

- **MSRP_SR_CLASS_TRANSITION**
  MSRP SR Class state transition occurred on an interface.

- **MSRP_TALKER_ADV_JOIN**
  Talker Advertise Join message for a stream was transmitted/received on an interface.

- **MSRP_TALKER_FAIL_JOIN**
  Talker Failed Join message for a stream was transmitted/received on an interface.

- **MSRP_LISTENER_JOIN**
  Listener Join message for a stream was transmitted/received on an interface.

- **MSRP_DOMAIN_JOIN**
  Domain Join message was transmitted/received on an interface.

- **MSRP_TALKER_ADV_LV**
  Talker Advertise Leave message for a stream was transmitted/received on an interface.

- **MSRP_TALKER_FAIL_LV**
  Talker Failed Leave message for a stream was transmitted/received on an interface.

- **MSRP_LISTENER_LV**
  Listener Leave message for a stream was transmitted/received on an interface.

- **MSRP_DOMAIN_LV**
  Domain Leave message was transmitted/received on an interface.

- **MSRP_BW_ALLOC_SUCCESS**
  MSRP Bandwidth was allocated for a listener on an interface.

- **MSRP_BW_ALLOC_FAIL**
  MSRP Bandwidth could not be allocated for a listener on an interface.

- **MSRP_BW_DEALLOC**
  MSRP Bandwidth was de-allocated for a listener on an interface.

- **MSRP_ERROR**
  MSRP Join was discarded because of an error.
42.2.4 MRP

Multiple Registration Protocol (MRP) protocol includes MSRP and MVRP, and allows participants in an MRP application to register attributes with participants in a Bridged Local Area Network (BLAN).
42.3 AVB Configuration

This section describes the AVB configuration:

- Section 42.3.1: Enabling gPTP
- Section 42.3.2: Enabling MSRP
- Section 42.3.3: Displaying MSRP Configuration and Status
- Section 42.3.4: Enabling MVRP
- Section 42.3.5: Displaying MVRP Configuration and Status

42.3.1 Enabling gPTP

Configure gPTP on the switch though the ptp mode command. PTP is enabled on individual interfaces with the ptp enable command.

Example

- These commands configure gPTP on the switch and enable PTP on Ethernet interfaces 41-45.

```
switch(config)#ptp mode gptp
switch(config)#interface ethernet 41-45
switch(config-if-Et41-45)#ptp enable
switch(config)#show running-config

<-------OUTPUT OMITTED FROM EXAMPLE-------->

! ptp mode gptp
!
end

switch(config-if-Et41-45)#show active
interface Ethernet41
  speed forced 10000full
  msrp
  ptp enable
interface Ethernet42
  speed forced 10000full
  msrp
  ptp enable
interface Ethernet43
  speed forced 10000full
  msrp
  ptp enable
interface Ethernet44
  speed forced 10000full
  ptp enable
interface Ethernet45
  ptp enable

switch(config-if-Et41-45)#
```

42.3.2 Enabling MSRP

MSRP is enabled on an interface with the msrp command.
Example

- These commands enable MSRP on Ethernet interfaces 41-43.

```
switch(config)#interface ethernet 41-43
switch(config-if-Et41-43)#msrp
interface Ethernet41
  speed forced 10000full
  msrp
interface Ethernet42
  speed forced 10000full
  msrp
interface Ethernet43
  speed forced 10000full
  msrp
switch(config-if-Et41-43)#
```

42.3.3 Displaying MSRP Configuration and Status

MSRP configuration information and status is displayed with the `show msrp` command.

Example

- This command displays the MSRP status for Ethernet interfaces 41-43.

```
switch(config)#show msrp interfaces ethernet 41-43
```

MSRP Global Status : Enabled
Max Frame Size : 1522

Stream data is available for the talker and listener. The `show msrp interfaces` command displays the status and configuration information for each stream.
Examples

- This command displays data for listener station streams on Ethernet interfaces 1 and 2.

  ```
  switch(config)#show msrp interfaces ethernet 1-2
  MSRP Global Status : Enabled
  Max Frame Size : 1522
  Max Fan-In Ports : No limit

  switch(config)#
  ```

42.3.4 Enabling MVRP

MVRP is disabled by default. To enable MVRP on an interface, use the `mvrp` command. MVRP is enabled globally if it is enabled on at least one interface.
Example

- These commands enable MVRP on Ethernet interface 34.

```plaintext
switch(config)#interface ethernet 34
switch(config-if-Et34)#mvrp
switch(config-if-Et34)#
```

42.3.5 Displaying MVRP Configuration and Status

MVRP configuration information and status are displayed with the `show mvrp` command.

Example

- This command displays the MVRP status for Ethernet interfaces 30 through 40.

```plaintext
switch(config)#show mvrp interfaces Ethernet 30-40

MVRP Global Status : Enabled

<table>
<thead>
<tr>

</tbody>
</table>

switch(config)#
```
42.4 AVB Command Descriptions

MSRP Commands
- msrp
- msrp streams load-file
- show msrp
- show msrp interfaces
- show msrp streams

MRP Commands
- mrp leave-all-timer
- mrp leave-timer

MVRP Commands
- mvrp
- show mvrp
msrp

MSRP enables Multiple Stream Registration Protocol (MSRP), which is a signaling protocol that provides nodes with the ability to reserve network resources to ensure Quality of Service (QoS) between talker and listener endpoints. The Stream Reservation Protocol (SRP) utilizes MSRP to reserve bandwidth for data streams, and configure a complete path between endpoints.

The msrp command enables MSRP on the configuration mode interface. If MSRP was not previously enabled on any interface, the MSRP agent is launched by this command.

The no msrp and default msrp commands disable MSRP on the configuration mode interface, and removes the corresponding msrp command from running-config. The command stops the MSRP agent when MSRP is no longer enabled on any interface.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

- msrp
- no msrp
- default msrp

**Example**

- These commands enable MSRP on Ethernet interface 3/3/3. Because it was not previously enabled on any other interface, the command launches the MSRP agent.

  switch(config)#interface ethernet 3/3/3
  switch(config-if-Et3/3/3)#msrp
  Launching MSRP Agent
  switch(config-if-Et3/3/3)#show active
  interface Ethernet3/3/3
  msrp
  switch(config-if-Et3/3/3)#

- These commands disable the MSRP agent on Ethernet interface 3/3/3. Because it is not enabled on any other interface, the command stops the MSRP agent.

  switch(config-if-Et3/3/3)#no msrp
  Stopping MSRP agent
  switch(config-if-Et3/3/3)#show active
  interface Ethernet3/3/3
  switch(config-if-Et3/3/3)#msrp

  switch(config-if-Et3/3/3)
**mrp leave-all-timer**

The `mrp leave-all-timer` command specifies the mrp leave all timer interval for the configuration mode interface.

When starting MRP, a participant starts its LeaveAll timer. Upon timer expiry, it sends a LeaveAll message and restarts its timer. When other participants receive the message, they register their attributes and restart their leave-all timers.

The default leave-all timer interval is a randomly selected value from 10 to 15 seconds. Under normal conditions, this value should not be adjusted.

The `no mrp leave-all-timer` and `default mrp leave-all-timer` commands restore the default leave-all timer interval on the configuration mode interface by removing the corresponding `mrp leave-all-timer` command from `running-config`.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

```
mrp leave-all-timer period
no mrp leave-all-timer
default mrp leave-all-timer
```

**Parameters**

- `period` leave all timer interval (seconds). Values range from 10 to 60. Default value is a randomly selected value from 10 to 15.

**Example**

- This command sets the MRP leave-all timer interval on Ethernet interface 17 to twelve seconds.

```
switch(config)#interface ethernet 17
switch(config-if-Et17)#mrp leave-all-timer 12
switch(config-if-Et17)#
```
mrp leave-timer

The leave-timer controls the deregistration of attributes. If an MRP participant needs other participants to unregister their attributes, it sends a Leave message. When receiving a Leave message, the Leave-timer starts and unregisters the attributes if it doesn’t receive Join messages for the attributes before the Leave-timer expires.

The `mrp leave-timer` command specifies the mrp leave-timer interval for the configuration mode interface. The default leave-timer interval is 0.6 seconds. Under normal operation conditions, this value should not be adjusted.

The `no mrp leave-timer` and `default mrp leave-timer` commands restore the default leave-timer interval of 0.6 seconds on the configuration mode interface by removing the corresponding `mrp leave-timer` command from `running-config`.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

```
mrp leave-timer period
no mrp leave-timer
default mrp leave-timer
```

**Parameters**

- `period`  leave all timer (seconds). Values range from 0.6 to 30.

**Example**

- This command sets the MRP leave timer interval on Ethernet interface 17 to 0.8 seconds.
  
  ```
  switch(config)#interface ethernet 17
  switch(config-if-Et17)#mrp leave-timer 0.8
  switch(config-if-Et17)#
  ```
msrp streams load-file

The load-file for MSRP streams provides a file that contains an alias that can be substituted in the name (stream-id) of a string.

The `msrp streams load-file` command allows users to include a line in the file (example: `0102.0304.0506 XYZW4` or `0102.0304 XYZW5`) that causes the bytes to be replaced with the accompanying string in `show msrp streams` commands.

The `no msrp streams load-file` and `default msrp streams load-file` commands remove the alias assignment by removing the corresponding `msrp streams load-file` command from `running-config`.

Command Mode

- Global Configuration

Command Syntax

```
msrp streams load-file [FILE TYPE]
no msrp streams load-file
default msrp streams load-file
```

Parameters

- **FILE TYPE** The options include:
  - `certificate`: device name, directory, or file name
  - `extension`: device name, directory, or file name
  - `file`: device name, directory, or file name
  - `flash`: device name, directory, or file name
  - `ftp`: device name, directory, or file name
  - `http`: device name, directory, or file name
  - `https`: device name, directory, or file name
  - `scp`: device name, directory, or file name
  - `sftp`: device name, directory, or file name
  - `sslkey`: device name, directory, or file name
  - `system`: device name, directory, or file name
  - `terminal`: device name, directory, or file name
  - `tftp`: device name, directory, or file name
  - `usb1`: device name, directory, or file name

Example

- This command indicates that the file named `file1` contains the alias names that is used in MSRP stream names.

  ```
  switch(config)#msrp streams load-file file1
  switch(config)#
  ```
**mvrp**

MVRP dynamically registers and unregisters VLANs on an interface. When an interface wishes to join a VLAN advertised by an MSRP talker (to receive a stream), MVRP sends a Join message. On receipt of the Join message, the interface is added to the VLAN. If the VLAN does not already exist, MVRP dynamically creates the VLAN and propagates it through the network.

The `mvrp` command enables Multiple VLAN Registration Protocol (MVRP) on the configuration mode interface. If MVRP was not previously enabled on any interface, MVRP is also enabled globally by this command.

The `no mvrp` and `default mvrp` commands disable MVRP on the configuration mode interface by removing the corresponding `mvrp` command from `running-config`. These commands also disable MVRP globally when MVRP is no longer enabled on any interface.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

```
mvrp
no mvrp
default mvrp
```

**Example**

- These commands enable MVRP on Ethernet interface 34. If MVRP was not previously enabled on any other interface, these commands also enable MVRP globally.
  
  ```
  switch(config)#interface ethernet 34
  switch(config-if-Et34)#mvrp
  switch(config-if-Et34)#
  ```
**show msrp**

The **show msrp** command displays MSRP operational information for the specified interfaces.

**Command Mode**

EXEC

**Command Syntax**

```
show msrp [INTERFACE_NAME]
```

**Parameters**

- **INTERFACE_NAME** Interface type and number. Values include
  - <no parameter> all Ethernet interfaces.
  - `interfaces ethernet e_range` Ethernet interface list.

  Valid `e_range` formats include number, range, or comma-delimited list of numbers and ranges.

**Example**

- This command displays the MSRP status for Ethernet interfaces 41 through 43.

```
switch(config)#show msrp interfaces ethernet 41-43

switch(config)#
show msrp interfaces

The **show msrp interfaces** command displays station stream information for the specified station type, interfaces and streams.

**Command Mode**

EXEC

**Command Syntax**

```
show msrp interfaces [INTERFACE_NAME] STATION_TYPE_NAME [STREAMS]
```

**Parameters**

- **INTERFACE_NAME** Interface type and number. Values include:
  - `<no parameter>` all Ethernet interfaces.
  - `ethernet e_range` Ethernet interface list.
- **STATION_TYPE** Endpoint type. Values include:
  - `talker` Command displays data for talker station streams.
  - `listeners` Command displays data for listener station streams.
  - `streams` Command displays data for talker and listener station streams.
- **STREAMS** Streams for which command displays information. Options include:
  - `<no parameter>` all streams.
  - `stream-id hex_string` specifies the stream command for which command displays information.

Valid `e_range` formats include number, range, or comma-delimited list of numbers and ranges.

Valid `hex_string` formats include `<H>`, `<H.H>`, `<H.H.H>`, or `<H.H.H.H>`, where H is a four-digit hex number that ranges from 0 to `FFFF`.

**Example**

- This command displays data for listener station streams on Ethernet interfaces 1 and 2.
  ```
  switch(config)#show msrp interfaces ethernet 1-2 listeners

show msrp streams

The `show msrp streams` command displays configuration and status information on the specified MSRP streams.

**Command Mode**

EXEC

**Command Syntax**

```
show msrp streams [STREAM_NAME] [INFO_LEVEL]
```

**Parameters**

- **STREAMS** Streams for which command displays information. Options include:
  - `<no parameter>` all streams.
  - `stream-id hex_string` specifies the stream command for which command displays information.

Valid `hex_string` formats include `<H>, <H.H>, <H.H.H>, or <H.H.H.H>, where H is a four-digit hex number that ranges from **0** to **FFFF**.

- **INFO_LEVEL** type of information that the command displays. Options include:
  - `<no parameter>` command displays stream identification information.
  - `detail` command displays identification and transmission characteristics.
  - `propagation` command displays ingress and egress port information.

**Examples**

- This command displays stream identification information.

```
switch(config)# show msrp interfaces streams

Chapter 43

SNMP

This chapter describes the Arista switch SNMP agent and contains these sections:

- Section 43.1: SNMP Introduction
- Section 43.2: SNMP Conceptual Overview
- Section 43.3: Configuring SNMP
- Section 43.4: SNMP Commands

43.1 SNMP Introduction

Arista Networks switches support many standard SNMP MIBs, making it easier to integrate these platforms into existing network management infrastructures. With only a few configurations, many public domain and commercially available network management tools can quickly manage Arista switches out of the box. Support of SNMP V2 groups and views and V3 security allow network managers to tune switch monitoring to match the administration policy of the IT organization.

43.2 SNMP Conceptual Overview

Simple Network Management Protocol (SNMP) is a protocol that provides a standardized framework and a common language to monitor and manage network devices.

43.2.1 SNMP Structure

The SNMP framework has three parts:

- **SNMP manager**: The SNMP manager controls and monitors network host activities and is typically part of a Network Management System (NMS).
- **SNMP agent**: The SNMP agent is the managed device component that manages and reports device information to the manager.
- **Management Information Base (MIB)**: The MIB stores network management information.

The agent and MIB reside on the switch. Enabling the SNMP agent requires the definition of the manager-agent relationship. The agent contains MIB variables whose values the manager can request or change. The agent gathers data from the MIB and responds to requests for information. For a list of supported MIBs, please refer to the release notes for a specific EOS version.

This chapter discusses enabling the SNMP agent on an Arista switch and controlling notification transmissions from the agent. Information on using SNMP management systems is available in the appropriate documentation for the corresponding NMS application.
43.2.2 SNMP Notifications

SNMP notifications are messages, sent by the agent, informing of an event or a network condition. A *trap* is an unsolicited notification. An *inform* (or inform request) is a trap that includes a request for a confirmation that the message is received. Events that a notification can indicate include improper user authentication, restart, and connection losses.

For a list of supported traps, please refer to the release notes for a specific EOS version.

43.2.3 SNMP Versions

Arista switches support the following SNMP versions:

- **SNMPv1**: The Simple Network Management Protocol, defined in RFC 1157. Security is based on community strings.
- **SNMPv2c**: Community-string based Administrative Framework for SNMPv2, defined in RFC 1901, RFC 1905, and RFC 1906. Security is based on SNMPv1.
- **SNMPv3**: Version 3, as defined in RFCs 2273 to 2275.

43.3 Configuring SNMP

This section describes the steps that configure the switch SNMP agent to communicate with an SNMP manager, including the following:

- Enabling and Disabling SNMP
- Configuring Community Access Control
- Configuring SNMP Parameters
- Configuring the Agent to Send Notifications
- Extending the SNMP Agent Through Runtime Scripts

43.3.1 Enabling and Disabling SNMP

SNMP is enabled globally by issuing any `snmp-server community` or `snmp-server user` command. The `no snmp-server` command disables SNMP agent operation by removing all non-default `snmp-server` commands from *running-config*.

43.3.2 Enabling SNMP in a VRF

By default, SNMP is enabled only in the *default* VRF. The switch can only send SNMP traps and informs if the host that has been configured to receive them is accessible through an interface in a VRF in which SNMP has been enabled.

To enable or disable SNMP in a VRF, use the `snmp-server vrf` command.

43.3.3 Configuring Community Access Control

SNMP community strings serve as passwords that permit an SNMP manager to access the agent on the switch. A Network Management System (NMS) can access the switch only if its community string matches at least one of the switch’s community strings.

The `snmp-server community` command configures the community string.
Example

- This command adds the community string `ab_1` to provide read-only access to the switch agent.

```bash
switch(config)#snmp-server community ab_1 ro
```

Community statements can reference views to limit MIB objects that are available to a manager. A view is a community string object that specifies a subset of MIB objects. The `snmp-server view` command configures the community string.

Example

- These commands create a view that includes all objects in the `system` group except for those in `system.2`.

```bash
switch(config)#snmp-server view sys-view system include
switch(config)#snmp-server view sys-view system.2 exclude
```

- This command adds the community string `lab_1` to provide read-only access to the switch agent for the previously defined view.

```bash
switch(config)#snmp-server community lab_1 view sys-view
```

### 43.3.4 Configuring SNMP Parameters

This section describes these SNMP parameter configuration tasks:

- Configuring the Engine ID
- Configuring the Group
- Configuring the User
- Configuring the Host
- Enabling Link Trap Generation
- Configuring the Chassis-id String
- Configuring the Contact String
- Configuring the Location String

#### Configuring the Engine ID

The `snmp-server engineID remote` command configures the name of a Simple Network Management Protocol (SNMP) engine located on a remote device. Use the `snmp-server engineID local` command for the local engine.

A remote agent’s engine ID must be configured before remote users for that agent are configured. User authentication and privacy digests are derived from the engine ID and user passwords. The configuration command fails if the remote engine ID is not configured first.

**Important!** When the remote engine ID is changed, all user passwords associated with the engine must be reconfigured.

Example

- This command configures DC945798CAB4 as the name of the remote SNMP engine located at 12.23.104.25, UDP port 162.

```bash
switch(config)#snmp-server engineID remote 10.23.104.25 udp-port DC945798CA
```

```bash
switch(config)#
```
Configuring the Group
An SNMP group grants specific levels of SNMP access to group users. The `snmp-server group` command configures a new SNMP group.

Example
- This command configures `normal_one` as an SNMPv3 group (authentication and encryption) that provides access to the `all-items` read view.
  
```
switch(config)#snmp-server group normal_one v3 priv read all-items
switch(config)#
```

Configuring the User
Members of SNMP groups are called “users.” The `snmp-server user` command allows a new user to be added an SNMP group and configures that user’s parameters. Remote users are configured by specifying the IP address or port number that accesses the user’s SNMP agent.

Example
- This command configures the local SNMPv3 user `tech-1` as a member of the SNMP group `tech-sup`.
  
```
switch(config)#snmp-server user tech-1 tech-sup v3
switch(config)#
```
- This command configures the remote SNMPv3 user `tech-2` as a member of the SNMP group `tech-sup`. The remote user is on the agent located at 13.1.1.4.
  
```
switch(config)#snmp-server user tech-2 tech-sup remote 13.1.1.4 v3
switch(config)#
```

Configuring the Host
The `snmp-server host` command configures an SNMP host (to which SNMP traps will be sent). The `snmp-server host` command sets the community string if it was not previously configured.

Example
- This command adds a v2c inform notification recipient at 12.15.2.3 using the community string `comm-1`.
  
```
switch(config)#snmp-server host 12.15.2.3 informs version 2c comm-1
switch(config)#
```

Enabling Link Trap Generation
The `snmp trap link-change` command enables SNMP link trap generation on the configuration mode interface. SNMP link trap generation is enabled by default. If SNMP link trap generation was previously disabled, this command removes the corresponding `no snmp link-status` statement from the configuration. The `show snmp notification` command displays the SNMP link trap generation information.

Example
- This command disables SNMP link trap generation on the Ethernet 5 interface.
  
```
switch(config-if-Et5)#no snmp trap link-change
switch(config-if-Et5)#
```
Specifying the Source Interface

The `snmp-server local-interface` command specifies the interface from where an SNMP trap originates. The `show snmp local-interface` command displays the interface of the IP address for SNMP traps.

Example

- This command configures the Ethernet 1 interface as the source of SNMP traps and informs.

  ```
  switch(config)#snmp-server local-interface ethernet 1
  switch(config)#
  ```

Configuring the Chassis-id String

The chassis ID string is typically set to the serial number of the switch. The SNMP manager uses this string to associate all data retrieved from the switch with a unique identifying label. Under normal operating conditions, editing the chassis ID string contents is unnecessary.

The `snmp-server chassis-id` command configures the chassis ID string. The default chassis ID string is the serial number of the switch. The `show snmp` command displays the chassis ID.

Example

- This command configures `xyz-1234` as the chassis-ID string, then displays the result.

  ```
  switch(config)#snmp-server chassis-id xyz-1234
  switch(config)#show snmp
  Chassis: xyz-1234
  ```

Configuring the Contact String

The SNMP contact string is information text that typically displays the name of a person or organization associated with the SNMP agent.

The `snmp-server contact` command configures the system contact string. The contact string is displayed by the `show snmp` and `show snmp v2-mib contact` commands.
Example

- These commands configure *Bonnie H at 3-1470* as the contact string.
  
  switch(config)#snmp-server contact Bonnie H at 3-1470
  switch(config)#

Configuring the Location String

The location string typically provides information about the physical location of the SNMP agent. The `snmp-server location` command configures the system location string. By default, the system location string is not set.

Example

- These commands configure *lab-25* as the location string.

```
switch(config)#snmp-server location lab_25
switch(config)#show snmp v2-mib location
Location: lab_25
switch(config)#
```

43.3.5 Configuring the Agent to Send Notifications

The following steps are mandatory when setting up the SNMP agent to send notifications:

**Step 1** Configure the remote engine ID.

**Step 2** Configure the group.

**Step 3** Configure the user.

**Step 4** Configure the host.

**Step 5** Enable link trap generation on the interfaces.

Section 43.3.4 describes each of these tasks.

43.3.6 Extending the SNMP Agent Through Runtime Scripts

The switch supports the execution of user supplied scripts to service portions of the OID space. Scripts run under one of two operational modes:

- **Normal mode** scripts run over an indefinite period to process subsequent objects after the initial request. Maintaining an executing script avoids startup and connection delay each time an object requires processing.

- **One-shot mode** scripts process a single object, then terminate execution; requires the `one-shot` keyword.

Startup and data collection overhead is required for each request. In both modes, the SNMP server is blocked from serving other requests when waiting for script responses.

The `snmp-server extension` command configures the execution of user-supplied scripts to service portions of the OID space. Use the `one-shot` keyword to specify one-shot execution.

Examples

- This command specifies the file `normal-example.sh`, located in flash as the script file that services the specified OID space in normal mode.

```
switch(config)#snmp-server extension .1.3.6.1.4.1.8072.2 flash:normal-example.sh
switch(config)#
```
Contents of the script file:

```
#!/bin/bash
while read cmd; do
  case $cmd in
    PING)
      printf "PONG\n"
      ;;
    get)
      read oid
      printf "$oid\n"
      printf "integer\n"
      printf "42\n"
      ;;
    *)
      printf "NONE\n"
      ;;
  esac
done
```

Testing the script:

```
switch(config)#show snmp mib get .1.3.6.1.4.1.8072.2
NET-SNMP-EXAMPLES-MIB::netSnmpExamples = INTEGER: 42
```

- This command specifies the file `one-shot-example.sh`, located in flash as the script file that services the specified OID space in one-shot mode, executing once and then exiting.

```
switch(config)#snmp-server extension .1.3.6.1.4.1.8072.2
flash:one-shot-example.sh one-shot
switch(config)#
```

Contents of the script file:

```
#!/bin/bash
oid="$2"
printf "$oid\n"
printf "integer\n"
printf "42\n"
```

Testing the script:

```
switch(config)#show snmp mib get .1.3.6.1.4.1.8072.2
NET-SNMP-EXAMPLES-MIB::netSnmpExamples = INTEGER: 42
```

43.3.6.1 Normal Script Behavior

The first time the SNMP server requires a script result, it launches it with no arguments. The server communicates with the script through stdin/stdout. Before each request, the script is sent the string `PINGIn` on stdin. The expected response from the script is printing `PONGIn` to stdout.

GET and GETNEXT Requests

For GET and GETNEXT requests, the script is passed two lines on stdin, the command (get or getnext) and the requested OID. The expected response from the script is the printing of three lines to stdout: the OID for the result varbind, the TYPE, and the VALUE itself.
**Table 43-1** lists legal TYPE values and resulting VALUE encodings. If the command does not return an appropriate varbind, it should print "NONE\n" to stdout and continue running; this results in an SNMP **noSuchName** error or a **noSuchInstance** exception.

### Table 43-1  Extension Script Type and Encoding

<table>

<td>ascii string</td>
</tr>
</tbody>
</table>

**SET Requests**

For SET requests, script is passed three lines on stdin: the command (set), and the requested OID, and the type and value, both on the same line. If the assignment is successful, the expected script response is to print **DONE\n** to stdout. Indicated errors by writing one of the error strings described in **Table 43-2** In each case, the command should continue running.

<table>

</tr>
</tbody>
</table>

**Table 43-2  Set Request Error Strings**

### 43.3.6.2 One-Shot Script Behavior

The command should exit after it finishes processing a single object.

**GET and GETNEXT**

For each GET or GETNEXT request, the script is invoked once for each OID in the space that it serves. It receives two arguments: -g for GET or -n for GETNEXT, and the requested OID.

The expected script response is the response varbind as three separate lines printed to stdout: the result OID, the type, and the value.

If the command does not return an appropriate varbind, then the script should exit without producing any output. This results in an SNMP **noSuchName** error, or a **noSuchInstance** exception.

Possible reasons that a command would not return an appropriate varbind includes:

- The specified OID didn’t correspond to a valid instance for a GET request.
• There were no following instances for a GETNEXT.

**SET**

A SET request results in the command being called with the arguments: -s, OID, TYPE and VALUE, where TYPE is a listed token. Table 43-1 indicates the type of the value passed as the third parameter.

When the assignment is successful, the script exits without producing any output. Errors are indicated by writing just the error name (Table 43-2); the agent generates the appropriate error response.
43.4 SNMP Commands

Global Configuration Commands

- no snmp-server
- snmp-server chassis-id
- snmp-server community
- snmp-server contact
- snmp-server enable traps
- snmp-server engineID local
- snmp-server engineID remote
- snmp-server extension
- snmp-server group
- snmp-server host
- snmp-server location
- snmp-server local-interface
- snmp-server user
- snmp-server view
- snmp-server vrf

Interface Configuration Commands

- snmp trap link-change

Display Commands

- show snmp
- show snmp community
- show snmp engineID
- show snmp group
- show snmp local-interface
- show snmp mib
- show snmp notification host
- show snmp notification
- show snmp user
- show snmp v2-mib chassis
- show snmp v2-mib contact
- show snmp v2-mib location
- show snmp view
no snmp-server

The no snmp-server and default snmp-server commands disable Simple Network Management Protocol (SNMP) agent operation by removing all snmp-server commands from running-config.

SNMP is enabled with any snmp-server community or snmp-server user command.

Command Mode

   Global Configuration

Command Syntax

   no snmp-server
   default snmp-server

Example

   • This command disables SNMP agent operation on the switch.

switch(config)#no snmp-server
switch(config)#
**show snmp**

The **show snmp** command displays SNMP information including the SNMP counter status and the chassis ID string.

**Command Mode**

EXEC

**Command Syntax**

`show snmp`

**Example**

- This command displays SNMP counter status, the chassis ID, the previously configured location string, logging status and destination, and the VRFs in which the SNMP agent is operating.

```
switch>show snmp
Chassis: JFL08320162
Location: 5470ga.dc
2329135 SNMP packets input
  0 Bad SNMP version errors
  0 Unknown community name
  0 Illegal operation for community name supplied
  0 Encoding errors
  38132599 Number of requested variables
  0 Number of altered variables
  563934 Get-request PDUs
  148236 Get-next PDUs
  0 Set-request PDUs
2329437 SNMP packets output
  0 Too big errors
  0 No such name errors
  0 Bad value errors
  0 General errors
  2329135 Response PDUs
  0 Trap PDUs
SNMP logging: enabled
    Logging to 172.22.22.20.162
SNMP agent configured in VRFs: default
SNMP agent enabled in default VRF
switch>
```
show snmp community

The `show snmp community` command displays the Simple Network Management Protocol (SNMP) community access strings configured by the `snmp-server community` command.

**Command Mode**

EXEC

**Command Syntax**

`show snmp community`

**Example**

- This command displays the list of community access strings configured on the switch.

  `switch>show snmp community`

  Community name: public

  `switch> cheroot@switch:~#`
show snmp engineID

The `show snmp engineID` command displays the local SNMP engine information configured on the switch.

**Command Mode**

EXEC

**Command Syntax**

`show snmp engineID`

**Example**

- This command displays the ID of the local SNMP engine.

  switch> `show snmp engineid`
  Local SNMP EngineID: f5717f001c730436d700
  switch>
show snmp group

The `show snmp group` command shows the names of configured SNMP groups along with the security model, and view status of each group.

**Command Mode**

- EXEC

**Command Syntax**

```
show snmp group [GROUP_LIST]
```

**Parameters**

- **GROUP_LIST** the name of the group.
- `<no parameter>` displays information about all groups.
- `group_name` the name of the group.

**Field Descriptions**

- **groupname** name of the SNMP group.
- **security model** security model used by the group: `v1`, `v2c`, or `v3`.
- **readview** string identifying the group’s read view. Refer to `show snmp view`.
- **writeview** string identifying the group’s write view.
- **notifyview** string identifying the group’s notify view.

**Example**

- This command displays the groups configured on the switch.

```
switch>show snmp group
  groupname : normal                          security model:v3 priv
  readview : all                             writeview: <no writeview specified>
  notifyview: <no notifyview specified>

switch>
```
show snmp local-interface

The `show snmp local-interface` command displays the interface whose IP address is the source address for SNMP traps.

**Command Mode**
 EXEC

**Command Syntax**

`show snmp local-interface`

**Example**

- This command displays the source interface for the SNMP notifications.

```
switch>show snmp local-interface
SNMP source interface: Ethernet1
switch>
```
show snmp mib

The **show snmp mib** command displays values associated with specified MIB object identifiers (OIDs) that are registered on the switch.

**Command Mode**

EXEC

**Command Syntax**

```
show snmp mib OBJECTS
```

**Parameters**

- **OBJECTS** object identifiers for which the command returns data. Options include:
  - `get oid_1 [oid_2 ... oid_x]` values associated with each listed OID.
  - `get-next oid_1 [oid_2 ... oid_x]` values associated with subsequent OIDs relative to listed OIDs.
  - `table oid` table associated with specified OID.
  - `translate oid` object name associated with specified OID.
  - `walk oid` objects below the specified subtree.

**Example**

- This command uses the get option to retrieve information about the sysORID.1 OID.

  ```
  switch#show snmp mib get sysORID.1
  SNMPv2-MIB::sysORID[1] = OID: TCP-MIB::tcpMIB
  ```

- This command uses the get-next option to retrieve information about the OID that is after sysORID.8.

  ```
  switch#show snmp mib get-next sysORID.8
  SNMPv2-MIB::sysORDescr[1] = STRING: The MIB module for managing TCP implementations
  ```
show snmp notification host

The `show snmp notification host` command displays information for Simple Network Management Protocol notification. Details include IP address and port number of the Network Management System, notification type, and SNMP version.

**Command Mode**

EXEC

**Command Syntax**

```
show snmp notification host
```

**Field Descriptions**

- **Notification host**    IP address of the host.
- **udp-port**   port number.
- **type**    notification type.
- **user**    access type of the user.
- **security model**   SNMP version used.
- **traps**    details of the notification.

**Example**

- This command displays the hosts configured on the switch.

```
switch>show snmp notification host
Notification host: 172.22.22.20    udp-port: 162   type: trap
user: public                       security model: v2c

switch>
```
show snmp notification

The `show snmp notification` command displays the SNMP trap generation information.

**Command Mode**

EXEC

**Command Syntax**

`show snmp notification`

**Example**

- This command displays the SNMP traps configured on the switch.

```
switch>show snmp notification

<table>
<thead>
<tr>
<th>Type</th>
<th>Name</th>
<th>Enabled</th>
</tr>
</thead>
<tbody>
<tr>
<td>entity</td>

</tbody>
</table>

switch>
```
show snmp user

The show snmp user command shows information about Simple Network Management Protocol (SNMP) users. Information that the command displays about each user includes their SNMP version, the engine ID of the host where they reside, and security information.

Command Mode
EXEC

Command Syntax
show snmp user [USER_LIST]

Parameters
- USER_LIST the name of the group.
- <no parameter> displays information about all users.
- user_name specifies name of displayed user.

Example
- This command displays information about the users configured on the switch.

switch>show snmp user

User name: test

Security model: v3
Engine ID: f5717f001c73010e0900
Authentication protocol: SHA
Privacy protocol: AES-128
Group name: normal
switch>
show snmp v2-mib chassis

The **show snmp v2-mib chassis** command displays the Simple Network Management Protocol (SNMP) server serial number or the chassis ID string configured by the **snmp-server chassis-id** command.

**Command Mode**
EXEC

**Command Syntax**

```
show snmp v2-mib chassis
```

**Example**

- This command displays the chassis ID string.

```
switch>show snmp v2-mib chassis
Chassis: JFL08320162
switch>
```
**show snmp v2-mib contact**

The *show snmp v2-mib contact* command displays the Simple Network Management Protocol (SNMP) system contact string configured by the *snmp-server contact* command. The command has no effect if a contact string was not previously configured.

**Command Mode**

EXEC

**Command Syntax**

`show snmp v2-mib contact`

**Example**

- This command displays the contact string contents.

  ```
  switch>show snmp v2-mib contact
  Contact: John Smith
  switch>
  ```
show snmp v2-mib location

The `show snmp v2-mib location` command displays the Simple Network Management Protocol (SNMP) system location string. The `snmp-server location` command configures system location details. The command has no effect if a location string was not previously configured.

**Command Mode**

EXEC

**Command Syntax**

```
show snmp v2-mib location
```

**Example**

- This command displays the location string contents.

```
switch>show snmp v2-mib location
Location: santa clara
switch>
```
show snmp view

The show snmp view command displays the information of a Simple Network Management Protocol configuration and the associated MIB. SNMP views are configured with the snmp-server view command.

Command Mode
EXEC

Command Syntax
show snmp view [VIEW_LIST]

Parameters
- VIEW_LIST the name of the view.
- <no parameter> displays information about all views.
- view_name the name of the view.

Field Descriptions
- First column view name.
- Second column name of the MIB object or family.
- Third column inclusion level of the specified family within the view.

Example
- These commands configure an SNMP view, then displays that view.

```
snmp-server view sys-view system include
snmp-server view sys-view system.2 exclude
show snmp view
sys-view system - included
sys-view system.2 - excluded
```
snmp-server chassis-id

The `snmp-server chassis-id` command configures the chassis ID string. The default chassis ID string is the serial number of the switch. The `show snmp` command displays the chassis ID.

The `no snmp-server chassis-id` and `default snmp-server chassis-id` commands restore the default chassis ID string by removing the `snmp-server chassis-id` command from the configuration.

**Command Mode**

Global Configuration

**Command Syntax**

```plaintext
snmp-server chassis-id id_text
no snmp-server chassis-id
default snmp-server chassis-id
```

**Parameters**

- `id_text`  chassis ID string

**Example**

- These commands configure `xyz-1234` as the chassis-id string, then display the result.

  ```plaintext
  switch(config)#snmp-server chassis-id xyz-1234
  switch(config)#show snmp
  Chassis: xyz-1234
  8 SNMP packets input
    0 Bad SNMP version errors
    0 Unknown community name
    0 Illegal operation for community name supplied
    0 Encoding errors
    8 Number of requested variables
    0 Number of altered variables
    4 Get-request PDUs
    4 Get-next PDUs
    0 Set-request PDUs
  21 SNMP packets output
    0 Too big errors
    0 No such name errors
    0 Bad value errors
    0 General errors
    8 Response PDUs
    0 Trap PDUs
  SNMP logging: enabled
    Logging to taccon.162
  SNMP agent enabled
  switch(config)#
  ```
**snmp-server community**

The `snmp-server community` command configures the community string. SNMP community strings serve as passwords that permit an SNMP manager to access the agent on the switch. The Network Management System (NMS) must define a community string that matches at least one of the switch community strings to access the switch.

The `no snmp-server community` and `default snmp-server community` commands remove the community access string from the configuration.

**Command Mode**

Global Configuration

**Command Syntax**

```
snmp-server community string_text [MIB_VIEW] [ACCESS] [ACL_NAMES]
no snmp-server community string_text
default snmp-server community string_text
```

**Parameters**

- `string_text` community access string.
- `MIB_VIEW` community access availability. Options include:
  - `<no parameter>` community string allows access to all objects.
  - `view view_name` community string allows access only to objects in the `view_name` view.
- `ACCESS` community access availability. Options include:
  - `<no parameter>` read-only access (default setting).
  - `ro` read-only access.
  - `rw` read-write access.
- `ACL_NAMES` community access availability. Options include:
  - `<no parameter>` community string allows access to all objects.
  - `list_v4` IPv4 ACL list.
  - `ipv6 list_v6` IPv6 ACL list.
  - `ipv6 list_v6 list_v4` IPv4 and IPv6 ACL list.

**Example**

- This command adds the community string `lab_1` to provide read-only access to the switch agent.

  ```
  switch(config)#snmp-server community lab_1 ro
  switch(config)#
  ```
**snmp-server contact**

The `snmp-server contact` command configures the system contact string. The contact is displayed by the `show snmp` and `show snmp v2-mib contact` commands.

The `no snmp-server contact` and `default snmp-server contact` commands remove the `snmp-server contact` command from the configuration.

**Command Mode**

Global Configuration

**Command Syntax**

```
snmp-server contact contact_string
no snmp-server contact
default snmp-server contact
```

**Parameters**

- `contact_string` system contact string.

**Example**

- These commands configure *Bonnie H* as the contact string, then display the result.

```
switch(config)#snmp-server contact Bonnie H
switch(config)#show snmp
Chassis: xyz-1234
Contact: Bonnie H.
8 SNMP packets input
  0 Bad SNMP version errors
  0 Unknown community name
  0 Illegal operation for community name supplied
  0 Encoding errors
  8 Number of requested variables
  0 Number of altered variables
  4 Get-request PDUs
  4 Get-next PDUs
  0 Set-request PDUs
24 SNMP packets output
  0 Too big errors
  0 No such name errors
  0 Bad value errors
  0 General errors
  8 Response PDUs
  0 Trap PDUs
SNMP logging: enabled
  Logging to taccon.162
SNMP agent enabled
switch(config)#
```
snmp-server enable traps

The `snmp-server enable traps` command enables both Simple Network Management Protocol (SNMP) traps and SNMP inform requests; use the `snmp-server host` command to specify which will receive SNMP notifications. Sending notifications requires at least one `snmp-server host` command.

The `snmp-server enable traps` and `no snmp-server enable traps` commands, without a MIB parameter, specify the default notification trap generation setting for all MIBs. These commands, when specifying a MIB, control notification generation for the specified MIB. The `default snmp-server enable traps` command resets notification generation to the default setting for the specified MIB.

Command Mode

- **Global Configuration**

Command Syntax

```
snmp-server enable traps [trap_type]
no snmp-server enable traps [trap_type]
default snmp-server enable traps [trap_type]
```

Parameters

- `trap_type` controls the generation of informs or traps for the specified MIB:
  - `<no parameter>` controls notifications for MIBs not covered by specific commands.
  - `entity` controls entity-MIB modification notifications.
  - `lldp` controls LLDP notifications.
  - `msdpBackwardTransition` controls msdpBackwardTransition notifications.
  - `msdpEstablished` controls msdpEstablished notifications.
  - `snmp` controls SNMP-v2 notifications.
  - `switchover` controls switchover notifications.
  - `snmpConfigManEvent` controls snmpConfigManEvent notifications.
  - `test` controls test traps.

Examples

- These commands enables notification generation for all MIBs except spanning tree.
  ```
  switch(config)#snmp-server enable traps
  switch(config)#no snmp-server enable traps spanning-tree
  switch(config)#
  ```

- This command enables spanning-tree MIB notification generation, regardless of the default setting.
  ```
  switch(config)#snmp-server enable traps spanning-tree
  switch(config)#
  ```

- This command resets the spanning-tree MIB notification generation to follow the default setting.
  ```
  switch(config)#default snmp-server enable traps spanning-tree
  switch(config)#
  ```

- This command enables switchover MIB notification generation, regardless of the default setting.
  ```
  switch(config)#snmp-server enable traps switchover
  switch(config)#
  ```

- This command resets the switchover MIB notification generation to follow the default setting.
  ```
  switch(config)# default snmp-server enable traps switchover
  switch(config)#
  ```
snmp-server engineID local

The **snmp-server engineID local** command configures the name for the local Simple Network Management Protocol (SNMP) engine. The default SNMP engineID is generated by the switch and is used when an engineID is not configured with this command. The **show snmp engineID** command displays the default or configured engine ID.

SNMPv3 authenticates users through security digests (MD5 or SHA) that are based on user passwords and the local engine ID. Passwords entered on the CLI are similarly converted, then compared to the user's security digest to authenticate the user.

---

**Important!** Changing the local engineID value invalidates SNMPv3 security digests, requiring the reconfiguration of all user passwords.

---

The **no snmp-server engineID** and **default snmp-server engineID** commands restore the default engineID by removing the **snmp-server engineID** command from the configuration.

**Command Mode**

Global Configuration

**Command Syntax**

```
snmp-server engineID local engine_hex
no snmp-server engineID local
default snmp-server engineID
```

**Parameters**

- **engine_hex** the switch’s name for the local SNMP engine (hex string).
  
The string must consist of at least ten characters with a maximum of 64 characters.

**Example**

- This command configures DC945798CAB4 as the name of the local SNMP engine.

```
switch(config)#snmp-server engineID local DC945798CAB4
switch(config)#
```
The `snmp-server engineID remote` command configures the name of a Simple Network Management Protocol (SNMP) engine located on a remote device. The switch generates a default engineID; use the `show snmp engineID` command to view the configured or default engineID.

An SNMPv3 inform requires a remote engine ID to compute the security digest that authenticates and encrypts data transmitted to remote users. SNMPv3 authenticates users with MD5 or SHA through the engine ID and user passwords. CLI passwords are similarly authenticated.

**Important!** Changing the engineID value invalidates SNMPv3 security digests, requiring the reconfiguration of all user passwords.

The `no snmp-server engineID remote` and `default snmp-server engineID remote` commands remove the `snmp-server engineID remote` command from the configuration.

**Command Mode**
Global Configuration

**Command Syntax**
```
snmp-server engineID remote engine_addr [PORT] engine_hex
no snmp-server engineID remote engine_addr [PORT]
default snmp-server engineID remote engine_addr [PORT]
```

**Parameters**
- `engine_addr` location of remote engine (IP address or host name).
- `PORT` udp port location of the remote engine. Options include:
  - `<No parameter>` port number 161 (default).
  - `udp-port port_num` port number. Ranges from 0 to 65535.
- `engine_hex` the switch’s name for the remote SNMP engine (hex string).
  The string must have at least ten characters and can contain a maximum of 64 characters.

**Example**
- This command configures DC945798CA as the engineID of the remote SNMP engine located at 10.23.10.25, UDP port 162.

```
switch(config)#snmp-server engineID remote 10.23.10.25 udp-port 162 DC945798CA
switch(config)#
```
snmp-server extension

The snmp-server extension command configures the execution of user supplied scripts to service portions of the OID space.

The no snmp-server extension and default snmp-server extension commands deletes the snmp-server extension command from running-config.

Command Mode
Global Configuration

Command Syntax

```
 snmp-server extension OID_space FILE_PATH [DURATION]
```

Parameters

- **OID_space** OID branch serviced by the script, in numerical format.
- **FILE_PATH** path and name of the script file. Options include:
  - file: file is located in the switch file directory.
  - flash: file is located in flash memory.
- **DURATION** the execution scope of the script.
  - <no parameter> script runs after initial request to process subsequent requests.
  - one-shot script processes a single object (runs once), then terminates.

Examples

- This command specifies the file example.sh, located in flash, as the script file that services the listed OID space.

```
 switch(config)#snmp-server extension .1.3.6.1.4.1.8072.2 flash:example.sh
```
snmp-server group

The snmp-server group command configures a new Simple Network Management Protocol (SNMP) group or modifies an existing group. An SNMP group is a data structure that user statements reference to map SNMP users to SNMP contexts and views, providing a common access policy to the specified users.

An SNMP context is a collection of management information items accessible by an SNMP entity. Each item of may exist in multiple contexts. Each SNMP entity can access multiple contexts. A context is identified by the EngineID of the hosting device and a context name.

The no snmp-server group and default snmp-server group commands delete the specified group by removing the corresponding snmp-server group command from the configuration.

**Command Mode**

Global Configuration

**Command Syntax**

```
snmp-server group  group_name VERSION [CNTX] [READ] [WRITE] [NOTIFY]
no snmp-server group  group_name VERSION
default snmp-server group  group_name VERSION
```

**Parameters**

- **group_name** the name of the group.
- **VERSION** the security model utilized by the group.
  - v1   SNMPv1. Uses a community string match for authentication.
  - v2c  SNMPv2c. Uses a community string match for authentication.
  - v3 no auth  SNMPv3. Uses a username match for authentication.
  - v3 auth  SNMPv3. HMAC-MD5 or HMAC-SHA authentication.
  - v3 priv  SNMPv3. HMAC-MD5 or HMAC-SHA authentication. AES or DES encryption.
- **CNTX** associates the SNMP group to an SNMP context.
  - <no parameter> command does not associate group with an SNMP context.
  - context context_name  associates group with context specified by context_name.
- **READ** specifies read view for SNMP group.
  - <no parameter> command does not specify read view.
  - read read_name  read view specified by read_name (string – maximum 64 characters).
- **WRITE** specifies write view for SNMP group.
  - <no parameter> command does not specify write view.
  - write write_name  write view specified by write_name (string – maximum 64 characters).
- **NOTIFY** specifies notify view for SNMP group.
  - <no parameter> command does not specify notify view.
  - notify notify_name  notify view specified by notify_name (string – maximum 64 characters).

**Example**

- This command configures normal_one as SNMP version 3 group (authentication and encryption) that provides access to the all-items read view.

```
switch(config)#snmp-server group normal_one v3 priv read all-items
switch(config)#
```
snmp-server host

The `snmp-server host` command configures an SNMP host (to which SNMP traps will be sent) and sets the community string if it was not previously configured. The host is denoted by host location and community string. The command also specifies the type of SNMP notifications that are sent: a `trap` is an unsolicited notification; an `inform` is a trap that includes a request for a confirmation that the message is received.

The configuration can contain multiple statements to the same host location with different community strings. For instance, a configuration can simultaneously contain all of the following:

- `snmp-server host host-1 version 2c comm-1`
- `snmp-server host host-1 informs version 2c comm-2`
- `snmp-server host host-1 version 2c comm-3 udp-port 666`
- `snmp-server host host-1 version 3 auth comm-3`

The `no snmp-server host` and `default snmp-server host` commands remove the specified host by deleting the corresponding `snmp-server host` statement from the configuration. When removing a statement, the host (address and port) and community string must be specified.

**Command Mode**

Global Configuration

**Command Syntax**

```
snmp-server host host_id [VRF_INST] [MESSAGE] [VERSION] comm_str [PORT]
no snmp-server host host_id [VRF_INST] [MESSAGE] [VERSION] comm_str [PORT]
default snmp-server host host_id [VRF_INST] [MESSAGE] [VERSION] comm_str [PORT]
```

**Parameters**

- `host_id` hostname or IP address of the SNMP host.
- `VRF_INST` specifies the VRF instance being modified.
  - `<no parameter>` changes are made to the default VRF.
  - `vrf vrf_name` changes are made to the specified user-defined VRF.
- `MESSAGE` message type that is sent to the host.
  - `<no parameter>` sends SNMP traps to host (default).
  - `informs` sends SNMP informs to host.
  - `traps` sends SNMP traps to host.
- `VERSION` SNMP version. Options include:
  - `<no parameter>` SNMPv2c (default).
  - `version 1` SNMPv1; option not available with informs.
  - `version 2c` SNMPv2c.
  - `version 3 noauth` SNMPv3; enables user-name match authentication.
  - `version 3 auth` SNMPv3; enables MD5 and SHA packet authentication.
  - `version 3 priv` SNMPv3, HMAC-MD5 or HMAC-SHA authentication. AES or DES encryption.
- `comm_str` community string to be sent with the notification as a password.
  - `comm_str` community string to be sent with the notification as a password.

Arista recommends setting this string separately before issuing the `snmp-server host` command. To set the community string separately, use the `snmp-server community` command.

- `PORT` port number of the host.
SNMP Commands

- `<no parameter>` socket number set to 162 (default)
- `udp-port p-name` socket number specified by `p-name`

Guidelines

The switch can only send SNMP traps and informs if the host that has been configured to receive them is accessible through an interface in a VRF in which SNMP has been enabled. SNMP is enabled by default only in the default VRF. Enable or disable SNMP in a VRF with the `snmp-server vrf` command.

Example

- This command adds a version 2c inform notification recipient.

  switch(config)#snmp-server host 10.15.2.3 informs version 2c comm-1
  switch(config)#
The **snmp-server location** command configures the system location string. By default, no system location string is set.

The **no snmp-server location** and **default snmp-server location** commands delete the location string by removing the **snmp-server location** command from the configuration.

**Command Mode**
Global Configuration

**Command Syntax**
- `snmp-server location node_locate`
- `no snmp-server location`
- `default snmp-server location`

**Parameters**
- `node_locate` system location information (string).

**Example**
- These commands configure **lab-east** as the location string.
  ```
  switch(config)#snmp-server location lab_east
  ```
snmp-server local-interface

The `snmp-server local-interface` command specifies the interface where SNMP originates informs and traps.

The `no snmp-server local-interface` and `default snmp-server local-interface` commands remove the inform or trap source assignment by removing the `snmp-server local-interface` command from running-config.

Command Mode

Global Configuration

Command Syntax

```
  snmp-server local-interface INTERFACE
  no snmp-server local-interface
  default snmp-server local-interface
```

Parameters

- **INTERFACE** Interface type and number. Values include:
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-Channel Interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
  - `vrf vrf_name` The VRF in which SNMP is enabled. The keyword `default` specifies the default VRF.

Example

- This command configures the Ethernet 1 interface as the source of SNMP traps and informs.

  `switch(config)#snmp-server local-interface ethernet 1`
snmp-server user

The `snmp-server user` command adds a user to a Simple Network Management Protocol (SNMP) group or modifies an existing user’s parameters.

To configure a user, the IP address or port number of the device where the user’s remote SNMP agent resides must be specified. A user’s authentication come from the engine ID and the user’s password. Remote user configuration commands fail if the remote engine ID is not configured first.

The `no snmp-server user` and `default snmp-server user` commands remove the user from an SNMP group by removing the user command from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**

```
snmp-server user user_name group_name [AGENT] VERSION [ENGINE] [SECURITY]
no snmp-server user user_name group_name [AGENT] VERSION
default snmp-server user user_name group_name [AGENT] VERSION
```

**Parameters**

- `user_name` name of user.
- `group_name` name of group to which user is being added.
- `AGENT` Options include:
  - `<no parameter>` local SNMP agent.
  - `remote addr [udp-port p_num]` remote SNMP agent location.
    - `addr` denotes the IP address; `p_num` denotes the udp port socket. (default port is 162).
- `VERSION` SNMP version; options include:
  - `v1` SNMPv1.
  - `v2c` SNMPv2c.
  - `v3` SNMPv3.
- `ENGINE` engine ID used to localize passwords. Available only if `VERSION` is `v3`.
  - `<no parameter>` Passwords localized by SNMP copy specified by `agent`.
  - `localized engineID` octet string of engineID.
- `SECURITY` Specifies authentication and encryption levels. Available only if `VERSION` is `v3`.
  - `<no parameter>` no authentication or encryption.
  - `auth a_meth a_pass [priv e_meth e_pass]` authentication parameters.
    - `a_meth` authentication method: options are `md5` (HMAC-MD5-96) and `sha` (HMAC-SHA-96).
    - `a-pass` authentication string for users receiving packets.
    - `e_meth` encryption method: Options are `aes` (AES-128) and `des` (CBC-DES).
    - `e-pass` encryption string for the users sending packets.

**Example**

- This command configures the remote SNMP user `tech-1` to the `tech-sup` SNMP group.

  ```
  switch(config)#snmp-server user tech-1 tech-sup remote 10.1.1.2 v3
  ```
**snmp-server view**

The `snmp-server view` command defines a view.

An SNMP view defines a subset of objects from an MIB. Every SNMP access group specifies views, each associated with read or write access rights, to allow or limit the group's access to MIB objects.

The `no snmp-server view` command deletes a view entry by removing the corresponding `snmp-server view` command from the `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
snmp-server view view_name family_name INCLUSION
no snmp-server view view_name [family_name]
```

**Parameters**

- `view_name` Label for the view record that the command updates. Other commands reference the view with this label.
- `family_name` name of the MIB object or family.
  
  MIB objects and MIB subtrees can be identified by name or by the numbers representing the position of the object or subtree in the MIB hierarchy.
- `INCLUSION` inclusion level of the specified family within the view. Options include:
  - `include` view includes the specified subtree.
  - `exclude` view excludes the specified subtree.

**Example**

- These commands create a view named `sys-view` that includes all objects in the `system` subtree except for those in `system.2`.

  ```
  switch(config)#snmp-server view sys-view system include
  switch(config)#snmp-server view sys-view system.2 exclude
  ```
snmp-server vrf

The `snmp-server vrf` command enables SNMP in the specified VRF. By default, SNMP is enabled only in `default` VRF.

- User-defined VRFs: The `no snmp-server vrf` command disables SNMP in the specified VRF by removing the corresponding `snmp-server vrf` command from the `running-config`.
- Default VRF: The `no snmp-server vrf` command disables SNMP in the VRF by adding a `no snmp-server vrf default` statement to `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**

```plaintext
snmp-server vrf vrf_name
no snmp-server vrf vrf_name
default snmp-server vrf vrf_name
```

**Parameters**

- `vrf_name` The VRF in which SNMP is enabled. The keyword `default` specifies the default VRF.

**Guidelines**

The switch can only send SNMP traps and informs if the host that has been configured to receive them is accessible through an interface in a VRF in which SNMP has been enabled. SNMP is enabled by default only in the `default` VRF. Enable or disable SNMP in a VRF with the `snmp-server vrf` command.

**Example**

- These commands disable SNMP in the default VRF, then enable it in the user-defined VRFs named “magenta” and “columbia.”

  ```plaintext
  switch(config)#no snmp-server vrf default
  switch(config)#snmp-server vrf magenta
  switch(config)#snmp-server vrf columbia
  switch(config)#
  ```
snmp trap link-change

The **snmp trap link-change** command enables Simple Network Management Protocol (SNMP) link-status trap generation on the configuration mode interface. The generation of link-status traps is enabled by default. If SNMP link-trap generation was previously disabled, this command removes the corresponding **no snmp link-status** statement from the configuration to re-enable link-trap generation.

The **no snmp trap link-change** command disables SNMP link trap generation on the configuration mode interface.

The **snmp trap link-change** and **default snmp trap link-change** commands restore the default behavior by removing the **no snmp trap link-change** command from **running-config**.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Loopback Configuration
- Interface-Management Configuration
- Interface-Port-channel Configuration
- Interface-VLAN Configuration
- Interface-VXLAN Configuration

**Command Syntax**
- `snmp trap link-change`
- `no snmp trap link-change`
- `default snmp trap link-change`

**Guidelines**
The switch can only send SNMP traps and informs if the host that has been configured to receive them is accessible through an interface in a VRF in which SNMP has been enabled. SNMP is enabled by default only in the **default** VRF. Enable or disable SNMP in a VRF with the **snmp-server vrf** command.

**Example**
- This command disables SNMP link trap generation on the Ethernet 5 interface.

  ```
  switch(config-if-Et5)#no snmp trap link-change
  switch(config-if-Et5)#
  ```
Arista Networks’ Latency Analyzer (LANZ) is a family of EOS features that provide enhanced visibility into network dynamics, particularly in areas related to the delay packets experience through the network. The LANZ feature is available on the FM6000, Arad, Trident II, Trident 3, Jericho, Tomahawk and XP80 switch platforms.

This chapter describes the purpose, behavior, and configuration of LANZ features. Topics covered by this chapter include:

- Section 44.1: Introduction to LANZ
- Section 44.2: LANZ Overview
- Section 44.3: Configuring LANZ
- Section 44.4: LANZ Commands

### 44.1 Introduction to LANZ

LANZ tracks interface congestion and queuing latency with real-time reporting. With LANZ application layer event export, external applications can predict impending congestion and latency. This enables the application layer to make traffic routing decisions with visibility into the network layer.

With LANZ, network operations teams and administrators have near real-time visibility into the network, enabling early detection of microbursts. LANZ continually monitors congestion, allowing for rapid detection of congestion and sending of application layer messages.

### 44.2 LANZ Overview

LANZ monitors output queue lengths to provide congestion information for individual interfaces. This allows for more detailed analysis of congestion events, and allows identification of potential latency problems before they arise. On some platforms, LANZ also monitors global buffer usage.

Output queues for each port are monitored, and information about queue congestion events can be accessed in the form of system log messages, reports, or streaming.

#### 44.2.1 LANZ Monitoring Mechanism

LANZ provides congestion data by continuously monitoring each port’s output queue lengths. When the length of an output queue exceeds the upper threshold for that port, LANZ generates an over-threshold event.
44.2.1.1 Notifying and Polling Modes

**Notifying Mode**

In Notifying Mode (available on all platforms), LANZ monitors congestions on all queues and generates Start, Update, and End events every five seconds or at user-configured intervals.

- **Start** event is generated when any queue on an interface exceeds the upper threshold.
- **Update** events are generated periodically while the congested queue remains above the lower threshold. The interval at which Update events are generated is configured using the `queue-monitor length update-interval` command.
- **End** event is generated when the congested queue drops below the lower threshold.

**Polling Mode**

Polling Mode is available only on Arad and Jericho switches. On these switches, LANZ can be configured to use Notifying Mode, but it operates in Polling Mode by default. In Polling Mode, LANZ polls the most congested queue in each ASIC and continues to report an over-threshold state every 800 microseconds until all queue lengths for the port pass below the lower threshold.

44.2.2 LANZ Logging

Over-threshold events generated by LANZ can be logged as system log messages. Log messages are generated for events on all ports, at a maximum rate of one message per second per interface. The interval between messages can be configured globally.

Log messages indicate the time of the event, the interface affected, the threshold set for that interface, and the actual number of entries in the port’s queue.

44.2.3 LANZ Reporting

Detailed LANZ data can be viewed through the CLI or exported as a CSV-formatted report.

A circular FIFO event buffer is dynamically shared by all interfaces. When an interface begins generating LANZ over-threshold events it can fill all available buffer space. However, each interface is guaranteed sufficient resources for a minimum of 500 entries.

44.2.4 LANZ Streaming

On some platforms, external client applications can also receive congestion event information as a data stream. The switch can stream LANZ data to up to 100 clients via TCP through port 50001. Streamed data is in Google protocol buffer format, and includes both over-threshold events and LANZ configuration information.

44.2.5 Platforms

The LANZ feature is available on the FM6000, Arad, Trident II, Trident 3, Jericho and Tomahawk switch platforms. To determine the switch platform from the CLI, enter `show platform ?` at the prompt.

Settings and capabilities differ slightly between the platforms:

- Arad chips measure threshold values in bytes; all others measure threshold values in segments:
  - **FM6000** 480-byte segments
  - **Trident II** and **Tomahawk** 208-byte segments
  - **Trident 3** 256-byte segments
- FM6000, Trident II, Trident 3, and Tomahawk chips allow configuration of both upper and lower threshold values.
- FM6000, Arad, Jericho, Trident II, Trident 3, and Tomahawk chips support LANZ data streaming.
- Only FM6000 chips support global buffer monitoring.
- While the FM6000, Trident II, Trident 3, Jericho and Tomahawk chips can monitor congestion events for all queues, the Arad chips only monitor the most congested queues.
- Polling Mode is available on Arad and Jericho platforms.
- LANZ is available on CPU ports on Arad, Jericho, Trident II and Tomahawk platforms.
- LANZ is available on fabric ports on Trident, Trident II, Trident 3, and Tomahawk platforms.
44.3 Configuring LANZ

LANZ is disabled by default and must be enabled to function. Upper and lower queue-length thresholds can be defined for individual interfaces.

These sections describe the basic LANZ configuration steps:

- Section 44.3.1: Enabling and Disabling LANZ
- Section 44.3.2: Specifying the LANZ Mode on Jericho and Arad Switches
- Section 44.3.3: Configuring LANZ Congestion Thresholds
- Section 44.3.4: Setting LANZ Traffic Sampling
- Section 44.3.5: Logging LANZ Congestion Events
- Section 44.3.6: Viewing LANZ Data
- Section 44.3.7: Streaming LANZ Data

44.3.1 Enabling and Disabling LANZ

For the switch to collect and display latency information, LANZ must be enabled. The `queue-monitor length (global configuration mode)` command enables LANZ with the current settings, or with the default settings if none have been configured. LANZ is disabled by default.

When LANZ is enabled, the switch monitors queue lengths on all front-panel ports, and on CPU and fabric ports on selected platforms. Queue length data is available in the following forms:

- syslog data (see `queue-monitor length log`)
- CLI display or CSV-format output (see `show queue-monitor length`)
- data stream (see `queue-monitor streaming`)

To disable LANZ globally, enter the `no queue-monitor length` command in global configuration mode. Disabling LANZ globally also discards LANZ log data, but retains settings. To disable LANZ on an individual interface, enter the `no queue-monitor length` command in interface Ethernet configuration mode.

Examples

- This command enables LANZ on the switch.
  ```
  switch(config)#queue-monitor length
  ```
- This command disables LANZ on the switch.
  ```
  switch(config)#no queue-monitor length
  ```
- These commands disable LANZ on Ethernet interface 7.
  ```
  switch(config)#interface ethernet 7
  switch(config-if-Et7)#no queue-monitor length
  ```

44.3.2 Specifying the LANZ Mode on Jericho and Arad Switches

On Jericho and Arad switches, LANZ operates by default in Polling Mode, which provides congestion data for the most congested queue per ASIC. They also support Notifying Mode (the LANZ mode used on all other switches), which generates Start, Update, and End events for all queues.

Notifying Mode is enabled using the `queue-monitor length notifying` command.
Examples

- This command enables Notifying Mode on a Jericho or Arad switch.
  
  ```
  switch(config)#queue-monitor length notifying
  ```

- This command disables Notifying Mode on a Jericho or Arad switch, returning LANZ to the default Polling Mode.
  
  ```
  switch(config)#no queue-monitor length notifying
  ```

44.3.3 Configuring LANZ Congestion Thresholds

When LANZ is enabled on the switch, it generates over-threshold events when queue lengths on any monitored interface exceed the upper threshold value and continues generating them until all the queue lengths on that interface drop back below the lower threshold.

44.3.3.1 Setting the Congestion Update Interval

The `queue-monitor length update-interval` command specifies the frequency with which congestion information is updated in microseconds.

- This command sets the time between congestion updates to 10 seconds.
  
  ```
  switch(config)#queue-monitor length update-interval 1000000
  ```

- This command resets the time between congestion updates to its default value of 5 seconds.
  
  ```
  switch(config)#default queue-monitor length update-interval
  ```

44.3.3.2 Congestion Thresholds on FM6000, Trident II, Trident 3, and Tomahawk Switches

Queue lengths are measured in 480-byte segments on FM6000 switches, in 208-byte segments on Trident II and Tomahawk switches, and in 256-byte segments on Trident 3 switches. The default threshold values are 512 segments and 256 segments. To change the threshold values for a specific interface, use the `queue-monitor length thresholds` command.

FM6000 switches can also monitor global buffer usage. Global buffers are measured in 160-byte segments; the default threshold values are 10940 segments and 4376 segments. To enable global buffer monitoring, use the `queue-monitor length global-buffer` command. To change the threshold values for global buffer usage monitoring on the switch, use the `queue-monitor length global-buffer thresholds` command.

Examples

- These commands set the upper and lower queue-length thresholds on Ethernet interface 5 to 300 segments and 200 segments.
  
  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#queue-monitor length thresholds 300 200
  ```

- These commands enable global buffer monitoring on the switch and set the upper and lower thresholds to 9000 segments and 4000 segments.
  
  ```
  switch(config)#queue-monitor length global-buffer
  switch(config)#queue-monitor length global-buffer thresholds 9000 4000
  ```
44.3.3 Congestion Thresholds on Arad Switches

Queue lengths are measured in bytes. The top threshold value can be between 2 and 52428800 bytes (the default value is 52428800 bytes). To change the upper threshold value for a specific interface, use the `queue-monitor length threshold` (Arad/Jericho) command.

**Example**

- These commands set the upper queue-length threshold on Ethernet interface 5 to 2614400 bytes.
  
  ```
  switch(config)# interface ethernet 5
  switch(config-if-Et5)# queue-monitor length thresholds 2614400
  ```

44.3.4 CPU Port Congestion Thresholds

CPU port queue lengths are also monitored on selected platforms. All CPU ports share common threshold values, which are configured using the `queue-monitor length cpu thresholds` command. Individual CPU port congestion thresholds cannot be separately configured.

**Examples**

- This command sets the upper queue-length threshold for congestion monitoring on all CPU ports to 1000 segments and the lower limit to 300 segments.
  
  ```
  switch(config)# queue-monitor length cpu thresholds 1000 300
  ```

- This command resets the queue-length thresholds for CPU port congestion to the default values of 512 and 256.
  
  ```
  switch(config)# default queue-monitor length cpu thresholds
  ```

44.3.5 Fabric Port Congestion Thresholds

Fabric port queue lengths are also monitored on selected platforms. All fabric ports share common threshold values, which are configured using the `queue-monitor length fabric thresholds` command. Individual fabric port congestion thresholds cannot be separately configured.

**Examples**

- This command sets the upper queue-length threshold for congestion monitoring on all fabric ports to 1000 segments and the lower limit to 300 segments.
  
  ```
  switch(config)# queue-monitor length fabric thresholds 1000 300
  ```

- This command resets the queue-length thresholds for fabric port congestion to the default values of 512 and 256.
  
  ```
  switch(config)# default queue-monitor length fabric thresholds
  ```

44.3.4 Setting LANZ Traffic Sampling

Traffic experiencing congestion can be configured to automatically send congested traffic to either the CPU or an Ethernet egress interface destination, once a queue threshold is crossed, by enabling LANZ mirroring through the command `queue-monitor length mirror`. The CPU or an egress interface mirror destination is then configured through the command `queue-monitor length mirror destination`. LANZ traffic sampling includes exporting congested traffic to a packet capture device or another tool for analysis, or directly to the switch CPU for inspection through the command `tcpdump queue-monitor`. 

Example

- This command enables LANZ traffic sampling.
  
  ```
  switch(config)# queue-monitor length mirror
  switch(config)#
  ```

- This command disables LANZ traffic sampling.
  
  ```
  switch(config)# no queue-monitor length mirror
  switch(config)#
  ```

Examples

- This command configures LANZ traffic sampling for a CPU interface mirror destination.
  
  ```
  switch(config)# queue-monitor length mirror destination cpu
  switch(config)#
  ```

- This command configures LANZ traffic sampling for an Ethernet interface mirror destination for ports 1 through 5.
  
  ```
  switch(config)# queue-monitor length mirror destination Ethernet 1-5
  switch(config)#
  ```

- This command configures LANZ traffic sampling for an Ethernet interface mirror destination for ports 6, 10, and 12 through 14.
  
  ```
  switch(config)# queue-monitor length mirror destination Ethernet 6,10,12-14
  switch(config)#
  ```

Example

- This command inspects traffic on the switch.
  
  ```
  switch(config)# tcpdump queue-monitor
  tcpdump: WARNING: lanz: no IPv4 address assigned
  tcpdump: verbose output suppressed, use -v or -vv for full protocol decode
  listening on lanz, link-type EN10MB (Ethernet), capture size 65535 bytes
  ...
  0 packets captured
  0 packets received by filter
  0 packets dropped by kernel
  switch(config)#
  ```

44.3.5 Logging LANZ Congestion Events

To generate syslog messages when queue lengths on an interface exceed its upper threshold, enable logging with the `queue-monitor length log` command. When logging is enabled, a log message is generated each time one or more queues on an interface exceed the upper threshold value for that interface (see `queue-monitor length threshold (Arad/Jericho)` or `queue-monitor length thresholds`). Once an interface is over threshold, additional messages are generated at a maximum rate of one per `interval` as long as the queue length remains above the lower threshold for that interface. No syslog message is generated when queue length drops back under threshold.

Queue length information is not included in log messages, but can be accessed by displaying LANZ data or exporting reports.

On FM6000 platforms, log messages can also be created whenever global buffer usage exceeds its upper threshold value (see `queue-monitor length global-buffer thresholds`). To enable global buffer monitoring, use the `queue-monitor length global-buffer` command. To log over-threshold events for the global buffer, use the `queue-monitor length global-buffer log` command.
Examples

- This command enables queue-length over-threshold logging with a minimum interval of 10 seconds between messages for a given interface.
  switch(config)#queue-monitor length log 10
- This command disables queue-length over-threshold logging on the switch.
  switch(config)#queue-monitor length log 0
- This is an example of a queue-length log message.
  Oct 27 12:48:22 switch QUEUE_MONITOR-6-LENGTH_OVER_THRESHOLD: Interface Ethernet6 queue length is over threshold of 512, current length is 1024.
- This command enables global buffer over-threshold logging on the switch with a minimum interval of 60 seconds between messages.
  switch(config)#queue-monitor length global-buffer log 60

44.3.6 Viewing LANZ Data

LANZ status, and the data stored in the LANZ data buffer, can be viewed using the CLI. Output varies by switch platform, and can be limited to a specified number of records.

44.3.6.1 Viewing LANZ Data on Arad Platform Switches

When LANZ is enabled on an Arad platform switch, the `show queue-monitor length` command displays a report of recent over-threshold events for a range of interfaces or for all interfaces. By default, the command displays data for all interfaces, limited to the last 1000 records, with the most recent events listed first. To view a subset of the LANZ data, limited to a specified number of records, use the `show queue-monitor length limit` command.

Example

- This command displays the last 100 records for Ethernet interfaces 6 through 8.
  switch#show queue-monitor length ethernet 6-8 limit 100
  Report generated at 2010-01-01 12:56:13

<table>
<thead>
<tr>
<th>Time</th>
<th>Interface</th>
<th>Queue length (segments, 1 to 512 bytes)</th>

</tbody>
</table>

To view the current LANZ configuration for the switch and for each interface, use the `show queue-monitor length status` command.
Example

- This command displays LANZ configuration and status information.

```
switch(config)#show queue-monitor length status
Per-Interface Queue Length Monitoring

Queue length monitoring is enabled
Maximum queue length in bytes : 52428800
Port threshold in bytes:
  Port     High threshold  
  Et3/1    5242880        
  Et3/2    5242880        
  Et3/3    5242880        
  Et3/4    5242880        
  Et3/5    5242880        
```

44.3.6.2 Viewing LANZ Data on FM6000, Trident II, Trident 3, and Tomahawk Platform Switches

When LANZ is enabled on an FM6000, Trident II, Trident 3, or Tomahawk platform switch, the `show queue-monitor length` command displays a report of recent over-threshold events for a range of interfaces or for all interfaces. By default, the command displays data for all interfaces, limited to the last 1000 records, with the most recent events listed first. To view a subset of the LANZ data, limited to a specified number of records, use the `show queue-monitor length limit` command.

Example

- This command displays the last 100 records for Ethernet interfaces 6 through 8.

```
switch#show queue-monitor length ethernet 6-8 limit 100
Report generated at 2010-01-01 12:56:13

<table>
<thead>
<tr>
<th>Time</th>
<th>Interface</th>
<th>Queue length (segments, 1 to 512 bytes)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0:00:07.43393 ago</td>
<td>Et6</td>
<td>1049</td>
</tr>
<tr>
<td>0:00:39.22856 ago</td>
<td>Et7</td>
<td>2039</td>
</tr>
<tr>
<td>1 day, 4:33:23.12345 ago</td>
<td>Et6</td>
<td>1077</td>
</tr>
</tbody>
</table>
```

To view the current LANZ configuration for the switch and for each interface, use the `show queue-monitor length status` command.
**Example**

- This command displays LANZ configuration and status information.

```
switch(config)#show queue-monitor length status
queue-monitor length enabled
Global Buffer Monitoring
------------------------
Global buffer monitoring is enabled
Segment size in bytes :   160
Total buffers in segments : 36864
High threshold : 10940
Low threshold :  4376

Per-Interface Queue Length Monitoring
-------------------------------------
Queue length monitoring is enabled
Segment size in bytes :   480
Maximum queue length in segments : 3647
Port thresholds in segments:
Port     High threshold  Low threshold
Et1                 512            256
Et2                 512            256
Et3                 512            256
Et4                 512            256
Et5                 512            256
```

<--------OUTPUT OMITTED FROM EXAMPLE-------->

To view all available LANZ records, use the `show queue-monitor length all` command.
Example

- This command displays all available LANZ records.

  `switch>show queue-monitor length all`

  E-End, U-Update, S-Start, TC-Traffic Class
  GH-High, GU-Update, GL-Low
  Segment size for E, U and S congestion records is 480 bytes
  Segment size for GL, GU and GH congestion records is 160 bytes
  * Max queue length during period of congestion
  + Period of congestion exceeded counter

  `switch>`

  On the FM6000, Trident II, Trident 3, and Tomahawk platforms, information is also available for the number of dropped packets (see `show queue-monitor length drops`) and transmission latency (see `show queue-monitor length tx-latency`); global buffer usage can also be viewed on FM6000 platforms (see `show queue-monitor length global-buffer`).

### 44.3.7 Streaming LANZ Data

To support analysis of latency conditions, the switch can be configured to stream LANZ congestion and configuration data. The switch streams LANZ data via TCP in Google protocol buffer format through port 50001 and through the management interface.

You must create a client application to receive the streaming data. By default, the switch will accept up to 10 client connections for streaming LANZ data. This limit can be configured up to a maximum of 100. Maximum connections can be configured when LANZ is disabled.

#### 44.3.7.1 Enabling and Disabling LANZ Data Streaming

LANZ data streaming is disabled by default. To enable streaming, issue the `no show queue-monitor streaming clients` command in queue-monitor streaming configuration mode. To disable streaming, use the `show queue-monitor streaming clients` command.

When streaming is disabled, a message is sent to any connected clients and the connections are closed.
To ensure client access to LANZ data, add a rule to any relevant ACL permitting traffic destined for the LANZ port (50001) before initiating a client connection for streaming from a remote host. A static rule (sequence number 130) in the default control plane ACL permits LANZ traffic, but a similar rule must be added to any user-created ACL.

Examples

- These commands enable the streaming of LANZ data from the switch.
  ```
  switch(config)#queue-monitor streaming
  switch(config-qm-streaming)#no shutdown
  switch(config-qm-streaming)#
  ```

- These commands disable LANZ data streaming.
  ```
  switch(config)#queue-monitor streaming
  switch(config-qm-streaming)#shutdown
  switch(config-qm-streaming)#
  ```

44.3.7.2 Configuring Maximum Connections

By default, the switch will accept a maximum of 10 client connections for LANZ data streaming. This maximum can be configured using the `max-connections` command. If a client connects to the switch after the limit has been reached, an error message is sent and the connection is closed.

Example

- This command sets the maximum number of client connections for LANZ data streaming to 50.
  ```
  switch(config-qm-streaming)#max-connections 50
  ```

44.3.7.3 LANZ Streaming Messages

When streaming is enabled, LANZ sends a message whenever a congestion event or a configuration event occurs. The messages are streamed in Google protocol buffer format.

Configuration Messages

A configuration message is sent whenever a change is made to the LANZ configuration settings on the switch. The switch also sends a configuration message when a new client connection is established.

The configuration message includes the following information:

- `timestamp` time of change in configuration in tens of microseconds (UTC).
- `lanzVersion` LANZ feature version.
- `numOfPorts` number of ports in the switch.
- `segmentSize` segment size.
- `maxQueueSize` maximum queue size in segments.
- `qLenInterval` frequency of updates.
- `intfName` name of the port.
- `switchId` ID of the chip on a multi-chip system.
- `portId` ID of the port.
- `internalPort` “true” if it is an internal port.
- `highThreshold` higher threshold value.
- `lowThreshold` lower threshold value.
Congestion Messages

A congestion message is sent whenever LANZ generates an over-threshold event. The congestion message includes the following information:

- **timestamp**: time of congestion in micro-seconds (UTC).
- **intfName**: name of the port.
- **switchId**: ID of the chip on a multi-chip system.
- **portId**: ID of the port.
- **queueSize**: queue size in segments at time of congestion.

44.3.7.4 Creating the LANZ Client

For a client device to receive streaming data from the LANZ server, it must be running a client application designed to receive LANZ data. Client programs must be based on the Google protocol buffer schema file describing the structure of the congestion and configuration messages which LANZ streams.

**Google Protocol Buffers**

Google protocol buffers provide an efficient mechanism for serializing LANZ data for streaming. A protocol buffer package is needed in order to run a LANZ client.

The latest version of the Google protocol buffer source code is available at this address: [http://code.google.com/p/protobuf/downloads/list](http://code.google.com/p/protobuf/downloads/list)

**LANZ Message Schema**

LANZ client applications must be designed based on the LANZ protocol buffer schema, which defines the format and contents of the streamed messages. The schema file is shown below, and is also available in the Extensions/LANZ directory on this page: [https://www.arista.com/en/support/software-download](https://www.arista.com/en/support/software-download)
package LanzProtobuf;

message ConfigRecord {
  required uint64 timestamp = 1; // Time of change in configuration in micro-seconds (UTC)
  required uint32 lanzVersion = 2; // LANZ feature version
  required uint32 numOfPorts = 3; // Num of ports in the switch
  required uint32 segmentSize = 4; // Segment size
  required uint32 maxQueueSize = 5; // Maximum queue size in segments
  optional uint32 qLenInterval = 10; // Frequency of update
}

message PortConfigRecord {
  required string intfName = 1; // Name of the port
  required uint32 switchId = 2; // Id of the chip on a multi-chip system
  required uint32 portId = 3; // Id of the port
  required bool internalPort = 4; // 'True' if it's an internal port
  required uint32 highThreshold = 5; // Higher threshold
  required uint32 lowThreshold = 6; // Lower threshold
}

repeated PortConfigRecord portConfigRecord = 6; // Lanz config details of each port

message CongestionRecord {
  required uint64 timestamp = 1; // Time of congestion in micro-seconds (UTC)
  required string intfName = 2; // Name of the port
  required uint32 switchId = 3; // Id of the chip on a multi-chip system
  required uint32 portId = 4; // Id of the port
  required uint32 queueSize = 5; // Queue size in segments at time of congestion
}

message ErrorRecord {
  required uint64 timestamp = 1; // Time of event in micro-seconds (UTC)
  required string errorMessage = 2; // Text message
}

message LanzRecord {
  optional ConfigRecord configRecord = 1;
  optional CongestionRecord congestionRecord = 2;
  optional ErrorRecord errorRecord = 3;
}

Implementation Procedure
The following steps create and install a functional client to receive streamed LANZ data. This procedure assumes a functional Python programming environment.

Step 1 Download the example client (lanz_client.py) from the Arista website. It is available in the Extensions/LANZ directory on this page:

Step 2 Decompress the GPB archive to a directory.

Step 3 Run the GPB C++ compilation and install. With default flags using GCC on *nix platforms, this will produce a binary called “protoc” in your /usr/local/bin directory.

Step 4 From the archive root, cd to python, and run the following commands:
python setup.py build
python setup.py test

**Step 5** Next, use the protoc compiler to convert the Lanz.proto file into a Python program called Lanz_pb2.py, used by the client. The command to do so is:

```
protoc --python_out=. Lanz.proto
```

The `--python_out=` flag drops the compiled Python program in the directory where you ran the command.

**Step 6** Run `lanz_client.py -h` to activate the LANZ client.
44.4 LANZ Commands

LANZ Commands: Global Configuration
- clear queue-monitor length statistics
- queue-monitor length (global configuration mode)
- queue-monitor length cpu thresholds
- queue-monitor length fabric thresholds
- queue-monitor length global-buffer
- queue-monitor length global-buffer log
- queue-monitor length global-buffer thresholds
- queue-monitor length log
- queue-monitor length mirror
- queue-monitor length mirror destination
- queue-monitor length notifying
- queue-monitor length update-interval
- queue-monitor streaming
- tcpdump queue-monitor

LANZ Commands: Interface Ethernet Configuration Mode
- queue-monitor length threshold (Arad/Jericho)
- queue-monitor length thresholds

LANZ Commands: Queue-Monitor Streaming Configuration Mode
- max-connections

LANZ Display Commands
- show queue-monitor length
- show queue-monitor length all
- show queue-monitor length cpu
- show queue-monitor length csv
- show queue-monitor length drops
- show queue-monitor length ethernet
- show queue-monitor length global-buffer
- show queue-monitor length limit
- show queue-monitor length drops
- show queue-monitor length statistics
- show queue-monitor length status
- show queue-monitor length tx-latency
- show queue-monitor streaming clients
**clear queue-monitor length statistics**

The `clear queue-monitor length statistics` command resets the occurrences of all over-threshold events on the switch including global buffer information (if supported).

**Command Mode**

Privileged EXEC

**Command Syntax**

`clear queue-monitor length statistics`

**Example**

- This command resets all over-threshold events and global buffer information on an FM6000 switch.

```
switch# clear queue-monitor length statistics
switch#
```
**max-connections**

The `max-connections` command sets the maximum number of client connections the switch accepts for streaming LANZ data. The default maximum is 10 connections. To stream LANZ data, you must use the `queue-monitor streaming` command to enable LANZ data streaming.

**Command Mode**
Queue-Monitor-Streaming Configuration

**Command Syntax**
```
max-connections connections
```

**Parameters**
- `connections` maximum number of simultaneous LANZ streaming client connections the switch will accept. Values range from 1 through 100.

**Related Commands**
- `queue-monitor streaming` places the switch in queue-monitor-streaming configuration mode.

**Examples**
- This command sets the maximum number of client connections the switch accepts for LANZ data streaming to 50.
  ```
  switch(config-qm-streaming)#max-connections 50
  switch(config-qm-streaming)#
  ```
queue-monitor length (global configuration mode)

The **queue-monitor length (global configuration mode)** command enables LANZ with the current settings, or with the default settings if LANZ has not yet been configured. LANZ is disabled by default.

When LANZ is enabled, the switch monitors queue lengths on all ports and generates over-threshold events when an output queue becomes congested. Over-threshold event data is available in the following forms:

- syslog data (see `queue-monitor length log`)
- CLI display or CSV-format output (see `show queue-monitor length`)
- data stream (see `queue-monitor streaming`)

The **no queue-monitor length** and **default queue-monitor length** commands entered in global configuration mode disable LANZ and discard LANZ log data, but retain settings. LANZ settings include:

- logging settings (see `queue-monitor length log`)
- queue length thresholds (see `queue-monitor length threshold (Arad/Jericho)` or `queue-monitor length thresholds`)
- data streaming settings (see `queue-monitor streaming`)

**Command Mode**

Global Configuration

**Command Syntax**

```markdown
queue-monitor length
no queue-monitor length
default queue-monitor length
```

**Examples**

- This command enables LANZ on the switch.
  ```
  switch(config)#queue-monitor length
  switch(config)#
  ```

- This command disables LANZ on the switch.
  ```
  switch(config)#no queue-monitor length
  switch(config)#
  ```
queue-monitor length cpu thresholds

The `queue-monitor length cpu thresholds` command sets the queue length threshold to define "congested" on all CPU ports for purposes of LANZ reporting. If LANZ is enabled (see `queue-monitor length (global configuration mode)`), an over-threshold event is generated when one or more queues on a CPU interface exceed the upper threshold, and over-threshold events continue to be generated until all queue lengths on the interface drop below the lower threshold. (To log these events, use the `queue-monitor length log` command.) Different monitoring thresholds cannot be set for individual CPU ports.

The `no queue-monitor length cpu thresholds` and `default queue-monitor length cpu thresholds` commands reset thresholds to the default values (high: 512 segments; low: 256 segments).

**Command Mode**
Global Configuration

**Command Syntax**
```
queue-monitor length cpu thresholds upper_limit lower_limit
no queue-monitor length cpu thresholds
default queue-monitor length cpu thresholds
```

**Parameters**
- `upper_limit` is the queue length in segments that triggers an over-threshold event. Values range from 8 to 16382. Default setting is 512. Segment size varies by platform.
- `lower_limit` When logging is enabled, an over-threshold interface continues generating over-threshold events until all its queues drop back below this length. Must be lower than `upper_limit`. Values range from 1 to 16382. Default setting is 256.

**Examples**
- This command sets the upper queue-length threshold for congestion monitoring on all CPU ports to 1000 segments and the lower limit to 300 segments.
  ```
  switch(config)#queue-monitor length cpu thresholds 1000 300
  switch(config)#
  ```
- This command resets the queue-length thresholds for CPU port congestion to the default values of 512 and 256.
  ```
  switch(config)#default queue-monitor length cpu thresholds
  switch(config)#
  ```
queue-monitor length fabric thresholds

The `queue-monitor length fabric thresholds` command sets the queue length threshold to define "congested" on all fabric ports for purposes of LANZ reporting. If LANZ is enabled (see `queue-monitor length (global configuration mode)`), an over-threshold event is generated when one or more queues on a fabric interface exceed the upper threshold, and over-threshold events continue to be generated until all queue lengths on the interface drop below the lower threshold. (To log these events, use the `queue-monitor length log` command.) Different monitoring thresholds cannot be set for individual fabric ports.

The `no queue-monitor length fabric thresholds` and `default queue-monitor length fabric thresholds` commands reset thresholds to the default values (high: 512 segments; low: 256 segments).

**Command Mode**

Global Configuration

**Command Syntax**

```
queue-monitor length fabric thresholds upper_limit lower_limit
no queue-monitor length fabric thresholds
default queue-monitor length fabric thresholds
```

**Parameters**

- `upper_limit` is the queue length in segments that triggers an over-threshold event. Values range from 8 to 16382. Default setting is 512. Segment size varies by platform.
- `lower_limit` When logging is enabled, an over-threshold interface continues generating over-threshold events until all its queues drop back below this length. Must be lower than `upper_limit`. Values range from 1 to 16382. Default setting is 256.

**Examples**

- This command sets the upper queue-length threshold for congestion monitoring on all fabric ports to 1000 segments and the lower limit to 300 segments.

  ```
  switch(config)#queue-monitor length fabric thresholds 1000 300
  switch(config)#
  ```

- This command resets the queue-length thresholds for fabric port congestion to the default values of 512 and 256.

  ```
  switch(config)#default queue-monitor length fabric thresholds
  switch(config)#
  ```
queue-monitor length global-buffer

The **queue-monitor length global-buffer** command includes global buffer usage in LANZ reporting. When global buffer reporting is enabled, over-threshold events are generated when global buffer usage exceeds the upper threshold. To set the threshold value, use the **queue-monitor length global-buffer thresholds** command. Usage data may be viewed using the **show queue-monitor length global-buffer** command. To view status and threshold information, use the **show queue-monitor length status** command.

Global buffer usage is measured in segments of 160 bytes.

The **no queue-monitor length global-buffer** and **default queue-monitor length global-buffer** commands disable global buffer usage reporting by removing the corresponding **queue-monitor length global-buffer** command from running-config.

**Command Mode**

Global Configuration

**Command Syntax**

```
queue-monitor length global-buffer
no queue-monitor length global-buffer
default queue-monitor length global-buffer
```

**Guidelines**

This command is available on FM6000 platform switches.

**Examples**

- This command enables global buffer monitoring on the switch.

  ```
  switch(config)#queue-monitor length global-buffer
  switch(config)#
  ```

- This command disables global buffer monitoring on the switch.

  ```
  switch(config)#no queue-monitor length global-buffer
  switch(config)#
  ```
queue-monitor length global-buffer log

The **queue-monitor length global-buffer log** command enables logging of global buffer over-threshold events. When logging is enabled, a log message is generated each time the contents of the global buffer exceed the upper threshold value set for the switch (see **queue-monitor length global-buffer thresholds**). Once the global buffer is over the threshold, additional messages are generated at a maximum rate of one per **interval** as long as the buffer value remains above the lower threshold for the switch.

Global buffer logging is disabled by default.

Log messages do not include buffer usage or congestion information. To view this information, use the **show queue-monitor length global-buffer** command.

The **no queue-monitor length global-buffer log** and **default queue-monitor length global-buffer log** commands disable global buffer logging by removing the corresponding **queue-monitor length global-buffer log** command from **running-config**. The **queue-monitor length global-buffer log** command with an interval value of 0 also disables global buffer logging.

**Command Mode**

Global Configuration

**Command Syntax**

```
queue-monitor length global-buffer log interval
no queue-monitor length global-buffer log
default queue-monitor length global-buffer log
```

**Parameters**

- **interval** minimum interval in seconds between logged messages.
  - 0  global buffer logging is disabled on the switch (the default setting).
  - 1 to 65535  minimum logging interval (in seconds).

**Guidelines**

This command is available on FM6000 platform switches.

**Examples**

- This command enables global buffer logging with a minimum interval of 10 seconds between messages.
  ```bash
  switch(config)#queue-monitor length global-buffer log 10
  ```

- This command disables global buffer logging on the switch.
  ```bash
  switch(config)#no queue-monitor length global-buffer log
  ```
queue-monitor length global-buffer thresholds

The `queue-monitor length global-buffer thresholds` command sets global buffer thresholds for the switch. An over-threshold event is generated when usage of the global buffer exceeds the upper threshold, and over-threshold events continue to be generated until usage drops below the lower threshold. (To log these events, use the `queue-monitor length global-buffer log` command.)

The `no queue-monitor length global-buffer` and `default queue-monitor length global-buffer` commands disable global buffer reporting.

The `no queue-monitor length global-buffer thresholds` and `default queue-monitor length global-buffer thresholds` commands erase custom global buffer threshold settings.

**Command Mode**
- Global Configuration

**Command Syntax**

```
queue-monitor length global-buffer thresholds max_segments min_segments
no queue-monitor length global-buffer log
default queue-monitor length global-buffer log
```

**Parameters**

- `max_segments` upper threshold in 160-byte segments. Value ranges from 2 to 36864. Default is 10940.
- `min_segments` lower threshold in 160-byte segments. Value ranges from 1 to 36864. Default is 4376.

**Examples**

- This command sets the upper and lower global buffer thresholds to 9000 segments and 3000 segments.
  ```
  switch(config)#queue-monitor length global-buffer thresholds 9000 3000
  switch(config)#
  ```

- This command resets the upper and lower global buffer thresholds to their default values.
  ```
  switch(config)#no queue-monitor length global-buffer thresholds 9000 3000
  switch(config)#
  ```
queue-monitor length log

The `queue-monitor length log` command enables logging of queue-length over-threshold events when LANZ is enabled on the switch (see `queue-monitor length (global configuration mode)`). When logging is enabled, a log message is generated each time one or more queues on an interface exceed the upper threshold value for that interface (see `queue-monitor length threshold (Arad/Jericho)`). Once an interface is over threshold, additional messages are generated at a maximum rate of one per `interval` as long as the queue length remains above the lower threshold for that interface. No syslog message is generated when queue length drops back under threshold.

Logging is disabled by default.

Log messages do not include queue length information. To view queue length information, use the `show queue-monitor length` command.

The `queue-monitor length log` command with an interval value of 0 disables event logging.

**Command Mode**
Global Configuration

**Command Syntax**
```
queue-monitor length log interval
```

**Parameters**
- `interval` minimum interval in seconds between logged messages from a single interface.
  - 0 queue-length logging is disabled on the switch (the default setting).
  - 1 to 65535 minimum logging interval (in seconds).

**Examples**
- This command enables over-threshold logging with a minimum interval of 10 seconds between messages for a given interface.
  
  ```
  switch(config)# queue-monitor length log 10
  ```

- This command disables queue-length over-threshold logging on the switch.
  
  ```
  switch(config)# queue-monitor length log 0
  ```

- This is an example of a queue-length log message.
  
  ```
  Oct 27 12:48:22 switch QUEUE_MONITOR-6-LENGTH_OVER_THRESHOLD: Interface Ethernet6 queue length is over threshold of 512, current length is 1024.
  ```
**queue-monitor length mirror**

The `queue-monitor length mirror` command enables LANZ mirroring. As a result, traffic experiencing congestion can be configured to automatically send congested traffic to either the CPU or an Ethernet egress interface destination, once a queue threshold is crossed (see `queue-monitor length mirror destination`).

**Command Mode**

Global Configuration

**Command Syntax**

```
queue-monitor length mirror
```

**Example**

- This command enables LANZ traffic sampling.
  ```
  switch(config)#queue-monitor length mirror
  switch(config)#
  ```
- This command disables LANZ traffic sampling.
  ```
  switch(config)#no queue-monitor length mirror
  switch(config)#
  ```
queue-monitor length mirror destination

The queue-monitor length mirror destination command results in automatically sending traffic experiencing congestion to either the CPU or an Ethernet egress interface destination, once a queue threshold is crossed. Before using this command, first enable LANZ mirroring through the command queue-monitor length mirror.

**Command Mode**
- Global Configuration

**Command Syntax**
```
queue-monitor length mirror destination cpu | Ethernet <ports 1-24>
```

**Parameters**
- **ports** any combination of Ethernet ports 1 through 24.

**Examples**
- This command configures LANZ traffic sampling for a CPU interface mirror destination.
  ```
  switch(config)#queue-monitor length mirror destination cpu
  switch(config)#
  ```
- This command configures LANZ traffic sampling for an Ethernet interface mirror destination for ports 3, 11, and 15 through 20.
  ```
  switch(config)#queue-monitor length mirror destination Ethernet 3,11,15-20
  switch(config)#
  ```
queue-monitor length notifying

The queue-monitor length notifying command enables Notifying Mode on Arad and Jericho switches. By default, LANZ operates in Polling Mode on Arad and Jericho switches. On all other switches, LANZ operates only in Notifying Mode.

When Notifying Mode is enabled, the switch provides detailed congestion information including Start, Update, and End events, rather than only polling the most congested queue in each ASIC. Notifying Mode uses both upper and lower threshold values. Both can be set with the queue-monitor length thresholds command. While a queue is congested, the maximum queue size is updated every five seconds by default; this interval can be configured using the queue-monitor length update-interval command.

The no queue-monitor length notifying and default queue-monitor length notifying commands reset LANZ to the default Polling Mode.

Command Mode
Global Configuration

Command Syntax
queue-monitor length notifying
no queue-monitor length notifying
default queue-monitor length notifying

Guidelines
• Polling mode is available only on Arad and Jericho platform switches.
• On Jericho platforms, LANZ will revert to Polling Mode if there are not enough counter resources to operate in Notifying Mode.
• On Arad platforms, Notifying Mode is incompatible with SSO. Enabling SSO while Notifying Mode is enabled will cause LANZ to revert to Polling Mode.
• On Arad platforms, Notifying Mode is not available for CPU queues. Use Polling Mode when monitoring congestion on CPU queues on Arad switches.
• If the switch is rebooted while Notifying Mode is enabled, queue threshold values may be lost.

Examples
• This command enables Notifying Mode on an Arad or Jericho switch.
  switch(config)#queue-monitor length notifying
  switch(config)#
• This command disables Notifying Mode on an Arad or Jericho switch, returning LANZ to the default Polling Mode.
  switch(config)#no queue-monitor length notifying
  switch(config)#
queue-monitor length threshold (Arad/Jericho)

The queue-monitor length threshold command sets the upper queue-length threshold to define "congested" on the command-mode interface for purposes of LANZ reporting. If LANZ is enabled (see queue-monitor length (global configuration mode)), an over-threshold event is generated when one or more queues on the interface exceed the upper threshold, and over-threshold events continue to be generated until all queue lengths on the interface drop below the lower threshold. (To log these events, use the queue-monitor length log command.)

Entering the no queue-monitor length command in interface configuration mode disables LANZ on the interface. Entering either the queue-monitor length threshold command or the default queue-monitor length threshold command enables LANZ on the interface by removing the no queue-monitor length command from the configuration.

The no queue-monitor length threshold and default queue-monitor length threshold commands erase custom queue length threshold settings for the interface.

Command Mode
- Interface-Ethernet Configuration

Command Syntax
- queue-monitor length threshold upper_limit
- no queue-monitor length
- default queue-monitor length

Parameters
- upper_limit is the queue length in bytes that triggers an over-threshold event. Values range from 40962 to 52428800 bytes. Default setting is 52428800.

Guidelines
On Arad and Jericho switches, the queue length is measured in bytes. Only the upper threshold is configurable using this command, and it is set at a default value of 52428800 bytes. Both upper and lower thresholds can be set using the queue-monitor length thresholds command.

Examples
- These commands set the upper queue-length threshold on Ethernet interface 3/30 to 40000000 bytes.
  switch(config)#interface ethernet 3/30
  switch(config-if-Et3/30)#queue-monitor length threshold 40000000

- These commands reset the upper queue-length threshold on Ethernet interface 3/30 to its default value of 52428800 bytes.
  switch(config)#interface ethernet 3/30
  switch(config-if-Et3/30)#default queue-monitor length threshold
  switch(config-if-Et3/30)#
queue-monitor length thresholds

The *queue-monitor length thresholds* command sets both upper and lower queue length thresholds to define "congested" on the command-mode interface for purposes of LANZ reporting. If LANZ is enabled (see *queue-monitor length (global configuration mode)*), an over-threshold event is generated when one or more queues on the interface exceed the upper threshold, and over-threshold events continue to be generated until all queue lengths on the interface drop below the lower threshold. (To log these events, use the *queue-monitor length log* command.)

Entering the *no queue-monitor length* command in interface configuration mode disables LANZ on the interface. Entering either the *queue-monitor length* command or the *default queue-monitor length* command in interface configuration mode enables LANZ on the interface by removing the *no queue-monitor length* command from the configuration.

The *no queue-monitor length thresholds* and *default queue-monitor length thresholds* commands in interface configuration mode both erase custom queue length threshold settings for the interface.

**Command Mode**  
Interface-Ethernet Configuration

**Command Syntax**

```
queue-monitor length thresholds upper_limit lower_limit
no queue-monitor length
default queue-monitor length
```

**Parameters**

- *upper_limit* queue length in segments that triggers an over-threshold event. Must be higher than *lower_limit*. The minimum value is 2. The maximum is the largest number of segments which can be queued before packets are dropped, and varies based on factors including flow control state and private buffer settings. Default setting is 512.
- *lower_limit* lower queue length threshold in segments. When logging is enabled, an over-threshold interface continues generating over-threshold events until all its queues drop back below this length. Must be lower than *upper_limit*. Values range from 1 to 4806. Default setting is 256.

**Guidelines**

Queue lengths are measured in 480-byte segments on FM6000 switches, in 208-byte segments on Trident II and Tomahawk switches, in 256-byte segments on Trident 3 switches, and in bytes on Arad and Jericho switches. Default thresholds vary by platform. Both upper and lower thresholds are configurable.

**Examples**

- These commands set the upper and lower queue-length thresholds on Ethernet interface 5 to 300 segments and 200 segments.
  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#queue-monitor length thresholds 300 200
  switch(config-if-Et5)#
  ```
- These commands reset the upper and lower queue-length thresholds on Ethernet interface 5 to their default values.
  ```
  switch(config)#interface ethernet 5
  switch(config-if-Et5)#default queue-monitor length thresholds
  switch(config-if-Et5)#
  ```
queue-monitor length update-interval

The **queue-monitor length update-interval** command sets the interval between congestion updates when LANZ is in Notifying Mode.

The **no queue-monitor length update-interval** and **default queue-monitor length update-interval** command reset the update interval to its default value of 5000000 (5 seconds).

**Command Mode**
Global Configuration

**Command Syntax**

```
queue-monitor length update-interval interval
no queue-monitor length
default queue-monitor length
```

**Parameters**
- **interval** is the time in microseconds between congestion updates. Values range from 80-10000000; default setting is 5000000 (5 seconds).

**Examples**
- This command sets the time between congestion updates to 10 seconds.
  
  ```
  switch(config)#queue-monitor length update-interval 10000000
  switch(config)#
  ```

- This command resets the time between congestion updates to its default value of 5 seconds.
  
  ```
  switch(config)#default queue-monitor length update-interval
  switch(config)#
  ```
queue-monitor streaming

The queue-monitor streaming command places the switch in queue-monitor-streaming configuration mode. Queue-monitor-streaming configuration mode is not a group change mode; running-config is changed immediately upon command entry. The exit command does not affect running-config.

To enable LANZ data streaming on the switch, use the no show queue-monitor streaming clients command.

The exit command returns the switch to global configuration mode.

Command Mode
Global Configuration

Command Syntax
queue-monitor streaming

Commands Available in queue-monitor streaming Configuration Mode
- max-connections
- show queue-monitor streaming clients

Example
- This command places the switch in queue-monitor streaming configuration mode.

switch(config)#queue-monitor streaming
switch(config-qm-streaming)#
**show queue-monitor length**

The `show queue-monitor length` command displays a report of recent over-threshold events for all interfaces, limited to the last 1000 records, with the newest events listed first.

LANZ must be enabled to use this command (see `queue-monitor length (global configuration mode)`). If LANZ is disabled, the command displays “queue-monitor is disabled.”

To limit the output to a specified number of seconds and/or records, use the `show queue-monitor length limit` command.

**Command Mode**

EXEC

**Command Syntax**

`show queue-monitor length`

**Example**

- This command displays the last 1000 LANZ records on an Arad or Jericho platform switch in Polling Mode.

```
switch> show queue-monitor length

```
show queue-monitor length all

The **show queue-monitor length all** command displays all available over-threshold event records on the switch including global buffer information, with the most recent events listed first.

LANZ must be enabled to use this command (see **queue-monitor length (global configuration mode)**). If LANZ is disabled, the command displays “queue-monitor is disabled.”

**Command Mode**

EXEC

**Command Syntax**

```
show queue-monitor length all
```

**Guidelines**

This command is available on FM6000 platform switches.

**Example**

- This command displays all available LANZ records from the switch.

```
switch> show queue-monitor length all

E-End, U-Update, S-Start, TC-Traffic Class
GH-High, GU-Update, GL-Low
Segment size for E, U and S congestion records is 480 bytes
Segment size for GL, GU and GH congestion records is 160 bytes
* Max queue length during period of congestion
+ Period of congestion exceeded counter

show queue-monitor length csv

The **show queue-monitor length csv** command displays LANZ records in comma-separated value (CSV) format with the oldest samples displayed first.

LANZ must be enabled to use this command (see `queue-monitor length (global configuration mode)`). If LANZ is disabled, the command displays “queue-monitor is disabled.”

**Command Mode**

EXEC

**Command Syntax**

```
show queue-monitor length csv
```

**Example**

- This command displays LANZ records in CSV format.

```
switch>show queue-monitor length csv

show queue-monitor length drops

The `show queue-monitor length drops` command displays a report of cumulative transmission drop totals for a range of interfaces or for all interfaces. Output can be limited to a specified number of seconds or records. The most recent events are listed first. By default, the command displays data for all interfaces, limited to the last 1000 records. Newest events are listed first.

LANZ must be enabled to use this command (see `queue-monitor length (global configuration mode)`). If LANZ is disabled, the command displays “queue-monitor is disabled.”

**Command Mode**

EXEC

**Command Syntax**

`show queue-monitor length [INTERFACES] [FACTOR] drops`

**Parameters**

- **INTERFACES** interface type and number for report. Values include:
  - `<no parameter>` displays information for all interfaces.
  - `ethernet e-range` e-range formats include a number, number range, or comma-delimited list of numbers and ranges

- **FACTOR** limiting parameter for report. Values include:
  - `<no parameter>` displays the last 1000 records.
  - `limit number samples` displays the last `number` records.
  - `limit number seconds` displays all records generated during the last `number` seconds.

  Value of `number` ranges from 1 to 1000000.

**Guidelines**

This command is available on FM6000, Trident II, Trident 3, and Tomahawk platform switches.

**Example**

- This command displays the last 10 records of transmission drop data on an FM6000 switch.

```
switch>show queue-monitor length limit 10 samples drops

show queue-monitor length ethernet

The show queue-monitor length ethernet command displays a report of recent over-threshold events for a range of interfaces, with the newest events listed first.

LANZ must be enabled to use this command (see queue-monitor length (global configuration mode)). If LANZ is disabled, the command displays “queue-monitor is disabled.”

Command Mode

EXEC

Command Syntax

show queue-monitor length ethernet e-range

Parameters

e-range the range of interfaces to be included in the report; formats include a number, number range, or comma-delimited list of numbers and ranges

Examples

- This command displays the last 1000 records for Ethernet interface 9 on an FM6000 platform switch.

  switch>show queue-monitor length ethernet 9

switch>
```

**Note**
The non-sequential listing of ingress ports shown here is specific to Jericho switches; interfaces on Arad switches are always displayed sequentially.
**show queue-monitor length global-buffer**

The *show queue-monitor length global-buffer* command displays a report of recent high usage, low usage and update events for the global buffer. Newest events are listed first.

LANZ must be enabled to use this command (see *queue-monitor length (global configuration mode)*). If LANZ is disabled, the command displays “queue-monitor is disabled.”

**Command Mode**

EXEC

**Command Syntax**

```
show queue-monitor length global-buffer
```

**Guidelines**

This command is available on FM6000 platform switches.

**Example**

- This command displays the global buffer event records for the switch.

  ```
  switch>show queue-monitor length global buffer

  ```
show queue-monitor length limit

The **show queue-monitor length limit** command displays a report of recent over-threshold events for a range of interfaces or for all interfaces, limited by a specified number of records.

LANZ must be enabled to use this command (see `queue-monitor length (global configuration mode)`). If LANZ is disabled, the command displays “queue-monitor is disabled.”

**Command Mode**

EXEC

**Command Syntax**

```
show queue-monitor length limit [INTERFACES] number
```

**Parameters**

- **INTERFACES** interface type and number for report. Values include:
  - `<no parameter>` displays information for all interfaces.
  - `ethernet e-range` e-range formats include a number, number range, or comma-delimited list of numbers and ranges
  - `number` number of records to display. Values range from 1 to 1000000.

**Example**

- This command displays the last 100 records for Ethernet interfaces 6 through 8.

```
switch>show queue-monitor length ethernet 6-8 limit 100 samples
Report generated at 2010-01-01 12:56:13
Time          Interface  Queue length (segments, 1 to 512 bytes)
-------------  ---------  --------------------------
0:00:07.43393 ago  Et6      1049
0:00:39.22856 ago  Et7      2039
1 day, 4:33:23.12345 ago  Et6      1077
```

```
show queue-monitor length statistics

The **show queue-monitor length statistics** command displays LANZ statistics for all interfaces, showing the traffic class and number of recorded congestion events for each interface.

LANZ must be enabled to use this command (see queue-monitor length (global configuration mode)). If LANZ is disabled, the command displays “queue-monitor is disabled.”

**Command Mode**

- EXEC

**Command Syntax**

```
show queue-monitor length statistics
```

**Example**

- This command displays LANZ statistics for all interfaces on the switch.

```
switch>show queue-monitor length statistics
Report generated at 2016-02-09 22:59:56
Interface       Traffic Class Count
-----------------------------------
Et29             11                1
```
**show queue-monitor length status**

The *show queue-monitor length status* command displays the current LANZ configuration for the switch and for each interface. On certain platforms, the status of global buffer monitoring and per-linecard LANZ mode are displayed.

**Command Mode**

- EXEC
- Global Configuration

**Command Syntax**

```
show queue-monitor length status
```

**Guidelines**

On FM6000 platform switches, this command includes status information about global buffer monitoring.

On Arad and Jericho based linecards, if LANZ is globally enabled (using the *queue-monitor length* command), the command displays the monitoring mode per-linecard.

On Arad and Jericho switches, even when all linecards are configured in Notifying Mode (using the *queue-monitor length notifying* command), some linecards may still run LANZ in Polling Mode under the following circumstances:

- On Arad-based linecards, LANZ falls back to Polling Mode when SSO redundancy mode is configured on the card (here, the mode is shown as “polling due to SSO configured”).
- On Jericho-based linecards, LANZ may run in Polling Mode when many features that use the switch’s statistic capabilities have been configured (here, the mode is shown as “polling due to counters exhausted”).
Examples

- This command displays the current LANZ configuration on an FM6000 device.

<--------OUTPUT OMITTED FROM EXAMPLE--------->
show queue-monitor length tx-latency

The `show queue-monitor length tx-latency` command displays the latency data of recent LANZ events for a range of interfaces or for all interfaces. Output can be limited to a specified number of seconds or records. The most recent events are listed first. By default, the command displays data for all interfaces, limited to the last 1000 records. Newest events are listed first.

LANZ must be enabled to use this command (see `queue-monitor length (global configuration mode)`). If LANZ is disabled, the command displays “queue-monitor is disabled.”

**Command Mode**

EXEC

**Command Syntax**

```
show queue-monitor length [INTERFACES] [FACTOR] tx-latency
```

**Parameters**

- **INTERFACES**  interface type and number for report. Values include:
  - `<no parameter>`  displays information for all interfaces.
  - `ethernet e-range`  e-range formats include a number, number range, or comma-delimited list of numbers and ranges

- **FACTOR**  limiting parameter for report. Values include:
  - `<no parameter>`  displays the last 1000 records.
  - `limit number samples`  displays the last `number` records.
  - `limit number seconds`  displays all records generated during the last `number` seconds.

Value of `number` ranges from 1 to 1000000.

**Guidelines**

This command is available on FM6000, Trident II, Trident 3, and Tomahawk platform switches.

**Example**

- This command displays transmission latency data for the last 1000 LANZ events on the switch.

  ```
  switch>show queue-monitor length tx-latency
  Report generated at 2017-03-10 15:40:02
  Time                          Interface(TC)  Tx-Latency (usecs)

  0:02:47.33135 ago             Et23/3(1)      724.684
  0:02:52.33106 ago             Et23/3(1)      730.985
  switch>
  ```
show queue-monitor streaming clients

The `show queue-monitor streaming clients` command displays the number of presently connected clients through LANZ streaming, and also displays their host-names. Ensure that both LANZ and LANZ streaming are enabled in order to use this command.

**Command Mode**

EXEC

**Command Syntax**

`show queue-monitor streaming clients`

**Example**

- This command displays the number of clients connected to LANZ streaming.

```
switch#show queue-monitor streaming clients
Number of clients connected: 3
--------------------------------
172.20.63.161:6565
172.24.17.58:42
172.38.54.142:333
```
shutdown (queue-monitor-streaming configuration)

The `shutdown` command disables the streaming of LANZ data to external clients. The `no shutdown` command enables LANZ data streaming. Streaming is disabled by default.

**Command Mode**
- Queue-Monitor-Streaming Configuration

**Command Syntax**
- `shutdown`
- `no shutdown`

**Example**
- These commands enable the streaming of LANZ data on the switch.

```
switch(config)#queue-monitor streaming
switch(config-qm-streaming)#no shutdown
switch(config-qm-streaming)#
```
tcpdump queue-monitor

The `tcpdump queue-monitor` command exports congested traffic to a packet capture device or another tool for analysis, or directly to the switch CPU for inspection.

**Command Mode**
Global Configuration

**Command Syntax**
```
tcpdump queue-monitor
```
```
tcpdump queue-monitor <file | filecount | filter | lookup-names | max-file-size | packet-count | size | verbose>
```

**Parameters**
- `file` output file.
  - `certificate`: certificate file.
  - `flash`: flash file.
  - `sslikey`: sslikey file.
  - `usb1`: usb1 file.
- `filecount` specify the number of output files: 1 to 100.
- `filter` set the filtering expression to select which packets will be dumped.
- `lookup-names` enable reverse DNS lookups.
- `max-file-size` specify the maximum file size by entering 1 to 100 million bytes.
- `packet-count` specify 1 to 10000 packets to capture.
- `size` specify the maximum number of bytes to dump per packet with a size of 1 to 65536 bytes.
- `verbose` enable verbose mode.

**Example**
- This command inspects traffic on the switch.
  ```
  switch(config)#tcpdump queue-monitor
  tcpdump: WARNING: lanz: no IPv4 address assigned
tcpdump: verbose output suppressed, use -v or -vv for full protocol decode
listening on lanz, link-type EN10MB (Ethernet), capture size 65535 bytes
...
0 packets captured
0 packets received by filter
0 packets dropped by kernel
switch(config)#
```
VM Tracer

This chapter describes VM Tracer configuration and usage and contains these sections:

- Section 45.1: VM Tracer Introduction
- Section 45.2: VM Tracer Description
- Section 45.3: VM Tracer Configuration Procedures
- Section 45.4: VM Tracer Configuration Commands

45.1 VM Tracer Introduction

VM Tracer is a switch feature that determines the network configuration and requirements of connected VMware hypervisors. The switch uses VMware's SOAP XML API to discover VMware host server components, including:

- instantiated VMs with their network configuration (VLANs and distributed/virtual Switches).
- server hardware IPMI data which can be shown to the network manager.

VM Tracer also supports adaptive auto-segmentation, which automatically provisions and prunes VLANs from server-switched ports as VMs are instantiated and moved within the data center.
45.2 VM Tracer Description

Cloud operating systems manage large virtualized computing infrastructures, including software and hardware. Cloud operating systems consist of virtual machines and hypervisors:

- A virtual machine (VM) is a software implementation of a computer that operates as running on dedicated physical hardware. Multiple VMs share physical machine resources from a single physical device. Each VM is controlled by its operating system.
- A hypervisor, also called a virtual Machine Manager (VMM), is software that manages multiple operating systems running concurrently on a physical device.

VM Tracer tracks activity of VMs that are controlled by hypervisors connected to the switch’s Ethernet or LAG ports. VM Tracer supports vSphere versions 6.0– 6.5. vSphere features include distributed virtual switches (DVS) and VM movement among VMware servers (VMotion).

vSphere components include:

- ESX and ESXi: hypervisors that run on VMware host server hardware.
- vCenter: centralized tool that manages multiple servers running VMware hypervisors.
- NSX for vSphere® (NSX-V): network virtualization platform delivering networking and security.

Monitoring VLAN based configurations requires vCenter access. Monitoring VXLAN based configurations requires access to vCenter and NSX-V. The following sections describe topologies that monitor these networks:

- Section 45.2.1: Monitoring VLAN Based Configurations
- Section 45.2.2: Monitoring VXLAN Based Configurations

45.2.1 Monitoring VLAN Based Configurations

vCenter manages ESX hosts and VMs through a central database. VM Tracer identifies interfaces connected to a specified ESX host and sends discovery packets (CDP or LLDP) on interfaces where VM Tracer is enabled. The ESX host updates the vCenter when it receives a discovery packet. VM Tracer reads this data from the vCenter through a SOAP XML API to associate the ESX host to the connected switch ports. Figure 45-1 displays the network topology of this configuration.

Figure 45-1: VM Tracer Topology – Monitoring VLAN Based Configurations
Chapter 45: VM Tracer

VM Tracer connects to a maximum of four vCenters through a SOAP (Simple Object Access Protocol) API to discover VMs in the data centers that the vCenters manage. VM Tracer maintains a list of VMs in the data center and gathers network related information about each VM, including the number of Vnics (virtual network interface card), the MAC address of each Vnic, the switch to which it connects, and the host on which it resides. VM Tracer also identifies the host NICs connected to the switch through the bridge MAC address and the interface port name. VM Tracer then searches for VMs on this host and connected to the vswitch or dvswitch whose uplink is mapped to the connected NIC.

For each connected interface, VM Tracer creates a VM Table that lists its active VMs, sorted by Vnic MAC address. Each VM entry includes its name, Vnic name, VLAN, switch name, datacenter name, and portgroup. An entry is deleted when the corresponding VM is removed, moved to a different host, or its Vnic is no longer part of the vswitch or dvswitch. An entry is added when a VM is created or moved to a host connected to the interface. VM Tracer monitors vCenter for VM management updates. If an interface goes down, all VM entries for that interface are removed from the VM Table.

45.2.2 Monitoring VXLAN Based Configurations

Monitoring VXLAN based configurations require access to the NSX for vSphere® (NSX-V), in addition to the configuration described in Section 45.2.1. Each VM Tracer session can communicate with one NSX-V through a REST interface over XML and gathers VXLAN information by polling it on a 30 second polling cycle. VXLAN data that the switch receives from the NSX-V includes:

- VNI range.
- VXLAN segment.
- Multicast address range.
- network scope.

The network scope specifies the virtual address space the VXLAN segments span and is defined by the server group (cluster) collections within the segments, which in turn contain a collection of distributed virtual switches (DVS) from ESX hosts within the clusters.

VM Tracer uses this information to build a network model. Communications with NSX-V requires a single polling thread that detects network connectivity and constantly updates the local data model.

Figure 45-2 displays the network topology of this configuration.

Figure 45-2: VM Tracer Topology – Monitoring VXLAN Based Configurations
45.3 VM Tracer Configuration Procedures

The following sections describe the session configuration process, configuring the NSX-V connection for VXLAN based configurations, and the procedure for enabling VM Tracer on individual interfaces. The switch defines vmtracer configuration mode and VMtracer mode:

- vmtracer configuration mode is a command mode for configuring VM Tracer monitoring sessions.
- VMtracer mode is defines an interface state where discovery packets are sent to attached vSwitches.

45.3.1 Configuring vCenter Monitoring Sessions

A VM Tracer session connects the switch to a vCenter server for downloading data about VMs and vSwitches managed by ESX hosts connected to the switch’s ports. The switch supports four VM Tracer sessions.

The switch is placed in vmtracer configuration mode to edit session parameters, including the vCenter location and dynamic VLAN usage. Changes take effect by exiting vmtracer mode.

The `vmtracer session` command places the switch in vmtracer configuration mode for a specified session. The command either creates a new session or loads an existing session for editing.

- This command enters vmtracer configuration mode for the system_1 session.

```
switch(config)#vmtracer session system_1
switch(vmtracer-system_1)#
```

In vmtracer configuration mode, the `url (vmtracer mode)`, `username (vmtracer mode)`, and `password (vmtracer mode)` commands specify the location and the account information that authenticates the switch. The url parameter must reference a fully formed secure URL.

- These commands specify the IANA url along with the username and password that allow the switch to access the location.

```
switch(vmtracer-system_1)#url https://example.com/sdk
switch(vmtracer-system_1)#username a-switch_01
switch(vmtracer-system_1)#password abcde
switch(vmtracer-system_1)#
```

Default session settings allow auto-segmentation, or the dynamic allocation and pruning of VLANs when a VM managed by the ESX host connected to the switch is created, deleted, or moved to a different host. The `autovlan disable` command prevents auto-segmentation, regardless of VM activity.

The `allowed-vlan` command specifies the VLANs that may be added when a VM is added or moved. By default, all VLANs are allowed.

- This command disables auto-segmentation.

```
switch(vmtracer-system_1)#autovlan disable
switch(vmtracer-system_1)#
```

- These commands enable auto-segmentation and limit the list of allowed VLANs to VLAN 1-2000.

```
switch(vmtracer-system_1)#no autovlan disable
switch(vmtracer-system_1)#allow-vlan 1-2000
switch(vmtracer-system_1)#
```

The `exit` command returns the switch to Global configuration mode and enables the VM Tracer session. Vmtracer configuration mode can be re-entered for this session to edit session parameters.

- This command exits vmtracer configuration mode.

```
switch(vmtracer-system_1)#exit
switch(config)#
```
The **no vmtracer session** command disables the session and removes it from *running-config*.

- This command disables and deletes the system_1 VM Tracer session.
  
  ```
  switch(config)#no vmtracer session system_1
  switch(config)
  ```

### 45.3.2 Configuring vShield Monitoring Sessions

To monitor VXLAN based VMware configurations, the switch must communicate with a NSX for vSphere® (NSX-V). Vmtracer-vxlan configuration mode specifies the location and user account data that allows the switch to access a NSX-V within the configuration mode vmtracer session.

The switch is placed in vmtracer configuration mode to edit session parameters, including the vCenter location and dynamic VLAN usage. Changes take effect by exiting vmtracer mode.

The **vxlan (vmtracer mode)** command is executed from vmtracer mode for a specified session and places the switch in vmtracer-vxlan configuration mode for that session. Each VM Tracer session can be associated with one vShield instance.

- These commands create the vShield instance for the VMTracer session named vnet-1.
  
  ```
  switch(config)#vmtracer session vnet-1
  switch(config-vmtracer-vnet-1)#vxlan
  switch(config-vmtracer-vnet-1-vxlan)#
  ```

In vmtracer-vxlan configuration mode, the **url (vmtracer-vxlan mode)**, **username (vmtracer-vxlan mode)**, and **password (vmtracer-vxlan mode)** commands specify the vShield server’s location and the account information that authenticates the switch to the vShield server. The url parameter must reference a fully formed secure url, such as `https://vcshield.democorp.com/sdk`.

- These commands specify the vShield’s URL along with the username and password that allow the switch to access the vShield server.
  
  ```
  switch(config-vmtracer-vnet-1-vxlan)#url https://vshieldserver.company1.org/sdk
  switch(config-vmtracer-vnet-1-vxlan)#username a-shield_01
  switch(config-vmtracer-vnet-1-vxlan)#password home
  ```

### 45.3.3 Enabling vmtracer Mode

VMtracer mode is an interface setting that enables interfaces to send discovery packets to the connected vSwitch. The **vmtracer** command enables VMtracer mode on the configuration mode interface.

- These commands enable VMtracer mode on the Ethernet 3 interface.
  
  ```
  switch(config)#interface Ethernet3
  switch(config-if-Et3)#vmtracer vmware-esx
  ```

The **no vmtracer** command disables vmtracer mode on the configuration mode interface.

- This command disables vmtracer mode on the Ethernet 3 interface.
  
  ```
  switch(config-if-Et3)#no vmtracer vmware-esx
  ```

### 45.3.4 Displaying VM Tracer Data

#### 45.3.4.1 Displaying Session Status

The **show vmtracer session** command displays information about the specified session.
Without the `detail` parameter, the command displays connection parameters and status for the vCenter associated to the specified session.

- This command displays connection parameters for the vCenter associated with the system_1 session.

```
switch#show vmtracer session system_1
vCenter URL https://vmware-vcenter1/sdk
username arista
password arista
Session Status Disconnected
```

With the `detail` parameter, the command displays connection status and data concerning messages the vCenter previously received from ESX hosts connected to the switch.

- This command displays connection parameters and message details for the vCenter associated with the system_1 session.

```
switch#show vmtracer session system_1 detail
vCenter URL https://vmware-vcenter1/sdk
username arista
sessionState Connected
lastStateChange 19 days, 23:03:59 ago
lastMsgSent CheckForUpdatesMsg
timeOfLastMsg 19 days, 23:14:09 ago
resonseTimeForLastMsg 0.0
numSuccessfulMsg 43183
lastSuccessfulMsgMsg CheckForUpdatesMsg
lastSuccessfulMsgTime 19 days, 23:14:19 ago
numFailedMsg 1076
lastFailedMsgMsg CheckForUpdatesMsg
lastFailedMsgTimeTime 19 days, 23:14:19 ago
lastErrorCode Error -1 fault: SOAP-ENV:Client [no subcode]
"End of file or no input: Operation interrupted or timed out after 600s send or 600s receive delay"
Detail: [no detail]
CheckForUpdates:
```

45.3.4.2 Displaying VM Interfaces

The `show vmtracer interface` command displays the VM interfaces (Vnics) that are active on switch interfaces where vmtracer mode is enabled. For each Vnic, the command displays the name of the attached VM, the adapter name, its VLAN, the VM power state, and the presence status of its MAC address in the switch’s MAC table.
• This command displays the Vnics connected to all VM Tracer-enabled interfaces.

```bash
switch#show vmtracer interface
```

Ethernet8 : example.com
VM Name VM Adapter VLAN Status
esx3.aristanetworks.com vmk0 0 Up/Down
vSphereManagement Network adapter 1 0 Up/Down

Ethernet15 : example.com
VM Name VM Adapter VLAN Status
Openview Network adapter 1 123 Up/Down
VmTracerVm Network adapter 1 123 Down/Down

```

Ethernet23 : example.com
VM Name VM Adapter VLAN Status
Ethernet24 : example.com
VM Name VM Adapter VLAN Status
```

45.3.4.3 Displaying VMs

The **show vmtracer vm** command displays VM interfaces (Vnics) accessible to the VM Tracer-enabled interfaces. For each active listed VM, the command displays its name, adapter, and the connected hypervisor.

• This command displays the VMs connected to all VM Tracer-enabled interfaces.

```bash
switch#show vmtracer vm
```

VM Name VM Adapter Interface VLAN
Openview Network adapter 1 Et15 123
vSphereManagement Network adapter 1 Et8 0
VmTracerVm Network adapter 1 Et15 123example.com vmk0 Et8 0

• This command displays connection data for the VMs connected to all VM Tracer-enabled interfaces.

```bash
switch#show vmtracer vm detail
```
VM Name Openview
intf : Et15
vnic : Network adapter 1
mac : 00:0c:29:ae:7e:90
portgroup : dvPortGroup
vlan : 123
switch : vds
host : example.com
45.4 VM Tracer Configuration Commands

Global Configuration Commands
- `vmtracer session`

Interface Configuration (Ethernet and Port Channel) Commands
- `vmtracer`

VMTracer Configuration Commands
- `allowed-vlan`
- `autovlan disable`
- `password (vmtracer mode)`
- `source-interface`
- `url (vmtracer mode)`
- `username (vmtracer mode)`
- `vrf (vmtracer mode)`
- `vxlan (vmtracer mode)`

VMTracer-VXLAN Configuration Commands
- `password (vmtracer-vxlan mode)`
- `url (vmtracer-vxlan mode)`
- `username (vmtracer-vxlan mode)`

VM Tracer Display Commands
- `show vmtracer all`
- `show vmtracer interface`
- `show vmtracer session`
- `show vmtracer session vcenter`
- `show vmtracer session vsm`
- `show vmtracer vm`
- `show vmtracer vm detail`
- `show vmtracer vnic counters`
- `show vmtracer vxlan segment`
- `show vmtracer vxlan vm`
allowed-vlan

The `allowed-vlan` command specifies the VLANs that may be added when a VM is added or moved from the hypervisor connected to the session specified by the `vmtracer` mode. By default, all VLANs are allowed.

**Command Mode**
Vmtracer Configuration

**Command Syntax**

```
allowed-vlan VLAN_LIST
no allowed-vlan vlan
default allowed-vlan vlan
```

**Parameters**

- **VLAN_LIST** The VLAN list or the edit actions to the current VLAN list. Valid `v_range` formats include number, or number range.
  - `v_range` The list consists of the `v_range` VLANs.
  - `add v_range` The `v_range` VLANs are added to the current VLAN list.
  - `all` The list consists of all VLANs (1-4094).
  - `except v_range` The list consists of all VLANs except for those specified by `v_range`.
  - `none` The list of VLANs is empty.
  - `remove v_range` The `v_range` VLANs are removed from the current VLAN list.

**Related Commands**
- `vmtracer session` places the switch in vmtracer configuration mode.

**Examples**

- This command sets the list of allowed VLANs to 1 through 2000.
  ```
  switch(vmtracer-system_1)#allow-vlan 1-2000
  switch(vmtracer-system_1)#
  ```

- This command adds VLANs to 2501 through 3000.
  ```
  switch(vmtracer-system_1)#allow-vlan add 2051-3000
  switch(vmtracer-system_1)#
  ```
autovlan disable

Default VM Tracer session settings enable auto provisioning, which allows the dynamic assignment and pruning of VLANs when a VM attached to the ESX connected to the switch is created, deleted, or moved to a different ESX host. The autovlan setting controls auto provisioning.

The **autovlan disable** command disables auto provisioning, which prevents the creation or deletion of VLANs regardless of VM activity. The **allowed-vlan** command specifies the VLANs that may be added when a VM is added or moved. By default, all VLANs are allowed.

The **no autovlan disable** command enables the creation and deletion of VLANs caused by VM activity. This is the default setting.

**Command Mode**

Vmtracer Configuration

**Command Syntax**

```
autovlan disable
no autovlan disable
default autovlan disable
```

**Related Commands**

- vmtracer session places the switch in vmtracer configuration mode.

**Example**

- This command disables dynamic VLAN creation or pruning within the configuration mode VM Tracer session.

  ```
  switch(vmtracer-system_1)#autovlan disable
  switch(vmtracer-system_1)#
  ```
password (vmtracer mode)

The password command specifies the token that authorizes the username to the vCenter associated with the VM Tracer mode session.

Command Mode
Vmtracer Configuration

Command Syntax
password [ENCRYPTION] [password]

Parameters
- **ENCRYPTION** encryption level of the password.
  - <no parameter> password is a clear-text string.
  - 0 the password is a clear-text string. Equivalent to <no parameter>.
  - 7 the password is an encrypted string.
- **password** text that authenticates the username.
  - password is a clear-text string if ENCRYPTION specifies clear text.
  - password is an encrypted string if ENCRYPTION specifies an encrypted string.

Related Commands
- vmtracer session places the switch in vmtracer configuration mode.

Example
- This command configures abode as the clear-text string that authorizes the username a-switch_01 located at example.com/sdk.

```
switch(vmtracer-system_1)#url https://example.com/sdk
switch(vmtracer-system_1)#username a-switch_01
switch(vmtracer-system_1)#password abode
switch(vmtracer-system_1)#
```
password (vmtracer-vxlan mode)

The `password` command specifies the token that authorizes the username on the NSX for vSphere® (NSX-V) server located at the URL configured for the configuration mode VM Tracer. The switch uses this account to access NSX-V information.

The `password` statement is replaced in `running-config` for the configuration mode interface by a subsequent `password` command. The statement is removed by deleting the NSX-V instance through a `no vxlan (vmtracer mode)` command in vmtracer configuration mode.

Command Mode
Vmtracer-vxlan Configuration

Command Syntax
```
password [ENCRYPTION] password
```

Parameters
- `ENCRYPTION` encryption level of the password.
  - `<no parameter>` `password` is a clear-text string.
  - `0` the `password` is a clear-text string. Equivalent to `<no parameter>`.
  - `7` the `password` is an encrypted string.
- `password` text that authorizes the username.
  - `password` is a clear-text string if `ENCRYPTION` specifies clear text.
  - `password` is an encrypted string if `ENCRYPTION` specifies an encrypted string.

Related Commands
- `vxlan (vmtracer mode)` places the switch in vmtracer-vxlan configuration mode.

Example
- This command configures `5678` as the clear-text string that authorizes the username `admin` to the NSX-V located at `https://example.com/sdk`.

```
switch(config)#vmtracer session vnet-1
switch(config-vmtracer-vnet-1)#vxlan
switch(config-vmtracer-vnet-1-vxlan)#url https://example.com/sdk
switch(config-vmtracer-vnet-1-vxlan)#username admin
switch(config-vmtracer-vnet-1-vxlan)#password 5678
switch(config-vmtracer-vnet-1-vxlan)#exit
vmtracer session vnet-1
    allowed-vlan 1-4094
vxlan
    url https://example.com/sdk
    username admin
    password 7 s2Xq4GSB1YU=
switch(config-vmtracer-vnet-1)#
```
show vmtracer all

The **show vmtracer all** command displays VM Tracer data for all switches with the vSphere scope.

**Command Mode**
EXEC

**Command Syntax**
```
show vmtracer all
```

**Example**
- This command displays data for both switches in the vSphere scope.
  ```
  switch>show vmtracer all
  
  Switch : a109(10.10.30.109)
  Ethernet49     : 10.102.28.3/10G

  ```
show vmtracer interface

The `show vmtracer interface` command displays the VM interfaces (Vnics) that are active on the VM Tracer enabled interface. For each Vnic, the command displays the name of the attached VM, the adapter name, its VLAN, the VM power state, and the presence status of its MAC address in the switch's MAC table.

**Command Mode**

EXEC

**Command Syntax**

`show vmtracer interface [INT_NAME] [INFO_LEVEL]`

**Parameters**

- **INT_NAME** the interfaces to be configured. Values include:
  - `<no parameter>` command returns information for all interfaces.
  - `ethernet e_range` Ethernet interface range.
  - `port-channel p_range` Port Channel interface range.

  Valid `e_range` and `p_range` formats include number, number range, or comma-delimited list of numbers and ranges.

- **INFO_LEVEL** specifies information that the command returns.
  - `<no parameter>` connection parameters and status for VM associated to specified sessions.
  - `detail` connection status and data concerning messages the VM.
  - `host` name of the connected host.

**Examples**

- This command displays the Vnics connected to all VM Tracer enabled interfaces.

  ```
  switch>show vmtracer interface
  Ethernet8 : example.com

  VM Name       VM Adapter   VLAN   Status
  esx3.aristannetworks.com vmk0    0     Up/Down
  vspheremanagement Network adapter 1 0     Up/Down
  
  Ethernet15 : example.com

  VM Name       VM Adapter   VLAN   Status
  Openview Network adapter 1 123  Up/Down
  VmTracerVm Network adapter 1 123  Down/Down
  
  Ethernet23 : example.com

  VM Name       VM Adapter   VLAN   Status
  
  switch>
  ```

- This command displays the Vnics connected to the Ethernet 8 interface.

  ```
  switch>show vmtracer interface Ethernet8
  Ethernet8 : example.com

  VM Name       VM Adapter   VLAN   Status
  example.com    vmk0        0     Up/Down
  vspheremanagement Network adapter 1 0     Up/Down
  
  switch>
  ```
show vmtracer session

The `show vmtracer session` command displays vCenter and vShield connection information for a specified VM Tracer session.

**Command Mode**

EXEC

**Command Syntax**

```plaintext
show vmtracer session [SESSION_LIST]
```

**Parameters**

- `SESSION_LIST` VM Tracer sessions for which the command returns information.
  - `<no parameter>` all configured VM Tracer sessions.
  - `session_name` name of one VM Tracer session.

**Examples**

- This command displays connection parameters associated to the abcde session.

  ```plaintext
  switch>show vmtracer session abcde
  
  Session abcde
  vCenter URL       https://example.com/sdk
  username                        Administrator
  autovlan                        enabled
  allowed-vlans     1-4094
  sessionState      Connected
  VShield URL       https://vmware-vshield5.1.xyz.abcde.com
  username                    admin
  sessionState      Connected
  
  switch>
  ```
show vmtracer session vcenter

The `show vmtracer session vcenter` command displays vCenter information for a specified VM Tracer session.

**Command Mode**
EXEC

**Command Syntax**

```
show vmtracer session session_name vcenter [INFO_LEVEL]
```

**Parameters**

- `session_name` VM Tracer sessions for which the command returns information.
- `INFO_LEVEL` specifies information that the command returns.
  - `<no parameter>` displays connection and status information for the specified vCenter.
  - `detail` displays connection, status, and history information for the specified vCenter.

**Examples**

- This command displays connection parameters for the vCenter associated to the abcde session.

  ```
  switch> show vmtracer session abcde vcenter
  Session abcde
  vCenter URL       https://vmware-vcenter5.1/sdk
  username                        Administrator
  autovlan                        enabled
  allowed-vlans     1-4094
  sessionState      Connected
  switch>
  ```

- This command displays connection parameters and history details from the vCenter associated to the abcde session.

  ```
  switch> show vmtracer session abcde vcenter detail
  Session                      abcde
  vCenter URL            https://vmware-vcenter5.1/sdk
  username                        Administrator

  switch>
  ```
show vmtracer session vsm

The show vmtracer session vsm command displays NSX-V information for a specified VM Tracer session.

Command Mode
EXEC

Command Syntax
    show vmtracer session session_name vsm [INFO_LEVEL]

Parameters
- **session_name**  VM Tracer sessions for which the command returns information.
- **INFO_LEVEL**  specifies information that the command returns.
  - <no parameter>  connection and status information for the specified NSX-V.
  - detail  connection, status, and history information for the specified NSX-V.

Examples
- This command displays connection parameters for the NSX-V associated to the abcde session.
  
  switch>show vmtracer session abcde vsm
  
  Session abcde
  VShield URL       https://example.com/sdk
  username                    admin
  sessionState      Connected
  switch>

- This command displays connection parameters and history details from the vShield Manager associated to the abcde session.
  
  switch>show vmtracer session abcde vsm detail
  
  Session                     abcde
  VShield URL                  https://vmware-vshield5.1/
  username                   admin

  The given remote host was not resolved.
  switch>
**show vmtracer vm**

The `show vmtracer vm` command displays VMs interfaces (Vnics) that are accessible to VM Tracer enabled interfaces. For each active VM, the command displays the name of the VM, its adapter, and the hypervisor to which it connects.

**Command Mode**

EXEC

**Command Syntax**

```
show vmtracer [INT_NAME] vm [VM_LIST]
```

**Parameters**

- **INT_NAME** the interfaces name Values include:
  - `<no parameter>` command returns information for all interfaces.
  - `interface ethernet e_range` Ethernet interface range.
  - `interface port-channel p_range` Port Channel interface range.
  
  Valid `e_range` and `p_range` formats include a number, number range, or comma-delimited list of numbers and ranges.

- **VM_LIST** The virtual machines for which the command displays information. Options include:
  - `<no parameter>` command returns information for all present VMs.
  - `vm_name` command returns information only for specified VM.

**Related Commands**

- `show vmtracer vm detail` displays connection information for one or more specified VMs.

**Examples**

- This command displays the VMs connected to all VM Tracer enabled interfaces.

```
switch>show vmtracer vm
VM Name     Esx Host    Interface VLAN   Status
vCenter1     172.22.28.8 Po45     native  Down/Down
vCenter2     172.22.28.8 Po45     native  Up/Up
vCenter3     172.22.28.8 Po45     11      Down/Down
vCenter4     172.22.28.8 Po45     native  Down/Down
VMKernel     Po43     native  Up/Up
demo vcenter 5 clone Po43     native  Up/Up
switch>
```
show vmtracer vm detail

The show vmtracer vm detail command displays connection data for VMs interfaces (Vnics) that are accessible to VM Tracer enabled interfaces.

Command Mode
EXEC

Command Syntax
show vmtracer vm [VM_LIST] detail

Parameters
- **VM_LIST** The virtual machines for which the command displays information. Options include:
  - <no parameter> command returns information for all present VMs.
  - **vm_name** command returns information only for specified VM.

Examples
- This command displays connection data for the VMs connected to all VM Tracer enabled interfaces.

```
switch#show vmtracer vm vmcenter1
VM Name  vCenter1 Server App
Interface :  Po45
vNIC      :  Network adapter 1
MAC       :  00:31:22:8e:b8:41
Portgroup :  VM Network
VLAN      :  native
Switch    :  Switch2
Status    :  Down/Down
Host      :  10.22.18.28
Data Center :  vcenter-5

switch>
```

- This command displays connection data for the VMs connected to all VM Tracer enabled interfaces.

```
switch#show vmtracer vm detail
VM Name  vCenter1 Server App
Interface :  Po45
vNIC      :  Network adapter 1
MAC       :  00:31:22:8e:b8:41
Portgroup :  VM Network
VLAN      :  native
Switch    :  Switch2
Status    :  Down/Down
Host      :  10.22.18.28
Data Center :  vcenter-5

VM Name  vCenter2 Server App
Interface :  Po45
vNIC      :  vmk0
MAC       :  00:33:23:3c:e1:4e
Portgroup :  Management Network
VLAN      :  native

switch>
```
show vmtracer vnic counters

The show vmtracer interface vnic counters command displays input and output packet counts for VM interfaces (Vnics) that are active on the specified interface or VM.

Command Mode
EXEC

Command Syntax
show vmtracer [ENTITY] vnic counters

Parameters
- ENTITY the virtual machine or interface over which statistics are gathered and displayed.
- <no parameter> command returns information for all active VMs.
- interface ethernet e_range Ethernet interface range.
- interface port-channel p_range Port Channel interface range.
- vm vm_name command returns information for specified VM.

Valid e_range and p_range formats include a number, number range, or comma-delimited list of numbers and ranges.

Examples
- This command displays the Vnics connected to Ethernet interface 24.

  switch>show vmtracer interface ethernet 24 vnic counters
  Physical Intf: Ethernet24
  Host: 10.17.28.8/site1/dvUplink1
  VM Name vNic Input
  Pkt/Byte/% Output Pkt/Byte/%
  vCenter1 Network adapter 2 2550/ 187175/ 0.6 6/
  360/ 0.0
  vCenter2 Network adapter 2 418615/ 30678024/ 99.4 1904439/
  1145654613/100.0
  Summary 421165/ 30865199/100.0 1904445/
  switch>
show vmtracer vxlan segment

The **show vmtracer vxlan segment** command displays information about the VXLAN segments that are managed by the connected NSX for vSphere® (NSX-V).

**Command Mode**  
EXEC

**Command Syntax**  
```
show vmtracer segment ENTITY
```

**Parameters**  
- **ENTITY** specifies the information that the command displays. Options include:
  - <no parameter> displays information for VXLAN segments.
  - pool displays resource pools available to segments.
  - pool pool_name displays connection information about the specified pool.
  - range displays the VNI range of the managed segments.

**Examples**  
- This command displays the VXLAN segments managed by the NSX-V.
  switch>**show vmtracer vxlan segment**

<table>
<thead>
<tr>
<th>Name</th>
<th>VNI</th>

**show vmtracer vxlan vm**

The `show vmtracer interface vnic counters` command displays the VXLAN segments, their VTEP IP numbers, and their VM endpoints that are managed by the connected NSX for vSphere® (NSX-V).

**Command Mode**

EXEC

**Command Syntax**

`show vmtracer vxlan vm`

**Examples**

- This command displays the VM endpoints of the VXLAN segments managed by the NSX-V.

```
switch>show vmtracer vxlan vm
Vxlan Segment      VTEP IP              VLAN  VMs
Eng Wire           192.168.200.1/24   200   Eng VM3, Eng VM2
Eng Wire           192.168.100.1/24   100   Eng VM1
HR Wire            192.168.100.1/24   100   HR VM2, HR VM1
HR Wire            192.168.200.1/24   200   --
switch>
```
source-interface

The source-interface command allows you to connect to a remote vCenter endpoint by using the primary address of the interface as the source IP address. If the interface is not specified, the source IP address is determined by the routing table.

The no source-interface and default source-interface commands restore default behavior by removing the source-interface command from the running-config.

Command Mode
Vmtracer Configuration

Command Syntax

source-interface [INTERFACE_NAME]

no source-interface
default source-interface

Parameters

- **INTERFACE_NAME** specifies the interface for which the information is displayed. Options include:
  - Ethernet e_num specifies the Ethernet interface number.
  - Loopback l_num specifies the loopback interface number. Value ranges from 0 to 2100.
  - Management m_num specifies the management interface number. The values are 1 or 2.
  - Port-Channel {lag_num | lag_num.sub_num} specifies the port-channel interface number. Value of interface ranges from 1 to 2000. Value of sub-interface ranges from 1 to 4094.
  - Tunnel tunnel_num specifies the tunnel interface number. Value ranges from 1 to 255.
  - UnconnectedEthernet port_num specifies the unconnected Ethernet port number. Value ranges from 1 to 8.
  - VLAN vlan_num specifies the VLAN interface number. Value ranges from 1 to 4094.

Related Commands
- vmtracer session places the switch in Vmtracer configuration mode.

Examples
- This command configures VM Tracer to use Ethernet interface 17 to derive the source address for session packets.

```
switch(config)#vmtracer session system_1
switch(config-vmtracer-session-system_1)#source-interface Ethernet 17
```

- This command configures a loopback interface 0 for VM Tracer session.

```
switch(config)#vmtracer session system_1
switch(config-vmtracer-session-system_1)#source-interface Loopback 0
```

- This command configures management interface 1 for VM Tracer session.

```
switch(config)#vmtracer session system_1
switch(config-vmtracer-session-system_1)#source-interface management 1
```
• This command configures port-channel interface 10 for VM Tracer session.
  
  switch (config)#vmtracer session system_1
  switch (config-vmtracer-session-system_1)#source-interface port-channel 10
  switch (config-vmtracer-session-system_1)#

• This command configures tunnel interface 25 for VM Tracer session.
  
  switch (config)#vmtracer session system_1
  switch (config-vmtracer-session-system_1)#source-interface tunnel 25
  switch (config-vmtracer-session-system_1)#

• This command configures unconnected Ethernet interface 1 for VM Tracer session.
  
  switch (config)#vmtracer session system_1
  switch (config-vmtracer-session-system_1)#source-interface unconnected Ethernet 1
  switch (config-vmtracer-session-system_1)#

• This command configures VLAN interface 25 for VM Tracer session.
  
  switch (config)#vmtracer session system_1
  switch (config-vmtracer-session-system_1)#source-interface vlan 25
  switch (config-vmtracer-session-system_1)#
url (vmtracer mode)

The `url` command specifies the vCenter server location that is monitored by the session being edited by the current vmtracer mode. The command must reference a fully formed secure `url`.

**Command Mode**
Vmtracer Configuration

**Command Syntax**
```
url url_name
```

**Parameters**
- `url_name` location of the vCenter server. Valid formats include IP address (dotted decimal notation) and fully qualified domain name.

**Related Commands**
- `vmtracer session` places the switch in vmtracer configuration mode.

**Example**
- This command specifies the location of the vCenter monitored by the system_1 VM Tracer session.

  ```
  switch(vmtracer-system_1)#url https://example.com/sdk
  switch(vmtracer-system_1)#
  ```
url (vmtracer-vxlan mode)

The `url` command specifies the NSX for vSphere® (NSX-V) server location that is monitored for VXLAN information by the configuration mode VM Tracer session. The command must reference a fully formed secure URL.

The `url` statement is replaced in `running-config` for the configuration mode session by a subsequent `url` command. The statement is removed by deleting the NSX-V instance through a `no vxlan (vmtracer mode)` command in vmtracer configuration mode.

**Command Mode**

Vmtracer-vxlan Configuration

**Command Syntax**

```
url url_name
```

**Parameters**

- `url_name` location of the NSX-V server. Valid formats include IP address (dotted decimal notation) and fully qualified domain name.

**Related Commands**

- `vxlan (vmtracer mode)` places the switch in vmtracer-vxlan configuration mode.

**Example**

- This command configures the location of the NSX-V monitored by the vnet-1 VM Tracer session.

```
switch(config)#vmtracer session vnet-1
switch(config-vmtracer-vnet-1)#vxlan
switch(config-vmtracer-vnet-1-vxlan)#url https://example.com/sdk
switch(config-vmtracer-vnet-1-vxlan)#exit
switch(config-vmtracer-vnet-1)#show active
vmtracer session vnet-1
   allowed-vlan 1-4094
   vxlan
      url https://example.com/sdk
switch(config-vmtracer-vnet-1)#
```
**username (vmtracer mode)**

The `username` command identifies the switch's account name on the vCenter server. The switch uses this user name to access vCenter information.

**Command Mode**

Vmtracer Configuration

**Command Syntax**

`username name_string`

**Parameters**

- `name_string` vCenter account user name. Parameter must match the user name configured on the vCenter.

**Related Commands**

- `vmtracer session` places the switch in vmtracer configuration mode.

**Example**

- This command configures the user name for the vCenter associated with the system_1 session. The session uses this user name to log into the vCenter server.

```
switch(vmtracer-system_1)#username a-switch_01
switch(vmtracer-system_1)#
```
username (vmtracer-vxlan mode)

The `username` command identifies the switch’s account name on the NSX for vSphere® (NSX-V) server located at the URL configured for the configuration mode VM Tracer. The switch uses this user name to access NSX-V information.

The `username` statement is replaced in `running-config` for the configuration mode interface by a subsequent `username` command. The statement is removed by deleting the NSX-V instance through a `no vxlan (vmtracer mode)` command in vmtracer configuration mode.

**Command Mode**

Vmtracer-vxlan Configuration

**Command Syntax**

```plaintext
username name_string
```

**Parameters**

- `name_string` NSX-V account user name. Parameter must match a user name configured on the NSX-V.

**Related Commands**

- `vxlan (vmtracer mode)` places the switch in vmtracer-vxlan configuration mode.

**Example**

- This command configures the user name of admin for the NSX-V located at the URL specified by the URL command.

```
switch(config)#vmtracer session vnet-1
switch(config-vmtracer-vnet-1)#vxlan
switch(config-vmtracer-vnet-1-vxlan)#url https://example.com/sdk
switch(config-vmtracer-vnet-1-vxlan)#username admin
switch(config-vmtracer-vnet-1-vxlan)#exit
switch(config-vmtracer-vnet-1)#show active
vmtracer session vnet-1
  allowed-vlan 1-4094
  vxlan
    url https://example.com/sdk
    username admin

switch(config-vmtracer-vnet-1)#
```
The `vmtracer` command enables vmtracer mode on the configuration mode interface. Interfaces with vmtracer mode enabled send discovery packets to the connected vSwitch.

The `no vmtracer` and `default vmtracer` commands disable vmtracer mode on the configuration mode interface by removing the corresponding `vmtracer` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-channel Configuration

**Command Syntax**
- `vmtracer HOST_TYPE`
- `no vmtracer HOST_TYPE`
- `default vmtracer HOST_TYPE`

**Parameters**
- `HOST_TYPE` the type of hypervisor that controls the vSwitch to which the interface connects.
  - `vmware-esx` ESX or ESXI hypervisor (VMware).

**Examples**
- These commands enable vmtracer mode on the Ethernet 3 interface.
  ```
  switch(config)#interface Ethernet 3
  switch(config-if-Et3)#vmtracer vmware-esx
  switch(config-if-Et3)#
  ```
- This command disables vmtracer mode on the Ethernet 3 interface.
  ```
  switch(config-if-Et3)#no vmtracer vmware-esx
  switch(config-if-Et3)#
  ```
vmtracer session

The `vmtracer session` command places the switch in vmtracer mode for the specified session. The command creates a new session or loads an existing session for editing.

A VM Tracer session connects the switch to a vCenter server at a specified location, then downloads data about VMs and vSwitches managed by ESX hosts connected to switch ports. The switch supports a maximum of four VM Tracer sessions.

VM Tracer session parameters are configured in vmtracer mode. Parameters configured in vmtracer mode include the vCenter location and dynamic VLAN usage.

The `no vmtracer session` and `default vmtracer session` commands disable the session and remove its configuration from `running-config`.

Command Mode
GLOBAL CONFIGURATION

Command Syntax

```
vmtracer session name
no vmtracer session name
default vmtracer session name
```

Parameters
- `name` The label assigned to the VM Tracer session.

Commands Available in vmtracer Configuration Mode
- `allowed-vlan`
- `autovlan disable`
- `password (vmtracer mode)`
- `url (vmtracer mode)`
- `username (vmtracer mode)`
- `vxlan (vmtracer mode)`

Examples
- This command enters vmtracer mode for the system_1 session.
  ```
  switch(config)#vmtracer session system_1
  switch(vmtracer-system_1)#
  ```
- This command disables the system_1 VM Tracer session. The system_1 session and all of its parameters are removed from `running-config`.
  ```
  switch(config)#no vmtracer session system_1
  switch(config)#
  ```
vrf (vmtracer mode)

The vrf command allows the switch to communicate with a vCenter server by enabling VmTracer configuration mode. By default, VmTracer is enabled only in the default vrf.

Command Mode
Vmtracer Configuration

Command Syntax
vrf vrf_name

Parameters
• vrf_name specifies information of the corresponding VRF.

Example
• These commands place the VRF vrf1 in the Vmtracer configuration mode.

switch(config)#vmtracer session system_1
switch(config-vmtracer-session-system_1)#vrf vrf1
switch(config-vmtracer-session-system_1)#
**vxlan (vmtracer mode)**

The `vxlan` command places the switch in vmtracer-vxlan configuration mode. To monitor VXLAN based VMware configurations, the switch must communicate with a NSX for vSphere® (NSX-V). Vmtracer-vxlan configuration mode specifies the location and user account data that allows the switch to access a NSX-V within the configuration mode vmtracer session. Each VM Tracer session can be associated with one NSX-V instance.

The `no vxlan` and `default interface vxlan` commands delete the NSX-V instance from the configuration mode vmtracer session by removing all vmtracer-vxlan mode commands from `running-config`.

**Command Mode**

Vmtracer Configuration

**Command Syntax**

- `vxlan`
- `no vxlan`
- `default vxlan`

**Related Commands**

- `vmtracer session` places the switch in vmtracer configuration mode.

**Commands Available in vmtracer-vxlan Configuration Mode**

- `password (vmtracer mode)`
- `url (vmtracer mode)`
- `username (vmtracer mode)`

**Example**

- These commands create the vShield instance for the VMTracer session named vnet-1.

```bash
switch(config)#vmtracer session vnet-1
switch(config-vmtracer-vnet-1)#vxlan
switch(config-vmtracer-vnet-1-vxlan)#
```
MapReduce Tracer

This chapter describes Arista’s implementation of MapReduce Tracer, including configuration instructions and command descriptions. Topics covered by this chapter include:

- Section 46.1: MapReduce Tracer Introduction
- Section 46.2: MapReduce Tracer Configuration
- Section 46.3: Displaying MapReduce Tracer Results
- Section 46.4: MapReduce Tracer Command Descriptions

46.1 MapReduce Tracer Introduction

MapReduce Tracer is a network tool that monitors Hadoop nodes that are directly connected to Arista switches. MapReduce Tracer requires the following:

- Hadoop clusters are deployed with a L3 design.
- The top of rack switch is the default gateway to all attached TaskTracker nodes.
- JobTracker RPC ports do not require authentication.
- Nodes cannot simultaneously belong to multiple Hadoop clusters.
- All TaskTrackers within a cluster are accessed through a common HTTP access port.
- The switch’s DNS or static host configuration facilitates TaskTracker name resolution.

Map Reduce Tracer supports these Hadoop releases:

- Apache 0.20.205
- Apache 1.2.1
- Cloudera 3u6
- Cloudera 4.1.3
- Cloudera 4.3.0
- HortonWorks 1.3
- Cloudera 4.5.0

These sections briefly describe Hadoop, Hadoop data structures, and MapReduce Tracer.
46.1.1 Hadoop Description

Apache Hadoop is an open-source, Java-based software framework that supports large dataset storage and processing in a distributed computational environment. Hadoop is licensed under Apache License 2.0 and developed through a global community.

Hadoop facilitates application execution on systems composed of thousands of nodes utilizing petabytes of data. Its distributed file system facilitates rapid data transfer among nodes and supports continued operations when individual nodes fail or become inaccessible.

Hadoop Distributed File System (HDFS) is a distributed file-system that stores data on the commodity machines to provide high aggregate bandwidth across the cluster.

46.1.2 Hadoop Cluster Structure

A cluster is a group of servers that function as a single system to provide high availability through load balancing and parallel processing. A Hadoop cluster is a type of computational cluster designed for storing and analyzing large amounts of unstructured data in a distributed computing environment.

Typical Hadoop clusters include one master and multiple worker nodes. The master node consists of a TaskTracker, JobTracker, NameNode and DataNode. Worker nodes include a TaskTracker and DataNode.

46.1.3 Map Reduce

MapReduce is an algorithm that Hadoop implements to process large datasets by distributing parallel tasks to nodes within a cluster. The MapReduce program includes a Map procedure that filters data and a Reduce procedure that processes the data.

MapReduce manages task and data distribution to cluster nodes such that tasks are executed in parallel, and data transfers between cluster components support redundancy and fault tolerance.

The MapReduce engine consists of one JobTracker and multiple TaskTrackers – all nodes within the Hadoop cluster. The JobTracker receives MapReduce jobs from a client application and manages the completion of these jobs by submitting tasks to available TaskTracker nodes. If a TaskTracker fails to perform the assigned task, the JobTracker reschedules that part of the job to another node.

46.1.4 MapReduce Tracer Function

MapReduce Tracer is a feature that tracks and interacts with Hadoop nodes directly connected to Arista switches in a cluster. It communicates with a JobTracker to obtain a list of all nodes in a cluster and then queries JobTracker and TaskTrackers on these nodes for information regarding the jobs they are running and progress of those jobs. This creates a map of TaskTrackers with kinds of jobs they are running. Commands are available to display this data in tables through the CLI and EAPI.

MapReduce Tracer monitors only nodes that connect directly to the switch in L3 networks. Directly connected nodes use the top-of-rack switch as their default gateway and the switch learns ARP entries for these nodes. The list of nodes provided by JobTracker is filtered by tracking ARP entries to remove nodes that are not directly accessible.

MapReduce Tracer creates a database of nodes from the filtered list. After the database is created, the switch queries the JobTracker and TaskTrackers to obtain the following:

- The number of monitored Hadoop nodes.
- The list of monitored nodes, including their IP addresses.
- Jobs that the TaskTrackers are running.
- JobTracker and TaskTracker statistics.
MapReduce Tracer can simultaneously monitor multiple clusters. This means the directly connected TaskTracker nodes can belong to different clusters. A maximum of 5 clusters are supported per switch.

### 46.2 MapReduce Tracer Configuration

MapReduce Tracer configuration commands are structured into two configuration levels:

- Monitor-hadoop configuration mode is a child of global configuration mode and controls global MapReduce Tracer settings.
- Monitor-hadoop-cluster configuration mode is a child of Monitor-hadoop configuration mode and defines polling configurations that monitor individual Hadoop clusters.

These sections describe MapReduce Tracer configuration processes:

- Section 46.2.1: MapReduce Tracer Global Configuration
- Section 46.2.2: Hadoop Cluster Access Configuration

MapReduce Tracer functions after it is enabled globally. Each polling configuration can be individually enabled after the feature is enabled globally.

### 46.2.1 MapReduce Tracer Global Configuration

MapReduce Tracer global parameters are configured in Monitor-hadoop configuration mode. Tasks performed from this mode include specifying connection parameters to Hadoop clusters and globally enabling MapReduce Tracer.

**Entering Monitor-Hadoop Configuration Mode**

Monitor-hadoop configuration mode is entered by `monitor hadoop`. Monitor-hadoop configuration mode is not a group change mode; statements are stored in the `running-config` when they are entered through the CLI. The `exit` command returns the switch to global configuration mode.

**Examples**

- These commands place the switch in monitor-hadoop configuration mode.
  
  ```
  switch(config)#monitor hadoop
  switch(config-monitor-hadoop)#
  ```

- This command exits monitor-hadoop mode.
  
  ```
  switch(config-monitor-hadoop)#exit
  switch(config)#
  ```

- This command deletes all previously configured monitor-hadoop configuration mode commands.
  
  ```
  switch(config)#no monitor hadoop
  switch(config)#
  ```

**Globally Enabling MapReduce Tracer**

MapReduce Tracer is globally enabled by `no shutdown (Monitor-Hadoop)`. MapReduce Tracer is globally disabled by default.
Example

- These commands globally enable MapReduce Tracer.

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#no shutdown
switch(config-monitor-hadoop)#show active
monitor hadoop
    no shutdown
switch(config-monitor-hadoop)#
```

Creating a Cluster Monitor

A cluster monitor is created by entering monitor-hadoop-cluster mode with `cluster (Monitor Hadoop)`. Each monitor is labeled with a cluster ID and probes one Hadoop cluster. When the command specifies a monitor with a previously defined cluster ID, subsequent commands edit that monitor’s parameters. A monitor with a new cluster ID is created by a command that specifies a nonexistent cluster ID.

Example

- These commands enter monitor-hadoop-cluster mode to edit a cluster monitor. The monitor’s cluster-id is CL2.

```
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#show active
monitor hadoop
    cluster CL2
switch(config-monitor-hadoop-CL2)#
```

46.2.2 Hadoop Cluster Access Configuration

Cluster monitors are configured in monitor-hadoop-cluster configuration mode. Each monitor corresponds to a hadoop cluster through these configurable parameters:

- JobTracker access parameters (address, port number, and username)
- TaskTracker access port
- Polling interval
- Cluster description
- Enabled setting

The minimum explicit configuration includes JobTracker address and username; default values are defined for all other parameters. By default, cluster monitors are disabled.

The `cluster (Monitor Hadoop)` command places the switch in monitor-hadoop-cluster mode for the specified monitor, where a cluster’s connection parameters are specified. Monitor-hadoop-cluster mode is not a group change mode.

A cluster monitor is enabled by `no shutdown (Monitor Hadoop Cluster)` when MapReduce Tracer is globally enabled.

46.2.2.1 JobTracker Configuration

A cluster’s JobTracker is located on the master node and schedules work to the cluster’s TaskTracker nodes. The `jobtracker (Monitor Hadoop Cluster)` command specifies connection parameters to the monitored cluster.

JobTracker parameters include its node location (IPv4 address or hostname), RPC port, and username. The default RPC port is 8021. Location and username parameters do not have default values and must be explicitly configured.
Example

- For the CL2 monitor, these commands configure connection parameters to a JobTracker node at 10.4.4.4 with the username `account1`. The default RPC port (8021) is implicitly specified.

```plaintext
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#jobtracker host 10.4.4.4 username account1
monitor hadoop
  cluster CL2
    jobtracker host 10.4.4.4 user account1
switch(config-monitor-hadoop-CL2)#
```

46.2.2.2 TaskTracker Configuration

The `tasktracker` (Monitor Hadoop Cluster) command specifies the HTTP port that access TaskTrackers of the Hadoop cluster probed by the configuration mode monitor. The switch compiles a list of the cluster’s TaskTracker addresses by periodically polling the cluster’s JobTracker.

The default TaskTracker HTTP port is 50060.

Examples

- For the CL2 monitor, these commands configure a TaskTracker access port of 51000.

```plaintext
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#tasktracker http-port 51000
monitor hadoop
  cluster CL2
    tasktracker http-port 51000
switch(config-monitor-hadoop-CL2)#
```

- These commands restore the default TaskTracker HTTP access port address of 50060.

```plaintext
switch(config-monitor-hadoop-CL2)#no tasktracker http-port
switch(config-monitor-hadoop-CL2)#show active
monitor hadoop
  cluster CL2
    tasktracker http-port 50060
switch(config-monitor-hadoop-CL2)#
```

46.2.2.3 Polling Interval Configuration

When the monitor configuration is complete, the switch polls the cluster’s JobTracker to maintain the list of active TaskTracker nodes associated with the monitored cluster and compile Hadoop job statistics. The `interval` (Monitor Hadoop Cluster) command specifies the interval between polls to the JobTracker of the monitored cluster. The default interval is 10 seconds.
Example

- This command sets the JobTracker polling interval to 25 seconds for the cluster monitored by the CL2 MapReduce Tracer configuration.

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#interval 25
switch(config-monitor-hadoop-CL2)#show active
monitor hadoop
    cluster CL2
    interval 25
switch(config-monitor-hadoop-CL2)#
```

46.2.3 MapReduce Tracer Example

The commands in this section create monitors that probe two Hadoop clusters, enables each monitor individually, then enables MapReduce Tracer globally. Monitor parameters for the clusters include:

- Cluster ID: CL_1
  - Jobtracker: IP address 10.15.2.2; RPC port 8021; username xyz1
  - TaskTracker: HTTP address 54000
  - JobTracker polling interval: 10 seconds (default)
- Cluster ID: CL_2
  - Jobtracker: IP address 10.21.5.2; RPC port 9521; username qrst4
  - TaskTracker: HTTP address 50060 (default)
  - JobTracker polling interval: 5 seconds

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#cluster CL_1

switch(config-monitor-hadoop-CL_1)#jobtracker host 10.15.2.2 username xyz1
switch(config-monitor-hadoop-CL_1)#tasktracker http-port 54000
switch(config-monitor-hadoop-CL_1)#no shutdown
switch(config-monitor-hadoop-CL_1)#exit

switch(config-monitor-hadoop)#cluster CL_2
switch(config-monitor-hadoop-CL_2)#jobtracker host 10.21.5.2 rpc-port 9521 username qrst4
switch(config-monitor-hadoop-CL_2)#interval 5
switch(config-monitor-hadoop-CL_2)#no shutdown
switch(config-monitor-hadoop-CL_2)#exit

switch(config-monitor-hadoop)#no shutdown
switch(config-monitor-hadoop)#show active
monitor hadoop
    no shutdown
    cluster CL_1
        jobtracker host 10.15.2.2 user xyz1
        tasktracker http-port 54000
        no shutdown
    !
    cluster CL_2
        jobtracker host 10.21.5.2 rpc-port 9521 user qrst4
        interval 5
```
no shutdown

switch(config-monitor-hadoop)#show active all
monitor hadoop
  no shutdown
  cluster CL_1
    jobtracker host 10.15.2.2 rpc-port 8021 user xyz1
    tasktracker http-port 54000
    interval 10
    no shutdown

cluster CL_2
  jobtracker host 10.21.5.2 rpc-port 9521 user qrst4
  tasktracker http-port 50060
  interval 5
  no shutdown

switch(config-monitor-hadoop)#exit
switch(config)#
46.3 Displaying MapReduce Tracer Results

MapReduce Tracer display commands provide information about the configuration and activity on the monitored clusters.

46.3.1 MapReduce Tracer Status

MapReduce Tracer status is accessed through `show monitor hadoop status`. Status information includes the enabled status and the number of monitored clusters, TaskTrackers, and locally running jobs.

Example

- This command displays MapReduce Tracer status for all connected clusters and TaskTrackers.

```
switch>show monitor hadoop status
Last updated: 2013-10-06 18:14:23
Mapreduce Tracer status:
  Admin status                            : Enabled
  Operational status                      : Enabled
  Number of clusters configured           : 3
  Number of local TaskTrackers            : 4
  Number of jobs running locally          : 4
```

46.3.2 Cluster Configuration and Connections

The following cluster configuration and connection information is available through these commands:

- Configuration and connection data for all monitored clusters – `show monitor hadoop cluster all`.
- Configuration and connection data for a specified cluster – `show monitor hadoop cluster status`
- Connection and activity information for TaskTrackers in a specified cluster, on a specified node, or accessed through a specified interface – `show monitor hadoop tasktracker status`.

Example

- This command displays configuration and connection data for the `Cluster0` cluster.

```
switch>show monitor hadoop cluster Cluster0 status
Last updated: 2013-10-06 18:14:23
Cluster status for cluster:  Cluster0
  Admin status : Enabled
  JobTracker host : host0
  JobTracker RPC port : 9000
  JobTracker user : user0
  JobTracker polling interval : 100 seconds
  TaskTracker HTTP port : 8800
  Operational status : Enabled
  Active TaskTrackers : 31
  Blacklisted TaskTrackers : 1
  Decommissioned TaskTrackers : 1
  Tracker expiry interval : 20.0
  Map slots (used/total) : 10/100
  Reduce slots (used/total) : 11/110
  JobTracker heap size : 1.04GB (max: 2.08GB)
```
46.3.3 Job Lists

The following commands display rosters of currently running job or jobs that previously ran:

- Jobs running on all monitored Hadoop clusters – `show monitor hadoop`.
- Jobs running on a specified cluster and byte counter data – `show monitor hadoop cluster counters`.
- Jobs that previously ran on a specified cluster – `show monitor hadoop cluster history`.
  - Includes jobs that ran since the monitor was enabled, the switch was reloaded, or the job history was cleared (`clear monitor hadoop job-history`).
- Jobs running on a specified cluster – `show monitor hadoop cluster jobs`.
- Jobs that ran on all configured clusters is accessed through `show monitor hadoop history`.
  - Includes jobs that ran since the monitor was enabled, the switch was reloaded, or the job history was cleared (`clear monitor hadoop job-history`).
- Jobs running on a specified TaskTracker and byte counter data – `show monitor hadoop tasktracker counters`.

Examples

- This command displays the jobs that are running on all monitored clusters.

  ```plaintext
  switch> show monitor hadoop
  Last updated: 2013-10-06 18:14:23
  Currently running jobs: 4
  JobId  Job Name         Cluster   Maps(#/%)  Reduces(#/%)  Start Time
  ------ ------------------------- ---------- ------------- -------------------
  1      ReallyAVeryLon\gNameForAJob1 Cluster0  2/12.34%   0/13.45%      2013-10-06 17:56:03
  2      ShortName2       Cluster0  2/24.68%   0/26.90%      2013-10-06 17:37:43
  510001 ReallyAVeryLon\gNameForAJob1 Cluster1  2/12.34%   0/13.45%      2013-10-06 17:56:03
  510002 ShortName12      Cluster1  2/24.68%   0/26.90%      2013-10-06 17:37:43
  ```

- This command displays data the jobs that previously ran on connected Hadoop clusters.

  ```plaintext
  switch> show monitor hadoop history
  Job history for all clusters:
  JobId  Job Name         Cluster   Start Time   End Time     Bytes In  Bytes Out
  ------ ------------------------- ----------- ------------ ---------- ---------
  2      AReallyBigHist\oricalJobName Cluster0  2013-10-06 17:41:03 2013-10-09 06:47:43 26.08GB 13.04GB
  442    AReallyBigHist\oricalJobName Cluster1  2013-10-06 17:41:03 2013-10-09 06:47:43 26.08GB 13.04GB
  442    AReallyBigHist\iricalJobName Cluster1  2013-10-06 17:41:03 2013-10-09 06:47:43 26.08GB 13.04GB
  2      AReallyBigHist\oricalJobName Cluster0  2013-10-06 17:41:03 2013-10-09 06:47:43 26.08GB 13.04GB
  441    HistoryJob1       Cluster1  2013-10-06 17:57:43 2013-10-08 00:31:03 26.08GB 13.04GB
  1      HistoryJob1       Cluster0  2013-10-06 17:57:43 2013-10-08 00:31:03 26.08GB 13.04GB
  ```
This command displays jobs running on cluster **Cluster0** and byte counters for each job.

```
switch>show monitor hadoop cluster Cluster0 counters
Last updated: 2013-10-06 18:14:23
Counters for currently running jobs on cluster: Cluster0

```

46.3.4 Job Data

The following commands display information about jobs that are running or previously ran on monitored clusters. Available data include job identifiers, JobTracker ID, start time, stop time, data consumption, and progress statistics.

- Data consumption, start and stop times, and JobTracker ID for a specific job – `show monitor hadoop cluster history jobs`.
- Data consumption, start and stop times, priority, JobTracker ID, and progress statistics for a specified job – `show monitor hadoop cluster jobs <job number>`.
- HDFS (Hadoop Distributed File System) data consumption and and shuffle byte counters for a specified job – `show monitor hadoop cluster jobs counter`.
- Data through and start time for jobs running on all monitored clusters – `show monitor hadoop counters`.
- Progress statistics and start times are available for jobs running on specified TaskTracker – `show monitor hadoop tasktracker jobs`.
- Job progress and byte counts of jobs running on a specified Hadoop cluster – `show monitor hadoop tasktracker running-tasks`.
- Progress statistics, HDFS data consumption, start time, and progress information for the specified task of a running job – `show monitor hadoop tasktracker running-tasks cluster job task`.
- Data consumption and start times for jobs running on a specified TaskTracker – `show monitor hadoop tasktracker counters`.

Examples

- This command displays information about job 1 that ran on cluster Cluster0.

```
switch>show monitor hadoop cluster Cluster0 history job 1
Job history data for job: HistoryJob1
  Cluster : Cluster0
  Job Id   : 1
  JT Id    : 201310110013
  User     : HistoryUser1
  Job start time : 2013-10-06 17:57:43
  Job end time  : 2013-10-08 00:31:03
Per Interface job counters:
  Interface       TaskTracker        Bytes In       Bytes Out
  -------------- ------------------ -------------- ---------
  Ethernet7       TaskTracker2       26.08GB        13.04GB
```

switch>
• This command displays information about job 1 that is running on cluster Cluster0.

```
switch>show monitor hadoop cluster Cluster0 jobs 1
Last updated: 2013-10-06 18:14:23
Information for job: ReallyAVeryLongNameForAJob1 running on cluster: Cluster0
Cluster                  : Cluster0

```

46.3.5 TaskTracker Lists

These commands display lists of TaskTrackers that are active on monitored clusters:

• TaskTrackers on a specified cluster – show monitor hadoop cluster tasktracker.
• TaskTrackers on all monitored clusters – show monitor hadoop tasktracker all.

Example

• This command displays the TaskTrackers on the Cluster0 cluster.

```
switch>show monitor hadoop cluster Cluster0 tasktracker
Last updated: 2013-10-06 18:14:23
Total 2 TaskTrackers on cluster Cluster0:
Node               IP Address       Interface           Maps    Reduces
------------------ ---------------- ------------------- ---------- -------
TaskTracker1       10.100.0.1       Ethernet7           4       0
TaskTracker2       10.100.0.2       Port-Channel7       4       0
```

switch>

46.3.6 TaskTracker Connection and Activity

The following TaskTracker connection and activity data is available through these commands:
• Connection and activity information for TaskTrackers on a specified cluster or accessed through a specified interface – `show monitor hadoop tasktracker status`.

• Data consumption for TaskTrackers connected to monitored clusters – `show monitor hadoop tasktracker all counters`.

**Example**

• This command displays connection and activity data for TaskTracker on the *TaskTracker1* node.

  ```
  switch> show monitor hadoop tasktracker host TaskTracker1 status
  Last updated: 2013-10-06 18:14:23
  TaskTracker          : TaskTracker1
  IP Address           : 10.100.0.1
  Interface            : Ethernet7
  State                : active
  Running jobs         : 2
  Running tasks        : 4
  Map Tasks            : 4
  Reduce Tasks         : 0
  Total bytes read     : 2.08GB
  Total bytes written  : 4.24MB
  ```

### 46.3.7 Data Bursts

The `show monitor hadoop traffic burst` command displays the largest data bursts for jobs running on a specified cluster or accessed through a specified node or interface. A data burst is the data consumed during a polling interval.

**Example**

• This command displays traffic burst data for all running jobs that are accessible through port channel interface 7.

  ```
  switch> show monitor hadoop traffic burst interface Port-Channel 7
  Last updated: 2013-10-06 18:14:23
  Bursts on Interface: 'Port-Channel7' in cluster: Cluster0
  Top 2 input bursts:
      JobId  Job Name                  Burst     Time
           --------------------- ------------ -------------------

46.4 MapReduce Tracer Command Descriptions

Global Configuration Commands
- `monitor hadoop`

Clear Hadoop Monitor Commands
- `clear monitor hadoop burst-counters`
- `clear monitor hadoop job-history`

Display Commands
- `show monitor hadoop`
- `show monitor hadoop cluster all`
- `show monitor hadoop cluster counters`
- `show monitor hadoop cluster history`
- `show monitor hadoop cluster history jobs`
- `show monitor hadoop cluster jobs`
- `show monitor hadoop cluster jobs <job number>`
- `show monitor hadoop cluster jobs counter`
- `show monitor hadoop cluster status`
- `show monitor hadoop cluster tasktracker`
- `show monitor hadoop counters`
- `show monitor hadoop history`
- `show monitor hadoop status`
- `show monitor hadoop tasktracker all`
- `show monitor hadoop tasktracker all counters`
- `show monitor hadoop tasktracker counters`
- `show monitor hadoop tasktracker jobs`
- `show monitor hadoop tasktracker running-tasks`
- `show monitor hadoop tasktracker running-tasks cluster job task`
- `show monitor hadoop tasktracker status`
- `show monitor hadoop traffic burst`

Hadoop Commands
- `cluster (Monitor Hadoop)`
- `shutdown (Monitor-Hadoop)`

Hadoop-Cluster Commands
- `description (Monitor Hadoop Cluster)`
- `interval (Monitor Hadoop Cluster)`
- `jobtracker (Monitor Hadoop Cluster)`
- `shutdown (Monitor Hadoop Cluster)`
- `tasktracker (Monitor Hadoop Cluster)`
clear monitor hadoop burst-counters

The clear monitor hadoop burst-counters command resets MapReduce Tracer burst counters for all jobs running on specified clusters.

**Command Mode**

Privileged EXEC

**Command Syntax**

```
clear monitor hadoop burst-counters [CLUSTERS]
```

**Parameters**

- **CLUSTERS**  Hadoop clusters for which command displays data. Options include:
  - <no parameter>  all clusters.
  - `cluster c_name`  Cluster name.

**Example**

- This command clears the burst counters for all jobs running on CL2 cluster.

```
switch# clear monitor hadoop burst-counters cluster CL2
Cleared burst counters
switch#
```
clear monitor hadoop job-history

The clear monitor hadoop job-history command resets the job history database for all specified clusters.

Command Mode
Privileged EXEC

Command Syntax
```
clear monitor hadoop job-history [CLUSTERS]
```

Parameters
- **CLUSTERS** Hadoop clusters for which command displays data. Options include:
  - <no parameter> all clusters.
  - `cluster c_name` Cluster name.

Example
- This command clears the job history on the CL2 cluster.
  ```
switch#clear monitor hadoop job-history cluster CL2
Cleared job history
switch#
```
cluster (Monitor Hadoop)

The cluster command is a monitor-hadoop command that places the switch in monitor-hadoop-cluster mode for configuring and enabling a MapReduce Tracer monitor for a Hadoop cluster. The command either accesses an existing monitor configuration or creates a monitor.

Monitor-hadoop-cluster configuration mode is not a group change mode; running-config is changed immediately upon entering commands. Exiting monitor-hadoop-cluster mode does not affect running-config. The exit command returns the switch to monitor-hadoop configuration mode.

The configuration mode monitor is enabled by no shutdown (Monitor Hadoop Cluster). Enabling a monitor also requires that MapReduce Tracer is globally enabled (no shutdown (Monitor-Hadoop)).

The no cluster and default cluster commands remove the specified Hadoop cluster configuration from running-config.

Command Mode
Monitor-hadoop Configuration

Command Syntax
cluster cluster_name
no cluster cluster_name
default cluster cluster_name

Parameters
• cluster_name Hadoop cluster name.

Related Commands
• monitor hadoop places the switch in monitor-hadoop configuration mode.

Commands Available in Monitor-hadoop-cluster Configuration Mode
• description (Monitor Hadoop Cluster)
• interval (Monitor Hadoop Cluster)
• jobtracker (Monitor Hadoop Cluster)
• shutdown (Monitor Hadoop Cluster)
• tasktracker (Monitor Hadoop Cluster)

Examples
• These commands create the CL2 monitor and enters monitor-hadoop-cluster mode for the monitor.
  switch(config)#monitor hadoop
  switch(config-monitor-hadoop)#cluster CL2
  switch(config-monitor-hadoop-CL2)#show active
  monitor hadoop
  cluster CL2
  switch(config-monitor-hadoop-CL2)#

• These commands exit monitor-hadoop-cluster mode.
  switch(config-monitor-hadoop-CL2)#exit
  switch(config-monitor-hadoop)#show active
  monitor hadoop
  cluster CL2
  switch(config-monitor-hadoop)#
• These commands remove the CL2 monitor.

  switch(config-monitor-hadoop)#no cluster CL2
  switch(config-monitor-hadoop)#show active
  switch(config-monitor-hadoop)#
description (Monitor Hadoop Cluster)

The description command adds a text string to the configuration mode MapReduce Tracer cluster monitor. The string has no functional impact on the monitor.

The no description and default description commands remove the text string from the configuration mode monitor by removing the corresponding description command from running-config.

Command Mode

Monitor-hadoop-cluster Configuration

Command Syntax

description label_text
no description
default description

Parameters

• label_text character string assigned to the monitor configuration.

Related Commands

• cluster (Monitor Hadoop) places the switch in monitor-hadoop-cluster configuration mode.

Examples

• These commands add description text to the CL2 monitor.

switch(config)#monitor hadoop
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#description First Cluster
monitor hadoop
cluster CL2
description First Cluster
jobtracker host 10.3.3.3 user JANE
switch(config-monitor-hadoop-CL2)#
interval (Monitor Hadoop Cluster)

The `interval` command specifies the polling interval between queries to the Hadoop cluster JobTracker specified by configuration mode statements. The switch polls a cluster’s JobTracker to update its list of active TaskTracker nodes and the statistics of jobs running in the cluster. This command controls the frequency of these polls. The default interval is 10 seconds.

The `no interval` and `default interval` commands restore the default interval of 10 seconds by removing the `interval` command from `running-config`.

**Command Mode**

Monitor-hadoop-cluster Configuration

**Command Syntax**

```
interval period
no interval
default interval
```

**Parameters**

- `period` interval (seconds) between JobTracker polls. Value ranges from 1 to 600. Default is 10.

**Related Commands**

- `cluster (Monitor Hadoop)` places the switch in monitor-hadoop-cluster configuration mode.

**Example**

- This command sets the JobTracker polling interval to 25 seconds for the CL2 cluster configuration.
  
  ```
  switch(config)#monitor hadoop
  switch(config-monitor-hadoop)#cluster CL2
  switch(config-monitor-hadoop-CL2)#interval 25
  switch(config-monitor-hadoop-CL2)#show active
  monitor hadoop
  cluster CL2
  interval 25
  switch(config-monitor-hadoop-CL2)#
  ```
jobtracker (Monitor Hadoop Cluster)

The jobtracker command specifies JobTracker access parameters for the cluster monitored by configuration mode monitor statements. A cluster’s JobTracker is located on the master node and schedules work to the cluster’s TaskTracker nodes.

Parameters required to communicate with a JobTracker include its node location (IPv4 address or hostname), RPC port, and username. The default RPC port is 8021. Location and username parameters do not have default values and must be explicitly configured. A JobTracker command that specifies a partial parameter list modifies the existing corresponding jobtracker statement in running-config.

The no jobtracker and default jobtracker commands perform the following:

- removes the jobtracker statement from running config when it lists all command parameters.
- modifies the existing jobtracker statement when it lists a subset of command parameters.

Command Mode
Monitor-hadoop-cluster Configuration

Command Syntax

```
jobtracker [LOCATION] [PORT] [USER]
no jobtracker [LOCATION] [PORT] [USER]
default jobtracker [LOCATION] [PORT] [USER]
```

All parameters can be placed in any order.

Parameters

- **LOCATION** Address or hostname of JobTracker node. Options include:
  - <no parameter> location remains undefined or unchanged from a previous configuration.
  - host ipv4_addr IPv4 address of master (JobTracker) node.
  - host hostname Hostname of master (JobTracker) node.

- **PORT** JobTracker RPC port number. Default value is 8021. Options include:
  - <No parameter> Port number remains unchanged from previous configuration.
  - rdp-port port_num Port number of master (JobTracker) node. Value ranges from 1 to 65535.

- **USER** Username that accesses JobTracker node. Options include:
  - <No parameter> username remains undefined or unchanged from previous configuration.
  - username name_string JobTracker username.

Related Commands

- cluster (Monitor Hadoop) places the switch in monitor-hadoop-cluster configuration mode.
Example

- For the CL2 cluster configuration, these commands establish a connection to the JobTracker node at 10.4.4.4 with the username **account1**. The default RPC port (8021) is implicitly specified.

  ```
  switch(config)#monitor hadoop
  switch(config-monitor-hadoop)#cluster CL2
  switch(config-monitor-hadoop-CL2)#jobtracker host 10.4.4.4 username account1
  switch(config-monitor-hadoop-CL2)#show active
  monitor hadoop
    cluster CL2
    jobtracker host 10.4.4.4 user account1
  switch(config-monitor-hadoop-CL2)#
  ```

- These commands modify the JobTracker configuration to specify an RPC port of 9000.

  ```
  switch(config-monitor-hadoop-CL2)#jobtracker rpc-port 9000
  switch(config-monitor-hadoop-CL2)#show active
  monitor hadoop
    cluster CL2
    jobtracker host 10.4.4.4 rpc-port 9000 user account1
  switch(config-monitor-hadoop-CL2)#
  ```
monitor hadoop

The `monitor hadoop` command places the switch in monitor-hadoop configuration mode for configuring MapReduce Tracer monitors. A MapReduce Tracer monitor interacts with Hadoop cluster nodes that are directly attached to the switch. Tasks that the switch can perform through this interaction include:

- compile a list of nodes in the cluster
- compile a list of jobs the nodes are running
- download progress of the running jobs

Monitor-hadoop configuration mode is not a group change mode; `running-config` is changed immediately upon entering commands. Exiting monitor-hadoop configuration mode does not affect `running-config`. The `exit` command returns the switch to global configuration mode. MapReduce Tracer is enabled in monitor-hadoop mode through the `no shutdown (Monitor-Hadoop)` command.

The `no monitor hadoop` and `default monitor hadoop` commands delete previously configured `monitor hadoop mode` configuration commands.

**Command Mode**

  Global Configuration

**Command Syntax**

- `monitor hadoop`
- `no monitor hadoop`
- `default monitor hadoop`

**Commands Available in Monitor-hadoop Configuration Mode**

- `cluster (Monitor Hadoop)`
- `shutdown (Monitor-Hadoop)`

**Examples**

- These commands place the switch in monitor-hadoop configuration mode.

```
switch(config)# monitor hadoop
switch(config-monitor-hadoop)#
```

- This command exits monitor-hadoop mode.

```
switch(config-monitor-hadoop)# exit
switch(config)#
```

- This command deletes all previously configured monitor-hadoop configuration mode commands.

```
switch(config)# no monitor hadoop
switch(config)#
```
show monitor hadoop

The `show monitor hadoop` command displays a list of jobs that are running on all monitored Hadoop clusters.

**Command Mode**

EXEC

**Command Syntax**

`show monitor hadoop`

**Example**

- This command displays the jobs that are running on all monitored clusters.

```
switch> show monitor hadoop
Last updated: 2013-10-06 18:14:23
Currently running jobs: 4

JobId    Job Name         Cluster   Maps(#/%)  Reduces(#/%)  Start Time

switch>
```
show monitor hadoop cluster all

The `show monitor hadoop cluster all` command displays configuration and connection information for all monitored Hadoop clusters.

**Command Mode**

EXEC

**Command Syntax**

`show monitor hadoop cluster all`

**Example**

- This command displays configuration and connection data for all connected Hadoop clusters.

```
switch>show monitor hadoop cluster all
Total number of clusters configured: 3

```
**show monitor hadoop cluster counters**

The `show monitor hadoop cluster counters` command displays a list of jobs running on the specified Hadoop cluster and data consumption associated with these jobs.

**Command Mode**

EXEC

**Command Syntax**

```
show monitor hadoop cluster c_name counters
```

**Parameters**

- `c_name`  Cluster name.

**Examples**

- This command displays jobs running on cluster `Cluster0`.

```
switch>show monitor hadoop cluster Cluster0 counters
Last updated: 2013-10-06 18:14:23

switch>
```
show monitor hadoop cluster history

The `show monitor hadoop cluster history` command displays all jobs that ran on the specified cluster. The list includes all jobs that ran since the switch was reloaded, the job history was cleared (clear monitor hadoop job-history), or MapReduce Tracer was enabled.

Command Mode

  EXEC

Command Syntax

  `show monitor hadoop cluster c_name history`

Parameters

  - `c_name`  Cluster name.

Examples

  - This command displays the jobs that were ran on the cluster named `Cluster0`.

    switch>`show monitor hadoop cluster Cluster0 history

    Jobs history on cluster: Cluster0

    switch>
show monitor hadoop cluster history jobs

The **show monitor hadoop cluster history jobs** command displays data about the specified job. Hadoop jobs are identified by job number and the cluster that ran the job.

Data that the command returns include job identifiers, JobTracker ID, start and stop times, and data consumption.

**Command Mode**

EXEC

**Command Syntax**

```
show monitor hadoop cluster c_name history jobs job_number
```

**Parameters**

- **c_name**  Cluster name.
- **job_number**  Job number. Value ranges from 0 to **2147483647**.

**Examples**

- This command displays information about job 1 that ran on cluster Cluster0.

```
switch>show monitor hadoop cluster Cluster0 history job 1
Job history data for job: HistoryJob1
  Cluster           : Cluster0
  Job Id            : 1
  JT Id             : 201310110013
  User              : HistoryUser1
  Job start time    : 2013-10-06 17:57:43
  Job end time      : 2013-10-08 00:31:03
Per Interface job counters:
  Interface        TaskTracker       Bytes In       Bytes Out
                 --------------          -----------        ---------
  Ethernet7        TaskTracker2      26.08GB        13.04GB

switch>
```
**show monitor hadoop cluster jobs**

The **show monitor hadoop cluster jobs** command displays a list of jobs that are running on the specified cluster.

**Command Mode**

EXEC

**Command Syntax**

```
show monitor hadoop cluster c_name jobs
```

**Parameters**

- `c_name` Cluster name.

**Examples**

- This command displays the list of jobs running on cluster `Cluster0`.

```
switch>show monitor hadoop cluster Cluster0 jobs
Last updated: 2013-10-06 18:14:23

switch>
```
show monitor hadoop cluster jobs <job number>

The `show monitor hadoop cluster jobs <job number>` command displays information about the specified job. Hadoop jobs are identified by job ID and the cluster that is running the job.

Data that the command returns include time of update, job identifiers, start times, data consumption, and completion progress.

Command Mode

EXEC

Command Syntax

`show monitor hadoop cluster c_name jobs job_number`

Parameters

- `c_name` Cluster name.
- `job_number` Job number. Value ranges from 0 to 2147483647.

Examples

- This command displays information about job 1 that is running on cluster `Cluster0`.

  `switch>show monitor hadoop cluster Cluster0 jobs 1

</tbody>
</table>
```

switch>
**show monitor hadoop counters**

The *show monitor hadoop counters* command displays byte counter data for all jobs running on clusters for which MapReduce Tracer is configured.

**Command Mode**

EXEC

**Command Syntax**

```
show monitor hadoop counters
```

**Examples**

- This command displays byte counter data for all jobs running on clusters that the switch is accessing through MapReduce Tracer.

```
switch> show monitor hadoop counters
Last updated: 2013-10-06 18:14:23
Counters for running jobs:

<table>
<thead>
<tr>
<th>JobId</th>
<th>Job Name</th>
<th>Cluster</th>
<th>Bytes In</th>
<th>Bytes Out</th>
<th>Start Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>510002</td>

</tbody>
</table>
```

switch>
**show monitor hadoop history**

The *show monitor hadoop history* command displays jobs that ran on clusters for which MapReduce Tracer is configured. The list includes all jobs that ran since the switch was reloaded, MapReduce Tracer was enabled, or the job history was cleared (**clear monitor hadoop job-history**).

**Command Mode**

EXEC

**Command Syntax**

```text
show monitor hadoop history
```

**Example**

- This command displays data that jobs that previously ran on connected Hadoop clusters.

```text
switch>show monitor hadoop history
Job history for all clusters:

</table>
```

switch>
show monitor hadoop status

The `show monitor hadoop status` command displays system status for MapReduce Tracer.

**Command Mode**

EXEC

**Command Syntax**

`show monitor hadoop status`

**Example**

- This command displays MapReduce Tracer status for all connected clusters and TaskTrackers.

  ```
  switch>show monitor hadoop status
  Last updated: 2013-10-06 18:14:23
  Mapreduce Tracer status:
  Admin status : Enabled
  Operational status : Enabled
  Number of clusters configured : 3
  Number of local TaskTrackers : 4
  Number of jobs running locally : 4
  ```

  switch>
show monitor hadoop tasktracker all

The **show monitor hadoop tasktracker all** command displays a list of TaskTrackers that are on all monitored Hadoop clusters.

**Command Mode**

EXEC

**Command Syntax**

`show monitor hadoop tasktracker all`

**Examples**

- This command displays the TaskTrackers of all monitored clusters that are connected to the switch.

```
switch>show monitor hadoop tasktracker all
Last updated: 2013-10-06 18:14:23
All local TaskTrackers:

<table>
<thead>
<tr>
<th>Node</th>
<th>Cluster</th>
<th>IP Address</th>
<th>Interface</th>
<th>Maps</th>
<th>reduces</th>
</tr>

<td>0</td>
</tr>
</tbody>
</table>
```

switch>
show monitor hadoop tasktracker all counters

The **show monitor hadoop tasktracker all counters** command displays byte counters for the TaskTrackers of all monitored Hadoop clusters.

**Command Mode**

EXEC

**Command Syntax**

```
show monitor hadoop tasktracker all counters
```

**Examples**

- This command displays byte counter data for the TaskTrackers servicing all MapReduce Tracer Hadoop clusters.

```
switch>show monitor hadoop tasktracker all counters
Last updated: 2013-10-06 18:14:23
Counters for all TaskTrackers:

<table>
<thead>
<tr>
<th>Node</th>
<th>IP Address</th>
<th>Interface</th>
<th>Bytes Read</th>
<th>Bytes Written</th>
</tr>
</thead>
<tbody>
<tr>
<td>TaskTracker1</td>

<td>8.30GB</td>
<td>16.95MB</td>
</tr>
</tbody>
</table>

switch>
```
show monitor hadoop tasktracker counters

The show monitor hadoop tasktracker counters command displays a list of jobs running on the specified TaskTracker and output from byte counters associated with these jobs.

Command Mode
EXEC

Command Syntax
   show monitor hadoop tasktracker NODES counters

Parameters
- **NODES**  TaskTracker node access point. Options include:
  - host *hostname*  Node name.
  - interface ethernet *e_range*  Ethernet interfaces through which node connects.
  - interface port-channel *p_range*  Port channel interfaces through which node connects.

Examples
- This command displays the jobs running on the TaskTracker on the *TaskTracker1* node.

```
switch>show monitor hadoop tasktracker host TaskTracker1 counters
Last updated: 2013-10-06 18:14:23
Running job for TaskTracker: TaskTracker1
  JobId   Job Name          Cluster    Bytes In   Bytes Out  Start Time
  ------- ----------------- ---------- ---------- ----------- -------------------
     2       ShortName2        Cluster0   37.36GB    76.29MB    2013-10-06 17:37:43

show monitor hadoop tasktracker jobs

The **show monitor hadoop tasktracker jobs** command displays data about the jobs that are running on TaskTrackers located on the specified node or accessed through the listed interfaces.

Including a cluster parameter filters results to include data only from the cluster polled by the specified monitor.

**Command Mode**
EXEC

**Command Syntax**

```
show monitor hadoop tasktracker NODES jobs [CLUSTERS]
```

**Parameters**

- **NODES** TaskTracker node access point. Options include:
  - `host hostname` Node name.
  - `interface ethernet e_range` Ethernet interfaces through which node connects.
  - `interface port-channel p_range` Port channel interfaces through which node connects.

- **CLUSTERS** Hadoop cluster for which command displays data. Options include:
  - `<no parameter>` TaskTracker on specified NODE can be in any cluster.
  - `cluster c_name` TaskCluster on specified NODE must be in named cluster.

**Examples**

- This command displays data for jobs running on **TaskTracker1**.

```
switch>show monitor hadoop tasktracker host TaskTracker1 jobs
Last updated: 2013-10-06 18:14:23
Running job for TaskTracker: TaskTracker1

```
show monitor hadoop tasktracker running-tasks

The `show monitor hadoop tasktracker running-tasks` command displays progress and byte counts of tasks executed by TaskTrackers located on the specified node or accessed through the listed interfaces.

Including a cluster-ID parameter filters results to include data only from the specified cluster.

**Command Mode**
EXEC

**Command Syntax**
```
show monitor hadoop tasktracker NODES running-tasks [CLUSTERS] [JOBS]
```

**Parameters**
- **NODES** TaskTracker node access point. Options include:
  - `host hostname` Node name.
  - `interface ethernet e_range` Ethernet interfaces through which node connects.
  - `interface port-channel p_range` Port channel interfaces through which node connects.
- **CLUSTERS** Hadoop cluster for which command displays data. Options include:
  - `<no parameter>` TaskTracker on specified NODE can be in any cluster.
  - `cluster c_name` TaskCluster on specified NODE must be in named cluster.
- **JOBS** Job list. Options include:
  - `<no parameter>` all jobs.
  - `job <0 to 2147483647>` Specifies number of single job.

**Examples**
- This command displays data for tasks running on TaskTracker named `TaskTracker1`.

```
switch>show monitor hadoop tasktracker host TaskTracker1 running-tasks

switch>
show monitor hadoop tasktracker running-tasks cluster job task

The `show monitor hadoop tasktracker running-tasks cluster job task` command displays detailed data for the specified task.

**Command Mode**

EXEC

**Command Syntax**

```
show monitor hadoop tasktracker NODE running-tasks cluster name job jnum task tnum
```

**Parameters**

- **NODE** TaskTracker node access point. Options include:
  - **host hostname** Node name.
  - **interface ethernet e_range** Ethernet interfaces through which node connects.
  - **interface port-channel p_range** Port channel interfaces through which node connects.
- **name** Cluster name.
- **jnum** Job number. Value ranges from 0 to 2147483647
- **tnum** Task number. Value ranges from 0 to 2147483647

**Examples**

- This command displays data for task 1 of job 1 on **TaskTracker1** of **Cluster0**.

```
switch>show monitor hadoop tasktracker host TaskTracker1 running-tasks cluster Cluster0 job 1 task 1

**show monitor hadoop tasktracker status**

The `show monitor hadoop tasktracker status` command displays connection and activity information for the TaskTracker on the specified clusters or accessed through the specified interface. The following command formats display the listed TaskTracker information:

- `show monitor hadoop cluster c_name tasktracker status`: TaskTrackers on specified cluster.
- `show monitor hadoop tasktracker node status`: TaskTrackers on specified nodes or interfaces.
- `show monitor hadoop tasktracker all status`: all connected TaskTrackers.

**Command Mode**
EXEC

**Command Syntax**
```
show monitor hadoop cluster c_name tasktracker status
show monitor hadoop tasktracker NODES status
show monitor hadoop tasktracker all status
```

**Parameters**
- `c_name`  Cluster name.
- `NODES`  TaskTracker node access point. Options include:
  - `host hostname`  Node name.
  - `interface ethernet e_range`  Ethernet interfaces through which node connects.
  - `interface port-channel p_range`  Port channel interfaces through which node connects.

**Examples**
- This command displays connection and activity information for all TaskTrackers connected through Ethernet interfaces 7 and 8.

```
switch> show monitor hadoop tasktracker interface Ethernet7,8 status

switch>
```
show monitor hadoop traffic burst

The `show monitor hadoop traffic burst` command displays the largest data bursts for specified Hadoop cluster jobs. A data burst is the data consumed during a polling interval. The command displays input and output burst:

- Input bursts include bytes written to the host.
- Output bursts include bytes written by the host.

Command Mode

EXEC

Command Syntax

```
show monitor hadoop [CLUSTERS] traffic burst [NODE]
```

Parameters

- **CLUSTERS** Hadoop clusters for which command displays data. Options include:
  - `<no parameter>` all clusters.
  - `cluster c_name` Cluster name.
- **NODES** TaskTracker node access point. Options include:
  - `host hostname` Node name.
  - `interface ethernet e_range` Ethernet interfaces through which node connects.
  - `interface port-channel p_range` Port channel interfaces through which node connects.
Examples

- This command displays traffic burst data for all running jobs.

```plaintext
switch>show monitor hadoop traffic burst

```
**shutdown (Monitor-Hadoop)**

The `shutdown` command globally disables MapReduce Tracer on the switch. Enabling MapReduce Tracer for an individual cluster requires the feature to be globally enabled through this command and enabled for the individual cluster through the `shutdown (Monitor Hadoop Cluster)` command. By default, MapReduce Tracer is globally disabled.

The `no shutdown` command globally enables MapReduce Tracer. The `shutdown` and `default shutdown` commands globally disable MapReduce Tracer by removing the corresponding `no shutdown` command from *running-config*.

**Command Mode**

Monitor-hadoop Configuration

**Command Syntax**

```
shutdown
no shutdown
default shutdown
```

**Related Commands**

- `monitor hadoop` places the switch in monitor-hadoop configuration mode.

**Example**

- These commands globally enable MapReduce Tracer.
  ```
  switch(config)#monitor hadoop
  switch(config-monitor-hadoop)#no shutdown
  switch(config-monitor-hadoop)#show active
  monitor hadoop
  no shutdown
  switch(config-monitor-hadoop)#
  ```

- This command globally disables MapReduce Tracer.
  ```
  switch(config-monitor-hadoop)#shutdown
  switch(config-monitor-hadoop)#show active
  switch(config-monitor-hadoop)#
  ```
shutdown (Monitor Hadoop Cluster)

The `shutdown` command disables MapReduce Tracer for the configuration mode cluster. Globally disabling MapReduce Tracer (`shutdown (Monitor-Hadoop)`) also disables the function on the individual cluster. Enabling MapReduce Tracer for the cluster requires the function to be enabled globally and for the individual cluster.

The `no shutdown` command configures the MapReduce Tracer setting as `enabled` for the configuration mode cluster. The `shutdown` and `default shutdown` commands disable MapReduce Tracer for the cluster by removing the corresponding `no shutdown` command from `running-config`.

**Command Mode**

Monitor-hadoop-cluster Configuration

**Command Syntax**

```
shutdown
no shutdown
default shutdown
```

**Related Commands**

- `cluster (Monitor Hadoop)` places the switch in monitor-hadoop-cluster configuration mode.

**Example**

- These commands globally enable MapReduce Tracer, then enables it for the CL2 cluster.
  
  ```
  switch(config)#monitor hadoop
  switch(config-monitor-hadoop)#no shutdown
  switch(config-monitor-hadoop)#cluster CL2
  switch(config-monitor-hadoop-CL2)#no shutdown
  switch(config-monitor-hadoop-CL2)#show active
  monitor hadoop
  cluster CL2
  no shutdown
  switch(config-monitor-hadoop-CL2)#exit
  switch(config-monitor-hadoop)#show active
  monitor hadoop
  no shutdown
  cluster CL2
  no shutdown
  switch(config-monitor-hadoop)#
  ```

- These commands disable MapReduce Tracer for the CL2 cluster. MapReduce Tracer remains globally enabled.
  
  ```
  switch(config-monitor-hadoop)#cluster CL2
  switch(config-monitor-hadoop-CL2)#shutdown
  shutdown
  switch(config-monitor-hadoop-CL2)#show active
  monitor hadoop
  cluster CL2
  switch(config-monitor-hadoop-CL2)#exit
  switch(config-monitor-hadoop)#show active
  monitor hadoop
  no shutdown
  cluster CL2
  switch(config-monitor-hadoop)#
  ```
tasktracker (Monitor Hadoop Cluster)

The tasktracker command specifies the HTTP port for accessing TaskTrackers of the Hadoop cluster monitored through configuration mode statements. The switch compiles a list of the cluster’s TaskTracker addresses by periodically polling the cluster’s JobTracker (jobtracker (Monitor Hadoop Cluster)). The default TaskTracker HTTP port is 50060.

The no tasktracker and default tasktracker commands restore the configuration mode TaskTracker HTTP port to 50060 by removing the corresponding tasktracker command from running-config.

Command Mode
Monitor-hadoop-cluster Configuration

Command Syntax

<table>
<thead>
<tr>
<th>Command</th>
<th>Syntax</th>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>tasktracker http-port</td>
<td>port_number</td>
<td>TaskTracker HTTP port number. Value ranges from 1 to 65535. Default value is 50060.</td>
</tr>
<tr>
<td>no tasktracker http-port</td>
<td></td>
<td></td>
</tr>
<tr>
<td>default tasktracker http-port</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Parameters
- **port_num**  TaskTracker HTTP port number. Value ranges from 1 to 65535. Default value is 50060.

Related Commands
- cluster (Monitor Hadoop) places the switch in monitor-hadoop-cluster configuration mode.

Example
- These commands specify a TaskTracker HTTP port address of 51000.

  switch(config)#monitor hadoop
  switch(config-monitor-hadoop)#cluster CL2
  switch(config-monitor-hadoop-CL2)#tasktracker http-port 51000
  switch(config-monitor-hadoop-CL2)#show active
  monitor hadoop
    cluster CL2
    tasktracker http-port 51000
  switch(config-monitor-hadoop-CL2)#

- These commands restore the default TaskTracker HTTP port address of 50060.

  switch(config-monitor-hadoop-CL2)#no tasktracker http-port
  switch(config-monitor-hadoop-CL2)#show active
  monitor hadoop
    cluster CL2
  switch(config-monitor-hadoop-CL2)#show active all
  monitor hadoop
    cluster CL2
      jobtracker rpc-port 8021
      tasktracker http-port 50060
      interval 10
      shutdown
  switch(config-monitor-hadoop-CL2)#
sFlow

This chapter describes Arista’s implementation of sFlow, including configuration instructions and command descriptions. Topics covered by this chapter include:

- Section 47.1: sFlow Conceptual Overview
- Section 47.2: sFlow Configuration Procedures
- Section 47.3: sFlow Configuration Commands

47.1 sFlow Conceptual Overview

47.1.1 sFlow Technology

sFlow is a multi-vendor sampling technology that continuously monitors application level traffic flow at wire speed simultaneously on all interfaces. sFlow provides gigabit speed quantitative traffic measurements without impacting network performance.

sFlow has the following network traffic monitoring characteristics:

- sFlow provides a network view of active route usage that measures network traffic.
- sFlow is scalable to 10 Gb/s without impacting switch performance or the network load.
- sFlow is implemented on a wide range of devices, without requiring additional memory and CPU.
- sFlow is an industry standard.

An sFlow configuration consists of:

- sFlow agents, embedded on network equipment, that monitor traffic and generate data.
- sFlow collectors that receive and analyze sFlow data.

Arista switches include an sFlow agent that monitors ingress data through all Ethernet interfaces.

47.1.1.1 sFlow Agents

The sFlow agent is a software process that runs as part of the network management software within an Arista switch. It combines interface counters and flow samples into sFlow datagrams that are sent to an sFlow collector. Packets typically include flow samples and state information of the forwarding/routing table entries associated with each sample. Additional data can be gathered for entries originated by BGP.

The sFlow Agent performs minimal processing when packaging data into datagrams. Immediate data forwarding minimizes agent memory and CPU requirements.
47.1.1.2 sFlow Collector

An sFlow collector is a server that runs software that analyzes and reports network traffic. Collectors receive flow samples and counter samples respectively as sFlow datagrams from sFlow agents. Arista switches reference a collector’s IP address and UDP port as a configurable setting through a CLI command. Arista switches do not include sFlow collector software.

47.1.1.3 sFlow Data

The sFlow Agent uses two forms of sampling: statistical packet-based sampling of switched flows and time-based sampling of network interface statistics.

- **Switched flow sampling**: A sample is taken by either copying the packet’s header or extracting feature data from the packet.
- **Interface statistics sampling**: Counter sampling extracts statistics by periodically polling each data source on the device.

sFlow implements flow sampling and counter sampling as part of an integrated system. An sFlow datagram incorporates both sample types.

47.1.2 Arista sFlow Implementation

Arista switches provide a single sFlow agent instance that samples ingress traffic from all Ethernet and port channel interfaces. The switch provides two levels of settings for enabling sFlow:

- a global setting that enables packet sampling on the entire switch.
- interface settings that control sampling on individual interfaces when sFlow is globally enabled.

sFlow default settings include:

- global: sFlow and BGP sFlow export are globally disabled.
- Ethernet and port channel interfaces: sFlow is enabled on all interfaces when it is enabled globally. BGP sFlow export is likewise enabled on all interfaces when it is enabled globally.

The switch performs sFlow polling when sFlow is globally enabled. The CLI provides commands that globally disable sampling while counter polling remains enabled. Sample enabling is not controllable on individual interfaces.

The switch sends sFlow datagrams to the collector located at an IP address specified by a global configuration command. If the collector destination is not configured, the switch samples data without transmitting the resulting datagrams.

Although the CLI enforces the configured sampling rate limit, it may drop samples if it cannot handle the number of samples it receives over a specified period. Under normal operation, the maximum packet sample rate is one per 16384 packets. The CLI allows for higher sampling rates by using the `dangerous` keyword.

The switch can also be configured to allow the routing agent to export BGP information to the sFlow agent. When BGP sFlow export is enabled, sFlow will add BGP information to packets whose destination is a BGP route.

The following lists describe sFlow’s sampling behavior relative to different packet types:

- Packets that are sampled:
  - CPU
  - IP Options and MTU violations
  - Flooded packets
• Multicast packets
• Packets that are not sampled:
  • LACP frames
  • LLDP frames
  • STP BPDUs
  • IGMP packets
  • PAUSE frames
  • PIM hello packets
  • CRC error frames
  • Packets dropped by ACLs or due to VLAN violations

47.1.3 sFlow and Mirroring

The sFlow and Mirroring is supported using the same interface for both a mirroring session and sFlow at the same time. But when sFlow and mirroring is configured on the same interface, the TAP Aggregation is not supported. And when TAP Aggregation mode is enabled, the interface configured as a source for both a mirroring session and sFlow will only mirror packets, and sFlow samples are not produced.

The sFlow and Mirroring are supported on the following switch series:

However, the following switches have a limitation:

When a mirroring session and sFlow is configured on a same interface for the above devices, the following packet types are not sampled though they are sampled with only sFlow.
• STP BPDUs
• LACP frames
• LLDP frames
• OSPF packets
• PIM HELLO packets
• Packets dropped due to VLAN violations
47.2 sFlow Configuration Procedures

Implementing sFlow on an Arista switch consists of configuring the following agent parameters:

1. Collector location address.
2. Agent source address.
3. Polling interval.
4. Sampling rate.

Optionally, sFlow can be configured to include output interface and traffic class information in samples using the \texttt{sflow sample} command, and to include BGP information in samples whose destination is a BGP route using the \texttt{sflow extension bgp} command.

After configuring the sFlow agent, sampling is initiated by globally enabling sFlow on the switch.

Platform-specific Considerations

When BGP sFlow export is enabled on Arad platform switches (DCS-7280E and DCS-7500E), BGP information can be added to some sFlow packets with ECMP destinations. See \texttt{Enabling BGP sFlow Export} for details.

DCS-7500E switches use actual hardware egress port information in sFlow packets. All other platforms use software simulation to determine the egress port.

Configuring the Collector Location

The \texttt{sflow destination} command specifies the IP address and UDP port of an sFlow collector. The switch supports multiple collectors.

Example

```
switch(config)#sflow destination 10.42.15.12 6100
switch(config)#sflow destination 10.52.12.2 6343
```

Configuring the Agent Source Address

The \texttt{sflow source} command specifies the source address that the switch places in all sFlow datagrams that it sends to the collector. This address is normally set to an IP address configured on the switch.

Example

```
switch(config)#sflow source 10.2.9.21
```

The \texttt{sflow source-interface} command can be alternatively used to specify the interface from which an IP address is derived that the switch places in all sFlow datagrams that it sends to the collector. This address is normally set to an IP address configured on the switch.

Example

```
switch(config)#sflow source-interface vlan 25
```

running-config cannot simultaneously contain sflow source and sflow source-interface commands.

Configuring the Polling Interval

The sflow polling-interval command specifies the interval for sending counter data to the sFlow collector. The default interval is two seconds.

Example

- This command configures the switch to send sFlow data every ten seconds.

```
switch(config)#sflow polling-interval 10
switch(config)#
```

Configuring the Sampling Rate and Sample Contents

The sflow sample command sets the packet sampling rate. Packets are sampled at random intervals to avoid inaccurate sampling of periodic events. A rate of 16384 corresponds to an average sample of one per 16,384 packets. The default rate is 1048576.

Example

- This command configures the sFlow sampling rate as 65536 (one per 65,536 packets).

```
switch(config)#sflow sample 65536
switch(config)#
```

The sflow sample command can also optionally configure sample packets to include information about the traffic class of the sample. Traffic class is communicated by rewriting the DSCP field in the sample packet.

By default, samples include information about the output interface. To remove this information, use the [no] sflow sample output interface command.

- These commands configure sFlow to include traffic class information in samples but to exclude output interface data.

```
switch(config)#no sflow sample output interface
switch(config)#sflow sample rewrite dscp
switch(config)#
```

Enabling BGP sFlow Export

The sflow extension bgp command enables BGP sFlow export. When it is enabled, the routing agent will export the BGP routing table and autonomous system path information to the sFlow agent. When sFlow receives a sampled packets whose destination is a BGP route, it will look up the following additional BGP routing information and include it in the sample:

- next hop IP
- AS numbers
- AS system path to the destination
- communities
- local pref

On Arad platform switches (DCS-7280E and DCS-7500E), BGP sFlow export will also add the above BGP information to sample packets with ECMP destination routes unless they exit the switch via a trunk port or subinterface. When egress port is a trunk port or subinterface, the sample packet will only include AS path information from the first path of the ECMP route and a BGP next hop of “0.”
On all other switch platforms, ECMP destination routes will include AS path information from the first path, but will identify the BGP next hop as “0.”

**Note**
A BGP instance must be configured on the switch for BGP sFlow export to operate. See the “Border Gateway Protocol (BGP)” chapter for details.

### Example
- These commands configure a BGP instance in AS 50 and enable BGP sFlow export globally.

```
switch(config)#router bgp 50
switch(config-router-bgp)#exit
switch(config)#sflow extension bgp
switch(config)#
```

### Extended Switch and Router Information
By default, extended switch and router information is added to sFlow sample packets.

Extended switch information includes the following:
- source and destination VLANs and priorities

Extended router information includes the following:
- IP version and address of next-hop router
- source and destination mask lengths

The `no sflow extension switch` and `no sflow extension router` commands prevent the addition of extended switch and router information to sFlow sample packets.

### Example
- These commands prevent extended switch and router information from being added to sFlow sample packets.

```
switch(config)#no sflow extension switch
switch(config)#no sflow extension router
switch(config)#
```

### Enabling sFlow
The `sflow run` command globally enables sFlow on the switch. The `sflow enable` command controls sFlow operation on Ethernet and port channel interfaces when sFlow is globally enabled. The `sflow enable` command has no effect when sFlow is globally disabled.

### Example
- These commands enable sFlow on the switch, then disables sFlow on Ethernet interface 10.

```
switch(config)#sflow run
switch(config)#interface ethernet 10
switch(config-if-Et10)#no sflow enable
switch(config)#
```
47.3 sFlow Configuration Commands

This section contains descriptions of sFlow commands.

Global Configuration Commands
- sflow extension bgp
- sflow extension router
- sflow extension switch
- sflow destination
- sflow polling-interval
- sflow run
- sflow sample
- sflow source
- sflow source-interface

Interface Configuration Commands
- sflow enable

Privileged EXEC Command
- clear sflow counters

sFlow Display Commands
- show sflow
- show sflow interfaces
clear sflow counters

The clear sflow counters command resets the global sFlow statistics, which includes the number of samples and sample pool. The hardware trigger count is not reset.

The show sflow command displays global sFlow statistics.

Command Mode
Privileged EXEC

Command Syntax
  clear sflow counters

Example
• This command resets the sFlow counters.
  switch#clear sflow counters
  switch#
sflow extension bgp

The sflow extension bgp command enables BGP export to sFlow. When enabled, this feature the routing agent will export the BGP routing table and autonomous system path information to the sFlow agent. When sFlow receives a sampled packets whose destination is a BGP route, it will look up the following additional BGP routing information and include it in the sample:

- next hop IP
- AS numbers
- AS system path to the destination
- communities
- local pref

The no sflow extension bgp and default sflow extension bgp commands disable BGP export to sFlow by deleting the corresponding sflow extension bgp command from running-config.

Note

A BGP instance must be configured on the switch for BGP sFlow export to operate. See the “Border Gateway Protocol” chapter for details.

Command Mode

Global Configuration

Command Syntax

sflow extension bgp
no sflow extension bgp
default sflow extension bgp

guidelines

BGP sFlow export behaves differently on different switch platforms as follows:

- DCS-7500E switches use actual hardware egress port information in sFlow packets. All other platforms use software simulation to determine the egress port.
- On Arad platform switches (DCS-7280E and DCS-7500E), BGP sFlow export works for sample packets with ECMP destination routes unless they exit the switch via a trunk port or subinterface. When egress port is a trunk port or subinterface, the sample packet will only include AS path information from the first path of the ECMP route and a BGP next hop of “0.”
- On all other switch platforms, ECMP destination routes will include AS path information from the first path, but will identify the BGP next hop as “0.”
- DCS-7500E switches use actual hardware egress port information in sFlow packets. All other platforms use software simulation to determine the egress port.

Example

- These commands configure a BGP instance in AS 50 and enable BGP sFlow export globally.

```bash
switch(config)#router bgp 50
switch(config-router-bgp)#exit
switch(config)#sflow extension bgp
switch(config)#
```
sflow extension router

By default, the switch provides extended router information in sFlow packets, including the IP version and address of the next-hop router and source and destination mask lengths.

The no version of the sflow extension router command prevents this information from being included in sFlow packets.

The sflow extension router and default sflow extension router commands restore the default behavior by deleting the corresponding no sflow extension router command from running-config.

Command Mode
Global Configuration

Command Syntax
- sflow extension router
- no sflow extension router
- default sflow extension router

Example
- This command prevents the switch from including extended router information in sFlow packets.

switch(config)#no sflow extension router
switch(config)#
sflow extension switch

By default, the switch provides extended switch information in sFlow packets, including source and destination VLANs and priorities.

The no version of the sflow extension switch command prevents this information from being included in sFlow packets.

The sflow extension switch and default sflow extension switch commands restore the default behavior by deleting the corresponding no sflow extension switch command from running-config.

Command Mode
Global Configuration

Command Syntax

sflow extension switch
no sflow extension switch
default sflow extension switch

Example

• This command prevents the switch from including extended switch information in sFlow packets.

  switch(config)#no sflow extension switch
  switch(config)#
sflow destination

The sflow destination command specifies an sFlow collector IP address and UDP port. The switch supports sFlow collector addresses through multiple sflow destination commands in running-config.

The no sflow destination and default sflow destination commands remove the specified sFlow collector IP address by deleting the corresponding sflow destination command from running-config.

Command Mode
   Global Configuration

Command Syntax
   sflow destination dest_addr [UDP_PORT]
   no sflow destination dest_addr [UDP_PORT]
   default sflow destination dest_addr [UDP_PORT]

Parameters
   • dest_addr sflow collector’s IP address.
   • UDP_PORT sFlow collector’s data reception port. Options include:
     • <No parameter> port number 6343 (default).
     • port_num port number. Value ranges from 0 to 65535.

Example
   • This command configures the switch to send sFlow data to the collector located at 10.42.15.12; the collector receives the data through UDP port 6100.

     switch(config)#sflow destination 10.42.15.12 6100
     switch(config)#
sflow enable

The **sflow enable** command enables sFlow on the configuration mode interface when sFlow is globally enabled. By default, sFlow is enabled on all interfaces when sFlow is globally enabled (**sflow run**). The **sflow enable** command is required only when **running-config** contains a **no sflow enable** statement for the specified interface.

The **no sflow enable** command disables sFlow on the configuration mode interface. When sFlow is globally disabled, this command persists in **running-config** but has no effect on switch operation.

The **default sflow enable** command removes the corresponding **no sflow enable** command from **running-config**, enabling sFlow capability on the interface.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

**Command Syntax**

- `sflow enable`
- `no sflow enable`
- `default sflow enable`

**Examples**

- These commands enable sFlow on the switch and disable sFlow on Ethernet interface 12.

  ```
  switch(config)#sflow run
  switch(config)#interface ethernet 12
  switch(config-if-Et12)#no sflow enable
  switch(config-if-Et12)#
  ```

- This command removes the **no sflow enable** command for Ethernet interface 12 from **running-config**, enabling sFlow on the interface whenever sFlow is globally enabled.

  ```
  switch(config-if-Et12)#sflow enable
  switch(config-if-Et12)#
  ```
sflow polling-interval

The **sflow polling-interval** command specifies the counter's polling interval. The switch uses this interval to schedule a port's counter data transmissions to the sFlow collector.

The default interval is two seconds.

The **no sflow polling-interval** and **default sflow polling-interval** commands revert the polling interval to the default of two seconds by removing the **sflow polling-interval** command from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

```
sflow polling-interval interval_period
no sflow polling-interval
default sflow polling-interval
```

**Parameters**

- **interval_period** polling interval (seconds). Value ranges from 0 to 3600 (60 minutes). Default is 2.

**Example**

- This command configures the switch to send sFlow counter data every ten seconds.

```
switch(config)#sflow polling-interval 10
switch(config)#
```
sflow run

The `sflow run` command globally enables sFlow on the switch. The default sFlow global setting is `disabled`. sFlow cannot be enabled on individual interfaces when it is globally disabled.

The `sflow enable` interface configuration command controls sFlow operation on individual Ethernet and port channel interfaces when sFlow is globally enabled. When sFlow is enabled globally, sFlow is also enabled on all interfaces by default.

The `no sflow run` and `default sflow run` commands globally disable sFlow on the switch.

Command Mode
- Global Configuration

Command Syntax
```
sflow run
no sflow run
default sflow run
```

Examples
- This command enables sFlow on the switch.
  ```
  switch(config)#sflow run
  switch(config)#
  ```
- This command globally disables sFlow.
  ```
  switch(config)#no sflow run
  switch(config)#
  ```
**sflow sample**

The **sflow sample** command sets the packet sampling rate. Packets are sampled at random intervals to avoid inaccurate sampling of periodic events; the packet sampling rate defines the average number of ingress packets that pass through an interface for every packet that is sampled. A rate of 16384 corresponds to an average sample of one per 16,384 packets. The switch may drop samples if it cannot handle the configured sample rate. Under normal operation, the maximum packet sample rate is one per 16384 packets. Higher sampling rates can be specified with the **dangerous** option.

By default, samples include information about the output interface. To remove this information, use the **[no]** sflow sample output interface command.

The **sflow sample** command can also optionally configure sample packets to include information about the traffic class of the sample. Traffic class is communicated by rewriting the DSCP field in the sample packet.

The **no sflow sample** and **default sflow sample** commands reset the packet sampling rate to the default of 1,048,576 and remove output interface and traffic class information from samples by removing the **sflow sample** command from the configuration.

**Command Mode**

Global Configuration

**Command Syntax**

```
  sflow sample  SAMPLE_RATE  [rewrite dscp]
  no sflow sample
  default sflow sample
```

**Parameters**

- **SAMPLE_RATE**  size of the packet sample from which one packet is selected. Default sample size is 1048576 packets. Options include:
  - **recommended_rate**  integer between 16384 to 16777215.
  - **dangerous any_rate**  permits overriding the recommended range of sampling rates. The **any_rate** value range varies by platform:
    - **fm6000**  1 to 65535
    - **trident**  1 to 16777216
  - **rewrite dscp**  configures sFlow to rewrite the DSCP field of sample packets to indicate the traffic class of the original packet.

**Examples**

- This command configures the sFlow sampling rate as 65536 (one per 65,536 packets).
  ```
  switch(config)#sflow sample 65536
  switch(config)#
  ```

- This command configures the sFlow sampling rate as 256 (one per 256 packets).
  ```
  switch(config)#sflow sample dangerous 256
  switch(config)#
  ```

- This command configures sFlow to include traffic class information in samples.
  ```
  switch(config)#sflow sample rewrite dscp
  switch(config)#
  ```
[no] sflow sample output interface

By default, sFlow samples include information about the output interface of the sampled packet. The no sflow sample output interface command prevents sFlow from including that information.

**Command Mode**

Global Configuration

**Command Syntax**

```
no sflow sample output interface
```

**Examples**

- This command configures sFlow to not include output interface information in samples.

```
switch(config)#no sflow sample output interface
switch(config)#
```
**sflow source**

The `sflow source` command specifies the address that is listed as the source in all sFlow datagrams that the switch sends to the collector. The source address is normally set to an IP address configured on the switch. This command cannot be used if `running-config` contains an `sflow source-interface` command.

The `no sflow source` and `default sflow source` commands remove the `sflow source` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
sflow source source_addr
no sflow source
default sflow source
```

**Parameters**

- `source_addr` source IP address (dotted decimal notation).

**Example**

- This command configures 10.2.9.21 as the sFlow source address.

```
switch(config)#sflow source 10.2.9.21
switch(config)#
```
**sflow source-interface**

The `sflow source-interface` command specifies the interface from which the sFlow source IP address is derived. The switch enters the interface’s IP address as the source in sFlow datagrams that it sends to the collector. This command cannot be used if `running-config` contains an `sflow source` command.

The `no sflow source-interface` and `default sflow source-interface` commands remove the `sflow source-interface` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
sflow source-interface INT_NAME
no sflow source-interface
default sflow source-interface
```

**Parameters**

- `INT_NAME` Interface type and number. Options include:
  - `interface ethernet e_num` Ethernet interface specified by `e_num`.
  - `interface loopback l_num` Loopback interface specified by `l_num`.
  - `interface management m_num` Management interface specified by `m_num`.
  - `interface port-channel p_num` Port-Channel Interface specified by `p_num`.
  - `interface vlan v_num` VLAN interface specified by `v_num`.

**Example**

- This command configures the sFlow source address as the IP address assigned to the loopback 0 interface.

  ```
  switch(config)#sflow source-interface loopback 0
  switch(config)#
  ```
**show sflow**

The `show sflow` command displays configured sFlow parameters, operational status, and statistics. The `show sflow interfaces` command displays the interfaces where sFlow is enabled.

**Command Mode**

EXEC

**Command Syntax**

```
show sflow [detail]
```

**Parameters**

- `detail` adds hardware sampling status and number of discarded samples to the information displayed.
Examples

- This command displays the base sFlow information.

```bash
switch#show sflow

show sflow interfaces

The **show sflow interfaces** command displays the interfaces where sFlow is enabled.

The **show sflow** command displays configured sFlow parameters, operational status, and statistics.

**Command Mode**

EXEC

**Command Syntax**

```
show sflow interfaces
```

**Examples**

- This command displays the show sflow interface message when sFlow is globally disabled.
  ```
  switch#show sflow interfaces
  sFlow Interface (s):
  --------------------
  sFlow is not running
  ```

- This command displays the show sflow interface message when sFlow is globally enabled and enabled on all interfaces.
  ```
  switch(config)#sflow run
  switch(config)#show sflow interfaces
  Default sFlow configuration for an interface: Disable
  sFlow Interface (s):
  --------------------
  Ethernet1 - running(Counter)
  Ethernet2 - running(Counter)

  Ethernet4 - running(Flow,Counter)
  Ethernet5 - running(Flow,Counter)
  ```
Sampled Flow Tracking

This chapter describes Arista's implementation of sampled flow tracking, including configuration instructions and command descriptions. Topics covered by this chapter include:

- Section 48.1: Sampled Flow Tracking Overview
- Section 48.2: Configuring Sampled Flow Tracking
- Section 48.3: Sampled Flow Tracking Configuration Examples
- Section 48.4: Sampled Flow Tracking Commands
48.1 Sampled Flow Tracking Overview

Network administrators require access to flow information that passes through various network elements to analyze and monitor networks. Sampled flow tracking provides access to IP flow information by sampling traffic flows in ingress direction on the interfaces on which it is configured. The samples are then used to create flow records that are exported to the configured collectors in the Internet Protocol Flow Information Export (IPFIX) format.

Sampled flow tracking terminology:

- **Flow tracker**: It is a collection of interfaces that collect samples and create flow records. The flow tracker has one or more exporters.
- **Exporter**: It sends flow records to one or more collectors.
- **Collector**: It receives flow records from one or more exporters.
- **Data record**: It contains values of the parameters corresponding to a template record.
- **Template record**: It defines the structure and interpretation of fields in a data record. It is an ordered sequence of type and length pairs.
- **Options template record**: It is a type of template record that defines the structure and interpretation of fields in a data record, including how to scope the applicability of the data record.

Data records are created based on the following flow key fields: source IP address, destination IP address, IP protocol, source port, destination port, VRF, and VLAN. These records support IPv4 flow data record and IPv6 flow data record.

Sampled flow tracking supports the following options data records:

- **VRF record**: mapping of VRF ID to VRF name.
- **Interface record**: mapping of interface ID to interface name.
- **Flow key indicator record**: mapping of template ID to flow key indicator.
- **Flow tracker record**: contains information about configured flow tracker.

48.1.1 Sampled Flow Tracking Limitations

The limitations of Sampled flow tracking are:

- Sampled flow tracking is active only when sFlow is disabled on the device.
- Sampled flow tracking does not support export of IPFIX messages over ECMP paths.
- Sampled flow tracking route simulation is not supported for ECMP paths.
48.2 Configuring Sampled Flow Tracking

These sections describe sampled flow tracking configurations.

48.2.1 Configuring Sampled Flow Tracking

Use the `flow tracker sampled` command to enable sampled flow tracking on a tracker. Each tracker should have a minimum of one exporter configured.

**Example**

This command enables sampled flow tracking on an interface `Eth1` and the flow tracker `ftr1`.

```
switch(config)# interface Eth1
switch(config-if-Et1)# flow tracker sampled ftr1
```

Use the `sample` command to enable the sample rate for a specific sampled flow tracker. The default sample rate is 1048576.

**Example**

These commands configure a sample rate of 1024 for the sampled flow tracker.

```
switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)#sample 1024
```

48.2.2 Configuring the Sampled Flow Tracker

Use the `tracker` command to configure a sampled flow tracker for a device.

**Example**

This command configures a sampled flow tracker named `ftr1`.

```
switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
```

Use the `record export on interval` command to configure the interval at which active flow records are exported. The default interval is 300000 milliseconds.

**Example**

These commands configure an active record interval of 7000 for the exporter `exp1`.

```
switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)#tracker ftr1
switch(config-ftr-sampled-tr-ftr1)#exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)#record export on interval 7000
```

Use the `record export on inactive timeout` command to configure the interval at which timed-out inactive flow records are exported. The default interval is 15000 milliseconds.

**Example**

These commands configure an inactive record interval of 4000 for the exporter `exp1`.

```
switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)#tracker ftr1
switch(config-ftr-sampled-tr-ftr1)#exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)#record export on inactive timeout 4000
```
48.2.3 Configuring Exporter for Sampled Flow Tracker

Use the `exporter` command to configure or unconfigure an exporter for a specific tracker.

Example

This command configures exporter `exp1` for the specific tracker `ftr1`.

```
switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
switch(config-ftr-sampled-tr-ftr1)# exporter exp1
```

Use the `collector` command to configure the collector for the specific exporter.

Example

These commands configure a collector for the IPv4 address 192.0.2.0 and collector port number 10.

```
switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
switch(config-ftr-sampled-tr-ftr1)# exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)# collector 192.0.2.0 port 10
```

Use the `local interface` command to configure the local source interface for the specific exporter.

Example

These commands configure the local source interface `Ethernet1` for the exporter `exp1`.

```
switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
switch(config-ftr-sampled-tr-ftr1)# exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)# local interface Ethernet1
```

Use the `dscp` command to configure the DSCP value for the specific exporter. The default DSCP value is 0.

Example

These commands configure a DSCP value of 10 for the exporter `exp1`.

```
switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
switch(config-ftr-sampled-tr-ftr1)# exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)# dscp 10
```

Use the `format ipfix version` command to configure the IPFIX version and maximum packet size for the specific exporter. The default IPFIX version is 10 and the default maximum packet size is 9152.

Example

These commands configure an IPFIX version of 10 and a maximum packet size of 854 for the exporter `exp1`.

```
switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
switch(config-ftr-sampled-tr-ftr1)# exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)# format ipfix version 10 max-packet-size 854
```

Use the `template interval` command to configure the interval at which templates are exported for the specific exporter. The default template interval is 3600000 milliseconds.
Example

This command configures the interval of 3400000 milliseconds for the exporter \textit{exp1}.

\begin{verbatim}
switch(config-ftr-sampled-tr-exp-ftr1-exp1)# template interval 3400000
\end{verbatim}
48.3 Sampled Flow Tracking Configuration Examples

This section describes the command configurations required to configure sampled flow tracking.

48.3.1 Sampled Flow Tracking Basic Configuration

The following commands enable a basic configuration.

**Step 1** Enable configuration mode for the sampled flow tracking on a device.

```
switch(config)#flow tracking sampled
```

**Step 2** Configure a sampled flow tracker for a device.

```
switch(config-flow-tracking-sampled)# tracker ftr1
```

**Step 3** Configure an exporter for the specific tracker.

```
switch(config-ftr-sampled-tr-ftr1)# exporter exp1
```

**Step 4** Configure the collector for the specific exporter.

```
switch(config-ftr-sampled-tr-ftr1-exp-exp1)#collector 172.31.22.131
```

**Step 5** Configure the local source interface Ethernet1 for the specific exporter.

```
switch(config-ftr-sampled-tr-ftr1-exp-exp1)#local interface Ethernet1
```

**Step 6** Enable sampled flow tracking.

```
switch(config-ftr-sampled-tr-ftr1-exp-exp1)#no shutdown
```

**Step 7** Configure the interface Ethernet2 for the specific exporter.

```
switch(config)#interface Ethernet2
```

**Step 8** Configure the sampled flow tracker on the interface Ethernet2.

```
switch(config)#interface Ethernet2
switch(config-if-Et2)# flow tracker sampled ftr1
```
48.4 Sampled Flow Tracking Commands

This section contains descriptions of Sampled flow tracking commands.

Configuration Commands
- collector
- dscp
- exporter
- flow tracking sampled
- format ipfix version
- local interface
- record export on inactive timeout
- record export on interval
- sample
- shutdown (sampled flow tracking)
- template interval
- tracker

Interface Configuration Command
- flow tracker sampled

Privileged EXEC Command
- clear flow tracking sampled counters

Sampled Flow Tracking Display Commands
- show flow tracking sampled
- show flow tracking sampled counters
- show flow tracking sampled flow-table
- show flow tracking sampled ipfix options-table
- show flow tracking sampled ipfix template
clear flow tracking sampled counters

The clear flow tracking sampled counters command clears the flow tracking counters for all trackers, a specified tracker, or a specified tracker and exporter.

Command Mode
Privileged EXEC

Command Syntax
   clear flow tracking sampled counters [tracker tracker_name [exporter exporter_name]]

Parameters
- **tracker tracker_name**  Specifies the flow tracker.
- **exporter exporter_name**  Specifies the exporter.

Example
- This command clears the flow counters for the tracker *ftr1* and exporter *exp1*.
  
  switch#clear flow tracking sampled counters tracker ftr1 exporter exp1
  switch#
collector

The **collector** command configures a collector to receive flow records from a specified exporter. The **no collector** and **default collector** commands remove the configured collector from **running-config**.

**Command Mode**

Sampled Flow Tracking Exporter Configuration

**Command Syntax**

```
collector {ipv4_address | ipv6_address} [port port_number]
no collector {ipv4_address | ipv6_address} [port port_number]
default collector {ipv4_address | ipv6_address} [port port_number]
```

**Parameters**

- **ipv4_address** Specifies the IPv4 address of the collector.
- **ipv6_address** Specifies the IPv6 address of the collector.
- **port port_number** Specifies the port number for the collector. Values range from 1 to 65535. The default value is 4739.

**Example**

- These commands configure a collector for the IPv4 address 192.0.2.0 and collector port number 10.

```
switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)#tracker ftr1
switch(config-ftr-sampled-tr-ftr1)#exporter expl
switch(config-ftr-sampled-tr-ftr1-exp-expl)#collector 192.0.2.0 port 10
switch(config-ftr-sampled-tr-ftr1-exp-expl)#exit
switch(config-ftr-sampled-tr-ftr1)#exit
switch(config-flow-tracking-sampled)#exit
switch(config)#
```
**dscp**

The `dscp` command configures the Differentiated Services Code Point (DSCP) value for a specific exporter.

The `no dscp` and `default dscp` commands reset the DSCP value to the default of 0.

**Command Mode**
Sampled Flow Tracking Exporter Configuration

**Command Syntax**

```plaintext
dscp  dscp_value  
no dscp  
default dscp
```

**Parameters**

- `dscp_value` the DSCP value assigned to the exporter. Value ranges from 0 to 63. Default value is 0.

**Example**

- These commands configure a DSCP value of 10 for the exporter “exp1.”

```plaintext
switch(config)#flow tracking sampled  
switch(config-flow-tracking-sampled)#tracker ftr1  
switch(config-ftr-sampled-tr-ftr1)#exporter expl  
switch(config-ftr-sampled-tr-ftr1-exp-exp1)#dscp 10  
switch(config-ftr-sampled-tr-ftr1-exp-exp1)#exit  
switch(config-ftr-sampled-tr-ftr1)#exit  
switch(config-flow-tracking-sampled)#exit  
switch(config)#
```
exporter

The exporter command places the switch in sampled flow tracking exporter configuration mode for the specified exporter and creates the exporter if it does not yet exist.

The no exporter and default exporter commands remove the specific exporter from running-config.

Command Mode
Sampled Flow Tracking Tracker Configuration

Command Syntax
  exporter  exporter_name
  no exporter  exporter_name
  default exporter  exporter_name

Parameters
  - exporter_name  the name of the exporter.

Example
  - These commands create exporter "exp1" for the flow tracker "ftr1" and place the switch in configuration mode for that exporter.

    switch(config)#flow tracking sampled
    switch(config-flow-tracking-sampled)#tracker ftr1
    switch(config-ftr-sampled-tr-ftr1)#exporter exp1
    switch(config-ftr-sampled-tr-ftr1-exp-exp1)#
**flow tracker sampled**

The `flow tracker sampled` command configures an interface to be part of a flow tracker. An interface can belong to only one flow tracker.

The `no flow tracker sampled` and `default flow tracker sampled` commands remove the specified interface from the specified tracker.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

```
flow tracker sampled tracker_name
no flow tracker sampled tracker_name
default flow tracker sampled tracker_name
```

**Parameters**

- `tracker_name` the name of the flow tracker to which the interface is to be added.

**Example**

- This command configures Ethernet interface 1 to participate in the flow tracker “ftr1.”

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# flow tracker sampled ftr1
switch(config-if-Et1)#
```
flow tracking sampled

The flow tracking sampled command places the switch in sampled flow tracking configuration mode. Sampled flow tracking configuration mode is a group-change mode; changes made in a group-change mode are saved by exiting the mode.

The no flow tracking sampled and default flow tracking sampled commands remove all sampled flow tracking configuration from running-config.

Command Mode

Global Configuration

Command Syntax

flow tracking sampled
no flow tracking sampled
default flow tracking sampled

Commands Available in Sampled Flow Tracking Configuration Mode

- abort  exits mode without saving changes
- exit   exits mode and saved changes
- sample configures sample parameters
- shutdown (sampled flow tracking) enables or disables sampled flow tracking
- tracker configures a flow tracker

Example

- This command places the switch in sampled flow tracking configuration mode.

switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)#
format ipfix version

The `format ipfix version` command configures the IPFIX version and maximum packet size for a specific exporter.

The `no format ipfix version` and `default format ipfix version` commands remove the previously configured IPFIX version and the maximum packet size value from `running-config`.

**Command Mode**
Sampled Flow Tracking Configuration

**Command Syntax**

```
format ipfix version ipfix_version [max-packet-size max-packet-size value]
no format ipfix version ipfix_version [max-packet-size]
default format ipfix version ipfix_version [max-packet-size]
```

**Parameters**

- `ipfix_version`  the IPFIX version. Default value is 10.
- `max-packet-size max-packet-size value`  the IPFIX maximum packet size. Value ranges from 512 to 65472. Default value is 9152.

**Example**

- These commands configure an IPFIX version of 10 and a maximum packet size of 854 for the exporter `exp1`.
  
  switch(config)# flow tracking sampled
  switch(config-flow-tracking-sampled)# tracker ftrl
  switch(config-ftr-sampled-tr-ftrl)# exporter expl
  switch(config-ftr-sampled-tr-ftrl-exp-exp1)# format ipfix version 10
  max-packet-size 854
**local interface**

The **local interface** command configures the local source interface for the specific exporter.

The **no local interface** and **default local interface** commands remove the local interface for the specific exporter from **running-config**.

**Command Mode**
Sampled Flow Tracking Configuration

**Command Syntax**

```
local interface interface
no local interface
default local interface
```

**Parameters**

- **interface** Interface type and numbers. Options include:
  - **Ethernet eth_num** displays the information of the specified Ethernet interface. The value ranges from 1 to 64.
  - **Loopback lb_num** displays the information of the specified loop back interface. The value ranges from 0 to 2100.
  - **Management m_num** displays the information of the specified Management interface. The management port number ranges from 1 to 2.
  - **Port-Channel pc_num** displays the interface or sub-interface information of the specified port channel. The interface and sub-interface values of port channel ranges from <1-1000> and <1-2000>.<1-2000>.<1-4094> respectively.
  - **Tunnel t_num** displays the information of the specified tunnel. The value ranges from 0 to 255.
  - **Vlan vlan_num** displays the information of the specified VLAN interface. The value ranges from 1 to 4094.

**Example**

These commands configure the local source interface **Ethernet1** for the exporter **exp1**.

```
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftrl
switch(config-ftr-sampled-tr-ftrl)# exporter exp1
switch(config-ftr-sampled-tr-ftrl-exp-exp1)# local interface Ethernet1
```
record export on inactive timeout

The record export on inactive timeout command configures the interval at which inactive flow records time out and are exported for a flow tracker.

The no record export on inactive timeout and default record export on inactive timeout commands remove the timeout interval from running-config.

Command Mode
   Sampled Flow Tracking Configuration

Command Syntax
   record export on inactive timeout timeout_value
   no record export on inactive timeout
   default record export on inactive timeout

Parameters
   - timeout_value the flow record inactive export timeout value in milliseconds. Value ranges from 3000 to 900000. The default value is 15000 milliseconds.

Example
   - These commands configure an inactive record interval of 6000 for the exporter exp1.
     switch(config)# flow tracking sampled
     switch(config-flow-tracking-sampled)# tracker ftrl
     switch(config-ftr-sampled-tr-ftrl)# exporter expl
     switch(config-ftr-sampled-tr-ftrl-exp-expl)# record export on inactive timeout
     6000
record export on interval

The record export on interval command configures the interval at which active flow records are exported for a flow tracker.

The no record export on interval and default record export on interval commands remove the interval from running-config.

Command Mode
Sampled Flow Tracking Configuration

Command Syntax
record export on interval interval_value
no record export on interval
default record export on interval

Parameters
- interval_value the flow record export interval in milliseconds. Value ranges from 5000 to 36000000. The default value is 300000 milliseconds.

Example
- These commands configure an active record interval of 9000 for the exporter exp1.
  
  switch(config)# flow tracking sampled
  switch(config-flow-tracking-sampled)# tracker ftr1
  switch(config-ftr-sampled-tr-ftr1)# exporter exp1
  switch(config-ftr-sampled-tr-ftr1-exp-exp1)# record export on interval 9000
The `sample` command enables the sample rate for a specific sampled flow tracker. The `no sample` and `default sample` commands remove the sample rate configured for a specific sampled flow tracker from `running-config`.

### Command Mode
Sampled Flow Configuration

### Command Syntax
- `sample sample_rate`
- `no sample`
- `default sample`

### Parameters
- `sample_rate` the sample flow tracking rate to be assigned for a sampled flow tracker. Value ranges from 1024 to 16777216. Default value is 1048576.

### Example
- These commands configure a sample rate of 2056 for the sampled flow tracker.

```plaintext
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)# sample 2056
```
show flow tracking sampled

The **show flow tracking sampled tracker** command displays information about the status of a specific tracker and the status of a specified exporter within that tracker. If no tracker is specified in the command, then all information about all trackers is displayed.

**Command Mode**

EXEC

**Command Syntax**

```
show flow tracking sampled [tracker tracker_name [exporter exporter_name]]
```

**Parameters**

- **tracker tracker_name** the specific flow tracker.
- **exporter exporter_name** the specific exporter within the tracker.

**Examples**

- This command displays the status information of the tracker `ftr1` and the exporter `exp1`.

```
  switch# show flow tracking sampled tracker ftr1 exporter exp1
  Flow tracking status
  Type: Sampled
  Running: yes
  Sample rate: 1024
  Tracker: ftr1
  Active interval: 30000ms
  Inactive timeout: 120000ms
  Groups: IPv4, IPv6
  Exporter: exp1
  VRF: default
  Local interface: Management1 (172.30.150.179)
  Export format: IPFIX version 10, MTU 1500
  DSCP: 48
  Template interval: 3600000ms
  Collectors:
    172.31.22.131 port 4739
  Active interfaces:
    Et1
```
**show flow tracking sampled counters**

The *show flow tracking sampled counters* command displays information about the flow tracking counters of a specific tracker and the counters of a specified exporter within that tracker.

**Command Mode**

**EXEC**

**Command Syntax**

```
show flow tracking sampled counters [tracker tracker_name [exporter exporter_name]]
```

**Parameters**

- `tracker tracker_name`  the specific flow tracker.
- `exporter exporter_name`  the specific exporter within the tracker.

**Examples**

- This command displays the flow tracking counter information of the tracker `ftr1` and the exporter `exp1`.

```
switch# show flow tracking sampled counters tracker ftr1 exporter exp1
Tracker: ftr1
  1 flows, 22 RX packets
  Flows created: 1, expired: 0
  Group: IPv4
    1 flows, 22 RX packets
    Group: IPv6
      0 flows, 0 RX packets
Export: exp1 (IPFIX)
  Collector: 172.31.24.133 port 4739
    52 messages, last sent 0:00:27 ago
    0 flow records
    2350 options data records, last sent 0:00:27 ago
    6 templates, last sent 0:12:27 ago
  Collector: 172.31.22.131 port 4739
    52 messages, last sent 0:00:27 ago
    0 flow records
    2350 options data records, last sent 0:00:27 ago
    6 templates, last sent 0:12:27 ago
```
show flow tracking sampled flow-table

The **show flow tracking sampled flow-table** command displays information about the active flows maintained in the EOS.

**Command Mode**

EXEC

**Command Syntax**

```
show flow tracking sampled flow-table [detail | dst-ip | dst-port | group | interface | protocol | src-ip | src-port | tracker | vlan | vrf]
```

**Parameters**

- **detail**  displays detailed flow records.
- **dst-ip**  displays flow records based on destination IPv4 or IPv6 address.
- **dst-port**  displays flow records based on a specified destination port.
- **group**  displays flow records based on IPv4 or IPv6 flow groups.
- **interface**  displays flow records based on ingress interface.
- **protocol**  displays flow records based on the flow IP protocol.
- **src-ip**  displays flow records based on source IPv4 or IPv6 address.
- **src-port**  displays flow records based on a specified source port.
- **tracker**  displays flow records based on flow tracker.
- **vlan**  displays flow records based on a specified flow VLAN ID.
- **vrf**  displays flow records based on flow VRF.

**Examples**

- This command displays information about the active flows on the device.

```
switch# show flow tracking sampled flow-table
Tracker: ftr1, Flows: 1
Group: IPv4, Flows: 1

VRF VLAN Source Destination Protocol Start Time Pkts Bytes
---- ------ ------------- ------------- ---------- ----------------------------
red 42 10.10.1.1:0 10.20.1.2:0 UDP 2019-04-18 15:06:50 7 700
```

- This command displays detailed information about the active flows on the device.

```
switch# show flow tracking sampled flow-table detail
Tracker: ftr1, Flows: 1
Group: IPv4, Flows: 1
Flow: UDP 10.10.1.1:0 - 10.20.1.2:0, VRF: red, VLAN: 42

Packets: 15, Bytes: 1500, TOS: 0, TCP flags: none
Source MAC: 001c.73ee.0be4, Destination MAC: 001c.7374.3b85
Ingress Interface: 'Ethernet1', Egress VLAN: routed, Egress Interface: CPU
Next hop: unknown, BGP next hop: unknown (AS unknown), Source AS: unknown
Source prefix length: 24, Destination prefix length: 32
```
### show flow tracking sampled ipfix options-table

The `show flow tracking sampled ipfix options-table` command displays information about the sampled IPFIX options table available.

**Command Mode**

EXEC

**Command Syntax**

```
show flow tracking sampled ipfix options-table tracker [flow-key | flow-tracker | interface | vrf]
```

**Parameters**

- `tracker`: displays the output for a specific flow tracker.
- `flow-key`: displays the flow keys options table.
- `flow-tracker`: displays the flow tracker options table.
- `interface`: displays the interface options table.
- `vrf`: displays the VRF options table.

**Examples**

- This command displays the sampled IPFIX options table for the tracker `ftr1`.

  ```
  switch# show flow tracking sampled ipfix options-table
  Tracker: ftr1
  Observation domain: ftr1, ID: 1
  Active interval: 30sec
  Inactive timeout: 120sec
  Selector algorithm: random(3)
  Sampling: 1/1024
  Flow tracking type: sampled(1)

**show flow tracking sampled ipfix template**

The `show flow tracking sampled ipfix template` command displays information about the exported IPFIX data templates and options templates.

**Command Mode**
EXEC

**Command Syntax**
```plaintext
show flow tracking sampled ipfix template [data | options | tracker]
```

**Parameters**
- **data** displays the data templates.
- **options** displays the flow options template.
- **tracker** displays the flow tracker template.

**Examples**
- This command displays the sampled IPFIX options table for the tracker `ftr1`.

```plaintext
switch# show flow tracking sampled ipfix template
Tracker: ftr1

Data Template, Group: IPv4, Fields: 26, Template ID: 261
  ingressVRFID (234), 4 bytes
  vlanId (58), 2 bytes
  sourceIPv4Address (8), 4 bytes
  destinationIPv4Address (12), 4 bytes
  protocolIdentifier (4), 1 byte
  sourceTransportPort (7), 2 bytes
  destinationTransportPort (11), 2 bytes
  sourceMacAddress (56), 6 bytes
  postDestinationMacAddress (57), 6 bytes
  octetDeltaCount (1), 8 bytes
  packetDeltaCount (2), 8 bytes
  flowStartMilliseconds (152), 8 bytes
  flowEndMilliseconds (153), 8 bytes
  flowEndReason (136), 1 byte
  tcpControlBits (6), 2 bytes
  ingressInterfaceType (368), 4 bytes
  ingressInterface (10), 4 bytes
  postVlanId (59), 2 bytes
  egressInterface (14), 4 bytes
  ipClassOfService (5), 1 byte
  bgpSourceAsNumber (16), 4 bytes
  bgpNextHopIPv4Address (18), 4 bytes
  ipNextHopIPv4Address (15), 4 bytes
  sourceIPv4PrefixLength (9), 1 byte
  destinationIPv4PrefixLength (13), 1 byte

<--------OUTPUT OMITTED FROM EXAMPLE-------->
```
**shutdown (sampled flow tracking)**

The `shutdown` command disables sampled flow tracking for the specific exporter.
The `no shutdown` command enables sampled flow tracking for the specific exporter.

**Command Mode**
- Sampled Flow Tracking Configuration

**Command Syntax**

```
shutdown
no shutdown
default shutdown
```

**Example**
- These commands sampled flow tracking for the specific exporter `exp1`.

```
switch(config)# flow tracking sampled
switch (config-flow-tracking-sampled)# tracker ftr1
switch (config-flow-tracking-sampled)# tracker ftr1
switch (config-ftr-sampled-tr-ftr1)# exporter exp1
switch (config-ftr-sampled-tr-ftr1-exp-exp1)# local interface Ethernet1
switch (config-ftr-sampled-tr-ftr1-exp-exp1)# no shutdown
```
template interval

The template interval command configures the interval at which templates are exported for a specific exporter. The default template interval is 3600000 milliseconds.

The no template interval and default template interval commands reset the interval rate to the default.

Command Mode
Sampled Flow Tracking Configuration

Command Syntax

```
template interval interval
no template interval
default template interval
```

Parameters
- **interval**  the interval rate in milliseconds. The value ranges between 5000 and 3600000 milliseconds. The default rate is 3600000 milliseconds.

Example
- This command configures the interval of 3400000 milliseconds for the exporter exp1.

```
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
switch(config-ftr-sampled-tr-ftr1)# exporter exp1
switch(config-ftr-sampled-tr-exp-ftr1-exp1)# template interval 3400000
```
**tracker**

The `tracker` command configures a sampled flow tracker for a device.

The `no tracker` and `default tracker` commands remove the sampled flow tracker from the *running config*.

**Command Mode**

Sampled Flow Configuration

**Command Syntax**

```
tracker tracker_name
no tracker tracker_name
default tracker tracker_name
```

**Parameters**

- `tracker_name` the flow tracker name.

**Examples**

- These commands configure the sampled flow tracker `ftr1`.

  ```
  switch(config)# flow tracking sampled
  switch(config-flow-tracking-sampled)# tracker ftr1
  ```
OpenFlow

This chapter describes Arista’s OpenFlow implementation. Sections in this chapter include:

- Section 49.1: OpenFlow Introduction
- Section 49.2: OpenFlow Description
- Section 49.3: OpenFlow Configuration
- Section 49.4: OpenFlow Command Descriptions

49.1 OpenFlow Introduction

Arista EOS supports OpenFlow 1.0 controlled by OpenFlow controllers for filtering and redirecting traffic.

49.2 OpenFlow Description

OpenFlow is a programmable network protocol that manages and directs traffic among Ethernet switches, routers, and wireless access points over the network in support of Software-Defined Networking (SDN) applications. OpenFlow can be used for traffic flow management in metro, WAN, and data center networks, and also security management in enterprise and campus data center applications, and other applications with the appropriate use of OpenFlow controllers.
49.2.1 OpenFlow Controller

The Arista device supports an active controller connection for which the Arista device will initiate (seek) the TCP connection to a given OpenFlow Controller address.

Figure 49-1: Reactive and proactive modes

The controller can be any standard OpenFlow controller.

Switch consists of three parts:

- A flow table, to tell the switch how to process the flow.
- A channel that connects the switch to a remote controller, allowing commands and packets to be sent between a controller and the switch.
- The OpenFlow Protocol, which provides a way for a controller to communicate with a switch.

An OpenFlow-enabled device supports an OpenFlow Client (control plane software), which communicates with an OpenFlow Controller using the OpenFlow protocol. The OpenFlow Controller runs on a server or a server cluster. OpenFlow-enabled devices support the abstraction of a flow table, which is manipulated by the OpenFlow Controller. A flow is a collection of packets where some selected header fields match particular values for those fields. The flow table is sorted by flow priority, which is defined by the controller.

Flow table

Forwarding decisions for incoming packets are decided by a simple lookup on its flow-table entries. Packets that don’t match any flow entry are dropped by default. Every flow entry in the flow-table contains:

- Header fields to match against packets: Each entry contains a specific value, or ANY, which matches any value.

```
<table>
<thead>
<tr>
<th>Ingress Port</th>
<th>Ether Source</th>
<th>Ether Type</th>
<th>VLAN Id</th>
<th>IP Proto</th>
<th>Src Port</th>
<th>Dst Port</th>
</tr>
</thead>
</table>
```

- Counters to update for matching packet: These counters are used for statistics purposes, in order to keep track of the number of packets and bytes for each flow and the time that has elapsed since the flow initiation.

- Actions to apply to matching packets: The action specifies the way in which the packets of a flow will be processed. An action can be one of the following: 1) forward the packet to a given port or ports, after optionally rewriting some header fields, 2) drop the packet 3) forward the packet to the controller.
Channel
The channel is the interface that connects each OpenFlow switch to a controller. Through this interface
the controller exchanges messages with the switches in order to configure and manage them.

49.2.2 OpenFlow Modes

Bind modes
The switch can be configured to divide traffic entering the switch in either of two ways:

- By interface, so that only packets arriving on certain interfaces are processed by OpenFlow
  (interface bind mode, the default).
- By VLAN, so that only packets associated with certain VLAN IDs are processed by OpenFlow
  (VLAN bind mode).

Other packets are forwarded normally according to the MAC address table, filtered by ACLs, mirrored
to other ports.

Note
The hybrid mode of operation is experimental.

The switch can also be configured to apply a limited set of OpenFlow actions to any packets, regardless
of ingress interface or VLAN, as well as forward the packets normally (monitor bind mode).

Interface bind mode
When the switch is configured in interface bind mode, the ingress interface of a packet is processed
according to entries in the OpenFlow table.

Only interfaces bound to OpenFlow are mapped to OpenFlow ports and exposed to the controller via
features reply and port status messages. Output actions in flow table entries and in packet out
messages can refer only to mapped ports. Use the `show openflow ports` command to see which
interfaces the switch maps to OpenFlow ports and exposes to the controller.

- In OpenFlow configuration mode, use the `bind mode (OpenFlow)` command to select interface
  bind mode.
- In the OpenFlow configuration mode, use the bind interface command to bind one or more
  interfaces to OpenFlow.

When an interface is bound to OpenFlow, certain switch functions are disabled on the interface,
including spanning tree protocol (STP). The OpenFlow controller and application must ensure that flow
table entries do not allow traffic to loop in the network.

Only Ethernet and Port-Channel interfaces can be bound to OpenFlow. If an Ethernet interface is
configured as a member of a LAG, attempting to bind the interface to OpenFlow has no effect. However,
the Port-Channel interface of which it is a member may itself be bound to OpenFlow.

VLAN bind mode
When a packet arrives at a switch interface, the switch assigns it a VLAN for internal processing, based
on the switchport configuration of the ingress interface and on the packet's VLAN tag (if any). If the
switch is configured in VLAN bind mode, the internal VLAN determines whether the packet is
processed according to entries in the OpenFlow table and whether the packet is matched by a given
entry in the OpenFlow table. After the switch has processed the packet, the switchport configuration of
each potential egress interface controls whether the packet is transmitted tagged with the internal
VLAN ID, transmitted untagged, or filtered.
Several configuration commands affect whether packets received on a given interface are processed by OpenFlow, and whether packets directed to an interface via an OpenFlow output action are transmitted or filtered:

Use the VLAN configuration mode command to create the VLANs to be accepted by the switch and processed by OpenFlow.

In the interface configuration mode, use switchport commands to configure the interface as either an access port or a trunk port. For an access port, set the VLAN to an OpenFlow VLAN; for a trunk port, configure which OpenFlow VLANs are allowed.

In OpenFlow configuration mode, use the `bind mode (OpenFlow)` command to select VLAN bind mode, and use the `bind vlan (OpenFlow)` command to bind one or more VLANs to OpenFlow.

### Untagged packet processing in VLAN bind mode

The OpenFlow protocol also allows a flow table entry to explicitly match untagged packets, or to strip the VLAN tag from matched packets. Since the switch actually assigns a VLAN internally to packets received without a tag, the OpenFlow function on the switch must be configured with a single "native" VLAN ID in order to make sense of such flow entries. When an OpenFlow native VLAN is configured:

- A flow table entry defined to match untagged packets actually matches packets whose internal VLAN is the OpenFlow native VLAN.
- A flow table entry with a strip VLAN tag action actually sets the packet's internal VLAN to the OpenFlow native VLAN.
- Packets sent to the controller via a packet-in message are sent untagged if they are assigned to the native VLAN, and tagged otherwise.
- Untagged packets received from the controller via a packet-out message are assigned to the native VLAN.

In contrast, when no OpenFlow native VLAN is configured:

- Flow table entries defined to match untagged packets or with a strip VLAN tag action are rejected.
- All packets sent to the controller via a packet-in message are sent tagged.
- Untagged packets received from the controller via a packet-out message are dropped.

There is no explicit command to configure the OpenFlow native VLAN. To configure a VLAN as the OpenFlow native VLAN:

- Use the VLAN configuration mode command.
- Every interface handling the OpenFlow traffic, in interface configuration mode, uses switchport commands to configure the interface as either an access port or a trunk port. For an access port, set the access VLAN to N; for a trunk port, either set the native VLAN to N or configure the interface to drop untagged frames.
- In OpenFlow configuration mode, use the `bind vlan (OpenFlow)` command to assign VLAN N to OpenFlow.

Configuring two interfaces as access ports with different OpenFlow-bound VLANs, or as trunk ports with different native OpenFlow-bound VLANs, violates these constraints and causes the OpenFlow function to behave as no OpenFlow native VLAN is configured.

Use the `show openflow` command to see whether an OpenFlow native VLAN has been configured.
Spanning Tree Protocol in VLAN bind mode

STP can operate on OpenFlow-bound VLANs. The switch default STP configuration is one multiple spanning tree (MST) instance containing all VLANs, including OpenFlow-bound VLANs. When STP is configured on OpenFlow-bound VLANs, packets received from or sent to blocked ports are dropped, regardless of the rules defined in the OpenFlow flow table.

For some applications, you may want to disable STP on OpenFlow-bound VLANs. Before doing so, be sure that the OpenFlow controller and application is configured properly to manage multiple redundant paths through the network without allowing traffic to loop.

To ensure proper operation of STP on the switch and to support OpenFlow applications that inter-operate with STP, OpenFlow forwards inbound STP packets both to the spanning tree agent on the switch and to the OpenFlow controller as packet-in messages. This behavior overrides any flow table entries that might otherwise match STP packets, and is not configurable.

Monitor bind mode

Unlike interface and VLAN bind modes, monitor bind mode is tailored for specific applications. The switch both forwards traffic normally and selectively mirrors packets under OpenFlow control.

When the switch is configured in monitor bind mode, all traffic entering the switch is forwarded normally, regardless of ingress interface or internal VLAN. All Ethernet and Port-Channel interfaces are mapped to OpenFlow ports and exposed to the controller (except LAG members and mirror destination ports).

In this mode, the entire switch is bound to OpenFlow, and OpenFlow processing is applied to packets in addition to the normal forwarding behavior.

Currently the only actions that can be performed on packets in monitor bind mode are:

- Output normally
- Copy to mirror destination port

In monitor bind mode, the default action taken on packets that are not matched by any flow table entry is output normally. The switch rejects flow entries not conforming to these restrictions.

Routing Between the OpenFlow and Non-OpenFlow Domain

The switch can be configured to perform standard IP routing of traffic processed by OpenFlow. From the controller's point of view, the switch appears to have a virtual port 40000 (OpenFlowRouter) in addition to the physical ports.

Packets sent out the OpenFlowRouter port can undergo standard IP routing into a different IP subnet. After routing, those packets can either exit the switch or be processed by OpenFlow again.

49.2.2.1 Port mapping

For switches that support QSFP+ modules, a 40G interface can be configured as four 10G ports. These Ethernet interfaces are mapped to OpenFlow ports according to the formula port = M * 200 + N for EthernetM/N. For example, interface Ethernet1/1 is mapped to OpenFlow port 201; Ethernet1/2 to OpenFlow port 202, Ethernet16/1 to OpenFlow port 3201, Ethernet16/2 to OpenFlow port 3202, and so on.

When IP routing is configured, the OpenFlow Router interface is mapped to OpenFlow port 40000. Port-Channel (LAG) interfaces are mapped to OpenFlow ports according to the formula port = 40000 + N for Port-ChannelN. For example, interface Port-Channel23 is mapped to OpenFlow port 40023.
The OpenFlow virtual ports all and flood refer to all Ethernet interfaces on the switch, but normal VLAN egress policies apply: a packet tagged with a given OpenFlow-bound VLAN (or untagged, if a native OpenFlow VLAN is configured) will egress a given interface only if the interface is configured to handle traffic for that VLAN. If an interface is not configured to handle traffic for any OpenFlow-bound VLAN, then no packets sent to all or flood will egress on that interface.

49.2.2.2 Queue mapping
All multicast transmit queues that are configured to be mapped from a QoS traffic class are mapped to OpenFlow. OpenFlow-mapped queues can be used by the enqueue action in flow table entries and are included in queue stats reply messages. By default, all the multicast queues 0 to 3 are mapped.

Use the `show qos maps` command to view the current mapping of traffic class to multicast transmit queue, and use the `qos map traffic-class to mc-tx-queue` configuration command to modify it. If no traffic class is mapped to a given multicast transmit queue, the queue will not be mapped to OpenFlow and will be unavailable for use by the enqueue action.

49.2.2.3 Table size
The switch supports one flow table. OpenFlow packet processing is performed in hardware; software forwarding (via the switch CPU) is not supported.

The switch advertises the table size for the l2-match profile. This should be taken as an approximation, as other switch features such as ACLs can consume hardware resources shared with OpenFlow. If the controller attempts to add a flow entry but there are insufficient resources to implement it in hardware, the switch returns an error message.

49.2.2.4 Match fields
A flow table entry can specify an exact value or wildcard for any of the following fields:
- L2 source and destination addresses
- VLAN ID (and untagged packets, if the native OpenFlow VLAN is configured)
- VLAN priority
- L2 frame type
- IPv4 source and destination addresses with subnet masking
- IPv4 TOS/DSCP field
- IPv4 protocol
- TCP/UDP source and destination port numbers

Matching the IPv4 source or destination address within an ARP message is not supported, nor is matching the ARP opcode.

49.2.2.5 Actions
In VLAN and interface bind modes, the following flow entry actions are supported:
- Copy packet on ingress to a mirror destination port (vendor-specific extension)
- Set L2 source and destination addresses
- Set VLAN ID
- Strip VLAN tag (if the native OpenFlow VLAN is configured)
- Set VLAN priority
- Set IPv4 TOS/DSCP
• Output or enqueue to physical port (see Section 49.2.3 for restrictions on multiple output actions)
• Output or enqueue to all or flood (see Section 49.2.3)
• Output to controller (buffering not supported; entire packet contents are always sent)
• Drop (no action)
• Copy packet on egress to a mirror destination port (vendor-specific extension)

In monitor bind mode, only the following actions are supported:
• Copy packet on ingress to a mirror destination port (vendor-specific extension)
• Output per normal forwarding (this action is required in every flow entry)
• Copy packet on egress to a mirror destination port (vendor-specific extension)

### 49.2.3 OpenFlow Limitations

Consider the following when using OpenFlow:

• OpenFlow is supported on both the 7050 and 7050X series of switches.
• OpenFlow Hybrid mode is not supported.
• Output to an ingress port is silently dropped. Flow table entries with an output to ingress port action are accepted by the switch, but matching packets are not actually forwarded via the ingress port. (But for packet-out, the output to ingress port action is supported.)
• Output/enqueue actions must follow modify actions. The switch will return an error if a modify action follows an output/enqueue action.
• Each action can be performed at most once. The switch will return an error if the same action appears more than once. Output and enqueue actions may appear at most once per port.
• Support output to only one queue. The switch will return an error if multiple enqueue actions appear with different queue ids, or if both enqueue and output actions appear.
• Packet is sent at most once per port even if there are overlapping output or enqueue actions. For example, the switch will accept a rule with actions output to all ports and output to a specific port 12, but will transmit the packet on port 12 only once even though it is contained in both actions.
• Flow entry priority is always respected, even for exact-match flow entries. The switch does not force exact-match flow entries to be processed at the highest priority.
• For packet-out messages, only output actions are supported (to a physical port, or to all, flood, or ingress port). The switch will return an error if a packet-out message is received with any other action.
• The switch-to-controller connection is plain TCP. The switch does not support encrypted TLS connections to the controller.
• Matching source and destination IP and operation code in ARP packets is not supported. Flow entries with matching the ARP Ethernet type are accepted by the switch, but the source and destination IP and protocol (opcode) match field values are ignored (i.e. the fields are wildcarded).
• A flow mod message with modify or modify_strict command does not modify the cookie value of existing flow entries. If the modify is treated as an add, however, the new entry will be assigned the specified cookie value.
• Matching all 802.3 packets without SNAP headers is not supported. The switch does not treat a dl_type value of 0x5ff as special.
• The port_mod message is not supported. It is not possible to modify the behavior of physical ports via the port_mod message. In particular, the no_flood port_config bit cannot be used to exclude ports from the flood virtual output port set.
• Changing the list of controllers causes the current controller connection to be dropped. When the OpenFlow feature is enabled and the list of controllers is changed in any fashion (e.g. by adding or deleting a controller), the current controller connection will be dropped.

• When adding a large number of flow table entries, add higher-priority entries before lower-priority entries. Due to hardware limitations, the switch will take much longer to add a new flow entry if the table already contains many entries with lower priority.
49.3 OpenFlow Configuration

By default, the OpenFlow feature is disabled on Arista devices. You must first enable the OpenFlow feature on the device. These sections describe OpenFlow configuration tasks:

- Section 49.3.1: Configuration Procedures
- Section 49.3.2: Enabling Basic OpenFlow
- Section 49.3.3: Optional OpenFlow Commands
- Section 49.3.4: Displaying OpenFlow Configurations

49.3.1 Configuration Procedures

Use the OpenFlow configuration mode commands to configure the following basic parameters:

- `openflow`: places the switch in OpenFlow configuration mode.
- `controller (OpenFlow)`: set the controller IP address and port
- `bind interface (OpenFlow)`: bind interfaces to OpenFlow
- `shutdown (OpenFlow)`: enable or disable OpenFlow

49.3.2 Enabling Basic OpenFlow

Configure the management interface. Assign an IP address to the interface and set the default gateway IP address, allowing the OpenFlow function on the switch to establish a TCP connection with the OpenFlow controller.

The following commands turn on OpenFlow pointing to a controller, ready to receive flow setup messages to be programmed in hardware for all traffic.

- The `openflow` command places the switch in OpenFlow configuration mode.
  
  ```
  switch(config)#openflow
  switch(config-openflow)#
  ```
  
- The `controller (OpenFlow)` command points to the primary OpenFlow controller. Others can be configured as a standby list.
  
  ```
  switch(config)#OpenFlow
  switch(config-openflow)#controller tcp:15.16.15.16:6633
  switch(config-openflow)#
  ```
  
- The `bind vlan (OpenFlow)` command dictates what VLAN or interfaces are tied to OpenFlow. Since hybrid mode is not supported, Arista recommends binding all VLANs or all interfaces to OpenFlow.
  
  ```
  switch(config)#openflow
  switch(config-openflow)#controller tcp:1.2.3.4:6633
  switch(config-openflow)#bind mode vlan
  switch(config-openflow)#bind vlan 1
  ```
  
- The `shutdown (OpenFlow)` command determines if the configuration takes effect or not. The following command enables OpenFlow on the switch.
  
  ```
  switch(config-openFlow)#no shutdown
  switch(config-openFlow)#
  ```
49.3.3 Optional OpenFlow Commands

Keepalive
The keepalive (OpenFlow) command allows you to set the interval for switch to controller keepalives (default of 10 seconds scales best for large scale multi-node OpenFlow switch networks). After three consecutive reply (from the controller) misses, the switch will try to connect to the second configured controller, if configured.

```
switch(config-OpenFlow)#keepalive
switch(config-OpenFlow)#
```

Profile
The profile (OpenFlow) command determines the type of flows. To double flow table size (in case all flows are L2 only), setting a profile of l2-match is best suited. Default is full-match (includes L3/4 field match).

```
switch(config-OpenFlow)#profile l2-match
switch(config-OpenFlow)#
```

Default-action
The default-action (OpenFlow) command tells the Arista OpenFlow agent the action that needs to be taken for packets (drop or send-to-controller) that don’t match any existing flows programmed locally on the hardware.

```
switch(config-OpenFlow)#default-action drop
switch(config-OpenFlow)#
```

49.3.4 Displaying OpenFlow Configurations
Show commands display the state of OpenFlow running on the Arista switch.

- The show openflow command displays the configuration state of the OpenFlow feature and the flows that are actively installed in the hardware of the Arista switch.

```
switch(config)# show openflow
OpenFlow configuration: Enabled
DPID: 0x0000001c73111a92
Description: sw3-Arista
Controllers:
  configured: tcp:172.22.28.228:6633
  connected: tcp:172.22.28.228:6633
  connection count: 3
  keepalive period: 10 sec
Flow table state: Enabled
Flow table profile: full-match
Bind mode: VLAN
  VLANs: 1-2
  native VLAN: 1
IP routing state: Disabled
Shell command execution: Disabled
Total matched: 7977645 packets
```
The `show openflow flows` command shows the default flow that is installed when OpenFlow is enabled.

```
switch(config)# show OpenFlow flows
Flow flow00000000000000000005:
  priority: 100
  cookie: 45035996453121666 (0xa000000ab1ae82)
  match:
    ingress interface: Ethernet3
    Ethernet type: IPv4
    source IPv4 address: 10.0.0.0/255.255.255.0
  actions:
    output interfaces: Ethernet11
    matched: 0 packets, 0 bytes
Flow __default__:
  priority: -1
  cookie: 0 (0x0)
  match:
  actions:
    output to controller
    matched: 5519922 packets, 433188045 bytes
```
49.4 OpenFlow Command Descriptions

OpenFlow Global Configuration Mode

- `openflow`

Openflow Configuration Commands

- `bind interface (OpenFlow)`
- `bind mode (OpenFlow)`
- `bind vlan (OpenFlow)`
- `controller (OpenFlow)`
- `default-action (OpenFlow)`
- `description (OpenFlow)`
- `keepalive (OpenFlow)`
- `profile (OpenFlow)`
- `routing recirculation-interface (OpenFlow)`
- `routing vlan (OpenFlow)`
- `shell-command allowed (OpenFlow)`
- `shutdown (Openflow)`

OpenFlow Display and Clear Commands

- `clear openflow statistics`
- `show openflow`
- `show openflow flows`
- `show openflow ports`
- `show openflow profiles`
- `show openflow queues`
- `show openflow statistics`
bind interface (OpenFlow)

When the switch is configured in interface bind mode, the ingress interface of a packet determines whether the packet is processed according to entries in the OpenFlow table or forwarded normally by the switch.

Only interfaces bound to OpenFlow are mapped to OpenFlow ports and exposed to the controller via features reply and port status messages. Output actions in flow table entries and in packet out messages can refer only to mapped ports. Use the `show openflow ports` command to see which interfaces the switch maps to OpenFlow ports and exposes to the controller.

In the OpenFlow configuration mode, use the `bind mode interface` command to select the interface bind mode.

When an interface is bound to OpenFlow, certain switch functions are disabled on the interface, including spanning tree protocol (STP). The OpenFlow controller and application must ensure that flow table entries do not allow traffic to loop in the network.

Only Ethernet and Port-Channel interfaces can be bound to OpenFlow. If an Ethernet interface is configured as a member of a LAG, attempting to bind the interface to OpenFlow has no effect. However, the Port-Channel interface of which it is a member may itself be bound to OpenFlow.

The `no bind interface` and `default bind interface` commands revert the specified list configuration to its default by removing the corresponding `bind interface` command from `running-config`.

**Command Mode**

OpenFlow Configuration

**Command Syntax**

```
bind interface INTF
no bind interface [INTF]
default bind interface [INTF]
```

**Parameters**

- **INTF** Interface that are tied to OpenFlow. Options include:
  - `ethernet e_range` Ethernet interfaces specified by `e_range`.
  - `port-channel p_range` port channel interfaces specified by `p_range`.

Valid `e_range` and `p_range` formats include number, range, or comma-delimited list of numbers and ranges.

**Example**

- This command binds Ethernet 1 to OpenFlow.

```
switch(config)# openflow
switch(config-openflow)# bind interface ethernet 1
```
bind mode (OpenFlow)

The **bind mode** command controls the way packets are divided on ingress between OpenFlow processing and normal switch processing.

The switch can be configured to divide traffic entering the switch in the following ways:

- **Interface bind mode**: Packets entering the switch from certain interfaces are only processed by OpenFlow according to flow table entries; packets entering from other interfaces are forwarded normally. (interface bind mode is the default).
- **VLAN bind mode**: Only packets associated with certain VLAN IDs are processed by OpenFlow.
- **Monitor bind mode**: All packets are forwarded normally, and are also processed by OpenFlow; a restricted set of actions are applied to packets matching a flow table entry.

Other packets are forwarded normally according to the MAC address table, filtered by ACLs, mirrored to other ports.

The switch can also be configured to apply a limited set of OpenFlow actions to any packets, regardless of ingress interface or VLAN, as well as forward the packets normally (monitor bind mode).

The **no bind mode** and **default bind mode** commands revert the specified list configuration to its default by removing the corresponding **bind mode** command from **running-config**.

**Command Mode**

Open flow Configuration

**Command Syntax**

```
bind mode METHOD
no bind mode
default bind mode
```

**Parameters**

- **METHOD** bind interfaces to OpenFlow. Options include:
  - **interface** Only packets arriving on certain interfaces are processed by OpenFlow.
  - **monitor** All packets are forwarded normally, and are also processed by OpenFlow.
  - **vlan** Only packets associated with certain VLAN IDs are processed by OpenFlow.

**Example**

- In this example, packets received without VLAN tags are assigned to the default VLAN 1 upon entering the switch and are processed by OpenFlow. All VLAN-tagged packets are dropped.

```
switch>enable
switch#configure
switch(config)#interface et1-48
switch(config-if-Et1-48)#switchport mode access
switch(config-if-Et1-48)#switchport access vlan 1
switch(config-if-Et1-48)#exit
switch(config)#openflow
switch(config-openflow)#controller tcp:1.2.3.4:6633
switch(config-openflow)#bind mode vlan
switch(config-openflow)#bind vlan 1
```
bind vlan (OpenFlow)

The **bind vlan** command adds one or more VLAN IDs to the set of VLANs that are processed by OpenFlow in VLAN bind mode. The VLANs must be created separately using the VLAN configuration mode commands.

If you specify a nonexistent VLAN with the **bind vlan** command, the binding will be stored in the running configuration but will not take effect until the VLAN is created.

A range of VLANs may be passed to the **bind vlan** command to add more than one at a time.

The number of VLANs that may be bound to OpenFlow depends on available hardware resources, which are shared with other features including IP routing and ACLs. On the 7050 Series switches the maximum number is 1024.

Use the **show openflow** command to verify which VLANs are bound to OpenFlow; this command reflects the actual hardware state rather than the configuration.

The **no bind vlan** and **default bind vlan** commands removes one or more VLANs from the set of VLANs that are processed by OpenFlow in VLAN bind mode.

**Command Mode**

OpenFlow Configuration

**Command Syntax**

- `bind vlan v_range`
- `no bind vlan [v_range]`
- `default bind vlan [v_range]`

**Parameters**

- `v_range` VLAN list. VLAN numbers range from 1 to 4094.

**Examples**

- These command bind VLANs 1 and 2 to OpenFlow.
  
  ```
  switch(config-openflow)#bind mode vlan
  switch(config-openflow)#bind vlan 1,2
  ```
clear openflow statistics

The clear openflow statistics command resets the flow statistics for OpenFlow.

Command Mode
Privileged EXEC

Command Syntax

clear openflow statistics

Example

• This command resets the OpenFlow counters.

switch#clear openflow statistics
switch#
controller (OpenFlow)

The `controller` command adds the address of an OpenFlow controller to which the switch should connect. The parameter must take the form tcp:1.2.3.4:6633 where 1.2.3.4 is the IP address of the controller and 6633 is the TCP port number.

The `controller` command may be used multiple times to add multiple controllers. The switch will attempt to connect to the first controller in the list of controllers. If the connection attempt fails, or the current connection terminates, the switch will try the next controller in that list, and so on. If the switch cannot connect to the last controller in the list, it will retry with the first controller in the list.

The order in which controllers are added is the order that the switch uses to establish controller connections. This ordering can be seen in the output of the `show openflow` command.

The `no controller` command either removes the specified controller from the list of controllers if a controller address is given as a parameter, or removes all controllers from the list of controllers if `no` parameter is given. If there are no controllers remaining after this command is executed, the OpenFlow function is effectively disabled.

**Warning**

Adding or removing a controller will cause the current controller connection to be dropped. The switch will then attempt to connect to the first controller in the list of controllers, then second controller, and so on.

The `no controller` and `default controller` commands delete s the `controller` statement from `running-config`.

**Command Mode**

OpenFlow Configuration

**Command Syntax**

controller tcp:ip_address:tcp_port
no controller tcp:ipaddress:tcp_port default controller tcp:ipaddress:tcp_port

**Parameters**

- `ip_address`  ip address used for OpenFlow. Dotted decimal location.
- `tcp_port`  name of the TCP port used for OpenFlow. Value ranges from 0 to 65535.

**Example**

- These commands enable OpenFlow and sets the controller for an OpenFlow instance.

  switch(config)# openflow
  switch(config-OpenFlow)# controller tcp:1.2.3.4:6633
default-action (OpenFlow)

The **default-action** command sets the action for the default flow table entry. This entry is automatically added by the switch. It has the lowest priority, and matches packets that are not matched by any other entry.

Use **default-action drop** to change the default entry's action to drop packets instead of sending them to the controller. (Note: In this mode, the switch deviates from the OpenFlow specification.)

The **no default-action** command restores the default entry's action to send packets to the controller.

**Command Mode**
- OpenFlow Configuration

**Command Syntax**

```
default-action ACTION_TYPE
no default-action
default default-action
```

**Parameters**

- **ACTION_TYPE** Action for the default flow table entry. Options include:
  - **controller** Sets the default entry's action to send packets to the controller.
  - **drop** Changes the default entry's action to drop packets instead of sending them to the controller.

**Example**

- This command sets the default entry's action to drop packets instead of sending them to the controller.

  ```
  switch(config)# openflow
  switch(config-OpenFlow)# default-action drop
  ```
**description (OpenFlow)**

The `description` command allows overriding the switch description string (normally the switch hostname) sent to the controller.

The `no description` and `default description` commands remove the description text for the switch hostname from `running-config`.

**Command Mode**
OpenFlow Configuration

**Command Syntax**

```
description label_text
no description
default description
```

**Parameters**
- `label_text` character string up to 256 characters assigned to describe the switch.

**Examples**
- These commands add the description test to the switch
  
  ```
  switch(config-openflow)#description test
  switch(config-openflow)#
  ```
keepalive (OpenFlow)

The keepalive command alters how often the switch sends an OpenFlow echo request to the currently connected controller (every 10 seconds by default). If an echo reply is not received after three successive echo requests, the switch disconnects from the controller. It then attempts to establish a new controller connection depending on the controller configuration.

The no keepalive command restores the default keepalive period by removing the keepalive command from the running-config.

Command Mode
OpenFlow Configuration

Command Syntax
- keepalive keep_alive_time
- no keepalive
- default keepalive

Parameters
- keep_alive_interval: keepalive period, in seconds. Value ranges from 1 to 100000. Default value is 10 seconds.

Example
- This command sets the keepalive time for OpenFlow to 30 seconds.
  switch(config)#openflow
  switch(config-openflow)#keepalive 30
  switch(config-openflow)#
openflow

The `openflow` command places the switch in OpenFlow configuration mode.

The `no openflow` and `default openflow` commands delete the openflow configuration mode statements from `running-config`.

OpenFlow configuration mode is not a group change mode; `running-config` is changed immediately upon entering commands. Exiting OpenFlow configuration mode does not affect `running-config`. The `exit` command returns the switch to global configuration mode.

**Command Mode**

Global Configuration

**Command Syntax**

```
openflow
no openflow
default openflow
```

**Commands Available in OpenFlow Configuration Mode**

- `bind interface (OpenFlow)`
- `bind mode (OpenFlow)`
- `bind vlan (OpenFlow)`
- `controller (OpenFlow)`
- `default-action (OpenFlow)`
- `description (OpenFlow)`
- `keepalive (OpenFlow)`
- `profile (OpenFlow)`
- `routing recirculation-interface (OpenFlow)`
- `routing vlan (OpenFlow)`
- `shell-command allowed (OpenFlow)`
- `shutdown (OpenFlow)`

**Example**

- This command places the switch in OpenFlow configuration mode:
  ```
  switch(config)#openflow
  switch(config-openflow)#
  ```
- This command returns the switch to global management mode:
  ```
  switch(config-openflow)#exit
  switch(config)#
  ```
profile (OpenFlow)

The profile command sets an alternate flow table profile. Use the show openflow profiles command to see the flow table profiles supported by the switch.

The no profile and default profile commands restores the default flow table profile by removing the profile command from the running-config.

Command Mode
OpenFlow Configuration

Command Syntax

```
profile FIELD_TYPE
no profile
default profile
```

Parameters

- **FIELD_TYPE** Profiles supported by the switch for the active bind mode. Options include:
  - full-match Supports matching the full set of OpenFlow match fields.
  - l2-match Supports matching only a subset but with a larger maximum number of flow table entries.

Example

- This command advertises the table size for the full-match flow table profile.

```
switch#(config-openflow)# profile full-match
switch#(config-openflow)#
```
Chapter 49: OpenFlow

OpenFlow Command Descriptions

routing recirculation-interface (OpenFlow)

The routing recirculation-interface command designates a switch interface to recirculate routed OpenFlow traffic for a second pass of processing. Exactly one recirculation interface must be configured to use routing, regardless of the number of VLANs being routed.

Any Ethernet or Port-Channel interface can be used for OpenFlow routing recirculation.

When an interface is configured for OpenFlow routing recirculation:

- The switch programs the hardware into a special MAC loopback mode, so the interface cannot be used to carry normal traffic.
- The link LED turns green and the recirculation function works even if a transceiver is not present or a cable is not inserted.
- The link speed is forced to the maximum.
- Interface configuration commands such as switchport and shutdown are ineffective, although they are preserved in the running configuration and become effective again when the interface is no longer configured for OpenFlow routing recirculation.

The routing recirculation-interface and default routing recirculation-interface commands revert the configuration to its default by removing the corresponding routing recirculation-interface command from running-config.

Command Mode

OpenFlow Configuration

Command Syntax

bind interface INTF
no bind interface [INTF]
default bind interface [INTF]

Parameters

- **INTF** Options include:
  - ethernet e_range Ethernet interfaces specified by e_range.
  - port-channel p_range port channel interfaces specified by p_range.

Valid e_range and p_range formats include number, range, or comma-delimited list of numbers and ranges.

Example

- This command recirculates traffic routed to and from VLAN 1 via the routed transit VLAN 401.

  
  switch(config-openflow)#bind mode vlan
  switch(config-openflow)#bind vlan 1
  switch(config-openflow)#routing recirculation-interface et48
  switch(config-openflow)#routing vlan 1 routed-vlan 401
  switch(config-openflow)#enable
routing vlan (OpenFlow)

The *routing vlan* command enables IP routing of traffic processed by OpenFlow for a specific VLAN. The *no routing vlan* and *default routing vlan* command disables IP routing of traffic processed by OpenFlow for a VLAN.

**Command Mode**

- OpenFlow Configuration

**Command Syntax**

- `routing vlan VLAN_ID routed-vlan vlan_transit`
- `no routing vlan VLAN_ID`
- `default routing vlan VLAN_ID`

**Parameters**

- **VLAN_ID** Options include
  - `v_num` The full form of the command is `routing vlan 123 routed-vlan 456`, where 123 is the VLAN of the OpenFlow traffic to be routed, and 456 is a (non-OpenFlow-bound) VLAN configured for standard IP routing.
  - `untagged` To route untagged OpenFlow traffic, use the command `routing vlan untagged routed-vlan 456`

**Examples**

- This command associates the VLAN with an untagged VLAN 22 to match during the OpenFlow pass.
  
  ```bash
  switch(config-openflow)# routing vlan untagged routed-vlan 22
  ```
shell-command allowed (OpenFlow)

The **shell-command allowed** command allows the controller to run shell or CLI vendor extension commands on the switch.

When this extension is enabled, the switch will execute any CLI command sent by the controller, bypassing normal access controls, so enable it only if the controller is trusted.

The **no shell-command allowed** and **default shell-command allowed** commands disables the corresponding **shell-command allowed** from the **running-config**.

**Command Mode**

OpenFlow Configuration

**Command Syntax**

- `shell-command allowed`
- `no shell-command allowed`
- `default shell-command allowed`

**Example**

- This command allows the controller to run arbitrary CLI commands on the switch.

  ```
  switch(config)#openflow
  switch(config-openflow)#shell-command allowed
  switch(config-openflow)#
  ```
show openflow

The `show openflow` command shows the effective OpenFlow configuration parameters.

**Command Mode**

EXEC

**Command Syntax**

`show openflow`

**Example**

- This command displays the actual hardware state of OpenFlow.

```plaintext
switch# show openflow
OpenFlow configuration: Enabled
DPID: 0x000000123456789a
Description: My awesome OpenFlow switch
Controllers:
  configured: tcp:1.2.3.4:6633 tcp:5.6.7.8:6633
  connected: tcp:1.2.3.4:6633
  attempted connection count: 24
  successful connection count: 1
  keepalive period: 10 sec
Flow table state: Enabled
Flow table profile: full-match
Bind mode: interface
  interfaces: Ethernet2, Ethernet4, Ethernet6, Ethernet8
IP routing state: Enabled
  recirculation interface: Ethernet44
VLAN untagged: routed to/from VLAN 3636
Shell command execution: Disabled
Total matched: 4601 packets
switch#
```
show openflow flows

The **show openflow flows** command displays the contents of the flow table, showing each entry with its match rules, actions, packet counters, and timeouts.

The default flow table entry is automatically created by the switch. It always has the lowest priority, and matches packets that are not matched by any other entry. The default entry's action is to send the packet to the controller.

**Command Mode**

EXEC

**Command Syntax**

```
show openflow flows
```

**Example**

- This command displays the contents of the flow table.

```
switch# show openflow flows
Flow flow00000000000000000002:
    priority: 0
    cookie: 0 (0x0)
    idle timeout: 60.0 sec
    match:
        ingress interface: Ethernet2
        source Ethernet address: 00:a9:87:65:43:21
        destination Ethernet address: 00:12:34:56:78:9a
        untagged/native VLAN ID
        VLAN PCP: 0
        Ethernet type: IPv4
        source IPv4 address: 10.0.1.1
        destination IPv4 address: 10.0.1.2
        IPv4 TOS: 0
        IPv4 protocol: ICMP
        source TCP/UDP port or ICMP type: 8
        destination TCP/UDP port or ICMP code: 0
    actions:
        output interfaces: OpenFlowRouter
        matched: 4 packets, 408 bytes
Flow __default__:
    priority: -1
    cookie: 0 (0x0)
    match:
    actions:
        output to controller
switch#
```
**show openflow ports**

The *show openflow ports* command displays the mapping between OpenFlow port number and switch interface.

In interface bind mode, all OpenFlow-bound interfaces (except routed ports and LAG members) are mapped to OpenFlow ports and exposed to the controller.

In VLAN bind mode, Ethernet and Port-Channel interfaces (except routed ports and LAG members) configured to carry traffic for one or more OpenFlow-bound VLANs are mapped to OpenFlow ports and exposed to the controller.

In monitor bind mode, all Ethernet and Port-Channel interfaces (except routed ports and LAG members) are mapped to OpenFlow ports and exposed to the controller.

**Command Mode**

EXEC

**Command Syntax**

*show openflow ports*

**Example**

- This command displays which interfaces the switch maps to OpenFlow ports.

```
switch# show openflow ports
Port 1: Ethernet1
Port 15: Ethernet15
switch#
```
show openflow profiles

The `show openflow profiles` command displays the flow table profiles supported by the switch for the active bind mode. For each profile, it shows:

- Which fields can be matched by a flow table entry and which can be wildcarded
- Which actions are supported for matched packets (in monitor bind mode, only normal and mirror actions are supported)
- The maximum number of entries that can be added to the flow table

The hardware resources available to OpenFlow are shared with other switch features like ACLs, so the actual maximum number of flow entries may be lower than the number shown by `show openflow profiles` command.

On Series 7050 switches, two profiles are available: the full-match profile supports matching the full set of OpenFlow match fields with a maximum of 750 flow table entries, while the l2-match profile supports matching only a subset but with a larger maximum number of flow table entries (1500).

**Command Mode**

EXEC

**Command Syntax**

```
show openflow profiles
```
Example

- This command displays the flow table profiles.

```
switch# show openflow profiles
full-match:
  Match fields:
    ingress interface
    source Ethernet address
    destination Ethernet address
    VLAN ID
    VLAN PCP
    Ethernet type
    source IPv4 address
    destination IPv4 address
    IPv4 TOS
    IPv4 protocol
    source TCP/UDP port or ICMP type
    destination TCP/UDP port or ICMP code
Wildcard fields:
    ingress interface
    source Ethernet address
    destination Ethernet address
    VLAN ID
    VLAN PCP
    Ethernet type
    source IPv4 address
    destination IPv4 address
    IPv4 TOS
    IPv4 protocol
    source TCP/UDP port or ICMP type
    destination TCP/UDP port or ICMP code
Actions:
    copy ingress to mirror dest interfaces
    forward normally
    copy egress to mirror dest interfaces
Table size: 750 entries max
```

```
12-match:
  Match fields:
    ingress interface
    source Ethernet address
    destination Ethernet address
    VLAN ID
    VLAN PCP
    Ethernet type
Wildcard fields:
    ingress interface
    source Ethernet address
    destination Ethernet address
    VLAN ID
    VLAN PCP
    Ethernet type
Actions:
    copy ingress to mirror dest interfaces
```

forward normally
  copy egress to mirror dest interfaces
  Table size: 1500 entries max
switch#
show openflow queues

The `show openflow queues` command displays the queues exposed to the OpenFlow controller for each switch interface, and packet and byte counters for each queue.

**Command Mode**

EXEC

**Command Syntax**

`show openflow queues`

**Example**

- This command displays the packet and byte counters for each queue on the active OpenFlow interfaces.

```
switch# show openflow queues
Port 1 (Ethernet1):
  Queue 0: 0 packets (0 bytes) transmitted, 0 dropped
  Queue 1: 0 packets (0 bytes) transmitted, 0 dropped
  Queue 2: 0 packets (0 bytes) transmitted, 0 dropped
  Queue 3: 0 packets (0 bytes) transmitted, 0 dropped
Port 15 (Ethernet15):
  Queue 0: 0 packets (0 bytes) transmitted, 0 dropped
  Queue 1: 0 packets (0 bytes) transmitted, 0 dropped
  Queue 2: 0 packets (0 bytes) transmitted, 0 dropped
  Queue 3: 0 packets (0 bytes) transmitted, 0 dropped
switch#
```
show openflow statistics

The `show openflow statistics` command displays statistics sampled every 5 seconds over the past 5 minutes:

- Number of entries in the flow table
- Number of flow_mod, packet_out and packet_in messages processed in the 5-second interval
- Number of packet_out messages dropped in the 5-second interval (the OpenFlow agent starts dropping packet_out messages when the transmit queue of the controller TCP connection exceeds 50% of capacity)

**Command Mode**

EXEC

**Command Syntax**

`show openflow statistics`
**Example**

- This command displays statistics sampled every 5 seconds.

```markdown
**switch# show openflow statistics**
```

<table>

**switch#**
**shutdown (Openflow)**

The `shutdown` command, in OpenFlow mode, disables OpenFlow on the switch. OpenFlow is disabled by default.

The `no shutdown` and `default shutdown` commands re-enable OpenFlow by removing the `shutdown` command from *running-config*.

**Command Mode**

Openflow Configuration

**Command Syntax**

```
shutdown
no shutdown
default shutdown
```

**Example**

- These commands enable OpenFlow on the switch.
  ```
  switch(config)#openflow
  switch(config-openflow)#no shutdown
  switch(config-openflow)#
  ```

- This command disables OpenFlow.
  ```
  switch(config-openflow)#shutdown
  ```
DirectFlow

This chapter describes Arista’s DirectFlow implementation. Sections in this chapter include:

- Section 50.1: Introduction
- Section 50.2: DirectFlow Configuration
- Section 50.3: DirectFlow Feature Interactions
- Section 50.4: DirectFlow Command Descriptions

50.1 Introduction

Like OpenFlow, DirectFlow exposes the underlying forwarding ASICs capabilities through a programmable interface like EAPI or the standard CLI.

Unlike OpenFlow, DirectFlow works in conjunction with all other aspects of standard L2/L3 bridging or forwarding, and DirectFlow traffic is subject to the standard packet processing pipeline within the ASIC. You can think of DirectFlow as a stage in packet processing that processes traffic after ingress checks and before any egress actions.

This feature enables you to configure flows that consist of a matching criteria and actions, and to modify how traffic is processed (for example, by overriding the L2 lookup decision or rewriting a mac address or VLAN).

Features like MAC learning, STP state checks, ingress or egress VLAN membership checks on ports, ACLs, QoS and other features are all respected by DirectFlow. Traffic that doesn't match any programmed flow is processed normally while traffic that matches programmed flows is now subject to the actions specified in the flows.

DirectFlow and OpenFlow are mutually exclusive and you can run only one of the two at any given time.

How DirectFlow is different from OpenFlow

There is no default flow matching all traffic, so traffic not matched by other rules is forwarded as normal. This means the configuration/controller/application doesn’t consume TCAM space programming flows for normal forwarding.

DirectFlow works with other features and so the user can use ACL, rate limiting, STP etc. in their network as normal and not build all of that into the application used to inject flows.

DirectFlow flows can be configured from the CLI or using EAPI, giving users the option of using flow based forwarding without an external controller. This is especially useful where the number of flows is small and static e.g.to process a small subset of the traffic in a different manner to the normal L2/L3 pipeline.
Unlike OpenFlow which requires the switch support OUTPUT NORMAL or re-circulate a packet in order to send a packet from the OpenFlow domain to non-OpenFlow domain, there is just one domain with DirectFlow.

### 50.1.1 DirectFlow Flows

Similar to OpenFlow, you can define a relative priority between flows and define idle or hard timeouts for the flow. DirectFlow also enables you to insert a flow entry that matches on specified criteria, and define actions to be taken on traffic that matches the specified matching conditions. You can define flows to match on TCP flags, IPv6 source and destination addresses, input ports, and more.

For more information, see:
- Section 50.1.1.1: DirectFlow Non-persistent Flows
- Section 50.1.1.2: Supported matches
- Section 50.1.1.3: Supported actions

#### 50.1.1.1 DirectFlow Non-persistent Flows

DirectFlow enables you to configure flows that are not visible in the startup or running configurations and do not persist over a reboot. This feature is designed to be used for flows that are configured by a custom agent using the EOS SDK or eAPI and age out (expire) after a specified time period.

For example, if you are using a custom agent that reacts to traffic sent to the CPU (the redirect to CPU action), and you want to use a flow that will drop all matching traffic for 5 minutes, the agent can program a non-persistent flow that expires after a hard timeout of 300 seconds.

Using a non-persistent flow for this purpose ensures that other administrator actions (for example, saving the configuration) do not result in the flow being resurrected on startup or reverting to the saved configuration. It also removes the need for the agent to delete the expired flow.

**Note**  
By default, all DirectFlow flows are persistent. You must use the `no persistent` command to configure a non-persistent flow.

#### 50.1.1.2 Supported matches

DirectFlow supports all matches supported on EOS with OpenFlow 1.0. This includes matches on VLAN, ether type, source or destination MAC address, COS, source or destination IP address, IP protocol, IP TOS, L4 source, destination ports, ICMP type, and code.

In addition, DirectFlow also allows matching on:
- TCP flags
- IPv6 source address
- IPv6 destination address
- Traffic injected from the CPU
- Input port

DirectFlow also permits re-using the same flow on multiple input ports, saving valuable TCAM space.

#### 50.1.1.3 Supported actions

DirectFlow supports all actions supported on EOS with OpenFlow 1.0, including:
- Setting the source or destination MAC address
- VLAN
- COS
- IP TOS
- Transmit queue
- Output port list and mirroring traffic pre-modification (ingress mirror) and post-modification (egress mirror).
- Redirect to CPU

The redirect to CPU action is useful in cases in which a custom agent is running on EOS and you want to trap specific traffic (matching traffic) and send the trapped traffic to the agent. See the example “Redirect to CPU” on page 3197.
50.2 DirectFlow Configuration

Consider the following when using DirectFlow.

- DirectFlow takes effect ONLY after exiting the individual flow configuration sub-mode.
- Match criteria are connected with Boolean AND operators i.e. they must all match for the condition to be true and action to be taken.
- CLI is automatically set to match the ethertype to IP if IP fields (such as source or destination address or L4 ports) are chosen as part of other match/ action commands.
- In a single flow, only the following fields can be matched along with IPv6 source and destination addresses:
  - VLAN priority
  - VLAN ID
  - EtherType
  - Source interface
  - Class of Service (CoS)

50.2.1 Commands Used to Enable DirectFlow, Configure and Display Flows

A number of different commands are provided for the DirectFlow feature. The different commands enable you to enter the DirectFlow configuration mode, enable DirectFlow, configure flows, and display configured flows.

Important! ALL match criteria specified in a flow definition must match in the packet for the actions specified to be applied to the traffic.

Enter the DirectFlow Configuration Mode

The **directflow** command places the switch in DirectFlow configuration mode.

```
switch(config)#directflow
switch(config-directflow)#
```

Enable DirectFlow

The **shutdown (DirectFlow)** command determines if the configuration takes effect or not. To enable DirectFlow, enter the following command.

```
switch(config-directflow)#no shutdown
```

Create the Flow

The **flow (DirectFlow)** command creates a new flow entry. It must be unique or it will be overwritten by an existing entry.

```
switch(config-directflow)#flow Test-1
switch(config-directflow-Test-1)#
```

Create the DirectFlow Match Criteria

The **match (DirectFlow-flow mode)** command allows you to configure a rule or a flow which match on L2, L3, L4 fields of a packet and specify a certain action to either modify, drop or redirect the packet.

```
switch(config-directflow-Test-1)#match ethertype ip
switch(config-directflow-Test-1)#match source ip 10.10.10.10
```
Action Set

The action set (DirectFlow-flow mode) command allows you to configure a packet to be routed out a layer three interface using a DirectFlow entry.

```
switch(config-directflow-Test-1)#action egress mirror ethernet 7
switch(config-directflow-Test-1)#action set destination mac 0000.aaaa.bbbb
```

Finalize the Flow

DirectFlow flows do not take effect until you exit the configuration sub-mode for the specified flow. Use the exit command to finalize the flow and put it into effect.

```
switch(config-directflow-Test-1)#exit
switch(config-directflow)#
```

Redirect to CPU

The action output interface cpu (DirectFlow-flow mode) command allows you to configure flows so that traffic that matches the matching conditions specified in the flow is redirected to the CPU.

```
switch(config)#directflow
switch(config-directflow)#flow redirect-http-cpu
switch(config-directflow-redirect-http-cpu)#match ip protocol tcp
switch(config-directflow-redirect-http-cpu)#match destination port 80
switch(config-directflow-redirect-http-cpu)#action output interface cpu
```

Configuring a Non-persistent Flow

DirectFlow flows are persistent by default. Use the no persistent command to configure non-persistent flows.

```
switch (config)#directflow
switch (config-directflow)#flow example-non-persistent
switch (config-directflow-example-non-persistent)#match input interface ethernet 25
switch (config-directflow-example-non-persistent)#action drop
switch (config-directflow-example-non-persistent)#no persistent
switch (config-directflow-example-non-persistent)#timeout hard 300
```

Display details for configured flows

The detail option of the show directflow flows command enables you to display the details of configured flows. You can use this command to verify that a non-persistent flow is deleted after the timeout period configured for the flow has elapsed.

The following example shows the use of this command to view the configuration of a non-persistent flow before the timeout period has elapsed, and a second time, after the timeout period has expired.
The initial use of the command displays the flow configuration (before the timeout expires).

```bash
switch (config-directflow)#show directflow flows example-non-persistent detail
Flow example-non-persistent: (Flow programmed)
persistent: False
priority: 0
hard timeout: 300
idle timeout: 0
match:
  ingress interface:
    Et25
actions:
  drop
matched: 0 packets, 0 bytes
```

The **second** use of the command displays the flow details (after the timeout expires). The output shows that the flow is no longer programmed.

```bash
switch (config-directflow)#show directflow flows example-non-persistent detail
Flow example-non-persistent: (Flow not programmed)
persistent: False
priority: 0
hard timeout: 300
idle timeout: 0
match:
  ingress interface:
    Et25
actions:
  drop
matched: 0 packets, 0 bytes
```
50.3 **DirectFlow Feature Interactions**

DirectFlow flow entries can have one of the following actions:

- A set of egress ports for sending a matched packet
- Copy to CPU
- Redirect to CPU
- Drop
- No specified action (in this case, the traffic is output normally).

The only exception is the ingress or egress mirroring action, where the DirectFlow entry causes the packet to be mirrored.

When the ingress or egress packets are mirrored, the original traffic is sent out normally.

**Bridging Features**

- DirectFlow entries have precedence over all entries in the MAC table, including static MAC entries and static MAC drop entries. Packets that do not match DirectFlow entries are forwarded based on the MAC address table.
- VLANs: DirectFlow entries can modify the VLAN of a packet. MAC learning takes place in the original VLAN for DirectFlow entries that modify the VLAN. The modified packet will be subject to VLAN membership checks on the egress port. If a packet has no VLAN tag, DirectFlow assumes it came in on the native VLAN for the ingress interface. A VLAN override causes the packet to obey the VLAN rules on the egress port.
- Q-in-Q: Q-in-Q is supported as DirectFlow entries match only on the outer tag.
- Counters: All packets that match DirectFlow entries cause interface counters to increment as usual.

**Spanning Tree**

DirectFlow runs alongside MSTP, RSTP, and PVST. DirectFlow entries do not match on packets that ingress an STP discarding port. DirectFlow entries that cause a packet to be forwarded out an STP discarding port will result in the packets being dropped on egress.

When STP is enabled, BPDUs will always be trapped to the CPU. When STP is disabled, BPDUs will be subject to DirectFlow entries and not be copied to the CPU by default.

**LLDP, LAGs, and LACP**

- LLDP packets are always trapped to the CPU. DirectFlow entries can never match LLDP packets.
- LAGs are fully supported, and can be part of a match criteria and part of an output action to an interface.
- LACP packets are always trapped to CPU. DirectFlow entries can never match LACP packets.

**sFlow**

sFlow is unaffected by DirectFlow.

**IGMP Snooping**

IGMP control packets are trapped to the CPU when IGMP Snooping is enabled. DirectFlow entries can match IGMP Snooping control traffic and override the trap to CPU.
Link-local-multicast packets are flooded in hardware in the VLAN via a TCAM entry. DirectFlow entries can match link-local-multicast packets and change the flooding behavior. As DirectFlow entries have to specify output interfaces or drop, the action will conflict and so matching DirectFlow entries will get precedence.

When IGMP snooping is enabled, unknown IPV4 multicast packets are flooded to the multicast-router ports in the VLAN. If DirectFlow entries match unknown IPV4 multicast packets, they will override the flooding behavior.

Data packets in groups under IGMP snooping control are sent to the group members through a MAC table entry. Matching DirectFlow entries override the MAC table entries.

**ACLs**

DirectFlow entries are lower priority than any configured Port ACLs (ingress). Packets coming in on a port that match DirectFlow entries obey any configured ACL on that port, and will only apply to packets that have a *permit* action.

DirectFlow entries are higher priority than any configured RACLs. Packets coming in on an L3 interface that match DirectFlow entries ignore any RACLs configured on that interface.

DirectFlow entries are lower priority than any configured Egress ACLs.

### 50.3.1 Layer Three Features and DirectFlow

DirectFlow runs alongside IP routing. If a packet is routed out a layer three interface using a DirectFlow entry, the actions associated with the entry will have to specify the new source MAC and destination MAC for the packet, as well as the physical port or LAG. If there are no output ports specified in an entry, packets that match that entry will be dropped.

**Unicast Routing**

When unicast routing is enabled, DirectFlow entries that match take precedence for all packets that would have been otherwise been routed. The three exceptions are the ingress mirror, egress mirror and copy-to-CPU actions where the packets will be routed normally in addition to the action being performed. Routed packets that do not match DirectFlow entries are forwarding based on the L3 lookup.

**Multicast Routing**

When multicast routing is enabled, DirectFlow entries that match take precedence for all packets that would have otherwise been multicast routed. The packets are not replicated based on the hardware multicast tables, but are forwarded strictly according to the actions specified by the DirectFlow entry. The entry can specify a set of output interfaces, which will result in the packet being replicated based on the DirectFlow entry.
50.3.2 Displaying DirectFlow Configurations

To `show directflow flows` command displays the contents of the flow table, showing each entry with its match rules, actions, and packet counters.

- This example shows the status of a default (persistent) flow.

```
switch(config-directflow)#show directflow flows
Flow Test1:
    priority: 0
    match:
        ingress interface: Ethernet1
        ethertype ip
        source ip address: 10.10.10.10
    actions:
        output mirror: Ethernet2
    matched: 0 packets, 0 bytes
switch(config-directflow)#
```

- This example shows the status of a non-persistent flow. The flow will be deleted once 5 minutes have elapsed.

```
switch(config-directflow)#show directflow flows example-non-persistent
Flow example-non-persistent:
    persistent: False
    priority: 0
    hard timeout: 300
    idle timeout: 0
    match:
        ingress interface: Ethernet2
    actions:
        drop
    matched: 0 packets, 0 bytes
```
50.4 **DirectFlow Command Descriptions**

**DirectFlow Global Configuration Mode**
- `directflow`

**DirectFlow Configuration Command**
- `action drop` (DirectFlow-flow mode)
- `action mirror` (DirectFlow-flow mode)
- `action output` (DirectFlow-flow mode)
- `action output interface cpu` (DirectFlow-flow mode)
- `action set` (DirectFlow-flow mode)
- `flow` (DirectFlow)
- `match` (DirectFlow-flow mode)
- `persistent`
- `priority` (DirectFlow-flow mode)
- `shutdown` (DirectFlow)
- `timeout` (DirectFlow-flow mode)

**DirectFlow and Clear Commands**
- `show directflow`
- `show directflow flows`
action drop (DirectFlow-flow mode)

The action drop command configures packets that match an entry to be dropped. The no action drop and default action drop commands remove the statement from the DirectFlow configuration mode.

Command Mode

Directflow-flow Configuration

Command Syntax

    action drop
    no action drop
    default action drop

Example

• This command sets the action for packets from Test-1 to be dropped.

    switch(config-directflow-Test-1)#action drop
    switch#
action mirror (DirectFlow-flow mode)

The **action mirror** command can be used to ingress or egress mirror traffic to a mirror destination. This requires a mirror destination to be setup on the switch. If a packet comes in or goes out an interface that is part of another mirror session, then the destination for that destination as well as the DirectFlow destination will receive a copy of the packet.

The **no action mirror** and **default action mirror** commands remove the statement from DirectFlow configuration mode.

**Command Mode**

Directflow-flow Configuration

**Command Syntax**

```
action DIRECTION mirror INT_NAME
no action DIRECTION mirror INT_NAME
default action DIRECTION mirror INT_NAME
```

**Parameters**

- **DIRECTION** transmission direction of traffic to be mirrored.
  - **ingress** mirrors before any rewrites.
  - **egress** mirrors after rewrites.
- **INT_NAME** Source interface for the mirroring session.
  - **ethernet e_range** Ethernet interfaces specified by `e_range`.
  - **port-channel p_range** Port channel interfaces specified by `p_range`.

**Example**

- This command configures mirror traffic to Ethernet 2.

  ```
  switch(config-directflow)# flow Test1
  switch(config-directflow-Test1)#match ethertype ip
  switch(config-directflow-Test1)#match source ip 10.10.10.10
  switch(config-directflow-Test1)#action egress mirror ethernet 2
  switch(config-directflow-Test1)#
  ```
action output (DirectFlow-flow mode)

The action output command configures an Ethernet or port channel interface as the output of a specified port mirroring session.

The no action output and default action output commands remove the statement from DirectFlow configuration mode.

Command Mode
  Directflow-flow Configuration

Command Syntax
  action output DESTINATION
  no action output DESTINATION
  default action output DESTINATION

Parameters
  • DESTINATION  transmission direction of traffic to be mirrored.
    • all  mirrors transmitted and received traffic.
    • flood  mirrors received traffic only.
    • interface ethernet e_range  Ethernet interfaces specified by e_range.
    • interface port-channel p_range  Port channel interfaces specified by p_range.

Example
  • This command configures Ethernet interface 7 as the output for the mirroring session.
    switch(config-directflow-Test1)#action output interface ethernet 7
    switch(config-directflow-Test1)#
action output interface cpu (DirectFlow-flow mode)

The **action output interface cpu** command configures the action (other commands are used to define the traffic matching conditions).

The **no action output interface cpu** and **default action output** commands remove the statement from DirectFlow configuration mode.

**Command Mode**

Directflow-flow Configuration

**Command Syntax**

```
action output DESTINATION
no action output DESTINATION
default action output DESTINATION
```

**Parameters**

- **DESTINATION** transmission direction of traffic to be mirrored.
  - **all** mirrors transmitted and received traffic.
  - **flood** mirrors received traffic only.
  - **interface cpu** Ethernet interfaces specified by `e_range`.

**Example**

- This command configures Ethernet interface 7 as the output for the mirroring session.

  ```
  switch(config-directflow-Test1)#action output interface ethernet 7
  switch(config-directflow-Test1)#
  ```

- These commands configure the action to redirect traffic matching the flow to the CPU and the matching conditions for the flow.

  ```
  switch (config)#directflow
  switch (config-directflow)#flow redirect-http-cpu
  switch (config-directflow-redirect-http=cpu)#match ip protocol tcp
  switch (config-directflow-redirect-http-cpu)#match destination port 80
  switch (config-directflow-redirect-http-cpu)#action output interface cpu
  ```
**action set (DirectFlow-flow mode)**

The **action set** command allows you to configure a packet to be routed out a layer three interface using a DirectFlow entry. The actions associated with the entry will have to specify the new source MAC and destination MAC for the packet, as well as the physical port or LAG. If there are no output ports specified in an entry, packets that match that entry will be dropped.

The no **action set** and default **action set** commands remove **action set** statement from DirectFlow configuration mode.

**Command Mode**

Directflow-flow Configuration

**Command Syntax**

```
action set **CONDITION**
no action set **CONDITION**
default action set **CONDITION**
```

**Parameters**

- **CONDITION** specifies parameter and value. Options include:
  - `cos 0 to 7`  cost of service.
  - `destination mac mac_addr` Dotted hex notation.
  - `ip tos 0 to 255` Type of service.
  - `source mac mac_addr` Dotted hex notation.
  - `traffic-class 0 to 7` Dotted hex notation.
  - `vlan 1 to 4094` Number of VLAN.

The no **action set** and default **action set** commands require only the **CONDITION** type without a specific condition value.

**Example**

- These commands change the destination MAC of the frame.

```
switch(config-directflow)#flow Test1
switch(config-directflow-Test1)#action egress mirror ethernet 7
switch(config-directflow-Test1)#action set destination mac 0000.aaaa.bbbb
```
directflow

The `directflow` command places the switch in DirectFlow configuration mode.

The no `directflow` and default `directflow` commands delete the DirectFlow configuration mode statements from `running-config`.

DirectFlow configuration mode is not a group change mode; `running-config` is changed immediately upon entering commands. Exiting OpenFlow configuration mode does not affect `running-config`. The `exit` command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

directflow
no directflow
default directflow

Commands Available in DirectFlow-Flow configuration mode:

- `flow (DirectFlow)`
- `shutdown (DirectFlow)`

Example

- This command places the switch in DirectFlow configuration mode:
  
  ```text
  switch(config)#directflow
  switch(config-directflow)#
  ```

- This command returns the switch to global management mode:
  
  ```text
  switch(config-directflow)#exit
  switch(config)#
  ```
flow (DirectFlow)

The `flow` command places the switch in flow configuration mode.

The `flow` command specifies the name of the flow that subsequent commands modify and creates a new flow definition if it references a nonexistent flow. All changes in a flow configuration mode edit session are pending until the session ends:

- The `exit` command saves pending changes to `running-config` and returns the switch to DirectFlow configuration mode. Changes are also saved by entering a different configuration mode.
- The `abort` command discards pending changes, returning the switch to DirectFlow configuration mode.

The `no flow` and `default flow` commands delete the specified role by removing the role and its statements from `running-config`.

Command Mode

DirectFlow Configuration

Command Syntax

```
flow flow_name
no flow flow_name
default flow flow_name
```

Parameters

- `flow_name` Name of flow.

Commands Available in DirectFlow-Flow configuration mode:

- `action drop (DirectFlow-flow mode)`
- `action mirror (DirectFlow-flow mode)`
- `action output (DirectFlow-flow mode)`
- `action set (DirectFlow-flow mode)`
- `match (DirectFlow-flow mode)`
match (DirectFlow-flow mode)

The `match` command allows you to configure a rule or a flow which could match on L2, L3, L4 fields of a packet and specify a certain action to modify, drop or redirect the packet.

All traffic ingressing on the switch will be matched against the flows installed. In cases where none of the packets match, normal switching or routing behavior will take over. When multiple entries match a packet, precedence is given to the entry that was installed first.

The `no match` and `default match` commands remove the `match` statement from the configuration mode.

**Command Mode**
- Directflow-flow Configuration

**Command Syntax**
```
match CONDITION
no match CONDITION
default match CONDITION
```

**Parameters**
- `CONDITION` specifies criteria for evaluating a route. Options include:
  - `cos <0 to 7>` cost of service.
  - `destination ip ipv4_subnet` destination IPv4 subnet. L3 fields valid only if ethertype is IP (0x0800).
  - `destination mac mac_addr` Add to the existing community. Dotted hex notation.
  - `destination mac mac_addr mask mac_mask` Add to the string community. Dotted hex notation.
  - `destination port <0 to 65535>` Fields accepted only if protocol is TCP|UDP
  - `ethertype <0 to 65535>` Layer 4 destination port.
  - `ethertype ARP` Layer 4 destination port.
  - `ethertype IP` Layer 4 destination port.
  - `icmp code <0 to 255>` Fields accepted only if protocol is ICMP
  - `icmp type <0 to 255>` Fields accepted only if protocol is ICMP
  - `input interface ethernet e_num` Ethernet interface specified by `e_num`.
  - `input interface port-channel p_num` Port channel interface specified by `p_num`.
  - `ip protocol <0 to 255>` Type of service.
  - `ip protocol icmp` L3 fields valid only if ethertype is IP (0x0800).
  - `ip protocol tcp` L3 fields valid only if ethertype is IP (0x0800).
  - `ip protocol udp` L3 fields valid only if ethertype is IP (0x0800).
  - `ip tos <0 to 255>` L3 fields valid only if ethertype is IP (0x0800).
  - `source ip ipv4_subnet` L3 fields valid only if ethertype is IP (0x0800).
  - `source mac mac_addr` Add to the existing community. Dotted hex notation.
  - `source mac mac_addr mask mac_mask` Add to the string community. Dotted hex notation.
  - `source port <0 to 65535>` Fields accepted only if protocol is TCP|UDP
  - `tcp flag ack` Layer 4 destination port.
  - `tcp flag fin` Layer 4 destination port.
• tcp flag psh  Layer 4 destination port.
• tcp flag rst  Layer 4 destination port.
• tcp flag syn  Layer 4 destination port.
• tcp flag urg  Layer 4 destination port.
• tcp flag urg  Layer 4 destination port.
• vlan <1 to 4094> mask <1 to 4095>  Number of VLAN.

The no match and default match commands require only the CONDITION type without a specific condition value.

Example
• This command creates the rules to match on Ethertype IP and Source IP 10.10.10.10.
  switch(config-directflow)# flow Test1
  switch(config-directflow-Test1)#persistent
  switch(config-directflow-Test1)#match ethertype ip
  switch(config-directflow-Test1)#match source ip 10.10.10.10
**persistent**

DirectFlow flows are persistent by default. Once finalized, they appear in the running configuration, and if saved to *startup config* they will persist over a reboot. The *no* form of the *persistent* command prevents the flow from showing up in *running config*, ensuring that it will not persist over a reboot.

**Command Mode**
Directflow-flow Configuration

**Command Syntax**

`no persistent`

**Example**
- These commands create and enable a non-persistent DirectFlow flow.

```
switch(config)#directflow
switch(config-directflow)#flow example-non-persistent
switch(config-directflow-example-non-persistent)#match input interface ethernet 25
switch(config-directflow-example-non-persistent)#action drop
switch(config-directflow-example-non-persistent)#no persistent
switch(config-directflow-example-non-persistent)#timeout hard 300
switch(config-directflow-example-non-persistent)#exit
switch(config-directflow)#
```
priority (DirectFlow-flow mode)

The `priority` command sets the priority for the flow match rules. Each flow-table entry has an optional priority field, with a higher number indicating a higher priority. Flows with the same priority may be loaded in any order, and the order may be changed at any time. If multiple entries match a packet, precedence is given to the entry that was installed first.

Priority numbers range from 0 to 65535. The default is 0. The higher priority rules match first.

The `no priority` and `default priority` commands remove `priority` statement from the DirectFlow configuration mode.

**Command Mode**

Directflow-flow Configuration

**Command Syntax**

```
priority priority_value
no priority
default priority
```

**Parameters**

- `priority_level` priority xxx. Value ranges from 0 to 65535. Default is 0.

**Example**

- These commands assign the priority of 150 to flow Test-1.

```
switch(config-directflow-Test-1)#priority 150
switch(config-directflow-Test-1)#
```
**show directflow**

The *show directflow* command displays summary information for DirectFlow. With the `counters` or `details` options, it displays counters or details for all flows configured on the switch.

**Command Mode**

EXEC

**Command Syntax**

`show directflow [counters|details]`

**Example**

- This command displays summary information for DirectFlow.

  ```
  switch# show directflow
  DirectFlow configuration: Enabled
  Total matched: 0 packets
  Total programmed flows: 3 flows
  switch#
  ```

- This command displays counters for all DirectFlow flows configured on the switch.

  ```
  switch# show directflow counters
  Flow Name    Source    Matched packets    Matched bytes
  -------      -----      -----------        -----------
  test3        config     0              0
  test2        config     0              0
  test1        config     0              0

  Total matched packets: 0
  switch>
  ```
This command displays details for all DirectFlow flows configured on the switch.

```
switch# show directflow detail
Flow test3: (Flow programmed)
persistent: True
priority: 0
priorityGroupType: default
tableType: ifp
hard timeout: 0
idle timeout: 0
match:
    Ethernet type: 0x86dd
actions:
    output interfaces:
        Et32
source: config
matched: 0 packets, 0 bytes
Flow test2: (Flow programmed)
persistent: True
priority: 0
priorityGroupType: default
tableType: ifp
hard timeout: 0
idle timeout: 0
match:
    Ethernet type: IPv4
    source IPv4 address: 10.1.2.12/255.255.255.255
    IPv4 protocol: TCP
    destination TCP/UDP port or ICMP type: 8080
actions:
    output interfaces:
        Et3/1

```

switch>
**show directflow flows**

The **show directflow flows** command displays the contents of the flow table, showing each entry with its match rules, actions, and packet counters. Including the name of a specific flow limits the output to information about the specified flow.

**Command Mode**

EXEC

**Command Syntax**

```
show directflow flows [flow_name [counters|detail]]
```

**Parameters**

- `flow_name` name of flow for which to display information. If no flow name is entered, command displays information for all flows.
- `counters` displays DirectFlow counters for the specified flow.
- `detail` displays detailed information for the specified flow.
Example

- This command displays the contents of the flow table.

```plaintext
switch# show directflow flows
Flow test3:
  persistent: True
  priority: 0
  priorityGroupType: default
  tableType: ifp
  hard timeout: 0
  idle timeout: 0
  match:
    Ethernet type: 0x86dd
  actions:
    output interfaces:
      Et32
    source: config
  matched: 0 packets, 0 bytes
Flow test2:
  persistent: True
  priority: 0
  priorityGroupType: default
  tableType: ifp
  hard timeout: 0
  idle timeout: 0
  match:
    Ethernet type: IPv4
    source IPv4 address: 10.1.2.12/255.255.255.255
    IPv4 protocol: TCP
    destination TCP/UDP port or ICMP type: 8080
  actions:
    output interfaces:
      Et3/1
    source: config
  matched: 0 packets, 0 bytes
Flow test1:
  persistent: True
  priority: 0

shutdown (DirectFlow)

The **shutdown** command, in DirectFlow mode, disables DirectFlow on the switch. DirectFlow is disabled by default.

The **no shutdown** command re-enables DirectFlow.

**Command Mode**

Directflow Configuration

**Command Syntax**

- shutdown
- no shutdown
- default shutdown

**Example**

- These commands enable DirectFlow on the switch.
  ```
  switch(config)#directflow
  switch(config-directflow)#no shutdown
  switch(config-directflow)#
  ```

- This command disables DirectFlow Flow.
  ```
  switch(config-directflow-Test1)#shutdown
  ```
timeout (DirectFlow-flow mode)

The `timeout` command, in DirectFlow mode, command configures the connection timeout period for connection sessions. The connection timeout period defines the interval between a user’s most recently entered command and an automatic connection shutdown. Automatic connection timeout is disabled by setting the idle-timeout to zero, which is the default setting.

**Command Mode**
- Directflow-flow Configuration

**Command Syntax**
- `no priority`
- `no timeout hard`
- `no timeout idle`

**Parameters**
- **idle**  
  - `0` Automatic connection timeout is disabled.
  - `<1-4294967295>` Automatic timeout period (seconds).
- **hard**  
  - `0` Automatic connection timeout is disabled.
  - `<1-4294967295>` Automatic timeout period (seconds).

**Example**
- These commands enable a hard timeout period of 5 seconds on the switch.
  ```
  switch(config)#directflow
  switch(config-directflow-Test1)#timeout hard 5
  switch(config-directflow-Test1)#
  ```
- These commands enable DirectFlow on the switch.
  ```
  switch(config)#directflow
  switch(config-directflow-Test1)#no timeout hard
  switch(config-directflow-Test1)#
  ```
